**BURNET, GILBERT**, in *Biography*, an eminent English prelate and writer, was born at Edinburgh in 1643. His father was the descendant of an ancient family in the shire of Aberdeen, educated for the bar, esteemed for judgment and knowledge in his profession, and disinterested in the exercise of it. As to his religious principles, he was a moderate episcopalian; and in the time of Cromwell lived in retirement, but after the restoration was appointed one of the lords of Session. His mother was exemplary for virtue and piety, and zealously attached to the Presbyterian discipline. Having received the first rudiments of education from his father, he prosecuted his studies in the college of Aberdeen, and made such proficiency, that when he was scarcely 14 years of age, he took his degree of Master of Arts, and became a student of civil law. But soon changing his purpose, he devoted himself to divinity; and at the age of 18, he was put upon his trial as a probationer, or expectant preacher. Declining, on account of his youth, to accept a good living which was offered him, he finished his education by means of the counsel and conversation of some eminent Scots divines, and, in 1663, visited the two English Universities, where he had an opportunity of intercourse with the most learned persons of that period. Having again refused ecclesiastical preferment in Scotland, he travelled into Holland in the following year, and after residing for some time at Amsterdam, he passed through the Netherlands into France, and made some stay at Paris. On his return to Scotland by way of London, he became a member of the Royal Society; and, in 1665, he received priest's orders, and was presented to the living of Saltoun. Here he discharged the duties of his office with exemplary assiduity, and gained the esteem of the presbyterians, though he was the only clergyman in Scotland that used the liturgy of the church of England. At this time he incurred the resentment of the episcopal order, by drawing up a memorial of the abuses of the Scots bishops, copies of which he circulated among all the prelates of his acquaintance; but this conduct, on the part of a young man at the age of 23 years, gave such offence, that Sharp, Archbishop of St. Andrew's, proposed to deprive and excommunicate him. Against this attack Burnet made a spirited defence, and Sharp proceeded no farther. In 1669 he accepted the office of theological professor in the University of Glasgow, and continued for four years and a half to perform the duties of it with singular diligence; exposing himself at the same time, by his moderation, to the ill-will of the zealots of both the episcopalian and presbyterian parties. His pamphlet, published this year, and entitled, "A modest and free Conference between a Conformist and Non-conformist," was well received by all candid persons, though it did not escape the censure of bigots. Notwithstanding the time and attention which he devoted to his public lectures, he was employed in arranging the papers of the Hamilton family, and compiling from them his "Memoirs of the Dukes of Hamilton;" and he was thus led to negotiate and conclude a reconciliation between the earl of Lauderdale and the duke of Hamilton. During his stay in London on this occasion, he was offered a Scots bishopric, which he refused. On his return to Glasgow, he married lady Margaret Kennedy, the daughter of the earl of Cassilis; who was distinguished by her piety and knowledge, and though inclined to the party of the presbyterians, was far from being a zealot, and had given evidence of her loyalty, even at the risk of her life,

during the usurpation of Cromwell. In 1672, Burnet, published "A Vindication of the Authority, Constitution, and Laws, of the Church and State of Scotland;" in which he defended the royal prerogatives of the crown of Scotland, and the establishment of episcopacy in that kingdom, against the principles of Buchanan and his followers. This publication drew upon him the censures of Dr. Hekes, whose calumnies he confuted, and occasioned some severe reflections of Dr. Swift, by whom he is charged with having altered his sentiments concerning the doctrine of passive obedience. Whereas the illegality of resistance, merely on account of religion, probably in opposition to the violent Scotch covenants, is the point for which he contends. It seems, indeed, always to have been his opinion, that resistance could not be justified by single acts of oppression, and that it was not lawful till attempts were made to overturn the very basis of the constitution. In recompence for this acceptable service to the court, he was again offered a bishopric, with the promise of the first archbishopric that should become vacant; but he declined accepting this dignity. In the following year he visited London with the ostensible design of obtaining a licence for the publication of his "Memoirs of the Dukes of Hamilton," and, as it is said, with a secret purpose of withdrawing himself from state concerns, under a persuasion that popery was the prevailing interest at court. At this time, however, he was a favourite with his Majesty and the duke of York, and was nominated one of the king's chaplains in ordinary. In an interview with the king, to whom he was introduced by the duke of Lauderdale, he used all the freedom which, as he thought, became his profession. But suspecting the designs of the court party, he inclined to the opposition in the Scots parliament, and thus incurred the enmity of the duke of Lauderdale, who preferred accusations against him, which deprived him of the royal favour. As a measure of personal security, he resigned his professorship at Glasgow and determined to settle in London; but upon his arrival there he was coldly received by the king, and struck out of the list of his chaplains. He was now considered as a sufferer for his principles, and, in 1675, having refused the living of St. Giles's, Cripplegate, which was offered him, he was appointed, by the recommendation of lord Holles, preacher at the Rolls, and he was soon after chosen lecturer of St. Clement's, where he acquired the reputation of a very popular preacher. In the course of this year he was repeatedly examined at the bar of the House of Commons with respect to the designs of Lauderdale, and obliged to communicate some particulars that had passed between himself and the duke in private conversation. The alarm that agitated the country at this time, occasioned by the progress of popery, induced Dr. Burnet to write "The History of the Reformation of the Church of England;" the first volume of which appeared, in folio, in 1679, when the popish plot occupied the public attention: the publication of this work was highly acceptable, and the author received the thanks of both houses of parliament, which was an honour that had no precedent, and he was requested to complete it. Accordingly, in 1681, he published the second volume. The third volume, being a "Supplement" to the two former, appeared in 1714. This work, though it was attacked by many censorious critics, has been generally esteemed the most valuable of the author's performances, and contains a correct and ample account of the transactions to which it relates. It was well received abroad as well as at home, and very much contributed to advance the reputation of the author. Dr. Birch, in his *Life of Archbishop Tillotson* (p. 59) observes, that this is

of the most valuable histories in our own or any other language; and that the publication of it was of most favourable consequence to the nation, amidst the alarms of popery. Dr. Burnet is also famous (see Letters on the Prevalence of Christianity), that Bishop Burnet, in his immortal history of the Reformation, has fixed the protestant religion in this country, and brought many converts among us; and the world has ever since known the English Eusebius. An incident occurred about this time which led to an interview between Dr. Burnet and the earl of Rochester, whose character as a person of wit and profligacy is well known. Having been requested to visit the unhappy female with whom the earl had had a criminal connection, in a dangerous manner he treated her in a manner which rendered this lord capable of forming an acquaintance with him. Accordingly invited by his situation and prospects in the closing scene of life, he visited and encouraged the visits of Dr. Burnet, and the result of many conferences that passed between them on religious subjects was the earl's conversion to the Christian faith, and his sincere repentance. Of their mutual acquaintance, and the effects produced by it, we have an interesting relation in an "Account of the Life and Death of the earl of Rochester," published by Dr. Burnet in 1680; a very popular work, which was purified with great satisfaction by all the friends of religion. Of this book, Dr. Johnson says (Preface, &c. to the Works of the Poets, vol. IV.) that it ought to be read by the "critic for its eloquence, the philosopher for its arguments, and the saint for its piety." During the alarm of the popish plot, Dr. Burnet was frequently consulted by king Charles concerning the state of the nation, and allured to support the court interest by the offer of the bishopric of Chichester, which he refused; but he availed himself of an inducement which attendance at the death-bed of Mrs. Roberts, one of the king's mistresses, suggested, for writing a letter to his Majesty, in which he used great freedom in reprehending the vices and errors both of his private life and public administration. When the king had perused it twice he threw it into the fire, and spoke of the writer with displeasure. Dr. Burnet at this time recommended moderate measures; and instead of the exclusion of the Duke of York, he proposed the scheme of a prince regent; and yet he maintained a steady adherence to his friends, nor did any prospect of preferment induce him to abandon them. The speech delivered by lord Russell on the scaffold, is said to have been penned by Dr. Burnet. In 1682 he published his "Life of Sir Matthew Hale," and his "History of the Rights of Princes in disposing of Ecclesiastical Benefices and Church Lands," together with an "Answer" to the animadversions of an anonymous writer on the latter performance. In the following year, perceiving the storm that was gathering, he retired to Paris, where he was well received; and at this time appeared his "Translation and Examination of a Letter, written by the last general Assembly of the Clergy of France to the Protestants inviting them to return to their Communion, &c." and also his "Translation of Sir Thomas More's Utopia," with a preface concerning the nature of translations. In 1684, he was so much the object of court-resentment, that he was discharged from the office of lecturer at St. Clement's by the king's mandate to the rector; and, by an order transmitted from the lord-keeper North to Sir Harbottle Grimston, Master of the Rolls, forbidden to preach any more at the Rolls chapel. In the following year he published his "Life of Dr. William Bedell, bishop of Kilmore, in Ireland." Upon the accession of king James, he left the kingdom, and lived in a very retired manner at Paris, that he might incur no suspicion of being

concerned in any conspiracies in favour of the duke of Monmouth; and from Paris he travelled into Italy, and was agreeably received both at Rome and Geneva. At the latter place he remonstrated against the subscriptions to the formula, commonly called "Consensus," a confession of doctrine that was imposed upon those who were admitted into orders; and succeeded in releasing the clergy of Geneva from such subscriptions. After a tour through the southern parts of France, Italy, Switzerland, and many parts of Germany, of which he has given an account in his "Travel," published in 1687, (in which year also appeared his "Translation of Lactantius, concerning the Death of the persecutors,") he was invited to the Hague by the Prince and Princess of Orange, and had a great share in the councils relating to England. However, to gratify king James, and in compliance with an earnest request communicated by his ambassador at the Hague, he was dismissed from the court, though he still retained his influence. This expression of royal displeasure was followed by a prosecution for high treason, instituted against him both in Scotland and England; and as the States refused to deliver him up at the demand of the English court, designs were formed for seizing his person, and even for destroying him. About this time Dr. Burnet married Mrs. Mary Scott, a Dutch lady of large fortune, noble extraction, from a branch of the family of Buccleugh in Scotland, and very distinguished accomplishments.

In the whole conduct of the revolution in 1688, Dr. Burnet took a very active part; and having notified the project at an early period to the house of Hanover, he accompanied the prince of Orange in his expedition to England, as his chaplain: upon his landing near Exeter, he drew up the association for pursuing the ends of the prince's declaration; and as soon as king William was advanced to the throne, his attachment and services were recompensed by promotion to the see of Salisbury, to which he was consecrated in 1689. Having taken his seat in the house of lords, he recommended moderate measures with regard to the clergy who scrupled to take the oaths, and a toleration of the Protestant dissenters: and upon occasion of settling the succession of the crown, he was appointed by the king to propose in parliament the duchess (afterwards electress) of Brunswick, as next in succession after the prince of Denmark and her issue. He was thus engaged in an epistolary correspondence with princess Sophia, which lasted till her death. In this year, he addressed to the clergy of his diocese a "Pastoral Letter," concerning the oaths of allegiance and supremacy to king William and queen Mary, in which he grounded the title of their majesties to the crown upon the right of "conquest;" and in so doing, he gave such offence to several members of parliament, that they procured an order for burning the book by the hands of the common executioner. A similar offence was committed by Charles Blount esq. (See BLOUNT), and it incurred the same censure and ignominy. As soon as the bishop was released from his parliamentary duty, he withdrew to his diocese, and applied with exemplary diligence to his episcopal functions, which he performed in a manner that engaged universal respect and esteem. Besides being indefatigable in preaching, lecturing, catechising, confirming, and examining for holy orders, he instituted at Salisbury a small nursery of ten students in divinity, to each of whom he allowed a salary of 30*l.* a year. But when he found that this institution gave offence, and was considered as a kind of tacit censure upon the method of education at the universities, he laid it aside. In 1692, he published his treatise, entitled "The Pastoral Care," illustrating and enforcing the duties of

of the clergy: and in the following year, "Four Discourses to the Clergy of his Diocese," on the "Truth of the Christian Religion," the "Divinity and Death of Christ," the "Infallibility and Authority of the Church," and the "Obligation to continue in the Communion of the Church." In 1694, he preached the funeral sermon of archbishop Tillotson, and vindicated his memory from the attacks of his enemies; and, in the following year, he wrote in the highest strain of eulogy, an "Essay on the Character of Queen Mary, on occasion of her death." Having lost his wife in 1698, he soon supplied the loss by a marriage with Mrs. Berkley, whom he entrusted with the care of his children, and who seems to have been well qualified for undertaking this charge, as she was a lady of distinguished benevolence and piety. Her treatise, entitled, "A Method of Devotion, or Rules for holy and devout Living, &c." was published in 8vo. and well received. In the same year, bishop Burnet was appointed preceptor to his highness the duke of Gloucester, and he took great pains in the conduct of his education till his death. In 1699, he published his "Exposition of the 39 Articles of the Church of England," which, notwithstanding the censure passed upon it by the lower house of convocation, and several private attacks, has been reckoned a learned and judicious performance. It was undertaken at the request of queen Mary, revised and corrected by archbishop Tillotson, and perused and approved before publication, by the archbishops Tenison and Sharp, and the bishops Stillingfleet, Patrick, Lloyd, Williams, and More. Bishop Burnet had the honour of first projecting the scheme for the augmentation of poor livings, which was sanctioned in 1704 by act of parliament. See AUGMENTATION. During the remaining years of his life, he was employed in the composition and publication of several treatises appropriate to his profession, among which, we may reckon a collection of "Sermons," and "Pamphlets," 3 vols. 4to. 1706; an "Exposition of the Church Catechism," 1710; and "Sermons on several Occasions," with an "Essay towards a new Book of Homilies," and a "Preface," containing a judicious and elaborate defence of the revolution. He was also the author of a great variety of pieces, some of which were published during his life, and others after his death. A catalogue of his works, drawn up by Dr. Flexman, is annexed to the later editions of his "History of his own Time." To this catalogue, some few publications have been added in the last edition of the "Biographia Britannica;" and particularly "Thoughts on Education," printed at London in 1761, from an original MS., drawn up when the author was not quite 25 years of age, and containing a variety of observations which indicate much knowledge and reflection. The close of his life, which was terminated by a pleuritic fever on the 17th of March, 1715, was suitable to the character which he had uniformly maintained, and manifested that tranquillity and firmness, which his religious principles were adapted to produce and justify. His remains were deposited in the parish church of St. James's, Clerkenwell. By his last will he left orders, that the "History of his own Time" should not be printed till six years after his death, and then faithfully, without adding, suppressing, or altering it in any particular. Accordingly, the first volume was printed at London in 1723, and the second in 1734, with an "Account of the Author's Life" annexed to it, in folio, by his son, Thomas Burnet esq. This work has given rise to a great number of strictures, and various sentiments have been entertained concerning it. At its first appearance, a general clamour was excited against it among the Tories and high church-men; and many other persons

were offended by the freedom with which particular characters were drawn, and particular facts represented. The wits too combined to expose it to ridicule. The real merit of this history seems to be very candidly and impartially appreciated in the last edition of the "Biographia Britannica." Allowing for the errors and inaccuracies common to the historians of that period, for some instances of party prejudice and credulity, and for that disposition to look on the dark side of a character, and to exaggerate the failings and faults of public men, which in some cases may have given a bias to the author's judgment; admitting his integrity, and his desire to state the truth of facts according to the best of his knowledge; and recollecting that when he appeals to the testimony of others, he honestly refers us to his authorities, and that several of the facts which occur in his history, and which were at first discredited or considered as dubious, have, since his time, been proved to be true; this history may be regarded as containing, upon the whole, a faithful and interesting representation of times and manners. "In short, it is written with a spirit of integrity and liberty that cannot fail of recommending it to a judicious reader; and there are few histories in our language which will be found to convey more solid and useful information. Accordingly, notwithstanding the various attacks to which it hath been exposed, it seems to be rising in reputation; and, in our opinion, (Biog. Brit.) it clearly deserves the encomium which hath lately been bestowed upon it by a very elegant poet."

"Yet Burnet's page may lasting glory hope,  
How'er insulted by the spleen of POPE.  
Tho' his rough language haste and warmth denote,  
With ardent honesty of soul he wrote:  
Tho' critic censures on his work may shower,  
Like faith, his freedom has a saving power."

Hayley Ess. on Hist. p. 51.

This testimony deserves the more to be regarded, as the bishop has spoken of poets in terms somewhat disparaging, and thus incurred the obloquy of persons of taste. Virgil for his fancy, says Burnet, in his "Thoughts on Education," deserves not the name of a poet, but of an eloquent versifier. Dryden he represents, probably referring to his plays, and not to his personal character, as a monster of immodesty, and of impurity of all sorts: and Prior he styles, *one* Prior, though he had long before distinguished himself by his elegant poetical productions.

As a writer, though the bishop ought not to be ranked in the first class of authors, he deserves the praise of perspicuity, vigour, and variety of knowledge; and we ought therefore to allow for party-prejudice, when we advert to the asperity with which Dr. Swift has reprobated his style. What were his sentiments as a theologian, we may infer from the publications already enumerated, and particularly from the testimony borne to his vindication of the 39 articles by the principal dignitaries of the church. With his attachment to the church, he blended a considerable degree of moderation and liberality towards Protestant dissenters, and others who differed from him: and with respect to political matters, although he has been reproached as a party-man, he was candid in his judgment of persons of different connections, and he even exercised great kindness towards some who had engaged in designs against the government. In his general character, he was pious and devout, copdescending and communicative, benevolent and charitable; exemplary in the diligence with which he performed all his clerical and episcopal functions, disinterested as a patriot, and eminently ardent and active in his prosecution of every

measure, which, in his judgment, tended to the public good. His feelings were vanity, credulity, self-importance, over-officiousness, and a kind of gossipping garrulity. It is natural to imagine, that, considering the times in which he lived, and the ostensible part which he took in public and political concerns, he would not be likely to escape reproach; but notwithstanding the freedom and severity with which his principles and character have been scrutinized and censured, his name has descended to posterity with honour, and his public services at an interesting period in the history of this country, as well as his private character, will be recognized with veneration by all persons, who are attached to the interests of constitutional liberty and the Protestant religion.

Bishop Burnet, by his second wife, Mrs. Mary Scott, had seven children, three sons and four daughters. His three sons survived him, as well as two of his daughters. *William*, his eldest son, was educated as a gentleman-commoner in the university of Cambridge, and made choice of the profession of the law. Having been a great sufferer in the South sea scheme of 1720, he became governor, first of New York, and the Jerseys, and afterwards of the Massachusetts and New Hampshire. He died at Boston in 1729; and was the author of a tract, entitled, "A View of Scripture Prophecy."

*Gilbert*, the bishop's second son, was educated at Leyden, and as a commoner of Merton-college, in the university of Oxford, with a view to the church. Having entered into holy orders, he was king's chaplain in 1718, when he could not be 30 years of age, and he is said to have contributed to a periodical paper at Dublin, entitled "Hibernicus's Letters," and also to another valuable paper, entitled "The Free-thinker," afterwards published in 3 vols. 12mo. and now become scarce. He was also a distinguished writer on the side of Hoadly in the Bangorian controversy, and was considered by this eminent prelate as one of his best defenders. His "Full and Free Examination of several important Points relating to Church Authority, &c. &c." was printed in 1718, 8vo. and has been reckoned a masterly performance, displaying great liberality of mind, strong powers of reasoning, and an accurate acquaintance with scripture. In 1719, he published an Abridgment of the third volume of his father's History of the Reformation. He died in early life. The Gilbert Burnet who abridged the Boylean lectures was a different person. See *BOYLE's Lectures*.

*Thomas*, the bishop's third son, enjoyed the same advantages of education with his two elder brothers. He was admitted a commoner of Merton college in the university of Oxford, and having studied two years at Leyden, made a tour from France, through Germany, Swisserland, and Italy. Upon his return to England, he devoted himself to the profession of the law, and in early life pursued a course of dissipation, which occasioned great uneasiness to his father. At this time, however, viz. in 1712 and 1713, he wrote several political pamphlets in favour of the Whigs against the administration of the four last years of queen Anne. One of these pamphlets caused his being taken into custody in January 1713: and in another, entitled "Some new Proofs, by which it appears, that the Pretender is truly James the Third," he gives the same account, in substance, of the Pretender's birth, that was afterwards published in the bishop's History of his own Time. Notwithstanding these literary engagements, he still pursued his wild courses; but one day, being unusually grave, his father asked him what was the subject of his meditation: "A greater work," replied the son, "than your lordship's History of the

Reformation;" "what is that, Tom?" "My own reformation, my lord." "I shall be heartily glad to see it," said the bishop, "but almost despair of it." This, however, was happily accomplished after the bishop's decease; and Mr. Burnet became, not only one of the best lawyers of his time, but a very respectable character. After the accession of George I. he wrote a letter to the earl of Halifax on the "Necessity of impeaching the late Ministry," which was followed by "A second Tale of a Tub, &c." being a satire on the earl of Oxford and his ministry. Soon after his father's death, he published "A Character of the right reverend Father in God, Gilbert Lord Bishop of Sarum; with a true Copy of his last Will and Testament." Mr. Burnet was also concerned with others in writing a travestie of the first book of the Iliad, under the title of "Homerides," which gave occasion to Mr. Pope for introducing him into the Dunciad, and in a weekly paper called the "Grumbler." About this time he was appointed his majesty's consul at Lisbon, where he remained for several years. Upon his return, he resumed the profession of the law, and rose through several gradations of preferment, in 1741, to the rank of one of the justices of the court of common pleas. He also received the honour of knighthood, and became a member of the royal society. In the court of common pleas he continued, with great reputation, to his death, which happened on the 5th of January 1753. His character was that of an able, upright judge, a sincere friend, a sensible and agreeable companion, and a munificent benefactor to the poor. A remarkable clause in his will, in which he expresses the sentiments of a judicious and candid person, who understood the true nature of Christianity, and, who, whilst he gave the preference to the church of England, was persuaded that no religious establishment was entirely free from defects, furnished occasion for some strictures in a serious and sensible pamphlet, entitled "The true Church of Christ, *which, and where to be found, &c.*" Some poetical productions of his youth were published in 1777, 4to.; the characteristic excellence of which is an easy negligence and elegant simplicity.

Besides sir Thomas Burnet, there lived in the last century another *Thomas Burnet*, who was an eminent divine, and author of several valuable publications. He was educated in New College, Oxford; became rector of West Kingston, Wilts, and prebendary of Sarum; and died in May 1750. His four principal works are, "An Answer to Tindal's Christianity as old as the Creation;" a "Treatise on Scripture Politics;" a "Course of Sermons preached at Mr. Boyle's Lecture;" and an "Essay on the Trinity," in which last performance he endeavours, with great ingenuity and plausibility, to unite the rationality claimed by the Unitarians, with the orthodox language of those who admit the Athanasian doctrine of the Trinity. Gen. Dict. Biog. Brit.

BURNET, THOMAS, a learned and ingenious divine, erroneously supposed to be a native of Scotland, was born at Croft, in Yorkshire, in 1635, entered, in 1651, at Clarendon, in the University of Cambridge, under the mastership of Mr. John Tillotson (afterwards archbishop of Canterbury), and upon the removal of Dr. Ralph Cudworth from the mastership of that college to that of Christ-college, admitted of that house, and chosen fellow in 1653, and in 1661, senior proctor of the University. After his travels, as tutor to the earl of Wiltshire, and as governor to the duke of Bolton, and the earl of Ossory, afterwards duke of Ormond, he settled at home; and became distinguished as an elegant writer and an acute philosopher. Of his celebrated work, entitled "Telluris Theoria Sacra, &c." the first two books were published in 1680, and the two remaining books in 1689, in 4to. This performance

formance was so much admired on its first appearance in Latin, that the author published an English edition of it, in substance the same with the Latin, but newly composed with a variety of additions, in 2 volumes; the first of which was dedicated to king Charles II. and the second to queen Mary. To the sixth edition, in 1726, is added, the "Author's Defence of the Work from the Exceptions of Mr. Warren, and the Examination of Mr. Keil." Of this theory a particular account will be given in a future article. See EARTH. We shall here observe, that though the principles of it have been demonstrated to be erroneous, and it can be regarded only as a beautiful philosophical romance, it was much applauded on its first appearance, and many persons were seduced by the invention and ingenuity displayed in it, and by the elegance of its composition. Among its admirers we may reckon Bayle, who entertained a very high opinion of it, and particularly Mr. Addison, who addressed to the author an elegant Latin poem, into which he has transfused the fancy and sublimity of the original. The mathematicians, however, were not so easily seduced. Mr. Keil attacked it with severity; and Mr. Flamsteed observed concerning it, that "there went more to the making the world than a fine turned period; and that he was able to overthrow it in one sheet of paper." In 1685 Dr. Burnet was elected, by the interest of the duke of Ormond, into the mastership of the Charter-house; and soon after he entered into holy orders. In his situation at the Charter-house he resisted the illegal attempt of king James II. to introduce one Popham, a papist, as a pensioner into that house; and his opposition to him was supported by the other governors, the lord chancellor Jefferies excepted, so that the king desisted from pursuing the contest. After the revolution, Burnet was appointed chaplain to king William, and through the interest of archbishop Tillotson, clerk of the closet to that prince. In 1692 he published his "Archeologiæ Philosophicæ," in which he not only questioned the literal history of the fall, but imprudently introduced an imaginary dialogue between Eve and the Serpent, which gave great offence. So sensible was he of the imprudence of this dialogue, that when a new edition of the "Archeologia" was printing in Holland, he desired that it might be suppressed, and it was likewise omitted in the second edition of the year 1733. To this work was prefixed a dedication to king William, in which the character of that prince is drawn with great strength and elegance. The clergy were so offended by the publication of this work, that it is said to have occasioned his removal from the office of clerk of the closet; and though he was favoured by king William, and patronized by archbishop Tillotson, the scepticism and heterodoxy charged on his writings prevented his preferment in the church, and particularly his advancement to the episcopal bench, and even to the see of Canterbury, which is said to have been in contemplation. He died September the 27th 1715, and was buried in the chapel of the Charter-house. After his death were published two posthumous treatises; one entitled "De Fide et Officiis Christianorum," being part of a larger design, and a valuable compend of Christian doctrine and duty, written with a liberal spirit, but not deemed altogether unexceptionable; and the other, entitled "De Statu Mortuorum et Refurgentium;" to which is added, an appendix, "De Futura Judæorum Restauratione." In this work the author has given greater scope to his fancy; attacked the doctrine of the eternity of hell-torments; and contended for the final salvation of the whole human race. But so apprehensive was the author lest his notions concerning the temporary duration of future punishments should be made an ill use of by the bulk of mankind, that in a note to

this work, he earnestly protested against its being translated. Dennis, however, in defiance of the author's protestation, not only published a translation of the treatise, but with a fidelity which can hardly be thought a sufficient excuse for the effrontery of it, inserted the note in English at the bottom of the page. Dr. Burnet was also the author of three small tracts in opposition to Mr. Locke, to which was published a reply by Mrs. Cockburne, contained in Dr. Birch's edition of that lady's works. Whatever opinion may be entertained of Dr. Burnet's speculations, philosophical and theological, his style, both in Latin and English, has been universally admired for its elegance and perspicuity. Biog. Brit. Brucker's Hist. Philos. by Enfield, vol. ii. p. 484.

BURNET, THOMAS, a Scotch physician, educated at Edinburgh, where he arrived at the honour of being fellow of the Royal College, and physician to the king, was author of "Thesaurus Medicinæ et Practicæ ex præstantissimorum Medicorum Observationibus collectus," 4to. London, 1672. It has been frequently reprinted, and contains many curious and useful observations. Also, "Hippocrates Contractus, in quo Hippocratis Opera omnia in brevem Epitomen reducta debentur," 8vo. Edinb. 1685. A convenient compendium, with perpetual references to the Opera Omnia. Haller. Bib. Med.

BURNET, in *Agriculture*, the name of a plant that may be cultivated in some cases with advantage, as a green winter food for different sorts of animals. As the providing of a large supply of green food for live stock, especially fattening sheep, ewes, and lambs, and for milch cows, during the winter and early spring months, is an object of the greatest importance to the farmer, he should not neglect the culture of such plants as promise to be beneficial in this way; for as turnips, though well adapted to the purpose, cannot be preferred in severe winters, and clover, rye, and other grasses, are not ready sufficiently early: burnet, in such cases, should be attended to in this view. It is not, probably, however, so agreeable a food for animals as that of some other plants, but from its standing several winters without injury, and being an early plant, it may frequently be found highly useful.

It succeeds on almost any sorts of soil but those of a strong clayey nature, and may be sown, like other feeds, with corn, and covered by means of a slight harrowing. The produce is in proportion to the goodness of the land. The quantity of seed sown is commonly about a bushel to an acre. The author of the New Farmer's Calendar thinks it advantageous to mix burnet with ray-grass and white clover, or with the latter alone, not only with the view of securing a good bottom, but to render the herbage more palatable to cattle in general, which he has been convinced, by ocular proof, have no great relish for burnet: they, however, become accustomed, he says, to its cucumber-flavour in time, and contented with it; no small inducement to which is, that they are commonly fed with it when no other grass is to be obtained. And Mr. Young observes, that it does well mixed with ray-grass, or cock's-foot, in the proportion of about three pecks of burnet to one of either of the other two. April is recommended as the proper season for sowing burnet with crops of barley or oats, covering it in by two harrowings. It may likewise be sown with buck-wheat in May, with great propriety.

In the raising of crops of this sort much depends upon having good well ripened seed of the true kind, which is always the best provided by collecting it from the best plants by the farmer himself.

When designed for sheep pasture, the best method of sowing this crop is probably that of broadcast over the surface; but in other cases the drill mode may be employed.

Of the salubry of this plant there is, the first of these writers thinks, "no question; and even its medicinal virtues are confidently spoken of, particularly for sheep suspected of unsoundness. It is excellent winter-food for deer and rabbits. Several reasons are to be assigned for the ill success which has attended various attempts to cultivate this grass, as will appear in the following directions. Its chief use is as an early grass, and whilst young; and it must never be given to cattle when old and stalky, nor kept to that state when intended for hay. In fact, burnet should always be reckoned out of season when other grasses can be had. It never ought to be fed but from January to the end of April; and upon lands proper for it, with judicious management, it will afford pasture even in January. It receives less injury from frost than any other herbage, and will even grow in the winter months, provided the weather be not too severe. If shut up in April, it will mow at Midsummer; after which it must be reserved for seed until January or February, when, if the weather be favourable, it may be cut and carried to the stock, as in summer, and afterwards fed, but not too close, with sheep, until the time of shutting up again. It will produce upwards of a ton of hay per acre, and may be mowed again for seed; but if driven so hard, of course it will not produce so large a quantity of spring-feed as when mowed but once. The value of the seed upon an acre will be from five to ten pounds." But "granting the truth of this account of burnet," continues the same author, "it would be altogether superfluous to enlarge upon its value to a live-stock farmer; but such advantages will ever be looked for in vain upon a cold barren clay, or without the seed's being fresh and good, or without culture and manure, even on a proper soil. One of the first objects is, to be sure the seed be good, which is seldom the case, burnet being a grass very little cultivated, and in which he has been more than once foiled in his endeavours to raise a crop, from that circumstance. It may be further advantageously cultivated in drills, and treated precisely like lucerne, a method which he has lately adopted. It may be sown indifferently either in spring, summer, or autumn. It frequently happens that the crop is thin until the third year, but afterwards very luxuriant, fully covering the soil. It is further observed, that burnet is a native of this country, growing spontaneously in many parts, particularly, as he has observed, upon Salisbury Plain, whence he is of opinion, an indication may be drawn of its proper soil: like lucerne, it defies drought in summer, which makes it valuable in another point of view. The feed has been warranted as good food for horses as corn; a consideration for those who may have the convenience of bruising it."

In the twenty-first volume of the Annals of Agriculture we have the following statement of the advantage derived from five roods of wet land, a strong tenacious loam, on a dry and clay-mixt bottom, eaten off by ewes and lambs in the beginning of April, besides the straw, which was carefully laid up for winter provision for sheep, in wet weather, and the chaff for horses with their corn, which are reckoned together with a week's keep of fifty sheep, just taken out, as tantamount to the expence of mowing, dressing, and carting.

The land on which burnet is sown should always be made perfectly fine before the seed is put in.

The true management of this sort of crop, according to Mr. Young, is not to cut it down much in the autumn or winter seasons, as the great peculiarity of the plant is to afford a full bite in March; and when you have it six or eight inches high in October, more food will be found at that period, for it retains its leaves, as the winter frosts have but little effect upon it. "Some," says he, "who have found fault with it, and asserted that it is unprofitable, have fed off the after-grass bare in the autumn, and let their sheep and cattle get into it in winter. It is then no wonder the burnet does not answer the character given of it by others, who have managed in a different manner."

The crops of this sort which are designed for seed, should be cut about the beginning of July, when care should be taken that it does not shed. It is the best practice to thresh it out in the field in the same manner as many other sorts of small seeds, the straw being made into hay. The produce in both seed and hay is very considerable. When intended for hay, it should be cut rather early in order to prevent its becoming too coarse.

Besides the modes of application, for which it has been already recommended, it is of vast utility as an early spring feed for sheep. The intelligent author of the Farmer's Calendar has observed that, "an acre of it, managed properly, will at this season yield much more food than an acre of clover and rye-grass."

The importance of the seed and chaff of this plant, as provender for horses, has been highly spoken of by some, but its advantages in this way have not been yet ascertained by any satisfactory set of experiments.

BURNET, in *Botany*. See POTERIUM and SANGUISORBA.

BURNET *Saxifrage*. See PIMPINELLA.

BURNET, *Burneta*, or *Burnetus*, in *Middle Age Writers*, denotes brown cloth made of dyed wool.

In which sense, the word stands contradistinguished from brunus, which was applied to the wool undyed.

BURNEY'S ISLAND, in *Geography*, an island on the north-east coast of Siberia, in the Frozen Sea; about 3 leagues from the main.

BURNHAM-MARKET, a town of Norfolk, in England, has the latter part of its name to distinguish it from other Burnhams in the same county. It is situated near the coast, on the northern extremity of Norfolk. Here was formerly a small monastery of White Friars, or Carmelites, of which Robert Bale was prior. At Burnham-Deeptdale are some salt marshes, which are found to be very conducive to the fattening and preservation of sheep. On the high grounds along this coast are several tumuli, which some of our topographers attribute to the Saxons and Danes, who were slain here during the piracies of the latter. Here is a small weekly market on Mondays, and the parish contains 169 houses, and 743 inhabitants. Burnham-market is 118 miles N. E. of London.

BURNING, the action of fire on some pabulum, or fuel, whereby the minute parts thereof are torn from each other, and put into a violent motion; and some of them assuming the nature of fire themselves, fly off *in orbem*, while the

the rest are diffipated in form of vapour, or reduced to ashes.  
 SEC COMBUSTION.

BURNING is also applied to the action of divers things which are cold to the touch, or do not contain fire.

In this sense *aqua fortis* is said to burn cloth. There are certain fogs which burn or scorch the corn. Virgil observes that severe cold itself will *burn*, that is, have much the same effects on the parts of the body as fire itself, in causing gangrenes.

BURNING, *extraordinary cases of*.—We have instances of persons burnt by fire kindled within their own bodies. A woman at Paris, who used to drink brandy in excess, was one night reduced to ashes by a fire from within, all but her head and the ends of her fingers. *Novum Lumen Phosphor. accens. Amst. 1717.*

Signora Corn. Zangari, or, as others call her, Corn. Bandi, a lady aged 62, of an unblemished life, near Cesena in Romagna, underwent the same fate in March, 1731. She had retired in the evening into her chamber, somewhat indisposed, and in the morning was found in the middle of the room, reduced to ashes, all except her face, skull, three fingers, and legs, which remained entire, with the shoes and stockings on. The ashes were light, and, on pressing between the fingers, vanished, leaving a gross stinking moisture behind, with which the floor was smeared; the walls, and furniture of the room, being covered with a moist cineritious foot, which had not only stained the linen in the chests, but had penetrated into the closet, as well as into the room over-head, the walls of which were moistened with the same viscous humour. *Mem. de Trev. an. 1731. p. 1293.*

Sig. Mondini, Bianchini, and Maffei, have written discourses express, to account for the cause of so extraordinary an event: common fire it could not be, since this would likewise have burnt the bed and the room; besides that it would have required many hours, and a large quantity of fuel, to reduce a human body to ashes; and, after all, a considerable part of the bones would have been left entire, as they were anciently found after the fiercest funeral fires. Sig. Mondini attributes this effect to lightning. A philosopher of Verona maintains, that such a conflagration might have arisen from the inflammable matters wherewith the human body naturally abounds. Sig. Bianchini accounts for it from an internal fire, occasioned by spirit of wine camphorated, which the lady used by way of bath or lotion, when she found herself out of order. Maffei's system is a combination of the three last: he supposes it owing to lightning, but lightning generated in her own body; agreeable to his doctrine, which is, that lightning does not come from the clouds; but is always produced in the place where it is seen, and its effects perceived. The humours of her body, naturally inflammable enough, were become preternaturally so, by her putrid indisposition; and these, by perspiration, had enveloped her body with an atmosphere of the same kind, replete likewise with mineral matters, whereby its activity was heightened. She had probably risen in the night to use her lotion, and, by the friction of her hand, had helped to kindle the flame.

We have various relations of several other persons being burnt to death in this unaccountable manner; as Grace Pet, of Ipswich, aged 60, in 1744; who had previously drank a large quantity of spirituous liquor, and the trunk of whose body was found incinerated, resembling a heap of coals covered with white ashes, and emitting an extremely fetid odour and smoke; and Mary Clues, of Coventry, 52 years of age, in 1772, who had been much addicted to intoxication, so that scarcely a day passed in which she did not drink at least a pint of rum or anniseed water. In her case no-

thing remained of the skin, the muscles, and the viscera; the bones of the cranium, the breast, the spine, and the upper extremities, were entirely calcined, and covered with a whitish efflorescence; and the room was filled with a very disagreeable vapour. A similar instance is mentioned by Vicq. d'Azyr, in the "Encyclopedie Methodique." A woman, about the same age, who indulged to excess in spirituous liquors, and went to bed every night in a state of intoxication, was found entirely burnt, and reduced to ashes. Le Cat, in a memoir on spontaneous burning, mentions several other instances of combustion of the human body; and two other facts of a similar kind are published in the "Journal de Medicine," (vol. lix. p. 440.) An attempt has been made to establish the opinion, that these destroying internal fires are caused in the entrails of the body by enflamed effluvia of the blood, by juices and fermentations in the stomach, by the many combustible matters which abound in living bodies, for the uses of life, and, finally, by the fiery evaporations which exhale from the settlings of spirit of wine, brandies, and other hot liquors, in the *tunica villosa* of the stomach, and other adipose or fat membranes; within which these spirits engender a kind of camphor, which in the night-time, in sleep, by a full respiration, are put in a stronger motion, and are more apt to be set on fire. See *Phil. Trans. N<sup>o</sup> 476. p. 453, seq. Ibid. vol. lxiv. part ii. p. 340.*

Others ascribe the cause of such persons being set on fire, to lightning; and their burning so entirely, to the greater quantity of phosphorus, and other combustible matter they contained.

M. Pierre Aime Lair communicated to the "Philomathic Society" at Paris, a memoir on the subject of the apparently spontaneous combustion of living individuals of the human species; and in addition to the instances already mentioned, and some others which he recites, he informs us, that Dr. Swediaur related the cases of some persons at Warsaw, who, having drank abundantly of malt spirits, fell down in the street, with the smoke issuing out of their mouths; and the people, who came to their assistance, said they would take fire; for preventing which, they made them drink a great quantity of milk, or used a more singular expedient, by causing them to swallow urine immediately on its evacuation. The circumstances collected from the several instances recited by M. Lair, are reduced by him to the nine following facts: 1. The persons who have experienced these effects of combustion, were generally much addicted to the drinking of extremely strong spirituous liquors: and accordingly it has been remarked, that the inhabitants of the north are most subject to these accidents. 2. They were usually very fat. 3. This combustion has happened more frequently in the case of women. 4. These women were old. 5. Their bodies did not appear to have been burned by a combustion perfectly spontaneous; but it appears that the fire had taken place in consequence of some very slight external cause, such as the fire of a taper, candle, or pipe of tobacco. 6. The extremities of their bodies, such as the legs, the hands, or the cranium, escaped the fire. 7. Water, instead of extinguishing the fire of the burning parts of the body, gave it a greater velocity; a circumstance which also occurs in fat that is burnt. 8. The fire very slightly damaged, and, in many instances, did not injure the combustible objects which were in contact with the body at the moment it was burning. 9. The combustion of these bodies left a residue of oily and fetid ashes, with a greasy foot of a very penetrating and disagreeable smell. After reciting these several circumstances, the author endeavours to ascertain the cause of so surprising a pheno-

phenomenon, and with this view he advances several hypotheses, which it is needless to detail, as the facts are not sufficiently numerous nor well known to admit of establishing a satisfactory theory concerning the spontaneous combustion of human bodies. The author, however, appears to attribute it to a particular state of the fat produced by spirituous liquors; and he founds his opinion principally on the peculiar corpulence of the persons who have fallen victims to these accidents, and on the observation that has been made, that the parts which were not so fat, such as the extremities of the head, have escaped. And, lastly, he supports his theory by the well known fact of the spontaneous combustion of a mixture of animal foot and linseed oil, which is a mixture similar to that of a fat body containing charcoal in a very minute state of division.

BURNING is also a denomination given by physicians to divers disorders, on account of a fermentation of heat that attends them. In which sense we say a *burning* FEVER. See CAUSUS.

Among the divers species of madness incident to dogs, one is called the *burning* madness. If a mare which has been covered, and the colt knit within her, be covered by another horse, he is said to *burn* her.

BURNING is more particularly used for the herpes, or *ignis sacer*, called ERYSIPELAS and *arsura*.

BURNING, among *Surgions*, denotes the application of an actual cautery, that is, a red-hot iron instrument, to the part affected; otherwise denominated cauterization. See CAUTERY.

BURNING, in *Antiquity*, was a practice much used by the Greeks, Romans, and northern nations; and still retained by many people in both Indies, with respect to their dead. See BURIAL.

In this sense, *burning* stands opposite to burying; though, after burning, the bones remaining, and ashes, have been usually collected into urns, and deposited in the earth.

Burning is not so ancient among the Greeks as interring; though we find it obtained in the time of the Trojan war: and it is reported by the scholiast on Homer (*Iliad. æ.*) to have been first introduced by Hercules. At and after the Trojan war, burning was generally practised by the Grecians; inasmuch that when Lucian (*De Luctu*) enumerates the various methods used by different nations in the disposal of their dead, he expressly assigns burning to the Greeks, and interment to the Persians. Socrates in Plato's *Phædon*, mentions both customs: and it appears, that some of them considered the custom of burning as cruel and inhuman; whence a poet, cited by Eustathius (*Il. æ.*) introduces a person, exclaiming against, and calling out upon Prometheus to haste to his assistance, and steal, if possible, from mortals the fire he had given them. Others ascribe the origin of this practice, which prevailed very anciently, not only in Asia, but in the western parts of the world, to respect and friendship for the deceased; whose ashes they deposited in urns, and preserved with great care, and interred with funeral honours. Potter. *Arch. lib. iv. cap. 6. tom. ii.*

Kings were burnt in cloth made of the asbestos-stone, that their ashes might be preserved pure from any mixture with the fuel, and other matters thrown on the funeral pile. And the like usage is still retained for the princes in Tartary.

Among the Greeks, the body was placed upon the top of the pile, on which were also thrown divers animals, and even slaves and captives, besides unguents and perfumes. In the funeral of Patroclus, we find a number of sheep and oxen thrown in, then four horses, followed by two dogs, and lastly, by twelve Trojan prisoners. Hom. *Il. xxiii.*

To this custom of slaughtering animals, and of condemning slaves or captives to the flames, on occasion of burning the dead, Virgil alludes (*Æn. x. 518. xi. 82. xi. 197.*); and also Cicero (*Flacc. 38.*). Afterwards gladiators, denominated *Bulluarii*, (which see,) were made to fight, as a substitute to human sacrifices. Thus also among the Gauls, slaves and clients were burnt on the piles of their masters (see *Cæs. Bell. Gall. vi. 17.*); and among the Indians and Thracians wives were burnt on the piles of their husbands; and if one man had several wives, there was sometimes a contest among them, which should be preferred, and the preference was decided by lot. *Ælian. vii. 18. Serv. in Æn. v. 95.* A similar practice has long existed among the Brahmins of India. See BRAHMINS. Thus among the Romans, friends testified their affection; as Plotinus to his patron (*Plin. vii. 36.*), Plantins to his wife Orestilla. (*Val. Max. iv. 6. 3.*) Soldiers to Otho (*Tacit. Hist. ii. 49.*), and Mæster, a freedman, to Agrippina, (*Tacit. Annal. xiv. 9.*) The body of the deceased was covered with the fat of beasts, that it might the sooner be consumed, it being regarded as a singular blessing to be quickly reduced to ashes. For the same reason, when a number of bodies was arranged to be burnt on the same pile, they blended those of most temperament, and which were easily inflamed, with others: and to this purpose Plutarch (*Sympos. l. iii. Quæst. 4.*), and Macrobius (*Saturn. l. vii. c. 7.*) observe, that to ten men it was customary to add one woman.

Soldiers usually had their arms burnt with them: The garments worn by the living were also thrown on the pile with other ornaments and presents; a piece of extravagance, which the Athenians carried to so great a length, that some of their law-givers were forced to restrain them, by severe penalties, from defrauding the living by their liberality to the dead.

The pile was set on fire by some of the nearest relations, who prayed and offered vows to the winds to assist the flames, that the body might be quickly consumed. While the body was burning, in the case of celebrated commanders, the soldiers and attendants expressed their respect for the dead by making a solemn procession three times round the pile, accompanying their motions with shouts and sound of trumpet: and the friends of the deceased stood by the pile, pouring forth libations of wine, and calling upon the deceased. When the flames ceased, the remains of the fire were extinguished with wine, and the bones and ashes were collected, sometimes washed with wine and anointed with oil, and sometimes enclosed with fat; and then deposited in urns of gold, silver, wood, stone, or earth, according to the condition of the deceased; those of persons of rank were adorned with flowers and garlands, and sometimes they were covered with cloth till they were lodged in the earth. Homer. *Il. xxiii. xxiv.* Virgil. *Æn. vi.* Potter. *ubi supra.*

The Romans, at first, usually interred their dead. See BURIAL. But they adopted, at an early period, the custom of burning from the Greeks (see *Plut. in Numa*); and this custom is mentioned in the laws of Numa, and of the twelve tables (*Cic. de leg. ii. 22.*), but it did not become general, till about the end of the republic. Sylla was the first of the patrician band of the "Gens Cornelia," that was burnt: and he is supposed to have ordered it, lest any one should dig up his body, and dissipate his remains, as he did those of Marius. *Pliny (H. N. l. viii. c. 54.)*

Eustathius assigns two reasons for the prevalence of burning in Greece; the first, that bodies being thought to be unclean after the soul's departure, were to be purified by fire: and that the soul, or purer part, being separated by the flames, from the gross inactive matter, might take its flight

flight to the heavenly mansions with more freedom. This latter opinion obtained so much, that the Indian philo-  
sophers had not patience to wait for burning till after death; they had recourse to it in their life-time; erected themselves piles for the purpose, to loosen their souls from confinement. Calanus, who followed Alexander out of India, finding himself indisposed, obtained that prince's leave to prevent the growth of his distemper, by committing himself to the flames; and Hercules, before his reception into heaven, was purified from the dregs of earth by the same means. Quintil. Declam. x. Potter. ubi supra.

Pliny assures us, that burning was brought into use among the Romans, on occasion of the cruel usage which the bodies of the dead Romans underwent in enemies' countries. But this must only be understood in regard of the common usage; since we find mention of burning as practised by some even in the earliest ages of Rome: Numa forbid his own body to be burned, commanding it to be laid entire in a stone coffin, which shews that the practice of burning was not then unknown at Rome. Under the emperors, as we learn from Tacitus (Annal. xvi. 9.), it became almost universal.

In some cases burning was expressly forbid, and looked upon as the highest impiety. Thus infants who died before the breeding of teeth, were entombed unburnt, in the ground, in a particular place set apart for this use, called *Juggrundarium*. The like was practised with regard to those who had been struck dead with lightning, who were never to be burnt again, but buried in the spot where they fell, called *bidental*, which see.

Some say, that burning was denied to suicides as a punishment.

The manner of burning among the Romans was not unlike that of the Greeks: the corpse being brought without the city, if they designed to burn it, was carried directly to the place appointed for that purpose; which, by the law of the twelve tables, was without the city: (Cic. de Leg. ii. 23.) according to the custom of other nations, as the Jews, (Matt. xxvii. 53. John, xix. 20 and 41.), the Athenians, (Cic. Fam. iv. 12. Liv. xxxi. 24.), and others, (Cic. Flacc. xxxi. Tusc. v. 23. Plut. in Arat. Strabo, l. x.) If this place joined to the sepulchre, it was called *lustum*, if separate from it, *ustrina*: the body, when brought thither, was laid on the *rogus*, a pile of wood prepared to burn it on, built in shape of an altar, but of different height, according to the quality of the deceased; and at the distance of 60 feet from any house. The wood used was commonly from such trees as contained most pitch or rosin; and if any other were used, they split it for the more easy catching fire: round the pile they set cypress trees, probably to hinder the noisome smell of the corpse. The body was not placed on the bare pile, but on the couch or bed on which it lay. The eyes of the deceased were opened, (Plin. ii. 37.) to which Virgil is thought to allude, *Æn.* iv. 214. This done, the next of blood performed the ceremony of lighting the pile, which they did with a torch, turning the face all the while the other way, as if it were done with reluctance. During the ceremony, more especially at the funeral of an illustrious commander or emperor, decursions round the pile were performed, with ensigns inverted, and games were celebrated; after which, when the fire was extinguished, and the embers soaked with wine, came the *offilegium*, or gathering the bones and ashes; also washing and anointing them, and repositing them in urns; which were common to both the Greeks and Romans. Tibull. lib. i. Eleg. i. Virg. *Æn.* lib. vi. Kennet and Potter. lib. cit. It is commonly supposed the practice of burning ceased at Rome under the empire of the Antonines.

The practice, prevalent among the Hindoos, and of which some rare instances still occur, of widows burning themselves on the funeral piles of their deceased husbands, has been already mentioned; (see also the article BRACHMANS). Mr. Colbrooke, in a paper "on the duties of a faithful Hindoo widow," published in the 4th volume of the Asiatic Researches, has collected, from the ancient Sacerit books all the particulars that may serve to elucidate this extraordinary ritual. "Having first bathed, the widow, dressed in two clean garments, and holding some *cusa* grass, sips water from the palm of her hand. Bearing *cusa* and *tila*, or sesamum, on her hand, she looks towards the east or north, while the Brâhmâna utters the mystic word *Om*. Bowing to Nerayana, she next declares: "On this month, so named in such a *pacsha*, on such a *tithi*, I (naming herself and her family), that I may meet *Arundhati*, and reside in *Svarga*; that the years of my stay may be numerous as the hairs on the human body; that I may enjoy with my husband the felicity of heaven, and sanctify my paternal and maternal progenitors, and the ancestry of my husband's father; that lauded by the *Apsarasas*, I may be happy with my lord, through the reigns of 14 *Indras*; that expiation be made for my husband's offences, whether he has killed a Brâhmâna, broken the ties of gratitude, or murdered his friend: thus I ascend my husband's burning pile. I call on you, ye guardians of the eight regions of the world! Sun and moon! Air, fire, æther, earth, and water! My own soul! Yama! Day, night, and twilight! And thou, conscience, bear witness: I follow my husband's corpse on the funeral pile!" Having repeated the above declaration, called the *Sancalpa*, she walks thrice round the pile; and the Brâhmâna utters the following *Mantras*: "Om! Let these women, not to be widowed good wives, adorned with collyrium, holding clarified butter, consign themselves to the fire. Immortal, not childless, nor husbandless, excellent, let them pass into fire, whose original element is water." From the *Rigvéda*: "Om! Let these wives, pure, beautiful, commit themselves to the fire with their husband's corpse," A *paúrânica muntra*.

With this benediction, and uttering the mystic *Namô Namô*, she ascends the flaming pile. While the prescribed ceremonies are performed by the widow, the son, or other near kinsman, of the deceased, applies the first torch with the forms directed for the funeral rites in the *Grihya* (extracts or compilations from the sacred books); by which his tribe is governed. The last rites in this tragic scene, as we may call it, but not so deemed by those who practise them, are as follow: "Adorned with all jewels, decked with *minium* and other customary ornaments, with the box of *minium* in her hand, having made *pijâ* or adoration to the *Dévâtâs*, thus reflecting that *this life is nought; my lord and master to me was all*:—she walks round the burning pile; she bestows jewels on the *Brahmanas*, comforts her relations, and shews her friends the attentions of civility; while calling the sun and elements to witness, she distributes *minium* at pleasure; and having repeated the *sancalpa*, proceeds into the flames; there embracing the corpse, she abandons herself to the fire, calling *Satya! Satya! Satya!* The by-standers throw butter and wood on the pile, which is reckoned an act transcendently meritorious, and even those who join in the procession are rewarded in heaven for every step of their march. Such liberal immunities are a proof, says Mr. Colbrooke, that burning could never be a frequent practice in the east.

The sacrifice above described is not absolutely enjoined; but it is recommended by all the allurements which enthusiasm can invent. There are, however, some cases of exemption. If the widow has an infant child; or if she is pregnant: and, among certain casts, if the husband dies in a distant

distant country, the ceremony is interdicted. But if the woman declines burning, for she is allowed the alternative, she must thenceforth live a life of the most rigid austerity, and devote herself wholly to acts of piety and mortification. But though the alternative be allowed, the Hindoo legislators have shewn themselves disposed to encourage widows to burn themselves with their husband's corpse.

Mr. Campbell, during his stay at Tanjore, was a spectator of this horrid ceremony; performed by a young widow, not more than 16 years of age. He has minutely described all the circumstances attending it; for an account of which we refer the reader to his "Journey over Land to India," 4to. 1795.

*BURNING alive*, among the Romans, a punishment inflicted on deserters, betrayers of the public councils, incendiaries, coiners, and even Christians: it was called *crematio*.

The Jews had two ways of burning; one called burning of the body, performed with wood and faggots; the other, burning of the soul, *combustio anime*, performed by pouring scalding-hot lead down their throats. The priest's daughter, who committed whoredom, he that lay with his own daughter, or grand-daughter, or his mother-in-law, were burnt alive. Phil. Trans. N<sup>o</sup> 230. Godw. Moses & Aaron, lib. v. cap. 7.

*BURNING, Uffio, in Chemistry*, is distinguished from *CALCINING*; as the former is performed in close vessels, and terminates in charring, or reducing the body to a blackness; whereas the latter turns them white, being performed in the open air. It also differs from roasting, *toffio*, as, in burning, the fire is applied in contact with the body; in roasting, at a distance from it.

*BURNING, OR BRENNING*, in our *Ancient Customs*, denotes an infectious local disease, obtained by intercourse with the lewd women who were kept in the public stews. See *STEWES*.

Mr. William Beckett, a surgeon of great learning in this branch of history, has left us a curious account of the *brenning*, which was published in a letter to Dr. James Douglass, A. D. 1718. Mr. Beckett has certainly failed in proving the antiquity of lues venerea or syphilis; but the information contained in his letter is too much to our present purpose to be wholly omitted. We shall, however, resume this investigation when we describe the origin of the venereal disease; intending, in the article before us, to give only an extract from Mr. Beckett's interesting letter; viz.

"I shall begin with the first degree of this disease, and prove, from authentic evidences, it was anciently called the *brenning* or *burning*; and that this word has been successively continued for many hundreds of years, to signify the same disease we now call a *clap*; and that it was not discontinued till that appellation first began to have its rise. The most likely method to accomplish my design, will be first to examine those records that relate to the stews which were by authority allowed to be kept on the Bank-Side in Southwark, under the jurisdiction of the bishop of Winchester, and which were suppressed the 37th of Hen. VIII. For it is impossible but, if there were any such distemper in being at that time, it must be pretty common among those lewd women who had a licence for entertaining their paramours, notwithstanding any rules or orders which might be established to prevent its increase: but if we shall find that there were orders established to prevent the spreading of such a disease, that persons might be secure from any contagious malady after their entertainment at those houses, (which were anciently 18 in number, but in the reign of Hen. VII. reduced to 12), we may then securely depend upon it, that it was the frequency of the disease that put those who had the authority under a

necessity of making such rules and orders. For the same powers, who granted a liberty for keeping open such lewd houses, must find it their interest to secure, as much as possible, all persons from receiving any injury there; lest the frequency of such misfortunes should deter others from frequenting them, and so the original design of their institution cease; from the entire sinking of the revenues. Now I find that, as early as the year 1162, divers constitutions relating to the lordship of Winchester, (being also confirmed by the king), were to be kept for ever, according to the old customs that had been time out of mind. Among which these were some, viz. 1. No steward to take more for a woman's chamber in the week than 14d. 2. Not to keep open his doors upon holy days. 3. No single woman to be kept against her will, that would leave her sin. 4. No single woman to take money to lie with any man, except she lie with him all night till the morning. 5. No steward to keep any woman that hath the perilous infirmity of burning. These and many more orders were to be strictly observed, or the offenders to be severely punished. Now we are assured, there is no other disease that can be communicated by carnal conversation with women, but that which is venereal, by reason that only is contagious; and it is evident the burning was certainly so: for, had it been nothing else but some simple ulceration, heat, or inflammation, there would have been no contagion; and that affecting only the woman, could not be communicated by any venereal congress, and so not infer a necessity of her being comprehended under the restraining article. These orders likewise prove the disease was much more ancient than the date above mentioned; because they were only a renewal of such as had been before established time out of mind.

"But to confirm this farther, I find that in the custody of the bishop of Winchester, whose palace was situated on the Bank-side, near the stews, was a book written upon vellum, the title of which runs thus: "Here begynne the ordinances, rules, and customs, as well for the salvation of mannes life, as for to aschew many mischiefs and inconvenients that daily be lik there for to fall out, to be rightfully kept, and due execution of them to be done unto any person within the fame." One of the articles begins thus: "De his qui custodiunt mulieres habentes nephandum infirmitatem." It goes on, item, "That no steward keep noo woman wythin his house, that hath any sickness of brenning, but that she be put out upon the peyne of makeit a fine unto the lord of a hundred shillings." This is taken from the original manuscript, which was preserved in the bishop's court, supposed to be written about the year 1430. From these orders we may observe the frequency of the distemper at that time; which, with other inconveniences, was dayly like there for to fall out: and the greatness of the penalty, as the value of money then was, that is laid on it, proves it was no trifling or insignificant thing.

"But the bare proof of there having been anciently such a disease as was called the *burning*, may be thought to be insufficient, unless we were perfectly assured what it was, and how it was in those times described: I shall therefore do it from an unquestionable authority, which is that of John Arden, esq.; who was one of the surgeons to king Richard II. and likewise to king Henry IV. In a curious manuscript of his upon vellum, he defines it to be, a certain inward heat and excoriation of the urethra; which description gives us a perfect idea of what we now call a *clap*; for frequent dissections of those who laboured under that disease have made it evident, that their urethra is excoriated by the virulency of the matter they receive from the infected woman; and this excoriation or ulceration is not confined to the

*osifolia* or mouths of the *glandulae mucosae*, as has been lately thought, but may equally alike attack any part of the urethra not beyond the reach of the impelled malignant matter. The heat before described, which these persons are sensible of, as well now as formerly, is a consequent of the excoriated urethra; for the salts contained in the urine must necessarily prick and irritate the nervous fibrillæ, and excite a heat in those parts of the urethra which are divelled of its natural membrane; which heat will always be observed to be more or less, as the salts are diluted with a greater or less quantity of urine; a thing I have often observed in persons who have laboured under this infirmity in hot weather, when the perspirable matter being thrown off in greater quantities, the salts bear a greater proportion to the quantity of urine, and thereby make its discharge at that time so much the more painful and troublesome.

Thus we see this very early and plain description of this disease among us to be entirely conformable to the latest and most exact anatomical discoveries. Here is no tone of the testicles depraved, according to Trajanus Petronius; no exulceration of the *parastatae*, according to Rondeletius; no ulceration of the femoral vessels, according to Platerus; no seat of the disease in the *vesiculae seminales*, or *prostate*, according to Bartholin; nor in those parts and the testicles at the same time, according to our countryman Wharton, and others, who have falsely fixed the seat of this disease, and whose notions, in this respect, are now justly exploded; but a single and true description of it, and its situation, about 150 years before any of those gentlemen obliged the world with their learned labours.

Having, I hope, sufficiently made it appear, the burning was a disease very early among us, and given the description of it, I shall proceed to say something of the ancient method that was made use of to cure it. We are not to expect the measures our predecessors in those early times made use of should be calculated for the removing any malignity in the mass of blood, or other juices, according to the practice in venereal cases at this time; because they looked upon the disease to be entirely local, and the whole of the cure to depend upon the removal of the symptoms. Hence it was they recommended such remedies as were accommodated to the taking off the inward heat of the part, and cure the excoriations or ulcerations of the urethra. The process for the accomplishing of this, I shall set down from the before-mentioned John Arden, who wrote about the year 1380. His words are as follow: "Contra incendium. Item contra incendium virgæ virilis interioris ex calore & excoriatione, fiat talis syringa (i. e. injectio) lenitiva. Accipe lac mulieris masculinum nutritivum, & parum zucarium, oleum violæ & ptisanæ, quibus commixtis per syringam infundatur, & si prædictis admiscueris lac amigdalorum melior erit medicina." There is no doubt but this remedy, being used to our patients at this time, would infallibly take off the inward heat of the part, and cure the excoriations or ulcerations of the urethra, by which means what issued from thence would be entirely stopt: and this was all they expected from their medicines, for as much as they were entirely unacquainted with the nature of the distemper; and did not in the least imagine, but if the symptoms that first attacked the part were removed, the patient was entirely cured.

I shall now, as a farther confirmation of what I have advanced, proceed to prove, that by this *brenning* or *burning* is meant the venereal disease, by demonstrating that succeeding historians, physical and chyrurgical writers, and others, have all along with us in England used the very same word to signify the venereal malady. In an old manuscript I have, written about the year 1390, is a receipt for "bren-

ning of the pyntyl, yat men clepe ye apegalle;" galle being an old English word for a running sore. They who know the etymology of the word *ap on*, cannot be ignorant of this. And in another manuscript, written about 50 years after, is a receipt for burning in that part by a woman. Simon Fish, a zealous promoter of the reformation, in the reign of Hen. VIII. in his supplication of beggars, presented to the king, in 1530, says as follows: "These be they," speaking of the Romish priests, "that corrupt the whole generation of mankind in your realm; that catch the pockes of one woman and bear them to another; that be burnt with one woman and bear it to another; that catch the leproy of one woman and bear it unto another." But to make this matter still more evident, I am to observe, that Andrew Boord, M. D. and Romish priest, in the same reign, in a book he wrote, entitled "The Breviary of Health," printed in 1546, speaks very particularly of this sort of burning; one of his chapters begins thus: "The 19th chapter doth shew of burning of an harlot;" where his notion of communicating the burning is very particular. He adds, that if a man be burnt with an harlot, and do meddle with another woman within a day, he shall burn her: and as an immediate remedy against the burning, he recommends the washing the pudenda two or three times with white wine, or else with sack and water; but if the matter have continued long, to go to an expert surgeon for help. In his 82d chapter, he speaks of two sorts of burning, the one by fire, and the other by a woman, through carnal copulation, and refers the person that is burnt of a harlot to another chapter of his for advice, "yf he get a dorser or two," so called from its protuberancy or bunching out: for I find about that time the word *bubo* was mostly made use of to signify that sort of swelling which usually happens in pestilential diseases.

From hence it appears, the burning by its consequents, was venereal, since every day's experience makes it evident, that the ill treatment of the first symptoms of the disease, either by astringent medicines, or the removing them by cooling and healing the excoriated parts, will generally be attended with such swellings in the groin, which we rarely observe to happen from any other cause whatsoever.

I shall give a few more instances of this disease being called the *burning*, and conclude. In a manuscript I have of the vocation of John Bale to the bishoprick of Ossory in Ireland, written by himself, he speaks of Dr. Hugh Weilon, who was dean of Windsor, in 1556, but deprived by cardinal Pole for adultery, as follows, "At this day is lecherous" "Welton, who is more practised in the art of brech-burning than all the whores of the flevs." And again, speaking of the same person, he says, "He not long ago brent a beggar in St. Botolph's parish." The same author says of him elsewhere, "He had been fore bitten with a Wincheller goose, and was not yet healed thereof;" which was a common phrase for the pox at that time, because the flevs were under the jurisdiction of the bishop of Winchester. Mich. Wood, in his epistle before Stephen Gardiner's oration, "De vera Obedientia," printed at Rhoan, 1553, gives another evidence of the burning. And William Bullein, a physician in the reign of queen Elizabeth, in a book he published, called "The Bulwark of Defence, &c." printed in 1562, bringing in Sickness demanding of Health what he should do with a disease called the "French Pockes," Health answers, "He would not that any should fishe for this disease, or to be bold when he is bitten, to thynke thereby to be helped, bvt rather to eschewe the cause of thys infirmity, and filthy rotten burning of harlots."

In the Sloane library, N<sup>o</sup> 4037, is another letter, (bound up in folio, with a great many different MSS.) from Mr. William Beckett to Sir Han Sloane, dated Feb. 4th 1717; wherein the principal facts mentioned in the letter to Dr. Douglass are recited. But we found nothing besides which is worthy of notice, except the following remark: "This *burning* or *burning*, (being, upon the distill of these words, called gonorrhœa), is what we now call the *clap*:" which word I take to be of a modern usage; for, in all my enquiries, I cannot find it was ever designed to signify the same thing it does now, before the reign of "Charles I."

BURNING, in *Law*. See ARSON, BRANDING, TREASON, &c.

BURNING of diamonds, is used among the jewellers for putting the DIAMONDS into a fierce fire, in order to divest them of a yellow or brown colour.

BURNING on the forehead, *Frontis infulio*, was anciently the penalty of a calumniator. In the middle age, we find frequent instances of *burning* in the cheek; a punishment allotted to bondmen, or villains guilty of theft.

BURNING-bush. See BUSH.

BURNING-glass, or *burning-mirror*, a machine whereby the sun's rays are collected into a point; and by that means their force and effect extremely heightened, so as to burn objects placed therein.

Burning-glasses are of two kinds: the first convex, called *lentes causticae*; which transmit the rays of light, and in their passage refract, or incline them towards the axis; having the property of lenses, and acting according to the laws of refraction.

The second, which are the more usual, are concave; very improperly called burning-glasses, being usually made of metal: these reflect the rays of light, and, in that reflection, incline them to a point in their axis; having the properties of *specula* or mirrors; and acting according to the laws of reflection. See MIRROR and REFLECTION.

The first, or convex kind, authors suppose to have been unknown to the ancients; but the latter they are generally allowed to have been acquainted with. Their magnifying power is taken notice of both by Seneca and Pliny; and their burning power is mentioned in a treatise of Optics, ascribed to Euclid, theorem 31. It is probable that the Romans had a method of lighting their sacred fire by means of reflecting concave *specula*. But Porta, and many others, suppose, that the burning mirrors of the ancients were made of metal, in the form of a section of a parabola, having the vertex cut off; it being the well-known property of this curve to reflect all rays that fall upon it parallel to the axis into the focus. Historians tell us, that Archimedes, by means of reflecting mirrors, burnt a whole fleet; and though the effect related be very improbable, yet it sufficiently proves, that such things were then known. The machines then used, nobody doubts, were metallic and concave, and had their focus by reflexion: it being agreed, that the ancients were unacquainted with the refracted *foci* of convex glasses. Yet M. de la Hire has discovered even these in the Clouds of Aristophanes; where Strepsiades tells Socrates of an expedient he had to pay his debts, by means of a round transparent stone or glass, used in lighting of fires, by which he intended to melt the bond; which in those days was written on wax. The glass here used to light the fire, and melt the wax, M. de la Hire observes, could not be concave; since a reflected focus coming from below upwards, would have been exceedingly improper for that purpose: and the old scholiast of Aristophanes confirms the sentiment. Pliny makes mention of globes of glass and crystal, which being

exposed to the sun, burnt the clothes and flesh on people's backs; and Lactantius adds, that a glass sphere, full of water, and held in the sun, lighted the fire even in the coldest weather; which incontestibly proves the effects of convex glasses.

Indeed, there is some difficulty in conceiving how they should know such glasses burnt, without knowing they magnified; which it is granted they did not, till towards the close of the thirteenth century, when spectacles were thought of. For as to those passages in Plautus, which seem to intimate the knowledge of spectacles, M. de la Hire observes, they do not prove any such thing: and he solves this, by observing, that their burning glasses being spheres, either solid, or full of water, their *foci* would be one fourth of their diameter distant from them: if then their diameter were supposed half a foot, which is the most we can allow, an object must be at the distance of an inch and an half, in order to its being perceived magnified: those at greater distances do not appear greater, but only more confused, through the glass than out of it. It is no wonder, therefore, the magnifying property of convex glasses was unknown, and their burning one known; it is more wonderful there should be 300 years between the invention of spectacles and telescopes.

Every concave mirror, or *speculum*, collects the rays dispersed though its whole concavity, after reflexion, into a point or focus; and is therefore a burning mirror.

Hence, as the focus is there where the rays are the most closely contracted, if it be a segment of a large sphere, its breadth must not subtend an arch above eighteen degrees: if it be a segment of a smaller sphere, its breadth may be thirty degrees; which is verified by experiment. As the surface of a mirror, which is a segment of a larger sphere, receives more rays than another of a less, if the latitude of each subtend an arch of eighteen degrees; or even more or less, provided it be equal; the effects of the greater mirror will be greater than those of the less.

And, as the focus is contained between the fourth and fifth parts of the diameter, mirrors that are segments of greater spheres burn at a greater distance than those which are segments of a smaller.

Since, lastly, the burning depends on the union of the rays, and the union of the rays on the concave spherical figure; it is no wonder, that even wooden mirrors, gilt, or those prepared of alabaster, &c. covered with gold; nay, even that those made of paper, and covered with straw, should be found to burn.

Among the ancients, the burning mirrors of Archimedes and Proclus are eminent; by one of which, the Roman ships besieging Syracuse, under the command of Marcellus, according to the relation of Zonaras, Tzetzes, Galen, Eustathius, Anthemius, &c. and by the other, the navy of Vitalian besieging Byzantium, according to the same Zonaras, were burnt to ashes.

Many have questioned the fact recorded by several historians concerning the surprising effects of Archimedes's burning mirrors; and they have principally urged the impossibility of producing such effects by means of concave specula, the focal distance of which must have been much too small for the purpose. Des Cartes, particularly, discredited the story, as fabulous, on this account; but Kircher made many experiments with a view of vindicating its credibility. Apprehending that the concave specula of the ancients were sections of a parabola, he began with combining several of this figure; but, failing of success in this way, he tried the effect of a number of plane mirrors; and with five mirrors of the same size, placed in a frame, he contrived to throw the rays

rays reflected from them to the same place, at the distance of more than a hundred feet; and by their means he produced such a degree of heat, as led him to conclude that, by increasing their number, he could have set fire to inflammable substances at a greater distance. He likewise made a voyage to Syracuse, in company with his pupil Schottus, in order to examine the place of the supposed transaction; and they were both of opinion that the galleys of Marcellus could not have been more than thirty paces from Archimedes. M. Buffon, though ignorant of the particular testimonies of ancient writers, relative to the invention of Archimedes, and of the attempts of Kircher above mentioned, has more lately, by a similar contrivance, sufficiently evinced the practicability of the operation.

Dr. Wolfe, in the year 1768, after having given an account of some parabolic mirrors, constructed by M. Hoesen of Dresden, offers a conjecture, that those of Archimedes might be of this kind, since it is not difficult to describe a parabola, whose parameter is 2000 feet; and that rays reflected from such a speculum might be received by a lens, after having been brought to a focus, and transmitted parallel to any distance: but he was not apprized, that Kepler and Dechales had shewn, that no rays could be conveyed parallel to one another, except those which proceeded from the same points in the sun's disk. *Dutens du Miroir Ardent d'Archimede.* Paris, 1755. *Phil. Transf.* vol. xlviii. p. 621, &c. *Ibid.* vol. lix. p. 8.

Among the moderns, the most remarkable burning mirrors are those of Magine, twenty inches in diameter; of Septala of Milan, which was near three feet and a half in diameter, and which burnt at the distance of fifteen or sixteen paces; of Villette, and Tschirnhausen, the new complex one of M. Buffon, that of Trudaïne, and that of Parker.

Villette, a French artist at Lyons, made a large mirror, which was bought by Tavernier, and presented to the king of Persia; a second, bought by the king of Denmark; a third, presented by the French king to the Royal Academy; a fourth has been in England, where it was publicly exposed.—The effects of this mirror, as found by Dr. Harris and Dr. Desaguliers, are, that a silver sixpence is melted in 7" and  $\frac{1}{2}$ ; a halfpenny of king George I. in 16", and running with a hole in 34". Tin melts in 3", cast iron in 16"; slate in 3"; a fossil shell calcines in 7"; a piece of Pompey's Pillar in Alexandria vitrifies in the black part in 50", in the white in 54"; copper ore in 8"; bone calcines in 4", and vitrifies in 33". An emerald melts into a substance like a turquois stone; a diamond weighing four grains, loses  $\frac{2}{3}$  of its weight; the asbestos vitrifies; as all other bodies will do, if kept long enough in the focus; but when once vitrified, the mirror can produce no farther effect.—This mirror is forty-seven inches wide; and is ground to a sphere of seventy-six inches radius; so that its focus is about thirty-eight inches from the vertex. Its substance is a composition of tin, copper, and tin-glass. *Phil. Transf.* vol. iv. p. 198.

M. Tschirnhausen's reflecting mirror deserves next to be mentioned. The following things are noted of it in the *Acta Eruditorum*, for 1687, p. 52. 1. Green wood takes fire instantaneously, so that a strong wind cannot extinguish it. 2. Water boils immediately, and eggs in it are presently edible. 3. A mixture of tin and lead, three inches thick, drops presently, and iron or steel-plate becomes red hot presently, and a little after burns into holes. 4. Things not capable of melting, as stones, bricks, &c. become soon red hot, like iron. 5. Slate becomes first white, then a black glass. 6. Tiles are converted into a yellow glass, and shells into a blackish yellow one. 7. A pumice-stone emitted from a volcano, melts into white glass; and, 8. A piece of crucible

also vitrifies in eight minutes. 9. Bones are soon turned into an opaque glass, and earth into a black one. It is made of copper, and its substance is not above double the thickness of the back of a knife: this was about 4 $\frac{1}{2}$  French feet in diameter, and it burnt at the distance of twelve feet.

Every lens, whether convex, plano-convex, or convexo-convex, collects the sun's rays, dispersed over its convexity, into a point by refraction; and is therefore a burning glass. The most considerable of this kind known, is that made by M. de Tschirnhausen: the diameters of his lenses are three and four feet; the focus at the distance of twelve feet, and its diameter an inch and a half. To make the focus more vivid, the rays are collected a second time by a second lens parallel to the first; and situated in that place where the diameter of the cone of rays formed by the first lens is equal to the diameter of the second; so that it receives them all: and the focus from an inch and a half, is contracted into the space of eight lines, and its force increased proportionably. It was purchased by the duke of Orleans, who presented it to the French Academy. Its weight was 160 pounds.

Its effects, among others, as related in the *Acta Erudit.* Lipsiæ, are, that it lights hard woods, even moistened with water, into a flame, instantly; that water, in a little vessel, begins to boil presently; all metals are melted; brick, pumice-stone, delft wares, and the asbestos stone, are turned into glass; sulphur, pitch, &c. melted under water: the ashes of vegetables, woods, and other matters, transmuted into glass; in a word, every thing applied to its focus, is either melted, turned into calx, or into smoke; and the colours of jewels, and all other bodies, metals alone excepted, are changed by it. He observes, that it succeeds best, when the matter applied is laid on a hard charcoal, well burnt.

Though the force of the solar rays be here found so stupendous, yet the rays of the full moon, collected by the same burning glass, do not exhibit the least increase of heat.

Wolfius tells us, that an artist of Dresden made burning mirrors of wood, bigger than those of M. Tschirnhausen or Villette, which had effects at least equal to any of them.—Traberus teaches how to make burning mirrors of leaf gold, viz. by turning a concave, laying its inside equally with pitch, and covering that with square pieces of the gold, two or three fingers broad, fastening them on, if need be, by fire. He adds, that very large mirrors may be made, of thirty, forty, or more concave pieces, artfully joined in a turned wooden dish or scuttle: the effects of which will not be much less than if the surface was continuous.—Zahnus adds farther, that Newman, an engineer at Vienna, in 1699, made a mirror of paste-board, covered withinside with straw glued to it; by which all kinds of metals, &c. were readily melted.

Sir Isaac Newton's burning mirror consisted of seven concave glasses, each of which was eleven inches and a half in diameter, and so disposed as to have one common focus: six of them were placed round the seventh and contiguous to it, in such a manner as to form the segment of a sphere, whose subtense is about thirty-four inches and a half; the focus is about twenty-two inches and a half distant, and about an inch in diameter. This speculum vitrified brick or tile in one second, and in about half a minute melted gold. M. Zeher, not long since, made some improvement of this instrument; and formed panes of plain glass into the necessary degree of curvature, by heating them so hot on a dish made of metal, that they could all assume the same form. M. Buffon has constructed furnaces for converting plain into concave mirrors; the mirrors are exposed to a degree of heat sufficient to soften the glass, in consequence of which it conforms itself to the spherical figure of the mould on which it is placed. This method is subject to many difficulties and

accidents; however, out of twenty-four mirrors treated thus, M. Buffon perceived three: two of which are thirty-seven inches in diameter, and the other forty-six inches. The last was tin-foiled, and presented to the French king; and is represented by the maker, as the most powerful burning mirror in Europe, and yet the moon's light reflected from this concave speculum, on a thermometer placed in the focus, produced no sensible dilatation of the included fluid. M. Buffon has also made attempts for constructing convex lenses of great power, by fixing two of the above mentioned concave glasses together, and filling the cavity between them with water: one of the glasses broke in the trial; but others have since undertaken to construct these water lenses. He has likewise suggested another improvement in the construction of burning glasses, consisting in a contrivance for diminishing the thickness of the middle or central part of the lens from three inches to one inch; whereby he proposes to prevent the diminution of light occasioned by its passing through the middle part of a lens of large diameter, and short focus, which must be proportionably thick in that part. This new kind of lens is composed of three parts ground to the same radius, or of two circular zones, or bands, surrounding a central or middle part. He computes that the heat in the focus of a lens of this kind, three feet in diameter, will be about four times greater than that produced by any burning glass yet known.

But the most considerable improvement which M. Buffon has introduced into the optical apparatus is his machine, consisting of a number of mirrors; whereby he seems to have revived the secret of Archimedes, and to have vindicated the credit of history in this point. In the year 1747 he constructed a machine, with a hundred and forty plane mirrors, each about four inches long, and three broad; these are fixed at about a quarter of an inch distance from each other, upon a large wooden frame of about six feet square. Each of them has three moveable screws, which are so contrived, that the mirror can be inclined to any angle, and in any direction that meets the sun; and by this means, the solar image of each mirror is made to coincide with all the rest. The experiment was first tried with twenty-four mirrors, which readily set on fire a combustible matter, prepared of pitch and tow, and laid on a deal board, at the distance of sixty-six French feet.

He then farther pursued the attempt, and put together a kind of polyhedron, consisting of 168 pieces of plane looking glass, each being six inches square; and by means of this some boards of beech-wood were set on fire, at the distance of a hundred and fifty feet, in the month of March, and a silver plate was melted at the distance of sixty feet. This machine, beside other advantages, may be easily moved, so as to burn downwards or horizontally; and it burns either in its distant focus, or in any nearer interval, which our common burning-glasses cannot do, because their focus is wholly fixed and determined. This machine, in the next stage of its improvement, contained three hundred and sixty plane mirrors, each eight inches long, and six broad, mounted on a frame eight feet high, and seven feet broad. With twelve of these mirrors, light combustible matters were kindled at the distance of twenty feet; at the same distance, a large tin vessel was melted with forty-five of them, and a thin piece of silver with a hundred and seventeen. When the whole machine was employed, all the metals and metallic minerals were melted at the distance of twenty-five, and even of forty feet. Wood was kindled in a clear sky, at the distance of two hundred and ten feet. The focus, at the distance of fifty feet, is about seven inches broad; and at the distance of two

hundred and forty feet, it becomes two feet in diameter. Mr. Buffon afterwards constructed a machine, which contained four hundred mirrors, each half a foot square, with which he could melt lead and tin at the distance of a hundred and forty feet. *Phil. Trans. abr. vol. x. p. 194. &c. M. de Buffon Histoire Naturelle, &c. Supplement. vol. i. Montucla, Histoire des Mathematiques. vol. i. p. 232.*

There is no solid substance that resists the efficacy of modern burning-glasses. Messrs. Macquer and Bauré have succeeded in melting small portions of PLATINA, by means of a concave glass, twenty two inches in diameter, and of twenty-eight inches focus; though this metal is not fusible by the strongest fires that can be excited in furnaces, or sustained by any chemical apparatus. Yet it was long ago observed by the Academicians del Cimento, that spirit of wine could not be fired by any burning glass which they used; and notwithstanding the great improvement which these optical instruments have since received, M. Nollet has not been able, by the most powerful burning mirrors, to set fire to any inflammable liquors whatever.

The principle upon which M. Trudaine constructed his burning lens was that of combining two circular segments of glass spheres, and applying them with their concave sides towards each other, so as to form a lenticular cavity of four feet in diameter. The cavity was filled with spirits of wine; of which it contained 140 French pints. The focus of parallel rays in this instrument was 10 feet 10 inches and one line distant from the centre of the glass; and originally contracted to a circle of about eight lines in diameter, by the interposition of a second and smaller lens of solid glass. The maker presented it to the Royal Academy of Sciences, but it was soon afterwards accidentally broken. The expense of its construction is said to have amounted to 1000l. sterling; and yet its powers were not very great; for, according to Mr. Magellan, it required 20 minutes for coagulating the particles of platina, which Mr. Parker's lens could do in less than a tenth part of the time. This seems indeed to be the most powerful burning lens that has yet been constructed. Mr. Parker, of Fleet-street, London, was induced, at an expense of upwards of 700l., to contrive and at length to complete a large transparent lens, that would serve the purpose of fusing and vitrifying such substances as resist the fires of ordinary furnaces, and more especially of applying heat in vacuo, and in other circumstances in which it cannot be applied by any other means. After directing his attention for several years to this object, and performing a great variety of experiments in the prosecution of it, he at last succeeded in the construction of a lens, of flint glass, three feet in diameter, which, when fixed in its frame, exposes a surface two feet  $8\frac{1}{2}$  inches in the clear; without any other material imperfection besides a disfigurement of one of the edges by a piece of the scoria of the mould, which unfortunately found its way into its substance. This lens was double convex, both sides of which were a portion of a sphere of 18 feet radius. From the papers and drawings, with which the ingenious inventor has obligingly furnished us, we are able to give the following accurate account of this lens, illustrated by appropriate engravings. The elevation of this lens is exhibited in *Plate II. Optics, fig. 1.* The large lens is A, whose diameter in the frame is 3 feet, and in the clear 2 feet  $8\frac{1}{2}$  inches; its thickness at the centre is  $3\frac{1}{4}$  inches; its focal distance 6 feet 8 inches; and the diameter of the burning focus 1 inch; its weight was 212 pounds. B is a second lens, whose diameter in the frame is 16 inches, and which shews in the clear 13 inches; the thickness in the centre is  $1\frac{3}{8}$  inch; length of the focus 29 inches, and its diameter  $\frac{3}{8}$  of an inch;

its weight 21 pounds. When the two above lenses are compounded together, the length of the focus is 5 feet 3 inches, and its diameter half an inch. C is a truncated cone, composed of 12 ribs of wood, at the larger end of which is fixed the great lens A, and at the smaller extremity the lesser lens B; near the smaller end is also fixed a rack, D, passing through the pillar L, moveable by a pinion turning in the said pillar, by means of the handle E, and thus giving a vertical motion to the machine. F is a bar of wood, fixed between the two lower ribs of the cone at G; having, within a chased mortise in which it moves, an apparatus, H, with the iron plate I, fixed to it; and as this part turns on a socket, K, a method is thus obtained of placing the matter under experiment so as that it may be acted upon by the focal rays in the most direct and powerful manner. L L is a strong mahogany frame, moving on castors, M M, and immediately under the table, N, are three friction wheels, by which the machine moves horizontally. O is a strong iron bow, in which the lens and the cone hang.

In *fig. 2.* a section of the large lens is seen: *a*, the large lens, marked A in the former figure; *bb* is the frame which contains the lens; *c* the small lens, marked B in the preceding figure; *dd* is the frame which contains this lens; *ee* is the truncated cone, marked C in the other figure; *f* is the bar, on which the apparatus, marked F in the former figure, moves; *g* is the iron plate, denoted by I in the said figure; *h* the cone of rays, formed by the refraction of the great lens *a*, and falling on the lens *c*; and *i* is the cone of rays formed by the refraction of the lens *c*. In *fig. 3.* *k* exhibits the front view of the great lens; *l* the frame containing the large lens; and *m* the strong iron bow in which the lens hangs.

It is difficult to form an accurate estimate of the burning power of this lens; inasmuch as it is next to impossible to discover what should be deducted for the loss of power, in consequence of the impediments that the glass of which it was made must occasion, as well as the four reflections (i. e. two reflections on the immersion, and two more on the emission of the rays of heat), by way of diminution; but we will endeavour to appreciate it after making a full allowance for these deductions, which must necessarily result from every means of concentrating the solar rays, and which must be considered to be as the friction of an engine, of which nature they really partake.

The solar rays received on a circular surface of 2 feet 8½ inches, when concentrated within the diameter of one inch, will be 1056.25 times its intensity, or this number of times greater than the heat of the sun as felt on the surface of the earth. We will suppose that as the heat of the air, in ordinary summer weather, is 65°, and in sultry weather is 75°, the average of which is 70°, and that we take this degree as the average effect, the accumulated power of the lens, on the supposition of an equal effect over the whole surface of the focus, will be equal to 73938°.

It must be recollected by those who have had an opportunity of examining the effects of this lens, that the external part of the focal light was less intense than that part which was near the centre of it; or, rather, that the effect was very much accumulated in the centre: but as it is possible that the refraction of the light and of the caloric fluid may not take place in the same angles, we think it safest to consider it as if an uniform effect, and after deducting one-fourth part thereof as a compensation, there remains 55454°, as the expression of its power.

As the application of the second lens reduced the diameter of the focus to half an inch, the effect, without allowing

for the reduction of its power, would be equal to 221816°, but deducting one-fourth for the second transmission, there remains 166362° as the expression of its power.

Supposing that the rays of the sun emanated from a point, the focus of the lens would also be a point; for the rays transmitted through one edge of the lens would meet those transmitted through the other edge, so that the focus would be without parts, or a mathematical point; but as the sun is known to measure 31' 32" during the apogee, and 32' 38" during the perigee, the focus must necessarily be 0.7105 parts of an inch diameter at Midsummer, and 0.7594 at Christmas. The length of the luminous axis at Midsummer must, from the same cause, be 3.428 inches, and, at the opposite period, 3.557; because the dimension of the focus is actually dependent on the apparent diameter of the sun, the semi-diameter being to be added to increase the measure of the converging rays on each of the opposite sides, the tangent of which is the semi-diameter of the focus: and by the same means the length of the axis is discovered, adding to and subtracting from the converging angle, by which means the points at which they meet on the axis are discovered. These two points disclose the commencement of the luminous appearance thereon.

The variation between the above calculated diameter of the focus and what it really was, points out the errors in the instrument, which must arise from one of two causes, or from both, viz. that the axis of the two sides are not coincident, or that they are not opposite to each other; should the difference have been occasioned by either, the focus would have been elliptical; but as this was not ascertained, it can only be said that a very small deviation in each would have occasioned this enlargement of the focus; and possibly they might have acted in contrary ways, which would have made it nearly circular.

But as this lens was exported many years ago, we are not able to determine whether the focus stated to have been one inch diameter was ascertained by its burning effect, or by the diameter of the focal rays: if by the diameter of the rays, the enlargement thereof must have resulted from the above causes; but if from its burning power, it tends rather to establish the theory of Dr. Herschell, that the rays of caloric are less refrangible than those of light, and that the true burning focus lies rather beyond the apparent focus.

We are far from thinking the above statement an extravagant supposition, when it is recollected, that all the experiments on which we ground our opinion were made with a total exposure of the substances to the action of the circumambient air; and had the property of this fluid, as to its conducting power of heat, been then well understood, so as to have prevented the diminution of the effect, we are well satisfied the result would have justified our conclusion.

The ingenious experiments of Mr. Wedgwood, and the extensive use of his pyrometer, for the admeasurement of heat required to melt metals, are now too well understood to require any eulogium in this place; it is sufficient to state that he estimates the heat required to melt the following substances to be as follows:

	Fahr.	or by	Wedg.
Red heat visible in day light	1077°		0
Fine gold	5237		32
Welding heat of iron greatest	13427		95
Cast iron melts	17977		130
Greatest heat of his small furnace	21877		160
Extremity of the scale of his pyrometer	32277		240

The power of the lens estimated by this pyrometer will be found to be 1096°, and supposing the hottest furnace to be 240°, the focal heat thereof is 5.2975 times greater.

# BURNING-GLASS.

In justification of the opinion we have given, we now proceed to submit a selected enumeration of the experiments which were made with this justly celebrated instrument, under the inspection of major Gardner, brother to the admiral Lord Gardner, together with some gentlemen of the Royal Society.

Substances fused, with their Weight and Time of Fusion.	Weight in Grains.	Time in Seconds.
Gold, pure, - - - -	20	4
Silver, do. - - - -	20	3

Cornish Moor Stone, - - - -	10	60

Mr. Parker farther informs us, that a diamond, weighing 10 grains, exposed to this lens for 30 minutes, was reduced to 6 grains; during which operation it opened, and foliated like the leaves of a flower, and emitted whitish fumes, and when closed again it bore a polish, and retained its form. The editor has been favoured by Mr. Parker Jun. with the following additional observations on the powers of this lens.

Gold remained in its metallic state, without apparent diminution, notwithstanding an exposure at intervals of many hours: but what is remarkable, the rest, or cupel, which was composed of bone ash, was tinged with a beautiful pink colour.

Platina. The experiments evince that the specimens were in different states of approach to a complete metallic form; several of them threw off their parts in sparks, which in most instances were metallic.

Copper, after three minutes exposure, was not found to have lost in weight.

Iron, steel-shear. What is remarkable in this experiment is, that the lower part, i. e. that part in contact with the charcoal, was first melted, when that part which was exposed to the focus remained unfused: an evidence of the effect of flux on this metal.

Iron scoria, and the turnings of iron. The scoria appears to have been melted in much less time than the turnings, a result that might have been expected to have been directly the reverse; but some allowance must be made for the probable difference in the effects or intensities of the solar rays at the periods at which the experiments were made.

Calx of iron from vitriolic acid, precipitated by mild fixed alkali, weighing 5 grains before exposure, weighed afterwards 5 $\frac{1}{4}$  grains; which indicates an increase of weight by an absorption of phlogiston.

Regulus of zinc began almost instantly to flow, and was nearly evaporated; the remains were magnetic.

Regulus of cobalt was completely evaporated in 57".

Regulus of bismuth was nearly evaporated when exposed on a charcoal rest; but on black lead it began to fuse in 2", and very soon after passed into a state of complete fusion; it lost only half a grain in weight from an exposure of 180"; on a bone-ash rest it fused in 3", and in 180" it was reduced to 7 $\frac{1}{2}$  grains.

Regulus of antimony: 33 grains were fused in 3" on charcoal, and after 195" there remained only 11 grains; but when exposed on a charcoal rest for the same time, there remained afterwards 28 grains, which shewed a magnetic affection.

Fine kearsh from the cannon foundery evaporated very fast during 120", and in 30" more the remainder began to flow into globules, which, on being cold, were attracted by the magnet. This experiment of itself supports the claim of this instrument to a vast superiority over the heat of any furnace hitherto known.

Crystal pebble of North America: 5 grains exposed contracted in 15", perfectly glazed in 135", ebullisced in 150", and when taken out appeared semi-dianphanous, of a slate colour.

Several of the semi-crystalline substances, exposed to the focal heat, exhibited symptoms of fusion: such as the agate, oriental flint, cornelian, and jasper; but as the probability is that these substances were not capable of complete vitrification, it is enough that they were rendered externally of a glassy form.

Garnet completely fused on black lead in 120", lost  $\frac{1}{4}$  of a grain, became darker in colour, and was attracted by the magnet.

Ten cut garnets taken from a bracelet, began to run the one into the other, in a few seconds, and at last formed into one globular garnet.

The clay used by Mr. Wedgwood to make his pyrometric test, run in a few seconds into a white enamel. Seven other kinds of clay sent by Mr. Wedgwood were all vitrified.

Several experiments were made on limestone, some of which were vitrified, but all of which were agglutinated; it is, however, suspected that some extraneous substance must have been intermixed. A globule produced from one of the specimens, on being put into the mouth, flew into a thousand pieces, occasioned, it is presumed, by the moisture.

Stalactites Zeolithus spatosus: 9 grains took a globular form in 60"; in 148" the globule began to get clear; in 155" was perfectly transparent, and as it grew cold diminished in transparency, and at last resolved itself into a beautiful red; on being cut by a lapidary, it was found to be so hard as to serve as a diamond to write on glass.

Several specimens of lavas, and other volcanic productions, were exposed to the focus of the lens, all of which yielded to its power. This furnace of nature, the volcano, is supposed to be hotter than any furnace constructed by the art

art of man, and as none of these substances have been found perfectly vitrified, the conclusion is, that the volcano must exceed them in its power.

The following observation made by major Gardner, he applies to all the experiments made by him during a period of many months; we will use his own words:

“That no substance can remain any length of time in its focus unfused or unvitrified, unless it be externally white or diaphanous; but in a number of instances even these properties do not prevent their being fused or vitrified: when they do, it appears, in the first case, that the rays were in part reflected (perhaps before they came in contact with the intensely white substance); and from this circumstance the sun’s rays are prevented from exerting their full power upon them.”

Some experiments were made in the year 1802, with Mr. Parker’s lens, with the view of ascertaining whether the moon communicated any heat to the earth, in common with the reflected light from which we derive so much advantage.

This experiment was attended by sir Joseph Banks, with several members of the Royal Society, together with Dr. Crawford, who provided the most sensible thermometers; but after applying them to the luminous focus, so far from a perceptible increase of heat, it was thought there was perceived rather a diminution thereof; but this suspicion did not lead them to a fair investigation of the fact.

