towers or castles, wherewith towns or camps were defended. Du-Cange Gloss. Lat.

BRETAGNE, in *Geography*. See BRITANNY.

BRETCHEREM, or GRATHAM, a small town of Polish Prussia with a castle on the same river, in the territory of Culm; 48 miles E. of Culm.

BRETENOUX, a town of France, in the department of the Lot, and chief place of a canton in the district of Figeac, 4 miles N. N. W. of St. Ceré. The place contains 569, and the canton 8734 inhabitants; the territory comprehends 140 kilometres, and 15 communes.

BRETESSED, in *Herabry*, a term used by French heralds to express any charge that is embattled on both sides opposite to each other.

BRETEUIL, in *Geography*, a town of France, in the department of the Eure, and chief place of a canton, in the district of Evreux, 5 leagues S. S. W. of Evreux. The place contains 1893, and the canton 12,775 inhabitants; the territory includes  $187\frac{1}{2}$  kilometres, and 14 communes.

BRETEUIL, is also a town of France, in the department of the Oise, and chief place of a canton, in the district of Clermont,  $3\frac{1}{2}$  posts S. of Amiens. The place contains 2100, and the canton, 11,632 inhabitants; the extent of the territory comprehends  $147\frac{1}{2}$  kilometres, and 19 communes.

BRETHREN and Sisters of the Free Spirit, in *Ecclesiastical History*, an appellation assumed by a new sect which sprung up towards the close of the thirteenth century, and gained many adherents in Italy, France, and Germany. They took their denomination from the words of St. Paul, Rom. chap. viii. ver. 2. 14. and maintained, that the true children of God were invested with the privilege of a full and perfect freedom from the jurisdiction of the law. They were enthusiasts to a degree of distraction, both in their principles and practice. They resembled the BÉGHARDS, by which name they were sometimes called, in their aspect, apparel, and manner of living. Some of their professed principles resembled those of the Pantheists; for they held, that all things flowed by emanation from God; that rational souls were portions of the Deity; and that the universe was God; and that by the power of contemplation, they were united to the Deity, and acquired hereby a glorious and sublime liberty, both from the sinful lusts and the common instincts of nature: and hence they concluded, that the person who was thus absorbed in the abyss of the Deity, became a part of the Godhead, and was the son of God in the same sense and manner that Christ was, and that he was freed from the obligation of all laws, human and divine. They treated with contempt all Christian ordinances, and all external acts of religion, as unsuitable to the state of perfection at which they were arrived. Some of them were honest but deluded enthusiasts: and they endured the torments inflicted upon them by the inquisitors with astonishing calmness and triumph. Others proceeded to the most extravagant licentiousness of conduct. They held their secret assemblies stark naked, and lay in the same beds with their spiritual sisters, and indiscriminately with other women, without the least scruple or hesitation; modesty and decency being, according to their creed, marks of inward corruption. And some of them proceeded still farther, and maintained, that the *divine man*, or believer, could not sin, let his conduct be ever so horrible or atrocious. Many edicts were published against them; but notwithstanding the severities they suffered, they continued till about the middle of the fifteenth century. They were called by several other names, such as Schweistrones, Picards, Adamites, and Turlopms. Mosheim's Eccl. Hist. vol. iii. p. 122, &c. 202, &c. 273, &c.

**BRETHREN and Clerks of the Common Life**, a denomination assumed by a religious fraternity towards the latter end of the fifteenth century. They lived under the rule of St. Augustin, and were eminently useful in promoting the cause of religion and learning. Their society was first formed, in the preceding century, by Gerard de Groote, a native of Deventer; but did not flourish till about the period above-mentioned, when it obtained the approbation of the council of Constance, and became very respectable in Holland, the Lower Germany, and the adjacent provinces. It was divided into two classes; the *lettered brethren*, or *clerks*, and the *illiterate*: they lived in separate habitations, but maintained the closest fraternal union. The former applied to the study of polite literature, and the education of youth; whilst the later were employed in manual labour, and the mechanic arts. Unrestrained by religious vows, they nevertheless had all things in common; and this community was the great bond of their union. From the schools erected by the class of clerks proceeded many celebrated persons, who contributed to the revival of literature and taste in Germany and Holland; such as Erasmus, Hegius, Murelius, &c. They were frequently called *Beghards*, and *Lollards*, by way of reproach. Mosheim, vol. iii. p. 253.

**BRETHREN, White, fratres albi**, were the followers of a leader about the beginning of the fifteenth century, who was arrayed in a white garment; and, as they were also clothed in white linen, they were distinguished by this title. Their leader was a priest from the Alps, who carried about a cross, like a standard, and whose apparent sanctity and devotion drew together a number of followers. This deluded enthusiast practised many acts of mortification and penance, endeavouring to persuade the European nations to renew the holy war, and pretended that he was favoured with divine visions. Boniface IX. apprehending that this enthusiast or impostor concealed insidious and ambitious views, ordered him to be apprehended and committed to the flames, upon which his followers dispersed. Mosheim, vol. iii. p. 275.

**BRETHREN of the Obedience.** See OBSERVANCE.

**BRETON**, in *Geography*, a river of England, which runs into the Stour, near Hadleigh in Suffolk.

**BRETON**, a sand-bank, about two miles from the coast of France, in the English channel, and at the same distance south from Granville, towards Cancale bay, the middle of which is dry at low water.

**BRETON, Cape**, lies at the north end of the lake which extends northward from the Bayonne river at the bottom of the bay of Biscay. It is known at Bayonne by its flat tower, and often called "Cabriton."

**BRETON, Cape**, an island, or rather a collection of islands, called by the French "Les Isles de Madame," situated in the Atlantic ocean, on the coast of North America, between 45° 28' and 47° N. lat. and between 59° 44' and 61° 29' W. long. and about 45 leagues E. of Halifax. This island is about 109 miles in length, and from 20 to 34 in breadth; and, though attached to Lower Canada, is separated from Nova Scotia by a narrow strait, called the "Gut of Canso," which forms the communication between the Atlantic ocean and the gulf of St. Lawrence. It is surrounded with sharp pointed rocks, separated from one another by the waves, above which some of their tops are visible. All its harbours are open to the east, turning towards the south; and on the other parts of the coast there are not a few anchoring places for small vessels, in creeks or between islets. The soil is generally swampy and mossy, and unfit for agriculture; and as it abounds with lakes and forests, the climate is cold and foggy. The scarcity and poverty of pastures have likewise prevented the increase of cattle. Al-

though it abounds in timber, such as pine, beech, birch, maple, spruce, and fir, it has derived little advantage from it. The fur-trade of this island has always been very inconsiderable; its peltry consisted only in the skins of a few lynxes, elks, musk-rats, wild-cats, bears, otters, and foxes, both of a red and silver and grey colour. Some of these were procured from a colony of Miemac Indians, who had settled on the island with the French, and never could raise more than 60 men able to bear arms. The rest came from St. John's on the neighbouring continent. The fishery is a much more important object; and, in 1743, when this island belonged to the French, the whole value of it is said to have amounted annually to a million sterling; and no less than 564 ships, besides shallops, and 27,000 seamen, were employed in this trade. At present the inhabitants of the island take about 30,000 quintals of fish annually, which are shipped for Spain and the straits, principally by merchants from Jersey (belonging to England) who yearly resort hither, and keep stores of supplies for the fishermen. Part of their fish was sent to the French southern islands, in 20 or 25 ships from 70 to 140 tons burden. Besides the cod, which made at least half their cargo, they also exported to the other colonies, timber, planks, thin oak-boards, salted salmon and mackerel, train-oil, and sea-coal. In return they received sugar and coffee, rum and molasses; the overplus of which they conveyed to Canada and to New England, where they obtained in exchange, fruits, vegetables, wood, brick, and cattle. Besides this allowed trade, they also carried on a clandestine or smuggling commerce, in flour and salt-fish. In this island there is a very extensive bed of coal, which lies in a horizontal direction, about six or eight feet below the surface: but this has been chiefly used as ballast. In one of the pits a fire has been accidentally kindled, which could never yet be extinguished. These mines yield a revenue of 12,000l. yearly to the crown. The number of inhabitants in cape Breton does not exceed 1000.

This island was discovered, according to the French authors, about the year 1500, by the Normans and Bretons, who navigated these seas; and as it was supposed to be a part of the continent, it was called *Cape Breton*, which appellation it has absurdly retained. But though it had been for some time a place of resort for fishermen in the summer, the French did not take possession of it before the year 1713; they then changed its name into that of "Isle Royale," and fixed upon fort St. Dauphin as their chief settlement. But as this harbour, though spacious and sheltered from winds, was difficult of access, they directed their views to another station; and in 1720 commenced their fortifications at Louisbourg. The settlers were chiefly Europeans; the Acadians and French of Nova Scotia not choosing to leave that country. This island remained in the possession of the French till the year 1745; when it was captured by the New-England militia under the command of William Pepperell esq. a colonel of the militia, and a squadron under commodore Warren. It was afterwards restored to the French, and retaken in 1758, by admiral Boscawen and general Amherst; and finally ceded to Great Britain by the peace of 1763; since which period the fortifications have been blown up, and the town of Louisbourg dismantled. This island, with respect to matters of government, was considered as annexed to Nova Scotia, till the year 1784, when it was erected into a separate government by the name of Sydney, its capital. The other principal town is Louisbourg. The present seat of government is at Spanish river, on the north side of the island. This island may be regarded as the key to Canada, and the fishery in its neighbourhood depends on its protection; and the most convenient harbour for its security and supply is Louisbourg.

**BRETON**, *Pertuis*, or *Breton channel*, lies on the west coast of France, and on the north of the island of Rhié, between that island and the main.

**BRETON**, *Port*, lies at the extreme part of the Mediterranean, on the coast of Syria in Asia; N. N. E. from Larissa gulf, at the distance of about 14 or 15 leagues.

**BRETONNAYAN**, **RENÈ**, in *Biography*, practised medicine with reputation at Turin, towards the end of the 16th century, but is only now known by a singular work in verse: "La Generation de l'homme, et le temple de l'ame, avec autres œuvres poetiques extraites de l'Esculape, de R. B." Paris, 1583, 4to. In the course of the poem the author treats of the stone, gout, melancholy, colic, &c. The heart he calls the sun of the microcosm; the liver the temple of human nature. He describes also a variety of cosmetics to beautify the skin, which was at that time pretty much the custom, among writers on medicines, particularly those who treated on the diseases incident to women. Haller. Bib. Ch. Eloy. Dict. Hist.

**BRETOYSE**, or **BRETOIS**, the law of the marches of Wales; in use among the ancient Britons.

**BRETTA**, or **BRETTEN**, in *Geography*, a town of Sweden, in the province of Dalecarlia, at the western extremity of the lake Vener or Wener, and at the distance of about half a Swedish mile from Wenerborg.

**BRETTEN**, or **BRETHEINE**, a town of Germany, in a prefecture of the same name, in the circle of the Lower Rhine, and palatinate of the Rhine, seated on a hill on the Salzbach, and accommodating the Roman catholics, Lutherans, and Calvinists, in their respective worship. It is famous as the birth-place of Philip Melancthon. It was set on fire by the French in 1689; distant 21 miles S. from Heidelberg, and 18 S. E. from Spire.

**BRETTEVILLE sur Laife**, a town of France, in the department of the Calvados, and chief place of a canton in the district of Falaise; 10 miles N. N. W. of Falaise. The place contains 790, and the canton 14,450, inhabitants; the territory comprehends 230 kilimetres, and 41 communes.

**BRETTEVILLE l'Orgueilleuse**, a town of France, in the department of the Calvados, and chief place of a canton in the district of Caen; 2 leagues W. N. W. of Caen.

**BRETTIGAU**. See **PRETTIGAU**.

**BREVAL**, a town of France, in the department of the Seine and Oise, and district of Mantes, one league S. W. of Mantes.

**BREVANNE**, a town of France, in the department of the Upper Marne, and district of Chaumont, 6 miles S. of Bournont.

**BREUDEL**, **JOHN PHILIP**, in *Biography*, a Dutch physician of eminence, who lived the latter end of the 16th and the beginning of the 17th centuries, only now known by a "Collection of medical consultations," which he published in 1615, at Frankfort, 4to. and which were much esteemed.

**BREUDEL**, **ZACCHARY**, born at Jena in Saxony, in 1592, was initiated into the knowledge of medicine by his father, who was one of the professors in that university. In 1617, he was made doctor, and, on the secession of his father, professor in medicine, an office which he filled several years with distinguished attention and ability. He has left several works, the principal of which are "Chemia in artis formam redacta," Jena, 1630, 12mo.; "De Medicina, arte nobilissima," 1635, 4to.

**BREUDEL**, **ADAM**, professor in anatomy and botany in the university of Wittemberg, distinguished for his knowledge of the Greek language, as well as for his skill in his profession,

published, in 1700, a collection of inaugural dissertations, among which Haller notices, as of superior value, "De hydrope ovarii muliebris," in which he gives an accurate description of that organ; "Embryonem in ovulo ante conceptionem," an opinion which is now pretty generally ascribed to; "De nutritione factis in utero materno." He also published "De lapidicina microcosmi," 4to. 1711, shewing the varieties in stones found in the kidneys and bladder. He relates the case of a young woman who destroyed a foetus she was pregnant with, and procured abortion, by passing a fillet up the vagina into the uterus, but her life fell a sacrifice to the experiment: also, "Observationum anatomicarum decades tres," 4to. They came out from 1606 to 1618. In the third part he describes the exhaling vessels of the heart.

**BREUDEL**, **JOHN GODFREY**, nephew to Adam, professor in anatomy at Gottingen, the beginning of the last century, published, in 1738, an accurate anatomical description of the "valvula Eustachij," with engravings; and, in 1747, "De auris humanæ concha;" "De phosphoro urinario," and other similar works, which have considerable merit. He died at Gottingen, January 18th 1758, aged 47. Haller. Bib. Medica. Botan. Anatom. et Chirurg. Eloy. Dict. Hist.

**BREVE**, **BREVIS**, *short*, in *Grammar*.—Syllables are distinguished into *longæ* and *breves*, according as they are pronounced quicker or more slow; the time of a breve is half that of a long, or, as the grammarians express it, a breve is one time, and a long two. See **ACCENT**.

**BREVE**, is used in the *Civil Law* for a short note or minute.

In which sense, the word is also written *brevis* (subaude *libellus*) and in English Brief or breve; amounting to much the same with what is otherwise called *schedula* and *brevicula*. See **BRIEF**.

**BREVE** more particularly denotes a list or register of the names of the soldiers under the command of a general.

**BREVE** is more particularly used in *Common Law* for a writ or brief; by which a man is summoned or attached to answer in action; or by which any thing is commanded to be done in the king's courts, in order to justice &c. It is called "breve" from the brevity of it; and is directed to the chancellor, judges, sheriffs, and other officers. See **WRIT**. Hence,

**BREVE perquirere**, is to purchase a writ or licence of trial in the king's courts by the plaintiff; and on this depends the usage of paying to the king in suits for money due on bond, 6s. 8d. when the debt is 40l. and 10s. when it is 100l.

Fitzherbert has given a new *Natura Brevium*; thus called by way of distinction from an Old *Natura Brevium*, composed about the time of Henry III. There is a copy of this book of Fitzherbert filled with manuscript notes by sir M. Hales, in Dr. Williams's Library in Red Cross Street.

**BREVE de recto**, see **RECTO**.

**BREVE**, in *Music*, is a note or character of time, formed square without any tail; and equivalent to two measures, or semibreves. See **CHARACTERS of music**, and **SEMI-BREVE**.

In fugues, *tempo di capella*, of two semibreves in a bar, the movement is said to be *alla breve*, from a bar containing one *breve* or two semibreves, and from the rapidity with which these seeming long notes are executed; *breves* as quick as semibreves, and semibreves as quick as minims, &c. See **TIME-TABLE**, and **NOTATION**.

**BREVE**, *Breve de Bengale*, *Breve des Philippines*, and *Breve*

*Breue de Malagafcar*, in *Ornithology*, names given by Buffon to different varieties of *CORVUS BRACHYURUS*.

BREVE, *viz.* See *Vas breve*.

BREVEN, in *Geography*, a mountain of Switzerland, situate on one side of the valley of Chamouny, and opposite to the glaciers. The height above the Mediterranean is estimated at 8358 feet.

BREVET, in the *French Law*, denotes an act issued by a secretary of state, importing a grant of some favour or donation from the king. The word is formed from the middle age Latin, *breveium*, of *breve*, *short*. In which sense brevet amounts to much the same with our WARRANT. They say a brevet of nomination, a duke by *brevet*; such a person had a brevet of a marshal of France.

BREVET more particularly denotes the commission of a subaltern officer, being only written on parchment, and without seal. A brevet-officer is one whose rank is above his pay; e. g. a brevet-major serves only as a captain, and receives pay as such. Hence, a subaltern, who obtains rank by brevet is under a necessity of discharging the additional expences of his new dignity, together with the fees of his new commission, without additional pay.

BREVET, in the *Sea Language*, is sometimes used for a BILL of lading.

BREUGHEL, or BRUEGHEL, PETER, in *Biography*, commonly called *Old Breughel*, in contradistinction to his son, an eminent painter and engraver, was born at Breughel, a village near Breda in 1510, and acquired the first principles of his art from Peter Cock or Koeck-van-Aelt, whose daughter he married. He afterwards travelled in France and Italy; studied nature, amidst the mountains of Tyrol and the scenery of the Alps; and availed himself of the works of the greatest masters in Italy. On his return from Italy he resided for some time at Antwerp, and from thence he removed to Brussels. Whilst he was employed by the magistrates of this city in taking views of the canal which falls into the Scheldt, he sickened, and died in 1570; after having caused to be burned in his presence all his licentious and satirical designs. He chiefly excelled in landscapes, and droll subjects, resembling those of Jerom Bosche; and he was particularly fond of representing the marches of armies, robberies, skirmishes, sports, dances, weddings, and drunken quarrels; and in order to acquire greater skill and accuracy in this kind of representations, he often assumed the habit of a peasant, and joined the meaner boors at their feasts and amusements. His figures were correct, and their draperies well chosen; the heads and hands were touched with spirit; and his expression, though not elegant, was true. His principal performance is in the emperor's collection at Vienna, which is the "Representation of the building of the tower of Babel, by Nimrod." Several of his paintings are in the cabinets of the emperor and elector palatine, and dispersed through various parts of Europe. For his amusement he engraved some few landscapes and grotesque subjects. Pilkington and Strutt.

BREUGHEL, PETER, the *younger*, known by the appellation of the "Hellish Breughel," from his delight in representing horrible subjects, the son of the preceding artist, was born at Brussels, and became the disciple of Gelles Coningloo. His compositions rather excite disgust than satisfaction; and his human figures, though freely pencilled and not ill coloured, are not much more elegant than those of the infernal kind. In his historical subjects he generally introduced witches and devils; such as Orpheus charming Pluto and Proserpine to procure the deliverance of Eurydice, surrounded with horrible forms and appearances; Saul and the witch of Endor; or St. Anthony's

temptations. He also was an engraver. He died in 1642. Pilkington and Strutt.

BREUGHEL, JOHN, distinguished from his mode of dress by the appellation of "Velvet Breughel," was the son of Peter Breughel the Old, and born at Brussels in 1560. He was instructed, probably, by his father, and by other artists; but, whoever were his instructors, he acquired an eminence in every art of painting, in colouring, in design, and in pencilling, far superior to that of his father, and of all his contemporaries in his style. He began with painting flowers and fruit, which he executed with admirable skill; and then proceeded to landscapes, sea-ports, and markets, in which he introduced a number of small figures, surprisingly exact and correctly drawn. At Cologne, where he resided for some time, he gained an extraordinary reputation; and his pictures were well known and admired in Italy, in which country he spent some time. He died, according to the most probable accounts, in 1625. That the industry of this artist must have been singular, sufficiently appears from the number and variety of his pictures, and the exquisite neatness and delicacy of their execution. It has been lamented, however, by connoisseurs, that his distances are overcharged with a bluish tinge. Breughel often decorated the pictures of his friends with small figures, thus greatly enhancing their value; he was employed in painting flowers, fruits, animals, and landscape scenery, in the pieces of history-paintings; and in this way Rubens made occasional use of his pencil. He sometimes joined this master in larger works, which have been much admired; and particularly in a "Vertumnus and Pomona," a picture three feet high and four broad, highly commended by Houbraken, and sold at Amsterdam for above 280*l.* sterling; and "a Terrestrial Paradise," painted for Charles I. king of England. In the gallery of the archiepiscopal palace at Milan, there is an admirable landscape of Breughel, representing a desert, in which Giovaana Battista Crespi painted the figure of St. Jerom; and among a great number preserved in the Ambrosian library in that city, there is an oval picture of the Virgin, painted by Rubens, which is encompassed by a garland of flowers admirably executed by Breughel. Most considerable cabinets possess specimens of the art of this master. Some small engravings of landscapes &c. are also ascribed to Breughel. Pilkington and Strutt.

BREUGHEL, ABRAHAM, called the *Neapolitan*, was born at Antwerp in 1672; and removing to Italy at an early age, he studied with such success, that he acquired a degree of reputation, which made his works much sought for, and highly valued. Nature was his model; and he represented his objects with elegance and truth, with a warm and natural colouring, and with a broad and free touch; which indicates a ready and expert hand. The performances of this master are classed among those of the most admired artists. The fortune, acquired by his profession, was considerable; but, he lost the whole of it by the dishonesty of a merchant in whom he confided, and died in consequence of the grief occasioned by this misfortune. Pilkington.

BREUGHEL, PETER, of Bois le Duc, took his degree of doctor in medicine at Padua, and was in such esteem with Philip II. king of Spain, that he was by his command appointed professor in medicine at the university of Louvain, though, from his frequent attendance on the nobility in the neighbouring provinces, he was not able to perform the duties of that office. On his death, which happened in the year 1577, he left a sum of money to found a college at Louvain for six students, who were to be instructed in the different branches of medicine. The college, which is still

in existence, bears the name of the founder; but no addition having been made to the revenue, it is now only capable of maintaining three students. Eloy. Dict. Hist.

**BREVIA**, *testata*, mentioned by *Feodal Writers*, were written memorandums, introduced to perpetuate the tenor of the conveyance and investiture of lauds, when grants by parol only became the occasion of dispute and uncertainty. To this end they registered in the deed the persons who attended as witnesses, and heard it read without signing their names; the clerk adding their names in a sort of memorandum. Modern deeds are an improvement and amplification of these. Blackstone's Comment. vol. ii. p. 307.

**BREVIARE**, to abbreviate or reduce a thing into a shorter compass. This is otherwise called *abbreviare* and *inbreviare*.

**BREVIARIUM**, is more particularly used among Roman writers, to denote a book introduced by Augustus, containing the accounts of the empire. The design of it was for giving an account to the people how the monies levied on them were applied. The emperor Tiberius laid aside the breviarium, but it was resumed by Caligula.

**BREVIARY**, is an epitome and abridgment, or short state of a thing. The word is Latin, *breviarium*, though not pure, as appears from Seneca, who observes, that the ancients, in lieu of it, used *summarium*.

**BREVIARY** was also used among the ancients for the place where the briefs, or what was written abbreviately, were preserved.

**BREVIARY**, among *Ecclesiastical Writers*, denotes the office or service, both for day and night, as performed in the Romish churches.

**BREVIARY** is more frequently used for a church-book, containing the office of the breviary, that is, the prayers, and other parts of the service, with the several variations to be made therein, according to the several days, canonical hours, feasts, and the like.

D. Mege derives the name breviary from hence, that the ancient monks in their journeys, &c. had little books, wherein were the psalms and lessons read in the choir, collected out of large volumes: and F. Mabillon tells us, he has seen two such books in the archives of Cîteaux; they were not above three fingers broad: their letter was exceedingly small, and consisted mostly in abbreviations, expressing a whole period in a few syllables: whence they had a good title to the appellation of breviaries, q. d. *abridgments*. Some deduce the appellation breviary hence, that when the popes resided in the Lateran palace, the office read in the papal palace was much shorter than that said in the other churches of Rome; which office, thus abbreviated, was compiled by Innocent III., and called *officium capellare*, till such time as the Franciscan friars adopting the same, in conformity to the papal chapel, it became denominated *breviarium*, and shortly after was in general use. Marg. Vocab. Eccl. p. 38. Menag. Orig. Franc. The first time the word breviary occurs, in the sense of a church-book, is in a letter of the archbishop of Lyons to the bishop of Langres, in 1099; or rather by Micrologus, who lived in 1080.

The Roman breviary is general, and may be used in every place: but on the model of this have been formed various others, peculiarly appropriated to each diocese, and each order of religious.

The breviary consists of the services of matins, lauds, prime, third, sixth, nones, vespers, and the complines, or *post-communio*; that is, of seven different hours; on account of that saying of David, *Septies in die laudem dixi tibi*. The obligation of reciting the breviary every day,

which was at first universal, by degrees was reduced to the beneficiary clergy alone, who are bound to do it on pain of mortal sin, and of refunding their revenues, in proportion as they are delinquent herein. In the fourteenth century, there was a particular reservation in favour of bishops, for passing, on occasion, three days without rehearsing the breviary. The institution of the breviary not being very ancient, the lives of the saints were inserted in it, agreeable to the opinions of the times, i. e. full of ridiculous ill-attested facts; which gave a handle to several purgations, or reformations thereof, by several councils, particularly those of Trent and Cologne; by several popes, as Pius V. Clement VIII. and Urban VIII. as also by several cardinals and bishops, each of whom lopped off some of the extravagancies, and brought the work nearer to the simplicity of the primitive offices; as acknowledging, that in the ancient church there was nothing read, but scripture itself.—Cardinal Quignon carried the reformation the farthest; leaving out the little office of the Virgin, the verses, responses, and a great part of the lives of the saints.

The breviaries now in use are almost innumerable: the difference between them consists principally in the number and order of the psalms, hymns, pater-nosters, ave-maries, credos, magnificats, cantemuses, benedictuses, canticamuses, nunc dimittises, miserereres, hallelujahs, gloria patris, &c.

The most eminent, after the Roman breviary, are those of the Benedictines, of the Bernardines, of the Chartreux, of the Præmonstratenses, of the Dominicans, the Carmelites, the Franciscans, and Jesuits; also that of Cluny, of the church of Lyons, the church of Milan, and the Mozarabic breviary used in Spain. But, in reality, there is scarcely a church in the communion of Rome, in France, Flanders, Spain, Germany, &c. that has not something particular in the form and manner of its breviary, though the differences are generally inconsiderable. See **AMBROSIAN**, **GALLICAN**, &c.

The breviary of the Greeks, which they call *ωρολογιον*, *horologium*, q. d. *dial*, is nearly the same, in almost all the churches and monasteries that follow the Greek rite. The Greeks divide the psalter into twenty parts, *καθισματα*; which are a kind of rests, pauses, or stations: and each pause is again subdivided into three parts. In general, the Greek breviary consists of two parts; the one containing the office for the evening, called *μεσονυχιον*; the other that for the morning, consisting of matins, lauds, prime, tierce, sixth, none, vespers, and complines. The breviary of the Maronites contains some more considerable variations.

Among the people who speak the Slavonic language, or any of its dialects, the breviary is rehearsed in the vulgar tongue, as among the Maronites in Syriac, among the Armenians in Armenian, &c. Those who rehearse the breviary in the Slavonic, are divided as to the rite; some following the Roman or Latin rite, as the inhabitants of Dalmatia and the neighbouring coasts; whereas those who live farther within the continent as in Hungary, Bosnia, Slavonia, &c. and in Poland, Lithuania, and Muscovy, follow the Greek rite. The breviaries of the Copts and Abyssinians are much alike.

**BREVIATE**, is sometimes used for an abridgment, or short extract of a book or paper. Phil. Trans. N<sup>o</sup> 57. p. 2212.

**BREVIATOR**, an officer under the eastern empire, whose business was to write and transcribe briefs. At Rome, those are still called breviators, or abbreviators, who dictate and draw up the pope's briefs. See **ABBREVIATOR**.

**BREVIUS**, *et Rotulis liberandis*, in Law, a writ or mandate

mandate to a sheriff, to deliver to his successor, the county, and the appurtenances, with the rolls, briefs, remembrances, and all other things belonging to that office.

**BREVICORNIS**, in *Entomology*, a species of *CFRAMEX* that inhabits Sierra Leona in Africa. The thorax is unarm'd, and green: wing-cases obscure: antennæ short, and black. Fabr. &c.

**BREVICORNIS**, a species of *NECYDALIS* found in Guinea. The wing-cases are very minute: head and thorax fuscous, with a longitudinal yellow line: antennæ, very short and thick. Gmel. &c.

**BREVICORNIS**, a species of *CIMEX* of an obscure or dull cupreous colour: antennæ, very short and compressed; the anterior thigbs dentated. Fabr. This sort is from China.

**BREVICORNIS**, a species of *TIPULA* of a black glossy colour: margin of the wings blackish: abdomen fuscous: anterior shanks spinous. Fabr. A native of Europe, called by Degeer, *Tipula flavicauda*.

**BREVICORNIS**, a species of *MONOCULUS* that inhabits marshes overflow'd by the sea. It is simply described as having the hairs of the tail very short. Müll-Stroem, &c. *Obs.* The antennæ in the male of this species are hooked; those of the female forked at the tips.

**BREVIER**, among *Printers*, is the denomination of a small species of letters between *minion* and *bourgeois*. See *PRINTING*.

**BREVINE**, in *Geography*, a town of Swisserland, in the principality of Neuchatel, 12 miles W. of Neuchatel. N. lat. 47°. E. long. 6° 23'.

**BREVIPEDES**, in *Entomology*, a species of *STAPHYLINUS* that inhabits Europe. The colour is deep black: wing-cases and legs testaceous: shanks short. Linn. Inhabits Europe.

**BREVIPIILIS**, in *Zoology*, that variety of the dog (*CANIS*) known by the name of king Charles's dog.

**BREVIS cubiti**, in *Anatomy*, one of the extensor muscles of the cubitus, arising from the external spine of the humerus.

**BREVIS radii**, one of the supinator muscles of the radius, arising partly from the external condylus of the humerus, and partly from the upper and exterior part of the ulna; and inserted into the superior part of the radius, which it embraces wholly: and serves to turn the palm of the hand upwards.

**BREVIS** is also used by some for the third of the extensors of the carpus, which, arising from the lower part of the humerus, and running along the radius, terminates in the bone of the carpus which sustains the middle finger. Some anatomists join this with the second *EXTENSOR*, and call them *bicornis*, or *radialis externus*: others choose to distinguish them because they have different origins, and insertions; and that their bellies are separable.

**BREVIS extensor pollicis pedis**. See *EXTENSOR*.

**BREVIS flexor pollicis pedis**. See *FLEXOR*.

**BREVIS peroneus**. See *PERONÆUS*.

**BREVIS pronator radii**. See *PRONATOR*.

**BREVIS**, in *Entomology*, a species of *CERAMBYX* of a blackish colour, with spinous thorax: thighs rotundate, short: anterior joints of the feet lobed with hairs. Sulz. &c. A native of Surinam.

**BREVITY**, in a general sense, that which denominates a thing brief or short.

**BREVITY** is more particularly used in speaking of the style or composition of discourse. Brevity of discourse is by some called *brachylogia* and *breviloquentia*; sometimes *laconismus*. Tacitus and Perius are remarkable for the brevity of their style. There are two kinds of brevity, one arising from dryness, poverty, and narrowness of genius;

the other from judgment and reflection; which latter alone is laudable. Brevity is so essential to a tale, a song and an epigram, that without it, they necessarily languish and become dull. Rhetoricians make brevity one of the principal marks or conditions of eloquence; but the rules they prescribe for attaining it, are difficult to apply, so as still to keep the due medium between too much and too little.

A just brevity is attained by using all the words which are necessary, and none but those which are necessary. Sometimes it may also be had, by choosing a word which has the force of several. It is this last kind which Quintilian admires so much in Sallust; and the imitation of which, by other writers, has caused so much obscurity. See *OBSCURITY*.

**BREVIUM cyfos**. See *CUSTOS*.

**BREVIUM falso retorno**. See *FALSO*.

**BREUNLINGEN**, in *Geography*, a small town of Germany, in the circle of Swabia, which, at the peace of Munster, was ceded to the house of Austria.

**BREVOORDT**, a fortified town in the United Netherlands, in the province of Guelderland, and county of Zutphen, surrounded by a marsh; seven leagues S. E. of Zutphen.

**BREW**, a river of England, which runs into the British channel, about 8 miles N. of Bridgewater.

**BREWED-WINE**. See *WINE*.

**BREWER**, a person who professes the art of *BREWING*. Brewers are called, in *Middle Age Writers*, *brsutores*, *braciatores*, *braxionarii*, *brastatrices*, *braxatrices*, and *canbarii*. Du-Cange Gloss. Lat. tom. i.

The brewers of London make a *COMPANY*, incorporated by Henry VI. in 1438, consisting of a master, three wardens, twenty-eight assistants, and one hundred and eight liverymen. See *COMPANY*.

The apparatus and utensils of a brewer, or a brewhouse, are a furnace made close and hollow for saving fuel, with a vent for the passage of the smoke, lest it taint the liquor; a copper, which is preferable to lead; a mask-fat near the head, a cooler near the mask-fat, and guile-fat under the cooler; adjoining to all, are several clean tubs, to receive the worts and liquors.

**BREWER**, in *Geography*, a strait in the Magellanean sea, about the island called Statenland, which parts it from the straits of Le Maire. It was discovered by the Dutch navigator Brewer, about the year 1643.

**BREWER'S Haven**, a good harbour at the N. end of the island of Chiloe, on the coast of Chili, in South America, and in the South sea. The Dutch attempted to land here in 1643, in order to obtain possession of some part of Chili; but they were driven off by the Spaniards and natives. S. lat. 42° 30'. W. long. 74° 10'.

**BREWING**, *Brassage de la biere*, Fr. *Das Brauen*, Germ. The art of brewing, or of preparing a vinous fermented liquor from the farinaceous feeds, is of very high antiquity. The ancient Egyptians, from the soil and climate of their country not being favourable to the culture of the vine, were induced to seek a substitute in barley, from which, in all probability, by the process of malting, they knew how to procure a fermented liquor. The town of Pelusium, situated on one of the mouths of the Nile, was particularly celebrated for its manufactories of malt liquor, of which there were two kinds; one called *Carmi* was sweet, and appears to have resembled our sweet and glutinous ales, the other named *Zibum*, seems to have been analogous to modern beer. The Germans, from the testimony of Tacitus, were capable of preparing a liquor similar to wine (*quandam vini speciem*) from barley, by fermentation. Julian, Strabo and Polybius, show, that the same art

was known to the Spaniards, the Gauls, and the inhabitants of the British islands, and the north of Europe. All the ancient malt liquors, however, seem to have been made entirely of barley, or some other farinaceous grain, and therefore were not generally calculated for long keeping, as this quality depends considerably, though not entirely, on the bitter extract of hops, or other vegetables, with which the liquor is mingled.

Modern malt liquor is essentially composed of water, of the soluble parts of malt and hops, and of yeast.

For a particular account of the preparation of MALT, we refer our readers to that article. It will be sufficient for our present purpose, to mention, that barley consists of fecula or starch, albumen, and a little gluten; and, that by the process of germination or malting, the starch is converted into saccharine mucilage. If each grain of barley was perfectly malted, the whole of its starch would be changed into sugar; this, however, is never the case: the soluble contents, therefore, of such malt as the brewers make use of, arranged in the order of their respective proportions, are saccharine mucilage, starch, albumen, and gluten, of which only the first is absolutely necessary for the production of a vinous liquor. Three or four different kinds of malt are distinguished by the brewer by their colours, which depend on the degree of heat that was used in the drying. Malt that has been dried by a very gentle heat scarcely differs in its colour from barley; if exposed to a somewhat higher temperature, it acquires a light amber-yellow hue; and by successive increments of heat, the colour becomes deeper and deeper, till, at length, it is black. The change of colour is owing to the grain being partially charred or decomposed; and in proportion to the extent to which this alteration is allowed to proceed, will the produce of sugar, that is of fermentable matter, be diminished. The principal advantage of high-dried malt over the paler kind, is the deep yellowish brown tinge which it gives to the liquor: but this colour may be communicated much more economically by burnt sugar. The malt, whether pale or high-dried, must be bruised between rollers, or coarsely ground in a mill before it is used, and it is found by experience, that malt which has lain to cool for some weeks is, in many respects, preferable to that which is used as it comes hot from the mill. The first step in the process of brewing, is

#### § 1. *Mashing.*

This is performed in the *mash-tun*, which is a circular wooden vessel, shallow in proportion to its extent, and furnished with a false bottom, pierced with small holes, fixed a few inches above the real bottom: when it is small, it ought to have a moveable wooden cover. There are two side-openings in the interval between the real and false bottom; to one is fixed a pipe for the purpose of conveying water into the tun; the other is fitted with a spigot for the purpose of drawing the liquor out of the tun. The brewing commences by strewing the grist or bruised malt evenly over the false bottom of the mash-tun, and then, by means of the side pipe, letting in from the upper copper the proper quantity of hot water. The water first fills the interval between the two bottoms, then forcing its way through the holes in the false bottom, it soaks into the grist, which, at first floating on the surface of the water, is thus raised off the bottom on which it was spread. When the whole of the water is let in, the process of mashing, properly so called, begins. The object in mashing is to effect a perfect mixture of the malt with the water, in order that all the soluble parts may be extracted by this fluid: for this purpose, the grist is first incorporated with the water by

means of iron rakes, and then the mass is beaten and agitated, and still further mixed by long flat wooden poles, resembling *oars*, which indeed is the name by which they are technically known. In some of the large porter breweries, the extent of the tun is so great, that the process of mashing cannot be adequately performed by human labour, and recourse is had to a very simple and effectual instrument for this purpose. A very strong iron screw, of the same height as the mash-tun, is fixed in the centre of the vessel, from which proceed two great arms or shafts, also of iron, and beset with vertical iron teeth a few inches asunder, in the manner of a double comb: by means of a steam engine, or any other moving power, the iron arms which at first rest on the false bottom, are made slowly to revolve upon the central screw, in consequence of which, in proportion as they revolve, they also ascend through the contents of the tun to the surface; then, inverting the circular motion, they descend again in the course of a few revolutions to the bottom. These alternate motions are continued till the grist and water are thoroughly incorporated. When the mashing is completed, the tun is covered in to prevent the escape of the heat, and the whole is suffered to remain still, in order that the insoluble parts may separate from the liquor: the side spigot is then withdrawn, and the clear wort is allowed to run off, slowly at first, but more rapidly as it becomes fine, into the lower or boiling copper.

The operation of mashing, as it is the first in order, is the most important; and all the succeeding ones are modified according to the circumstances, under which this primary one is effected. The principal thing to be attended to, is the temperature of the mash, which depends, partly on the heat of the water, and partly on the state of the malt. If any quantity of barley is mingled with twice its bulk of water, the temperature of the mass will be very nearly that of the mean temperature of the ingredients. If the palest malt is subjected to the same experiment, the temperature will be somewhat greater than that of the mean heat. This excess is found to increase very rapidly, in proportion to the colour or dryness of the malt employed; so that when one part of the highest dried malt is mixed with two parts of warm water, the temperature will be no less than 40° Fah. above the mean. In calculating, therefore, the heat of the mash, it is necessary to take into consideration, both the dryness of the malt, and the proportion which it contains of unmalted, or imperfectly malted barley. The object in mashing is to extract from the malt, as much as possible of the saccharine mucilage; but this is so intimately combined with the other parts of the grain, that the range of temperature which can be employed for this purpose, is very confined. If the water was let upon the grist boiling hot, the starch which it contains would not only be dissolved, but converted into a gelatinous substance, in which all the other parts of the malt, and most of the water, would be entangled, beyond the possibility of recovery by any after-process; and great loss is perpetually sustained by inattentive brewers, from this very circumstance. The most eligible temperature upon the whole for mashing, appears to be about 135° to 150° of Fahrenheit: the heat of the water, therefore, for the first mashing, must be somewhat below this temperature, and the lower in proportion to the dark colour of the malt made use of. Thus, for pale malt, the water of the mash may be at 180° and upwards; but for high-dried brown malt, it ought not much to exceed 170°. The wort of the first mashing is always by much the richest in saccharine matter; but to exhaust the malt, a second and third mashing is required; and as no heat is generated, except in the first mashing, the water in the succeeding ones may

be fairly raised to nearly 1.00°. The proportion of wort to be obtained from each bushel of malt, depends entirely on the proposed strength of the liquor. For sound small beer, 30 gallons of wort may be taken from each bushel of malt; but for the strongest ale, only the produce of the first mashing, or about 6½ gallons per bushel, is employed. But whatever be the proportion of wort required, it must be held in mind, that every bushel of well made malt will absorb, and retain 3½ gallons of water, and, therefore, the water made use of must exceed the wort required, in the same proportion.

It is of great importance to the brewer, to ascertain the strength of his worts, or their richness in saccharine matter; this may be done, partly by the taste, but more accurately by an instrument called a *Saccharometer*, which in fact is only a hydrometer, the scale of which is adapted to the various densities of wort. The name Saccharometer, however, is an improper one, as it is apt to mislead the brewer: this instrument shows merely the specific gravity of the liquor, and this depends, not only upon the sugar, but the starch, and every other part of the malt which is soluble in water. But the relative proportions of these substances are, in all likelihood, very various in different parcels of malt; whence arises a serious objection to much dependence on the saccharometer.

§ 2. *Boiling and hopping.*

If only one kind of liquor (whether ale or beer) is to be made, the produce of the three mashings is to be mixed together: but, if both ale and beer are required, the wort of the first, or of the first and second mashings, is appropriated to the ale, and the remainder is set aside for the beer. All the wort destined for the same liquor, after it has run from the mash-tun, is transferred to the large lower copper, and mixed while it is heating with the required proportion of hops. The stronger the wort is, the larger proportion of hops does it demand: and this is calculated in two ways, either according to the quantity of malt employed, or the richness of the wort. Where the former basis of calculation is referred to, the quantity of hops, especially in private families, where economy is not so strictly attended to as in large establishments, is one pound of hops to a bushel of malt, whether the wort is intended for the strongest ale, or the weakest small beer. In public breweries, the proportion of hops is considerably smaller, and is regulated, not merely by the quantity of malt, but the richness of the wort. For strong ales, the common proportion is about 1 pound of hops to 1.3 bushel of malt; for beer, the quantity is lowered to 1 pound of hops to 1.7 bushel of malt. When both ale and beer are brewed from the same malt, the usual practice is to put the *whole* quantity of hops in the ale wort; and after they have been boiled a sufficient time in this, to transfer them to the beer-wort, in order to be exhausted by a second boiling.

When the hops are mixed with the wort in the copper, the liquor is brought to boil; and the best practice is to keep it boiling as fast as possible, till, upon taking a little of the liquor out, it is found to be full of minute flakes, like curdled soap. These flakes consist of the gluten and starch of the malt separated from their former solution in the wort, by the joint action, in all probability, of the heat, and the bitter extract of the hops. For the ascertainment of this important question, no regular experiments, however, have been as yet instituted.

The boiling copper is in most breweries uncovered, but in some it is fitted with a steam-tight cover, from the centre of which passes a cylindrical pipe, that terminates by several recurved branches in the upper or mashing copper: the steam,

therefore, produced by the boiling, instead of being wasted, is let into the cold water of the upper copper, and thus raises it very nearly to the temperature required for mashing, besides impregnating it very sensibly with the essential oil of the hops, in which the whole of the flavour resides, and which would otherwise be discharged into the air, and thus be lost.

§ 3. *Cooling.*

When the liquor is sufficiently boiled, it is discharged into a number of shallow tubs called coolers, where it remains exposed to a free draft of air, till it has deposited the hopseeds and coagulated flakes with which it was charged, and is become sufficiently cool to be submitted to the next process, which is that of fermentation. It is necessary that the process of cooling should be carried on as expeditiously as possible, particularly in hot weather; for unfermented wort, by exposure to a hot close air for a few hours, is very liable to contract a nauseous smell and taste, when it is said technically to be *foxed*, in consequence of small spots of white mould forming on its surface. Liquor made from pale malt, and which is intended for immediate drinking, need not be cooled lower than 75° or 80°, and in consequence may be made all the year through, except perhaps during the very hottest season; but beer from brown malt, especially if intended for long keeping, requires to be cooled to 65° or 70°, and therefore cannot possibly be made except in cool weather; hence it is that the months of March and October have always been reckoned peculiarly favourable to the manufacture of the best malt liquor.

§ 4. *Tunning and barrelling.*

From the coolers the liquor is transferred into the fermenting or working tun, which is a large cubical wooden vessel capable of being closed at pleasure. As soon as the wort is let in, it is well mixed with yeast, in the proportion of about one gallon to four barrels, and in about five hours afterwards the fermentation commences. The signs of fermentation are muddiness of the liquor, the formation of froth or yeast on the surface, and a copious disengagement of carbonic acid. In the first stage of fermentation, on taking some of the yeast in a bowl it soon falls down into a liquid; but when the fermentation is sufficiently established to allow of barrelling, the yeast has a certain degree of toughness, and will remain a long time without falling in. When the wort is let down hot into the working tun, the fermentation is conducted with the tun closed, and proceeds rapidly, so that in about 18 or 20 hours it is fit to be cleaned or put into the barrels; but when the wort is let down at 65° it requires 48 hours for the first fermentation, and is peculiarly liable to be affected by a considerable change of weather.

Although, in common practice, the coagulated fecula and gluten are deposited and left in the coolers, yet, skilful brewers mix them again with the wort by agitation, and ferment the liquor in this state. Fermentation is considerably retarded by this practice; but, in return, the liquor is much clearer and more completely fermented, as is obvious from the remarkable diminution of specific gravity which it undergoes.

The last process is transferring the liquor from the working tun to the barrels, when the fermentation is completed. During a few days, a copious discharge of yeast takes place from the bung-hole, and the barrels must be carefully filled up every day with fresh liquor: this discharge gradually becomes less, and in about a week ceases; at which time the bung-hole is closed up and the liquor is fit for use, after standing from a fortnight to three months according to its strength, and the temperature at which it has been fermented.

**BREWING**, among *Distillers*, denotes the method of extracting the more soluble parts of vegetables with hot water, and thus procuring a solution or decoction fitted for vinous fermentation.

In which sense brewing is a necessary step towards distillation.

A fermentable solution, fit for yielding a spirit, or brandy, is obtainable from any vegetable, under proper management; but the more readily and perfectly the subject dissolves, the better it is disposed for fermentation, and the production of brandies. Thus sugar, honey, treacle, manna, and other inspissated vegetable juices, which totally unite with water, into a clear and uniform solution, are more immediate, more perfect, and better adapted subjects of fermentation than roots, fruits, or herbs, in substance, the grains, or even malt itself; all which dissolve but very imperfectly in hot water.

Yet malt, for its cheapness, is generally preferred in England, and brewed for this purpose, much after the common manner of brewing for beer; only the worst malt will serve for distillation; and the tincture, without the addition of hops, and the trouble of boiling, is here directly cooled and fermented.

The grain intended for brewing is previously malted, to prepare it for dissolving more easily and copiously in the water, so as to afford a richer tincture or solution, which, after due fermentation, will yield about one half more of proof spirit than the tincture of an equal weight of unmalted corn.

Brewing is also used, in an ill sense, for the counterfeiting and compounding especially of wines. Vintners and wine-coopers are suspected of brewing wines, or mixing divers inferior sorts, to imitate some better kind. The necessity of accommodating their liquors to the palates of their guests, is another cause of brewing; inasmuch that some have confessed they commonly draw out of two or three casks for every pint.

**BREWING**, the appearance of a collection of black and tempestuous clouds, arising gradually from a part of the horizon, being an indication of an approaching storm.

**BREWINGTON, FORT**, in *Geography*, lies in the township of Mexico, New-York, and at the west end of lake Oneida, about 24 miles S. W. from fort Oswego.

**BREWWOOD**, or **BREEWOOD**, a market town of Staffordshire, England, consists of 581 houses, and 2863 inhabitants, the greater number of whom are engaged in the iron manufactories. The bishop of the diocese had formerly a seat here, and a small Benedictine nunnery was founded here in the time of Richard I. A large free grammar school is established in this town. Here are a market on Fridays, and one fair annually. Gough's edition of Camden's *Britannia*, vol. ii.

**BREY**, a small town of Germany, in the circle of Westphalia, and bishopric of Liege, seated on the river Neer, 29 miles N. of Liege.—Also, a town of Upper Guelderland, 6 miles W. of Venlo.

**BREYDA FIORDUR**, a bay of Iceland, in the west quarter, and in the district called Dala-Syssel.

**BREYDEL**, **CHARLES**, called *Cavalier*, in *Biography*, a painter of landscapes, was born at Antwerp, in 1677, and remained under the instruction of old Rysbrack, the landscape painter, for three years, after which period he became, in consequence of his close application, competent to commence the practice of his art. Having been diverted from his purpose of visiting Italy, by the encouraging reception which he met with at Frankfort and Nuremberg, he spent two years with his brother, Francis Breydel, at the court of Hesse-Cassel; and he afterwards went to Amster-

dam, where he copied several views of the Rhine, from the designs of Grissier, and thus improved his colouring, pencilling, and taste of design, so that the works of this artist may be regarded as his second and best school. At length he settled at Ghent, where his performances were much admired; but he was reduced, by extravagance in his dress, furniture, and table, to the necessity of earning money expeditiously, and to multiply pictures much inferior in design and execution to others, which had been produced by his pencil. His health declined towards the close of his life; and his performances, during the intervals of ease which he enjoyed, amidst recurring paroxysms of the gout, wanted the spirit, delicate finishing, and firmness of touch of his better days. Whilst the ideas and style of Grisser were his models, his pictures, which were views of the Rhine, were well designed, neatly executed, and excellently coloured. But he changed this manner, in order to imitate Velvet Breughel, whose works were universally admired, and selected for his subjects battles, sieges, and encampments. He often copied the prints of Vandermeulen; but afterwards composed very readily in this style, without borrowing from any other artist. His best pictures are full of spirit, his touch is firm and well adapted to his style, and his design is correct. Some of them appear too laboured, but others are full of harmony. He died in 1744. Pilkington.

**BREYDEL, FRANCIS**, brother of the preceding, was born at Antwerp, in 1679; and is supposed to have been a disciple of old Rysbrack. At an early age he excelled in portraits, and was appointed painter to the court of Hesse-Cassel, where his works were held in high estimation. From Hesse-Cassel he removed to England, and continued here for several years, with his friend Vandermyn. Besides portraits, he painted conversations, feasts, assemblies, and carnivals; and his conversations, as well as his other compositions, are finely executed, agreeably coloured, and well disposed. This artist died in 1750. Pilkington.

**BREYER**, in *Geography*, the name of an island on the coast of North America. N. lat. 44° 19'. W. long. 66° 25'.

**BREYNIA**, in *Botany*, (in memory of Jac. Breynius, and his son, Jac. Phil. Breynius, both celebrated botanists). Forster 73. Schreb. 1655. La Marek Illust. 860. Class, *polygamia diacia*.

Gen. Char. 1. Complete flowers. *Cal.* perianth poly-leaved, top-shaped, minute, with six segments; segments, concave, blunt, closely converging, depressed, flat at the end, so that it is pervious only by a small hole. *Cor.* none. *Stam.* filaments none; anthers five, linear, erect, flattened longitudinally to the style, approximating. *Pist.* germ, very small. Style cylindric, as long as the calyx; stigma obtuse. *Pericarp.* berry, dry, globose, three-celled, supported by the perianth, now increased to three times its former size, and spreading very wide. *Seeds*, two in each cell, convex at the back, flat on the sides. 2. Stameniferous flowers. *Cal.* one leaved, with five segments; segments roundish, concave, nearly equal. *Cor.* none. *Nectary*, five glands, on short pedicels, alternate with the stamens. *Stam.* filaments five, very short; anthers roundish, as long as the calyx. 3. Pili-liferous flowers. *Cal.* and *Cor.* as in the stameniferous. *Pist.* germ globose; style none; stigmas five, obcordate, resembling petals. *Pericarp.* five-celled. *Seeds*, solitary, rather three-fided. Native of New Caledonia and Tannan, in the South Seas.

**BREYNIA**, (Brown). See *CAPPARIS CYNOPHALLOPHORA*, and *SILIQVOSA*.—(Jacquin). See *CAPPARIS BREYNIA*.

**BREYNIA**, (Pet). See *SERIPHUM CINERUM*, and *PLUMOSUM*.

**BREYRELDE**, in *Geography*, a town of Flanders, 8 miles S. of A. d.

**BREYSICH**. See **BRISCH**.

**BREZAN**, a town, having a castle, of Poland, in the palatinate of Lemberg, and district of Lubek.

**BRIZE**, a town of France, in the department of the Mayne and Loire, 8 miles S. of Saumur.

**BRIZOLLES**, or **BRESSOLLES**, a town of France, in the department of the Eure and Loire, and chief place of a canton in the district of Dreux; 4 leagues W. of Dreux. The place contains 810, and the canton 6951 inhabitants: the territory comprehends 26½ kilometres, and 22 communes.

**BRIZOVA**, a principal town of Lower Hungary, in the Upper district. The inhabitants follow agriculture and handicrafts.

**BRIAC-ST.**, a town of France, in the department of the Ille and Vilaine, and in the district of St. Malo, 1½ league W. of St. Malo.

**BRIACK island**, about 2 miles long from N. N. E. to S. S. W. lies on the coast of France, in the English channel. See **BREHAT**.

**BRIADEN**, a town of Asiatic Turkey, in Syria, 100 miles N. N. E. of Damascus.

**BRIANÇON**, a town of France, and chief place of a district, in the department of the Higher Alps, situate on the Durançe, surrounded with rocks and mountains, and defended by forts and redoubts; 14 leagues N. N. E. of Gap. The place contains 2979, and the canton 7187 inhabitants; the territory includes 257½ kilometres and 8 communes. N. lat. 44° 40'. E. long. 6° 45'.

**BRIANÇONNET**, a fortress of Savoy, in the Tarentaise, near the town Moutiers, situate on a rock which is inaccessible, except by the side of a river, where it is ascended by two or three hundred steps. The common passage from Savoy to the Tarentaise and Italy is by this fortress.

**BRIANÇONNOIS**, the name, before the revolution, of a district of France, in the province of Dauphiny, about 12 leagues long and 6 wide, comprehending several vallies, which are situated among the Alps. The air is cold in winter, and warm in summer. The inhabitants are sober, active, industrious; they cultivate some wheat and fruit, and feed flocks of sheep; they gather manna from the trees, and make some wine. This district now forms a part of the department of the Lower Alps. Its inhabitants were formerly known to the Romans under the appellation of Brigantes.

**BRIANSK**. See **BRANSK**.

**BRIANZA**, mountains of Italy, near the lake of Como, in the Milanese.

**BRIAR**, in *Botany*, a name given to many species of the rose.

**BRIAR Creek**, in *Geography*, a water of Savannah river, in Georgia; the mouth of which is about 50 miles S.E. by S. from Augusta, and 55 north-westerly from Savannah.

**BRIARÉ**, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Gien, seated on the Loire, and 2 leagues S.E. of Gien. The place contains 1655, and the canton 7700 inhabitants; the territory includes 330 kilometres, and 14 communes. At this town commences the canal, which unites the Loire and Seine. N. lat. 47° 40'. E. long. 2° 45'.

**BRIAREUS**, in *Fabulous History*, a giant, the son of Æther, Titan, or Cælus, and Terra. This was his celestial appellation; on earth he was called "Ægeon." Jupiter derived singular succour from him, when Juno, Pallas, Neptune, and the other gods, endeavoured to bind him in chains, and to dethrone him; though he afterwards conspired with

his brethren, the giants, to dethrone Jupiter. Virgil describes him (*Æn.* x. 365.) on this occasion, as having 100 hands, 50 heads, and breathing out fire. According to the fable, Jupiter punished him by throwing him under mount Ætna, which, as often as he moves, belches out fire.

**BRIAREUS**, in *Natural History*, a species of **GORGONIA**, found in the West Indian seas. This kind is subramose, round, thick, rising from a broad dilated base; the flesh white within; externally grey; florets large, bearded, with eight tentacula; bone composed of small glassy needles of a purple colour irregularly and compactly disposed in a longitudinal manner. Ellis, Solander, &c.

**BRIASCA**, in *Geography*, a town of European Turkey in Moldavia; 76 miles E. of Jassi.

**BRIATEUXE**, a town of France, in the department of the Tarn, and the district of Lavaur; 1½ league N.E. of Lavaur.

**BRIATICO**, a town of Naples, in the province of Calabria Ultra; 11 miles N.E. of Nicotera.

**BRIBACH**, a river of Swabia, in the Black forest, which rises near the source of the Danube, and unites with the Brege below the town of Doneschingen.

**BRIBE**, a reward given to pervert the judgment, or corrupt the conduct. See **BRIBERY**.

The word is French, *bribe*, which originally denotes a bit, fragment, or relic of meat taken off the table; on which footing, bribe imports as much as *penis mendicatus*, and still keeps up the idea of the matter whereof bribes anciently consisted. Hence also the Spaniards use *bribar* and *brivar* for *begging*; and *brivia*, *brivoneria*, and *brivonismo*, for *beggary*. Menag. Orig. Franc. p. 131. Skinner Etym. in voc. In *Middle Age Writers*, a bribe given to a judge, is called *quota litis*, and the receiver, *cambi particeps*, or *cambi particeps*; because the spoils of the field, i. e. the profits of the cause, were thus shared with the giver. Du-Cange. Gloss. Lat. tom. i.

**BRIBERY**, in *Common Law*, is when a person, occupying a judicial place, takes any fee, gift, reward, or brokerage, for doing his office, or by colour of his office, except of the king only. In a larger sense, bribery denotes the receiving or offering of any undue reward, to or by any person concerned in the administration of public justice, as an inducement for acting contrary to duty; and sometimes it signifies the taking or giving of a reward for a public office.

In the east it is the custom never to petition any superior for justice, kings not excepted, without a present; a practice adapted to the genius of despotic countries. The Roman law, though it contained many severe injunctions against bribery, as well for selling a man's vote in the senate or other public assembly, as for the bartering of common justice, nevertheless tacitly encouraged this practice; because it allowed the magistrate to receive small presents, provided they did not in the whole amount exceed a hundred crowns in the year. Plato, in his Ideal Republic (*De Leg.* l. 2.) more wisely orders those who take presents for doing their duty to be punished in the severest manner; and by the laws of Athens, the offerer as well as the receiver of a bribe were prosecuted. In England, this offence of taking bribes is punished, in inferior officers, with fine and imprisonment; and in those who offer a bribe, though not taken, the same. (3 Inst. 147.) But in judges, especially the superior ones, it has been always regarded as a very heinous offence; inasmuch, that anciently it was punished as high treason, and the chief justice Thorp was hanged for it in the reign of Edw. III.; and at this day it is punishable with forfeiture of office, fine, and imprisonment. By statute

11 Hen. IV. all judges and officers of the king, convicted of bribery, shall forfeit treble the bribe, be punished at the king's will, and be discharged from the king's service for ever.

Officers of the customs taking any bribe, whereby the crown may be defrauded, forfeit 100*l.*, and are rendered incapable of any office; and the person giving the bribe or offering any bribe to officers of the customs, to induce them to connive at the running of goods, shall forfeit 50*l.* See CUSTOMS. Candidates that bribe electors, after the date or *teste* of the writs, or after the vacancy, by giving or promising any money or entertainment, are disabled to serve for that place in parliament; and he that takes as well as he that offers a bribe, forfeits 500*l.* and is for ever disabled from voting, and holding any office in any corporation, unless, before conviction, he discovers some other offender of the same kind, whereby he is indemnified for his own offence. The oath against bribery, in the election of members of parliament, is as follows: "I do swear, I have not received, or had, by myself, or any person whatsoever, in trust for me, or for my use and benefit, directly or indirectly, any sum or sums of money, office, place, or employment, gift, or reward, or any promise or security, for any money, office, employment, or gift, in order to give any vote at this election." Upon this oath, archdeacon Paley (*Principles of Moral and Political Philosophy*, vol. i. p. 208.) remarks, that the several contrivances to evade this oath, such as the electors accepting money under colour of borrowing, and giving a promissory note, or other security for it, which is cancelled after the election; receiving money from a stranger, or a person in disguise, or out of a drawer or purse, left open for the purpose; or promises of money to be paid after the election; or stipulating for a place, living, or other private advantage of any kind, if they escape the legal penalties of perjury, incur the moral guilt: for they are manifestly within the mischief and design of the statute, which imposes the oath; and within the terms indeed of the oath itself; for the word "indirectly" is inserted on purpose to comprehend such cases as these. See PARLIAMENT. Blackstone's *Comm.* vol. i. p. 179. vol. iv. p. 139.

BRIBEKOU, in *Geography*, a town of Africa, on the Gold Coast.

BRIBIESCA. See BRIVIESCA.

BRICE, ST., a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Fougères; 2½ leagues N.W. of Fougères. The town contains 1193, and the canton 13,830 inhabitants; the territory comprehends 150 kilometres, and 11 communes.—Also, a town of France, in the department of the Seine and Oise; 3 leagues N. of Paris.—Also, a town of France, in the department of the Yonne; 2 leagues S.E. of Auxerre.—Also, a town of France, in the department of the Marne, and in the district of Reims; 1 league N.W. of Reims.

BRICHERASCO, a town of Piedmont, in the district of the Four Vallies; 2½ miles S.S.W. of Pignerolo.

BRICIANI, *Knights of St. Bridget*, a military order, resembling that of Malta, established by St. Bridget, princess of Sweden, in 1366, and approved of by pope Urban V. who gave it the rule of St. Augustin. The arms of the Briciani were a cross azure, like that of the knights of Malta; under which was a tongue of fire, to express the ardour of their zeal: their office was to fight against heretics, bury the dead, assist widows and orphans, &c.

BRICK, a kind of facitious stone, composed of an argillaceous earth, tempered and formed in moulds, dried in the sun, or burnt in kilns.

The use of bricks is of the highest antiquity. The earliest buildings of Asia were of bricks, dried in the sun, and cemented with bitumen. In this manner, we learn from the historical books of the Old Testament, Nineveh was built by Nimrod; and the famous walls of Babylon, reckoned by the Greeks among the wonders of the world, were of the same materials.

Unburnt bricks were used in Egypt: the making of them was one of the oppressions to which the Israelites were subjected during their servitude in that country. The antique edifices which at present exist in Egypt are principally of stone: however, Pococke describes a pyramid of unburnt brick, called "Kloube-el-Menshieh (the bricks of Menshieh), from a village near, called Menshieh-Dashour. It was doubtless built near the plain, on account of the bricks, which seem to be made of the earth brought by the Nile, being of a black sandy earth, with some pebbles and shells in it. It is mixed up with chopped straw, in order to bind the clay together; as they now make unburnt bricks in Egypt, and many other eastern parts, which they use very much in their buildings. I found some of these bricks 13½ inches long, 6½ inches broad, and 4 inches thick; and others 15 inches long, 7 inches broad, and 4½ inches thick. I observed on the north side the bricks were laid lengthways from north to south, but not every where in that direction; however, I particularly took notice that they were not laid so as to bind one another. It is much crumbled and ruined, but as it is I measured it, and found it to be 157 feet on the north side, and 210 feet on the west side; it is 150 feet high. By what I could judge, from the present slope of it, I concluded that it was built with five degrees, like the pyramid of Saccara, each being about 10 feet broad and 30 deep, so that the ascent to it is easy, as the bricks are crumbled away."

The Greeks and Romans also used this material, both sun-dried and burnt. Vitruvius instances several celebrated buildings, as the walls of Athens; the cells of the temples of Jupiter and Hercules, which were of brick, the surrounding columns and entablature being of stone; the ancient walls of Arezzo in Italy; the house built by the Attalic kings at Tralles, which was always given for the habitation of those who bore the office of priests in that city. The paintings which were brought from Lacedæmon to ornament the Comitium, in the edileship of Varro and Murena, were cut from walls of brick; the house of Cræsus at Sardis; and the celebrated tomb of Mausolus, in which, though the ornaments were all of Proconnesian marble, the walls were built of brick, and (says Vitruvius) remain to this time exceedingly substantial, and the incrustation appears as polished and shining as glass.

The following directions for making unburnt bricks are given by Vitruvius. They should not be made of sandy, stony, or gravelly loam, for such kind of earth renders them heavy; and upon being wetted with rain after being laid in the wall, they swell and dissolve, and the straw which is put in them does not adhere on account of their roughness: the earth of which they are formed should be light chalky white or red. They should be made in spring or autumn, as being the best time for drying; for the intense heat of summer parches the outside before the inside is dry, which afterwards drying in the building, causes them to shrink and break. They are best when made two years before they are used, as they cannot be sufficiently dry in less time. If they are used when newly made and moist, the plaster work which is laid on them remaining firm and stiff, and they shrinking, and consequently not preserving the same height with the incrustation, it is, by such contraction, loosened and separated.

separated. At Utica, therefore, the laws allow no bricks to be used before they have lain to dry five years.

Vitruvius proceeds to describe the different kinds of bricks, which were of three sizes; the first, called *didoron*, were in general use among the Romans; they were a foot long, and half a foot broad. The other two sorts were used by the Greeks; one called *tetradoron*, which were on every side four palms, or one foot; the other *pentadoron*, five palms, or fifteen inches every way: the first were used in private, and the latter in public edifices. They had also half bricks of each sort; and in building, the whole bricks were laid in one course, and the half in the next.

At Pitane in Asia, at Calentum in Spain, and at Marfeilles, they had bricks so light as to swim on water, the earth of which they were made being of the nature of pumice stone.

When Vitruvius mentions bricks, it appears that he means sun-dried bricks; for he observes, that bricks could not be used by the Romans within the city; as to save room in so crowded a town, the laws did not permit any walls in public places to be made thicker than one foot and a half, while brick walls of that thickness would not support more than one story. Accordingly, the walls were built with hewn stone, *testaceous substances* (*structuris testaceis*), or rubble. That these testaceous substances were tiles, is evident, for he observes, that it could not be known at first whether they were of good loam and well burnt, but that they should be laid in a roof during a winter and summer before they were used in a wall.

Augustus boasted that he had found Rome of brick, and left it of marble. It could be only sun-dried bricks that he referred to, for baked bricks were used in the most sumptuous edifices: the temple of Peace, the Pantheon, and all the *Thermæ* were of this material.

Whatever may be the precise time of the introduction of baked bricks in the edifices of Rome, they appear to have been always square. M. Quatremere de Quincy, in the *Encyclopedie Methodique*, observes, that in his researches among the antique buildings of Rome, he has found bricks of three sizes. The least were  $7\frac{1}{2}$  inches square, and  $1\frac{1}{2}$  thick; the medium ones  $16\frac{1}{2}$  inches square, and from 18 to 20 lines in thickness; and the larger ones 22 inches square, by 21 or 22 lines thick. The smaller bricks were employed to face walls of rubble work; and to make a better bond with the wall, they were cut diagonally into two triangles, the longer side was placed on the outside, and the point towards the interior of the work. To tie more effectually the facing with the rubble, they placed at every four feet in height one or two courses of the large square bricks. The large bricks were also used in the arches of openings or discharge, which were necessary in the building.

No long bricks, such as are used at present, are found in antique constructions.

In modern times, bricks have been used in all countries. Chardin thus describes the manufacture of bricks in Persia. The material of Persian buildings is brick, either dried in the sun or burnt in the fire. The tiles or bricks of earth are made in thin wooden moulds, of 8 inches long, 6 wide, and  $2\frac{1}{2}$  inches thick. The labourers temper with their feet the earth, which is generally mixed with straw cut very small, to give it more consistence, and that the bricks may last longer and not break. They pass the hands over the bricks to smooth them, after having dipped them in a vessel of water mixed with straw, still finer than was at first used. Then taking off the mould they leave the bricks to dry for two or three hours, after which they are ranged over one another, where they remain till the drying is completed.

The baked bricks are made of two parts of earth and one of cinders, well tempered together, in moulds larger than for the others. They leave them to dry in the sun for several days, then place them in a large furnace, ranged one over the other, at some distance, which they fill with plaster. They close the furnace and light the fire, which is kept up for three days and nights.

Bricks have several advantages over stone as building materials. From their porous structure they unite better with the cement used: they are lighter than stone, and not subject to attract damps and moisture.

The earth proper for the manufacture of bricks is a clayey loam, neither absounding too much in sand, which renders the ware heavy and brittle, nor yet with too large a proportion of argillaceous matter, which causes it to shrink and crack in drying.

The general process of the manufacture is as follows: The earth should be dug in the autumn; it should lie during the whole of the winter exposed to the frost, as the action of the air, in penetrating and dividing the particles of the earth, facilitates the subsequent operations of mixing and tempering. During this time the earth should be repeatedly turned and worked with the spade. In the spring the clay is broken in pieces, and thrown into shallow pits, where it is watered and suffered to remain soaking for several days. The next step is that of tempering the clay, which is generally performed by the treading of men or oxen. In the neighbourhood of London, however, this operation is performed by means of a horse-mill. The tempering of the clay is the most laborious part of the process, and that on which the perfection of the manufacture essentially depends. It is to neglect in this part, that we are chiefly to attribute the bad quality of modern bricks, in comparison with the ancient. All the stones should be removed, and the clay brought to a perfectly homogeneous paste, using the least possible quantity of water.

The following experiment, made by M. Gallon, merits attention. He took a certain quantity of the earth, prepared for the making of bricks; he let it remain for seven hours, then caused it to be moistened and beaten during the space of thirty minutes: the next morning the same operation was repeated, and the earth was beaten for thirty minutes; in the afternoon it was again beaten for fifteen minutes. Thus this earth had only been worked for an hour and a quarter longer than usual, but at three different times. The material had acquired a greater density by this preparation; for a brick made with this earth weighed five pounds eleven ounces, while another brick, made in the same mould, of the earth that had not received this preparation, weighed only five pounds seven ounces. Then having dried these bricks in the air, during the space of thirteen days, and having burnt them along with others, without any particular precautions, they were examined when taken from the kiln, and it was found that the bricks made of the earth which had been the most worked still weighed four ounces more than the others, each having lost five ounces by the evaporation of the moisture. But their strength was very different; for on placing them with the centre on a sharp edge, and loading the two ends, the bricks formed with the well-tempered earth, were broken with a weight at each end of 65 pounds or 130 pounds in all, while the others were broken with 35 pounds at each end, or 70 pounds in the whole.

The earth, being sufficiently prepared in the pits, is brought to the bench of the moulder, who works the clay into the brick-moulds, and strikes off the superfluous earth. The bricks are delivered from the mould and ranged on the ground; and when they have acquired a sufficient hardness

to admit of handling, they are dressed with a knife, and flaked or built up in long dwarf walls, and thatched over, where they remain to dry.

The burning of bricks, which is the next operation, is performed either in a kiln or a clamp. In the former, the bricks being set in, and the kiln covered with pieces of brick, they put in wood to dry them with a gentle fire; and thus they continue till they are pretty dry, which is known by the smoke turning from a whitish to a thin black smoke. They then cease to put in wood, and proceed to burn with brush, furze, straw, brake, or fern faggots, having first closed up the mouth of the kiln with a thin log (pieces of brick piled upon one another and closed with wet brick earth instead of mortar), then they continue to put in more faggots till the kiln and its arches look white, and the fire appears at the top, upon which they slacken the fire for an hour, and let all cool by degrees. Thus they continue alternately heating and slackening, till the ware be thoroughly burnt, which is usually effected in 48 hours.

About London they burn in clamps, built of the bricks themselves, after the manner of arches in kilns, with a vacancy between each brick's breadth, for the fire to play through; but with this difference, that, instead of arching, they gather the flues over by making the bricks project over one another. The place for the fuel is carried up straight on both sides till about three feet high; they then nearly fill it with wood, and over that lay a stratum of sea coal, and then overspan the arch; sea-coal is also strewed between every row of bricks in the clamp; lastly, they kindle the wood which communicates with the coals; and when all is burnt out, they conclude that the bricks are sufficiently burnt.

The proper burning of bricks is a matter of considerable difficulty, and requires an experienced workman; as it is necessary to maintain an equal heat throughout the whole mass, neither too little, which would leave the bricks weak and crumbly, nor too great, which would cause them to run together into a vitrified slag. This operation is much better performed in kilns than in clamps, as the fire can be kept up and regulated at discretion; while in clamps, as the whole of the fuel must be put in at once, the manufacturer is always tempted to use too little, and the outside bricks are necessarily under-burnt. These are called *famel bricks*, and are sold at an inferior price.

The legislature has often interfered to regulate the manufacture of bricks. By stat. 12 Geo. I. cap. 35, earth or clay, designed for making bricks for sale, shall be dug and turned at least once between the 1st of November and the 1st of February, and not be made into bricks till after the 1st of March, and no bricks be made for sale but between the 1st of March and 29th of September. But by stat. 10 Geo. III. cap. 49, earth may be dug for making bricks at any time in the year, provided such earth be turned once before it be made into bricks. And by the former statute, no Spanish is to be mixed with the earth or breeze used in the burning of bricks; and all bricks are to be burnt either in kilns, or distinct clamps, each sort by itself.

By stat. 3 Geo. II. cap. 22, there may be mixed with the brick-earth any quantity of sea-coal ashes, sifted or screened through a sieve or screen half an inch wide, and not exceeding 20 loads, to the making of 100,000 bricks, each load not exceeding 36 bushels. And breeze may be mixed with coal in the burning of bricks in clamps for sale, &c. Stock-bricks and place-bricks may be burnt in one and the same clamp, so that the stock bricks be set in one distinct parcel, and not mixed and surrounded with place-bricks.

For the more effectually securing the observation of these

laws, it was enacted, by 12 Geo. I. cap. 35, for the better discovery of offenders, that the master and wardens of the company of tylers and bricklayers should have power to search brick-kilns, &c.; but they having permitted, and even encouraged divers persons to make bricks contrary to the directions in the said act, by 2 Geo. II. cap. 15, they are divested of that power, and any two, three, or more persons, appointed by the justices of peace, are empowered, within 15 miles of London, to go in the day-time into any grounds, sheds, or places where any clay or earth shall be digged or digging for bricks or pan-tiles, or any bricks or pan-tiles shall be making or made for sale, and there to view, search, and inspect the same, &c. Offenders to forfeit 20 shillings for every thousand of unstatutable bricks, and 10 shillings for every thousand of such tiles; one moiety to the use of the prosecutor, the other to the poor of the parish where the offence shall be committed.

By 17 Geo. III. cap. 42, all bricks made for sale shall, when burned, be not less than 8½ inches long, 2½ thick, and 4 wide.

By 43 Geo. III. c. 69. (consolidating the excise duties) passed July 4, 1803, every thousand of bricks made in Great Britain, not exceeding 10 inches long, 3 inches thick, and 5 inches wide, is liable to a duty of 5s. and exceeding the fore-mentioned dimensions to 10s.; and every thousand of bricks made in Great Britain, and smoothed or polished on one or more sides, not exceeding the superficial dimensions of 10 inches long by 5 inches wide, is subject to a duty of 12s. and if such bricks exceed these dimensions, to the duty on paving tiles. The said duties are to be paid by the makers. An additional duty of 10d. per thousand was imposed on bricks and tiles in the ways and means for the year 1805.

The different kinds of bricks made in this country are principally place bricks, grey and red stocks, marble facing bricks, and cutting bricks. The place-bricks and stocks are used in common walling. The marles are made in the neighbourhood of London, and used in the outside of building; these are very beautiful bricks, of a fine yellow colour, hard, and well burnt, and in every respect superior to the stocks. The finest kind of marble and red bricks are called cutting bricks, they are used in the arches over windows and doors, being rubbed to a centre and gauged to a height. There is also a fine kind of white bricks made near Ipswich, which are used for facing, and sometimes brought to London for that purpose. The Windsor bricks, or fire-bricks, which are made at Hedgerley, a village near Windsor, are red bricks, containing a very large proportion of sand; these are used for coating furnaces, and lining the ovens of glass-houses, where they stand the utmost fury of the fire. Dutch clinkers are also imported, long narrow bricks, of a brimstone colour, very hard and well burnt; they are frequently warped, and appear almost vitrified by the heat. The use of them is for paving yards and stables.

*BRICK-walls.* See *WALL*.

*BRICKS, Oil of.* See *OIL of Olives*.

*BRICK-dust.* It is a custom with some persons to reduce this substance to a very fine powder, and give it, instead of chalk, in the heat-burn. Many of the lozenges, so much famed for the cure of this disorder, and sold under the pompous name of coral lozenges, are only made of a mixture of this uncouth medicine, and sugar, made into the consistence of paste, with gum tragacanth reduced to a mucilage with rose-water.

*BRICK* is also used in speaking of divers other matters made in the form of bricks.

In which sense, we say a penny-brick, or brick-bread. Some also mention brick-tin, a sort of tin in that shape brought

brick from Germany; and brick-soap, made in oblong pieces, from a pound and a half to three pounds.

**BRICK**, τῆρα or τῆραξ, *laerulus*, in the *Military Art*, denotes one of the forms of the Grecian army, which was taken up in the figure of a brick or tyle, with four unequal sides; its length being extended towards the enemy, and extended its depth. That of the brick inverted, denominated *τῆραξ ἄνω*, was an oblong square, after the fashion of a tower, with the small end towards the enemy. Homer. *Iliad*. μ. v. 43.

**BRICK**, or **BRIGUES**, in *Heraldry*, are figures or bearings in arms, resembling a building of bricks; being of a square form, like billets; from which they only differ in that they shew their thickness, which the other do not.

**BRICK-ARTH**, in *Agriculture*. See *Brick/so* SOIL.

**BRICK-KILN**, a place to burn bricks in.

**BRICK-LAYER**, an artificer whose business it is to build with bricks, or make brick work.

Brick layers work or business, in London, includes tiling, walling, chimney work, and paving with bricks and tyles. In the country, it also includes the mason's and plasterer's business. The materials used by brick-layers, are bricks, tyles, mortar, laths, nails, and tyle-pins. Their tools are, a brick-trowel, wherewith to take up mortar; a brick ax, to cut bricks to the determined shape; a saw, for sawing bricks; a rub-stone, on which to rub them; also a square, wherewith to lay the bed or bottom, and face or surface of the brick, to see whether they be at right angles; a bevel, by which to cut the under sides of bricks to the angles required; a small tannel of iron, wherewith to mark the bricks; a float stone, with which to rub a moulding of brick to the pattern described; a banker, to cut the bricks on; linepins, to lay their rows or courses by; plumb-rule, whereby to carry their work upright; level, to conduct it horizontal; square to set off right angles; ten foot rod, wherewith to take dimensions; jointer, wherewith to run the long joints; rammer, wherewith to beat the foundation; crow and pick-ax, wherewith to dig through walls.

The London brick-layers and tylers make a regular company, which was incorporated in 1568, and consists of a master, two wardens, twenty-eight assistants, and one hundred and eight on the livery.

A brick-layer and his labourer will lay in a day about a thousand bricks, in whole work, on a solid plane, when the wall is but a brick and a half, or two bricks thick; and since a cubic yard contains 460 bricks, he will lay above two cubic yards in a day: and hence it may be easily computed how many brick-layers are required to finish a certain piece of work in a given time.

Brick-laying is one of the arts subservient to architecture. Moxon has an exercise express on the art of brick-laying, wherein he describes the materials, tools, and methods of working used by brick-layers. See *Brick WALLS*.

**BRICK-WORK**. There is very little to be added under this head, to what has been said in the preceding article, to which the reader is referred.

Bricks, when used in external walls, are generally worked in what is called Flemish bond, that is, with headers and stretchers alternately, and the courses so disposed, that the middle of the bricks of one fall over the joints of the next. Brickwork is measured by the square foot reduced to the thickness of one brick and a half; thus a wall two bricks thick, ten feet long, and three feet high, = 30 square feet would be called 40 feet reduced. It is valued by the rod of 272 feet. Facing and gauged arches are measured by the superficial square foot, and cornices by the foot running or the length.

**BRICKWELL**, CHARLES, and JAMES, in *Biography*, two brothers, who appear to have made their travels serve to the improvement of natural history. The elder published "A natural and political History of Portugal," 8vo. London, 1726; the other, "A natural History of Carolina," 8vo. 1739, Dublin, in which he gives a particular account of plants, indigenous to that country; and the same year, also at Dublin, "A Catalogue of American Trees and Shrubs, which will bear the Climate of England," fol. with engravings. Haller. *Bib. Botan.*

**BRICON**, in *Geography*, a town of France, in the department of the Upper Marne, and district of Chaumont; 7 miles W. of Chaumont.

**BRICZANI**, a town of European Turkey, in the province of Moldavia; 30 miles S. E. of Cokzin.

**BRIDE**, a woman just married, or a wife in the first days of her matrimonial state. See **MARRIAGE**.

Among the Greeks, the bride was usually conveyed in a chariot from her father's house to that of her husband in the evening, as the most convenient time for concealing her blushes; she was placed in the middle, her husband sat on one side, and his intimate friend on the other; torches were carried before her, and in the procession they were sometimes accompanied by singers and dancers. When they arrived at the end of their journey, the axle-tree of the carriage was broken, signifying, by this action, that the bride was never to return to her father's house. The day on which the bride left her father's house was celebrated as a festival, distinct from the nuptial solemnity; which was kept at the house of the bridegroom, and began in the evening, at the time of the bride's arrival. A banquet was prepared for her reception, from respect due to the gods of marriage, who had been previously invoked, and that the marriage might be made public, as it was usually attended by a concourse of friends. Before the bride was conducted to the marriage-bed, which was richly adorned, according to the quality of the person, she bathed her feet in water, which the Athenians fetched from the fountain "Callirhoe," afterwards called *Επιγαμνιος*, from nine cisterns, supplied by it with water; which water was brought by a boy nearly allied to one of the married pair. The bride was then lighted to bed with several torches, round one of which the married person's mother tied her hair-lace, taken from her head for this use, to which custom Seneca alludes, *Theb.* v. 305. Whilst the married couple were shut together in a chamber, the laws of Athens obliged them to eat a quince, thus intimating that their first conversation ought to be mutually agreeable; and then the husband proceeded to loose his bride's girdle, called ζώνη; during which time the young men and maids stood without the door dancing and singing songs, called *επιγαμνιαι*, *epithalamia*. In the morning they returned again, and sung other epithalamia. See **ΑΠΑΥΛΙΑ** and **ΑΝΑΚΑΛΥΠΤΕΡΙΑ**.

Among the Romans, the maid espoused remained a *bride*, *sponsa*, till she entered the husband's house; from which time she commenced a wife, *uxor*.

The bridegroom was attended by a brideman, *paranympheus*; the bride by a *pronuba*, or bridemaids, whose business was to instruct her young mistress in the duties of the genial bed, and to prepare every thing for a prosperous copulation.

The ancient ceremonies practised in respect of a bride were numerous; most of them emblematical, or significant of some part of her duty; as, dressing her hair after a peculiar manner, and parting it with a spear; putting on her a crown; girding her with a girdle, which the bridegroom was to loosen; putting a yoke on her neck; dressing her in yellow  
socks;

focks; and veiling her with the *flammeum*. She was to seem to be ravished or torn by force from her mother, in memory of the rape of the Sabines under Romulus; she was to be carried home in the night-time to the bridegroom's house, accompanied by three boys, called *patrini* and *matrimi*, one of whom carried a torch, and the other two, called *paranymphæ*, led the bride, a spindle and a distaff being carried with her: she brought three pieces of money, called *asses*, in her hand to the bridegroom, whose doors, on this occasion, were adorned with flowers and branches of trees: being here interrogated who she was, she was to answer, *Caia*, in memory of *Caia Cæcilia*, wife of Tarquin the Elder, who was an excellent *lanifica*, or spinstrefs; for the like reason, before her entrance, she lined the door-posts with wool and smeared them with grease.

Fire and water being set on the threshold, she touched both; but starting back from the door, refused to enter, till at length she passed the threshold, being careful to step over, without touching it; here the keys were given her; a nuptial supper was prepared for her, and minstrels to divert her; she was seated on the figure of a Priapus, and here the *patrini* and *matrimi* resigned her to the *pronuba*, who brought her into the nuptial chamber, and put her into the genial bed. This office was to be performed by matrons who had only been once married, to denote that the marriage was to be for perpetuity. When the bridegroom was brought to her, epithalamia were sung by the women, who were divided for that purpose into two bands, one whereof sung in the evening, the other the next morning; and, for the like purpose, nuts were also thrown about for the boys to scramble for. Potter Archæol. lib. iv. cap. 11. tom. ii. Val. Max. 10. Plut. Quæst. Rom. 30. Serv. ad Æn. lib. iv. ver. 450. Kenn. Rom. Ant. p. ii. lib. i. c. 9. Fabr. Bibl. Ant. cap. 10. § 5.

BRIDE, in *Geography*, the name of a river in Ireland, which rises in the Nagle mountains, county of Cork, and having passed near the towns of Rathcormuck and Tallow, from the latter of which it is navigable, joins the Blackwater about 8 miles above Yonghall.

BRIDE, in *Ichthyology*, a French name of the fish called by Linnæus *Chatodon capiffratus*, which see. *Sparus capiffratus* of Linnæus also bears this name among the French.

BRIDE'S BAY, *St.* in *Geography*, a bay of St. George's channel, on the west coast of the county of Pembroke, in South Wales, having good anchorage in 7 to 10 fathoms; but as the westerly winds cause a great sea, in the mouth of the bay, the island of Ramsey affords shelter. This island is its northern limit, and Seamore is its southern point; and on the north of the bay is the city of St. David's. N. lat. 51° 48'. W. long. 5° 23'. In spring tides it has high water at 6 o'clock.

BRIDEGROOM, the spouse or mate of a bride.

Among the Spartans, the bridegroom, as we are informed by Plutarch, in his "Lycurgus," (Op. t. i. p. 43. cd. Xylandr.) committed a kind of rape on his bride. After the preliminaries of marriage were settled, the woman, that conducted the business, shaved off the bride's hair close to her skin, dressed her in man's clothes, and left her upon a mattress; whilst she was in this state the bridegroom stole privately into the room, untied her virgin girdle, and took her into his embraces; and after a short interval, he returned to his companions, with whom he continued to spend his life, remaining with them by night as well as by day, unless he stole a short visit to his bride, which he had no opportunity of doing without great circumspection, and fear of being discovered.

Vol. V.

Among the Romans, the bridegroom was decked to receive his bride; his hair was combed and cut in a peculiar form; he had a coronet or chaplet on his head, and was dressed in a white garment. Pitisc. Lex. Ant. tom. i.

By the ancient canons, the bridegroom was to forhear the enjoyment of his bride the first night, in honour of the nuptial benediction given by the priest on that day. Johaf. Ecelef. Law. ann. 740. § 88.

In Scotland, and perhaps also some parts of England, a custom called *marchet*, obtained, by which the lord of the manor was entitled to the first night's habitation with his tenants' brides. See BOROUGH *English*, and MARCHET.

BRIDEMIE, in the *Persian Tables*, the constellation *Lycus*, or the Wolf.

BRIDEWELL, in our *Customs*, denotes a work-house, partly for the correction of vagrants and disorderly persons, and partly for the employment of the parish poor.

They are supplied during their abode here with cloathing and diet; and those who are committed for correction are not only made to work, but, according to their crimes, they receive occasionally such a number of stripes as the governor of the house of correction ordains.

Bridewell, near Fleet-street, is a foundation of a mixt and singular nature, partaking of the hospital, the prison, and work-house; it was founded in 1557, by Edward VI. who gave the place, where king John had formerly kept his court, and which had been repaired by Henry VIII. to the city of London, with 700 marks of land, bedding, and other furniture. Several youths are sent to this hospital as apprentices to manufacturers, who reside there; they are clothed in blue doublets and breeches, with white hats. Having faithfully served their time of seven years, they have their freedom, and a donation of ten pounds each, for carrying on their respective trades.

BRIDGE, in *Architecture*, from the Saxon *byric*, is a structure of carpentry, masonry, or iron-work, built over a river, canal, or valley, for the convenience of passing from one side to the other, and may be considered as a road supported in the air by arches or lintels, and these again supported by proper piers or buttments.

Bridges generally form the continuation either of an highway or of a street; in the first case they are frequently built in a rude and cheap manner, and too often without proper attention to those principles which would ensure permanence and solidity to the structure; but when they take their lead or direction from a principal street in a capital city, their construction is attended with great expence, and a degree of elegance and durability is required in their formation, which calls for the utmost judgment and skill in the architect. The magnitude of bridges also varies with their situation. When they are erected in places not much frequented, they are often, without any impropriety, made about eight or ten yards wide, but the breadth of a bridge for a great city should at least be such as to allow a safe and easy passage for three carriages, and two horsemen abreast, and for three or four foot passengers in the same manner on each banquet.

A stately bridge over a large and rapid river, while it is one of the most difficult, is justly esteemed one of the most noble and striking specimens of human art. To behold grand arches composed of an immense quantity of small materials, so disposed and united together as to form one compact body, which, bearing the stream, affords above an ample communication with the distant shores, and allows below an uninterrupted passage to navigation, is enough to awaken the admiration of every spectator. The art of bridge building, accordingly, has received considerable attention from writers on architecture, the earliest of whom is Alberti, who

has given several judicious precepts, which, with little alteration, were afterwards laid down by Palladio, Serlio, and Scamozzi. The best of these rules are also given by Goldman and Bankhart, and by Hawkesmoor in his history of London bridge. M. Gautier has a considerable volume upon bridges ancient and modern. M. Belidor has treated on this subject, in his "Archit. Hydraulique;" and M. Parent, in his "Elémens et Recherches Mathemat." vol. iii. De la Hire, too, has touched upon the subject, in his "Traité de Méchanique;" Perronet also has given the result of his experience in a magnificent work, which has acquired great credit in France; Bossut has given an excellent treatise in the "Mémoires de l'Académie;" and Regemoites, in the year 1771, published an account of a bridge constructed by him on the river d'Allier at Moulins. This bridge consists of thirteen arches, 64 feet span each, and 24 feet high: semi-elliptic.—The top of the bridge is level. Mr. Rion published, in 1765, "Short Principles for the Architecture of Stone Bridges;" and Mr. Sempie has given some excellent practical remarks in his "Treatise on Building in Water," published in 1776. Other writers on the subject of arches and bridges are Muller, Labelye, Atwood, Emerton, and Dr. Hutton in his "Principles of Bridges."

*History of Bridges.*—We have no records which will enable us to trace the art of bridge-building from its first rude and imperfect state, through its various stages of improvement, to its present maturity and grandeur. It cannot, however, be doubted, that men in the earliest ages would do as our villagers do at present: the accidents of nature would present a model; a fallen tree, or a wave-worn cavern would frequently form a natural bridge, and the first bridges were composed of lintels of stone or wood, either of length sufficient to stretch from bank to bank, or when this was impracticable, supported by piers or posts placed in the bed of the river. There are still considerable structures of this kind in China, and many of them in this country on a rural scale. This method, however, would in many situations be opposed by insuperable difficulties: the frequent piers required for the support of lintels would, by contracting the water-way, increase a strong current to a dangerous, rapid torrent, impeding navigation, and undermining and destroying the piers themselves. It would, therefore, be found necessary, in constructing bridges over rapid rivers, to have the supports as few and distant, and the openings as wide as possible; this could only be effected by the use of arches of stone and trusses of wood; accordingly these inventions must have been completed before bridges of importance had become common.

The origin of arches is so obscure, and our lights so few, that it is, perhaps, impossible at this time to determine to whom this invention is due. The Egyptians, skilful as they were in architecture, do not appear to have possessed arches; their temples were roofed with slabs laid horizontally from column to column, and the openings covered with masonry lintels, or, as in the passages within the great pyramid, with courses of stones projecting over one another like inverted steps, till they met at top. Some of their tombs, however, which are excavated in the solid rock, have the appearance of vaults, as the ceilings are hollowed out in a circular form, and there are instances of hemispherical niches. Similar forms also prevail in the Hindoo excavations at Ellore, in the Decan, and in the island of Salfette. See Mr. Daniel's Plates of Indian Antiquities and Hindoo Excavations. This practice, though it has the form, has not the principle of an arch; for it is evident that a solid lintel gains no strength by being hollowed in the middle, neither is the execution more difficult; and though both the Hindoos and Egyptians attained this step, they never, at least, there are no remains which authorize

us to suppose that they ever did make any further progress in the discovery of arches.

The Chinese are acquainted with the use of arches, and from the known adherence of this nation to ancient modes, we may attribute a very high antiquity to this practice among them. Their arches are of various forms, pointed, semi-circular, semi-elliptical, and horse-shoe shaped; their construction, as described by Mr. Barrow, is curious, "each stone, from five to ten feet in length, is cut so as to form a segment of the arch, and, as in such cases there is no key-stone, ribs of wood fitted to the convexity of the arch are bolted through the stones by iron bars, fixed fast into the solid parts of the bridge. Sometimes, however, they are without wood, and the curved stones are morticed into long transverse blocks of stone." Mr. Barrow proceeds to observe, that "there are, however, arches wherein the stones are smaller, and pointed to a centre as in ours. I have understood from the late captain Parish, that no masonry could be superior to that in the great wall, and that all the arched and vaulted work in the old towers was exceedingly well turned."

However, the most ancient arches, of whose erection we have dates, are those in the cloacæ of Rome, which were begun by Tarquinius Priscus. There are also arches in several Greek theatres, stadia, and gymnasia, among others, the theatre of Bacchus at Athens, erected, probably, 400 years before the Christian era.

The Greeks, it is well known, often neglected the most necessary objects to lavish enormous sums on works of magnificence, though destitute of any essential utility. Pericles, so far from thinking of aqueducts, could never be prevailed upon even to construct a bridge over the little Cephissus. The Romans discovered, in this respect, a more solid manner of thinking; they were, it is true, much attached to pomp, but they never neglected works of public utility: they never risked their lives unnecessarily in crossing a torrent, as the Athenians must have done previous to the arrival of the emperor Adrian; for it was Adrian who undertook to form, by a bridge, a safe communication across the Cephissus, between the territories of Attica and Eleusis, on the most frequented road of Greece. While, therefore, we ascribe to the Greeks the use of arches and vaults, properly constructed for covering various openings in their buildings, we must look to the Romans for the application of arches to bridges, and for the chief improvements in those useful structures.

The construction of the Roman bridges is best described by Bergier: they possessed all the requisites which are met with in a modern bridge; they consisted of *pila*, or piers, *fornice*, or arches, *sublices*, or buttments, *pavimenta*, and *aggeres*; the roads over in the middle for carriages, on each side of which were *decurforia*, or banquets, somewhat higher than the rest of the road for foot passengers, and separated from it by a *sponde*, or railing, and sometimes even covered over to shelter passengers from the rain, as in the Pons Ælius. Among the Romans, the building and repairing of bridges was first committed to the priests, thence named *pontifices*, then to the censors and curators of the roads, and lastly, the emperors took the care of the bridges into their own hands.

The ancient bridges of Rome were eight in number. The bridge of *Fabricius*, which joins the island of the Tyber to the city; it is now called *Ponte Quatro Capi*, from the four heads of Janus, which are placed upon it. The bridge of *Cestius*, now called of *San Bartholomæo*, which from the other side of the island passes to Trans-Tevere. The first bridge built at Rome, which was of wood, and thence called *Pons Sublicius*, was afterwards rebuilt of stone by Æmilius Lepidus;

Lepidus; some vestiges are still to be seen at the bottom of the Aventine mountain. The bridge called *Senatorius*, and also *Palatinus*, of which some arches remain near to Santa Maria. The bridge of *Faniculus*, which, as it was rebuilt by Sixtus IV. is now called *Ponte Sisto*. The *Milvius*, now called *Ponte Molle*. There are also, near the hospital of Santo Spirito, the remains of the *Triumphal Bridge*, so named because the procession of the triumphs passed over it to go to the Capitol. Near to this is the bridge of Santo Angelo, formerly called *Pons Ælius*, from the Emperor Ælius Adrianus; it was repaired by Nicholas V. and afterwards ornamented with statues by Clement IX. Of these bridges the last mentioned is the only one at all remarkable for size.

One of the most celebrated of the bridges of antiquity was that built by Trajan over the Danube. It was erected by that emperor for the convenience of sending succours to the Roman legions on the other side of the Danube, in case they should be suddenly attacked by the Daci, but demolished by his successor, Adrian, lest the barbarians, overpowering the guards set to defend the bridge, should, by means of it, pour into Mæsia and cut off the garrisons there. Some of the piers are still to be seen in the middle of the river, near the town of Warhel in Hungary. According to the description given by Dion Cassius, (lib. 68. cap. 13.) this bridge consisted of 20 piers of squared stone, each of them 150 feet high above the foundation, 60 feet in breadth, and 170 feet distant from each other, which was the span or width of the arches, so that the whole length of the bridge was nearly 1500 yards. Considerable doubt, however, is thrown on this account by Montfauçon, who observes, that in the bas-reliefs of the Trajan column, this bridge is represented with only four piers besides the abutments, which support three larger arches or trusses of wood, with two smaller stone arches at the extremities.

On the road from Loretto to Rome, at the bottom of the hill on which the town of Narni is situated, there are the broken remains of an ancient bridge, which appears to have been very magnificent. Its form and dimensions are stated by Agostino Martinelli, in a book printed at Rome in 1676, entitled "Descrittione de diversi Ponti esistenti sopra la Fiume Nera & Tevere." This bridge which joined two mountains, between which flows the river Nera, was of an extraordinary height, and was built in this manner by Augustus, that the inhabitants of Narni might pass on a level from one mountain to another. The whole length was 850 palms (637 feet). It consisted of four large and unequal arches; the first, which was entire in the time of Martinelli, while all the others were broken, was 100 palms (75 feet) in span, and 150 palms (102 feet) in height; the second arch 180 palms (135 feet) in span; the third 152 palms (114 feet); and the fourth, which abutted against the other mountain, 190 palms, or 142 feet.

The *Pont du Gard*, about 3 leagues from Nîmes, is a very considerable Roman work. This structure was at once a bridge over the river Gardon, and an aqueduct which carried water to Nîmes. The first row of six arches, which is the bridge, supports a second arcade of eleven arches, which is continued upon the slope of the two mountains forming the valley; above the second is a third arcade of 35 arches, much smaller than those below, supporting the canal on a level with the two mountains, along which the water was conducted to Nîmes by a continued aqueduct. This remarkable edifice is built of stones of an extraordinary size, connected together without cement by iron cramps. The length of the first arcade is about 465 feet, of the second 785, of the third 850, and the height from the river 190 feet.

The celebrated Roman bridge *Pont, St. Esprit*, near Lyons, has long been reckoned one of the finest and boldest of the ancient bridges in France. Its whole length is upwards of 800 yards; it is very crooked, bending in many places, and making several unequal angles, especially in those parts where the Rhone has the strongest current. The arches are from 15 to 20 fathoms wide, and have their feet, or the bottoms of the piers, protected by two pedestals which project from them; the lower part of the piers consists of several courses of footings jutting out like steps. Between the great arches there are smaller arches like windows that come down nearly to the top of the pedestals, about the middle of the pier. This mode of construction was adopted with a view of breaking gradually the mighty force of the Rhone, the several courses of steps jutting out from the piers were intended to oppose and break the stream by portions, and prevent it from coming with its whole force at once upon the fabric; and when the flood should rise so high as to cover the steps and pedestals, then the small window-like arches would assist to convey the water through, which might otherwise endanger the great arches.

The bridge of Brioude is of great antiquity, and very remarkable, as the largest stone arch with which we are acquainted. This bridge has only one arch, under which passes the whole stream of the river Allier. The arch is formed of two ranks of squared stones; all the rest of the fabric is of rubble work. The two extremities of the arch are founded upon the rock, which occasions the springing on one side to be higher than on the other; its span is 181 feet, and its greatest height from the water to the soffit of the arch is 68 feet 8 inches, and the width of the bridge between the parapets is 13 feet.

In the middle ages bridge building was reckoned among the acts of religion; and a regular order of hospitallers was founded by St. Benezet, towards the close of the 12th century, under the denomination of pontifices or bridge-builders, whose office was to assist travellers by making bridges, settling ferries, and receiving strangers in hospitals or houses built on the banks of rivers. We read of a hospital of this kind at Avignon, where the hospitallers dwelt under the direction of their first superior St. Benezet. The Jesuit Raynaldus has a treatise expressly on St. John the bridge-builder.

The bridge of Avignon was begun in the year 1176, and finished in 1188; it consisted of 18 arches, and was about 1000 yards in length. Several of its arches have been destroyed by the rapidity of the current together with the force of the ice.

Over the several canals at Venice are laid nearly 500 bridges of different sizes; the greater number of them are of stone. The chief of these, called the *Rialto*, is celebrated as a master-piece of art: it consists of one flat and bold arch, nearly 100 feet span, and only 23 feet high above the water, and was built in 1588 to 1591, after a design of Michael Angelo. The breadth of the bridge, which is 43 feet, is divided by two rows of shops into three narrow streets, that in the middle being the widest; and there is in the centre an open archway; by which the three streets communicate with one another. At each end of the Rialto is an ascent of 56 steps; the view from its summit is very lively and magnificent. The whole exterior of the shops and the bridge is of marble. The foundation extends 90 feet, and rests upon 12,000 elm piles. This structure cost the republic 250,000 ducats.

The aqueduct bridge of Alcantara, near the city of Lisbon, is one of the most magnificent works of the kind ever executed. It was begun in the reign of John V. king of Portugal,

The width of the different Arches are as under :

Project in the year 1713, and finished the 6th of August 1722. The architect, under whose inspection it was begun and finished, was the brigadier Mansel de Maya. The stream which passes through this duct, for the use of the inhabitants of the city of Lisbon and villages adjacent, have their chief supply from a spring near the Ribeira de Caranque, about three leagues and a half from Lisbon, where the aqueduct commences; and the water is conveyed from thence through the hills by subterraneous passages, where some other springs unite with it, and across many valleys on the top of ranges of very magnificent arches, of which that crossing the vale of Alcantara is the chief. From a subterraneous course the water is conveyed through the building on the top of the arches by means of two channels, each of which is about 12 inches deep; it generally flows about the depth of seven inches, and is an abundant and never failing supply of water to Lisbon. The interior height of the building is about 13 feet; and through the centre, between the streams, is a wide handsome walk or foot-path, paved with beautiful free-stone. The building is continued the same height and width through the whole of the aqueduct from Lisbon to the spring, near the Ribeira de Caranque, so that if by accident any part becomes out of repair, the workmen have easy access to it. The subterraneous passages are lighted and ventilated by frequent openings made from the surface of the earth into the aqueduct; and over each of these openings turrets or square towers are erected, which have windows latticed with iron bars to admit the light and air, and at the same time to prevent mischievous persons from throwing any thing into the building to mire it.

This pile is lighted and ventilated by 79 windows and 16 turrets; the former are three feet seven inches long by 13 inches wide, railed with iron and latticed with bars; the latter rise 23 feet six inches above the roof, and are 16 feet square; beneath every second turret is an arched door-way into the aqueduct on each side of the building, wherein the water flows, and between that building and a parapet wall is a foot path leading from Lisbon towards the very pleasant village of Bemfique, about four miles from Lisbon, where several gentlemen have their quintas or country-seats: one in particular, the quinta of Gerard de Vifme esq. an English merchant of the first eminence, must not pass unnoticed; it is a perfect palais enchanté, whose shady bowers, beautiful gardens, fine ponds, purling streams, and sportive fountains, are frequently honoured with visits by the queen and royal family.

The height of the grand arch is 227 feet, and the total length of the piers and arches 2464 feet.

Several of the bridges in France are remarkable for their size and boldness of construction, among which may be mentioned the bridge of Neuilly, built by M. Perronet, over the Seine, on the alignment of the great avenue of the Champs Elysées, in front of the palace of the Tuilleries. This bridge, which is level at top, consists of five equal arches of 120 feet French (128 feet English) in span, and 30 feet French (32 feet English) rise. The arches are oval, composed of 11 arcs of circles of different diameters; thus the upper portion of the arch was formed with a circle of 160 feet radius, which, by its settlement during the building, and after the striking of the centres, was flattened, till it became an arc of a circle of 259 feet radius, differing so little from a flatband, that, as Perronet observes, the rise of the curve, in a length of 33 feet, amounted only to 6 inches 9 lines. The piers are 14 feet wide, and the breadth of the bridge 48 feet. It was begun in the year 1768, and terminated in 1780.

The bridge on the Seine, at Mantes, consists of three arches, that in the centre having an opening of 120 feet French (128 English), and the two others 108 feet French (116 English); the piers being 25 feet 6 inches wide, and the abutments 29 feet. This structure was begun by M. Hupeau in 1757, and completed by Perronet.

The bridge of Pont-Sainte-Maixence, on the river Oise, on the great road from Paris into Flanders, is also a work of Perronet's. This bridge, which is 41 feet wide, has three arches of 77 feet opening each, being a segment of a circle described with a radius of 118 feet. Each pier is singularly composed of four cylindrical pillars 9 feet diameter, leaving, therefore, three spaces or intercolumniations between them, which are arched over, the two external ones closed with a thin walling, and the middle one left open.

The bridge over the Loire, at Orleans, is composed of nine arches, which spring at 12 inches above low water; the middle arch is 106 feet in span, with a rise of 30 feet; the two arches at the extremities being 98 feet wide and 26 feet high, and the others in proportion; the four middle piers 19 feet, the four others 18 feet, and the abutments 23 feet 6 inches thick, making the whole length 1100 feet; the arches are oval, described from three centres. This bridge was built by M. Hupeau, begun in 1750, and finished in 1760.

The water channel under the grand arch is about 24 feet wide and seven feet deep, but, except in very rainy seasons, no water passes through this channel; the small running stream constantly passing through the vale of Alcantara is conveyed by a very narrow channel under the pavement through the grand arch, and then continues its course through the valley, in a stream between two and three feet wide, till it empties itself into the Tagus at Alcantara bridge, about the distance of two miles from the aqueduct. The expence attending the execution of so magnificent a work, and keeping the same in repair, has been immense, yet the small tax of a single rey on every pound of meat, raises a fund sufficient for the purpose. There is a chapel seen through the eleventh arch, dedicated to Nossa Senhora dos Terramotos, our Lady of the Earthquakes; in commemoration of that dreadful event the earthquake in 1755, when the greatest part of the city of Lisbon, with most of her stately buildings, and magnificent temples, were levelled with the ground.

We have many bridges of considerable note in our own country. The triangular bridge at Croyland in Lincolnshire, which was erected about the year 860, is said to be the most ancient Gothic structure remaining entire in the kingdom. There are two circumstances in the construction of this bridge, which render it an object of great curiosity. First, it is formed by three semi-arches, whose bases stand in the circumference of a circle, at equal distances from each other. These unite at the top; and the triune nature of the structure has led some to imagine that it was intended as an emblem of the Trinity. Secondly, the ascent on each of the semi-arches is by steps paved with small stones set edge-ways, and is so steep, that none but foot-passengers can go over the bridge: horsemen and carriages frequently pass under it, as the river in that place is but shallow. For what purpose this bridge was really designed, it is difficult, if not impossible, to determine. Utility, it is obvious, was one of the least motives to its erection. To boldness of design and singularity of construction it has more powerful claims; and these qualities it must be allowed to possess in as great a degree as any bridge in Europe. Although this bridge has been erected for many centuries, it exhibits no marks of decay: twelve months ago there were no fissures to be perceived in either of the arches, and all that was missed were a mound and sceptre, which have been torn from the hands of a statue of king Ethelbert by the ruthless hand of time.

London bridge is in the old Gothic style, and had twenty small locks or arches; but there are now only 19 open, two having lately been thrown into one in the centre. It is 940 feet long, 44 high, and 47 clear width between the parapets. The piers are from 15 to 35 feet thick, with sterlings projecting at each side and end, so that the greatest water-way, when the tide is above the sterlings, is 545 feet, scarcely half the breadth of the river; and below the sterlings the water-way is reduced to 204 feet, causing a dangerous fall at low water. London bridge was first built with timber in the reign of Ethelred, between the years 993 and 1016; it was repaired, or rather rebuilt of timber in 1163, and the present stone bridge was begun under king Henry II. in 1176, and finished under king John in the year 1209. It is probable there were no houses on the bridge for upwards of 200 years, since we read of a tilt and tournament held on it in 1395. Houses were erected upon it afterwards, but being found a great inconvenience and nuisance, they were removed in 1753, and the avenues to the bridge enlarged, and the whole made more commodious: the two middle arches were then thrown into one, by removing the pier from between them. The expence of the repairs amounted to above 80,000l.

There were other bridges in England built in the manner of London bridge; as the bridge at Rochester, which is 550 feet long, and has 11 arches; also the late bridge at Newcastle upon Tyne, which was broken down by a great flood in the year 1771, for want of a sufficient space for water-way through the arches. The longest bridge in England is that over the Trent at Burton, built by Bernard abbot of Burton, in the 12th century. It is all of squared free-stone, and is strong and lofty, 1545 feet in length, and consisting of 34 arches.

The bridge at Blenheim consists of three arches, the chief of which spans 101 feet 6 inches.

Near Old Aberdeen there is a bridge over the river Don, very much celebrated. It is in the Gothic taste. There is also a remarkable bridge called Sarah or Island bridge, built over the Liffey above Dublin, in the year 1792, by Mr. Alexander Stevens, a mason from Edinburgh: it consists of a single elliptical arch 106 feet span, and only rising 22 feet;

it is therefore six feet wider than the Rialto at Venice, and one foot less in height.

But the most extraordinary bridge in Great Britain is, doubtless, that over the river Taff, near Llantrisant, in Glamorganshire, called in Welsh *Pont y ty Prydd*. This is the work of William Edwards, an uneducated mason of the country, who was only indebted for his skill to his own industry and the power of his genius. He had engaged, in 1746, to build a new bridge at this place, which he executed in a style superior to any thing of the kind in this or any part of Wales, for neatness of workmanship, and elegance of design. "It consisted of three arches, elegantly light in their construction. The hewn stones were excellently well dressed and closely jointed. It was admired by all who saw it. But this river runs through a very deep vale that is more than usually woody, and crowded about with mountains. It is also to be considered, that many other rivers of no mean capacity, as the Crue, the Bargoed Taff, and the Cunno, besides almost numberless brooks that run through long, deep, and well-wooded vales or glens, fall into the Taff in its progress. The descents into these vales from the mountains being in general very steep, the water in long and heavy rains collects into these rivers with great rapidity and force, raising floods, that in their descriptions would appear absolutely incredible to the inhabitants of open and flat countries, where the rivers are neither so precipitate in their courses, nor have such hills on each side to swell them with their torrents. Such a flood unfortunately occurred after the completion of this undertaking, which tore up the largest trees by the roots, and carried them down the river to the bridge, where the arches were not sufficiently wide to admit of their passage. Here, therefore, they were detained. Brush-wood, weeds, hay, straw, and whatever lay in the way of the flood, came down, and collected about the branches of the trees, that stuck fast in the arches and choaked the free current of the water. In consequence of this obstruction to the flood, a thick and strong dam, as it were, was thus formed. The aggregate of so many collected streams being unable to get any further, rose here to a prodigious height, and, with the force of its pressure, carried the bridge entirely away before it. William Edwards had given security for the stability of the bridge during the space of seven years; of course he was obliged to erect another, and he proceeded on his duty with all possible speed. The bridge had only stood about two years and a half. The second bridge was of one arch, for the purpose of admitting freely under it whatever incumbrances the floods might bring down. The span or chord of this arch was 140 feet, its altitude 35 feet, the segment of a circle whose diameter was 170 feet. The arch was finished, but the parapets not yet erected, when such was the pressure of the unavoidably ponderous work over the haunches, that it sprung in the middle, and the key-stones were forced out. This was a severe blow to a man who had hitherto met with nothing but misfortune in an enterprise which was to establish or ruin him in his profession. William Edwards, however, possessed a courage which did not easily forsake him; he engaged in it a third time, and by means of cylindrical holes through the haunches, so reduced their weight, that there was no longer any danger from it. The second bridge fell in 1751; the third, which has stood ever since, was completed in 1755." (Mr. Malkin's Tour in South Wales.) The present arch is 140 feet in span, and 35 feet high, being a segment of a circle of 175 diameter. In each haunch there are three cylindrical openings running through from side to side; the diameter of the lowest is nine feet, of the next six feet, and of the uppermost three feet. The width of the bridge is about eleven

eleven feet. To strengthen it horizontally, it is made widest at the abutments, from which it contracts towards the centre by seven off-sets, so that the road-way is one foot nine inches wider at the extremities than at the middle.

The bridges of Westminster and Blackfriars, over the river Thames at London, are among the finest structures of the kind in Europe. The former is 1220 feet long, and 44 feet wide, having a commodious broad footpath on each side for passengers. It consists of thirteen large, and two small arches, fourteen intermediate piers and two abutments. The length of each abutment is 76 feet; the opening of each of the smaller arches is 25 feet; the span of the first of the large arches at each end is 52 feet, of the next 56 feet, and so on increasing by four feet at a time to the centre arch, the span of which is 76 feet. The two piers of the middle arch are 17 feet wide, and the others decrease equally on each side, by one foot at a time, every pier terminating with a salient right angle against either stream. The arches are semi-circular, and spring from about the height of two feet above low water. The breadth of the river in this place is about 1220 feet, and the water-way through the bridge amounts to 370 feet. The bridge was begun in 1738, and opened for passengers in 1750, at a neat expence of 218,500*l*. It is constructed of the best materials, and in a neat and elegant taste; but the arches are too small in proportion to the quantity of masonry.

Blackfriars bridge, nearly opposite to the centre of the city of London, was begun in 1760, and completed in ten years and three quarters, at a neat expence of 152,840*l*. It is an exceedingly light and elegant structure; but, unfortunately, the materials do not seem to be of the best kind, as many of the stones in the piers are decayed. The bridge consists of nine large, handsome, and nearly elliptical arches; the central arch is 100 feet wide, and the four arches on each side, reckoning towards the shores, decrease gradually, being 98, 93, 83, and 70 feet respectively, leaving a water-way of 788 feet. The whole length from wharf to wharf is 995 feet, the breadth of the carriage-way 28 feet, and that of the raised foot-way on each side seven feet. The upper surface of the bridge is a portion of a very large circle, which forms an elegant figure, and admits of convenient passage over it. On each pier there is a recess or balcony, with two Ionic columns and pilasters, which stand on a circular projection of the pier above high water mark. The bridge is rounded off at each extremity to the right and left, in the form of a quadrant of a circle, rendering the access commodious and agreeable. This edifice must be regarded as a fine specimen of Mr. Mylne's ingenuity and judgment, though the method of construction has never been made public.

Besides the bridges already mentioned, there are many other neat and elegant structures in different parts of Great Britain and Ireland. The bridge over the Tees at Winstan in Yorkshire, was designed by sir Thomas Robinson, and built by John Johnson, a common mason at Walsingham, in the year 1761. It consists of a single arch 108 feet 0 inches span: is built of rubble-stone; and cost only 500*l*. An elegant stone bridge has lately been built over the Tweed at Kelfo, upon the plans and under the direction of Mr. John Rennie. This has five elliptical arches of 72 feet span each; is quite level at top. It has two Doric pilasters, which stand on a circular projection of the pier, with a simple block cornice. The coil of this bridge was about 13,000*l*. exclusive of the roads at each end, which cost about 3000*l*. more, in all 16,000*l*.

The bridge over the Pease, or rather Peaths, on the road from Dunbar to Berwick upon Tweed, is rather an uncommon structure. This bridge crosses a deep ravine called the

Peaths. It consists of four semi-circular arches. That at the east side of the ravine is 54 feet span; the second 55 feet; the third 52 feet, and the further or western arch 48 feet. The height of the bridge, from the bottom of the ravine to the surface of the road, is 124 feet. The situation is beautiful, and has a most romantic appearance. It was designed and built by the late Mr. David Henderfon, architect in Edinburgh, and does him considerable credit.

The aquæduct bridge, constructed by Mr. Rennie on the river Lune at Lancaster, is one of the most magnificent works of the kind which has been erected for the purposes of navigation. At the place where it is built, the water is deep and the bottom bad. It consists of 5 arches of 70 feet span each, and about 39 feet above the surface of the water. It has a handsome cornice, and every part of it is finished in the best manner. The foundations are laid at the depth of 20 feet under the surface of the water, and stand on a flooring of timber, supported by piles. The foundation alone cost 15,000*l*. The superstructure cost above twice that sum, although the stone was found within about a mile and a half of the place where the aquæduct was built. Barges of 60 tons burthen navigate the canal. The total height from the surface of the river to the surface of the canal is 51 feet.

It may be observed in this place, that the Romans always, without any exception that we are acquainted with, made their arches either of a semi-circle, or of a lesser segment of a circle. The voussiors were generally included between two concentric curves, on which account these are called extradossed arches. The earlier Italian architects followed the example of the Romans in the forms of their arches, which are either semicircular, or of a smaller segment, called by them *arco intiero*, and *arco scemo*, from which term our workmen have taken that of *skeme arch*. Elliptical arches are very much used by the engineers of France, most of the bridges in that country being in this manner. The French distinguish their arches into three kinds, *Parc plein-centre*, *Parc surbaissé*, and *Parc surbaissé*; the first is a semi-circle, the second higher, and the third lower than a semi-circle, being formed by the greater or smaller axis of an ellipsis; in practice, however, these are generally composed of several arcs of circles of different diameter, as in this case the joints are more easily traced. The arcs surbaissés are also called *anse de panier*. The *arc bombé* is an arc surbaissé, formed by a segment of a circle.

The ancients always laid their wrought stones without mortar between the joints, frequently using iron cramps to connect them more firmly together. Their large arches, and those which had to bear very great weights, were composed of several ranks of voussiors extradossed, and breaking joint, as is seen in the great cloaca of Rome, and in several bridges and aquæducts. Modern architects, however, generally use only one rank of voussiors, each of which is terminated at top by a horizontal joint, and laterally by a perpendicular joint, for the purpose of ranging better with the courses of the haunches and spandrels.

The decoration of bridges ought to be simple and large, their beauty consisting chiefly in the proportion of the voids and solids, the contour of the arches, and apparent strength and solidity, together with boldness of construction. However, many modern architects have carried simplicity to excess, particularly in Paris, where the arches of all the bridges are plain, and without any member of architecture. A happy introduction of rustic work of various forms and sizes breaks the monotony of the large masses, and enriches the edifice. This method was often employed by the ancients, and we never find that they neglected to ornament the arches of their bridges with archivolts more or less rich.

Palladio, in all his designs of bridges, has never omitted this simplest and best decoration of arches. Cornices and balustrades also are both useful and ornamental in these structures.

Generally speaking, large arches are more expensive than smaller. In a bridge lately designed over a river, wherein the foundations were very difficult to construct, one design with three arches of 116 feet each, was estimated at 13,174*l.* and another of five arches of the same kind was estimated at 12,041*l.*, which was contracted for and built for the above sum.

*Wooden bridges* now demand our attention. The simplest case of these edifices is that in which the road-way is laid over beams placed horizontally, and supported at each end by piers or posts. This method, however, is deficient in strength and width of opening: it is therefore necessary, in all works of any magnitude, to apply the principles of trussing, as used in roofs and of arches. Wooden bridges of this kind are stiff frames of carpentry, in which, by a proper disposition, beams are put, so as to stand in place of solid bodies, as large as the spaces which the beams enclose; and thus, two or three or more of these are set in abutment with each other, like mighty arch stones.

Palladio has given several very elegant designs of wooden bridges, which he thus describes. The bridge of the Cismone. The Cismone is a river, which, falling from the mountains that divide Italy from Germany, runs into the Brenta a little above Bassano. And, because it is very rapid, and great quantities of timber are sent down it by the mountaineers, it was resolved to make a bridge there, without fixing any posts in the water, which were liable to be carried away by the violence of the current, and the shock of the stones and trees that continually came down. The invention of this bridge, (says Palladio,) is, in my opinion, very worthy of attention, as it may serve on all occasions where these difficulties may occur, and because that bridges thus made are strong, beautiful, and commodious; strong, because all their parts mutually support each other; beautiful, because the texture of the timbers is very agreeable; and commodious, being even, and in the same line with the remaining part of the street. The river where this bridge was erected is 100 feet wide; this width is divided into six equal parts; and at the end of each part, excepting at the banks, which are strengthened with pilasters of stone, the beams are placed, that form the breadth of the bridge, upon which, a little space being left at their ends, were placed other beams lengthways, which form the sides. Over these, directly upon the first, the *colonelli* (king-posts) were disposed on each side; these king-posts are connected to the beams which form the breadth of the bridge by means of irons passing through the projecting ends of the beams, and bolted and pinned through both. See *fig. 1. Plate XXXII. of Architecture.*

Palladio proceeds to describe three other methods of constructing wooden bridges without posts in the water, like the bridge over the Cismone. The bridges after the first method are to be made in this manner: the banks being strengthened by pilasters as necessity shall require, one of the beams forming the breadth of the bridge is to be placed at some distance from it, then the first strut is to be placed with one end upon the pier, and the other end abutting against the first queen-post, which is to be connected with the beams by irons. Then the second beam for the breadth is to be placed at a distance equal to the space between the first beam and the pier, which is to be supported in like manner with a strut and queen-post, and thus proceeding as far as is required, observing to have a king-post in the

middle of the length in which the struts meet both ways, and with collar beams between all the posts which stiffen and support the whole construction. Bridges after this manner are to be wider at the extremities, and contract towards the middle. See *fig. 2. Plate XXXII. of Architecture.*

The invention of the following bridge has the upper part which supports the weight in the form of a polygon, inscribed in a flat segment of a circle; the beams forming the breadth of the road-way are upheld by king-posts and irons, and the whole stiffened and supported by braces crossing one another between the king-posts. Struts at each end, reaching from the piers to the first beams, are also added to shorten the bearing, and increase the strength of the fabric. See *fig. 1. Plate XXXIII. of Architecture.*

The third design may be made with a greater or smaller arch than is here represented. The height of the bridge, in which are placed the braces between the king-posts, or rather radii, is to be an eleventh part of the span. (See *fig. 2. Plate XXXIII. of Architecture.*

Mr. Coxe, in the first volume of his Travels, has slightly described a very singular bridge at Wittingen, in Switzerland, the construction of which is quite simple. The span is 230 feet, and it rises only 5. The sketch (*fig. 3. Pl. XXXIII.*) will make it sufficiently intelligible. ABC is one of two great arches approaching to a Catenarian shape, built up of 7 courses of solid logs of oak, in lengths of 12 or 14 feet, and 16 inches or more in thickness. These are all picked of a natural shape, suited to the intended curve; so that the wood is nowhere cut across the grain to trim it into shape. These logs are laid above each other, so that their abutting joints are alternate, like those of a brick wall; or, in the language of the workmen, they *break joint*. It is indeed a wooden wall, simply built up by laying the pieces upon each other, taking care to make the abutting joints as close as possible. They are not fastened together by pins or bolts, but held together by iron straps, which surround them at the distance of five feet from each other, where they are fastened by bolts and keys. These two arches being erected, and well butted against the rock on each side, were freed from their supports, and allowed to settle. They are so placed that the intended road *abc* intersects them about the middle of their height. The roadway is supported by cross joists, which rest on a long horizontal summer-beam; and this is connected with the arches on each side by uprights bolted into them. The whole is covered with a roof, which projects over the arches on each side, to defend them from the weather. Three of the spaces between these uprights have struts, or braces, which give the upper work a sort of trussing in that part. This bridge is of a strength much more than adequate to support any load that can be laid upon it; though it is manifest, by the attempt to truss the ends, that it was the contrivance of a person ignorant of principle. It was the work of one Ulrich Grubenhann, of Tuffen, in the canton of Appenzel, a carpenter without education, but celebrated for several works of the same kind.

At Schaffhausen, in Switzerland, where the Rhine flows with great rapidity, several stone bridges had been destroyed, when, in 1754, Grubenhann offered to throw a wooden bridge of a single arch across the river, which is nearly 390 feet wide. The magistrates, however, required that it should consist of two arches, and that he should, for that purpose, employ the middle pier of the last stone bridge, which would divide the new one into two unequal arches of 172 and 193 feet span. The carpenter did so; but continued to leave it a matter of doubt, whether the bridge is at all supported by the middle pier. It was erected on a plan nearly similar to the Wittingen bridge, at the expence of about 800*l.* Sterling.

Fig. Travellers inform us, that it took if a man passed over it; yet waggons heavily laden also went over it without danger. We are sorry to add, that this curious bridge was burnt by the French when they evacuated Schaffhausen, in April 1795.

Besides the wooden bridges already described, there are several elegant and well constructed edifices in Great Britain: the most eminent of which was that at Walton-upon-Thames. This bridge consisted of three wooden arches, and five brick arches at each end; the middle arch was 130 feet in span, with a rise of 28 feet, constructed of three principal ribs, framed in the manner represented in *Plate XXXIV.* of *Archit. &c.* It was the design of the ingenious carpenter, Mr. Etheridge.

*Iron Bridges.* Iron being the most abundant, cheap, and generally useful of all metals, has of late been employed in many works where great strength was required in proportion to the weight of the material: hence cylinders, beams, and pumps for steam-engines, boats, and barges for canals and navigable rivers, beams and pillars for warehouses and other large buildings, and at length bridges, have been constructed of iron.

Iron bridges are the exclusive invention of British artists. The first that has been erected on a large scale is that over the river Severn, at Coalbrook Dale, in Shropshire. This bridge is composed of five ribs, and each rib of three concentric arcs connected together by radiating pieces. The interior arc forms a complete semicircle, but the others extend only to the sills under the roadway. These arcs pass through an upright frame of iron at each end, which serves as a guide; and the small space in the haunches between the frames and the outer arc is filled in with a ring of about seven feet diameter. Upon the top of the ribs are laid cast iron plates, which sustain the roadway. The arch of this bridge is 100 feet 6 inches in span; the interior ring is cast in two pieces, each piece being about 70 feet in length. It was constructed in the year 1779, by Mr. Abraham Darby, iron-master at Coalbrook Dale, and must be considered as a very bold effort in the first instance of adopting a new material. The total weight of the metal is 378½ tons.

The second iron bridge, of which the particulars have come to our knowledge, was that designed by Mr. Thomas Payne, author of many political works. It was constructed by Messrs. Walkers at Rotherham, and was brought to London, and set up in a bowling-green at Paddington, where it was exhibited for some time. After which it was intended to have been sent to America; but Mr. Payne not being able to defray the expence, the manufacturers took it back, and the malleable iron was afterwards worked up in the construction of the bridge at Wearmouth.

The third iron bridge of importance erected in Great Britain, was that over the river Wear, at Bishop Wearmouth, near Sunderland, the chief projector of which was Rowland Burdon, esq. M. P. As this is the most considerable structure of the kind, it may be proper to give a brief sketch of its history. In consequence of the increasing trade and population of Sunderland and the two Wearmouths, the ancient ferry, which was almost in the middle of the harbour, had become very insufficient and unsafe, so that, besides frequent delays and disappointments, several instances had occurred of the loss of lives. About the year 1790, in which Mr. Burdon was returned to parliament by the county of Durham, some gentlemen interested in the welfare of the town and neighbourhood of Sunderland, united for the purpose of removing the evils arising from the ferry, and Mr. Burdon was appointed one of the committee. Conceiving at first that a stone bridge would be proper, they began to adopt measures for its erection. An architect was

chosen to carry on the necessary works, who in due time produced plans, estimates, and a model of the intended edifice. But as the work was of considerable magnitude and importance, it was thought expedient to refer the design to the opinion of some gentlemen of celebrity for scientific and practical knowledge in and near the metropolis; their report being unfavourable, the scheme of erecting a stone bridge was abandoned. The committee, however, being now warmly engaged in the business, continued to prosecute their inquiries; and Mr. Burdon in particular being frequently called by his parliamentary duty to London, was very diligent in his endeavours to obtain information and hints from various quarters, as to the peculiar advantages and disadvantages of different materials, as well as of various modes of construction. Mr. Burdon had the good fortune to be assisted in the maturing of his plans by Mr. Thomas Wilson, a truly ingenious man, and at the same time to learn much of the construction of iron bridges from Messrs. Walkers, of Rotherham, so that at length he became persuaded that iron would be the most proper material of which to form the proposed bridge. He thought it best, however, to adhere to the ancient construction, by dividing the arch into portions in the manner of arch stones, and taking advantage of the ductility and tenacity of iron to produce an arch of that metal at least fifteen times lighter than a corresponding arch of stone, and capable of being put together upon an ordinary scaffolding, instead of an accurate centre, in a much shorter space of time.

Mr. Wilson, in conjunction with Messrs. Walkers, constructed and set up an experimental rib at Rotherham, which being found to answer expectation, the success of the experiment was communicated by Mr. Burdon to the town of Sunderland and the county; and his proposition for the erection of an iron bridge was acceded to. The first stone was laid in September, 1793; and Mr. Wilson was appointed to the superintendance of the work. The iron-work was cast by Messrs. Walkers, of Rotherham, and the arch was turned upon a very light but firm scaffolding, so judiciously constructed that not any interruption was given to the passage of the numerous vessels which navigate the busy river of Sunderland. The mode of bracing the ribs was so simple and expeditious, that the whole was put together and thrown over the river in ten days; the scaffolding was immediately removed, and the bridge opened for general use on the 9th of August, 1796.

During the period occupied in erecting the bridge, Mr. Burdon took out a patent to secure the invention of "a certain mode or manner of making, uniting, and applying cast iron blocks to be substituted in lieu of key-stones, in the construction of arches." He thus proceeds to describe his invention, which "consists in applying iron or other metallic compositions to the purpose of constructing arches upon the same principle as stone is now employed, by a subdivision into blocks easily portable, answering to the key-stones of a common arch, which being brought to bear on each other gives them all the firmness of the solid stone arch, whilst, by the great vacuities in the blocks, and their respective distances in their lateral position, the arch becomes much lighter than that of stone, and by the tenacity of the metal the parts are so intimately connected that the accurate calculation of the extrados and intrados, so necessary in stone arches of magnitude, is rendered of much less consequence. *Fig. 4. Plate XXXIII.* of *Archit. &c.* represents a block of cast iron, five feet in depth from A to A, and four inches in thickness, having three arms B, B, B, and making a part of a circle or ellipsis; the middle arm is two feet in length from B to C, and the

the other two are in proportion. On each side of the arms are grooves (three quarters of an inch deep, and three inches broad) for the purpose of receiving malleable or bar-iron, and in each arm are two bolt holes, D. *Fig. 2.* represents two of these blocks placed together, and the joints confined to their respective positions by the bar-iron on each side of the arms as at E, E, E, which, with other similar blocks so united and bearing upon each other, become a rib. *Fig. 3.* and F, F, *fig. 2.* are hollow tubes six feet long, and four inches in diameter, having shoulders at each end, with holes answering to those of the blocks; G is a block of another rib connected with the former by the tubes F, F, placed horizontally. Through the holes in the shoulders and arms of the block and bar-iron are bolts, fastened with cotters or forelocks, as at H, H, H, H. The blocks being united with each other in ribs, and the ribs connected and supported laterally by the tubes as above described, the whole becomes one mass, having the property of key stones cramped together." This extract serves to explain the more minute parts of the construction: a few words more will describe the structure itself.

The bridge consists of a single arch, whose span is 236 feet; and as the springing stones at each side project two feet, the whole opening is 240 feet. The arch is a segment of a circle of about 444 feet diameter, its versed sine is 34 feet, and the whole height from low water about 100 feet, admitting vessels of from two to three hundred tons burthen to pass under, without striking their masts. A series of one hundred and five blocks form a rib, and six of these ribs compose the breadth of the bridge. The spandrels, or the spaces between the arch and the roadway, are filled up by cast-iron circles, which touch the outer circumference of the arch, and at the same time support the roadway, thus gradually diminishing from the abutments towards the centre of the bridge. There are also diagonal iron bars, which are laid on the tops of the ribs, and extended to the abutments to keep the ribs from twisting. The superstructure is a strong frame of timber planked over to support the carriage-road, which is composed of mail, lime-stone, and gravel, with a cement of tar and chalk immediately upon the planks, to preserve them. The whole width of the bridge is 32 feet. The abutments are masses of almost solid masonry, twenty-four feet in thickness, forty-two in breadth at bottom, and thirty-seven at top. The fourth pier is founded on the solid rock, and rises from about twenty-two feet above the bed of the river. On the north side the ground was not so favourable, so that it was necessary to carry the foundation ten feet below the bed. The weight of the iron in this extraordinary fabric amounts to 260 tons; 46 of these are malleable, and 214 cast. The entire expence was 27,000*l.*

From this account of the bridge across the Wear, the attentive reader will see much to admire in its construction: it is not, however, totally free from defects. We conceive that the spandrels are very improperly filled up. It is true, that it is done in such a manner as is exceedingly light and pleasing to the eye; but the iron hoops may, we think, be easily compressed at the points of contact, and changing their shape will oppose very little resistance. As the arch forms so small a portion of a circle (about  $64\frac{1}{2}$  degrees), the weight at the spring of the arch need not, according to the theory of equilibration, be double to that at the crown, to support, without danger of rising, any pressure arising from the mass of the structure itself: but in so flat and light an arch, an overload on any part must have a great tendency to bend it, and consequently tend considerably to break it, at a distant part, with all the energy of a long lever: we think, therefore, that a better form might

have been adopted than what has been put in practice at Wearmouth bridge.

The third iron bridge is that over the Severn at Buildwas, about two miles above Coalbrook Dale. An old stone bridge of three narrow arches having been carried away by a high flood in 1795, the present iron bridge was planned and built by the Coalbrook Dale Company, under the superintendance of Mr. Thomas Telford, the county surveyor, in 1796. It consists of a single arch, 130 feet in span, the rise from the springing to the fossite being 27 feet; and as it was thought necessary to keep the roadway as low as possible, the outside ribs are made to go up as high as the railing; they are connected with the ribs that bear the covering plates, by means of pieces of iron dovetailed in the form of king-polls. The plates which compose the covering over the lower ribs, are cast with deep flaunches; they are laid close to each other, and form an arch of themselves. These side ribs, or arches, would have added much more to the strength of the bridge than they now do, had the materials been of a substance that would not expand or contract; but that not being the case, they, in warm weather, when they expand, rather tend to derange the other parts of the bridge than strengthen it; and the appearance of the whole is by no means pleasing.

About the same time that the bridge at Buildwas was erected, an iron bridge was thrown over the river Teme in Herefordshire. Its parts were so slender and ill-disposed, that no sooner was the wooden centre taken away than the whole tumbled into the river.

The splendid example of the bridge at Wearmouth gave an impulse to public taste, and caused an emulation among artists, which has produced many examples and more projects of iron bridges. The Coalbrook Dale Company have constructed several, among which is a very neat one over the river Parrot at Bridgewater. Mr. Wilson, the engineer, employed by Mr. Burdon, has also built several, and has lately finished a very elegant one over the river Thames, at Staines, which is by far the most complete in design, as well as the best executed, of any that has hitherto been erected. This bridge consists of a single arch, 181 feet in span, and 16 feet 6 inches in rise, being a segment of a circle of 480 feet. The blocks, of which the ribs are composed, are similar to those in the Wearmouth bridge, except that these have only two concentric arcs instead of three, as at the latter. The arcs are cast hollow, and the blocks connected by means of dowels and keys; thus obviating the great defect observed at Wearmouth, of having so much hammered iron exposed to the action of the air. Four ribs form the width of the arch, which are connected together by cross-frames. The spandrels are filled in with circles, which support a covering of iron plates an inch thick: on this is laid the roadway 27 feet wide. Two hundred and seventy tons are the weight of the iron employed in the bridge, and three hundred and thirty of the roadway.

For further practical details on the construction of bridges, the reader is referred to the articles *FOUNDATIONS in Water*, *CAISSON*, *COFFERDAM*, &c.

*BRIDGES, Theory of.* In considering the theory of bridges, the first objects of enquiry are, the nature of an arch; and the principles on which depend its stability and permanence. It will be seen, by referring to the article *ARCH* in this dictionary, that we have adopted the opinion of those mathematicians who conceive that an arch is kept in equilibrium, or from falling, by the weight or vertical pressure of the superincumbent wall or mass. The principles on which they proceed, have now obtained the name of *the theory of Equilibration*.

It will be readily admitted, by those who attend to these subjects, that whatever properties may be shewn to relate to a geometrical or lineal arch, considered without thickness, and of its superincumbent plane, may be easily and safely transferred to a real arch of solid materials, and the heavy matter sustained by it; for it is manifest that a solid arch may be conceived either to be generated by the motion of a lineal arch, and its plane in a direction perpendicular to that plane, or to be made up of an indefinite number of such equal lineal arches and corresponding planes: and in either case, what is shewn to obtain with respect to the former, may without hesitation be applied to the latter. This the reader will keep in mind.

The first hint of a principle which we recollect, is contained in Dr. Hooke's assertion, that the figure into which a chain or rope, perfectly flexible, will arrange itself when suspended from two hooks, is, when inverted, the proper form for an arch composed of stones of uniform weight. The reason assigned for this principle is, that when the flexible scissel of heavy bodies becomes inverted, still touching one another in the same points, the force with which they press on each other in this last case, is equal and opposite to the forces with which they draw each other in the case of suspension. The curve formed by a rope, or flexible chain, of extremely small links, when thus suspended, is well known to our geometricians by the name of the *catenarian* curve; by the French it is called *la chaînette*. If a curve of this kind be disposed in such a manner that its vertex shall be uppermost; and if a multitude of globes be so arranged that their centres shall be in the circumference of this curve, they will all remain motionless and in equilibrium: much more will this equilibrium subsist, if, instead of globes, we substitute thin voussoirs, having flat sides, which touch each other in directions perpendicular to the curve. In the former case, the equilibrium will be destroyed very easily, just as a globe resting on a plane surface is easily put into motion; in the latter, the equilibrium cannot be destroyed without considerable force, just as when a heavy body is placed upright on a broad flat base, it will not only stand, but will require considerable force to push it over.

Since the catenarian curve is readily described mechanically, it is no wonder that this principle of Dr. Hooke's should be very generally received; but many of those who adopted it, forgot that it could not be extensively applied, without certain modifications: these modifications, it will be seen farther on, cause this principle to coincide exactly with the true theory of equilibration. As to the contrary, it is manifest, from what we have already said, that it is only the form of a very slender arch rib of uniform thickness, and unfit for the purpose of a bridge; which requires a considerable mass of masonry to lie upon the arch and fill up the space to the roadway, thus completely destroying the equilibrium at first established in the arch itself. It would be possible, indeed, to construct a catenarian curve of equilibration, having a horizontal line for the extrados, but then the thickness of the mass above the crown of the arch must be enormous; thus, for a catenarian of 100 feet in span, and 40 feet high, the distance from the top of the arch to the horizontal extrados must have been nearly 37 feet to ensure an equilibrium. For these reasons the catenarian curve has been very seldom used in the erection of bridges.

Another principle, which was first assumed about the end of the 17th century, is, that every perpendicular column of masonry above the arch is merely kept from sliding down the arch by the next adjoining column. It is very obvious, at first sight, that this principle is not consistent with nature; it has therefore found but few advocates. When analytical expressions are deduced for the curvature of arches con-

structed on this principle, it is worth observing, that they coincide exactly with those which would flow from the supposition that the arch was in equilibrio, in consequence of having a fluid, with a horizontal surface, pressing upon every part of it.

A third principle is drawn from the consideration of the arch stones being frustums, or parts of wedges. This principle, we believe, originated in France, and has been presented in various forms by De la Hire, Belidor, Varignon, Parent, and other French philosophers, and lately by our ingenious countryman Mr. Atwood.

In the method now alluded to, it is considered what weight, in or upon a wedge, is balanced by forces acting against the sides; or what force such a wedge exerts both horizontally and perpendicularly to its sides; and thence it is computed what must be the position and shape of the contiguous wedges of given weights; or what must be their weights to a given shape and position, so as just to exert the adequate degree of resistance required by the first wedge; and so on, from wedge to wedge, till the whole is balanced. A mere arch constructed in this way, would remain in equilibrio as long as the constituent voussoirs had liberty to slide, without friction, down the respective inclined planes on which they lay. This method is, indeed, liable to many objections. First, this theory requires, that either the density or the magnitude of the respective voussoirs, from the crown to the foot of the arch, should keep constantly increasing in proportion to the differences of the tangents of the several angles, which the joints of the voussoirs make with the vertical axis of the curve. Now, if the architect should wish to change the density of his materials in the required proportion, we know not what materials he could use; for the density must always be very great towards the spring of the arch; and, in many cases, it must be infinitely great. If, on the other hand, the magnitudes of the voussoirs were gradually increased, it would be necessary that those at the spring, and consequently the abutments, should be immensely great, and often infinite; besides, that the wedges must be cut to different oblique angles, very difficult in execution, and totally unsafe when erected as the acute angles would be in constant danger of flushing off. Here too, in real practice, there would be a total want of balance, on account of the mass of masonry and rubble work, which fills the space between the arch and the road-way. But even this is not all; the arch stones cannot be made, nor indeed ought they, to act as the true mathematical wedge, the properties of which were employed in attempting to establish the equilibrium. The wedge of these theorists is supposed to have its butting sides perfectly polished, and to have its weight or other force on its back balanced by proper equivalent forces acting perpendicularly against those sides. Now this is so far from being the case in the practice of bridge-building, that architects contrive to have the butting sides of their wedges so rough as to occasion a great deal of friction between them; and to increase the adhesion of these sides the more, they introduce between them the best and strongest cement they can procure. By these means, so far from the arch stones being kept in their places only by forces perpendicular to their butting sides; and having liberty to slide along those sides, as in the wedge theory, they are absolutely prevented from the possibility of so sliding, and in a great measure kept in their places in the arch, by forces that act even perpendicular to those which the wedge theory requires. On these accounts, then, we conceive that, however specious and plausible this theory may appear on paper, it ought not to be admitted, since it is manifestly inapplicable to any case which can ever occur in real practice.

On the contrary, the theory which we have adopted, or that  
given

given by Emerſon in his fluxions, published in the year 1742, and which has been ſo ably and judiciously handled by Dr. Hutton in particular, is conſiſtent with nature and with truth. This theory eſtabliſhes an equilibrium among all the vertical preſſures of the whole fabric contained between the ſoffit, or under-ſide of the arch, and the road-way over all. It is now very generally adopted by the moſt ſkilful engineers and architects, as the only true one; becauſe it ſecures a balance in the whole of the ponderating matter, by making an equality at every point of the curve, between all the adjacent preſſures when reduced to the tangential directions, or perpendicular to the joints, which are ſuppoſed to be at right angles to the curve of the arch in every part, as ſuch ſtructures naturally require them to be: for, if the joints be perpendicular to the curve, there will ariſe a lateral preſſure, whoſe direction is not along the tangent; which, wanting a force to ſuſtain it, will deſtroy the equilibrium, and ſome of the ſtones will endeavour to fly out.

When ſpeaking of the principle advanced by Dr. Hooke, we obſerved, that by means of peculiar modifications, it was capable of univerſal application to caſes occurring in practice, and was at the ſame time conſiſtent with the theory we have aſumed. This we ſhall now proceed to ſhew. In *Pl. XXXVIII. Architecture, fig. 1. is fig. 2. Pl. VI.* (referred to in the article ARCH) completely inverted. Let this repreſent a flexible chord or chain, void of gravity, hanging from the points A and G, which are fixed; at the points B, C, D, E, F, ſuppoſe weights to be ſuſpended, (acting in the directions BH, CI, DK, &c.) proportional to the ſeveral lines Bi, Cm, Dn, Es, and Fy. Then the caſe now before us will be the complete inverſion of that which is firſt ſtated in *Prob. 1. article ARCH*, the drawing forces in this inſtance being reſpectively equal and oppoſite to the ſeveral preſſing forces in that: therefore, every thing proved there, by means of the compoſition and reſolution of forces, will be found to obtain here, only in a contrary direction. Conſequently, if the number of weights hanging from the chord ADG be indefinitely increaſed, it will aſſume a curvilinear ſhape, ſimilar in its nature to the arch of equilibration, only in an inverted poſition; and the various theorems which relate to the weights and preſſures of the ſtanding arch, apply with equal facility and accuracy to the weights hanging from the ſuſpended arch. Whether, therefore, we conſider the ſtanding or the hanging arch, it is equally true, that in the caſe of juſt equilibration, the column either preſſing or drawing at any point of the arch is reciprocally as the radius of curvature and the cube of the ſine of the angle, in which the vertical line cuts the curve in that point (*Cor. 2. pr. 1. ARCH*); or, ſince the coſecant varies as the ſine inverſely, the column above-mentioned is reciprocally as the radius of curvature, and directly as the cube of the ſecant of the curve's inclination to the horizon, in the given point.

But the analogy between the ſtanding and the hanging arch has been traced out, not ſo much for the purpoſe of corroborating the true theory of equilibration, as for the ſake of deducing from it a very popular and general mode of conſtruction; ſtrictly accurate in its principle, and yet ſo ſimple in its application, that the moſt illiterate artiſt may ſafely practice it. Suppoſe it were required to aſcertain the form of an arch which ſhall have the ſpan AG (*fig. 2. Pl. XXXVIII. Architecture*) and the height D 8, and which ſhall have a road-way of the form BEC above it. Let the outline figure ABECG be inverted, ſo as to form a figure A becG. Suspend a fine chain of uniform thickneſs from the points A and G, and of ſuch a length, that its lower point will hang a little below d, correſponding to D. Divide AG into a number of equal parts (the more the better) in the points 1,

2, 3, &c. and draw vertical lines, cutting the chain in the correſponding points 1, 2, 3, &c. Now take pieces of another chain, whoſe links are eaſily ſeparated, and hang them on at all the points 1, 2, 3, &c. of the chain A dG: trim theſe pieces of chain, by taking off links at ſome places, and hanging on at others, till their lower ends all coincide with the inverted road-way bec. The greater lengths hung on in the vicinity of A and G, will pull down thoſe points of the chain, and cauſe the middle point d, which is leſs loaded, to riſe a little, and bring it near to its proper height. It is obvious this is an arch of equilibration for a bridge ſo loaded, that the weight of the arch-ſtones is to that of the ſuperincumbent matter between the arch and road-way, as the weight of the chain A dG, is to the ſum of the weights of all the little bits of chain, very nearly. But this proportion is not known before-hand; we muſt, therefore, proceed thus: adapt to the curve produced in this way ſuch a thickneſs of the arch-ſtones as may be thought ſufficient to ensure ſtability; then compute the weight of the arch-ſtones, and the weight of the rubble, or other materials with which the haunches are to be filled up to the road-way. If the proportion of theſe two weights be nearly the ſame with the proportion of the weights of the chain, we may reſt ſatisfied with the curve now found: but if it be much different, we may ſoon find how much ſhould be added to, or taken from, the appended bits of chain, in order to make the two proportions equal. We ſhall then have a curve infinitely near to the inverſion of the curve wanted. This method we can ſafely recommend, as we know it to have been frequently uſed with facility and ſucceſs.

It would draw us far beyond the limits we are obliged to aſſign ourſelves, were we to give a complete view of the theory in all its branches: thoſe who are deſirous of obtaining a more intimate acquaintance with the ſubject are, therefore, referred to Dr. Hutton's ingenious treatiſe on bridges; for our own parts, we muſt content ourſelves with juſt touching upon a few of the moſt important particulars. Under the article ARCH, and the correſponding plate, we have given figures of the extrados, of a circular and elliptical arch of equilibration; from which it may be ſeen how far the extrados extends from the vertex of the curve, before it becomes unfit for a road-way by reaſon of its bending upwards: in this reſpect, it appears, that the flat elliptiſis has the advantage of the circular arch; but the cycloidal arch of equilibration, though ſimilar to theſe, has the advantage of both, becauſe the extrados runs farther on, nearly parallel to the arch before it comes to the point of inflection. We ſhould obſerve, however, that in many caſes, even of circular or elliptical arches, the evil ariſing from the inflection of the extrados may be thrown off to a greater diſtance, by a very ſimple expedient: for, in an arch of equilibration, as NBH, *fig. 3. Pl. XXXVIII. of Architecture*, whoſe extrados is EIK SF, ſince the points at m, n, o, &c. are kept in equilibrio by the heights of the wall Im, Kn, Lo, &c. if the lines Im, Kn, Lo, &c. be divided in a given ratio, in i, k, l, &c. the ſmaller maſs, under the new extrados e, i, k, f, f, will ſtill ſecure the equilibrium. Now it is obvious, that the lower extrados runs much farther from the crown than the upper one, before it has a point of inflection: and hence appears one great advantage ariſing from the uſe of iron in bridges inſtead of ſtone. Suppoſe, for inſtance, that an arch was to be conſtructed, having the ſpan AD, and height CB, and that the neceſſary thickneſs of a ſtone arch at the crown was BS; here it is plain, that if the road-way were made, having a practicable ſlope as SKa, it would fall far below the required extrados at KIE, and conſequently, the arch, for

want of a sufficient weight over the portion  $A m n$ , and an equal portion on the other side of the vertex, would be in constant danger of rising in the haunches. But a bridge formed of hollow iron vouffours would be abundantly strong, with far less thickness over the crown, as  $B s$ ; and then the true extrados  $e i k f f$  would, in every part, have a proper slope for a road-way; while, at the same time, the structure is in no danger of being destroyed for the want of an equilibrium in all its parts.

We have mentioned under the article ARCH, what kind of arches ought to be preferred in the erection of bridges; and have shewn which are strongest: we may here observe, that if there be two arches of the same kind, with an equilibrated load over each of them, the strength of the one will be to the strength of the other reciprocally, as the radii of curvature at the vertices of the two arches: hence, an elliptical arch, standing on its shorter axis, will be stronger than a semicircular arch of the same span; and the semicircular arch of equilibration will be stronger than a flat elliptical arch of the same span. As to the effect of an additional weight over any part of an arch, it will vary in proportion of the horizontal distances from the extremities of the arch. Hence, the greatest danger arising from an additional weight, is when it lies over the crown of the arch; for then the product of the horizontal distances from the abutments is equal to the square of the semi-span, and is the greatest it can be.

Since in any arch of equilibration, the pressure arising from the incumbent weight at any point is reduced to the direction of the tangent at that point, we have in any such arch  $VB$ , *fig. 4. Pl. XXXVIII. of Architecture*, the weight of the part  $VBEA$ , the pressure along the tangent  $FB$ , and the horizontal pressure in direction  $DB$ , respectively as the lines  $FD$ ,  $BF$ , and  $BD$ , or as the corresponding lines in a triangle, whose sides are severally perpendicular to those in  $BDF$ . Hence, it is easy to find the area of the portion  $AEBV$ , thus: make  $cv$  parallel and equal to  $CV$ , the radius of curvature at the vertex; and draw  $cb$  perpendicular to the tangent  $BF$ , meeting  $vb$  the perpendicular to  $cv$  in  $b$ ; then in the triangle  $cvb$ ,  $cv$  corresponds to  $DB$ , and  $vb$  to  $DF$ ; and the area of the parallelogram  $av$ , having  $vc = VE$ , is equal to the area of  $ABVE$ : in like manner, by drawing  $cg$  perpendicular to  $GI$ , the tangent at  $G$ , we should have the parallelogram  $hb$  equal to the portion  $HB$  over the part  $GB$  of the arch. The area of the space  $HEVG$ , between the arch and the road-way, being thus ascertained, its weight of course becomes known, and, consequently, its horizontal pressure against the abutment, as at  $G$ : for it will be, as the line  $vg : vc ::$  the weight over the semi-arch: the horizontal thrust against the abutment, or a pier, at  $G$ .

But in estimating the thrust against the piers, &c. it is most common to ascertain the position of the centre of gravity of the load above the arch. Now, in cases of equilibration, this may sometimes be effected without much difficulty: for it is well known, that if a heavy body be sustained by two forces, their directions must meet, either at the centre of gravity of that body, or in a vertical line which passes through it; therefore, since the whole incumbent weight, over a properly balanced arch, is sustained in equilibrium by two forces, acting in the direction of the tangents to the extreme points of the curve, the centre of gravity of the materials upon the arch will be in the vertical line which passes through the intersection of these tangents: and, in most cases occurring in practice, the centre of gravity will be nearly equidistant from the extrados and intrados of the equilibrated arch. Thus, in the curve  $AVB$ , loaded to the equilibrium, *fig. 5. Pl. XXXVIII. of Architecture*,

the centre of gravity of the superincumbent mass is in the vertical line  $D d$ , passing through the intersection of the tangents  $AD$ , and  $BD$ . And the centre of gravity of the materials  $AVHK$ , between the crown and the abutment, is about the middle of the vertical line  $E e$ , passing through the intersection of the tangents  $AD$  and  $V i$ . If the arch be part of a circle,  $iV$  is the tangent of half the arch  $AV$ , which, subtracted from half the span, leaves  $AG =$  sine of  $AV$ —tangent of half  $AV$ : and since  $G e =$  versed sine of arc  $AV$ —versed sine of arc  $eV$ , we shall, by adding  $\frac{1}{2} E e$  to  $G e$ , have the altitude of the centre of gravity, from  $AC$  the horizontal line. If  $AV$  be a parabola,  $AG = \frac{1}{2} AC$ ; but if it be an equilibrated curve, with a horizontal extrados, then  $AG = \sqrt{\frac{VH \times CV \times R}{2VH + CV}}$ , where  $R$  is the radius.

of curvature of the arch at the crown. When the arch is not justly equilibrated, other methods of finding the centre of gravity of the mass supported must be had recourse to. See Hutton on bridges, p. 49—56. It may be worth while, however, to describe here an easy practical method, accurate enough for most purposes: namely, to draw on a piece of card paper, a plan of the arch, and its load; then to cut out half of it as  $DABC$ , *fig. 6. Pl. XXXVIII. of Architecture*, and to determine experimentally the point  $K$  in the piece cut out, on which, when supported, the whole will rest; for this point will manifestly correspond with the centre of gravity.

The place of the centre of gravity being determined, we may now shew how to ascertain the thickness of a pier, necessary to support a given arch. Let  $ABCD$ , *fig. 6. Pl. XXXVIII.* represent the mass over half the arch;  $DEFG$  the pier. From the centre of gravity  $K$  of the mass, draw  $KL$ , perpendicular to the horizon: then the weight of the arch, in the direction  $KL$ , will be to the horizontal push, or lateral pressure at  $A$ , in the direction  $LA$ , as  $KL$  to  $LA$ . For the weight of the arch in the direction  $KL$ , the horizontal push in the direction  $LA$ , and the oblique push in the direction  $KA$ , will be as the three sides  $KL$ ,  $LA$ ,  $KA$ . So that if  $A$

denote the weight or area of the arch, then  $\frac{LA}{KL} \cdot A$ , will be its force at  $A$  in the direction  $LA$ ; and  $\frac{LA}{KL} \times GA \times A$ , its

effect on the lever  $GA$ , to overset the pier, or to turn it about the point  $F$ . Again, the weight of the pier will be as its area  $EF \times FG$ , and, supposing the load over the arch and the pier to be of similar materials,  $EF \times GF \times \frac{1}{2} FG$  or  $\frac{1}{2} EF \times FG^2$ , is the effect on the lever  $\frac{1}{2} FG$  to prevent the pier from being overset. Here it is supposed, that the length of the pier, from point to point, is the same as the thickness of the arch, and that the centre of gravity of the pier falls in the vertical plane bisecting  $FG$ . Now, that the pier and the arch may be in equilibrio, the two effects just

stated must be equal: therefore, we have  $\frac{1}{2} EF \cdot FG^2 = \frac{LA}{KL} \times GA \times A$ , from which it follows, that the thickness of the pier is  $FG = \sqrt{\frac{2GA \cdot AL}{EF \cdot KL}} \times A$ .

In the above investigation, it is supposed, that the whole of the pier is out of water: but if any part of it be immersed in water, that part will lose so much of its weight as is equal to its bulk of water, if the water can get below the pier or into the joints. This, however, may easily be brought into the calculation. By applying the above theorem to the several cases which may arise, the thickness of the pier may be found, so that it shall just balance the spread

or shoot of the arch, independent of any arch on the other side of the pier. But the weight of the pier ought a little to preponderate, or exceed in effect, the shoot of the arch; and, therefore, the thickness ought to be taken a little more than what the theorem will give: indeed, in most cases occurring in practice, the thickness must be between the *fifth* and the *seventh* part of the span of the arch.

The only remaining consideration in the theory, relates to the form of the ends of a pier, so as to afford the least resistance to the force of the stream of water. Now, it may be found by a fluxional process, that if the water strike every part of the pier with equal velocity, the end of the pier should be a right-lined triangle, when the force of the water upon it is the least possible: when the variably increased velocity, as in the case of a flood, is used, the form of the ends comes out a little curved. One third of the absolute force is taken off, by making the ends of the pier semicircular;  $\frac{1}{5}$  would be taken off, if the ends were parabolic; but when the ends are right angled triangles, with the right angles pointed into the stream, the absolute force of the water upon the pier is reduced to one half; and an acute angle pointed to the stream will reduce its force still more. But in rivers, on which heavy craft navigate, and pass the arch, it is generally better to make the ends nearly semicircular: for, although it does not divide the water so well as the triangle, yet it will bear the shock of the vessels better, and, at the same time, be more likely to turn them off towards the middle of the arch.

BRIDGE, in *Gunnery*, the two pieces of timber which go between the two transoms of a gun-carriage, on which the bed rests.

BRIDGE, in the *Military art*. *Flying bridge*, *pont volant*, or *pons ductarius*, signifies a bridge constructed of pontoons, leather boats, beams, hollow casks, sheaves of rushes, blown bladders, called *ascogephyri*, or the like, laid upon a river, or marshy and boggy ground, and covered over with planks, for the passage of a body of troops.

*Flying bridge*, *pont volant*, taken in a more particular signification, denotes a bridge composed of several boats, connected by a flooring of planks, and surrounded by a balustrade or railing. It is furnished with one or more masts, to which is fastened a strong cable, supported at proper distances by boats, and extending to an anchor to which the other end is made fast, in the middle of the water. By this contrivance, the bridge becomes moveable, like a pendulum, from one side of the river to the other, without other help than a rudder. Such bridges were formerly sometimes constructed of two stories, for the quicker passage of a great number of men, or that both infantry and cavalry might pass at the same time. The use of this kind of flying bridge is, however, attended with great difficulty and danger, and subject to the most fatal accidents. An unfortunate instance of this occurred at the evacuation of Nimeguen in the campaign of 1794, where, while the Dutch garrison were occupied in crossing the river, an unlucky shot from the French batteries carried away the top of the mast, and the bridge swinging round to the enemy's side of the Waal, above 400 of the garrison were immediately made prisoners. Those who remained in the tower, to a much greater number, bereft of the means of escape, surrendered to the besiegers.

Another kind of *flying*, or *floating bridge*, is formed of two small bridges laid over one another in such a manner, as that the uppermost stretches and runs out by the assistance of cords drawn through small pulleys, placed along the sides of the undermost bridge, which is thus pushed for-

ward, till the farther extremity of it rests against the place it is intended to be fixed upon.

When these two bridges are extended to their utmost length, so that the two middle ends meet, they should not be above four or five fathoms long; for if longer, they will break. Their chief use is for surprising out-works, or fortified posts that have but narrow moats. In the memoirs of the Royal Academy of Sciences, we find a new contrivance of a floating bridge, which lays itself on the other side of the river. Vide Hist. Acad. R. Scienc. an. 1713, p. 104.

*Draw-bridge*, or *pons subduciarius*, is a bridge fastened at one end with hinges, so that the other end may be lifted up or let down by some easy contrivance. The most common method is by a kind of balance called *plyers* (which see); in which case the bridge stands upright, to hinder the passage of a moat, or the like; and the breadth of this bridge is usually about nine or ten feet, and its length about fifteen feet. There are others so constructed as to be drawn back, for hindering a passage, and to be thrust over again for affording a passage. Others open in the middle, half turning to one side, and the other half to the other, being joined again at pleasure; but these are subject to an obvious inconvenience, as one half of them remains on the enemy's side. The marquis de L'Hopital has given the construction of a curve, in which a weight will always be a counter-balance to a draw-bridge; which the younger Bernoulli has shewn to be no other than the cycloid. Act. Erud. Lips. an. 1695.

Drawbridges are likewise frequently used on canals, navigable rivers, and wet-docks; for small canals they consist of one leaf or frame only, moveable on hinges; but for large canals, such as the Forth and Clyde canal, in Scotland, and for wet-docks, &c. they are made in two pieces which meet in the middle, forming an arch, and are raised or lowered by means of balance frames, moveable on the tops of uprights, suited in height to the magnitude of the bridge. Such bridges, however, have been found inconvenient in use, owing to the obstruction they give to the yards and rigging of ships in passing through them. This gave rise to the invention of a different sort of bridge, which, for small canals, consists of one frame or leaf only, turning on a centre or series of balls or rollers; and for large canals, or navigable rivers, they are formed of two parts, which meet in the middle. The first that have come to our knowledge are those at Cherbourg and Toulon. Neither of them, however, are so complete as those that have lately been constructed at the West India and London docks; the latter spans 40 feet, and 15 feet wide in the roadway, and is made of thin ribs of cast iron, about an inch and a half thick, turning on a number of concentric rollers, moving between two circular rings of cast iron, which are very nicely turned, and there is a flap for each leaf, which lets down by a screw, and abuts against the stone work on each side, forming the whole, when shut, into an arch, capable of carrying any weight which can ever pass over it.

The whole, though weighing 85 tons, moves with great ease, and can be opened and shut in less than three minutes, thereby occasioning very little obstruction to travellers, while vessels pass through the locks.

*Bridge of communication*, is a bridge made over a river, to preserve a free intercourse between two armies, or fortified places, separated by the stream.

The bridge now most generally employed, and which, by reason of its superior efficacy, has gradually almost superseded the use of all those above-mentioned, is that constructed of copper or wooden boats, fastened with stakes or anchors to the bed of the river, and covered over with planks.

planks. Modern armies generally carry with them a number of these copper boats, or pontoons, that they may always be in readiness for throwing over bridges. Several of these being joined side by side, till they reach across the river, and planks laid over them, make all plain for the troops to march upon.

The most remote ages of antiquity furnish us with many remarkable instances of bridges of this kind. One of the earliest upon record, is that laid by Darius Hystaspes over the Ister, or Danube, in his Scythian expedition, about the year before Christ 508. Herodotus, l. iv. c. 98. Darius also crossed the Thracian Bosphorus with 700,000 men by means of a bridge of boats, the strait being five stadia, or 1008 yards in breadth. That of Xerxes, in the year 480 before Christ, seven Greek stadia, or, as some estimate them, nearly a mile in length, across the Hellespont, is still more remarkable. The boat-bridges of Xerxes began at Abydos, and terminated a little below Sestos. This passage, which is the narrowest part of the strait, is only about  $37\frac{1}{2}$  toises, or 800 yards wide. But, as the length of the bridges is said to have been seven stadia, M. D'Anville (M. de l'Acad. des Bell. Lettr. t. 28. p. 334.) has from thence inferred, that these stadia were only 51 toises, or 108 yards, each. The first bridge of Xerxes having been carried away by the force of a tempest, he substituted two others, that towards the Pontus Euxinus, consisting of 360 vessels of the largest dimensions used in the ancient navies; the other of 340. These were steadily moored by means of large anchors. Six immense cables, fastened to large piles driven into the opposite shores, extended the whole length of the bridges. Across these were laid trunks of trees, and upon them a flooring, which was covered with earth for the passage of the army. The whole was secured by a railing on each side. This contrivance is the model of most of the bridges of boats which have since been constructed, with this difference, that the vessels of Xerxes were arranged stem and stern upon the water, a plan exactly contrary to the present method. That the Persians were in the habit of constructing bridges of this kind, appears from these examples, and from another recorded by Xenophon, who mentions that of Sitace over the Tigris, composed of 27 boats. The Greeks and Romans were very expert in this part of the military science. Several bridges of boats are mentioned by Appian, in his account of the social war. That of Cæsar over the Rhine is familiar to the readers of ancient history; and in all his campaigns, we observe particular attention on the part of that celebrated commander with regard to the passage of rivers, or preserving communications by means of bridges. In the contest between the armies of Otho and Vitellius about Cremona, a bridge of this kind is noticed by Tacitus. That of Trajan over the Danube has been already mentioned. Where boats were wanting, the ingenuity and cruelty of the ancients found other expedients for overcoming the obstacles presented by the rivers to their progress. Hamilcar Barca, in his war against the mercenaries, crossed the Macar by means of the following stratagem. He observed that when the west-north-west wind prevailed, the sand it agitated almost choked up the mouth of the river, and formed a kind of natural bridge for the passage of his troops. He availed himself of this discovery to pass the Macar in the night, and obtain by surprise an easy victory. Sapor the Persian, by a refinement in cruelty, made use of the bodies of his prisoners to facilitate the passage of his army. (Vid. Herod. lib. iv. cap. 97, 101.—Ibid. lib. vii. cap. 33—36.—Xenophon Anab. lib. ii.—Appian, de Bel. Civ.—Cæsar de Bel. Gall. lib. iv.—Tacitus, hist. lib. ii.—Dion Cassius, hist.—Polybius, lib. i.—Treb. Poll. in Valerian.)

Of late years the laying of bridges across rivers has been greatly improved and facilitated. In the campaigns of 1799 and 1800 in particular, this branch of the military science attained that pinnacle of excellence which it will be difficult to surpass. Few objects present more varied details than the crossing a river by open force, and in presence of an enemy. In operations of this kind, localities and other physical circumstances differ so infinitely, and give rise to such numerous combinations of advantages or disadvantages, that it is impossible to lay down any given precepts which may be applicable in all cases. What may be very proper and feasible upon one river, or at a certain season of the year, may be impracticable elsewhere, or in any other period. Sometimes the necessaries for the expedition must be transported by water; at others, by land. Rivers which have marshy banks, a smooth bed, an even current, and a muddy bottom, require totally different precautions from those with a rapid and formidable current, which are overhung with thick woods, or have a rocky bottom. The best commentary upon these several cases, will be a detailed account of the operations adopted in them.

The passages of the Rhine by the French troops at Urdingen, Neuwied, Kehl, and Diersheim; at Reichlingen, Atzmoor, and Lucistieg in Swisserland; those of the Limmat, the Danube, the Lech, the Inn, and finally of the Mincio, will evince the progress lately made in the construction of bridges of pontoons. Two of these have been treated with great precision by an engineer in the French service, whose work well deserves the attention of military men in general. (Dedon, relation des passages, de la Limmat et du Rhin. Par. 1801, 8vo.)

Under this article of *bridges* we may also mention *portable bridges*, easily taken asunder, and put together again. M. Couplet mentions one of this kind, 200 feet long, and which 40 men may carry. See Du Hamel. Hist. Roy. Acad. Scienc. l. iii. § 5. c. 4.

*Pendant*, or *hanging bridges*, called also *philosophical bridges*, are those which are not supported by posts or pillars, but hang at large in the air, being sustained only at the two ends or buttments. Of such bridges, consisting of a single large arch, instances have been already mentioned. Bridges of this kind are used by the Spaniards for passing the torrents in Peru, over which it would be difficult to throw more solid structures either of stone or timber. Some of these hanging bridges are formed so strong and broad, that loaded mules pass along them. Ulloa, tom. i. 358. Dr. Wallis gives the design of a timber-bridge, 70 feet long, without any pillars, which may be useful in places where pillars cannot be conveniently erected. Phil. Transf. N<sup>o</sup> 163, p. 714. Dr. Plot informs us, that there was formerly a large bridge over the castle-ditch at Tutbury in Staffordshire, made of pieces of timber, none much above a yard long, and yet not supported underneath, either with pillars or arch-work, or any other sort of prop whatever.

It has been already mentioned, that the ancient Romans paid particular attention to the construction and reparation of bridges; and that in the middle ages the building of bridges was reckoned among the acts of religion. By our ancient laws, *pontium reparatio*, or the reparation of bridges, was part of the *trinoda necessitas*, to which every man's estate was subject. However, by the great charter, 9 Hen. III. c. 15. no town nor freeman shall be distrained to make bridges nor banks, but such as of old time, and of right, have been accustomed. And none can be compelled to make new bridges, where none were ever before, otherwise than by act of parliament. 2 Inst. 701. By the common law, some persons are bound to repair bridges by reason of the tenure

of their lands or tenements; and some by reason of prescription only. 2 Inst. 700. But if a man make a bridge for the common good of all the subjects, he is not bound to repair it; and if none are obliged by tenure or prescription at common law, then the whole county or franchise shall repair it. 2 Inst. 701. By 22 H. VIII. c. 5. it is enacted, that, as in many places it cannot be known and proved, what hundred, town, parish, person, or body politic, ought to repair bridges broken in the highways, in every such case, the said bridges, if they be without a city or town corporate, shall be made by the inhabitants of the county; if within a city or town corporate, then by the inhabitants of such city or town corporate; if part be in one shire, city, or town corporate, and part in another, or part within the limits of a city or town corporate, and part without, the inhabitants of the shire, cities, or towns corporate, shall repair such part as lies within their limits. The decays of bridges are presentable in the leet, or torn. 2 Inst. 701. By the above act, the justices, or four of them at the least, shall have power to inquire, hear, and determine in the general sessions, of all manner of annoyances of bridges broken in the highways, to the damage of the king's liege-people, and to make such process and pains upon every presentment against such as ought to be charged to make or amend them, as the king's bench usually doth, or as it shall seem by their discretions to be necessary and convenient for the speedy amendment of such bridges. Such part of the highways as lies next adjoining to any ends of any bridges within the space of 300 feet, shall be made and repaired as often as necessary; and the justices shall inquire into, and determine annoyances in such highways. By 12 Geo. II. c. 29. no money shall be applied to the repair of bridges, until presentment be made by the grand jury at the assizes or sessions, of their insufficiency, inconveniency, or want of reparation. Again, by 1 Ann. st. 1. c. 18. no fine, issue, penalty, or forfeiture, upon any presentment or indictment for not repairing bridges, or the highways at the ends of them, shall be returned into the exchequer, but shall be paid to the treasurer, to be applied towards the said repairs, and not otherwise: and no presentment or indictment for not repairing bridges, or highways at the ends of bridges, shall be removed by "certiorari" out of the county into another court. The charges of repairing and amending bridges, and highways at the ends of them, shall be paid out of the general county rate. 12 Geo. II. c. 29. The four justices in session may appoint two surveyors, with salaries, to see the bridges amended. 22 H. VIII. c. 5. This business of surveying bridges is usually annexed by the justices to the office of the high constables, with the allowance of salaries. The stat. 14 Geo. II. c. 33. gives justices the power of changing the situation of bridges, as it enables them to purchase lands adjoining any county bridge, for the more commodious enlarging, and convenient rebuilding the same. By 12 Geo. II. c. 29. justices, at their general or quarter sessions, after presentment made by the grand jury of bridges wanting reparation, may contract for rebuilding and repairing the same, for any term not exceeding seven years, at a certain annual sum. They shall give public notice of their intention to contract, make contracts at the most reasonable prices, and take security of the contractors for due performance.

If a man has toll for men or cattle passing over a bridge, he is to repair it. And toll may be paid in these cases by prescription or statute.

By many special statutes, enacted upon the occasion, it is made felony to destroy bridges, &c. erected by virtue of these acts of parliament.

*BRIDGE-MASTERS*, are officers of the city of London, chosen

by the citizens, who have certain fees and profits belonging to their office, and the care of London bridge, &c.

*BRIDGE*, in *Music*, a small wooden machine for strings to rest on, in tuning violins, tenors, basses, guitars, monocords, &c. In this last the bridges are moveable.

*BRIDGEND*, in *Geography*, a town of Glamorganshire, in South Wales, situated on the banks of the river Ogmore, over which is a stone bridge, dividing the town into two parts. One of these is called Bridgend, and the other Newcastle. The latter, being seated on high ground, commands some very fine and extensive prospects. There is another part of the town called Oldcastle, by way of distinction from the former, each of which was formerly protected by a castle, and some remains of both are still standing. At Oldcastle is a chapel of ease under Coity, that being the mother-church; and at Newcastle is a large well-built parish church. The river Ogmore abounds with salmon, trout, sewin, and various other fish, with which the markets are generally well supplied. The soil round Bridgend is fertile and well cultivated; and the town is also in a state of considerable improvement. The agricultural society of the county has established a woollen manufactory in this town, and supplied it with different machines. About two miles east is the village of Coity, where are the remains of a very large and venerable castle, which, next to Caerphilly, was the largest in South Wales. Bridgend has a good weekly market on Saturdays, and two fairs annually. It is 20 miles from Cardiff, 181 W. from London; contains 1688 houses, and 7140 inhabitants. *Malkin's Tour in South Wales*, 4to. 1804.

*BRIDGENORTH*, a large ancient borough town of Shropshire, England, is built on the top and declivities of a hill, which rises steeply from the river Severn. It covers a considerable extent of ground; many of the streets are narrow, and some alleys which lead from those to the river, consist of long flights of steps. Bridgenorth appears to have obtained some consequence as early as the time of Ethelfleda, wife of king Ethelred; and was fortified and furnished with a castle by Robert de Belleme, or Beliafme, son of Roger de Montgomery, in the time of Henry I. Collecting a few associates, he here made a stand against the forces of that monarch, but, being vanquished, was obliged to fly into Normandy; where, according to Speed, he continued to "blow those embers that others had kindled." The castle at this place appears to have been of great extent and importance, and was mostly occupied by the Normans during their wars against the Welsh. In the reign of Richard II. it was committed to the custody of Hugh de Burrell, a favourite of that monarch, whose remains were interred at Hales Owen church in this county. In the civil wars, this castle was the scene of a violent struggle between the forces of the king and those of the parliament. It was then much battered; and one of the towers which now leans about ten degrees out of the perpendicular, was then partly undermined. The singular position of this building very much resembles one at Pifa in Italy, and is often contemplated with wonder by the passing traveller. Part of the site of the castle is occupied by a large handsome new church, and at the other end of the town is an ancient church, which suffered much in its ornaments, painted glass, &c. in the above wars.

Bridgenorth is separated into two parts, divided by the Severn, and respectively called from their relative situations, upper and lower town. The hill on which the former stands rises almost perpendicularly from the river, and consists mostly of solid rock, in which many cellars are excavated.

This borough had several privileges granted it by charters from

from Henry II. and king John; and returned members to parliament *ab origine*. It is governed by two burgesses, annually elected out of twenty-four aldermen; and the right of election is vested in the burgesses and freemen within and without the borough, amounting to about 700. There are a large well supplied weekly market on Saturdays, and three annual fairs. The town contains 945 houses, and 4308 inhabitants, 3805 of whom are employed in the manufactures and trade of the place.

David Caldwell died at Bridgenorth in November 1766, at the advanced age of 107 years. He was born in the army in the shire of Ayr, Scotland, and served as a drummer in king William's army, and many years a soldier under queen Anne. He perfectly retained his faculties to the last. Camden's *Britannia*. Magna Britannia. History of the Boroughs of Great Britain.

BRIDGES, JAMES, in *Biography*, published in 1751, a well known work on the subject of farriery, in which he appears to have been well versed, with the following quaint title: "No Foot, no Horse; or, an Essay on the Anatomy of the Foot of a Horse. With particular Directions for the Cure of the chief internal Diseases the Horse is subject to." With plates, 8vo. London. Haller. Bib. Anat.

BRIDGET, ST. in *Heraldry*, an order of knighthood instituted in Sweden in 1366. They were to oppose heresy, secure the confines of the kingdom, bury the dead, succour widows and fatherless children, and to keep up hospitality. Their ensign was a cross of eight points, four of which were moline, the other slower de lis, azure, and under a tongue of five proper. This badge or ensign was embroidered on a short white robe.

BRIDGE-TOWN, in *Geography*, the capital of the island of Barbadoes, situate in the south-western part of the island, in the parish of St. Michael, and in the innermost part of Carlisle bay. This bay is large enough to contain 500 ships, being one league and a half long, and one broad; but the bottom of it is foul, and apt to cut the cables. The town lies at the entrance of St. George's valley, which runs several miles into the country. It has a free-school, an hospital, and a college, founded and liberally endowed by colonel Codrington; but its success is said not to have answered the designs of its founder. It has also commodious wharfs for loading and unloading goods, and is well defended by a number of forts; such as James fort on the west, Willughby's fort on a tongue of land running into the sea, Needham's fort, and St. Anne's fort, which lies more within the land. But thus secured from foreign enemies, it is very subject to hurricanes, and it has often suffered by fires. It was burnt down in 1688; and in 1756, 1766, and 1767, the greatest part of the town was destroyed. Before the devastation occasioned by the two last of these fires, it contained 1500 houses, mostly constructed of brick, very elegant, and said to be the finest and largest in all the Caribbee islands; the town has been since rebuilt; but it had scarcely risen from its ruins, before it was made a scene of desolation by a violent storm in 1780. See BARBADOES. It is again recovering its former splendour. The streets are paved, and the houses lofty, and well built. The church of St. Michael is as large and beautiful as many cathedrals, and is furnished with an excellent organ and ring of bells, and a curious clock. Upon the whole, the town is destitute of few elegancies or accommodations for entertainment and amusement which are to be found in the cities of Europe. This is the seat of the governor, council, assembly, and court of chancery, &c. Within a mile of the town to the north-east, the governor has a handsome country villa, built by the assembly, called "Pilgrims." The

number of militia for Bridge-town and the precinct of St. Michael is 1200 men, who are called the royal regiment of foot-guards. Packet boats have been lately established to carry letters to and from Great Britain monthly. The adjacent grounds are low and flat, and were often overflowed by the spring-tides, which rendered the situation of the town insalubrious; but most of them have been drained, and it is now reckoned as healthy as any place in the island. N. lat. 13° 9' 30". W. long. 60° 2' 30".

BRIDGE-TOWN, a settlement of America in Cumberland county, and district of Maine, having Hebron on the N.W. and Bakers-town (on the west side of Androscoggin river) on the S.E.; which three settlements lie on the northern side of little Androscoggin river. It contains 529 inhabitants; and lies 34 miles N. by N.W. from Portland, and 156 N.E. from Boston. Bridge-town consists of large hills and vallies; the highland affords red oak of large size, and the vallies are covered with rock maple, bals, ash, birch, pine, and hemlock. In this district is a pond, on the east side of which is a cove, extending about 100 rods farther to the east than the general course of the shore, and so shallow, that a man may wade 50 rods into the pond. On the bottom of this cove are stones of various sizes, which appear to have an annual motion towards the shore, though some of them are two or three tons in weight. The shore of the cove is lined with these stones, which seem to have moved out of the water.

BRIDGE-TOWN, the chief town of Cumberland county in New Jersey, near its centre; 50 miles S.S.E. of Philadelphia, 80 S. by E. of Trenton, and 145 S.W. of New York. Also, a post town in Queen's county, Maryland, lying on the western side of Tuckahoe creek, 8 miles E. from Centreville, as far S.E. from Church-hill, and 65 S.W. from Philadelphia.—Also, a town of Kent county in the same state, seated on the north bank of Chester river, 7 miles S.E. from Cross Roads, and 4 southerly from Newmarket.

BRIDGE-TOWN, in the island of Antigua. See WILLOUGHBY Bay.

BRIDGEWATER is a large, populous borough, and market town of Somersetshire, England, seated on the river Parret, which winds in a bold stream hence towards the estuary of the Bristol chanuel. The town is situated in a flat and rather woody country, having rich moors to the north and east. It was formerly of much greater importance than at present, as it has suffered material injury by means of conflagrations, and various vicissitudes of warfare; particularly in 1645, when the town was besieged by the parliament's army under the command of Sir Thomas Fairfax, who committed great devastations. The markets are on Thursdays and Saturdays; and for the accommodation of those who frequent them, a spacious and convenient market-house has been lately erected. There are also four annual fairs. Bridgewater is a very ancient corporation, governed by a mayor, recorder, two aldermen, and twenty-four common-councilmen. The town was formerly protected by a castle, the greater part of which was demolished during the civil wars. It was in the castle yard, or castle fields at Bridgewater, that the duke of Monmouth encamped his raw and undisciplined troops, previously to his battle on Sedgemoor, where he was defeated. The castle and manor were formerly held by the queens of England. The corporation have also their peculiar manor within the town. The church dedicated to St. Mary is a large handsome structure, with a tower and spire at the west end. A very fine altar piece was given by the Hon. Anne Powlett. Here was formerly an ancient hospital founded by William Briwere in the time of Henry III., but not a vestige of it remains.

mains. Bridgewater sends two members to parliament; and the right of voting is vested in the inhabitant householders paying scot and lot. The revenues of the corporation, consisting of the manor of the borough, the great and small tythes, with some manors in Dorsetshire, are valued at 5000*l.* per annum. The authority of the magistrates extends throughout the parish, and the corporation are conservators of the river Parret. The burgesses are free in all parts of the united kingdom, except London and Dublin; and the sheriff of Somersetshire cannot send any process into the borough, it having been made a county within itself by Henry VIII. It was made a free borough by king John, a mayor town by Henry IV. and sent to parliament 23d Edward I. This borough was formerly under the patronage of the celebrated Bulb Doddington, and has been the object of strong contest in different elections. The Midsummer county sessions are constantly held here; and the assizes every other year. At the port the manufactures of Manchester, Liverpool, Birmingham, &c. are landed for the use of the western counties. The duties paid for imposts are very considerable. Coals are also brought from the Welch coast to supply the town and neighbourhood: the duty on which for seven years was estimated at between 16 and 17,000*l.* Thirty-two vessels belong to the port from 20 to 120 tons burthen. The town contains 493 houses, and 3634 inhabitants, 986 of whom are engaged in trade and manufactures. The houses are built in an irregular manner; but the principal street is wide, and well paved. The quay is also large and commodious. There are several meeting-houses for presbyterians, anabaptists, and quakers; and it is a singular circumstance, that in one of these there is a pew appropriated for the mayor and aldermen, should they be of that persuasion. Bridgewater is 147 miles W. from London, and 12 S. from the Bristol channel. A suburb called Eastover, is joined to the town by a strong stone bridge. See SEDGEMOOR. Collinson's History of Somersetshire, vol. iii. 4to. 1791.

BRIDGEWATER, a township of America, in Grafton county, New Hampshire, incorporated in 1769, and containing 281 inhabitants.—Also, a township of Somerset county, in New Jersey, containing 2578 inhabitants, including 357 slaves.—Also, a considerable township in Plymouth county, Massachusetts, containing 4975 inhabitants, of whom many are manufacturers of hardware, nails, &c.; about 30 miles E. of S. from Boston.—Also, a township of Windsor county, Vermont, about 55 miles N.E. of Bennington, containing 293 inhabitants.

BRIDLE, from *la bride*, Fr. in the *Manege*, is an instrument for the guidance and management of the horse by the hand, and is composed of the *bits* and *reins*, which see.

“It is probable, that some time must have elapsed before the instrument called a *bit* was used for the government of horses, by putting it into their mouths. By looking back into antiquity for the practices of past times, and the origin of many customs descended to us, we every where find the greatest plainness and simplicity in their first state; and the more ancient, the ruder and simpler they were. The style of architecture, the fashion of the habits and dresses of early times, the method of preparing food, and many articles besides, are convincing proofs of this assertion. By degrees light broke in, and men advanced progressively from one improvement to another. It is curious to observe, that in ancient Greece many of the terms appropriated to navigation were also used in horsemanship. The word *κελως*, or keles, which signifies a *runner*, served likewise, as Suidas says, to denote light sailing vessels, and swift horses. Homer calls ships horses of the sea; and the pilot, the coachman

or driver of the vessel. Pindar calls a bridle an anchor; and in this sense Neptune may properly be called the inventor of the horse, which implied no more than a ship. These little observations are only offered to the reader as an argument that bits and bridles were used in the most distant ages; but at what exact period to fix their origin, is a task by no means easy to perform. It is probable to suppose, that the people of the first ages of the world, prompted by their necessities, and acting from them alone, made no other use of the horse at first than what might be for domestic purposes, teaching him to submit to carry men and burdens; and having reconciled and made him patient, they taught him, by degrees, to distinguish and obey the different sounds of the voice, as well as to be directed by the guidance of a switch or wand which the rider carried in his hand.

It is, however, apparent, that they made use of cords or thongs to stop and confine the horse in any place where they chose he should stay. These cords they fastened round the horse's neck, as may be seen in the figures, though of a much later date, carved upon Trajan's pillar at Rome. These ropes hanging down from the necks of horses, are imagined to have suggested the first hint of traces for drawing machines. Strabo says that the Moors, or Africans, used cords for bridles. It is probable to think, that after a time they might discover, that if a cord was put into the mouth, or at least over the nose, like our halters, which may be used both ways at the same time, it would be a more effectual method of guiding and controlling the horse; and hence is derived the supposed origin of bridles, which, in after ages, have been multiplied in such numbers, and under such a variety of shapes, increasing and improving as men grew more skilful in riding, and applied it to sundry purposes.” Berenger, Hist. and Art of Horsemanship, vol. i. p. 40.

When bridles came into fashion, the most remarkable were those called “*lupata*,” having bits of iron resembling wolves' teeth, to which Horace refers, l. i. od. 8.

“*Cur neque militaris*

*Inter æquales equitat, Gallica nec lupatis,  
Temperat ora frænis?”*

Virgil (Georg. ii. l. 115.) seems to ascribe the first invention of them to the Lapithæ, or Centaurs, who inhabited a town in Thessaly, called “*Pelethronium*,” when he says,

“*Fræna Pelethronii lapithæ, gyroque dedere  
Impositi dorso.—*”

But some are of opinion, that he speaks of bridles, as invented not by the Lapithæ, but by a person of that nation, whose name was Pelethronius, to whom Pliny (H. N. l. vii. c. 56.) attributes the invention of them.

BRIDLE, in *Anatomy*. See FRÆNUM.

BRIDLE, among *Surgeons*, is a kind of BANDAGE contrived for retaining the lower jaw in its place.

BRIDLE, *scolding*, or BRANK, an instrument formerly used in some parts of Scotland, and in Staffordshire, for correcting scolding women. It consists of a kind of head-piece, which opens and incloses the head, whilst an iron appendage is put into the mouth, and takes particular hold of the tongue, which it effectually keeps from stirring: thus harnessed, the offender is led in triumph through the streets. A figure and description of the Staffordshire bridle is given by Dr. Plott, who prefers it to the ducking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt successive dips; to neither of which inconveniences this instrument is liable.

BRIDLE-chain, in *Husbandry*, a name given by our farmers to a part of the structure of their PLOUGH. This is an iron chain of several links, fastened at one end to the beam of the plough, near that part where the collar receives

the tow-chain; and fastened at its other end to the flake of the plough, or to that upright piece which runs parallel to the left crowstaff, and at its bottom pins in the tow-chain; this flake is fastened to the crowstaff, sometimes by the end of this *bridle-chain*, and sometimes by a wythe or cord.

*Bridle-hand*, in the *Manege*, signifies the horseman's left-hand, in respect of which the right hand is called the spear or sword-hand.

*Bridles* in *Sea-language*, denote the upper part of the moorings in the king's harbours, to ride ships of war.

*Bridles of the bow-line*. See *Bow-line*.

**BRIDLINGTON**, or **BURLINGTON** as sometimes written, in *Geography*, is a sea port town of the east riding of Yorkshire in England. It is built on the shore of a bay, to which it gives name, which is found to be a safe harbour for vessels, when the wind is strong from the N. N. W. and N. E., being secured by two projecting piers of considerable extent, running out obliquely into the sea, and rendering the entrance very narrow. The principal trading vessels are colliers, and most of the inhabitants are connected with these. Here was formerly a priory of black canons, founded early in the reign of Henry I. The church has been large, but its choir, transepts, and steeple, have been entirely destroyed, leaving only the nave for parochial service. A Mr. William Hustler was a considerable benefactor to the town, and in the 16th Charles II. Richard Boyle baron Clifford was created earl of Burlington, (from this town). In the 8th William III., and 1st of George I. acts of parliament were obtained to repair the piers, &c. of the harbour. Bridlington is now frequented as a bathing place; it lies at about 10 miles S. W. of Flamborough-head, 40 east of York, and 206 north from London. The houses amount to 707, and inhabitants to 3130. Gough's edition of Camden's *Britannia*.

**BRIDON**, or **BRIDONN**, in the *Manege*, is derived from the French *Bridon*, a diminutive of *la bride*. By *la bride*, the French denote the reins going to the curb; and by *bridon*, the reins going to the snaffle or lesser bit, which is held in reserve in case of any accident with the former. In the English language, it is called a *bridoon*, and a very different use is made of it. The reins of the *bridoon* pass parallel to the line of the horse's head, through a loop hanging from the head stall, and from thence to the hook of the saddle, for they are only used in harnessed horses at present, especially of the richer orders of society, and where elegance of appearance is considered.

The rein so disposed draws against the corners of the mouth, and not upon the bars, as the snaffle does, and tends more forcibly to elevate the head, as the curb does to depress it; though they are often used at one and the same time, the snaffle having an intermediate effect.

Bridles of late have been constructed with a property, somewhat similar to the *bridoon*, to be used with the hand, the rein passing from the head stall, through a tube or pipe placed in the situation of the cross piece of the snaffle, to the hand; so that when drawn tight against the mouth, it presses the cheeks upwards, and shortens the head-stall which has not a good appearance. A ring is also fixed to this hollow cross piece for the reins, as in the ordinary snaffle, so that the rider has it in his option to use either.

**BRIDPORT**, in *Geography*, an ancient borough, market and manufacturing town of Dorsetshire, England, is situated in a vale at the distance of about one mile north of Bridport bay. It is nearly surrounded by eminences, some of which assume a conical shape; and on its western and eastern sides, run two small rivulets, which are highly useful to the manufacturers. Seated on the great western road, at the distance of 135 miles S. W. from London, it derives many

advantages from travellers, and further advantages from its contiguity to the English channel.

It seems to have been a very considerable town before the conquest, as it is thus noticed in the *Domesday Book*: "In Edward the Confessor's time, here were 120 houses, subject to every service to the king, and paying geld for 5 hides, viz. to the use of the king's domestics, (Huscarles)  $\frac{1}{2}$  a mark of silver, except the customs pertaining to the farm of one night for one night's lodging. Here was one mint-maler, who paid to the king one mark of silver, and 20 shillings on the charge of coinage. Now there are but 100 houses, and the remaining 20 are ruined, that the inhabitants are unable to pay the tax." The manor anciently belonged to, and was held of the crown, in fee-farm by the burgesses, to whom it now belongs. The town received its charter of incorporation from Henry the III., who granted "to the men of Bridport, that the village should be a free borough; and that they and their heirs should hold it, with all liberties, &c. paying yearly to the exchequer at Michaelmas, the farm which they usually paid, and 40s. for the increase of the village." The charter now in force was granted by Charles II. The earliest return to parliament was made in the twenty-third of Edward I. The right of election is vested in the inhabitant householders, paying scot and lot, and the number of voters is about 160. This town does not seem memorable for any historical transaction, though it appears to have been alternately the quarters of the royal and parliament's troops during the civil wars; and in the duke of Monmouth's rebellion, several excesses were committed here by his forces. In 1685, the town exhibited a solemn scene, when twelve of its inhabitants were executed for being actively concerned in that rebellion. The town is large, and has a very respectable appearance; many of the houses being new brick buildings, and its principal streets are broad and spacious. The number of houses is 283; of inhabitants 3117, who are principally supported by the manufacture of seins, and nets of all sorts, lines, twines, and small cordage, as well as sail-cloths. Large quantities of these articles are exported to America and the West India islands; but the greater part is consumed in the Newfoundland and British fisheries; it being computed that upwards of 1500 tons of hemp and flax are worked up annually. This manufacture was so flourishing in the reign of Henry VIII., that cordage for the whole English navy was ordered to be made exclusively here, or within five miles of the place. A handsome market-house and town-hall has been erected in the centre of the town, on the ruins of an old chapel dedicated to St. Andrew. Here were formerly several religious foundations, no relics of which now appear. Here are also a charity-school, three alms-houses, and a gaol. The church is a large ancient pile of building, in the form of a cross; the tower in the centre of the structure is adorned with pinnacles and battlements. The dissenters in this town have meeting-houses, and are both numerous and respectable. The haven is situated at the mouth of the river Brit, a mile south of the town. It does not appear that Bridport was of any consequence in maritime affairs; and although several attempts have been made to make it a port, they have all proved ineffectual. The cliffs here are composed of sand, though the surrounding country is covered with lime-stone full of shells. The height of the cliffs is in some places nearly 200 feet; and they contain *belemnites* and other fossils; besides pyrites, gypsum, hepatic ore, &c. Giles de Bridport, consecrated bishop of Salisbury March 11, 1256, was, according to Leland, "caulid Britport, because he was borne," in this town. The markets are Wednesday and Saturday: and there are three fairs annually. Hutchins's *History of Dorsetshire*, vol. i.

**BRIDPORT**, a township in America, in Addison county, Vermont, on the east shore of lake Champlain, about 72 miles N. N. W. from Bennington, containing 449 inhabitants.

**BRIDY**, or **BREDY**, a town of Asiatic Turkey, in the Arabian Irak; 140 miles N.W. of Bassora.

**BRIE**, the name, before the revolution, of a district of France, situated partly in Champagne, and partly in the Isle of France, and called from its particular situation "Brie Champenoise," and "Brie Françoise," or "Brie Parisienne." The principal towns are Meaux, Provins, and Chateau Thierry.

**BRIE fur Hieres**, or **BRIE Comte Robert**, so called from Robert of France, count Dreux, a former possessor, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Melun, seated on the Yerre, and  $3\frac{1}{2}$  posts S.E. of Paris. The place contains 2571, and the canton 8089 inhabitants; the territory comprehends 170 kilometres, and 15 communes.

**BRIEC**, a town of France, in the department of Finisterre, and chief place of a canton, in the district of Quimper;  $2\frac{1}{2}$  leagues N.N.E. of Quimper. The town contains 3000, and the canton 4735 inhabitants; the territory includes  $222\frac{1}{2}$  kilometres, and 2 communes.

**BRIEF**, formed from the French *breve*, of the Latin *brevis*, which signifies the same, denotes a thing of short extent or duration. It is more particularly used for a summary, or short state of a thing; and also for an act or writing drawn up by a notary.

**BRIEF attested**, *Breve testatum*, a public instrument clothed with the proper formalities.

**BRIEF of devising**, *Brevis divisionalis*, denotes a last will or testament, or **DEVISE**.

**BRIEF of an oath**, *Breve sacramenti*, an instrument made on oath, and authenticated by the subscription of witnesses.

**BRIEF** is also used for a judicial epistle, directed by a lord or other superior to his subjects or dependents, enjoining something to be done or forborn. In which sense, we say, the lord's, king's, bishop's, or pope's brief.

**BRIEF** also denotes the territory or district within which the lord's brief had course. In which sense, we meet with the bishop's brief, *breve episcopi*, the count's brief, *breve comitis*, &c.

**BRIEF** also denotes the yearly revenue arising out of the lands usually described in briefs.

**BRIEF**, *Breve*, in *Common Law*, is so called, *quia breviter intentionem proficientis exponit*, because couched in a few plain words without preamble, &c. See **BREVE**.

**BRIEF** also signifies an abridgment of the client's case, made out for the instruction of counsel, on a trial at law; in which the case of the party is to be briefly but fully stated; the proofs must be placed in due order, and proper answers made to whatever may be objected against the cause of the client by the opposite side; and in preparing this, great care is requisite, that nothing be omitted to endanger the cause. An attachment has been granted against a party and his attorney, for surreptitiously getting possession of the brief of a counsel on the other side, and applying the same to an improper purpose in his defence. 1 Bro. P. C. 519. Although a brief is not of itself evidence against the party for whom it is prepared, yet, as a discovery of the secrets and merits of his case may be productive of perjury or subornation of perjury, and thereby obstruct the justice of the court in which the suit is depending; the obtaining of it in a surreptitious manner is an offence highly deserving censure and punishment.

**BRIEF**, in *Scots Law*, a writ issued from the chancery,

directed to any judge-ordinary, commanding and authorising that judge to call a jury to inquire into the case mentioned in the brief, and upon their verdict to pronounce sentence.

**BRIEF a l' Eveque**, denotes a writ to the bishop, which, in "quare impedit," shall go to remove an incumbent, unless he recover, or be presented "pendente lite." 1 Keb. 386.

**BRIEF** is also used for a letter patent, granting a licence for collecting money to rebuild churches, restore loss by fire, &c.

Churchwardens are, by stat. 4 Ann. c. 14, to collect money upon these briefs, which are to be read in churches, &c. and the sums collected to be indorsed on the brief in words at length, and signed by the minister and churchwardens; after which they shall be delivered, with the money collected, to the persons undertaking them, in a certain time, under the penalty of 20l. A register is to be kept of all money collected, &c.: and the undertakers, in two months after the receipt of the money, and notice to sufferers, are to account before a master in chancery, appointed by the lord chancellor.

**BRIEFS**, *apostolical*, denote letters which the pope dispatches to princes and other magistrates, touching any public affair. They are thus called, as being very concise, and written on paper, without preface or preamble; by which they are distinguished from *bulls*, which are more ample, and always written on parchment, and sealed with lead or green wax; whereas briefs are sealed with red wax; and with the seal of the fisherman, or St. Peter in a boat; a seal is never applied, but in the pope's presence. The brief is headed with the name of the pope, apart; and commences with *Dilecto filio salutem, et apostolicam benedictionem, &c.* after which it proceeds directly to the matter in hand, without further preamble. Briefs are not subscribed by the pope, nor with his name, but with that of his secretary. Pope Alexander VI. instituted a college of secretaries for briefs; since which time they have been made much longer, and more ample than before. See **ABBREVIATOR**. Formerly briefs were only dispatched about affairs of justice; but now they are likewise used in matters of benefices, expective graces, and dispensations.

**BRIEFS of the dead**, *Brevia mortuorum*, were letters sent by the monks of one monastery to those of another, with whom they were in fraternity, to inform them of the deaths or obits of their monks, for whom they were to say the stated and customary prayers and masses.

These were also called *literæ currentes*, a formula of which we have in the book of the usages of the Cistercian order.

**BRIEF of remembrance**, *Breve recordationis*, or *rememorationum*, or *memorable*, denotes a character, otherwise called **NOTITIA**.

**BRIEG**, in *Geography*, one of the largest and most fertile principalities of Silesia, surrounded by those of Oels, Breslau, Schweidnitz, Munsterberg, Ncyfze, Oppeln, and in a detached part of it bordering on Poland. Its form is irregular; its extent being about 36 miles in length, and from 8 to 21 in breadth. It produces corn, madder, and tobacco. The first duke of Brieg was Boleslaus III. who obtained it in 1314; from him it descended to Frederick II. who embraced Lutheranism in 1523, and in 1537 concluded a compact of fraternity and succession with Joachim II. elector of Brandenburg; and on this was founded the claims of Frederick II. king of Prussia. The chief towns of this principality are Brieg, Ohlau, Strehlen, Nimptsfel, Creutzburg, and Pittschen; and its chief rivers are the Ohlau and Oder.

**BRIEG**, in Latin *Brega*, a city of Silesia, a circle-town, and the capital of the above province; seated on the river

Ober, and formerly one of the largest and most considerable cities of Silesia; the castle, college, and arsenal being great ornaments to it, and most of the houses well built. It has also a manufacture of good cloth. But in 1618 it suffered much from a fire, and still more from the siege of the Prussians in 1741, to whom it was ceded by the peace, and who increased the fortifications, and built a new suburb. North of Brieg, at a small distance, is a large forest of oak, beech, and pines, partly belonging to the city; and between them is a spacious meadow, intersected by a broad dike paved with stones, where is held on St. James's day a yearly fair for cattle and horses. N. lat.  $50^{\circ} 40'$ . E. long.  $17^{\circ} 35'$ .

BRIEG, or BRIG, a town of Switzerland, and capital of one of the seven independent districts or commonwealths of the Valais, bearing the same name; seated near the conflux of the river Salina with the Rhone. The surrounding country abounds with pasture; and in the vicinity of the town are warm baths; 23 miles E. of Sion. N. lat.  $46^{\circ} 18'$ . E. long.  $7^{\circ} 49'$ .

BRIEL, or BRILL, a maritime town of Holland, situated on the north side of the island of Voorn, near the mouth of the Meuse, with which it communicates by means of a spacious and convenient harbour. In 1572 the confederates of the United Provinces laid in this place the foundation of their republic; for being expelled the Low Countries by the duke of Alva, they retired to England, and having equipped a small fleet of 40 sail under the command of count Lumay, they sailed towards this coast, being called in derision "gueux," or beggars of the sea, and geese of the sea. Upon the duke's complaining to queen Elizabeth that they were pirates, she obliged them to leave England; and accordingly they set sail for Enckhuysen; but the wind being unfavourable, they accidentally steered towards the isle of Voorn, and, attacking the town of Briel, which was incapable of effectual resistance, they took possession of it, fortified it, and made it the first asylum of their liberty. In 1585, a treaty was concluded between the States of Holland and queen Elizabeth; and Briel was one of the cautionary towns delivered into her hands for securing the fulfilment of their engagements. Accordingly it was garrisoned by the English during her reign, and part of the next; but restored to the States in 1616. N. lat.  $51^{\circ} 51'$ . E. long.  $4^{\circ} 5'$ .

BRIENNE-LE-CHATEAU, a town of France, in the department of the Aube, and chief place of a canton, in the district of Bar-sur-Aube, 4 leagues N.W. of Bar-sur-Aube. The place contains 3193, and the canton 14,692 inhabitants; the territory comprehends  $277\frac{1}{2}$  kilometres, and 28 communes.

BRIENNOIS, a name given before the revolution to a small district of France, in Burgundy, near the Loire, of which Semur en Briennois was the capital.

BRIENON, or BRIESNON, a town of France, in the department of the Yonne, and district of Auxerre; 2 leagues W. of St. Florentin.

BRIENTZ, a lake of Switzerland, in the canton of Bern, about 8 miles long and 2 wide; situated nearly at right angles with the lake of Thun.—Also, a town of Switzerland in the same canton, adjacent to the lake, and N.E. of it; famous for the cheese made in its vicinity; 22 miles S.E. of Bern. The river Aar runs through the centre of this lake. N. lat.  $46^{\circ} 41'$ . E. long.  $7^{\circ} 52'$ .

BRIENZA, a town of Naples, in the Principato Citra; 20 miles N. of Policastro.

BRIES, BRIZNA, BREZNO, or BANYA, a royal free town of Hungary, seated on the river Gran, which by suc-

cessive fires has been much reduced; whose inhabitants are chiefly employed in the breeding of sheep.

BRIETZEN, or WRIETZEN, a town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg, near the Oder; 32 miles E. from Berlin. It has frequently suffered much from fire.

BRIEUC, ST., a city of France, capital of the department of the North Coasts, and the see of a bishop; surrounded by mountains, which intercept the view of the sea, though at the distance only of about a mile, on which it has a small harbour. The churches, of which St. Michael is the largest, streets, and squares, are tolerably handsome; but the town has neither walls nor ditches. The convent of the Cordeliers is well built, and has a spacious garden; near it is the college maintained by the town for the instruction of youth. Brieuc consists of two parts; the first contains 4000, and the second 4050 inhabitants; the canton of the former contains 14,737, and that of the latter 15,108 inhabitants; and the territory of both comprehends 265 kilometres, and that of the first includes 5, and that of the second 8 communes. N. lat.  $48^{\circ} 33'$ . W. long.  $2^{\circ} 58'$ .

BRIEUL-SUR-BAR, a town of France, in the department of the Ardennes, and district of Vouziers; 3 leagues N. of Grandpré.

BRIEY, a town of France, and principal place of a district, in the department of the Moselle, 4 leagues N.W. of Metz. The place contains 1433, and the canton 9626 inhabitants; the territory includes 225 kilometres, and 32 communes.

BRIG, in *Sea-Language*. See BRIGANTINE.

BRIGA, in *Geography*, a town of France, in the department of the Maritime Alps, and chief place of a canton, in the district of Monaco; 22 miles N.E. of Nice. The town contains 2895, and the canton 4386 inhabitants; the territory comprehends 365 kilometres, and two communes.

BRIGADE, in the *Military Art*, a party or division of a body of soldiers, whether horse, foot, or artillery, under the command of a brigadier.

The word is French; some derive it from the Latin *briga*, a *brigue*, or *secret intrigue*. Du-Cange derives it from *brigand*, an ill-disciplined soldier, who scour the country, and plunders it of every thing, without waiting for the enemy; as the armies of Arabs, Tartars, &c. The origin of brigand is again deduced from *brigandine*, a sort of armour used in the army raised by the Parisians, during the captivity of their king John in England, notorious for their robberies.

There are, strictly speaking, three sorts of brigades; viz. the brigade of an army, the brigade of a troop of horse, and the brigade of artillery. A brigade of the army consists of either foot or dragoons, the exact number of which is not fixed, but generally including three regiments, or six battalions; a brigade of horse may consist of eight, ten, or twelve squadrons; and that of artillery of eight or ten pieces of cannon, with all their appurtenances. The eldest brigade takes the right of the first line, the second of the second line, and the rest in order; the youngest always occupying the centre: the cavalry and artillery observe the same order. The troops of horse-guards in England are divided into several brigades, according to their strength.

BRIGADE-Major, in the *Military Art*, an officer chosen from among the most ingenious and expert captains. Brigademajors are to wait, at proper times, to receive the word and orders, which they carry first to their brigadier, and afterwards to the adjutants of regiments at the head of the brigade.

gade, where they regulate together the guards, parties, detachments, and convoys, and appoint them the hour and place of rendezvous at the head of the brigade, where the brigade-major takes and marches them to the place of general rendezvous. A major of brigade ought to keep a roll of the colonels, lieutenant-colonels, majors, and adjutants, belonging to the brigade. When a detachment is to be made, the major-general of the day regulates with the brigade-majors, how many men and officers each brigade shall furnish; and they again, with the adjutants of the regiments, how many each battalion is to send, which the adjutants divide among the companies. The complements each regiment is to furnish, are taken by the adjutant at the head of each regiment, at the hour appointed, who delivers them to the brigade-major at the head of the brigade, who again delivers them to the major-general of the day, and he remits them to the officer who is to command the detachment.

**BRIGADIER-GENERAL**, an officer whose rank is the next above that of a colonel, appointed to command a corps consisting of several battalions or regiments, called a brigade. Every brigadier marches at the head of his brigade upon duty. The brigadier of foot commands him of horse in garrison, and the brigadier of horse, him of foot in the field. Brigadiers of the horse-guards command youngest captains of horse, who have generally some higher rank in the army.

**SUB-BRIGADIER** of a troop of horse-guards, an assistant of the brigadier.

**BRIGANDINE**, in *Heraldry*, a jacket or coat of mail, consisting of a number of small plates of iron, sewed upon quilted linen or leather, covered with the same, and worn by troops called brigands.

**BRIGANDINI**, **BRIGANTINI**, **BRIGANDINARI**, or **BRIGANCHI**, in *Middle Age Writers*, military thieves, or highwaymen, who infested France and the Netherlands. See **BRABANCONES**.

**BRIGANTES**, in *Ancient Geography and History*, a people of very ancient origin, who occupied several parts of Rhetia, the islands of Britain, Spain, &c. According to Stephanus Byzantinus, they were the same with the Bregi or Briges; and the Briges were, according to Strabo (*Geog.* l. xii. p. 550.) the same with the Phryges or Phrygians. From a passage in Herodotus (l. vii.) it appears, that they retained the name of Briges whilst they remained in Europe with the Macedonians; but that when they migrated into Asia, they were distinguished by the appellation of Phryges. Some have suggested, that the name of Brigantes was formed from Gombri or Gombri, the descendants of Gomer, one of the most ancient progenitors of the people of Europe; by subjoining the Celtic *cant*, denoting a hundred, whence is derived *Gombri-cant*, and expressing the termination *bricant*, by the Latin *Brigantes*. Whatever be the etymology of the name, the Briges or Brigantes are placed by Steph. Byz. in the mountains of Thrace and Macedonia; and some of them, as Herodotus informs us, passed into Phrygia, whilst others proceeded as far as Rhetia towards the west, where Strabo recognizes them. Here we find the lake "Brigantius," and a town of the Brigantes. From hence they advanced towards the north, following the course of the river Rhine, which signifies, in Celtic, the conductor, as far as the ocean, and crossed it to the British islands. It is not improbable, that others of the Brigantes migrated into Gaul, and there founded the city of the Brigantes, now called Briançon, and that other colonies of the same nation passed into Spain, where we discover a reference to their name in several places. Those Brigantes who traversed the ocean into the isle of Albion became the most numerous and

powerful people of the ancient Britons. Their territories reached from sea to sea, quite across the island, and comprehended that large tract of country, which is now divided into Yorkshire and the county of Durham on the east coast, and Lancashire, Westmorland, and Cumberland on the west. These Brigantes are supposed to have been descended, as we have already intimated, from the ancient Phrygians, who were the first inhabitants of Europe, and to have come over into this island from the coast of Gaul, before the Belgæ arrived in that country. They were settled, without doubt, in this island in times of very remote antiquity, and esteemed themselves the Aborigines, or first inhabitants of it. The Brigantes were not in the least affected by the incursions of the Romans under Julius Cæsar; but Seneca (in *Ludo*) insinuates, more probably, with poetical compliment than truth, that they were subdued by the emperor Claudius:

"———Ille Britannos

Ultero noti littora ponti, et cæruleos

Scuta Brigantes, dare Romulæis colla catenis

Justit."