Since this period some experiments have been made that evince the power of communicating cold by reflection; but as this fact has not yet been explained consistently with the present received theory, we shall content ourselves with taking notice of the experiment made by M. Piccèt. Two concave mirrors being placed at the distance of  $10\frac{1}{2}$  feet from each other, a very delicate air thermometer was put into one of the foci, and a glass matras full of snow in the other. The thermometer sunk several degrees, and rose again when the matras was removed. When nitric acid was poured upon the snow (which increased the cold) the thermometer sunk  $5^{\circ}$  or  $6^{\circ}$  lower. Here cold seems to have been emitted by the snow, and reflected by the mirrors to the thermometer, which it is thought could not happen unless cold were a substance.

It has been found that upon an admixture of equal quantities of snow, which is always at  $32^{\circ}$ , and of water heated to  $172^{\circ}$ , the result is that the compound only retains the lowest heat of  $32^{\circ}$ , so that  $140^{\circ}$  of heat or caloric disappears.

Much has been said respecting the point or degree at which the thermometer should indicate the presence of heat. The experiments of Dr. Crawford seem to place it at  $1268^{\circ}$  below the present 0. Mr. Kirwan places it at  $1048^{\circ}$ . Messrs. Lavoisier and Laplace at  $2736^{\circ}$ ; and by a mixture of four parts of sulphuric acid with three pints of water, it seems that it should be placed at  $5803^{\circ}$  below 0.

Experiments of this kind may be made *ad infinitum*, and in time it may possibly be ascertained that cold is a real substance; but for the purpose of getting an answer to the present question, we will accommodate the scale of Fahrenheit, by adding  $108^{\circ}$  thereto so as to make the 0 correspond with the caloric imbibed by snow or ice before it can melt. The average temperature of the air, mentioned under the article BURNING Glass, of  $70^{\circ}$  will be now considered as  $178$  of the new scale.

The superficies of spherical bodies are to each other as the squares of their respective diameters. The diameter of the moon is considered to be 2180 miles, and its mean distance from the earth 240,000; from which it follows, on the supposition that all the solar rays received by the moon

were reflected back, and that the earth was absolutely without heat, that the effect of this reflection would be found to be .00367 of a degree (for  $\frac{240,000 \times 2^2}{2180^2} : 178^{\circ} :: 2180^2 : .00367$ ); which multiplied into 1056.25, and this sum increased four times for the increased power of the second lens, would give  $15,51234^{\circ}$  as the heat of the focus;  $92.28766^{\circ}$  below the present 0, or  $124.28766^{\circ}$  below the freezing point.

This dissertation is interesting in another point of view, for this calculation ascertains that the light afforded by the moon, when compared with that by the sun, abstracting all impediments in both cases, is only as 1 to 48,480.

A subscription was proposed for raising the sum of 700 guineas, towards indemnifying the charges of the inventor, and retaining the very curious and useful machine above described in our own country; but from the failure of the subscription, and some other concurring circumstances, Mr. Parker was induced to dispose of it to capt. Mackintosh, who accompanied lord Macartney in the embassy to that country; and it was left, much to the regret of philosophers in Europe, at Pekin; where it remains in the hands of persons, who most probably know neither its value nor use.

BURNING of Heath, in Agriculture, a practice employed in some districts for clearing ground covered with this substance, in order to procure grass and herbage for cattle. The most proper time for this business is towards the latter end of the summer, when the plants are withered: care should be taken that the fire extends no farther than is intended, by clearing away all the grass, and other dry vegetable matters, on the side which is to be preserved from the flames, to a distance sufficient to prevent all communication; the grass and other substances which are cut down, being spread upon the part intended to be burnt, may serve for kindling the fire after they are become dry, and in a state fit for combustion.

For this operation a fair calm day should likewise be chosen; when, by kindling the fire on the side the wind blows from, the danger of its spreading too extensively is more fully guarded against. If, however, notwithstanding these precautions it should spread to places intended to be preserved, and where there is no water, the most effectual way of stopping the progress of it is to dig a trench; as, by throwing up the earth on the side where the fire is, the grass is covered and the flames thereby hindered from extending farther.

BURNING of Lime, the process of converting hard or strong calcareous substances into lime by means of fire. See LIME-burning.

BURNING of Straw, a wasteful dissipating practice employed in some districts for the purpose of converting it into ashes for manuring land. It is observed by Mr. Young, in the Report of Lincolnshire, that “the most singular practice he ever met with in manuring subsists on the Wolds; it is that of spreading dry straw on the land and burning it. At lord Yarborough’s, he says, he first heard of this custom. His lordship’s tenant, Mr. Richardson, a very good and intelligent farmer, gave him the account, having long practised it with success. The quantity is about five tons an acre. At Great Lumber he *straw-burnt* a piece in the middle of a field preparing for turnips, and on each side of it manured with ten loads an acre of yard-dung, and the burned part was visibly superior in the crop. In another piece the same comparative trial was made, in 1796, for turnips; and now, in 1797, the barley is equally superior. On another farm he had at Wold-Newton he did it for turnips, then barley, and laid

laid with sainfoin; and the burnt straw was better in all these crops than yard-dung. Burning gorse in this manner returns great crops; but the expence is too high. He is clearly of opinion, that it is the warmth from the fire that has the effect, and not the ashes; for the quantity is nothing, and would blow away at one blast. It is proper to observe, says he, that they do not value straw used in feeding cattle at more than 4s. or 5s. a ton. Mr. Mallis of Lumber is of the same opinion, and thinks four tons are enough; and never knew that fail for turnips. This straw burning husbandry the reporter found again at Bledney. Mr. Lloyd, who, he should observe, is an excellent farmer, thinks that it takes six tons per acre, which will last longer in its effect, and beat the dung which that straw would make, and in general last longer than common dunging. Keeping much cattle, he cannot praise it, but highly approves it. In discourse at Horn-cattle ordinary on burning straw, the practice, he says, was much reprobated; yet an instance was produced that seemed to make in favour of it. Mr. Elmhurst, of Hazlethorp, burnt twelve acres of cole-seed straw on eight acres of the twelve, and the effect was very great, and seen even for twenty years. He sowed wheat on it, four bushels an acre, and had five quarters: the four acres upon which nothing was burnt, much the better land, yet the crops on the burnt part were by that mode equal to the rest. But in another similar experiment for turnips, Mr. Rancilff observed, the result and the effect lasted only for one crop. Mr. Kirkham, who was in company, gave it as his opinion, that, as cattle would not eat stubble, it might be beneficial to collect and stack that, and, before turnip sowing, burn it. The reverend Mr. Allington of Swinap has burnt on the land for turnips, the long-straw dung from the surface of the farm yard, and has had better turnips there than where the dung was laid. This has been the case in two experiments he has made." On stiff adhesive soils it is probable some advantage may be produced by the action of the fire in this mode, but in other cases it must be a wasteful practice. The nature of the land on which these trials were made is not, however, mentioned.

"About Tathwell," the reporter adds, "there is no burning straw upon land; Mr. Clough, Mr. Hyde, and Mr. Pearson, scouted the idea of such a thing being common. It has, however, been tried there, for Mr. Oldham of Elkington did it, after ploughing for turnips, with long straw from the yard, and he succeeded well for the most part."

**BURNING of Land.** See **PARING** and **BURNING**.

**BURNING of metals, ustio metallorum,** is either performed by fire, or by corrosive salts; which latter is also denominated **CEMENTATION**.

The first preparation of most ores is by ustion, or burning, whereby to dispose them for fusion. This is usually performed by exposing them, without addition, to a naked fire; sometimes fixed alkalis and absorbents are added, to hinder the avolation of the metalline particles. Some hold burning in the stone or glebe most advantageous; others burning in the meal. Phil. Trans. N<sup>o</sup> 109. The baser metals, tin and lead, may be burnt like plants to ashes. For gold and silver, the case is otherwise.

**BURNING mountains.** See **VOLCANO**, **EARTHQUAKE**, **MOUNTAIN**, &c. See also **ÆTNA**, **HECLA**, **VESUVIUS**, &c.

The ancients describe a meteor under the denomination of *burning buckler, clypeus ardens*. Plin. Hist. Nat. lib. ii. cap. 34. Mem. Acad. Inscr. tom. vi. p. 95.

Travellers into Italy describe a burning spot of ground at Firenzuola, in the Apennines, out of which a crackling flame continually arises, yet without any cleft for it to issue

out at. Maffei supposes the steams which the place yields, to be a kind of native *phosphorus ardens*, which take fire on their coming in contact with the air.

**BURNING, among Painters.**—Several of the painters' colours require burning, to fit them for use, as lamp-black, umber, ivory, &c.

The burning, or rather drying, of lamp-black, is performed by setting it over the fire in an iron ladle, or crucible, till no smoke arises from it. To burn umber, they put it in large lumps into a naked fire, where it is left till thoroughly red-hot. Ivory must be burnt, to make a black, in two crucibles, luted, covered with coals.

**BURNING, in Enamel Painting.** See **ENAMELLING**.

**BURNING** is also an operation in *Pharmacy*. Simples are frequently burnt in earthen-vessels, either to reduce them to ashes, as in the preparation of vegetable salts, or in order to dry them, that they may be more commodiously pulverized, as is practised in regard of hartshorn, &c.

**BURNING phosphorus,** See **PHOSPHORUS**.

**BURNING plant.** See **EUPHOREIA**.

**BURNING spring, in Natural History.** See **SPRING**.

**BURNING zone, in Geography.** See **TORRID zone**.

**BURNISHED gold or silver,** denotes those metals laid on any work or leaves, and afterwards passed over with a burnisher to heighten their lustre.

**BURNISHER.** See **BURNISHING**.

**BURNISHING,** the operation of giving an uniform and brilliant surface to a variety of substances by friction, with a polished hard instrument usually called a burnisher.

The modes of politure in use amongst artificans may, perhaps, be all reduced to four:—the asperities of a rough surface may be removed by cutting off the protuberances, as in *planing*; by abrading them, as in *filig* and *polishing*; by obtunding them with the hammer, as in *planishing*; and by accomplishing the same purpose in the manner now under our consideration.

It will be readily perceived, that the two latter operations can only be performed on such substances as possess a certain degree of malleability or ductility; those which are brittle, as glass or hardened steel, will necessarily be incapable of being burnished.

To speak of all the descriptions of artificans who use this process would be to enumerate almost the whole of those who work on metals. The instruments with which it is performed are also as various as the surfaces to be subjected to their action: we shall therefore only speak of such as are used for plane surfaces. The burnisher in this case is generally a piece of very hard steel three or four inches long, and about one eighth of an inch thick, with a somewhat convex edge, not much unlike that of the steel which is commonly used for striking fire, all the angles of it being smoothly rounded off, so that the longitudinal section of the part to be applied to the subject is a semi-ellipse of great eccentricity, the edge of which is nearly semi-cylindrical. It is applied in different ways according to the nature and extent of its use in the workshop. The manufacturers of ornaments for stoves, who use a great number of burnished plates of soft steel, frequently insert it into the lower extremity of a wooden pole, which is suspended over the work-bench, from one end of a strong wooden spring fixed horizontally in a frame attached to the ceiling, and pressing downwards; so that the workman has only to pass it backwards and forwards horizontally at right angles to its own plane, over the surface of the plate, its pressure being produced, or, at least, assisted by the action of the spring. Some workers in metal apply the burnisher by attaching it to the under side of a lever, which has a handle at one end, and is hooked at the

other

other into a fixed staple; others fix it obliquely into one end of a staff, the other end of which is curved like a scythe, and passes over the right shoulder of the workman, who is by this means enabled to exert a considerable degree of pressure; and others again merely insert it into a handle, or a short bar with a handle at each end, and apply it in the same manner as a common rasp or file, or in some instances as if shading with a black lead-pencil. In whichever of these modes the burnisher is applied, the direction of its motion should be always rectilinear, parallel to itself, and at right angles with the edge of the instrument.

There is also another method of applying the burnisher, which is by keeping the instrument itself at rest, whilst the surface, subjected to its action, is turned in a lathe. The process is thus conducted by the brazier, ironmonger's founder, pewterer, and indeed all the artificers who employ that engine.

There are two precautions necessary to be observed in this operation: the one is to keep the semi-cylindrical edge of the instrument as highly polished as possible by frequently touching it on a piece of buff leather, rubbed with finely prepared *crocus martis*, and the other to keep the surface to be burnished constantly lubricated during the friction, with some liquid of a smooth consistence, such as milk, oil, or a solution of soap, the latter of which seems to be the fittest, and most generally approved of for this purpose. If this be neglected the surface is apt to ripple up before the instrument, and the ridges thus produced being laminated, by the continuance of the friction, into very thin flakes or scales, the work becomes defaced by dark coloured spots and streaks, which are frequently iridescent like those on the wings of a butterfly, and the process consequently fails.

Bookbinders burnish the edges of their books by rubbing them with a dog's tooth. Gold and silver are burnished with a wolf's tooth, a dog's tooth, or the blood stone, or by *tripoli*, a piece of white wood, emery, and the like.

Deer are said to *burnish their heads*, when rubbing off a white downy skin from their horns against a tree, they thrust them, as is said, into a reddish earth, to give them a new colour and lustre.

BURNLEY, in *Geography*, a market town of Lancashire, in England, is seated on a peninsula of land between the rivers Calder and Brown, which unite their streams a little north of the town. Its advantageous situation on these streams has occasioned several manufactories to be established here. Amongst these are some cotton machines, fulling mills, corn mills, and a mill for grinding dyers' wood. The church of this place, a large handsome structure, is under Whalley, and though only a curacy is considered a very valuable living. Some lead mines have been discovered in the vicinity of the town, and various Roman coins have been found. Burnley is a great thoroughfare. The country around it abounds with pit-coal, and great quantities of free-stone, flag-stone and slate, are obtained from quarries in this neighbourhood. Here are a grammar school, and two dissenting meeting-houses; a market on Mondays, and five annual fairs. In the vicinity of the town is a very fine seat, lately belonging to Charles Townley, esq. who had amassed the finest and most valuable collection of ancient sculpture in this country. Burnley is 211 miles N. of London; and it contains 687 houses, and 3305 inhabitants. Whitaker's History of Whalley, &c. 4to.

BURNOOSE, an article of dress among the Arab Bedouens and Kabyls, in Barbary; corresponding to our cloak, and worn by them over their *hykes*. This forms a considerable branch of their woollen manufactory. It is wove in one piece, and resembles in its shape the garment of

the little god Telephorus, being straight about the neck, with a cape, or Hippocrates' sleeve (for a cover to the head), and wide below like a cloak. Some of them are likewise fringed round the bottom, like Parthenaspa's and Trajan's garment upon the basso relievos of Constantine's arch. The burnoose, without the cape, seems to answer to the Roman *pallium*; and with it to the *bardocucullus*, referred to by Martial, l. xiv. 178.

"Gallia Santonico vestit te *bardocucullo*."

BURNS, ROBERT, in *Biography*, was the son of a farmer near the town of Ayr, the capital of Ayrshire, in Scotland, where he was born on the 29th of January, 1759. The family had all of them been farmers in the north of Scotland, but the misfortunes of the poet's father had occasioned him to accept the situation of gardener to a gentleman of small fortune in the neighbourhood of Ayr, in which employment he continued for the first six or seven years of the poet's life. The father was a man of observation and experience, as well as of strict integrity, and wished to keep his children more under his own eye, than was consistent with the service in which he was engaged. For this purpose, he ventured on a small farm on his master's estate, and joined with some others of his neighbours to provide a schoolmaster for their children. Robert Burns was principally distinguished at these early years, by a retentive memory, a stubbornness of disposition, frequently attendant on genius, and an enthusiastic piety. At the age of ten or eleven, he was not only well grounded in English grammar, but somewhat more than usual of a critical scholar. He was principally indebted to a credulous and ignorant old woman in the family, for furnishing him with those legendary and supernatural tales, which feed a poetical imagination with its richest repast. The first regular compositions in which he took pleasure were, The Vision of Mirza, and a hymn of Addison, which came within the compass of his school studies. The Life of Hannibal, and the History of Sir William Wallace were the first books he read as a volunteer, and they gave him more pleasure than any he read afterwards. Nor was polemical divinity without its attractions, but he soon raised the cry of heresy against himself, and it pursued him through life. He gained at this time a slight knowledge of French, and received afterwards some lessons in practical mathematics; but his studies were rendered irregular by the necessity of hard labour, owing to the advanced age of his father, and the ill success of his farm. Robert was the eldest of seven children, and a very dexterous ploughman. But his father's master died, and they fell into the hands of a factor, against whose insolence and rapacity they had to contend, till the sixteenth year of the poet, who now began first to exercise his functions as such, in consequence of his first amorous attachment to his *harvest partner* of fourteen. Soon afterwards his father removed to a larger farm, on which the family subsisted comfortably for four years; when they became embarrassed by litigation with their landlord, and William Burns was only saved from a prison by the intervention of a mortal disease. During these four years, his reading was confined to Salmon's and Guthrie's Geographical Grammars, the Spectator, Pope's Works, some of Shakspeare's Plays, Tull and Dickson on Agriculture, the Pantheon, Locke's Essay on the Human Understanding, Stackhouse's History of the Bible, Justice's British Gardener's Directory, Boyle's Lectures, Allan Ramsay's Works, Taylor's Scripture Doctrine of Original Sin, A select Collection of English Songs, which he carried with him when he drove his cart, and Hervey's Meditations. He was very awkward in his person and manner, a disadvantage which

he sought to remedy by attending a country dancing-master, in opposition to his father's direct negative. This produced an unfortunate disagreement between them, to which he attributed in a great measure the subsequent dissipation of his habits.

Thus did his life pass till his twenty-third year; bodily labour was his employment, and a succession of love adventures his amusement. The bias of his mind was strengthened by the addition of *Tristram Shandy* and *The Man of Feeling* to his library. He now engaged with a flax-dresser in a neighbouring town; but the shop took fire, while the partners were carousing, and the poet was left without a sixpence. After his father's death, he joined his second brother in a farm, but without success. During this period, he formed a connection with a young woman, the consequences of which induced him to give her an acknowledgment of private marriage. Her parents, however, finding his situation so desperate, prevailed with her to relinquish it. He was driven to the verge of ruin, and threatened with a goal, when he engaged to go to Jamaica. But as his compositions had become popular in the neighbourhood, he resolved to publish his poems before he quitted his native country. The first edition, in 1786, produced him nearly twenty pounds for the expenses of his voyage; he had taken the last farewell of his friends, when a letter from Dr. Blacklock, advising a second edition, carried him to Edinburgh, and opened at once new prospects to his poetical ambition, and new temptations to those sensual propensities, which depraved his genius, and shed a pernicious influence over his future life.

His genius and talents introduced him into the circles both of rank and literature; and his powers of conversation are said to have increased the applause bestowed on his writings. Professor Dugald Stewart observes, in a letter to Dr. Currie, "that all the faculties of his mind were equally vigorous; and his predilection for poetry was rather the result of his own enthusiastic and impassioned temper, than of a genius exclusively adapted to that species of composition. From his conversation I should have pronounced him fitted to excel in whatever walk of ambition he had chosen."

He had gained five hundred pounds by the sale of his poems, with part of which he entered on the farm of Ellisland, on the banks of the river Nith, six miles above Dumfries, in the year 1788. He had previously been placed on the list of candidates for the office of exciseman; and unfortunately for his health and his morals, he afterwards obtained the appointment. Before he hired the farm, he had become the husband of the young woman mentioned above, who had been turned out of doors by her father. He was now become a parent in his turn; in the success of his undertaking the happiness of his family was involved, and he determined, after pondering seriously on the past, to abandon the society and dissipation of which he had been enamoured. It is greatly to be regretted that he found it so much easier to form than to execute his project of reformation. At the end of the year 1791, he found it necessary to resign his farm into his landlord's hands, and remove to a small house at Dumfries. Here he was betrayed into an approbation of the French revolution, more ardent than was consistent with the opinions of his superiors. He was therefore subjected to the animadversion of the board, but retained his situation by promising more guarded behaviour, on the intervention of a friend. "Among the inhabitants of Dumfries," says Dr. Currie, "there were never wanting persons to share his social pleasures; to lead or accompany him to the tavern; to partake in the wildest sallies of his wit, to witness the strength and degradation of his genius." Thus

beset where he was most vulnerable, it is a subject of greater sorrow than surprise, that he should have fallen into those irregularities, which terminated his short career in July 1796, in the thirty-eighth year of his age. Yet, lowered as was his character, and pernicious as were his habits to his corporeal frame, he retained his vigour of mind and imagination to the last, and never, in his greatest distresses, lost sight of honour in his pecuniary transactions, or bartered his independence to supply his necessities.

With respect to his social character, it is exactly fixed by the lively remark of a Scotch lady, that no man's conversation ever carried her so completely off her feet as that of Burns.

The character of his poetical compositions is strongly marked with the impression of his birth and station. He took no pains either to elevate his imagery, or polish his dialect. He adopted the simplicity of nature for his guide, and refreshed himself at the stream of native sensibility, in his weary pilgrimage through an obscure and unhappy life. He is always interesting, but never splendid. His scenery is drawn on the spot, and his characters and incidents bear the stamp of biographical and historical truth, rather than of poetical fiction. His humour is rich, his pathos is natural, and he sometimes rises to the sublime; but his superiority is most decisively established in the descriptive. His poetical character cannot be better concluded than in the words of Dr. Currie.

"To determine the comparative merit of Burns would be no easy task. Many persons, afterwards distinguished in literature, have been born in as humble a situation of life; but it would be difficult to find any other who, while earning his subsistence by daily labour, has written verses which have attracted and retained universal attention, and which are likely to give the author a permanent and distinguished place among the followers of the muses. If he is deficient in grace, he is distinguished for ease, as well as energy; and these are indications of the higher order of genius. The father of epic poetry exhibits one of his heroes as excelling in strength, another in swiftness; to form his perfect warrior, these attributes are combined. Every species of intellectual superiority admits perhaps of a similar arrangement. One writer excels in force, another in ease; he is superior to both, in whom both these qualities are united. The force of Burns lay in the powers of his understanding, and in the sensibility of his heart; and these will be found to infuse the living principle into all the works of genius which seem destined to immortality. His sensibility had an uncommon range. He was alive to every species of emotion. He is one of the few poets that can be mentioned, who have at once excelled in humour, in tenderness, and in sublimity; a praise unknown to the ancients, and which in modern times is only due to Ariosto, to Shakspeare, and perhaps to Voltaire. To compare the writings of the Scottish peasant with the works of these giants in literature, might appear presumptuous; yet it may be asserted, that he has displayed them by proper culture, with lengthened years, and under happier auspices, it is not for us to calculate. But while we run over the melancholy story of his life, it is impossible not to heave a sigh at the asperity of his fortune; and as we survey the records of his mind, it is easy to see, that out of such materials have been reared the fairest and most honourable monuments of genius."

In his correspondence there are much good sense, and an admirable turn of expression. The late Dr. Robertson thought Burns's prose equal to his poetical compositions; and the public in general are nearly of the same opinion. His critical powers were more matured, and his taste more correct

correct than can at all be accounted for by his opportunities ; and the circumstance must be ascribed to the happy temperament of a mind, which could by sympathy assimilate itself to that state of refinement and cultivation, usually the result of scholastic instruction, or the elegant pursuits of polite life. On the whole, the character of Burns is equally interesting, as a noble specimen of untutored nature, forcing itself to a level with the higher and more favoured classes of its species ; and instructive as a warning, that the advantages of the conflict, however successful, are irretrievably lost, unless discretion is called in to secure and perpetuate the trophies won by genius. Persons of keen sensibility are exposed to peculiar dangers ; and poets are perhaps of all others the description of men, who contribute most to the refined pleasures of society, and are least successful in appropriating to themselves their own individual share of personal happiness or public esteem. Their occupations are calculated to increase the peculiarities, rather than to strengthen the governing powers of their minds ; their sensibility is indulged at the expence of their peace, and the pride of genius is foisted by a contempt of the ordinary rules, which restrain the passions of common men. To causes like these must we attribute, and on such grounds of palliation must we excuse, the morbid melancholy, the sceptical propensities, and the intemperate habits of Burns. When these are forgotten, or only remembered through the favourable medium of candid biography, his poems, with all the disadvantages of an obscure dialect, will be recited by his rustic countrymen, as long as the simplicity of their feelings remains unphilosophical, and read with admiration by the critic, as long as the laws of poetry and criticism are suffered to accord with the dictates of nature.

BURNT, in speaking of medicines, imports as much as imperfectly calcined. See CALCINATION.

Burnt bodies are generally dry and astringent. The other medicinal qualities belonging to bodies are frequently destroyed, at least impaired, by the burning.

BURNT-Clay, in *Agriculture*, such clay as has undergone a process of calcination by means of fire. In this process, it is supposed by Dr. Darwin that oxygen is combined in large proportions either with the clay itself or the metallic particles which it may contain, and on this account probably becomes useful as a manure. This business may be accomplished by means of clamps or kilns, or simply by piling up heaps of clay loosely together, with a little dry brush-wood, or other similar combustible materials in the middle of them to which the fire may be applied. In this way much manure may be easily procured, where the materials abound. Calcined clay, as a manure, is probably most proper for close compact soils, as it opens and renders them more porous, and thereby disposes such lands to part with their vegetable nourishment more readily.

It is also supposed, by the author we have just mentioned, that calcined clay, as it exists in soft bricks, has a power of decomposing marine salt, as he once observed in a cellar, where beef had been long salted on one side of a nine-inch wall, the wooden salting-tub for which was attached to it ; a great efflorescence having appeared on the other side of the wall, which he believed to be fossile alkali, or natron. If this idea be just, says he, the soft bricks from old buildings, or clays so far purposely burnt, may in this manner be serviceable to vegetation, by separating the fossile alkali from the sea-salt, washed from decomposing animal and vegetable substances, which, by converting carbon into an hepatic carbonis, as lime is supposed to do, might render it soluble in water, and capable of being absorbed by the lymphatic vessels of the roots of plants. And, continues he,

if clay, calcined to a certain degree, and thus united with oxygen, possessed the power of decomposing marine salt, there is reason to believe, when it is more slowly united with oxygen by its exposure to the atmosphere by the spade or plough, that it may possess the same property, and that this may have given rise to the very contradictory reports concerning the use of sea-salt in agriculture, as it may probably be of great advantage to clayey soils, but perhaps not so to other soils. See CLAY.

BURNT-grain, a vegetable disease frequently met with in the ears of grain, but which is probably not yet well understood ; the characteristic marks of which, according to some, are, that the plants which produce burnt ears are strong and vigorous ; that the infected ears are not at first distinguishable from those that are healthy ; but, when they are past their bloom, they appear of a deep green colour, approaching to blue ; they afterwards become whitish, and are then easily known. "As this change of colour is effected by the sun, when a number of white ears have been suddenly perceived in looking over a wheat field, the sun's heat has been often thought to cause this distemper, or a fog preceding that heat. And though all the ears produced from one grain are commonly infected, yet sound ears are met with on plants that have produced others which were infected. Some ears have even been observed, part of which only were vitiated ; and, finally, some grains enclosing partly a white flour, the remainder black dust."

It has been farther remarked, that, in burnt ears, the chaff, or outward coat, is commonly sound, with this single difference, that, when the ears are nearly ripe, it appears more withered and dry than in the healthy ears. The husk which immediately enclosed the grain is not destroyed, but has consistence enough for the grain to preserve nearly its natural form, with a whitish look ; and the burnt grains are shorter, rounder, and lighter, than such as are uninfected ; they are sometimes larger and sometimes smaller. The furrow which runs the length of a grain of wheat is sometimes totally effaced, at others visible : the piths at the extremity of the grains are dried up, but the bud of a burnt grain is not visible. Till the blooming season, there is very little difference between the diseased grains and those which are healthy ; they are only a little more swelled : but, in the blooming season, the infected ears assume a bluish colour ; the chaff is more or less speckled with small white spots : the grains are of a deeper green, and larger than in the natural state, and, as long as they preserve that colour, they adhere strongly to the chaff. The distemper, it is said, has often attacked very young ears, while yet enclosed in the sheath. The stamina on the sides of the grain are then dried up and sickly ; the embryo in part takes the deep green colour above-mentioned ; the infected ears have not the consistence of those that are healthy. In the same proportion as the distemper advances, the chaff becomes dry and whitish. The grains have some degree of firmness. On opening them, which may easily be done with the nail, there appears an unctuous, dark-brown, stinking substance. The dust of burnt grain has also some cohesion or tenacity. By others it is, however, supposed to originate from insects ; in which view we have the following remedies proposed on the authority of experiment in the seventh volume of the Bath papers. The trials were made in the middle of a twenty-acre close, the residue of which was sown with the same kind of wheat, and treated in the same mode as Nos. I. and II. and was equally as clean, and the crops have been so ever since. The writer's mode of medicating his wheat was as in No. II.

"No. I. Sowed five drills with Mr. Cooke's machine,

with wheat treated agreeable to Mr. Middleton's receipt.

"No. II. Sowed five drills with wheat wetted with old urine, three quarts to a bushel, and turned about with a shovel till all the urine was imbibed, then plenty of quicklime sifted over it, and turned over and over with a shovel, and left in a heap till the next morning.

"No. III. Sowed five drills with wheat steeped two hours in a strong lye, made of wood-ashes and lime, and laid on the barn floor to dry.

"No. IV. Sowed with five drills of the same kind of wheat."

The result was as follows:

"Nos. I. and II. Scarce a burnt ear to be found in them.

"No. III. About a twentieth part burnt.

"No. IV. Near a fourth burnt.

"No. V. Picked ten good corns out of an ear, the remainder were burnt; planted them in the garden; six only vegetated, which produced seventy-two ears, one root of which only was burnt; consequently the opinion that the good corns in a burnt ear produce burnt again is fallacious, otherwise the whole must have been burnt."

The above experiments seem to prove, says the writer, that "wetting wheat with old urine, and drying it with lime, is a preventative;" and he conceives that an insect, by depositing its egg, eggs, or seed, on the corn, when growing, is the cause of *burnts*. Supposing this to be the case, "the wetting the corn with brine, urine, or strong lye, would of course destroy some of the eggs or seed, or even an animalcule, and the lime, by its corrosive quality, annihilate the remainder;" but "should any of the eggs, &c. remain on the corn animable, there may be here and there a burnt in the crop." But, "if on the other hand the insect should deposit its egg, eggs, or seed, in the earth, it is possible the brine, urine, and lime, wherewith the corn is as it were coated when sowed, may be displeasing to the delicate taste of the little animal, and prevent its wounding the tubes of the plant." Farther and more accurate experiments are, however, still wanting to fully elucidate and ascertain the nature and best modes of preventing this vegetable malady. See SMUT.

**BURNT island**, in *Geography*, an island in Christmas Sound, at the southern extremity of South America.—Also, an island near the southern coast of Newfoundland; 15 miles E.S.E. from Cape Ray. N. lat.  $47^{\circ} 30'$ . W. long.  $58^{\circ} 50'$ .

**BURNT islands**, a cluster of islands in the Indian ocean, situate on the coast of Malabar, W.N.W. from Goa. N. lat.  $15^{\circ} 50'$ . E. long.  $73^{\circ} 30'$ .

**BURNT planet**. A planet is said to be burnt, *combustus*, when it is in conjunction, or nearly so, with the sun. Thus Saturn is said to be burnt when not above five degrees distant from the sun; Jupiter when six, &c. Planets in this situation are supposed by astrologers to be much weakened or enfeebled in their influences.

**BURNT way**, *combusta via*, among *Astrologers*, that part of the zodiac from the beginning of Libra to the middle of Scorpio; or, according to others, from the middle of Libra to the end of Scorpio, comprehending 45 degrees; a space supposed very unfortunate, and in which the planets are much enfeebled in their virtues, especially the moon. Vital. Lex. Math. p. 118.

**BURNT wine**. See WINE.

**BURNT-COAT island**, in *Geography*. See PENOBSCOT bay.

**BURNTISLAND**, or BRUNT-ISLAND, is a parish, and royal burgh, and sea-port town in Fifeshire, Scot-

land. Mr. Pennant describes it as "the best harbour on the coast, formed by a rocky ile, eked out with piers." This harbour, though capacious, and of great depth, at high tides, is dry at low water. The town is situated on the banks of the Frith of Forth, upon a peninsula which is screened on the north, by an amphitheatrical range of hills. It is nearly opposite to Leith, from which it is distant six miles, and about nine miles N.W. from Edinburgh. From the remains of fortified walls, and entrenchments, it appears that this place has been garrisoned, and was probably first fortified by the French, when allied to the queen regent during the troubles of 1560. Cromwell besieged it during his usurpation, and forced the inhabitants to capitulate, though not without certain conditions which ultimately proved advantageous to the town; for, among other stipulations, he agreed to repair the streets and harbour, and build the quay. In 1715, the town was surprised and taken by the rebels, who boldly opposed all resistance, and passed part of their troops from this place over to the opposite shore. Before the union, the trade of Burntisland was very considerable, and consisted principally in the exportation of corn and malt to England, but this trade has declined for many years, and it is not till very lately that the town has felt the benefit of its revival. At present here are a sugar-house, a vitriol work, and a distillery, besides ship building which is carried on to some extent. The town is governed by 21 persons who are denominated, and divided into 14 guild counsellors, 3 of whom are bailiffs, and 7 trade counsellors.

The parish and environs of Burntisland are diversified with mountain and plain. To the westward of the town the shore is rocky, and on the east it is sandy. The rocks constitute a good defence to the harbour, and at the same time furnish sufficient sea-weed to make 12 or 15 tons of kelp annually. Within these are some productive oyster-beds, and other shell fish frequent the recesses. "The hills in the neighbourhood of the town exhibit many appearances of volcanic fire; one is extremely like an extinguished volcano, the crater being converted into a lake on the top of the hill, similar to those observed by the abbe Spallanzani." (See *his Travels in the Two Sicilies*). On the north side of this hill are several basaltic columns, and near the summit are the remains of an encampment, called *Agricola's Camp*. The population of this parish in 1801 was 1530. W. long.  $3^{\circ} 5'$ . N. lat.  $56^{\circ} 8'$ . Pennant's Tour in Scotland. Gazetteer of Scotland.

**BURNTWOOD**. See BRENTWOOD.

**BURNTWOOD river**, a river of North America, which flows from Burntwood lake through Split lake into port Nelson river, and there discharges itself into Hudson bay. The lake is in N. lat.  $55^{\circ} 3'$ . W. long.  $98^{\circ} 40'$ .

**BURONZO**, a town of Italy; in the country of Verceceli, 12 miles N.W. of Verceceli.

**BUROW**, a town of Germany, in the circle of Upper Saxony, and principality of Anhalt Zerbit; 2 miles W. of Cofwick.

**BURR**, the round knob of a horn next the deer's head.

**BURR** denotes a hollow triangular chisel, used to clear the corners of mortises.

**BURR**, in *Botany*. See BUD.

**BURR**, in *Geography*, a small rocky island, with some smaller rocks often covered by the water in its neighbourhood on the eastern coast of the county of Down, Ireland, a little to the north of which is tolerable anchorage. It is nine Irish miles south of Donaghadee, and as many north of the entrance into Strangford lough. N. lat.  $54^{\circ} 28'$ . W. long.  $5^{\circ} 19'$ .

**BURR**, in *Heraldry*, means a broad ring of iron behind the place made for the hand on the tilting spear, which burr is brought to the rest when the tilter charges his spear to secure it.

**BURR-pump**. See **BILDGE** and **PUMP**.

**BURR-reed**, in *Botany*. See **SPARGANIUM**.

**BURR-stones**. See **MILL-stones**.

**BURRA**, in *Geography*, a large and fertile mountain of Arabia, near Homran.

**BURRA**, one of the Shetland islands of Scotland, situated on the western coast of the main land. N. lat.  $54^{\circ} 28'$ . E. long.  $1^{\circ} 32'$ .

**BURRAMPOOTER**, or as it is called by the people of Afam, *Burrampoot*, a large river of Asia, and the noblest tributary stream of the Ganges, derives its name from a Sanscrit word, *Brahma-pooter*, which signifies the "Son of Brahma," and became known to us, as a capital river, in consequence of the survey made of it by major Rennell, in 1765. He found it to be rather larger than the Ganges, and that its course previous to its entering Bengal was from the east, although all former accounts represented it as proceeding from the north. This noble river has its source on the opposite side of the same mountains that give rise to the Ganges, and first takes its course eastward, or directly opposite to that of the Ganges, through the country of Thibet, where it is named "Sanpoo" or "Zanciu," which bears the same interpretation as the "Gonga" of Hindostan, namely, "the river." After winding with a rapid current through Thibet, it washes the border of the territory of Lassa, and then deviating from an east to a south-east course, it approaches within 220 miles of Yunnan, the westernmost province of China. Hence it turns suddenly to the west through Afam, where it probably changes its name, being there called *Burrampoot*, and enters Bengal on the north-east. After its entry into Bengal, it makes a circuit round the western point of the Garrow mountains; and then, altering its course to south, it meets the Ganges about 40 miles from the sea. After the river Megna has fallen into the *Burrampooter*, it communicates its name, though a much smaller river to the other, during the rest of its course. A singular circumstance, lately discovered, attends the courses of the Ganges and *Burrampooter*, with respect to each other. Issuing from opposite sides of the same ridge of mountains, they direct their respective courses towards opposite quarters, till they are more than 1200 miles asunder; and afterwards meet in one point near the sea, after each has performed a winding course of more than 2000 miles. The *Burrampooter*, during a course of 400 miles through Bengal, bears so intimate a resemblance to the Ganges, except in one particular, that the same description may serve for both. The exception is, that during the last 60 miles, before its junction with the Ganges, it forms a stream which is regularly from 4 to 5 miles wide; and which, the freshness of its water excepted, might pass for an arm of the sea. In attempting to convey an adequate idea of the grandeur of this magnificent object, major Rennell adopts the poetical language of Thomson, in his "Seasons:"

" ——— Scarce the muse

Dares stretch her wing o'er this enormous mass  
Of rushing water; to whose dread expanse,  
Continuous depth, and wondrous length of course,  
Our floods are rills ———"

The major, in accounting for the singular breadth of the Megna, is led to suppose, that the Ganges once joined it where the Issamuty now does near Fringy-bazar, and that their joint waters scooped out its present bed. The present junction of these two mighty rivers below Luckipour, produces a body of running fresh water, hardly to be equalled

in the old hemisphere; and, perhaps, not exceeded in the new. It now forms a gulf interperfed with islands, some of which rival, in size and fertility, our Isle of Wight. The water at ordinary times is hardly brackish at the extremities of these islands; and, in the rainy season, the sea (or at least the surface of it) is perfectly fresh to the distance of many leagues from the shore. For an account of the bore in the Megna, see **BORE**. Rennell's Memoir.

**BURRAS-pipe**, an instrument used by goldsmiths, consisting of a copper box with a spout, having teeth like a saw; sometimes also used by surgeons for the application of certain solid medicines by infusion.

**BURREL-fly**, in *Entomology*. See **WRINGLE-TAIL**.

**BURREN**, in *Geography*, a barony in the northern part of the county of Clare, Ireland. It is very mountainous, and Cromwell's forces which were sent to harass the inhabitants for refusing to pay contributions, complained that it had neither wood, water, nor earth, sufficient to hang, drown, or bury a man. Such, however, is the luxuriance of the pasturage, interspersed among the rocks, that these seemingly barren hills support a great number of cattle, and very large flocks of sheep.

**BURRISAKANE**, a port town of the county of Tipperary, Ireland, 79 Irish miles S.W. from Dublin.

**BURRISHOOLE**, a village and parish of the county of Mayo, Ireland, situated near the mouth of a small river of the same name, which falls into Newport or Clew bay, about two miles north of the town of Newport. It was once of sufficient importance to give name to the barony it is in; and even to the bay also. There still remains some part of a monastery founded here by one of the family of Bourke or Burgho of the branch called M'William Oughter. The barony is very mountainous, and entirely destitute of wood, but the soil in the valleys, which is mostly moory loam, is pretty good for tillage, in which it is almost exclusively employed. The barony includes the large island of Achill, and a great number of other islands.

**BURROCK**, a small wear or dam, where wheels are laid in a river for the taking of fish.

**BURROS-IN-OSSORY**, a post town of the Queen's county, Ireland, near the confines of Tipperary, 53 Irish miles S.W. of Dublin.

**BURROSILEAGH**, a post town of the county of Tipperary, Ireland, 77 Irish miles S.W. from Dublin.

**BURROUGH**. See **BOROUGH**.

**BURROUGH**, EDWARD, in *Biography*, one of the earliest preachers among the Quakers, was born of parents belonging to the established church, at or near Kendal, in Westmorland, about the year 1634. In early life, he was distinguished by his piety and virtue, as well as by the manliness of his resolution, and the courteousness of his temper. Anxious for the purity of religious worship, he adopted, in his twelfth year, that of the Presbyterians, because he conceived it to be most conformable to the scriptures. At the age of 17, he attended the preaching of George Fox; and though at first he confided in his own ability to refute the doctrines which were taught by this zealous propagator of the tenets and practices of the Quakers, he was proselyted by conferences with him, and became an ardent partisan of this sect. This second change of his religious opinions incensed his parents to such a degree, that they turned him out of doors; and to this hardship he submitted without repining. At the age of 20, he accompanied his intimate friend, Francis Howgill, to London, where he embraced every opportunity that offered itself, of addressing assemblies of people; and such were his natural eloquence and the fervour of his zeal, that he succeeded in gaining proselytes. His success, however, excited the interference of the magistrates,

trates, and, in the year 1654, he was committed to prison. But he was soon released, and visited Ireland, where he remained more than six months; and during his residence in that country, he published a book, entitled "The Trumpet of the Lord sounded out of Zion, which sounds forth the controversy of the Lord of Hosts;" in which he exposes the vices of various ranks of society, and particularly accuses Cromwell for suffering oppression to be practised in his name. This work was followed in 1657 by several private letters addressed to the protector, containing admonitions against pride, and remonstrances against the persecutions of his brethren. Cromwell, it is said, disclaimed in reply any disposition to persecute. On the accession of Richard Cromwell, he renewed his remonstrances to him and his council, and in terms sufficiently explicit, predicted the instability of the new government. In 1659 he made a visit to Dunkirk, for the purpose of disputing in the convents and monasteries, and of attempting to convert their inhabitants. This attempt was perilous, and served only to excite horror and aversion. Upon his return to England, his zeal was kindled by the news of the bloody persecutions of the Quakers by the Presbyterians of New England: and immediately after the restoration of Charles II., he obtained access to him, and so far succeeded in representing the distressed state of his brethren in America, as to procure a mandamus, and the appointment of Nicholas Shattock, a Quaker, banished from New England on pain of death, to carry it out to the colony. Notwithstanding the laudable interference of Charles on this occasion, a persecution against the Friends commenced in 1662 in his own metropolis, which he adopted no means of preventing. Burrough was at this time at Bristol; but as soon as he received the intelligence, he determined to confront the storm in London, though in parting with his friends he had intimated an apprehension, that his own life would be the sacrifice. Soon after his arrival he preached at a meeting-house of the society, and was committed to Newgate; and refusing to pay the fine imposed upon him at the ensuing sessions, he was remanded to prison, where, with 150 other persons confined on the same account, he remained about eight months. At length, he fell a sacrifice to the fever that carried off many of his companions, and expired on the 14th of February 1662-3, in his 28th year. During his illness, his mind retained its usual vigour, and he derived consolation from the conviction, that he had passed his life in performing the will of his maker. Against his enemies he retained no animosity, but prayed by name for Richard Brown, the alderman who had committed him. His character, notwithstanding the enthusiasm of the new sect to which he was attached, appears to have been truly estimable; and his efforts for restraining the spirit of perfection, redound much to his honour. His works were numerous; and they were collected in 1672 in one volume, small folio. Gen. Biog.

*BURROUGH-DUCK*, in *Zoology*, a common English name for the *TADORNA*.

*BURROUGHS'S MACHINE*, in *Mechanics*, a machine for grinding and polishing glasses, invented by Mr. Burroughs of Southwark, for which the Society of Arts gave him a premium of 70*l*.

This machine consists of a cog-wheel *A*, *Pl. II. Optics. fig. 4.* 12 feet in diameter, carrying 72 cogs; which turn a trundle-head *B*, one foot four inches in diameter, and furnished with eight rounds; and also an horizontal spur-wheel *C*, of 12 cogs, and one foot eight inches in diameter. The trundle-head *B* turns a spur-wheel *D* of ten cogs, and two feet eight inches in diameter. This spur-wheel has two cranks, *a*, *b*,

in its shaft; one of which *a* gives motion to a wooden frame, *c*, about 34 inches long and 19 broad. On the under side of this frame are fastened by screws twelve pieces of polished metal, each five inches and a half long, and three broad, covered with leather; and underneath these polishers, a glass plate cemented in another frame is placed on the bench *d*, and polished with tripoli by the motion given to the upper frame by the crank *a*. The nuts of the screws which fasten the polishers to the upper frame are not screwed close to the wood, in order to give the frame room to play; by which contrivance the perpendicular rise of the crank is avoided, and the motion of the polishers always parallel and equal. The under frame may be moved by the hand in any direction without stopping the machine; by which means the plate, when larger than the polishing frame can cover in its motion, will be equally polished in every part.

The other crank, *b*, gives motion to two other polishers marked *n*, *o*, which have an alternate motion by the bending of the crank; they move upon the same plate, and have an equal number of polishers as that already described.

The same crank also gives motion to a contrivance represented at *e* for polishing spectacle-glasses. It consists of two segments of the same sphere; one concave and the other convex. On the latter the glasses are cemented; and polished by the former, which is moved by the crank *b*. The convex segment may be moved round by the hand without stopping the machine, so that all the glasses on its superficies will be equally polished.

The other spur wheel *C*, by means of a crank in its shaft, gives motion to another frame *g*, employed in grinding the glass-plates. The rod *h*, extended from the crank *f* to the frame *g*, is fastened to the latter by means of a pivot, in order to admit of a rotatory motion, as well as that given it by the crank in a longitudinal direction. This rotatory motion is effected by means of a rod of iron *i*, called a *trigger*, sharp at the extremity next the frame, where it touches the teeth of an horizontal spur-wheel, or circular piece of wood, fixed on the grinding plate, while the other end is extended three feet two inches to the centre of motion.

But this contrivance, in which the merit of the machine principally consists, will be much better conceived from a small delineation of it by itself *fig. 5.*, where *F* is the crank marked *f* in *fig. 4.* and turned by the spur-wheel *C* in the same figure. *G* is the trigger, three feet two inches long. *I*, a roll fixed on the trigger for the rod to slide on. *H*, the horizontal spur-wheel, eleven inches in diameter, fixed on the grinding plate; the teeth of which are touched by the trigger; but with a very unequal force, as it will wholly depend upon the grinding-plate's being farther from, or nearer to, the centre of motion of the trigger. By this simple contrivance, the grinding-plate has a very compound motion, never moving exactly in the same track, and therefore must grind the plates equally in every part. Several attempts have been made by others for producing the same effect: but without success; the grinding-plate always follows the same track, and consequently the plates are ground equally.

*BURROW*, or *BARROW*. See *BARROW*.

*BURROW*, SIR JAMES, in *Biography*, master of the crown-office, was a fellow both of the Royal and Antiquarian Societies, and on the death of Mr. West in 1772, he occupied the chair of president at the Royal Society till the anniversary election, when he surrendered it to sir John Pringle; and in 1773, on occasion of an address presented by the society to his majesty, he received the honour of knighthood. He published two volumes of reports in 1766, two others in 1771 and 1776, and a volume of decisions of

the court of king's bench, upon settlement cases, from 1732 to 1772, to which was subjoined an "Essay of Punctuation," in three parts 4to., 1763, 1772, 1776. This essay was also printed separately in 4to., 1773. He also published, without his name, a few anecdotes and observations relating to Oliver Cromwell and his family, serving to rectify several errors concerning him; published by Nicol. Comm. Papadopoli, in his "Historia Gymnasii Patavini," 1763, 4to. He died Nov. 5, 1782.

**BURROWS**, holes in a **WARREN**, serving as a covert for rabbits, &c.

A coney's coming out of her burrow is called *bolting*. To catch coney, they sometimes lay purse-nets over the burrows, then put in a terrier close muzzled, which making the creature bolt, she is caught in the net.

**BURRUN-Sunker**, in *History*, the denomination of a fifth or adventitious class of Hindoos, distinct from, and subordinate to the four regular casts or classes into which they are distributed, and supposed to be the offspring of an unlawful union between persons of different casts. These are mostly dealers in petty articles of retail trade. This adventitious cast is not mentioned by European authors; and they seem to consider the members of this cast as belonging to the **SOODER**. Preface to the code of Gentoo laws, p. 46 and 99. See **CASR**.

**BURS**, in *Navigation*, are boats so called in Bengal, which are used for inland navigation on the Ganges, and are very lightly built of thin deals, without either keel or side-timbers. The edges of the planks are fastened together with staples, and the seams are stopped up with moss, and payed with grease. Their largest breadth is about one third of their whole length from the stern, where they run up with a bend: they are very sharp forwards, and are not very high above the water. Although they are of different sizes, they are all of the same shape and construction; and some of them can load fifty thousand pounds weight of merchandize, and more. They are provided with a single mast, which has a large square sail; and as they take in a great quantity of water from the sides and bottoms, the crew are compelled to employ some persons continually in baling. They are used for the carriage of cotton, and other bulky materials, the weight of which cannot bear any proportion to their size. In common with all the other boats of the country, their bottoms are nearly flat; and indeed, it would be impracticable on the Ganges to employ vessels formed for drawing any considerable quantity of water, as the navigation is rendered extremely dangerous from the continual shifting of the sands.

**BURSA**, *Burse*, originally signifies a purse.

**BURSA** is more particularly used, in *Middle Age Writers*, for a little college or hall in an university, for the residence of students, called *burfales*, or *burfarii*.

**BURSA**, *Burse*, or *Bourse*, in the French universities, still denotes a foundation for the maintenance of poor scholars in their studies.

The nomination of burfes is in the hands of the patrons and founders thereof. The burfes of colleges are not benefices, but mere places assigned to certain countries and persons. A burse becomes vacant by the burser's being promoted to a cure, as being incompatible.

**BURSA**, or **PRUSA**, in *Geography*, a beautiful town of Asiatic Turkey, in the province of Natolia, situate at the northern foot of mount Olympus, and well watered by springs. The Jews have four synagogues, the Greeks three churches, and a metropolitan: the Armenians have likewise a church, and an archbishop. The Berekline is a spacious edifice, well built and filled with warehouses and shops, in

which are exposed to sale all kinds of merchandizes, brought hither from the Levant, besides the beautiful carpets, silk stuffs, velvet, &c. manufactured in the city itself. The Bithynian silk, which is the finest in Turkey, is mostly manufactured here, besides considerable quantities brought from Persia, which, though less fine, is wrought by the Prussian workmen, who are allowed to be the best in Turkey for weaving hangings, tapestry, carpets, and such articles, which are in great request, and carried from hence into all parts of Europe. The commerce of this place is much increased by the caravans that pass through it from Aleppo and Smyrna to Constantinople, and also to Isphahan. This city was built by Prusias, king of Bithynia, after whom it was called Prusa or Prusia. In the year 947, it was taken and dismantled by Seifeddulat, an Arabian prince of the race of Hamadan; but soon after reconquered and fortified by the Greeks, who possessed it from that time till the year 1356, when Orchan, the son of Othman II., the emperor of the Turks, reduced it and made it the seat of his empire. From the conquest of Prusa, authors have dated the true æra of the Ottoman empire. About a league from the town are some celebrated warm baths, on the road to which are seen the tombs of several sultans, and chapels of marble and jasper. By Tournefort's computation of families, the number of inhabitants has been estimated at 60,000. N. lat. 40° 3'. E. long. 28° 15'.

**BURSA**, in *Zoology*, a species of **ALCYONIUM**, called in common the sea-purse. This is somewhat globular, pulpy, and green. Gmel. Pallas describes it as being subglobular, hollow, very green and soft, or pulpy, and thickly covered with transparent papillæ.

The alcyonium bursa inhabits the sea coasts of Europe; it is coriaceous, and about the size of a middling apple. The species is termed by Ray, &c. bursa marina: Aurantia marina, C. Bauh. Aurantium marinum, Marf. hist. mar. &c.

**BURSA mucosa**, in *Anatomy*, is an apparatus for facilitating the motion of muscles and tendons upon these parts on which they are designed to glide backwards and forwards.

They are also found between other parts which have a similar sliding motion on each other; as for instance, between the joint of the shoulder and the acromion.

The apparatus consists of a bag, one surface of which is closely connected to the muscle, and the other to the subjacent parts.

In structure it resembles the bursa or capsules of joints, as in them there is secreted into its cavity a slippery fluid like the synovia. When a muscle or tendon moves freely and frequently upon a bone, the surface of the latter is rendered more smooth by a thin crust of cartilage being formed upon it; and this circumstance further increases the similitude of these contrivances to joints. An instance of this may be observed on the upper part of the os calcis upon which the tendo Achillis glides. These bursa will be noticed in the description of the individual muscles to which they belong. Dr. Monro has published a detailed account of the bursa to which the reader is referred.

**BURSA pastoris**, in *Botany*, *alpina, rosea, lutea*, Mor. See **DRABA aizoides**.

**BURSA alpina**, hirsuta. C. Bauh. See **DRABA hirta**.

**BURSA major**, loculo oblongo. C. Bauh. and J. Bauh. See **DRABA muralis**.

**BURSA minor**, loculo oblongo. C. Bauh. See **DRABA verna**.

**BURSA**. Fucks.

**BURSA major**, folio sinuato. C. Bauh. } See **THLASPER**

**BURSA major**, folio non sinuato. C. B. } *Bursa pastoris*.

**BURSA media**. C. B.

BURSA minor. Dod.

BURSA minor, foliis incis. C. Bauh.

BURSA parva, folio glabro spisso. J. Bauh. } See TBERIS

BURSA minima. Lob. } nudicaulis.

BURSA orientalis, Tourn. See BUNIAS cornuta.

BURSALI, in *Geography*, a country of Africa, in Negroland, situated on the side of the river Gambia; about 12 leagues in length.

BURSALIS musculus, in *Anatomy*, a name given by Cwpper and others to a muscle of the thigh, called also *marfupialis* by the same authors. It is the *obturator internus* of Winslow and Albinus, and is described by Vesalius under the name of *deimus tertius moventium*, and by Spigelius under that of *circumagentium tertius*, or *obturator internus*.

BURSAM. *revocatio per*, in the Norman *Laws*, is a right belonging to the next akin, to redeem or purchase back, within a year after sale, a fee or tenement alienated by his kinsman, on paying the price it had been sold at. Du-Cange.

BURSAR or BURSER, *burfarius*, is used in *Middle Age Writers* for a treasurer or cash-keeper.

In this sense we meet with burfars of colleges. Conventual burfars were officers in monasteries, who were to deliver up their account yearly on the day after Michaelmas.

The word is formed from the Latin *burfa*; whence also the English word *purse*: and hence the like officer, who in a college is called burfar, in a ship is called PURSER.

BURSARS or BURSERS, in *Universities*, also denote those who enjoy certain benefices left for defraying the expences of the education of young men of promising parts, and small fortune. Actions brought for the effects of a college, are entered in the name of the principals and *burfars*. See BURSA.

BURSARIA, *Burfary*, in *Middle Age Writers*, denotes the place of receiving and paying money and rents by the burfars, or officers of account, in religious houses. See BURSA and BURSAR.

BURSARIA, in *Botany*. Cavanilles. Icon. Plant. 350. Class and order, *pentandria monogynia*. Gen. Ch. Cal. very small, deeply divided into five segments. Cor. Petals five, linear. Stam. five. Pist. germ. superior, style short, stigma simple. *Peric.* capsule heart-shaped, compressed, one-celled, opening into two parts, each with two valves, and two horns. Seeds two.

Sp. *Burfaria Spinosa*; a shrub. Leaves alternate, ridge-shaped, obtuse, emarginate, on short petioles. Spines axillary, very long. Flowers reddish in axillary racemes. A native of New-Holland.

BURSARIA, in *Entomology*, a species of APHIS, found on the black poplar, in the hollow excrescences which it forms in the leaves.

BURSARIA, in *Zoology*, a species of SERTULARIA, described by Ellis, as an inhabitant of the British coasts. The denticles are opposite, compressed, fastigate, branched, and dichotomous; called the Shepherd's Purse coralline in English.

BURSCHEIDT, in *Geography*, a town in Germany, in the bishopric of Cologne, near Aix-la-Chapelle, with a Cistercian abbey, the abbess of which has a seat in the diet.

BURSE, in *Matters of Commerce*, denotes a public edifice for the assembly and intercourse of merchants and traders; and is used in the same sense with the more modern appellation of EXCHANGE. In the times of the Romans, there were public places for the meeting of merchants in most trading cities of the empire: that built at Rome in the 259th year after its foundation, under the consulate of Appius Claudius, and Publius Servilius, was denominated the "College of Merchants," of which some remains are still

visible, and known by the modern Romans, under the name "Loggia." The Hans towns, after the example of the Romans, gave the name of Colleges to their burfes.

The first place of this kind to which the name burse was given, Guicciardini assures us, was at Bruges; and it took its denomination from a hotel adjoining to it, built by a lord of the family of *la Bourfe*, whose arms, which are three purses, are still found on the crowning over the portal of the house. Catel's account is somewhat different, viz. that the merchants of Bruges bought a house or apartment to meet in, at which was the sign of the purse. From this city the name was afterwards transferred to the like places in others, as in Antwerp, Amsterdam, Bergen in Norway, and London.

BURSE of merchants, *Bourse des marchands*, denotes a court or jurisdiction established in several trading cities of France, for the taking cognizance, at the first instance, of all disputes arising between merchants, bankers, negociants, and the like, and from which no appeals lie but to the parliament.

The burse is a kind of consular jurisdiction, the judges whereof are also denominated *priors* and *consuls*.

The burse of merchants at Tholouse was established by Henry II. in 1549, after the manner of the judges confervators of the privileges of the fairs at Lyons. The chief officers are a prior and two consuls, chosen yearly, and empowered to choose and associate, to the number of sixty, several merchants to assist them in the decision of differences. These are called judges *conseillers de la retenue*. The burse of Rouen, or as it is commonly called, the convention of Rouen, is of some years later standing than that of Tholouse, having only been erected in 1566. The latest of the consular burfes is that of Marseilles, established by Louis XIV. in 1691; whose jurisdiction extends through several of the neighbouring dioceses.

BURSEEAH, in *Geography*, a town of Hindostan, in the Malwa country, 90 miles E. of Ougein.

BURSEREA, in *Botany*, (in honour of Ioachim Burser, the disciple of Caspar Bauhin, whose Herbarium, consisting of thirty volumes, is now at Upsal,) Linn. gen. 440. Schreb. 1608. Juss. 372. Vent. vol. 3. 448. Class and order, *hexandria monogynia* Linn. *Polygamia Diacia* Schreb. Nat. Ord. *Terebinthaceæ* Juss.

Gen. Ch. Cal. small, caducous, one-leaved, with three or five divisions. Cor. Petals, three or five, ovate or lanceolate, a little longer than the calyx, and alternating with its divisions. Stamens, six, eight, or ten: filaments straight, shorter than the petals: anthers ovate or oblong. Pist. germ. superior, ovate, obtusely three or five cornered: style very short: stigma capitate, obtuse. *Peric.* capsule one-celled with three succulent valves. Linn. on the authority of Jacquin. Berry coriaceous, ovate, three-cornered; containing under a fleshy pulpy substance generally one, but sometimes two, three, or even five ovate, compressed nuts; convex and even on one side, angular and uneven on the other, enclosing a kernel. The natural number is more than one, but the rest are generally abortive. La Marck.

Ellen. Ch. *Pericarp*, a coriaceous drupaceous berry, containing from one to five nuts, angular on one side, and convex on the other. La Marck.

Obf. La Marck observes, that as the fruit contains a true stone with a kernel within it; and as, moreover, it is inclosed in a pulpy substance, and with a fleshy skin, it cannot be considered as a capsule: but in opposition to this opinion given in the Encyclopædia, we may remark that, if his figure, (Illustr.) be correct, it opens with three valves; a character not compatible with the definition either of a berry or a drupe. Authors differ much in their description of the fructification. Schreber places it in the class Polygamia, but doubts whether

whether it does not properly belong to *diacia*, the anthers in the pistiferous plants appearing to be sterile.

Sp. 1. *B. gummifera*, Linn. (*Terebinthus*, Comm. Brown. Sloan. Catech. *Pilacia*, Linn. Sp. Pl. Ed. 1.) La Marck *Illust.* pl. 256. Jamaica birch tree. "Racemes axillary, flowers white." La Marck. A large and lofty tree. Trunk upright, smooth, round, covered with a smooth, thin, brown or greyish epidermis, peeling off in shreds like the European birch. *Leaves*, deciduous, alternate, unequally winged; leaflets three, five, seven, and sometimes nine, opposite, petioled, ovate, acute, entire, smooth on both sides, a little shining beneath, about an inch and half or two inches broad, three inches long, a little heart-shaped at their base. *Flowers*, small, without smell, in compound axillary racemes, near the summit of the branches. *Fruit*, the size of a hazel nut, greenish, tinged with purple when ripe, resinous, odorous. La Marck. From the interior bark exudes a clear, glutinous balsamic juice, which smells like turpentine, and soon thickens in the air, into the form of a gum. The bark of the root is thought to be the *Sima-rouba* of the shops, which is an effectual remedy in bloody fluxes. La Marck supposes that the *Terebinthus* of Catechy with lanceolate leaves, and a bluish-violet fruit, is either a distinct species, or at least a well-marked variety. A native of the West Indies. 2. *B. paniculata*. La Marck. "Racemes panicled, terminal; flowers purple." *Com. Herb.* Ic. and MSS. A large tree. *Branches* below the leaves rough with tubercles and scars. *Leaves* alternate, unequally winged; leaflets five or seven, ovate-acuminate, entire, smooth, petioled, with nerves slightly projecting beneath. *Flowers* small, numerous in panicled, terminal racemes about six inches long. *Calyx* small, one-leaved, three-lobed. *Petals* three, longer than the calyx, broad at their base, obtuse at their summit, with a small scarcely discernible point. *Stamens* six: filaments half the length of the petals, nearly connivent: anthers, brown, oblong, with three furrows. In many flowers, Commerçon could not observe any appearance of a pistil, but in others there was a very obtuse stigma in the centre of a kind of receptacle flattened above, and somewhat five-cornered. It produces a resinous juice like the preceding. A native of the Isle de France. 3. *B. obtusifolia*. La Marck. (*Marignia*, Comm.) "Racemes panicled, subterminal; leaflets obtuse." A large tree, very resinous. *Leaves* alternate, scattered, unequally winged; leaflets five or seven, and sometimes nine, ovate-oblong, obtuse, thickish, coriaceous, smooth on both sides, even and shining above, petioled, opposite, an inch and half broad, three inches long. *Flowers* small, very numerous, whitish: racemes much branched. *Calyx* very small, with five divisions. *Petals* five, ovate-lanceolate, expanding, nearly twice the length of the calyx, and attached between its divisions. *Stamens* ten: filaments very short; anthers small, round, yellowish. *Germ.* round; stigma almost sessile. *Fruit*, a drupaceous coriaceous berry, about the size of a hazel-nut; pulp rather thick, gelatinous, and reddish: nuts from one to five, rather thick, convex on one side, angular on the other. A native of the Isle of France.

BURSERIA, Læf. See VERBENA *Lappulacea*.

BURSLEM, in *Geography*, a village of Staffordshire, in England, famous for its pottery, three miles N. of Newcastle under Line.

BURSTADT, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz; two miles E. of Miltenberg.

BURSTEN, a person ruptured, called by physicians *herniosus*; in middle age writers, *ponderosus*. See HERNIA.

BURTHEN. See BURDEN.

BURTON, WILLIAM, in *Biography*, a skilful topo-

grapher, and antiquary, was born of a good family at Lindley in Leicestershire, in 1575; and educated at Brazen-Nose college in the university of Oxford. When he left college, he entered for the study of the law in the Temple, and in due time was called to the bar. But as his fortune was easy, and his health delicate, he declined pursuing his profession, and retired into the country, where he devoted himself to the study of antiquities, and became eminent in this department. His description of Leicestershire, published in 1622, in a small folio, and republished by William Wittingham of Lynn, in 1777, was one of the earliest county histories, having been preceded by only four others; and from this circumstance it derives its chief reputation. The style of it is loose and the digressions are numerous. After having been much injured by the civil wars, he died at his seat of Fulde, in Staffordshire, in 1645; and left behind him several MSS. collections of arms, monuments, and other matters of antiquity. His son, whom he named Cassibilan, published a translation in verse of Martial's epigrams.

Another *William Burton* was born in London, and educated at Queen's college, Oxford; and after having been Greek lecturer in Gloucester Hall, was constrained by indigence to leave the university in 1630. He afterwards became master of the free grammar school at Kingston upon Thames, which office he resigned two years before his death in 1657. Besides his principal work, which was "A Commentary on Antoninus his Itinerary, &c." illustrated with a chorographical map of the several stations," Lond. 1658, folio, he wrote, in Latin, a history of the Perlic language and other works, enumerated by Wood in his *Athenæ*. His great-grandfather is said to have expired with excess of joy upon being informed of the death of Queen Mary. *Biog. Brit.*

BURTON, ROBERT, brother of the antiquary, *William*, was born at Lindley, in 1576, and educated at Brazen-nose and Christ-church colleges, in the university of Oxford. He retained two preferments in the church, viz. the vicarage of St. Thomas in Oxford, and the rectory of Segrave in Leicestershire, till his death in 1639. He was much addicted to astrology, and is said to have predicted the time of his own death. With the character of a general scholar and hard student, well versed in the pedantic literature of the times, he combined great integrity and benevolence. But his temper was of an humorous and melancholic cast, which gave a singular kind of oddity to his conduct. In order to relieve his melancholy, he diverted himself by listening to the ribaldry of the bargemen, which seldom failed to occasion vehement bursts of laughter. At other times he was one of the most facetious companions in the University. His famous book, entitled the "Anatomy of Melancholy," was composed with a view of soothing his peculiar disposition; and consists chiefly of extracts from ancient authors, illustrating the causes, effects, and cure of that morbid affection. The author's own reflections are few; but they are original, ingenious, and striking. To the bookseller, this work, printed first in 4to and afterwards frequently in folio, was very profitable. After it had been long neglected and almost forgotten, it attracted notice in consequence of an ingenious essay by Dr. Ferriar of Manchester, who detected among the plagiarisms of Sterne, various passages copied verbatim from Burton. The author died in 1639; and the following inscription, written by himself, was put upon his monument in Christ-church: "Paucis notus, paucioribus ignotus, hic jacet Democritus junior, cui vitam dedit et mortem melancholia." *Biog. Brit.*

BURTON, JOHN, a learned divine of the last century, was

born in 1696, at Wembworth, in Devonshire, and admitted a scholar of Corpus Christi college at Oxford in 1713, of which he at length became a tutor. In the exercise of this office, he devoted himself with singular assiduity and zeal to the improvement of his pupils; and he exerted himself in a variety of ways for the advancement of learning. Besides the attention which he paid to academical discipline, he improved the mode of discussing philosophical questions in the schools, and had the honour of introducing the study of Locke, and other modern philosophers, in connection with Aristotle. He also took great pains in promoting classical literature, by frequent lectures both in the Greek and Latin languages; and he extended the utility of the university press for the aid and encouragement of literary undertakings. In 1733 he was elected a fellow of Eton college; and about the same time was presented to the vicarage of Maple-Derham, in Oxfordshire. On this occasion he was induced, by motives of sympathy and compassion, to marry the widow of his predecessor in that living, with the charge of three infant daughters that were left delicate; and though he thus formed a connection which, according to the maxims of the world, would be condemned as imprudent, he found in the event that the choice of a person who possessed every qualification for fixing his attachment, except money, contributed to his future happiness. In this retired station of a country clergyman, he continued for several years; occupying himself in literary pursuits, and in the improvement of his house and grounds, not less for the benefit of his successors than for his own amusement. After the death of his wife in 1748, an event which deeply affected him, and which he much lamented, he chiefly resided on his fellowship at Eton; where his situation was such in every respect as suited his studious and literary disposition. In 1752 he took his degree of doctor in divinity; and continued to appear occasionally both as a writer and a preacher, much esteemed by the higher and lower classes of his own order, with whom he had frequent and free intercourse, and also by the common people, with whom he associated in the most condescending and affable manner. His leisure hours he amused by poetical exercises. Towards the close of his life he was attacked with a fever, which impaired his intellects, and shattered his decaying frame; but at intervals he seemed to recover the powers both of his body and mind. On the evening of Sunday, the day before his death, he discoursed according to his usual manner, with more than usual perspicuity and elegance, on some theological subject; and after a very serene sleep, he gently departed this life on the following day, February the 11th, 1771, and was buried at the entrance of the inner chapel at Eton. The works of Dr. Burton are chiefly collected in two volumes of Sermons, which are much laboured, of a considerable length, and containing a great variety of matter; an octavo volume of theological dissertations, entitled "Opuscula Miscellanea Theologica;" and another of "Opuscula Miscellanea Metrico-prosaica;" comprehending a variety of pieces in Greek and Latin, with two or three copies of English verses. In one of these pieces, entitled "Commentariolus Thomæ Secker, Archiep. Cantuar. memoriæ sacræ," Dr. Burton indulged himself in some severity of animadversion against the dissenters, on account of their supposed opposition to the settlement of a bishop in America, which induced Dr. Furneaux in his letters to Mr. Justice Blackstone, to vindicate that body of men against the charge brought against them. Dr. Burton was also the author of some other publications besides those contained in the volumes above-mentioned. In 1744 he published at

Oxford, in large 8vo. "The Genuineness of Lord Clarendon's History of the Rebellion, printed at Oxford, vindicated," in which he fully refutes the slander that had been advanced by Oldmixon, in his Critical History of England. In 1758, appeared his "Dissertatio et Notæ Criticæ spectantes ad Tragedias quasdam Græcæ, editas in Pentalogia." The publication of the five select tragedies, which constitute the "Pentalogia," had been recommended to him by a pupil of promising talents, Joseph Bingham, who had printed almost the whole text and notes, when in 1736 he was cut off by a premature death. Dr. Burton has added a preface, dissertations, and additional notes. This work has been reprinted at the Clarendon press, and is much esteemed as a book for students in Greek. In 1766, Dr. Burton published a discourse, entitled, "Papiſts and Pharisees compared, or Papiſts the corrupters of Christianity," occasioned by Philips's life of Cardinal Pole. About the same time he also delivered a set of sermons, still in MS.; the design of which was to refute the articles of the Council of Trent. He is also understood to have been the author, under the name of Phile-leutherus Londinensis, of "The Remarks on Dr. King's Speech before the University of Oxford, at the dedication of Dr. Radcliff's library, on the 13th of April, 1749;" to which Dr. King replied in his "Elogium famæ inserviens Jacci Etonensis, or Gigantis; or, the Praises of Jack of Eton, commonly called Jack the Giant; collected into English metre, after the manner of Thomas Sternhold, John Hopkins, John Burton, and others. To which is added, a Dissertation on the Burtonian Style, by a Master of Arts." But the most severe attack on Dr. Burton's style, as affected and pedantic, was that of Churchill in one of his poems, (works, vol. iii. p. 124.) who has exercised all the uncandid severity of his pen to expose it to ridicule. However, prejudice cannot deny, that Dr. Burton was "an able divine, a sound scholar, and an excellent academic; and that he set an useful example to university-men, whether as fellows, tutors, officers, or editors. In short, his abilities, virtues, and learning were such as justly entitle him to have his name transmitted with honour to posterity." Biog. Brit.

BURTON, JOHN, the scholar of Keeble, a harpsichord player, with a powerful hand, and much enthusiasm in his art; but having in his youth exercised his hand more than his head, he was not a deep or correct contrapuntist. He had, however, in his pieces and manner of playing them a style of his own, to which, from his having been one of the first harpsichord players in our country, who attempted expression and light and shade, he excited an interest and attention, which would now perhaps be much more difficult to obtain.

Travelling into Italy, with Mr. Beckford, at the time when the Mall'aria raged, he became a victim, about 1779, to the imprudence of passing from Rome to Naples on the verge of the Pontine marshes, in spite of the admonitions of the native inhabitants.

BURTON, or BURTON in *Kendal*, in *Geography*, a small market-town on the borders of Lancashire, in the county of Westmoreland. Here are some good houses and two large inns, situated on the great turnpike road. It derives some advantages from travellers; and from the canal, lately brought here, by which a commercial communication is opened with the rivers Dee, Mersey, Trent, Derwent, Humber, Severn, &c. Here are a small market on Tuesdays, and one fair annually. It is 251 miles N.W. from London, and contains 128 houses, and 548 inhabitants. Houfman's Topographical Description of Cumberland, &c. 8vo. 1800.

BURTON-upon-Trent, is an ancient and large market-town of Staffordshire, England. It is situated in a pleasant and fertile valley on the banks of the river Trent, which separates

rates this part of the county from Derbyshire. This town has long been celebrated for its ale breweries and malt-houses. The Burton ale is a beverage in high repute at most of the large towns of England, and is exported to different places on the continent. It is commonly of a thick and glutinous quality, of a sweetish taste, and a small quantity produces inebriation with those persons not accustomed to it (vide ALE). Among the manufactures of this place are hats, which are made in large quantities for the army, navy, &c.; serews, spades, and other iron utensils, are also made here; as are some tammies and woollen cloths. Three extensive cotton manufactories are established in the vicinity of the town; and about half a mile distant, on an island, is a considerable forge, for converting bloom and scrap iron into bars. The river Trent has long been made navigable from Gainsborough to this town for boats of large burthen. The Burton boat company are proprietors of this navigation, and of many boats on the grand trunk canal. This passes parallel with the town, and at about one mile distance communicates with the Trent.

BURTON, in the time of Leland, had "one parish church, a chapel at the bridge end," and was noted for its marble and alabaster works. Here is a long bridge of 36 arches, which crosses the Trent, and was, according to Mr. Gough, "built in the time of Henry II., or earlier." The parish church, built in 1722, adjoins the abbey, which was founded by Wulfic Spot, in 1004, for Benedictines. Some of its ancient walls remain, but are altered and fitted up as the manor house. Its abbot had a large piece of hilly ground, about one mile from the abbey, which he called Sinai. This still bears the name of Sinai park. Burton was formerly ornamented with a castle, which, Mr. Gough says, was built by one of the Ferrars' family, in the time of the Conqueror. Here are a free-school, two alms-houses, and a town-hall, the latter of which was built, in 1772, by the earl of Uxbridge, who is lord of the manor, and holds his courts-leet, &c. in this structure. The town has, within a few years, been greatly improved by the paving and lighting of its streets. It has a large market on Thursdays, and four fairs annually, one of which continues for five days, and is noted for its large shew of horses. Burton is 125 miles N.W. from London, and contains 738 houses, with 3678 inhabitants, the greater part of whom are engaged in trade and manufactures. Gough's edition of Camden's Britannia, vol. ii. Shaw's History of Staffordshire.

BURTON, a small township of America, in Grafton county, New Hampshire, incorporated in 1766, and containing 141 inhabitants.—Also, a township in the British province of New Brunswick, situated in Sunbury county, on the river St. John.

BURTON, in *Sea Language*, a small tackle consisting of two single blocks, and a rope passing through them, until it becomes three or four-fold. It is employed in loading or discharging goods, as bales, casks, &c. and in removing the anchors, or any weighty body, on deck, in setting up the top-mast rigging, &c.

BURUGERD, in *Geography*, a town of Persia, in the province of Irak-Agemi; 92 miles S.E. of Amadan.

BURULUK, a town of Russia, in the government of Voronetz; 96 miles S.W. of Voronetz.

BURUN, a town of European Turkey, in the province of Romania; 50 miles E. of Emboli.

BURUNNUTAPCHARA, a cape in the Caspian sea, 112 miles S. of Guriev. N. lat. 52° 50'. E. long. 63° 14'.

BURWAH, a town of Hindollan, in the country of Bahar; 155 miles S. of Patna. N. lat. 23° 10'. E. long. 84° 30'.

BURY, is sometimes used to denote the hole or den of some animal under ground. See BURROW.

In which sense we say the bury of a mole, a tortoise, or the like. The *gryllotalpa*, or mole cricket, digs itself a bury with its fore-feet, which are made broad and strong for that purpose. Naturalists speak of a kind of urchin in the island of Maraguan, which have two entries to their buries, one towards the north, the other to the south, which they open and shut alternately, as the wind happens to lie.

BURY, in *Geography*, a market town of Lancashire, England, is seated in a fine valley on the banks of the river Irwell, at the distance of 195 miles N.W. from London, and 9 miles N. of Manchester. Situated in the midst of a great manufacturing district, most of its houses and inhabitants are appropriated to and engaged in the cotton works. Leland mentions Bury as being only a poor market-town in his time, but it has now acquired considerable wealth and commercial importance; which has partly arisen from the laudable exertions of sir Robert Peele bart., who, having a seat at Chamber-hall in this neighbourhood, has established and promoted some large manufactories for calico printing, &c. The principal of these works, under the firm of Peele and Co. are situated on the side of the Irwell, from which they have large reservoirs of water.

The cotton manufactories, which are now so very flourishing in this district, appear to have been brought here from Bolton in Yorkshire. Since their establishment at Bury, they have been greatly facilitated and promoted by means of various scientific and mechanical contrivances, which sir Robert Peele has encouraged. Among the inventions that have been brought forward under his patronage, is one called the wheel, or flying shuttle, which was first made by Mr. Robert Kay. This engine is calculated to make several cards at once. It straightens the wire out of the ring, cuts it into lengths, staples it, crooks it into teeth, picks the holes in the leather, puts the teeth in, row after row, and performs the whole with a single operation of the machine, in an expeditious manner, by one person turning a shaft.

The parish of Bury is large, and divided into six townships, and has four chapels of ease, besides a modern handsome church in the town. The presbyterians, independents, and methodists have also places of worship. Here is a handsome free-school, well endowed, and provided with two masters; also a charity school for boys and girls. About one half of the town is leasehold, under the earl of Derby, and the remainder is glebe belonging to the rectory. The living, in the gift of that earl, is rendered very valuable from the following circumstance: an act of parliament passed in 1764, empowering the rector, for the time being, to grant building leases for 99 years, renewable at any intervening period, on an agreement between the parties. The relative population of Bury, and its present extent, may be estimated from comparing the accounts of each in 1773 and 1801. In the former period there were 463 houses and 2050 inhabitants, and at the latter, according to the report of the house of commons, 1384 houses and 7072 inhabitants.

According to tradition there were two castles in and near this town. Indeed, its name partly confirms this; and at the west end of the town is a field called *Castle cross*, where foundation walls have been dug up. At *Castle fields* in Walmley was an encampment; and near it is an eminence called Castle-hill. Aikin's Description of the Country round Manchester, 4to. 1795.

BURY St. Edmunds, is a large, populous, and ancient borough town in the county of Suffolk, England, and

seated on the side of a hill, which slopes gently to the river Larke. This place obtained its present name and principal importance from the relics of king Edmund, who being barbarously murdered by the Danes at Hoxne in this county, was proclaimed a royal martyr, and his shrine became an object of great veneration in the time of British monachism. Though a monastery had been previously founded here by Sigebert, king of the East Angles, yet it does not appear that this monarch's establishment excited any notoriety, or attracted many inhabitants. The abbey founded here in honour of St. Edmund, was raised by Ayllwin, about the year 1007, but was afterwards augmented by additional endowments, and enlarged in buildings. Nearly the whole was, however, destroyed by Sweyn king of Denmark, whose son Canute rebuilt the abbey, and restored the town to its former importance. Previous to this event, it appears that the town was known by the name of Beodrichworth. Canute offered up his crown at the shrine of St. Edmund, as did many other English kings, his successors. The church and monastery appear to have been rebuilt in the year 1020, and the former was consecrated on St. Luke's day, A. D. 1032, by Agelnothus, archbishop of Canterbury. From this period it grew into great repute, and several monarchs, with many eminent persons, were desirous of being interred in this holy place. During the prosperity of the abbey, it was environed with a strong wall and ditch, and there was an hospital, or religious house, at every gate of the town. Among these the abbey-gate, or entrance to the abbot's palace, is the principal structure remaining; and this is an interesting relic of architectural antiquity. It was erected in the reign of Richard II. about the year 1377, and at present is in a good state of preservation. Its western front is adorned with several niches and carvings in tabernacle work, &c. Another of these structures, called Church-gate, or the portal, is remaining, and formerly led to the grand conventual church. It now serves as a tower to St. James's church, and is supported on two semicircular arches, which admit of a free passage for carriages.

The town of Bury St. Edmunds, with its suburbs, extends from north to south, about  $1\frac{1}{2}$  mile, and in breadth  $1\frac{1}{2}$  mile. It is divided into five wards, and contains 34 streets, which are well paved, and intersect each other at nearly right angles. While the abbey was standing, there were three churches within its precincts, besides the one belonging to the monastery. That dedicated to St. Margaret is now made use of, with considerable alterations, as the shire-hall, where the county assizes are held. The two other churches "are deservedly esteemed for their exact and beautiful symmetry, their large and elegant windows, neat pillars, and noble roofs." In the church of St. Mary, it appears that Mary Tudor, third daughter of Henry VII., and wife of Lewis XII., king of France, was interred. After the decease of the latter monarch, she married Charles Brandon, duke of Suffolk, and died in his life time at Westhorpe in this county.

Bury has, at different times, been the seat of the English sovereign, and the place of assembling his parliaments. King Edward I. and Edward II. had mints here; and Stow says that here was also a mint in king John's time. Among the other public buildings and establishments of the town, are the guildhall, the wool-halls, the gaol, the bridewell, the theatre, the market-crofs, the butchery, and new shambles, the subscription-rooms, the free grammar school, and four meeting-houses.

Bury has the privilege of three annual fairs, one of which usually continues for three weeks. Here are also two

weekly markets on Wednesdays and Saturdays. In 1758, the number of inhabitants in this town was 5,819, and in 1801, they appear to have increased to 7,655. Though the population has thus evidently greatly increased, yet at some former periods many inhabitants have been swept away by the plague, &c. Mr. Nichols, in his History of Leicestershire, states that 1000 persons died of the plague in Bury in 1257, and in 1638 upwards of 600 persons died of this dreadful calamity.

Bury was first privileged to send members to parliament by king James I. who incorporated it in the fourth year of his reign; and by two other charters in the sixth and twelfth years of his reign. The right of election is vested in the aldermen, burgesses, and common-councilmen, amounting to 37. Gillingwater's Historical and Descriptive Account of St. Edmund's Bury, 12mo. 1804.

BURYING *alive*, was, among the Romans, the punishment of a vestal (see VESTAL), for the violation of her vow of chastity. After being tried and sentenced by the pontifices, this punishment was inflicted and accompanied with funeral solemnities in a place called the "Campus Sceleratus," near the Porta Collina; and her paramour was scourged to death in the Forum. The unhappy priestess was let down, on this occasion, into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed on which to lie; but this was mere show, for the moment she was at the bottom, they began to cast in the earth upon her, till the pit was filled up. Mem. Acad. Infer. t. iii. p. 278. This mode of punishment is said to have been first devised by Tarquinius Priscus. Dionys. iii. 67. Lord Bacon mentions instances of the resurrection of some persons who had been buried alive. Of this number was the famous Duns Scotus. See DUNS. For the places and different modes of burying, see BURIAL.

BURZANO, in *Geography*, a town of Naples, in the province of Calabria Ultra; 10 miles E.N.E. of Bova.

BURZET, a town of France, in the department of the Ardeche, and chief place of a canton in the district of l'Argentiere. The place contains 2670, and the canton 4945, inhabitants; the territory comprehends 110 kilometres and 4 communes.

BUS, CÆSAR DE, in *Biography*, the founder of the Fathers of the Christian doctrine, was born at Cavallion in 1544, and after pursuing, for some time, a licentious course, became sensible of his misconduct, entered into the church, and was appointed canon of a cathedral. Adopting a rigorous mode of living, and distinguished by his zeal in instructing the ignorant, and exhorting sinners to repentance, he formed a new institution for teaching the principles of the Christian religion. See FATHERS of the Christian doctrine. De Bus lost his sight some years before his death, which happened at Avignon in 1607. To him is also ascribed the establishment of the URSULINES in France. He published a set of "Familiar Instructions on the Christian Doctrine," written in a simple style, and still read by pious persons. Nouv. Dict. Hist. Mosheim. Eccles. vol. iv.

BUSANCY, in *Geography*, a town of France, in the department of the Aisne, and district of Soissons; 4 miles S. of Soissons.

BUSARD, in *Ornithology*. See *Moor BUZZARD*.

BUSBEC, or BOESBEC, AUGHER-GHISEN, in Latin *Busbequius*, in *Biography*, a celebrated traveller and ambassador, was the natural son of Ghisen, lord of Boesbec, a village on the Lys, and born at Commines, in Flanders, in 1522. Having been legitimated by a rescript of the emperor Charles V., he pursued his studies with great diligence and

and success, in some of the most celebrated universities of Europe. He accompanied the ambassador of Ferdinand, king of the Romans, to England, and was present at the marriage of Philip and Mary; and was appointed by this sovereign, when he became emperor, as his ambassador to sultan Solyman II. During his seven years' residence in the Turki'h dominions, he acquainted himself with various particulars relating to the natural and political history of the country, and collected a great number of MSS. and inscriptions, together with drawings of plants and animals, which served, on his return, to form a narrative, written in Latin, and abounding with valuable information. He was afterwards entrusted with the education of the sons of Maximilian II., and in 1570, conducted this emperor's daughter to France, on occasion of her marriage with king Charles IX. After the death of Charles, he continued in that country as minister for the queen-dowager, and also for the emperor Rodolph, till the year 1592. Having obtained permission to take a journey into the Low Countries, he was assaulted in Normandy by a party of soldiers belonging to the garrison of Rouen, and the treatment he suffered produced a degree of irritation, which terminated in a fever that proved fatal to him at the house of a lady near Rouen, in 1592. He was a man of extensive literature, and master of seven languages. The first copy of the famous 'Monumentum Ancyranum', which he caused to be transcribed at Ancyra, was brought by him into Europe. Besides his "Travels in the East," he wrote "Letters from France to the Emperor Rodolph," which exhibit an interesting picture of the French court at that period. An edition of all his works was published by Elzevir at Leyden in 1633, and at Amsterdam in 1660, in 4to. Gen. Dict.

BUSBY, RICHARD, an eminent school-master, was born at Luton, in Lincolnshire, in 1606, educated at Westminster school as a king's scholar, and elected student of Christchurch, in 1624. At college he was esteemed a great master of the Greek and Latin languages, and a complete orator. Having taken orders, he was admitted, in 1639, to the prebend and rectory of Cudworth, in the church of Wells; and in 1640, he was appointed master of Westminster school, which office he held with singular reputation for 55 years. His talents for this arduous office have been greatly extolled; though it does not now appear what was his peculiar and discriminating excellence. It has been said that he possessed a singular sagacity in discovering the appropriate genius of his pupils, and that he so much approved an early manifestation of wit in his scholars, as to pardon the imprudent exercise of it, when he himself was its object. Perhaps, his pre-eminence to others who have occupied similar stations might have principally consisted in the firmness and vigour of his mind, and in that kind of uniform and systematic discipline, attended with a considerable degree of severity, which commanded awe and maintained order. With a reference to this trait of his character, sir Roger de Coverley (see Spectator, N<sup>o</sup> 329.) is made to exclaim, at the view of his effigies, "Dr. Busby; a great man! he whipped my grandfather; a very great man!" Pope also gives us a lively description of a master belonging to the Busbeian class, or of the "Genius of the public Schools," in the following appropriate lines:

"When lo! a spectre rose, whose index-hand  
Held forth the virtue of the dreadful wand;  
His beaver'd brow a birchen garland wears,  
Dropping with infant's blood, and mother's tears,  
O'er every vein a shudd'ring horror runs:  
Eton and Winton shake through all their sons.

All flesh is humbled; Westminster's bold race  
Shrink, and confess the genius of the place;  
The pale boy-senator yet tingling stands,  
And holds his breeches close with both his hands."

Dunciad, B. iv.

Dr. Busby, however, though his fame has descended to us as that of a strict and severe disciplinarian, was not an ill-natured man; but the severity which he exercised, and which has almost become proverbial, seems to have been the result of habit and system. It has, indeed, been animadverted upon with disapprobation by some modern writers, not only as unjustifiable, but as tending to the extreme of cruelty. Somewhat to this purpose is the reflection of Mr. Knox, in his essay on parental indulgence (Essays, vol. ii. p. 344.) who says, "Inhumanity even in a Busby cannot admit of palliation." As a man of learning, Dr. Busby is known by several books, such as Latin and Greek grammars, and editions of the satires of Juvenal and Persius, and of the epigrams of Martial, adapted to the use of his school, and evincing his skill and accuracy as a grammarian. After the restoration, he was made a prebendary of Westminster, as well as treasurer and canon-rector of the church of Wells; and in the same year he also took his degree of doctor in divinity. To the church and monarchy he was zealously attached, and he infused similar principles and spirit into the minds of his pupils, among whom were several who occupied some of the highest offices in the state. Several instances of his private and public charity are recorded. Having, by a course of temperance, notwithstanding the fatigues of his public station, attained to the advanced age of 89, he died in 1695, and was buried in Westminster abbey, where a monument, with an ample, laudatory inscription, was erected to his memory. Biog. Brit.

BUSCA, in *Geography*, a town of Italy, in the province of Coni; 7 miles W. of Coni.

BUSCHE, HERMAN VON DEM, in Latin *Buschius*, in *Biography*, a distinguished scholar, who contributed to the revival of literature, and the improvement of taste in Germany, was the descendant of a noble family in Westphalia, and born at the castle of Sassenborg in the bishopric of Minden, in 1468. After a previous course of study improved by travels through Italy, France, and Germany, and various attempts to excite among his own countrymen a taste for pure Latinity, he established a school at Cologne; but here his residence was made uneasy to him by the monks, so that in 1506 he removed to Leipzig. The ecclesiastics, however, whose Latin style he condemned, and which he wished and laboured to reform, counteracted his efforts of improvement, and he was under a necessity of often changing his abode. At Cologne, whither he returned after his travels in Germany and the Low Countries, he published "Pemptades Decimationum Plantinarum," and a "Commentary on Claudian de Raptu Proserpine." The clergy again molested him in this city, as he had given them fresh occasion of offence by aiding Ulric Von Hetton in composing the celebrated "Epistola Obscurorum Virorum," in which the monastic Latin of that period is the subject of ridicule. From Cologne, he removed to Wesel, where, as rector of the Latin school, he read the works of Luther, Melancthon, and Pomeranus, which had been just published. From Wesel, he went to Wittenberg; and, at the recommendation of Luther and others, the landgrave of Hesse appointed him professor of history at Marburg, where he published "A Treatise on the Authority of the Word of God." About this time he embraced the doctrines of Luther, and married in the year 1527. Towards the close of his life,

he had an unhappy quarrel with the anabaptists at Munster, which agitated a constitution, already enfeebled by years, to such a degree, as to occasion his death, in 1534. His principal works are "Commentar. in Donatum;" "Annot. in Silium Italicum;" "Comment. in primum lib. Martialis;" "Scholia in Æneid;" "Annot. ad Juvenal;" "Epigrammatum, libri iii.;" "Comment. in Satyr. Persii;" Paris, 1644. He also published many Latin poems. According to the account given of his writings by Erasmus, they are nervous, lively, and animated, and display great acuteness of judgment; and his style is said to approach nearer to that of Quintilian than to that of Cicero. Gen. Biog.

BUSCHETTO, DA DULICHIO, a celebrated Greek architect, was a native of the isle of Dulichio, and employed, in 1016, by the republic of Pisa, in building and ornamenting their dome or cathedral church; which he enriched with many noble columns, and which has ever since been reckoned one of the most sumptuous edifices in Italy. He died at Pisa, where was erected a monument to his memory, bearing an inscription which intimates his extraordinary knowledge of the mechanic powers. His disciples were numerous, and he is regarded as the principal founder of the science of architecture in modern Italy. Felibien, Vies des Architectes.

BUSCHING, ANTHONY-FREDERICK, a well-known geographer, was born at Stadthagen, a town of Germany, in 1724, and instructed for several years by Hauber, afterwards pastor of a German congregation at Copenhagen, in the Greek, Chaldaic, and Syrian languages, and also in astronomy, algebra, and other branches of the mathematics. In 1744, he entered as a theological student at Halle, where he derived singular benefit from the patronage of the celebrated professor S. J. Baumgarten; and in 1746, he published his first work, which was "An Introduction to the Epistle of Paul to the Philippians," with a preface by his patron. At the close of his academical studies he began his exegetical lectures on Isaiah, which were followed by those on the New Testament. In 1748, he was invited to superintend the education of the eldest son of count Lynar, at Koitzitz; where he was also employed in revising a German edition of Vitringa on Isaiah, and where he commenced an extensive correspondence with persons of eminence in the literary world. In the following year he accompanied count Lynar to Petersburg; and in the course of his journey thither he formed the plan of a new geography, with a view of supplying the imperfections of Hubner's and Hager's works on this subject. After encountering some difficulties and discouragements in the progress of his undertaking, he determined to devote his whole time to it; and releasing himself from his engagements as tutor, repaired, in 1752, to Copenhagen, where he enjoyed peculiar advantages for the completion of his work. During his residence in this city, he conducted a monthly publication, in which he gave an account of the state of the arts and sciences in Denmark. In 1754, he removed to Germany, and at Halle wrote a dissertation, entitled "Vindiciæ Septentrionis," announcing also his intention to commence a course of lectures on the constitution of the principal states of Europe; but he was diverted from prosecuting this plan by an invitation to the office of extraordinary professor of philosophy at Gottingen, with a salary of 200 rix-dollars to enable him to finish his geography. Accordingly, he accepted the invitation, and having settled at Gottingen, in 1754, he married in the following year a literary lady, several of whose poetical pieces he had previously published. This lady had been elected an honorary member of the German society at Gottingen, and had also been named imperial poetess laureat by Haberslein, pro-rector of the university of Helmstadt. In the

prospect of a vacancy in the chair of theological professor in the university of Gottingen by the death of Mosheim, Busching was advised by his friends, in 1755, to offer himself as a candidate; but as he had conceived a dislike to the theology of the schools, he thought it most honourable to announce his sentiments to the public, before he undertook the office of theological professor. Accordingly, on occasion of his applying to the theological faculty of Gottingen for the degree of doctor, he delivered to them, in MS., his "Epitome theologiæ e foliis sacris literis concinnatæ, et ab omnibus rebus & verbis scholasticis purgatæ," which he afterwards printed; and, after some opposition, he obtained the degree. This dissertation was afterwards reprinted with additions; and as it contained some points of doctrine that were thought exceptionable, he was accused of heterodoxy, and ordered by a rescript, issued in 1757, to forbear publishing any thing on the subject of theology, till it had been submitted to the inspection of the privy-council of Hanover; and he was also commanded to abstain from giving theological lectures, particularly on disputed subjects. He remonstrated against this treatment, and in a letter to Munkhausen, the Hanoverian minister, he expressed his purpose in the following declaration: "If your excellency should make me chancellor of the university, with a salary of a thousand dollars, on condition of my teaching nothing but the usual theology of the schools, I would respectfully refuse your offer." At this time Busching had a salary of 400 dollars at Gottingen, besides pecuniary presents from the minister, and some privileges, which enabled him to expedite his great geographical works. In 1759, he was appointed public professor of philosophy, and the first part of his geography had already gone through three editions. He was now at leisure to prosecute it; and, that he might not be interrupted, he declined accepting several advantageous offers. On the subject of education he had published a treatise, compiled from his lectures at Gottingen, which very much contributed to his reputation. In 1761, he undertook the office of pastor to a Lutheran congregation at Petersburg; and here he founded a school on a large scale for the benefit both of boys and girls. To this school he paid particular attention; and in 1763, it had risen to such reputation, that it contained upwards of 300 scholars of various nations and sects; and Catharine II. granted to it, by the recommendation of field-marshal count Munich, several privileges. But on occasion of a dispute between Busching and his congregation respecting this new institution, he abandoned the direction of it, and determined to return to Germany; though the empress Catharine was very desirous of retaining him in Russia. Among other connections which he formed during his residence at Petersburg, he contracted an intimacy with Muller, the celebrated historian and traveller; and from the information he thus obtained with regard to Russia, he was enabled to publish his "Historical Magazine." The place which he selected for his residence, with a view to the prosecution of his literary labours, was Altona; and here he continued, declining some advantageous proposals, made to induce his return to Gottingen, and resolving never to accept a pension, till the year 1766, when he was appointed director of a gymnasium at Berlin. In this capital he was treated with great respect; and besides the employment of superintending the seminary committed to his care, he engaged in writing various elementary treatises for the use of the different classes in the Latin and French languages, natural history, the history of religion, the fine arts, &c.; which were favourably received by the public. His incessant application, however, impaired his health, and brought on a pulmonary complaint with which he was afflicted for several

several years, and which terminated his useful life, in 1793, after he had been director of the gymnasium at Berlin for 26 years. He was buried in his garden at mid-night, without pomp or ceremony, according to his own desire expressed in his will. In his own delineation of his character, he acknowledges, that though he was candid and open-hearted, affable, ready to assist others, and of a compassionate disposition, he had behaved with harshness to many persons, and on various occasions. He expresses his confidence in the Supreme Being, his firm faith in the Saviour of the world, and his satisfaction with the dispensations of providence. His temper, he says, was warm, and occasionally irritable; and his firmness had sometimes assumed the appearance of obstinacy; and his quickness had betrayed him occasionally into precipitation. "I am moderate," says he, "in all things; contented with little, and master of my appetites. In my intercourse with the world I expect too much from myself; I am therefore often dissatisfied with my own conduct; and on that account wish to confine my intercourse within a very narrow circle, and to shun society. I am free from pride, but not void of ambition, though I often struggle with this passion, and on reflection endeavour to suppress it. I am so much attached to labour, that it seems to me a requisite to life, and that my impulse to it is greater than to any sensual pleasure whatever."

BUSCHING was a ready writer, so that his literary productions amounted to more than a hundred, consisting of elementary books, relating to schools and education, and such as were theological, historico-geographical, and biographical. Although his works possess considerable merit, they abound with repetitions, and his style is diffuse and inelegant. But the department in which he principally excelled was that of geography. His "Geography" comprehending Europe and the Russian part of Asia, contains a variety of interesting and useful information; and was published after the year 1754, at different periods, in single volumes, of which eight editions were published during the life of the author. His "Magazine for Modern History and Geography" was comprised in 22 parts, 4to. and published between the years 1767 and 1788: and his "Weekly Account of new Maps" appeared in detached parts, during an interval of 15 years, from 1773 to 1787. Gen. Biog.

BUSCHOFF, in *Geography*, a town of the duchy of Courland; 8 miles S. of Seelburg.

BUSCHWEILER, a town of France, in a district of the same name, in the department of the Lower Rhine, formerly Alsace.

BUSE, in *Ornithology*. See FALCO BUTEO.

BUSELAPHUS *Caji*, in *Zoology*. See ANTILOPE BUBALIS.

BUSENTO, in *Geography*, a river of Italy, which runs into the sea, near Policastro.

BUSEY, a town of the island of St. Domingo, situated near Port-au-Prince, and having a fort.

BUSH, a tuft or assemblage of boughs or branches.

BUSH also denotes a coronated frame of wood hung out as a sign at taverns. It takes the denomination from hence, that, anciently, signs where wine was sold were *bushes* chiefly of ivy, cypress, or the like plants, which keep their verdure long. And hence the English proverb "Good wine needs no bush."

BUSH, in *Geography*, the name of a river in Ireland, which after taking a winding course through the northern part of the county of Antrim, falls into the north channel about a mile west of the Giant's Causeway.

BUSH-TOWN. See HARTFORD.

BUSH-harrow, in *Agriculture*, an implement constituted

of any sort of bushy wood, interwoven in a kind of frame consisting of three or more cross bars, fixed into two end-pieces in such a manner as to be wider behind than before, and very rough and brushy underneath. To the extremities of the frame before are generally attached two wheels, about eight or twelve inches in diameter, upon which it moves; sometimes, however, wheels are not employed, but the whole rough surface is applied to, and dragged on the ground. See HARROW.

BUSH-harrowing, the operation of harrowing with an instrument of the kind described above. It is chiefly necessary on grass-land, or such as has been long in the state of pasture, for the purpose of removing the worm-casts and of breaking down and reducing the lumps and clods of the manures that may have been applied, and thereby rendering them more capable of being washed into the ground, or, in some measure, for removing the mossy matter that may have formed on the surfaces of such lands.

A rather dry time should be chosen for the performing of the business, in order that these substances may be in a more pulverizable state, and of course more readily broken down and applied to the roots of the grass plants. It should never be attempted when there is such a degree of moisture as to produce clogginess.

BUSH-vetch, a plant of the vetch kind, which may probably be cultivated to advantage by the farmer, where lucerne and other plants of a similar nature cannot be grown. It is observed by Mr. Swayne, in the third volume of the letters and papers of the Bath Society, that "its root is perennial, fibrous, and branching; the stalks many, some of them shooting immediately upwards, others creeping just under the surface of the ground, and emerging, some near to, and others at a considerable distance from the parent stock. The small oval leaves are connected together by a mid-rib, with a tendril at the extremity; the flowers are in shape like those of the common vetch, of a reddish purple colour; the first that blossom usually come in pairs, afterwards to the number of four at a joint; the pods are much shorter than those of the common vetch, larger in proportion to their length, and flatter, and are of a black colour when ripe; the seeds are smaller than those of the cultivated species, some speckled, others of a clay colour." Being a perennial plant, it should seem, he thinks, "to be a very proper kind to intermix with grass seeds for laying down land intended for pasture; and that it is as justly entitled to this epithet as any herbaceous plant whatever, having observed a patch of it growing in one particular spot of his orchard for 14 or 15 years past. It is not only a perennial, but an evergreen; it shoots the earliest in the spring of any plant eaten by cattle with which he is acquainted, vegetates late in autumn, and continues green through the winter, though the weather be very severe; add to this, that cattle are remarkably fond of it." See VICIA.

These peculiarities should make it particularly valuable to the farmer as a green food for sheep in the winter and spring, when food of that denomination is so exceedingly scarce.

The same writer has likewise observed, that, "the chief reason which has hitherto prevented its cultivation has been the very great difficulty of procuring good seed in any quantity. The pods," he finds, "do not ripen altogether; but as soon almost as they are ripe, they burst with great elasticity, and scatter the seeds around; and after the seeds have been procured, scarce one-third part of them will vegetate, owing," as he supposes, "to an internal defect, occasioned by certain insects making them the nests and food for their young."

It appears from this author's account also, that a crop of this kind of vetch "may be cut three or four times, and in some cases even so early as the beginning of March;" a circumstance of much importance to such farmers as have a large stock of cattle. In his trials with this plant, cut in this way, a plat of good stitfish loamy land, of twenty-five square yards, produced,

1st cutting, 16lb. green,	supposed 4lb. dry.
2d do. 130 do.	would have weighed 21½ dry.
3d do. 62 do.	would have weighed 14 dry.
4th do. 76½ do.	would have weighed 12½ dry.
Total 284½ green.	52 dry.

An acre, therefore, says he, reckoning 4840 square yards to it, in the same circumstances, would have produced the total amount of

Tons	cwt.	qrs.	lb.	
24	11	3	3	green.
4	9	3	15	dry-fodder.

And it is further added, that "at the time the first cutting was made there was scarce a green blade of grass to be seen; and that the season, till after the third cutting, was as unfavourable to vegetation as perhaps any, in the memory of man."

It is said to succeed best on soils of the clayey kind; but from the stems rising so closely together there is danger, in moist seasons, of their rotting at the root. See VETCH.

**BUSH, burning,** in *Scripture History*, denotes that bush in which God manifested himself to Moses at the foot of mount Horeb, as he was feeding the flocks of his father-in-law, by the schechinah or symbol of his presence in a flame of fire. Exod. chap. iii. The emblem of the burning-bush is used as the seal of the church of Scotland, with this motto: "Tho' burning, is never consumed."

**BUSH-lime,** among *Bird-Catchers*, denotes an arm or bough of a bushy-tree, full of thick and long, yet smooth and straight twigs, daubed over with bird-lime, and placed on some hedge where birds frequent, used especially for the taking of pheasants and fieldfares. See *BIRD-lime*.

**BUSHEER,** or **ABUSCHÆHR,** in *Geography*, the capital of an independent state of Arabia of the same name, near the Persian gulph, possessing a commodious harbour, in which ships can approach close to the houses. This circumstance induced Nadir Shah to station a fleet here. Since that time, this city has been better known, and become more considerable. It is at present the sea-port town of Schiras; and the English, the only European nation who continue to trade with Persia, have a factory in this place. The Arabs inhabiting the district of Abuschæhr are not of the tribe of Houle, who possess all the ports on the whole coast from Bender Abbas to Cape Berdistan. Among them are three eminent families; the two first of which have been, from time immemorial, settled in this country. The third, named "Matariseli," came lately from Oman, where they were employed in fishing, entered into alliance with the other two, and found means to usurp the sovereign authority, which they have now held for several years. The present scheid of this family possesses likewise the isle of Bahrein, by which he is enabled to maintain some shipping, and he has also considerable domains in Kermesir. By abandoning the Sunnites, becoming a Shiite, and marrying a Persian lady, he had rendered himself odious to his subjects and neighbours; and his children are no longer reckoned among the Arabian nobility. Abu-schæhr lies south from Bender-Rigk, which see.

**BUSHEL,** a measure of capacity for things dry; as grains, pulse, dry fruits, &c. containing four pecks, or eight gallons, or one eighth of a quarter.

Du-Cange derives the word from *buffellus, buffellus,* or *biffellus*, a diminutive of *buz,* or *buza*, used in the corrupt Latin for the same thing: others derive it from *buffulus*, an urn, wherein lots were cast; which seems to be a corruption from *buxulus*.

*Buffellus* appears to have been first used for a liquid measure of wine, equal to eight gallons. "*Octo libra faciunt galonem vini, & octo galones vini faciunt buffellum London. que est octava pars quarterii.*" The word was soon after transferred to the dry measure of corn of the same quantity.—"*Pondus octo librarum frumenti facit buffellum, de quibus octo consistit quarterium.*"

By 12 Hen. VII. cap. 5. a bushel is to contain eight gallons of wheat: the gallon, eight pounds of wheat, troy-weight; the pound, twelve ounces troy-weight; the ounce, twenty sterlings; and the sterling, thirty-two grains, or corns of wheat growing in the midst of the ear.

This standard bushel is kept in the Exchequer; when, being filled with common spring water, and the water measured before the house of commons in 1696, in a regular parallelepiped, it was found to contain 2145.6 solid inches; and the said water, being weighed, amounted to 1131 ounces and 14 penny weights troy. *Greaves, Orig. of Weights, p. 25.*

By act of parliament made in April 1697, it was determined, that every round bushel with a plain and even bottom, being made 18½ inches wide throughout, and 8 inches deep, should be esteemed a legal "Winchester bushel," according to the standard in his majesty's exchequer. A vessel thus made will contain 2150.42 cubic inches; and consequently the corn gallon contains only 268½ cubic inches. *Ward's Mathematics, p. 36.*

Besides the standard or legal bushel, we have several local bushels, of different dimensions in different places. At Abingdon and Andover, a bushel contains nine gallons; at Appleby and Penrith a bushel of pease, rye, and wheat, contains 16 gallons; of barley, big, malt, mixt malt, and oats, 20 gallons. A bushel contains at Carlisle, 24 gallons; at Chester, a bushel of wheat, rye, &c. contains 32 gallons, and of oats 40; at Dorchester, a bushel of malt and oats contains 10 gallons; at Falmouth, the bushel of stricken coals is 16 gallons, of other things 20, and usually 21 gallons; at Kingston upon Thames, the bushel contains eight and a half, at Newbury, 9; at Wycomb and Reading, eight and three fourths; at Stamford, 16 gallons. *Houghton. Collect. tom. i. n. 46. p. 42.* At Paris, by the old measures, the bushel was divided into two half bushels: the half bushel into two quarts; the quart into two half quarts; the half quart into two litrons; and the litron into two half litrons. By a sentence of the provost of the merchants of Paris, the bushel was to be eight inches two lines and an half high, and ten inches in diameter; the quart four inches nine lines high, and six inches nine lines wide; the half quart four inches three lines high, and five inches diameter; the litron three inches and an half high, and three inches ten lines in diameter.—Three bushels made a minot, six a mine, twelve a septier, and an hundred and forty-four a muid.

In other parts of France, the bushel varied: fourteen one eighth bushels of Amboise and Tours made the Paris septier. Twenty bushels of Avignon made three Paris septiers. Twenty bushels of Blois made one Paris septier. Two bushels of Bourdeaux made one Paris septier. Thirty-two bushels of Rochel made nineteen Paris septiers. Oats were measured in a double proportion to other grains; so that twenty-four bushels of oats made a septier, and 248 a muid. The bushel of oats was divided into four picotins,

cotius, the picotin into two half quarts, or four litrons. For salt four bushels made one minot, and six a septier. For coals eight bushels made one minot, sixteen a mine, and 320 a muid. For lime, three bushels made a minot, and forty-eight minots a muid. See MEASURE and WEIGHT.

By 31 G. III. c. 30. the bushel by which all corn shall be measured and computed for the purposes of this act, shall be the Winchester bushel, and a quarter shall be deemed to consist of 8 bushels: and the justices of each county, and the mayor of such cities and towns as are counties of themselves, or enjoy exempt jurisdictions, and from which returns are by this act directed to be made, shall cause a standard Winchester bushel to be provided and kept; and all measures shall be computed by the stricken and not by the heaped bushel: and where corn shall be sold by weight, 57lbs. avoirdupoise of wheat shall be deemed equal to one Winchester bushel; and 55lbs. of rye; 49lbs. of barley; 42lbs. of beer or bigg, and 38lbs. of oats; and further, 50lbs. of wheat-meal, 45lbs. of wheat-flour, 53lbs. of rye-meal, 48lbs. of barley-meal, 41lbs. of beer or bigg meal, and 22lbs. of oat-meal, shall be deemed equal to every such bushel of corn unground. And for the more easy measuring ground corn in sacks, the proper officer may make choice of and weigh two sacks out of any number not exceeding twenty, and so in proportion; and thereby compute the quantity of the whole. And the inspector of corn returns shall make a comparison between the Winchester measure and that commonly used in the city or town for which he is inspector; and within one month after his appointment, shall cause a statement in writing of such comparison to be hung up in some conspicuous place in the market and town-hall of such city and town; and shall renew the same if defaced, and shall return a copy thereof, to the receiver of corn returns.

**BUSHING.** See COAKING.

**BUSHMILLS,** in *Geography*, a small town of the county of Antrim, and province of Ulster, in Ireland, where there is a bridge over the river Bush. In the bed of the river, near the bridge, are ranges of basaltic columns, similar to those of the Giant's-caulaway; and also on the summit of an adjoining mountain. In the neighbourhood is the ruin of the castle of Dunluce, which is situated in a singular manner on an isolated abrupt rock, perforated by the waves; which have formed under it a very spacious cavern. The only approach to this castle is along a narrow wall, built somewhat like a bridge; which circumstance must have rendered it almost impregnable before the invention of artillery. Bushmills is 120 miles north of Dublin, and about 6 miles east of Coleraine. Hamilton's Antrim.

**BUSHWICK,** a small but pleasant town of America, in King's county, Long Island, New York. The inhabitants, 540 in number, are chiefly of Dutch extraction; and of these 90 are electors.

**BUSHY RUN,** a north-east branch of Sewickly creek, near the head of which is General Boquet's field. The creek runs south-easterly into Youghiogeny river, 20 miles S. E. from Pittsburg, in Pennsylvania.

**BUSIR,** or **BOUSIR,** anciently *Bufiris*, the name of four different towns or villages of Egypt, viz. one on the west side of the Nile, at a small distance from the pyramids, and 18 miles S. W. of Cairo. N. lat. 29° 56'. E. long. 31° 6'.—Also, another on the west side of the Nile, 7 miles N. W. of Achmounain or Hetsmuncin. N. lat. 28° 10'. E. long. 30° 44'. See **BUSIRIS**.—A third near the western banks of the Nile, 12 miles S. W. of Atfich.—A fourth in the Delta, on the western side of the east branch of the Nile;

about 5 miles S. of Semennud, mentioned by Herodotus (l. ii. c. 59.). See **BUSIRIS**.

**BUSIRIS,** in *Entomology*, a species of **PAPILIO**, (Hesp. Urb.) with oblong entire wings of a black colour; on the anterior pair two yellow spots and dots; posterior ones with a yellow disk. This is a native of India. *Donov. Inf. Ind.*

**BUSIRIS,** in *Ancient Geography*, a city of Lower Egypt, now **Busir**, on the Busrinic branch of the Nile, and capital of the Busrinic nome in the Delta; said to have been built by Busris, a cruel tyrant, who was slain by Hercules; but Strabo (*Geog.* vol. ii. p. 1154) denies the existence of such a person. His had a stately temple erected to her in this city, some ruins of which are said to be still remaining. The Busris of the Thebais, the second Busris mentioned in the preceding article (**BUSIR**), having revolted from the Romans, was destroyed by Dioclesian in his expedition against Egypt, A. D. 296.

**BUSIRIS,** in *History*, the name of several kings, who, according to Diodorus Siculus (l. i. c. 17.) reigned in Egypt; one of whom is said to have built the magnificent and powerful city to which the Greeks gave the name of Thebes. He acknowledges, however, that the barbarity of a certain Busris was fabulous; and that the fable was grounded on a custom practised in Egypt, of sacrificing all the red-haired people they met with, most of whom were strangers, as the natives of the country were scarcely ever of this colour, to the manes of Osiris: Busris signifying, in the Egyptian tongue, the sepulchre of Osiris. Virgil ranks the barbarity of this tyrant among the fictions of the poets. Virgil, however, has been censured for applying the epithet "Inlaudati" to Busris (*Georg.* l. iii. v. 3.); as it does not sufficiently express the terror which the cruelty of such a monster tended to excite. Aulus Gellius (l. ii. c. 6.) has endeavoured to vindicate Virgil's use of this term, as implying a tacit condemnation and detestation of the character of Busris, because a person who, in all things, and at all times, remains unpraised, "illaudatus," must be the worst and the most wicked of wretches; and if "laudare" be considered as signifying, in old Latin, to name, "illaudatus" being the same as "illaudabilis" implies, in Virgil's use of it, that Busris did not deserve to have his name repeated. Bayle, dissatisfied with these apologies for the Roman poet, suggests that this verse is one of those in which poets are forced, upon account of the length or shortness of syllables (the different feet) to employ useless words, mere expletives, or even such as prejudice the sense. Although Isocrates made a panegyric on the tyrant Busris, Bayle suggests that he only intended to censure the impertinent panegyric of Polycrates, a teacher of oratory in the island of Cyprus, who had written the elogium of Busris, and the accusation of Socrates. Melancthon, from his researches (in *Chron. lib. ii.*) concludes, that Busris was probably the Pharaoh who occasioned the destruction of the children of the Israelites. Orosius places him 775 years before the foundation of Rome; and, according to Eusebius, he was contemporary with Joshua, about 700 years before Romulus built Rome. *Gen. Dist.*

**BUSITIS,** in *Geography*, a district of Arabia Deserta, said to have derived its name from Bus or Buz, Nahor's second son, and to have been the country of Elihu, the fourth interlocutor in the history of Job; called by the **LXX. BUZETES**.

**BUSK,** a town of the duchy of Courland; 18 miles S. S. W. of Mittaw.

**BUSKIN,** **COTHURNUS**, an article of dress, somewhat in the manner of a boot, covering the foot and mid-leg, and tied beneath the knee: very rich and fine, and used principally on the stage by the actors in tragedy.

The buskin is said to have been first introduced by Æschylus: it was of a quadrangular form, and might be worn indifferently on either leg. Its sole was made to thick, as, by means of it, men of ordinary stature might be raised to the pitch and elevation of the heroes they personated: in which it was distinguished from the sock, worn in comedy; which was a low, popular shoe. By aid of this appendage, the stature of the tragic actors was frequently increased to four cubits, or about six English feet and half an inch, the height of Hercules and the most ancient heroes. The buskins raised them four or five inches; while gauntlets lengthened their arms; and their breast, sides, and every part of the body, were rendered apparently thicker in proportion.

Dempster observes, that the buskin was not confined to actors only, but girls likewise used it to raise their height; and travellers and hunters to defend themselves from the mire, &c.

As the buskin was the distinguishing mark of tragedy on the stage, we find it in classic authors frequently used to signify "tragedy itself," and to express strong and vehement declamation or lofty style, which was usually affected by these actors of colossal figure.

BUSKY, in *Geography*. See BUCK.

BUSLEIDEN, JOHN, in *Biography*, a native of Arlon, in Luxemburg, became master of the requests in the court of Charles V. and counsellor to the sovereign council of Mechlin. He was also employed in embassies to pope Julius II. and the kings Francis I. and Henry VIII. As a man of literature he was distinguished, and he was an intimate friend of several learned men, particularly of Erasmus and sir Thomas More. He founded, in the University of Louvain, the college of the three tongues, for teaching Latin, Greek, and Hebrew. On his journey to Spain, in 1517, he fell sick, and died at Bourdeaux. The only piece of his writing is a letter prefixed to More's Utopia. Gen. Dict.

BUSODRA, in *Geography*, a town of Asiatic Turkey, in the Arabian Irak; 90 miles N. W. of Bassora.

BUSS, in *Navigation*, a small ship, used by the English and Dutch in the herring-fishery, which see.

The word is originally Flemish, *buis*, or *buys*, which signifies the same.

The ship has three short masts, each in one piece. On each is carried a square-sail, and sometimes a top-sail above the main-sail. In fine weather are added a sort of studding sail to the lower sails, and a driver. Occasionally is also added a jib forward, upon a small bowsprit or spar. To shoot their nets, the seamen lower the main and fore-masts, which fold on deck by large hinges, and stow aft upon crotches. The buss is commonly from forty to seventy tons burthen. It has two apartments, one forward, and the other aft; the former of which is used as a kitchen. Every buss has a master, an assistant, a mate, and seamen in proportion to the size of the vessel. The master commands in chief, and without his express orders the nets can neither be cast nor taken up; the assistant has the command after him; and the mate is next in order, whose business is to see the seamen manage their rigging in a proper manner; to attend to those who draw in their nets, and those who kill, gut, and cure the herrings, as they are taken out of the sea. The seamen generally engage by the voyage, and their provisions consist commonly of biscuit, oat-meal, and dried or salt and fresh fish.

Buss, *Buffa*, is also the name of a large sort of vessel of war, in use in the middle age, spoken of by antiquaries and historians under the several denominations of *buffa*, *bufcia*, *burcia*, *buza*, *bucca*, and *bucia*.

BUSSCHOFF, HERMAN, in *Biography*, a Dutch physician, was born at Utrecht, in the beginning of the 15th cen-

ture, and resided many years at Batavia, in the East Indies; and while in that country, was induced, he says, to make use of an Indian doctress, to cure him of the gout, by burning little conical pellets of moxa (the pith of a species of artemisia,) on the parts affected; a mode of treatment in that and various other complaints, in great repute in China and Japan. The operation lasts, he says, about half an hour, and is attended with very little pain. It leaves small scars on the parts, which in a few days are digested out, and the little ulcers that remain heal under any common applications. As soon as the operation was over, he fell into a profound sleep, which lasted twenty-four hours. On waking he was entirely free from the pain of the gout, and the swelling and tenderness of the parts which remained were dissipated in a few days. A second attack of the gout, which occurred some years after, was cured in the same manner. He had known, he says, scirrhous tumours, nodes, and lethargies relieved by the same application. Having collected accounts of a sufficient number of cures effected in this way, he wrote a small treatise on the subject, in the Dutch language, and sent the manuscript to Holland to be printed. He also sent a parcel of the moxa, and of matches made of sandalwood, which the Indians use to light the pellets with. The book was printed in 1675, at which time sir William Temple was ambassador at the Hague, and on his being attacked with the gout (it was his first fit) he was easily induced to try the remedy, which procured him the promised ease. The following year he published an essay on the cure of the gout by moxa, with an account of the method of using it, and the benefit he had received from it. The same year Buschhoff's book was translated into English, on the recommendation, sir William says, of the professors of Gresham College, but no notice is taken of them in the title or preface to the translation. It was published in 12mo. with chirurgical observations by Henry Van Roonhuysen. The remedy became for a time extremely popular here; but, not being found to answer the expectations that had been raised, it is long fallen into disuse. It is probable, however, that in recent cases, and in constitutions not broken by intemperance, some benefit might accrue from the application. Haller. Bib. Med. The Author's Preface, &c.

BUSSET, in *Geography*, a town of France, in the department of the Alier, and district of La Palisse; 5 miles S. E. of Cassel.

BUSSETTO, a town of Italy, and capital of a small district in the duchy of Placenza; 8 miles S. E. of Cremona.

BUSSEI, or BOISSISI, an island of Africa, in the Atlantic, near the island of Bissao.

BUSSIERE-*Badil*, a town of France, in the department of the Dordogne, and chief place of a canton in the district of Nontron; 8 miles N. of it. The place contains 1,220, and the canton 7,049 inhabitants: the territory includes 150 kilometres, and 9 communes.

BUSSIERE-*Galande*, a town of France, in the department of the Upper Vienne, and district of Limoges; 5 leagues S. W. of it.

BUSSIERE-*Poitvine*, a town of France, in the department of the Upper Vienne, and district of Bellac; 10 miles N. W. of it.

BUSSIERES, JOHN DE, in *Biography*, a distinguished writer of France, was born in 1607, at Ville-Franche, in Beaujolois, and entered among the Jesuits. His poems, written in French, are forgotten; but his Latin poems, first printed at Lyons, in 1658, 12mo, are still read. Of these the principal is "Scanderbeg," an heroic poem in 8 books; besides which there are "Rhea Delivered," some Idylls and Eclogues. Bussieres likewise wrote a "History of France,"

2 vols. 4to.; and an abridgment of universal history, entitled "Flores Historiarum." He died in 1678.

**BUSSIERES**, in *Geography*, a town of France, in the department of the Upper Marne, and district of Langres; 4 leagues S. E. of Langres.

**BUSSORES**, by corruption from *Buffora* in Persia, whence they were originally brought, a name given by some to that species of pigeon called the **CARRIER**.

**BUSSOVATZ**, in *Geography*, a town of Bosnia; 20 miles S. of Serajevo.

**BUSSY le Grand**, a town of France, in the department of the Côte d'Or, and district of Semur, three leagues N.E. of it.

**BUST**, in *Geography*. See **BOST**.

**BUST**, or **BUSTO**, in *Sculpture*, that portion of the human figure which comprises the head, neck, breast, and shoulders; the Italians also apply this term to the human figure as low as the hips, with or without the head and arms. This definition of the bust agrees with that species of sculpture which represents the portraits of illustrious Romans, either entirely round and mounted on pedestals, or in alto relievo on the sides of sarcophagi, or other sepulchral monuments, and was most likely of Roman production; very different from the *Erma* of the Greeks, which we call **Terms**: the *Erma* was a four square prop with the head of some divinity or man upon it.

The etymology of the Italian busto is perhaps from the Latin, *bustum*; Festus says "the place is properly called *bustum*, in which the dead is burnt and buried, (quasi beneustum,) as if well burnt; where it is only burnt, but buried in another place, the first is said to be *ustrina*, (ab *urendo*) burning; but *bustum*, the place of burial, which we call the sepulchre:" as many of these bustos have been principal ornaments of the sepulchre, they may have derived their name from the situation, or, on account of their consequence in it, have had its name transferred to them. The series of Roman emperors in the capitol, and the fine bronze busts in the king of Naples's collection at Portici, exhibit examples of every species in this kind of sculpture. Bernini and other artists among the moderns, have likewise left examples of the several varieties.

**BUSTS**, *Communicative*, in *Acoustics*, are two heads of plaster of Paris, placed on pedestals on the opposite sides of a room, and connected with each other by means of a tin tube about an inch in diameter, passing from the ear of one head, through the pedestal under the floor, and ascending to the mouth of the other. The end of the tube which adjoins the ear of the one head, should be considerably larger than the end which proceeds from the mouth of the other. The whole apparatus should be so contrived, that there may not be the least suspicion of any communication. If a person speak with a low voice into the ear of one bust, the sound will be reverberated through the length of the tube, and will be distinctly heard by every one who shall place his ear to the mouth of the other. By means of two tubes, one passing to the ear and the other to the mouth of each head, two persons may converse together, by applying their mouth and ear reciprocally to the mouth and ear of the busts; and at the same time, other persons that stand in the middle of the chamber, between the heads, will not hear any part of the conversation. If a bust be placed on a pedestal in the corner of a room, and two tubes, such as those above mentioned, be so disposed, that one may pass from the mouth, and the other from the ear of the busts through the pedestal and the floor, to an under apartment, we shall obtain what is called the "Oracular head." There may be likewise wires that pass from the under jaw and the eyes of the bust,

by which they may be easily moved. A person placed in the under room, who, at a given signal applies his ear to one of the tubes, will hear any question that is asked; and may immediately reply, favouring the deception by moving at the same time the mouth and the eyes of the bust, by means of the wires. Hooper's Rational Recreations, vol. ii. p. 202, &c.

**BUSTA Gallia**, was a place in ancient Rome, wherein the bones of the Gauls, who first took the city, and were slain by Camillus, were deposited. It differed from

**BUSTA Gallorum**, a place on the Appennines, thus called by reason of many thousands of Gauls killed there by Fabius.

**BUSTARD**, in *Geography*, a river of Upper Canada which runs into the river St. Lawrence, westward of Black river, in a bay of its own name. It communicates within land, with several lakes in its extended course; and at its mouth lie the Otters islands. N. lat. 49° 20'. W. long. 68° 5'.

**BUSTARD** is also a bay on the east coast of New Holland, with a good anchorage in five fathoms. S. lat. 24° 4'. E. long. 151° 42'.

**BUSTARD**, in *Ornithology*. See **OTIS**.

**BUSTIA**, in *Geography*, a town of European Turkey, in the province of Albania; 52 miles W. S. W. of Delfino.

**BUSTO Grande**, a town of Italy, in the duchy of Milan; 16 miles N.W. of Milan.

**BUSTUARIE mæcha**, a kind of public prostitutes, who frequented the *busta* or tombs, which it seems were ordinarily places of rendezvous for persons of this description. Others suppose that these were women hired to attend a funeral, and lament the loss of the deceased.

**BUSTUARI**, a kind of gladiators, among the ancient Romans, who fought about the *bustum*, or pile, of a deceased person, in the ceremony of his obsequies.

The practice at first was, to sacrifice captives on the tomb, or at the *bustum*, of their warriors: instances of which we have in Homer, at the obsequies of Patroclus, and among the Greek tragedians. Their blood was supposed to appease the infernal gods; and render them propitious to the manes of the deceased. In after-ages, this custom appeared too barbarous; and in lieu of these victims, they appointed gladiators to fight; whose blood, it was supposed, might have the same effect.—According to Valerius Maximus and Florus, Marcus and Decius, sons of Brutus, were the first, at Rome, who honoured the funeral of their father with this kind of spectacle, in the year of Rome 489.—Some say, the Romans borrowed this custom from the Etruscians; and they from the Greeks.

**BUSTUM**, in *Antiquity*, denotes a pyramid or pile of wood, whereon were anciently placed the bodies of the deceased, in order to be burnt. The Romans borrowed the custom of burning their dead from the Greeks. The deceased, crowned with flowers, and dressed in his richest habits, was laid on the *bustum*. See **BURNING**. Some authors say, it was only called *bustum*, after the burning, *quasi beneustum*: before the burning it was more properly called *pyra*; during it, *rogus*; and afterwards, *bustum*. When the body was only burnt there, and buried elsewhere, the place was not properly called *bustum*, but *ustrina*, or *ustrinum*.

**BUSTUM**, in the *Campus Martius*, was a structure whereon the emperor Augustus first, and, after him, the bodies of his successors were burnt. It was built of white stone, surrounded with an iron palisade, and planted within side with alder trees.

**BUSTUM** was also figuratively applied to denote any tomb. Whence those phrases, *facere bustum*, *violare bustum*, &c.

**BUTEN** of an altar, was the hearth or place where the fire was kindled.

**BUSULGINO**, in *Geography*, a settlement of Siberia, or the Indigida: 288 miles N. N. E. of Latschiverfk.

**BUSULUTZII**, a district of Russia, in the province of Orenburgh and government of Ufa, seated on the Samara, near the river Bufuluk; 17½ miles S. W. of Ufa.

**BUSZA**, a town of Poland, in the palatinate of Bracław: 52 miles S.W. of Bracław.

**BUTCHER**, a person who slaughters cattle for the use of the table, or for sale. The method of slaughtering cattle by a separation of the spinal marrow, is now successfully practised in many parts of the world, and is much commended on the ground of humanity, as well as of expedition. Lord Somerville in his work "On the System of the Board of Agriculture," informs us, that with a view to the introduction of it into this kingdom, he made it his business, during his residence in Portugal, to have a person instructed in the use of the knife which is used for this purpose with great adroitness. He has given a plate exhibiting the mode of operation, as well as the size and form of the knife with which it is performed. The animal, in this mode of slaughtering, is unnerved from head to foot at the first touch of the spinal marrow: and the term of "laying down cattle," which expresses the operation, bespeaks the mildness with which it is executed. The person employed in this business has "laid" without being head-lined, 15 oxen in a row, with surprising regularity and expedition, and their fall is almost instantaneous. Holding them only by the horn in the left hand, and standing in front of the animal, he passes the knife over its brow, through the vertebræ of the neck, into the spine. The method in that country of the carter walking at the head of his oxen, when at work, may probably induce them to stand more quietly than would otherwise be the case. Should that be the fact, cattle in this country may be head-lined as usual, and the operation would then be as safe as it is easy.

Among the ancient Romans there were three kinds of established butchers; viz. two colleges, or companies, composed each of a certain number of citizens, whose office was to furnish the city with the necessary cattle, and to take care of preparing and vending their flesh. One of these communities was at first confined to the providing of hogs, whence they were called *suarii*; and the other were charged with cattle, especially oxen; whence they were called *pecuarii*, or *boarii*. Under each of these was a subordinate class, whose office was to kill, prepare, &c. called *lani*, and sometimes *carnifices*. Briffonius, Modius, and others, mention a pleasant way of selling meat, used for some ages among this people: the buyer was to shut his eyes, and the seller to hold up some of his fingers; if the buyer guessed aright, how many it was the other held up, he was to fix the price; if he mistook, the seller was to fix it. This custom was abolished by Apronius, prefect of Rome; who in lieu thereof introduced the method of selling by weight.

The Jews have their own butchers; as they have a peculiar method of selling and preparing their meat. The exercise of this office has been considered among them as singularly important, and requiring previous instruction, for which, application has been sometimes made to a learned rabbi, and for which, a formal licence has been thought necessary.

Some derive the term butcher from *buccarius*, of *bucca*, mouth; others from *castrum*, killer of cattle.

The French call a place set apart either for the slaughter of cattle, or exposing their flesh to sale, a *butchery*, *boucherie*. The English distinguish, calling the latter a *steak-house*,

or *market*, the former a *slaughter-house*.—Nero built a noble edifice of this kind at Rome: on which occasion was struck that medal, whose reverse is a building supported by columns, and entered by a perron of four steps; the legend, MAC. AVG. S. C. *Macellum Augusti Senatus Consulito*.

In London, the furnishing of the markets with butcher's meat is cantoned into several offices. We have carcass-butchers, who kill the meat in great quantities, and sell it out to another sort called retail butchers, dispersed in all out-parts, villages, and towns, near the city. There are besides, cow-jobbers, or salefren, who buy and sell cattle, acting between the butchers and the breeders, or feeders. Something like this also obtains at Paris.

The company of butchers was not incorporated until the third year of king James I. when they were made a corporation by the name of master, wardens, and commonalty of the art and mystery of butchers; yet the fraternity is ancient. Their arms are azure, two axes faltier-wise argent, between three boars' heads coupéd, attired or, a boar's head gules, between two garbes vert. See COMPANY.

There are some good laws made for the better regulation of butchers, and for preventing the abuses committed by them.

By stat. 2 and 3 Edw. VI. 15. revived, continued, and confirmed by stat. 22 and 23 Car. II. c. 19. now expired, butchers (and others) conspiring to sell their victuals at certain prices are liable to 10l. penalty, or 20 days' imprisonment, with merely bread and water, for the first offence; 20l. or the pillory, for the second offence; and 40l. or pillory, and the loss of an ear, and infamy, for the third offence: the offence to be tried by the sessions or leet. By stat. 4 Hen. VII. c. 3. no butcher shall slay any beast within any walled town, except Berwick and Carlisle, on pain of forfeiting for every ox 12d., for every cow or other beast 8d. By the ordinance for bakers, butchers, &c. butchers selling swine's flesh mangled, or dead of the murrain, or that buy flesh of Jews, and sell the same to Christians, for the first time shall be grievously amerced, the second time suffer the pillory, the third time be imprisoned and fined, and the fourth time forswear the town.

By stat. 3 C. I. c. 1. butchers are not to kill or sell meat on Sundays, on the penalty of forfeiting 6s. 8d., one third to the informer, and two thirds to the poor. By 1 Jac. I. c. 22. and 9 Ann. c. 11. regulations are made as to the watering and gassing of hides, and penalties annexed to the violation of them; and also to the selling of putrefied or rotten hides; and also by the said stat. 1 Jac. I. no butcher shall be a tanner or currier. See CATTLE, FORESTALLING, and VICTUALS.

**BUTCHER-bird**, in *Ornithology*. See LANIUS.

**BUTCHER'S broom**, in *Botany*. See RUSCUS *aculeatus*.

**BUTCHER'S island**, in *Geography*, a small island of the East Indies, about two miles long and one broad, distant about three miles from Bombay, and deriving its name from the cattle that are kept there for the use of that settlement. It has a small fort.

**BUTE**, an island in the Frith of Clyde, situated a little to the west of Renfrewshire, and a little south of Argyleshire. The name at different periods has been variously written, as *Bote*, *Both*, *Dothe*, and *Boote*, and is denominated *Botis* by the anonymous geographer of Ravenna. This island was from "very early times part of the patrimony of the Stuarts; large possessions of it were granted to sir John Stuart, son of Robert II., by his beloved mistress Elizabeth More; and it has continued in the same family to the present time." Bute isle occupies an area of ground measuring on an average about 18 miles in length, by 4 in breadth, and containing about 20,000 acres, and 4000 inhabitants. The

northern parts of it are rocky and barren, but its southern parts are mostly inclosed, well cultivated, and fertile. The whole is divided into two parishes, in one of which is the royal burgh of *Rothsay*, which is the principal town of the island and of the shire. The coast is rocky, and indented with several small harbours, from which are annually fitted out a number of buffes for the herring-fishery. This is the principal trade of the island, and has been promoted even at the expence of agriculture. The climate, as usual in small islands, is necessarily damp. Its produce is barley, oats, and potatoes; turnips with artificial grasses have been lately cultivated. Indeed, from the example and recommendation of the marquis of Bute, who is the principal proprietor of the island, and derives his title from it, the system of agriculture pursued here is far before most of the northern counties, and such as is calculated to obtain the greatest produce from the lands. The same nobleman has also directed the fishermen and farmers to be distinct, and each to attend to his respective pursuit. The farms are mostly small, as few exceed the rent of sixty pounds a year, but the medium is about twenty-five. Arable land was let, when Mr. Pennant visited the island, at nine or ten shillings an acre, and the price of labourers was eight pence a day. Rents were mostly paid in money, and the rent-roll of the island was about 4000l. a year. The government of Bute is managed by a deputy-sheriff, who is always resident, and determines most petty actions; but criminal actions are carried to Inverary, where the judges of the court of judicatory meet twice a year. The marquis of Bute is admiral of the county, by commission from his majesty, and not at all dependent on the lord high admiral of Scotland. He has, therefore, full powers, either in himself, or by deputy, to judge and decide on all crimes of murder, piracy, &c. Among the remains of antiquity is part of a Druidical circle at Langel-chorid. At Kin-garth are the ruins of a church, of which two cemeteries remain. One of these was exclusively appropriated to the interment of females, because, observes Mr. Pennant, "in old times certain women being employed to carry a quantity of holy earth, brought from Rome, lost some by the way, and so incurred this penalty for their negligence, that of being buried separate from the other sex." Near this place is a circular inclosure called the *Devil's Cauldron*; it is made of stones piled together without mortar, but trimmed in the inside in a smooth and regular manner. The walls are about seven feet in height, and ten feet in thickness. The area is thirty feet in diameter, and the entrance gradually narrows, from the outside of the wall inwards. Near *Rothsay* are the remains of an ancient castle, with a fort, barracks, and drawbridge, which was formerly the residence of the kings of Scotland. See **ROTHESAY**.

**BUTE**, a county or shire of Scotland, comprehending the above island, with those of Arran, the two Cumbrays, and Inchmarnock. This county, with that of Caithness, combine to send one member to parliament alternately. See Pennant's *Tour in Scotland*, vol. ii. Sinclair's *Statistical Account of Scotland*.

**BUTEA**, in *Botany* (in honour of the late earl of Bute, a munificent patron of botanical science). Willd. 1323. Roxburgh. *Corom.* i. p. 22. Class and order, *diadelphia decandria*. Nat. Ord. *Papilionaceæ* Linn.—*Leguminosæ* Juss.

Ess. Ch. *Cal.* subbilabiate. *Cor.* standard very long, lanceolate. *Legume* compressed, membranaceous, with one seed at the summit. Willd.

Species, 1. *B. frondosa*. Roxb. *Corom.* i. tab. 21. (Plaso, Rheede. *Mal.* 6. tab. 16, 17. *Arbor siliquosa trifolia indica*, Ray *Hist.* 1721. *Erythrina monosperma*, La Marck *Encyc.*

tom. ii. p. 391.) "Little branches pubescent; leaflets roundish, emarginate." Willd. An evergreen tree. *Stem* about fifteen feet high; outer bark, cinereous, dry, brittle, clothed with a dark red cuticle; inner bark soft, but thick, from which, when cut, exudes a gummy blood-red juice, of a sweetish taste. *Leaves* alternate, petioled, growing by threes, about ten inches long; leaflets about four inches long, even above, transversely nerved beneath, reticulated between the nerves; the terminal leaflet at right angles with the other two, wedge-shaped at its base; the lateral leaves larger on the exterior side than on the interior, with short and thick petioles. *Flowers* red, rather large, in racemes, on alternate, or scattered, somewhat tomentous, peduncles. *Calyx* short, five-toothed. Wings of the *corolla* a little shorter than the standard; keel shorter than the wings. *Legumes* elliptic-oblong, pubescent, from four to five inches long, and near two inches broad. Ray from Rheede, and La Marek from a dried specimen, communicated by Jussieu. A native of the East Indies, on the coasts of Malabar and Coromandel.

Obs. Jussieu informed La Marek that from this tree is procured the gum lac of commerce; and in fact there are found here and there, on the branches of most of the specimens in his Herbarium, resinous lumps which greatly resemble that substance. These lumps are much divided, and not in entire masses, like those of gum or resin which proceed from various trees; so that they do not appear to be the inspissated juice mentioned by Rheede, but, agreeably to the common opinion with respect to gum lac, may be elaborated by a species of ants, somewhat in the same manner as bees form their wax, and discharged on the same tree from which the crude juice was obtained.

2. *B. superba*. Roxb. *Corom.* i. tab. 22. "Little branches smooth; leaflets attenuated at the base, roundish, obtuse." Willd. Very similar to the preceding, but differs in the particulars mentioned in the specific character, and in having leaves three times as large, the leaflets being a foot long. A native of the coast of Coromandel.

Dr. Roxburgh has described these two species in the third volume of the *Asiatic Researches*, p. 469, 8vo. The first is the *Maduga* of the Gentoos. The juice above-mentioned hardens into a ruby-coloured brittle astringent gum, soon losing its beautiful colour when exposed to the air; entirely soluble in water, and also in a great measure in spirits. Infusions of the flowers dye cotton cloth, previously impregnated with a solution of alum, or alum and tartar, of a most beautiful bright yellow. The second species is the *Tida maduga* of the Gentoos. This also yields a red gum from its bark, and its flowers afford the same beautiful yellow dye and pigment.

**BUTEO**, in *Ornithology*, the species of **FALCO** we call the common buzzard in this country. It has the cere and legs yellow; the body brown, and the belly pale, with brown spots. This is rather larger than a kite in the body; its length about 20 inches.

**BUTEONIS**, in *Zoology*, a species of **ECHINORHYNCHUS**, of a very clear white colour, with the vesicles of the tail bluish and lentiform. Goeze. Length of this kind two inches and a quarter. Insects the intestines of the buzzard.

**BUTEONIS**, a species of **ASCARIS**, that infests the intestines of the buzzard, *Falco buteo*, but of which no particular description has been hitherto given. Goeze, *Gn. el.* &c.

**BUTEONIS**, is also a species of **CYCULLANUS**, found in the intestines of the same bird, of which we have no description.

**BUTHIROTUM**, **BUTRINTO**, in *Ancient Geography*, a fine town of Epirus, mentioned by Virgil, Strabo, and Pliny, who represents it as a Roman colony. It was seated on a river, called Xanthus, in Thesprotia, over against Corcyra, as Butrinto is at present opposite to Corfu. Cæsar gives it this position; and Virgil says that Æneas landed there, and was astonished to find a Trojan who reigned here, and who was Helenus the son of Priam. This king liberally supplied the wants of Æneas, and gave him useful advice with respect to his navigation.

**BUTHIROTUS**, a river of Italy, in the country of the Brutians. Cluver.

**BUTHIURUS**, a town of Africa in Libya Interior, and near the source of the river Bagrada. Ptolomy.

**BUTHYSLA**, *βουθυσία*, in *Antiquity*, a sacrifice of the greatest kind: such were the hecatombs. See SACRIFICE and HECATOMBS.

The Greeks frequently prefixed the particle *βου*, *bu*, to words, to denote things of extraordinary magnitude, as including to the bigness of oxen.

**BUTI**, in *Geography*, a town of Italy, in the duchy of Tuscany, seated on the Arno; 20 miles N.N.E. of Leghorn. The mountains of Pifa form near this place a deep narrow hollow, called the valley of Buti, bounded by the sides of the mountains, which are covered with pine, chestnut, and olive trees. In the bottom is a smooth ground, cut by an impetuous torrent; and in the lowest part of it is situated the land of Buti, in two divisions, the higher, called the "castle," and the lower, "the town." It is continually exposed to a cold, moist air, except during some days in summer; it is often covered with a thick cloud, and subject to sudden changes of weather, particularly to heavy rains; owing to its being below the high mountains of Pifa, and near to the lake of *Bientina*, which see.

**BUTIGA**, is an inflammation of the whole face, otherwise called *gutta rosacea*.

**BUTIS**, in *Ancient Geography* and *Mythology*. See **BUTUS**.

**BUTLASS**, in *Geography*. See **PUDDAR**.

**BUTLER**, or **BOTILER**, an officer whose chief charge is over the cellar and liquors. See **ARCH-Butler**.

**BUTLERS**, *buticularii*, among the Normans, denoted wine-tasters, appointed to examine liquors, and see that they were right and legal.

**BUTLER of France**, *buticularius Francie*, was one of the four great officers of the household of the ancient kings of that country, who signed all the royal patents, or at least was present at the dispatch of them. His seat was among the princes, and he even disputed the precedency of the constable of France. He had a right of presiding at the chamber of accounts; and in the registers of that office of the year 1397, mention is made that John de Bourbon, grand butler of France, was admitted there as first president. But the title has been since abolished, and, in lieu thereof, a new office of *grand echançon*, or cup bearer, was erected.

**BUTLER, JAMES**, duke of Ormond, in *Biography*, an accomplished English courtier and eminent statesman, in the 17th century, was the son of Thomas Butler esq. a branch of the Ormond family, and by his mother, the grandson of sir John Poyntz, and born at Newcastle-house in Clerkenwell, London, in 1610. Upon the decease of Thomas, earl of Ormond, his grandfather, sir Walter Butler of Kileash, assumed the title, and his father was called by courtesy viscount Thurles. After the death of his father, who was drowned on his passage from Ireland to England, in 1619, and who left a widow and 7 children in embarrassed circumstances, this title devolved upon him. In 1620, he was sent

over to England by his mother, and placed under the tuition of a parish schoolmaster at Finchley, near Barnet; but by the interposition of king James, who claimed the wardship of the young lord, he was removed to Lambeth, and his education was committed to the superintendance of archbishop Abbot. In this situation he is said to have enjoyed little advantage with regard to general instruction; but he acquired those principles of the Protestant religion to which he maintained a steady attachment in the progress of his life. Upon the death of king James, he was taken home by his grandfather, the earl of Ormond, and no farther care seems to have been taken with regard to his education. At the age of 18, he attended the duke of Buckingham at Portsmouth, and after the assassination of this favourite by Felton, he returned to London; and marrying his cousin, the lady Elizabeth Preston, in 1629, he brought to an amicable termination the disputes that had long disturbed the harmony and injured the interests of both families. In the following year he removed to Ireland, and purchased a troop of horse. In 1632 his grandfather died, so that he succeeded to the title and estates of the earldom of Ormond; and in 1633, when lord Wentworth, afterwards earl of Strafford, became governor of Ireland, he was distinguished by the peculiar attention of this eminent statesman; who, on occasion of their first interview, said to his attendants, "that if his skill in physiognomy did not fail him, that young nobleman would make the greatest man of his family." The connection thus formed between the lord-deputy and the young earl, subsisted, with little interruption, during the whole of Strafford's administration. At the age of 24 he was sworn of the privy council, and on occasion of the troubles which broke out in Scotland, he was appointed to the command of the army levied in Ireland, under the lord-lieutenant. To the interest of lord Strafford he uniformly adhered; and this unfortunate nobleman testified the sense he entertained of the importance of his services, by requesting that the king would confer his blue garter upon his friend the earl of Ormond; which, however, he declined accepting during this reign. Upon the commencement of the great rebellion in Ireland in 1641, the earl of Ormond was appointed lieutenant-general and commander in chief of the army, which consisted at that time of no more than 3000 men. With this inconsiderable force, and a few additional troops which he was able to raise, he resisted the progress of the rebels, and in 1642 dislodged them from the Naes near Dublin, raised the blockade of Drogheda, and routed them at Kilsesh. His exertions, however, were impeded by the jealousies of the lords justices, and afterwards of the earl of Leicester, the lord lieutenant; but the king, with a view of counteracting this opposition, gave him an independent commission under the great seal, and, as a further mark of favour, created him marquis of Ormond. In 1643 he obtained a considerable victory with very inferior forces over the rebels under the command of the Irish general Preston, but for want of suitable encouragement, he was under a necessity of concluding a cessation of hostilities, for which measure he was much blamed in England; though he availed himself of it by sending over troops to the assistance of the king, who was then at war with the parliament. His majesty, in recompence of his fidelity, and the service rendered to the royal cause, created him lord-lieutenant of Ireland, in the room of the earl of Leicester; and he entered upon his government in the beginning of the year 1644. In the exercise of this office, he had to contend with many difficulties, occasioned by the rebellious spirit of the old Irish, and the machinations of the English parliament. Having maintained an unsuccessful struggle for three years, he was at length, viz. in 1647, obliged to sign a treaty with the parliament's

parliament's commissioners, and to come over to England, where he waited on the king at Hampton-court, and obtained his majesty's full approbation of all his proceedings. His circumstances, however, were embarrassed and perilous, so that he thought it most prudent to provide for his own safety by embarking for France.

During his short residence in this country, he corresponded with the Irish for the purpose of inducing them to engage in the royal cause; and having engaged lord Inchiquin to receive him in Munster, he landed at Cork, after escaping the imminent danger of shipwreck, in 1748. On his arrival, he adopted measures which seemed to revive the hopes of the king's friends. These hopes were farther encouraged by the abhorrence excited through the country on occasion of the king's death; and in consequence of this favourable impression on the public mind, the lord lieutenant caused Charles II. to be immediately proclaimed. But Owen O'Neale, instigated by the Pope's nuncio, and supported by the old Irish, raised obstacles in his way, which he determined to overcome by the bold enterprise of attacking the city of Dublin, then held for the Parliament by governor Jones. This enterprise, however, failed, with very considerable loss on the part of the Marquis: and soon after Cromwell arrived in Ireland, and having stormed Drogheda, surrendered it to military execution, thus striking terror into the Irish, so that they became dissatisfied with the lord-lieutenant, and insisted on his leaving the kingdom. At the close of the year 1655, he embarked for France, and there joined the exiled family. In order to retrieve his own affairs, the marchioness went over to Ireland, and having in some measure succeeded in exempting her own estate from forfeiture, she remained in the country, and never saw her husband till after the restoration. In the mean while the Marquis was employed in various commissions in behalf of the king; and he rendered essential service to his cause by rescuing the duke of Gloucester out of the hands of the queen-mother, and preventing her severe treatment from inducing him to embrace the Catholic religion. He was also instrumental in detaching the Irish catholic regiments from the service of France, one of which he was appointed to command, and in obtaining the surrender of the town of St. Ghilan, near Brussels, to the Spaniards. In a secret embassy to England for the purpose of investigating the state of the royal party, he escaped several hazards of discovery from the spies of Cromwell; and at length, when Charles II. was restored to the throne of his ancestors, the Marquis accompanied him, and was liberally recompensed for his faithful attachment and active services. Besides the restoration and augmentation of his large estates in the county of Tipperary, he was raised to the dignity of duke of Ormond, and he officiated as lord high-steward of England at the king's coronation. After his appointment to the lord-lieutenancy, in 1662, he made several efforts, attended with considerable success, for reducing the country to a state of tranquillity, and he promoted various improvements, particularly with respect to the growth of flax and manufacture of linen, which very much conduced to its subsequent prosperity. His attachment to earl Clarendon, however, involved him in the odium which pursued that great man; and though his conduct, after rigorous scrutiny, furnished no matter of just censure, he was nevertheless deprived of his government by the machinations of the duke of Buckingham, in 1669; but in the same year, he was elected to the office of chancellor of the University of Oxford. In 1670, a desperate design was formed against him by colonel Blood, whom he had imprisoned in Ireland on account of his having engaged in a plot

for the surprisal of Dub'in castle. Blood, being at this time in London, determined to seize his person, in his return from an entertainment given in the city to the prince of Orange; and in the prosecution of his purpose, his accomplices dragged the duke out of his coach and placed him behind one of them who was on horseback, in order to convey him to Tyburn, and execute him on the public gallows; or, as others say, to take him out of the kingdom, and compel him to sign certain papers relating to a forfeited estate of Blood. The duke by his struggles threw both the man and himself from the horse, and by seasonable assistance he was released from the custody of these assassins. This daring act of violence excited the king's resentment; but Blood, for certain reasons, having been taken into favour, his Majesty requested the duke to forgive the insult. To which message he replied, "that if the king could forgive Blood for attempting to steal his crown, he might easily forgive him for an attempt on his life; and that he would obey his Majesty's pleasure without inquiring into his reasons." For seven years the duke of Ormond, who was equally adverse to papists and fanatics, and who possessed a spirit which would not stoop to the cabals formed by mistresses and persons destitute of honour, was neither in favour with the court nor employed by it; but at length, in 1677, he was surpris'd by a message announcing the king's intention to visit him. The object of this visit was to disclose his Majesty's resolution of appointing him to the lord-lieutenancy of Ireland; and this resolution had been adopted by the influence of the duke of York, who had reason to imagine that the "cabal," or court-party, proposed to introduce the duke of Monmouth into this high station in the room of the earl of Essex, who had been removed. In order to counteract this plan, the duke of York recommended his grace of Ormond to the king, as the most likely person to engage general confidence, and to unite discordant parties in both countries. The king persisted in his resolution, and the duke of Ormond took possession of the government. Upon his arrival, he adopted vigorous measures for disarming the papists and maintaining public tranquillity; and though he did not escape calumny, the king determined to support him against all attempts for removing him, and declared with an oath, "that while the duke of Ormond lived, he should never be put out of that government." He was desirous, indeed, of calling a parliament in Ireland for settling affairs, but to this measure the king would not give his consent. In 1682, when he came over to England to acquaint the king with the state of his government, he was advanced to the dignity of an English dukedom; but notwithstanding this mark of royal favour, he had given such offence by his importunity with respect to an Irish parliament, that immediately on his return he was apprised of an intention to remove him. Upon the accession of James, the duke caused him to be proclaimed, and soon after resigned his office and came over to England. Although the duke's principles did not suit the projects of the new reign, he was treated with respect by the king, and received from him the honour of a visit whilst he was confined to his chamber with the gout. He died at Kingston-hall, in Dorsetshire, July 21st, 1688, in the 78th year of his age, and was buried in Westminster-abbey.

"The character of the duke of Ormond was that of a high-spirited and liberal nobleman, upright in his intentions and steady to his political principles, which were those of monarchy with large prerogatives, but not beyond the law. He was a steady friend to the church of England, and had in his family several men of learning who attained to eminence, among whom were Dr. Hough, the excellent

excellent bishop of Worcester, and the very ingenious Dr. Burnet of the Charter house. From a low though honourable beginning, he arrived at great rank and prosperity, and left a numerous progeny, of which he lived to see the third generation. He was active and well versed in business; and his talents, though not of the first class, enabled him to appear with reputation in several difficult conjunctures." *Biog. Brit. Gen. Biog.*

BUTLER, JOSEPH, an eminent prelate of the English church, was born at Wantage in Berkshire, in 1692, and was intended by his father for the ministry among protestant dissenters of the presbyterian denomination. With this view, after having finished his grammatical education at his native place, he was sent to a dissenting academy, kept by Mr. Samuel Jones, first at Gloucester and afterwards at Tewksbury. Of his application and proficiency as a theological student, he exhibited a signal evidence in two letters addressed to Dr. Clarke, and containing a statement of doubts that had occurred to him concerning the conclusiveness of some arguments in the Doctor's "Demonstration of the Being and Attributes of God." The first of these letters, dated Nov. 4, 1713, displayed a sagacity and depth of thought which excited the particular notice of Dr. Clarke. Encouraged by this condescension, Mr. Butler addressed the doctor again upon the same subject; and received an answer. The whole correspondence, which comprised three other letters, was annexed to the celebrated treatise above-mentioned, and retained in all the subsequent editions. The correspondence was secretly conducted by Mr. Secker, the friend and fellow-pupil of Mr. Butler; and procured for him, as soon as he became known, the friendship of Dr. Clarke. Whilst he was engaged in the prosecution of his studies at Tewksbury, he entered into an examination of the principles of nonconformity; and the result of his inquiry was a resolution of conforming to the established church. His father was at first dissatisfied with his purpose, and attempted to divert him from it: but, finding that his son's resolution was fixed, he consented to his removal to Oxford, where he was admitted a commoner of Oriel college in 1714. Here he formed an intimate friendship with Mr. Edward Talbot, second son of bishop Talbot, and to this circumstance he owed all his future preferments in the church. Having taken orders soon after his admission at Oxford, he was recommended, in 1718, by Mr. Talbot and Dr. Clarke to Sir Joseph Jekyll, who appointed him preacher at the Rolls chapel. In this situation he continued till the year 1726, when he published, in one volume octavo, "Fifteen Sermons preached at that Chapel." These sermons established his character as an acute and solid reasoner; and as they are rather deep disquisitions, than popular discourses, adapted solely to a learned and attentive audience, the author thought proper to make an apology for their abstruseness in a preface to a second edition, revised and improved in 1729; in which preface he has also abridged and illustrated the principles laid down in his sermons. The style of these compositions is destitute of that ease and perspicuity, which might justly have been desired, but which Butler was never able fully to attain. His friend Secker is said to have taken pains in rendering more familiar the language both of these discourses and of his other works. By the judicious reader, notwithstanding these defects, they have been always held in high estimation. Under the patronage of Dr. Talbot, then bishop of Durham, to whom Butler was recommended by his son on his death-bed, he was presented, first, viz. in 1721, to the rectory of Houghton near Darlington, and afterward, viz. in 1725, to that of Stanhope in the same

diocese. At this latter place, Mr. Butler, having resigned the Rolls chapel in 1726, resided during seven years, diligently discharging the duties of a good parish priest. The situation, however, was too retired and solitary for a person of his gloomy disposition; and his friend Mr. Secker, who was apprised of this circumstance, was anxious to draw him out of solitude into a more active and conspicuous scene. With this view he took the liberty of mentioning him to queen Caroline; who, apprehending that he was dead, asked archbishop Blackburne, if this was not the fact: to which the archbishop replied, "No, madam, but he is buried." By the recommendation of Mr. Secker, the lord chancellor Talbot nominated him his chaplain; and Mr. Butler accepting the nomination, came up to London by way of Oxford, in 1733, and was created doctor of laws. The chancellor also gave him a prebend in the church of Rochester, and it was stipulated that he should continue to reside half the year at Stanhope. In 1736, he was appointed clerk of the closet to queen Caroline, and in the same year, he published his celebrated work, entitled "The Analogy of Religion, natural and revealed, to the Constitution and Course of Nature."

The first edition of this work, which for depth and originality of thought and reasoning, is one of the most masterly performances that ever appeared in the world, was published in 1736 in 4to: the subsequent editions have been in 8vo., and the last by Dr. Halifax, bishop of Gloucester, was published in 1788. The foundation of the mode of reasoning pursued in this treatise had been laid by the author in his sermons, and particularly in the last of them "On the Ignorance of Man." For a general account of it; see the article ANALOGY. To the "Analogy" are annexed two Dissertations; one on Personal Identity, and another on the Nature of Virtue.

Whilst queen Caroline lived, Dr. Butler attended her for two hours every evening; and by her urgent recommendation to the king, he was raised in the year following that of her death, viz. in 1738, to the see of Bristol, and in 1740, to the deanry of St. Paul's in London, upon which he resigned his rich living of Stanhope. Besides attention to the various duties of his diocese and deanry, bishop Butler preached several sermons in the metropolis on particular occasions, which were printed, and which have since been annexed to the later editions of the sermons at the Rolls chapel. In 1746, he succeeded Dr. Egerton, bishop of Hereford, as clerk of the closet to the king; and in 1750, he was translated to the see of Durham. At his primary visitation in 1751, he delivered a charge to his clergy of which the principal subject was "External Religion." In recommending on this occasion the utility of outward forms and institutions, towards fixing and preserving in the minds of men a sense of devotion and duty, he was thought by several persons to have spoken too favourably of pagan and popish ceremonies, and to have countenanced, in a certain degree, the cause of superstition. He had also put up a plain marble cross in his chapel at Bristol. The charge was animadverted upon by an able and spirited writer in 1752, in a pamphlet entitled, "A Serious Enquiry into the Use and Importance of external Religion, &c." The circumstance of the cross at his chapel, and the offence taken by some persons at this charge, might possibly have given rise to the calumny which was advanced, almost 15 years after his death, in an obscure and anonymous pamphlet, entitled "The Root of Protestant Errors examined;" and which charged him with having died in the communion of the church of Rome. The charge is absurd and groundless, and hardly deserves refutation. It is sufficiently exposed in  
 bishop

bishop Porteus's life of archbishop Secker; and the character of the worthy prelate has been more amply vindicated by Dr. Halifax, then bishop of Gloucester, in a preface to the second edition of his charge, printed in 1786, containing an account of the character and writings of the author. Soon after his removal to his new bishopric, the health of bishop Butler began visibly to decline; and having made ineffectual trial of the waters at Bristol, he removed to Bath, where he died on the 16th of June, 1752. His remains were interred in the cathedral at Bristol, where a monument, with an inscription, is erected to his memory. For bishop Butler's intellectual character, it will be sufficient to refer to his invaluable writings. Of his piety we may observe, that it was sincere and fervent, but perhaps inclining too much to the gloomy and ascetic extreme. His benevolence was ardent and diffusive. During his residence on the see of Bristol he expended in the repairs and improvement of the episcopal palace the sum of 4000*l.*, which exceeded the whole amount of his receipts from that see. His benefactions were numerous and liberal. He maintained the hospitality and dignity of his diocese with spirit, setting apart three days in the week for the entertainment of the principal gentry of the county, and condescending to invite the poorest of his clergy to his table, and to visit them in their parishes. At his decease it is said that he ordered all his MSS. to be burnt, without unfolding the covers of any of them. *Biog. Brit. Halifax's Preface.*

BUTLER, SAMUEL, a celebrated poet of the 17th century, was born at Strensham, in Worcestershire, as some say, in 1600, and according to others, in 1612. Having laid the foundation of grammar-learning in the free-school at Worcester, he was sent to Cambridge, where he resided, without being matriculated in that University, for 6 or 7 years. Upon his return to his native county, he lived as clerk with an eminent justice of the peace, in whose easy and reputable service he had leisure for applying to his favourite studies, history and poetry, and also for amusing himself with music and painting. Under the patronage of Elizabeth, countess of Kent, he had access to a valuable library, and the opportunity of frequent intercourse with the great Mr. Selden, who employed him in writing foreign letters, and translating for him. He also lived for some time with sir Samuel Lake, a gentleman of an eminent family in Bedfordshire, and a famous commander under Oliver Cromwell. About this time he wrote his celebrated burlesque poem, entitled "Hudibras," under which character, as it is generally supposed, he intended to ridicule sir Samuel. After the restoration, Butler was made secretary to Richard earl of Carberry, lord president of Wales, and by him appointed steward of Ludlow castle, when the court was revived there; about which time he married Mrs. Herbert, a lady of good family and some fortune. The first part of his "Hudibras" was printed in 1663, and it was introduced to the notice of the court by the "Mecenas" of that age, the earl of Dorset; and yet, though it was highly extolled by the prevailing party, both in church and state, and much admired, as well as frequently cited, by the king, the author received no other recompence besides praise and barren promises, and was suffered to pass his days in an obscure and neglected condition. The only boon which was conferred upon him by the king (and even this grant is disputed) was a donation, exempt from office fees, of 300*l.* which he honourably devoted to the discharge of his debts; but the professions of regard and service made to him by lord chancellor Clarendon, and by the duke of Buckingham, were futile and inefficient. Respected for his integrity and beloved for his social qualities by his few intimate friends, he died in 1680, and was buried in the

VOL. V.

church-yard of St. Paul's, Covent-garden, at the expence of his friend Mr. Longueville of the Temple; and, in 1721, a monument was erected to his memory among the poets in Westminster abbey, by alderman Barber, the printer. The inscription sanctions the common opinion of his poverty by the following words: "Ne cui vivo deerant ferè omnia deesset etiam mortuo tumulus:" *i. e.* left he who, when living, wanted almost every thing, should, when dead, want also a tomb.

A monument has since been erected, by private subscription, in the portico of the church, near which he was buried, bearing the poet's bust, taken from that in Westminster abbey; and on a stone beneath the medallion are inscribed the following lines, contributed by Mr. O'Bryan:

"A few plain men, to pomp and pride unknown,  
O'er a poor bard have raised this humble stone,  
Whose wants alone his genius could surpass,  
Victim of zeal! the matchless Hudibras!  
What! tho' fair freedom suffered in his page!  
Reader! forgive the author—for the age—  
How few, alas, disdain to cringe and cant,  
When 'tis the mode to play the sycophant!  
But oh! let all be taught from Butler's fate,  
Who hope to make their fortune by the great,  
That wit and pride are always dangerous things,  
And little faith is due to courts and kings."

His poem, entitled "Hudibras" is one of the most original works, with regard both to its style and matter, that was ever written. It is of the burlesque kind, being usually styled a "mock-heroic," or "mock-epic," and much resembles Homer's "Margites," which, according to Aristotele, bore the same relation to comedy, that the Iliad and Odyssey do to tragedy. The hint of it was suggested by the inimitable Don Quixote; and it was intended as a general satire on those times of anarchy and confusion, during which the poet lived, and its leading aim was to expose by ridicule the religious and political principles of the Puritans, as they appeared after the civil war which overthrew church and state in the reign of Charles I. Of this poem there are three parts, which were printed separately; but the story was left unfinished. The diction and versification are often grossly familiar and negligent, though, upon the whole, they add to the humorous effect; and it is justly remarked by Dr. Johnson, in opposition to the judgment of Mr. Dryden, that the heroic style and measure would not have been better adapted to the author's purpose. The frequent double rhymes, introduced by the author, although they are often very imperfect, seem to give a kind of comic tone to the whole, and to improve the wit by combining the most incongruous ideas. Butler, besides the talent which he possessed of interesting and amusing the reader by odd and whimsical notions and associations, was well acquainted with human life. To this purpose Dr. Johnson (*Lives of the Poets*) observes, that "he had watched with great diligence the operations of human nature, and traced the effects of opinion, humour, interest, and passion. From such remarks proceeded that great number of sententious distichs which have passed into conversation, and are added as proverbial axioms to the general stock of practical knowledge." Of the numerous editions of this poem, the most valuable is that of Dr. Zachary Grey, published in 1744, with copious annotations, and a preface, in 2 volumes, 8vo. The singular popularity of this poem produced several unsuccessful imitations of it, and some vain attempts to translate parts of it into Latin. But it is not easy, or perhaps possible, to transfer the humorous turn of the phrase, for which this performance is distinguished, into any foreign language. The undertaking, however dif-

ficult, was attempted in a French translation of *Hudibras*, in 3 vols. 12mo. with notes, by — Townley, junior, esq. of Townley in Lincolnshire. A collection of pieces, under the title of “The Poetical Works of Mr. Samuel Butler,” was published after his death, in 3 vols. 12mo.; but most of these are falsely ascribed to him, and none of them are of much value. However, in 1750, there appeared a more respectable publication, entitled “Genuine Remains in Prose and Verse of Mr. Butler, from the original MSS. formerly in the possession of W. Ligonville, esq.” 2 vols. 8vo. The editor was Mr. Thyer of the Manchester library, who has established the authenticity of these pieces, and accompanied them with notes. The poetical part contains a satire on the Royal Society; and the prose consists of “Characters,” drawn with much force and humour, and “Thoughts” on various subjects. *Biog. Brit.*

BUTLER, CHARLES, Magd. Coll. Oxford, Master of Arts, published, in 4to. 1733, the principles of music in singing and sitting, with the twofold use thereof, ecclesiastical and civil. This tract, which is dedicated to Charles I. seems to have been the only theoretical or didactic work, published on the subject of music, during his reign. The author appears to have been a learned and ingenious man. He had previously published “The Principles of Grammar,” in which he had proposed a new and more simple orthography for our language, of which Dr. Johnson has given an account in the grammar prefixed to his dictionary. The Saxon and new characters he uses, in order to explode such letters as are redundant, or of uncertain powers, render this musical tract somewhat difficult to peruse. It is, however, better digested, more compressed, and replete with useful information, than any work of the kind that appeared for more than a century after Morley’s “Introduction.” The quotations are perhaps too numerous, and the display of musical erudition may be thought to border on pedantry; yet, allowing these to be censurable, the book contains more knowledge, in a small compass, than any other of the kind, in our language.

BUTLER, \* \* \*, an eminent harpsichord master, who during many years had a constant and numerous succession of scholars. He succeeded Keeble in playing the organ at Ranelagh; was organist of St. Ann’s church, Soho; and afterwards of St. Margaret’s, Westminster; he played the harpsichord at Hickford’s subscription concert, and at frequent benefits there and elsewhere. He was a correct but not a brilliant or learned performer; and seems never to have attempted composition. Travelling to Naples, about the year 1775, to place his son under Piccini, after that important business was done, in returning to Rome, through the Pontine marshes, he was seized by the mall’ aria, like poor Burton, and died on the road.

BUTLER, WILLIAM, born at Ipswich, about the year 1535, was educated at Clare-hall, in Cambridge, where settling and practising medicine, he became one of the most popular physicians in his time, and was frequently sent for, in cases of difficulty, to distant parts of the country. Sir Theodore Mayerne gives an account of a cure performed by him, in a violent defluxion on the face; and Wood quotes a case, in his account of Francis Presham, esq. in which he pronounced a patient to have taken poison, from the change produced on a piece of gold he had directed him to hold in his mouth; probably, says Aikin, it was a preparation of mercury that had been swallowed.

Dr. Wittie, in his preface to his “Translation of Primrose’s Vulgar Errors,” says, he was in such repute, that many empirics, after his death, sold preparations under his name, which were much sought for. He appears to have been a

humourist, from various stories current concerning him; and, perhaps, like Dr. Radcliffe, he owed much of his fame and fortune to that disposition. In the year 1612 he was called in to attend prince Henry, with sir Theodore Mayerne. He pronounced the fever to be a peccilence, and gave little hopes of his recovery. Five years after, viz. January 26th 1617, he died in the 83d year of his age, and was buried in St. Mary’s church, Cambridge. He left no writings, but the following elegant inscription was placed on his tomb:

“Gulielmus Butlerus, Clarencis quondam focus, medicorum omnium quos præfens ætas vidit facile princeps, hoc sub marmore secundum Christi adventum expectat; et monumentum hoc privata pietas statuit, quod debuit publica. Abi viator, et, ad tuos reversus, narra te vidisse locum in quo falus jacet.”

BUTLER, WILLIAM, was born at a town in Derbyshire, in the year 1726. After the usual school education, he went to Edinburgh, and in 1761 took the degree of Doctor in Medicine, and published for his inaugural thesis, “Dissertatio Medica et Chirurgica de Arteriotomia,” 8vo. He then returned to Derby, where he practised medicine for about ten years, when he came and settled in London. In 1773 he published a treatise on the kink-cough, the name he gives to the tussis convulsiva, or whooping-cough. In the cure he relied principally on the efficacy of the extractum cicutæ, which he considered as a specific in the complaint. Two years after, he gave an account of the puerperal fever, as it appeared in Derbyshire and some of the adjacent counties, 8vo.; and in 1794, a treatise on the disease commonly called angina pectoris. This disease was first described by Dr. Heberden. His account of it is published in the second volume of “Medical Transactions,” by the Royal College of Physicians. Dr. Butler had no doubt of its being a gouty affection, and calls it the diaphragmatic gout, and thinks it generally curable. In the fit he gives opium with aromatics. For the cure he recommends pills with aloes and soap, to keep the body soluble. These with temperance, he says, will usually succeed in putting an end to the complaint. While he was at Edinburgh, where he appears to have resided about seven years, he published “A Method of Cure for the Stone, chiefly by Injections,” 12mo. 1754, and “Dissertatio de Frigore quatenus Morborum Causa,” 8vo. 1757. He died at his house in Lower Grosvenor-street, March 21st, 1805. *European Mag.*

BUTLER’S *ale*. See ALE.

BUTLER’S *bay*, in *Geography*, lies on the north side of an island, in the straits of Magellan; it is small and surrounded with rocks. S. lat. 53° 37′. W. long. 74° 9′.

BUTLER’S *stone*, a medicinal preparation of which the ancient chemists relate wonders. See Boyle’s Works, Abr. vol. i. p. 50.

The inventor, from whom it takes its name, was a Scotchman, in great favour with king James I. and is said to have done wonders with it, not only in the speedy cure of the most dangerous distempers, but in the making of gold out of lead and quicksilver.

The preparation of this stone is given by Morley, *Collect. Chym. Leyd.* cap. 375.

BUTLER’S *town*, in *Geography*, a town of North America, on the west side of the head-waters of the Ohio.

BUTLERAGE, or PRISAGE, in *Political Economy*, a very ancient hereditary duty belonging to the crown, which is considerably older than the customs, being taken notice of in the great roll of the exchequer, 8 Ric. I. still extant. Prilage was a right of taking two tons of wine from every ship (English or foreign) importing into England twenty tons or more; one before and one behind the mast; which

by a charter of Edward I. called "Charta Mercatoria," (31 Edw. I. c. 1 & 2. 27 Edw. III. c. 26,) was exchanged into a duty of 2s. for every ton imported by merchant-strangers, and called *butlerage*, because it was paid to the king's butler. See CUSTOMS.

**BUTMENTS**, in *Architecture*, those supporters or props, on or against which the feet of arches rest.

Butments of arches are the same with buttresses. They answer to what the Romans call *sublices*; the French, *culees* and *butees*.

The word comes from the French *bouter*, to abut or terminate on any thing; or rather from *buter*, to prop.

The name butment is also given to little places taken out of the yard, or the ground plot of a house, for butteries, sculleries, &c.

**BUTMENTS**, or **ABUTMENTS** of a bridge, denote the two massives at the end of a bridge, whereby the two extreme arches are sustained and joined with the shore on either side. The butments of bridges next the banks should be built more firm and solid, as serving to sustain the whole series of arches, and hinder them from spreading. See BRIDGE.

**BUTNERIA**, in *Botany*, Duh. See CALYCANTHUS floridus.

**BUTOA**, in *Ancient Geography*, an island placed by Pliny among those of Crete, between Ophiussa and Arados.

**BUTOMUS**, in *Botany*, (*βουλομος*, from *βου*; ox, and *τεμνω* to cut; a name given by Theophrastus to an aquatic plant, on account of its being greedily cropt by oxen, or as others think, with less probability, because the sharp edges of its stem wound their tongues and lips. Hecyehius defines it, *φυτον βουσι δεδομενον τροφην οιον χορτον*, a plant given to oxen for food like grafs: and Suidas, *φυταριον παραπλησιον καλαμω οπερ εθιωνσι οι βοες*, a plant allied to the reed eaten by oxen. Caspar. Bauline supposes it to be his juncus floridus, the plant before us, to which Linnæus has since given the ancient name; others, the sparganium ramosum of Linnæus; and others, a species of iris.) Linn. gen. 507. Schreb. 693. Willd. 804. Gært. 86. Juss. 46. Vent. vol. 2. 158. Class and order, *enneandria hexagynia*. Nat. ord. *tripetaloidæ*, Linn. *Junci*, Juss. *Alismoidæ*, Vent.

Gen. Ch. *Cal.* involucre simple, three-leaved, short. *Cor.* Petals six, roundish, concave, withering; three outer ones alternate, smaller, more acute. *Stam.* Filaments nine, awl-shaped; anthers bilamellate. *Pist.* germs six, oblong, acuminate, ending in styles; stigmas simple. *Peric.* Capsules six, oblong, gradually attenuated, erect, one-valved, opening on the inner side. *Seeds* numerous, oblong-cylindrical, obtuse at both ends, fixed to the inside of the capsule.

Ess. Ch. *Cal.* none. *Petals* six. *Capsules* six, many-seeded.

Species. *B. umbellatus*. Flowering rush, or water gladiole. Gært. Tab. 19. f. 3. La Marck, Illust. Pl. 324. Curt. Flor. Lond. 1. 29. Eng. Bot. 651. (*Juncus floridus*, Matth. Camer. J. Bauh. C. Bauh. Ray. Park. Rudb. *Gladiolus aquatilis*. Dod. Gerard. Johns.) *Root* perennial, horizontal, tuberous. *Leaves* all radical, linear, triangular, very entire, smooth, flat in the upper part, acute, near three feet long, erect. *Scapus* solitary, simple, round, taller than the leaves. *Umbel* terminal, simple, many-flowered. *Involucre* of three membranaceous, pointed leaflets. *Peduncles* bracteate at the base. *Flowers* variously shaded with rose-colour, purple and white. *Stamens* spreading, equal, placed in a regular circle on the receptacle; filaments white; anthers red. *Germs* keeled, red. *Styles* short; stigmas emarginate. A native of watery ditches and ponds in many parts of Europe, and a favourite of the British botanist, on account of its being the only indigenous plant of its class.

**BUTONES**, in *Ancient Geography*, a people placed by Strabo in Germany, and said to be subdued by Maroboduus.

**BUTONICA**, in *Botany*, Rumph. La Marck, and Bosc. See BARRINGTONIA speciosa.

**BUTONICA**, Rumph. See EUGENIA acutangula, and *racemosa*.

**BUTORIUS**, in *Ornithology*, a name by which some have called the common bittern, ARDEA STELLARIS.

**BUTOW**, in *Geography*, a town of Germany, in the circle of Upper Saxony, and Farther Pomerania, 39 miles N. E. of New Stettin.

**BUTRINTO**, anciently *BUTHROTUM*, a sea port town of Albania, in a gulf to which it gives name, in the canal of Corfu, the see of a Greek bishop, suffragan of Janina. It belongs to the Venetians; 56 miles W. S. W. of Delfino. N. lat. 39° 45'. E. long. 20° 40'.

**BUTRIUM**, or *BUTRIO*, in *Ancient Geography*, a town of Italy, in the country of the Cenomani, according to Ptolemy, and placed by M. d'Anville north of Ravenna.

**BUTSKOPF**, (Marten) in *Zoology*, synonymous with butts-kopper.

**BUTTS-KOPPER**, (Egede). See DELPHINUS ORCA.

**BUTT**, in *Agriculture*, a provincial term applied to such ridges or portions of arable land as run out short at the sides or other parts of fields.

**BUTT**, in our *Ancient Customs*, denotes a place erected for archers to shoot at, and in which a mark or white was fixed.

**BUTT**, in *Commerce*, is used for a vessel, or measure of wine, containing two hogshheads, or 126 gallons.—Otherwise called PIPE.

A butt of currants is from fifteen to twenty-two hundred weight.

**BUTT**, in *Ship-building*, the end of a plank, or strictly speaking, that end of a plank which was nearest the root of the tree. Each end of a plank is securely bolted to a frame or timber, to prevent its rising from the bottom or side of the ship, which, in that case, would be said to have sprung or started a butt. At sea this is very dangerous, and difficult to get secured if the plank is under water. Butt also signifies the ground or largest end of all timbers.

**BUTTS**, or **BACKS**, a denomination given to that sort of tanned leather, which is prepared from the stoutest and heaviest ox hides, and chiefly used for the soles of shoes. For the process of preparing it, see TANNING.

**BUTTA**, in *Ancient Geography, a town of Africa, situated between the two Syrtes, N. of Teger. Ptolemy.*

**BUTTELSTETT**, in *Geography*, a town of Germany, in the circle of Upper Saxony, and principality of Weimar; five miles N. of Weimar.

**BUTTEN**, a town of Arabia, 28 miles E. of Chamir.

**BUTTER**, in *Rural Economy*, a fat unctuous substance prepared from milk by the process of churning. It is a matter naturally distributed through the whole substance of the milk in very small particles, which are interposed betwixt the caseous and serous parts, amongst which it is suspended by a slight adhesion, but without being dissolved. It is in the same state in which oil is, in emulsions: hence the whiteness of both; and hence, by rest, the oily parts separate from both these liquors to the surface, and form a cream. When butter is in the state of cream, its proper oily parts are not yet sufficiently concentrated to form an homogeneous mass. While separated by the interposition of a large quantity of serous particles, the butter cannot be completely formed; but by pressing out these heterogeneous parts by means of continued percussion, by the well known

operation of churning, it then becomes an uniform soft mass.

Messrs. Parmentier and Deyeux, in a memoir on milk, (Mem. qui a remporté le premier prix, &c. Paris, 1791), instituted several experiments to ascertain whether butter really exists in the cream, and is merely separated by agitation, or by the act of churning, or whether this process effectuates a chemical change. They incline to the latter opinion; because they found that the separation of the particles of butter could not be produced in any other manner; cream left in the milk yields fat cheese, but not butter. The oily parts do not rise into butter by exposure of cream to heat, nor by boiling it. The application of acids by separating the cheesy matter blended with the cream, instead of facilitating, retards the fermentation of butter. Half an ounce of oil was mixed with four ounces of cream; this was gently agitated and exposed to moderate heat; part of the oil swam on the surface, without uniting with the buttery particles in the cream; the other part rendered the fermentation of butter more difficult, and its consistence softer. Thus, whether solvents were applied to attach the buttery or cheesy particles of the cream, agitation was still necessary, and the change into butter was rendered more difficult.

Different methods are employed in obtaining and preparing this substance from milk as well as in managing and preserving it for use. See DAIRYING.

BUTTER, *Whey*, an inferior sort of butter made from whey in extensive cheese dairies. It is prepared in different methods in different dairy-districts. See DAIRYING.

BUTTER, *History of*. The word *butter* is formed from *βουτυρον*, a compound of *βους*, *cow*, and *τυρος*, *cheese*; q. d. *cow's-cheese*. Some authors, from a regard to this etymon, affect to write the word *butyr* and *butyr*. This is the etymology adopted by the Grecian and Roman authors. Cheese was known to them at a much earlier period than butter: and it is therefore possible, that, at first, they might have considered the latter as a kind of cheese, since it appears that *τυρος* once signified any kind of coagulated substance. But to the first syllable of the word, it has been objected, that the Greeks used the milk of sheep and goats much earlier than cow's milk; and, for this reason, some have conjectured, that this first syllable was added, agreeably to the custom of the Greeks, in order to magnify the object, or to express a superior kind of cheese. Varro, de Re Rustica, II. 5. p. 274. Vigerus, de præcipuis Græcæ Dictionis Idiotismis, Lugd. Bot. 1684. p. 40. Others have supposed, that the name *βουτυρον* is not originally Greek, but that it might have been introduced into Greece from some foreign country, together with the theory which it expresses. Accordingly, the term has been thought to be of Scythian extraction.

Butter, though commonly used at present in most parts of Europe, was not known, or very imperfectly known to the ancients. The ancient translators of the Hebrew writers, however, seem to have thought, that they found it mentioned in scripture, (Bochart Hierozoicon, II. 45. p. 473.) Accordingly, they have referred to the following passages: Gen. xviii. 8. Deuteron. xxxii. 14. Judges v. 25. 2 Sam. xvii. 29. Job xx. 17. xxix. 6. Prov. xxx. 33. Isaiah vii. 15. 22. But biblical critics agree, that the word *חֵמָה*, *chameah*, signifies milk or cream, or four thick milk; and some of them who doubt or deny the early use of butter among the Eastern nations, will not allow that it denotes butter. See Michael's Suppl. ad. Lexic. Heb. pars. 1. p. 807. The word, it is said, plainly alludes to something that is liquid; and it appears, that *chameah* was used for washing the feet, that it was drank, and that it

had the power of producing intoxication; and it is known, that mare's milk, when four, will produce the like effect. It is further said, that we may conceive of streams of milk, but not streams of butter. The error has been ascribed to the LXX interpreters who have translated the Hebrew term by the word *βουτυρον*, *boutyron*. These translators who lived 200 years after Hippocrates, and who resided in Egypt, might, as Michaelis suggests, have been acquainted with butter, or have heard of it; but it is highly probable, that they meant cream, and not our usual butter. According to the common translation, indeed, it may be concluded, that the passage in Proverbs, ch. xxx, describes the preparation of butter by shaking or beating; but the original words *כֹּחַ מֵיץ חֵלֵב*, *chaleh metz*, signify squeezing or pressing, *frictio mulgentis educit lac*; so that milking and not making is supposed to be alluded to in this passage. It was late before the Greeks appear to have had any notion of butter. Homer, Theocritus, Euripides, and the other poets, make no mention of it: and yet they frequently speak of milk and cheese; nor does Aristotle, who has collected several curious particulars relating to the other two, say any thing of butter. At first, indeed, he gives milk only two component parts, the watery and the caseous; and he remarks afterwards, for the first time, and in a place where it would be little expected, (Hist. Anim. iii. 20. p. 388.) that in milk there is also a fat substance, which, under certain circumstances, is like oil. Herodotus is the most ancient writer, who, in his account of the Scythians, (l. iv. 2.) particularly describes the process used among them for making butter; and this circumstance affords a presumption, that butter was not then in use among the Greeks, and that they must have acquired it from the Scythians. The word *βουτυρον* first occurs in Hippocrates, (De Morbis, l. iv. ed. 1595. fol. 5. p. 67.) who was almost contemporary with Herodotus, as both of them flourished in the 5th century before Christ. "The Scythians," says Hippocrates, "pour the milk of their mares into wooden vessels, and shake it violently; this causes it to foam, and the fat part, which is light, rising to the surface, becomes what is called butter, (*ὁ βουτυρον καλεῖται*.) The heavy and thick part, which is below, being kneaded and perfectly prepared, is, after it has been dried, known by the name of "hippace." The whey or serum remains in the middle."

In this passage the author speaks very distinctly of butter, cheese and whey. Butter is often mentioned by Hippocrates, and he prescribes it externally as a medicine under the appellation *πικερίον*, *pikerion*, which seems to have been in earlier use among the Greeks than the term *βουτυρον*, or butter. In the time of Galen this term *pikerion*, which the Greeks seem to have borrowed from the Phrygians, had ceased to be in use; and it is not to be found in Hesychius, Suidas, or Polix. The poet Anaxandrides, who lived soon after Hippocrates, (see Fab. Bib. Græc. i. 666, 740.) describing the wedding of Iphicrates, who married the daughter of Cotys, king of Thrace, and the Thracian entertainment given on that occasion, says, that the Thracians ate butter, which the Greeks at that time considered as a wonderful kind of food. Athenæi, Deipnos. l. iv. p. 131, and Casaubon. Animadv. in Athen. l. iv. c. 3. p. 248. Strabo, in three passages (viz. l. 3. vol. i. p. 233. l. xv. vol. ii. p. 1031. and l. xvii. vol. ii. p. 1176.) refers to butter. In the former, he says, that the Lusitanians used butter instead of oil; and in the last he mentions the same circumstance respecting the Æthiopians, who, as Ludolfus informs us, (Hist. Æthiop. l. iv. 4. 13.) were acquainted with butter; and in the third Strabo relates, that elephants, when wounded, drank this liquid in order to make the darts fall from their bodies. The genuineness.

ness of this latter passage is doubted, as Aristotle, Pliny, and Ælian say that these animals used oil for this purpose. Ælian, indeed, (lib. xiii. c. 7.) says, that the Indians anointed the wounds of their elephants with butter. Plutarch, (*Adversus Colotem*, apud Op. t. ii. p. 1109. ed. Xyland.) informs us, that a Spartan lady paid a visit to Berenice, the wife of Deiotarus, and that the one smelled so much of ointment, and the other of butter, that neither of them could endure the other. Dioscorides, about the year 33 B. C. (*Mat. Med.* ii. 81. p. 107.), says, that good butter was prepared from the fattest milk, such as that of sheep or goats, by shaking it in a vessel till the fat was separated; and he ascribes the same effects to it, when applied externally, as those produced by our butter at present. Dioscorides is the first writer who observes, that fresh butter might be melted and poured over pulse and vegetables instead of oil, and that it might be employed in pastry in lieu of other fat substances. From him also we learn, that a kind of foot was prepared from butter, for external applications, and that it was used in curing inflammation of the eyes and other disorders. For this purpose the butter was put into a lamp, and, when consumed, the lamp was again filled, till the desired quantity of foot was collected in a vessel placed over it. Galen, who distinguishes and confirms in a more accurate manner the healing virtues of butter, observes, that cow's milk produces the fattest butter; that butter made from sheep's or goats' milk is less rich; and that asses' milk yields the poorest butter. He expresses his astonishment that Dioscorides should say, that butter was made from the milk of sheep and goats; he assures us, that he had seen it made from cow's milk, and that he believes it had thence acquired its name. *De Simplic. Med. Facult. l. x. p. 151. ed. Basil. ii. p. 134.* "Butter," says he elsewhere (*De Aliment. Facult. iii. cap. 15. p. 54. ed. Basil. iv. p. 340.*) may be very properly employed for ointments; and when leather is besmeared with it, the same purpose is answered as when it is rubbed over with oil. In cold countries, which do not produce oil, butter is used in the baths; and that it is a real fat may be readily perceived by its catching fire when poured over burning coals. From the circumstances above recited we may infer, that butter must have been very little known to, or used by, the Greeks and the Romans in the time of Galen, who wrote at Rome and lived at the end of the second century of the Christian era.

The Roman writers, who give an account of the ancient Germans, relate, that they lived principally on milk. Some say, that they used cheese, whilst others affirm that they were unacquainted with the method of preparing it. Strabo, (lib. iv. vol. i. p. 305), speaking of the ancient Britons, says, that some of them were so ignorant, that though they had abundance of milk, they did not understand the art of making a cheese; but by his mode of expression he intimates, that they were not all equally unacquainted with this art. Pliny, on the other hand, says, (*N. H. lib. xxviii. c. 9. § 35.*) that the barbarous nations not only made cheese, but butter, which they used as a most pleasant kind of food, and that it distinguished the rich from the poor; and to them he ascribes the invention of it. By "barbarous nations," this author most commonly means the Germans and Britons, because they were not thoroughly subjected to the Roman government, nor instructed in the Roman arts. He observes, that butter was commonly made from the cow, the fattest from the sheep, and that it was also made from goats' milk; that in cold weather the milk was warmed, but that in summer this precaution was not necessary. The vessel employed for making it seems, from his description, to have resembled

such as are now used; he says it was covered, and that in the lid there were holes. Whether Tacitus by "*lac coarctatum*," (*De Moribus Germanorum*, cap. 23.), which, according to him, was the most common food of the Germans, meant cheese or butter, is not easily determined.