It appears, however, that they soon contracted some alliance with, or made some kind of submission to, the Romans. For, when Ostorius, the Roman governor, had defeated the Iceni, and was marching his army into the west against the Cangri, he was called away by the news of an insurrection among the Brigantes, which he soon quieted. Tacitus *Annal.* l. xii. c. 32. But it also appears (*Id.* l. xii. c. 36.) that these people were, some time after this, governed by their own princes, particularly by the famous Cartimandua, who was a faithful and useful ally to the Romans. They afterwards commenced hostilities against the Romans in the beginning of Vespasian's reign, A. D. 70, and were partly subdued by Petilius Cerialis, then governor of Britain, and soon after totally reduced by the renowned Agricola. Tac. *Vit. Agr.* c. 17. 20. The country of the Brigantes composed almost the whole of the fourth Roman province in Britain, called "Maxima Cæsariensis," and was governed by the consular president of that province. During the times of the Romans, this was a frontier province, and was therefore much frequented, and carefully guarded by that people. The towns of the Brigantes were Epiacum, Vinnovium, Caturraconium, Calatum, Ifurium, Rigodunum, Olicana, Eboracum, and Camulodunum; which see respectively. Henry's *Hist.* Book i. c. 3. § 1.

The Brigantes of Ireland are supposed to have lived in that part which is now the county of Waterford, adjoining the river Brigus. It is natural to conclude that these were either a colony of the Brigantes of Britain, or sprung from the same race. Even general Vallancy seems to admit this; and he has quoted a passage from a work of Monf. Brigante, showing the Brigantes to be Celts of the posterity of Japhet, and to have received their name from their attention to navigation. That they proceeded immediately from Germany and Rhetia is rendered probable by Ptolemy's having placed near them the Canuci and Menapii, people found in Germany on the coasts of the ocean. The English words, *brig* and *brigantine*, are supposed to be derived from the same source.

**BRIGANTI**, **ANNINAL**, in *Biography*, a celebrated Neapolitan physician, who flourished the latter part of the 16th century, published, in 1577, at Naples, two small works in Italian, 4to. the one containing "Regulations proper to be observed for preventing the propagation, and diffusion of the plague;" the other, "On the prevention and cure of the measles;" also, "Epistolæ medicinales," Svo. 1582; much commended by Toppius. The author treats largely

largely in them of the cure of *lues venerea*. Haller Bib. Med. Eloy Dict. Hist.

**BRIGANTINE**, a small, light, flat, open vessel, which goes both with sails and oars, and is either for fighting or giving chase.

It has usually twelve or fifteen benches on a side for the rowers, a man and an oar to each bench. Brigantines are principally used by the Corsairs, all the hands aboard being soldiers, and each having his musquet ready under his oar.

But the term is generally used for a merchant-ship with two masts, though mariners of different nations apply it to a peculiar sort of vessel of their own marine. Among English seamen the rigging of a brigantine or brig is little different from the fore and main masts of a ship, the braces of the sails on the main-mast leading forward. The after-main-throw must be served from the mast-head to the dead-eye, to prevent its being chafed by the main-boom and gaff. The after-back-stay is fitted with a tackle, that it may be slackened when the main-sail jibes, or is bowled forward by the boom-pendent and tackle. Brigs carry no main-yard, but a cross-jack-yard.

**BRIGANTINUS LACUS**, in *Ancient Geography*, a lake of Rhetia, now the lake of Constance, which see.

**BRIGANTIUM**, or **BRIGANTIA**, a town of Rhetia, seated on the preceding lake, now Bregentz; which see.—Also, a town of Gallia Narbonensis, E. N. E. of Salinæ, in the country of the Caturiges, near the pass into Italy across the Alps, reckoned in the times of the Romans among the cities of the second order, and exhibiting in the inscriptions, and medals of gold, silver, and copper, which have been found in its vicinity, traces of its ancient importance, now Briançon; which see.—Also, a town of Hispania Citerior, seated at the bottom of a small gulf, north of Magnus Portus, and near it, now Betancois; which see.

**BRIGE-BOTE**, **BRIGG-Lote**, or **BRIGH-Lote**, in *Ancient Law Writers*, signifies a being freed from contributing to the reparation of bridges. See **PONTAGE**. The word is formed of the Saxon *brig*, *abridge*, and *bote*, *compensation*. It is sometimes also written *brugh-bote*, or *bruch-bote*.

**BRIGEUM**, in *Ancient Geography*, a town of Spain, towards the S. W. of Asturica.

**BRIGES**. See **BRIGANTES**.

**BRIGEUIL**, in *Geography*, a town of France, in the department of the Vienne, 8 miles E. of Montmorillon.

**BRIGGS**, **HENRY**, in *Biography*, a celebrated mathematician, was born at Warley Wood, near Halifax, in Yorkshire, about the year 1556; and admitted a scholar of St. John's college, in the university of Cambridge, in 1579; where he took the degree of Bachelor of Arts in 1581, that of Master, in 1585, and was chosen fellow of his college in 1588. His favourite study was the mathematics, in which he excelled, so that in 1592 he was appointed examiner and lecturer in that faculty, and soon after reader of the physico-mathematics, founded by Dr. Linacre. Upon the settlement of Gresham college, in London, he was chosen the first professor of geometry, in 1596; and at this time he constructed a table for determining the height of the pole from the magnetical declination; which table was published in Dr. Gilbert's book, "De Magnete," and by M. Blondelville, in his "Theoriques of the seven Planets;" London, 1602, 4to. In 1609 he commenced an acquaintance with Mr. James Usher, afterwards primate of Ireland, which was maintained by a correspondence for several years. In one of his letters, dated March 1615, he informs him, that he was wholly employed about the noble invention of logarithms, lately discovered; which he explained in his lectures, proposing an alteration in the scale of baron Napier,

from the hyperbolic form to that in which 1 should be the logarithm of the ratio of 10 to 1. This alteration was proposed to the baron in a letter; and, in 1616, Briggs made a journey to Scotland for the purpose of conversing with him on the subject; and he repeated his visit in the following year. The result of their conferences, which were conducted with singular mutual respect, was the adoption of his plan; so that upon his return from the second visit, Briggs published the "Chilias prima," or first thousand, of his logarithms, in 8vo. In 1619, he was appointed the first professor of geometry, at Oxford, in the institution founded by sir Henry Savile; and resigning his professorship at Gresham college, in 1620, he removed to Oxford, and settled at Merton college, where he was soon after incorporated master of arts in that university, and where he continued till his death. Although his time was much occupied in the duties of his office, and in the prosecution of his labours on logarithms, as well as other important subjects, he published, in 1622, a small tract on the "North-west Passage to the South Sea," through the continent of Virginia and by Hudson's bay, occasioned by his being a member of the company trading to Virginia, and reprinted in vol. iii. of Purchas's Pilgrims. His next performance was the extensive and elaborate work, entitled "Arithmetica logarithmica," printed at London, in 1624, folio; containing 30 chiliads of logarithms from 1 to 20,000, and from 90,000 to 100,000, calculated to 14 places of figures, besides the index. To this work he prefixed a large dissertation on the nature, construction, and use of logarithms, and on the method of supplying the intermediate numbers from 20,000 to 90,000. He also completed a table of the logarithmic sines and tangents for the whole quadrant, for every hundredth part of a degree, to 14 places of figures, exclusively of the index, with a corresponding table of natural sines, to 15 places; and of tangents and secants for the same, to ten places. These tables, in which the intermediate logarithms of the numbers from 20,000 to 90,000 were supplied by Mr. Adrian Vlacq, of Targou, in Holland, were published at Gouda, under his care, in 1628; and a translation of this edition was published at London, under the title of "Logarithmicall Arithmetike, &c." in 1631, folio. Mr. Briggs had conceived the design of illustrating at large the use of logarithms in the doctrine of spherical triangles, and proposed to complete it in two books; but he lived to write only the first; leaving the second to the care of his old friend Mr. Henry Gellibrand, who finished the work, and it was published at Gouda, in 1633, folio, under the title of "Trigonometria Britannica," five, "De Doctrina Triangulorum, libri duo, &c." An English translation of it was published in a folio treatise by Mr. John Newton, in 1658, under the same title. In the execution of both these works, Mr. Briggs manifested a very surprising combination of assiduous application and inventive genius; and furnished several important discoveries in the mathematics, which have been usually referred to a later period; such as the binomial theorem (which see); the differential method and construction of tables by differences; the interpolation by differences; angular sections, &c.

This eminent mathematician died January the 26th 1630, in Merton college, and was buried in the choir of the chapel, under the honorary monument of sir Henry Savile, having over his grave only a plain stone, with his name inscribed on it. Dr. Smith, in his "Comment. de Vit. et Stud. H. Briggii," London, 1707, 4to. gives him the character of a man of great probity, easy and accessible to all, free from arrogance, moroseness, envy, ambition, and avarice, and preferring a studious retirement to all the splendid circumstances

of life. The learned Mr. T. Gataker, who attended his lectures at Cambridge, represents him as highly esteemed by all persons skilled in the mathematics, both at home and abroad. Mr. Oughtred calls him "The mirror of the age for excellent skill in geometry." Dr. Barrow, his successor at Gresham college, in his inaugural oration, celebrates his great abilities, skill, and industry, in perfecting Napier's remarkable invention of logarithms; which, without his care and pains, might have remained an imperfect and useless design. Besides the works already enumerated, he wrote many others, the chief of which are the following: 1. "Tables for the Improvement of Navigation," published in the 2d edition of Wright's "Errors in Navigation detected and corrected," London, 1610, 4to. 2. "Euclidis Elementorum, vi. Libri priores, &c." London, 1620, folio. 3. "Mathematica ab Antiquis minus cognita," communicated by the author to Dr. George Hakewill, and published in his "Apologie," London, fol.; and also in the "Appendix to Ward's Lives, No. 9." 4. "Commentaries on the Geometry of Peter Ramus," re-published. 5. "Duæ Epistolæ ad celeberrimum Virum, Christianum Longemontanum," re-published, and containing remarks on a treatise of Longemontanus about squaring the circle, and the other being a defence of arithmetical geometry. 6. "Animadversiones Geometricæ," 4to. 7. "De eodem Argumento," 4to. These two last treatises contain a great variety of geometrical propositions concerning the properties of many figures, with several arithmetical computations relating to the circle, angular sections, &c. 8. "An English Treatise of common Arithmetick," fol. 9. "A Letter to Mr. Clark of Gravesend," dated 1606, and containing a description of Bedwell's ruler, and directions for using it. The four last were in the possession of Mr. W. Jones, father of the late sir William Jones. Ward's Lives of the Professors of Gresham college, p. 120, &c. Biog. Brit. See LOGARITHMS.

BIGGS, WILLIAM, was born at Norwich, which city his father represented in parliament, about the year 1652. At the age of 13 he was sent to Bennet college, in Cambridge, and placed under the care of Dr., afterwards archbishop, Tennison. Having taken his degrees of bachelor, and master of arts, in 1682, he was chosen fellow of the college. He now quitted the university, and went to Montpellier, where he applied diligently to the study of medicine, particularly attending the lectures and demonstrations of Viesiens, in anatomy. On his return from the continent he published, at Cambridge, "Ophthalmographia, sive Oculi, ejusque Partium Descriptio Anatomica, cui accessit nova Visionis Theoria," 12mo. 1576. The year following he took his degree of doctor in medicine; and fixing in London, he was made fellow of the College of Physicians, and of the Royal Society. In 1682 his "Theory of Vision," was published in a separate volume by Hooke. The year following he sent to the Royal Society, a continuation of his Theory of Vision, with answers to some objections that had been made to it. This was printed in N<sup>o</sup> 147 of the Philosophical Transactions. The same acquired by these works brought him into considerable practice, and he was soon after made physician to St. Thomas's hospital. On the revolution he was appointed physician to king William, and continued in great favour and reputation to the time of his death, which happened at Town Malling, in Kent, September 4th, 1704. Dr. Briggs also sent to the Royal Society, "Exemplum Cæcitatæ nocturnæ et Visus duplicis," which is printed in N<sup>o</sup> 159 of their Transactions. In 1685, he published a Latin version of his Theory of Vision, with a commendatory epistle from sir Isaac Newton, affixed to it. In the preface he promises two other works on the subject, viz.

"De Usu Partium Oculi, et de Affectibus ejusdem." These, however, were never printed. Haller Bib. Anat. Gen. Biog.

BRIGHT, TIMOTHY, a physician of eminence of the 16th century, united, as it was not unusual at that time, the clerical with the medical character. He took his degree of doctor in medicine at Cambridge, and, as we learn from Wood, he was made rector of Methley, in Yorkshire, in 1591. He appears by his writings to have had a good share of practice, and to have been well versed in the doctrines of the early Greek writers. The work by which he is principally known is his "Treatise of Melancholy," containing the causes thereof, and reasons of the strange effects it worketh in our minds, with the physical cure, and spiritual consolation for such as have thereto adjoined an afflicted conscience," 12mo. 1586, London. He excuses his writing this treatise, contrary to his usual custom, in the English language, from its being a practical work, and to be read by persons out of the pale of physic. It was also done, he observes, by the Greek and Roman writers. He entertained, however, very lofty ideas of the dignity of the medical character. "No one," he says, "should touch so holy a thing that hath not passed the whole discipline of liberal sciences, and washed himself pure and clean in the waters of wisdom, and understanding." The cure of melancholy is to be attempted by bleeding, by purges and vomits. The reasons for using these remedies are assigned. He had before, viz. in 1583, published "De Dyscrasia Corporis Humani," 8vo. London. He was also author of "Hygieine, seu de Sanitate tuenda, Medicinæ Pars prima," 8vo. 1588. "Therapeutica, hoc est de Sanitate restituenda, Medicinæ pars altera," 8vo. 1589. They were reprinted in 1598, in 16to. Haller Bib. Med.

BRIGHTHELMSTON, or popularly BRIGHTON, in *Geography*, is a celebrated bathing place, market and sea-port town, on the Sussex coast, England. Its name is said to be derived from Brighthelm, a Saxon bishop who lived here, or in the vicinity. The town stands mostly on an eminence, which slopes gently to the south-east, where is that beautiful verdant walk called the Steyn, which is the general promenade of the bathing visitors. To the north and north-east, the town is sheltered by a range of hills, called the South Downs, which, by breaking the current of cold wind from those points, render the atmosphere of the town generally mild and temperate. This, combining with a pleasant beach, and the frequent residence of the Prince of Wales, have given much celebrity to Brighton, and occasioned a considerable resort of company during the summer months. This town is mentioned in the Domesday book, by the name of Bristlemestune; and Mr. Lee, in his history of Lewes, &c. infers that it was a place of some note in the time of Anglo-Roman dynasty, from the quantity of Roman coins, &c. that have been found in its vicinity. The landed property of Brighton is divided into three manors, and was at the conquest possessed by William de Warren. About this period a class of Flemings settled here, and appear to have applied themselves wholly to fishing. The town continued merely a small fishing place till a very recent period. It was provided with a market, by charter obtained through the influence of John de Warren, earl of Surrey, in 1313; and in 1773, an act of parliament was obtained for a daily market. The situation of the town on the coast of the island, opposite France, has subjected it to repeated attacks and much distress in the time of war with that nation. At the commencement of the wanton and impolitic war proclaimed by Henry VIII. A. D. 1513, against Lewis XII. of France, we find that Brighton was plundered by the enemy, who also wreaked their vengeance by burning many of its houses. In consequence of  
this

this event, and the continued terror which prevailed during warfare, the inhabitants resolved to erect fortifications, as some security against future attacks. A block-house for ammunition, &c. walls, gates, and other means of security were therefore provided for the town in 1558, and in 1613. It does not appear that Brighton suffered any thing material from foreign foes after the latter period; but the boisterous ocean now commenced hostilities, and, previous to the year 1675, destroyed twenty-two copyhold tenements under the cliffs, besides a good deal of attached land. In the memorable storms of 1703 and 1705, one hundred and thirteen tenements, with the block-house, walls, gates, &c. were laid ruined by the encroaching waves, which have since made great depredations on this shore. In 1651, Charles II. secretly embarked here for the continent, and thus escaped the vigilant pursuit of his cruel enemies.

In consequence of the repeated damages done by the sea, the inhabitants of Brighton subscribed a large sum of money, and collected much more by bribe, &c. in order to raise some artificial barrier; and early in the last century the cliffs were secured by wooden fences, called groins, projecting towards the sea. This town may attribute its popularity to Dr. Richard Ruffel, who, having settled here, wrote a treatise on the importance of sea-bathing, and successfully recommended the practice in scrophulous, and glandular complaints. He caused a valuable mineral spring at Wick, about one mile from the town, to be inclosed in a basin. A building was afterwards erected over it. The name of Ruffel must be held in grateful remembrance by the inhabitants of all watering places, if they reflect that he was the restorer, and great promoter of that highly important restorative of health—sea-bathing. To commemorate his name, the late Rev. Dr. Manningham wrote the following lines,

“ Clara per omne Ævum Ruffelli fama manebit  
Dum retinet vires unda marina suas.”  
Admiring ages Ruffel's name shall know  
Till ocean's healing waters cease to flow.

The successor of Dr. Ruffel, (Dr. Rhellan) also contributed to bring Brighton into repute by publishing the natural history of the town in 1760.

Brighton is the station for packets between this part of England and Dieppe, &c. Here are several charities, and endowed schools; also a convenient, but small play-house, erected in the year 1789. The church, an ancient structure, stands on a hill, a little north of the town, and contains some curious, and interesting monuments, and inscriptions.

In the east street of Brighton, which forms the western boundary of the Steyn, stands the Marine Pavilion, a residence of his royal highness the prince of Wales. It was finished in the year 1787, and from its eastern front commands a fine view of the sea, &c. Adjoining to this, is an excellent family mansion belonging to the duke of Marlborough; many other elegant houses, handsome rows, squares, and streets, now combine to give Brighton a respectable appearance, and render it attractive, and comfortable for its inhabitants and occasional visitors. It is 54 miles south from London, 8 from Lewes, and contained in 1801, 1427 houses, and 7339 inhabitants. *Ancient and modern History of Lewes and Brighton*, by W. Lee, 8vo. 1795.

BRIGIOSUM, in *Ancient Geography*, BRION, a place of Gaul, situate, according to the Theodosian table, between Avedonacum and Raurana, in the route which leads from Mediolanum to Limonium in Aquitania Secunda.

BRIGITTINS, or BRIDGETTINS, more properly BRIGITTINS, a religious order denominated from their foundress St. Bridget, or Birgit, a Swedish lady, in the four-

teenth century, whom some represent as a queen; but Fabricius, on better grounds, as a princess, the daughter of king Bigerus, legislator of Upland: she is famous for her revelations. The Brigittins are sometimes also called the “Order of our Saviour;” it being pretended that Christ himself dictated the rules and constitutions observed by them to St. Bridget. In the main, the rule is that of St. Augustin; only with certain additions supposed to have been revealed by Christ; whence they also denominate it the “Rule of our Saviour.” The first monastery of the Brigittin order was erected by the foundress, about the year 1344, in the diocese of Lincopen; on the model of which all the rest were formed. The Brigittins profess great mortification, poverty, and self-denial, as well as devotion; and they are not to possess any thing they can call their own, not so much as a halfpenny, nor even to touch money on any account. This order spread much through Sweden, Germany, the Netherlands, &c. In England we read but of one monastery of Briggittins, and this built by Henry V. in 1413, opposite to Richmond, now called Sion-house; the ancient inhabitants of which, since the dissolution, are settled at Lisbon. The revenues were reckoned at 1945*l.* per annum.

BRIGNE, in *Ichthyology*, a name given by the French fishermen to the *Perca punctata* of Linnæus. Lacepede retains this fish in his natural history, under the name of *Centropomus Loup*.

BRIGNAIS, in *Geography*, a town of France, in the department of the Rhone and Loire; 2 leagues S. of Lyons.

BRIGNEUIL *P. Ans.*, a town of France, in the department of the Charente, and district of Confolens; 3 leagues S. E. of Confolens.

BRIGNOLA, a town of Italy, in the state of Genoa; 23 miles N. E. of Genoa.

BRIGNOLLES, a town of France, and chief place of a district, in the department of the Var, seated among mountains, in a fertile country, and celebrated for its fruit, and particularly its plums, which take their denomination from it; 6 leagues N. of Toulon. The town contains 5460, and the canton 12,114 inhabitants: the extent of the territory comprehends 160 kilometres, and 6 communes. N. lat. 43° 24'. E. long. 6° 15'.

BRIGUS, in *Ancient Geography*, a river of Ireland, mentioned by Ptolemy, supposed to be the main channel of the rivers Suire, Nore, and Barrow, which unite below the towns of Ros and Waterford. Collect. de Rebus Hibern.

BRIGUS, *Cape and Bay*, lie in the bay of Capetown, on the east coast of Newfoundland. The cape is high and rugged, and the bay narrow and deep.

BRIHUEGA, in *Geography*, a town of Spain, in New Castile, seated on the river Tajuna, the principal commerce of which consists in wool. This town was taken possession of in 1710, by general Stanhope, with the English army, in behalf of the archduke Charles; was besieged by the duke of Vendome in favour of Philip, king of Spain, and its garrison were obliged to surrender as prisoners of war. It is distant 43 miles E. N. E. from Madrid. N. lat. 41° 0'. W. long. 30° 20'.

BRIL, MATTHEW, in *Biography*, a painter of landscape and history, was born at Antwerp, in 1550, and having acquired the rudiments of his art in that city, went to Rome for further improvement; where he acquired such reputation as to be employed by Gregory XIII. in the Vatican, and pensioned till his death in 1584.

BRIL, PAUL, brother to the preceding, a painter of landscapes, was born at Antwerp, in 1554, and educated in the art of painting, under Daniel Voitchnaus. After his removal to Rome, where he saw the works of Titian and Caracci,

Caracci, he wholly abandoned his Flemish stiff manner, and acquired a more pleasing style, and a charming tone of colour. He succeeded his brother Matthew, both in his employment and pension, but far excelled him in the exercise of his art. The figures in his landscapes were generally painted by Andrew Caracci; and by this circumstance their value was greatly enhanced. His manner of painting is represented as true, sweet, and tender; the touchings of his trees as firm, but delicate; his scenery, situations, and distances are admirable, being commonly taken from nature; and the masses of his light and shadow as strong, yet, very judicious. In the latter part of life, his landscapes were always both beautiful and exquisitely finished. They were frequently painted on copper. The genuine works of Brill, especially those of the large size, are rare, and afford very high prices in every part of Europe. Within a few years one of his landscapes sold in Holland for 16*l.* and another at an auction in London for more than 120 guineas: and they were thought to be cheap. He etched several landscapes in a masterly, spirited style. This master died in 1626. Pilkington and Strutt.

BRILESUS, in *Ancient Geography*, a mountain of Greece in Attica.

BRILL, in *Geography*. See BRIEL.

BRILLAC, a town of France, in the department of the Charente; 5 miles N. of Confolens.

BRILLIANT, in a general sense, something that has a lucid and bright appearance.

BRILLIANT, in the *Manege*, is applied to a horse, that is brisk, high-mettled, and stately, with an elevated neck, fine movements, and excellent haunches, upon which he rises, though ever so little put forward.

BRILLIANTE, *Ital. Music*, spirited, animated, with fire.

BRILLIANTS, a name given to diamonds, of the finest water. See DIAMOND.

BRILON, in *Geography*, a town of Germany, in the circle of the Lower Rhine, and capital of the duchy of Westphalia; having calamine in its neighbourhood; 60 miles E. N. E. of Cologne.

BRIM, the utmost edge of a thing, as of a glass, plate, or the like. The brims of vessels are made to project a little over, to hinder liquors, in pouring out, from running down the side of the vessel. The brimming, or brimming of vessels, was contrived by the ancient potters, in imitation of the supercilium or drip of the cornices of columns; it is done by turning over some of the double matter when the work is on the wheel.

Among florists, the brim of a flower denotes the outward edge of the petala, or that part thereof which turns.

A sow is said to brim, or go to brim, when she takes the boar.

The hart goes to rut, the roe to tourn, the boar to brim.

BRIMBATUS, in *Natural History*, one of the synonyms of *Holothuria pentacta*, which see.

BRIMENIUM, in *Ancient Geography*. See BREMENIUM.

BRIMFIELD, in *Geography*, a township of America, in the county of Hampshire, and state of the Massachusetts, situated E. of Connecticut river, and containing 1211 inhabitants; 34 miles S. E. of Northampton, and 75 W. of Boston.

BRIMOND, in *Ornithology*, one of the synonyms of *Anas histrionica*; or Harlequin Duck.

BRIMSTONE, a common appellation of sulphur.

BRIMSTONE, *flower of*. See FLOWER.

BRIMSTONE marble, a preparation of brimstone, in imitation of marble.

VOL. V.

BRIMSTONE medals, figures, &c. may be cast in the following manner: melt half a pound of brimstone over a gentle fire; with this mix half a pound of fine vermilion, and when you have cleared the top, take it off the fire, stir it well together, and it will dissolve like oil; then cast it into the mould, which must first be anointed with oil. When cool, the figure may be taken out; and, in case it should change to a yellowish colour, you need only wipe it over with *aqua fortis*, and it will look like the finest coral.

BRIN BLANC, Buffon, in *Ornithology*, *trochilus superciliosus*, the supercilious humming-bird.

BRIN BLEU, Buff. is *trochilus cyanurus*, the blue-tailed humming-bird.

BRINDISI, or BRUNDISIUM, in *Geography*, a celebrated city of Naples, in the Terra d'Otranto, situated at the entrance of the Adriatic. It was anciently large and flourishing; and may still be considered as a great city, if the extent of its walls be considered; but the inhabited houses do not occupy above half the inclosure. The streets are crooked and rough, the buildings are poor and ruinous, and it has no very remarkable church or edifice. It is, however, an archbishop's see; but the cathedral, dedicated to St. Theodor, though a work of king Roger, is inferior in point of architecture to many churches founded by that monarch. Of ancient Brundisium, there remains are merely numerous broken pillars, fragments of coarse Mosaic, the column of the light-house, a large marble basin receiving the water from brazen heads of deer, some inscriptions, ruins of aqueducts, coins, and other small articles for furnishing the cabinet of an antiquary. Its castle, built by the emperor Frederic II. to protect the northern branch of the harbour, and repaired by Charles V. is large and stately. The port is double, and is the finest in the Adriatic. The outer part is formed of two promontories, that separate gradually as they advance into the sea, leaving a narrow channel at the base of the angle. The island of St. Andrew, on which Alphonfus I. built a fortress, lies between the capes, and secures the whole road from the fury of the waves. In this triangular space, large ships may ride at anchor. At the bottom of the bay the hills recede in a semi-circular shape, and thus leave room for the inner haven, which encircles the city in the figure of a stag's head and horns, and is supposed to have given rise to the name of Brundisium; which, in the old Messapian language, signified the head of a deer. This interior port is peculiarly beautiful, and admirably adapted to every purpose of trade and navigation. It is very deep, extending in length  $2\frac{1}{2}$  miles, and in its greatest breadth 1200 feet, and is sheltered on every side by the hills and town. In ancient times, the communication between the two havens was marked by lights placed upon columns of the Corinthian order; but of these only one remains entire upon its pedestal. It is of the green and white marble, called "Cipollino;" and its capital is adorned with figures of Syrens and Tritons, intermingled with the Acanthus leaf, and upon it is a circular vase, which formerly held the fire. Near it is another pedestal of similar dimensions, with one piece of the shaft lying upon it, but the rest of the column was sold to the people of Lecce, after the earthquake of 1456, which overturned it, and destroyed great part of the city. The interval between these pillars corresponded to the entrance of the harbour; which is very favourably situated for trade. Here goodness of soil, depth of water, safety of anchorage, and a central position, are all united; and yet it has neither commerce, husbandry, nor populousness. From the obstructions in the channel which communicate with the two havens arise the various evils that desolate this disastrous town. Julius Cæsar began its ruin by his attempt to block

up Pompey's fleet, by diving piles into the neck of land between the two ridges of hills, and throwing in earth, trees, and rains of houses: however, Pompey sailed out and escaped to Greece. In the 17th century, the prince of Taranto sunk some ships in the middle of the harbour, to prevent the royals from entering the port; and these occasioned an accumulation of sand and sea-weeds, which choked up the mouth and rendered it impassable. In 1752, the evil was increased; and from that period the port became a staid, green lake, full of infection and noxious insects; so that no fish but eels could live in it, nor any boat ply except canoes made of a single tree. The low grounds at each end were overflowed with marshes, which produced annually a grievous pestilence, that destroyed or drove away the largest portion of the inhabitants. From 15,000 they were reduced in 1766 to 5000 livid wretches, tormented with agues and malignant fevers: and in 1775 above 1500 persons died during the autumn. Whereas 50 years before the air of Brindisi was esteemed so wholesome and balsamic, that the convents of Naples were accustomed to send their consumptive friars to this city for the recovery of their health. It was at length determined to make some efforts for opening the port afresh, and plans were drawn up for that purpose. By means of machines, and of the labour of galley slaves, the channel has been partly cleared, so as to have two fathom of water, and to admit large boats and a free passage to the sea; and thus the water of the inner port is set in motion, and once more rendered wholesome. The plan, however, was found, in 1780, to fail of complete success, and the canal was again in a great measure choked up, so that the pestilential air prevailed as much as ever. But attempts have been renewed for clearing it again, and opening a passage to the waters, and draining the adjacent marshes; and the inhabitants of Brindisi had a return of health, and are happy in the prospect of returning commerce and opulence. In cleaning the channel, the workmen have found some medals and seals; and they have drawn up many of the piles that were driven in by Cæsar, which are small oaks stripped of their bark, and are found as fresh as if they had been felled only a month, though buried above 18 centuries seven feet under the sand.

The soil about the town is light and good, and produces excellent cotton, with which the Brindisians manufacture gloves and stockings.

It is not easy to ascertain who founded Brundisium, and who were its first inhabitants. Strabo says that it was originally occupied by the Cretans, who landed here from Gnoffus with Theseus. Others say that it was founded by the Japyges. The Romans took early possession of a harbour so convenient for their enterprizes against the nations dwelling beyond the Adriatic. They sent a colony hither, A. U. C. 509. Pompey fought an asylum in this city, and from hence fled to Greece. Here Octavius first assumed the name of Cæsar, and he concluded one of his short-lived treaties of peace with Antony. Brundisium was celebrated as the birth-place of the tragic poet Paenivius, and became remarkable for the death of Virgil. The barbarians, who ravaged every corner of Italy, did not spare so rich a town; and in 836, the Saracens gave a finishing blow to its fortunes. The Greek emperors were desirous of restoring it to its ancient strength and splendour, if the Normans had allowed them opportunity; but after obstinate struggles, and varieties of success and defeat, they were finally expelled Brindisi by William I. The crusades, which drained other kingdoms of their wealth and subjects, contributed to enrich and establish this city, as it was one of the ports where pilgrims and warriors took shipping. It was also benefited by the residence of the emperor Frederick,

whose frequent armaments for the holy land required his presence at this place of rendezvous. At length the loss of Jerusalem, the fall of the Grecian empire, and the ruin of the Levant trade, after the Turks had conquered the east, reduced Brindisi to a state of inactivity and desolation, from which it has never been able to emerge. N. lat. 40° 52'. E. long. 18° 5'. Swinburne's Travels into the Two Sicilies, vol. ii.

BRINDLEY, JAMES, in *Biography*, a person of extraordinary genius for mechanical inventions, and distinguished by his skill in planning and conducting inland navigation, was born at Tautel, in the parish of Wormhill, and county of Derby, in the year 1716. His parents possessed a small freehold, the income of which his father dissipated by field diversions, and by associating with persons above his rank; and thus the education of the son was wholly neglected. Urged by the necessities of his family, he contributed to its support till he was nearly 17 years of age, by that kind of labour which, in country places, is assigned to the children of the poor; but at this age he bound himself apprentice to a wheelwright, whose name was Bennet, near Macclesfield in Cheshire, and soon became expert in his business, discovering, at the same time, a singular genius for the extension and improvement of the mechanic arts in general. Accordingly, in the early period of his apprenticeship, he performed several parts of the business without any instructions from his master, and gave so much satisfaction to the millers who employed him, that he was always consulted in preference to his master or any other workman; and before the expiration of his servitude, when Mr. Bennet, by his age and infirmities, became unable to work, he carried on the business with reputation, and provided a comfortable subsistence for the old man and his family. About this time his master was employed in constructing an engine paper-mill, the first of the kind that had been attempted in these parts; but as he was likely to fail in the execution of it, Mr. Brindley, without communicating his design, set out on Saturday evening after the business of the day was finished, and having inspected the work, returned home on Monday morning, after a journey of 50 miles, informed his master of its defects, and completed the engine to the entire satisfaction of the proprietors. Mr. Brindley afterwards engaged in the mill-wright business on his own account, and soon acquired the reputation of a most ingenious mechanic. The fame of his inventions and contrivances was in a little while spread far beyond his own neighbourhood; and in 1752, he was employed to erect a curious water-engine at Clifton in Lancashire, for the purpose of draining coal-mines, which had before been performed at an enormous expence. The water for the use of this engine was conveyed from the river Irwell by a subterraneous channel, nearly 600 yards long, which passed through a rock; and the wheel was fixed 30 feet below the surface of the ground. In 1755, he constructed a new silk mill at Congleton in Cheshire, according to the plan proposed by the proprietors, after the execution of it by the original undertaker had failed; and in the completion of it he added many new and useful improvements. He introduced one contrivance for winding the silk upon the bobbins equally, and not in wreaths; and another for stopping, in an instant, not only the whole of this extensive system, in all its various movements, but any individual part of it at pleasure. He likewise invented machines for cutting the tooth and pinion wheels of the different engines, in a manner that produced a great saving of time, labour, and expence. He also introduced into the mills, used at the potteries in Staffordshire for grinding flat-stones, several valuable additions, which greatly facilitated the operation. In 1756, he constructed

fructed a steam engine at Newcastle-under-Line, upon a new plan, which evinced his genius for invention and contrivance. The boiler was made with brick and stone, instead of iron plates, and the water was heated by fire-places, so constructed as to save the consumption of fuel. He also introduced cylinders of wood instead of those of iron, and he substituted wood for iron in the chains which worked at the end of the beam. But in these and similar contrivances for the improvement of this useful engine, he was obstructed by interested engineers; and his attention was diverted from the prosecution of them by the great national object of "Inland Navigation." In planning and executing canals his mechanical genius found ample scope for exercise, and formed a sort of distinguishing era in the history of our country. However, envy and prejudice, and an attachment to established customs, raised a variety of obstacles to the accomplishment of his designs and undertakings; and if he had not been liberally and powerfully protected by the duke of Bridgewater, at the commencement of the business, his triumph over the opposition with which he encountered must have been in a very considerable degree obstructed and retarded. The noble duke possessed an estate at Worsley, about 7 miles from Manchester, rich in mines of coal, from which he derived little or no advantage, on account of the expence which attended the conveyance of this article by land carriage to a suitable market for consumption. Fully apprized of the utility of a canal from Worsley to Manchester, he consulted Mr. Brindley on the subject; who, having surveyed the country, declared the scheme to be practicable. Accordingly, his grace obtained, in the years 1753 and 1759, an act of parliament for this purpose; and Mr. Brindley was employed in the conduct and execution of the undertaking, the first of the kind ever attempted in England, with navigable subterraneous tunnels and elevated aqueducts. At the commencement of the business it was determined, that the level of the water should be preserved without the usual obstructions of locks. But in accomplishing this object, many difficulties occurred; and it was soon found that it would be necessary to carry the canal over rivers and many deep vallies, and that it would not be easy to obtain a sufficient supply of water for completing the navigation. However, Mr. Brindley, patronized by the duke, and furnished with ample resources, persevered, and at length conquered all the embarrassments, occasioned by the nature of the undertaking, and by the passions and prejudices of individuals. Having completed the canal as far as Barton, where the river Irwell is navigable for large vessels, he proposed to carry it over that river, by an aqueduct 30 feet above the surface of the water. This was considered as a chimerical and extravagant project; and an eminent engineer, who was consulted on the occasion, ridiculed the attempt. "I have often heard," says he, "of castles in the air, but never before was shewn where any of them were to be erected." The duke of Bridgewater was not discouraged; but confiding in the judgment of Mr. Brindley, empowered him to prosecute the work; and in about 10 months the aqueduct was completed. This astonishing work commenced in September 1760, and the first boat sailed over it the 17th of July, 1761. The canal was then extended to Manchester, where Mr. Brindley's ingenuity in diminishing labour by mechanical contrivances was exhibited in a machine for landing coals upon the top of a hill. It is no wonder, that an object, so curious in itself, and of such national importance, should have attracted general attention. See CANAL.

The duke of Bridgewater, having found by experience the utility of these inland navigations, extended his views to Liverpool; and obtained, in 1762, an act of parliament for

branching his canal to the tide-way in the Mersey. This part is carried over the river Mersey and Bollan, and over many wide and deep vallies. Over the vallies it is conducted without a single lock; and across the valley at Stretford, through which the Mersey runs, a mound of earth, raised for preserving the water, extends nearly a mile. In the construction of this mound Mr. Brindley displayed his mechanical genius, by rendering the canal itself subservient to his design, and by bringing the soil, necessary for his purpose, along the canal in boats of a peculiar form, which were conducted into caissons or cisterns; so that on opening the bottoms of the boats, the earth was deposited where it was wanted, and the valley was thus elevated to a proper level for continuing the canal. Across the Bollan the ground was raised by temporary locks, formed of the timber used in the construction of the caissons just mentioned. In the execution of every part of the navigation, Mr. Brindley displayed singular skill and ingenuity; and in order to facilitate his purpose, he produced many valuable machines. His economy and foresight, in every part of the work, deserve to be particularly noticed, and they are peculiarly discernible in the stops, or flood-gates, that are fixed in the canal, where it is above the level of the land. These stops are so constructed, that if any of the banks should give way and occasion a current, the adjoining gates will rise merely by that motion, and prevent any other part of the water from escaping, besides that which is near the breach between the two gates.

Encouraged by the success of the duke of Bridgewater's undertakings, a subscription was entered into by a number of gentlemen and manufacturers in Staffordshire, for constructing a canal through that country, in pursuance of a scheme which had been suggested some years before; and Mr. Brindley was engaged to make a survey from the Trent to the Mersey. Upon his report that a canal for connecting these rivers was practicable, application was made to parliament, in 1765, for an act to this purpose, which was obtained in the same year. Accordingly, in 1766, this canal, "The Grand Trunk Navigation," was begun; and it was conducted, with great spirit and success, under the direction of Mr. Brindley, as long as he lived. For a further account of this canal, see CANAL.

The next object which engaged the attention of Mr. Brindley was the construction of a canal from the Grand Trunk, near Haywood in Staffordshire, to the river Severn near Bewdley, by means of the port of Bristol which was connected with the ports of Liverpool and Hull. This canal, about 46 miles in length, was completed in 1772. His next undertaking was the survey and execution of a canal from Birmingham, which should unite with the Staffordshire and Worcestershire canal near Wolverhampton. This navigation, which is 26 miles in length, was finished in about three years. Our engineer advised the proprietors, in order to avoid the inconvenience of locks, and for the more effectual supply of the canal with water, to have a tunnel at Smethwick; but his advice was disregarded; and the managers have since been under a necessity of erecting two steam-engines. The canal from Droitwich to the river Severn, for the conveyance of salt and coals, was executed by Mr. Brindley; and he also planned the Coventry navigation, which was for some time under his direction; but a dispute arising about the mode of executing it, he resigned his office. Some short time before his death, he began the Oxfordshire canal, which, uniting with the Coventry canal, serves as a continuation of the Grand Trunk navigation to Oxford, and thence by the Thames to London. The last undertaking, in which Mr. Brindley engaged, was the canal from Cheshamfield to the river Trent at Stockwith. He

surveyed and planned the whole, and executed some miles of the navigation, which was finished by his brother-in-law, Mr. Henthall, in 1777. Such was the established reputation of Mr. Brindley, that he was consulted on a variety of occasions; and, indeed, few works of this kind were undertaken without his advice.

He was employed by the city of London, to survey a course for a canal from Sunning, near Reading in Berkshire, to Monkey island, near Richmond; but, on account of the opposition of the land-owners, this plan was defeated. He had also, for some time, the direction of the Calder navigation; but, on account of a difference among the commissioners, he declined any further concern in it. In 1766, he laid out a canal from the river Calder, at Cooper's bridge, to Huddersfield in Yorkshire, which has since been executed. In 1768, he revised the plan for the inland navigation from Leeds to Liverpool; but, though he was appointed engineer for conducting the works, his other engagements obliged him to decline this employment. In the same year, he planned a canal from Stockton, by Darlington, to Winstan, in the bishopric of Durham. Three plans of the like kind were formed by him in 1769; one from Leeds to Selby; another from the Bristol channel, near Uphill in Somersetshire, to Glattonbury, Taunton, Wellington, Tiverton, and Exeter; and a third from Langport, in the county of Somerset, by way of Ilminster, Chard, and Axminster, to the south channel at Axmouth, in the county of Devon. In 1770, he surveyed the country, for a canal from Andover, by way of Stockbridge and Rumsley, to Redbridge near Southampton; and, in 1771, from Salisbury, by Fordingbridge and Ringwood, to Christchurch. In 1772 he performed the same office, for a similar navigation from Preston to Lancaster, and from thence to Kendal in Westmoreland. He also planned a canal for joining that of the duke of Bridgewater at Runcorn, near Liverpool, in the execution of which scheme he proposed to have constructed an aqueduct over the river Mersey, at a place where the tide flows to the height of 14 feet. He also surveyed the county of Chester, with a view to a canal from the Grand Trunk to the city of Chester. He revised the plan for joining the Forth and the Clyde, and proposed some considerable improvements, which were afterwards adopted by the managers. A canal was also laid out by him for uniting that of Chesterfield, by the way of Derby, with the Grand Trunk at Swarkestone. He was also consulted in the various plans for the draining of the low lands in different parts of Lincolnshire, and the isle of Ely. He gave the corporation of Liverpool a plan for clearing their docks of mud, which has been practised with success; and he proposed a method, which has also succeeded, of building walls against the sea without mortar. The last of his inventions was an improved machine for drawing water out of mines, by a losing and gaining bucket, which he afterwards employed with advantage in raising coals.

When difficulties occurred in the execution of any of his works, Mr. Brindley had no recourse to books, or to the labours of other persons; but as all his resources were those of his own inventive mind, he generally retired to bed, and lay there one, two, or three days, till he had devised the expedients which he needed for the accomplishment of his objects. He then got up, and executed his design without any drawing or model, which he never used, except for the satisfaction of his employers. His memory was so tenacious, that he could remember and execute all the parts of the most complex machine, provided he had time, in his previous survey, to settle, in his mind, the several departments, and their relations to each other. In his calcu-

lations of the powers of any machine, he performed the requisite operation by a mental process, in a manner which none knew but himself, and which, perhaps, he was not able to communicate to others; and after certain intervals of consideration, he noted down the result in figures; and then proceeded to operate upon that result, until at length the complete solution was obtained, which was generally right.

Some have said that Mr. Brindley had been so much neglected in early life, as never to have learned to read and write; and it has also been affirmed, that his aspect was that of an idiot, and his language mean, obscure, and almost unintelligible. But neither of these facts is well founded. Although he read little, and wrote less, he had frequent occasion for correspondence with his friends and employers. His countenance was sensible and animated; but as he was unostentatious in his outward appearance, his dress was always plain. His conversation, on occasions of importance, and among his intimate friends, was instructive and interesting; and enlivened by the singular genius, and the benevolent and patriotic spirit, for which he was distinguished, and which gave energy to his pursuits. His want of literature, indeed, compelled him to cultivate, in an extraordinary degree, the art of memory; and in order to facilitate the revival, in his mind, of those visible objects and their properties, to which his attention was chiefly directed, he secluded himself from the external impressions of other objects, in the solitude of his bed. Dr. Wallis, who was eminently distinguished by the tenaciousness of his memory, so that he could extract the cube root of any number to 100 places of figures in his mind, availed himself, for this purpose, of a similar seclusion. Mr. Brindley's incessant attention to important and interesting objects, precluded him from participating in any of the ordinary amusements of life, and indeed, prevented his deriving from them any pleasure. Accordingly, though he was once prevailed upon by his friends in London to see a play, he found his ideas so much disturbed, and his mind rendered so unfit for business, as to induce him to declare, that he would not on any account go to another. It is not improbable, however, that by indulging an occasional relaxation, remitting his application, and varying his pursuits, his life might have been prolonged, and his usefulness extended. Whereas the multiplicity of his engagements, and the constant attention which he bestowed on them, brought on a hectic fever, which continued, with little or no intermission, for some years, and at last terminated his useful and honourable career on the 27th of September, 1772, in the 56th year of his age, at Turnhurst, in Staffordshire. He was buried at New Chapel, in the same county.

The talents of Mr. Brindley were of a singular kind; and under the patronage of his grace the duke of Bridgewater, they had an opportunity of being unfolded and exercised to their full extent, in the execution of works new to this country, and which will perpetuate his fame to future generations. The brief recital which has been given of his stupendous undertakings, will enable the reader to form some judgment of this extraordinary person. Such was the enthusiasm with which he engaged in all schemes of inland navigation, that he seemed (if we may credit report) to regard all rivers with contempt, when compared with canals. To this purpose, it is said, that in an examination before the house of commons, when he was asked by a member, for what purpose he apprehended rivers were created? he replied, after some deliberation, "to feed navigable canals." As to his private character, those who knew him well, and had an opportunity of conversing familiarly with him, respected

him in a high degree "for the uniform and unshaken integrity of his conduct; for his steady attachment to the interest of the community; for the vast compass of his understanding, which seemed to have a natural affinity with all grand objects; and, likewise, for many noble and beneficial designs, constantly generating in his mind, and which the multiplicity of his engagements, and the shortness of his life, prevented him from bringing to maturity." *Biog. Brit.*

**BRINDONES**, in *Botany*, a name given to the fruit of the mangoutan of the Celebes Islands, the *GARCIANA CELEBICA* of Linnæus. In the old French Encyclopedic, it is erroneously conjectured to be a species of LIMONIUM.

**BRINE**. This term is used technically for a solution in water of common salt, or any saline liquid in which this salt is predominant. Thus the native springs of salt water are called *brine-springs*; the sea water is termed *brine*, &c.

*Leach*, or *leech-brine*, is the mother water left in the pans during the manufacture of salt, after most of the pure salt has been obtained by boiling down. It consists of muriat of soda mixed with the earthy muriats, and other impurities of natural brine.

For every thing relating to the manufacture of salt from brine, see *MURIAT of Soda*.

**BRINE** also denotes a pickle pregnant with salt, wherein things are steeped to keep.

**BRINE-pans**, the pits wherein the salt-water is retained, and suffered to stand, to bear the action of the sun, whereby it is converted into salt. There are divers sorts of salt-pans, as the water-pan, second-pan, sun-pan; the water being transferred orderly from one to another.

**BRINE-pit**, in *Salt-making*, the salt spring from whence the water to be boiled into salt is taken. There are of these springs in many places; that at Namptwich, in Cheshire, is alone sufficient, according to the account of the people of the place, to yield salt for the whole kingdom; but it is under the government of certain lords and regulators, who, that the market may not be overstocked, will not suffer more than a certain quantity of the salt to be made yearly. See *PIT*.

**BRINE-salt**. See *SALT*.

**BRINE-springs**. See *SALT* and *SPRING*.

**BRINEK**, or *BRINETI*, in *Astronomy*, the bright star in the constellation *Lyra*; more frequently called *Lucida Lyre*.

**BRINGERS-UP**, in a *battalion*, are the whole last rank of men in it, or the hindmost man in every *file*.

**BRINGING-IN a horse**, in the *Manege*, is the keeping down his nose, when he boars, and tosses it up to the wind. A horse is *brought-in* by a strong hard branch.

**BRING-TO**, in *Seamanship*, to check, or retard, the velocity, or rate, of sailing of a ship, by arranging the sails in such a manner, that they shall counteract each other, and thereby prevent her either from advancing a-head, or getting stern-way. In this situation the ship is said to *lie-to*, or to *lie-by*. Bringing-to is generally used to detain a ship in any particular station, in order to wait the approach of some other vessel that may be advancing towards her; or in waiting for a boat from the shore; or, until there be sufficient depth of water to admit the vessel to sail into a tide-harbour.

**BRING-up**, an expression used for coming to an anchor.

**BRING by the lee**, is when by bad steering, or otherwise, a ship's head moves from the wind, which she brings successively altern, and then so far round upon that which was formerly the lee side, that the sails are laid aback.

**BRINJAN**, in *Geography*, a town of Hindostan, in the country of Boglana; 12 miles N.N.W. of Nassuk.

**BRINJAUN**, or *BRINJAM*, a town in the peninsula of

India, in the Travancore country, on the coast of Malabar; 25 miles W. of Travancore. N. lat. 8° 19'. E. long. 77° 5'.

**BRINING of Grain**, in *Rural Economy*, the practice of immersing it in some sort of liquor or pickle, with the intention of preventing the smut, or other diseases. Steeps, or pickles for this use, are prepared in various ways, and with very different sorts of materials; but chiefly by dissolving saline substances in water, urine, or some other fluid, till they are very strongly impregnated with them. The grain, after having remained in these steeps a sufficient length of time, as six, eight, or ten hours, or more, according to circumstances, and the light part that swims on the surface removed, is taken out and dried by proper draining, and the sifting of a little lime in a fine powdery state over it. The sowing should be performed as soon as possible after this has been done, as the grain is liable to be soon injured by its being delayed. How far the use of steeps or brining grain may be advantageous, or whether such practices have any other utility than that of hastening the vegetation of the seed after it is committed to the earth, has not yet been well ascertained by experiment. See *STEEP*.

**BRINING of Hay**, the practice of blending salt with hay in the operation of stacking, in order to preserve it more effectually, and render it more palatable to animals. It is chiefly had recourse to when hay has been much injured by rain in making. The practice is said to prevail in America.

**BRINKE**, in *Geography*, a town of Germany, in the circle of Westphalia, and bishopric of Osnabruck; 16 miles S.E. of Osnabruck.

**BRINN**. See *BRUNN*.

**BRINON les Allemands**, a town of France, in the department of the Nièvre, and chief place of a canton, in the district of Clamecy; 10 miles S. of Clamecy. The town contains 314, and the canton 9959 inhabitants; the territory includes 142½ kilometres, and 26 communes.

**BRINON l'Archêvêque**, a town of France, in the department of the Yonne, and chief place of a canton, in the district of Joigny; 4 leagues N. of Auxerre. The town contains 2372, and the canton 12395 inhabitants: the territory comprehends 257½ kilometres, and 11 communes.

**BRINS**, a town of Bohemia, in the circle of Boleslaw; 3 miles S. S. E. of Gabl.

**BRIOCA**. See *BRUEGA*.

**BRIOLLAY**, a town of France, in the department of the Maine and Loire, and chief place of a canton, in the district of Sagre. The place contains 849, and the canton 6143 inhabitants; the territory includes 142½ kilometres, and 8 communes.

**BRION**, a town of France, in the department of the Two Seves, and district of Thouars; 1½ league from Thouars.—Also, a town of France, in the department of the Lozère, and district of Marvejols; 3 leagues W. S. W. of St. Chely.

**BRION island**, one of the Magdalen islands, in the gulf of St. Lawrence, 5 or 6 leagues W. from the Bird islands. N. lat. 47° 50'. W. long. 60° 47'.

**BRIONNE**, a town of France, in the department of the Eure, and chief place of a canton, in the district of Bernay, seated on the Rille, 3½ leagues N. N. E. of Bernay. N. lat. 49° 51'. E. long. 0° 51'.

**BRIONNI**, a small island in the gulf of Venice, near the coast of Istria. N. lat. 45° 10'. E. long. 13° 51'.

**BRIONY**, in *Botany*. See *BRONIA*.

**BRIORD**, in *Geography*, a town of France, in the department of the Ain; 10 miles S. of Belley.

BRIOB-TOMBOT, a town of France, in the department of the Oise; 15 miles N. of Beauvais.

BRIOUDE, a town of France, and principal place of a district in the department of the Upper Loire, seated on the river Allier, over which is a bridge of stone, which is regarded as a Roman work. The town contains 5586, and the district 15597 inhabitants: the territory comprehends 265 kilometres, and 19 communes. This is called "Old Brioude," by way of distinction from "Brioude Gbfe," which lies also near the river Allier, in which is a collegiate church, called St. Julian. N. lat. 45° 14'. E. long. 5° 25'.

BRIOUX, a town of France, in the department of the Two Seves, and chief place of a canton, in the district of Melle; 2 leagues S. W. of Melle. The place contains 742, and the canton 9225 inhabitants; the territory includes 15 kilometres, and 22 communes.

BRIOUZE, a town of France, in the department of the Ome, and chief place of a canton, in the district of Argentan; 4½ leagues W. of Argentan. The town contains 940, and the canton 9350 inhabitants: the territory includes 162½ kilometres, and 17 communes.

BRIQUEBEC, a town of France, in the department of the Channel, and chief place of a canton, in the district of Valognes; 2½ leagues W. of Valognes, and 3¼ S. of Cherbourg. The town contains 4000, and the canton 11,108 inhabitants: the territory comprehends 175 kilometres, and 11 communes.

BRIQUENAY, a town of France, in the department of the Ardennes, and district of Vouziers; 4 miles N. of Grandpré.

BRIQUERAS, a town of Piedmont, in the valley of Lucerne; 4 leagues S. of Pignerol. N. lat. 44° 41'. E. long. 7° 24'.

BRISACH, or BREYSACH, *Old*, a town of Germany, formerly the capital of Brisgaw, seated on the Rhine, and partly upon an eminence, which commands the adjacent champaign country. The bridge of boats over the Rhine at this place was demolished some years ago, and the passage altered to a ferry. It was formerly an imperial city, but mortgaged in 1331, by the Emperor Lewis of Bavaria, to Otto duke of Austria, and the mortgage was ratified by Charles V. in 1548. This place had formerly a fortress, which was taken by the French in 1688, but restored in 1697, and again taken in 1703, but surrendered in 1715. The fortifications were razed in 1741, by order of Maria Theresa, queen of Hungary and Bohemia, and the town became an open place. N. lat. 48° 51'. E. long. 7° 49'. See BRISGAW.

BRISACH, *new*, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the district of Colmar, situate about a mile from the west side of the Rhine, and opposite to the old town. It was built by Lewis XIV. and fortified by M. Vauban; it stands entirely upon the plain, and its streets are so regular that in the great market all the gates of the town are to be seen. The town contains 1682, and the canton 7925 inhabitants: the territory comprehends 170 kilometres, and 16 communes. The road from this place to Basle, 9 leagues N. distant from it, is very pleasant, and commands a prospect on the left hand beyond the Rhine into the margraviate of Baden. N. lat. 48° 5'. E. long. 7° 46'.

BRISAGO, a town of the Milanese, seated on the borders of the Italian baillages, and near the west bank of the Lago Maggiore or lake of Locarno, and 5 miles S. of Locarno. N. lat. 45° 55'. E. long. 8° 33'.

BRISAU, or BRZEZOWA, a town of Moravia, in the circle of Olmutz, 6 miles S. of Zwitau.

BRISBANE, JOHN, in *Biography*, originally of Kelfo, in

Scotland, practised medicine several years, towards the end of the last century in London, and published in 1769, "Anatomy of Painting, or a short and easy Introduction to Anatomy, consisting of tables of Albinus, with linear figures on a smaller scale, including Albinus's figures of the Uterus," fol. London. Also "select Cases in the practice of Medicine," 8vo. 1772, London. Among these, are interspersed some useful practical observations. Haller. Bibl.

BRISÉ, in *French Amory*, signifies broken, and implies an ordinary with part of it broken off. The *English* blazon it with the word coupé.

BRISEIS, in *Entomology*, a species of PAPILIO, the wings of which are dentated, brown, and glossed with shining green: on the anterior wings two ocellated spots, and a white band: two black spots beneath. Inhabits Germany. Linn. Fabr. &c.—This is *Papilio Jantho* of Pallas.

BRISIS, in *Fabulous History*, the wife of Mynes king of Lynessa, who was taken captive by Achilles, after he had taken the city and killed her husband. But when Agamemnon robbed him of this object of his ardent affection, she became the accidental cause of innumerable disorders in the Grecian army. Achilles, enraged, retired to his tent; and till the death of Patroclus refused to fight against the Trojans.

BRISCELIO, in *Geography*. See BERSILLO.

BRISGAW, a district of Germany, in the circle of Suabia, situated on the east side of the Rhine, by which it is separated from France; a portion of it was formerly possessed by the marquis of Baden, and the principal part belonged to the house of Austria; but by the 18th article of the treaty of Campo Formio in 1797, confirmed by the 4th article of the treaty of Luneville, in 1801, his majesty the emperor, king of Hungary and Bohemia, bound himself to cede to the duke of Modena, as an indemnification for the territory which that prince and his heirs possessed in Italy, the Brisgaw; which he is to possess upon the same conditions as those, in virtue of which he possessed the Modenese.

BRISIACUS, *Mons*, in *Ancient Geography*, a town on the right or east side of the Rhine, now Old Brisach.

BRISICH, or BREYSICH, in *Geography*, a town of Germany, in the circle of Westphalia, and duchy of Juliers; 16 miles N. N. W. of Coblenz.

BRISIGUELA, a town of Italy, in the province of Romagna, belonging to the state of the church; 6 miles from Faenza.

BRISITINO, a town of Naples, in the province of Capitanata; 11 miles S. S. W. of Manfredona.

BKISK, a town of Germany, in the circle of Upper Saxony, and Uckermark of Brandenburg; 8 miles S.S.W. of Beeskow.

BRISKET, in the *Manege*, that part of a horse extended from the two shoulders to the bottom of the chest.

BRISKOW, a town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg; 4 miles S. of Franckfort on the Oder.

BRISSAC, a town of France, in the department of the Maine and Loire, and district of Angers; 2¾ leagues S.S.E. of Angers.

BRISSEAU, PETER, in *Biography*, after receiving his degree of doctor in medicine, at Montpellier, went to Paris, where he acquired considerable reputation by his practice. In 1677, he was admitted of the college of physicians at Tournay. He was soon after appointed by Lewis XIV. physician to the military hospitals at Tournay and Mons; and on Tournay's being taken by the allies in 1709, he removed to Doway, where he died September 10th, 1717, aged 86 years. Brisseau was author of several works; but what acquired him

him most credit, was his "Nouvelles Observations sur la Cataracte," Tournay, 1706, 12mo. continued in 1708, by "Suite des Observations sur la Cataracte." He was the first who demonstrated, that the cataract is a disease of the crystalline lens. Lafuier, and Quarré, who held the same opinion, had not dissected any eyes, affected with the disease, or published any thing upon the subject; nevertheless, the College of Surgeons at Paris refused to give Brisseau the credit of the discovery. "Observations faites par M. B." 12mo. 1706. These are all on surgical subjects. He cured a soldier of a wound in the skull, through which a portion of brain had escaped. Two earlier publications by him were "Dissertations on Bleeding," and on "Sympathetic Motions." Haller. Bib. Med. et Chirurg.

BRISSEAU, MICHAEL, son of Peter, and born at Tournay, was admitted member of the college of physicians there in 1696. He thence removed to Doway, where he was made first professor in medicine, and physician to the military hospital. He wrote six chirurgical observations, which are printed with Palfins' works in surgery and anatomy. Haller. Bib. Anat. Eloy Dict. Hist.

BRISSOIDES, in *Natural History*. See ECHINUS.

BRISSON, BARNABAS, in *Biography*, an eminent French lawyer and man of letters, was the descendant of a respectable family at Fontenai-le-Compté, in Poitou, and entered at the bar of the parliament at Paris. His reputation was such, that Henry III. advanced him to several honourable offices, and in 1580, to the post of president *à mortier*; and conceiving very highly of his talents and learning, employed him in various negotiations, and sent him as his ambassador to England. Upon his return he commissioned him to make a collection of all his own ordinances, and those of his predecessors, which he completed with great expedition. The principal of his other learned works are: "De Verborum, quæ ad Jus pertinent, Significatione," fol.; "De Formulæ et Solemnibus Populi Romani Verbis," fol. Paris, 1583, a work of authority and frequently cited; "De Regio Perfarum Principatu," 1580, frequently printed, and last at Straßburg, in 1710, with the notes of Sylburg and Lederlin; "De Jure Connubiorum Liber singularis," Paris, 8vo. 1564; "Opera Varia," 4to. 1606. The termination of Brisson's life was disastrous; for having continued at Paris, during its siege by Henry IV. in 1589, he was compelled by the league to assume the place of first president of the parliament, instead of Achilles de Harlay, then a prisoner in the Bastille. In consequence of his official conduct, the faction of sixteen brought an accusation against him and some others, members of the parliament; and he was hanged in November, 1591. Several persons were afterwards punished for the concern they had in his death. His public principles are variously represented: some extolling him as a good citizen, others representing him as a man of ambition, who fell a victim to his desire of rising to consequence by means of faction. *Nouv. Dict. Hist.*

BRISSON, ST., in *Geography*, a town of France, in the department of the Loiret, and district of Gien; 4 miles S. of Gien.

BRISSOT, PETER, in *Biography*, was born at Fontenai le Comté, in the year 1478, and made doctor in medicine at Paris, in 1514. He now went to Lisbon, where he was soon distinguished for his superior learning, and ability in his profession. As he read the Greek fathers in medicine, in their original language, he was very free in his censures on the Arabian writers, who had formulated, and disfigured the Greek text, as to make it extremely difficult to discover the authors' opinions, in their translations. This freedom excited the indignation of the followers of the Arabians, which blazed out with great fury,

on Brissot's publishing, in 1525, "De Vena fecunda tum in pleuritie, tum in aliis viscerum inflammationibus, libellus apologeticus," Paris, 4to. As he maintained, in this work, that blood might be drawn from the side affected in pleurisy, which was contrary to the then prevailing opinion, he was considered as an innovator, and treated as a man holding heretical opinions. The work was reprinted in 1533, with some additions by the author, and in 1622, by R. Moreau, with other pieces on the same subject. *Haller. Bib. Med.*

BRISSET, JAMES-PETER, one of the principal agents in the late French revolution, and head of a party distinguished by his name, was the son of a "traitcur," or master of an eating-house, and born in 1754 at Chartres, in the Orleanois. The circumstances of his father enabled him to give his children a good education; and James Peter was destined for the bar. But having served five years as a clerk, with a view to the profession of the law, he abandoned the prosecution of it with disgust, and determined to devote himself to literature and the sciences. At this time, he formed an acquaintance with some English travellers, learned their language, and perused some English books; and to these circumstances he attributes the character and fortune of his future life. Attached, as he professes himself to have been, to the language and customs of England, he changed the appellation of "de Ouarville," which he derived from that of a village where his father possessed some landed property, designed for him, into "de Warville," after the English orthography; and he is thus denominated in his writings. As he had incurred his father's displeasure by relinquishing the profession of the law, his resources failed him; and he was indebted to the bounty of his friends for those supplies, which enabled him to prosecute his studies at Paris, which he continued to do for two years. At the close of this period, he entered into an engagement with the proprietor of a popular paper, entitled "Le Courier de l'Europe," and printed at Boulogne, which was committed to his superintendence. When this paper was discontinued by the interference of government, Brisset returned to Paris; and soon after, viz. in 1780 and 1781, he assumed, in a more direct and regular manner than he had hitherto done, the profession of an author. Revolting, as he says, from the instant in which he began to reflect, against religious and political tyranny, he determined to devote his whole life to the extirpation, both of the one and the other; but as the former had fallen under the reiterated strokes of Rousseau, Voltaire, Diderot, and d'Alembert, he had the vanity to think, that the demolition of the latter was an honour reserved for himself. In this work, he seems to have engaged with principles and views, resembling those of his predecessors; and that his intention might not be misunderstood, he avows his purpose to destroy that political idol, which, under the name of "Monarchy," practised the most violent despotism; and, in order the more effectually to accomplish his aim, he began with an attack on certain abuses in government, which needed reformation, and which, with judgment and moderation, might have been corrected, without destroying government itself. Accordingly, he began with directing the attention of his countrymen to the subject of criminal jurisprudence; and, with this view, he published, in 1780, his "Theory of criminal Laws," in 2 vols. 8vo, which was soon followed by two discourses on collateral subjects, which gained the prize in 1782 at the academy of Chalons-sur-Marne. He also began a work, which was afterwards completed in 10 vols. entitled "A philosophical Library of the criminal Laws;" and he published a volume "Concerning Truth," and "Thoughts on the Means of attaining Truth in all the Branches.

Branches of human Knowledge," which he intended, merely as an introduction to a work on a more enlarged and comprehensive plan. During the progress of these political and literary labours, to which, with the confidence of youth, he had annexed ideas of singular importance and utility, although his notions were crude, and his knowledge superficial, he prosecuted the study of several modern languages, and gained an acquaintance with the rudiments of various sciences.

Brissot, at the period of his residence at Boulogne, had been introduced to mademoiselle Dupont, who was employed under mad. de Genlis as reader to the daughter of the duke of Orleans, and whose mother kept a lodging house in that place: and having married this lady, whom mad. Roland extols as a pattern of every domestic virtue, he found it necessary to exert his literary talents for gaining a subsistence. But as France did not afford that unrestricted liberty, which as an author he wished to indulge, he formed a design of printing, in Switzerland or Germany, a series of works in a kind of periodical publication, under the title of "An universal Correspondence on Points interesting to the Welfare of Man and of Society," which he proposed to smuggle into France. With this view, he visited Geneva and Neuchâtel, in order to establish correspondences; and he also made a journey to London, which was to be the central point of the establishment, and the fixed residence of the writers. His intentions, however, were divulged by the treachery of some of his confidential associates; and the scheme, romantic in itself, whatever the judicious and candid may think of its ultimate design and tendency, totally failed. During his abode in London, he concerted the plan of a periodical work or journal, on the literature, arts, and politics of England, which, being published in London, was allowed to be reprinted at Paris, and first appeared in 1784. The avowed object of this publication, as he himself declares, was "the universal emancipation of men." In London, he was arrested for debt; but being liberated by the generosity of a friend, he returned to Paris, where he was committed to the bastille, in July 1784, on the charge of being concerned with the marquis Pelleport in a very obnoxious publication. But by the interest of the duke of Orleans, obtained by mad. Genlis at the intercession of his wife, he was released, on condition of never residing in England, and discontinuing his political correspondence. In 1785, he published two letters to the emperor Joseph II. "Concerning the Right of Emigration, and the Right of the People to revolt," which he applied particularly to the case of the Walachians; and, in the following year, appeared his "Philosophical Letters on the History of England," in 2 vols. and "A critical Examination of the Travels of the Marquis de Chatelleux in North America." With a view of promoting a close, political, and commercial union between France and the United States, he wrote in 1787, with the assistance of Claviere, a tract, entitled "De la France et des Etats Unis, &c." "On France and the United States; or on the Importance of the American Revolution, to the Kingdom of France, and the reciprocal Advantages which will accrue from a commercial Inter-course between the two Nations." Of this work, an English translation was published, both in England and America. At this time, he was in the service of the duke of Orleans, as secretary to his chancery, with a handsome salary, and apartments in the palais royal; and, without doubt, employed in aiding his schemes of ambition. In this situation, he wrote a pamphlet against the administration of the archbishop of Sens, entitled "No Bankruptcy, &c." which occasioned the issuing of a *lettre de cachet* against him. But to avoid its effect, he went to

Holland, England, and the Low Countries; and at Mechlin, he edited a newspaper, called "Le Courier Belgique." For the purpose of promoting the views of a society at Paris, denominated "Les Amis des Noirs," and established for the purpose of abolishing negro slavery, he embarked for America in 1788; and, during his residence in that country, he sought for a convenient situation, in which a colony of Frenchmen might be organized into a republic, according to his ideas of political liberty. But his return was hastened in 1789 by the intelligence he received of the progress of the French revolution; after his arrival, he published his "Travels in America;" (Nouveau Voyage dans les Etats Unis, &c. 3 vols. 8vo. Paris, 1791.) and as he found the attention of the public directed to the approaching assembly of the States-General, he wrote his "Plan of Conduct for the Deputies of the People." At this time, he had withdrawn from the partisans of the duke of Orleans; and he took an active part in the plans that were then projected for the organization of the people, with a view to their union and energy in accomplishing the revolution. To the lodgings of Brissot, as a person who was held in estimation at this period, the keys of the bastille, when it was taken, were conveyed; he also became president of the Jacobin club; and he distinguished himself in various ways as a zealous promoter of those revolutionary principles, which, afterwards, gave occasion to a great number of atrocious excesses. After the king's flight to Varennes, Brissot openly supported the republican cause; nor does there seem to be sufficient reason for supposing, that he was secretly concerned in the plot for raising the duke of Orleans to the throne. But as some form of monarchy was still the object of the national wish, he was obliged to restrain his impetuosity. The popularity acquired by his writings, and conduct, was such, as to induce the Parisians to return him as one of their members in the "Legislative national assembly," which succeeded the "Constituent assembly" in October 1791, of which assembly he was appointed secretary; and he became afterwards a member of the committee of public instruction. Although inferior to many others in talents and knowledge, his activity raised him to the rank of head or chief, in the party denominated "Girondists" or "La Gironde," the name of the department to which several of its members belonged, and also from his own name "Brissotins." In his career of ambition, he does not seem to have been influenced by pecuniary considerations; power, more than wealth, being the object of his aim; for, at this time, he and his family lodged in an apartment up four pair of stairs, and subsisted on his stipend as deputy, and the inconsiderable gains accruing from a newspaper. As a determined enemy to monarchy, he was unremitting in his efforts to engage the nation in a war, with the avowed purpose of involving the king and his ministers in difficulties which would terminate in their ruin; and this part of his political conduct must ever be lamented and execrated by the friends of freedom, and of mankind. In the impeachment of M. Delessart, the minister for foreign affairs, Brissot took a principal lead; and alleged against him several articles of accusation, in consequence of which, he was apprehended, tried by the high national court at Orleans, and condemned to die, without being first heard in his own defence, so that he became the first victim to that desperate faction, which afterwards deluged France with blood. His colleagues were so completely terrified by this event, that they requested leave to resign, and the ministry was at once completely dissolved. Their successors, appointed by the king, under the direction and influence of Brissot, were Dumourier, Roland, and Claviere. This appointment was followed by a declaration

of war, decreed by the national assembly, against the king of Hungary and Bohemia; and Brissot, during the existence of this administration, which terminated soon, was considered as the most powerful person in France. About this time, Brissot began to entertain secret jealousy and suspicion, with regard to the views of La Fayette; and he concurred with other members of the assembly, in signing an accusation against him, which, however, he was not able to substantiate. He, and his republican party, were likewise industrious in their endeavours to throw an odium on the court, by alleging, that a private correspondence was carried on between the king and queen and the emperor; and they even averred, that an "Austrian committee," and a conspiracy in favour of the enemies of the country, existed among the friends of the court. The charge seemed to be unsupported by sufficient evidence; the king publicly contradicted these accusations as calumnies; nevertheless, they made no small impression on the minds of the public. To the writings and conduct of Brissot, the horrid massacres at the Tuilleries, on the 10th of August 1792, have been principally ascribed, though he is said to have preserved the lives of several of the Swiss guards on that fatal day. He was employed to draw up the declaration to the neutral powers concerning the suspension of the king's authority; but he is said to have regarded with horror the sanguinary spirit that was now predominant among the leaders of the Jacobins. Whilst, indeed, he was ascending to the pinnacle of power, he seems to have been the ardent advocate of insurrection and the revolutionary power: but as he found himself raised to that station, he began to inculcate "order and the constitution." To him we may not unjustly apply that expression in Tacitus, which he cites against the anarchists in the national convention: "Rerum potiri volunt; honores, quos quietâ republicâ desperant perturbatâ, consequi si posse arbitrantur." In the shocking massacre of the prisoners at Paris in September, he had probably no concern. When the "National convention," the idea of which is said to have been suggested by him, assumed the direction of the state, and assembled on the 20th of September 1792, he was returned as member for the department of Eure and Loire, his native country. In this assembly, he openly avowed himself an advocate for a republican government, in opposition both to the Jacobins and Orleansists; and was expelled the Jacobin club. On this occasion, he wrote a vindication of his public conduct, under the title of "An Address to all the Republicans." He appears to have been shocked by the prospect of the fatal issue of the king's trial, and to have attempted the preservation of his life, by deferring his execution, till the constitution should be perfected. The war with England, which soon followed the death of Louis, is ascribed to his ardour and credulity; for he was led to imagine, that the consequence of it would be a civil war in this country; and it is said, that this, as well as the war with Holland, was decreed in the national convention, Feb. 1, 1793, at his motion. This charge, however, he retorts on his accusers, and says, that the anarchists, by voting the death of the king, were themselves the authors of the war. See his "Letter to his constituents, on the situation of the national convention; on the influence of the anarchists, and the evils it has caused; and on the necessity of annihilating that influence, in order to save the republic." English translation, 8vo. 1794.

Brissot's influence gradually declined; and his party was at length overpowered by a more violent and sanguinary faction, denominated the "Mountain," so called, from its members usually sitting in the convention, on the upper seats of the hall, at the head of which was Robespierre, of

execrable memory. The treachery and desertion of Dumourier likewise contributed to hasten the downfall of this party. To their imbecility or perfidy, the public calamities that threatened the country, were generally ascribed; and, after the establishment of the "Revolutionary tribunal," for the purpose of trying crimes committed against the state, in March 1793, a petition was presented in the following month by the communes of the 48 sections of Paris, requiring, that the chiefs of the Girondists, or Brissotins, denounced in it, should be impeached, and expelled the convention. In May and June, decrees of arrest were issued against them; and against Brissot among the rest, who attempted to make his escape into Switzerland. But he was stopped and imprisoned; and in the following October, he and 21 of his associates were brought before the revolutionary tribunal. Brissot, who was elevated in the midst of them, maintained a firm and tranquil mind; but, though their accusers could support their charges by little more than mere furnishes, the whole party was immediately condemned to the scaffold. This band of friends, among whom were several of the most virtuous public characters of the time, passed together an heroic night, and were next morning led to execution. "There Brissot," says one of his biographers, "after seeing the blood of 16 associates stream from the scaffold, submitted to the stroke, with the utmost composure, and thus expiated the political faults of his life." These consisted, perhaps, more in vanity, enthusiasm, and precipitation, than in bad intentions; though he cannot be pronounced untainted with the vices, inseparable from a course of ambition. In the relations of private life, his character stands without reproach. Life of J. P. Brissot, said to be written by himself. Gen. Biog.

BRISSUS, in *Natural History*. See ECHINUS.

BRISTLE, a thick glossy kind of hair, wherewith the swine kind more especially are covered. The name is sometimes also applied to the quills of porcupines, and the mustaches or whiskers of cats. Hogs' bristles are hard, transparent, horny substances, of a prismatical figure, without any appearance of cavities or pores in them, discoverable even by the microscope. Cats' bristles have a large solid pith in the middle.

Hogs' bristles constitute an important article of exportation in Russia. In 1793, the value of those that were shipped off amounted to 742,000 rubles.

BRISTLE-dice, a sort of false dice, furnished with a piece of hog's bristle stuck in the corners, or other places to hinder their falling on certain sides, and make them run high or low at pleasure.

BRISTLE-moss, in *Botany*. See ORTHROTICHUM.

BRISTLED, in *Heraldry*, is a term used to denote the hair on the neck and back of a boar, which is usually of a different colour.

BRISTOL, in *Geography*. This second city of England is situated on the southern extremity of Gloucestershire, and the northern of Somersetshire, and once formed part of both counties. It is seated principally on a peninsula between the rivers Frome and Avon, and lies in 51° 30' N. lat. 2° 46' W. long. and is in a bearing west 117 miles from London, and 12 from Bath. Various conjectures have been formed relative to its ancient and present name. Barret, in his large history of this city, says it received the appellation of Caer-Oder at an early period; but is at a loss for the origin of Oder. Caer-Brito, its original designation, was evidently the generic name it obtained while a protected city of the Britons, under the Roman forces, which were stationed at Abone in its immediate vicinity. From this it was changed to Brightstow, or Brighticstow, perhaps a translation of Caer-Brito; or it might have taken that name from

Brightick, son of Algar, and great-grandson of Alfred, who was hereditary lord of the place. Its present name, Bristol, appears to have been derived from some early Latin writers, and, or it, by way of euphony, into Brittolina, while that of the common pronunciation, Brillow, is evidently an abridged mode of pronouncing Brightitow. It is a tradition, from an account which William of Worcester gave out of a MS. he saw in the house of the Calenderies, that Bristol was founded, or rebuilt by Brennus, son of Malmundus D. wallo, who reigned a king of the Britons 50 years antecedent to the Christian era. In allusion to which two flames are placed over St. John's gate, in this city, emblematic of Brennus and Belinus, who are said to have reigned conjointly after the decease of their father. It is probable that a situation so eligible must have struck the early Britons, who therefore made it a place of associated importance, previous to the Roman invasion; however, it is evident that it was a place of importance during that period, for Gildas, as early as A. D. 450, reckons this among the fortified and eminent cities of Britain, under the name of Caer-Bristol. Nennius also, A. D. 620, mentions it in his enumeration of 28 cities of Britain. On the dereliction of the island by the Romans, the Saxons overran the country and took possession of Brillol. Leland says, it was by them considerably increased; and also remarks, that St. Jordanus, a disciple of St. Augustine, sent by pope Gregory to convert the Saxons to Christianity, preached the gospel at Bristol, where he died and was buried. Thus we find it a place of note at the end of the 6th century. In Domesday book, finished by command of the conqueror in 1086, the inhabitants are styled burghesses. It was then exceeded in rate by no city, except London, York, and Winchester.

*Early and present extent.* The city, as first laid out at the conflux of the Frome and Avon, was, except on the northern part, where afterwards the castle was erected, insulated by these rivers. The ground rose each way to the centre, forming a pleasant hill. It was divided into four transverse streets, and walled round after the course of the river for its better defence. At the end of each street were a fortified gate and a church, and four churches surrounded the cross at the centre of the city. In this state Bristol could not exceed a mile and a half in circumference. The influx of people drawn hither by its growing trade soon extended it beyond the walls, both on the Gloucestershire and Redcliffe side of the Avon. Other walls and gates therefore would become necessary, and it was thus further defended, before the wooden bridge was built across the Avon. Leland mentions others, which he terms "Eiternavel secunda moenia urbis." Indeed, the large and strong castle, with its outworks, when completed, as it joined closely to the old town and the buildings on the southern side of the river, inclosed also by a strong wall, were great additions to the city, and thus made its circumference at least two miles and a half. The accession of the monastery of St. Augustine, with Gaunt's church and hospital to the west, the priory of St. James to the north-west, and the purchase of the castle precincts, and laying it out in streets, added very considerably to the extent of Brillol, towards the close of the 17th century. Since that period most of the buildings have been erected, both in the city and suburbs, which bear a modern appearance, and these have been numerous; so that it may be truly said, that Bristol has increased, within the last 40 years, full a fourth. This city once formed part of the Saxon kingdoms of Wessex and Mercia; and after the whole of England was subjected to one monarch, and divided into counties or shires, constituted part of the counties of Gloucester and Somerset, though it was generally considered as belonging to the latter county. It was by royal

charter, temp. Edw. III. made a county of itself; and by other different charters, its boundaries have been extended from time to time, till they now form a line on the Gloucestershire side, of  $4\frac{1}{2}$  miles and 37 perches, and on the Somersetshire side  $2\frac{1}{2}$  miles and 18 perches: the whole city is therefore 7 miles and 55 perches in circumference, and, taking in the suburbs from Lawrence-hill in the east to the Hotwells in the west, is more than 3 miles in length. Its breadth, from Stokes Croft turnpike on the north, to Ashton turnpike on the south, is upwards of  $2\frac{1}{2}$  miles. The number of houses and inhabitants it is difficult to ascertain. In the late survey by order of government, the return from Bristol must have been very inaccurate, and is stated at 10,896 houses, and 63,645 inhabitants. Anderson, in 1758, puts the latter down at 100,000, but gives no documents for this enumeration. The houses may be rated on an average estimate at 17,000; and if the environs of Temple-breet, Lewin's-mead, College-place, Lime-kiln-lane, &c. be attended to, the rate of 7 to a house will not appear too high. This calculation, including those in hospitals, alms houses, &c. will bring it to about 128,000 persons, which will not far exceed the truth.

*Public Buildings, &c.* The buildings in the old part of the city are awkward, and the various alterations that have taken place at different periods have destroyed all uniformity. The city stands on very uneven ground, and very high walls are raised round most of the houses; but the enormous height to which they are often built, appears highly unreasonable, especially when it is considered that an enclosing wall has been known to cost the value of the house itself. This fashion is declining, and Bristol can now boast some good and handsome houses, in the open streets, squares, &c. Among the principal buildings are the Cathedral, Redcliffe Church, the Exchange, Infirmary, Public Library, Theatre, Assembly-rooms, &c.

The *Cathedral* is only part of the original building, which was the church belonging to the abbey of St. Augustine, founded by Robert Fitzharding, younger son of the king of Denmark, whose monument is still preserved within it. At the dissolution of the monastery, this noble building, then 350 feet in length, was partly demolished; but when the king determined to erect six new bishoprics, of which Bristol was one, and was informed there was enough of the fabric left for a cathedral, he put a stop to its further demolition; the western part being removed, it was left in that mutilated state in which it remains; the present fabric consists of the transept, the eastern part of the nave, and the choir. At the west end is a large square tower, highly ornamented and crowned with battlements and four pinnacles. The present church, from east to west, is 175 feet; its breadth of transept, from north to south, 128 feet; the breadth of nave and aisles 73 feet, and height of the tower 140 feet. The establishment is a dean, six prebendaries, four minor canons, sacrist, &c.; and service is performed twice every day.

The *Church of St. Mary Redcliffe*, says Camden, "is like a cathedral, and on all accounts the first parish church in England." It was founded in 1292 by Simon de Burton, who was six times mayor of Bristol. According to the mayor's calendar, this church was finished A. D. 1376, and was then celebrated for its architecture all over England. The tower and spire were 250 feet high; but in 1445 a terrible storm of thunder and lightning destroyed part of the spire, and the church was much damaged. The latter was repaired by the munificence of Mr. William Cannynge, merchant, but the spire was never rebuilt. The church stands on an eminence, called Redcliffe-hill, and is built in the form of a cross. The nave rises above the aisles, is lighted by a series of lofty windows on each side, and is supported by flying buttresses. The tower is large, and with the remain-

ing part of the spire, richly ornamented with carved work, and also a variety of niches and statues. Though a lofty and massy building, yet, from the peculiar beauty of its masonry, it has a light and airy appearance both without and within. The roof, nearly 60 feet in height, is arched with stone, and ornamented with various devices. The church, including our lady's chapel, is in length 239 feet, and the transept, from north to south, 117 feet. The breadth of the nave and aisles is 59 feet, and at the cross, nave and aisles, 114 feet. The height of the aisles both direct and transepts is 25 feet. The height of the nave is 54 feet. St. Mary's chapel has been separated from the church, and is used as a grammar-school. A peculiarity observable in Redcliffe-church is that the transept consists of three divisions, or aisles, similar to the body of the church, which has a fine effect when the spectator places himself in the centre of the building, and looks around him. Besides the above, there are 15 other parish churches in Bristol, some of which are modern structures. Temple church is rather curious, and its tower is out of the perpendicular. There are also 22 chapels, or places of worship for dissenters of different denominations, and 5 chapels of the established religion.

The *Exchange*, finished and opened in 1743, was built by Wood, the architect of Bath, at an expence of 50,000*l*. It is a handsome building, in the Grecian style, 110 feet in front, and 148 feet in depth. The principal front is upon a bold rusticated basement, the central part of which makes a tetrastyle of almost whole columns, with Corinthian capitals, supporting a pediment, in the tympan of which are the arms of England carved in stone. The place intended for the merchants is a peristyle of the Corinthian order, 90 feet by 80, and capable of containing 1440 persons.

The *General Hospital*, for the reception of all cases, and all persons of whatever nation, is a handsome edifice, though it has unfortunately never been yet completed.

The *Theatre-royal*, King-street, is a peculiarly neat and convenient structure: indeed, Mr. Garrick pronounced it to be the completest in Europe of its dimensions; and he wrote a prologue and epilogue, which were delivered at the opening, May 30th, 1766.

The *Bristol City Library*, is so called, because part of its collection belongs to the corporation, and the greatest part to a society of gentlemen. It contains an excellent assemblage of ancient and modern books, which, by donations and annual subscriptions, are rapidly increasing. They are contained in a large freestone building erected for the purpose, with a convenient house for the head librarian, who has also an assistant librarian.

The *Assembly-room*, in Prince's-street, has a beautiful front of free-stone, consisting of a rustic basement, with a central projection supporting four Corinthian columns, coupled and crowned with an open pediment. On the frieze, in relief, is the following motto: "Curas cithara tollit," Music dispels care.

To these may be added, the *Guildhall*, where the assizes, sessions, and other public business are transacted.

*Government, civil Officers, &c.*—The original government of Bristol seems to have been mixed, military and civil; the chief authority residing in the lord constable of the castle, who deputed another officer for the execution of justice, called "prepositus villæ," or provost of the town. The earliest account of this officer occurs in Domesday-book. In the reign of king John, Bristol obtained a charter to be governed, like London, by a mayor, &c. From the Annals, it appears, that the civil government, at different periods, has been variously modelled, as appears from the following list:

1. Till A. D. 1205. A prepositus under the custos of the castle.
2. 1266. A mayor and two prepositors.
3. 1313. A mayor and two scenefials.
4. 1372. A mayor and two bailiffs.
5. 1500. A mayor, sheriff, and two bailiffs.
6. To this day. A mayor and two sheriffs chosen annually.

The government of the city is now administered by a mayor, a recorder, twelve aldermen, who are all justices of the peace, two sheriffs, an under-sheriff, twenty-eight common-council-men, town-clerk, deputy town-clerk, chamberlain, vice-chamberlain, steward of the sheriffs' court, clerk of the arraigns, registrar of the court of conscience, and also a high steward. There are other officers pertaining to the corporation, as sword-bearers, two coroners, water-bailiff, quay-masters, school-masters, clerk of the markets, keepers of the prisons, inspectors of nuisances, eight serjeants at mace, criers of the court, common-crier, exchange-keeper, sheriffs' officers, club-men, city marshal, and a band of musicians in constant pay. Great form is observed on the 15th of September, in the election of mayor, when the whole body corporate is convened. He is allowed 1000*l*. for the year of his mayoralty, and the sheriffs 500*l*. each for the year of their shrievalty. The mayor has the highest marks of honour granted to magistracy, scarlet ermine gowns, sword, mace, cap of maintenance, &c. He holds a daily sessions in the council-house to hear complaints, and accommodate differences, courts of conscience, and pie-powder, quarterly sessions, and a general jail delivery twice a year: one for the decision of civil, and the other of criminal causes, wherein the court has the power of life and death. The mayor, aldermen, and common council have the custody of the city seal, which is impressed with the city arms. These are gules, a castle on a hill by the sea-side, and the helm of a ship passing by, all proper; to which were afterwards added two unicorns as supporters. The motto is, "Virtute et Industria."

From the time Bristol was made a county of itself, it has, by various charters, and grants, been endowed with additional privileges and immunities, all of which were confirmed by a new charter from queen Anne. By another of king Edward IV. 1461, Bristol was exempted from the authority of the high admiral of England by land and water; and the right of determining differences, belonging to the court of admiralty, was referred to the mayor and corporation. The jurisdiction by water extended up the river only to lower Harrate, till an act of William carried it to Hanham; thence it reaches to Kingroad and down the channel to the Flat-holmes. To this place, Gildas, the ancient British saint and historian, retired, and here he died. The opulent corporation of Bristol is possessed of large estates, both in the city and in the country; and they are the patrons of several church livings, so that they not only possess great influence, but have it in their power to encourage genius, and reward industry and merit. The city is divided into twelve wards, each of which has an alderman to preside over it. The recorder is always one of the aldermen, and, by virtue of his office, the principal. The senior alderman, as in London, is called the father of the city. Every ward has one chief constable, and twelve others, a night constable, and a proper number of watchmen under him.

Bristol contains three prisons: Newgate, at the end of Wine-street, which is a gaol for malefactors and debtors; Bridewell, or the city prison, for the confinement and correction of less offenders; and at the end of Gloucester-street is a prison, on Howard's plan, for that part of the suburbs

which stands in the county of Gloucester, and a Bridewell on the Somerset side. The act for lighting Bristol with lamps was procured in the reign of William III. This obliged the citizens to hang out their own lamps; but they are now provided, and the lighting contracted for, by the different parishes. Most of the streets are well paved on the sides with flag stones; but the pitching with pebbles in the carriage-way is at present extremely uneven and bad, and requires amendment. The poor rates are separately assessed, and collected on the respective parishes; but the poor are taken care of conjointly, and have a house called St. Peter's hospital. There are fourteen stands of hackney coaches in various parts of the city, and one at Dowry square. Each coach is numbered, and marked C. B. There has lately been instituted at Bristol a society for the suppression of vice.

Bristol appears to have been a *borough* at the Conquest, and at a very early period, by ancient prescription, sent two burgesses to parliament. A list of its representatives is still extant from the 23d of Edward I. 1295. None can vote for members but such as are free of the city, which freedom is attained by servitude, by hereditary right, by marrying a freeman's daughter, or by purchase. The number of freemen, at present, is about 8000. The city gives title to an earl, and the earldom was formerly in the noble family of Digby, but is now in that of Hervey.

*Commerce, Trade, Shipping, &c.*—That a port so situated as Bristol should have early participated in the commerce of the country, can be no matter of surprize. William of Malmesbury, in 1139, says, it was a place much addicted to trade, and was then full of ships from Ireland, Norway, and every part of Europe, which brought hither much commerce, and great foreign wealth. From the charter of king John something may be learnt of the commerce of the place in his reign, but more will be furnished by that of Edward III. Bristol was grown so opulent in 1327, that the mayor and commonalty lent the king (Richard II.) 500 marks, which is the first instance (except London) in the Federa of a lay community lending money to the crown; and, in future loans, we find Bristol follow London. In 1487, a petition was presented to the king, to empower the citizens of Bristol to remove all obstructions in the river Avon that impeded its navigation between Bristol and Bath; for before the time of Richard I. the Avon was navigable to Bath. In 1711, an act of parliament was obtained, at an expence of 15,000l. to amend this navigation by placing weirs, locks, and other obstructions. In the roll of the fleet of Edward III. which was at the siege of Calais, in 1347, we find the proportion of ships and men furnished, on that occasion, by London and Bristol: the former supplied 25 ships, and 662 men, and the latter quota was 22 ships, and 608 men. William Cannyns is distinguished as a great merchant here in 1445, and he appears to have traded with peculiar privileges, to Prussia, the Hanseatic towns, and Denmark. William of Worcester says, that Cannyns employed for eight years, in his own shipping concerns, 800 men, and he specifies the ships and tonnage employed by him. The same Cannyns paid king Edward IV. 4000 marks for his peace, *i. e.* for leave to trade to prohibited places, and to be free of imposts and duty.

The commercial character of the Bristol merchants will best appear from the letters patent which were granted to John Cabot, a Genoese by birth, but a resident merchant in this city, and to his three sons, who fitted out vessels for the purpose of discovery. In 1527, Robert Thorn obtained leave to go on a voyage of discovery, to find out a north-west

passage. In 1583, sir Humphrey Gilbert performed a voyage for the colonization of America, an account of which is given in Hackluyt. Many other voyages were afterwards made from Bristol, with the like public-spirited views, though not with equal success. The merchants had, previous to 1526, traded to St. Lucas in Spain, and thence to the Canaries, sending out cloth, soap, &c. and bringing in return sugar, drugs, dye-stuff, &c.; and De Wit, in his interest of Holland, says, this city very early engaged in the cod-fishery on the coast of Newfoundland, and also entered into the West-India trade soon after the discoveries were made. In 1556, the merchants were incorporated into the society called Merchant Venturers; and various grants, immunities, and franchises, were annexed to their society. Sebastian Cabot was constituted the first governor. In 1588, four ships were fitted out from Bristol to join the Queen's fleet at Plymouth. With regard to the present state of trade, it is very considerable to Florida, Carolina, Virginia, New York, Newfoundland, Quebec, Spain, Portugal, West Indies, Denmark, Sweden, Russia, Prussia, &c. The ardour for the African trade seems much to be abated; and the Bristolians now yield the palm of traffic in human-beings to the rival port of Liverpool. The merchants in Bristol trade with a more entire independence on London than any other port in Britain. Whatever exportations they make to any part of the world, they can import the full returns, and find a market, without consigning their ships or cargoes to London. They have buyers at home for their largest importations, consequently the shopkeepers of Bristol, most of whom are wholesale dealers, keep up a great inland trade, having riders and carriers, like the London merchants.

The quay of Bristol, which was commenced where the bed of the Frome was altered, reaches round from the stone bridge on the Frome, to the new handsome bridge over the Avon; in extent one mile, being one uninterrupted wharf of hewn stone, with sufficient depth of water, at flood tides, for the largest ships to ride close to the walls, and discharge their cargoes. These, as the tide ebbs, ride safe at their moorings on a soft oozy bed of mud; but foreign and sharp keeled ships are often strained, and obliged to go into dock after lying here. This occasioned a new floating-dock to be made, at the expence of 20,000l. It is situated near the Hot-well-road; its gates will admit a 64 gun vessel, and it will contain 40 sail of shipping. Here also are dry and wet docks, for repairing and building ships. A scheme has long been in contemplation to dam up the water, and keep the vessels in the harbour constantly afloat. In 1803, an act of Parliament was obtained for the purpose, a plan was adopted, and this great work is now executing with all possible expedition. When completed, the port will be capable of holding 1000 sail of shipping, which convenience must, eventually, be of great advantage to the city. The plan is to dam up to a certain height the whole of the present bed of the Avon and Frome, and to make a new channel for the river through Redcliffe meads. Three hundred thousand pounds are already subscribed, and three years given to accomplish the design. From what has already been done, it is conjectured that the expence will not exceed the estimate; and if workmen can be obtained, it is presumed that it will be finished within the assigned period. By this plan, ships will not only be kept afloat at the quays, but may enter the locks, and go to sea at neap tides, which will be a wonderful saving in time and expence; and a navigation will be opened up the Avon, as high as the town of Keynsham, in one level: the money to be raised by duties and taxes, bearing an interest of 4 per cent. and not exceeding 8 per cent. The interest is to be raised by a tax on houses in the city, of  
one

one shilling per pound rent, and a port-duty on all goods and merchandize imported. The tax on houses is considered too partial to be just; and the duties on articles imported may probably act as a considerable prohibition on foreign vessels frequenting the port. Time alone, however, must discover the policy or impolicy of thus raising the sum necessary for its accomplishment. The trade of this port has been ever fluctuating from the time of Henry II. 1137, (when William of Malmesbury makes such honourable mention of it) to the present time. Every vessel of above 60 tons burthen pays a certain wharfage; and from the water-bailiffs' returns, it appears that, in 1745, it amounted to 918l. 18s. 7½d: in 1775, to upwards of 2000l. In 1742, the privateers fitted out from Bristol, according to Barret, exceeded in tonnage, number of guns and men, the whole royal navy of Great Britain. In 1769, there were entered inward at the Custom-house 427 foreign ships, exclusive of Londoners, Coasters, &c.

In 1787 the entry at the custom house was as follows:

		Ships.		Tons.	
Entered inwards—Brit.		416	48,125	Foreign, 69 11,112	
Entered outwards—Brit.		382	46,729	Foreign, 66 10,445	

The following is a list of ships and vessels belonging to this port in 1787:

Foreign Trade.			Coasters.			Fishing Vessels, &c.		
Ships.	Tons.	Mcn.	Ships.	Tons.	Mcn.	Ships.	Tons.	Mcn.
328	53,491	3,971	30	3078	142	7	340	30

After this period the trade increased considerably; and another computation states, that in 1788, 34 ships were employed to Jamaica, 38 to the Leeward islands, 37 to Africa, 33 to Newfoundland, 50 to North America, and 200 between Bristol, Ireland, France, Spain, London, &c. amounting to 1392; besides 103 trows from 50 to 130 tons burthen, employed in the Severn and Wye trade. But the commerce of Bristol received a severe check during the last war; and the present paralyzes the spirit of adventure, and the hand of industry. Should peace quickly return, and the port be finished, there can be little doubt but this place will become more flourishing than ever.

Besides the foreign trade, Bristol has many very considerable manufactures; and the cheapness of fuel, with the ready conveyance to a market, renders this an advantageous place for carrying on various trades. The brass rollery business was begun here about 1704. The manufactory of zinc out of calamine stone, and the ore of zinc called black Jack, was established at Bristol in 1743, for which Mr. Champion obtained a patent. Mr. Emerson at Hanham established works for making brass, by exposing copper to the fumes of calamine, and obtained the finest brass in the world. Vide Watson's Chemistry.

The glass houses of Bristol are not only numerous, but great quantities of different glass articles, and bottles, are annually made here. This trade is increasing, and it is said that more glass is manufactured at Bristol than at any other place in England. Many large iron founderies are also established here, and a steam-engine factory is erected for boring cannon; smelting lead, and making of white and red lead, are among the manufactories of this city.

There are 20 sugar-houses for the refining and manufacture of sugars; several large distilleries, which help to supply London; and the exportation to foreign parts is very considerable. The manufacture of soap has long been an article of great trade here; for, in 1523, it supplied London with the best gray speckled soap at 1d. per pound; but it is now 1s. Large quantities are still sent to London,

to most parts of the kingdom, and to America. This place was, at an early period, noted for its woollen trade. In 1339, we find from Rymer, that the cloth manufacture was removed from Flanders, when Bristol was appointed a principal staple of wool, and many looms were set up for weaving woollen cloths. In Henry VIIIth's reign, it was full of clothiers, weavers, and tuckers; and the magistrates gave great encouragement to set up the Colchester rug manufactory, and many sums have at times been left to the corporation in trust for the use of young clothiers. This trade is not entirely taken away, as some woollen stuffs, ferges, &c. are still made. The manufacture of silk fringes, sail cloth, cottons, morocco-leather, &c. must not be omitted. Several potteries also now rival those of Staffordshire.

*Military History, Castle, &c.*—It is highly probable, that so conspicuous and important a place early partook of the disasters arising from the internal commotions of this kingdom, and the evils arising from foreign invasion. But history is silent, the records being lost till 915, when Stow says, a great navy of Danes sailed up channel and infested the western coasts, landed in divers places, and took great plunder; at which time Bristol suffered from the marauding enemy. King Edward son of Alfred, 911, according to the Saxon annals, sent his army out of Mercia, and met them in Wexsex, where he fought and routed them. The battle was decisive, and the Danes were then subject to the Saxon monarch. Edward went on to build towns and castles; and amongst others he built that of Bristol, on the Mercian side of the river Avon. Camden, therefore, was evidently mistaken when he asserts that Robert Rufus, natural son of Henry I. was the founder of the castle of Bristol. Turgot mentions it as the work of Edward in 915, and says, it was "the goodlielt of five built on the banks of Avon;" and in 1088, it is mentioned by Roger Hoveden as "Castram fortissimam;" and if it were so strong 20 years after the conquest, there cannot be a doubt, but it previously existed as a fortress for the defence of the city. Another decisive proof of Camden's error is, that the castle was held by Godfrey bishop of Constance, and Robert de Mowbray earl of Northumberland, in a rebellion against king William Rufus in 1088; before king Henry I. earl Robert's father, was at man's estate. This earl, though not the founder, certainly rebuilt some parts, repaired others, and erected a palace and other offices. He also built a magnificent tower, scarcely equalled at that time in England, and encompassed the whole with strong walls. Leland informs us, that Robert built part of it, and that "the dungeon tower was made of stone brought out of Normandie by the redde earl of Gloucester." It was not till 1130, that earl Robert began to rebuild and improve the castle; which, excluding the out-works, was 450 feet from east to west, and 300 feet from north to south. There were in it two great courts, many towers, a church, and a magnificent chapel. The king had also a palace within the walls. The principal buildings stood upon an area, covering 3¼ acres of ground, exclusive of courts, yards, and other accommodations for the officers and the garrison. Leland informs us, that the great tower stood in the north west part of the castle; and in his time, about 26th of Henry VIII., the whole was in a decayed state, and tending fast to ruin. In the reign of John, the castle was annexed to the crown; and here that monarch cruelly confined the princess Eleanor, (called the damsel of Brittany,) who, after forty years miserable confinement, died here in 1241. In the barons wars, during the reign of Henry III., prince Edward his son supplied the castle with provisions, and fined the townsmen

townsfolk for not affording him with supplies. The latter believed him in the castle, and the prince fled to Windsor, where he was soon forced to accept terms at the hands of the barons. When the duke of Lancaster opposed Richard II. the inhabitants of Bristol threw open their gates to the duke's forces, who stormed and took the castle, in which many of the king's friends had taken refuge. The inhabitants of Bristol sided with the earl of Richmond, afterwards Henry VII. at which time Giles lord d'Aubenev held the castle. During the reformation, tumults broke out in the castle; and at Bristol, the castle, walls, and gates of the city were repaired and mounted with cannon; but by the prudent conduct of Mr. William Chester, the discontented were soon appeased, and a general pardon was procured for the delinquents. In the years 1545 and 1553, a mint was established in the castle; and the church plate, seized by the commissioners, was here coined. By a petition to king Charles I. (62), the king granted the castle and its appurtenances to the mayor and corporation of Bristol, and made it a part of that county and city; and in 1631, it was sold to the mayor and burgeses for 950*l*. In the commencement of the war, between the king and his parliament, the castle was repaired and garrisoned by the parliament army, under the governor Col. Nath. Fiennes. This was considered a place of the greatest consequence, and served to awe all the western counties, having accommodations for a large army. The king, therefore, was very desirous of obtaining possession; a plot was formed by Yeatmans and Bouchier, to deliver it up to the king's forces; but this being discovered, prince Rupert, at the head of a considerable army, besieged it; but fearing the length of a blockade, he determined to take it by storm, which he quickly effected. But the place was thus dearly bought, for the king lost most of his valuable officers, and more than 500 of his best troops. It was thought of so much consequence, that a public thanksgiving was ordered for the success of his majesty's arms. The citizens subscribed 1400*l*. to prevent the plunder of the soldiery; and orders were consequently given for death to be the penalty of plunder. Bristol was ordered to pay 50,000*l*. in money, and clothe and equip 1500 of the king's soldiers. At the battle of Naseby, prince Rupert repaired to Bristol, which he found supplied with men, provisions, and ammunition, so that he wrote to the king, assuring him he was able to sustain a four months' siege. This revived the hopes of the king's party; and it was thought that the prince would make a vigorous and desperate defence; but, to the surprise of all, he made but a very feeble and short resistance. This unexpected and disastrous event damped the royal cause, which from that day rapidly declined; and certainly the capitulation of this grand station hastened the fatal catastrophe of the king's submission, and subsequent decapitation. After Oliver Cromwell was proclaimed protector, he issued orders for the demolition of the castle of Bristol. The dismantling was begun in 1665, and the whole was razed to the ground. Scarcely any vestiges are now remaining. Thus this fortress, deemed impregnable in former ages, and which has made such a distinguished figure on the page of history, the subject of so much negotiation, and so much contention, was destroyed after having weathered the storms of seven centuries. The inhabitants, previous to this period, appear to have always been in opposition to the reigning princes, but subsequently, however, the reverse appears the case. In the duke of Monmouth's rebellion, they espoused the cause of king James. During the rebellion, in the reign of George I., and especially in 1745, they were decidedly for the house of Hanover; and

and in the present day their exertions in defence of the nation are too well known to need a comment.

Such are the most material places, objects and events, connected with the city of Bristol. We may further state that its buildings cover an area of about 1000 acres of ground, and the suburbs above 500 more. With the appendages it contains 600 streets, squares, lanes, courts, &c. in which are erected 47 churches and chapels. Here are 5 hotels, 50 inns and taverns, 7 banking houses, and 4 prisons. It is the chief city, quay, and mart of the western parts of the kingdom, and is classed among the principal cities of Europe.

Bristol is the birth-place of many distinguished literary and public characters, the memoirs of whom will be introduced under their respective heads. We shall therefore only mention the names of the principal: Thomas Chatterton, poet, sir William Draper, William of Worcester, William Cannyngs, Edward Colton, Ann Yearlley, Mary Robertson. For an account of the Hotwells, Clifton, St. Vincent's rocks, and many places in the vicinity, see CLIFTON. Barret's History of Bristol, 4to. 1789.

BRISTOL, a township of America, in Lincoln county, and district of Maine, containing 1718 inhabitants; 204 miles N.E. from Bolton.

BRISTOL, a county in the southern part of the state of Massachusetts, situate to the east of a part of Rhode island; its principal town is Taunton. It has 15 townships, 97,360 acres of improved land, 130,767 of that which is unimproved, 31,709 inhabitants, and 17,860 head of cattle.

BRISTOL, a county in the state of Rhode island, bordering on Brillol county in the Massachusetts, north-east; and mount Hope bay, east; and including the townships of Bristol, Warren, and Barrington. The number of inhabitants is 3211, of whom are 98 slaves.

BRISTOL, a sea-port town, and capital of the preceding county, lies on the western side of the peninsula, called Bristol-neck, and on the east side of Bristol bay; including Popasquash-neck, and the whole northern and eastern parts of Bristol-neck to Warren, north; and to mount Hope bay, east. Its distance, including the ferry, about half a mile broad, is about 3 miles from Rhode island, 13 miles N. from Newport, 24 S.E. from Providence, and 63 from Boston. Although it has suffered greatly by the ravages of war, it is now in a very flourishing state, having 1406 inhabitants, including 64 slaves. Its situation is beautiful; its climate healthy; its soil rich; and its harbour safe and commodious. Onions, in considerable quantities, and a variety of provisions and garden stuff, are raised here for exportation. N. lat. 41° 45'. W. long. 71° 20'.

BRISTOL, a township in Hartford county, Connecticut; 16 miles W. of the city of Hartford.

BRISTOL, a town in Bucks county, Pennsylvania; 11 miles S.S.E. from Newtown, and 20 N.E. from Philadelphia; seated on Delaware river, opposite to Burlington in New Jersey, and containing about 50 or 60 houses. It is noted for its mills of various kinds. N. lat. 40° 17'. W. long. 75° 8'.

BRISTOL, a township in Philadelphia county.—Also, a small town in Charles county, Maryland.—Also, a township in Addison county, Vermont, east of Vergennes, having 211 inhabitants.—Also, a new town of New York, in Schoharie county, incorporated in 1797.

BRISTOL Bay and River, lie on the north-west coast of North America; the north point of the bay is cape Newnam, and the south point is cape Oenemak, on the peninsula of Alaska. These two points of the bay are in N. lat. 54° 30' and 58° 42', and in W. long. 162° 24' and 163° 30'.

The river, which runs into the bay from the east, is about a mile broad at the entrance, and has plenty of salmon. N. lat.  $58^{\circ} 27'$ . W. long.  $158^{\circ} 5'$ . The variation on this coast is nearly  $20^{\circ}$  E.

**BRISTOL Bay**, a bay on the S.W. coast of Nova Scotia. N. lat.  $44^{\circ} 41'$ . W. long.  $63^{\circ}$ .

**BRISTOL Cape**, lies in Sandwich island, 8 leagues N. from cape Montague, and E. from Freezland peak. S. lat.  $59^{\circ} 2'$ . W. long.  $26^{\circ} 51'$ .

**BRISTOL Channel**, the estuary or wide frith of the Severn, is that part of the Atlantic Ocean, which lies between the south coast of Wales and the counties of Somerset, Devon, and Cornwall, in England.

**BRISURE**, in *Fortification*, a line of four or five fathoms, which is allowed to the curtain and orillon, to make the hollow tower, or to cover the concealed flank.

**BRISURE**, in *Heraldry*, is the mark of distinction of houses or families, when borne as such on a bend, fesse, &c.

**BRIT**, in *Geography*, a river in England, which runs into the sea, 2 miles south of Bridport, in Dorsetshire.

**BRITAIN, GREAT**, the most considerable island of Europe, comprehending the two kingdoms of England and Scotland, with the principality of Wales, and extending from Lizard point, N. lat.  $50^{\circ}$  nearly to Dungeness-head in N. lat.  $58^{\circ} 30'$  nearly. Accordingly, its length is about 590 miles. Its greatest breadth from the Land's End, in W. long.  $5^{\circ} 45'$ . to the north Foreland, in E. long.  $1^{\circ} 17'$ . is about 488 miles. Its form, however, is somewhat triangular; as it has three promontories, projecting in different directions, viz. the Land's End, in Cornwall, towards the west; the North Foreland, in Kent, towards the east; and Dungeness-head, in Caithness, towards the North; and the circuit of its three sides, allowing for the windings of the coast, contains, by a general estimate, about 1800 miles. But if Great Britain were considered as a perfect triangle, the length of its three sides would measure about 1520 British miles. It is bounded on the north by the Northern Ocean, on the west by the Atlantic and the Irish Sea, which separates it from Ireland, on the south by the British Channel, which divides it from France, and on the east, towards Germany, by the North Sea and German Ocean. Some have supposed, that Great Britain was, in times of very remote antiquity, united with the continent. The entire separation of Great Britain from the continent must have happened, according to the conjectures of Mr. Kirwan, (*Irish Transact.* vol. vi. p. 301.) long after the deluge, and that of Ireland from Great Britain at a still later period; for wolves and bears were anciently found in both, and these must have passed from the continent into Britain, and hence into Ireland, as their importation cannot be suspected. The divisive force that separated Britain from Germany seems, according to this writer, to have been directed from north to south, but gradually weakened in its progress. Hence that island is sharpened to the northward; but the impression must have been considerably enfeebled by the opposition of the granitic mountains that form the Shetland and Orkney isles. The broken structure of the calcareous or argillaceous and arenaceous materials of the more southern parts presented less resistance, were more easily preyed upon, and gave way to what is now called the German Ocean, while these materials themselves were spread over Westphalia, &c. or formed the subsoil of Flanders, Holland, and the sand-banks on its coast. The rupture of the isthmus that joined Calais and Dover was probably effected by an earthquake at a later

period, and gradually widened by tides and currents. Ireland was protected by Scotland from the violence of the northern shock; and hence its separation from Scotland appears to have been late and gradual. That from England was probably diluvial, and effected by a southern shock. These changes, says this writer, happened at least 3600 years ago. But to return from this digression.

The fertility and pleasantness of Great Britain gave occasion to imagine, that these were the fortunate islands, described by the poets, where the face of nature exhibited a perpetual spring. In former times this was the granary of the western empire; from hence was transported every year an immense quantity of corn for the supply of the army on the frontiers of Germany. As to the history of its more early state, its population, fertility, and a variety of other circumstances relating to it, we refer to the next article.

The climate of Great Britain is, perhaps, more variable than that of any other country on the globe; and this circumstance has been ascribed to the opposition between the vapours of the Atlantic Ocean, and the drying winds from the eastern continent. The western coasts are subject to frequent rains; and the eastern part of Scotland has a clearer and drier temperature than that of England. The humidity of the climate, whilst it invests the delicious vales and meadows with a verdure unknown to any other region, injures the health of the inhabitants, by occasioning colds and catarrhs, which too frequently terminate in consumptions, that are fatal to many in the prime of youth. Besides, the moist and foggy climate conspires, with the excessive use of gross animal food, to produce that melancholy, which foreigners have considered as a national characteristic of the country. To the mutability of the climate we may reasonably ascribe the precariousness of the seasons. To this purpose it has been observed by some judicious persons, that since the year 1775, a considerable change has taken place, with regard to the temperature of the year, both in Great Britain and Ireland. The winters have been, in general, more moist and mild, and the summers have been more humid and more cold, than the average of preceding years. With us the year might not improperly be divided into eight months of winter and four of summer. The spring dawns in April, which is commonly a mild month, but eastern winds prevail in May, and check the efforts of reviving nature, and disappoint the promise of the year. June, July, August, and September, are usually warm summer months, with occasional frosty nights even in August, and cold east wind; and some summers have of late years been chilled by constant rain. Our winter commences with the beginning of October, which, however, is often a mild and pleasant month; severe frost does not commonly occur till Christmas. November is the most gloomy month of the year; and allowed, generally, to be the most unsettled month, interspersed with dry frost, cold rains, and strong winds, with storms of hail and sleet. But all observations of this kind must be considered as general in their nature; and counteracted by different situations with regard to latitude, and by a variety of local circumstances.

The population of Great Britain has been variously estimated; some reckoning it at 7,000,000, and others at more than 12,000,000. But in the year 1800 an act was passed, (41 Geo. III.) "for taking an account of the population of Great Britain, and of the increase or diminution thereof." From an abstract of the returns made to parliament, in consequence of this act, the following result was deduced:

SUM.

# BRITAIN.

## SUMMARY of ENUMERATION.

	HOUSES.			PERSONS.		
	Inhabited.	By how many families occupied.	Uninhabited.	Males.	Females.	Total.
England - - - -	1,472,870	1,787,520	53,965	3,987,935	4,343,499	8,331,434
Wales - - - -	108,053	118,303	3,511	257,178	284,368	541,546
Scotland - - - -	294,553	364,079	9,537	734,581	864,487	1,599,068
Army, including militia - - - -	- - - -	- - - -	- - - -	198,351	- - - -	198,351
Navy, including marines - - - -	- - - -	- - - -	- - - -	126,279	- - - -	126,279
Seamen, in registered shipping - - - -	- - - -	- - - -	- - - -	144,558	- - - -	144,558
Convicts, on board the hulks - - - -	- - - -	- - - -	- - - -	1,410	- - - -	1,410
<b>Totals</b> -	<b>1,875,476</b>	<b>2,269,902</b>	<b>67,013</b>	<b>5,450,292</b>	<b>5,492,354</b>	<b>10,942,646</b>

On this enumeration it is observed, that the total population of Great Britain probably exceeds the number of persons specified in the above summary, in as much as from some parishes no returns were received. From the number of houses in Ireland, nearly ascertained by the collection of a hearth-money tax, it has been computed, that the population of that part of the united kingdom somewhat exceeds four millions of persons. It should also be observed, that the islands of Guernsey, Jersey, Alderney, and Sark, the Scilly islands, and the Isle of Man, were not comprised in this enumeration; and that the total population of these islands has been usually estimated at about 80,000 persons. On these considerations, with a very moderate allowance for omissions in the returns, the total population of the united kingdom of Great Britain and Ireland amounts to *fifteen millions one hundred thousand* persons; and besides these, its eastern and western possessions and colonies contain many natives of the British isles. On a more enlarged survey of these colonies and settlements, we may consider their inhabitants either as subjects of Great Britain, or as augmenting its importance by their intimate connection with it. The most important of these are now in Asia; and in Hindostan, the nations subject to Great Britain cannot be now calculated at less than 40 millions. The acquisition of the Dutch settlements, the colony of New Holland, and more minute stations, must also be taken into the account. In America, and what is called the West Indies, Canada, Nova-Scotia, Newfoundland, and the more northern settlements, with Jamaica, and the other islands, may, perhaps, contain a million. In Africa, the settlements at the Cape of Good Hope, the islands of St. Helena and at Sierra Leone, present an insignificant number; and Gibraltar is to be regarded merely as a military station. However, if we compute the North American states, detached from the mother country, at a population of five millions, the united kingdom of Great Britain and Ireland at 15 millions, and our colonies and settlements at only two millions, we shall find in the various countries of the globe an increasing population of 22 millions, diffusing the English language and manners to a vast extent, and contributing in one way or other to the wealth, power, greatness, and prosperity of Great Britain.

From the above table it appears, that the enumeration of 1801 amounts to 8,872,980 persons for England and Wales; and to this number an appropriate share of soldiers and mariners is to be added. These appear to have been 469,188;

and if, exclusive of them, the total population of the British isles is 14,630,812, (15,100,000—469,188) about a thirtieth part may be added to the inhabitants in order to ascertain the population of any distinct part. Accordingly, in the following table, the existing population of England and Wales is taken at 9,168,000; and the population attributed to the other years, is obtained by the rule of proportion, thus: if 255,426 baptisms (the average medium of the last five years, deduced from the returns of parish registers,) were produced from a population of 9,168,000, from what population were 152,540 (the baptisms of 1700, given in the same returns) produced?

TABLE of Population throughout the last Century.

ENGLAND and WALES.	
In the Year.	Population.
1700 - - -	5,475,000
1710 - - -	5,240,000
1720 - - -	5,565,000
1730 - - -	5,796,000
1740 - - -	6,064,000
1750 - - -	6,467,000
1760 - - -	6,736,000
1770 - - -	7,428,000
1780 - - -	7,953,000
1785 - - -	8,016,000
1790 - - -	8,675,000
1795 - - -	9,055,000
1801 - - -	9,168,000

Upon a view of this table it may be observed, that although the beginning of the century exhibits a decreasing population, the lost number had been regained in 1720; and since that time a continual, though irregular, increase is manifest. It also appears, that the population of England and Wales, in 1801, compared with that of the beginning of the last century, is as 1,000 to 597, or nearly as ten to six.

The following table for Scotland is formed in the same manner; but being founded on a collection of no more than 99 parish registers, from different parts of the country, it is of much less authority. These parishes contain less than a seventh of the whole population. In Scotland there are in all about 900 parishes.

TABLE of Population throughout the last Century.

SCOTLAND.	
In the Year	Population.
1700 - - -	1,048,000
1710 - - -	1,270,000
1720 - - -	1,390,000
1730 - - -	1,309,000
1740 - - -	1,222,000
1750 - - -	1,403,000
1760 - - -	1,363,000
1770 - - -	1,434,000
1780 - - -	1,458,000
1785 - - -	1,475,000
1790 - - -	1,567,000
1795 - - -	1,669,000
1801 - - -	1,652,370

The population of Scotland, in 1801, compared with that of the beginning of the last century, appears to be as 1000 to 634, or nearly as 10 to 6½, which, as the 99 parish registers were received from the manufacturing parts of Scotland, gives too high a statement of the increase of population.

In the year 1695 a poll-tax was levied in Ireland; and on this occasion it was calculated, that the number of inhabitants was 1,034,000; but the usual evasion of taxation may be supposed to have considerably lessened the real number. About the year 1795, Ireland contained, at least, 4,000,000, and since that time the number has not increased. However, it may not be very erroneous to estimate the population of Ireland at 1,500,000 in the year 1700, and at 4,000,000 in the year 1801. If this be granted, the population belonging to all the British isles has increased during the last century from 8,100,000 to 15,100,000.

Of the population of Great Britain, the army has, of late years, engrossed a considerable share. It consists of regulars, in cavalry, and infantry, and the militia, exclusive of artillery and engineers. The volunteer corps in Great Britain and Ireland amounted in December, 1803, to 430,000; and on the 1st of January, 1805, the secretary of war made the following return of the state of the British forces at home, and on foreign stations, viz. 21,223 of cavalry, including 1,088 horse artillery; 8,559 of artillery; 124,878 of infantry, including 20,747 men for limited service, and 21,208 men belonging to foreign and provincial corps in British pay; and 89,809 of militia: so that the whole British force, in regulars, militia, and volunteers, amounts to 674,469 men. To these we may add the royal regiment of artillery, the horse brigade, the brigade of gunners and drivers, and companies of foreign artillery, amounting on the 1st of January, 1805, to 16,670; and the corps of royal artillery, artificers and labourers, including, at the same period, 704 men.

But the great rampart and supreme glory of Great Britain consist in her navy, in size, strength, and number of ships, far exceeding any example on record. In 1805, the total of ships in commission amounted to 684, consisting of 111 of the line, 19 fifties to forty-fours, 150 frigates, and 404 ships of various kinds; besides several repairing, in ordinary, and building: amounting in the whole to 895. For this immense fleet, the number of seamen, annually voted, amounts from a hundred to a hundred and twenty thousand; a number which no other country ancient or modern could have supplied. To support the expenditure occasioned by the army and navy of Great Britain, to defray the other charges of government, and also to discharge the interest of the national debt, a very large

sum is raised by a variety of taxes, in aid of the revenue, arising from the excise and customs. The ability of the country for bearing the burden which its exigencies impose upon it, consists in the produce of its land and manufactures, and in the circulation of property, occasioned by its domestic trade and foreign commerce. These sources of national wealth have been improved to an astonishing degree in the course of the last century and a half. Availing ourselves of the estimate of the national wealth of Great Britain, furnished by Mr. Grellier, an ingenious writer, in one of our periodical publications (Monthly Magazine, vol. x.) we shall subjoin the following statement of its vast increase during the period above mentioned. In 1664, sir William Petty estimated the wealth of England at the sum of two hundred and fifty millions. His computation is subjoined.

Value of the land; being 24 millions of acres, yielding 8 millions per annum rent, worth at 18 years purchase	£. 144,000,000
Houses; reckoning those within the bills of mortality, equal in value to one-third of the whole	30,000,000
Shipping; 500,000 tons, at 6l. per ton, including rigging, ordnance, &c.	3,000,000
Stock of cattle on the 24 millions of acres and the waste belonging to them, including parks, fisheries, warrens, &c.	36,000,000
Gold and silver coin, scarce	6,000,000
Wares, merchandize, plate, furniture	31,000,000
	<u>£. 250,000,000</u>

But since the time when this computation was made, a great difference in the value of money has taken place, which difference appears from the table of sir George Shuckburgh Evelyn, in the Philos. Transf. for 1798, part 1, page 177, to be in the proportion of about 5 to 14; and, therefore, the total wealth of England and Wales, in 1664, would have amounted to 700,000,000l. according to the present value of money.

The value of land has progressively increased, in consequence of improvements in cultivation, and the increased consumption of its produce, from 18 years' purchase, at which sir William Petty states it, to from 28 to 30 years' purchase. The whole landed rental of England and Wales, and the Low-lands of Scotland, was stated by this writer at about 9 millions; and if he had included the High-lands of Scotland, it is reasonable to suppose that he would not have made the whole rental of the island more than 9,500,000l. G. King and Dr. Davenant, in the reign of queen Anne, stated the rental of England and Wales at 14,000,000l.; about 25 years ago, it was generally reckoned at 20,000,000l.; but at present it considerably exceeds that sum. The cultivated land appears, from the statement of Mr. Middleton, in his "View of the Agriculture of the County of Middlesex," to be 39,027,000 acres, and the commons and wate-lands to be 7,889,000 acres; and, therefore, the total of acres in England and Wales amounts to 46,916,000 acres. If, therefore, we consider the commons and waste lands as equal in annual value to only one million of cultivated acres, the whole may be taken at 40 millions: and taking the average rent, which, at 15s. per acre, appears to be a moderate computation, at a tenth less, the rental amounts to 27,000,000l. and the value at 28 years' purchase to 756,000,000l. The number of cultivated acres in Scotland is upwards of 12 millions, and of uncultivated acres upwards of 14 millions, which, being of little use, may be wholly excluded; and the cultivated part, being rated at an average of 10s. per acre, yields the sum of 6,000,000l.

per annum: and the total rental of Great Britain will be 33,000,000l. and the value of the land, at 30 years' purchase, be 990,000,000l. Other writers have endeavoured to prove, (see Beche's "Observations on the Produce of the Income Tax,") that in the whole extent of England and Wales there are no more than 38,500,000 acres of land; and that Scotland, with its adjacent islands, contains about 21 millions of acres. It is not so easy to ascertain the value of the houses as it is to determine the value of the land; but the following statement of their rent, founded on the numbers returned as chargeable and excused to the window duties, in England and Wales, in 1781, will not be thought too high:

Number of cottages 284,459, at 20s per annum	} £. 284,459
Number of houses under 10 windows, 497,801, at 5l. per annum	} 2,489,005
Number of houses under 21 windows, 171,177, at 15l. per annum	} 2,567,655
Number of houses, above 20 windows, 52,373, at 40l. per annum	} 2,094,920
Total	} <u>£. 7,436,039</u>

The total rent, at 20 years' purchase, makes 148,720,780l. and including Scotland at less than a sixth of England and Wales, the whole will amount to 170,000,000l.

In order to form an idea of the value of cattle and farming stock, on the land, we may consider the black cattle and calves, sheep and lambs, swine, pigs, and poultry, annually consumed in London as worth 6,000,000l. which cannot be more than a seventh part of the whole consumption, amounting therefore in value to 42,000,000l.: but the whole number of cattle existing must be more than double the quantity brought to market; so that, including horses, asses, cows kept for milk, and oxen employed in agriculture, the whole value of the cattle cannot be less than 90,000,000l.

Taking the annual consumption of grain of all sorts at 14,000,000 quarters, which is probably below the truth, it may be presumed, that in general there is at least three or four months' supply on hand, which, at only 35s. per quarter, will amount to at least 6,125,000l. The value of hay and straw, and all kinds of fodder, and of all implements of husbandry, cannot be less than five or six millions, and with the former sum will make about 12,000,000l. The total value of cattle and farming stock is therefore 102,000,000l.; and if it be estimated as equal in value to only three times the yearly rent, it will amount to nearly this sum.

The value of the shipping belonging to Great Britain may be more accurately ascertained: for it appears that, in 1794, the tonnage of the vessels in the merchants' service was 1,589,162 tons; but taking it at 1,500,000l. at 8l. per ton, it makes 12,000,000l. and this is without doubt below the real value. In the year ending the 5th of January, 1804, the number of British ships entered inwards was 11,396; their tonnage 1,614,365; and the number of foreign ships 4,252, and their tonnage 638,034; the number of British ships cleared outwards, was 3,662, and their tonnage 574,542; and the number of foreign ships 3,662, and their tonnage 574,542. The shipping of the navy may perhaps be estimated at 4,000,000l. making, with the former sum, 16,000,000l. to which some addition should be made for the value of the small craft employed on our rivers and canals.

The quantity of money in the country has, at different times been a subject of dispute, and has never been determined with precision. However, by the re-coinage in 1773, 1774, and 1776, it was found, that the value of the light gold delivered into the bank amounted to 15,563,593l.; and it was generally admitted that somewhat more than two

millions of heavy guineas remained out in circulation, which with the silver and copper coin, made the whole, at that time, about 20 millions, at which sum Mr. Chalmers estimated it in the year 1786. Mr. Grelrier estimates it at about 25 millions.

Of the value of the merchandize and manufactures usually in the hands of the merchants, wholesale dealers, shop-keepers, and manufacturers, it is very difficult to form a satisfactory idea. The total amount of the exports in 1797 was 28,917,000l. and of imports 21,013,000l. according to the custom-house accounts; but these accounts being considerably below the true value, if we take the whole as rated only 60 per cent. under the value in 1800, the annual amount of foreign trade estimated for that period, will be 79,888,000l. to which some addition should be made for smuggled goods. Mr. Pitt, in 1799, computed the imports at 25,000,000l. and the exports at more than 33,000,000l.; and in Feb. 1801, the foreign exports at 17,000,000l. and the domestic at 20,000,000l., amounting to a total of 37,000,000l. The official value of all imports, on an average of six years, ending the 5th of January, 1804, was 29,490,945l.; and the official value of British manufactures exported, on the same average to the same time, was 23,834,340l.; and real value 40,100,870l.; and the official value of foreign merchandize exported, on the same average, to the same time, was 15,323,500l.; and the real value 9,323,257l. It was the opinion of a numerous meeting of merchants in March, 1797, that there is always, at the least, two months' supply of export and import merchandize in the custody of the merchants and traders, which, according to the above total of 79,888,000l. will amount to 13,314,660l., to which some addition should be made for property in the hands of foreign merchants. But the value of goods in the hands of manufacturers and retail traders far exceeds this sum. The official value of British manufactures exported in 1798 was 19,771,510l.; but this being at least 71 per cent. below the real value, we may take the actual value, on an average of two years, at 31,356,793l., which, it is presumed, cannot be more than a third of the whole produce of our manufactures; and accordingly, this will amount to 94,070,379l. If we deduct 5,000,000l. for that small part which is supposed to be in the hands of the merchants, the remainder will be 89,070,379l.; and of this it is probable that there is much more than three months' supply in the hands of the manufacturers and retail traders, which, estimated in this proportion, amounts to 22,267,594l.

As to the value of that part of the property of individuals which consists in household furniture, wearing apparel, provisions, fuel, carriages, &c. &c. we can recur only to conjecture; but it may be thought not to be over-rated at three times the yearly rent of the houses which contain it, or 26,026,000l. in the whole of Great Britain.

The following summary will exhibit the results of the above estimates:

Value of the land of Great Britain	£. 990,000,000
Houses	170,000,000
Cattle, and all kinds of farming stock	102,000,000
Shipping, navy, and merchant ships	16,000,000
Money	25,000,000
Goods in hands of merchants and whole- sale dealers	} 13,314,000
Goods in hands of manufacturers and retail-traders	} 22,267,000
Furniture, apparel, &c.	26,026,000
Total	} <u>£. 1,364,607,000</u>

From the above statement it appears that, since the year 1664, there has been an average gain of upwards of four millions per annum, of which a very considerable part has been derived, directly or indirectly, from foreign commerce. The great increase of the annual income affords a further proof that there must have been such an accumulating surplus. Sir W. Petty (Pol. Arith. p. 123.) supposed the income derived from land to be 8,000,000*l.* the profits of personal estates 8,000,000*l.* and the profits of all kinds of labour 26,000,000, making together 42,000,000*l.* Mr. G. King estimated the whole income at 43,500,000*l.* Dr. Davenant, in 1701, states the income derived from land at 10,000,000*l.* the profits of trade at 6,000,000*l.* and those of sciences, arts, labour, industry, manufactures, retailing foreign goods, and buying and selling home commodities, at 33,000,000*l.* making in the whole 49,000,000*l.* These accounts are exclusive of Scotland; but after making a sufficient addition for this country, it will appear that there has been a considerable increase of the general income. Sir John Sinclair, in his "Hints addressed to the Public," in 1783, observed, that the income of the country arising from lands, commerce, and manufactures, was commonly calculated at 100,000,000*l.* which he inclined to think a low valuation; and, without doubt, the profit derived of late years from each of these sources has considerably increased. It is not easy to form a very precise estimate of the national income; but the following statement is presumed to be not very inaccurate:

The land rental, after deducting one-fifth	} £. 20,000,000
The tenants' rental of land, deducting two-thirds of the rack-rent	} 6,000,000
The amount of tythes, deducting one-fifth	} 4,000,000
The produce of mines, canal navigations, &c. deducting one-fifth	} 3,000,000
The rental of houses, deducting one-fifth	} 5,000,000
The profits of professions	} 2,000,000
The rental of Scotland, taking it at one-eighth of that of England	} 5,000,000
The income of persons resident in Great Britain, drawn from possessions beyond the seas	} 5,000,000
The amount of annuities from the public funds, after deducting one-fifth for exemptions and modifications	} 12,000,000
The profits on the capital, employed in our foreign commerce	} 12,000,000
The profits on the capital employed in domestic trade, and the profits of skill and industry	} 28,000,000
Total	£. 102,000,000

From rent of lands	£. 33,000,000
—ditto of houses	8,500,000
Profits of farming, or the occupation of the land	} 6,120,000
Income of labourers in agriculture	} 15,000,000
Profits of mines, collieries, and inland navigations	} 2,000,000
Profits of shipping in merchants' service, and small craft	} 1,000,000
Income of stock-holders	} 15,500,000
From mortgages, and other money lent on private securities	} 3,000,000
Profits of foreign trade	} 11,250,000
Ditto of manufactures	} 14,100,000
Pay of the army and navy, and seamen in merchants' service	} 4,500,000
Income of the clergy of all descriptions	} 2,200,000
Income of the judges, and all subordinate officers of the law	} 1,800,000
Professors, school-masters, tutors, &c.	} 600,000
Retail trades, not immediately connected with foreign trade or any manufacture	} 8,000,000
Various other professions and employments	} 2,000,000
Male and female servants	} 2,000,000
Total	£. 130,570,000

If the total expenditure be estimated at 125,860,000*l.*, which has been deduced from a minute, and, perhaps, as accurate a statement of particulars as the subject, admitting of various conjectures and presumptions, allows, the difference between this expenditure and the general income shews the annual gain of the country, or the sum applicable to the extension of commerce, the reservation of a greater quantity of foreign articles, the increase of shipping and buildings, agricultural or mechanical improvements, or other augmentations of the general stock.

On introducing the income-tax, Mr. Pitt, chancellor of the exchequer, gave the following estimate of the annual income of Great Britain:

As one of the principal sources of the wealth of Great Britain consists in its manufactures, it may not be improper to give a brief statement of them; reserving a more copious detail for other articles in this dictionary, under which they will separately occur. The woollen manufacture deserves to be first mentioned, because it is the most ancient, and, in a variety of respects, the most important staple of the country. In an examination of the principal woollen manufacturers by a committee of the house of commons not long ago, the quantity of wool grown in this country was estimated at 600,000 packs of 24*lbs.* each, which, valued at 11*l.* per pack, amount to 6,600,000*l.*: and though the increase of value of manufactured wool is various, and depends on its quality, yet it was stated, that the total value of the wool manufacture in this country amounts to 19,800,000*l.* But the calculation supposes, that the number of sheep, in 1791, was 28,800,000, which exceeded the truth at that time, and much more since that period; and it was formed upon an unusually high price of wool. But the estimate will be much less objectionable, if it be formed on 500,000 packs at 10*l.* 10*s.* per pack, and thus the value of the wool will be 5,250,000*l.*, and its manufactured value will be 15,750,000*l.* The average value of woollen goods exported for 1797, 1798, and 1799, is 6,104,211*l.* which, as the custom-house values of goods exported are much below their real value, requires an addition of about 25 per cent. and thus it becomes 7,630,263*l.* The value of goods retained for home consumption will be nearly equal to that of such as are exported; and, therefore, the whole value of the manufacture appears to be about 15,260,000*l.* and may be taken, at a medium, between this sum and that before stated, at 15,500,000*l.* Deducting 10 per cent. on the cost of the goods, for the profits of the manufacturer, with interest of his capital, there will remain 14,090,909*l.* for the cost of materials and wages of labour: and as the value of the wool is about 5,250,000*l.*; the amount of workmanship, or the wages of all the persons employed in this manufacture, is 8,840,509*l.*; and the whole number of persons employed, averaging their wages at 8*s.* each per week, does not exceed 425,043.

The value of the leather manufacture may be stated at 10,500,000*l.* from which deducting 954,545*l.* for the profits of the capital, and 3,500,000*l.* for the cost of the raw

article, there will remain 6,045,445*l.* for the wages of persons employed in it, which, allowing to each 2*5l.* a year at an average, makes the number employed 241,818.

The cotton manufacture was formerly inconsiderable, in comparison with its present state. The total quantity of cotton wool imported into England, on an average of five years, ending with 1705, was 1,170,881*lbs.*; and so late as the year 1781, it amounted to only 5,101,920*lbs.* But this manufacture was so much extended, that before the commencement of the last war the consumption of cotton wool amounted to upwards of 32,000,000*lbs.* per annum. During the years 1796, 1797, 1798, and 1799, the annual import, at an average, was 32,434,000*lbs.*; the value of which, when manufactured, cannot be less than 9,500,000*l.*; and if we deduct from this sum 865,636*l.* for profits of capital, at 10 per cent. and 3,824,250*l.* for cost of the raw material at 2*s.* 6*d.* per pound, there will remain 4,832,114*l.* for wages, which, divided at the rate of 1*5l.* per annum for each person, on account of the number of women and children employed, makes the whole number 322,140 persons.

The silk manufacture has of late years experienced little fluctuation; the average of raw and thrown silk imported for three years preceding the 5th of January, 1797, was 883,438*lbs.*; and the usual quantity cannot be stated at less than 900,000*lbs.* the value of which, when manufactured, is about 2,700,000*l.* The cost of the silk, averaging that of the raw and thrown at 28*s.* per pound, amounts to 1,260,000*l.*, and the profits of the manufacturer to 245,454*l.* at the rate of 10 per cent. on the cost when manufactured. The number of persons employed in this manufacture has been stated at 200,000 and upwards; but there is reason, says Mr. Grellier, to believe that it does not exceed 60,000 of all descriptions.

The linen manufacture of Great Britain is chiefly confined to Scotland, though some branches of it are carried on in Manchester and other parts of England. The total quantity of British linen exported during the years 1797, 1798, 1799, was 56,481,000 yards; and if the quantity retained for home consumption is not greater than the export, the value of the whole must be at least 1,600,000*l.*; and that this does not exceed the truth is probable, if the yearly value of the whole manufacture in Great Britain, with the thread and other branches of the flax trade, is stated at 2,000,000*l.*, and the number of persons employed at 60,000.

The hemp manufacture at present exceeds 1,500,000*l.*, but it is less in time of peace; and the number of persons employed is probably not less than 35,000.

The paper manufacture has of late greatly advanced. About 100 years ago, the paper made in this country was almost wholly the coarse wrapping paper, and for a long time the superior kinds were for the most part imported; but the export is now considerable. The annual value of the manufacture, at the present high prices of the article, cannot be less than 900,000*l.*; and the number of persons employed is 30,000.

The glass manufacture has of late very much improved and increased; so that it may now amount to 1,500,000*l.* and the persons employed in it are about 36,000.

The potteries and manufactures of earthen ware and porcelain have rapidly advanced during the present century, in consequence of the improvement they have received, and the introduction of many new and beautiful wares both for our own use and foreign markets. We are particularly indebted to Mr. Wedgwood, "for converting clay into gold." The annual value will probably not be over-rated at 2,000,000*l.*, and the number of persons employed at 45,000.

The iron manufacture is supplied partly by the produce of our own mines, and partly by those of other countries.

With respect to the first it is said, the total produce of pig-iron in Britain does not at present exceed 100,000 tons; and reckoning on an average, that 33 cwt. of crude iron produces one ton of bars, and that the manufacture of malleable iron amounts to 35,000 tons per annum, this branch will require 57,750 tons of crude iron; and the value in bars at 20*l.* a ton is 700,000*l.*; the remaining 42,250 tons, cast into cannon, cylinders, machinery, &c. at 14*l.* a ton, is worth 591,500*l.* The supply of foreign bar-iron is chiefly obtained from Russia and Sweden; and the quantity imported, on an average of 12 years, has been 44,135 tons, worth, at 22*l.* per ton, 970,970*l.*, which, together with the former sums, amounts to 2,262,470*l.* Some years ago, the value of the iron manufacture was estimated at 8,700,000*l.*; but if this sum should appear too high, we may include tin and lead, and the value of the whole will probably amount to 10,000,000*l.*, and the number of persons employed to 200,000.

The copper and brass manufactures are now established in this country. Till about the years 1720 or 1730, most of the copper and brass utensils used for culinary and other purposes in this country were imported from Hamburg and Holland, being procured from the manufactories of Germany; and even so late as the years 1745 and 1750, copper tea-kettles, saucepans, and pots of all sizes, were imported in large quantities. But by the persevering industry, capitals, and enterprising spirit of our miners and manufacturers, these imports have become totally unnecessary; so that the articles are now all made here, and far better than any other country can produce. The discovery of new copper-mines in Derbyshire and Wales, about the year 1773, contributed to the extension of the manufacture in this country; and it appears to be still increasing, notwithstanding the late great advance in the price of copper. The value of wrought copper and brass, exported during the year 1799, was 1,222,187*l.*; and there is reason to believe, that the whole value of these manufactures at present is at least 3,500,000*l.*, and the number of persons employed 60,000.

The steel, plating, and hard-ware manufactures, including the toy-trade, have been of late much extended, and may probably amount in value to 4,000,000*l.*, and the persons employed to at least 70,000.

It is acknowledged, that many of these estimates must be essentially defective, from the want of public documents respecting many important branches of trade. However, they serve to shew, in a general view, the relative extent of our principal manufactures, as in the following summary:

	Annual Value.	Persons employed.
Woollen - - -	£. 15,500,000	425,043
Leather - - -	10,500,000	241,818
Cotton - - -	9,500,000	322,140
Silk - - -	2,700,000	60,000
Linen and flax - -	2,000,000	60,000
Hemp - - -	1,500,000	35,000
Paper - - -	900,000	30,000
Glass - - -	1,500,000	36,000
Potteries - - -	2,000,000	45,000
Iron, tin, and lead	10,000,000	200,000
Copper and brass -	3,500,000	60,000
Steel, plating, &c. -	4,000,000	70,000
	£. 63,600,000	1,585,000

To the above enumerated manufactures of greater importance, we might have added those of hats, horn, straw, &c. which taken together are of very considerable amount, and employ a great number of hands. There are also some, which, though not generally included among the manufactures,

# BRITAIN.

factures, partake of the nature of these, and might, not improperly, be classed with them. To this head we might refer the elegant branch of exportation, or that of beautiful prints, for which this country is in an eminent degree indebted to the late alderman Boydell. Grellicr, Month. Mag. Jan. 1801.

The commerce of Great Britain extends through the eastern and western hemispheres of the globe, by means of the capital and credit of the country, the skill and industry of its artizans and manufacturers, the number of its ships and the character of its seamen, and the enterprising spirit as

well as established reputation of its merchants. The number of registered vessels belonging to the British dominions, and employed in trade in 1802, was 20,568, their tonnage 2,128,055, and the number of seamen navigating the same, 154,530. In 1803, the number of vessels was 21,445; their tonnage 2,238,249; and the number of men 155,445; being an increase of 877 ships, of 110,194 tons, and of 915 men.

The following table will exhibit a complete view of British commerce solely from the port of London, for one year, ending Jan. 5, 1795, since which the commerce has increased.

Names of the Countries.	Value of Imports into London.			Value of Exports from the Port of London, to Foreign Parts.

## RECAPITULATION.

The aggregate value of goods imported into London in one year	-	29,706,476	17	4
British manufactures exported	£. 11,396,539	13	8	
Foreign merchandize, do.	14,208,925	14	6	
	-	<u>25,605,465</u>	<u>8</u>	<u>2</u>
Value of goods imported in upwards of 9000 coasting vessels, averaged at 500l. each.	} 4,500,000	0	0	
Value of goods exported coastways, in about 7000 vessels, at 1000l. each.	} 7,000,000	0	0	
	-	<u>11,500,000</u>	<u>0</u>	<u>0</u>
Total amount of property shipped and unshipped in the river Thames, in the course of a year, estimated at	-	<u>66,811,942</u>	<u>5</u>	<u>6</u>

If we add to this estimate, the accounts belonging to the other parts of Bristol, Liverpool, &c. the account must be enormous.

From the states of North America are chiefly imported tobacco, rice, indigo, timber, hemp, flax, iron, pitch, tar, and lumber; from the West Indies, sugar, rum, cotton, coffee, ginger, pepper, guaiacum, sarsaparilla, manchineal, mahogany, gums, &c.; from Africa, gold-dust, ivory, gums, &c.; from the East Indies and China, tea, rice, spices, drugs, colours, silk, cotton, saltpetre, shawls, and other products of the loom; from our remaining settlements in North America, furs, timber, pot-ash, iron; and from the various states of Europe, numerous articles of utility and of luxury. Pinkerton's Geog. vol. i. p. 100.

For other particulars relating to Great Britain, see CONSTITUTION, DEBT, FUND, PARLIAMENT, REVENUE, &c. &c. See also ENGLAND, SCOTLAND, and WALES.

BRITAIN, in *History*. It will be most suitable to the plan of this work, to divide the history of England into several branches, each of which may be consulted under the proper heads. These divisions will be,—the history of the island anterior to the Saxon invasion, which will be the subject of the present article;—the history of the Saxon octarchy from the invasion of the Saxon tribes to the period of the Norman conquest, which will be introduced under the word SAXONS;—the history of England from the Norman conquest to the accession of James I., for which see the article ENGLAND;—and the history from that period to the present times, which will be inserted under the same head. SCOTLAND, IRELAND, and WALES, will be separate subjects of history; and their transactions, so long as they continued independent nations, may be fought for under their respective names. So much as is necessary to be known of the history of the other British isles, will be found under the articles of HEBRIDES, *Isle of Man*, ORKNEYS, and SHETLAND. These different topics will comprise all that is material in the history of the British isles.

It would give us very little trouble to state the history of Britain anterior to the Saxon invasion, if we could adopt the account so popular among our ancestors, and give the fictions of Jeffery of Monmouth a place in our authentic annals. But Jeffery's history, though supported by the belief of most of the men of learning in the sixteenth century, by many in the seventeenth, and by some in the last, cannot for a moment be suffered to rank in our estimation as true history. We need not combat the tale by a profound disquisition: it has the merit of discrediting itself by its absurdities and improbabilities; and we might dismiss it into oblivion without another sentence, but that the public may be curious to know what sort of fiction it was, which was capable of interesting our ancestors so much, and of seducing so many learned men to patronize and defend it.

After settling Eneas in Italy, marrying him to Lavinia, and killing Turnus, in exact conformity to Virgil, Jeffery gives him one Sylvius for a grandson, whose friends, the magi of the day, oblige with a prophecy, that his wife was pregnant with a son, who would destroy both his father and mother, and after travelling over many countries in banishment, would at last arrive at the highest pitch of glory.

This luckless lad was Brute, who killed his mother in his birth, and, at 15 years of age, completed the prediction by destroying his father. Being expelled Italy by his kinsmen for the parricide, he went to Greece, and found the Trojans kept in slavery by one Pandrusus, whom the author compliments with the title of king of the Grecians, but whom no Greek historian has ever acknowledged. Brute assembled the Trojans from all parts, and sent a letter to this Pandrusus, assuring him that the Trojans would rather live after the

manner of wild beasts on flesh and herbs with liberty, than enjoy the greatest luxury under his slavery.

Pandrusus was surpris'd at this message; but he was ignorant that he had to do with a hero whom his historian had determined to make an infallible conqueror. It was, therefore, in vain he besieged a town called Sparatinum, the situation of which only Jeffery knew, but with which he has forgotten to acquaint us; for though he outnumbered the Trojans so much that their brave commander dreaded a pitched battle, yet Brute contrives a stratagem to enter their camp at night, deceive the watch, and kill them all in their sleep. He accomplishes all this as easily as he conceived it. Pandrusus is taken prisoner; his army annihilated. A consultation is held to consider what is to be done with the captive; and as it is a rule with Jeffery to detail the very words of every conversation, the speeches are again recited at full length; and Pandrusus is liberated on condition of giving Brute his daughter Ignoge for wife, with plenty of gold, silver, ships, corn, wine, and oil, and also permission to remove to some other country.

With his new wife and 324 ships, and after many swoons on the part of Ignoge, and many kisses on the part of Brute, "which he ceased not till she grew weary of crying, and fell asleep," he set sail, and two days afterwards came to an uninhabited island, in which was a convenient temple of Diana, and a statue of the goddess, that kindly gave answers to all who consulted her. In six very pretty lines, which Milton thinks too good for the age of the translator, he asks her whither they were to go, though a reasonable man would have formed some notion of that before he had set out, and not have trusted to the vague chance of a deserted island and a priestless oracle.

After repeating the words exactly nine times, and walking four times round the altar, and laying himself before it upon the skin of a white hart, he fell asleep. About the third hour of the night (for Jeffery is very particular in circumstance, though the incident is plac'd about 2000 years before him), about the third hour of the night, "the usual hour for deep sleeps," apparitions, and visions, the goddess in person appeared to the Trojan, and in eight lines as harmonious as his own, informs him, that beyond Gaul there was an island in the west, formerly occupied by giants, but then deserted, where he should find another Troy, and a race of kings, by whom all the world should be subdued.

With this answer, but without being made much wiser by it, for Brute knew as much about Paradise as about Gaul, they put to sea again in a westward course, and in 30 days came to Africa, being ignorant as yet whither to steer. At last they reached the straits of Gibraltar, after great danger from pirates, where their ship had nearly been overturned by those sea-monsters called Syrens. However, they made a shift to escape, and contrive by advancing still to the west, for no retrograde course is mentioned, to get into the Tyrrhenian sea, though, unfortunately for accurate geography, this sea, instead of being near Spain, or beyond it, is in the direct contrary course, because it washes the lower part of Italy. But be this as it may, here they pick up some Trojans, whose general was Corineus. This was a very modest man, but withal so courageous, "that if he encountered with any giant, he would immediately overthrow him, as if he had been a child."

From this Tyrrhenian sea they reached the Loire, as suddenly as if Jeffery had supposed they were close together. In vain all the kings and princes of Gaul united against the invaders; for they, whom some pirates had greatly endangered, and some Syrens had nearly drowned, now defeat all the confederated Gauls, burn their cities, lay waste their fields, and make "dismal slaughter among the people, being unwilling

unwilling to leave so much as one alive of all that wretched nation." After these humane exertions, "they build towns, as Homer testifies," in some work to Homer and to us equally unknown; and then doubting if it were prudent to fight there any more, they fail to Britain, the promised land, and arrive at Totnefs.

A new train of miracles begins; and, indeed, a little impiety is exhibited by Jeffery, for the goddess told Brute, that this island had formerly been inhabited by giants, but was now deserted; yet, in contradiction to the divine assertion, the daring monk, in his sixteenth chapter, peoples it, though thinly, with giants still.

However, at their coming, away fly the giants to their caves, to the great discontent of Corineus, "to whom it was the greatest possible diversion to encounter them." To indulge his favourite inclination, he begs "the country of Cornwall for his share, because the giants were in greater number there, than in all the other provinces." Brute obliges him: and an opportunity soon arrives to make Corineus very happy.

"Among the rest there was one detestable monster, named Goemagot, in stature 12 cubits (or about 18 feet high), and of such prodigious strength, that at one shake he would pull up an oak, as if it had been an hazel wand. One day, when Brute was at Totnefs, this fellow, and 20 more of his companions, fell upon the new-comers, among whom they made a dreadful slaughter." This was precisely what Corineus wanted; for as the other twenty were soon dispatched, Brute ordered "Goemagot to be preserved alive, out of a desire to see a combat between him and Corineus, who took vast pleasure in such rencounters."

"Overjoyed at this, Corineus threw aside his arms, and challenged the giant to a wrestling match;" but a Cornish hug from the Goliath of Cornwall soon broke three of Corineus's ribs, which, we are very circumstantially told, were two on his right side, and one upon his left. But this accident, instead of disabling, "enraged Corineus to such a degree," that though never mentioned but as a mortal man, and of mortal size, he seized hold of this tremendous giant, "threw him over his shoulders as if he had been a hare, ran with him as fast as he was able for the weight to the next shore, nay, got even up to the top of a very high rock, and there hurled down the savage monster into the sea." "The place where he fell," adds Jeffery, "is called Goemagot's leap to this day."

The above circumstances present a faithful abridgment of the first sixteen chapters of this ancient history. The first patrons of "The British History" defended all its story. The later advocates allow it to contain a few hyperboles, but warmly maintain that it ought not to be wholly rejected on this account. But, unfortunately, the whole history is in this strain; of this only a few more brief specimens need be given.

Brennus, who besieged Rome at the head of the Gauls, when Camillus and the geese saved the capitol, was, according to this history, a Briton; and his brother Belinus, then king of Britain, was with him. Conan, king of Amoric, wanting wives for his soldiers, asks the king of Cornwall for some, who sends him 11,000 daughters of his nobility, and 60,000 of a meaner sort. The greater part of these are drowned; the rest are murdered. The magi commanded Vortigern to find a youth who had never had a father, and Merlin is accordingly brought, whose mother had a miraculous conception from a demon. The king cannot build a tower, because it is swallowed up as fast as it is raised. Merlin foretells, that there is a pond deep under the ground, which occasions it, and that at the bottom of it are two hollow stones, in which two dragons are asleep. Uther Pen-

dragon, to gratify his passion for Igera, is transformed by Merlin into the figure of her husband. To crown the whole, Cadwallo being tossed on a certain island, and longing for venison, his servant Brian goes in search of some, but finding none, he cuts out a piece of his own thigh, which he roasts upon a spit, and carries to his master as venison!!! Whatever may have been the prejudices of former times in favour of the book, every reader will now treat it with derision, though he may not chuse to adopt the quaint phraseology of the Dutchman, who called it a "groote, grove, lange, dicke, tastelücke, ende unbefchaemte logen," which in plain English is, a great, heavy, long, thick, palpable, and shameless lie.

The account of Brutus and his Trojans having colonized Britain, was in existence before Jeffery. It appears in Nennius, who lived about, or before, the ninth century: his preface is a triumph to the advocates of the Trojan, because it announces that he had taken his history not only from the Roman annals, the chronicles of the holy fathers, and the histories of the Scots and Saxons, but also from the traditions of his ancestors, and from the monuments of the ancient inhabitants of Britain. On inspecting his history, it is curious to remark to what sources he refers his several incidents. The tale of Brutus is from the annals of the Romans; and his genealogy up to Æneas, thence to Noah, and thence to Adam, was furnished to the chonographer by the traditions and writings of those who first inhabited Britain. Unfortunately for the tale, no Roman annals that we know of have sanctioned the history of Brute; and we may be allowed to deny that the Druids had any acquaintance with the Jewish scriptures.

Of other romances on this remote part of our history; the dishonest forgery of Annus of Viterbo, who made certain annals of Berofus and others, in which Samothes, the son of Japhet, is said to have led a Celtic colony into Britain; of Albion, a giant, who was sent after Samothes to give it a name; of the visits of Hercules and Ulysses; of Albina, the princess of Syria, and her thirty sisters, committed to the mercy of the sea for murdering their husbands, who were thrown providentially on England; of Celto, the daughter of Britannus; of Britannus, the grandson of Nemeth, who brought a colony here out of Ireland, and of such like wild and absurd inventions, we need only say that they are fit to class with the history of Jeffery, and may be permitted to repose in oblivion, as proper companions to his Brute and Corineus. To the same grave may be consigned all those writers who have wasted their time in deriving the Britons from Japhet, from Gomer, from Javan, from Thiras, from Afskenaz, or from Shem. Such derivations are as unreasonable as the speculation of the man who affirmed that the earth was divided between the three sons of one father, as a typical representative of the divine Trinity.

The only accounts that can be fully relied on for the early history of the European nations, are those which the Roman and Grecian writers have transmitted to us. Even their statements frequently demand our criticism, but we must dig for truth in their mines.

From the extent of geographical knowledge which Homer displays, we might not unreasonably expect to find some allusion to the British islands in his works; but although he mentions with familiarity Italy, Sicily, Greece, Thessaly, Epirus, with some adjacent countries, and by Strabo and later authors, has been thought to allude to Spain, no other part of Europe is explicitly commemorated in his Epopeas.

One of the oldest Greek books which contains any allusion to the British islands, is the Argonautica ascribed to Orpheus. The celebrated person of this name lived anterior

rior to Homer; but the poems that pass under his name, are by Suidas and Stobæus attributed to a man whom they call Orpheus the younger, and whom others name Onomacritus. He has been referred to the times of Pisistratus, or about 560 years before Christ.

This poem is curious as a specimen of the geographical opinions which the author and his contemporaries entertained of the western part of Europe. It was a voyage from Thesaly to Colchis on the eastern part of the Euxine. But the part most interesting to us, is the manner in which these adventurers are stated to have returned home; for, instead of tracing back their course to Colchis, the difference of which was comparatively small, they sail to the Palus Meotis, or Sea of Afoph, thence up the lands to the northern ocean, and, after circumnavigating Europe, arrived at last at their destined port. So little was Europe known at this early period, that it was fancied to have been possible to have sailed from the Euxine sea into the Hyperborean ocean.

Whoever reads this composition, from verse 1053 to 1295, though he may be entertained with the romantic fable of the Macrobian, who are seated in the icy ocean, and who, after living 1000 years in the most active exertions of wisdom and justice, void of labour and law, sink from uninterrupted felicity, into a gentle, but perpetual sleep; yet he will need no further evidence to convince him, that the author was wholly ignorant of the continent of Europe. It is indeed singular, that he mentions the island Iernida, which is presumed to be Ireland, and which the Argonauts pass with apprehension in their voyage from the North sea. But this is not mentioned with the accuracy of a man who knew what he was writing about, or else Britain, and not Ireland, would have been commemorated; for though Camden thinks that the island next mentioned under the name of Πικησιον, or Picis Oblitam, was Britain, this cannot be the fact, because, after they had left Iernida, they were tossed by a furious tempest for twelve days before Lynceus discerned the island Πικησιον. It is remarkable, that in opposition to all the mythologists, the author makes this island in the Atlantic to have been the residence of Ceres, and the place from which Proserpine was carried off by Pluto. With equal peculiarity he makes another island in the same sea, which he calls Νυκτιον Χερσον; and which Camden, by a strange error, thought to be the same as the former, though three days sail from the habitation of Circe. The geographical mistakes of this author are worthy of notice, because the man who aspired to write in the celebrated name of Orpheus, is not likely to have been the most ignorant of his contemporaries.

About 450 years before Christ, Herodotus, the father of history, flourished. Greece was then so destitute of knowledge, that, like many of his countrymen who possessed activity and energy of intellect, he travelled to Tyre, Egypt, and Assyria, in search of the information which these countries in his days almost exclusively possessed. His composition seems to indicate that he made geographical subjects a principal object of inquiry; and he sought for it at those places where it was most likely to be obtained. The situation of Greece, which on its eastern side lies parallel with Asia Minor, and had frequent intercourse with Egypt, Phœnicia, Sicily, and that part of the Italian peninsula which now composes the kingdom of Naples, introduced him to an acquaintance with the three continents. It is therefore, if any where, in his works, that we may reasonably expect to find the most accurate collection of the facts which were then known concerning the population of Europe, and of the British islands.

But when we take up the history of Herodotus, which gained the Olympic laurel, we perceive that no regions were

at that time known, (with only one exception, which we shall hereafter notice,) except those which military horrors had explored. He is accurate about the tribes or nations that swarmed round the western shores of the Euxine from the modern Constantinople to the sea of Afoph, because Darius had prosecuted a wild expedition against the Scythians who dwelt there. But the historian fails where the Persian despot was checked; or, if he indulges some hasty excursions beyond, it is only to repeat tales so absurd, that the credit of his whole history has been impeached from his Scythic reveries. In other parts of the world, wherever the nations warred whose transactions he records, he seems anxious to be minute and faithful; but every other country which the glitter of arms had not revealed, he did not condescend, because he was unable, to describe.

It is, perhaps, from this circumstance, that when we turn from Greece, and the adjacent kingdoms, and extend with national partiality our view westward over the regions now divided into Spain, France, Germany, the Northern empire, and the British islands, we find the historian lamenting, but ingenuously confessing, the penury of his information.

“I have nothing certain to relate concerning the western boundaries of Europe. I know as little of the islands called Cassiterides, from the tin which is thence imported among us; and though I have diligently inquired, yet have I never seen any man who by his own experience could inform me of the nature of that sea which bounds the extremities of Europe; however, it is certain that amber and tin come from its remotest parts.”

The ignorance of Herodotus must have been the ignorance of his age; for it seems to have by no means proceeded from his neglect of inquiry. “Europe has not been fully discovered by any man; and we have no account whether it be bounded on the north and east side by the sea.”

About 120 years after Herodotus, the preceptor of Alexander flourished, who reigned for so many ages in Europe the monarch of metaphysics. A treatise has been preserved to us, which is usually attributed to him; but to which his right has been disputed by men whose erudition is formidable enough to leave the question undecided, even by those whom their arguments may not convince. If the circumstance that asserts the claim of Aristotle appeared unsatisfactory to the two Scaligers, to Casaubon, Salinasius, Menage, Vossius, and others, we cannot but be, at least, doubtful on the subject. By these gentlemen it has been given to Theophrastus, or to Anaximenes of Lampichus, or to the stoic Posidonius. But whether the book “De Mundo” be the composition of Aristotle, or of some of his contemporaries, or of his immediate successors, or even of later writers, it is, under every opinion, a proper subject for our present consideration. It seems to be a physiological account of the universe; but it also contains a very rapid and concise survey of the geography of the world. If it was written in the age of Aristotle, it will shew how little the geographers of those times knew. If it be of later date, it will prove that lapse of time gave no increase of knowledge.

After a singular conjecture, which Columbus has since happily demonstrated to be just, that beyond the Atlantic there were other continents, some larger, some smaller than our own, he describes the coasts which the ocean, as he thought, washed; and after conducting the sea from the westward through the streights of Gibraltar to the Propontis, he states its progress from the eastern regions. He tells us, that it comes towards the Gallic gulph, and thence to the columns of Hercules.

“In this sea are two islands, called Βεβανικαι, αλειον και Ιερην, larger than those we named above. They are directly above the Celts.”

These

These curious passages deserve a moment's consideration. Of Europe this geographer knew that the northern parts were inhabited by the Scythians, and the western by the Celts; and that beyond the Celts were two islands called *Bretanikai*, whose names were *Albion* and *Hierna*.

This is the earliest author in which the British islands are explicitly named.

That the British islands were known to the ancient world long before the time of Cæsar, may be inferred from the passage in Polybius, which mentions them. This author lived about 200 years before the christian æra. He enjoyed the confidence of Scipio and Lælius; and when he determined to write history, he made many journeys to the parts which he intended to describe.

In the latter part of his third book, he promised to write concerning the *Βρετανικαί νήσοι*, the British islands, and the making of tin. Unfortunately for our curiosity, this treatise has not reached us. It is certain that he composed it, because Strabo mentions his discussions concerning Britain. Three other Grecians also wrote concerning Britain. These were Pytheas, Dicaearchus, and the celebrated Eratosthenes, who all lived anterior to Polybius, and whose opinions about our island Polybius compared and disputed.

Thus we find that Britain was an island which had obtained much notice among the Grecians. We may also perceive, from some intimations of the classical writers, that the British islands had been discovered and visited by the Phœnicians and Carthaginians.

There seems to be no reason to doubt that the *Cassiterides* were another name for the British islands. Pliny says, that Midacritus first brought tin from these islands; and Strabo acquaints us, that the Phœnicians had been long accustomed to visit the *Cassiterides* from Spain for the sake of traffic; but concealing their course from others. He gives a striking instance of their effort to conceal the navigation to our islands. When the Romans followed a Phœnician ship bound thither, for the express purpose of discovering the market, the master ran his ship ashore, and destroyed it, rather than let them trace his course; and he was indemnified by his countrymen for the loss out of the public treasury. But the Romans, by frequent attempts, at last obtained the knowledge which they fought.

Bochart derives *Bretanike*, the Greek name for Britain, from the Phœnician or Hebrew words *ברתאניך*, *Baratanac*, the land of tin. *Cassiteros*, the Greek for tin, from which the islands were called *Cassiterides*, he also compares, with much ingenuity, with the Chaldee *Kitaræ* and *Kiltira*, by which the Targums of Jonathan and Jerusalem render the Greek word *κασσιτερος*.

It was the invasion of Cæsar, about 54 years before Christ, which brought the Romans first acquainted with the natives of Britain. Cæsar, ambitious of attaining the highest distinction in the Roman state, applied himself to warfare, as the surest means of raising an exalted reputation, and of creating a solid power. With this view, he attacked and conquered the Gauls; and in prosecution of the same purpose he invaded Britain.

Not being well acquainted with the harbours of the island, he sent C. Volusenus in a vessel to explore them. The natives, at first alarmed at his preparations and threats, sent overtures of peace. Cæsar received them civilly, but persisted in his invasion. After five days absence, Volusenus arrived at Cæsar's station, and reported his observations. Cæsar embarked two legions of foot in about eighty transports; and with these, and eighteen more for the rest of his army, he sailed towards Britain.

He arrived at a part inconvenient for landing from its mountainous aspect, and beheld the rocks covered with the armed inhabitants. He remained five hours at anchor, wait-

ing for the arrival of his whole force; and when the wind and tide served, he sailed out about eight miles farther to a plain and open shore.

The Britons sent their horse and chariots to oppose his landing, and all their forces followed. A severe contest ensued. The Roman vessels were too large for the shallow sea, and their soldiers were obliged to leap into the waves in unknown places, and with heavy armour, and to conflict with the active natives, who were well acquainted with the coast, and zealous in their opposition. At last the Roman galleys brought their engines to bear against the Britons. Their appearance and effect checked the brave savages, and the standard-bearer of the tenth legion, at that critical moment, rushing with his eagle towards the enemy, the Romans followed with new courage, and, after a desperate struggle, compelled the Britons to retire.

This defeat occasioned new proposals of pacification, which were broken, and the struggle re-commenced. The Britons were repulsed again, but Cæsar chose to abandon all further efforts to conquer the island, and returned to the continent.

In the following year he invaded the island again. The natives vigorously opposed him under the command of *Cassivellaun*. They experienced defeats, but their resistance was too fierce for the Romans to support, and Cæsar again withdrew from the island, having shewn the island to the Romans (says Tacitus) but not having conquered it.

The Britons remained unmolested by any attacks from the Romans till the reign of Claudius, at which period, unfortunately for their independence, but perhaps happily for their civilization, they were invaded by *Aulus Plautius*. Divided by civil feuds, and no longer opposing to the Romans that union of will and power by which they had baffled the genius of Cæsar, the separate exertions of their various tribes were generally disastrous, and the struggle ended in the complete conquest of the island. The events of this conflict are chiefly recorded at great length by Tacitus, and are too familiarly known to us to be recited here. In the third and fourth centuries Britain gave some disturbance to the Roman empire, by the turbulence of that part of the Roman army which was stationed within it. At various intervals they made some of their favourite officers emperors, who contended for the purple with the other competitors. In these centuries Britain was much distressed by the incursions of the *Picts* and *Scots* on the north and west, and by the *Franks* and *Saxons* from the sea. At last the barbarians pressed so vigorously on the Roman empire, that the Roman forces were compelled to abandon Britain in 409, and the island for a short time recovered its independence, to lose it again on the triumphant invasions of the *Saxons*. See *SAXONS*.

*BRITAIN, New*, in *Geography*, an appellation which has been appropriated, by some geographers, to the most northern regions towards *Hudson's bay*, and the coast of *Labrador*; and comprehending the whole tract of country that lies north of *Canada*, commonly called the *Esquimaux* country, including *Labrador*, *New North* and *South Wales*; said to be 850 miles long and 750 broad. This is in general a mountainous, frozen, and barren country; abounding with lakes, rivers, and bays, that furnish plenty of fish. The fishery and the fur-trade are the only products of this country that render it valuable. It is very thinly inhabited by a people resembling the *Laplanders*, and the other nations in the north-western parts of Europe, from whence their ancestors probably migrated. But the name of *New Britain* is not admitted in French or English maps. See *HUDSON'S Bay*, and *LABRADOR*.

*BRITAIN, New*, an island, or rather a group of islands, in the Pacific ocean, being a part of that extensive tract denominated

MINISTAL AUSTRALASIA. It was first explored and named by Dampier, who passed a strait called after his name, between this territory and Papua, or New Guinea. In 1767, Capt. Carteret discovered a channel that lies between New Britain and New Ireland; and he called its north point Cape Soper, its south point Cape Orford, and a bay about the middle of its eastern coast Port Montague. This land was first by Ptolemy's 'quadron in 1721, and by M. de Bougainville in 1768. Dampier, who visited the bay since Capt. Carteret's discovery in 1705, found the land mountainous and woody, but interspersed with fertile vales and beautiful meadows. The country seemed very populous, the natives resembling those of Papua, and navigating their canoes with great skill. The chief produce seemed to be cocoa nuts, but there were yams, and other roots, particularly ginger; and the sea and rivers swarmed with fish. In the main land, and adjacent isles, there are several volcanos. A Spanish frigate, called the *Princesa*, sailed from Manilla, towards the close of the year 1780, for San Blas in California; and having, in her way thither, fallen in with some of the islands which form the northern part of the group called New Britain, she discovered, on the 20th of January 1781, nine small islands covered with palm-trees, surrounded by a sand bank, and forming within themselves a lagoon, or pond of still water, and agreeing, in every other respect, with the description which is given by Valentin of Ontong Java, discovered by Le Maire and Schouten in 1616. The latitude of the southern part of this cluster of islands was observed to be  $4^{\circ} 53' S.$  New Britain lies between  $4^{\circ}$  and  $6^{\circ} 50' S.$  lat. and  $148^{\circ} 20'$  and  $151^{\circ} 20' E.$  long.

BRITANNIC PLAGUE, in *Medicine*. See SWEATING-SICKNESS.

BRITANNICA, in *Botany*. See RUMEX *Aquaticus*, or HYDROLAPATHUM.

BRITANNICO, JOHN, in *Biography*, an eminent Italian scholar of the 15th century, was born in the Brescian territory, of a family originally from Great Britain; and having studied at Padua about the year 1470, kept school at Brescia, and distinguished himself by several learned annotations on various classic authors, particularly Juvenal, Horace, Persius, and Statius in his *Achilleid*. He also wrote grammatical and other tracts, and an eulogy on Bartholomew Cajetano. He is supposed not to have long survived the year 1518, and did not live to publish his notes upon Pliny's Natural History.

BRITANNICUS *Codex Erasmi*, in *Biblical History*, a MS. copy of the New Testament, which is one of the two MSS. (the *Codex Ravianus* being the other) that contain the disputed passage of the three that bear record in heaven, 1 John, v. 7. This MS. is probably the same with that denominated Montfortianus and Dublinensis, noted 61 in the first part of Wettstein's N. T. in the second 40, and in the third 34. It is of the 12mo size, contains the whole N. T., is written on a thick glazed paper, and not on vellum, in a modern hand, and is probably of the 16th century. Mill relates, that it belonged originally to one Froy, a Franciscan friar, who possessed it either about or before the middle of the 16th century; a few years previous to which period, that is, between 1519 and 1522, it was known to Erasmus by the name of "Codex Britannicus." From Froy it came into the possession of Thomas Clement, probably a doctor of philosophy and medicine in England; from him it came into the hands of William Chare, a learned Greek scholar; after Chare, it was possessed by Dr. Thomas Montfort, and from him took its name, because it belonged to him when it was collated for the London Polyglot; and since the time of Usher, who had it after Montfort, it has been preserved in the library of Trinity-college in Dublin, where it is noted G. 97; and hence it is sometimes called Dublinensis. As Erasmus, in the two first editions of his Greek Testament,

omitted 1 John, v. 7. but in the later editions inserted it, because he had found it, as he relates, in a *Codex Britannicus*, it has been concluded, with a very great degree of probability, that the Montfortianus is the same as the Britannicus of Erasmus; because, though every MS. in Great Britain has been carefully searched, this is the only one which contains the passage in question. In proof of this it is strongly urged, that the text of the third edition of Erasmus, in 1522, differs in this interpolated passage from all other editions, except those which were immediately copied from it, and at the same time agrees word for word with the *Codex Montfortianus*. Although no critic would ascribe a high antiquity to the *Cod. Montf.* we have no reason to suspect that it is a mere transcript from the Complutensian Polyglot, which is said to be the case with respect to the *Codex Ravianus*. For the difference is strongly marked in numerous passages, and even the text in question, for which this MS. is famous, is not the same as in that Polyglot. Erasmus describes the *Codex Britannicus* as a Latinizing MS.; and Wettstein entertains the same opinion with regard to the Montfortianus, of which the passage in question, 1 John v. 7, affords the strongest proof; for in the *Cod. Montf.* it not only differs from the usual text, but is written in such Greek as manifestly betrays a translation from the Latin. For the satisfaction of those who may not have access to other means of information, we shall give it below, with all the abbreviations, as it is given by Travis, in his letters to Gibbon, p. 153.

Οτι τρεις εἰσιν οἱ μαρτυ  
 ρουντ' εν τω ουνω, πατηρ, λογος, και πνευμα αγιον  
 και ουτοι οι τρεις εν εἰσι  
 Και τρεις εἰσιν οἱ μαρτυ  
 ρουντ' εν τη γη, πατηρ, υἱος, και αιμα.

Here the article is omitted before the words expressive of Father, Son, and Holy Ghost, because there is no article in the Latin, and it occurred not to the translator, that the usual Greek was ο πατηρ, ο λογος, το πνευμα. He has also εν τη γη, which is false Greek, for επι της γης, because he found in the Latin, in terra. He has likewise omitted και οι τρεις εις το εν εἰσι, which is wanting in many Latin MSS. because the Lateran council, held in 1215, had rejected it through polemical motives. The omission of this clause at the end of the 8th verse proves, not only that the writer of the *Codex Montfortianus* copied from the Vulgate, because no ancient Greek MS. omits the clause in that place, but that he copied even from modern transcripts of the Vulgate, because this final clause is found in all the MSS. of the Vulgate, written before the 13th century. It is further alleged, that πνευμα, in the 6th verse, is altered to χριστος, because christus is the reading of the Vulgate, though it is not found in any Greek MS. Besides, in this MS. the Latin arrangement is observed with regard to the division of the text into chapters, though at the same time the κεφαλαια of Eusebius are noted. This Latin arrangement was introduced by Hugo de S. Caro, in the 12th century, and is that of our printed Bibles; but though observed in the modern MSS. of the Vulgate, it was in general not admitted into the Greek MSS. which adhered to the κεφαλαια of Eusebius. Its admission, therefore, into the *Codex Montf.* not only shews what influence the Vulgate has had in this MS.; but proves, at the same time, independently of other arguments, that the *Codex Montf.* is very modern. For no Greek MS. is known, in which the text is divided into our present chapters, that was written before the 15th century; when the Greeks, who fled from their own country into the west of Europe, became transcribers for the members of the Latin church, and of course adopted the Latin divisions. Moreover, the dots over the ι and υ, which have been urged in favour of the antiquity of this MS. on the authority of Montfaucon, who, in his

"Palæographia," had said that these dots were in use a thousand years ago, are likewise used in the most modern MSS. (see the same Palæographia, p. 324. 333.); and therefore, so far from being a proof of antiquity, they are used as an argument to prove, that the Cod. Montf. is very modern. No one MS. written in small letters, among the specimens produced by Montfaucon, before the 12th century, has these dots. As these letters, *i* and *u*, are always dotted in the Cod. Montf., but not always in the MSS. of the 13th and 14th centuries, and still less often in those of the 12th century, we may infer that the Codex Montfortianus is at least as modern as the 15th century. Michaelis's *Int. to the N. T.* by Marsh, vol. ii.

BRITANY, or BRETAGNE, in *Geography*, was, before the revolution, a considerable province of France, with the title of a duchy, reunited to the crown by Francis I. in 1532. It derived its name from the Britons, by whom it was chiefly inhabited, when they were driven from their own country by the Saxons, and sought refuge in that part of Gaul called *Armorica*, which see. This province forms a kind of peninsula, bounded on the north, west, and south by the sea, and on the east by Maine and Anjou. Its mean length is estimated at 57 leagues, and its breadth at about 33: its extent of coast was computed at about 150 leagues, containing a considerable number of bays and good ports. Its navigable rivers are the Loire and the Vilaine, united with the Drance by means of a canal between Rennes and Dijon. The other rivers are the Ardre, the Ille, the Men, the Borneau, the Claye, and the Aden, which discharge themselves into the ocean. The climate is temperate; and the soil, which is generally gravel or gravelly sand, with low ridges of granite, is diversified with hills and plains; and extensive heaths, resembling Cornwall in its appearance, in some places covered with forests of wood, and in others well cultivated, and producing wheat, hemp, flax, &c. Numerous herds of cattle are bred and fattened in the pastures; game and fish are plentiful; cider is the ordinary drink of the inhabitants, and some parts produce wines and brandy. In some districts of this province there are mineral springs, and mines of iron, lead, and coal. The character of the Britons is rough and choleric; but they are brave, good soldiers, and excellent seamen. The commerce of this province is considerable, and consists of a variety of articles, recited under its principal towns. By the new arrangement, Bretagne forms the departments of the Ille and Vilaine, the North-coasts, Finistère, Morbihan, and Lower Loire.

BRITE, in *Agriculture*, a term applied to hops, when they are over-ripe or shatter; in which case they are said to *brite*.

BRITISH AMERICA, in *Geography*. See AMERICA.

BRITISH COIN. See COIN.

BRITISH CONSTITUTION. See CONSTITUTION.

BRITISH CROWN. See CROWN.

BRITISH ISLANDS, in *Geography*, are those which are adjacent to the British coasts, and subject to the crown of Great Britain. Of these a geographical description, and other particulars relating to them, will be found under their respective names. We shall here only observe, that some of them, as the isle of Wight, of Portland, of Thanet, &c. are comprised in some neighbouring county, and are therefore to be looked upon, in a legal point of view, as annexed to the mother island, and part of the kingdom of England. As to others that require more particular consideration, see *Isle of MAN*, *ALDERNEY*, &c.

BRITISH LANGUAGE. The language of the ancient Britons, when they were first invaded by the Romans, was a dialect of the CELTIC; which had been the language of all the nations of Europe descended from Gomer, and still continued to be spoken by the people of Gaul, and several other countries. This is undeniably evident (says Dr. Henry,

*Hist.* vol. ii. p. 336.) from the nature and reason of things; from the testimony of ancient authors; from the names of rivers, lakes, mountains, &c. in Britain being significant and descriptive in the Celtic tongue; and from the remains of that most ancient and venerable language in some parts of Britain, as well as in some countries on the continent. See WALES.

BRITO, BERNARD DE, in *Biography*, a Portuguese historian and elegant writer, was born at Almeida in 1569, and having entered into the order of Cistercians, was sent to pursue his studies in Italy. On his return he was appointed principal historiographer for Portugal, and was the first writer who undertook a general history of that country; of which, under the title of "Monarchia Lusitana," he published one volume in 1597, and a second in 1609. The work was continued by fathers Antony and Francis Brandano to seven volumes folio; the last of which was printed at Lisbon in 1612. Brito also wrote "Eulogies of the Kings of Portugal, with their Portraits;" "Ancient Geography of Portugal;" and "Chronicle of the Cistercian Order." He died in 1617. *Nouv. Dict. Hist.*

BRITOLAGÆ, in *Ancient Geography*, a people who, according to Ptolemy, inhabited Lower Mœsia, towards the mouth of the Danube.

BRITTEN, in *Geography*, an island in the Frozen ocean, near the south-west coast of Nova-Zembla. N. lat. 71° 6'. E. long. 55° 14'.

BRITTLENESS, in *Natural Philosophy*, that quality of bodies by which they are soon and easily broken by pressure or percussion. It stands opposed to tenacity.

Brittle bodies are extremely hard; the least percussion exerts a force on them equivalent to the greatest pressure, and may consequently easily break them. This effect is particularly remarkable in glass suddenly cooled, the brittleness of which is thereby much increased. Tin, though in itself tough, gives a brittleness to all the other metals, when mixed therewith. The brittleness of glass seems to arise from the heterogeneity of the parts whereof it is composed, salt and sand, which can never bind intimately together.

In timber, brittleness seems to be connected with durability; the more brittle any sort of wood is, the more lasting it is found. Thus it is oak is of so long duration, while beech and birch, as being tough, presently rot, and are of little service for building.

BRITTLENESS of the hoof, in horses. See HOOF.

BRITTON, THOMAS, in *Biography*, the musical small-coal man. This was an ingenious, innoxious, and humble man, of a profession which no longer subsists. Not only the use, but even the name of small-coal is hardly known at present. Dr. Johnson defines it: "Small-coal, little wood coals, used to light fires;" and illustrates the word from the *Spectator*, and *Gay*.

"A small-coal man, by waking one of these distressed gentlemen, saved him from ten years imprisonment." *Spectator*.

"When small-coal murmurs in the hoarser throat,  
From smutty dangers guard thy threatened coat."

Gay's *Trivia*.

In our own memory, small-coal was daily cried about the streets, and of general use in the capital at least, in kindling fires.

Britton was a great favourite of Hearne, the antiquary, whom he much resembled in his fondness for old things, and who has given a long account of him in the appendix to "Homingi Chartularium Ecclesie Wigorniensis," and informs us, that Britton was born at or near Higham Ferrers, in Northamptonshire, from which place he went to London, where he bound himself apprentice to a small-coal man. After he had served his full time of seven years, his master

gave him a sum of money not to set up. Upon this, Tom went into Northamptonshire again, and after he had spent his money, he returned, and set up a small-coal trade, though his master was still living, taking a stable in Clerkenwell, which he turned into a house. This seems the only dishonourable action with which Tom could ever be charged.

Some time after he had been settled in business here, he became acquainted with Dr. Garaniere, his neighbour, an eminent chemist, who admitting him into his laboratory, Tom, with the doctor's consent, and his own observation, soon became a notable chemist, contrived, and built himself a moving laboratory, in which, according to Hearne, "he performed with little expence and trouble, such things as had never been done before."

Besides his great skill in chemistry, he became a practical, and, as was thought, a theoretical musician. Tradition only informs us, that he was very fond of music, and that he was able to perform on the viol da gamba at his own concerts, which he at first established gratis in his miserable house, which was an old mean building, the ground-floor of which was a repository for his small-coal; over this was his concert-room, long, low, and narrow, to which there was no other ascent than by a pair of stairs on the outside, so perpendicular and narrow, as scarcely to be mounted without crawling.

Hearne allows him to have been a very diligent collector of old books of all kinds, which, in his courses through the town crying his small-coal, he had a good opportunity of doing at stalls, where he used to stop and select for purchase whatever was ancient, particularly on his two favourite subjects of chemistry and music. On the former, it has naturally been suggested, that he had picked up books on Rosycrucian mysteries, and not impossible, but that he may have walled some of his small-coals in the great secrets of alchemy in the transmutation of metals.

With respect to music, he collected all the elementary books in English that were then extant: such as Morley's introduction, Simpson's division violist, Playford, Butler, Bath, and Mace; nine books of instruction for the psalmody, flute, and mock trumpet. But besides his vast collection of printed music, the catalogue of which fills eight pages in 4to. of sir J. Hawkins's list of music, he seems to have been such an indefatigable copyist, that he is said to have transcribed with his own hand, very neatly and accurately, a collection of music which sold after his decease for near 100l.

Mr. Walpole, in his anecdotes, says that "Woolaston the painter, who was a good performer on the violin and flute, had played at the concert, held at the house of that extraordinary person, Thomas Britton the small coal man, whose picture he twice drew, one of which was purchased by sir Hans Sloane, and is now in the British museum: there is a mezzotinto from it. T. Britton, who made much noise in his time, considering his low station and trade, was a collector of all sorts of curiosities, particularly drawings, prints, books, manuscripts on uncommon subjects, as mystic divinity, the philosopher's stone, judicial astrology, and magic; and musical instruments, both in and out of vogue. Various were the opinions concerning him: some thought his musical assembly only a cover for seditious meetings; others, for magical purposes. He was taken for an atheist, a presbyterian, a jesuit. But Woolaston the painter, and the son of a gentleman, who had likewise been a member of that club, averred it as their opinions, that Britton was a plain, simple, honest man, who only meant to amuse himself. The subscription was but ten shillings a year; Britton found the instruments, and they had coffee at a penny a dish. Sir Hans Sloane bought many of his books and MSS. now

in the museum, when they were sold by auction at Tom's coffee-house near Ludgate."

We have in early life conversed with members of this concert, who spoke of him in the same manner. So late as the middle of the last century, mezzotinto prints of him were in all the print shops, particularly an excellent one by Smith, under which, and almost all the prints of Britton, were the following verses by Hughes, who frequently performed on the violin at the concerts of this ingenious small-coal man.

"Though mean thy rank, yet in thy humble cell  
Did gentle peace and arts, unpurchased, dwell;  
Well pleased Apollo thither led his train,  
And music warbled in her sweetest strain.  
Cyllenius so, as fables tell, and Jove,  
Came willing guests to poor Philemon's grove.  
Let useless pomp behold, and blush to find,  
So low a station, such a liberal mind."

In most of the prints, he was represented with his sack of small-coal on his shoulder, and his measure of retail in his hand.

In the Guardian, N<sup>o</sup> 144, Steele speaking of the variety of original and odd characters, which our free government produces, says: "We have a small-coal man, who beginning with two plain notes, which made up his daily cry, has made himself master of the whole compass of the gammut, and has frequent concerts of music at his own house, for the entertainment of himself and friends."

But the assertion of sir John Hawkins, that Britton was the first who had a meeting that corresponded with the idea of a concert, is not correct: in the time of Charles I. and during the usurpation, at Oxford, meetings for the performance of *Fancies* in six and seven parts, which preceded sonatas and concerts, were very common. And in Charles the Second's time, Banister, father and son, had concerts, first at taverns and public houses, and afterwards at York buildings.

It is, perhaps, not a matter worthy of dispute; but we imagine, that it would be difficult to prove that Handel ever played at the small-coal man's concert. Handel was proud, and never had much respect for English composers. He had been caressed and patronized by princes and nobles so long, that he would as soon have gone into a coal-pit to play at a concert, as to the hovel of our vender of small-coal.

About the commencement of the last century, a passion prevailed among several persons of distinction, of collecting old books and MSS.: and it was their Saturday's amusement during winter, to ramble through various quarters of the town in pursuit of these treasures. The earls of Oxford, Pembroke, Sunderland, and Winchelsea, and the duke of Devonshire, were of this party, and Mr. Bagford and other collectors assisted them in their researches. Britton appears to have been employed by them; and as he was a very modest, decent, and unassuming man, he was a sharer in their conversation, when they met after their morning's walk, at a bookseller's shop in Ave-Maria lane. Britton used to pitch his coal sack on a bulk at the door, and, dressed in his blue frock, to step in and spend an hour with the company. But it was not only by a few literary lords that his acquaintance was cultivated; his humble roof was frequented by assemblies of the fair and the gay; and his fondness for music caused him to be known by many dilettanti and professors, who formed themselves into a club at his house, where capital pieces were played by some of the first professional artists, and other practitioners; and here Dubourg, when a child, played, standing upon a joint-stool, the first solo that he ever executed in public.

We cannot terminate this article better than from Dr. Aikin's

Aikin's account of Britton. (Gen. Biog.) The circumstances of his death were as extraordinary as those of his life, if the story is to be credited. A ventriloquist was introduced into his company by an acquaintance who was fond of mischievous jests. This man, in a voice, seemingly coming from a distance, announced to poor Britton his approaching end, and bid him prepare for it, by repeating the Lord's prayer on his knees. Britton, whose mystical and magical books had probably made him credulous, obeyed the injunction, went home, took to his bed, and actually died in a few days. This was in September 1714. He was buried with a very respectful attendance in Clerkenwell church-yard.

BRITUIN, in *Geography*, a cape on the west coast of Nova Zembla. N. lat.  $74^{\circ} 40'$ . E. long.  $52^{\circ} 14'$ .

BRIVA *Isara*, in *Ancient Geography*, a place of Gaul, on the Isara or Oise, a little north of its confluence with the Sequana or Seine.

BRIVAS, a place of Gaul, belonging to the Averni, upon the Elaver or Allier, a little north of Condate: famous as the burial-place of St. Julian, near which, the emperor Avitus was interred in 456. See BRIOUDE.

BRIVATESPORTUS, or GESORRIVATE, *le Croisic*, a place of Gaul, at the mouth of the Loire, near its union with the river Herius or Vilaine, according to Ptolemy.

BRIUEGA, or BRIOCA, in *Geography*, a small town of Spain in Castile, seated on the Tajuna, having a castle. It trades in wool and stuffs. In 1710, general Stanhope, commander of the English forces, was obliged to surrender himself and his men prisoners of war at this place.

BRIVES, a town of France, and principal place of a district, in the department of Correze, situate in a fertile valley on the Correze; 4 leagues S. W. of Tulle. The place contains 5762, and the canton 13,685 inhabitants: the territory comprehends 195 kilometres, and 11 communes. This is a considerable place, lively, and very populous. The surrounding country produces wine, and nut oil, and abounds in wood. The town has some manufactures, and is adorned by many neat churches. N. lat.  $45^{\circ} 10'$ . E. long.  $1^{\circ} 40'$ .

BRIVESAC, a town of France, in the department of the Correze; 6 leagues E. of Brives.

BRIVIO, GIOVANNI, in *Biography*, an Italian singing-master and composer of Milan, where he opened a singing-school in 1730. The celebrated Salimbini, Appianini, and Mancini were his scholars; as was G. ulia Frasi, who was long a favorite singer in England, and who, though only a second-rate performer at the Opera, was many years the best female singer at our concerts, and in Handel's Oratorios.

Brivio, as a composer, had considerable merit, and furnished the lyric theatres of Italy with several successful operas.

BRIVIO, in *Geography*, a town of Italy, in the Milanese, on the road from Bergamo to Como.

BRIX, a town of France, in the department of the Channel; 5 miles W. of Valognes.

BRIXA, *Le*. See LEBRIXA.

BRIXELLUM, in *Ancient Geography*, a town of Gallia Cispadana; now BERSELLO, which see.

BRIXEN, *Bishopric of*, in *Geography*, a district of the Tyrol, in Germany, is situated among the Rhætan Alps, and is very fruitful, especially in wine. The prelate has a revenue of about 30,000 crowns per annum, and is a prince of the empire and state of the circle of Austria: though in ecclesiastical matters, he is suffragan to the archbishop of Saltzburg. He has a vote and a seat in the diet of the empire, and furnishes his contingent of taxes and imposts. The religion of the diocese is Roman catholic; but among the peasants there are some Lutherans; the capital is Brixen.

BRIXEN, the capital of the preceding bishopric, seated on the river Eyfach, at some distance south of the Brenner

mountains. It is surrounded with hills and vineyards, and is a well-built populous town; the houses being adorned with piazzas, and painted on the outside. It has many public buildings, exclusive of the cathedral, which are handsome, and several spacious squares: the mineral waters in its vicinity cause it to be much frequented. In 1080, a council was held here by the emperor Henry IV. which deposed pope Gregory VII. This town was taken by the French in March, 1796. N. lat.  $46^{\circ} 35'$ . E. long.  $11^{\circ} 50'$ .

BRIXENSTADT, a town of Germany, in the circle of Franconia, and principality of Anspach, affording an asylum for involuntary homicides; 16 miles E. N. E. of Wurzburg.

BRIXIA, in *Ancient Geography*, a town of Regio Transpadana, belonging to the Cenomani, seated on the Mela; now BRESCIA, which see.

BRIXIA, a river of Susiana, which discharges itself into the Persian gulf, and which rendered the coasts dangerous, according to Pliny, by the quantity of mud deposited by it.

BRIXTON BAY, in *Geography*, lies on the west side of the isle of Wight, and is an open bay to the north-west from the south point of this island. The ground is rocky, and in swelling seas or winds in shore, it does not afford a desirable retreat nor a safe anchorage.

BRIZA, *Quaking grass*, in *Botany*, ( $\beta\rho\zeta\omega$ , to nod) Linn. 84. Reich. 90. Schreb. 115. Gærtn. 6. Tab. 1. Juss. 32. La Marck. Tab. 45. Smith Flor. Brit. 34. Class. *triandria digynia*. Nat. Ord. *Gramina*. Gen. Char. *Cal.* glume many-flowered, two-valved, spreading, blunt, collecting the flowers into a subcordate, two-rowed spikelet. *Cor.* two-valved; the lower valve the size and figure of the calyx, the upper one very small, flat, roundish, enclosing the other. *Ned.* two-leaved; folioles linear, crenulate. *Stam.* filaments three, capillary, oblong. *Pysl.* germ, roundish, spreading. *Stigmas*, plumose. *Peric.* none; the corolla unchanged contains the seed, and when ripe, opens and drops it. *Seed.* one, adhering to the corolla, compressed. *Ess.* Char. *Cal.* bivalved, many-flowered; little spikes two-rowed. *Cor.* two-valved, ventricose, with cordate obtuse valves; *seed* adhering to the corolla, depressed.

La Marck observes, that Briza is too nearly allied to Poa, to make a good distinct genus. He has, however, kept them separate; but judging that what has been called a multivalve calyx in Uniola, its principal difference from Briza, is nothing more than two or three abortive florets, he has abolished the genus, and described its species under Briza. In agreement with the greater number of authors, we have thought it best to preserve the original distribution. Species 1. *B. minor*. Lin. (Eng. Bot. 1316.) *aspera*, Knap. (Gram. Brit. 61.) "Spikelets triangular, seven-flowered; calyx longer than the florets, stipule very long, lanceolate." Dr. Smith. *Root* fibrous, small, annual. *Culm* erect, about seven inches high, round, roughish, with minute spines pointing downwards, leafy, often branched at the base. *Leaves* sheathing, erect, lanceolate, acute, flat, of a pleasant green, striated, rough at their margin. *Sheath* striated, smooth. *Stipule* lanceolate, very long, embracing the stem, decurrent, adhering to the leaf above, very tender. *Panicle* spreading widely; branches growing two together, branchlets dichotomous, divaricated, capillary, rough, green. *Spikelets* pendulous, trembling, deltoid, smooth, beautifully variegated with white and green, with about seven flowers. *Calyx-glumes* nearly equal, concave, very obtuse, striated, membranaceous at the margin, longer than the florets. *Florets* alternate, gradually smaller; inner glumes very small, emarginate. Dr. Smith describes the culm as smooth, but in specimens sent us from the west of England, it has a slight roughness, just sensible to the touch, and visible with a strong magnifier. We have, therefore, followed Mr. Knap in this part of the description.

The

The greater length of the calyx is most observable when the panicle has just burst from its sheath. At a more advanced period the disunion nearly disappears. It is a rare plant in England, peculiar to the southern counties, and chiefly found in Cornwall. 2. *B. nodosa*, Linn. common quaking grass, cow-quakes, shakers, ladies-hair, bird's eyes. Eng. B. 110. Knop. Gram. Brit. 65. "Spikelets ovate, seven-flowered, calyx shorter than the florets, stipule very short, obtuse." Dr. Smith. *Root* perennial, fibrous, elongated. *Leaves* erect, round, leafy, very smooth. *Leaves* acute, flat, sheathed, a little rough. *Stipule*, very long, striated, smooth. *Panicle* very short, obtuse, scarcely decurrent, not adhering to the leaf above. *Panicle* widely spreading, many-flowered, branches growing by twos, branchlets as in the *minor*, but brown and green. *Spikelets*, pendulous, trembling, ovate, or a little heart shaped, smooth, shining, variegated with white and brown. *Calyx-stipules* nearly equal, concave, obtuse, scarcely pointed, scarious at their margin. *Florets* as in the *minor*. Dr. Smith. Common in the dryish meadows of Europe, and other parts of Europe. It has no peculiar excellence, and has never been cultivated separately. 3. *B. virens*, Linn. "Spikelets ovate, few-flowered: calyx equal to the florets." Very like the present drug, but the leaves are twice as broad. *Root* annual. *Stipule* acute, decurrent, adhering to the leaf above. *Panicle* fuller, green, more branched; branchlets much divaricated, occasioned by callous knots depressing them at their base. *Flowers* rather smaller, readily falling off when shaken. Native of the Levant, Spain, &c. Introduced into England, 1787, by Mr. Zier. 4. *B. geniculata*, Willd. "Spikelets ovate, calyx shorter than the flowers, culm geniculate." Thunb. Cape of Good Hope. 5. *B. capensis*. (Poa Brizoides, Linn. Sup.) "Spikelets ovate, ten-flowered, panicle close. Thunb." Pedicels simple. Cape of Good Hope. 6. *B. maxima*, Linn. "Spikelets cordate; florets seventeen." *Root* annual. *Leaves* broad. *Culm* about a foot and half high. *Spikelets* very few, very large, shining, scarious, variegated with green and white. *Peduncles* simple. Italy, Portugal, Cape of Good Hope, India. 7. *B. eragrostis*, Linn. "Panicle oblong; spikelets lanceolate, many-flowered." La Marek. *Root* annual. *Culm* from five to seven inches high, decumbent near the bottom. La Marek observes, that it is nearly allied to *Poa eragrostis*, and Willdenow doubts whether it be more than a variety of it; but Villars asserts that it may always be distinguished by the outer valve of the corolla, which is concave, pellucid, with a nerve running along the middle, and two along the edge. South of Europe. 8. *B. monspessulana*, Allion. "Spike nodding, simple; spikelets alternate, peduncled, subsolitary, ovate: calyx five-flowered." Martyn's Miller.

BRIZACA, in *Ancient Geography*, a town of Asia, in Armenia Major. Ptolemy.

BRIZANA, a river of Asia, in Persia Propria. Its mouth was dangerous, according to Arrian, on account of the banks and rocks with which it abounded. Ptolemy calls this river Buzana.

BRIZE, in *Agriculture*, a word that signifies such lands as have remained long without tillage.

BRIZE-vents, or BRISE-vents, a kind of shelters used by gardeners, who have not walls on the north-side, to keep the cold winds from damaging their melon beds.

Brize-vents are inclosures six or seven feet high, and an inch thick, made of straw, supported by stakes fixed into the ground, and props across both inside and outside, fastened together with willow twigs, or iron-wire.

BRIZEMBOURG, in *Geography*, a town of France, in the department of the Lower Charente, and district of St. Jean d'Angely;  $2\frac{1}{2}$  leagues S. of St. Jean d'Angely.

BRIZEN, a town of Germany, in the circle of Upper

Saxony, and Middle Mark of Brandenburg; 4 leagues N. of Wittenberg.

BRIZIO, or BRICCIO, FRANCESCO, in *Biography*, a painter of architecture and landscape, was born at Bologna, in 1574, and educated first in the school of Passerotti, and afterwards under Ludovico Caracci. Having applied with great diligence to the study of the principles of perspective and architecture, he acquired a style in his compositions of such distinguished excellence, that his pictures were much admired, not only for the truth of the perspective, and the beauty of the colouring, but also for the grandeur of his ideas, the majestic style of the architecture, the elegance of the ornaments, and the noble taste of landscape, which he introduced to set off his buildings. He was also an engraver, and is said to have assisted Agostino Caracci, in the plates which he engraved; we have also some etchings by this master. Of his prints we may mention his "Holy Family," from Correggio; "St. Roch," from Parmigiano; the "Flight into Egypt," from Ludovico Caracci; and "Christ and the Woman of Samaria," from Agostino Caracci. He died in 1623. Pilkington. Strutt.

BROACH, BROCHA, in *Middle Age Writers*, denotes an awl or bodkin. Among us broach is chiefly used for a steel instrument serving to open holes in metals. It is sometimes also applied to a stick on which thread or yarn is wound; and, in the North, to a sort of wooden needles used in knitting certain coarse things.

See an account of the broach used in weaving tapestry, under TAPESTRY.

In some part of England, a spit is called a broach: and hence also to broach a barrel, is to tap it. The ancient lords received from their tenants a fee or tribute, called *pertusagium*, for the liberty of broaching a cag of ale.

The term *broach* or *breche*, is also used in Scotland, to denote a certain utensil used by the Highlanders for fastening their vest, and resembling the "fibula" of the Romans. This broach is commonly of silver, of a round figure, and furnished with a tongue, crossing its diameter, and serving to fasten the folds of the garment: some have two tongues, one on each side of a cross bar in the middle. Ancient broaches of elegant workmanship, and richly ornamented, are preserved in several families; some of which are inscribed with names, to which particular virtues were ascribed, and others furnished with receptacles for relics, supposed to defend from harm: so that they seem to have been used not only in dress, but for the purpose of amulets.

BROACH, in *Geography*. See BAROACH.

BROACH to, is when a ship sailing large suddenly flies up to the wind, in consequence of the difficulty of steering, or of bad steering, &c. so that the sails are all taken aback.

BROAD-ARROW, in *Heraldry*, differs from the *pecon* by having the inside of its bars plain.

BROAD Bank, in *Geography*, a bank on the coast of Flanders, the south end of which is about 4 or 5 leagues N.E. by N. from Calais cliff. On the west side between this and Rattle-bank, is a channel of 18 or 19 fathoms.

BROAD Bay, a bay of America, in the district of Maine, lying on the line of Lincoln and Hancock counties, bounded by Pemaquid point on the west, and Pleasant point on the east.

BROAD Bay, on the coast of Wales. See ST. BRIDE'S Bay.

BROAD-cast Husbandry, in *Agriculture*, that sort of arable cultivation in which the seed is put into the soil by the hand, without the aid of machinery. In this way the seeds are scattered over the surface of the ground, without being confined in regular rows, as is the case in the drill method, which is mostly opposed to it. The putting of the seed into the earth in this way seems better suited to the stony and more

stiff kinds of land, than that by means of machines, as they must constantly be liable to be put out of order, and of course to deposit the seed in an irregular manner. See HUSBANDRY.

**BROAD-cast Sowing**, that mode of putting grain, turnips, pulse, clover, grasses, &c. into the earth, by dispersing them over the surface by the hand. See SOWING.

**BROAD Fourteens**, in *Geography*, the name of a sand which lies 5 or 6 leagues N. E. from the Texel, extending by a small tad N. from the Texel, and N. W. by N. from Flyer Vlieland island towards the south. Upon this sand are generally 14 fathoms of water, and between it and the land from 18 to 19, and more northerly 20 fathoms.

**BROAD Haven**, a considerable harbour of the county of Mayo, Ireland, lying between Urris and Binwy heads. It is very extensive, has good ground, and water of sufficient depth for any ship; but is so much exposed to northerly winds, that there is not room for more than two large ships in well sheltered anchorage. Small vessels, however, may go further up, and lie very safe on soft sand, with three or four feet water under them at low water. The western shore of this bay is formed by the peninsula of the Mullet, sometimes erroneously represented as an island. There are at present only a few fishing villages on the coast of this harbour. About two miles N. by E. of Binwy head are three or four very remarkable rocks, called the *Stags of Broadhaven*. Lon. between  $9^{\circ} 40'$ , and  $9^{\circ} 41'$  W. Lat.  $54^{\circ} 19'$  N.

**BROAD piece**, in *Coinage*, a denomination given to certain gold pieces broader than a guinea; particularly Caroluses and Jacobuses.

**BROAD River**, in *Geography*, an arm of the sea, extends along the west and north-west sides of Beaufort or Port Royal island, on the coast of South Carolina, and receives Coosa river from the north-west, which may be also called an arm of the sea. These two arms embrace all the islands between Coombahee river and Dawfuskee sound, with which Broad river also communicates. Channels between Broad river and Coosa form the islands. The entrance through Broad river to Beaufort harbour, which is one of the best in the state, lies between Hilton's head and St. Phillip's point.

**BROAD River**, or *Cherakee-haw*, a water of Savannah river, from the Georgia side, which empties into the Savannah at Petersburg.

**BROAD River**, in South Carolina, rises by three branches from the N. W. viz. the Ennoree, Tiger, and Packolet, which unite about 40 miles above the mouth of the Saluda river; and this, with Broad river, forms Congaree river. Broad river may be rendered navigable 30 miles in North Carolina.

**BROAD Sand**, lies on the west side of the buoys of the channel in the Zuyder Sea, within the Texel.

**BROAD-side**, in the *Sea-Language*, a discharge of all the guns on one side of a ship at the same time.

A broad-side is a kind of volley of cannon, and ought never to be given at a distance from the enemy above musket-shot at point-blank.

**BROAD Sound**, in *Geography*, is the opening from the S. W. into the roads and harbours of the Scilly islands. In this sound there is good anchorage, when St. Mary's island on the E. S. E. and Samson island to the W. N. W. and the S. point of Trefco island on the N. are nearly at the same distance of about a mile.—Also, a sound in the N. W. point of France, called by the French "Passage de Liroise," lying between Point de Sant and the island of Uphant, and extending to sea about 5 leagues from St. Matthew's point.—Also, a sound on the coast of Norway, between which and

the north part of Stadland are Flowack islands.—Also, the sound which is the entrance into Boston harbour from the N. E. in a direct line for Nick's Mate island.—Also, a sound in the South Pacific ocean, on the east coast of New Holland, within the bay of Inlets, having cape Palmerston for its N. W. entrance. It is separated from Thirily sound by an island lying in the direction of S. S. E. and S. called Long island. S. lat.  $21^{\circ} 30'$  to  $21^{\circ} 50'$ . E. long.  $149^{\circ} 20'$ .

**BROAD-stairs Pier**, lies within the bight of the point between the north Foreland and Ramsgate, and nearly at west from the Foreland.

**BROAD stone**, in *Building*, a species of free-stone, thus denominated because it is raised broad and thin out of the quarries; or not exceeding two or three inches in thickness; chiefly used for paving.

**BROAD-wheeled Waggon**. See WAGGON.

**BROAD-worm**, in *Zoology*, synonymous with *lumbricus latus* of old writers. See TENIA, and TAPE-WORM.

**BROADALBIN**, in *Geography*, a township of America, in Montgomery county, New York; containing, by the state-census of 1796, 277 inhabitants, who are electors.

**BROADLEY**, a town of Poland, in the principality of Belez: 48 miles E. of Belez.

**BROBACH**, a town of Germany, in the circle of the Lower Rhine, and electorate of Treves; 15 miles S. E. of Treves.

**BROCADE**, in *Commerce*, a sort of stuff, or cloth of gold, silver, or silk, raised and enriched with flowers, foliages, or other figures, according to the fancy of the manufacturer.

Formerly, the term was restrained to cloths woven either wholly of gold, both of wool and warp, or of silver, or of both together; but by degrees it came likewise to pass for such as had silk intermixed, to fill up and terminate the flowers of gold and silver. At present, any stuff of silk, satin, or even simple taffety, when wrought and enriched with the flowers, &c. obtains the denomination of brocade.

In the manufacture of brocades, the flatted gilt wire is spun in threads of yellow silk, approaching as nearly as possible to the colour of gold itself. The wire, winding off from a bobbin, twists about the thread as it spins round, and by means of curious machinery, a number of threads are thus twisted at once by the turning of one wheel. The principal art consists in so regulating the motion, that the several circumvolutions of the flatted wire in each thread may just touch one another, and seem, as it were, one continued covering. At Milan, it is said, there is made a sort of flatted wire, gilt only on one side, which is wound upon the thread, so that only the gilt side appears; the preparation of this wire is kept a secret, and has been attempted in other places with little success. There is also a gilt copper wire, made in the same manner as the gilt silver. Savary observes, that this kind of wire, called false gold, is prepared chiefly at Nuremberg; and that the ordinances of France require it to be spun, for its distinction from the gilt silver, on flaxen or hempen threads. The Chinese, instead of flatted gilt wire, use slips of gilt paper, which they both interweave in their stuffs, and twist upon silk threads; but whatever be the pretended beauty of the stuffs of this kind of manufacture, it is obvious that they must want durability: accordingly, the Chinese themselves, as we learn from Du Halde, sensible of this imperfection, scarcely use them any otherwise than in tapestries, and such other ornaments as are not intended to be much worn or exposed to moisture.

The Venetians have carried on a large trade, to the Levant, in a kind of brocade called *damasquète*, which, though

though it has only about half the quantity of gold or silver as that made among us, looks far more beautiful. The flattened wire is neither wound close together on the silk threads, nor the threads struck close in the weaving; yet, by passing the stuff betwixt rolls, the disposition and management of which is kept a secret, the tissue or flower is made to appear one entire brilliant plate of gold or silver. The French ministry judged this manufacture important enough to deserve their attention; and accordingly, for contriving the machinery, they engaged the ingenious M. Vaucanson, known throughout Europe for his curious pieces of mechanism, who, in the memoirs of the academy for the year 1757, gives an account of his success, and of the establishment of such a manufacture at Lyons.

The lower roll is made of wood, thirty-two inches in length and fourteen in diameter; the upper one of copper, thirty-six inches long and eight in diameter: this last is hollow, and open at one end, for introducing iron heaters. For making the rolls cylindrical, he has a particular kind of lathe, wherein the cutting tool, which the most dexterous hand could not guide in a straight line through such a length as thirty-six inches, is made to slide, by means of a screw, on two large steel rulers, perfectly straight, and capable of being moved at pleasure, nearer, and always exactly parallel, to the axis of the roll.

He first disposed the rolls nearly as in the common flattening mill. In this disposition, ten men were scarcely sufficient for turning them with force enough to duly extend the gilding; and the collars, in which the axes of the rolls turned at each end, wore or galled so fast, that the pressure continually diminished, inasmuch that a piece of stuff of ten ells had the gilding sensibly less extended on the last part than on the first. He endeavoured to obviate this inconvenience by screwing the rolls closer and closer in proportion as the stuff passed through, or as the wearing of the collars occasioned more play between them; but this method produced an imperfection in the stuff, every turn of the screw making a sensible bar across it. To lessen the attrition, each end of the axes, instead of a collar, was made to turn between three iron cylinders called friction-wheels: but even this did not answer fully, for now another source of unequal pressure was discovered. The wooden roll, being compressible, had its diameter sensibly diminished: it likewise lost its roundness, so that the pressure varied in different points of its revolution. On trying different kinds both of European and Indian woods, all the hard ones split, the soft ones warped without splitting, and, of more than twenty rolls, there was not one which continued round for twenty-four hours even without being worked in the machine.