From what has been above said it appears, that butter is not a Grecian, much less a Roman, invention; but that the Greeks were made acquainted with it by the Scythians, the Thracians, and the Phrygians, and the Romans by the people of Germany. It appears also, that when they had learned the art of making it, they employed it only as an ointment in their baths, and particularly in medicine. Columella, (l. vi. 12. p. 582.) and not Pliny, is, as Vossius thinks, the first Latin writer, who makes use of the word "*butyrum*." Pliny (l. xxviii. c. 19.) recommends it mixed with honey to be rubbed on children's gums, in order to ease the pain of teething, and also for ulcers in the mouth. The Romans, in general, seem to have used butter for anointing the bodies of their children to render them pliable; and we are told by Sidonius Apollinaris (*car. 12.*) that the ancient Burgundians besmeared their hair with it. Clemens Alexandrinus (*Pædag. i. p. 107.*), informs us, that the ancient Christians of Egypt burnt butter in the lamps at their altars instead of oil; and the Abyssinians have retained a somewhat similar practice. It is certain, from the above detail, that butter was used neither by the Greeks nor Romans in cookery, or the preparation of food. It is never mentioned by Galen and others, as a food, though they have spoken of it as applicable to other purposes. No notice is taken of it by Apicius; nor is any thing said of it in that respect by the authors who treat on agriculture, though they have given particular information concerning milk, cheese, and oil. Indeed, the ancients had usually accustomed themselves to the use of good oil; and butter in later times has been very little employed in Italy, Spain, Portugal, and the southern parts of France, where it has been sold in the shops of apothecaries for medicinal purposes. In warm countries it has been found difficult to preserve it for any length of time. In the Roman churches it was anciently allowed, during Christmas time, to use butter instead of oil, on account of the great consumption of it in other ways. Accordingly, in the cathedral of Rouen, there is a tower called the "butter-tower," *tour du beurre*, because George d'Amboise, archbishop of Rouen, in 1500, finding the oil fail in his diocese during Lent, permitted the use of butter, on condition that each inhabitant should pay six deniers for the liberty, with which sum this tower was erected. There are other butter-towers at Notre Dame, Bourges, &c.

From the account of the method of making butter transmitted to us by the ancients, we have reason to suppose, that they were not acquainted with the art of making it so compact and firm as that of more modern times; but it seems to have been in an oily, or almost liquid state. Butter is spoken of as somewhat fluid. The moderns cut, knead, and spread butter; but the ancients poured it out like oil; and it is represented by the Greek translators of the scripture as flowing in streams. On this account the butter of the ancients would not be long kept or easily transported; and the use of it must have been very limited. See Beckmann's *Hist. of Inventions*, vol. ii.

In different ages and nations various processes have been used for making butter. In Barbary, the effect of the operation, which we call "churning," is produced by putting the cream into a goat's skin turned inside out, which the Arabs suspend in their tents, and then press to and fro in one uniform direction. In this way they quickly occasion

the necessary separation of the unctuous and wheyey parts. Shaw's Travels, p. 168. Dr. Chandler (Travels in Greece, p. 217.) took notice in his way from Athens to Corinth of another mode of churning practised in the Levant; which was that of treading on skins of cream in order to separate the butter from its more watery part: and this practice, as some have supposed, throws light on a passage of Job (ch. xxix. 6.), that has hitherto been somewhat obscure. Harmer's Observations, vol. iii. p. 172.

In Bengal, butter is easily made by the slight turning of a stick in milk; and when they would make butter pass for fresh when it is old and rank, they melt it and pour upon it four curdly milk; some hours after which they strain it through a cloth for sale. For an account of other processes, relating to the making, curing, and preserving of butter; see DAIRYING.

**BUTTER**, in *Commerce*. The trade of butter is very considerable. The butter made in the county of Essex, and well known under the name of Epping butter, is that which is most highly esteemed in London and its vicinity. This appellation, in the more restricted use of it, is applied to that butter which is made from the milk of cows that feed during the summer months in Epping-forest, where the leaves and shrubby plants contribute to improve its flavour. For the method of making this butter, see DAIRYING. It is made up for market in long rolls, weighing a pound each; and in the county of Somerset the same kind of butter is dished in half-pounds for sale, rubbing salt round the inside of the dish, so as to make it in the working appear handsome. In many parts of the kingdom they colour their butter in winter; but by such means they do not enhance its goodness. It rarely happens that the farmers in or near Epping use any colour, and if they do, it is very innocent. They procure some found carrots, the juice of which they press through a sieve, and mix with the cream when it enters the churn, which makes it appear like May butter: nor do they at any time use much salt, though a little is absolutely necessary. The Cambridgeshire salt butter is held in the highest esteem, and is made nearly after the same method as that of Epping; and, by washing and working the salt from it, the cheesemongers in London often sell it, at a high price, for fresh butter. It is deposited, when made, in wooden tubs or firkins, each containing 56 pounds, which are exposed to the air for two or three weeks, and often washed; but the most ready method of seasoning them is by the use of unslaked lime, or a large quantity of salt and water well boiled, with which they should be scrubbed several times, and afterwards thrown into cold water, where they should remain three or four days, till they are wanted. They should then be scrubbed as before, and well rinsed with cold water; but before they receive the butter, care must be taken to rub every part of the inside of the firkin with salt. Then, if the butter be properly made and perfectly sweet, it may be gently pressed into the firkin; but it must be well salted when it is made up, and the salt should be equally distributed through the whole mass, and a good handful of it be spread on the top of the firkin; after which the head should be immediately put on. They pursue nearly the same method in Suffolk and in Yorkshire; nor is the butter made in those countries much inferior to that made in Cambridgeshire; indeed, it is often sold in London for Cambridge butter. Uttoxeter in Staffordshire has been long a market famous for good butter, with which the London cheesemongers are supplied. It is bought by the pot, of a long, cylindrical form, weighing 14 pounds. The mountains of Wales, the highlands of Scotland, and the moors,

commons, and heaths of England, produce excellent butter, under proper management; and though not equal in quantity, it is far superior in quality to that which is produced from the richest meadows.

Butter, in its natural state, contains a considerable proportion of mucilaginous matter which is more putrescible than the pure oily parts. When it is proposed, therefore, to expose the butter to the heat of warm climates, it ought to be freed from that mucilage, before it be covered and packed for keeping. In order to prepare butter for a distant voyage in warm climates, it should be put into a vessel of a proper shape, which should be immersed into another containing water. Let the water be gradually heated, till the butter be thoroughly melted; in that state let it continue for some time, and be allowed to settle; the mucilaginous part will fall entirely to the bottom, and the pure oil will swim at top, perfectly transparent, while hot; but when it cools, it becomes opaque, assumes a colour somewhat paler than the original butter, before it was melted, and a firmer consistence, more nearly resembling that of tallow; and consequently it will better resist the heat of a warm climate than common butter. When this refined butter is become a little stiff, and while it is still somewhat soft, the pure part should be separated from the dregs, then salted, and packed up in the same way with other butter; this will retain the salt better, and keep much longer sweet, in hot climates, than if it had been cured in its original state. This refined butter may be preserved by adding to it, after it has been purified, a certain proportion of fine honey; mixing them well, so that they may thoroughly incorporate. This mixture has a pleasant taste, and spread on bread, is useful for coughs and colds. It will keep for years, without manifesting the smallest tendency to rancidity; and of course, butter might be thus preserved in long voyages, without spoiling. Dr. Anderson suggests, that one ounce of honey might be sufficient to preserve 16 ounces of butter.

By 36 Geo. III. c. 86. the 13 & 14 C. II. c. 26. and so much of 4 W. c. 7. as discharges persons from the effect of any part of 13 & 14 C. II. for preventing frauds in the sellers of butter, after the factor or buyer hath contracted for the same, are repealed; and new regulations are made respecting the packing, weight and sale of butter, which are as follows:—every cooper or other person, who shall make any vessel for the packing of butter, shall make the same of good and well-seasoned timber, light and not leaky, and shall groove in the heads and bottoms thereof: and every such vessel shall be a tub, firkin, or half-firkin, and no other, capable of containing the several quantities of butter herein-after mentioned; viz. every tub shall weigh of itself, including the top and bottom, not less than 11 lb. nor more than 15 lb. avoirdupois weight, and neither such top nor bottom shall be more than  $\frac{5}{8}$ ths of an inch thick in any part thereof, and shall be capable of containing 84 lb. of butter, and not less; every firkin shall weigh of itself, including the top and bottom, not less than 7 lb. nor more than 11 lb. and neither the top nor bottom shall be more than  $\frac{4}{8}$ ths of an inch thick in any part, and shall be capable of containing not less than 56 lb. of butter: and every half-firkin shall weigh of itself, including the top and bottom, not less than 4 lb. nor more than 6 lb. and neither the top nor bottom shall be more than  $\frac{3}{8}$ ths of an inch thick in any part, and shall be capable of containing not less than 28 lb. of butter, on pain of forfeiting by the cooper or other person making the same, 10s. for every such vessel. The maker shall brand on the outside of the bottom with an iron, his name at full length in permanent and legible letters, together with the exact weight or tare thereof, on the

like penalty. And by 38 Geo. III. c. 73. every maker shall mark in like manner his place of abode, or dwelling, after his name, on the same penalty. By 36 Geo. III. c. 85. every dairy-man, or seller of butter, or person packing butter for sale, shall pack it in such vessels, properly soaked and seasoned, branding his name after such seasoning on the bottom within, and on the top without; and also on the outside of the top, and on the bounge or body thereof, the true weight or tare of such empty vessel so seasoned, and his name on the body, across two different staves; and he shall distinctly and at full length, imprint his name upon the top of the butter in such vessel when filled; on pain of forfeiting 5 l. for every such offence: the quantities to be packed, shall be, exclusively of the tare of the vessel, in every tub not less than 84 lb.; firkin 56 lb. and half firkin 28 lb. of good and merchantable butter; and no butter which is old or corrupt, shall be mixed or packed up into any such vessel, with that which is new churned; nor shall any whey butter be packed or mixed with that which is made of cream; and no butter shall be salted with great salt, but with fine small salt, and not intermixed with more than is needful for its preservation, on pain of forfeiting 5 l. Any fraud with regard to the vessel or butter, marks or staves, &c. shall render the person concerned in it liable to a forfeiture of 30 l. for every such offence. Factors buying or selling butter in vessels not legally marked according to the acts, shall forfeit 20 s. for every such offence: and cheesemongers and other dealers in butter, having in their possession any vessel containing butter for sale, not externally marked, shall forfeit 10 s. for every such offence: and they are required to deliver the full quantity, or be liable to an action for recovery of satisfaction with coils: nor shall they repack butter for sale, on pain of forfeiting 5 l. for every tub, firkin, or half firkin so repacked. Foreign butter, however, may be repacked in such vessels, the name of the original seller being erased, and the name of the person selling being marked with an iron brand, in words at length, together with the words, "foreign butter," upon the body of every such vessel: counterfeiting, or forging marks subjects to a penalty of 40 l. All penalties above 5 l. are to be recovered in the courts at Westminster; and those not exceeding 5 l. may be determined by one justice, and levied by distress and sale of the offender's goods, for the use of the informer; or for want of sufficient distress, the offender may be committed to the gaol or house of correction, without bail, for a time not exceeding 3 calendar months, nor less than 28 days. Every information or prosecution must be commenced, within four months after the offence committed.

The statute 4 W. c. 7. regulates the shipping of butter and cheese for London; the person shipping shall receive for his pains 2 s. 6 d. for every load; and if he shall make default, he shall forfeit on conviction before one justice; for every firkin of butter 10 s. and for every weigh of cheese 5 s. half to the poor, and half to the informer, to be levied by the constable by distress and sale. He shall keep a book of entry, for receiving and shipping the goods, under the penalty of 2 s. 6 d. for every firkin of butter, &c. The master of a ship refusing to take in butter or cheese, before he is full laden, shall forfeit for every firkin of butter 5 s. and for every weigh of cheese 2 s. 6 d. This act does not extend to any warehouse in Cheshire or Lancashire. In the act of 8 Geo. c. 27. there are special directions concerning the sale of butter in the city of York; and in 17 Geo. II. c. 8. concerning the same in New Malton.

BUTTER, in its reference to *diet* and *medicine*, may be regarded as resembling in its sensible qualities, and in consequence of a chemical analysis, the expressed and unctuous

oils of vegetables, and animal fats. Butter, by distillation in the water bath, gives out a portion of watery fluid, that either remained interposed between its parts from the first, or was taken up during the washing which it undergoes in the process of making. A stronger heat, carefully managed, expels first a strong acid of a penetrating smell, which is followed by a concrete coloured oil, possessing the same odour. Very little coal remains: the acid appears to be of the same nature as that distinguished by the name of the acid of fat; and it may be also obtained from butter by means of lime or an alkali. See FAT and OIL. Butter, like the other mild and fat oils, is liable to a change called "Rancidity;" and it becomes rancid sooner than most other fat oils, probably on account of the water, which may favour the development of its acid. Washing with water, or ardent spirit, restores it in some measure to its former state, by carrying off the disengaged parts of the acid. Butter, not well freed from the milk, more readily becomes rancid, than that which is more entirely separated from it; and butter by being melted, and freed from a deposit which it makes, on being kept for some time in a melted state, may thus be longer preserved from rancidity. By the application of salt, the rancidity of butter is obviated; and the more perfect the salt is, the greater is its efficacy, and a less quantity will suffice: and if at the same time we assist its antizymic power, by the addition of a small quantity of nitre, sugar, and honey, we may then preserve butter very long in a condition fit to be used as an aliment. The rancidity of butter, according to the experiments of Parmentier and Deyeux, (Memoire qui a remporté le premier prix, &c. 1790.) is found to proceed entirely from the coagulable, or cheesy matter which is mixed with it. The quantity of this mixture is increased by the economical method of warming the milk, in order to increase the quantity of cream, and by letting the cream remain for too long a time before it is churned. Thus the cream that rises without the aid of warmth, and that is formed into butter, while perfectly fresh, will yield the most delicate kind, and may be preserved for the longest time. Whether the oily part of milk is most safely employed in the state of cream, when it is joined with some portion of the caseous and serous parts, or when it is more entirely separated from these in the state of butter, is a question that has not been absolutely determined. Dr. Cullen (Mat. Med. Vol. i. p. 349.) expresses his opinion, that a quantity of oil in the state of cream will be more easily digested than an equal quantity of the oily part in the state of butter. Some difference, however, in this matter may arise from the difference of stomachs, more or less disposed to digest oils; and persons have been known, who could digest cream better than butter. Another difference may also arise from the stomach being more or less disposed to acidity; and in the more acceftent stomach, cream may be more offensive than butter. Butter, as a wholesome aliment, should be fresh and free from rancidity, and not fried or burnt; otherwise it will disorder digestion, and be injurious. As to its medical effect, butter, as well as the other olea blanda, or mild oils, is considered as a laxative. To this purpose Dr. Cullen observes, that a person, being advised to take as a medicine, every morning, four ounces of fresh butter, found its constant effect to be that of producing a stool or two more than usual. By some it has been supposed, that it has a tendency to stop in the capillaries and glands, and to foul the viscera; whence proceed blotches and cutaneous diseases.

BUTTER, *clarified*, is newly churned butter, without salt, melted over a clear fire, and having the curdly part skimmed off. Two spoonfuls of the clarified remainder have been recommended

course is to be given twice or thrice a day, as a sort of tonic to amend the bloody flux, and relaxions of the eyes and breath.

**BUTTER-MILK.** *Butyrum Majol.* is a medicine in some repute among good women, for strains, aches, and wounds. It is made of butter churned at that time, and exposed to the sun of the whole month, till, by repeated faisons, it be brought to a whiteness. Helmont calls it *unguentum of grafi.* Quincy affirms it is no better than plain lard.

Naturalists speak of showers and dews of butter. See *MILK.*

**BUTTER-MILK,** in *Rural Economy*, the milk which is left after the butter has been separated by means of churning or other processes.

In some districts this sort of milk is either sold to the poor, or made use of by the farmer's servants. But in large dairies it is most frequently employed as a food for hogs, and in moistening the bran which is given to the poultry in the farm-yard. See *DAIRYING.*

Butter-milk is commonly procured from milk after it has been kept some time, and has become more or less acid; but it may be procured from any recent milk, and in this case, it is not acid, and only differs from entire milk by the absence of its oily parts. In this state it is still tolerably nourishing; and being often more easily digested than entire milk, it has been employed in phthical cases with greater advantage than either the entire milk, or the watery parts of it in a more acid state. It is, however, in this last state, that it is most commonly employed; and it is highly useful in all cases where the refrigerant powers of milk are required. As the longer it has been kept it seems to have its acidity increased, so it proves more powerfully refrigerant. Some have imagined, that in certain cases it might be dangerous, but unless when drank in very large quantity, or when the body is very warm, Dr. Cullen says, that he has not perceived its bad effects; and in the last case, it is probable that cold water would have been equally injurious. With respect to the acid of butter milk, or other acid states of the watery part of milk, it is worth observing, that such acid does not increase the accefcency of the stomach, or occasion the flatulency that recent vegetable acids and accefcents commonly do; and therefore it is more safely than these employed by dyspeptic persons. Cullen, *Mat. Med.* vol. i. p. 353.

**BUTTER-BUMP,** or *littern*, in *Ornithology.* See *ARDEA fellaris.*

**BUTTER-BUR,** in *Botany.* See *TUSSILAGO petasites* and *hybrida.*

**BUTTER-CUP.** See *RANUNCULUS acris.*

**BUTTER-JAGS.** See *MEDICAGO falcata.*

**BUTTER-NUT,** a fruit in New England, whose kernel yields a great quantity of sweet oil.

**BUTTER-WORT.** See *PINGUICULA.*

**BUTTER,** *Butyrum*, is also used to express several chemical substances—as *butter* of ANTIMONY, of ARSENIC, of BEN, of BISMUTH, of CACAO, of FLAX, of SATURN, of TIN, of WAX, &c. on account of their form of consistence resembling that of butter.

**BUTTER of stone,** a kind of mineral drug found on the highest mountains, and hardest rocks of Siberia, being drawn by the sun's heat, in the way of transudation, from the dry substance of the stones themselves, and adhering to the surface thereof like a sort of calx, which having received its full coction, is scraped off by the inhabitants under the name of *kamine mast.* The Russians ascribe many virtues to it. It is much used for the dysentery and venereal diseases; but its

operation is so violent, however corrected by other ingredients, that none but the Russians dare use it.

**BUTTER,** *vegetable.* See *SHEA-trees.*

**BUTTERANT,** in *Geography*, a village of the county of Cork, in Ireland, remarkable for the ruins of several ecclesiastical buildings. It was formerly a corporate town, governed by a mayor and aldermen, but it is now gone to decay. The ruins, which are situated on a precipice above the river Owbeg, have a very picturesque appearance. The poet Spencer lived in this neighbourhood. Distance S.W. from Dublin 130½ miles, and 21 miles N. by W. from Cork.

**BUTTERFELDE,** a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg; 5 miles N. of Barwalde.

**BUTTERFIELD,** a settlement of America, in Cumberland county, and district of Maine, containing 189 inhabitants, and lying about 43 miles N. from Falmouth, on Casco bay; having Butterfield-ship on the north, and Bucktown on the south.

**BUTTERFISH,** in *Ichthyology*, a small species of the *BLENNIUS* genus, called specifically by naturalists *gunnellus*, and the *spotted blenny*: it is distinguished by the name of *butterfish* by the inhabitants on several of the English coasts. *Donov. Brit. Fishes.* See *BLENNIUS GUNNELLUS.*

**BUTTERFLY,** in *Entomology.* See *PAPILIO.*

**BUTTER-FLY,** *satyrion*, in *Botany.* See *ORCHIS.*

**BUTTERFLY fish,** in *Ichthyology*, an English name of the ocellated blenny, *BleNNIUS ocellaris*, a fish found in the Mediterranean sea; and which is distinguished by having a large black ocellar spot in the anterior part of the dorsal fin, whence this fish is supposed to bear a fanciful resemblance to the wing of a butterfly.

**BUTTERHILL,** in *Geography*, a high round hill of America, on the west bank of Hudson river, at the northern entrance of the High-lands.

**BUTTERIS,** in *Ferriery.* See *BUTTRESS.*

**BUTTERMERE,** in *Geography*, a village of Cumberland, in England, is seated in a part of the country which has been frequently admired and described by topographers and tourists. The majestic mountains, and transparent lakes of this district, present those wild but delightful features of landscape, which cannot fail to awaken sensations of pleasure and delight. The village has nothing peculiar to excite notice, but the water or lake, which gives name to the place, is particularly beautiful. It occupies an area of about one mile and a half in length, by half a mile in breadth. Its western shore is hemmed in by a range of rugged mountains, rising abruptly from the margin of the water. These assume a dark and heavy aspect, and are known to the shepherds, who are almost the only persons that trace their craggy steep, by the names of Hay-cock, High-crag, High-stile, and Red-pike. The eastern shores rise more gently, are partially wooded, and admit of cultivation at a short distance from the lake; the north end is skirted by the verdant vale of Buttermere, and the southern extremity is bounded by Ho-nister-crag, which forms an abrupt termination to a chain of mountains. From this steep, numerous torrents are continually pouring down their foaming waters into the lake: one of these cataraets falls between four and five hundred yards. The river which furnishes the principal supply of water to the lake, flows through Gatesgarth-dale, which is described by Mr. Gilpin as a most singular and tremendous scene. It winds slowly and solemnly in one large segment; being a narrow concave valley, the sides of which are almost perpendicular, and composed of a broken craggy rock. The river which runs through this valley, is as wild as the valley itself,

itself. It has no banks, but the fragments of rocks, no bed but a channel composed of rock strata, among which the water forces its course. The middle of the valley is adorned, as these valleys in some parts are, by a craggy hill; on the top of which stands the fragment of a rock, that looks, in Ossian's language, like the *stone of power*, the rude deity of desolation, to which the scene is sacred. Gilpin's Tour to the Lakes, &c.

**BUTTERY.**—Officers in the king's buttery are a gentleman, yeoman, and three grooms of the buttery. The buttery among us is usually placed near the cellar; being commonly the room next the top of the cellar stairs.

**BÜTTNARD**, in *Geography*, a town of Germany, in the circle of Franconia, and bishopric of Würzburg.

**BUTTING**, *imbotare*, in *Middle Age Writers*, is used for tunning of wine, or putting it into butts.

**BUTTING-pillar.** See **PILLAR**.

**BUTTLINGEN**, in *Geography*, a town of Germany, in the circle of Lower Saxony, and duchy of Lunenburg Zell.

**BÜTTNERA**, or **BYTTNERA**, in *Botany*, (in honour of D. S. A. Büttner, professor of botany at Gottingen,) Linn. gen. 268. Schreb. 366. La Marck, Illust. 383. Willd. 417. Juss. 217. Vent. vol. iii. 198. Class and order, *pentandria monogynia*. Nat. Ord. *Malvaceæ* Juss.

Gen. Ch. *Cal.* one-leaved, five-cleft, deciduous; segments ovate-lanceolate, acute, widely spreading. *Cor.* petals five, oblong, arched inwards, a little connivent, dilated and three-lobed at their summit; the middle lobe extended into a long filiform kind of awn, reflected outwards. *Nectary* surrounding the germ, pitcher-shaped, five-toothed. *Stam.* filaments five, awl-shaped, inserted between the teeth of the nectary, short, stretched outwards, covered by the arches of the petals: anthers ovate, twinned. *Pist.* germ superior, globular, five-furrowed: style awl-shaped, short; stigma obtuse, pentagonal. *Peric.* capsule globular, muciculate, five-grained; grains two-valved, opening at the inner side. *Seeds* solitary, ovate.

Ess. Ch. *Cal.* five-cleft; petals five, arched, three-lobed at their summit, the middle lobe prolonged into a filiform kind of awn. *Capsule* five-grained, muciculate.

Sp. B. *scabra* Linn. spec. "Leaves lanceolate, rib and petioles prickly." (Loef. it. 313. Aubl. Guian. 1, 241, t. 96.) *Root* perennial. *Stem* shrubby at bottom; branches alternate, long, angular, armed with short, reflexed, cartilaginous prickles. *Leaves* linear-lanceolate, alternate, toothed; midrib armed with recurved prickles; lower ones petioled, upper sessile: stipules two, deciduous. *Flowers* axillary, single, on short peduncles. Found by Aublet in Guiana, between Cayenne and Couron. 2. B. *carthagenensis*, Linn. Mant. "Leaves ovate; rib and petioles prickly." (B. aculeata Jacq. Americ. 76. pi. 41.) *Root* perennial. *Stem* with branches spreading on every side in the manner of the common bramble, rather woody, five-cornered; the furrows and angles obtuse, armed with crooked reflexed prickles, tender branches, round, prickly, alternate. *Leaves* smooth, quite entire, or with only one or two serratures, alternate, deciduous; those on the old branches ovate, acute, four inches long or more, on the younger lanceolate-acuminate, less. *Racemes* short, aggregate, and axillary on the younger branches. *Flowers* without smell, small, white, very numerous. A native of Carthage and St. Domingo. Obs. La Marck and Willdenow unite the two preceding; but in concurrence with professor Martyn, we have not ventured to oppose the authority of Jacquin, who affirms that his aculeata and Aublet's plant are not the same species. 3. B. *ovata*. La Marck. "Leaves ovate, serrated;

petioles unarmed: branches five-angled, prickly: stem erect." (La Marck Illust. Pl. 140. Cavan. Diss. 5. t. 140. f. 1.) *Root* perennial. *Stem* four or five feet high, without prickles; branches all ascending, rather slender, green, smooth, supple, prickly at the angles. *Leaves* about an inch long. *Flowers* axillary, in a small corymbus or umbel, from three to six together, on short peduncles. *Calyx* with five acute, expanded divisions. *Petals* trifid at their summit; the middle segment a very long purple or violet thread. Found in Peru by Joseph de Jussieu, who sent seeds to the Royal garden at Paris. Described from the living plant by La Marck. 4. B. *cordata*. La Marck (Büttnera aculeata Dombey Herb. Peruv.) "Leaves cordate, acuminate, serrated, pubescent beneath; petioles without prickles. *Stem* prickly." A Sarmentose shrub about eight feet high. *Stem* five-angled; prickles on the angles incurved. *Leaves* three inches broad. *Flowers* whitish, in small, peduncled, axillary umbels. *Capsules* round, slightly hispid. Found by Dombey in the neighbourhood of Lima in Peru. 5. B. *tereticaulis*. La Marck. "Leaves ovate-lanceolate, acuminate, very entire: branches prickly, round." La Marck Ill. Pl. 140. f. 2. *Branches* a little pubescent. *Leaves* petioled, two inches long, about half an inch broad. *Capsules* small, round, more hispid than the preceding. Native of Peru, gathered by Joseph de Jussieu. 6. B. *microphylla*. Linn. Mant. "Branches zigzag, even; leaves ovate, obtuse, on short peduncles." La Marck. A shrub. *Stem* four or five feet high, much branched at its summit; prickles solitary, stipular, horizontal: branches green, smooth, supple, obtusely angular. *Leaves* sometimes emarginate, entire, smooth, about half an inch long. *Flowers* small, whitish green, peduncled, axillary, from three to five together. *Calyx* one-leaved, with five spreading divisions. *Petals* trifid; segments linear, the lateral ones the shortest. *Capsule* thorny all over. La Marck. A native of America, cultivated in the Imperial garden at Vienna. 7. B. *herbacea*. Willd. "Leaves heart-shaped, toothed, without glands; stem herbaceous, without prickles." Willd. Roxb. Corom. 1. tab. 29. A native of the East Indies, on the summits of mountains. 8. B. *catalpifolia*. Willd. "Leaves heart-shaped, very entire; stem climbing, without prickles." Jacq. Hort. Sch. t. 46. A native of Caracas in South America.

**BUTTOCK**, in *Ship Building*, that part of the after body of a ship, bounded by the counter and quarters, and having the stern post in the middle. The buttock is the support of the after part of the ship; it ought not, however, to be too full, because then the ship would be difficult to steer: nor too lean, as, in a rough sea, the after part will fall down too much.

**BUTTOCKS** of a horse, in the *Manege*, are situated below the crupper and the origin of the tail, and extend to the place where the hind-leg joins the body.

**BUTTON**, in its most ordinary acceptation, signifies a well known appendage to garments for conveniently fastening them together.

Trifling as this article may appear to some of our readers to be in itself, there is certainly no manufacture which includes such an infinite variety of operations as that of the button-maker. The number of substances of which they are made is almost inconceivable, and each requires a distinct set of manipulations. Amongst them are gold, silver, plated copper, white metal, pinchbeck, steel, japanned tin, glass, foil stones, mother of pearl, ivory, bone, horn, tortoise-shell, jet, cannel-coal, paper, leather, and a thousand others; exclusive of those buttons which consist of a mould of wood or bone covered with silk or mohair, and the manufacture of which belongs to a different class of artisans. It would

very far exceed the limits of a work like the present if we were to enter into all the details of so multifarious a business as this: we shall therefore only trace a few outlines of the processes most ordinarily in use.

*Of the manufacture of metal buttons.* These are originally formed in two different ways; the blanks are either pierced out of a large sheet of metal with a punch driven by a fly-press, or cast in a pair of flasks of moderate size, containing 10 or 12 dozen each. In this latter case, the blanks are previously fixed in the sand, exactly in the centre of the impression formed by each pattern, so as to have their extremities immersed in the melted metal when poured into the flask, by which means they are consequently firmly fixed in the button when cooled. See *FOUNDERS*. The former process is generally used for yellow buttons, and the latter for those of white metal.

We shall first give an instance of the former mode of procedure as used in the manufacture of gilt buttons. The *gilding metal* is an alloy of copper and zinc, containing a smaller proportion of the latter than ordinary brass, and is made either by fusing together the copper and zinc, or by fusing brass with the requisite additional proportion of copper. This metal is first rolled into sheets of the intended thickness of the button, and the blanks are then pierced out as before mentioned. The blanks thus formed, are, when intended for plain buttons, usually planished by a single stroke of a plain die driven by the same engine, the fly-press: when for ornamented buttons, the figure is frequently also struck in like manner by an appropriate die, though there are others which are ornamented by hand. The shanks, which are made with wonderful facility and expedition by means of a very curious engine, are then temporarily attached to the bottom of each button by a wire clamp like a pair of sugar-tongs, and a small quantity of folder and resin applied to each. They are in this state exposed to heat on an iron plate containing about a grofs, till the folder runs, and the shank becomes fixed to the button, after which, they are put singly in a lathe, and their edges turned off smoothly.

The surface of the metal, which has become in a small degree oxidated by the action of the heat in foldering, is next to be cleaned, which, in this, as in a great variety of other instances in the manufacture of metallic articles, is effected by the process of *dipping* or *pickling*; that is, some dozens of them are put into an earthen vessel pierced full of holes like a colander; the whole dipped into a vessel of diluted nitric acid; suffered to drain for a few seconds; again dipped successively into four or five other vessels of pure water, and then dried.

The next operation is the *rough burnishing*, which is performed by fixing the buttons in the lathe, and applying a burnisher of hard black stone from Derbyshire: the minute pores occasioned by the successive action of the heat and the acid are thus closed, and the subsequent process of gilding considerably improved, both with regard to economy and perfection.

The first step towards the gilding of all the alloys of copper consists in covering the surface uniformly with a thin stratum of mercury, by which means the amalgam, which is afterwards applied, attaches itself to it much more readily than it would otherwise do. This part of the process is called *quicking*, and is effected by stirring the buttons about with a brush in a vessel containing a quantity of nitric acid supersaturated with mercury; which latter is, of course, by the superior elective attraction of the copper for the acid, precipitated in its metallic state on the buttons, whose surfaces become uniformly and brilliantly covered with it. The mercury which hangs in loose drops on the buttons is then

shaken off by jerking the whole violently in a kind of earthen colander made for the purpose; and they are then ready for receiving the amalgam.

The amalgam is made by heating a quantity of grain gold with mercury in an iron ladle, by which means the former is soon dissolved, and the whole is then poured into a vessel of cold water. The superabundant mercury is strongly pressed out through a piece of chamois leather, and the remaining amalgam, which is of about the consistence of butter, is then fit for application.

This is performed by stirring the buttons, whose surfaces are already thinly covered, or wetted with mercury, in an earthen vessel with the requisite proportion of amalgam and a small quantity of diluted nitric acid, by which means the amalgam also attaches itself to their surfaces with a considerable degree of equality. The necessary quantity of gold is about five grains to a grofs of buttons of an inch in diameter.

The next process is the volatilisation of the mercury by heat, which is usually called by the workmen *drying off*. This is performed by first heating the buttons in an iron pan, somewhat like a large frying pan, till the amalgam with which they are covered becomes fluid, and seems disposed to run into drops, on which they are thrown into a large felt cap, called a *gilding cap*, made of coarse wool and goat's hair, and stirred about with a brush to equalize the covering of the surface by the gold. After this, they are again heated, again thrown into the gilding cap and stirred, and these operations successively repeated till the whole of the mercury is volatilised. This part of the process, as will readily be conceived, is extremely unwholesome, and has the most terrible effects on the constitution of the workmen, so that it would be no small desideratum, (and it does not seem to be difficult), conveniently to effect this agitation and friction of the heated buttons in a covered vessel; in which case also, though of inferior importance, the volatilised mercury might be saved. For preventing the waste and injury attending this process, an apparatus resembling that delineated in *Plate II. Miscellany, fig. 1.* has been partially and successfully adopted by Mr. Mark Sanders, an eminent button-maker of Birmingham.

"A hearth of the usual height is to be erected, in the middle of which a capacity for the fire is to be made; but instead of permitting the smoke to ascend into the top A, made of sheet or cast iron, through which the mercury is volatilised, a flue for that purpose should be conducted backwards to the chimney B. An iron plate, thick enough to contain heat sufficient to volatilise the mercury, is to cover the fire-place at the top of the hearth C. There must be an ash-hole, D, under the fire-place. The square space E, seen in the fire-place, is the flue, which serves to carry the smoke back under the hearth into the chimney B. The door of the fire-place and ash-pit may either be in front, as represented in the plate, or at the end of the hearth at F, which will perhaps less incommode the work people. It would be of great advantage if the space between A and the iron plate C was covered up with a glass window coming down so low as only to leave sufficient room for moving the pan backwards and forwards with facility. If the sides were also glass instead of brick-work it would be still better, as the work-people would be able to have a full view of their work without being exposed to the fumes of the mercury, which, when volatilised by heat communicated to the pan by the heated iron plate over the fire-place, would ascend into the top A, appropriated for its reception, and descend into the tub G, covered at top and filled pretty high with water. By this means the hearth would, in fact, become a

Distilling apparatus for condensing and recovering the volatilised mercury. In the tub G the principal part would be recovered; for, of what may still pass on, a part would be condensed in ascending the tube H, and fall back, while the remainder would be effectually caught in the tub or cask I, open at the top, and partly filled with water. The latter tub should be on the outside of the building, and the descending branch of the tube H should go down into it at least 18 inches, but not into the water. The chimney or the ash-pit should be furnished with a damper to regulate the heat of the fire.

The water may be occasionally drawn out of the tubs by a siphon, and the mercury clogged with heterogeneous matter may be triturated in a piece of flannel till it passes through, or placed in a pan of sheet iron, like a dripping-pan, in a sufficient degree of heat, giving it a tolerable inclination, so that the mercury, as it gets warm, may run down and unite in the lower part of the pan. But the mercury will be most effectually recovered by exposing the residuum left in the flannel bag to distillation in a retort made of iron or of earthen ware.

When the mercury is volatilised from the buttons, or, as the workmen denominate it, when the buttons are dried off, they are finally burnished, and are then finished and fit for carding.

The reader unacquainted with this branch of manufacture will be surprised to learn how far a small quantity of gold, incorporated with mercury, will spread over a smooth surface of copper. Five grains, worth one shilling and threepence, on the top of a gros, that is, 144 buttons, each of one inch diameter, are sufficient to excuse the manufacturer from the penalty inflicted by an act of parliament; yet many, upon an assay are found to be deficient of this small quantity, and the maker fined and the buttons forfeited accordingly. Many hundred grosses have been tolerably gilt with half that quantity; so extremely far can gold be spread, when incorporated with mercury, over the surface of a smooth piece of copper". Philosophical Magazine, N<sup>o</sup> 33. p. 19, &c.

The white metal buttons which are composed of brass alloyed with different proportions of tin, after having been cast as before mentioned, are polished by turning them in a lathe, and applying successively pieces of buffalo skin glued on wood, (or *buffs* as the workmen call them) charged with powdered grindstone and oil, rotten stone and crocus martis. They are then *white-boiled*, that is, boiled with a quantity of grain tin in a solution of crude red tartar, or argol, and lastly, finished with a buff with finely prepared crocus.

*Glass buttons.* These articles are also frequently wholly composed of glass of various colours in imitation of the opal, lapis lazuli, and other stones. The glass is in this case kept in fusion, and the button nipped out of it whilst in its plastic state, by a pair of iron moulds, like those used for casting pistol shot, adapted to the intended form of the button: the workmen previously inserting the shank into the mould so that it may become imbedded in the glass when cold.

*Mother of pearl buttons.* This substance is also frequently used in the manufacture of buttons; in which case, the mode of fixing in the shank is somewhat ingenious. It is done by drilling a hole at the back which is under-cut, that is, larger at the bottom than the top, like a mortise, and the shank being driven in by a steady stroke, its extremity expands on striking against the bottom of the hole, and it becomes firmly rivetted into the button. To these, foil-stones are also frequently added, in which case, they are usually attached with isinglass-glue. Steel studs are also often ri-

vetted into buttons of this and various other kinds. See FOIL-STONES and STUDS

*Shell buttons.* This name is given to those buttons which consist of a back which is generally of bone without any shank, but corded with catgut, and covered in front with a thin plate of metal struck with a die. They are now, however, much less in use than formerly. The backs are cut out with a brace whose bit is a circular saw, like that of a furgeon's trephine, and the four holes through which the catgut passes are drilled by four drills moving parallel to each other, and acting at once. They are then corded by children who tie the catgut on the inside; the cavity is filled with melted resin, and the metal shell applied warm. The button is then pressed between two centres in a lathe, which are forced together by a weight acting on a lever, (an ingenious application of this engine frequently made use of in this manufacture), and the edge of the shell turned down during its revolution with a small burnisher.

In the year 1790, a patent was granted to Mr. Henry Clay of Birmingham for a new method of manufacturing buttons of slate, or slit stone; and in 1800, Mr. Joseph Barnett of the same place obtained a patent for an improved mode of making buttons, by fixing two shanks, or other fastening, on one button, one on each side, on the under surface, opposite to each other, instead of only one in the centre.

The practice of wearing buttons consisting merely of a mould covered with the same kind of cloth as the garment itself, being at present extremely general, it may perhaps be proper to remark, that this is prohibited on pain of pecuniary penalties, from 40s. to 5l. per dozen, by several statutes which have been made at different times for the promotion of this manufacture; and under which, several convictions have taken place within a few years. These are, 10 W. 3. c. 2. 8 Ann. c. 6. 4 Geo. c. 7. and 7 Geo. c. 12. The importation of buttons is prohibited on pain of forfeiture, and penalty of 100l. on the importer, and 50l. on the seller, by 13 & 14 C. II. c. 13. § 2. and 4 W. III. c. 10. § 2.

By 36 Geo. III. c. 60. any person putting false marks on gilt buttons, erasing any marks except such as express the real quality, or any other words, except *gilt* or *plated*, incurs the penalty of forfeiting such buttons, and also 5l. for any quantity not exceeding 12 dozen; and if above, after the rate of 1l. for every 12 dozen. The penalty, however, does not extend to those who mark the words *double* and *treble gilt*, provided, in the case of double gilt buttons, gold shall be equally spread upon their upper surface, exclusively of the edges, in the proportion of 10 grains to the surface of a circle 12 inches in diameter; and in that of treble gilt, the gold shall amount to 15 grains in the same proportion. The penalty on making false bills of parcels, expressing any other than the real quality of such buttons, is 20l.; and that on mixing buttons of different qualities, forfeiture of the same, and 5l. for any number between one and 12 dozen, and above this number, 1l. for every 12 dozen. In order to ascertain what shall be deemed gilt or plated buttons, gilt buttons shall have gold equally spread upon the upper surface in the proportion of five grains to the surface of a circle 12 inches in diameter; and plated buttons shall have the superficies of the upper surface made of a plate of silver fixed upon copper, or a mixture of it with other metals, previously to its being rolled into sheets or fillets. All pecuniary penalties may be recovered by action or suit within three calendar months, in the courts of Westminster, and one justice may, by warrant, cause metal buttons liable to

forfeiture, to be seized and kept in safe custody, to be produced as evidence upon any action, or cause them to be destroyed. Pecuniary penalties may also be adjudged by two justices in the place where the offender resides, or the offence is committed. This act, however, does not extend to buttons made of gold, silver, tin, pewter, lead, or mixture of tin and lead, or iron tinned, or of Bath or white metal, or any of these metals inlaid with steel, or buttons plated upon shells.

**BUTTON**, in *Botany*, a term sometimes used for a bud, in the technical language of the French naturalists; it is the middle flate between the eye and the burgeon.

**BUTTON**, in *Building*, denotes a slight fastening for a door or window, made to turn on a nail.

**BUTTON** of a lock, denotes a round head serving to move the bolt.

**BUTTON**, in *Chemistry*, signifies the metal which is collected generally in a roundish mass at the bottom of a crucible after fusion, or which remains in the cupels after cupellation.

**BUTTON**, in *Fencing*, signifies the end or tip of a foil, being made roundish, and usually covered with leather, to prevent making contusions in the body.

**BUTTON** of the reins of a bridle, in the *Manege*, is a ring of leather, with the reins put through it, running all along the length of the reins. See **BRIDLE**.

To put a horse under the button, is when he is stopped, having no rider on his back, by the reins being laid on his neck, and the button lowered, so far that the horse's head is brought in by the reins, and fixed to the true posture or carriage.

**BUTTONS**, in reference to the *Rigging* of a ship, denote small pieces of thick leather under the heads of nails that are driven through ropes.

**BUTTON and Loop**, a short piece of rope, having at one end a walnut knot, crowned, and at the other end an eye. It is used as a becket to confine ropes in.

**BUTTON'S Bay**, in *Geography*, lies on the west side of Hudson's bay, north of, and near to Churchill river. It is so called from sir Thomas Button, who, attempting to discover a north-west passage, lost his ship, and came home in a sloop built in the country.

**BUTTON'S Isles**, are five small islands at the south end of Hudson's straits, near the north coast of Labrador, and near the entrance of cape Chidley. N. lat.  $60^{\circ} 18'$  to  $60^{\circ} 40'$ . W. long.  $65^{\circ} 10'$ .

**BUTTON Island**, called also *Bern island*, an island of the Indian ocean, north of Java, and near Banca and Billiton. S. lat.  $5^{\circ} 49'$ . E. long.  $105^{\circ} 48' 30''$ . This island, as well as the *Cap* in the same longitude and S. lat.  $50^{\circ} 58' 30''$ , are steep and rugged, and difficult of access. At a little distance they appear like the remains of old castles, mouldering into ruin, with tall trees growing upon the tops of them; but, at a nearer view, they exhibit traces of a volcanic origin. In the *Cap* are two caverns, running horizontally into the side of a rock, and containing a number of the birds' nests, so much prized by Chinese epicures. See **BIRDS' Nests**.

**BUTTON-stones**, in *Natural History*, a kind of figured stone so denominated from its resembling the button of a garment.

Dr. Hook gives the figure of three sorts of button-stones, which seem to have been nothing else but the filling up of three several sorts of shells. They are all of them very hard flints, and have this in common, that they consist of two bodies, which seem to have been the filling up of two holes or vents in the shell. *Philos. Works*, p. 284. Dr. Plott

describes a new species of button-stone, finely striated from the top, after the manner of some hair buttons, on which account it may be denominated *porpites*, unless we should rather take it for a new species of *echinites*. *Hist. Oxf.* chap. 5. § 178.

This name is also given to a peculiar species of slate found in the marquise of Bareith, in a mountain called Fichtelberg; which is extremely different from the common sorts of slate, in that it runs with great ease into glass in five or six hours time, without the addition of any salt, or other foreign substance, to promote its vitrification, as other stones require.

It contains in itself all the principles of glass, and really has mixed in its substance the things necessary to be added to promote the fusion of other stony bodies.

The Swedes and Germans make buttons of the glass produced from it, which is very black and shining, and it has hence its name button-stone. They make several other things also of this glass, as the handles of knives, and the like, and send a large quantity of it unwrought in round cakes, as it cools from the fusion, into Holland.

**BUTTON-tree**, or *Button-wood*, in *Botany*. See **CEPHALANTHUS** and **CONOCARPUS**. In North America the *Platanus occidentalis* is also called button-wood.

**BUTTON-weed**. See **SPERMACOCE**.

**BUTTONNESS**, in *Geography*, a cape of Scotland, on the south-east extremity of the county of Angus, in the German ocean, at the north-west of the entrance into the frith of Tay; 9 miles E. of Dundee. N. lat.  $56^{\circ} 26'$ . W. long.  $1^{\circ} 33'$ .

**BUTTRESS**, a *butment*, or mass of stone, or brick, serving to prop or support the sides of a building, wall, or the like, on the outside; where it is either very high, or has any considerable load to sustain on the other side, as a bank of earth, &c. See **ARCH**, and **ARC-BOUTANT**.

The theory and rules of *buttresses*, or props for easing walls, is ranked among the desiderata of architecture. They are usually placed leaning against the edifice they are to sustain. We find them used against the angles of steeples, churches, and other buildings of stone; also along the walls of such buildings as have great and heavy roofs, which would otherwise be subject to thrust the wall out. They are also placed as supports against the feet of arches turned cross great halls, in old palaces, &c. and are much used in fortification.

**BUTTRISS**, **BUTTRICE**, or **BUTTERIS**, likewise denotes a tool, made of steel and fitted to a wooden handle, used by farriers, to pierce the sole of a horse's foot, which is overgrown; to pare the hoof; to fit the shoe; and to cut off the skirts of the sole that overcast the shoe.

**BUTTS**, **WILLIAM**, in *Biography*, born towards the end of the 15th century, was educated at Gonville college in Cambridge, where he appears to have taken his degree of doctor in medicine. Being distinguished for his superior abilities, he was appointed physician to king Henry VIII.; and though he was not one of the founders of the College of Physicians, as Granger calls him, he was one of their early members, being admitted in the year 1529; and was in such repute for his learning, that Dr. Caius dedicated his works to him. It is also probable that he assisted the surgeons in procuring their charter, as his portrait is among those of the members who were present when it was delivered to the company. *Goodall's College of Physicians*. *Aikin's Biog. Mem. of Medicine*.

**BUTTSTADT**, or **BUTTSTETT**, in *Geography*, a town of Germany, in the circle of Upper Saxony, and principality of

of Weimar, situated on the Lofse, and carrying on a great trade in cattle with Poland and Hungary; 9 miles N. of Weimar.

BUTUA, ΒΥΔΟΑ, in *Ancient Geography*, a town of Illyria, named *Buthoe* by Steph. Byz., and *Butua* by Ptolemy. See ΒΥΔΟΑ.

BUTUNTUM, or ΒΥΤΟΝΤΟΜ, a town of Italy, in that part of Apulia called Peucetia, south-east of Baviium, on the Trajan way.

BUTUS, in *Entomology*, a species of SPHINX (*Zygaena*, Fabr.), the wings of which are greenish and shining, at the tips darker; abdomen fulvous. Fabricius. Inhabits South America.

BUTUS, *Sphix butus* of Cramer, is the species described by Fabricius under the name of GNOΜΑ, which see.

BUTUS, or BUTIS, in *Ancient Geography*, a town of Lower Egypt, seated on the west of that branch of the Nile anciently called *Hermopoliticus*, and which running near to Schennytus, now called Samanoud, discharges itself into the lake of Bourlos or Berelos. It was famous for an oracle of Latona, called Butis, and in some respects the same with Isis, which was consulted by persons that repaired to it from all parts of Egypt. The temple of this divinity was spacious and magnificent; surrounded by a portico 50 feet high, which was supported by marble columns, and the sanctuary was formed out of an enormous mass of granite, 60 feet square and 6 thick, and weighing 15,000,000 pounds. It was hewn in a quarry in the isle of Philé, near the cataracts, and conveyed on rafts, through a distance of 200 leagues, to the place where it was deposited. Butus was also decorated with two temples in honour of Apollo and Diana. Herodotus, l. xi. c. 155. Strabo, l. 17. vol. ii. p. 802.

BUTZBACH, in *Geography*, a town of Germany, in the circle of the Upper Rhine, and principality of Upper Hesse, situate in a marshy, but fertile, plain; 7 miles S.S.W. of Gießen.

BUTZOW, a town of Germany, in the circle of Lower Saxony, and principality of Schwerin; 24 miles N. E. of Schwerin.

BUUDER, or BUDENSTADE, a trading place and fishing port of Iceland.

BUVETTE, or BEUVETTE, in the *French Laws*, an established place in every court, where the lawyers and counsellors may retire, warm themselves, and take a glass of wine by way of refreshment, at the king's charge.

There is one for each court of parliament, but these are only for persons belonging to that body; there are others in the *palais* whither other persons also resort.

BUXALOONS, in *Geography*, an Indian town of America, on the north-west bank of Alleghany river; nearly 25 miles from Fort Franklin, at its mouth.

BUXBAUM, JOHN CHRISTIAN, in *Biography*, applied himself solely to the study of botany, in which he acquired considerable celebrity. His first work, "Enumeratio Plantarum in agro Halensi, locisque vicinis nascentium," was published in 1721 at Halle in Saxony, near which place he appears to have been born. Haller commends this catalogue, which contains many of the minuter plants, mosses, and funguses, some of which were then first noticed. This procured him so much credit, that he was sent for to Russia and made member of the academy at Petersburg. He then went to Constantinople, and visited several of the islands in the Archipelago, attentively examining all the varieties of plants, found in those rich countries. As the fruit of these travels, he published, in 1728, 4to. "Centuria prima Plantarum circa Byzantium et in Oriente observatarum. Petrop." in which he briefly described some new and many very rare plants.

He died the following year, but had previously prepared a second, third, and fourth centuries, which were published in 1729, 1733, and 1740. A fifth century, with an appendix, was added. Besides these, he was author of several communications on the subject of botany, which were published in the first, second, third, and fourth volumes of the Commentaries of the Imperial Academy at Petersburg. Hall. Bib. Bot.

BUXBAUMIA, in *Botany* (from Buxbaum, a German botanist, who travelled in Russia, and published descriptions of new plants). Linn. gen. 562. Schreb. 1659. Jussieu 12. La Marc Enc. Class and order, *Cryptogamia musci*. Nat. ord. *Musci* Linn. and Juss.

Gen. Ch. *Caps.* ovate, oblique, gibbous, on one side. *Peristome* double; outer one of sixteen teeth truncate; inner membranaceous, plaited.

Species, 1. *B. aphylla*. "Capsule on a fruit stalk; leaves none." Linn. Amæn. 5. tab. 1. Dill. Musc. tab. 68, 5. Flor. Dan. 44. La Marc. Ill. Pl. 872. *Fruit stalk* swelling at the base into a black, somewhat villous, small bulb; half an inch long, dark, red, glossy, erect. *Capsule* of an uniform pale colour, ovate, gibbous, about the size of a common pea. The only moss known without leaves. Turner. Spic. Musc. Hib. This curious plant was first discovered by Buxbaum on the banks of the Volga, near Astracan; afterwards by Monti in Italy, and Celsius sen. in Sweden, both of whom sent specimens to Dillenius; and by Haller in Switzerland, and by others in different parts of Europe. It has lately been found near the lake of Killarney in Ireland. 2. *B. foliosa* (*B. fessilis* Schmid. Hed. Phascum Flor. dan. t. 249. upper fig. Phascum montanum Hud. Maximum Light. Sphagnum acaulum maximum Dill. tab. 32. f. 13.) "Stem none; capsule nearly sessile, leaves linear-lanceolate." Dr. Smith. La Marc Illust. Pl. 872. f. 2. Eng. Bot. 329. *Stem* very short, or rather none. *Leaves* numerous, lanceolate, flat, keeled, acuminate; inner ones with a bristly tooth on each side towards the summit. *Capsule* solitary, nearly sessile, the size of a grain of wheat, ovate oblique, smooth green; calyptra awl-shaped, red; lid conic, striated; exterior fringe obsolete; interior membranaceous, white, plaited, closed. Dr. Smith. A native of England, and other parts of Europe.

BUXE FIORD, in *Geography*, a bay on the west coast of West Greenland. N. lat. 64° 15'. W. long. 49° 40'.

BUXENTUM, now *Poli-castro*, in *Ancient Geography*, a town of Italy, in the eastern part of Lucania, called by the Greeks *Pyxus*. It was founded by Micynthus, a prince of Messana in Sicily, and afterwards deserted. It was colonized by the Romans. Strabo, Livy. According to Strabo (l. 6. vol. i. p. 253.) *Pyxus* was the name of a promontory, port, and river.

BUXI, in *Entomology*, a species of TIPULA (*Tipula flava* of Schrank). The colour is yellow: head and thorax black; wings brown and incumbent. A native of Europe. Gmel. &c.

BUXI, a species of CHERMES, having setaceous antennæ, and yellowish brown wings, *Psylla viridis*, &c. Geoffroy.

BUXTEHUDE, DIETRICH, in *Biography*, son of John Buxtehude, organist at St. Olaus at Elfsinor, was a disciple of John Thiel, and organist of the church of St. Mary in Lubec. Mattheson, in his *Vollkommene Capellmeister*, p. 130. celebrates him as a famous organist and composer, and speaks of six suites of lessons for the harpsichord of his composition, in which the motion of the planets is represented or delineated. With this is printed a choral composition to German words, being a lamentation on the death of his father. In 1696 he published two sets of sonatas *a violino, viola*

*viola da gamba, e combalo.* Mattheson, in his *Life of Handel*, tells us, that "he and Handel travelled together to Lubec, upon there being a vacancy in an organist's place, and in the organ, composed several double fugues, *da monte not da piano.* Buxtehude was then at Lubec, and an admirable player on the organ; however, Handel's powers on that instrument astonished even those who were accustomed to hear that great performer.

BUXTEHUDE, in *Geography*, a town of Germany, in the circle of Lower Saxony, and duchy of Bremen, seated on the Este, which fills the ditches. The fortifications have been razed: 16 miles W.S.W. of Hamburg.

BUXTON, JEDEDIAH, in *Biography*, a person deserving to be recorded on account of his singular memory and powers of calculation, was the son of a school-master at Elmton, a small village near Chesterfield, in Derbyshire, and born, probably, in 1704 or 1705. His education, notwithstanding the profession of his father, was so much neglected that he was never taught to read or write. His whole attention seems to have been absorbed by the different denominations and relative proportions of numbers to such a degree that he took hardly any notice of external objects, except with respect to their numbers. When any interval of time was mentioned to him, he immediately gave the amount of it in minutes; and he assigned also the number of hair-breadths in any distance that chanced to be spoken of, although no question was proposed to him. To such a degree was he capable of abstraction and of fixing his attention, that no noise discomposed him, and that no incidental question or occurrence could divert his thoughts, or occasion any confusion, so as to prevent his renewing and pursuing his calculation, which he performed by mere memory, without the aid of pen or paper. It would be endless to recite particular instances of his powers of computation, and of the methods he used for solving the most operose and intricate questions relating to numbers. By merely striding over a piece of land he could tell the contents of it as accurately as if he had measured it by the chain. His constant application to figures prevented his making the smallest acquisition in any other branch of knowledge; nor did his ideas seem to be extended beyond matters of mere calculation. In 1754 he visited London, and was introduced to the Royal Society, before which he gave several satisfactory evidences of his peculiar talents for computation. In this visit his curiosity was excited by a strong desire to see the king and royal family, but in this he was disappointed. At the play-house he seemed to be altogether uninterested by the splendour of the scenery or the action of the performers; and during the dances his attention was engaged in reckoning the number of steps. After a fine piece of music, he declared that the innumerable sounds produced by the instruments perplexed him beyond measure, but he counted the words uttered by Mr. Garrick in the whole course of the entertainment, and affirmed that in this he had perfectly succeeded. He was married and had several children. He subsisted by labour, and remained contented in obscurity; and prolonged his life to the age of about 70 years. *Biog. Diet.*

BUXTON, in *Geography*, a large handsome village of Derbyshire, in England, is celebrated for its mineral waters, the fame of which occasions it to be much frequented by valetudinarians, and many other persons, who resort hither for health, or pleasure. It is situated in two parishes, but the principal part forms a chapelry to Bakewell. Buxton lies in an extensive hollow, with bleak elevated tracts of moor land completely surrounding it. Several plantations have, however, been made of late years on the adjacent

hills, and some land cultivated. The late Dr. Gale, as appears from a manuscript of his quoted in Gough's *Additions to the Britannia*, placed the Aquis of Ravennas at Buxton; though he had previously conjectured it to be at Aidon, in Northumberland. That its warm springs were known to the Romans, is evident from various concurring circumstances. Several ancient roads concitate at this spot, particularly one called the Bath-way, or Bathom-gate, which commences at Brough, a Roman station, near Hope, and was traced by the late Mr. Pegge; and another, that came from Manchester, and is known in different parts of its course by the appellations of High-street, Street-fields, Street-lane, Old-gate, &c. Specimens of Roman workmanship have also been discovered here at different times. Bishop Gibson mentions a Roman wall "cemented with red Roman plaster, close by St. Anne's well, where are the ruins of the ancient bath." This wall was taken down in the year 1709, when Sir Thomas Delves of Cheshire, in memory of a cure he had received from the waters, erected a stone alcove over the well. Some capacious leaden cisterns, and different articles, apparently Roman, were found in digging the foundation. The shape and dimensions of the ancient bath, which was about six yards from the present bath-room, were clearly discovered when the building of the Crescent commenced in the year 1781. Its form appeared to be an oblong square; it measured from east to west thirty feet, and fifteen in a contrary direction. The spring was situated at the west end; and at the east might be perceived a flood-gate, by which the water was let out. The wall was built with limestone, covered on the outside with a strong cement; the floor consisted of lime mixed with coarse sand, saturated with blood. Near one end a cavity was formed in the floor resembling the figure of a boat, extending circularly in length almost from one side wall to the other; its breadth was about two yards; and its depth below the level of the floor, at the deepest part of the curvature, about eighteen inches: the water was conveyed into this room by a leaden pipe. Though the very early use of the Buxton waters is apparent from the above circumstances, we have no record of their being in use in the middle ages, or of their having obtained any high reputation till the sixteenth century, when Dr. Jones gave them celebrity by a treatise on their beneficial qualities. About this time the earl of Shrewsbury erected a house for the reception of visitors, on the site of the building now called *The Hall*, part of which belonged to the old fabric. This hall becoming insufficient to accommodate the increasing number of visitors, most part of it was taken down in 1670, when a new enlarged edifice was erected on the spot by William, third earl of Devonshire. This building, which has been frequently improved, is still the principal hotel for the reception of company. Within it are the baths, adjoining, but in distinct apartments, five in number; the gentlemen's, the ladies', the poor's, and two private. The springs have been calculated to throw up about sixty gallons of water every minute. The time requisite to fill the baths is two hours and fifty minutes. The water is usually drunk at St. Anne's well, a modern, but elegant little building in the antique style, where it is conveyed into a white marble basin, from the original spring, through a narrow grit-stone channel. This well is regarded as one of the seven wonders of the Peak; chiefly from the circumstance that both hot and cold spring water may be obtained within twelve inches of each other, from a double pump, situated on the opposite side of the building to that which contains the basin. The principal ornament of Buxton is its *Crescent*, a magnificent range of building, which was erected

erected by the duke of Devonshire within the last twenty years, from the design and under the superintendance of Mr. Carr, the architect. It consists of three stories; the lowest rustic, forming a beautiful colonnade, which extends the whole length of front, and is seven feet wide within the pillars and eleven feet high. The divisions between the windows above are formed by Ionic pilasters, which extend to an elegant balustrade that skirts the whole front, the span of which is 257 feet. The Crescent is built with grit-stone obtained near the spot, and faced with fine free-stone, procured from a quarry about two miles distant. Near the back of the Crescent are the *stables*, an extensive pile, which was also constructed at the charge of his grace of Devonshire, who is said to have expended 120,000*l.* in completing the whole. The poor who resort to Buxton, on bringing a certificate from the minister of their parish, and medical attendant, vouching for their being proper objects of charity, are admitted to partake of the benefit of a fund formed by collecting one shilling from every visitor who stays here more than a day. This is appropriated to the purchase of necessary medicines, and supplying fourteen indigent persons with six shillings weekly for one month; they are also permitted to bathe gratis. Buxton season generally commences in June, and concludes in October. In these monthly assemblies are held three days in the week, and a small theatre is opened on the other three days.

Buxton contains about 100 houses, chiefly of stone; the inhabitants, generally resident, are about 400. The visitors in the bathing season are uncertain, but are estimated at 700 annually, who are the principal support of the inhabitants. Several shops for the manufacture and sale of ornaments of fluor spar and alabaster are established in this village. The place where the crystals, denominated Buxton diamonds, are found, is about two miles south-west from the village: it is a waste uneven piece of land, several acres in extent, and called the *Diamond Hill*.

Between one and two miles westward of Buxton, in the vast mass of lime-stone, which ranges in this part of the county, is a fissure, or cavern, called *POOLE'S HOLE*, from an ancient tradition, that an outlaw, named Poole, once made it his residence. This being considered a great natural curiosity, we shall be rather particular in our description of it. Nothing grand nor picturesque marks the entrance into this cavity, neither does its interior present any of the magnificence which so eminently distinguishes the Peak cavern at Castleton. It opens with a crevice so low and contracted that the curious visitant is obliged to proceed with caution in a stooping posture nearly twenty-five yards, when the passage widens into a spacious vacuity, from whose roof depends a quantity of stalactite, produced by the droppings of water impregnated with calcareous matter. Part of this substance adheres to the roof, and gradually forms those pendant spiral masses called stalactites, or (locally) *water-icicles*; another portion drops with the water to the ground, and attaching itself to the floor is there deposited, and becomes the *stalagmite*, a lumpy mass of the same matter. One of the former, of immense size, called the *Fitch of Bacon*, occurs about the middle of the cavern, which here becomes very narrow; but, after a short space, spreads again to a greater width, and continues large and lofty, till we reach another surprisingly large mass of stalactite, to which the name of *Mary Queen of Scots' Pillar* is attached, from the tradition of that queen having visited this cavern and advanced thus far into its recesses. As this pillar cannot be passed without some difficulty, few people venture beyond it; and, indeed, the remaining part of the cavern offers few objects to repay the fatigue of exploring

it. The money given by visitants is divided among ten aged women who reside here, and act as guides by the permission of the duke of Devonshire, to whom the ground belongs. The extent of the cavern does not exceed three hundred yards.

The stone in this neighbourhood, though of several kinds, is mostly applied to the making of lime, many hundred tons of which are here burnt annually. The workmen and their families, like the Troglodytes of old, reside in *caves*; for any other name would be ill-adapted to describe their habitations, which are scooped out of the hillocks or small mounts, formed with the refuse of the lime-kilns. The crust of these heaps of rubbish having been consolidated by time and the weather, is now impervious to the rain; and being left of sufficient thickness, forms a substantial roof. Each habitation contains two or three rooms; but few have any other light than is admitted through the chimney and door-way.

About three miles from Buxton and two from Chapel-in-the-Frith, in a pasture field, is a natural curiosity, called "The Marvel Stones," of which Mr. Bray gives a particular description in his *Tour through Derbyshire*, and to which probably Dr. Stukely alluded, when he mentions having heard of what appeared to him a druidical work near Hope. Near the northern extremity of an eminence called *Combe-Moss*, three miles from Buxton, are some ancient military works, consisting of two deep trenches, which run parallel to each other to an extent of about two hundred yards.

Buxton is situated 163 miles N.W. from London. Warner's *Northern Tour*, vol. i. Pilkington's *View of the present State of Derbyshire*, 2 vols. 8vo. 1789.

*Buxton Water.* The native warm springs that have given so much celebrity to this town are very numerous, and afford a great abundance of water for every purpose both of bathing and domestic supply.

Buxton water is perfectly clear and colourless, entirely void of smell and taste, nor has it any quality, besides its temperature, which distinguishes it from the purist of the numerous springs with which all mountainous countries usually abound. The heat is very uniformly 82° in all seasons and circumstances, taken in the stone reservoir which first receives it, and hence, though to the touch this water is positively cold, or rather cool, it is entitled to be considered as a warm spring, being uniformly of a much higher temperature than common springs. In St. Anne's well, the original and principal reservoir, a quantity of thin steam is constantly given out from the water which hovers over its surface and contributes to keep up the heat during the bathing.

Along with the water, which rises up through the crevices of the floor of the well, a considerable number of air-bubbles are constantly seen to rise at the same time, and passing through the water break at its surface. These may readily be collected by immersing a bottle and funnel full of water in an inverted position and intercepting them in their passage upwards. Dr. Pearson was the first chemist who ascertained the nature of this gas, and he found it to consist almost entirely of azotic gas mixed with a small portion of atmospheric air, and not carbonic acid gas as had been conjectured by preceding observers. A small portion of the same gas also is found in combination with the water, which is readily separable by boiling. The water then yields about a sixty-fourth part of its bulk of this air.

The analysis of the water exhibits a few saline substances, but in very minute proportion and perfectly insignificant; for, in fact, it is by its purity and warmth that this natural spring is distinguished. By Dr. Pearson's experiments a

gallon of the water yielded on evaporation only 15 grains of residuum, of which  $1\frac{1}{2}$  grain was eliminated to be muriat of soda,  $2\frac{1}{2}$  to be sulphat of lime, and  $10\frac{1}{2}$  to be carbonat of lime held in solution by a slight excess of carbonic acid.

The water of Buxton is employed largely both for external and internal use. Its uniformity of temperature and the great abundance of the supply give to Buxton uncommon advantages as a tepid bath. A slight shock of cold is felt on the first immersion, which is immediately succeeded by a very agreeable glow over the whole body; and it is to be observed that the shock is so slight, owing to the small difference between the heat of the water and that of the body, as to be borne without inconvenience by very delicate and irritable habits, in whom the rougher operation of the cold bath or immersion in the sea often occasions permanent head-ach, sickness, languor, catarrh, and other inconveniences.

There is not, however, the least reason to suppose any thing peculiar, or any occult salutary qualities in the Buxton bath, more than in any other pure water heated to  $82^{\circ}$  and confined in a stone reservoir so as to retain the same temperature during the whole time of bathing. Therefore all the regulations and medical directions for its use may be entirely referred to the article BATHING.

Buxton water is also taken internally by invalids, and many important virtues have been attributed to it, thus used. That it contains nothing deleterious may be safely pronounced, both from the evidence of chemical analysis, and (what is more to the point) from the well-known fact that most of the water used at the principal hotels for making tea and other common purposes is derived from the same source. Therefore, whatever stress may be laid on its supposed inflammatory tendency in certain cases, it cannot be doubted but that to the rest of the world it is a pure, salutary, innocent beverage.

Like other warm pure waters it is highly advantageous in many painful complaints of the kidneys and bladder and urinary passages; like them it powerfully relieves many of the most distressing dyspeptic symptoms, and like them it shews no decided action on the bowels, its use being sometimes attended with diarrhœa, sometimes with the opposite state, which last generally demands the assistance of active purgatives.

The cases for which Buxton is resorted to are mostly chronic, such as gout, rheumatism, derangement of the biliary and digestive organs, diseases of the urinary passages, and the like, and it is no small additional recommendation to the invalid to be abundantly furnished with every thing that can contribute to convenience, comfort, and amusement.

BUXTON, in *Geography*, a township of America, in the county of York and district of Maine, seated on Saco river; 16 miles north-westerly from Pepperel-borough, at the mouth of the river, and 118 miles N.E. from Boston; containing 1564 inhabitants.

BUXTORF, JOHN, in *Biography*, an eminent Hebrew scholar, was born at Camen in Westphalia, in 1564. As to his religious persuasion, he was a Calvinist; and having settled at Basil, he was appointed by the magistrates professor of the Hebrew and Chaldee languages, which he taught with great reputation till his death in 1629. In order to perfect himself in these languages, he obtained the assistance of many learned Jews, and thus acquired a predilection in favour of rabbinical learning. His works, in the department of literature to which he was devoted, were numerous, learned, and useful. These are as follow; viz. "Lexicon Chaldaicum, Thalmudicum, et Rabbinicum," Basil. fol.

1639; a small "Hebrew and Chaldaic Dictionary," composed of words from the Bible only, 12mo.; "Theaurus Linguae Hebraicæ," 2 vols. 8vo.; a small "Hebrew Grammar," much esteemed; the Leyden edition of which was revised by Leusden; a large "Hebrew Bible, with the Rabbinical and Chaldaic Paraphrases, the Massora, Tiberias, &c." 4 vols. fol. Basil. 1618 and 1619; "Synagoga Judaica," a collection of Jewish modes and ceremonies, intended to expose the Jews, but abounding too much with puerilities intermixed with a mass of learning; "Institutio Epistolæ Hebraicæ," a collection of Hebrew letters; "Concordantiæ Hebraicæ," 8vo. 1632; "Bibliotheca Rabbinica," with a treatise "De Abbreviaturis Hebræorum." Nouv. Dict. Hist.

BUXTORF, JOHN, son of the preceding, was born at Basil in 1599, and directing his attention to studies similar to those of his father, he became professor of the oriental languages in his native city. Besides translations of some of the rabbinical writings, such as the Moreh Nevochim of Maimonides, and the book called Cosri, he published "A Chaldaic and Syriac Lexicon," 4to. 1621; and having adopted his father's sentiments with regard to the Hebrew vowel points, he defended them against Ludovicus Capellus in a book entitled, "Tractatus de Punctorum Vocalium et Accentuum in Libris Veteris Testamenti Hebraicis Origine, Antiquitate et Autoritate," Basil, 1648; and afterwards in a more considerable work, entitled, "Anti-critica, seu Vindiciæ Veritatis Hebraicæ adversus Ludovici Capelli Criticam, quam vocat Sacram," Basil, 1653. He published likewise "Dissertationes on the Old and New Testament;" "Exercitationes Philologico-criticæ;" "Florilegium Hebraicum;" and other works. He died at Basil in 1664.

There were two other Buxtorfs, *John-James* and *John*, successively professors in the same chair at Basil, and both writers on subjects of literature. In general, the school of the Buxtorfs has been reproached, notwithstanding its acknowledged learning, with too great predilection for the rabbinical doctrines; and their decisions with regard to the authority of the Hebrew points have been gradually losing ground, and have now comparatively few advocates, after having been very prevalent through Germany and other Protestant countries. Nouv. Dict. Hist.

BUXUS, in *Botany*, *box* (a corruption of  $\pi\upsilon\zeta\omicron\varsigma$ , the Greek name in Theophrastus for the same plant, so called  $\delta\iota\alpha\ \tau\omicron\ \pi\upsilon\chi\tau\omicron\nu\ \tau\eta\ \xi\upsilon\lambda\omicron\varsigma$ , on account of the density of its wood). Linn. gen. 1053. Schreb. 1420. Juss. 338. Vent. 3. 491. Gart. 630. Class and order, *monocia tetrandria*. Nat. ord. *Tricocææ*, Linn. *Euphorbia*, Juss. and Vent.

\* Male flowers prominent from the buds. Gen. Ch. *Cal.* perianth three-leaved; leaves roundish, obtuse, concave, spreading. *Cor.* petals two, roundish, concave, similar to those of the calyx but larger. *Stam.* filaments four, awl-shaped, erect, expanding, rather longer than the calyx; anthers erect, twin. *Pist.* rudiment of a germ without style or stigma.

\* Female flowers from the same bud generally single, surrounded by eight or ten males. *Cal.* perianth four-leaved, similar to those of the male. *Cor.* petals three, similar to those of the male. *Pist.* germ roundish, obtusely three-cornered; styles three, short, permanent; stigmas obtuse, hispid. Linn. *Peric.* capsule globular, very smooth, glossy, coriaceous, three-grained, before it opens three-beaked, three-valved; valves two-horned; grains of a paper-like substance, two-valved, opening elastically. *Seeds* two in each cell, ovate, attenuated upwards, triangularly compressed, obliquely truncate at the summit, somewhat spongy, smooth. Gart.

Ess. Ch. Male. *Cal.* three-leaved; petals two, rudiment

of a germ. Female. *Cal.* four-leaved. *Pet.* three; styles three; capsule three-beaked, three-celled; seeds two in each cell.

Species, 1. *B. balearica*, La Marek. "A tree; leaves oblong-ovate, an inch and half long; stem very long." Branches straight, four-cornered. Leaves opposite, on short decurrent petioles, entire, smooth, shining, coriaceous. Flowers in large bunches; anthers linear. A native of Majorca, &c. Cultivated in the royal garden in Paris, but is tender, and does not endure severe frosts. 2. *B. arborefcens* (Sempervirens, Linn.). "Leaves ovate-oblong, attenuated towards the summit; anthers ovate; stem arborefcens." La Marek. A shrubby tree, from twelve to sixteen feet high. Stem twisted, branched. Leaves opposite, permanent, very entire, emarginate, shining, often reddish in winter. Flowers in small or moderate bunches; filaments not more than the sixth of an inch long. There is a variety with narrow leaves which, as well as the next species, is said by Miller to be specifically distinct. Its wood is of a close grain, very hard and heavy, and on that account is much used by the turner, engraver, carver, mathematical instrument maker, comb, and pipe, or flute maker, and a variety of other artisans. A native of most parts of Europe, from Britain southward. It is found abundantly in the south of France, Savoy, and Italy, and in the temperate parts of Asia and America. In England it has given name to Box-hill in Surrey, Boxwell in Gloucestershire, and Boxley in Kent, all which are mentioned by Ray as producing it; but on account of the value of the wood, the quantity is now much diminished. Mr. Woodward has more recently observed it on the chalk hills near Dunstable. 3. *B. suffruticosa*, dwarf box. "Leaves small, obovate; stem a low under shrub." La Marek agrees with Miller in treating this as a distinct species, though nearly related to the preceding. When suffered to grow freely, it never rises to a greater height than about three feet, and grows in thick, much branched tufts. Its leaves also are small, and rather ovate or roundish-oval, with a white line on their back, more strongly marked than in the preceding species. It grows wild in many parts of France, by the road sides, about villages, and in stony waste places. It is singular that it does not flower when cultivated in England, and was never seen in that state by Mr. Miller, though encouraged to grow many years in the greatest luxuriance. La Marek does not mention this circumstance, nor, indeed, can it be supposed to be thus barren in France, where it is said to be truly indigenous. 4. *B. myrtifolia*, myrtle-leaved box. "Leaves small, oblong, rather narrow; stem a low under shrub." La Marek. It resembles the preceding in its size, but differs both in habit and foliage, not forming a thick tuft or bush, but having an elongated stem like a tree, with open branches; its leaves are rather narrow, with scarcely any appearance of a white line on their surface. A small branch in flower, communicated to La Marek, had no female flowers. Native place not known. Encyc. Methodique. Box was formerly employed as a medicine in various diseases, but in Ray's time was grown into disuse on account of its offensive smell; and before his time even its medical virtues began to be called in question. Dr. Withering, however, has recently recommended it; observing, that an empyreumatic oil distilled from its shavings is often used as a topical application for the piles; that it frequently relieves the tooth-ach, and has been given internally in epilepsies, and that the powdered leaves destroy worms.

*Propagation and Culture.* The arborefcens box was much admired by our ancestors on account of its being easily clipped into the shape of animals, and other fantastic appearances. It was in equal request with the Romans for the same purpose. The younger Pliny, in particular, gives a

florid description of the pleasure grounds at one of his country seats, in which, among other curious devices, the letters of his own name, and of other words, were orderly expressed in rows of thorn box. These extravagancies have now given way to a juster taste in ornamental gardening; but box is still cultivated in our nurseries as a beautiful evergreen; and, left to its natural growth, is a pleasing addition to the shrubbery. It has the additional recommendation of thriving under the thickest shade, and is able to withstand the severest weather of our climate. The dwarf box is used to divide the beds from the walks of flower-gardens; and though it has been condemned as affording shelter for noxious insects, the same objection will lie, in some degree, against every other kind of vegetable bordering; but supposing it to be peculiarly liable to this inconvenience, the evil is considerably counterbalanced by its closeness and durability. It may be propagated by cuttings, layers, and seed. The cuttings should be planted, about the time of the autumnal rains, at the distance of four inches from each other; they should be a foot long, and rather more than half of the length should be covered by the soil. A slip of the last year's growth, stripped from the wood, is an excellent set. The cuttings or slips may stand three years, and should then be transplanted into the nursery in moist weather, any time between August and April. The layers should be earthed between Michaelmas and March. This, as professor Martyn observes, is one of its natural methods of propagation, for when it breaks down by its own weight, or by a fall of snow, it sends out fibres soon after it has come into contact with the ground. The seed should be sown, as soon as it is ripe, on a light loam or sand in a shady border, and regularly watered. Some will come up the next spring, but some will lie in the ground till the next season. They should then have the same treatment as the cuttings. This is said to be the only method in which large trees can be raised. The best time for removing the tree is October. Martyn's Miller.

*BUXY*, in *Geography*, a town of France, in the department of the Saône and Loire, and chief place of a canton in the district of Chalons-sur-Saône, and 8 miles S.W. of it. The place contains 1602, and the canton 14,085, inhabitants; the territory includes 277½ kilometres and 31 communes.

*BUY DE MORNAS*, *CLAUDE*, in *Biography*, was born at Lyons and died at Paris in 1785. He is principally known as the author of an instructive and useful Atlas of Geography and History, Paris, 1762 and 1770, 4 vols. 4to. He also published a Cosmography, on the same plan, in 1770.

*BUY*, in *Geography*. See *Buis*.

*BUYING*, the act of making a purchase, or of acquiring the property of a thing for a certain price.

Buying stands opposed to selling, and differs from borrowing or hiring, as in the former the property of the thing is alienated for perpetuity, which in the latter is not.

By the civil law, persons are allowed to buy hope, *specie pretio emere*, that is, to purchase the event or expectation of any thing: e. gr. the fish or birds a person shall catch, or the money he shall win in gaming.

There are divers species of buying in use among traders; as buying on one's own account, opposed to buying on commission; buying for ready money, which is when the purchaser pays in actual specie on the spot; buying on credit, or for a time certain, is when the payment is not to be presently made, but, in lieu thereof, an obligation given by the buyer for payment at a time future; buying on delivery, is when the goods purchased are only to be delivered at a certain future time.

**BUYING the refusal**, is giving money for the right or liberty of purchasing a thing at a fixed price, in a certain time to come; chiefly used in dealing for shares in stock. This is sometimes also called by a cant name, *buying the bear*.

**BUYING of titles.** See MAINTENANCE.

**BUYING the Small-pox.** See SMALL-POX, *Inoculation of*.

**BUYTRAGO**, in *Geography*, a small town of Spain, in New Castile, on the confines of Old Castile, in front of which the mountain-stream Lozoya winds along a deep rocky bed: while, on the other side, the town, with its towers and steeples, leans romantically against a steep ascent in a recess among the mountains, that separates the two Castiles. These mountains are rich in minerals; and the environs of this city, which is episcopal, are famous for the wood which they furnish. It is 36 miles N. of Madrid, and 18 E. of Segovia.

**BUYTRON**, a town of Spain, in Andalusia; 27 miles N.W. of Seville.

**BUZANCAIS**, a town of France, in the department of the Indre, and chief place of a canton in the district of Chateauroux, 11 miles W.N.W. of it. N. lat.  $46^{\circ} 38'$ . E. long.  $1^{\circ} 29'$ . The town contains 3199, and the canton 11,130, inhabitants; the territory includes  $422\frac{1}{2}$  kilometres and 13 communes.

**BUZANCY**, a town of France, in the department of Ardennes, and chief place of a canton in the district of Vouziers, 2 leagues N. of Grandpré. The town contains 774, and the canton 8275, inhabitants; the territory includes 265 kilometres and 24 communes.

**BUZARA**, in *Ancient Geography*, a mountain in the eastern part of the interior of Africa. Ptolemy.

**BUZARAS**, a town of Africa, in Mauritania Cæsariensis.

**BUZAW.** See **BUTZO**.

**BUZERI**, a people of Asia, in Cappadocia, on the west of the Euxine.

**BUZES**, a people of Africa, in Marmarica.

**BUZET**, in *Geography*, a small town of France, in the department of the Upper Garonne,  $4\frac{1}{2}$  leagues N.E. of Toulouse. N. lat.  $43^{\circ} 47'$ . E. long.  $1^{\circ} 45'$ .

**BUZIKINA**, a town of Siberia, 220 miles E. of Eniseisk.

**BUZIM**, a town of Siberia, on the Tchulim, 80 miles N.N.E. of Tomik.

**BUZULEITSK.** See **BUSULUTSK**.

**BUZWARAH.** See **BEZOARA**.

**BUZY**, a town of France, in the department of the Meuse, and district of Verdun, 13 miles E. of it.

**BUZZARD**, in *Ornithology*, the trivial name of several species of the falcon tribe, as, for instance, the common buzzard, *falco buteo*, greater buzzard, *falco gallinarius*, American buzzard, *falco borealis*, honey buzzard, *falco apivorus*, Java buzzard, *falco javanicus*, &c.

**BUZZARD, American**, of Latham, *red-tailed falcon* of Arctic Zoology, is the *FALCO borealis*; the cere and legs are pale yellow; the body is brown above and white below, the tail is of a pale rust colour, having a transverse dusky or black narrow bar near the end. It inhabits North America, particularly Carolina. Its size is about that of the common buzzard.

**BUZZARD, Honey.** See **APIVORUS**.

**BUZZARD, Moor**, *falco aruginosus*, the *milvus aruginosus* of Aldrovand and Ray, and the *lufard* of Buffon, has the cere greenish, the body brownish-grey, the crown of the head, chin, axillæ, arm-pits, or space below the root of the wings, and legs, yellow. It inhabits Europe, building its nest in marshy places, and subsisting on aquatic birds, fish, and rabbits.

**BUZZARD'S Bay**, in *Geography*, a bay of America, in the state of Massachusetts, lying between  $41^{\circ} 25'$  and  $41^{\circ} 42'$  N. lat. and between  $70^{\circ} 38'$  and  $71^{\circ} 10'$  W. long. This and Barnstable bay on the north east form the peninsula, whose extremity is called cape Cod. It runs into the land about 30 miles N.E. by N. and its mean breadth is about 7 miles.

**BUZZARDET**, in *Ornithology*, the whitish falcon, *Falco albidus*.

**BYAREM**, in *Geography*, a town of Hindostan, in the country of the Nizam, 89 miles N.E. of Hyderabad, and 60 E. of Warangole.

**BYBASSUS**, in *Ancient Geography*, a maritime town of Asia Minor, in Caria, probably situated in the country called by Pliny *Bubassus*.

**BYBE**, a country of Thrace.—Also, a town of Italy, on the confines of Peucetia. Steph. Byz.

**BYBERRY**, in *Geography*, a township of America, in the county of Philadelphia, and state of Pennsylvania.

**BYBLIS**, in *Ancient Geography*, a mountain of Asia Minor, before the town of Miletus.

**BYBLOS**, or **BYBLUS**, a maritime town of Phœnicia, situate between Berytus and Botrys, 18 miles S. from Tripoli according to the Itinerary of Antonine. The ancient inhabitants of this town served in all the maritime expeditions of Tyre, and as they excelled in all arts relating to wood, they were employed in building Solomon's temple at Jerusalem, 1 Kings chap. v. At this time they were subject to the Tyrians; but when Phœnicia was reduced under the dominion of the Persians, they had their own kings. According to Arrian (de Exped. Alex.) their ships formed a part of the fleet of Darius; but when Alexander had entered Phœnicia and made himself master of Byblus, they deserted Darius and united their naval force with that of Alexander. Under the successors of Alexander, Byblus sometimes belonged to Egypt and sometimes to Syria. Strabo informs us (l. 16. vol. ii. p. 755.), that Pompey rescued them from the oppressive tyranny of one of their sovereigns by cutting off his head. From him we learn, that it was seated on an eminence at a small distance from the sea, and that it was the royal residence of Cinyras, and that it was the seat of the famous superstition practised in its temples in memory of Adonis. See **ADONIS**. The river Adonis flowed from the adjacent mountains, and passing by Byblus, discharged itself into the sea about two leagues S. of the town. This river, called Ibrahim and Obrahim Bassa, has the only bridge to be seen, that of Tripoli excepted, from thence to Antioch. It consists of a single arch, 50 feet wide and upwards of 50 high, of a very light architecture, and appears to have been a work of the Arabs. Byblus is now known by the name of Djebail or Gibyle, and is the most considerable town in that district of the pachalic of Tripoli, denominated Kefronan, and extending from Nahr-el-keib, by Lebannon, as far as Tripoli. It has not, however, above 6000 inhabitants. Its ancient port resembles that of Latakia or Laodicea, but is in a worse state, scarcely any traces of it remaining. Volney's Travels in Egypt and Syria, vol. ii. p. 176.

**BYBLOS**, a fortified place of Egypt, seated on the Nile. Steph. Byz.

**BYCE**, **BUGES**, or **SACRA PALUS**, in *Geography*, a lake of Chersonesus Taurica, in European Sarmatia, to the west of the *Palus Mæotis*, from which it is separated by an isthmus. It is mentioned by Ptolemy, Pliny, and Strabo, who assigns to it a circuit of 4000 stadia.

**BYDEAS-KIRCHE**, a town of Sweden, in West Bothnia, near Umea.

**BYEFIELD**, a parish of Newbury, in Essex county, and state

state of Massachusetts, North America, having a quarry of limestone, in which is found asbestos, and, in its vicinity, beautifully variegated marble. A flourishing woollen manufactory is also established in this place, together with machinery for cutting nails.

**BYGLAND**, a lake of Norway, in the diocese of Christianian, and district of Raabygdlagat, formed by the river Otteraa, on the west side of Bygledfield, and precipitating itself at the waterfall of Fennie, in the parish of Eje.

**BYHORS**, an island of the East Indies, lying west of Borneo.

**BYK**, a river of European Turkey, which runs into the Dniester, 6 miles N. W. of Bender.

**BY-LAWS**; those private ordinances of subordinate communities by which their affairs are governed and regulated; the rights of the individuals composing them defined; and wrongs relative to their joint concerns, prohibited and punished.

The word is formed from the Saxon *by*, habitation, will, and *laxa*, q. d. *lex villæ*, or *town-law*.—They are also called *birlaws*, *byrlaws*, and *burlaws*, *vilager*, or *bellagines*. Such is the custom in Kent of deciding controversies among neighbours about boundaries, by the tenechals, or bailiffs.

In Scotland, these are called *laws of burlaw*, or *byrlaw*, which are made and determined by neighbours, elected by common consent in burlaw-courts; wherein cognizance is taken of complaints betwixt neighbour and neighbour.—The men thus chosen as judges or arbitrators are called *burlaw-men*, or *byrlaw-men*.

Every body of men united by common interests, and having affairs of common concern, must necessarily have some general rules for the regulation of their conduct with respect to them. Without these nothing like unity or concurrence of action could possibly exist, whatever were the objects of the association. These regulations may be divided into two classes, with regard to the nature of the body to which they relate. Societies which are formed merely by the voluntary association of their members must have their rules or by-laws, as well as those communities which have a known description, and are recognized as forming part of the general constitution of the country: the former, however, receive no aid from the general law of the land in the enforcement of obedience to their rules, and have no ultimate remedy for their infraction but the expulsion of the disobedient member; whereas, the general law will enforce obedience to the by-laws of the latter, when in themselves legal and reasonable, and duly made on a subject within the jurisdiction of the legislating body. Thus, the inhabitants of a parish or town not incorporated may make a by-law for the repair of the church or of a highway, or concerning any thing within their district of which the public weal requires the regulation, and in such case the majority shall bind the whole. 5 Co. 63, a. Hob. 212. 3 Salk. 76. The tenants in a leet, or the tenants of a manor, may make a by-law relative to any thing which concerns the common interest; as, in the latter case, to regulate the exercise of their rights of common. Mo. 75. 579. 584. 1 Rol. Abr. 366. Hob. 212.

From what has been already said, it will naturally be inferred, that this power, which is, under some circumstances, conceded even to such bodies as are not incorporated, must, *a fortiori*, belong to such as are; the very existence of whose rights depends on that of the body itself, and does not arise, as in the former case, from those of the members considered as individuals. This right of legislation belongs originally, unless it be otherwise specified in the charter of incorporation, to the body at large; but they may afterwards delegate it to a select body, who then become the representatives of the whole, and may exercise this authority as extensively as

the community itself might have done. Rex v. Spencer, Burr. 1837. In many instances, however, this power of making by-laws has been originally vested in a select body by the same charter by which the corporation itself was created, and in this case it seems that the body at large does not possess it. Rex v. Head, Burr. 2521. The king may, if he pleases, at the time of creating a new corporation aggregate, enact a code of by-laws by which it shall be governed, as may also the founder of an eleemosynary corporation, each having a right to stipulate on what terms alone the creature of his bounty shall be endued with existence; but neither the one nor the other can afterwards, without express reservation of such right or the consent of the body, change or alter such code; nor will such by-laws, as to their general legality or operation, have any other force or effect than they would have had if enacted by the corporation itself. Skin. 513. Hob. 210.

With regard to the *substance* of a by-law, it is not only necessary that it should not militate against the express provisions of the law of the realm; but it must also be reasonable and consistent with its general principles, which reasonableness and legality are to be determined by the judges of the superior courts, whenever its validity shall come in question before them. To state the various possible cases in which a by-law would be void, would be therefore to enumerate all those provisions, and the principles and maxims on which they are founded. We shall, however, mention a few of the most general cases in which ordinances of this kind have been holden to be invalid. A by-law cannot direct the forfeiture of goods, 8 Co. 125, a; or the levying of money on any subject, except in those cases in which a burthen is to be borne by a particular society of which he is a member; as in that already mentioned, of assessing parishioners or townsmen, for the repair of a church or highway. Jeffreys Case, 5 Co. 66, a. Nor can it operate *ex post facto*. 1 Keb. 733. Or alter a constitution given by the crown. Rex v. Breton & an, Burr. 2260. It must not operate in restraint of trade. Harrison v. Godman, Burr. 12. Hesketh v. Braddock, Burr. 1847. 1 Roll. Abr. 363; though it may regulate it and prohibit fraud. 5 Co. 52, b. Nor can it direct a penalty to be sued for in a court in which the jurors must necessarily be interested as members of the corporation. Burr. 1855.

As to the power of a by-law to bind those who are not members of the legislating body, there seems to be a distinction between those corporations which are invested with a local jurisdiction, and those which, being established for purposes with which locality has no connection, have only a jurisdiction over their own internal concerns. When the corporate body has a jurisdiction over a certain territory, a by-law made by them for the public good, and whose object is general, without being limited to people of any particular description, binds every body coming within the limits of the jurisdiction, whether strangers or members of the corporate body; for every man, says Holt, who comes within the local jurisdiction of a corporation must take notice of their by-laws at his peril. Skin. 35.

This right of making by-laws for their own government, not contrary to the law of the land, was allowed by the law of the twelve tables at Rome. But no trading company is, with us, allowed to make by-laws, which may affect the king's prerogative, or the common profit of the people, under penalty of 4cl. unless they be approved by the chancellor, treasurer, and chief justices, or the judges of assize in their circuits; and even though they be so approved, still, if contrary to law, they are void. Stat. 9 Hen. VII. c. 7. 11 Rep. 54.

**BYLAZORA**, in *Ancient Geography*, a town of Europe,

in Peonia, advantageously situated on the confines of Macedonia and Dardania. It was taken by Philip, and is mentioned by Livy. Polybius.

BYLOT's bay, in *Geography*. See BAFFIN's bay.

BYLTÆ, in *Ancient Geography*, a Scythian nation bordering on the west of Imaus, according to Ptolemy, and corresponding to BALISTAN or LITTLE THIBET, which see.

BYMASUS, a town of Greece, in Peonia. Steph. Byz.

BYNG, GEORGE, in *Biography*, lord viscount Torrington, an eminent naval officer, descended from an ancient family in Kent, was born in 1663. At the age of 15 he entered into the sea-service; but quitted it in three years, for the purpose of serving under general Kirk, governor of Tangier, who advanced him from the station of a cadet, first to that of an ensign, and then to a lieutenantcy. In 1684, he returned to the naval department; and in the following year, he was in great danger of losing his life by engaging and boarding a Zingian pirate; which sunk with him, so that he was taken out of the sea in a wounded state, and almost expiring. In 1688, being on board the fleet that opposed the landing of the prince of Orange, he was confidentially employed in negotiating its surrender to the prince's party. Soon after he was raised to the post of captain, and served under admirals Rooke and Russell in the Channel and Mediterranean. In 1703, he had the command of a third rate at the taking and burning of the French fleet at Vigo; and in the following year he was made a rear-admiral, and served with sir Cloudesly Shovel in the Mediterranean, by whom he was deputed to negotiate a peace with the Algerines. In 1704, he commanded the squadron that attacked and cannonaded the garrison of Gibraltar, and induced a capitulation; and he so much distinguished himself in the battle of Malaga, that, as a recompence of his services, he was knighted by queen Anne. In 1706, he was dispatched with a squadron of 20 ships of war for the relief of Barcelona, and he performed various important services on the coasts of Spain and Portugal during that and the following year. On his return home he was signally preserved from shipwreck, when sir Cloudesly Shovel, under whom he served, was lost on the rocks, called the "Bishop and his Clerks." In 1708, he was advanced to the rank of admiral of the blue, and commanded a squadron that was employed to prevent an invasion of Scotland by the pretender, by means of a French army from Dunkirk. He pursued the French fleet to the Scots coast, and obliged it to return without landing its troops. Soon after his arrival in London, he was appointed to the command of a fleet destined for a descent on the coast of France, and in the same year he had the honour of conducting the queen of Portugal to Lisbon, where he received a commission appointing him admiral of the white, and a very valuable present from her majesty of her picture set in diamonds. In 1709, he commanded a squadron in the Mediterranean; and on his return he was made a lord of the admiralty. But disapproving the measures of administration towards the close of the queen's reign, he was removed. However, on the accession of George I. he was reinstated in his office, and created a baronet. In 1717, when an invasion of Great Britain was projected by Charles XII. of Sweden, sir George was sent to the Baltic with a fleet, which acted in concert with the Danes, and remained there till the Swedes had abandoned their design. In the following year the Spaniards landed an army in Sicily, and sir George Byng was deputed with a fleet to counteract their operations. This was conducted in a manner that redounded very highly to his reputation and to the honour of the British flag. Upon his arrival in the bay of Naples, he found that the Spaniards

had made themselves masters of the town of Messina, and were engaged in the siege of the citadel. The English were obliged, by their treaties with the emperor, to defend the Sicilians; but as England and Spain were not at war, the admiral attempted to negotiate with the Spanish commander a cessation of hostilities; his efforts, however, were ineffectual, and he proceeded, according to his instructions, to make use of force. Having deserted the Spanish fleet, consisting of 27 sail of ships of the line and frigates, he commenced the attack; and in the running fight which ensued, took seven Spanish ships, the admiral's being one of them; and several more were afterwards captured and destroyed by a detachment under captain Walton, who, in the laconic style of an officer, who valued himself more in performing than in describing a gallant action, informs the admiral, "We have taken and destroyed all the Spanish ships and vessels which were upon the coast, the number as per margin." The damage sustained by the English fleet, which, indeed, was of somewhat superior force, was very inconsiderable. The Spaniards complained of being taken by surprise, and when they had no apprehension of hostilities. The conduct of sir George Byng, however, who executed the orders with which he had been entrusted, was not censurable; and the action was very important to the state of political affairs at the period in which it occurred. The admiral remained in the Mediterranean, assisting the German troops to recover Sicily, and preventing the escape of the Spanish troops, till all affairs were settled, and the court of Spain had acceded to the quadruple alliance. The talents displayed by the admiral on this occasion, both as a negociator and as a commander, were such as to insure the confidence of all parties. Upon his return, his services were rewarded with the office of treasurer of the navy, and the rank of rear-admiral of Great Britain; and in 1721, he was raised to an English peerage by the title of viscount Torrington and baron Byng of Southill, Bedfordshire. He was also created a knight of the bath in 1725. On the accession of George II. he was placed at the head of the admiralty, in which station he died of an asthma, in January, 1733, in the 70th year of his age. He had several children, one of whom was the unfortunate admiral John Byng, executed upon a rigorous sentence, for defect of duty, in 1757. Biog. Brit.

BYNNI, in *Ichthyology*, a species of CYPRINUS, distinguished by having thirteen rays in the dorsal fin, the third of which is thick and horny: tail linear, bifid: beards or cirri, four. Forks. A fish of a silvery colour, and oblong oval form, that is very common in the Nile. The length is about one cubit: the flesh excellent.

BYRAM. See BAHAM.

BYRAN, in *Geography*, a river of North America, forming part of the western boundary of Connecticut, and falling into Long Island sound, opposite to Captain's Islands.

BYRAN, a town in America, in Charles county, Maryland, about 9 miles N. E. from Fort Tobacco, and 24 S. E. from the Federal city.

BYRD FORT, lies on the eastern bank of Monongahela river, on the south side of the mouth of Red-stone Creek; 35 miles S. from Pittsburg, and about 39 N. W. from Ohio-pyle Falls. Near this spot stands the compact part of the town of Brownville. N. lat. 39° 58'. W. long. 81° 12'.

BYROM, JOHN, in *Biography*, a poetical writer, and inventor of a new short hand, was born at Kerfal near Manchester, in 1691; and having finished his course of grammar learning at Merchant Taylor's school in London, was admitted a pensioner of Trinity college in the university of Cambridge, in 1708. To logic and philosophy he directed only that degree of attention which was necessary to qualify him

him for his degrees; but his predominant inclination was to poetry; and of his talents in this way, the first public specimen appeared in his beautiful pastoral, "Colin to Phœbe," printed in the 8th volume of the Spectator, No. 603; the two letters on dreams in the same volume, 586 and 593, are also ascribed to him. Mr. Byrom, having taken both his degrees in arts, was chosen fellow of his college in 1714, and by the sweetness of his temper and the sobriety of his manners, recommended himself to the particular notice of Dr. Bentley, the master. His fellowship however terminated in 1716, on account of his not having entered into holy orders; and leaving college, he went abroad and resided for some time at Montpellier for the recovery of his health. In France he became acquainted with Father Malebranche's Search after Truth, and some pieces of Mad. Antoinette Bourignon; and he returned home prepossessed in favour of the visionary philosophy of the former, and the enthusiastic extravagance of the latter: indeed, towards the close of his life he seems, by some of his poems, to have been attached to the mysticism of Jacob Boehmen. Whilst he was deliberating what course of life to pursue, his mind became more unsettled in consequence of his passion for an amiable cousin, who encouraged his addresses, and whom at length he married against the consent of her parents. This connection involved him in difficulties; and as he obtained no assistance from her father, who was in affluent circumstances, he was reduced to the necessity of seeking support by teaching short hand, according to a new method which he had invented at Cambridge. He began at Manchester, and leaving his wife with her relations at that place, he removed to London, where he prosecuted his instructions in that art, deriving from them for several years a competent subsistence. In this art he was a competitor with Weston, who challenged him to a trial of skill. In this contest he gained a decisive victory; and in consequence of it, he was encouraged by a great number of pupils, several of whom were persons of rank and quality; and he occasionally read a lecture upon the history and utility of short hand, which, being interspersed with various strokes of wit that were natural to him, was very entertaining. His winter months were devoted to this employment in London, and he spent the summer season with his family at Manchester. In March 1724, he was chosen a fellow of the Royal Society. At length the family estate at Kersal devolved upon him by the death of his elder brother, without issue. By this accession of fortune he was enabled to enjoy, without those interruptions which his former employment had occasioned, the conjugal felicity to which his own disposition was adapted, and to which the faithful and affectionate attachment of his wife very eminently contributed. During the latter part of his life, he almost wholly devoted himself to the composition of various pieces in verse, some of which are witty and humorous; and others, the most numerous, are on serious subjects. He was so accustomed to the language of poetry, that his dissertations on learned and critical questions were written in verse. These were collected in September, 1773, and printed at Manchester in two volumes, 12mo. Mr. Byrom closed an innocent and inoffensive life with resignation and cheerfulness at Manchester in September, 1763, in the 72d year of his age. Some time before his death, he is said to have committed several of his lighter pieces to the flames; and these were of such a nature that they deserve the character expressed in a distich of Ovid, adopted as the motto of Mr. Waller's works:

"Non ego mordaci distrinxi carmine quemquam;

Nulla venenato est litera mixta joco."

By the great truths of Christianity his mind had been so much impressed in his early years, that he derived his chief pleasure from employing his pen on religious subjects. Mr.

Pegge, (Archeol, vol. v. p. 12, — 32) has thus delineated his character: "My late worthy friend, Mr. Byrom, whose memory I shall always revere, was undoubtedly a man of parts and learning, but rather too fond sometimes of paradox. Amidst his other qualifications, he had a particular knack at versification, and has accordingly delivered his sentiments on this subject (viz. the History of St. George) as well as on all others, in a metrical garb; for, I presume, we can scarcely call it a poetical one." Biog. Brit.

BYRON'S bay, in *Geography*, lies on the north-east coast of Labrador.

BYRON'S island, a low flat island in the Pacific ocean, about 21 miles in length. S. lat. 1° 18'. E. long. 171°.

BYRON'S strait, a narrow sea which separates New Ireland from New Hanover.

BYRRHUS, in *Entomology*, a genus of coleopterous insects having the antennæ clavated and the club perforiated; palpi, or feelers, equal and somewhat clavated; and both the jaw and lip bifid.

The species of this genus are *gigas*, *pilula*, *ater*, *dorsalis*, *varius*, *aneus*, *nitidus*, *fasciatus*, and *viridescens*.

BYSCHIZ, in *Geography*, a town in Bohemia in the circle of Bolestaw: 6 miles E. of Melnik.

BYSSUS, in *Botany*, (βύσσο; Gr. said by Julius Pollux to be a species of flax, brought from India into Egypt: but Pausanias and Philostratus describe it as the produce of a tree, supposed by Dillenius to be the now well known woolly substance in which the seeds of gossypium, or the cotton tree, are enveloped. Dillenius seems to be the first among the moderns who revived the name and applied it to a tribe of plants till then either neglected or confounded with the fungi and lichens. It appeared in his edition of Ray's Synopsis, 1724, and afterwards more fully in his Historia Muscorum, 1741; but had in the mean time been adopted by Micheli in his Nova Genera, 1729.) Linn. gen. 1208. Schreb. 1673. Juss. 6. Class and order, *cryptogamia algæ*. Nat. ord. *Algæ* Jussieu. Gen. ch. "Fibres simple, uniform, like fine down. Frustrification unknown." The genus as it was formed by Dillenius included species, some of which have the appearance of very minute dust, others of fine wool; it is accordingly divided by Linnæus into two distinct sections. Haller was of opinion that the powdery Byssi are properly lichens; Dr. Withering, in the third edition of his Botanical Arrangements, has actually placed them in that genus; and Dr. Smith was once inclined to entertain the same idea, (See English Botany, p. 192.) but on farther consideration he has adopted Acharius's new genus lepraria for all the species that have no shields, and appear to be propagated by their powdery part. (See Eng. Bot. p. 134.) Supported by such respectable authority we have made the necessary alteration in the generic character, and shall insert in the present article only such as consist of real filaments.

Species 1. *B. septica*, Linn. Syst. Nat. vol. 3. p. 235. "Hair-like, very soft, parallel, very easily broken, pale." Flaky Snow Byssus; Dill. Musc. tab. 1. fig. 9. It consists of unbranched threads so tender and light that the breath will disperse it, and when handled seems to dissolve into water from the moisture attached to it. Found in damp cellars and vaults, most luxuriantly on bins or wooden shelves where wine has been spilt, hanging down in form of a jelly bag, to the length of a foot or more. Withering, 2. *B. flos aquæ*, Linn. Sp. Pl. "Threads feathered, swimming on water." Naturalists are divided in opinion concerning this substance. Linnæus seems to have founded his specific character on the observations of Bergius. Dillenius, by whom it was first mentioned in a botanical point of view, in his edition of Ray's Synopsis, compares it to paper, and says, that in spring it covers stagnant waters with a very thin and even crust, not like

like a conferva, consisting of threads, nor of any perceptible downy matter, but merely of a thin green lamina. Linnæus in his *Flora Laponica*, published thirteen years afterwards, notices a green farinaceous Byffus intermingled with water, which Dillenius, in his *Historia Mulcorum*, quotes as a synonym of his green paper Byffus, observing that this plant also at first consists of a powdery matter which afterwards unites itself into a membranaceous substance, and when dry becomes white; it is the aquatic membranaceous Byffus of the *Flora Laponica*, which Linnæus himself in the *Species Plantarum* makes a variety of *B. flos aquæ*. Weir, in his *Cryptogamia*, asserts that it is not a real plant, but only unorganised vegetable matter, produced by the dissolution of putrefied plants. Dr. Withering, on the other hand, believed that it will prove a conferva; for observing a pond in the state of flowering, as the country people term it, he examined some of the water, but the particles floating in it were so minute, that even with the assistance of a very good microscope he could not satisfy himself as to their figure or structure. Two or three weeks later in the spring, he found threads not jointed nor branched, either straight or coiled up like a cork-screw. Some of this water kept in a glass jar, after two or three weeks more, let its contents subside, and then it began to appear like a conferva. The threads soon became much larger and assumed a jointed appearance. La Marek describes it from actual observation as consisting of short, feathered, extremely fine threads, forming a soft green crust on the surface of the water. 3. *B. cancellata* Linn. "Threads exactly and universally latticed." Lederm. Micro. tab. 72. Found in fresh still waters, swimming like a kind of mucor or mould of a yellowish green colour. 4. *B. phosphorea*. Linn. "Downy, of a violet colour, and growing on rotten wood." Dill. tab. 1. fig. 6. Consisting at first of very fine short upright down; afterwards pressed close to the wood, cloathing it like a thin membrane or crust, taking a deeper violet colour. 5. *B. velutina* Linn. "Filamentous; green: filaments branched." Dill. tab. 1. fig. 14. Found on trees, rocks, and the surface of the ground in shady places, which it covers with a very fine short silky down, like velvet, of a beautiful green colour. 6. *B. aurea* Linn. "Filaments simple or branched, closely matted together, powdery, orange-coloured." Dr. Smith, Dill. tab. 1. fig. 16. Eng. Bot. 212. Fibres very fine, thick-set, erect. Found on calcareous rocks and banks, particularly in Derbyshire, and sometimes on damp limestone buildings. It often uniformly covers a space of many inches in diameter, and looks like a fine piece of orange-coloured cloth or velvet, but the surface is sometimes more tufted and broken, and it frequently grows in a straggling manner, scattered over mosses. It loses its beautiful golden colour in five or six weeks after it is gathered, and then becomes of a permanent greenish grey. Dr. Smith. 7. *B. nigra* Hud. "Filaments branched, matted, powdery, black." Dr. Smith, Dill. 1. 18. Eng. Bot. 703. First sent to Dillenius by Dr. Richardson from the west-riding of Yorkshire. It has since been often found on shady overhanging rocks in the alpine parts of England, Scotland, and Wales. It forms patches of various sizes, perfectly black, and may easily be scraped from the stone. When gathered, it strongly resembles a piece of felt scraped from a hat, both in texture and colour. It consists of a mat of fine, soft, but elastic, branched filaments, often covered with an equally black, stony powder, which is probably the seed, though it has not been observed to be produced at any particular season exclusively. Dr. Smith. 8. *B. purpurea*. Lightfoot; (*Rubia Huds.* 2d. ed.) "Filaments erect, simple or branched, purple." Dr. Smith. Eng. Bot. 192. Filaments scarcely longer than the breadth of a hair, thick-set, in broad uniform patches. When much moistened

these filaments become clotted together in clusters, and in that moist state exhale a kind of sweet scent, agreeing in this respect with the *Byffus lolithus* of Linnæus, which is however really a crustaceous lichen. Dr. Smith. Found by the Rev. Hugh Davies on the micaceous rocks of Anglesea, and by Mr. Lightfoot on the base of Abbot Mackinnon's tomb in Y-comb-kill. 9. *B. fulva* Hudson. "Filaments branched, tawny." Dill. tab. 1. fig. 17. Filaments longer, more rigid and more loosely disposed than those of *B. aurea*. It retains its colour when dry. On putrid wood. 10. *B. barbata* Huds. (*B. aurantiaca* La Marek, *fulva* Wath.) "Filaments upright, branched, bundled, with annual interruptions, tawny, with smooth, swelled, deeper-coloured tips." Dr. Smith. Dill. tab. 1. fig. 19. Weth. Bot. Ar. tab. 18. fig. 5. Lenz. Bot. 701. It forms perennial, thick, tawny-coloured tufts, from one to two inches high. The growth of each year is marked by a swelling and a darker colour in each principal filament or stem. Young plants consist of a simple filament, regularly and beautifully feathered at the summit. In fine specimens sent by the right honourable Lady Elizabeth Noel to Dr. Withering and Dr. Smith, the swelled tips were remarkably conspicuous, and, as her ladyship with great probability supposed, contained the fructification. These tips are smooth, semi-transparent, and of a rich saffron colour. In Dr. Withering's specimens, when examined in the microscope, they were observed to be filled with granules, and to be beset with brittle-shaped tubes, pointing upwards. In Dr. Smith's specimens, which he conjectures were in a less advanced state, they had not the same appearance. On moist rotten wood. 11. *B. candida* Huds. "Filaments much branched: branches fasciculated, white." Dill. in Ray's Syn. tab. 23. as it grew on an old beam in a cellar. Dill. Hill. tab. 1. A. on an oak leaf; B. on the half rotten sole of an old shoe. From a broadish, mucilaginous, villous base, spring various slender branches, spreading more in breadth than in height, elegantly divided and subdivided, and ending sometimes in numerous capillary fibres, but generally in surfaces a little expanded without any determinate number or figure. Substance pure white, luid, or yellowish, pressed close to the substance on which it grows. Dill. 12. *B. cryptarum* Linn. "Capillary, perennial, ash-coloured, adhering strong to the rock on which it grows." Dill. 1. 20. Filaments very tender, soft, greenish ash-coloured, an inch long, loosely disposed, so firmly attached as to be scarcely pulled off by the fingers. Linn. Filaments simple, dull white, brittle, diverging in a crowded manner from a centre, an inch and half long, and the thickness of a human hair. Dill.

BYSSUS, or BYSSUM, a fine sort of thready matter produced in India, Egypt, and about Elis in Achaia, of which the richest apparel was anciently made, especially that wore by the priests both Jewish and Egyptian.

In reality, the ancients seem to have applied the name indifferently to any kind of matter that was spun and wove finer than wool: so that it is probable there were divers sorts of byffus. It is certain, that Aristotle gave the name byffus to the hair or silken threads of the *pinna marina*; whether it were on account of its resemblance to the byffus of which cloths were made, or whether it were that this was the true byffus itself. What countenances this latter opinion is, that the byffus of the *pinna marina* may be spun, and consequently there is little doubt but that in ages when silk was scarce, it might be used in the cloaths of great men. Add, that this byffus, though grossly spun, appears much finer and more beautiful than wool, and comes not much short of silk. Stockings and other such manufactures are still made of it, which would be more valuable if silk were less

less common. To spin this byffus, they leave it some days in a cellar to moisten and grow soft: after this they comb it to get out the impurities, and, lastly, spin it as they do silk. Gesner, Hist. Anim. l. 4. c. 6. Acad. des Sc. Ann. 1712, M. p. 204: others think that the byffus signifies a kind of very fine flax, which grew in Egypt or Judæa. Bochart, Phaleg. l. iii. c. 4. Others again are of opinion that it is cotton, or a mixture of linen and cotton. The probability of its being cotton is strengthened by the description given of the byffus by Pollux, which cannot be applied to any thing but cotton. This writer says (l. vii. c. 17), that this material came from a kind of nut which grew in Egypt, and also in India; that they opened the nut, extracted this substance, spun it, and wove it for garments. Philostratus (de Vit. Apollon. l. ii. c. 10) describes it much in the same manner. These characteristics agree very well with cotton. Arrian, Tertullian, and Mela, concur in representing the garments worn by the Indians as consisting of flax or wool, which was produced by the trees.

It is found in a kind of brown nut, which grows on a small shrub. Besides it seems evident from the analogy of languages, that the word used by Moses in describing Joseph's garment (Gen. xli. 42.) must mean cotton. This is the opinion of some of the most learned interpreters and commentators. We learn farther from profane authors, that robes of cotton were very ancient in Egypt, and that they were worn only by persons of the greatest distinction. Plin. H. N. l. xix. § 2. It is no less certain that robes of linen were also used in very ancient times; and it appears from the testimony of Moses, that flax was cultivated in Egypt from time immemorial. Exod. ix. 31. Deut. xxii. 11. Hence some have supposed that the ancient byffus was either a very fine sort of cotton, or a mixture of linen and cotton. Forster "de Byffo Antiquorum." Lond. 1776, 8vo. This ingenious writer, in an elaborate dissertation on the subject, cites a variety of passages from ancient authors, from which he concludes that the byffus was a kind of flax, if it may be so called, which was obtained from plants and trees in India, Arabia, and Egypt, denominated by the barbarians "Goffipion," and corresponding to the modern cotton. He adds, that the ancients were acquainted with two species of cotton trees, the "bombax" and "goffypium," both belonging to the Linnæan class of *monadelphica polyandria*. The byffus of which Pliny speaks (l. xix. c. 1.) and which he extols for its softness and whiteness, was the goffypium, or white cotton; and that of which Philostratus speaks (ubi supra), the colour of which was red, *φαιδὸς τεύβαν*, was obtained from "bombax." Osbeck, in his "Travels" (vol. I. p. 383) informs us, that the true flax was unknown in India and in Egypt, and yet in both these countries the same vegetables were cultivated and the same arts practised. We often read, however, of flax (*linum*) in works pertaining to the Egyptians, as composing the vestures of the priests and others, particularly when they celebrated the mysteries of Isis. What this substance was is explained by Pliny, when he says that garments of cotton were much valued by the Egyptian priests, "Vestes indè (Xylinx) sacerdotibus gratissimæ." The "vestes xylinx" were synonymous with the "vestes byffinx." Moreover, Plutarch (in Isis and Herodotus, l. ii. c. 86) inform us, that the religion of the Egyptians enjoined their wrapping up dead bodies in stuffs woven with byffus. That this byffus was our cotton is evident from the authorities to which Mr. R. Foister refers; and it may be also inferred from the fillets which were bound round their mummies. Authors usually distinguish two sorts of byffus, that of Elis, and that of Judæa, which was the finest. Of this latter were the priestly ornaments made. Bon-

fricius notes, that there must have been two sorts of byffus, one finer than the ordinary, by reason there are two Hebrew words used in Scripture to denote byffus, one of which is always used in speaking of the habit of the priests, and the other of that of the Levites. See Luke xvi. 19.

BYSSUS *montinus*. See AMIANTHUS.

BYSTRICZA, in *Geography*, a town of Poland, in the palatinate of Volhynia; 80 miles N. E. of Lucko.

BYSTROPOGON, in *Botany*, (from *βυσ*, obturo, and *πογον*, barba; the mouth being closed by a sort of beard.) P'Herit. Sert. Angl. t. 22. 23. Juss. 449. Vent. 2. 3. 4. Willd. 1101. Bose Nouveau Dict. Clafs and order, *didynamia gymnospermia*. Nat. Ord. *Terticillate*, Linn. *Labiate*, Juss.

Gen. Ch. *Cal.* one-leaved, generally with five awns, closed by a beard at the opening. *Cor.* one-petalled, ringent; upper lip bifid; lower three-lobed; middle lobe the largest. *Stam.* filaments four, distant; anthers incumbent. *Pist.* germ superior, four-parted; style awl-shaped; stigma simple or bifid. *Peric.* none. *Calyx* closed with a beard, and containing the seeds. *Seeds* four.

Ess. Char. *Cal.* bearded. *Cor.* upper lip bifid; lower three-lobed. *Stamens* distant.

Species. 1. *B. pedunculata*, P'Herit. (*nepeta pedinata*, Linn.) "Panicles compact; flowers directed one way; leaves ovate."

*Root* perennial. *Stem* five or six feet high, four-cornered, even; branches in pairs; each pair at right angles with the next, scarcely fragrant. *Leaves* petioled, heart-shaped, veined, naked, ferrated. *Spikes* terminal, interrupted, scarcely foliaceous, in peduncled whorls. *Braçtes* bristle-shaped, numerous, the length of the flowers. *Calyx* five-parted, bristle-shaped. *Corolla* yellow, scarcely the length of the calyx; border five-cleft; four segments equal, acute, spreading; the fifth, or lip purplish, rather round. (Such is the description of the corolla in Willdenow, with which that of professor Martyn in Miller agrees; but if any regard is to be paid to the essential generic character, two of the equal segments constitute the upper lip, and the other two, with the intermediate larger segment, belong to the lower lip.) *Style* purplish. *Stigma* simple. A native of Jamaica and Peru. 2. *B. fidaefolium*, P'Herit. "Panicles very loose; peduncles in whorls, filiform; leaves heart-shaped." A native of Peru; discovered by Dombey.

3. *B. suaveolens*, P'Herit. (*Ballota suaveolens*, Linn. *Melissa Jamaicana*, Pluk. tab. 306. f. 3. *Spicata*, Plum. tab. 163. f. 1. *Mentastrium maximum*, Sloane, tab. 102. f. 2. *Mesospberum hirsutum*, Browne, tab. 18. f. 3.) "Peduncles axillary, solitary; calyxes truncate, awned; leaves heart-shaped." *Root* annual. *Stem* upright, shrubby at the bottom, branched, hirsute. *Leaves* opposite, roundish, crenate, nerved, villous; petioles long, slender, lax. *Peduncles* axillary, three or five-flowered. *Flowers* approximating, blue; calyx ten-streaked, villous, viscid; teeth awned, upright, villous; tube of the corolla narrower at the base; filaments, from the bottom of the tube, standing up above the opening of the corolla, pubescent; anthers blackish. *Germ* ovate; style shorter than the stamens; stigma simple, blunt. *Seeds* two, seldom four, naked, ovate, black, slightly compressed. A native of South America and the West Indies. It is called by the Portuguese *erva cidreira*, from its smelling like a citron; in Jamaica, *spikenard*, from its pleasant smell. It is one of the most grateful cephalics and alexipharmics; and may be used in disorders of the nerves and viscera, where such warm medicines are required. Martyn from Swartz, Sloane, and Browne. 4. *B. plumosum*, P'Herit. (*Mentha plumosa*, Linn. Sup.) "Panicles dichotomous; calyxes feathered; leaves ovate, somewhat ferrated, tomentose beneath." *Panicles* terminal and axillary, several times dichotomous, deriving a  
round

round form from their divaricated, little branches, hairy. *Calyxes* flat, stellate; rays awl-shaped, very hairy, spreading. *Corolla* small; receptacle villous. A native of the Canary Islands, where it was found by Masson. 5. *B. origanifolium*, P'Herit. "Panicles dichotomous; calyxes feathered; leaves ovate, very entire, very white beneath." Found also by Masson. This, and the preceding, to which it is nearly allied, connect the first three species with the two succeeding, P'Herit. 6. *B. Canariensis*, P'Herit. (*Mentha Canariensis*, Linn. Sp. Pl. Pluk. t. 307. f. 2. *Heliotropium*, Camar. Comm. Hort. t. 65.) "Peduncles dichotomous; flowers capitate; leaves ovate, crenate, rather villous beneath." Root perennial. Stem woody, three or four feet high, much branched. Leaves on long petioles, hairy, and ash-coloured on their under side. Peduncles lateral, pretty long, each sustaining four roundish heads, dividing by pairs, and spreading from each other. Flowers white. A native of the Canary Islands and Madeira. It was cultivated in 1714, by the dukes of Beaufort, and has been called by the English gardeners *Madam Maintenon*. 7. *B. punctatum*, P'Herit. "Peduncles dichotomous; flowers capitate; leaves ovate, toothed, smooth, finely dotted." Segments of the calyx not awl-shaped as in all the other species. Native of Madeira; introduced into England in 1775, by Sir Joseph Banks, bart.

BYSTRZICA, in *Geography*, a town of Lithuania, in the palatinate of Wilna; 24 miles N. E. of Wilna.

BYSZOW, a town of the duchy of Courland; 42 miles S. S. W. of Goldingen.

BYTESCH, a town of Moravia, in the circle of Brunn; 17 miles W. N. W. of Brunn.

BYTIN, a town of Lithuania, in the palatinate of Novogrodek; 40 miles S. S. W. of Novogrodek.

BYTTNERA, in *Botany*. See BÜTTNERA.

BYZACIUM, or BIZACIUM, in *Ancient Geography*, one of the two provinces into which Africa Propria was divided: the other being Zeugitania, or the *Regio ZEUGITANA*. Shaw, in his geographical description of the kingdom of Tunis, with which Africa Propria nearly corresponds, divides it into the *Summer* and *Winter* circuits; the former being comprehended under the denomination of Zeugitania, and the latter under that of Byzacium. This province, or at least the sea-coast of it, seems to have been the "Emporia" of Livy and Polybius, so called on account of the number of its ports appropriated to the commerce of grain. It was bounded on the north by the proconsular province; on the east by the Mediterranean sea and the river Triton; on the south by a part of Libya; and on the west by Numidia. Its capital city was *Adrumetum*. It was inhabited, according to Pliny (l. x. c. 4.) and Strabo (l. xvii. p. 1192) by the Libyphœnicians, that is, by a mixture of Aborigines, or native Africans, and Carthaginians. Pliny asserts that it was about 250 Roman miles in circumference, and that the soil was so fertile as to produce an hundred fold. With regard to its extent, Dr. Shaw observes (Travels, p. 72), that if we bound Bizacium to the N. and S. with the parallels of Adrumetum and Tacape, and to the W. with Susestula, one of the western cities of it, we shall have a circuit of at least 500 Roman miles. Its limits, however, are not easily defined with precision, because the ancients have passed over the interior part of it bordering upon Libya, in a very slight manner, and have very much mistaken the course, magnitude, and source of the river Triton. However, Byzacium appears not to have differed much in extent and situation from the present winter circuit of the Tunisiens. As to its fertility, Dr. Shaw observes, that it falls vastly short of the character attributed to it by the ancients. The parts which are adja-

cent to the sea-coast are generally of a dry sandy nature with no great depth of soil in the best of them; and they are planted, for the most part, with olive-trees, which flourish in great perfection: neither is the inland country in a much better condition.

BYZANT. See BESANT.

BYZANTINA blatta. See BLATTA.

BYZANTINE *Historians*, in *Literary History*, a denomination distinguishing those Greek writers, who flourished from the time of Constantine the Great, in the beginning of the 4th century, who transferred the seat of empire from Rome to Constantinople (Byzantium) A. D. 328, till the year 1453, when the eastern empire terminated on occasion of the capture of Constantinople by Mahomed II. Of the Greek writers, to whom this appellation is peculiarly appropriated, the principal are the following, viz. Zosimus, Zonaras, Nicetas Choniates, Nicephorus Gregoras, Chalcocondyles, Syncellus, Theophanes, Leo Grammaticus, Cedrenus, Glycas, Constantine Manchas, Agathius, Theophylact, Genesius, Constantine Porphyrogenetta, Anna Comnena, Phranza, Cinnamus or Sannamus, George Acropolita, George Pachymer, Jo. Cantacuzenus, G. Codinus, M. Ducas, and Procopius. The whole series of Byzantine writers comprised in 36 volumes, fol. has gradually issued (A. D. 1648, &c.) from the royal press of the Louvre, with some collateral aid from Rome and Leipzig; but the last edition or that of Venice in 28 vols. fol. A. D. 1729, &c. though cheaper and more copious, is not less inferior in correctness than in magnificence to that of Paris. The merits of the French editors are various; but the value of Anna Comnena, Cinnamus, &c. is enhanced by the historical notes of Charles du Fresne du Cange. Fab. Bib. Græc. l. v. c. 5. tom. vi. p. 229, &c.

BYZANTINE *MS.*, in *Biblical History*, a Greek MS. containing the four Gospels, collated by Wettstein and noted 86 in the first part of his N. T. Its age is not ascertained; it was purchased by Alexius Comnenus II., in 1183; and preserved at Presburg.

BYZANTIUM, in *Ancient Geography*, now known by the name of *Constantinople*, and called by the Turks *Stamboul*, or *Istanbul*, a Turkish corruption of εἰς τὴν πόλιν, a city of Thrace, situated in a promontory nearly of a triangular form. The obtuse point of the unequal triangle, which represents the figure of Constantinople in its present extent, advances towards the east, and the shores of Asia, meeting and repelling the waves of the Thracian Bosphorus. The northern side of the city is bounded by the harbour; and the southern is washed by the Propontis, or sea of Marmara. The basis of the triangle is opposed to the west, and terminates the continent of Europe. On the point of the promontory stood the citadel. The walls of the city were built of large square stones, so jointed as apparently to form only a single block; they were much loftier on the land's side than towards the water, being naturally defended by the waves, and in some places by the rocks, on which they were built, and which project into the sea. This city, besides a gymnasium, and several kinds of public edifices, possessed all the conveniences which a rich and numerous people were able to procure. They assembled in a forum, spacious enough to contain a small army ranged in order of battle: and there they confirmed or rejected the decrees of their senate. The territory of Byzantium produced abundance of grain and fruits; but it was exposed to the frequent incursions of the Thracians, who inhabited the adjoining villages. The harbour supplied a vast quantity of fish in autumn, when they descended from the Euxine into the lower seas, and also in the spring, on their return to the Pontus. This fishery, and the curing of the fish, furnished large

large sums to the revenues of the city, which was crowded also with merchants, and supported by an active and flourishing commerce. Its port, sheltered on every side from tempests, attracted thither the vessels of all the Grecian nations; and its situation at the head of the strait enabled it to stop, or subject to heavy duties, the foreign merchants who traded in the Euxine, and to furnish the nations who drew from it their subsistence. Hence arose the constant endeavours of the Athenians and Lacedæmonians to engage this city in their interests.

Byzantium was founded, according to Eusebius (in Chron.) about the third year of the 30th Olympiad, while Tullus Hostilius reigned at Rome. But Diodorus Siculus (l. v.) asserts, that the foundations of this city were laid in the time of the Argonauts, about 1263 years before Christ, by one Byzas, who then reigned in the neighbouring country, and from whose name the city was called Byzantium.

This Byzas, if we may credit Eustathius (in Dionys. v. 804.) arrived in Thrace a little before the Argonauts came into those seas, and settled there with a colony of Megareans. Others say, that the navigator Byzas, who was styled the son of Neptune, founded the city 656 years before the Christian æra: and that his followers were drawn from Argos and Megara. See Scaliger Animadv. ad Euseb. p. 81. Du-Cange Constantinopolis, l. i. p. i. cap. 15, 16. Some ancient medals of Byzantium, which have reached our times, bear the name and head of Byzas, with the prow of a ship on the reverse, probably of that ship which brought him into Thrace.

Velleius Paterculus (l. ii. c. 15.) ascribes the glory of founding this great metropolis to the Milesians; and Ammianus Marcellinus (l. xxii. c. 8.) to the inhabitants of Attica. Justin (l. ix. c. i.) says, that it was built by Pausanias king of Lacedæmon; but in this he must have been mistaken, since it is certain, that Pausanias, the commander of the Lacedæmonian fleet, took it (about the year B. C. 476.) from the Persians, who had made themselves masters of it before the king of Lacedæmon had ever been in Asia. (Thucyd. l. iii. Herodot. l. iv.) Pausanias might probably have rebuilt and fortified it, whilst he continued in possession of it, and carried on a secret conspiracy with the Persians. It underwent many revolutions, having been sometimes subject to the Persians, sometimes to the Lacedæmonians, and also to the Athenians, who took possession of it about the year B. C. 407. About the year 340 B. C. Philip of Macedon laid siege to this city; but was compelled to raise it, and to retreat, by Phocion, the Athenian general. Its situation was justly considered by the ancients as the most pleasant, and also the most convenient, for trade, of any in the world; and it is therefore no wonder, that the possession of it should be an object of various and successive contests. After many vicissitudes, Vespasian, A. D. 71, reduced Greece, which Nero had declared free, and likewise Lycia, Rhodes, Byzantium, Samos, Thrace, and Cilicia, to Roman provinces, alleging, that they were no longer capable of liberty, since they only made use of it to undo themselves by their intestine divisions. In the contest between Niger and the emperor Severus, the former placed a numerous garrison in Byzantium, and the latter instead of pursuing his enemy and besieging him in this strong city, detached a large body of troops to Cyzicus, near which a battle ensued between them and the numerous army of Æmilianus, which terminated in a defeat of this general, and obliged Niger to quit Byzantium, A. D. 194. Upon this Severus invested the place abandoned by his enemy, and commenced a siege, which lasted three years. The bloody battle of Issus decided this contest; and the head of Niger was sent by Severus to his army, encamped before Byzantium, and exhibited to the besieged on the

point of a spear: and from Byzantium it was sent to Rome, as the token and trophy of Severus's victory. Such were the strength of this city, its advantageous situation for defence, and the obliquity of the besieged, that it was not subdued without many assaults and many sallies, which render the capture of it one of the most extraordinary events in military history. On the side of the sea it was guarded by a harbour into which the current set with such violence, that those who attempted to approach the city in this way were obliged to pass under its walls. Although the walls were not high, the sea itself, and its rocks, were a sufficient barrier. On the land side, care had been taken to fortify it with high and thick walls, built of hewn stones fastened together with cramps of iron; and the whole circuit was flanked with towers built in such manner and at such distances, that they defended one another. Before and during the siege, the Byzantines had provided themselves with various machines of war, some of which hurled large beams and stones upon the besiegers on their approach, and others threw at them showers of darts and smaller stones to a greater distance. Strong iron hooks fastened to chains were sunk at the foot of the wall and dragged up whatever they laid hold of. These machines were mostly constructed by one Prifeus, a Bithynian, and a famous engineer; who, after the surrender of the place, was sentenced to death by the generals of Severus, but obtained his pardon of the emperor, in the prospect of deriving from his talents future services. The entrance of the harbour of Byzantium was barred by a chain, and upon the piers, which advanced on each side into the sea, were built towers for preventing the approach of an enemy. This harbour contained 500 small vessels, most of which were armed with pointed prows of iron; and some of them had two rudders, one at each end of the ship, and a double complement of men; by which means they could at a moment's warning, and without tacking about, either advance upon the enemy or fall back, as occasion required. Dion Cassius informs us, that the Byzantines successfully practised a stratagem for taking some of the enemy's ships, whilst they lay at anchor at some distance from the shore. They employed divers, who, swimming under water, cut the cable, and drove into the body of the ship a strong nail fastened to a rope, the other end of which was in one of their own vessels. This nail, being put in motion, dragged the other after it, and it thus appeared to move without oars or wind. As the besieged lost many of their ships, they built others of the timber of their houses, and the women cut off their hair in order to furnish materials for ropes. When their supply of darts and common stones failed, they made use of the stones of the walls of their theatres, which they demolished; nor did they spare the statues, even of brass, which adorned their city. Such was their distress by famine, that they were reduced to the necessity of soaking thongs of leather, in order to derive some nourishment from them, and at length of devouring one another. In this situation of extreme indigence and misery, some of the most robust and vigorous took advantage of a storm to embark on board of their ships and to seek a supply of food for their fellow citizens, or to perish in the attempt. Having overloaded their ships, the Romans attacked them in their return; and either overlet or sunk them all, so that not a single vessel escaped. The Byzantines, thus deprived of their only hope, opened their gates to the besiegers, and surrendered at discretion. The conquerors showed them no mercy; but massacred all the soldiers, magistrates, and commanders; and by order of the emperor, who exulted with his soldiers on the capture of the city, the estates of its inhabitants were confiscated; the city was deprived of its privileges and even of its title of city,

and was reduced to the condition of a mere village; so that it was subjected together with its territory to the jurisdiction of the Perinthians, who insolently abused their power. Its fortifications were totally dismantled; and thus Severus deprived the empire of one of its strongest bulwarks, which kept all Thrace in awe, and commanded Asia and the Euxine sea. "I saw it," says Dion Cassius, "in such a state of ruin and desolation as would have made any one think it had been conquered, not by Romans, but by barbarians." The emperor, at the request of his infant son, Caracalla, mitigated some part of its punishment, rebuilt a considerable part of it, calling it "Antonia" from the surname of Antonius, assumed by his son; but never restored it to its ancient privileges, nor reversed the order by which it was subjected to the Perinthians; for we find by ecclesiastical history, that till the time when Constantine rebuilt Byzantium and gave it his name, the bishop of this city acknowledged the bishop of Perinthus, or Haracla, for his metropolitan. In the year 262, the tyrant Gallienus exercised cruel vengeance on Byzantium for reasons which are not particularly specified; but the Byzantines having some ground for mistrusting him, at first shut their gates against him; but afterwards admitting him upon his promise of moderation and clemency, he basely broke his word, and caused both the garrison and inhabitants to be massacred; so that at the time when Trebellius Pollio wrote, there was not an ancient family in Byzantium, except such whose accidental absence, occasioned either by business or pleasure, or by their being employed in the armies, had preserved some remains. On occasion of the war between Licinius and Maximin, Byzantium was besieged and taken by the latter; but it was soon after recovered by Licinius. But in 324 Licinius was defeated by Constantine the Great, first at Adrianople and then at Chalcedon: and the cities of Byzantium and Chalcedon opened their gates to the conqueror. In the year 330, Constantine resolved to enlarge the ancient city of Byzantium, and to make it the second, if not the first, city of the Roman empire. Accordingly he began by extending its walls from sea to sea; and while some of the workmen were employed in rearing them, others were employed in raising a great number of stately buildings, and, among the rest, a palace equal in magnificence and extent to that of Rome. As he designed to fix his own court there, and was desirous that the succeeding emperors should follow his example, and honour his new city with their ordinary residence, he spared neither cost nor labour to render it both beautiful and convenient. With this view, he built a capitol and amphitheatre, formed a circus maximus, several forums, porticos, and public baths; and divided the whole city into 14 regions, securing the inhabitants by many wholesome laws, and granting them great privileges and immunities. By these means, Byzantium became, in a short time, one of the most flourishing and populous cities of the empire; whole families flocking thither from all parts, especially from Pontus, Thrace, and Asia. Constantine published an edict, importing that such as had lands in those countries should not be able to dispose of them, nor even leave them at their deaths to their heirs, unless they had a house in his new city. The common people were enticed thither from the most distant provinces, and even from Rome itself, by the emperor's donations, and the great quantity of corn, oil, and wheat, which was daily distributed among them. But however desirous the emperor was to see his new city filled with people, yet he did not choose it should be inhabited by any but Christians, and therefore he ordered all the idols to be pulled down, and their temples to be consecrated to the true God. He built, besides, an incredible number

of churches, and caused crosses to be erected in all the squares and public places. When most of the buildings were finished, the emperor on the 11th of May, in the year 330, the 25th of his reign, caused this city, by a very solemn dedication, to be consecrated, according to Cedrenus, to the Virgin Mary; but, according to Eusebius, to the God of Martyrs. It was on this occasion, that Constantine styled the new city after his own name, "Constantinople," or the city of Constantine, and likewise "second," or as others will have it, "New Rome." At the same time he put it on an equality with ancient Rome, granting it the same rights, immunities, and privileges, that were enjoyed by that metropolis. He established a senate, and other magistrates, with a power and authority equal to that of the Roman senate, and declared "New Rome" the metropolis of the east, as "Old Rome" was of the west. Constantine having accomplished this great work, according to some in five, according to others in two years, fixed his residence in the new city, and never more returned to Rome. The removal of the imperial seat from Rome to Constantinople happened in the year of the Christian æra 330, the 25th of Constantine's reign, and 1128 after the foundation of Rome. *Anc. Un. Hist.* vols. xiii. xiv. *Crevier's Roman Emperor*, vols. viii. ix. x. *Gibbon's Rom. Emp.* vol. iii. p. 1 &c. See **CONSTANTINOPLE**.

**BYZIA, VIZA, VISÉ**, in *Geography*, a mean town of Turkey in Europe, in Romania, which was anciently the residence of the kings of Thrace, and which has still a Greek bishop. It is situated in a sangiakship of the same name, which extends eastward from the foot of mount Hæmus to the sea of Marmara. See **BIZYA**.

**BYZO**. See **BIZU**.

**BZONNE**. See **BIZONE**.

**BZOVIVUS, or BZOWSKI, ABRAHAM**, in *Biography*, an industrious and voluminous writer, was born in Poland in 1567, and having studied at Cracow, entered into the order of Dominicans. He afterwards read lectures in philosophy at Milan, and in divinity at Bologna. On his return to Poland, he taught and preached with great applause, and became principal of a college belonging to his order; to the aggrandizement of which he very much contributed, by the erecting of churches and convents, by furnishing their libraries, and by reforming their constitutions. On his settlement at Rome, he became librarian to the duke of Bracciano; and having compiled "An Abridgement of Ecclesiastical History," taken chiefly from the annals of Baronius, he was induced to engage in the continuation of that work, and with this view lodgings were assigned to him by the pope in the Vatican. This work commencing in 1193, where Baronius had left off, was continued to his own times, and comprised in 12 volumes, folio, of which 9 have been printed: viz. 8 at Cologne, from 1616 to 1630, and the 9th at Rome in 1672. With a spirit similar to that of his predecessor he arrogates plenary power to the papal see, and manifests the zeal of a credulous and partial advocate rather than the fidelity of an historian. By his abuse of the emperor Lewis of Bavaria, he excited the indignation and remonstrances of the duke of Bavaria, a descendant of the same house, who obliged him to make a public retraction. He also offended the Franciscans, by his reproaches of Scotus, the "subtle doctor," and by other acts of hostility: and he likewise gave great offence to the Jesuits. His work is, upon the whole, little esteemed. Bzovivus wrote 3 volumes of the lives of the popes, and a great number of other works, which are completely sunk into oblivion. Having quitted the Vatican, he retired to the Dominican convent of Minerva, and died there in 1637. *Gen. Dist.*

# C.

## C

**C**, The third letter, or second consonant of the alphabet, has two sounds, one like *k*, as in the word *call*; and the other like *s*, as in *Cæsar*. It has the former sound before *a, o, u*, and a consonant; and the latter before *e, i*, and *y*. It might be omitted, says Dr. Johnson, in the language without loss, since one of its sounds might be supplied by *s*, and the other by *k*, but that it preserves to the eye the etymology of words, as *face* from *facies*, *captiue* from *captivus*. **C**, having no determinate sound, according to English orthography, never ends a word. **C** is formed, according to Scaliger, from the  $\chi$  of the Greeks, by retrenching the stem or upright line; though others derive it from the  $\beth$  of the Hebrews, which has in effect the same form; allowing only for this, that the Hebrews, reading backwards, and the Latins, &c. forwards, each have turned the letter their own way. However, the **C** not being the same as to sound with the Hebrew *capb*; and it being certain the Romans did not borrow their letters immediately from the Hebrews, or other Orientals, but from the Greeks; the derivation from the Greek  $\chi$  is the more probable. Add, that F. Montfaucon, in his *Palæographia*, gives us some forms of the Greek  $\chi$ , which come very near that of our **C**; this, for instance,  $\zeta$ : and Suidas calls the **C**, the Roman kappa. The second sound of **C** resembles that of the Greek  $\Sigma$ ; and many instances occur of ancient inscriptions, in which  $\Sigma$  has the same form with our **C**. Gruter, vol. i. p. 71. vol. iii. p. 1020.

All grammarians agree, that the Romans pronounced their **Q** like our **C**, and their **C** like our **K**. F. Mabillon adds, that Charles the Great was the first who wrote his name with a **C**; whereas all his predecessors of the same name wrote it with a **K**: and the same difference is observed in their coins. In Latin MSS. the **C** is often substituted for **Q**, as *cotidie* for *quotidie*, &c. and the use of **C** for **K** was very common among the Latins. By the negligence of copyists **C** is often put in the room of **P** in ancient MSS.; on some ancient medals of Sicily, particularly those of Gela, **C** occupies the place of  $\Gamma$ , as  $\text{CEA}\Omega\text{ION}$  for  $\text{ΓEA}\Omega\text{ION}$ : and the Romans for a long time retained it in the room of **G**.

**C** was also a numeral letter among the *Romans*, signifying an hundred: according to the verse,

“Non plus quam centum **C** litera fertur habere.”  
Some add, that a dash over it, made it signify an hundred thousand. **CC** denoted 200,000, and **CCC** 300,000, &c. In the Fasti and Calendars **C** denoted the day on which it was allowed to assemble the Comitia.

**C** is also an abbreviation.

In proper names, **C** was used for *Cains*; as **C. Cæsar**, &c. Their lawyers used it single for *Codice* or *Consule*, and double, **CC**, for *Consulibus*. On some marbles a **C** reversed,  $\text{C}$ , denoted *Caia*.

**C** was also used in their courts, as a letter of condemna-

## C A A

tion, and stood for *condemno*; in opposition to **A**, which signified *absolvo*. On this account the letter **C** was called “*Litera tristis*.” Cicero pro Milone, c. 6.

**C**, in *Music*, is the name of the second space in the base, the third space in the treble, and of every line on which the tenor or **C** clef is placed.

In the *guido* scale or gammut, the **C** in the second space in the base is called **C** fa-ut; its octave above, on the sixth line, **C** sol-fa-ut, as is the **C** in the third space in the treble, its octave.

**C** sometimes, in *Ital. Music*, stands for *canto*, as **C** 1, canto primo. It stands likewise, when placed at the clef, for common time, and, with a line through it, thus  $\text{C}$ , for cut time, or a quicker kind of movement.

In music of the 15th and 16th centuries, in specifying the time or moods, as they were then called, when triple time, which then was stiled *perfect*, and common time *imperfect*, the laws of prolation were very complicated and difficult to comprehend. An  $\bigcirc$ , or complete circle, implied perfect time, when, without a point, a long  $\text{C}$  was equal to three breves; a breve to three semi-breves, &c. and a **C**, or semi-circle, implied imperfect or binary time, which Morley calls “prolation of the less.” See MOONS, PROLATION, and TIME-TABLE.

When at the clef a concealed canon, (*canone chiufo*), had two different marks for time placed over each other, it implied, that one of the parts sung the notes as they were written, and the other doubled all their lengths, the upper part leads off the canon.

**C**, when placed in a score over the *viola*, or tenor part, implies *Col Basso*, with the base.

The French regard *ut* as the representative of **C**, the first note of their gammut; but Guido, the Italian, and the English always look upon **G** on the first line in the base, as the first note in the gammut, or scale of music. See HEXACHORD, PROPRIETY, and SOLMISATION.

In Gregorian notes on a staff of three lines only, **C** implies the tenor or **C** clef.

**C. Album**, in *Entomology*. See **C. ALBUM**.

**C. Aureum**. See **C. AUREUM**.

**CAA-APIA**, in *Botany*, the Brazilian name for the *Dorstenia Brasiliensis* of La Marek, first described by Marggrave and Piso, and since found by Commerçon, both in Brazil and Magellan.

**CAAB**, or **CAB BEN ZOHAIK**, in *Biography*, an eminent Arabian poet, was at first a Jewish rabbin; and when Mahomet made war on the tribes which had embraced Judaism, wrote some severe satirical verses against him. But, on Mahomet's subsequent success, he was proselyted, and presented

him with a copy of verses in his praise; upon which he was pardoned and received into favour. The impostor conferred on him the honour of his mantle which was afterwards purchased at a great price by the caliph Moavia from his heirs. Caab is said to have had a large share in the composition of the Koran. He died in the first year of the Hegira, A. D. 627. D'Herbelot.

CAABA, a square stone edifice in the temple of Mecca, supposed to have been built by Abraham and his son Ishmael; being the part principally revered by the Mahometans, and to which they always direct themselves in prayer. See **KEBLA**.

The word is Arabic, *caaba*, and *caabab*, a denomination which some will have given to this building, on account of its height, which surpasses that of the other buildings in Mecca; but others, with more probability, derive the name from the quadrangular form of this structure.

This edifice is indisputably so ancient, that its original use and the name of its builder are lost in a cloud of idle traditions. The Mahometans affirm, that it is almost coeval with the world, and they pretend, that Adam, after his expulsion from paradise, supplicated divine permission to erect a building like what he had seen there, called "Beit al Mamâr," or the frequented house, and "Al Dorâh," towards which he might direct his prayers, and which he might compass, as the angels do the celestial one. Upon which God let down a representation of that house in curtains of light, and set in Mecca, perpendicularly under its original, ordering the patriarch to turn towards it when he prayed, and to compass it by way of devotion. After Adam's death, they say, his son Seth built a house in the same form, of stones and clay, which, being destroyed by the deluge, was rebuilt by Abraham and Ishmael, at the command of God, in the place where the former had stood, and after the same model; directions for this purpose having been given them by revelation. Independently of these fabulous traditions, it is not improbable, that it was erected by some of the patriarchs descended from Ishmael; but whether it was built as a place of divine worship, as a fortress, as a sepulchre, or as a monument of the treaty between the old possessors of Arabia and the sons of Kedar, it is impossible to ascertain. Reland supposes that it was the mansion of some ancient patriarch, and on that account revered by his posterity. At length it came to be considered as a building appropriated to the service of the Pagan Arab divinities; but that it was not originally a temple seems to appear from these circumstances, that the door was not placed in the middle of the structure, and that, for many ages, there was no divine worship performed in it, though the Pagan Arabs frequently went in procession round it. It is most probable, however, that the Caaba was primarily designed for religious purposes; and it is certain, that it was held in the highest veneration long before the birth of Mahomet. Having undergone several reparations, it was, a few years after his birth, rebuilt by the tribe of Koreishi, who had acquired the custody of it either by fraud or force, on the same foundation; afterwards repaired by Abdallah Ebn Zobeir, the caliph of Mecca, and again rebuilt by Yusuf, surnamed Al Hejâj, in the 74th year of the Hegira, with some alterations, in the form in which it now remains.

The length of the Caaba, from north to south, is 24 cubits, its breadth, from east to west, 23 cubits, and its height 27 cubits. The door, which is on the east side, is raised about 4 cubits from the ground, and the floor is level with the bottom of the door. In the corner next this door is the "black stone" so celebrated amongst the Mahometans. This stone is set in silver, and fixed in the south-east corner of the building, or that which looks towards Basra, about 2 cubits and one third, or seven spans, from the ground. The Moslems

pretend, that it was one of the precious stones of Paradise, and that it fell down to the earth with Adam, and being taken up again, or otherwise preserved at the deluge, the angel Gabriel afterwards brought it back to Abraham, when he was building the Caaba. It was at first whiter than milk, but became black by the sins of mankind, or rather by the touches and kisses of so many people; the surface only being black, and the interior parts remaining still white. The Hindoos, (see Asiatic Researches, vol. iv. p. 371.) maintain, that this black stone was no other than the "linga," or "phallus" of Maha-deva, an ancient divinity; and that when the Caaba was rebuilt by Mahomet (as they affirm it to have been,) it was placed in the wall, out of contempt; but the newly converted pilgrims could not give up the worship of the black-stone; and sinister portents forced the ministers of the new religion to connive at it. Indeed, stones were worshipped not only in Arabia, particularly at Mecca, but were distinguished by the appellation of *βαυτολας*, (see *Βαυτολος*;) in Syria and Greece. It is also affirmed, that the black-stone was the object of an idolatrous worship from the most remote times. However this be, the black stone is held in very high estimation by the Mahometans, and is kissed by the pilgrims with great devotion, being called by some "the right-hand of God on earth." When the Karmatians profaned the temple of Mecca, and took away this stone, neither love nor money would induce them to restore it, though the inhabitants of Mecca offered no less than 5000 pieces of gold for it. However, after having kept it 22 years, and finding that they could not prevail with the pilgrims to abandon Mecca, they sent it back, with some contemptuous expressions, of their own accord. In the temple of Mecca is also the stone in Abraham's place, on which they pretend he stood when he built the Caaba, and bearing the traces of his footsteps; this is enclosed in an iron chest, and the Koran enjoins prayers to be offered before it. On the east side of the Caaba is the well Zemzem, which is covered with a small building or cupola, and the water of which bears the reputation of curing many bodily diseases, and even of washing away moral pollution and guilt. This water is much revered, as it is supposed to issue from the spring which supplied Ishmael when his mother Hagar wandered with him in the desert, and is not only drunk by the pilgrims on the spot, but conveyed in bottles to most parts of the Mahometan dominions. There is also a white stone, said to be the sepulchre of Ishmael, which is very ancient, and which was held in considerable repute among the Pagan Arabs. It is situated on the north side of the Caaba, within a semicircular enclosure, 50 cubits long, and receives the rain-water that falls off the Caaba by a spout, formerly of wood, but now of gold. The Caaba has a double roof, supported within by three octangular pillars of aloes wood, between which are suspended, on a bar of iron, some silver lamps. The outside is covered with rich black damask, adorned with an embroidered band of gold, which is changed every year, and which is provided by the Turkish emperors. At some distance the Caaba is surrounded, but not entirely, by a circular enclosure of pillars joined towards the bottom by a low ballustrade, and towards the top by bars of silver. Without this inner enclosure, on the south, north, and west side of the Caaba, are three buildings, which are the oratories, or places where three of the orthodox sects assemble to perform their devotion; and towards the south-east stand the edifice which covers the well Zemzem, the treasury, and the cupola of Al Abbas. All these buildings are enclosed, at a considerable distance by a magnificent piazza, or square colonnade, resembling the Royal Exchange of London, but much larger, covered with small domes and cupolas, from the four corners of which rise as many minarets or steeples, with double

galleries, and adorned with gilded spires and crests, as are the cupolas which cover the piazza and other buildings. Between the pillars of both inclosures hang a great number of lamps, which are constantly lighted at night. The first foundations of this outward inclosure were laid by Omar, the second caliph, who built no more than a low wall, to prevent the court of the Caaba, before open, from being encroached on by private buildings; but the structure has been since raised, by the liberality of many succeeding princes and great men, to its present lustre. The precincts of Mecca, to the distance of 10 miles from the Caaba, are considered as sacred, so that in these it is not lawful to attack an enemy, or even to hunt or fowl, or cut a branch from a tree; and they have long ago enjoyed the rights of sanctuary. The ceremonies prescribed to the pilgrims on their arrival at Mecca, consist chiefly in processions round the Caaba, running between the mounts Safâ and Merwâ, making the station on mount Arafat, slaying the victims, and shaving their heads in the valley of Minâ.

In compassing the Caaba, which they do seven times, beginning at the corner where the black-stone is fixed, they move with a quick pace the three first times of perambulating it, and make a more quick progress during the four last circuits; in conformity, as they say, to the instructions of Mahomet, who directed his followers thus to shew themselves strong and active to cut off the hopes of the infidels, who had given out, that the immoderate heats of Medina had rendered them weak. As often as they pass the black-stone, they either kiss it, or touch it with their hand, and kiss that. At the close of the ceremonies, the pilgrims slay their victims in the valley of Minâ; and these must be sheep, goats, kine, or camels; part of these is eaten by themselves and their friends, and the rest distributed to the poor. Having concluded their sacrifices, they shave their heads and cut their nails, burying both in the consecrated ground, and then visit the Caaba to take their final leave of the sacred building.

These ceremonies, as the Mahometans allow, were observed by the Pagan Arabs many ages before the appearance of their prophet; and were confirmed by Mahomet, with some few alterations. He ordered, that when they compassed the Caaba, they should be clothed, whereas, before his time, they performed this piece of devotion naked. Each tribe either found or introduced into the Caaba their domestic worship: the temple was adorned, or defiled, with 360 idols of men, eagles, lions, and antelopes; and most conspicuous was the statue of Hebal, of red agate, holding in his hand seven arrows, without heads or feathers, the instruments and symbols of profane divination. But Mahomet destroyed these idols, sanctified the Caaba, and made it the chief place of resort and worship for all devout believers. With regard to the procession round the Caaba, Reland (*De Rel. Mah.* p. 123.) observes, that the Romans had a ceremony of this kind in their worship: as they were ordered by Numa (see Plutarch on Numa) to use a circular motion in the adoration of the gods, either to represent the orbicular motion of the world, or the perfecting the whole office of prayer to that God who is maker of the universe, or else in allusion to the Egyptian wheels, which were hieroglyphics of the instability of human fortune. *D'Herbelot. Bib. Or. Sale's Prel. Disc.* to the Koran, p. 114. 122.

CAAMINI, in *Botany*, a name given by the Spaniards and others to the finest sort of the Paraguay tea. It is the leaves of a shrub which grows on the mountains of Maracaya, and is used in Chili and Peru as the tea is with us. The mountains, where the trees which produce this valuable leaf grow naturally, are far from the inhabited parts of Paraguay; but the people of the place know so

well the value and use of it, that they constantly furnish themselves with great quantities of it from the spot. They used to go out on these expeditions many thousands together, and their country was left to the insults of their enemies in the mean time, and many of them perished with the fatigue.

To remedy these inconveniences, they have of late planted the trees about their habitations; but the leaves of these cultivated trees have not the fine flavour or the virtues of the wild ones. The king of Spain has permitted the Indians of Paraguay to bring to the town of Santfoy, twelve thousand robes of the leaves of this tree every year: but they are not able to procure so much of the wild leaves annually; about half the quantity is the utmost they bring of this; the other half is made up of the leaves of the trees in their own plantations, and this sells at a lower price, and is called *pabos*. The robe is about five and twenty pounds weight; the general price is four piastres for the robe, and the money is always divided equally among the people of the colony.

CAANA, in *Geography*. See KENNÉ.

CAANTJE of Verkenkop, in *Ichthyology*, the *ACARAUNA* of Maregrave, Willughby, Ray, &c. and the *CHÆTODON NIGRICANS* of Gmelin, which see.

CAAOPIA, in *Botany*, the Brazilian name of *Hypericum bacciferum*.

CAAPEBA. See CISSAMPPLUS.

CAB, or KAB, denotes a Hebrew measure of capacity, equal to the sixth part of the seah, or an eighteenth of the ephah. *Arbuthnot's Tab. Anc. Coins, &c.* n. 14. and 15.

The cab of wine contained two English pints; the cab of corn,  $2\frac{1}{2}$  pints corn measure.

We also find mention of the cab as a dry measure, in Grecian and Roman writers: some make it equal to the Grecian choenix, and assert it to be the quantity of what a labourer eats per day, as assigned by Cato.

CABAÇOS, in *Geography*, a market town of Portugal, in Estremadura, 4 leagues from Espinhal, and 4 from Thomar, situate on a plain in a pleasant country near the river Nabaõ, and almost encompassed by hills, which consist partly of sand-stone and partly of lime-stone. This town formerly belonged to the knights-templars, after the destruction of which it was transferred to that of Christ. The plain on which it stands is almost entirely covered with olive-trees, and in its vicinity are cork trees.

CABAIGUAN, a town of the island of Cuba, 35 miles S.E. of Villa del Principe.

CABAL, a name given to a sort of drink made of dried raisins. The manner in which the Portuguese make cabal is this; they take out the stones of about twenty pounds of raisins, and then bruising the raisins a little, they put them into a barrel of white wine, in the month of January or February, and let them stand till about Easter. It is then very clear and rich, luscious and palatable to the taste. It is recommended to stop coughs, and give strength to the stomach. It is worth while to try the experiment with the same proportion of raisins to the same quantity of our English cyder, which would probably prove a fine drink. *Phil. Trans. N° 157.*

CABAL, in *English History*, an appropriate appellation, distinguishing the infamous ministry of Charles II. and formed of the initial letters of their names, viz. Clifford, Ashley, Buckingham, Arlington, and Lauderdale. Lord Clifford was an undisguised papist; the earl of Arlington, a concealed one; Buckingham was a debauchee, and reputed an atheist; Shaftsbury was a man of acknowledged genius, but, according

according to Burnet, a deist; though he possessed great knowledge of men and things, he frequently changed sides as his interest directed; and Lauderdale was a man of learning, and from having been almost a republican, was become a tool of the prerogative, and disposed to concur in the most desperate councils; with scarcely any traces of religion remaining, though he called himself a presbyterian, and manifested to the last an aversion to king Charles I. These were the men to whom Charles entrusted the conduct of his affairs; and who plunged the remaining part of his reign into difficulties, which almost proved fatal to his government. By their counsel and concurrence the king and duke of York were encouraged in their designs of introducing popery and arbitrary power; in order to which, a secret treaty was concluded with France; the triple alliance was broken; and a new war declared with the Dutch for destroying their common-wealth; and by this means the king had a plausible pretence for keeping up a standing army, which might serve to secure him in the exercise of an absolute authority over his subjects, to set aside the use of parliaments, and to settle the Roman catholic religion in the three kingdoms. At length, however, parliament interposed, A.D. 1674. Clifford, indeed, was dead; Shaftsbury had made his peace with the country party, and Buckingham was desirous of imitating his example; and Lauderdale and Arlington were exposed to all the effects of national resentment. Articles of impeachment were drawn up against the latter, which, however, were never prosecuted; and the former declined daily in the favour of the king, and became contemptible to the people. Thus ended the power of a junto, that seemed to have formed a plan for overturning the constitution, and establishing upon its ruins unlimited monarchy.

**CABALA vein**, in *Natural History*, a name given by our Sussex miners to one kind of the iron ore commonly wrought in that country. It is a stony ore, of a brownish colour, with a blush of red, which is more or less conspicuous in different parts of the same masses. It is usually found in thin strata, lying not far from the surface, and is not very rich in iron, but it runs very readily in the fire.

**CABALACA**, or **XABALA**, in *Ancient Geography*, a town of Albania, according to Pliny and Ptolemy.

**CABALARIA**, in *Botany*. Flor. Peruv. pl. 30. Class and order, *polygamia diœcia*. Gen. Char. Cal. small, persisting, campanulate, with five deep, oval divisions. Cor. wheel-shaped: tube very short; border divided into five oval segments. Stam. anthers five, inserted at the base of the segments of the corolla. Pist. stigma nearly sessile, five-sided; germ superior, nearly round. Peric. drupe globular, one-seeded, with five oblong points. Male and hermaphrodite flowers on separate plants; the former differ from the latter only in having abortive pistils.

Eight species are described in the Flora Peruvienfis. They are all shrubs, and are nearly allied to the genus *Sideroxyllum*. Jussieu has separated one of them from the rest, and formed for it a distinct genus, which he calls manglilla.

**CABALI**, in *Ancient Geography*, a people of Africa, in Libya, situate in the interior of the country of the *Auschise*, according to Herodotus; who represents them as very numerous, and extending along the coasts of the sea towards the territory of Barca, and as adopting customs and habits similar to those of the inhabitants of the country adjacent to Cyrene.

**CABALIA**, a country of Asia Minor, in Lycia, in

which were the towns of Oenoanda, Balbura, and Bubon, according to Pliny and Ptolemy.

**CABALISTE**, in *Commerce*, a term used at Thouloufe, and in the whole province of Languedoc; and signifying a merchant who does not trade in his own name, but is concerned in the trade of another merchant in chief. See *ANONYMOUS partnerhsip*.

**CABALLARIA**, in *Middle Age Writers*, lands held by the tenure of furnishing a horseman, with suitable equipage, in time of war, or when the lord had occasion for him.

**CABALLEROS**, or **CAVALLEROS**, in *Commerce*, are Spanish wools, of which there is a considerable trade at Bayonne in France.

**CABALLI**, among *Mythic Philosophers*, denote the shades or astral bodies of men who died any sudden or violent death, before the expiration of their predestinated term of life. The *caballi*, called also *cabales* or *cobales*, are supposed to wander as goblins or ghosts over the face of the earth, till their destined term is accomplished; being doomed to live out the time as spirits, which they ought to have spent in the flesh.

**CABALLINE**, **CABALLINUS**, from the Greek *καβαλλος*, a horse, something relating to, or partaking of, the nature and qualities of a horse.

**CABALLINE Aloes**. See **ALOES**.

**CABALLINUM**, *Cabillonum* (Cæsar), *Cabylinum* (Strabo), *Cabilio* (Peulinger), *Cabellio* (Anton. Itin.), *Cabaldunum* (Not. Imper.), and *Cabillo* (Ammian. Marcell.), in *Ancient Geography*, Chalons-sur-Saone, a town which belonged to the Ædui, where Cæsar established magazines, and between which and Augustodunum he formed a communication by a road. The emperor Constantine assembled his army in this place.

**CABALLINUS Fons**, a fountain of Greece, in Bœotia, near mount Helicon. It is the *Hippocrene* of the poets.

**CABALLUS**, FRANCIS, in *Biography*, born at Brescia in Italy towards the end of the 15th century, was several years a distinguished teacher of medicine in the university of Padua, where he died, at an advanced age, in the year 1540. The work by which he distinguished himself is entitled "Libellus de Animalium Theriacam Ingredientibus." It was first published with the Opera Medica of Montagnana, fol. 1497, Venice, and has been frequently reprinted, and shews the author to advantage, as intimately acquainted with the ancient writers. Haller. Bib. Med. Eloy. Dict. Hist.

**CABALLUS Equus**, in *Zoology*, the common-horse, with solid hoofs, a long flowing mane, and tail universally covered with long hairs. See **HORSE**.

**CABALSUM**, in *Ancient Geography*, a town of Egypt. Antonin. Itin.

**CABANA**, a place of Gedrosia, mentioned in the Periplus of Nearehus, and supposed to be the *Cunana* of Ptolemy.

**CABANDËNI**, a country of Asia, in Susiana.

**CABANE**, in *Geography*, a town of South America, in the country of Brasil, and government of St. Paul.

**CABANES**, LES, a town of France, in the department of the Tarn; 4 leagues N. W. of Alby.—Also, a town of France, in the department of the Arriège, and chief place of a canton in the district of Foix, 2 leagues S. E. of Tarascon. The town contains 430, and the canton 5,586, inhabitants; the territory includes 340 kilometres and 25 communes.

**CABANODURUM**, in *Ancient Geography*, a town of Norica, on the Danube. Ptolemy.

**CABARET**, or *Petite linotte* of Buffon, in *Ornithology*, the

the mountain linnæ of the British Zoology, and the *FRINGILLA MONTIUM* of Gmelin. &c.

**CABARITA**, in *Geography*, a small island near the north coast of Jamaica. N. lat. 18° 24'. W. long. 76° 40'.

**CABARITTA**, a river on the fourth side of the island of Jamaica, which runs into the sea about 1½ mile W. from Savanna la Mer.

**CABAROS**, or **TITAN**, the most western of the islands of Hieres, E. of Toulon, on the coast of France, in the Mediterranean.

**CABARRUS**, a new county of America, in the district of Salisbury, North Carolina.

**CABASA**, in *Ancient Geography*, an episcopal town of Egypt, in the Delta, and the capital of the nome called *Cabasites*.

**CABASILAS**, **NILUS**, in *Biography*, a Greek, archbishop of Thessalonica, flourished in the 14th century, and wrote two treatises against the Latins. The design of the first treatise is to shew, that the division between the Greek and Latin churches is owing to the popes' having refused to submit the decision of controverted questions to an oecumenical council, and arrogating the decision to themselves; and the second relates to the supremacy of the pope, and attempts to prove, that though he holds his episcopacy of Rome from St. Peter, he is indebted for his primacy to laws, councils, and princes: it also denies the pope's infallibility, and his jurisdiction over other patriarchs. These treatises, which are clear, methodical, and learned, were first printed in Greek at London, without date; in Greek and Latin at Basil in 1544; at Franckfort in 1555; at Hainault, with the notes of Salmasius, in 1608; and at Amsterdam in 1645. This prelate was also the author of a large work on the procession of the Holy Spirit. Du-Pin. Mosheim.

**CABASILAS**, **NICHOLAS**, nephew of the former, and his successor as archbishop of Thessalonica, was employed in negociations by the emperor Cantacuzenus. In opposition to the Latins, he composed an accusation against them, and a work "On the Procession of the Holy Spirit." He also wrote "An Exposition of the Liturgy," in which he delivers the doctrine of the Greek church concerning the mass; and which was printed in Latin at Venice in 1545, and at Antwerp in 1560; and in Greek and Latin in the "Bibliotheca Patrum," Paris, 1624. In the same "Bibliotheca," is also included his "Life of Jesus Christ," translated into Latin, and separately printed at Ingolstadt, in 1604. A translation of his work "Against Usury" is also contained in the "Bibliotheca." In the sciences of mathematics and astronomy, he is said to have surpassed all his contemporaries. With respect to his character as a writer he resembled his uncle. Du-Pin. Mosheim.

**CABASSOLE**, **PHILIP DU**, a friend and frequent correspondent of Petrarch, was born at Cavailon in Provence, and became bishop of that city in 1344. As chancellor to Sanche, queen of Sicily, he, conjointly with her, governed that kingdom during the minority of her grand-daughter Joan. In 1366, he was nominated patriarch of Jerusalem, and was appointed by Urban V., cardinal and vicar-general of the diocese of Avignon. During the residence of the popes in this city, he was entrusted by Gregory XI. with the superintendance of the estates of the church in Italy. He was also bishop of Sabina. He died in 1372. A work "De Nugis Curialium," and two books "Of the Life and Miracles of St. Mary Magdalen," are ascribed to Cabassole. Du-Pin.

**CABASSUS**, or **CABESSUS**, (Homer Iliad. l. xiii. v. 363.) in *Ancient Geography*, a town of Asia, in Armenia

Minor. Steph. Byz. and Strabo place it in Cappadocia. Hellenicus refers it to Lycia.

**CABASSUT**, **JOHN**, in *Biography*, a priest of the oratory, was born at Aix in 1604, and became director to cardinal Grimaldi, whom he accompanied to Rome, and by whom he was persuaded to publish several works. He was an indefatigable student, and condescending in his advice to all who applied to him with cases of conscience. He was professor of canon law at Avignon, and died at Aix in 1685. His works are, "Juris Canonici Theoria et Praxis," Lyons, 1660, often reprinted, and improved by the notes of Gibert; in a folio edition, printed at Poitiers in 1738; "Notitia ecclesiastica Consiliorum Canonum, veterumque Ecclesiæ Rituum," 1670, fol.; "A Treatise on Usury;" and decisions on various questions under the title of "Hæreses subsecivæ." Moreri.

**CABATANUS**, in *Ancient Geography*, a town of Arabia Felix, in the territory of the Chatramotitæ. Strabo.

**CABAY**, a name given by the Indians and inhabitants of Ceylon and Arracan to garments made of silk or cotton, ornamented with gold, worn by the principal persons of the country.

**CABBAGE**, in *Botany*. See *BRASSICA rapa*.

**CABBAGE**, in *Agriculture*, the name of a well known excellent plant, of which there are several varieties cultivated by the farmer, as winter and spring food for different sorts of live stock. It is a sort of culture that is of much consequence on all the stiff heavy soils which are too moist and strong for the successful practice of turnip husbandry. And another circumstance that adds to its importance is the little danger that attends the crop, and the largeness of the quantity of food that is produced; as it has been found to be considerably more in proportion to the space of ground that is occupied, than that of turnips. Mr. Young has observed that cabbages "flourish to very great profit on all good soils, and have the particular property of enabling the farmers of clays and wet loams, to winter more cattle than those of lighter lands can effect, by means of that excellent root, the turnip. The great evil of clay farms used to be," says he, "the want of green winter food, which confined their stocks to hay alone, and, consequently, prevented their reaping those extended articles of profit, that arise from numerous heads of cattle; and, besides the immediate benefit from the cattle, they lost also the opportunity of raising large quantities of dung, which never can be effected so well as by keeping cattle. But all these evils are by the cabbage culture remedied, and the clay farmers put in possession, in many respects, of an equality with the turnip ones. If the difference between a summer fallow-year on clay and a turnip-fallow on light land be considered, the importance of this discovery will, he contends, be sufficiently clear. Thirty shillings for an acre expense of the first, are not an exaggerated calculation; but all is saved on the turnip land, perhaps with profit; and the barley that follows the turnips is probably nearly as good as that which succeeds the summer-fallow clay. Supposing the following clover and wheat equal to both, according to soil, still there remains a superiority in the article manure; for all that is raised by the consumption of the turnip crop is so much superior to the clay soil. But reverse the medal: suppose cabbages to be introduced on the clay, and the scene is changed. That crop will exceed the turnips, yield more profit, and enable the farmer to make more manure. For these reasons, the recommendation of cabbages appears to be extremely well founded, and consequently, those farmers who possess the proper soils, cannot determine too soon to enter on the cultivation of them. But there is another circumstance

cumstance attending some sorts of cabbages, which make them highly eligible on all farms, which is, their lasting for sheep feed longer in the spring. Ruta бага, turnip cabbage, cabbage turnip, and green borecole, are in perfection in April, and last even to May, the most pinching period of the year. Turnips will do no such thing; consequently, those farmers who possess turnip soils, should on no account slight the culture of cabbages for this purpose."

In regard to the preparation of the land, the author of "Practical Agriculture" advises, that "as the roots of the plants run deep, and stand in need of a large proportion of nourishment, a considerable degree of pulverisation should be effected, and the soil be well loosened to a considerable depth. These effects, he conceives, may be produced in the most perfect manner, by repeated deep ploughings, and exposing as large a surface as possible to the action of the frosts during the winter season, by laying the land up into pretty high ridges. Three ploughings are mostly found sufficient for this purpose; but the number should always vary according to the nature and state of the land. When this sort of crop succeeds wheat, barley, oats, or beans, the land is generally ploughed up in the autumn by a pretty deep furrow, and formed into ridges of about three feet in width; in this state, it may continue till the spring, when it should be well broken down by harrowing in different directions. It is then to be ploughed again, but with somewhat less depth than before. After this, as near as possible to the time of planting, the ground may again be well harrowed over, and a suitable proportion of good stable manure applied, as from fifteen to twenty-three horse cart loads to the acre; or where composts are made use of, from twenty to thirty, and immediately turned into, or inclosed in the middle of the ridges. After this is accomplished, the land becomes ready for the reception of the plants. In some districts, however, a practice prevails of spreading the manure upon the land, and turning it in with the first ploughing. In this way the ground is supposed to be prevented from becoming too open by the action of the manure, and the danger of the plants being injured in droughty seasons prevented. It is obvious, however, he thinks, that in this mode, much of the benefit to be derived from the manure must be lost by its remaining so long incorporated with the soil before the plants are put in, and that the great advantage of having it in its most active and concentrated state, immediately below the roots of the plants, must be wanting." It is stated in the "View of the State of Agriculture in Mid Lothian," that "in the vicinity of Edinburgh, in preparing for this crop, the ground is ploughed in November, and again in April following, and well reduced by harrowing, &c. It is then laid out in three feet drills, thirty carts of dung per acre being laid in the drills, which are then split with the plough covering the dung, and then rolled lengthways, after which, the plants are put in." And the author of the "Agricultural Survey" of the county of Kent conceives, that "the tillage necessary for cabbage is to plough the land in the winter six or seven inches deep, and to cross-plough it in the spring in a dry season, and then after manuring with a good covering of rotten dung, before planting in June, to plough it again, turning over a furrow ten inches wide for planting upon." But in Suffolk, according to the account of the secretary to the board of agriculture, "the land is prepared by four ploughings: the last of which buries an ample quantity of dung, and forms the land a second time on three feet ridges to be planted upon."

Dr. Dickson, in his "System of Practical Agriculture," observes, that "in the field culture of cabbages, several dif-

ferent sorts are capable of being employed, but that those varieties that are most useful as cattle food, and the most capable of withstanding the severity of the winters in this northern climate, are the Scotch, the drumhead, the American, and the open green cabbage, or spring kale. The first, when of the true firm flat topped kind, has been found to be wholly incapable of being injured by frosts, except in some cases a few of the outside leaves. The second sort, or true drum-head, is likewise extremely hardy, and more close in its texture than many other varieties, being of course very heavy in proportion to its size. It admits of being planted closer than the large American cabbage, which in particular situations is an advantage. This sort is known in some districts by the name of the fallow loaf cabbage, but it would seem to differ from it in some respects. As this kind is not found sufficiently hardy to bear the effects of very severe frosts, a mixed stock is frequently employed, which is produced by planting it and the common red cabbage together, and after the seed pods are formed, cutting the latter, and leaving the former for seed. This mixed kind, which is of a deep green colour veined with purple, besides retaining the size of the drum-head, possesses the hardness of the red cabbage. The third, or American kind, has not only a large size, but continues good to a late period in the spring. The last, or kale sort is perfectly hardy, and capable of being converted to use as a cattle and sheep food at the latter end of April, or beginning of May, when other sorts of green food are extremely scarce, and difficult to be procured. But, besides these, the varieties known by the titles of the flat, Dutch, the Yorkshire, the Savoy, and several others, may, he says, be made use of where the climate is more mild."

The same writer also adds, that "the chief advantage of planting large sized cabbages in the field is that of their being capable of being set out at such distances as to readily admit of their being cleaned and kept in order by the plough, without any loss being sustained in the quantity of the produce. Where the soil is not of great staple, and the expense of hand labour reasonable, the smaller sorts may, he thinks, be made use of with advantage."

Mr. Young, however, fears that "the great American cabbage, which, thirty years ago was to be had, and which came to 50 or 60, and even 80lb. weight is lost at present. And the great cattle cabbage, the great Scotch, the drumhead, the Dutch, and other sorts are not distinct varieties. A farmer should, he thinks, at first get the best stock he can, and then trust only to the seed he raises himself. At present he is inclined to believe, that the best sort to be procured is the large red cabbage. It comes to a good size, and is harder than most others."

In procuring seed for raising young cabbage plants, great care should be taken, that it be obtained from the most perfect plants of the different kinds, and such as have seeded without any other variety of the same tribe blowing near them, as it is, perhaps, only in this method, that they are capable of being kept of a true kind. It may, therefore, in this view be of great advantage to have the plants intended to stand for seed, planted out by themselves in a piece of ground at a distance from the others, and well protected from birds. When seed of this sort is purchased, such as is new should always be preferred, as it not only vegetates much quicker, but is more to be depended upon for a proper supply of plants. In dry seasons, steeping the seed in water, or some other liquid, may also be of utility. The beds on which the seed is sown should be of a good rich quality, well prepared by digging, and the application of manure; as where the soil is poor and not sufficiently enriched,

riched, the plants are apt to be weak and stunted in their growth, as well as much injured by weeds. Much injury also frequently arises to young cabbage plants from the seed being sown too thick; care should therefore be taken to have them properly thinned out whenever they come up in too thick a manner. One ounce or an ounce and a half of good seed may in general be sufficient for sowing a bed fourteen or fifteen feet long, and five or six in width, or for raising two or three thousand good plants; in which proportion, half a pound will afford more plants than are sufficient for planting an acre of ground. Mr. Young advises three ounces of seed to each square perch well raked in, and then a peck of foot sown over each foot of ground; and that when it is intended to cultivate these crops on a large scale, an acre of land should be inclosed for the purpose, kept well manured, and the seed drilled in at nine inches, for the convenience of weeding and hoeing.

In respect to the periods of putting the seed into the ground, they must depend much upon the intentions of the cultivator: where the produce is to be consumed during the winter months, as in December, January, or February, the seed should be sown in July the preceding year, and the plants be put out in March, April, and May, the following year; but if intended for consumption in March, April, or May, the seed should be put in about the latter end of February or beginning of March, in the former year, and the plants be set out in the first or second week in July in the same year. By continuing to sow with regularity in the months of February, May, and July, or August, successive crops of young healthy plants may be secured, and the round of cabbage husbandry be effectually preserved. These periods of sowing and planting out should, however, be attended to with considerable exactness, in order to secure good and certain crops, and the seed-beds be well protected from birds. But that the cultivator may not be disappointed in the number of plants, it may be useful to sow a little seed at different times, at the distance of a few days from these periods, always choosing as moist a time as possible for the purpose. And by hastening or protracting the time of transplanting, or setting out the crops, the growth of the plants may be so managed as to have them ready for use either more early or later, according as circumstances may require. The author of *Practical Agriculture* observes, that, "in both the spring and autumn plantings it is, however, the best practice to be sufficiently early, as in the former case the plants will have the great advantage of the spring showers, and be in less danger from the heat of the summer season; and in the latter, more fully established in the soil before the winter sets in, as the growth of the plant after September cannot in any degree be depended upon in field culture. Besides, from the length of time which is requisite for their attaining their full size, it must always be advantageous to have them set out early. They seldom arrive at their full growth in less than four months, where they grow in the most perfect manner. By sowing very early in the spring, and setting the plants out as expeditiously as possible, both full and forward crops may often be obtained. There is, however, in general, an advantage in the autumn plants, that though they be more liable to be injured in the winter by slugs, and other causes, they are in a state to be planted out very early in the spring, while those of the spring sowings can seldom be set out till the summer is much advanced." In this culture different methods have been attempted, such as setting the plants to stand the winter in the field, and letting them remain in the seed-bed to be put out in the spring; the former is most advisable in mild winters and sheltered situations, as the

crops will be much more forward; but in exposed situations the latter may be adopted with more success. By sowing in May and June, forward crops of large cabbage may be procured the ensuing year, and coleworts for the following spring; but in this last intention they should be planted closer together than usual. In this way the loss of weight, and danger of cabbage crops in the winter months, are fully obviated. On the whole, the sooner the autumnal plants are put out in the field after the frosts are over, the better; and the spring plants should be placed out as soon as possible after them, as before the end of April. It is the custom of some nice cultivators to prick the plants out from the seed-beds, while very young, into other beds; and the practice is certainly very advantageous, not only in checking their too forward growth, but in rendering them more fit for planting out and less liable to run to seed when transplanted into the field. The expence and trouble of this operation are, however, too great, where the cabbage culture is conducted on an extensive scale, to admit of its being generally performed.

Another practice, adopted by the late Mr. Bakewell, and since employed by other cultivators, by which the inconvenience of waiting for a suitable moist time for setting out the plants, and the danger of their not succeeding under other circumstances, are avoided, is that of drilling the seed in where the plants are to remain at the proper seasons, as April, May, or June, and the following month. But the first is the most general in this mode of culture. The crops, in this system of management, should be put in after turnips, potatoes, beans, peas, tares, or others of the hoeing or cleaning kinds: the land being ploughed in ridges three or four feet in width in the latter cases, before the winter frosts, and before the time of drilling the seed, manure to the extent of from twenty to thirty cubical yards to the acre, according to circumstances, introduced by reversing the former ridges. After having remained in this state, secure from rain, a week or fortnight, when the soils are stiff, harrowing should be performed, but under other circumstances the roller to which the drill is fixed will level them sufficiently, as they should not be reduced too greatly. In performing the business, the Northumberland drill is to be attached to a roller eight feet in length for four feet ridges, and six feet, where they are three, by means of a chain, hooks, and staples. The roller thus covers the ridge that is drilling and that which is to be drilled by the next turn. Proceeding constantly in this way, the seed will be effectually covered by four pieces of Jack chain about two feet in length, which are fixed to the centre of the drill behind, and drawn after it, and deposited to the proper depth of about half an inch by weighing on or loading the drill. When the plants appear, if a surge of foot be drilled over them to the extent of ten or twelve bushels the acre, Mr. Young thinks it will be of great advantage in protecting them from the attacks of the fly. This, he supposes, may be very conveniently done by one hopper and a round of cups similar to those of Cook's drill, but larger, fixed to such a frame as that of the Northumberland drill.

There can be little doubt but that this method will be highly advantageous, as saving much labour and preventing the plants from being checked in their growth by transplanting, when the soils are sufficiently fine and mellow; but under other circumstances it cannot probably be wholly depended upon.

In planting out crops of this sort, care should be taken to have the business performed as soon as possible after the land has been well saturated with rain; as in this case the plants much sooner establish themselves in the soil, and

# C A B B A G E.

fewer vacancies are left, by their decay, to be afterwards filled. The plants are likewise much more readily raised from the seed-bed, and with much less injury to the roots, which is a matter of importance. The work is performed upon the land in a flat state, and also when raised into ridges by means of the plough; but the latter method is the more general, and ought probably to be preferred wherever the soil is much inclined to the retention of moisture. On the lighter and more dry soils the flat surface may, however, be more proper and useful, as preserving a due degree of moisture more effectually, especially in dry seasons.

In regard to the distance of planting, it must depend in a great measure upon the strength and goodness of the soil, and the natural size of the variety of cabbage that is employed; but in general it should be such as that the ground between them may be cultivated and kept clean by the plough, and yet admit of bearing a full crop. It is evident that where the plants stand thin they will attain a larger size, while in close planting there will be a greater number of plants upon the land, which may compensate for the disadvantage in the want of size. It seems probable that both cabbages and turnips may be set out too thin, as the increase of size is not always equal to that of number. It is the practice in some districts, where this culture is well performed, to set them out regularly at the distance of three feet each way, as in this method the plough in cleaning and earthing up the crops, can be conducted both in longitudinal and cross direction, and of course the soil between the plants be not only stirred in the most effectual manner, but the earth most completely laid up to the roots of the plants, and their growth more fully promoted. Where the larger varieties of cabbage are employed, and the land is sufficiently strong, this may of course in general be the most advantageous distance; but where the smaller varieties are made use of, and the ground is of a less strong and rich quality, two feet and a half may be a more proper distance. Other cultivators follow a different practice, some preferring four feet by two feet and a half, while others advise only two feet by twenty inches, or even 18 inches. In these latter distances the cabbages are, however, under the necessity of being hand-hoed between the plants in the rows, the intervals only being cleaned by the plough. The culture cannot of course be by any means so perfectly performed; the soil in the former method being wholly removed, except the small portions immediately about the roots of the plants, while in these much of it will remain untouched, and be not only left in a more foul condition for succeeding crops, but less beneficial in promoting the growth of the cabbages. The experiments and observations of Mr. Baker, in the cultivation of cabbages in the field, led him to recommend the following as the most suitable distances for the different varieties which he employed.

way on the strong soils, and eighteen or twenty inches on such as are light. Whatever distances may be thought the most advantageous, it is observed by a late writer, that it will constantly be necessary to attend to the manner of setting them out, the size of the plants, and the mode of taking them up from the seed-beds, as much depends upon these operations being properly performed. In setting the plants out in the ridge method, it is necessary to have them placed in lines as regularly as possible, according to the distances employed, along the middle or crown of the ridges, immediately upon the part in which the manure has been inclosed; as by having this accomplished in an accurate manner, they not only admit of being cultivated betwixt with more ease and convenience, but derive the utmost possible advantage from the manure, and at the same time, from its being more concentrated, require a smaller proportion to be employed. The size of the plants is likewise a circumstance of consequence, as the large stout plants not only take root with more certainty, but are less exposed to danger from slugs and other causes. In removing the plants from the seed or other bed, for the purpose of being planted out, it is also of much utility to have their roots as little broken or otherwise injured as possible. Moist or rainy weather is the most suitable for this operation; but in dry seasons it may be easily accomplished after the plants in the beds have been well watered. The number of plants that are employed must obviously be different, according to the distances at which they are planted; but from five to seven thousand are generally sufficient for an acre of land. In setting the young plants out into the ground, it is necessary to see that the labourers fix them well in the soil, by applying the mould so firmly round their roots by means of the dibble, that they cannot easily be drawn out by taking hold of their uppermost leaves. The plants are mostly dropped at proper distances by women and children, and the dibblers follow, having a flick for marking the distances with in an exact manner. In this way an ordinary labourer will plant a quarter of an acre or more in a day, and an expert gardener nearly as much more. In the course of a fortnight or three weeks, after the first setting out of the plants, it will be requisite to fill up all the vacancies that have been produced by the failure of particular plants: in performing which a moist time, if it be possible, should be fixed upon."

In respect to the expence of planting out and the other necessary operations in crops of this sort, it must be liable to vary greatly, according to the circumstances of the soil, and the situation in respect to labourers. In Suffolk, according to the writer of the corrected report of the agriculture of that district, it is in general about three shillings the acre, but in other places frequently a little higher, the whole charge of an acre being estimated in this way:

*Expence of cabbage culture on one acre.*

	<i>£.</i>	<i>s.</i>	<i>d.</i>

*£. 5 1 3*

The nature of the soils on which they are cultivated is not, however, described.

For all the larger sorts of cabbages on the different sorts of strong rich soils, the most advantageous distances may be three feet each way, and on the more light soils two feet and a half. But for the smaller sorts, two feet each

In this estimate, the whole of the expence of manure is, however, it is observed, charged to the cabbage crop: but the advantage ought properly to be divided, which would lessen the expence considerably. From the increase in the prices of land and labour which has lately taken place, the expences of this sort of cultivation will at present stand considerably higher.

In the after culture of this sort of crop, much advantage is derived from having the mould or soil frequently stirred and applied to the roots of the plants. It is, indeed, only by a due repetition of these operations, that the plants attain their most perfect size and growth. The business is accomplished by means of ploughs, hoes, and hand-hoes. Where the plants are set out in a regular manner at sufficient distances, the work may be performed in the most cheap and effectual way by the use of the horse-hoe, or the common light swing-plough; but, where narrow distances are employed, it can only be well executed by means of the hand-hoe. Sometimes both the horse and the hand-hoe are made use of, as where the crop is planted close in the rows with wide intervals. It is observed, by an useful modern writer, that "the number of hoeings must in general depend upon the state of the land and the nature of the season, but three will in most cases be necessary. The first should be given about three weeks or a month after planting, according to the growth of the plants, and the second at an equal distance of time; the third may be repeated as the necessity of the crop may require, attention being constantly paid to keep the land perfectly clean from weeds, and the earth or mould well loosened and laid up to the plants. In the first operation, it is usual to turn the mould or soil from the plants, but, in the subsequent ones, to apply it up to them, which, where the plants are set regularly in squares at the distance of three feet, may be performed in both directions of the ground, in the most perfect manner. In this way the cultivator not only in a great measure avoids the heavy expence of hand-hoeing, but contributes to the growth of the crop in the most effectual manner."

In executing the work by means of horse labour, some make use of the horse-hoe, others, the double mould-boarded and common hoe ploughs; and it has been contended by Dr. Anderson, that it may be effected with equal exactness, and in an equally effectual manner, by any common light swing-plough. The author of "Practical Agriculture" observes, "that, after these hoeings have been accomplished, the hand-hoe may be occasionally employed just about the roots of the plants, if there should be necessity. And where the crops are planted out at narrow distances, either wholly or in the rows only, it must altogether, or in a great measure, be depended upon for the after-culture of the crops. In these cases two or three hoeings are mostly found necessary. The expence of each hand-hoeing in such crops is, in general, from two shillings to half a crown, or three shillings an acre." And where the crops have been put in, in the drill method, they will require to be thinned out to proper distances in the rows as soon as the plants have attained a few inches growth, being afterwards cleared and moulded up in the same manner as those which are planted out in the common way.

These crops, like many others, are liable to be injured by the attacks of animals of the insect kind, at different periods of their growth. While the plants are young and tender in the seed-bed, the beetle, or fly, often greatly injures or destroys them. They, likewise, occasionally suffer in the seed-bed from the attacks of the caterpillar, produced by the cabbage butterfly (*Papilio Brassicae*), though much less frequently, as this insect makes its appearance, in gene-

ral, too late to do much injury to field crops. Much harm is likewise done to cabbage-plants while young, on their being first planted out, by the slug, but afterwards they are little exposed to its attacks. The depredations of the fly or beetle, as well as the caterpillar, may, in general, be, in a great measure, prevented, by the sowing or dispersing of wood ashes, foot, or other similar matters, in a powdery state, over the young plants, on the first appearance of the insects among them. But, "besides the attacks of insects on the leaves of the plants, cabbages are subject to a disease in the roots, in which they become swelled out and knobby, and the plants weak and of imperfect growth. This vegetable disease has been supposed to be caused by the attacks of grubs below the surface of the ground, and to be chiefly prevalent where the same sort of cabbages are sown and planted on the same spots of ground for several years together."

It has been remarked, that, "where care is taken to plant out the proper hardy sorts of cattle-cabbages, there is little danger of their being injured by the severity of the frosts during the winter months, as seldom more than a few of their large outside leaves have been found to suffer. Many of the hardy varieties of cabbage have, indeed, been found to stand the winter frosts equally, or even better, where there are frequent thaws, than those of the borecole, or kale kinds; but the latter would appear better adapted as a green food, especially for sheep, in the early spring months, as it may be repeatedly eaten down or cut over, and by that means furnish a more full supply of food."

It has been remarked "that, in respect to the quantity of produce that may be derived from an acre of land under a crop of this kind, it must depend in a great degree upon the quality of the soil, the proportion of manure that is employed, the method of culture, the goodness of the plants, and the favourableness of the season, about the time of planting them out." But that "it may probably, in general, be estimated at from twenty to thirty tons. In comparing the produce of cabbage crops with those of turnips in different modes of planting, and on different kinds of soils, it was found, taking the best part of the crops, that, at a medium, an acre of the former, on good land, well managed, produced twenty-five tons, and of the latter fifteen tons. The value of the crops must likewise be affected by various circumstances, as the kinds of live stock by which they are consumed, the manner in which it is accomplished, and the situation of the cultivator with respect to markets; but that in common they may be calculated at from four or five to seven or ten pounds the acre, and in many situations considerably more."