These failures put him upon contriving another method of pressing the rolls together, so that the force should always accommodate itself to whatever inequalities might happen. The axis of the copper roll being made to turn between friction wheels as before, that of the wooden one is pressed upwards by a lever at each end furnished with a half collar for receiving the end of the axis. Each lever has the end of its short arm supported on the frame of the machine, and the long arm is drawn upwards by an iron rod communicating with the end of the short arm of another lever placed horizontally: to the long arm of this last lever is hung a weight, and the levers are so proportioned, that a weight of 30 pounds presses the rolls together with a force equivalent to 17536 pounds, which was found to be the proper force for the sufficient extension of the gilding. By this contrivance four men can turn the rolls with more ease than ten can turn those which are kept together by screws; and the same weight acting uniformly in every part, the pressure continues

always equal, though the wooden roll should even become oval, and though the stuff be of unequal thickness.

A piece of cloth, of about two ells, is sewed to the beginning and end of the stuff, to keep it out to its width when it enters and parts from the rolls, which could not be done by the hands for fear of burning or bruising them: as it would take too much time to sew these cloths to every small piece of an ell or two, a number of these is sewed together. The stuff is rolled upon a cylinder, which is placed behind the machine, and its axis pressed down by springs to keep the stuff tight as it comes off. Four iron bars, made red hot, are introduced into the copper roll, which in half an hour acquires the proper degree of heat, or nearly such a one as is used for the ironing of linen: the wooden roll is then laid in its place, and the machine set to work. If more than thirty ells are to be passed at once, the wooden roll must be changed for another, for it will not bear a longer continuance of the heat without danger of splitting, and therefore the manufacturer should be provided with several of these rolls, that when one is removed, another may be ready to supply its room: as soon as taken off from the machine, it should be wrapt in cloth and laid in a moist place.

The principal inconvenience attending the use of this machine is, that the heat necessary for extending the gilding, though it improves the brightness of white and yellow silks, is injurious to some colours, as crimson and green. A double pressure will not supply the place of heat: and the only method of preventing this injury, or rendering it as slight as possible, appeared to be to pass the stuff through with great celerity.

Rich brocades may be cleaned, and the lustre of them recovered, by washing them with a soft brush dipped in warm spirit of wine.

Neither alkaline liquors nor soap should be used for this purpose; because the former, while they clean the gold, corrode the silk, and change or discharge its colour, and the latter also alters the shade, and even the species of certain colours. But spirit of wine may be used without any danger of its injuring either the colour or the quality of the subject, and, in many cases, it proves as effectual for restoring the lustre of the gold, as the corrosive detergents.

Spirit of wine seems to be the only material adapted to this intention; however, this is not proper in all cases: for if the base metal, with which the gold of the covering was alloyed, has been corroded by the air, the particles of the gold may thus be dissolved; and the silver underneath, tarnished to a yellow hue, may continue a tolerable colour to the white; but in such cases the removal of the tarnish would be prejudicial to the colour. See Lewis's Com. Philosophico-Technicum, p. 62. 226.

BROCADE-SHELL, in *Conchology*, a trivial name given sometimes to *CONUS GEOGRAPHICUS*. Linn. In a more general sense, the epithet brocade, synonymous with the French *brocard*, is applied to various other objects of natural history, whose disposition of colours, and markings, bear a fancied resemblance to that sort of stuff, silk, cloth, and which is commonly understood by the word brocade. Brocard among the French, and brocade with us, is not, therefore, the language of naturalists, but of dealers, and unscientific collectors.

BROCARDICS, BROCARDICA, denote maxims or principles in *Law*; such as those published by Azo, under the title of *Brocardica Juris*.

Vossius derives the word from the Greek *πρώτοις*, q. d. *first elements*. Others, with more probability, from *Burchard*, or *Brocard*, bishop of Worms, who made a collection of canons, called from hence *Brocardica*; and as this work

work abounded much in sentences and proverbs, the appellation *brocardica* became hence extended to every thing.

**BROCATELI**, called by the French *brocadet*, an ordinary kind of stuff made of cotton, or coarse silk, in imitation of brocade; chiefly used for tapestry and other furniture. That manufactured at Venice is the most esteemed.

**BROCATELLO**, a name given by lapidaries to a calcareous stone or marble, composed of fragments of four colours, white, grey, yellow, and red.

**BROCCO**, in *Geography*, a town of Naples, in the county of Lavora; 5 miles W. of Capua.

**BROCCOLI**, in *Botany and Gardening*. See *BRASSICA OLERACEA*.

**BROCHOS**, in *Surgery*, is a term of doubtful signification. It has been considered by some as a Greek name for the *laqueus*, or noose; and by others, as denoting bandages in general. Castellus informs us, that this word relates to certain surgical instruments; and he refers to the authority of Galen and Orisbasius. It has also been considered as expressive of a privation of voice, or aphonia. Persons having a very large and prominent upper lip, have been denominated *brochi*: although Dr. Turton, in his Medical Glossary, says that *brochus* signifies one who has "the chin and nether lip sticking out."

**BROCHUS**, in *Ancient Geography*, a town of Phœnicia, seated near a marsh, between Libanus and Antilibanus. Polybius.

**BROCK**, among *Sportsmen*, sometimes denotes a badger, otherwise called a grey *brock*.

**BROCK**, and **BROCKET**, are also used to denote a hart of the third year.

**BROCKDROP**, in *Geography*, a town of Germany, in the circle of Lower Saxony, and duchy of Holstein; 6 miles W. of Krempe.

**BROCKEL**, or **BRAKEL**, a town of Germany, in the circle of Westphalia, and county of Verden; 5 miles E. of Rotenburg.

**BROCKEN**. See *HARTZ*.

**BROCKLESBY, RICHARD**, in *Biography*, who attained to considerable eminence, and acquired a splendid fortune by the practice of medicine in London, was of a respectable family of Cork, in Ireland, but was born at Minehead in Somersetshire, where his mother was on a visit to one of her relations at the time of his birth. This happened on the 11th of August, 1722. His parents were quakers; but it does not appear that they were solicitous to initiate him in the principles of that sect. At an early age he was sent to a famed academy at Ballymore, in the north of Ireland. There he formed an intimacy with Edmund Burke, which was improved into the most cordial friendship when they met together afterwards in London. Having completed his school education, he went to Edinburgh, and after attending the lectures of the professors in the different branches of medicine there, he proceeded to Leyden, and took his degree of doctor, under the celebrated Gaubius, in June, 1745, giving, for his inaugural thesis, a dissertation "De Saliva sana et morbosa." The following year he came to London, and settled in Broad-street; and as the income allowed him by his father was not large, and he found that sum not much increased, for the first few years, by the profits of his profession, he determined to regulate his expences in such a manner, as to secure him from the misery of dependence. "Never suffering himself, as he was used to to have a want that was not accommodable to his fortune." The same year he published an Essay concerning the Mortality of the Horned Cattle, which contributed to extend his

name and character. In 1751 he was admitted a licentiate in the Royal College of Physicians, in London. In 1754 he received an honorary degree of doctor in medicine, from the university of Dublin, and the following year he was admitted by the university of Cambridge, ad eundem. He then became a candidate, and in June, 1756, was elected a fellow of the College of Physicians. As his practice was now much increased, and by the prudence of his conduct, and the suavity of his manners, he had conciliated to himself the friendship of his professional brethren, he was, by their recommendation, appointed physician to the army by Lord Barrington. In this capacity he went to Germany, and continued there, until a few months before the conclusion of the war, in 1763. The following year he published the result of his observations and practice, under the title of "Economic and Medical Observations, from 1738 to 1763, tending to the Improvement of Medical Hospitals." 8vo. He now returned to London, and settled in Norfolk-street, in the Strand. His fortune was by this time increased by an estate of 500*l.* per annum, which devolved to him on the death of his father; and the duke of Richmond, and five other noble personages, agreed to give him pensions of 100*l.* per annum each, as a recompence for attending their families. This, with his half pay from the army, made up a handsome income; and as he possessed the aldermanly virtue, as dean Swift calls it, discretion, he was enabled to keep a carriage, and to live with some degree of splendour. Soon after he was made a fellow of the Royal Society; and not being incumbered with a family, he dedicated what time he could spare from attending his patients, &c. to reading, or to associating with persons eminent for literature and science. On his suggestion, a professorship in chemistry was added to the establishment of the college at Woolwich; and on his recommendation the late Dr. Adair Crawford, author of an ingenious philosophical treatise on heat, was appointed the first professor. Though it has been intimated, that the doctor's habits were frugal and economical, yet there are abundant proofs he was not deficient in liberality. On being informed that Dr. Johnson, with whom he cultivated a strict intimacy, wished, in the latter part of his life, to visit the continent for the recovery of his health, but was restrained from going, by the narrowness of his circumstances, he, in a handsome and delicate manner, made him an offer of an annuity of 100*l.* per annum for the remainder of his life; and on Dr. Johnson's declining to accept the offer, he pressed him to reside in his house, as more airy and healthy than that in which he then lived. To his friend Edmund Burke he sent 1000*l.*, which he told him he had intended leaving him at his death, but thought it might then come to him, at a time when it would be of little use. The present was accepted, in a manner which shewed that the doctor was not wrong in his conjectures. In the year 1794, finding the infirmities of age increase fast upon him, he gave up his half pay in the army, and declined, excepting among his particular friends, visiting patients. A little before this time, his patron and friend, the duke of Richmond, had appointed him physician general to the royal regiment of artillery, and corps of engineers. This he retained, as giving him occasion of going to Woolwich, and visiting the laboratory there, to which he was attached. In the beginning of December, 1797, he went to Beaconsfield, to the house of Mrs. Burke, the widow of his deceased friend, where he continued a few days, and returned on the 11th of the month, to dine with his two nephews, Mr. Beeby and Dr. Young, the charge of whose education he had taken principally upon himself. Though much fatigued with his journey, he appeared pleased with the interview,

and supported his part of the conversation with cheerfulness. At noon he retired to rest, but found the labour of going up stairs almost too much for him; and observed, "What an idle piece of ceremony this buttoning and unbuttoning is to me now." After sitting some minutes in a chair to recruit himself, he went to bed, and in a few minutes quietly expired. His fortune, which is said to have exceeded 30,000*l.*, was left between his two nephews, a few legacies to friends, and distant relations excepted.

As Dr. B. was of a quiet and peaceable disposition, he was not likely to enter into any serious broil; he was, however, at one time, obliged to accept a challenge. The occasion was this: the late doctor, afterwards Sir John Elliot, in the course of his attendance on a patient with Dr. B., had made use of means to obtain the favour of the family of the patient, which were not compatible with the character of a gentleman. Of this Dr. B. talked openly, and the expressions he used on the occasion were reported to Dr. Elliot, with an intimation, that if he did not insist on an apology from his antagonist, no one would, hereafter, meet or associate with him. A duel was the result, which, however, terminated without the effusion of blood, the seconds having taken care to place the combatants at such a distance, that their balls, if they should hit, would do no mischief.

Besides the works mentioned before, Dr. B. was author of "Oratio Harveiana," published 1763, 4to.; "An Account of a poisonous Root lately found mixed with Gentian," Phil. Transf. No. 486.; "Experiments on cutting the Tendons, in various Animals," *ibid.* vol. 43.; "Case of a Lady labouring under Diabetes," Med. Obs. vol. 3.; "Experiments relative to the Analysis of Seltzer Water," *ibid.* vol. 4.; "Case of an Encysted Tumour in the Orbit of the Eye," *ibid.*; and "A Dissertation on the Music of the Ancients," supposed to be written in the early part of his life.

BROD, a fortified town of Slavonia, seated on the Save, and famous for a victory gained over the French in 1688. N. lat. 45° 20'. E. long. 18° 36'.

BROD, *Bomisch*, a town of Bohemia, in the circle of Kaurzim; reduced to ashes in 1637, and since rebuilt; 7 miles N.W. of Kaurzim.

BROD, *Teutsch*, a town of Bohemia, in the circle of Czassau, on the Sazava, taken by the allies in 1741; 20 miles S. E. of Czassau.

BROD, *Ungarisch*, a town of Moravia, in the circle of Hradisch; 8 miles S. E. of Hradisch.

BRODEAU, JOHN, (Lat. *Brodeus*), in *Biography*, a learned critic, was born at Tours about the beginning of the 16th century, and having studied law at Bourges under Alciatus, devoted himself to the belles lettres. He travelled into Italy, and formed connections with Sadolet, Bembo, Manutius, and other literary characters. After his return to France, he distinguished himself by several works of criticism, the principal of which is a collection of observations, corrections, explanations, &c. of ancient authors, entitled "Miscellanea." The first six books of this work were published in the second volume of Gruter's "Lampas, seu Fax Artium," in 1604; and the four latter books in the fourth volume of the same collection. In his notes on Euripides, he has been charged with plagiarism. He was also versed in mathematics, and the oriental languages, as well as classical literature. He died at Tours, where he was canon of St. Martin, in 1563. Gen. Dict.

BRODENFELD, in *Geography*, a town of Germany, in the circle of Upper Saxony, and territory of Vogtland; 3 miles E. of Oelsnitz.

BRODERA, a fortified town of Hindostan, in the country of Guzerat, situate on the small river Dader, in the north-east part of the tract lying between the rivers Tapy and Myhie, through which the great road leads from Surat to Ougein. This is a modern town in comparison with several others, having been built by the son of the last king of Guzerat, near the site of an ancient town, formerly called Radipore, but now Old Brodera, which is entirely gone to decay. It stands in a very fertile, though sandy, country, has good walls and towers, and is full of artificers, who manufacture the finest stuffs of Guzerat, bafts, nicanees, cannaquins, cheloes, &c.: the cottons of Brodera are finer than those of Baroach, but narrower and shorter. Indigo is also an article of trade in this place, and the vicinity supplies gum-lac. The Dutch factory established at Brodera in 1620, was abandoned before the year 1670. N. lat. 22° 15' 30". E. long. 73° 11'.

BRODERIES, *Fr.* a term in *Music* for embroidering or gracing a melody. It is equivalent likewise with *doubles*, variations, *fleurtil*, an old term for flourishing an air. All these terms are used for the notes of music which the performer adds to his part in the execution, to vary a melody often repeated, to embellish passages too plain and simple, or to shine by the activity of throat or finger. Nothing manifests the good or bad taste of a musician, says Rousseau, more than the choice and application of these ornaments. French vocal performers were very sparing of their *broderies* or graces in the middle of the last century; for if we except the celebrated Jeliotte and mademoiselle Fel, no French singer durst venture to make a single change in his part on the stage. French melody had been for some years growing more slow, and lamentable, that it was capable of no improvement by graces. The Italians are unable to execute a melody quite plain; they give full scope to their memory or fancy, and try who can make the greatest number of changes: an emulation often absurd, and carried to an offensive excess. However, the accents of their melody are so strongly marked, that there is little fear of the air being so disguised, as not to be recognizable through all the performers' redundances.

With regard to instruments, a solo player may do what he pleases; but a performer in a full piece, who dares embroider his part, was never suffered in a good orchestra.

BRODETZ, in *Geography*, a town of Bohemia, in the circle of Boleslaw; 5 miles S. of Jung Buntzlaw.

BRODIATORES, in the *Middle Age*, a kind of *librarii*, or copists, who did not write the words and letters plain, but variously flourished and decorated, after the manner of embroidery. Du-Cange Gloss. Lat. tom. i.

BRODNITZ, in *Geography*, a town of Prussia, in the bishopric of Culm: 30 miles E. of Culm.

BRODOW, a town of Germany, in the circle of Lower Saxony, and duchy of Holstein, 4½ miles N. E. of Newflatt.

BRODY, a town of Poland, in the palatinate of Lemberg; 30 miles S. of Lucko.

BRODZIEC, a town of Lithuania, in the palatinate of Minsk; 48 miles E. of Minsk.

BROECK, CRISPIN VANDEN, in *Biography*, a painter and engraver, was a native of Antwerp, and flourished about the year 1590. As a painter, he had some reputation in the historical line; but the prints engraved from his designs, which are numerous, evince him to have been a man of genius and great fertility of invention. Among the engravings that are attributed to him, is the "Circumcision of Christ," in chiaro-scuro; the outline of which is etched in a bold free manner on copper; and the block of wood, which produces the lighter tints,

tints, is so contrived as to imitate the hatchings of white chalk upon the lights.

The daughter of this artist, viz. "Barbara Vanden Broeck," learned to draw of her father, and was probably instructed in the art of engraving in the school of the Colaerts. Her progress, however, was such as to reflect no small credit on her talents. Mr. Strutt notices the following plates of her execution; the "Last Judgment," done altogether with the graver, and in the style of Martin Rota; a "Holy Family," with St. John and several angels; and another "Holy Family," with St. John kneeling, and attendant angels, published by Hendius, A. D. 1621.

**BROECKHUYSE, JOHN**, Lat. *Broukhusius*, an elegant scholar and Latin poet, was born at Amsterdam in 1649. Disliking the profession of an apothecary, to which he was apprenticed, he left his master, and entered on board an India ship; and by degrees became master of an armed vessel. In this situation he felt an inclination for letters and poetry; and, by the advice of Grævius, applied to the study of the Latin language, of which in a few months he made himself complete master. He afterwards abandoned his sea-faring employment, and devoted himself with ardour to classical studies. Whilst he was on board his ship, he wrote several pieces, one of which was entitled "Celadon, or Impatience to revisit his Country;" and a collection of his poems was published at Utrecht in 1684, by which he acquired great reputation. As a critic, under which character he excelled, he published valuable editions of Sannazarius, Propertius, Tibullus, and Aonius Palearius. He also translated into Latin father Rapin's "Parallel of Homer and Virgil." He died in 1707, and a monument was erected to his memory at Amsterdam, where he was interred. A splendid edition of his poems in 4to. was published at Amsterdam, in 1711. Moreri. Gen. Biog.

**BROECKHUYSEN, BENJAMIN VAN**, a Dutch physician of considerable learning and ingenuity, of the 17th century. After taking his degree of doctor in medicine at Leyden, he was made physician to the armies of the republic, and then physician to the fort and town of Bois le Duc. He was also known and esteemed by king Charles II. of this country, when resident in Holland.

His works are, "Œconomia Corporis animalis, seu Cogitationes fuccinctæ de Mente, Corpore, utriusque Conjunctione," Noviomagi, 1672. "Œconomia animali ad Circulationem Sanguinis breviter delineata," Gouda, 1685, 8vo. He was a follower of the system of Des Cartes, and maintained that the blood was heated in the heart by fire actually resident there; and to this he attributed the impulse it received, and which maintained and supported its circulation. "Rationes philosophico-medice," Haag. 1687, 4to. written in a florid and poetical style, explaining the animal œconomy on Cartesian principles. Haller. Bib. Anat. Eloy. Dict. Hist.

**BROEK, ELIAS VANDEN**, a painter, was born and studied at Antwerp in 1657, and became the disciple of Ernest Stuven, and studied De Heem, says Houbraken, or of Mignon, according to Descamps. He painted, in a loose, easy, and natural manner, all sorts of fruits, flowers, frogs, and reptiles. He designed and coloured every object after nature. Broek died in 1711. Pilkington.

**BROEK**, in *Geography*, a town or rather a large village of North Holland, distinguished by the elegant neatness and beauty of the houses and streets, and also of the inhabitants. The houses, which are built of wood and covered with tiles, are painted and ornamented on the outside with a variety of vivid colours, according to the fancy of the owner; and the windows are generally fashed and decorated with curtains.

The inside of the houses is also equally neat and embellished. In the fronts of most of them are agreeable gardens, diversified with gravel walks, shell-work, images, and little hedges, or painted rails. The streets are paved with bricks, and watered by rivulets that pass by the sides of the houses; and in order to their being kept clean, they are too narrow to admit of carriages, nor are cattle suffered to pass through them. The same attention to neatness and ornament is manifest in the environs of Broek. The town is chiefly inhabited by persons who have retired from business, or who are connected with some commercial houses at Amsterdam. The females are beautiful, but singularly reserved, particularly among strangers. The principal articles of trade are cattle and corn. Broek is distant one league W. from Monikedam.

**BROERS BANK**, lies on the coast of Holland, across a village of the same name, and the cloyster of Ten Duyn, running W.N.W. about a league into the sea.

**BROEUCQUES, JOHN FRANCIS DU**, was born at Mons, in 1690. At a proper age he was sent to Louvain, and in 1712 was admitted doctor in medicine; having finished his studies there, he returned to Mons, where he was much esteemed for his professional abilities, and continued practising to the time of his death, which happened suddenly, July 11th, 1749. He published in 1725, in 12mo. "Réflexions sur la Méthode de traiter les Fievres par le Quinquina." In this he combats, and successfully, some of the prejudices still remaining against the use of that medicine. "Preuves de la Nécessité de regarder les Urines, et de l'Usage que les Medecins on doit faire pour la Guérison des Maladies," 1729.

**BROEUCQUES, ANTHONY FRANCIS**, one of the sons of the former, took his degree in medicine at Louvain in 1747, and on the death of his father succeeded to his practice, in which he continued until 1767, the time of his death. Two small useful works, the result of much practice, were published by him: "Discours sur les Erreurs vulgaires, qui se commettent dans le Traitement des Enfants," Mons, 1754, 12mo. "Reformation des Erreurs vulgaires sur le Régime que la Médecine prescrit aux Malades et aux Convalescens." Mons, 1757, 12mo. Eloy. Dict. Hist.

**BROGLING**, a method of fishing for eels, otherwise called **SNIGGLING**.

**BROGLIO, or BROIL**, in *Geography*, a town of Piedmont, in the county of Nice, 15 miles N.E. of Nice. N. lat. 44° 12'. E. long. 6° 42'.

**BROGNE**, a town and abbey of the county of Namur; 10 miles W.S.W. of Namur.

**BROILING OF MEATS**, in *Domestic Economy*. See *DRESSING of Meats*.

**BROJO CASTRA**, in *Geography*, a town of European Turkey, in Livadia; 22 miles N. of Livadia.

**BROKEN**, among *Painters*, a colour is said to be broken, when it is taken down or degraded by the mixture of another.

**BROKEN ARROW, or Clay-Catska**, in *Geography*, an Indian town in the Creek country, in West Florida, on the west side of Chatauche river; 12 miles below the Cusfatah and Coweta towns, where the river is fordable.

**BROKEN BACKED**, in *Sea-Language*, denotes the state of a ship which is so impaired and loosened in her frame, as to droop at each end; a disorder to which the French ships are most exposed, on account of their length, &c.

**BROKEN Bay**, in *Geography*, a capacious inlet, being the æstuary of the Hawksbury and other rivers, on the eastern coast of New Holland, about 8 miles to the northward of Port Jackson. S. lat. 33° 20'. E. long. 151° 27'.

**BROKEN Islands**, a name given to an assemblage of rocky eminences,

eminences, for the most part barren, situate on the coast of Armenia, in the East Indies, and affording shelter only to pirates and thieves. N. lat. 16 30'. E. long. 94° 28'.

**BROKEN KNEES.** Among *Horse-Jockies*, broken knees are a mark of a dumber.

**BROKEN NOSES,** in *Arabic*. See NUMBER and FRACTURES.

**BOOKS KEY,** in *Dioptries*, the same with ray of REFRACTION, which see.

**BROKEN WIND,** in *Veterinary Science*, a disease frequently happening to horses. The following are the indications which mark its presence. The breathing of the horse becomes altered from its natural state, and from an easy, gentle, and constant respiration is changed to a painful, laborious, heaving, and violent agitation of the flanks, which rise by several successive ebullitions to a preternatural height, then suddenly relax and fall downward beyond the natural extent of their parts: the nostrils become dilated, and held rigid and opened to their natural extent, and the face becomes every where congested and distended: such are the appearances in very aggravated cases; in more recent cases these appearances are less evident, and it is a disease that can exist in every degree of mildness or violence.

When the disease has been of long standing, and little pain or care is taken with the animal, as may be more particularly observed in cart horses, and horses employed in farmer's work in the country, the abdomen becomes large and pendulous; but in more recent cases, and in horses otherwise situated, we have observed that, in the early stage at least, the abdomen is rather contracted and is painfully held up in this disorder.

Great thirst attends this disease, perhaps arising from the increased action or fever which it occasions, and this has been too often mistaken for the cause of it, and has led to the most cruel privations.

There is no disorder, perhaps, of the horse, which has so much engaged the attention of anatomists and of speculative ingenious men, as this, to discover its cause. It has, however, we believe, never yet been satisfactorily explained; at least, there is no author that we are acquainted with that has formed any connected or probable account of it, unless perhaps very lately, and which was derived from the source we are about to mention.

Haller seems to have supposed it proceeded from a relaxed or ruptured diaphragm. Lower imagined that a relaxation or injury of the phrenic nerves might occasion it; some have assured us, after examination, that the lungs are not at all affected in this complaint, and that its seat was about the larynx and air-passages; and some of the writers on this subject have believed, that the lungs were grown too big for the chest, and that this was the source of the mischief, and that there have been many other conjectures equally absurd. Some thought they elucidated the nature of this disease by comparing it to a consumption, and others to an asthma. We trust something more natural and satisfactory will be found in the following statement of our observations on this singular disease.

In the year 1795, being engaged in the dissection of a grey mare that was sent to the veterinary college to be destroyed on account of this complaint; on opening the chest, the lungs appeared free from inflammation, being very white; and, as it appeared free from redness and increase of colour, the general concomitant of disease, we were led for a while to consider the lungs as not the seat of the disorder, as others had done (for several of the pupils were present at this dissection). On cutting into their substance, no inflammation was perceivable; on examining them more closely,

we observed a small bladder or vesicle on the outside of the lungs, in the external investing pleuritic coat; this was conceived by some who were present to be a tubercle, and that tubercles might be the cause of the broken wind. Suspecting, however, from its appearance, that it was not solid, but contained air, it was punctured, and it immediately subsided. This instantly suggested to the writer of this article, that the lungs were actually in a state of *emphysema*, or that air was contained in a state of extravasation in their substance, and which not only seemed evidently the case in this instance, but we have since fully verified it by examination and dissection of a considerable number of cases of broken wind, and found that it is the constant appearance. This extravasation of air in the substance of the lungs is perhaps occasioned by a rupture of the air-cells, as suggested by Mr. Coleman at that time, unless it is formed in them, and thrown out by some morbid operation of the blood-vessels, as sometimes happens in the intestines and *ovaria*; for the exact way in which this emphysema arises has not been yet ascertained. It fully explains the cause of the white appearance of the lungs, the membranes being separated and divided by air lying between them partially admit the light, also the puffy appearance they make, and the crackling noise they give on their being handled; all admit of a ready explanation by this discovery, and so do the symptoms which attend the disorder; for the common air escaping, from disease or a sudden rupture of the cells, into the membranes composing the lungs, thereby compress and obliterate more or less the natural cavities destined for the reception of the air, and thus occasion the effort we observe to overcome this obstruction, and which naturally induce the appearances we have described as the symptoms attending this disorder: it also accounts for its incurability, and the oppression which a full stomach occasions. As the extravasation proceeds, the complaint gradually, or sometimes suddenly, increases, so as to be insupportable to the animal; and at length being quite useless, he is necessarily destroyed. In some cases, the disease, without much increasing, may exist for many years, and till the horse dies from other disease or age. This white appearance of the lungs it is that had deceived so long those who had been led through curiosity to examine the lungs in this complaint; it being so unusual to see any part in a state of disease more delicately white than in its healthy state; and singular it is, that the extravasated air should not bring on the inflammation and destruction of these organs.

Horses, in bad cases of broken wind, are observed to void air in considerable quantities by the anus, as though the extravasated air of the lungs was absorbed and carried to the intestines; or it is probably only indigestion which is the cause of this: and the smiths, not unfrequently, on this account, cut through and divide the *sphincter ani*, then the power of closing the rectum is lost, and the air escapes without any noise; and they are led from hence frequently to imagine they have cured the complaint.

We are now led to consider what the cause is, which in the general estimation of mankind leads horses to this disease, viz. their being allowed too much water; and here, we apprehend, every observer of common feeling and humanity must be shocked at the recollection of what instances have fallen within his own observation of cruelty in this respect, and of what horses are daily and hourly suffering from the most barbarous of all customs, the denying a sufficiency of water to sound horses to prevent their becoming broken-winded. True it is, that water administered to horses in an improper manner, especially after the privation above  
spoken

spoken of, may become a cause of their being broken-winded; but would any one infer from this, that it is necessary that all horses should be kept almost entirely without water, exposed to a never-ceasing thirst, till an opportunity of gratifying the appetite in this way occurs; and the natural and healthful beverage being too largely taken, becomes a poison, and induces the very mischief which so much cruel and useless pains had been taken to avoid; for the horse that is allowed to drink frequently and as much as he likes, will never from this source become broken-winded. No horse on a common, exposed to the water of the brook, which he can partake of as often as he pleases, will ever become broken-winded from this cause, unless he had previously suffered a privation of water, and, in his first excesses to overcome his thirst, had injured himself. Let us now consider, under what circumstances it is advantageous to deprive a horse, for a time, of his water. The traveller, who starts in the morning on his journey, would be incommoded, if the horse's stomach was loaded with water; it is quickly absorbed from the stomach, and passing off in perspiration, becomes unsightly and troublesome; and though it may be true, that perspiration, not too heavy, by keeping a moisture on the skin, and by its evaporation, induces a coolness that might be refreshing, yet to be inundated with it would be highly disagreeable. The water should, therefore, be given at an earlier hour in the morning, and should have time to pass off before the horse is used on the road; and if he be deprived, in a great measure, of it during the day, he should be the more plentifully supplied with it during the night-time, so as not to create a violent thirst, which can only be gratified, the first opportunity that happens, at the expence of his health, or perhaps his existence.

Sorry should we have been, if, after much inquiry into the nature of this disease, we should have discovered that the above practice of depriving horses almost entirely of water, though cruel, was necessary; and that we must acquiesce, with painful sensations, in the use of this custom. We are, on the contrary, convinced from experience, as well as the most incontrovertible reasoning, that the practice is as destructive and pernicious, as it is cruel and unnatural; for we are aware, the suggestions of humanity would avail but little, where an opposite course would best serve the interests of mankind in regard to this animal; however, they are, fortunately for it, not incompatible; on the contrary, all the comforts he can receive will best insure his life and labours.

It should be recollected that the horse is fed on the driest food, as corn, beans, bran, hay, &c. and this requires, to its being well digested, a certain portion of moisture, which must be either derived externally, or from the blood; and horses are often expected to work hard under these circumstances, to sweat and perspire profusely, and digest their food as well, without any water: the consequence of this is, that their dryness and thirst must arrive at a pitch that is scarcely governable; and to these causes we may add, as contributing to the mischief, the hot, crowded, low-stables of large towns and cities, where they are often, in consequence of such treatment, seized with various inflammatory complaints, as affections of the limbs, eyes, brain, and lungs, and other diseases. They are sometimes miserably allowed to wet their mouths on the road, and this is deemed sufficient for their wants; or, if they by any accident get to water, the consequences ensue that we have above described.

With chaises and post-coaches are ever seen the greatest number of broken-winded horses, because the artificial and mischievous system pursued by the drivers of such vehicles na-

turally lead to it. It is a practice with the brewers' dray-horses, both in the metropolis and the country, as often as they come home, to let them go to the trough and drink their fill; among these broken-winded horses are very rare, though they have all the water they can desire.

Wetting horses all over with cold water, while in a profuse sweat, we believe not to be so injurious a custom as would at first appear, if the law for its application is understood, but, on the contrary, very beneficial and refreshing. Those who do it should be apprized of the danger of carrying it to the extent that would chill the horse, when the worst consequences would often ensue: to avoid ill effects, the horse, after this bathing, should not be left long to stand still and chill, or in any cold place, or draft of air; but while his skin is yet warm, (as in the case of a return-chaise,) he should be put in, and drove home, till again perspiration is fully induced upon the skin, when all danger would be prevented; and it would be best, perhaps, not to repeat it, at least to the same extent, on his arrival home: as he is then to stand still in the stable, there would be some risk of inflamed lungs, inflamed feet, or the gripes, from the blood being confined in the interior of the system.

Muddy water is often conceived to be best for horses, and is given them in preference by some groomers. A horse, however, must arrive at an extraordinary degree of thirst before he would touch it; and it is only better, as being in general warmer, having been exposed to the air and sun, and is certainly safer for horses than water drawn from a cold spring or deep well; the contrast of temperature being too great with the horse heated by violent exercise.

When the cause of any disease is not understood, the theories for its explanation will be vague and unsatisfactory, and the remedies various, often opposite, and almost infinite, and so it has been with this complaint; for there is nothing can equal the absurd nostrums recommended in books of farriery, in this complaint in particular, as well as in some others; and the farther we go back, the more sure and sound is the information respecting it. The ideas of the Romans were coarse and absurd; but the Greeks appear to have had a better knowledge of it, as is seen by the following translation given by Ruellius: "*Cum in pulmonibus quid rumpi ceperit, hoc vitium πνευμοναξ Graiis quasi pulmonis rupta dixeris appellatur;*" and it is afterwards much better described, in a chapter given by Theophrastus in the same work, and at considerable length, too much so to admit of being inserted in this place. Whether, however, the term *Pulmonis rupta* did really convey to their ideas the actual cause of the disorder, may be doubted by the context, any more than broken-wind to an Englishman, or *Cheval pouffé* to a Frenchman. The ancients appear to have had a belief in its being cured, especially before it became inveterate; the remedies they mention, however, may be fairly suspected of possessing any such power.

We cannot conclude this article more usefully to the public than by cautioning them against a common practice, especially among the lower order of horse dealers, of violently squeezing the wind-pipe and throat, to ascertain if a horse be broken-winded, which is often attended with the most mischievous consequences; the cough will be in proportion to the violence of the irritation used, and this, even in cases of broken wind, unless in the last stage of it, when other symptoms sufficiently denote it; so that, as a criterion, we believe it to be of little value.

A grey poney was brought to the Veterinary College, during the professorship of M. St. Bel' in the year 1791, with great difficulty of breathing, a copious discharge of saliva from the mouth, and a running at the nose; so far it appeared somewhat like glanders; but the glands under the jaw

jaw, and all the external parts of the throat, were free from swelling.

The difficulty of breathing was considerable, and threatened suffocation: this induced us to suppose some obstruction was the cause, either in the nostrils, fauces, or larynx.

The operation of bronchotomy was had recourse to, which immediately relieved him: present suffocation being thus prevented, our next plan was to remove the obstacle, which we imagined might be in the nose. The frontal bone was trepanned, and it was intended to trepan the nasal bone, but this was not executed, for the pus from the former found its way through into the nose, and the nose was injected every day, through this opening, with a warm decoction of herbs. As the orifice in the trachea every day became smaller, it was difficult to keep in the *canula*, which accidentally a few days after falling out, the horse was suffocated and expired. On opening the head, there was no obstruction any where to be found; on opening the larynx, the true cause was discovered.

The internal membrane that lines the larynx, or wind-pipe, was enlarged or distended with a fluid, in a way that prevented the admission of air. This membrane was detached from the sides of the larynx, and so distended, that the two portions met each other in the centre of the pipe, forming two hemispherical tumours, which acted as valves, and completely excluded the admission of air. On cutting into these tumours, they were composed of cellular membranes, distended by a small portion of fluid: the surrounding parts did not bear any marks of inflammation. If these tumours had formed on one side only, they might have been attributed, perhaps, to some puncture, or some injury from bleeding, or other cause of this sort; but being on both sides of the throat, it is probable both sides must have been irritated, to produce it, and nothing so likely as violent compression of that sort we see men use when they propose to try horses for broken wind; for they endeavour to squeeze the pipe till both sides meet, otherwise the horse will not cough, or only slightly. Since this, another exactly similar case was brought to one of the slaughter-houses of town, while we were casually staying there, and the horse was said to die of suffocation, they could not tell why. On examining the larynx, a similar mischief was discovered.

During the last six years, we have opened more than 10 horses that were broken-winded, and uniformly found the lungs emphysematous: violent breathing and appearances, in every respect like broken wind, attend other affections where the lungs are injured, as in large abscesses forming in the lungs, water thrown out in the chest in roasters, and even violent pain in any part of the body, will produce appearances resembling broken wind, which again disappear when those affections are removed.

When the stomach is loaded, especially with water, all the symptoms of this disorder are more easily remarked, especially on exercise; it is, therefore, one of the most sure means of ascertaining it; and on this account horses with this complaint, are in general kept from drinking great quantities of water, which they are much disposed to do, probably from the fever observed to attend the complaint, and also, perhaps, from the blood in the lungs not undergoing so completely the changes it ought to do in that viscous.

Some horses are differently affected in broken wind to others: the respiration is quickened in some without much heaving, and the abdomen in such is contracted and hard, instead of being large and pendulous. It is sometimes attended with a cough, which is not deep, but short and hard, as though the lungs refilled perfectly the impulse of this exertion. On exercise the cough is much increased, after which he seems relieved; the head in coughing is held

low, his neck stretched out as though he endeavoured to bring something from his throat: "*quasi officula devorasset*:" the face has a rigid emaciated appearance, resembling, though less violent, that constriction which attends lock jaw. The eyes are often yellow from diffused bile; the nostrils dilated and rigid. The appetite is not affected by it, if any thing it is increased.

The writer of this article endeavoured to rupture the cells of the lungs of a sound horse, by inflating them, and laying weights upon them, and found that no moderate pressure would do it; indeed when removed from the body, no experiment could be very satisfactory, and he desisted from farther experiments with this design.

**BROKER.** The origin of the word is contested; some derive it from the French *broyer*, "to grind;" others from *brocarder*, "to cavil, or riggle;" others deduce broker from a trader *broken*, and that from the Saxon *broc*, "misfortune;" which is often the true reason of a man's breaking. In which view, a broker is a broken trader, by misfortune; and it is said that none but such were formerly admitted to that employment.

**BROKERS** are of several kinds; exchange-brokers, insurance-brokers, stock-brokers, and pawn-brokers.

**BROKERS**, *exchange*, are a sort of negotiators, who contrive, make, and conclude bargains between merchants and tradesmen, in matters of money or merchandize, for which they have a fee, or premium. See **EXCHANGE**.

These, in our old law-books, are called *broggers*, and in Scotland, *broccarii*, i. e. according to Skene, mediators or intercessors in any contract, &c. See **PROXENETA**.

They make it their business to know the alteration of the course of exchange, to inform merchants how it goes, and to notify to those who have money to receive or pay beyond sea, who are proper persons for negotiating the exchange with; and when the matter is accomplished, that is, when the money is paid, they have for brokage, two shillings per 100 pounds sterling.

These, by the statutes of 8 and 9 William III. 6 Ann. c. 16. are to be licensed in London by the lord-mayor and aldermen, who administer an oath, and take bond for the faithful execution of their office: and any person acting without such a license and admission, is liable to the forfeiture of 50*l.* and persons employing them forfeit 50*l.* This is also the case at Bristol, by stat. 3 Geo. II. c. 31. They are also to register contracts, &c. under the like penalty; and not to deal for themselves on pain of forfeiting 200*l.* They are likewise to carry about with them a silver medal, having the king's arms, and the arms of the city, &c. and to pay 40*s.* a year to the chamber of the city.

In France, till the middle of the seventeenth century, their exchange brokers were called "*courtiers de change*;" but by an arret of council in 1639, the name was changed for that more creditable one of "*agent de change, banque, et finance*;" and in the beginning of the eighteenth century, to render the office still more honourable, the title of "*king's counsellors*" was added.

At Grand Cairo, and several places of the Levant, the Arabs, who do the office of exchange brokers, are called "*consuls*:" the manner of whose negotiating with the European merchants has something in it so very particular, that we have referred it to a distinct article.

The exchange-brokers at Amsterdam, called "*makelaers*," are of two kinds; the one, like the English, called "*sworn brokers*," because of the oath they take before the burgo-masters; but the owners negotiate without any commission, and are called "*walking brokers*."—The first are in number 395; whereof 375 are Christians, and 20 Jews: the others are nearly double that number; so that in Amsterdam there

are nearly 1000 exchange brokers.—The difference between the two consists in this; that the books and persons of the former are allowed as evidence in the courts of justice; whereas, in case of dispute, the latter are disowned, and their bargains disannulled.

The fee of the sworn exchange brokers of Amsterdam is fixed by two regulations, of 1613, and 1623, with regard to matters of exchange, to eighteen sols for 100 livres de gros, or 600 florins, i. e. three sols for 100 florins; payable, half by the drawer, and half by the person who pays the money. But custom has made considerable alterations herein.

The Jews, Armenians, and Banians, are the chief brokers throughout most parts of the Levant and the Indies. In Persia, all affairs are transacted by a sort of brokers whom they call "delal," i. e. "great talkers." The manner of making their contracts is very singular, and has been explained under the article BANIANs.

The French distinguish two kinds of brokers; one for the service of merchants, the other of manufacturers, artificers, and workmen. The business of the former is to facilitate the sale of goods in the wholesale and mercantile way; that of the other, to procure the goods wanted for manufacturers, artificers, &c. or to sell their goods when made. At Paris there is scarce a company of tradesmen, or even mechanics, but have their brokers, who are usually taken out of their body, and make it their sole business to negotiate in the particular kinds of goods to which such company is by statutes restrained. There are brokers for drapery, brokers for grocery, brokers for mercery, &c. There are even brokers for tanners, curriers, cutlers, and the like. Dict. of Comm.

BROKERS, *insurance or policy*, are agents who transact the business of insurance between the merchant or party insured and the underwriters or insurers. These insurance brokers, from the nature of their employment, ought to be, and indeed generally are, persons of respectability and honour, in whom unlimited confidence may be reposed. To the broker the merchant looks for the regularity of the contract, and a proper selection of responsible underwriters: and to him, also, the underwriters look for a fair and candid disclosure of all material circumstances affecting the risk, and for the payment of their premiums. There is usually an open account between each broker, and every underwriter, with whom he has much dealing. In this account the broker makes himself debtor to the underwriter for all premiums, and takes credit for all losses to which the underwriter is liable, and which the broker is authorized to receive. Indeed, it is generally understood, that by the usage of trade in London, the underwriters give credit only to the broker for their premiums, and can resort only to him for payment; and that he alone, and not the underwriters, can recover the premiums from the insured. This point, however, has never been settled by any judicial determination. But though the underwriter thus looks to the broker for his premium, and though the broker in his account with the underwriter, takes credit for the losses and returns of premiums, which he is authorized to receive from the underwriter; yet, such losses are not to be regarded as a *debt* from the underwriter to the broker. In the case of the bankruptcy of a policy broker, the court of king's bench (23 Geo. III.) held, that though credit for the premiums must be given to the broker, because the underwriters know nothing of the principals; yet, that they could not set off the losses or returns of premium due to the principals, and which *they* only could sue for, against a debt due from the defendants to the bankrupt. In this case, the defendants had no commission *del credere*. In a subsequent case, where the action was brought by the assignees of an underwriter against the factor, it was

determined (26 Geo. III.) that the defendant might set off losses upon policies subscribed by the bankrupt, and due to the defendant's correspondents; but there the defendant had a commission *del credere*, which, lord Mansfield said, made him liable to his correspondents for losses, without first bringing an action on the policy against the underwriter.

Where the merchant happens to reside at a distance from the place where he means to be insured, the policy is usually effected by the mediation of his agent or correspondent there, who, if he be not a broker, employs one, and gives him all necessary instructions. In order to his being an agent in such a case, he must either have express directions from the principal to cause the insurance to be made, or else it must be a duty arising from the nature of his correspondence with the principal. And no general authority which he may have in relation to a ship or goods, will make him an agent for the purpose of insuring, on behalf of the parties interested. However, though one man cannot, in general, compel another against his consent to become an agent for procuring an insurance to be effected for him, there are three cases, in which an order to insure must be complied with: as, *first*, where an agent has effects of his principal in his hands; *secondly*, where he has been in the practice of making insurances, and has given no notice to discontinue; and, *thirdly*, where he accepts bills of lading sent him on condition to insure.

To the office of agent or broker, great responsibility attaches: and, in the execution of it, it is the duty of each to conduct himself with the greatest fidelity, punctuality, and circumspection. For in this, as in all other cases, where a man, either by an express or implied undertaking, engages to do an act for another, and he either wholly neglects to do it, or does it improperly or unskilfully, an action on the case will lie against him to recover a satisfaction for the loss or damage resulting from his negligence, or want of skill. Hence, if a merchant here accept an order from his correspondent abroad to cause an insurance to be made, but limits the broker to too small a premium, in consequence of which no insurance can be effected; he is liable to make good the loss to his correspondent; for though, it is his duty to get the insurance done at as low a premium as possible, yet, he has no right so to limit the premium, as to prevent the insurance from being effected. And even a voluntary agent, who has no prospect of remuneration for his trouble, is liable, provided that he takes any step in the business.

It is not only the duty of the agent, in transacting the business of insurances, to conduct himself with fidelity and punctuality towards his employer, but he is also bound to observe the strictest veracity and candour towards the insurer: for any fraud or concealment on his part will avoid the policy, even though the insured be altogether ignorant and innocent respecting it.

In an action against an agent, or broker, whether for negligence or unskilfulness in effecting an insurance, the plaintiff is entitled to recover to the same amount as he might have recovered against the underwriters, if the policy had been properly effected. But he can only recover what, in *point of law*, he might have recovered on the policy; and not what the indulgence or liberality of the underwriters might probably have induced them to pay. In such an action, the agent may avail himself of every defence, such as fraud, deviation, non-compliance with warranties, &c. which the underwriters might have set up in an action on the policy: but if the agent act in the usual manner, it will be deemed sufficient.

There are many reasons why an agent or broker ought not to be an insurer. He becomes too much interested to settle with fairness the rate of premium, the amount of partial losses,

17s. &c.; and though he should not himself occasion any unnecessary delay or obstacle to the payment of a loss, he will not be over-anxious to remove the doubts of others: besides, he ought not, by underwriting the policy, to deprive the party of his unbiased testimony, in case of dispute.

If an agent or broker, meaning to appropriate the premium to his self, and take the chance of a safe arrival, represent to his employer that an insurance has been effected agreeably to his instructions, the principal may maintain an action over for the policy against the agent or broker; and, upon proof of a loss, he shall recover to the same amount as he would have been entitled to recover against the underwriters, if a policy had been effected. *Marshall on Insurance, vol. i. See INSURANCE and POLICY.*

**BROKERS, piece**, a sort of petty dealers in drapery, who sell fragments or remnants of cloths, stuffs, silks, and the like, at a lower price.

**BROKERS, stock**, are those employed to buy and sell shares in the joint stock of a company or corporation; and also, in the public funds. The negotiations, &c. of these brokers are regulated by stat. 6 Geo. I. cap. 18. and 7 and 10 Geo. II. cap. 8. which, among other things, enact, that contracts in the nature of wagers, &c. incur a penalty of 500l. and by the sale of stock, of which the feller is not possessed, and which he does not transfer, a forfeit of 100l.; and contracts for sale of any stock, of which the contractors are not actually possessed, or to which they are not entitled, are void, and the parties agreeing to sell, &c. incur a penalty of 500l.; and that brokers keep a book, in which all contracts, with their dates, and the names of the parties concerned, shall be entered, on pain of 50l.: these enactments, however, are little regarded by the gamblers in the public funds. See *STOCK-JOBBER.*

**BROKERS of household furniture.** See *APPRAISERS.*

**BROKERS, pawn**, are persons who keep shops, and let out money to necessitous people upon pledges, for the most part on exorbitant interest. These are more properly called pawn-takers, or tally-men, sometimes fripers, or friperers.

Of these is to be underitood the statute of 1 Jac. I. c. 21. by which it is enacted, that the sale of goods, wrongfully gotten, to any broker in London, Westminster, Southwark, or within two miles of London, shall not alter the property thereof. If a broker, having received such goods, shall not, upon the request of the right owner, truly discover them, how and when he came by them, and to whom they are conveyed, he shall forfeit the double value thereof to the said owner.

But there are several excellent regulations respecting pawn-brokers of later date. By stat. 25 Geo. III. c. 48. pawn-brokers are annually to take out a licence on a 10l. stamp, within the bills of mortality, and 5l. in any other part of the kingdom, for each shop kept, under a penalty of 50l. By stat. 29 Geo. III. c. 57. confirmed by stats. 31 Geo. III. c. 52. and 33 Geo. III. c. 53. pawnbrokers are allowed the following rates of profit for interest and warehouse-room. For every pledge upon which there has not been lent above 2s. 6d. one halfpenny, for any time during which the said pledge shall remain in pawn, not exceeding one month, and the same for every month afterwards, including the current month in which such pledge shall be redeemed; for 5s., one penny; for 7s. 6d., one penny half-penny; for 10s., two-pence; for 12s. 6d., two pence half-penny; for 15s., three-pence; for 17s. 6d., three-pence half-penny; for 1l., four-pence; and so on progressively and in proportion for any sum not exceeding 40s.; and for every sum exceeding 40s. and not exceeding 10l., at the rate of 3d. and no more for the loan of every 20s. of such money lent by the month; and so in proportion for any fractional sum. A

party applying for the redemption of goods pawned, within seven days after the expiration of any month, may redeem them without paying any thing for the seven days; and applying after seven days, and within sixteen days, pays the profit for one month and the half of another month; but after the expiration of the first fourteen days, the pawn-broker may take for the whole month. He is required to make entries, and to give duplicates. Any person fraudulently pawning the goods of another, and convicted before a justice, shall forfeit 20s. and the value of the goods pawned, &c. to be ascertained by the justice; and on failure of payment, be committed to the house of correction for not more than three months, nor less than one month, and be publicly whipped; the forfeitures being applied to the satisfaction of the injured party, and the defraying of costs, and the overplus, if any, to the poor of the parish. Any person counterfeiting or altering a duplicate, may be seized and taken before a justice, who is to commit the offender to the house of correction for not more than three months, nor less than one. If a person shall offer to pawn any goods, refusing to give a satisfactory account of himself and the goods; or if there be reason to suspect that the goods are stolen; or if any person, not entitled, shall attempt to redeem goods pawned; they may be taken before a justice for examination: and if it appear that the goods were stolen or illegally obtained; or that the person attempting to redeem them has no title or pretence to the same, the justice is to commit him to be dealt with according to law, provided the nature of the offence shall authorize such commitment by any other law; or otherwise, for not more than three months, nor less than one. A justice may grant a search-warrant, and a peace-officer break open doors, and restore the goods, if found, to the owner. If pawn-brokers refuse to deliver up goods pledged within one year, on tender of the money lent and interest, a justice is empowered, on conviction, to commit them till the goods be delivered up, or reasonable satisfaction be obtained. Goods may be sold by public auction after the expiration of one year; being exposed to public view, and catalogues of them published, and two advertisements of sale by the pawnbroker to be inserted in some newspaper, two days at least before the first day's sale, under penalty of 5l. to the owner. Pawnbrokers, receiving notice from the owners of goods before the expiration of a year, are not allowed to dispose of them, till after the expiration of three months from the end of the said year. They are to enter an account of sales in their books of all goods pawned for upwards of 10s.; and the overplus, in case of sale, shall, upon demand within three years, be paid to the owner, necessary interest, costs, &c. being deducted: and refusal to pay the overplus shall incur a forfeiture of treble the sum lent, to be levied by distress. Pawnbrokers shall not purchase goods in their custody, or suffer them to be redeemed for that purpose; nor lend money to any person appearing to be under twelve years of age, or intoxicated, or purchase duplicates of other pawnbrokers, or buy any goods before eight in the forenoon, and after seven in the evening; nor receive any goods in pawn before eight in the forenoon, or after nine at night, between Michaelmas and Lady-day; and before seven in the forenoon, and after ten at night, during the remainder of the year, except the evenings of Saturday, and those preceding Good Friday and Christmas day; nor carry on the trade on any Sunday, Good Friday, or Christmas day. Pawnbrokers are to place in their shops, a table of rates allowed by this act; and they are required to have their Christian and surname, and business, written over the door, under a penalty of 10l. half to the informer, and half to the poor. Pawnbrokers offend-

ing against this act, in cases where no penalty is provided, shall for every offence forfeit 5*l.* leviable by distress, half to the informer, and half to the poor. Complaint shall, in all cases, be made within twelve months. This act does not extend to pledges for money above 10*l.*, nor to persons lending money upon goods at 5 per cent. interest.

In the cities of Italy, there are companies established by authority for the letting out money in pawns, called "mounts of piety;" an honourable title, like that of the "charitable corporation," but little becoming such institutions; inasmuch as the loan is not *gratis*. In some parts of Italy, they have likewise "mounts of piety" of another kind, wherein they only receive ready money, and return it again, with interest at so much per annum. At Bologna, they have several such "mounts;" which are distinguished into *frank and perpetual*; the interest of the former is only four per cent.; in the latter, seven.

**BROKURAGE**, the fee paid to a **BROKER**.

**BROKAY**, in *Geography*, a town of Hindostan, in the country of Candesh; 8 miles S.W. of Burhanpour.

**BROLO**, a town of the island of Sicily, in the valley of Demona; 7 miles W. of Patì.

**BROMBERG**, a town of Polish Prussia, seated on the river Bro, called also *Bidgeß*, which see.

**BROME, ALEXANDER**, in *Biography*, a poet of the 17th century, was attorney of the lord mayor's court of London in the reign of Charles II., and wrote the greatest number of the songs and epigrams that were published in favour of the royalists, and against the "rump," in the time of Oliver Cromwell, and during the rebellion. These, with his epistles and epigrams, translated from different authors, were printed in one volume 8vo. after the restoration. He also published a version of Horace, and left behind him a comedy, entitled "The Cunning Lovers." He also published two volumes in 8vo. of the plays of Richard Brome, a dramatic writer in the reign of Charles I., who had been originally a menial servant to the celebrated Ben Jonson. One of the plays of R. Brome, called "The Jovial Crew," was not long ago revived, and successfully exhibited. He died in 1652. The editor of his plays, A. Brome, was born in 1620, and died in 1666. *Biog. Dram.*

**BROME**, in *Geography*, a town of Germany, in the principality of Lunenburg-Zell, seated on the Ohre, and belonging to a jurisdiction of the same name, which comprehends a part of the marshy forest of Dromling.

**BROME grass**, in *Botany*. See **BROMUS**.

**BROMELIA**, (in memory of Olaus Bromel, a Swede, author of *Lupologia*, Stock. 1687, 12mo. and *Chlori's Gothica*, 1694, 8vo.) in *Botany*, Linn. gen. 395. Reich. 427. Schreb. 450. Clafs. *hexandria monogynia*. Nat. Ord. *coronaria*. *Bromelie*. Juss.

Gen. Char. *Cal.* perianth three-cornered, superior, permanent; segments three, ovate. *Cor.* either monopetalous with three deep divisions, or of three petals, narrow, lanceolate, erect, longer than the calyx. *Neclary*, adhering to each petal above the base, converging. *Stam.* filaments six, awl-shaped, shorter than the corolla, inserted into the receptacle. Linn. Schreb., on the corolla or calycine glands. *Bot.*, on calycine glands produced above the germ (thence in some degree gynandrous?) Juss. Anthers erect, arrow-shaped. *Pist.* germ inferior; style simple, thread-shaped, the length of the stamens; stigma obtuse, trifid. *Pericarp*, a berry or capsule, one or three-celled. *Seeds*, somewhat oblong, obtuse.

Ess. Char. *Calyx* trifid, superior. *Cor.* with neclareous scales at the base.

\* Flowers on a common receptacle; corolla monopetalous.

Species, 1. *B. Ananas*, pine-apple. (La Marek Ill. Pl. 223.) "Leaves ciliate-spinous, sharp-pointed; spike comole." Linn. *Root* perennial, fibrous. *Root-leaves* from two to three feet long, and from two to three inches broad, channelled, often a little glaucous. *Stem* short, cylindrical, thick, leafy. *Spike* glomerate, dense, scaly, oval or conic, crowned with a tuft of leaves, similar to the root and stem leaves, but smaller. *Flowers* bluish, sessile, small, and scattered upon the common, thick, fleshy receptacle. *Corolla*, half buried in the substance of the receptacle, which, after the flowers fall off, increases in size, and becomes a succulent fruit, covered on all sides with small triangular scales, and resembling the strobile of the genus *Pinus*, whence its common English name is derived. It is a native of South America, and is said to be found also in Africa and the East Indies. 2. *B. Karatas*. Linn. "Leaves erect, long, narrow; flowers sessile, aggregate, subradical. *Root* perennial, fibrous, blackish. *Leaves* smooth, light-green, disposed in a kind of circle, and leaving a large open space in the middle. *Flowers* numerous, purple, or bluish, sessile on the crown of the root, and forming a close, orbicular, convex group. *Calyx* and *germ* covered with a ferruginous down. *Corol.* funnel-shaped. *Pericarp*, berry ovate, three-celled, very fleshy, succulent, of an agreeable, acidulous taste, when ripe. *Seeds* oblong. La Marek, from the MSS. of Plumier. A native of South America and the West Indies. 3. *B. hemisphærica*. La Marek. "Subcaulescent; flowers sessile, disposed in a close hemispherical group. Nearly allied to the preceding; but the leaves are more open and shorter; and the root, when the plant is in fructification, throws up a very short stem. La Marek supposes that the *humilis* of Linneus is only a variety of the *hemisphærica*, of a smaller size, with fewer flowers, and less pleasant fruit. A native of Mexico.

\*\* Flowers upon distinct receptacles, with polypetalous corollas; the proper bromelias of Plumier.

4. *B. Pinguin*. Linn. "Leaves ciliate-spinous, sharp-pointed; raceme terminal." (La Marek Illustr. Pl. 223. Gært. Pl. 11. *fruit*). Resembling *B. ananas* in general habit. *Root* perennial. *Leaves* five or six feet long, according to Jacquin, more thorny than those of *B. ananas*, green above, and covered with a whitish powder beneath; the inner ones red and shorter than the others. *Stem* cylindrical, thick, firm, two or three feet high, pubescent, surrounded by the red interior leaves. *Scales* pale red, or whitish, diminishing in size as they approach the summit of the stem. *Flowers* rose-coloured, sessile, in the axils of the upper scales, and forming a beautiful, pyramidal spike. *Fruit* about the size of a walnut, ovate-pyramidal, obscurely three-cornered, three-celled, covered with a thick subrose-fleshy rind, rugged, with confluent dots, and terminated by the permanent, trifid stigma resembling a tuft of small leaves. The fruit is described by La Marek as a capsule, but is said by Brown

(Jamaic.) to have an agreeable sweet pulp, joined with such a sharpness, that, if suffered to continue in the mouth, it will cause the blood to ooze from the palate and gums. A native of the West Indies. Description chiefly from La Marek. 5. *B. nudicaulis*. "Radical leaves dentate-spinous; stem leaves very entire." Linn. *Root* perennial, parasitical, attaching itself to the trunks of large trees. *Root-leaves* two feet long, three inches broad, stiff, concave, smooth, green, pointed, and edged with strong black spines. *Stem* cylindrical, firm, thick, two or three feet high, covered with a short down, which generally gives it a whitish colour, though it is sometimes almost entirely red. *Stem-leaves* or *scales* oblong, very entire, part red or purple, part whitish. *Flowers* spiked, rose-coloured, sessile, not accompanied by scales, whence

whence its trivial name, and by which it is so clearly distinguished from the preceding, that it ought to form part of the specific character. *Berries* ovate, of a bright red colour. Its leaves like those of the European *diffusus*, or teak, retain the water from rain and dew, and afford a delicious draught to the hunter and traveller in its native scorching climate. Common in the woods of the West Indies, and sent from the coast of Guinea to Mr. Miller. 6. *B. serotina*. La Marek. "Radical leaves short and spinous; stem-leaves very long and very entire, without spines." Burm. Amer. *Root-leaves* lanceolate, sharp-pointed, striated, covered beneath with a whitish powder, and a little enlarged at the base. *Stem* or *Stems* cylindrical, firm, about the thickness of the finger. *Stem-leaves* sword-shaped, pendent. *Flowers* of a beautiful red, in a close pyramidal spike. *Bractes* lanceolate. *Corolla* three-petalled; petals an inch and a half long, ending in a small purple point. *Stamens* white, included in the corolla. Native of Martinico. 7. *B. linguata*. Linn. "Leaves ferrate-spinous, obtuse; spikes alternate." Mill. *Root* perennial, fibrous. *Root-leaves*, some almost lying on the ground, others upright, pale green, concave, many of them rolled up into the shape of a horn, and terminated by a short blunt point. *Stem* four feet high. *Stem-leaves* alternate, oblong, pointed, concave, without spines. *Spikes*, one terminal, the others in the axils of the scales, or upper leaves of the stem. *Flowers* small, sessile. *Berries* round, with a small point, in simple racemes, of a bright coral red. *Seeds* small, oblong, reddish. A native of the West Indies. 8. *B. bracteata*. Willd. "Laves ferrate-spinous; bractes ovate-lanceolate; scape elongated; raceme compound; branchlets subdivided; flower sessile." Swartz. *Root* perennial, parasitical. *Bractes* scarlet, membranaceous, very entire. 9. *B. paniculigera*. Willd. "Leaves ferrate-spinous; bractes lanceolate; raceme compound; branchlets subdivided; flower peduncled." Swartz. *Scape* more than a foot high. *Bractes* scarlet, alternate, membranaceous, half a foot long. *Raceme* two feet long, erect. *Peduncles* an inch long, tomentose. 10. *B. Chrysantha*. Willd. "Leaves ferrate-spinous; bractes lanceolate, toothed; raceme subcompound, shorter than the leaves; flowers peduncled." *Raceme* a foot long, compound at the base. *Flowers* yellow. *Peduncles* smooth. *Bractes* shrivelling. 11. *B. Acanga*. Linn. "Panicl diffuse; leaves ciliate-spinous, sharp-pointed, recurved." Native of Brazil. This species, which appeared in the first edition of the *Species Plantarum*, was omitted in the second, from a doubt whether it is specifically distinct from *B. Karatas*; but, on farther consideration, it was replaced by Linnæus himself in the *Systema Naturæ*, and has been admitted by the subsequent editors of the *Species Plantarum*, but is not noticed by La Marek.

Plumier, and the other older botanists, divided this genus into three; *Anana*, *Karata*, and *Bromelia*. The flowers of the *Anana*, says Jusseu, are in a close spike, on a scape which is leafy at top; as the spike ripens, it takes the form of a fleshy, scaly, esculent fibroble, composed of united berries, which are scarcely divided into cells, and frequently do not ripen their seeds. The *Karatas* have a dense radical corymbus, and ovate berries. The *Bromelias* are loosely spiked or paniced on a scape or stem; and the fruit can scarcely be called a berry. La Marek, if he were not unwilling to increase the number of genera without absolute necessity, would be disposed to keep the *Anana* and *Karata* united, on account of their common receptacle and monopetalous corolla, and to separate the rest which have poly-petalous corollas on distinct receptacles. The general and essential characters, as they stand in Linnæus, Schreber,

Martyn, and even La Marek, will by no means include all the species; we have therefore enlarged the former, and abridged the latter, in order to make them sufficiently comprehensive.

*Propagation, Culture, and Use.* The *Ananas*, or common pine-apple, has long been cultivated in the West Indies; but its fruit has only lately been brought to perfection in Europe. The first person who completely succeeded was Monf. Le Cour of Leyden, in Holland, a contemporary of Mr. Miller; though it was introduced into England so far back as 1690 by Mr. Bentick. It is propagated, either from seed, or from the crown at the top of the fruit, or from the suckers at the side of the stem. As the method of propagating by seed is the slowest, it is seldom practised in Europe. There are, moreover, here comparatively few plants which bear perfect seed, owing, as Mr. Miller conjectured, to the greater number having only stamiferous flowers; and he founded his opinion on the different situation of the cells in the two kinds; those which produce seed lying near the centre of the fruit, and those which are abortive nearer the rind.

When the seed is intended to be preserved, the ripe fruit should be hung up in a warm room, till all the moisture of its pulpy part is evaporated, and should afterwards be kept in a dry place. In spring, when the weather begins to grow warm, the seed should be sown in a pot filled with good garden earth; the pot should then be plunged in a hot-bed; and when the plants have acquired a certain height, they should be removed into fresh pots, and treated like other tropical plants. The grand essential is to guard them from too much moisture.

The *Ananas*, contrary to a common opinion, is thought by some persons to be equally good, whether it be produced from the crown or the suckers. See the next article.

BROMELIA, in *Gardening*, comprehends a plant of the fine fruit kind, the *B. Ananas*, or pine-apple, and some other species raised for the purpose of variety.

Of the first there are several varieties in cultivation; but those which principally deserve the attention of the cultivator, are the queen, which is the most to be relied on for a certain and regular crop; the Antigua and sugar-loaf, the fruit of which is larger; the Montserrat; the king, and the green pine.

The white pine, called by Miller the queen pine, is the most common in Europe. Its flesh is whitish and fibrous; and its rind, when ripe, is as yellow as that of an orange. Its smell is highly pleasant, and it excels most of the rest in size and beauty; but it falls short of some others in flavour, edges the teeth, and makes the lips smart. The yellow pine edges the teeth less; but both are exceeded by the sugar-loaf, which is distinguished from all the others by the purple stripes on the inside of its leaves. Its fruit, when ripe, inclines to a straw colour. The Montserrat pine is now rare in Europe, but is esteemed one of the best in America. The protuberances of the fruit are longer and flatter than those of the common sort. The smooth pine may be a distinct species: its fruit having no crown of leaves, and its root and stem-leaves being without spines. There are several other varieties; but as they are continually changing, it is not necessary to specify them.

The *Karatas* is chiefly propagated by seeds; for though it throws out suckers, they are ill-shapen, and produce unfightly plants. The seeds should be sown early in the spring, in small pots filled with light rich earth, and plunged into a hot-bed of tanner's bark. When the plants are strong enough, they should be transplanted each into a separate pot, and again plunged into the hot-bed, where they should

should remain till Michaelmas, and then be removed into the stove, and treated like the ananas. The penguin is cultivated in precisely the same manner. Neither of them will produce their fruit in England, till they are three or four years old. The latter being very spinous makes an impenetrable hedge, and is much used in the West Indies for fencing pasture lands.

The other species are cultivated only for curiosity, and are raised from seeds brought from their native country, not producing any in England.

Besides the varieties of the *B. ananas*, or pine-apple, above mentioned, there are others known to gardeners, and sometimes introduced into cultivation.

The culture of the pine-apple is more difficult, and requires a more exact and nice attention in its management, in this climate, than that of almost any other plant. It is only capable of being accomplished so as to afford good fruit, by the assistance of the stoves of the hot-house, with the artificial aid of fire heat. And in order to effect the business with the greatest ease and convenience, and in the most perfect manner, besides the stove of the hot or fruiting-house, others are necessary for the purpose of bringing the plants forward in, till ready to set out in the fruiting-stove, which are trimmed nursery-stoves, or pits of successive stoves. And where large quantities of such plants are cultivated, it is also useful to have what are termed bark-pits, formed either by deep frames of wood or of brick work six feet in width, with sufficient length, five or six feet deep behind, and four and a half in front, having the tops glazed; for the purpose of making hot-beds in, for the immediate reception of the crowns and suckers from the parent plants, and to prevent the succession-stove from being crowded too much. Where the whole culture of these plants is to be effected in one stove only, the plants must be raised and fruited together, by which practice not one half of the same hot-house can be occupied at one time with fruiting plants; besides, the young plants are often liable to be brought forward too rapidly. All these different stoves and nursing pits should be provided with proper fires and fire-places, so contrived as to work steadily and save fuel as much as possible, as upon this the expence of the culture of these plants in a great measure depends. See *HOT-HOUSE Stove* and *BARK Pits*.

It is remarked by Mr. Nicol, that stoves for this use are variously constructed: "some are single pitted, some double, and some even triple; some have flues running under, and some round the bark-bed." These he considers as being very dangerous to the roots of the plants, if overheated. He also disapproves of double and triple stoves, as being very uneasy to work in stormy weather, and confining a vast quantity of stagnant unwholesome air in dull hazy weather. A stove in which there is a perfect command of fire-heat, and which admits a free circulation of air in all parts, is to be preferred, and none are so convenient for this purpose as single ones. The situations for them should be dry, and the bottoms or floors raised above the surface of the ground. The common practice of having borders for vines to be trained up the rafters, Mr. Nicol considers as highly prejudicial to the pine plants.

*Preparation of the bark beds.*—The circumstance of importance in the culture of these plants, is that of forming the beds in the stoves and pits. These are differently constituted with different cultivators, and are designed for the purpose of plunging the pots into, with the plants in them, in order to their due growth, and support. These beds are mostly composed of tanners' bark, as being a substance that not only affords the most uniform and durable heat, but which is best suited to the nourishment and growth of the plants and fruit, as well as the most manageable. See *BARK bed*.

The great art in making of these beds, is that of producing such an uniform moderate bottom heat as may not injure the roots of the plants, while it is sufficient to promote their regular growth. The author of the "Scotch Forcing Gardener" observes, that his idea of "the quantity and quality of bottom heat that is required by the pine," is different from that generally entertained. He never wishes the plants, except in striking suckers, to stand in a bottom heat higher than that of blood heat, and that too of a mild moist nature. If the watch stick to the depth of the bottom of the pot feels just a little warm to the hand, or when applied to the cheek, when the body is of a comfortable temperature, it is sufficient; and he thinks it consistent with reason, that the bottom and superficial heat should correspond at all times. In order more effectually to attain this end, and that the roots may sustain no injury, he has recourse to the following rules in forming, turning, and trenching the beds. He never fits the tan in the pit, or adds above an eighth part of new, which, if necessary, he gives place to by skimming off a little of the surface of the old. The new tan is never suffered to lie within a foot of the surface, by which means the pots are instantly plunged in the old. He lays the half of whatever quantity of new tan is added in the bottom of the trench, and divides the other equally to within a foot of the surface of the beds. In trenching he throws the sides to the middle, and the middle to the sides, that there may be an equal mixture of the old tan. Thus the beds are rendered of a mild and equal temperature from the first, and continue much the same for three or four months, and after the first filling they are attended with very little expence for new tan. It is obvious, therefore, that, in filling the pit of a new pinery, it should either be done several months before the plants are placed in, or the tan should be well sweated and wasted, by previous turning in an open shed, &c. And in other cases, it is advisable not to plunge the pots above half their depth for the first two or three months after filling. In adding new tan, it should invariably be thrown up in a heap for eight or ten days before using, in order to drip and sweeten, and should never be applied fresh from the tan yard, as it is wet and apt to heat violently, as well as cake in the beds. It is remarked, that some object to tan, as being expensive and troublesome in working with; but if this method is practised, these inconveniences will be inconsiderable; and as the plants require frequent shifting, the trouble of stirring up the bark-beds at such times is but trifling; the addition of new tan being sometimes unnecessary. He is convinced that there is no ingredient which can be substituted for tan, that will equally answer the purpose in the pinery, and of course recommends the use of it in preference to all others, where it can be easily procured; and more or less of it is always necessary. He considers oak leaves as the next best material, but they cannot be had in many places. Where they are used, he advises that at least eighteen inches of well reduced tan be laid on the surface to plunge the pots in; after these, a mixture of stable dung and tree leaves of any kind. But they should be well fermented before they are used, and at least two feet of reduced tan laid on the surface for the reception of the plants. It is supposed by some, that the reason of pines being planted in pots instead of the surface of the beds, is the want of permanent heat in them, as they may be removed with more facility in the time of renewing the bark, &c.; but Mr. Nicol has a different opinion of the matter, so that, if the heat of the beds were ever so permanent, he would grow them in pots. As all the different plants of any kind do not grow alike in their native climates, much less the pine in an artificial one, there is a necessity for having, at least, two compartments, and growing the plants in

pots, that they may be removed and dried according to circumstances, with the greater ease and safety. Besides, many sorts of plants, in any situation, do much better in pots than elsewhere; if these are all of the succulent kind, or such as have a fleshy stem, which is the pipe. There would also seem to be a reason, which is the basic, coherent nature of tan, that it is a proper medium for the growth and support of such kinds of plants.

The usual period of sowing and renovating or refreshing these plants is to be in the month of autumn, or September, October, and the following month, that the heat may be well kept up during the winter, and in the spring, as soon as the beginning of April; a watering up being given in the interval between the renewals. The plants in these cases should be constantly well fixed up, to allow for the settling that always takes place.

*Mould proper for growing the Plant.*—The most suitable sort of earthy material for the culture of the pine-apple plant is that of the firm vegetable kind, or some composition in which it is a principal ingredient; a large proportion of which should always be provided in a proper state for the purpose. The most beneficial kind is that which is obtained from the decayed leaves of the oak, or a mixture of it with that from the leaf of a birch, elm, beech, sycamore, &c. This mould is prepared by collecting them as they fall in the autumn, and piling them in a heap, throwing a very little light mould over them, to prevent their blowing away. They should remain in this state during the winter, and till the beginning of May, when they should be turned over and mixed well together. In this way, by the spring following, they will be reduced into a mould proper for use. This mould, however, be sifted before it is employed, in order to remove pieces of stick or other improper matters. A compost of turfy vegetable mould with rich garden soil and well rotted stable dung from a hot-bed, in the proportion of one-third of the latter, which have remained together for a considerable time, is likewise recommended by some. Brown, strong, loamy earth, when reduced by long exposure to the air, is another useful material; and pigeons' dung that has been at least two years in a heap, and frequently turned and exposed to the influence of the weather, may be employed: also shell marl, and sea or river gravel, which has been sifted and kept in a dry place, having the size of large peas, &c. may sometimes be employed. The proportions in which they are advised to be made use of for different purposes in the culture of these plants by Mr. Nicol, are these: "For crowns and suckers entire vegetable mould, with a little gravel at bottom, to strike in; afterwards three-fourths vegetable mould, and one-fourth loam, mixed with about a twentieth part of gravel, and a little entire gravel at bottom, till a year old. For year old plants, till shifted into fruiting pots, one half vegetable mould, one half loam, to which add about a twentieth part of gravel, and as much shell marl with a little gravel at bottom, as above. For fruiting in, one half loam, a fourth vegetable mould, a fourth pigeons' dung, to which add gravel and marl, as above, and lay two inches of entire gravel at bottom."

*Raising the Plants.*—This is the next point of material consequence in the cultivation of these plants, and which is effected either by the crowns produced on the tops of the fruit, the offsets, or suckers from between the leaves, and the roots of the old plant. The last should never be employed when it can be avoided; of the other two, suckers are preferred by some, while crowns have the advantage, according to others; but Mr. Nicol justly remarks, that if the former have the superiority in being the stronger plants, they have likewise the disadvantage of running to fruit more unseasonably

than the latter. The crowns are procured by twisting them off the fruit, when it is made use of, and the suckers by breaking down the leaf immediately beneath them, and moving them gently both ways till they come off, which should not be attempted till the under parts appear of a brownish colour, and ripe, as under other circumstances they are liable to break in the middle and be spoiled. When taken off, they should each of them be cleared of a few of the lower outward leaves about the bottom where they are to form roots, by rubbing them off; some also pare the under parts of the stumps smooth with a knife. They are then laid or hung up in a dry place four or five days, or more, that the over moisture and wounds of the stumps, or thick parts of the plants, may be dried up and sufficiently healed over before they are planted, and the danger of their rotting be prevented. The author of the "Scotch Forcing Gardener," however observes, "that if they are perfectly ripe, and the old plants have had no water for a week or two before they were taken off (which they ought not), nothing of this kind is necessary." Each plant frequently affords many suckers, but rarely more than one crown. The crowns are usually gathered one by one as the fruit is used, and stuck into a bark-bed till the whole crop of them, as well as the suckers, can be potted together. The plants, after being thus prepared and collected, must be placed, according to their sizes, singly in pots three or four inches in diameter, and five or six deep, provided for the purpose, and filled with entire vegetable mould, as directed above, having the bottoms previously laid with clean gravel, of the size of horse beans, to the thickness of an inch or something more: some, however, only advise pieces of slate or tile to be put over the holes in the pots. The first is probably the best method, as preventing the water most effectually from stagnating about the roots of the plants.

In planting they should be put neither too shallow, nor too great a depth, but have the mould pretty closely pressed round them.

The nursing pit should be prepared for their reception by having new tan to the extent of a fifth or sixth part added, but none suffered to lie within ten or twelve inches of the surface. In these beds, when of a due heat, the pots should be plunged up to their brims, in regular order, at the distance of two or three inches pot from pot each way, keeping them perfectly level, and the largest towards the back parts. Some advise a slight watering to be immediately given, but others think that neither the crowns nor suckers should have any for the first fortnight after planting, nor any over-head the first winter, lest they should be injured in their hearts by the damp which it occasions.

As the plants thus raised only produce fruit in the second, or more generally, in the third year's growth, commonly with suckers and crowns for future increase, and become afterwards of no use but as stocks for supplying a few more suckers, there is obviously a necessity for raising fresh supplies of plants annually.

*Culture in the raising Stove.*—The management of the plants the first year, or while they remain in the nursery-stoves and pits, requires much attention to keep them in a regular and healthy growth by preserving a continued proper degree of heat in the beds, and a judicious application of water with a suitable admission of free air. Mr. Nicol observes, that where the plants have been struck in the beginning of September, the beds will mostly continue of a kindly heat till about the beginning of November, but should then be wrought over, introducing about an eighth part of new tan by trenching it in. But though the plants will in general have made good roots by this period, they do not in  
common

common stand in need of being fresh potted; such only as are in any degree matted being put into other pots of the next size to those in which they are growing. The matted part being simply taken off, they should be replaced with the bulb as entire as possible. They are then to be plunged in the beds, as in the former case, quite up to the brims of the pots, and should remain till the beginning of April; at which period the beds should be again wrought over, as directed above, and the plants have the mould wholly shaken from the roots, after which they should be replaced in the same pots with fresh mould, and replunged in the beds. In this case the roots being fresh should never be disturbed, the parts that are decayed in the stumps or other places being merely removed.

As the heat of the beds, without the aid of fire, will not be sufficient during these periods for the healthy growth of these plants, it will be requisite to have recourse to that of the artificial kinds. This should be applied about the beginning of October, or the following month, according to the state of the season. In the application of this heat great care should be had to keep it so moderate as not to force the plants forwards too much, and render them in danger of fruiting unseasonably, while it is sufficient for their perfect growth. The former is shewn by their drawing up with long leaves and white hearts; and the latter, by the want of the proper healthy aspect. To accomplish this in the most certain manner, Mr. Nicol recommends working the stoves so as to keep the thermometer as near as possible to 65°, at seven or eight o'clock in the morning and nine at night, until about the first of March, and then to increase it gradually to 70°, at which it should be maintained so long as artificial heat may be required. When the weather is very severe, it is likewise necessary to cover and defend the glasses in the night time, as well as occasionally in the day, with canvas for the purpose, cloths fixed with rollers and pulleys, or large garden mats. At the above period the plants usually begin to grow in a vigorous and rapid manner, and require potting again about the first or middle of May, at which time the bed should be stirred up to about half its depth, and, if necessary, a very little new tan worked in. The plants should be put into pots about six inches in diameter on the inside in the tops on a medium according to their sizes, with the balls entire; and if any of them are matted, that part should be displaced, plunging them to the brims at the distance of about fifteen inches from centre to centre of the plants in the largest kind, and a foot in the smaller kinds, giving a slight watering at the time. Another potting becomes necessary about the beginning of August; and where there are three compartments, the plants should now be removed into the succession house, the bark-beds being worked over to the bottom. The plants must be put into pots of eight inches diameter, plunging them to the brims at the distance of sixteen inches on a medium, and settling them with a gentle watering. At these periods a more free admission of fresh air becomes necessary, especially when the weather is mild and favourable. Where other houses or succession-stoves are employed in the culture of these plants, they may at this time be removed into them, in order to be more conveniently managed in their growth the second year.

*Culture in the Succession Stoves or Pits.* In the second year's growth it will be necessary, towards the middle of November, to work the bark beds over to last during the winter; but the plants need not be shifted, the decayed leaves about their bottoms being only twisted off, and a little fresh mould laid on the surface of the pots, where it may be requisite, replunging the pots to the brims as before. Some advise the leaves of the plants to be tied up while they are potting or

removing them, in order to keep them from being bruised; but the writer just mentioned disapproves of the practice, as he finds they are generally much more bruised in tying than when left loose. The method which he follows, is to have a person standing opposite to him in the time of potting, which is performed on a stage about a yard high, whose business is to hold up the leaves in a loose, though regular manner, between the arms, and prepare and hand the pots. In this manner he has often been able to shift an hundred one-year old plants in two hours. In conveying the plants through the doors of the stoves, the person should proceed with the back foremost, by which means the leaves are saved from injury, as the pot goes first, and the leaves are drawn backwards after it.

About the beginning of March the plants again require shifting, and the bark beds should then be trenched over as before. The plants at this time must be shaken out, and replaced in the same pots, in new mould, cutting off any of the decayed roots, or the ends of the stumps, twisting off a few of the bottom leaves, plunging them as before in the beds, and giving them a slight watering. Towards the first of June, the plants should again be shifted. The bark beds being wrought over to about half their depths, and a little fresh tan added when necessary, the plants, with their balls entire, should then be placed in pots of about ten inches diameter, plunging them, at the distance of eighteen inches from centre to centre, into the beds, and settling them with a little water.

In regard to potting, it is remarked by the same author, that at all times a few of the bottom leaves should be twisted off each plant, that fresh roots may be made more readily to furnish the surface, which tends to keep them more steady in the pots. The fire heat in these cases should be begun about the same period as before, according to Mr. Nicol, and kept to about 60 degrees of the thermometer till the beginning of March, and then gradually increased to 65° for the remainder of the season. The plants should be refreshed occasionally with a little water, according as the earth in the pots becomes dry, or as the state of the weather demands. They should likewise have a more free admission of fresh air, whenever the season will admit of it without danger.

*Culture in the fruiting-stove or hot-house.* The plants raised in the nursery pits, and continued in their growth in the succession stoves, having attained a proper size and strength, should, towards the latter end of August, or the beginning of the following month, be placed in the pots in which they are to fruit, in the same manner as before, and deposited in the stoves of the hot-house, which should have the bark beds prepared for their reception, by trenching them over to the bottoms, and adding about a tenth part of new tan in a proper state of preparation for the purpose, being well blended, and made so as to fill up the pits well. The pots in which the plants are now put, should be about a foot in diameter; which should be plunged in the beds to the brims, a gentle watering being immediately given. In potting the plants, Mr. Nicol in these cases advises the use of a small sick to trundle the mould down between the balls and the sides of the pot, so as to leave no cavities, a circumstance which should be attended to, as being of great utility. The management in this state differs but little from that of the preceding; the chief circumstance to be regarded, is that of keeping up the heat in as regular a manner as possible, with the addition of a due quantity of refreshing moisture, and free air. The beds should, about the middle of November, be stirred up to half their depth, and a little tan added; but the plants must not be shifted at this period, only

only requiring to be re-plunged to the brims again in the beds for the winter. It is the common practice at this time to add a large quantity of new tan, in order to keep up a strong bottom heat through this season; than which Mr. Nicol thinks nothing can be more erroneous. He has already remarked, that the bottom and superficial heat ought to correspond at all times; and if the house is to be wrought at 60° only for the winter, it follows, he supposes, that a very moderate bottom heat is sufficient. The temperature of the house being so much reduced in winter, is, he concludes, to prevent the plants from starting too soon into fruit; and their doing so is frequently more in consequence of too much bottom heat, than irregularity in the temperature of the stove. In the beginning of February, which is the best shewing season, the bark beds will require trenching, which is the only time of the year that the above author advises a deviation from the rules given above. From this time the house, in his opinion, should be wrought as high as 70°, and the bottom heat keep pace with the artificial, for which new tan, to the extent of a sixth part, should be added. Such of the plants, he observes, as are not shewn, are healthy at the root, and stand erect and firm in the pots, should have a little fresh mould laid on the surface by the removal of about two inches of the old. But those that are already shewn, and those that are anywise unhealthy, or appear stunted, should be shaken out entirely, and replaced with fresh mould in the same pots; but none of the roots, unless wasted, should be cut away, or removed. This, so far as it respects the plants that are shewn, he presumes has not been hitherto recommended; he is consequently happy in being enabled to do it with confidence, as it has ever been a matter to be regretted, that pines, from the want of sun and air in the winter months, are apt to be stunted, and shew their fruit too soon; and that fruit so shewn, seldom comes to any considerable size or flavour; the plants so stunted, being unable to nourish the fruit, and these, from the want of sunshine in the early months, coming far short in flavour of that matured at a later period. It is added, that the experiment was tried on a dozen of plants, the half of which were in, and the other half past, the flower at this time of the year; the result was, that they were kept back a full month by the operation; those that were past the flower equalled, and those that were only in flower exceeded any of the others of their own forwardness at the time of shifting. Being encouraged by this success, he treated his whole stock of fruiting plants in the same manner in the following seasons, and they were kept back to a better season, and swelled their fruit to as good a size as those that shewed in February. Towards the beginning or middle of May, the bark beds should be again trenched to the bottom, a tenth part of new tan added, and the plants re-plunged in the beds in the same manner as in the preceding cases, nothing further being necessary. Though it is not possible to apply the heat constantly with that degree of exactness that has been recommended, it is of great importance to approach it as near as can be conveniently done, which, by proper attention to the thermometers employed for the purpose, may in a great degree be accomplished, especially where the person who manages the fires, has likewise the command of the house, which should always be the case.

Several sorts of fuel are employed, but coal or cinders make the most regular and durable fires, where they can be obtained. Ground tan heat may also be employed where the fire-places are properly constructed for the purpose. See HOT-HOUSE.

With regard to the admission of air, the author of "The Scotch Forcing Gardener" recommends very large portions

in the fruiting-house while the fruit is ripening, as it is, he thinks, not only essential to the flavouring of it, but highly conducive to the ripening and hardening of the suckers, which is also a point of importance. Though it is the practice of some to shade their plants from the sun, the above author supposes they can never have too much of its influence. It is advised, that in a winter even frosty air should be admitted in a moderate degree at the top of the house, and in fresh weather, at this season, to the extent, that the thermometer may not be more than 5° above the fire-heat medium, being continued till the middle of March; after which, and for the whole season, not more than 10°. It is observed that in winter fires are frequently made in the morning, solely for the purpose of admitting air, and at the same time keeping up the temperature of the house, and that although the pine, from its nature, does not appear to quickly feel the effects of bad management, there are few plants in reality do it more so, and too due an attention to the temperature of the house, especially in winter, cannot be paid, the want of which is sure to throw the plants into fruit in an untimely season.

In respect to the application of water in the culture of these plants, it is advised to be given very sparingly in dull weather, particularly in the winter season, from about the beginning of October to the first or middle of March, once in eight or ten days is generally sufficient, in a small proportion; but from that period plentiful waterings are requisite, in considerable quantities at a time, mostly once in three or four days. Watering much over head in winter, except in clear weather, is not advised; but in the summer months it is recommended, as a good practice, to first give the quantity requisite to the root from the spout of a watering pan, and then a sufficient quantity to wet every part of the leaves from the rose; the reason of which is, that the different kinds of pines are formed to require very different quantities of water: the queen requiring more than the king; the Antigua, or brown fugar loaf, and the Montserrat and green or stript fugar loaf, a medium between the two, in plants of an equal state of health and size.

With the fruiting plants, very large quantities are required from the time they are out of flower, till they begin to colour; but which should then be gradually withheld, and towards its maturity totally, as this increases the flavour of the fruit, and perfects the ripening of the suckers.

Steaming is considered as not only useless to the health of the pine, but, in dull hazy weather, prejudicial; of course, when there are grapes in the hot-house, it should be regulated so as to suit them.

Water well impregnated with air should be used at all times, which should be applied about eight in the morning, and from four to five in the afternoon. In the watering of these plants, a tin pipe is recommended as useful and convenient, for the more ready conducting the water in the quantity intended to any particular plants of the bark beds. It should be six feet long, an inch and half in diameter at the upper end, and at the other about half an inch, and be formed of two or three separate pieces to lengthen or shorten at pleasure. At the longest end a kind of funnel should either be fixed, or so contrived as to take off and on occasionally, to receive the water from the watering pot. By this means water is capable of being conveyed to the plants separately, in any proportion, to the hearts of them, without wetting the bark beds more than is necessary to moisten the earth in the pots, &c. It is particularly applicable in winter as well as in the spring, during the bloom of the fruiting plants. In winter it may sometimes be proper to have some conveniences in the stove to preserve water in,

that

that it may be raised in its heat a little previous to watering the plants with it.

Some have attempted the culture of the pine-apple without the assistance of hot-houses, or stoves constructed for the purpose, simply by common deep garden frames, and dung hot-beds, aided by occasional linings, in order to promote and keep up a regular degree of heat; but this is a very imperfect method, and seldom attended with much success.

The injuries to which these plants are chiefly exposed during their growth, are brown and white scaly insects, of the *coccus* tribe, and the ant. But as the last is seldom seen, if the former be not present, Mr. Nicol concludes that their presence is in consequence of that of the insects on which they seem to feed. And the brown scaly insect is conceived to be no further injurious, than by discolouring the plants; but the white scaled, or bug, is of the most mischievous nature to the plants, as, where it abounds, they never succeed well. In order to remove them, Mr. Nicol found the following method answer perfectly, in a case where the plants were greatly affected. Having prepared a strong heat for the plants in the bark bed of the nursing pits, he shook out and cut every fibre from their roots, whereby they were rendered the same as suckers at first, not excepting those that were in fruit, some of which were just in flower, dipped them into a liquor prepared by boiling two pounds of soft soap and flower of sulphur, with one pound of roll tobacco, and two ounces of nux vomica, in eight gallons of water to six; put them into pots of six inches diameter, and plunged them to the brims; kept up a fire heat to about  $75^{\circ}$ , gave them but little air, shading them in sun-shine, and afterwards gave them plentiful waterings over head with the same mixture, reduced to about half its former strength. He continued this treatment for two whole months; at the end of which he again shook out their roots, and washed the whole plants in pure water, put them into fresh pots of eight inches diameter, and re-plunged them into a kindly heat in another nursing pit, treating them in all respects as any other plants. He never saw a vestige of the bug afterwards; a few of those plants that were shewn, however, died, but the others, he observed, produced such fruit as might be expected from plants of such sizes of any other kind.

*Time of Maturation, and cutting of the Fruit.* The common season for the ripening of this sort of fruit is from June till September; but from August to the end of the latter month is the principal period of their attaining to the greatest perfection. Mr. Nicol remarks, that some kinds put forth suckers at the base of the fruit, which should be rubbed off as they appear; others put forth suckers from the root; and as these are not proper to be taken into the stock, they should also be twisted off, or otherwise destroyed, as they appear. It is added, that if a plant were to be divested of all its suckers, the fruit would open to a much larger size in consequence; but as this waste ultimately tends to the extirpation of the whole stock, it is by no means advisable. It is proper, however, to reduce the number of suckers on the plant to two or three at most, which should be done in the May shifting; and as the suckers are about half grown at the time, the cultivator is enabled to choose the best, and at the same time to easily destroy the others, by breaking out their hearts. Where the increase of the stock is the object, all suckers, even at the root, should be encouraged in their growth. As some of the kinds also grow on long foot-stalks, which are apt to bend down as the fruit gets heavy, they should be supported by small stakes, or other means, as when the fruit falls over the stalk, it is liable to be bruised, and the nourishment of the fruit retarded.

This sort of fruit loses much of its flavour, when suffered to grow till fully ripe; where not prevented, it should therefore always be cut by the time it has attained a greenish yellow colour, and either left in the heart of the old plants, or laid on the wall-plate, &c. in the stove for a few days, after it has been separated from the stem.

The sign of the fruit having attained perfection in most kinds, is that of their assuming a fine golden colour, with a delightfully fragrant smell; at which time it should always be removed. The method of performing which, is by having several niches of the stems with it, and also the crown of leaves at the top. It is eaten in the highest perfection soon after being cut; but when required, it may be preserved for several weeks, by putting the stem into a bottle of pure water, renewed every two or three days, and placed in a well-dried room of above  $60^{\circ}$  of heat.

The cultivation of the other species may be performed either by sowing the seeds obtained from abroad, in the autumn or spring months, in pots plunged in the hot-beds of the stove, or by means of suckers, in the manner of the pine-apple plants. They must be kept constantly in the stove, where they afford much variety, when properly managed, in assemblage with other plants of the same sort.

BROMFIELD, WILLIAM, in *Biography*, who, in a long course of practice, attained to the highest degree of reputation in his profession, was born in London, in the year 1712, and was initiated in the practice of surgery, under Mr., afterwards serjeant, Ranby. With such a preceptor, and with a mind susceptible of information, he early found himself capable of practising on his own account. In the year 1741 he began to give lectures in anatomy and surgery, and soon found his theatre crowded with pupils. Two or three years after, in conjunction with the reverend Mr. Madan, he formed the plan of the Lock hospital, for the sole reception of that unfortunate class of patients, who are affected with the venereal disease. By a strong and forcible appeal to the humanity of the public, and by shewing the advantages that ultimately might redound to them, from the improvements that might be expected to be made, in such an asylum, in the method of treating that frightful disease; a subscription was raised sufficient to enable the projectors of it to erect the present spacious and handsome building, but not for its maintenance, which is still effected by voluntary contributions. To this hospital Mr. Bromfield was made surgeon, an office he filled with advantage to the patients and credit to himself for many years. With a view of contributing to its success, he altered an old comedy, "The City Match," written in 1639, by Jasper Maine, and procured it to be acted at Drury-lane theatre, in the year 1755, for the benefit of the hospital. He was also, very early after its being instituted, elected one of the surgeons to St. George's hospital. In the year 1761, he was appointed in the suite of the noble persons, who were sent to bring over the princess of Mecklenburgh, our present queen, and was soon after appointed surgeon to her majesty's household. In the year 1751, he sent to the Royal Society a case of a woman who had a fœtus in her abdomen nine years, which is printed in their transactions for the same year. In 1757, he published an account of the English night shades, the internal use of which had been recommended in scrophulous cases; but they had failed in producing the expected benefit with him. Under their use, the ulcers became worse; they occasioned thirst, dimness of sight, and, if not cautiously given, death. In 1759, he gave "A Narrative of a Physical Transaction with Mr. Aylet, Surgeon, at Windsor." This is a controversial piece, and the author clears himself from the imputation of having treated his antagonist improperly. In 1767, he published, "Thoughts concerning

contains the present peculiar Method of treating persons afflicted with the Small-Pox." This relates to the Situation, who were now in the zenith of their reputation. He takes the method of exposing their patients to the open air, in the middle of winter, of repelling the eruption, and exposing, or preventing the eruptive process, too bold, &c. for objections. On the whole, however, he acknowledges, they were deserving of commendation, for the improvements they had introduced, in the treatment, both of the inoculated, and natural small-pox. His next work, the most considerable one, written by him, was "Chirurgical Cases and Observations," published in 1773; in 2 vols. 8vo. Though there is not much judicious practice, and many valuable observations contained in these volumes, yet they did not answer the expectations of the public, or correspond to the fame and credit the author had obtained; accordingly in the following year they were attacked by an anonymous writer, led to be Mr. Jullamond, in a pamphlet, entitled, "Notes on Chirurgical Cases and Observations, by a Professor of Surgery." The strictures contained in these notes are keen and ingenious, and, though evidently the produce of ill-humour, yet seem to have had the effect of preventing so general a diffusion of the cases, as the character of the author would otherwise have procured them. They have never been reprinted. About this time the author took a spacious mansion in Chelsea Park, which he enlarged, altered, and furnished in an elegant style. It is now occupied by sir Henry Wilson. Hither he retired, after doing his business, which he began gradually to contract into a narrower circle. With that view, a few years after, he gave up his situation as surgeon to the Lock hospital. His other appointments he kept to the time of his death, which happened on the 24th of November, 1792, in the 80th year of his age. The above are all the memorials we have been able to collect of this ingenious gentleman, of whom no life has been before written.

**BROMIO**, in *Geography*, a torrent of Swisserland, in the canton of Bellinzone, which takes its rise in mount Uccallo, or the Vogelsberg, near Splugen, and joins the Tesino in the Levantine valley.

**BROMISCUS**, in *Ancient Geography*, a town in Macedonia, situate, according to Thucydides, in the gulf where the lake of Bolbé discharged itself into the sea.

**BROMIUS**, in *Entomology*, a species of **TABANUS**, having a purple band through the eyes, and the body cinereous. Linn. Fa. Sv. Frequent in Germany, and some other parts of Europe. Degeer calls this *Tabanus maculatus*.

**BROMLEY**, in *Geography*, a market town in the county of Kent, England. The manor of Bromley was given by king Edgar, in 700, to the bishop of Rochester, who, in consequence, had a palace erected here, and the bishops of that see appear to have made it their seat till the present time. Near the palace is a spring, which has been found to possess the same qualities as the water at Tunbridge Wells. In monkish times this was held in high estimation, and a chapel was erected near it for the use of pilgrims. A college, or hospital, was erected at Bromley, by Dr. Warner, bishop of Rochester, in the reign of Charles II. for twenty poor clergymen's widows. This is said to have been the first endowment of the kind in England. In consequence of a bequest from the reverend Mr. Hetherington, of 2000*l.* and of bishop Pearce, who left 5000*l.* more, the trustees have been enabled to augment the annual allowance to the widows from 20*l.* to 30*l.* and the chaplains from 30*l.* to 60*l.* By another bequest from a Mrs. Betenson, ten additional houses have been erected, and endowed. Bromley is situated on the river Ravenbourn, at the distance of 10 miles S. E. from London. Here are a

weekly market on Thursday, and two fairs annually. The town consists of 424 houses, and 2700 inhabitants. Wilson's History of Bromley, 12mo.

**BROMLEY**, a township of America, in Bennington county, Vermont, about 32 miles north-easterly from Bennington, containing 71 inhabitants.—**Alto**, a town in Somerset county, New Jersey.

**BROMLEY**, or **ABBOTS-BROMLEY**, a small market town of Staffordshire, in England. The adjunct *abbots* was given to it in consequence of its abbey, which is now entirely destroyed. This town consists of one street, near the centre of which is the town hall, where the court-leet and court-baron of the earl of Uxbridge are annually held. Bromley stands in a fine open fertile country, distant 19 miles N. W. from London, and 11 from the city of Litchfield. Here are a weekly market on Tuesdays, and three annual fairs. The town contains 202 houses, and 808 inhabitants.

Near Bromley is Blithfield, the seat of lord Bagot; and at two miles distance is How-crofs, the seat of the earl of Shrewsbury. The forest of Needwood, considered the great ornament of Staffordshire, is 3 miles from this place.

**BROMPTON**. See **CHATHAM**.

**BROMSEBRO**, a town of Sweden, in the province of Smaland, which has a large bridge over the river that here discharges itself into the sea. A small island lies in the middle of the river, on which two stones are erected for boundaries. This place is famous for a congress, held in 1541, and again in 1572, for settling some disputes concerning the arms of the three northern crowns; and also, for a treaty of peace, concluded in 1645, between Sweden and Denmark. It is 4 leagues from Christianople.

**BROMSGROVE**, a town of Worcestershire, in England, is noted for its manufactures of worked, linen cloths, fish-hooks, needles, nails, &c. It had formerly a manufactory for broad and narrow cloths, but this is removed into Gloucestershire. In the reign of Edward I. Bromsgrove sent two members to parliament, and it has had many privileges conferred on it by different monarchs. Edward VI. founded a grammar school here, which was additionally endowed by sir Thomas Cooks. The church and town are large and handsome, and the former, from its high situation, is approached by a flight of fifty steps. It is ornamented with some painted glass, and contains several fine monuments. Among these is one for judge Lyttleton, 1600; bishop Hall, of Bristol, 1710; sir Humphrey Stafford, who was killed in Cade's rebellion; sir John Talbot, of Grafton; and another ascribed to a daughter of Henry VII. This parish contains twelve manors, and its houses amounted, in 1801, to 1178, and its inhabitants to 5998, of which 1208 were engaged in manufactures and trade. Bromsgrove is 115 miles N. W. from London, and 12 from the city of Worcester.

About one mile and a half distant is Grafton manor, the ancient seat of the earl of Shrewsbury. Hewell-Grange, the seat of the earl of Plymouth, is at 4 miles distance. Dodford priory is within two miles of Bromsgrove. Nash's History of Worcestershire.

**BROMUS**, in *Botany*, (*βρωμος*, food,) Linn. 89. Reich. 95. Schreb. 120. Juss. 32. Willd. 140. La Marek, Illust. 119. pl. 46. Smith Flor. Brit. 38. Class. *triandria digynia*. Nat. Ord. *gramina*, grasses.

Gen. Char. *Cal.* glume, many-flowered, two-valved, spreading, collecting the florets into an oblong two-rowed spikelet; valves ovate-oblong, acuminate, awnless; the lower one smallest. *Cor.* two-valved; the outer valve the size and form of the calyx, concave, obtuse, bifid, putting out a straight

Straight awn generally below its apex; inner one lanceolate, small, awnless. *Neel.* two-leaved; leaflets ovate, acute, gibbous at the base. *Stam.* filaments three, capillary, shorter than the corolla; anthers oblong. *Pist.* germ top-shaped; styles two, short, reflex, villous. *Stigmas* simple. *Pericarp.* the corolla closely shut, adhering to the seed, not deliquescent. *Seed* single, oblong, covered, convex on one side, furrowed on the other.

*Ess. Char.* *Cal.* two-valved; spikelets many-flowered, oblong, two-rowed; (the awn below the apex of the outer glume of the corolla, Linn.) inner glume fringed with strong, distant, bristly hairs, Dr. Smith.

The genus *Bromus* is entirely artificial, and there are no natural boundaries between it and *Festuca* that have been hitherto ascertained. It was originally assumed by Linnæus, that a terminal straight awn should determine a plant to be a *Festuca*; but in practice this distinction has not been strictly observed, and great confusion has accordingly arisen in the distribution of species. Dr. Smith's new character will prove a happy one, if it shall be found to prevail in all the foreign species, which have the general habit of *Bromus*; but we fear it will sometimes fail. It is already sufficiently evident, that the position of the dorsal awn, and the fringe of the glume, cannot both be admitted into the essential character of the genus.

Sp. 1. *B. secalinus*, Linn. (Eng. Bot. pl. 1171. Knap. p. 79.) *Polymorphus*, Scopoli, Hudson, Withering. "Panicle spreading; peduncles nearly simple; spikelets ovate, compressed, ten-flowered, florets distinct, roundish." Dr. Smith. Smooth rye brome-grass. *Root*, annual. *Stem* about three feet high, simple, round, smooth, and leafy. *Leaves*, broadish, flat, ribbed, rough at the edge and underneath, clothed above with short, soft hairs; sheaths furrowed but not rough. *Stipule*, very short. *Panicle*, when young, erect, with lanceolate, closed spikelets; when mature, pendent, with the spikelets so expanded that the rachis is visible between them. *Calyxes* unequal, awnless; glumes elliptic, smooth, three-nerved, membranaceous at the edges. *Florets*, roundish, smooth, rarely downy, ovate, flat; outer glume marked with seven slight ribs, with a rough and rather short awn; inner glume toothed rather than fringed. Dr. Smith. Knap. Native of England, in Norfolk frequent. 2. *B. multiflorus*, Weigel, Gmelin, Willd. (Knap. Tab. 80.) Considered by Linnæus, a variety of *secalinus*. "Panicle spreading; peduncles seldom with more than one spikelet; spikelets, ovate-lanceolate compressed, fifteen-flowered; florets subimbricate, roundish." Dr. Smith. *Root*, annual. *Stem*, smooth. *Lower leaves*, naked beneath, a little hairy at the edges above. *Upper leaves*, pubescent, with a short woolliness beneath, hairy above; all rough at the edge; sheath smooth. *Stipule*, very short, lacerated, scarcely hairy. *Panicle*, as in the former. *Spikelets*, ovate-lanceolate, rather compressed, imbricate, and finally rather remote. *Glumes* generally slightly pubescent, rarely smooth. Dr. Smith. 3. *B. mollis*, Linn. said by La Marck, in Encyc. Meth. to be only a variety of *B. secalinus*, but the error is corrected in the Illust. (Curtis & Eng. Bot. 1078. Knap. 77.) "Panicle erect, close, compound. Spikelets, ovate. Florets, imbricated, depressed, ribbed, downy." Dr. Smith. *Root*, annual, of a few simple fibres. *Stem*, erect, about two feet high, simple, striated, generally smooth; joints swelling, often thickly clothed with hairs. *Leaves* and their sheaths thickly covered with a soft hoary pubescence. *Stipules*, bluntly jointed. *Panicle*, two or three inches long, erect, at first close, afterwards a little expanding; branches half-whorled, the upper simple, the lower more or less subdivided, angular, pubescent. *Spike-*

*lets*, nearly upright, ovate, acute, rather tumid. *Florets*, from seven to ten, closely imbricated, elliptical, concave, and depressed. *Calyx* of two unequal glumes, scarios at their edges, keeled, villous, marked with seven or nine strong green ribs. *Cor.* glumes similar to those of the calyx, the external one bearing a rough awn about its own length, a little below its summit; inner one membranaceous, without nerves, with a thick green fringed edge. Its compound dense panicle, and its strongly ribbed, depressed, closely imbricated glumes, at once distinguish it from the two former. The *B. nanus* of Weigel is only a starved dwarf variety. Dr. Smith. It is a common plant in meadows; and in some parts of the north of England, constitutes a principal part of their herbage, but chiefly in fields lately laid down, and owing perhaps not to its being preferred on account of its own excellence, but to the largeness of its seeds, which are more easily gathered, and consequently more profitable to the collector. Mr. Knapp informs us, that in the southern part of Scotland it is cultivated by itself like ray-grass in England. 4. *B. racemosus*, Linn. *Polymorphus*, Hudson, &c. (Eng. Bot. 1079. Knap. 78.) "Panicle, nearly erect, spreading, simple; spikelets ovate, of about six imbricated, depressed, ribbed, smooth florets." Dr. Smith. It agrees in general habit with the preceding, but is more slender; its glumes are perfectly smooth and shining, and their ribs less prominent. 5. *B. pselinatus*, Willd. "Panicle, spreading; spikelets, ovate, smooth, inner valve of the corolla fringed, awnless." Thunberg. A native of the Cape of Good Hope. 6. *B. lanceolatus*, Willd. "Panicle, erect, spreading; spikelets, lanceolate, smooth, a little compressed; awns, at the time of flowering, straight; at the ripening of the seed, bent." Roth. *Root*, annual. A native of dry situations about the Caspian sea. 7. *B. alopecurus*, Willd. "Panicle, close, erect; spikelets round, awns divaricated." Vahl. *Spikelets*, nearly sessile, spirally twisted at the bottom. 8. *B. squarrosus*, Linn. "Panicle nodding; peduncles simple; spikelets ovate, twelve-flowered; florets imbricated, depressed; awns divaricated." Dr. Smith. *Root*, annual. *Stem*, a foot high, simple, smooth, striated, leafy. *Leaves* and sheaths pubescent, with a very short deflexed down. *Panicle* with few flowers. *Peduncles*, simple, compressed, thickening upwards. *Spikelets*, very large, ovate, swelling, polished, closely imbricated. *Calyx* unequal, nerved, awnless. *Corol.* outer glume but little larger than the calyx, many-nerved, bipartite at the summit; awns awl-shaped, rugged, the length of the glumes; inner glume much less, ciliated with a few distant bristles. *Seed*, elliptic, adhering to the corolla, villous at the summit. Native of France, Germany, Siberia, &c. Its claim to be admitted into the British Flora rests entirely on the authority of Hudson, who probably mistook for it some variety of *B. secalinus*. 9. *B. japonicus*, Willd. "Panicle, spreading, branched; spikelets oblong, smooth; awns divaricated." Thunb. *Root*, annual. A native of Japan. 10. *B. bifidus*, Willd. "Panicle, erect, branched; spikelets ovate, with about three flowers; glumes bifid, setaceous; awn divaricated." Thunb. *Spikelets*, small, smooth. *Glume*, terminated by two awl-shaped points of nearly its own length. *Awn* jointed, curled; leaves naked on both sides; sheaths hairy; glumes villous." *Root*, perennial. *Stem*, a foot and half high, strong. *Leaves*, the breadth of a reed, keeled, green, *Sheaths* with reversed hairs. *Spikelets*, from eight to fourteen, flowered, oblong. Gathered in Canada by Kalm. 12. *B. catbarticus*, Willd. "Panicle, spreading, erect, nearly simple; spikelets, broadly lanceolate, striated, rough; awns short, striat." Vahl. *Root*, perennial, scaly. *Sheaths* naked.

*Spikelets*, broader than those of the preceding, acute. A native of Chili, whose inhabitants use a decoction of its root as a purgative. 13. *B. brizoides*, La Marek, Ill. "Panicle, erect; spikelets, ovate, smooth; glumes furnished with broad membranaceous aricles." Native of Mont-Vides. Commerlon. 14. *B. menia*, Reich. "Panicle, erect; spikelets, roundish, awl-shaped, naked, nearly awnless." Pollich. *Root*, perennial, extremely creeping. *Stem*, a foot and half high, striated, smooth. *Leaves* broad, acuminate, smooth, dark green; mid-rib whitish, rough. *Panicle*, at first close and upright, afterwards widely spreading, and nodding a little at the top. *Pedicels* several together, lower ones very long, upper ones very short, often quite simple. *Spikelets* containing from seven to ten florets. *Glumes of the calyx* unequal, lanceolate, concave, blunt, smooth, greenish, with broad, silvery, thin, membranaceous edges; larger glume with one green nerve, smaller with three. *Glumes of the corolla* unequal; larger with seven green raised streaks, awn short, frequently wanting; smaller, flat, membranaceous, narrower, the edges rolled back, and surrounded by two green rough streaks. Martyn quoted from Krocker Flora Siciliaca. La Marek in his Illust. has directed the description in Encyc. Meth. to be expunged. Native of Germany and Switzerland. 15. *B. asper*, Linn. Sup. *ramsus*, Syst. Veg. Ed. 13. but not Mantissa; *memoralis*, Hudson; *birsum*, Curtis; *dumetorum*, La Marek. (Curtis fasc. 2 Pl. 8. Eng. Bot. 1172. Knap, 85.) "Panicle drooping, branched; florets lanceolate, almost cylindrical, but slightly ribbed; leaves uniform, lower ones hairy." Dr. Smith. *Root* annual or biennial. *Stem* often six feet high, erect; smooth in the upper part. *Leaves* spreading, broad, of a full green, ribbed, rough, clothed with long spreading hairs, all nearly of equal breadth; *sheaths* rough, with deflexed hairs. *Spikelets* linear-oblong, pendulous, often brownish, a little downy. *Calyx-glumes* very unequal. *Florets* about nine, roughish on the keel; awn rough, shorter than the glumes; inner glume closely fringed; its membranaceous edges bent in. *Anthers* saffron-coloured. Moist woods and hedges in England, Germany, Switzerland. 16. *B. erectus*, Hudson, Ed. 1. *pratensis*, La Marek. (Eng. Bot. 471. Knap, 86.) "Panicle, erect, a little branched; florets lanceolate, roundish, radical leaves narrow, ciliate, with white scattered hairs." Dr. Smith. *Root* perennial, black, downy. *Stem* about three feet high, erect, stiff and strait, simple, rarely pubescent. *Leaves* linear-lanceolate, striated, rough. *Sheaths* striated, smooth. *Panicle* nearly simple. *Spikelets* linear-oblong, compressed, erect, often of a purple hue, either smooth or downy. *Calyx-glumes* lanceolate, acute, keeled; the inner one larger, three-nerved. *Florets* from five to nine, imbricated, lanceolate, a little compressed, somewhat angular, keeled, slightly nerved, rough at the keel; awns about the length of the keel, barely dorsal, strait, rough; inner glume rather downy than pectinated. Approaching to *festuca*, in which genus Dr. Smith would have been inclined to place it, if it had not so close an affinity with *B. asper*, an indubitable bromus. Sandy or chalky soil in England and France. 17. *B. littoreus*, Willd. "Panicle nearly erect, rough; spikelets oblong, from four to six-flowered, smooth, nearly awnless." Retz. Native of Sweden, Pomerania, Switzerland. 18. *B. ciliatus*, Linn. "Panicle drooping; leaves slightly hairy on both sides, as also the sheaths; glumes ciliated." *Root* perennial. *Stem* slender. *Spikelets* oblong, compressed, eight-flowered. *Calyx-glumes* naked. *Corolla-glumes* lanceolate, very hairy at their edges, but not on the back. Native of Canada. 18. *B. sterilis*, Linn. (Curtis Fasc. 1. Pl. 9. Eng. Bot. 1030. Knap, 84.) "Panicle droop-

ing, mostly simple; florets lanceolate, ribbed, furrowed, leaves downy." Dr. Smith. *Root* annual, small; fibres capillary. *Stem* a foot and half high, slender, striated, leafy to the top. *Leaves* spreading, flat, rather flaccid, narrow, sharpish, ribbed, rough at the edges. *Sheaths* cylindrical, ribbed, with soft deflexed hairs. *Stipule* oblong, torn. *Panicle* large, slender, spreading, rough. *Spikelets* lanceolate, pendulous, brownish green, afterwards dark purple, from six to eight-flowered. *Calyx-glumes* very unequal, the larger one angular, ribbed. *Corolla-glumes* with seven or nine nerves, the two near the edge the greatest, furrowed, and a little downy between the ribs: the inner glume pectinated with distant bristles. *Styles* growing laterally out of the germen. A native of uncultivated places in England and other parts of Europe. 19. *B. arvensis*, Linn. (Eng. Bot. 920. Knap, 82.) "Panicle spreading; peduncles branched; spikelets lanceolate, about eight-flowered; florets elliptical, imbricated, depressed, smoothish." Dr. Smith. *Root* annual, small. *Stem* two or three feet high, leafy, striated, smooth. *Leaves* striated, a little downy on each side, rough at the edges. *Sheaths* thickly clothed with soft hairs pointing downwards. *Stipule* very short. *Panicle* rather erect, many-flowered; branches whorled, spreading, rough. *Spikelets* acute; at first erect, afterwards drooping; remarkable for a glossy appearance, scarcely observable in other bromi. *Calyx-glumes* very unequal, acute, ribbed, membranaceous at the edge. *Glumes of the corolla*, the outer one rough at the keel, membranaceous at the edge; inner one smaller, without nerves, obtuse, pectinated at the edge. *Seed* villous at the summit. A native of England, and other parts of Europe, sometimes in corn fields, but as frequently in cultivated places. 20. *B. spiculi tenuata*, Knapp. (Pl. 81.) "Panicle branched and drooping; branches supporting one or several spikelets; spikelets acutely lanceolate; florets smooth." Allied to the preceding. *Stem* from one to three feet high. In its more luxuriant state, branches very long; upright when young, flexile and pendent in maturity. *Spikelets* about eight-flowered. *Calyx* smooth, four-ribbed, serrated on the keel. *Corolla* smooth, but with some small spines on the back. When the panicle first rises from the sheathing of the upper leaf, the lower stage of branches is generally, though not universally, supported by two caducous bracts, perhaps peculiar to this species. Found by Mr. Knapp sparingly at Seaton, on the coast of Durham. 21. *B. geniculatus*, Linn. Man. "Panicle erect; florets distant; peduncles angular; stem procumbent at the knot." *Root* annual. *Stems* scarcely four inches high, decumbent to the last knot. *Panicle* spreading. *Pedicels* not at all attenuated, but compressed, obscurely three-sided, but with only two sharp angles, rough. *Spikelets* oblong, four-flowered. *Florets* rough, scarcely downy. *Awn* strait, the length of the floret. Native of Portugal. 22. *B. tetorum*, Linn. "Panicle drooping; spikelets linear." *Root* annual, or at most biennial. *Stems* about a foot high, after flowering lying on the ground. *Leaves* narrow, flat, pubescent on the lower side, white-villose on the upper, ciliate towards the base; lower sheaths villous. *Peduncles* capillary. *Spikelets* about five-flowered. *Awn* strait, very slender, the length of the glume. Native of the continent of Europe, on walls and dry hills. 23. *B. giganteus*, Linn. *frigosus*, La Marek, Illust. (Curtis Fasc. 5. Pl. 7. Knap, 87.) "Panicle drooping, branched, with about four florets in the spikelet." Knap. *Root* perennial. *Stem* from four to seven feet high, smooth and shining, striated, leafy. *Leaves* rather erect, acuminate, a foot long, broad, flat, ribbed, rough on both sides and at the edges; sheaths long, striated, perfectly smooth. *Stipule* short, clasping the stem, purplish. *Panicle* elongated, branched, many-flowered, the rachis and branches rough. *Spikelets* alternate, ovate-

ovate-lanceolate, smooth, drooping. *Calyx-glumes* unequal, acuminate, smooth, keeled; the inner one broad, or with three ribs. *Outer glume of the corolla* smooth, ovate-lanceolate, scarcely keeled, with five ribs at the summit; *awn* terminal, two or three times longer than the floret, capillary; white, sometimes a little bent: inner glume the length and nearly the breadth of the other, its edge rough, but not ciliated. Dr. Smith, who on that account places it under the genus *festuca*. Mr. Knapp says the inner valve of the corolla is minutely fringed, and in his figure, the awn is decidedly dorsal, but neither of these particulars is confirmed by our specimens gathered in Yorkshire. We have, nevertheless, continued it among the bromi, induced, rather by the general habit of the plant, than by any other consideration. A native of woods and moist hedges in the temperate parts of Europe. 24. *B. rubens*, Linn. "Panicle fasciculated, spikelets nearly sessile, villous, awns erect." The *scoparius* of Linnæus is suspected by La Marek, and determined by Cavanilles, to be only a variety. *Root* annual. *Stem* from seven to ten inches high, a little bent at its lower knots. *Leaves* smooth, short, and striated. *Spikelets* sometimes smooth, sometimes green, often blood-red, but generally paler: awns sometimes upright, sometimes divaricated on the same plant. Native of Spain. 25. *B. rigens*, Linn. Mant. "Panicle spiked; spikelets nearly sessile, erect, downy, with about four florets." *Stems* six or seven inches high, leafy. *Leaves* ribbed, slightly hairy on the upper surface; sheaths covering the whole culm. *Spikelets* scattered, tenacious. *Awns* nearly erect, the length of the spikelet. A native of Portugal, Vandel. 26. *B. triflorus*, Linn. "Panicle spreading, with about three flowers." *Stem* near two feet high. *Leaves* with short hairs. *Panicle* six or seven inches long. *Spikelets* oblong, pointed. La Marek. Native of Germany and Denmark. 27. *B. diandrus*, Curtis; *madridentis*, Linnæus; *muralis*, Hudson, 2d Ed. *ciliatus*, 1st Ed. *dilatatus*, La Marek; (Curtis Flor. Lond. Fasc. 1. Pl. 9. Eng. Bot. 1006. Knapp. 83.) "Panicle upright, spreading, scarcely subdivided; florets lanceolate, ribbed; furrowed with only two stamens." Dr. Smith. *Root* annual. *Stems* a foot and half high, erect, stiff, slender, striated, smooth. *Leaves* often entirely smooth; sheaths ribbed, a little keeled, generally smooth, but sometimes with hairs pointing downward. *Stipule* short. *Panicle* scarcely three inches long, erect. *Spikelets* linear-lanceolate, erect, rough, often brownish. *Florets* diandrous, slightly ribbed, the two principal ribs standing peculiarly close to each other. Found by Dr. Withering in Portugal, and by sir Joseph Banks at the foot of St. Vincent's rock near Bristol. It is probably the same plant with the *B. rigidus* of Willdenow, who does not appear to have known that the *madridentis* of Linnæus is diandrous. 28. *B. stipioides*, Linn. Mant.; *incrassatus*, La Marek. Encyc. Method. "Panicle erect, ovate-pyramidal, spikelets smooth, about four-flowered, pedicells flattened, and enlarged above." La Marek. *Root* annual. *Stem* six or seven inches high, slender. *Leaves* narrow, smooth. *Panicle* upright, rather close, oblong. *Spikelets* smooth, greenish, or tinged with purple violet. *Florets* three or four, each supported by a pedicell, broader and flat towards the top. *Awns* strait and perfectly terminal. A native of Italy and Spain; described by La Marek from a living plant. 29. *B. ramosus*, Linn. "Stem much branched; spikelets sessile; leaves involute-subulate." *Root* perennial, creeping, hard, jointed, producing at different intervals tufts of leaves and items. *Stems* a foot and half high, slender, smooth, leafy; throwing out toward the bottom short, alternate, generally barren branches. *Leaves* short, glaucous, rolled up. *Spikelets* from three to five, from eight to ten-flowered; awns short,

terminal, resembling those of *B. pinnatus*. La Marek. On the shores of the Levant and Portugal. 30. *B. pinnatus*, Linn. "Spike simple, erect, two-rowed; spikelets sessile, roundish; awns shorter than the glume: leaves almost naked." Dr. Smith. *Root* perennial, a little creeping. *Stem* a foot and a half, or two feet high, erect, simple, round, leafy, very smooth, straight, and rigid, scarcely tapering. *Leaves* somewhat erect, lanceolate, acuminate, rather rigid, striated, nerved, rough, often naked, rarely hairy on the upper surface. *Sheaths* smooth and polished, (Dr. Smith,) generally hairy (La Marek and Knapp, with whom our own specimens agree.) *Stipule* short, obtuse, ciliated. *Spikelets* from six to ten, downy, often curved. *Calyx-glumes* rather elliptical, somewhat awned, many-nerved. *Florets* twelve or more, closely imbricated, nerved, and hairy, chiefly towards the summit; awn terminal, shorter than the glume, sometimes very short, rough; inner glume ciliated with great bristles. Native of a dry calcareous soil in many parts of Europe. In England, not uncommon in Yorkshire, Oxfordshire, and Kent. 31. *B. sylvaticus*, Pollich; *gracilis*, Weigel and Willdenow. "Spike simple, drooping, leaning one way; spikelets sessile, roundish; awn longer than the glume; leaves hairy." *Root* fibrous, tufted, perennial. *Stems* two feet high, round, leafy, tapering, very slender, and a little drooping in the upper part. *Leaves* spreading, flat, pointed, a little rigid, rough, ribbed, more or less hairy, bright green. *Sheaths* straight, close, hairy. *Stipule* short, blunt, torn. *Spike* simple, drooping, zig-zag. *Spikelets* six or seven, alternate, sessile, cylindrical, linear-lanceolate, generally downy. *Glumes of the calyx* unequal, with short awns. *Florets* from six to nine, imbricated, in the upper part strongly ribbed and rough; awn terminal, rough, generally much longer than the glume: inner glume fringed like the preceding; supposed by some to be only a variety of *B. pinnata*; but they cannot be confounded by any one who is acquainted with their native habits and places of growth. Frequent in copses and thickets, especially in a gravelly soil. 32. *B. cristatus*, Linn. "Spikelets imbricated in two rows, sessile, depressed." *Root* perennial. *Stem* about half a foot high, downy, leafy, lower sheaths villous. *Spikelets* about 20, downy, four-flowered. *Awn* terminal. La Marek. A native of Siberia and Tartary. 33. *B. distachyos*, Linn.; *platylachyos*, La Marek. Illust. "Spikelets three or four, erect, compressed, rigid, sessile; glumes ciliated." *Root* annual. *Stem* from six to ten inches high, leafy, a little bent at the knots. *Leaves* rather short, soft, and ciliated at their edges. *Spikelets* large, alternate, from two to five. *Florets* eight or nine. *Awns* long, straight, terminal; the external glume ciliated. La Marek. A native of the southern provinces of France.

The last six species have the terminal awn of *festuca*. Hudson and Knapp have accordingly referred the *pinnatus* and *sylvaticus* to that genus, in their arrangement of British grasses; but Dr. Smith, partly on account of their general habit, but chiefly of their ciliated interior corolla glume, has continued them among the bromi. The last five have the inflorescence of *triticum*.

*Bromus glomeratus*, Scopoli. See *DACTYLIS*.

*Bromus capillaris*. See *CYNOSURUS*.

*Bromus*, in *Entomology*, a species of *SPHINX* (*Zygæna*), described by Fabricius as a native of Surinam. It is ferruginous, with hyaline wings, and the margin entirely black.

*BRONYARD*, in *Geography*, is a market town of Herefordshire, England, situated in a valley, in a part of the county which abounds with orchards. It is irregularly built, and badly paved. Many of the houses are small timber structures, and the market house is in a very shattered state. The church, an ancient edifice, is now undergoing consider-

able repairs. Bromyard contains 242 houses, and 983 inhabitants. It has a small weekly market on Tuesdays, and four annual fairs. It is 125 miles W. from London.

BRON, a town in France, in the department of the Eure and Loire, and chief place of a canton, in the district of Chateaudun, 2½ leagues N. W. of Chateaudun; the place contains 1918, and the canton 10,611 inhabitants; the territory includes 277 kilometers, and 121 communes.

BRONCHANT, in *Heraldry*, a term used by the French heralds to denote the situation of any beak, when placed on a field strewed with fleurs-de-lis.

BRONCHIA, or BRONCHIE, in *Anatomy*, the two primary divisions of the trachea or wind-pipe, which convey the air to the lungs. See LUNGS.

BRONCHIAL Arteries arise from the descending aorta, and accompany the bronchia into the lungs. See the description of the ARTERIES and LUNGS.

BRONCHIAL glands, absorbent glands situated at the root of the lungs. See the description of the ABSORBENT vessels and LUNGS.

BRONCHIAL Veins are those which accompany the bronchial arteries. See the description of the VEINS and LUNGS.

BRONCHOCELE, in *Surgery*, an appellation usually given to a swelling seated on the fore-part of the throat, and well known in England by the popular name of a *Derbyshire neck*, or monilous craw. The word *bronchocele* is derived from βρογχος, the *wind-pipe*, and κελον, a *tumour*. This disease was familiar to some of the ancients, and is described by Celsus (*De Re Medica*, lib. vii. cap. 13.), although his account of its nature and treatment is very imperfect. The most common situation of this swelling is the sides of the *thyroid gland*, and in a great many cases it seems to consist of a general enlargement of that organ; but not unfrequently the gland becomes sub-divided into various distinct fleshy portions, connected closely to each other by cellular membranes.

The form and contents of this tumour will be found very different in different subjects; for the most part, however, it is roundish during the first years of its existence, and moderately compressible, endowed with little sensibility, highly vascular in its texture, not readily going into suppuration, and leaving the external skin of its natural colour. Some authors have said, that the bronchocele consists of a honey-like matter; others, that it contains little portions of bone and hair; others, that it is inflated by air; and some, that it is distended by a watery, serous, or puriform fluid, &c. Probably most of these opinions may be occasionally true; but our own experience inclines us to believe, that in the greater number of cases the swelling is truly sarcomatous, or fleshy. This disease should be distinguished from aneurism of the carotid or thyroid artery; from serofulous enlargements of the lymphatic glands; and from an extension of the membrane lining the trachea, which sometimes forms a real hernia, by protruding between its annular cartilages. See ANEURISM, SCROFULA, and HERNIA.

Although bronchocele is found in many countries, it exists with peculiar frequency at the bottom of mountains, where much wet and heat prevail; from which circumstance, it has been supposed by some people to be chiefly confined to the sub-alpine regions. "Le goître est une tumeur indolente de la glande thyroïde, qui survient principalement aux habitans des vallées placées au pied des Alpes secondaires; et que je nomme, pour cette raison, *sub-sub-alpines*." *Traité du Goître et du Crétinisme* par F. E. Foderé, Paris, An. viii.

Who has not heard of the swelled throat of the Alps? an ancient poet inquires.

"Quis tumidum guttur miratur in Alpibus?"

The French name, *goître*, or *gouëtre*, is evidently a corruption of the Latin word *guttur*, the throat; and although M. Louis has maintained, that the bronchocele and the goitre ought not to be mistaken for each other; these two names are now so universally applied to a similar affection, that it would be vain to attempt any correction of the supposed error. Vide *Encyclopedie*, Art. *Goître*, composed by M. Louis. In another place he says again, "Il ne faut pas confondre, comme on fait assez communement, la *bronchocele* avec une autre tumeur du cou qu'on nomme *goître*." Art. *Bronchocele*, *ibid*. He would confine the term bronchocele to an hernia of the wind-pipe, which, in his opinion, may be cured by compressing the tumour with a suitable bandage and cushion.

Upon the disorder which constitutes the subject of the present article, we know not any author who has written so amply and experimentally as M. Foderé, who had many opportunities of observing the bronchocele in all its stages, where it prevailed as an endemic disease.

This affection more frequently attacks females than males, children than adults, and relaxed or delicate constitutions than those which are rigid and vigorous; but it will sometimes affect persons of apparently good constitutions, and of either sex, on their going to reside in the low vallies beneath the Alps, the Pyrenées, the Apennines, &c. where it is endemial and hereditary. Scrofula and rickets seem to make the greatest ravages among people who are liable to bronchocele: but M. Foderé is positive that the latter disease, nevertheless, differs materially from the two former; and that the *goître* is purely a local complaint of the neck, unattended with the least danger, except it occasion violent mechanical pressure by the enormous bulk of the swelling. Vide chap. v. § 19, to 24. *Traité du Goître et du Crétinisme*.

The remote physical causes which have been assigned for this disease, are various and unsatisfactory: viz. the drinking of hard, cold, or snow-water; the use of alimentary substances not sufficiently nutritious; the repulsion of some cutaneous disorder; the abuse of vinous or spirituous liquors, &c. Theories, which have been founded on any of these supposed causes, are too hypothetical, and are contradicted by numerous facts; besides which, the bronchocele will be found to prevail where none of these causes exist in a striking degree, as several writers have sufficiently proved. The disease, however, is known to predominate most in countries affected by great humidity of the atmosphere, joined with excessive heat; it augments in the spring-time, and diminishes in the autumn; it is less prevalent in a cold and dry winter, than during a season of dampness and moderate warmth; it is even said to be influenced in its progress, wherever it is endemial, in exact proportion to the degree of moisture indicated by the hygrometer. These facts are established by the observation of Messrs. Foderé and Villars, after numerous and varied experiments.

We cannot, moreover, acquiesce in the explanation which has been offered respecting the proximate cause of this disease, or the phenomena of which it consists. The thyroid gland, some writers tell us, contains a viscid humour, which continually lubricates the larynx and trachea by its exudation; and it is the stagnation or detention of this mucus in the capsules of the gland, say they, which forms the disorder in question! But, we ask, have the uses of the thyroid gland been ascertained? Has its minute structure been developed? Have there been any muciferous ducts or outlets detected? Is it really a secreting organ? Further, we are told, that the humid air is imbibed by the cellular texture of this gland; that it thereby becomes expanded, or tumefied; that its se-  
cretory

cretory ducts are thus obstructed; and that bronchocele consists altogether in this laxity or atonic state of the organ. But, surely, all this is hypothetical; for, even supposing the imbibition of moist air to take place (which, however, remains to be proved), would it not be received into the absorbent vessels, and transmitted to the thoracic duct? And, why should it be imagined, that the thyroid gland imbibes the moist atmospheric air, more than other parts of the body which are equally exposed?

Upon the whole, we see no reason for adopting the above opinion, however respectably it has been supported; and we do not feel competent to offer any explanation ourselves of the proximate cause of this disease. Perhaps some light will be thrown on the inquiry, when we are better informed as to the economy and natural use of the thyroid gland; but, for the present, we are without *data*, or suitable analogies, to afford a legitimate conclusion. We proceed, therefore, to the means which have been employed for the prevention and cure of this complaint; a subject on which much has been said and written, although not to the entire satisfaction of practitioners or patients in general.

As to preventive measures, they must chiefly consist of such as tend to meliorate the soil and air of those places wherein the bronchocele is endemic. If it be a fact, that marshy lands, an humid atmosphere, deep and woody vales, surrounded by lofty hills, which intercept the salubrious breezes, are among the physical causes of this disease, the prevention must partly depend upon the removal or avoidance of such causes; and this should be especially attended to by persons who are naturally of a delicate or soft fibre, and are therefore predisposed to debilitating complaints.

The curative means are either medical or surgical. The internal remedies, which have acquired the greatest reputation, are burnt sponge, soap, sulphurated kali, prepared natron, and artificial soda-water. It has been advised to exhibit a dose of calomel and neutral salts once a week, during the use of the other medicines; likewise to keep the neck warm; to reside in a dry, pure atmosphere; and to swallow the above-named remedies very slowly, which is particularly insisted on if the patient take these medicines in a solid form. Authors have also alleged, that benefit is sometimes derived from the external application of mercurial ointment, blistering plaster, soap liniment, camphorated oil, dry frictions, moderate compression, and electrical sparks. But of all these means, the burnt sponge, made into lozenges, has received the highest encomiums. For our own part, we have been disappointed in our expectations from these lozenges; although many practitioners consider them as almost infallible, if properly administered and persevered in. The following is the formula recommended by Mr. Ring:

Take of Burnt sponge, two ounces;

Powdered gum Arabic, two drams;

Powdered cinnamon, half a dram;

Simple syrup, enough to form the whole into

a mass, which is to be divided into forty-eight troches. Care must be taken that no more syrup be used, than is absolutely necessary to make the dry ingredients properly cohere; for which reason, it must be added slowly, and the mass will be well beaten. The lozenges are to be dried before a fire, on a plate which has been slightly oiled, to prevent them from sticking; and they must be kept in a bottle or gallipot, tied over with a bladder.

One of these tablets is to be exhibited three times a day, for a considerable time. Some practitioners, indeed, have given so much as six or eight drams of the burnt sponge daily, without any inconvenience; and, too often, without any benefit to their patients. It would be deserving the at-

tention of surgeons, to ascertain, if possible, the cause of this diversity in their success; and whether the nature of the affection, in the cases said to have been cured by the use of the sponge, does not essentially differ from those in which this remedy has been taken largely to no good purpose.

Dr. Herrenscheidt, of Berne, thinking that the burnt sponge has a tendency to injure the stomach, and produce a leucorrhœa, advises that it should not be calcined, but employed in decoction; and this, he says, is equally efficacious. Whereas, M. Foderé prefers it to be only half-burnt, and mixed with honey and cancella alba; of which the bulk of a large nut is to be taken three times a day, for several weeks.

This last author tells us, he has seen an extremely large swelling of the neck dispersed by the daily use of thirty grains of the sulphate of potash, dissolved in a pint of water; and he considers the cure as more easily effected, by requiring the patient to take a cathartic every week, during the whole time of the medicinal course; by keeping the neck very warmly covered; by swallowing the burnt sponge, &c. insensibly, or holding it a considerable while in the mouth; by beginning the remedy at the decline of the moon; and by changing the air to a dry or open situation, which, indeed, he regards as indispensably necessary.

The success will also much depend on the patient's being young, and otherwise healthy; but if the swelling be of a scirrhus or indurated nature, there is very little hope of relief, except by a manual operation, such as Cornelius Celsus long ago recommended. However, the extirpation of the tumour can hardly be undertaken, unless it be detached, encysted, and seated at the fore-part of the neck.

The swelling being situated in the vicinity of so many important organs, will deter a surgeon from hastily proposing its entire excision: besides, there are cases related, in which, the mere opening of the cyst has effected a cure; and, in these cases, the contents were either evacuated at once, or gradually lessened by suppuration. When there is an evident fluctuation of matter, a seton drawn through the tumour might perhaps be advantageous; or, as Celsus and others have suggested, the application of a caustic might be partially useful: but, if the life of a patient be not endangered by this disease, it would be prudent to avoid such irritating means. Although the ulcer which remains after the use of a caustic will sometimes be exceedingly distressing and difficult to heal, we are not of opinion, with Mr. Benjamin Bell, that it ever "degenerates into a cancer."

We ought not to conclude this article without alluding to a celebrated remedy, prepared and sold at Coventry, for the cure of bronchocele. It is generally supposed to be less efficacious than burnt sponge alone, and to consist of equal parts of sponge, cork, and pumice stone, calcined; which is formed into a bolus, with sugar or syrup, to be laid under the tongue every night. Mr. Prosser, who published an account of the bronchocele and its treatment in 1771, recommends the following powders, in preference to the Coventry medicine:

℞ Cinnab. Antimon. opt. levig. ʒj.

Milleped. pp. & pulv.

Spong. calcin. āā gr. xv. m. f. pulvis.

One of these is to be taken an hour or two before breakfast, for two or three weeks; and after the interval of about a fortnight, they are to be again renewed; and three of the following pills are to be taken at bed-time, during the second course of the powders:

℞ Pil. Mercurial. ph. nov. ʒ ss.

F. Pil. N<sup>o</sup> 48. æquales.

The dose is to be adjusted to the age and constitution of the patient, who should be prepared for this course by two

or three previous purges, and avoid taking cold. If these means be used for about a month or six weeks, without any external application, Mr. Prosser has no doubt of success. However, the patient should be under twenty-five years of age. At this age the cure is uncertain; but at a more advanced period of life it is much more improbable, and seldom or ever succeeds. Mr. Gooch, in his "Medical Observations," mentions an *aqueous BRONCHOCELE*; and so does Mr. Davies in the Med. and Phys. Journal, N<sup>o</sup> 71, Jan. 1805.

**BRONCHORST, PETER**, in *Biography*, a painter of perspective and history, was born in 1588 at Delft, where he learned the art of painting. His subjects were views of ancient and modern churches, which he executed with great success. In the council chamber at Delft are his "Judgment of Solomon," and "Christ driving the money-changers out of the temple;" described as performances in which the architecture is elegant, and the figures carefully finished. He died in 1661. Pilkington.

**BRONCHORST, JOHN-VAN**, a painter of history and landscape, was born at Utrecht in 1603; and as he discovered an extraordinary genius before he was 11 years of age, he was placed under the direction of John Verburg. He was afterwards for some time assistant to Peter Mattys, a painter on glass, at Brabant. After his return to his own country, he entered the school of Cornelius Poelenburg, and being charmed with his taste of design, pencilling, and colour, imitated his style with great success. Till his 36th year he painted on glass; but after that time in oil, after the manner of Poelenburg, and obtained a lasting reputation. In the choir of the new church at Amsterdam, there are three of his paintings on glass, which are exhibited as curiosities; and in the same church, on the folding doors of the organ, are three historical paintings in oil, "the triumph of David over Goliath;" "the anointing of Saul;" and "the attempt of Saul to kill David while he was playing on the harp," which are excellent performances. He also amused himself with the point; and some landscapes from Poelenburg, and other subjects from his own composition, are attributed to him. Pilkington and Strutt.

**BRONCHORST, PETER**, was born at Leyden in 1648, and, from an obscure original, arrived, by the power of his own genius and incessant application, without any master, at distinguished excellence as a painter in water-colours. His subjects were birds and animals of all kinds, which he copied after nature with uncommon life, exactness, and expression. He died in 1723. Pilkington.

**BRONCHORST, or BRONHORST**, in *Geography*, a town of the United Dutch States, in the county of Zutphen; 5 miles N. of Doelburg.

**BRONCHOTOMY**, in *Surgery*, is the operation of cutting into the trachea or wind-pipe; from  $\beta\rho\upsilon\chi\omicron\varsigma$  and  $\tau\rho\epsilon\mu\omega\upsilon$ . It has been also named **LARYNGOTOMY**, and **TRACHEOTOMY**; although there can be no reason whatever for employing the latter terms in preference to the usual appellation. Mr. Benjamin Bell, however, has said, that as bronchotomy "consists in an opening made into the trachea, and not into the bronchiæ, it ought more properly to be named *tracheotomy*;" but to such hypercriticalisms, we can only reply, in the language of M. Petit-Radel: "Quelques nomenclateurs, peu instruits dans la langue Grecque, et ignorant que les anciens désignoient le trachée ou le nom de  $\beta\rho\upsilon\chi\omicron\varsigma$ , qu'ils ont confondu avec  $\beta\rho\upsilon\chi\iota\alpha$ , qui sont les anneaux des subdivisions de ce canal, ont mieux aimé désigner cette operation sous le nom de *trachéotomie* ou *laryngotomie*; mais ces dénominations n'ont pu généralement prevaloir." Encyclop. Méthod. Art. *Bronchotomie*.

The operation of *bronchotomy* may be practised, with

greater or less probability of success, in cases where a patient is in danger of suffocation, from an obstacle in the trachea, or a constriction of the glottis. There may be likewise a necessity for our resorting to this operation, where the trachea is compressed by a tumour externally, or where the tonsils and parts adjacent become so enlarged as to impede respiration considerably. In short, should any mechanical cause be supposed to exist, of threatening suffocation and impending death, the surgeon's duty will be too plain and imperious to admit of hesitation: an incision must be made into the trachea without a moment's delay, unless some other obvious remedy can be suggested for the patient's restoration. The cases to which we here allude are so various, that they cannot be all enumerated; but no well instructed practitioner will suffer any person to lose his life, for want of an operation so easily performed, so little attended with bad consequences in itself, and so certainly efficacious in a multitude of examples which frequently occur.

Perhaps few, if any, surgical means can be proposed for the relief of a patient in extreme danger, so revolting to mankind, as this of bronchotomy. A general and long established prejudice prevails against it, arising from an erroneous opinion, that "wounds of the wind-pipe are always mortal." Although this opinion is refuted by almost daily observation, and numbers of people have recovered after cutting their own throats (i. e. dividing their trachea) in the most horrid manner; yet still, the popular notion exists, and must be encountered. It is therefore advisable, prior to the performance of this operation, that all the reasons which influence the surgeon's decision, should be stated fairly, and the probable or certain consequences of a different procedure be judiciously represented to the patient or the bystanders, to prevent any groundless blame in the event of ill success.

As the cause of interrupted respiration may be different, on different occasions, so must there be a variety in the manner of performing this operation, according to the existing circumstances: in some cases, a simple incision into the wind-pipe, about half an inch below the cricoid cartilage, will effect the relief we wish for; but, in other cases, the wound must either be kept open by a canula; or a portion of one or two of the cartilaginous rings must be cut out, in order that the patient may continue to breathe with facility through the artificial orifice. Sometimes, again, it may be requisite to make a second opening, with a view to assist us in the extraction of a foreign substance; and when that object shall have been attained, probably there will be no further necessity for an artificial air-hole remaining open in the trachea, so that the external as well as the internal wound may be healed with all convenient speed.

When it is required that the patient should breathe for some time through the wound, it would, we think, be generally preferable to cut out a portion of the cartilage, (which has been often done with safety), rather than to harass the patient by keeping a metallic canula in the wound, between the divided cartilages. An incessant coughing and sense of uneasiness will be likely to ensue from the presence of a canula, which might, therefore, be a source of greater mischief than could possibly arise from the removal of a small piece of cartilage. Every person knows what distressing consequences immediately follow on the admission of only a crumb of bread into the glottis: and how aggravated must the sensations of a man be, who has a silver tube remaining in his larynx or trachea for several days, especially if it happen to touch the opposite parietes! Should an extraneous body be lodged in the trachea, it is not always capable of being removed without making an incision across three or four of the cartilaginous

laginous rings, (i. e. in the direction of the wind-pipe itself), exactly opposite, or a little below the foreign substance.

Several kinds of instruments have been proposed for executing this simple operation; such as concealed lancets, trocars and canulæ, guarded scalpels, &c. But, we cannot conceive what hazard or difficulty should occur to a surgeon who is at all used to handle a common dissecting knife, in making a longitudinal incision through the fore-part of the neck and trachea. We are very much inclined to simplify all chirurgical operations and instruments; rather than to make a parade, which sometimes tends to magnify real difficulties, or to create imaginary ones in the eyes of a young practitioner. Besides, the operation of which we are now treating is among the number of those which usually call for prompt and definitive measures; wherein the surgeon has no opportunity, (except in large cities), to search for curious instruments, and, therefore, should feel confident, that his business may be well performed without them. The apparatus essentially necessary, on this and many other important occasions, will, doubtless, be in the possession of every surgeon, or may be easily obtained when called for.

The following has been recommended as one of the best modes of performing the operation of Bronchotomy:

The patient is placed upon a low stool, or in that posture in which he finds it most easy to breathe; his head is held upright, but by no means bent backwards, and secured by an assistant. Opposite the third or fourth cartilaginous ring of the trachea, the skin is now drawn up into a high cross fold; and it is cut through exactly at the middle of the trachea, to such a depth, that when the fold is let go, the incision extends itself longitudinally from the first cartilaginous ring down to near the upper extremity of the sternum. By making the incision of a proper length, the operation will be greatly facilitated, as its edges can then be drawn farther from each other.

As soon as the hæmorrhage has been entirely stopped, that part of the trachea, where the incision is finally to be made, must be laid bare, by dissecting away the cellular substance and muscular fibres situated about the membranous interstice between the third and fourth ring, and by either entirely removing them or pressing them sideways. The operator then places the nail of the fore-finger of his left hand upon this interstice; and applying the thumb and middle finger of the same hand to both sides of the trachea, he pushes the point of his instrument, which must previously be dipped in some fresh oil of almonds, along the nail of his fore-finger, through the above-mentioned membranous interstice, between the third and fourth cartilaginous ring, into the trachea. He then applies the fore-finger of his left hand to one or the other of the cartilaginous rings, close to the tube or canula, in order to hold it back whilst he withdraws the blade of his instrument. If we make use of Richter's curved instrument, we must move the hand upwards in pushing it in, in order that we may turn the point of the instrument downwards, and prevent its touching the back part of the trachea.

But in order that we may prevent the tube from slipping out of the wound, and also to prevent its moving to and fro in the trachea, several doffils are introduced above and below into the wound, so as to keep the lips asunder. To the rings, on both sides of the external opening of the tube, two narrow slips of linen are applied, which press the rings down upon the trachea; and the whole is covered and secured with adhesive plaster. And that none of the fluids which are collected in the wound may make their way into the canula and wind-pipe, the patient must lie or sit inclined on one side, and the wound must, from time to time, be wiped

dry with a sponge. When the tube fills with mucus, it must be cleaned with a small feather; or two such tubes may be employed, one enclosing the other, and either of them removed, when necessary, for the purpose of clearing it of mucus.

As an improvement upon the instruments heretofore employed, Mr. Benjamin Bell proposes one which has nearly the form of a flat straight trocar, and ought never to be less than two inches in length. Before it is pushed between the two cartilages, it must first be thrust through several linen compresses, which not only serve to cover the pledget of ointment intended to protect the wound, but also produces the advantage that (by removing one or more of the compresses, which may be done by cutting them open at the sides with a pair of scissors,) we are able to increase the length of the tube at pleasure. In order to secure the tube in the situation where it is left after the operation, he passes it through an opening in a plate of polished steel, which is curved so as to fit to the shape of the fore-part of the neck, and fastened behind with straps and a buckle. To prevent any foreign substance from getting through the orifice of the canula into the trachea, it may be covered with a piece of fine gauze, which should previously be wetted, that the dust may not penetrate through it, but stick to the outside.

When the cause which gave rise to the operation has been removed, and the patient can again breathe through his mouth, the tube is withdrawn, and the orifice healed up like any other wound of the wind-pipe; in doing which great caution should be used, lest any thing should get into the trachea, which might produce dangerous consequences.

Messrs. Chopart and Desault propose, that the incision into the trachea should be made between the thyroid and cricoid cartilages, and through the ligamentum crico-thyroïdenum; which, however, we cannot recommend, on account of the far greater sensibility and irritability of the larynx, whereby the most violent symptoms, threatening immediate suffocation, might be excited.

When this operation becomes necessary, on account of any foreign substance lodging in the trachea, it may be performed in the following manner. The integuments are first divided as above described; and a longitudinal incision is made at the anterior part of the trachea, from above, downwards, through three or more of the cartilaginous rings. An assistant then draws asunder the sides of the wounded trachea with a blunt hook, upon which the operator introduces a crooked forceps, with which, he carefully seeks for, and extracts the foreign body.

In this case, it is also indispensably necessary, that the hæmorrhage from the external wound should be entirely stopped before any incision is made into the trachea, as otherwise a very violent cough would be excited.

If an extraneous substance should flick in the larynx, it might perhaps be dangerous, (as some have advised), to cut the thyroid cartilage longitudinally, since this operation would excite very violent coughing; and might likewise be superfluous, if it were possible to lay hold of the foreign substance with a crooked forceps, introduced through an incision made at the usual place, below the cricoid cartilage.

BRONCHUS, in *Anatomy*, properly denotes the lower part of the *aspera arteria*, dividing into bronchiæ, or branches. In which sense bronchus stands contradistinguished from larynx.

The name bronchus is also extended to the whole *aspera arteria*, or trachea.

BRONCHUS also denotes a person afflicted with a bronchocele, or tumour of the throat, called by *Ulpina gutturosus*.

**BRONCOLI**, THOMAS, in *Biography*, a Neapolitan physician, who published in 1622, 4to. "De populari horribili et pestilenti Gutturis et annexarum Partium Affectione, Neapolin et totum fere Regnum vexante, Consilium." This is an early account of the *scarlatina anginosa*, which seems not to have made its appearance in this country until about the middle of the last century, when Dr. John Fothergill published an accurate account of the disease, with the method he had found most successful in treating it. He is very earnest in advising his brethren to be careful in distinguishing it from the common quinsy, as it requires a mode of treatment very opposite to that disease. The *scarlatina anginosa* has of late years become one of the most frequent, as well as most infectious and dangerous epidemics that visit this country.

**BRONE**, in *Geography*, a river of Switzerland in the Valais, which joins the Rhone near Sion.

**BRONGUS**, in *Ancient Geography*, a river of Mæsia, which, according to Herodotus, discharged itself into the Tiber.

**BRONI**, or **BRONNO**, in *Geography*, a town of Italy in the Milanese, where the French were defeated by the Imperialists in 1703; 10 miles S.W. of Pavia. N. lat. 41° 50'. E. long. 10° 0'.

**BRONITZA**, a village of Russia, seated on the Mafta, within 20 miles of the Novogorod. In this village an excellent caviare is prepared of the roe extracted from large quantities of fish caught in the Mafta. At the distance of about 2 miles is an insulated well of sand and clay, of a circular form, the lower parts of which are thickly strewed with detached pieces of red and grey granite. This eminence was remarkable in the times of idolatry for an oracular temple, the site of which is now occupied by a brick white-washed church.

**BRONNIKOO**, a town of Siberia, on the Irkutsch, 28 miles N. of Tobolsk.

**BRONTES**, in *Entomology*, a species of *PAPILIO* (*Pleb. Urb.*) of a small size, that inhabits Africa. The wings are subcaudated, above and beneath fuscous, with a band on the first pair, and margin of the second snowy white. Fabricius. Obs. In *Spec. Inf.* of that writer it is described under the specific name of *Annus*.

**BRONTES**, is also the name of *PAPILIO PANISCUS*, in some German writers.

**BRONTEUM**, in *Antiquity*, that part of the theatre underneath its floor, wherein brazen vessels, full of stones and other materials, to imitate the noise of thunder, were kept. Potter. Arch. Græc. lib. ii. cap. 8.

**BRONTI**, in *Geography*, a town of the island of Sicily, 28 miles W. of Taormina.

**BRONTIÆ**, among *Naturalists*, a kind of figured stones, commonly hemispherical, and divided by five pointed zones.

The word is formed from *βροννη*, *thunder*; alluding to the popular tradition, that those stones fall in thunder showers; whence they are also denominated thunder-stones, sometimes polar-stones, fairy-stones, and also *ombria*, by naturalists.

Some take the *brontia* for the petrified shells of the *echinus spatagus*, or *briscus*, of Aristotle. Dr. Woodward rather supposes them to have been formed, and received their shape, in the shell of the *echinus spatagus*; on which footing they are also ranked in the number of *ECHINITES*. Dr. Plott contests both.

**BRONTIÆ** are sometimes also used in England for a kind of figured stones, shaped like arrow-heads, less properly called *BELEMNITES*, and popularly *thunder-bolts*.

Dr. Woodward takes not these for natural stones, but supposes them to have been fashioned thus by art, to serve as weapons before the invention of iron.

Some also give the denomination *brontia* to the *BATRACHITES* and *CHELONITES*.

**BRONTOLOGY**, books containing the doctrine of thunder, and of the prefaces drawn therefrom. See *THUNDER*.

**BRONZE**, **BRONZO**, *Italian*, a mixed metal for casting statues and other ornaments; Vafari says, the Egyptians mixed two-thirds of brass and one of copper. Pliny l. 34. c. 10. says, one-tenth of lead, and one-twentieth of silver should be added to the brass, and the mixture of these three, he calls Grecian; among the moderns two-thirds of copper and one of brass are found to be a good mixture. The ancients formed most instruments of brass, which the moderns make of iron and steel; Homer describes most of the arms in his poems, offensive and defensive, as brazen; he calls the Greeks by the general epithet of brass-coated; and seldom mentions steel; most of the arms and instruments found in Herculaneum, Pompeia, Stabea, &c. were of brass or bronze, whether agricultural, mechanical, mathematical, architectural, or culinary; the remains of very few iron instruments having been discovered, and a complete set of surgical instruments of bronze, found in Pompeia, shew the great prevalence of this metal among the ancients.

**BRONZE**, *casting*, is performed in the following manner: the figure or pattern to be cast in bronze, must have a mould made on it in a mixture of plaster of Paris and brick-dust, not more than one-third of the former, and two-thirds of the latter; the mould should be sufficiently thick for strength, according to its size; in its joints little channels should be cut from different parts of the internal hollow tending upwards, to give vent to the air, which the metal will force out, as it runs into the mould. When the mould is made, a thin layer of clay should be neatly and smoothly spread over the inside, the same thickness the bronze is intended to be; then the mould must be closed, and the hollow within the layer of clay filled with two-thirds of brick-dust, and one third of plaster mixed with water; this will make the core; and if the figure to be cast should be large, before the plaster and brick-dust are poured into the mould which is to form the core, strong bars of iron forming a skeleton of support for the metal figure, when cast, must be laid in the mould, and round this the core must be cast; when this is done, the mould must be opened again, and the layer of clay taken out; the mould and core must then be thoroughly dried and even burned with charcoal or lighted straw, for if the least particle of wet or damp remains, the cast will be blown to pieces, and the persons engaged in the work will most likely be maimed or killed by the dispersion and force of the hot metal. After they are perfectly dried, the core should be laid in the mould again and supported in its place by short bars of bronze, which run through the mould into the core; the mould may now be closed and bound round with bars of iron, strong in proportion to the size of the work; the mould should then be laid in a situation for casting, and well supported with dry materials, as sand, stones, &c.: great care must be taken that these also are dry, to avoid fatal consequences. A channel must be continued from the reservoir of metal to the mouth of the mould, with a sufficient slant or inclination for the liquid bronze to run easily; it is a necessary caution that no person should engage in bronze-casting without the assistance of experienced workmen, on account of the danger attending it. Many particulars relating to this article may be found in Pliny's Natural History; in the Life of Benvenuto Cellini, and Vafari's Lives, in the chapter upon bronze-casting. The form of the furnace for this purpose, as well as the manner of running the metal, are the same as employed in casting bells.

**BRONZE**, in *Painting*, denotes a colour prepared by the colourmen of Paris, in imitation of bronze. There are two sorts of it, the red and the yellow, or golden: the latter, the yellow, is made solely of the finest and brightest copper-dust that can be had; and in the former there is only added a small quantity of red ochre, well pulverised. They are both applied with varnish, and, to prevent its turning greenish, the work is dried over a chaffing-dish, as soon as bronzed.

**BRONZERIUS**, JOHN-JEROM, in *Biography*, was born of wealthy parents, in a small town in the Venetian territory, in 1577. After making great progress in the study of the belles lettres, philosophy, and astronomy, he was sent to Padua, where he was initiated into the knowledge of medicine and anatomy, and in 1597, was made doctor. He now went to Venice, where he practised medicine to the time of his death, in 1630. His publications are, "De innato calido, et naturali spiritu, in quo pro veritate rei Galeni doctrina defenditur," 1626, 4to.; "Disputatio de Principatu Hepatis ex Anatomie Lampetræ," Patav. 4to. Though from dissecting the liver of this animal he was satisfied the blood did not acquire its red colour there, yet he did not chuse to oppose the doctrine of Galen. His observation, however, was probably not lost, but led the way to a more complete discovery of the fact, by subsequent anatomists. "De Principio Effectivo Semini Infuso." Haller. Bib. Anat.

**BRONZES**. Thus *Antiquarians* denominate figures of men or beasts, urns, and every piece of sculpture, which the ancients made of the above metal. Statues, busts, &c. cast of this metal, are called by this name, whether they be originals or copies.

**BRONZING** is the art of imitating bronze. See **BRONZE**, in *Painting*.

**BRONZINO**, in *Biography*. See **ALLORI**.

**BRONZINO**, AGNOLO, a painter of history and portraits, was born at Florence, in 1511, and became the disciple of Puntormo, with whom he continued for several years, and whose style he acquired to such a degree that the paintings of one and of the other could not be readily distinguished. His extraordinary abilities are sufficiently evinced in all his performances. Among others, at Florence, a "Nativity" is mentioned as incomparable; and also a "Venus," embracing Cupid, attended on one side by mirthful loves, and on the other by jealousy, fraud, and other passions, allegorically represented. The composition and finishing in both these are highly extolled. As his master, Puntormo, died before he had finished the chapel of St. Lorenzo, at Florence, the duke appointed Bronzino to complete it. Bronzino also distinguished himself in the painting of portraits; particularly those of Andrea Doria, Dante, Boeccacc, and Petrarch, and of all the illustrious persons of the house of Medici. His works at Florence, Pesaro, and Pisa, bear lasting testimony to his merit; nor was he less respected and esteemed for his amiable qualities than for his professional talents. His taste of design was grand; his pencil neat, but free; his colouring resembled that of Puntormo; and in his draperies he imitated the manner of Michael Angelo Luonaroti. He died in 1580. Pilkington.

**BRONZOLO**, in *Geography*, a town of Germany, in the country of Tyrol, seated on the Adige; 5 miles S. of Bolzano.

**BROOD**, the young of fish and fowls.

The word is derived from the Saxon *breclan*, to breed; which alludes to βρωω, to be big with young. The word is also used for a set of any young. In which sense we say, a brood

of vipers, a brood of oysters. A brood of pheasants is more properly called an eye. Phil. Trans. N<sup>o</sup> 369.

**BROOD** of sea-fish is spawned, and lies in still waters, where it may have rest to receive nourishment, and grow to perfection. And here it is often destroyed by weirs, draw-nets, and nets with canvas, or like engines in the bottoms of them; in harbours, havens, and creeks.—Every weir near the main sea takes, in twelve hours, sometimes five bushels, sometimes ten, sometimes twenty or thirty. For the preventing hereof, by 3 Jac. I. cap. 12. it is enacted, that none shall erect a weir, or weirs, along the sea-shore, or in any haven, or creek, or within five miles of the mouth of any haven or creek, or shall willingly destroy the spawn or fry of fish, on pain of 10*l.* to be divided betwixt the king and the prosecutor. Neither shall any one fish in any of the said places, with any net of a less mesh than three inches and a half betwixt knot and knot (except for the taking smoulds in Norfolk only), or with a canvas net, or other engine, whereby the spawn or fry of fish may be destroyed; on pain to forfeit the said engine or net, and 10*s.* in money, to be divided betwixt the poor of the parish and the prosecutor.

**BROOD**, or **BROOD-comb**, called by the French *couvain*, is that part of the comb of a bee-hive, which contains in its cells the future progeny of the hive, in the three different states of eggs, worms, and nymphs. See **BEE**, and **QUEEN-bee**.

**BROODING**, the act of a hen, or other bird, sitting on a number of eggs, to keep them warm, till they hatch, or produce young ones. See **HATCHING**.

**BROOK**, a little river or small current of water. A brook is sometimes distinguished from a river by the latter flowing continually, and the former only occasionally.

**BROOKE**, Sir ROBERT, in *Biography*, an eminent lawyer of the 16th century, was born at Claverly, in Shropshire, educated at Oxford, and from thence removed to the Middle-Temple. In 1552, he was called to be serjeant at law; and in 1553, appointed lord chief justice of the common pleas; about which time he was knighted. He died in 1558, leaving behind him the reputation of great skill in his profession, and of integrity in the exercise of it, both at the bar and on the bench. His works are "An Abridgment, containing an Abstract of the Year-books, till the time of Queen Mary;" "Certain Cases adjudged in the times of Henry VIII., Edward VI., and queen Mary, from the 6th of Henry VIII. to the 4th of queen Mary," and "Reading on the Statute of Limitations, made 32d Henry VIII. cap. 2."

**BROOKE**, HENRY, an ingenious author in polite literature, was the son of a clergyman, and born in Ireland in 1706. Having commenced his education under Dr. Sheridan, and prosecuted it in Dublin college, he removed to the Temple; where his lively genius and agreeable temper conciliated the esteem and attachment of many friends. After his return to Ireland, he privately married his cousin, an amiable young lady, at a very early age, of whom he was appointed guardian, and lived for some time in domestic retirement; but his increasing family obliged him to exert his abilities for their support. With this view he came over to London, and, as it is said, under the eye of Pope, wrote his philosophical poem of "Universal Beauty," in 1735. He returned again to Ireland, and engaged in the practice of the law; but his predominant desire of acquiring distinction in poetry and elegant literature induced him again to visit London, where he produced a tragedy, entitled "Gustavus Vasa," and containing sentiments of liberty so strongly expressed, that government prohibited its public exhibition at the theatre. This opposition excited an enthusiastic ardour among his friends;

friends and party, at the head of whom was Frederick prince of Wales; and the play was published by subscription in 1739, much more to his advantage than if it had been acted. Warmly attached to his royal highness, Brooke took a house at Twickenham, near Mr. Pope's, and sent for his wife, who was propoed by the prince as wet-nurse to a child, of whom the princess was then pregnant. But his expences exceeding his income, he was prevailed upon by his wife to part with his house, to dismiss his servants, and to retire to privacy in his native country. His attachment to the muses, however, continued; and in 1745 his tragedy, entitled "The Earl of Westmoreland," was acted at Dublin; and in the same year he published his "Farmer's Letters," which were addressed to the people of Ireland, and designed to promote the principles of liberty and patriotism. At this time he was patronized by the earl of Chesterfield, then the lord-lieutenant, and appointed barrack-master. As a poet he afterwards distinguished himself by three pieces, communicated to the public in Moore's "Fables for the Female Sex," 1747. His piece, entitled "The Female Seducers," has been peculiarly admired, not only for tenderness and pathos, as well as sublime poetry, but for the devotional spirit which always characterized the author. Disappointed in his views of farther advancement, he retired into the country, in company with an only brother; where they reared together their numerous families, with mutual harmony and affection. His intervals of leisure were employed in writing dramatic pieces and novels, the former of which he hoped to have introduced on the London stage. But though Mr. Garrick would at one time have engaged him as a writer; his proposals were not duly regarded by Mr. Brooke, who flattered himself with more encouraging prospects, and they were, therefore, never renewed. His tragedy of the "Earl of Essex," however, which had been acted at Dublin, in 1749, was also performed at Drury-lane in 1760; but as to his other tragedies and comedies, it does not appear whether they were exhibited in any theatre. In 1762 he published a treatise in 8vo. entitled "The Trial of the Roman Catholics," favourable to that class of Irish subjects; and in 1766, his novel, called "The Fool of Quality," which attracted considerable attention, though its general plan was wild and incoherent, and the latter volumes were strongly tinged with methodism, in which the religious fervour of his mind at length terminated. Generous and sympathizing in his disposition, and destitute of economy, he was reduced to the necessity of first mortgaging, and, at length, of selling his patrimony; in consequence of which he resided for some years in a rented house at Kildare, which he afterwards quitted for a farm near his former habitation. The affliction of losing his wife, after an union of nearly 50 years, and also of a favourite child, depressed his spirits and deranged his understanding to such a degree as to terminate in almost total imbecility. His novel, entitled "Juliet Grenville," published in 1774, indicated still more sensibly than the last volumes of the Fool of Quality, the decline of his faculties. His two poems, viz. "Redemption," and the "Fox-chace," are among his later works, and little known or read. He died in October 1783, leaving only two survivors of his seventeen children. His dramatic and other works (the novels excepted) were printed in 4 vols. 8vo. 1780. Life prefixed to his works. Gen. Biog.

BROOKE, FRANCES, the daughter of a clergyman, whose name was Moore, and the wife of the Rev. John Brooke, of Norfolk, was distinguished both by her literary talents and the gentleness and suavity of her manners. Her death, which happened at Sleaford, in Lincolnshire, Sept. 26th

1789, was occasioned by a spasmodic complaint. Her first literary performance was a periodical work, entitled "The Old Maid," continued from November 15th, 1755, until July 1756, and published in one volume 12mo. In the latter year she published "Virginia," a tragedy, with odes, pastorals, and translations, 8vo. In 1763, she published her novel, entitled "The History of Lady Julia Mandeville," which was read with general approbation, although not without a wish that the catastrophe had been less melancholy. In the same year she also published "Letters from Juliet Lady Catesby to her Friend Lady Henrietta Campley," 12mo.; a translation from the French. She soon afterwards accompanied her husband, who was chaplain of the garrison at Quebec, to Canada; and there witnessed those romantic scenes that are so admirably described in her "History of Emily Montague," 4 vols. 12mo. 1769. In the following year appeared "Memoirs of the Marquis of St. Forlaix," 4 vols. 12mo. Soon after her return from Canada, she formed an intimate acquaintance with Mrs. Yates, and had, as some have said, a share with her in the Opera-house. As Mr. Garrick had rejected her first play, which was the tragedy of Virginia, she made a second attempt to obtain his favour, but without success. This conduct, on the part of the manager, excited her resentment, which she expressed with a severity, afterwards lamented and retracted, in a novel, entitled "The Excursion," and published in 2 vols. 12mo. 1777. Her "Siege of Sinope," was acted at Covent-Garden, in 1781, and met with temporary approbation, probably from the support that was given to it by the theatrical talents of Mr. Henderfon and Mrs. Yates; but her most popular performance was "Rosina," presented to Mr. Harris, the manager of Covent-Garden, and acted at that theatre in 1782. Her last work was "Marian," which appeared in 1788, and was acted with some success, though it was much inferior to her Rosina. She was also the translator of the "Abbé Millot's Elements of the History of England, from the Invasion of the Romans to the Reign of George II." in 4 vols. 12mo. Biog. Dict.

BROOKFIELD, in *Geography*, one of the most ancient, wealthy, and populous towns of Worcester county, in the state of Massachusetts, situate in the south-western part of the county, and containing 3200 inhabitants; 64 miles W. of Boston, on the post road leading from Boston to New York, and 27 miles W. of Worcester. Its Indian name was "Quaboag." In the vicinity of this town are iron ore, and large quantities of stone, which yield coppers. It was settled by people from Ipswich, in 1660, and incorporated in 1673.—Also, a township in Orange county, Vermont, including 421 inhabitants; 81 miles northerly from Bennington.—Also, a township of Lincoln county, in the district of Maine, 14 miles above Norridgewalk, on Kennebeck river; formerly called "Seven Mile Brook."—Also, a town in Montgomery county, New York; 160 inhabitants of which are electors by the state census of 1796.—Also, a township in Fairfield county, Connecticut; 6 miles N.N.E. from Danbury.

BROOKHAVEN, a township in Suffolk county, Long-island, New York, containing 3224 inhabitants, of whom 223 are slaves, and by the state census of 1796, 535 electors. The town includes about 40 houses, together with an episcopalian and a presbyterian church; 60 miles E. of New York.

BROOKLIME, in *Botany*. See VERONICA BECCA-  
EUNGA.

BROOKLYN, in *Geography*, a pleasant town of America, in Norfolk county and state of Massachusetts, containing about 60 or 70 families; situate between Cambridge and Roxbury, and separated from Boston on the east by a narrow bay, which

which sets up south from Charles river, and forms a peninsula of Boston. This town supplies Boston with vegetables, and it is the place whither persons of fortune retire from public life.—Also, a township in King's county, New York, on the west end of Long island, containing 1603 inhabitants, of whom 405 are slaves, and 224 are electors, by the state census of 1796. In this place are a prebysterian church, a Dutch reformed church, a powder magazine, and some elegant houses lying chiefly in one street. It is separated from New York by East river, which is nearly a mile broad; and forms an agreeable object from the city.—Also, a township in Wyndham county, Connecticut, about 20 miles N. of Norwich.

**BROOM**, in *Botany*. See **GENISTA** and **SPARTIUM**.

**BROOM**, *African*. See **ASPALATHUS**.

**BROOM**, *Butchers*. See **RUSCUS ACULEATUS**.

**BROOM-flower**, in *Heraldry*, the denomination of an order, instituted by St. Louis king of France, in the year 1234, on occasion of the coronation of his queen Margaret, eldest daughter of Raymond Berengarius, count of Provence. The *habit* of the knights was a cloak of white damask, with a violet-coloured hood. The *collar* was a gold chain of broom-flowers, enamelled proper, interlaced with lozenges of gold and flower-de-lis, pendent therefrom, a cross stony, with this inscription "Exaltat Humiles;" the founder accounting the broom the symbol of humility. Their number was at the sovereign's pleasure, and this order continued till the death of king Charles V.

**BROOM-gall**, in *Entomology*. See **GALLS of the Broom**.

**BROOM-loch**, or *lake*, in *Geography*, an extensive salt-water lake, or arm of the sea, on the north-west side of the county of Ross in Scotland, famous for its excellent herrings. On this lake is the village of Ullapool.

**BROOM-rape**, in *Botany*. See **OROBANCHE**.

**BROOM** also denotes a well known household besom, or implement wherewith to sweep away dirt, dust, and the like: thus we say, a birch-broom, a hair-broom, a rush-broom, a heath-broom. The primitive kind of brooms, from whence the denomination is given to all the rest, was made of the *genista*, or wild broom, growing on commons.

**BROOME**, **WILLIAM**, in *Biography*, a native of Cheshire, was educated upon the foundation at Eton, but failing of a vacancy in a scholarship at King's college, though he was captain of the school for a whole year, he was superannuated, and sent to St. John's college by the assistance of friends, where he obtained a small exhibition. He appeared in the world at an early period as a translator of the Iliads into prose, in conjunction with Ozell and Oldisworth, a translation, which, though now forgotten, was, in Toland's opinion, superior to that of Pope. After his introduction to Mr. Pope, he was employed by him to make extracts from Eustathius for the notes to the translation of the Iliad; and in Pope's Miscellanies, many of his early pieces were inserted. When the success of the Iliad gave encouragement to a version of the Odyssey, Pope called Fenton and Broome to his assistance; taking half the work upon himself, and assigning the other half to his coadjutors, four books being allotted to Fenton, and eight to Broome. To the lot of Broome fell the 2d, 6th, 8th, 11th, 12th, 16th, 18th, and 23d; together with all the notes. The stipulated pecuniary recompence of Broome was 500l. together with copies amounting to the value of about 100l. more. Fenton, it is said, was to receive 300l. for his four books. This disproportionate distribution of recompence offended Broome, and produced a misunderstanding between him and his employer. He represented Pope as avaricious, and Pope pursued him with avowed hostility. Among other disrespectful reflections in

the Dunciad and the Bathos, he reckons Broome among "the parrots who repeat another's words, in such a hoarse odd tone, as makes them seem their own." It is said that they were afterwards reconciled; but they never became friends. Mr. Broome published a miscellany of poems, but never acquired any very high dignity in the church. Whilst he was rector of Sturston in Suffolk, he married a rich widow; and in 1728, on the king's visit to Cambridge, he obtained the title of LL.D. In 1773, he was presented by the crown to the rectory of Pulham in Norfolk, which he held with Oakley Magna, in Suffolk, given to him by lord Cornwallis, together with the vicarage of Eye in Suffolk; he then resigned Pulham, and retained the other two preferments. Towards the close of his life, he amused himself with translating odes of Anacreon, which he published in the Gentleman's Magazine, under the name of Chester. He died at Bath, Nov. 16th 1745, and was buried in the abbey church. Johnson's Lives.

**BROOMING**, or **BREAMING** of a *ship*, the burning off the filth she has contracted on her sides with straw, reeds, broom, or the like, when she is on a careen, or on the ground. See **CAREENING**.

**BROONS**, in *Geography*, a town of France, in the department of the Northern coasts, and chief place of a canton, in the district of Dinan;  $3\frac{1}{2}$  leagues S. W. of Dinan. The place contains 2,001, and the canton 11,823 inhabitants; the territory includes 220 kilometres and 10 communes.

**BROOTZI**, a town of Siberia; 48 miles N. W. of Tomsk.

**BROOZENKOWA**, a town of Poland, in the palatinate of Podolia; 32 miles N. E. of Kaminiac.

**BROQUIES**, a town of France, in the department of the Aveyron, and district of St. Afrique, seated on the Tarn; 7 leagues S. of Rhodéz.

**BRORA**, a sea-port town on the east coast of Scotland, in the county of Sutherland; near it is a coal-mine, the coals of which are said to take fire on being exposed to the air; here is likewise a quarry of lime-stones, interspersed with a variety of shells; 10 miles N.N.E. of Dornock.

**BRORA**, a river of Scotland, which passes through a lake of the same name, in the county of Sutherland, and runs into the sea at the town of Brora.

**BRORE**, a river of Germany, which discharges itself into the Meuse, about a league below Maastricht.

**BROS**, a royal free town of Transylvania, seated on the Maros; the capital of a tribunal of the same name, in a fertile country, the inhabitants of which distinguish themselves by their skill in agriculture. By an inscription on one of the gates, addressed to the emperor Trajan, it appears to have been a Roman colony.

**BROSCHAN**, a town of Bohemia, in the circle of Leitmeritz; 4 miles S. of Leitmeritz.

**BROSCHI**, in *Biography*. See **FARINELLO**.

**BROSELEY**, in *Geography*, a large, populous village of Shropshire, England, is rendered remarkable from a phenomenon which occurred here at the beginning of the last century. Beneath the surface of the earth is a continued bed of coal, which is dug, and appropriated on the spot to various iron forges, potteries, &c. and great quantities of it are sent to different towns by means of the Severn which divides this parish from Colebrook dale. In the year 1771, it was discovered that a vapour which arose from a well or pit, would take fire upon being condensed in a tube, and ignited by flame. This circumstance excited great curiosity, and many persons came from different parts of the country to witness the burning well, as it was called. A gentleman

wrote an account of it for the Philosophical Transactions, and further particulars were published in the Gentleman's Magazine, vol. xxv. p. 303. It continued to burn for some time, till the proprietor of the land having sunk a coal pit in the immediate vicinity, thereby destroyed the operating cause. The parish of Brofely contains 1031 houses, and 4832 inhabitants. It is 146 miles N. W. from London.

**BROSIMUM**, in *Botany*. (from *βρωσιμος*, eatable). Swartz. Prod. 12. Schreb. 1486. Gmelin Syst. Nat. Martyn's Miller. Bosc. Clafs, *diocia monandria*. Gen. Char. 1. Stameniferous flowers. *Cal.* ament common, globular, covered on all sides with imbricated, circular, peltate, membranaceous, deciduous scales; three larger, furrounding the base of the ament; the others smaller, of an irregular form, between each of which the stamens break out. *Cor.* none. *Sam.* filaments solitary, very short, round; anthers bilamellate; lamellas circular, peltate, the lower deliscent from the upper; pollen globular. *Pist.* germ at the top, included in a spongy ament, very small, ovate, abortive. *Style* one, erect, bifid at the summit. *Stigmas* reflexed, simple. 2. Pistilliferous flowers on a different tree. *Cal.* ament like the former. *Cor.* none. *Pist.* germ globular, (the scaly body of the ament itself). *Style* rising from the middle of the germ at top, long, bifid. *Stigmas* simple, acute, a little reflexed. *Pericarp*, berry pedicelled, spherical, one-celled. *Seed* solitary, with a two-lobed kernel, furrounded by a thin membrane and bipartite.

*Ess.* Char. Ament globular, covered all round with circular peltate scales. *Cor.* none. *Filam.* solitary, between the scales. *Style* bifid. *Berry* one-seeded.

Sp. 1. *B. Alcastrum*. Brown, Jam. "Leaves ovate, lanceolate, perennial; aments solitary; fruit corticose." A tree making about one-third part of the woods in some parts of Jamaica. Its wood is not despicable, and its leaves and younger branches are a fattening fodder for all sorts of cattle. Its fruit, when roasted, eats like a chestnut, and is called bread-nut; and when boiled with salt-fish, pork, beef, or pickle, is a wholesome and not unpleasent food. Its leaves and younger branches are full of gum, which renders them disagreeable to cattle at first, but of which they soon become fond. 2. *B. spurium*. Brown, Jam. "Leaves lanceolate-ovate, acuminate; aments ovate, in pairs; fruit soft." A timber tree in Jamaica, called milk-wood, but not much valued.

*Obs.* Swartz's description of the germ and fruit is very obscure; that given by Bosc, though not easily reconciled with it, is more intelligible. "Flowers united in a globular ament, composed of peltate scales, each of which, in the barren plants, covers a stamen, and in the fertile ones, a germ with a bifid style, without either calyx or corolla." Fruit a one-seeded drupe.

**BROSME**, in *Ichthyology*, a species of *GADUS*, that inhabits the southern seas of Greenland. The mouth is bearded; tail oval, and pointed. Müll.

**BROSME** is also a synonymous name of *coryphæna rupestris*. *Egede Groenl.*

**BROSNA**, in *Geography*, a river of Ireland, which issues from Lough-Boyle in the county of Westmeath; and soon after passes through Lough Ennel; on leaving which it runs southward into the King's county, and joins the Shannon, about three miles above Banagher.

**BROSNA**, *Little*, a river which forms, for many miles, the southern boundary of the King's county, and flows into the Shannon, about four miles below Banagher.

**BROSSAC**, a town of France, in the department of the Charente, and chief place of a canton, in the district of Barbezieux; 10 miles S.S.E. of Barbezieux. The place con-

tains 1017, and the canton 4887 inhabitants: the territory comprehends 150 kilometres, and 13 communes.

**BROSSÆA**, in *Botany*, (from *Guy de la Brosse*, formerly intendant of the royal garden at Paris). Linn. gen. 1229. Spec. Plant. Sup. Reich 261. Schreb. 330. Juss. 161. Willd. 375. La Marek Ill. 316. Nat. Ord. *licornes?* *Ericæ*, Juss. Clafs, *pentandria monogynia*. Gen. Char. *Cal.* one-leaved, five-parted; segments oblong, acuminate, erect, the length of the corolla. *Cor.* monopetalous, truncated at the end, entire, or crenulate. *Stam.* five, included in the corolla. *Pist.* germ superior? pentagonal; style awl-shaped, shorter than the corolla; stigma simple. *Pericarp*, capsule roundish, five-furrowed, five-celled, covered with the calyx, which is now enlarged, converging, and fleshy, opening at the sides. *Seeds* numerous, very small.

*Ess.* Char. *Calyx* fleshy, five-parted. *Cor.* truncated. *Caps.* five-celled, many-seeded.

Sp. *B. coccinea*, Linn. "Shrubby, with a scarlet flower and black fruit," Plum. A shrub three or four feet high. *Root* branched; *leaves* alternate, petioled, sharply ovate, slightly toothed, smooth, pale green; *flowers* in racemes at the end of the branches, alternate, peduncled, with two bracts about the middle of the peduncles.

**BROSSARD**, in *Biography*, practised surgery many years at Chatre, in the early part of the last century. He had the merit of reviving the practice of using agaric in stopping hemorrhages, after amputations, which had been discontinued. Though that fungus does not possess the powers he attributed to it, and must not be depended on, in stopping the bleeding of large vessels, yet in preventing the effusion of blood, from the smaller arteries, it is of acknowledged utility. He was rewarded by Lewis XV. with a pension, for divulging the secret, in a short memoir, published on the subject, in 1757. Haller. Bib. Chirur. Eloy. Dict. Hist.

**BROSSARD**, SEBASTIAN, author of the first dictionary published in a modern language, and which has been of singular use to subsequent musical lexicographers, particularly to Grassineau, and Jean Jaques Rousseau. Indeed musical historians would be ungrateful not to acknowledge, that the numerous list of writers on the subject of music, ancient and modern, whence he drew his materials, and which he has inserted at the end of his work, has not opened to them subjects of inquiry, and sources of information. And we think with M. Framery, that Rousseau has treated this intelligent and zealous writer unworthily, in accusing him of publishing an Italian dictionary, with a French title. When the second edition of Brossard was published in 1702, the French musical technica was insufficient, alone, to furnish a book; nor could their explanation be much wanted, while taken from the current language of the country. Brossard must be allowed to have marked out the road for Rousseau to pursue, which, with his impressive eloquence, he has certainly rendered more flowery and pleasant.

Honest Walther, in 1732, has been more just to his prototype in his German musical lexicon; where there is a greater extent of musical information than in any book of the size that we have met with.

The French biographers inform us that Brossard, born 1660, was a canon of the cathedral of Meaux, who excelled in knowledge of the theory of music. The writings which he published on the subject were all well received; particularly a musical dictionary, which was of great service to J. J. Rousseau, in furnishing him with the greatest part of the materials for his musical articles in the Encyclopedie, which he afterwards collected, and formed into a volume.

Mr. Grassineau might, without excessive humility, have called his musical dictionary a translation. We know the pains,

pains, expence, and perseverance necessary to collect and read such a number of books in all languages, few of which are either amusing or instructive, to which the first compiler of a dictionary or a history is condemned. Johnson calls our language a "multiform and chaotic dialect;" and the technical language of music certainly merits these titles more than the terms of any other art or science. Broffard died in 1730, at 70.

BROSSE, GUY DE LA, great uncle to the celebrated statesman M. Fagon, was born at Rouen, towards the end of the sixteenth century. Being much attached to botany, he gave a piece of ground, in which the rudiments of the jardin royal des plantes medicinales, at Paris, was laid. This was, after much sollicitation, enlarged, endowed, and an establishment for the improvement of botany formed, by cardinal Richlieu, and de Brosse was appointed physician to the king, Lewis XIII., and curator of the garden. This was about the year 1626. He had been twelve years solliciting the establishment, and seems to have spent the remainder of his life, which was extended to the year 1641, in improving it. His works, which all relate to his favourite subject, are, "Dessein, du Jardin Royal pour la Culture des Plantes Medicinales, à Paris, avec l'Edit du Roy touchant l'Establissement de ce Jardin en 1626." 8vo. "De la Nature, Vertu et Utilité des Plantes, et Dessein du Jardin Royal de Medicine, Paris, 1628." This was afterwards, viz. in 1640, published in folio, with 50 plates, which are much commended. "Description du Jardin, &c. contenant la Catalogue des Plantes, et le Plan du Jardin, 1636." Haller. Bib. Botan. Eloy. Dict. Hist.

BROSSE, or DE BROCHE, PETER LA, was born at a town in Touraine, and educated to the practice of surgery, in which he acquired so much celebrity, as to be called to attend Philip III. of France; to whom, by his artful management, he made himself so useful, that he made him his chamberlain, and entrusted to him the government of the kingdom. Elated with this extraordinary success, he became insolent to the peers, none of whom could get access to the king but through him. Finding the queen was become his enemy, as well as most of the principal persons in the kingdom, with the view of ruining her with the king, he took the horrid resolution of poisoning prince Lewis, the eldest son of the king, by his former queen. This he effected in the year 1276, and then accused the queen of having committed the murder, in order to raise her son to the throne; but the villainy of the man was discovered by the means, it is said, of a nun; and he was executed, to the great joy of the country. The story is told by Henault, in his Abrigé Chronologique de l'Histoire de France.

BROSSES, CHARLES DE, an eminent mathematician, and man of letters, was born at Dijon in 1709; and pursuing the line of profession for which his family had been distinguished, he became a counsellor of parliament in 1730, and a president à mortier in 1741. As he was eminent for his zeal and integrity, as well as for his talents, he was entrusted with the conduct of many interesting transactions, and in consequence of presenting the remonstrances of the people to the throne, he shared the honourable disgrace incurred by many other worthy persons in the reign of Lewis XV. However, he afterwards obtained distinguishing marks of court approbation, by being appointed president of the parliament of Burgundy in 1774. His intervals of leisure were devoted to the pursuits of literature and science; and in these his range was so extensive as to comprehend history, geography, mythology, antiquities, metaphysics, and languages. He was also acquainted with a great number of learned men, both at home and abroad, and was a member of

various literary societies. Buffon had been his school-fellow, and regarded him from his youth as a genius of a superior order. Besides being the author of several memoirs in the collections of the academies of Paris and Dijon, the Journal des Scavans, and the Dictionnaire Encyclopedique, he wrote the following separate works: "Letters on the Discovery of Herculeaneum," 1750, 8vo.; "History of Voyages to the Southern Regions," 2 vols. 4to. 1756; in which he maintains the existence of a southern continent, disproved by the subsequent voyages of the French and English, at least within any accessible latitudes: "On the Worship of Fetiches, or a Parallel between Ancient Idolatry and that of the People of Negroland," 1760, 12mo.; a curious philosophical and mythological performance: "Treatise on the mechanical Formation of Languages," 2 vols. 12mo. 1765; in which he attempts to establish a general etymological system, deduced from the supposition of a primitive language, founded on the mechanical formation of articulate sounds: "History of the Roman Republic in the Course of the seventh Age of Rome, by Sallust, partly translated from the Original of that Author, and partly composed and restored from the scattered Fragments of his last Works," 3 vols. 4to. 1777; and "Lettres Historiques et Critiques sur l'Italie," &c. 3 vols. 8vo. Paris, 1799. In private and social life he was no less amiable than respectable in his public and literary character. He died at Paris, May 7, 1777. Eloge par M. Muret. Nouv. Dict. Hist.

BROSSETTE, CLAUDE DE, was born at Lyons in 1671, first entered among the Jesuits, and afterwards became a lawyer. He was a member of the academy of Lyons, and keeper of the public library in that city. His works, besides some professional performances, were "A brief History of the Town of Lyons," and "A new historical Eulogy of the Town of Lyons," 4to. 1711, both elegantly written; "Historical Elucidations of the Satires, and other Works of Boileau Despreaux," 2 vols. 4to. 1716, often reprinted in various sizes; and "A Commentary on the Satires and other Works of Regnier," 8vo. 1729. Brossette corresponded with several literary persons, particularly with Rousseau and Voltaire. He died at Lyons in 1746. Nouv. Dict. Hist.

BROTCHET, in *Ichthyology*, one of the French synonyms of the garfish or sea-pike. See *ESOX LUCIUS*.

BROTERA, in *Botany*, a genus in the class *monadelphia dodecandria*, formed by Cavanilles for a plant found in New Spain, which differs from his genus *Dombeya*, only in the structure of the capsule: but, as Bosc observes, it agrees in generic character, and ought to be united with *Pentapetes Phænicea*, the only species for which Willdenow has preserved that Linnæan genus, the other two original species having been separated from it to form a new genus, which from their winged seeds is called *Pterospermum*. La Marck not thinking the difference in the structure of the capsule a sufficient generic distinction, has abolished the genus *Dombeya* of Cavanilles, Juslieu, Venteuat and Willdenow, and has placed all its species under the genus *Pentapetes*, with the original *Pentapetes Phænicea*, still retaining *Pterospermum* as a distinct genus. See *PENTAPETES*, where the *Brotera* of Cavanilles will be described.

BROTHEROD, in *Geography*, a town of Germany, in the circle of Franconia, and county of Henneburg, belonging to the landgrave of Hesse Cassel; 3 miles N. of Schmalkalden.

BROTHEL. See *BAWDY-house* and *STEWES*.

BROTHER, *Frater*, a term of relation between two male children, sprung from the same father or mother, or both. Scaliger and Vossius derive *frater* from *φρατρης*, for *φρατρης*, which properly signifies a person who draws water in the

the same well; *πηλαί*, in Greek, signifying *well*, and *δραχμαί*, a company of people, who have a right to draw water out of the same well.—The word, it is said, came originally from the city Argos, where there were only a few wells distributed in certain quarters of the city, to which those of the same neighbourhood alone repaired.

By the civil law, brothers and sisters stand in the second degree of consanguinity; by the canon law, they are in the first degree. By the Mosaic law, the brother of a man who died without issue, was obliged to marry the widow of the deceased. Deuter. xxv. 7. See LEVIRATE.

The ancients applied the term brother indifferently to almost all who stood related in the collateral line, as uncles and nephews, cousin-germans, &c.—This we learn not only from a great many passages in the Old Testament, but also from profane authors: Cicero, in his Philippics, says, “Antonina was both wife and sister of Mark Antony; because she was daughter of his brother C. Antonius.” And as to cousins, Tullius Hostilius, in Dionysius Halicarnassus, calls the Horatii and Curatii, brothers; because they were sisters’ children.

The language of the Jews, bishop Pearson observes, included in the name of brethren not only the strict relation of fraternity, but also the larger of consanguinity. We are brethren, says Abraham to Lot, Gen. xiii. 8. whereas Lot was only his nephew.—So Jacob told Rachel that he was her father’s brother, Gen. xxix. 12. whereas he was only her father’s nephew.—This consideration has been urged with good advantage against the Antidicomarianites, who, from the mention made of the “brethren of Jesus,” (John ii. 12. Matth. xii. 46.) have impugned the perpetual virginity of the mother of Christ, for which, however, there seems to be no sufficient foundation.

Among us, it is customary for kings to give the title “brother” to each other; the unction in coronation being esteemed to create a kind of “brotherhood.” Nor is the custom modern: Menander mentions a letter of Cosroes, king of Persia, to the emperor Justinian, beginning thus: Cosroes, king of kings, &c. to the emperor Justinian “my brother.”

Kings now also give the same appellation to the electors of the empire; and the like was given, by the king of France, to the king of Sardinia, while only duke of Savoy.

In the civil law, brothers, *fratres*, in the plural, sometimes comprehend sisters: as *Lucius and Titia, fratres; tres fratres, Titius, Mævius, & Scia.*

BROTHERS, *foster*, those which sucked the same nurse. The French call them “*fratres du lait*,” or brothers by milk; which is most properly used in respect of a person who sucked a nurse at the same time with the nurse’s own child.

BROTHERS, *German, Fratres Germani.* See GERMAN.

BROTHER was also used, in *Middle Age Writers*, for a *comes*, or governor of a province.

BROTHER is applied, in a less proper sense, to denote a person of the same profession. In which sense, judges, bishops, priests, &c. call each other brothers.

BROTHER in *Christ, frater in Christo*, the same with *spiritual brother*, a person admitted into a monastic society or fraternity.

BROTHER is more particularly used to denote the relation between monks of the same convent: as brother Zachary, brother Bonaventure, &c. In English, we more usually say, friar Zachary, &c. from the French word *frere*, brother.

This appellation is borrowed from the primitive Christians, who all called each other “brothers:” but it is prin-

cipally used for such of the religious as are not priests; those in orders are generally honoured with the title of *fathers, patres, peres*; whereas the rest are only simply *brothers*.

The monks of St. Dominic are particularly called *preaching brothers*, or *fratres predicants*: those of St. Francis, *minor brothers*; those of charity, *ignorant brothers*, &c. *Conscript brothers, fratres conscripti*, denote laymen and others entered in the catalogue of the brothers of a monastery, or rather possessed of the fraternity thereof. *Outer brother, frater exterior*, sometimes denotes a lay-brother. *Strange brother, frater adveniens*, a host or guest belonging to another monastery. *Foreign brother, frater externus*, either a monk, priest, or canon of some other monastery, to whom the prayers of the society are granted. *Mature brother, frater maturus*, one distinguished by his age, gravity, or probity, above the rest.

BROTHERS, *spiritual*, denote laymen admitted into a monastic fraternity. The name was also given to those otherwise called *mature brothers*, and sometimes also to a sort of adopted brothers, or persons who commenced a kind of brotherhood, with the ceremony of breaking bread together, in the church before the priest.

BROTHER, *lay, frater laicus, or conversus.* See LAY Brother.

BROTHER, *given, frater donatus*, among the Carthusians, denotes a young person dressed in minim cloth, and wearing a hat, whose office is to serve in the house, answering to what in other orders is called an offered brother, *frater oblatus*.

BROTHER is also an appellation more peculiarly given to certain orders of religious: thus the

BROTHERS of *St. Alexis*, in the Low Countries, were an order of persons who attended on those who lay dying, and took care of the burial of the dead.

BROTHERS of *Ave Maria.* See SERVITES.

BROTHERS of *Charity*, a sort of religious Hospitallers, founded about the year 1297, since denominated *Billetins*. They took the third order of St. Francis, and the scapulary, making three usual vows, but without begging.

BROTHERS of *Charity*, also denote an order of Hospitallers still subsisting in Romish countries, whose business is to attend the sick poor, and minister to them both spiritual and temporal succour. They are all laymen, except a few priests, for administering the sacrament to the sick in their hospitals. The Brothers of Charity usually cultivate botany, pharmacy, surgery, and chemistry, which they practise with success.

They were first founded at Granada, by St. John de Dieu; and a second establishment was made at Madrid, in the year 1553: the order was confirmed by Gregory XIII. in 1572. Gregory XIV. forbid them to take holy orders: but by leave of Paul V. in 1609 a few of the brothers might be admitted to orders. In 1619 they were exempted from the jurisdiction of the bishop. Those of Spain are separated from the rest, and they, as well as the brothers of France, Germany, Poland, and Italy, have their distinct generals, who reside at Rome. They were first introduced into France by Mary of Medicis, in 1601, and have since built a fine hospital in the Faubourg St. Germain.

BROTHERS of *Charity of St. Hippolytus*, a religious congregation first set on foot by Alvarez, a citizen of Mexico, in 1585, who associated with him several other pious persons to attend on the sick, and founded an hospital without the walls of that city; which being approved of by the pope, and the number of like hospitals increasing, a congregation was formed under the title of “The Charity of St. Hippolytus,”

lytus," because the first hospital had been dedicated to that saint, on whose feast-day the city first fell into the hands of the Christians. Clement VIII. in 1594, granted them all the privileges of the Brothers of the Charity of St. John de Dieu.

**BROTHERS of Death**, a denomination usually given to the religious of the order of St. Paul, the first hermit.

They are called "Brothers of Death," *fratres a morte*, on account of the figure of a death's head, which they were always to have with them, in order to keep perpetually in their minds the thoughts of death. This order, by its constitutions, made in 1620, does not seem to have been established long before pope Paul V. Lewis XIII. in 1621, permitted them to settle in France. It was probably suppressed by pope Urban VIII.

**BROTHERS of Penitence**, or of the Penitence of Jesus Christ, a name given at Thoulouse to the religious of the third order of St. Francis; called also *Beguini*: and to a fraternity of Penitents held in the chapel of the church of the third order, under the direction of the *Beguini*. See **BEGUINS**.

**BROTHERS, Pyed**, *fratres pii*, a denomination given to all monks, whose habit was partly white, partly black; they were otherwise called *Agaches*.

**BROTHERS of St. Gregory the Illuminator**, a religious order established in Armenia, in the fourteenth century, which being much reduced and decayed by the conquests of the Turks and Persians, was, in 1356, united to the order of St. Dominic.

**BROTHERS, Joyful**, *fratres gaudentes*, in Italy, denote the knights of the order of the Virgin Mary, first instituted at Bologna in 1261, for whom a rule was prescribed by pope Urban IV.

**BROTHERS, poor**, in the Charter-house, a denomination given to decayed gentlemen, to the number of eighty, who are subsisted with diet, cloathing, and lodging on the establishment. The poor brothers are to be gentlemen by descent, reduced to poverty, or decayed merchants, soldiers, or officers of the king's household. The conditions of admission are that they have no estate for life worth 200l. nor coming in, *viii & modis*, 24l. per annum; and that they be fifty years old, unless they have been maimed in the public service; in which case, the age of forty suffices. They wear a livery-gown within doors.

**BROTHERS, White**, the name of a sect which appeared in Russia towards the beginning of the fourteenth century; so called from their white cloaks, on which was a St. Andrew's cross of a green colour. See **BRETHREN**.

**BROTHERS of Arms**, an appellation given to those who contract a kind of fraternity in war, obliging themselves to the mutual service and assistance of each other. In the military orders, the knights are also called brothers.—In the order of Malta, there is a particular class, who are called "serving brothers;" consisting of such as cannot give proof of their nobility. In Latin they are denominated *fratres clientes*.

**BROTHERS by adoption**. See **ADOPTION**.

Two brothers who have only the same father, are called *fratres consanguinei*; and those who are only descended from the same mother, *fratres uterini*.

**BROTHERS of the Cross**. See **FLAGELLANTES**.

**BROTHERS of the rosy cross**. See **ROSYCRUSIANS**.

**BROTHERS, sworn**, *fratres conjurati*. See **FRATRES**.

**BROTHERS**, in *Alchemy*, *lame*, or *maimed*, denote the imperfect metals, which are to be cured of their lameness by the perfect elixir; i. e. are to be purified and separated from their dross, &c. by the philosopher's stone.

**BROTHERS**, in *Geography*, islands in the Indian sea, on the north side of the entrance into the straits of Malacca. N. lat. 7° 18'. E. long. 78° 10', to 78° 15'.

**BROTHERS, Seven**, islands in the Indian sea. S. lat. 3° 24'. E. long. 60° 25'.

**BROTHERS, Three**, islands in the Indian sea. S. lat. 3° 45'. E. long. 62° 25'.—Also, islands in the East Indian sea. N. lat. 10° 32'. E. long. 107° 59'.—Also, islands in the same sea. S. lat. 5° 20'. E. long. 117° 30'. The most northerly, which is about 5 or 6 leagues somewhat southerly from Thumb shoal, is called by the Dutch "North Brother." Between these and Celebes, lies Tonakeke island, which is larger than any of them.—Also, three remarkable hills on the east coast of New Holland, which may be seen 14 or 16 leagues off at sea. S. lat. 31° 40'. W. long. 207° 10'.

**BROTHERS, Two**, lie on the east coast of New Holland, off cape Manifold; one of them is low and flat, and the other high and round; near the shore is a third island.—Also two islands of New Zealand, near queen Charlotte's sound.

**BROTHERHOOD**. See **FRATERNITY**.

**BROTHERHOOD of God**, in the *Middle Ages*, a denomination given to an association formed for restraining and abolishing the right and exercise of private war. The people, eager to obtain relief from the sufferings that were thus occasioned, among other expedients, had recourse to a pretended revelation. Towards the end of the 12th century, a carpenter in Guienne gave out, that Jesus Christ, together with the blessed Virgin, had appeared to him, and having commanded him to exhort mankind to peace, had given him, as a proof of his mission, an image of the Virgin holding her son in her arms, with this inscription: "Lamb of God, who takest away the sins of the world, give us peace." This low fanatic addressed himself to an ignorant age, prone to credit what was marvellous. He was received as an inspired messenger of God. Many prelates and barons assembled at Puy, and took an oath, not only to make peace with all their own enemies, but to attack such as refused to lay down their arms, and to be reconciled to their enemies. Thus they formed the above-mentioned association. But the influence of this superstitious terror or devotion was not of long continuance.

**BROTHERTON**, in *Geography*, an Indian village of North America, adjoining New Stockbridge in the state of New York, inhabited by about 150 Indians, who migrated from different parts of Connecticut, under the care of the Rev. Mr. Occom. These Indians receive an annuity of 2160 dollars, which sum is partly appropriated to the purpose of maintaining a school, and partly to compensate a superintendent for transacting their business, and disposing the remainder of their money for their benefit.

**BROTIER, GABRIEL, Abbé**, in *Biography*, a distinguished scholar, and member of the French Academy of Belles Lettres, was born at Tonnay in the Nivernois, in 1723, and educated in the Jesuits' college of Louis-le-Grand, of which he was for several years librarian. Accustomed through life to write notes in the margins of all the books which he read, and distinguished also by a retentive memory and singular penetration, he had thus collected materials for several volumes; and as he applied to study for 10 or 12 hours a day, he had acquired an immense fund and variety of knowledge. With the exception of the mathematics, his knowledge comprehended every branch of science, natural history, chemistry, and even medicine. It was his custom every year to read Hippocrates, and the books of Solomon, in the original languages; for these, he said, were the best remedies for all bodily and mental diseases. But he was principally

principally devoted to the belles lettres: and had acquired an accurate acquaintance with all the dead languages, particularly the Latin, and with most of the modern languages of Europe. He was also well versed in ancient and modern history, chronology, coins, medals, inscriptions, and the usages of antiquity; and he had collected a great mass of materials for a new history of France, which he was prevented from undertaking. On the dissolution of the order of Jesuits, he found a pleasant asylum in the house of M. de la Tour, an eminent printer, and in this retreat he spent the last 26 years of his life. Here he published his edition of "Tacitus," enriched with notes and learned dissertations, and supplements; and also a new edition of "Pliny the Naturalist," to which he has added notes and illustrations, being merely a concise abridgment of what he had prepared with a view of correcting and enlarging the edition of Hardouin, and of giving an historical account of all the new discoveries made since the beginning of the 18th century. His other works of inferior importance were a beautiful edition of "Phædrus," an edition of Rapin's poem, "De Hortis," to which he subjoined a "History of Gardens," written in Latin with great elegance, and abounding in the most beautiful imagery. Besides a lively imagination, Brotier possessed a sound and discriminating judgment, and an elegant taste. His conceptions were clear, and his mode of communicating knowledge perspicuous. From the abbé Fontenay's further delineation of his character, we shall select the following particulars. "Humble and unassuming, and of such delicate modesty as caused him to blush when the least encomium was passed upon him; good-tempered, plain in his manners, and giving himself up to society with the smiles and simplicity of a child; his conversation was engaging, and always instructive when it turned on subjects of literature and science. Widely differing in this respect from those men of letters, who, if we may be allowed the expression, are misers of their knowledge, and seem to hoard it up for themselves, or that they may make an ostentatious display of it in some publication, the abbé Brotier answered with great readiness the questions of every person who applied to him for information, and intrusted those around him with the utmost affability and condescension." "That intimate friendship which united me to the abbé Brotier," says Fontenay, "gratitude for the services he did me, his talents, and his virtues, will always endear his memory to me; and I may justly say with the Roman poet:

"Multis ille bonis flebilis occidit,  
Nulli flebilior quam mihi."

This accomplished and elegant scholar died at Paris, Feb. 12th 1783, at the age of 67.

The following is a list of the abbé Brotier's works, as given in *La France Littéraire*, by J. S. Ersch, published at Hamburg in 1797, and cited in Aikin's *General Biography*: "Examen de l'Apologie de M. l'Abbé de Prades," 1757, 8vo; "Conclusiones ex universa Theologia," 1754, 4to.; "Traité des monnoies Romaines, Grecques, et Hebr. comparées avec les monnoies de France, pour l'intelligence de l'Ecriture Sainte et de tous les auteurs Grecs et Romains," 1762, 4to." "Prospectus d'une edit. Lat. de Tacite, en 5 vols, 4to.," 1761; "C. Corn. Taciti Opera, recognovit, emend. suppl. explevit, notis, dissert. tabulis geogr. illustravit," 1771, 4 vols. 4to.; "Supplementa, lib. 7. 10 Annal. Taciti," 1755, 8vo.; "Cl. viri de la Caille vita," 1763, 4to.; "C. Plinii Historia naturalis," 1779, 6 vols. 12mo.; "Renati Rapini Hortorum, lib. iv. et cultura hortentis, hidoriam hortorum addidit," 1778, 8vo.; "Phædrus Fabularum, lib. v. cum notis et suppl. access. Parallela J. de la Fontaine Fabulæ," 1785, 12mo. A. C. Brotier, the ab-

bé's nephew, who was arrested in February 1797, as being the chief of a conspiracy, published, in 1790, "Paroles mémorables recueillies par Gabr. Brotier," 12mo.

BROTO, in *Geography*, a town of Spain in Arragon; 6 leagues from Jaca.

BROUAGÉ, a maritime town of France, in the department of the lower Charente, 2 leagues S.W. of Rochefort; it consists of 5 or 6 streets, which terminate in a large square, and is famous for its salt-works. N. lat. 45° 50'. W. long. 1° 0'.

BROUCA, a town of Sicily, on the south side of the gulf of Catania, and 5 leagues S. of it. N. lat. 37° 25'. E. long 15° 30'.

BROUCK. See BRUGG.

BROUGH, or BROUGH UNDER STAINMOR, a small town of Westmoreland, in England, consists chiefly of one long street, and is seated on the great road between York and Carlisle. The surrounding country, though bleak and naked, contains some good soil. Here the long chain of mountains, which bound the eastern side of Westmoreland, is interrupted by another range of hills, which crosses it from the east to the west. A charter was obtained for a market and fair in the time of Edward III.; but the greater markets at Kirkly Stephen and Appleby have entirely superseded this at Brough. Here are the remains of a castle, which bears marks of great antiquity; and its keep is called in old records, "Cæsar's Tower." Antiquaries are agreed in placing the Roman station, "Verteris," at this place; and this appears extremely probable from the various Roman coins, &c. that have been found here, from the character of the castrametation, and its distance from the stations "Lavatis" (Bowes), and "Voreda" (Old Penrith). The remains of the castle occupy an eminence, which rises rather abruptly on the north and west from a plain; and on the south and east, where not so steep, it is additionally fortified with a ditch and vallum. Soon after the Norman conquest, this was a place of meeting and consultation with some of the borderers, who conspired against the conqueror.

Near Brough is a large cotton-spinning manufactory, belonging to John Carlton, esq. who has a beautiful seat near the town called Hillbeck hall. Brough has three fairs annually; one of which, in September, is noted in the north of England for the great quantity of cattle, horses, &c. which are brought to it. This town is 261 miles N.W. from London; and contains 117 houses, with 694 inhabitants. *Houfman's Topograph. Descript. of Cumberland, &c.* 8vo.

BROUGHTON, ΗΥΘΗΝ, in *Biography*, a learned divine, was born in 1549 at Oldbury, in Staffordshire. Of his early education nothing is now known; but it is said by the biographers of Bernard Gilpin, that he was met by this excellent person in his journey to Oxford, whither he was travelling on foot for the purpose of becoming a scholar there, and taken to his own school at Houghton, whence he was sent to Cambridge. At that university he became one of the fellows of Christ's College, and here he so distinguished himself by his application and proficiency, and particularly by his knowledge of the Greek and Hebrew languages, as to attract the notice and obtain the patronage of the earl of Huntingdon, who encouraged and assisted him in his studies. From the university he removed to London, and there became a celebrated preacher. His mode of preaching, according to Dr. Lightfoot, was to select two parallel texts, one from the Old Testament, and the other from the New, and to discourse upon them in their mutual connection; indulging many fanciful and over-trained interpretations. Notwithstanding his popularity as a preacher, he pursued his studies without intermission; and he is said to have frequently

quently spent 16 hours out of the 24 at his books. In 1588, he published a work, the result of much previous labour, entitled, "The Consent of Scriptures;" which is a kind of Scripture chronology and genealogics. In this work he zealously maintains the incorruptness of the sacred text, both of the Old and New Testament; and he contends, that the original tongue of Adam and Eve continued unchanged till the Babylonish captivity, that the characters and points are the same with those written by God on the two tables, and that the sacred tongues were changed in the time of the prophet Daniel; but that the sense of the original tongue is preserved by the LXX. and the New Testament. The chief of the Masorites, according to this writer, was Ezra; and they have kept the letters and words with such care, that none of them can perish. This work, which excited great attention, was warmly opposed by Dr. Reynolds of Oxford; and the author thought the controversy of such importance, that he wished to have it settled by public authority. For explaining his doctrine, Mr. Broughton instituted weekly lectures in London; and they were conducted for some time at St. Paul's, with the permission of the queen and council, on condition of his returning the names, abodes, and occupations of all his auditors; but by the opposition of the bishops, this indulgence was discontinued, and he was obliged to deliver his lectures in private rooms engaged for the purpose in different parts of the town. Such was the extravagance of his attachment to the Hebrew language, that, having taught the son of a friend to read and speak it at the age of 7 or 8 years, he rigorously prohibited his talking even to his mother in English. In 1589 he went to Germany, and resided for some time at Frankfurt, where he held a long dispute in the Jewish synagogue with a rabbi concerning the truth of the Christian religion. But in his various disputations with the Jews, and also with the papists, he paid no great regard to the rules of prudence and politeness. After his return to England, in 1594, he published "An Explication of the Article of Christ's Descent to Hell," maintaining with great learning that the word *hades* no where, either among the Greeks, or in the Scriptures, properly denoted hell, or a place of torment, but only the place of souls, the state of the dead, or the invisible world. This opinion, though now generally received, was, upon his first avowal of it, violently opposed, and particularly by archbishop Whitgift and bishop Bilson. During a great part of queen Elizabeth's reign he passed much of his time abroad; conversing with learned men, and propagating his peculiar opinions. To the archbishop of Mentz, who treated him with particular distinction, he dedicated his translation of the Hebrew prophets into Greek; and it has been said, though not with great probability of truth, that he was offered a cardinal's hat, if he conformed to the church of Rome. On the subject of Christ's descent, he addressed an epistle in Greek to the Genevans, which was printed at Mentz in 1601; and in this epistle he reproved that church for its unbecoming heat and violence with regard to some points, and spoke with great severity of the celebrated Beza, to whom he also addressed some rude letters, giving to the Jesuit Serrarius, to whom he sent copies, full permission to publish them. In 1607, the new translation of the bible was begun; and it was thought surprizing, that Broughton had no concern in it: but his peculiar notions, and the dislike of the episcopal bench, prevented his being employed. Finding no encouragement at home, he removed again to the continent, and became for some time preacher to the English at Middleburg in Zealand. But when his health began to decline, he determined to return to England, and to die in his own country. Accordingly he embarked in November 1611; and in the following year he lodged in the house

of a friend at Tottenham High Cross, where he died of a pulmonary consumption in August, 1612. His funeral was attended by a great concourse of friends; and his remains were interred in St. Antholin's church-yard. As a scholar, and controversial divine, Mr. Broughton was self-opinionated, choleric, rude, and dogmatical; but for the heinous charge of ingratitude to his first friend and patron, Bernard Gilpin, against whom he is said to have incensed the bishop of Durham, there seems to be no sufficient foundation. His works are for the most part printed together in one large folio volume, at London, in 1662, with this singular title, "The Works of the great Albionean Divine, renowned in every nation for great skill in Salem's and Athens' tongue, and familiar acquaintance with all rabbinical learning, Mr. Hugh Broughton." Dr. Lightfoot, addicted to similar kind of literature, highly extols them; but they are now forgotten. During his life, Broughton was not only a subject of angry controversy, but of ridicule; an instance of which occurs in Ben Johnson's "Alchymist." But this contemptuous reflection was more than counterbalanced by an elegy, possessing great poetical beauties, written by an obscure author, called "W. Primroses," and annexed to his works. In this elegy, theology is personified, and represented as lamenting the loss of him. What he says of him as a linguist, is as follows:

"Who, tuneful as the silver-pinion'd swan,  
Canaan's rich language in perfection sang."  
"He knew the Greek, plenteous in words and sense,  
The Chaldee wife, the Arabic profound,  
The Latin pleasing with its eloquence,  
The braving Spanish with its lofty frown,  
The Tuscan grave with many a laurel crown'd,  
The lisping French, that fits a lady vain,  
The German, like the people, rough and plain,  
The English, full and rich, his native country's strain."