It has been farther observed, in a late work, that "in the application or expenditure of cabbage crops, as they are often liable to a considerable diminution in the quantity or weight of food which they contain, by standing over the winter to the spring months, it may be the best and most economical practice to make use of them late in the autumn, while their leaves are in perfection, in completing the fattening of such neat cattle or sheep as have been brought considerably forward in the pastures during the summer season. In this way there is much less loss sustained than is generally the case where they are suffered to stand for spring feed, by the decay and destruction of the outside leaves and other parts of the plants. In the feeding of milk-cows, at the same period, they may likewise be of very great utility, as supplying a large proportion of green food, whether the whole plant be made use of, or only the more loose green leaves, which may often be removed without much injury to the cabbages. In this method of ap-

## C A B B A G E.

plication they have been shewn to be more beneficial than hay, given in any proportion, when only combined with straw, and that the butter is not in any way injured by them while they are given in a sound state. When employed in this way, without any combination of other sorts of food, as hay or straw, an acre has been found sufficient for four or five cows; and, with straw and a little hay, for seven or eight. In Mr. Young's experiments, detailed in the 16th volume of the "Annals of Agriculture," in feeding the smaller sorts of cows, such as would fatten to about forty-five stones, of fourteen pounds each; in October three milch ones ate 96 pounds each of cabbages, and 10½ lbs. of hay in the day; and in another experiment 39 pounds of cabbages, with 10½ lbs. of hay each, in the day; or in the proportion of two tons 18 cwt. of cabbages and 15 cwt. of hay in six months.

It has been well remarked that, "in this way of consuming cabbage crops, the cows should always be confined to the farm yard, and not suffered to eat them, after being scattered on the ground; as in the latter way the farmer must sustain injury both in the treading of his land, and in the loss of a large portion of valuable manure. Besides, it is suspected that such sort of food will go farther, when carefully applied in the yard, than when consumed on the land, as much waste must be unavoidable in the latter method."

And it is farther added that, "in the fattening of neat cattle, an acre of good cabbages may be sufficient for three beasts of from forty to fifty stones each; which have been grazed in the pastures in the summer. A middle sized bullock consumes, in general, of this sort of food in the proportion of about one hundred pounds in twelve hours; but much in this business must constantly depend on the state of the stomach, and the methods of feeding the animals. It would, however, seem probable, that cabbages possess the property of fattening cattle; not only more expeditiously, but in less proportion than turnips; an acre of the former having been found to fatten one in four more than the same extent of the latter crop."

It is likewise stated in the same work, that "in feeding this crop off with sheep, it has been remarked, that such as weigh about twenty pounds the quarter consume in the proportion of from eight to ten pounds in twelve hours, half an acre being nearly sufficient for one hundred sheep, when the crop is good. The cabbages, when run to seed in the spring months, are also consumed with avidity by these animals; but this practice should never be attempted, as much injury must always be sustained by the land. The refuse of cabbage crops may, however, sometimes be usefully applied in the more early spring months, before they begin to run, to the feeding of lambing ewes, as by such means the quantity of milk is much increased, and the lambs, of course, better supported. "Store hogs are likewise said to be kept upon this vegetable with advantage, and to prefer it to turnips; but on trial with the finer breeds of this sort of animals, it has not been found a beneficial mode of applying such crops, as they constantly rejected both the cabbage and turnips for most other sorts of food, and unless prepared by heat seldom ate them up clean."

It has been remarked, that, "though few experiments have been made in the feeding of horses with this sort of food, it is probable, that, after being chopped, cut, or shaved down by means of a stock or other knife, and blended with some other sort of dry, cut fodder, it might be employed with great advantage both in the saving of other more valuable kinds of food, and in promoting the condition of the animals; as from its containing much saccharine

matter, there can be little doubt of its possessing a highly nutritious quality. In this use the more sweet and delicate sorts of cabbage ought probably to be preferred.

That the application of this sort of cabbage in this way has been scarcely attended to, is fully shewn by the observations of Mr. Marshall, in his account of the midland district, who registers it as extraordinary, that neither in that, nor any other district, an instance had been met with of cabbages being made use of in the way of food for horses."

It is suggested that, "where cabbages are employed for winter and spring consumption, it has been the practice with some cultivators to have them cut or drawn while in full perfection, and piled up in houses for the purpose, or stacked in the open air, being closely covered over by means of straw, broom, or rushes, or any other cheap material; as in this way they are always ready and at hand, when they cannot be procured from the field on account of the wetness of the land, or the effects of frost or snow. The practice is said to be made use of in Germany, with such success, as to keep them in a good state of preservation during the whole of the winter season. From the sweet juicy nature of the vegetable, it is supposed, in this method, liable to be injured, not only by taking on too much heat, but by becoming mouldy. Besides, by keeping in such stacks they, like the turnip, shrink considerably, and are probably much impaired in their quality."

CABBAGE-*Sprub*, Anjou or Colewort, in Botany. See BRASSICA.

CABBAGE, *Dog's*. See THELIGONUM CYNOCRAMBE.

CABBAGE, *Turnip*. See BRASSICA.

CABBAGE, *turnip*, in Agriculture, is a plant of the cabbage kind, in which the bulb or apple is of a roundish flat form, appearing principally above the surface of the ground, and as it were an enlargement of the stem of the plant, the leaves that surround it having much resemblance to those of broccoli. It has been occasionally cultivated under the title of *cape cabbage*, and often confounded, with the *turnip-rooted cabbage*, by those who have not sufficiently attended to the circumstances by which they are distinguished. It would seem to be the plant cultivated in different parts of Germany under the title of *kablrahi*. The result of the trials made with it in field culture would seem to shew it an useful hardy plant.

The soils most adapted to the growth of this plant are those of the more light and dry kinds, that have some degree of elevation, with respect to situation, and which are in a good state of fertility from previous tillage. The land should be prepared, by ploughing three or four times, in nearly the same manner as for the common turnip; being laid up in the autumn, in order to be rendered fine and mellow. When thus prepared, at the time of planting, it should be ploughed into small two-bout ridges, and a suitable proportion of manure turned in. On the ridges, when flattened by a light roller, the plants are to be put in.

The same method should be pursued in providing the seed as has been advised for cabbages. In this culture it is sometimes sown in beds in the fields, whence the plants are afterwards to be drawn and set out; and in others, in drills or broad-cast, where the plants are to remain, being only thinned out to proper distances by the hoe. Dr. Dickson remarks, in his "Practical Agriculture," that "the first method is probably, in general, to be preferred, though some cultivators contend that the plants succeed better, when not removed from the places in which they were deposited when sown, and which later experience in cultivating the common cabbage seems to show to be the case. Where the transplanting method is practised, the seed should be

sown

sown sufficiently early to have the plants of a proper size, as about six or seven weeks growth at the time of transplanting. About the middle of March, or beginning of April, may be the most proper periods. The seed, in these cases, should be sown very thin, and the weak plants afterwards thinned out, till they are left at not less than three inches distance from each other. Five or six ounces of seed will, in general, be a proportion sufficient for affording plants for setting out an acre of ground. In the drill method, the same proportion of seed may also in common be sufficient, which should be put in the soil about the beginning or middle of April; but if sown later, as in May or June, it frequently succeeds. In the broadcast mode, from the plants not coming quickly to the hoe, the latter end of March may probably be the most proper period of sowing; the proportion of seed being somewhat increased.

The planting in these crops may be performed either upon the plain surface of the prepared ground, or after it has been thrown up into ridges in the manner first described; but the latter is by much the best method, especially where the land is inclined to moisture. The most eligible time for executing the business is, as in the common cabbage, when the land has had a good shower of rain, the operations of ploughing and setting out the plants proceeding together; but Dr. Dickson observes, that "neither operation should be attempted when the ground is much soaked with rain, as much injury is not only done to the land, but the plants seldom thrive well."

In planting out, different distances are practised; some preferring the distance of two feet from row to row, and eighteen inches apart in the rows, where the soils are good; but in those of inferior quality not more than twelve; while others advise their being planted two and a half or three feet asunder, on two-bout ridges, the plants being placed as nearly as possible in the middle, immediately upon the dung, as recommended in the culture of the common cabbage.

The after culture in the crops must be performed in different ways, according to the methods of sowing or planting that have been practised. When the seed is put in by the hand, the crop can only be kept clean by means of the hand-hoe, which should be applied as frequently as is necessary for the purpose. But in the drill method, as well as where the crops are planted out with broad intervals and narrow distances in rows, it may be convenient to make use of both the plough or horse-hoe, and the hand-hoe, employing the former in stirring and clearing the intervals, and the latter in keeping the ground between the plants clean. When planted on ridges, it is recommended, that as soon as the plants have become firmly established in the soil, and weeds begin to appear, to throw a furrow from each side of them by means of a small plough that is narrow behind, stirring the parts not thus moved by the hand-hoe, and after the decay of the weeds these turned down, but before the plants get too large to return them to their former situation, care being taken, not to cover the hearts of the plants with the earth. These operations may be repeated as frequently as the state of the crop may require. But as this plant forms its bulb above the surface of the ground, the earth or mould should never be laid up so much to the roots of the plants as in the common cabbage, as it may not only prevent the swelling of the bulbs, but cause their destruction. It has been suggested in the work just noticed, that in dry seasons this plant may probably be cultivated with greater advantage than that of the turnip, as not being subject to the destructive attacks of the fly, and being less exposed to danger from other animals that are liable to destroy crops of that sort. When situated close to turnips that have been wholly de-

voured by the fly, it has never been perceived that plants of this kind were in the least touched by it. The bulbs or roots of these plants frequently attain a considerable size where the soils are good, the largest sometimes weighing eight or ten pounds, and are said to be much more hardy than the common turnip, though not so much so as the turnip-rooted cabbage. The quantity of produce on an acre is not probably in general equal to that of the common turnip, though it is very considerable.

The application of this sort of cabbage is chiefly in the feeding of neat cattle and sheep during the autumn or spring months, according as it may be sown more early or late; but the most profitable appropriation of it is probably in the latter season, as from the middle of March, till it is removed from the ground. In this way it may become an useful assistant to crops of the turnip kind. In which use, it possesses a particular advantage, in being formed, as it were, upon a footstalk above the surface of the earth, as it can on that account be more conveniently got at and removed during the time of frost, or when snow is upon the ground, than the common turnip. The proportion of nutritious matter contained in crops of this sort is considerable, and of a rich quality. Cows thrive extremely well on it when given in a proper manner. When fed off by sheep, the best method is that of burdling, in the manner practised for common turnips. In this mode of application they are said to require little or no hay, even where the intention is to fatten the animals, as they make a greater progress on them than on any other sorts of food, except that of oats. Both cows and sheep have been found to feed upon the sprouts with avidity, after their having blossomed, and been cut and left to wither. But this practice should be cautiously practised, as much injury must constantly be done to the land, by the plants being suffered to run to seed. When the bulbs are shrunk and withered from being cut and packed up in houses, they are said to form a nutritious food for horses, but farther trials are wanting to fully establish the fact. It is observed, in the "Annals of Agriculture," that instead of cutting off the bulbs below the parts where they are formed, in order to preserve them in houses for the above purpose, it is the practice of some cultivators to plough them up wholly, using a common plough, without any coulter, having only a round share with a blunt edge for the purpose. This is passed along under the rows, and performs the work with much ease, and in a very expeditious manner.

CABBAGE, *turnip-rooted*, in *Botany*. See BRASSICA.

CABBAGE, *turnip-rooted*, in *Agriculture*, a plant of the cabbage kind, which differs principally from the former, in forming its bulb, or protuberance, below the surface of the ground, in having it of an oblong shape, and in the leaves bearing a considerable resemblance to those of the common turnip. It has been introduced into field culture with advantage. The soils best suited to the growth of this sort of crops are those of the more friable loamy kinds, or such as have been formed by the gradual deposition of earthy matters from the overflowings of large rivers, or the sea. But of whatever kind, the parts of them should have been well broken down and reduced by means of tillage, and not be too retentive of moisture. In preparing the ground, it should be brought into a considerable state of pulverization, or fineness, by repeated ploughings and harrowings; and enriched by the application of manure, in the proportion of eight or ten waggons' load to the statute acre, which should be turned in with the last ploughing, in forming the one-bout ridges for receiving the plants. This is sometimes performed by the common plough; but it probably may be executed with more exact-

ness

It is by means of a double mould-board contrived for the purpose.

The seed must be procured from the best and most perfect plants of the kind, in the manner that has been already directed for common cabbage, and be employed while it is perfectly fresh; a such seed as has been kept for some length of time seldom vegetates well, or with much regularity. But where it is necessary to make use of it, the best method is to steep it in water for a few hours before it is put into the ground. The time of sowing must be sooner or later, according to the intention of the cultivator, in respect to the consumption of the crop; but for the summer planting, the best time is generally about the latter end of March or the beginning of April; for which purpose a piece of ground should be prepared, by repeated turning over in the winter, so as to become perfectly fine and free from weeds. This must now be covered by some well reduced farm-yard manure, adding a little fresh horse-dung from the stable. This is then to be turned lightly in, by means of the plough, and a suitable proportion of seed sown over the whole; being covered in by means of a strong rake or light harrow. But where this sort of preparation has not been made, a piece of old grass land, reduced by paring and burning, may, according to Mr. Tugwell, an experienced cultivator, be dressed in a similar manner; or the sulfoil of a winter sheep-fold, the straw, dung, and thin turfy materials having been previously removed. As the plants rise, attention should be paid to the fly, guarding against its attacks by the application of wood-ashes or soot, when it first appears, over the crops. When the plants are found to grow too fast, or advance too high in the stems, before the period of setting them out in the field, so as to attain an improper shape not easily afterwards removed, it may be necessary to draw up the whole of the plants clean on one side of the bed, digging or turning the soil over in the place where they stood, to the depth of four or five inches, with the spade, putting the plants in the trenches in the proportion of forty or fifty in each yard, the roots being covered by the earth taken out of the succeeding trench, and slightly trodden down upon them. In this manner all the plants that require it are to be entrenched; by which their improper growth may not only be checked, but the plants be rendered more fit to be set out in the field. But where the land for the seed-bed has been properly prepared, and is perfectly free from weeds, this process will seldom be found necessary to be employed.

The planting out of this sort of plants may be executed in the same manner as the turnip-cabbage, either upon the plain ploughed surface, or after the land has been raised into ridges. The latter is however to be preferred, especially where the soil is inclined to moisture. They are planted at different distances, according to the goodness of the land: but the most general practice is from two to two and a half or three feet. In the ridge method, it is usual to set them on the middle of the ridges, at the distance of two feet in the rows. The plants should be carefully drawn from the seed-bed towards the latter end of June, for the summer planting, when of the size of good large cabbage plants; and in order that as little injury as possible may be done to the roots, this work should be performed immediately after rain, or after the beds have been well watered. They are then to be made up into small bundles, and distributed by women and children singly along the ridges, or on the plain surface of the land, at proper distances, to be directly put into the soil by the dibblers; in doing which they should be plunged up to the place of the branching out of the leaf stems, the mould or soil being firmly closed about them in the manner advised

in the culture of the common cabbage. It is particularly necessary to attend to this last operation in dry seasons, as the success of the crop in a great measure depends upon it: and at the same time care should be taken that a greater number of plants be not drawn from the seed bed than can be planted out in the same day, and that they be as little as possible exposed to the action of the sun and wind. It is also necessary for a few days to guard against their being pulled up and destroyed by rooks, or other birds, which are apt to attack them.

The after culture of the crops must be carefully attended to in these, as well as in other crops of a similar kind. In about ten days, or a fortnight, when the plants grow well, they will in general require the assistance of the hand-hoe, to clear the ridges and give the plants a slight dressing. And as soon afterwards as may be convenient, the intervals should be cleared either by the common plough, or any other more suitable implement, by passing them twice along each, turning the furrows, where the land is clear, and not too close or compact, up towards the rows, being careful not to earth up the plants to too great a height; but where the contrary is the case, be turned from them, so as to form a ridge in the middle of the interval, the implement being passed within a few inches of the plants in performing the operation. This ridge in dry seasons should be split down, and returned to the row again, in the course of a few days; another hand-hoeing being given as soon afterwards as may be found convenient. This last operation may frequently be unnecessary on the more light and clean descriptions of land; but on the strong and more compact soils it may be had recourse to with advantage, both in respect to the present and future crop.

The quantity of produce in crops of this kind, is frequently found, on good land, to be from 25 to 30 tons on the acre. It is stated, in the ninth volume of the Bath papers, that, in a practice of 20 years, the produce of an acre of this crop was, on an average, invariably found to be equal to the support of 70 sheep for a month, in the most hungry, trying, and difficult part of the year; and this on land then not worth more than 13s. the acre, but which contained between seven and eight thousand plants, averaging above four pounds each in weight. In the Transactions of the Society for the Encouragement of Arts, &c. various accounts are given of the great use of the produce in these crops, as well as of their vast utility as a late spring sheep feed. They have likewise been found beneficial in feeding milk cows, and hogs are very fond of them, sows giving abundance of milk while feeding on them. From this plant being a native of a more cold and northern climate, it of course retains, in some measure, the late habits of the situation from which it was originally brought, and becomes proper for the purpose of feeding live stock, at a later period in the spring, than many other plants to which it has a resemblance. It is seldom before the middle of April that the juice begins to rise, and the plant becomes proper for being fed upon. About this time, however, as is shewn by the bushy appearance of its top, it begins to push forward, and be in a condition to be made use of. When employed before this period, it is said, in the work just noticed, to be comparatively of little advantage; and, in some cases, even injurious to the animals that feed on and consume it. The principal application of crops of this sort is in the feeding of sheep, which are confined upon portions of them by hurdles, in the manner practised for the common turnip. The roots are, however, to be pulled up and prepared by being cut in two by means of an implement of the mattock kind, having a claw on one side nine inches long, with a transverse edge at its end, two inches in width, and on the other a sort of cleaver;

cleaver; with this tool, acting as a lever by means of the handle, the roots are readily taken up, after which any dirt that may adhere to them is shaken off by a blow or two, and the roots split by the cleaver. This enables the sheep to begin in the centre of the roots, and proceed outwards, eating them with more ease, and much more completely, than in any other method. When they are not cut, the hard substance of the rind renders them difficult of being eaten by the animals. One year old sheep, or what are frequently denominated tegs, wethers, and all dry sheep, may in preference be fed on this root; but when ewes and lambs are to be kept upon it, the hurdles must be so contrived as to admit the lambs to pass through them to feed at large, as by this contrivance much benefit will be derived.

Crops of this nature may be found, on the whole, from the hardy and other properties of the plants, to constitute an excellent nutritious food for sheep at those periods in the spring when few other sorts of green food can be procured or depended upon. The culture of it, in proportion to the quantity of sheep that may be kept on the farm, should therefore be carefully attended to by the sheep farmer. Dr. Dickson remarks, that this vegetable has been asserted to be capable of being preserved for some time out of the ground, without its properties being in the least injured; but, as in most other bulbous roots, the best and most economical practice is probably that of employing it in its fresh state. When thus made use of, there can be little doubt of its proving a valuable assistant to the turnip crop, as a late spring feed for sheep or other animals.

**CABBAGE-bark tree**, in *Botany*. See *GEOFFROYA inermis*.

**CABBAGE-tree**. See *ARECA oleracea* and *CALALIA kleinia*.

**CABBAGE-butterfly**, in *Entomology*, the common English name of *Papilio brassica*.

**CABBAGING**, among *Gardeners*, is sometimes used to denote the knitting or gathering of certain pot-herbs into round bunched heads. In which sense the word amounts to the same with what Evelyn calls *poning*, *pommer*; q. d. *appling*, or growing applewise. Others call it simply *heading* or *bunching*.

To make lettuce cabbage, they transplant it, taking care, during the great heats, to water it; otherwise, instead of *poning*, it runs to seed. To promote the cabbaging of cabbage, those who live on the sea-coast, put sea-weed, with a little nitre, under their roots.

Cabbage-plants of the early kind begin to turn in their leaves for cabbaging in May. The Battersea fort cabbage apace when they once begin, and as soon grow hard and burst open; but the sugar-loaf kind is longer before it comes, and is as slow in its cabbaging.

**CABBALA**, a mysterious kind of science, delivered by revelation to the ancient Jews, as they pretend, and transmitted by oral tradition to those of our times; serving for interpretation of the books both of nature, and scripture.

The word is also written *Cabala*, *Caballa*, *Kabbala*, *Kabala*, *Cobalifica*, *Ars Cabala*, and *Gaballa*. It is originally Hebrew, קַבְּלָה, *kabbalah*; and properly signifies *reception*; formed from the verb קָבַל, *libel*, to receive by tradition, or from father to son, especially in the Chaldee and Rabbinical Hebrew.

Cabala, then, primarily denotes any sentiment, opinion, usage, or explication of Scripture transmitted from father to son. In this sense, the word cabala is not only applied to the whole art, but also to each operation performed according to the rules of that art. Thus it is, R. Jac. Ben Ascher, surnamed Baal-Hatturim, is said to have compiled most of the cabbalas invented on the books of Moses before his time.

As to the origin of the cabbala, the Jews relate many marvellous tales. They derive the mysteries contained in it from Adam; and assert, that whilst the first man was in Paradise, the angel Rasiel brought him a book from heaven, which contained the doctrines of heavenly wisdom; and that when Adam received this book, angels came down from heaven to learn its contents, but that he refused to admit them to the knowledge of sacred things, entrusted to himself alone; that, after the fall, this book was taken back into heaven; that, after many prayers and tears, God restored it to Adam; and that it passed from Adam to Seth. The Jewish fables further relate, that the book being lost, and the mysteries contained in it almost forgotten, in the degenerate age preceding the flood, they were restored, by special revelation, to Abraham, who transmitted them to writing in the book "Jezirah;" and that the revelation was renewed to Moses, who received a traditionary and mystical, as well as a written and preceptive, law from God. Accordingly, the Jews believe, that God gave to Moses on mount Sinai, not only the law, but also the explication of that law; and that Moses, after his coming down, retiring to his tent, rehearsed to Aaron both the one and the other. When he had done, Aaron standing on the right hand, his sons, Eleazar and Ithamar, were introduced to a second rehearsal: this being over, the seventy elders that composed the sanhedrim were admitted; and lastly, the people, as many as pleased: to all of whom Moses again repeated both the law and explanation, as he received them from God. So that Aaron heard it four times, his sons thrice, the elders twice, and the people once. Now, of the two things which Moses taught them, the laws and the explanation, only the first were committed to writing: which is what we have in Exodus, Leviticus, and Numbers: as to the second, or the explication of those laws, they were contented to impress it well in their memory, to teach it their children; they to theirs, &c. Hence, the first part they call simply the law, or the written law; the second, the oral law, or cabbala. Such is the original notion of the cabbala.

The cabbala being again lost amidst the calamities of the Babylonish captivity, was once more revealed to Esdras; and it is said to have been preserved in Egypt, and transmitted to posterity through the hands of Simeon ben Setach, Elkanah, Akibha, Simeon ben Joelai, and others. The only warrantable inference from these accounts, which bear the obvious marks of fiction, is, that the cabbalistic doctrine obtained early credit among the Jews as a part of their sacred tradition, and was transmitted, under this notion, by the Jews in Egypt to their brethren in Palestine. Under the sanction of ancient names, many fictitious writings were produced, which greatly contributed to the spreading of this mystical system. Among these were "Sepher Happeliah," or the book of wonders; "Sepher Hakkaneh," or the book of the pen; and "Sepher Habbahir," or the book of light. The first unfolds many doctrines said to have been delivered by Elias to the rabbi Elkanah; the second contains mystical commentaries on the divine commands; and the third illustrates the most sublime mysteries. Among the profound doctors, who, besides the study of tradition, cultivated with great industry the cabbalistic philosophy, the most celebrated persons are the rabbis Akibha, who lived soon after the destruction of Jerusalem (See AKIBHA;) and Simeon ben Joelai, who flourished in the second century (See SIMEON BEN JOELAI). To the former is ascribed the book, entitled "Jezirah," concerning the creation; and to the latter, the book "Solar," or brightness; and these are the principal sources, from which we derive our knowledge of the cabbala. From the third century to the tenth, few traces of the cabbalistic philosophy occur

occur in the writings of the Jews. The probable reason is, that these mysteries, which differ materially from the ancient doctrine of the Jewish church, were entrusted only to the initiated, under a solemn oath of secrecy; and therefore few persons would venture to commit them to writing. Books that were written would be studiously concealed from public inspection, and their enigmatical language would be a seal upon their meaning, which could not be broken by the vulgar hand of an uninitiated Jew. Besides, the Jews were for many centuries deeply involved in controversies concerning their traditional laws, and if they were possessed of Talmudical erudition, they thought themselves sufficiently learned: not to add, that the whole nation was oppressed and harassed by persecution.

That this system of the cabbalistic philosophy, which we may consider as the acroamatic, esoteric, or concealed doctrine of the Jews, by way of contradistinction from the exoteric or popular doctrine, was not of Hebrew origin, we may conclude with a very great degree of probability, from the total dissimilarity of its abstruse and mysterious doctrines, to the simple principles of religion taught in the Mosaic law; and that it was borrowed from the Egyptian schools will sufficiently appear from a comparison of its tenets with those of the oriental and Alexandrian philosophy. (See ALEXANDRIAN.) Many writers have, indeed, imagined that they have found in the cabbalistic dogmas, a near resemblance of the doctrines of Christianity, and they have thought, that the fundamental principles of this mystical system were derived from divine revelation. This opinion, however, may be traced up to a prejudice which originated with the Jews, and passed from them to the Christian fathers, by which they were led to ascribe all Pagan wisdom to an Hebrew origin; a notion which very probably took its rise in Egypt, when Pagan tenets first crept in among the Jews. Philo, Josephus, and other learned Jews, in order to flatter their own vanity, and that of their countrymen, industriously propagated this opinion; and the more learned fathers of the Christian church who entertained a high opinion of the Platonic philosophy, hastily adopted it, from an imagination that if they could trace back the most valuable doctrines of Paganism to a Hebrew origin, this could not fail to recommend the Jewish and Christian religions to the attention of the Gentile philosophers. Many learned moderns, relying implicitly upon these authorities, have maintained the same opinion, and have thence been inclined to credit the report of the divine original of the Jewish cabbala. But the opinion is unfounded; and the cabbalistic system is essentially inconsistent with the pure doctrine of divine revelation. The true state of the case seems to be, that the Jews, like other oriental nations, from the most remote period, had secret doctrines or mysteries. During the prophetic ages, these, probably, consisted in a simple explanation of those divine truths, which the prophets delivered under the veil of emblems. After this period, when the sects of the Essenes and Therapeutæ were formed in Egypt, foreign tenets and institutions were borrowed from the Egyptians and Greeks, and, in the form of allegorical interpretations of the law, were admitted into the Jewish mysteries. These innovations chiefly consisted in certain dogmas concerning God and divine things, at this time received in the Egyptian schools, particularly at Alexandria, where the Platonic and Pythagorean doctrines on these subjects had been blended with the oriental philosophy. The Jewish mysteries, thus enlarged by the accession of Pagan dogmas, were conveyed from Egypt to Palestine, at the time when the Pharisees, who had been driven into Egypt under Hyrcanus, returned, with many other Jews, into their own country. From this time the cabbalistic mysteries continued

to be taught in the Jewish schools; but, at length, they were adulterated by a mixture of Peripatetic doctrines, and other tenets, which sprang up in the middle age. These mysteries were not, probably, reduced to any systematic forms in writing, till after the dispersion of the Jews, when, in consequence of their national calamities, they became apprehensive that those sacred treasures would be corrupted, or lost. In preceding periods, the cabbalistic doctrines underwent various corruptions, particularly from the prevalence of the Aristotelian philosophy. The similarity or rather the coincidence, of the cabbalistic, Alexandrian, and oriental philosophy, will be sufficiently evinced by briefly stating the common tenets in which these different systems agreed; they are as follow: "All things are derived by emanation from one principle: and this principle is God. From him a substantial power immediately proceeds, which is the image of God, and the source of all subsequent emanations. This second principle sends forth, by the energy of emanation, other natures, which are more or less perfect, according to their different degrees of distance, in the scale of emanation, from the first source of existence, and which constitute different worlds or orders of being, all united to the eternal power from which they proceed. Matter is nothing more than the most remote effect of the emanative energy of the Deity. The material world receives its form from the immediate agency of powers far beneath the first source of being. Evil is the necessary effect of the imperfection of matter. Human souls are distant emanations from Deity, and after they are liberated from their material vehicles, will return, through various stages of purification, to the fountain whence they first proceeded." From this brief view it appears, that the cabbalistic system, which is the offspring of the other two, is a fanatical kind of philosophy, originating in defect of judgment and eccentricity of imagination, and tending to produce a wild and pernicious enthusiasm. For a fuller account of the tenets of the Jewish cabbala, we refer to Brucker's Hist. of Philos. by Enfield. vol. ii. chap. iii.

Dr. Burnet examines into the merits of the several parts of the cabbala, which he finds to be without rational foundation, and not conducing to any real knowledge. But he conjectures, that the most ancient cabbala, before it was confounded and defiled with fables, might contain something of the original of things, and their gradations; particularly, that, before the creation, all things had their being in God; that from him they flowed as emanations; that they will all flow back again into him, when they are destroyed; and that there will succeed other emanations and regenerations, and other destructions and absorptions to all eternity, as they had been from all eternity; that nothing is produced out of nothing; and that the things produced never return to nothing, but always have their subsistence in God. Burn. Archæol. lib. i. cap. 7. Phil. Trans. N<sup>o</sup> 201. p. 800.

Among the explications of the law, which, are furnished by the cabbala, and which, in reality, are little else but the several interpretations and decisions of the Rabbins on the laws of Moses, some are mystical; consisting of odd abstruse significations given to a word, or even to the letters whereof it is composed: whence, by different combinations, they draw meanings from Scripture, very different from those it seems naturally to import. The art of interpreting Scripture after this manner is called more particularly cabbala: and it is in this last sense the word is more ordinarily used among us. This cabbala, called also artificial cabbala (to distinguish it from the first kind, or simple tradition), is divided into three sorts. The first, called *gematria*, consists in taking letters as figures, or arithmetical numbers, and explaining

explaining each word by the arithmetical value of the letters whereof it is composed; which is done various ways. The second is called *notaricon*; and consists either in taking each letter of a word for an entire diction, or in making one entire diction out of the initial letters of many. The third kind, called *themurah*, q. d. *changing*, consists in changing and transposing the letters of a word; which is done various ways.

The generality of Jews prefer the cabbala to the Scripture; comparing the former to the sparkling lustre of a precious stone, and the latter to the fainter glimmering of a candle.

The cabbala only differs from masorah, as the latter denotes the science of reading the Scripture, the former of interpreting it. Both are supposed to have been handed down from generation to generation by oral tradition only, till at length the readings were fixed by the vowels and accents, as the interpretations were by the *masorah* and *gemara*. Prideaux Conn. p. i. lb. v. p. 506.

The cabbala hitherto spoken of may be called speculative cabbala; in opposition to the following, which may be called practical cabbala.

CABBALA is also applied to the use, or rather abuse, which visionaries and enthusiasts make of Scripture, for discovering futurity, by the study and consideration of the combination of certain words, letters, and numbers, in the Sacred Writings. All the words, terms, magic figures, numbers, letters, charms, &c. used in the Jewish magic, as also in the hermetical science, are comprised under this species of cabbala, which professes to teach the art of curing diseases, and performing other wonders, by means of certain arrangements of sacred letters and words. But it is only the Christians that call it by this name, on account of the resemblance this art bears to the explications of the Jewish cabbala: for the Jews never use the word cabbala in any such sense, but ever with the utmost respect and veneration. It is not, however, the magic of the Jews alone which we call cabbala, but the word is also used for any kind of magic.

CABBALIC art, *Ars caballica*, is used by some writers for *ars palestrica*, or the art of wrestling.

CABBALISTIC art. See CABBALA, and CABBALISTS.

CABBALISTS, a sect among the Jews, who follow and practise the cabbala, or interpret Scripture according to the rules of the literal cabbala, above laid down.

The Jews are divided into two general sects; the Caraites, who refuse to receive either tradition, or the Talmud, or any thing but the pure text of Scripture: and the Rabbinites or Talmudists, who, beside this, receive the traditions of the ancients, and follow the Talmud.

These latter are again divided into two other sects; pure Rabbinites, who explain the Scripture in its natural sense, by grammar, history, and tradition; and Cabbalists, who, to discover hidden mystical senses, which they suppose God to have couched therein, make use of the cabbala, and the mystical rules and methods above mentioned.

There are visionaries among the Jews, who believe that Jesus Christ wrought his miracles by virtue of the mysteries of the cabbala. Some learned men are of opinion, that Pythagoras and Plato learned the cabbalistic art of the Jews in Egypt; and fancy they see evident footsteps thereof in their philosophy: others, on the contrary, say, it was the philosophy of Pythagoras and Plato that first furnished the Jews with their cabbala. Be this as it will, it is certain, that in the first ages of the church, most of the heretics gave into the vain notions of the cabbala: particularly the

Gnostics, Valentinians, and Basilidians. Hence arose the *απορρητοι*: and the multitude of talismans, wherewith the cabinets of the virtuosi were stocked.

See a particular account of the cabbalistic art, as practised not only by Jews, but by Heathens and Christians, in Baskage's Hist. of the Jews, book iii. chap. 10—28.

CABBIN. See CABIN.

CABBY *ijland*, in *Geography*, lies N. of Holyhead island on the coast of Wales, about two miles from the north point of that island.

CABE, a river of Spain, which uniting with the Velezar, runs into the Minho, a little to the west of Orense in Galicia.

CABEÇA, or CABESSE, in *Commerce*; the Portuguese who carry on the trade of silks in the East Indies, distinguish them by the names of *cabeça*, and *larillo*; that is to say, head and belly. The *cabeça* silks are the finest; the *larillo* being from fifteen to twenty per cent. inferior to them. The Indian workmen endeavour to mix them together; for which reason the more experienced European merchants, who carry on that trade, take care to open the bales, and to examine the silks. The Dutch distinguish two sorts, viz. the ordinary cabeffe, and the "cabeffe de mora."

CABEÇA *de Vide*, in *Geography*, a small town of Portugal, in the province of Alentejo, with a strong castle. N. lat. 39°. W. long. 60° 43'.

CABEÇA, LA, in *Zoology*, a snake of South America in Panama, there called the double-headed snake, from an imagination that it has a head at each extremity, and that from the bite of each it conveys a poison equal in activity to that of the coral or rattle-snake. Its usual length is said to be about half a yard, resembling in figure an earth-worm. Its diameter is about six or eight lines, and its head different from the heads of other snakes, being of the same dimensions with its body. The creature, however, has only one head, which, as it resembles a tail, has occasioned the notion that it has two heads. Its motion is very slow, and its colour variegated with spots of a paler tint.

CABEÇAS, LAS, in *Geography*, a town of Spain, in the province of Andalusia, containing several ruins that indicate its having been formerly a large place; 4 leagues S. of Seville.

CABEÇAS *Rubias*, a town of Spain, in the country of Seville, on the confines of Portugal; 40 miles N. W. of Seville.

CABEÇAS, a town of the island of Cuba; 130 miles S. W. of Havanna.

CABEÇON, a town of Spain, in the province of Leon, seated on a mountain, with a fort on the river Pisuerga; 3 leagues N. N. E. from Valladolid.—Also, a town of Spain, in the province of Asturia; 18 miles W. S. W. of St. Andre.

CABEGO, a river of Portugal, which runs into the Lima, 7 miles above Ponte de Lima.

CABEL, or KABEL, ADRIAN VANDER, in *Biography*, a painter of landscape, sea-ports, and cattle, was born at Ryswick, in 1631, and became a disciple of John Van Goyen, under whose instruction and example he made a rapid progress in his profession, and by whom his name was changed from Vander Touw to Vander Cabel. He copied nature and designed every object before he inserted any in his compositions. His taste in designing animals and figures was formed after that of Calligione; and in landscape his model was the style of Salvator Rosa. His manner is great, and much after the *goût* of the Italian school. The touchings of his trees are excellent; his figures and animals are very correct, and marked with spirit.

Although his different pictures have unequal merit, they are all distinguished by the freedom of his hand, and the fine touch of his pencil. In his colouring he was solicitous to imitate the Caracci and Mola; but the beauty of his design and composition is often injured by too dark and deep tone of colouring. His etchings, of which some few remain, are performed in a slight, free style. He died in 1695. Pilkington and Strutt.

**CABELLIO** *Cavaillon*, in *Ancient Geography*, a town of Gallia Narbonensis. This was a Roman colony in the time of the triumvir Lepidus, 42 years before the Christian era. With regard to the construction of the triumphal arch of Cavaillon it is conjectured, that as Pompey had granted the two banks of the Rhone to the inhabitants of Marseilles, the town of Cavaillon, upon the Durance and near the Rhone, belonged to them. This monument was accordingly erected to commemorate the exploits of Pompey and the Roman armies. The medals of this city were bronze, gold, and silver.

**CABELLO** *port*, in *Geography*, lies on the north coast of the Spanish main, in N. lat.  $10^{\circ} 31'$ . W. long.  $67^{\circ} 32'$ .

**CABELON**, lies on the coast of Coromandel in India, 7 miles from Corimore N. by E. and 5 leagues from Madras or fort St. George. To the south of Cabelon are the 7 Pagodas, by which the coast is known.

**CABENDA**, or **CABINDA**, a sea-port town of Africa, in the kingdom of Angoy or Gov on the coast of Loango, is situate on the mouth of the river of the same name, about 5 leagues N. of Cape Palmerino. The bay lies very commodious for trade, wooding, and watering on the sea-shore. Some parts of the adjacent ground are flat and marshy; but it gradually ascends about 3 miles within land and forms a ridge of hills, on the ascent of which is a town, where a stock of wood is always kept for the supply of foreign ships. The town of Cabenda is seated on the round point of the bay, looking towards the west, and the English factory on the south-west of the road, at some distance, N. E. from the town. The Portuguese, Dutch, and other Europeans come to this port for water and provisions. The houses, or rather huts, are built of dirt and reeds. The country round the bay is mostly barren, and the people very lazy. They breed no cattle except some hogs, but they have plenty of poultry. The wild beasts are so numerous in the woods that they destroy all of the tame kind. Civet-cats and parrots are numerous. The coast abounds with oysters; and the natives fish both on the beach and in the bay with drag-nets, having long canes that are fixed at equal distances, instead of corks, to shew when any fish is caught. These nets are made of a peculiar root, which, being beaten, becomes flexible like hemp. S. lat.  $6^{\circ}$ . E. long.  $12^{\circ} 5'$ .

**CABERASA**, in *Ancient Geography*, a town of Asia, in Media. Ptolemy.

**CABES**, or **GABES**, in *Geography*, a town of Africa, in the kingdom of Tunis, situate on a river near a gulf of the same name. N. lat.  $33^{\circ} 40'$ . E. long.  $10^{\circ} 55'$ .

**CABESA**, a town of the island of Cuba; 55 miles N. of St. Jago.

**CABESTA** *Gatta*. See *CAT's Head*.

**CABESTAN**, or **CABESTAING**, **WILLIAM DE**, in *Biography*, a famous Provençal poet of the 13th century, mentioned by Petrarch, who passed the first years of his life in the castle of the lord of Cabestan; and being enamoured of a lady belonging to the house of Baux, wrote verses in her praise, which were popular. The lady, in order to secure his inviolable attachment, administered to

him an herb by way of philtre, which deranged his understanding. He was recovered by an antidote, which converted his love into hatred. In his attendance on Triline Carbonal, the wife of Raimond de Seillans, he ingratiated himself with her to such a degree as to excite the jealousy of her husband, who privately killed him and barbarously tore out his heart. Thus he caused to be dressed, and served up to his wife in a dish. After she had partaken of it, she was told what she had eaten, and died of grief. This event occurred about the year 1213. Moreri.

**CABESTERRE**, in *Geography*, a name given in the Antilles islands, to that part of the island which looks towards the east, and which is always refreshed by the trade-winds, blowing from the north to the east-south-east. The opposite part is called "Bass-terre," being lower and less exposed to the wind, and of course hotter: here the sea is less agitated than in the Cabesterres, and it is consequently better adapted to the anchorage and loading of vessels.

**CABESTERRE**, or *Le Marigot*, a town of the island of Guadaloupe on the east coast. N. lat.  $16^{\circ} 10'$ . W. long.  $61^{\circ} 44'$ .

**CABESTES**, lies near La Vera Cruz, on the S. W. coast of Campachy bay in the gulf of Mexico.

**CABEZZO**, a province of the kingdom of Angola in Africa, joining to Oacco on the north, and to Lubalo on the south, and having the Coanza on the north-east, and Rimba on the south-west. It is populous, and well stored with cattle and other provisions; and it has a mine of iron on a mountain, called the "Iron mountain," which supplies the Portuguese with great quantities of that metal, forged by the natives into a great variety of warlike and other useful implements. The inhabitants are plentifully furnished with water by the Rio Longo, and other smaller rivulets and lakes. Their trees are of a large size, and the bark being slashed with a knife yields an odoriferous resin, resembling wax in colour and consistency, and reckoned very medicinal. The avenue to the royal palace is decorated by a number of palm-trees that are very large and beautiful.

**CABIAI**, of Buffon, in *Zoology*, the thick-nosed Tapir of Pennant, the *Sus Hydrochæris* of Linnæus, and *CAVIA CAPYBARA* of Pallas, &c. which see.

**CABIDOS**, in *Commerce*. See *CAVIDOS*.

**CABIGIAK**, or **САБИГАК**, in *Modern History*, a tribe of Oriental Turks. Their origin is thus related. A female belonging to the army of Oghuz-Khan was delivered in the hollow of a tree to which she entered; and the infant was adopted by Oghuz, and called "Cabigiak" or the bark of wood, from the manner of his birth. In process of time his posterity became numerous and extended themselves to the north of the Caspian sea. They have retained the appellation of their ancestor, and their country is denominated in Persia and in Turkish "Descht Kipteliak." From this country proceeded the armies which first ravaged the dominions possessed in Persia by the Moguls; and they were the first troops which Bajazet the first sultan of the Turks opposed to Tamerlan: but instead of fighting against Tamerlan, they took a part with him and united with the Tartars, whom they regarded as their brethren of one and the same origin. D'Herbelot, Bib. Or.

**CABILAH**, a tribe of independent and vagabond Arabs, under the conduct of a chief. Some Arabian writers reckon 80 of these tribes. D'Herbelot.

**CABILIAU**, in *Ichthyology*, a name by which some authors have called the common cod-fish, the *morhua* and *afellus major* of other writers.

**CABILLEN**, in *Geography*, a town of the duchy of Courland; 10 miles E. of Goldingen.

**CABIN**, or **CABBIN**, is sometimes used for the huts or cottages of savages, and other poor people.

The habitations of the Indians in Virginia are cabins, about nine or ten feet high, which are made after this manner: they fix poles into the ground, and bring the tops of them one within another, and so tie them together; the outside of these poles they line with bark, to defend them from the injuries of the weather, but they leave a hole in the top, right in the middle of the cabin, for the smoke to go out; round the inside of their cabins they have banks of earth cast up, which serve instead of stools and beds. Phil. Trans. N<sup>o</sup> 126.

**CABIN**, a room or apartment in a ship, where any of the officers usually reside. There are many of these in a large ship; the principal of which is designed for the captain, or commander. In ships of the line, this chamber is furnished with an open gallery in the ship's stern, as also a little gallery on each quarter. The apartments in which the inferior officers or common sailors sleep and mess, are usually called *births*, which see. The bed-places built up for the sailors at the ship's side in merchantmen, are also called cabins.

The word comes from the French *cabane*, Spanish *cabana*, or Italian *capanna*, a little straw hut; and that from the Greek *κζζων*, a stall or manger.

**CABIN point**, in *Geography*, a small post-town of America, in Surry county, Virginia, situate on Upper Chipoak creek, 26 miles E.S.E. of Petersburg, 87 from Portsmouth, and 329 S.S.W. of Philadelphia.

**CABINET**, or **CABBINET**, the most retired place in the finest apartment of a building; set apart for writing, studying, or preserving any thing very precious.

A complete apartment consists of a hall, anti-chamber, chamber, and cabinet; with a gallery on one side.

**CABINET** is sometimes particularly used for a place at the end of a gallery, wherein are preserved the paintings of the best masters, conveniently ranged, and accompanied with busts, and figures of marble and bronze, with other curiosities. In this sense, cabinet amounts to the same with what is called by Vitruvius, *pinacotheca*. Sometimes there are several rooms destined for this use, which are all together called cabinet, or gallery.

**CABINET** also denotes a kind of buffet or chest of drawers, partly for the preservation of things of value, and partly as a decoration of a chamber, gallery, or other apartment.

These cabinets are made of oak or of chestnut, of inlaid work or japan, of ebony and of other scarce wood.

In the repository of the Royal Society is a Chinese cabinet, filled with the instruments and simples used by the surgeons of that country. The most remarkable are those which are contrived for scratching, picking, and tickling the ears, in which the Chinese take great pleasure. Phil. Trans. N<sup>o</sup> 246. p. 390, seq.

**CABINET**, in *Gardening*, is a little insulated building in manner of a summer-house, built in some agreeable form, and open on all sides; serving as a place of retirement, and to take the fresh air under cover.

According to Miller, a cabinet is a kind of saloon, placed at the end or in the middle of a long arbour.

It differs from an arbour, which is long, in form of a gallery, and arched over head; whereas the cabinet is either square, circular, or in cants, making a kind of saloon.

**CABINET**, in *Natural History*. This term is applied with some latitude to any small or select collection of natural curiosities, without regarding whether the articles it comprises be contained within a cabinet or not. Thus, for instance, it is not unfrequent with us to speak of cabinets of animals, cabinets of

birds, of fishes, reptiles, and other similar articles, as a mode of expressing such an assemblage of natural history as may not be of sufficient importance to deserve the epithet of a museum. The word cabinet in its usual acceptation with the naturalist is not, therefore, confined solely to the boxes, press, or chest of drawers, in which articles of curiosity are contained, but implies at once both the repository itself, and the articles arranged in it.

So much depends upon the fancy, taste, or judgment of the collector in the formation, or, as it is sometimes denominated, building, cabinets for the reception of articles of this description, that no explicit directions can be given for this purpose with propriety. The most material object to be considered is the compactness of the drawers and chest, according to the size of the articles to be deposited in them, in order to comprise as much as convenient within the smallest compass in which they can lie without injury to each other, and at the same time be seen and examined with ease.

Cabinets of fossils, shells, and corals have the drawers sometimes divided for this purpose into small compartments, by means of an inner frame work, that lets into the bottom of the drawer; but trays of various sizes made either of card or palleboard have a much neater appearance, and are preferred by many as being more commodious, and more easily shifted from one part of the drawer to another, as the addition of new acquisitions in any particular tribe or genus may require. Nothing can be more desirable than to have the cabinets well made, that the drawers may slide with perfect ease in their proper recesses in the press. The drawers should fit so close, when shut up, as to preclude the entrance of dust of any kind. The cabinet itself should be also placed in a dry situation, as there are few articles of natural history that are not affected in a greater or less degree by an excess of damp, or even heat.

The construction of an entomological cabinet depends less on the taste of the collector, in the present day, than the preceding, except so far as relates to the elegance or external embellishment of the cabinet, or the excellence of the workmanship. The drawers are uniformly made shallow, the bottom of each is lined with cork, and the top is covered with glass, through which the insect may be seen without being exposed to the air, or accidents that would arise from their being touched by the incautious spectator.

Cabinets for insects are built of various sizes, from those which contain ten or a dozen drawers to others that include above an hundred. They are usually of mahogany, but it is immaterial whether be they made of mahogany or waincot; some have them of cedar, but seldom of deal, or any other wood of a soft texture. The drawers may be from fifteen to thirty inches in length, the same, or nearly the same in breadth, and about two or three inches in depth. The cork with which the bottoms are lined must be chosen as free from cracks and holes as possible; it should be also glued into the drawers to prevent its warping, and be filed or cut very level; and after this the irregularities on the surface of the cork should be rubbed down with pumice-stone, till the whole is rendered perfectly smooth, before the paper is pasted over it. The paper should be of a fine smooth and even grain, but neither very stout, nor highly stiffened with size, lest it should turn the points of the pins, when placing the insects in the drawers. The top of every drawer must be covered with a plate of glass, to prevent the admission of dust or air. This plate is usually fitted into a frame of the same size as the drawer, and is made either to slide in a groove, or let in on a rabbet; the latter contrivance is much the best, because in sliding the glass along the groove, if any of the pins happen to stand too high as to touch the frame-work.

the insects will be injured by the jerk, or, as more frequently happens in this case, be broken to pieces. On the contrary, when the frame falls in upon a rabet, it is of no consequence whether the edge of the frame sinks into the drawer below the level of the heads of the pins on which the insects are placed or not; it is only necessary to observe, that the glass does not press upon the pins, since it is the glass only that can come in contact with them.

Instead of cork for the purpose of lining the bottom of the drawers for insects, it was customary among old collectors to cover the bottom of them with a thin coat or layer of pitch, or green wax, over which the paper was sometimes laid, and upon this the insects were stuck. The disadvantage of this method, although recommended by recent authority, is evident, when we consider how liable both the pitch and wax are to be affected by the state of the weather. An eminent collector, the late Mr. Tunstall, had the whole of his insects disposed on green wax, each insect being placed on a small tablet of it, and the tablets afterwards affixed with a small portion of melted wax to the bottom of the drawers. This cabinet was once removed to a short distance in the country, during the winter season, when, notwithstanding the precaution of fastening the tablets in this manner to the bottom of the drawers, some of them snapped asunder with the cold, and rolling about among the rest occasioned the loss of many valuable insects. In another instance a celebrated collection of insects, stuck on wax in a similar manner, that had been presented to a great public museum, was indiscreetly exposed to the heat of a brisk fire, with a design of warming the wax, that the pins might be more easily withdrawn, for the purpose of removing the insects to another cabinet; but, sad mischance! the wax melting in a much shorter time than was expected, almost every insect in the cabinet sunk into the fluid mass, and was destroyed. Accidents of this kind may operate as a caution to others, and prove, at least, the superior advantage of lining the bottoms of the drawers with cork instead of wax.

Every crevice in the drawers for insects should be carefully closed up. Indeed the entomologist, duly attentive to the preservation of his insects, will conceive no pains nor expence ill bestowed in having his cabinet so well constructed as to render it impossible for the air or dust to penetrate. A small recess should be also made along the inner edge, or side of the drawer, for the admission of a quantity of camphor, about one fourth part of an ounce of which in each drawer will preserve the insects contained in the drawer from the depredations of mites, or any other small insects, for years. It is an erroneous supposition, which many people entertain, that insects cannot be preserved; for it may be safely affirmed from experience, that if they are placed in a close cabinet, as before directed, and the drawers occasionally replenished with fresh camphor every second or third year, or at most every year, insects are not more perishable than almost any other description of natural objects. They may be preserved in this manner without injury or diminution of beauty for ten, twenty, or thirty years; we have seen insects that have been collected at a period more remote still, and which scarcely manifested any symptom of decay.

Some naturalists prefer cajuput oil for scenting the drawers to destroy the mites, and other destructive vermin, with which the insects would otherwise, in time, become infested. Musk is another powerful antidote and preservative; and again, the use of bitter aloes is strongly recommended; but upon the whole, we are, for our own part, so fully satisfied of the efficacy of camphor, that we should always consider it preferable for this purpose to any other preservative. It has been thought necessary by some, that

the cork, with which the drawers are lined, should be well impregnated with a solution of corrosive sublimate mercury, in a saturated solution of crude sal-ammoniac in water. (an ounce of which will be sufficient to dissolve twenty scruples of the sublimate). This may be tried, since it has been strongly advised, although we believe the precaution needless. Mr. Drury adopted another plan: he pruned a quantity of crude verdegrease with common bees wax, and spread a thin layer of it between the bottom and the cork, in those drawers which were designed for the reception of his more delicate insects. We are, however, of opinion, that a solution of alum in water, washed either over the cork or paper of the drawer, would answer the same purpose, and be attended with less trouble. See article ENTOMOLOGY.

CABINET of Medals. See MEDALS.

CABINET is also used in speaking of the more select and secret councils of a prince or administration: thus we say, the secrets, the intrigues of a cabinet. To avoid the inconveniences of a numerous council, the policy of Italy and practice of France have introduced cabinet councils; a remedy worse than the disease. King Charles I. is charged with first establishing this usage in England. Besides his privy council, that prince erected a kind of cabinet council, or junto, under the denomination of a council of state; composed of archbishop Laud, the earl of Strafford, and lord Collington, with the secretaries of state. Yet some pretend to find the substance of a cabinet council of much greater antiquity, and even allowed by parliament, who anciently settled a quorum of persons most confided in, without whose presence no arduous matter was to be determined; giving them power to act without consulting the rest of the council. As long since as the 28th of Henry III. a charter passed in affirmance of the ancient rights of the kingdom; which provided that four great men, chosen by common consent, who were to be conservators of the kingdom, among other things, should see to the disposing of monies given by parliament, and appropriated to particular uses; and parliaments were to be summoned as they should advise. But even of these four, any two made a quorum; and generally the chief justice of England and chancellor were of the number of the conservators. Math. Par. 28 Henry III.

In the first of Hen. VI. the parliament provides, that the quorum for the privy council be six or four at least; and that in all weighty considerations, the dukes of Bedford and Gloucester, the king's uncles, should be present; which seems to be erecting a cabinet by law.

CABIRA, afterwards called *Diopolis*, and since *Sebastopolis*, in *Ancient Geography*, a town of Pontus, south-east of Amasia, upon the river Iris. Mithridates built a palace in this city, where he had also a fish-pond, and in its vicinity parks for chase, and, according to Strabo, mines. This city became memorable for the defeat of Mithridates by Lucullus. When Pompey took possession of it, he gave it the name of "Diopolis," and the queen Pythodoris, widow of Polemon, named king of Pontus by Antony, called it "Sebaste," or "Sebastopolis," i. e. the city of Augustus, in honour of that prince.

CABIRI, in *Antiquity*, certain deities worshipped more especially by the Samothracians, and in the isle of Imbros, and some other parts of Greece.

These Cabiri were originally Syrians or Phœnicians; and we are chiefly indebted to the fragment of Sanctioniathon, recorded by Eusebius in his "Præparatio Evangelica," for the information, scanty and dubious as it is, which has been transmitted concerning them. From him we learn, that they were the sons of Sydye, and the same with the Dioscuri, Corybantes, and Samothracæ; that they first discovered

vered the art of building ships; that from the time of Cronus (Saturn) their descendants navigated the sea on rafts or vessels of their own construction; and that they landed on mount Casius, where they consecrated a temple. It is also related, that Cronus gave the city of Berytus to Neptune and the Cabiri. Sanchoniathon further says, that these sons of Sydye were eight in number; but he mentions only one of them by name, viz. Asclepius, who was furnished Esmunus, from שמש, *Saman*, signifying the eighth. He was the god of health, and restorer of life. Bochart supposes, that this Sydye was Jupiter: Cumberland in his "Sanchoniatho's Phœnician History," (p. 173, &c.) maintains, that he was Shem, the son of Noah; Shuckford supposes, (Connection, &c. vol. i. p. 213.) that he was Mizraim, the son of Ham, (Gen. x. 6.) or Menes, who settled in Egypt about the 15th year of Nimrod, A. M. 1772, according to him, or 2188 B. C. according to Blair's Tables. According to Pausanias (l. ix. p. 751.) the original Cabiric divinity was Prometheus. The learned Bryant (Analysis of Anc. Myth. vol. ii. p. 460.) concurs with those who are of opinion, that Sydye, or Sadic, was the patriarch Noah, and that the name by which he is called, or Sadic. corresponds to the character given of him in the book of Genesis, ch. vi. 9. He was שדי, Sadic, a just man and perfect in his generation. All science, and every useful art were attributed to him; and through his sons they were transmitted to posterity. He supposes that the Cabiri were the same with the Curetes, Corybantes, Telchines, and the Idæi Dactyli of Crete. However, in treating of them, great confusion has arisen from not considering that both the deity and priest were comprehended under the same title. Hence it has happened, that the appellation of Cabiri has been used by the ancients indifferently, to signify the gods in whose honour certain mysteries were instituted, the institutors of these mysteries, and the principal hierophants who officiated in them. From the account that has been already given from Sanchoniathon of the origin of the Cabirian deities, it is reasonable to imagine, that they were persons eminently distinguished for their exploits, and for the invention of arts useful to mankind; and that on this account they were deified by the Phœnicians; and we may easily conceive, that the navigators who first passed from Phœnicia into Greece introduced there the worship which they had rendered to the Cabiri, as the inventors of navigation. To this purpose Diodorus Siculus very justly observes, (lib. i. p. 14.) that the Greeks worshipped for their Gods some heroes and great men, that had formerly been famous in Egypt, whose lives, or at least short memoirs of them, had been written at first in a plain and simple manner; but succeeding writers embellished the accounts given of them, by intermixing with them various fictions. Diodorus ascribes to the Cabiri the invention of fire, and the art of manufacturing iron. Hence it is, that on a medal of Gordian, and another of Furia Sabina Tranquillina, both struck at Carræ, where the Cabiri were worshipped, we find the figure of a Cabirus on a column, holding a hammer in his right hand. For the same reason, Herodotus (l. iii.) observes, they were represented like Vulcan. We need not wonder, if we consider the various useful arts that were ascribed to these deified persons, that they should be so generally honoured. The Phœnicians, Syrians, Egyptians, Greeks, Cypriots, Phrygians, Etruscans, Latins, Carthaginians, and almost all the ancient Pagans, manifested the most profound veneration for the Cabiric mysteries. The name by which they are called denotes the high estimation in which they were held; for, instead of deriving it, as some have done, from the nymph Cabira, or from mount Cabirus

in Phrygia, its etymology may more probably be sought in the Hebrew, or Phœnician language, in which, the word "Cabir" denotes great and powerful: and, accordingly, they are described by Cassius Hermina (see Macrobi. Sat. l. iii. c. 4. p. 376.) as "the great, beneficent, and powerful Gods."

We have already observed, that the honours they received seem to have originated with the Phœnicians, and by their navigators the worship of these deities was introduced into the island of Samothrace, where they landed before they passed over to the continent. At Memphis, in Egypt, they had a famous temple, which was held to sacred, according to Herodotus, (l. iii. c. 37.), that no person, excepting the priests, was suffered to enter within its walls. In several cities of Syria the worship of these deities prevailed. At Cabira in Pontus, they had one of the most magnificent temples in the world. In Phrygia also, and Cilicia, there are evident traces of the same kind of worship. The Cabiric rites were also practised at Imbros and Lemnos; and they prevailed likewise in Greece, and particularly at Theba, in Bœotia: and as their chief province related to the sea and shipping, they were more especially implored by mariners for success in their voyages. When the worship of the Cabiri was introduced from Phœnicia, or Egypt, into Greece, it underwent various modifications and changes, as the Greeks were too proud to acknowledge themselves indebted, even for their superstition, to strangers. Accordingly, they altered the names of their gods, and disguised their origin. By some of the Greek writers, they are represented as the sons of Jupiter and Calliope; by others, as the sons of Jupiter and Electra, or of Jupiter and Leda. Some refer Jupiter himself, and Bacchus, to the class of Cabiri; and others say they were the sons of the Sun and Minerva: others pretend that their mother was the nymph Cabira, the daughter of Proteus, and their father, Vulcan; and it is thought, that one of their sons is represented on the medals of Thessalonica, under the name of CABEIPOC, holding in one hand a hammer, such as Vulcan is represented with on the ancient monuments, and dressed, like him, with a cap on the head. The worship of Vulcan and his sons was established in Egypt, in the isles of Lemnos, and in other places, where they were honoured under the name of Cabiri, for having invented corn and the manufacture of it. As for particular names which the Greeks gave to the Cabiri, those which most frequently occur are Castor and Pollux, the sons of Jupiter and Leda. These Grecian Gods were represented as Cabirian deities on some of the Greek medals of Marcus Aurelius and Lucius Verus. These were also known by the names of Jason and Dardanus, the sons of Jupiter and Electra; and also by those of Alcon and Eurimedon, the sons of Vulcan and Cabira, to whom is ascribed a son called Camillus, or Cadmillus, i. e. Mercury. According to Cicero, three others, called Tritopareus, Eubuleus, and Dionysius, were the sons of Jupiter and Proserpine. Mnaseas, a Phœnician author, has, according to Josephus, mentioned three others; viz. Axieros, said by some to be Ceres, and by others Jupiter; Axiocherfa, or Proserpine; and Axiocherfos, or Pluto.

The nature of the mysteries of the Cabiri, and the rites of which they consisted, are not ascertained. They were disclosed only to the initiated, and penalties were annexed to the crime of divulging them. The mysteries of Ceres Cabiria in Bœotia were the same with those of the Cabiri in Samothrace: and it has been said by Clemens Alexandrinus, in speaking of the worship of these deities among the Etruscans, that they were kept secret under a penalty, on account of the injury that attended them. The Pclafgi, Samothracias,

mothracians, and others, celebrated them in the night, and, as it is related, with great indecency; and to this circumstance it is owing, that they have transmitted no written account of them to posterity. The "phallus" is said to have been one of their symbols in the Cabirian mysteries of Samothrace. M. de St. Croix in his "Memoirs concerning the sacred Religion of ancient Nations," (Paris, 1784), forgets, that the origin of the use of this symbol was as follows. Cadmillus, the youngest of the Cabiri, having been killed by two of his brothers, who cut off his privities and fl'd to mount Olympus, where they buried them; this Cabiri's death was commemorated by that symbol, and by many various expressions of grief on the part of the initiated. This author, combining the above relation of Herodotus with a passage in Pausanias, where the mysteries of the Cabiri are said to have been founded on a "present that was made to them by Ceres," concludes, that this "present," which Pausanias did not dare to specify, was no more than the obscure representation of the mutilated parts of Cadmillus; and this, he adds, was the venerable object that was committed to the custody of the Vestals in after-times, as a sacred pledge of the safety of Rome, whither the Samothracian priests, who took refuge in Italy, carried the religious rites and mysteries of the Cabiri. Whether this account be true or not, it is certain that the "phallus" was introduced under one form or name or another into the religious mysteries of ancient nations, and that the celebration of these mysteries was accompanied with many indecorous rites. Under the appellation of Cabiri, the ancients comprehended divinities of each sex, of all ages, of every rank and condition, celestial, terrestrial, maritime, and infernal, to which they appropriated various attributes. To some of the Cabiri, who were the inventors of navigation, they ascribed the discovery of iron; to others, the origin of laws, letters, and writing; and to others again the discovery of various modes of incantation and magic, the medical use of plants, &c. &c. The worship that was paid to them in different places referred more directly or indirectly to those several attributes. Such was the estimation in which these deities were held in the remote ages of antiquity, and afterwards by the Greeks under various appellations, by which they were distinguished, that princes and persons of rank resorted to Samothrace in order to be initiated into their mysteries. Accordingly, we find that Cadmus, Orpheus, Hercules, Castor and Pollux, Ulysses, and other heroes of the Trojan war, Philip the father of Alexander, and many others, made a voyage to this island, probably, under a notion that they might derive succour from the Cabirian deities in tempests and perilous voyages. Such was the veneration in which the Cabiri were held in the island of Samothrace, that it was thought an act of irreverence even to pronounce their names. Those who were admitted to the sacred ceremonies performed in honour of these deities used to assemble in a wood, which became a place of refuge for offenders, and was more respected than even the temple of Delphi or the island of Delos. To this island, Peres, king of Macedon, fled for refuge, and took up his habitation in a temple of Castor and Pollux, hoping that the Romans would not profane a sanctuary revered by all the nations of the world; and, indeed, the Romans did not make any attempt upon his life or person so long as he continued there. Of all the oaths that were in use among the ancients, that by the Gods of Samothrace was deemed the most sacred and inviolable. Those who were found to have falsified this oath, were looked upon as the curse of mankind, and persons devoted to destruction. Of course, these mysteries were highly respected, and care was taken that they should not

be revealed. With this view, the priests had a language peculiar to themselves, which was not understood by the people. The Corybantes were the ministers of these mysteries, not only at Lemnos and Imbros, but through the whole of Phrygia. For a more ample account of the various opinions of the fabulous ages, with regard to the names, origin, number, attributes, mysteries, and worship of the Cabiri, the reader, who is desirous of further information, may consult the writings of Clemens Alexandrinus, and Bochart. See CERES, ELEUSIS, and MYSTERIES. See also CORYBANTES, CURETES, and DIOSCURI.

CABIRI is also used to denote the *Gabri*, or Persian fire-worshippers. Hyde de Rel. Perfarum, cap. 29. See GABRES.

CABIRI, in *Ancient Geography*, a people who inhabited the vicinity of mount Ida. Strabo says, that in his time, many supposed them to be the same with the Curetes. See CABIRI, *supra*.

CABIRIA, in *Mythology*, a surname of Ceres, who was the principal Cabirian deity: she had a sacred grove under this name in Bœotia.

CABIRIA, *Καβίρια*, religious feasts instituted in honour of the gods *Cabiri*. They were celebrated at first at Lemnos, afterwards adopted by the inhabitants of the islands of Samothrace and Imbros, and from thence passed into Greece to Athens, and particularly to Thebes, where they became famous.

These feasts were very ancient, and prior even to the time of Jupiter; who is said to have restored them: they were held by night. Children above a certain age were here consecrated; which consecration was supposed to be a preventive against all dangers of the sea, &c.

The ceremony of consecration called *θρονισμός*, or *θρονισμός*, q. d. *enthronizing*, consisted in placing the initiated youth on a throne, the priests dancing round him: the badges of the initiated were a purple girdle or scarf, and a crown of olive. When a person had committed any murder, the cabiria gave him an asylum.—Meusius is very particular in the proof of each of these points.

CABIRIDES, nymphs, who were the daughters of Vulcan and Cabira.

CABIRUS, in *Ancient Geography*, a mountain of Asia Minor, in Phrygia.—Also, a river of Asia, in the territory of the Suerii, at the mouth of which was good anchorage. Pliny.

CABISTRA, a town of Cappadocia, mentioned by Cicero in his Letters, lib. xv. Epist. 11. ad Senat. & ad Attic. lib. v. Epist. 18.

CABLE, in *Navigation*, a thick, long, three-strand rope, ordinarily of hemp, serving to hold ships firm at anchor, and to tow vessels in large rivers. In Europe, the cables are commonly made of hemp; in Africa, of long straw, or rushes called *bafs*; and in Asia, of a peculiar kind of Indian grass.

The word cable comes from the Hebrew word *chebel*, cord. Du-Cange derives it from the Arabic, *babl*, cord, or *babala*, vincire: Menage, from *capulum*, or *cabulum*; and that from the Greek *καμῆλος*, or the Latin *camelus*.

The term cable is sometimes also applied to the cordage used to raise massy loads, by means of cranes, wheels, and other like engines; though in strictness, cable is not to be applied to ropes of less than three inches in circumference. Every cable, of whatever thickness it be, is composed of three strands: each strand of three twists; and each twist of a certain number of caburns, or threads of rope yarn, more or less, as the cable is to be thicker or smaller.

Every merchant-vessel, how small soever, has three cables; viz. the main or master-cable, which is that of the chief anchor,

anchor, called the sheet-cable; and the two bowers, best and small. The ordinary length of the great cable is 120 fathoms or braces.

To make a cable: after forming the strands, they use flaves: which they first pass between the strands that they may turn the better, and be intertwined the more regularly together. And to prevent any entangling, a weight is hung at the end of each strand. The cable, being properly twisted, neither too much, so as to become stiff, nor too little, so as to be weakened, is untwisted again three or four turns, that the rest may the better retain its state. The usual allowance for the diminution of length by twisting, is one-third of the whole; so that for a cable of 120 fathoms, the rope-yarn must be 180 fathoms long.

The number of threads which each kind of cable is to be composed of, is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained. Supposing, then, the lengths to be equal, the number of threads and the weights will be as the areas of their bases, or, which comes to the same, as the squares of their circumferences. Having then the weight and number of threads of any one cable, we may easily calculate the following table. (See Aubin's Marine Dictionary.)

Circumference.	Threads.	Weight.
3 Inches	48	192 Pounds
4	77	308
5	121	484
6	174	696
7	238	952
8	311	1244
9	393	1572
10	485	1940
11	598	2392
12	699	2796
13	821	3284
14	952	3808
15	1093	4372
16	1244	4976
17	1404	5616
18	1575	6296
19	1754	7016
20	1943	7772

Several salutary laws respecting the manufacture of cables have been made in the reign of his present majesty, Geo. III. See 25 Geo. III. c. 56. It has also been enacted, that commanders of vessels belonging to British subjects, having on board foreign made cordage, shall make entry thereof at their arrival into any British port; and the master making default herein, all such foreign cordage as shall be on board shall be forfeited to his majesty; and shall for every such offence forfeit the sum of 20s. for every hundred weight thereof.

In the French marine, the circumference of the largest cable is one twenty-fourth part of the extreme breadth of the ship; or half the breadth in feet will be the circumference in inches. Thus, the circumference of the largest cable of a ship, whose extreme breadth is 32 feet, will be 16 inches. The length of a cable is 120 fathoms, each 5 French feet. The weight of one fathom of cable in French pounds is nearly equal to one-tenth of twice the square of the circumference; and, consequently, the weight of a whole cable will be nearly equal to twenty-four times the square of the circumference. The weight of an anchor is half the weight of the cable to which it belongs.

CABLE, *bit the*. See BITS.

CABLES, *Bower*, those belonging to the best and small bower anchors, and are named accordingly.

CABLE, *clinch a*, is to run it through the hawse-hole and the ring of the anchor, three or four fathoms in length; then haul the bight up in the head, and pass the end of the cable over the bight, and through the ring, between it and its own part; then pass the cable bends, and cross them with strands, well greased, one at the end, and the other about one foot from the end; and be careful not to form the clinch larger than the ring of the anchor.

CABLE, *coil the*, to make it up in a circular or elliptical form, for the convenience of stowing it; each complete round or turn of the cable is called a *fake*, and one range of fakes along-side of each other is called a *tier*. There are generally from five to seven fakes in a tier, and three or four tiers in the whole length of a cable; but this depends on the length of a fake, and the number contained in a tier. Several authors, and particularly Messrs. Hutchinson and Gower, have recommended that all cables should be coiled the same way they bit, or the way they run round the windlafs, and their tiers should be on the side opposite to that on which they lead. The best bower, which is in general the working cable, should lead foremost up the hatchway, then the small bower, and, abaft all, the sheet, which, being the least wanted, can be made up snug round the fore part of the hatchway, out of the way. Should new cables come immediately from the rope-walk, let them be coiled down into the craft that is to bring them on board the same way they are to be coiled on board. A cable generally kinks from more turns being forced into it by the coiling than it naturally had; the kinks may, however, be avoided, either by coiling the cable against the sun, or with the sun, and the end taken through the coil, and the cable coiled down in the tier the way required. It should be a rule, in coiling cables, never to lay out near the hatchway, but to keep that part of the tier as low as possible, that the bends may have sufficient room to upset. Were all cables first coiled down from the rope-walk against the sun, they would be better adapted to coil on either side of a ship, for a cable coiled against the sun will more easily reverse, and have less kinks in it than a cable coiled with the sun.

CABLE, *cut the*. When a ship is riding at anchor in an open bay or roadstead in a gale of wind, it many times becomes necessary, for the preservation of the ship and crew, to cut the cable with a hatchet at the hawse holes or at the bits, when it cannot be purchased, and stand out to sea, under any convenient sail that it may be possible to set. This may be also necessary when compelled to fly from or pursue an enemy. If a ship parted her cable, the insurance would be lost. See *Slip the CABLE*.

CABLE, *elastic*. See COIR.

CABLE, *laid*, any rope laid in the same manner as a cable.

CABLE'S *length*, is 120 fathoms, each 6 feet. The distance between two adjacent ships of war, when formed into the line of battle, is appointed to be one or more cables' length, according to circumstances. The method of keeping the ship in its proper position with respect to the one next a head, is to calculate the angle which the whole or any particular portion of the main-mast of that ship would subtend at the proposed distance. Then, if the angle observed by a quadrant is the same as that by calculation, the ship is in her proper station; if greater, she is too far a-head, and therefore some sail must be taken in; but if less, the ship is too far astern, and more sail must be set in order to regain her station. If the main top-gallant truck be brought to coincide with a mark, the same height above the water as the observer, this angle is found as follows: from the logarithm of

of the given height, its index being increased by 10, subtract the logarithm of the assigned distance, the remainder will be the log. tangent of the required angle. But if there is no fixed mark, and in that case the angle subtended by the distance between the truck and the water is to be observed, the measure of this angle may be found by calculation as follows: from the height of the truck above the water subtract the height of the observer; from the log. of the remainder, its index being increased by 10, subtract the log. of the distance, the remainder will be the log. tangent of an arch; add from the log. of the height of the observer, its index increased by 10, subtract that of the distance, the remainder will be the log. tangent of an arch; the sum of these two arches will be the angle required.

*Ex. mple.* Let the assigned distance between two adjacent ships be one cable's length, or 720 feet, the height of the main-top-gallant truck of the ship a-head above the water 190 feet, and the height of the observer's eye 24 feet; required the angle subtended by the mast?

Height truck	190				
Height observer	24				
Difference		166	log. 2.22011		
Distance	720		log. 2.85733		2.85733
Arch	tangent	9.36278	12° 59'		
			1 53		8.52288
		Angle required		14	54

See also Dr. Mackay's Navigation, p. 224.

**CABLE, link worming of a,** is an operation performed for preserving it in rocky and stony ground, or defending it against ice. For this purpose chains are twisted round cables in the following manner. Take three chains, each about 15 fathoms in length, and all of an equal size, and in thickness proportioned to the purpose to which they are adapted. Let these be wound round the cable, so that they may project sufficiently to sustain the greatest part of the friction, one end of them being fastened to the ring of the anchor, and each chain being from thence wormed round its respective hollow or channel of the cable, so as not to prevent its stretching. Fasten the other ends of the chain to the cable. The chains need not be very heavy; but the links should be short, because they will thus be more pliant, and worm more easily. These chains will effectually guard the cable against the chafing of the rocks, and they may be put on in a few minutes, so that it is not necessary to have them fitted on but when they are likely to be serviceable. As the weight of the three chains, even for a large cable, will not exceed 500 pounds, the only remaining difficulty is that which arises from the smallness of the hawse-holes; in order to obviate this, the holes may be enlarged; and with the additional aid of a boy or spare man at the head of the vessel, to cast off the chains as they come up, and hand them in above, every inconvenience will be removed. But if it should require a few minutes more to weigh an anchor so secured than a common one, this can be no argument against a measure that tends to preserve and ensure the safety of the vessel and of the ship's company. In high latitudes, where ice may cut or damage the cables, while riding at anchor, the use of three other chains such as the preceding, but not more than five or six fathoms in length, may be recommended. These may be wormed round the cables in the same manner at the surface of the water, and will be an excellent means of guarding them from the pressure of the ice, so as to prevent its either wounding them or chafing them quite asunder. ¶

**CABLE, heave in the,** the order to draw it into the ship by means of the windlafs or capstan.

**CABLE, pay away, veer, or give out more,** that is to slacken the cable that it may run out of the ship.

**CABLE, serve the,** is to bind it round with ropes, old canvas, leather, or other materials. To prevent it from being galled or fretted in the hawse by friction. A piece of tanned horse-hide, big enough to be wrapped two or three times round the cable, has been recommended as the best kind of service to prevent it from chafing or fretting in a storm: this service is also easily put on and taken off. The method of putting it on the cable is first to wrap two or three folds of old canvas, the length of the leather-service, which if too stiff to put on dry, requires only to be dipped in water, and beat against any wood, which will make it soft and pliable. Then wrap it as tight as possible upon the old canvas round the cable, tying it tight and smooth on with fennit, or three-yarn nittles, made for that purpose, greasing them and the service very well before veering it into the hawse-hole. It may be observed that all cables should be served against the lay.

**CABLE, sheet-anchor,** the largest cable belonging to a ship.

**CABLE, shot of the.** See SHOT.

**CABLE, splice a,** is to join or connect two pieces of cable, or two cables together, by interweaving their strands. The snugget and belt method of splicing a cable, is to put the ends in twice each way; then to pick out the strands, and worm part of them round the cable, and taper away the rest, which let be snuggetly marled down. After this, let there be clapped on a good throat, and two end seizings of six thread ratline. The strands of the small bower and stream cables had better be pointed, that these cables may be more briskly spliced in case of necessity.

**CABLE, slip the,** is to let it run quite out, when there is not time to weigh the anchor. Slipping the cable, if time will permit, is preferable to cutting it, as the anchor and cable are thus preserved. Before it is either cut or slipped, a spare buoy-rope should be passed through the hawse-hole, and fastened near the end with a rolling-hitch; the end should be wormed in the cunt-line and flopped, that it may be easily regained.

**CABLE, stowing the.** See STOWING.

**CABLE, stream,** a hawser or rope a little smaller than the bower cables, used to moor a ship in a river or haven, which is sheltered from the wind and sea.

**CABLE tier,** the hollow space in the middle of a cable when it is coiled.

**CABLE Island,** in Geography, a small rocky island, the resort of sea-fowl, on the southern coast of Ireland, forming the south-western point of Youghal bay. On the north side of it is good anchorage. W. long. 7° 51'. N. lat. 51° 53'.

**CABLED,** in Heraldry, is applied to a cross formed of the two ends of a ship's cable: sometimes also to a cross covered over with rounds of rope; more properly called a cross corded.

**CABLET,** in Sea Language, denotes any cable-laid rope under nine inches in circumference. Cablets used for tow lines or hawsers, require the strands to be laid shorter than cable strands, but not so short-laid in closing; for, being used in water, they would become stiff, hard, unhandy to coil away, and liable to break in cold weather. Yarn for ropes of this sort should be finer than for cables, and spun to run from 18 to 20 threads to three inches in circumference. It should not be much tarred, as the tar would ooze out and the strands kink.

**CABLIAU** of *Ström. söndm*, in *Ichthyology*, the common cod-fish, *GADUS MORHUA* of modern naturalists. In the *Linn. Fn. Suec.* it is called *CABELLA*.

**CABLING**, in *Architecture*, the figure of a staff, or reed, either plain or carved, in resemblance of a rope, or a rush, wherewith a third part of the flutings of a column are sometimes filled up; hence called *cabled flutings*.

There are also *cablings* in relievo without fluting, especially on certain pilasters, as in the church of Sapienza at Rome. See *FLUTES*.

**CABLISH**, *Cablicia*, in the *Forest Law*, denotes brush, or browse wood; though Spelman takes it more properly to signify trees, or branches, thrown down by the wind; from the French *chablis*, or *bois chablis*, which denotes the same.

**CABO**, in *Geography*, a kingdom of Africa, in Nigritia, situate to the south of the Rio Grande, and near the source of the Cafamanka, about 150 leagues from its mouth. Little is known concerning it; but some voyagers assert that the king is rich and powerful, and that in time of peace he keeps 7000 men well armed, in order to command due respect from his neighbours.

**CABO Corso**, or *Cape-Coast*, a cape and factory of Africa, on the Gold coast. N. lat. 5° 16'. W. long. 2° 8'.

**CABO de Cruz**, a bold point of land on the south side of the island of Cuba. N. lat. 19° 57'. W. long. 78° 28'.

**CABO de St. Juan**, the north-easternmost point of the island of Porto Rico. N. lat. 18° 30'.

**CABOCHED**, **CABOSHED**, or **CABOSSED**, formed from the obsolete French *caboche*, from *caput*, head, in *Heraldry*, is where the head of a beast is cut off behind the ears, by a section parallel to the face; or by a perpendicular section: in contradistinction to *couped*, which is done by a horizontal line; besides that it is farther from the ears than *caboffing*. The head in this case is placed full-faced, or affrontée, so that no part of the neck is visible. This bearing is by some called *Trunked*.

**CABOCHON**, in *Conchology*, the name given by Argenville to the Linnæan *PATELLA EQUESTRIS*; which see.

**CABOCLES**, in *Modern History*, a name given in the West Indies by the Portuguese to those produced between Americans and Negroes.

**CABOLITÆ**, in *Ancient Geography*, a people of Asia, placed by Ptolemy in Paropamisus.

**CABOMBA**, in *Botany*. See *NECTRIS*.

**CABOT**, **SEBASTIAN**, in *Biography*, an eminent navigator, the son of a Venetian pilot distinguished by his skill in the same art, and often resident in England, was born at Bristol about the year 1477, and instructed by his father in those branches of mathematical science which were necessary for forming a skilful seaman. Before he had attained the age of 17 years, he made many trips to sea; thus adding an acquaintance with the practical part of navigation to the knowledge of its theory. In his first voyage of any importance, he accompanied his father for the discovery of unknown lands, and particularly for exploring a north-west passage to the East Indies. John Cabot, encouraged in this attempt by the discoveries of Columbus, who returned from his first expedition in 1493, obtained, in 1495, letters patent from king Henry VII. empowering him and his three sons to discover, conquer, and settle lands then unknown, in recompence of which they were to be invested with many privileges. The king, however, reserved to himself one-fifth part of the neat profits, and restricted them to return from their voyage into the port of Bristol. Accordingly in the following year he prepared for his expedition, and

obtained the king's permission to take up six ships of 200 tons burden and under, in any harbour of the realm, and to engage a sufficient number of mariners. His majesty was at the expence of fitting one ship at Bristol, and the merchants of that city and of London added three or four small vessels, freighted with suitable commodities. With this fleet John Cabot and his son Sebastian set sail in the Spring of 1497, and pursued their course till the 24th of June, when they discovered the island of "Baccalaos," so called from the fish which they found in great abundance on its coast, but now known by the name of Newfoundland. Another adjoining island they called St. John, probably from the Saint's day on which it was discovered. On this island, as they supposed it to be, which was the south-west part of Newfoundland, they found inhabitants who were clothed with the skins of beasts, and who used bows, arrows, pikes, darts, wooden clubs, and kings. Three of these natives were brought with them to England. It is supposed, however, that Sebastian had made some voyages of discovery in the reign of Henry VII. without his father; and that in some of these he sailed as far north as 67° and a half, but was prevented from proceeding farther by the mutiny of his sailors. After the discovery of Newfoundland, Cabot and his son sailed down to Cape Florida; and on their return to England they were well received, as they were the first navigators who had actually seen the continent of America; Columbus not having observed it till the following year. During the succeeding period of 20 years, there is a chasm in the history of Sebastian's transactions; nor is it certain when or where his father died, though he probably terminated his life in England, to which he appears to have been much attached. In the 8th year of the reign of king Henry VIII. we find that Sebastian Cabot had formed an intimate connection with Sir Thomas Pert, then vice-admiral of England; and that he had obtained, by his interest with the king, a good ship for the purpose of prosecuting his discoveries. It seems to have been at this time his intention to have sailed by the south to the East Indies, and with this view he sailed first to Brazil; but disappointed in his purpose through the timidity of his coadjutor, Sir Thomas Pert, as Hakluyt asserts, he directed his course to the islands of Hispaniola and Porto Rico, and having trafficked here for some time, he returned to England. Thus disappointed in his views, he left England and removed to Spain, where he was very respectfully received and appointed pilot-major, for the purpose of reviewing all projects of discovery, which were, at that period, numerous and important. In the year 1524, many opulent merchants entered into a treaty with him, and engaged to defray the charges of an expedition to the Moluccas, or Spice islands, by the new-found passage of Magellan. Accordingly he set sail from Cadiz with four ships, in April 1525; and proceeded first to the Canaries, then to the Cape Verde islands, and afterwards to Cape St. Augustine, and to the island of Patos, or Geffe. At the bay of ALL SAINTS he was liberally supplied with provisions, for which he made a very ungrateful return by forcibly carrying away four son of the principal persons of the island. He then proceeded to the river La Plata, and landed on a desert island Martin Mendez, his vice-admiral, Captain Francis de Rojas, and Michael de Rojas, where he left them because they had censured his conduct. Being prevented by a mutiny among his men and by scarcity of provisions from prosecuting his voyage to the Spice Islands, he sailed about 30 leagues up the river La Plata, and found an island which he called St. Gabriel, about a league in compass and half a league from the continent towards Brazil; and having discovered about

three leagues higher a river which he named St. Salvador, and which, being very deep, afforded a good harbour, he brought up his vessels and unloaded them. Here he built a fort; and advancing with boats 30 leagues higher, he found another river, called Zarcarana, and constructed on the banks of it, as the inhabitants were intelligent and not unfriendly, another fort, called by himself Santi Spiritus, or of the Holy Ghost, and by his followers Cabot's fort. He afterwards discovered the shores of the river Parana, with several islands and rivers, and at length arrived at the river Paraguay, where he found people tilling the ground; a circumstance which had not before occurred to him in that part of the world. In a conflict with the Indians, by whom he was opposed, he killed many of them, but 27 of his own men were slain, and three taken prisoners. During this winter he fell in with James Garcia, who had been dispatched from Galicia for the purpose of making discoveries, and having returned together to the fort of the Holy Ghost, they sent messengers to Spain. The two persons that were deputed by Cabot gave a very favourable account of the countries adjoining to the river La Plata which he had subdued, and produced gold, silver, and other valuable commodities, as testimonies to their commander's good conduct. At the same time they demanded a supply of provisions and ammunition, as well as other articles adapted to the purposes of commerce, together with a recruit of seamen and soldiers. The merchants, however, who had fitted out Cabot's squadron, were unwilling to comply with these requisitions, and chose to surrender their rights to the crown of Castile. But the king delayed the necessary preparations so long, that Cabot, who had been five years employed in this expedition, and who was tired with waiting for necessary supplies, determined to return home. Accordingly he embarked his men and effects on board the largest of his ships, leaving the rest behind him; and arrived at the Spanish court in the spring of the year 1531. In the mean while prejudices had been excited against him, on account of the rigour with which he had treated the Spanish mutineers, and because he had not proceeded to the Moluccas; so that his reception was not favourable. However, he retained his place, and continued in the service of Spain for many years; till at length, for reasons with which we are not acquainted, he resolved to return to England. This took place towards the latter end of the reign of Henry VIII. at which time he resided at Bristol. In the commencement of the following reign he was introduced first to the protector, lord Somerset, and by him to king Edward VI. who took great pleasure in his conversation, and granted him, in 1549, a pension of 16*l.* 13*s.* 4*d.* a year; an annuity which was allowed him, according to Hakluyt, as grand pilot of England. From this time he was highly favoured by the king, and consulted upon all commercial matters. In May 1552, the king granted a licence, together with letters of safe conduct, to such persons as were willing to embark on board three ships, destined for exploring a passage by the north to the East Indies. The enterprise was undertaken by the advice and recommendation of Cabot, then governor of the company of Merchant-adventurers; and he furnished necessary directions, which evinced both his wisdom and integrity. For his trouble and charge in this business, his Majesty presented him with a gratuity of 20*l.* This expedition was entrusted to the command of Sir Hugh Willoughby, and it produced the discovery of the important trade to *Archangel*, which see. Cabot was also appointed by royal charter governor for life of the Russia company, in whose concerns he took a very active part; and in 1555 letters patent were issued by

which their Majesties, Philip and Mary, granted him an annuity of 16*l.* 13*s.* 4*d.* during his life. In April 1556, he appears to have retained the habitual ardour of his mind for the prosecution of discoveries; for he visited Mr. Burroughs at Gravesend on board his small vessel destined for Russia, and gave a liberal entertainment to the sailors on this occasion. This is the last circumstance that is recorded concerning him; and he is supposed to have died in the following year, when he had probably attained the age of nearly 80 years. He was a skilful navigator, and possessed in his time a very high reputation. To his capacity, integrity, and zeal, society was very much indebted. The variation of the compass was first observed by him. See VARIATION. Cabot published a large map, which was engraved by Clement Adams, and hung up in the privy gallery at Whitehall; and on this map was inscribed a Latin account of the discovery of Newfoundland. He also published a work entitled "*Navigazione nelle Parte Setentrionali*," printed at Venice in 1583, fol.; and his instructions above referred to were printed in Hakluyt's voyages. Biog. Brit.

CABOT, in *Geography*, a township of America, in the county of Caledonia and state of Vermont, situate on the height of land between lake Champlain and Connecticut river, about 17 miles from the 15 miles falls in this river, and containing 1202 inhabitants.

CABOTE, in *Ichthyology*. See CORAX.

CABOURG, in *Geography*, a town of France, in the department of Calvados, and district of Caen, ten miles N. of it.

CABRA, a town of Spain in Andalusia, situate at the foot of a mountain, near the source of a river of the same name, containing, besides a church and six convents, a college for the study of philosophy and divinity; 25 miles S.E. of Cordova.

CABRA, an inconsiderable town of Portugal, in the province of Beira; 20 miles E. S.E. of Viseu.

CABRA, or KABRA, a town of Africa in the kingdom of Tombuctoo, situate on the river Guin, or Neel Abeed, west of the island Imbala or Guimbala, and about 12 miles S. of Tombuctoo, of which it is the port. It is a large town without walls and a place of great trade. The inhabitants are said to be subject to diseases that are attributed to the heterogeneous qualities of their food, which is usually a farrago of milk, fish, flesh, butter, oil, and wine. Here resides a judge, who is appointed by the king for deciding all controversies. N. lat. 16° 24'. E. long. 1° 30'.

CABRAL, or CABRERA, PEDRO ALVAREZ, in *Biography*, a Portuguese navigator, who commanded the second fleet fitted out in 1500 for the East Indies by Emanuel, king of Portugal. Anxious to avoid the coast of Africa in the course of his voyage, he stood out far to sea, and after a month's sailing, was driven by a tempest on the shore of an unknown country, which proved to be that part of South America, now called Brasil. Having landed at Santa Cruz on the 24th of April, 1500, he took possession of the whole country for the crown of Portugal. (See BRASIL.) From this new coast he proceeded to Sofala in Africa, whither he arrived after having lost six of his thirteen ships; and from thence he failed to Calicut, where he obtained leave of the sovereign, or zamorin, to form a commercial establishment. Some time after there occurred a jealousy between him and the inhabitants, which produced hostilities, in the course of which Cabral burnt several ships in the port, and battered the town, so that the zamorin was at length obliged to acquiesce in the terms that were proposed. He afterwards went to Cananor, where he made a treaty with the prince; and in 1501 he returned to Portugal with a rich cargo. He published an account of this voyage, printed in an Italian translation by Ramusio at Venice. Having gained reputa-  
tion

tion by his discoveries and exploits, he died in his own country. Nouv. Dict. Hist.

**CABRAL**, in *Geography*, a town of Spain, in the territory of Cordova; 3 miles N.W. of Lucena.

**CABRE**, a town of the island of Cuba; 30 miles S. of Spiritu Santo.

**CABRELLA**, a town of Portugal, in the province of Estremadura;  $7\frac{1}{2}$  leagues E.S.E. of Setuval.

**CABRERA**, Lat. *Capraria*, a small island in the Mediterranean, deriving its name from the number of goats upon it. It is mountainous and desert; no part being inhabited except its port, which is large and safe, and the entrance of which, opposite to Majorca, is defended by a castle and a small garrison. Under the west end of the island there is a good road. Criminals are banished into this island;  $2\frac{1}{2}$  leagues S. from Majorca.—Also, a small island near the north coast of the island of Sardinia, N. lat.  $41^{\circ} 15'$ . E. long.  $9^{\circ} 27'$ .—Also, another island, named likewise Capraa, lying about E.N.E. from Cape Corfe, on the north point of Corsica, nearly N. from the west end of the Elbe Island.—Also, another island E. of the island Sapienza, at the S.W. point of the Morea.—Also, another island in the gulf of Venice, not far from the coast of Italy, and nearly north from mount St. Angelo, or the gulf of Varennes.

**CABRERA island**, lies on the south coast of Candia island, S. of the Archipelago islands, about twelve leagues E.N.E. from the island of Goza. On the east of it is a fair bay, in which is a good road; and another to the west.

**CABRERES**, a town of France, in the department of the Lot, and district of Cahors; 13 miles E.N.E. of it.

**CABRES**, *Illa del*, or Goat island, a small island belonging to Africa, near the coast of Guinea, at a small distance from the island of St. Thomas. It is mountainous and covered with lemon-trees.

**CABRETA**, *cape*, lies on the coast of Spain, 5 leagues E. from the island Tariffa, and the westernmost point of the great bay of Gibraltar.

**CABRIEL**, a river of Spain which runs into the Xucar, soon after it enters Valencia.

**CABRIERES**, a town of France, in the county of Venaissin, the inhabitants of which were ordered to be massacred by an arret of parliament in 1545, under the pretext of religion; 3 leagues N. of Cavillon.

**CABRILLA**, in *Ichthyology*, a species of PERCA, found in the Mediterranean sea, the body of which is marked with four longitudinal sanguineous bands. Linn. Mus. Ad. Fr.

**CABRITA island**, in *Geography*, See CAPREA.

**CABROL**, BARTHOLOMEW, in *Biography*, a native of Languedoc, received his education in anatomy and surgery, at Montpellier. Returning to his own country, in 1555, he was appointed surgeon to the hospital of St. Andrew, in that city. In 1570 he was invited by the University of Montpellier to take the office of demonstrator in anatomy; an office he filled with credit several years. In 1594 he published an anatomical treatise, under the title of "Alphabet Anatomique," at Tournon, 4to. reprinted at Geneva in 1602, and afterwards translated into Latin, with the title of "Alphabeton Anatomicum," id est, "Anatomes Elenchus accuratissimus, omnes humani corporis partes, ea qua secari solent methodo delineans, accessere osteologia, observationesque medicis ac chirurgis peritiles, 1604, Geneva." In this form it has been frequently reprinted; and is valuable, Haller says, for the number of curious and useful observations contained in it. It is inserted in a collection of treatises, entitled, "Collegium Anatomicum clarissimorum trium viro- rum, Jassolini, Severini et Cabrolii. Douglas Bibliog. Haller, Bib. Chir. Eloy. Dict. Hist

**CABRON**, *cape*, in *Geography*, the north-east point of Presque ile de Samana, in the island of St. Domingo, 22 leagues S.E. by E. from old cape François. N. lat.  $19^{\circ} 33'$ . W. long.  $68^{\circ} 40'$ .

**CABRUSI**, in the *Writings of the Ancients*, a word frequently used to express Cyprian, or coming from the island of Cyprus. The ancient Greeks had almost all their vitriols and vitriolic minerals from this island; they therefore sometimes called these cabrusi, without any addition. It is very probable that our word copperas, the common name of green vitriol, is a false pronunciation of this word cabrusi.

**CABUIA**, a West Indian species of hemp, produced in the province of Panama, from a plant somewhat like the *chardon* or *iris*; when ripe, they lay it to steep in water, and after drying it again, beat it with wooden mallets till nothing but the hemp remains, which they afterwards spin, and make thread and ropes of it; the former of which is so hard and tough, that with it they saw iron, by fitting it on a box, and laying a little fine sand over the metal as the work proceeds.