Biog. Brit.

BROUGHTON, THOMAS, a learned episcopalian divine, and one of the first writers in the Biographia Britannica, was born in London, July 5, 1704, educated at Eton, and removed to Cambridge about the year 1722, where he entered himself of Gonville and Caius college. At school he had distinguished himself by the acuteness of his genius, and the studiousness of his disposition; and at the university he directed his chief attention to the modern languages, and to the mathematics, which he studied under the famous professor Saunderson. In 1727, he took both deacon's and priest's orders, and left the university, to supply the curacy of Offley in Hertfordshire. In 1739, he was presented to the rectory of Stepington or Stibington in the county of Huntingdon; and soon after he was chosen reader to the Temple, and thus introduced to an acquaintance with bishop Sherlock, who, in 1744, preferred him to the valuable vicarage of Bedminster, near Bristol, together with the annexed chapels of St. Mary Redcliff, St. Thomas, and Abbot's Leigh. Upon receiving this presentation he removed to Bristol, where he married a wife, by whom he had seven children, of whom six survived him. He resided on his living till his death, which happened Dec. 21st 1774; and his remains were interred in the church of St. Mary Redcliff.

Mr. Broughton, during his residence in London, associated with the principal literary men of his time, and as he was a great lover of music, he was introduced to the acquaintance of Mr. Handel, whom he furnished with the words for many of his compositions. In his public character he united moderation of temper with a zealous attachment to the christian cause; and in his private life, his disposition was mild, cheerful, and liberal, and he devoted his time and

attention to the interests and happiness of his family. From the time of his quitting the university till he was considerably advanced in life, he engaged in a variety of publications, of which the following list is taken from a paper in his own hand-writing: "Christianity distinct from the Religion of Nature, in three parts, in answer to Christianity as of old as the Creation;" "Translation of Voltaire's Temple of Taste;" "Preface to his Father's Letters to a Roman Catholic;" "Alteration of Dorrel on the Epistles and Gospels, from a Popish to a Protestant Book," 2 vols. 8vo.; "Part of the new Edition of Bayle's Dictionary in English, corrected, with a Translation of the Latin, and other Quotations;" "Jarvis's Don Quixote, the Language thoroughly altered and corrected, and the poetical parts new translated;" Translation of the mottoes of the Spectator, Guardian, and Freeholder;" "Original Poems and Translations by John Dryden esq., now first collected and published together, 2 vols.;" "Translations of the quotations in Addison's Travels, by him left untranslated;" "the first and third Olinthiacs, and the four Philippics of Demosthenes (by several hands), revised and corrected, with a new Translation of the second Olinthiac, the Oration de Pace, and that de Chersoneso, to which are added all the Arguments of Libanius, and select notes from Ulpian," 8vo.; "Lives in the Biog. Brit.;" "The Bishops of London and Winchester on the Sacrament, compared;" Hercules, a musical Drama;" "Bibliotheca historico-sacra, an historical Dictionary of all Religions from the Creation of the World to the present time," 1756, 2 vols. folio;" "A Defence of the commonly received Doctrine of the human Soul;" and "A Prospect of Futurity, in 4 Dissertations, with a preliminary Discourse of the natural and moral evidence of a future State." He also left in manuscript "A short View of the Principles upon which Christian Churches require of their respective Clergy, Subscription to established Articles of Religion," which was composed not long before his death. From several fugitive pieces found in manuscript among his papers, and two unfinished tragedies written at the age of 17, it is inferred that he possessed no inconsiderable talents for poetry. Biog. Brit.

**BROUGHTON Island**, in *Geography*, an island of America, lying at the mouth of Alatamaha river in Georgia, which belonged to the late Henry Laurens, esq. The fourth channel, after its separation from the north, descends gently, winding by McIntosh and Broughton islands, in its way to the ocean through St. Simon's sound.

**BROUHNUSIUS**, in *Biography*. See BROECKHUYSE.

**BROUNCKER**, or **BROUNKER**, WILLIAM, lord viscount of Castle Lyons in Ireland, and first president of the Royal Society after its incorporation, was the son of sir William Brounker, made viscount in 1645, and born about the year 1620. At an early period he manifested a genius for those mathematical sciences, in which he afterwards excelled. The place and course of his education are not known; but in June, 1646, he was created doctor of physic at Oxford; and in 1657 and 1658, he corresponded on mathematical subjects with Dr. John Wallis, who published his letters in the "Commercium epistolicum," printed at Oxford in 1658, 4to. In April 1660, he united with the nobility and gentry in subscribing a declaration, acknowledging general Monk to be the restorer of the laws and privileges of these nations. After the restoration, he was made chancellor to queen Catharine, and keeper of her great seal, a commissioner of the admiralty, and master of St. Catharine's hospital near the tower of London. He was also an active and useful member of the Royal Society at its first establishment, and held the office of president with

honour to himself, and advantage to the institution, for 15 years, viz. from July 1662 till November 1677. Of his works, notwithstanding his activity in promoting literature and science, there are few extant. These are "Experiments on the recoiling of Guns," published in Dr. Spratt's History of the Royal Society;" "An algebraical Paper upon the squaring of the Hyperbola," published in the Philosophical Transactions (See Lowthorp's Abr. vol. i. p. 10, &c.); "Several Letters to Dr. James Usher, archbishop of Armagh," annexed to that primate's life by Dr. Parr; and "A Translation of the Treatise of Des Cartes, entitled *Musice Compendium*," published without his name, but enriched with a variety of observations, which shew that he was deeply skilled in the theory of the science of music.

Lord Brounker died at his house in St. James's street, Westminster, April 5, 1684, and was buried in a vault in the middle of the choir belonging to the hospital of St. Catharine. Biog. Brit.

**BROUSONNETRA**, in *Botany*. See PAPIRIUS.

**BROUSSE**, in *Geography*, a town of France, in the department of Puy le Dôme; 6 leagues E. of Clermont.

**BROUSSON**, CLAUDE, in *Biography*, a French protestant, who was a zealous partizan, and at length a martyr of the reformed religion, was born at Nismes in 1647, and educated to the law. He exercised the profession of an advocate for 20 years, first at Castres and afterwards at Toulouse, with singular reputation for generosity and disinterestedness, as well as firmness and ability. As he took part in his pleadings with the protestant ministers and churches, an attempt was made to corrupt his integrity by the office of a counsellor's place, which he rejected with contempt. It was at his house that the deputies of the protestant churches assembled in 1683, and here they concurred in the resolution of continuing to assemble for public worship though their churches were demolished. The execution of this purpose was productive of many tumults, seditions, and massacres; and though they were terminated by an amnity issued from the court of Louis XIV., this was accompanied by an order for arresting seven or eight persons, who had been principally concerned in framing the resolution. Brousson was one of these; and apprehending the consequence, he had previously retired to Nismes; and as soon as he received the intelligence of the proposed arrest, he fled to Geneva, and afterwards to Lausanne. At this latter place he published his "State of the Reformed in France," 1684; and his "Letters to the French Clergy in favour of the Reformed Religion," 1685. About this time he was appointed one of the deputies from the principal refugees in Swisserland, for engaging the protestant powers to interest themselves in favour of the French reformed that were dispersed through Europe. At Berlin, he composed, by desire of the elector of Brandenburg, his "Letters from the Protestants in France to all other Protestants." From Berlin he went to Holland, and had several conferences with the prince of Orange and pensioner Fagel. Afterwards returning to Swisserland, he printed "Letters to the Roman Catholics;" and, with a view to the more effectual distribution of them in France, he ventured, in 1689, to visit that country. On his arrival in the Cevennes, he accepted the office of minister to a congregation of protestants, which assembled on the top of a high mountain, and, notwithstanding the various persecutions with which he encountered, he continued the exercise of his ministerial functions in these parts for 4 years. In 1698, he returned to Lausanne, and from thence removed to Holland, where he printed "A summary Relation of the Wonders wrought by God in the Cevennes and Lower Languedoc,

Languedoc, for the consolation and instruction of his desolated Church," to which his enemies would naturally ascribe the character of fanaticism. He also published a volume of sermons, and received from the States of Holland a pension, as a minister. Towards the close of the year 1695, he again visited France, travelling through most of its provinces and employing his pen in various writings. During the negotiation for the peace of Ryswick, he exerted himself in exciting the protestant powers to treat for the re-establishment of the French reformed churches. Failing of success in this object, he made another tour through France, and, after encountering a variety of hazards, he was at length apprehended at Oleron in September, 1698, and carried for trial to Montpellier. Having been convicted of preaching in defiance of the royal edict, and of having held correspondence with the enemies of the state, he was condemned to be broken alive upon the wheel, and he endured the execution of this dreadful sentence with all the firmness appropriate to his character. His eloquence and zeal were universally acknowledged, and by his own party he was regarded as a martyr. The States of Holland did honour to his memory, by adding 600 florins, as a pension to his widow, to the 400 which had been allowed to himself. *Nouv. Dict. Hist.*

**BROUVELIEURES**, in *Geography*, a town of France, in the department of the Vosges, and chief place of a canton, in the district of St. Dié; one league N. of Bruyères. The place contains 414, and the canton 3574 inhabitants; the territory comprehends 130 kilometres and 10 communes.

**BROUWER**, in *Biography*. See **BRAUWER**.

**BROUZET, NICHOLAS**, was born in the neighbourhood of Montpellier, where he took his degree of doctor in medicine, in the year 1736, whence he went to Paris, and was admitted corresponding member of the Royal Academy of Sciences, and soon after was made physician to the hospital at Fontainebleau. He published in 1754, "Essai sur l'Education medicinale des Enfans, et sur leurs Maladies;" a popular work, by which he obtained much credit. In his chapter on Generation, he follows the system of Buffon, and supposes the organized particles to attract each other, as the particles of salt do in forming crystals. He also contends for the power of the imagination of pregnant women, in marking and deforming the fœtus; but though there are these, and other blemishes, the work contains many useful practical rules for the management of infants, and for the cure of their diseases. It was translated into English and published in London, in 1755. *Haller Bib. Chir. Eloy. Dict. Hist.*

**BROW-antler**, the first branch of the horn of a hart or buck, shooting out from the beam, or main horn, next the head.

**Brow-post**, in *Carpentry*, a beam which goes across or overthwart a building.

**BROWALLA Heide**, or **BROWELLA heath**, in *Geography*, a plain of Sweden in the province of Smaland, lying about two Swedish miles from Wexio, and famous for being the place where the Danes were totally routed by the heroine Bleuda, who commanded the Smaland women, in the defence of their husbands, who were engaged in another expedition. As a recompence of their bravery, the women of Smaland were honoured with extraordinary privileges, and wore a kind of martial head-dress; and they have still an equal share of inheritance with the men.

**BROWALLIA**, in *Botany*, (named by Linnæus in honour of Browallius, bishop of Abo, who defended the sexual

system against Seigefbeck). *Linn. gen.* 773. *Reich.* 834. *Schreb.* 1036. *Juss.* 123. *Gært.* 304. *Pl.* 53. *Willd.* 1175. *La Marck. Pl.* 535. *Clafs, didynamia angiospermia. Nat. Ord. Luride—Scrophularia* *Juss. Gen. Char. Cal.* perianth one-leaved, tubular, short, five-toothed, permanent; teeth rather unequal. *Cor.* monopetalous, funnel-shaped; tube cylindric, as long again as the calyx; border flat, five-cleft; segments rounded, emarginate, the upper one a little larger than the rest, and constituting the upper lip. *Stam.* filaments four, included in the tube; the two longest with larger anthers, which close the throat of the corolla. *Anthers* simple, incurved, converging; the inner ones twin, the outer ones opening at the top with a small hole. *Pist.* germ ovate, retuse; style thread-shaped, the length of the tube of the corolla; stigma thick, four-lobed. *Peric.* capsule ovate, obtuse, clothed with the calyx, two-celled, many-seeded, two-valved; valves bifid at the top; partition flat, thin, parallel to the valves, and separating from the sides of the capsule as it advances to maturity, whence Linnæus judged it to be one-celled. (*Gært.* and *Juss.*) *Seeds* numerous, small.

*Eff. Ch. Cal.* five-toothed, *Cor.* border five-cleft, nearly equal, spreading; throat closed by the two larger anthers.

*Sp. 1. B. demissa*, *Linn.* (*La Marck Pl.* 535.) "Downy; peduncles alternate, one-flowered." *Root* annual. *Stem* herbaceous, about a foot high, branched. *Leaves* alternate, petioled, ovate-pointed, with short hairs on their petioles and nerves. *Flowers* axillary and terminating, solitary, shorter than the leaves. *Corolla* of a bright, but pale blue colour. *Seeds* sent to Mr. Miller from Panama, in 1735, who named the plant Dalea, in honour of Mr. Dale, an eminent English botanist, and sent the seeds under that name to Linnæus, who thought proper to change the name to *Browallia*. 2. *B. elata*, *Linn.* (*Curt. Bot. Mag.* 34.) "Rather smooth, flowers one or more, terminating." *Root* annual. *Stem* about two feet high, cylindric, stiff, much branched. *Leaves* lanceolate. *Flowers* of a beautiful violet-blue. *Native* of Peru. Both these species must be raised on a hot-bed in the spring, and may afterwards be transplanted into a warm flower border, where, if the weather be favourable, they will flower and ripen their seeds. 3. *B. alienata*, *Linn.* "Upper leaves opposite, two stamens the length of the corolla." Taken up by Linnæus solely on the authority of Miller's figure; and as Miller himself did not insert it in the later editions of his Dictionary, it is a dubious plant. 4. *B. humifusa*, *Forsk.* "Hispid, prostrate; flowers axillary, nearly sessile, white." *Stems* slender, branched, hispid. *Leaves* opposite, oblong, sessile, narrowed at their base. *Peduncles* axillary, solitary, very short. *Calyx* hispid, cylindric, with five thread-shaped divisions. *Tube* of the corolla straight, half an inch long; border open, almost regular, with four oval divisions. *Capsule* compressed, one-celled? many-seeded, enveloped by the calyx.

**BROWERSHAVEN**, in *Geography, so called from *port des Brassiers*, the port or haven of brewers, a sea-port town of Zealand on the north side of the island of Schouwen, opposite to Goree. In 1426, a bloody battle was fought near this town between Philip, duke of Burgundy, and Humphry, duke of Gloucester, brother to Henry V. king of England, who came with 3000 English to the assistance of Mary de Jaqueline, countess of Holland, in which the duke of Gloucester was defeated; 5 miles S. of Gorée and 8. S. W. of Helvoetsluys. *N. lat.* 51° 45'. *E. long.* 4° 15'.*

**BROWHEAD**, a cape of Ireland, at the eastern extremity of Barley Cove, in the south-western part of the county of Cork. *N. lat.* 51° 23' 30". *W. long.* 9° 40'.

BROWN, a dusky kind of colour, inclining somewhat towards reds. Dyers distinguish divers shades and gradations of brown, a sad brown, London brown, clove brown, purple brown, walnut-tree brown, &c.

The brown colours are bistre, brown ochre, Cologne earth, ombre and brown pink; which see.

Spanish brown is a dull red colour, used by house-painters chiefly for priming, and by colourmen in preparing cloths for pictures and other coarse work, as being cheap and easy to work. It is obtained from a native earth, which is found in the slate and of the colour in which it is used. The name seems to import that it was formerly brought from abroad; but that which is now used is dug up in several parts of England.

For the method of dying browns, see DYEING.

BROWN, ROBERT, in *Biography*, the founder of the sect denominated BROWNISTS, was the son of Anthony Brown, esq. of Tolthorp, in Rutlandshire, and the grandson of Francis Brown, whom king Henry VIII., in the 18th year of his reign, privileged by charter to wear his cap in the presence of himself, his heirs, or any of his nobles; and not to uncover but at his own pleasure; which charter was confirmed by act of parliament. Thus descended of an ancient and respectable family, nearly allied to the lord treasurer Burleigh, he was born at Northampton, towards the middle of the 16th century, studied divinity in the university of Cambridge, and afterwards became a school-master in Southwark. Adopting the opinions of Cartwright (see CARTWRIGHT), he determined to form from them what he conceived to be a more perfect system of doctrine and practice; and, about the year 1580, he began to inveigh with intemperate vehemence and ardour against the discipline and ceremonies of the church of England, representing her government as Antichristian, her sacraments as superstitious, her liturgy as a mixture of popery and paganism, and the mission of her clergy as no better than that of Baal's priests in the Old Testament. In the following year he preached at Norwich to a Dutch congregation, in which were several persons inclined to Anabaptism; and having in this situation gained some profelytes to his opinions, and established a character for sanctity and zeal, he formed a connection with a school-master, whose name was Richard Harrison; and, with his assistance, he collected a number of disciples, partly Dutch and partly English, who, disapproving the forms and service of the established church, were formed into a separate society under the denomination of BROWNISTS. Upon this, Brown was convened before Dr. Freake, bishop of Norwich, and other ecclesiastical commissioners; but as he persisted in maintaining his opinions, and behaved in an unbecoming manner before the court, he was committed to the custody of the sheriff, from which, however, he was released by the interposition of his relation, the lord-treasurer Burleigh, who candidly imputed his error and obliquity to zeal rather than malice, and recommended reasoning rather than harsh treatment, as the most likely means of reclaiming him. The lord-treasurer's letter to the bishop produced the desired effect. His lordship afterwards requested archbishop Whitgift to give his kinsman necessary instruction and counsel; but Brown left the kingdom, and settled at Middleburg in Zealand, where he and his followers obtained leave of the States to worship God in their own way, and to form a church according to their own model; a sketch of which was drawn up by Brown, in a treatise printed at Middleburg in 1582. This consists of three tracts; the *first* entitled "A Treatise of Reformation, without tarrying for any, &c.;" the object of which is to excite the people to withdraw from the church, and unite with him, and to exclude

the civil magistrate from any authority over ecclesiastical persons and concerns: the *second* is, "A Treatise upon the 23d chapter of St. Matthew, &c." in which the author exclaims against the abuse of tongues in preaching, that is, against the use of Hebrew, Greek, or Latin, infermons; also, against the use of logic and rhetoric, &c.; against disorderly preaching at St. Paul's cross, &c.; and against parish-preachers and hired lecturers: and the *third* is entitled, "A Book which sheweth the Life and Manners of all true Christians, and how unlike they are unto Turks and Papists, and Heathen folk, &c." Some time before the year 1585, Brown left Middleburg, and came over to England; for in this year he was cited to appear before archbishop Whitgift, to answer to certain matters contained in a book published by him; and when he had been brought, by the prelate's reasoning, to a tolerable compliance with the church of England, he was sent to his father in the country, and recommended by the lord-treasurer to his favour and affection. Brown's opinions, however, were too deeply fixed to be easily eradicated; and therefore his father, with a severity very different from the conduct of the lord-treasurer, disowned him for his son, and expelled him from his house. Brown had now no settled habitation, and encountered various hardships; but at length he settled in Northamptonshire, and persisted in zealously propagating his tenets. Being cited to appear before the bishop of Peterborough, he refused to obey, and was excommunicated for contempt. This censure alarmed and humbled him; and having made his submission, he obtained absolution. Accordingly, about the year 1590, he renounced his principles of separation, from that time continued in the communion of the church, and was soon after preferred to the rectory of a church in Northamptonshire. Fuller, however, is of opinion, that Brown never formally recanted his opinions with regard to the main points of his doctrine; but that his promise of a general compliance with the church of England, improved by the countenance of his patron and kinsman, the earl of Exeter, prevailed upon the archbishop, and procured this extraordinary favour for him. He adds, that Brown allowed a salary for one to discharge his cure; and though he opposed his parishioners in judgment, yet agreed in taking their tithes. His sect, however, long survived his revolt; and of its peculiar tenets an account is given under the article BROWNISTS. Brown is represented as a man of good parts and some learning; but his temper was imperious and uncontrollable; nor was his conduct agreeable to the Sabatarian strictness which was afterwards professed by his followers. Fuller says of him, that he had a wife with whom he never lived, and a church in which he never preached, though he received the profits of it: and as all the other scenes of his life were stormy and turbulent, so was his end; for the constable of his parish requiring somewhat roughly the payment of certain rates, his passion moved him to blows; of which the constable complained to justice St. John, who inclined to pity rather than to punish him; but Brown behaved with such insolence, that he was sent to Northampton gaol, on a feather-bed in a cart, being very infirm, and aged above 80 years, where he soon after sickened and died, in the year 1630; after boasting of his persecutions, and "that he had been committed to 32 prisons, in some of which he could not see his hand at noon-day. *Biog. Brit.*

BROWN, THOMAS, an ingenious writer, who lived towards the close of the 17th century, was the son of a farmer in Shropshire, and educated at Newport school in that county, where he acquired a considerable acquaintance with the Latin, Greek, French, Italian, and Spanish languages; which

which was farther improved at Christ-church, in the university of Oxford. But notwithstanding his literary attainments, his conduct was so irregular, that he was under a necessity of quitting the university; and, instead of returning to his father, he removed to London, where he was in danger of starving. In these circumstances of penury and distress, he was relieved, by being appointed school-master at Kingston upon Thames; a profession, however, which, being very unfruitful to his disposition, he soon abandoned. Returning to London, he commenced author; and employed himself in writing for the bookfellers. His publications were very numerous, and consisted of dialogues, letters, poems, &c. in which his erudition was enlivened by his humour; for, in his writings, as well as in his conversation, he was always sprightly and facetious. But though he had the reputation of a scholar, he was destitute of prudence; and, as he indulged his genius for satire to an extravagant degree, he was more likely to forfeit than to conciliate the friendship of those who were able to assist him; and it was said of him, that he rather chose to lose his friend than his joke. He took pleasure in libelling both the clergy and laity, and his indecorous treatment of religion laid the foundation for remorse, which is said to have embittered the last moments of his life. Mr. Jacob informs us, that towards the close of his career, he was favoured by the earl of Dorset; that being invited to dine with him in company with Dryden, and some other gentlemen of similar description, he found, to his agreeable surprise, a bank note of 50*l.* under his plate, at which time Dryden was presented with another of 100*l.* Brown died in 1704, and was interred in the cloister of Westminster abbey, near the remains of Mrs. Behn, with whom he had been intimate. His works, consisting of dialogues, essays, declamations, satires, letters from the dead to the living, translations &c. were printed in 4 vols. 12mo. in 1707. They are not destitute of learning, and abound with humour, which is justly charged with want of delicacy. Biog. Dict.

BROWN, MOSES, vicar of Olney, Berks, and chaplain of Morden college, was born in 1703, and was originally a pen cutter. In 1723, he published two dramatic pieces, called "Polidus, or distressed Love," a tragedy, and "All bedevilled," a farce, both acted at a private theatre in St. Alban's street. On the institution of the Gentleman's Magazine, he became a contributor to it; and obtained some of the prizes, offered by Mr. Cave, for the best poems; and, in 1739, he published a volume of poems in 8vo., and, in 1749, "Sunday Thoughts," a poem, 12mo. In 1756, he published "Percy Lodge," a descriptive poem; he also edited "Walton's complete Angler;" and, in 1773, republished his "Piscatory Eclogues." He also translated Zimmermann, and was the author of some sermons. He died Sept. 13th, 1787. Biog. Dict.

BROWN, JOHN, a clergyman of the church of England, and an ingenious writer, was born in 1715 at Rothbury, in Northumberland, and educated, first at Wigton, and afterwards at St. John's college, Cambridge, where he acquired great reputation. Upon his quitting the university in 1735, he took orders, and first settled as minor canon and lecturer in the city of Carlisle. In 1739, he took his degree of master of arts at Cambridge; and in the year of the rebellion 1745, he distinguished himself by his zeal for government, and by the intrepidity with which he entered as a volunteer at the siege of Carlisle. In the following year, he preached, on occasion of the trial of some of the rebels, two admirable discourses on the connection between religious truth and civil liberty, and between superstition, tyranny, irreligion, and licentiousness; and his avowed attachment

to the principles of whiggism recommended him to the patronage of Dr. Osbaldeilton, bishop of Carlisle, who obtained for him a living in Westmoreland. About this time, his talents for correct and elegant verification were evinced, in a poem on "Honour," inscribed to lord Lonsdale, and in an "Essay on Satire," addressed to Dr. Warburton, and prefixed to this eminent critic's edition of Pope's works. The friendship of Warburton was soon followed by that of Mr. Ralph Allen of Prior-Park, who entertained Mr. Brown at his house, and offered him pecuniary assistance. During his visit at Prior Park, he preached two sermons at the abbey-church of Bath; one of which, exposing the mischiefs of immoderate gaming, is said to have induced the magistrates to issue an order for the suppression of the public gaming tables. In 1751, he published a work which may be still regarded as one of his most capital productions: viz. "Essays on the Characteristics of the earl of Shaftsbury," comprehending one "On Ridicule, considered as a Test of Truth;" another, "On the Motives to Virtue, and the Necessity of religious Principle;" and a third, "On revealed Religion and Christianity." These essays are written with elegance and spirit, and, at the same time, with candour and politeness. They were of course much read, and frequently re-published, so that a fifth edition of them appeared in 1764. In 1755, Mr. Brown was honoured with the title of doctor of divinity at Cambridge; and, in the same year, he ventured to appear before the public under the new character of a dramatic writer. With the assistance of Mr. Garrick, his tragedy of "Barbarossa" was exhibited on the stage with advantage; and this was succeeded in the ensuing year by "Athelstan." Both these performances were published without his name.

The next publication which we shall mention, forms a kind of era in the author's life; it appeared in 1757, and was entitled "An Estimate of the Manners and Principles of the Times." This work was published at a time, when the spirits of the people were extremely depressed by some unprosperous events that had occurred at the commencement, and during the progress of the war, in which the nation was engaged; and it was designed to shew, that a vain, luxurious, and selfish effeminacy, in the higher ranks of life, marked the character of the age, and to point out the causes and the effects of this effeminacy. The "Estimate," adapted to the circumstances and disposition of the people, at the time when it appeared, was read with avidity, and seven editions of it were called for, in little more than a year. It did not pass, however, unnoticed; it was attacked in a variety of publications; but the most effectual reply to it was, as Voltaire observes, that the English, from that period, began to beat their enemies in every quarter of the globe. In 1758, Dr. Brown published a second volume of the "Estimate," and afterwards, "An explanatory Defence of the Estimate, by way of Appendix;" but the circumstances of the country were changed, and the public attention drooped, so that these pieces, though well written, were much less popular. Besides, the vanity and superior confidence of the author, which had not escaped notice in his first publication, became now more conspicuous, and disgusted even many of his admirers; nor could the avowal of the integrity of his intentions, and the greater modesty with which he vindicated himself, in the "Explanatory Defence," avail to remove the prejudices that had been conceived against him. Dr. Brown manifested an irritability of temper, and a propensity to quarrel with his friends and patrons, which prevented him from obtaining those ecclesiastical preferments, to which his literary reputation entitled him; so that the vicarage of St. Nicholas, in Newcastle upon

upon Tyne, with the office of one of the king's chaplains in ordinary, concluded the final term of his church promotion. In 1763, he published "An additional Dialogue of the Dead, between Pericles and Cosmo," which was supposed to be a vindication of Mr. Pitt's political conduct against some reflexions of lord Lyttelton; and this was followed in 1764, by "The Cure of Saul, a sacred Ode," which was set to music, and performed as an oratorio; and by an ingenious and elegant performance, entitled "A Dissertation on the Rise, Union, and Power, the Progressions, Separations, and Corruptions of Poetry and Music." This dissertation, though ingenious and critical, advanced fanciful principles, and manifested a degree of credulity, with respect to the supposed effect of certain public institutions among the ancients, which gave rise to a variety of strictures. In 1764, Dr. Brown detached from his "Dissertation" the substance of that part which related to poetry, and published it separately in an octavo treatise, entitled "The History of the Rise and Progress of Poetry through its several Species;" and, in the same year, he published a volume of "Sermons," being chiefly a collection of those which had before been printed singly. Of the new are those excellent discourses on education, in which the author has unanswerably refuted some of the positions of Rousseau in his *Emilius*, and other speculations, and satisfactorily evinced the necessity and importance of forming the minds of children to early habits of piety and virtue. The author's attention was again directed towards politics, and in 1765, appeared his "Thoughts on civil Liberty, Licentiousness, and Faction," containing censures on those persons, who, at that time, opposed the measures of administration, and closing with a prescribed code of education. As he proposed that this code should be adopted and enforced by government, it produced the animadversions of Dr. Priestley, in his "Essay on the Course of a liberal Education, for civil and active Life." The author's discourses on education in general, were followed by a sermon "On the Female character and education," to which is annexed an appendix, in which he states, in a very liberal manner, the moral and political principles which should be inculcated on the attention of young persons; and, in his opinion, these are such as are evidently founded on the precepts of christianity, and the laws of freedom. He proceeds further to discuss the question, "whether there be any opinions or principles which ought not to be tolerated (or suffered to be taught) in a well-ordered, free community?" and to this question, he replies, that, in his judgment, there are many opinions or principles, tending evidently to the destruction of society or freedom, and which, therefore, ought not to be tolerated in such a community. Accordingly, he alleges instances in the three principal kinds, religious, moral, and political, taken from Mr. Locke, and supported by his authority. In 1766, appeared Dr. Brown's last publication, which was "A Letter to the Rev. Dr. Lowth, occasioned by his late Letter to the right Rev. Author of the divine Legation of Moses," and repelling insinuations, unjustly supposed to have been aimed at his moral character, on account of his adulation and defence of Dr. Warburton. Besides the works already mentioned, Dr. Brown published a "Poem on Liberty," and some anonymous pamphlets. He had also announced an intention of publishing "Principles of Christian Legislation;" but his design was frustrated by his death. In his will, however, he gave orders, among other particulars relating to the arrangement and publication of his works, that this treatise should be finished; but this part of his will was never executed.

At the time when Dr. Brown's discourses on education

were published, Dr. Dumaresq had been invited to reside in Russia, and was employed by the empress in suggesting regulations for the establishment and conduct of several schools, which she was about to erect in various parts of her dominions. On this occasion, a correspondence was proposed by a lady of England, between him and Dr. Brown, who entered largely into the subject, sketched the outline of a grand scheme of education, and also of legislation, for the Russian empire, and voluntarily offered to remove to Russia for the purpose of aiding in the execution of it. Dr. Dumaresq, after some previous deliberation and conference with Monf. Muller, his associate, on the business, translated Dr. Brown's paper into French, and presented it to M. de Pannin, who laid it before the empress. She was impressed by the communication; and Dr. Dumaresq was commissioned to invite Dr. Brown to the Russian court. He accepted the invitation, and received a remittance of 1000*l.* which the empress had ordered towards defraying the expences of his journey. The length of the journey, the changes of climate, and various other circumstances alarmed his friends, who observed, that his constitution was enfeebled by repeated attacks of the gout: and they dissuaded him from the undertaking, which, after various preparations, he at length determined to renounce. As he had received only 200*l.* of the money that had been ordered, and returned above one half of it, after deducting the expences which he had unavoidably incurred; his honour and integrity in the whole transaction were unimpeachable; more especially as he continued to transmit to the empress such observations as might serve to facilitate the execution of her plans, and render them effectual to the purpose for which they were adopted. This negotiation agitated the spirits of Dr. Brown; and its issue, in which, however, he thought it prudent to acquiesce, disappointed and mortified him. The pride of his temper, and the sense he entertained of his own importance, contributed, in no small degree, to that dejection of mind, which, concurring with a constitutional tendency to insanity, led him to put an end to his life with a razor, Sept. 23d, 1766, in the 51st year of his age. Biog. Brit.

BROWN, SIR WILLIAM, M.D. of a respectable family in the county of Norfolk, was born in the year 1692. His father, who was a physician, first inspired him with a taste for the study of medicine. In 1707, when he was only 15 years of age, he was admitted of Peterhouse in Cambridge; and having passed through the preliminary degrees, he was in 1721 admitted doctor in medicine. Of the respect he retained for his alma mater, and of his fondness for literature, he gave evidence, by leaving to the university of Cambridge a sum of money, the interest of which he directed to be laid out every year, in furnishing three gold medals, to be given to the three most successful candidates in Greek, and Latin poetry. Of the books left him by his father, he says, he kept for his pocket companions, Bleau's Greek Testament, Hippocrates's Aphorisms, and an Elzevir's Horace; "from the first to draw divinity, from the second physic, and from the last good sense and vivacity." Soon after leaving college, he went to Lynn in Norfolk, where he practised physic nearly thirty years, and as it appears, with reputation and profit; for speaking of his leaving that town, to come to London, he says, "The manly age and inclination, with conformable studies, I diligently applied to the practice of physic, in the country; where, as that age adviseth, I sought riches and friendships. But being at length fatiated with friends, whom truth, not flattery, had procured; fatiated with riches which Galen, not fortune, had presented; I resorted to this college (of physicians) where I might addict myself totally to the service of honour."

This

This was about the year 1750. He did not, however, decline practice when he came to London, going wherever he was sent for; but as he was a humourist, and had many singularities in his dress, manners, and conversation, he never became very popular as a physician in this place. This did not prevent his receiving all the honours the college could bestow upon him. They gratified his vanity, his ruling passion, by electing him president two succeeding years. It was the custom, Sir William tells us, in his farewell oration, "to continue the president, an entire Iustrum, five years. But two years, he adds, more than satisfy me; that each of the elects may, in his turn, hold the sceptre of prudence, no tenure pleasing longer than a year." He felt, however, this deviation from their custom, and the college probably lost a legacy; but they were obliged to pass him by, as his singularities had attracted the notice of Mr. Foot, the Aristophanes of the age, who appeared in the *Devil upon Two Sticks*, one of his farces, in the costume of the doctor; the wig, the coat, the glass, and every action so exactly imitated, that no one could doubt who was intended to be represented. At one of the exhibitions of this piece the doctor was present, and the next day he sent a card to Mr. Foot, complimenting him on having so happily represented him; but finding he had forgot the muff, he had sent him his own. This good-natured reproof disarmed Foot, and the imitation was discontinued. About the same time he became the subject of a print, in which he was caricatured not by distorting, but by giving an exact delineation of his person, dress, and gesture: the inscription is *Fuscus, eques, medicus, rhetor, dux, atque poeta. Ecce!* 1771. The doctor, however, took all in good part, and continued rather to follow his own humour, than the manners and fashions of the world. As proofs of his good nature, and proofs of his being perfectly at peace with himself, we may mention that when he was at Lynn, a pamphlet being published to ridicule him, he nailed it to the outside of his door, that it might be read by all who passed by; and when he was in the 80th year of his age, he went to Batson's coffee-house, on St. Luke's day, in his laced coat and band, with fringed white gloves, to shew himself to Mr. Crosby, then lord-mayor. A gentleman present observing how well he looked, the doctor observed, "He had neither wife nor debts." He had, however, been married, and left one daughter, who became the wife of Martin Folkes, and mother to Sir Martin Browne Folkes, bart. From the time of his coming to London he lived in Queen Square, Great Ormond Street, where he ended his days on the 10th of March, 1774, in the 82d year of his age. He had always been fond of scribbling, and in the early part of his life printed (for they could hardly be said to be published, the circulation of them being nearly confined to his friends) "Translations, or Imitations, of certain Odes of Horace;" and afterwards, when in London, his "Harveian Oration," and "A Vindication of the College of Physicians against the Licentiates, and their Advocate, solicitor-general Murray." These he collected together, and in 1765, printed under the title of "Opuscula Varia, &c." He also published a farewell oration, on quitting the presidency of the college, from which the principal traits of his life here given have been taken. *New and General Biog. Dict.*

BROWN, JOHN, a surgeon of eminence in London, published in 1678, "A Treatise of Glandules, and Strumas, the King's Evil, &c." 4to.; and in 1681, "A complete Treatise of the Muscles, as they appear in the Human Body," folio, London. This has been translated into Latin, and printed at Leyden, Amsterdam, Berlin, &c. though now superseded by more accurate descriptions. The plates are

principally taken from Julius Cassarius. He also communicated to the Royal Society, an account of a diseased liver, which is published in their Transactions. *Haller. Bib. Anat.*

BROWN, PATRICK, M.D. practised medicine at Jamaica, and published in 1756, folio, "The civil and natural History of Jamaica, containing an Account of its natural Productions, Fossils, Vegetables, and Animals." He describes the manner practised there, of cultivating the sugar-cane, coffee-tree, cotton, ginger, and indigo, and of collecting aloes from incisions made in the leaves of the plant. *Haller. Bib. Bot.*

BROWN, JOHN, a celebrated teacher of medicine, born in the parish of Buncle in the county of Berwick, in the year 1735, of parents in a mean situation in life. In common with the children of other villagers in Scotland, he received his education at a grammar school. As his mind was much above the rank he was born in, his progress in literature was proportionably superior to the rest of his school fellows. He there imbibed a taste for letters; so that when he was afterwards put apprentice to a weaver, instead of attending to his business, his whole mind was bent on procuring books, which he read with great eagerness. Finding this disposition could not be conquered, his father took him from the loom, and sent him to the grammar school at Dunfermline, where the famous Duns Scotus had been educated. Here, under the tuition of Mr. Cruickshanks, he made such progress, that he was soon regarded as a prodigy. He read all the Latin classics with the greatest facility, and was no mean proficient in the knowledge of the Greek language. "His habits," we are told, "were sober; he was of a religious turn, and was so strongly attached to the sect of Seceders, or whigs, as they are called in Scotland, in which he had been bred, that he would have thought his salvation hazarded, if he had attended the meetings of the established church. He aspired to be a preacher of a purer religion." An accident, however, disgusted him with this society, before he was of an age to be chosen a pastor, for which it appears he was intended. Having been prevailed on, by some of his school-fellows, to attend divine service at the parish church at Dunfermline, he was summoned before the session of the seceding congregation, to answer for this offence; but his high spirit not brooking to make an apology, to avoid the censures of his brethren, and the ignominy of being expelled their community, he abdicated his principles, and professed himself a member of the established church. As his talents for literature were well known, he was taken, at the age of twenty, to the house of a gentleman in the neighbourhood of Dunfermline, as tutor to his son. Here he did not long reside, for what cause is not known, but went the same year, 1755, to Edinburgh, where he applied to the study of theology, in which he proceeded so far as to deliver, in the public hall, a discourse upon a prescribed portion of scripture, the usual step preliminary to ordination. But here his theological studies appear to have ended, and he suddenly left Edinburgh, and returned to Dunfermline, and officiated as an usher in the school where he had been educated. He now exhibited himself as a free-liver and free-thinker, his discourse and manners being equally licentious and irregular; which accounts for his dereliction of the study of theology. At Dunfermline he continued twelve months, from Michaelmas 1758, to the same time in the year 1759. During this time, a vacancy happening in one of the classes in the high school at Edinburgh, Brown appeared as a candidate, but was not successful. Soon after he was applied to by a student in medicine, at Edinburgh, to put his inaugural thesis into Latin. This task he performed in so superior a manner, that it gained him great reputation: it opened to him a path, which he

had not probably before thought of, for turning his erudition to profit. On the strength of the character procured him by this performance, he returned to Edinburgh, determined to apply to the study of medicine. "He had now," he said, "discovered his strength, and was ambitious of riding in his carriage as a physician." At the opening of the session, he addressed Latin letters to each of the professors, who readily gave him tickets of admission to their lectures, which he attended diligently for several years; in the interim, teaching Latin to such of the pupils as applied, and assisting them in writing their theses, or turning them into Latin. The price, when he composed the thesis, was ten guineas; when he translated their compositions into Latin, five. If he had been now prudent, or had not indulged in the most destructive excesses, he might, it is probable, in a few years have attained the eminence he promised himself; but he marred all by his intemperance. In no long time after this, his constitution, which had been hardy and robust, became debilitated, and he had the face and appearance of a worn-out debauchee. His bad habits had not, however, prevented his getting the friendship or assistance of Dr. Cullen, who, desirous of availing himself of his talents, employed him as a tutor to his sons, and made use of him as an assistant in his lectures; Brown repeating to his pupils, in the evening, the lecture they had heard in the morning, and explaining to them such parts as were abstruse and difficult. In 1765 he married, and took a house, which was soon filled with boarders; but continuing his improvident course, he became a bankrupt at the end of three or four years. He now became a candidate for one of the medical chairs, but failed; and as he attributed his missing this promotion to Dr. Cullen, he very unadvisedly broke off his connection with him, and became the declared enemy to him, and his system; which he had always before strenuously defended. This probably determined him to form a new system of medicine, doubtless meaning to annihilate that of his former patron. As he had read but few medical books, and was but little versed in practice, his theory must have been rather the result of contemplation, than of experience. That in forming it, he was influenced by his attachment to spirituous liquors, seems probable from internal evidence, and from the effects he attributed to them of diminishing the number, as well as the severity of the fits of the gout, under which he suffered. He always found them more severe and frequent, he says, when he lived abstemiously. One of his pupils informed Dr. Beddoes, "that he was used, before he began to read his lecture, to take fifty drops of laudanum in a glass of whisky; repeating the dose four or five times during the lecture. Between the effects of these stimulants, and voluntary exertions, he soon waxed warm, and by degrees his imagination was exalted into phrenzy." His intention seems to have been to simplify medicine, and to render the knowledge of it easily attainable, without the labour of studying other authors. All general, or universal diseases, were therefore reduced by him to two great families or classes, the sthenic and the asthenic; the former depending upon excess, the latter upon deficiency of exciting power. The former were to be removed by debilitating, the latter by stimulant medicines, of which the most valuable and powerful are wine, brandy, and opium." As asthenic diseases are more numerous, and occur much more frequently than those from an opposite cause, his opportunities of calling in the aid of these powerful stimuli were proportionately numerous. "Spasmodic and convulsive disorders, and even hemorrhages," he says, "were found to proceed from debility; and wine, and brandy, which had been thought hurtful in these diseases, he found the most

powerful of all remedies in removing them." When he had completed his plan, he published his theory, or system, under the title of "Elementa Medicinæ," from his preface to which the preceding quotations have been principally taken. Though he had been eleven or twelve years at Edinburgh, he had not taken his degree of doctor; and as he was now at variance with all the medical professors, not thinking it prudent to offer himself there, he went to St. Andrew's, where he was readily admitted to that honour. He now commenced public teacher of medicine, making his *Elementa* his text book; and convinced, as it seems, of the soundness of his doctrine, he exultingly demands (preface to a new edition of the translation of his *Elementa*, by Dr. Beddoes) whether the medical art hitherto conjectural, incoherent, and in the great body of its doctrines false, was not at last reduced to a science of demonstration, which might be called the science of life." His method in giving his lectures was, first to translate the text book, sentence by sentence, and then to expatiate upon the passage. The novelty of the doctrine procured him at first a pretty numerous class of pupils; but as he was irregular in his attendance, and his habits of drinking increased upon him, they were soon reduced in number, and he became so involved in his circumstances, that it became necessary for him to quit Edinburgh; he therefore came to London in the autumn of the year 1786. Here, for a time, he was received with favour; but his irregularities in living increasing upon him, he came to his lodgings, in the evening of the 8th of October in 1788, intoxicated, and taking, as it was his custom, a large dose of laudanum, he died in the course of the night, before he had entered on his career of lecturing, for which he was making preparations. He had the preceding year published "Observations on the old Systems of Phyc," as a prelude to the introduction of his own; but it was little noticed. His opinions have, however, met with patrons in Germany and Italy, as well as in this country, and several volumes have been written on the subject of them; but they are now pretty generally, and deservedly, abandoned. Beddoes' edition of John Brown's translation of his *Elementa Medicinæ*, 1795.

BROWN, JOHN, an ingenious artist and elegant scholar, was born at Edinburgh in 1752, and declined to the profession of a painter. Whilst he was at Rome, he became acquainted with Sir William Young and Mr. Townley, and accompanied them, as a draftsman, into Sicily. In this island he was employed in taking several fine views of its antiquities, which were exquisitely finished, and preserved the appropriate character of the buildings which he intended to represent. Upon his return to his native town, after a residence in Italy of more than ten years, he gained the esteem of many literary persons by his elegant manners and instructive conversation on various subjects of art, and particularly on music, of which his knowledge was very extensive and accurate. He was particularly distinguished by the attention of lord Monboddo, who, in the fourth volume of the "Origin and Progress of Language," represents him as eminently skilled in the arts of painting, sculpture, music, and poetry: nor was he less deserving of respect for his moral qualities than for his literary attainments. In 1786 he visited London, where he was much employed as a painter of small portraits with black lead pencil, which, besides being correctly drawn, faithfully exhibited the features and character of the persons whom they represented. Death, however, deprived the public of this ingenious artist in 1787, by the progress of a disease, which he bore with a firmness of mind that had marked his character through life. Soon after his death, his "Letters on the Poetry and Music of the

the Italian Opera," were published in 12mo., together with an introduction, by lord Monboddo, in one volume, 12mo., 1789, for the benefit of his widow. Mr. Brown left behind him several very highly finished portraits in pencil, and many exquisite sketches in pencil, and in pen and ink, which he had taken of persons and places in Italy. The peculiar characteristics of his hand were delicacy, correctness, and taste; and the leading features of his mind were acuteness, liberality, and sensibility, joined to a character firm, vigorous, and energetic. His last performances were two exquisite drawings, one from Mr. Townley's celebrated bust of Homer, and the other from a fine original bust of Mr. Pope, generally supposed to have been the work of Rysbrack. From these two drawings, two very beautiful engravings have been made by Mr. Bartolozzi, and his pupil, Mr. Bovi. Biog. Dict.

BROWN, ABRAHAM, one of the principal performers on the violin, before the arrival of Giardini, in this country. After the death of Felling, in 1752, he succeeded him at Ranelagh, as leader of the king's band, and at several concerts. But this performer, who had a clear, sprightly, and loud tone, with a strong hand, and had travelled through Italy, was ignorant of music, and the pieces he played consisted of notes, *et rien que des notes*: for he had no soul or sense of expression. He brought over a favourite solo of Tartini (the second in the second set, published by Walsh), with which alone he figured at all concerts, for at least six or seven years, without ever entering into Tartini's true style of playing it, or that of any performer of his school. Mr. Brown, however, had not the mortification either to feel or know his defects; but, on the contrary, was comforted with a full conviction of his superiority.

BROWNE, GEORGE, an Irish prelate, and the first bishop that espoused and promoted the reformation in that country; was originally an Augustine friar of London, and educated in the house of his order, near Holywell, in Oxfordshire. He afterwards became provincial of the Augustine monks in England. Having taken the degree of doctor of divinity at some foreign university, he was admitted to the same degree at Oxford in 1534, and soon after at Cambridge. Upon the perusal of some of Luther's writings, he entertained a favourable opinion of his doctrine, and recommended to the people to make their supplications solely to Christ, and not to the Virgin Mary, or the Saints. These sentiments procured for him the favour of Henry VIII., who promoted him in March, 1535, to the archbishopric of Dublin, and soon after appointed him one of the commissioners for executing the royal mandate, that obliged the Irish to renounce the papal supremacy. In the conduct of this business he encountered many difficulties; as he also did in carrying through the parliament, which met in Dublin, May 1, 1536, the bill for establishing the king's supremacy over the church of Ireland. During the progress of the reformation, when Henry began to suppress the monasteries in England and Ireland, archbishop Browne completed the design which he had formed of removing all superstitious relics and images out of the two cathedrals of St. Patrick's and the Holy Trinity, in Dublin, and out of the other churches in his diocese; and he placed, in their room, the creed, the Lord's prayer, and the ten commandments, in gold letters. In 1541, the king converted the priory of the Holy Trinity into a cathedral church, consisting of a dean and chapter; and the archbishop, three years after, founded in it three prebends, from which time it has been denominated Christ-Church. The order of king Edward VI. for introducing into all the churches of Ireland the English liturgy, and the Bible in the vulgar tongue, though warmly

opposed by the popish party, was readily received by archbishop Browne; and on the Easter day following, the liturgy was read at Christ-Church in the presence of the mayor and bailiffs of the city, and the lord deputy St. Leger; on which occasion the archbishop preached a sermon against keeping the scriptures in the Latin tongue, and against the worship of images. This sermon is annexed to the archbishop's life. When Dowdall, the primate, was deprived of this dignity, on account of his opposition to the royal order, it was conferred in October, 1551, on archbishop Browne; but upon the accession of queen Mary, he also was deprived both of the primacy and archbishopric in 1554, under pretence that he was married; but in reality, because he had been zealous in promoting the reformation. He died about the year 1556, leaving behind him the character of a faithful subject, a zealous promoter of religion, and a pattern of meekness, cheerfulness, and benevolence. Biog. Brit.

BROWNE, WILLIAM, an English poet, was born at Tavistock in Devonshire, in 1590, and admitted into Exeter college, Oxford, about the beginning of the reign of king James I. Having made very considerable proficiency in classical learning and polite literature, he left the college, and removed to the Inner Temple, London, where he devoted himself to the muses, and probably paid little attention to the study of the law. In 1613, he published the first part of his "Britannia's Pastorals," fol.; a great part of which he seems to have written before he had attained his 20th year. In the following year he published "The Shepherd's Pipe, in Seven Eclogues," 8vo.; and in 1616, the second part of his "Britannia's Pastorals," which were well received, and gained him great reputation. He also wrote the "Inner Temple Masque," and some other small poems, which are included in the edition of his works published by Mr. Davies in 1772, in three small volumes. In his Pastorals there is much poetical imagery, and sometimes beautiful description, and his versification is often very harmonious; but though he knew how to move the heart by strokes of genuine nature and passion, his writings abound with point and conceit, and other frivolous ornaments, which indicate a vitiated taste; with a fertile imagination and a vigorous mind, his judgment was perverted by those Italian models, which it was the fashion of his time to imitate. His descriptions, though picturesque, are extravagant; his conceptions, though strong, have marks of deformity; and his language never flows in a strain of continued purity. He could not plan with precision and delicacy, and was unable to join correctness with spirit. Such is the account given of his writings by an anonymous critic. In 1624, he returned to his college; became tutor to that earl of Carnarvon, who was killed at the battle of Newbury, and who is highly extolled by Clarendon; was created M. A. in that year; and was styled in the university-register "Vir omni humanâ literatura et bonarum artium cognitione instructus." He was afterwards taken into the family of the earl of Pembroke; and, as Wood says, "got wealth, and purchased an estate." Towards the close of his life, he is supposed to have retired into his own country, and to have died there about the year 1645. Biog. Brit.

BROWNE, Sir THOMAS, more known now as an antiquary, than as a doctor of physick, was born in the parish of St. Michael, in Cheapside, the 10th of November, 1605. Being left by his father, who died when he was young, an ample fortune, he was sent to Winchester school, and having passed through the usual exercises there in 1623, he was admitted a gentleman commoner in Pembroke college, Oxford. In 1627, he took his degree of bachelor, and three years after of master of arts. During this time, besides apply-

ing with assiduity to classical literature, in which he made great progress, he had attended to the study of medicine, which he practised for a small time at Oxford. With a view of improving himself in that art, he determined on visiting the schools on the continent; but he went first to Ireland, where his mother then was with her husband, sir Thomas Dutton, who held a post in that kingdom. With him he travelled over the greatest part of Ireland; and having collected what might be gathered there, in furtherance of his design, he went to France, and spent some time at Montpellier. He then visited Padua, and thence proceeded to Leyden, where he continued, until he took his degree of doctor in medicine. This was about the year 1633. In 1637, he came to London, and soon rendered his name famous, by the publication of his "Religio Medici;" a work of deep reflection, and evidently the fruit of much study and attention. It was no sooner published, we are told, than it excited the attention of the world, by the novelty of paradoxes, the dignity of sentiment, the quick succession of images, the multitude of abstruse allusions, the subtlety of disquisition, and the strength of language with which it was written. He begins with declaring himself a Christian, though he has been classed among the free-thinkers. Whatever might be his inconsistency on some points, he favoured the notion of guardian angels, allowed the reality of apparitions, and of diabolical illusions; and affirms from his own knowledge, the certainty of witchcraft. This latter opinion is said to have had no small influence in occasioning the condemnation of some unhappy victims, the execution of whom was one of the latest instances of the kind that disgrace the English annals. His natural disposition, however, was averse from severity and intolerance; he declares himself to be an enemy to persecution, and he was almost tempted by his benevolence, to doubt of the eternity of future punishments, and the absolute condemnation of virtuous heathens. His sentiments were those of philanthropy, and he inclined to a favourable opinion of mankind in general. In his moral compositions, however, he seems to have been more influenced by vanity, than by a real desire of improving mankind. Sir Kenelm Digby published observations upon the "Religio Medici," which are now generally bound up with the work. The remarks are acute and ingenious, but what seems most wonderful is, that it cost the writer only twenty-four hours in procuring, reading, and making his annotations on the book. It was soon after translated into Latin by Mr. Merryweather, a gentleman of Cambridge, and from his version it was again translated into Italian, German, Dutch, and French. An edition of the Latin version was published at Strasburgh, with large notes by L. Nicolaus Moltfarius. The peculiarities of this book roused the author, as is usual, Dr. Johnson observes, many admirers, and many enemies; it was only, however, professedly answered, by one writer, Alexander Ross, in a work, entitled "Medicus Medicatus," which was never much noticed. In 1637, he was incorporated in the university of Oxford, and then went and settled at Norwich, where he was much resorted to, and attained high reputation, Anthony Wood says, for his skill in his profession, which, in a few years, procured his admission as honorary member of the Royal College of Physicians in London. In 1641, he married Mrs. Dorothy Micham, a lady of a good family in Norfolk, and of great personal as well as mental endowments. These excellent qualities of the lady did not free him from the sarcasms of the wits who remembered the Dr. had expressed a wish, in his famed works, that procreation or population might go on without the cohabitation of the sexes; which he called "the foolishlest thing a wife man did." The doctor and his

lady, however, lived together in great harmony for more than forty years, and left a son, who was educated to medicine, and three daughters. In 1646, he published his treatise on vulgar errors, "Pseudodoxia Epidemica." In this he combats, with great learning and ingenuity, numerous notions or opinions on natural and other objects, which had obtained general credit, not only among the common people, but among physicians and other literary persons. The work is, of course, miscellaneous, and occupies as many chapters as there are errors he wished to reform; but as it is in general circulation, and has been frequently reprinted, it is unnecessary to say more of it, than that it added considerably to the fame the author had obtained by his former work. In this work, however, he opposed the Copernican system of astronomy, and contended for the immobility of the earth. In 1671, he was knighted by king Charles II. in his passage through Norwich, and with particular marks of esteem. He had before, viz. in 1658, published "Hydroptaphia, or Discourse on Urn-burial, together with the Garden of Cyrus, or the Quincunxial Lozenge, or Net-work Plantation of the Ancients, &c." In these he treats, Dr. Johnson says, with his usual learning, on the funeral rites of the ancient nations; exhibits their various treatment of the dead; and examines the substances found in his Norfolkian urns. There is not, perhaps, any one of his works which better exemplifies his reading or memory. It is scarcely to be imagined how many particulars he has amassed together, in a treatise which seems to have been occasionally written; and for which, therefore, no materials could have been previously collected. This is the last work our author published; but he continued to live esteemed for his virtues, as well as for his literary attainments, until he had completed his 77th year, when he was seized with an affection in his bowels, which put an end to his life at Norwich, on his birth-day, the 19th of Nov. 1682. "Dr. Browne left several tracts in his closet, which, Whitefoot says, he designed for the press." Of these two collections have been published, one by Dr. Tension, in 1686; the other in 1732, by a nameless editor. "It is not on the praises of others, but on his own writings, that he is to depend for the esteem of posterity, of which he will not easily be deprived, while learning shall have any reverence among men; for there is no science in which he does not discover some skill; and scarce any kind of knowledge, profane or sacred, abstruse or elegant, which he does not appear to have cultivated with success. His style is vigorous, but rugged; learned, but pedantic; deep, but obscure; it strikes, but does not please. His tropes are harsh, and his combinations uncouth. In defence, however, of his uncommon words and expressions, it should be considered, that his sentiments were uncommon, and that he was not content to express, in many words, that idea for which any language could supply a single term." Life of Sir Thomas Browne, by Dr. Samuel Johnson. Gen. Biog.

BROWNE, EDWARD, son of sir Thomas, was born at Norwich, in 1642, where he received the rudiments of his education. In 1657, when he was fifteen years of age, he was sent to Cambridge, and there continued his studies with diligence until 1665, when he took his degree of bachelor in medicine. He now went to Merton college in Oxford; and at the end of two years proceeded doctor. To perfect himself in natural philosophy, he went to the continent, and travelled over great part of Bohemia, Hungary, and Friuli, countries abounding with mineral productions, which he examined with particular care. On his return, he settled in London, and there published, in 1673, in 4to. the observations he had collected during his travels. This was so well received, as to induce him to revise, correct, and, at length,

in 1685, to enlarge it to two volumes in 4to. In London he became soon distinguished for his superior learning and abilities, and was made fellow of the Royal College of Physicians, and of the Royal Society, physician to Bartholomew's hospital, and first physician to king Charles II. He assisted Dryden with a translation of the lives of Themistocles and Sertorius, toward his version of Plutarch's lives, and is said to have given some communications to the Royal Society, on the subject of chymistry, in which we have the testimony of Mr. Boyle, he was more than commonly skilled. But his manners were as polite as his learning was various and profound, which made king Charles II., no ill judge of the characters of men, say, "he was as learned as any of the college, and as well bred as any at court." He was, however, left out of the list of court physicians by James II. but was afterwards consulted by his successor, king William. In 1705, he was chosen president of the college of physicians, which office he continued to fill until 1708, the time of his death, which happened in the month of August in that year, at his seat at Northfleet, near Greenhithe, in Kent. Gen. Biog.

BROWNE, SIMON, a learned minister, and writer among the Protestant dissenters, was born at Shepton-Mallet, in Somersetshire, about the year 1680, and received his academical education at Bridgewater under the instruction of the Rev. Mr. Moor. Distinguished by his talents and proficiency, he commenced the exercise of his ministry before he had attained the age of 20 years, and was settled for a considerable time with a respectable congregation at Portsmouth. During his residence in this town, he published, in 1706, his "Caveat against evil Company," and in 1709, "The true Character of the real Christian," in one volume 8vo. In 1716, he removed to London, and took the charge of the congregation in the Old Jewry, which was one of the most respectable and considerable in the kingdom. In 1720, he published a volume of "Hymns and Spiritual Songs, in Three Books," 12mo.; and in 1722, a volume of "Sermons." In his address to the congregation, prefixed to this volume, he avows it to have been his "design to promote pure, peaceable, and practical religion, without rage or bitterness against any, and to spread the spirit of Christianity, not that of a party." He adds, that "to raise the passions, without first setting the judgment right, is to carry the man into all the wilds and wanton freaks of enthusiasm."—"But, on the other hand, it will signify little to the advancement of real religion to set the head right, if we cannot also warm and engage the heart. For though the affections should not have the supreme direction, they must be the immediate springs of human action." Such were the principles and views with which he conducted his ministerial services, and which rendered the congregation at the Old Jewry so numerous and so respectable. The publication of his sermons was soon followed by "A Letter to the Rev. Mr. Thomas Reynolds," in which he reproaches those dissenters, whose zeal for orthodoxy made them anxious to compel their brethren, inconsistently with their principles as dissenters, to make very particular and explicit declarations of their belief in the doctrine of the Trinity, and in which he also pointed out the unreasonableness and inefficacy of requiring any subscription to human articles of faith.

Mr. Browne, having continued in the exercise of the pastoral office with great reputation on his own part, and very much to the satisfaction and improvement of his congregation for about 7 years, was visited, in 1723, with a very complicated and severe affliction, occasioned by the loss of his wife and an only son, which distressed him to such a degree, that he was for some time in a state bordering upon

distracted; but his disorder at length subsided into a melancholy of a very extraordinary nature. He desisted from the duties of his function, and could not be persuaded to join in any act of worship, either public or private. He imagined "that almighty God, by a singular instance of divine power, had, in a gradual manner, annihilated in him the thinking substance, and utterly divested him of consciousness: that though he retained the human shape, and the faculty of speaking, in a manner that appeared to others rational, he had all the while no more notion of what he said than a parrot. And, very consistently with this, he looked upon himself no longer as a moral agent, a subject of reward or punishment." In this persuasion, he continued, with little variation, to the end of his life. He seemed to be much grieved, and to think his veracity questioned, when he could not persuade others to think of him as he thought of himself. This incredulity, on the part of others, he sometimes represented as the judicial effect of the same divine power that had reduced him to his distressed state. For some time he was unwilling that any prayers should be made on his account, and he declined putting up any for himself, and refused even to say grace at table. Being once importuned to say grace at the table of a friend, he repeatedly excused himself; but the request being repeated, and the company kept standing, he manifested tokens of great distress, and, after some irresolute gestures and hesitation, expressed, with great fervour, this ejaculation: "Most merciful and Almighty God, let thy spirit, which moveth upon the face of the waters, when there was no light, descend upon me; that from this darkness there may rise up a man to praise thee!" On another occasion, when he was earnestly solicited to say grace, he at length complied, and expressed himself in the following manner: "Lord, I am nothing, I ask nothing, and I want nothing; but bless these good creatures to those who are about to receive them!" It appears, however, that after his retirement into the country, and towards the close of his life, he was less uninclined to join in acts of devotion, and that he was even desirous that prayers should be put up for himself. At the commencement of his disorder, he felt so unhappy as to be frequently inclined to destroy himself; but he afterwards became more calm and composed, and seemed to experience little or no terror of mind; and he was often not only rational and serious, but cheerful and pleasant in conversation, provided nothing was said relating to his own case. It is remarkable, that, whilst this strange phrenzy continued, his faculties appeared to be in every other respect in their full vigour; his conceptions were clear, and his powers of reasoning strong; and he pursued his studies without intermission. His congregation respected him so much, that they delayed, for a considerable time, appointing a successor; but when he was reduced to the necessity of quitting the ministry, and his place was supplied by Mr. (afterwards Dr.) Chandler, Mr. Browne retired to his native town of Shepton-Mallet. He there amused himself with translating several parts of the ancient Greek and Latin poets into English verse. He afterwards composed several little pieces for the use of children, an English grammar and spelling book, an abstract of the scripture history, and a collection of fables; the two last being in metre. He also amassed together, in a short compass, all the themes of the Latin and Greek tongues, and compiled a dictionary to each of these, in order to render the acquisition of those languages more easy and compendious. During the two last years of his life, he was employed in defending the truth of Christianity, against some of the attacks then made against it, and in recommending mutual candour to Christians of different sentiments co-

earning the doctrine of the Trinity. In 1732, he published, in 1732, "A sober and charitable Disquisition concerning the Importance of the Doctrine of the Trinity; particularly with regard to Worship, and the Doctrine of Satisfaction; endeavouring to shew, that those in the different Schemes should bear with each other in their different Sentiments; nor separate Communion, and cast one another out of Christian Fellowship on this Account." He also published, in the same year, "A fit Rebuke to a ludicrous Infidel, in some Remarks on Mr. Woolston's fifth Discourse on the Miracles of our Saviour; with a Preface concerning the Prosecution of such Writers by the Civil Powers;" in which he proves, with great ability, that all such interpositions of the civil magistrate, to prevent attacks against Christianity, were extremely dishonourable to it. It was also in this year that he published his "Defence of the Religion of Nature, and of the Christian Revelation, &c." In all these treatises, written in his retirement, where he could derive little assistance from books, or the conversation of learned friends, he displays very extensive knowledge, and great powers of reasoning. To the last of the above-cited performances he had prefixed a very singular dedication to queen Caroline, expressing the unhappy delusion under which he laboured, and which his friends, at the time of the publication, prudently suppressed. A copy of it, however, was preserved. It was published in the "Adventurer," No. 88. vol. iii. p. 155; and as it exhibits a very curious display of the state of his mind, we shall here subjoin it, for the gratification of those who have not immediate access to the other publication:

'Madam,

'Of all the extraordinary things that have been tendered to your royal hands since your first happy arrival in Britain, it may be boldly said, what now belspeaks your majesty's acceptance is the chief.

'Not in itself, indeed; it is a trifle unworthy your exalted rank, and what will hardly prove an entertaining amusement to one of your majesty's deep penetration, exact judgment, and fine taste.

'But on account of the author, who is the first being of the kind, and yet without a name.

'He was once a man; and of some little name; but of no worth, as his present unparalleled case makes but too manifest; for by the immediate hand of an avenging God, his very thinking substance has for more than seven years been continually waiting away, till it is wholly perished out of him, if it be not utterly come to nothing. None, no not the least remembrance of its very ruins, remains, not the shadow of an idea is left, nor any sense that, so much as one single one, perfect or imperfect, whole or diminished, ever did appear to a mind within him, or was perceived by it.

'Such a present from such a thing, however worthless in itself, may not be wholly unacceptable to your majesty, the author being such as history cannot parallel: and if the fact, which is real and no fiction, nor wrong conceit, obtains credit, it must be recorded as the most memorable and indeed astonishing event in the reign of George II. that a tract composed by such a thing was presented to the illustrious Caroline; his royal consort needs not be added; fame, if I am not misinformed, will tell that with pleasure to all succeeding times.

'He has been informed, that your majesty's piety is as genuine and eminent, as your excellent qualities are great and conspicuous. This can, indeed, be truly known to the great searcher of hearts only; he alone, who can look into them, can discern if they are sincere, and the main inten-

tion corresponds with the appearance; and your majesty cannot take it amiss, if such an author hints, that his secret approbation is of infinitely greater value than the commendation of men, who may be easily mistaken and are too apt to flatter their superiors.

'But if he has been told the truth, such a case as his will certainly strike your majesty with astonishment, and may raise that commiseration in your royal breast which he has in vain endeavoured to excite in those of his friends; who, by the most unreasonable and ill-founded conceit in the world, have imagined, that a thinking being could for seven years together live a stranger to its own powers, exercises, operations, and state, and to what the great God has been doing in it and to it.

'If your majesty, in your most retired address to the king of kings, should think of so singular a case, you may, perhaps, make it your devout request, that the reign of your beloved sovereign and consort may be renowned to all posterity by the recovery of a soul now in the utmost ruin, the restoration of one utterly lost at present amongst men.

'And should this case affect your royal breast, you will recommend it to the piety and prayers of all the truly devout, who have the honour to be known to your majesty: many such doubtless there are; though courts are not usually the places where the devout resort, or where devotion reigns. And it is not improbable, that multitudes of the pious throughout the land may take a case to heart, that under your majesty's patronage comes thus recommended.

'Could such a favour as this restoration be obtained from heaven by the prayers of your majesty, with what a transport of gratitude would the recovered being throw himself at your majesty's feet, and adoring the divine power and grace, profess himself,

'Madam,

'Your majesty's most obliged

'and dutiful servant,

Simon Browne.'

After his retirement into the country, the want of exercise, which he could not be persuaded to use, brought on a complication of disorders, and a mortification in his leg, which terminated his life at the close of the year 1732, in the 52d year of his age. His learning and knowledge were extensive. His theological sentiments were liberal, and he was a zealous advocate for freedom of inquiry. His piety and virtue were distinguished and exemplary; and he was animated by an ardent zeal for the interests of rational and practical religion. None who duly regard the talents he possessed and the public services of which he was capable, can forbear lamenting the malady under which he laboured. "His abilities," says one of his biographers, "made him respected, and his virtues rendered him beloved; but such was the peculiarity of his case, that he was at once an evidence of the dignity, and of the weakness of human nature." Biog. Brit.

BROWNE, ISAAC HAWKINS, an ingenious and elegant poet of the last century, was born in 1706, at Burton-upon-Trent, of which parish his father was minister. Having received his grammatical education, first at Litchfield, and afterwards at Westminster-school, where he distinguished himself by his rapid proficiency, he was admitted, at the age of 16 years, into Trinity college, Cambridge; here he applied with singular assiduity, principally to classical literature, but without neglecting the appropriate studies of the place, or the various branches of mathematics, and the principles of the Newtonian philosophy; and such was the reputation which

he acquired, that he was one of the first scholars elected upon the foundation, established in 1724, by king George I. for the study of modern history and languages, with a view of qualifying young men for employment at court and in foreign embassies. To this circumstance he alludes in his poem on the death of the founder, which was the first of his poetical productions, and much approved. About the year 1727, he settled at Lincoln's Inn, and prosecuted the study of the law with a view to the profession of a barrister, for which he was originally designed; but though he acquired a considerable degree of knowledge, he never arrived at any great eminence in the practice of the law, and relinquished it for a long time before his death, that he might have the greater leisure for gratifying his inclination in literary pursuits. Possessed of a fortune, which was adequate to his desires, and which, by preserving the happy mean between extravagance and avarice, he neither diminished nor increased, he was the less anxious about the emoluments of his profession. Soon after his settlement at Lincoln's Inn, he addressed to his friend Mr. Highmore, the painter, a poem on "Design and Beauty," in which he adopted the elegant ideas of the Platonic philosophy. Among other pieces, composed by him, the most pleasing and popular was his "Pipe of Tobacco," consisting of an imitation of the styles of six poetical writers, then living, viz. Cibber, Ambrose Philips, Thomson, Young, Pope, and Swift. In this collection, much admired for the strain of humour and spirit of discrimination with which it was written, the imitation of A. Philips was the production of his friend Dr. Hoadly, chancellor of the diocese of Winchester.

In 1744, Mr. Browne married a lady, whose amiable temper contributed very much to his domestic felicity; and he was chosen twice, viz. in this year, and again in 1748, to serve in parliament for the borough of Wenlock, in Shropshire. For this appointment he was indebted to the interest of William Forester, esq. who recommended him to the electors from no other motive than the opinion he entertained of his abilities, and the confidence he had in his integrity and principles. As he had obtained his seat without opposition or expence, and without incurring obligation to any political party, he was an independent member; and though he supported the administration of Mr. Pelham, he never received any favour, nor desired any employment. The love of his country, and an ardent zeal for its constitution and liberties, formed a distinguishing part of his character. Although he possessed an uncommon degree of eloquence in private conversation, he was deterred, by a peculiar kind of delicacy and nervous timidity, from ever appearing as a parliamentary speaker. In 1754, he published his principal work, which was his Latin poem "De Animi Immortalitate," in 2 books, and which unites the philosophical learning and elegance of Cicero, with the numbers, and much of the poetry of Lucretius and Virgil. This poem was very much admired by the best judges at the time of its publication, and its popularity was so great, that several English translations of it soon appeared. The best of these is that of Mr. Soame Jenyns, in his "Miscellanies." It was the author's intention to have added a third book, proposing to carry natural religion as far as it would go, and in so doing, to lay the true foundation of Christianity, of which he was a firm believer: but of this book he only left an imperfect fragment. Having passed through a life distinguished by private virtues, and graced by a variety of accomplishments, Mr. Browne died in 1760, in the 55th year of his age. His only son, Mr. Hawkins Browne, to whose education he had paid particular attention, and in which he had succeeded to his wishes, published an elegant edition of his poems, in large octavo,

in 1768. Several of them are also printed in Doddsley's Collection. Biog. Brit.

*BROWN Bay*, in the *Manege*, is understood of horses of a very dark chestnut colour.

*BROWN'S Bay*, in *Geography*, lies on the south side of Nonfuch harbour, near the east end of the island of Antigua in the West Indies.

*BROWN'S Point*, the north-west point of the peninsula called *Island Magee*, in the county of Antrim, Ireland, at the entrance into Loch-Larne. N. lat.  $54^{\circ} 51'$ . W. long.  $5^{\circ} 41'$ . Huddart.—Also, a cape at the southern extremity of the island of Tobago, in the West Indies. N. lat.  $11^{\circ} 10'$ . W. long.  $60^{\circ} 40'$ .

*BROWN'S Sound*, lies on the north-west coast of North America. N. lat.  $55^{\circ} 18'$ . W. long.  $132^{\circ} 20'$ . The lands on the east side of this sound are tolerably level; but on the west are mountains, which rise above the clouds, and exhibit in winter a dreary aspect. The land abounds with various sorts of pines; the animals in its vicinity are deer, wolves, sea-otters, and seals; the fish are salmon, halibut, and a species of cod, &c. In summer, ducks, brants, flags, &c. are plentiful.

*BROWNÆA*, in *Botany* (named from Dr. Patrick Brown, author of the history of Jamaica.) Lin. gen. 837. Reich. 898. Schreb. 1115. Juss. 366. Jacq. Amer. 366. Willd. 1272. Lamarck. Bosc. Class. *monadelphia endecandria* (*decandria*, Schr.) Nat. Ord. *Lomentaceæ*—*Leguminosæ*. Juss. Nat. Char. *Calyx* double; outer one-leaved, conical, with two unequal segments; inner longer, one-leaved, funnel-shaped, with five divisions. *Cor.* petals five; claws long, inserted within the tube of the inner calyx; borders ovate, obtuse. *Stam.* filaments ten or eleven, awl-shaped, alternately shorter, attached to the tube of the inner calyx, and united near the bottom; anthers oblong. *Pist.* germ oblong, pointed, pedicelled, adhering to the tube of the inner calyx; style awl-shaped; stigma blunt. *Pericarp.* legume oblong, compressed, bilocular, narrowed about the partition; partition membranaceous. *Seeds* solitary, ovate, compressed, rather rugged, involved in fungous fibres.

Ess. Char. *Calyx* double, outer bifid, inner quinquesfid. *Cor.* five-petalled.

*Obs.* Linnæus, Jacquin, &c. have considered the calyx as single, and the corolla double; but from a careful consideration of Lamarck's figure of the *coccinea*, we have been induced to adopt the ideas of Jussieu, and the other French botanists.

Sp. 1. *B. coccinea*. Linn. (Jac. Amer. Pl. 121. Lamarck Pl. 575. No. 1.) "Stamens the length of the corolla; peduncles somewhat aggregate; branches smooth." Willd. A shrub from eight to ten feet high, branched. *Leaves* abruptly winged; leaflets in two or three pairs, ovate-lanceolate, sharply pointed, very entire, smooth, on shortest petioles. *Flowers* lateral, large, scarlet, pendent, from six to ten together, on very short nearly united peduncles. *Stamens* ten. A native of rocky woods, in South America. 2. *B. grandiceps* (Jacq. Collect. 3. Pl. 22. La Marck Illust. Pl. 575. No. 2?). "Stamens the length of the corolla; flowers capitate-spiked; branches downy." Willd. *Foliols* net-veined. *Flowers* scarlet, in a spike five inches long and four broad. A native of mountainous woods in South America. 3. *B. Rosa de Monte* (Bergius in Philof. Transf. vol. 63. Pl. 8. p. 174. La Marck Illust. Pl. 575. No. 3.) "Stamens twice as long as the corolla; flowers in heads." Willd. A tree. *Branches* swelling into scattered knobs. *Branchlets*, or common petioles, generally alternate, round, smooth, rugged at the base, spreading. *Leaves* leathery,  
about

about seven inches long, ovate-oblong, very entire, narrowing abruptly towards the end, smooth on both sides, with short petioles; the lower ones gradually diminishing; the lowest ovate, a little heart-shaped at the base. *Flowers* collected into a head or fascicle, surrounded by a leafy involucre; 1 and its or bractes ovate, rather sharp-pointed, somewhat membranaceous, concave, smooth, about two inches long, red, including one and sometimes two or three flowers, deciduous; the outer ones rounded, the inner smaller, and gradually becoming linear. *Filaments* constantly eleven. Gathered at Porto Bello in America, by a Mr. Pike, and sent to Bergius.

It does not appear that either of the three species has been cultivated in Europe.

BROWNIA *pauciflora*. Willd. See PALOYA.

BROWNFIELD, in *Geography*, a small settlement in York county, and district of Maine, in North America; which, together with Suncook, contains 250 inhabitants; so called in 1791 by captain Gray in honour of Sam. Brown, *ctq.* of Boston.

BROWNISTS, in *Ecclesiastical History*, a religious sect, which sprung out of the Puritans, towards the close of the 16th century, and derived their appellation from Robert BROWN.

The revolt of Brown, already mentioned under his article, was far from being followed with the dissolution of the sect. On the contrary it daily increased; insomuch that sir Walter Raleigh, in a speech, delivered in the house of commons, in 1592, computes no less than twenty thousand followers of it.

The occasion of the separation of the Brownists was not any fault they found with the faith, but only with the discipline and form of government of the other churches in England. They equally charged corruption on the episcopal form, and on that of the presbyterians, by consistories, classes, and synods; nor would they join with any other reformed church, because they were not assured of the sanctity and regeneration of the members that composed it, and on account of the toleration of sinners, with whom they maintained it an impiety to communicate. They condemned the solemn celebration of marriages in the church, and the use of the ring in marriage, as making it a sacramental sign, which encouraged the popish heresy, that matrimony is a sacrament; and maintained, that matrimony being a political contract, the confirmation thereof ought to come from the civil magistrate. They would not allow any children to be baptized, whose parents were not members of the church, or of such as did not take sufficient care of the education of those baptized before. They rejected all forms of prayer; and held, that the Lord's prayer was not to be recited as a prayer; being only given for a rule, or model, whereon all our prayers are to be formed. They held, that the evil life of the ministry destroyed the efficacy of the sacraments; and they objected against bells in churches, because, as they pretended, they were consecrated to the service of idolatry. They urged also many other objections against the forms and ceremonies of the established church, which are recapitulated in a small 4to. pamphlet, published at Middleburgh in 1599, on occasion of a controversy between Francis Johnson, a Brownist, and H. Jacob, about some of the tenets of the Brownists, and entitled "A Defence of the Churches and Ministry of England, against the Reasons and Objections of Master Francis Johnson, and others of the Separation, commonly called Brownists; in two treatises, published especially for the benefit of those in these parts of the Low Countries."

The form of church government which they established was *democratical*. When a church was to be gathered, such as desired to be members of it made a confession of it; and

signed a covenant, by which they obliged themselves to walk together in the order of the gospel. The whole power of admitting and excluding members, with the decision of all controversies, was lodged in the brotherhood. Their church-officers were chosen from among themselves, for preaching the word, and taking care of the poor, and separated to their several offices by fasting, prayer, and imposition of hands of some of the brethren. But they did not allow the priesthood to be any distinct order, or to give any indelible character. As the vote of the brotherhood made a man a minister, and gave him authority to preach the word, and administer the sacraments among them; so the same power could discharge him from his office, and reduce him to a mere layman again. And as they maintained the bounds of a church to be no greater than what might accommodate those who could meet together in one place, and join in one communion; so the power of these officers was prescribed within the same limits. The minister or pastor of one church could not administer the Lord's supper to another, nor baptize the children of any but those of his own society. Any lay-brother was allowed the liberty of giving a word of exhortation to the people; and it was usual for some of them, after sermon, to ask questions, and reason upon the doctrines that had been preached. In a word, every church on the "Brownists" model, is a body corporate, having full power to do every thing which the good of the society requires, without being accountable to any classis, synod, convocation, or other jurisdiction whatever. It has been said, particularly by Dr. Fulke, that if we compare the principles of the Brownists with those of the ancient Donatists (which see), we shall find them to be the same; and that Brown derived them from the Puritans and Separatists. Brown, it is said, was preceded by Bolton, and followed by Barrow, a man of ingenuity and learning, but, like many others of his sect, of a warm spirit, who was condemned and executed, at the instigation of the bishops, very much to the disgrace of the reign of queen Elizabeth. Indeed the laws were executed with great severity on the Brownists; their books were prohibited by queen Elizabeth, and their persons imprisoned, and many of them were hanged. The ecclesiastical commission, and the star-chamber, in fine, distressed them to such a degree, that they resolved to quit their country. Accordingly, many families retired, and settled at Amsterdam, where they formed a church, and chose Mr. Johnson for their pastor; and after him, Mr. Ainsworth, author of the learned commentary on the Pentateuch. This church, notwithstanding its unhappy intestine divisions, flourished under a succession of pastors for above 100 years. Other Brownists erected churches after their own model, at Arnheim, Middleburgh, Leyden, and other places. See AINSWORTH. The next person that appeared as an active supporter of Brownism was Robinson, who somewhat softened the dogmas of Brown, and endeavoured to unite the discordant members of his sect. For some time the followers of Robinson steered a middle course between the Brownists and the church of England, calling themselves "Semi-Separatists;" but at length they proceeded farther than the Brownists themselves. The Brownists, though ranged under different leaders, generally retained the name of their founder for several years after his death; for in the civil war in 1640, &c. we read of a mob of 2000 Brownists, who entered St. Paul's church in London, when the high-commission court was sitting, and making a great tumult, cried out "No Bishops," "No High Commission," &c.; and in 1642, king Charles, in a speech made at the head of his forces on their march towards Shrewsbury, mentions the Brownists, and by a strange kind of junction connects them

and the Anabaptists with *Atheists*. In the following year he proposes to the parliament to frame a good bill for the better preservation of the book of common prayer from the scorn and violence of Brownists, Anabaptists, and other sectaries. At length, however, the appellation of Brownists was changed into that of Independents, a denomination assumed by those, who adopted many of their tenets, and conformed to their discipline. At the present enlightened period, when the principles of toleration are understood and inculcated, and a liberal spirit pervades all ranks of the community, the severity with which the Brownists were treated, will find no advocates; nor will any one attempt to justify or palliate their errors and misconduct. Their rigid and narrow sentiments in point of discipline; their denying the church of England to be a true church; their maintaining that her government was so wholly Popish and Antichristian, as to render all her ordinances and sacraments invalid; and their not only renouncing communion with her, but with all other reformed churches, excepting such as should be of their own model, are sufficient proofs that they did not come behind their persecutors in bigotry. Nor is it unlikely, but that if they had risen to power, they would have exercised it in a very unjustifiable manner. Neal's History of the Puritans, vol. i. p. 231—260—363—386—436. 4to. Neal's Hist. of New Eng. tom. i. cap. 2. p. 58. Robinson, Apologia iusta, &c. Brownitarum et Barrowitarum, 12mo. 1619. Biog. Brit. Art. *Robert Brown*. See INDEPENDENTS.

**BROWNSEA ISLAND**, in *Geography*, an island within the harbour of Poole, in England, containing about 800 acres of land, where the Danes landed in 1015.

**BROWNSTOWN HEAD**, a cape on the south-coast of Ireland, which is the eastern point of Tramore bay, on the narrow channel of Rineshark. N. lat.  $52^{\circ} 7'$ . W. long.  $7^{\circ} 7'$ .

**BROWNSVILLE**, or **RED STONE OLD FORT**, a flourishing post-town of America, in the county of Fayette, and state of Pennsylvania, on the south-eastern bank of Monongahela river, between Dunlap and Red-Stone creeks, and next to Pittsburg: the most considerable town in the western part of the state. The town is regularly laid out, and contains about 100 houses, an Episcopalian and Roman catholic church, a brewery, and a distillery. It is connected with Bridge-port, a small village on the opposite side of Dunlap creek, by a bridge 260 feet long. Within a few miles of the town are 4 Friends' meeting-houses, and 24 grist, saw, oil, and fulling mills. The trade and emigration to Kentucky afford a lucrative employment to boat-builders; 100 boats of 20 tons each being built here annually. Byrd's fort formerly stood here, on the south side of the mouth of Red-Stone creek, in N. lat.  $39^{\circ} 58'$ . W. long.  $81^{\circ} 12' 30''$ ; 37 miles S. from Pittsburg; 13 S. by E. from Washington; and 341 W. from Philadelphia.

**BROWS**, or **EYE-BROWS**, are two hairy arches above the orbits of the eyes, bunching out by means of some fat under the skin in this place.

That end next the nose is called the head, *caput*, the other the tail, *cauda*, of the eye-brow.

The use of the eye-brow is partly to break the rays of light descending from above, that they may not dart too strongly into the eyes; and partly to be a screen to the eyes from sweat, dust, or other matters descending from the forehead.

**BROWSE**, the tops of the branches of trees, whereon beasts feed. This is sometimes also called *brouce*, and *brutle*; probably from the French *brouet*, which signifies the same.

**BROWSE** more properly denotes the food which deer find in young copfes, continually springing anew.

**BROWSE**, *beasts of*, or **BROWSING** *beasts*, a denomination including all of the fallow kind, as the deer, roe-buck, rupicapra, &c.

**BROWSE-wood**, the same with spray or brushwood.

**BROWTING**, *Brouter*, among the *French Gardeners*, signifies breaking off the tips of the slender branches of trees, when too long in proportion to their strength.

**BROYE**, in *Geography*, a river of Swisserland, which rises in the canton of Friburg, traverses lake Morat, and issuing from thence, and winding through a marshy plain, discharges itself into the lake of Neuchatel.

**BROYLE**, a harbour, cape, and settlement on the east side of the island of Newfoundland; 15 miles N.E. from the settlement of Aquafort, and 30 S.W. from St. John, the capital. N. lat.  $47^{\circ} 7'$ . W. long.  $52^{\circ} 36'$ .

**BROZZO**, a town of Italy, in the principality of Piedmont, 25 miles N. of Turin.

**BRSESKIE**, **BRSESTZ**, or **BRZESK**. See **BRZESK**.

**BRSEST**, a town of Poland, and capital of a palatinate of that name, in the province of Cajavia; 80 miles W.N.W. of Warfaw. It is situated in a marshy plain, and surrounded with a wall, rampart, and moat. N. lat.  $52^{\circ} 31'$ . E. long.  $19^{\circ} 35'$ .

**BRUA**, a river of Iceland, flowing from the south to the north.

**BRUANT**, in *Ornithology*. See **EMBERIZA CITRINELLA**.

**BRUANT de l'Isle de Bourbon**. See **EMBERIZA BORBONICA**.

**BRUARIA TURBARIA**. See **TURBARY**.

**BRUCÆUS**, **HENRY**, in *Biography*, son of Gerard, one of the magistrates of Alost, in Flanders, was born in that city, in the year 1531. Having passed through the usual school-education, in which he distinguished himself, he was sent to Rome, where he taught the mathematics for some years; then turning his mind to the study of medicine, he went to Boulogne, and having completed his studies, and taken his degree of doctor, he travelled, for his further improvement, over a great part of France. At Paris, he was introduced to the acquaintance of Adrian Turneby and Peter Ramus. Returning to Alost, he was made physician and principal magistrate of the city. As he had become a convert to Lutheranism, he readily accepted the invitation of John Albert, duke of Mecklenburgh, to settle at Rostock, where he might with safety profess his religion. He was here appointed professor in mathematics, and soon became popular also as a physician. After residing here 25 years, he was seized with apoplexy, of which he died, December 31st, 1593. His works are, "Propositiones de Morbo Gallico," 4to. 1569. He recommends beginning the cure with the decoction of guaiacum; that not succeeding, to have recourse to mercurial unguents. "De Scorbuto Propositiones, de quibus publicè disputandum est," Rosloch. 1589, and again 1591, 8vo. They are printed with Eugeleus, "Liber Observationum de Scorbuto," Lipsiæ, 1614, &c. He attributes the origin of the disease to feeding on dried and salted meat, and to living in a cold and damp atmosphere. "Epistolæ de variis Rebus et Argumentis medicis, cum Smetii Miscellaneis, Francof. 8vo. 1611. Haller. Bib. Med. Eloy. Dict. Hist.

**BRUCCA**, in *Geography*, a town of Italy, in the kingdom of Naples, and Principato Citra; 13 miles W. of Policastro.

**BRUCE**, **JAMES**, in *Biography*, was among the most celebrated of our modern travellers; and it appears at present, as if the general credit of his narrative would surmount those prejudices, under which it has long laboured from the

supposed improbability of certain facts altogether repugnant to European habits and opinions.

He was born at Kinnaird house, near Falkirk, in Scotland, in the year 1730. His descent was ancient and honourable; on the female side, to his own inexpressible gratification, connecting itself even with royalty. He was educated at Harrow, where his proficiency is said to have been highly creditable to his talents. He was afterwards removed to the university of Edinburgh, where he became a law student. Circumstances, not necessary to the elucidation of his public character, occasioned him to alter his views, and enter into partnership with a wine-merchant in London, whose daughter he married. His wife died in less than a twelvemonth, when he went abroad, and did not return, till recalled by the death of his father. The estate of Kinnaird devolved to him, and he now began to entertain thoughts of appearing in public life. The first overtures of political employment ended in disappointment to the adventurer: but lord Halifax procured him the consulship at Algiers; a situation which, he hoped, would facilitate the project he already entertained, of penetrating the interior of Africa. He went to Algiers in 1763, where he studied the oriental languages with much diligence. He likewise prepared himself for his great expedition by what may comparatively be considered as *home travels*, of which he never published any account, through Asia Minor, the islands of Rhodes and Cyprus, and other contiguous countries. Some of his drawings on this expedition are in the king's library at Kew. The ostentatious traveller has characterized this present as "the most magnificent ever made in that line by a subject to his sovereign." He seems, indeed, to have had very just ideas of his sovereign's dignity, as well as very high ones of his own; for, when the bey of Cairo desired to see him, and, after a long conversation, ordered him a purse of sequins, covered with fruit and flowers, Mr. Bruce accepted of one orange only, but positively refused the money. The bey requested to know the reason. "I am," said Mr. Bruce, "an Englishman, and the servant of the greatest king in Europe: it is not the custom of my country to receive pecuniary gratuities from foreign princes without the approbation of our sovereign." The bey, being himself a sovereign, was far from being displeas'd with the elevated sentiment of the excuse.

It was in June, 1768, that he commenced his great journey to the sources of the Nile. He sailed to Alexandria, and thence proceeded to Cairo, which he left in December of the same year, embarking on the Nile, and navigating as far as Syene. He passed through Arabia Deserta and Arabia Felix, making various excursions into the latter country. His embarkation on the Red sea took place in 1769, and in September he arrived at a small island on the frontiers of Abyssinia. In November he gained an entrance into the kingdom, and arrived at Gondar, the capital, in 1770. The limits of this article will not allow us to enter on his adventures, multifarious and oftentimes extraordinary as they were. For a topographical and historical account of Abyssinia, we must refer to that head in the present work. In November, 1770, he arrived at the sources of the Nile. A considerable degree of suspicion has been thrown on his whole narration by the triumph with which he congratulates himself on having made a discovery that had eluded all prior research, when it is now generally understood that the Portuguese Jesuits had been at those very fountains before him. If he was acquainted with that fact, his vanity in that instance certainly triumphed over his veracity; but it does not seem necessarily to follow, that the whole must be treated as a romance. After all, though the interest of every jour-

ney should be pointed by some determinate object, the reader will probably be much more engaged by the detail of circumstances, and the delineation of manners and customs, than in a dry controversy, whether or not the traveller did really discover the sources of the Nile. In this point of view, travelling may be compared with sporting; the exercise is of much more value than the game.

On his return to Gondar, he found Abyssinia in a state of *civil war*. He engaged on the part of the reigning prince, whose favour was attended with the inconvenience of a positive refusal to part with him. The plea of ill health, however, procured his release, and he was permitted to set out in the beginning of 1772. The distress to which he was reduced in this journey was extreme. His camels all perished; and he was obliged to abandon his drawings, papers, and instruments, which however he afterwards retrieved. He arrived at Cairo with much difficulty, and the loss of nearly all his retinue. He passed some time with Buffon in France, and returned to England in 1773.

He retired to Kinnaird for the recovery of his health, and for a long time neglected the gratification of public curiosity. His time was occupied by the circumstances attending a second marriage, the improvement of the waste lands on his paternal estate, and the formation of a museum, enriched with Arabic and Abyssinian manuscripts, and various curiosities both natural and artificial. His work appeared in 1790, in 5 volumes 4to. It was eagerly read; but an air of vanity and arrogance pervading the style, seems to have inspired the public with a disposition to severe criticism and incredulity, which the confirmation of many facts by subsequent travellers has already in some measure checked. Mr. Bruce died in April, 1794, in consequence of a fall in conducting some company down stairs, which at the time did not threaten such fatal consequences.

Mr. Bruce's figure was above the common size; his limbs athletic, but well-proportioned; his complexion sanguine; his countenance manly and good-tempered; and his manners easy and polite. The whole outward man was such as to announce a character well calculated to contend with the many difficulties and trying occasions, which so extraordinary a journey could not but have thrown in his way. His internal characters, the features of his understanding and disposition, seem in a great measure to have corresponded with these outward lineaments. As a country-gentleman, though not without a tincture of haughtiness, he exhibited the elegance of a man of fashion, and the hospitality of a Briton.

BRUCE'S *Island*, in *Geography*, an island in the Red sea, on the coast of Abyssinia. N. lat. 23° 42'. E. long. 35° 50'. The south of it is high and rocky, and the north low and terminating in a sloping bank. Bruce gave it his own name.

BRUCE *Hill*, a considerable mountain in the south-western part of the county of Cavan, in Ireland, from which the river Erne takes its rise; 11 miles S.S.W. of Cavan.

BRUCEA, in *Botany*, (in honour of James Bruce, who brought the seeds into England from Abyssinia). Schreb. 1508. Juss. 373. La Marck. Bosc. Clafs. *diacia tetrandria*. Nat. Ord. *Terebintaceae*. Juss. Gen. Char. 1. Barren flowers. *Cal.* perianth four-cleft, flat, villous; segments lanceolate, acute, spreading. *Cor.* petals four, lanceolate, acute, ciliate, spreading, scarcely larger than the calyx. *Nett.* placed on the receptacle, flat, four-lobed; the lobes obsoletely emarginate, opposite to the petals. *Stam.* filaments four, upright, short, opposite to the segments of the calyx, inserted on the receptacle between the lobes of the nectary. *Antbers* roundish. 2. Fertile flowers. *Cal.* and *Cor.* as in the former. *Nett.* the inner margin of the receptacle thickened, four-lobed; lobes emarginate.

*Stam.*

*Stem.* filaments four, inserted into the receptacle on the outside of the divisions of the nectary, thread-shaped, thicker towards the summit, rather sharp, a little shorter than the petals; anthers none. *Pist.* germs four, superior, ovate, compressed on the inner side; styles awl-shaped, reflexed, incumbent on the germens; stigmas sharp. *Pericarp* unknown (Schreb.); capsules four (L'Heretier). *Seeds* single.

Essen. Char. *Cal.* four-cleft. *Cor.* four-petalled. *Peric.* four, one-seeded.

Species. *B. ferruginea*, L'Heretier; *antidysenterica*, Bruce. (Bruce, V. 69. L'Heretier, Pl. 10. La Marck, Pl. 810.) A shrub of the middling size. *Stem* upright. *Branche*s few, alternate, spreading, straight, leafy at the summit, with broad scars below left by the fallen leaves. *Leaves* crowded, crowning the extremity of the branch; lower ones pendent, a foot long, unequally pinnated, on round, tomentose, rufous petioles. *Leaflets* eleven or thirteen, on short petioles, oblong-ovate, entire, acuminate, veined, villous. *Spikes* of flowers axillary, linear, tomentose, nearly as long as the leaves. *Flowers* on the common peduncle whorled in short spikelets or bunches, of an herbaceous colour tinged with red or russet.

The male plant began to flower in the stove of the Paris botanic garden, in May and June, 1780 or 1781, when it was between two and three feet high. The female plant has flowered in the royal garden at Kew, where it was introduced in 1775. The root is used in Abyssinia as a specific in the dysentery. It is a plain, simple bitter, without any resinous or aromatic taste.

*Obs.* The figure in Bruce's Travels is monœcious.

BRUCH, or BROICH, in *Geography*, a signiory of Germany, in the circle of Westphalia, and duchy of Berg, about 4 leagues in circuit, deriving its name from a castle, 4 miles E. of Duisburg.

BRUCH, a town of France, in the department of the Lot and Garonne, and district of Nerac; 5 miles N. N. E. of Nerac.

BRUCHHAUSEN, a town of Germany, in the circle of Westphalia, and county of Hoya; 5 miles W. of Hoya.

BRUCHIUM, in *Ancient Geography*. See ALEXANDRIA.

BRUCHSAL, in *Geography*, a pretty small town of Germany, in the circle of the Upper Rhine, and bishopric of Spire, seated on the Salza; where the bishop has a handsome palace, and an arsenal; 11 miles S. E. of Spire, and 5 miles S. E. of Philippsburg. In its vicinity is a very large salt-work; and the surrounding country has many spacious forests, which, however, are intersected by several well cultivated vales. These woods, the timber of which is carried to Holland by the Rhine, constitute the principal revenue of the courts of Spire and Carlsruhe.

BRUCHIUS, in *Entomology*, a genus of COLEOPTEROUS insects, with filiform antennæ, equal filiform feelers, and acuminated lip. Gmel. The species of this genus are *pisi*, *umbellatarum*, *robiniæ*, *gibbosus*, *scabrosus*, *clathratus*, *cacao*, *undatus*, *theobromatis*, *marginalis*, *canalis*, *bipunctatus*, *varius*, *gleditschizæ*, *spinosus*, *bactris*, *rusipes*, *granarius*, *cisli*, *abdominalis*, *feminarius*, *maculatus*, *mimosæ*, *ferraticornis*, *pectinicornis*; which see respectively.—*B. abdominalis* is a native of India. It is black; abdomen cinereous, and without spots; anterior legs testaceous. Fabricius.

BRUCIOLI, ANTONY, in *Biography*, an Italian writer, was born at Florence, about the close of the 15th century; and having engaged in the conspiracy against cardinal Julio de Medici, he was obliged to seek refuge in France, whence he returned on the expulsion of the Medici family in 1527; but being suspected of heresy, on account of the freedom

with which he spoke of monks and priests, he left Florence in 1529, and repaired to Venice, where, in 1532, he published his Italian version of the Bible, which was dedicated to Francis I., king of France. This version was accompanied with an ample commentary in 7 volumes folio; containing some strictures, which excited a suspicion, that the author had imbibed some of the principles of the reformers. Although he pretended that he had translated directly from the originals, father Simon demonstrated that he had little knowledge of the Hebrew, and that he had generally used the Latin version of Pagninus. His work was condemned by the Catholics, but approved and encouraged by the Reformers; several editions of it were printed, the last of which is that of Venice in 1546-48, 3 vols. folio. Brucioli lived at Venice, without molestation; and employed himself in a variety of literary works. Besides Italian translations of Pliny's natural history, and of several pieces of Aristotle and Cicero, and editions, with notes, of Petrarch and Boccacio, he published a folio volume of "Dialogues." Aretine writing to him in 1542, says, "Are you not satisfied with having composed more volumes than you are years old; and with having spread your name through the whole world?" He was still living in 1554. *Nouv. Dict. Hist. Gen. Biog.*

BRUCK, in *Geography*, a town of Germany, in the circle of Franconia, and principality of Culmbach, seated on the Rednitz.

BRUCK, or BRUGG, a town of Germany, in the archduchy of Austria, situate on the river Leyta. In the environs of this town asparagus grows spontaneously without culture. It is distant 25 miles E. from Baden, and 20 E. S. E. from Vienna.

BRUCK, a town of Germany, in the circle of Upper Saxony, and electorate of Saxony; 10 miles S. W. of Potsdam.

BRUCK, or PRUCK, a town of Germany, in the circle of Bavaria and Upper Palatinate; 18 miles N. N. E. of Ratibon. See PRUCK.

BRUCKENAU, a town of Germany, in the circle of the Upper Rhine, and bishopric of Fulda; 14 miles S. of Fulda.

BRUCKER, JOHN-JAMES, in *Biography*, a learned Lutheran clergyman, was born Jan. 22, 1696, at Augsburg, and educated at Jena, where, in 1718, he took his degree of master of arts. In 1720 he returned to the place of his nativity; in 1724 he became rector at Kasbeneren; and in 1731, he was chosen a member of the Academy of Sciences at Berlin. At Augsburg he was afterwards pastor of St. Ulrich's church, and senior minister; and died there in 1770. Among his works are the following, viz. "Tentamen Introductionis in Historiam Doctrinæ de Ideis," Jena, 1719, 4to.; "Meditationes Philosophicæ de falsa virtute exemplo Alexandri magni illustrata," Ibid. 1720, 4to.; "Historia Philosophica Doctrinæ de Ideis," Augsb. 1723, 8vo.; "De Vita et Scriptis Cl. Etringeri," Ibid. 1724, 8vo.; "Otium Vindelicum, sive Meletematum Historico-philosophicorum Triga," Ibid. 1721, 8vo.; "Historia Vitæ Adolphorum Oeconum," Lips. 1734, 4to.; "Dissertatio Epistol. de Vita Hier. Wolfii," Ibid. 1739, 4to.; "De Hoescheli Meritis in Rem Literariam," Ibid. 1739, 4to.; "Institutiones Historiæ Philosophicæ," Ibid. 1727, 8vo. and 1756, 4to. But the most important work, to which he owes his chief reputation, is his "Historia Critica Philosophiæ," published at Leipzig between the years 1742 and 1744, in four large volumes 4to. and re-printed at the same place in 1767, with large improvements and additions, in 6 vols. 4to. To Dr. Enfield the English reader is indebted for an excellent abridged translation of this comprehensive and learned work, published in

1791, in 2 vols. 4to. In this instructive work the author comprises the history of philosophy under three periods: the *first*, commencing from the earliest times, and extending to the decline of the Roman empire, comprehends the Barbaric and the Grecian philosophy: the *second*, from the decline of the Roman republic to the revival of letters, comprehends the philosophy of the Romans, the oriental philosophy, that of the Jews, that of the Saracens or Arabians, and that of the Christians: and the *third* period, from the revival of letters to the beginning of the 18th century, includes attempts to restore and correct the Sectarian philosophy, attempts to introduce new methods of philosophizing, and attempts to improve philosophy in the true Eclectic method.

BRUCKLAW, in *Geography*, a town of Germany, in the circle of Upper Saxony, and county of Reus; 8 miles W. N. W. of Greitz.

BRUCKMAN, FRANCIS-ERNEST, in *Biography*, was born at Helmitadt, in 1707, and, having completed his studies, was created doctor in medicine, at the university there, in the year 1721. As his taste inclined him to botany, he travelled over Bohemia, Austria, and a great part of Germany, examining and collecting plants indigenous to those countries, and other natural productions. In return for his communications to the Academia Nat. Curios. and of Berlin; he was made corresponding member of those societies. Having finished his travels, he settled at Brunswick, where he continued in quest to the time of his death, March 21st, 1753. When young, and before he had taken the degree of doctor, he published, "Specimen Botanicum, exhibens fungos subterraneos, vulgo tubera terræ dictos," Helmit. 1720, 4to. with engravings. He considered the black spots on the bark as seeds. In 1727, "Opuscula Medico botanica," 4to. Brunswick. In this he treats of the medical qualities of various vegetable productions, among others of coffee, the use of which he condemns. "Epitoloæ Itinerariæ," containing his observations on vegetable and other natural productions, collected during his travels. The epistles are 300 in number, the first century was published in 1742; the two last in 1749, 4to. They contain a great body of useful information. The titles of a few of the epistles follow, for the rest, or such of them as are most curious, consult Haller's Bib. Botan. "De Tur edlicole, seu Phallo;" "De Alga Saccharifera;" "Animadversiones in Pisonis et Boetii Libros;" "De Museis novum descriptis;" "De Melone Aquiformi;" "De Solani tuberos, radice infantem referente;" "De Ufu Corticis Sambuci in Hydrope," &c. &c. Haller. Bib. Bot. and Chirurg. Eloy. Dict. Hist.

BRUCKOBEL, in *Geography*, a town of Germany, in the circle of the Upper Rhine, and county of Hanau Munzenberg; 2 miles N. of Hanau.

BRUCTERII, in *Ancient Geography*, a people of Germany, placed by most geographers next to the Fritii, between the Amisia, now the Ems, and the lake Flevis, now the Zuyder Zee. They were powerful and warlike; but before the time when Tacitus wrote, (see Germ. 37.) that is, before Trajan's second consulship, they had been exterminated by their neighbours, who had conspired against them; and their place was occupied by the Charnavi and Angriarii. They were conquered by Drusus in a naval fight, on occasion of his first German campaign; again by Tiberius in the 4th year of the Christian æra; and afterwards, A. D. 14 and 15, by Germanicus. In the year 69 they joined Civilis in his attack upon the Romans. Towards the commencement of the 4th century, Constantine, having passed the Rhine, entered their country and laid it waste with fire

and sword. Their villages were burnt, their cattle slaughtered, their men and women massacred, and those that escaped the sword, and were made prisoners, met with a still more cruel fate. As he judged them incapable of ever performing any really useful service, on account of their perfidy and invincible ferocity, they were condemned to the same punishment as the kings of the Franks, whom he had vanquished, and delivered to wild beasts, whose savage disposition they imitated.

BRUDUS, EMANUEL, in *Biography*, son of the physician Dionysius, of Paris, practised medicine for some years in England. He published, in 1544, at Venice, "De Ratione Viæus in singulis Febribus ad Anglos," 8vo. It is a thick and bulky volume, and has been several times reprinted, once by Gesner, in 1555. He appears to have read the old Greek and Arabian writers with attention, and to have drawn his doctrine principally from them. Too slender a diet should not be given to the English in fevers, but care should be taken to keep up the strength of the patients. This should be done in all fevers, of which he describes the different stages, with the treatment in each. He is every where prolix, but some good practical rules may be deduced. "Dialogus circa quasdam Questiones in Medicina," 4to. without date. Haller. Bib. Med.

BRUEGEL, in *Geography*, a town of Upper Guelderland; 10 miles S. E. of Venloo.

BRUEHL, WALTER, or BRAUT, in *Biography*, a German physician, published in 1579, Antw. fol. "Praxis Medica, Theorica et Empirica, familiarissima, in qua morborum internorum cognitio, et curatio traditur." The work, though little noticed now, was in much estimation, as appears by its having passed through eight editions, the last printed at Venice in 1602, 8vo. It is dedicated to the earl of Huntington, which makes it probable the author had been in this country. Haller. Bib. Med. Pract. Eloy Dict. Hist.

BRUEL, in *Geography*, a town of Germany, in the circle of Lower Saxony, and duchy of Mecklenburg; 12 miles N. E. of Schwerin.

BRUEL, *Brughl*, or *Brugl*, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne; 6 miles S. of Cologne.

BRUE'RE, a town of France, in the department of the Cher, and district of St. Amand, seated on the Cher; 1½ league N. W. of St. Amand.

BRUEYS, DAVID-AUGUSTIN, in *Biography*, a French writer, was born of a protestant family, at Aix, in 1640, and educated for the bar; but his inclination to controversial theology led him to abandon the profession of an advocate; and, in 1682, he published an answer to bishop Bossuet's exposition of the doctrine of the church. The bishop, however, converted him to the catholic faith; and after he had buried his wife, he entered into the ecclesiastical state, and distinguished himself as the champion of popery against Jurieu, Lenfant, and other protestant divines. Of the sincerity of his conversion his subsequent conduct afforded some ground of suspicion; as he diverted his attention from theology and devoted it to dramatic subjects. Accordingly he composed several pieces for the stage, some of which were written in conjunction with his friend Palaprat. Of these the most celebrated are the comedy of "Le Grondeur," (the Grumbler), which Voltaire prefers to all the lighter pieces of Moliere, and a revived ancient piece, called "L'Avocat Patelin," distinguished for its humorous simplicity. At a more advanced age he again resumed theological controversy, and wrote "The History of Fanaticism in our own times," relating to the state of religion in the Cevennes.

**Cevennes.** The Abbé Brueys, as he was usually styled, died at Montpellier in 1723. His dramatic works were collected into 3 vols. in 1735. *Nouv. Dict. Hist.*

**BRUFF**, in *Geography*, a small post and market town of Ireland, in the county of Limerick; situate on the road from Cork to Limerick; 12 miles S. of the latter city, and 106 miles S. W. of Dublin.

**BRUFFIER, LA**, a town of France, in the department of the Vendée, and district of Montaigu; 13 leagues E. N. E. of Montaigu.

**BRUGD**, in *Ichthyology*. See *SQUALUS MAXIMUS*, *great shark*.

**BRUGES, JOHN OF**, in *Biography*. See *EYCK*.

**BRUGES**, in *Geography*, a town of France, in the department of the Lower Pyrenées, and district of Pau; 4 leagues S. of Pau.

**BRUGES**, once a commercial, flourishing, and populous city of the Aultrian Netherlands, and a bishop's see, and now, since the French revolution, the capital of a district, in the department of the Lys, which is divided into five parts; the first part containing, according to Tineau's statistical view of France, 9508 inhabitants, the canton 14,444, and its territory comprehending 207½ kilometres, and five communes: the second part includes 7049, and its canton 13,022 inhabitants; its territory comprehends 70 kilometres, and 4 communes: the third part contains 7553, and the canton 13,896 inhabitants; its territory includes 105 kilometres, and 7 communes: the fourth part contains 6796, and its canton 14,320 inhabitants; its territory comprehends 107½ kilometres, and 11 communes: and the fifth part contains 2821, and its canton 11,974 inhabitants; its territory includes 147½ kilometres, and 12 communes. According to this statement the population of Bruges amounts to 33,700 persons; but others, by a more moderate computation, estimate the number at 20,000. Bruges is about a league and a half in circumference; is advantageously situated for commerce, about 8 miles from the sea; and communicates, by means of navigable canals, with Ghent, Ostend, Nieuport, Furnes, Damme, Sluys, &c. As the adjacent country is nearly level, the water about it has no perceptible current; but it is easily changed in half an hour's time, by opening the sluices, and discharging it into the sea. According to Guiccardini, this city was first founded about the year 760; and took its name from a bridge called "Brug-flock," in its vicinity, between Oudembourg and Radembourg or Ardembourg, which are two maritime towns, said to have had considerable commerce in this country, till they were ruined by the Danes or Normans. Out of the ruins of Oudembourg was built the original town or castle of Bruges. In the 13th and 14th centuries, Bruges was the greatest emporium in all Europe. Navigation was then so imperfect, that a voyage between the Baltic and the Mediterranean could not be performed in one summer; and, therefore, it became necessary to establish a magazine or storehouse about midway between the commercial cities in the North and those in Italy. Bruges was selected as the most convenient station; and this choice of course introduced vast wealth into the Low Countries. Bruges was at once the staple for English wool; for the woollen and linnen manufactures of the Netherlands; for the naval stores, and other bulky commodities of the North; and for the Indian commodities, as well as domestic productions, imported by the Italian states. The extent of its commerce in Indian goods, with Venice alone, appears from one fact. In the year 318, five Venetian galleasses laden with Indian commodities arrived at Bruges, in order to dispose of their cargoes at the fair. These galleasses were vessels of considerable bur-

den. The citizens of Bruges, enriched by its commerce, displayed in their dress, their buildings, and their mode of living, such magnificence as even to mortify the pride and excite the envy of royalty. To this purpose we may mention a singular instance. In 1301, Joanna of Navarre, the wife of Philip le Bel, king of France, having been some days in Bruges, was so much struck with the grandeur and wealth of that city, and particularly with the splendid appearance of the wives of the citizens, that she was moved (says Guiccardini, *Descrit. de Paoli Bassi*, p. 408,) by female envy to exclaim with indignation, "I thought that I had been the only queen here, but I find there are many hundred more." However, in the year 1487, this city, become rich and also insolent, in consequence of its extensive commerce, had the audacity to seize on Maximilian, king of the Romans, and to kill some of his ministers in his presence. This violent insult brought about its ruin; for the emperor Frederick, father of Maximilian, took occasion to block up Sluys, its proper haven, by the assistance of Antwerp and Amsterdam, which had been for some time envious of its engrossing the whole trade of the Low Countries; upon which the commerce removed from Bruges to Dort, and from thence soon after to Antwerp. According to Thuanus and Guiccardini, it removed directly to Antwerp, which soon vied with Bruges in opulence and splendour. "Till this time (says bishop Huet, in his "Memoirs of the Dutch trade,") there was scarce a nation in Europe, how inconsiderable soever, that had not their proper mercantile magazine or store-house at Bruges, and a company or factory there residing; as the English, French, Scots, Catalians, Portuguese, those of Arragon, Catalonia, Biscay, Venice, Florence, Genoa, Lucca, Milan, Germany, Denmark, Sweden, and all the Hanse towns." The pensionary, De Wit, in his "Interest of Holland," accounts in a somewhat different manner for the loss of its commerce, which Bruges sustained. He says, that the fisheries and manufactures of the Netherlands increased more and more, together with the traffic by sea to Bruges, which lasted till the year 1482, when Flanders had wars with the archduke Maximilian, about the guardianship of his son and his dominions, which continued for ten years. In the mean time, Sluys, the sea-port of Bruges, being most disturbed, those of Antwerp and Amsterdam, in order to draw the trade to their own cities, assisted the archduke in his unbridled tyranny and barbarous destruction of that country, and thereby regained his favour, and attained their own ends. Notwithstanding the decline of its commerce, Bruges, having a communication with the sea from Ostend, by means of a navigable canal, is still a place of considerable trade; and has various manufactures of broad sayes, baize, and other woollens.

Bruges was formerly in the diocese of Tournay; but in 1559, it was erected into a bishopric, by Philip II. king of Spain, subject to the archbishop of Malines. In 1420, Philip the good, duke of Burgundy, instituted at Bruges the order of the golden fleece. The parts about the city which belong to this order are called "Franc of Bruges," and contain 37 villages, and accordingly enjoy certain immunities. The streets of Bruges, which are about 260 in number, are spacious, and the houses, though old, well built; it has seven gates, and six grand markets; but, having neither fountain nor river, the city is supplied with water from the rivers Lys and Scheldt, conveyed from Ghent by means of pipes. The principal buildings are the town-house, built in the Gothic manner, and situate in the large square called the Burg, the halls, the mint, &c. At the end of the square, called the grand market, is a fine steeple,

supported by four pillars, which is one of the most beautiful of the kind in Europe, 533 steps in height, and furnished with bells and chimes, which play a different tune every quarter of an hour. On the side of the great square is an edifice serving as a magazine for cloth, built over a canal, and so sustained by pillars, that small vessels may pass under it, in order to cross the city from the canal of Ostend to that of Ghent. The square in which the Wednesday's market is kept, contains several walks between rows of trees, and a new guard-house in the middle. At Bruges there are several fine churches. The cathedral is dedicated to St. Donat, but the church of Notre Dame is the most beautiful, and its steeple serves as a sea mark for the ships that are coming to Ostend; within it are two tombs of gilt copper, of extraordinary magnificence, and the rich vestments of Thomas à Becket, adorned with precious stones. In the high altar in the cathedral is a picture by Segers, viz. "The Adoration of the Magi," which is considered by sir Joshua Reynolds as one of the best of that painter's works; and in the choir is a picture by Jean Van Eyck, of the "Virgin and Child, with St. George, and the other saints." Besides the cathedral and two collegiate churches, there are five parish churches, 14 chapels, and 12 convents for men and women. Bruges has also several alms-houses and schools, and it is distinguished by the provision which it affords for widows and orphans. There are still remaining 17 palaces or houses, that were the ancient habitations of so many consuls of trade. The magistracy of Bruges is composed of two burgo-masters, 12 echevins, 12 counsellors, 6 pensionaries, and two greffiers. This city, which is but indifferently fortified, was unsuccessfully bombarded by the Dutch, July 4, 1704; in 1706 it submitted to the allies, after the battle of Ramilies; in 1708 it was invested by the French and obliged to surrender; in 1709 the allies re-entered it, by virtue of a capitulation signed on the capture of Ghent, Dec. 30, 1709; and on the 24th of July, 1794, the magistrates opened the gates to the French troops, and signed a formal submission to the French republic. Bruges is 8 miles E. of Ostend, 24 N. W. of Ghent, and 46 W. of Antwerp. N. lat. 51° 15'. E. long. 3° 15'.

BRUGG, or BRUCK, a town of Switzerland, in the canton of Argow, seated on the river Aar. It formerly belonged to the counts of Hapsburg, of the house of Austria; the inhabitants embraced the protestant religion in 1529. N. lat. 47° 23'. E. long. 8° 5'.

BRUGGEN, a town of Germany, in the circle of Lower Saxony, and bishopric of Hildesheim, on the east side of the Leine;  $\frac{1}{2}$  leagues S. W. from Hildesheim.

BRUGGEN, or Bruck, a town of Germany, in the circle of Westphalia, and duchy of Juliers, on the Schwalm; 6 miles N. E. of Ruremond. On the 2d of March, 1793, a battle was fought near this town, between the Prussians, under the command of prince Frederick of Brunswick, and the French, in which the latter were defeated, with the loss of 1300 killed and 700 prisoners.

BRUGHAN, a river of North Wales, which runs into the Severn, about 2 miles above Llanidlos, in the county of Montgomery.

BRUGIAT, a town of France, in the department of the Allier, and district of Gannat;  $\frac{1}{2}$  leagues E. of Gannat.

BRUGNETTO, a town of Genoa, situate at the foot of the Apennines; the see of a bishop, suffragan of Genoa; 35 miles E. S. E. of Genoa.

BRUGUIERA, in Botany, (named in honour of Brugiere, the well-known French botanist,) a new genus, formed by La Marck, for a plant placed by Linnæus in the genus

Rhizophora, to which it is closely allied, but differs in having a polygonous fruit. La Marck Illust. Pl. 397. Bosc. Clafs, *dodecandria monogynia*. Nat. Ord. *Holeracea*. *Caprifolia*, Juss. Gen. Char. *Cal.* one-leaved, open, permanent; segments ten or twelve, linear, acuminate, keeled without, channelled within, a little fleshy. *Cor.* petals ten or twelve, oblong, bifid at the summit, pointed, folded together lengthways so as to appear in some degree bivalved, ciliated, villous at the base, shorter than the segments of the calyx and alternating with them. *Stam.* from twenty to twenty-two; filaments attached by pairs to the base of each petal, and enclosed within its fold; anthers upright, oblong. *Pist.* germ inferior, style triangular; stigmas three. *Fruit*, consisting at first of a capsule, which is semi-inferior, terminated by the permanent style, one-celled, one-seeded, formed in some degree out of the calyx: but when the seed contained in the capsule is come to maturity, its summit is prolonged into a nearly cylindrical body, a little angular, furrowed, with a blunt point, very smooth and shining, and from four or five inches to a foot long. This appearance is no other than the germination of the seed; and the prolongation is the radicle of the embryo plant, which having by its weight detached the seed from the capsule, fixes itself in the mud, into which it has fallen perpendicularly, in consequence of the capsule's having changed its original upright for a pendent position. This mode of germination is common also to all the species of the true Rhizophora. *Ess. Ch.* *Calyx* superior, divided into ten or twelve segments; petals ten or twelve, doubled, bearing the stamens; stamens from twenty to twenty-two. *Style*, one; capsule one-seeded.

*Spec. B. gymnorhiza*, "Leaves ovate-lanceolate, root above ground." Linn.; a specific character formed to distinguish it from the different species of Rhizophora. A tree about ten or twelve feet high. *Trunk* commonly crooked, covered with a thick, brown, rugged, cracked bark. *Branches* very numerous, extending in all directions, the lower ones throwing out naked flexible shoots, which strike into the earth, and, like the fig-tree of Bengal, produce new trunks, so that it is often difficult to determine the parent stock; the whole forming by the intermixture of the branches an impenetrable thicket. *Leaves* opposite, decussate, ovate, acuminate, smooth, very entire, on short petioles. *Flowers* solitary, axillary or lateral, greenish yellow, pendent. A native of the banks of salt-water rivers, and on the sea-shore in the East Indies. See Ray. Hist. Plant. and Savigny in Encyclopedie Methodique, under Palctavier.

BRUGUIERE, JOHN, in *Biography*, a physician of Montpellier, founded a college for the maintenance and instruction of two young men, to be brought up to the practice of medicine, and dying without children in 1452, he left 800 *écus d'or*, to purchase a piece of land, the rent of which was to be appropriated to the support of his institution, to which he also left his library. Astruc. Mem. pour servir a l'Hist. de la faculte de Med. de Montp.

BRUGUIÈRE, La, in *Geography*, a town of France, in the department of the Tarn, and chief place of a canton, in the district of Castres,  $1\frac{1}{2}$  league S. of Castres; the place contains 3929, and the canton 6896 inhabitants; the territory comprehends  $137\frac{1}{2}$  kilometres and 7 communes.

BRUGUIÈRES, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the district of Toulouse; 3 leagues N. of Toulouse.

BRUHESIUS, PETER, or PETER VAN BRUHEZEN, in *Biography*, a physician of Brabant, born the early part of

the 16th century, was so much esteemed as to be made physician to Eleonora of Austria, sister to the emperor Charles V., while she was resident in the Low Countries. He afterwards settled in Bruges, and was appointed pensionary physician to that city. The time of his death is not known, but his memory was honoured by an epitaph, written in 1571, by the poet Nicolaus, who speaks highly of his professional abilities. He published, "De Theriarum Aquisgranensium Viribus, Causa, et legitimo Ufu, Epistole duæ," 1550 and 1555. Antwerp, 12mo. "De Ratione medendi Morbi Articularis, 1592, in Henry Garret's *Confilia Varioium de Arthritide*." "De Ufu et Ratione Cauteriorum," in the same collection. He was a believer in judicial astrology, and published "An Almanac," at Bruges, in which he sets down the precise times, or circumstances, under which bleeding, purging, and other operations might be safely undergone. Eloy Dict. Hist.

BRUHIER, JOHN JAMES, born at Beauvais, the end of the 17th century, studied medicine at Angers, where he was admitted to the degree of doctor; he afterwards settled in Paris, and acquired considerable reputation by his practice, and by his writings. He died October 24th, 1756. In 1733, he published a translation of Deventer's Treatise on Midwifery, under the title of "Observations sur le Manuel des Accouchemens," 4to. Paris, and afterwards several of Hoffman's works; his "Medicus Politicus," 12mo. "Medicina rationalis," in 9 volumes, his treatise on fevers, 3 vols. 12mo. "Le Caprices d'Imagination," &c. But the works by which he is most known, were his warnings against burying persons supposed to be dead, too early, "Dissertation sur l'Incertitude des Signes de la Mort, et l'Abus des Enterremens, et Embaumemens precipites." Paris 1742. He was at the pains of collecting histories of persons who had revived, after being supposed to be dead, some of whom had been buried. Bodies ought not to be interred, he says, until putrefaction has commenced. "Memoire sur la Necessite d'un Reglement general au Sujet des Enterremens," 1745. No one should be buried until the fourth day from their dying. "Addition aux memoires," &c. adding to the number of examples of persons who had been buried alive, or had revived after being interred. These works have passed through numerous editions, and have been translated into every modern European language, and have doubtless been the means of preserving many lives. M. de la Soriniere, on his being received into the Royal Academy at Angers, read a copy of verses he had composed on the subject, beginning

Bruhier, ton immortel ouvrage,  
Ouvre les yeux a bien des gens,  
Sur l'abus, la cruel usage,  
D'enterrer les morts, tout vivans, &c.

Haller Bib. Chirurg. Eloy. Dict. Hist.

BRUHL, a town of France, in the department of the Roer, and chief place of a canton, in the district of Cologne. The place contains 1932, and the canton 14,976 inhabitants; and the territory includes 31 communes.

BRUJA, BUFF, in *Ornithology*. See LANIUS MADAGASCARIENSIS, Gmel.

BRUIN, JOHN DE, in *Biography*, professor of natural philosophy and mathematics at Utrecht, was born at Gorcum in 1620; and having pursued a course of philosophy at Leyden, and prosecuted his studies at Bois-le-Duc, and Utrecht, he removed to Leyden, where he taught mathematics. He afterwards became professor at Utrecht, and besides his official duties, made dissections in private and read lectures on Grotius's treatise, "De Jure Belli et Pacis." He was distinguished by his attachment to experimental

philosophy and by his observations in astronomy. As an author, he published dissertations, "De Vi Altrice," "De Corporum Gravitate et Levitate," "De Cognitione Dei naturali," "De Lucis Causa et Origine," &c. He also maintained the Cartesian hypothesis in a dispute with Isaac Vossius, and wrote an apology first against a divine named Vogelfang. In 1655, he married the sister of the wife of Daniel Elzevir, the famous bookseller of Amsterdam, and died in 1675.

BRUIN, JOHN DE, born at Amsterdam in 1681, was early initiated into the knowledge of surgery; but in 1700, determining to confine himself to the practice of midwifery, he entered as a pupil to Roger Roonhuysen, to learn of him the art of delivery in cases of difficulty, by means of an instrument he had invented, and which obtained the name of Roonhuysen's lever. Aided with this instrument, he was enabled to relieve and bring down the head of a foetus, that was firmly fixed in the pelvis, without injury to the mother, or the child. As this instrument, and the manner of using it, were kept secret by Roonhuysen, De Bruin paid a stipulated price for obtaining the knowledge of it; and became so skilful in using it, that he was consulted in all cases of difficulty. On his death, which happened January 23d, 1753, the secret was purchased by De Vischer, and Van de Pool, physicians at Amsterdam, and through them communicated to the world. Eloy Dict. Hist.

BRUISE, in *Surgery*. See CONTUSION.

BRUISER, in *Mechanics*, the name of a concave tool used for grinding and polishing the specula of telescopes. It is made of brass, about a quarter of an inch thick, and hammered as near to the gage as possible. It is tinned on the convex side, and made equally broad at bottom and top. This serves to reduce the figure of the hones, when it is too convex, and to rub down any gritty matter that happens to be mixed with the putty, before the speculum is applied to the polisher. See Phil. Trans. vol. lxxvii. part i. art. 16. and Smith's Optics, book iii. chap. 2.

BRUSING, in *Pharmacy*, signifies the operation of breaking or pounding a thing coarsely, or by halves; frequently practised on roots, woods, and other hard bodies, to make them yield their juice or virtue more freely than they would do whole.

BRUIT, Fr., NOISE. The editors of the New French Encyclopedie, as well as Rousseau, have honoured this sworn foe to music, and persecutor of refined ears, with a long article. Rousseau defines noise in general to be every motion of the air which strikes the tympanum, and is perceptible by the auricular organ; but, in music, noise is opposed to sound, and extends to every sensation of the ear which is not sonorous and appreciable. To explain the difference musically, we may suppose that every musical sound is accompanied by its harmonics, and that noise having no such coincident vibrations, has no determined tone or type in the harmonical system. Noise may, perhaps, be of the same nature as sound, but being produced by violence, and the aggregate of a confused multitude of different sounds heard at once, they mutually counteract the undulations of each other. All elastic bodies seem sonorous in proportion as their matter is homogeneous, as the degree of cohesion is more equal throughout, and its body not divided into numerous small masses, which being of different solidity, consequently give birth to varying sounds. Why should not noise produce sound, since it can excite it? For every violent noise makes the strings of a harpsichord sound, nor, indeed, any single strings as a musical tone does, but the whole instrument at once; because no one finds its unison or

harmonies. Again, why should not noise give the sensation of sound, since with sound noise is produced? Put down all the keys of a harpsicord or piano-forte at once, and a sensation of nothing but noise will be the consequence, and its effect will continue no longer than that of any other noise. Why should not noise be sound, since a musical string forced, or a pipe over-blown, is only noise, any more than a voice which screams with all its might, or a great bell heard in the belfry? Because it is impossible to discriminate one sound from another; though the tone of the same bell at a distance is easily ascertained, it would be the screaming voice if softened and rendered tuneable.

Put it may be asked, whence comes this great change of noise into sound. It is from the diminished violence of the vibrations, which had caused so many aliquot parts to sound at once that the total became mere noise. For the aliquot parts in vibration are not only the half, the third part, the fourth, and all the consequences, but the seventh part, the ninth, the hundredth, and still more; all which have the same effect as the putting down all the keys at once, the bell in the belfry, and the voice of a screamer; and thus sound itself becomes noise, and noise sound. A coarse, confused, and dissonant music, is contemptuously called noise; as a bad opera ill performed is said to produce a great noise, but no effect." Thus far the citizen of Geneva, with his usual force and ingenuity, has described noise. A passage is given from "La Poétique de la Musique," of M. De la Cépide, in support of Rousseau's doctrine, which in this instance seems to want no support.

Messrs. Ginguéné and Framerie have taken up the subject after M. De la Cépide, merely to expand and amplify Rousseau's arguments, without fortifying them by any additional matter, except in censuring the augmentation of force in an orchestra by sabots, cymbals, double drums, and tromboni, which producing nothing but noise themselves, prevent us from hearing every thing that deserves the name of music.

Instruments of percussion may be of use in the open air to mark the steps of an army on its march, and the screaming and clamour of the real during battle, to drown the cries of the wounded and groans of the dying; but in an enclosed theatre or concert-room, they only torture delicate ears, and change into punishment the pleasures of sensibility.

BRUKA, or BRUKO, in *Geography*, a town of Africa, on the south coast of the river Gambia; 160 miles from the sea.

BRUKSAL, an island of Africa, near the mouth of the river Senegal.

BRULE, or BRULLOS, *Cape*, lies on the coast of Egypt; 11 leagues W. N. W. northerly from Damietta, or the ancient Pelusium — Also, a cape on the coast of Cape Breton, in North America, near the gulf of St. Lawrence, separating the bay of Morienne from the bay of Miray.

BRULON, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of La Flèche; 3 leagues N. of Sablé. The town contains 1310, and the canton 10,994 inhabitants; the territory includes 200 kilometres, and 16 communes.

BRUMALIA, or BROMALIA, a feast of Bacchus, celebrated among the ancient Romans, during the space of thirty days; commencing on the 24th of November, and ending the 26th of December. Some say this feast was celebrated twice a year, viz. on the 12th of the calends of March, and on the 18th of the calends of September.

The word comes from *bruma*, the day of the winter solstice; in regard of the time when the feast was held: though others derive it from *Brumus*, or *Bromius*, names of Bacchus.

The *brumalia* were instituted by Romulus, who used, during this time, to entertain the senate. During this feast indications were taken of the felicity of the remaining part of winter.

The *Brumalia* were also called *Himalia*.

BRUMALIS, in *Ornithology*, a species of *EMBERIZA* that inhabits the Tyrolese country, called by Latham the *Brumal Bunting*. Scopoli thus describes this little bird: body beneath, the front, and region of the eyes citron colour: hind head and neck cinereous.—Obs. The back is yellow brown, vent citron, thighs whitish, quill feathers brown, having the exterior margin citron.

BRUMATA, in *Entomology*, a species of *PHALÆNA* (*Geometra*) the wings of which are yellowish, with a black streak, and a paler one behind. The female is apterous, or without wings, and spotted with black. Linn. Found on apple-trees.

BRUMATH, in *Geography*, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Strasburg, 3 leagues N. of Strasburg. The town contains 2671, and the canton 12,951 inhabitants; the territory comprehends 182½ kilometres, and 21 communes.

BRUMEL, ANTHONY, the most ancient contrapuntist of the French school of whose compositions we have been able to find any remains, was contemporary with Jusquin, and scholar of Okenheim; and though he is not likely to be inquired after by the present age, he was so respected in his day, that his name should not be consigned to the gulph of oblivion while a vestige of his works remains; and several still subsist in Clarcanus, and the Museum collection. The fame of the great musicians of antiquity is so established in books, that, though not a single relic of their works has been extant these two thousand years, their names and renown are still held in veneration by mankind.

BRUMOY, PETER, in *Biography*, a celebrated French writer, of the order of the Jesuits, was born at Rouen in 1688, commenced his noviciate at Paris in 1704, and finished his studies at Caen. Having been for some time employed in teaching rhetoric in different parts of the country, he took the vows of his order at Paris in 1722, and undertook the education of the prince de Talmont. He engaged for several years in the *Journal de Trevoux*, but in consequence of publishing father Margat's history of Tamerlane, he was exiled from Paris. On his return he continued his "History of the Gallican Church;" but having nearly finished the 12th volume, he was taken off by a paralytic stroke in 1742, leaving behind him the character of an amiable man and an esteemed writer. The work from which he acquired the greatest reputation was his "Théâtre des Grecs," in 3 vols. 4to.; containing prose translations and analyses of the principal Greek tragedies, with dissertations on the Greek theatre, &c. The author, whose erudition and taste are much esteemed by the best judges, has been censured by some writers for manifesting too strong a bias towards the ancients, and Voltaire in particular is displeased for his not having allowed the superiority of the French theatre above the Greek. Brumoy published likewise, in 1741, a collection of his own pieces, in 4 vols. 12mo, consisting of Latin poems, founded upon the model of Lucretius, epistles, and dramatic pieces, tragic, comic, and pastoral. His poem on the "Passions" has been much extolled for the elevation of its sentiments, and its poetic beauties. The discriminating excellence of his tragedies consists in the delineation of the tender passions. The "Revolutions of Spain," begun by father Orleans, were finished by Brumoy. *Nouv. Dict. Hist.*

BRUN, CHARLES LE, an eminent French painter, was the

the son of a sculptor, descended from a Scots family probably of the name of "Brown," and born at Paris in 1619. Manifesting in very early life the bent of his genius, so that at the age of four years he took coals from the fire for drawing figures on the floor, and at the age of twelve years made a good portrait of his grandfather, he was placed under the instruction of Vouet, whom he astonished by his rapid progress. In 1642 he was sent by the chancellor Seguier to Italy, where he continued 6 years, boarding in the house of the famous Poussin and employing himself in copying the works of the principal masters, and in studying the *costume* of different ages and nations, so as to acquire the character of a learned painter. He also imitated the taste of Poussin so exactly as to deceive several connoisseurs. On his return from Rome to Paris, in 1648, he was received into the Academy, and as he engaged in the highest branch of his art, historical and allegorical painting, and selected great works, he rose to the most distinguished rank in his profession. He was patronized by the superintendant Fouquet, and by him recommended to Cardinal Mazarin, and by his interposition, to the king. By the interest of Colbert, he was afterwards made the king's first painter, and ennobled in 1662. Lewis XIV. honoured him with peculiar tokens of favour, and frequently attended him whilst he was painting the family of Darius at Fontainebleau. In his five large pieces of the history of Alexander the great, he is said to have exhibited the exploits of that conqueror in a more glorious light than Quintus Curtius in his history. As an evidence of his attention to truth and nature, it is reported that he caused Persian horses to be drawn at Aleppo as models for those which he painted in Alexander's battles. He was employed by Colbert in painting the chapel and pavilion of Aurora at his feat of Sceaux, and by his interest he had the direction of the royal works, and particularly of the Gobelins manufactory, for the tapeltry of which he made designs of the four seasons and four elements, that were engraved by Le Clerc. At the Gobelins he had handsome lodgings, and he was allowed a considerable pension. The Academy of painting was altogether under his direction, and he contributed in an eminent degree, by procuring an establishment at Rome for the gratuitous education of young artists selected from Paris, and in a variety of other ways, to the promotion of the fine arts in France, and to the peculiar magnificence of the reign of Lewis XIV. With a particular view to this last object, he was occupied for fourteen years in representing by history and allegory, in the great gallery at Versailles, the splendid events of this period down to the peace of Niméguen. But the work, though he devoted to it much time and attention, became the subject of criticism, so that his reputation derived little advantage from it. When Louvois succeeded Colbert as superintendant of the royal edifices, Mignard was set up as a rival to Le Brun, and the mortification he experienced preyed upon his spirits, so that he fell into a decline, and died in 1690, leaving a wife but no children. Le Brun maintained, in his manners and style of living, the dignity of a man of quality: foreign princes testified their respect for his talents by the eagerness with which they endeavoured to obtain possession of his works, and the grand duke of Tuscany paid him the compliment of requesting a portrait of him for his gallery. Thus flattered and honoured, both at home and abroad, it is no wonder that his pride should be mortified by the advancement of a rival; more especially when we consider, that he manifested a jealousy of competitors in his conduct towards Le Sueur, which was unworthy of his talents and character. When this great genius lay on his death bed, Le Brun, after having visited him,

said on his departure, "that death was taking a great thorn out of his foot;" an expression which indicated want of becoming sensibility, and which occasioned the unfounded report that he had procured poison to be administered to his rival.

The distinguishing merits of Le Brun as a painter are greatness of conception, good ordonnance, expression, and elevation: but he is censured for too much of the French flutter and affectation, a want of variety in his attitudes and draperies, and deficiency of colouring. Among the most estimable of his performances we may reckon the "Battles of Alexander," the merit of which has been more conspicuous by the excellent engravings of Girard Audran, the "Penitent Magdalen" much admired, the "Carrying of the cross," the "Crucifixion," and "St. John in the lake of Patmos." His designs have been copied by many capital engravers: and he himself etched for his amusement several plates, in a dark bold style, manifesting the hand of the master, among which are the "Four times of the day" and an "Infant kneeling upon the cross," from his own designs.

As a writer, he is known for two works: one "On Physiognomy," and another "On the Passions," which latter has supplied various models for drawing. D'Argenville. Gen. Dict. Pilkington. Strutt.

BRUN, PETER LE, a learned ecclesiastical writer, was born at Brignole, in Provence, in 1661, became a priest of the oratory, and was engaged for 13 years in giving lectures, at the seminary of St. Magloire, at Paris, on the Scriptures, councils, and ecclesiastical history. In 1693 he published "Letters to prove the illusion of Philosophers on the Divining Rod," afterwards published under the title of "Critical History of the Superstitious Practices which have seduced the Vulgar and embarrassed the Learned, with the Method and Principles for discriminating the natural from the supernatural Effects," three vols 12mo. in which the author admits the reality of diabolical illusions in his attempt to give a natural explanation of fraudulent deceptions. He also wrote "An historical and doctrinal Treatise on theatrical Spectacles," 12mo. in which he maintains their unlawfulness to a Christian. At the request of the Abbé Bignon, he published an elaborate work on "Liturgies," in 4 vols. 8vo. the first of which appeared in 1716, and three others in 1726. The opinions which he advanced on the consecration of the mass, involved him in a controversy, during the prosecution of which his life was terminated by a disorder in the breast, in January, 1729. As a writer, he was profound and methodical, with a clear and simple style: and his piety was equal to his erudition. Nouv. Dict. Hist.

BRUN, or BROWNE, CAPE, in *Geography*, lies in the N.N.E. point of the entrance into the great road of Toulon, on the coast of France, in the Mediterranean.

BRUNCA, LA, a sea-port town on the west coast of the island of Sicily, at the entrance of the gulf of Catania, 16 miles south of Catania.

BRUNDISI or BRUNDISIUM. See BRINDISI.

BRUNELLA, in *Botany*. See PRUNELLA.

BRUNELLESCHI, PHILIP, in *Biography*, an eminent Italian architect, was born at Florence in 1377; and in early life having a taste for mathematics and mechanics, and a desire to learn sculpture, he became acquainted with Donatelli, a rising artist in this department, and accompanied him to Rome, in order to survey the monuments of architecture and sculpture in that capital. Here Brunelleschi employed his whole time, with indefatigable assiduity, in making drawings; and taking measures of all the famous relics of antiquity; and having conceived a design of establishing his fame, by

erecting,

erecting, on a new plan, a dome for the cathedral of St. Maria del Fiore at Florence, he remained in Rome, after the departure of his friend, in order to qualify himself for this undertaking. As in his youth he had been initiated into the business of a goldsmith, he now found his knowledge useful in procuring a maintenance by setting jewels for the goldsmiths. In 1497 sickness obliged him to return to Florence; and at this time the Florentines had convoked an assembly of architects and engineers to deliberate on the completion of the cathedral. Brunelleschi gave his opinion and then returned to Rome. Many plans were proposed for erecting the proposed dome; but Brunelleschi was singular in asserting that a double dome might be raised to a sufficient height, without that immense mass of timber-work which others had thought to be necessary. Having communicated his designs, he engaged the confidence of the magistrates, and he was employed in the execution of the work. He proceeded in it with ardour, and lived to complete the dome as far as the lantern; carrying it to such a height, and executing it with such beauty, as astonished the whole country. Such indeed was the beauty with which it was executed, that Michael Angelo afterwards said, it would be very difficult to imitate, and perhaps impossible to surpass it. Brunelleschi was employed by Cosmo the Great in building the abbey of canons regular at Fesoli, and in forming for him the model of a palace, which his prudence and moderation would not allow him to execute. But as Cosmo preferred the more humble plan of Michelozzi, Brunelleschi was so indignant that he destroyed his model, though its superiority was acknowledged by Cosmo. He afterwards undertook the construction of the Pitti palace, and carried it up to the second story; but the completion of it, after his death, was the work of Ammanati. The church of St. Lorenzo in Florence was almost entirely the work of Brunelleschi. He was no less skilled in military, than in civil architecture; and in this department, he gave to the duke of Milan the plan of a fortress for his capital; and he also contrived the two citadels of Pisa, and other fortifications in that part of Italy. As a civil engineer, he was employed in 1445, by the marquis of Mantua in constructing dykes for restraining the Po to its bed; and soon after the completion of this work, he died at the age of 69, much regretted by his brother-artists, and more so by the poor, to whom he was a father. His merit was more generally acknowledged after his death than during his life; for he had the mortification of seeing several of his undertakings left unfinished for want of due encouragement. Brunelleschi was also a cultivator of Italian poetry, and some of his burlesque verses have been printed along with those of Burchiello. D'Argenville. Tiraboschi.

**BRUNELLIA**, in *Botany*. Class, *dodecandria pentagynia*. Gen. Char. *Calyx* with five ovate segments, permanent. *Cor.* none. *Stam.* filaments eleven, villous at their base. *Nect.* eleven permanent glands, alternating with the stamens. *Pist.* germs five, superior; styles tubular; stigmas simple. *Peric.* capsules five, disposed in the form of a star, oblong, pointed, one-celled, one-valved, opening lengthways. *Seeds* two, pedicelled, inclosed in an aril. Two trees of this genus are figured in the Flor. Peruv. pl. 12. Bosc.

**BRUNET**, in *Ornithology*, the name assigned by Buffon to *Fringilla peccoris*, which see. Thus also *Brunet du Cap de Bonne Esperance*, Buff. is *turdus capensis*, which see.

**BRUNET**, in *Geography*, a small island near the south coast of Newfoundland, at the entrance into Fortune bay. N. lat. 47° 15'. W. long. 55° 4'.

**BRUNET**, *Cape*. is the south point of the entrance into the bay of Arcasson, on the west coast of France, from

which a tail stretches off towards the sea, in the direction of W.S.W.

**BRUNETTE**, L.A. a strong and well-garrisoned fortress of Piedmont, near Sufa, commanding two vallies. By an article in the peace concluded between the French and the king of Sardinia, in April 1796, this fortress was to be dismantled.

**BRUNFELSIA**, in *Botany* (named by Plumier from Otto Brunfelsius of Mentz, who published the first good figures of plants in 1530, and died in 1534). Linn. 260. Reich. 281. Schreb. 1013. Willden. 1151. Juss. 127. La Marek. Bosc. Class, *pentandria monogynia*, Linnæus, Reichard, and Bosc; & *didynamia angiosperma*. Gmelin, Schreber, Willdenow, and La Marek. Nat. Ord. *Personata*—*Solanac.* Juss. Gen. Char. *Calyx* one-leaved, bell-shaped, five-toothed, obtuse, very small, permanent. *Cor.* one-petalled, funnel-shaped; tube very long, slightly curved inwards; border flat, with five blunt, nearly equal lobes. *Stam.* filaments four, very short; anthers two, a little higher than the others, prominent from the mouth of the tube (a fifth filament very small, abortive, Juss. & Bosc.) *Pist.* germ roundish, small; style thread-shaped, the length of the tube; stigma rather thick. *Pericarp.* a berry, Linn. Swartz, Juss. La Marek, Bosc; a capsule berried on the outside, one-celled, two-valved, opening by a distinct suture from the summit to the base, Schreb. Willd. Martyn. *Seeds* many, compressed, convex on one side, angular on the other, rugged, with little points.

Ess. Char. *Calyx* five-toothed, narrow; tube of the corolla very long; capsule one-celled, many-seeded, with a large fleshy receptacle.

Sp. 1. *B. Americana*, Linn. trumpet-flower. (La Marek Illust. Pl. 5+8.) "Leaves elliptic, acuminate, on longish petioles; tube of the corolla erect; lobes of the border entire." Swartz. A tree of a moderate size. *Trunk*, the thickness of the human body. *Branches* loose. *Leaves* alternate, very entire, narrowed towards the base, smooth. *Flowers* growing three or four together at the ends of the branches. *Tube* of a pale colour, sprinkled with violet spots; border at first very white, at length pale yellow. *Fruit* nearly spherical, a little larger than a nut, of an orange colour, containing numerous russet seeds placed between the external covering and a fleshy succulent substance which occupies all the inside. La Marek. A native of Jamaica, Martinico, and other West Indian islands. Cultivated by Mr. Miller, in 1739. 2. *B. undulata*. "Leaves lanceolate-ovate, drawn to a point at both ends; petioles very short; tube of the corolla curved; border waved." Swartz. A native also of Jamaica, &c.

*Obs.* Schreber's description of the receptacle not being reconcileable with La Marek's, and not being in itself very intelligible, has been omitted.

Both these species may be raised in the spring, either from seeds or cuttings, and should be treated like other tropical plants. In summer they should have much fresh air; but in winter must be kept close. With proper management they will produce flowers every season in June and July.

**BRUNI**, LEONARD, in *Biography*. See **ARETINO**.

**BRUNIA**, in *Botany*, (from Cornelius Brun, the celebrated traveller). Linn. 274. Reich. 293. Schreb. 376. Juss. 381. Gært. 152. Pl. 30. Willd. 428. Ventenat, vol. iii. p. 474. A genus formed by Linnæus for several shrubby plants, which have some resemblance in habit to *erica* and *protea*, and are allied in their mode of inflorescence to *statice*; but its distinguishing characters were not accurately fixed: for Linnæus afterwards separated from it two

of the original species, annexing one to *diosma*, and the other to *protea*, and admitted an additional one, which he had formerly referred to *physica*. Reichard was sensible that the species of Linnæus differ from each other in the number of styles and situation of the germ, but left them as he found them. Gærtner also observed, that the genus stood in need of a thorough investigation; and that the plants with an inferior ought to be separated from those which have a superior germ. In conformity with this idea, Schreber formed a new genus for the former, with the additional characters of two styles, either quite separate, or joined together, and filaments inserted on the calyx. This genus he called *levisanus*; but in honour of one of Linnæus's disciples, it has since been named *staavia*. The essential character of *brunia*, as it stands in Schreber, consists of a superior germ, single style, and stamens inserted on the claws of the petals. But the confusion was not yet completely removed; for two of the species with a superior germ have decidedly two styles. It was therefore necessary either to divide the original genus into three, or to allow to *brunia* a greater latitude with respect to the style. The latter has been preferred by the present French botanists, except La Marek; and we do not hesitate to adopt Ventenat's generic character of *brunia*, especially as it corresponds with Willdenow's disposition of the species, though the essential characters of *brunia* and *staavia* in the German author are both erroneous. We shall only add, that some obscurity nevertheless must remain, till we have new and accurate detailed descriptions of all the species taken from recent and complete specimens. Gen. Char. *Receptacle* common, chaffy. *Calyx* common, many-leaved. *Cal. proper*, inferior, with five segments. *Petals* five, elongate, upright, clawed. *Stam.* five, attached to the claws of the petals. *Pist.* germ superior; style single or double; stigmas two. *Pericarp*, a dry ovate drupe, containing a hard, two-celled nut, with but few seeds.

Ess. Char. *Stamens* on the claws of the petals; germ superior. *Pericarp*, a dry, two-celled drupe.

Species, 1. *B. nodiflora*, Linn. (La Marek, *Illust. Pl.* 126.) "Leaves three-sided, curved inwards; heads of flowers terminal, on the lateral branches." Thun. A branched, evergreen undershrub. *Leaves* very small, pointed, upright, closely imbricated, forming in the slender branches five longitudinal, somewhat spiral, angles. *Heads of flowers* whitish, about the size of a small cherry. *Styles* two. 2. *B. paleacea*, Linn. "Leaves three-sided, upright, closely pressed to the stem; heads corymbose, chaffy; chaff longer than the flowers." Willd. Similar to the foregoing. *Leaves* smaller. *Heads of flowers* many, paniced. *Receptacle* villous. *Styles* two. 3. *B. lanuginosa*, Linn. "Leaves linear, very slender, spreading, smooth; heads of flowers globular, smoothish, aggregate, terminal." La Marek. Little branches reticulated, with a woolly substance, in the manner of a spider's web, whence the trivial name. *Leaves* numerous, very small, smooth, tipped with a black point. *Heads of flowers* white, small, smooth, numerous. Bergius says, that the germ is inferior; but it appeared to La Marek in a dried specimen to be superior, incorporated with the top-shaped base of the flower. *Style* awl-shaped; stigma simple. If Bergius should prove to be right, and if, as the simple stigma seems to indicate, the fruit should be found one-celled, it must be removed to *staavia*. 4. *B. abrotanoides*, Linn. "Leaves linear-lanceolate, spreading, with three flat sides, callous at the points." Linn. A much branched undershrub, about a foot and half high. *Leaves* smooth, rounded. *Heads of flowers* small, smooth, terminating, many together, disposed somewhat in the form of an umbel. *Style* one, emarginate. 5. *B. verticillata*, Linn. jun. "Leaves with

three flat sides, obtuse, smooth; little branches whorled, fastigate; heads terminating." Linn. jun. *Heads* not globular. 6. *B. saporba*, Willd. "Leaves with three flat sides, thread-shaped, with callous points, spreading, ciliate-villous." Willd. "Edges of the leaves thinly ciliated with long hairs." 7. *B. fraganoides*, Willd. "Leaves with three flat sides, pressed to the stem; the edges and the midrib thickly ciliated." Willd. These two are inserted from their habit; the flowers not being known. 8. *B. ciliata*, Linn. "Leaves ovate, acuminate, ciliate," Linn. *Style* bifid. All the species are natives of Southern Africa.

*Observ.* La Marek, in the letter-press to his plates, has retained all the species under *brunia*; and, in contradiction to his own descriptions published some time before in the alphabetical part, has made a superior calyx part of its essential character. The germ of *B. nodiflora*, he now says, is certainly inferior; and it must be confessed, that he is in some degree supported by the high authority of Gærtner, who has figured the fruit of this species, and calls it semi-inferior; but through a strange inattention in the essential character, he describes the fruit as a capsule; in the general one, as a dry berry. He divides the genus into two families: 1. With globular heads of flowers destitute of leaves, comprising the species described above, except the two introduced by Willdenow, and the *ciliata* of Linnæus, which he appears to have discarded. 2. With heads surrounded by a lengthened, coloured calyx, forming a kind of involucre. This family consists of the two species, which have been referred to *staavia*.

Professor Martyn has inserted under *brunia*, only the *lanuginosa*, *ciliata*, and *verticillata*; assigning to *levisanus*, the *nodiflora*, *paleacea*, and *abrotanoides*, as well as the *radiata*, and *glutinosa*, which constitute the *staavia* of Willdenow, Ventenat, and Rose. See STAAVIA.

BRUNIA *levisanus*. See PROTEA *Levisanur*.

BRUNIA *uniflora*. See DIOSMA *Cupressina*.

BRUNIQUEL, in *Geography*, a town of France, in the department of the Lot, and district of Montauban; 8 leagues S.S.E. of Cahors.

BRUNN, JOHN-JAMES, in *Biography*, was born at Basle in the year 1591. Applying to the study of medicine, he was admitted to the degree of doctor in that faculty in 1615; and in succession was advanced to the rank of professor in anatomy, botany, and in the practice of medicine. To the last he was appointed in the year 1529, and he continued performing the duties of these offices to the time of his death, in 1650. His work is "Systema Materiæ Medicæ, continens Medicamentorum simplicium et compositorum Seriem ac Sylvam, Methodo medendi ac Formulæ Remediorum præferendis accommodatum," Bas. 1630, 8vo. The work has been many times re-published; and in 1680, with notes, by Gerard Blasius. Hall. Bib. Med. Eloy. Dict. Hist.

BRUNN, in *Geography*, a town of Germany, in the archduchy of Austria, 4 miles W. of Horn.—Also, a town of the same archduchy, 8 miles W. of Ebenfurth.

BRUNN, or BRIUN, a city and royal borough, the second town in rank, and the first in commerce, of Moravia, the capital of a circle of the same name, situated at the conflux of the rivers Schwartzschaw and Surtawa. Although this city is not large, it is well-built and populous; the number of inhabitants being estimated at 18,000. It has considerable manufactures of cloth, velvets, and plush. The diets of the state are held here, alternately with Olmutz. It is defended by a strong fortress called "Spilberg," erected on an eminence near the town, at the foot of which stand two cloisters of nuns, and an hospital of the knights of

Malta. The Prussians laid siege to this fortress in 1742, but were obliged to abandon the enterprise. In the town are six cloisters, the bishop's palace, a collegiate church, and a college of Jesuits. The cloister of Augustine hermits is famous for an image of the virgin Mary, pretended to have been made by St. Luke, and a foundation for young ladies. Brunn is distant about 3 miles S.W. of Olmutz. 100 S.E. of Pague, and 156 S.E. of Dresden. N. lat. 49° 10'. E. long. 16° 15'.

BRUNN, a circle of Moravia, bounded on the north by Bohemia, on the east by the circle of Olmutz and Ibradisch, on the south by Austria, and on the west by the circle of Iglau and Znaym. In this circle are many iron-mines and forges, medicinal springs, quarries of marble, glass-houses, and alum-works. It is said to contain 70 towns, and above 20,781 houses. The capital is Brunn.

BRUNNEA, in *Entomology*, a name given to a species of *MUSCA*, that is entirely of a brown colour. Linn. This is a native of Europe.

BRUNNEA, an East Indian species of *VESPA* of the larger kinds. The prevailing colour is dull, ferruginous; first and second segment black at the base. Fabr.

The legs and antennæ of this insect are ferruginous.

BRUNNEA, a species of *PHALÆNA*, having brown wings, with a large transverse yellow spot in the middle; margin chestnut brown. This is of the *Noctua* family, and inhabits Germany.

BRUNNEA, a species of *CHRYSOMELA*, of a small size, that inhabits New Holland. It is testaceous, with the suture of the elytra, and a small line in the middle, fuscous. Fabr. &c.

BRUNNEA, in *Natural History*, a species of *PLANARIA*, of an oblong shape, and brown colour, with a longitudinal black line. Müll. Hist. Verm. Its habitat unknown. This is nearly allied to *nigra*, another species of *PLANARIA*.

BRUNNEARIA, in *Entomology*, a species of *PHALÆNA* (*Geometra*), the wings of which are deep yellow, with a black margin above, and two black streaks beneath. This is a native of Italy.

BRUNNEATA, a species of *PHALÆNA* (*Geometra*), with ferruginous wings, and four abrupt brown bands. Inhabits Upsal. Borgstr. Inf.

BRUNNEN, in *Geography*, a populous village of Switzerland, in the canton of Schwitz, situate in the midst of a bay formed by a branch of the lake Lucern, or lake of the four cantons; celebrated for the treaty concluded in 1315, between Uri, Schwitz, and Underwalden, which gave birth to the Helvetic confederacy. It was again distinguished in April 1798, by being the place where deputies from the cantons of Uri, Schwitz, Underwalden, and Glarus, unanimously determined to maintain their independence, and to resist the innovations of the French. Brunnen is separated from Schwitz by a pleasant and fertile plain, laid out in meadows, and planted with fruit trees, and distant from it about 2½ miles S.W. N. lat. 46° 56'. E. long. 8° 2'.

BRUNNEOLUS, in *Entomology*, a Linnæan species of *ICHNEUMON*, peculiar to Europe. The pervading colour is black; abdomen and legs reddish; antennæ reddish, with the base black; posterior brown.

BRUNNER, BALTHAZAR, in *Biography*, born at Hall, in Saxony, the middle of the 16th century; adding himself to the study of medicine, was sent to the university at Erford, and afterwards to Leipzig, where he was admitted to the degree of doctor in that faculty. He then travelled over part of Italy, France and England, and having passed three years in those countries, returned to Hall, where he

acquired much reputation for his learning and for his skill in his profession. He died in 1604. A few years after his death, were published, collected from his papers, "Confilia medica, summo studio collecta et revisa, a Laurentio Hoffman, Halæ Sax." 1617, 4to. "De Scorbuto Tractatus duo," Svo.: since printed with the treatise of Eucalenus, written in a methodical manner, and giving an accurate account of the disease. Among other remedies, he recommends the juice of water cresses taken in milk-whey. Though attached to chymistry, in which he was allowed to be expert, he left no written documents on that subject. Haller Bib. Med. Eloy. Dict. Hist.

BRUNNER, JOHN CONRAD, a Swiss physician and anatomist of eminence, was born at Dieffenhofen, the 16th of January 1653. After passing through the usual school education, he was sent, at the age of 16, to Strasburg, where, applying assiduously to the study of physic, and anatomy, he was created doctor in medicine in 1672. For his thesis, he gave the anatomy of a child with two heads, which it was his fortune to meet with. He now went to Paris, and attended the schools and hospitals there, with such assiduity, as to attract the notice, and gain him the intimacy of Dionis and du Verny, who were present while he made the experiments on the pancreas, which enabled him, some years after, to publish a more accurate description of that viscus, than had been before given, under the title of "Experimenta nova circa Pancreas. Accedit Diatribe de Lympha et genuino Pancreatis usu," Svo. 1682, Leide. He proved that the fluid secreted by the pancreas is not necessary to digestion, and that an animal may live after that viscus is taken out of the body, having tried the experiment upon a dog, which perfectly recovered from the operation. On quitting Paris, he came to London, and was introduced to Dr. Willis, Lower, and Henry Oldenburg, secretary to the royal society. From England, he passed to Holland, and studied for some months at Leyden. At Amsterdam, he visited Swammerdam and Ruysch, with whom he afterwards corresponded. Returning home, he was made professor of medicine at Heidelberg, and first physician to the elector palatine, who conferred on him the title of baron de Brunn in Hamerstein. About the same time, he married one of the daughters of the celebrated Wepfer, and was elected honorary member of the academia naturæ curios. in return for some ingenious dissertations which he had communicated to them. In 1688, he published "Dissertatio Anatomica de Glandula pituitaria," 4to. Heidelb. From this time, he became in such great request, for his knowledge and success in practice, that he was, in succession, consulted by most of the princes in Germany. Among others, in 1720, he was sent for to Hanover, to attend the prince of Wales, afterwards king George II. In 1715, he published at Heidelberg, "Glandula Duodeni seu Pancreas secundum detectum," 4to. which was only an improved edition of his "De Glandulis in Duodeno Intestino detectis," which had been before twice printed. There are some other lesser works, the titles, and accounts of which are given by Haller, in his Bib. Anat. In the later edition of Wepfer's works are given dissections by our author, of the heads of some persons who died of apoplexy, of whom he had had the care. Though early afflicted with gravel, and in the latter part of his life with gout, he continued to attend to the calls of his patients, though living a great distance from his residence. When, in his 74th year, he went in great haste to Munich, to attend the elector Maximilian Emanuel, on his return, he was seized with a fever, which, in a few days, put an end to his existence, on the 2d of October 1727. Haller Bib. Anat. Eloy. Dict. Hist.

**BRUNNEUM**, in *Entomology*, a species of **HISTER**, described as a Swedish insect. The colour is ferruginous; wing-cases somewhat striated. Linn.

**BRUNNEUS**, a species of **CURCULIO** of a large size, found at the Cape of Good Hope. The general colour is brown; beak fuscous; wing-cases testaceous, and streaked with dots. Fabr. Gmel. &c.

**BRUNNEUS**, a species of **PTINUS** of a brown colour, with the wing-cases very smooth, with pubescent striæ. Linn. &c. A native of Europe.

**BRUNNEUS**, a species of **CRYPTOCEPHALUS**, found in Europe, that is described by Linnaeus. The colour is brown; abdomen fuscous; wing-cases smooth.

**BRUNNEUS**, a species of **ELATER** that inhabits Europe. The thorax is rufous, in the middle black; wing-cases and body ferruginous. Linn.

**BRUNNEUS**, a species of **CIMEX**, of an ovate form, and brown colour, except the wings, which are white. This is found in Europe, and is described as above by Linnaeus.

**BRUNNEUS**, a species of **ASILUS**, the thorax of which is cinereous, lincated with black; abdomen and legs brown, with black spots. Fabr. This kind is a native of Cayenne. The head is whitish; snout black; antennæ brown; abdomen cylindrical; wings white; legs at the tips black.

**BRUNNEUS**, in *Zoology*, a species of **COLUBER** of a brown colour, spotted with white; abdomen whitish. Boddaert. This is ferpens cobellas of Seba.

**BRUNNICIAND**, in *Entomology*, a small insect of the *Tortrix* tribe of **PHALÆNA**, named in compliment to Brunnich. This species which inhabits Germany, and the north of Europe, has the wings of a fuscous colour, with a common rhomboid white spot on the back. Fabr.

**BRUNNICHELLA**, a species of **PHALÆNA** of the *Timea* tribe, named after Brunnich. It is of a black colour with three violaceous bands. Vandelli, &c. Inhabits Europe.

**BRUNNIPES**, a species of **TENEBRIO**, the size of which is small. It is of a black colour, very smooth and glossy; wing-cases striated; antennæ and legs ferruginous. Fabr. &c. Inhabits Europe.

**BRUNNIPES**, a species of **STAPHYLINUS** of a black colour, with the legs and antennæ at the base and tip ferruginous. Inhabits Europe.

**BRUNNUS**, a species of **CERAMBYX** of a brown colour; thorax armed with three spines; wing-cases obtuse, with two obscure elevated striæ; antennæ compressed and short. Inhabits North America. Gmel. &c. *Obs.* The *Cerambyx pensylvanicus* of Degeer.

**BRUNNUS**, a species of **SPHINX**, (*Scfa*), the wings of which are brown, and without spots; posterior ones emarginate. A native of Surinam. Fabr.

**BRUNO**, **GIORDANO**, in *Biography*, a bold innovating philosopher of the 16th century, was born at Nola in the kingdom of Naples; and, though he first entered among the Dominicans, the freedom of his religious opinions rendered it expedient for him to seek a refuge at Geneva in 1582. But the rigid system of orthodoxy, inculcated by Calvin and Beza, obliged him to leave this city, after a residence in it of two years, and to return to Paris; where, notwithstanding his opposition to the Aristotelian philosophy, he was allowed, for some time, to deliver public lectures in the university. In 1586, he defended for three days, at a solemn disputation, opinions concerning nature and the world, which he published in 1588, at Wittemberg, under the title of "*Acrotismus, seu Rationes Articulorum Physicorum adversus Peripateticos Parisiis propolitorum.*" Before this time, he took a journey to England, and formed

an acquaintance with sir Fulk Greville, and sir Philip Sydney, to the latter of whom he dedicated two works. From Paris, he removed to Wittemberg, and made an open profession of Lutheranism. After a temporary residence at Helms-tadt, and at Frankfort, where he superintended an edition of his numerous works, printed by John Wechel, he settled at Padua; but being arrested, he was first confined in the prison of the inquisition at Venice, and afterwards at Rome. After two years' confinement, he was condemned by the inquisitorial tribunal, and burnt alive in February 1600. The crimes that have been alledged against him, were his Lutheran heresy, his desertion from the Dominicans, and his atheistical opinions. Bruno was of a paradoxical turn of mind, and of a confident sanguine disposition; fond of advancing novel and fanciful sentiments, but confused and obscure in his method of explaining them. Bayle and La Croze have charged him with founding his philosophy on the principles of Spinoza; but, in reality, he attempted to unite the ancient emanative and atomic systems. In his works are found obscure hints of the vortices of Des Cartes, the atoms of Gassendi, the optimism of Leibnitz, and the celestial physics of Copernicus; but his suggestions on these topics are very darkly and inaccurately expressed; and he seems to have been more distinguished by his bold attack of ancient errors, than by his introduction and establishment of new truths. One of his most famous works is "*Spaccio della Bestia trionfante,*" or the demolition of the triumphant beast; Lond. 1584, a work satyrizing many received systems of religion, and charged with advancing atheistical opinions. Besides several philosophical and theological writings, he was the author of an Italian comedy in prose, entitled "*Il Candelaio,*" and of some Latin poetry.

Toland's *Posthumous works*, vol. i. *Gen. Diss.* Brucker's *Hist. Philos.* by Enfield, vol. ii. *Spectator*, N<sup>o</sup> 389. vol. v.

**BRUNO**, a saint of the Roman church, and founder of the order of Carthusians, was born at Cologne, about the year 1040, and studied at Rheims, where he became a canon and regent of the public school. Compelled to leave Rheims by the tyranny of Manasses, the archbishop, he determined, in 1080, to retire from the world to the desert of Chartreux, where, in 1084, he founded his new order. After residing in this solitude for 6 years, he was summoned to Rome by pope Urban II., who had been his scholar at Rheims; but disgusted with the manners of the capital, he withdrew to Calabria; and declining to accept the archbishopric of Reggio, he obtained from count Roger a forest, with its adjacent district, named la Torre, near Squillace, where he founded the second house of his order. In this retreat he died in 1101; and he was canonized by pope Leo X., in 1514. His works, which are enumerated by Cave, have been confounded with those of his contemporary St. Bruno of Segni, who flourished about the year 1087, and died in 1125. The principal treatises of Bruno, the Carthusian, are a "*Commentary on the Psalms,*" and another "*On St. Paul's Epistles,*" besides several collections of sermons, and two letters to his disciples. A collection of his works was printed at Paris in 1524 and at Cologne in 1611, 3 vols. fol. Cave's *Hist. Lit.* vol. ii. p. 158.

For an account of the order established by Bruno, see **CARTHUSIANS**.

**BRUNO**, **JAMES PANCRACE**, born at Altdorf on the 23<sup>d</sup> of January 1629, after receiving a liberal education in his own country, was sent to Padua, where he was admitted doctor in medicine in 1653. Returning thence, he settled at Nuremberg, and soon became distinguished for superior learning and abilities. In 1662, he was invited to accept the chair of professor in medicine by the university at Alt-

dorf, his native city, and he continued in that office to the time of his death, October 13, 1700. Besides his commentaries upon many parts of the works of Hippocrates, and his edition of the *Hexagone medica* of Gaspar Hoffman, Bruno published "Oratio de Vita, Moribus, et Scriptis Gasp. Hoffmanni, Lepii." 1664, 12mo. "Dogmata Medicinæ generalia in ordinem noviter redacta," Norib. 1670, 8vo. "Ca tellus renovatus, hoc est. Lexicon Medicum correctum et ampliatum," 1682, 4to. The additions to this work are numerous and valuable, and the volume, so improved, has been frequently reprinted. "Mantissa Nomenclaturæ Medicæ hexaglotte; Vocabula Latina Ordine alphabetico, cum annexis Arabicis, Hebræis, Græcis, Gallicis et Italicis præponentis," Noribergæ 1682, 4to. "Epitome, Elementa veræ Medicinæ complectens," Alt. 1696, 8vo. "Monita et peritima Medicinæ miscellanea," *ibid.* 1698, 4to. His son Frederic James, born at Altdorf in 1665, following the steps of his father, was made doctor in medicine at the university there, in 1697, and practised in that art with considerable credit, to the time of his death, 1727. Haller Bib. Eloy. Diët. Hist.

BRUNO, in *Geography*, a river of Italy, which runs into the lake of Castiglione, near Buriano, in the duchy of Tuscany.

BRUNOR, Buffon, in *Ornithology*. See LOXIA BICO-1OR, or orange-bellied grosbeak.

BRUNOY, in *Geography*, a town of France, in the department of the Seine and Oise, and district of Corbeil; 2 leagues N. of Corbeil.

BRUNSBURG, a town of Germany, in the circle of Westphalia, belonging to the order of Corvey; 4 miles W. N. W. of Hoxter.

BRUNSBUTTLE, a sea-port town of Germany, subject to Denmark, in the circle of Lower Saxony, and duchy of Holstein, on the north side of the Elbe; 40 miles N. W. of Hamburg. N. lat. 44° 30'. E. long. 8° 42'.

BRUNSFELS, Οἶνον, in *Biography*, a celebrated restorer and improver of botany, was born at Mentz, the end of the 15th century. He received his education at Solmes, a town in that neighbourhood; and having taken the degree of master of arts, entered a monastery of Carthusians at Mentz, where he resided some years. Embracing at length the tenets of Luther, he left the monastery, and went to Strasburg, and opened a school for the instruction of youth. In this employment, undertaken to procure a maintenance, he continued nine years, reading, during the vacations, the Greek, Arabic, and Latin writers on medicine; in which he became so expert, that in the year 1531, he was enabled to publish new editions of the works of Serapion, Averboes, and Rhazes. He had the preceding year taken his degree of doctor in medicine at Basle. Soon after, he settled at Berlin, and was made physician to that city, where he died on the 10th of November 1534. Whilst at Strasburg, he published two small tracts to facilitate the study of grammar to children, annotations on the gospels, and on the acts of the apostles, and an answer to Erasmus's *Spongia*, in defence of Hutten. The following are the principal of his botanical and medical works. "Catalogus illustrium Medicorum," 4to. 1530. "Herbarum vivæ icones, ad Naturæ imitationem, summa cum diligentia et artificio efficiatæ, cum effectibus earundem," fol. vol. iii. 1530, 1531, 1536. The plates are much commended by Haller, who, on account of this work, ranks the author among the restorers of botany. "Theses, seu communes loci totius Medicinæ, etiam de usu Pharmacorum, Argentinæ," 1532, 8vo. "Onomasticon Medicinæ, nomina continens omnium stirpium, &c. Argent." 1534, folio. For his great skill in medicine, he was thought deserving of the following:

"Te nato, defuncta fere medicina revixit:

Præonii vindex nomenis tuus eras."

Adami Vitæ Medic. German. Haller Bib. botan.

BRUNSFELSIA, in *Botany*. See BRUNFELSIA.

BRUNSTATT, in *Geography*, a town of France, in the department of the Upper Rhine, and district of Altkirch; 7 miles N. of Altkirch.

BRUNSTEIN, a mountainous bailiwick of Germany, in the principality of Calenberg, lying on the Leine and Ruhme, and comprehending 6 villages. The chief trade of the inhabitants consists of thread and linen.

BRUNSVIGIA, (Heist), in *Botany*. See AMARYLLIS ORIENTALIS.

BRUNSWICK, *duchy of*, in *Geography*, is a district of Germany, in the circle of Lower Saxony, bounded on the north by the duchy of Lunenburg, on the east, by the duchy of Magdeburg and the principalities of Anhalt and Halberstadt, on the south, by Thuringia and Hesse, and on the west, by the principality of Minden, and county of Lippe, or by the circle of Westphalia, from which it is separated by the river Weser. Its capital is Brunswick. The territory of the duke of Brunswick, commonly called the principality of Wolfenbuttle, from a less important town than Brunswick, includes 1472 square miles, and 170,000, or, as some say, 185,000 inhabitants. It is fertile in corn and pastures, and abounds with mines and game: it has also several medicinal springs and extensive forests; but its manufactures and commerce, which were once flourishing, have sustained considerable injury by the German wars of the 17th century. Its principal rivers are the Weser, Ocker, Leye, Ilmenau, and Viper. The territories belonging to the house of Brunswick extend far beyond the limits of this duchy, and comprehend, besides Wolfenbuttle, Grubenhagen, Calenberg, and Gottingen, the principalities and duchies of Lunenburg, Hanover, Zell, Ultzen, Danneberg, Marpuy, Giffhorn, Einbeck, and Hamelen, which see respectively.

BRUNSWICK, a city of Germany, in the circle of Lower Saxony, and district of Wolfenbuttle. It is the capital of the preceding duchy, and the residence of the prince, to whom it belongs, and who is usually styled the "duke of Brunswick and Wolfenbuttle." The town is situated in a plain, on the banks of the Ocker, which enters the plain by two branches, but within it, separates into a greater number of streams, that unite again at its issue out of the city. It is accordingly divided into five different parts, called the Old Town, the New Town, the Hagen or Burg, the Old Wieck, and the Sack. The form of the town is nearly square, and its extent about 2 miles in circumference. The houses in general are old, and constructed of wood; but many new buildings have been lately erected, and the city is every day acquiring fresh beauty. It has several churches, one of which is for the accommodation of the Lutheran worship, which is the prevalent religion of the place, and others appropriated to the French and Dutch calvinists, and to the Roman catholics. Among the public buildings, we may reckon the prince's palace, to which is annexed a library, containing a curious collection of scarce and curious bibles, or fragments of bibles in several languages, to the number of above 1000 volumes; the academy for martial exercises; the armoury; the Caroline college founded by duke Charles, and erected in 1745; the opera-house; the play-house; the "packhofe" where all goods, imported or exported, are rated and taxed; the council-house where the magistrates meet; the "Autorkof," assigned in 1681 to the foreign dealers, at the fair, for the security and more convenient sale of their goods; the mint; the work-house or house of correction;

correction; the orphan-house, which since the year 1753, has had annexed to it a Latin school, with a printing-house and book-shop; two gymnasia, with an anatomy and surgery school, founded by duke Charles, and opened in 1751; a college for the study of physic, instituted in 1757; a large lazaretto; and a hospital. With respect to the academy at Brunswick, Dr. Moore informs us, (*View of Society and Manners in France, &c.* vol. ii. p. 70.) that it has been new modelled, and the plan of education improved, by the attention, and under the patronage of the hereditary prince. Students now resort to it from many parts of Germany, and some even from Great Britain. Such of them as are intended for a military life, will find advantages in this academy, superior to those that may be had at any other place on the continent. They will here be under the protection of a family partial to the British nation; every branch of science is taught by masters of known abilities; the young students will see garrison duty regularly performed, and may, by the interest of the prince, obtain liberty to attend the reviews of the Prussian troops at Magdeburg and Berlin: and they will have few temptations to expence in a town, where they can see no examples of extravagance; they will have few opportunities of dissipation, and none of gross debauchery.

The reigning prince of Brunswick is said to administer the finances of the state with wife frugality, and to diminish the debts, in which, at his accession to the duchy, he found himself involved. As the father of his people, he employs his power to increase their prosperity and happiness. Many of their former burdens are already diminished, and property is not heavily taxed, and the finances are daily advancing to a better condition.

Brunswick is strongly fortified; and on the ramparts it has a mortar-piece of brass, 10½ feet in length, and 9 feet 2 inches in circumference, and weighing 1800 quintals, which will carry a ball of 730 lbs. weight to the distance of 33,000 paces, and throw a bomb of 1000 lbs. weight; but it requires 52 lbs. of powder for a charge. Although fortifications have occasioned much calamity to many towns in Germany, by attracting the vengeance of enemies, so that many of them are now dismantled; those of Brunswick were of singular utility in 1761, when they preserved the town from being pillaged, and afforded prince Frederick an opportunity of gaining signal honour. When the town was besieged by a body of 20,000 men under prince Xavier of Saxony, prince Ferdinand detached 5000 of his army under his nephew Frederick, assisted by general Luckner, with order to make an attempt for raising the siege, and saving his native city. The prince dispatched a messenger to the governor, with a letter wrapped round a bullet, and which he was instructed to swallow, in case of his being taken by the enemy. However, he had the good fortune to make his way into the town; and the prince, in the middle of the night specified in the letter to the governor, fell suddenly on the enemy's cavalry, who, unsuspecting of his approach, were encamped carelessly within a mile of the town; and having by this sudden movement dispersed the cavalry, he produced an alarm among the infantry, which occasioned their retreat. Early in the morning, the young prince entered Brunswick, amidst the acclamations of his fellow-citizens, whom he had relieved from the horrors of a siege. On the arrival of his brother, the hereditary prince, at his father's palace, he found Frederick at table, entertaining the French officers, who had been taken the preceding night.

Brunswick was formerly one of the Hanse towns, and governed as a republic: but when it became a fortified city, its commerce was injured, and its population diminished.

Its number of inhabitants is now estimated at about 22,000; the peasants are sober and laborious, and as they are robust, though clownish, they make good soldiers. They have several manufactures in the town; but one of the chief employments of the people is spinning wool and flax: and they are provided with an excellent institution for supplying the poor with these means of subsistence. This institution furnishes all who chuse to apply with the materials, and they are paid for their labour on the same terms with those of the manufacturers; and yet, what arises from the sale of the yarn and thread, is sufficient to defray all the expences of the establishment. Adults perform this work at their own habitations; but 200 children work every day in the house, and are there also instructed in reading and writing. The first spinning wheels are said to have been invented in this place in 1530, by a statuary, named Jurgen. The strong beer of Brunswick, called "Mum," after the name of its inventor, Christian Mummen, is exported to various parts of Europe, and even Asia. Brunswick has two considerable fairs every year.

Brunswick appears to have been in being so early as the 8th century. In 775, it is said, that the emperor Charles the Great came to the Ocker, which runs through "Brunonis vicum," or Brunswick; and it is also related, that in the beginning of the 8th century, bishop Swibert with his train of followers went to Saxony, and coming to a large town called Brunswick, preached there, and converted great numbers. Hence, it has been thought not improbable, that the place was founded by duke Bruno, son-in-law to duke Witikind, if not by his father duke Bruno of Enjern. Bruno I. margrave of Saxony, is said to have enlarged and embellished this city A. D. 955. In the time of Henry the Lion, it consisted of five precincts, within its separate wall; but this duke, in 1177, inclosed them all within one wall. In 1314, the burghers of Brunswick were discharged from all kinds of villanage; and in 1345, the citizens by mortgage acquired the government of the town, and arrogated other immunities, which were the occasion of severe and tedious contests between them and the duke. At length, in 1671, duke Rudolphus Augustus made himself master of the town after a long siege, by means of the cannon which had been lent him by the inhabitants for another purpose; and he erected a citadel to secure their subjection. In 1757, it was taken by the French, but evacuated in the following year: and an unsuccessful attempt was made against it in 1761. Brunswick is distant 7 miles N. of Wolfenbuttel; in N. lat. 52° 15' 43". E. long. 10° 35'.

BRUNSWICK, FAMILY OF, in *History*. This ancient and illustrious house is descended from the marquis of Azo of Este, who was proprietor of the Milanese, the state of Genoa, and several other countries in Lombardy. About the year 1040 he married Cunigunda, or Cuniza, heiress of the first Welfs, or Guelfs, earls of Alost, in Suabia; and their son Welf, or Guelf, obtained the duchy of Bavaria of Henry IV. in 1071. His grandson, Henry duke of Bavaria, acquired Brunswick along with Saxony. In 1195, William, son of Henry the Lion, and of Matilda, or Maude, eldest daughter of king Henry II. of England, in whom was united the Anglo-Saxon and Norman blood, acquired Lunenburg; and his son Otho, in 1235, was the first duke of Brunswick and Lunenburg. His son, Albert I. in 1252, was furnished the Great. Magnus II. in 1268, was furnished Torquatus, from a large chain which he wore. His son, Bernard, retained Lunenburg; while Brunswick passed to Henry the second son, and continued in the line of his descendants till the year 1434. The dukes of Lunenburg acquired some small portions of adjacent territory. Henry being put to the ban of the empire, in 1521, was suc-

succeeded by his son, who only assumed the title of duke of Zell, a title which continued till the reign of George William, in 1645. In 1617, Christian, duke of Zell, obtained possession of Grubenhagen. In 1692, George William, duke of Zell, consented that the electorate, instituted in favour of his family, should be conferred on his younger brother, as he had no male heir. Ernest did in 1678, having married Sophia, daughter of Elizabeth, daughter of James I. of England. He was succeeded by his son George Lewis, elector, in 1698, and king of England, in 1714, who, in 1715, added to his family the duchy of Bremen, with the principality of Verden. In 1727, he was succeeded in the British throne and electorate by his only son, George Augustus, or George III. from whom, in 1760, they devolved upon his grandson, our present sovereign, George III.

*Brunswick Lounsburg*, or *Lounsburg*, in *Geography*, an electorate of Germany, the territories of which are chiefly situated in the circle of Lower Saxony, is frequently denominated, from its capital, the electorate of Hanover; which see. See also LUSEBURG.

BRUNSWICK, *Wolfenbüttele*. See *Duchy of BRUNSWICK and WOLFENBÜTTELE*.

BRUNSWICK, *Nova*, a province in the northern part of Nova Scotia, according to the division of 1784, the other retaining the original name, lies on the north west of the bay of Fundy, and is bounded on the south by the north shores of this bay, and by the river Missiquash to its source, and from thence by a due east line to Verte bay, and on the west by a line running due north from the main source of St. Croix river, in Passamaquoddy, to the high lands, which divide the streams that fall into the river St. Lawrence, and the bay of Fundy; and from thence by the southern boundary of the colony of Quebec, until it touches the sea-shore at the western extremity of the bay of Chaleur; then following the course of the sea-shore to the bay of Verte, in the straits of Northumberland, until it meets the termination of the eastern line, produced from the source of the Missiquash already mentioned, including all the islands within the said limits. The towns of this province are the capital Fredericktown, seated about 90 miles from the estuary of the river St. John, St. Ann's almost opposite to it, St. Andrew's and St. John's. In 1784, another town, near the mouth of the river St. John, was erected, under the appellation of New Brunswick, into the metropolis of the province so called. There are some other settlements near the bay of Fundy, with a fort called Howe. A tribe of savages, called the Marcehtes, inhabits this province, and they are estimated at 140 fighting men. It has two considerable bays, several lakes, among which the grand lake is 30 miles long and about 9 broad; and its chief rivers are St. John's, Magegadavick, or eastern river, Dickwesset, St. Croix, Merrimichi, Petitcodiac, and Memram-Cook, all of which, except the three last, discharge themselves into Passamaquoddy bay. St. John's river is navigable for vessels of 50 tons about 60 miles, and for boats about 200; the tide flowing about 80. It opens into a vast extent of country, in which are rich vales and meadows under cultivation; and the upland is in general well-timbered; the trees being pine and spruce, hemlock, and hard-wood, principally beech, birch, maple, and some oak. The pines on St. John's river are the largest in British America, and afford a considerable supply of masts for the royal navy. The fish are salmon, bass, and sturgeon. This river affords a common and near route to Quebec. The river St. Croix separates New Brunswick from the province of Maine, belonging to the United States. The rivers which fall into Passamaquoddy bay have on their banks meadows and vales,

and must formerly have been covered with a large growth of timber, as the remains of large trunks are still visible. The great chain of the Appalachian mountains passes on the north-west of this province, probably terminating at the gulf of St. Lawrence. The chief products of this province are timber and fish. See NOVA SCOTIA.

BRUNSWICK, a county of America, in Virginia, lying between Nottaway and Meherrin rivers; is about 38 miles long, and 35 broad, and contains 12,827 inhabitants, including 6776 slaves.—Also, a maritime county, in the district of Wilmington, North Carolina, containing 3071 inhabitants, of whom 1511 are slaves. This is the most southerly county of the state, having South Carolina on the south-west, and bounded by cape Fear river on the east. Smithville is the seat of Justice.—Also, the chief town in the above county, seated on the west side of cape Fear river; and formerly the best built in the whole state, and carrying on the most extensive trade. It lies about 17 miles S. W. of Wilmington, and was formerly the seat of government; but in 1780 it was consumed by the British forces, and has now only three or four houses, and an elegant church in ruins. N. lat. 34° 2'. W. long. 78° 12'.—Also, a township in Essex county, Vermont, on the west bank of Connecticut river, opposite to Stratford, in New Hampshire.—Also, a city in Middlesex county, New Jersey, situate on the south-west bank of Rariton river, in a low situation, under a hill rising to the west of the town. It has between 200 and 300 houses, and about 2500 inhabitants, one half of whom consists of Dutch. This town has a considerable inland trade, and over the river, opposite to this city, is one of the most elegant and expensive bridges in America. It is 13 miles N. from Princeton, 60 N. E. from Philadelphia, and 35 S. W. from New York. N. lat. 40° 30'. W. long. 74° 30'.—Also, a town of Cumberland county, in the district of Maine, lying 30 miles N. E. of Portland, and of Bolton 151, on the south side of Merry-meeting bay, and partly on the south-western side of Androscoggin river. It contains 1387 inhabitants; and is the seat of Bowdoin college. N. lat. 43° 52'. W. long. 69° 58'.—Also, the chief town of Glynn county, in Georgia, situated at the mouth of Turtle river, where it empties into St. Simon's sound. N. lat. 31° 10'. The harbour is safe and spacious enough to contain a large fleet. The town is regularly laid out, but not finished. From its advantageous situation, and the fertility of the back country, it promises to be one of the most commercial and flourishing places in the state. It is distant 19 miles S. of Darien, 60 S. S. W. of Savannah, and 110 S. E. of Louisville. N. lat. 31° 14'. W. long. 81° 45'.

BRUNSWICK *bay*, one of the Hudson-bay company's settlements, situate on Moose river, half way from its mouth; S. W. from James's bay, and N. E. from Lake Superior. N. lat. 50° 15'. W. long. 85° 31'.

BRUNSWICK *green*, *Frieze-land-green*. This colour is largely used for the bluish greens of paper-hangings, and other coarse kinds of painting in water colours. It is prepared in the following way. Take a barrel, or any other close vessel of wood or earthen ware, and fill it half full of filings or clippings of copper; then pour in a saturated solution of sal-ammoniac, sufficient to moisten the whole thoroughly: put on the cover of the vessel, and set it in a warm place. In a few hours the copper will begin to decompose the sal-ammoniac, and form muriat of copper, ammonia being at the same time disengaged. The muriated oxyd absorbs a considerable quantity of moisture, on which account it is requisite from time to time to add fresh portions of dissolved sal-ammoniac, till, in the course of a few weeks, nearly the whole of the copper is converted into oxyd. The contents of the barrel are

are now to be emptied and passed through a sieve in a tub of water, by which the unoxidated copper will be separated from the pigment, which will pass into the water. This being well washed, and slowly dried in the shade, is pure Brunswick green. Three parts muriat of ammonia, and two of copper yield six parts of the green. It is rarely, however, that pure Brunswick green is met with, as it is largely adulterated with cerusse.

BRUNTRUT, or PRUNTRUT, in *Geography*. See PO-RENTRU.

BRUNUS, in *Biography*, an Italian physician and surgeon of great name in his time, flourished in the early part of the 14th century, and is said to have been intimate with Petrarch. He was author of "Chirurgia Magna et Parva," published at Venice in 1450 in a collection of chirurgical treatises, fol. which has been several times reprinted. The *Chirurgia* is a compilation, taken from the Greek and Arabian physicians, principally from Albucasis, from whom he describes the operation of cutting for the stone in the bladder. In the fistula of the anus he recommends opening the sinuses, without which, we cannot, he says, be certain of curing. Haller. Bib. Chirurg. Eloy Dict. Hist.

BRUNUSEE, a town of Germany, in the duchy of Stiria; 12 miles W. of Rackerburg.

BRUSA, a town of Turkey, in Asia, built by Prusias, the friend of Hannibal. It is still extensive and populous, but the streets are narrow. Many houses are built so much against the hill, that the upper rooms open into the gardens. They reckon 70 mosques, but most of them are neglected, or absolutely in ruins. The police is ecclesiastic. The bazaar is ample, and one of the khans is singularly commodious. The sale of raw and manufactured silks constitutes its commerce.

BRUSA-SORCI, in *Biography*. See RICCIO.

BRUSCH, in *Geography*, a river of France, which runs into the Rhine at Strasburg. It forms a canal by means of Sluices from Molsheim.

BRUSCIO, a town of Swisserland, in the Valteline, situated near a river which discharges itself into the Adda. N. lat. 46° 9'. E. long. 10° 3'.

BRUSCUS, in *Botany*. Ger. See RUSCUS.

BRUSEGANA, in *Geography*, a town of Italy, in the Paduan; 4 miles W. N. W. of Padua.

BRUSH, an assemblage of hairs or hogs bristles, fastened in the holes of a wooden handle or board, pierced for that purpose, and serving to cleanse divers bodies by rubbing therewith. Of brushes there are a flat, or square brush, cloaths-brush, head-brush, horse-brush, beard-brush, comb-brush, weavers-brush, and the like. The manner of making brushes, is by folding the hair or bristle in two, and bringing it by means of a pack-thread, or wire, engaged in the fold, through the holes wherewith the wood is pierced all over, or fastened therein with glue or pitch. When the holes are thus all filled, they cut the ends of the hair to make the surface even.

BRUSH, *Painter's*. See PENCIL.

BRUSH, *Sheermen's*, is made of wild boars' bristles, and serves to lay the wool or nap of cloth, after sheering it for the last time.

The fish-brush is of use in medicine, especially in case of rheumatisms, and certain cutaneous disorders. See FRICTION.

The brush is also applied to the soles of the feet of newborn infants, when fainting, to find whether they be alive or dead.

BRUSH, in *Electricity*, denotes the luminous appearance of the electric matter, issuing in a parcel of diverging rays, from a point. Beccaria ascribes this appearance to the force

with which the electric fluid, going out of a point, divides the contiguous air, and passes through it to that which is more remote. See *Plate, Electricity*. See STAR.

BRUSHES, *wire*, are used by silver-smiths and gilders, for scrubbing silver, copper, or brass pieces, in order to the gilding of them.

There is a method of dying or colouring leather, performed by only rubbing the colour of the skin with a brush. This the French leather-guilders called *brouffire*; being the lowest of all the sorts of dye allowed by their statutes.

BRUSH of a *fox*, among *Sportsmen*, signifies his drag or tail, the tip or end of which is called the chape.

BRUSH *iron-ore*, signifies a kind of ore full of *friez*, resembling the hair of a brush.

BRUSH is also used in speaking of a small thicket or copse. In this sense, the word is formed from the middle age Latin *bruscia*, *bruscus*, which signifies the same.

BRUSH-wood denotes smaller slender wood or spray. See BROWSE.

BRUSHING. Among *Jockies*, a brushing gallop denotes a brisk one: a horse should have his brushing gallop in a morning before watering.

BRUSINSKOL, in *Geography*, an island of Russia, in the lake of Onzkoë; 40 miles S. E. of Petrovaskoi.

BRUSKAU, a town of Poland, in the palatinate of Braclaw; 48 miles N. N. W. of Braclaw.

BRUSLEE ISLAND, lies on the coast of France, in the English channel, below the Seven Islands, and Lanion haven and river.

BRUSQUET, LE, a town of France, in the department of the Lower Alps, and district of Digne; 5 miles N. N. E. of Digne.

BRUSSELS, in Latin *Bruxelle*, in Flemish *Bruxellas*, a large and handsome town, annexed to France, being the chief place of the department de la Dyle. It was formerly the capital city of Brabant, and of the Austrian Netherlands; where the governor-general held his court with all the splendour of royalty. It is situated partly on a hill and partly in a vale, on the banks of the river Sennæ, which runs through the town. Various etymologies are given to the name of Brussels: it has been derived from *Brugge-Senne*, bridge on the Sennæ; from *Brugsel*, hermitage bridge; from *Broyfcell*, a nest of swans, on account of the number of those birds found in the adjacent river and marshes; and from *Brouffilles*, bushes, it being formerly surrounded by woods. It is highly probable that the ancient forest of Ardenne extended to this place; and that the present forest de Soigne was part of it. Brussels was not existing in the 7th century. It owes its origin to a little island formed by two branches of the river, on which St. Gery, or Gaugerie, bishop of Cambrai, built a chapel and preached the gospel to the heathens who were seated in the vicinity; he died in 619. In 1044, the town, being considerably enlarged, was surrounded by a wall, and fortified with towers, of which traces are still remaining. A second, more extensive inclosure, took place in 1379, and now exists, but the town extends itself far beyond; since many villages are become its suburbs, by a continuity of buildings and streets. Brussels is ornamented by many handsome public structures. The principal church is collegiate, dedicated to St. Gudule, and was built in 1047, but rebuilt between 1226 and 1273. The palace displays considerable taste and magnificence, and formerly contained one of the most beautiful chapels in Europe, which escaped the great conflagration in 1731, but was pulled down in 1777 to make way for the erection of the new square called Place Royale. The town-house, or guild-hall, was built in 1442; it has a steeple 364 feet high, surmounted by a colossal statue, 17 feet high, of St. Michael with the dragon under

under his feet, which turning on a pivot, acts as a vane. The park in the upper town (anciently part of the forest de Soigne,) is a beautiful promenade, and has a public pleasure-garden in one of its groves. The green walk near the canal has a pleasing appearance, being two miles in length. Besides the place royale, Brussels is ornamented with seven squares or market-places. The principal are the great market, the place St. Michael, the corn-market, the petit sablon, and the grand sablon, where a beautiful fountain was erected by lord Aylesbury. In this town are twenty public fountains, adorned with statues, &c. the most remarkable is the manneke pitt, on which is represented a child in brass, which is so admirably executed that it has excited the notice of many connoisseurs, and particularly the elector palatine in 1698, and Lewis XV. in 1747. The population of Brussels is estimated at 80,000. In Timbeau's Statistical View of France, its four parts or cantons are represented as containing 66,297 inhabitants, and including  $7\frac{1}{2}$  kilometres, and one commune. It had formerly considerable trade in the manufacture of camlet and tapeltry, which is now on the decline: but its lace is still in high estimation, as the most beautiful in the world. Its carpets are also noted all over Europe. This town has suffered frequently by war: it was bombarded in 1695 by marshal Villeroy; and besieged, in 1708, by the elector of Bavaria, and in 1746, by marshal Saxe. It was taken by the French in the summer of 1794. Charles II. king of England, and his brother the duke of York, made Brussels their occasional residence during the usurpation of Cromwell. This town has given birth to many celebrated men: among others are, Duquesnoy, Vanhelmont, St. Aldegonde, Breugh Cham-paigne, D'Artois, and other painters. Brussels is 21 miles S. of Antwerp, 26 S. E. of Ghent, and 141 N. by E. of Paris. N. lat.  $48^{\circ} 51'$ . E. long.  $4^{\circ} 28'$ .

BRUSSELS, ROGER *of*, in *Biography*. See VANDER WEYDE.

BRUSSOW, in *Geography*, a town of Germany, in the circle of Upper Saxony, and Ucker Mark of Brandenburg; 12 miles N. E. of Prenzlau.

BRUSTERVORT POINT is situate in the Baltic sea; 3 leagues N. by W. from Koningburg deep, and 16 leagues N. E. by N. from Memel deep.

BRUSZILOW, a town of Poland, in the palatinate of Kiof; 46 miles W. of Kiof.

BRUTA, in *Zoology*, is the second order of animals in the MAMMALIA class, the character of which consists in having no fore teeth in either jaw. The genera of this class are, *bradytus*, *myrmecophaga*, *manis*, *dasytus*, *rhinoceros*, *elephas*, and *trichecus*; which see.

BRUTE, or BEAST, a term generally applied to quadrupeds, and also to other animals, and implying inferiority of intellect.

Among brutes, the monkey kind, both in the external shape and internal structure, bear the nearest resemblance to man. In the monkey-kind, the highest and the most nearly approaching the likeness of man, is the orang-outang, or *homo sylvestris*.

Philosophers are much divided about the essential characters of brutes. Some define brute as an animal not risible, or a living creature incapable of laughter; others, a mute animal, or a living thing destitute of speech; the Peripatetics, an animal endowed with a sensitive power, but without a rational one. The Platonists allow reason and understanding, as well as sense, to brutes, though in a degree less pure and refined than that of men. Indeed, the generality of the ancient philosophers thought that brutes reasoned: this, among the heathens, was the opinion of Anaxagoras, Porphyry, Celsus, Galen, Plutarch, as well as Plato and others.

Plutarch has a dialogue under this title, that brutes use reason (Op. vol. ii. p. 988.) The whole Pythagorean sect should also be of the same sentiment, because the metempsychosis imports, that human souls pass into the bodies of brutes. The Stoics also holding that the Divine Being is diffused through all creatures, were necessitated to maintain the souls of brutes to be divine, and, consequently, that they had reason. Among Christians, Lactantius, and the whole body of Manichees and Gnostics, assert the same. Can any person, says Lactantius (Inst. Div. l. iii. c. 10.), deny that brutes have reason, when they often outwit man himself? He allows every thing to brutes which men have, except a sense of religion. Some Sceptics have ascribed religion and virtue to brutes; and they say that Solomon (Eccles. iii. 18, 19) seems to assure us, that the souls of men have no pre-eminence over those of brutes. Sextus Empiricus, in particular (Pyrrhon, l. i. c. 15.), institutes a comparison between dogs and the human kind. The former excel the latter as to sense; they have a quicker scent, by which they pursue beasts that are unseen; they discover them sooner by the eye, and their hearing is more acute. Accordingly it is alleged, that a dog is not destitute of the faculty of reasoning, from the famous instance mentioned by Chrylippus, who observed that a hound coming into a road which separates into three directions, makes choice of the third by virtue of an induction or syllogism; because, after having scented the two ways by which the beast did not pass, he runs straight upon the third without scenting it; where the reason is obvious: the beast passed either that way, or that way, or this way; but he passed neither that way nor that way, and therefore this way. See Stanley's Hist. Philos. p. 780. That a dog is possessed of what they call internal reason, appears, from his choosing things convenient, flying the hurtful, pursuing his food, and running away from the whip; and when wounded or sick, acting prudently, as the circumstances of his case, and his abilities and opportunities dictate. It has also been argued, though certainly with no great appearance of reason, that we owe the discovery of many medicines, and the invention of many arts, to brutes. Thus, it is said, that from the spider man learned the art of weaving; from the swallow he borrowed architecture; from the goose swimming, from fish navigation; from silk-worms sewing; to omit many other instances of the like kind alleged by Plutarch (De Solert. Animal. Op. tom. ii. p. 974.), Vollius (De Orig. Idol. l. iii. c. 27.), and others. How many actions of brutes, it is said, are to be observed, which cannot be accounted for without the first processes of reasoning? If we say, that dogs, by long habits and force of rewards and punishment, may be taught many things, do not this docility, and remembrance of blows, argue memory, fear, and desire, which cannot subsist without knowledge, sense, pleasure, and pain? And if brutes have knowledge, it is allowed that they must also have judgment and reason. The Cartesians, on the other hand, maintain that brutes are mere machines, wholly destitute not only of reason and thought, but of every degree of perception: and that they perform their various functions as mere "automata," excited to motion only by means of animal spirits, which act upon the nerves and muscles. This extravagant and paradoxical opinion Des Cartes has been suspected of borrowing from Gomez Pereira, a Spanish physician, who employed 30 years in compiling a treatise, which he entitles "Antoniana Margarita," from the Christian names of his father and mother, published in 1554; but it is more probable, that it was a conclusion originally deduced from his notion of the animal spirits in the economy of human nature. However this be, the notion was revived by Des Cartes, and further asserted by Le Grand, d'Armafon, and others of his followers, who were led to adopt this doctrine from

from that principle of his philosophy, that the essence of the soul consists in thinking; so that, supposing knowledge and thought in brutes, they must have souls like those of men; the sensitive soul of the Aristotelians being held by him a mere chimera. But Pereira does not appear to have been the first inventor of the doctrine; something like it having been held by some of the ancients, as we find from Plutarch (*De Placit. Phil. l. v. c. 20.*), and St. Augustin (*de Quant. Animæ. Pæsch. Invent. Nov. Antiq. c. 3.*). Des Cartes was probably led to adopt this opinion of the mere mechanism of brutes in order to obviate two great objections; one against the immortality of the souls of brutes, if they were allowed to have any; and the other against the goodness of God, in suffering creatures who had never sinned to be obnoxious to so many evils. In favour of this opinion it has been argued, that many human actions are merely mechanical, being performed without the perception of the agent, and any direction from his will; and these must be ascribed to the impression of objects, and the original disposition of the machine, in which the influence of the soul has no concern: so that in such circumstances often occurring with regard to actions that are habitual, human beings are no better than automata.

2. Some natural movements of the body are so involuntary, that we cannot restrain them, and seem to depend altogether on mechanism. 3. To this mechanism we are also to attribute those likings and antipathies for and against particular objects, which precede knowledge and discrimination, and which in advanced life baffle and controul reason; and they furnish striking proofs of that irresistible influence which certain objects have on the human frame. 4. Our passions are known to depend on the motion of the blood, and the reciprocal impressions caused by the animal spirits between the heart and brain, that are so intimately connected by their nerves; and hence it is inferred, that if effects of this kind may be produced by such simple mechanical means as the mere increase of motion in the blood, without any direction of the will, we need not wonder that the actions of brutes should result merely from a refined mechanism, without thought or perception. 5. It has been further urged, that human ingenuity has produced many surprising phenomena by mechanical means, such as are exhibited in automata of human contrivances; and as the mechanism of the body of the meanest animal must infinitely surpass that of the most curious machines of this nature, the effects produced by it must be proportionably more surprising. In reply to these arguments, it has been alleged, that they only prove, if we allow their full force, the possibility of the case, that brutes are mere machines, or that the power of God might produce certain actions by mechanism, but not that he has actually done so; and, moreover, that if they be admitted, they will prove too much, or that human beings may be mere machines, and not only irrational but insensible too. To the Cartesian hypothesis it has been more directly objected, that the phenomena of perception, foresight, memory, volition, and spontaneous exertion, and of various passions of joy, sorrow, fear, anger, gratitude, love, &c. exhibited by brutes, are inexplicable by any mechanical principles and laws. We have the same evidence in many cases of the sensibility of brutes which we have of that of mankind; and that they are also endowed with the powers of reflection and reasoning, as well as with sensation. If beasts were automata or machines, they could have no perception of pleasure or pain, and consequently no cruelty could be exercised towards them; which is contrary to the common sense and observation of mankind, and seemingly contrary to those declarations of scripture, which obviously intimate that they are the objects of severe

and of mild and merciful treatment. Prov. xii. 10. Ray's Wisdom of God in the Creation, p. 56.

The late professor Bergmann, in an ingenious treatise, written in German, and entitled "Inauguralfrage, &c." or "Researches designed to shew what the Brute Animals certainly are not, and, also, what they probably are, &c." 8vo. Mentz, 1785, has produced a variety of arguments in order to prove that brutes are not machines. But if they are not mere machines, what are they? manifestly, sensitive beings, with an immaterial principle; and thinking, or reasoning beings, to a certain degree. In certain classes of animals this appears evident to the professor, who seems to have observed, with great sagacity and attention, their various operations and proceedings, their ways and means, &c. He thinks it impossible to deduce this variety of action in any animals (if we except those of the lowest classes in the gradation of intelligence) from a general and uniform instinct: for they accommodate their operations to times and circumstances. They combine; they choose the favourable moment; they avail themselves of the occasion; and seem to receive instruction by experience. Many of their operations announce reflection; the bird repairs a shattered nest, instead of constructing, instinctively, a new one; the hen, who has been robbed of her eggs, changes her place, in order to lay the remainder with more security; the cat discovers both care and artifice in concealing her kittens. Again, it is evident, that, on many occasions, animals know their faults and mistakes, and correct them: they sometimes contrive the most ingenious methods of obtaining their ends; and when one method fails, have recourse to another; and they have, without doubt, a kind of language for the mutual communication of their ideas. How is all this to be accounted for (says Bergmann) unless we suppose them endowed with the power of perceiving, thinking, remembering, comparing, and judging? They have these powers, indeed, in a degree, inferior to that in which they are possessed by the human species, and form classes below them in the graduated scale of intelligent beings. But though it seems to him unreasonable to exclude them from the place which the principles of sound philosophy, and facts ascertained by constant observation, assign to them in the great and diversified sphere of life, sensation, and intelligence; he does not, however, consider them as beings, whose actions are directed to moral ends, nor, consequently, as accountable and proper subjects for reward or punishment in a future world.

That brutes possess reflection and sentiment, and are susceptible of the kind as well as the irascible passions, independently of sexual attachment and natural affection, is evident from the numerous instances of affection and gratitude daily observable in different animals, particularly the dog. Of these, and other sentiments, such as pride, and even a sense of glory, the elephant exhibits proofs equally surprising and unquestionable; for which we refer to the article ELEPHANT. The brute creation manifests also a wonderful spirit of sociality, independent of sexual attachment. It is well known that horses, which are perfectly quiet in company, cannot be kept by any fences in a field by themselves; oxen and cows will not fatten by themselves, but neglect the finest pasture that is not recommended by society; sheep constantly flock together. Nor is a propensity to associate restricted to animals of the same kind and size. Instances to this purpose are enumerated in White's Natural History of Selborne, to which we refer the reader. From these instances we may conclude that Milton, when he puts the following sentiment in the mouth of Adam, seems to have been mistaken:

"Much less can bird with beast, or fish with fowl

So well converse, nor with the ox the ape."

Mr. Locke (Essay, vol. i. p. 120, 148.) maintains, that the souls of brutes are wholly material; that they do not possess the power of abstraction; and that the having of *general ideas* is that which puts a perfect distinction between men and brutes. Accordingly, he supposes, that they have no use of words, or any general signs by which to express their ideas. It has, however, been a subject of dispute, whether brute animals have any language intelligible to one another. Some have pretended, that they have a kind of jargon, by which they can make a mutual communication of their sentiments; and Porphyry relates, that Tiresias and Apollonius Tyaneus understood this language. There is at least a similitude of speech in brutes; for they know each other by their voices, and have their signs whereby they express anger, joy, and other passions. Thus, a dog assaults in one strain, fawns in another, howls in another, and cries when beaten in another. To us, indeed, their speech, if it may be so called, appears rude and inarticulate; but perhaps ours, though understood by them, is the same in their ears. But if the voice of brutes be unintelligible to us, does not the same hold of the language of our own kind, till we have been instructed in it? And the language of foreigners, what is it but a confused unmeaning heap of sounds? Laughter, as the sign of mirth and joy, has been thought peculiar to men; and yet we see somewhat resembling it in brutes, signified by the motion of their ears, eyes, mouth, and tongues.

Dr. Hartley (see his Observations on Man, p. 239.) has investigated the intellectual faculties of brutes, and applied his theory of vibrations and association in accounting for the inferiority of brutes to mankind, with regard to intellectual capacities. He ascribes the difference subsisting between them to the following circumstances, which he has taken occasion to illustrate on the principles of his theory. The first of these is the small proportionate size of their brains, whence brutes have a far less variety of ideas and intellectual affections than men. The second cause of this difference is the imperfection of the matter of their brains, whereby it is less fitted for retaining a large number of miniatures, and combining them by association, than man's. The third cause is their want of words, and such like symbols; fourthly, the instinctive powers which they bring into the world with them, or which rise up from internal causes, as they advance towards adult age, is another cause of this difference; and, fifthly, it is partly owing to the difference between the external impressions made on the brute creation, and on mankind. This ingenious writer supposes, with Des Cartes, that all the motions of brutes are conducted by mere mechanism; yet he does not suppose them to be destitute of perception; but that they have this in a manner analogous to that which takes place in us; and that it is subjected to the same mechanical laws as the motions. He adds, that it ought always to be remembered, in speaking on this subject, that brutes have more reason than they can show, from their want of words, from our inattention, and from our ignorance of the import of those symbols, which they do use in giving intimations to one another, and to us.