**CABUL**, CABULISTAN, or ZABULISTAN, in *Geography*, a country of Asia, on the limits of Hindostan, and west of the Indus, which was formerly a province of Persia, afterwards annexed to the Mogul empire, and comprehended again under the Persian monarchy in 1739, by Nadir Shah. It is bounded on the north by Kuttore or Caferistan, and the Hindoo-Kho mountains, which latter separate Cabul from Balk and Badakshan; on the west by the same mountains and Candahar, on the south by Moultan and Lahore, and on the east by Cashmere. This Soubah, under the Mogul emperors, comprehended the whole space between the Indus and the mountains of Hindoo-Kho, being in dimensions 150 coffes (each cofe being about  $1\frac{7}{8}$  statute mile,) according to the Ayin Acbaree; and this is its greatest extent; for 100 coffes are given for its breadth between Kurrabagh, situate 11 royal coffes S.W. of Ghizni, and Chuganferai at the western extremity of Caferistan. Cabul is confined on the north by the continuation of Hindoo-Kho; and on the north-east by Caferistan. Towards the south, or the quarter of Bungush, its extent is not ascertained: but as its greatest breadth is included within the space between Kurrabagh and Chuganferai, we may conclude that it cannot extend far beyond the river of Nughz. We have an ample description of Cabul in the Ayin Acbaree; from which, as well as from every other account, it appears to be a country much diversified by mountains covered with eternal snow; hills of a moderate height and easy ascent, rich plains and stately forests; and these enlivened by innumerable streams of water. It produces every article necessary to human life, together with the most delicate fruits and flowers. In the Ayin Acbaree Cabul is reckoned a part of the soubah of Cashmere; but it has been since, with great propriety, regarded as a soubah of itself. Cabul, with respect to its natural geography, is divided into two parts, separated by a ridge of very high mountains, usually covered with snow, which runs from west to east from the neighbourhood of Ghizni to that of Deenkyte on the Indus, below Attock. The tract lying to the north of this ridge is named Lumghan, or the Lumghanat; and that on the south Bungush, or the Bungushat; each having one or more considerable rivers intersecting their whole length, and discharging themselves into the Indus. Each tract has also its proper roads, and its passes over the Indus, from the districts of Cabul, Candahar, and Ghizni, respectively: but the northern, or Lumghanat road, is that in common use, either to Persia or to Samarcand, notwithstanding its circuitous nature, as it respects the former of these countries; for it is both the easiest and the safest.

Cabul, as well as Candahar, together with some districts

on the east of the Indus, are comprised within the extensive dominions of Timur Shah Abdalla, (usually styled king of Candahar,) which extend wellward to the neighbourhood of the city of Terhith: including generally Cabul, Candahar, Pishawur, Ghizni, Gaur, Saitan or Sigistan, and Korafan. This tract is at least 800 British miles in length, from east to west, and its breadth, though unascertained, does not bear any proportion to its length. It does not differ much from the tract comprised within the ancient kingdom of Ghizni. Timur Shah's Indian subjects are chiefly Afghans; the rest, Persians and Tartars of almost every denomination. His government is said to be mild and equitable, with some degree of relaxation as to military discipline; which, in a government purely military, forebodes dissolution. Rennell's Memoir.

CABUL, a city of Asia in the above province, is the present capital of the successor of Timur Shah, and situated on a river of the same name, near the foot of the Indian Caucasus, or Hindoo Kho; and the proximity of this ridge occasions the most rapid changes in the temperature of the atmosphere. Its situation is spoken of in terms of rapture by the Indian hillarians; it being no less romantic than pleasant; enjoying a wholesome air, and having within its reach the fruits and other products both of the temperate and the torrid zones. In a political light, it is considered as the gate of India towards Tartary; as Candahar holds the same place with respect to Persia. Mr. Forster, in his "Journey from Bengal to England," describes Cabul as a walled city, about  $1\frac{1}{2}$  mile in circumference, and seated on the eastern side of a range of two united hills, generally the figure of a semicircle. The fortification, which is of a simple construction, with scarcely a ditch, and the houses built of rough stones, clay, and unburned bricks, exhibit a mean appearance, and are ill suited to the grandeur that might have been supposed to subsist in the capital of a great empire. But the Afghans, he says, are a rude and unlettered people, and their chiefs have little propensity to the refinements of life, which indeed their country is ill adapted to gratify. From the Indus to the western limit of this extensive territory, there is an invariable deficiency of wood; inasmuch, that the lower class of people in the northern quarter suffer as much, perhaps, from the want of fuel in the winter season, as those of other countries would do from a scarcity of provisions.

This quarter of Asganistan, possessing but few Indian productions, receives sugars and cotton cloths, chiefly from Peshawur, whither it sends iron, leather, and tobacco. To Candahar it exports iron, leather, and lamp-oil, whence the returns are made in sundry manufactures of Persia and Europe, with a large supply of excellent melons. The Tartars of Bucharia bring to Cabul the horses of Turkestan, furs, and hides; the latter resembling those in Europe called Bulgar; the amount of which is applied to the purchase of indigo, and other commodities of India. The adjacent parts of Usbeck Tartary, of which Balk is the capital, hold a kind of dependency on Timur Shah.

The Afghans are the indigenous possessors of a tract of country, which stretches from the mountains of Tartary to certain parts of the gulf of Cambay and Persia; and from the Indus to the confines of Persia. The inhabitants of this wide domain have no written character, and speak a language peculiar to themselves. They are a robust, hardy race of men, and being generally addicted to a state of predatory warfare, their manners largely partake of a barbarous insolence, and they avow a fixed contempt for the occupations of civil life. See **AFGHANS**.

Ahmed Abdalla, first king of Candahar, was originally the chief of an Afghan tribe, conquered by Nadir Shah, on

whose death he suddenly appeared among his former subjects, and soon erected a considerable kingdom in the eastern part of Persia, including most of the Indian provinces ceded by the Mogul to Nadir. He established his capital at Cabul. Ahmed died about the year 1773, and was succeeded by Timur, who continued to reside at Cabul; but the monarchy has been styled that of Candahar from a central province. The successor of Timur was Zemaun, who probably still rules this extensive country. Cabul is situated in N. lat.  $34^{\circ} 32'$ . E. long.  $68^{\circ} 34'$ .

CABUL, a river of the above-mentioned province, has also the proper name of Kamah or Kamah from the vicinity of Jalalabad, 60 or 70 miles below the city of Cabul down to Pishawur. At Jalalabad it is navigable for junks, or rafts of a particular construction; and as no embarkations in hollow vessels are in use, we may infer that the navigation is interrupted by rapids, for the water of the Kamah is sufficient to carry boats. The Cabul, after receiving the rivers of Bijore, Penjekoreh, Chendoul, and Sewad, joins the Indus at Attock.

CABURE, in *Ornithology*, the Brazilian name of the great eared owl of that country, *STRIX BRASILIANA* of recent authors. The CABOURE of Willughby is the same bird.

CABURNS, in *Sea-language*, denote small lines made of spun yarn, wherewith to bind cables, seize tackles, and the like.

CABUSEIBA, in *Botany*. See *MYROXYLON PERUVIANUM*.

CABYBARA, in *Zoology*, an animal of the *CAVIA* genus, distinguished specifically by having no tail; fore feet three toed, and palmated. Schreber.

This animal grows to the length of about two feet and an half; the head is oblong; snout narrow; nostrils black and roundish; upper lip cleft; whiskers black; eyes large; ears short, erect, naked, and black. It inhabits the eastern parts of South America, where it frequents fenny woods near large rivers; swims and dives well; feeds on fish and vegetables, the former of which it catches in the night; brings forth one young at a time. This is the thick nosed tapir of Pennant.

CABYLA, or CALYBE, in *Ancient Geography*, a small town of Thrace.

CABYLES, in *Modern History*, the Moorish mountaineers of Algiers (See **ALGIERS**), are partly the immediate descendants of the most ancient inhabitants of the country, and in this respect frequently denominated Brebers or Berbers (See **BREBES**); and partly the mixed progeny of the aborigines and of the nations who in former times invaded the country and settled in it; but all of them have always been and still are distinguished from the other inhabitants of the country by their language, love of freedom, and rude unpolished manners. The Cabyles are divided into distinct tribes, many of which are free and independent, and do not acknowledge the superiority of Algiers; especially those who inhabit the inaccessible ridges of mountains. The neighbouring tribes are often united by friendly alliance, without subjecting themselves to a common head. Others live in a continual state of contention and feud with their neighbours, the chief causes of which are the infidelity and elopement of their wives. They are, in general, well-grown, robust, meagre, and of a sun-burnt red, and often blackish-yellow complexion, and have black or dark-brown hair. Their external appearance is rendered still more uncount by dirt and tattered clothes. They commonly dwell in straw-huts; though stone-houses occasionally occur in their "daskras," or villages. Their number decreases, and their love of liberty gradually declines. The inhabi-

tants of the highest parts of the mountains, however, still assert their independence, and defend their liberty with undaunted valour against every hostile attack. Their courage, concurring with a perfect knowledge of the country, saves them from the superior force of their enemies, as the Algerines have, within a late period, frequently experienced. The government, therefore, endeavours to maintain a good understanding and friendship, where force is ineffectual, and often yields even to unreasonable demands. Thus the Cabyles of Couco are treated with great lenity; for the situation of their country is favourable, and they can assemble a strong army; and they carry great quantities of oil and soap for sale to Algiers. The case is the same with respect to the Cabyles who inhabit the sea-coast about Bugia, Bona, and Tabarca. Among the Cabyles, who acknowledge no common chief, those of the greatest age are particularly honoured; and only their priests, or "Marabuts," enjoy the general confidence of the tribes, and have under the cloak of religion acquired great power and authority, which in some instances have become hereditary. These then act in the capacity of heads of the tribes, form treaties of peace, send ambassadors, and are by others, and even by the Turks, considered as the chiefs of the nation. In the vicinity of the sepulchre of a deceased Marabut, or saint, is generally the habitation of the Marabut of the tribe, who, by means of a flag hoisted on a pole erected upon the edifice, gives the usual signal when the time of prayer arrives. From the same place signals are made, on the approach of the enemy, to the Cabyles, to assemble them at the appointed place of rendezvous. The language of the Cabyles, like that of the Moors, is a dialect of the Arabic. It deviates, however, so much from the latter, that in many places Moors and Cabyles are not able to understand one another.

CABYNE, in *Geography*, a small island in the Indian ocean, south of Bruto; and near the island called Hagedissen or Lizard-island.

CACABELOS, a small town of Spain in Leon, seated in a valley between high mountains; 40 miles N. W. of Leon.

CACABOGA, in *Zoology*, the name of an American serpent, by some accounted the same with the Tareiboia, or black water snake of that part of the world; but by others described as being of a yellow colour, living about houses, and doing great mischief among poultry, although its bite is not fatal to mankind. This is an ambiguous species.

CACACA, in *Geography*, a town of Africa, in the kingdom of Fez, taken by the Moors from the Spaniards in 1534, is defended by a strong fort on a rock; 16 miles S. of Melilla.

CACAGUALES, a town of North America, in the country of Mexico, and province of Tlascala.

CACALIA, in *Botany*, (*κακάλια*, Dioscorides.) Clus. C. Bauh. 197. Tournef. Cl. 12. gen. 10. Tab. 258. Ray Method. Plant. 34. Hist. 291. Linn. gen. 933, who in his earlier works called the genus Kleinia, but afterwards adopted the name taken up by Clusius, &c. though dubious of its identity with the plant of Dioscorides and Pliny. Reich. 1013. Schreb. 1269. Gært. 963. Tab. 166. Juss. 178. Vent. 2. 510. La Marek Pl. 673. Class and order, *synonymia polygamia equalis*. Nat. Ord. *Compositae discoidae*. Linn. *Corymbifera*. Juss.

Gen. Ch. *Cal.* common, simple, oblong, somewhat calyced at the base, cylindrical; scales five to ten, or more, equal, lanceolate-linear, forming a tube, with a few short ones incumbent on the base. *Cor.* compound, tubular; florets hermaphrodite, uniform; border four or five-cleft,

erect, gradually lessening into the tube. *Stam.* filaments five, very short, capillary; anthers cylindrical, tubular. *Pyl.* germ oblong; style throat-shaped, the length of the filaments; stigmas two, oblong, revolute. *Peric.* the permanent calyx. *Seeds* solitary, narrow-ovate; down capillary. *Recep.* naked, flat, dotted.

Ess. Ch. *Cal.* cylindrical, oblong, somewhat calyced at the base.

Obs. Linnæus in his Species Plant. and Syst. Nat. admitted some plants into this genus, which in opposition to his own generic character are without the short scales at the base of the calyx. These are now placed under a distinct genus, for which Linnæus's original name Kleinia has been revived. La Marek in Encyc. and professor Martyn in his edition of Miller, still, however, adhere to the arrangement of Linnæus. The latter has inconsistently retained the original generic character, which the former has altered so as to adapt it to all his species.

Species. \* *Stems shrubby.*

1. *C. pendula*, Willd. Forsk. descrip. 145. "Stem and branches fleshy, leafless, scaly; peduncles one-flowered," Vahl. Symb. 3. p. 90. Perennial. *Stem* about three feet high, branched, trifid towards the summit. *Scales* scattered, spiral-wise, rather crowded, about half an inch long, lanceolate-awlshaped, yellowish, rigid, pungent, pressed close to the branches. *Peduncles* from the summits of the branches, solitary, straight, about seven inches long, with a few linear, small, remote scales. *Calyx* many-leaved, containing many florets. *Corolla* purple. 2. *C. cylindrica*, La Marek. "Stem weak; leaves slender, cylindrical, fleshy, with a few hairs at their axils." Perennial. *Stem* a foot and a half high. *Branches* slender, cylindrical, smooth, leafy. *Leaves* scattered, cylindrical, two inches long, pale green. A native of Africa, cultivated in the royal garden at Paris. 3. *C. carnosa*, Willd. "Leaves roundish, fleshy, incurved; peduncles terminal, one-flowered, naked." Ait. Hort. Kew. 3. p. 156. Perennial. Native of the Cape of Good Hope. 4. *C. ficoides*, Linn. Sp. Pl. (Kleinia Hort. Clus.) "Leaves compressed, fleshy." Perennial. *Stems* seven or eight feet high, Miller; (about two feet; La Marek), woody at bottom, soft and succulent upwards, irregularly branched. *Leaves* scattered, thick, tapering, succulent, a little curved, a little compressed in a direction perpendicular to the horizon; the upper ones covered with a very glaucous meal resembling that on some kinds of plum. *Flowers* yellowish white, at the extremities of the branches; in a loose, branched corymb. *Stigma* dark purple. Miller and La Marek. A native of Africa. 5. *C. repens*, Linn. Mant. 110. "Leaves depressed, fleshy." Perennial. It differs from the last in having a creeping root; and leaves not compressed but concave on their upper surface. Native of the Cape of Good Hope. The leaves and upper part of the branches of these two are pickled by the French with their meal on, and esteemed not inferior to rock samphire. 6. *C. cuneifolia*, Linn. Mant. 110. "Leaves wedge-shaped, fleshy." Perennial. Smaller than the two preceding. *Leaves* scattered, glaucous, veinless, flat above, and somewhat convex underneath. A native of the Cape. Cultivated in the Upsal garden. Linnæus, though he could not make it flower, judged it to be a Cacalia, not a Cotyledon, on account of its leaves not being opposite. 7. *C. articulata*, Linn. Sup. 354. Thunberg prod. 142. PHerit. stirp. tab. 83. (laciniata Jacq. ic. rar. tab. 168. runcinata La Marek?) "Stem decumbent, jointed; lower leaves hastate, upper lyrate." Linn. jun. "Leaves fleshy, flat; leaflets three-lobed:" Willd. "Leaves petioled, flat, hastate-runcinate, fleshy, glaucous;" La Marek. Perennial. *Stems* three

three feet high, upright but weak, round, fleshy, marked with lines of a deeper green, branching; young branches jointed. *Leaves* feathery, generally pinnate; pinnules oblong, tooth-gathered or entire, the end one largest. Jacquin. Pinnatifid or hastate, but more frequently ternate-pinnatifid; the segments lanceolate, spreading very much, the two lowest distinct; the sinuses rounded. L'Herit. Runcinate, or sometimes simply hastate, situated towards the summit of the branches and stem. *Flowers* white, or slightly tinged with red, in a loose corymb; peduncles long. La Marek. Obs. According to Jacquin, as quoted by Professor Martyn, the calyx is without incumbent scales at the base, which would make it a *Kleinia*; but Willdenow, who had access to a living plant, continues it under *calacia*. A native of the Cape of Good Hope. 8. *C. papillaris*, Linn. Sp. Pl. (*Kleinia* Hort. Clif. *Calacanthemum* Dill. elth.) "Stem beset with truncated, petiolar spines; leaves lanceolate, plain." Perennial. *Stem* about three feet high, cylindrical, beset on all sides with apparently truncated tubercles, which are the permanent petioles of fallen leaves. *Leaves* three or four inches long, nearly cylindrical, with a longitudinal furrow, glaucous-green, scattered about the summits of the branches. A native of the Cape of Good Hope. 9. *C. Kleinia*, Linn. Spec. Plant. (*Kleinia*, Hilt. Cist. 595. *Calacanthemum* Dill. elth.) "Stem compound; scars of the petioles obsolete, leaves lanceolate, flat; flowers corymbose." *Stem* thick, fleshy, cylindrical, branched, smooth; the scars of the fallen leaves a little protuberant; branches smaller at their insertion and seemingly jointed. *Leaves* four or five inches long, fleshy, pointed, slightly furrowed on their upper surface, growing in tufts at the summits of the branches. *Peduncles* several, in the centre of the tuft of leaves, each supporting a corymb of oblong, pale-carnation coloured flowers. La Marek. *Receptacle* narrow, sprinkled with obsolete papillæ, naked, smooth. *Seeds* oblong, nearly cylindrical, smooth, rufescent; down longer than the calyx, of a silky whiteness; rays capillary, very minutely denticulated. A native of the Canary Islands. By some gardeners it has been called cabbage tree, from the resemblance of its stalks to those of cabbage; by others, carnation tree from the shape of the leaves and colour of the flowers. Miller. 10. *C. odora*, Willd. "Leaves lanceolate, flat; flowers umbellate." Vahl. Symb. 3. p. 90. Perennial. *Stem* erect, branched, scarred, with three white, elevated lines proceeding from each scar upwards and downwards. *Leaves* at the summits of the younger branches, sessile, scattered, thick, smooth. *Peduncles* six or seven, erect, forming an umbel from the summits of the branches, and furnished at their base with a few lanceolate scales. *Calyx* cylindrical, five-leaved, smooth, with two linear leaves at its base. Vahl. Found by Forkal on the mountains of Arabia Felix. 11. *C. Antephorbium*, Linn. Spec. Plant. 1168. (*Kleinia*, Hort. Clif. *Antephorbium*, Bauh. Pin. 387. Dod. pempt. 378. Lob. ic. 2. p. 26. Moris. Hilt. 3. p. 345. tab. 37. fig. 10. Dill. elth. 63. tab. 55. f. 2, 3.) "Leaves ovate-oblong, flat, with a triple line at the base of the petioles." Perennial. *Stems* several, three or four feet high, cylindrical, as large as a man's finger, irregularly branched. *Leaves* succulent, pale green. It was formerly esteemed a specific against the poisonous effect of euphorbium. A native of the Cape of Good Hope. It has been cultivated in European gardens since 1570, but it very rarely flowers. The flower figured by Dillenius was produced in the garden of Mr. Blaitwait at Dirham in Gloucestershire. 12. *C. rigida*, Willd. "Leaves ovate, obtuse, flat." Thunb. Prod. 142. Perennial. A native of the Cape of Good Hope. 13. *C. arbuscula*, Willd. "Leaves lanceolate, flat, smooth." Thunb. Prod. 142. A native of the Cape of Good Hope. 14. *C.*

*tomentosa*, Linn. Sup. 353. "Leaves sessile, lanceolate, toothed, tomentous beneath." Perennial. Found by Thunberg at the Cape of Good Hope. 15. *C. asclepiadea*, Linn. Sup. 352. "Stem tomentose; leaves petioled, ovate-lanceolate, entire, very smooth above, tomentose beneath, revolute at the edge, panicles terminal." Perennial. *Stems* upright, straight. *Leaves* opposite, spreading at the base, and gradually drawn to a point, veined, the consistence of a bay leaf; petioles roundish, tomentose. *Panicles* small, crowded. *Calyx* with few flowers; the scales at its base rather large. It has the habit of an *asclepias*. Found by Mutis in South America. 16. *C. appendiculata*, Linn. Sup. "Stem tomentose; leaves ovate-heart-shaped, acute, angular, tomentose beneath; petioles with leafy appendages." Perennial. *Stem* angular, hoary. *Leaves* higher than the stem, on long petioles, a little angular, nerved, veined; appendages three pair of very small, opposite, entire, petioled leaflets; the largest pair situated the farther from the leaf. *Pedicles* furnished with a bractæ. *Flowers* yellow. Found by Masson in watery places of the island of Teneriff. Another plant was found by him on the mountains of the same island which he judged to be a distinct species, but the younger Linnæus thought it only a variety with a very smooth stem, and leaves cordate-oblong, a little toothed, and not angular. 17. *C. reticulata*, Willd. "Leaves heart-shaped, roundish, embracing the stem, toothed; flowers corymbose." Vahl Symb. iii. 91. Perennial. *Stem* branched; branches from the nerves of the decurrent leaves, angular, smooth, thickened at the joints under the leaves. *Leaves* resembling those of *borbonia crenata*, alternate, about an inch long, smooth, reticulated with veins; teeth, as well as the edges of the reflexed leaves, thickened; nerves of a blood colour at the base. *Corymb* somewhat fastigiate; peduncles and pedicels smooth, with a small leaf at the base of the pedicels. *Calyx* simple, smooth; leaflets twelve, linear, lanceolate, equal. *Doron* simple, the length of the calyx, Vahl. 18. *C. procumbens*. Martyn's Miller, (Rumph. Amb. t. 103. f. 2.) "Stem somewhat shrubby, procumbent; leaves ovate-lanceolate, slightly serrated, fleshy; racemes elongated, interrupted." Lour. Cochinch. 485. Perennial. *Stems* nine feet high, procumbent, round, equal, smooth, succulent, branched. *Leaves* bright green, smooth, alternate, petioled. *Calyx* cylindrical, even. *Florets* gold-coloured, few, long, with the segments of the border erect. A native of China and Cochinchina, where it is used as a pot-herb.

\*\* *Stems herbaceous.*

19. *C. acaulis*, Linn. Sup. 353. "Leaves semicolumnar; scapes one-flowered." Thunb. Prod. 142. Perennial. A native of the Cape of Good Hope. 20. *C. lutea*, Miller. "Leaves five-parted, acute, glaucous beneath; flowers terminal, on very long peduncles." *Scape* about eight inches high, terminated by six or eight yellow flowers, forming almost an umbel. *Leaves* cut into five or six long, acute segments almost to the midrib; segments acutely cut in two or three places. A native of St. Helena, whence it was sent to Mr. Miller. 21. *C. radicans*, Linn. Sup. 354. "Stem creeping, taking root; leaves round-ovate, fleshy." Thunb. Prod. 142. Perennial. Cape of Good Hope. 22. *C. sempervirens*, Willd. (*Semperviva*, Fork. and La Marek.) "Stem erect; leaves fleshy, lanceolate, obtuse; peduncles generally two, terminal, one-flowered." Perennial. *Stem* scarcely a foot high. *Leaves* crowded together at the base of the stem, sessile, two inches long, smooth, shining, flat, keeled beneath. *Peduncles* straight, smooth, sprinkled with white dots, beset with linear scattered scales. *Calyx* red, or nearly violet, with thirteen teeth and thirteen furrows. *Florets* near sixty. A native of Arabia Felix, on mountains.

23. *C. fonchifolia*, Linn. Sp. Pl. 1169. (Kleinia, Flor. Zeyl. Muel Schari, Rheed. *Senecio maderaspatanus*, Pluk. Amalth. 192. t. 444. f. 1. *Chondrilla zeylandica*, Burm. Zeyl. 61. *Senecus ambonensis*, Rumph. Amb. 5. p. 257. t. 103. *Tagolina*, Pet. Gaz. t. 80. f. 13.) "Leaves embracing the stem, toothed; lower ones lyre-shaped; upper lanceolate, arrow-shaped." Willd. Root annual. Stem slender, a little branched, about a foot and half high, round, and sprinkled with a few hairs. Leaves alternate, with a few hairs, especially on the rib. Flowers terminal, about the size of those of common groundsel, cylindrical. Peduncles bristle-shaped. Calyx perfectly simple. The whole plant has the appearance of the common cow-thistle, but it is easily distinguished from it by the simple calyx and tubular florets. A native of Ceylon, Malabar, Amboina, China, &c. A decoction of it is esteemed a febrifuge and antialthmatic; its juice is given in diarrhoeas. 24. *C. sagittata*, Willd. "Leaves toothed; the lower ones petioled, obovate; the upper oblong-lanceolate, arrow-shaped, embracing the stem." Vahl Symb. iii. p. 92. excluding the synonyms. Annual. Resembling the preceding, but three times larger in all its parts. Lower-leaves petioled, obovate, not lyre-shaped. Flowers of an elegant orange-purple colour. A native of Java. 25. *C. hieracioides*, Willd. "Stem simple; leaves petioled, obovate, toothed." Annual. Stem a foot high, erect, sometimes with one or two very small branches from the axils of the lower leaves. Leaves alternate, obtuse, remotely toothed, smooth on both sides; the uppermost lanceolate, sessile. Flowers somewhat corymbose. Peduncles alternate, pubescent, supported by a lanceolate bract. Calyx with twelve lanceolate leaves, and many flowers. A native of the East Indies. 26. *C. bicolor*, Willd. "Stem branched; leaves lanceolate, smooth, toothed; those of the stem embracing it; those of the branches petioled," Willd. Roxburgh. Stem two feet high or more, erect, smooth, striated. Peduncles very long, terminal, scaly, one-flowered. Calyxes twelve-leaved, many-flowered, the size of those of *C. sagittata*. Florets purple. A native of the East Indies. 27. *C. incana*, Linn. Sp. Pl. "Leaves lanceolate, toothed." Stem erect, tall. Leaves scarcely petioled, rather thick. Peduncles terminal, branched, long, naked, or with one or two very small leaves. A native of the East Indies. 28. *C. rotundifolia*, Willd. "Stem branched; leaves roundish, petioled, repand, pubescent; flowers corymbose." Stem two feet high or more, erect, round, striated, slightly pubescent. Leaves alternate, small, scabrous on both sides, sprinkled with very short hairs. Corymbs terminal, many-flowered, divaricated. Calyxes of twelve lanceolate leaves. A native of the East Indies. 29. *C. scabra*, Willd. "Radical leaves petioled, oblong, toothed; stem-leaves lanceolate, sessile." Vahl. Symb. iii. p. 92. Stem erect, a foot high, simple, round, striated, hairy, especially at the base. Root-leaves two inches long, with unequal teeth, terminating in a sharp point, rather scabrous above, veined, narrowed at the base, and decurrent into the petiole. Stem-leaves few; the three lowest near together, an inch and half long, with four or five teeth on each side; the three upper ones remote, half an inch long, linear-lanceolate, very entire, erect. Petioles of the radical leaves long, hirsute, flat. Flowers five, peduncled, alternate, situated near the summit of the stem; pedicels round, hirsute, with a linear-lanceolate bract at the base of each pedicel, and another in the middle. Calyx perfectly simple, of twelve linear-oblong leaflets the length of the florets. Down sessile, feathered with very minute hairs, visible only under a lens. Vahl. A native of Brazil. 30. *C. indica*, La Marck. "Stem downy; leaves nearly deltoid, irregularly toothed, on long petioles; bractes bristle-shaped, investing the peduncles." Stem about a foot high, clothed with a white cottony down, branched near the bottom, leafy. Flowers nearly solitary at the summit of each branch; scales of the calyx straight; peduncles cottony. A native of the East Indies, communicated to La Marck by Somerat. 31. *C. saracenicus*, Linn. Sp. Pl. 1169. (*Solidago* Lemonier, Ob. 163. Sauv. Monsp. 84. Gouan Monsp. 144. *Senecio perennis*, Vaill. Act. 366. *Virga aurea*, Morif. Hill. iii. p. 23. Bauh. Hist. ii. p. 1063. *Corynza* Chem. Act. Par. 1705. p. 394.) "Leaves lanceolate, serrated, decurrent." Perennial. Stem two or three feet high, striated, almost entirely smooth, leafy, straight, a little branched at its summit. Leaves alternate, pointed, sessile, or even embracing the stem, smooth above, and slightly pubescent beneath. Flowers pale yellow, in a terminal corymb. Calyx nearly simple. Peduncles furnished with bristle-shaped leaflets. La Marck. A native of the south of France. This plant has so strong a resemblance to *Senecio Saracenicus*, that La Marck has separated it from that genus chiefly in deference to the authority of Linnæus. 32. *C. hastata*, Linn. Spec. Pl. (*Senecio*, Gmel. Sib. ii. p. 136. t. 66.) "Leaves three-lobed, acuminate, serrated; flowers nodding." Perennial. Stem covered with a glaucous meal. Leaves hastate-deltoid. Flowers of about five white florets, without the setaceous bractes, except at the subdivisions. Anthers black. Peduncles hoary, somewhat tomentose, Linn. Calyx cylindrical, consisting of many leaves in a simple or nearly double series, calyced at the base with acute scales. Receptacle rather flat, naked, with pentagon areas, inclosing a depressed little nipple. Seeds roundish, striated, of a pale bay colour. Down capillary, soft, white, minutely toothed, a little longer than the seed. Gært. A native of Siberia. La Marck judges it only a variety of the preceding. 33. *C. juaveolens*, Linn. Sp. Pl. "Leaves hastate-arrow-shaped, toothed; petioles dilated upwards." Perennial. Stems four or five feet high, striated, leafy. Leaves alternate, pointed, smooth. Flowers whitish, in a terminal compound corymb; calyx and peduncle smooth, with setaceous bractes under the calyx, and under the divisions of the peduncles. A native of Virginia and Canada. 34. *C. atriplicifolia*, Linn. Sp. Pl. (*Porophyllum*, Gron. virg. 1. p. 94. *Nardus*, Pluk. alm. t. 101. f. 2.) "Leaves somewhat heart-shaped, toothed, sinuate; calyxes with five florets." Root perennial, composed of many fleshy, spreading tubes. Stems three or four feet high, round, slightly striated, leafy, a little branched. Leaves alternate, petioled, smooth, of a glaucous colour beneath: lower ones heart-shaped, rounded, as large as the human hand, with large, unequal indentures; those on the stem heart-shaped, pointed, angular. Flowers small, oblong, pale, or reddish, in a terminal, loose corymb. Calyx simple, consisting of five or six linear leaflets, scariose at their edges. La Marck. A native of Virginia and Canada. 35. *C. reniformis*, Willd. "Leaves petioled; radical ones between kidney and heart-shaped, toothed in a repand manner; stem ones oblong, toothed, wedge-shaped at the base, very entire; corymbs fastigiate." Perennial. Radical leaves large, smooth, hairy underneath on the nerves; stem-leaves very entire, remotely toothed from the middle to the end. Corymbs many-flowered. Calyx of five, lanceolate, obtuse leaflets. Florets numerous, white. It resembles *C. atriplicifolia*, but is clearly distinguished from it by the form of its leaves, and its fastigiate corymbs. A native of Pennsylvania. 36. *C. petastites*, La Marck. (*Alpina*, Linn. Sp. Plant. Willden. 33, but not all the synonyms, hirsuta, Villars Dauph. 3. 170, 173. *C. incano folio*, Clus. hist. 2. p. 115. *C. foliis crassis hirsutis*, Bauh. Pin. 198.) "Lower leaves large, roundish-heart-shaped, angular, toothed, stem-

leaves somewhat hastate, auricled at the base; corymb loose." Perennial. *Stem* three or four feet high, round, reddish, a little pubescent. *Radical leaves* near a foot in diameter, toothed between the angles, green and smooth above, whitish and cottony underneath, resembling those of the common butterbur; petioles long; stem-leaves smaller, alternate, furnished at their base with two roundish auricles which embrace the stem; upper ones lanceolate, sessile and embracing the stem. *Flowers* purple, in a terminal, loose, and branched corymb; florets two or three; calyx simple, of four leaflets. La Marck. *Bracts* linear at the base of each peduncle. *Calyx* calyced, with three linear, open leaflets. Villars. Observed by La Marck on Mont d'Or, in Auvergne, in sheltered, moist situations, and especially in the ravines where it grows in abundance. There is a smaller variety with clustered flowers. 37. *C. leucophyllus*, Willden. (alpina Tournef. inlt. 452. tomentosa, Jacquin and Villars.) "Leaves petioled, cottony on both sides, toothed; lower ones heart-shaped, acuminate; upper ones lanceolate; petioles naked; flowers corymbose; calyxes many-flowered." Willd. This species is remarkable for the whiteness of all its parts. *Stem* from twelve to fifteen inches high, straight, simple, cottony. *Leaves* alternate, frequently with two small auricles at the base of the petiole. *Flowers* terminal, in several fascicles, or small, close corymbs; calyx of more than six leaflets; florets from eight to fifteen. It varies in sometimes having the upper surface of the leaves green. A native of the Alps. This variety seems to be the albifrons of the younger Linnæus and Willdenow, excluding all the synonyms quoted by the latter. 38. *C. alliariefolia*, La Marck, (alpina  $\beta$ . Linn. pyrenaica. Tourn. 452.) "Leaves between kidney and heart-shaped, serrated, smooth on both sides, without auricles: calyx with about five florets." La Marck. Perennial. *Stem* about a foot high, almost smooth. *Leaves*, especially the lower ones, rounded like those of erythraea alliaria, or rather those of caltha palustris, green on both sides, with branched nerves. *Flowers* purple, in a small, compound, terminal corymb. *Calyx* smooth, of five or six oblong, obtuse leaves. A native of the Pyrenees and the mountains of Dauphiny. Obs. Gouan's description of his *C. alliariz*, (Illust. p. 65.) does not correspond with this plant, though he quotes some of its synonyms. 39. *C. cebinata*, Linn. Sup. 353. "Leaves between kidney and heart-shaped, angular, toothed, downy beneath; leaflets of the calyx tubercled." Found by Masson on precipices in the island of Teneriff. 40. *C. candicans*, Willd. "Downy; radical and lower leaves ovate, petioled, crenate; upper ones sessile, elliptic, very entire." Vahl. Symb. 3. p. 91. t. 71. *Stem* a foot high, erect, simple, leafy, about the size of a swan's quill, and, as well as the rest of the plant, the calyxes excepted, clothed with a very white wool. *Radical leaves* two inches long; *lower stem-leaves* three inches; *petioles* of the radical and lower stem-leaves three inches long, flat, embracing the stem, dilated upwards into the leaf. *Corymb* terminal, many-flowered. *Pedicels* one-flowered, with an acuminate leaflet at the base of each. Scales of the *calyx* lanceolate, smooth. Florets the length of the calyx. Vahl. A native of the straits of Magellan. 41. *C. scandens*, Willd. "Stem climbing; leaves triangular, sinuate-toothed." Thunb. Prod. 142. A native of the Cape of Good Hope. Obs. The *C. scandens* of P'Heritier is the Eupatorium Scandens of Linnæus removed to Mikania by Willdenow. 42. *C. quinqueloba*, Willd. "Stem climbing; leaves five-lobed." Thunb. Prod. 142. Cape of Good Hope. 43. *C. bipinnata*, Linn. Sup. (pinnatifida, Berg. cap. 230.) "Leaves twice pinnate, linear." *Stem* erect, striated, smooth. *Leaves*

rather crowded, toothed, smooth, three inches long. Panicle terminal, somewhat fastigiata. *Flowers* yellow. *Calyxes* cylindric, five-leaved, five-flowered, acute. A native of the Cape of Good Hope. 44. *C. bulbosa*, Mart. Mil. "Leaves radical, lyrate; stem almost naked; panicle few-flowered." Lour. Cochinch. 485. *Root* a roundish knotted, perennial bulb. *Root-leaves* toothed, somewhat fleshy, petioled, few. *Stem* a foot and a half high, upright, round. *Flowers* gold coloured, on a terminating peduncle, several together. *Calyx* cylindric, with a calycle of five thread-shape loose leaflets. Tube of the *florets* longer than the border, inflated, reflexed, with a short converging border. *Stigmas* two, long, erect. A native of China and Cochinchina. 44. *C. pinnatifida*, Mart. Mil. "Leaves pinnatifid; segments lanceolate, serrated; stem twisted. Lour. Cochin. 486. *Stem* two feet high, upright, thick. *Leaves* smooth, not fleshy. *Flowers* yellow, in a terminating panicle, few together. *Calyx* oblong, round. A native of China near Canton, among rice.

*Propagation and Culture.* All the sorts which are natives of the Cape of Good Hope may be propagated during the summer months, by cuttings, which should be laid to dry a fortnight, that the wound may be healed over before they are planted; but if they have been kept six months they will take root. The pots in which they are planted may be plunged in a moderate hot-bed; but if they are planted in June or July they will root as well in the open air. They should have a light sandy earth, and in winter be placed in an airy glass-case, where they may enjoy the sun and air in mild weather, but must be protected from the frost. Like other succulent plants from the same country, they must have little water in winter, and only a moderate quantity in summer.

The *carnea* increases fast by its roots, which may be parted either in the beginning of September or at the end of March. They should be planted in pots filled with light earth, and constantly kept in the tan-bed in the stove.

The *papillaris* and *anteuphorbium* require a sandy poor soil, and must be kept very dry both summer and winter; but they require the open air in summer. The *kleinia*, if kept in a dry warm glass case in winter, and in a warm sheltered situation in summer, will flower annually, and grow to the height of eight or ten feet.

The *fonticifolia* is propagated by seeds, which succeed best when sown in autumn soon after they are ripe, and the pot plunged in the tan-bed in a stove. In spring they may be sown in a hot-bed, and at a proper time transplanted into another hot bed, shading them till they have taken root. When the plants have acquired strength they should be planted in pots, and either plunged into a moderate hot-bed under a deep frame, or placed in a glass-case, where they will flower and perfect their seeds. The *suaveolens* and *atropicifolia* multiply greatly by their spreading roots, and also by their seeds, which are sown to a great distance by the wind. The roots should be transplanted in autumn. They require a loamy soil, and a shady situation. See Martyn's Miller.

CACALIA *Porophyllum* and *Suffruticosa*, Linn. *ruderalis*, Swartz; and *angulata*, Vahl. See KLEINIA.

CACALIA *Souchifolia*, Forskal. See KLEINIA *angulata*.

CACALIA *Linaria*, Cavanilles. See KLEINIA *suffruticosa*.

CACALIA *Coraisfolia* and *Laurifolia*, Lin. Sup. See MIRANIA.

CACALIA *foliis auriculatis*, &c. Burman. Zeyl. 52, t. 21. See EUPATORIUM *Zeylanicum*.

CACALIA *foliis rotundioribus*, Morif. 3, 94. See EUPATORIUM *Rotundifolium*.

**CACALIE**, in *Entomology*, a species of *CHRYSOMELA* that inhabits Austria: the colour is greenish, with a longitudinal streak on the wing-cases and suture blue: wings red. *Herbst*.

**CACALIANthemum**, in *Botany*, *Dill. Elth.* See *CACALIA Papillaris* and *C. Kleinia*.

**CACALLA**, or **CAZALLA**, in *Geography*, a town of Spain, in the country of Seville, famous for its wine; 40 miles N. of Seville.

**CACALOTL**, in *Ornithology*, the Brazilian name of the *CORVUS VARIUS* of *Briffon*, a variety of our common raven, according to *Fernand's History of New Spain, &c.*

**CACALOTOTL**. *Ray* describes the lesser ani of modern writers, *CROTOPHAGA ANI* of *Gmelin*, under this name.

**CACAMO**. See *ACAMANTIS*.

**CACAO**, in *Botany*. See *THEOBROMA* and *CHOCOLATE*. The cacao nuts are used by the Indians as money; 150 of the nuts being estimated at much the same value with a Spanish ryal.

**CACAO affinis**. *Sloane*. See *RANDIA mitis*.

**CACAO**, in *Entomology*, a species of *BRUCHUS*, found among the seeds of the *Theobroma*. The body is fuscous with griseous spots. *Fabricius, &c.*

**CACAOTETE**, in *Natural History*, the name by which the Brazilians call the *BELEMNITES*, which is very common with them as well as with us.

**CAPEHON**, in *Geography*, a river of Virginia, which runs about 70 miles north-easterly along the western side of north ridge, and discharges itself into Potowmack river, 30 miles N. from Fredericks-town.

**CACARA**, in *Botany*, *Rumph.* See *DOLICHOS unguiculatus* and *pruriens*.

**CACASTOL**, in *Ornithology*, the name given by *Buffon* to the Mexican stare, *STURNUS MEXICANUS*, a bird of a blue colour varied with black. *Ray* calls it *Caxcastototl*, and *Briffon* *Cotinga Mexicana*.

**CACATOCHA** of *Valent*, in *Ichthyology*. See *CORYPHÆNA PENTADACTYLA*. The fish called by the same writer *CACATOCHA BABINTANG* is the *CHÆTODON ARGUS* of *Brunniche*, a species distinguished by having eleven dorsal spines, the body marked with many black dots, and the tail entire.

**CACATORY fever**, a denomination given by *Sylvius* to an intermittent fever, accompanied with a severe looseness, and sometimes gripes.

**CACATUA**, in *Ornithology*, synonymous with *Kakatoë*, and *Cockatoo*. *Briffon* calls the lesser white *Cockatoo*, *PSITTACUS SULPHUREUS* of *Gmel.* *Cacatua luteo-cristata*. His *cacatua minor* is the red vented *cockatoo* of *Brown*; and the *cacatua rubro-cristata*, the greater red-crested *cockatoo* of *Latham, &c.*

**CACAVATE**, in *Botany*, a name given to the cacao (*Theobroma Linn.*) in the general history of plants published at *Lyons, 1587*.

**CACCARI**, in *Geography*, a town of Naples, and province of Calabria Citra; 10 miles W. of *Umbriatico*.

**CACCAVONE**, a town of Naples, in the country of *Molise*: 9 miles N. of *Molise*.

**CACCIA**, a small district of the island of *Corfica*. See *ALGERI*.

**CACCIA**, *Ital.* **CHASSE**, *Fr.* a musical term for a *Hunting-piece*. *Cornoda caccia*, a *hunting horn*, commonly called a *French horn*. *Alla caccia*, in the *hunting style*. See *CHACE*.

**CACCINI, GIULIO ROMANO**, in *Biography*, one of the first cultivators of *recitative* during the latter end of the 16th  
VOL. V.

century at *Florence*. He is said, by *Gio Battista Doni*, to have been a young, elegant, and spirited singer, accustomed to attend the meetings of a society of learned noblemen and gentlemen at *Florence*; the members of which society were much displeas'd with the little respect that was paid to lyric poetry by the composers of that time, who thought of nothing but fugues, canons, and crowded harmony, which being totally devoid of melody, rendered the words that were set in this manner wholly unintelligible; as the music was all in choruses, *fugato*, where every part was singing different words at the same time. These gentlemen wish'd to discover some kind of simple melody that would tune declamation, admit of harmony occasionally, and approach as nearly as possible to the declamation of the ancients; which they were sure was in musical intervals, as it was accompanied by instruments. *Tibia pares et impares*.

"Caccini being seized with a passion for this kind of music, studied it with great diligence, composing and singing to a single instrument, which was generally the *Theorbo lute*, played by *Bardillo*, who happened then to be at *Florence*. In imitation therefore of *Galilei*, but in a more beautiful and pleasing style, Caccini set many canzonets and sonnets, written by excellent poets, and not by such wretched scriblers (*rimatori a dozzina*) as were usually employed before, and are still frequently the favourites of musicians; so that he may be said to have been the first to see this error, and to discover that the art of counterpoint will not alone complete the education of a musician, as is generally imagined. And he afterwards confessed, in a discourse prefixed to his works, that the conversations held at *Count del Vernio's* were of more use to him, than thirty years study and exercise of his art. Here he likewise claims the merit of having first published songs for a single voice, which, indeed, had the greatest success. And it must be confessed, that we owe to him, in a great measure, the new and graceful manner of singing, which at that time spread itself all over *Italy*; for he composed a great number of airs which he taught to innumerable scholars, and among the rest to his daughter, who became a famous singer, and still continues very excellent in that faculty.

"In the recitative style, however, Caccini had a formidable rival in *Jacopo Peri*, a *Florentine*, who was not only a good composer, but a famous singer, and performer on keyed instruments, having been taught by *Christopher Malvezzi*; and applying with great diligence and enthusiasm to this kind of singing, succeeded wonderfully, and met with universal applause.

"The first poem set in this new manner was *Dafne*, a pastoral written by *Rinuccini*, and set by *Jacopo Peri* and *Caccini*, in a manner which charmed the whole city." See *RECITATIVE and OPERA*.

Various experiments in dramatic music were made at the houses of the nobility of *Florence*, previous to the exhibition of the first serious opera, which was the *Euridice*, written by *Rinuccini*, and chiefly set by *Jacopo Peri*, for the royal nuptials of *Mary of Medicis* with *Henry IV.* of *France*, in 1600. Though the music of this drama went under the name of *Peri*, who performed a part in it himself, yet he confesses in his preface that *Giulio Caccini*, "whose great merit was known to the whole world," composed some parts of it, and taught the singers. Caccini himself afterwards set the entire drama of *Euridice* to music *in stilo Rappresentativo*, and published it at *Florence*. Specimens of his musical recitation are given in *Burney's General History of Music*, vol. IV. so that there can be no doubt but that Caccini was one of the first founders of the musical drama or *OPERA*, whence all the improvements in setting  
4 O words,

words, in finging, and in producing instrumental effects by a well regulated orchestra for these last 200 years, may be deduced.

CACCO, in *Ornithology*, one of the synonymous names by which Buffon distinguishes the long-billed rain cuckow, *CUCULUS VETULA* of *Gmelin*, &c.

CACELLA, in *Geography*, a sea-port town of Portugal, in the province of Algarva, on the south-coast, about 8 miles W. from the mouth of the Guadiana. N. lat.  $37^{\circ} 9'$ . W. long.  $6^{\circ} 40'$ .

CACERA DELL' PAGANI, a town of Naples, in the province of Capitanata; 13 miles S. of Troia.

CACERES, a town of Asia, in the island of Luçon or Manila, founded by the second governor and proprietor of these islands, D. Francis de Sande, and consisting of Indian huts and some convents, well built. It is the residence of a bishop, under whom are the provinces of Colilaya, Camarines, and Ifalon. N. lat.  $14^{\circ} 15'$ . E. long.  $124^{\circ} 40'$ .

CACERES, a town of Spain, in the province of Extremadura, seated on the Sabor, and well known for its fine wool: 20 miles W. of Truxillo.

CACERES, a town of North America, in Mexico, and district of Tlascala; 70 miles N. W. of Vera Cruz.

CACHACHRON HEAD, the south point of Dominica island in the West Indies, and nearly N. from the north end of Martinico.

CACHALES, in *Ancient Geography*, a river of Greece in the Phocide, which washed the walls of Tithoreus, according to Pausanias.

CACHALOT, or CACHELOT, in *Zoology*. See PHYSETER MACROCEPHALUS.

CACHAN, or KASHAN, in *Geography*, a town of Persia, in the province of Irac, which carries on an extensive trade in silk, stuffs, brocades, and fine earthen ware, inhabited by Christians and Guebres; 50 miles N. of Ispahan. N. lat.  $34^{\circ} 10'$ . E. long.  $50^{\circ} 2'$ .

CACHAO, CHACO, CHECO, or KESHO, one of the eight provinces of Tonquin, seated in the central part of the kingdom, and encompassed by the other seven. Its soil is fertile, and some parts of the country are mountainous; it abounds with a variety of trees, and particularly that which yields the varnish. The silk manufacture is carried on in this province more than in any of the others. It takes its name from its capital, which is the metropolis of the whole kingdom; though Dampier reckons it as, in other respects, hardly comparable to a Chinese city of the third rank, having, however, a considerable population, which principally depends on the crowds of neighbouring villagers who resort to it at particular times, and especially on market-days, with their various commodities. These persons are allowed to have their halls in different parts of the city, for the convenience of the disposal of their wares. The town itself, though it is the constant residence of the Tonquinefe monarchs, has neither walls nor fortifications; and if we except the royal palace and the arsenal, has little else worthy of notice. The streets are neither regular nor handsome; some of them, indeed, are airy and wide, but the rest are narrow, and all of them are paved: the houses are low and mean, constructed of wood and clay, and not above one story high. The magazines and warehouses belonging to foreigners are the only edifices built of brick. In various parts of the city there are, even in dry weather, ditches of stagnated water and stinking mud, which are very offensive to strangers; and yet, upon the whole, its airy situation, and serene air, render it healthy and pleasant to the natives; so that it is seldom, if ever, visited with those pestilential diseases that are com-

mon in large cities of those eastern climes. On account, however, of the materials with which its edifices are constructed, it is subject to frequent and dreadful conflagrations. As a preventive of the desolating effects of these calamities, every house is furnished with a low building of brick, in form of an oven, in which the inhabitants deposit, on occasions of any alarm, their most valuable property. The government likewise obliges every family to keep a cistern, always full of water, on the top of the house, together with a long pole and bucket for throwing water upon the house. The chief palace of the chowa, or king, is situated in the centre of the city, and surrounded with a strong wall, enclosing within its circuit a great number of apartments, two stories high; those of the chowa and his wives are embellished with a variety of carving and gilding after the Indian manner, and are finely varnished. In the outward court are a great number of sumptuous stables for the king's elephants and horses; the inner courts are inaccessible, not only to strangers, but even to the king's subjects, the members of the privy council and the ministers of state excepted. This enclosure, which is of a vast circumference, is faced with brick within and without, and the whole structure is terminated by spacious gardens. The king is a kind of prisoner in this palace, and his authority is exercised by an officer, whose family have long transmitted the executive power in hereditary succession. The arsenal is a large building, well stored with warlike ammunition and artillery. It stands on the banks of the river Song-koy, and on that branch of it which Dampier calls Dombea, represented by him as the deepest and widest of the two. The English factory-house is situated on the north side of the city, fronting the river. It is a low edifice, with a spacious dining-room in the centre, and on each side are the apartments of the merchants, factors, and servants. At each end of the building are small houses for other uses, which form two wings, with the square in the middle, and parallel with the river, near the bank of which stands a flag staff, on which they commonly display the English colours on Sundays, and all other remarkable days. Adjoining to this house, on the south side, is the Danish factory, which is neither so large nor so convenient. On the same side of the river runs a long dike, with its timber and stones strongly cemented together, which prevents the river, during the time of their heavy rains, from overflowing the city. This river disembogues itself into the gulf of Tonquin. Dr. Halley, in the *Philosophical Transactions*, has given an account of the surprising tides in this bay; each flux being of 12 hours duration, and its reflux the same, so that there occurs but one high-water in 24 hours. Cachao, or Kesho, is the only city in the whole kingdom, and is said to consist of about 20,000 houses. N. lat.  $22^{\circ} 10'$ . E. long.  $105^{\circ} 31'$ . See TONQUIN.

CACHAR, a rich but mountainous territory of the kingdom of Ava, lying north-west of Munnipoora, subject to the independent sovereignty of a rajah. Its capital is Cospore.

CACHASSÆ, in *Ancient Geography*, a people of Scythia, placed by Ptolemy on this side of Imaus, between the Noroffi and the Aspathi.

CACHE, or, as it is called in China, *Cayas*, and in many parts of India, *Cas*, *Casoe*, *Caste*, and *Casse*, in *Commerce*, a small copper coin, equal in value to a little more than a French denier.

CACHEF, or CACHEEF, in the *Turkish Affairs*, the governor of a city, town, or even a province of Egypt.

The title cachef is also given to the captains or commanders of little flying armies, intended to keep the Arabs in obedience.

Egypt is divided by the Turks into thirty-nine *cachef-tecks*, or governments.

CACHEMIRE, in *Geography*. See CASHMERE.

CACHEO, a town of Negroland in Africa, seated on the river St. Domingo, or Cacheo, and belonging to the Portuguese, who have three forts, and carry on a great trade there in slaves and wax. N. lat. 12° 5'. W. long. 16° 20'. The river divides into several large branches before it falls into the ocean.

CACHET, CHRISTOPHER, in *Biography*, born at Neufchateau in Lorraine, the 26th of November 1572, received the rudiments of his education among the Jesuits. To improve himself further, he visited the principal states of Italy, but purposing to practise medicine, he fixed his residence at Padua, and after finishing his studies there, he settled at Nancy, where he arrived at the highest honours in his profession, being physician and aulic counsellor to four of his sovereigns, as appears by his epitaph, under his portrait, in the house of the Cordeliers at Nancy, where he was buried Sept. 30, 1624.

Ut erat bono publico natus,  
Lucem literis, nomen libris, laudem suis, Patriæ gloriam,  
famam sibi,

Principibus sæpe salutem peperit.

Serenissimis ducibus

Carolo 3tio. Henrico 2do. Francisco 2do. Carolo 4to.

Archiatr et consiliarius.

He was author of several works: "Controversiæ Theoricæ Practicæ, in primam Aphorismorum Hippocratis Sectionem. Opus in duas partes divisum, Philosophis ac Medicis perutile et perjugundum. In quo quæcumque ad Venæsectionem, Purgationem, et Victus Rationem pertinent, enodantur, &c." Tulli Leucorum, 1612, 8vo. "Pandora Bacchica furens, Medicis Armis oppugnata;" Tulli, 1614, 12mo. "Apologia dogmatica in Hermetici ejusdem anonymi scriptum de curatione Calculi, in qua Chymicarum Ineptiarum vanitas exploditur;" Tull. 1613, 8vo. "Vrai et assuré Preservatif de la Petite Verole et Rougeole;" 1617, 8vo. The only art here taught is to keep children carefully from all infected places. Haller. Bib. Med. Eloy. Dict. Hist.

CACHETUS, in *Ancient Geography*, a river of Asia, in the kingdom of Pontus, near the town of Heraclea, according to Diodorus Siculus.

CACHEXIA, a term applied by the older writers in *Medicine*, to denote those conditions of the body, from whatever causes they may arise, in which the functions are imperfectly performed, and the complexion unhealthy. It is derived from *κακός*, bad, and *ἕξις*, habit. The cachectic state of the constitution was supposed to depend upon an acrimony, or some other morbid change in the fluids of the body; and this seems to have been chiefly inferred from the change of complexion. Hence Van Swieten observes, that "expert physicians always examine carefully into the appearance of the skin, in those parts where the integuments are thin, and the vessels lie exposed, when they wish to know the condition of the blood and humours." § 1170. These hypotheses, however, are now considered as unfounded. But upon whatever circumstances the cachectic state depends, it is obvious, that it occurs in all instances of slow convalescence from acute and chronic diseases in general, and accompanies all lingering affections of the viscera and other parts; and therefore that it is essentially different in its nature in different instances. Hence it is impossible to give a general history of it, as of a specific disease; or to enumerate the remedies which may be successfully employed for its cure. Where it is merely a debility, consequent on some

severe disease, moderate exercise, a light nutritious diet, and tonic medicines are indicated. But where it is a concomitant of some organic affection, the nature of that must determine the nature of the remedy to be adopted.

In the more accurate language of the present day, this vague and indefinite term is seldom employed. But it has been used with great propriety by Sauvages and Cullen to denote a particular class of diseases, in their respective systems of nosology; including those complaints in which the general habit is affected, and a change of complexion, with emaciation or morbid enlargement, are characteristic symptoms. Such are dropsy, jaundice, rickets, &c.

CACHIBONA, or CLYDE, in *Geography*, a river of the island of Dominica, which runs into the sea on the east coast, a little to the north of Halifax bay.

CACHICAME, in *Zoology*, Buffon's name of the Pig-headed Armadillo; *Dasyfus novemcinctus* of Linnæus.

CACHIMAYO, in *Geography*, a large river of South America, in Peru, which falls into the ocean within 2 leagues of La Plata.

CACHIQUE *Tower and Bay*, are situated on the coast of Barbary, in the Mediterranean, nearly W. from Algiers 6 or 7 leagues.

CACHOLONG, in *Mineralogy*. See CHALCEDONY.

CACHOPS Sands, in *Geography*, are two remarkable banks, which contract the channel of the mouth of the Tagus, at its influx into the sea, below Lisbon.

CACHORRODOMATO, in *Zoology*, the name by which the Portuguese in America call the TAIBBI; a creature said to resemble the Opossum in many respects, and by some suspected to be the male of that creature.

CACHRUS, in *Entomology*, a species of PAPILIO, (*Plbejus*) with entire yellowish wings, and a common fuscous border spotted with white. Fabr. &c. This inhabits South America.

CACHRYS, in *Botany*, *καχρυς*, Gr. The word is used in various senses by different authors, and has been the occasion of great perplexity to the grammarians and commentators. In Theophrastus (lib. iii. cap. 7.) it seems to denote the catkins of the oak, walnut, pine, &c. by other writers it is used, sometimes for the root, sometimes for the seed of the plant to which modern botanists have given the same name, and sometimes for the plant itself. It also signified the seeds of roasted barley; and some have supposed that the plant derived its name from the resemblance of its seeds to those of barley. (See the notes on Theophrastus by Constantine and Bodeus a Stapel, p. 139, 140.) Tournef. Infl. p. 325. Plate 127. Raii Meth. Plant. 47. Linn. gen. 342. Schreb. 474. Willd. 538. Gært. 808. Pl. 140. Juss. p. 223. Vent. vol. iii. p. 26. Libanotis Cachryophorus, Raii Hist. Plant. p. 424. Class and order, *pentandria digynia*. Nat. ord. *Umbellata*, Linn. *Umbellifera*, Juss.

Gen. Ch. *Cal.* universal and partial umbels manifold; universal and partial involucre, many-leaved, linear-lanceolate; perianth proper, scarcely discernible. *Cor.* flowers all uniform: petals five, lanceolate, almost upright, equal, flatish. *Stam.* filaments five, simple, the length of the corolla: anthers simple. *Pistl.* germ top-shaped, inferior: styles two, inferior, the length of the corolla. *Peric.* fruit somewhat egg-shaped, obtuse, very large, splitting in two. *Seeds* two, very large, very convex on one side, flat on the other; of a fungous or spongy substance, each enclosing a solitary ovate-oblong kernel.

Ess. Ch. fruit somewhat egg-shaped, with a thick integument of a spongy substance.

Sp. 1. *C. odontalgica*, Linn. Sup. 181. Pallas It. vol. iii. p. 270. t. g. f. 1, 2, 3. Vol. v. p. 106. Pl. 4. French translation. Gært. vol. ii. p. 274. Pl. 140. f. 3. "Radical

dical leaves twice pinnate, white with down: stem naked: seeds perfectly plain." *Root* perennial, very long, acrid and aromatic, producing when chewed an abundance of saliva in the mouth, and on that account employed as a cure for the tooth-ache. Pinnules of the radical leaves ternate, the leaflets elegantly incurved upwards. *Stem* simple, streaked, from nine to twenty one inches high, panicled at top with unbelled branches forming a kind of thyrse; naked, with the exception of a stipule-like leaf at the origin of each branch, cut nearly half way down into three or four segments, and a pair of short lanceolate leaves a little above the middle of each branch. *Flowers* yellow. Gærtner observes, that the structure and position of the cotyledon of the seed is very singular, being leafy, elliptic, divaricated downward and collateral, nearly as in menispermum, except that both are included in one cell of the albumen. Found abundantly by Pallas in the arid deserts, between the Volga and the Jaick.

2. *C. Morifoni*, Willd. Allion. Aust. p. 23. Morif. Umb. 63. Pl. 3. f. 1. *C. lævigata*. La Marck Encyc. 1. p. 255. "Leaves super-decompound, bristle-shaped, cut into many segments: seeds plain, smooth." Vahl. Symb. 3. p. 49. *Root* perennial, long, thick as a man's arm, white. *Stem* two or three feet high, striated, smooth. *Root-leaves* large, finely cut; the last segments bristle-shaped and short: upper leaves of the stem opposite. *Flowers* yellow. *Seeds* white, smooth, not furrowed. La Marck quotes the libanotis of Gouan as a synonym of this species; but Gouan describes the seeds of his plant as furrowed. Professor Martyn observes, that the libanotis of Gouan seems to be a different species from that of Linnæus. A native of Spain, Italy, and the south of France.

3. *C. Libanotis*, Linn. Sp. Pl. Morif. Hist. 3. p. 267. S. 9. Pl. 1. fig. 6. Umb. Pl. 3. f. 3. Libanotis ferulæ folio, femine anguloso. Bauh. Pin. 158. "Leaves twice pinnate; leaflets acute, much divided; seeds furrowed, smooth." *Root* perennial, large, white, branched, aromatic. *Stem* thick, round, smooth, finely striated, leafy, branched, about two feet high. *Leaves* large, green, almost as finely cut as the preceding. *Flowers* yellow. The whole plant has an aromatic, sweet smell, and is esteemed carminative, astringent, and anti-icteric. A native of Italy, the south of France, and the coast of Barbary.

4. *C. ficula*, Linn. Sp. Pl. Morifon. Hist. 3. p. 267. S. 9. Pl. 1. f. 3. Umb. Pl. 3. f. 2. "Leaves many times divided; leaflets linear, acute: seeds furrowed, hispid." *Root* perennial, large, long, branched. *Stem* two or three feet high, thick, round, striated, smooth, branched. *Radical-leaves* a little resembling those of Peucedanum, large, a little rough to the touch: their common petiole imperfectly cylindrical, striated. *Flowers* yellow. *Seeds* deeply channelled, angular, remarkably rough.

5. *C. taurica*, Willd. "Leaves twice pinnate; leaflets linear, acute; seeds furrowed, tubercled." *Leaves* as in the preceding, but narrower. Involucre universal, none; partial of eight or ten linear leaflets. *Flowers* dioicous. *Seeds* three times less than those of the preceding, furrowed, thickly set with large, globular, often reddish tubercles. Willdenow, from a dried specimen. A native of Tauris and Siberia.

6. *C. cretica*, Willd. La Marck Encyc. 1. p. 257. "Leaves twice pinnate; leaflets lanceolate, ferrated; seeds furrowed, rough." *Root* perennial. *Stem* two feet and a half high, channelled; leaflets resembling those of Angelica Sylvestris. *Seeds* ovate-pointed, blackish, channelled, rough with stiff hairs, and furnished with a remarkably fungous integument. A native of Candia.

7. *C. panacifolia*, Willd. Vahl. Symb. 1. 25. Martyn's Miller. (*C. paltinacea*, La Mark Encyc. *C. ficula*, Morif. Hist. 3. p. 267. S. 9. Pl. 1. f. 4. *Panax ficulum*, Boccone. Sec. 1. Pl. 1.) "Radical-leaves pinnate, ovate-obtuse, somewhat

lobed; seeds hirsute." *Root* perennial. *Stem* four or five feet high, almost naked; branches alternate. *Radical-leaves* large, unequally winged with five or three leaflets, elliptic, obtuse; crenulated, and sometimes lobed, pubescent, a little harsh to the touch, of a greyish green colour: leaflets at the summit of each leaf, decurrent on the petiole. *Flowers* white. Involucres of from six to nine leaves. Germs covered with white hairs. La Marck. Seeds a little spongy. Vahl. A native of Sicily, Spain, and Barbary.

*CACHRYS Orientalis*, Tournef. Cor. 23. Travels, 2. p. 121. Pl. See *LASERPITIUM ferulatum*.

*CACHRYS*, in *Entomology*, a species of *PAPILIO* (*Hesperia* Fabr.) that inhabits Cayenne. The wings are entire, yellowish, with a common brown border spotted with white. Fabr. &c.

*CACHU, CACHOU, or CATECHU*. See *CATECHU*.

*CACHUNDE*, the name of a medicine highly celebrated among the Chinese and Indians, and made of several aromatic ingredients, the perfumes, medicinal earth, and precious stones; they make the whole into a stiff paste, and form out of it several figures according to their fancy, which are dried for use; these are principally used in the East Indies, but are sometimes brought over to Portugal. In China, the principal persons usually carry a small piece in their mouths, which is a continued cordial, and gives their breath a very sweet smell. It is a highly valuable medicine also, in all nervous complaints, and is esteemed a prolonger of life, and a provocative to venery, the two great intentions of most of the medicines in use in the East.

*CACHYMIA*, in *Metallurgy*, a term used by Paracelsus for an imperfect metallic ore, as he expresses it, an immature metalline body, which is neither a saline substance nor a metal.

The cachymix may be divided into sulphureous, as marcasite; mercurial, as arsenic or orpiment; and saline, as all talcs.

*CACIDARI*, in *Ancient Geography*, a people of Scythia, on this side of Imaus, according to Pliny.

*CACIQUES*, in *History*, a denomination anciently given in America to governors of provinces and generals of armies. It was also appropriated to the sovereigns of the five great kingdoms into which the island of Hispaniola was divided when the Spaniards first visited it, and also to the sovereigns of the principalities or kingdoms in the other islands. Their power over the subject, which was hereditary, was absolute, and they were regarded with almost idolatrous veneration. Besides these, there were also subordinate chieftains, or princes, who were tributaries to the sovereign of each district. They seem to have somewhat resembled the ancient barons or feudatories of Europe; holding their possessions by the tenure of service. Oviedo (lib. iii. c. 4.) relates, that they were under the obligation of personally attending the sovereign, both in peace and war, whenever they were so commanded. We have already observed, that the dignity of the Cacique was hereditary: but if Martyr is to be credited, the law of succession among them was different from that of all other people; for he observes (P. Martyr, decad. iii. lib. 9.) that the Caciques bequeathed the supreme authority to the children of their sisters, according to seniority, and disinherited their own offspring; being certain, as he further observes, that, by this policy, they preserved the blood-royal, which might not happen to be the case in advancing any of the children of their numerous wives. The account of Oviedo, however, is more probable; he remarks (lib. v. c. 3.) that one of the wives of each Cacique was particularly distinguished above the rest, and appears to have been con-

sidered by the people as the reigning queen, and that her children, according to the priority of birth, succeeded to the father's honours; but, in default of issue by the favourite princess, the sisters of the Cacique, if no brothers survived, took place of the Cacique's own children by his other wives. The principal Cacique was distinguished by regal ornaments, and numerous attendants. When he travelled through his dominions, he was commonly borne on men's shoulders; and he was held in such veneration, that if he ordered any of his subjects to cast themselves headlong from a high rock, to drown themselves in the sea, merely at his own sovereign pleasure, he was obeyed without a murmur; opposition to the supreme authority being considered not only as unavailing, but as impious. Their veneration extended even beyond death; for when a Cacique died, his body was embowelled, and dried in an oven, moderately heated, so that the bones and even the skin were preserved entire. The corpse was then placed in a cave with his ancestors; and thus they intended to render, not the name alone, but the persons also, of their worthies immortal. If a Cacique died in battle, and the body could not be recovered, they composed songs in his praise, which they taught to their children, and these songs formed a branch of those solemnities which were called "Arietoes," consisting of hymns and public dances, accompanied with musical instruments made of shells, and a sort of drum, the sound of which was heard at a great distance. Martyr relates (Decad. iii. lib. 9.) that on the death of a Cacique, the most beloved of his wives was immolated at his funeral. But Oviedo (lib. v. c. 3.) denies that this custom was general among them.

CACOBÆ, in *Ancient Geography*, a people placed by Ptolemy in India, on this side of the Ganges.

CACOCHYMIA, from *κακος*, bad, and *χυμος*, juice, or humour, a word formerly employed by medical writers to denote a supposed morbid condition of the fluids of the living body.

CACODES, in the *Ancient Writers of Medicine*, a name given to several kinds of matter discharged from the human body, which had an ill smell. The offensive matter voided sometimes by vomit has this name, as also that evacuated by stool, and the discharge of foul ulcers.

CACOETHES, or CACOETHIA. See MALIGNANT.

CACONGO, in *Geography*, a kingdom of Africa, on the coast of Loango, situate between three considerable ports, much frequented by foreigners; viz. Loango, Cabinda, and Cacongo. The territory is in general flat, the air is more salubrious than that of Congo or Angola, and the soil also more fertile, on account of its frequent showers, and its black mould, which, in the other adjacent kingdoms, is either chalky or sandy. The inhabitants are likewise more civilized, though not less superstitiously addicted to the same heathenish rites, than their neighbours. They bear the character of a treacherous, fraudulent, turbulent, and cowardly race; but they are much employed in traffic with the Europeans, and especially the Dutch, from whom they purchase a great variety of European goods, as coarse cloths, knit caps, hatchets, and other iron tools, linen, and other commodities, which they exchange for slaves at Congo, Angola, and other African states. This country is governed by its own hereditary princes, but under the protection of the kings of Loango, to whom they were formerly vassals, though they have since shaken off the yoke. The chief town is of the same name, and it is situated in S. lat. 4° 45'. E. long. 13°.

CACONGO, one of the chief rivers of the above kingdom, the others being the Kaja and the Cabinda. It runs 4 leagues S. of the Kaja, and 7 to the N. of the Cabinda, and

is said to be navigable by boats of 10 tons burden. This river runs through almost the whole length of the kingdom from east to west, and after a course of about 80 or 90 miles, falls into the sea, near the town of Cacongo. About 4 miles from its mouth is the town, or rather village of Mememba, where the sea makes a kind of semicircular bay, which affords a convenient road for the vessels that traffic thither, the whole coast between the Cacongo and Zaire being extremely dangerous and full of rocks and shoals. The lands on each side are fertile and delightful, and abound with elephants' teeth, which the Membates, who are situated on the other side of the Zaire fetch and carry to the port of Pinda, where the Portuguese, or any other Europeans, buy and export them.

CACOORS, in *Botany*, a species of MIMOSA, which sec. The seeds of this plant are mentioned by sir Hans Sloane as being thrown ashore on the Hebrides and Orkneys. See MOLUCCA BEAN.

CACOPHONIA, compounded of *κακος*, evil, and *φωνη*, voice, in *Grammar* and *Rhetoric*, the meeting of two letters, or syllables, or even of two words, which yield an uncouth and disagreeable sound.

CACOPHONIA, in *Medicine*, denotes a vice or depravation of the voice, or speech; of which there are two species, *aphonia* and *dysphonia*.

CACOPHONY, Gr. in *Music*, the combination of many sounds ill chosen, or out of tune, noise.

CACORLA, in *Geography*, a little town in Spain, in the country of Jaen, belonging to the archbishop of Toledo, 4 leagues E. of Ubeda.

CACOSIN, a town of the island of Cuba, 50 miles N.N.W. of Bayamo.

CACOUZIA, in *Botany*. La Marck Encyc. Illust. Pl. 359. Aublet. Guian. p. 450. t. 179. Juss. 320. (Schoufbae, Willdenow 857.) Class and order, *decandria monogynia*. Nat. ord. *Onagrea* Juss. *Myrti* Lam.

Gen. Ch. *Cal.* superior, bell-shaped, coloured, five-pointed, deciduous. *Cor.* petals five, sharply egg-shaped, inserted at the divisions of the calyx. *Stam.* filaments very long, inserted on the calyx below the insertion of the petals; anthers ovate. *Pist.* germ inferior, angular; style simple, as long as the stamens; stigma acute. *Peric.* a kind of berry, five-angled, somewhat spindle-shaped, almost woody, pulpy within, covered with a white skin or aril.

Ess. Ch. *Calyx* bell-shaped, five-parted, bearing the corolla; petals five; berry five-angled, one-seeded; seed arilled.

Obs. Nearly allied to Combretum and Fuchsia, but differing in the fruit.

Species, *C. coccinea*. A perennial shrub, with a stem about six or seven inches in diameter, branched, climbing to the top of the highest trees, from which its branches hang down, clothed with leaves and flowers. *Leaves* alternate, ovate, acuminate, very entire, veined, green, firm, with an even surface, on very short petioles. *Flowers* scarlet, sessile, scattered in long terminal spikes, with a long straight pointed bracte to each flower. La Marck. A native of Cayenne.

CACTI, the third natural order in the fourteenth class of Jussieu, with the following character. *Calyx* superior, divided at the apex. *Petals* definite or indefinite, inserted at the top of the calyx. *Stamens* definite or indefinite, with the same insertion as the petals. *Germ* inferior, simple; style single; stigma divided. *Berry* inferior, one-celled, many-seeded; the seeds attached to its inner surface. *Stem* shrubby or arborescent; *leaves* alternate or none. It contains only two genera, *Ribes*, with definite petals and stamens, and *Cactus*, with petals and stamens indefinite. Jussieu observes that

that these two genera, notwithstanding the difference in the number of their stamens and petals, are closely connected by their inferior germen, single style, and one-celled fruit, with the seeds attached to its inner surface, and that the affinity is strengthened by the similar structure of the spines in several of their species. La Marek adds to this natural order Tetragonia and Mesembryanthemum, which Jusseu arranges under Ficoides, his fifth order of the same class.

CACTI, in *Entomology*, a species of COCCINELLA, with the wing-sheaths black, and two red spots. Fabricius. Found on the cañi of America.—Also, a species of COCCUS.

CACTOIDEÆ, in *Botany*, the fifth natural order of Ventenat's fourteenth class, who places under it only the Linnæan genus Cactus, considering Ribes as more properly belonging to the Saxifragæ, but forming the connecting link between that order and Cactus. This able botanist has fallen into a slight absurdity in calling an order which contains only the genus Cactus, Cactoides; which in fact is only saying that Cactus is like itself.

CACTUS, (κακτος, Gr. the name of a plant described first by Theophrastus, and afterwards by Dioscorides, Athenæus, and Pliny. Theophrastus, whom the succeeding writers have nearly copied, speaks of it as a plant not indigenous in Greece, and peculiar to Sicily, producing from the root several creeping stems, with a broad and prickly leaf, which, when stripped of their bark, are eaten either fresh or pickled; with an upright stem besides, which he says is called pternix, and is eaten fresh but not pickled; and having a prickly pericarp, called asculia, which is likewise eatable when separated from the down of the seeds, and resembles the head of a palm. Most of the earlier modern botanists, supported by the authority of Athenæus, suppose it to be the same plant which the Greeks called κινναρα, and the Romans Carduus, the Cynara scolymus of Linnæus, or common artichoke; but Bodæus a Siapel strongly insists, that it must be another plant not ascertained by modern botanists. See his Notes on Theophrastus, p. 627—629, where he has corrected the corrupt texts of Theophrastus and Athenæus, by comparing them with each other, and with the Latin of Pliny. What are called by Theophrastus creeping stems, are probably nothing more than the strong midrib of the broad prickly leaves). Linn. gen. 613. Schreb. 838. Willden. 966. Gært. 799. Juss. p. 311. Vent. vol. 3. 291. Class and order, *icofandria monogynia*. Nat. ord. *Succulentæ* Linn. *Cañi* Juss. *Cactoides* Vent.

Gen. Ch. Cal. superior, imbricated, tubular, deciduous. Cor. petals numerous, disposed in several ranks; the outer ones shorter, the inner rather larger. Stam. filaments numerous, inserted into the calyx; anthers oblong. Pist. germ inferior; style cylindric; stigma headed, multifid. Peric. berry oblong, umbilicated at its summit, one-celled. Seeds numerous, bedded in pulp.

Ess. Ch. Calyx superior, imbricated. Corolla of many petals. Berry one-celled. Seeds numerous.

Obs. Linnæus, on account of the conformity in the parts of fructification, has united in one genus a numerous tribe of succulent plants, differing greatly from each other, and many of them from all other plants, in their general structure and habit, which former botanists had distributed into separate genera, under the names of Melocactus, Cereus, Opuntia, and Pereskia. He observes, that Melocactus is monocotyledinous, and Opuntia dicotyledinous; but that nevertheless they are of the same natural genus. Jusseu mentions the circumstance on the authority of Linnæus, but gives no farther information on the subject, referring the germination of Melocactus, as well as the existence and nature of the perispermum in all the Cacti, to future inquiry.

\* *Echinomelocacti*, turks'-cap, or melon-thistle; of a roundish form, in some degree resembling a melon.

Species 1. *C. mammilaris*, smaller melon-thistle. Linn. Sp. Plant. (*Echino-melocactus minor*, Herm. Par. 136. tab. 136. Ficoides, Pluk. Alm. 184. tab. 29. f. 1. Comm. hort. 1. p. 105. t. 55. Brad. succul. 3. p. 11. tab. 19.) "Roundish, covered with ovate, bearded tubercles." The body of the plant consists of a roundish fleshy substance, sessile, about the size of a man's fist, without remarkable angles, but beset on all sides with numerous conic tubercles, which are cottony at their summit and terminated by small diverging spines. There is also a slight cottony down between the tubercles. The flowers are small, whitish, scattered about the plant between the tubercles. The berries are of a purplish blue colour, according to La Marek, but are said by Miller to be of a fine scarlet, and continue fresh upon the plant through the winter. They have an agreeable flavour, and are very good to eat, especially when properly dressed. Bosc. A native of South America, among rocks. 2. *C. glomeratus*, clustered melon-thistle. La Marek. Plum. Sp. 19. tab. 201. f. 1. "Ovate, downy, compound, growing close together, covered with papillary tubercles." In several respects it resembles the preceding, but differs from it in growing several together in a close group, in its glaucous colour, and very white abundant down, in its size, which does not exceed that of a puller's egg, and in the red colour of its flowers. Observed by Plumier at St. Domingo, and described by La Marek from his MSS. It appears to be rather larger than the mamillifera. 3. *C. melocactus*, great melon-thistle. Linn. Sp. Pl. (*Melocactus*, Bauh. Pin. 384. Tourn. 653. *Echinomelocactus*, Clu<sup>t</sup>. Exot. tab. 92. Lob. ic. 2. p. 24. Bradl. Succ. 4. p. 9. tab. 32.) "Roundish, with fourteen angles." A roundish mass, sometimes more than a yard in circumference, and in its native country almost twice as large; consisting internally of a soft, green, fleshy substance, full of moisture; deeply divided into fourteen or fifteen regular, smooth, flat-sided parts; the ridge of the ribs furnished with a row of clustered, stiff, straight, diverging spines, about an inch long, and red at their summit. Flowers red, situated at the top of the plant. A native of South America. 4. *C. coronatus*, crowned melon-thistle. La Marek. "Ovate, with twenty angles; crowned with a cottony pileus or cap." About a foot high, fleshy; ribs oblique or a little spiral; their ridges beset with a row of clustered diverging spines, about six or seven lines long, and generally a little curved; cap three inches and a half in diameter, composed of a white, very close cottony down, interspersed with clusters of red spines, which are stiff as the bristles of a brush, but not prickly. A native of South America. 5. *C. nobilis*, noble melon-thistle. Linn. Mant. "Roundish, with fifteen angles; spines broad, recurved." This species seems to hold a middle space between the last two; but its external surface is entirely red. It varies in its form, being sometimes oval or conic, and sometimes more globular. Its ribs are oblique or spiral, and its spines long, white as ivory, and a little curved. A native of St. Domingo, among rocks on the coast. Obs. Mr. Miller makes four distinct species of the great melon-thistle, and thinks that if the islands in the West Indies were examined, many more would be found. Professor Martyn considers them as only varieties. La Marek has made three species which we have adopted: though from the description in different authors, it is not easy to determine which are species and which varieties. They grow from apertures in the steep sides of rocks in the hottest part of America, and seldom live long when transplanted into a better soil. In times of great

great drought, the cattle rip them up with their horns, tear off the outside skin, and greedily devour the fleshy moist part. The fruit is an agreeable acid, and is frequently eaten in the West Indies. Miller.

\*\* *Erect cereufes*, supporting themselves. Torch-thistles, or torch-wood.

6. *C. cylindricus*, cylindric torch-thistle. La Marck, Jussieu. "Erect, weak, cylindric, not angular, but reticulated on their surface, with deffused furrows." La Marck. "Tesselated with regular, rhomb-shaped, little areas, bearing spines on their elevated centre." Juss. Spines clustered, whitish, very sharp. A native of Peru. 7. *C. trigonus*, three-sided torch-thistle. La Marck. (*C. petaiaya*. Linn. Syst. Nat. Jacq. Americ. 151.) "Stem erect, triangular, with scarlet, leafy fruit." Nearly allied to *C. triangularis* of the next division; but differs from it in having a stem, which supports itself to the height of eight or ten feet; and, though it rises still higher when it obtains the support of a neighbouring tree, does not attach itself by any radicle. Flower whitish, six inches in diameter, with scarcely any smell, opening in the night. Fruit of a shining scarlet colour on the outside, furnished with obtuse leaflets, which are irregularly notched at the summit; pulp white, fleshy, sweet: seeds small, black, shining. A native of Carthage, and other parts of South America. There is a variety which has a straight trilateral stem, almost as thick as a man's body, furnished with blackish, very sharp, clustered spines, about two inches long; dividing at the top into triangular, fleshy branches, of a delicate green colour, undulated, or scollopped at their angles, and disposed in a large spreading panicle. From the upper branches rise large beautiful white flowers, a little odorous, standing on a germ, furnished with some scaly leaves. The fruit is yellowish, smooth, of the form and size of a large apple, with a white sweet pulp, filled with small blackish seeds. Observed by Plumier at St. Domingo. La Marck observes, that it may perhaps be distinct from Jacquin's plant; but as they agree in so many characters, he has placed them together, that he may not multiply species without necessity. 8. *C. paniculatus*, La Marck. (*Melocactus arborefcens*, Plum. Sp. 19. Tournef. 653. *Cactus brachiatus*, Burm. Amer. tab. 192.) "Trunk erect, panicled at the summit with quadrangular, jointed branches; petals round, white, marked with red lines; fruit tubercled, yellowish." This plant, in its habit and size, exactly resembles the variety of the preceding species; but the interior petals are scarcely larger than a finger nail, crenulated, very white, pencilled with small red lines. Stamens entirely white: fruit ovate, a little larger than a goose's egg, with reddish spinous tubercles, and full of small seeds of a dark chestnut colour. A native of St. Domingo, described by La Marck from the MSS. of Plumier. 9. *C. tetragonus*, four-sided torch-thistle. Linn. Sp. Pl. "Quadrangular, long, erect; angles compressed." Stem seldom more than four or five feet high, branched, deeply and widely cut in a longitudinal direction, so as to give it the appearance of having four thin wings. A native of South America. 10. *C. pentagonus*. Linn. Sp. Pl. "Erect, long, jointed, with about five angles." Stem slender, feeble, but upright; internodes about a foot long: clusters of spines without any sensible down at their base. A native of America. 11. *C. hexagonus*, Linn. Sp. Pl. (*Cereus Surinamensis*, Ephem. n. c. 3. p. 349. tab. 7 and 8. Herm. Par. 116. Raj. Dendr. 23. *C. maximus Americanus*, Bradl. Succ. 1. p. 1. tab. 1. *Melocactus*, Plum. Sp. 19. Burm. Amer. tab. 191.) "Erect, long, with six angles; angles distant." Stem thirty or forty feet high, not branched if the top be not

injured, and it have room to grow; but whenever the stem is cut or injured, it puts out shoots from the angles, immediately under the wounded part, and frequently one or two lower down; these, if they are not cut off, form distinct stems, and grow upright, but are seldom so large as the principal stem. Flowers from the angles on the side of the stem, as large as those of hollyhoek, on a thick, fleshy, scaly, round, channelled, and hairy peduncle; calyx prickly, closely surrounding the corolla, green, with purple stripes; inner petals white, and crenated at their extremity. Miller. A native of Surinam, whence it was introduced into Holland, and bore flowers in 1681. It was cultivated in England in 1690, and has been the most common sort in the English stoves, but has not borne fruit, nor often produced flowers. 12. *C. heptagonus*, Linn. Sp. Pl. "Erect, oblong, with seven angles." Stem perennial, one or two feet high. A native of America. 13. *C. repandus*, Linn. Sp. Pl. Brown. Jam. 238. (*Cereus altissimus gracilior*, Sloan. Jam. 197. Hist. 2. p. 158. Raj. Dendr. 22. Trew. Ehret. t. 14.) "Erect, long, octangular; angles compressed, waved; spines longer than the wool." Stem rather slender. Fruit yellow without, with scattered asperities; snow-white within, containing many black seeds. A native of South America. 14. *C. lanuginosus*, Linn. Sp. Pl. (*Cereus curassavicus*, Herm. Parad. tab. 115.) "Erect, long, with about nine angles; angles obsolete; spines shorter than the wool." Stem rather glaucous; spines intermixed with a yellowish wool. Flowers greenish. Fruit about the size of a walnut, red externally, and without spines. A native of Curassou. 15. *C. royeri*, Linn. Sp. Pl. (*Cereus*, Boer. Lug. 1. p. 293. Herm. 48. Par. 115.) "Erect, jointed, with nine angles; divisions between the joints somewhat egg-shaped; spines the length of the wool." Perhaps only a variety of the preceding. Stem long; channels between the angles shallow, woolly, and very spinous; spines long, and yellowish; down pale white. Fruit red, and without spines. A native of America. 16. *C. peruvianus*, Linn. Spec. Pl. (*Cereus peruvianus*, Bauh. Pin. 458. Lob. ic. 2. p. 25. Cierge epineux, Aët. Acad. 1516. p. 146.) "Erect, long, with about eight angles; angles obtuse." Stem branched in its upper part; angles furnished with small clusters of brown, very slender, diverging spines, proceeding from a cottony tuft. Flowers lateral, almost sessile, solitary, whitish, five or six inches in diameter; scales of the calyx fleshy, green, purplish at their extremity; petals about thirty, lanceolate, white, with a tint of bright purple at their summit; stamens very numerous, shorter than the petals; anthers yellowish; style the length of the stamens; stigma with ten straight divisions. There is now, or at least in 1803, there was growing at the Museum of Natural History in Paris, a superb plant of this species near forty feet high. It was presented more than a hundred years ago, by Hotton professor of botany at Leyden to Fagon first physician to Lewis XIV., and superintendent of the royal garden, when it was only four or five inches high. The growth of each year is distinguished by a contraction of the stem; each of these contractions is at first very deep, and remains nearly the same for some years, when it gradually diminishes, and at length is entirely obliterated. This plant grew at first about a foot and a half in a year, and when it was fourteen years old was twenty-three feet high and seven inches in diameter. At the age of eleven it produced its first two branches, about three feet from the ground. A year after it produced its first flowers, and has continued to flower ever since. See Dict. Agric. Nonv. Encyclopedie. A native of Peru. 17. *C. fimbriatus*, La Marck. Burm. Amer. tab. 195. f. 1. "Erect, long, with

with about eight angles; petals fringed, fruit spinous, scarlet." *Stems* growing many together, about the thickness of a man's thigh, and from eighteen to twenty feet high; conic and very spinous at their summit, beset at their angles with clusters of white, long, very sharp spines. *Flowers* at the summit of the stem, rather large; style much longer than the stamens. *Fruit* globular, fleshy, nearly the size of an orange, of a bright shining red colour, rough with tubercles and armed with whitish, sharp spines; flesh of a flame colour, very tender, of an agreeable, acidulous flavour, and filled with numerous black seeds. La Marck from the MSS. of Plumier. A native of St. Domingo. 18. *C. polygonus*, La Marck. *Burm. Americ. tab. 196.* "Erect, branched, with eleven angles; fruit warty, red." This species is nearly allied to *C. repandus*, but is distinguished from it by the number of its angles, and by the red colour of its fruit, and of the down on its summit. *Stem* perennial, about ten feet high, and six or seven inches in diameter; angles waved, and beset with clusters of small spines: bark greyish, thick, covering a woody substance nearly as durable as oak, with an abundant, succulent, greenish pith. *Branches* from the summit of the stem, straight, long, a little larger than a man's arm, fleshy, greenish, with angles and spines similar to those of the stem, terminating in the shape of a cone and clothed near the summit with a very red woolly down. *Flowers* growing near the summit, solitary, white, about the size of a crown piece. *Fruit* fleshy, the shape and size of a fig, reddish brown without, succulent, nearly insipid, seeds small, black. La Marck from the MSS. of Plumier. A native of St. Domingo. 19. *C. menfarum*, Encyc. Diction. Agricul. Bosc. Nouv. Dict. Thierry de Menoville, *Traité de la Culture du Nepal 1786.* "Erect, with many angles, branched; fruit without spines, scaly, brown without, red within." Nearly allied to the preceding, but less in size, not so much branched or spinous, and of a darker green colour. *Flowers* red. A native of Guaxaca and Tehuacan in South America, where it is known by the name of Pitahiaha, and is greatly esteemed by the natives on account of its delicious fruit. Linnæus has applied the same name to a very different species, which La Marck, whom in this instance we have followed, has called *trigonus*. 20. *C. aurantiformis*, Encyc. Dict. Agric. Bosc. Thierry. "Erect, with many angles, branched; fruit spherical, gold-coloured." Habit of the preceding. *Flowers* white. *Fruit* containing a white, insipid, but refreshing pulp. A native of St. Domingo. 21. *C. divaricatus*, La Marck. (*Melocactus*, Plum. Spec. 19. *Burm. Am. Tab. 193.*) "Very spinous; trunk erect, striated, branched at the top; branches straight, striated, standing out on all sides; fruit gold-coloured, tubercled." *Stem* a little thicker than a man's thigh, three or four feet high, greenish; formidably armed with numerous, very sharp, diverging spines. *Flowers* lateral, near the summits of the branches. *Fruit* globular, a little larger than a man's fist; pulp white, sweetish; seeds small, brown. A native of St. Domingo.

\* *Creeping Cereuses with lateral roots.*

22. *C. grandiflorus*, great or night-flowering, creeping cereus, Linn. Spec. Plant. (*Cereus scandens minor*, Miller Icon. Tab. 90. *C. gracilis scandens ramosus*, flore ingenti, &c. Trew. Ehr. Tab. 31, 32. Eph. Nat. Cur. 1752, vol. ix. app. 184. Tab. 11, 12, 13. *C. americanus*, major articulatus, Volk. Hesp. 1. 133. t. 134.) "Creeping, with about five angles." *Stem* cylindrical, branched, greenish; angles not very prominent; spines small, clustered, diverging. *Flowers* lateral, about six inches, sometimes near a foot in diameter, sweet-scented; calyx large, long,

tubular, scaly below, composed in its upper part of straight, linear, pointed, yellowish leaflets, disposed in several rows, and forming a kind of ray to the flower; petals white, numerous, lanceolate, disposed in several rows, in a beautiful rosaceous form; style a little longer than the stamens; stigma with twenty divisions. The flowers begin to open between seven and eight o'clock in the evening, usually in the month of July, are fully blown by eleven, and by three or four in the morning they begin to fade, and soon after hang down in a state of irrecoverable decay. When the plants are large, several flowers will open in the same night, and there will be a succession of them for several nights together. *Fruit* a little larger than a goose's egg, covered with scaly tubercles, fleshy, orange or red, of an agreeable acid flavour; seeds very small. A native of Jamaica, Vera Cruz, and St. Domingo. 23. *C. flagelliformis*, pink-flowered, creeping cereus. Linn. Spec. Pl. Kniph. Cent. 1. Tab. 12. Knorr. Del. 1. f. 8. Curtis Bot. Mag. 17. 54. (*Cereus minor scandens*, flore purpureo, Ehr. Sel. 2. f. 2. Trew. Ebr. t. 30. *Ficoides Americanum*, Pluk. Alm. 148. t. 158. f. 6. Sloane Jam. 197. Hist. 2. p. 258.) "Creeping, with ten angles." *Stems* cylindrical, channelled, about the size of a man's little finger, from three to five feet long; spines numerous, weak, clustered, proceeding from elevated points or tubercles. *Flowers* lateral, sessile, oblong, of a lively pink colour; calyx coloured, tubular, its lower part composed of small, straight, sharp scales; petals and upper leaves of the calyx, oblong, acuminate, of a similar colour, and distinguished from each other only by their size; stamens the length of the interior petals; filaments very white; anthers small, yellow; style the length of the stamens, stigma scarcely divided. It produces more flowers than the preceding species, which keep open three or four days, if they have not too much warmth. The fruit had been produced, but not ripened, at Chelsea, in the time of Mr. Miller. A native of the warmer climates of South America. 24. *C. parasiticus*. Parasitic creeping cereus. Linn. Spec. Pl. "Creeping, round, striated, without spines." Professor Martyn suspects it to be the root of some species of Epidendrum, but La Marck gives the following synonyms and description. *Cactus repens parasiticus inermis aphyllus, ramosus, propendens*. Burn. Jam. 238. *Opuntia minima*, Plum. Sp. 6. *Burm. Amer. tab. 197. f. 2.* *Stems* slender, cylindrical, jointed, branched, climbing or pendant from the trunks of large trees: when young beset with prickles, but losing them when old, and retaining only the remnants of them, which form greyish, sharp tubercles. *Flowers* small, lateral, sessile. *Fruit* not so large as a common pea. A native of St. Domingo. 25. *C. pendulus*, slender, creeping cereus. Willden. Martyn, Swartz. 77. *Burm. Jam. 238.* (*Cassyta baccifera*, I. Mil. Illust. *Cassyta polysperma*, Ait. Cat. Hort. Kew. *Rhipsalis Cassytha*, Gært. 1. p. 137. Tab. 28. f. 1.) "Branches in whorls, round, smooth, without spines." A native of Jamaica, hanging from the largest trees to the length of two or three feet. Gærtner observes that, though sir Joseph Banks had hinted to him in a letter that it ought to be referred to the genus cactus, he was induced to keep it separate, because the embryo of cactus is slightly spiral, and the albumen of the seed farinaceous; whereas there is no albumen in this, and the embryo fills the whole cavity of the seed. 26. *C. triangularis*, triangular creeping cereus, Linn. Sp. Pl. Brown. Jam. 468. Jacq. Amer. 152. 75. Aët. Helv. 5. 268. t. 2. (*Cereus Bradl. Suc. 1. p. 4. t. 3. Eph. Nat. Cur. 1752. v. ix. app. 199. tab. 10. f. 14. 1754. v. ix. app. 349. t. 3. Ficoides*, Pluk. Alm. 147. t. 29. f. 3.) "Creeping, triangular." Perennial. *Stems* long, climbing up trees, and

and supporting themselves by lateral roots, branched, twisted, jointed, oblong, fleshy, near three inches in diameter, contracted at the joints, with small clusters of short spines on their edges. *Flowers* large, white, lateral, foliary; the lower and tubular part of the calyx consisting of short scales, green at their base, and reddish at their summit; the others longer and sharper, with a yellowish point. *Fruit* ovate, the size of a goose's egg, red without, and within marked with projecting tubercles, which are the remnants of the fallen scales of the calyx, superior in flavour to that of any other species. A native of the Antilles, Jamaica, Guiana, and Brazil. It is cultivated in the island of Barbadoes for the sake of its fruit. There is a variety with more scaly fruit, red without and white within, of a sweetish but less pleasing taste.