"As brutes," says Dr. Priestley (Disquisitions on Matter and Spirit, p. 238, &c.) "have the same external senses that we have, they have, of course, all the same inlets to ideas that we have; and though, on account of their wanting a sufficient quantity of brain, perhaps chiefly, the combination and association of their ideas cannot be so complex as ours, and therefore they cannot make so great a progress in intellectual improvements, they must necessarily have, *in kind*, every faculty that we are possessed of. Also, since they evidently have memory, passions, will, and judgment too, as their actions demonstrate, they must, of course, have the

faculty that we call *abstraction*, as well as the rest; though, not having the use of words, they cannot communicate their ideas to us. They must, at least, have a natural capacity for what is called *abstraction*; it being nothing more than a particular case of the *association of ideas*, of which, in general, they are certainly possessed as well as ourselves. Besides, if dogs had no general or abstract ideas, but only such as were appropriated to particular *individual objects*, they could never be taught to distinguish a *man* as such, a *hare* as such, or a *partridge* as such, &c. But their actions shew, that they may be trained to catch hares, set partridges, or *birds* in general, and even attack *men*, as well as to distinguish their own master, and the servants of the family in which they live. Whether brutes will survive the grave we cannot tell. This depends upon other considerations than their being capable of reason and reflection. If the resurrection be properly *miraculous*, and entirely out of all the established laws of nature, it will appear probable that brutes have no share in it; since we know of no declaration that God has made to that purpose, and they can have no expectation of any such thing. But if the resurrection be, in fact, *within the proper course of nature*, extensively considered, and consequently there be something remaining of every organized body that death does not destroy, there will be reason to conclude that they will be benefited by it as well as ourselves. And the great misery to which some of them are exposed in this life may incline us to think, that a merciful and just God will make them some recompence for it hereafter. He is *their* maker and father as well as *ours*. But with respect to this question, we have no sufficient *data* from which to argue, and therefore must acquiesce in our utter ignorance, satisfied that the maker and judge of all will do what is right."

It has been, till very lately, a general opinion in the Christian world, that the souls of brutes were wholly material, and therefore mortal. The great lord Bacon entertained this opinion. "Anima sensibilibus," says he, "sive brutorum, planè substantia corporea censenda est." The celebrated anatomist Willis also professed the same. The sentiments of Malebranche seem to have coincided with those of Des Cartes; for he says, that they eat without pleasure, and cry without pain, that they fear nothing, know nothing; and if they act in such a manner as to indicate understanding, it is because God, having made them to preserve them, has formed their bodies so as mechanically to avoid whatever might hurt them. The learned Gale maintains at large (Philosophia Generalis, p. 323.) that the sensitive soul is corporeal; and the celebrated Dr. Cudworth has revived the long-explored notion of the *soul of the world*, from which the souls of brutes issue, and to which he supposes they return, without retaining their separate consciousness after death. However, in order to solve the difficulty respecting their state and that of mankind, he supposes the immortality of the soul not to follow necessarily from its immateriality, but from the appointment of God. But in accounting for the difference in the divine dispensations to them and us, he conceives them to be destitute of morality and liberty. Some speak, however, as if they held brutes to be moral beings, and under the obligation of the law of nature. Ulpian, and other civil lawyers, are supposed to be of this opinion; as also the Stoics, from whose school this tenet is said to have been first borrowed. It is alleged, on the other hand, that brutes *cannot* be subject to a law, unless they have a power of knowing him that made the law, judging whether we have a right to command them, and what is contained in the law, that they may direct themselves accordingly; which seem all to be things out of the reach of brutes. But Ulpian's definition of the law of nature, "jus naturale est quod natura omnia animalia docuit," when fairly

fairly interpreted, does not imply that brutes have reason and reflection, but may be understood of that natural instinct common to man and brutes, by which they are impelled to self-defence, propagation of their species, &c.

We shall close this article with briefly noticing the fanciful opinion of father Bougeant, who has laboured to prove, both from reason and scripture, that the spirits of brute creatures are devils. As so many guilty victims of divine vengeance, they are sentenced to endure a variety of evils. By nature, he says, they are extremely vicious; but God, by irrecoverably reprobating them, has, at the same time, divested them of their liberty, so that they can be no longer criminal: an hypothesis equally absurd in its principles and in its consequences.

**BRUTIA**, in *Entomology*, a species of *MUTILLA* that inhabits Calabria. Its character is thus described: colour black; thorax rufous; abdomen with six silvery white spots, and belt of the same. Pctagn. Inf. Cal.

**BRUTIA**, in the *Medical Writings of the Ancients*, a term used to denote the fattest and most resinous kinds of pitch, and such as was the most proper for making the oil of pitch, called "oleum picinum." The term is derived from Brutia, or Brutium, the name of the country where it was procured. Plin. N. H. l. xv. c. 7.

**BRUTIAN FOREST**, in *Ancient Geography*, now called *La Sila*, an extensive forest of Brutium or Calabria, which covered a surface of 200 miles in circumference; and from which Hiero, king of Syracuse, and after him the Romans, drew their masts and other timber for shipping. The same forest is still covered with large woods of pines or firs; but from these extensive woods little benefit is derived, except in turpentine and fuel.

**BRUTIUM**, one of the two peninsulas of that part of Italy, anciently known by the name of Magna Græcia, which extended to the straits that separated Sicily from Italy; the other peninsula being called Calabria. Part of it towards the north is now distinguished by the appellation of Calabria Citra, and the more southerly part is denominated Calabria Ultra. It was inhabited by the Brutii, who were slaves of Lucania, that had revolted from their masters, taken up arms, and rendered themselves independent. Some derive their name from a Lucanian term, denoting "Rebels:" but others with greater probability seek the etymology of their name in the nature and productions of their soil. Accordingly, as most of their trees were resinous, they find in the oriental term "Brata," or, as the Syrians write it "Bruta," the origin of the appellation Brutii. Calabria, it is likewise alleged, has a similar derivation from "Calab," signifying pitch or resin. Their principal rivers were, on the west, Lamatis and Metaurus, and on the east, Cæcinus, Targines, Neochthar and Cratis. Their chief towns, in the west, from north to south, were Pandolia, Conventia, Hipponium, and Rhegium; and, on the east, from south to north, Loeri, Seylacium, Croton, Petilia, and Roscianum. The "Brutium promontorium" was that promontory since called "Cabo de Scilio."

**BRUTO**, JOHN-MICHAEL, in *Biography*, a polite Italian scholar, was born at Venice about the year 1515; and in the course of his vagrant life, he resided for some time at Padua, afterwards visited Florence, Lucca, and other Italian cities, passed some years at Lyons in France, and travelled into England and Spain. In 1574 he accepted an invitation from Stephen Batori, prince of Transylvania, by whom he was employed in writing the history of that country; and after his advancement to the crown of Poland, accompanied him to Cracow. On the death of this prince, he removed to Vienna, and became historiographer to the em-

peror Rodolph II. He closed a wandering life, in the course of which, notwithstanding the patronage he enjoyed, he never rose above indigence, in Transylvania in 1594. As a writer, he had the reputation of learning and merit; and, though he contemned the affectation of the Ciceronians, his Latinity was pure and elegant. His critical works comprised notes on Horace, Cæsar, and Cicero; but his historical writings are the most valuable. His Florentine history, extending to the death of Lorenzo de Medici, is considered as one of the finest monuments of the age. It was printed at Lyons in 1562, under the title of "Florentinæ Historiæ, libri viii. priores." As it was conformable to the political conduct of the house of Medici, it was industriously suppressed, and few copies of it now remain. His elegant tract "De Origine Venetiarum," his treatise "De Inflatione Italiæ," and his "History of Hungary," are preserved in the imperial library at Vienna. Of his smaller printed works, comprising orations, Latin letters, and two treatises, one on the manner of studying history, and the other containing conjugal precepts, a new edition was printed at Berlin in 1698, 8vo. Bayle. Tiraboschi.

**BRUTOBRIA**, or **BRUTOPOLIS**, in *Ancient Geography*, a town of Spain in Bætica, situate between the river Bætis, and the country of the Tyritani or Turditani. Steph. Byz.

**BRUTON**, or **BREWTON**, in *Geography*, is a pleasant, well-built market-town in Somersetshire, England, situated 113 miles W. from London, and 12 S. from Frome, at the western extremity of the forest of Selwood, and takes its name from the river Brew or Brue, which rising in that forest, passes through the town in its way to Glastonbury. The surrounding scenery is extremely interesting: the vales are meadows, the declivities orchards, and the eminences sheep-walks. The manor was once the property of Sir Maurice Berkeley, whose younger son John, as a reward for his services to the royal cause, was created by Charles II. lord Berkeley of Stratton. The title became extinct in 1772, and the manor is now in the possession of sir Richard Colt Hoare, bart. of Stourhead in Wiltshire. On this site was anciently an abbey, founded by St. Algar, earl of Cornwall. The town consists principally of five streets, in the center of which is the market place, where, till lately, stood a curious old hexagonal market cross, supported by six pillars at the angles, and a larger one in the center. The roof consisted wholly of the ribs of arches, which diverged from pillar to pillar, and were finely ornamented with sculpture. This edifice was eighteen feet high, the top flat, and encompassed with a stone ballustrade: it was built, as Leland informs us, by John Ely, the last abbot of Brewton. The market is on Saturday. In the High-street is a market-house, built by a subscription of the farmers who frequented this market, upon land given them for that purpose by Hugh Saxey, esq. who, from a low station, was advanced to the post of auditor to queen Elizabeth. He died in 1620, possessed of several manors and estates in the counties of Somerset and Gloucester; which, in conformity to his intention, were settled in 1638 on twelve gentlemen of the county for the erection and endowment of an hospital here for the maintenance of old men, women, and boys. The number now supported are eight men, ten women, and twelve boys; the latter are boarded, educated, and apprenticed; and the aged are comfortably provided for. The annual income belonging to this charity is about 2500l. In the court of the hospital is a statue of the founder, with this inscription:—"Hugh Saxey, esq. founder of this hospital, auditor to queen Elizabeth, and king James." There is also a free-school in the town, instituted by king Ed-

ward VI. and endowed by bishop FitzJames, and his brother Sir John, lord chief justice. Bruton consists of 333 houses, containing 1631 inhabitants, the greater part of whom are employed in agriculture: for though Leland tells us, that in his time "Brewton was much occupied with making of clothe," yet at present the only manufacture is a little hosiery, and silk reeling, at the latter of which three or four hundred young persons are employed. The church, dedicated to St. Mary, is a large structure, and has two quadrangular towers, one occupying the west end, and the other rising from one side of the north aisle. The latter seems to have been the original tower, but the former is the handsomest. The interior of the church is well ornamented, and contains a great number of monuments. Collinson's History of Somersetshire, vol. i. 4to. Maton's Tour through the Western Counties, vol. ii. 8vo.

BRUTUS, or BRUTE, in *Biography*, the first king of Britain, according to the fabulous relation of Jeffry or Geoffrey of Monmouth. See BRITAIN.

BRUTUS, LUCIUS JUNIUS, the founder of the Roman republic, was the son of Marcus Junius, a wealthy patrician, who had married the daughter of Tarquin the Proud, with whom terminated the race of kings at Rome. The father and brother of Brutus were assassinated by order of this tyrant at the beginning of his reign; and Brutus himself escaped by feigning idiotism, whence it is said the name of "Brutus" was derived. Under this character he was admitted into the royal palace, brought up with the king's sons, and regarded merely as the object of their diversion. On occasion of a plague which broke out at Rome, Tarquin sent his sons to consult the oracle of Delphi as to the cause and cure of the contagion; and Brutus also was ordered to accompany them for their amusement. The princes prepared magnificent presents for Apollo; but their companion is said to have offered to the god an elder stick, enclosing a rod of gold, and serving as an emblem of himself. It is further reported, that when the princes made an enquiry, which of them should be king of Rome, the oracle replied, that the government should be reserved for him who should first kiss his mother; and that they, interpreting this answer literally, agreed to kiss their mother at the same time, and to reign jointly. But Brutus, interpreting the response of the oracle allegorically, fell down upon the earth, after his return to Italy, and kissed it, as the common mother of all mankind. Whatever may be thought of this story, it is certain, that the tragical death of Lucretia (see LUCRETIA) roused the dormant and disguised spirit of Brutus; and that, having snatched the poignard out of her bosom, he vowed vengeance on the aggressors, and excited her relations to concur with him in retaliating on Tarquin and his family the dishonour she had suffered, and the lamentable event in which it had terminated. Accordingly they all bound themselves by a solemn oath to execute their purpose, and agreed to follow the counsel and example of Brutus, who seemed now, by a kind of extraordinary inspiration, to have recovered his faculties, and to possess talents, which had hitherto been concealed, fit for conducting their deliberations, and securing their prosperous issue. The gates were immediately shut, the senate was assembled, and a public decree was proposed and carried for banishing the king, annihilating the royal form of government, and establishing a commonwealth. Brutus, and Collatinus, the husband of Lucretia, were elected as the first chief magistrates of the state, under the denomination of "consuls;" an important change in the constitution of the Roman government, which took place in the year of Rome 245, B. C. 509. This change, so hastily concerted and accomplished, although it

had obtained the concurrence of the senate, and of the people, excited an alarm amongst those who were attached to the old constitution, and particularly among the young nobility, who were zealous partizans of the dethroned and expelled sovereign. In the number of the malcontents, were the two sons of Brutus, and three nephews of Collatinus. These were active in the conspiracy formed against the new government; and they concurred with others in binding themselves by a very solemn oath to murder the consuls, and to re-establish monarchy. Whilst they were concerting measures for this purpose, the plot was disclosed by a slave to P. Valerius, a patriotic senator, and orders were issued for apprehending them. When the sons of Brutus, venerated by the people as their deliverer, appeared before the consular tribunal, the attendant multitude was seized with a general panic; and as soon as they were convicted of the crime alleged against them, the senators, in a kind of confused murmur, expressed their anxiety and wishes, by uttering the words, "Banish them! banish them!" Collatinus wept, and the stern patriot Valerius was silent. But the father, sacrificing private feelings to the public good, and apprized of the necessity of suppressing rebellion by an awful example of punishment, with a steady countenance, and firm tone of voice, gave orders to the lictors to execute the law on his sons. The distress of the assembled multitude on this solemn occasion was such as no words can describe; mournful looks and secret groans pleaded for pity; and when the consul seemed to pay no regard to their anxiety and tears, they loudly remonstrated, and exclaimed with one voice, "We give them back to their country, and to their family." Neither the intercessions of the people, nor the suppliant cries of the criminals, could alter the fixed purpose of Brutus, who witnessed the execution of the sentence; and having seen them stripped, beaten with rods, and beheaded, retired from the tribunal, to indulge, without doubt, those parental feelings which the necessity of the times had induced him to disguise and restrain. Of his conduct on this occasion very different sentiments have been entertained. Whilst some have extolled, others have condemned it. But to the judgment of sober reason, it exhibits a noble example of the triumph of public virtue over private affections; and the display of it required that sternness of temper, and those peculiar ideas of the extent of parental authority, which seem to have characterized this ancient Roman. Collatinus was more flexible; and he wished to spare his nephews, and to suppress the evidence which the slave Vindicius had adduced against them. The zeal of Valerius was roused; and whilst the people were tumultuous, Brutus returned, and having again ascended the tribunal, justified his own conduct, but referred the fate of the other criminals to the decision of the people, who concurred in condemning them, and ordering them for execution. Collatinus, however, accused by Brutus for his weakness, and want of patriotism, was obliged to renounce his authority, and to retire to Lavinium, where he lived privately to an advanced age. Upon his removal, Brutus, in order to obviate every suspicion that it was his intention to govern singly, convoked the people by centuries in the Campus Martius, for the election of a new consul; and Valerius, afterwards known by the name of "Poplicola," whose meritorious conduct in the disclosure of the conspiracy has been already mentioned, was chosen to supply the vacancy. Some difference occurs in the relation of these events by Dionysius of Halicarnassus, Livy, and Plutarch; but they all agree in the principal fact, respecting the conduct of Brutus towards his sons. During the consulate of Brutus and Valerius, Tarquin and his partizans made some

vigorous

vigorous efforts for regaining the throne of Rome; and, joined by the Veientes, the avowed enemies of the Romans, they advanced towards the city. But they were met by the consuls at the head of the Roman forces; the command of the horse being assumed by Brutus, and that of the infantry by Valerius; the horse of the enemy, commanded by Arunx, one of Tarquin's sons, came forward to the charge; and as the hostile armies approached each other, Arunx discovered Brutus, attended by his lieutors; and inflamed with resentment, he exclaimed, "There is the enemy of my family, the usurper of my father's throne." He then immediately advanced to a personal encounter, and Brutus flew to meet him. Actuated by passion, more than by cool courage, these two champions, neglecting the means of personal defence, transixed each other with their spears, and at the same instant fell dead from their horses. This happened in the year B. C. 509. The conflict, thus commenced, terminated in a victory on the part of the Romans; and, as soon as it was decided, Valerius buried his colleague Brutus with great pomp, and gave Rome the first example of those funeral orations, which it was afterwards customary to pronounce in commendation of their great men. The Roman matrons distinguished themselves on this occasion; for, regarding Brutus as the avenger of the honour of their sex, they mourned for him a whole year; and his statue was afterwards erected in the capitol, with a naked sword in his hand. The Romans venerated his memory, as that of the second founder of their city, who had restored liberty to their country, cemented it by the blood of his own sons, and died in defending it against an usurper; and they considered him as having undergone more hardships and dangers in establishing the commonwealth, than Romulus had done in first founding the kingdom. Virgil has nobly sketched his history and praise in the following lines:

"Consulis imperium hic primus sævasque secures  
Accipiet: natoque pater, nova bella moventes,  
Ad pœnam pulchra pro libertate vocabit.  
Infelix! utcumque ferent ea facta minores;  
Vincit amor patriæ, laudumque immensa cupido."  
Æn. VI. 820.

"He first shall hold the consul's sway, and wield  
The dreaded axes; he, a Roman sire,  
For thee, fair Liberty! his rebel sons  
Shall doom to public death. Unhappy man!  
How'er posterity the deed may judge,  
His country's love, and boundless thirst of praise,  
Shall quell the father."

Dionys. Halic. lib. iv. and v. Livy, lib. i. and ii. Plut. in Poplicol. apud Op. T. i. p. 97, &c.

BRUTUS, MARCUS JUNIUS, an illustrious Roman, derived his name and descent, as some have said, as well as his spirit, from L. J. Brutus, the subject of the preceding article. Cicero records this line of his descent, both in his speeches and writings, as a fact, which was not doubted by any; and he often speaks of the "image of old Brutus," which Marcus kept in his house among those of his ancestors; and Atticus, who was peculiarly curious in the antiquities of the Roman families, drew up Brutus's genealogy for him; and deduced his succession from that ancient hero, in a direct line, through all the intermediate ages from father to son. Plutarch also, on the authority of Posidonius the philosopher, was of the same opinion. Other ancient writers, however, and particularly Dionysius of Halicarnassus, allege several arguments against this descent, which seem to be very plausible; and they say that the family of the patriot was extinct in the execution of his two sons. However this be, M. J. Brutus was the son of a senator of the same name, who belonged to

the party of Marius, and who was put to death for his severities by Pompey at the surrender of Mutinæ. His mother was Servilia, the sister of Cato, who disgraced herself by her connexion with Cæsar, which gave rise to the opinion that Brutus was his natural son. But as he was born in the consulship of L. Cornelius Cinna III. and Cn. Papirius Carbo I. A. U. 668, he was no more than 15 years younger than Cæsar himself; and this circumstance fully confutes the vulgar story of his being commonly believed to be Cæsar's son. As Brutus lost his father, when he was young, the care of his education devolved on his uncle Cato: under whose direction it was conducted on that liberal plan which prevailed among Romans of distinction, after their connection with Greece. He studied the language and philosophy of that country; and he acquired, by means of his natural talents and sedulous application, a distinguished reputation for eloquence. At the bar and in private assemblies his rhetorical powers were exercised; he pleaded several causes of great importance, and he was allowed to be the most eloquent and learned of all the young men of rank and family at the period in which he lived. His manner of speaking was correct, elegant, and judicious; though he wanted that force and copiousness which are required in a consummate orator. But he was principally delighted with the study of philosophy, in which, though he professed himself a disciple of the moderate sect of the old academy, he nevertheless, from a certain pride and gravity of temper, and from a deference to the example of Cato, affected the severity of the Stoic. His disposition, however, which was mild, gentle, and compassionate, was incompatible with this system; and he was often constrained, by the tenderness of his nature, to confute the rigour of his principles. On the doctrines of the philosophy which he had adopted, he wrote some treatises, and he transfused both the language and sentiments of his sect into Latin. His accomplishments as a scholar and an orator are sufficiently attested by Cicero, who has done him the honour of introducing him as one of his speakers in his dialogue "De Claris Oratoribus," and addressed to him his treatise entitled "Orator." Attached to Cato from his youth, he imbibed, under his discipline, an ardent love of liberty and virtue; and having accompanied him in his expedition to Cyprus, where he was employed by his uncle, after the unhappy end of its king, Ptolemy, in securing the royal treasures for the public. This commission he executed to the satisfaction of his uncle; and by marrying his daughter Portia, he formed a closer alliance with this venerable patriot, and was led to make him the model of his public conduct. Accordingly, after his example, when the civil war broke out between Cæsar and Pompey, he joined the party of the latter; although he had reason to resent his conduct for the murder of his father; and Cæsar's familiarity with his mother induced him to manifest a partiality in favour of her son. At the battle of Pharsalia, in which Brutus was engaged on the side of Pompey, Cæsar gave special orders to find out and preserve him unhurt; and after this battle, which terminated the republic, he surrendered himself to Cæsar, who rejoiced in his safety, and immediately received him into favour, testifying his regard for him by pardoning his friend Cassius at his intercession. Cæsar entrusted him with the government of Cisalpine Gaul, and afterwards nominated him prætor of Rome. Notwithstanding the gratitude and respect he was thus induced to entertain for Cæsar, he was alarmed by his usurped dominion, and a view of the degraded state into which his country was reduced by the violation of the laws and constitution, excited a disgust which no favours could compensate. At the same time, Cassius, who had married his sister, was assiduous in endeavouring

pouring to kindle the flame of patriotism in his breast. He caused the name of his supposed ancestor, Junius Brutus, to be sounded in his ears; and led him to believe that the Romans expected his assuming the hereditary office of rescuing them from a tyrant. These arguments at length prevailed, and Brutus agreed to take the lead in a conspiracy against Cæsar's life. His character induced several other eminent citizens to join in the design; and they resolved to execute it on the ides of March (March 15) A. U. 710, B. C. 44. It is said, that when Cæsar saw his beloved Brutus among the conspirators, with his dagger drawn against him, he desisted from any farther self-defence, wrapped his head in his mantle, and surrendered himself to his fate. Averse from needless effusion of blood, Brutus, by impolitic forbearance, permitted Antony to escape; and by readiness to acquiesce in the reading of Cæsar's will, and by the pompous solemnities of his funeral, he furnished Antony with a pretence for exciting in the minds of the people a reverence for his memory, and a detestation against his murderers; in consequence of which he and his party were obliged to secure their lives by retiring from Rome to Antium. Afterwards, when Octavianus joined Antony, and they concurred in assuming the sovereign power, he and his faithful Portia quitted Italy, and set sail for Athens. Here, at convenient intervals, he renewed the prosecution of his philosophical studies; whilst at the same time he secretly prepared for war, and sent a messenger to Macedonia, to engage the Romans of that province in the party of the republic, and to facilitate his admission into it as governor for the senate. Having obtained a complete supply of men, arms, and money, he marched into Macedonia; and gained possession of the army, and of the person, of Caius, the brother of Antony, who had been deputed to seize Dyrrachium and Apollonia.

When Octavianus became sole master of Rome, he proceeded to the condemnation of all who had been concerned in the murder of his adopted father; and the names of Brutus and Cassius were inserted, much to the regret and grief of the people, in the bloody roll of proscription. They, however, were at this time in the command of powerful armies, which speedily formed a junction at Smyrna. Having performed some separate services in the subjugation of those maritime powers, the Rhodians and Lydians, they met again at Sardis; and determined to direct their march to the straits of Hellepont, in order to pass over into Europe, for the purpose of opposing the progress of Antony and Octavianus, who had now arrived at Macedon. It was in the course of this march that the frightful apparition, recorded by Plutarch and other historians, presented itself to Brutus, and which, under the appellation of his evil genius, announced another visit to him at Philippi. Cassius ascribes this phenomenon to the illusion of a troubled imagination, under the influence of anxiety and bodily fatigue; and if it be any thing more than an idle fabrication, to this cause it may be reasonably attributed. On the plains of Philippi the two hostile armies assembled for the decision of the interesting contest. Brutus and Cassius having settled their plan of conduct, if the issue of this conflict should prove unfavourable, they prepared for action. In the first battle Brutus defeated Octavianus, but in the ardour of the contest he left Cassius unsupported, and thus occasioned his defeat and death. This event he grievously deplored, and shedding many tears over the body of his friend, bewailed the loss of him under the honourable appellation of "the last of the Romans." He had now the sole command of a numerous and mutinous army; which compelled him to risk another engagement, having first put to death all the slaves

whom he had made prisoners, and having promised to his soldiers, in case of victory, the pillage of Thessalonica and Lacedæmon. In the second battle the wing which he commanded routed that of Octavianus, whilst Antony defeated the other committed to the conduct of Cassius's lieutenant. But, instead of pursuing this advantage by following the fugitives, this experienced general availed himself of it by turning round on the rear of Brutus, and entirely breaking and dispersing his troops. Brutus having escaped being made prisoner by the heroic friendship of Lucilius, who surrendered himself under the name of Brutus, and who was generously saved by Antony after the discovery of the fraud, fled with a few friends to a retired valley, where he spent an anxious night. With the returning dawn, he perceived that he was surrounded by the enemy, and conjured some of his domestics to put an end to his life. Upon their refusal, he dismissed them with a request that they would provide for their own safety; and he then renewed his application to Strato, an Epirote, and his former fellow student; but Strato persisted in his denial, till Brutus called upon a slave to perform the fatal office. Upon this the generous Greek exclaimed, "Forbid it, Gods, that it should ever be said, that Brutus died by the hand of a slave for want of a friend!" and covering his face with his left hand, presented with his right his sword, upon which Brutus threw himself with such violence that it pierced through his body, and he instantly expired. Thus perished, in the 43d year of his age, according to Cicero, but in the 37th according to Velleius Paterculus, one of the most irreproachable characters in Roman history; according to Blair's table, A. U. 712, B. C. 42.

To his generosity, humanity, uprightness, and well-principled virtue, public and private, writers of all parties have borne testimony; and those who have condemned the act of assassinating Cæsar, have ascribed it, on the part of Brutus, to patriotic motives. Indeed, Antony himself did him the justice to say, that he "was the only one of the conspiracy who entered into it out of principle; that the rest, from private malice, rose up against the man, he alone against the tyrant." No man in public life seems to have set up virtue more sincerely as the object of his veneration and pursuit than Brutus; and it does not, therefore, seem probable, that, according to the report of some writers, his last speech should be a confession of error in having followed an empty name. "His memory," says one of his biographers, "was cherished and honoured as long as a spark of Roman spirit survived the loss of constitutional freedom; and the names of Brutus and liberty are to this day inseparably associated." His body was treated with respect by Antony; but the vindictive Octavianus caused the head to be cut off, in order to expose it at the feet of Cæsar's statue. But his destination was defeated, as it was thrown over-board in a storm. The remains were honourably burnt by order of Antony, and the ashes sent in an urn to Servilia. Plutarch's Brutus, apud Op. t. i. p. 984. Middleton's Life of Cicero, vol. ii. p. 226. Anc. Un. Hist. vol. xi. and xii.

BRUTUS, in *Entomology*, a species of PAPILO (*Eq. Achiv.*) The wings are white with a black border; on the lower pair beneath, a fuscous band. This inhabits Africa; it is a large and rare insect. Cramer describes a variety of it under the name of Merope.

BRUTUS, in *Geography*, a military township of America, in New York, through which runs the river Seneca, and where it receives the waters of Owasco lake, passing from the south-east through the town of Aurelius and Scipio. It lies 11 miles N. E. from the north end of Cayuga lake, and 19 S. S. E. from lake Ontario.

**BRUTZ**, a town of France, in the department of the Ille and Vilaine, and district of Redon, 2 leagues south of Rennes.

**BRUX**. See **MOSE**.

**BRUYE**, or **BUGA**, an island in the bay of Bengal, near the mouth of the river Ava, about 8 leagues long and 3 broad. N. lat. 16° 15'. E. long. 97° 37'.

**BRUYERE**, **JOHN DE LA**, in *Biography*, a French writer of reputation, was born, in 1640, in the Ile of France, and, at a proper age, recommended by Bossuet to instruct the duke of Burgundy in history. The residue of his life was passed at court, where he maintained the character of a man of letters; philosophical and unambitious in his temper, as well as polite and unaffected in his manners, uniting the gaiety and social disposition of the well bred gentleman with the studious habits of the scholar. In 1693 he was admitted into the French Academy; and, in 1696, a fit of apoplexy terminated his life. His work entitled "Characters of Theophrastus, translated from the Greek, with the Characters or Manners of this Age," was first published in 1687, and has been several times reprinted. In this work, of which Malezieux predicted that "it would gain many readers and many enemies," the author has had the honour of participating with Moliere in the correction of more follies and indecorums than perhaps any other moralist, ancient or modern. The pencil with which he pictured modern characters and manners is strong but delicate; his style nervous but abrupt, occasionally obscure, and affectedly sententious. The maxims of Publius Syrus are almost wholly transplanted into his works. Keys were made of his characters, for the court, the capital, and the provinces; and his book, by means of its success, produced many imitations. The best editions of the "Characters" are those of Amsterdam in 1741, and of Paris in 1750 and 1765. The author's "Dialogues on Quietism" were arranged for publication by M. Du Pin, and printed in 1699. *Nouv. Dict. Hist.*

**BRUYE/RES**, in *Geography*, a town of France, in the department of Vosges, and chief place of a canton, in the district of Epinal, and 11 miles E. of it. The town contains 1911 and the canton 12,435 inhabitants: the territory includes 210 kilometres, and 32 communes.

**BRUYERES SOUS LAON**, a town of France in the department of the Aisne, and district of Laon, 1 league S.S.E. of Laon.

**BRUYN**, **CORNELIUS LE**, in *Biography*, a traveller and painter, was born at the Hague, and having commenced his travels through Muscovy, Persia, the Levant, and the East Indies, in 1674, completed them in 1708. His "Voyage to the Levant" was published at Amsterdam in 1714, folio, and his "Travels to Muscovy, Persia, &c." in 1718, in 2 vols. fol.; an edition much esteemed for the beauty of its plates, but exceeded in value by that of Rouen in 1725, in 5 vols. 4to. on account of the corrections and notes of the Abbé Banier. As a traveller, Bruyn is curious and instructive, but his style is inelegant and his facts sometimes inaccurate. *Nouv. Dict. Hist.*

**BRUYN SWICK**, in *Geography*, a plantation of America, in Ulster county, New York.

**BRUYS**, **PETER DE**, in *Biography*. See **PETROBRUSSIANS**.

**BRUZEN DE LA MARTINIERE**, **ANTONY-AUGUSTIN**, an industrious compiler, was born at Dieppe, in 1666, and educated at Paris, under the care of his uncle, the celebrated Richard Simon. In 1709 he was employed, by the duke of Mecklenburgh, in researches into the history of that duchy, and afterwards attached to the duke of

Parma, and to the king of the Two Sicilies, who appointed him his secretary with a handsome salary. Upon his retirement to the Hague, he completed his "New Geographical Dictionary," which was dedicated to the king of Spain, and recompensed by the title conferred upon him by that monarch, of his first geographer. After a life of study and labour, as well as of social intercourse and pleasure, suited to his friendly disposition and polite manners, he died at the Hague in 1749. His reading was extensive, and he wrote with judgment, facility, and generally with elegance. His favourite studies were geography, history, and polite literature. The most valuable of his numerous works are "The great Geographical, Historical, and Critical Dictionary," 10 vols. fol. Hague, 1726 to 1730, and Paris, 1768, 6 vols. fol.; "Puffendorff's Introduction to the History of Europe, greatly augmented and corrected," of which the last edition is that of the Hague, in 11 vols. 12mo; "Geographical and Historical Treatises to facilitate the Knowledge of the Holy Scriptures, by various celebrated Authors, Huet, Le Grand, Calmet, Hardouin, &c." 2 vols. 12mo. 1730; and "Select Letters of M. Simon," with a life of the author and curious notes, Amst. 4 vols. 12mo. *Nouv. Dict. Hist.*

**BRYA**, in *Botany*, (*Browne Jam.*) See **AMERINUM EBENUS**.

**BRYAN**, in *Geography*, a county of America, in Georgia, adjoining Chatham county on the west and south-west.

**BRYANT**, **JACOB**, in *Biography*, the son of a Custom-house officer at Plymouth, was, for the honour of Devonshire, born there; though he has been represented by some as a native of Kent, from the circumstance of his father's being transferred to that county whilst himself was a child.

Placed upon the foundation of Eton college he was early distinguished for classical attainments; and the high reputation with which he entered King's served as an incentive to his future exertions. Succeeding at the ordinary period to a fellowship in that college, he continued its ornament till nearly the end of the century, and the boast of both institutions to the close of his life. Having devoted himself early to habitual study, he persevered with but few interruptions; and these are to be considered as referring rather to a change of subject, than a breaking off from his ordinary pursuits; for, during his secretaryship to the duke of Marlborough and the Board of Ordinance, he availed himself of the opportunities which his employments afforded for rendering his knowledge in modern tactics subservient to that of the ancients. As he attended the father in the capacity of secretary during his military commands, so he accompanied the son to the seat of the Muses; and, in the office of private instructor, superintended the studies while at Eton of the present duke of Marlborough, as well as those of his brother Lord Charles. Devoting himself to a life of literature, his diligence was unremitting in his favourite pursuit, and the effects of it were consecrated to the best purposes of learning and religion.

The first work which he formally published was "Observations and Enquiries relating to various parts of antient History, containing Dissertations on the Wind Euroclydon, and on the Island Melite; together with an Account of Egypt in its most early State, and of the Shepherd Kings, 1767." Those who knew Mr. Bryant formed considerable expectations from his acknowledged reputation, when this volume was announced; nor were they disappointed on its appearance. The opinion entertained of his learning was confirmed by it, and the ingenuity displayed in it acquired him considerable commendation.

His next communication to the public, and the work on which his character as a scholar must ultimately rest, was his "New System, or Analysis of Ancient Mythology; wherein an Attempt is made to divest Tradition of Fable, and to reduce Truth to its original Purity." Of this publication the *first* and *second* volumes came forth together, in 1774, and the *third* followed two years after. It being his professed design to present a history of the Babylonians, Chaldeans, Egyptians, Canaanites, Helladians, Ionians, Leleges, Dorians, Pelasgi, and other ancient nations, his researches for this purpose were not only of necessity recon- dute, but in many instances uncertain; but to facilitate his passage through the mighty labyrinth which led to his primary object, he not only availed himself of the scattered fragments of ancient history wherever he could find them, but also of a variety of etymological aids; for being persuaded that the human race were the offspring of one stock, and conceiving thence that their language in the beginning was one, this favourite notion was exemplified by him in the investigation of radical terms, and applying these as collateral aids. Considering that his knowledge of the Oriental dialects was very confined, it is to be lamented that upon some occasions he has indulged too freely to fancy; yet thus much must be confessed, that his defects in this kind of learning form a strong plea in his favour; for if, without understanding these languages, he has succeeded in tracing out so many radicals as his table of them exhibits, and more especially if he has been right in explaining them, it will follow that his explanations must be founded on truth, and therefore are not chimerical. In opposition, however, to them, Mr. Bryant experienced some severe and petulant attacks: first, from a learned Dutchman, in a Latin version of his work; and shortly after from the late Mr. Richardson, who was privately assailed by Sir William Jones; a circumstance which there is reason to think Mr. Bryant never knew.

To their strictures Mr. Bryant replied in an anonymous pamphlet, of which he printed a few copies for the perusal of his friends, but never professedly published. It is hoped, however, that, in the next edition of his Mythology this tract will be added, as it is among the best of his works.

Amongst other parts of the Mythology which were attacked with asperity, that which relates to the Apamean medal was severely assailed. Mr. Bryant defended himself in a separate publication (which also should be subjoined to the new edition); and though what he offered on the subject was lightly treated by some, who highly appreciated their knowledge of medals, yet the opinion of professor Eckhel, the first medalist of his age, has decided on the controversy in favour of Mr. Bryant.

Whatever may be the merit, in the opinion of the learned, of Mr. Bryant's *New System* at large, no person can possibly dispute, that a very uncommon store of learning is perceptible through the whole; that it abounds with great originality of conception, much perspicacious elucidation, and the most happy explanations on topics of the highest importance: in a word, that it stands forward amongst the first works of its age.

About this time the *Vindiciæ Flavianæ*, a tract on the much disputed testimony of Josephus to Christ, was printed, and a few copies sent to a bookseller in either university; but as the pamphlet appeared without the name of its author, and no attention was shewed it, Mr. Bryant recalled them, and satisfied himself with distributing the copies thus returned amongst a few particular friends. The new light, however, which Mr. Bryant threw upon the subject, and the acuteness with which the difficulties

attending it were discussed, soon caused the *Vindiciæ* to be known, and at length to be published with his name.

Dr. Priestley having, by his statement of the doctrine of philosophical necessity in a less exceptionable point of view than that in which it had been heretofore seen, attracted attention to the subject, Mr. Bryant was alarmed at the pernicious tendency, as he conceived, of the doctrine; and with the design of checking its advancement, addressed the Doctor on the subject. But whatever impression this address might have produced on other readers, it certainly left his antagonist unconvinced; which, however, was not the case in a former instance, for Dr. Priestley liberally confessed that, in respect to the testimony of Josephus concerning our Saviour, Mr. Bryant had made him completely a convert.

The poems attributed to Rowley having been published by Mr. Tyrwhitt, Mr. Bryant's attention was next drawn to them. From the communications of his friend Dr. Glynn, and his own enquiries at Bristol, Mr. Bryant having acquired such information as convinced him, that they had their foundation in reality, and were not entirely of Chatterton's fabrication, embarked in the contest; but though he failed to produce conviction in several particulars, his book discovers considerable talent, as well as much knowledge of English antiquities and literature, and abounds with arguments which cannot be repelled.

The hypothesis of Mr. Bryant in reference to the original language was always kept in view by him, and as researches were extended on all sides to obtain elucidations, the language of the gipsies engaged his attention; accordingly the collections which he made from it, were published in the *Archæologia*, vol. vii.

His next production, but which still remains unpublished, was an illustration in Latin of gems in the possession of the duke of Marlborough, engraved for his Grace by Bartolozzi. Of this magnificent work Mr. Bryant's observations formed the text of the first volume, that of the second was written by Dr. Cole, prebendary of Westminster.

The friendship which subsisted between Mr. Bryant and the family of his patron, prompted him on all occasions to subserve their wishes, and to this disposition are the public indebted for his Treatise on the Authenticity of the Scriptures and the Truth of the Christian Religion, which was written to gratify the dowager lady Pembroke, and is an excellent book for popular instruction.

In two years after (for the treatise just mentioned appeared in 1792) the world were obliged by a large volume, entitled "Observations upon the Plagues inflicted upon the Egyptians; in which is shewn the Peculiarity of those Judgments, and their Correspondence with the Rites and Idolatry of that People; with a Prefatory Discourse concerning the Grecian Colonies from Egypt." This is certainly to be reckoned amongst Mr. Bryant's best performances, and as such will be studiously read.

Professor Dalzel having communicated to the Royal Society of Edinburgh, and afterwards published in a separate volume, M. le Chevalier's "Description of the Plain of Troy," Mr. Bryant, who many years before had not only considered, but written his sentiments on the Trojan war, first published his observations on M. le Chevalier's treatise, and afterwards a dissertation concerning the war itself, and the expedition of the Grecians as described by Homer; with the view of shewing that no such expedition was ever undertaken, and that no such city in Phrygia existed. [The elegant treatise of Mr. Wood on the genius and writings of Homer, were edited, for his deceased friend, by Mr. Bryant.]

The clamour excited by these pamphlets almost exceeded belief. The author was attacked in all companies without mercy, and even by men from the press, who should have thought more soberly, for having indulged so excessive a scepticism, as could not, in its most direct effects, but be pernicious to the cause of divine revelation. Such censures, however, when duly weighed, could be disgraceful only to their authors, whose want of temper, or of judgment, rendered them unable to discriminate.

Amongst Mr. Bryant's principal opponents were Mr. Gilbert Wakefield, Mr. Morrit, and Dr. Vincent: but though the champions for the war strenuously assailed their antagonist, several of Mr. Bryant's objections remain as yet unanswered.

In the following year Mr. Bryant submitted to the public a work of a different kind and character, under the title of "The Sentiments of Philo Judæus concerning the ΛΟΓΟΣ, or Word of God, together with large Extracts from his Writings, compared with the Scriptures in many other particular and essential Doctrines of the Christian Religion." But, learned and curious as this treatise unquestionably is, it appears to have interested the general reader less perhaps than any of his other productions. In addition to those already noticed may be added his "Observations on famous controverted Passages in Justin Martyr and Josephus," and a pamphlet addressed to Mr. Melmoth, written with less temper than might have been wished. Mr. Bryant closed his labours with a quarto volume of Dissertations on the prophecy of Balaam; the standing still of the sun in the time of Joshua; the jaw bone of the ass with which Sampson slew the Philistines; and the history of Jonah and the whale: subjects in themselves exceedingly curious, and treated with much ingenuity; but these tracts upon them having been written above thirty years before, Mr. Bryant in revising so altered, as, through a defect of memory, to render the remarks in one part inconsistent with those in another, which materially diminished the value of the whole.

Other writings to a considerable extent still remain in the hands of his executor, who is said to have submitted them for publication to a competent judgment.

In forming a general estimate of Mr. Bryant's literary character, it will be found that, as a classical scholar, he had few equals; his acquaintance with history and the topics of general information was of very uncommon extent, but from the want of Oriental literature and the stricter sciences he yielded too often to the impulses of a vigorous fancy. It will, notwithstanding, be found from repeated perusals of his writings, that he deservedly ranks amongst the foremost of his age; and from having consecrated his great talents and acquisitions to the service of religion, will be ever entitled to the veneration of mankind.

In his person Mr. Bryant was lower and more delicately formed than men in general, and consequently less capable of strong exercise; but, in early life he had great agility, particularly in swimming, a circumstance which enabled him to save Dr. Barnard, afterward head master of Eton, when drowning. In his ordinary habits of life he was remarkable for his temperance, and though his time and studies were principally devoted to literature, and the pursuit of truth, yet his conversation with those he received and conversed with was uncommonly spritely, as he never failed to mix entertaining anecdote with instruction. In his person he was particularly neat, and in his deportment courteous. His liberality was often conspicuous, and the spirit of religion diffused itself through all his actions. As few comparatively live so long, instances of such exemplary merit can but rarely be found. Elected from Eton to King's, in 1736,

Vol. V.

he proceeded bachelor of arts in 1740; in 1744, took the degree of master, and died, after a long residence, at Cypenham, near Windsor, on the 14th of November, 1804, of a mortification in his leg, occasioned by a hurt from the tilting of a chair in reaching down a book from its shelf. At his own desire, Mr. Bryant was interred in his parish church, beneath the seat he there occupied.

BRYANT'S Cove, in *Geography*, lies on the east coast of Newfoundland, half a league S.W. from Harbour Grace, and two and a half leagues to the south-west of Spanish bay, in which there is good fishing for boats.

BRYANT'S Lick, a south-east branch of Green river, the mouth of which is about 27 miles E. of Craig's fort, and 10 E. of Sulphur spring, in Mercer's county, Kentucky.

BRYANTHUS, in *Botany* (Gmel. Sib.) See ANDROMEDA *bryantha*.

BRYE, JOHN THEODORE DE, in *Biography*, excelled in the art of designing and engraving. He was a native of Liege, but resided chiefly at Franckfort, where he carried on a considerable commerce in prints. His taste was formed on the works of Sebald Beham. He seldom used the point, but worked almost wholly with the graver. His style of engraving was neat and free, excellently adapted to small subjects, comprehending many figures; such as funeral parades, processions, &c. His drawing was very correct; his heads spirited and expressive, and the other extremities of his figures well marked. His back-grounds, though slight, are admirably touched. He died March 27, 1598. His great works were the plates for the first four volumes of Boissard's Roman Antiquities; the plates for illustrating the Manners and Customs of the Virginians, copied by Picart in his Religious Ceremonies of all Nations; the plates to the Latin Narrative of the Cruelties of the Spaniards in America, published in 1598, and his "Descriptio Indiæ Orientalis et Occidentalis," 5 vols. fol. 1598; and among other detached prints his "Procession for the Funeral of Sir Philip Sidney," engraved at London, 1578. Strutt.

BRYENNIUS, NICEPHORUS, was a native of Orestia in Macedonia, and married the princess Anna Comnena, daughter of Alexius Comnenus, who raised him to the rank of Cæsar, but declined announcing him as his successor in prejudice of his own son. After the death of Alexius, the empress Irene and her daughter Anna attempted to elevate Bryennius to the empire, but he refused to concur in the plot. Having been sent, in 1137, to besiege Antioch, he fell sick, and returning to Constantinople died in that city. His history of the reigns of Isaac Comnenus and of the three succeeding emperors, was comprised in four books, and published with a Latin translation, by the jesuit Poussines at Paris in 1661, to which the annotations of Du Cange were annexed in 1670.

BRYENNIUS, MANUEL, the last writer on music in the Greek language that has come to our knowledge. He flourished under the elder Palæologus, about the year 1320; and it is probable that he was a descendant of the house of Brienne, an ancient French family, that went into Greece during the Crusades, at the beginning of the thirteenth century. Fabric. Bib. Gr. Du Cange. Fam. Byzant.

The work is divided into three books, all which are consiaed to harmonics: the first is a kind of commentary on Euclid; and the second and third little more than explanations of the doctrines of Ptolemy.

Meibomius had promised a Latin translation of this work, but dying before it was finished, Dr. Wallis performed the task, and it now constitutes a part of the third volume of his works, published at Oxford in 3 vols fol. 1699.

That the Greek music had undergone many alterations

since the ancient treatises which are come down to us were written, is certain from the change and increase of its vocabulary. Bryennius (lib. iii. sect. 3) has given as names of intervals, a list of barbarous terms not to be found in any preceding writer within our knowledge: and in the Greek glossary of Du Cange, and the Abate Martini's papers on the present music of Greece, a great number occurs that is not to be found either in writers of high antiquity, or in Bryennius: as lib. iii. sect. 4. the words Ἠχοί, and πλάγιοι, appear for *tonus* and *obliquus*; and πλάτεις, διέτεροι, τριτοί, τετατοί, are used to distinguish the modes or tones; a proof that he was a modern Greek. Padre Martini is of opinion that these terms were first introduced in church music, to exclude the Pagan titles of Dorian, Phrygian, Lydian, &c.

The technical language of the Greeks has always been copious, and in music perhaps its seeming redundancy is more conspicuous than in any other art or science. But in other arts and sciences words are representatives of things existing; whereas, in denominating the tones and inflexions of voice, which, to realize, require new creation, there can be no correspondence between the type and substance. The colours, the forms, and objects which a painter wishes to represent, are in nature; and the poet, in all the ebullitions of wild enthusiasm and fervid imagination, describes what he has seen and felt, or what *is* to be seen and felt, and for which common language must supply him with symbols. But it has never entered the thoughts of man to give names to all the minute shades of colour between black and white, or to the gradations by which light is propagated between the time of total darkness and the sun's meridian. And yet, in a scale of sounds, from the lowest musical tone in the human voice to the highest, where octaves are not represented by similar signs and appellatives, the names and characters must be numerous. The lines and clefs of the European music have certainly freed it from many perplexities with which it was embarrassed, even in the artless times of Canto Ferreo.

**BRYGI**, in *Ancient Geography*, inhabitants of Thrace, who were subdued by the Macedonians, and served under Xerxes, when he invaded Greece.

**BRYGMUS**, in *Medicine*, a grinding or gnashing of the teeth; a symptom common in epilepsy, and some other convulsive disorders: from βρυγμῶ, to snap, or gnash, with the teeth.

**BRYONIA**, in *Botany*, (βρυονία, Dioscorides; from βρύω, germino, pullulo, expressive of the vigorous and rapid growth of its annual stems from the perennial root.) Linn. gen. 1093. Reich. 1194. Schreb. 1480. Gærtner 551. Jussieu 394. Ventenat, vol. iii. 511. Class, *monœcia syn-genesia. Pentandria*, Smith. Nat. Ord. *cucurbitaceæ* Linn. & Juss.

Gen. char. Male flowers. *Cal.* Perianth one leafed, campanulate, five-toothed; teeth oval-shaped. *Cor.* five, parted, campanulate, fastened to the calyx; divisions ovate. *Stam.* Filaments three, very short, two bearing each two anthers, and the third with only one. Female flowers. *Cal.* Perianth as in the males, superior, deciduous. *Cor.* as in the males. *Pist.* Germ. inferior. *Style* trifid, the length of the expanding corolla; stigmas emarginate, patulous. *Peric.* Berry subglobular, smooth. *Seeds*, not numerous, fixed to the coat, subovate. Schreb. Not more than six, inclosed in their proper cells. Gært.

Species, 1. *B. alba*. Linn. "with black berries, and the inward substance of the root of a pale box colour; leaves palmate, callous-scabrous on both sides." This species, though mentioned by many of the old botanists, does not seem to be much known since the time of Linnæus. La Marek observes that he knows nothing of it, and seems to speak with some degree of doubt with respect to its exist-

ence. In this, however, he is certainly wrong; it must have been known to Linnæus. Bose says that it is a truly distinct species, but gives no description. It appears to be confined to the north of Europe, and not to be found in England or France, for though Plukenet speaks of it as not unfrequent about Cambridge, he was probably mistaken; it had not been observed by Ray, nor has it been found since in that neighbourhood by Professor Martyn, nor in any other part of Great Britain. 2. *B. dioica*. Jacq. Aull. t. 199. Hall. Helv. 574. Allion. Ped. 455. Pollich. pal. 915. Ray hist. 659. Syn. 261. Huds. Ang. 437. Smith Flor. Brit. 398. Eng. Bot. 439. "Berries red; root yellowish white within; leaves palmate, callous-scabrous on both sides; flowers dioicous." *Root* large, fleshy, white. *Stems* annual, scandent, angular, rough, leafy, somewhat branched, very long. *Leaves* alternate, petioled, palmate, five-lobed, angular, rough on both sides, with minute callous points. *Stipules* none. *Tendrils* solitary, simple, accompanying the petioles. *Peduncles* axillary, somewhat umbellate with few flowers. *Corolla* white, elegantly marked with green veins. *Anthers* connate by pairs with an odd one. *Filaments* all a little united at the base. *Berries* globular, scarlet, smooth. *Seeds* six, elliptic, spotted. The leaves in autumn have the smell of musk. Smith. The roots have been artificially made to assume a human shape, and shewn to the common people as roots of the celebrated mandrake, *Atropa Mandragora*, to which many fanciful virtues have been attributed. For this purpose the earth is removed round the root of a thriving young plant, so as not to disturb the lower fibres, and a mould, such as is used for platter figures, is made fast with wires to receive the growing woody part of the root; the earth is then replaced, and in the course of a summer a root of the required shape is produced. 3. *B. palmata*, Linn. "Leaves palmate, smooth, five-parted, repand-ferrate." *Root* perennial. *Berries* yellowish, globular, rather large. Native of Ceylon. Introduced into England in 1778, by Messrs. Gordon and Græfer. 4. *B. laciniosa*, Linn. Gært. tab. 88, fig. 2, copied by La Marek. pl. 796, fig. 2. "Leaves palmate; divisions lanceolate, ferrated, petioles muricate." *Root* perennial. *Leaves* cordate, palmate, rough above, roughish beneath on the rib and nerves. *Petioles* almost prickly; not peduncles as it stands in the Mantissa, as copied by Reichard, and translated without a comment by La Marek. *Corolla* yellow, hairy, or tomentous within, smooth without. *Germ* smooth. *Fruit* sessile, of the size of a cherry, marked with six milk-white lines. *Berry* fleshy, three-celled, the pulp in each cell easily separable from it, gelatinous-membranaceous, two-celled, green. *Seeds* six, one in each cell of the pulp. La Marek describes a plant cultivated in the Royal garden at Paris, which he supposes to be the *Nebočmekka* of the Hortus Malabaricus, and not specifically distinct from the *laciniosa* of Linnæus, though Linnæus has cancelled the reference to it as a synonym in the Mantissa, after having admitted it in the Species Plantarum. The plant in the French garden has deeply palmated smooth leaves, but the *petioles*, as well as the posterior nerves, are armed with almost thorny prickles. 5. *B. Africana*. Linn. Herm. Parad. 107. tab. 108. Gærtner, 2, tab. 88, copied by La Marek, Pl. 796. fig. 3. "Leaves palmate, five-parted, smooth on both sides; divisions pinnatifid." Upper leaves five-parted, scabrous at the edge; divisions pinnatifid, almost linear, acute. *Berries* solitary, roundish, beaked, obtusely angular, yellow. Linn. Rind of the berry fleshy, rather thick, orange-coloured on the outside; pulp, membranaceous-spongy, easily separable from the rind, regularly divided into six, sometimes only four cells. *Seeds* one in each cell, ovate-globular, compressed at the sides, and

and especially towards the navel, to a sharp edge, with very minute, whitish bristles or scales lying close to their surface. Gært. La Marck describes a plant, cultivated at Paris, which he takes to be the same, in which the leaves are roughish beneath. 6. *B. cretica*. Linn. "Leaves palmate, rough with callous points on their upper surface." *Root* long, not so large as *B. dioica*, running deep into the ground. *Stems* slender, rough, furnished with tendrils. *Leaves* divided like those of the common sort, but less, streaked or spotted with white. *Flowers* axillary, pale, streaked, on long pendant peduncles. *Berries* small, semi-globular, divided at top into two parts, red, generally containing only two seeds. Miller, and La Marck. Native of Candia, whence the seeds were sent to C. Bauhin. Cultivated by Miller, before 1779. 7. *B. bouariensis*, Mil.; *seifolia*, La Marck. Dill. Elth. tab. 50. fig. 58. La Marck, Pl. 796. 1. "Leaves semi-palmate, five-parted, with obtuse segments, hairy." *Root* and *stems* like those of the common bryony. *Leaves* resembling those of the common fig, but smaller; narrower and smaller at the ends of the branches, hairy, and very rough, upper surface deep green, lower whitish. Native of Buenos Ayres. Cultivated in the Eltham garden, about 1726. Mil. 8. *B. variegata*, Miller. "Leaves palmate, with lanceolate segments, spotted on the upper, smooth on the under side; fruit ovate, scattered." 9. *B. grandis*. Linn. Mant. "Leaves cordate, angular, smoothish, glandular at the base underneath; tendrils simple." *Stem* shrubby, smooth, large, branching, scandent. *Leaves* roundish, five-angled, not lobed, smooth on both sides, scarcely denticulate, obtuse, alternate, petioled. *Flowers* large, whitish, androgynous, lateral; peduncles one-flowered. *Berry* roundish, red, smooth, five-celled. *Seeds* few, oblong, obtuse, compressed. Native of India and Cochinchina. Introduced into England in 1783, by Mr. I. Græfer; into France, by M. Sonnerat. 10. *B. cordifolia*. Linn. "Leaves cordate, oblong, five-lobed, toothed, scabrous; petioles long, with two teeth at the base of the leaf." *Stem* angular, rough. Native of Ceylon. La Marck suspects it to be a variety of the preceding. 11. *B. Maderaspatana*, Berg. cap. 351. *Cucumis Maderaspatana*. Linn. "Leaves cordate-triangular, toothed, scabrous; berries globular, axillary, in pairs." La Marck. *Stem* slender, angular, thinly sprinkled with small callous protuberances. *Leaves* longer than the petiole, toothed at the edges, slightly villous beneath, green, and rather rough. *Flowers* small, axillary, with a villous calyx, growing two or three together on very short peduncles. *Berries* globular, many-seeded. A native of the East Indies. La Marck says, that it is certainly a bryony. 12. *B. scabrella*. Linn. fil. 424. "Leaves cordate, angular, and lobed, callous-hispid; tendrils simple; berries globular; seeds muricate." Martyn. Whole plant very scabrous. *Stems* five-cornered, hispid. *Tendrils* simple. *Leaves* blunt, unequally toothed, a little curled at the edge; petioles hispid. *Peduncles* many; axillary short. *Calyx* bell-shaped, five-toothed. *Corollas* small, very like those of *melobria*, yellow. It has altogether the stature of *melobria*, but the whole plant is hispid and rugged, and has the flames of bryony. A native of the East Indies found by Dr. Kœnig, and introduced into England in 1781, by Sir Joseph Banks, bart. La Marck describes a plant under the same specific name, which he thinks nearly allied to the preceding, with a doubt whether it be the *scabrella* of the younger Linnaeus. It differs from Martyn's plant in having its berries perfectly smooth; a circumstance which the younger Linnaeus has left undetermined. La Marck's description was made from a dried specimen. 13. *B. scabra*. Linn. fil. 423. "Leaves cordate, angular, toothed, callous-pointed above,

villous underneath, scabrous on both sides. *Tendrils* simple. *Berries* globular, smooth." Found at the cape by Thunberg and Masson, and introduced into England in 1774. La Marck does not notice this species, unless it be his *scabrella*. 14. *B. nana*. La Marck. "Lower leaves cordate-roundish, very entire; upper ones deeply three-lobed; lobes obtuse." Allied to *B. Africana*, but much smaller, and with leaves less deeply cut. *Stems* slender, a little villous, scarcely more than a foot and a half high. *Leaves* alternate-petioled, green, smooth above, scabrous, with callous points beneath. Native of Africa. Described from a living plant without flowers in the Royal garden at Paris. 15. *B. Abyssinica*. La Marck. "Leaves large, cordate, toothed; upper ones lobed-angular; petioles and peduncles very villous." *Stem* six or eight feet high, villous, especially near the top. *Leaves* soft, almost smooth, deep green above, a little glaucous beneath; the lower ones cordate and toothed, the upper ones with four or five angular, unequal lobes. *Flowers* yellowish, axillary, in pairs; peduncles simple, short. *Corolla* five-parted, spreading, veined. A native of Africa. Described from a living plant in the Royal garden at Paris. 16. *B. Americana*. La Marck. "Leaves large, cordate, three-lobed; berries oval, with two or three seeds." *Root* tender, white, a little bitter. *Stems* long, angular, twining, jointed, with a leaf, a tendril, and a flower at each joint. *Leaves* petioled, a little rough, with a few rather spinous teeth, and resembling those of the common fig. *Flowers* pedunculate, with five divisions, greenish without, white within. *Berries* oval, about the size of an olive, red. *Seeds* two or three, bedded in a spongy pulp. Plumier's MSS. A native of the Antilles. 17. *B. Japonica*. Thunb. "Leaves cordate, undivided, and angular, toothed, unarmed-hispid." Lobes of the leaves angular, sharp, with very minute hairs on the upper surface, pale underneath, dotted with scales, an inch long. It creeps on walls. Native of Japan. 18. *B. racemosa*. Miller. Plum. pl. 83. t. 97. "Leaves cordate, three-lobed, the upper ones ovate and somewhat rugged; flowers in racemes; berries nodding, oval." A native of Jamaica. 19. *B. verrucosa*. Ait. Hort. Kew. 3. 385. "Leaves cordate, angled; the upper surface and the veins underneath callous-scabrous; the callosities remote; tendrils simple; berries globular." 20. *B. latebrosa*. Ait. Hort. Kew. 3. 384. "Leaves subtrilobate, hairy, drawn to a point at the base." This and the foregoing were observed by Masson in the Canary islands, and introduced here in 1779. The latter is easily distinguished from its congeners by the leaves not being in the least cordate at the base, but decurrent along the petioles. 21. *B. amplexicaulis*. La Marck. "Stem angular, smooth; leaves flat, cordate, subangular, embracing the stem; berries solitary, acuminate." *Stems* slender, scandent; leaves alternate, cordate, slightly angular, smooth on both sides, dotted above, glaucous below, on short petioles; the upper sometimes divided into straight diverging lobes. *Flowers* small, axillary, solitary, peduncled. *Germ* sharp-pointed at the summit. *Berry* fleshy, acuminate, very smooth, nearly the size of a hazel nut. A native of the East Indies, communicated by M. Sonnerat, and described from a dried specimen. 22. *B. hastata*. Martyn. Lour. Cochinch. 594. "Leaves hastate, edged with little teeth, smooth; peduncles many-flowered." *Stem* herbaceous, slender, scandent, cirrhose. *Flowers* androgynous, white, axillary. *Calyx* none. *Corolla* tubular, with a five-parted, upright border. *Filaments* placed at the bottom of the corolla, with three alternate, warted glands. *Berry* ovate, acute, small, red, one-celled; containing a few ovate, arilled seeds. Native of China about Canton. 23. *B. triloba*. Martyn. "Leaves three-lobed, five-nerved; stipules round-

ish, concave; peduncles one-flowered." *Stem* straggling, grooved, climbing by trifid tendrils. *Leaves* cordate, serrate-repant, smooth on both sides. *Stipules* ferrate. *Flowers* androgynous, white, axillary, solitary. *Berry* ovate, sharpish, smooth, yellow, an inch and half long, five-celled, many-seeded. Native of Cochinchina. 24. *B. Cochinchinensis*. Martyn. Lour. Cochin. 595. "Leaves five-cornered, rough; berries three-celled, ten-cornered." *Stem* herbaceous; four-grooved, branching, scandent, cirrhose. *Leaves* cordate, toothed, alternate, petioled. *Flowers* androgynous, white, large, axillary, solitary, on long peduncles. *Calyx* one-leaved; the tube at bottom cylindrical, at top ovate, dilated; border five-cleft with linear segments. *Corolla* almost wheel-shaped, fixed to the mouth of the calyx; segments ovate-oblong. *Filaments* placed on the middle of the tube of the calyx. *Anther* one, large, oblong-ovate, placed on the three filaments in form of a tripod. *Germ* inferior, ovate-oblong, grooved. *Style* filiform, shorter than the tube. *Stigma* oblong, three-cornered, trifid at the tip. *Berry* ovate, sharpish at both ends, red, smooth. *Seeds* ovate-oblong, compressed, smooth. Professor Martyn observes, that it differs from the other bryonies, but must remain here, unless it be made to constitute a new genus.

*Propagation and Culture.* The exotic species require the protection of the bark or dry stove, according to the temperature of their native climate. They are propagated by seeds sown on a hot-bed, and transplanted into pots filled with light fresh earth. Several of them will endure the open air in summer, but in winter must be sheltered, and should then have little water. They generally flower in July, and in favourable summers will ripen their seeds. Those which are annual must be sown on a hot-bed early in the spring, and, when about three inches high, transplanted into small pots; afterwards shifted into larger pots, and placed in the bark-stove, where their branches may be trained to the wall, or against an espalier, that they may have sun and air, without which they will not produce fruit. When full of fruit, they make a pretty variety in the stove. Miller.

*Medical and Economical Uses.* The fresh root of the common bryony, taken up in the beginning of spring, abounds with a thin milky juice, which may be collected, for two or three days successively, by baring the root of its earth, cutting the top transversely, and forming a cavity in the middle to receive it. Both the root in substance, and the juice, have a disagreeable smell and a nauseous, bitter, biting taste: applied for some time to the skin, they inflame, and even vesicate the part. On drying the one, or inspissating the other, they lose most of their acrimony, and nearly the whole of their ill scent. In summer, the root is much less juicy and powerful. This strong and irritating cathartic, though now seldom prescribed, is said to be of great efficacy in evacuating serous humours; and has chiefly been employed in hydropical disorders; but is reported to have good effects also in asthma, mania, and epilepsy. In small doses it operates as a diuretic, and is resolvent and deobstruent; given in powder, from a scruple to a dram, it proves strongly purgative; the juice, in doses of a spoonful or more, has similar effects; but is more gentle in its operation. An extract, prepared by water, acts more mildly and with greater safety, and may be given from half a dram to a dram. Externally the fresh root has been employed in cataplasms as a resolvent and discutient, also in ischiadic and other rheumatic affections. Woodville, Med. Bot. vol. iii. p. 518. A decoction made with one pound of the fresh root is the best purge for horned cattle. Withering. Bosc observes (Nouv. Dict.) that it has much affinity with the root of jatropha manihot, and that a wholesome capava may be made of it by the same

process as is employed in the West Indies on the manihot. Beaumé was the first who discovered, that, when grated in water, it yields a fecula exactly the same with that of the potatoe. During the scarcity at the time of the French revolution, Bosc himself often eat of it, and found it very nourishing. He could never entirely deprive it, by maceration, of its peculiar smell and taste; but the unpleasantness was overcome by a pretty high seasoning. The root must be gathered for this purpose in autumn and winter; and a single one will often be a sufficient breakfast for one person. The root of *B. Alyssinica* boiled is said to be eaten in its native country.

BRYONIA (Plumier). See *MFLOTHRIA pendula*, and *RAJANIA hastata*.

BRYONIA alba (Sloane Jam.) See *CISSUS fcyoides*, *acida*, *et trifoliata*.

BRYONIA nigra (Sloane Jam.) See *TOURNEFORTIA volubilis*.

BRYONIA (Dal. Pharm.) See *CONVOLVULUS JALAPA*.

BRYONIA (C. Bauh.) See *TAMUS*.

BRYONIA, in *Conechology*, a species of *STROMBUS*, about seven inches in length, fuscous, variegated with white and blue in clouds. This shell is specifically described as being of a conic form, with a mucronate, eight-dentated lip, and knotty spire. Described by Lister.

This shell is extremely rare. Gmelin is in doubt whether it belongs to the *STROMBUS* genus. Native place unknown.

BRYONIÆ SIMILIS (Pluk.) in *Botany*. See *DIOSCOREA villosa*.

BRYONIOIDES (Dill. Elth.) See *SICYOS angulata*.

BRYONIOIDES (Pluk.) See *CISSUS acida*.

BRYUM, (from  $\beta\rho\upsilon\omicron$ , germino, pullulo) first used as a generic name by Dillenius in his catalogue of plants in the neighbourhood of Giessen, printed at Frankfort on the Mayne in 1717, introduced by him into his edition of Ray's *Synopsis* 1724, and finally illustrated with full descriptions and figures of all the then known species in his admirable *History of Mosses*, published at Oxford 1741. It was given to a family of mosses distinguished by the following characters. Stems generally erect, and little if at all branched. Peduncles either terminal, or springing directly from the stemless root; and when apparently lateral proceeding from the termination of the last year's stem, not surrounded at its base, like hypnum, with a perichætium or scaly involucrem, but having instead of it an oblong knob or tubercle. Capsules when young covered with a smooth calyptra. It was taken up by Linnæus in his *Flora Lapponica* and *Genera Plantarum*, both published in 1737, and continued in all his subsequent works, with no material change of the original generic character. Dillenius enumerates eighty-one species in his *Historia Muscorum*, sixty-one of which appear as English plants in the third edition of Ray's *Synopsis*; but in the *Species Plantarum* the number is reduced to thirty-two, many of Dillenius's species being considered only as varieties, and those which appear to be dioicous being removed by Linnæus to *Mnium*. The twelfth edition of the *Systema Naturæ* has only thirty-one, the *B. capillare* of the *Species Plantarum* being also removed to *Trinium*. The number has since been greatly increased, so that Dr. Withering in the third edition of his *Botanical Arrangement* reckons ninety-two British species.

Hedwig, in his new system of mosses which is generally received in Germany, and is beginning to make its way in England through the powerful influence of Dr. Smith and Mr. Dawson Turner, has contracted the genus distinguished by this name within much narrower limits, taking

out of it his *Gymnostomum*, *Anistangium*, *Encalypta*, *Leeria*, *Grimmia*, *Weissia*, *Trichotomum*, *Didymodon*, *Cynodontium*, *Tortula*, *Barbula*, *Bartramia*, and part of his *Splachnum*, *Fissidens*, and *Dicranum*; and confining it to such species as have the following character. *Peristome*, or fringe surrounding the mouth of the capsule, double; *outer* toothed, teeth sixteen acute; *inner* ciliate; cilia difform, arising from a keeled membrane. *Male Flower*, capitulum-form, dioicous. It has however since been again extended with various modifications by different authors. Schreber includes in it Hedwig's *Mnium* and *Webera*, with this character. *Capsule*, ovate-oblong. *Peristome*, double; *outer* with sixteen broadish acute teeth; *inner* membranaceous, plaited and keeled, lacinate, with alternate broadish and capillary divisions. *Masc.* capitate, or discoid, or gemmaecous. Dr. Smith's *Bryum* comprehends *Webera*, *Pohlia*, and *Meesia*; and Mr. Turner adds *Mnium*. Dr. Smith's generic character stands thus; *capsule*, ovate-oblong, not furrowed. *Peristome*, *outer* with sixteen teeth dilated at the base; *inner* membranaceous, variously toothed and lacinate. *Calyptra* not furrowed. Pedicel terminal. He enumerates thirty-three British species.

1. *B. nutans*, silky pendulous thread-moss. Schreber, Swartz, Roth, Ehrh.; (*Jericium*, With. Hull. Sibth.) Dill. t. 50. f. 61. Eng. Bot. 1240. "Stem generally simple; leaves lanceolate acute, keeled; capsule obovate, pendulous, obtuse." *Stems* growing in thick tufts, erect, short, often simple, most leafy at their summits. *Leaves* pale green, glossy, lanceolate, acute, keeled, one-nerved, tipped with a serrulate point. *Fruit-stalk* terminal, solitary, erect, sometimes two inches long, glossy, tawny purple, paler upwards. *Capsule*, pendulous, obtuse, a little attenuated or elongate at the base, rusty-coloured, not glossy. *Lid* convex, with a short, blunt point. *Outer fringe* yellowish; inner variously lacinated. Perennial. 2. *B. aureum*, gold thread-moss, (*Mnium pyriforme*, Linn.) Dillen. tab. 50. f. 60. Eng. Bot. 389. "Stem perfectly simple; leaves setaceous, upper ones very long; capsule pendulous, pearshaped, suddenly contracted about the middle." *Stems* in tufts, erect, simple, half an inch high, filiform. *Leaves* pale yellowish green, capillary, loose, keeled, very entire; upper ones very long, spreading in form of a star. *Flowers* terminal. *Fruit-stalks* solitary, erect, an inch long, capillary, of a gold colour, glossy, somewhat waved. *Capsule* gold coloured, highly glossy, pendulous, pearshaped, rather blunt, attenuated from the base to the middle; lid rather conic, short, somewhat pointed; calyptra awlshaped, white. Fringe yellow without; white within, teeth in a double series. Annual. 3. *B. elongatum*, Dicks. Fasc. 2. 8. (*Pohlia* Hed. *Mnium* *Pohlia* Hoff.) "Stem generally simple; leaves linear-lanceolate, thickened at the edge. *Capsule* rather nodding, cylindrical, elongate at the base." *Stem* erect, short, simple, but at length a little branched. *Leaves* deep green, spreading, lanceolate or linear-lanceolate, acute, one-nerved, very entire, curled when dry. *Fruit-stalks* an inch and a half long, solitary, nearly erect, purple, yellow near the top. *Capsule* a little nodding but not pendulous, cylindrical, curved, brown, a little contracted at its orifice, lengthened at its base into an obconical apophysis of nearly its own length; lid conical, acute, short; fringe outer very short, brown; inner white, toothed in a single series. Perennial. Obs. Dillenius confounded this species with *nutans*. 4. *B. trichodes*, long, capillary, thread-moss, Linn. (*Mnium uliginosum*, With. *Meesia uliginosa*, Hed.) Dill. Tab. 49. f. 58. "Stem generally simple; leaves linear, obtuse; capsule obovate, incurved, somewhat nodding; fruit-stalk very long." *Stems* in tufts, scarcely an inch high, sometimes much shorter,

erect, black with a ferruginous down at the base. *Leaves* erect but spreading, of a full yellow green, glossy, obtuse, very entire, keeled. *Fruit-stalks* terminal, solitary, very long, erect, capillary, red, but brown at the base, and yellowish at the top. *Capsule* inclining, obtuse on a short apophysis. Lid conical, obtuse, very short; fringe outer short, inner reticulated twice as long as the outer. Calyptra awl shaped, straight. Perennial. 5. *B. dealbatum*, pale-leaved thread-moss (*Meesia* Swartz, Hed.) Dicks. Tab. 5. f. 3. "Stem very short, simple; leaves lanceolate, reticulated, a little serrated at the top; capsule obovate, nodding." *Stems* in tufts. *Leaves* pellucid, acute, one-nerved. *Fruit-stalks* solitary, terminal, erect, an inch and a half long, red. *Capsule* curved, opaque, with a very contracted apophysis. Lid convex, with a short point, red; fringe outer short, ferruginous; inner reticulated, twice as long as the outer. 6. *B. cylindricum*, Dicks. Tab. 11. f. 4. "Stem simple; leaves lanceolate-linear, serrated towards the top; capsule rather erect cylindrical." *Stem* scarcely half an inch high, erect. *Leaves* of a pleasant green colour, erect but spreading, acute, keeled, one-nerved. *Fruit-stalk* erect, terminal, an inch long, red. *Capsule* pale brown, small, slender, with an obconic apophysis of its own magnitude, fringe pale. 7. *B. carneum*, Linn. (*B. delicatum* Hed. *Mnium carneum* Hoff.) Dill. Tab. 50. f. 69. "Stem generally simple; leaves lanceolate, acute, very entire, reticulated, placed rather remote from each other; capsule pendulous, topshaped." *Stems* not half an inch high, in tufts, erect, red. *Leaves* alternate, pale green, pellucid, reticulated, very entire, one-nerved. *Fruit-stalks* terminal, solitary, half an inch long, a little zigzag, of a pale rose colour. *Capsule* pendulous, flesh-coloured, opaque; lid conic, short, obtuse; fringe outer, rusty brown; inner, yellowish, toothed in a double series. 8. *B. alpinum*, Linn. Mant. Dill. Tab. 50. f. 64. "Stem branched, erect; leaves ovate-lanceolate, acute, imbricated; capsule oblong, pendulous." *Stems* in tufts, one or two inches high; branches erect, stiff, round, acute. *Leaves* imbricated densely on all sides, beautifully variegated with green and purple, glossy, very entire, pellucid, often with a very red nerve, when dry pressed close to the stem. *Fruit-stalks* lateral, solitary, an inch long, red, straight, rising higher than the stem. *Capsules* obovate-cylindrical, red when ripe; lid hemispherical, umbonate; fringe white or rose coloured. 9. *B. caespitium*, Linn. (*Mnium caespitium* With. Relh. Abb.) Dill. Tab. 50. f. 66. except the variety F. G. lesser matted thread-moss. "Stem branched at the base, matted, leaves ovate-lanceolate, flat, ending in a hair; capsule obovate, pendulous." *Stems* forming a dense tuft, branched from the base; branches trilinear, simple, spreading, leafy, obtuse. *Leaves* of a pleasant green, very entire, one-nerved, the upper one larger, spreading in form of a star. *Fruit-stalks* from the base of the branches, about an inch and a half long, capillary, erect, purple at the base, green at the top. Lid convex, umbonate, fringe yellow, teeth acuminate. 10. *B. bicolor*, Dicks. Fasc. 4. 16. Dill. Tab. 50. f. 66. F. G. "Stem very short, branched at the base; leaves ovate-lanceolate, acuminate; capsule ovate, obtuse, pendulous." *Stems* scattered, with long fuscous roots. *Leaves* yellowish green, small, spreading, flat, very entire, a little pointed but not ending in a hair. *Fruit-stalks* from the base of the branches, half an inch long, erect, very red, glossy. *Capsule* rather large, thick, red at the base, fulvous at the top, often entirely blood red; lid hemispherical, umbonate, glossy, fulvous or scarlet; fringe nearly resembling that of *B. carneum*. 11. *B. argentum*, Linn. (*Mnium* Hoff.) silvery thread-moss. "Stem branched at the base,

base, matted; leaves ovate, concave, ending in a hair, imbricate; capsule oblong, pendulous." *Stems* in convex tufts, half an inch high, branched from the base; branches thread-shaped, erect. *Leaves* with a silvery gloss, closely imbricated, very entire, one-nerved, ending in a short hair. *Fruit-stalk* from the base of the branches, scarcely an inch long, capillary, glossy, purple at the base, yellow at the top. *Capsule* short, reddish. Lid conical, very short, fulvous, fringe, yellow. 12. *B. Zierii*, Dicks. Fasc. 2. Tab. 4. Fig. 10. Eng. Bot. 1021. "Stem erect, branched; leaves ovate, concave, imbricated, pointed; capsule clubshaped, drooping." Perennial. *Stems* in tufts; branches round, obtuse. *Leaves* soon white or flesh-coloured, glossy, very entire, one-nerved. *Fruit-stalks* from the base of the branches, not an inch long, nearly erect, reddish. *Capsule* scarcely pendulous, before maturity clubshaped, green; when ripe obovate, or ovate, with an obconic apophysis; lid conical, short; fringe, red. Calyptra awlshaped, acuminate. 13. *B. jalaceum*, (argenteum *l.* Linn. *Mnium holosericeum* Hoff.) Dill. Tab. 50. f. 63. "Stem branched at the base; leaves ovate, concave, imbricate, obtuse; capsule clubshaped, pendulous." Perennial. *Stem* larger than in *B. argenteum*; branches slender, erect, acute. *Leaves* glossy, yellowish green, (not silvery,) closely imbricated, small, very entire. *Fruit-stalk* from the base of the branches, an inch or more long, a little flexuose, red. *Capsule* brown; lid convex, umbonate, glossy, pale brown. 14. *B. capillare*, Linn. Sp. Pl. (*Mnium* Linn. Fl. Suec. With. &c.) "Stem branched at the base, matted; leaves obovate, ending in a hair, twisted when dry; capsule clubshaped, pendulous." Perennial. Resembling *B. caespitium* but larger. *Branches* about an inch long, erect, thickened at the base, stellate. *Leaves* of a fine green, obtuse, very entire, one-nerved. *Fruit-stalks* an inch and a half long, firm, red. *Capsule* obtuse, between cylindrical and club-shaped, large; lid ferruginous, glossy, hemispherical, with a short, straight point, outer fringe fulvous with acuminate teeth. 15. *B. annotinum*, summer thread-moss (*Mnium annotinum* Linn.) Dill. Tab. 50. f. 68. "Stem branched at the base; leaves ovate-lanceolate, pellucid, keeled, somewhat ferrated; capsule obovate, pendulous." Perennial. *Stems* red, erect, leafy; male simple, often elongate, gemmiparous; feminine branched. *Leaves* fine green, under a lens reticulate, keeled, one-nerved, acute. *Fruit-stalks* terminal, solitary, an inch and half long, red. *Capsule* nearly pear-shaped; lid conic, short, acute, flesh-coloured; fringe pale. 16. *B. compactum*, Dicks. Fasc. 4. Tab. 11. Fig. 11. "Stem divided at the base; leaves lanceolate, keeled, ferrated near the tip; capsule ovate, pendulous." Perennial. *Stems* in dense tufts, half an inch high, sometimes simple, naked below, red. *Leaves* yellowish green, glossy, acute, somewhat revolute. *Fruit-stalks* terminal, erect, half an inch long, a little flexuose, ferruginous. *Capsule* short, dilated at the margin, almost topshaped; lid convex, umbonate. 17. *B. attenuatum*, slender, proliferous thread-moss. Dicks. Fasc. 4. Tab. 10. f. 8. "Stem simple, proliferous; leaves stellate, ovate, very entire, reticulate; capsule clubshaped, cylindrical, erect." Perennial. *Stems* ascending half an inch long, filiform, often throwing out new stems which take root. *Leaves* rounded, acute, one nerved, pellucid. *Fruit-stalks* terminal, erect, half an inch long, yellowish. *Capsules* erect, slender, pale brown, contracted at the orifice; lid convex, without a point. 18. *B. hornum*, swan-neck thread-moss (*Mnium hornum* Linn.) Dill. Tab. 51. f. 71. Curtis Tab. 71. "Stem simple; leaves lanceolate, denticulate-ferrated; fruit-stalk curved;

capsule ovate, drooping." Perennial. Larger than the preceding species. *Stems* in tufts, simple, leafy, red, ferruginous and tomentose at the base. *Leaves* fine green, pellucid, membranous, spreading acute, with a strong red nerve, waved when dry. *Masculine flower* large, terminal, discoid, surrounded with large obtuse leaves; feminine on a different plant. *Fruit-stalk* terminal, solitary, very long, straight, and red at the base, curved, and yellowish at the top, thickened under the capsule. *Capsule* large, drooping, turgid, retuse, of a pale rust colour, with a scarlet orifice; lid hemispherical, with a short point; outer fringe of a citron colour, with acute teeth, inner white. 19. *B. crudum*, (*Mnium crudum*, Linn.) Dill. Tab. 51. f. 70. "Stem simple; leaves lanceolate, acute, very entire; upper ones narrow, denticulate; capsule oblong, drooping." Perennial. Transparent-green thread-moss. *Stems* in tufts, simple, erect, scarcely an inch high, naked at the base, dark purple. *Leaves* crowded at the top of the stem, glossy, of a fine green, pellucid, spreading, flat, one-nerved; lower ones shorter, upper narrower, and generally ferrated near the tip. *Fruit-stalk* terminal, erect, an inch long, red. *Capsule* ferruginous, scarcely red at the orifice; lid hemispherical, with a slight tip, yellowish; fringe citron-colour; calyptra recurved, deciduous. 20. *B. marginatum*, Dicks. Fasc. 2. Tab. V. fig. 1. "Stem simple; leaves lanceolate, acute, denticulate, thickened at the margin; capsule ovate; lid conic." Thick-edged thread-moss. Perennial. *Stems* an inch high, erect, red. *Leaves* with a red nerve and margin. *Fruit-stalks* solitary, erect, an inch long, flesh-coloured. *Capsule* pendulous, retuse; lid, conic-awl-shaped; calyptra awlshaped, reddish, recurved. 21. *B. interruptum*, Dicks. Fasc. 4. Tab. ii. f. 6. "Stem branched, interruptedly leafy; leaves lanceolate, acute, completely ferrated; capsule pear-shaped, rather erect." Interrupted thread-moss. Perennial. *Stems* in tufts, an inch and half high, branched in a determinate direction, red. *Leaves* fasciculated, yellowish green, glossy, reticulated, one-nerved; lower ones remote, small, short; *fruit stalks* terminal, erect, red, scarcely an inch long; *capsule* brown, dilated at the mouth; lid hemispherical, obtusely umbonate. 22. *B. nigricans*, Dicks. Fasc. 4. Tab. ii. f. 10. "Stem branched at the base; leaves lanceolate, stiff, ferrated towards the tip; capsule top-shaped, pendulous." Dark-green thread-moss. Perennial. "Stems in tufts. *Leaves* dark-green, imbricated, acute, keeled, dilated at the base; *fruit-stalks* terminal, ferruginous, curved at the top. *Capsules* with a spreading orifice; lid convex, obtusely umbonate; fringe yellow. 23. *Bryum? inclinans*, Dickson Fasc. 4. Tab. ii. f. 9. "Stems branched; leaves bristle-shaped, very entire, curled when dry; capsule ovate, inclining; apophysis small." Inclining curled thread-moss. Perennial. *Stem* erect. *Leaves* loosely imbricated, keeled, dilated at the base. *Fruit-stalks* lateral, erect, half an inch long. 24. *B. cubitale*, Dicks. Fasc. 2. Tab. v. f. 2. "Stem ascending, a little branched; leaves lanceolate, very entire, decurrent; fruit-stalk knee-jointed; capsule club-shaped, pendulous." Elbow shaped thread-moss. Perennial. *Stems* two or three inches high, leafy, clothed with a rusty down. *Leaves* spreading, fine green, pellucid, acute, thickened at the edge with a strong red nerve. *Fruit-stalk* terminal, solitary, three or four inches long, yellowish brown, glossy. *Capsule* attenuated at the base. *Obs.* The largest bryum hitherto discovered. 25. *B. ventricosum*, (*Bryum triquetrum*, Hudf. Hull. *Mnium Pseudo-triquetrum* Hed. Hoff. With.) Dicks. Fasc. i. p. 4. Dill. Tab. li. f. 73. "Stem branched in a determinate direction; branches ascending; leaves alternate, lanceolate, ferrated at the tip; capsule ventricose, pendulous." Swelling

Swelling bog-thread-mofs. Perennial. *Stems* in tufts, with long roots, clothed with a rusty down; branches numerous, ascending, red, loosely leaved. *Leaves* pale green, alternate, erect, spreading, acute, one-nerved, twisted when dry. *Fruit-stalks* terminal, or from the tip of the branch of the preceding year, an inch and an half or two inches long, erect, purple at the base, yellowish at the top. *Capfule* ovate, short, a little contracted under the orifice; lid convex, with a short point; fringe yellow. 26. *B. binium*. Schreb. Roth. Swartz (*B. triquetrum*  $\beta$  Hudf. *Mnium Binium* Hoff.) Dill. Tab. li. f. 73. "Stem branched; leaves alternate, linear-lanceolate, a little serrated at the top; capfule obovate, club-shaped, pendulous." Long-stalked bog-thread-mofs. Perennial. Larger than the preceding. *Stem* two or three inches high, irregularly branched, of a dark rusty colour. *Leaves* elongate, yellowish green. *Fruit-stalks* from the end of the two or three year-old branches, two or three inches long, dark purple, glossy, sometimes knee-jointed towards the base. *Capfule* narrowed at the base, contracted under the orifice, twice as large as in the preceding; fringe yellow. 27. *B. turbinatum*. Swartz. Roth. (*B. triquetrum*  $\gamma$  Hudson, *Mnium nutans* With. Hull. *Mnium turbinatum* Hed. Hoff.) Dill. Tab. li. f. 74. "Stem branched, leaves ovate, awned, very entire, capfule pear-shaped, pendulous." Pear-shaped bog-thread-mofs. Perennial. *Stems* scarcely an inch high, in tufts; leaves fine green, spreading, alternate, approximate, one-nerved. *Fruit-stalks* an inch long, purplish brown, a little flexuose. *Capfule* attenuated at the base; lid convex, without a point; fringe rust-coloured. 28. *B. fcellare*. Roth. (*B. ferpyllifolium*,  $\epsilon$  Hudf. *Mnium proliferum*, Var. 2. With. *Mnium fcellare*, Hed. Hoff.) Dill. Tab. lii. f. 78. "Stem branched; leaves ovate, acuminate, reticulated with round meshes; the upper ones ferrate, flellate; capfule oblong, drooping." Starry-leaved thread-mofs. Perennial. *Stem* determinately branched, one or two inches high. *Leaves* fine green, with a strong red nerve, scarcely reaching the tip. *Fruit-stalk* terminal, about two inches long, a little curved, thickened at the tip; lid hemispherical. 29. *B. cuspidatum*. Swartz. Roth. Hull. Sib. (*Mnium ferpyllifolium*  $\beta$  Linn. *M. cuspidatum* Hedw. Hoff. With. *B. ferpyllifolium*  $\gamma$  Hudf.) Dill. Tab. liii. f. 79. "Stem simple; barren one, procumbent, a little branched; leaves ovate, serrated; capfule ovate; lid hemispherical." Pointed-leaved thyme-thread-mofs. Perennial. *Stems* leafy, of two kinds; the barren ones procumbent, throwing out roots, three inches or more long; fertile ones erect, simple, an inch long. *Leaves* fine green, pellucid, under a lens minutely reticulated, alternate, broad-ovate, somewhat waved, acutely serrated, pointed, with a strong pale nerve. *Fruit-stalk* terminal, an inch long, flexuose, rose-coloured. *Capfule* pendulous, short, ventricose, retuse, yellow, with a scarlet orifice; lid without a point; fringe lemon-coloured. 30. *B. punctatum*. Roth. Hull. Sibth. (*Mnium ferpyllifolium*, Linn. *M. punctatum*, Hedw. With. *B. ferpyllifolium*, Hudf. Swartz.) Dill. Tab. liii. f. 81. Eng. Bot. 1183. "Stem nearly simple; leaves obovate, very entire, dotted, reticulated; capfule elliptical; lid awl-shaped." Dotted-leaved thyme-thread-mofs. Perennial. Habit of the preceding, but distinguished at once by its dotted leaves. *Stems* an inch and half high, leafy, red, often flexuose. *Leaves* broadly ovate, very obtuse, a little pointed, thickened at the edge, red, repand, with a strong red nerve; the upper ones stellate. *Fruit-stalks* terminal, more than an inch long, purplish, bowed at the top; *capfule* pendulous, green, with a purple orifice, finally brown; lid yellow, convex at the base, with a rather obtuse recurved point. 31. *B. rostratum*.

Schrad. (*Mnium punctatum*, Var. ii. With. *M. ellipticum*. Hoff. *B. ferpyllifolium*  $\beta$  Hudf.) Dill. Tab. liii. f. 80. "Stem simple; leaves obovate-spatulate, ferrulate; capfule ovate; lid awl-shaped." Long-beaked thyme-thread-mofs. *Stem* shorter than in the preceding. *Leaves* less and narrower, not reticulated. *Fruit-stalks* solitary or aggregate, terminal, an inch and half long, flesh-coloured, purple at the base. *Capfule* pendulous, green, flesh-coloured at the mouth; lid yellow, convex at the base, with an obtuse, recurved point, a little shorter than the capfule. 32. *B. roseum*. Schreb. Swartz. Roth. (*Mnium ferpyllifolium*  $\gamma$  Linn. *M. proliferum*, With. Hull. *M. roseum*, Hedw. Weiff. *B. proliferum*, Sibth. *B. ferpyllifolium*  $\delta$  Hudf.) "Stem somewhat proliferous; leaves crowded, stellate, ovate, acute, sprinkled with small dots, scabrous at the margin; lid conical." Rosaceous thyme-thread-mofs. Perennial. *Barren stems* elongate, procumbent, covered with smaller, obtuse, alternate leaves. *Fertile stems* erect, an inch high, often proliferous, squamous, and without leaves below, leafy above. *Leaves* a little decurrent, flat, rough, or slightly crenulated at the margin. *Fruit-stalks* terminal, often aggregate, an inch and half or two inches long, stiff, red, glossy. *Capfule* pendulous, ovate-oblong, glossy; lid, on the authority of Dillenius, conical, short. 33. *B. ligulatum*. Schreb. (*Mnium ferpyllifolium*  $\delta$  Linn. *M. undulatum*, Hedw. With. *Bryum undulatum*, Sibth. Turner.) "Stems simple, but finally branched at top; leaves oblong, waved, serrated; fruit-stalks aggregate." Long-leaved thyme-thread-mofs. Perennial. *Root* creeping. *Stems* erect, almost inclining to shrubby, leafy; barren ones elongate; fertile ones finally determinately branched; branches stellate ascending. *Leaves* fine green, close-set, alternate, decurrent, spreading, linear-oblong, obtuse, one-nerved, acutely serrate, soon growing flaccid when gathered. *Fruit-stalks* aggregate, two inches long, fulvous, glossy. *Capfule* pendulous, ovate, short; lid conical, short.

The system of Hedwig does not seem likely at present to be received in France. La Marck, in the Dictionnaire Methodique, does little more than enumerate and describe the species of Linnæus, as they stand in the last edition of the *Sytlema Naturæ*. Bose, in the Nouveau Dictionnaire d'Histoire Naturelle, published so lately as 1803, says, that the bryum of Linnæus is a very natural genus; but that the German botanists, who never think that they have genera enough, have exercised their skill upon it, and have formed out of it seventeen genera, most of them founded on characters which are scarcely discernible with the best lens. It must be acknowledged that there is some reason for the complaint; and we feel a pride in reflecting that our two great English cryptogamists have steered a middle course, and have produced a real improvement in the science; avoiding at the same time the difficulties which are justly objected to by the French naturalist.

As Hedwig's new genus *bartramia*, which was formed entirely at the expence of Linnæus's *bryum*, has been omitted in its proper place, owing to the German system of mosses not having publicly received the powerful patronage of Dr. Smith and Mr. Turner, when that part of our dictionary was written, it cannot now be more properly introduced than as an appendix to the present article. The other genera will be found under their respective letters of the alphabet.

*Bartramia*, Hedw. Gen. Char. *Capfule* spherical, furrowed when ripe. *Outer fringe* of sixteen teeth, dilated at the base; *inner* membranaceous, plaited, variously lacinated. *Calyptra* smooth; lid depressed.

British species. *B. hallcriana*, Hedw. Swartz. Roth. (Bryum

(*Bryum laterale*, Hudf. Light. With. Hull. Dickf. Ehrh. *B. pomiforme*, Var. i. Scop. *Mnium laterale*, Hoff.) Haller Hist. vol. iii. tab. xlv. f. 8. Eng. Bot. 997. "Fruit-stalks lateral, curved, shorter than the leaf; leaves linear, awl-shaped, one-nerved, with an even surface." Lateral bartramia. Perennial. *Stems* in tufts, erect, two or three inches high, branched, leafy. *Leaves* spreading, dense, of a fine green, rather inclining to one side, soft, thin, keeled, ferrulated towards the tip, dilated at the base. *Fruit-stalks* axillary, solitary. *Capsule* globose, at length laterally contracted, and longitudinally marked with sixteen strong furrows, a little drooping, ferruginous; inner fringe plaited, almost entire, a little torn at the opening: lid convex, short; calyptra conical, soon falling off. 2. *B. pomiformis*, Hedwig. Swartz. Roth. (*Bryum pomiforme*, Linn. &c.) Dill tab. xlv. f. 1. Haller tab. xlv. f. 7. Moris. vol. iii. tab. vi. f. 6. "Fruit-stalks erect, longer than the stems; leaves awl-shaped, one-nerved." Apple bartramia. Perennial. *Stems* in dense tufts, branched, fastigiate, leafy, often an inch high. *Leaves* fine green, spreading, linear-awl-shaped, with a strong nerve, ferrulated near the tip, not much dilated at the base, striated when dry. *Fruit-stalks* solitary, terminal at first, but soon becoming axillary, an inch, or an inch and a half long, red. *Capsules* erect, globose, green; when ripe brown, a little curved and drooping, longitudinally furrowed; fringe short; outer red; inner very thin; lid convex, very short; calyptra conic-awl-shaped, soon falling off. 3. *B. fontana*, Swartz, Smith, and Turner, (*Mnium fontanum*, Linn. Hedw. With. &c. *Bryum fontanum*, Hudf. Sibth.) Dillen. tab. xlv. f. 2. Flor. Dan. 298. Eng. Bot. 390. "Fruit-stalks erect, longer than the stem; leaves ovate, very entire; branches fasciculated, erect, thread-shaped." Fountain bartramia. Perennial. *Stems* in dense tufts, often a span high, determinately branched, leafy, towards the bottom clothed with a rusty down. *Leaves* yellowish green, imbricated on all sides of the stem, short, acuminate, keeled, one-nerved. *Flowers* dioicous, terminal; males forming a disc, surrounded by larger leaves and new little branches. *Fruit-stalks* solitary, three inches high, red, springing from the divarications of the branches. *Capsules* obliquely drooping; ovate-spherical, brown, with many furrows, lid convex, with a short, acute, crooked point; fringe short, brown; inner one in a double series. 4. *B. arcuata*, Smith. (*Mnium arcuatum* and *hypnum chrysoconum*, Dickf. *Bryum arcuatum*, Hall.) Dill. tab. xxxix. f. 36. Eng. Bot. 1237. "Fruit-stalks recurved; leaves lanceolate, one-nerved, furrowed, ferrulated; branches scattered, spreading." Curve-stalked bartramia. Perennial. *Stems* erect, branched, leafy, clothed with a dense rusty down; branches numerous. *Leaves* imbricated but spreading, yellowish green, glossy, acuminate; *Fruit-stalks* solitary, terminal, at length lateral, short, red, with a small scaly perichætium. *Capsule* drooping, globose, green, glossy, furrowed; lid a little convex, with a short, obtuse point, scarlet; outer fringe short, fulvous, with obtuse teeth; inner membranaceous, white, with sixteen divisions, corresponding with the outer teeth.

**BRYUM**, *laëuca folio*, a name given by some to the oyster-green. See TREMELLA.

**BRYUNE BAY**, in *Geography*, lies on the east side of Greenland, in N. lat. 65° 46'. In this bay is a little island called "Kangak" or Forehead, where a colony was founded in 1755, by Andrew Olsen, a factor belonging to the company of merchants. The harbour is one of the best and safest in the country, lying half a league from the open sea, between two small islands, but the adjacent country is barren, and has no rein-deer. Besides the ordinary fish, seals, and birds, the sea affords occasionally the whale,

which come here in January and February, but they are seldom taken by the Greenlanders, and never by Europeans, for want of proper boats and tackle.

**BRZESC**. See BRSEST.

**BRZESK** or **BIRSETSK**, a town of Lithuania, in a territory of the same name, one of the districts of the province of Polesia, called also the palatine of Brzeskie, or Birsetsk, is seated on the river Bug, in a marshy situation, and has a castle built upon a rock. Near it is a royal palace with a good garden. In this town is a famous Jewish synagogue, to which the Jews resort from all the countries of Europe. A Greek bishop resides in this town, and a provincial diet is also held in it. N. lat. 52° 12'. E. long. 24°. In the month of October, 1794, a battle was fought near this town between the Russians and the Poles; the battle lasted eight hours, and the Poles were totally defeated. Out of 13,000 of the best Polish troops, only 500 were made prisoners, as they refused quarter; and the rest, 300 men excepted, were cut to pieces; so that the field of battle, for some miles, was covered with the dead.

**BRZESNO**, a town of Bohemia, in the circle of Boleflau, 5 miles E. of Jung Buntzlau.

**BRZEZANY**, **BRETANY**, or **BREZAN**, a well built town, with a castle, of Poland, in the palatinate of Red Russia, 24 miles N.N.E. of Halicz. N. lat. 49° 45'. E. long. 25° 20'.

**BRZEZIN**, a town of Poland, in the palatinate of Bielsk; 44 miles N.W. of Bielsk.

**BRZEZINY**, a small town of Poland, in the palatinate of Lenczicz; 48 miles S.E. of Lenczicz.

**BRZISTEW**, a town of Bohemia, in the circle of Boleflau; 11 miles S.E. of Jung Buntzlau.

**BRZOSTECK**, a town of Poland, in the palatinate of Sandomirz; 56 miles S.S.W. of Sandomirz.

**BSURA**, a river of Poland, which runs into the Vistula, 12 miles E. of Plocsko.

**BU**, a town of France, in the department of the Eure and Loire, and district of Dreux, 2 leagues N.E. of it.

**BUA**, or the *Isle of Partridges*, a small island in the northern part of the Adriatic, near the coast of Dalmatia, joined to the town of Trau by a bridge, 20 miles W.N.W. of Spalatro.

**BUADH-VAILL**, q. d. mouth-piece of victory, called also, in the old Irish tales and romances, *Benwoven* and *Barr-waill*, is supposed by Mr. Ousley to have been a species of trumpet. It is made of a light fine-grained wood, probably willow, and is 6 feet 4 inches long; the wider end measures 3¼ inches diameter, from whence it gradually tapers to a point at the other end, where a mouth-piece is supposed to have been fixed. This instrument, which is particularly described and illustrated by figures in the fourth volume of the Irish Transactions, was found, in 1791, in the county of Mayo, lying horizontally in the body of a turf bog, at the depth of about 9 feet from the surface. The precise age of this instrument, the wood of which was perfectly found, is not ascertained. Mr. Ousley supposes it to have been at least previous to the settlement of the English in Ireland, as it is not mentioned by Cambrensis, or any subsequent author. Lord Dillon, on whose estate it was found, concludes, from the great accumulation of bog over it, that it must have been in the situation in which it was discovered for many ages, and this is further confirmed by the rudeness of its contrivance and workmanship, which indicates its remote antiquity.

**BUALLT**. See BUILTH.

**BUAMACHUCO**, a town of South America, in the country of Peru, and jurisdiction of Caxamarquilla, chiefly inhabited by Indians.

BUANES, a town of France, in the department of Landes; 5 miles W. of Aire.

BUARCOS, or BUARGAS, a town of Portugal on the sea coast, in the province of Beira; 7 leagues S.W. of Coimbra.

BUARID, a small island in the Red sea, near the coast of Arabia, 4 miles W. of Lohcia.

BUBALE, in *Zoology*. See BUBALUS.

BUBALINUS SERPENS, a name assigned by some authors to the *Anacandaya* of the Ceylonese, a very terrible sort of serpent, according to report, common in that part of the world. It is most mischievous among cattle, a circumstance implied by the name it bears in India. The particular kind of serpent bearing this name is not exactly known to us.

BUBALUS, the *Buffalo*. Gmelin describes this animal, *Bos Bubalus*, after Linnæus, as having the horns re-supinate, or lying backwards, turned inwards, and flat on the front, or anterior part.

The Buffalo appears to be so closely allied to our common ox, that without an attentive examination it might be easily mistaken for a variety of that animal. In point of size it is rather superior to the ox, and upon an accurate inspection it is observed to differ in the shape and magnitude of the head, the latter being larger than in the ox; the forehead is more elevated, the muzzle of a longer form, much larger, square, and less depressed. But it is chiefly by the structure of the horns that the Buffalo is distinguished, these being of a shape and curvature altogether different from those of the ox: they are of a gigantic size in proportion to the bulk of the animal, and of a compressed or depressed form, with a sharp exterior edge; for a considerable length from their base these horns are straight, and then bend slightly upwards: the prevailing colour of them is dusky, or nearly black. The buffalo has no dewlap: his tail is small, and destitute of vertebrae near the extremity, and his ears long and pointed. The teats of the buffalo, which are four in number, Desmeuse conceives to be sufficiently indicative of this species, without adverting to any other character; for these, he remarks, are not disposed, as in other animals, in two longitudinal parallel lines, but on the contrary range in a single row in a transverse direction.

This animal has an appearance of uncommon strength. The bulk of his body, and prodigious muscular limbs, denote his force at the first view. His aspect is ferocious and malignant, at the same time that his physiognomy is strongly marked with features of stupidity: his head is of a ponderous size, his forehead convex, his eyes diminutive, and his muzzle flat, and what serve to render his visage still more savage are the tufts of frizzled hair which hang down from his cheeks and the lower part of his muzzle.

Most commonly the buffalo is entirely of a blackish colour with the exception of the hair at the top of the forehead, and the tuft at the extremity of the tail, which are of a yellowish white colour. The skin itself is also of a black colour, and from this general cast it is but very seldom observed to vary; though we meet with descriptions in the works of travellers of white, grey, and reddish, or bay buffaloes. In Europe they are, however, sometimes whitish on the insides of the limbs, and Sonnini records an example of one which he saw in Egypt, which had all the legs, belly, and sides, perfectly white. It varies, however, greatly as to the length and thickness of its hair, and is sometimes seen nearly naked.

This animal is originally a native of the hotter parts of India and Africa, from whence it is said to have been introduced into Italy in the seventh century; and is now completely naturalized to the climate of the South of Europe.

Mr. Pennant supposes the *Bos aegypti* of Aristotle to have meant buffaloes. Gmelin is of the same opinion, referring for his *Bubalus* to *Bos aegypti* in *Ἀεθχρωσις*. *Arist. Hist. An.* &c.; and he considers also the *Bos Indicus* of Pliny as the same animal. This conjecture has the sanction of much respectable authority, but there are naturalists of no mean celebrity who are disposed to discountenance it. Buffon endeavours to prove that the animal we are acquainted with at this day under the name of buffalo, was altogether unknown to the ancient Greeks or Romans; and further, that the buffalo was not transported from its native countries, the hottest parts of Africa and the Indies, to be naturalized in Italy, before the seventh century. In support of the former of these assertions, he adduces the silence of all authors prior to that age. For the second, he observes that the wild buffaloes of the hotter parts of Asia and Africa are precisely of the same kind as our buffalo. He compares the description of this animal with the remarks of travellers and navigators who have spoken of the buffaloes of Persia and the Mogul empire, Bengal, Egypt, Guinea, and the Cape of Good Hope; and from this comparison infers that in all those countries the buffalo is of the same individual species as our European buffalo, subject only to some inconsiderable variation.

The buffalo grows in some countries to an extremely large size. Mr. Pennant quotes a pair of horns in the British Museum in proof of this, which are six feet and a half long, and the hollow of which will hold five quarts. Jerom Lobo, in his account of Abyssinia, affirms that some of the horns of the buffaloes of that country will hold ten quarts, and Dillon saw some in India which were ten feet long: they are sometimes wrinkled, but generally smooth. The distance between the points of the two horns of the buffalo is commonly about five feet. Wild buffaloes occur in many parts of Africa and India. In Malabar, and the islands of Borneo and Ceylon, they are abundant, and are considered as excessively fierce and dangerous animals. The buffaloes of Abyssinia grow to twice the size of our largest oxen, and are called elephant-bulls, not only on account of their vast size, but from their naked black skin resembling that of an elephant.

In a state of wildness the buffaloes live in the forests, and go about in great troops. The hunting of these animals is a favourite, but very dangerous pursuit, among the Indians, and requires the greatest share of dexterity. The hunters never venture in any numbers to oppose these ferocious animals face to face, but conceal themselves in the thickets, or among the branches of the trees, from whence they strike their javelins upon the buffaloes as they pass below them. These people are very fond of the flesh, which is affirmed by some to be hard and indifferently flavoured. They drive a considerable trade in the skins and horns of the buffalo, which for many purposes is far more useful than those of the ox. In the Mogul dominions it is no uncommon circumstance to ensnare the wild buffalo, the lion, or the tiger, in nets, when the people amuse themselves before they put them to death by forcing them to combat each other, and it is said that instances have occurred in which the buffalo has proved victorious over these powerful antagonists, by attacking one when he had overcome the other. Thunberg, in his travels through Japan, speaks of having seen, in the environs of Miaco, buffaloes with a hump upon the back; but from this peculiarity it has been thought most likely that it was the Zebu which that traveller observed, and not a variety of the buffalo.

The domestic buffalo is much cultivated in Egypt, where

according to Sonnini it yields plenty of excellent milk, from which butter is made as well as several kinds of cheese. "The buffalo (says that writer) is an acquisition of the modern Egyptians, with which their ancestors were unacquainted. It was brought over from Persia into their country, where the species is at present universally spread, and is very much propagated. It is even more numerous than that of the common ox, and is there equally domestic, though but recently domesticated, as is easily distinguishable by the constantly uniform colour of the hair, and still more by a remnant of ferocity and intractability of disposition, and a wild and lowering aspect, the characters of all half-tamed animals. The buffaloes of Egypt, however, are not near so wild nor so much to be feared as those of other countries. They therefore partake of the very remarkable gentleness of other domestic animals, and only retain a few sudden and occasional caprices. The sight of any thing red, which is said to make them fly into fits of ungovernable fury elsewhere, makes no impression on those of Egypt. The inhabitants of the country, besides their red turban, wear also in general another shawl of the same colour, which envelopes the neck and chest, and I never observed that the sight of either at all affected the buffaloes. They are so fond of the water, that I have seen them continue in it the whole day. It often happens that the water which is fetched from the Nile near its banks has contracted their musty smell."

These animals multiply more readily than the common ox: they are also more robust, better capable of bearing fatigue, and, generally speaking, less liable to distempers. They are therefore employed to advantage in different kinds of labour. Buffaloes are made to draw heavy loads, and are commonly directed or restrained by means of a ring passed through the nose. Two buffaloes yoked, or rather chained, to a cart, are able to draw as much as four strong horses. As they carry their neck and head low, the whole weight of their body is employed in drawing; and their masts much surpasses that of a labouring horse. In its habits the buffalo is much less cleanly than the ox, delighting to wallow in the mud; and, next to the hog, may be considered as the dirtiest of domesticated quadrupeds. His voice is deeper, more uncouth and hideous than that of the bull. The milk of the female buffalo is said by some authors to be not so good as that of the cow, but it is more plentiful, and is used for the purposes of the dairy in the warmer regions. In the sixth supplemental volume of Buffon, it is affirmed that the milk is far superior to cow's milk, not only in taste but colour, and that it makes the most excellent butter, cheese, &c. The skin and horns are of more value than all the rest of the animal; the former being of extreme strength and durability, and consequently well adapted for various purposes in which strong leather is required; the latter are of a fine grain, strong, and bear a good polish, and are therefore in much esteem with cutlers and other artificers. Italy is the country where buffaloes are most common in a domesticated state, being used there, as in India, both for the dairy and the draught. The parts in which they are most successfully cultivated are the district of the Pontine marshes, and those of Sienna. The Spaniards are attentive to this race of cattle, and indeed the cultivation of this useful animal seems to be pretty general in all countries on the borders of the Mediterranean sea both in Europe and Africa.

For so robust a creature, the buffalo is of a delicate constitution, and suffers equally by an excess of cold or heat. In the summer it retires to shady places, or into the water in which it takes the greatest delight; and in winter retreats to the warmer coverts, or the recesses and shelter of the

forests. This instinctive quality of the animal seems to imply that the buffalo originated rather in temperate climates than in such as are either very hot or cold.

Besides the maladies that are common to the ox and other cattle, the buffalo is subject to one of a particular sort, with which it is attacked only in the early part of its life. This is called by the French *barbone*, an expression that implies it to be most common in the male. The symptoms of this disorder are easily detected by a considerable swelling that takes place in the throat and under-parts of the muzzle, and sometimes by the whole body becoming inflated. The poor animal thus afflicted refuses all kinds of nourishment; his eyes tickle; his tongue appears covered with a thick white scum; and when he attempts to walk, he moves with difficulty at a slow pace, with a lame or limping motion. They breed in the fourth year, producing young for two years together, and remaining sterile the third. The buffalo has seldom more than one young at a birth, or two at the utmost; and they commonly cease breeding after their twelfth year. Their term of life is pretty much the same as that of the common ox.

The small naked Indian buffalo of Pennant, and its analogous variety, the dwarf buffalo, appear to us to belong rather to the species *Bos Caffer*, than to the above; and will be therefore considered separately under that article. See *CAFFER*.

**BUBASTIS**, or **BUBASTUS**, in *Ancient Geography*, a famous town of Lower Egypt, seated on the most eastern branch of the Nile, which, from the name of this city, was called by the ancients the "Bubastic" river, or canal. The prophet Ezekiel calls this place "Phi-Beseth." M. d'Anville supposes, that the Bubastic canal of Ptolemy was not that which proceeded from Bubastis to the sea, this being the Pelusiac canal; but that which passed from this city towards the south, and, joining with the Trajan canal, discharged itself into a lake called "Lacus Anari." In this place was a magnificent temple dedicated to Diana, who, in the Egyptian language, was denominated "Bubastis;" and hence has been derived the name of the city.

**BUBASTIS**, in *Mythology*, a name or attribute ascribed by the Egyptians to Isis, or the moon, which, being personified, was regarded as a distinct deity, and gave name to the city above-mentioned, whither the people resorted from all parts of Egypt, at a certain period of the year. The symbol of this deity was a cat, which was fed by the priests with sacred food, and, when it died, embalmed and carried in pomp to the tomb prepared for it. To this fabulous circumstance, the veneration manifested by the Egyptians for the cat has been ascribed. In the language of the priests, Bubastis was represented as the daughter of Isis; and hence the Greeks, who honoured the moon by the name of Diana, bestowed it also on this Egyptian divinity. Accordingly Herodotus (lib. ii.) says, that Bubastis was called Diana by the Greeks; and to her the Egyptians attributed the office of assisting pregnant women. The Greeks and Latins ascribed the same power to Diana. See Horace, lib. iii. od. 22. According to the Greeks, Diana was the daughter of Jupiter and Latona; and Bubastis sprung, according to the Egyptian mythology, from Osiris and Isis. Bubastis was called by the Greeks also Ilthya, or Iucina, from her presiding over child-birth; and the Egyptians adored her under this name in the city of Ilthya, situated near Latopolis. Plutarch, in his treatise of Isis and Osiris, says, that at the festivals celebrated in honour of Bubastis, they burnt men alive, calling them Typhons, and throwing their ashes to the winds. Amasis, says Porphyry, in his discourse of abstinence, who cites the same fact, abolished these sanguinary sacrifices, and established

established figures of wax of the natural size for the human victims. Herodotus, on the other hand, contends (lib. ii.), that the Egyptians were never guilty of this crime. "How can a people," says he, "who can scarcely prevail upon themselves to sacrifice a few animals, shed human blood upon the altars of their gods?" In order to reconcile these contradictory testimonies, Savary conjectures, that the pastoral Arabs, who subjugated Egypt, long before the arrival of the Israelites, brought with them that barbarous custom, which had been established among them from remote antiquity; and as an evidence of the probability of this opinion, it is suggested, that the Egyptians abstained from shedding human blood, as soon as the Pharaoh Amasis had taken Heliopolis from these ferocious conquerors, and had driven them to the frontiers of Arabia.

It has been questioned, how Bubastis could be called the daughter of Isis, as she was also the symbol of the moon. The Egyptian theology, says Savary, explains this apparent contradiction. Isis was the general appellation of the moon, Bubastis a particular attribute. The sun, in conjunction with the star of the night, formed the celestial marriage of Osiris and Isis; the crescent, which appears three days after, was allegorically styled their daughter. In this sense, the Hebrews called the same phenomenon "the birth of the moon;" and to the same purpose Horace says, (od. 23. lib. iii.):

"Cælo supinas si tuleris manus,  
Nascentè lunâ, rutica Phidyæ," &c.

Hence we may deduce the reason why, in the city of Ili-thyia, where Bubastis was adored, the third day of the lunar month was consecrated by a particular worship. On this day the moon assumes the form of a crescent; and therefore the Egyptians celebrated a solemnity in honour of Bubastis, which in their tongue signified "New Moon." The crescent with which her head was crowned, obviously expresses the intention of the priests in creating this symbolical divinity. Savary's Letters on Egypt, vol. ii.

BUBASTUS (Cramer), in *Entomology*, a variety of SPHINX *didyma*, Fabr. See DIDYMA.

BUBBLES, BULLÆ, in *Physics*, little round drops or vesicles of any fluid filled with air, and formed, either on its surface, upon the addition of more of the fluid, as in raining; or in its substance, upon a vigorous intestine commotion of its parts.

Bubbles are dilatate or compressible, i. e. they take up more or less room, as the included air is more or less heated, or more or less pressed, from without; and are round, because the included aura acts equally from within all round. Their coat, or cover, is formed of the minute particles of the fluid, retained either by the velocity of the air, or by the brisk attraction between those minute parts and the air. See COLOUR.

These little bubbles, rising up from fluids, or hanging on their surface, form the white scum at top; and these same bubbles form the steam, or vapour, flying up from liquors in boiling, &c. the manner of which see under BOILING, VAPOUR, &c.

BUBBLE, in *Commerce*, is a cant name given to a sort of projects, for the raising of money on imaginary grounds; very frequent in the years 1718, 1719, 1720.

The pretended design of these undertakings was, to raise a stock, for the retrieving, setting on foot, or carrying on some promising and useful branch of trade, manufacture, machinery, or the like. In order to which, proposals were given out, shewing the advantages of the design, and inviting persons into it. The sum necessary to carry on the affair, together with the profits expected from it, were di-

vided into a certain number of shares, or subscriptions, to be purchased by persons disposed to adventure therein.—The real design, in some, was to raise a sum for the private advantage of the projectors, to be laid out by them in the South-sea stock, &c. in hopes, by the rise thereof, to be able to refund the subscribers' money, with profit to themselves. In others, the design was absolutely to defraud the adventurers of their subscription money, without any view to restitution. There was a third kind somewhat different: the projectors of these, to proceed the more securely, proposed to have books opened, and subscriptions taken at some time to come; and in the mean time took money by way of *premium*, to entitle persons to be admitted subscribers, as soon as the affair should be ripe for dividing into shares. Several thousand shares were thus very frequently bespoke in one day; and premiums, from one shilling to some pounds, paid thereupon to the projectors.

The number of bubbles, and their qualities, are very extraordinary; some of them, too, authorized by patents; and, in others, the projectors and their proprietors formed into corporations; some for fisheries, some for insurances, some for the digging of mines, &c. A statute was enacted (6 Geo. I. c. 18), which subjected all unwarrantable undertakings, by unlawful subscriptions, to the penalties of a "præsumptio;" and a proclamation was issued in 1720, for restraining these bubbles; but they were not sufficient for suppressing and abolishing them. At length, in the same year, writs of "seire facias" were issued against several companies by name, and in general against all other projects promulgated contrary to law; and the crown-lawyers were strictly enjoined to prosecute all such as had opened books of subscriptions, and all who subscribed to them, or who made or accepted any transfer in them. The publication of the "seire facias," by authority, in the Gazette, struck so general a panic amongst the conductors of all these bubbles, that the suddenness of their fall was no less astonishing than their extent and magnitude.

BUBBLING WATERS. See WATER.

BUBBOLA, in *Ornithology*, a synonymous name of the hoopoe, *upupa epops*, which see.

BUBEREZNOUSKOI, in *Geography*, a town of Russian Tartary, on the river Zulux, 32 miles north of Arkadinskaia.

BUBIL, in *Ornithology*, a species of TURDUS, of a brown colour, with a black longitudinal band behind the eye. Gmel. This inhabits China, and is the only song-bird that is naturally an inhabitant of the Chinese dominions. It is the same species as the *boubil* already described. See BOUBIL.

BUBLITZ, in *Geography*, a town of Hinder Pomerania, in the principality of Cammin, 4 miles S. E. from Cossin. This small town, belonging to a bailiwick of the same name, lies on the Gozel, not far from the borders of Poland. In 1605, and again in 1682, it was wholly consumed by fire.

BUBO, in *Anatomy*, is sometimes used to denote that part otherwise called *inguen*, or groin.

BUBO, in *Ornithology*, a species of STRIX, or owl of the eared tribe, known in this country by the name of the great eared, or horned owl. This bird is the largest species of its tribe, being in point of size almost equal to the eagle. Willughby for this reason calls it the eagle-owl. The body of this creature is of a tawny colour, very beautifully variegated with lines, streaks, and speckles of black, brown, cinereous, and ferruginous. The wings are long; the tail short, and marked with dusky bars; legs thick, covered down to the extremity of the toes with a thick and close down of a testa-

ecous colour. The claws are large, much incurvated, and of a dusky colour.

This bird is of a solitary disposition, residing almost constantly in the depths of extensive forests, in ruined edifices standing in lonely situations, or among rocks that are difficult of access. It therefore abounds most in woody and mountainous countries. There are few instances of its having been observed in Britain. Once or twice it has been shot in Scotland, and another time in Yorkshire. In France it is rather more frequent, but is still less so there than in Germany, Sweden, and Lapland. Besides the European variety, which is found generally diffused over the continent, there are three other very distinct varieties of the *strix bubo*. The first is the Athenian owl, *bubo Atheniensis* of Linnaeus, which Latham and other ornithologists agree in admitting to be nothing more than a variety of *bubo*. This is *le grand due d'Italie* of Buffon, and *great horned owl from Athens* figured by Edwards. Allen names it the *black-winged horn owl*, in allusion to the blackish colour of the wings; the whole plumage being of a darker colour than in *bubo*, but the wings especially. This bird is further distinguished by the legs which are shorter and weaker, but the claws are large and sharp; the face is of a whitish grey colour. Another variety, *le grand due de Buffon*, differs only from the Athenian variety in having the legs bare of feathers, and both the legs and feet weaker. The existence of the last mentioned variety rests principally upon Maregrave, who describes it under the Brazilian name of *jacuruta*. He informs us it is the size of a goose, with a head like that of a cat; the eyes shining like crystal, with a yellow circle. Near the aperture of the ears it has several pointed feathers, two fingers long, which being moveable can be erected at pleasure. The tail is broad, the wings not reaching to the end of it. Legs covered to the feet. Colour of the bird variegated with yellow, blackish, and white. This is the variety *o. bubo magellanicus* of Gmelin.

It should be further added, that the Virginian owl is considered by Buffon to be a mere variety of the species *bubo*; the two birds differing only in the position of the ear-like tufts of feathers on the head. We must allow, that it admits a doubt whether the Virginian owl be in reality a distinct species from *bubo*, or not.

*Bubo*, in *Surgery*, is a term derived from the Greek *βουβων*, *inguen*, which among the ancients had various significations; viz. the inguinal region or groin; an inflammation and swelling of the absorbent glands in the groin; an inflamed or suppurating gland at the bend of the elbow, or under the armpit; a phlegmonous tumour behind the ear, in the neck, or in some other external part of the body, accompanied with febrile symptoms, &c. Vide *Definit. Medicar. Gorrhzi*, et *Æconom. Hippocr. Tussis*, Art. *βουβων*.

As the remote causes and consequences of buboes are various, so there have been numerous pathological distinctions introduced; many of which, however, are of but little importance to the practical surgeon: for example, *benign bubo*, *malignant bubo*, *pestilential bubo*, *sympathetic bubo*, *venereal bubo*, *serofulous bubo*, *variolous bubo*, *feirrhous bubo*, *erysipelatous bubo*, *œdematous bubo*, *phlegmonous bubo*, *idiopathic bubo*, *consecutive bubo*, &c. &c. The principal indications of cure are not so much governed by the supposed character and name of the local disorder, as by the nature and tendency of its remote cause: which being detected and removed, will very seldom leave any doubt as to the choice we should make of topical remedies. To describe all the possible causes, symptoms, concomitants, and secondary effects of buboes, in whatever part of the body they may arise, with their various modes of treatment, would be to write a large volume.

Our present business will be, to give only a short account of the principal diagnostic signs of buboes, and their surgical management in ordinary cases.

Buboes are distinguished from other tumours by one or more of the following circumstances:

1. *By their usual situation.* They are only to be found in the course of the lymphatic vessels; i. e. chiefly along the inner sides of the leg and thigh, ascending to the groin; also upon the under surface of the arms, going towards the axilla; or, upon either side of the neck, and underneath the lower jaw.

2. *By their form and structure.* These glands are usually roundish or oblong; at the beginning of the inflammation, and for some time after, they are hard, or but slightly compressible; they are moveable among the cellular membrane, by which they are surrounded; they have very little sensibility on being touched, until the inflammation advances considerably; they are not, at first, attended with redness, or discoloration of the superincumbent skin; and when they are fairly suppurated, the matter (being confined within a distinct capsule) does not recede upon pressure, like the pus in a lumbar abscess, &c.

3. *By their progress and termination.* They are commonly slow in taking on the inflammatory state, and in advancing to complete maturation. The symptoms will frequently remain a long time, even when their exciting cause has been apparently removed; and the diseased absorbent glands will be apt to inflame repeatedly, with longer or shorter intermissions, after their natural structure has been once deranged.

4. *By the manner of their first appearance.* Buboes often appear in clusters, accompanied with induration and enlargement of the neighbouring lymphatic vessels, which resemble tense chords under the skin; they never arise suddenly, like ruptures and false aneurisms, assuming a large bulk in a very short period; they may generally be ascribed to the presence of an acrid matter, or other cause of local irritation, affecting the adjacent orifices of the absorbent vessels; though, occasionally, buboes will originate from morbid action excited in the glands themselves by cold, &c. or by some vitiated and poisonous fluid, which, after circulating through the system of blood-vessels, is deposited in the glandular substance.

We have known a small crural hernia in a strangulated and irreducible state, mistaken by a celebrated practitioner for an enlarged and indurated lymphatic gland. An incipient true aneurism has been also treated as a suppurating bubo, and even been advised to be opened with a lancet, to the great hazard of the patient's life. Another mistake, not much less serious than these, we have likewise witnessed; viz. that of the operation for an aneurism being proposed at an hospital, in a case where the patient had had deep glandular abscesses or buboes situated over the femoral artery, which might therefore communicate a feeling of pulsation to the examiners. This patient, having been terrified at the proposed operation, left the hospital abruptly, and languished for some months under repeated evacuations of pus, &c. from the diseased glands. His disorder was not clearly understood, until after the man's decease, when it was minutely inspected, and proved to be as stated above. Such cases shew the great difficulty, as well as the importance, of forming a just diagnosis of glandular affections under particular circumstances.

We shall now suggest a few hints for the general management of buboes.

#### *Treatment of a simple Bubo.*

All kinds of buboes may be included under two heads; the *simple* and the *complicated*. In the former, we are

to suppose there is no malignity arising from the presence and action of any poisonous matter or acrimonious fluid in the bubo; for when that is the case, regard must be paid to the existing cause, and peculiar means should be adopted, with a view to remove the latent *virus* from the system.

A simple bubo generally terminates, either by resolution or suppuration. There are circumstances, under which no art can prevent a suppuration; but, whenever it can be prevented, we should endeavour to resolve the tumour, by what are called discutient or antiphlogistic means. The most powerful remedies of this class are, local bleeding by leeches, cold saturnine applications, perfect rest of the member affected, saline purgatives, and moderate or spare diet. But, if the inflammation be not considerable; if the tumefied gland remain indurated; and there be no obvious source of topical irritation, which we hope to get rid of by the gland maturing; we may then, with a design of resolving the induration, employ lightly stimulating means: such as, dry cupping, electrical sparks, volatile liniment, camphorated oil, mercurial frictions, warm farinaceous poultices, andomentations, &c. At the same time we should direct the patient to use rather a generous diet, with warm clothing, and moderate exercise.

Suppose, however, that the diseased gland goes on to a state of suppuration, which often will happen in spite of all the efforts we can employ to obviate it; a question arises, when the pus has formed, whether or no the abscess should be opened? Some surgeons advise us, in all cases, to leave buboes to themselves, to let them burst, and never interfere with the natural process. This conduct, or rather negligence, we do not wholly approve; for it often occurs, that the pus insinuates itself widely before it finds vent; and it then, perhaps, only oozes by little and little, while the skin remains loose, flaccid, and unhealthy. On the other hand, if a simple incision be made with a lancet through the skin, the sore will not always heal readily, and the surgeon incurs blame for not perfecting what he began.

The common rule to be adopted, and which we have observed to be followed with the best effects, is to let the tumour break of itself, if it be situated in the face or neck, where we always wish to avoid a scar; but in other cases to open the abscess with a caustic, in preference to the knife, so as to destroy a small circular portion of skin. If the gland underneath be very much indurated, and the suppuration does not soon come on kindly, nor the healing process advance, we apply red-nitratèd mercury, either by itself, or mixed in some ointment, every day, until the sore assumes a more healthy aspect; still continuing the cataplasms, so long as the morbid hardness remain. See CAUSTIC and ABSCESS. Should the edges become callous and indolent, not being disposed to cicatrize, they may be now and then touched with the caustic, or with an escharotic lotion. Attention must be paid likewise to the patient's ordinary state of health, and such a plan of conduct pursued, as may be indicated by the existing circumstances.

#### Treatment of the complicated Bubo.

A bubo may be dependent on another disease; and is then to be considered not as a local or primary affection, but as symptomatic of the original malady. Buboes are extremely common, as a symptom of the venereal disease, plague, serofula, measles, &c.

In the lues venerea, indeed, it but seldom (in comparison with other symptoms) occurs as a sequel of the general contamination, but mostly precedes it. The syphilitic infection very frequently produces buboes in the first instance, before the whole system has been vitiated; though, in some few cases, this order is reversed. And, whenever we believe the

venereal bubo to be a primary or local disorder, unattended with absorption of the virus, our treatment should be much more lenient and topical than in other cases, where we suspect the contrary. See LUES VENEREA, and SYPHILIS. We are perfectly convinced, that great mischief has been done by the indiscriminate and free use of mercury in venereal buboes, especially if they have existed only a short time. Innumerable facts prove that other means, besides a course of mercury internally, will cure venereal buboes; and in particular we may appeal to the effects produced by nitric acid, as recently detailed by Dr. Rollo, Mr. Pearson, Mr. Platt, Dr. Beddoes, and Mr. Blair.

With reference to this subject, and to shew that a salivation has not been universally regarded as necessary for the cure of syphilitic buboes, we shall quote the words of the medical gentlemen of St. Thomas's hospital, who thus express their opinion in a little work printed for the use of their pupils, A. D. 1775.—“If the patient has a suppurating bubo, you should not only wait until it be suppurated and opened, but until it be so near healing, that you may be sure it will be cicatrized before the salivation be over. From a neglect of this caution, you will sometimes have tedious, painful, and phagedenic sores remaining. Mercury will oftener exasperate than dispose them to heal.” See General Rules in raising a Salivation, &c. p. 4.

Whatever be the nature of the disease which occasions buboes to arise, we should principally direct our attention to that disease, and not to the treatment of the local symptoms. Consequently the remarks we have to offer on the management of pestilential buboes, serofulous buboes, &c. must be reserved for other articles in the Cyclopædia. See PLAGUE, FEVER, SCROFULA, and MEASLES.

BUBON, in *Botany*, (*Βουβων*) Hippoc. and Dioscor. from *βουβων*, the groin, or a tumour to which that part is liable, and which it was supposed to cure. Linn. gen. 350. Reich. 380. Schreb. 482. Willden. 546. Gart. 12. Tab. 23. fig. 2. La Marek, Pl. 194. Juss. 221. Ventenat vol. iii. p. 19. Class and order *pentandria digynia*. Nat. Ord. *umbellata*, Linn. *umbellifera*, Juss.

Gen. Char. *Cal. Umbel universal*, of about ten rays, the middle ones shorter; *partial*, of from fifteen to twenty rays. *Involute universal*, of five leaves or more. *Leaves* lanceolate-acuminate, spreading, equal, much shorter than the umbel, permanent; *partial* with rather more leaves, of the same shape, as long as the partial umbel. *Peduncles proper*, scarcely visible. *Flowers* all fertile, forming an uniform umbel. *Cor.* petals five, lanceolate, inserted. *Stam.* filaments five, simple, as long as the petals; anthers simple. *Pist.* germ ovate, inferior; styles two, bristle-shaped, permanent, scarcely the length of the corol, spreading and reflected; stigmas obtuse. *Pericarp*, none; fruit dividing into two, crowned. *Seeds* two, ovate, flat on one side, convex on the other, striated.

Ess. Char. Fruit ovate, striated.

Species, 1. *B. macedonicum*, Macedonian parsley. Linn. Hort. Cliff. 95. Baekwel, Tab. 382. Gart. fruct. 1. 102. *Apium macedonicum*. Bauh. Pin. 154. Tourn. 305. Ray. hist. 463. N<sup>o</sup> 4. *Petrofelinum macedonicum*, Lob. Ic. 708. Dod. Pempt. 697. Ger. 864. 2. f. 1. emac. 1016. f. 2. Park. 924. 1. “Leaflets rhomb-ovate, deeply toothed; teeth acuminate; umbels very numerous; seeds rough with hairs.” Biennial in its native climate, but in England it seldom flowers till the third or fourth year, and then dies. *Stem* a foot and a half, or two feet high, cylindrical, with numerous pubescent, whitish branches. *Leaves* smooth, pale green, resembling those of parsley, but with pubescent petioles; those from the root growing almost horizontally, spreading

spreading near the surface of the ground. *Umbels* terminating, the stem and branches small, whitish; peduncles and leaves of the involucre pubescent. Miller and La Marck. *Seeds*: ovate-acuminate, of a bay-brown colour; convex, striated their whole length with five elevated lines, and beset with hoary hairs, on one side; flat or slightly concave on the other. Native of Greece and Barbary. Its seeds have a pleasant aromatic taste and smell, and are esteemed diuretic, emmenagogue, and carminative. They are an ingredient in *Tnerica*. 2. *B. Galbanum*. Lovage-leaved Bubon, Linn. Hort. Clif. 96. Jacquin. hort. 3. 21. tab. 36. Berg. cap. 77. Woodville Med. Bot. v. 1. tab. 12. Oreofelinum, Afric. Tourn. 319. Anisum Africanum Pluk. Phyt. tab. 12. fig. 2. Morif. hist. 3. p. 297. Ferula Ray. Sup. 252. "Leaflets ovate-wedge-shaped, acute, finely serrated; umbels few; seeds smooth; stem shrubby, glaucous." An evergreen shrub from eight to ten feet high. *Stem* cylindrical, jointed, smooth, covered with a glaucous exudation, which comes off when handled; towards the bottom, woody and naked; towards the top, sending off leaves and branches. *Leaves* alternate, bipinnate, smooth, of a pale green colour, inclining to glaucous. *Umbels* terminal from the stem, and pendant branches; leaflets of the general involucre, about twelve, lanceolate, membranous, and bent downwards; of the partial one six, spreading. *Flowers* small, greenish yellow. *Seeds* smooth, marked with three elevated lines, without a membranous wing. Native of the Cape of Good Hope: cultivated by Gerard in 1596. It is from this plant, that the drug called galbanum is said by Linnæus to be obtained. Linnæus asserts this on the authority of Plukenet, and has been followed by the London, Edinburgh, and other medical colleges. But Herman, who was an intelligent physician, and practised many years in the East Indies, and at the Cape of Good Hope, is of opinion, that the inspissated juice of several kindred plants is brought to Europe, and vended under the same name. Galbanum is commonly imported from Turkey and the East Indies, in large, softish, ductile, pale-coloured masses, which by age acquire a brownish-yellow appearance: these are intermixed with distinct white grumes or tears, which are accounted the best part of the mass; but the separate hard tears are externally of a ferruginous colour, and always preferred to the mass itself. It has a strong unpleasant smell, and a warm bitterish acrid taste. Like other gummy resins, it unites with water by trituration into a milky liquor, but does not perfectly dissolve in water, vinegar, or wine. Rectified spirit takes up a greater quantity, but not the whole. A mixture of two parts of rectified spirit, and one of water, dissolves all but the impurities. Medically considered, it may be said to hold a middle rank between asafetida and ammoniac: but it is much less fetid than the former, and is therefore accounted less antispasmodic, nor is it supposed to have expectorant powers equal to those of the latter: it has the credit, however, of being more useful in hysterical disorders, and of promoting and correcting various secretions and uterine evacuations. It has been applied externally to expedite the suppuration of inflammatory and indolent tumours, and as a warm stimulating plaster. It is an ingredient in the pilule e gummi, the emplastrum lithargyri cum gummi, of the London pharm. and in the empl. ad clavos pedum of the Edin. Miller, La Marck, and Woodville. 3. *B. levigatum*. Hort. Kew. 1. p. 352. "Leaflets lanceolate, very obtusely and obsoletely crenate; seeds smooth; stem shrubby." A native of the Cape; introduced into England by Mr. Masson, 1774. 4. *B. gummiferum*. Linn. Sp.c. Ferula Africana galbanifera folio myrrhidis Comm. hort. 2. p. 115. t. 58. "Leaflets gashed, acuminate; the

lower ones broader; seeds smooth; stem shrubby," nearly allied to *B. galbanum*. A native of the Cape, cultivated by Miller in 1731. 5. *B. rigidius*. Linn. Hort. Clif. 95. (Ferula durior Bocc. mus. 2. p. 84. t. 76. Bar. rar. t. 77). "Leaflets linear." A low perennial plant with the habit of a small fernula. *Stem* about a foot and a half high, cylindrical, striated, but little branched. *Lower leaves* large, tripinnate; leaflets linear, stiff, and short. *Flowers* yellow, in loose umbels. A native of Sicily.

*Propagation and Culture*.—*B. wacedonicum* is propagated by seeds, sown in light sandy earth, either early in the autumn, or in April: if the season prove hot and dry, the ground should be shaded in the middle of the day, and frequently watered. In the beginning of October, the plants should be transplanted into a warm dry border, and a few of them put into pots to be sheltered under a frame, in case the winter be severe. The seeds of galbanum and gummiferum should be sown in pots filled with light loamy earth, as soon as they arrive. If it be in autumn, they should be kept during the winter in a bed of tanners' bark, where the heat is gone. In spring, the plants will come up, and in April, should be carefully transplanted into fresh pots filled with the same kind of earth. After having remained in the bark till they have taken root, they should be gradually enured to the open air, and may be placed in June with other exotic plants in a sheltered situation. In winter, they must be kept in a green-house, where they should have but little water. Miller's Dict.

BUBON, in *Ancient Geography*, a town of Asia Minor, in Caballia, over against Caria. This city, according to Pliny, (l. v. c. 27.) was situated in the vicinity of Great Cibyra, and had, with this and two other cities, formed a league, offensive and defensive, called the "league of the four cities." When the prætor Murena, in the year of Rome 670, dismembered the state of Cibyra, the town of Bubon was annexed to Lycia. According to Steph. Byz, this town, and also that of "Balbuso," derived their names from the pirates who founded them.

BUBONIUM, in *Botany*, Tabern. See INULA SALICINA.

BUBONIUS, *Lapis*, in *Natural History*, a figured stone, in shape resembling an owl's head, of a stony substance, black within and cineritious without; it was thus denominated by Dr. Plott, having not before been named by naturalists. Plott's Oxford, ch. v. §. 45.

BUBONOCELE, in *Surgery*, is a tumour in the groin, formed by the protrusion of the intestines, or omentum, through the openings designed for the passage of the spermatic cord, in the male, and the round ligament in the female.

It appears first in the groin, at an aperture, situated midway between the symphysis pubis and superior spinous process of the ilium, and which may be properly called the superior abdominal ring, and then passing obliquely downwards and inwards, it emerges at the inferior abdominal ring in the tendon of the external oblique muscle, and appears within the scrotum. Whilst placed in the groin, surgeons usually call it the inguinal hernia, and when it has extended into the scrotum, it is termed scrotal hernia. The protruded parts are contained in a sac formed by the peritonæum; and whilst the tumour remains in the groin, it is placed under the tendon of the external oblique muscle; but when it descends into the scrotum, it is covered, both by a fascia given off by the external oblique muscle, and by the cremaster. The spermatic cord usually passes behind the sac, through its whole course, but it has been found in some instances divided by it, and in others, passing before the tumour. The epigastric artery is placed near the mouth of the sac, sometimes on the inner, but most frequently on its

outer side. This hernia may be distinguished from other diseases of the scrotum, with which it is liable to be confounded, by the following marks:

1. By its dilating under coughing.
2. By its disappearing in the recumbent, and re-appearing in the erect postures.
3. By the gradual progress of the disease from the groin to the scrotum.
4. From its feel, which is irregular, and doughy, where omentum is contained, but elastic and regular, if it contains intestine; and where the intestines return into the cavity of the abdomen, it recedes with a gurgling noise.

The inguinal hernia is more frequent on the right, than on the left side, probably, because our strongest exertions are made on that side; and the inguinal hernia in the male is more frequent than any other species, on account of the magnitude of the abdominal rings.

This hernia exists in the three following states:

1. Reducible, where the parts can be returned into the cavity of the abdomen.
2. Irreducible, when they cannot be returned.
3. Strangulated, when they are inflamed and obstructed by the effects of pressure.

In the reducible state, a steel truss must be applied, the pad of which should press upon the upper abdominal aperture; for the object in wearing it is to close the communication between the hernial sac, and the abdomen, by adhesion, which can only be effected by the pressure being applied upon the mouth of the sac. Trusses are faulty in this respect, being made to press upon the pubis, instead of midway between the pubis and spinous process of the ilium. A double truss is required if there are two herniæ; the construction of which differs from the others, in having two pads instead of one.

When irreducible, it grows to an enormous size, the scrotum often becomes diseased, and the person is always liable to accidents. It is therefore necessary that some means should be adopted to prevent its increase. If it is an omental hernia, a steel truss may be safely worn, which will prevent any further protrusion; but if it is intestinal, a bag truss should be applied, which ought to lace on its fore part, and thus, by preserving a constant pressure upon the part, any increase of the tumour is prevented, and even its size will gradually diminish.

The strangulated state is produced by the pressure, either of the abdominal ring, of the mouth of the hernial sac, of the edges of the aperture surrounding the mouth of the sac, or by a cord formed by adhesion within the sac, which becomes entwined around the intestine.

Whatever is the cause, it becomes necessary to liberate the part from pressure, or the person cannot long survive.

For this purpose, it is proper to put the patient in a supine position, with the body a little bent, and the thighs raised to a right angle with the spine, so as to relax the rings through which the hernia has passed. The surgeon then embracing the lower part of the tumour with his right hand, and applying the fingers of the other opposite the orifice of the sac, kneads the swelling into the cavity of the abdomen. If this plan, after a trial of a quarter of an hour, does not succeed, the patient should be bled copiously, and put in a warm bath, and when faint from the operation of both these causes, another attempt to return the tumour is to be made. If this is unsuccessful, a tobacco clyster composed of half a drachm of tobacco, infused in a pint of boiling water, is to be injected, and after some minutes should be repeated, if the first has produced but little effect in exciting nausea and fainting. Another, and often successful mode of attempting the reduction, is by the application of ice enclosed in a

bladder, and laid on the part; but if the abdomen is sore upon pressure, no time should be lost in any of these trials, but an operation to liberate the bowels should be immediately performed, in the following manner: the patient is to be placed on a table three feet six inches in height, the body to be horizontal, and the legs hanging from the knees over the table, and the surgeon, standing between them, makes an incision from the upper part of the tumour through the skin, and then successively and cautiously, through the fascia and cremaster muscle, and this exposes the surface of the hernial sac. This being pinched up between the fingers, is to be opened by a very small incision, and a director being introduced, the sac is to be cut to within an inch of the abdominal ring, in the oblique muscle to its lower part. The intestine or omentum is thus exposed, and a small quantity of fluid generally escapes. The finger is then to be passed into the sac towards the abdomen, and the seat of the stricture examined. If the stricture is at the abdominal ring, the probe-pointed bistory should be passed between the sac and the ring, and the latter only cut in the direction of the tumour, and no danger whatever results from doing this. And, if the stricture arises from the pressure of the parts forming the upper aperture, the knife is still to be passed in the same direction as before, but further under the tendon of the external oblique, and the upper part of this aperture is to be cut in the same direction as the former. But when the mouth of the sac itself girts the contents, it must be divided as follows: The finger is to be thrust within the sac to the stricture, and then the probe-pointed bistory carried along the middle of the finger is insinuated within the stricture, which is to be cut upwards or forwards at the middle of the anterior part of the hernial sac. The epigastric artery has been found on either side of the mouth of the sac, but it is never situated on its anterior part, and this, therefore, is the part which should always be cut.

When a band is entwined around the intestine, or omentum, it is easily seen, and as readily divided.

The stricture being divided, and the intestine or omentum being found free from mortification, they are to be returned into the cavity of the abdomen by small portions, and by gentle pressure; but if the quantity of omentum is large, a portion of it should be cut away, and ligatures applied upon the divided vessels.

When the hernia is very large, and has been long irreducible, it is right to divide the stricture at the abdominal ring, (which is in a large hernia the usual seat of the stricture) without opening the hernial sac. The incision for this purpose is to be made through the skin, over the neck of the tumour, so as to expose the ring and the fascia, which it sends off: an opening is to be made through the fascia, and a director passed under the abdominal ring, which being divided, the contents of the tumour will be liberated from pressure.

When an inguinal hernia is so small as to extend no further than the upper part of the scrotum, the operation is to be begun midway between the pubis and the ilium over the tumour, and the incision carried as far as the hernia extends. The tendon of the external oblique muscle which is exposed by the division of the skin, is next to be cut through, and the hernial sac being then seen, is to be opened in a very cautious manner. The stricture which is situated, either in the sac itself, or occasioned by the edges of the upper ring, is then to be cut in a direction parallel with the linea alba.

The inguinal hernia in the female is not so frequent an occurrence as in the male, because the abdominal rings are less. It passes through the same apertures as in the male, and when large, extends itself into the labium pudendi. It requires the

the same truss in the reducible state, as that worn by the male, and when strangulated, it demands the same means for reduction. If the operation is required, it is to be performed in the following manner. An incision is to be made from the upper part of the tumour to the lower, and along its middle, and when the skin is thus divided, a fascia is exposed which covers the sac, which being next cut through, the sac becomes exposed, and is to be carefully opened, and the stricture felt for. If it is situated at the ring of the oblique muscle, the probe-pointed bistory must be passed between the sac and the ring, and the ring cut upward; but if the stricture is at the mouth of the sac, the bistory is to be passed within the sac, and the stricture is to be divided at the anterior and middle part of the mouth of the hernial sac.

**BUBROMA**, in *Botany*, (from *Bovus*, an ox, and *βρωμα* food.) Schreb. 1216. Willden. 1389. Martyn's Miller. (Guazuma Juss. 276. Ventenat 3. 196. La Marck, Bosc.) Class and order *polyadelphia dodecandria*. Nat. Ord. *columnifera*, Linn. *Malvaceae* Juss.

Gen. Char. Cal. perianth three-leaved; leaves ovate, concave, acute, reflected, deciduous; two a little larger. Cor. Petals five, concave or hollowed, in the shape of a pouch at their base, lengthened at their summit into a long bifid awn, inserted into the nectary at the base. Nectary a bell-shaped pitcher, divided into five equal, lanceolate, sharp, minute, upright segments, spreading a little at the tip. Stam. Filaments five, filiform, upright, bent outwards at the tip, outwardly fastened to the nectary, and alternate with its segments, trifid at the tip; anthers three on each filament, two at the tip on each side, the third a little lower, each placed on one of the divisions of the filament; the cells margined. Pist. germ superior, roundish, hispid; style filiform, about the length of the stamens; stigma simple, bearded, but not divided. Pericarp, capsule, (Drupe, La Marck) subglobular, woody, muricated all round with club-shaped tubercles, punched with a tenfold series of small transverse holes, five-celled, valveless, not opening; partitions woody-fibrous; cells covered on the inside with a thin membrane. Seeds numerous, angular, almost reniform, attached in a double row in each cell to the common central receptacle.

Obs. Jussieu, Ventenat, La Marck and Bosc. call the five segments of the nectary, barren filaments, and describe its lower part as a tube formed by the union of all their ten filaments. Schreber says, that the capsule is terminated by a five-rayed leafy lobe; but there is no appearance of such an appendage in La Marck's figure, nor is it mentioned by any other author. According to Swartz, the rind is perforated like a sieve, referring, doubtless, to Schreber's ten-fold series of little transverse holes, improperly translated by Mr. Martyn, dots, through which, we presume, the ripe seeds escape; and, if we rightly understand Schreber's rather obscure description, there is one for each seed.

Ess. Char. Perianth three-leaved. Petals five, lengthened into a bifid awn. Anthers three on each filament. Stigma simple. Capsule muricate, perforated with holes, five-celled, valveless.

Species, *B. Guazuma*, elm-leaved Bubroma, or bastard cedar. (Theobroma Guazuma, Linn. hort. Cliff. 379. &c. Reichard, Swartz obl. 291. Brown Jam. 306. 1.) La Marck, Pl. 637. A tree forty or fifty feet high. Trunk nearly the size of a man's body, covered with a dark-brown, furrowed bark. Branches extending nearly horizontally; smaller ones leafy, tomentose. Leaves alternate, ovate, acuminate, a little heart-shaped, obtusely and unequally ferrated, glossy, bright green on their upper, and pale on their under

surface, with a strong midrib, and several transverse veins; petioles tomentose, a little thicker than the leaf; stipules linear-awl-shaped, approximating to the branches. Racemes corymbose, axillary. Flowers small, pale yellow; awn purplish. A native of the East and West Indies. In the West Indies it is planted in rows to make a shady walk. For this purpose, it is pollarded at the rainy season, when nine or ten feet high; within a month of which operation, it is covered with foliage, and forms a head more than six feet in diameter. As it is liable to suffer by the wind, its upper branches are lopped every five or six years. Cattle are fed on its leaves and fruit in dry seasons, when other forage is scarce. Its seeds are very mucilaginous, but agreeable to the palate. The wood is light and easily wrought, and is employed in coach pannels. A decoction of the inner bark is very glutinous, and very like that of the elm. It is said to be excellent in the elephantiasis, a disorder to which the negroes are much subject.

*Propagation and Culture*.—This tree was cultivated in England by Mr. Miller, in 1739. La Marck's description was formed from a living plant which flowered in the stove of the royal garden at Paris, about 1788. The seeds must be sown in a hot bed in the spring, and when the plants are fit to be removed, should be put into separate pots, and treated in the same way as the coffee-tree.

**BUBRY**, in *Geography*, a town of France, in the department of Morbihan, and district of Lorient, 10 miles N.N.E. of Hennebont.

**BUC, GEORGE**, in *Biography*, an English antiquarian, was the descendant of an ancient family, and was born in Lincolnshire towards the close of the 16th century. In the reign of James I. he was made one of the gentlemen of his Majesty's privy chamber, and knighted. The work by which he was chiefly distinguished was his "Life and Reign of Richard III. in five books," in which he takes great pains to vindicate that prince's character. But in this attempt he evinces more zeal than judgment, and his work is a pedantic, rhetorical panegyric, rather than a judicious and impartial history. It is printed in bishop Kennet's collection of the English Historians, London 1706 and 1719. He was also the author of "The Third Universitie of England; or, a Treatise of the Foundations of all the Colleges, ancient Schools of Privilege, and of Houses of Learning and Liberal Arts, within and about the most famous Citie of London, &c." written in 1712, with a view of shewing that all the arts and sciences are taught in the metropolis, and annexed to the edition of Stow's Chronicle by E. Howes, London, 1631. He composed likewise a treatise of "The Art of Revels." Camden represents him as a person of excellent learning, and acknowledges obligations to him. Biog. Brit.

**BUCA**, in *Conchology*, an old name for buccinum.

**BUCA**, in *Ancient Geography*, a town of Italy, in the country of the Frentani, situate on the sea-coast.

**BUCANECEPHALUM**, in *Botany*. Pluk. See **SARRACENIA**.

**BUCAO**, in *Ornithology*, a name given in the Philippine islands to a species of screech-owl, which is the size of a peacock. It is very common in those islands, but wholly unknown to us. It is a very beautiful bird, but makes a hideous noise in the night.

**BUCARDITES**, or **BUCARDITA**, in *Natural History*, a name given by many authors to a stone in some degree resembling the figure of an ox's heart. It is usually of the substance of the coarser stones, and is no other than a quantity of the matter of such stone received while moist into the cavity of a large cockle, and thence assuming the figure of

the inside of that shell, the depression of the head of the cockle, where the *cardo* or hinge of this shell is, makes a long and large dent in the formed mass, which gives it a heart-like shape. Plott mentions a *bucardites*, which he found at Stretford in Staffordshire, which weighed twenty pounds, though broken half way, curiously reticulated, with a white spar-coloured stone. Nat. Hist. Oxf. chap. v. § 145.

**BUCARDIUM**, in *Conchology*, with old authors, a name applied to the bull's heart chama, *Chama cor* of Linnæus; and, in a more general sense, as a generic title for all the *cordiformes*, or heart shells in the *chama*, the *venus*, and the *arca* genera. *Bucarde* of the French, comprehends the subcordiform shells of the genus *Cardium*.

**BUCARELLI**, in *Geography*, a large bay on the North-west coast of America, discovered by Don Juan de Ayala, a Spanish navigator, in 1775. It was named "The entrance of Bucarelli," by Don de la Bodega and Don Maurelle, in honour of friar Don Anthony Maria Bucarelli, of Ursua, viceroy of Mexico, and was visited again in 1779, by two frigates under the command of Don Ignace Arteaga and Don de la Bodega, in 1779. The entrance of this bay is situated, according to the determinations of La Perouse in 1786, in about 136° 15' W. long. from Paris, and according to the observations made by Capt. Cook in 1778, of the coasts near this entrance, very nearly 227° E. long. from Greenwich, or 135½° W. from Paris, and in N. lat. 55° 15'. The Spanish commandant caused a complete survey to be made of this gulf, which runs upwards of eight leagues inland, contains several large islands, and presents in its circumference 11 fine harbours, where ships may anchor with safety. Maurelle says, that he does not know a single port in all Europe that could be preferred to that of Santa Cruz, which was the name they gave to the port at which their frigates anchored, and which is situated at the entrance of the gulf on its east coast. Maurelle met with but few habitations in his expedition; seeing only one village, situate at the top of a steep mountain, which could only be ascended by a slight of steps, or rather wooden ladder, whence, if the foot slipped, one must fall down the precipice. For an account of the inhabitants, &c. See *Cross Sound*.

**BUCAROS**. See *ALCARRAZAS*.

**BUCCA FERREA**, in *Botany*. Mich. See *RUPPIA*.

**BUCCALES glandule**, in *Anatomy*, the mucous glands of the mouth, which are situated beneath the membrane which lines the cheek. See *MOUTH*.

**BUCANEERS**, or **BUCANEERS**, a term frequent in the West Indies, properly used for a kind of savages, who prepare their meat on a grate, or hurdle, made of Braslwood, placed in the smoke, at a good height from the fire, and called *buccan*. Whence, also, the little lodges, raised for the preparation of their food, are called *buccans*; and the action of dressing it *buccaning*.

Meat buccaned is said to have an excellent taste, the vermilion colour of a rose, and a charming smell; all which it retains many months. Oexemelia, from whom we have this, adds, that the neighbouring people send their sick hither; that, by eating their buccaned meat, they may be recovered.

The origin of the word is referred to the people of the Caribbee islands, who used to cut their prisoners of war in pieces, and lay them on hurdles with fire underneath, which they call *buccaning*, i. e. roasting and smoaking together: hence our buccaneers took both their name, and their custom; with this difference, that what the former did to men, these did to animals caught in hunting.

The Spaniards, Savary tells us, called the buccaneers in

their territories *matadores*, that is, *killers*; and *monteros*, that is, *hunters*: the English call theirs, *cow-killers*.

The buccaneers are of two distinct professions: the one only hunt bulls for their skins; the other beasts for their flesh.

The art of *buccaning*, Oexemelia describes thus: the beast being flaid, and the bones stripped out, the flesh is cut into pieces of the length of the arm, and salted, and the next day laid on the buccan; which consists of twenty or thirty bars laid across, half a foot from each other: under this they raise a thick smoke, adding the skin and bones of the beast, to heighten it.

This is found vastly better than any simple sewel: because the volatile salts of those parts are by this means communicated to the flesh, and give it such a relish, as that, after a little of this buccaning, the nicest palate will eat it without further preparation.

Buccaneers are usually confounded with freebooters, from whom, in strictness, they ought to be distinguished. The ancient inhabitants of Hispaniola, and the other Caribbee islands, after their conquest by the Europeans, consisted of four ranks or orders of persons, viz. *bucaneers*, or bull-hunters, who scoured the woods; *freebooters*, who scoured the seas as pirates; *husbandmen*, who tilled the lands; and *slaves*. Of these the two first distinguished themselves most by their military disposition, and the ravages they made, especially among the Spaniards.

The name is particularly given to the French inhabitants of the island of St. Domingo, whose sole employment is to hunt bulls or wild boars; in order to sell the hides of the former, and the flesh of the latter. The French buccaneers packed their hides in bundles, which they called loads, and which consisted of those of full-grown bulls, of young bullocks, and of cows. Each load was formerly sold for about six pieces of eight rials; the French coins not being current in the island of St. Domingo. The boar meat, previously seasoned, was also sold by the bundle or pack, weighing commonly 60 pounds, at the rate of six pieces of eight per pack. It was packed up in palmetto leaves, the weight of which was deducted; so that each pack contained 60 lbs. of buccaned meat. These buccaneers had also a great trade in the lard of boars, which they melted and deposited in large pots, which they called "potiches." This lard, which is called *mantegua*, is also sold for about eight pieces of eight per pot.

Of this article there were a great consumption and trade in the French settlements of the islands of St. Domingo, and in those of Tortuga; beside which they sent great quantities of them to the Antilles, and even into the continent of French America. There was also a great deal of it sold for the support of the crews of the ships that came from France for trading, or which the privateers of Tortuga fitted out for cruising against the Spaniards. The Spaniards also, who had their buccaneers, under the appellation of "matadores," or "monteros," and who were employed in bull-hunting, prepared their hides after the manner of the French; and these hides found a ready market at the Havannah, a famous harbour in the island of Cuba. From hence they were brought by the flota and galleons, which touched at this port, in their return from Vera Cruz and Porto Bello, to Spain, and under the denomination of Havannah hides, were esteemed the best of any that were brought from America to Spain.

Sometimes the word *buccaneer* signifies also those famous adventurers of all the nations in Europe, who joined together to make war against the Spaniards in America: and,

## BUCCANEERS.

under that name, their history has been published in the year 1686, by Alexander Oliver Oexemelia.

These adventurers had taken possession of the small island of Tortuga, as early as the year 1632, and found little difficulty, after having excluded the Spaniards, and fortified themselves in this island, in establishing themselves on the northern coast of Hispaniola. They at first subsisted chiefly by the hunting of wild cattle. Part of the beef they ate fresh, and part they dried; and the hides they sold to the masters of such vessels as came upon the coast, and who furnished them, in return, with cloaths, liquors, fire-arms, powder, and shot. Their dress consisted of a shirt dipped in the blood of the animals they had slain; a pair of dirty trowsers; a leathern girdle, from which hung a short sabre, and some Dutch knives; a hat without any rim, except a flap before, in order to enable them to pull it off; and shoes made of raw hides; but they wore no stockings. When the wild cattle became scarce, these buccaneers were under a necessity of turning their industry to other objects. The more sober minded among them applied to the cultivation of the ground, which abundantly requited their toil; while those of a bold and restless disposition associated themselves with pirates and outlaws of all nations, and formed the most terrible band of ravagers that ever infested the ocean. To these ravagers, however, rendered famous by their courage and their crimes, France and England are indebted, in some measure, for the prosperity of their settlements in the West Indies.

These piratical buccaneers, assuming the name of the "Brothers of the coast," formed themselves into small clans or societies; and made their excursions in open boats, each of which generally contained between 20 and 30 men, exposed to the intemperature of the climate, and encountering alternately the burning heat of the day, and the chilling damps of the night. The natural inconveniences, connected with this mode of life, were augmented by others arising from their licentious disposition. A love of freedom and independence, by which they were actuated to a degree of frenzy, in common with other savages, rendered the buccaneers averse from all restraints which civilized men impose upon themselves for their common happiness; and as the authority, which they had conferred on their captain, was chiefly restricted to giving orders in battle, they lived in the greatest disorder. Like savages, having no apprehension of want, and taking no care to guard against famine by prudent economy, they were frequently exposed to all the extremities of hunger and thirst. But deriving, even from their distresses, a kind of courage that defied all danger, they were transported with an astonishing degree of enthusiasm whenever they saw a sail. On the mode of attack they seldom deliberated, but it was their custom to board the ships that fell in their way as soon as possible. The smallness of their own vessels, and their dexterity in managing them, preserved them from the fire of the enemy. They presented only to the broadside of a ship their slender prows, filled with expert marksmen, who fired at the port-holes of the enemy with such exactness, as to confound the most experienced gunners. And when they could fix their grappling tackle, the largest trading vessels generally were obliged to strike. In cases of extreme necessity, they attacked the ships of every nation; but those belonging to Spain were assailed as the principal objects of their piracy. They thought, that the cruelties, which the Spaniards had exercised on the natives of the new world, furnished a sufficient apology for any violence that could be committed against them; nor did they ever embark on any expedition without publicly praying to Heaven for success, nor return loaded with booty without

solemnly returning thanks to God for their good fortune. This booty was originally carried to the island of Tortuga, the common rendezvous of the buccaneers, and at first their only place of safety; but afterwards the French went to some of the ports of Hispaniola, where they had established themselves in defiance of the Spaniards, and the English to those of Jamaica, where they could dispose of their prizes to greater advantage, and lay out their money more to their own satisfaction, either in business or in pleasure. Before the distribution of the spoil, each adventurer, holding up his hand, protested that he had secreted no part of what he had taken; and if any one was convicted of perjury, which seldom occurred, he was punished by being expelled the community, and by being left, at the first opportunity, on some desert island, as a wretch unworthy to live in society, even among the destroyers of their species.

After having provided for the sick, the wounded, and the maimed, and after having settled their respective shares, and distributed such as belonged to those who had no relations or friends, in charity to the poor, and to churches; they indulged in all kinds of licentiousness. When they were asked, why they dissipated so heedlessly and rapidly the spoil which they collected with so much personal danger? they replied, "Exposed as we are to a variety of perils, our lives are totally different from those of other men. Why should we, who are alive to-day, and run the hazard of being dead to-morrow, think of hoarding? Studious only of enjoying the present hour, we never think of that which is to come." The ships that sailed from Europe to America seldom tempted the avidity of the first buccaneers, as the merchandize they carried could not readily have been sold in the West Indies in those early times. But they eagerly watched the Spanish vessels on their return to Europe, when they were known to be laden with treasure. They commonly followed the galleons and flota, transporting the produce of the mines of Mexico and Peru as far as the channel of Bahama; and if any ship was accidentally separated from the fleet, they instantly beset her, and she seldom escaped. And they even ventured to attack several ships at once, which were commonly surrendered, when they came to close quarters; for the Spaniards considered them as demons, and trembled at their approach. The Spaniards, indeed, who found themselves a continual prey to these furious ravagers, were almost reduced to despair; they lessened the number of their ships, and the colonies gave up their connections with one another. The buccaneers were thus emboldened; and instead of confining themselves to those invasions of the Spanish settlements, which had for their object a supply of provisions, they determined, more especially as their opportunities of making captures by sea were diminished, to procure by land that wealth which they could not obtain on the ocean. Accordingly, they formed themselves into large bodies, and plundered many of the richest and strongest towns in the New World. Maracaybo, Campeachy, Vera Cruz, Porto Bello, and Carthagena, on this side of the continent, and Quayaquil, Panama, and many other places on the coasts of the South Sea, severely suffered from their depredations. In a word, the buccaneers, the most extraordinary association of men that ever appeared on the face of the globe, but whose duration was transitory, subjected to their arms, without a regular system of government, without laws, without any permanent subordination, and even without revenue, cities and castles, which had baffled the utmost efforts of national force; and if conquest, not plunder, had been their object, they might have made themselves masters of all Spanish America.

Among the buccaneers, who first acquired distinction in  
this

this mode of plundering, was Montbars, a gentleman of Languedoc, who conceived from his youth a violent antipathy to the Spaniards, on account of the enormities they had committed in the conquest of the New World, and who, determining on retaliation, embarked about the middle of the 17th century, on board a French ship for the West Indies, in order to join these enemies of Spain. An enthusiasm which originated in humanity, at length became the source of the most unfeeling barbarity; for so much did the Spaniards suffer from the fury of this enthusiast, that he acquired the name of the "Exterminator." Michael de Basco and Francis Lolois were also greatly renowned for their exploits both by sea and land. The most important enterprize, in which these leaders, with eight vessels and 660 associates, engaged, was that of the gulf of Venezuela. This gulf runs up into the land for about 50 leagues, and communicates, by a narrow strait, with the lake of Maracaybo. They began (A. D. 1667,) with storming and taking the castle, called "La Barra," which defended this strait, and putting to death the garrison, consisting of 250 men; and they then advanced to the city of Maracaybo, built on the western coast of the lake, at the distance of about 10 leagues from its mouth. But on their arrival, the inhabitants had abandoned it and removed their most valuable effects. Here they spent a fortnight in debauchery and riot; so that when they proceeded to Gibraltar, a town at the extremity of the lake, to which the flying inhabitants had retired, they found it newly fortified, and after reducing it at the expence of much blood, they took possession only of an empty town. Exasperated at this second disappointment, they set fire to Gibraltar; and Maracaybo would have shared the same fate, if it had not been ransomed. But previously to this ransom, they despoiled it of its bells, images, and all the ornaments of the churches, intending, as they said, to build a chapel in the island of Tortuga, and to consecrate that part of their spoil to sacred uses. But of all the buccaneers, French or English, no one was so uniformly fortunate and successful, or executed so many daring enterprizes, as Henry Morgan, a native of Wales. While de Basco, Lolois, and their companions, were squandering, at Tortuga, the spoils they had acquired in the gulf of Venezuela, he sailed from Jamaica, to attack Porto-Bello: and he conducted his measures so well, that soon after his landing, he surpris'd the centinels, and made himself master of the town, (A. D. 1668,) before the Spaniards could put themselves into a posture of defence. In order to reduce the citadel, whither the inhabitants had conveyed their most valuable property, and the plate of the churches, he recurred to the following artful expedient: he compelled the priests, nuns, and other women, whom he had made prisoners, to plant the scaling ladders against the walls of the fortress, from a persuasion that the gallantry and superstition of the Spaniards would not suffer them to fire on the objects of their love and veneration. In this imagination, however, he was deceived. The Spanish governor used his utmost efforts to destroy every one that approached the works; so that Morgan was reduced to the necessity of carrying the place by storm. Having thus succeeded, he took possession of a vast quantity of rich merchandize, and also of bullion and specie amounting to one hundred thousand pounds sterling. With this booty Morgan and his associates returned to Jamaica; and formed a new enterprize against Maracaybo. Accordingly he collected 15 vessels and 960 men; and with this armament (A. D. 1669,) entered the gulf of Venezuela unobserved, silenced the fort that defends the passage to the lake of Maracaybo, and found the town totally deserted; but he discovered the chief citizens, and the greater part of

their wealth in the neighbouring woods. He proceeded to Gibraltar, which was left desolate; however, whilst he was attempting, by the most horrid cruelties, to extort from the inhabitants, whom he had seized, a discovery of their hidden treasures, he was informed of the arrival of three Spanish men of war at the entrance of the lake. Having reconnoitred the enemy, he considered his condition as desperate. Nevertheless, he concealed his apprehensions, and sent a letter to the Spanish admiral, boldly demanding a ransom for the city of Maracaybo. The answer returned by the admiral was resolute; insisting on his surrendering his booty and prisoners, with leave to return to his own country, or if he refused, announcing his fixed purpose of putting every man to the sword. Morgan and his associates deliberated; and they at length determined to risk any consequence rather than resign their booty, which they had gained with so much peril. As the admiral adhered to his declared purpose, Morgan informed him, that if he would not allow him to pass, he would find means to effect his escape without his permission. He accordingly divided the spoil, so that each might have his own portion of it to defend; and having filled a vessel, taken from the enemy, with combustibles, he gallantly proceeded to the mouth of the lake; and having burnt two of the Spanish ships and captured one, he made a feint of disembarking men, in order to attack the fort by land, and thus diverted the attention of the garrison, whilst he passed the bar with his whole fleet, without receiving any damage. Morgan, having disposed of his booty at Port Royal in Jamaica, put to sea again (A. D. 1670,) with a larger fleet, and a more numerous body of adventurers; and after reducing the island of St. Catharine, steered for the river Chagre, by which he intended to advance to Panama. At the entrance of the river stood a strong fortress; an arrow was shot from the bow of an Indian, and lodged in the eye of one of his associates; but Morgan, pulling the arrow from the wound, wrapped one of its ends in tow, put it into his loaded musket, and discharged it into the fort; and this arrow falling on the roof of one of the houses, which, according to the custom of the country, were constructed of wood, and covered with straw, set fire to it; and thus the Spaniards were thrown into the utmost consternation. After the death of the governor, who bravely perished with his sword in his hand, at the head of a few resolute men, the place surrendered to the assailants. Morgan proceeded up the river to Craces, and thence by land to Panama, and, after several reconcounters, took quiet possession of it, and deliberately pillaged it for some days. Here he met with a fair captive, who inflamed his savage heart with love; and finding all his solicitations ineffectual, he made a forcible attempt on her person. "Stop, ruffian," she exclaimed wildly, and springing from his arms; "stop! thinkest thou to ravish from me my honour, as thou hast wrested from me my fortune and my liberty? No! be assured that my soul shall sooner be separated from this body:" and she drew a poniard from her bosom, which she would have plunged into his heart, if he had not avoided the blow. Enraged by this virtuous resistance, Morgan threw the female into a loathsome dungeon, and endeavoured to subdue her by severities. But his followers became clamorous on account of his detention of them to no important purpose, and constrained him to relinquish this amorous pursuit. Before their return, the booty was divided, and the share of Morgan himself amounted to 100 thousand pounds sterling. This wealth he carried to Jamaica, and never more engaged in any piratical enterprize. Some have said (see Edwards's Hist. of the West Indies, vol. i. p. 169,) that king Charles II., though he issued public orders for the suppression of the hostilities of the

buccanera, exacted and received a share of their booty; and that this circumstance induced him to manifest peculiar favour to Morgan, to receive him graciously on his visit to England, and to confer upon him the honour of knighthood. Several other expeditions were formed by the buccaniers of the 17th century, against the Spanish settlements. Van Hora, a native of Olland, who served almost through life among the French, was very active in his depredations. Associating, on one occasion, with 1200 other persons of the same description, and manning a fleet of six vessels, he sailed to Vera Cruz, and, favoured by the darkness of the night, reached the place and landed without discovery. He and his companions made themselves masters of it without resistance; and having confined all the citizens in the churches, whither they had fled for shelter, they placed at the door of each church barrels of gun-powder, and a buccanier with a lighted match to set fire to them, upon the least appearance of an insurrection. They then proceeded to pillage the city; and having carried off whatever they could find of value, they made a proposal to the prisoners, to ransom their lives and liberty by a contribution of 437,500*l.* Half this money was paid them; but whilst they were expecting the other moiety from the interior parts of the country, they were alarmed by the sight of an European fleet of 17 ships, and reduced to the necessity of making a retreat, which they accomplished, by boldly sailing through the Spanish fleet, carrying with them 1500 slaves. Other expeditions were concerted against Peru; and if the intrepidity of these numerous marauders had been directed by a skilful and respectable commander, they would have dispossessed the Spaniards of this important colony. But their character prevented their union in a large and compact body, and their steady prosecution of the same object. However, they successively attacked the most considerable places on the coast of the South Sea, enriched themselves by plunder, and committed a great number of enormities. Others of the buccaniers associated with Gramont, a native of Paris, who had distinguished himself in a military capacity in Europe, and embarked with him, in 1685, to attack Campeachy. Having landed without opposition, after some resistance on the part of the Spaniards, they made themselves masters of the city; and after carrying off the treasures which they had collected in the town and its environs, and depositing them in their ships, they proposed to the governor of the province to ransom his capital. Upon his refusal they determined to burn the place, and to demolish the citadel. Accordingly they destroyed to the value of a million of logwood, which was a very considerable part of their spoil, and after this act of folly and frenzy, they returned to St. Domingo. At a subsequent period, viz. in 1697, 1200 buccaniers joined a Squadron of seven ships, that sailed from Europe, under the command of Pointis, to attack the famous city of Carthage. In this enterprize they succeeded, took the city, and acquired booty to the amount of 1,750,000*l.* After they had set sail, their rapacious commander attempted to deprive them of their spoil; upon which they resolved to massacre him; but being diverted from their purpose by one of their number, who proposed returning to the city, where their share of the plunder had been left by Pointis, they immediately sailed towards Carthage. Having entered the city without resistance, they confined all the men in the great church, and demanded payment of 218,750*l.* which they alleged to be their share of the booty, of which they had been defrauded, accompanying their demand with threats of vengeance if it was refused. A venerable priest ascended the pulpit, and by his eloquent address persuaded his hearers to surrender all the gold, silver, and jewels in their possession.

But the sum raised falling short of that which was demanded, an order was issued for plundering the city. The adventurers, having amassed as much treasure as they could find, set sail; but unfortunately they met with a fleet of ships belonging to Holland and England, both which nations were then in alliance with Spain, so that several of the pirates were taken or sunk, with all the cargo which they had on board their ships; and the rest escaped to St. Domingo. This was the last memorable event in the history of the buccaniers. The total separation of the English and French buccaniers, in consequence of the war between the two nations, which followed the revolution in 1688, very much weakened the force of these powerful plunderers: and the king of Spain also being then in alliance with England, repressed the piracies of his subjects in the West Indies. However the French buccaniers continued their depredations, and with no small success, till the peace of Ryfwick, in 1697; when all differences between France and Spain having been adjusted, hostilities were every where suspended; and not only the association, but the very name of this extraordinary class of men, became extinct. They were lost among the other European inhabitants of the West Indies.

Before this period, however, the French colony in Hispaniola had arrived at a considerable degree of prosperity; and Jamaica, into which the spoils of Mexico and Peru were more abundantly poured, was already in a flourishing condition. The buccaniers found at Port Royal better reception and greater security than any where else. They could there land their booty with the utmost facility, and spend in a variety of pleasures, the wealth produced by their piracy; and as prodigality and debauchery soon reduced them again to indigence, that grand incitement to their sanguinary industry induced them eagerly to concert fresh depredations. Thus the settlement derived benefit from their perpetual vicissitudes of fortune, and was enriched by their rapacity as well as by their profusion; by the views which led to their want, and also by their abundance. The wealth, which flowed into Jamaica through this channel, gave great activity to every branch of culture; and after the piracies of the buccaniers were suppressed, it proved a new source of riches, by enabling the inhabitants to open a clandestine trade to the Spanish settlements, whence it had its origin.

**BUCBARI, BUKARI, BOKERI, OR BUKRI,** in *Geography*, a town of Morlachia, in that district of Hungarian Dalmatia called Zengh, or Segna, belonging to Austria, and seated on a rocky eminence in the north-east part of the Adriatic. This town was declared by the emperor a free port for the commerce of the East Indies in 1780. The harbour, or rather the gulf of Buccari, or Bukaria, is commodious and safe; but a little exposed to the south-east wind, which sometimes makes it dangerous. From this place great numbers of cattle are shipped for Italy. N. lat. 45° 20'. E. long. 15° 13'.

**BUCBATA,** in *Entomology*, a species of *CONOPS* (*Myopa*, Fabr.). The prevailing colour of this insect is ferruginous; abdomen hooked, and grey; face vesicular and white; wings clouded. Linn. Inhabits Europe.

**BUCBATUS,** a species of *QESTRUS*, of a griseous colour, with the face white, and dotted with black. Inhabits South Carolina.

**BUCCELLARII,** formed from *buccellus*, a kind of loaf, or cake of a circular figure, an order of soldiery under the Greek emperors, appointed to guard and distribute the ammunition-bread. The buccellarii were also called, in respect of their country, *Gallogræci*, or *Helenogalatae*, q. d. Greeks of Galatia; sometimes *Maryandini*.

Authors are much divided as to the office and quality of the buccellarii: some give the denomination to parasites in the courts of princes and great men, maintained at their table and expence. In reality, among the Visigoths, buccellarius was a general name for all clients or vassals, who lived at the expence of their lords. Spelman rather supposes them to answer to what among us are called "tenants by military service."—Others represent the buccellarii as stationary soldiers in the provinces, who, when the emperor commanded, marched before and behind him as his body guard.—According to others, they were men whom the emperors employed in putting persons to death secretly.

**BUCCELLATUM**, formed from *bucca*, or *buccella*, a morsel, or mouthful of meat, in *Ancient Military Writers*, denotes camp bread or biscuit baked hard and dry, both for lightness and keeping. Soldiers always carried with them enough for a fortnight, and sometimes much longer, during the time that military discipline was kept up.

**BUCCHOREST**, or **BUCKHAREST**, or **BAKAREST**, in *Geography*, a fortified town of European Turkey, and capital of Walachia, seated on the river Dombrovitz; the usual residence of the waywode, and the see of a Greek archbishop. The Lutherans hold their assemblies here, under the protection of Sweden. The number of inhabitants is estimated at 60,000. N. lat. 44° 50'. E. long. 26° 45'.

**BUCCINA**, an ancient military metalline instrument, crooked like a-horn, used in war; especially for proclaiming the watches of the night, and giving notice to the soldiery when they were to mount, and when to quit the guard.

The word comes from *bucca*, mouth, and *cano*, I sing; because played on by the mouth: others suppose it formed from *βυξων*, or *βυξων*, which signifies the same; formed from *βυξ*, bullock, and *cano*, I sing; because anciently made of bullocks horns: others from the Hebrew *buk*, a trumpet. Varro will have it to have been originally formed by *onomatopœia*, from *bou bou*, alluding to the sound it gives. Others, with more probability, derive it from *buccinum*, the name of a shell-fish.

The buccina is usually considered as a species of *tuba*, or trumpet; from which, however, in propriety, it appears to have differed, not only in respect of figure, which in the tuba was straight, and in the buccina recurved or crooked; but in sound, that of the buccina being sharper and audible to a greater distance than the trumpet-sound.

The buccina approached nearest to the *cornu*, or horn: originally the two seem to have been the same; though in after times a difference arose; the name buccinum being restrained to the lesser sorts, and the cornu to the larger.—Some also take the buccina to have been less crooked than the cornu, which made a full semicircle.

Varro assures us, that the buccinæ were also called *cornua*, horns; because originally made of the horns of cattle, as is still done among some people. Servius intimates, that they were at first made of goats or rams-horns; and accordingly, in Scripture, the like instruments used both in war, and in the temple, are called "rams-horns," *keren-jobal*, and *sopheroth hajjobelim*, or buccinæ of rams.

This instrument was in use among the Jews, to proclaim their feast-days, new moons, jubilees, sabbatic years, and the like. At Lacedæmon, notice was given by the buccina when it was supper-time; and the like was done at Rome, when the grandees had a buccina blown both before they sat down to table, and after.

The sound of the buccina was called *buccinus*, or *bucinus*, and the musician who played on it, *buccinator*.

**BUCCINA** also denotes the space or extent to which the sound of the buccina may be heard.

**BUCCINA auris**, in *Middle Age Writers*, denotes the *tympa-num* or *drum* of the ear.

**BUCCINATOR**, he that sounds or winds the buccina.

Among the Romans there was a public slave, denominated *buccinator nominum*, whose office it was to attend the public crier.

**BUCCINATOR Musculus**, in *Anatomy*, arises from the alveolus, containing the last grinder of the lower jaw, from the coronoid process, and from the tubercle behind the socket of the last grinder of the upper jaw; its fibres proceed over the membrane of the mouth, where it lines the cheek, and terminate extensively in both the lips and in the angle of the mouth. It may draw the lips backwards towards its posterior attachments, and when the lips are made fixed parts by the action of the orbicularis oris, it will thrust any matter intervening between the cheek and the cavity of the mouth into that cavity, for the purposes of mastication and deglutition.

**BUCCINATOR**, in *Entomology*, a species of *HYDRACHNA*, of an obovate form; colour red, black behind; tail cylindrical, yellow, and narrowed at the base.

Degeer has this as *acarus caudatus*. It is found on banks. The body is black beneath, eyes reddish, legs black.

**BUCCINUM**, in *Botany*. Dodon. gal. See *DELPHINIUM Consolida*.

**BUCCINUM**, in *Conchology*, a genus of univalves, described by Linnæus as having the shell spiral and gibbous; the aperture ovate, terminating in a short canal inclining to the right, with a retuse tail or beak; and the pillar lip expanded. Animal inhabiting the shell a limax.

Linnæus comprehends a vast number of species in his genus buccinum, which, for the sake of methodical uniformity and perspicuity, he places under several distinct sections; a mode of arrangement in which he has been closely followed by his editor, Gmelin, in the last edition of the *Systema Naturæ*. We shall follow the latter writer, as usual, in the first instance, and afterwards notice certain alterations that have been made in the arrangement of the buccinum genus by other naturalists.

*Ampullacea*, the first family, is distinguished by having the shell inflated, rotundate, thin, subdiaplanous, and fragile. This section includes the species *olearium*, *galea*, *perdix*, *pomum*, *dolium*, *caudatum*, *niveum*, and *clathratum*.

*Cassidea caudata*, in which the tail or beak is exerted, short, reflected; lip unarmed externally. Many species are included in this section; namely, *echinophorum*, *plicatum*, *cornutum*, *rufum*, *tuberosum*, *flammeum*, *testiculus*, *decussatum*, *areola*, *tigrinum*, *undulatum*, *cicatricosum*, *tessellatum*, *pennatum*, *maculosum*, *bilineatum*, *gibbum*, *ventricosum*, *strigosum*, *rugosum*, *ponderosum*, *recurvirostrum*, *trifasciatum*, *senegalicum*, *ochroleucum*, *striatum*, *castis*, *strigatum*, *tyrrhenum*, and *abbreviatum*.

*Cassidea unguiculata*. Shells of this family have the posterior part of the lip prickly on the outside, but in other respects resemble those of the last section; the species are *erinaceus*, *glaucum*, *vibex*, *tessulatum*, *nodulosum*, *limbria*, *papillosum*, and *glans*.

*Callosa*. These shells have the pillar lip dilated and thickened. The species of this tribe are few; namely, *arcularia*, *pullus*, *gibbosulum*, *mutabile*, and *neriteum*.

*Detrita*, in which the pillar lip has the appearance of being worn flat; *harpa*, *costatum*, *pericum*, *monodon*, *patulum*, *hæmaltoma*, *lapillus*, *sinaragdulus*, *tuba*, *pyrum*, *spadiceum*, *umbilicatum*, *candidum*, *scala*, *crassum*, *marginatum*, *labyrinthus*,

mathus, rusticum, varium, filosum, coronatum, squalidum, crassum, and fornicatum, are the species of this family.

*Lævigata*, smooth, and not included in the preceding sections. Spiratum, pyrozonias, læve, ocellatum, pyramidale, glaberrima, strigofum, trifasciatum, leucozonias, cancellatum, obtusum, glabratum, stromboides, praerosum, australe, orbita, and turgitum.

*Angulata*, angulated, and not included in the foregoing sections. Undosum, affine, tranquebaricum, varicolor, crenatum, sulcatum, rumpfi, bezoar, gracile, undatum, ciliatum, viridulum, carinatum, solutum, tenia, lineatum, macloviense, foliorum, textum, strigofum, anglicum, porcetum, lævissimum, igneum, plumatum, lyratum, clathratum, reticulatum, niveum, sealare, indicum nodulosum, piscatorium, S. mauritii, armillatum, plicatum, vulgatum, stolatum, nanum, exile, chalyis, verrucosum, alatum, nigro-punctatum, vitidum, lævigatum, lamellosum, scutalatum, haustorium, ventricosum, testudineum, catarraëta, tabitense, and lamellatum.

*Turrata*, smooth and subulate. The species of this kind are maculatum, crenulatum, heceticum, vittatum, stigmatum, duplicatum, lanceatum, dimidiatum, murinum, tigrinum, acus, succinctum, commaculatum, hastatum, aciculatum, phallus, flumineum, asperum, muricinum, tuberculatum, punctulatum, acicula, fasciolatum, niveum, mucronatum, digitellus, obliquum, chalybeum, fluviatile, radiatum, lividum, edentula, pugio, canaliculatum, variosum, cuspidatum, cinereum, virginicum, proximum, monile, cingulatum, and geminum.

The definition of the genus buccinum, as laid down by Linnæus, is liable to objection in several respects. It includes a number of shells so very dissimilar in general form, and ambiguous in their most essential character, that we cannot easily reconcile ourselves to retain the whole within the limits of a single genus. But we are still persuaded that all the species which can conveniently be comprised under either of the subdivisions ought to be retained, and those only to be removed from the buccinum genus which can with more propriety be referred to the other analogous genera of univalves. Bruguière divides the Linnæan shells of this tribe into four distinct genera; to the first of which he gives the name of *buccin*, or buccinum, the others he calls *vis*, *casques*, and *pourpres*. La Marck has innovated farther still on the Linnæan order; or, rather, he has laboured to overthrow the system of the illustrious Swede altogether, and in its place to establish the arrangement of his own. The shells which Bruguière retained under the title of buccin, La Marck divides again into four new genera; namely, buccin, harpe, tonne, and eburne.

The shells of the buccinum kind are commonly furnished with an operculum; the animal, as before observed, a limax or snail, subject to some slight difference in its form in different species. They are oviparous, and the males are said to be smaller and higher in colour than the females.

**BUCCIORSERAI**, in *Geography*, a town of Hindostan, in the circar of Doaab; 18 miles S. E. of Etaya.

**BUCCO**, in *Anatomy*, a name given by Riolanus, and some others, to the muscle more usually called *buccinata*, and *contrahens labiorum*.

**Bucco**, in *Ornithology*, a genus of birds in the PICÆ order, distinguished by having the bill sharp edged, compressed on the sides, notched on each side near the apex, bent inwards, with a long slit beneath the eyes. Nostrils covered with incumbent feathers: feet formed for climbing. Gmel.

The species of the bucco genus are tamatia, cayennensis, capensis, elegans, macrorhynchus, melanoleucus, philippinensis, niger, parvus, grandis, viridis, Lathamii, fuscus,

rubricapillus, zeylanicus, dubius, and cinereus; which see.

**BUCCULA**, in *Anatomy*, the fleshy part under the chin. Some extend the name farther to the whole lower part of the face, comprehending the under part of the lower lip, with the chin and the fleshy part under it.

**Buccula**, in *Antiquity*, denotes the *umbo* of a shield, or the part prominent in the middle thereof.

It is thus called, because usually made in the form of a mouth or face, either of a man or some animal. The like figures were sometimes also found on other parts of armour, especially on the *lorica* and *thoraces*.

**BUCENI**, in *Geography*, a town of European Turkey, in the province of Moldavia; 38 miles N. N. W. of Galatz.

**BUCENTAUR**, the name of a large state-vessel, used by the Venetians, in the ceremony of espousing the sea, performed each Ascension-day with much pomp.

The word comes from βυκενταυρος; composed of βυ, a particle of augmentation, used to denote an enormous greatness, and κενταυρος, centaur. Justiniani adds two other etymologies: the first from *bis*, and *taurus*, or rather *centaurus*, the name of one of Æneas's vessels in Virgil: the other from *bucentaurus*, for *ducentaurus*, a word forged to signify a vessel capable of holding two hundred men.

P. Justiniani gives a very precise description of the bucentaur, which is adorned with five pillars on both sides, and gilt from the prow to the stern, also covered over head with a kind of tent, made of purple silk; and he adds, that its origin is carried up as high as the year of Christ 1311, though others trace it higher, to the year 1177, when the emperor Frederic Barbarossa came to Venice, to make peace with the republic and the pope: at which time the pope, in consideration of the services the state had done him, in sheltering him in their city, when he had been driven out of his own, granted them several privileges; and made a present to the doge of a gold ring, which is the origin of that, yearly cast by the doge, from the bucentaur, into the sea.

It is on Ascension-day, that the doge, being advanced in the bucentaur a little way into the gulph, throws a gold ring into the sea, and says, "We marry thee, O sea, in token of that true and perpetual dominion which the republic has over thee."

In this vessel the doge receives the great lords, and persons of quality that visit Venice, accompanied with the ambassadors, and counsellors of state, and all the senators seated on benches near him.

The archduchess Maria Josepha, married to the prince of Saxony, on the day of her entry into Dresden, was received in a magnificent galley, finely rigged, and called a *bucentaur*, because built after the model of that of Venice.

A vessel of the same name, as large and magnificent as that of the Venetians, was constructed by order of the elector of Bavaria, and launched in a lake six leagues in length.

**BUCEPHALA**, in *Entomology*, a species of ΒΟΜΒΥΧ, the anterior wings of which are cinereous, with two ferruginous streaks, and a large yellow terminal spot at the tip. Gmel. &c.; called in English the buff-tip moth. Feeds on the lime, oak, willow, &c.

**BUCEPHALA**, or *Bucephalia*, in *Ancient Geography*, a town of India, on the west side of the river Hydaspes, built by Alexander on the site of his camp before his engagement with Porus, and so called (as Arrian says) in honour of his horse Bucephalus, which was killed, as some say, in that action, or who died, according to Arrian, of old age, being about 50 years old, and was buried on this spot. Hesycheus

lays

says, that this horse derived its name from being branded on the buttock with the head of an axe. As he had been long the companion of the toils and dangers of his master, he shared extraordinary tokens of regard. When he was lost for a time in the country of the Uxii, Alexander issued a proclamation, commanding his horse to be restored, and threatening to ravage the whole country with fire and sword. The command was instantly obeyed. "So dear," says Arrian, "was this horse to Alexander, and so terrible was Alexander to the Barbarians." Arrian. de Exped. Alex. lib. v. p. 219, 220. ed. Gronovii.

**BUCEPHALA**, a name given to a small town on one of the islands of the Grecian Archipelago, now called "La Cavale," which Alexander caused to be built there in honour of his horse Bucephalus.

**BUCEPHALA**, in *Ornithology*, the name of a species of *ANAS* that inhabits North America. In the *Arctic Zoology* it is called the *buffel headed duck*. This kind is of a whitish colour, with the back and wings black: the head large or tumid, silky, and shining.

Buffon calls this *le petit canard à grosse tête*. The bill is short, and either blue or brown: head black, glossed with green, or purple: collar and upper part of the breast white; lower part, with the abdomen, clouded brownish: area of the wing white: tail cinereous: legs fulvous.

**BUCEPHALON**, in *Botany*. Plum. See **TROPHIS**.

**BUCEPHALUS**, in *Entomology*, a species of *CRYPTOCEPHALUS* of a cyaneous colour, having the mouth, margin of the thorax, and the legs red. *Fabr.* Called by *Schaller*, *Chrysomela bucephala*.

**BUCER**, **MARTIN**, in *Biography*, an eminent German reformer, was born in 1491 at Schelestadt, in the province of Alsace. At the age of seven years he entered into the order of the Dominicans; and having studied logic and philosophy at Heidelberg, he afterwards applied himself to divinity, and became a proficient in the Greek and Hebrew languages. At Heidelberg he held some conferences with Luther in 1521, and having previously perused some of his writings, and also those of Erasmus, he was proselyted to the protestant party. Of his conversion he gave evidence by marrying; and his wife was a converted nun, by whom he had 13 children. He settled at Strasburg, and officiated there both as minister and theological professor for 20 years; and to his labours the progress of the reformation in that city was much indebted. His talents and reputation caused him to be employed in many conferences and negotiations; and in 1548 he was sent for to Augsburg to sign the agreement between the papists and protestants, called the "Interim;" but his opposition to that project involved him in a variety of troubles. At this time he was invited to England by archbishop Cranmer, and appointed a professor of theology in the university of Cambridge. King Edward VI. for whose use he composed a book, entitled "Concerning the Kingdom of Christ," manifested great regard for him; and when he complained of the cold of this climate, presented him with 100 crowns towards purchasing a German stove. He died of a complication of disorders in 1551, and was interred at Cambridge with distinguished funeral honours. In the bigotted reign of queen Mary, his body was dug up and burnt, and his tomb demolished; but it was set up again by order of queen Elizabeth. His erudition was various and extensive; of which he furnished ample evidence by his numerous writings, and by his learned lectures. His style, however, was obscure, nor was it always easy to comprehend his meaning. He was moderate in his temper, and particularly solicitous for preserving unity among the foreign churches. On occasion of the disse-

rences that took place between Luther and Zuinglius, and their respective followers, he inclined to the sentiments of the latter; but by his endeavours to reconcile them, he incurred reproach from the zealots of both parties. His zeal for maintaining peace and concord betrayed him into an ambiguity of language, and conciliatory artifices, which gave offence both to his friends and enemies. He seems to have been inclined to allow the merit of good works, nor was he adverse to episcopacy; and on both these accounts he was regarded with some degree of suspicion by Calvin and his followers. He was much opposed by the popish party at Cambridge; and as he did not possess the talents of an acute and ready disputant, Peter Martyr advised him to avoid all public disputes. Gen. Dict. Mosheim's Eccl. Hist. vol. iv.

**BUCERAS**, in *Botany*. Brown. Jam. See **BUCIDA**.

**BUCERAS**, Haller. See **TRIGONELLA Fanum Græcum**.

**BUCEROS**, in *Ornithology*, the name of a genus in the order *PICÆ*, called in English hornbill. Birds of this kind have the bill convex, curved, sharp at the edge, of a large size, and serrated outwardly; a horny or somewhat bony protuberance on the upper mandible, near the front of the head; nostrils behind the base of the bill. Tongue acute and short. Feet gressorial.

Of this genus there are twelve species, namely bicornis, abyssinicus, africanus, malabaricus, hydrocorax, rhinoceros, galeatus, panayensis, manillensis, nasutus, albus, and obscurus. Obs. The last is named plicatus by Latham, who also adds four new species to the buceros genus, giuginianns, orientalis, griseus, and viridis.

**BUCHAN**, **WILLIAM**, in *Biography*, doctor in medicine, of a respectable family in Roxburghshire, was born at Ancram in the year 1729. Having passed through the usual school education, he was sent to the university at Edinburgh. His inclination leading him to mathematics, he became so considerable a proficient in that branch of science, as to be enabled to give private lessons to many of the pupils. Having made choice of medicine for his profession, he attended the lectures of the several professors, necessary to qualify him for practice; and as he continued in the university nine years, and was of a studious turn of mind, his progress in knowledge may be supposed to have been equal to his application. He now removed to Sheffield in Yorkshire, where he commenced practitioner, in conjunction with another gentleman, who had invited him thither. Soon after he became a candidate, and succeeded in gaining the appointment of physician to the Foundling Hospital at Aekworth. From the opportunity he enjoyed here of seeing, and attending to the diseases of children, he was probably induced to give for his inaugural thesis, on his taking the degree of doctor in medicine, "De infantum vita conservanda." It was then much approved, and the substance of it now forms a section in his "Domestic Medicine." He is said from the regulations introduced by him for the management of the children in the hospital, to have considerably reduced the proportionate number of deaths of the children supported by that institution. This, however, did not prevent government from withdrawing their support to the hospital, which was in consequence given up, and the doctor, with his wife and son, removed to Edinburgh, and continued to practise medicine there for several years, during which he employed his leisure hours in composing his "Domestic Medicine," a work too well known to need being particularly described. It is written on the plan of Tissot's "Avis aux Peuples," to which it is certainly not inferior. It has been said, that by familiarizing the method of treating diseases, as it is attempted to be done by works of this kind, the medical

medical profession would be degraded, and the professors of the art would lose a portion of their respectability, and of their profits: but experience has shown that none of these events have followed; neither have we much reason for believing that the public are better judges of the merit of their medical advisers since the appearance of this popular work, which is one of the advantages we were taught to expect from it. If it has been profitable to any considerable degree, it may seem rather to have operated as a prophylactic, teaching the method of preventing diseases by regimen, than the art of discriminating them, or the mode of curing them when present. However that may be, since the year 1771, when the "Domestic Medicine" was first published, it has passed through nineteen editions, each of them, we are told, of 5000, or more copies. It has also been translated into all the modern languages, and procured for the author a gold medal, and a commendatory letter, more valuable than the medal, from the empress of Russia. On the death of the late Dr. Gregory, Dr. Buchan offered himself as a candidate for the late professorship, but did not succeed. Mr. Ferguson, teacher of natural philosophy, dying soon after, he left the doctor his apparatus, with which, in conjunction with his son, he gave lectures at Edinburgh twice each season, for three years. In the mean while his fame being extended by the sale of his book, he was induced to come to London about the year 1778. He had now opportunity of superintending the reprinting of his "Domestic Medicine," to which from time to time he made such alterations and additions as increasing experience had enabled him to collect, which entitled him to further remuneration from the booksellers. In 1786 he published "Cautions concerning Cold Bathing, and drinking Mineral Waters," 8vo. This was followed in 1796 by "Observations concerning the Prevention and Cure of the Venereal Disease." The next year he published "Observations concerning the Diet of the Common People." This has been incorporated with his Domestic Medicine. His last work published in 1800, is on "the offices and duties of a mother." He died on the 25th of February, 1805, of a dropsy in the chest, at the house of his son, in Percy Street, and was buried in the cloisters, on the west side of Westminster abbey.

BUCHAN, in *Geography*, a district or territory on the east coast of Scotland, lying partly in the county of Aberdeen, and partly in that of Bamff. The latter part extends northwards from the Ugie to the sea, and westward as far as Deveron, comprehending a tract of twenty miles in length by nine in breadth. The surface is mostly barren, though some parts of it are well cultivated. The coast is bold and rocky, and in some places presents almost perpendicular precipices. This district formerly belonged to the earl of Buchan; but upon the attainder of that family in 1320, Robert Bruce divided the lands among his friends; and though the title has been renewed in the present family of the Erskines, the present earl of Buchan possesses but little property in the district. See Sir John Sinclair's Statistical Account of Scotland.

BUCHANAN, GEORGE, in *Biography*, a famous poet and historian, eminently distinguished among modern writers by the purity and elegance of his Latin style, was the descendant of an ancient family reduced to indigence, and born in the shire of Dumbarton, in Scotland, in 1506. The talents which he manifested in early life induced an uncle to send him to Paris for his education; but after pursuing his studies with singular assiduity for nearly two years, the death of his uncle and his own ill state of health obliged him to return home. Urged, perhaps, more by his necessities than by

inclination, he enlisted as a common soldier in the body of French auxiliaries brought over to Scotland with John duke of Albany; but soon disgusted with their mode of life, he attended the lectures on logic delivered at St. Andrew's by John Major, and accompanied him to Paris. After struggling about two years with indigence and misfortune, he was appointed, in 1526, grammatical professor in the college of St. Barbe; and having remained in this situation three years, he obtained the patronage of Gilbert Kennedy, earl of Cassils, and was introduced into his family as private tutor and domestic companion. In this situation he continued five years; and availing himself of the intervals of leisure which he enjoyed, he translated Linnacæ's rudiments of grammar into Latin, which was printed at Paris by Robert Stephens, in 1536. Two years after his return to Scotland his noble patron died; and he was appointed by king James V. preceptor to his natural son James, afterwards the famous regent, earl of Murray. About this time he incurred the resentment of the Franciscan friars by a satirical poem, entitled "Somnium;" but the clamour of these monks served only to increase his prejudice against them, and to strengthen his inclinations towards Lutheranism. As soon as the king discovered, in 1538, that they were forming a conspiracy against himself, he commanded Buchanan to write a poem against them. His first performance was less poignant than the king wished it to have been; and he was commanded a second time to write with greater severity. Accordingly he published his "Franciscanus;" written more in the style of Juvenal than of Horace, and abounding so much with invective and ridicule, that these monks became his irreconcilable enemies, and excited the general indignation of the clergy against him. The king himself was induced to withdraw his protection; so that Buchanan was tried for heresy, and in 1539 committed to prison. However, he soon found an opportunity of making his escape, and fled, first to England, and afterwards to France. But at Paris he dreaded the influence of his avowed enemy, cardinal Beaton, who happened to be then in the city, and he withdrew to Bourdeaux, whither he was invited by Andrew Goveanus, a learned Portuguese, who was principal of a new college in that city. Here he taught for three years in the public schools; and he also composed two tragedies, viz. "Baptistes, five Calumnia," said to have been translated by Milton, and published in 1641, and "Jephtes, five Votum," and translated the "Medea," and "Alceftis" of Euripides. During his residence at Bourdeaux the emperor Charles V. passed through the city, and was presented by Buchanan with an elegant Latin poem, which gave him great satisfaction. Cardinal Beaton made several attempts to render his situation uneasy to him, but they were counteracted by the interposition of his friends. However, in 1543, he left Bourdeaux on account of the pestilence, and for some time took part in the education of Michael de Montaigne, the celebrated author of the "Essays." In the following year he went to Paris, and joined Turnebus and Muretus in conducting the education of the students in the college of Bourbon. In 1547, he accompanied Goveanus to the newly founded university at Coimbra; but the death of his friend, after a happy union of one year, subjected him to the enmity of the bigotted natives, who accused him of heresy, and confined him for a year and a half in the prison of the Inquisition, from whence he was afterwards removed to a monastery. In this situation he began his translation of "David's Psalms" into Latin verse, a work which has contributed in a high degree to his reputation as a poet. His translation of the 104th psalm has been particularly admired. In 1551, he was released, and the king, desirous of retaining him

him in the country, granted him a small pension. But having no strong inducements to prolong his stay in this country, he embarked for England; where, notwithstanding some advantageous offers were made to him, public affairs were in an unsettled state; and he thought it most advisable to remove to France, in 1553. Although he seems to have been fond of this country, he deploras in some of his elegies the miserable condition of those who were employed in the department of instruction at Paris. In 1555, he was entrusted by Marshal de Briſac, who then commanded in Piedmont, with the education of his son; and having continued in this station for five years, he devoted his intervals of leisure to the study of the sacred writings, and also to some poetical compositions, viz. his "Ode" upon the capture of Calais by the duke of Guise, his "Epithalamium," on the marriage of Mary queen of Scots to the dauphin of France, and part of his poem on the "Sphere." In 1560, he returned to Scotland, and avowed his conversion to Protestantism, which was then the established religion of the country. He was soon after appointed principal of St. Leonard's college in the university of St. Andrew's; where he also for some time taught philosophy; and at this period he made a collection of his Latin poems. Such was the respect entertained for his uncommon abilities and learning, that, in 1567, he was appointed, though a layman, moderator of the general assembly of the church of Scotland. When his former pupil, the earl of Murray, came into power, he formed an intimate connection with him and with the party, that was adverse to queen Mary. He accompanied this nobleman to York, and to Hampton court, where he acted as an assistant to the commissioners that were deputed from Scotland to conduct the accusations against the queen. Previous to this period he had been appointed by an assembly of the Scots nobility preceptor to the young king James VI. It was under his tuition, which continued for several years, that James acquired that scholastic knowledge, on which he so much prided himself; and it is said, that when Buchanan was afterwards reproached with having made his majesty a pedant, he replied, "that it was the best he could make of him." It is moreover reported, that Buchanan's reverence for his royal pupil did not prevent his giving him a severe whipping, when he persisted against remonstrance in disturbing him whilst he was reading. In 1571, Buchanan published his "*Detectio Mariæ Reginae*," arraigning the character and conduct of queen Mary, and expressly charging her with being concerned in the murder of her husband, lord Darnly; and of all our historians he alone avowedly accuses the queen of a criminal passion for David Rizzio. On this subject it will be sufficient to observe in this place, that admitting, with the most respectable and impartial judges, the general guilt of Mary, Buchanan discusses the question and enforces the charge alleged against her with the vehemence and acrimony of a partizan. Such was the high estimation in which Buchanan was held, that after the assassination of his patron, the earl of Murray, in 1570, he continued in favour with those who possessed power in the country, and was appointed one of the lords of the council, and lord privy seal. He had also a pension of 100*l.* a year settled on him by queen Elizabeth; which can hardly be considered as an adequate recompence for the services rendered by him, or suitable to the high offices which he sustained, and of which his tenure was precarious and of no long continuance. In 1579, he published his famous treatise "*De Jure Regni apud Scotos*," written in the form of a dialogue, and containing an explicit avowal of the right of subjects to decide upon and controul the conduct of their rulers. This work, as we may

naturally imagine, was highly extolled by some, and as violently censured and condemned by others. The author, however, ventured to dedicate it to his royal pupil, although the doctrine it contains was not very conformable to his views and inclinations. Whatever may be thought by contending parties of the principles which Buchanan has advanced in this publication, the avowal of them precludes the suspicion of his having been actuated by mercenary motives. During the last twelve or thirteen years of his life he was employed in composing his history of Scotland; and for the sake of obtaining greater leisure he retired from court and passed some of his last years at Stirling. This work, entitled "*Rerum Scotticarum Historia*," and comprised in 20 books, was published at Edinburgh in 1582, not long before his death, which happened on the 5th of December in the same year. Towards the close of his life, his circumstances were much reduced; and it is said, that when he was dying, he ordered the small sum of money that remained, and which was insufficient for defraying the expences of his funeral, to be given to the poor, expressing at the same time great indifference about the fate of his corpse. Accordingly, he was buried at the expence of the city of Edinburgh. The manner of his death has given occasion to his enemies for calumniating him as a libertine and an atheist; but for charges of this kind, chiefly adduced by bigotted Catholics, there is no just foundation. Sir James Melvil, differing with him in his political sentiments and connections, has nevertheless done him the justice to declare, that he died a sincere member of the reformed church. Against his moral character, it has been alledged, that he reduced himself by extravagance and debauchery to penury and indigence, at the close of his life; but to this charge it has been replied, that his inattention to pecuniary matters, and the profuseness of his charity, might account for his indigence, without ascribing it to culpable prodigality. His advocates, however, allow, that when he possessed wealth, he was, to an extreme degree, careless of the future, and that he made no provision for the season of dotage and helplessness. It has been further urged against him, that several of his poems indicate indelicacy and licentiousness; but his advocates have sought an apology for him from the age in which he lived, the taste of which was in this respect very different from that of a later period. The ancient satirists, says Mr. Hume, often used great liberties in their expressions; but their freedom no more resembles the licentiousness of Rochester, than the nakedness of an Indian does that of a common prostitute. With regard to his temper, Buchanan seems to have been harsh and unamiable; and, as a party-man, virulent and little inclined to indulge scruples. The persecutions of priests, and the oppression of misfortune, served to augment the natural fretfulness and asperity of his disposition, and gave an edge to his spleen. However, in his conduct he frequently exhibits a noble independence; and with respect to the public principles which he adopted, there is no reason to suspect in his avowal of them want of integrity; however he might have been influenced in some degree by partiality to his party, or deceived by the reports of others. The learned John Le Clerc has very ably shewn (*Bibliothèque Choisie*), that there is much reason to conclude, that many of the severe censures which have been thrown out against Buchanan, were the result of ignorance, of prejudice, and of party animosity. Sir John Melvil, who was of the opposite party, allows, that as far as he was concerned in public affairs, he distinguished himself by his probity, and by his moderation. But whatever different opinions may have been entertained by persons of opposite parties concerning his disposition and moral character, all concur in

applauding him as a writer. "His poetical character," says a very competent judge, "stands extremely high; yet his merit does not consist so much in sublimity or lofty flights of the imagination, as in splendour of diction, and harmony and variety of versification. He wrote in almost every species of composition. His "Psalms" are in almost all kinds of measure, and some of them exquisitely beautiful. In tragedy, he is charged with want of elevation, and with familiarity of style approaching to the comic. His didactic poem "On the Sphere," is elegant but unequal. His odes, epigrams, satires, eulogies, and miscellaneous pieces, possess merit of various kinds, not without many defects. They shew, however, extreme facility in the use of language, and an inexhaustible vein of poetical expression." As a poet, says Mr. James Crawford, he imitated Virgil in heroics, Ovid in elegiacs, Lucretius in philosophy, Seneca in tragedies, Martial in epigrams, Horace and Juvenal in satires. As an historian, he is said to have combined the brevity of Sallust with the elegance and perspicuity of Livy. He has been charged, however, with an inclination to fable in his narrative, and with an undue attachment to the party with which he was connected. Of his dialogue "De Jure Regni," it has been said, that, notwithstanding some objectionable sentiments and invectives, it contains rational principles of government; that it displays uncommon acuteness and extent of knowledge; and that it was calculated to enforce sound maxims of civil policy, at a period in which they were little understood. Of his "Scots History," written in his old age, archbishop Spotwood says, it was written with such judgment and eloquence, that no country can shew a better; though he adds, that Buchanan is justly blamed for siding with the factions of the time. The celebrated Thuanus observes, that although, according to the genius of his nation, he sometimes inveighs against crowned heads with severity, yet this work is written with so much purity, spirit, and judgment, that it does not appear to be the production of a man who had passed all his days in the dust of a school, but of one who had been all his life-time conversant in the most important affairs of state. Of Buchanan's history, Dr. Robertson says, (Hist. of Scotland, vol. i. p. 5, 8vo.) that "if his accuracy and impartiality had been, in any degree, equal to the elegance of his taste, and to the purity and vigour of his style, his history might be placed on a level with the most admired compositions of the ancients. But, instead of rejecting the improbable tales of the chronicle writers, he was at the utmost pains to adorn them; and hath clothed, with all the beauties and graces of fiction, those legends, which formerly had only its wildness and extravagance." These two works, as Mr. Mackenzie informs us, were condemned in Scotland by act of parliament. "The happy genius of Buchanan," says the celebrated historian just cited (Hist. of Scotland, vol. ii. p. 302.), "equally formed to excel in prose and in verse, more various, more original, and more elegant, than that of almost any other modern who writes in Latin, reflects, with regard to this particular, the greatest lustre on his country." Of his different works many editions have separately appeared; and a complete collection of them was published at Edinburgh, in 1714, in 2 vols. fol. and reprinted at Leyden, in 1725, in 2 vols. 4to. Biog. Brit.

To the memory of this truly great man an obelisk 100 feet high was erected by subscription, in 1788, at Killearn, the place of his nativity, designed by Mr. J. Craig, nephew to the celebrated poet Thomson.

BUCHAN-NESS, in *Geography*, the easternmost headland in Scotland. N. lat. 57° 30'. W. long. 1° 46'.

BUCHARIA, BUKHARIA, or BOKHARA, an extensive

region of Asia, lying between the river Jihon to the west, and the desert of Cobi and other deserts bordering on China, to the east. It is supposed to derive its name from the city of Bokhara (which see) near the Jihon or ancient Oxus, which was the emporium of the commerce carried on by the Europeans in that quarter; and afterwards extended to the adjoining country, beyond it. Bokhar, or Bukhar, as Abulghazi Khan informs us, was a Mungl or Mogul word, importing a "learned man;" and as all those who formerly wished to be instructed in the languages and sciences went, for that purpose, into Bukharia, the name was originally given to it by the Moguls, who conquered this country in the time of Genghis Khan. This extensive region is divided into two parts, called *Great* and *Little Bucharìa*, corresponding to the southern districts of the two ancient Scythias, which were separated by the ridge of mountains denominated the "Imaus," and called by Sherefeddin the "Karangoutac" mountains.

BUCHARIA, *Great*, is that extensive and important region of Independent Tartary, which comprehends part of the Touran or Turan of the ancient Persians, and was chiefly known to the Greeks and Romans by the names of Sogdiana and Bactriana; the former being the Arab "Mawalanahar," or country beyond the river, i. e. the Jihon or Oxus, and corresponding to "Tranfoxana," the name anciently given to those provinces which lay beyond this river; while Bactriana corresponds with Balk, and accordingly belongs to Iran, and not to Touran. Major Rennell cautions us against confounding, as some geographers have done, the modern Bucharìa with the ancient Bactria. Bucharìa, he says, is situated beyond the Oxus or Jihon, and is the country anciently named "Sogdiana," from "Sogd" the valley, a beautiful valley in which Samarcand (anciently Maracanda) is situated: whereas Bactria or Bactriana lay on the south of the Oxus, and comprehended the present provinces of Balk and Gaur, and probably part of Korafan.

Great Bucharìa extends more than 700 British miles in length from north to south, by a medial breadth, if Fergana be included, of about 350; thus rather exceeding Great Britain in size, but much inferior to the country named Little Bucharìa. On the north it is bounded by the mountains of Argun and Kara Tau; on the west by a desert, the river Amu, and other deserts, which divide it from Kharafm and Khorafan; and on the south, if it be extended so as to include Balk, by the mountains of Gaur or Paropamisus, and the Hindoo Koh; and on the east by the chain of Belur. According to these boundaries, it is situated between about 35° and 42° N. lat. and between about 60° and 70° E. long. The original population of this country was Scythian; and the natives are still denominated by the same Tartaric name of "Tadjiks," which the barbarous victors assigned to the Persians. The Persian monarchs were often engaged in wars with those of Touran, or the Scythians on this side and beyond the Imaus, whose queen, Thomyris, is said to have slain Cyrus in battle. After the progress of Alexander as far as Cogend on the river Sihon (or ancient Jaxartes), this country became better known, being probably the furthest limit of his course towards the north. When Genghis Khan died, A. D. 1227, he bequeathed Great Bucharìa to his second son Jagatay Khan, and it took the name of Jaghatay or Zagatay in honour of its new proprietor: which name it retained as long as the Khans descended from him reigned in these parts. But in 1498, sultan Babur, a descendant of Timur, was expelled with his Monguls from Great Bucharìa; and the Tartarian victors, called Uzbeks, established a powerful monarchy in the country. Successive Khans held the sceptre from 1498 to 1658; and soon after this period

the extensive and fertile country of Bucharia seems to have been divided into several governments, under numerous Khans. All the great towns, both of Great and Little Bucharia, from the borders of Khorasam as far as China, are inhabited by the Bukhars, or descendants of the ancient possessors, called by the Tartars, Tadjiks. These are well made and very fair, allowance being made for the climate; they have generally large, black, and lively eyes; their countenances are open, their noses aquiline, their hair black, and their beards bushy. The women are generally tall, and well-shaped, with fine complexions, and very beautiful features. Both men and women wear calico shifts and drawers; over which the men wear a veil of quilted silk, or calico, reaching to the mid-leg, and tied about the middle with a silk-crease girdle or sash. In winter they are covered with a long cloth gown, faced and lined with fur. The head is covered with a round cloth bonnet, having a large fur border; and some wear turbans. Their boots resemble the Persian buskins, and they possess a singular art of preparing horse-hides for this use. The women wear long gowns that are full and loose; their hair hangs in tresses, and is adorned with pearls and other jewels. Their bonnets are small, flat, and coloured. The Bucharians are a commercial people; and their caravans travel through the whole continent of Asia, and traffic with Russia, Thibet, China, India, and Persia. Russia contains several colonies of Bucharians, who are settled in many large towns of the southern provinces, and maintain a constant communication with the merchants of their own country. Their principal marts are Tomsk, Kiacta, and Orenburg, which is the most considerable. Their caravans are exposed to pillage from the Kirguse Tartars, through whose country they are obliged to pass. Their exports are gold and silver, chiefly in Persian coins and Indian rupees, gold-dust found in the sand of the rivers of Bucharia, precious stones, particularly rubies, lapis lazuli, spun and raw cotton, cotton luffs in great abundance, both Indian and Bucharian, half-silks, unprepared nitre, native sal-ammoniac, lamb-skins, raw silk in small quantities, rhubarb, and large droves of sheep and horses, which are bought for sale by the Kirguse Tartars. Pallas says, that above 60,000 sheep and 10,000 horses are yearly sold at Orenburg. The Bucharians receive in return cloth, leather, beads, and trinkets, hardware, indigo, cochineal, &c. The Bucharians never bear arms; but on this account they are despised by the Tartars, as a cowardly and weak people. The Jagatay Tartars, who are the descendants of the Tartars who first possessed this region, are now comprised under the general name of Uzbeks. The Uzbeks are commonly reputed the most civilized of all the Mohammedan Tartars, although, like the rest, they are great robbers. Both men and women are clothed, like the Persians, as low as their boots; and the chiefs wear plumes of white heron feathers on their turbans. Their most delicious dishes consist of "pillaw," which is rice stewed in broth, and horse-flesh. Their common drink is kumiss and arak, both made of mare's milk. Their language is a mixture of the Turkish, Persian, and Mongolian tongues. Their arms consist of the sabre, dart, lance, and bow, of a larger size than ordinary, which they manage with much strength and dexterity. For some time past they have used muskets. When they go to war, many of their cavalry wear coats of mail, and a little buckler for defence. They value themselves on being the most robust and valiant of all the Tartars; and even their women, who surpass the other Tartars in beauty, are not averse from warfare, but will sometimes attend their husbands to the field. Although many of these inhabitants of Bucharia reside in huts in the summer, yet in winter they inhabit the towns and villages. The religion of the Uzbeks

and Bucharians is the Mahometan of the Sonni sect; and the government of the Khans is despotic. The amount of their population is not precisely ascertained; but it is probable that upon an emergency an army of 100,000 men might be mustered. We have no accurate statement of the revenue of these fertile provinces; but it is not improbable that the revenue of Great Bucharia is at least equal to that of Khorasam, which, by Mr. Hanway's account, is equal to half a million sterling annually. The climate in general appears to be excellent; the heat even of the southern provinces being tempered by the high mountains capped with perpetual snow; and the proximity of the Siberian deserts and the lofty Alps, renders the sun much more temperate than that of other countries, such as Spain, Greece, and Asiatic Turkey in the same parallel. The face of the country presents a great variety; but though there are numerous rivers, hills, and mountains, there seems to be a deficiency of wood. Near the rivers the soil is productive, so that the grass sometimes exceeds a man's height; and in some parts considerable industry is shewn in the cultivation of rice and other grain. In the hands of any other persons besides those of the Tartars, this country might rival any European region. There is not a more flourishing or a more delightful country, says a famous Arabian geographer, than this, especially the district of Bokhara. From the ancient castle of this city a scene of luxuriant and beautiful verdure presents itself on every side of the country; so that the spectator would imagine the green of the earth and the azure of the heavens were united; and as there are green fields in every quarter, so there are villas interspersed among the green fields. In all Khorasam and Mawerahnahar there are not any people more long-lived than those of Bokhara. The rivers and lakes of this country are numerous and considerable in size; and its mountains are lofty and extensive. For the principal rivers, see AMU, SOGD, MORGAB, KISILE-DARIA, DEHASH, &c.; and for the principal range of mountains, see BELUR.

The cities in Great Bucharia generally give name to the provinces, or receive their appellation from them. In the north is the province of Fergana, the capital of which is Andegan. The other chief provinces are the western part of Shash, and a district called by M. d'Auville Oshushna, from a town of the same name, and by Ebn Haukal, Sctrustitah. The most fertile province is Sogd; and next to this are Vash, Kotlan, and Kilan. The Alpine region that separates this country from Little Bucharia, is Belur; and the most southern provinces are Tokarestan and Gaur. The chief city of Great Bucharia is Samarcand, and vying with this for dignity is Bokhara. See also of these articles respectively. See also PALK, ZOUF, BADAKSHAN, TERMED, &c.

BUCHARIA, *Little*, is so called, not because it is more limited in extent than Great Bucharia, being in reality much larger; but because it is inferior to it as to the number and importance of its cities, the quality of its soil, and the amount of its population. This country corresponds to the "Scythia extra Imaum" of the ancients, and to the "Serica" of Ptolemy. The Scythians beyond the Imaus are described by this geographer as restricted to a confined strip of territory on the eastern side of the Imaus, and divided by an imaginary line from the Seres, who were undoubtedly the people of Little Bucharia. But as ancient knowledge here terminated, it is probable that the Scythians beyond the Imaus not only held the eastern ridges of these mountains, as a barbarous race continues to do without molesting the industry of the distant plains, but that they were diffused along the ridge of

Alak, and the wide region called Geté, extending as far as the mountains of Bogdo, till they were expelled or subdued by more numerous or powerful nations from the east. But as it is now allowed by all geographers that the range called Belur Tag represents the Imaus, and that this range runs from north to south, forming the eastern boundary of Great Bucharia, it will be evident from Ptolemy's description and maps that "Serica" can be no other country but Little Bucharia, always possessed by an intelligent and industrious race of men; not only the ridge of Imaus, but the remarkable course of two considerable rivers towards the north-east, while all his other Asiatic streams have very different directions, sufficiently indicate Little Bucharia, in which the rivers correspond with Ptolemy's delineation; the Oechardes being probably the Orankash of modern maps, or perhaps the river of Yarcand; while his Bautifus may be the river of Koten, or that of Karia. The knowledge of Ptolemy does not appear to have extended eastward further than 80° from Greenwich; and, therefore, few comparisons can be instituted between the modern names and situations and those of Ptolemy. M. D'Anville supposes that the mountains of Annabi are those of Altai; whereas they are those of Alak, called by some Musart, on the north of Little Bucharia. The mountains on the south correspond with those of Mus Tag, or the mountains of Ice on the north of Thibet. To the south also lies the sandy desert of Cobi, of unascertained extent, but supposed by some to reach westward as far as the northern snowy mountains of Thibet already mentioned. The southern part of Little Bucharia contains several large provinces, as Koten and Karia or Kereja, so called from their capital cities; and the intelligent Strahlenberg has denominated Koten a kingdom, and has inserted several names of rivers and towns. On the east Little Bucharia is bounded by deserts and provinces of Mongolia, and particularly by the province of Hami or Chamiel belonging to China. The western and northern parts of this country are more accurately known by means of various accounts, and by the maps of D'Anville and Isenick. To the north is the Alak mountain, and beyond it Soongaria, and in the west the Belur Tag, which separates it from Great Bucharia. In Rennell's map, however, the western boundary is that ridge of the ancient Imaus, denominated by Shereffeddin the Karangoutac mountains, and between this and the Belur ridge is Baltitan or Little Thibet. The chief rivers of Little Bucharia are the Bulanghir, probably the Polonkir of the Jesuitic maps, flowing into the lake Lock-nor, the Chaidu and Yarcand Darija issuing from it, and supplying several branches as the Koten, Orankash, &c., and the Kereja proceeding from a lake in the desert of Sultus. The principal towns are Cashgar, Yarcand, Akfu, Chialish, Turfan, Koten, and Karia, which see respectively. Independently of the regions to the north, the extent of Little Bucharia, from the confines of Hami to the mountains of Belur, is more than 1000 British miles; and the breadth, from the mountains of Thibet to those of Alak, more than 500. It is of course comprehended between 36° and 43° N. lat., and about 72° and 87° E. long. As the land is much elevated and abounding in mountains, the climate is cold; and, in contradiction to the usual course of nature, the southern part bordering on the Alps of Thibet is colder than the northern, which is protected by the lower ridge of Alak. Among its hills are several fertile plains; but the population is not extensive. Between the cities in this country there are no villages; and in travelling a whole day from one to another, there is not a house of entertainment to be found. From Du Halde's atlas it may be

deduced that the Containh, or Great Khan, could raise 20,000 men from this province, taking one man from 10 families; and hence the number of families would be 200,000, which would yield a population of one million. The inhabitants, who are for the most part descendants of Bucharians, with a great mixture of Tartars or Turcomans, and a few Kalmuks, are generally swarthy and black-haired, although some of them are very fair, handsome, and well made. They are said to be polite and benevolent; and their language is probably that called the Zagathian or Turkish, which has supplanted their native tongue. The dress of the men resembles that of the Tartars, reaching no lower than the calf of the leg, and bound with girdles like those of the Poles. The garments of the females are of the same kind, commonly quilted with cotton; and they wear long ear-rings, twist their hair in tresses, lengthened by decorated ribbands and tassels of silk and silver, so as to hang down to their heels. Their necklaces are ornamented with pearls, small pieces of coin, and several gilded or silvered baubles. Some of them tinge their nails with henna. Persons of both sexes wear trowsers, with light boots of Russia leather, and occasionally high-heeled slippers. The head-dress resembles that of the Turks. Married women are distinguished from those that are single by a long piece of linen worn under their bonnets, which is folded round the neck and tied in a knot behind, so that one end of it hangs down to the waist. Both sexes carry about them prayers written by their priests, and kept in a small purse, under the form of relics. Their houses are commonly of stone, well built, and decorated with some articles of china. When they go to sleep, they throw off every garment; they are cleanly in the preparation and use of their food, which is usually minced-meat, and their general drink is tea, which they prepare with milk, salt, and butter. At their meals they use neither chairs nor tables, knives nor forks, but sit crossed-legged on the ground, and when the meat is served up ready cut, they take it up with their fingers or wooden ladles. Their wives are purchased, so that a person who has many daughters is accounted rich. The ceremonies of marriage differ little from those of other Mahometans, and polygamy, though regarded among the Bucharians as a kind of sin, is generally practised. Their children are named on the third day after birth, and circumcised on the 7th, 8th, or 9th day. In sickness the mullah or priest has great influence; and when a person dies, he lays a koran on his breast, and recites some prayers, after which the body is interred in some pleasant wood and inclosed with a hedge or pallisade. Their money consists of copper kopeiks, weighing nearly one-third of an ounce; and in passing silver or gold, they weigh it, like the Chinese. The prevailing religion is the Mahometan; and the Kalmuks or Eluths allow unlimited toleration. The government, before the Chinese took possession of the country, was first of all administered by a Khan, and afterwards by the containh of the Kalmuks, who appointed inferior magistrates. The soil of Bucharia is in many parts of it fertile and productive, and yields various kinds of fruits, and particularly wine. It is also rich in mines of gold and silver, but neither the natives nor Kalmuks are sufficiently skilful to work them; and out of the torrents, which flow from the mountains when the snow melts, they collect gold-dust, which they carry to India, China, and Siberia. Precious stones and diamonds are also found in this country, and the southern mountains near Thibet furnish musk. As the dress is chiefly cotton, the plant probably abounds in this country; though from their proximity to China the Seres might easily have transmitted silk to ancient Europe. Pallas speaking

speaking of Bucharia, but probably meaning Great Bucharia, mentions raw silk as a product of the country, very fine lamb-skins, the hair of camels, and an excellent rhubarb, which latter article grows in the south-east part of Little Bucharia.

In more ancient times, Little Bucharia, as we have already observed, was the country of the Seres; but it seems to have been but little known before the time of Genghis Khan, upon whose death this country, as well as Great Bucharia, became the portion of his son Jagatay, or Zagathai, and was occasionally called by his name, but more generally known by the appellation of Cashgar. It was then considered as a part of Mogulistan, or Mongolia; and the northern provinces belonged to the country of Geté. It had a succession of Khans, separate from Great Bucharia, till about the beginning of the 14th century. From that time it seems to have been governed by a succession of the descendants of Timur, till the year 1683, when it was subdued by the Eluths, or Kalmuks. To them it remained subject, till at a recent period it was conquered by the Chinese. In 1759, Kiang Long, or Chin Lung, completely vanquished these people; and thus annexed an extensive territory to his dominions.

BUCHAU, a free imperial town of Germany, in the circle of Swabia, seated on the Feder lake; 24 miles S.W. of Ulm. N. lat. 48° 6'. E. long. 9° 37'.

BUCHAU, a small country of Germany, in the circle of the Upper Rhine, comprehending the estate of the abbey of Fulda, of which Fulda is the capital.

BUCHEN, a small town of Germany, in the circle of the Lower Rhine, and electorate of Mentz; 22 miles E. of Heidelberg.

BUCHENBERG, a town of Germany, in the circle of Swabia, and territory of the abbey of Kempten; 5 miles W.S.W. of Kempten.

BUCHERI, a town of Italy, in the valley of Noto; 3 miles N.E. of Monte-Rosso.

BUCHHOLZ, a small town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg; 23 miles S.S.E. of Berlin.—Also, a small mine-town of Germany, in the circle of Erzgebirg, having a seat and voice at the Land-diets. At this place considerable quantities of lace are made.

BUCHIGLIERA, a town of Naples, in the province of Calabria Citra; 11 miles W.N.W. of Umbriatico.

BUCHLOE, or BUCHLAKE, a town of Germany, in the circle of Swabia, and bishopric of Augsberg; 18 miles S.S.W. of Augsberg.

BUCHNER, ANDREW ELIAS, in *Biography*, physician and aulic counsellor to the king of Prussia, and professor of medicine, first at Erfurt, and afterwards at Hall in Saxony, published, in 1755, in 4to.; “*Historia Academiæ Naturæ Curiosorum*,” of which he was several years president; “*Fundamenta Materiæ Medicæ, Simplicium Historiam, Vires et Præparata exhibentia*,” Hall, 1754, 8vo.; “*Syllabus Materiæ Medicæ selectioris, cum designatione ponderis, &c.*” Hall, 1755, 8vo. He was also author of several ingenious dissertations published in the *Miscell. Nat. Curios.* and of a number of dissertations, or inaugural theses, on botanical subjects. Among these, Haller particularly notices the “*Disputatio de genuinis viribus Tabaci, ex ejus principis constitutivis demonstratis; et de genuinis Opii effectibus in Corpore Humano*,” each of them containing several ingenious experiments made on animals, with the view of ascertaining the properties of those drugs; also a method of instructing deaf persons. He died in the year 1769. Hall. Bib. Bot.

BUCHNER, J. GOTTFRIED, of whom we have no biogra-

phical memoirs, has left some curious and useful works in botany, of which the following are the titles: “*Dissertationes Epistoliciæ de Memorabilibus Voigtlandiæ: 1. De arbore una nocte virente, et florem simulque fructus, tempore hiemali proferente; 2. De arboribus et plantis insolito tempore florentibus; 3. De arbore quovis æstate binis vicibus, et flores et fructus protrudente; 4. De arboribus diversi generis fructus in uno stipite proferentibus; 5. De frumentis spicis proliferis, aliisque plantis monstrosis; 6. De aloe Americana majori, aliisque plantis exoticis Voigt. florentibus*,” 4to. 1743. The remainder of his writings, consisting of dissertations on similar subjects, is published in the second, fourth, fifth, and seventh volumes of the *Miscel. Nat. Curios.* Haller. Bib. Botan.

BUCHNERA, in *Botany* (in honour of A. E. Buchner, a German naturalist). Linn. gen. 772. Reich. 833. Schreb. 1035. Willd. 1174. Gart. 323. Juss. 100. Class and order, *didynamia angiospermia*. Nat. Ord. *Personate*, Linn.; *Pediculares*, Juss.

Gen. Char. *Calyx* of one leaf, five-toothed, permanent. *Cor.* monopetalous; tube rather long, bored; border flat, short, five-cleft, nearly regular. *Stam.* four, very short; anthers oblong, obtuse. *Pist.* germ ovate-oblong; style thread-shaped, the length of the tube; stigma obtuse. *Peric.* capsule acuminate, two-celled, many-seeded, opening at the top in two divisions; partition contrary. *Seeds* angular; receptacle fastened to the middle of the partition.

Ess. Char. *Cal.* five-toothed. *Cor.* funnel-shaped; border five cleft, nearly equal. *Stam.* four unequal. *Capsf.* two-celled; partition simple, contrary to the valves. *Seeds* numerous, small. Gart.

Sp. 1. *B. Americana*, Linn. Syst. Nat. “*Leaves toothed, lanceolate, three-nerved.*” *Stem* scarcely branched. *Spike* with flowers remote from each other. *Stamens*, two in the throat of the corolla; two in the middle of the tube. The plant grows black with drying. Native of Virginia and Canada. 2. *B. elongata*, Willd. “*Leaves nearly linear-lanceolate, entire; calyx a little hairy, longer than the capsule.*” Swartz. A native of Jamaica, Vera Cruz, and Guiana. 3. *B. cernua*, Linn. Mant. “*Leaves cuneate, five-toothed, smooth; flowers spiked; stem shrubby.*” *Stem* half a foot high, regularly branched, a little jointed by the scars of the leaves, purplish. *Leaves* opposite, often ternate, sessile, with two acute serratures on each side the tip, even. *Spikes* terminal, solitary, oblong. *Flowers* sessile, erect, with a linear acute bractæ shorter than the calyx, and two shorter lateral bristles. *Calyx* tubular, oblong, semiquinquefid, equal; segments connected by a membrane. *Corol.* white; tube filiform, twice as long as the calyx, recurved; border flat, five-cleft; segments subovate. *Antb.* below the jaw; stigma inclosed, reflex, rather thick. On mountains at the cape of Good Hope. 4. *B. cuneifolia*, Linn. Supp. “*Leaves wedge-shaped, smooth, seven-toothed at the tip.*” Found by Thunberg at the Cape of Good Hope. 5. *B. cordifolia*, Linn. Supp. “*Stem four-cornered; leaves opposite, heart-shaped, three-nerved, serrated; racemes terminal, approaching to spikes.*” Referred to this genus by the younger Linnæus, though very different in habit, and more resembling a vervain, on the authority of Koenig, who found it about Tanjour. 6. *B. grandiflora*, Linn. Supp. “*Scabrous; leaves opposite, sessile, oblong, entire; peduncles axillary, one-flowered, two-leaved; calyx funnel-shaped.*” A very beautiful plant. *Stem* erect, smooth, very simple. *Leaves* five-nerved. *Peduncles* toward the summit of the stem, solitary, shorter than the leaves, with two opposite linear-subulate bractes about the middle. *Calyx* five-toothed, long, but shorter by half than the tube of the corolla, which gradually

gradually enlarges into a large, flat border, with five rounded lobes. *Obs.* The younger Linnæus, not having seen the fruit, was not certain of the genus, especially as it has some resemblance to the *gerardias*, and, like them, becomes entirely black in drying. Native of South America. Mutis. 7. *B. abipiti*, Linn. Mant. "Leaves three-toothed; flowers peduncled; stem rather shrubby." Stem half a foot high, much branched. Leaves opposite, sessile, lanceolate, about the size of those of *polygonum aviculare*, generally with a tooth on each side near the tip. Flowers toward the top of the branches, lateral, opposite; peduncles one-flowered, longer than the leaves, erect. Calyx monophyllous, five-toothed, a little hispid. Corolla yellow, twice as long as the tube of the calyx. Capsule bilocular, ovate-oblong, scarcely longer than the calyx. 8. *B. viscosa*, Hort. Kew. "Leaves linear lanceolate, distantly toothed, a little glutinous; flowers peduncled; stem shrubby." Native of the cape of Good Hope. Found by Masson, and introduced into England 1774. 9. *B. capensis*, Linn. Mant. "Leaves toothed, linear, alternate; calyx pubescent." Stem annual, about five inches high, straight, with four or five simple branches near the top. Leaves generally alternate. Flowers sessile, in short, terminal spikes. Calyx a little inflated. Corolla yellow; tube slender, slightly villous; two of the stamens projecting a little beyond the throat of the corolla. Stem, branches, leaves and calyxes clothed with a somewhat viscid down. La Marck, from a dried specimen. Allied to *rhinanthus capensis*, Linn. Native of the Cape. 10. *B. asiatica*, Linn. Spec. Plant. "Leaves very entire, linear; calyx scabrous." Stem obtusely four-cornered; branches alternate, with the habit of an *euphrasia*. Leaves linear; upper ones alternate, lower opposite. Tube of the corolla filiform, inclosing the stamens; border two-cleft, one segment nearly upright and trifid, the other open and heart-shaped. Vahl. (*Symb.* 3. p. 81.) describes the leaves as covered on the upper surface, and at the rib and margin of the lower, with numerous white scales, producing very small, solitary hairs; and the calyxes as solitary, nearly sessile, striated; the striae toothed with numerous minute, rigid hairs. La Marck has, in his Herbarium, a plant resembling *euphrasia Indica Orientalis* of Plukenet, and which he presumes is *buchnera asiatica*. It is rough to the touch; and the calyxes are striated in a very remarkable manner. Native of Ceylon and China. 11. *B. euphrasifodes*, Willd. "Leaves linear, very entire, scabrous with hairs; segments of the corolla linear, obtuse." Vahl. Resembles *euphrasia longiflora*. Stem acutely four-cornered, branched; branches opposite, higher than the stem, pressed close to it, and almost imbricated. Leaves short, opposite and remote below, alternate and crowded above. Calyx sessile, axillary, about the length of the leaves. Tube of the corolla villous; segments linear. Vahl. Native of the East Indies. 12. *B. gesnerioides*, Willd. "Leaves oblong, ciliated, pressed close to the stem, squamiform; tube of the corolla curved." Stem half a foot high, branched at the base, at first sight appearing naked. Leaves very minute. Flowers sessile, axillary, longer than the leaf, furnished on each side with a linear, obtuse bracte, ciliated at the margin. Calyx five-cleft; segments lanceolate, ciliated. Corolla nearly of *euphrasia longiflora*; tube smooth; segments of the border oblong. Capsule oblong, obtuse, bilocular. Willdenow, from a dried specimen. Native of the East Indies. 13. *B. pinnatifida*, Linn. Suppl. "Leaves pinnatifid, smooth." Found at the cape of Good Hope by Thunberg. *Obs.* La Marck is inclined to think that *buchnera manulca*, and *erinus*, are properly only one genus. They differ from *hebenstreitia* and *selago* in having a two-celled, polypermous capsule.

*BUCHNERA humifusa* (Forsk.) See *BROWALLIA*, where, on Forskål's authority, it is placed by La Marck, and said to have a one-celled capsule; but Vahl, on the other hand, ascribes to it a bilocular capsule with a partition opposite to the valves, very like that of *buchnera asiatica*, from which plant, he says, it differs only in its prostrate stem and obovate leaves. It does not appear, that either La Marck or Willdenow had seen a specimen.

BUCHODZ, PETER JOSEPH, in *Biography*, a physician, who rose by his merit to the first rank, in eminence, in his profession, was born at Mentz, about the year 1736. After receiving a liberal classical education, in which he is said to have made a more than ordinary proficiency, he was sent to Pont-a-Mousson, and was admitted to the degree of doctor in medicine at the university there, in 1759. Being soon distinguished for superior abilities and industry, he was in succession made physician to Stanislaus, king of Poland, to the duke of Lorraine, &c. and teacher or demonstrator in botany to the Royal College of Physicians at Nancy. He was also associated as foreign member to most of the medical and philosophical academies on the continent, to which he from time to time communicated his observations. His works are numerous, all on botanical subjects. The titles of a few of them follow: "Discours sur la Botanique," Paris, 1760. "Traité historique des Plantes qui croissent dans la Lorraine, et les trois évêchés," Nancy, 8vo. from 1763 to 1769, 9 vols. The work was abruptly broken off incomplete. He was assisted in forming it, by the papers and the Hortus Siccus of his father-in-law, Marquet, to which he made large additions. The first volume contains discourses on botany, with explications of the systems of Tournefort and of Linnæus; the second, purging; the third, peccoral; the fourth, sternutatory; the fifth, emmenagogue; the sixth, plants exciting perspiration. In each volume are engravings of the most remarkable plants in each class, with occasional experiments to ascertain their properties. "Medicine rurale et pratique," Paris, 1768, 12mo. containing useful information, and enabling the poor to select proper remedies for their complaints. "Secrets de la Nature et de l'Art pour les Alimens, la Médecine, la Vétérinaire, avec un Traité sur les Plantes qui peuvent servir à la Teinture, &c." Paris, 1769, 12mo. 4 vols. "Dictionnaire raisonné des Plantes et des Arbustes de France," Paris, 1770, 4 tom. For the titles of the remainder of his works, see Haller. Bib. Botan.

BUCHOLTZ, in *Geography*, a town of Germany, in the circle of Westphalia, and county of Verden: 18 miles E.N.E. of Verden.

BUCHOREST. See BUCHAREST.

BUCHORN, an imperial town of Germany, in the circle of Swabia, seated on the north side of the lake of Constance. The inhabitants are Lutherans. Here are warehouses for goods consigned to it for the passage of the lake. It is distant 13 miles E. from Constance. N. lat. 47° 41'. E. long. 9° 20'.

BUCHOV, a town of Hungary; 2 miles W. of Boleko.

BUCHOW. See BUCK.

BUCHWALD, BALTHAZAR, JOHN, in *Biography*, a German physician, published, in 1720, "Specimen Medicopraeticum Botanicum," 4to Hafnia, containing the descriptions and accounts of the medical properties of many of the common plants, with dried specimens of the plants affixed to the leaves. "De Diabetis Curatione, præprimis per Rhabarbarum, 4to 1737," also "Vici Analysis, ejusque in diversis Morbis Usus, 4to 1753." Haller. Bib. Botan.

BUCHY,

**EUCHY**, in *Geography*, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Rouen,  $4\frac{1}{2}$  leagues N.E. of it. The town contains 673, and the canton 9060 inhabitants; the territory comprehends  $162\frac{1}{2}$  kilometres and 30 communes.

**BUCIDA**, in *Botany* (originally called by Brown, *Buceras*, ox-horned, but changed by Linnæus into *Bucida*, without assigning a reason). Linn. Sp. Pl. Reich. 602. Schreb. 758. Willd. 881. Jussieu 75. Class and order *decandria monogynia*. Nat. ord. *Holoracæ* Linn. *Elaagni* Juss.

Gen. char. *Cal.* Perianth one-leaved, pitcher-shaped, obsoletely five-toothed, superior, permanent. *Cor.* none. *Stam* filaments ten, capillary, longer than the calyx and inserted into its base. *Anther* upright, heart-shaped. *Pist.* germ inferior, ovate; style the length of the stamens: stigma obtuse. *Peric.* berry dry, ovate, one celled, crowned with the calyx. *Seed* one, ovate.

Essent. char. *Cal.* fine toothed, superior. *Cor.* berry one-seeded.

Spec. 1. *B. Buceras*. Olive bark tree, Linn. Brown Jam. t. 23. f. 1. Sloane Jam. t. 189. f. 3. La Marck, pl. 356. "Spikes elongate; leaves wedge-shaped, smooth." Vahl. *Stem.* a tree, thirty feet high, about one in diameter. *Branches* divaricate, or flexuose, roundish, smooth, and even. *Leaves* only at the divarications and summits of the branches, crowded together, petioled, obovate or ridge-shaped, obtuse, very entire, veined, smooth, near two inches long. *Spikes*, or rather spike-like racemes numerous, simple, peduncled, axillary near the ends of the branches, about the length of the leaves. *Flowers* small, yellowish, alternate, sessile, hoary without, tomentose within. The style or upper part of the germ, especially at the extremity of the raceme is sometimes extended to the length of an inch or more, and curved somewhat in the form of a bull's horn; whence Linnæus and other authors have observed its affinity to *rhizophora*. Described by La Marck from a dried specimen. A native of the West-Indies and South America. In Jamaica it is called black olive; in Antigua, French oak; and in the French islands, Grignon. Its bark is used for tanning leather: and its wood is excellent for chests of drawers and other kinds of cabinet-makers' work, as it is seldom attacked by worms. 2. *B. capitata*. Willd. "Flowers with capitate spikes; leaves ridge-shaped, ciliated." Vahl.

**BUCINO**, in *Geography*, a town of Naples; 6 miles W.N.W. of Cangiario.

**BUCIOCHE**, in *Commerce*, a sort of woollen cloth manufactured at Provence in France, which the French ships carry to Alexandria and Cairo.

**BUCK**, in *Zoology*, a male horned beast of venery or chase, whose female is denominated a *doe*. A buck the first year is called a *awn*, the second a *pricket*, the third a *forel*, the fourth a *fore*, the fifth a *buck of the first head*, and the sixth a *great buck*. See **DEER** and **HUNTING**.

**BUCK** is also applied to the males of the hare and rabbit kind. Hares commonly go to *buck* in January, February, and March, and sometimes all the warm months; sometimes they seek the buck seven or eight miles from the place where they sit. The *buck* rabbit is said to kill all the young he can come at; on which account the doe is careful to hide her offspring in some remote corner, out of his way. The doe coney goes to buck as soon as she has kindled. She cannot suckle her young till she has been with the buck. When he has bucked, he usually falls backward, and lies as in a trance half dead, at which time he is easily taken.

**BUCK**, or **BUCK**, in *Geography*, a town of Poland, in the palatinate of Beltz, 24 miles S.S.E. of Beltz.

**BUCK**, or **BUCHO**, a town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, 23 miles N.W. of it.

**BUCK-bean**, in *Botany*, a corruption of bogbean, one of the English names of *menyanthes trifoliata*, derived from the place of its growth, and from a slight resemblance of its leaflets to those of the common cultivated bean.

**Buck island**, in *Geography*, one of the smaller Virgin Isles in the West Indies, situate on the coast of St. Thomas, in St. James's passage. N. lat.  $18^{\circ} 15'$ . W. long.  $63^{\circ} 30'$ .

**Buck-mast**, in *Botany*, is used by some for the mast or fruit of the beech tree.

**Buck-skins**. See **SKINS**.

**Buck-stall**, in our *Ancient Law Books*, a toil wherein to take deer. By an ancient statute, no person is allowed to keep a *buck-stall*, who has not a park of his own. Stat. 19. Hen. VII.

**BUCKEBURG**, in *Geography*, a town of Germany, in the circle of Westphalia, and county of Schauenburg, surrounded with walls, and having a castle, where the tribunal of justice is held. It contains one church, two colleges, and a house of orphans; 3 miles east of Minden.

**BUCKEBERG**, a bailliage of the canton of Soleure in Switzerland, on the east side of the Aar; its average annual value is 1661.; the inhabitants of this bailliage profess the reformed religion, and in ecclesiastical affairs they are under the protection of Bern. They take the oath of fidelity every third year to the government of Soleure: but if aggrieved in their religious establishment, have recourse to Bern. The senate of Bern nominates to the vacant benefices, but the priests are under the necessity of obtaining the confirmation of the chapter of Soleure. Bern also enjoys supreme jurisdiction in criminal affairs. If a criminal is arrested for any capital offence, he is tried by the bailiff of Buckeberg and the jury of the bailliage; but if condemned to death, he is delivered for execution to Bern, provided that republic discharges the expence of the trial. Soleure enjoys all the other rights of sovereignty. N. lat.  $47^{\circ} 9'$ . E. long.  $7^{\circ} 20'$ .

**BUCKEN**, a town of Germany, in the circle of Westphalia and county of Hoya; 2 miles S. of Hoya.

**BUCKENHAM**, or **NEW BUCKENHAM**, a small town in the county of Norfolk, England, is seated on the river Wareney. It obtains the appellation of New, to distinguish it from another place of the same name, which is more ancient, and is called Old Buckenham. Both these places have been of some note, but both have greatly declined. Henry I. created this a distinct parish, and William d'Albany built a handsome church here. At Buckenham was formerly a splendid castle, the site of which was subsequently occupied by a priory. The lords of the manor are butlers at the coronation of our kings. Here are two annual fairs, but the market has been discontinued. The parish contains 125 houses and 664 inhabitants. Blomefield's History of Norfolk.

**BUCKET**, in *Hydraulics*, a kind of vessel or recipient chiefly of use for the raising or conveyance of water from wells, and other places. The word is formed from the French *baquet*, a *pail* or *tub*. In an army, buckets are carried with the artillery, in the fire-workers stores. Town buckets, for extinguishing fires, are made of thick leather, strongly soaked and boiled. One method of raising water, described by hydraulic writers, is by the means of a chain of buckets.

**BUCKET**,

BUCKET, *sea-page*. See SEA-GAGE.

BUCKHAVEN, in *Geography*, a village on the coast of Fifeshire, in the parish of Wemyss, in Scotland. This place is wholly inhabited by persons engaged in the fisheries, as this part of the coast is much frequented by haddocks. About 50 years back these fish were caught here in such abundance, that they were sold at the rates of sixpence and ten-pence per hundred. The first inhabitants of this place are said to have been some Dutch fishermen, whose vessel was stranded here in the reign of Philip II. In the year 1791, the village contained 601 inhabitants. Sinclair's Statistical Account of Scotland.

BUCKIE, a considerable fishing village in the parish of Rathven, county of Banff, Scotland. Here is a tolerable harbour, to which belong 6 sloops, 14 boats, and 1 yawl. It is seated at the mouth of a river of the same name, and contained, in 1793, 703 inhabitants. The property of the place belongs about equally to the duke of Gordon and the honourable baron Gordon. Sinclair's Statistical Account of Scotland.

BUCKING, among *Miners*. See ORE.

BUCKING, an operation performed on linen cloth, cotton, and yarn, to render them somewhat white, by working them with lie made of ashes. Bucking of cloth is the first step or degree of whitening it. See BLEACHING.

To drive a buck of yarn, they first cover the bottom of the bucking-tub with fine ashes of the ash-tree, then spread the yarn thereon, then cover it again with ashes, and thus *stratum super stratum*, till the yarn is all in; when they cover the whole with a bucking-cloth, and lay on it more ashes, and pour in warm water, till the tub be full, and let it stand all night. Next morning they let the lye run into another vessel, and, as it waits, fill up the tub with warm water from a kettle, and, as this wastes, fill it up with the lye that runs from the bucking tub, still observing to make the lye hotter and hotter, till it boils. Thus are both the tub and kettle to be supplied for at least four hours, which is called *driving a buck of yarn*.

BUCKINGHAM, in *Geography*, the county town of Buckinghamshire, England, appears to be a place of considerable antiquity, and has been the scene of some particular historical events. According to bishop Kennet, it was at or near this town that the Roman general, Aulus Plautius, surprised and routed the Britons, under the command of Caractacus and Togodumnus, the sons of Cunobeline. In the early Saxon times, it became celebrated as the burial-place of the infant saint Rumbald, who was born at King's Sutton in Northamptonshire, and is reported, by catholic fabulists, to have lived but three days, during which period he professed himself a Christian, and wrought many miracles. According to the Saxon Chronicle, Edward the Elder resided here in the year 918, and built two forts to repel the incursions of the Danes. The town was ravaged by the Danish soldiers in 941, and again in 1010, when, having plundered the adjacent country, they retreated hither to secure their spoils. At the time of the Norman conquest, Buckingham is stated to be the only borough in the county; yet it was then but an inconsiderable place. In the reign of Edward III. its importance was increased by that monarch making it a mart for wool; but the trade being removed to Calais, it again declined; and in the 27th of Henry VIII. Buckingham was in the list of decayed cities and towns which were relieved by act of parliament. The removal of the assizes to Aylesbury still lessened the consequence of Buckingham; and in 1724, a dreadful fire completed its misfortunes, when, out of 387 houses, 138 were consumed,

besides outhouses and manufactories. The damage was estimated at 40,000l. Since that period the trade has in a small degree revived, part of the county business being restored, and the assizes fixed here by act of parliament in 1758, in which year a gaol was erected. The town-hall is a large brick building, surmounted by a gilt swan, the arms of the borough. But the most conspicuous and principal ornament of the town is the church, which stands on the summit of an artificial mount, which was anciently occupied by a castle. This stately fabric was begun in 1777, and completed in 4 years, at the expence of about 7000l.; the greater part of which was contributed by the late earl Temple. The church is built of stone, and has a handsome square tower attached to its west end, ornamented with pinnacles, embrasures, and a light tapering spire, which rises to the height of 150 feet from the ground. The interior is constructed on the same plan as Portland Chapel in London. A large gallery, supported by Doric columns, projects from three of its sides. From the gallery rise twelve more columns of the Ionic order, sustaining a richly decorated ceiling. The corporation consists of a bailiff and twelve burgeses, in whom is vested the right of election for members of parliament. It does not appear that this town sent members previous to 36 Hen. VIII. though three persons were sent, as early as 11 Edward III. to a council of trade held by that monarch at Westminster. A free-school was founded here, about 1540, by Isabel Denton; the endowment of which has been increased by successive donations; and a Sunday school has been lately established for the children of the poor. The extent of the town and parish is computed at 3800 acres. The houses, which are chiefly brick, and irregularly built, are estimated at 545, and the inhabitants at 2605, who are divided into several religious sects; the presbyterians, quakers, and methodists have each a place of worship. Lace-making is carried on to a considerable extent; for as it requires but little ingenuity, and cheap materials, there is scarcely a female who is not provided with a lace-pillow and its necessary implements. The profits of the business depend on the facility of execution; and the daily earnings are therefore different. Some women can gain from eighteen-pence to two shillings a day; but others not more than one shilling. Their receipts have lately experienced a considerable drawback, from the establishment of a manufactory at Nottingham, where lace is made by *machinery*, and being quicker executed, is retailed at a lower price; but its quality is not so good as that made by hand. Buckingham is situated 57 miles N. W. from London. It has a market on Saturdays, and seven annual fairs.

About two miles north of Buckingham are the magnificent mansion and celebrated gardens of STOWE, the chief ornament of the county, and principal seat of George Grenville Nugent Temple, marquis of Buckingham. Domesday book contains the earliest account of this manor, and states, that in the reign of Edward the Confessor its value was 60s. and that it was held by Robert d'Oyly and Roger Ivory of the bishop of Baieux. The present mansion is a large handsome structure, seated on a high spot of ground, which slopes, in a southerly direction, to a fine lake of water. The interior of this house is furnished in the most elegant style, and contains a large collection of pictures, and a very spacious library filled with choice books, numerous manuscripts, &c. The pleasure grounds, which consist of about 400 acres, are ornamented with numerous plantations, temples, &c. and are diversified with various inequalities of ground. Beauties of England and Wales, vol. i. "A Description of the House and Gardens at Stowe," 8vo. 1797.

BUCKINGHAM, a county of America, in the state of Virginia, lying between the Blue ridge and the Tide waters, containing, according to the census of 1790, 9779 inhabitants, of whom 4168 are slaves.

BUCKINGHAM *Houfe*, the most westerly of the settlements belonging to the Hudfon bay company in New South Wales, lies north-westerly from Hudfon-house, on the northern side of Saffkashawen river, near its source. N. lat. 54°. W. long. 110° 20'.

BUCKINGHAMSHIRE, one of the inland counties of England, appears to have been mostly peopled, at the time of the Roman invasion, by a class of the Britons, which the historians of that period named *Cattieuchlani*. When the Romans had subjugated the island, this part of it was included in that division named *FLAVIA CÆSARIENSIS*. After their departure, it became the theatre of many battles and revolutions, and, at length, in the Saxon dynasty, constituted a part of *Mercia*, to whose monarchs it became subject during the continuance of that kingdom. Buckinghamshire is bounded on the north by Northamptonshire; on the east by the counties of Bedford, Hertford, and Middlesex; on the south by Berkshire; and on the west by Oxfordshire. Its extent has been variously estimated; but the most correct computation has been given in the General View of its Agriculture; wherein it is said to be 45 miles in length, 18 in breadth, and 138 in circumference. It contains about 518,400 acres of land, and is divided into 8 hundreds, including 16 market-towns, 185 parishes, about 21,000 houses, and about 107,440 inhabitants. Its limits are mostly artificial; the river Coln bounding only a small portion on the east side, and the Thames separating it from Berkshire.

The face of this country is much varied. The southern parts are occupied by the Chiltern hills and their appendages. These eminences are chiefly composed of chalk intermixed with flints; and though very inferior to the northern district, with respect to richness of soil, have been rendered extremely productive from the great attention given to the cultivation and improvement of the land. The prolific *Vale of Aylesbury* spreads through the middle of the county, and furnishes a rich pasturage to vast numbers of cattle, its amazing fertility being chiefly employed in the support of the dairy and grazing systems. The more northern parts are diversified with gentle sand-hills, which enter from Bedfordshire. In the vicinity of the Chiltern hills, where the soil is light, and inimical to production without much labour, the most sedulous care is bestowed, and every mode of improvement adopted. In the vale of Aylesbury, and the more northern divisions of the county, the astonishing produce of the meadows rendering exertion less necessary, the farmer turns a deaf ear to every argument of an infructuous tendency.

The soil of this county is principally composed of rich loam, strong clay, chalk, and loam upon gravel. Its chief application, in the Chiltern district, is to the growth of wheat, barley, oats, beans, and saintfoin; the northern division, as we have already intimated, is chiefly applied to pasture and meadow, with a very small proportion of arable. The great quantities of butter annually made on the dairy farms, are mostly purchased by the London dealers, who contract for it half-yearly. The average weight produced weekly from each cow, is eight pounds in summer and six pounds in winter. In some of the dairies a very useful machine, called a mill-churn, has lately been introduced, by which the fatiguing operation of churning is greatly facilitated, the mill being worked by a horse. In other dairies a barrel-churn is used, with two handles, turned by two men, who make from six to six score pounds of butter at one churn-

ing. The skim and butter milk are made use of to fatten swine. In the neighbourhood of Medmenham, Great and Little Hampton, &c. many calves are suckled; and at Aylesbury, and its vicinity, great attention is given to the rearing of ducks, to supply the markets of the metropolis. For ploughing, and other laborious operations of agriculture, horses are preferred to oxen. The latter have frequently been tried, but the flintiness of some parts of the soil, and the very heavy quality of others, have caused the farmer to decide in favour of the horse. In the southern parts, the swing and high wheel ploughs are chiefly used, and are drawn by four horses ranged two abreast. In the northern division the loose handle swing and low wheel ploughs, worked by five or six horses in a line, are principally used. The progress of agricultural improvement is considerably checked on many estates, by the restrictive conditions on which they are leased; the tenants being confined to two or three crops and a fallow, with a prohibition to the growth of clover and green food. The manures are principally marl, peat-ash, yard and rabbit dung. On some of the strong and cold soils, hair and hoofs are strewn with much advantage. Soot and ashes are equally beneficial to the wheat and young clover. Farms are generally let from 60l. to 250l. a year; some amount to 500l.; and two or three to 1000l. In the Agricultural View of the County, the common fields were estimated at 91,900 acres, but a large proportion has since been inclosed. The waste lands are but inconsiderable, their extent not being more than 6000 acres, the greatest part contained in the heaths of Iver, Fulmer, Stoke, and Wycombe. The southern division of the county produces large quantities of fine beech: near a sixth part of the land between the road to Oxford and the Thames is supposed to be covered with that wood. On Wavendon heath (now the property of the duke of Bedford) several flourishing plantations of Scotch firs have been made since its inclosure, about the year 1778. In the coppices on Whaddon chace are numbers of fine oak and ash trees. The chief manufactures are those of paper and lace. The latter affords employment for nearly all the lower class of females in the county.

The principal rivers are the Ouse and the Thame. The Ouse enters Buckinghamshire on the western side, passes Water Stratford, and flows in a devious course to Buckingham; thence winding to the north through a rich tract of meadow land, pursues its way to Stony Stratford, Newport-Pagnell, and Olney; soon afterwards, turning suddenly to the east, it leaves the county near Brayfield. The Thame rises near the borders of the county in Hertfordshire, and flowing through the vale of Aylesbury from east to west, receives the waters of several smaller streams, and enters Oxfordshire near the town of Thame. The interchange of traffic has been much facilitated of late years by the Grand Junction canal, which enters this county near Woolverton, and running eastward, goes within a mile of Newport-Pagnell; thence, flowing to the south, it passes Fenny Stratford, Stoke Hammond, Linlade, and Ivinghoe, into Hertfordshire, near Bulbourne. From a branch of the canal at Old Stratford, a cut has been made to Buckingham, and another from Bulbourne to Wendover.

Buckinghamshire is in the diocese of Lincoln, with the exception of six parishes belonging to the see of Canterbury, and four to the diocese of London. It sends fourteen members to parliament; viz. two for the county, two for Buckingham, two for Aylesbury, two for High Wycombe, two for Amersham, two for Wendover, and two for Great Marlow. It pays twelve parts of the land tax, provides the

militia with 560 men, and is in the Norfolk circuit. General View of the Agriculture of the County of Buckingham.

BUCKLAND, a township of America, in Hampshire county, and state of Massachusetts, containing 718 inhabitants; 120 miles west from Boston.

BUCKLE, in *Matters of Trade*, a little metalline machine, whereby to retain and keep fast certain parts of the habit, as well as of the harness of horses, &c.

The word is formed from the French *buckle*, and that, according to Casseneuve, from the barbarous Latin *physcula*, which signified the same. According to Menage, from *bucula*, the *ansa*, or handle of a buckler. The buckle is a part of modern dress, corresponding to the *fibula*, among the ancients. Buckles are of divers sorts, as shoe and garter buckles; some round, others square, or oval, or cut, each of which have their respective artificers by whom they are made. The like may be said of the great variety of buckles belonging to the pack and hackney saddles.

BUCKLE, *girth*, among *Sailors*, is a four square hood, with a tongue, which is made steady, by going through a hole of leather, and fastened with narrow thongs.

BUCKLER, a piece of defensive armour, used by the ancients to screen their bodies from the blows of their enemies.

The word comes from the barbarous Latin *bucularium*; of *bucula*, the umbo or middle point of this weapon, which had usually a head or mouth, represented prominent thereon.

The buckler is the same with what we otherwise call shield or target; and by the one or the other we indifferently render what among the ancients were denominated *clypeus*, *scutum*, and *parma*: though the three latter were different from each other.

The *scutum* was an oblong shield, with an iron boss or *umbo* projecting from the middle; 4 feet long and 2½ broad, made of wood, joined together with small plates of iron, and wholly covered with a bull's hide. The *clypeus* was a round shield of a smaller size. The *parma* was a round buckler, made of wood, and covered with leather.

The buckler of Achilles is described in Homer, that of Æneas in Virgil, that of Hercules in Hesiod: Ajax's buckler was lined with seven bulls' hides.

The buckler among the Greeks, called *Δοπις*, was sometimes composed of wicker-work, and sometimes of the wood of fig, willow, beech, or poplar; but most commonly of hides, which were doubled into folds, and fortified with pieces of metal. In the middle of the buckler was a boss, upon which was fixed another prominence. A thong of leather, and sometimes a rod of metal, reached across the buckler, and served for hanging it on the shoulders. Sometimes it was held by little rings; and it had afterwards a handle, composed chiefly of small iron bars crossing each other, in the form of the letter X. When the wars were ended, and the bucklers suspended in the temples of the gods, they took off the handles, that they might become unfit for immediate use. Little bells were sometimes hung upon bucklers to strike terror into the enemy. They were often adorned with various figures of beasts and birds, of the celestial bodies, and of the works of nature. The bucklers of the Argives seem to have been longer than the rest, and to have covered the whole body. Their form was usually round. Phil. Trans. N<sup>o</sup> 241, p. 206. See SHIELD. See also ARMOR, and ARMS.

The ancients were particularly solicitous to preserve their bucklers in fight; it being highly infamous, and even penal,

to return without them. It was on their bucklers that they carried off the bodies of their slain, especially those of distinction.

The Spaniards still retain the sword and buckler in their night-walks.

*Bucklers*, on medals, are either used to signify public *votus*, rendered to the gods for the safety of a prince; or that he is esteemed the defender and protector of his people.—These were particularly called *votive bucklers*, and were hung at altars, &c.

BUCKLER, in *Heraldry*. See SHIELD.

BUCKLER of a *case*, denotes a moveable head, whereby to compress the contents of it.

In this sense we say, a buckler of pilehards.

BUCKLER *Mustard*, in *Botany*. See BISCUTELLA and CLEPULA *Fontbluffi*.

BUCKOVINA, in *Geography*, a part of the ancient province of Dacia, became subject to Austria in 1777, and was annexed to Galitz, vulgarly denominated Galicia. It contains no town of any consequence; but Czernowitz is reckoned the principal. Hoeck estimates the number of inhabitants at 130,000; they speak Polish and German; and their religion is the Roman Catholic. The annual revenue is reckoned at 100,000 florins.

BUCKRAH, a town of Hindostan, in the Soubah of Oude; 18 miles N.W. of Goorackpou. — Also, a town of Hindostan, in the country of Bahar; 25 miles north of Patna.

BUCKRAM, a thick sort of linen or hempen cloth, stiffened with gum or glue, used in the linings of cloths, to sustain and make them keep their form.

Of buckram are also made wrappers for covering cloth and other commodities, in order to preserve them from being soiled, and their colours from fading. Buckram is sold wholesale for the dozen of small pieces, each about four ells long, and of breadth corresponding to the piece from which they are cut.

BUCKS, in *Geography*, a county of Pennsylvania, in America, lying S. W. from Philadelphia, separated from Jersey by the river Delaware on the south-east and north-east, and having Northampton county on the north-west. It contains 25,401 inhabitants, including 114 slaves. Bucks is a well cultivated county, containing 411,900 acres of land, and comprehends 27 townships, the chief of which is Newtown. It abounds with lime-stone, and in some places iron and lead ore. At the north end of the county is a remarkable hill called Haycock, situate in a township of the same name. This hill is 15 miles in circumference, with a gradual ascent, and commands from its summit a very delightful prospect. The waters of Tohickon creek wash it on all sides except the west.

Bucks *Harbour*, a bay of the Atlantic, on the south coast of the district of Maine, in America. N. lat. 44° 42'. W. long. 63° 34'.

BUCKSHORN, in *Botany*. See PLANTAGO *Coronopus*.

BUCKSTOWN, in *Geography*, a town of America, in Hancock county, and district of Maine, on the east side of Penobscot river, containing 316 inhabitants, 260 miles N.E. from Boston.

BUCKTHORN, in *Botany*. See RHAMNUS.

BUCKTHORN, *sea*. See HIPPOPHÆ *rhamnoides*.

BUCKTOWN, in *Geography*, a town of America, in Dorchester county, Maryland, situate between Blackwater and Transquacking creeks, 12 miles from their mouths at Fishing bay, and 8½ miles S.E. from Cambridge.—Also, a township

township in Cumberland county, and district of Maine, near Portland, containing 453 inhabitants.

BUCK-WHEAT, in *Botany*. See *POLYGONUM fagopyrum*.

BUCK-WHEAT, in *Agriculture*, is a sort of grain much cultivated in the field in some districts. It is earnestly recommended to farmers by Mr. Young, in his excellent Calendar of Husbandry, as being yet only known by name in nineteen parishes out of twenty throughout the kingdom. It possesses as many excellencies to good farmers, he supposes, as any other sorts of grain or pulse that are employed in cultivation; having the property of ameliorating the land, as well as that of preparing it for wheat or any other crop. It is equally valuable with barley, and where known sells at nearly the same price; and, besides its utility in fattening some sorts of animals, is the best of all crops for sowing grass seeds with, as it affords them the same shelter as barley or oats, without depriving them of their necessary support. The time of sowing it has likewise an advantage in affording a full opportunity for getting the soil into a proper condition. And there is scarcely one fourth of the expence of a barley crop incurred in the seed.

It is said by some to thrive well on any soil, even those of the poorest kinds; and that in most of the arable districts it is sown on the inferior sorts of land, as when cultivated on the richer kinds, it is found to run too much to straw.

Mr. Bannister, however, observes, in his Synopsis of Husbandry, that it delights in land which has been reduced into good order by tillage, and has likewise partaken liberally of the dung-cart, for which reason it often succeeds a crop of turnips; and there is this advantage attending the cultivation of it, that as, from the tender nature of the plant, it requires to be sown late, it may follow a crop of turnips that has been fed off at a time when it would be highly imprudent to sow the ground with barley.

Mr. Young considers this as a very profitable crop on all sorts of land, except the very heavy kinds, that require late sowing, and where barley cannot be put in at a sufficiently early period; as he suspects there are not many soils on which a buck-wheat crop sown in May will not be more valuable than one of barley sown at the same time, though it is the common practice in many districts to put that crop in at so late a season.

The lands intended for this grain should undergo a proper tillage in April, so as to render them fine and perfectly clean from weeds, especially where grass-seeds are to be sown with it.

The proper time for sowing buck-wheat, Mr. Bannister observes, is in May, "when there is no longer any danger to be apprehended from the frosts; for so tender is this vegetable at its first appearance, as to be unable at an earlier period to withstand the vernal cold; and the slightest frost, in their infant state, would infallibly cut off the young shoots; and, as from this circumstance it must be sown at a season when dry weather may be expected, the crop does on that account not unfrequently miscarry." And Mr. Young asserts, that it often succeeds well, when put into the ground in June, and even the beginning of July, which is considered as an advantage in a crop that prepares the land for wheat.

But the author of the Synopsis of Husbandry remarks, that "being sown late, the harvest likewise falls out very backward, by which the greater part of the crop is often devoured by the hogs in the field; as this grain seldom ripens till towards Michaelmas, when the other corn stubbles have been long open. Add to this, the injury likely to accrue from rain, which may be expected to fall in great abundance

at this season, so that the haulm, being extremely succulent, does in the most kindly harvest require a great deal of field room: but in a wet autumn it is a very difficult matter to get the crop home in good order; and in such years he has known the swarths of buck-wheat lying abroad throughout the greatest part of November." Hence there is evidently great hazard in this grain, not only from its being exposed to the ravages of the hogs, when cultivated in open fields, as before mentioned, but from the shedding of the seed; circumstances which will cause the returns to be very trifling when threshed. To this may be added the inferior value of the straw, chaff, &c. when compared with an oat or barley crop."

The proportion of seed which is necessary, must vary in some measure according to the nature of the land; but, in general, a bushel to the acre is fully sufficient. It should be well harrowed in with a light short-tined harrow.

This grain generally, as has been seen, bears a price equal to that of barley, and is used for fattening of swine, poultry, and other domestic animals. "In its external form," Mr. Bannister says, "it bears not the smallest resemblance to wheat; and the method of culture, and the progress of its growth, are totally different from that grain: but, when ground, it produces a white flour, whence it may probably have gained the appellation. In Hertfordshire and Buckinghamshire, it is a common mode of husbandry to sow turnip seed with buck-wheat; but the Kentish farmers usually sow their wood or weld on their buck-wheat lands; and as the seeds of either covet a light bed, and both of them require to be sown late, the wood generally succeeds well when raised among buck-wheat; and sometimes buck-wheat, turnips, and wood are crowded together on one season." This is, however, a practice by no means to be generally adopted.

The proper quantity of this grain, according to this writer, "to sow on an acre, is half a bushel; and such is the uncertainty of the return, that five quarters have been produced from an acre in some years, while in others not so much as five bushels."

"The green haulm of buck-wheat has a peculiar inebriating effect on swine. He has seen hogs, which have fed heartily on it, come home in such a state of intoxication, as to be unable to walk without reeling."

This sort of grain is likewise, he says, sometimes "sown on stiff lands, for the purpose of ploughing in the stalks as a manure. On fallows, where the land has a clayey bottom, this method may be pursued to advantage; but it is to be noted, that the ground should be in pretty good heart, so as to throw out a large burthen of haulm, otherwise no benefit can accrue from this mode of husbandry." At the stirring of the fallow in May, in this mode of culture, the seed should be sown pretty thick; and when the stalks have arrived to their full growth, they should be laid flat with the roller, and afterwards turned in with the plough; and when the ground has continued in this state till towards Michaelmas, by which time the stalks of the buck-wheat will be rotted, the seed furrows for the succeeding crop should be begun. "This method of ploughing-in the green stalks of buck-wheat contributes, it is observed, much toward the melioration of stiff soils, and disposes them to work more kindly than they would otherwise have done, by overcoming that adhesion, which is the greatest evil that attends this species of land."

The author of the "New Farmer's Calendar," who assures us that he speaks from much actual experience, says, that "the invariable result has shewn its inferiority to every other grain, but superiority over other vegetable food, namely carrots,

carrots, potatoes, and the like. In the state of herbage, cattle, he knows, will eat it; but it is from Flobson's choice, as a hundred trials have convinced him. Its fitness for ploughing into the land is undoubted, on account both of its bulk and succulence. The juice of it, however, is watery, and far enough from nutritious. Hogs, he has found from numerous trials, fatten neither so fast with it, nor is the flesh so firm as that which has been fattened upon corn. He has used it in large quantities ground, with hard-working horses both draught and saddle, but the difference of price by no means compensated for its inferiority to oats and beans; and besides, it did not always agree with them, as he sometimes fancied it had a kind of stupefying effect. In nutriment, however, he confesses, that it is superior to carrots for working-horses. He tried it with a flock of several hundred head of poultry; and it was in the same degree inferior both in the fattening and laying flock. He does not hear that it is very highly prized even in the distillery." In fine, he concludes, that "buck-wheat is valuable upon land that will grow nothing else, and where it is produced with small expence; and that when ready, its best application is to the market." The experience of other practical farmers, however, affords a more favourable opinion of the utility of this grain.

It has been said, the same writer further observes, that this grain being black cannot be discoloured by wet; which is by no means a practical remark, since its discolour consists in the loss of its fine black; beside which, the grain feels cold and damp, to the great injury of the sample. Wet or dry, the only use for the haulm is under foot. To those who expect to get money by buck-wheat, he recommends early sowing, and even to allow it the manure necessary for a following wheat crop; he should think, by such management, five, perhaps ten quarters might be obtained from an acre of good land, which would remain in excellent order for wheat. This necessarily supposes land in no want of late spring-tillage. In this case, should a suspicion be entertained of the crop running too much to haulm, it might, he thinks, be advantageously rowed and hoed.

In the "Rural Economy of Norfolk," Mr. Marshall remarks, that "buck-wheat is propagated as grain, and as a manure; and that, as the main intention of its propagation, whether as a crop or as a melioration of the soil, is the same, namely, the cleansing of foul land, it may be convenient to keep the two objects in nearly the same point of view. With respect to species there is only one; this grain having not yet, he believes, run into any varieties sufficiently striking to have distinguishing names appropriated to them. It is sown almost indiscriminately on all species of soils; he, however, thinks that light poor land has the preference; it is, says he, to this species of soil that buck seems most especially adapted. It likewise succeeds every species of crop; the state of the soil as to foulness and poverty being generally more attended to than either the nature of the soil or the crop it bore last. The soil proceeds upon the state of the land, and the intention jointly; if the soil be tolerably clean, and the buck be intended to be ploughed under as manure, it is sown on one ploughing; but, in general, the ground is broken, as for barley or peas, to forward the fallow, and secure the crop.

The seed-process is the same for both intentions; excepting that, for a crop, the seed is sown first, namely, immediately after barley-feed; and that intended to be ploughed under is sown as soon afterwards as the ground is in a state fit to receive the seed. It is universally sown above-furrow. The quantity of seed, six pecks to two bushels an acre. The growth of buck is so rapid as to outstrip and smother

almost every species of weeds; an excellency peculiar to this crop. The method of ploughing buck under, and the after-management of buck-fallows, are nearly as for wheat. The harvest-process is like that of barley, as is that of its farmery and management; except that the straw being fit for litter only, and the grain being wanted for the fattening of pigs in autumn and the beginning of winter, it is frequently threshed out immediately after harvest, before the live stock are taken into the farm-yard."

Mr. Mosely of Suffolk cultivated this crop after tares, finding it highly advantageous as a preparation for wheat, by preserving the land, after that crop had been removed, from the dissipating effects of the sun till the period of the wheat being sown. This is a combination of crops by which much is effected in the opinion of Mr. Young; "a coat of manure is gained at no expence, the year carried through from Michaelmas to Michaelmas, and three crops put in on three ploughings, viz. tares, buck-wheat, and wheat." It is not, he says, easy to form a more complete system.

It is recommended in the first volume of the Annals of Agriculture, in feeding horses, to try the efficacy of buck wheat mixed with bran, chaff, or grains, either in the whole, or broken in a mill; as a bushel of it, which goes further than two bushels of oats, even with beans, mixed with at least four times as much bran, will be full feed for any horse a week, and much less hay will do. It is also further remarked, that in fattening hogs eight bushels of buck-wheat meal will go as far as twelve bushels of barley-meal. In the feeding of poultry and pigeons it is likewise highly useful and advantageous, as they eat it with great avidity, and thrive well upon it.

BUCOLICA, is used by some for the art of managing, feeding, and breeding cattle.

BUCOLICS, in *Ancient Poetry, Pastorals*; a kind of poems relating to shepherds and their flocks. The word is derived from βύς, and κολόν, *cibus, meat*; hence βυκολεω, *to feed cattle*, and βυκολος, *herdsman*.

Bucolic poetry is the most ancient of all the kinds of poetry; and is supposed to have had its origin in Sicily, amidst the mirth and diversions of the shepherds; and to have been inspired by love and idleness: by degrees, their rural galantries were brought under rules, and became an art. The concerns of the flocks, the beauties of nature, and the pleasures of a country life, were their principal subjects. Moschus, Bion, and Theocritus, were the most agreeable among the ancient bucolic poets.

Fontenelle observes, that Theocritus's style is sometimes a little too bucolic. Some authors attribute the invention of bucolic poetry to a shepherd called *Daphnis*; and others to Bucolius, son of Laomedon: but this appears all fiction. Some ascribe the invention of bucolic poetry to the herdsmen of Laconia, who, not being able to hold the customary feast of virgins in honour of Diana Caryatis, by reason of the war with Xerxes, instituted βυκολιασμοι, or bucolic exercises, in lieu thereof.

Hence also the origin of a sort of poetical champions, called βυκολιζουσαι, by the Latins *luctiones*, who went about the country, contending for the prizes frequently proposed for the conquerors in this kind of combat; of which rank *Daphnis* was the most distinguished. They not only rehearsed their verses, but played on a kind of *flûta*, or pipe, called *syrix*. Scal. Poet. lib. i. cap. 4. Pott. Arch. lib. ii. cap. 20. Hist. Acad. Infer. tom. iii. p. 123, & 131, &c.

Bucolic poetry is by some called *Astralic*, as being supposed to have first commenced among the ancient herdsmen in riding a sort of waggons called *astrabes*. It is usually divided into *monoprosopium*, or monologue, wherein only a single per-

son speaks, and *amabzum*, or dialogue, wherein are several interlocutors.

Bucolics, says Vossius, bear some resemblance to comedy, as they are both pictures and imitations of ordinary life; but with this difference, that comedy represents the manners of the inhabitants of cities; whereas bucolics exhibit rural occupations. Sometimes this kind of poetry has action, and sometimes only narration, and it is sometimes composed of both. The hexameter verse is the most proper for bucolics in the Greek and Latin languages.

Theocritus's IDYLLIA, and Virgil's ECGLOGUES, are the chief of the ancient bucolics now extant. The first modern Latin bucolics are those of Petrarch, about 12 in number, written about the year 1350. Their number multiplied so soon, that a collection of 38 modern bucolic poets in Latin was printed at Basil in 1546. These writers judged this indirect and disguised mode of dialogue, consisting of simple characters which spoke freely and plainly, the most safe and convenient vehicle for abusing the corruptions of the church. The eclogues of Mantuan, which appeared about the year 1400, were the model of Alexander Barclay (see BARCLAY), and became so popular, that Mantuan acquired the estimation of a classic, and was taught in schools. But although Barclay copies Mantuan, the recent and separate publication in England of Virgil's bucolics, by Wynkyn de Worde, might partly suggest the idea of this new kind of poetry. See Wharton's Hist. of Eng. Poetry, vol. ii. p. 256.

BUCORTA, in *Geography*, a river of Italy, which runs into the sea near Pagliapoli, in Calabria Ultra.

BUCQUET, JOHN-BAPTISTE, MICHEL, in *Biography*, was born at Paris, February the 18th, 1746. After passing through the usual school education, in the course of which he had eminently distinguished himself, he was sent by his father to be instructed in jurisprudence; but his disposition leading him to the study of natural philosophy, he soon quitted the law, and applied himself with zeal to acquire a knowledge of anatomy, botany, chemistry, and mineralogy, attending the lectures of the most celebrated masters, and with such assiduity, that he was soon qualified to become a teacher. His first course was on mineralogy and chemistry conjointly. These he treated in a familiar manner; and as he had made himself perfectly acquainted with the subjects of his lecture, and had a peculiar facility in communicating the knowledge he had acquired, he soon became a popular teacher. This procured him the intimacy of the celebrated Lavoisier, with whom he went through a series of experiments, to ascertain the properties of heat; they also analysed a variety of minerals, at that time but little known. To enable his pupils the more easily to profit by his lectures, he published an "Introduction to the Analysis of the Vegetable Kingdom." He also sent to the Royal Academy accounts of various chemical experiments, which were published with their memoirs. He had now acquired so much reputation, that on the death of M. Bourdelin, he was admitted a member of this academy. He had before, viz. in the year 1776, become a member of a society, instituted at Paris, for the improvement of medicine. To this society he sent the account of a process for making opium transparent; for making lapis causticus; and a memoir on the action of volatile alkali in the deliquium, caused by carbonic acid. By these various labours, pursued with ardour and intenseness, he had now, though a young man, so impaired his health, as to render him incapable of performing his duties without having recourse to powerful stimulants, which, while they gave a momentary vigour, still farther sapped his constitution. But as he was married, and had several children, for whom he had made but slender provision, he determined to persevere.

He has been known, his biographer says, to take two pints of æther and an hundred grains of opium in a day. In this way, something similar to that practised by John Brown of Edinburgh, he passed the latter months of his life. His last memoir, read to the academy was on inflammable air, and the means of rendering the hydrogen gas of marshes as pure as that obtained during the solution of metals. He died on the 24th of January, 1780, escaping, by this early and premature dissolution, the keen and bitter pang he must have felt at seeing his friend Lavoisier hurried to the guillotine, an event which took place, to the regret of all lovers of science, a few years after. Gen. Biog.

BUCRETIUS, DANIEL, a physician of eminence of Brussels, was initiated into the knowledge of anatomy and medicine under Spigelius, who, a little before his death, entrusted him with his papers, containing his system of anatomy, with directions to publish them. This office Burecius performed with diligence, supplying such parts as were not completed, partly from his own observations and labour, and partly from the plates of Julius Caperius. Having completed this work, which was published in royal folio, at Padua, in 1626, he went to Paris, and attended for some months the dissections of Riolan. Riolan complaining to him, that Spigelius had introduced into his work many observations, taken from his books, without making any acknowledgement from whence he had received them, Burecius confessed he had done it, to do honour to his master. Sometime after he retired into a monastery, where he died of a dysentery, about the year 1630. Douglas. Bibliog. Anat.

BUCTON, in *Anatomy*, a word used by Severinus, and some others, as a name for that part of the *pudendum muliebre* commonly called the HYMEN.

BUCY LE LONG, in *Geography*, a town of France, in the department of the Aisne, and district of Soissons, 1 league N. E. from it.

BUCZA, a town of Lithuania, in the palatinate of Brzesc, 90 miles E. of Brzesc.

BUD, in *Botany*, in its strict and most usual acceptation, as an English word, denotes the protuberances which appear in the axils of the leaves of trees and shrubs, and sometimes when there is an excess of vegetative power, on the trunks themselves, unaccompanied by a leaf; and which contain the rudiments either of separate leaves and flowers, or of both together, on an elongated receptacle, which gradually shoots out into a young branch. But, as a scientific term, it is convenient to include in it all the means employed by nature for the renewal of plants, without the intervention of fertilized seeds. A bud, taken in this extensive sense, is seated either on the ascending caudex, or on the descending caudex, or on a tuberous radicle. On the ascending caudex, it is either a gem, or a cauline bulb: on the descending caudex, it is either a root bulb or a turio: on the tuberous radicle, it is usually called an eye. See those words.

BUD, in *Vegetable Anatomy*. The transpiration of the leaves, during their exposure to the light and heat, determines the course of the juices of the vegetable powerfully towards their points of attachment. The tubes, which convey the sap, elaborate it; the cambium is gradually formed, and deposited around the base of the leaves: it there gives birth to new tubes, which obeying the impulse communicated to them, elongate towards the bark, and penetrate it. As the spring is the season most favourable to the production of new parts, it is then that we first perceive what is called the *eye* of the *bud*, within the axilla of the leaves, or that angle formed between their base and the branch. In the course of the summer, the eye enlarges,

enlarges, and becomes a bud: it continues to increase during the autumn, and in the winter falls into a state of torpidity; in the ensuing spring, however, it revives, and expands into a *shoot*, or succulent branch, which acquires solidity in the summer, and becomes clothed with leaves or flowers.

The period required for the evolution of the buds is subject to vary: it is sometimes retarded for five years; at other times accidental causes accelerate this process. Thus, if the leaves, which accompany the buds, happen to perish, their development is so much more rapid, that these buds produce branches sustaining leaves and flowers in autumn, which, in the ordinary course of vegetation, would not appear before the ensuing spring. These untimely productions, however, are destroyed by the first frost.

The buds of the same tree are not all developed in the same time, some being more exposed than others to the action of air and light. In general, those situated at the extremity of the branches are the first to unfold themselves.

The position and figure of the buds are peculiar in each genus, and often even serve to characterize the species of plants. A knowledge of these distinctions is found very useful by those who rear trees in nurseries.

Bonnet arranged buds into five orders, according to their position upon the branch. In the first they occur alternately as in the *filler'd tree*. In the second, they arise opposite to each other as on the *ash*. The third mode of arrangement is, when the buds surround the branches in a ring; the example of this which Mr. Bonnet quotes, is the *pomegranate*; but all the young branches of this tree have the buds placed opposite. The fourth position of the buds is, where they form, with respect to each other, quincunxes, and, when taken together, compose a spiral figure, which surrounds the branches in the manner of a cork-screw. This takes place in many *fruit-trees*, but more especially in the *plum-tree*. In the fifth order are those trees which have the leaves surrounding the branches in a double spine, as they appear in the *pine*. The true buds of the pines do not, however, grow in the axillæ of the leaves, but on the extremity of the branches.

In the trees with opposite buds, the extremity of the branches are usually furnished with three buds, the one in the middle being much the largest; and when the buds are placed alternately, the branch is commonly terminated by a single bud.

The direction of the buds is different in different species; sometimes they stand out so much from the branch, that they form with it almost a right angle, as may be seen in the *lilac*; in other instances, as the *cornel tree*, they are closely applied in all their length to the side of the branch. In the *Fernimus Europæus*, the buds at the extremity of the branches are laid close, as those of the *cornel-tree*; whilst those on the other parts of the branch are directed outwards.

There are numerous other peculiarities in the form and appearance of the buds, which, although useful for the gardener to know, it would be tedious to enumerate in this place.

No annual plant can, with propriety, be considered as possessing buds; these parts being intended to survive the winter, and contain the rudiments of the branches and flowers, which are to be developed on the return of the season of vegetation. The true bud ought not, therefore, to be confounded with those small cones found in the axillæ of herbaceous plants, and which are converted into branches in a few days. The lilaceous plants, and other monocotyledons with bulbous roots, do not produce buds in the axilla of their leaves: the bulbs of these vegetables perform all the functions of buds, and have, therefore, very properly

been ranked as such, and called by some writers *subterraneous buds*. Although we acknowledge the similitude of these two parts to each other in the fullest extent, we prefer giving the description of bulbs under their proper name. See *BULB*.

Besides the varieties of buds which serve to distinguish different genera, and sometimes the species of plants, there are other peculiarities which characterize the nature and offices of different buds upon the same tree: some buds being intended to develop the leaves and branches; others to contain only the parts of fructification; and others again give origin to both leaves and flowers. Those of the first kind are called the *leaf-buds*, or *buds with wood*; the second, the *flower* or *fruit-buds*; and the last are termed the *mixed buds*. The cultivators of fruit trees are careful to discriminate the different kinds of buds, as a guide in the various operations of grafting, pruning, &c. The leaf-buds, compared with the others, are slender, long, and pointed; the fruit-buds are thick, short, and round; and those of a mixed nature, have an intermediate form, being neither so pointed as the one, nor so round as the other.

In a great number of trees, the flower buds are situated upon the extremity of the little ramifications, called fruit-branches. See *BRANCHES*. Fig 9. of Plate II. in *Vegetable Anatomy*, represents a fruit-bud of the *pear-tree*, sustained by one of these little branches; *a* the branch; *b* the bud; and on the neighbouring branch upon which this one grows, is seen a wood-bud, indicated by *c*.

In the *peach-tree*, and many others of the same family, the wood and fruit-buds arise together from the same branch: this is shewn by fig. 10. of Plate II. in *Vegetable Anatomy*: *a* is a short portion of a branch of the *peach-tree*, on which are placed three buds; *b, b*, the two external buds contain the flowers &c. the intermediate one is the wood-bud.

When the male and female flowers are situated upon different parts of the same plant, or upon separate individuals, it is proper to distinguish the flower-buds into two kinds; as in many species, the buds, which furnish the catkins, are very unlike those which produce the fruits: thus, in the *walnut-tree*, the fruits owe their origin to the buds placed along the length of the branches, whilst the catkins proceed from other buds so very small that they are hardly perceptible, and which are situated at the side of those which furnish the fruits.

The buds of almost every vegetable which is congenial to a northern climate, are clothed with a number of scales, and a cotton-like substance. The scales are laid upon each other in an imbricated manner, or like the tiles of a house. Those situated most externally are strong, hard, and dry, and generally of a brown colour, but the scales which are covered by others are more pliant, tender, and succulent; and the nearer they approach to the centre of the bud, they acquire more of the herbaceous texture of young leaves; the internal scales are usually of a pale green or white colour. The scales are very generally lined with a downy or cotton-like substance. This becomes dry and coloured upon the external scales; but where it is shielded from the action of the air, it remains soft and white, not unlike the downy surface of satin. The form of each scale is that of a spoon or shallow oval cup, with one extremity more thin and pointed than the other. The surfaces of the scales are usually besmeared with a viscid matter, of a gum resinous nature; this becomes involved in the down, and forms a perfect barrier to the transusion of air or moisture to the internal parts of the bud; and not infrequently the resinous matter is so abundant, that it exudes upon the external surface of the bud, giving it all the appearance of being coated

coated with varnish, as may be observed on the buds of the *horse-chestnut*, the *tacamahaca*, &c.

If those buds, which have their superficies imbued by a resinous substance, be removed from their situation, and if the surface which unites them to the branch be covered with wax, they may be suffered to lie in water for several months, without experiencing any alteration; nay, it is stated by Mirbel, that this experiment has been prolonged for some years, without the least injury to the buds.

On prosecuting the dissection of the bud to its centre, we discover either the rudiments of the future branch, or the parts of the fructification in extreme miniature. In the wood buds, the embryo of the branch consists of some succulent filaments, or imperfectly formed leaves, folded together and supported upon a tender footstalk, very similar to the plumule of the trunk contained in the grain; and in the fruit-buds, the parts composing the flower can be discerned at a very early period, although in a very soft and half organized state.

Both the rudiments of the branch and flower undergo a continual, though secret development, during their existence in the bud; which has been ascertained by dissections of the buds, instituted at different periods of their growth. The little plumule of the branch can be discovered as soon as the bud is fairly formed, and continues gradually to acquire more perfect organization, until it bursts from its nidus in the full season of vegetation. The rudiments of the blossoms of the *pear-tree* are to be seen in the month of January, in a group of eight or ten flowers, attached by filaments to a common peduncle. In the midst of these little flowers there are several minute, thin leaves, of various forms, and of a pale green colour, which Duhamel conceives are designed to perform the same offices, with respect to the embryo flower, that the seminal leaves answer in the seed. The stamina may be observed, at this period, within the flowers, but as yet almost transparent. The petals are hardly discernible, and the pistils cannot be detected. In the month of March the tops of the stamina are red; the petals, although small, may be clearly perceived, and even the pipins may be distinguished; they are white, and each nourished by a particular filament: it is probable, that the pipins, and all the essential parts of the fructification, are coeval with the bud itself, although their softness and transparency prevent their being distinguished: so just was the observation of Grew, that the flowers of the spring were formed in the preceding year.

The structure of the wood and flower buds is exemplified in *Plate II.* in *Vegetable Anatomy.* *Fig. 11.* exhibits the external appearance of the bud of the *horse-chestnut*, which is selected for the sake of its great size. The scales are seen laid over each other, like the tiles of a house; their more pointed extremities being turned upwards, and all their edges in close contact, as the bud appears in winter. At the base of the bud may be seen some projecting rugæ, and immediately beneath these the impressions left from the attachment of the former leaves. *Fig. 12.* shows a longitudinal section of the same bud; *a*, the brown scales which form the external envelopes; *b*, the tender scales situated more internally, and becoming more thin, pliant, and folded, the nearer they are to the centre; *c*, the imperfectly-formed leaves of the young branch compressed together, and involved by the white down or cotton-like substance; *d*, the bark of the branch which sustains the bud; *e*, the ligneous portion of it; *f*, its pith. *Fig. 13.* represents a bud of the *horse-chestnut*, despoiled of its scales in order to bring into view the fetal branch, which has its parts separated a little, and cleaned from the down which envelops them, that they

may be more distinctly observed. The marks appearing beneath the plumule, point out the attachments of the scales, which have been removed.

The fourteenth, fifteenth, sixteenth, and seventeenth figures in *Plate II.* in *Vegetable Anatomy*, are intended to explain the structure of the fruit-bud. *Fig. 14.* is the fruit-bud of the *peach-tree*, divided longitudinally, and considerably magnified; *a, a*, indicate the imbricated scales which compose the external envelope of the bud; *b, b*, refer to the cut edge of the calyx of the flower, which, in the embryo state, forms a complete cell, inclosing the parts of fructification; *c, c*, are the stamina, almost pellucid; *d*, the pistil. *Fig. 15.* exhibits one of the scales abstracted from its situation, and highly magnified; it appears entirely covered by villous processes. *Fig. 16.* shews the flower bud of the *peach-tree*, a little larger than the natural size, as it appears when divested of its scaly coverings; *a*, is the calyx, with its edges applied to each other, so as to form a perfect cyl. *Fig. 17.* is the same calyx drawn a little larger, and with its leaflets separate from each other, and turned back to expose the stamina; and in the pistil within the calyx may also be seen the rudiments of the petals.

The buds of the *pine* differ in many respects from those of other trees. According to Mr. Tschudi, who has described these buds, they are placed always on the extremity of the branches; they are commonly numerous, the bud, which is at the extremity, being succeeded by others much smaller than itself; they are all contained in one membranous sheath, formed of many cylindrical pieces, adjusted the one to the other, and accompanying the development of the bud. When it first appears it is about two fingers in length; it then continues to extend, soon becomes large, and the little leaves, which have been hitherto sealed up, unfold themselves, and the branch comes forth. It is possible to discover, a long time before the buds are matured, those which are to appear upon the extremity of the branch.

It is difficult to decide with certainty what are the parts of the branch from which the buds, in the first instance, are derived. When the bud makes its appearance, it is so imperfectly organized, that it scarcely admits of dissection, or of being distinguished into those parts which it is ultimately to exhibit. Accordingly, we find, that anatomists have held very different opinions upon this subject. Pontedera conceived that the rudiments of the buds were lodged in the wood alone. Duhamel supposed that all the parts of the branch were continued into the bud; the internal part of the bark being prolonged to form the scales, and the bark of the plumule; the ligneous fibres giving rise to those of the embryo branch, and the pith being extended into the interior of the different parts of the bud. On the contrary, Hill and others assert, that the buds are formed exclusively by the parenchyma. The scales of the bud however, appear to be leaves which have never arrived at maturity: this is the opinion of Mirbel, which he illustrates with much ingenuity; he supposes that the leaves, which afterwards appear as the scales of the bud, are rendered abortive, by the abatement in the circulation of the sap, which takes place on the approach of winter; for, if the motion of the sap were to be either totally suspended, or not impeded at all, no scales would form, which is exactly what may be observed in a few trees which inhabit cold countries, and in most plants that are natives of hot climates. If, also, the top of a tree be cut off before the evolution of the buds, those which are afterwards developed are unfurnished with scales.

Around the base of the bud there is always a degree of tumefaction of the branch, which is called a *burr*; this is formed at the eruption of the bud, and enlarges in all directions,

tions, before the scales fall, and the parts contained in the bud are unfolded. The *burr* is supposed to answer two very important purposes; with respect to the bud, the first is to supply the place of the leaves, by collecting a greater portion of the sap around the root of the bud, and thus supporting it during its hibernation, and yielding, during the season of interrupted vegetation, a degree of provisional nourishment to the embryo branch or flower, which is necessary for the secret development they are known to experience. The other use of the *burr* appears to be to separate the scales of the bud from each other previous to the expansion of the shoot; this is accomplished by the enlargement of the *burr* on the return of spring. It is evident, the slightest separation of the scales, at their origin, must cause a considerable one of their unattached edges; without the assistance derived from the growth of the *burr*, it seems quite impossible that the tender plumule of the branch or the embryo flower should ever be able to force asunder the hard and unyielding scales that encase them, more especially in those instances where the scales are agglutinated to each other by the gum-resinous matter.

In some experiments which were undertaken by Senebier upon the buds of the *cherry*, *apple*, and *pear* trees, he found, that by depriving the flower-buds of their scales and little leaves, he did not interrupt the evolution of the flower, nor prevent their going on to produce fruits. Senebier accounts for the flowers surviving the privation of their scales, by supposing that the *burr* in some degree might supply their place.

The most extraordinary circumstances in the history of buds, are the conversion of flower-buds into wood-buds, and that of wood-buds into flower-buds. The former is related as being effected by Mariotte in this manner: he deprived, in the latter part of the month of August, a rose-tree of its branches and all its leaves, and suffered to remain only the buds, which ought to produce flowers the ensuing spring; these buds continued to grow, but when the period of their development arrived, instead of furnishing flowers they put forth leaves and branches.

The conversion of the wood-buds into those bearing fruit is accomplished by a variety of means, practised by common gardeners. Thus, if the upper part of a branch be cut away, the buds near the extremity of the remaining stem, from acquiring a greater proportional supply of nutriment, will produce leaves and wood, which might otherwise have been flowering-buds; and, on the contrary, if a vigorous branch of a wall-tree, which was expected to bear only leaf-buds, be bent down to the horizon, or lower, it will bear flower-buds, with weaker leaf-buds. On this circumstance chiefly depends the management of wall-fruit trees, and of espaliers. For the purpose of converting leaf-buds into flower-buds it has been also recommended to bind some of the most vigorous shoots with strong wire, and even some of the large roots. Some gardeners score the bark in a spiral direction, or cut off an entire cylinder of the bark, three or four inches long, and replace it with a proper bandage.

The bud appears to fulfil nearly the same purposes in the vegetable economy as the seed. It contains the embryo of the branch or of the flower, and shields it from the operation of the air, the light, and moisture, and the vicissitudes of temperature, until it is enabled to withstand these influences by a full exercise of the functions of vegetable life. By this means the internal parts of the bud are capable of gradually, though invisibly, developing themselves, like the plantule of the seed, independently of the vegetable from which they have drawn their existence. The bud also, like the grain, admits of removal from its original connexions; of having its actions suspended for an indefinite period, and afterwards of having

them renewed at pleasure; of deriving, by transplantation or engrafting, its sustenance from different sources; and, lastly, on being laid in the earth, of producing an interior plant in a similar manner as the seed, when placed in the same circumstances. As the seeds are the oviparous progeny of vegetables, the buds may be considered as the viviparous offspring. They appear to differ chiefly in this circumstance, that the seeds always result from a sexual congress, and partake of the properties of both parents; whereas the buds proceed directly from one parent, to which their productions afterwards bear a perfect resemblance.

BUD is used, in *Country Language*, for a weaned calf of the first year; so called, because the horns are then in the bud.

BUDA, in *Geography*, called by the Germans *Ofen*, the ancient metropolis of Hungary, is seated on an eminence on the west side of the Danube, and is connected with Pesth, situate on the opposite side of the river, by a bridge of boats about  $\frac{3}{4}$ ths of a mile in length, and consisting of 63 large pontoons. The old city is seated on a plain extending itself from the suburbs of New Buda to the space that lies between the Pilis mountains and the Danube, and was formerly called "Sicambria." But this is now a wretched place, and affords nothing remarkable besides the ruins of an old aqueduct, built either by the Romans or Hungarians. A wide subterraneous passage has been discovered, with which the Turks seem to have been well acquainted, and which leads from this place to the citadel of Buda. New Buda is a royal free town. It was formerly the capital of the kingdom; and, in its connection with Pesth, the largest and finest of all the Hungarian towns, and the residence of the kings. The houses are mostly constructed of square stone; but since the Turks took possession of it, they suffered the finest buildings to sink into decay. The lower part of the city, called the "Jews town," extends like suburbs from the upper city to the Danube. The higher town occupies the declivity of a mountain, and is fortified with walls and towers. The castle, seated on an eminence towards the east side, commands the greatest part of it, is encompassed by a deep moat, and is defended by an old-fashioned tower, to which some new fortifications have been added. One suburb is enclosed with hedges. The most sumptuous of its present structures are the caravanferas, mosques, bridges, and baths. The chief public and private buildings are in Pesth, and within the fortress; the royal palace in particular is a large and stately edifice. The form of Pesth is quadrangular; and it has, besides the royal palace, a military hospital, with several churches and convents. At a little distance from it is a field, in which many diets have been held, and where the states of Hungary formerly met on horseback, and in arms, to elect their king. Among the decayed buildings of Buda, the church of the Ascension of the Virgin Mary is the principal, near which the Jesuits have an academical college and seminary. The Carmelite nuns have a convent, and the Franciscans have churches. Both Catholics and Calvinists are allowed the free exercise of their religion; and the Jews have a synagogue near the castle garden. But the most famous edifices of Buda are its baths; of which there are two forts, the upper or Trinity baths, and those of Mustapha, who was governor of the place, and built them with stone, covering them with lead. Some of these waters are of such moderate temperature, that they may be used in their natural state either for drinking or bathing; but others are so hot, that they must be mixed with cold water, or conveyed to cool in other baths, before they can be used. The adjacent country is fertile, though not well cultivated; and affords good red wine and excellent melons.

This city was the residence of the Hungarian monarchs, till it was taken by the Turks, under the sultan Solymán, in 1526; but though they were dispossessed of it the next year by Ferdinand, archduke of Austria, they recovered it again in 1529. Although it was afterwards frequently besieged, it continued under the dominion of the Turks till the year 1686, when it was besieged and taken, after an obstinate resistance and great slaughter, by the duke of Lorraine. From this time it has remained under the dominion of the house of Austria. In 1784, the seat of the provincial government, and the public offices, were restored from Presburg to Buda; and, therefore, this city, joined with Pesth, may still be regarded as the capital of Hungary. The population of Buda is estimated at 20,000; but if Pesth be included, it may be computed at 34,000. Dr. Townson, (*Travels in Hungary*, 4to. 1796.) states it at 38,000. The university of Buda, as we are informed by this traveller, possesses an income of about 20,000l. sterling, of which only 4,000l. are applied towards paying the salaries of the professors. Besides the usual chairs which exist in every university, there are those of natural history, botany, and economy. The instruments for natural philosophy, and the models of machines are good; and the museum of natural history, which contains the collection of the late professor Piller, besides that of the university, may be ranked among the fine collections of Europe. Buda is distant 125 miles E.S.E. from Vienna, and 15° N.N.W. from Belgrade. N. lat. 47° 30'. E. long. 19° 10'.

BUDA, a town of Lithuania, in the palatinate of Wilna; 80 miles E. of Wilna.

BUDEUS, WILLIAM, in *Biography*, one of the most learned men of the 15th century, and a descendant of an ancient and honourable family, was born at Paris, in 1467; and having passed through the grammar schools at Paris, and having spent three years at Orleans, in the study of the law, to little or no purpose, he conceived a disgust at the prevalent barbarism of literature, and devoted himself wholly to youthful pleasures. At length, however, he was seized with an ardent passion for literary pursuits, which induced him to abandon every amusement, and to dedicate his whole time and attention to study, so that he scarcely allowed himself the necessary intervals for his meals and rest. By means of unreweared assiduity, first without any assistance, whence he called himself *αυτομαθής*, and *αμαθής*, i. e. *self-taught*, and *late-taught*, and afterwards with the advantage of instructions from Hermonymus, whom he retained at a large salary, and from Lascaris in Greek, and James de Fevre in mathematics, he acquired singular reputation as a scholar, and particularly for an acquaintance with the Latin and Greek languages. He had reason, however, to regret that want of early practice, which is adapted to form ease and elegance of language; and hence his style, both in French and Latin, though strong and lofty, was harsh and perplexed. His first literary performances were translations of some treatises of Plutarch; and, in 1508, he published "Notes on the Pandecks." But his principal reputation among the learned was owing to his treatise "De Aste," which contributed in a very eminent degree to facilitate the study of the ancient coins, weights, and measures. The fame which he thus established excited envy among his contemporaries; and Erasmus, though he acknowledged his merit, became jealous of him, so that a disagreement took place between these two distinguished persons, which prevented Budæus's citing Erasmus in his works. By avoiding the topics which might occasion a suspicion of his faith, he precluded those objections to the revival of learning, to which the interested and the ignorant were at that time disposed to recur. Upon

his first introduction to the French court, he was employed by Lewis XII. in two embassies to Italy, and appointed the king's secretary; and in the reign of Francis I., who distinguished himself by his patronage of learned persons, he obtained the place of master of requests, together with the office of librarian and secretary to the king; and was deputed on an embassy to Leo X. He was also chosen provost of the merchants of Paris. At his suggestion, in concurrence with that of Du Bellay, Francis founded the Royal College, for giving instruction in the languages and sciences. During his progress with the king in Normandy, in 1540, he was seized with a fever, and this terminated in his death, after his return to Paris, in the 73d year of his age. His funeral was performed, in conformity to his express orders, privately, and by night; and this circumstance gave his enemies occasion to charge him with having adopted the sentiments of the reformers, though he had explicitly, and even acrimoniously, condemned them in some of his publications. He had also occasionally declaimed with vehemence against the court of Rome, and the corruptions of the clergy. The suspicion, however, was confirmed by the removal of his widow to Geneva, where she, and two of his sons, avowed themselves protestants. Of his character it is said, that it was fair and honourable; though Bayle observes concerning him, that he was more feared than beloved in the republic of letters; and that in his disputes with Erasmus he was the least moderate of the two. His works were collected and printed at Basil, in 1557, in 4 vols. fol. Besides the treatises already mentioned, he wrote "Commentaries on the Greek and Latin Languages;" and a "Treatise on the Instruction of a Prince," dedicated to Francis I. Gen. Dict.

BUDARIN, in *Geography*, a town of Russian Tartary, in the government of Caucasus, on the west side of the Ural; 36 miles S.S.W. of Uralik.

BUDAWUN, a town of Hindostan, in the country of Malwa; 240 miles S. of Delhi, and 132 N. E. of Ougein.

BUDAYEON, a town of Hindostan, in the country of Oude; 24 miles S.W. of Bereilly, and 70 N. E. of Agra.

BUDDÆUS, JOHN-FRANCIS, in *Biography*, a learned and diligent professor and writer, was born at Anclam, in Pomerania, in 1667; and after having acquired a large fund of learning in the languages, as well as in philosophy and divinity, he first gave private lectures at Jena, and in 1692, was appointed professor of Greek and Latin at Coburg. From thence, he was removed by the invitation of Frederic, elector of Brandenburg, to the chair of moral and political professor in his newly founded university of Halle. After continuing in this station 12 years, he re-assumed the professorship of theology at Jena, where he died, in 1729. Besides the diligent discharge of his professional duties, he maintained an extensive correspondence, and wrote many works. Of these the principal are, "Elementa Philosophiæ practicæ, instrumentalis et theoreticæ," 3 vols. 8vo., which served for a long time as a text-book in the Protestant German Universities: "A System of Theology," 2 vols. 4to. much esteemed by the Lutherans: "The great German Historical Dictionary," 2 vols. fol.; "A Treatise on Atheism and Superstition," 8vo., translated into French; and "Miscellanea Sacra," 3 vols. 4to. Nouv. Dict. Hist.

BUDEKANO, in *Geography*, a town of Hindostan, in the country of Agimere, seated on the river Pudder; 87 miles W. of Oudipour, and 100 N. of Amedabad. N. lat. 24° 30'. E. long. 72° 50'.

BUDDENBORG, a town of Germany, in the circle of Westphalia, and county of Marek; 2 miles N. W. of Lünen.

BUDESDALE. See BOTESDALE.

**BUDDING**, in *Gardening*, is a method of propagation, practis'd for various sorts of trees, but particularly those of the fruit kinds. It is the only method which can be had recourse to with certainty, for continuing and multiplying the approved varieties of many sorts of fruit and other trees; as although their seeds readily grow, and become trees, not one out of a hundred, so rais'd, produces any thing like the original; and but very few that are good. But trees or stocks rais'd in this manner, or being budded with the proper sorts, the buds produce invariably the same kind of tree, fruit, flower, &c. continuing unalterably the same afterwards.

This mode of propagation is particularly useful for peaches, nectarines, and apricots, which succeed better by budding than grafting; and are usually worked upon plum stocks, rais'd from seed, and sometimes, from those rais'd from suckers, layers, and cuttings. These sorts of trees are often likewise budded upon stocks rais'd from the kernels of these kinds of fruit; they are, however, more strong and durable, in general, when grafted upon plum stocks. Plum and cherry trees are also often propagated by budding, as well as grafting; the second sort is, however, generally the most prosperous by the latter method, as being more apt to gum and go off by budding. These different trees being of the same genus, grow upon stocks of each other, but much the best upon their own stocks, as plum upon plum, and cherry upon cherry stocks.

Apples and pears may likewise be propagated by the budding method, as well as by grafting; but as they grow freely by grafting, which is the most easy and expeditious, they are more commonly increased in that method. In short, most kinds of fruit trees, as well as others, that are capable of being propagated by grafting, also succeed by budding; grafting is, however, more adapted to some sorts, and budding to others. Various sorts of forest and flowering trees, deciduous as well as evergreen, may likewise be propagated by budding, which is a certain method to continue particular varieties, such as many of the variegated leaved kinds, as the variegated hollies, and many other sorts. The budding in almost all sorts, is performed on young trees rais'd from seed, suckers, layers, &c. which, when rais'd purposely for budding and grafting upon, are called stocks, and which, after becoming about half an inch thick in the bottoms of the stems, or a little more or less, according to circumstances, are of a proper size for the purpose, though it may be performed upon stocks from the size of a goose quill to an inch or more, being mostly done upon stocks or trees of the same genus.

The stocks for this use, are commonly, as has been observed, rais'd from seed, as the kernels or stones of these different sorts of fruit, &c. sown in autumn or spring in beds in the nursery an inch or two deep, which, when a year or two old, should be transplanted into nursery rows, two feet asunder, and fifteen or eighteen inches distant in the rows, to stand for budding upon, keeping them to one stem, and suffering their tops to run up entire; when of two or three years growth, or about the size of the little finger at bottom, or a little more, they are as has been seen of due size for budding upon. Stocks rais'd from suckers arising from the roots of the trees of these different sorts, layers, and cuttings of them, are also made use of; but they are not so good for the purpose. Budding may likewise be performed occasionally upon trees that already bear fruit, when intended to change the sorts, or have different sorts on the same tree, or to renew any particular branch of a tree; the operation being performed on the young shoots of the year, or of one or two years' growth only.

The most proper season for performing the operation of budding, is from about the middle of June, until the middle or latter end of August; some, however, begin to bud in June, but the buds inserted so early are apt to shoot in the same year, and these not having time to harden, are liable to be killed in winter. The buds for this use should in general be taken only from the young shoots of the year, as those of the same summer's growth, which must be cut from the trees of the sorts intended to be propagated, always choosing them from healthy thriving trees; and if fruit trees, from such as bear the finest fruit of their respective kinds and varieties. A quantity of the best moderately strong young shoots should be cut each day as they are wanted; and as they are gathered, the leaves cut off, but not quite close, reserving about a quarter of an inch of their foot-stalks, trimming off also the soft unripened top end of each cutting, covering them from the sun and air, and taking them out as wanted. As each cutting furnishes many buds, they are to be cut off about an inch and a half long, one at a time, as they are inserted in the stocks. Those in the middle part of the cutting are preferable to those towards each end, though in cases of scarcity of cuttings, every one of them may be used. One bud only is in general inserted in each stock; some, however, place two on each side opposite each other.

The most proper height to bud stocks varies according to the intention, but from about three or four inches to six feet or more from the ground is practis'd. To have dwarf trees for walls and espaliers, &c. they must be budded from within about three to six inches from the bottom, that they may first furnish branches near the ground: for half standards, at the height of three or four feet; and for full standards, at from about five to six or seven feet high; the stocks being trained accordingly.

The necessary implements and materials for this purpose, are a small budding knife for preparing the stocks and buds for insertion, having a flat thin haft to open the bark of the stocks in order to admit the buds; and a quantity of new bafs strings well moistened, to tie them with.

In performing the operation of budding, the head of the stock is not to be cut off, as in grafting, but the bud inserted into the side, the head remaining entire till the spring afterwards, and then cut off. A smooth part on the side of the stocks at the proper height, rather on the north side, away from the sun, should be chosen; and then with the knife, an horizontal cut made across the rind, and from the middle of that cut, a slit downwards about two inches in length, in the form of the letter T, being careful lest the bud be wounded. Then having cut off the leaf from the bud, leaving the foot-stalk remaining, make a cross cut about half an inch below the eye, and with the knife slit off the bud with part of the wood to it, somewhat in the form of an escutcheon, pulling off that part of the wood which was taken with the bud, being careful, that the eye of the bud be left with it, as all those buds which lose their eyes in stripping, should be thrown away as good for nothing: then having gently rais'd the bark of the stock where the cross incision was made with the flat haft of the knife clear to the wood, thrust the bud in, placing it smoothly between the rind and the wood of the stock, cutting off any part of the rind belonging to the bud, which may be too long for the slit; and after having exactly fitted the bud to the stock, tie them closely round with bafs string, beginning at the under part of the slit, and proceed to the top, taking care not to bind round the eye of the bud, which should be left open, and at liberty. When the buds have been inserted about three weeks or a month, examine which of them have

taken; those which appear shrivelled and black being dead, but such as remain fresh and plump are joined; and at this time, loosen the bandage, which, if not done in time, is apt to pinch the stock, and greatly injure, if not destroy the bud. The March following, cut off the stock about three inches above the bud, sloping it that the wet may pass off, and not enter into the stock. To the part of the stock which is left, some fasten the shoot which proceeds from the bud, to prevent the danger of its being blown out, but this must continue no longer than one year; after which, it must be cut off close above the bud, that the stock may be covered by it. Some advise it to be cut close at first, which is probably the best practice.

But though it is the ordinary practice to divest the bud of that part of the wood which was taken from the shoot with it, yet in many sorts of tender trees, it is better to preserve a little wood to the buds, without which they often miscarry. The not observing this, has occasioned some to imagine, that some sorts of trees are not to be propagated by budding, which, if performed in this method, might have succeeded. Where this has been done, the whole effort of the stocks being directed to the inserted buds, they soon push forth strongly, one shoot from each; many shoots also arise from the stocks, but these must be constantly rubbed off as often as they appear, that all the power of the stocks may be collected for the vigorous growth of the bud shoots, which now commence trees; and which, by the end of the summer, will, in some sorts, be advanced three or four feet in height. In the autumn or spring following, the young trees may be transplanted into the places where they are to remain, or remain longer in the nursery, according to the purpose for which they are designed. In trees that are designed for fruit on walls, espaliers, or as dwarfs, the first shoots from the buds should, in the spring after they are produced, be headed down to four or five eyes to force out some shoots near the bottom; but if designed for half or full standards, and budded at proper heights, the first shoots of the buds may either be shortened as above, to four or five eyes to provide lateral branches near the top of the stem, to form a spreading head, or be suffered to grow up in height, and branch out in their natural way, by which they will form more erect heads of loftier growth. Such full or half standards as are designed for walls, and were budded high on the stocks, must also necessarily have the first shoots headed down in the spring following, to force out lateral shoots to furnish the allotted space of walling; and on the other hand, where trees are designed for any sort of standards, and budded low on the stocks, the first shoots of the buds should be trained up for stems to a proper height before they are stopped, and then topped to throw out shoots to form heads of the desired heights. See INOCULATION.

BUDDLE, in *Mineralogy*, a name given by the English dressers of the ores of metals, to a sort of frame made to receive the ore after its first separation from its grossest foulness.

The ore is first beaten to powder in wooden troughs, through which there runs a continual stream of water, which carries away such of it as is fine enough to pass a grating, which is placed at one end of the trough; this falls into a long square receiver of wood, called the *launder*: the heaviest and purest of the ore falling at the head of the launder, is taken out separately, and requires little more care or trouble; but the other part, which spreads over the middle and lower end of the launder, is thrown into the buddle, which is a long square frame of boards, about four feet deep, six long, and three wide; in this there stands a man bare-footed, with a trampling shovel in his hand, to cast up the

ore about an inch thick, upon a square board placed before him as high as his middle; this is termed the *buddle-head*: and the man dexterously, with one edge of his shovel, cuts and divides it longwise, in respect of himself, about half an inch asunder, in these little cuts; the water coming gently from the edge of an upper plain board, carries away the filth and lighter part of the prepared ore first, and then the metalline part immediately after; all falling down in the buddle, where, with his bare feet, he strokes it and smoothes it, that the water and other heterogeneous matter may the sooner pass off from it.

When the buddle by this means becomes full, the ore is taken out; that at the head part, being the finest and purest, is taken out separate from the rest, as from the launder. The rest is again trampled in the same buddle; but the head, or, as it is called, the forehead, of this buddle, and of the launder, are mixed together, and carried to another buddle, and trampled as at first. The foreheads of this last buddle, that is, that part of the ore which has fallen at the head, is carried to what they call a drawing buddle, whose difference from the rest is only this, that it has no tye, but only a plain sloping board, on which it is once more washed with the trampling shovel. Tin-ore, when it is taken from this, is called black tin, and this is found to be completely ready for the blowing-house. Phil. Trans. N<sup>o</sup> 69. See *Dressing of ORE*.

BUDDLEA, in *Botany* (in honour of Adam Buddle, an eminent English botanist at the latter end of the 17th century, whose Herbarium is now deposited in the British Museum) Lin. gen. 140. Reich. 146. Schreb. 184. Willd. 220. Gært. 275. Juss. 118. La Marck. Illuf. 182. Class and order, *tetrandria monogynia*.

Nat. ord. *Scrophulariæ* Juss. *Personæ* Vent.

Gen. char. *Cal.* Perianth very small, four-cleft, acute, erect, permanent. *Cor.* one-petalled, bell or funnel-shaped, four-cleft, erect, longer than the calyx, segments ovate or obtuse. *Stam.* Filaments four, very short, inserted below the divisions of the corolla: anthers very short, simple. *Pist.* Germ superior, ovate: stigma obtuse or bifid. *Caps.* ovate, two-furrowed, two-celled, two-valved (each finally dividing into two, Juss. partition double, parallel to the valves, Gært.)

Essen. char. *Cal.* four-cleft. *Cor.* four-cleft. *Stam.* from the divisions. *Caps.* two-celled, two-furrowed, many-seeded.

Species 1. *B. americana*. Linn. Brown. Jam. 144. Sloan. Jam. 139. Hist. 2. p. 29. T. 173. f. 1. "Leaves ovate, serrated; spikes panicled, terminal." La Marck. A shrub, nine or ten feet high. *Branches* tomentose. *Leaves* opposite, acute, narrowing at their base into the petiole, green above, whitish beneath. *Flowers* yellow, small, bell-shaped, sessile on the common peduncles. Lam. A native of the West Indies, sent to Sir Hans Sloane from Jamaica by Dr. Houftoun in 1730. 2. *B. occidentalis*. Linn. Pluk. t. 210. f. 1. is referred to by Linnæus, but La Marck thinks that that figure does not express any species of this genus. Gært. t. 47. f. 7. Lam. Illuf. Pl. 69. f. 1. "Leaves lanceolate, acuminate, slightly serrated; spikes interrupted, somewhat panicled." Lam. It differs from the preceding in having longer, narrower, and less serrated leaves, white flowers, and interrupted spikes. Lam. Swartz doubts whether it be more than a variety. Miller, in addition to the distinctions mentioned by La Marck, says that it has long, narrow, spear-shaped leaves between the spikes; whereas those of the former species are naked. Sent to Mr. Miller from Carthagena by Dr. Houftoun. 3. *B. betonicæ-folia* Lam. Illuf. "Leaves ovate-oblong, slightly scolloped,

much wrinkled; spikes interrupted, panicled." Leaves petioled, obtuse. J. f. Just. Native of South America. 4. *B. thyrifera*. Linn. Hort. "Leaves lanceolate-linear, serrated, ferrugineous beneath, terminal." Leaves erect, tomentose beneath. Commerson. Native of Monte Video. 5. *B. virgata*. Linn. Jun. Supp. Thunb. Prod. 30. "Leaves linear-oblong, obtuse, entire, or obscurely toothed; branches slender, erect; racemes terminal. Habit of Hyffop. Branches and leaves hoary, with a fine down. Linn. Jun. *L. urtica* like those of lavender; the upper ones growing gradually smaller. Lam. Found by Thunberg at the Cape of Good Hope. 6. *B. falcifolia*. Lam. Hort. "Leaves oblong-lanceolate, a little toothed, petioled, white, with down beneath; spikes slender, terminal." Native of India, specific character formed from a specimen without flowers in the Herbarium of Jussieu. It is probably the same as the *B. falcifolia* of Willdenow taken up from Vahl with the following specific character. "Leaves lanceolate, serrated outwards, tomentose beneath; racemes terminal; pedicels many-flowered; flowers nodding." 7. *B. volubilis*. Linn. W. "Leaves linear, acute, very entire; stem twining; cymes axillary, downy-ferruginous." Found by Commerson in the Isle of Bourbon. 8. *B. globosa*. Hort. Kew. V. 1. p. 170. Lam. Willd. (*B. capitata*, Jac. ic. rar. 2. p. 332. Palquin. Feuille. peruv. 2. p. 71. tab. 38.) "Leaves lanceolate, sharp-pointed, scolloped, downy beneath; heads globose." Lam. A branched, ever-green shrub, from eight to ten feet high. Leaves about five inches long, finely scolloped at their edges, narrowed at the base, opposite, connate, reticulated with veins like those of the common sage. Flowers small, bell-shaped, yellow, of a pleasing smell, on a common globular receptacle. Heads of flowers peduncled, axillary and terminal. A native of Chili, introduced into England by Mess. Kennedy and Lee in 1774. 9. *B. madagascariensis*, La Marck, tab. 69. fig. 3. Willd. "Leaves lanceolate, entire, petioled, tomentose beneath; flowers in terminal racemes." Leaves opposite, entire. Racemes compound. Flowers several together, on common peduncles, which gradually diminish in length, till the flowers become sessile near the top of the raceme. Calyx short. Corolla funnel-shaped. A native of Madagascar, found by Sonnerat, and described by Lamarek from a dried specimen in the Herbarium of Commerson. 10. *B. falsifolia*. Hort. Kew. Lam. Willd. (*Lantana falsifolia*, Linn.) "Leaves ovate-lanceolate, scolloped, wrinkled, nearly sessile; racemes compound." La Marck. A shrub five or six feet high. Branches tomentose, four-cornered. Leaves opposite, sometimes ternate, sharp-pointed, wrinkled and reticulated like those of sage, a little tomentose. Stipules sub-ovate, in pairs. Racemes terminal, and axillary on the upper part of the branches. Flowers in small, tomentose, opposite, peduncled fascicles or corymbs, with bractes at their base, and at the base of the common peduncles. Calyx very short. Corolla tubular, slender, pale purple, covered with a mealy down, tube three times longer than the calyx; border with very short divisions. A native of the Cape of Good Hope; cultivated by Mr. Miller in 1760. The fruit was unknown to Linnæus; and does not appear to have been seen by any succeeding botanist, not having been brought to perfection in any of the English or French gardens. La Marck was induced to place it in this genus by the similarity of its flowers to those of *B. madagascariensis*. 11. *B. diversifolia*. Willd. (*B. indica*, Lam.) "Leaves ovate, entire, petioled; corymbs axillary, very short, clothed with a ferruginous down." A shrub. Leaves opposite, on short petioles, a little tomentose, and ferruginous on their lower surface. Flowers from six to nine; in small, opposite corymbs, shorter than the leaves. Calyx tomentose, very short, and

almost truncate. Corolla tubular, tomentose on the outside, slender. Style the length of the corolla. Fruit unknown. A native of Java, communicated by M. Sonnerat, and described by La Marck from a dried specimen. 12. *B. incompta*. Linn. jun. Supplement. Willd. La Marck Dict. but omitted in the subsequent illustrations. "Leaves fasciculated, ovate, hoary; branches zig-zag, stiff; racemes terminal." Found by Thunberg at the Cape of Good Hope. 13. *B. asiatica*. Martyn's Miller. Lour. Coch. "Leaves lanceolate-linear, wrinkled, smooth, spikes full." Stem suffruticose, three feet high, with ascending branches. Leaves long, not interrupted. Calyx with awl-shaped, upright segments. Corolla with rounded divisions. Style equal to the filaments. Stigma longish, bifid. Native of Cochin-china. 14. *B. ternata*. Martyn's Miller. Lour. Coch. "Leaves ternate, acuminate; peduncles one-flowered." Stem suffruticose, two feet high, upright, round, branched. Leaflets lanceolate, serrated. Flower white, axillary. Segments of the calyx converging. Nectary hairy. Stigma bifid. Native of Cochin-china.

*Propagation and culture.* The americana, occidentalis, globosa, and falsifolia, are the only species which have hitherto been cultivated in Europe. The americana and occidentalis must be raised from seed sent in their capsules from their native country, which should be sowed in small pots, and very lightly covered with rich, light earth. The pots should be plunged into a moderate hot-bed, and gently watered every third or fourth day. If the seeds are fresh and good, and sown in the spring, the plants will come up in about six weeks, and may generally be transplanted in about two months after. They should then be planted separately in similar pots and earth, shaded from the sun, and occasionally watered. After they have taken root, they should have fresh air every day, according to the warmth of the season, and be moderately supplied with water. About the middle of August it will be proper to shift them into larger pots, and to turn over the tan in the bed, that the heat may be renewed. In the autumn they must be removed into the stove, where they must constantly remain plunged in the tan-bed. In the winter they should have little water, and must be kept warm; but in summer they should have fresh air, and be frequently sprinkled all over with water. They will flower about the fourth year from the seeds.

The globosa and falsifolia may be propagated by cuttings on an old hot-bed in July, covered with a bell-glass, and shaded from the sun. In a month they may be planted in pots; and when they have taken fresh root, should be removed to a sheltered situation till the winter, when they must be preferred in the conservatory, or dry stove. The globosa will flower well, and live through a mild winter out of doors in a warm sheltered border.

**BUDDLING** of *calamine*, denotes the operation of cleansing it from filth, by washing and picking it, preparatory to the baking it in the oven. Phil. Trans. N<sup>o</sup> 198. p. 675. See **CALAMINE**.

**BUDDLING-dish**, a small, shallow vessel, like the basons of a pair of scales, for the washing of ores of metals by the hand.

**BUDDRA**, in *Geography*, a river of the peninsula of India, which rises in the Mysore country, and joining the Toom near the county of Hooley-Onore forms the Toombuddra river.

**BUDDRINANT**, or **BADRENAUT**, a town of Thibet, on the east side of the river Alikmundra, or Alukmundra. N. lat. 32°. E. long. 80° 20'.

**BUDDS VALLEY**, a place in the county of Morris, and state of New Jersey, in America, situated on the head waters of Rariton.

**BUDE** river and haven, lie on the north coast of Cornwall, about S.S.W. and S.½W. from Hartland point, on the coast of Devon.

**BUDEA**, or **BUDACUM**, in *Ancient Geography*, a town of Magnesia. Also, a town of Asia Minor in Phrygia. Steph. Byz. *Budca* was one of the appellations given to Minerva.

**BUDEL** (*Ridinger*), in *Zoology*, the water-dog: (*CANIS*) variety *aquatilis*.

**BUDELICH**, in *Geography*, a town of Germany, in the circle of the Lower Rhine, and electorate of Treves; or by the French arrangement, in the department of the Sarre, and chief place of a canton, in the district of Treves; 11 miles E. of Treves; the town contains 195, and the canton 6560 inhabitants; and the territory comprehends 24 communes. N. lat. 49° 52'. E. long. 6° 55'.

**BUDERICH**. See **BURICH**.

**BUDESHEIM**, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz; one mile E. of Bingen.

**BUDETIN**, a town of Hungary; 16 miles E. N. E. of Bolefko.

**BUDGE**, in *Law*. See **BOUCHE** of court.

**BUDGE-barrels**, are small barrels well hooped, with only one head, the other end having nailed on a piece of leather, to draw together upon strings, like a purse.

Budge-barrels are used for carrying powder along with a gun or mortar; as being less dangerous, and also easier than whole barrels. They are also used upon batteries of mortars, for holding meal-powder.

**BUDGE**, **EUSTACE**, in *Biography*, the relation and friend of Addison, and an ingenious writer, was the son of Gilbert Budge, D. D. of St. Thomas near Exeter, and was born about the year 1685. He was educated as a gentleman commoner at Christchurch College, Oxford, and afterwards entered at the Inner Temple, London, with a view to the profession of the law. But an inclination to pleasure, and also to polite literature, diverted his attention from studies appropriate to the bar; and in 1710, he accompanied Addison to Ireland, as one of his clerks. By associating with persons of taste and fashion, and cultivating an acquaintance with the best writers, ancient and modern, he acquired the accomplishments of the gentleman and scholar. But though he was distinguished by a lively imagination, tenacious memory, genteel address, and graceful elocution, his consummate vanity depreciated his other talents, and became a prominent feature of his character through life. His first exhibition as an author was in the *Spectator*; and the papers marked X in the first seven volumes are attributed to him. The eighth volume is said to have been wholly conducted by Addison and Budge. Dr. Johnson, however, says that his papers were either written by Addison, or so much improved by him, as to be rendered in a manner his own; and, it is observed, that their style resembles that of Addison. The humorous and admired epilogue to the *Distressed Mother*, usually ascribed to Budge, is also said to have been the composition of Addison. About this time, Budge wrote several epigrams and songs, which together with Addison's sincere attachment to him, recommended him to general notice and esteem. But, notwithstanding his literary connections and engagements, and his accession to a family estate, encumbered indeed with debts, of 950*l.* a year, he was unremitting in his attention to the duties of his office. In the preface to the *Guardian*, he is represented as having a concern in that work, in connection with Addison and Sir Richard Steele; but his papers are not now discriminated. In 1714, he published a translation from the Greek, of "The Characters of Theophrastus,"

which was commended by Addison, and which appears to have been executed with ingenuity and elegance. In this year, he was advanced to the offices of under secretary to the lord lieutenant, chief secretary to the lords justices of Ireland, and deputy clerk of the council in that kingdom. To these was added the honour of a seat in the Irish parliament, where he distinguished himself as a speaker. When the rebellion broke out in 1715, he was entrusted with the charge of transporting troops to Scotland, which he executed in a manner equally able and disinterested. In the beginning of the year 1717, when Addison became secretary of state, he was promoted, under his patronage, to the office of accountant and comptroller general of Ireland. But this tide of prosperity took an unfavourable turn soon after this latter appointment, when the duke of Bolton was appointed to the vice-royalty. When the duke's secretary insisted on quartering upon him a friend, his indignation was roused; and he attacked both the secretary and the lord lieutenant in a virulent lampoon, which he published against the advice and remonstrance of Addison, and which caused him to be deprived of his place as accountant. Upon his return to England, he determined, in opposition to the counsel of his best friends, to publish his case, and, by this second act of indiscretion, he increased the resentment of his enemies. By a popular pamphlet written in 1719 against the famous peerage bill, he incensed the earl of Sunderland; and, at this time, the death of Addison, his steady friend and faithful counsellor, terminated all his expectations from the court. His circumstances, however, were easy and affluent, and he might have lived with dignity and independence. But deluded by the insatiation of the fatal year 1720, he embarked in the South Sea scheme, and lost 20,000*l.* Having taken an active part in the concerns and debates of the company, and published pamphlets on the occasion, that were well received, he attracted the notice of the duke of Portland, who had been a sufferer in this bubble as well as himself; and he was taken under his special patronage, with the promise of accompanying him as his secretary to Jamaica, of which island he was appointed governor. But the implacable resentment of the court frustrated his expectations, for the duke was expressly forbidden to take him out as his secretary. This cruel treatment irritated his temper; and with a view of giving importance to his opposition, he spent nearly 5000*l.* in various unsuccessful efforts for obtaining a seat in parliament; and he was aided by the duchess-dowager of Marlborough in 1727 with the sum of 1000*l.* for this purpose. His attempts failed; his affairs of course became deranged; and he involved himself in a variety of quarrels and law-suits, which entailed upon him distresses that disgraced and embittered the close of his life. In 1732, he published an historical work, entitled "Memoirs of the Life and Character of the late Earl of Orrery, and of the Family of the Boyles," which, whatever valuable information it may contain, does not bear the character of impartiality. It is needless to mention his other publications, which, though well received, are now forgotten, or to add that he contributed several papers to the "Craftsman," and that he established a weekly pamphlet called the "Bee," which had no long duration. His reputation was sunk very low; and a circumstance occurred which totally ruined it. On the death of Dr. Matthew Tindall, the author of "Christianity as old as the Creation," in the publication of which he was thought to have had some concern; a bequest to Budge of 2100*l.* appeared in his will. This legacy, so disproportionate to Tindall's circumstances, so injurious to his nephew, the Rev. Nicholas Tindall, the translator of Rapsin, and so contrary to his

known intentions and conduct, surpris'd those who heard of it, and excited a suspicion of unfair dealing, very reproachful to Budgell. The will was contested and set aside. To this transaction, Pope, who has introduced Budgell into the Dunciad, and satirized him in several parts of his works, evidently alludes in one of his epistles :

“ Let Budgell charge low Grub-street on my quill,  
And write whate'er he please except my will.”

At length, this unfortunate man, unable to struggle any longer with his embarrassed circumstances and indelible disgrace, adopted the resolution, strengthened by the pride of his temper, and his disbelief of revelation, to put an end to his life ; and, on May 4th, 1737, he took a boat at Somerset stairs, and having ordered the waterman to shoot the bridge, he threw himself overboard, with stones in his pockets, and immediately sunk. He had previously attempted to persuade a natural daughter to share his fate ; but she, preferring a continued life to this shocking mode of terminating it, became afterwards an actress at Drury Lane theatre. On the bureau of Budgell was found a slip of paper, on which were written these words :

“ What Cato did, and Addison approv'd,  
Cannot be wrong.”

But this charge against Addison is wholly groundless ; for he attempted to obviate the ill effects that might be supposed to arise from Cato's example by a dying disapprobation of his own conduct. Biog. Brit.

**BUDGERONS**, in *Geography*. See **BOESEROONS**.

**BUDGEROWS**, in *Sea Language*, the denomination given to travelling boats, or pleasure barges, used by the Europeans, as well as by the principal natives, in Bengal. On the outside, they are constructed like the **BURS** ; but within, they are much better adapted for convenience. The space from the middle to the stern is occupied by one or two apartments, having windows on the sides, and from six to seven feet high ; and some of them 14 feet wide : the sternmost of them is the bed room. These budgerows are of various sizes ; from 25 to 60 feet in length, and longer. They are rowed by a number of men, from 6 to 20, with oars, which are long poles, to the end of which a little oval board is nailed, in lieu of a leaf, and which do not strike the water cross-ways, but obliquely backwards. They are steered by a large paddle or oar, extending 10 feet from the stern ; and forwards stands a mast, upon which is hoisted a square sail, when they go before the wind ; and they have likewise a top-mast with a square top-sail for fine weather. When they have a side wind, they drive down athwart the stream, not having a keel or timber enough under water, as they are flat bottomed, and draw scarcely a foot, or a foot and a half of water. Some of them draw from four to five feet. The English gentlemen in Bengal have much improved the budgerows, by introducing a broad flat floor, square sterns, and broad bows. They are thus rendered much safer, sail near, and keep their wind ; and there is no danger attending their taking the ground. Besides, they are adapted for carrying more fail. The motion acquired by the oars of a large budgerow hardly exceeds eight miles a day, at ordinary times. A gentleman in his budgerow is usually attended by a “ pulwah” for the accommodation of the kitchen, and a small boat, called a “ paunchway,” for conveying him either on shore, or on board, as it often happens that the budgerow cannot come close to the place where he wishes to land, or to embark.

**BUDHA**, in *Mythology*. See **BOODH**.

**BUDHURS**, or **BUDDAGHS**, in *Ichthyology*, a provincial name given by the Irish to a large sort of trout that is

found chiefly in the vast waters, *Lough Neagh*, in Ireland. These are sometimes taken of thirty pounds weight each.

The budhurs appear to be nothing more than the common trout, *Salmo Fario*, that have attained to this vast size, of which we have instances in other waters besides that of Lough Neagh. A trout, to the full as large as the budhurs are in common, namely of twenty four pounds weight, was captured very lately in the river Thames near Hampton. Don. Brit. Fish.

**BUDIN**, or **BUDYN**, in *Geography*, a town of Bohemia, in the circle of Schlan ; eight miles N. of Schlan.

**BUDINGEN**, a town of Germany, in the circle of the Upper Rhine, and county of Isenburg ; 10 miles E. N. E. of Frankfort on the Mayne.

**BUDINI**, probably the **BUDENI** of Ptolemy, in *Ancient Geography*, a people placed by Herodotus in European Scythia, adjoining to the Sauromates. These people were very numerous, and remarkable for their red hair and blue eyes. Their food was flesh and milk. Herodotus says, that their principal city was Gelone, built in a wood, where temples were consecrated to the gods of Greece, and in which were celebrated triennial feasts in honour of Bacchus. The inhabitants of this city were of Greek origin, and their language was a mixture of Greek and Scythian. Of these Budini the Scythians demanded succour for opposing the army of Darius.

**BUDINUM**, or **BUDINUS**, the ancient name of a mountain of European Sarmatia. Ptolemy.

**BUDIŠSEN**, in *Geography*. See **BAUTZEN**.

**BUDLANIOW**, a town of Poland, in the palatinate of Podolia ; 36 miles N. W. of Kaminiac.

**BUDNÆANS**, in *Ecclesiastical History*, a sect of Polish Unitarians, so called from the name of their leader, Simon Budnæus. They not only denied all kind of religious worship to Jesus Christ, but asserted, that he was not begotten by any extraordinary act of divine power ; being born, like other men, in a natural way. Budnæus, after having profelyted a great number of persons in Lithuania and Russian Poland, was deposed from his ministerial functions in the year 1584, and publicly excommunicated, with all his disciples ; but afterwards abandoning his peculiar sentiments, he was readmitted to the communion of the Socinian sect. Crellius ascribes the origin of the above opinion to Adam Neuser. Mosh. Eccl. Hist. vol. iv. p. 525.

**BUDOA**, or **BUDUA**, in *Geography*, a fortified sea-port town of Dalmatia, subject to the Venetians ; the see of a bishop, suffragan of Antivari. It is seated between the gulf of Cattaro and the town of Dulcigno, on the coast of Albany. It was unsuccessfully besieged by the Turks in 1686. N. lat. 42° 12'. E. long. 19° 22'.

**BUDRIO**, a small town of Italy in the Bolognese, the vicinity of which produces large quantities of fine hemp ; 10 miles N. of Bologna. N. lat. 44° 27'. E. long. 11° 35'.

**BUDRUN**, a fortified town of Asiatic Turkey, in the province of Natolia, near the sea coast, with a harbour in the gulf of Stanchio.

**BUDSDO**, in the *History of Mythology*, one of the two principal sects in the island of Japan, the other being denominated *Sinto*. The sect of Budso was imported from Hindostan, and is supposed to be the same with that of Budha or BOODH, reported to have been born in Ceylon, about 1000 years before the birth of Christ. Passing through China and Corea, it has been mingled with foreign maxims, but the tenet of the metempsychosis remains ; wicked souls being supposed to migrate into the bodies of animals, till they have undergone a due purgation.

**BUDUN**, is the name of one of the Ceylonesse gods : he is supposed to have arrived at supremacy, after successive transmi-

transmigration, from the lowest state of an insect, through the various species of living animals. There have been three deities of this name, each of which is supposed to reign as long as a bird removes a bill of sand, half a mile high, and six miles round, by a single grain in a thousand years. See SAKRADAWENDRA: see also BOODH.

BUDWEIS, or BUDĚGOWICE, in *Geography*, a royal and well fortified city of Bohemia, in the circle of Beehin, seated on the river Moldaw, enjoying the staple-rights of salt, and having in its vicinity mines of gold and silver; and, as it is said, pearls, which are fished for in the river Moldaw. It was erected into a bishopric by the emperor, in 1787. The king of Prussia laid siege to it with 8000 men, under general Nassau in 1744, and took it; but did not long retain it; 66 miles S. of Prague. N. lat. 42° 15'. E. long. 14° 19'.

BUDWIZ, a town of Moravia, in the circle of Znaym; 84 miles S. E. of Prague.

BUDZADGEH, a town of Asiatic Turkey, in the province of Natolia; 40 miles N. E. of Iznick.

BUDZIAC *Tartary*. See BESSARABIA.

BUDZIENICZE, or BUDZENICE, a town of Lithuania, in the palatinate of Minsk; 56 miles W. of Rohaczow. N. lat. 52° 40'. E. long. 28° 20'.

BUECH, a river of France, which runs into the Durance, near Sisteron, in the department of the Lower Alps.

BUEIB, a town or village of Egypt, called the "Straits," seated on a mountain in the road of the pilgrims; 30 miles N. E. of Cairo.

BUEIB, called the "Narrows," a town or village of Upper Egypt, seated on the west side of the Nile; 32 miles S. E. of Asna or *Efneh*.

BUELA, a town of Persia, in the province of Korassan; about 313 miles N. W. of Herat. N. lat. 37° 40'. E. long. 57° 2'.

BUENAYRE. See BONAIRE.

BUENA-VISTA. See BONAVIDA.

BUENE-VENTURA. See BONAVENTURE.

BUENOS AYRES, so called on account of the peculiar salubrity of its climate, a Spanish territory or vice-royalty of South America, established as such in 1776, is reckoned by Ulloa the fifth bishopric belonging to the audience of Charcas. This name comprehends the whole country from the eastern and southern coast of that part of America, to Cordova and Tucuman on the west, to Paraguay on the north, and on the south to the sea and the Terra Magellanica or Patagonia, the vertex of that triangular point of land which forms South America. This country is watered by the great river La Plata, first discovered in 1515, by Juan Diaz de Solis, who, with his two attendants, was massacred by the natives; and partly subdued, in 1526, by Sebastian Gabot. Buenos Ayres abounds with horned cattle and wild horses, which find a shelter from the heat of the sun, and an ample supply of food in the immense plain, called by the Spaniards "Pampas," which commences about 20 miles from the capital, and extends 100 miles westward to the foot of the mountains, and about 500 miles southward towards Chili. This plain is wholly covered with very high grass, and is for the most part uninhabited and destitute of trees. From the travels of Helms we learn, that the largest tamed ox is sold for one piastre, or about 3s. 6d., and that a good horse may be purchased for two piastrs. The hides of these animals constitute a principal article of trade in this country. The rivers and sea supply all kinds of fish; the country abounds with game; and fruits of every quarter of the globe grow here in the utmost perfection; so that with regard to the salubrity of the air and the various enjoyments

of life, a finer country cannot be imagined. Although the climate is healthy and pleasant, there is a great difference in the seasons. In the summer the air is serene, and the excessive heat of the sun is moderated by breezes which blow every morning. In the winter storms often occur, with rain and dreadful lightning and thunder. The capital of this country is Buenos Ayres, and within its government are three other cities, viz. Santa Fe, Las Corrientes, and Monte-video.

BUENOS AYRES, *Nuestra Señora de*, the capital of the country of the same name, and of the kingdom of La Plata, was founded by Don Pedro de Mendoza in 1535, who was at that time governor, on a spot called Cape Blanco, on the fourth side of Rio de la Plata, adjoining to a small river; from which the plain on which it stands, ascends gently. Soon after its first establishment, it was abandoned; but rebuilt in 1582, and erected into a bishopric in 1620. It is said to contain about 4000 houses, and from 24 to 30 thousand inhabitants, who are chiefly Spaniards and native Americans. It is well fortified and defended by a numerous artillery. Although the breadth of this city, like other towns situated on rivers, is not proportional to its length, its streets are straight and of a proper width. The principal square is very large, and built near the small river; and in the front of it is a castle, where the governor constantly resides. The houses, which were formerly constructed with mud-walls, thatched with straw, and very low, are now much improved; some being built with chalk, and others with brick, most of them tiled, and having one story besides the ground floor. The cathedral, which is the parish church for the greater number of the inhabitants, is a spacious and elegant structure; and the chapter is composed of the bishop, dean, archdeacon, and two canons. At the farther end of the city is another church appropriated to the Indians. Here are also several convents, and a royal chapel in the castle where the governor resides. This is the great resort of the merchants of Europe and Peru, who traverse the country from hence by Cordova and Tucuman to Potosi; and for the accommodation of travellers there is an uninterrupted post-road, with post-horses and proper relays of horses and carriages across the continent to Peru. No regular fleet comes to this place; the whole intercourse with Europe being carried on by 2 or 3 register ships. The returns are chiefly gold and silver of Chili and Peru, sugar, and hides. The contraband trade, however, has been found the most advantageous; and this has been principally carried on by the Portuguese, who keep magazines for that purpose in those parts of Brazil which lie nearest to this country. The most valuable commodities are brought here to be exchanged for European goods; such as the Vicugna wool from Peru, copper from Coquimbo, gold from Chili, and silver from Potosi. From Corientes and Paraguay are conveyed hither tobacco, sugar, cotton, thread, yellow wax, and cotton cloth; and from Paraguay, the herb so called and so highly valued for tea, which is drank every where in South America by the higher classes, and which supplies a branch of trade, amounting, as it is said, to a million of pieces of eight annually, wholly paid in goods, as no money is allowed to pass here. The commerce between Peru and Buenos Ayres is chiefly for cattle and mules, to an immense value. This city is situated about 77 leagues from Cape Santa Maria, which lies on the north coast near the entrance of the river de la Plata; and its little river not having water sufficient for ships of burden to come up to it, they anchor in one of the two bays on the same coast. That farthest to the eastward is called Maldonado, 9 leagues from the above cape, and the other named Monte-video from a mountain near it, and distant 20 leagues from the said cape. The navigation to the city is dangerous.

for want of depth of water, and on account of shoals and rocks in the river, and the frequent recurrence of storms. It is, therefore, usual to anchor every night, and to have the ship's way founded by a pilot. Within 7 leagues of the town, the goods are removed on board some light vessel; and wait for their cargoes, while they are refitting at Leonado de Barragan, situated 7 or 8 leagues below. S. lat.  $34^{\circ} 35'$  -  $6'$ . W. long.  $58^{\circ} 31' 15''$ .

**BUENTO**, a town of Africa, in the kingdom of Monomotapa.

**BUFETAGE**, *bufetajium*, or *bufetaria*, a duty paid to the lord for the drinking, or rather selling of wine in taverns.

The word is formed from *bufetage*, or *bufeterie*, of the French *boire*, to drink. Du-Cange Gloss. Lat. tom. i.

**BUFF**, in *Commerce*, a sort of leather prepared from the skin of the buffalo, or bubalus; which being dressed in oil, after the manner of shammy, or chamois, makes what we call *buff-skin*; anciently much used among the military men for a kind of coats or doublets; and still retained by some of our grenadiers, as well as the French *gen d'armes*, on account of its exceeding thickness and firmness. It is also used for waist-belts, pouches, &c.

Buff-skin, or buff-leather, makes a very considerable article in the English, French, and Dutch commerce, at Constantinople, Smyrna, and along the coast of Africa.

The skins of elks, oxen, and other like animals, when dressed in oil, and prepared after the same manner as that of the buffalo, are likewise denominated buff, and used for the same purposes.—In France there are several considerable manufactories employed in the preparation of such skins; particularly at Corbeil, Paris, and Rouen: their first establishment is owing to the Sieur Jabas, a native of Cologne. The manner of preparation see under SHAMMY.

The skin of the American moose deer, when well dressed, makes excellent buff. The Indians make their snow-shoes of this skin. Their way of dressing it, which is reckoned very good, is thus: after they have haired and grained the hide, they make a lather of the moose's brains in warm water, and, after they have soaked the hide for some time, they stretch and supple it. Phil. Trans. N<sup>o</sup> 368.

**BUFF river and bay**, in *Geography*, lie on the north-east side of Jamaica; within which is Crawford's town, in St. George's parish, and county of Surry. N. lat.  $18^{\circ} 27'$ . W. long.  $76^{\circ} 32'$ .

**BUFF**. See **BUFFLES**.

**BUFFA**, see **BURFOON**. See **GIARDINI**.

**BUFFALMACCO**, **BUGNAMICO**, in *Biography*, an historical painter, was born at Florence in 1262, and was for some years a disciple of Andrea Tassi. He possessed a singular talent for droll humour, and is said to be the first who devised the use of a label drawn from the mouth of a figure for representing that figure as speaking; though sentences wrote over the heads of figures had before been practised by Cimabue. He died in 1340. Pilkington.

**BUFFALO**, in *Zoology*. See **BUBALUS**.

**BUFFALOE**, in *Geography*, a township of America, west of Susquehannah river in Pennsylvania.

**BUFFALOE**, a river of America, in the Tennessee government, which runs S. W. into Tennessee river, in N. lat.  $35^{\circ} 10'$ .—Also, a water of the Ohio, which enters it at the fourth bank, 50 miles above the mouth of the Wabash.

**BUFFALOE Creek**, a creek of North America in New York, connected with Niagara river near its mouth, opposite to lake Erie. The Seneca Indians have a town 5 miles from its mouth, which is able to furnish 80 warriors. N. lat.  $42^{\circ} 52'$ .

**BUFFALOE Lake**, a lake of North America, situate near Copper-mine river, in the country of the Copper Indians. N. lat.  $66^{\circ}$ .—Also a lake of North America, which receives the Beaver river, about 25 miles long, and from 2 to 10 wide. N. lat.  $55^{\circ} 55'$ . W. long.  $108^{\circ} 55'$ .

**BUFFALOE Lick**. See **GREAT RIDGE**.

**BUFFALOE Lowlands**, a tract of land, in Northumberland county, Pennsylvania, about 88 miles S. E. from Presque Isle.

**BUFFALOE's Bay**, lies within the point of the cape of Good Hope, across which from point to point is a ledge of rocks continuing northward to the fourth point of the entrance into Simon's bay, on the west side of False bay.

**BUFFALOE's Point**, lies above Rongoufoula river, on the bight between Jeffere and Culpe rivers. Ships stop here which do not venture higher up into the Hughly river.

**BUFFAROLO**, a town of Italy, in the Milanese; 17 miles W. of Milan.

**BÜFFEL**, **BÜFFELUS**, **BUFFLE**. See **BOS BUBALUS**.

**BUFFET**, or **BEAUFET**, was anciently a small apartment or recess, separated from the rest of the room by means of slender wooden pillars, in which were deposited china, glass-ware, &c. It was sometimes called a cabinet. The term has since been sometimes applied to a large table, more usually called a "side-board," furnished with drawers, and serving either for convenience or shew, to receive plate, bottles, glasses, &c. In France, among persons of distinction, the buffet is a detached room, decorated with pictures, exhibiting fountains, cisterns, and vases, and commonly faced with marble or bronze. Among the Italians, the buffet, called "credenza," is inclosed within a ballustrade as high as the elbow.

**BUFFETTO**, in *Geography*, a town of Switzerland, in the Valteine, seated on the fourth side of the river Adda. N. lat.  $46^{\circ} 2'$ . E. long.  $9^{\circ} 50'$ .

**BUFFIER**, **CLAUDE**, in *Biography*, an ingenious writer, was born of French parents, in Poland, in 1661, and educated at Rouen. He entered among the Jesuits at Paris in 1679, and afterwards fixed his residence at the college of the society in that city. Besides his engagements with the compilers of the Memoires de Trevoux, he wrote a great variety of works, some of which have been much esteemed. But his most celebrated performance is his "Traité de premiers Verités, &c." or treatise of first truths, and of the sources of our judgments; in which the opinions of philosophers on the first notions of things are examined; Paris, 1724, 12mo. The principles of this work are the same with those adopted and expanded in the writings of Drs. Reid, Oswald, and Beattie, under the denomination of *Common Sense*. His "Elements of Metaphysics, made intelligible to all Readers," 1725, 12mo. is a work formed upon the same plan. He was also the author of a "French Grammar upon a new Plan," which was well received. His principal works have been collected and published under the title of "Cours des Sciences, sur des Principes nouveaux et simples, &c." or a course of sciences on new and simple principles, for the purpose of forming the language, the understanding, and the heart, in the ordinary commerce of life, 1732, fol. This laborious and useful writer died in 1737. Nouv. Dict. Hist.

**BUFFLES**, or **BUFF**, in *Geography*, an island of Africa, on the fourth coast of Benin, in the mouth of the river Camarones, or Camonoars.

**BUFFON**, **GEORGE-LOUIS LE CLERC**, *Count of*, in *Biography*, an eminent naturalist and writer, was the son of a counsellor of the parliament of Dijon, and born at Montbard in Burgundy,

gundy, September the 7th, 1707. He manifested an early inclination to the sciences, which diverted him from pursuing the profession of the law, to which his first studies at Dijon were devoted, and for which his father had designed him. The science which seems to have engaged his earliest attachment was astronomy; with a view to which he applied with such ardour to the study of geometry, that he always carried in his pocket the elements of Euclid. At the age of 20, he travelled into Italy, and in the course of his tour he directed his attention to the phenomena of nature more than to the productions of art; and at this early period he was also ambitious of acquiring the art of writing with ease and elegance. In 1728 he succeeded to the estate of his mother, estimated at about 12,000*l.* a year; which, by rendering his circumstances affluent and independent, enabled him to indulge his taste in those scientific researches and literary pursuits, to which his future life was devoted. Having concluded his travels, at the age of 25, with a journey to England, he afterwards resided partly at Paris, where, in 1739, he was appointed superintendant of the royal garden and cabinet, and partly on his estate at Montbard. Although he was fond of society, and by no means insensible to the attractions of the fair sex, he was indefatigable in his application, and is said to have employed 14 hours every day in study. We learn from the biographical anecdotes relating to him, collected by Herault de Sechelles, and published in Peltier's "Paris, pendant l'Année 1795, et l'Année 1796," that he would sometimes return from the suppers at Paris at two in the morning, when he was young, and order a boy to call him at five; and if he lingered in bed, to drag him out on the floor. At this early hour it was his custom, at Montbard, to dress, powder, dictate letters, and regulate his domestic concerns. At six he retired to his study, which was a pavilion called the tower of St. Louis, about a furlong from the house, at the extremity of the garden, and which was accommodated only with an ordinary wooden desk and an arm chair. Within this was another sanctuary, denominated by prince Henry of Prussia "the Cradle of Natural History," in which he was accustomed to compose. On this retreat no one was suffered to intrude. At nine his breakfast, which consisted of two glasses of wine and a bit of bread, was brought to his study; and after breakfast he wrote for about two hours, and then returned to his house. At dinner he indulged himself in all the gaieties and trifles which occurred at table, and in a freedom of conversation, which obliged the ladies to withdraw. When dinner was finished, he paid little attention either to his family or guests; but having slept about an hour in his room, he took a solitary walk, and then he would either converse with his friends or sit at his desk, examining papers that were submitted to his judgment. This kind of life he passed for 50 years; and to one who expressed his astonishment at his great reputation, he replied, "Have not I spent fifty years at my desk?" At nine he retired to bed. In this course he prolonged his life, notwithstanding excruciating sufferings occasioned by the gravel and stone, which he bore with singular fortitude and patience, to his 81st year; and retained his senses till within a few hours of his dissolution, which happened on the 16th of April, 1788. His body was embalmed, and presented first at St. Medard's church, and afterwards conveyed to Montbard, where he had given orders in his will to be interred in the same vault with his wife. His funeral was attended by a great concourse of academicians, and persons of rank and literary distinction; and a crowd of at least 20,000 spectators assembled in the streets through which the hearse was to pass. When his body was opened, 57 stones were found in his bladder, some of which

were as large as a small bean; and of these 37 were crystallized in a triangular form, weighing altogether 2 ounces and 6 drams. All his other parts were perfectly sound; his brain was found to be larger than the ordinary size; and it was the opinion of the gentlemen of the faculty who examined the body, that the operation of lithotomy might have been performed without the least danger; but to this mode of relief M. Buffon had invincible objections. He left one son, who fell a victim to the atrocities under Robespierre. This son had erected a monument to his father in the gardens of Montbard; which consisted of a simple column, with this inscription:

"Excelsæ turri humilis columna

Parenti suo filius BUFFON, 1785."

The father, upon seeing this monument, burst into tears, and said to the young man, "Son, this will do you honour." Buffon was a member of the French Academy, and perpetual treasurer of the Academy of Sciences. With a view to the preservation of his tranquillity, he wisely avoided the intrigues and parties that disgracefully occupied most of the French literati in his time; nor did he ever reply to the attacks that were made upon his works. In 1771 his estate was erected into a comté; and thus the decoration of rank, to which he was by no means indifferent, was annexed to the superior dignity he had acquired as one of the most distinguished members of the republic of letters.

Before we give an account of his works, we shall mention a few particulars relating to his person and character. His figure was noble and manly, and his countenance, even in advanced age, and notwithstanding excruciating pains, which deprived him of sleep sometimes for 16 successive nights, was calm and placid, and exhibited traces of singular intelligence. Vanity, however, which seemed to have been his predominant passion, extended even to his person and to all its exterior ornaments. He was particularly fond of having his hair neatly dressed, and for this purpose he employed the friseur, in old age, twice or thrice a day. To his dress he was peculiarly attentive; and took pleasure in appearing on Sundays before the peasantry of Montbard in laced clothes. At table he indulged in indelicate and licentious pleasantries, and he was fond of hearing every gossipping tale which his attendants could relate. In his general intercourse with females he was as lax and unguarded as in his conversation. During the life of his wife, he was chargeable with frequent infidelities; and he proceeded to the very unwarrantable extreme of debauching young women, and even of employing means to procure abortion. His confidence, in the latter period of his life, was almost wholly engrossed by a mademoiselle Blesseau, who lived with him for many years. His vanity betrayed itself on a variety of occasions in relation to his literary performances. These were often the subjects of his discourse, and even of his commendation. When he was recommending the perusal of capital works in every department of taste and science, he added, with singular presumption and self-confidence; "Capital works are scarce; I know but five great geniuses;—Newton, Bacon, Leibnitz, Montesquieu, and myself." He was in the habit of reciting to those who visited him whole pages of his compositions, for he seemed to know them almost all by heart; but notwithstanding his vanity, he listened to objections, entered into a discussion of them, and surrendered his own opinion to that of others, when his judgment was convinced. He expressed himself with rapture concerning the pleasures accruing from study; and he declared his preference of the writings to the conversations of learned men, which almost always disappointed him; and therefore he voluntarily secluded himself from society with such, and in company was fond of trifling. He maintained, however, an extensive correspondence with

several persons of rank and eminence; and particularly with prince Henry of Prussia, and with the late empress of Russia, who ably criticised some of his opinions, and favoured with great zeal in her dominions his researches in natural history. Of his literary vanity he gave evidence even towards the close of life; alleging that he feared not death, and that the hope of immortal renown was the most powerful of death-bed consolations. He took great pains in forming the style of his writings; and as composition was to him a difficult task, he repeatedly revised his works before he published them. Such was his attention to style, that he could not bear the least deviation from accuracy and propriety in the use of language. "The style," said he, "is the man; our poets have no style; they are coerced by the rules of metre, which makes slaves of them." To this circumstance it was owing that he abandoned poetry which he attempted in his youth, and restricted himself to prose. "Two things," says he, "form style, invention and expression. Invention depends on patience; contemplate your subject long; it will gradually unroll and unfold—till a sort of electric spark convulses for a moment the brain, and spreads down to the very heart a glow of irritation. Then are come the luxuries of genius, the true hours for production and composition—hours so delightful, that I have spent 12 and 14 successively at my writing-desk, and still been in a state of pleasure. It is for this gratification, yet more than for glory, that I have toiled. Glory comes if it can, and mostly does come. This pleasure is greater if you consult no books; I have never consulted authors, till I had nothing left to say of my own." Such was his regard to fame, that he destroyed every paper which he thought useless or unfinished; and thus preserved his reputation from being massacred by posthumous publications.

Of the free sentiments which he had imbibed with regard to religion, his works afford ample evidence. They sufficiently indicate his attachment to the system of materialism. "Religion," said he to one who was reading to him verses on the immortality of the soul, "would be a noble present, if all that were true." Notwithstanding the licentiousness of his religious opinions, as well as of his moral conduct, he conformed to the external rituals of religion, adding, as some will say, hypocrisy to his impiety; when he was at Montbard, he received the annual communion in his seignorial chapel, attended high mass every Sunday, and distributed a louis weekly among different descriptions of pious beggars. "There must," he said, "be a religion for the multitude; and we should avoid giving offence." "I have always," he added, in conversation with a friend, "named the Creator; but it is only putting, mentally, in its place, the energy of nature, which results from the two great laws of attraction and impulse. When the Sorbonne plagued me, I gave all the satisfaction which they solicited; it was a form which I despised, but men are silly enough to be so satisfied. For the same reason, when I fall dangerously ill, I shall not hesitate to send for the sacraments. This is due to the public religion. Those who act otherwise are madmen." Thus, as he boasts, he avoided sharing the mischievous attacks which Voltaire, Diderot, Helvetius, and others had made upon religion, whilst, by the avowal of such licentious sentiments in conversation, and by the opinions circulated in his writings, he was perpetually sapping its foundations, and counteracting every obligation of truth and integrity. But let us divert our attention from the principles and character of Buffon, which have been sufficiently developed, and which no reflecting person can contemplate without disgust, to his works. In this view of him he appears with much greater advantage. His first publication was a translation from the English of "Hales's Vegetable Statics," in 1735; which was followed

in 1740 by a translation from the Latin of "Newton's Fluxions." His "Theory of the Earth" was first published in 1744, which was included in his most comprehensive celebrated work entitled "Natural History, general and particular," which commenced in 1749, and at its completion in 1767 extended to 15 vols. 4to. or 31 vols. 12mo. Supplements were afterwards added, amounting to several more volumes. In the anatomical part the author was aided by M. d'Aubenton; but in all the other parts Buffon himself displays his learning, genius, and eloquence, and he also indulges his fancy, in exploring and delineating the whole economy of nature. He begins with a theory of the earth, which, as well as the other planets, he supposes to have been originally a mass of liquefied matter, dashed out of the body of the sun by the violent illapse of a comet. He then covers it with ocean, from which he forms strata by deposition, and mountains by the flux and reflux of the tide. Subterraneous fires, eruptions, and earthquakes, produce other changes; and the world we now inhabit is but the ruins of a former world. For a more particular account and examination of his theory, see EARTH and PLANETS. In his account of the population of the earth with living creatures, he investigates the analogies between vegetable and animal life; and in explaining the mystery of animal generation, he allows ample range to his imagination in a variety of hypotheses and conjectures. He conceives certain "living organic molecules," of the same nature with organized beings, to exist equally in animal and vegetable matter; and these, in the process of nutrition, to be received into "internal moulds," of which animal and vegetable bodies are formed, where they are assimilated into the same substance as the parts to which they are transmitted, and thus nourish them. When this nutritive matter superabounds, it is detached from all parts of the body, and deposited in a fluid form in one or more reservoirs. This constitutes a prolific matter, which is ready for producing a new animal or vegetable, of the same species, when it meets with a proper matrix. The supposed seminal animalcules are only these organic particles, which are similar in both sexes, but must unite in order to produce a new animal by the process of generation. See GENERATION. Buffon's natural history of animals commences with that of man; whom he traces from the cradle to the grave, through the development and maturation of his bodily organs and mental powers, the nature and operation of his senses, and the several varieties of his species, introducing and intermixing in the research many curious discussions. He then investigates and unfolds the nature of brute animals in general; and marks the distinction between them and men, by denying them a soul, and a memory, properly so called, and making all their actions to spring from external impressions. The class of quadrupeds occupies the whole remainder of this first work. To his history of quadrupeds he added, in 1776, a supplementary volume, which, besides an ingenious dissertation on mules, contains the history and figures of several new animals, and valuable additions to most of those described in the original publication. Disdaining the arrangements of systematic naturalists, he has rejected all the received principles of classification, and has thrown his subjects into groups, laxly formed from general points of resemblance. Not content with deviating from established modes of distribution, he ridicules the authors of systematic arrangements, and particularly the late ingenious and indefatigable Linnæus, whose zeal and labours in investigating and classing natural objects entitle him to the highest applause. It is hardly necessary to remark, that he has adapted his style to the particular subjects of his discussion. Whilst the mere enumeration of facts, or descriptions of the figure, dimensions, and colour of animals,

mals, admit of no other ornament than that of perspicuity; topics of philosophy and argument require a higher and more figurative expression; and addresses to the passions and finer feelings of men, allow full scope to the exercise of genius and of taste. Of these different species of writing, the works of Buffon afford numerous examples. It has been observed, however, that his style occasionally rises above the level of his subject; and this is particularly the case, when he is painting in glowing colours the manners and habits of the lion, the horse, the elephant, and others of his favourite subjects. By the indulgence of this passion for high painting, he has been betrayed into a deviation from the limits of simple truth, and has been led to wander into the regions of fancy. In particular and minute observation he excels, and by his indefatigable researches he has made a very copious addition to the treasure of authenticated facts. In some cases he has been misled by an undue attachment to theory, as well as by the ambition of distinguished eloquence. "On various topics," says a judicious biographer, "he had formed general theorems, which he was inclined to support against exceptions by denying or neglecting the instances produced on the other side. Farther, he not infrequently gives the mere inferences from his opinions as if they were known and tried facts; thus dangerously confounding hypothesis with that experience which is the only true basis of all natural knowledge. He often attributes more to the operation of certain causes, such as change of climate, domestication, and the like, than sober reason can warrant; and even, according to the tenor of his argument, sometimes ascribes opposite effects to the very same cause. These blemishes materially lessen the confidence with which his work can be used as authority, and later inquirers are continually detecting errors in his statements. Yet the great mass of matter will probably always remain unimpeached; and certainly no writer has ever done so much to render natural history entertaining, and to elevate its rank among the objects on which the human intellect is employed. In one point, however, he will by many be thought to have derogated from the true dignity and value of his subject. He is every where the enemy of the doctrine of final causes, and substitutes, to a designing and benevolent author, the fortuitous operations of a certain unconscious "Nature," which as often exhibits examples of blunder and defect, as of skilful and happy contrivance." "Studiously to overlook so beautiful a part of the economy of things, as the adaptation of means to ends, is surely as inconsistent with the philosophical as the religious spirit," which may, possibly, in some instances, have betrayed him into error. This "fault is aggravated in Buffon by the pleasure he occasionally takes in declaiming upon the defects of nature, in a strain which would seem to impute malignity of intention to the Author of being, and which he appears to have derived from the shallow philosophy of his predecessor Pliny. The moral reader of Buffon will likewise be frequently offended with the grossness of his descriptions in all points relative to sex: in which he not only indulges in an anatomical plainness of language, but, what is much worse, adopts a studied sensualism, the object of which is to exalt the value of sexual gratifications, and make a propensity to them one of the indications of nobleness of nature."

After the completion of his history of quadrupeds in 1767, Buffon was interrupted in the progress of his labours by a severe and tedious indisposition; and therefore the two first volumes of his "History of Birds" did not appear till the year 1771. In the composition of the greatest part of these he was indebted to the labours of M. Gueneau de Montbeil-

lard, who adhered so closely to Buffon's mode of thinking and of expression, that the public could not perceive any difference. The four subsequent volumes were the joint production of both writers; and each author prefixed his name to his own articles. The three remaining volumes were written by Buffon himself, with the assistance of the abbe Bexon, who formed the nomenclature, drew up most of the descriptions, and communicated several important hints. The work was completed in 1783, but on account of the much greater number of species of birds than of quadrupeds, the want of systematic arrangement is more to be regretted in this than in the other history. A translation of Buffon's "Natural History," by Mr. Smellie of Edinburgh, comprised in 8 vols. 8vo. was published in 1781; to which a 9th volume was added in 1786, containing a translation of a supplementary volume of Buffon, and consisting chiefly of curious and interesting facts with regard to the history of the earth. The translator has omitted the anatomical dissections and measurements of M. D'Aubenton, which greatly enhanced the bulk, as well as the price of the original, and which the author himself had omitted in the last Paris edition of his performance. There are likewise some other omissions, which are not very important; respecting the method of studying natural history, methodical distributions, and the mode of describing animals. These omissions have been amply compensated by the translator's addition of short distinctive descriptions to each species of quadrupeds, of the figures of several new animals, and of the synonymy, as well as the generic and specific characters given by Linnæus, Klein, Brisson, and other naturalists, together with occasional notes. A translation of Buffon's "History of Birds," in 9 vols. 8vo. with notes and additions, was also published by Mr. Smellie in 1793.

In 1774, Buffon began to publish a "Supplement" to his Natural History, consisting of the "History of Minerals." The first volume contains an account of his *BURNING glass*, for which, see that article. These supplemental volumes, of which the 5th, in 4to., appeared in 1778, contain many curious and valuable experiments, as well as much theory, too lax for the rigour of modern science. The concluding volume may be considered as a kind of philosophical romance. It comprehends what the author fancifully denominates the "Epochas of Nature," or those great changes in the state of the earth which he supposes to have successively resulted from his hypothesis of its original formation out of the sun. Of these epochas he enumerates seven, of which six are supposed to have been previous to the creation of man. In the description of these epochas, as to both their causes and effects, the author has indulged the sport of fancy, and formed a sort of fairy tale, which he has contrived to render amusing and instructive. Such as we have recounted are the principal works of this great author, which have been collected and published in 35 vols. 4to. and 62 vols. 12mo.; and of the whole or parts of which new editions occasionally appear. After he had completed his "History of Minerals," he had formed a design of composing the "History of Vegetables;" but this project was defeated by his death. Several of the subjects that occur in his "Natural History," and its supplements, have been discussed in separate memoirs, and may be found in the Memoirs of the Royal Academy of Sciences at Paris, for the years 1737, 1738, 1739, 1741, and 1742. Some account of them will be found in different articles of this dictionary. See particularly ACCIDENTAL Colours, HEAT, MAGNETISM, TIMBER, &c. Nouv. Dict. Hist. Encyclopedie Physique, tom. i. Lett. de Herault Seehelles, *ubi supra*. Smellie's Translations. Gen. Biog.

BUFFONI, in Ornithology, a species of FALCO, called by

Latham the *Gayenne ring-tail*, as being an inhabitant of that part of the world. It is specifically distinguished by having the cere blue; legs yellow; body above dark brown, beneath reddish-buff; eye-brows yellow; tail fasciated with pale, and dusky brown. Gmel. &c. Length of this bird two feet.

**BUFFOON**, a droll, or mimic, who diverts the public by his pleasantries and follies. Menage, after Salmastius, derives the word from *buffo*; a name given to those who appeared on the Roman theatre with their cheeks blown up; that, receiving blows thereon, they might make the greater noise, and set the people a laughing. Others, as Rhodiginus, make the origin of buffoonery more venerable; deriving it from a feast instituted in Attica, by K. Erichtheus, called *BUPHONIA*.

Buffoons are the same with what we otherwise find denominated *scurrae*, *gelastiani*, *mimologi*, *minijstelli*, *goliardi*, *joculatores*, &c. whose chief scene is laid at the tables of great men. Gallienus never sat down to meat without a second table of buffoons by him. Tillemont also renders *PANTOMIMES* by buffoons; in which sense he observes, the shews of the buffoons were taken away by Domitian, restored by Nerva, and finally abolished by Trajan. Crevier's Hist. of the Emperors, vol. vii. p. 45.

**BUFFY COAT**, or size of the blood, in *Medicine*. See *BLOOD*, *appearances of*.

**BUFO**, in *Entomology*, a species of *BOMBUX*, that inhabits Germany. The wings are yellowish, with a broad brown band, and yellow spots. Fabr.

**BUFO**, a species of *CURCULIO*, that inhabits Siberia. The colour is fuscous; wing-cases slightly reticulated, with a white stripe in the middle. Fabr.

**BUFO**, in *Zoology*, the specific name of the common toad, *rana bufo* of Linnæus, and other Latin writers. Gmelin adopts the concise description of the Linnæan *Fauna Suecica*, "corpore lurido fuscoque," for this species. But, besides the body of the toad being lurid and fuscous, the back is marked with tubercles, which ought likewise to be distinctly noticed in its specific character. The description given of it by Roefel is not amiss, "Bufo terrestris, dorso tuberculis exasperato, oculis rubris." Hist. Ran.

Authors make three or four varieties of the common toad. The var.  $\beta$  of Gmelin, is *bufo calamita* of Laurenti; the back of this kind is olivaceous with an unequal, clear, yellowish-red, band down each side.  $\gamma$ , another variety, Laurenti describes under the name of *bufo viridis*, the body being marked with confluent green spots, and warts: those warts which rise within the area of the green spots are of the same colour, while the rest, which are situated in the spaces between them, are red, upon a bicoloured ground.  $\delta$ . *bufo obstetricans* of Laurenti is distinguished by being of a smaller size than either of the preceding. In Act. Paris. 1741, this last variety is described under the title of *bufo terrestris minor*. Independently of these, which may be considered as permanent varieties of the common toad, it should be observed, that different individuals exhibit a great diversity in their general colours, markings, the size of the dorsal tubercles, and other particulars. The olivaceous hues with darker variations prevail most commonly. In the early part of summer they are sometimes found with the shoulders and limbs marked with reddish spots, and the under parts of the limbs and body tinged with yellow.

The toad, says an ingenious writer, is the most deformed and hideous of all animals: the body is broad, the back flat, and covered with a pimply dusky hide, the belly large, swagging, and swelling out, the legs short, and its pace laboured and crawling; its retreat gloomy and filthy: in short, its general appearance is such as to strike one with

disgust and horror. Yet it is said by those who have resolution to view it with attention, that its eyes are fine; to this it seems that Shakspeare alludes, when he makes his Juliet remark, "Some say the lark and loathed toad change eyes," as if they would have been better bestowed on so charming a songster, than on this ravenous animal. Pennant. The eyes are uncommonly beautiful, being surrounded by a reddish gold coloured iris, and the pupil, when in a state of contraction, appearing transverse.

*Rana bufo* and its varieties appear to be confined exclusively to the European continent. It inhabits woods, gardens, fields, and damp shady places, and frequently makes its way into cellars, or any obscure recesses in which it may occasionally conceal itself; and where it may find a supply of food, or a security from too great a degree of cold. In the early part of spring, like others of this genus, it retires to the waters, where it continues during the breeding season, and deposits its ova or spawn in the form of double necklace-like chains or strings, of beautifully transparent gluten, and of the length of three or four feet, in each of which are disposed the ova in a continued double series throughout the whole length, having the appearance of so many small jet-black globules or beads. These globules are, in reality, no other than the tadpoles, or larvæ convoluted into a globular form, and waiting for the period of their evolution, or hatching, which takes place in the space of about fourteen or fifteen days, when they break from the surrounding gluten, and, like the tadpoles of frogs, swim about in the water, and are nourished by various animalcules, gluten, leaves of aquatic plants, &c. When these have arrived at their full growth, the legs are formed, the tail gradually becomes obliterated, and the animals leave the water, and betake themselves to the surface of the ground. This generally happens early in the autumn.

The time of their propagation is very early in the spring: at which season the females are seen crawling about oppressed by the males, who continue on them for hours, and adhere so fast as to tear the skin from the parts to which they stick. The number of females appears to be greatly disproportionate to that of the males in general. It is asserted by Mr. Arscott, a gentleman of Devonshire, who favoured Mr. Pennant with a circumstantial account of a favourite toad kept for nearly forty years in his house, and a cursory history of the toads, that he has commonly known thirty males to one female: twelve or fourteen of the former he has seen clinging round a single female at one time. But this is even far less remarkable than the observation of the late Mr. John Hunter, who assured Mr. Pennant, that during his residence at Belleisle, he had dissected some hundreds of toads, and yet never met with a single female amongst them.

That the female toad receives the obstetrical assistance of the male on some occasions is a fact established on the best authority. Mr. Demours, in particular, has given a full and accurate account of such a circumstance in the Memoirs of the French Academy, that deserves attention. It has been more than once repeated by later writers, but cannot still, with propriety, be omitted in this place. The memoir is thus translated by Dr. Templeman:

"In the evening of one of the long days in summer, Mr. Demours, being in the king's garden, perceived two toads coupled together at the edge of an hole, which was formed, in part, by a great stone at the top.

"Curiosity drew him to see what was the occasion of the motions he observed, when two facts, equally new, surprised him. The first was the extreme difficulty the female had in laying her eggs, inasmuch that she did not

seem capable of being delivered of them without some assistance. The second was, that the male was mounted on the back of the female, and exerted all his strength with his hinder feet in pulling out the eggs, whilst his fore feet embraced her breast.

“ In order to apprehend the manner of his working in the delivery of the female, the reader must observe that the paws of these animals, as well those of the fore-feet, as of the hinder, are divided into several toes which can perform the office of fingers.

“ It must be remarked, likewise, that the eggs of this species of toads are included each in a membranous coat that is very firm, in which is contained the embryo: and that these eggs, which are oblong, and about two lines in length, being fastened one to another by a short, but very strong cord, form a kind of chaplet, the beads of which are distant from each other about the half of their length. It is by drawing this cord with his paw, that the male performs the functions of a midwife, and acquits himself in it with a dexterity that one would not expect from so lumpish an animal.

“ The presence of the observer did not a little discompose the male: for some time he stopped short, and threw on the *curious impertinent* a fixed look that marked his inquietness and fear; but he soon returned to his work with more precipitation than before, and a moment after he appeared undetermined whether he should continue it or not. The female likewise discovered her uneasiness at the sight of the stranger, by motions that interrupted sometimes the male in his operation. At length, whether the silence and steady posture of the spectator had dissipated their fear, or that the case was urgent, the male resumed his work with the same vigour, and successfully performed his function.”

The hideous appearance of the toad, Mr. Pennant remarks, is such as to have rendered it in all ages an object of horror, and the origin of most tremendous inventions. Ælian makes its venom so potent, that, basilisk-like, it conveyed death by its very look and breath; but Juvenal is content with making the Roman ladies who were weary of their husbands, form a potion from its entrails, in order to get rid of the good man:

“ Occurrit matrona potens, quæ molle calenum  
Porrectura viro miscet sitiente rubetam.” Sat. I.

This opinion begat others of a more dreadful nature; for in after-times superstition gave it preternatural powers, and made it a principal ingredient in the incantations of nocturnal hags:

“ Toad that under the cold stone  
Days and nights has, thirty-one,  
Swelter'd venom sleeping got,  
Boil thou, first i' th' charmed pot.”

Shakspeare.

But these, and other similar fables of its venomous properties, Mr. Pennant observes in another place, have been long since exploded. The notion of its being a poisonous animal, he conceives to have arisen from its excessive deformity, joined to the faculty it has of emitting a juice from its pimples, and a dusky liquid from its hind-parts. That it possesses any noxious qualities, this writer was unable to bring forward proofs in the smallest degree satisfactory, though we have heard many strange relations on that point. On the contrary, he knew several of his friends who have taken them into their naked hands, and held them long, without receiving the least injury. It is well known that quacks have eaten them, and have besides squeezed their juices into a glass and drank them with impunity. We may also say, that these reptiles are a common food to many

animals, such as buzzards, owls, Norfolk plovers, ducks, and snakes, neither of which, Mr. Pennant concludes, would touch them were they in any degree noxious.

It appears, however, from the experiments of Laurenti, that although the toad does not possess any poisonous properties, it is not perfectly innocuous to the smaller tribe of animals. He found that small lizards, on biting the common toad, were for some time disordered and paralytic, and even appeared dead, though they completely recovered afterwards. He also observed, that dogs, on seizing a toad, and carrying it for some little time in their mouth, will appear to be affected with a very slight swelling of the lips, accompanied by an increased evacuation of saliva; the mere effect of the slightly acrimonious fluid which the toad, on irritation, exudes from its skin, and which seems at least to be productive of no dangerous symptoms in such animals as happen to taste or swallow it. For a further account of this creature, see the articles TOAD, and RANA.

BUFONIA, in *Botany*, said by Dr. Smith, in English Botany, to have been so named by Linnæus after the celebrated Count Buffon at the instigation of Sauvage. but with the invidious addition of the trivial name *tenuifolia*, to express the *slenderness* of that great zoologist's claim to a botanical honour, and with the malicious omission of one *f* in the generic name; whence it seems rather to be derived from the Latin word *Bufo* which signifies a toad. Ventenat actually adopts this etymology, and says the name was given it on account of its growing in *marshy* places. Dr. Withering seems to have entertained the same idea when he called it toad-grass. Gærtner, Schreber, Professor Martyn, and Dr. Smith have added the other *f*; but we have preferred the original spelling of Linnæus, which has been followed by most other authors. Linn. Reichard 180. Willd. 260. Gært. 1243. Juss. p. 300. Vent. vol. iii. p. 238. Class and order, *tetrandria digynia*. Nat. ord. *Caryophyllæa*, Juss. Vent.

Gen. Char. *Cal.* perianth four-leaved, erect, permanent; leaflets awl-shaped, keeled, membranaceous at the margin. *Cor.* petals four, oval, erect, equal, shorter than the calyx. *Stam.* filaments four, equal, the length of the germ. Anthers twin. *Pist.* germ ovate, compressed; styles two, the length of the stamens; stigma simple. *Peric.* capsule oval, compressed, one celled, two-valved. *Seeds* two, oval, compressed with a swelling, convex on one side.

Ess. Char. *Calyx* four-leaved: *petals* four: *capsule* one-celled, two-valved, with two seeds.

Obs. It is sometimes deficient in the number of its stamens.

Species. 1. *B. tenuifolia*. Linn. Sauvage Monf. 141. Ger. Prov. 400. Villars Dauph. 650. Hudson H. Aug. 72. With. ed. 3. v. ii. p. 305. Smith H. Brit. v. i. p. 191. Gært. Tab. 129. f. 1. La Marck Pl. 87. f. 1. bad. Eng. bot. 1313. “Stem panicled; flowers lateral and terminal; calyx striated.” La Marck Illust. annual. *Stems* one or more, six or eight inches high, slender, erect, branched, round, leafy, smooth. *Leaves* erect, opposite, awl-shaped, three ribbed connate, with a broad sheathing base. *Flowers* white, peduncled, forming a spike-like panicle. *Calyx-leaves*, lanceolate, with a white edge. *Germs* superior; *styles* short, distant; *stigmas* capitate. *Seeds* large and rough. A native of dry situations in Spain and the southern provinces of France, which invalidates Ventenat's reason for deriving the generic name from *bufo*, a toad. Its chief claim to a place in the English Flora rests on the authority of Plukenet, who has certainly figured it, and asserts that it was found by the sea-side near Boston in Lincolnshire. On this ground Ray, who had seen it near Montpellier,

Montpellier, but not in England, admitted it into the second edition of his Synopsis. Dillenius, in the third edition, says it was found also by Doody, on Hounslow heath; but it has not since been discovered in either of those places.

*B. perennis*, La Marck Illuf. Pl. 87. f. 2. "Stems branched and bearing flowers near the top; calyx leaves scarious at the edge" perennial. Peduncles longer than in the preceding species, forming a panicle without the appearance of a spike. Frequent in dry stony places in Auvergne.

BUFONIS, in *Zoology*, a species of ASCARIS found in the intestines of the toad. The body of this kind is filiform, and the tail rounded. It is viviparous. *Goetze*.

BUFONIS, a species of TÆNIA, or tape worm, that infests the intestines of the toad. The anterior part is roundish, behind filiform: head continued obtuse: joints invested with a thin membrane, cylindrical, and oblong; margin silvery. *Gmel.* It is *Tænia dispar.* of *Goetze*.

Obf. The colour is white, and opaque. Length of the worm six inches.

BUFONITA, in *Natural History*, the TOADSTONE. This is a fossil that has been received not only among the list of native stones by the generality of authors, but even has held a place among the gems, and is still worn in rings by some people: it is, however, as much an extraneous fossil, as any animal remaining of that kind. There has been a strong opinion in the world, that it was found in the head of an old toad; and that this animal voided it at the mouth, on being put on a red cloth.

The general colour of the bufonita is a deep, dusky brown; but it varies greatly in this respect in several specimens, some of which are quite black, others of an extremely pale, simple brown, a chestnut colour, liver colour, black, grey, or whitish.

The bufonitæ are usually found immersed in beds of stone; and so little doubt is there of what they have originally been, viz. the petrified teeth of the *lupus piscis*, or wolf fish, that part of the jaw of the fish has sometimes been found, with the teeth petrified in it. See GRONDEUR.

The bufonitæ are said to be cordial and astringent: many other fanciful virtues are ascribed to them, which the present practice has rejected.

Dr. Kramer says, *pulvis bufonum*, when applied by way of poultice, with barley-flour and urine, is an excellent remedy for ripening pestilential buboes, but that it has no such effect in venereal, or any other than pestilential buboes.

BUG, in *Entomology*. See CIMEX.

BUG, in *Geography*, a river of Poland, which rises in Red Russia, and after a winding course through the centre of the kingdom, joins the Vistula between Plocko and Warsaw.

BUG-caterpillar, in *Entomology*, a name given by Bonnet to a small kind of caterpillar, which smells exactly like a bug. This is not the only species which yields a sensible smell, for there is another which, at the time of the change into the chrysalis state, emits a very pleasant rose-like scent; and their cases, which are made of earth and silk, retain that smell for a long time after, even for several years. Many other insects in this state are known to have a peculiar scent. See LARVA.

BUGA marble, in *Natural History*, a name given by the Spaniards to a species of black marble, called by our artificers the Namur-marble, and known among the ancient Romans by the name of *marmor Luculleum*. It is common in many parts of Europe, and is used by the Spaniards in

medicine as well as in building; the powder of it being said to be an excellent styptic, applied to fresh wounds.

BUGALET, in *Sea-language*, a small vessel with two masts, used on the coast of Brittany. The foremast is very short; and on each mast is carried a square sail, and sometimes a top-sail over the main sail. These vessels have a bowsprit, and set one or two jibs.

BUGARONIE, CAPE, in *Geography*, lies on the coast of Africa, in the Mediterranean, between Bugia bay on the West, and Cape Ferra on the east.

BUGEAT, a town of France, in the department of the Corrèze, and chief place of a canton in the district of Ussel; the town contains 629, and the canton 6011 inhabitants: the territory comprehends 307½ kilometres and 12 communes.

BUGEE, in *Zoology*, a sort of monkey mentioned by Ray in his Synopsis of quadrupeds. He tells us it is an Indian animal, and very rare even in India; that it is about the size of the beaver, and much of the same colour, but its tail and claws are wholly of the monkey kind. The species meant by Ray is altogether uncertain.

BUGELUGEY, the name of a large species of lizard, called by Clusius, and some other authors, *Lacertus indicus*. This is *Lacerta Ameiva* of Gmelin. See AMEIVA.

BUGEN, in *Geography*, a town of Germany, in the circle of Upper Saxony, and middle mark of Brandenburg, 10 miles W. of Frankfurt on the Oder.

BUGENHAGEN, or BUGENHAGIUS, JOHN, in *Bio-geography*, a learned protestant divine, was born at Wollin in Pomerania, in 1485. From being a Catholic priest and a violent opposer of Luther's doctrines on their first promulgation, he became a convert and zealous propagator of them in the north of Germany. At Wittenberg, where he was minister, he was in high esteem both for his learning and moderation; and his reputation induced Christiern III. king of Denmark, to invite him for the purpose of settling the reformation in that kingdom. In this arduous task he gave great satisfaction. He died at Wittenberg in 1558. Of his various works the most worthy of notice are, "Commentaries on the Holy Scriptures," in several volumes, 8vo. a "Harmony of the Evangelists," and a "History of Pomerania." *Nouv. Dict. Hist. Mosheim, E. H. vol. iv. p. 304.*

BUGEY, in *Geography*, a province or small district of France, before the revolution, bordered on the east by Savoy, on the south by Dauphiny, on the west by Bresse, and on the north by Franche Comté, and dependant on the government of Burgundy. It is about 20 leagues long, and 12 broad. Its capital is Belley. Before the time of Brennus, the tract of land denominated Gex, and part of Bresse, formed a distinct country; which is termed by Polybius the "Celtic Delta," in allusion to its triangular form. M. Peter I. I. Bacon-Tacon in his "Recherches sur les Origines Celtiques, &c." Paris, 1799, traces the primitive history of Bugey to the first ages of the world, and thinks that its mountains retain their original form; being a continuation of mount Jura, which is itself closely connected with the Alps. He also endeavours to prove, that the worship of Isis was, from time immemorial, established in the Bugey; and that the topographical nomenclature of the county is still in a manner entirely "Isiac." He is inclined, likewise, to suppose, that the inhabitants of this district, 600 years before our æra, accompanied Bellocus, from the first part of whose name is derived Belley, on his memorable expedition into Italy, where he founded the cities of Cremona, Vicenza, Aquileja, Pavia, Mantua, &c. From various concurring circumstances this author

also concludes, that the Rhodians, about 300 years before Christ, founded a colony on the Bugey, and on the authority of Pliny and Eusebius, he assumes that they gave their name to the river Rhone. He further suggests, from some names that occur in Bugey, that some intercourse formerly subsisted between this country and England; and that the Gauls peopled our island, and founded the cities of London and Dover.

BUGGANZ, BAKA-BANYA, or BUKANETZ, a royal, free, and mine town of Hungary, in the Bath district, formerly famous for its gold and silver mines, but now subsisting by tillage. It was sacked and burnt by the Turks in 1664; 32 miles W. of Gran.

BUGGARD, a town of Denmark, in the island of Funen, 16 miles W. of Odense, or Ottensee.

BUGGENHAGII, in *Ichthyology*, a species of *CYPRINUS*, distinguished, according to Bloch, by having nineteen rays in the anal fin.

The length of this fish is about twelve or fourteen inches: the body is of a blackish colour above: compressed on the sides, and silvery scales large: flesh white. This sort is found in the lakes of Germany and Sweden.

BUGGERS, *Bulgarii*, anciently signified a kind of heretics, otherwise called *Paterini*, *Cathari*, and *Albigenses*.

The word is formed of the French *Bugres*, which signified the same, and that from *Bougria* or *Bulgaria*, the country where they chiefly appeared.

The Buggers are mentioned by Matthew Paris, in the reign of Henry III. under the name of *Bugares*. *Circa dies autem illos invaluit heretica pravitas eorum qui vulgariter dicuntur Paterini & Bugares, de quorum erroribus malo tacere quam loqui.*

BUGGER, or BUGGERER, came afterwards to be used for a Sodomite; it being one of the imputations laid, right or wrong, on the Bulgarian heretics, that they taught, or at least practised, this abominable crime. *Casen. Orig. p. 27. Menag. Orig. p. 114. Trev. Dict. Univ. tom. i. p. 1149. voc. Bougre. Du-Cange, Gloss. Lat. tom. i. p. 637. voc. Bulgari.*

BUGGER, *Bulgarius*, is also a denomination given to usurers, a vice to which the same heretics are said to have been much addicted. *Du-Cange, Gloss. Lat. tom. i. p. 637.*

BUGGERY, in our *Laws*, signifies the crime of sodomy; it is said to have been introduced into England by the Lombards, by whom it is usually supposed to have been borrowed from the *Bougres*, or *Bulgarians*. Sir Edward Coke defines buggery, *carnalis copula contra naturam, et hoc per confusioem specierum* (viz. by a man's or woman's coupling with a brute beast) *vel sexuum*, by a man's having to do with a man, or a woman with a woman.

The delicacy of the English law treats this crime, in its very indictments, as not fit to be named, "*peccatum illud horribile, inter Christianos non nominandum.*" *Rot. Parl. 50. Edw. III. n. 58.* A similar taciturnity was observed by the edict of Constantius and Constans. *Cod. 9. 9. 31.*

This crime the voice of nature and of reason, and the express law of God (*Lev. xx. 13. 15.*) determine to be capital. Of this we have a signal instance long before the Jewish dispensation, in the destruction of two cities by fire from heaven; so that this is an universal, not merely a provincial precept. Our ancient law in some degree imitated this punishment, by commanding such miscreants to be burnt to death (*Brit. c. 9.*); though Fleta (*l. i. c. 37.*) says, they should be buried alive; either of which punishments was indifferently used for this crime among the ancient Goths. *Stiern. de jure Goth. l. 3. c. 2.* But now the general pu-

nishment of all felonies is the same, namely by hanging: and this offence (being in the times of popery only subject to ecclesiastical censures) was made felony without benefit of clergy by statute 25 Hen. VIII. c. 6. revived and confirmed by 5 Eliz. c. 17. And the rule of law is, that if both are arrived at years of discretion, *agentes et consentientes pari pena plebantur.* 3 Inst. 59. If the person on whom it is committed be a boy under the age of discretion (generally reckoned at fourteen), it is then felony only in the agent. All persons present, aiding and abetting in this crime, are principals; and the statutes make it felony generally. There may be accessaries before and after the fact; but they are not, like principals, excluded from benefit of clergy. 1 Hale's Hist. P. C. 670. In every indictment for this offence, there must be the words, "*rem habuit veneream et carnaliter cognovit, &c.*" By the articles of the navy (art. 29. stat. 22 Geo. II. c. 33.), this crime, committed by any person in the fleet, is punished with death by the sentence of a court-martial. Buggery is usually excepted out of our acts of general pardon. This "crime against nature," says judge Blackstone (vol. iv. p. 215.), ought to be strictly and impartially proved, and then as strictly and impartially punished. But it is an offence of so dark a nature, so easily charged, and the negative so difficult to be proved, that the accusation should be clearly made out; for, if false, it deserves a punishment inferior only to that of the crime itself. Threats of charging persons with this crime, or actual accusations, are methods to which the profligate frequently recur for the purpose of extorting money, which is an act of felony.

BUGGESSES, in *Geography*. See BONI, and BOUGI-NESE.

BUGIA, or BOUJIAH, a large sea-port town of Africa, in the kingdom of Algiers, and province of Constantina. It is built upon the ruins of a large city, the supposed Saldæ of Strabo, constructed by the Romans at the foot of a high mountain that looks towards the north-east: a great part of the walls runs up to the summit of the mountain, where is a castle that commands the place, besides two others at the bottom, built for a security to the port. It is one of the garrisoned towns of the kingdom, where three suffrags continually reside; but though the garrison consists of from two to three hundred men, it is not sufficient to overawe and prevent the depredations of the Kabyles, who disturb the town on every market-day, and are guilty of unsufferable rapine and barbarity. The town is watered by a large river, called by Marmol and Dapper, "Huet el Quibir," or the "great river," which is supposed to be the "Nafava" of Ptolemy, as it discharges itself into the sea a little to the eastward, after having received a great number of rivulets. The harbour, called by Strabo the port of Sarda, or rather Salda, is formed by a narrow neck of land, that runs out into the sea; a great part of which was formerly faced with hewn stone. Over this was conducted an aquæduct for supplying the port with water, by discharging it into large basons; but the well, aquæduct, and basons are destroyed: and the tomb of Seedy Bugree, one of the tutelary saints of the place, is the only thing remaining worth notice. Bugia is a populous place; and the inhabitants carry on a considerable trade in plough-shares, mattocks, and such utensils, which they manufacture of the iron supplied by the adjacent mines. The Kabyles likewise furnish every market with great quantities of oil, wax, and dried figs, which are shipped off for the Levant, and sometimes for Europe. They also supply soap and timber fit for building. N. lat. 36° 35'. E. long. 5° 20'.

BUGIE, a sea-port town of Egypt, on the west coast of the Red sea, nearly opposite to Sidon, the port town of Mecca,

Mecca, and about 37 leagues west of it. N. lat. 22° 15'. E. long. 38° 40'.

BUGINVILLÆA, in *Botany* (named by Commerfon in honour of Bouganville, the celebrated French circumnavigator). Willd. 767. Juss. 91. Class and order, *obandria monogynia*. Nat. ord. *Nyctagineæ*, Juss. Gen. Char. *Calyx* none. *Corol.* tubular, a little swelling at the base, and contracted about the middle, permanent, four-toothed. *Filaments* eight, inserted on the receptacle shorter than the corolla. *Germe*n superior, oblong. *Pericarp* one-seeded.

Species, *B. spectabilis*, La Marck, *Illustr. Pl.* 294. A beautiful evergreen shrub. *Stem* armed with recurved prickles placed a little above the axils of the leaves. *Leaves* alternate, petioled, roundish-ovate, acuminate, very entire, veined. *Panicle* terminal; peduncles three-flowered. *Flower* inserted on the midrib of a roundish bract, resembling a leaf, and longer than the flower, seated on the common peduncle, and adhering to the bottom of the corolla. A native of Brazil described and figured from a dried specimen sent by Commerfon.

BUGLANEH, in *Geography*. See BAGLANA.

BUGLAS See *Island* of NEGROES.

BUGLE, in *Botany*. See AJUGA.

BUGLE, among *Sportsmen*, formed probably from the Saxon *bugen*, to bend, denotes a hunting-horn.

In *Heraldry*, the bugle-horn is generally borne fringed and garnished; which circumstance must be mentioned in the blazon.

BUGLE, is also used for a shining bead of black glass.

BUGLIO, in *Geography*, a town of Switzerland, in the Valceline. N. lat. 46°. E. long. 9° 40'.

BUGLOSS, in *Botany*. See ANCHUSA.

BUGLOSS, *common blue vipers*. See ECHIUM *vulgare*.

BUGLOSS, *cowslips*. See PULMONARIA *officinalis*.

BUGLOSS, *wild vipers*. See ECHIUM *italicum*.

BUGLOSS, *small wild vipers*. See ASPERUGO *procumbens*.

BUGLOSS, *sea*. See PULMONARIA *maritima*.

BUGULM, or BUGULMINSK, in *Geography*, a town and district of Russia, in the government of Ufa, seated on the Bugulm, a rivulet that falls into the Ik; 112 miles W. of Ufa.

BUGURUSLANK, a town of Russia, in the government

ment of Ufa, seated on the Kinel; 148 miles W.S.W. of Ufa.

BUGUTCHANI, a town of Siberia, 168 miles E. of Eniseik.

BUHEL, or BUHL, a town of Germany, in the circle of Swabia, and margraviate of Baden, 6 miles S.W. of Baden-Baden.

BUHLITZ, a town of Germany, in the circle of Upper Saxony and Farther Pomerania.

BUI, a town of Russia, in a district of the same name, pertaining to the government of Koltroma, seated on the river Koltroma, at its junction with the river Vara.

BUI, a river of Russia, which joins the Kama near Mu-levo.

BUIE, a strong town of Istria, belonging to the states of Venice, the residence of a governor; 9 miles S. of Capo d'Istria.

**BUILDING, Art of.** The art of building is, perhaps, the most ancient of all arts; clothing is rejected or dispensed with by some savages, and in some favoured climates the arts of procuring food are rendered almost unnecessary by the unsolicited bounty of nature; but we are acquainted with no people that do not form dwellings, places of shelter and security during the night, of assembly to the family, and store-houses of the property, however trifling, that none are without. It is not even confined to man; birds, beasts, and insects have their architecture; but their modes, inspired by instinct, are invariable as the operations of nature; to man alone is given the principle of improvement.

The forms and methods of building depend essentially on the nature of the materials furnished by the country, and the state of society among its inhabitants; and, accordingly, nations very remote in situation, and distant in time, have resembled one another in these particulars. Vitruvius relates that the Colchians, in the kingdom of Pontus, where they abound in forests, fix trees in the earth close together in ranks to the right and left, leaving as much space between them as the length of the trees will permit; upon the ends others are laid transversely, which enclose the space for habitation in the middle; then at the top the four angles are braced together with alternate beams, and the roof is also formed by beams laid across from the extreme angles gradually converging, and rising from the four sides to the middle point at the top, and then covered over with boughs and loam. The interstices which remain in the walls, on account of the coarseness of the materials, are stopped with chips and loam. The reader will observe how accurately this passage describes the log-houses of the American back-settlers. On the other hand, the Phrygians (continues Vitruvius) who inhabit a champaign country, destitute of timber, select little natural hills, excavate them in the middle, dig an entrance, and widen the space within as much as the nature of the place will permit; above they fix stakes in a pyramidal form, and cover them with reeds or straw, heaping thereon great piles of earth. This kind of covering renders them very warm in winter and cool in summer. The habitations of the Phrygians thus described, appear to resemble very nearly the subterraneous dwellings of the Samoyedes and Greenlanders. The kind of cabin, however, most frequently found among barbarous nations, is of a conical shape, formed by branches of trees interlacing one another, and meeting in a point at the summit, their exterior surface being covered with reeds, or leaves, or clay. Such are the wigwams of the North American Indians, and the kraals of the Hottentots and Caffres.

But to proceed to civilized nations. The edifices of the Egyptians, which are regarded as the earliest monuments of

wrought stone, are also the most distinguished in that method. The immense quarries of Egypt probably inspired the taste, as they furnished the materials, while the periodical overflows of the Nile facilitated their transport. Thus favoured by nature, the energetic industry of the ancient Egyptians delighted in every thing wonderful and gigantic; the pyramids, immortal as the country, proud tombs which have long outlived the memory of the mighty kings whose ashes they contain; granite temples, extensive as towns, and laboured as cabinets, temples which enclose in their courts, or support upon their roofs villages of the modern inhabitants; mile long avenues of sphinxes, colossal statues, and obelisks. The art of building, among the Egyptians, was reduced to the simplest principles; unacquainted with arches, the doorways and other openings were covered with solid lintels, and the temples roofed with massy slabs, the walls, columns, and entablatures were formed of stones of the largest size, perfectly wrought, and laid in horizontal courses, without cement or ligatures; the walls were of enormous thickness, and generally diminishing upwards, with a regular slope, in the manner of fortifications. The passage within the great pyramid is roofed in a singular manner with courses of stones projecting over one another, like inverted steps, till they meet at the summit; thus shewing a method of ceiling with stone which may be regarded as intermediate between the use of lintels and of arches. Some of the tombs also present examples of vaults hollowed in the solid rock, and of niches. So far, and, according to our present information, no farther did the Egyptians proceed towards the discovery of arches. But we expect with impatience the account to be published by the National Institute of France, when accurate measurements, correct drawings, and minute research, conducted under all the advantages of leisure and protection, will replace the hasty sketches and imperfect remarks of individuals, who, though deserving of applause and gratitude for having done so much, under circumstances of danger and discouragement, have left still more to be desired. The size of the masses of stone employed in these constructions is altogether astonishing, and displays mechanical skill and energy, which leave far behind all the similar enterprises of modern nations. Thus, in the temple of Hermopolis, one of the least of the remains, the columns are 9 feet 6 inches in diameter, the architrave is composed of five stones, each 23 feet long, and the frieze of as many; the only remaining stone of the cornice is in length 36 feet. Of the hundred columns of the portico of the temple at Karnac, the least is in diameter 8 feet, and the greatest 12½ feet. The two obelisks at Luxor, of rose-coloured granite, are still 70 feet above the ground, and to judge by the depth to which the colossal statues which accompany them are buried, we may reckon about 30 feet more concealed from the eye, making in all 100 feet for the height of these monuments. Their preservation is perfect; the hieroglyphics with which they are covered are cut in deep and in relief at the bottom, and shew the bold hand of a master, and a beautiful finish. (Denon's Travels in Egypt.) But the account which Herodotus gives of the monolithic chapel of the temple of Latona, at Buttis, is the most extraordinary; it was 40 cubits in every dimension, and was covered by another single stone, 40 cubits square, and 4 cubits thick. The same historian also informs us, that this enormous load was brought on rafts from the island of Philœ to Buttis, a distance of 200 leagues. This is undoubtedly the greatest weight that has ever been moved by the power of man.

The wonders of human industry also characterise the monuments of the ancient inhabitants of India; but their efforts were directed, almost exclusively, to excavation. The

ceaves of Elephantina and Saffette, the sculptured rocks of Mavalpuram, and, above all, the vast temples scooped in the granite mountains of Ellora, rival, in the incalculable labour of their execution, the works of the Egyptians.

The remains of Persepolis retrace the style of Egypt; from whence it appears, that the Persians received the art of building in wrought stone. Diodorus Siculus relates, that it was not till after the conquest of Egypt that they built the famous palaces of Susa and Persepolis, and that these great works were directed by Egyptian architects.

The same tale for gigantic constructions and extraordinary works in large stones is found among nations who, without communication with those already mentioned, must receive it from nature alone. When the Spaniards conquered Mexico and Peru, they remarked that the natives were accustomed to build edifices with large stones, perfectly wrought and jointed, and laid without mortar; they had also transported from great distances masses of extraordinary dimensions. Stonehenge, and various works of the same nature, in our own country and on the continent, may also be mentioned as efforts of energetic construction, which had preceded every thing of finish and ornament. Thus it should appear that this mode of building has every where been adopted previous to that with small stones and mortar.

The inhabitants of countries deprived of stone quarries supplied the deficiency by means of bricks. These were at first used crude, being merely dried in the sun, during a considerable time; but at length the manufacturers found the method by baking them to form bricks as solid and durable as stone. Of this material were built the walls of Babylon and the temple of Belus, the most ancient example of this mode of construction which history records, and which were reckoned among the wonders of the world. We also learn that bitumen was used as cement in these buildings, which renders it probable that at this period the method of reducing calcareous stones into lime to form mortar was not known.

It is, however, to the discovery of lime, that we owe the durability and perfection of cementitious building. Bitumen forms a porous connection which the air dissolves and the action of the sun evaporates, while calcareous cements are capable of acquiring a hardness superior to that of the generality of bricks and building stones.

The buildings of the Greeks were at first of wood and clay; but they soon substituted stone and marble to the beams and posts which formed their original edifices; and these were so regular and beautiful, that they offered a model, which art never lost sight of in the most sumptuous decorations. From this imitation arose the orders of architecture, and a reasoned system, which, assigning to every member its use and situation, preserved its original form, and perpetuated the memory of the ancient art of building. The Greeks, favoured by nature with abundant quarries of marble and other building stones of the best quality, proceeded on the same simple principles of construction which characterize the Egyptian monuments: large blocks of stone squared with mathematical accuracy, and laid without cement; openings covered with lintels, with a few exceptions of arches and vaults in the theatres and gymnasia; pediment roofs frequently covered with marble tiles. The observations of Mr. Reverly, given in the preface to the third volume of Stewart's "Antiquities of Athens," deserve transcription. "I shall add a few words on the construction of the buildings of Athens, which have not been mentioned in this work. The temple of Minerva is an example of this important part of their architecture. The columns are all constructed of single blocks in diameter, and in courses of more than a diameter in height: the wall

enclosing the cell of the temple, is formed of a single course of marble blocks in thickness, shewing a face inside and outside, the vertical joints corresponding over each other, and in seventeen horizontal courses, reckoning from the bottom of the architrave to the top of the upper step, rising to a height of thirty-three feet. The capitals consist each of one single block, 2, 9, 9, high, and the architrave lies upon them without any other precaution being taken to relieve the weight from the projecting edges of the abacus, than the most extreme accuracy in the two surfaces of the underface or fossit of the architrave, and the top of the abacuses, to render them perfectly parallel. The architraves are composed of three blocks, from face to back, each extending from centre to centre of the columns, and each block allo the whole height of the architrave, and of equal thickness. The frieze is in two courses in height, and each course wants so much of being the whole thickness of the frieze, as allows the metope, with the sculpture, which is cut on a thin slab, to lie against it. The triglyphs tail-in in one height, but do not go through. I observed that a triglyph, lying among the ruins, was so formed, that the back of the block was considerably narrower where it went into the frieze than the breadth of the triglyph, so that each extremity of the triglyph projected on to the face of the slab of the metope several inches, thus forming a rebate, which enclosed the metope. The cornice is in blocks, which are the width of one mutule and one space, their ends forming a complete course on the inside. The tympanum of the pediment is composed of one course of upright slabs, in the outside face, with horizontal courses behind them. The pavement, of which great part remains, is in squares of equal size, large and thick; the joints, as is the universal practice at Athens, are cut with the most mathematical precision, and are extremely difficult to discover in those parts which have taken a dark tint." "The perfect state in which these monuments remain, which have not been destroyed by violence, is one proof of the judgment with which they were constructed. The temple of Minerva would have been entire, except its timber roof, at this day, if a bomb had not been thrown into it by the Venetians, when it was used as the powder magazine of the Turks. The propylea, applied to the same purpose, was struck by lightning, and blown up. The small temple of Theseus is almost as entire as when it was first erected. Even so small a building as the Choric monument of Licierates is now entire, a circumstance arising chiefly from the great judgment shewn in its construction, by erecting it with large blocks, and consolidating the whole with a roof wisely made of one single piece of marble."

The erection of porticos required a frequent employment of very considerable blocks, and accordingly implied great skill in the art of transporting and elevating these masses. Vitruvius celebrates the simple and ingenious method practised by Ctesiphon, in conveying the shafts of the columns of the temple of Diana at Ephesus from the quarries, which were in single stones, sixty feet long; these, by means of axle-trees, adapted at each end, were made to revolve in the manner of a garden-roller.

The ancient Etruscans have left monuments of the same taste in the art of building; however, it is to them that is generally ascribed the method of building with small stones and mortar, at least, it is in the country which they inhabited, that are found the most ancient vestiges of this mode of construction. This method was carried to perfection by the Romans, who were also probably the inventors of domes. Their first temples were round and vaulted, as those of Quirinus, Romulus, Faunus, Cybele, Vesta, &c. Cossutius was the first Roman architect who built after the manner of the Greeks, about

200 years before the Christian era. From this period, though the Romans adopted the Grecian architecture, they did not reject their original mode of construction. Their most considerable edifices are built with pebbles and rubble stones, grouted in mortar, with the arches and angles and facings of brick, or small rubble stones squared, and strengthened at intervals, with regular bonding courses of stone or brick, running through the whole thickness. The walls, so built, were generally incruled with stucco or marble. This method of building is much more expeditious and economical than constructions of wrought stone, which occasion a considerable waste of materials, extraordinary labour in dressing and squaring, and necessitate great expence in removing and elevating. By this method the Romans, employing all kinds of workmen, and materials to the smallest fragments, were enabled to raise the prodigious number of edifices which surpass, in extent, the monuments of any other people.

Vitruvius describes the different kinds of wall used in his time in this manner. The sorts of walls are the *reticulated*, which is now generally used, and the ancient, which is also called the *incertain*. Of these two, the reticulated is the handsomest; but the joints are so ordered, that in all parts the courses have an infirm position; whereas, in the incertain, the materials rest firmly one upon the other, and are interwoven together, so that they are much stronger than the reticulated, though not so handsome. Both sorts are formed of very small pieces, that the walls, being saturated with mortar, may endure the longer; for the stones being of a porous and spongy nature, absorb the moisture from the mortar, and when there is abundance of mortar, the wall having more humidity, will not so soon decay, but will, on that account, be rendered more durable; for as soon as the humidity is extracted from the mortar by the suction of the stones, then the lime and sand separating, the cement is dissolved, and the mortar, no longer uniting the materials, the walls soon become ruinous. This may be observed in some tombs near the city, which are built with marble, or hewn stone, and the internal parts rammed with rubble stone; the mortar being, by length of time, drained of its humidity by the suction of the stones, and the union of the joints being dissolved, they separate, and fall to ruin. To avoid this error, (Vitruvius proceeds), the middle space must be strengthened with abutments of the red hewn stone, or bricks, or common flints built in walls two feet thick, and bound to the front with cramps. Another sort, is that called by the Greeks *emplecton*, which, (says Vitruvius), is also used by our villagers. The faces of the stones in this kind are smooth, the rest is left as it grows in the quarry, being secured with alternate joints and mortar; and our artificers quickly raising a shell, which serves for the faces of the wall, fill the middle with rubble and mortar. But the Greeks do not build in that manner; they not only build the facing courses regularly, but also use alternate joints throughout the whole thickness, not ramming the middle with rubble, but building it the same as the face; besides this, they dispose single pieces, which they call *diatonos*, in the thickness of the wall, extending from one face to the other, which bind and exceedingly strengthen the walls.

The works in wrought stone of the Romans were, as well as those of the Greeks, constructed without cement; but they used cramps and ligatures of iron and bronze in extraordinary profusion. It is remarked by Mr. Wood, in describing the great temple of Balbec, probably a work of Antoninus Pius, that "the shafts of these columns consist of three pieces, joined most exactly without cement, which is used in no part of these buildings, and strengthened by

iron pins received into a socket worked in each stone. Most of the bases had two such sockets, one circular and another square, corresponding to two others of the same shape and dimensions in the underpart of the shaft. By measuring some of the largest of these, which were circular, we found the iron pin which they received must have been a foot long, and above a foot in diameter. When we observed, by finding such sockets in all the fallen fragments of this temple, that each stone had probably been strengthened in this manner, we were less surprised at the quantities of iron said to have been carried away by the Bashaws of Damascus at different times from these ruins, on which they had left evident marks of their violent, though unsuccessful, attempts to get at the iron of the columns which are standing. How much this method contributes to the strength of the building, is remarkably seen in the most entire temple, where a column has fallen against the wall of the cell with such violence, as to beat in the stone it fell against, and break part of the shaft, while the joinings of the same shaft have not been in the least opened by the shock." The use of metal was not confined to cramps and bolts, the ancients even constructed roofs of bronze; the portico of the Pantheon, before its spoliation by Urban VIII., was covered with beams and rafters of this material. Tiled with marble, and supported with granite columns; this portico presented a rare combination of grand and beautiful architecture, with the richest materials, and the appearance of indestructibility. Serlio has preserved a design of this metallic roof, which was formed of beams and rafters, after the usual methods of carpentry; these were united and secured by pins and nails of the same metal; and as well to economise the material, as to lessen the weight of the whole, the pieces were hollow. The interior of the portico is divided by the columns into three divisions, or aisles; the two lateral were ceiled, and that in the middle vaulted, also with bronze. The quantity and beauty of this metal may be appreciated by the throne of St. Peter, and the Baldaquin of the same cathedral, the most considerable, beyond comparison, of modern works in bronze, and whose enormous mass is not the equivalent of the spoils of the Pantheon from which they were formed, for an inscription on the portico of this edifice informs us, that the excess of this valuable metal was cast into the cannons of St. Angelo.

Bronze was also used with magnificent profusion in the decoration of buildings; thus many edifices preserve not indeed the ornaments themselves, these have long been torn away by the rapacity of barbarism, but the marks and cramp-holes, by which were attached alto relievos or trophies or inscriptions.

It excites regret to reflect that the means employed by the ancients to increase the beauty and ensure the solidity of their edifices, have, in many instances, only served to accelerate their destruction; the beautiful marbles of the Grecian temples are continually carried off by Turkish carvers of grave stones, or burnt into lime; the inhabitants near the site of the temple of Apollo Didymæus, appear to have been principally supported by this impious manufacture. Palmyra and Balbec have long furnished mines of metal to the neighbouring Bashaws; the Coliseum bears, in innumerable scaffolding holes, the marks of an attempt at its entire ruin in search of the cramps which connect its stones; and the amphitheatre of Nîmes is still blackened by combustions kindled for the same purpose; the temple of Peace, the baths and palaces of the emperors, and indeed almost all the edifices of grandeur and magnificence have been more ruined by the violences of rapine than the injuries of time.

It may be remarked, before we quit the subject of antique constructions, that the Greeks and Romans in their buildings of wrought stone appear always to have worked only the beds of the stones before placing them in the building, leaving the faces to be worked after the erection of the edifice; an excellent method, which saves from injury the arrises and moldings. On this account, unfinished columns are sometimes found in their remains; as in the relics of the temple of Apollo Didymæus, near Miletus, may be seen two columns supporting their architrave, with the flutes entirely worked; also, one left standing in its unfinished state, the channels under the capital, and at the base only, being marked out, as a direction to the workmen in completing the flutings, after the structure was raised. (Ionian Antiquities). Similar instances are also found in the Island of Delos.

The durability and extreme solidity of the Roman cementious buildings, in which the mortar has very generally acquired a hardness superior to that of the rubble stones which it connects, compared with the fragility and crumbling nature of the mortar, used by modern builders, had led some to suppose, that the ancients possessed processes and recipes for the formation of cements, the knowledge of which had perished together with many other valuable secrets in the ages of barbarity, which succeeded the fall of the Roman empire. But better information, and the experiments of ingenious men, have exploded this opinion, and there can be no doubt, that proper attention to the choice of lime stone and sand, to the burning of lime, and, above all, care and labour in the mixing and tempering these materials, would enable our workmen to rival those of Rome in this important part of construction. In some instances, this has been tried, and though the lapse of ages may be necessary to make the comparison complete, yet present appearances are sufficient to banish any reasonable fear of the result. See the article CEMENTS, *calcareous*.

Architecture, together with all the arts and sciences that adorn and illustrate humanity, experienced the feebleness and degradation which attended the decline and fall of the Roman empire. Impudent compilers of the spoils of the edifices of happier times, the builders of those ages, have only perpetuated their own ignominy. Constantine was the first of these depredators; he ruined the arch of Trajan to adorn his own with its inappropriate ornaments, and the Mausoleum of Adrian supplied columns to support the aisles of his churches.

In the general confusion occasioned by these practices, it is not to be wondered at that the principles of Grecian architecture, somewhat corrupted in the best times of Rome, should be entirely lost: architraves were omitted and columns were made to support arches and vaults; arcades were every where substituted to colonnades, vaults to ceilings; thus the excessive use of arches and vaults is characteristic of the method of construction adopted in the middle ages.

This corrupted Roman style continued with various and increasing deteriorations, and under different names, as in our own country, of Saxon and Norman, to be the prevailing architecture of Europe till towards the 12th century, when what is generally called the Gothic style prevailed. This is an architecture of singular and original merit, surprizing, and fantastic, and magnificent, and awful; but for the description of Gothic architecture the reader is referred to that article; our business at present is with the modes of building observed in these edifices.

The Gothic mode of construction is an ingenious compendium of building well adapted to the peculiar style of architecture; economical in materials and labour. Rejecting

heavy cornices, architraves, and lintels, of all kinds, the builders had seldom occasion to use stones larger than a man might carry on his back up a ladder from scaffold to scaffold, though they had pulleys and spoked wheels upon occasion. Thus they were readily enabled to raise up their works to an extraordinary height; in which particular they appear to have placed great pride and emulation. Hence the lofty towers and spires, ambitious ornaments that tyrannise over the body of the building, and claim attention at the expence of those useful parts to which they ought, but disdain, to be subordinate. The churches were arched over with groined vaulting, which threw the weight on the springing points instead of distributing the pressure equally along the walls, as was the case with the Roman plain vaults and ceilings; the points of pressure from the vaults were opposed by buttresses, and the intermediate spaces of the walls were thin, and occupied with windows: in this respect again differing from Roman construction where the walls are of uniform thickness in their whole extent, without apparent buttresses. The vaulting was ingeniously composed of a skeleton of hewn stone, and the interstices filled in with lighter materials. Thus Mr. Price remarks, in his Observations on the Cathedral Church of Salisbury, that "the groins and principal ribs are of Chilmark stone, but the shell or vaulting between them is of hewn stone and chalk mixed, on top of which is laid a coat of mortar and rubble, of a consistence probably ground in a kind of mill and poured on hot while the lime was bubbling, because by this the whole is so cemented together as to become all of one entire substance. This composition is very remarkable, somewhat resembling the pumice stone, being porous and light, by which it contributes prodigiously to the strength of the whole, and at the same time the least in weight of any contrivance that perhaps was ever used."

The machine of a Gothic edifice, consisting so essentially of vaults and arches, required great contrivance in balancing and sustaining their pressures; this was effected by means bold, ingenious, but sometimes presumptuously insufficient. The genius of these architects had a tincture of extravagance which led them to sacrifice always the apparent, and too often the real solidity of their buildings to those picturesque and marvellous effects which captivate the imagination of every one, but offend the judgment of the connoisseur. Accordingly these edifices must not expect to rival the duration of the immortal constructions of Greece and Rome.

The pendants from the vaults are among the most pleasing and innocent of the plays of ingenious construction in the Gothic style; but the attempt to substitute weight to butment, generally observed in the middle aisle pillars of cathedrals, supporting unassisted the pressure of the side vaulting, is a serious defect, which threatens the ruin of these venerable piles. On this account Sir Christopher Wren observes, that "almost all the cathedrals of the Gothic form are weak and defective in the poise of the aisles. As for the vaults of the nave, they are on both sides equally supported and propped up from spreading by the bows or flying buttresses which rise from the outward walls of the aisle. But for the vaults of the aisles they are indeed supported on the outside by the buttresses, but inwardly they have no other stay but the pillars themselves, which, as they are usually proportioned, if they stood alone without the weight above could not resist the spreading of the aisle one minute: true indeed the great load above of the walls and vaulting of the nave should seem to confine the pillars in their perpendicular station, that there should be no need of butment inward; but experience hath shewn  
the

the contrary, and there is scarce any Gothic cathedral that I have seen at home or abroad, wherein I have not observed the pillars to yield and bend inwards from the weight of the vault of the aisle."

Hence it appears that the method pursued in erecting these buildings was to insert the springing stones as the work proceeded, but to leave the vaults to be turned after the walls were carried up to their full height and the whole roofed in.

The pointed arch has several advantages over arches formed by one segment of a circle; particularly, as applied to vaults, it will rise with little centering, requires lighter vouffoirs, and less butment. The Gothic architects seem to have perpetually calculated the minimum of necessary resistance and solidity, and they displayed considerable skill in aggravating the appearance of boldness by the choice of materials; we have already seen the light composition of their vaults, and on the other hand they frequently used Parbec marble, a very hard and strong stone for the slender shafts which had to support great weights. The roofs of Gothic buildings are very high pitched, a form more of choice than necessity, rather adopted in compliance with their pointed and pyramidal style of architecture, than necessitated by the climate, as they are generally covered with lead. These roofs are therefore faulty in burdening the walls with an unnecessary load of lead and timber, and they are also deficient in construction by the omission of tye beams to counteract their tendency to spread and thrust out the walls.

Modern architecture, though it has adopted its decorations from the remains of Greek and Roman antiquity, has still retained considerable traces of the Gothic style. These may be observed in the affectation of height, in the ostentatious ornaments of domes and steeples, and in the fondness for complicated forms of plans and multiplicity of parts; and accordingly the construction also is a medium between Gothic temerity and Roman prudence; the balancing of arches and vaults still exercised the skill of the architects; the domes of St. Peter's, of the Vatican, and St. Paul's of London, illustrate the ingenuity and mathematical science of their authors, but we no longer find apparent solidity rejected, or real solidity sacrificed. We have seldom the grand constructions in hewn stone of the Greeks, nor, on the other hand, the economical building of Gothic architects, nor the cementitious walls of the Romans.

Stone, brick, timber, and metal, are our materials. Stone is used rough in rustic buildings, either dry or in mortar; but the stone employed in more finished edifices, either as facing to brickwork, or, where the material is plentiful, in the whole substance of the walling, is used in blocks of moderate size, squared and laid in mortar, and bonded with alternate courses; modern architects, and particularly the French, have shewn much ingenuity in the masonry of arches and coives and plat-bands. Iron is used plentifully both for cramping stones together and in ligatures to entire walls, thus all considerable domes are strengthened and secured from spreading by strong chains surrounding them; and lead is continually employed in large quantities on roofs. Timber is used in all edifices to form roofs and floors, and to bind and strengthen the walls and foundations, and many buildings are erected entirely with this material. Carpentry is the art in which modern workmen chiefly excel.

The buildings of this country may be comprehended under the following classes: rough stone, like the common houses of the rocky districts, which are either worked dry or with mortar; hewn stone, as the buildings of Bath; brick and stone mixed, in which, as they are always remote

from quarries of stone, that material is the most expensive, and therefore employed in the ornamental parts, as cornices, plat-bands, window fills, and all the members of architecture, and sometimes applied as a facing to the brick wall; in this manner are all the buildings of London; and, lastly, timber, which was formerly the most common of all, and is still a very considerable class; such are all the cottages of the poor out of the rocky districts, and many farm houses and considerable dwellings. These are formed of a frame of timber-work, which in the better sort of houses has its interstices filled in with brick-work, and is called brick nogging, or brick and stud, and then lathed over and plastered, or rough-cast, or stuccoed, or sometimes boarded; the poorer sort, however, are covered with reeds and clay. English buildings are roofed with reed and thatch, which was formerly the most general mode, and is still very prevalent in the country; also with tiles, slate, lead, and copper. Slates are used constantly in the stone counties, and brought thence to other parts, as a light, durable, and handsome covering. Tiles are the manufacture of the brick districts, and used there. Lead and copper, as the most expensive materials, are seldom employed to cover entire roofs, but chiefly for gutters and platforms.

Our buildings may justly claim the merit of lightness in construction, economy of labour and materials, and convenient distribution. Their real and evident defect is the want of solidity; this is in great measure to be attributed to the bad quality of the cements, which are composed with such disgraceful carelessness and ignorant haste by the workmen. Our bricks too, which are made on the principle which pervades all our manufactures of sacrificing every thing to quantity and cheapness, are neither tempered nor burnt sufficiently. In the arts of carpentry and joinery our workmen are peculiarly eminent, both in the bold and skilful construction of roofs and bridges, and in neat and accurate internal finishing.

As the buildings of London are regulated by what is commonly called the *Building Act*, "an act for the further and better regulation of buildings and party walls, and for the more effectual preventing mischiefs by fire, within the cities of London and Westminster and the liberties thereof, and other the parishes, precincts, and places within the weekly bills of mortality, the parishes of St. Mary-le-bone, Paddington, St. Pancras, and St. Luke at Chelsea," which repeals and amends several former acts for the same purpose, it may be proper to give a brief abstract of part of it. This act, passed in the 42nd year of the reign of his present majesty, A. D. 1774, begins by dividing all buildings into seven rates or classes, for the purpose of subjecting them to various regulations respecting the thickness of their walls. Cap. 2. The *first rate* comprehends churches and all places of public worship, all buildings for brewing, distilling, soap making, melting of tallow, dying, boiling of turpentine, casting brass or iron, refining sugar, and glass making, of whatever dimensions these buildings may be, and also every warehouse, and other buildings whatsoever, not being a dwelling house, which exceeds three clear stories above ground, exclusive of the rooms in the roof, or which is of the height of 31 feet above the pavement of the street to the top of the coping; and every dwelling house, which with its offices connected otherwise than by a fence wall, or open passage, exceeds when finished the value of 850l., or covers more than nine squares of building on the ground floor, (each square containing 100 superficial feet). The regulations for these are, cap. 3 and 4, that all the *external walls* shall be built, at the foundation, of the thickness of two bricks and a half, or 21½ inches, thence to diminish gradually 2¼ inches

inches on each side to the top of the footing, which is to be nine inches high, and two inches below the surface of the paving or flooring of the cellar story; thence, the wall is to be carried up two bricks, or  $17\frac{1}{2}$  inches in thickness to the under side of the one pair of stairs floor, and thence, in the thickness of one brick and a half, or 13 inches, up to the under side of the plate under the roof or gutter; and thence, the parapet is to be built in the thickness of one brick, or  $8\frac{1}{2}$  inches, with the exception of such parts of the wall as shall be wholly of stone, which may be of the thickness of 14 inches below the ground floor, and nine inches above. The party walls of the same buildings are to be built at the foundation three bricks and a half, or two feet six inches and a half in thickness; thence to diminish gradually  $4\frac{1}{2}$  inches on each side to the top of the footing, which must be one foot high, and two inches below the cellar floor; thence, the wall is to be built in the thickness of two bricks and a half, or one foot nine inches and a half up to the under side of the ground floor; and thence in the thickness of two bricks, or  $17\frac{1}{2}$  inches, up to the under side of the floor of the rooms (if any) in the roof of the highest building adjoining to such party wall; and thence of the thickness of one brick and a half in length, or 13 inches, to the top of the wall.

Cap. 5. defines the second rate of buildings, which consists of every warehouse, stable, or other building, not being a dwelling house, that exceeds two clear stories, and does not contain more than three clear stories above ground, or which is of the height of 22 feet and under 31 feet from the pavement to the top of the coping; and also every dwelling house which with its offices exceeds the value of 300l., and does not amount to more than 850l., or which covers more than five, and less than nine squares of building. Cap. 6 and 7. The external walls of the second rate are to be built at the foundation in two bricks thick, and diminish regularly  $2\frac{1}{4}$  inches on each side to the top of the footing, which must be nine inches high; thence to be carried up in one brick and a half thick to the under side of the one pair of stairs floor; and thence to the under side of the coping of the parapet in the thickness of one brick; stone work excepted, which may be of the thickness of nine inches above the ground floor. The party walls are to be three bricks and a half at the foundation, diminishing  $4\frac{1}{2}$  inches on each side to the top of the footing, which is to be nine inches high; thence, the wall must be two bricks and a half thick up to the under side of the ground floor; thence, two bricks thick up to the under side of the floor of the two pair of stairs story; and thence, of the thickness of one brick and a half to the top of the wall.

Cap. 8. The third rate of building is defined to include every warehouse, stable, and other building, not being a dwelling house, which exceeds one clear story, or does not contain two clear stories above ground, or which is above 13 feet, and less than 22 feet in height from the pavement to the top of the coping, and also every dwelling house, which with its offices exceeds the value of 150l., and does not amount to 300l., or which covers more than three and a half and less than nine squares of building. Cap. 9 and 10. The external walls of such buildings are to be two bricks thick at the foundation, and to diminish  $2\frac{1}{4}$  inches on each side to the top of the footing, which must be six inches high; thence, the wall is to be carried up one brick and a half thick to the under side of the ground floor, and thence, one brick in thickness to the coping of the parapet. The party walls are to be three bricks thick at the foundation, diminishing  $4\frac{1}{2}$  inches on each side to the top of the footing, which is to be nine inches high, and thence, to be built two bricks in thickness to the under side of the ground floor,

and thence, one brick and a half thick to the top of such wall.

Cap. 11. The fourth rate of building which is defined to include every warehouse, stable, or other building, not being a dwelling house, which does not exceed one clear story above ground, or the height of 13 feet from the pavement; and every dwelling house which with its offices does not exceed the value of 150l., or three squares and a half of building. Cap. 12 and 13. The external walls of this rate are to be similar to those of the third rate. The party walls must be two bricks thick at the foundation, diminishing  $2\frac{1}{4}$  inches on each side to the top of the footing, which must be nine inches high; thence, to be carried up in one brick and a half thick to the under side of the ground floor; and thence, one brick in thickness to the top of such wall.

Cap. 18. Every building except such as are particularly included in the first or seventh rates, which is at the distance of four feet and not eight feet from any public road, and which is detached from any building not in the same possession, 16 feet and less than 30 feet, is declared to be of the fifth rate, and may be built of any dimensions whatever.

Cap. 19. The sixth rate only differs from the fifth in demanding, that such buildings may be eight feet distant from the street or road, and detached 30 feet from other buildings; and this rate may be built of any dimensions, and with any materials whatever.

Cap. 20. Every crane-house on any wharf or quay, and every shamble, windmill, or water-mill, and also every building situated without the cities of London and Westminster, and the liberties thereof, used as workshops for tanners, fellmongers, glue makers, calicoe printers, whittlers, whitening makers, curriers, buckram stiffeners, oil-cloth painters, wool staplers, throwsters, parchment makers, is declared to be of the seventh rate of building, and may be built of any dimensions whatever. Cap. 21. Crane-houses must be built externally of stone, brick, slate, tile, oak, elm, steel, iron, or brass; and all other buildings of the seventh class may be erected of any materials whatever, but must not be covered with pitch, tar, or any inflammable composition.

Cap. 22. Every office which shall be entirely detached from the building to which it belongs, or connected therewith only by a fence, wall, or covered passage, open on one or both sides, shall be deemed to be of the rate or class of building such office would be of, if it did not appertain to any other building.

Cap. 14. The materials of party walls are to be brick or stone, and no timber to be used in them, except such as is necessary for planking, bridging, or piling the foundation; and cap. 27. for templets, chains and bond, and also the ends of girders, beams, purlins, binding and trimming joists, or other principal timbers, observing always to leave  $8\frac{1}{2}$  inches of solid brick work between the ends and sides of such timbers and the timbers of adjoining buildings. Cap. 26. Party walls are to be carried up one foot six inches above the roof of the highest adjoining building, which shall gable against them; and to be one foot above the jutters. Cap. 29. Chimnies built in party walls are subject to the following regulations: the back of the chimney from the hearth, to 12 inches above the mantle, is to be built in 13 inches thick in the basement story, and  $8\frac{1}{2}$  inches thick in the upper stories; and in those cases where chimnies are built back to back on each side of a party wall, the entire thickness of the backs is to be, in first rate houses, eighteen inches in the cellar story, and thirteen inches in the upper stories, and in the second, third, and fourth rates, the thickness in the cellar story is to be thirteen inches, and eight inches and a half in the upper stories.

Cap. 38. Every owner of any building within the limits of this act, who may think it necessary to repair or rebuild the party wall between his and the adjoining premises, is to give three months notice in writing to the owner of the adjoining building, appointing a survey to be made of the said wall, and naming two surveyors or able workmen on his part, and requiring the other party also to name two surveyors to meet at an appointed place, to view and certify the state of the wall. But if the owner of the adjoining premises shall neglect to appoint two surveyors on his part, according to notice, then the two surveyors first named, together with two other surveyors, to be named by the party giving notice, may, within six days after the time appointed in the notice, view the party wall, and certify in writing under their hands to the court of mayor and aldermen, or to the justices of the peace in their next quarter or general sessions as the case may be, the condition of the party wall, and whether the same, or any part thereof, ought to be repaired or pulled down and rebuilt; and, in case the major part of the surveyors appointed shall not, within the space of a month from the appointment, sign the certificate, then it shall be lawful for any one or more of the justices of the peace for London or Westminster, or the county of Middlesex or Surry, as the case may be, to appoint one other surveyor to be added to the surveyors before appointed, all or the major part of whom are to meet, and view the party wall; and in case the major part of them shall certify the wall to be decayed or ruinous, and not sufficiently secure from fire, then, within three days from the making such certificate, a copy of it is to be delivered to the owner of the adjoining building, or affixed to the door if it is unoccupied, and also filed with the clerk of the peace in the city, county, or liberty, where such wall is situate; and the last mentioned owners may appeal from the certificate to the next general or quarter sessions, when the justices are to summon before them one or more of the surveyors, and examine the matter upon oath, and thereupon make such orders as they think just.

Cap. 41. The person at whose expence a party wall is built, shall be reimbursed by the owner of the adjoining premises who makes use of the wall, a part of the expence in the following proportion. If the adjoining building be of the same, or a superior class to the building belonging to the person at whose expence the party wall was constructed, the owner of such adjoining building shall pay one moiety of the expence of so much of the party wall as he shall make use of: but if the adjoining building be of an inferior rate, the owner shall pay a sum equal to a moiety of the expence of building a party wall, as required by the act for such class of building.

Cap. 46. Door and window frames are to be set in reveals and recesses, at least four inches from the front of the building, except the door cases of warehouses. Cap. 48. Every coping, cornice, fascia, window dressing, portico, balcony, ballustrade, or other external decoration, or projection whatever, is required to be made externally of brick, stone, burnt clay, or artificial stone, stucco, lead, or iron, except the cornices and dressings to shop windows, or the covered ways to any building. No water is to be suffered to drip next to any public way from the roof of any building, except from the roofs of porticos or other entrances, but to be conveyed by metal pipes, or wooden trunks, or brick or stone funnels into drains or reservoirs.

Cap. 49. No bow window or other projection shall be built next to any public street, so as to extend beyond the general line of the fronts of the houses in the said streets, except such projections as are necessary for copings, cor-

nices, fascias, door and window dressings, or for open porticos, steps, or iron palliades; and also, except shop windows, which are allowed in streets 30 feet wide or more, to project ten inches from the line of building, and five inches in streets of less width.

Cap. 53. No stack of warehouses shall contain more than 35 squares of building on the ground plan, except such warehouses are divided by one or more party walls into divisions of not more than 35 squares each, and any communications made through the party walls are to have door cases and fills of stone, and iron doors. Stables are only to contain 25 squares in one division, with the same regulations.

Cap. 55. If any building of the first, second, third, or fourth rates, (except the inns of court or chancery, the royal exchange, companies halls, and except warehouses and dwelling houses, let at a rack rent for not more than 25 pounds by the year) shall be converted into two or more dwelling houses, work-shops, stables, or other buildings which shall be in distinct tenures on the ground floor, then each such tenement shall be considered as a separate building, and be divided by party walls.

Cap. 59. No iron, tin, copper, or other pipe or funnel for conveying smoke or steam, is allowed to be in front of any building next to a public street, nor in the inside of any building nearer than 14 inches, to any timber or other combustible material.

Cap. 62. The mayor and aldermen of the city of London, and the justices of the peace for the county of Middlesex, Surry, the city of Westminster, and the liberty of the tower of London, are empowered to appoint surveyors to see the rules and regulations of this act properly complied with: and cap. 63. before any building is begun to be erected, the master workman is bound to give 24 hours notice thereof to the surveyor of the district, in which the building is, who is to attend and view the building, and enforce the observance of the act. The fees to be paid by the builder to the surveyor are, for a building of the first rate 3l. 10s., and for an alteration or addition to the same 1l. 15s.; for a building of the second rate 3l. 3s., and for an alteration 1l. 10s.; for the third rate 2l. 10s., and 1l. 5s.; and for the fourth rate 1l. 1s., and 15 shillings.

BUILDING, *Ship*. See SHIP.

BUILT, in *Sea Language*, is an epithet applied to ships, denoting their peculiar form and structure, and distinguishing some from others of a different class or nation. Thus we use *frigate-built*, *galley-built*, &c. *English-built*, *French-built*, &c.

BUILTH, or BUALLT, in *Geography*, is a market town of Brecknockshire, Wales, finely situated on the banks of the river Wye, over which there is a handsome stone bridge. According to some antiquaries, here was the Roman station which Ptolemy calls *Bulleum Silurum*. Several intrenchments are still remaining in the vicinity of the town, and some Roman bricks, inscribed LEG: II. have been found here. The Chronicle of Caradoc relates, that the Danes, in 893, who had been vanquished and harassed by Alfred, fled to this part of the country, and, among other devastations, nearly demolished the town of Builth. It was, however, again rebuilt and fortified with a strong castle, and again suffered a nearly similar fate, in 1217, by Reynald de Bruce, who then broke off his alliance with Llewelyn ap Iorwerth, and united with Henry III. In 1221 he was besieged in this fortress by a party of Welsh lords; but Henry, to whom he had remained constant, came with an army and raised the siege. About 1256, we find this fortress in the possession of Rhys Fychan, whom Llewelyn ap Gruffydd defeated and forced

forced out of Builth. In various other wars between the English and Welsh, this place was alternately occupied by the conquering power, and in each conflict experienced some damage.

This town is singularly built on two parallel terraces, and forms two streets, on the side of a steep declivity. The upper street is clean and respectable, but the lower, and more populous street, on the banks of the Wye, is narrow, and most of the houses have a poor and mean appearance. Builth, from its contiguity to Herefordshire, and from the combined attractions of its salubrious air, grand and interesting scenery, and the quality of its waters, is much resorted to by strangers. It is provided with two weekly markets, and three fairs annually. Builth is 171 miles N. W. from London, 15 from Brecknock, and contains 994 houses, and 5159 inhabitants.

About one mile N. W. of Builth is a celebrated mineral spring, called The Park wells; and about seven miles N. E. is Llandrindod wells, consisting of three springs. These waters are esteemed of highly medicinal qualities, and are recommended by the faculty in many disorders of the human frame. Dr. Linnæus has written a treatise on their peculiar properties. These wells are situated on a common, on which are a few scattered houses, and a large building for the accommodation of those who visit them. The wells of Llanwrthly, which are similar in quality to some of those of Llandrindod, lie on the other side, at no great distance from Builth. Malkin's Tour in South Wales, 4to. 1804. Evans's Cambrian Itinerary, 8vo. 1801.

**BUINABA POINT**, a cape on the west coast of Ireland, being the southern point of the entrance into Newport or Clew bay, in the county of Mayo. Near it are some rocks and a ledge which require the attention of mariners. In some nautical books it is called *Ruinaba*. W. long.  $9^{\circ} 45'$ . N. lat.  $53^{\circ} 46'$ . M'Kenzie. Beaufort.

**BUINSK**, a town and district of Russia, in the government of Simbirsk, seated on the river Sviaga; 36 miles N. N. W. of Simbirsk.

**BUIS, LE**, a town of France, in the department of the Drôme, and chief place of a canton in the district of Nyons,  $2\frac{1}{2}$  leagues S. E. of it, and seated on the Oreze. The town contains 2215, and the canton 8932, inhabitants; the territory comprehends 325 kilometres and 24 communes. The district called Buis, before the revolution, was a territory of Dauphiny, small and mountainous, but moderately fertile.

**BUISKOI**, a town of Siberia, 64 miles S. E. of Nertshinsk.

**BUITRAGA**, a small town of Spain in New Castile, seated on a rock, which is fortified both by art and nature.

**BUKANS**. See **BUGGANZ**.

**BUKARI**. See **BUCCARI**.

**BUKI**, a town of Poland, in the palatinate of Kiof, 44 miles south of Bialacerkiew. N. lat.  $49^{\circ} 25'$ . E. long.  $30^{\circ} 28'$ .

**BUKO**, a small town of Germany, in the ancient duchy of Mecklenburg, called *Newo Buko*, by way of distinction from Old Buko, a neighbouring church village.

**BUKOVITZE**, a town of Croatia; 14 miles S. E. of Carlstadt or Carlowitz.

**BUKTARMINSKOI MOUNTAIN**, a branch of the Altay mountains of Russia, which commences in the superior region of the river Buktarma, at the frontier heights between the Chinese and the Russian empires, declines from the south towards the north and west, and accompanies the fore-mentioned stream, on both its sides, till its confluence with the

Irtysh. It reaches to east and north-east as far as the mountains that run along the Kokufan, and towards the north up to those that follow the course of the Ulba. From the Binskoï snow mountains up to the head of the Uiman, which falls into the Kokufan, it forms a lofty ridge, rising almost throughout in high summits of snow, and on this side extends its greatest height to the source of the last-mentioned river. This huge mountain, as yet little known, and partly inaccessible, consists, as far as it has been examined, in its highest points, of various kinds of granite, porphyry, and flint breccia. But in its chasms, and particularly towards the shore of the main or most considerable rivers, different sorts of schistus, chalk-stone, marl, breccia, and sand-stone are frequently met with. Jasper is found in abundance, with porphyry and trapp, in the superior regions. Of the chalk-mountains seen in the lower confines of the Buktarma, some are very craggy, and have a number of caverns. In these mountains there has hitherto been explored but one mine, the Buktarminskoi, with any hope of success. See **AL-TAI**.

**BUKUKUNSKOI KAMEN**, a fortress of Siberia; 120 miles S. W. of Doroninsk.

**BUKUPIENICK**, a town of Poland, in the palatinate of Lublin; 22 miles S. of Lublin.

**BUL**, in the *Hebrew Calendar*, the eighth month of the ecclesiastical, and second of the civil year, since called *Marshewan*; it answers to our October, and has nine and twenty days.

**BUL**, in *Ichthyology*, one of the English names for the common flounder.

**BULAC**, in *Geography*. See **BOULAC**.

**BULACAN**, a small province of the island of Laçon, or Manilla, lying between Panpanga and Tondo. It abounds in rice and palm-wine.

**BULACH**, a town of Switzerland, in the canton of Zurich, and a prefecture of the same name, which first entered into an alliance with Zurich, in 1407. The inhabitants are Protestants; distant 8 miles N. from Zurich. N. lat.  $47^{\circ} 25'$ . E. long.  $8^{\circ} 27'$ .

**BULACH**, a town of Germany, in the circle of Swabia, and duchy of Wurtemberg. In the annexed bailiwick is a mountain, which furnishes iron and copper ores; 20 miles W. S. W. of Stuttgart, and 4 S. W. of Calu.

**BULAFO**, a musical instrument, much used by the Negroes of Guinea, &c. It consists of several pipes made of hard wood, set in order; which diminish by little and little in length, and are tied together with thongs of thin leather twisted about small round wands, put between each of the pipes, so as to form a small interstice. They play on it with sticks, the ends of which are covered with leather, to make the found less harsh.

**BULAKUAN**, in *Geography*, a remarkable castle in the empire of Morocco, situate on the banks of the Morbeya, in the province of Duquella. It stands in a wild and barren spot, on the summit of a commanding eminence more than 200 feet high, and forms a pyramid, with rounded angles; and a large river runs beneath it, which, from its depth and rapidity, inspires a kind of horror. This castle was built at the close of the 13th century, by Muley Abdalmomen, the first king of the race of the Moahedins; but many additions were made to it by Muley Abdallah, son of Muley Ishmael. This prince caused subterraneous passages to be dug at a great expence for procuring water from the river; and in order to secure his water-carriers from the fire of the musketry, he built conduits, which brought the waters from the neighbouring mountains, the ruins of which are still visible on the road from Bulakuan to Morocco. Near the

castle is a village, and another before you pass the river; each of which contains about 200 houses, or thatched huts, being piles of rough hewn stone without mortar. Both these villages, inhabited by Moors, are exempt from taxes, in consideration of their giving needed assistance in crossing the river. Although the cattle stands in a sandy barren situation, the banks of the river below it present to view well-cultivated gardens, with their orchards and vineyards. Each garden contains a windlass and a bucket, for supplying it with water. The only ferry-boat for passing the river near this castle, is a raft, composed, for the occasion, of reeds, to which skins, inflated with wind, are tied with cords, made of the palm-leaf. This is sustained by several Moors, who, whilst they swim, guide and support it by their shoulders, in spite of the rapidity of the current. On this crazy craft travellers and their effects are transported. We learn from Livy, that, during the second Punic war, when Hannibal went from Spain to Italy, a part of his army passed the Rhone, the Ticino, and the Po, on goat-skins filled with air. A kind of temporary bridge is constructed for the passage of the emperor, consisting of two thick osier cables, fastened to large piles on each bank of the river. These cables are formed into a kind of hurdle, by passing through them iron stakes about 5 feet long, and laying upon it fods 6 inches thick. Chenier's Present State of the Empire of Morocco.

**BULAM**, or **BOOLAM**, an island in the Atlantic, near the coast of Africa, at the mouth of the Rio Grande,  $\frac{1}{2}$  league from the continent, and about 18 leagues long, and from 4 to 5 broad. N. lat.  $11^{\circ}$ . W. long.  $14^{\circ} 50'$ . Some have considered it as one of the Bissago isles. See **BISSAGOS**. The whole coast of this island is described as bordered with woods, beyond which the country is singularly fertile, rich, and beautiful. It was formerly uninhabited, and cultivated by the natives of the other islands, who visited it in seed-time and harvest, and returned home for the rest of the year. It was found to be abundantly productive of rice, maize, millet, fruits, and roots. The ground is said to rise imperceptibly from the shore for the space of 2 leagues, thus exhibiting a most agreeable prospect. This ascent serves as a base to higher mountains, which stand in the centre of the island, covered with fine wood, and separated by beautiful vallies, with such regularity, that nature would seem to have been improved by art. This island was recommended, so long ago as the commencement of the last century, by M. de la Bruce, to the French government, as a fit place for a settlement; and the advice was repeated, in 1767, by the abbé Demanet. However, during the year 1791, a society was formed in London for establishing a settlement on some eligible spot on or near the coast of Africa. Those who formed this association, allured by the flattering information which they had received of the island of Bulam, fixed on this as the object of their destination. The subscribers were to receive a grant of 500 acres of land for the sum of 30l. and in that proportion for any greater or less number of acres, as far as 2000. In the space of one month after opening the subscription, 9000l. were paid into the hands of trustees. After having encountered various difficulties, the adventurers arrived at Bulam, and immediately took possession of it by hoisting the British flag. The natives unexpectedly attacked the new comers; killed some of them, and obliged the others to relinquish what they had obtained. Accordingly, as they were thus compelled to abandon it, they sought for refuge in a settlement belonging to the Portuguese, where most of the unfortunate adventurers became victims to the climate of the country. Mr. Montefiore, who was a principal agent in this business, despairing of the colonization of Bulam, embarked for **SIERRA LEONE**, of which he gives a very favourable

account. However, from another account, compiled from the records of the Bulam society, we are led to entertain a more favourable opinion of the situation and prospects of this colony. Mr. Beaver, who resided at Bulam as chief in command, in a letter dated July 1793, expresses great confidence of the final success of the undertaking; declaring that, with sufficient support (not *military*; every thing having been fairly purchased, and amicably settled with the neighbouring Africans) "not one-tenth part of what had been afforded to the Sierra Leone company," he could, long ago, "have added to our present territories land sufficient to maintain 500,000 people, and at very little expence." He concludes his letter, addressed to the trustees of the Bulam association, with observing, "that if the good people of England knew but one half of the advantages to be derived from colonizing this part of Africa, on an *extensive* scale, you might command half the money in the kingdom." This officer resided at Bulam about two years.

Dr. Chisholm, in his "Essay on the malignant pestilential fever, &c." Svo. 1795, maintains that the yellow fever was originally brought to the West Indies from Bulam in the ship Hankey, on board of which it commenced.

**BULARCHUS**, in *Biography*, a Greek painter, flourished 740 years B.C. and is said to have been the first who introduced (at least among the Greeks) different colours in the same picture.

**BULARSKAIA**, in *Geography*, a town of Siberia, on the south side of the Irtysh, opposite to Tobolsk.

**BULATMAI**, in *Ichthyology*, a species of **CYPRINUS**, the anal fin of which contains eight rays: the second dorsal fin is large, and not serrated: beards or cirri four. *Habits*.

Cyprinus Bulatmai is a rare fish, of the size of the common carp. The colour is steel blue, glossed with gold above, and silvery, shining with a golden hue beneath: the scales are of the middle size, semicircular, distant, and imbricated: flesh white as snow, and very good. This inhabits the Caspian sea.

**BULB**, or **BULBUS**, in *Botany*,  $\beta\omicron\lambda\lambda\omicron\varsigma$ , Gr. as it is employed by Theophrastus, is sometimes the name of a plant allied to Scilla Allium, and others of the same family, but not particularly ascertained by modern botanists, and sometimes denotes the peculiar kind of root by which those plants are distinguished. In the latter sense it was admitted by Pliny, and other Latin writers, and is preserved in most of the modern languages of Europe. Our English gardeners universally speak of it as a *root*; and it is said by professor Martyn, in his "Language of Botany," to have been "so called by botanists, till Linnæus corrected the error, and shewed that it is a single *bud* enveloping the whole plant." But Linnæus was by no means the first who viewed it in this light. Our countryman Grew, in the second book of his "Anatomy of Plants," presented to the Royal Society in 1672, says expressly, that "all bulbous *roots* are, as it were, hermaphrodites, or *root* and *trunk* both together; for the *strings* only are absolute *roots*; the *bulb* actually containing those parts, which springing up, make the *leaves* or *body*; and is, as it were, a great *tud* under ground." About the same time Malpighi was engaged in a similar course of study at Bologna, and communicated the result of his researches also to our Royal Society. Under their patronage his "Anatome Plantarum" was published in London, the first part in 1675, and the second, which contains the treatise "De Radicibus," in 1679. He treated the subject more at large, and dissected, described, and figured several of the best known bulbs. In complete agreement with Dr. Grew, he uniformly states the bulb to be a germ or bud, consisting of leaves or coats which enclose the rudiments of the future plant,

plant, and produce other embryo buds for its farther propagation and increase. Nor were these great physiologists the first who started the idea. We find it clearly expressed by Clusius, who wrote a hundred years earlier. "Est ergo tulipe, ut & alarum bulbosarum tunicatarum, bulbus nihil aliud quam gemma grandis subterranea, quæ præter adnatas externas intra se concepit alium bulbum seu gemmam, qui matri bulbo succedens ei idem videtur, cum revera non sit, sed diversus ipsiusque soboles; cumque intra ipsum bulbum conceptus & enutritus sit, adnatis extremis grandior & habitior evadit, ipsiusque parentis æmulus." Even in the time of Theophrastus, as we learn from his "History of Plants," lib. i. cap. 10. it had been disputed whether a bulb is properly a part of the root: a question which the venerable botanist, after stating the arguments on both sides, finally resolves in the affirmative, on the general principle, that roots are capable of appearing under different forms, and that all which is under ground belongs to the root. It appears, however, that, at so early a period, there were some who compared the bulb to the *κρυμα, κυμα,* or *cyma*, the fleshy part of the stalk of a cabbage, when it first rises above the surface of the ground; and, if we admit the proposed reading of one of the commentators, others went so far as to call it *οστος*, oculus, an eye, or gem; but the conjectural restoration of a passage so corrupt in the manuscripts as to be confessedly unintelligible, cannot be brought forward to establish a fact in the history of science. Since the publication of the *Philosophia Botanica*, no doubt has been entertained on the subject; the botanists, as well as others, still speak of bulbous roots: nor can any material objection be made to the continued use of the term, if it be understood to mean a bulb-bearing root, or as it is accurately expressed in the *Termini Botanici*, "*radix bulbo instructa.*"

Gems and bulbs are somewhat quaintly, but not unaptly, styled by Linnæus, *hybernacula*, the winter quarters of the young, or rather embryo plant; and they belong respectively to different families of the vegetable kingdom. They are distinguished from each other by their situation, and by such differences in their form and texture as their peculiar circumstances require. In the *Systema Naturæ*, a *gem* is said to be an *hybernaculum* seated on the ascending caudex; and a *bulb* to be an *hybernaculum* seated on the descending caudex: in popular language, the former is above, the latter beneath the surface of the ground: i. e. the gem is a stem-bud, and the bulb a root bud. In the *Termini Botanici* of Elingren, published in *Amœnitates Academicæ* under the eye of Linnæus, the distinction between them is taken, not from their situation, but their substance. A gem is there said to consist of the rudiments of future leaves; and a bulb to be the rudiment of those which are past. In this definition the great naturalist, for to him it must ultimately be attributed, even allowing the general principle to be just, has sacrificed clearness, if not propriety of expression, to his characteristic love of antithesis. The rudiments of future leaves require no explanation: but the *rudiments* of those which have *perished*, it is not so easy to understand. He undoubtedly meant the remains of what were once the rudiments of the leaves; and which, sheltered by the surrounding earth, have not been entirely destroyed, though considerably changed in their appearance, by a change in the temperature of the air. Or as it is stated by Ferber in the dissertation entitled "*Proleptis Plantarum*," published also in *Amœnitates Academicæ*, "*bulbus a gemma in eo solum differt, quod bases foliorum persistentes a copioso succo, quem e terrâ hauriunt, fiant carnosæ, & nova folia suis gemmis instructa exerceant intra priorum bases. Non confundi debent bases foliorum præteritorum cum foliis futuræ plantæ;*

*illas enim haud aliter considerare oportet, quam ut squamas gemmarum exteriores ab aere vel frigore induratas.*"

It is natural to inquire how the remains of leaves which in their perfect state were above the surface of the ground, have been drawn down so as to become the scales or coats of subterraneous bulbs. To account for this, Linnæus must have adopted, though we do not remember that he has quoted, the theory of the old botanists concerning the gradual descent of the caudex, supposed to be produced by the mechanical action of the radicles or string roots, which, to borrow the homely language of Grew, "descending themselves directly into the ground, like so many ropes, lug the trunk after them." This idea is mentioned by Dr. Darwin in his *Phytologia* with some degree of contempt, and passed over without a formal refutation as the unfounded doctrine of "some inaccurate observers." Without presuming to detract from the established authority of Grew, who certainly ought not to be ranked with the tribe of inaccurate observers, we may venture to intimate that the integuments which form what may be called the body of the bulb, are not in all cases the remains of decayed leaves, but have been originally formed below the surface, and have never advanced beyond their present appearance. In this point of view they have actually been represented by some of the disciples of Linnæus under his immediate inspection; as appears from Lœffing's dissertation "*De Gemmis Arborum in Amœnitates Academicæ.*" "*Bulbos diximus,*" says that writer, "*nihil aliud esse, quam gemmas, cum eodem modo ac illæ includant intra se futuram plantam; sed eorum tuniæ evadunt succulentæ a copioso nutrimento, quod hauriunt e terrâ cui innascuntur, quo repleti non possunt amplius extendi:*" i. e. bulbs, we have asserted, are no other than gems; for like them they include the future plant, but their coats are rendered succulent by the copious nourishment which they draw from the earth, and in consequence of this repletion become incapable of farther extension.

Of these two concise definitions of a bulb, that given in the *Philosophia Botanica* is evidently inaccurate: since it is so expressed, as to include the root buds of perennial herbaceous plants, called by some authors, but not by Linnæus, turiones; which have not the form, and have never been known either in popular or scientific language, by the name of bulbs. That in the *Termini Botanici* is, as we have seen, deficient in perspicuity; and when properly explained, does not appear to possess sufficient precision. Bulbous plants are defined by Mr. Ray to be those which consist of a single tuber or head, either scaly or tunicated, throwing out numerous fibres from its base. In this definition our great countryman should not have introduced the word *tuber*; for in the preceding sentence he has expressly divided the fleshy roots which swell laterally, into bulbous and tuberous. A bulb, therefore, and a tuber, were, in his ideas, as we believe them to be in nature, distinct things.

A bulb is now universally understood to be a species of bud of a peculiar structure suited to its situation on the plant. A bulbous root consists of this bud, of the proper radicles, and of the intermediate caudex. A tuber, if we mistake not, is a radicle, swollen, either wholly, or in part, to an extraordinary thickness, and having generally, if not always, imbedded within its substance the rudiments of one or more future buds; as in the well known root of the potatoe, *solanum tuberosum*. See *TUBER*.

Bulbs are divided by Linnæus, in his *Philosophia Botanica*, into four kinds, the squamous, the tunicated, the solid, and the articulated.

The squamous bulb consists of imbricated lamellæ; i. e. of scales laid partially one over the other, like the tiles or  
lates

flates on the roofs of buildings, but more loosely connected, and a little diverging at their points; as in several species of lily. The root of the white lily is described and figured by Malpighi in his "Anatome Plantarum." It is composed of scales, or, as he calls them, leaves, gibbous without, and a little concave within, so adapted to each other as to form a bulb. These scales proceed at different elevations from a solid elongated body, styled by Malpighi a radical trunk, the descending caudex of Linnæus, which sends out from its base a number of compound radicles, and from its upper extremity, within the scales, the root leaves and stem of the plant.

The tunicated bulb consists of numerous tunics or coats, as in the common onion, *allium cepa*. These coats lie close together in concentric layers, and proceed from a short broad caudex, having its upper surface more or less convex. They enclose at their centre the embryo plant of the ensuing season; and between them, at different distances from the centre, other bulbs, called *cayeux* by the French naturalists, and *offsets* by English gardeners, for the future increase of the species.

The solid bulb is said by Linnæus to consist of a solid substance, and the tulip is given by him as an example: but he must be understood to speak comparatively, not strictly and absolutely. The tulip root is thus described by Dr. Darwin in his *Phytologia*. "In the tulip root dissected in the early spring, just before it begins to shoot, a perfect flower is seen in its centre; and between the first and second coat, the large next year's bulb is, I believe, produced; between the second and third coat, and between this and the fourth coat, and perhaps further, other less and less bulbs are visible, all adjoining to the caudex at the bottom of the mother bulb; and which, I am told, require as many years before they will flower as the number of coats with which they are coated." It is evident from this description, that the bulb of the tulip is as really coated as that of the onion. Indeed it had been arranged by Mr. Ray among the tunicated bulbs long before the time of Linnæus. It differs only in having its coats more fleshy, and less easily separated from each other: characters found in a still greater degree in several other bulbs which are, nevertheless, by no means truly solid.

It appears to us that no proper bulb is or can be so. If we adhere to the idea given of it by Linnæus, as a kind of hybernaculum, or winter quarters of the embryo plant, it must have a space within it for that purpose: it must also, as we conceive, have scales or coats, within which *cayeux*, or *offsets*, for the future increase of the plant may be formed. The bulbs which have been called solid, have coats, either comparatively thick, and so closely compacted together, as, on a slight inspection, to resemble one indiscriminate mass; or, so small and few, as to be exceeded in bulk by the full grown caudex. Hence has arisen the difference in authors with respect to their distribution of this kind of root. The bulb of the crocus, for instance, has so dubious an appearance, that Mr. Ray, in his "*Historia Plantarum*," has placed it among the tuberose roots; but our great naturalist would not have so classed it, had it passed under his eye in an early stage of its growth, when it is clearly tunicated. It is considered by Philibert in his "*Introduction a l'Etude de Botanique*," lately published at Paris, as a mixed bulb, or rather a tunicated tuber. "In the bulb properly so called," says that acute naturalist, "the caudex is less in bulk than the tunics, and the rudiments of the stem embraced by them: in the tunicated tuber the caudex is more considerable; and in the pure tuber, the tunics are entirely wanting." "Thus," continues he, "in the crocus are found only two or three

tunics, which are finally lengthened into a spathe, and closely embrace the leaves implanted on the caudex; whereas, in the true bulb the leaves are surrounded by a great number of tunics which never increase in length. Take up a crocus some time after it has flowered, and you will find that the exterior coats are destroyed; the caudex is naked, and several small bulbs appear seated on its convex surface; or, as it is somewhat ambiguously expressed in the original, "le caudex est a decouvert; & sur plusieurs de ses points, vous remarquez de petits bulbes, naissans de la tuberosité même du caudex." It seems evident, from the latter part of the sentence, that this ingenious writer, in the present case, confounded the tuber and the caudex, which are, in fact, always distinct parts of a plant; and was thence led to give to the root of the crocus a character which it does not possess. This root has nothing about it equivalent to a tuber; but is strictly bulbous, and, like that of the onion, consists of proper radicles, a caudex, and a tunicated bulb. The only difference between them arises from the relative proportion of the caudex and the tunics; a difference which, though sufficiently obvious in the extremes, may be lost in such gentle gradations, as to render it impossible to draw a line of distinction, and which therefore cannot be received as a specific character. In the instance before us, it exists, we believe, only in those bulbs which have arrived, or are nearly arriving at maturity, and are about to produce flowers. We this day, March 12th, dissected a young bulb which had produced leaves above ground, but would not have flowered during the present year. Its coats bore a considerable proportion to the caudex, and contained within them, distinctly formed, two new bulbs, each enclosing an embryo plant, furnished with the rudiments of its future leaves. An older one, in flower, examined at the same time, was, to all appearance, completely solid, with the exception, however, of the usual thin, brown, dry, and loose envelopes, which were, doubtless, the shrivelled remains of the former coats. All the rest was the proper caudex, greatly increased in size, and having on it, at different distances from the central flower-stalk and leaves, two *cayeux*, or *offsets*, seated on its naked surface. Each of these *offsets* consisted of an apparently new and very small caudex, springing from a shallow concavity in the surface of the old one, and of numerous coats much exceeding their proper caudex in bulk, and all extended either into the sheaths, the leaves, or the spathe of the future flower. Another mature plant had two flowering stems proceeding from two bulbs, so closely connected together as to resemble one, but separated near the top by the usual brown membranous coverings. These bulbs were, doubtless, formed in the same season, and within the same coat of the parent bulb, on opposite sides of the flowering bud of the preceding season; and appear to have so far exhausted the caudex, though now arrived at its full size, as to render it incapable of producing any more *offsets*.

The bulb of the common corn flag, described and figured by Malpighi, approaches still nearer the naked descending caudex, or what has been improperly called the solid bulb. It was considered, indeed, by this eminent naturalist as a tuber, consisting of homogeneous matter collected into one continuous substance: but it is evident, from his description, that it has the characters of a true bulb. The exterior surface of the tuber or bulb, says he, "*stripped of its folioles and involucre*," presents to the view various gems; and a little below their origin, leaves, as usual, break out, which, being plucked off, leave fragments of their stalks, as represented in his figure, and give to the whole the appearance of a trunk or stem.

The root of the orobanche, figured and described by the same author, is of a more dubious nature. In the first place, it does not belong to the monocotyledinous division of plants, in which the legitimate bulbous plants are usually, if not always, found. In the next place, it produces on its surface scattered gems, each supported by an exterior, caducous leaf; some of which gems spring also from the stem, or ascending caudex. We presume, therefore, that it may be stiled a descending caudex, with germ-bearing leaves, analogous to those of trees and shrubs. It may be proper, however, to remark, that Bernard Jussieu, as we learn from La Marck's "Flore Françoise, Discours Préliminaire," p. 54. placed in the royal garden at Trianon, orobanche, lathræa, and some others, in the division of the monocotyledinous plants. Anthony Jussieu, on account of their having both a calyx and a corolla, and their evident affinity to other didynamous genera, has judged them to be dicotyledinous. What induced his illustrious uncle to think otherwise we are not told. The parasitic growth of all the species of orobanche renders it difficult to ascertain in what manner they spring from the seed; but the disposition adopted by so eminent a botanist, and the description of the root given above from Malpighi, seem to indicate a something of a monocotyledinous character, and afford ground for a conjecture, that in these plants a connecting link between those grand natural divisions may be found.

The root of the common turnip (*brassica rapa*) which has been called a bulb by many writers, though not by Linnæus, is nothing more than an intumescence of the descending caudex, produced by a luxuriant soil; and most generally the effect of cultivation, differing from the cultivated carrot (*daucus carota*), which no one ever thought a bulb, merely in form. Neither of them has any claim to the character of an hybernaculum.

The articulated, or jointed bulb, consists of lamellæ or scales, linked or chained together; such as are found on tuberous moschatel (*adoxa moschatellina*), the greater toothwort (*lathræa squamata*), and bulbiferous coral-root (*dentaria bulbifera*). The only instance of this kind of root given by La Marck, is that of white saxifrage (*saxifraga granulata*), but he thinks it should rather be ranked with the tuberous than the bulbous roots.

Ventenat, in the "Botanic Dictionary," prefixed to his "Tableau du Règne Végétal," confines the term bulb to those which are strictly tunicated or coated, among which, as we have seen, those stiled solid by Linnæus ought to be placed; and has ranked with the tubers universally so called, (such as those of the common potatoe), the globular root of the turnip radish, (a variety of *raphanus fativus*), intending, doubtless, to include the common turnip; the scaly root of the lily; the knotty root of the common dropwort (*spiræa filipendula*); the articulated root of tuberous moschatel; the fasciculated root of *asphodelus luteus* and *ereticus*; the grumous root, of the garden ranunculus (*R. Asiaticus*); and the scrotiform, or didymous root of several species of orchis. We are inclined to think that this able botanist is right in separating all these from the proper bulb; the essential character of which will then depend on its tunicated structure, and the difference of the species will arise from the various thickness of the coats, and the proportion of their whole substance to that of the descending caudex: but the remaining ones are so dissimilar to each other in several important respects, that they cannot, with any degree of precision, be called by the same name.

The true distinction between a bulb and a tuber appears to us to be in their relative situation with respect to the descending caudex. The bulb *crowns* the proper root, and

has the caudex interposed between it and the radicles. The tuber is situated *under* the caudex, either on the same plan with the radicles, as in some species of orchidæ; or, still lower, when it is evidently an intumescence of the radicle itself, as in the common potatoe. Linnæus, in his practical works, uniformly calls those roots of the orchidæ, which answer this description, bulbs; solely, it should seem, on account of their general appearance; for they are not mentioned under any of his four divisions, and do not correspond with either of the definitions quoted above from the "Philosophia Botanica," and the "Termini Botanici." That they do not essentially differ from the tuber of the common potatoe, is evident from the steps by which, in different species, they approach that well known and invaluable esculent. In orchis *bifolia*, *pyramidalis*, *ultrata*, &c. they spring immediately from the caudex along with the proper radicles: in orchis *mascula*, *ophrys apifera*, &c. they swell suddenly from the radicle itself at a small distance from its origin: and in *ophrys monorchis*, the new tuber is so far from the caudex as to be apparently not different from that of the potatoe. These scrotiform tubers differ only in number from the palmate, fasciated, and aggregate tubers of other species, between which, and those of common pilewort (*Ranunculus ficaria*), *asphodelus luteus*, &c. as far as the subject has been hitherto investigated, no certain line of distinction can be drawn. All the radicles of *ophrys nidus avis*, birds-nest orchis, are swollen into tubers. The rare *ophrys Loefelii* appears to differ from all the rest of its natural family, in having a true bulb. A tuber, therefore, is an intumescence of the radicle, as the turnip, carrot, &c. are of the caudex; and, like them, may possibly be, in some cases, merely a reservoir for the nourishment of the present stem, particularly in a drougthy season. In this light the singular tubers of *spiræa filipendula* are considered by Dr. Smith. But it is more commonly, and as no actual observations have been made on the roots of *filipendula* to determine the question, we are rather inclined to think it always a real hybernaculum, having imbedded in its substance the rudiments of one or more future buds in a less advanced state than that of the bulb. When the tuber is small, and contains only a single bud, as in several leguminous plants, and perhaps some grasses, it is called a tubercle.

Ventenat is probably correct in placing the grumous root of the garden ranunculus under this head. But the scaly root of the white lily, &c. differs essentially from the tuber in being placed upon the caudex; as it does from the true coated bulb, in having a looser texture; being, in fact, composed of unconnected scales, which, by their concave shape, are so adapted to each other, as to produce the appearance of a bulb. The scales of common wood sorrel (*oxalis acetosella*) are of the same kind, but smaller, and somewhat less compact: those of tuberous moschatel have, in a still less degree, the form of a bulb: and in the bulbiferous coral-root the resemblance totally vanishes. They all, we apprehend, agree in having the rudiment or bud of a future plant situated at their axils, to protect which seems their proper use; and if torn off with a small part of the caudex, and planted in a suitable soil, will readily take root. Radical fibres are indeed plentifully thrown out under the scales of tuberous moschatel while they are attached to the parent plant; they are found more sparingly in bulbiferous coral-root; and sometimes, as appears from Malpighi's figure, occur in the white lily. Roots of this kind seem to form a connecting link between the true tunicated bulb, and the proper bud or gem of the ascending caudex in trees and shrubs. The greater toothwort, having no other radicles, is, we conceive, rather allied to the *ophrys nidus avis*; and in this

this opinion we have the satisfaction to find that we are supported by the authority of Dr. Smith. See English Botany, p. 50. The granules of the white saxifrage, which La Marck considers as tubers, more nearly resemble the proper bulb, being seated on the descending caudex, which throws out radicles beneath them, and may be regarded as bearing some affinity to what Linnæus calls stem-bulbs, though he has constructed his definition of the term bulb so as to exclude them. They are placed either in the axils of the leaves, as in *lilium bulbiferum*, *dentaria bulbifera*, &c.: or on the common receptacle of the head of flowers, as in several species of *allium*: or, within the calyx, instead of a proper seed, as in *polygonum viviparum*. Botanists have paid little attention to their natural history; and have, for the most part, done nothing more than announce their existence. We know not that any inquiry has ever been made, whether those which are found in the three very different situations just mentioned are precisely of the same nature and structure, or whether they do not so far differ from each other as to render it expedient to give them distinguishing names. It appears, from Dr. Darwin's description of what he calls the summit bulbs of *allium magicum*, that in every thing but situation they are exactly similar to the root bulb of that and other kindred plants. "In cutting one of them horizontally," he tells us in his *Phytologia*, "I observed three young bulbs inclosed in the concentric fleshy membranes of the summit bulb in the following manner: five thick, fleshy, concentric coats of the general summit bulb being taken away, there appeared one single naked small bulb; and on the sixth coat being removed, two other bulbs became visible, which were included in it." A philosophic view of all the different methods in which plants are propagated without the intervention of an impregnated germ; and of the order in which they are connected together, so as to form a regular gradation from the gem or proper stem-bud to the tuber of the common potatoe and the tubercles of vicia, lathyroides, and many other plants, is one of the numerous desiderata in vegetable phythology. The history of bulbs alone would require a long course of experiments.

**BULB**, in *Vegetable Anatomy*. This term is commonly applied to the enlargements of the roots of many herbaceous plants, which are therefore said to possess *bulbous roots*. See **BULBOUS ROOTS**. The true bulb, however, does not in strictness constitute any part of the root, but in its structure and uses bears a perfect analogy to the bud. See **BUD**. Bulbs are in some instances met with in the axillæ of the leaves; as in the *lilium bulbiferum*, and even in the flower itself, in many species of *allium* and *agave*; but their most usual situation is upon the root. It is there that they are found in the *hyacinth*, *tulip*, the *common onion*, and a number of the herbaceous monocotyledons. The root in all these instances is an irregular circular plate, from the lower part of which proceeds a tuft of the fine or fibrous roots; the upper part sustains the bulb.

The bulb is composed of a number of laminæ, which are placed one upon another; and contain in their centre the embryo of the plant.

When the laminæ have not been exposed to the air, they are thick, and loaded with juices, are generally of a white colour, and consist chiefly of parenchyma, in which are spread some fibres, forming nervures. They resemble very much etiolated leaves.

When the bulbs have been removed from the earth, and kept for any length of time in an open and dry situation, the external layers shrink up, become thin and glossy upon the surface, and often acquire a brilliant metallic colour.

The laminæ in the *onion*, *hyacinth*, *tulip*, and many others, consist of circular tunics, the one entirely enveloping the other; but in the *lilies* they assume the form of scales, and more exactly correspond with the coverings of buds. See *Plate II.* in *Vegetable Anatomy*; *fig. 18.* shows the bulb and root of the *onion*; *a* is the bulb, which has the superior part cut off to bring into view the concentric layers of which it is composed; *b* indicates the circular plate forming the common centre of the fibrous roots, which are marked by *c*. *Fig. 19.* of the same plate exhibits the bulb of a *lily*, which is made of thick imbricated scales; from the base which supports the scales the fibrous roots take their origin.

The pulpy laminæ, which constitute the great mass of all bulbs, are analogous to the scales of the bud, and, like them, serve to protect the young plant or flower from all external influences, until the embryo attains a certain degree of development, or becomes vigorous enough to be nourished by its own independent actions. The embryo in the bulb, as in the seed and bud, is always formed in the year preceding its evolution. Thus we may clearly discern in the bulb of the *tulip*, as early as the month of August, the lineaments of the flower which is to make its appearance the ensuing April. See *Plate II.* of *Vegetable Anatomy*. *Fig. 20.* represents a *bulb* of the *tulip*, cut down through the middle in the month of September; *aa* the various investments of the bulb; *bb* the innermost tunics, thinner than the rest, and containing the young flower; *c* the embryo tulip, implanted as it were in the circular root, which serves as the basis of all the parts of the bulb; *d* the circular plate, or common radicle.

As bulbous plants do not produce buds in the axillæ of their leaves, the circular root, which supports the bulb, gives origin to small bulbs, which are in many respects analogous to the lateral buds. They exist, like them, for a certain period in an immature or embryo state, inclosed by the leaves or tunics of the parent bulb. They are formed in many species at the commencement of the season of vegetation; when they become apparent, they are as small as a grain of corn; they increase at first slowly, but afterwards they grow with rapidity, and when the flower is ready to blow, they acquire fibrous roots preparatory to their detachment from the parent bulb. When the root-buds approach maturity, the bulb, from whence they arise, ceases to vegetate, and ultimately dies and rots. It is in this manner that the root of a tulip becomes apparently removed from its situation, the original bulb being replaced by others which produce the flowers of the following year.

There are some bulbs, as those of the *hyacinth*, which furnish, for several years, the lateral bulbs or root-buds; but in these cases it is only at the end of two or three years that the small bulbs attain the magnitude of the original one. If, however, they be detached during the first year, they will grow independently of the parent bulb, which in this case does not perish, but continues to exist for several years, and to produce new offsets.

Bulbs, like buds, may be distinguished into *leaf bulbs* and *flower bulbs*; as an example of which, let a seed of tulip be sown, it produces in the first summer a plant, which dies in the autumn, but leaves in the earth one or more bulbs. These afford stronger plants, the ensuing spring, than those of the first year, but which do not yet bear flowers. They also perish in the autumn, and leave behind them other leaf bulbs, stronger or more perfect than those of the preceding year; and a succession of leaf bulbs is thus generated for four or five years, until at length the bulb acquires sufficient vigour for feminal generation; and then it produces, in its place, a large flower bulb, surrounded by several leaf bulbs.

**BULBOCODIUM**, in *Botany*. (from *βολβος*: a bulb, and *κωδών*: wool.) Linn. gen. 407. Reich. 440. Schreb. 555. Willd. 624. Jussieu 54. Class and order, *hexandria monogynia*. Nat. ord. *Spathacei* Linn. *Narcissi* Juss.

Gen. char. *Cal.* none. *Cor.* six-petalled, funnel-shaped; claws very long, linear; throat connecting the petals; petals lanceolate, concave. *Stam.* filaments six, awl-shaped, inserted on the claws of the petals; anthers incumbent. *Pist.* germ ovate, awl-shaped, obtusely three cornered, superior; style thread-shaped, the length of the stamens; stigmas three, oblong, erect, channelled. *Peric.* capsule triangular, acuminate, angles obscure, three-celled; seeds numerous.

*Obs.* It has sometimes only four stamens and four petals.

Spec. B. *vernum*, La Marck, Illust. Pl. 230. (*Colchicum vernum*. Cluf. Park. Ger. emend. Ray.) *Root* bulbous. *Leaves* three, lanceolate, enveloped in their lower part by a thin membranous sheath. *Flower* little, if at all longer than the leaves, white at first, but afterwards acquiring different shades of purple, rising almost immediately from the root; borders of the petals arrow-shaped, and their narrow acuminate segments so fitted to each other, and so closely connected, as to give the whole the appearance of a monopetalous corolla like that of colchicum. *Stamens* shorter than the petals. It flowers early in the spring, and has the general appearance of the crocus, from which it differs in the number of its stamens, as it does from colchicum in having only one style. Lam. Encyc. and fig. A native of mountainous situations in Spain, the south of France, and Russia. It appears to have been cultivated in England by Parkinson, so early as 1629, but is now become very rare in our gardens, its bulbs being tender, and not much inclined to increase. It may be propagated by offsets like other bulbous rooted plants, removed soon after the leaves decay, but this should not be done more than once every three years. It may also be produced from seed sown at the latter end of September, or any part of October, in pots filled with fresh loamy earth, where they should remain, only varying the situation according to the season: till the next summer but one, when as soon as their leaves are decayed, the roots should be taken up, and planted in the borders of the flower garden. **BULBOUS roots**, in *Gardening*, are such roots as are composed of bulbs, and which differ essentially from the tu-

berous roots, which consist of an entire solid fleshy substance. Under this head are comprehended some esculent plants, such as garlick, onions, leeks, shallots, &c. and a numerous train of flowery plants, mostly herbaceous perennials, producing beautiful flowers, many of them being hardy enough to succeed in beds and borders in the open ground, and others in the stove or greenhouse. The principal of the flowery tribe belong to the following genera: the *amaryllis*, including the Guernsey lily, bella-donna lily, Jacobea lily, &c.; *narcissus*, or daffodil, including jonquils, hyacinths, tulip, fritularia, and crown imperial *lilium*, or common lily, including martagons; *ornithogalum*, or star of Bethlehem; *galanthus*, or the snow-drop; *leucojum*, or great snow-drop; *scilla*, or sea onion; *colchicum*, or meadow saffron; *albuca*, or bastard star of Bethlehem; *muscaria*, or musk and grape hyacinth; *iris*, the bulbous and persian; *haemanthus*, or blood flower; *allium*, or moly; *crocus*, including spring and autumn kinds; *bulbocodium*, and *pancratium*, or sea daffodil. The different species and varieties of which are seen under their respective genera.

Bulbous roots may in fact be said to be annual or biennial, as the same individual root lasts for a certain time only, in some, not more than a year after having attained a flowering stalk; in others, longer, as previous to their dissolution, they afford from their sides a supply of suckers or offsets to perpetuate the respective kinds, so that at the end of many years, what is still often considered as the same individual root, is in reality another. All bulbous rooted plants renew their leaves and flower stems annually; and their principal seasons for flowering are at different times during the spring and summer months, some producing their flowers at one time, and their leaves at another, as in some species of amaryllis and colchicum; others produce their flowers and leaves together, as in the hyacinth, tulip, narcissus; and the leaves and flower stems of all the sorts perish annually at a certain period after flowering, after which time, the root becomes in a state of maturity in respect to its growth for a few weeks, in which new fibres are prepared for the future plant. This is the proper time to remove the roots, either to separate the offsets for propagation for planting the roots in fresh prepared earth, or for removing them to any other part of the garden or other ground. And, likewise, for preserving the bulbs out of ground for autumn and spring planting, when the beds or borders can be more conveniently prepared for their reception; for most sorts taken up at this period may be kept out of ground several months; or if occasion require, some sorts admit of being kept out of the ground from the time of the flowers and leaves decaying, until the following spring, as is often practised when intended for spring planting, to obtain a longer succession of blooms by succeeding the autumn plantation.

Bulbous roots may, however, remain several years unmoved, and when greatly increased by offsets be only taken up at the proper period to separate the increased progeny, and replanted again as may be necessary. It is, however, particularly necessary to take up all the choice kinds of bulbous roots annually to separate the offsets for increase, as well as to prepare the earth of the beds and borders afresh, to promote the beauty and merit of the succeeding year's bloom, especially for the curious tulips, hyacinths, narcissus, &c. The more inferior sorts of bulbous roots should also be removed every other, or as often as their offsets are considerably increased in number, which, if permitted to remain so long as to increase into large bunches, cramp each other in growth, and produce small ill-nourished flowers of little beauty.

All the bulbous roots which have been taken up at the above

above period in summer, should be chiefly planted, where practicable, again in the following autumn, about October or November, as they flower much stronger than when kept out of the ground till the spring season.

The Rev. Mr. Marshall, in his work on gardening, however, directs that autumn flowering bulbs, when their leaves are decayed, should be taken up in May, and that none of the kinds remain too long without being taken up, as they are liable to be cramped and confined in their growth, and of course decline in their beauty.

It is recommended as the best practice with flowering bulbs, to plant the spring kinds in the beginning of the autumn, as in the latter end of September, or beginning of the following month; and those of the summer flowering sorts in October, or the succeeding month; and those of the autumn blow in the latter part of July, or in the following month; too early and too late planting being equally to be avoided, as when put in too soon, they are liable to be impaired by being too forward when the winter and early spring proves severe, and when delayed too long they are apt previously to exhaust themselves by forming new root fibres.

Bulbous roots of the laminated kinds, such as lilies, should not be kept out of the soil longer than six or eight weeks; the summer flowering sorts being set at separate periods in the autumn, and in the beginning of the year before the latter end of February, so as to produce a proper succession of flowers.

With others of the same nature, this method is also common, but they should have dry sandy soils in order to stand the winter without rotting, where there happens to be much wet, succeeded by severe frosts. In these cases, the protection of mats and the haulm of peas may often be found useful. When bulbous roots have remained in the ground longer than the proper period, so as to have struck out new roots, they should always be removed with bulbs of earth, as where this is not attended to, they grow weak. On this account, the exact period for removal should be attended to with great care.

The offsets of bulbous roots should in general be put into the ground a considerable time before the periods of planting out the full sized roots: those from laminated bulbs mostly requiring to be immediately planted.

The soil most adapted to the growth of bulbous roots, in general, is that of a sandy loam where there is no stagnation of moisture below; many sorts of these roots are not however very difficult in this respect, provided there be not an over proportion of moisture. The ground for them should be prepared by digging it to the depth of six, eight, or ten inches, or more, reducing it well in the operation. After this has been done, it should remain a week or ten days before they are put in to become perfectly settled.

In regard to the disposal of these roots in planting, it is generally for the more large and curious sorts in beds a little rounded, of three or four feet in width according to circumstances; or in patches in the common borders, for the smaller kinds, in clusters of three, four, or five together, according to their growth. With the large sorts, such as the white orange lilies, crown imperial, &c. one in a place is sufficient. The roots of fancy flowering bulbs when planted in beds, are usually put in rows, eight or more inches apart, and from five to seven inches distant, in proportion to their growth. Some prefer less room; but where a strong blow is required, these distances are not too great. Hyacinths should in general have the space of seven or eight inches, and tulips eight or nine, though it is often the practice to allow the former not more than five or six inches. The depths of setting roots of the bulbous kinds, are, in general,

according to their sizes or growths, as three or four inches from their upper parts. But some sorts, as the crown imperial, and crocus, will rise from a considerable depth, as six inches or more, and others from still greater, which has induced some persons to plant them to such depths as are sufficient to prevent their being injured by digging over the surface ground; but in these cases, they must be liable to rot in wet seasons.

Different methods are employed in planting bulbous roots, as those of putting them in by the dibble, and in drills drawn by a hoe. The latter is in general to be preferred, as they are apt to lie hollow in dibbling, while by placing them in a drill, they may be gently pressed into the soil, and be perfectly covered up. When they are set in the beds, the best method is to draw off the mould to a sufficient depth to one side, leaving the surface perfectly level, watering it a little in dry seasons, and then forming it into proper squares, placing a bulb in the middle of each, covering them with the mould drawn off, so as to leave the bulbs in an upright position. After the bulbs have been put into earth, if the weather continue very dry, a little water should be sprinkled over the beds or other places, to forward their vegetation, and prevent their rotting. Some protection is necessary in raising the more curious sorts of these roots, as before they appear during the winter, the beds should be sheltered from too much wet, in order to guard against the effects of frost. And when they first present themselves above the ground, they should have the protection of an awning of cloth, mats, or other contrivances, in the nights when the weather is severe; but they should not remain on in the day time, when it is tolerable. Some sort of covering of the same sort is also necessary when they are in blow to shield them from the sun and rain, and continue them much longer in a perfect state of flowering.

There is a method of getting spring flowering bulbs forward, which is by setting them in pots or glasses for the purpose, in warm rooms, or in moderate hot beds, as by these means, they flower in winter. The hyacinth and narcissus, as well as several others, may be managed in this way with facility. These should be placed in pots of light dry sandy earth in autumn, as about the beginning of October, water being occasionally given. They may likewise be put into glasses at the same period, and occasionally every three or four weeks, till the latter end of February, in order to have them flower in succession. In this method the bottom of the bulbs should be just immersed in the water, which should be renewed once a week, or oftener, so as to keep it constantly up to the bottom of the bulbs. Soft water is the best for this purpose. The blow is said, by Mr. Marshall, to be considerably strengthened, by dissolving a portion of nitre, about the size of a pea, in the water each time it is changed.

Besides the raising of flowers from root-bulbs in these modes, there are some produced from little bulbs, forced on the sides of the top parts of the stems, as in the bulbiferous lily. These should be taken off about August, and after being dried a little in the sun, planted out in rows in the nursery in the same manner as the offsets.

By these means the various bulbous-rooted plants may be continued; but, in order to produce *new* varieties, recourse must be had to seed, which should be carefully saved, when fully ripened, from the best and most curious flowers; and which, after having been hardened a little in the sun, should be sown in boxes of light rich earth, setting them in sheltered sunny situations, but not under covers. This is usually done about the latter end of August, or beginning of the following month, the seeds of hyacinths, tulips, and other large sorts, being covered to the depth of nearly an inch. A  
little

The water should be occasionally given, when the season is dry, to keep the soil moist, but not wet. The seeds may be protected till they come up by a little covering of some kind of strawy material. Other sowings may be made in March, or the following month, the boxes being brought into southern exposures, where there is only the morning frost, towards May. The young seedling plants should be protected in severe and frothy weather, and where there is much rain, by means of mats, hoops, and reed hurdles, or other contrivances, to break off the north-east winds. The young plants should likewise be kept properly thinned out, and perfectly free from weeds; and when the stems decay, a little mould should be put upon them to the thickness of half an inch. In the following summer when the leaves decay, as about August, they should be planted out into nursery beds at the distance of two or three inches, according to the kinds. Some sorts, as the hyacinth and tulip, require to be removed from this into another nursery bed, as soon as their tops decline, and set at six inches distance; or it is probably a better practice to thin them out to this distance in the first beds. After this they are to be managed as blowing plants.

These sorts of roots of plants blow at different lengths of time after being raised; some in the following year, and others not till several years afterwards, as will be explained under the culture of each of the different sorts.

The bulbous rooted plants constitute some of the most showy and ornamental flowers of the beds, clumps, and borders of the garden and pleasure ground, affording considerable variety from their blowing at different periods during the early spring, summer, and autumnal seasons.

**BULCARD**, in *Ichthyology*, a name under which Willughby describes *Bleennius pholis*, the smooth Blenny; a fish found on the Cornish and other coasts.

**BULCKAU**, or **BULKA**, in *Geography*, a town of Germany, in the arch-duchy of Austria, seated on a river of the same name, which runs into the Taya, 4 miles W. of Laab; the town is distant one mile W. from Schratentaal.

**BULDAT**, a town of the Arabian Irak; 20 miles E. of Bardad.

**BULDURUISKOI**, a town of Siberia; 132 miles E.S.E. of Nertchinsk.

**BULEPHORUS**, in the court of the eastern emperors, was the same officer with *summe rei* RATIONALIS.

**BULEUTÆ**, in the cities of Greece and Asia, were the same with the *decuriones* at Rome. Calv. Lex. Jur. p. 128. See *DECURIO*. The word has been sometimes also used to denote *senators*. See *SENATOR*.

**BULEUTERIA**, *Βουλευτήρια*, in *Grecian Antiquity*, public halls at Athens, where companies of tradesmen assembled to deliberate on commercial concerns. Trade was much encouraged in this city: and if any one ridiculed it, he was liable to an action of slander. Solon himself was engaged in merchandize; the founder of the city Massilia was a merchant; Thales, and Hippocrates the mathematician, traded; and Plato sold oil in Egypt. Under the Roman empire, the senate, or general council of Grecian cities, was called "Bule" from *βουλή*, *consilium*: its members were denominated "Buleutæ," and the place where it met at Syracuse, "Buleuterium."

**BULFINCH'S HARBOUR**, in *Geography*, lies on the north-west coast of North America, in N. lat. 46° 52' 30". W. long. 123° 7' 30".

**BULGANAC**, a river on the south-west coast of the Crimea, in the Black Sea, falling into the sea in N. lat. 44° 38'. E. long. 34° 50'.

**BULGAR**, a mountain of Asiatic Turkey, in the province of Caramania; 30 miles S. of Cogni.

**BULGARIA, GREAT**, the name given by some geographers to a province of Asia, in Russian Tartary, situated beyond the Volga, on the banks of the rivers Kama, Bielaia, and Samara, but now incorporated into the dominions of Russia, and forming part of the government of Caucasus. Its ancient capital was Bulgar, Beloger, Belgard, or Borgard, which lay 30 versts below the mouth of the Kama, and 5 from the Volga; but according to other accounts the Volga flowed by the town. Borgard was first ravaged by the Tartars in 1234, and in 1500 entirely destroyed by the Russians. See *BULGARIANS*.

**BULGARIA, Little**, a province of European Turkey, bounded on the north by the Danube and Walachia, on the east by the Black sea, on the south by Mount Hæmus, which separated it from Romania and Macedonia, and on the west by Servia. It was formerly called the Lower Mysia, but derives its present name from the Bulgarians, by whom it was occupied. Its extent is about 280 miles in length and 180 in breadth. The country in general is mountainous, but the plains and valleys, washed by the Danube and rivers that flow into it, are rich and fertile, and produce corn and wine in great abundance. Its ancient capital was Ternowa, but its kings principally resided at Nicopoli; but its present capital is Sophia. It now forms a part of the Ottoman empire. The inhabitants are mostly Christians of the Greek church, ignorant and superstitious, having one patriarch and three archbishops, subject to the authority of the patriarch of Constantinople. They are intermixed, however, with Turkish Mahometans and Jews. Their language is the Slavonic, (which see,) but in pronunciation differing little from the Servian. The country is divided by the Turks into four Sangiakships, viz. those of Bidin or Widin, Sardinie comprehending Sophia, Nicopoli, and Silistria. The present inhabitants, though descended from ancestors who distinguished themselves by their martial achievements, are occupied in graziery, agriculture, and handicrafts. This country is famous for a gate, constructed by the emperor Trajan in the hills south of Sophia, among steep rocks and precipices almost inaccessible, in commemoration of his having marched with his army along a road formed by himself through places that were before impervious. It consists of two stone pillars, with an arch over them, representing a gate; but is now in a mutilated and ruinous condition.

**BULGARIANS**, or *BOLGARIANS*, in *Ancient History*, a tribe of Slavonians, who are supposed to have inhabited Asiatic Scythia and the countries lying north of the Caspian sea, near the Volga, whence it is said they obtained the name *Volgari*, which was changed into *Bulgari*; and thence their country was denominated *Volgaria* and *Bulgaria*. Others, however, reject this etymology, alleging that the Volga was anciently called *Raa*, or, in Arabic, *Idel*; and deduce the appellation of Bulgarians either from their famous and large city Belgard, or from the denomination of *BILIRIANS* which they assumed. The Bulgarians, after having extended their borders along the Don and the Yaik, about the Volga and the Kama, carried on a great trade to Persia, Bucharia, India, Greece, and even to Italy and France, by the Euxine. They also traded considerably with the Russians, and, by their instrumentality, with the northern nations. Bulgaria was therefore, in former times, the emporium of the European and Asiatic commerce. The Bulgarian empire fell afterwards under the dominion of the Tartars, and when the Russians conquered

the Tartars, became subject to Russia. Their country was rich and extensive; its borders extended along the Volga, from the mouth of the Oka downwards to the Khoalises, or Nether-Bulgarians, where they had their peculiar sovereigns; and the Ares or Votiaks, along the Kama, were under their supremacy. It is not known how far it reached westward, and on the Don: however, the Tschermiffes and Tschuvafches were subject to them. Their language was the Sarmatic. The ruins of large towns and stone buildings are evidences of their opulence, their civilization, and their industry; and the coins that are dug out of the earth, with Arabic and Indian inscriptions, demonstrate their extensive commerce.

It was not till the reign of Zeno, about the year 485, that they began to be heard of and dreaded by the Romans. Ennodius, the most ancient writer who mentions them, informs us, in the panegyric which he composed on Theodoric, king of the Ostrogoths, that they were a warlike and numerous nation, enured to the toils of war, ever ready to prefer death to slavery, and never known to have been put to flight, till they engaged this hero. From Asiatic Scythia and other countries which they occupied, they advanced, in quest of a more fertile country, to the Tanais, and from thence, in the reign of Zeno, to the banks of the Danube, under the conduct of their king or leader Bladinus. Having passed this river, they made an irruption into Thrace, with a view of settling in that country; but they were opposed by Theodoric, the Ostrogoth, at that time general of the Roman troops in that province, and compelled to repass the Danube. In 499, they made a successful irruption into Thrace and committed dreadful ravages, and defeated the army of the emperor Anastasius, commanded by Aristus, which was sent to resist them. Three years after this expedition they again invaded Thrace, and carried off an immense booty, of which they plundered the province. In 539, the 13th year of the emperor Justinian, they made an incursion over the Danube into Moesia, defeated the Roman troops, and were retreating with their spoils and captives, after having destroyed with fire and sword what they could not remove, when they were attacked by Justinian's army under the command of an experienced officer, and obliged to surrender their booty and to save themselves by flight. However, in the following year they again entered Thrace, which they plundered and laid waste; but they were routed with great slaughter, and the loss of many prisoners. For these victories the emperor assumed the appellation of "Bulgaricus," which appears on his coins. History gives no account of them till the reign of Constantine III. or V. (Blair) surnamed Pogonatus, which commenced in the year 668. In his time they passed the Danube, and entering the Roman territories, committed great devastations in the provinces bordering on that river. They were feebly opposed by the powerful army of Constantine, and left at full liberty to ravage the open country at pleasure. At length, in 678, Constantine agreed to pay them an annual pension, on condition of their not infesting the Roman territories, and joining his forces against all other barbarians, wherever he required their assistance. About this time some of them settled in the dukedom of Benevento.

It is said that Constantine allowed them to settle in Lower Moesia, to which they gave the name of Bulgaria, which this province still retains. Other writers, however, suppose that they had settled there several years before the reign of Constantine. In 687 Justinian II. refusing to acquiesce in the treaty stipulated with them by his father, invaded their country, and reduced them to great distress; but the Bulgarians, animated by despair, determined to

make a last effort in defence of their liberties; and falling unexpectedly upon the emperor's army, put it to flight, and obliged him to confirm his father's treaty. In 713 they made an irruption into Thrace and advanced to the gates of Constantinople, and after having ravaged the country, returned home, with an immense booty, unmolested. When Constantine Copronymus, in the 9th year of his reign, A.D. 749, ordered forts to be built on the borders of the provinces, adjoining the country of the Bulgarians, they remonstrated; but their ambassadors were dismissed with a disdainful answer. Upon this the incensed Bulgarians made a sudden irruption into the Roman territories, and having laid waste the country, returned home loaded with booty. The emperor collecting his forces marched against them in person; but whilst he was laying waste their country, they took advantage of attacking him in a narrow pass, obliged him to fly, and pursued him with great slaughter to the gates of Constantinople. In the years 763 and 775 the Bulgarians suffered great injury in their conflicts with the Romans; but upon the accession of Leo IV. A.D. 775, he concluded a peace with their king, whose daughter Irene he had married; but his son and successor Constantine Porphyrogenitus, in the 12th year of his reign, A.D. 791, deluded by some astrologers, attacked the Bulgarians, and was totally defeated. The Bulgarians renewed their irruption into the Roman provinces in the reign of Nicephorus; and the emperor retaliated by marching with a large army into their country and ravaging it with fire and sword. The ambassadors of the Bulgarians, who were sent to him to sue for peace and to request his leaving their country, were treated with scorn; upon which their king Crumus, actuated by despair and the thirst of revenge, began with fortifying all the passes through which the emperor was to retire, and then proceeded to attack the Roman camp. This he forced, slew the emperor, and cut off almost his whole army. The savage conqueror ordered the head of Nicephorus to be struck off, and after having exposed it to public view, he inclosed the skull in silver, and used it in all grand entertainments instead of a cup. In 811 Michael I. ascended the throne, and a peace was concluded between the Romans and Bulgarians; but it was of very short duration. Crumus, offended by the treacherous escape of some Roman prisoners, levied a considerable army, entered the Roman territories, and assisted by an Arabian in the use of military engines, reduced several fortified places, and ravaged the whole country. Among other cities which he reduced, he made himself master of Mesembria, in the vicinity of Mount Hæmus, and put the garrison to the sword. The emperor prepared for an engagement, and the two armies met in the neighbourhood of Constantinople. After a furious conflict of doubtful issue, the Romans were utterly defeated; and Michael retired to a monastery, and resigned the purple to Leo V. A. D. 813. The Bulgarians wantonly triumphing in their success, refused to listen to any pacific overtures; and a second engagement took place, in which the Romans, after an obstinate resistance, were routed. But whilst the Bulgarians were busily engaged in plundering the Roman camp, Leo renewed the fight and obtained a complete victory. The Bulgarians remained for five years in a state of tranquillity; but at length, in the year 877, they took occasion to re-enter the Roman territories, and in their usual manner to ravage them with fire and sword. A battle ensued, and the Roman army was routed. The prisoners were led by the victor in triumph round his camp, and having caused their noses to be cut off, he sent them, thus defaced, to Constantinople. After subsequent advantages gained on

the part of the Bulgarians, and repeated defeats and severe losses sustained by the Romans, Adrianople was besieged and taken, A. D. 922; and preparations were made for besieging Constantinople. But, before the close of the following year, an interview took place between Simeon the king of the Bulgarians, and Romanus the eastern emperor, and a peace was concluded between them. In the year 970 the Russi or Rossi, who inhabited the present Podolia, invaded Bulgaria and ravaged the country; but having invellied Adrianople with a powerful army of more than 308,000 men, they were defeated and cut to pieces by a body of 12,000 Romans. The Bulgarians submitted to Zimiscees, their deliverer; but upon his death, A. D. 975, they revolted from the Romans and renewed their usual ravages of their provinces. After a long and doubtful struggle between the Bulgarians and the emperor Basil, he at last prevailed, and, in the 44th year of his reign, A. D. 1018, reduced Bulgaria into the form of a Roman province. From this time the Bulgarians remained in subjection to the emperors of Constantinople, whom they powerfully assisted both against the Latins and the Turks, and were, on that account, allowed to chuse a king of their own nation, who nevertheless owned himself a vassal of the empire. The Bulgarians, however, revolted again in the reign of Isaac Angelus, A. D. 1186. In 1275, Stephen, the fourth king of Hungary, having vanquished the prince of Bulgaria and cut his whole army in pieces, obliged the Bulgarians to acknowledge him as their sovereign. With the assistance of the Greek emperors they shook off the Hungarian yoke; but attempting, in 1369, to recover Adrianople, which had been taken by the Turks, they were totally defeated by Amurath I.; and Bajazet, who succeeded Amurath, made an absolute conquest of the whole country in 1396, and reduced it to a province of the Turkish empire, in which state it has continued ever since. *Anc. Un. Hist.* vol. xvii. *Gibbon's Hist. Decl. and Fall of the Roman Emp.* vol. vii, ix, x, xi.

**BULGARIAN Language**, the same with the **SLAVONIC**, which see.

**BULGNEVILLE**, in *Geography*, a town of France, in the department of the Vosges, and chief place of a canton in the district of Neufchateau,  $3\frac{1}{2}$  leagues south of it. The town contains 955, and the canton 10,883 inhabitants. The territory comprehends  $262\frac{1}{2}$  kilometres and 27 communes.

**BULIA**, or **BULIS**, in *Ancient Geography*, a maritime town of Greece, in the Phocide, situate towards the gulf of Corinth, near the frontiers of Bœotia. It had two temples, one of Bacchus and another of Diana; the statues of which were formed of wood.

**BULIMIA**, in *Medicine*, a term signifying excessive hunger, from  $\beta\upsilon\lambda\iota\mu\acute{o}\varsigma$ , a participle denoting excess, and  $\lambda\upsilon\pi\acute{o}\varsigma$ , hunger. It is also called *fames canina*, *fames lupina*, dog's appetite, wolf's appetite, &c. This symptom occurs in cases where the food is not retained long enough in the stomach to be digested, as in cases of habitual vomiting, and in lientery; also where the aliment, duly prepared or concocted in the stomach, is nevertheless but scantily conveyed into the circulation, as in the case of worms, and obstruction of the mesenteric glands; and it is said that this symptom occurs where much acidity is present in the alimentary canal. Sauvages, with his usual fecundity, has enumerated seven different species of bulimy; but in most of the instances which he has mentioned, it is rather to be regarded as a concomitant of other disorders, than as a distinct and specific affection. Ruysch gives an instance of this complaint, which was connected with a dilatation of the pylorus, in

consequence of which the food slipped through the stomach into the intestines, before there was time for digestion to take place; and it is recorded by Lieutaud, that upon opening the body of a patient who had died of a disorder, in which a voracious appetite was a leading symptom, he discovered a preternatural termination of the ductus choledochus in the stomach. In this case the bile effused into the stomach seems to have kept up a constant irritation in that organ, and to have stimulated the stomach to expel the ingesta before they could be duly acted upon by the principal agent in the work of digestion, the galtric fluid.

From these observations it is evident that the plan of treatment must be varied, according to the diversity of the morbid conditions with which it is connected. Thus, when it is the consequence of an immediate rejection of the food by vomiting, the irritability of the stomach should be counteracted by mild gelatinous food, by opiates, tonics, &c. aided by stimulant epithems, and other topical applications. At the same time nutritive enemata should be injected into the intestines. In like manner, when it is the consequence of the food passing off too rapidly by stool (as in lientery), the remedies adapted to that condition of the body should be resorted to. (See **LIENTERY**.) If it proceed from worms, calomel, jalap, cowitch, and other anthelmintics, should be prescribed; if from mesenteric obstruction, rhubarb, neutral salts, and afterwards chalybeates; and, lastly, when it arises from acidity in the stomach and intestines, bitters and absorbents should be given.

After this view of the various causes of bulimy, and of the treatment as adapted to each of those causes, we shall proceed to notice some remarkable and well-authenticated instances of this affection. In 1700 there lived at Stanton, seven miles from Bury, a labouring man of middle age, who for many days together had such an inordinate appetite that he would eat up an ordinary leg of veal, roasted, at a meal. He would eat sow-thistles, and various other herbs, as greedily as cattle are wont to do; and all he could get was little enough to satisfy his hunger. He voided several long worms. This case is related by Dr. Burroughs, in the 22d vol. of the *Phil. Trans.* Two other cases are recorded in the 43d vol. of the same *Transactions*, one by Dr. Mortimer, the other by Dr. Cookson. The subjects of this affection were in both instances boys. The first of them was 12 years old, and lived at Blade Barnsley, in Yorkshire. His appetite was so ravenous, that if he was not supplied with food when he craved it, he would gnaw the very flesh off his own bones. When awake he was constantly devouring. Nothing passed his stomach; it was always thrown up again. In the space of six days he devoured 354 lbs. of liquid and solid food. The other boy was 10 years old, and had been seized with a fever about 15 months before, which continued for a fortnight, and was followed by constant vomitings. As in the former case, so in this, the food was no sooner swallowed than thrown up again. In the space of six days this boy devoured 371 lbs. of meat and drink, besides 1 lb. 10 oz. of salt. After more than a twelvemonth from the first attack, he died greatly emaciated.

In the third vol. of the *Memoirs of the Medical Society of London*, is inserted the history of a case of bulimy, accompanied with vomiting, wherein 379 lbs. of meat and drink were swallowed in the space of six days, yet the patient lost flesh rapidly. A cure was effected by giving food boiled down to a jelly, frequently, and in small quantities. In this form the food was retained, and the body being duly supplied with nourishment, the stomach and rest of the system recovered their proper tone and energy. But the most extraordinary instance of bulimy which perhaps ever occurred, is

that recorded in the third vol. of the Medical and Physical Journal, communicated by Dr. Johnson, commissioner of sick and wounded seamen, to Dr. Blanc, formerly physician to the navy. The subject was a Polish soldier, named Charles Domery, in the service of the French, on board of the Hoche frigate, which was captured by the Squadron under the command of sir J. Borslase Warren, off Ireland, in 1799. He was 21 years of age, and stated that his father and brothers had been remarkable for their voracious appetites. His began when he was 13 years of age. He would devour raw and even live cats, rats, and dogs, besides bullock's liver, tallow-candles, and the entrails of animals. One day (viz. September 7th, 1799) an experiment was made of how much this man could eat in one day. This experiment was made in the presence of the before-mentioned Dr. Johnson, admiral Child, and Mr. Foster, agent for prisoners at Liverpool, and several other gentlemen. He had breakfasted at four o'clock in the morning on 4 lbs. of raw cow's udder; at half past nine o'clock there were set before him 5 lbs. of raw beef and 12 tallow candles of 1 lb. weight, together with 1 bottle of porter; these he finished by half past ten o'clock. At one o'clock there were put before him 5 lbs. more of beef, 1 lb. of candles, and 3 bottles of porter. He was then locked up in the room, and sentries were placed at the windows to prevent his throwing away any of his provisions. At two o'clock he had nearly finished the whole of the candles, and great part of the beef; but without having had any evacuations by vomiting, stool, or urine; his skin was cool, pulse regular, and spirits good. At a quarter past six he had devoured the whole, and declared he could have eat more; but the prisoners on the outside having told him that experiments were making upon him, he began to be alarmed. Moreover, the day was hot, and he had not had his usual exercise in the yard. The whole of what he consumed in the course of one day amounted to

Raw cow's udder	-	-	-	4 lbs.
Raw beef	-	-	-	10
Candles	-	-	-	2
				---
				16 lbs.

Besides 5 bottles of porter.

The eagerness with which this man attacked his beef when his stomach was not gorged, resembled the voracity of a hungry wolf; he would tear off large pieces with his teeth, roll them about his mouth, and then gulp them down. When his throat became dry from continued exercise, he would lubricate it by stripping the grease off a candle between his teeth; and then, wrapping up the wick like a ball, would send it after the other part at a swallow. He could make shift to dine on immense quantities of raw potatoes or turnips, but by choice would never taste bread or vegetables. He was in every respect healthy, 6 feet 3 inches high, of a pale complexion, grey eyes, long brown hair, well made but thin, his countenance rather pleasant, and he was good-tempered. His evacuation by the bowels was by no means proportioned to the quantity of food he devoured, and even did not exceed that of other men; but his perspirations were profuse, not only when in bed, but also when up and eating. To the profuseness of this evacuation, Dr. Johnson, and the other medical gentlemen, have ascribed the rapid dissipation of the ingesta, and his incessant craving for fresh supplies of food. It does not appear that he had worms.

**BULINUS HEMASTOMUS**, in *Conchology*. See **TURBO HEMASTOMUS**.

**BULITAGA**, in *Geography*, a range of mountains which

separates the empire of Russia from Persia. N. lat. 48° 30' to 51°. E. long. 72° 14' to 73° 14'.

**BULITHOS**, *lapis bovinus*, a calculus or stone found in the gall-bladder, kidneys, or urinary bladder of oxen.

Instances hereof are given by Bromell, the Academy Naturæ Curiosorum, and other naturalists, by which it appears that Aristotle was mistaken in asserting, that man alone is subject to the stone, and inquiring solicitously into the reason hereof. Arist. Probl. § x. n. 42.

**BULK** of a ship, denotes her whole content in the hold for stowage of goods.

**BULK**, to break. See **BREAKING**.

**BULK-heads**, are partitions made across a ship, or lengthways, with boards of timber, whereby one part is divided from another. The *bulk-head afore* is the partition between the fore-castle and gratings in the head, and in which are the chafe-ports.

**BULKA**, in *Geography*. See **BULCKAU**.

**BULKLEY**, CHARLES, in *Biography*, a Protestant dissenting miller, was born in London in 1719, educated in Dr. Doddridge's academy at Northampton, whither he removed from Chelster in 1756, and commenced preacher in 1740. After some time he settled in London, where he was baptized by immersion, and joined the general Baptists. After having conducted his labours with ability and reputation, in connection with a congregation of this description, for a long series of years, during which he succeeded the eloquent Dr. Foster in his lecture at the Old Jewry, he died in 1797, in the 78th year of his age. Besides several single sermons, preached on particular occasions, he published "Discourses on several Subjects," 1752; "A Vindication of Lord Shaftesbury's Writings," 1753; "Notes on Lord Bolingbroke's Philosophical Writings;" "Observations on Natural Religion and Christianity, candidly proposed in a Review of the Discourses lately published by the Lord Bishop of London, in 3 volumes;" "Economy of the Gospel," 4to. 1764;" "Discourses on the Parables and Miracles of Christ," 4 vols. 1770; "Catechetical Exercises," 1774; "Preface to Notes on the Bible," 1791, &c. Evans's Funeral Sermon, 1797.

**BULL**, in *Astronomy*, the constellation TAURUS, which see.

**BULL**, Dr. JOHN, in *Biography*, was born about 1563, in Somersetshire, and became, by his great abilities on the organ and virginal, the wonder of his time. Indeed, the prosperous reign of queen Elizabeth was, perhaps, not rendered more illustrious by the musical productions of Tallis, Bird, and Morley, than the performance of Dr. Bull. His music-master was William Blithman, organist of the chapel royal to queen Elizabeth, in which capacity he held a very high rank. Bull, on the death of his master, in 1591, was appointed his successor in the queen's chapel; and in 1596, at the recommendation of her majesty, he had the honour of being the first that was appointed music-professor to Gresham college. And though unable to compose and read his lectures in Latin, according to the founder's original intention, such was his favour with the queen and the public, that the executors of sir Thomas Gresham, by the *ordinances*, bearing date 1597, dispensed with his knowledge of the Latin language, and ordered "The solemn music lecture to be read twice every week, in manner following, viz. the theoretique part for one half hour, or thereabouts; and the practique, by concert of voice or instruments, for the rest of the hour: whereof the first lecture should be in the Latin tongue, and the second in English.—But because at this time Mr. Doctor Bull, who is recommended to the place by the queen's most excellent majesty, being not able to speak Latin, his lectures

permitted to be altogether in English so long as he shall continue in the place of music lecturer there." Ward's Lives of the Professors of Gresham College, Pref. p. viii. The first lecture read by Bull, at Gresham college, was printed the same year that it was pronounced, under this title: "The Oration of Maister John Bull, Doctor of Musicke, and one of the Gentlemen of hir Majesties Royall-Chappell, as he pronounced the same, beefore divers worshipful persons, the Aldermen and Commoners of the citie of London, with a great multitude of other people, the 6th day of October, 1597, in the new created Colledge of Sir Thomas Gresham, Knt. deceased: made in the commendation of the founder, and the excellent science of Musicke." Imprinted at London by Thomas Este.

At first, application was made to the two universities, by the lord mayor and corporation of London, jointly with the mercers' company, left trustees of this institution, to nominate two persons in all the liberal arts fitly qualified to read lectures in their several faculties; but this application was not continued, as some jealousy seems to have been awakened at Oxford and Cambridge, lest this new college should be prejudicial to those ancient seats of learning.

What effect this liberal foundation had on other faculties let the friends and patrons of each particular science say; but as to music, it is hardly possible to read the lives of the professors without lamenting that the design of so noble an institution, established on such an extensive plan, should be so entirely frustrated as to become wholly useless to that city and nation for whose instruction it was benevolently intended. Dr. Bull, the only person on the list of music professors, who seems to have been able to inform by theory, or amuse by practice, those who attended the musical lectures, resigned his professorship in 1607. Indeed, during more than a year of his professorship, Mr. Thomas Bird, son of the venerable William Bird, exercised the office of a substitute to Dr. Bull, while he travelled on the continent for the recovery of his health. So that except about nine years from the date of the establishment, to the present times, it does not appear that the science of sound, or practice of the musical art, has been advanced by subsequent professors. For in the following list, given by Dr. Ward, up to the year 1740, including Dr. Clayton, elected 1607; John Taverner, 1610, who was no relation of the musician of that name; Richard Knight, 1638; William Petty, 1650, afterwards the famous sir William Petty; Dr. Thomas Baynes, 1660; William Perry, 1681; John Newy, 1696; Dr. Robert Shippen, 1705; Dr. Edward Shippen, his brother, 1710; John Gordon, 1723; and Thomas Brown, 1739; though all men of learning and abilities in other faculties, yet no one of them had ever distinguished himself, either in the theory or practice of music; nor are any proofs remaining that they had ever studied that art, the *arcana* of which they were appointed to unfold! What an abuse of reason and munificence does it seem, that those who had never meditated on the art, or been taught, themselves, should be fixed upon to teach, and direct the studies of others!

A silly story has been told by Anthony Wood (Fasti Oxon. vol. i. c. 131.) concerning a feat performed by Dr. Bull, who, at St. Omer's, when he first visited the continent, to a composition originally written in forty parts, added forty more in a few hours; which is so impossible, as not to be worth relating.

After the decease of queen Elizabeth, he was appointed organist to king James. And July the 16th, 1607, when his majesty and prince Henry dined at Merchant-Taylor's hall, the royal guests were entertained with music, both vocal and instrumental, as well as with several orations. And

while his majesty was at table, according to Stow, "Mr. Doctor Bull, who was free of that company, being in a citizens gowne, cappe, and hood, played most excellent melody upon a small payre of organs placed there for that purpose onely." (Chron. p. 891. edit. 1615.) In December, of the same year, he resigned his professorship of Gresham college, but for what reason does not appear, as he continued in England several years afterwards.

In 1613 he quitted England, and entered into the service of the archduke, in the Netherlands. He afterwards seems to have been settled at Lubeck, at which place many of his compositions in the list published by Dr. Ward, are dated; one of them as late as 1622, the supposed year of his decease.

Dr. Bull has been censured for quitting his establishment in England; but it is probable that the increase of health and wealth was the cause and consequence. Indeed he seems to have been praised at home, more than rewarded; and it is no uncommon thing for one age to let an artist starve, to whom the next would willingly erect statues. The professorship of Gresham college was not then a sinecure. His attendance on the chapel royal, for which he had forty pounds per annum, and on the prince of Wales, at a similar salary, though honourable, were not very lucrative appointments for the first performer in the world, at a time when scholars were not so profitable as at present; and there was no *public playing*, where this most wonderful musician could display his abilities, and receive their due applause and reward.

A list of more than two hundred of Dr. Bull's compositions, vocal and instrumental, is inserted in his life, which, when it was written in 1740, were preserved in the collection of Dr. Pepusch. The chief part of these were pieces for the organ or virginal, which we have seen and examined, having been transcribed into queen Elizabeth's virginal book, and printed in a collection called *Parthenia*. An *In nomine*, of five parts, we have scored from the Christ Church set of manuscript books, in Dr. Aldrich's collection, and have attentively perused his choral composition in the collections of Dr. Tudway and Dr. Boyce, which is the same verse anthem, with different words, for two voices, with a chorus. In all this vocal music that we have seen, there seems to be much more labour and study than genius. Tallis and Bird had so long accustomed themselves to write for voices, that the parts in their compositions are much more natural and flowing than those of Bull. In looking at the single parts of Tallis and Bird, there are notes and passages which appear wholly insipid and unmeaning, as melody; but which, when heard in harmony with any other part, produce admirable effects.

Indeed, possessed as he was of such extraordinary powers of execution on keyed instruments, we have been frequently astonished, in perusing Dr. Bull's lessons, at the few new and pleasing passages which his hand suggested to his pen. It has been said, that Dr. Pepusch preferred Bull's compositions to those of Couperin and Scarlatti, not only for harmony and contrivance, but air and modulation: an assertion which rather proves that the doctor's taste was *bad*, than Bull's music *good*. Though we should greatly admire the hand, as well as the patience, of any one capable of playing his compositions; yet, *as music*, they would afford us no kind of pleasure: *ce sont des notes, et rien que des notes*; there is nothing in them which excites rapture. They may be heard by a lover of music with as little emotion as the clapper of a mill, or the rumbling of a post-chaise.

After such frequent mention of the extreme difficulty of these old pieces, in mercy to modern performers, it may with truth

truth be said, that the loss, to refined ears, would not be very great, if they should for ever remain unplayed and undecyphered. For being generally built on some old and vulgar palmodic tunes, unmeaning in themselves, the crowded harmony and multiplied notes with which they are loaded, have not rendered them more pleasing. Indeed the infallible consequences of a young practitioner bestowing such time and labour on them as may be necessary to subdue the difficulties of execution they contain, would be corruption of taste, and neglect of more useful studies.

The instrumental music of queen Elizabeth's reign seems to partake of the pedantry and soppery of the times: eternal fugues upon dry and unmeaning subjects were the means of establishing reputation for *learning* and *contrivance*; as dull divisions and variations, in which the change was generally from bad to worse, seem to have been the only qualifications which entitled a professor to eminence for *taste* and *invention*.

The very terms of *canon* and *fugue* imply restraint and labour. Handel was perhaps the only great fughist, exempt from pedantry. He seldom treated barren or crude subjects; his themes being almost always natural and pleasing. Sebastian Bach, on the contrary, like Michael Angelo in painting, disdained facility so much, that his genius never stooped to the easy and graceful. We never have seen a fugue by this learned and powerful author upon a *motivo*, that is natural and *chantant*; or even an easy and obvious passage, that is not loaded with crude and difficult accompaniments.

As the youth of Bull must necessarily have been spent in subduing the difficulties of other composers, he seems, in his riper years, to have made the invention of new difficulties of every kind, which could impede or dismay a performer, his sole study. It seldom happens that those possessed of great natural force of hand, on any instrument, submit to the drudgery of much dry study; but this gift was so far from relaxing the labour and diligence of Dr. Bull, that he entered deeper into all the *arcana* of the art, and pedantry of the times, than most of his contemporaries. That he was "exquisitely skilled in canon," has been given as one of the most irrefragable proofs of his being a great musician; and canons, *recte et retro*, and *per arsin et thesin*, in triangular, and other fantastical forms, are carefully preserved, as stupendous specimens of his abilities.

*Walsingham* has been a subject upon which Dr. Bull and Bird have exercised their abilities in the most elaborate manner. In the sixteenth century, popular tunes were the foundations upon which the greatest contrapuntists constructed even the masses which they set to music; and in the next, the English, no longer in want of these tunes in the church, polished and tricked them up for the chamber, with every art and embellishment they could devise.

Both Bird and Bull have likewise worked on the hexachord, *ut re mi fa sol la*, ascending and descending; upon which theme they have constructed elaborate and ingenious lessons, of the most difficult execution. That of Bull has passages for the left hand, which perhaps none but himself could play during his own time, and which we have never seen introduced in any compositions of the present century, except those of Sebastian Bach; or heard executed, but by Palscha, near forty years ago; who must have vanquished them by the incessant labour of several years, out of his short life; for he was then but eight years old. A new, but similar difficulty, has lately been devised for keyed-instruments, in the rapid divisions for one hand, in *octaves*, which great application only can vanquish. The execution of long and rapid divisions of thirds and sixths, and even of common

chords, is not frequently wanted in modern music, and therefore they would baffle and embarrass the greatest performers, who have not worked at such passages with unremitting labour. But besides these difficulties, there are others of *measure*, in Bull's Lessons, where, in four parts, the left hand has two of six crotchets in a bar, while the right plays nine to each semibreve of the hexachord.

Specimens of the difficulties abounding in the compositions of the golden age of queen Elizabeth, may be seen in the Hist. of Mus. vol. iii. in order to invalidate the vulgar cast of such as are determined to blame whatever is modern, and who, equally devoid of knowledge and feeling, reprobate as *trash* the most elegant, ingenious, and often sublime compositions, that have ever been produced since the laws of harmony were first established.

Indeed we should suppose that the pieces of Bull were composed to be *tried*, not played, for private practice, not public use; as they surpass every idea of difficulty that can be formed from the lessons of Handel, Scarlatti, Sebastian Bach; or, in more modern times, Emanuel Bach, Mützell, Mozart, Clementi, Dupré, Cramer, and Beethoven.

BULL, GEORGE, an English prelate, was descended of an ancient family seated at Shapwick in Somersetshire, and born at Wells in that county, in 1634. Having finished his course of classical learning at Wells and at Tiverton, he was entered a commoner of Exeter college, Oxford, in 1648; where, notwithstanding the loss of time incurred by the pursuit of pleasures and diversions, he acquired the reputation of an acute disputant, and attracted the notice of his superiors. In 1649, refusing to take the oath to the commonwealth of England, he retired to North Cadbury in Somersetshire; and having applied with diligence to the study of divinity, he took orders, and accepted the small benefice of St. George's, near Bristol, where he maintained an exemplary character, and was eminently useful, preaching twice every Sunday, and performing the devotional service by the aid of the common prayer, though the regular use of the liturgy was prohibited. After the restoration in 1662, he was presented by the lord chancellor, earl of Clarendon, to the rectory of Suddington, St. Peter, near Cirencester, having been instituted, by the recommendation of lady Pool, to the adjoining rectory of Suddington, St. Mary, in 1658. In this situation he remained twenty-seven years; discharging his pastoral functions with assiduity, and prosecuting his studies with indefatigable application. Most of his works were composed during this period of his life. In 1669 he published his "Harmonia Apostolica," or "Apostolical Harmony," in two dissertations, in the first of which St. James's doctrine of justification by works is explained and defended; in the second, the argument of St. Paul with St. James is clearly demonstrated. This work, which was written in Latin, excited great opposition, and was attacked by several divines, both among episcopalian and nonconformists. The author's reply to his adversaries was contained in his "Examen Censuræ, &c.;" and his "Apologia pro Harmonia, &c.;" published together in 1675. In 1678 he was promoted to a prebend in the church of Gloucester; and in 1680 he finished his "Defence of the Nicene Faith," which was printed at the Oxford theatre in 1685, with the special approbation, and at the sole expence of bishop Fell, under the title of "Defensio Fidei Nicenæ, ex Scriptis quæ extant Catholicorum Doctorum, qui intra tria prima Ecclesiæ Christianæ sæcula floruerunt." This book is written, in a pure Latin style, against the Arians and Socinians on the one hand, and the Tritheists and Sabellians on the other: and it was received with great applause both at home, and in foreign countries. It did not,

however, escape the animadversions and censures of several Heterian writers. Five years after the completion of this book, the author was presented to the valuable rectory of Avening, in Gloucestershire. Soon after, in 1686, he was promoted by archbishop Sancroft, to the archdeaconry of London; and in consideration of his eminent services to the church, the university of Oxford conferred upon him the degree of doctor in divinity. During the reign of James II. he preached with great ardour against the errors of popery. In 1694, he published his "Judicium Ecclesie Catholice, &c.:" in defence of the anathema, decreed by the first council of Nice. For this work the author received the thanks of the whole body of the clergy of France; though, considered as the vindication of an anathema, which condemns some of the highest ornaments of literature and christianity both in and out of the church, it will not now be regarded as entitling Dr. Bull to any very distinguishing commendation. The last treatise written by this learned author, was his "Primitive Apollolical Tradition of the Doctrine received in the Catholic Church, concerning the Divinity of our Saviour Jesus Christ, asserted, and evidently demonstrated, against Daniel Zuericke the Prussian, and his late Followers in England." All his Latin works, published by himself at different times, were collected and printed in 1703 in one volume, folio, by Dr. J. E. Grabe, with a preface and annotations. In 1705, Dr. Bull was promoted to the bishopric of St. David's; and taking his seat in the house of peers, in the session, when the bill passed for the union of both kingdoms, he bore testimony in favour of the church of England, as being "in her doctrine, discipline, and worship, most agreeable to primitive and apostolical institution." He resided constantly in his diocese, and carefully discharged all the episcopal functions; but in 1710 he closed his laborious and useful life at Brecknock, the customary place of his residence, where he was interred; leaving behind him a widow and two children, the survivors of eleven. His constitution was naturally firm and vigorous; but his incessant application had to a considerable degree impaired it before the close of his life. His temper was lively, irritable, and inclined to melancholy; nor does he seem to have been entirely free from a tincture of superstition. He was remarkable for the firmness of his mind, and for an habitual sense of religion, which influenced his conduct after the first deviations of his youth. His learning was recommended by the modesty that accompanied and adorned it; and his patience, piety, and christian hope were signally exemplified during the painful paroxysms of the disease that terminated his life. Bishop Bull's sermons and larger discourses were published in 1713 by Mr. Nelson in three volumes, 8vo. The first of these volumes contains two sermons on the intermediate state, which were re-published in 1765 by the late professor Chappelow, and which have been animadverted upon by the author of the "Historical View of the Controversy concerning the intermediate State, &c." All the bishop's works have been published together, in folio, by Mr. Nelson, who also published his "Life" in 1717, 8vo. Biog. Brit.

**BULL**, in *Ecclesiastical Writers*, denotes an instrument dispatched out of the Roman chancery, sealed with lead; answering to the edicts, letters patent, and provisions, of secular princes.

The bull is thus described by Matthew Paris, anno 1257: "*In bulla domini pape stat imago Pauli à dextris crucis in medio bullæ figurata, et Petri à sinistris.*"

The word *bull* is derived from *bullæ*, a seal; and that from *bullæ*, a drop, or bubble: or, according to others, from the

Greek, *βῆλον*, *council*: according to Pezron, from the Celtic *buil*, or *bul*, a bubble.

We meet with four kinds of these *bullæ* or *bullæ*; golden, silver, waxen, and leaden; all in use among the emperors and kings of the middle and barbarous ages. In some, the impression is made on the solid metal itself; in others on wax; and only enclosed in a metalline box, or case.

Sealing with metals is an illustrious privilege, belonging only to princes, though assumed also by prelates, as princes of the church. The doges of Venice durst not arrogate this honour, till leave was given them by pope Alexander III. about the year 1170, to seal their diplomata with lead.

The *bull* is the third kind of apostolical rescript, and the most in use, both in affairs of justice and of grace. It is written on parchment; by which it is distinguished from a *brief*, or simple *signature*, which is on paper. A *bull* is properly a signature enlarged: what the latter comprehends in a few words, the former dilates and amplifies.

If the *bulls* be letters of grace, the lead is hung on silken threads; if they be letters of justice, and executory, the lead is hung by a hempen cord. They are all written in an old round Gothic letter.

The *bull*, in the form wherein it is to be dispatched, is divided into five parts; viz. the narrative of the fact; the conception; the clause; the date; and the salutation, in which the pope takes on himself the quality of "servant of the servants of God," *servus servorum Dei*.

Properly speaking, it is the seal or pendant lead alone that is the *bull*: it being that which gives it both the title and authority. The seal presents, on one side, the heads of St. Peter and St. Paul; on the other, the name of the pope, and the year of his pontificate.

By *bulls*, jubilees are granted: without them no bishops in the Romish church are allowed to be consecrated. In Spain, *bulls* are required for all kinds of benefices; but in France, &c. simple signatures are sufficient; excepting for bishoprics, abbey, dignitaries, and priories conventual. According to the laws of the Roman chancery, no benefits, exceeding twenty-four ducats per annum, should be conferred without *bulls*: but the French would never submit to this rule, except for such benefices as are taxed in the apostolical chamber: for the rest, they reserve the right of dissembling the value, expressing it in general terms: *Cujus & illi forsitan annexorum fructus 24 ducatorum auri de camera, secundum communem estimationem, valorem annum non excedunt.*

The *bulls* brought into France were limited and moderated by the laws and customs of the land, before they were registered; nor was any thing admitted till it had been well examined, and found to contain nothing contrary to the liberties of the Gallican church; those words, *proprio motu*, in a *bull*, were sufficient to make the whole be rejected in France. Nor do the Spaniards admit the papal *bulls* implicitly; but, having been examined by the king's council, if there appear any reason for not executing them, notice thereof is given to the pope by a supplication; and the *bull*, by this means, remains without effect: and the like method of proceeding with the court of Rome is observed by most of the other courts of Europe, in the papal communion.

To *fulminate bulls*, is to make publication thereof, by one of the three commissioners to whom they are directed; whether he be the bishop or official. This publication is sometimes opposed; but when it is, the fault is not charged on the pope who issued the *bull*; but an appeal is brought

to him against the person who is supposed to make it; thus the fault is laid, where it is known not to be just, to evade affronting the pontiff. See FULMINATION.

The *bull in aena Domini*, is a bull read every year on Maunday-Thursaday, in the pope's presence; containing various excommunications and execrations against heretics, those who disobey the see, who disturb or oppose the exercise of ecclesiastical jurisdiction, &c.

After the death of the pope, no bulls are dispatched during the vacancy of the see, to prevent any abuses; therefore, as soon as the pope is dead, the vice-chancellor of the Roman church takes the seal of the bulls; and in the presence of several persons, orders the name of the deceased pope to be erased; and covers the other side on which are the heads of St. Peter and St. Paul, with a linen cloth; sealing it up with his own seal, and giving it, thus covered, to the chamberlain, to be preserved, that no bulls may be feald with it in the mean time.

These decrees of the pope are often mentioned in our statutes, as 25 Edw. III. 28 Hen. VIII. c. 15.; 1 and 2 Ph. and M. c. 8.; and 13 Eliz. c. 2. They were formerly used, and of force in this country; but by stat. 28 Hen. VIII. c. 16. all bulls, &c. obtained from the bishop of Rome are void; and by 13 Eliz. c. 2. (see also 23 Eliz. c. 1.) the procuring, publishing, or using of any of them is high treason.

**BULL, golden**, is a denomination peculiarly given to an ordinance, or statute, made by the emperor Charles IV. in 1356, said to have been drawn up by that celebrated lawyer, Bartoli, and still reputed the *magna charta*, or fundamental law of the empire. It was composed and published at a diet convoked by the emperor at Nuremberg; and is thus called from a golden seal fixed to it, such as were used by the emperors of Constantinople, annexed to their edicts.

Till the publication of the golden bull, the form and ceremony of the election of an emperor were dubious, and undetermined; and the number of electors was not fixed: this solemn edict regulating the functions, rights, privileges, and pre-eminences of the electors. The original, which is in Latin, on vellum, is kept at Franckfort. On the back side of it there are several knots of black and yellow silk, to which hangs a *bull*, or seal of gold. It is pierced through the middle with a golden wire, the ends of which are fastened by a seal of gold, about the size of a half crown, one side exhibiting the figure of Charles IV. upon a throne, and the reverse, a kind of gate, inscribed "Aurea Romana." On the exergue are these words: "Carolus IV. Rom. Imp. semper Augustus, rex Bohemie." This is preserved in a square wooden box. This ordinance, containing thirty articles, was approved of by all the princes of the empire, and remains still in force. The election of the empire is by it declared to belong to seven electors; three of them ecclesiastics, viz. the archbishops of Mentz, Treves, and Cologne; and four seculars, viz. the king of Bohemia, prince Palatine, duke of Saxony, and marquis of Brandenburg.

**BULL, Carolins**, a famous constitution published by Charles IV. A. D. 1359, which cancelled all the statutes or regulations that had been made to the prejudice of ecclesiastical liberty, and denounced the severest penalties against those who should aggrieve the persons of the clergy. It was issued in order to pacify pope Innocent VI., who had been alarmed and offended by some plans of reformation which the emperor had adopted. With a view of reforming the German clergy, he communicated to the bishops the measures he had taken for this purpose, and threatened to sequestrate the revenues of those who should refuse to obey

his orders. The pope, believing the honour and liberty of ecclesiastics at stake, desired the emperor to forbear meddling with the reformation of the clergy, which was his province, and insisted upon his restoring what the secular noblemen had at different times usurped from ecclesiastics. This circumstance occasioned the publication of the Caroline bull.

**BULLS, golden**, were in use among the eastern emperors for a considerable time, leaden ones being confined to matters of a smaller moment. Spelman mentions a golden bull, in a treaty of alliance with our Henry VIII. and Francis I. of France: the same author relates, that the instrument, whereby Clement VII. gave king Henry VIII. the title of Defender of the Faith, had golden *bulls* affixed to it; and there are other instances in Du-Cange and Altaferra.

**BULLS, silver**, were not in so frequent use, though instances of them are not wanting.

**BULLS, leaden**, were sent by the emperors of Constantinople, to despots, patriarchs, and princes; and the like were also used by the grandees of the imperial court, as well as by the kings of France, Sicily, &c. and by bishops, patriarchs, and popes. Polydore Virgil makes pope Stephen III. the first who used leaden *bulls*, about the year 772. But others find instances of them as early as Sylvester, Leo. I. and Gregory the Great. The later popes, besides their own names, strike the figures of St. Peter and St. Paul on their bulls; a practice first introduced by pope Paschal II.

**BULLS, waxen**, are said to have been first brought into England by the Normans. They were in frequent use among the Greek emperors, who thus sealed letters to their wives, mothers, and sons. Of these there were two sorts, one red, the other green. Du-Cange, Gloss. Lat. tom. i. & Gloss. Græc. Montfaucon, Palæolog. lib. vi.

**BULL of Phalaris**, or *Perillus*, a brazen bull made by Perillus the Athenian, to flatter the cruelty of Phalaris, tyrant of Agrigentum, for the purpose of tormenting criminals. It was formed in the shape of that quadruped; and when persons were inclosed in it, fire was applied, and their cries are said to have resembled the roaring of a bull. Perillus is said to have been the first who suffered in it, for having extorted too great a recompence for the construction of it. Phalaris himself was punished by the people of Agrigentum for his cruelty, by being put to death, as some say, in his own bull. When Hannibal took the city, this bull, among other treasures and valuable curiosities, was sent to Carthage; but it was afterwards restored to the Agrigentines by Scipio, when he took Carthage, in the third Punic war. Cic. l. iv. in Verrem. c. 33.

**BULL**, in *Geography*, a large rock in the Atlantic ocean, about three miles W. of Dursey island, on the coast of the county of Kerry, Ireland. N. lat. 51° 33'. W. long. 10° 9'.

**BULL**, a rock near the west point of the island of Raghlin, in the North channel, about seven miles N.W. of Fairhead, in the county of Antrim, Ireland. N. lat. 55° 19'. W. long. 6° 10'.

**BULL, North and South**, two banks of sand in the bay of Dublin, Ireland, between which lies the small sand bank, called the *bar*. There are buoys to mark these banks, but notwithstanding every improvement of the harbour, and every precaution, they sometimes occasion shipwrecks.

**BULL**, in *Rural Economy*, an animal of much importance to the stock farmer. For the purposes of the breeder the head of the bull should, according to Mr. Culley, "be rather long, and the muzzle fine; his eyes lively and prominent, his ears long and thin, his horns white; his neck, rising;

rising with a gentle curve from the shoulders, and small and fine where it joins the head; his shoulders moderately broad at the top, joining full to his chine, or crops and chest backwards, and to the neck-vein forwards; his bosom open, breast broad, and projecting well before his legs, his arms or fore thighs muscular, and tapering to his knee; his legs straight, clean, and very fine-boned; his chine and chest so full as to leave no hollows behind the shoulders, the plates strong, to keep his belly from sinking below the level of his breast; his back or loin broad, straight, and flat, his ribs rising one above another in such a manner, that the last rib may be rather the highest, leaving only a small space to the hips or hooks, the whole forming a round or barrel-like carcass; his hips should be wide placed, round or globular, and a little higher than the back, the quarters from the hip to the rump long; and instead of being square, as recommended by some, they should taper gradually from the hips backwards, and the turls or pott-bones not in the least protuberant; rumps close to the tail, the tail broad, well haired, and set on so high as to be in the same horizontal line with his back."

This is an animal chiefly kept for the purpose of propagation, though he is capable of being subjected to the yoke; but there is no certainty of his working quietly; and the use he may make of his prodigious strength should constantly be guarded against. Bulls are for the most part naturally untractable, stubborn, and fierce; and frequently in the bulling season absolutely furious and uncontrollable; however, by castration, they may be rendered perfectly tame and quiet, without the least diminution of their strength. They also often grow larger, more heavy and unwieldy, and become more adapted to labour, as well as more tractable, by this operation. See Ox and CATTLE.

The disposition of these animals is, however, shewn to depend greatly upon the manner in which they are reared by the practice of Mr. Bakewell, who had all his bulls so tame and gentle, that they could be managed with the greatest facility.

Among the *Ancients*, those who triumphed, sacrificed a bull, when they arrived at the capitol. Bulls were offered to Apollo and Neptune. It was held a crime to sacrifice them to Jupiter, though we do not want instances of that practice.

Bulls were ranked by the Romans in the number of military rewards.

*BULL, African*, in *Natural History*, a small wild bull, common in that part of the world, and supposed to be the true *bubalus* of the ancients. See *BUBALUS*.

*BULL'S blood*, fresh drawn, is said to be a powerful poison, as coagulating in the stomach. This is related on the authority of Pliny, xxviii. 9. and xi. 38. and many persons among the ancients, such as Æson, Midas, Hannibal, and Themistocles, are said to have been poisoned by it. But the fact has been questioned by some, and denied by others. See Apollodorus, lib. 1. cap. 27. Strabo, lib. i. p. 106. Plutarch in Flaminius; and Valer. Maxim. vol. vi. ext. 3.

*BULL'S gall*, is an intense bitter, more pungent and acrimonious than that of any other animal; whence it is sometimes used to destroy worms.

*BULL, bannal*, denotes a bull kept by a lord, who has a right to demand all his tenants to bring their cows to be served by him.

*BULL, free*, according to Du-Cange, signifies the same with *bannal bull*. Hence *tauri liberi libertas*; which, however, should rather seem to denote a privilege of keeping a bull independent of the lord.

*BULLS, wild*. The wild bulls, now so numerous on the

continent of America, are said to have sprung from one bull and seven cows, which were carried thither by some of the first conquerors.

In the island of Hispaniola, the French buccaneers pursue bulls with dogs, and kill them with fire arms. See *BUCCANEERS*. At Buenos Ayres, the Spanish toradors chase them on horseback, armed with a long lance, at the end of which is a half-moon of sharp steel. Having drawn a number of the horned kind together, they let the cows escape, but dextrously take the bulls with their half-moons on the hind-legs, by which, disabling them from flight, they are easily dispatched.

*BULL-baiting*. See *BAITING*.

*BULL-fighting*, a sport or exercise much in vogue among the Spaniards and Portuguese, consisting in a kind of combat of a cavalier or torador against a wild bull, either on foot or on horseback, by riding at him with a lance. The Spaniards have bull-fights, i. e. feasts, attended with shews, in honour of St. John, the Virgin Mary, &c. This sport the Spaniards received from the Moors, among whom it was celebrated with great eclat. Some think, that the Moors might have received the custom from the Romans, and they from the Greeks. Dr. Plott is of opinion, that the *Ταυρομαχία* amongst the Thesalians, who first instituted this game, and of whom Julius Cæsar learned and brought it to Rome, were the origin both of the Spanish and Portuguese bull-fighting, and of the English bull-running. Nat. Hist. Staff. chap. x. § 76.

The practice was prohibited by pope Pius V. under pain of excommunication, incurred *ipso facto*. But succeeding popes have granted several mitigations in behalf of the toradors.

Mr. Gibbon, in his "History of the Decline and Fall of the Roman Empire," (vol. xii. p. 421.) has extracted from Muratori (Script. Rer. Italic. tom. 12.) an account of a bull-feast, which was celebrated in 1332, after the fashion of the Moors and Spaniards, in the Coliseum at Rome. The nobles were invited by a general proclamation, communicated as far as Rimini and Ravenna, to exercise their skill and courage in this perilous adventure. The Roman ladies were marshalled in three squadrons, and seated in three balconies, which were lined on this occasion with scarlet cloth. When the company was collected and arranged, the lots of the champions were drawn by an old and respectable citizen; and they descended into the arena, or pit, to encounter the wild bulls with a single spear. Amidst the crowd, the annalist has selected the names, colours, and devices, of 20 of the most conspicuous knights. Several of the names are the most illustrious of Rome and the ecclesiastical state; the colours were adapted to their taste and situation; and the devices are expressive of hope or despair, and breathe the spirit of gallantry and arms; the combats of the amphitheatre were dangerous and bloody. Every champion successively encountered a wild bull; and the victory may be ascribed to the quadrupeds, since no more than eleven were left on the field, with the loss of nine wounded, and eighteen killed on the side of their adversaries. Some of the noblest families might mourn, but the pomp of the funerals in the churches of St. John Lateran, and Maria Maggiore, afforded a second holiday to the people.

Similar combats with bulls in the amphitheatres, have been justly regarded as a striking feature of Spanish and Portuguese manners. Some have supposed that these spectacles, by rendering bloodshed familiar to the people, tend to deaden sensibility, and to make the national character ferocious and brutal. Others think, that they serve as an antidote to timidity, and as a means of cherishing resolution and valour. But theories of this kind are not justified by facts.

facts. Modern Italy, it is said, has no gladiators, but numerous assassins; whereas ancient Rome had scarcely one assassin, but whole armies of gladiators. As far as it respects the national character, it seems to be of little moment, whether bulls be killed by butchers or by champions; and it is well known, that such spectacles have little or no influence on the disposition, because they are attended by people of all ages and stations, and yet they neither give energy to the feeble, and boldness to the timid, nor make any alteration in the mildness of their manners. The bull-fights of Spain and Portugal attract a crowd of spectators, and yield very considerable sums of money to those who undertake and conduct them, of which part is appropriated to the purpose of defraying the expence of horses and bulls, and of paying the hire of the toradors; and part is applied to the support of religious and eleemosynary establishments. These entertainments have formed one of the chief funds of the hospital at Madrid. The bulls that are selected for these combats are of a peculiar breed, and the connoisseurs can readily distinguish by a view of them where they have been bred. The arena, where these shows are exhibited, is a kind of circus surrounded by ranges of seats, one above another; and the highest of them is covered. The lower part of the edifice is occupied by boxes. At Valladolid, which has no circus appropriate to these fights, the principal square is converted into a theatre, and the balconies of the adjoining houses are made to project in such a manner as to accommodate the numerous spectators who assemble on these occasions. The spectacle commences by a kind of procession around the square, in which the combatants appear both on horseback and on foot; and they are preceded by two alguazils on horseback, who are deputed to obtain of the president of the show an order for its commencement. Upon a certain signal, the animal appears; and the officers of justice by hastily withdrawing, give notice to the spectators that their cruel pastime is about to begin. The bull is received, on his appearance, with loud shouts; and the contest is begun by the "picadors," who are mounted on horses and dressed in the ancient Spanish mode, each of them being armed with a long lance. To the honour of this part of the combat, which requires strength, courage, and dexterity, several persons of rank occasionally aspire. When the bull darts upon these combatants, without any previous irritation, his courage is applauded; and if in spite of the pointed weapon which resists his assault, he returns to the charge, the shouts of the spectators are redoubled, and their joy seems to transport them into enthusiasm; but if the bull is timid, and avoids his persecutors, he is hooted at and hissed by the spectators, and insulted with reproaches and blows by those who are near him. If these modes of provocation are insufficient to rouse his ferocity, large dogs are let loose upon him, which seize him in a furious manner by the neck and ears; and which he tosses into the air, so that they fall to the ground stunned, and sometimes mangled. At length, however, the combat is renewed, and the animal, overcome by his assailants, perishes ignobly. If the animal manifests spirit and fierceness, the picadors pierce him with their lances; and thus irritated, he furiously attacks the horse which carries the combatant, rips up his sides, and overturns him and his rider. The picadors thus dismounted and endangered, are relieved by other combatants on foot, called "Chulos;" who divert the animal's attention by shaking pieces of differently coloured cloth before him; these the provoked animal pursues; and they escape merely by their agility. Sometimes they are under a necessity of throwing themselves over a barrier that encloses the arena. When this barrier is single, the bull pursuing the chulo, sometimes jumps over

it, and causes great consternation among the spectators on the lower benches, so that in their precipitance for escaping, they suffer as much as they might have done from the fury of the animal, who, however, becomes incapable of this kind of pursuit. The picador, when effectually relieved, mounts his horse, or if the first horse be killed or become unfit for service, procures another, and renews the combat. When the picadors have sufficiently tormented the bull, they withdraw, and leave him to the irritation of the combatants on foot. These latter, denominated "banderilleros," go before the animal; and when he aims at them, they plunge into his neck darts, called "banderillas," with hooked points, and ornamented with small streamers of coloured paper. The fury of the bull is now redoubled; he roars and tosses his head, and aggravates by the violence of his motion, the pain occasioned by his wounds: and in this situation, the agility of his adversaries is signally displayed. The danger that threatens them alarms the spectators; but accustomed to this kind of combat, they secure themselves by their address and dexterity. When the vigour of the bull is almost exhausted, and he is bathed with blood, and the people are anxious to witness the combat of another victim, the president of the entertainment issues the signal of death, which is proclaimed by the sound of trumpets. The "matador" then advances; and holding a dagger in one hand, he waves before his adversary with the other hand a kind of flag. They both stop and gaze at one another; and the spectators are again amused for some time by the impetuosity of the bull, and the agility of the matador. The assembled observers witness this scene in profound silence: and the matador coolly dispatches the furious animal by a blow, where the spinal marrow joins the head. The death is bloodless and instantaneous, and deserves imitation, as humanity would wish to save pain to the animals slaughtered for food. When the animal falls, a thousand voices proclaim with loud shouts the triumph of the conqueror. If the blow is not decisive, and the bull survives, murmurs succeed applause, and the matador is regarded only as an unskilful butcher. When the tragedy terminates, three mules ornamented with bells and streamers appear, and the bull is dragged by means of a rope tied round his horns from the arena. Sometimes the bull is pierced in various parts with lances, to which squibs are fastened, which being set on fire, the maddened animal stands pawing the ground while he draws in and exhales volumes of smoke. Sometimes an American is introduced, who, after the manner of hunting the wild bull in his own country, throws a rope round the horns, and entangling him as in a net, then kills him with perfect safety.

On each of the days set apart for these entertainments, six are thus sacrificed in the morning, and 12 in the afternoon: at least this is the case at Madrid. The three last belong exclusively to the matador, who, unaided by the picadors, exerts his ingenuity to diversify the pleasure of the spectators. The Spanish government are not insensible of the moral and political inconveniences arising from this species of frenzy. So far from encouraging, they discountenance it; whilst it would be dangerous precipitately to abolish it. The court itself formerly reckoned it among the number of its festivals, which occurred at certain periods. The theatre of them was the "Plaza-Mayer," and they were honoured with the presence of the king and royal family; and his guards presided there in good order. His halberdiers formed the interior circle of the scene; and their long weapons, held out in a defensive posture, were the only barrier which they opposed against the dangerous caprices of the bull. These entertainments, which by way of excellence

excellence were called "Fiestas Reales," are now become very rare. Charles III. who endeavoured to polish the nation, and to direct the public attention to useful objects, was very desirous of suppressing a trade from which inconveniences sprang: but he was too wise to employ violent means for this purpose. He, however, confined the number of bull-fights to those, the profits of which were applied to some charitable institutions, with a design of substituting to these other funds afterwards. Bull-fights being thus rendered less frequent, will, perhaps, gradually lose their attraction, until more favourable circumstances allow the entire abolition of them.

**BULL-running**, denotes a feudal custom obtaining in the honour of Tudbury in Staffordshire, where anciently, on the day of the Assumption of our lady, a bull was turned loose by the lord to the minstrels, who, if they could catch him before he passed the river Dove, were to have him for their own, or, in lieu thereof, to receive each forty pence; in consideration of which custom, they pay twenty pence yearly to the said lord. Plot. Nat. Hist. Staff.

**BULL and boar**.—By the custom of some places, the parson is obliged to keep a bull and boar for the use of his parishioners, in consideration of his having tithes of calves and pigs, &c. 1 Rol. Abr. 559. 4 Mod. 241.

**BULL-comber**, in *Entomology*. See SCARABÆUS TYPHÆUS.

**BULL-dog**, in *Zoology*, a kind of mastiff upon a smaller scale; with a somewhat flatter snout and a greater ferocity of aspect. The bull-dog is remarkable for the undaunted and savage pertinacity with which he provokes and continues the fight; and when he has fixed his bite, is with much difficulty disengaged from his antagonist. This is the dog employed in the barbarous diversion of bull-baiting. See CANIS.

**BULL's eye**, in *Astronomy*. See ALDEBARAN.

**BULL's eye**, in *Meteorology*, a little dark cloud, reddish in the middle, chiefly appearing about the Cape of Good Hope; thus denominated by the Portuguese, who, on the appearance of it, instantly take down their sails, as knowing that a terrible storm of thunder, lightning, and whirlwind, is at hand.

**BULL's eye**, in *Sea language*, denotes a sort of small oval block without sheaves, made of hard wood. It is turned in a lathe, has a groove round the outside, and an oval hole gouged through the middle. These blocks are used instead of blocks and iron thimbles; but, indeed, they are very seldom used at all.

**BULL-finch**, in *Ornithology*. See LOXIA PYRRHULA.

**BULL-frog**, in *Zoology*. See RANA CATESBEIANA, and OCELLATA.

**BULL-bay river**, in *Geography*, lies to the east of Port Royal, or Kingston harbour, in Jamaica, between Cane river and Four-mile wood.

**BULL and cow**, rocks near the south coast of Newfoundland. N. lat.  $46^{\circ} 55'$ . W. long.  $53^{\circ} 42'$ .

**BULL Sand**, lies about a league S. W. from the Spurn point, or eastern entrance of the Humber, on the coast of Yorkshire, between which and the point is a fine channel of ten or eleven fathoms.

**BULL's harbour and island**, or Scwee bay, lies on the coast of South Carolina, in North America, to the south-west from cape Carteret. The entrance of the harbour, which is within the island, is at the N. E. end of it, having a small island within that: between them is a passage, in N. lat.  $32^{\circ} 56'$ . and W. long.  $78^{\circ} 24'$ .

**BULL-head**, in *Geography*, a cape of Ireland, on the north side of Dingle bay in the county of Kerry, near three miles S. E. of Dingle. W. Long.  $10^{\circ} 4'$ . N. lat.  $52^{\circ} 6'$ .

**BULL-head**, in *Ichthyology*, is a trivial English name applied most commonly to that small kind of fish which we distinguish farther by the name of *river-bull-head*, (*Cottus Gobio Linn.*). Another fish of the same genus, *COTTUS CATAPHRACTUS* is called the *armed-bull-head*; this last lives in the sea.

**BULL-trout**, an English name for a fish of the salmon kind caught in many of the rivers of England; it is also called the scurf. See SALMO TRUTTA.

**BULL-rush**, in *Botany*. See SCIRPUS FLUITANS.

**BULLA**, in *Antiquity*, a golden ornament, of a globular figure, and generally supposed to have been hollow within, wherein was contained some amulet, to serve as a preservative from witchcraft and envy, hung about the neck by those who triumphed among the Romans; and also by the children of the patricians, and even *ingenui*, as a badge of their hereditary nobility and freedom, by which they might be animated to behave themselves in a manner worthy of their birth. Authors are divided in their opinions about the form of this ornament, which the Sabine women, in acknowledgement of that increase of wealth and power for which Rome was indebted to them, were allowed to hang about the necks of their children. Plutarch (in Romul.) says, that they resembled the little bubbles which are formed by the drops of rain, when they fall upon running water. Hence it has been inferred, that they were hollow and light; others think that they were half globes, flat on one side, and globular on the other. Some have supposed, that they were originally made in the shape of a heart, in order to prompt their wearers to the acquisition of wisdom; and others say, they were round, with the figure of a heart engraved on them. The form, in process of time, is said to have varied from a complete circle to that of a segment. Such was the shape of the golden bulla lately found at Manchester; and as this had no aperture by which an amulet could be introduced, Mr. Whitaker (Hist. Manchester, vol. i. p. 79) concludes, that they were not hollow; and he supposes, that they were intended at first rather as amulets than as ornaments; alleging that they were frequently impressed with the figure of the sexual parts. As to their origin, it has been affirmed by some, that they were first introduced by Romulus, and that he gave one of them to Tullus Hostilius, the first child born of the rape of the Sabines. Others ascribe the introduction of them to Tarquin the elder, who gave a bulla to his son, at the age of 14, together with the prætexta, because he had killed an enemy; and hence it was afterwards assumed by other patricians. But Macrobius says, that Tarquin extended the right of wearing this ornament to all the children of the patricians; and that accordingly he began with his own.

The bulla was not allowed to the children of slaves, or even of *liberti*, who, in lieu thereof, wore a leather collar round the neck, much after the manner of the purple string to which the bulla was hung. But the great vestal, and the Roman ladies, wore a bulla; the former by way of distinction, the latter as a piece of dress. We may add, that bullæ were sometimes allowed to statues; whence the phrase, "statuæ bullatæ." M. Lepidus, having killed an enemy, and saved a citizen, even when a boy, had a "bullated" statue erected to him in the Capitol, in memory of the exploit. The Roman youth laid aside the bulla, together with the "prætexta," and consecrated it to the Lares, when they arrived at their fifteenth year; as appears from the satyrist:

"Cum primum pavido custos mihi purpura cessit,  
Bullaque succinctis Laribus donata pendit."

Perf. Sat. v. ver. 20. Hist. Acad. Infer. tom. ii. Valer. Max. lib. iii. cap. 1. Cic. in Verr. I. 58. Macrob. Sat. 1. 6.

BULLA was also a denomination given to divers other metalline ornaments made after the form of bullæ.

In which sense, bullæ seem to include all golden and silver ornaments of a roundish form, whether worn on the habits of men, the trappings of horses, or the like. Such were those decorations used by the ancients on their belts and doors. Virgil, speaking of Pallas's belt or girdle, says:

“Notis fulserunt cingula bullis  
Pallantis pueri.” *Æneid. lib. xii. ver. 942.*

The bullæ of doors were a kind of large-headed nails fastened on the doors of the rich, and kept bright with great care. The doors of temples were sometimes adorned with golden bullæ.

The bullæ worn by soldiers on their belts, and also on the doors of houses, &c. have been considered by some, not merely as ornaments, but as a kind of amulets, and intended as preservatives from diseases and dangers, as well as incentives to glory.

BULLA also denoted a table hung up in the public courts, to distinguish which days were *fasti*, and which *nefasti*; answering in some measure to our calendar.

BULLA, in *Conchology*, the name of a genus of shells the character of which is thus defined: animal a limax; shell univalve, convoluted, and unarmed; mouth, or aperture, somewhat flattened, oblong, longitudinal, and at the base very entire; pillar-lip oblique, and smooth.

The species of this genus are ovum, volva, birostris, fpecta, verrucosa, gibbosa, naucum, aperta, hydatis, ampulla, lignaria, phylis, amplultra, ficus, rapa, canaliculata, conoidea, fontinalis, hypnorum, turrita, gelatinosa, terebellum, cypræa, virginea, fasciata, strigata, striatula, exarata, bifasciata, ambigua, zebra, achata, hyalina, ovata, ferruginosa, velum, vesica, cylindrica, oliva, voluta, dominicensis, purpurea, spectra, solida, stercofulvicum, scabra, akera, soluta, truncata, and carnea, which see respectively.

BULLA, in *Zoology*, a species of CYCLIDIUM, of an orbicular form and transparent. *Müll.*

BULLA is also a species of VOLVOX, the form of which is somewhat oval. *Martiniere.*

BULLA *Velutina*, of *Mülleri*, in *Conchology*. See HELIX HELIOTOIDEA.

BULLA *regia*, or *Bullaria* of Ptolemy, in *Ancient Geography*, a free town of Africa, on the route from Carthage to Hippona, between Sinittu and Novæ Aquilinæ. *Anton. Itin.*

BULLACE-TREE, in *Botany*. See PRUNUS *infinitia*.

BULLÆUM, in *Ancient Geography*, a town of the Silures in Britain, placed by Camden at Buallt or Builth in Brecknockshire, by Baxter at Caerphilly, and by Horsley at or near Usk in Monmouthshire: thus uncertain is its situation.

BULLAN-BAY, in *Geography*, a bay on the west coast of Ireland between the northern part of the Isle of Achil and the main land of the county of Mayo.

BULLANSPOUR, a town of the Hindostan, in the hilly country of Calhore, seated near the river Setlege, 159 miles E. of Lahore, and about N. 26° E. 60 geographical miles from Sirhind. N. lat. 31° 31'. E. long. 76° 40'.

BULLARII, in the court of Rome, the makers or drawers of bulls or constitutions. See BULL.

BULLARY, *Bullarium*, a collection of papal bulls.

We have extant divers kinds of bullaries; some containing

only the bulls of particular popes; such are the bullaries of Innocent XII. and Clement XI. Others contain the bulls granted to particular communities; such is the bullary of the order of Cluny, &c.

A general bullary of all the papal constitutions from Gregory VII. to Sixtus Quintus, was compiled by order of pope Sixtus Quintus, in 1586; since which has been published a great bullary, by Laert. Cherubin, containing the bulls of all the popes from Leo in 440, to Paul V. in 1559; since continued by Ang. Cherubin to the year 1644, and by Ang. a Lantusca and Jo. Paulus to the year 1676; and, lastly, by an anonymous editor to the time of Benedict XIII. under the title of “*Bullarium magnum Romanum*.” We have the same digested in a new method by Bouchardus; a commentary on it begun by Vinc. Petra, and a summary of it by Novarius. *Fabr. Bibl. Med. Ævi. Lat. lib. ii. tom. i. p. 816. 822.*

BULLATA, in *Conchology*, a species of VOLUTA, the shell of which is cylindrical, very glabrous, reddish, with somewhat livid belts; spire obtuse; pillar-lip with four plaits within; aperture effuse. *Chemnitz.* Inhabits the Indian seas.

BULLATUS, a species of SOLEN, the form of which is somewhat rotund, inflated, and striated slightly; anterior part of the shell retained open by the crenatures with which it is beset.—This sort inhabits the American seas, and it is believed those of India also. The shell is thin, somewhat pellucid, longitudinally striated, white, and spotted or clouded with purple. Hinge with a single tooth. Marginal teeth remote, compressed, and inserted in a kind of hollow in the opposite valve.

BULLATUS, a species of CONUS, the shell of which is yellow, clouded with white. *Lin.* Native place unknown. *Adanson* calls it *Potan*.

This shell is thin, sometimes of an uniform colour, but more frequently spotted, clouded, or striped; aperture of the mouth for the most part large, and bluish.

BULLE, in *Geography*, a town of Switzerland, in the canton of Friburgh, where the insurgents of Gruyeres assembled in 1781, in order to concert measures for obtaining a redress of grievances: 10 miles S. of Friburgh. N. lat. 46° 40'. E. long. 6° 54'.

BULLENMEER, a town of Germany, in the circle of Westphalia, and county of Oldenburg; 18 miles N. of Oldenburg.

BULLER, CAPE, a cape of South Georgia, to the west of the bay of islands, and about 7 leagues from cape North, nearly E. of it. S. lat. 53° 58'. W. long. 37° 40'.—Also, a cape on the coast of Terra del Fuego island, in S. lat. 53° 58'. W. long. 67° 40'.—Also, a cape on the coast of New Britain, in the East Indian ocean. S. lat. 4° 56'. E. long. 151° 23'.

BULLERS, or BOULERS of *Buchan*, a natural harbour, on the east coast of Scotland, about 6 leagues N. from Aberdeen, and 2 S. from Peterhead. It is only frequented by fishermen, and formed by a rock of an irregular oval form, projecting into the sea from the middle of a bay to the distance of 100 yards. Vessels of all sizes may shelter here from the weather; but landing is impracticable. It derives its name from boiling, on account of the turbulence of the water.

BULLES, a small town of France, in the department of the Oise and district of Clermont, seated on the river Bresche, and celebrated for its fine flax and linen; 2 leagues N. W. of Clermont.

BULLET, an iron or leaden ball, or shot, wherewith firearms are loaded. Some derive the word from the Latin

*botellus*, others from the Greek βαλλων, *to throcu*. *Bullets* are of various kinds, viz. *red-hot bullets*, made hot in a forge; intended to set fire to places where combustible matters are found. See SHOT.

*Iron bullets* are shells made cylindrical, with an aperture and a fusee at one end, which giving fire to the inside, when in the ground, bursts, and has the same effects with a mine.

*Chain-bullets*, consisting of two balls, joined by a chain three or four feet apart.

*Branch-bullets*, two balls joined by a bar of iron five or six inches apart.

*Two-headed bullets*, called also *angels*, being two halves of a bullet joined by a bar, or chain, are chiefly used at sea for cutting of cords, cables, sails, &c.

*Quarter-bullets*. See QUARTER.

The diameter of a leaden bullet, weighing one pound, is 1.69 inches, according to Sir Jonas Moore; or by a table in Muller's "Treatise of Artillery" (p. 56), 1.672 inches; and the diameter of any other bullet is found by dividing 1.69 inches by the cube root of the number, which expresses how many of them make a pound; or by subtracting continually the third part of the logarithm of the number of bullets in the pound from the logarithm .2278867 of 1.69, and the difference will be the logarithm of the diameter required.

Thus the diameter of a bullet, of which 12 make a pound, will be found by subtracting .3597270, a third part of 1.0791812 the logarithm of 12, from the given logarithm .2278867; or because this logarithm is less than the former, an unit must be added, so as to have 1.2278867; and then the difference .8681597 will be the logarithm of the diameter sought, which is .738 inches, observing that the number found will be always a decimal, because the number subtracted is greater than the other.

We may also deduce the diameter of any bullet from its given weight, provided that the specific gravity of lead is known: for, since a cubic foot of lead weighs 11325 ounces, and 678 is to 355 as the cube of a foot or 12 inches, i. e. 1728, to the content of a sphere, which is therefore 5929.7 ounces; and since spheres are as the cubes of their diameters, the weight 5929.7 is to 16 ounces, or one pound, as the cube 1728 is to the cube of the diameter of a sphere, which weighs 16 oz. or 1lb.; which cube is 4.66263, and its root is 1.6706, the diameter sought.

By the rule above laid down is calculated the following table, showing the diameters of leaden bullets, from 1 to 39 in the pound.

	0	1	2	3	4	5	6	7	8	9
0	0	1.69	1.441	1.172	1.064	0.988	0.920	0.853	0.845	0.812
1	0.724	0.760	0.738	0.710	0.701	0.685	0.671	0.657	0.645	0.633
2	0.623	0.612	0.603	0.594	0.586	0.577	0.570	0.563	0.556	0.550
3	0.544	0.537	0.532	0.527	0.521	0.517	0.512	0.507	0.503	0.498

N. B. The upper horizontal column shews the number of bullets to a pound; the second, their diameters; the third, the diameters of those of 10, 11, 12, &c. and the fourth, those of 20, 21, 22, &c. and the last those of 30, 31, 32, &c.

The government allows eleven bullets in the pound for the proof of muskets, and 14.5 in the pound, or 29 in two pounds for service; 17 for the proof of carabines, and 20 for service; and 28 in the pound for proof of pistols, and 34 for service. The diameter of musket bullets differs but 1-50th part from that of the musket-barrel; for if the shot but just rolls into the barrel, it is sufficient. Cannon-bullets or balls are of different diameters and weights, according to the nature of the piece.—See CALIBER and SHOT.

The first mention of iron-bullets in the "Fœdera," occurs A.D. 1550, in an acquittance for delivery of the artillery and ammunition of Boulogne; and yet stone-bullets remained in use considerably later than this time.

According to Merfenne, a bullet, shot out of a great gun, flies 92 fathoms in a second of time, which is equal to 589½ English feet; and, according to Huygens, it would be 25 years in passing from the earth to the sun: but according to some very accurate experiments of Dr. Derham, it flies, at its first discharge, 510 yards in five half-seconds; or about 7 miles in a minute: allowing therefore the sun's distance 95000000 English miles, a bullet would be near 26 years in its passage at the full speed.

Bullets shot into the water undergo a refraction; several experiments concerning which are given by Mr. Carté.—Vide Mem. Acad. Scienc. ann. 1705. p. 277.

The extraction of bullets from wounds is an operation described by chirurgical writers. Bullets sometimes remain easy in the body during many years.

Swallowing of musket-bullets is sometimes practised to remove iliac and colic pains. Mr. Young gives a case wherein this had a terrible effect: the bullet happening to miss its way down, instead of the *æsofagus*, got into the *trachea*. Mr. Chirac has a dissertation on the question, which of the two is safer in iliac cases, to swallow leaden bullets, or crude mercury? He gives the preference to the bullets. Phil. Trans. N<sup>o</sup> 263.

*BULLET-moulds* consist of two concave hemispheres, with a handle whereby to hold them; and between the hemispheres is a hole, called a gate, at which to pour in the melted metal. The chaps or hemispheres of bullet-moulds are first punched, being blood-red hot, with a round-ended punch, of the shape and size of the intended bullets. To cleanse the insides, they make use of a bullet-bore.

*BULLET-bore*, is a steel shank, having a globe at one end, wherewith to bore the inside of a mould clean, of the size intended.

*BULLET-iron*, a denomination given by some to Spanish or Swedish bars of iron.

BULLET, JOHN-BAPTIST, in *Biography*, a professor of theology, and dean of the university at Besançon, died in that city in 1775, at the age of 76 years. He was a member of several learned societies, and esteemed as a valuable writer. His principal works are, "His History of the Establishment of Christianity, taken solely from Jewish and Pagan Writers;" 1764, 4to. "The Existence of God, demonstrated by Nature;" 2 vols. 8vo. "Reply to the difficulties of unbelievers, respecting various passages in the sacred Writings;" 3 vols. 12mo. "De Apoitolicæ Ecclesiæ Gallicanæ Origine;" 1752, 12mo. "Memoirs on the Celtic Language," 1754-59, 3 vols. folio; to which work he is chiefly indebted for his reputation. "Historical Enquiries concerning Playing-Cards;" 1757, 8vo. "Dissertations on the History of France," 1759, 8vo; all written in French, except that with the Latin title. Nouv. Dict. Hist.

BULLEYN, WILLIAM, of a respectable family of the same name, in Suffolk, was born in the Isle of Ely, in the early part of the reign of Henry the eighth. At a proper age he was sent to Cambridge, which he quitted, probably after taking his bachelor's degree, and went to Oxford, where he applied himself to the study of medicine, and read the Greek and Arabian writers, in both which languages he appears to have been tolerably skilled. While resident there, he made excursions through the neighbouring countries, paying great attention to the plants that he had found recommended in the cure of diseases; and after taking the degree

degree of doctor, he extended his excursions, travelling over the greatest part of England and Scotland. He afterwards visited the continent, with the same view. On his return, he was made rector of Blaxhall in Suffolk, through the interest, probably, of his family, and practised medicine there. On the accession of queen Mary, he removed to Durham, thinking it more safe, being a protestant, to live at that distance from the court. He lived here in great intimacy with sir Thomas Hilton, governor of Tiumouth fort, and became a sharer, or joint proprietor of the salt pans. Sir Thomas dying under his care of a putrid fever, he fell into such disgrace, that he found it necessary to remove from Durham, and Mary being dead, he came to London; but the vengeance of the family pursuing him, he was taken up, arraigned, and tried for the murder of his friend; and though he easily cleared himself from the imputation of this crime, he was continued in prison, at the suit of the prosecutor, the brother of sir Thomas, for a debt due to the family. While in prison, he tells us, he wrote the greater part of his medical works. Having at length discharged his debt, he returned to London, was made a member of the College of Physicians, and acquired considerable reputation for his skill in the practice of medicine, which he enjoyed to the time of his death, January 7, 1576. His rector he gave up, at the time of his quitting Blaxhall. He was an ancestor, Granger says, of the late Dr. Stukely. There are two portraits of him, both cut in wood: the one a profile, with a long beard, published with his Government of Health, an octavo volume, 1548; the other a whole length, to his "Bullein's Bulwark of Defence against all Sickness, Soariness and Wounds that do dayly assault Mankind;" fol. 1562. His last work is entitled, "A Dialogue, both pleafante and pietifull; wherein is a goodlie Regiment against the Fever Pestilence; with a Consolation, and Comfort against Death;" 8vo. 1564. In this work, not more than a seventh part of which, Dr. Aikin says, is on the subject of medicine, the author appears as a person of much humour, and fancy. Haller mentions a work by Richard Bulleyn, who was also, like our author, both a divine and a physician; "De Nephrítide, ejusque Remediis," which was published in 1562. These works, which are now only sought for by collectors, as specimens of the engraving, and printing of the time, passed through several editions, and doubtless contributed in raising the reputation of the writer. This shews the little progress our ancestors had then made in civilization and knowledge, as our author was no better informed than to imagine, that beads made of ebony might be successfully worn as a charm against certain diseases, and "that witchcraft was more hurtful in the realm than either quartan, pox, or pestilence;" lamenting, "that damnable witches should be suffered to live unpunished, while so many blessed men (protestants) were burned." But these prejudices continued more than a century after his time; for in Charles the Second's reign we find doctor Chamberlain, then in high repute as an accoucheur, sanctioning the folly of putting necklaces on children to facilitate dentition, and writing a treatise, to shew the manner in which the beads effected this purpose. Aikin's Biographical Memoirs of Medicine, &c.

**BULLIALDUS**, or **BOULLIAU**, **ISMAEL**, a celebrated astronomer and scholar, was born of protestant parents at Houdun in France, September the 28th, 1605; and having finished his studies in philosophy at Paris, and in civil law at Poitiers, he applied to mathematics, theology, sacred and profane history, and civil law, with such assiduity, that he became eminent in each of these departments, and acquired the reputation of an universal genius. As he had

travelled for his improvement into Italy, Germany, Poland, and the Levant, he formed an extensive acquaintance with men of letters, and maintained a correspondence with the most distinguished persons of his time. Although he had been educated a protestant, he changed his profession at the age of 27 years, and became a catholic priest. His life was prolonged to his 89th year; and having retired to the abbey of St. Victor at Paris in 1689, he died there November the 25th, 1694. Besides his pieces concerning ecclesiastical rights, which excited attention, and the history of Ducas, printed at the Louvre, in 1649, in the original Greek, with a Latin version and notes, he was the author of several other works, chiefly mathematical and philosophical. His "Treatise on the Nature of Light," was published in 1638; and his work entitled, "Philolaus, five de vero Systemate Mundi," or true system of the world, according to Philolaus, was printed at Amsterdam in 1638, and re-published in 1645, under the title of "Astronomia Philolaica;" grounded upon the hypothesis of the earth's motion, and the elliptical orbit described by the planet, illustrated with various methods of demonstration. To this work were added his "Tabulæ Philolaicæ," much approved and recommended by Riccioli, who styles the author "Astronomus profundæ indaginis." Upon examining the hypothesis, or approximation of bishop Ward, he found that it did not agree with the planet Mars; and in his defence of the Philolaic astronomy against the bishop, he shewed that from four observations of Tycho on the planet Mars, this planet in the first and third quarters of the mean anomaly was more forward than it ought to have been upon Ward's hypothesis; but that in the second and fourth quadrants of the same, the planet was not so far advanced as that hypothesis required. He therefore undertook the correction of the bishop's hypothesis, and made it more conformable to the orbits of the planets, which were most eccentric, and introduced what Street has called in his "Caroline Tables," the "Variation;" for these tables were calculated by means of the correction of Bullialdus, and were thus more accurate than any which had preceded them. Dr. Gregory esteems this correction a very happy one, considered as a correction of an approximation to the true system; for we are thus enabled to deduce the coequate, or true anomaly *à priori* and directly from the mean, in a manner very well corresponding to the observations; which no one, says Mercator, had effected before. Bullialdus, while he makes every planet move in an ellipse, supposes it to be such a one as if cut out of a cone, would have the axis of the cone pass through one of its foci, or that next the aphelion. See Gregory's Astron. lib. iii. prop. 7.

In 1644 Bullialdus published a translation of "Theo, the Platonist of Smyrna," with notes; and in 1657 his treatise "De Lineis Spiralibus, Exerc. Geom. et Astron.;" Paris, 4to. In 1663 he published a treatise of "Ptolemy de judicandi Facultate;" and in 1682 appeared at Paris, in folio, his large work, entitled "Opus Novum ad Arithmeticeam Infinitorum," being a diffuse amplification of Dr. Wallis's Arithmetic of Infinites. Upon being consulted by M. Thoinard concerning the appearance of the moon in the month of March, and 33d year of the christian era, he made the requisite calculations, and replied, that it could not have been seen in Judæa till the 19th of that month, and that it was probable that Jesus Christ was crucified on the 3d of April of the same year. Bullialdus also published two admonitions or notices to astronomers; the *first*, concerning a new star in the neck of the whale, sometimes appearing, and sometimes disappearing; and the *second*, concerning a nebula in the northern part of Andromeda's girdle, which had

had not been discovered by any of the ancients, and which is subject to periodical changes. Moreri. Martin.

**BULLIG**, in *Geography*, a rocky shoal in the Atlantic near the west coast of Ireland; it is about half a mile S. of Carrikel an island near Gulin head, in the county of Galway. W. lon. 9° 47'. N. lat. 53° 12'.

**BULLIMONY**, or **BOLLIMONG**, denotes a mixture of several sorts of grain, as oats, pease, and vetches, called also *massin*, or *mong-corn*.

**BULLINGER**, **HENRY**, in *Biography*, a Swiss reformer, was born in 1504 at Bremgarten, on the borders of the canton of Zurich; and educated at Emmerick in the duchy of Cleves, whither he was sent by his father at the age of 12 years, and where he was supported for three years by the alms he procured for singing from door to door. Having been accustomed to the mortification and hardships attendant on this mode of subsistence, he entertained thoughts of entering among the Carthusians. But diverted from this resolution by the admonitions of his elder brother, he removed to Cologne at the age of 15 years, and devoted himself to the study of the school-philosophy, and of classical literature. About this time his attention was directed to the writings of Melancthon, and other reformers, the perusal of which produced a dislike of the doctrines of the Romish church, though he did not yet separate from it. Having finished his studies at Cologne in 1522, he returned to his father's house, and in the following year he was invited by the abbot of La Chapelle, near Zurich, to be a teacher in his convent, into which the reformation of Zuinglius was introduced in 1526, principally by his instruction. Attaching himself to this reformer, he accompanied him to the conference held at Berne in 1528; and he afterwards settled as reformed pastor at his native place. In 1531, after the victory obtained by the catholic cantons over the protestants, he was obliged to retire to Zurich, where he succeeded Zuinglius, who had lost his life in the battle. In this situation he applied with assiduity to his ministerial labours and his studies, and edified his church by his writings as well as by his sermons. When Bucer attempted to reconcile the Lutherans and Zuinglians, by introducing a kind of middle doctrine with regard to the eucharist, he counteracted his efforts; and he was appointed by the Swiss churches in 1545 to reply to the harsh censures, which were published by Luther against their doctrine respecting the sacrament. In 1549 he concurred with Calvin in drawing up a formulary, expressing the conformity of belief which subsisted between the churches of Zurich and Geneva, and intended, on the part of Calvin, for obviating any suspicions that he inclined to the opinion of Luther with respect to the sacrament. In the same year he urged many reasons against renewing the subsidiary treaty between the protestant Swiss and Henry II. king of France, and by his influence the proposal for this purpose was rejected. Among other arguments, he urged upon their consideration, "that it was not lawful for persons to hire themselves, in order to kill those who had done them no wrong;" a position, which, however consonant to the principles and spirit of christianity, many professed believers have too frequently disregarded. Bullinger afforded kind assistance to the English divines who fled into Swisserland from the persecution of queen Mary; and he drew up a confutation of the pope's bull that excommunicated queen Elizabeth, which has been translated into English. He also persuaded the magistrates of Zurich to erect a new college in 1538; and he prevailed with them to establish a school, on the site of an old nunnery, in which 15 youths were taught and maintained, free of expence. In 1551 he wrote a book, the purport of

which was to shew, that the council of Trent had no other design than to oppress the professors of sound religion; and, therefore, that the cantons should pay no regard to the invitations of the pope, which solicited their sending deputies to that council. In 1561 he commenced a controversy with Brentius concerning the ubiquity of the body of Christ, zealously maintained by the one, and as vehemently opposed by Bullinger, which continued till his death, that happened on the 17th of September, 1575. Besides a great number of printed works, amounting to ten volumes, he left several pieces in manuscript. Although Bullinger had been once married, and had eleven children, he was blamed for not taking another wife, when he became a widower at the age of sixty; such was the importance annexed by the first reformers to the connubial state, especially with regard to ministers, as it afforded a manifest proof of their renunciation of popery. Gen. Dict.

**BULLION**, denotes gold or silver in the mass or billet, before it is coined. 9 Ed. III. st. ii. c. 2.

The word is apparently formed from the French *billon*, a mass of gold or silver below standard, which Du-Cange derives farther from *billā*, as being *aurum aut argentum in massam seu billam*, i. e. *baculum conflatum*.

The term is applied to these metals, either when smelted from the ore, and not perfectly refined, or when so refined, and melted down in bars, or ingots, or any unwrought body of a certain degree of fineness. In order to render gold and silver fit for use, it is necessary to reduce and harden them by an alloy of some baser metal: and the quantity of this alloy is ascertained by the legislative regulations of different countries, so that the proportion of the one to the other may constitute the standard silver of such countries. According to the laws of England all sorts of wrought plate should be made in conformity to the legal standard: and the prices of standard gold and silver, regulate the value of the bullion, consisting of ingots, bars, dust, or foreign specie; consequently, in order to ascertain the value of bullion, it is first assayed. See **ASSAY**. See also **GOLD** and **SILVER**.

Silver *bullion* is sometimes also denominated **PLATE**.

Silver and gold, whether coined or uncoined (though used for a common measure of other things), are no less a commodity than wine, tobacco, or cloth; and may, in many cases, be exported as much to national advantage as any other commodity.

In all great commercial countries a good deal of bullion is alternately imported and exported for the purposes of foreign trade. This bullion, as it circulates among such countries in the same manner as the national coin circulates in every particular country, may be considered as the money of the great mercantile republic. Whilst the national coin receives its movement and direction from the commodities circulated within the precincts of each particular country, the money of the mercantile republic derives its movements from those that are circulated between different countries. Both are employed in facilitating exchanges, the one between different individuals of the same, the other between those of different nations. However, the importation of gold and silver is not the principal, much less the sole benefit which a nation derives from its foreign trade. It is, indeed, part of the business of foreign commerce to supply countries which have no mines with the gold and silver that are wanted in them: but this is, comparatively, a very insignificant object; nor is it by the importation of gold and silver, that the discovery of America has enriched Europe. But by opening a new and inexhaustible market to all the commodities of Europe, it gave occasion to new divisions of labour and improvements of art, which, in the narrow circle of the an-

cient commerce, could never have taken place for want of a market to take off the greater part of their produce.

Gold and silver, according to Mr. Locke, are the most solid and substantial part of the moveable wealth of a nation; and to multiply these metals should, he thinks, on that account, be the great object of its political economy. Countries that have political connections with foreign nations, and that are obliged to carry on foreign wars, and to maintain fleets and armies in distant countries, and to subsidize foreign princes, are under a necessity of sending money in some form or other, abroad; and therefore it has been said, that in time of peace it should endeavour to accumulate gold and silver, that when occasion requires, it may possess the means of carrying on foreign wars. Upon these popular principles, all the different nations of Europe have studied, though to little purpose, every possible means of accumulating gold and silver in their respective countries. Spain and Portugal, the proprietors of the principal mines which supply Europe with those metals, have either prohibited the exportation of them under the severest penalties, or subjected it to a considerable duty. The like prohibition seems anciently to have made a part of the policy of most other European nations. But when those countries became commercial, the merchants found this prohibition extremely inconvenient, and remonstrated against it, as hurtful to trade. They represented, first, that the exportation of gold and silver, in order to purchase foreign goods, did not always diminish the quantity of those metals in the kingdom, but might frequently increase that quantity; because these foreign goods, if not consumed in the country, might be re-exported, and sold in foreign countries for a profit, which would bring back with increase the treasure originally sent out for the purchase of them. They, moreover, represented that this prohibition could not hinder the exportation of gold and silver, which, on account of the smallness of their bulk in proportion to their value, could easily be smuggled abroad. These arguments produced the wished-for effect; and the prohibition of exporting gold and silver was restricted in France and England to the coin of these respective countries. The exportation of foreign coin and bullion was made free, and the first law for this purpose in England was passed in 1663. In Holland, and in some other places, this liberty was extended even to the coin of the country. A country that has no mines of its own, must undoubtedly draw its gold and silver from foreign countries; and, on account of their small bulk and great value, they are as easily transported as obtained. When the quantity of gold and silver imported into any country exceeds the effectual demand, no vigilance of government can prevent their exportation. All the sanguinary laws of Spain and Portugal are not sufficient for keeping their gold and silver at home. As they are easily transported from places where they abound, to those where they are wanted, their price does not admit of the same fluctuation with that of many other commodities, that are not so conveniently and speedily removed. The changes which take place in their value are generally slow, gradual, and uniform.

Instead of accumulating gold and silver, with a view to the augmentation of the real wealth of the country, Dr. Adam Smith (*Wealth of Nations*, vol. ii. p. 157.) recommends their being considered, under whatever form they exist, as utensils; and increasing the use for them, by increasing the consumable commodities, which are to be circulated, managed, and prepared by means of them, as the most effectual and most certain method of increasing their quantity, which will ever keep pace with the use to which they are applied; and beyond this, no law can ever prevent their being immediately

sent out of the country. He adds, that it is not always necessary to accumulate gold and silver, in order to enable a country to carry on foreign wars, and to maintain fleets and armies in distant countries. Fleets and armies are maintained, not with gold and silver, but with consumable goods: and the nation, which, from the annual produce of its domestic industry, from the annual revenue arising out of its lands, labour, and consumable stock, has wherewithal to purchase those consumable goods in distant countries, can maintain foreign wars there. See COIN and MONEY.

BULLION is also used for the place where the king's exchange is kept: or where gold and silver are brought in the lump to be tried or exchanged.

BULLIT'S LICK, in *Geography*, a salt-spring lying in Salt river, in Kentucky, America, and giving name to the river. It is distant 20 miles from the rapids of the Ohio, near Saltsburgh, and is the finest spring that was worked in the county.

BULLOCH-MORE, a rocky shoal, about a quarter of a mile long from east to west, which lies above a mile W. of St. John's point, in the mouth of Killibeg's harbour in the west of Ireland: the least water in it is six feet. M'Kenzie.

BULLOCK, in *Rural Economy*, the male of the cattle kind of animals, after being castrated. It is the same with ox. Animals of this kind are generally termed bullocks from two to five, six, or more years old.

The author of the "Synopsis of Husbandry" has observed, that in bullocks "a smooth coat and healthy countenance are proofs of their kindly disposition, and that they will not deceive the buyer in the future progress; whereas, a drooping countenance, a lank belly, and a staring coat, may be considered as unfavourable circumstances, and certain indubitable signs, either that such beasts are unhealthy, or by nature unthrifty and unprofitable." Besides these, much depends on the form and construction of the animal: "a close well-set bullock, with a large dewlap, stout legs, deep chest, broad buttocks, and thick flank, will rarely deceive the purchaser; whereas those of a contrary shape, loose-jointed, long-legged, with a prominent back-bone, great length of body, sharp buttocks, and a belly tucked up, though to appearance larger than the first mentioned, are not likely to pay so well for their meat, and will be found much lighter in the scale from these defects."

Fattening bullocks, it is observed, "require to be foddered with hay in the severity of the winter months, and for this season it is always a prudent measure, where it can be done, to lay in for mowing a certain portion of marsh or other good grass land, that there may be no want of fodder in the winter and spring of the year; for it is in March and April, if those months turn out to be unpropitious, that stock of every kind is more apt to suffer than in the depth of winter; and when young bullocks become much reduced in flesh at that season, it is a very difficult task to raise them, and they will continue during the process of their fattening, to betray marks of the check they met with in their youth, so as never to arrive at the weight when fattened, that they would have done if they had not been suffered to pitch in the early stage of their life."

Good water is likewise a very essential requisite in feeding horned cattle; and such graziers will never had their account in setting about this business, whose grounds do not abound with a continual and plentiful supply of it; nor will the beasts thrive on dry lands, though the grass should be in the largest abundance, for bullocks require a large quantity of water to dilute their victuals, and delight in the summer time to chew the cud in pools or rivulets, where they may enjoy a

cool retreat, and with alternate vibrations of the tail defend themselves from the troublesome attacks of flies, gnats, and other insects. The period when beef generally fetches the best price is towards the month of March; hence, those who are fortunate enough to have any fat beasts in the spring, are certain to make a good market of them, especially in years in which the crops of turnips turn out deficient; as when there are large growths of this root, vast numbers of horned cattle are fattened on them in Norfolk, and the adjoining counties, and these are often brought to Smithfield in such herds as to cause a considerable reduction in the market.

Besides the method of fattening bullocks on grass lands, there are several others in the wolds of Kent and Suffex, where the land is the most fertile of any in the southern parts of the kingdom, and where the meadows produce a grass of the most rich and nutritious quality, and in an abundance equal to the strength of the pasture, where the ponds and rivulets yield a continual supply of wholesome and refreshing drink, and where the hay, when well secured, possesses a virtue answerable to the green herbage: on these feeding lands the grazier finds his account in stocking his farm with bullocks of the largest size, either from the isle of Anglesea, or from Yorkshire, Staffordshire, or other places remarkable for breeding the most weighty beasts. These bullocks have generally been worked for some years, a practice which not only serves to render them tractable and docile, whence they lie more quiet in the feeding pastures, but which renders such beasts much more expeditious in getting into flesh, than those which have not been accustomed to the yoke. These bullocks having been raised into good condition by means of the grass without doors, are, at the approach of winter, taken into the house, where they are kept in separate stalls, and tended with a constant supply of this highly nutritious fodder, the intrinsic goodness of which is often alone sufficient to complete the business, and render the oxen fit for the butcher. But in order to accelerate the progress, troughs are set before them, which are constantly filled with ground beans, oats, &c. as likewise with oil-cake reduced into small pieces. This latter substance, though apparently not calculated to please the palate of a granivorous animal, especially so nice a feeder as a bullock, is coveted by them with such avidity, that, after they have been a few weeks accustomed to the taste of it, they quit any other provender to feast on this diet, so that a very small portion of hay will be required when the beasts begin to feed heartily on the cake. But it is to be observed that water is of the utmost consequence, and therefore should be liberally given them during the time that they are feeding on the cake, at which time they require a more copious supply of liquid than when they are confined to any other diet. Thus provided with a due supply of hay, oil-cake, and water, the beasts make a quick progress in their fattening, and if in pretty good heart when shut up, will be ready for the butcher at the time when beef is most likely to advance in price in the markets.

It is necessary to remark, that in the feeding of bullocks either on hay, corn, oil-cake, or a mixture of each, their feeds should be given them frequently, and in small proportions at a time, for, if the fattening beasts are suffered to blow on any part of their food, they can never more be brought to eat of the same again, until compelled by hunger, a sensation which they ought never to be allowed to feel. This shows the great necessity of a constant attendance on these animals, in order that their food may be given in due proportions, their water often changed, and their litter still kept fresh and clean under them, for of all brute animals,

a bullock is the most dainty in the choice of his food; whence, Mr. Bannister supposes, "he has probably obtained the appellation of *neat*, a term perpetually used to discriminate these cattle."

It is stated by the same writer that "when fed with oil-cake, each beast will require eight cakes per day, which are to be broken into pieces, of which one cake will form about four. Many people divide the cake by means of a large mortar and weighty pestle; but there is a far easier and more expeditious method of performing this work, which is, by holding the cake for a few minutes before the fire, which renders it, from a very hard substance, pliable and tender, so that it may be broken with the utmost facility between the fingers to any size that may be thought necessary, though it will be prudent not to break any more at one time than may be supposed wanting for the expenditure of the current day, that the beasts may enjoy their provender every day fresh out of the loft. And here a hint is offered in respect to preserving the cake, which is, that it be laid in a dry, clean loft, where it may be kept free from any extraneous mixture, but to be particularly careful that neither wet nor dampness be admitted to come in contact with it, which would certainly occasion it to be mouldy, and render it totally unfit for use: this caution seems the more necessary, as the cakes are generally purchased in the summer months, when the price is at the lowest, and kept for half a year or longer before they are used, in which time it is evident that either a drip in the thatch or tiling, or a dampness in the walls, or the flooring of the shed or warehouse wherein they are stowed, may bring no small detriment to the cakes; and thus the owner suffers a heavy loss in the first expence, and is utterly disappointed in his future views." Moreover "when bullocks are fattened on turnips and hay, they require only a small allowance of water, as the moisture of the turnips in a great measure supplies the place of other liquid. They may either be turned into the field, and fed with a daily portion, by dividing the clove with hurdles in like manner as is practised for sheep, or the turnips may be brought home and given to them in a yard or other inclosure; or, lastly, the beast may be tied up in stalls, as was directed for the cake-fed bullocks. Of these three methods, the last seems to be the most eligible, as by this means the beast will lie much more at his ease, and having his eyes detached from every object but his food will fatten more kindly, and with greater expedition, than when suffered to enjoy a wider range. The second method of bringing the turnips into a yard, and suffering the beasts to eat them there, is much preferable to that of penning the bullocks in the field, where they will probably not seldom make their way into the standing turnips, and be exposed to the inclemency of the weather; from both which circumstances much time will be lost in their fattening. Besides, they will be less under the inspection of the owner, and therefore liable to various accidents, which might either be prevented or remedied when the other method of feeding is pursued. The dung, likewise, will be totally lost when the bullocks are fed in the field; and this is a matter of great importance to a farmer, and the valuable addition which the muck from the ox stalls makes to the contents of the yard, being replete with the dung and stale of the beasts, may well compensate for the extra-attendance required on this occasion."

Turnips for fattening bullocks should be of the largest size, and, when brought out of the field into the yard, be divested of their tops, and of the dirt which adheres to them. The tops and small turnips may be thrown to the cows and lean beasts, and the large roots, after having been thus cleaned, be divided into three or four pieces, and flung into the trough before the fatting beasts, observing not to give

give too large a quantity at one time; and if any of the last serving should casually remain in the troughs when the baiting time comes round, these must be removed for a fresh supply. The hay too, which is allowed to these beasts, either when fed with turnips, or on oil-cake, should be the sweetest that can be got, and be apportioned out to them in small quantities. Turnips are more palatable, and likewise more nutritious, when given to the beasts drawn fresh out of the field; but to guard against the contingency of a frost, or of incessant rains, the first of which would render this business impracticable, and the other inconvenient; it seems a very judicious method to provide a flock of turnips in dry open weather, that they may be in readiness at those times when they cannot be procured fresh carted out of the field. These, when divested of their leaves and top roots, and cleansed from dirt, may be piled up in a covered shed, where no moisture can penetrate, and, in this manner, maintain their goodness for some length of time.

When bullocks are at first shut up to fatten on turnips, care should be taken that this food be given in moderation, and with a proper allowance of hay; otherwise, the sweetness of the turnip may tempt the beast to feed so voraciously, as to occasion too great a fullness in the maw, which is called *hoving*, or *blowing*, an accident which frequently happens to ruminant animals, when taken from dry meat or natural grass to turnips, clover, or other succulent sorts of food. See *HOVEN*.

Sometimes accidents happen to bullocks, when feeding on turnips, from pieces slipping into the throat and sticking there. To prevent suffocation, which would frequently be the consequence in such cases, the outside of the gullet should be rubbed down with a stick in order to force the piece down into the stomach; or, should that fail, a turned stick, or piece of cane formed so as to make a kind of probang may be introduced into the throat, and the turnip by that means be removed. See *STALL-FEEDING*.

By some, the black, red, and brindled bullocks are considered as most hardy, and better disposed to fatten than those of other colours. See *CATTLE* and *LIVE STOCK*.

*BULLOCK'S eye*, in *Architecture*. See *EYE*.

*BULLOCK-sheds*, in *Rural Economy*, the houses in which bullocks are kept while feeding. In the construction of these buildings, attention should always be had to their being well aired, to the facility of feeding and cleaning the animals in them, and to their being kept dry and clean by their having suitable drains and conveniences for urine and dung. In the rural economy of Norfolk, Mr. Marshall remarks, that a bullock-house there, consists of a centre building, thirty-six feet long, nineteen feet wide, and about eleven feet high to the eaves, with a pair of wide folding doors at each end, and a lean-to on each side, the whole length of the building, and eleven feet wide. The centre building is the turnip-house; the lean-toes, sheds for the bullocks, which stand with their heads toward, or rather in the turnip-house, from which they are parted by a range of mangers only; having the full freedom of breathing in its spacious area. By opening the doors at each end, a sufficient degree of air and coolness may be given in close weather, while, behind, the eaves of the sheds are brought down to within five feet of the ground, and are boarded with rough boards, except an opening at each end for the bullocks to creep in at, to prevent too great a coldness in severe weather, thus preserving a due temperature. The shed of these dimensions, thus constructed, holds twenty bullocks, ten on each side, fastened by the neck, with chains, swivels and rings playing freely upon posts seven feet high. At each corner of the tur-

nip-house, is a triangular bin for containing the topped and tailed turnips, or other provisions.

In autumn, it is farther observed, the entire building is sometimes used as a temporary barn for buck-wheat, peas, &c. and in summer the centre part is an excellent wagon-shed: had the doors been made a foot and a half higher, it is suggested that it would have been an admirable refuge for loads of corn or hay in a showery harvest. The main building is covered with reed, the lean-toes with tiles. And in the rural economy of Gloucestershire, the same writer remarks, that each bullock has a house and a yard to himself, in which he goes loose, occupying them by turns, as appetite or amusement directs him, having a manger and a drinking trough to go to at pleasure; of course, he cats when he is hungry, and drinks when he is thirsty. He is also at liberty to rub or to lick himself, as well as to keep his body in a proper degree of temperature as to heat and cold. Theory, says Mr. Marshall, could not readily suggest more rational principles.

The construction of these, however, varies in the minutiae. The water trough, for instance, is sometimes placed by the manger in the hovel or shed, sometimes in the open pen. Other less noticeable variations may likewise be seen in different buildings. But the plan and dimensions, which at present seem to stand highest in esteem, and on which several erections of this nature have been made within the last fifteen or twenty years, are the following: The building fifteen to fifteen feet and a half wide within, and of a length proportioned to the number of stalls required: the height of the plates five feet to six feet four inches, supported on the side to the north or east by close walling: on that to the south or west by posts, set on stone pedestals: the gables walling: the covering plain tiles on a single pitch-roof: against the back wall is a gang way, three and a half to four feet wide, formed by a length of mangers, three feet to three and a half feet wide, from out to out, at the top narrowing to about fifteen inches within at the bottom: the perpendicular depth fourteen or fifteen inches; the height of the top rail from the ground, about two feet nine inches: the materials two inch plank, staved and supported by posts and cross pieces, and stiffened by strong top-rails: the dimensions of the area of the covered stalls, about eight feet three inches square; of the open pens the same. The partitions between the stalls are of broad nails, passing from the outer pillars to similar posts, rising on the inner or stall side of the manger, and steadied at the top by slender beams, reaching across the building, each stall, or each partition, having a beam and a pair of principals. The partitions of the pens are gates, reaching from the pillars to the boundary wall; and likewise from pillar to pillar. When they are fixed in that situation, each bullock has his stall and his little yard. When in this, each is shut up in his stall, the yards form a lane, or driftway, for taking in or turning out any individual. The boundary wall of the pens is about four feet high, coped with blocks of copper-dross. On the outer side of it is a receptacle of manure; on the inner, a range of water troughs, with a channel of communication for the convenience of filling them. The materials of the troughs, are stone; of the channel, gutter-bricks, covered with slabs. These stone troughs, which are about fourteen inches by two feet six inches within, have a convenience in their construction, which is entitled to notice; instead of the sides and ends being all of them pecked down to an angle, square with the bottom, one of the ends is left bevelling, sloping, making a very obtuse angle with the bottom. This simple variation renders them easy to be cleaned, either with the shovel or the broom.

The floor is paved with hard burnt bricks, laid edgewise in mortar, being formed with a steep descent from the wall to a channel, from three to four feet from it, and with a gentle fall from the manger to the same channel, which becomes the general drain for rain water and urine. At one end of the pens is a pump (where a natural rill cannot be had) for supplying the troughs of water; and, at the other, a stack of stubble for litter, which is used in the stall only, the yard being left unthatched. At one end of the building is a cake-house, at the other the rick-yard; with a door at each end of the gang-way to receive the hay and the cake.

In some instances, there has been a double range of stalls on this plan, the area between them being the common receptacle for the dung. When a number of stalls, as twenty or thirty, are required, their arrangement brings them within a convenient compass, and the two ranges, with a proper aspect, become shelter to each other. Beside these loose stalls, there are others built nearly on the same plan, but without gates, and on a somewhat smaller scale, in which the cattle are fastened to the manger, or the partition posts, with a long chain, which gives them liberty to rub and lick themselves, and move about in their stalls. In this case, a water-trough is generally placed at the end of every second partition, level with the manger, with a general pipe of communication to fill them, each trough supplying two bullocks. This plan, he observes, lessens the expence in some degree, and prevents the bullocks from fouling their mangers. In the Cotswold hills, he remarks, that each bullock has different troughs, a small one for corn, a larger one for hay, with a water-trough, which runs the whole length of the shed, and is covered by a board, each bullock having a hole to drink at. There are various other constructions of sheds for this use, which will be more particularly described under their proper heads. See CATTLE-SHEDS, and FEEDING-HOUSES.

*BULLOCK-stalls*, the parts that are partitioned off in the sheds, in which the bullocks stand to eat their food. They should always be made sufficiently roomy. See CATTLE-SHEDS.

**BULLOCK**, in *Geography*, a new county of the state of Georgia in America.

*BULLOCK'S point and neck*, lie on the eastern side of Providence river, in the state of Rhode island.

**BULLS**, *bay of*, lies on the north of Cadiz in Spain, within Rota point, and affords a fine shelter from the N.W. to the N.E. winds; about N.N.W. from Cadiz-bay.

**BULLS**, *bay of*, or *Baboul bay*, a noted bay on the east coast of Newfoundland island, about six leagues to the south of St. John's harbour. It has 14 fathoms of water, and is very safe, being land-locked. The only danger depends upon a rock, 20 yards from Bread-and-Cheese point, and another with nine feet water off Magotty cave. N. lat. 47° 20'. W. long. 52° 20'.—Another bay of the same name lies on the west side of Trinity bay, running so far west, that it is scarcely three miles over land from the head or bottom of it to the bay of Placentia.

**BULLSKIN**, a township of Fayette county in Pennsylvania.

**BULLULLOS**, a town of Spain, in Andalusia, four leagues from Lucena.

**BULLY**, a town of France, in the department of the Lower Seine; six leagues N. of Rouen.

*BULLY-tree*, in *Botany*. See *ACHRAS* and *BUMELIA*.

**BULMAN**, in *Geography*, a rock or shoal on the south coast of Ireland, on which there is never less water than four feet. It lies near Hangman's point on the east side of

the entry into Kinfale harbour, and must be carefully guarded against by those who enter that port. N. lat. 51° 40'. W. long. 8° 28'.

**BULM MONOU**, a county of Africa, on the coast of Guinea.

**BULONGA island**, lies off the mouth of Aracan river, on the east side of the bay of Bengal.

**BULSEDI**, a town of Arabia, in the county of Yemen, 22 miles S. E. of Loheia.

**BULTEAU**, **LEWIS**, in *Biography*, a learned and pious French author, was born at Rouen in 1615, and succeeded his uncle as king's secretary, which office he occupied for 14 years, till he withdrew from it to study and religious retreat. Having entered as a lay-brother among the Benedictines of St. Maur, he passed the remainder of his days at the abbey of St. Germain des Prez, near Paris. His principal works were "An Essay on the monastic History of the East," 1680, 8vo. describing the manners, &c. of the Cænobites, and proving that monastic institutions are not so modern as has been supposed. "Abridgment of the History of the Order of St. Benedict, as far as the 10th century, 1684," 2 vols. 4to. "Translation of the Dialogues of Gregory the Great," with Notes, 1689, 12mo. His modesty would not allow his annexing his name to his works; his style was formed on the model of the writers of the Port Royal; and his knowledge of languages was very extensive. He died of an apoplexy in 1693. *Nouv. Dict. Hist.*

**BULTËL**, derived from the barbarous Latin *bultellus*, or *bultellum*, a searce, or boulder, denotes the bran or refuse of meal after dressing.

**BULTËL** also denotes a bag wherein meal is dressed, called also a *bult.r.* or rather *boulter*. See **BOLTERS**.

**BULTËR-cloth**. See **BOLTING-cloth**.

**BULTERS**, are strong lines, five hundred feet long, with sixty hooks, eight feet asunder, and baited with pilchards or mackerel, which are used on the coast of Cornwall in the fishery of congers. They are sunk to the ground by a stone fastened to them; and sometimes such a number of these are tied together as to reach a mile.

**BULWARK**, *Propugnaculum*, in the *Ancient Fortification*, amounts to much the same with bastion in the modern. See **BASTION**, and also **RAMPART**.

**BULWER**, **JOHN**, in *Biography*. This writer, who lived in London, and was in repute in his time for his skill in teaching deaf and dumb persons, and others, to communicate their thoughts, by motions of their fingers and hands, is now only known by his works, which are sufficiently singular to merit attention: viz. "Chirologia, or the Natural Language of the Hand; as also Chironomia, or the Art of Manual Rhetoric," London, 1644, 8vo. Rabelais gives an account of a curious contest of this kind, where the disputants, without speaking, communicated their opinions, by motions of the hands and fingers. The art is not entirely lost, but is now principally practised as an amusement by young people at schools. "Pathomyototomia, or the significant Muscles of the Passions of the Mind, and Dissection of the Muscles of the Affections," London, 1649, 8vo. He describes the muscles of the head, and denominates them from the expression in the countenance, occasioned by their contractions, as love, fear, rage, &c. "Man transformed, or the Artificial Changeling, shewing the several Ways how divers People alter the Natural Shape of some Parts of their Bodies," 1653, 4to. Joseph Clark, the famous posture-master, was a remarkable instance of a man possessing this power. He made himself tall or short, fat or lean, deformed or straight, at his discretion. He had also an equal power in altering his countenance,

countenance, so as to be unknown to his most intimate acquaintance. Haller. Bib. Anat.

BULZIG, in *Geography*, a town of Germany, in the electorate of Saxony, 2 miles S. of Zahna.

BUM-bailiffs, or Bound-bailiffs. See BAILIFFS of Sheriffs.

BUM-boat, in *Sea-Language*. See BOAT.

BUMALDA, in *Botany*. Thunb. nov. gen. p. 63. Flor. Jap. 8. Schreb. 453. Willd. 515. Juss. 381. Class and ord. *pentandria digynia*. Nat. ord. *rhamni* Juss. Gen. Char. *Cal.* perianth deeply divided into five ovate, obtuse, concave segments, a little shorter than the corolla. *Cor.* petals five, oblong, inserted on the germ. *Stam.* five, thread-shaped, erect, rough with hairs, inserted into the claws of the petals, nearly the length of the corolla; anthers inserted into the back, ovate, twin. *Pistl.* germ conic, villous, superior; styles two, erect, villous, the length of the filaments; stigmas simple, headed, truncate. *Capsule* not seen by Thunberg in a state of maturity, but supposed by him to be two-celled and two-beaked.

Sp. *B. trifolia*. A small dense shrub, smooth in all its parts. *Branches* cylindrical or obtusely angular, jointed, purple. *Branchlets* opposite, leafy, thread-shaped, much spreading, in other respects similar to the branches. *Leaves* opposite, petioled. *Leaflets* ovate, acuminate, finely serrated, pale underneath; on short, capillary, spreading or reflected petioles. *Racemes* terminal. Native of Japan.

BUMBUNNY, a name given by the people of Guinea to a plant common in that place, which serves them as an emetic; they boil a few of the leaves in water, and drink this liquor, which works very easily. Phil. Trans. N<sup>o</sup> 232.

BUMELIA, (*Βουμελία*, the name of a tree in Theophrastus and Pliny). Swartz. Prod. 49. Schreb. Ap. 1736. Willd. 401. Class and ord. *pentandria monogynia*.

Gen. Ch. *Cal.* perianth five-leaved; leaves roundish-ovate, incumbent, concave. *Cor.* one petalled, five-cleft or five-parted; tube very short, round; border five-parted; segments ovate, entire, spreading, concave, with two little scales at the base of each; nectary with five leaves, smaller than the segments of the corolla, at the base of the filaments, surrounding the germ, acute. *Stam.* filaments five, the length of the tube, inserted into its bottom between its lower segments; anthers ovate, erect. *Pistl.* germ superior, ovate; style thick, erect, shorter than the stamens; stigma obtuse. *Drupe* oval; kernel single, oblong, smooth, with a lateral scar.

Eff. Char. *Corolla* five-cleft; *nectary* five-leaved; *drupe* one-seeded.

La Marck says, that all Swartz's species should be referred to *Sideroxylum*, which he describes in his "Illustrations" as submonospermous, or, as he expresses it in the alphabetical part, having from one to five seeds. *Bumelia*, as a separate genus, differs from *Sideroxylum* only in the number of seeds. Willdenow enumerates the following twelve species, all natives of America.

1. *B. nigra*, bastard bully-tree. Swartz. (*Achras* 6. Browne Jam.) "Leaves terminating, oblong-lanceolate, smooth, waved about the margin; branches spreading; branchlets wandlike, flower-bearing." A tree. Fruit small, smooth, scattered on the branchlets; seeds roundish, with a very small ovate scar. A native of Jamaica. 2. *B. pallida*. Swartz. "Leaves terminating, elliptic, obtuse; peduncles crowded, lateral; branches erect." It resembles *B. nigra*, but is a smaller tree, with whitish bark, having branches less-spreading, with larger flowers and drupes. Swartz. A native of Jamaica. 3. *B. tenax*. Willd. (*Sideroxylum tenax*. Linn. Mant. *Chryso-phyllum carolinense* Jacq.) "Leaves obovate, obtuse, fil-

very-tomentous underneath; peduncles axillary, crowded." A tree 20 feet high, with a whitish bark, and very tenacious branches. *Germs* alternate, each producing numerous one-flowered peduncles, about an inch long. *Leaves* five or six, below or among the peduncles, petioled, very entire, deciduous. *Flowers* small. *Calyx* ovate; leaflets five, ovate, obtuse, the outer ones broader, converging. *Corolla* tube the length of the calyx; border five-parted; segments ovate, shorter than the calyx; nectary in the throat of the corolla, five-parted; segments with three clefts, the middle one generally the longest. *Stamens* the length of the corolla. *Pistl.* germ pentagonal; style and stigma simple. *Drupe* oval; kernel ovate, shining, with two apertures at the base, separated by a bowed partition. It varies with very short spines, thinly scattered on the branchlets. Linn. Observed by Dr. Garden in the dryer parts of Carolina. 4. *B. retusa*, mountain bastard bully-tree. Swartz. (*Achras* 7. Brown. Jam.) "Leaves wedge-ovate, obtuse, rigid; peduncles crowded, axillary." Native of Jamaica. 5. *B. fetidissima* Willd. (*Sideroxylon sectidissimum* Linn. Mant.) "Leaves lanceolate-oblong, obtuse, a little emarginate; peduncles crowded, axillary. A shrub, 12 feet high. *Leaves* rather alternate, shining. *Peduncles* one-flowered, numerous. A native of St. Domingo. 6. *B. falcifolia*, Swartz. (*Achras falcifolia*, Linn. Sp. Pl. under which name it has already been given in this work. La Marck refers his *Sideroxylum falcifolium* to the *Achras falcifolium* of Linnæus with a mark of doubt. Willdenow gives, as a synonym to the present plant, Jacquin's *Sideroxylon multichodendrum*, which La Marck has inserted in his Illustrations, but not in the Dictionary under the same name). "Leaves lanceolate, ovate, acuminate; peduncles crowded, axillary and lateral." Native of Jamaica and the Bahama islands. 7. *B. manglillo*, Willd. (*Sideroxylon manglillo* La Marck Encyc. *Chryso-phyllum manglillo* La Marck Illust. *Duhamelia manglillo* Domb. Peruv. *Manglilla* Juss. 151). "Leaves oblong, obtuse, smooth, whitish beneath; flowers axillary and lateral, aggregate, with short peduncles." An evergreen shrub, 10 or 12 feet high. *Leaves* alternate, very entire. *Flowers* small, white, in numerous small fascicles, either in the axils of the leaves, or scattered below the leafy part of the branches. *Peduncles* short. *Style* none. Fruit about the size of a small grain of pepper. Observed by Dombey in the neighbourhood of Lima. 8. *B. montana*. Swartz. "Leaves oblong, obtuse; peduncles long, axillary, distinct." Native of Jamaica. 9. *B. nervosa*. Willd. (*Chrysophyllum macrophyllum* Lam. Illust. C. cainito Aub. guin.) "Leaves alternate oval, of a different colour beneath; flowers aggregate, lateral, and axillary, tomentous, peduncled." Native of Cayenne. 10. *B. pentagona* Swartz. "Leaves lanceolate, acuminate, shining; peduncles axillary; drupes pentagonal." Native of the West Indies. 11. *B. rotundifolia*. Swartz. "Leaves roundish, marginated, veined, leathery, smooth on both sides." Native of Jamaica. 12. *B. cuneata*. "Leaves wedge-obovate." Native of Jamaica. Fruit of this and the preceding unknown.

BUMICILLI, a sect of Mahometans in Africa, said to be great forcerers: they fight against the devil, as they say; and frequently run about covered with blood and bruises, in a great fright: they sometimes counterfeit combats with him at noon-day, and in the presence of numbers of people, for the space of two or three hours, with darts, javelins, scimitars, &c. laying desperately about them, till they fall down on the ground oppressed with blows; after resting a moment, they recover their spirits, and walk off. What their rule is, is not well known; but they are said to be an order of religious.

**BUMPKIN** or **BOOMKIN**, in *Sea Language*, a short boom or bar of timber, projecting from each bow of a ship, to extend one edge of the foresail to windward; for which purpose there is a large block fixed to its outer end, through which the rope is passed that is fastened to the lower corner of the sail to windward, called the *tack*; and this being drawn tight down brings the corner of the sail close to the block, which being performed, the tack is said to be *aboard*. The bumkin is secured by a strong rope, which confines it downward to the ship's bow, to counteract the strain it bears from the foresail above dragging it upwards.

**BUN**, the dry stalk of hemp, stripped of its rind.

**BUNCH**, a cluster or assemblage of certain things, as of grapes.

**BUNCH** also denotes a tumor, or protuberance, natural or preternatural, either on an animal or a vegetable body.—The bunch growing about the graft of a plant is a sort of *callus* formed by the extravasated sap.

**BUNCA** of *Camels*. See **CAMELS**.

**BUNCA**, in *Surgery*, denotes an elevation of the back, arising from an exterior luxation of the *vertebrae* thereof. The cure is begun by keeping emollients a long time on the *vertebrae*, whereby to loosen the ligaments, and finished by wearing an iron boddice, which compressing the *vertebrae*, by degrees drive them back to their natural situation.

**BUNCHES** in horses, called also *knobs*, *warts*, and *wens*, are diseases arising from foul meat, bruises, hard labour, or the like; whereby the blood becoming putrefied and foul, occasions such excrescences.

**BUNCHEd** *cods*, among *Florists*, are those which stand out, and wherein the seed is lodged.

**BUNCHEd** *roots*, those round roots which have knobs or knots in them. See **BULB** and **ROOT**.

**BUNCRANA**, in *Geography*, a small post town of the county of Donegal, Ireland, situated on Lough Swilly, in the peninsula of Inishowen. It is 12 miles N.W. of Londonderry, and 124 N.W. of Dublin.

**BUNCOMB**, the largest and most western county of North Carolina, and supposed to be the most mountainous in the United States. It lies in Morgan district, and is bounded W. by the state of Tennessee, and S. by that of South Carolina. The Blue ridge passes through this county, and gives rise to many large rivers, as Catabaw, Weteree, Broad river, and Pacolet.

**BUNDAMIR**, a central river of Persia, which passes between Schiraz and Itakar, or the celebrated ruins of Persepolis, and is supposed to be an ancient Araxes, which see. This famous river flows into a salt lake called **BAKTAGAN**. Between this river and the Kuren, a branch of the mountains of Elwend extends S.E. See **ELWEND**.

**BÜNDE**, a town of Germany, in the circle of Westphalia, county of Ravensberg and prefecture of Limberg. At this place a considerable trade is carried on in yarn and coarse linen, and near it is a medicinal spring, discovered in 1748.

**BUNDEII**, a ridge of mountains in Hindostan, which runs parallel to the Godavery river on the south, but at a considerable distance from it.

**BUNDELA**, or **BUNDELCUND**, a territory of Hindostan, lying on the south-west side of the Jumnab, and separated from it by a narrow tract of low country. It is inhabited by a tribe of Rajpoots, who are deemed inferior to their brethren of Auzmere. Bundelcund is surrounded by the dominions of Oude, Benares, and the Mahrattas, and was formerly subject to a rajah named Hindooput; but it is now chiefly divided among his sons, or their descendants. It

is a mountainous tract of more than 100 miles square, and contains the celebrated diamond mines of Punna or Purna (probably the Panassa of Ptolemy), together with some strong fortresses, the principal of which is Callinger. It is subject to the depredations of the Mahrattas, and has of late years been attempted by Madajee Sindia, who failing to make himself master of the principal fortresses, abandoned the open country. The ancient limits of Bundelcund were much more extensive than the present; extending much further towards the Nerbuddah river. Chatterpour is reckoned the capital. Where the soil is not strong, it produces all sorts of fruits, but neither rice nor sugar. Cotton trees are abundant, and a species of tree from which is gathered a black nut.

The territories of Adjiffing are contiguous to Bundelcund, on the west: to the Mahrattas, on the south and south-west; and to the Benares territory, on the east. Their whole extent, including some tributary Zemindars on the south-east, may be about equal to Bundelcund; and like that, subject to the occasional depredations of the Mahrattas. Its capital is Rewal or Rooh, which see. Rennell's Mem. Introd.

**BUNDERKOLE**, a town of Hindostan, in the district of Kihitwar, seated between the two branches that form the Chunaub river, near the foot of the Imaus or Himmaleh mountains. N. lat. 33° 40'. E. long. 74° 58'.

**BUNDLE**, a collection of things wrapped up and bound together. A bundle of paper consists of 40 quires; a bundle of Hamburg yarn contains 20 skeins; and of basket rods, the band is 3 feet.

**BUNDLES**, in *Law*, denote a sort of records of the chancery, lying in the office of the Rolls, in which are contained the files of bills and answers; of *bab. cor. cum causis*; *certioraris*; attachments, &c.; *seire facias's*; certificates of statute staple; extents and liberates; *superfedas's*; bills on special pardons; bills from the Exchequer of the names of sheriffs; letters patent surrendered; and deeds cancelled; inquisitions; privy-seals for grants; bills signed by the king; warrants of escheators; customs, &c.

**BUNDURAL**, in *Geography*, a district of Hindostan, adjoining to the Imaus or Himmaleh mountains, in N. lat. about 33° and E. long. about 75° 30'.

**BUNEL**, **PETER**, in *Biography*, an elegant scholar of distinguished eminence, was born at Toulouse in 1499, and educated at Paris. Unable to procure a subsistence at home, he went to Padua, and afterwards to Venice, where he was entertained in the house of Lazarus du Baif, the French ambassador, and where he studied the Greek and Hebrew languages; of Latin he was before so complete a master, that he wrote it with such purity as to have been deemed the founder of the Ciceronian sect which prevailed so much among the Italian scholars. With George de Selve, bishop of Lavaur, who succeeded du Baif at Venice, he retired to Lavaur, and upon his death, returned to Toulouse, where he was rescued from indigence, and patronized by Messrs. de Faur. He accompanied the son of one of these in the capacity of tutor on a tour to Italy, and at Turin, was carried off by a fever in his 47th year. His reputation for literary taste and for a philosophical contentment of mind was eminently distinguished. In early life he seems to have incurred the suspicion of heresy, by manifesting an inclination to the opinions of the reformers; but he was rejected by Calvin, because he seemed to have had too favourable sentiments of the Pelagian doctrines. A collection of his Latin letters, written with peculiar purity of style, and containing much curious matter, was printed by Stephens in 1551, and afterwards reprinted

at Toulouse. The capitouls of Toulouse have placed his bust in their town-hall among other ornaments of their city. Gen. Dict.

BUNEL, JACOB, a painter of history, was born at Blois in 1558, and became the disciple of Frederick Zuccherò. He was in high reputation as a painter both at Rome and at Paris; and in the church of the Augustines, in the latter city, he painted a "Descent of the Holy Ghost," which was preferred by that excellent judge, Nicolo Poussin, to all the paintings in that city. Pilkington.

BUNG, the stopple of a cask, barrel, or the like.

The bung is a wooden plug, serving to stop the hole left in the top of a vessel to be filled by. It answers to what, among the ancients, was called *epistomium*, and in the middle age *sigillus*, the seal of a vessel, because in those days it was usually sealed.

After tunning new wine, or cyder, the bung is usually left open for some time, that when the liquor comes to work, there may be vent for the froth or scum, and that the hoops may not be in danger of being burst by the violence of the fermentation. Yet, in some cases, they leave wines to ferment, without giving them vent by the bung, in order to render them more brisk and spirituous: in which case, it is necessary the vessel be hooped with iron, and other precautions taken that the bung may not fly.

BUNGAY, in *Geography*, a town of Suffolk, England, is built on the banks of the river Waveney, which divides this county from Norfolk, and is navigable for barges from Yarmouth on the coast. This place is memorable for a dreadful fire which, in 1688, consumed nearly the whole of the town, and destroyed property to the amount of 29,896l. The town, however, revived after this deplorable event, and its houses, &c. were re-erected in an improved and more convenient style. The town consists of two parishes, and has two handsome churches. That, dedicated to St. Mary, is a large structure, with a lofty steeple. Between the two churches are the ruins of a Benedictine nunnery which was founded in the time of Henry II. Here are also the remains of a very strong castle, which appears to have been built by the Bygods, earls of Norfolk. In the time of the barons' wars, this place was strongly fortified by Hugh Bygod, who is said to have publicly defied the king, but he was obliged to compound with Henry II., by a sum of money, and hostages, to save it from a siege, and demolition by that monarch. The earl afterwards espoused the cause of Richard, Henry's son, against his father; when the king seized this, and the castle of Framlingham. The castle was demolished in the reign of Henry III., but in the 10th of Edward the first Roger Bygod obtained a licence to embattle his mansion which was built on the site of the castle.

The inhabitants of Bungay have the privilege of a very extensive common in the vicinity of the town. Here are a weekly market on Thursday, and two fairs annually. It is 106 miles N.E. of London, and contains 187 houses, and 903 inhabitants in Trinity parish, and 305 houses, with 1446 inhabitants, belonging to that of St. Mary.

BUNGO. See BONGO.

BUNGO, a province of Africa, in the kingdom of Loango.

BUNGURY, a town of Hindostan in Lahore, seated near the river Rauvee. N. lat. 32° 30'. E. long. 74° 58'.

BUNGUSH, a district of Cabul, situate to the south of the Cow river and east of the Sindé, terminating on both. N. lat. about 33° and E. long. about 70°.

BUNIALU, a town of Asiatic Turkey, in the province of Natolia; 28 miles W. of Castamon.

BUNIAS, in *Botany*, (the name of a plant with a root like a turnip, in Dioscorides and Pliny, from *βουνος* a hill), Linn. gen. 523. Schreb. 1070. Willd. 1217. Juss. 241. Vent. vol. iii. p. 114. Græt. 828. Clafs and order, *tetradynamia siliculosa*, Schreb. Willd. and Smith. *Siliqueja* Linn. Nat. Oed. *Silicifera* Linn. *Crucifera*. Juss. and Vent.

Gen. Char. *Cal.* perianth four-leaved; leaves ovate-oblong, spreading, deciduous. *Cor.* four-petalled, cruciform; petals obovate; claws attenuated, erect. *Stam.* six, the length of the calyx, two opposite ones a little shorter than the others; anthers erect, bifid at the base. *Pist.* germ oblong; stigma obtuse. *Silicle* irregular, ovate-oblong, somewhat four-sided, not opening, deciduous.

Ess. Char. *Silicle* deciduous, four-sided, with unequal acute angles, not opening. Dr. Smith.

Spec. 1. *B. cornuta*, Linn. (*Myagrum cornutum*, Lam. *Pugionium cornutum*, Gært. Willd. and Vent.) "Silicles with two spreading horns, spinous at the base," Linn. *Leaves* tongue-shaped, very entire, glaucous, without veins, half embracing the stem. *Racemes* terminal; very loose in a state of maturity, with wide-spreading peduncles. *Flowers* small, not larger than those of *Draba verna*. *Petals* narrow, very entire, acuminate, white, a little longer than the calyx. *Germ* somewhat hispid, two-celled. *Silicle* membranous, lenticularly-compressed, transversely oval; furnished at each extremity with a long, compressed, sword-shaped process, producing the appearance of two wide-spreading horns; reticulated on each side with veins; somewhat transparent between the veins, and armed with four pair of weak divaricated spines proceeding from the veins. *Cells* naturally two, placed by the side of each other and separated by a thin partition; but, in the mature fruit, one is constantly obliterated. *Seed* single, ovate-oblong, compressed, inclosed in an aril. Gært. Tab. 142. fig. 3. Native of the Levant and of the desert of the Calmucks near the Caspian sea. 2. *B. spinosa*, Linn. Mant. 96. (*Myagrum spinosum* Lam.) "Racemes spinosecent." Gært. Tab. 142. f. 2. *Root* annual. *Stems* a foot high, erect, branching, subdivided, round, slender, very smooth, green. *Leaves* ovate-oblong, blunt, somewhat angular, smooth, petioled. *Racemes* erect, stiff, rigid, terminating with compound spines, and a few sessile flowers. *Calyx* oblong, closed. *Petals* lanceolate, pale violet. *Germ* heart-shaped. *Style* cylindrical, the length of the germ, permanent. *Stigma* thickish. *Silicle* a spongy drupe, heart-shaped, turgid, smooth, and even terminated by the pyramidal, permanent style; rind thick, shell two-celled, hexangular, two opposite angles broader. *Seeds* solitary, roundish, Linn. and Gært. Native of the Levant. 3. *B. Erucago*, Linn. (*Erucago fegetum*, Tourn. *Myagrum Erucago*, Lam.) Jacq. Aust. Tab. 340. Gært. Tab. 142. f. 2. "Silicles four-angled, beaked; angles two-crested; lower leaves lyreshaped; lobes opposite, triangular," La Marck. *Root* annual. *Stems* numerous, a foot and half high, slender, spreading, rough with a very short pile. *Radical leaves* rather straight, with toothed lobes, soon withering. *Stem leaves* small, lanceolate, toothed, and distant. *Flowers* yellow, peduncled, in loose, terminal racemes. *Silicle* a quadrangular drupe with a rough surface, narrowed in the middle, terminated by the long style, and divided at its angles into two very prominent, toothed crests. *Rind* spongy-membranous, thin, whitish. *Shell* bony, four-celled; cells in pairs, one over the other, all fertile. *Seeds* roundish, plano-convex, rufescent. La Marck and Gært. Abundant in corn fields, in the southern parts of France. 4. *B. aspera*, Willd. "Silicles four-angled, all

all the leaves lanceolate." *R.* Annual. *Stem* near a foot high, somewhat branched; rough with minute prickles. *Lower leaves* broadly lanceolate, upper ones lanceolate, a little toothed; with a few white, forked and trifid hairs. *Flowers* yellow, in racemes. *Calyx* five-celled ventricose, converging. *Silicles* very long, ovate, enclosed with four opposite serrated angles; and terminated by a pyramidal, capitate style, the length of the silicle. Retz. Obs. 2 p. 21. Native country unknown. 7. *B. orientalis*, Linn. (Cræbe orientalis, Tourn. Myagr. orient. La Marck.) Gært. Tab. 142. "Silicles ovate, pinnatifid; lower leaves runcinate-lyr-shaped, upper ones lanceolate," Willd. *Root* perennial. *Stems* herbaceous, upwards of two feet high, branched. *Flowers* yellow, in long, terminating racemes. *Silicle* drupaceous, roundish or ovate oblong, gibbous, warty, ending in a short beak. *Rind* fungous, straw-coloured. *Shell* bony, of the shape of the silicle, smooth without; with two cells one above the other, the upper one, in such silicles as are roundish, generally obliterated. *Seeds* roundish, rufescent. Miller and Gærtner. Gathered by Tournefort in the Levant, and by Gmelin in Siberia. 6. *B. cochlearioides*, Willd. "Silicles ovate, bluntish, somewhat wrinkled; radical leaves oblong, stem-leaves arrow-shaped, embracing the stem." *Root* annual; a native of France, Italy, Hungary, &c. 7. *B. tatarica*, Willd. (Vella tenuissima, Pallas It. tom. 5. Pl. 6. French Tra. station.) "Silicles globular, somewhat hexagonal, with long beaks; leaves lanceolate, blunt, petioled." *Root* annual. *Stem* erect, branching, half a foot high. *Leaves* very entire; hispid, attenuated into a petiole at the base. *Flowers* white, in filiform racemes. *Silicles* six-furrowed, crowned with the thick, cylindrical, permanent style, two-celled, not opening. 8. *B. Myagroides*, Linn. Mant. 96. (Cakile myagroides, Vent.) La Marck Illust. Tab. 554. fig. 1. "Silicles two-edged, two-jointed, a little swelling above; leaves pinnate, with reflected sinuses." *Root* annual. *Stem* straight, two feet high, even, irregularly branched. *Lower leaves* pinnate or bipinnate, rather broad, not fleshy, deep green, with oblong, toothed divisions or pinnae; the upper ones very similar, but narrow and linear; all with reflected sinuses. *Racemes* terminal, long, straight. *Flowers* nearly sessile. *Calyx* oblong, closed. *Petals* very entire, pale, purple. *Anthers* yellow. *Style* sword-shaped. *Silicle* sub-cylindrical, rigid, approximating to the rachis; on a short peduncle; lower joint cylindrical, two-valved, generally with only one seed, the valves marked with a single streak; upper joint, compressed, obscurely two-edged, generally with only one seed, blunt, with a protuberant auricle on each side. Linn. A native of Siberia. 9. *B. egyptiaca*, Linn. Syst. Nat. tom. 3. p. 231. (Myagr. verrucosum, La Marck) Gært. Tab. 142. copied by La Marck in Illust. Pl. 553. fig. 3. "Silicles four-angled, rugged with warts on all sides; leaves runcinate." *Root* annual. *Stem* a foot high, branched, hispid below, smoother above. *Leaves* runcinate, somewhat toothed, even; with a few hairs beneath on the petioles. *Racemes* solitary, terminal, long. *Flowers* pedicelled. *Calyx* yellowish, spreading. *Petals* dark yellow, obovate, obtuse, spreading, with erect claws. *Stamens* yellow, distant. *Germ.* ovate, four angled, green. *Style* none; *stigma* capitate, yellow. *Silicle* drupaceous, small, ovate, four angled: the two narrower sides rugged with warts; the two broader marked with a double, longitudinal, elevated streak, which is crenulate, or slightly tubercled: rind very thin, membranaceous: shell bony, muricate, two celled; cells placed side by side. *Seeds* solitary, ovate, convex on one side, flat on the other, rufescent. Linn. and Gært. A native of Egypt. 10. *B. balearica*.

Linn. Mant. 429 (Myagr. bal. La Marck) Jacq. hort. Tab. 144. Gouan illust. tab. 20. "Silicles hispid; leaves pinnate; folioles somewhat toothed." *Root* annual. *Stem* a foot high, much branching, spreading, angular, smooth. *Leaves* petioled; pinnae lanceolate, sinuate, obtuse, smooth. *Panicles* in racemes, very long, erect: pedicels shorter than the flowers. *Calyx* closed, smooth, lanceolate, concave, glaucous. *Corolla* yellow; petals oblong, obtuse, the length of the calyx. *Silicles* globular, echinated on every side with dense, weak spines, and terminated by an awl-shaped, stiff beak, longer than the silicle. A native of Majorca and Minorca. 11. *B. prostrata*, Willd. Desf. Atl. tab. 150. "Silicles one-seeded, toothed; leaves pinnatifid; segments sinuate." *Stems* numerous, prostrate, pubescent from the root. *Leaves* pubescent, deeply pinnatifid; segments obtuse, toothed. *Flowers* white. *Silicles* roundish, compressed, terminated by the permanent style, pubescent. A native of the sandy soil in the northern part of Africa. 12. *B. Cakile* Linn. Hudson, Withering, Smith. (Cakile martina Tourn. La Marck, Vent. Willd. Cakile Serapionis Lob. Gært.) Eng. Bot. Pl. 231. La Marck Illust. Pl. 554. fig. 2. Gært. Tab. 141. "Silicles ovate, two-edged, smooth, one-seeded; leaves fleshy." Smith. *Root* annual, slender, woody, running deep into the sand. *Stem* round, much branched, woody, divided from the base into widely divaricated, zig-zag, twisted branches. *Leaves* alternate, thick and succulent, rather glaucous, smooth, more or less deeply pinnatifid and toothed; their segments all obtuse. *Flowers* pale purple in dense, terminal corymbi, which afterwards grow out into spikes. *Calyx* gibbous at the base. *Silicle* smooth, oblong, acuminate, obsolete four-angled, but so compressed as to make two opposite edges very prominent, two jointed, separating at the joints: the upper joint largest, deeply emarginate at the base, spongy, constantly fertile, one celled, not opening spontaneously, but easily separated into two valves at the prominent angles: the lower joint smaller, somewhat top-shaped, sometimes perfectly solid, and sometimes furnished with a cell, which is either barren or contains a single seed; but a fertile lower joint is very rare, and never occurred to the observation of Gærtner, Miller, Gært. and Smith. An inhabitant of the sea-coasts of Europe, Asia, Africa, and America. Willdenow describes the variety  $\beta$  of Vahl, which he conjectures to be *Isatis Egyptiaca* of Linnæus, as a second species of his genus *Cakile*, under the trivial name of *Egyptiaca*. It differs chiefly in having larger leaves, longer peduncles, and a seed always in each cell; but it seems to be only a variety of the common species.

Obs. This genus, like several others of the same natural family, is very perplexed and obscure, and differently treated by different authors. Linnæus, at first, formed it of such species as have rough or muricated filiques or silicles, including the *Eruca* of Tournefort, and framed its generic character accordingly: but afterwards, without changing the character, admitted the *Cakile* of Tournefort, which has not rough or muricated silicles, and which in his *Hortus Cliffortianus* and *Flora Succica*, he had placed under *Raphanus*. La Marck has abolished it entirely, keeping *Cakile* distinct, and placing the other species under *Myagr.* which, he says, forms with them a very natural genus, consisting of species with silicles, in some respects so different from each other, that, if not united under one very general character, they must constitute nearly as many genera as species. Jussieu, instead of uniting it with *Myagr.* is rather inclined to divide it into three, *Bunias*, *Eruca*, *Cakile*. Gærtner makes its essential character depend on a drupaceous silicle, adding that those who are delighted with

with a multitude of genera, may divide it according to the internal structure of the drupe, and the seeds into Bunias, Lœlia, and Erucago. In consequence of this established principle, he has not only restored the genus *Cakile* of Tournefort, but has also introduced a new one for the Bunias cornuta of Linnæus, under the generic name *Pugionium*, from *pugio* a dagger, suggested by the shape of the singular processes from the filicle. Willdenow and Ventenat have admitted the three genera, and the latter has also again made Erucago a distinct genus. In this diversity of opinion, we have thought it best to keep the Linnæan genus entire, only adopting the essential character given by Dr. Smith in his *Flora Britannica*, which appears to be equally comprehensive of the proper species and exclusive of others.

**BUNIAS** *Syriaca*, of Gærtner and Willdenow. See *ANASTATICA Syriaca*. La Marck says that it has the fruit of his *Myagrum*, and consequently cannot belong to the genus *Anastatica*. Gærtner, when his plates were engraved, followed the arrangement of Linnæus, but, when he wrote the descriptions, had discovered that the filicle is properly a drupe, though the rind is so thin as to be scarcely discernible, and that, therefore, it belongs to his genus *Bunias*.

**BUNIAS**, Gerard. - See *BRASSICA Napus*.

**BUNIUM**, (supposed, like *Bunias*, to be derived from *βουνος*, a hill, as is said, from its affecting high situations, but that being neither its peculiar nor universal character, it is probably so called from the form of its root) Earth-nut, Kipper-nut, Pig-nut, or Hawk-nut. Linn. gen. 335. Schreb. 468. Willden. 532. Juss. 223. Vent. vol. iii. 30. Gært. 807. *Bulbocastanum* Tourn. Class and order, *pentandria digynia*. Nat. Ord. *Umbellatæ* Linn. *Umbellifera* Juss.

Gen. char. *Umbel universal* manifold, with rays fewer than twenty: *partial*, very short, crowded. *Involucre universal* short, of many linear leaves, sometimes not more than three, or only one, and after the flowers are opened, often entirely wanting: *partial* setaceous, the length of the partial umbel. *Perianth proper* scarcely apparent. *Corolla universal* uniform. *Florets* all fertile. *Cor. proper* of five inflex-cordate, equal petals. *Stam.* filaments five, shorter than the corolla, simple: anthers simple. *Pistl.* germ oblong, inferior: styles two, reflexed; stigmas obtuse. *Peric.* none: fruit ovate, splitting in two. *Seeds* two, ovate, convex on one side, flat on the other. Linn. five striated, the spaces between the streaks slightly wrinkled. Gært.

Essen. Char. *Cor.* Uniform. *Umbel* crowded. *Fruit* ovate.

Sp. 1. *B. Bulbocastanum*. Linn. (*B. minus*. Gouan.) La Marck, Ill. 197. "Involucre many-leaved: stem straight and leafy at the base." Dr. Smith. "Leaves uniform, involucre many-leaved." Willd. "Fruit somewhat cylindrical, thicker at the apex; styles reflexed, deciduous." Gouan. *Root* perennial, tuberous, roundish. *Stem* round, alternately branched, leafy, striated, smooth. *Leaves* tripinnate: segments linear, of ten trifid. *Umbels* terminal, erect. *Partial umbels* close, white. *Involucre* three times shorter than the rays. Dr. Smith. Common on the Continent; rare in England; found by Martyn in the time of Dillenius, near Hornsey wood, and by Mr. William Wood, lately in Kensington gardens. 2. *B. flexuosum*, Stokes and Willdenow. "Involucre of three leaves or less; stem naked, tapering, and zig-zag at the base." Dr. Smith. "Stem leaves very narrow, involucre none." Willd. "Fruit ovate, acuminate; styles permanent." Gouan. *Root* tu-

berous, roundish. *Stem* elongated under the earth, tapering, zig-zag, white; about a foot and a half high, erect, branched, leafy, striated, smooth. *Radical leaves* on long petioles, tripinnate; segments linear, pinnatifid and gashed; stem leaves nearly sessile, triternate, finely divided; sheath short, grooved, smooth, the edge membranous and whitish. *Umbels* several; universal rays from seven to twelve, partial about twelve. *Involucre universal* and *partial* various; in Yorkshire specimens, the universal involucre most commonly consists of one or two lanceolate leaves, with three coloured ribs, proceeding from a projecting ring which surrounds the base of the umbel; partial one of from one to three leaves, exactly resembling those of the universal involucre and proceeding from a similar ring. *Styles* white according to Curtis, but in our specimens they are purple, with globular stigmas. A native of heaths, dry pastures, and woods, in almost every part of England. Linnæus confounded these two species, but, as Dr. Smith observes, appears to have drawn his description from the *Bulbocastanum*, the majus of old authors. They knew only one species, which must have been the flexuosum; but Magnol, his contemporary, mentions both in his index of plants growing about Montpellier, and adds that he found them to be specifically different by cultivating them in his garden. Johnson, in his edition of Gerard, distinguished them, and Dillenius was rather inclined to think them distinct; though Professor John Martyn, on whose authority he admitted the majus of the old botanists as a British plant, suspected that the difference was owing to the roots growing nearer than usual to the surface of the ground. Gouan, who cultivated them during eight years, is surprized that they have not been distinguished long since, and gives specific differences which, however, do not satisfy the present professor Thomas Martyn. But Dr. Stokes and Dr. Smith have, we apprehend, now determined the question. The tuberous roots of both species, on account of their sweetish taste, have long been a favourite esculent with boys, and when boiled or roasted are said to be little inferior to chestnuts. Ray recommends them when seasoned with pepper as a nourishing, stimulating, food; and the old empirics attributed medical virtues to them, which have long since been exploded. Gouan and Willdenow have perversely given the specific name majus to the minus of the old authors. 3. *B. aromaticum*, Linn. Mant. 218, "partial involucre of three leaves." *Root* annual, and as Bose observes, probably not tuberous. *Stem* erect, even, alternately branched. *Leaves* resembling those of *Carum Carui*, super-decompound. *Umbel* of ten or twelve rays on a long, striated peduncle. *Partial umbels* short. *Universal involucre* of about six, short, awl-shaped leaves. *Partial involucre* of about three leaves, the length of the little umbel. *Corolla* white. *Petals* equal, inflex-cordate. *Seeds* ovate, minute, yielding an aromatic odour, similar to *Marjoram*. A native of Crete and Syria.

**BUNIUM**, Sauvage, Monf. See *Sison verticillatum*.

**BUNIUS**, Dalech. J. Bauh. See *ÆTHUSA Bunius*.

**BUNIUS**, Rumph. and Burm. See *STILAGO Bunius*, now discovered to be the male of *Antidesma alexiteria*.

**BUNKER'S HILL**, in *Geography*. See *BREED'S Hill*.

**BUNKLE'S MANUSCRIPT**, in *Biblical History*, a modern MS. of the four Gospels, noted in Mill Bu, and 70 in the first part of Westein's New Testament. When this MS. was collated by Mill, it was the property of Mr. Bunkle of London; but at present it is preserved in the University library of Cambridge. Whether it was written a short time before or a short time after the invention of printing, which last is asserted by Westein, in opposition to Mill, is a matter of little importance. It is supposed to have

have been written by George of Sparta, who was sent on an embassy to England by Pope Sixtus IV. in 1476. It has not the ancient *αἰθάλαια*, but the modern chapters, which are found in our printed bibles. Michaelis's Int. to the New Testament by Marsh, vol. ii. and iii.

**BUNNASS**, in *Geography*, a river of Hindostan, which runs into the Indus; 25 miles S. E. of Oudipour.

**BUNNICK**, JOHN VAN, in *Biography*, a painter of history and portrait, was born at Utrecht in 1654, and under the instruction of Herman Sachtleven, became a considerable artist. Having for some time associated with Gerard Hoet in the exercise of his art, he determined to improve himself at Rome; and there became acquainted with Carlo Maratti, and Abraham Genoels, from whose works and conversation he derived great benefit. Intending to return home, he was detained by the duke of Modena, who engaged his service by the grant of an honourable pension, and retained him in his court for eight years. He designed well, disposed his figures with elegance and propriety, and was correct in his outline. He died in 1727.

His brother and disciple, *Jacob Van Bunnik*, became an excellent master, and distinguished himself by painting battles. His subjects were different from those of his brother, but in the manner of his handling and colouring, he resembled him entirely. He died in 1725. Pilkington.

**BUNNOO**, or **BANOU**, in *Geography*, a town of Cabul, situate between the mountains of Sindhia Baste, which lie south of Pashawur and the river Cophenes, or Cow river, or the great river of Bungush, which is formed by the waters of Ghizni and Gurdaiz, and passing by Nughz and Bunnoo, discharges itself into the Indus or Sindé, at Deinkote. N. lat. 33°. E. long. 70° 20'.

**BUNNUEL**, a town of Spain in Navarre, seated on the Ebro; 7 leagues from Tudela.

**BUNOLA**, a small town in the island of Majorca.

**BUNOWEN**, a village on the coast of Connemara, in the western part of the county of Galway, Ireland, which gives name to a bay, in which small vessels may ride in the summer time, or in moderate weather, the ground holding well, and the water from 2 to 2½ fathoms. N. lat. 53° 24'. W. long. 10° 8'.

**BUNRATTY**, a barony in the county of Clare, Ireland, which derives its name from the old castle of Bunratty, or Bonratti, which was built near the mouth of the small river Gearna, that flows into the Shannon, and was considered a fortress of great strength and importance. It was built by Thomas de Clare in 1277 for the protection of the English settlers; and was afterwards the occasional residence of the earls of Thomond. Being taken possession of by the adherents of the parliament in 1646, it was besieged by the Irish under lord Muskerry, and held out six weeks. It is about 8 miles west from Limerick. Hollinhead.

**BUNT** of a sail, in *Sea Language*, is the middle part of it, formed into a kind of bag, or pouch, that it may catch and receive the more wind.

The bunt is chiefly used in topails, the foremost leech of which is cut with a neck; for courses are for the most part cut square, or at least with a small allowance for bunt or compass, which is the middle part of the foot of such sails. They say, *the bunt holds much leeward wind*; that is, it hangs too much to leeward.

Seamen all agree, that a bellying or bunting sail carries a vessel faster to the windward than a straight or fast sail: the contrary of which is asserted by Dr. Hooke, who has a discourse to shew the preference of straight to bunting sails. Vide Hooke's Posthum. Works, p. 563, seq.

**BUNT-lines**, are small lines made fast to the bottom of the

square sails, in the middle part of the bolt-rope to a crenelle; and so are reeved through a small block, seized to the yard: their use is to trice up the bunt of the sail, for the better furling it up.

**BUNT-line-cloth**, is the lining sewed up the sail, in the direction of the bunt-line, to prevent the sails being chafed.

**BUNTINE**, a thin woollen stuff, of which the colours and signals of a ship are usually made.

**BUNTING**, in *Ornithology*, the English name of the birds of the *EMBERIZA* genus. See *EMBERIZA*.—*Bunting* is the name applied in common to *Emberiza Miliaria*.

**BUNTINGFORD**, in *Geography*, a small market-town in the county of Hertford, England. It stands on the banks of the river Rib, near the spot where the Roman road called Enning street, crossed it. Edward the third, in the 21st year of his reign, granted to this town, the privilege of a yearly market, and a fair. In the 41st year of his reign he further endowed it with a weekly market on Saturdays, and a fair in June. This town is only a chapelry to Layston, where the church is situated, but the inhabitants are accommodated with a neat and commodious chapel, which was finished in 1626. Here are a free-school, an alms-house, and other charities. The present market day is Monday; but the markets are very inconsiderable. Buntingford is 31 miles north from London, and with the remainder of the parish, contains 163 houses, and 799 inhabitants. Magna Britannia, vol. ii. 973.

**BUNTSPECHT**, in *Ornithology*; Frisch has the greater woodpecker, *picus major*, under this name.—*Kleiner Buntspecht* is the lesser spotted woodpecker, *picus minor*, in the same author.

**BUNTZLAU**, or **BUNZEL**, in Latin *Boleslavia*, in *Geography*, a town of Silesia, in a circle of the same name, and in the principality of Jauer. It is seated in a fertile country, on the Bober; and exports great quantities of its beautiful brown earthen ware. It was formerly noted for the rich mines in its vicinity, and the Silesian bards have celebrated the limpid and salubrious waters of the queck-brunn or quick-spring that lies near it. N. lat. 51° 12'. E. long. 15° 50'.

**BUNTZLAU**, *Alt*, an ancient town of Bohemia, in the circle of Boleslaw, founded by Wratislaus in 915, but reduced by the troubles of the 15th and 16th centuries to an inconsiderable place. It is seated on the Elbe, 8 miles S.S.W. of Benatek or Benatky.

**BUNTZLAU**, *Jung*, a town of Bohemia, and capital of the circle of Boleslaw, built in 973 by Boleslaw the younger, and ranked in 1600 among the royal boroughs by the emperor Rudolph. It is seated on the Iser, 28 miles N.N.E. of Prague.

**BUNYAN**, JOHN, in *Biography*, a very popular writer among persons of a particular description, sprung from an obscure origin, being the son of a tinker, and was born at Elstow near Bedford, in 1628. His parents gave him an education suitable to their condition, and taught him to read and write; but his conversation and conduct in early life were remarkably vicious and profane, though not without some checks, which indicated very strong religious impressions. In process of time these impressions, revived and cherished by the conversation of some pious women, with whom he accidentally associated, terminated in a thorough reformation, so that he became as much distinguished for his piety as he had once been for his profligacy. For several years he followed his father's occupation, and in the exercise of it travelled about the country, particularly in the neighbourhood of Bedford. He enlisted as a soldier in the parliament army, and at the siege of Leicester in 1645, his

life was singularly preserved by his consenting to give up his place as sentinel to a comrade, whose head was taken off by a musket ball. At the time of his marriage, his poverty was such, that neither he nor his wife possessed so much as a dish or a spoon; but she had, what he deemed of greater value, "the Plain Man's Path-way to Heaven," and "The Practice of Piety," which he was accustomed to read with her, and which afforded him singular satisfaction and advantage. Of the sincerity of his conversion he had exhibited such evidence, that he was admitted in 1655 a member of a Baptist congregation at Bedford; and he was so regular an attendant on meetings held for religious purposes, that, soon after the restoration, he was convicted of associating with others in unlawful assemblies and conventicles, sentenced to perpetual banishment, but afterwards committed to prison, where he supported himself and family, during a confinement of twelve years and a half, by making tagged laces, and where he employed part of his time in preaching to and praying with his fellow-prisoners. His library at this time consisted only of the Bible, and the Book of Martyrs; and yet he composed many of his works, and, particularly, his "Pilgrim's Progress," whilst he remained in prison. In the last year of his confinement, such was the estimation in which his talents and character were held, that he was unanimously chosen pastor of the congregation at Bedford. After his enlargement, for which he was indebted to the compassionate interference of Dr. Barlow, bishop of Lincoln, he travelled into several parts of England, for the purpose of visiting and confirming persons of the same profession; whence he obtained the appellation of "Bishop Bunyan." Upon the publication of king James II.'s declaration for liberty of conscience, Bunyan was enabled, by the voluntary contributions of his friends, to build a meeting-house at Bedford, where he constantly preached to very large congregations. He also frequently visited London, and preached there among the non-conformists; but in one of these visits he was seized with a fever, and died at his lodgings on Snow-hill, August the 31st, 1688, aged 60. His remains were interred in the burying ground belonging to the dissenters in Bunhill Fields. His religious sentiments were those of the most rigid Calvinists, to which he was zealously attached; his piety, though blended with some degree of enthusiasm, was sincere and uniform; and his moral conduct, after the period of his conversion, was not only irreproachable, but exemplary, though his zeal exposed both his principles and character to many unfounded reproaches and calumnies. As he never enjoyed the advantages of a liberal education, his public performances, as a preacher, and his writings, as an author, indicate very extraordinary talents. In his preaching, he spoke with considerable fluency, though not without some hesitation; and his ministerial labours were countenanced by the learned Dr. John Owen, who occasionally attended his sermons. Of his numerous works the most celebrated, both for its composition and popularity, is his "Pilgrim's Progress." This work, which has passed through more than fifty editions, and which has been translated into various languages, has been admired and applauded by some of the best judges; and there are few persons who have not read it, whatever may be their opinion of the theological system on which it is founded, and of the terrific ideas which it is adapted to excite in the minds of the young. The allegory is well conducted and sustained; the characters that are introduced are justly drawn; it abounds with lively description, and manifests the exuberance of invention. Lord Kaimes, speaking in his "Sketches of the History of Man," (vol. i.) of this work, and "Robinson Crusoe," the great favourites

of the vulgar, says, that "they are composed in a style enlivened, like that of Homer, by a proper mixture of the dramatic and narrative:" and Bunyan's genius, displayed in this performance, has been, perhaps, extravagantly extolled by other writers, among whom we may reckon Mr. Granger, Mr. Merrick, and Dr. Roberts, to whose sentiments great deference is due. Many of Mr. Bunyan's other works are of the allegorical or parabolical kind; and though not equally popular with the "Pilgrim's Progress," are much read by a certain class of persons. The most considerable of these is the "Holy War, made by Shaddai upon Diabolus." One of the most interesting of his works is "Grace abounding to the chief of Sinners," containing an account of his own life. All his works were collected together in 2 vols. folio, London, 1736, 1737: and a new edition, more complete than any of the preceding, with copper-plates, and a recommendatory preface, by Mr. George Whitfield, was published in 2 vols. folio, in 1767. Biog. Brit.

BUOMMATTEI, BENEDICT, an early Italian grammarian, was born at Florence in 1581, and having entered into the priesthood, discharged the duties of his function, and pursued literary studies at Rome and Padua, and chiefly in his native city. He was a member of several academies, and particularly of those of Della Crusca and the Apatisti, where he recited lectures and discourses, many of which have been published. But he is principally known by his two books "On the Tuscan Language," being the first work that deserves the title of a grammar of the Italian language, and still popular and highly esteemed. Buommattci died at Florence in 1647. Tiraboschi. Gen. Biog.

BUON, in *Geography*, a town of the kingdom of Naples, and Principato Ultra; 7 miles E.N.E. of Benevento.

BUONACCORDO, a small stringed musical instrument, resembling a spinet, used by children to learn to play on, because of the shortness of their fingers.

The word is Italian, and properly denotes a harpsichord.

BUONACCORSI, PHILIP, in *Biography*, an elegant modern Latin writer, was born of a noble family at S. Gigmignano, in Tuscany, in 1437, and residing at Rome in his youth, he was one of the founders of the Roman academy, according to the custom of which he assumed the name of "Callimaco," adding to it "Esperiente," in allusion to the vicissitudes of his life. Being suspected by pope Paul II. of a concern in a conspiracy against his life, he was under a necessity of securing himself by flight; and having wandered through Greece, Egypt, Cyprus, Rhodes, and other islands in the Archipelago, Thrace, and Macedonia, he at length took refuge in Poland; where he was introduced to king Casimir, who made him tutor to his son Albert, and his own secretary. He also employed him in several embassies. After the death of Casimir, he was entrusted by Albert, his successor, with the conduct of all the affairs of his court and kingdom; and though these marks of distinction excited the envy of Albert's courtiers, and many attempts were made to ruin him, he retained his sovereign's favour till his death, which happened at Cracow, in 1496. Callimaco, for such was the name by which he is distinguished as a writer, wrote in 3 books the life of Ladislaus, brother and predecessor of Casimir, with an account of the battle of Varna, in which he was killed. He also composed a life of Attila, and a small treatise on the attempts of the Venetians to excite the Tartars and Persians against the Turks. These pieces, with some orations and letters, have been published together, and passed through several editions. The style in which they are written is elegant and forcible; and in the opinion of Paul

G'ovio, no historian since Tacitus has equalled Buonaccorsi. Many unpublished works are preserved in the Vatican, and other libraries. Tiraboschi. Gen. Biog.

BUONACCORSI. See PIERINO DEL VAGA.

BUONAMICI, CASTRUCCIO, was born at Lucca in 1710, and having entered into the ecclesiastical state, sought advancement at Rome; but being disappointed in his views, he assumed a military character, and engaged in the service of the king of the two Sicilies. He still, however, indulged his taste for the pursuits of literature. His principal works are a relation in Latin of the war of Velletri in 1745, between the Austrians and Neapolitans, printed in 1746, under the title of "De Rebus ad Velitras gestis Commentarius," 4to.; for which work he was recompensed with a pension by the king of Naples, and the rank of commissary-general of Artillery; and "De Bello Italico Commentarii," 4to. in 3 books, 1750, 1751; containing the history of the war in Italy, for which he was honoured by the duke of Parma with the title of count. These histories, equally admired for accuracy of detail, and purity of Latin, have been several times re-printed. The author's treatise "De Scientia Militari," remains unpublished. He died at Lucca, in 1761. Nouv. Dict. Hist.

BUONAMICI, LAZZARO, was born at Bassano in 1479, and educated in the university of Padua, where he gained such reputation, that Pomponazzi, his tutor in philosophy, sometimes applied to him for the explanation of a passage in Aristotle. From Bologna, where he was employed in the instruction of the young persons of the Campeggi family, he removed to Rome, and became professor of the belles lettres in the college of Sapienza. In 1527, when the city was sacked, he lost his library, writings, and all his effects, and with difficulty saved his life. At Padua he occupied the chair of Greek and Latin eloquence, to which he was invited in 1530, and in this situation, where he was highly respected, and where he had a great concourse of students, he remained, notwithstanding several applications made for removing him by universities and sovereign princes, till his death, which happened in 1552. He was borne to his grave on the shoulders of his students. His writings, consisting of letters, prefaces, and Latin poems, are few, but they are sufficient to establish his character as an elegant writer. Notwithstanding his professional reputation, he dissipated much of his time in the intercourses of society and in play, to which he was so much addicted, that he sometimes devoted whole nights to it. His dread of criticism might also prevent his appearing before the public as an author. A collection of his poems was printed for the first time at Venice in 1572. Tiraboschi. Gen. Biog.

BUONAMICO, of CRISTOFANO, called BUFFALMACCO, was a Florentine painter, born in the year 1262, and a pupil of Andrea Tafi. He was an artist of great merit, and by Boccaccio celebrated for his wit and humour (vide Il Decamerone); and Franco Sacchetti in his "Tre Cento Novelle," relates a story of him when he was a boy, which shews the early bias of his mind; and as it portrays the character of the man, it may not be without its interest. Andrea Tafi was a painter of great industry, and used to rise before it was light to pursue his avocation, considering the gain more than the honour of his profession. Early rising, unfortunately, had no charms for his scholar, and therefore he devised a scheme to make him lie in bed till daylight. At the hour Tafi was about to rise, having previously provided himself with thirty black beetles, and on their backs fastened small pieces of wax taper, he lit them up, and sent them one by one, through a hole in the door, into his master's bed room; making a procession of moving light mysteriously unintelli-

gible; which so alarmed the old man, that he prayed and recommended his soul to mercy, and hid his face under the bed clothes. In the morning he told Buonamico he had seen ten thousand devils, and that his thoughts were so disturbed he could not rise to pursue his profession. On the succeeding night, Buonamico diminished the number of the beetles; but the repetition produced the same effect, and so frightened his master, that he determined to remove, being persuaded the house was haunted by evil spirits. Buonamico then sent to the parish priest that he might administer comfort. The priest came and soothed his mind; and Buonamico availed himself of the opportunity to make his observations on the probable cause of this perplexing event. He observed that he had always heard devils were great enemies to God; and consequently they must be so to all painters, as their practice was to paint saints and angels as perfect as possible, and endeavour to improve mankind, by shewing through all the circumstances of human life the happiness of heaven and the torments of hell; besides, whenever fiends were represented, they were made as hideous as the painters' imagination could suggest: and as it was well known that devils had more power by night than by day, they played him this trick to keep him in bed, that he might not interfere with their region of darkness: by such observations, which the priest thought very plausible, the old man was persuaded that it would be proper to lie in bed till daylight. After a few months, however, as the devils grew fainter in his recollection, Tafi's industry returned; but as they had played their part so well, Buonamico recurred to his former expedient, which produced an effect not less frightful and impressive. Priests were again sent for to restore him to tranquillity, who agreeing with Buonamico in the probable cause of this strange appearance, he determined to paint no more by candle-light; and this story was so generally circulated and believed, that all the painters in Florence were afterwards afraid to paint at night.

Among the first works of Buffalmacco, were a series of religious pictures representing the life of Christ, painted in a church at Faenza, and other subjects from the Old and New Testament; among which the massacre of the Innocents is particularly mentioned by Vasari, where despair and terror, agony and distress were forcibly expressed. Of this work nothing now remains, except the original drawings be in existence, which the same author describes to have been preserved in his time. He also painted in the cloisters of the abbey of Septimus, several historical subjects relating to St. James, to whom the church was dedicated; and on the ceiling he painted the four evangelists. He painted also many historical pictures on the outside of this building, which were well composed, and executed with skill. In these pictures he employed salt in the purple used for the shade tint of the flesh, which so corroded and destroyed all the other colours, that, in Vasari's time, nothing remained but the purple; which premature decay this author at first attributed to dampness, but, upon minute inspection, found it was owing to the salt that was employed.

For the monastery of the Carthusians at Florence he painted upon panel two pictures in distemper; and for the church of San Giovanni several, which were destroyed when the walls were beaten down in the war of 1529. He executed other works at Cortona and Peruggia, Arese and Arezzo, and painted several pictures in the church of St. Petronio in Bologna.

In the cathedral of Sienna is a Mosaic pavement, made from his drawings; which at this day is a specimen of his abilities in design and composition, very honourable to his reputation. Some of his latest works were executed at Pisa,

for the abbey church of St. Paul, taken from the Old and New Testament; and in one of these, representing Noah's ark, he introduced his own portrait, which is the only portrait known of him, and is the same Vasari introduced into the second edition of his "Lives of the Painters."

Buffalmacco enjoyed considerable reputation, nor was the age wanting in affording him opportunity to exert his talents; yet, from the following anecdote, he appears occasionally to have worked at a very low price. Vasari has recorded, that he painted a whole length figure of St. Christopher, 12 braccia in height, nearly 23 feet, for 8 florins; and this fact is preserved for the sake of a whimsical circumstance that attended the execution of it. The picture was ordered by a countryman, and was to occupy a wall in a church at Florence; when Buffalmacco went to paint, he found the wall only 9 braccia in height; that his employer, therefore, might have his measure, he painted St. Christopher lying upon his back; but unfortunately even in this position, the wall did not admit of his whole length; he then turned up the legs perpendicular to the body, which was so exceedingly ridiculous, that when the countryman came to see his faint, he flew into a violent passion, and demanded his money, declaring that he was both cheated and insulted, but the painter insisted that he had executed the commission with the strictest fidelity, and therefore could neither agree with him, nor comply with his request: upon which the countryman brought an action against him, and in the result was not more successful.

This propensity to make merry with life, made Buffalmacco regardless of the means by which its decline is supported; and at the advanced age of 78 years he died in extreme poverty and distress, supported in his last illness by the charity of an hospital, and buried by the company of the Misericordia. Vasari has written his life in 13 quarto pages, containing little more than general commendation and whimsical anecdotes connected with the exercise of his profession.

BUONAROTI. See ANGELO.

BUON-CONVENTO, in *Geography*. See BONCONVENTO.

BUONHABITACULO, a town of Naples; 8 miles N. of Policastro.

BUONTALENTI, BERNARDO, called GIRANDOLE, in *Biography*, a painter of history and portrait in miniature, acquired correctness of design, and the knowledge of colouring, from Salvati, Bronzino, and Vasari, and the art of miniature-painting from Julio Clovio. His works were much admired for the beauty of the colouring, and for a certain dignity of expression in his Madonnas, as well as in his portraits. Besides his merit as a painter, he was much approved as a statuary and an architect. He was born at Florence in 1547, and died in 1608. Pilkington.

BUONVICINO, in *Geography*, a town of Naples, in the province of Calabria Citra; 11 miles S. E. of Scalea.

BUOY, a small island on the east coast of Newfoundland, between Ferryland head and harbour. See BROYLE.

BUOY, in *Sea Language*, a body floating in water, to shew either the situation of a ship's anchor, or a danger, as sands, shoals, &c. that it may be avoided. Buoys are of various forms, and constructed of buoyant materials, as wood, cork, &c. The names of the principal kinds of buoys are *can*, *cast*, or *cable*, *nun*, and *wooden* buoys.

A *can-buoy* is made in form of a cone. This kind is particularly employed in pointing out the extremities or sides of any dangerous bank, sand, &c. A buoy for this purpose is, therefore, large, that it may be seen at some considerable distance, and is fastened to an anchor, sunk in a proper situa-

tion, to point out the danger. When there are several buoys on the same sand or shoal, they are generally painted of different colours, to prevent mistake, as black, white and red; this last colour is that which is best perceived, for a white buoy is not easily observed in broken water, and in many cases a black painted buoy is very indistinct. In going through a narrow channel, in place of having buoys on one side only, there are sometimes buoys on one side and beacons on the other; but as these last are more easily broke down by the violence of the waves, buoys may, therefore, be placed on each side; and to prevent mistake, those on the one side should be *can-buoys*, and *cast-buoys* on the other side. For this purpose it has been proposed, in going in to all ports, to have *can-buoys* on the starboard hand, and *cast-buoys* placed on the larboard hand; which varieties, experience has shewn, may be perceived at a considerable distance. For the *can-buoy*, in consequence of its broad heavy end, swims chiefly on its side; while the *cast-buoy*, being much narrower and lighter at its upper end, swims more upright, and higher out of the water.

*Cast-buoys* are any common casks used for buoys. When casks are employed to float, or buoy up the cable in different places to prevent it from being injured by rocks, &c. at the bottom, they are called *cable-buoys*.

*Nun-buoys* are in form of the middle frustum of two cones, abutting upon a common base, being casks, which are large in the middle, and tapering greatly towards each end.

*Wooden-buoys* are solid pieces of timber, being in form either of a cylinder, or *nun-buoy*. They are furnished with one or two holes, in which to fix a short piece of rope, whose two ends being spliced together, make a sort of circle or ring called a *strop*. These several buoys are represented in the *Plates of ships*.

*Buoy rope*, the rope that connects the buoy with the anchor. The length of this rope should be very little more than equal to the depth of the water where the anchor is to lie, that the buoy may thereby float, as nearly as possible, immediately above the anchor, and consequently point out its situation. The buoy rope is useful in weighing the anchor, either by means of a boat, or when the cable is broke or run out; and, therefore, it should always be of a sufficient strength for this purpose, otherwise the anchor may be lost. See *Plate of ships*.

*Buoy*, *Slings of the*, the ropes which are fastened about it, and by which it is hung. They are curiously spliced round the buoy, somewhat resembling the braces of a drum.

*Buoy*, *to stream the*, is to let it fall from the ship's side into the water. This is always done before the anchor is let go, that it may not be retarded by the buoy rope, in its descent to the bottom.

*Buoy of the Nose*, is situated about N. E. from Sheerness fort, on the N. W. point of the isle of Sheppey, the east entrance into Chathan river, or the Medway; and it is at the extreme point of a sand, which runs E. N. E. from the island of Grain, or west entrance of the Medway.

BUOYANT, denotes a thing floating, or apt to float.

BUPALUS, in *Biography*, a celebrated sculptor, descended from a line of ancestors of the same profession, was a native of Chios, and flourished in the 6th olympiad, or 540 years B. C. His brother *Athenis* was also of the same profession. They worked only in the white marble of the isle of Paros, and executed several statues at Rome. They were contemporaries with *Hipponax*, a poet of a deformed and contemptible figure, whom, for their diversion,

they represented under a ridiculous form. The poet revenge! himself by writing against them a sharp satire, which, as some say, caused them to hang themselves. But Pliny says, on the contrary, that after Hipponax had taken his revenge, they made several very fine statues, and particularly one of Diana at Cnidos, which was placed at a great height, and exhibited a frowning countenance to those who entered, and a pleasant one to those that departed. Pausanias l. iv. c. 3. p. 355. and l. 9. c. 35. p. 781. ed. Valartii) mentions Buphus as a good architect as well as sculptor.

**BUPHERIA**, in *Entomology*, a species of *PIMELIA* of the weevil kind; black, and glabrous; thorax lunated; jaws strong, toothed, and as long as the head. *Gmel.*

**Obf.** This is described by Forster under the name of *TESEBRIO BUPHERIUS*. It inhabits Spain.

**BUPHARI**, in *Botany*, Rheed. Mal. See *HIBISCUS pepulus*.

**BUPHAGA**, in *Ornithology*, a genus in the order *PICÆ*, of which only a single species has been hitherto discovered; and which, being a native of Africa, has received the name of *Africana*. The generic definition consists in having the bill straight, and somewhat quadrangular; mandibles gibbous, entire, and more gibbous on the outside. Legs formed for walking.

Linnaeus and Brisson have given this bird the name of *Buphaga*, and Buffon that of *Pic-bœuf*, from whence the epithet of beef-eater is derived. French authors of the present day write it *Picque Bœuf*. All these names refer to a peculiarity of the African *Buphaga*, which sometimes alights upon the backs of the cattle, and picks holes in them, in order to get at the larvæ of the *œstri*, or gad-flies, deposited by those tormenting creatures in the flesh, directly below the skin.

The species *Africana* is between eight and nine inches in length. The prevailing colour of the plumage above is brown; beneath, and also the rump, yellowish. Bill scarcely an inch in length. Tail cuneated, and consisting of pointed feathers. Legs and claws black.

**BUPHAGIUM**, in *Ancient Geography*, a town of Arcadia, situate in the western part of it, south of *Telphusa*. It derived its name from that of the hero *Buphagus*, the son of *Japetus* and *Thornax*, who was slain on the mountain *Pholoe*, for daring to offer insult to *Diana*. Pausanias, l. viii. c. 27. p. 658. Ed. Kuhnii.

**BUPHAGUS**, a river of Arcadia, which took its rise near *Buphagium*, and discharged itself in the river *Alpheus*. Pausanias.

**BUPHONIA**, from *βους*, ox, and *φονη*, slaughter, in *Antiquity*, an Athenian feast or ceremony, denominated from a bullock slain therein with quaint formalities.

The *buphonia* was properly a part or appendage of the ceremony of *DIIPOLIA*.

For the origin of the *buphonia* we are told it was forbidden by the laws of Attica to kill an ox: but it once happened, at the feast of the *diipolia*, that an ox eat the corn, others say the cakes, which had been dressed for the sacrifice. *Thaulon* the priest, enraged at this, presently killed him, and fled for it. On which the Athenians, fearing the resentment of the gods, and feigning themselves ignorant who had committed the fact, brought the bloody axe before the judges, where it was solemnly arraigned, tried, found guilty, and condemned. And, in memory of this event, a feast was instituted under the denomination of *buphonia*. In which it was still customary for the priest to fly, and judgment to be given about the slaughter of the ox.

**BUPHTHALMUM**, in *Botany*, (from *βους*, bull, and *φθαλμος*, eye) Linn. gen. 977. Schreb. 1321. Juss. 186.

*Cart.* 1006. Vent. vol. ii. 521. (*Asteriscus* and *Asteroides*, Tournef.) La Marck *Illust.* Pl. 682. Class and order, *Syngenesia polygamia superflua*. Nat. Ord. *Compositæ* Linn. *Corymbifera* Juss.

Gen. char. *Cal.* common, imbricated with a double or triple series of scales, in some species all equal and shorter than the ray of the flower; in others, the outer series longer and exceeding the ray. *Cor.* compound, radiate; florets of the disc numerous, funnel-shaped, with a five-parted rather spreading border; of the ray more than ten, ligulate, spreading, three-toothed. *Stam.* filaments five, capillary, very short; anthers cylindrical, united into a tube. *Pist.* of the disc. Germ ovate, compressed; style thread-shaped, the length of the stamens; stigma, thickish, either simple or bifid. Of the ray, germ uncipital; style thread-shaped; stigmas two, oblong. *Peric.* common, the calyx unchanged. *Seeds* of the disc oblong; of the ray compressed, with sharp edges; both crowned either with a toothed, or gashed, and almost leafy margin. *Receptacle* chaffy, convex.

Ess. char. *Receptacle* chaffy. *Seeds* crowned with a toothed or gashed margin; with sharp edges, particularly in the ray.

Species 1. *B. frutescens* Linn. "Leaves opposite, lanceolate; petioles two-toothed; stem shrubby." A small shrub about four feet high. *Stem* straight, jointed. *Bark* greyish. *Branches* bushy. *Leaves* opposite, oblong, broader towards their summit, narrowed into a petiole towards their base, connate like those of *Lychnis*, glaucous; covered with a very close, short down, and marked with three longitudinal nerves. *Flowers* yellow, terminal, solitary, peduncled. *Calyx-scales* oval, a little tomentous. *Semiflorets* rather broad, short, and toothed. *Chaff* terminated by a sharp point. La Marck, from a living plant. A native of the West-Indies and Virginia. Cultivated in the royal garden at Hampton Court in 1699. 2. *B. Peruvianum*. La Marck *Encyc.* "Leaves linear-lanceolate, silky, obscurely toothed about the middle; stem shrubby." Similar to the preceding but smaller, and of a more silvery appearance. *Leaves* narrower, and without teeth at their base. *Flowers* yellow, terminal, solitary. *Calyx-scales* ovate; semiflorets scarcely extending beyond the calyx. La Marck, from a living plant. Found by Dombey in Peru. 3. *B. arborescens*. Dill. *Elt. Tab.* 38. fig. 43. Plum. *sp. tab.* 106. f. 2. "Leaves opposite, lanceolate, without teeth, thick, green." La Marck. An ever-green shrub. *Stems* two or three feet high. *Leaves* opposite, connate, lanceolate, narrowed at their base, very entire, entirely green and glossy. *Flowers* yellow, terminal, solitary; semiflorets short; calyx-scales, large and smooth. La Marck, from a living plant. 4. *B. repens* Linn. Hort. Clif. 44 (*Verbena mutica* spec. plant. ? but not *Chrysanthemum humile* of Plumier) "Leaves opposite, sessile, three-lobed; stem creeping." *Stem* jointed, producing at its joints small fibrous roots, and straight, leafy, flower-bearing branches. *Leaves* opposite, sessile, broad toward their summit, irregularly toothed, with three sharp-pointed lobes. *Flowers* yellow, solitary, terminal. La Marck. Native of South America. 5. *B. durum* Linn. "Leaves alternate, lanceolate, very entire; stem somewhat shrubby." *Root* perennial. *Stem* a little woody, branched near the top. *Leaves* alternate, oblong, entire, narrowed at their base, a little broader towards the summit, and terminated by a short point. *Flowers* terminal, solitary. *Calyx-leaves* rather large. La Marck. A native of the Cape of Good Hope. 6. *B. sericeum*. Linn. Jun. Sup. "Leaves opposite, crowded, spatulate oblong, silky; calyx-scales brittle-shaped, shaggy; stem woody." *Branches* thick, woody, covered with the marks of former leaves.

*Leaves*

*Leaves* on the smaller branches, very entire, clothed with a white, close, and very soft pile. *Flowers* terminal, large, yellow. *Lower calyx-scales* longer, linear. Linn. Jun. Gathered by Masson in the island of Teneriffe. 7. *B. speciosissimum* Linn. Mant. "Leaves alternate, embracing the stem, ovate, naked, serrated, somewhat ciliate; stem one-flowered." *Root* perennial, spindle-shaped. *Stem* too feet high, smooth, and even, marked with very fine white lines. *Leaves* alternate, acute, somewhat heart-shaped, compact, reticulated with veins; petioles dilated at the base, somewhat membranaceous. *Calyx* common imbricated with obtuse, ovate, large leaflets. *Florets* of the ray folded, two or three-toothed, yellow; of the disc four-parted, erect, pedicelled. *Stamens* of the disc four, brown, without a germ. *Germ* of the ray ovate. *Seed* of the disc none; of the ray ovate, membranaceous. *Receptacle* hemispherical. Zoega, quoted by Linnæus. Linnæus places this species under *Bupththalmum*, but doubts whether it is not rather a *Silphium*. From Zoega's description it clearly belongs to the order polygamia necessaria. A native of the mountains about Brixen in the Tirol. 8. *B. grandiflorum*. Linn. La Marck. Illust. Pl. 682. fig. 1. "Leaves alternate, lanceolate, somewhat toothed, smooth; calyxes naked, stem herbaceous." *Root* perennial. *Stems* numerous, growing in tufts, generally simple, about a foot and a half high. *Leaves* alternate, linear-lanceolate, sharp-pointed, smooth, slightly toothed. *Flowers* yellow, large, about two inches in diameter, terminal. *Calyx* rather short; composed of two rows of narrow-pointed leaflets. La Marck, from a living plant. 9. *B. falicifolium* Linn. (Gært. Tab. 169. f. 1. copied by La Marck Ill. Pl. 682.) "Leaves alternate, lanceolate, somewhat serrated, pubescent, calyxes naked: stem herbaceous." *Root* perennial. *Stem* a foot and a half high, straight, cylindrical, pubescent, reddish, divided at its summit into two or three short branches. *Leaves* embracing the stem. *Flowers* large, yellow, terminal, solitary, semiflorets very narrow. La Marck, from a dried specimen. *Receptacle* slightly convex; chaff the length of the calyx, broader upwards, keeled, toothed, the keel extended into a short, flexible arm. *Seeds of the disc* smaller, oblong, narrow, three or four-cornered, a little compressed, straight; *of the ray*, larger, incurved, three-sided, drawn out at the sides into a kind of wing: in both, truncate at the top, and crowned with a toothed rim. The rim of the seeds of the disc is sometimes so deeply gashed, as to appear composed of several chaffy bristle-shaped leaflets. Gært. A native of the South of France, Austria, Switzerland, Lusatia, allied to the preceding, to which Gouan joins it, but differs in being abundantly pubescent, and having narrower semiflorets. 10. *B. helianthoides* Linn. (G. Heretier. stirp. nov. Tab. 45. *Helianthus levis*. Linn. spec. 1278. *Silphium Solidaginoides*. Linn. spec. 1302. *Rudbeckia oppositifolia*. Linn. spec. 1280.) "Leaves opposite, ovate, serrated, triply-nerved; calyxes leafy; stem herbaceous." *Root* perennial, whitish, branched, fragrant. *Stems* several, two yards high, upright, branched at the top, naked at the base, round, the thickness of a quill, of a sea-green colour: branches opposite, stiff like the stem. *Leaves* remote, acuminate, serrated about the middle, decurrent, veined, and wrinkled, flat, reclining, four inches long, two and a half broad. *Petioles* spreading, embracing the stem with a kind of ring, round on one side, channelled on the other, edged at the top by the leaf running along them. *Flowers* terminating, yellow, from two to three inches broad; peduncles commonly three, accompanying the uppermost leaves, stiff, very long, one-flowered, obscurely angular, thickened at the top, fistulous, sometimes with one or two linear sharp bristles. *Common calyx* concave, spreading, pubescent; scales

lanceolate, acute, a little serrated; those of the inner row spreading, and reflexed at the tip; those of the outer row few, twice the length of the other, and a little hanging down. *Florets* in the disc numerous, with a sharp, revolute border; in the ray about twelve, lanceolate, retuse, two-furrowed above, two-nerved beneath, spreading very wide, twice or three times the length of the calyx. *Germ* in the disc oblong, four-cornered and truncate; in the ray three-cornered. *Seeds* without any pappus or down, except the rim, which is scarcely thickened. *Receptacle* conical; chaff membranaceous, linear, acute, channelled-concave. This plant has the generic character of *bupththalmum*, the calyx of *silphium* or *rudbeckia*, and the habit of *helianthus*. Hence it has inadvertently been given by Linnæus under four different names. L'Heretier. A native of North America, whence it was sent by Catesby to the botanic garden at Chelsea, but is said by Forster to be found wild every where within the tropics. La Marck describes a plant under the same specific name, brought from South America, cultivated in the royal garden at Paris, which does not correspond with the above description, and with some doubt whether it be that intended by Linnæus. Its stems are herbaceous, feeble, not much more than a foot high, growing in loose tufts. Its leaves petioled, generally opposite, ovate, a little pointed, obtusely dentate, green, almost smooth, and scarcely an inch broad. *Flowers* yellow, rather small, solitary, peduncled and terminal. *Calyx* of two rows of oblong scales, those in one row not longer than those in the other. The juice of the plant is a little caustic. 11. *B. spinosum*, Linn. (La Marck, Pl. 682. fig. 2.) "Calyxes acutely-leaved; leaves alternate, lanceolate, embracing the stem, very entire; stem herbaceous." *Root* annual. *Stem* a foot and half high, stiff, hairy, with two or three alternate branches at the top. *Root-leaves* long, spreading, broader and almost obtuse at their summit, narrowed at their base. *Stem-leaves* lanceolate, hairy. *External calyx-leaves* very long, three-nerved, ending in a spine, spread open immediately under the flower like the points of a star. *Flowers* yellow, solitary, terminal; semiflorets very narrow. La Marck, from a living plant. A native of Languedoc, Spain, and Italy. 12. *B. aquaticum*, Linn. (Gært. Tab. 169. copied in La Marck, Illust. Pl. 682. fig. 4.) "Calyxes obtusely-leaved, sessile, axillary; leaves alternate, oblong, obtuse; stem herbaceous." *Root* annual, white, fibrous. *Stem* about a foot high, much branched, cylindrical, pubescent. *Leaves* alternate, sessile, oblong, obtuse, hairy. *Flowers* yellow, rather small; some sessile and axillary, others terminating; semi-florets broader and shorter than those of the preceding species. *Outer calyx leaves* obtuse, soft, forming a kind of involucre to the flower. La Marck, from a living plant. *Calyx* leafy at the base. *Seeds* compressed, bay-coloured, hispid, with whitish bristles, nearly uniform; those of the disc smaller, ovate, acuminate downwards; those of the ray larger, triangular-wedge-shaped, much compressed at the sides, and almost winged; both of them crowned with a many-leaved pappus, the leaflets of which are membranaceous, acuminate, ciliate-toothed, half the length of the seed. Gært. A native of the south of France, Portugal, and the Isle of Candia. 13. *B. maritimum*, Linn. (La Marck, Pl. 682. fig. 5.) "Calyxes obtusely leafy, peduncled; leaves alternate, spatula-shaped; stem herbaceous." *Root* perennial. *Stems* numerous, six or seven inches high, hairy, branched. *Leaves* long, obtuse, very narrow at their base, hairy. *Flowers* yellow, rather large, solitary, terminal. *External calyx leaves* resembling those of the stem. Native of Sicily and the southern parts of France. La Marck. 14. *B. oleraceum*, Martyn's Miller. "Calyx leaflets acute, connected laterally; leaves opposite, lanceolate,

late, curved back." *Stem* herbaceous, two feet high, upright, round, whitish, smooth. *Leaves* linear-lanceolate, unequally toothed, smooth, juicy, thick, ash-coloured. *Flowers* large, solitary. *Calyx* hemispherical, with sharp leaflets, connected by a lateral membrane. *Disk* of the *corolla* flat, with yellow florets; ray wide, spreading, with many white, trifid florets. *Receptacle* flatish, with very small chaff; crown of the seeds margined. *Stigma* in the florets of the disk simple. *Lour.* Coch. It is an odorous plant, and cultivated in the gardens of China as a pot-herb. Forster in *Flor. austral.* names two other species; *B. uniflorum*, found in Norfolk Island; and *B. procumbens*, found in the Friendly Islands. *Obs.* Just. doubts whether the frutescent species, with opposite leaves, should be placed in the same genus with those that are herbaceous and have alternate leaves. And Gærtner is of opinion, that if the seed in all the *Asterif. i.* of Tournefort, be not merely margined, but leafy, they ought to form a separate genus.

*Propagation and Culture.* The first two species can be propagated in this country, only by cuttings, which should be taken off in July when the plants have for some time been exposed to the open air; planted in small pots filled with light loamy earth, and plunged into a hot-bed of a very gentle warmth; shaded from the heat of the sun, and occasionally refreshed with a small quantity of water. In about six weeks they may be gradually enured to the open air, and soon after should be transplanted into fresh pots; when they have taken root, they may remain in a sheltered situation, till the middle of October, and should then be removed into the green-house. The first sort is hardier than the other. The seeds of *spinosum* and *aquaticum* may be sown on open borders, either in the beginning of April or, which is better, in Autumn, and will require no other care. The *maritimum* is easily propagated by slips during the summer season, and requires the same treatment as the first and second, but will thrive better in a common frame, screened from frost, than in a green-house. The *salicifolium*, *grandiflorum*, and *helianthoides*, may be propagated by parting the roots towards the end of October.

BUPHTHALMUM *canariense leucanthemum*, Pluk. See CHRYSANTHEMUM *frutescens*.

BUPHTHALMUM *lanuginosum*, C. Bauh. See ANACYLUS *valentinus*.

BUPHTHALMUM *cotula folio*, and *flore luteo*, 2. 3. C. Bauh.; *tenusifolium*, J. Bauh.; *creticum*, Breyn.; *alterum pennis*, Dalch.; *flore purpurascens*, Cam.; and *narbonense*, C. Bauh. See ANTHEMIS *valentina*.

BUPHTHALMUM, Linn. Hort. Clif. 414. Flor. Suec. 698. *alpinum triumf.* See ANTHEMIS *tinctoria*.

BUPHTHALMUM, Linn. Hort. Clif. 415. See AMELLUS *lychnitis*.

BUPHTHALMUM, Linn. Sp. Pl. Ed. 2. See OEDERA *prolifera*.

BUPHTHALMUM *hirsutum*, Brown Lam. 321. See SILPHIUM *trilobatum*.

BUPLEURARIA, in *Entomology*, a species of PHALLINA (Geometra). The wings are dentated, green, with a white streak, and a smaller one of the same colour; margin dotted with brown. Fabr.

This inhabits Europe. Knoch describes it under the name of *Pholena sesquialtrata*.

BUPLEURIFOLIA, in *Botany*, Pluk. See CORYMBIUM *scabrum*.

BUPLEURIOIDES, Walth. See PHYLLIS *nobla*.

BUPLEURUM, (from βουρ and πλεωρον, bovis coila, the rib or side of an ox, alluding, as explained by professor Martyn, to a supposed ill quality of burking kine that feed

upon it: but this explanation is better suited to the etymology of βουρρεσις, from βουρ and πρηω, to inflame, a name given by the Greeks, not only to an insect of the cantharis kind, but also to a plant noxious to cattle, which has been supposed to be the same with the bupleurum of Nicander, Pliny, and other ancient writers. Ventenat, with greater probability, is of opinion, that the name bupleurum alludes to the stiffness, (roider) of the leaves of several species of this genus. The same derivation was intimated long ago by Dodonæus, who, speaking of the probable identity of the plant, now called bupleurum, with the ancient one, says, "nec pessime quadrare nomenclaturæ et effigaturæ videtur: foliis namque longis—multis striis livide rigidis, quali costis in foliis singulis effigiantibus, et laterum modo inclusis, ut de heptapleuro loquitur Plinius." Linn. gen. 328. Schr. 460. Gært. 114. Juss. 224. Willd. 523.

Gen. Ch. *Cal.* Umbel universal, with fewer than ten rays; partial with scarcely ten, erect-expanding. *Involucre* universal, either of many leaves, or of from three to five, or none; partial of several broad leaves, either distinct, or all united at the bottom; *perianth* proper, obsolete. *Cor.* universal, uniform; florets all fertile, proper, petals five, involute, entire, very short. *Stam.* five, simple, anthers roundish. *Pist.* Germ inferior. *Styles* two, reflexed, small; *stigmas* very small. *Peric.* none. *Fruit* roundish, compressed, splitting in two. *Seeds* two, ovate-oblong, convex on one side, flat on the other. *Obs.* In most of the species, the partial involucre are specious, often longer than the corolla.

Essen. Char. *Leaves* of the partial involucre broad, spreading. *Fruit* ovate, gibbous, small, not crowned at the top.

Spec. \* *Herbaceous.* 1. *B. rotundifolium*, Linn. Hudf. 111. With. 267. Smith 124. (Perfoliata C. Bauh. &c.) Gært. Tab. 22. f. 7. La Marck, Illust. Pl. 189. Eng. Bot. 99. Thorough-wax. "Universal involucre none; leaves perfoliate." Linn. *Root* annual, small and fibrous; whole plant rigid and smooth. *Stem* erect, alternately branched, round, leafy, perfoliate. *Leaves* alternate, ovate, acute, very entire, somewhat glaucous, nerved. *Umbels* axillary and terminal, solitary, on long peduncles, six or seven-rayed, entirely destitute of an universal involucre; little umbels of about eight flowers; partial involucre of five, ovate, acute, unequal leaves, longer than the flower. *Flowers* yellow, on short peduncles. Dr. Smith, and La Marck. *Fruit* small, ovate, striated, gibbous, black. *Seeds* ovate-oblong, gibbous, terminated at the top by a very narrow, reddish-brown disc; marked on the convex side with thirteen elevated, linear striæ or streaks; on the flat side with a simple furrow. Gært. It derives its English name from its perfoliate leaves, or as professor Martyn accurately expresses it, from the singular circumstance of the stalk *twisting* or growing *through* the leaf, by which it may be distinguished from all our other indigenous plants. Like the fanicle, it has the reputation of being a vulnerary; but this, says Dr. Smith, (Eng. Bot.) is a quality which no medicine can have, any otherwise than as a tonic, strengthening the constitution; nor can any external application be specifically healing or consolidating, or be useful in any other way than as a defence from the air. La Marck speaks of it as an astringent, and says that it is used as a cataplasm in umbilical ruptures: but in this case, its operation can be only mechanical. A native of most parts of Europe, chiefly on a calcareous soil, but not very common in England. Martyn intimates, that it is peculiar to the southern counties, and says, that he has never observed it, except among wheat. We have occasionally found it in the neighbourhood of Leeds, but always among beans. 2. *B. bellatum*, Linn.

Linn. (Tourn. 310. Ital. Helv. 77. Tab. 18.) "Leaves of the partial involucre united; universal involucre of three leaves." *Root* perennial. *Stem* about a foot high, round, almost naked, often simple. *Root-leaves* very long, smooth and grass-like. *Universal umbel* loose, of five or six rays. *Universal involucre* of one, two, or three lanceolate leaves. *Partial involucre* of one leaf, slightly cut at the edge into eight or nine segments, surrounding the flowers in the form of a cup, or basin. La Marck and Martyn. A native of the Alps of Switzerland, and Dauphiné, introduced into England in 1775 by Dr. Pitcairn and Dr. Fothergill. 3. *B. petraeum*, Linn. and Willd. "Partial involucre united; universal involucre of five leaves." Linn. "Little involucre of about five united leaves; universal involucre of five leaves; stem-leaves heart-shaped-lanceolate, embracing the stem; radical leaves linear." Willd. Radical leaves linear, sessile. *Leaves* of the universal involucre five, equal, rather broad; of the partial involucre five, united as far as the middle. Linn. A native of the Alps of Switzerland. According to Villars this is only a variety of the preceding. 4. *B. graminifolium*, Willd. (*B. petraeum*, Jacq. Collec. 1. p. 209. Icon. rar. 1. t. 56. Vill. delph. 2. p. 576. t. 14. Allion. Aust. p. 24. La Marck, Flor. Franc. 990. 10. Encyc. vol. i. 517. Martyn in Miller; description but not the specific character nor all the synonyms. *Sedum petraeum* bupleuri folio, Pon. bald. 247. B. alpinum, Seguiet Veron. 2. p. 15. 3. p. 221.) "Root-leaves long, very narrow, grass-like; partial involucre distinct, general one of about five leaves." La Marck. *Root* perennial, long, thick toward the top. *Root leaves* numerous, five or six inches long. *Stem* about eight inches high, round, simple and leafless, or having a single branch near the top, with one leaf at the base, and an umbel of flowers at the end, smaller than that which terminates the stem. *Umbel* loose, of six or seven rays. *Universal involucre* of three or five leaves; *partial involucre* of five, six or seven small, lanceolate, nerved, very distinct leaves. A native of the mountains of Dauphiny, Provence, and Switzerland. 5. *B. angulosum*, Linn. (*B. ranunculoides* & La Marck.) "Partial involucre five-leaved, orbiculate, general involucre three-leaved, ovate; leaves embracing the stem, heart-shaped-lanceolate." Nearly allied to *B. stellatum*, but the leaves of the partial involucre are always distinct: it varies in having its leaves very narrow and striated, or lanceolate, and not striated. Linn. The former variety is a native of Switzerland, the latter, of the Pyrenées. 6. *B. pyrenaicum*, Willd. (*B. pyrenaicum*, Gouan and La Marck.) "Partial involucre roundish, emarginate, united; universal three-leaved, cut at the base; leaves lanceolate, heart-shaped, embracing the stem." Willd. It differs from *B. angulosum* in having much broader, lanceolate, acute leaves, the radical ones narrowed at the base; and in the rays of the umbel being shorter and fewer; as well as in the peculiar shape of the general and partial involucre expressed in the specific character: from *B. stellatum* which it resembles in habit, in its broader leaves, those of the stem being more numerous and heart-shaped at the base; and in the number of the divisions of the partial involucre. Willd. A native of the Pyrenées. 7. *B. longifolium*, Linn. "Partial involucre five-leaved, ovate; general one of about five leaves; leaves embracing the stem." *Root* perennial. *Root-leaves* narrowed into a petiole at their base, and broad towards their summit. *Stem-leaves* ovate, acuminate. *Umbel* terminal, composed of from six to nine rays. It resembles *B. rotundifolium*, but differs in its perennial root and longer leaves. Native of mountains in Germany, Switzerland, &c. 8. *B. falcatum*, Linn. Hare's-ear. "Partial involucre five-leaved, acute; general, commonly five-leaved;

leaves lanceolate; stem zigzag." *Root* perennial. *Stem* upright, about a foot high, slender, round, slightly zigzag, much branched, sometimes tinged with purple. *Leaves* frequently sickle-shaped; those next the root narrowed at their base into petioles, ovate-lanceolate, bright green, smooth, a little nerved; the others almost linear. *Universal umbel* loose, small, terminal, of about seven rays; *partial*, of ten or twelve. *Universal involucre* of from two to five, very unequal, lanceolate, sharp leaves; *partial*, of five lanceolate, regular leaves, the length of the partial umbel. A native of dry rocky soil in the south of Europe. It has the character of being a vulnerary and febrifuge. La Marck and Martyn. 9. *B. caricifolium*, Willd. (*B. gramineum*, Villars) "Partial involucre, five-leaved, sharp-pointed; universal one-leaved, lanceolate; leaves linear, attenuated at the base." *Root* perennial. *Radical leaves* very long, acute; *stem-leaves*, the lower ones a little attenuated, the rest sessile. *Umbel* of five or six unequal rays longer than the involucre. *Partial involucre* five-leaved, lanceolate, sharp-pointed. Willd. from a dried specimen. A native of the south of France and Switzerland. 10. *B. odontoides*, Linn. "Partial involucre, five-leaved, acute; universal, three-leaved; the central floret higher; branches divaricated." Linn. "Both involucre five-leaved, stellate; leaflets lanceolate, three-nerved; rays of the umbel very unequal." La Marck. *Root* annual. *Stem* from three to eight inches high, somewhat angular, much branched. *Leaves* linear-lanceolate, narrow, smooth, sessile. *Involucre* awned, concealing the umbels. La Marck and Martyn. *Seeds* only a quarter the size of those of *B. rotundifolium*, not striated, either slightly wrinkled or entirely plain, ovate-cylindrical, brown or blackish. Gærtner. A native of the south of Europe. 11. *B. semicompositum*, Linn. "Umbels both compound and simple." *Root* annual. *Stem* six inches high, furnished from its base with alternate, rather divaricated branches. *Leaves* oblong, narrowed into petioles at their base, broad and obtuse at their summit, and ending in a particular small point. *Simple umbels* peduncled; *compound*, almost sessile. Allied to the preceding, but differing from it constantly in such remarkable characters, that it ought to be regarded as more than a variety. La Marck. A native of the south of Europe. 12. *B. ranunculoides*, Linn. "Partial involucre, five-leaved, longer; universal, three-leaved; stem-leaves lanceolate." *Root* perennial, creeping. *Stem* about eight inches high, simple. *Leaves* grass-like, stiff. *Umbel* unequal. *Universal involucre* ovate, acute, short; *partial*, equal, obovate, acute. *Partial umbels* small, the length of the involucre. La Marck follows Haller in uniting this species with the angulosum. Gouan adds the petraeum, to which Villars objects as far as the sedum petraeum bupleuri folio, gathered by Pona on Mount Baldo is concerned, the graminifolium of Vake and this dictionary; but Villars himself suspects that the angulosum, and his graminium, which is Willdenow's and our caricifolium, may be only varieties of ranunculoides. A native of Switzerland and the Pyrenées. 13. *B. rigidum*, Linn. "Stem dichotomous, almost naked; involucre very small, acute." Linn. "Stem much branched, panicled, almost naked; lower leaves petioled, nerved, rigid; umbels generally of three rays." La Marck. *Root* perennial. *Stem* slender, nearly two feet high. *Lower leaves* lanceolate-elliptic, with strong white nerves; *upper-leaves* very small and distant. *Umbels* terminal, of two, three, or four rays. *Universal involucre* of three awl-shaped, very short leaves; *partial*, of five. Linn. and La Marck. A native of the south of France. 14. *B. tenuissimum*, Linn. "Slender thorough-wax, or least hare's-ear. (Eng. Bot. 478.)

“ Umbels simple, alternate, generally three-flowered; involucre of five awl-shaped leaves. Dr. Smith. “ Terminal umbels compound; lateral, simple, with few flowers; involucre universal and partial, short.” La Marck. *Root* annual, tapering, but little branched. *Stem* about a foot high, zig-zag, slender, stiff, smooth, erect, with several alternate branches. *Leaves* alternate, lanceolate, narrow, pointed, entire, tapering at the base. *Umbels* axillary, nearly sessile, solitary, generally three flowered; involucre awl-shaped, longer than the flowers. Dr. Smith. *Terminating umbels* compound, of from three to five rays; with a general involucre of from three to five short, pointed leaves; *lateral*, simple, and extremely small. La Marck. Haller remarks that the umbels can scarcely be said to be really compound. *Fruit* small, ovate-oblong, transversely thicker, rounded on each side, somewhat emarginate. *Seeds* pentagonal-prismatic, marked on the convex side with three acute-angled and distant ribs; the intervals a little wrinkled, of a pale or ash colour. A native of Germany, France, Italy, and England. It is found plentifully in salt water ditches on the coasts of Norfolk, Suffolk, &c. and, as is asserted by Hudson, more sparingly inland, about Cambridge and Huntingdon; but professor Martyn observes, that it has probably been overlooked in many other places; being a plant of little appearance and almost lost among the grass. 15. *B. baldense*, Willd. “ Stem erect, branched; leaves linear; universal involucre of about four unequal leaves, shorter than the umbel; partial involucre five-leaved.” *Root* perennial. *Radical leaves* linear, broader at the base. *Universal involucre* of three or four leaves, two larger than the others. A native of Croatia, Carniola, and mount Baldo. 16. *B. Gerardi*, Murray Syst. 274. (*B. junceum*, Mönch. Roth. Pollich. *junceum* and La Marck.) Ger. Prov. 233. Tab. 9. good. “ Stem erect, much branched; leaves linear, acuminate; universal involucre five-leaved; partial, five-leaved, linear-awl-shaped, longer than the umbel.” *Root* annual. *Stem* from six to nine inches high, slender, smooth, with straight filiform branches. *Leaves* linear, grass-like, clasping the stem, ending in a very short point, marked with three fine nerves. *Umbels* on long peduncles, lateral and terminating. *Universal involucre* four or five leaved, linear, awl shaped, very unequal; *partial*, four or five-leaved, linear-fetaceous, unequal, longer than the flowers. *Flowers* nearly sessile. *Seeds* oblong, striated, appearing as if cut off at the tip. A native of Provence and Austria. 17. *B. junceum*, Linn. & La Marck. “ Stem erect, panicled; leaves linear; universal involucre three-leaved; partial, five-leaved.” *Root* annual. *Stem* from two to three feet high, straight, round, hollow within, branched in the upper part. *Umbels* small; lateral ones simple, of one or two flowers; terminating ones compound, of two or three short rays. *Universal involucre* of two or three leaves, awl-shaped and unequal; *partial*, of about four linear-awl-shaped leaves. A native of the south of France, of Switzerland, Germany, and Italy. 18. *B. nudum*, Aiton. Kew. “ Stem branched, without leaves; root-leaves decomposed, plain, gashed; involucre universal and partial lanceolate-oblong.” *Root* perennial. A native of the cape of Good Hope. Introduced in 1773, by Dr. P. Ruffel.

\* *Sbrubby*.

19. *B. fruticosum*, Linn. “ Leaves lanceolate-obovate, very entire, sessile.” Willd. “ Rather obtuse.” La Marck. An ever-green shrub, four or five feet high. *Stems* straight, branched, bushy; bark of the trunk greyish, of the branches, brown or purplish. *Leaves* alternate, oval-oblong, rather obtuse, with a very small point, coriaceous, smooth, of a glaucous colour. *Umbels* terminal. A native

of the south of France, Italy, and the Levant. 20. *B. arborefcens*, Willd. “ Leaves oblong, very entire, petioled.” Thunb. Prod. 50. It differs from the preceding in having petioled leaves, very acutely, not bluntly, pointed at their summit; and umbels only half as large, on short peduncles. 21. *B. coriaceum*, Martyn and Willd. Ait. Kew. P'Heret. Stirp. nov. (*arborefcens* Jacq. Ic. Rar. 2. tab. 351. obliquum Vahl. Symb. gibraltericum, La Marck Encyc.) “ Leaves lanceolate, attenuated on both sides, very entire, sessile. Willd. “ Leaves lanceolate, coriaceous, oblique.” Hort. Kew. *Root* perennial. *Stems* from three to four feet high, upright, sparingly branched, round, annulated with the scars left by the fallen leaves. *Branches* alternate, upright, marked with lines, fistulous. *Leaves* alternate, approximating, long, acuminate, a little coriaceous, half embracing the stem, with a sharp, reflexed point, and one whitish nerve, glaucous, permanent, five inches long and near an inch broad. *Umbels* of about fifteen rays, alternate; on a common peduncle terminating each branch, with a few leaves on its lower part, a foot and a half long, and not half the thickness of the branch from which it springs. *Universal involucre* of about eight, oblong, acuminate, slightly convex, reflexed leaves; partial, five-leaved, smaller, ovate. *Seeds* oblong, rounded on one side with five wings, flat on the other. The whole plant is very fragrant when rubbed. La Marck and Martyn from P'Heretier. A native of Spain near Gibraltar; found by Masson, and introduced in 1784. 22. *B. frutescens*, Linn. “ Leaves linear; involucre universal and partial.” An under shrub, about a foot and a half high. *Stem* woody, divided into several knotty, twisted ramifications, with slender, herbaceous twigs. *Leaves* alternate, linear, glaucous. *Umbels* small, of from three to five rays. *Universal involucre* of three, short, pointed leaves. La Marck. A native of Spain. 23. *B. spinosum*, Linn. jun. Supp. “ Old branches of the panicle naked, thorny; leaves linear.” *Root* perennial. *Stem* low, irregular, with divaricated branches. *Leaves* acuminate, three-nerved. *Universal umbel* terminal, generally of three rays, which change into spines after the fructification is completed; *partial*, of five rays. *Involucre* of very small leaves, equal in number to the rays. Linn. Jun. and La Marck. A native of Spain. 24. *B. difforme*, Linn. “ Spring leaves decomposed, flat, gashed; summer leaves filiform, angular, trifid.” *Stem* from five to six feet high, straight, a little twisted, branched. In winter, and the beginning of spring, it bears two sorts of leaves; the first small, petioled, composed of three, flat, trifid, gashed leaflets resembling those of parsley; the others longer, slender, filiform, angular, divided half way down into three filiform segments, the middle one the longest, and each terminated by a very small point. In summer the former kind fall off. La Marck. *Universal involucre* of many awl-shaped, spirivelling leaves, connected at the base; partial, of five leaves. *Umbels* some simple, others compound. Linn. A native of the Cape of Good Hope.

*Propagation and Culture*. The bupleurums in general are cultivated only in botanic gardens. The seeds should be sown in autumn, where the plants are designed to remain, for they are injured by transplanting. The fruticosum, called by our gardeners shrubby Ethiopian Hartwort, will thrive in the open air, and is propagated by cuttings planted in pots filled with fresh loamy earth, and sheltered in winter under a hot-bed frame; they will take root in spring, should be placed in a shady situation in summer, and will not be fit to transplant till the autumn. The frutescens may be treated in the same manner, but is not so hardy. The difforme may also be propagated by cuttings, which readily take

take root if planted in April, in pots filled with light earth, and plunged into a moderate hot bed. They should afterwards be enured to the open air by degrees, be transplanted into separate pots, placed with other exotics in a sheltered situation till autumn, and then removed into the green-house or dry stove. If propagated from seeds, they should be sown in autumn, sheltered under a frame in winter, removed to a very gentle hot-bed in spring, and finally treated like those raised from cuttings. The spinosum, nudum and coriaceum may all be propagated by cuttings, and treated as the difforme. They will probably bear the open air in mild seasons, but are not yet sufficiently common to run that hazard. Martyn's Miller.

*BUPLURUM villosum*. Linn. Sp. Pl. and Syst. Nat. See *HERMAS Depuperata*.

*BUPORTHMUS*, in *Ancient Geography*, a mountain at the extremity of the peninsula formed by the Argolide, south-east of Peloponnesus. Upon this mountain were two temples, one of Ceres and Proserpine, and another of Minerva. Pausanias.

*BUPRASIMUM*, a town of Achaia, at a small distance north of the river Peicus and of the town of Elis, which gave name to a fruitful country in which it was situated. It did not exist in the time of Strabo.—Also, a river of Peloponnesus, in the country of Elis. Steph. Byz.

*BUPRESTIS*, in *Entomology*, a genus of coleopterous insects, distinguished in a peculiar manner for the uncommon brilliancy and highly metallic splendour of their colours, which emulate the finest and most beautifully polished metals. The insects of this kind have the antennæ ferrated, and as long as the thorax; feelers four, which are also filiform, with the last joint obtuse, or truncated; head partly retracted within the thorax.

Linnæus, Fabricius and Gmelin describe the following species: unidentata, bicolor, gigantea, vittata, fastuosa, punctatissima, berolinensis, corrusca, decora, lurida, obscura, punctata, fasciata, rauca, striata, ritulans, octoguttata, ignita, lineata, ocellata, aerosa, maculata, maculosa, stricta, ilernicornis, chrysis, violacea, aegyptica, mariana, farinosa, fulminans, cyanipes, modella, blanda, aurata, tripunctata, elegans, chrysofigma, dorsata, impressa, ornata, teniata, cayennensis, cylindrica, scabra, trochilus, deca stigma, rufica, canaliculata, acuminata, plebeja, tranquebarica, lugubris, cariosa, undata, aurifera, sibirica, splendens, fusca, aurulenta, tenebrionis, fascicularis, variolaris, onopordi, hirta, rubi, deaurata, nitidula, læta, falcis, cyanea, discoidea, bimaculata, quadrimaculata, novem-maculata, tristis, aenea, cuprea, nobilis, barbarica, umbellatarum, quadripunctata, cruciata, manca, pygmaea, minuta, mediatubunda, viridis, biguttata, atra, elata, ruficollis, festiva, linearis, granularis, depressa, calcarata, fuliginosa, hæmorrhoidalis, quercus, hirsuta, 11-maculata, fem-maculata, varicornis, acuta, nævia, picta, inaurata, tatarica, virginica, nana, marginata, nigra, rosacea, ungarica, nebulosa, bruttia, stephanelli, rugosa, and coccinea, which see respectively.

A monographia of the buprestis tribe is expected from the pen of Dr. Schreiber of Vienna, which, in all probability, will contain a greater number of species than those enumerated above. Several entirely new species are also described by Mr. Donovan in his recent elucidation of the entomological productions of New Holland; the most remarkable of which are buprestis grandis, macularia, limbata, futuralis, guttata, and several varieties of variabilis, and imperialis, the last of which is mentioned by Fabricius. Syst. Eleuth.

Some writers affirm that the larvæ of the buprestes live in the solid wood, or in the trunks of decayed trees; but this is rather uncertain, since they do not appear to be exactly

known in that state. The conjecture is, however, plausible, the perfect insects being almost constantly found upon trees, or plants, and flowers. Few species of this beautiful tribe of insects are found in Europe; the largest and most brilliant of those hitherto discovered, are from the Brasils, and other hot climates.

*BUPRESTOIDES*, a species of *ATTELABUS* (Spondylis), the colour of which is black; shells nervous; thorax somewhat globular. Gmel. Fabr. &c. Described as *Buprestis ater* by Linn. Cerambyx maxillofus, &c. Degeer. Scarabæus, &c. Frisch.

*BUPRESTOIDES*, a species of *CARABUS*, of a black colour; antennæ and feelers ferruginous; legs piceous. Inhabits the south of Europe. Gmel. &c.

*BUQUOL*, in *Geography*, a town of France, in the department of the Straits of Calais, and district of Arras; 5 miles W. of Bapaume. N. lat. 50° 12'. E. long. 2° 40'.

*BUR Parsley*, in *Botany*. See *CAUCALIS*.

*BUR-weed*. See *SPARGANIUM*.

*BURA*, in *Ancient Geography*, a town of the Peloponnesus, seated on the ridge of a mountain, west of the river Cratlis. It suffered much from an earthquake in the year 373 B. C. Pausanias mentions several fine statues of this city; and particularly those of Ceres, Venus, Bacchus, and Lucina. Venus had a temple, in which was placed her marble statue, made by Euclid, an Athenian statuary.

*BURA*, in *Geography*, one of the smaller Orkney islands, between Pomona and Ronaldsha.

*BURACO de velta*, in *Ichthyology*, the name of a fish caught on the shores of the Brasils, and more usually known among authors by its Braslian name, *GUABI-coara*.

*BURAGRAG*, in *Geography*, a river on the coast of Barbary, which rises in mount Atlas and falls into the Atlantic ocean at the town of Sallee.

*BURAMOS*, an idolatrous people of Africa, in Nigritia, on the borders of the river St. Domingo. Their country extends to the mouth of the Rio-Grande.

*BURANELLO*, in *Biography*. See *GALUPPI*.

*BURATTI*, or *BURATS*, in *Geography*, the name of a barbarous and idolatrous nation, which occupies part of Siberia. They are called *Bratki* by the Russians, and among themselves *Barga Buratt*. About the time of the Mongolian monarchy, or perhaps at an earlier period, they seem to have taken refuge in the wild mountainous region on the north side of the Baikal, which they still inhabit. The Russians found this nation in Siberia, when they conquered that country; and from the year 1644 they have peaceably submitted to the Russian supremacy. The whole Burat nation is at present, in consequence of the border treaty, under the dominion of Russia, and comprises numerous heathenish people in the government of Irkutsk, where it inhabits the region from the Yenissey, along the Mongole-Chinese borders, on the Angara, Tunguska, and the upper Lena, about the southern Baikal, on the Selenga, the Argoon, and its rivers. Several years ago this government was computed to contain 32,000 tributary Burats; but their present number is probably four times as large. They are divided into a great number of tribes, called "Kolbondas," which are subdivided into casts, or "Aimaks," and each Aimak is composed of a certain number of "Chottons," or villages, containing 10 or 20 families. The oldest of the Chottons governs it, and six of these Chottons are subject to a "Schulenga," or judge, chosen from among their chiefs, and confirmed in his office by the governor of the province. Twenty-four Schulengas form a tribe or Kolbonda, which is commanded by a common chief, selected from among the families of their ancient princes. It is his province to watch

the observance of the laws, to decide disputes, to diminish or augment the tribes, and to assemble and command the proportion of recruits, which are furnished by the nation in time of war, till they are united to the main body of the army. Catharine II. with a view of annexing dignity to this chief, gave orders that he should wear a girdle ornamented with silver, on which is inscribed the name of the cast he commands; and the Buratt has become proud of this decoration, though it is merely a mark of his slavery. According to the accounts taken in 1752, this nation forms 65 casts, containing 33,000 bows or heads of families; and as they speak the Mongol language, profess the religion of the Kalmuks, lead a similar kind of life, and manage their flocks in the same manner with the Barschkirians, it will be sufficient to refer for an account of several particulars relating to them to the articles BASHKIRS, KALMUKS, and MONGOLS. They have, however, some customs peculiar to themselves. They are allowed to marry as many wives as they can afford to purchase; and the price of a bride is paid in cattle of different kinds. A young girl, according to her beauty and character, may, among the rich, receive 100 horses, 20 camels, 50 horned cattle, 200 sheep, and 30 goats. When the cattle are delivered, the nuptials are celebrated. For this purpose they erect a "Jurte," of felt, entirely new, of a white colour, and very neat. The three first days are spent in feasting, singing, and dancing; and on these occasions the musical instrument is a guitar with two strings, resembling that which the Russians call "Balalaika." At the expiration of these three days, the marriage is consummated. When a husband dies and leaves several wives, she who has borne him children, or the eldest of such as have had children, becomes the mistress of the Jurte. Those who have had no children, return to their relations on fine horses, and carry with them the clothes and presents which they received from the husband. If they have no place of retirement, they continue in the Jurte, subordinate to the wife mother, and are entitled to the tenth of the cattle left by the husband. The Buratti resemble the Kalmuks in outward form, with some slight variations. Their countenance is fallow, and though they are tall, their bodily structure is feeble, and they seldom attain to an advanced age. They formerly suffered much from the small-pox, but since an inoculation hospital has been instituted at Irkutsk, the mortality seems to have been much diminished. They now frequently inoculate their own children. They are much subject to the itch, from their manner of living, food, and clothing. In chronic diseases they use the warm baths on the east side of the Baikal. Their physicians are the Schamanes, who pretend to heal them more by sacrifices, incantations, and spells, than by natural means. They subsist by the chase and by their flocks. A Bu at is known to possess a thousand sheep, besides horses, and other cattle. Their habitations are hexagonal cabins, constructed with beams laid over one another, to the height of about 3 feet, with an opening formed at the top by flakes for the discharge of the smoke. The Burats are a principal branch of the Kalmuks, and differ from the Tunguses only in their language, which is Mongolian. *Tooke's View of the Russian Empire*, vol. i. and ii. *Chaureau's Travels in Russia*, vol. ii. Eng. ed.

BURAZ, a town of Asiatic Turkey, in the province of Natolia; 28 miles S. E. of Dagnizlu.

BURBACII, a town of Hungary, celebrated for its wine; 8 miles E. of Eisenstadt.

BURBARUS, in *Ichthyology*, the name given by Paul Jovius, and some other writers on fishes, to the common carp, *Cyprinus carpio*.

BURBAS, in *Commerce*, a small coin at Algiers, with

the arms of the dey struck on both sides, worth half an asper.

BURBER, an Egyptian piece of money. It is a thick piece of copper, about as broad as a sixpence; twelve of these make a *medine* there.

BURBIDA, in *Ancient Geography*, a town of Spain, between Tuda and Turoqua. Anton. Itin.

BURBOT, in *Ichthyology*, the English name of *gadus lota*, a fish common in the Trent, and some few other of our rivers. It is also known by the appellation of the eel-pout. This is *musfela fluviatilis* of two or three old Latin writers.

BURCA, among the Turks, the name of the rich covering of the door of the house at Mecca; it is ten feet long, and five wide; and there are several figures and Arabic letters on it, very richly embroidered in gold, on a ground of red and green. This is carried about in their solemn processions, and is often made to stop, that the people may touch it.

BURCA, in *Ancient Geography*, a town of Africa in Mauritania Cæsariensis. Ptolemy.

BURCARDIA, in *Botany* (from J. H. Burckhard, M. D. who published *Charac. Plant.* 1702), a genus formed by Scopoli, and adopted by Schreber, for a plant described by Aublet in his account of the plants of Guiana, and called by him *Piriqueta*, which has been referred by Willdenow and Bosc to the genus *Turnera*. See *TURNERA rugosa*.

BURCHANA, or BURCHANIS, in *Ancient Geography*, an island placed by Pliny between the Rhine and the Cimbric promontory. It was reduced by Drusus, who employed for this purpose all the Roman forces in those parts.

BURCHARDIA, in *Botany*. See *CALLICARPA Americana*.

BURCHAUSEN. See *BURKHAUSEN*.

BURCHEIM. See *BURKEIM*.

BURCHIELLO, in *Biography*, an Italian poet, whose family name was *Domenico*, was a native of Florence, where he exercised the trade of a barber, and where his shop was the usual rendezvous of the men of letters in that city. He died at Rome in 1448. His poems, which were a singular kind of burlesque, abounded with ludicrous expressions, old proverbs, and various extravagancies, often unintelligible, and frequently low and indecent, but intermixed with flashes of wit and vivacity, that became very popular, and established a kind of style, called the "Burchellesque," which had several imitators. The pieces of this poet are chiefly sonnets, of which the first edition appeared at Bologna in 1475; and another edition, with a comment, no less hard to be understood than the original, was given at Venice in 1553. The Junti at Florence published all his poems in 1552 and 1558. Whatever amusement performances of this kind might afford in a rude age, and in the infancy of poetry, they have sunk into obscurity by the prevalence of good taste and decorum. Mr. Roscoe, in his "Life of Lorenzo de Medici," informs us, that a satire of Burchiello in *terza rima*, after the manner of Dante, exists in MS. in the library of the duke of Tuscany.

BURCKERSDÖRF, in *Geography*, a town of Germany, in the circle of Upper Saxony, and territory of Newstadt; 2 miles N.W. of Weyda.

BURCUS, in *Ancient Geography*, a river of Asiatic Sarmatia, on the banks of which was built the city of Cucunda, according to Ptolemy.

BURDA, in *Geography*, a river of Hindostan, which runs into the Godavery, 60 miles E. of Neermul.

BURDA,

BURDA, in some *Middle Age Writers*, denotes a garment made of rushes.

BURDACK, an Egyptian vessel, which sheep usually drink out of at Cairo. They are made of a peculiar sort of earth, which is supposed to cool the water, and are always set out to the north, to keep the cooler, and covered with a strainer, to prevent any thing falling into the water; they are of so porous a structure, that the water put into them will get through them in a few days.

BURDAH, in *Geography*, a town of Africa, near the river Gambia, in the kingdom of Tomani.

BURDALO, a river of Spain, in Estremadura de Leon, which rises in the vicinity of Truxillo, and discharges itself into the Guadiana.

BURDEGALA, or BURDIGALA, in *Ancient Geography*, now Bourdeaux, a trading port-town of Gaul, in the second Aquitania, the capital of the Bituriges Vivisci, seated on the Garunna. Strabo is the most ancient author who mentions it, and by his description he intimates, that the sea-water formed a marsh in its vicinity. The poet Ausonius leads us to conclude, that the Druids had a school in this city; it was the place of his nativity, and he had been a professor in its school. He has given a poetical description of this city. See BOURDEAUX.

BURDEN properly signifies a heavy weight or load.

Ringelberg recommends the bearing burdens as the best sort of exercise; especially to strengthen men of study. To this end, he had a gown lined with plates of lead, which he could just lift with both his hands. This load he bore six or seven days together, either increasing or diminishing it as he found occasion; by which means he could both write and exercise at the same time.

BURDEN also denotes a fixed quantity of certain commodities. A burden of gad-steel, is two score, or 120 pounds.

BURDEN, or BURTHEN, the weight of a ship when not overloaded to go to sea, and is usually expressed in *tons*, and sometimes in *lasts*. The common method employed by ship-builders to find the tonnage of a ship, is to multiply the length of the keel by the extreme breadth, and the product by half the extreme breadth; then, this last being divided by 94, the quotient is the burden in tons. If the ship is afloat, and the tonnage required, the length of the keel cannot be ascertained; in this case, therefore, ship-builders use the following rule. From the extreme length subtract three-fifths of the extreme breadth, the remainder is the assumed length of the keel. Now the length of the keel thus found being multiplied by the extreme breadth, and that product by half the breadth, which last product being divided by 94, will give the tonnage for merchants' ships; but for ships of war the divisor is 100.

According to an act settled by the 13 Geo. III. chap. lxxiv. the burden or tonnage of a ship is to be found as follows. Measure the length from the after part of the main stern post along the rabbet of the keel to a line perpendicular thereto, from the fore part of the main stem under the bowsprit; from which subtract three-fifths of the extreme breadth, exclusive of any doubling, and the remainder is to be esteemed the length of the keel for ascertaining the tonnage; which, being multiplied by the breadth and half-breadth, and divided by 94, as formerly, will give the tonnage. When it becomes necessary to ascertain the burden of a ship which is afloat, the following method is to be observed. Measure the nearest distance, at the load water mark, between the after part of the stern-post, and a plumb line suspended from the stern; which, deducted from the length measured from the point on the stern where the plumb-line was suspended to a point perpendicularly above the load water mark at the fore part of the stern, the remainder

is the extreme length of the ship: from which subtract three-fifths of the extreme breadth measured from outside to outside of the plank, exclusive of doubling or sheathing, and also one-fourth of the depth of the load water line abaft, and the remainder will be the length of the keel for tonnage; which, being multiplied by the breadth, and by the half-breadth, and the product divided by 94, will give the burthen in tons.

In Dr. Mackay's treatise on "Navigation," a rule, adapted to logarithms, is given to find the tonnage of a ship; and in his treatise on "the description and use of the sliding rule," is contained the method of ascertaining the tonnage by that means.

From the slightest reflection it will be evident the above-mentioned rules, although sanctioned by practice and by the legislature, cannot give the true burthen of a ship. Neither is the depth taken into the account; and although the length, extreme breadth and depth are taken into consideration, yet the form of the bottom, and the dimensions of the ship at various other parts are neglected; and hence, full built, deep ships will carry considerably more than according to the rule; and sharp low built ships will be greatly over-rated. Since, therefore, the several duties on shipping increase with the tonnage, ships are generally made deeper than their other dimensions require, which has the tendency of making them crank. For a more accurate method of ascertaining the burthen of a ship, see the article TON.

BURDEN, *ships of*, denote those of a larger and heavier sort, carrying 500 tons, or upwards.

BURDEN, or BURTHEN, from *Bourden*, Fr. a drone. Hence, in *Music*, a base of only one note, a *pedale*, and the drone of a bagpipe, is called a *drone-base*. And hence, that part of a song which is repeated at the end of every verse or stanza, is called the *burden of the song*.

"At every close she made, th' attending throng  
Replied, and bore the burden of the song."

Dryden.

Pope writes burthen:

"Sacred to ridicule, his whole life long,  
And the sad burthen of some merry song."

BURDEN also denotes the pipe, or string by which such a found is given.

Matth. Paris will have the name *burden* to have been originally given this pipe, on account of its resemblance to a pilgrim's staff, anciently called also *burdo*.

BURDO, in *Physiology*, a mongrel beast of burden, produced by a horse and she-afs, by which it is distinguished from the mule, which is that produced of a male afs by a mare.

BURDO, or BURDON, in *Middle Age Writers*, denotes a pilgrim's long staff, as doing the office on that occasion of a mule, or other vehicle.

BURDOA, or BURDOVA, in *Ancient Geography*, a town of Hispania, in Lusitania. Ptolemy.

BURDOCK, in *Botany*. See ARCTIUM *Luppa*, and XANTHIUM *Strumarium*.

BURDONARFI, an appellation sometimes given to pilgrims, or those who went out of devotion to the holy land.

The word is formed from BURDO, an appellation given to the staff wherewith they travelled.

BURDUGNO, in *Geography*, a small town of the Morea, seated on the Vasilipotamo, between the mouth of this river and the town of Mistra.

BURDWAN, or BURWAH, a town of Hindostan, in the country of Bengal; 50 miles N. W. of Calcutta. N. lat. 23° 10'. E. long 84° 30'.

BURE, WILLIAM-FRANCIS DE, in *Biography*, a book-feller of Paris, eminently skilled in bibliography, published

a standard work on this subject, entitled, "Bibliographie Instructive, ou Traité des Livres Rares et Singuliers," Paris, 1763, &c. 7 vols. 8vo. He also published a "Catalogue of the Library of M. de la Valiere," 1767, 2 vols. 8vo.; and "Museum Typographicum," 1775, 12mo. His accounts of different editions are very exact. He died in July 1782, respected for integrity as well as skill in his profession. *Nouv. Dict. Hist.*

BUREBA, in *Geography*, a country of Spain, in Old Castile, which was formerly a part of Navarre: its principal town is Birvieca.

BUREDGIAT, *El*, a town of Egypt, on the west side of the Nile, 10 miles W. of Menuf.

BUREIL, a town of Asiatic Turkey, in the province of Caramania; 10 miles S. of Yurcup.

BURELLE', in *Heraldry*, a term used by the French heralds for emblazoning Barry; the same as the English call barrulet.

BURELLE, or *Civitate Borelle*, in *Geography*, a small episcopal town of Naples, in the province of Abruzzo Citra, on the east side of the river Sangro. N. lat. 41° 56'. E. long. 15° 5'.

BUREN, a town of Germany, in the circle of Westphalia, and bishopric of Paderborn, seated on the Alme; 13 miles S. S. W. of Paderborn. N. lat. 51° 35'. E. long. 8° 25'.

BUREN, a town of the United Provinces, in the duchy of Gueldres, and capital of a fine corn country, belonging, before the late revolution, to the house of Orange, to which it descended in 1551, by the marriage of prince William I. with Anne heiress to Maximilian count of Egmond; 5 leagues N. of Bois-le-Duc, and 6 S. E. of Utrecht. Without the town is a good castle, walled and surrounded by a double moat. N. lat. 52°. E. long. 5° 22'.

BUREN, a town of Switzerland, in that district of the canton of Berne, called the Upper Argow, seated on the east side of the Aar, over which it has a bridge; 9 miles S. W. of Soleure. N. lat. 47° 6'. E. long. 7° 11'.

BURETRAS, the name of a village of Sweden, in West Bothnia.

BURETTE, PIERRE-JEAN, in *Biography*, born at Paris in 1665, was the son of a surgeon, who, not being very prosperous in his practice, had recourse for his support to music, which he had learned of his mother, an excellent performer on the harp and harpsichord. He first performed, professionally, at Lyons, and afterwards went to Paris and played on the harp to Louis XIV., who was much pleased with his performance.

His son, Peter-John, was so sickly and feeble during infancy, that he passed almost his whole youth in amusing himself on the spiret, and in the study of music; but he had so strong a passion for this instrument that he had scarcely arrived at his ninth year when he was heard at court, accompanied by his father on the harp. Two years after, the king heard him again, when he performed a duet with his father on the harp; and at eleven years of age, he assisted him in giving lessons to his scholars.

It is not generally known that the learned academician, Burette, who had written so copiously on the subject of ancient music, was so well acquainted with the modern; which must have rendered his opinions more valid, and given weight to his reasoning on musical subjects in general, which a mere man of letters seldom obtains. His taste for music, however, did not extinguish his passion for other sciences. He taught himself Latin and Greek with little assistance from others; and the study of these languages inclined him to medical inquiries. At eighteen years old he attended for the first time the public schools, went through a course of

philosophy, and took lessons in the schools of medicine. And even during this time he learned Hebrew, Syriac, Arabic, Italian, Spanish, German, and English, sufficiently to understand them in books.

He was at length admitted of the faculty at Paris, and practised with reputation during thirty-three years, having for his disciples almost all his brethren who have since enjoyed the highest reputation in that capital.

In 1705, he was received into the Academie de Belles Lettres; and in 1706, he had a considerable share in the publication of the "Journal des Sçavans," at which he laboured more than thirty years. In 1718, he had an appointment in the Bibliotheque du Roi.

The public are obliged to the abbé Fraguier for the learned dissertation which M. Burette produced on the music of the ancients. This learned abbé, supposing that the Greeks applied the same sense to the word *harmony*, as is given to it by the moderns, and that, consequently, they knew counterpoint, or music in parts, Burette proved that he was mistaken, and that the ancients meant no more by the term *harmony*, than we do by proportion. He demonstrated, that the Greeks practised no other simultaneous consonances than unisons and octaves.

This learned and indefatigable inquirer after the music of the ancient Greeks, was seized, in 1745, with a paralytic affection, and after languishing during the whole year 1746, he died in 1747, at 82. His library, consisting of 15,000 volumes, was composed of the most curious and well-chosen books that could be procured in all languages.

He has supplied the memoirs of the Acad. des Inscript. et Belles Lettres with dissertations on the dancing of the ancients, on play or gaming, on single combat, and on horseracing. He enriched these memoirs with a translation of Plutarch's treatise on music, with notes and remarks, which are dispersed through many volumes of the memoirs of that learned society. And this writer must be allowed, on every subject concerning ancient music, the merit of great diligence and learning; but he does not seem always to have been possessed of an equal share of sagacity, or with courage sufficient to confess himself unable to explain inexplicable passages in his author. He never sees a difficulty; he explains all. Hence, amidst great erudition, and knowledge of antiquity, there are a thousand unintelligible explanations in his notes upon Plutarch. "En écrivant," said Fontenelle, "j'ai toujours taché de m'entendre."—An admirable rule which every writer ought to adopt.

Thus much is said, not with a view to depreciate the merit of M. Burette, to whom almost all late writers on music have had great obligations, and whose labours have been of singular service to ourselves, among the rest; but to shew how few authors are to be always followed implicitly, or read without precaution. But though we have frequently differed from him, we have adopted his opinion when we thought it well founded; and there has been no subsequent writer on ancient music, who has not frequently availed himself of his labours.

BURFORD, in *Geography*, an ancient town of Oxfordshire, in England, is supposed by some writers to be one of the oldest towns of the Mercian kingdom. It is remarkable in the page of history, and in the annals of sporting. Near this town was the scene of that decisive engagement between the West Saxons and Mercians, which liberated the former from the tyranny of the latter. In the year 752, a pitched battle was fought here between Cuthred, king of Wesssex, and Ethelbald, king of Mercia, "two princes of high spirit and ambitious schemes." The conflict was violent, and the latter monarch was compelled to fly for safety; yet, during the engagement, the banner of Mercia, a golden dragon,

was seized and torn by Edelhun. The scene of this conflict is still pointed out by the name of a field a little westward of the town called Battle-edge; and the memory of the event is preserved by an annual procession on the eve of Midsummer day. At the conclusion of the seventh century, an ecclesiastical synod was held here to determine the time when Easter should be held. It was then decreed that Aldhelm, abbot of Malmesbury, should announce to the British church a stated and proper period for the celebration of this festival in future. The horse-races of Burford are frequent, and much frequented by the students from Oxford, and the neighbouring gentry, &c. Here are manufactories for duffels and for rugs. The town is seated in a low, narrow valley on the banks of the river Windrush. The high grounds are mostly appropriated to corn, in consequence of which, the markets at this place and at Whitney are abundantly supplied with that necessary article. The church is a spacious and interesting pile of building; displaying some curious specimens of ancient ecclesiastical architecture. Its western door is formed with a semicircular arch, ornamented with birds' heads, &c. and the fourth porch displays a highly decorated exterior. Near this town is an ancient manor-house, which was a religious foundation belonging to the abbey of Keynsham in Somersetshire. This belongs to John Leuthal, esq. a descendant from the famous speaker to the long parliament. Burford had a charter from Henry II. and is governed by two bailiffs, burgesses, &c. It is distant 72 miles N. W. from London, contains 304 houses, and 1516 inhabitants. Here are a market on Saturdays, and two annual fairs. Plott's History of Oxfordshire. Magna Britannia, vol. iv. 4to.

BURFORD SADDLE. See SADDLE.

BURG. See BORG.

BURG, a bailiwick and castle of Germany, in the circle of Upper Saxony, and county of Reufs; 4 miles S. W. of Schleit.—Also, a town in the circle of Lower Saxony, and duchy of Magdeburg, seated on the Ilse, in which are woollen manufactures; 14 miles N. E. of Magdeburg.—Also, a town of the United Netherlands, in the county of Zutphen, seated on the Old Iffel, between Anholt and Deutikem. N. lat. 52°. E. long. 6° 12'.

BURG, or BOURG, a town of Germany, in the circle of Westphalia, and duchy of Berg, seated on the Wippe; 6 miles S. of Solingen.

BURG-BERNHEIM, Mark, a town of Germany, in the circle of Franconia, and principality of Culmbach; 14 miles N. N. W. of Anspach.

BURG-LENGENFELD, a town of Germany, in the circle of Bavaria, and principality of Neuburg, on the Nab; 15 miles N. of Raubon.

BURG-SCHIEDUNGEN, an ancient fortified town, but now a church-village of Germany, in the circle of Thuringia; 3 miles S. E. of Nebra.

BURG-SCHWALBACH, a town of Germany, in the circle of the Upper Rhine, and county of Nassau-Saarbruck, and in a prefecture of the same name.

BURGH-upon the sands, a place lying at a small distance west of Carlisle, in the county of Cumberland, and remarkable for the monument erected there in honour of Edward I. who died there in 1307, on his return from a successful expedition against the Scots.

BURGAGE, in Law, a tenure proper to boroughs and towns, whereby the inhabitants hold their lands and tenements of the king, or other lord, at a certain yearly rate.

This tenure is described by Glanvil (l. vii. c. 3.), and is expressly said by Littleton (§ 162.) to be but tenure in socage. It is indeed only a kind of town socage; as common socage, by which other lands are holden, is usually of

a rural nature. A borough (see BOROUGH) is usually distinguished from other towns by the right of sending members to parliament; and where the right of election is by burgage tenure, that alone is a proof of the antiquity of the borough. Tenure in burgage, therefore, or burgage tenure, is where houses, or lands which were formerly the site of houses, in an ancient borough, are held by some lord in common socage, by a certain established rent. The free socage, in which these tenements are held, seems to be plainly a remnant of Saxon liberty; and this may account for the great variety of customs, affecting many of these tenements so held in ancient burgage; the principal and most remarkable of which is that called BOROUGH-Englisch; which see. There are also other special customs in different burgage tenures; as in some, that the wife shall be endowed of all her husband's tenements (Litt. § 166.), and not of the third part only, as at the common law: and in others, that a man might dispose of his tenements by will (Litt. § 167.), which in general was not permitted after the conquest, till the reign of Henry VIII; though in the Saxon times it was allowable. A pregnant proof, says judge Blackstone (Com. vol. ii. p. 84.), that these liberties of socage tenure were fragments of Saxon liberty.

BURGAGE is sometimes used to denote the rent, or quit-rent paid to the chief lord for the houses and tenements in a town or borough.

BURGAGE free, *Burgagium liberum*, denotes a tenure, whereby the tenants, after having paid their rent to the superior lord, were exempted from the service.

BURGANET, in Armoury, a steel-cap formerly worn by soldiers in battle. It has also been used in armorial bearings.

BURGAS, in Geography. See BERGASE.

BURGAU, a town and castle in a margravate of the same name, in Austrian Swabia, seated on the river Mindel; 5 leagues N. of Augsburg.

BURGAU, a considerable village of Germany, in the circle of Upper Saxony, and principality of Eisenach; 3 miles S. of Iena.

BURGAU, in Natural History, the name of a large species of Top-shell or Trochus. It is very beautifully lined with a coat, of the nature of the mother of pearl; and the artificers take this out, to use under the name of mother of pearl, though some call it after the name of the shell they take it from, *burgaudine*. Some other shells, however, appear pearly, when divested of their external covering. Among the modern French, *Burgau* is a trivial name for several different kinds of shells of the TURBO genus.

BURGAUDINE, the name given by the French artificers to what we call mother of pearl. In their works, they do not use the common naacre shell for this, but the lining of the American bergau. Hence some call the mother of pearl *burgaudine*, and others the *burgaudine* mother of pearl.

BURGDORF, in Geography, a town of Switzerland, in the canton of Berne, and chief place of a bailiwick, seated on the river Emme; about a league from the town are sulphureous fountains and baths, which are said to be beneficial in paralytic and nervous complaints; 8 miles N. E. of Berne, and 12 S. S. E. of Soleure. N. lat. 47° 2'. E. long. 7° 29'.

BURGDORF, a town of Germany, in the circle of Lower Saxony, and principality of Luneburg-Zell, seated on the Aue; it is walled and moated, and has a castle; 14 miles E. N. E. of Hanover, and 9 S. of Zell.

BURGE-LES-BAINS, a town of France, in the department of the Allier, and chief place of a canton, in the district

a sort of Moulins. The town contains 2,542, and the castle 12,104 inhabitants: the territory includes 342½ kilominutres, and 10 communes.

**BURGE-MASTER** of Greenland, in *Ornithology*. See *PROCELLARIA GLACIALIS*. The same name is given by Ray to the vagel gull, *Larus naevius*; it is also called Burgo-master, and Burgrmeister. In Martin's Spitzb. *Larus glaucus*, the glaucous gull, is termed Burgermeister.

**BURGEIN**, in *Geography*, a town of Egypt, on the W. side of the Nile; 17 miles N. of Achmoussain.

**BURGEL**, a town of Germany, in the circle of Upper Saxony, and margravate of Meissen, seated on the Sala; 6 miles S. E. of Dornburg.

**BURGEL**, *Burgel*, or *Mark-Burgel*, a very ancient town of Germany, in the circle of Franconia, and principality of Culmbach, seated on a high mountain near the river; 13 miles N. N. W. of Anspach.

**BURGEO**, a small island near the south coast of Newfoundland; 22 leagues N. W. of Miquelon. N. lat. 47° 20'. W. long. 57° 20'.

**BURGEON**, in *Botany*, as the term is used by English gardeners, is only another name for a gem or bud. The French botanists distinguish three stages of its growth, by three different names. At its first appearance in spring it is an eye, *œil*; about the solstice it becomes a bud, *bouton*, which continues to increase during the autumn; and in the following spring is a burgeon, *bourgeon*.

**BURGESS**, an inhabitant of a borough or a walled town, or one who possesses a tenement therein. In other countries, burgeses and citizen are confounded together; but with us they are distinguished. Stat. 5 R. II. c. 4. See **BOROUGH**. The word is also applied to the magistrates of corporate towns.

Anciently, burgeses were held in great contempt, being reputed servile, base, and unfit for war; so that the gentry were not allowed to intermarry in their families, or fight with them; but, in lieu thereof, were to appoint champions. A burges's son was reputed of age when he could distinctly count money, measure cloth, &c. Spelm. Gloss. Glanvil. lib. vii. cap. 9.

**BURGESS**, *king's*, *Burgensis regis*, was he who, though residing in another's jurisdiction, was exempt therefrom, and only subject to the jurisdiction of the king, unless the lord also enjoyed royal jurisdiction.

In statute 5 Rich. II. c. 4. where the several classes of persons in the commonwealth are enumerated, we meet with count, baron, banneret, *chevalere de countee*, *citizen de citie*, and *burgess de bourg*.

**BURGESS** is now ordinarily used for the representative of a borough town in parliament. See **BOROUGH**.

Burgeses are supposed to represent the mercantile part or trading interest of the nation. They were formerly allowed, by a rate established in the reign of Edw. III. two shillings a day as wages. It is much to be regretted, that the members for boroughs bear above a quadruple proportion to those for counties. The Universities were, in general, not empowered to send burgeses to parliament; though once, in 28 Edw. I. when a parliament was summoned to consider of the king's right to Scotland, writs were issued, requiring the University of Oxford to send up four or five, and that of Cambridge two or three, of their most discreet and learned lawyers for that purpose. But king James I. indulged them with the permanent privilege of sending constantly two of their own body, to serve for those students, who, though useful members of the community were neither concerned in the landed nor the trading interest; and to protect in the legislature the rights of the republic of letters. The right of

election of burgeses depends on several local charters and customs, which have occasioned infinite disputes; though, by 2 Geo. II. c. 24. the right, for the future, shall be allowed according to the last determination of the house of commons concerning it: and by 3 Geo. III. c. 15. no freeman, except such as claim by birth, servitude, or marriage, shall be entitled to vote, unless he hath been admitted to his freedom twelve calendar months before. No person is eligible as a burges, who hath not a clear estate of 300l. a year. Stat. 9 Ann. c. 7. See **PARLIAMENT**.

**BURG-GEMUNDE**, in *Geography*, a town of Germany, in the circle of the Upper Rhine, and principality of Upper Hesse; 14 miles S. E. of Marburg.

**BURGGRAVE**, properly denotes the hereditary governor of a castle, or fortified town, chiefly in Germany.

The word is compounded of *bourg*, *town*, and *graf*, or *grave*, *count*.

The burgraves were originally the same with what we otherwise call *castellans*, or *comites castollani*; but their dignity was considerably advanced under Rudolph of Hapsburg; before this time they were ranked only as counts, and below the princes, but under him began to be esteemed on a footing with princes. In some parts the dignity is much degenerated, especially in the Palatinate. There were formerly, according to Leti, fifteen families who enjoyed the title of burgraves, thirteen of which are now extinct. But this is differently represented by others. In Bohemia, the title burgrave is given to the chief officer, or to him that commands in quality of viceroy. In Prussia, the burgrave is one of the four chief officers of the province. In Guelderland, the burgrave of Nimeguen is president of the states of the province.

**BURGGRAVE**, JOHN-PHILIP, M. D. in *Biography*, practised physic several years, first at Darmstadt, and afterwards at Frankfort, and was author of several interesting works. "Libitina ovans Fatis Hygiæ, seu de Medicæ Artis æque ac Medicorum præcipuis Fatis," Frank. 1701, 8vo.; in which he recounts the principal occurrences in the lives of the most celebrated physicians from the time of Hippocrates. This was again printed in the year 1706, with some alterations, under the title of "Iatrice Hominum Lethicæ Curiosæ. De Existentiâ Spirituum nervorum, eorumque vera Origine, Indole, Motu, Effectibus, &c. in Corpore Humano vivo," &c. 1725, 4to. Dr. Goelicke wrote an answer to this under the title of "Spiritus Animalis ex Foro Medico relegatus;" which produced, from our author, "Spiritus Nervulus restitutus." 4to. 1729; so this unmeaning controversy ended. His next work, which gave him much credit with his countrymen, was, "De Aere, Aquis, et Locis Urbis Francofurtæ Commentatio," 1751. 8vo. He also published an edition of "Herman Conringius. de Habitibus Corporum Germanicorum Antiqui et Novi Causis," with a commentary, 1757. 8vo. Eloy. Dict. Hist.

**BURGH**, JAMES, an esteemed moral and political writer, was born in 1714, at Madderty, in Perthshire, and educated at the University of St. Andrew's, with a view to the ministry, which was his father's profession; but, obliged to decline it on account of his health, he embarked in the linen business, and lost his whole property. This misfortune reduced him to the necessity of seeking a subsistence in London, where he was first employed in correcting the press and making indexes, and afterwards as usher in a school. Whilst he occupied this situation at Great Marlow, in the county of Bucks, he published without his name, in 1745, a pamphlet entitled, "Britain's Remembrancer," which passed through five editions. In 1747 he became master of an academy, which he removed from Stoke-Newington to New-

ington-green, and which he supported with great reputation to himself and benefit to his scholars for 19 years. Independently of the attention which he devoted to his school, he composed and published several valuable works; of which the principal appeared in 1754, under the title of "The Dignity of Human Nature; or a brief Account of the certain and established Means for attaining the true End of our Existence," 4to. reprinted in 2 vols. 8vo. In 1762 he published "The Art of Speaking," containing rules for elocution, and lessons selected from ancient and modern writers, in which the emphatical words were distinguished by Italics. The first volume of his "Crito, or Essays on various Subjects, political, moral, and metaphysical," was published in 1766, and a second volume in 1767. In discussing the question concerning the origin of evil, he ascribes it to the machinations of powerful malignant spiritual beings, from which Christianity was designed to deliver us. In 1771 he gave up the charge of his school, and, though he suffered excruciating pain from the stone, pursued with great vigour of mind the composition of a work, for which he had collected a mass of materials, entitled "Political Disquisitions." The first two volumes of this work, comprehending a vast variety of political subjects, appeared in 1774, and the third in 1775; and they were well received by those who were zealous in the cause of public reform. Whilst he was prosecuting this work, the painful disease, which he had long sustained with patience and resignation, terminated his life in 1775. Those who were in habits of intimate acquaintance and frequent intercourse with him, highly esteemed him for his piety and integrity, his social cheerful temper, and the benevolent ardour with which he devoted himself to the promotion of the public good. If he was sanguine in his projects, they were such as tended, according to his judgment, to the general improvement of society and of mankind: and though his compositions are distinguished more by the variety of their subjects than by accurate arrangement, and by energy rather than eloquence of language, many of them will be read with satisfaction and advantage. Besides the treatises already mentioned, he published, at different times, "Thoughts on Education;" "An Hymn to the Creator of the World;" "A Warning to Dram-drinkers," 12mo. written at the request of Dr. Stephen Hales, and Dr. Hayter, bishop of Norwich; "Directions, Prudential, Moral, Religious, and Scientific," printed for the use of his scholars, and since pirated by booksellers, and sold under the title of "Youth's friendly Monitor;" and several periodical Essays on the topics of the times, in the news-papers. Biog. Brit.

**BURGH**, the same with borough, which see.

**BURGH-bote**, from *burg*, *castellum*, and *bote*, *compensatio*, is chiefly used for an aid or contribution levied for the repairing of a town or castle.

By the law of king Athelstan, the castles and walls of towns were to be repaired, and burgh-bote levied every year, within a fortnight after Rogation days. No person whatever was exempt from this service; the king himself could not release a man from burgh-bote: yet, in after-times, exemptions appear to have been frequently granted; inasmuch that, according to Cowel, the word burgh-bote came to be chiefly used to denote, not the service, but the liberty or exemption from it.

**BURGH-breche**, or *brech*, a fine imposed on the community of a town, or burgh, for the breach of peace among them.

**BURGH-mails**, were yearly payments to the crown of Scotland, introduced by Malcolm III. and resembling the *fee-farm* rents of burghs in England. See **MAIL**.

**BURGH-master**, an officer in the tin mines, who directs

and lays out the meers for the workmen, &c. otherwise denominated bailiff and bar-master, which see.

**BURGH** *find buoy*, in *Sea Language*, lies on the coast of Holland, W. by S. from the beacons on Voogel sand. On the Texel island are four churches, of which Burgh is the most northerly, except Oogh, which has no steeple.

**BURGHHAUN**, or **BURGHHAUN**, in *Geography*, a small town and citadel of Germany, in a bailiwick of the same name, in the circle of the Upper Rhine, and bishopric of Fulda, seated on the river Haun, and having two churches, one for the Lutherans, and another for the Catholics; 8 miles N. N. E. of Fulda.

**BURGHHERMASTERS**, **BOURGERMASTERS**, **BURGMESTERS**, or **BURCOMASTERS**, chief magistrates in the cities of Germany, Holland, and Flanders; to whom belong the giving of orders for the government, administration of justice, policy, and finances of the place: though the authority and office are not every where alike; each city having its particular laws and statutes.

The word is formed from the two Flemish words, *borger*, *burghes*, or *citizen*; and *mesler*, *master*. Some express it in Latin by *consul*, others by *senator*.—M. Bruneau observes, that *burgher-master*, in Holland, answers to what is called *alderman* and *sheriff* in England; *attorney* at Compeigne; *capitoul* at Tholouse; *consul* at Languedoc, &c.

**BURGHMOTE**, a borough-court; or court held for a town or borough. See **COURT** and **MOTE**.

The word is also written *burgemotus*, *burgimotus*, *burgmotelus*, and *burgemote*, from *burgh*, *oppidum*; and *mote* or *gemote*, *conventus*.

The *burghmote*, by the laws of king Edgar, was to be held thrice in the year: by those of Henry I. twelve times. Burghmote is different from *berghmote*, derived from *berg*, a hill, and *mote*, assembly, which denotes an assembly or court upon a hill, and is held in Derbyshire for deciding pleas and controversies among the miners.

**BURGEONES**, in *Ancient Geography*, the name of a people placed by Ptolemy in European Sarmatia.

**BURGLARY**, in *Law*, or *nocturnal house-breaking*, *burglatrocinium*, called by our ancient law, and now in Scotland *homefecken*, an unlawful entering into another man's dwelling, wherein some person is, or into a church in the night-time; in order to commit some felony, or to kill some person, or to steal something thence, or do some other felonious act; whether the same be executed, or not. This crime has been always regarded as very heinous; partly on account of the terror which it occasions, and partly because it is a forcible invasion and disturbance of that right of habitation, which every individual might require even in a state of nature, and against which the laws of civil society have particularly guarded. Whilst they allow the possessor to kill the aggressor, who attempts to break into a house in the night time, they also protect and avenge him, in case the assailant should be too powerful. Such regard, indeed, has the law of England to the immunity of a man's house, that it styles it his castle, and will never suffer it to be violated with impunity; agreeing in this respect with the sentiments of ancient Rome, as expressed in the words of Tully (*Pro Domo*, 41) "quid enim sanctius, quid omni religione munitius, quam domus uniuscujusque civium?" For this reason no outward doors can in general be broken open to execute any civil process; though, in criminal causes, the public safety supercedes the private. See **ARREST**. Hence, also, in part, arises the animadversion of the law upon eaves-droppers, nufancers, and incendiaries; and to this principle it must be assigned, that a man may assemble people together lawfully (at least if they do not ex-

ceed eleven) without danger of raising a riot, rout, or unlawful assembly, in order to protect and defend his house; which he is not permitted to do in any other case. 1 Hal. P. C. 54.

The definition of a burglar, as given by Sir Edward Coke (3 Inst. 63) is, "he that by night breaketh and entereth into a mansion-house, with intent to commit a felony." In this definition, says Judge Blackstone (Comment. vol. iv. p. 22,) there are four things to be considered; the *time*, the *place*, the *manner*, and the *intent*.

1. The *time* must be by night, and not by day; for in the day-time there is no burglary. In considering what is reckoned night, the day was anciently accounted to begin at sun-rising and to end immediately upon sun-set: but the better opinion seems to be, that if there be daylight or twilight sufficient, begun or left, for discerning a man's face, it is no burglary. 3 Inst. 63. 1 Hal. P. C. 350. 1 Hawk. P. C. 101. But this does not extend to moon-light: for then many midnight burglaries would go unpunished; and besides, the malignity of the offence does not so properly arise from its being done in the dark, as at the dead of night; when the whole creation, except beasts of prey, is at rest; when sleep has disarmed the owner, and rendered his castle defenceless.

2. As to the *place*. It must be by the definition a mansion-house; and, therefore, in order to account for the reason why breaking open a church is burglary, as it undoubtedly is, Sir Edward Coke quaintly observes, that it is "*domus mansionalis Dei*." But it is not necessary that it should in all cases be a mansion house; for it may be committed by breaking the gates or walls of a town in the night. Accordingly Spelman defines burglary to be "*Nocturna disruptio alicujus habitaculi, vel ecclesie, etiam murorum portarumve burgi, ad feloniam perpetranda*." No distant barn, warehouse, or the like, has the same privileges as a mansion or dwelling-house, nor is regarded as a man's castle of defence: nor is a breaking open of houses in which no man resides, and which, therefore, for the time being are not mansion-houses, attended with the same circumstances of midnight terror. A house, however, in which a man sometimes resides, and which the owner hath only left for a short season, *animo revertendi*, is the object of a burglary, though no one be in it at the time when the fact is committed. 1 Hal. P. C. 566. Folt. 77. If a barn, stable, or warehouse be parcel of the mansion-house, and within the same common fence, though not under the same roof, or contiguous, a burglary may be committed in it; for the capital house protects and privileges all its branches and appurtenants, if within the curtilage or homestead. 1 Hal. P. C. 558. 1 Hawk. P. C. 104. A chamber in a college or an inn of court, where each inhabitant has a distinct property, is, to all other purposes as well as to this, the mansion-house of the owner. 1 Hal. P. C. 556. A room, or lodging, in any private house, is also the mansion for the time being of the lodger; if the owner doth not himself dwell in the house, or if he and the lodger enter by different outward doors. But, if the owner himself lies in the house, and hath only one outward door at which he and his lodger enter, such lodgers seem only to be inmates, and all their apartments to be parcel of the one dwelling-house of the owner. Kel. 84. 1 Hal. P. C. 556. Thus also the house of a corporation, inhabited in separate apartments by the officers of the body corporate, is the mansion-house of the corporation, and not of the respective officers. Foster, 38, 39. If I hire a shop, parcel of another man's house, and work or trade in it, but never lie there, it is no dwelling-house, nor can burglary be committed in it; but if I or my

servant, usually or often lodge in the shop at night, it then becomes a mansion-house and the object of burglary. If the shop-keeper sleep in any part of the building, however distinct that part is from the shop, it may be alleged to be his mansion-house; provided the owner does not sleep under the same roof also. Leach's Hawk. P. C. 1. c. 38. § 16. By 13 Geo. III. c. 38. burglary in the workshops of the plate glass manufactory, with intent to steal the stock or utensils, is declared to be single felony, and punished with transportation for seven years. No burglary can be committed in a tent or booth, erected in a market or fair, though the owner may lodge in it. 1 Hawk. P. C. 104; but by Stat. 5 and 6 Ed. VI. c. 9. clergy is taken from this offence.

3. As to the *manner* of committing burglary; there must be both a breaking and an entry to complete this offence. But they need not be done at once: for, if a hole be broken one night, and the same breakers enter the next night through the same, they are burglars. 1 Hal. P. C. 551. There must in general be an actual breaking, so that it may be regarded as a substantial and forcible irruption. Such are breaking, or taking out the glass of, or otherwise opening, a window, and taking out goods; picking a lock, or opening it with a key; and lifting up the latch of a door, or loosing any other fastenings which the owner has provided. But if a person leaves his doors or windows of his house open, and a man enters by them, or with a hook or by any other means draws out some of the goods of the owner, it is no burglary; but if, having entered, he afterwards unlocks an inner or chamber door, or if he comes down a chimney, he is deemed a burglar. If a person enters by the open door of a house, and breaks open a chest and steals goods, this is no burglary by the common law, because the chest is no part of the house; though this is felony ousted of clergy by Stat. 3 W. and M. c. 9; but if one break open a cup-board or counter, fixed to a house, it is burglary. 1 Hal. P. C. 552, 553, 554. 1 Hawk. P. C. 102. So also to knock at the door, and upon its being open to rush in with a felonious intent; or under pretence of taking lodgings, to fall upon the landlord and rob him; or to procure a constable to gain admittance, in order to search for traitors, and then to bind the constable and rob the house; are all deemed burglarious acts, aggravated by the evasions that attend any of them. 1 Hawk. P. C. 102. And also, if a servant opens and enters his master's chamber-door with a felonious design; or if any other person lodging in the same house, or in a public inn, opens and enters another's door with such evil intent; it is burglary. Nay, if a servant conspires with a robber, and lets him into the house by night, this is burglary in both (Stra. 881. 1 Hal. P. C. 553. 1 Hawk. P. C. 103); for the servant is doing an unlawful act, and the opportunity afforded him of doing it with greater ease rather aggravates than extenuates the guilt. As for the entry, any the least degree of it, with any part of the body, or with an instrument held in the hand, is sufficient; as, to step over the threshold, to put a hand or a hook in at a window to draw out goods, or a pistol to demand one's money, are all of them burglarious entries. 1 Hal. P. C. 535. 1 Hawk. P. C. 103. Folt. 108. When several come with a design to commit burglary, and one does it while the rest watch near the house, the act of one is, by interpretation, the act of all of them. The entry may be before the breaking as well as after; for by Statute 12 Ann. c. 7. if a person enters into the dwelling-house of another, without breaking in, either by day or by night, with intent to commit felony, or being in such house, shall commit any felony; and shall in the night

night break out of the fame, this is declared to be burglary, although before this act different opinions were held concerning it; Lord Bacon (Elem. 65) holding the affirmative, and Sir Matthew Hale (1 Hal. P. C. 554) the negative. But it is universally agreed, that there must be both a breaking, either in fact or by implication, and also an entry, in order to complete the burglary.

4. As to the *intent*: it is clear, that such breaking and entry must be with a felonious intent, otherwise it is only a trespass. And it is the same, whether such intention be actually carried into execution, or only demonstrated by some attempt or overt act, of which the jury is to judge. And therefore such a breach and entry of a house as has been before described, by night, with intent to commit a robbery, a murder, a rape, or any other felony, are burglary; whether the crime be actually perpetrated or not. Nor does it make any difference, whether the offence were felony at common law, or only created such by Statute. 1 Hawk. P. C. 105.

Burglary, as above described, is a felony at common law, but within the benefit of clergy. The Statutes, however, of 1 Edw. VI. c. 12. and 18 Eliz. c. 7. take away clergy from the principals, and that of 3 and 4 W and M. c. 9. from all abettors and accessaries before the fact. And, in like manner, the laws of Athens, which punished no simple theft with death, made burglary a capital crime. Pott. Antiq. b. 1. c. 26. For encouraging the prosecution of offenders, it is enacted by Statute 10 and 11 W. III. c. 23, that any person who shall convict a burglar shall be exempted from parish and ward offices, where the offence was committed. To this, the statutes 5 Ann. c. 31. and 6 Geo. I. c. 23. have superadded a reward of 40*l*. And if an accomplice, being out of prison, shall convict two or more offenders, he is entitled to a pardon of the felonies enumerated in the act. Moreover, the statutes 25 Geo. II. c. 36, 27 Geo. II. c. 3, and 18 Geo. III. c. 19, provide, that the charges of prosecuting and convicting a burglar shall be paid by the treasurer of the county where the burglary was committed, to the prosecutor and poor witnesses. The Statute 10 Geo. III. c. 48, provides, for preventing the frequent commission of burglaries, that buyers or receivers of stolen jewels, gold, or silver plate, where the stealing shall have been accompanied by burglary (or robbery), may be tried and transported for 14 years, before the conviction of the principal. And the Statute 23 Geo. III. c. 88. enacts, that any person apprehended, having upon him any pick-lock key, &c. or other implement, with intent to commit a burglary, shall be deemed a rogue and a vagabond, within Statute 17 Geo. II. c. 5.

BURGLE, an article of diet of universal use in the eastern cookery. It consists of wheat, prepared by first softening the grain in hot water, and then breaking and unhusking it by means of a hand-mill; it is afterwards dried in the sun, and thus preserved for use. This food is sometimes, like rice, made into a "pilaw" (which see); but more commonly, being beat up with minced meat, suet, and spices, is formed into large balls, and either boiled or fried. Russell's Aleppo, vol. i. p. 117.

BURGLIN, in *Geography*, a lordship of Swisserland, which had formerly its own counts, afterwards barons, to both of whom it gave title, but purchased, in 1579, by the town of St. Gall. To this lordship belongs a parochial village and seat of the same name, once forming a town, but laid in ashes by the Appenzellers and the town of St. Gall.

BURGO DE OSEMA, a small town of Spain, in Old Castile, seated on a small river that soon after runs into the

Duero, near the town of Osma; 40 miles S. E. of Burgos.

BURGO SAND, lies on the larboard side of the channel at the entrance into Liverpool, which see.

BURGOMASTER of *Greenland*, in *Ornithology*. See BURGE-master.

BURGOO, or BURGOUT, a sea-faring dish, made of whole oatmeal, or groats, boiled in water, till they burst; then mixed with butter. It is made in Scotland and in Wales, by mixing oatmeal and water, and boiling it into a moderate consistence. It is a cheap and strengthening diet.

Burgoo, otherwise called *loblolly*, is held by Cockburn very proper to correct that thickens of humours and colliveness to which the other diet of sailors much disposes them. Yet the burgoo actually is the least liked of all their provisions, because of the scanty allowance of butter to it. The same author thinks it might be worth the consideration of those to whom the care of the seamen is committed, to contrive to render this food more agreeable to them.

BURGOS, in *Geography*, a large old city of Spain, the capital of Old Castile, and of a province of the same name, forming a kind of semicircle round a hill, on which is a castle, and extending itself along the plain to the small rapid river of Arlançon, or Arlanzi, over which it has a bridge, and along the bank of which is a handsome paved walk. It is the see of an archbishop, erected in 1574. The city is irregular, most of its streets being narrow and crooked, and its houses high. It has, however, many fine squares adorned with fountains and statues, public buildings, and noblemen's houses; and presents, at a distance, by its numerous steeples and edifices, and particularly the episcopal palace, situate without the town, a pleasing view. The cathedral is one of the most beautiful and best preserved Gothic structures in Spain; and the chapel, belonging to the convent of the Augustines, is magnificent, and famous for its crucifix, to which extraordinary devotion is paid. Bega, one of its suburbs, has many convents and hospitals; and, among others, a very large one for pilgrims. One of the nunneries is said to contain 150 nuns, most of them being of noble extraction; and the royal hospital is richly endowed. This city was built in the 9th or 10th century, on the ruins of the ancient Auca. Its situation, as it is surrounded by mountains, renders the air extremely cold for nine months in the year, and for the other three months very hot. The inhabitants of Burgos are said to speak the best Castilian, or purest Spanish, of any in the kingdom. N. lat. 42° 17'. W. long. 3° 42'.

BURGSTADT, or BURGSTADTEL, a small town of Germany, in the circle of Upper Saxony, and lordship of Schonberg, in which are some stuff-manufactures; 3 miles E. of Penig.

BURGSTALL, a town of Germany, in the archduchy of Austria, seated on the river Erlaph; 12 miles S. E. of Ips.

BURGUETTA, or ELBURQUETTA, a town of Spain, in Navarre, situate in the valley of Ronceval, where the rear-guard of Charlemagne, on his return to Spain, was defeated by the Saracens, and Roland, his nephew, slain, in the year 778: 8 leagues E. N. E. of Pampeluna.

BURGUI, a town of Spain, in Navarre, seated on the E sca.

BURGUILLER, a town of Spain in Andalusia, 3 leagues from Seville.

BURGUNDIAN CROSS, in *Heraldry*. Knights of this order were instituted on St. Mary Magdalen's day, in 1535.

by Charles V. emperor of Germany and king of Spain, after he had restored Mulkassas, king of Tunis, who was driven out of his kingdom by the noted pirate Barbarossa. The emperor being desirous to gain the love of all those who had valiantly signified themselves in that war, did, as a reward for their services, confer on them this honour of knighthood, on the day he made his public entry into Tunis; having on the coat he wore in battle, embroidered with a Burgundian cross, to which was added a steel striking sparks of fire out of a flint, with this inscription, BARBARIA, which badge was pendant from a gold collar.

BURGUNDIANS, BURGUNDIONES, in *History*, were a warlike and numerous people, who, upon the decline of the Roman empire, obtained a permanent seat and dominion in the provinces of Gaul. According to Ammianus Marcellinus (l. 28.), and Orosius (l. 7. c. 19.), they were originally descended from the Romans. The latter writer says, that Drusus, Nero, and his brother Tiberius, the adopted sons of Cæsar Augustus, having subdued the interior parts of Germany, left several camps in the country, and part of their army to keep the neighbouring people in subjection: from the Roman soldiers, who were on this occasion left to guard the Roman camps, are descended the Burgundians. The castles and strong holds, built for the defence of a country, are called by the Germans "burgts;" and hence the Romans, who guarded them, and their descendants, were named "Burgundians." As they embraced the Catholic faith, the ecclesiastics, whose spiritual jurisdiction they acknowledged, have described them as mild and tractable in their disposition; for in the countries where they settled, they treated the natives, not as strangers whom they had subdued, but as Christian brethren. Pliny the elder (l. iv. c. 16.) supposes them to be a German nation, descended from the Vindili, supposed to be the same people with the Vandals. Valesius (Rer. Franc. p. 48.) distinguishes the Burgundians of Germany from those of the same name, who dwelt more to the east, on the banks of the Danube. The Burgundians of Germany were sometimes in alliance, and sometimes at war, with the empire; and they are represented by contemporary writers as inferior in bravery to the other Germans, and as dwelling in castles and fortified places, whereas the other German nations scorned any fence besides their arms. See Socrat. Hist. Eccles. l. vii. c. 30. Most of them were mechanics, and, before they settled in Gaul, resorted in great numbers to that country, to earn a subsistence by their respective professions. As to their form of government, they were divided into several tribes, each of which had its respective chief or king, whose authority was so far from being hereditary, that it was not continued during life. If the events of the war accused the courage or conduct of the king or general, called "Hendinos," he was immediately deposed; and the injustice of his subjects made him responsible for the fertility of the earth, and the regularity of the seasons, which seemed to fall more properly within the sacerdotal department. The person of the priest, denominated "Sinfus," was sacred, and his dignity perpetual. The kings of the Burgundians did not think themselves degraded by serving in the Roman armies, by executing some of the chief offices of the empire, and by receiving, from the emperors, such dignities as they usually conferred upon their subjects. To the Burgundians is ascribed the first introduction into Gaul of legal duels, or duels ordered by the magistrates or judges, established in order to discover, from the event, the truth of contested facts. Gundebald is said to have been the first who established by law this maxim, that the best champion is the best man, and ought to be believed; a maxim, indeed, which has often proved fatal to

innocence. This unjust and sanguinary law was formally issued at Lyons, the 27th of June, Abienus being consul, that is, in 501.

In the history of the Burgundians nothing particularly worthy of notice occurs till the year 275, the first of the emperor Tacitus's reign, when, in conjunction with other barbarians, they crossed the Rhine, overran all Gaul, and made themselves masters of more than 70 cities in that country. But they were soon after defeated, and compelled to sue for peace, by Probus, the successor of Tacitus. In 287 they made another irruption into Gaul, together with the Alemanni; but were defeated by Maximian. See ALEMANNI. In the year 370, the 7th of Valentinian I. an army of 80,000 Burgundians appeared on the banks of the Rhine, impatiently expecting the support and subsidies promised by Valentinian; but after long and fruitless expectation, they were compelled to retire. In the year 407, they followed the Vandals, Sueves, and Alans, who had entered Gaul the last day of the preceding year, in order to partake in the spoils of these wealthy provinces; but they did not settle in that country till the year 413, when, as it is said, they obtained that part of Gaul which borders on the Rhine, or the present Alsace, and the remaining part of Germania Prima, which were ceded to them by Honorius. Thus commenced the kingdom of the Burgundians in Gaul, under Gundicar their first king. They afterwards, viz. in 435, in conjunction with the Heruli, the Huns, and the Franks, entered Belgic Gaul, committing dreadful ravages wherever they came; though, upon their first settling in Gaul, they had promised to assist the Romans, and serve in their armies as subjects of the empire. Aetius, having defeated their army, reduced them to the necessity of suing for peace, which, however, was of no long continuance. About this time they embraced Christianity. Having continued on the banks of the Rhine till the year 438, they were removed by Aetius to the present duchy of Savoy. During their residence here, they made themselves masters of several cities and places in Gaul; such as Lyons, Dié, Vienne, Auvergne, &c. Before the year 490, the Burgundians were masters of the whole of Lugdunensis Prima, styled by Sidonius Germania Lugdunensis; and in the years 514 and 528, it appears, from the acts of the councils of Agde and Epaune, that they were masters of above 28 cities; and, among others, of Lyons, Vienne, Befançon, and Embrun. In the year 490, Gundobald, or Gondebaud, conducted them into Italy, where they committed unparalleled ravages in Liguria. At this time the kingdom of the Burgundians was defined by the course of the rivers Saone and Rhone, and extended from the forest of Vosges to the Alps and the sea of Marseilles. Gondebaud, who died in 509, was succeeded by his son Sigismund, who dispatched an account of his accession to the emperor Anastasius at Constantinople, and acknowledged himself a subject of the empire. Sigismund, by the inhuman assassination of his son Sigeric, though he has acquired the honours of a saint and martyr, greatly irritated the Ostrogoths and their king Theodoric, and occasioned a war between the Franks and Burgundians. In a battle that took place A. D. 523, Sigismund was defeated and taken prisoner; and afterwards put to death, being buried alive in a deep well at Orleans; and the greater part of the country submitted to the Franks. The Burgundians, however, soon revolted, and proclaimed Gondemar, brother of Sigismund, their king, who, after a severe conflict with the Franks, concluded a peace with them, on condition that they should restore to him all the countries which they had seized during the war. This peace lasted 8 years; but in 532 a war broke out between these two nations; and Childebert and Clotharius, entering the

the territories of the Burgundians, laid siege to Augustodunum, now Autun, and obliged Gondemar to save himself by flight, and made themselves masters of his kingdom, which agreed to serve in their wars, and to pay them an annual tribute. But they continued, by agreement with their conquerors, to be governed by their own laws; till the reign of Louis-le-Debonnaire. *Anc. Un. Hist.* vol. 17. *Gibbon's Hist. Decl. and Fall of the Roman Empire*, vol. iv, v, vi.

BURGUNDIANS, the denomination of a political party, which, together with the Armagnacs, divided the whole kingdom of France, about the commencement of the 15th century. See ARMAGNAC.

BURGUNDY, in *Geography*, derives its name from the BURGUNDIANS (see the preceding article), and, before the revolution, was a very considerable province of France; bounded on the east by Franche-Comté, on the south by Lyonnois, on the west by Bourbonnois and Nivernois, and on the north by Champagne. The government or province of Burgundy contained, besides the duchy of the same name, La Bresse, of which le Bugey and le Valromey form a part, and the county of Gex. Its extent from north to south is about 60 French leagues, and from west to east about 30 leagues. Burgundy is divided lengthways by a chain of mountains, extending from Dijon to Lyons; the eastern part of the province is an immense rich plain, which terminates in the mountains of Franche-Comté and Savoy, and which is watered by the Saone and other rivers that flow into it; the other part of the province is mountainous, and in many places dry and uncultivated. The principal rivers that water it, besides the Saone, are the Seine, the Armançon, the Yonne, the Serain, the Ouche, the Deune, which runs into the Saone near Verdun, the Arroux, the Bourbonnince, the Rhone, the Loire, and the Doubs. The mineral waters of this duchy are those of Apoigni near Seignelay, Premeau near Nuits, Vevelay, Sainte-Reine, and Bourbon-l'Ancy. The province is fertile in various kinds of grain and fruit, tobacco, hemp, and flax; and among its wines, which are excellent, we may reckon those of Nuits, Beaune, Dijon, Vollenay, Pomard, Chassagne, Meursault, Vofne, Savignè, Mercy, Chambolle, Givri, Mercurey, Romaneè, la Tache, Richebourg, Saint-George, and Chamberlin. The mountains furnish excellent pasture for cattle and horses. Its mines afford ores of various metals, particularly iron, different sorts of stones, marble, granite, and also coal, and ochre for dyeing. Its forests supply abundance of wood. It has also various manufactures of iron, wool, linen, and cotton. Its corn, wine, iron, wood, wool, and cattle, furnish the principal articles of commerce. The district of Bresse has subterraneous lakes; and the cave of Arcy, as well as the salt spring of Vezelay, are worthy of notice. The principal towns of Burgundy are Dijon, the capital, Beaune, Chatillon-sur-Seine, Auxerre, Autun, Chalon, Maçon, Bourg, Belley, Gex, &c. Since the revolution, Burgundy is distributed into the departments of the Yonne, Côte d'Or, the Saone and Loire, and the Ain.

The ancient kingdom of Burgundy formed three provinces in the 5th and 10th centuries. The first was that of Provence, which some authors have called the kingdom of Burgundy Cis-Jurana, in reference to mount Jura, now called Mont St. Claud. This was established in 855, in favour of Charles, third son of the emperor Lothario I., and comprehended Provence, properly so called, i. e. the country contained between the Durance, the Alps, the Mediterranean, and the Rhone, together with the duchy of Lyons. The second was formed in 888 on the other side of mount Jura, and called Burgundy Trans-Jurana. It comprehended

little besides Switzerland, the Valais, the Genevefe and Chablais. The third kingdom was that of Arles, founded in 930, by the re-union of the kingdoms of Provence and Burgundy Trans-Jurana, in favour of Rodolphus II., who was before king of Burgundy Trans-Jurana only. The kings of France possessed themselves successively of this state: but the duchy of Burgundy, part of the late government of Burgundy, was never comprehended within the kingdom of Burgundy Cis-Jurana, or in that of Burgundy Trans-Jurana. It formed a distinct state, which continued subject to the kings of France. In the partition which took place in 843 between the sons of Louis-le-Debonnaire, Charles-le-Chauve had the part of the kingdom which was situated to the west of the Saone; and it was governed by dukes. But the power of these dukes gradually advanced to such a height, that one of them, named Rodolphus, in the time of Charles the Simple, was elected king of France. This duchy passed afterwards to Hugh the Great, duke of France, who proved a troublesome neighbour to Rodolph; and his son, Hugh Capet, seated himself and family on the throne of France. His son and successor, Robert, having inherited Burgundy, gave it to Henry, his eldest son, who succeeding to the throne of France, assigned it in 1032 to Robert I., his younger son, who was the head of the first ducal race of Burgundy. This subsisted for 330 years, and became extinct in 1361 in the person of Philip I., who died without issue. King John, being son to a princess of Burgundy, in 1361 united this duchy with the crown, and in 1363 conferred it on his son Philip the Bold, in whom the second ducal line commenced. With his great grandson Charles the Warlike, who lost his life before Nancy in 1477, the second line terminated. Although he left a daughter, Mary, who married Maximilian, archduke of Austria, and John, prince of Burgundy, count of Nevers and Rethel, who did not die till 1491; Lewis XI. seized upon the duchy, and united it to his crown, which has since retained it, notwithstanding the repeated claims and endeavours of the house of Austria to recover it. The various possessions of the dukes of Burgundy rendered them the most considerable power in Europe; and in 1433 a decree of Bayle assigned to Philip the Good the first rank after kings, and named him the first duke of the Christian world. The dukes of Burgundy were the first ancient peers of France. At the king's coronation they bore the crown, and girded on him the sword.

BURGUNDY, *Circle of*, a circle of the German empire, made a part of it in 1512 under the emperor Maximilian. It took its name from the province of Burgundy, now dismembered from the empire, and belonging to France, and has long since ceased to be reckoned among the circles of the empire. It was formerly under the direction and sovereignty of the king of Spain, and comprehend'd not only Higher Burgundy, or Franche Comte, but likewise the 17 provinces of the Low Countries, which in the reign of Charles V. were received as members of the empire.

BURGUNDY *Pitch*, see PITCH.

BURGUNDY *Pitch*, plaster of. See PLASTER.

BURGUARD, *Burgwardus*, or *Burgwardium*, in *Middle Age Writers*, the same with BULWARK. The name is also extended to the town, and even the country about such a fortress. It is formed from the Teutonic *burg*, town, and *ward*, custody, keeping.

BURHANPOUR, in *Geography*, a city of Hindostan, and capital of the Candesh country, and at one period, of the Deccan alio. It is a fine flourishing city, and is situated in the midst of a delightful country. This was one of the earliest conquests in the Deccan; and it is now in the hands of the Poonah, or western Marattas. About 20 miles to

the N.E. of it is a very strong fortress, named Aseer, or Aseegur. It has a considerable trade in fine cottons, white and painted, plain, and mixed with gold and silver, for veils, shawls, handkerchiefs, &c.; 135 miles N. of Aurungabad, and 625 S. of Delhi. N. lat. 21° 19'. E. long. 76° 22'.

BURHANPOUR, a town of Hindostan, in the county of Bengal; 15 miles S. of Moorshedabad, and 100 miles N. of Calcutta.

BURIAH, a river of Hindostan, which runs into the Jannah, 20 miles S. of Delhi.

BURIAL. The act of interring a deceased person.

Of the various modes of burial which have prevailed in the world, it was Cicero's opinion, (*De Leg. ii. 22.*) that *inhumation* was the oldest: and the records of history undoubtedly corroborate the notion. *Burning*, and inclosing the remains in urns, were perhaps never found expedient, till national animosities had given rise to inhuman treatment of the dead.

The common consent of mankind, from the beginning of time to the present moment, has concurred in the propriety and decency of interment: it is a natural act inspired by humanity; a practice, which has been continually observed by enemies in time of war; and but rarely denied in any country, but to those who have violated either the laws of God or nature. The duty of sepulture, and instances of the discharge of it, continually occur in Scripture. David passes high encomiums on the men of Jabez-Gilead who refused the bones of their king and prince from the enemy's walls, and committed them to their family vault. (*2 Sam. ii. 5.*) It is part of the praise of Tobit that he went about burying his murdered countrymen, at the hazard of his life. And Jeremiah threatens it as the greatest of punishments, that the wicked should be deprived of burial, and left on a dunghill: (*Jer. viii. 2.*) or as it is emphatically expressed, buried with the burial of an ass. Herodotus tells us, (*Euterpe. xc.*) that in Egypt, if either a native or a foreigner was found either destroyed by a crocodile, or drowned in the water, the city nearest which the body was discovered was obliged to embalm it, and pay it every respectful attention, and afterwards deposit it in some consecrated place. Iacus brings it as a proof that Cleon was not the son of Astyphylus, because he neither buried him, nor performed his funeral exequies. (*Orat. de Hereditate Astyphyli.*) A law of Athens compelled the burial of a dead body found by accident, and pronounced the refuser impious. Servius on Virgil (*Æn. vi. 176.*) says, writers on moral duties place the duty of interring the dead among the first. It was profanation for a priest to look on a dead body, but the height of impiety to leave it unburied. The Athenians carried their attention to the dead beyond the grave; and Solon, by an express law, forbid any reflections on their character. On this law Plutarch thus comments: "Piety should induce us to reverence the dead; justice should prevent us from intermeddling with the affairs of those who no longer exist; and policy should lead us to prevent the perpetuity of enmity." (*Solon. p. 89. E.*) Demosthenes extends the caution still further: not even any provocation from survivors of the family should urge us to any reflections on the dead; (*In Leptonein, p. 298.*) and every citizen was at liberty to bring an action against the abusive party. (*Ulpian in loc. Demosthenes in Bæotos. p. 588. Suidas.*) The Cynics, however, seem to have regarded burial with contempt; and Pliny (*H. N. l. vii.*) ranks concern about it amongst the weaknesses peculiar to man.

Among the earliest inhabitants of the world, neither the modes nor the appropriate place of burial can now be ascertained. Nor does it seem that the latter, even in the middle

periods of Jewish history, was always particularly determined. For we find they had graves and sepulchres both in the town and country, in fields, upon the highways, in gardens, in their own houses, and upon mountains: though the general custom seems to have been, that the dead should be interred without the city. They appear in many cases also to have thought it a misfortune not to be buried with their fathers. In Genesis (*xv. 15.*) when the affliction of Abraham's posterity was foretold, it was promised that he should go to his fathers in peace, and be buried in a good old age. He afterwards pleads most pathetically with the sons of Heth (*xxiii. 3—13*) for the purchase of a burial place for Sarah. It was in the cave of the field of Machpelah; and it afterwards received the bodies of himself, of Isaac, and of Jacob.

Joseph's body, having been embalmed, and put into a coffin, in Egypt, was brought away by the Israelites when they quitted the country, and buried in a plot of ground in Shechem, which Jacob had purchased of the sons of Hamor (*Gen. l. 25. Josh. xxiv. 32.*) Moses was secretly buried in a valley in the land of Moab, (*Deut. xxxiv. 6.*) and no man knew of his sepulchre. Eleazar, the son of Aaron, was buried on a hill. (*Josh. xxiv. 33.*) Joab, in his own house in the wilderness. (*1 Kings ii. 34.*) Manasseh and Amon, in the garden of Uzza; (*2 Kings xxi. 18. 26.*) and Rehoboam, Aza, Jehosaphat, Joram, Amaziah, Azariah, Jotham and Ahaz, in the city of David, with their fathers. "Joash, too, was buried in the city of David," but not in the sepulchres of the kings. (*2 Chron. xxiv. 25.*)

From the profane writers of antiquity we learn the practice among other nations: and not only from their authority, but from daily observation, we find the high raised *Tumulus* continued a mark of respect amongst the living, and a signal honour amongst the dead in every age of which we have any record. *Barrows* are the most ancient sepulchral monuments in the world: and their contents are as various as the different people that occupied the globe, or the different circumstances by which they were distinguished. The pyramids of Egypt are but barrows of a more solid material: and the church-yard hillock of the present day is but a relic of their universal prevalence. Homer is very particular in describing the barrow of Patroclus. It was first marked out with a circle; the foundations were then laid round the very spot where the funeral pile was still uncooled, and the earth thrown up over them.

Τορῶσαντο δὲ σῆμα, θεμελίαι τε πρὸς βαλοῖο  
 Ἀμφὶ πυρῆν εἶδας δὲ χύθῃν ἐπὶ γαίαν ἔχουσαν.  
 Χειρῆτες δὲ τὸ σῆμα, παλαιὸν κιον.

Il. 4. 255—257.

The remains of the body were collected in a golden urn, but (which is singular) were not lodged beneath the barrow.

Among the distinguished barrows of Greece may be ranked that of Egyptus in Arcadia, which Pausanias describes as not very large, and surrounded by a margin of stone: *Τῆς χωρῆς ἡμεγάλη, λιθῶν κρηπίδι ἐν κυκλίῳ περιεχομένη*: (*Arcad. c. 16.*) and which Homer admired (*Il. B. 603.*), as not having seen a finer. That of Icarus was a small one, on a headland where he was cast away: (*Pausan. Bæot. c. 11.*) and that of Achilles in a similar situation. (*Odyss. 2. 36.*) See BARROW.

With the Egyptians, and the ancient Greeks, (see Plato, *Minos prope fin.*), persons were occasionally buried, as we have already mentioned in the case of Joab, in their own houses: while in other instances hills and rocks were not only receptacles for the ancient inhabitants of Greece, Sicily and Asia, but of the *Persians*, and, to this day, of the Chinese. The general practice of burial, however, among the ancient Persians, is thus related by Herodotus, (*Clio. cxl.*)

"I will

“ I will not affirm it to be true, that these never are interred till some bird or dog has discovered a propensity to prey on them. This, however, is unquestionably certain of the Magi, who publicly observe this custom. The Persians first enclose the dead body in wax, and afterwards place it in the ground.” The custom to which Herodotus here particularly alludes as the exclusive privilege of the Magi, was afterwards universally adopted; and, in part, still continues. The place of burial of the Guebres, at the distance of half a league from Ispahan, is a round tower made of free stone: it is 35 feet high, and 90 in diameter, without gate, or any kind of entrance; they ascend it by a ladder. In the midst of the tower is a kind of trench, into which the bones are thrown. The bodies are ranged along the wall in their proper cloaths, upon a small couch, with bottles of wine, and victuals. The ravens which fill the cœmety, devour them. (Chardin’s Travels.) An exact model of this curious tower is preserved in the British Museum.

Among the Egyptians, the body having been embalmed by persons legally appointed to the exercise of the profession, was returned to the relations, who enclosed it in a case of wood made to resemble a human figure, and placed it against the wall in the repository of their dead. (Herod. Euterpe. lxxxvi.)

The custom of *burning* the dead, to which we have already alluded, is, however, of higher antiquity than we may at first suppose. Saul was burnt at Jabesh, and his bones afterwards buried; and Afa was burnt in the bed which he had made for himself, filled with sweet odours, and divers kinds of spices; but the practice existed, we are assured, neither in Persia nor Egypt: the Persians thought it profane to feed a divinity with human carcases; and the Egyptians abhorred it on another account, being fully persuaded that fire was a voracious animal, which devoured whatever it could seize; and when saturated, finally expired with what it had consumed. The Egyptians also held it unlawful to expose the bodies of the dead to animals; for which reason they embalmed them, fearing lest after interment, they might become the prey of worms. (Herod. Thalia. xvi.) In Persia, too, at the time Herodotus wrote, the custom of *burying alive* was common: and he was told that Amestris, the wife of Xerxes, when she was of an advanced age, commanded fourteen Persian children of illustrious birth to be interred alive in honour of the deity whom they supposed to exist under the earth. (Polymnia, xiv.)

Of the ancient *Ethiopian* practice we have a more minute description, related on the tradition of Cambyse’s spies. “ After all the moisture is extracted from the body, by the Egyptian, or some other process, they cover it totally with a kind of plaister, which they decorate with various colours, and make it convey as near a resemblance as may be of the person of the deceased. They then inclose it in a hollow pillar of crystal, which is dug up in great abundance, and of a kind that is easily worked. The deceased is very conspicuous through the crystal, has no disagreeable smell, nor any thing else that is offensive. This coffin the nearest relations keep for a twelvemonth in their houses, offering before it different kinds of victims, and the first-fruits of their lands. These are afterwards removed, and set up round the city.”

The funeral ceremonies attending the *Scythian* kings were still more singular. They were embalmed, and afterwards transported through the different provinces of their kingdom, till they were at last brought to the Gerghi, in the remotest parts of Scythia. Here the corpse was placed upon a couch, (round which, at different distances, were fixed daggers; and upon the whole, pieces of wood covered with

branches of willow) in a trench, nigh the spot where the Borysthenes begins to be navigable. In some other parts of this trench one of the concubines of the deceased, who had been previously strangled, together with his baker, cook, groom, most confidential servants, horses, and choicest effects, were buried; and a mound as high as possible raised above the whole. (Herod. Melpomene, lxxii.) With regard, however, to the Scythians in general, the practice was more simple. When any one died, the neighbours placed the body on a carriage, and carried it about to the different acquaintance of the deceased; these prepared some entertainment for those who accompanied the corpse; placing before the body the same as before the rest. Private persons, after being thus carried about for the space of forty days, were buried. But the Scythians did not all of them observe the same customs with respect to their funerals: there were some who suspended the dead bodies from a tree, and in that state left them to putrefy. “ Of what consequence,” says Plutarch, “ is it to Theodorus, whether he rots in the earth, or upon it? Such with the Scythians is the most honourable funeral.” The custom is also mentioned by Silius Italicus:

“ At gente in Scythicâ suffixa cadavera truncis,

Lenta dies sepelit, putri liquentia tubo.”

The African Nomades observed the same ceremonies with the Greeks, but the *Nasamones* buried their deceased in a *sitting attitude*; and were particularly careful, as any one approached his end, to prevent his expiring in a reclined posture. (Herod. Melpomene, etc.)

From the anecdotes of burial which have already been detailed, it should seem, that both among the Jews and Heathens, the place of interment was usually without the city. Such, also, was the case with the Athenians, the Smyrnæans, the Sicyonians, the Corinthians, and the Syracusans. The examples of Numa and Servius Tullus prove, that the Romans deposited their dead without the city before the introduction of the twelve tables: and it was a special privilege granted by the senate to particular persons, that they should be buried within the walls; (Cic. de Leg. ii. 23.) and the Jews, at least in the latter days of their existence as a nation, as we learn from the instances of Lazarus, (John xi. 38.) the widow’s son at Nain, (Luke vii. 13.) and the dead that were raised at the crucifixion, (Matt. xxvii. 53.) observed the same place of burial. The *Lacedæmonians*, however, buried within it. It had been a notion universally prevalent, that the touch of a dead body conveyed pollution; and Lycurgus, the legislator of Sparta, was ambitious to remove the prejudice. He not only introduced the custom of burial within the city, but erected monuments near the temples, that the youth might be trained from their infancy to the view of such objects, nor snudder at the spectacle of death.

The ancient Greeks and Romans were strongly persuaded that their souls could not be admitted into the Elysian fields, till their bodies were committed to the earth: and if it happened that they never obtained the rites of burial, they were supposed to remain in a wandering state, excluded from the happy mansions, for the term of 100 years. For this reason it was considered as a duty incumbent upon all travellers who should meet with a dead body in their way, to cast dust or mould upon it three times; and of these three handfuls, one, at least, was cast upon the head.

Of those who were allowed the rites of burial, some were distinguished by particular circumstances of disgrace attending their interment: persons killed by lightning were buried apart by themselves, being thought odious to the gods; (see Plin. ii. 54.) those who wasted their patrimony, forfeited the

right of being buried in the sepulchres of their fathers: and those who were guilty of self-murder, were privately deposited in the ground, without the accustomed solemnities.

The *Athenian* law mentioned by Ælian, (vii. 19.) obliged them to place the body to the west. This was the original position of the Athenians, as Solon shewed in defence of his countrymen's claims to Salamis; for on opening the graves in that island, he proved that the Athenians in it were so buried in a regular manner; but the Megarenian invaders at random, and just as it happened. Laetius (Solone) says, the Athenians, and the scholiast on Thucydides, all the Greeks, lay buried toward the east; that is, as Kuhnus on Ælian, (loc. cit.) properly explains it, with their faces looking to the east, and their heads to the west. This practice among Christians has been supposed to have a reference to the general resurrection. The motive for it among the Heathens has not been assigned.

The Athenian practice, however, with regard to those who died in the defence of their country, was at once so patriotic and affectionate, that it cannot but deserve particular attention. It affords an elevated idea of that polished people. About three days before the funeral, the bones of the slain were placed in a tent raised on purpose, so that every person might have an opportunity to frequent them, and pay the last tribute of a tear. All sorts of odoriferous herbs and flowers were strewed around the tent; and each man brought some in his hand, that he might consecrate them to the manes of his favourite friend. On the fourth day a coffin of cypress was sent from every tribe, to carry off the bones of their own members. After which went an empty covered hearse, in memory of those who could not be found. The procession was carried on with a peculiar decency of sorrow, whilst great numbers of inhabitants, both strangers and citizens, assisted in the train of mourners. The parents of the deceased attended at the sepulchre to weep. No eye could refrain from tears; and the melancholy distress which appeared in the faces of all alike, seemed but a true copy of the sentiments of all. The bones were accompanied in this manner to the public place of burial, situated in a pleasant spot without the city, called *Ceramicus*, and committed to the ground. The monument erected to the valour of these citizens was adorned with pillars, trophies, and inscriptions, such as were usual about the tombs of the most honourable persons, and the ceremony concluded with one speech in praise of them all; the main scope of which was, to animate the living with resolution, by commending the courage of the dead; to infuse a spirit of patriotism into the minds of their fellow citizens, by celebrating the principle of action which incites the valiant to battle. (Thucyd.)

The *ceramicus* was the place where the slain in battle were always buried, except those who fell at Marathon, whose distinguished merit entitled them to a monument upon the spot.

Among the *Romans*, inhumation, we find, was preferred by Numa, the Cornelian family, and Caius Marius; but both Virgil and Ovid speak of burning as the practice before the foundation of Rome; the former (*Æn.* xi. 208.) in the instance of Pallas; the latter (*Fast.* iv. 853.) in that of Remus. Plutarch says, Numa forbade it in his own case; and the law of the Twelve Tables forbade *burning* as well as *burial* within the city. Tacitus (*Ann.* xvi. 6.) says, Poppæa's corpse was not burned according to the Roman fashion. It is a misapprehension of Capitolinus's words to suppose Antoninus prohibited it. Macrobius (vii. 7.) who lived under Theodosius the younger, speaks of it as left

off in his time. (See Mr. Gough's *Sepulchral Mon. of Great Britain.*)

The drapery of the dead among the Romans was the *toga*, which was white in all cases except in that of the poor, who had it black. The magistrates and military men were wrapt in their purple robes of honour, or *toga pretextata*, or other precious garments of various colours. Persons of rank and fortune were buried in their official habits. Mark Anthony gave his own robe to cover the body of Brutus. By the laws of the Twelve Tables crowns were allowed to be worn on these occasions by those who had merited them, and garlands and flowers were cast on the body as it passed. The funerals of great men were conducted at the public expense. But the bodies of the Roman slaves were thrown to rot in holes dug perpendicularly, called *puticuli*. (Phil. Trans. N<sup>o</sup> 265.)

Having thus traced the conformity and occasional variation of practice among the more ancient nations in the article of sepulture, it may be worth while to deduce its history in England.

Both cremation and simple interment were druidical and ancient British fashions. The latter rite, however, was observed with the wild addition of whatever was of use in this life, under the notion that it would be wanted by the deceased in the world below; and in confirmation of this, arms and many singular things, of unknown use, are to this day discovered beneath the places of ancient sepulture. (Pennant's *Tour in Wales*, p. 381.) Barrows were their oldest tombs. Beneath some we find urns; beneath others skeletons; and in many instances, both. (Gough's *Sep. Mon.* I. iv.) The kist-vaen or coffin, composed of rough stones set edgewise, at the sides and ends, was another receptacle of the dead anciently used in Britain; (*Ibid.* p. xvi.) these are frequent in Wales; but seldom found to contain skeletons, or remains of bodies in them. See Dr. Stukeley's *Abury* (p. 13.) of one found in a barrow at Kowldrich; and another (p. 42.) similar, in Monkton field near Abury. Two that were found in Purbeck, on making a turnpike road to Corfe, had skeletons in them. Of this earlier kind and date were the rude stone chests under barrows in Orkney, which contained entire bodies. The Tartarian barrows have absolute stone vaults under them. (*Archæol.* ii. 222.)

The next and last improvement of the stone coffin, was by forming it of a single stone with mallet and tool; and this Dr. Pegge ascribed to the Romans; for he apprehended that during the general prevalence of the customs of cremation and urn-burial among the Romans, they had not always recourse to the funeral pile, but that bodies were sometimes interred whole and in their natural state. (*Sep. Mon.* I. xx.) Instances of Roman coffins of several pieces of stone are cited by Mr. Gough in the *Sepulchral Monuments* (vol. I. p. xxi.); and others, (p. xxvi.) to prove that the Romans used brick coffins, or sarcophagi, in their earliest periods. In the celebrated family vault of the freedmen of Augustus and Livia, discovered by the side of the Appian way about a mile out of Rome, 1725, among a few marble sarcophagi were two of *baked-earth*, made to contain the body whole. The Romans in Britain buried their warriors near the *via strata* or military ways; and hence we may derive the frequent inscription of *SISTE* or *ASPICE VIATOR*.

Woden enacted a law for burning the dead, which not only the *Saxons* and the *Danes*, but the remote *Sarmatæ*, and all the *Scandinavian nations* regularly observed; and tumulated the ashes, with or without urns, as circumstances required. The *Danes* distinguished by this, and the different funeral

funeral ceremonies three several epochs. (Worm. Mon. Dan. p. 40.) The first, which was the same with that in question, was called *Roifold* and *Brentetijde*, or the age of burning. The second, was stiled *Hoigold*, and *Hoiefeltijde*, or the age of tumuli or hillocks. The corpse at this period was placed entire, with all the ornaments which graced it during life. The bracelets, or arms, and even the horse of the departed hero were placed beneath the heap. Money, and all the rich property of the deceased, used to be buried with him, from the persuasion that the soul was immortal (Pomp. Met. l. iii. c. 2.) and would stand in need of these things in the other life.

Among the northern nations, when piracy was esteemed honourable, these illustrious robbers directed that all their rich plunder should be deposited with their remains, (Bartholinus Antiq. Dan. 438.) in order to stimulate their offspring to support themselves, and the glory of their name by deeds of arms. Hence it is we hear of the vast riches discovered in sepulchres, and of the frequent violation of the remains of the dead, in expectation of treasures, even for centuries after this custom had ceased. The third age was called *Christendoms-ald*, when the introduction of Christianity put a stop to the former customs.

From the remarks of the writers who have been already cited, we learn that the custom of burning, among the several nations, ceased with paganism. It therefore fell first into disuse with the Britons; for it was for some time retained by the Saxons after their conquest of this kingdom; but was left off on their receiving the light of the gospel. The Danes retained the custom of urn-burial the last of any: for of all the northern nations who had any footing in these kingdoms, they were the latest who embraced the doctrines of Christianity.

With regard to the barrows or tumuli, so frequent through the country, we have no good criterion by which a correct judgment may be made of the people to whom the different species belong: whether they are British, Roman, Saxon, or Danish. Some of them consist of heaps of naked stones, such as those in the isle of Arran; in many parts of Scotland; and in some parts of Cornwall. Others are composed with stones and earth, nicely covered with earth and sod. And they were sometimes of earth only. The size of the tumulus usually marked the quality of the person: and the earth and sods which were skimmed and paired from the surface round it, were lightly heaped up, and conferred on the deceased the last good wish, *Sit tibi terra levis*. The generality of these were round; but others were conical; and some, as on the plains of Wiltshire and at Rollwright, of an oblong form. Finally, other places of ancient sepulture consisted only of a flat area, encompassed like the druidical circles, with upright stones; and such were those of Ubbo, and of king Harald in Sweden. (Suecia Antiqua and Hodierna, tab. 315.)

The urns are also found placed in different manners, with the mouth resting downwards upon a flat stone, secured by another above; or with the mouth upwards, guarded in a like way.

Very frequently the urns are discovered lodged in a square cell composed of flags; and sometimes more than one of these cells are found beneath a *carn* or *tumulus*. Mr. Pennant even met with no fewer than seventeen, near Dupplin in Perthshire, disposed in a regular form. The urns found in these cells are usually surrounded with the fragments of bones that had resisted the fire; for the friends of the deceased were particularly careful to collect every particle; which they placed, with the remains of the charcoal, about the

urns, thinking the neglect of it the utmost impiety. (Pennant's Tour in Wales, loc. cit.)

The introduction of Christianity made a great alteration in the mode of burying the dead. Cremation ceased. The believing Romans betook themselves to the use of sarcophagi. The Romanized and converted Britons would naturally do the same. The Saxons as the successors of the Britons inclined from the very first to adopt their practices. And after the arrival of St. Austin in 596, and the consequent conversion of the nation, as well as the mode of placing the body to the east, universally took place. The oldest instance of a coffin that we know of in the Saxon times, was that of Etheldreda in 695 (Sep. Mon. l. xxvii.); and from this time downward, stone coffins have been continually discovered in every part of England. They may be regularly traced among us from the ninth century to the reign of Henry III.: and in some cases to that of Henry VIII. (Gent. Mag. 1759. p. 66.)

In the Norman times it was the custom to bury monks in the bare ground. Warin, the twentieth abbot of St. Albans, in 1195, ordered that they should be buried in stone coffins as more decent. (Matt. Paris, vit. ab. Albani p. 95.)

Among the primitive Christians burying in cities was not allowed for the first 300 years, nor in churches for many ages after; the dead bodies being first deposited in the atrium or church-yard, and porches, and porticoes of the church. On the introduction of Christianity into this country, a regular form of disposing of the dead bodies took place. The altar in the first Christian basilicæ was placed in the east of it, under a window, to receive the first advantage of light, or in conformity with what is said of our Lord's ascension. The people for greater regularity in worship were taught to look towards the altar; and the dead for a similar reason, were buried with their faces the same way; except the priests who were ordered by the same authority to face the congregation. The reason alleged by Gregory the Great for burying in churches or in places adjoining to them, was that their relations and friends, remembering those whose sepulchres they beheld, might hereby be led to offer up prayers for them. Hence too that striking and solemn address which marked the epitaphs of the monkish ages: *Orate pro anima miserimi peccatoris*. Gregory's reason was afterwards transferred into the body of the canon law. To this superstition and the profit arising from it, we may ascribe the original of church-yards. In the eighth century, the people began to be admitted into them, and some princes, founders, and bishops, into the church. The practice, first introduced into the Romish church by Gregory the Great, was brought over here by Cuthbert, archbishop of Canterbury, about the year 750: and the practice of erecting vaults in chancels and under the altars was begun by Lanfranc, archbishop of Canterbury, when he had rebuilt the cathedral there, about 1075. From that time the matter seems to have been left to the discretion of the bishop.

It was remarked to the writer of the present article by a learned antiquary, who is now no more, that in ancient times in this, and perhaps in other countries, then Roman Catholic, interment was never practised on the north side of the church. An opinion prevails that it was left for malefactors, for the unbaptized, for suicides, and for such as had incurred the greater censure of the church: and common observation will confirm the fact, at the present moment, that many more graves occur on the south than on the north sides of our churches. An extract from a letter  
of

of Mr. Samuel Denne (the gentleman above alluded to) affords a curious illustration of what has been asserted. "There is reason to believe that fifty years ago the north side of the church-yard of Wilmington (in Kent), might be unoccupied by corpses; and in 1733, on digging a grave to the north of John Chapman's head-stone, for the interment of Richard Harman of Stonehill, not a human bone was found, nor were there any marks of the ground's having been before moved. But in 1745 and 1746, when the hospital of the regiments of infantry, encamped upon Dartford heath, was in the mansion house formerly belonging to the Langworth family, 35 soldiers who died in the hospital were buried in this spot.

"On opening the ground for the interment of one of them, midway between the wall of the church, and the fence of the church-yard, and about ten feet to the west of Mr. Fowke's tomb, John Woodmansey, the parish clerk, discovered an earthen pot containing money, of silver. The quantity was not known, nor does any attention seem to have been shewn to the date of the pieces last coined. In consequence of this omission there is an ignorance of one circumstance that might nearly have ascertained in which national commotion this treasure was concealed. It is, however, an obvious remark that the owner of it thought this quarter of the church-yard a very secure place, which adds weight to the opinion, I have already hinted, that the parishioners of that age had an insuperable objection to the burying of their relations and friends behind the church."

In regard to the rites of burial as they are practised in the more distant quarters of the globe, our observations will be few. In *Japan*, *Peru*, *Pegu*, *Mexico*, *Tartary*, *Siam*, and the *Great Mogul's dominions*, the dead are burned: and for people of superior consideration the fires are made with aromatic woods, gums, balsams, and oils. In *China*, we are told it was formerly the custom to bury slaves with emperors and princes, and sometimes also their concubines alive; but this cruel practice has given way, in modern times, to the more harmless one of burning representations of their domestics in tin foil, cut into the shape of human beings, and of placing their statues in wood or stone upon their graves; this seems to be the remain of the Scythian custom which has been already quoted from Herodotus. The last remains of a relation are interred with all the honours that the family can afford. (Barrow's Travels in China, p. 483.)

Among the *Birmans* the deceased is burnt, unless he is a pauper, in which case he is either buried or cast into the river, as the ceremony of burning is very expensive. When the pile has been reduced to ashes, the bones are gathered and deposited in a grave. Symes's Ava. p. 314.

With every different tribe among the *Hottentots*, we are assured, the funeral ceremonies are alike. The deceased is thrust either naked, or with his pelisse on, into a hole in the earth, or subterraneous passage, where the body usually becomes the prey of some wild beast: though the relations generally thrust brush-wood or bushes into the aperture of the hole or passage. (Sparman's Voyage to the Cape of Good Hope, i. 358.) Another custom of a more horrid nature is likewise related on the same authority; Sparman says, that it is a common practice, in case of the mother's death, to inter children at the breast alive. In *New South Wales*, the dead are burned, afterwards deposited in the ground, and a funeral hillock raised upon the ashes. (Hunter's Voyage to New South Wales, p. 64.) Lastly, we shall mention, the custom of burial among the *South Sea Islands*. At Otaheite the inhabitants bury none in the *Morai*, but those offered in sacrifice, or slain in battle, or

the children of chiefs which have been strangled at the birth: An act of atrocious inhumanity too common. When a person of eminence dies, even if a child of the superior class, he is preserved and not buried, unless he died of some contagious or offensive disease. They take out the viscera, and dry the body with cloth, anointing it within and without with the perfumed oil, and this is frequently repeated. The relations and friends, who are absent, perform their part of the funeral rites at their arrival, each female presenting a piece of cloth to the corpse; and they continue to dress and decorate the body as if alive, and to furnish it with provisions, supposing that the soul which hovers round receives satisfaction from such marks of attention; they therefore not only take care of it thus, but repeat before it some of the tender scenes which happened during its life time. While any offensive smell remains they anoint the corpse with sweet scented oil, and surround it with garlands of flowers. A dead chief is usually carried round the island to the different districts where he had property, or where his particular friends reside; and the funeral ceremony repeated: but after a tour of some months, he is brought to rest at the place of his usual residence. Some bodies are preserved like dried parchment; others, when the flesh is mouldered away, are burned. (See the First Missionaries Voyage, p. 363, 364.)

By our common law, the granting of burial within the church is the exclusive privilege of the incumbent: except in cases where a burying place is prescribed for as belonging to a manor-house. (Gibson. 453.) The church-wardens, by custom, have, however, a fee for every burial there, by reason the parish is at the expense of repairing the floor. (Watson's Clergyman's Law, cap. 39.)

By the statute, 30 Car. 2. ft. 1. c. 3. for the encouragement of the woollen manufactures, and prevention of the exportation of money for the importing of linen, it is enacted, that no corpse of any person shall be buried in any shirt, shift, sheet, or shroud, or any thing whatsoever made or mingled with flax, hemp, silk, hair, gold, or silver, or in any stuff or thing, other than what is made of sheep's wool only; on pain of 5l. And an affidavit shall be made for this purpose either to a magistrate or the officiating minister.

By the canons of the church (Can. 68.), no minister shall refuse or delay to bury any corpse that is brought to the church or church-yard (convenient warning thereof being given him before) except the party deceased were denounced excommunicated *majoris excommunicatione*, for some grievous and notorious crime, and no man able to testify of his repentance. There were anciently other causes of refusal, particularly of heretics, against whom there was an especial provision in the canon law, that if they continued in their heresy they should not have christian burial: though no instances of its enforcement occur subsequent to the period of the reformation. They who had not received the holy sacrament, at least at easter, were excluded from Christian burial by a law of the Lateran council, which became afterwards a law of the English church. In like manner, persons killed in duels, tilts, and tournaments. But, at this day, these prohibitions are restrained to the excommunicate, the unbaptized and suicides.

BURIAL, *Christian*, is often used to denote that which is performed in holy ground, and with the usual service or ceremonies of the church.

BURIAL is also used to denote the dues paid for interment, especially to the minister. The burial fee paid to the priest on opening the grave, was called by our Saxon ancestors *soul-fee*. Phil. Transf. N° 189.

**BURIAL** of an *afs*, *afni feputura*, an ignominious kind of burial out of holy ground, under the gallows, or in a highway, where several roads meet, and performed by public hangmen, or the like. Such is that of suicides, excommunicated persons, &c. sometimes denominated canine burial, or burial of a dog.

In the middle age we also find mention of a peculiar kind of burial, called **IMBLOCATION**, practised on the bodies of persons excommunicated. Du-Cange.

**BURIAL** of the *crucifix*, *Sepultura crucifixi*, denoted a representation of the burial of Christ, anciently performed annually in churches on the day of the Parasceue. Du-Cange.

**BURIALS**, in computations of mortality, denote deaths, and stand opposed to births. In this sense, we have estimates of the burials in Brandenburg, in Frankfort, Breslaw, &c. Phil. Trans. N<sup>o</sup> 261, 220. and 176.

By a statute under King Charles II. a register is to be kept in every parish, of all persons buried within the same, or at the common burial-places thereof. Stat. 33 Car. II. c. 3. See **MORTALITY**.

**BURIAL** is also used for the inclosing of vegetable or mineral bodies in the ground, for divers purposes. Lord Bacon gives divers experiments of burying fruits, &c. for preservation and condensation, and to give nourishment to their respective trees. Works, tom. iii. p. 80.

Some commend burials in the earth, others in wheat, to season timber when first felled, and to make it of more durable use. Chemists sometimes bury their cements. The Chinese are said to bury their porcelain, to give it the greater beauty.

**BURIANA**, in *Geography*, a town of Italy, in the territory of Sienna, near the lake of Castiglione; 16 miles S. of Montieri.

**BURIAS**, or **BURIN**, one of the Manillas or Philippine Islands, south of Luzon, about five miles in compass, inhabited by a few tributary Indians, who are comprised in the parish of Mabate, which is another larger island south of it, and not far distant from Ticao. N. lat. 12° 30'. E. long. 122° 0'.

**BURICH**. See **BUDERICH**.

**BURICH**, is also a town of Germany, in the circle of Swabia, and margraviate of Baden-Durlach: five miles from Philipsburg.

**BURIDAN**, **JOHN**, in *Biography*, a celebrated schoolman of the 14th century, was a native of Bethune, and became professor in the university of Paris, and, as some say, regent in 1320. Aventine relates, that he was a disciple of Ockam, and being attached to the sect of the Nominals, was obliged by the prevalence of that of the Realists to quit Paris, and to remove to Germany, where he founded the university of Vienna. He wrote "Commentaries on Aristotle's Logic, Ethics, and Metaphysics;" but he has been principally remarkable on account of the sophism or argument, commonly called "Buridan's Afs." This seems to have been introduced for the purpose of illustrating the doctrine of that necessity of yielding to impressions of the senses under which beads are placed, and in which they are supposed to differ from man, who possesses free-will, or an internal self-determining power. With this view, Buridan feigned an hungry afs, placed between two measures of oats, in such a manner, that each made exactly the same impression on his senses; in which case, for want of a power of chusing one rather than another, he must die of hunger. The term "Buridan's Afs," has been since proverbially used to denote difficulty and hesitation in determining between two objects. Gen. Dict.

VOL. V.

**BURIE**, in *Geography*, a town of France, in the Lower Charente, and chief place of a canton, in the district of Saintes; the place contains 1510, and the canton 10,288 inhabitants; the territory comprehends 127½ kilometres, and 12 communes.

**BURIGNY**, **N. LEVESQUE DE**, in *Biography*, an estimable man of letters, was born at Rheims in 1691, and devoting himself to literary pursuits, acquired universal respect for the mildness and simplicity of his character. He was a member of the Parisian academy of belles lettres; and prolonged his life, with the exercise of his faculties, to his 94th year. His works are "A Treatise on the Authority of the Popes," 1720, 4 vols. 12mo. "History of Pagan Philosophy," 1724, 12mo., and 1754; "General History of Sicily," 1745, 2 vols. 4to.; "A Translation of Porphyry on Abstinence from Flesh," 1747, 12mo.; "History of the Revolutions of Constantinople," 1750, 3 vols. 12mo.; "The Life of Grætius," 1754, 2 vols. 12mo.; "of Erasmus," 1757, 4 vols. 12mo.; "of Bessuet," 1761, 12mo.; "of Cardinal du Perron," 1768, 12mo.; all in French. His works, which in their general character are correct, but diffuse and languid, are esteemed as valuable collections of authentic facts. Nouv. Dict. Hist.

**BURIS**, in *Surgery*, a name given by Avicenna, and some other old authors, to a scirrhus hernia, caused by a hard abscess.

**BURKA**, in *Geography*, lies in the island of Angra, in the gulf of Ballora, and has a spacious harbour, with plenty of water. See **ANGRA-Island**.

**BURKE**, **EDMUND**, in *Biography*, was born in Dublin, on the first of January, 1730. His father was an attorney of the Protestant persuasion. The son was placed, during the early part of his education, under the care of Abraham Shackleton, a Quaker schoolmaster of considerable merit, for whom his illustrious pupil entertained so large a share of affection through life, as never to omit paying him an annual visit of gratitude and respect, during a period of forty years. From Ballymore near Carlow, the residence of Shackleton, Mr. Burke was removed, at the age of sixteen, to Trinity College, Dublin. It is understood that he was more attentive to the instructions of his country schoolmaster, from whom he early derived much of his multifarious knowledge, than to the more regular discipline of tuition, instituted by the university. He gained no prize; but he obtained his scholarship, during the second year of his residence, which proves him at least not to have been deficient in classical attainments; for of such are that honour and emolument the reward. He was contemporary with Goldsmith; but it does not appear that any friendship commenced between these two great men, till after the poem of the "Traveller" had established Goldsmith's reputation. There is no foundation whatever for the opinion, that Burke was bred a Catholic; and it seems now generally agreed, that he did not finish his studies at St. Omer's. He was a candidate for the professorship of logic at Glasgow, but was too late in his application. On this disappointment, he repaired to London in 1749, after having taken his bachelor's degree, and entered himself a member of the Temple, with a view of being called to the bar.

At this time, the narrowness of his finances reduced him to the necessity of writing for the periodical papers; to which, he contributed essays on literary and political topics: but though the sphere in which he moved was not that of pleasure and fashion, he procured an introduction to the celebrated Mrs. Woffington, the actress, in whose society he passed many of his leisure hours. The severity with which he applied himself both to composition and study, having

considerably affected his health, Dr. Nugent was called in, who removed him from the inadequate accommodations of the Temple to the comforts of his own house. The attention of the family, and the particular kindness of Miss Nugent led to a matrimonial connection, in which Mr. Burke's expectations of domestic happiness were fully answered.

Mr. Burke's first acknowledged publication was, "A Vindication of natural Society; or a View of the Miseries and Evils arising to Mankind, from every Species of artificial Society;" written in imitation of lord Bolingbroke, for the purpose of attacking ironically that writer's philosophy, and exposing its injurious consequences. It did not meet with the reception which has since been thought to have been justly due to its merit as a composition.

He was not however discouraged by this failure from publishing his "Essay on the Sublime and Beautiful," which had been composed prior to the "Vindication," but reserved for the advantage of making a first appearance under cover of a well-known and admired character. Both these works came out in 1756.

Though there was no name to the "Inquiry," the first edition was sold within the year, and a second published in 1757, with an "Introductory Discourse concerning Taste." The applause which attended this performance was not temporary, nor the connections consequent on it without permanent advantage. It procured him relief from his pecuniary embarrassments, and an easy introduction to the circles of the first rank and abilities. Among the first who sought his acquaintance, were Dr. Johnson and sir Joshua Reynolds, to whom he has been supposed to have furnished the composition of the "Discourse to the Royal Academy." Much has been said on the subject; but there seems no reason for depriving the late illustrious president of the fame attached to an excellent writer, as well as an original and accomplished artist.

It was Mr. Burke's intention to have controverted the theories of Berkeley and Hume: he then thought of rivaling the historic labours of the latter in "Memoirs of his own Times;" for this purpose, he had made himself master of English history, especially since the revolution; and the project ended in the establishment of Dodley's "Annual Register," a very valuable work, of which he had the principal direction from 1758 to 1789.

In 1761, he accompanied "Single-Speech Hamilton" to Ireland. This latter gentleman made one very excellent speech in the English, and one more in the Irish house of commons; and Mr. Burke has been said to have been the composer of both these speeches, but probably with as little reason as in the case of sir Joshua's discourses. On Mr. Burke's return from Ireland, with a pension of 300l. per annum, it was no longer necessary to write for periodical publications. He, however, contributed occasionally to the "Public Advertiser," where the excellence of his writings introduced him to the notice of the marquis of Rockingham, while Mrs. Woffington recommended him to the duke of Newcastle. He accordingly became private secretary to the marquis, at the instance of Mr. Fitzherbert, and member for Wendover on lord Verney's interest, and thus commenced his political career.

In February 1764, was founded that club, which afterwards became distinguished by the title of the *Literary Club*. Sir Joshua Reynolds was the first proposer, and Johnson acceded to the plan, in the hope of enlarging his circle, and recovering the opportunities for conversation, which he had lost by the dissolution of the meeting in Ivy-Lane. The original members of the literary club were, besides the two

founders, Mr. Burke, Dr. Nugent, Mr. Beanclerk, Mr. Langton, Mr. Chamier, sir John Hawkins, and Goldsmith. They met at the Turk's Head, in Gerard street, Soho, on every Monday evening through the year.

About the time of Mr. Burke's entrance on public life, men's minds were equally agitated by the measures of government respecting Mr. Wilkes, and the growing discontents in America. Of the two parties in opposition, that of Mr. Pitt having insisted on very peremptory conditions, respecting court favourites and secret advisers, the duke of Newcastle, of whose party, on account of his age and infirmities, the marquis of Rockingham was considered as the leader, closed with the terms on which a new administration was proposed. Mr. Burke now, with a facility to which he was too prone, seceded from his old friendship with Mr. Hamilton; but he is said, at the same time, to have resigned the pension procured through that gentleman's interest. From this time he became a professed party-man; a bondage to which he was in some measure compelled, by laying himself under pecuniary obligations to the marquis of Rockingham. The nature and extent of the favour he received have been variously represented; but it is certain, that a considerable part, if not the whole of the purchase money for his villa at Beaconsfield, of which he now took possession, was promised either as a loan or a gift by the marquis.

On his entrance into parliament, he took infinite pains to qualify himself for the discharge of his new duty. Among other sources of improvement, he disdained neither the writings of the fathers, the subtleties of the school divines, the perusal of precedents and records, nor the oratorical contents of the Robin-Hood society. His principal opponent at the Robin Hood was a baker, of whom Goldsmith said, that "Nature intended him to have presided in the court of chancery." He procured his seat in 1765, and his first speech was on the stamp act. It attracted the notice, and obtained the applause of Mr. Pitt: Mr. Burke was principally consulted by the Rockingham administration on the affairs of America, and the middle course was adopted in conformity with his advice. The weakness of the party, and the feebleness of their policy, soon brought the ministry to a close; and its dissolution was hastened by Mr. Burke's project of a Canadian constitution, which lord Northington condemned in the most angry and contemptuous language. Mr. Pitt then made his own terms, as he thought, with the court. Mr. Burke had scarcely time to defend the conduct of his friends in print, before their successors resigned, and the parliament was dissolved. Mr. Burke was re-elected for Wendover, the Grafton ministry came into power, and Mr. Burke was the principal orator of opposition. He was adverse to the expulsion of Wilkes, and made an able speech to prove his subsequent eligibility, though he disliked the general character of the man. About this time, the letters of Junius began to appear; and on this occasion, the public have not lost sight of their propensity to attribute all able composition to Mr. Burke. There seems to be not the least foundation for supposing him to have been their author. He, however, gave his opinions and principles at considerable length, in his "Thoughts on the Causes of the present Discontents." The leading features of this pamphlet were, a pointed invective against inner cabinets and secret influence, and a picture of what a house of commons ought to be. Those who seek in this work for proofs of political apostacy in later life, will not find the evidence so decisive as they expect. The remedies proposed were not those of democracy, but of a fellow-feeling to be established between the aristocracy and the people. As a proof that

the views of the author did not even then rise up to the expectations of the whig-party in general, he was attacked by Mrs. Macaulay, as well as by the friends of the court.

While lord North was minister, the impetuosity of systematic opposition seems to have carried Mr. Burke's vindication of freedom further than was compatible with that fondness for ancient establishments, which always existed in his mind, and became so much stronger in the latter part of life. He took a distinguished part in the debates on the liberty of the press. During the whole of the American war, he uniformly opposed the minister with zeal and ability, and defended the people with warmth and energy. His habits during this period were those of sobriety and literary industry, as well as of parliamentary vigilance and exertion.

It is to the credit of both parties that political differences made no breach between Burke and Johnson. The latter, on taking leave of his host at Beaconsfield, wished him all the success on his canvass at Bristol, which "could possibly be succeeded him by an honest man."

The famous Bristol election took place in 1774, when Burke and Cruger, an American merchant, turned out lord Clare and Mr. Brickdale, the former representatives. So little assistance did Mr. Burke derive from Mr. Cruger's eloquence on the hustings, that the constant and only speech of the latter was, "I say ditto to Mr. Burke! I say ditto to Mr. Burke!"

It would exceed the limits of this article to detail Mr. Burke's controversy with Dean Tucker, or the part which he took on every great political question. It is necessary, however, to mention, that on the question of parliamentary reform, the Rockingham branch of opposition opposed the measure; and the duke of Richmond, lords Shelburne, Chatham, and Camden, Mr. Dunning, and Mr. Fox defended it.

The leading features of Mr. Burke's political conduct, while pay-master general in the Rockingham and Fox administration, was the adoption of the plan for economical reform, which had been rejected by the house of commons in 1780. It however underwent several modifications. The political convulsions which ensued on lord Rockingham's death, are well remembered. The coalition, and the India bill were suggested and pushed forward with much ardour by Mr. Burke, and principally, if not entirely, produced that decline of popularity, which both himself and his friends experienced.

The event in which Mr. Burke stood most prominent before the public, in the interval between the formation of Mr. Pitt's ministry, and the French revolution, was the impeachment of Mr. Hastings. His speeches on this occasion were among the most splendid triumphs of his eloquence, though not among the most solid attestations of his judgment. They were marked by intemperance and exaggeration, apparently produced rather by the ambition of rivaling Tully in his eloquent and classical abuse, than arising from a sober examination of facts, or a serious conviction of guilt. The charges of avarice and malice have never been adequately supported, and can only be mentioned to be denied in grave and impartial biography.

Mr. Burke had never been remarkable for an even temper in the discussion of political questions: his irritability increased with his years, and his conduct became intemperate and violent. He injured the cause, and incurred the displeasure of his associates on the question of the regency, and burst asunder all the ties of friendship, as well as political connection, on the breaking out of the French revolution. That event, together with the conduct and opinions of Mr. Burke relating to it, is so recent, that it will be sufficient barely to enumerate his publications on the subject, with

the single observation, that he seems from this time forward to have cherished his aristocratical principles into the most inveterate bigotry, and to have negatived in turn every maxim of practical freedom, which he had formerly enforced. Still, however, it is to be hoped, that his measures, as a public man, may candidly be attributed to impracticality of character, and ductility of imagination, rather than to any worse motives.

The celebrated "Reflections" were published in October 1790, which were first answered by Dr. Priestley, in vindication of his friend Dr. Price, and afterwards by Thomas Paine in his "Rights of Man."

The next publication of Mr. Burke was his "Second Letter to a Member of the National Assembly;" and the third, his "Appeal from the new to the old Whigs," in consequence of the publication from the whig club, declaring Mr. Fox to have maintained the pure doctrines of English whiggism.

In 1791, Mackintosh's "Vindiciae Gallicae" appeared, and Mr. Burke's principal publications afterwards were, his "Letter to Lord Fitzwilliam," and "Thoughts on a regicide Peace."

On the close of Mr. Hastings's trial, Mr. Burke retired from parliament; but his domestic comfort was irretrievably impaired, and his life probably shortened by the death of his son, in the year 1794. The father survived three years, which were principally employed in acts and schemes of benevolence to the French emigrants and their families. He retained his faculties in perfection to the last, and died without bodily struggle, or discomposure of mind, on the 8th of July, 1797.

The qualities of Mr. Burke's mind will be best exemplified by a few of his opinions on literary subjects. Virgil and Lucretius were his favourite Latin poets. He preferred the satires and epistles of Horace to the odes. He esteemed the Greek historians and orators more highly than the Latin. The delineation of ancient manners and characters in Homer delighted him; and he read the *Odyssæ* more frequently than the *Iliad*. Among the dramatic writers, he gave the preference to Euripides over Sophocles. The modern authors with whom he was most pleased, were Bacon, Shakspear, Addison, Le Sage, and Fielding. He thought Richardson far inferior to the latter: he did not like Swift, and had a very poor opinion of Gay; particularly of his "Beggars' Opera."

He paid much attention to farming, and displayed taste in his improvements at Beaconsfield. He was one of the most successful gentlemen farmers, and constantly supplied his family in town from the produce of his own estate. He was particularly hospitable, and indulged in the pleasures of the table, but never to excess. He was liberal to common beggars; and ascribed the ordinary principle of discouraging them, rather to avarice than policy.

As a speaker, Mr. Burke was characterised by a superfluity of ideas and images, often too abundant to be applied with propriety, or selected and arranged with judgment. Early in life, he was remarkably careful of his language, and revised his speeches with attention. Latterly, he became blameably diffuse and extravagant, though his ingenuity never failed. He was particularly ambitious of excellence in the management of his voice and action; yet, after all, the former was but harsh, and the latter forcible, but strained.

His "Essay on the Sublime and Beautiful" has placed him in the highest class of writers on subjects of taste and criticism; nor can his whole character be summed up with so much strength, conciseness, and truth, as in the memorable

able words of Johnson: "Burke is one, with whom, if you were to take shelter from a shower under a gate way, you would say you had been in company with the most extraordinary man you had ever seen."

BURKE, in *Geography*, a county of America, in Morgan district, North Carolina, containing 8118 inhabitants, of whom 595 are slaves. Its capital is Morgan-town.

BURKE is also a county in the lower district of Georgia, containing 927 inhabitants, of whom 515 are slaves. Its chief towns are Louisville and Wayneborough.

BURKE is also a township of Caledonia county, in the state of Vermont; distant 134 miles N. E. from Bennington.

BURKEN, a town of Germany, in the circle of the Lower Rhine and electorate of Mentz; 27 miles E. of Heidelberg.

BURKERSDORF, a royal town, with a citadel, of Austria, in the circle below the forest of Vienna, lying on the rivulet of Wien.

BURKHAUSEN, a well-built town of Germany, in the circle of Upper Bavaria, seated on the Salza, with a castle on a hill, the capital of a regency, and having 4 churches, and a Jesuits' college; 26 miles N. N. W. of Saltzburgh.

BURKHEIM, or PURKHEIM, a town of Germany, in the circle of Bavaria, and duchy of Neuburg; 7 miles W. S. W. of Neuburg.

BURKI, a town of Poland, in the palatinate of Kiev. N. lat. 48° 50'. E. long. 32° 6'.

BURKITT, WILLIAM, in *Biography*, was born at Hitcham in Northamptonshire in 1650, and, after a previous grammatical education, was admitted, at the age of 14 years, into Pembroke-hall in the university of Cambridge. Upon taking his degree, he quitted the university, and became chaplain in a gentleman's family. His first settlement, after his ordination by bishop Reynolds, was at Milden in Suffolk, where he continued to officiate for 21 years, first as curate, and afterwards as rector, and where he was much esteemed as a plain, practical, affectionate preacher. In 1692 he exchanged this situation for the vicarage of Dedham in Essex, where he died in 1703. His character was distinguished for piety and charity. He was active in making collections for the relief of the French protestants in 1687, &c. and in procuring the settlement of a worthy minister in Carolina: and by his last will he provided for the accommodation of a lecturer at Dedham. He has been principally known as a writer by his "Commentary on the New Testament."

BURKUNSTADT, in *Geography*, a town of Germany, in the circle of Franconia, and bishopric of Bamberg, seated on the White-Mayn.

BURLAMAQUI, JOHN-JAMES, in *Biography*, an eminent civilian, was descended of a noble family, originally from Lucca, and born at Geneva in 1694; where he became honorary professor of jurisprudence in 1720. After travelling into France, Holland, and England, he commenced the exercise of his functions, and rendered his school famous and flourishing. One of his pupils was prince Frederic of Hesse-Cassel, who, in 1734, took him to his residence, and detained him there for some time. Upon his return to Geneva, he surrendered his professorship; and in 1740 entered into the grand council; and, as a member of this illustrious body, he continued to serve his fellow-citizens till his death, in 1750. As a writer, he was distinguished less by his originality than by his clear and accurate method of detailing and illustrating the principles of others; among whom are Grotius, Puffendorf, and Barbeyrac. His works are, "Principles of Natural Law," 4to. Geneva, 1747, often

reprinted, translated into various languages, and long used as a text-book in the university of Cambridge; and "Political Law," 4to. Gen. 1751; a posthumous work, compiled from the notes of his pupils. Burlamaqui was much esteemed in private life; and respected as a lover of the fine arts, and a patron of artists. He had a valuable collection of pictures and prints; and a medal of him was executed by Daffier in a style of superior excellency. Nouv. Dict. Hist.

BURLATS, in *Geography*, a town of France, in the department of the Tarn, and district of Castres, 4 miles east of it.

BURLAW, or BYRLAW, *bur-lawa*, in *Middle Age Writers*, denotes country laws, or the laws concerning country affairs. Du-Cange. See BYE-LAW.

BURLEIGH, in *Biography*. See CECIL.

BURLESQUE, a jocose kind of poetry, chiefly used in the way of drollery, either to excite laughter merely, or to provoke derision and ridicule. Of the former kind is "Virgil travestie," which degrades a grave subject, by a certain colouring, so as to be risible; and of the latter, the "Lutrin" of Boileau, which lays hold of a low and trifling incident to expose the luxury, indolence, and litigious temper of a set of monks. This kind of burlesque produces effect by elevating the style far above the subject, and yet affecting to consider it as of the utmost dignity and importance. In a burlesque poem, such as the Lutrin, the Dispensary, and Hudibras, machinery may be employed with greater advantage than in any other species of poetry; and the more extravagant the machinery in a ludicrous poem, the greater is the entertainment which it affords. "Burlesque," says Mr. Shentone, (Works, vol. ii. p. 182. 3d edit.) "may, perhaps, be divided into such as turns chiefly upon the thought, and such as depends more upon the expression; or we may add a third kind, consisting in thoughts ridiculously dressed in language much above or below their dignity. The Splendid Shilling of Mr. Philips, and the Hudibras of Butler are the most obvious instances. Butler, however, depended much upon the ludicrous effect of his double rhymes." Dr. Johnson, in his life of Butler (Lives of the Poets), after observing, that "burlesque consists in a disproportion between the style and the sentiments, or between the adventitious sentiments and the fundamental subject," adds, that this, "like all bodies compounded of heterogeneous parts, contains in it a principle of corruption. All disproportion is unnatural: and from what is unnatural, we can derive only the pleasure which novelty produces. We admire it a while as a strange thing; but, when it is no longer strange, we perceive its deformity. It is a kind of artifice, which by frequent repetition detects itself; and the reader, learning in time what he is to expect, lays down his book, as the spectator turns away from a second exhibition of those tricks, of which the only use is to shew that they can be played."

F. Vavassor maintains, in his book "De Ludicra Dictione," that burlesque was absolutely unknown to the ancients; against the opinion of some others, that one Raintovius, in the time of Ptolemy Lagus, turned the serious subjects of tragedy into ridicule; which, perhaps, is a better plea for the antiquity of farce than of burlesque.

The Italians seem to have the justest claim to the invention of burlesque. The first author in this kind was Bernia; he was followed by Lalli, Caporalli, &c. From Italy it passed into France, and became there so much the mode, that in 1649 appeared a book under the title of "The Passion of our Saviour, in Burlesque Verse." Thence it came into England; but the good sense of the English never adopted nor owned it, notwithstanding one or two have excelled in it.

**BURLETTA**, Ital. from *burlesco*, to jest, be jocular, deride, turn to ridicule, in *Musie*. It is extraordinary that the term burletta, so common in speaking of comic operas, appears in no musical dictionary. Comic operas began by an *intermezzo*, a single act or scene, as an act tune between any two acts of a drama. See **OPERA BUFFA**.

**BURLING** of *Cloth*. See **CLOTH**.

**BURLING Iron**, an instrument used by the manufacturers of cloth, and borne in the arms of the company of weavers at Exeter.

**BURLINGS' Rocks**, in *Geography*, lie on the coast of Portugal, 14 leagues about N. N. W. from cape Roque, commonly called the rock of Lisbon, and 18 leagues S. W. from cape Montage. Behind the Burlings are a good road and anchorage, under the great island before the Hermitage, and 10 fathoms water. N. lat.  $39^{\circ} 20'$ . W. long.  $9^{\circ} 37'$ .

**BURLINGTON**. See **BRIDLINGTON**.

**BURLINGTON**, a county of America, in New Jersey, extending across from the Atlantic ocean on the S. E. to Delaware river, and part of Huntingdon county on the N. W., in length about 60 miles. A great part of it is barren; but about three-eighths of it are under cultivation, generally level, and well-watered. It has 18,095 inhabitants, including 227 slaves.—Also, a city, the capital of the above county, under the government of a mayor, aldermen, and common council. The extent of the township is 3 miles along the Delaware, and a mile back; being about 18 miles N. E. of Philadelphia, and 17 from Trenton. The island, which is the most populous part, is about a mile each way; and includes about 160 houses, and 1000 white and 140 black inhabitants, of the last some few being slaves. The streets are commodiously spacious, and mostly ornamented with rows of trees. The town is opposite to Bristol in Pennsylvania, where the river is about a mile wide. Under the shelter of Mittenicunk and Burlington islands is a safe harbour, conveniently adapted for trade, but too near to Philadelphia to allow of much foreign commerce. Burlington was first settled in 1677, and has an academy and a free-school. Mittenicunk island belongs to the latter, and yields a yearly profit of 180*l*. This town has a place of worship for the Friends, who are the most numerous, and another for the Episcopalians. It has two market-houses, a work-house, and the best gaol in the state. Here are likewise a nail manufactory, and an excellent distillery. N. lat.  $40^{\circ} 8'$ . W. long.  $74^{\circ}$ .

**BURLINGTON**, a township of America, in Otsego county, New York, divided by an act of the legislature in 1797 into two towns.—Also, a pleasant township, the chief in Chittenden county, Vermont, situate on the south side of Onion river, on the east bank of lake Champlain, and containing 332 inhabitants. The governor and patrons of the college of Vermont have selected this healthy and agreeable situation for a seminary, constituted for the education of young persons of all denominations. Burlington is 22 miles distant northerly from Vergennes, 122 from Bennington, and 332 from the city of New York. N. lat.  $44^{\circ} 30'$ .

**BURLINGTON**, or *Quinekeas Bay*, lies on the east side of lake Champlain, about 34 miles N. by E. from Crown point, 69 S. E. from lake St. Francis in St. Lawrence river, and 70 southerly from St. John's. N. lat.  $44^{\circ} 22'$ .

**BURLO**, a town of Germany, in the circle of Westphalia, and bishopric of Munster; 4 miles N. N. W. of Borchon.

**BURMAH**. See **BIRMAN Empire**.

**BURMANN**, FRANCIS, in *Biography*, a famous theological professor, was born in 1628 at Leyden, where he re-

ceived his education; and after having for some time officiated as minister at Hanau, and as agent of the college at his native place, he was invited to the chair of theology at Utrecht. In this station he distinguished himself by his lectures and writings. He died in 1679. His publications are "Commentaries on the Pentateuch and Historical Books of the Old Testament," written in Dutch, and printed at different times: "An Abridgment of Theology," 2 vols. 4to. in Latin; "Exercitationes Academicæ," 2 vols. 4to., and some controversial pieces. Moren. Gen. Biog.

**BURMANN**, PETER, an eminent philologist, was the son of the preceding, and born in 1665 at Utrecht, where he was educated, and where he attended the lectures of the learned Grævius. Devoting himself to the profession of the law, he studied for some time at Leyden, and in his 20th year took the degree of doctor of laws. Having gained reputation in the exercise of his profession, he was, in 1696, appointed professor of eloquence and history in his native city, and afterwards of Greek and politics. From this time he devoted himself wholly to literature, and became one of the most laborious commentators and editors of the age. He published, with his own notes and those of other critics, Velleius Paterculus, Quintilian, Valerius Flaccus, Virgil, Ovid, Suetonius, Lucan, Phædrus, and Petronius, and also a collection of the minor Latin poets, in 2 vols. 4to. He also wrote a treatise "On the Taxes of the Romans," edited several learned works, with prefaces and notes, and was the author of various dissertations, discourses, and pieces of Latin poetry. As a commentator, he was distinguished more by his industry and erudition than for his genius and taste; and though he is deficient in the elucidation of obscure and difficult passages, he has accumulated a mass of materials from which other grammarians and critics may derive great advantage. He was twice rector of the university, and thrice private secretary to the academical senate; and to his other honours was added the professorship of the history of the United States. He died in 1741. Moren. Gen. Biog.

**BURMANN**, JOHN, M. D. of a noble and wealthy family, and of no mean literary acquirements, employed much labour and expence in editing various botanical works, particularly those giving accounts of plants procured from the Indies. In 1736, he published an edition of Weinman's Herbal, to which he added several plates with African plants. His next publication, in which he had the assistance of Linneus, then a young man, was the "Thesaurus Zeylanicus, exhibens Plantas in Insula Zeylana nascentes, Iconibus illustratus," 4to. 1737, taken from various travellers, with new descriptions and plates. The following year he was appointed professor to the botanical garden at Amsterdam, and soon after published "Rariarum Africanarum Plantarum, Decades Decem," 4to. principally from Witsen and Vanderlell, to which, however, he made several additions. He translated Rumphius's great work into Latin, which he enriched with valuable notes, and published under the title of "Everhodi Rumphii Herbarium Amboinense, continens plantas in ea, et adjacentibus Insulis repertas." His last labour was procuring engravings to be executed, from the drawings of American plants left by Plumier, to which he added descriptions, with the modern, and former names. His son,

**BURMANN**, NICOLAS LAWRENCE, following the steps of his father, took his degree as doctor of medicine at Leyden, in 1759, and published, for his inaugural thesis, "Specimen Botanicum de Geraniis," 4to. In 1768, at Amsterdam, "Flora Indica, accedit series Zoophytorum Indicarum, nec

ron prodromus Floræ Cappensis." Haller. Bib. Botan. Lloy. Diet. Hist. Gen. Biog.

BURMANNIA, in *Botany* (in honour of John Burmann M.D. professor of botany at Amsterdam, author of *Theſaurus Zeylanicus*, &c.). Linn. 307. Schreb. 542. Willd. 606. Juss. 50. Clafs and order, *hexandria monogynia*. Nat. Ord. *coronarie* Linn. *Bromelia* Juss.

Gen. Ch. *Cal.* perianth long, one-leaved, prismatic, coloured, with three longitudinal, membranaceous angles; the mouth trifid, small. *Cor.* petals three, ovate, oblong, placed in the mouth of the calyx, very minute. *Stam.* filaments six, very short; anthers in the mouth of the calyx, placed two by two, separated by a reflexed joint. *Pist.* germ superior, cylindrical, half the length of the calyx; style thread-shaped, the length of the corolla; stigmas three, obtuse, concave. *Fric.* capsule covered by the calyx, cylindrical, three-cornered, three-celled, three valved, opening at the angles. *Seeds* numerous, very small.

Eff. Ch. *Cal.* prismatic, coloured, trifid; angles membranaceous. *Petals* three. *Capsules* three-celled, straight. *Seeds* minute.

Ob. La Marek describes the calyx as having its border divided into six segments, the three inner ones small, with the shape of petals. Jussieu, in conformity with the principles of his system, with respect to all monocotyledinous plants, had before adopted the same idea. He styles it a very singular genus, allied to no other, except perhaps to Hyposis.

Species, 1. *B. disticha* Linn. (La Marck. Illust. Pl. 225.) "Spike double." *Root* perennial, fibrous, small. *Stem* six or seven inches high, upright, straight, simple. *Root leaves* eight or nine, grass-like. *Stem leaves* short, acuminate, alternate, sheathing. *Spikes* divaricated. *Flowers* on short peduncles, in a single row on the upper side of each spike, erect, blueish, permanent; bractes awl-shaped. La Marck. Native of Ceylon in watery places. 2. *B. biflora*. "Flowers two." Linn. Smaller than the preceding. *Root* strong and fibrous. *Stem* naked, almost capillary. *Root leaves* very straight. *Flowers* one or two at the summit of the stem, purple. A native of marshes in Virginia. La Marck.

Both these species were cultivated by Mr. Miller, in 1768, but they are difficult to preserve in gardens, for as they will not thrive when planted in dry ground, they must be planted in pots plunged in troughs of water, so as to cover the surface of the mould about three inches. The troughs in which the first sort is planted must be constantly kept in a warm stove. The other should be placed in a green house in winter, but in summer may be exposed to the open air. With this management they will sometimes bear flowers. Martyn's Miller.

BURMANNIANA, in *Entomology*, a species of PHALÆNA (Tortrix) of a large size. This inhabits Surinam. The wings are pale, with four black coital spots on the anterior pair. *Gmel.* &c.

BURN, in *Surgery*, is a lesion of the animal body, occasioned by the application of heat in a solid form. It differs from a SCALD, only inasmuch as the latter is produced by the application of heat in a fluid form.

The consequences of a burn are more or less serious, in proportion to the extent and depth to which the ignited substance produces its effects. An extensive burn in an irritable person will sometimes occasion death, although the subjacent parts be not deeply injured; and a deep burn, of small extent, may likewise prove fatal, according to the structure or importance of the part affected.

The first effects of a burn are to cause pain and inflam-

mation; presently afterwards, the exhalent arteries, being excited to action, will effuse a quantity of serum under the skin, and raise the cuticle like a blister: if the burning acts deeply, it will kill and decompose the subjacent flesh, so as at length to produce an eschar.

In treating burns, we must attend to the existing symptoms. If the skin remains whole, and the accident be recent, we should immediately have recourse to very cold applications, with the view of discharging inflammation and abating pain. For this purpose, ice-water, lime-water, a solution of acetated ceruse, or Goulard's extract of lead, properly diluted, may be used with great freedom. Spirituous applications, which produce cold on evaporating, have been recommended with the same intention. The common people, with good reason, advise mashed potatoes, or turnips, to be applied cold, as a poultice. But the above means are only proper in the beginning, and where the skin is not removed, so as to leave an excoriated or raw surface. In conjunction with these antiphlogistic remedies, we may abate pain and procure rest by the liberal exhibition of opium; at the same time interpoling laxative medicines, and enjoining absolute repose to the injured part.

The plan, however, must be somewhat different in cases of deep and destructive burns, where suppuration, ulceration, or mortification, are likely to ensue.

In the second stage or degree of burns, where the mischief has penetrated rather deeply, but not below the common integuments, it is usual to apply to the part a dressing of soft ointment, which will not irritate or produce pain; such as the sperma-ceti ointment, saturnine cerate, elder ointment, or equal quantities of oil and lime-water shaken together, and applied several times a day. The antiphlogistic regimen should also be observed, if the inflammatory symptoms run high.

But, when the nature of the case is very serious, and there is room to expect a gangrenous or sloughing ulceration, in consequence of the burn being very extensive, we must be cautious not to push the antiphlogistic treatment too far; nay, it may even be altogether unappropriate, and a stimulating or tonic course of remedies may be proper. Mr. Edward Kentish, of Newcastle, who has had much practice among the workmen in the coal mines, where explosions often occur, is of opinion that pure alcohol or oil of turpentine is the best local application at the beginning, and a cordial diet to support the patient's strength. Our own experience justifies that gentleman's plan, and especially in very deep burns, where sloughing proves inevitable. We sometimes, however, have found it necessary to mix equal parts of olive, or linseed oil with the turpentine, to prevent its giving insufferable pain.

It is scarcely requisite to add, that in the event of gunpowder, or any other extraneous substance, being forced into the burned part, it should be gently washed away or removed with all possible care. If great tension arise in the part, we should occasionally employ warm emollient cataplasms and anodyne fomentations. When the vitality of a member has been totally destroyed, so that its use is irrecoverable, we may be compelled to amputate the limb. See MOXA, CAUSTIC, CAUTERY, HEAT, SCALD, and AMPUTATION.

BURN-baking, or *Beating*, in *Agriculture*, the operation of cutting or paring off the surface of turf, and reducing it to ashes by means of fire. It is principally employed as a method of bringing into cultivation such waste and other lands as contain much coarse grass, or other vegetable productions on the surface. Where this is not the case, it can seldom probably be made use of to so much advantage. It

is in some districts termed *Burn-beating*; and also *Denfki-ring*, from Devonshire, a county in which it has been long practised. See *PARING* and *BURNING*.

*BURN, heart.* See *CARDIALGIA*.