*Obs.* The plants of this and the preceding division have been called *Cereuses* from *cera*, wax, on account of the fancied resemblance of the stems of some of the species to a wax candle; and torch thistles, or torch wood, because the Indians use them as flambeaux. The very improper appellation of thistles is derived from their prickles.

\*\*\*\* *Opuntias*, Indian figs, or prickly pears, composed of articulated divisions growing one upon another, and commonly compressed or flattened at their sides. These plants are said to be profliferous, because the parts of the stem are separated from each other by so deep a contraction, that they seem rather distinct individuals than ramifications of the same plant. 27. *C. moniliformis*. Necklace Indian fig. Linn. Sp. Pl. (*Melocactus*, Plum. Sp. 19. ic. 198. Burm. Am. tab. 198.) "Proliferously jointed, divisions globular, spinous, glomerate." From the root, which is reddish, branched, and rather woody, there springs first a globular stem about the size of a green walnut, fleshy, tender, of a lively green, and beset with long, brown, sharp spines; from this globe soon proceed two others exactly similar, each of which produces two others, and so on successively, till the whole forms an assemblage of globes, spread on the ground, and united together like the pearls of a necklace. *Flowers* on the upper globular divisions red, solitary, sessile. *Calyx* furnished with acute scales at its base; style much longer than the petals. *Fruit* bright red, a little larger than a pigeon's egg; pulp white, tender, of a pleasant acidulous taste. *Seeds* small, of a gold colour. La Marck from the MSS. of Plumier. 28. *C. opuntia*, common Indian fig, or prickly pear, Linn. Sp. Pl. Brown Jam. 237. n. 2. Allion Pied. n. 1932. Plenck. Ic. t. 373. Gart. t. 138. f. 2. La Marck Illust. Pl. 114. (*Opuntia vulgaris*, Bauh. Hist. i. p. 154. Mil. Icon. 191. Tourn. 239. Plum. Sp. 6. Hall. Helvet. ii. 1099. *Ficus indica*, Lob. Ic. ii. p. 241.) "Proliferously jointed; divisions ovate, compressed, spines bristle-shaped." Six or eight feet high. *Divisions* about a foot long, eight inches broad, and one inch thick, fleshy, rounded at their edges, green, firm, attenuated at their base, appearing rather like leaves than divisions of the same stem, and having been sometimes, but erroneously, so called. As the plant grows old, the lower divisions increase more in thickness than in length and breadth; and the joints swell and enlarge till they equal the other parts of the stem, and form a cylindric trunk. The lower divisions sometimes hang down so as to touch the ground, and take root one after another, till at length a large space is covered by a single plant. The young ones have on their surface numerous fleshy, cylindric, pointed protuberances, several lines in length, and at least one line in diameter, which do not remain more than two months, and are succeeded by clusters of spines. These are considered by La Marck as proper leaves, but are said by Lancy (*Encyc. Dict. Agricult.*), to be rather rudiments of leaves. *Flowers* yellowish, generally

on the upper edge of the divisions, but sometimes on their sides; petals about ten; ovate-wedge-shaped; stamens not longer than the petals, irritable, when touched, before they shed their pollen; stigma with from five to ten divisions. *Fruit* nearly the shape of a fig, generally of a deep red colour, enclosing a red succulent, sweetish pulp, which is said to make the urine of those who eat it red as blood, without producing any other sensible effect. A native of America, like all the other species, but is now naturalized in many parts of the south of Europe, and on the coast of Barbary. A variety of it is found in America, as far north as Nova Scotia and Newfoundland, which is larger than the common sort, and armed with stronger spines; the fruit also is much larger, and of a deeper purple colour, the divisions rounder and more compressed, and the whole plant more upright. Mr. Miller's figure is taken from a specimen of this variety sent him by Mr. Peter Collinson. 29. *C. Ficus indica*, Linn. Sp. Pl. oblong Indian fig. (*Opuntia folio oblongo media*, Tourn. 239.) "Proliferously jointed, divisions ovate-oblong, spines bristle-shaped." This has the branches growing more upright than the former, and has longer spines; the fruit is also larger and of a deeper purple colour. It is the most common sort in Jamaica. 30. *C. tuna*, Linn. Sp. great Indian fig. (*Opuntia major validissimis spinis*, Tourn. 239. Sloane Jam. 103. Hist. ii. p. 149. t. 244. f. 1. *Tuna major*, Dill. Elt. 396. t. 295. f. 380.) "Proliferously jointed; divisions ovate-oblong; spines awl-shaped." This has stronger branches than the preceding, with larger whitish spines. The flowers are bright yellow. There is a variety with strong black spines and purplish fruit. La Marck considers the last two as only varieties of *C. opuntia*, and adds, as another variety, the *opuntia minima folio subrotundo* of Tourn. which is rarely more than half a foot high, with divisions two or three inches broad, and few spines. 31. *C. coccinellifer*, Cochineal Indian fig, Linn. Sp. Pl. Brown Jam. 237. (*Opuntia maxima*, Sloane Jam. 194. Hist. ii. p. 152. t. 8. f. 1, 2. *Tuna*, Dill. Elt. 399. t. 297. f. 383. *Ficus indica*, Pluk. Alm. 146. t. 381. f. 2.) "Proliferously jointed; divisions ovate-oblong, nearly without thorns." About six feet high. *Divisions* a foot long, five or six inches broad, and near two inches thick; spines few and harmless. *Flowers* few, blood-red; stamens longer than the petals, by which it is decisively distinguished from the last three species. A native of Mexico and other parts of South America. This species is said by Linnæus, and has been generally supposed by others, to be the plant on which the Cochineal insect feeds; but Thiery de Menonville is of a different opinion, founded on his personal observations at Mexico. 32. *C. tefludinis crus*, tortoise-leg Indian fig, Thiery. "Proliferously jointed; divisions oblong, compressed, but in a zig-zag manner, woody; spines numerous, very large, white; fruit spherical, green." In the course of a year it will grow to the height of ten feet, and produce thirty shoots; and in three or four years acquires the size of a tree. *Divisions* situated perpendicularly one upon another, and so bent as to produce, in the ideas of the colonists, a resemblance of the paws of a tortoise in the act of walking. *Flowers* aurora-coloured. *Fruit* unpleasantly acid. A native of sterile places in St. Domingo. 33. *C. luteus*, yellow Indian fig, Thiery. "Proliferously jointed; divisions compressed, ovate; woody, nearly without spines; flower and fruit yellow; petals spreading." A beautiful plant growing to the size of a tree. *Fruit* egg-shaped, of an agreeable flavour. 34. *C. campechianus*, Thiery. "Proliferously jointed; divisions compressed, oblong, woody, with few spines; flower and fruit red; style longer than the stamens and petals;

petals connivent." Smaller than the last two. *Divisions* oblong, dark green, smooth, shining; spines not more than two together. *Petals* of a bright reddish purple colour; stigma sulphur-coloured, with six divisions. *Fruit* the size of a pigeon's egg, truncate at the summit, blood-red throughout, rather insipid, armed with spines. A native of St. Domingo. 35. *C. sylvestris*, wild cochineal Indian fig, Thiery. "Proliferously jointed; divisions compressed, very spinous; flower and fruit red; petals spreading." Not rising into a tree, and seldom exceeding eighteen or twenty feet in height. *Divisions* pale green or yellowish, from ten to fifteen inches long, and from seven to ten broad: spines white, from ten to fifteen in a cluster, crossing each other so as almost to cover the surface. *Fruit* the size of a walnut. A native of the inner parts of Mexico, and the most common species from Theguacan to Guaxaca. The wild cochineal insect feeds on all the four preceding, but is most fond of the last; and is found on it in such numbers as to destroy whole divisions, and, in the opinion of Thiery, to prevent its growing to its full size. 36. *C. splendidus*, superb Indian fig, Thiery. "Proliferously articulate; woody, very large: divisions ample, oblong, glaucous; those formed in the first three years, spinous; the younger ones nearly unarmed: spines rigid and pungent." A large tree. *Divisions* numerous, thirty inches long, from twelve to fifteen, and even twenty broad, beset with tufts of stiff, red bristles, which are very pungent, and easily infirmate themselves into the skin, so as to become very troublesome when neglected. In the older divisions these tufts are accompanied by three spines of unequal size, very strong and sharp: the others have rarely more than one or two, and often none. The beautiful glaucous colour of this species, its immense size, the vigour and richness of its vegetation, with the number and amplitude of its divisions, render it, the most striking and magnificent of all its family, and give it, in Thiery's opinion, a just right to the epithet superb. This active naturalist never saw either the flower or the fruit, but was informed at Mexico, that the latter is delicious. It is not a native of Mexico, but is cultivated there solely for its fruit. Monf. Thiery brought it from Mexico to St. Domingo, and is convinced by experiments, made for three successive years, that it is equal to the *C. nopal* as a food for the true cochineal insect of the merchant and dyer. 37. *C. nopal*, Thiery. True cochineal Indian fig. "Proliferously jointed, woody; divisions compressed, ovate-oblong, perfectly smooth, green; those formed in the first three years spinous; the younger ones nearly unarmed; spines rigid and pungent." Very similar to the *splendidus*, from which it seems to differ, chiefly in colour. Monf. Thiery de Menonville is, however, well assured from all his inquiries and observations made on the spot, that this is the only species on which the true cochineal insect is bred in Mexico. He is persuaded that it does not grow wild in that country, and suspects that it is a variety of some unknown species, brought by cultivation to its present state of perfection. It differs from the *C. coccinifer* of Linnæus and other botanists in being always found with strong sharp spines. The latter is also said to grow wild in Jamaica, where *C. nopal* is entirely unknown. 38. *C. curassavicus*, curassow, or least Indian fig, or pinpillow. Linn. Sp. Pl. (*Opuntia minima* Bradl. succ. 1. p. 5. f. 4. *Ficus indica minima*, Com. hort. 1. p. 107. t. 56. Pluk. alm. 147. t. 281. f. 3.) "Proliferously jointed; slightly compressed, almost cylindrical, bellying out in the middle." *Divisions* about three feet long, feeble, and unable to support themselves, taking root as they lie on the ground, furnished with numerous clusters of white, sharp, slender spines. It is called pinpillow in the West Indies from the resemblance of its branches to a pin-

cushion stuck full of pins. It flowered once at Badmington in the collection of the late duchess of Beaufort, and produced a yellow flower, but did not ripen its fruit. Said to be a native of Curassoa. 39. *C. spinosissimus*, cluster spined Indian fig. Willd. Ait. Kew. 2. p. 155. Mart. hort. Cantab. 88. La Marck, enc. 1. p. 557. "Stem feebly erect, compressed; divisions compressed, disposed crosswise; spines very numerous, long, yellowish." Nearly allied to *C. divaricatus*, with which it would perhaps have been better associated, notwithstanding its compressed divisions. *Stem* from three to five feet high, not channelled or angular, producing near its summit, oblong, much compressed branches, in a cruciform direction, or making nearly right angles with each other; spines very slender in numerous clusters, each of which proceeds from a tubercle, and consists of two sorts of spines; the lower ones long, few in number, and diverging; the upper ones small, numerous, and collected into a bundle like the hairs of a pencil. A native of Jamaica. 40. *C. phyllanthus*, spleen-wort-leaved Indian fig. Linn. Sp. Pl. Brown jam. 237. (*Cereus*, Dill. elth. 73. t. 64. f. 74. *Opuntia*, Sloan. jam. 216. hist. 2. p. 159. *Phyllanthus*, Pluk. alm. 295. t. 247. f. 5.) "Proliferous, ensiform, compressed, ferrate-repand." Distinguished from all the other species by its peculiar form. *Divisions* of the stem sword-shaped, much compressed, feeble, about two inches broad, and from two to four feet long, bordered by large, rounded, indentures, and traversed longitudinally by a thick, cylindrical nerve, so as to bear some resemblance to the leaves of *Icolopendrium*: spines none. *Flowers* in the indentures at the edge of the divisions, and at the summit, whitish: calyx long, slender, curved, greenish, beset with scattered scales. *Fruit* esculent, bright red, with eight ribs, and scaly tubercles; pulp white; seeds black. A native of South America.

*Obs.* Professor Martyn has followed Willdenow in admitting a species on the authority of Swartz, which they call *alatus*: but it is evident from the description that it is no other than *C. phyllanthus*. Willdenow has most incautiously applied to both the synonym of Brown, (Jam. 237.) and has even transcribed it twice at full length, at the distance of only ten lines.

\*\*\*\*\* *Furnished with true leaves.*

The species placed under this section are totally different in habit from all the preceding, having not only real leaves, but stems and branches similar to those of other trees and shrubs.

41. *C. pereskia*, Barbadoes gooseberry, or blad-apple. Linn. Sp. Pl. Brown jam. 237. (*Pereskia*, Hort. Clif. 122. Plum. gen. 37. Dil. Elt. 305. t. 227. f. 294. *Malus americana*, Comm. hort. 1. p. 135. t. 70. *Portulaca*, Pluk. alm. 135. t. 215. f. 6. *Grossularia fructu majore arbor*, Sloan. Jam. 165. hist. 2. p. 86. Rai. dend. 27.) "Stem round, woody; prickles in pairs, recurved; leaves lanceolate-egg-shaped." An evergreen shrub. *Stem* branched, furnished in its lower part with long, stiff, clustered spines. *Branches* long, cylindrical, flexible, samentous, full of pith, and armed at each knot with a pair of prickles resembling those of the common bramble. *Leaves* alternate, roundish, succulent, contracted into a petiole at their base; green, smooth, about the size of those of purslane. *Flowers* monoicous, white, very fragrant, growing several together on a common short peduncle in the axils of the leaves. *Fruit* globular, leafy, pale yellow, pleasantly acid, a little larger than a hazel nut. *Seeds* generally three, black, roundish, compressed. A native of the West Indies. It was raised from seeds by Commelin, in 1690, and cultivated in the royal garden at Hampton Court, in 1696; but though it vegetates vigorously, it has not flowered in Europe. 42.

*C. portulacifolius*, Linn. Spec. (*Opuntia*, Plum. Sp. 6. ic. 197. fig. 1.) "Stem round, woody, spinous; leaves wedge-shaped, retuse." About the size of a common apple-tree. *Trunk* the thickness of a man's thigh, with spreading, spinous branches. *Leaves* alternate, in size and consistence like those of *C. pereskia*; with a solitary spine at the base, a little longer than the clustered ones on the branches. *Flowers* at the ends of the upper branches, probably monoicous, purplish, rosaceous; petals rounded, a little larger than a finger nail. *Fruit* globular, about the size of a common apple, without the tufts of leaves which are found on *C. pereskia*, greenish, with a whitish, mucilaginous, acid pulp. *Seeds* numerous, dark-coloured.

All the known species are perennial ;

CACTUS, in *Gardening*, comprehends different curious plants of the succulent exotic kinds, of strange and singular growths, cultivated in this climate for curiosity in stoves and green-houses. They may be divided into the melon-thistle, the torch-thistle, and creeping cereus, and the Indian fig kinds. The species principally cultivated in the first fort, are *C. mamillaris*, smaller cactus, or melon-thistle; *C. mulo-cactus*, melo-cactus, great melon-thistle, or turks' cap. In the second kind, *C. tetragonus*, four-angled upright cereus, or torch-thistle; *C. pentagonus*, five-angled upright torch-thistle; *C. hexagonus*, six angled torch-thistle; *C. heptagonus*, seven-angled upright torch-thistle; *C. repandus*, slender upright torch-thistle; *C. lanuginosus*, woolly upright torch-thistle; *C. peruvianus*, Peruvian upright torch-thistle; *C. royeri*, Royen's upright torch-thistle; *C. grandiflorus*, great flowering creeping cereus; *C. flagelliformis*, pink flowering creeping cereus; *C. triangularis*, triangular cereus, or strawberry pear. And in the third fort, *C. opuntia*, common Indian fig, or prickly pear; *C. ficus Indica*, oblong Indian fig; *C. tuna*, great Indian fig, or prickly pear; *C. coccinellifer*, cochineal Indian fig; *C. curassavicus*, curassao, least Indian fig, or pin-pillow; *C. spinosissimus*, cluster-spined Indian fig; *C. phyllanthus*, spleen-wort leaved Indian fig; *C. alatus*, narrow long jointed Indian fig; *C. moniliformis*, neck-lace Indian fig; *C. pereskia*, Barbadoes gooseberry.

The two first forts are plants of a very singular structure, having much the form of a large melon, without stems, branches, or leaves, sitting in a close manner to the surface of the earth, and differing in height from a foot to a yard, being deeply ribbed longitudinally in some forts, and in all closely armed with strong spines. They are perennial, both in root and top, continuing many years; affording ornament and variety in the stoves of hot-houses. Each species has several varieties.

The second fort also affords plants of highly curious succulent growths, in some of the species and varieties rising to a considerable height, and producing flowers of great beauty; and in others creeping or trailing to some distance, or hanging down over the sides of the pots that contain them—affording much variety in this way, as well as by their elegant and curious flowers, especially in some of the kinds, as the *grandiflorus*, and some others. The six-angled torch-thistle, and smaller creeping cereus, are the least tender.

In the third fort, the plants are likewise highly curious from their fleshy succulent jointed growths, and being beset with sharp spines: in many of the kinds most of the species, except the first, are less hardy than those of any of the other two kinds. They, however, produce much variety in stove collections among other plants of similar growths.

*Method of Culture in the Melon-Thistle Kind.*

These plants may be increased with facility, either by

fowing the seeds in pots of light sandy earth, and plunging them in the bark bed; when, after the plants have advanced a little in growth, they should be pricked out into separate very small pots, and plunging them in the bark bed, where they mostly make great progress, though it is often some years before they acquire any considerable size or growth; or by setting the young plants which issue from the sides of the old ones in pots of the same sort of earth, in the spring or autumn, managing them in the same way as those raised from seeds. But in order to have large plants at once, they may be procured from the West Indies in tubs of dry compost rubbish, care being taken to guard them well from cold and moisture. On their arrival they should be planted out in pots, and plunged in the bark bed till perfectly rooted, and become strong plants.

These plants should always be placed upon the tops of the shelves or shelves of the hot-houses in winter, and in the bark beds in summer; very moderate waterings being given in very hot weather, but none at all in the winter season, as they are very succulent plants, and quickly rot by moisture.

*Method of Culture in the Cereus or Torch Thistle Kind.*

These plants are constantly increased by planting the cuttings of branches, which have been laid in a dry place some weeks for the moisture to exhale, and the wounded parts to be healed over, in small pots in the summer season, filled with a compost constituted of one third light earth, the same quantities of sea-sand and sifted lime rubbish, well mixed together for some length of time before it is made use of, plunging them in the bark hot-bed of the stove; some rather coarse gravel or shells being previously placed in the bottoms of the pots to prevent the stagnation of moisture.

In the upright forts, the cuttings for this use may be provided by taking off the tops of such kinds as are wanted; the plants afterwards throwing out shoots below, so as to furnish plentiful supplies annually. But in the creeping forts, as there are various stalks and branches, these may be taken off in cuttings of from three to five or six inches in length, and be planted out in the same manner as the above.

About the beginning or middle of August, the plants, after being raised in this manner, should have air given them by degrees, in order to harden them against winter, but not be wholly exposed either to it, or the sun; and towards the end of September removed into the stove, or green-house, for the winter, during which season they must not have much water. The young plants should constantly have a dry situation in winter, as they imbibe the greatest part of their nourishment from the air, in order to prevent their roots from rotting; and should not be exposed in the open air, even in summer, unless under shelter, as rains are very injurious to them. Nor should the creeping forts be exposed too much to the open air, even in the hottest seasons; but, if they be designed to flower in winter, be kept very warm, and have no water given them at that period.

The great flowering creeping cereus, being a tender plant, requires a warm stove to protect it, in which it may be trained against the walls, or upon sticks. But the six-angled, and small fort, with pink-coloured leaves, are not so tender, being capable of being preserved in a good green-house, or when placed under a hot-bed frame, in the autumn, winter, and very early spring months.

*Method of Culture in the Indian Fig Kind.*

These plants are capable of being readily increased during the early summer months, by cuttings of the joints of the branches taken off, and planted in pots of light sandy com-

post. These cuttings, previous to planting, should, as in the other sorts, be laid in a dry place, ten or fifteen days, to heal over the cut parts; and the hot-house kinds, by being then plunged in the bark-bed, or other hot-bed, will be greatly promoted in their rooting; but the green-house sort, or common *epuntia*, readily strikes root without, though it is greatly forwarded by such assistance. They all require the earth to be occasionally moistened a little. In the summer season, they likewise often require water, but it must not be given in large quantities, lest it rot them; and in winter, it should be proportioned to the warmth of the stove; as, if the air be kept very warm, they require to be often refreshed with a very little to prevent the branches shrinking; but if kept in only a moderate degree of warmth, little is necessary. The heat in which they thrive best is that marked temperate on botanical thermometers, as when kept too warm in winter, it causes their shoots to be very weak and tender. The sorts which are inclinable to grow upright should have their branches supported with stakes, to prevent their being broken down with their own weight. Plants of this sort are mostly exposed to the open air in the summer season; but they thrive much better when continued in the stoves, provided they have free air; as when set abroad, the rains much diminish their beauty, retard their growth, and prevent their producing flowers and fruit in such plenty, as when constantly kept protected in the house.

**CACUS**, in *Natural History*, a species of *Madrepora*, with compressed, divergent, dichotomous, branches, carinated at the margin, and sides contiguously stellated, found only in a fossil state. Forst. Fn. Arab.

**CACULE**, in the *Materia Medica*, a name given by Avicenna, Serapio, and all the other Arabian writers, to the cardamon seeds. They distinguish two kinds of this fruit, a larger and a smaller. The larger is the grain of paradise, and the smaller the common cardamom seed of these times. They also called the cardamoms in general by the name *heil*, and distinguished the small kind, now principally in use, by the word *hilbanc*, which after-writers corrupted into *hillave* and *hilbua*, or *helbua*.

**CACULO**, in *Geography*, a small town of Africa, near the river Faleme, on its eastern bank. N. lat. 13° 56'. W. long. 10° 20'.

**CACUS**, in *Entomology*, a species of *SPHINX*, with black, indented wings, marked with three pale approximate streaks; posterior pair black striated with black. Cramer, &c. Inhabits Surinam.

**CACUS**, in *Fabulous History* and *Mythology*, the son of Vulcan, represented by Virgil as a monster, half man and half satyr, and of an enormous height, discharging from his mouth streams of flame. The fable reports that Hercules, after the defeat of Geryon, conducted his herd along the banks of the Tiber, and whilst they were feeding fell asleep. In the mean while Cacus stole away eight cows, and, in order to escape detection, drew them backwards by their tails into his den on mount Aventine. When Hercules determined to quit these pastures, the lowing of those bulls which remained was answered by that of the cows which Cacus had stolen, and thus the theft was discovered. Hercules ran with great fury towards the cavern; but found its entrance closed by a large rock, which was suspended by chains of iron forged by Vulcan. However, he removed the rock and found his way into the den amidst the flames and smoke vomited by the monster, seized him by the throat, and strangled him. In memory of this victory, the inhabitants of mount Aventine observed a yearly festival in honour of Hercules. The Latin poets have emulated one another in celebrating this defeat of Cacus. The den of Cacus, says Bryant (*Analysis of An-*

*cient Mythology*, Vol. II. p. 22), was properly Ca-chus, the cavern or temple of Chus; from which the poets and later historians have formed a strange personage, whom they represented as a shepherd, and the son of Vulcan. There certainly, he says, stood a temple of old upon the Aventine mountain in Latium, which was the terror of the neighbourhood. The cruelties of the priests, and their continual depredations, may be inferred from the history of Cacus. Virgil (*Æn.* lib. viii. v. 190, &c.) makes Evander describe the place to Æneas, though it is supposed in his time to have been in ruins. Livy (lib. i. c. 7.) mentions Cacus as a shepherd, and a person of great strength and violence. He is also mentioned by Plutarch (in *Amatorio*, vol. ii. p. 762) as vomiting fire and flames from his mouth. As in temples of this sort there were both priests and priestesses, we read of a Cacus and a Caca. The latter was supposed to have been a goddess who was made a deity for having betrayed her brother to Hercules. Lactantius de *Falsa Religione*, apud Institut. lib. i. c. 20. The learned Bryant adds, that, under the characters of Caca and Cacus, we have a history of Caucasian priests, who seem to have been a set of people devoted to rapine and murder.

**CACUTHIS**, in *Ancient Geography*, a river of India, which, according to Arrian, discharged itself into the Ganges.

**CACYPARIS**, a river of Sicily, on the eastern coast, between SYRACUSE and HELORUM.

**CACYRON**, a town placed by Ptolemy in the interior part of Sicily. The inhabitants are called by Pliny Cacyrini.

**CADA WATER**, a river of Scotland, which runs into Loch Fine; 9 miles S. W. of Inverary.

**CADABA**, in *Botany*. La Marck Encyc. Forst. *Ægypt.* 68. (*Stræmia*, Willd. 365. Vahl. *Sym.* 1. p. 20.) Class and order, *gynandria pentandria* Forst. *Pentandria monogynia* Willd. Vahl. Nat. ord. *Capparides*, Juss.

Gen. Ch. *Calyx* four-leaved, spreading, deciduous. *Cor.* petals four or none; claws filiform, the length of the calyx, situated on the receptacle of the calyx, two on each side; borders lanceolate, waved. *Nect.* tubular-ligulate, situated between the upper division of the calyx and the receptacle of the fructification. *Stam.* filaments five or four, inserted on the peduncle of the germ; anthers upright. *Pistl.* germ superior, cylindrical, pedicelled; style none; stigma simple. *Peric.* capsule pedicelled, cylindrical, one-celled, two-valved; valves revolute. *Seeds* numerous, kidney-shaped, disposed in three rows in a kind of pulp.

Ess. Ch. *Calyx* four leaved. *Nectary* ligulate. *Capsule* pedicelled, pulpy.

Obs. It resembles capparidis in its pulpy capsules, and cleome in its flowers. Its gynandrous stamens and tubular ligulate nectary distinguish it from the former, and its fruit from the latter. Vahl and Willdenow call the pericarp a berry; Jussieu considers it as a silique. La Marck styles it both a silique and a capsule within the compass of a few lines. Its valvular structure is inconsistent with the essential character of a berry; and the situation of its seeds does not correspond with the definition of a silique: it is therefore properly a capsule. We have preferred Forskål's original generic name to that afterwards adopted by Vahl. If there be no strong reason to the contrary, the right of priority should always be respected.

Sp. 1. *C. indica*, La Marck, (*Cleome fruticosa*: Linn. Sp. Pl. Burm. Ind. 140. tab. 46. f. 3. *Stræmia tetrandra*, Willd.) "Leaves oblong egg-shaped, smooth; flowers tetrandrous." A shrub. *Stem* cylindrical, branched. *Leaves* entire, alternate, petioled, sometimes obtuse and sometimes rather pointed, an inch long, and four or five lines broad; petioles short. *Flowers* whitish, peduncled; in short, simple, termi-

terminating racemes. *Pedice* of the fructification about an inch long, making an obtuse angle with the peduncle of the flower. *Capsule* pulpy, which determines it to be a cadaba, not a clove. A native of the East Indies, whence Sonnerat sent specimens of the flowers and fruit to La Marek. 2. *C. rotundifolia*, Forsk. "Leaves circular, smooth." A middle-sized tree. *Leaves* alternate, flat, rather thick, sometimes slightly sinuate, and often emarginate, petiole half the length of the leaf. *Flowers* erect, in terminating racemes, without petals; nectary greenish; the ligulate part ovate, flat, red above and yellow beneath. *Stamens* inserted on the lower part of the pedicel of the germ. *Fruit* two inches long, cylindric, swelling out in knobs, smooth, green; valves red within. *Seeds* black, in a dry reddish pulp. A native of Arabia. 3. *C. farinosa*, Forsk. "Leaves egg-shaped, oblong, mealy." A shrub. *Branches* round; covered, like the leaves, with a mealy down. *Leaves* alternate, obtuse, entire, flat, half an inch long. *Flowers* peduncled, in terminating racemes; petals waved; nectary white; stamen inserted a little below the middle of the pedicel of the germ. A native of Arabia. 4. *C. glandulosa*, Forsk. "Branches, leaves, calyx, and pistil glandular, vilous." A shrub. *Branches* round, as well as all the other parts of the plant covered with glandular hairs. *Leaves* half an inch long, petioled, alternate, roundish, entire, rough to the touch. *Flowers* nodding, from four to six, in a terminating raceme; capsule half an inch long, very hairy. A native of Arabia.

CADAHALSO, in *Geography*, a town of Spain, in New Castile, surrounded with pleasant gardens and woods; 6 miles N. of Escalona.

CADALEN, a town of France, in the department of the Tarn, and chief place of a canton in the district of Gailiac; 2 leagues S. E. of it. The town contains 1,627, and the canton 4,709 inhabitants; the territory includes 155 kilometres, and 7 communes.

CADAN, or KADAN, a town of Bohemia, in the circle of Saaz, seated on the Eger, and founded in 821; 10 miles E. of Saaz. N. lat.  $50^{\circ} 20'$ . E. long.  $13^{\circ} 34'$ .

CADAON, a river of Portugal, which forms the harbour of Setuval.

CADARA, in *Ancient Geography*, a town of Arabia Felix, on the Persian gulf.—Also, a large peninsula of the Red Sea, on the southern coast of Arabia, which formed an extensive bay, crossed by Ptolemy Philadelphus in 12 days and nights. Pliny.

CADARI, or KADARI, a sect of Mahometans, who assert free-will, attribute the actions of men to men alone, not to any secret power determining the will; and deny all absolute decrees, and predestination. The author of this sect was Mabad ben Kaled Al Gihoni, who suffered martyrdom for it. The word comes from the Arabic,  $\text{قَدَار}$ , *cadara*, power. Ben Aun calls the Cadarians, the Magi, or Manichees of the Mussulmen. This name is given by some to the Motazalites, though they disclaim it, and give it to the Jabarians, who likewise reject it as an infamous appellation, because Mahomet is said to have declared the Kadarians to be the Magians of his followers.

CADAVAL, in *Geography*, a town of Portugal, in the province of Traz-os-Montes; 13 miles S.S.W. of Mirandella.—Also, a town of Portugal, in the province of Estremadura, including a district of eight parishes, and about 350 inhabitants; 13 miles S.E. of Peniche.

CADAVAYLLO *River*, is about 3 leagues N.N.E. from the sand off the mouth of Lima river, on the coast of Peru in South America.

CADAVERUM, in *Entomology*, a species of ACARUS,

having the body somewhat bilobate, and the posterior part furnished with four bristles, which are longer than the body. Schranck. Found in the earcases of insects.

CADAUM CASTRA, in *Ancient Geography*, a place of Africa, in Mauritania Caesariensis, on the coast from Cala to Rufucurru. Antonin. Itin.

CA-DE', or CHIADA, in *Geography*. See *League of God's house*.

CADE, a cag, cask, or barrel; used in the book of rates for a determinate number of some sorts of fish.—Thus a cade of herrings is a vessel containing the quantity of five hundred herrings, and of sprats one thousand.

Anciently the cade of herrings appears to have contained six hundred fish, reckoning six score to the hundred.

CADE bay, in *Geography*, lies on the south-west side of the island of Antigua, in the West Indies, and a little to the north west from Carlisle bay on the south of the island.

CADE'S *Insurrection*, in *English History*, a formidable insurrection, which took place in Kent in 1450, and which was so called from the artful and bold adventurer, John Cade, by whom it was headed. Cade having collected a considerable number of the common people, by specious promises of reforming all abuses, whence he obtained the name of John Amend all, marched towards London, and encamped on Blackheath. From hence two addresses were sent by the insurgents to the king and council, artfully professing the greatest attachment to the person and government of the king, and requesting the redress of grievances, together with the punishment of evil counsellors, who had oppressed the people at home, and occasioned the loss of the king's dominions abroad, and that the king would govern by the advice of the dukes of York, Exeter, Buckingham, and Norfolk, and the well-affected barons of the kingdom. These addresses, which had marked out for destruction certain members of the council, were rejected, and it was resolved to subdue the insurgents by force. For this purpose, an army of 15,000 men was ordered to march against the insurgents; and a detachment overtook and engaged them near Seven-oaks, but was defeated. Cade and his followers, elated by this victory, returned to their former station on Blackheath; and as the aspect of affairs was now become serious and alarming, lenient measures were adopted, and the archbishop of Canterbury and the duke of Buckingham were deputed to treat with the rebels. In the conference that ensued, Cade behaved with decency and firmness, but refused to lay down his arms, till the requisitions in his address were granted. After the return of the messengers, the court retired to Kenilworth castle, and the tower of London was garrisoned. Cade advanced to Southwark, and was at length admitted into London. Having seized and beheaded lord Say and Sale, late high treasurer of England, and his son-in-law sir James Cromer, sheriff of Kent, they proceeded to pillage the city; but they were soon driven out of it, and failing in their attempts to repossess it, they agreed to a short truce. A proclamation was issued from the tower, which announced a pardon under the great seal to all who immediately departed to their own homes; and this proclamation produced such an effect, that in a few hours the army, lately so formidable, disappeared. Cade, finding that he was thus suddenly abandoned, put his booty on board a barge, and sent it to Rochester, and proceeded by land with a few attendants; but being denied admittance into Queborough castle, he dismissed all his followers, and put on a disguise. A proclamation was immediately published, offering a reward of 1000 marks to any who brought him in, dead or alive. He was discovered lurking in a garden at Hothfield, in Sussex,

by Alexander Eden, a gentleman of Kent, and, making some resistance, was killed, and his body was brought to London. Thus ended an insurrection, which, under a leader of higher rank and greater honour, might have produced a revolution.

**CADE Lamb**, in *Rural Economy*, a young lamb brought up in the house wholly by the hand. Where the ewe dies soon after lambing, the young lamb may be preserved and brought up in this way.

**CADE, oil of**, (huile de Cade, Fr.) is an empyreumatic oil of turpentine, thinner than tar, and obtained along with it in the distillation of pine wood. It appears to be very similar to what is called in this country *spirit of tar*. See **TURPENTINE**.

**CADE's point**, in *Geography*, lies at the north west end of the island of Nevis, in the West Indies, and is the nearest cape to Major's bay, at the south-east end of the island of St. Christopher's, or St. Kitt's.

**CADE-worm**, in *Entomology*, a name given by some authors to the larvæ of the phryganææ, which are found in ditches, and used as bait for fish. See **PHRYGANEÆ**.

**CADEL-AUANACU**, in *Botany*, Rheed. mal. 2. p. 61. t. 75. Rai. hist. 167. 1855. Sup. 112. 666 See **CROTON tiglium**.

**CADELI**, Rheed. mal. See **ACHYRANTHES aspera**.

**CADELIUM**, Rumph. Amb. See **PHASEOLUS Max.**

**CADEMOSTO**, or **CADAMUSTI**, **LEWIS**, or properly **ALVISE DA CA DE MOSTO**, in *Biography*, a celebrated Venetian navigator, was born about the year 1432; and having made several voyages in the Mediterranean, he left Venice in 1454, and being accidentally driven by a storm on the coast of Portugal, he was employed by the infant don Henry in a voyage of discovery. A caravel was fitted out and laden, chiefly at the expence of De Mosto, who embarked in March 1455 with Vincenzo Diaz, to whom the command of the vessel was entrusted, and proceeded to the coast of Africa. Being joined at sea by two other vessels, they sailed to some distance beyond Cape Verd; but the crews, through fear of the negroes, refusing to proceed further, they were under a necessity of returning to Portugal. In the following year, Cademosto, accompanied by Usomare, a Genoese, undertook a second voyage with three ships towards the same parts; and having passed cape Blanco, they were driven by a storm on Cape Verd islands, which had not yet been discovered. From hence, they proceeded as far as the mouth of the river St. Domingo. Cademosto, after his return to Portugal, published, in 1464, an account of his voyage, which is valuable, as it contains the earliest relation extant of the Portuguese navigations on the African coast, and of the gold trade of Tombut, and its principal branches. This work was first published at Vicenza in 1507; it was afterwards translated into Latin and French, and inserted by Grinæus in his collection entitled "Novus Orbis," and by Ramusio in his collection of voyages, and since in several others. The author resided some years at Lagos in general esteem. He returned to Venice in 1464, and after this period we have no further account of him. *Nouv. Dict. Hist.*

**CADENA**, in *Ancient Geography*, a town of Asia Minor, in Bithynia.

**CADENAC**, in *Geography*, an ancient town of France, in the department of the Lot, by which river it is surrounded, seated on a steep rock, which, having never submitted to the English in their various invasions and conquests, was invested with peculiar privileges; 28 miles E.N.E. of Cahors.

**CADENCE**, in *Music*, denotes a kind of clofe, or rest, either at the end of a song, or some of its parts, into which it is divided as into members, or periods.

The word seems a metaphor drawn from the dancing-school, where it properly signifies a pause, or fall, from motion to rest. A cadence is properly when the parts fall, and terminate on a chord, or note, the ear seeming naturally to expect it. Regularly it is to be made on the final or dominant, though sometimes also on the mediant or middle chord of a note.

Cadences in singing answer nearly to points or stops in discourse. They are rests contrived to favour the weakness of the performers, as well as the hearers, of a musical composition. Men are not able to sustain their attention, or their voice, beyond the space of two measures; even in this short interval we perceive the song to fall, and tend rapidly to a pause, or rest: the notes which introduce these pauses, are called cadences, on the proper conducting and expressing of which a great part of the musician's skill depends. The chief cadence or clofe is the key itself, in which the bass must always conclude; the next in dignity is the fifth above; then, if the key-note is made sharp, a cadence may be made on the second of the key; after which (by means of a sharp fifth) on the sixth; and by a sharp second on the third of a key; after which, returning to the original key and subject, when the hearer is reminded of both, by means of a flat seventh, there may be a clofe in the fourth of the key; after which, with a sharp seventh, the piece may terminate by a final cadence or clofe in the original key. See **CLOSE**, **MODULATION**.

In all these cadences, a major key is understood. For cadences in a minor key, see **COUNTERPOINT**.

Dr. Pepusch's definition of cadences in music is, perhaps, the most short, clear, and comprehensive, to be found in any elementary book.

"Cadences in music are the same as stops in speaking or writing; that is to say, they are endings or terminations either of a part or of the whole piece of music, as stops are of a part or of the whole speech. For which reason they are distinguished into full cadences and middle cadences; these last are like commas and semicolons, after which more is expected to follow, they not making so full a stop as the others; whereas after a full cadence we are sensible that we are come to a conclusion." *Treatise on Harmony*, p. 4.

This author's arrangement of the modulation in the key of C as the representative of all major keys, differs somewhat from the present practice. It is however that of the greatest masters of the early part of the last century.  $\overset{1}{C}$ ,  $\overset{2}{G}$ ,  $\overset{3}{E}$ ,  $\overset{4}{A}$ ,  $\overset{5}{F}$ , c, which include all the concords to the key note.

In a long piece of music, however, he allows a transient modulation into D minor, as a sixth cadence. But Dr. Pepusch's modulation into E differs totally from that of the secular composers of more modern times. It is, in fact, no more than a semi-cadence on the fifth of the key of A minor, with a sharp third; nor is the scale any thing more than that species of octave assigned by most writers on ancient music to the Dorian mode. See **MODE**, and **ANCIENT MUSIC**. It begins and ends in E without flat or sharp;  $\widehat{EFGAB} \widehat{CDE}$ . Dr. Pepusch says, that "from the peculiarity of its modulation, whatever is composed in this mode or key is so solemn, and it seems so much appropriated to church music, that it is called by the Italians *tuono di chiesa*. From the contemplation of this scale, the sieur Blainville, in 1751, fancied, or wished others to fancy, that he had discovered a new cadence, or key, different from the major and minor, the second being minor, and the seventh major. See *Dict. de Rousseau*, art. *Mode*.

The resolution of a discord, according to Rousseau, is a kind

kind of cadence. "And, as all harmonic phrases are necessarily connected by discords, expressed or understood, it follows, that all music may be said to consist of a succession of cadences." The *regle de l'octave* seems to favour this idea; as every other sound carries a discord. See *RÈGLE de l'octave*.

According to Rameau, there are four kinds of cadences; the perfect, imperfect, interrupted, and disappointed.

Padre Martini's cadences, in his *Saggio di Contrappunto*, being such as are peculiar to the ecclesiastical modes, will be of little use in secular music. The closes of Haydn, Mozart, and Paisiello, however new, elegant, and ingenious the treble may be, are all built on the bases and harmony of the old closes of 100 years ago; for in a full close, as the base must fall a fifth or rise a fourth, the treble must either fall from the ninth to the eighth, or rise from the seventh to the eighth.

In early days of counterpoint, the great study of composers was cadences. A Studio of Palestrina being found at Rome in the year 1770, it was chiefly filled with cadences and chants, in his own hand-writing.

In melody, the preparation for closes in the principal part are infinite; in harmony they are numerous, but may be numbered. Neither Rameau's cadences, nor those of Padre Martini, quite satisfy us. In Gasparini there is an ample collection, chap. vi. *per far le cadenze d'ogni forte*. From these Walther has cited many, but more correctly; for Gasparini's book, in the edition which we have seen, is miserably printed. The cadences in Walther are good, as far as harmony is concerned, which is not so changeable as melody; and to these, chiefly from Gasparini, we have all the Italian names: as *cadenza maggiore, minore, maggiore fininita, cadenza sfuggita, finta, fiorita, perfetta, imperfetta, irregolare, d'inganno, &c.*

In ancient music, cadence is nearly synonymous with rhythm. The French make use of the term cadence for a trille or shake.

CADENCE, in the *Modern Dancing*, is when the several steps and motions follow, or correspond to, the notes or measures of the music.

CADENCE, in the *Manege*, denotes an equal measure, or proportion observed by a horse in all his motions, when he is thoroughly managed, and works justly, either at the gallop, *terra à terra*, or the airs.

A horse's working in cadence imports, that his times or motions are uniform, and that one does not take in more ground than another.

CADENCE, in *Oratory*, and *Poetry*, denotes the harmonious movement of verse or prose; otherwise called the numbers, and by the ancients *ῥυθμὸς*. See RHYTHM.

As to prose, Aristotle suggests that though it be not measured like verse, it should nevertheless be numerous or harmonious (See NUMBER); and Cicero enjoins the orator to take care to gratify the ear, "superbissimum aurium judicium." Indeed, the finest thoughts will be destitute of power to please, if they are expressed in terms that are harsh and ill arranged. As the ear is agreeably soothed by a soft and flowing discourse, it is offended by want of harmony in the structure and flow of the periods; whether it

be occasioned by the excessive brevity and abruptness of termination, on the one hand, or by excess of length, a kind of crawling, languid, movement on the other, which are both alike disgusting to a delicate ear. By observing a due mean between those two extremes, a discourse acquires that harmony which is adapted both to please and even to persuade. See STYLE.

As to the cadence of verse, it depends, in Greek and Latin poetry, on the number and proper intermixture of those feet or periodic measures which enter into the composition of verse, and which vary in the different kinds of it; and, in living languages, the cadence results from the number of syllables which each verse admits, and from the richness, variety, and disposition of the rhymes. In the ancient poetry, says M. Rollin (*Method of Teaching and Studying the Belles Lettres*, vol. I. p. 249.) "There is a plain, common, and ordinary harmony of cadence, which supports itself alike universally, renders the verse smooth and flowing, carefully throws out whatever may offend the ear by a rough and disagreeable sound; and, by the mixture of different numbers and measures, forms that pleasing harmony, diffused throughout the whole body of the poem." "Besides this," he says, "there are certain particular cadences, of greater significancy, which make a more sensible impression. These sorts of cadences are very beautiful in versification, and add a considerable grace, provided they are used with prudence and address, and do not return too often. They prevent the tediousness, which uniform cadences, and regular returns, in one and the same measure, cannot fail of producing." "In the Latin poetry," he adds, "we have entire liberty to divide our verses as we please, to vary the pauses (*cæsuras*, or cadences), at will, and artfully to spare delicate ears the uniform returns of the dactyle and spondee, which close an heroic verse." Accordingly he produces a variety of examples from Virgil, which seem to evince and illustrate the value of this kind of liberty, and the use that may be made of it. Thus, long words, properly placed, form a full and harmonious cadence, especially if there are several spondees in the verse, e. g.

"Lucantes ventos tempestatesq; sonoras  
Imperio premit." *Æn. I. 57.*

Again, the spondaic verse has sometimes a great degree of gravity. Virgil has used it very advantageously in the description of Sinon's surprize and astonishment.

"Namque ut conspectu in medio turbatus, inermis  
Constitit, atque oculis Phrygia agmina circumspexit."  
*Æn. II. 67.*

It is also very proper for expressing any sentiment that is sad and doleful; e. g.

"Quæ quondam in bullis aut culminibus desertis  
Nocte sedens, serim canit importuna per umbras."  
*Æn. XII. 863.*

A monosyllable at the end of a verse serves sometimes to give it great force; e. g.

"Hæret pede pes, densusque viro vir." *Æn. X. 361.*

There are also several sorts of suspended cadences, which have their peculiar graces; e. g.

"Et frustra retinacula tendens

Fertur equis auriga, neque audit currus habenas."

*Georg. I. 513.*

Broken cadences likewise produce a good effect; e. g.

"Tali remigio navis se tarda movebat :

Vela facit tamen." *Æn. V. 280.*

Elisions contribute very much to the beauty of verse, by making the numbers smooth, flowing, rough or majestic, according to the difference of the objects to be expressed. Spondees and long words, which give a slowness and heaviness to verse, are proper for expressing sorrow; e. g.

"Extinctum

“Extinctum nymphæ crudeli funere Daphnim  
Flebant.” Eclog. V. 20.

Joy, on the other hand, demands the rapidity of dactyles; e. g.

“Saltantes satyros imitabitur Alpheisbœus.” Eclog. V. 73.

To express softness, we must select words consisting of many vowels, with smooth and flowing consonants; and avoid such syllables as are composed of several consonants, harsh elisions, and rough letters or aspirates; e. g.

“Devenère locos lætus, et amœna vireta  
Fortunatorum nemorum, sedesque beatas”

Æn. VI. 638.

In expressing roughness, we must chuse words which begin and end with an *r*, or which double the *r*; rough consonants, as the *x*, or the aspirate *b*; words formed of double consonants; and elisions: e. g.

“Ergo ægrè raitris terram rimantur.” Georg. III. 534.

Lightness and swiftness are expressed by dactyles: e. g.

“Mox aère lapsa quieto

Radit iter liquidum, celeres neque commovet alas.”

Æn. V. 216.

Heaviness, on the other hand, requires spondees: e. g.

“Illi inter sese magna vi brachia tollunt

In numerum, versantque tenaci forcipe ferrum.”

Georg. IV. 174.

In other cadences, words placed at the end have a peculiar force or grace: e. g.

“Vox quoque per lucos vulgo exaudita silentes  
Ingens.” Georg. I. 476.

See ORDER, JUNCTURE, and NUMBER.

CADENCE, in *Reading*, denotes the falling or lowering of the voice below the key note at the close of every period. They key-note, in speaking, is that tone or sound with which the modulation commences, and it is generally continued through every complete sentence or period; and to this the occasional inflexions of the voice, either above or below it, may be supposed to refer. Of course the tones that fall a little lower than the key at the close of a sentence or period, are called *cadences*; and they are sometimes distinguished into two kinds, under the appropriate epithets of *significant* and *ornamental*; the former serve to mark the sense and the latter to decorate the modulation. In many extensive and long periods, the full sense of which is long suspended, and where the final words are not very important, the cadence is a kind of notice of their termination, distinct from the pause, which, besides the ornamental variety it affords, is a very necessary and useful article in perspicuous elocution. As this cadence naturally accompanies the termination of every entire sense, it may sometimes fall before the semicolon, but more generally before the colon, as well as the period; for these marks are often found to terminate a complete sense; and in such cases the relation of that which follows to that which preceded, is signified to the mind by the relative shortness of the stop, and the mode of introducing the additional matter. See MODULATION, PAUSE, and PUNCTUATION.

CADENCED. An air or melody in *music* is said to be well cadenced, when the rhythm is good, the accents well placed, and the passages well phrased. See RHYTHM, ACCENT, and PHRASE.

CADENCY, in *Heraldry*, the state or quality of a cadet. Nisbet has an essay on the additional figures and marks of cadency. See DIMINUTION.

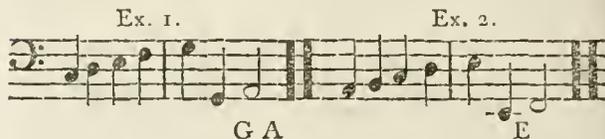

CADENE, in *Commerce*, one of the sorts of carpets which the Europeans import from the Levant, by way of Smyrna. They are the worst sort, and are commonly sold by the piece from one to two piales per carpet.

CADENET, in *Geography*, a town of France in the

department of Vaucluse, and chief place of a canton in the district of Apt, near the Durance, three leagues S. of Apt. The town contains 2051, and the canton 8811 inhabitants: the territory comprehends 260 kilometres and 9 communes. N. lat. 43° 40'. E. long. 53° 30'.

CADENSO, or CADENIO, one of the Laccadive islands in the Indian sea. N. lat. 11° 50'. E. long. 72° 32'.

CADENZA *Sfuggita*, in the *Italian Music*, is used when a part instead of ascending or descending the proper interval, to form a *cadence*, proceeds by some other interval. For instance, when the bass, instead of rising a fourth or falling a fifth, ascends only by a tone, or semitone-major.

Thus, in Ex. 1. where the bass, instead of proceeding to C, the key-note, after G, goes to A. Thus also, in Ex. 2. after E, the ear would naturally expect to hear A the key-note: but this is avoided, and F put in its place.

The interrupted and disappointed cadences in recitative are innumerable: being governed by the dialogue; in which a full and formal close from the chord of the fifth to the key-note seldom occurs, except in the last bar of the recitation preceding an air.

CADEQUIA, in *Geography*, a sea-port town of Spain in Catalonia, 5 miles N. E. of Rosas.

CADER, a town of Asia, in the Arabian Irak, on the Tigris; 100 miles S. of Bagdad.

CADER-IDRIS, the CHAIR OF IDRIS, a lofty mountain near Dolgellau in Merionethshire, North Wales, in height the second of the principality, is so called from a tradition of its having been a fortress belonging to Idris, who is supposed to have been a prince of these parts in ancient times. It is also said that Idris was a famous poet, astronomer, and philosopher, and that the summit of Cader-Idris was his favourite seat and observatory. Mr. Rowland in his “Mona Antiqua,” (p. 84.) says, that the ancients decyphered astronomy by the name of Edris; a name attributed to Enoch, whom they took to be the founder of astronomy; whence he derives Cader-Idris; and he adds that not far off there is another place, called “Cerrig-Brudyn,” i. e. the astronomer’s stones or circle. Accordingly the former of these places may have been the residence, and the latter the observatory of those druids in the Isle of Anglesey, who applied particularly to the study of astronomy.

This mountain rises on the sea-shore, close upon the northern side of the estuary of the small river Difynwy, about a mile from Towyn. It proceeds with almost a continual ascent, first northwards for about 3 miles, then for 10 miles further it runs E.N.E. giving out for its summit a branch nearly 3 miles long, in a south-westerly direction, parallel to the main ridge. It is very steep and craggy on every side, but the southern descent, especially to the border of Tallylyn lake, is the most precipitous, being nearly perpendicular. The breadth bears but a small proportion to its length; a line passing along its base and intersecting the summit, would scarcely equal 4½ miles; and in the other parts it is a mere ridge, whose base hardly ever exceeds 1 mile in breadth. Its peak, called “Pen-y-Gader,” is said by Pennant (Snowdonia, p. 98.) to be 2850 feet above Dolgellau. Cader Idris is the commencement of a chain of primitive mountains, extending in the N. N. Easterly direction, and including the Arrans and the Arennigs. It is much more lofty and craggy than the flats and secondary mountains, which surround

round it, and consists of siliceous porphyry, and siliceous schistose porphyry, both in mass and intersected by veins of quartz, argillaceous porphyry in mass, and granitoid of Kirwan in mass, composed of quartz and felspar. Here are found also several rocks, containing the component parts of quartz and porphyry, with so great a proportion of white and smoky-coloured greasy-looking quartz as almost to conceal the other ingredients. In several specimens the felspar, having been decomposed, has fallen out and given the quartz a porous appearance, which accounts for the porous lava said by some travellers to have been found here. There are no mines in Cader-Idris, or the neighbourhood. At the foot of this mountain is a small lake, called "Llyn-y-Gader;" above the exterior ridge is another deep and clear lake, kept constantly full by the numerous tributary torrents that fall down the surrounding rocks: and at a still higher elevation, is a second lake, clear as glass, and overlooked by steep cliffs so as to resemble the crater of a volcano, accurately represented in Wilson's excellent view of Cader-Idris. Some travellers have mentioned their having found lava and other volcanic productions here: but Mr. Aikin and his companions, who ascended this mountain, could discover nothing of this kind; nor did the water of the lake appear to differ in any respect from the purest rock-water, though it was repeatedly tried with the most delicate chemical tests. A clear, loud, and distinct echo repeats every shout that is made near this lake. On the summit of the mountain is a small plain, with two rocky heads of nearly equal height, one looking to the north, the other to the south. In the former direction Snowdon and its dependencies shut up the scene; on the west was seen the whole curve of the bay of Cardigan, bounded at a vast distance by the Caernarvon mountains, and nearer, dashing its white breakers against the rocky coast of Merioneth. The southern horizon was bounded by Plynlimon, and on the east the eye glanced over the lake of Bala, the two Arennig mountains, the two Arrans, the long chain of the Berwyn mountains, to the Breiddyn hills on the confines of Shropshire; and dimly in the distant horizon, was beheld the Wrekin, rising alone from the plain of Salop. On the opposite side of the mountain, by which these travellers descended, they found another beautiful mountain lake, whose cold clear waters discharge their superabundance in a full stream down the side of the mountain. All these waters abound with trout, and in some is found the Gwyniad, a fish peculiar to rocky alpine lakes. Following the course of the stream, they came on the edge of the craggy cliffs that overlook Tallylyn lake; and after a long and difficult descent they arrived on the borders of Tallylyn, where they entered the Dolghellau road. The plants which they found were *lobelia dortmanna*, in all the lakes, especially in Llyn-y-gader; *saxifraga hypnoides*; *S. nivalis*; *lycopodium selago*; *L. clavatum*; *festuca vivipara*; *vaccinium vitis-idaea*; *gnaphalium dioicum*; *pteris crispa*; *narthecium ossifragum*; *piuquicula vulgaris*; *sedum rupestre*; *S. telephium*, &c.

Beneath Tyrrau Mawr, one of the points of Cader-Idris, and on the right are some remains of *circles* of upright stones, with many *carns*, and several *maeni-birion*, of rude, upright columns. At a small distance beyond these, near the river Krogennan, are the remains of "Llys Bradwen," or the palace of Ednawain, chief of one of the fifteen tribes of North Wales, about the reign of Gruffydd ap Cynan, measuring nearly 30 yards square: having an entrance 7 feet wide, with a large upright stone on each side as a door-case: the walls are rude and uncemented. Aikin's Tour. 8vo. 1797. Evans's Cambrian Itinerary. 8vo. 1801.

CADEROUSSE, a town of France, in the country of Venaissin; 1 league W. of Orange.

CADES, in *Ancient Geography*. See KADESH.

CADESIA, a town of Persia, in the province of the Babylonian or Chaldean Irak, on the verge of the Desert, 61 leagues from Bagdad, and 2 stations, or 15 parasangs, from Cufa. It became famous among the Arabs for the defeat of the Persians, in the battle fought in the 15th year of the Hegira, (A.D. 636.) under the caliphate of Omar, by Saad, son of Abucaaz, general of the Arabs, against Rustam, surnamed Ferochzad, general of Jezdegerd, the last king of Persia, of the dynasty of Chosroes, or of the Sasanides. The army of the Moslems consisted of 30,000 men; but that of the Persians was much more numerous. The combat lasted three days, and the several periods of it were distinguished by their peculiar appellations: the first, from the seasonable appearance of 6000 of the Syrian brethren, was denominated the day of *succour*. The day of *convulsion* expressed the disorder of one, or, perhaps, of both, of the contending armies. The third, a nocturnal tumult, received the whimsical name of the night of *berking*, from the discordant clamours which were compared to the inarticulate sounds of the fiercest animals. The morning of the succeeding day determined the fate of Persia; and a seasonable whirlwind drove a cloud of dust against the faces of the unbelievers. The clangor of arms was re-echoed to the tent of Rustam, who was gently reclining in a cool and tranquil shade, amidst the baggage of his camp, and the train of mules, that were laden with gold and silver. On the sound of danger he started from his couch; but he was overtaken in his flight by a valiant Arab, who caught him by the foot, struck off his head, hoisted it on a lance, and instantly returning to the field of battle, carried slaughter and dismay among the thickest ranks of the Persians. This battle has been justly described by the epithets of obstinate and atrocious; and the Saracens acknowledge a loss of 7500 men. The standard of the Persian monarchy was overthrown and captured in the field; which standard was a leathern apron of a blacksmith, who, in ancient times, had arisen the deliverer of Persia; but this badge of heroic poverty was disguised, and almost concealed by a profusion of precious gems. After this victory, the wealthy province of Irak, or Assyria, submitted to the caliph; and his conquests were firmly established by the speedy foundation of Basora, a place which ever commands the trade and navigation of the Persians. D'Herbelot. Bib. Orient. Gibbon's Hist. vol. ix. p. 367, &c.

CADET, the younger brother of a family: a term naturalized in our language from the French.

In Paris, among the citizens, the cadets have an equal portion with the eldest; in other places the eldest has all. According to the custom of Spain, one of the cadets, in great families, takes the mother's name.

CADET also denotes a young gentleman-soldier, who, to attain to some knowledge in the art of war, and in expectation of preferment, chooses to carry arms as a private man in a company of foot.

Cadet differs from volunteer, as the former takes pay, though only that of a private man, whereas the latter serves without pay.

In 1682, the king of France established companies of cadets, wherein the young gentry were trained up to war, and taught the arts and exercises belonging thereto, as riding, fencing, mathematics, &c.

CADET, CLAUDE, in *Biography*, one of the physicians to Lewis XIV. was born at a village near Troyes, in 1695. Applying diligently to the study of medicine and surgery, at the age of 21, he was sent to Paris, and admitted among the attending surgeons at the Hotel Dieu, where he profited so well by the opportunities which offered for information, that in 1724, he was admitted of St. Come, and attained

tained to considerable eminence in his profession. He died at Paris, Feb. 10, 1745. His only work is, "Observations sur les Maladies scorbutiques," Paris, 1742, 12mo. which was republished, two years after, with additions. His two sons, Lewis Claude, and Anthony Alexis, who were both brought up to the practice of medicine, distinguished themselves by their publications on the subjects of chymistry and pharmacy, of which the following are most known: "Analyse Chymique d'une Eau Minerale nouvellement decouverte a Passy," 1757, 12mo.; "Reponse a plusieurs Observations de M. Baumé sur l'Ether Vitriolique, sur le Mercure precipité par se, sur la Reduction de Chaux, de Cuir, et d'Étain a travers les Charbons," Paris, 1775, 4to.; besides numerous communications to the Academy of Sciences, at Paris, and Curios. Nat.; of both which Lewis Claude was member. Eloy. Diét. Hist.

CADETES, in *Ancient Geography*, a people of Gaul, towards the maritime parts of Armenia. Cæsar.

CADEUMA, a town of Ethiopia, near Egypt. Pliny.

CADGE, a round frame of wood on which falconers carry their hawks when they expose them to sale.

CADGOLLS, in *Geography*, a mountain of Scotland, in the county of Ross; 6 miles S.E. of Tain.

CADI, among the Turks and Saracens, denotes an ordinary judge, who decides in all civil controversies within the district of a town or city, though subject to appeals to superior judges.

The word is Arabic كَادِي or كَاتِي, q. d. *judge*, formed of كَاتِي, *to judge*. D'Herbelot writes it *cadbi*.

The term *cadi*, used absolutely, denotes the judge of a smaller town or village who judges, without appeal, all litigious affairs, not only of the musulsims, but even those of the Jews and Christians; those of cities being called *mollas*, or *moulas*, sometimes *mouli-cadies*, or *great cadies*. The place of a *cadi*, or of a *molla*, is frequently occupied by a lieutenant, called *naiib*, who judges, like them, without appeal; he is a *muderis*, who runs the career of magistracy, and is generally appointed *cadi* the following year, and sent to another post. The *cadis* remain in this rank, and obtain no other advancement besides that of a tribunal, more extensive, and, consequently, more lucrative. They, nevertheless, become *mollas* of an inferior rank; such are those of Bagdad, Philopopolis, &c.; but they cannot become *cadikschers*, *mustis*, &c. unless they enter the grand mosque of Soliman I. and continue their studies. The tribunal of justice is denominated *makkama*, or *mekémé*.

We find numerous complaints of the avarice, extortion, and iniquity of the Turkish *cadis*; all justice is here venal; the people bribe the *cadis*; the *cadis* bribe the *moulas*; the *moulas* the *cadilechers*; and the *cadilechers* the *musti*.

It is usually vain to appeal, even if an appeal were allowed, from the sentence of the *cadi*; since the affair is never heard anew, but judgment is passed on the case, as stated by the *cadi*. The tribunal, whence these *cadis* issue their decisions, is sometimes at their own houses; but never at any place which corresponds with the idea annexed to so solemn an employment. In an empty mean apartment, the *cadi* is seated on a mat or wretched carpet; and on each side of him are his clerks and some domestics. The door is open to every body; the parties appear; and there, without interpreters, advocates, or attorneys, each pleads his own cause. Squatted on the ground, they state the facts, dispute, and reply again in their turns, sometimes the debates are violent; but the cries of the clerks, and the staff of the *cadi*, soon restore order and silence. Gravely smoking his pipe, and twisting the end of his beard round his finger, this judge listens, interrogates, and concludes by pronouncing a sentence without appeal, which at most allows but two months

delay. The parties are never very well satisfied; they retire, however, with respect, and pay a fee, estimated at one-tenth of the litigated property, without murmuring at the decision, as it is invariably directed by the "infallible Koran." Venality, indeed, is so barefaced, and so impudent, that the parties may bargain for their cause with the *cadi*, as they would for any common commodity. Corruption is habitual and general; nor is it likely to be otherwise in circumstances, where integrity may be ruinous, and injustice lucrative; where each *cadi*, deciding without appeal, fears neither a revision of his sentence, nor punishment for his partiality; and where, in short, the want of clear and precise laws afford a thousand ways of avoiding the shame of an evident injustice, by opening the crooked paths of commentaries and interpretations. The *cadis*, nevertheless, are often cashiered, and punished for notorious injustice with the bastonade and mulcts; but the law forbids them to be put to death. Constantinople has had *cadis* ever since the year 1390, when Bajazet I. obliged John Palæologus, emperor of the Greeks, to receive *cadis* into the city, to judge all controversies happening between the Greeks and the Turks settled there. In some countries of Africa, the *cadis* are also judges of religious matters. Among the Moors, *cadi* is the denomination of their higher order of priests, or doctors, answering to the rabbins among the Jews.

CADI, in *Ancient Geography*, a town of Mysia, according to Steph. Byz; but Strabo places it in Phrygia.

CADIA, in *Botany*, (the Arabic name of the plant,) Forsk. Arab. 90. Vitman Summa Plant. tom. iii. p. 141. L'Heret. Mag. Encyc. tom. v. p. 20. Vent. vol. iii. 374. (Panciatica, Hort. Pan. 1793. p. 9. Spændonæa, Defont. Dec Philos. v. 56. p. 260.) Clafs and order, *decandria monogynia*. Nat. Ord. *Leguminosæ*, Vent.

Gen. Ch. *Cal.* bell-shaped, five-cleft. *Cor.* petals five, rarely six or seven, inversely heart-shaped, equal. *Stam.* filaments ten, rarely more, awl-shaped, a little curved, gibbous at their base, the length of the corolla, ranged in a circle near the petals; anthers oblong, incumbent. *Pist.* germ pedicelled; style simple. *Peric.* legume linear, compressed, bent at the end, membranous, many-seeded. *Seeds* oblong, shining.

Ess. Ch. *Calyx* five-cleft; petals equal, inversely heart-shaped; legume many-seeded.

Sp. C. *purpurea*, Ait. Hort. Kew. 3. 492. Picc. Hort. Pan 9, with a coloured figure. A shrub. *Stem* about three feet high; branches and petioles pubescent. *Leaves* alternate, unqually pinnate; leaflets numerous, sometimes opposite, sometimes alternate, linear, retuse, the nerve commonly ending in a little point; stipules bristle-shaped, caducous. *Flowers* the colour of a peach-blossom, without scent; racemes few-flowered, axillary, pendant, shorter than the leaves. *Legume* less than a span in length. *Seeds* eight or ten. A native of Arabia.

CADIANG, a kind of lentiles in Batavia, and the adjacent country, which makes a considerable part of the food of the common people. Dr. Hawksworth's Account of the Voyage to the South Seas, vol. iii. p. 733.

CADIAPATAM POINT, in *Geography*, lies on the coast of Malabar, in the East Indies, near the extremity of the peninsula of India, to the west of Cape Comorin. Poolytopu village is situated on the sea-coast, E. N. E. 4 geographical miles from this point. N. lat. 8° 9' 18". E. long. 77° 26' 35".

CADIAR, a town of Spain in Grenada; 28 miles S. E. of Grenada.

CADIERE, LA, a town of France, in the department of the Var, and district of Toulon; 3 leagues N. W. of it.

CADILESCHER, CADI-LESKER, or KADILESKER, a capital

capital officer of justice among the Turks, answering to a chief-justice among us.

The word comes from the Arabic *kadi*, judge, the participle *al*, and *aschar*, army; as being at their first institution chiefly judges of the soldiery; of whose causes they have still the sole cognizance. D'Herbelot writes the name *cadilshkar*, or *cadhi-asker*.

It is said that this authority was originally confined to the soldiery; but that at present it extends itself to the determination of all kinds of law suits; yet, nevertheless, subject to appeals.

At Constantinople there are two cadileshers, who superintend the concerns of the Ottoman empire; one of Romania, or of Turkey in Europe, and the other of Natolia, or of Turkey in Asia. They were formerly the judges of military men, the former for European Turkey, and the latter for the Asiatic countries, when the Sultan commanded them in person. The cadilesher of Romania was then charged to decide on the affairs of the Mussulmans, and the other on those of the tributary subjects. For some time past, the former has the pre-eminence over the latter, and determines alone all the causes carried to his tribunal, by the sole will and at the request of the plaintiffs. The tribunal of the cadilesher of Natolia has been a long time suppressed as useless. They both assist at the divan of the grand visir, hear and discuss the business brought before them; after which the cadilesher of Romania alone pronounces the sentence. The musti presents annually a list to the sultan for the nomination of two cadileshers, of the stambol effendi, of the mollas of Mecca and of Medina, of those of Bursa, Adrianople, Cairo, and Damascus, as well as of those of Jerusalem, Aleppo, Smyrna, Larissa, Salonica, Scutari, Galata, and Aijup, which is one of the suburbs of Constantinople. It is commonly according to the rank of seniority that the choice is made, when favour does not advance some protected person, or the son of some great man. When chosen, the cadileshers remain in place only a year; but the cadilesher of Natolia generally succeeds that of Romania, and the former has before passed through the same rank. To them it belongs to appoint all the simple cadis of the empire; and this circumstance renders their place, in a country where every thing is venal, very lucrative, independently of the appanages which they possess. The cadilesher of Romania appoints the cadis of Turkey in Europe, and that of Natolia appoints those of Asia and Egypt. Subordinate to them is the stambol-effendi, molla, or judge of the capital. See STAMBOL-EFFENDI. The cadileshers are sometimes advanced to the rank of *musti* (which see); but according to the established order, he must be chosen from among the cadileshers of Romania, and those who have occupied that employment. Those who aspire to the office of cadilesher must pass through a previous course of education. For this purpose there are attached to the imperial mosques of Constantinople, Bursa, and Adrianople, *makdresses*, or colleges, to which young people are sent, from all parts of the empire, to be instructed in the law of the prophet, in religious, civil, and criminal jurisprudence, and to learn all the opinions and all the subtleties of the commentators on the Koran. They then undergo various examinations, and when they are thought to be well informed, the rank of *muderis* or professor is assigned to them. These colleges were founded by different sultans. The first was established at Nicæa, in the year 1330, by Orkhan. They enjoy a considerable revenue, and provide for the support of 2 or 3 thousand scholars. The *muderis*, who are not willing to follow the career of professor and obtain the eminent rank of molla, solicit of the cadileshers the place of *cadi*, which is easily granted them

for a pecuniary consideration. The *muderis*, who are ambitious of obtaining the most important places, such as those of molla, cadilesher, and musti, pass, after fresh examinations, to the mosque of Soliman I. and wait till their turn, their merit, or their interest procures for them an appointment. Eight of them, under the appellation of *makredje*, are appointed every year mollas, or judges, of the towns of Jerusalem, Aleppo, Smyrna, Larissa, Salonica, Scutari, Galata, and Aijup. Four, among the latter, are afterwards named to the cities of Bursa, Adrianople, Cairo, and Damascus, and the following year two of these become molla; of Mecca and of Medina; from among these last is taken the stambol-effendi. Thus, successively in their turn, they arrive at the place of cadilesher, and even of musti. But the *muderis*, before they can attain to this distinction, must either be protected, or manifest ardent zeal for religion, distinguished talents, great application to study, and very austere manners. The mollas, cadileshers, and others who are not employed, and who are waiting for offices, have appanages or benefices, called "Arpaiks." Several obtain inferior tribunals, where they place naibs, who discharge their functions, and to whom they grant only a part of the income.

Tournefort (Voyage Lev. tom. ii. lett. 14.) erroneously asserts, that, at Constantinople, a person could appeal from the sentence of a *cadi*; whereas Europeans only enjoy that privilege, when the sum in litigation exceeds 4000 aspres, or nearly the value of 66 livres, supposing the piastre at two livres. In all the towns of Turkey, the molla, the *cadi*, and the naib, judge without appeal; they condemn to fines, to corporal punishment, or to death, without allowing to the delinquent, or person accused, the power of having recourse to another tribunal. Pococke, Egypt, p. 170. Volney's Travels in Egypt and Syria, vol. ii. p. 389, &c. Olivier's Travels in the Ottoman Empire, &c. p. 172, &c.

CADILLAC, or CADILHAC, in *Geography*, a town of France, in the department of the Gironde, and chief place of a canton in the district of Bourdeaux, seated on the banks of the Garonne, and containing a fine castle, with a collegiate church;  $5\frac{1}{2}$  leagues S. S. E. of Bourdeaux. The place contains 1326, and the canton 11,200, inhabitants; and the territory includes  $97\frac{1}{2}$  kilometres and 16 communes. N. lat.  $44^{\circ} 37'$ . W. long.  $0^{\circ} 15'$ .

CADITES, an appellation given by Plott to a kind of figured stone, resembling a cadus or barrel.

The cadites swells in the middle, and goes tapering to both ends, being divided lengthwise, with such equidistant lineaments, as are usually made by the staves of a barrel, but without hoops, nor yet hollow.

CADIZ, in *Geography*, called *Gades* by the Romans, by the Phœnicians *Gadir* or *Gaddir*, i. e. a hedge or fenced place, and by some of the ancients *Tartessus*; a sea-port city of Spain, seated on a promontory in the extremity of a peninsula, and joined to the isle of Leon by a causeway. Towards the east it is washed by the gentle waves of a well-protected road; but towards the west it is open and exposed to the fury of the ocean. Both the harbour and bay of Cadiz are secure and spacious; the entrance being defended by fort Matagordo, and by fort Puntal standing opposite to it on a point of that neck of land on which Cadiz is built. The entrance into the harbour betwixt these forts and the points on which they stand, is reckoned to be about 500 fathoms wide. During the time of ebb, a considerable part of the harbour is dry. The outer and furthestmost bay, which begins between La Rota and San Sebastian, both of which are fortified, and extends to Puerto de Santa Maria, is divided into two parts by the rocks of Los Pueros and Diamante. On the south side Cadiz is inaccessible on ac-

count of the high and steep shore; on the north side also the access is dangerous, by reason of many sand-banks and rocks which lie under the water; and though the south-west side admits of landing, it is defended by fort Santa Catalina, or St. Catharine. On the S.S.W. point is a ridge of rocks, part of which, at full sea, is covered with water; the outermost of these is a small island, on which are a guard and light-house, with two chapels, and also fort San Sebastian. The city, therefore, is susceptible of attack only at the narrowest part of the neck of land lying betwixt it and the S.E. part of the island of Leon; and on this side it is also fortified.

The best view of Cadiz and its environs is that which may be had from the signal tower; and hence you look immediately down upon the houses, whose flat roofs, covered with a white cement, exhibit a singular but very pleasing appearance. Towards the west, you command the ocean, with numerous vessels, leaving or entering the harbour; and on the land side, you discover the four interesting sea-port towns of Rota, Santa Maria, Puerto Real, and Caraca, with the isle of Leon, and the connecting causeway; whilst a rich country, verging towards the setting sun, bounds the distant prospect. The streets of Cadiz are narrow, and yet well-paved and clean. The most beautiful part of the city looks towards the Puerto de Santa Maria, where the houses are lofty, built of white free-stone, brought from thence across the bay, and ornamented with painted balconies. In front they have a wide parade, well gravelled, planted with trees, and communicating with the sea-road, where the merchantmen and ships of war find shelter. Two considerable squares, one for the market, the other called Plaza de San Antonio, with the Calle-ancha, or Broad-street, joining to it by way of mall, contribute both to ornament and health; and as the whole city is nearly encompassed by a rampart, this forms an elevated, airy, and delightful promenade, much frequented in the evenings. A small part towards the west is bordered by five rows of elms, forming four avenues, adorned with elegant seats, and constituting the Alameda. Along the ramparts is also a row of houses; and the shaded parts towards the south serve for the lower classes to take their siesta, and enjoy the luxury of the sea-breeze. The inhabitants of Cadiz supply the want of other promenades by parties of pleasure in the environs of the city. With this view they go out in carriages either to Puerto de Santa Maria, where are fine avenues and gardens, or to Chielana, near the isle de Leon, which is almost entirely covered with country houses, and commands a very fine view of the bay, the town, and the sea. Although the extent of Cadiz is very limited, yet its houses are crowded together and are very lofty, so that the population is estimated at between 75 and 80,000. (Fischer's Travels in Spain.) Townsend (Journey through Spain, in 1786 and 1787), reckons them at no more than 65,987; but he says, that about 10 years since, they were computed at 85,000, besides about 20,000 people who entered daily from the sea and from the adjacent country. The most distinguished buildings are the two cathedrals, the ancient and the new; the former is chiefly remarkable for some good pictures, and for its treasures, consisting of gems, silver candlesticks, and lamps, numerous and bulky; three custodias, one of which, constructed of the finest silver, weighs 51 arrobas, or more than half a ton; and another consists mostly of solid gold. The new cathedral is a huge pile, with large and lofty domes, and many well-proportioned pillars; but upon the whole heavy and disgusting. Near the cathedral is the Plaza de Toros, appropriated to the bull-fights, built entirely of wood. At a small distance are the observatory, ill provided with instruments, and the academy for painting, sculp-

ture, and architecture. In the convents are some few good pictures. Of the three hospitals, one, called the Royal or Military Hospital, is designed for soldiers, and accommodates 80 students, who are maintained and educated at the king's expence. It has a good botanical garden, and a theatre for dissections, furnished with subjects from among the patients. The other two, one set apart for women, and the other for men, are distinguished for their neatness. Besides these hospitals for the sick, Cadiz has a retreat for 47 widows, founded by a Turkey merchant, who died in 1756. But the most interesting establishment in this city, and the best conducted of its kind in Spain, is the hospicio, or general workhouse. It accommodates (at an average of the year 1787) 855 paupers of every nation, age, and sex; who are either past labour, or instructed and employed in useful arts; and encouraged in proportion to the amount of their labour.

The heat of the climate at Cadiz is moderated by the sea-breeze; so that even in summer it enjoys a happy temperature, and few places are more healthy; but it becomes more intense whenever the solano or south-east wind prevails. This passes to them over the scorching plains of Africa; and such is its effect, that all the passions are inflamed, and during its prevalence, the inhabitants, who are most irritable, commit every species of excess.

This city abounds with almost all the necessaries and luxuries of life. Its fruits are cheap, and its most remarkable wines are sherry and pacaretti, both of which are procured from Xeres and its vicinity. But they are much distressed for want of fresh water, which they are obliged to fetch from Puerto de Santa Maria; and their ice, which is used for cooling it, is brought from Sierra, at the distance of 13 leagues. For domestic purposes, such as washing, &c. they collect their water in subterraneous cisterns, but being subject to waste by evaporation, it is procured with difficulty, and consumed with great economy. For preventing a scarcity of corn, and in order to ensure a profit by the sale of it, the city has established a public granary, from which the bakers are supplied at a given price; and, according to that, the magistrates regulate the assize of bread. The theatre at Cadiz is large, elegant, and commodious; the principal actors are Italians; and the inhabitants are chiefly attracted to it by the comedies called Saynetes, and the whimsical dances denominated Voleros. In Lent, whilst the most polished orators confine themselves to churches, other preachers harangue the multitude in the market-place, with a vehemence of voice and gesture suited to their congregations. Among the Franciscans, when the penitential sermon is finished, the lights are extinguished, and instantly scourges are applied. When the market-place is not occupied by orators, the scribes take possession of it with their benches, at which they sit with pen, ink, and paper, to write and read letters of all sorts, and to execute every kind of deed. In the year 1720, the commerce, which for two centuries had proved a source of wealth to Seville, was translated to Cadiz; and from that period its merchants have carried on a very considerable trade, which, however, has ebbed and flowed, according to incidental circumstances. Indeed, this port has been the emporium of commerce to the West Indies and America. Townsend informs us, that its whole trade employs about one thousand vessels, of which nearly one-tenth is Spanish. In 1784 the value of exports to America amounted, in Spanish and foreign produce, to 3,621,443 pounds sterling; and the value of imports in money and jewels was 8,297,164*l.* and in merchandise 2,990,757*l.* The articles of merchandize are cochineal, indigo, cacao, sugar, hides, Vicuna wool, cotton, copper, tin, tobacco, different kinds of wood, &c. which are distributed

distributed into different countries. Among the foreign merchants of all nations are many Germans, from Hamburg, Bohemia, and Augsburg. The former constitute the class called Hanseatics, and according to ancient convention enjoy considerable privileges. To foreigners indeed Cadiz is much indebted for various means of literary intercourse and improvement, as well as for the wealth resulting from an extended commerce. The manufactures of Cadiz are principally restricted to ribbons and linen; and several persons are employed in knotting silk, and marking stockings received from Nisines, and intended to be shipped for the American settlements. The most interesting branch of industry in the environs of Cadiz is the manufacture of salt; produced by the numerous salt-pools of the isle of Leon, with little labour or expence, because the sun and air quickly cause the water to evaporate, and leave the salt crystallized. Cadiz is the see of a bishop, suffragan of Seville.

The old *Gaddir* was built by the Tyrians; from them it was transferred to the Carthaginians; and afterwards it fell under the dominion of the Romans. It was recovered from the Moors in 1260. In 1596 Cadiz was taken and plundered by the English; and an unsuccessful attempt was again made for seizing it in 1702. During the late and present war it has been held by the English, at different periods, in a state of blockade. In some of the old Spanish chronicles, this city is denominated *Calis*, and hence English seamen usually call it *Cales*. The tide runs here N.E. and S.W.; and it is high water at spring tides at half past four o'clock. N. lat.  $36^{\circ} 31' 7''$ . W. long.  $6^{\circ} 11' 50''$ .

CADIZ, a town on the north coast of the island of Cuba, in a bay of the same name, about 16 $\frac{1}{2}$  miles E. of Havannah, and 50 N. of Spiritu Santo. N. lat.  $23^{\circ} 2'$ . W. long.  $79^{\circ} 53'$ . A river of this name runs into the sea, 10 miles E. from the town of Cadiz.

CADIZADELITES, a sect among the Mussulmen, resembling the ancient Stoics, who avoid all feasting and diversion, and affect an uncommon gravity in all they do or say. Those of them who inhabit the frontiers of Hungary, &c. agree in many things with the Christians, and drink wine even in the fast of the Ramazan.

They read the Slavonic translation of the Bible, as well as the Alcoran. Mahomet, according to them, is the Holy Ghost, which descended on the apostles at the feast of Pentecost.

CADLOCK, in *Botany*. See *SINAPIS*.

CADMA, in *Entomology*, a species of *PAPILIO* found in America. The wings are indented, fulvous; disk of the posterior pair beneath white, with two ocellated spots, the pupil of which is double and blue. Drury, &c.

CADMA, in *rural Economy*, a term applied to the smallest of the pigs which a sow has at one farrowing, and which is commonly much less than any of the others in the same litter.

CADMEAN Letters, the ancient Greek or Ionic characters, such as they were first brought by Cadmus from Phœnicia; whence Herodotus also calls them *Phœnician letters*. See *CADMUS*.

According to some writers, Cadmus was not the inventor nor even the importer of Greek letters, but only the modeller and reformer thereof; and it was hence they acquired the appellation *Cadmean*, or *Phœnician letters*: whereas before that time they had been called *Pelasgian letters*. See *LETTER* and *WRITING*.

CADMIA, in *Chemistry*. This term is entirely obsolete; as, however, it is of frequent occurrence in the writings of the older chemists, it may be proper to explain its meaning. Cadmia, according to Pliny, (*Hist. Nat. lib.*

xxxiv. ch. xxii.) was the common name given to that earthy substance which was employed by the Cyprian artists in the manufacture of brass: hence it is plain that it contained zinc, and was probably no other than the calamine of the moderns. The same word is also applied by the above-mentioned author to the metallic foot or ashes which collected in the chimneys of the brass founderies. It was an article of considerable use in the Roman pharmacopœa, and three varieties of it were distinguished by separate names: that called *Capnitis* resembled ashes, was the lightest and best esteemed, and was deposited at the farthest extremity of the chimney; the second kind, named *Botryitis*, depended in clusters from the central and lower part of the chimney, and was in high esteem for disorders of the eyes; the third variety, called *Plicitis*, was a metallic scoria adhering to the sides of the furnace, and was used for wounds and cutaneous eruptions; its colour was either blue, or black, and, no doubt, contained a considerable quantity of copper.

Succeeding chemists injudiciously ranked as *fossil cadmia* not only calamine, but the arsenical and bismuthic cobalt ore, and under the term *Cadmia fornacum* included all the kinds of metallic sublimates that are deposited in the chimneys of smelting houses, whether of copper, brass, lead, tin, &c.

CADMUS, q. d. *a man from the east*, in *fabulous History*, is reported to be a native of Sidon in Phœnicia, son of Agenor, king of that country, and brother of Europa. Having been sent by his father's order in quest of his sister Europa, who had been transported by Jupiter to the isle of Crete, and being forbidden to return without her, he wandered for a long time to little purpose, and at length, despairing of success, he settled at Tanagra upon the river Ilmeme in the Grecian province of Bœotia. He afterwards built Thebes, and laid the foundation of his new kingdom. The fable, however, says, that the walls of the city were raised by the harmony of Amphion's lyre, and that he only erected a citadel to which was given his own name, and merely laid the foundation of Thebes. When the city was finished, he married Hermione, or Harmonia, the daughter of Mars and Venus; and his nuptials were graced with the presence of all the gods and goddesses, Juno excepted, each of whom conferred some gift upon the bride. His kingdom is said to have been very flourishing, and in the progress of his reign he was much beloved and respected by his subjects; though the anger of Juno, who envied his felicity, occasioned many misfortunes, which harassed and grieved him before its termination. By his wife Harmonia, he had a son named Polydorus, who succeeded him in the sovereignty of Thebes, by whom it was transferred to his son Labdacus, the father of Laius, to whom it descended, and who was the husband of Jocasta, the mother of Œdipus. He had also four daughters, viz. Ino, who threw herself into the sea together with her children; Agave, whose son Pentheus was torn in pieces by the Bacchantes, for profaning the rites of Bacchus; Autonoe, the mother of Actæon; and Semele, the mother of Bacchus by Jupiter, who afterwards slew her with his thunderbolt. After having experienced many distressing vicissitudes, Cadmus is said to have retired with his wife Harmonia to the coast of Illyria, where they were both changed into serpents, or as some interpret the fable, where they degenerated from their pristine civility into barbarians. The fable also reports, that he fought with a mighty dragon, whose teeth he afterwards strewed on the ground, and from them was produced an army of men, who fought against one another, till they were all killed except five: whence a dearly-bought victory obtained the appellation of "Victoria Cadæa." Some say that

he was driven from the throne of Thebes by his grandson Pentheus; and that having commanded the Eneclæ who were at war with the Illyrians, he subdued the latter, and surrendered the government to his son Illyrius, who was born after his retreat to this country. To Cadmus, Greece is supposed to have been indebted for the first introduction of letters; which are said to have been of Phœnician origin, and 16 in number. Four others were afterwards added by Palamedes, and four by Simonides. He is also said to have been the first who established schools, and who taught the Grecians trade and navigation; and the epithet Cadmean, given to brass, is ascribed to him, because he was the inventor of it, and because he first introduced the use of it into those parts. Wherever he came he also introduced the religion of his country, which consisted in the worship of Dionusius, and in the rites denominated by the later Greeks the Dionusiaca. They seem to have been much the same with the Cabiritic mysteries, which Cadmus is said to have established in Samothracia.

The arrival of Cadmus in Greece is placed by Dr. Blair about 1493 years B. C. and his death, at the age of 112 years, is said to have happened in the year 1432 B. C. The arrival of Cadmus, and the foundation of Thebes, are dated in the Arundelian marbles the 64th year of the Attic æra, 1519 B. C. But Sir Isaac Newton, and those who adopt his chronology, allow Cadmus to have flourished but 1045 years before the Christian æra. Sir Isaac imagines, that the emigration of the Phœnicians and Syrians was occasioned by the conquests of David. "These people," says he, (Chron. p. 13.) "fleeing from Zidon and from David, came, under the conduct of Cadmus, and other captains, into Asia Minor, Crete, Greece, and Lybia, and introduced letters, music, poetry, metals and their fabrication, and other arts, sciences, and customs of the Phœnicians. This happened about 140 years before the Trojan war. It was about the 16th year of David's reign that Cadmus fled from Zidon. At his first coming into Greece, he sailed to Rhodes, and thence to Samothrace, an island near Thrace, on the north side of Lemnos, and there married Harmonia, the sister of Jafius and Dardanus, which gave occasion to the Samothracian mysteries."

Bochart has, with great ingenuity and learning, attempted to solve the enigmas, under which the history of Cadmus is represented. He supposes, that Cadmus was a fugitive Canaanite, who fled from the face of Joshua; and that he was so called from being a Cadmonite, which is a family mentioned by Moses. Gen. xv. 9. These Cadmonites were the same with the Hivites, and were called Cadmonim, or Easterlings, because they inhabited mount Hermon, the most eastern part of Canaan; and Bochart supposes, that Harmonia derived her name from that of this mountain. The fable of Cadmus and Harmonia being transformed into serpents he ascribes to their having retained the common name of Hivites, which in the Syriac signifies serpents. He explains the rest of the fable, concerning the teeth of the dragon, which were sown, and the armed men which sprang from them, upon the same principle. The learned Bynæus (Anal. Anc. Mythol. vol. ii. 138.) differs from Bochart in a variety of particulars. Indeed, he controverts the existence of such a person as Cadmus, and suggests several objections against the account given by Herodotus and others of the Cadmians having brought letters from Phœnicia into Greece. See LETTERS. The rites of Bacchus, he says, could not have been brought by Cadmus into Greece, if Bacchus was his descendant, or the son of his daughter Semele. It is said, that Cadmus was a Phœnician; but Diodorus Siculus (lib. i. p. 20.) speaks of him as

an Egyptian, and a native of Thebais. Pherecydes Syrus also represents him as an Egyptian; and by others he is said to have been the son of Antiope, the daughter of Belus, and consequently of Babylonish extraction. It was from the same part of the world that the mysteries, in which Cadmus was so well skilled, were imported; and here it was, that he was taught hieroglyphics, and the other characters, which are ascribed to him. These arts he carried first to the coast of Sidon and Syria; and from thence he is supposed to have brought them into Greece. Mr. Bryant having stated the origin and country of Cadmus, proceeds to shew that the accounts which are given of him by Herodotus, Diodorus, Strabo, and Pausanias, are insufficient to prove the reality of such an adventurer. It is not credible, he says, that a person should so often rove upon the seas amid such a variety of nations, and reside among them at his pleasure; much less that he should build temples, found cities, and introduce his religion wherever he listed; and that he should do all this in the course of his transient visits to different places. "Is it credible, that any person could have penetrated into the various regions, whither he is supposed to have gone? to have founded colonies in Phœnicia, Cyprus, Rhodes, Thera, Thafus, Anaphe, Samothracia? to have twice visited the Hellepont? to have worked the mines in the Pangæan mountains, and in other places? to have made settlements in Eubœa, Attica, Bœotia, and Illyria? and, above all, to have had such territories in Afric? He is represented as heir to the kingdom of Egypt: this he quitted, and obtained a kingdom in Phœnicia. He leaves this too; and after much wandering arrives in Greece; where he founds several cities, and reigns 62 years. After this, hard to conceive! he is made king in Illyria. He must also have reigned in Afric; and his dominions seem to have been considerable, as he founded an hundred cities. He is represented as a king in Armenia; and had there too no small territory. Sure, kingdoms in those times must have been very cheap, if they were so easily attainable. But the whole is certainly a mistake; at least, in respect to Cadmus. No person could possibly have effected what is attributed to him. They were not the achievements of one person, nor of one age. And place Cadmus at any given æra, and arrange his history, as may appear most plausible; yet there will arise numberless inconsistencies from the connexions he must have in respect to time, place, and people; such as no art nor disposition can remedy."

Should it be asked, if there were no such man as Cadmus, what did the ancients allude to under this character, and what is the true purport of these histories? The answer of Bryant is, that the travels of Cadmus, like the expeditions of Perseus, Scfoliris, and Osiris, relate to colonies, which at different times went abroad, and were distinguished by this title. Cadmus, he says, was one of the names of Osiris, the chief deity of Egypt. Both Europa and Harmonia are of the like nature. They were titles of the deity; but assumed by colonies, who went out and settled under these denominations. Cadmus was one of those deities. He was the same as Hermes of Egypt, called also Toth, Athoth, and Canathoth; and was supposed to have been the inventor of letters. He was sometimes stiled Cadmilus, another name for Hermes; under which he was worshipped in Samothracia and Hetruria. Lycophron (v. 219.) speaking of the prophet Prulis in Lesbos, tells us, that he was the son of Cadmus, and of the race of Atlas. And he was the person who was supposed to give information to the Greeks, when they were upon their expedition to Troy. Harmonia, the wife of Cadmus, who has been esteemed a mere woman, seems to have been an emblem of nature, and the fostering

nurse of all things. Harmonia was supposed to have been a personage, from whom all knowledge was derived. Accordingly, Hermon, or Harmonia, was a deity to whom the first writing is ascribed; and the same is said of Hermes. Cadmus is said not only to have brought letters into Greece, but to have been the inventor of them; from whence we may fairly conclude, that under the character of Hermon, Hermes, Taut, Thoth, and Cadmus, one person is alluded to. The deity called by the Greeks Harmonia, was introduced among the Canaanites very early by people from Egypt; and was worshipped in Sidon, and the adjacent country by the name of Baal-Hermon. Europa was likewise a deity; the same, according to Lucian, as Ashtaré, who was worshipped at Hierapolis in Syria. Cadmus, says Bryant, may principally be esteemed Ham, who by his posterity was looked up to as the sun, and worshipped under his titles; a circumstance, which was common to all, who were styled Baalim. His name favours this conjecture; for according to the etymological system of this writer, the sun was styled Achad, and Cadmus is a compound of Achad-Ham, rendered by the Greeks Acadamus and Academus, and contracted Cadmus. Upon the whole, if instead of one person Cadmus, traversing so much ground, and introducing the rites of his country at Rhodes, Samos, Thera, Thafus, Samothrace, and building so many cities in Libya, we suppose those things to have been done by colonies, who were styled Cadmians; all will be very right, and the credibility of the history not disputed. Many difficulties will be solved; and great light will be thrown upon the mythology of the ancients. The story then of Cadmus and Europa relates to people from Egypt and Syria, who went abroad at different times, and settled in various parts. They are said to have been determined in their place of residence by an ox or cow; which denotes that they were directed by an oracle; and this leads us to the Egyptian Apis. The Cadmeans, according to Bryant, were a two-fold colony, which came both from Egypt and Syria; from Egypt first, and then from Syria and Canaan. In their progress westward, they settled in Cyprus, Rhodes, Samos, Lesbos, and Thrace; also in Eubœa, Attica, and Bœotia. In process of time they formed settlements in other parts; particularly in Epirus and Illyria; and occupied some considerable provinces in Italy, as high up as the Padus. Wherever they passed or settled, they left behind them a variety of memorials; and especially such as related to their rites and worship. See CUTHITES.

CADMUS MILESIUS, in *Biography*, an ancient historian, who, according to Moreri, lived about the time of the Trojan war. Pliny, in speaking of the invention of things, informs us, (lib. vii. c. 56.) that Pherecydes Syrus taught the composition of discourses in prose, during the reign of Cyrus; and Cadmus Milesius to write history: and in another place (lib. v. c. 29.) he says, that Cadmus Milesius was the first who wrote in prose. He composed, "The Antiquities of Miletus and of all Ionia," in 4 books: a work on this subject, mentioned by Dionysius of Halicarnassus, and attributed to this historian, was thought by the best judges, as he informs us, to have been supposititious. —Another Cadmus, also a Milesian, was, according to Suidas, much younger than the former; and wrote "The History of Attica," in 16 books.

CADMUS, in *Entomology*, the name under which Cramer figures the Brazilian species of PAPILIO, called by Fabricius Acheronta. The wings of this insect are indented, and furnished with tails; anterior pair red at the base, the tip black spotted with white. *Fabr.*

CADOEPAN, in *Geography*, an island in the Indian Ocean, S.E. of Boaton, and near the islands of St. Matthew and Touran-Bellis, in which many cloves are produced.

CADOGAN, WILLIAM, in *Biography*, educated at Oriel College, Oxford, took his degree of master of arts in 1755; and the same year was made bachelor and doctor in medicine. He had previously, viz. in 1750, published a small treatise on the nursing and management of children, which was much esteemed, and contributed toward abolishing some improper treatment, both in feeding and dressing infants. They were first adopted by the managers of the Foundling Hospital, and by degrees became general. His next publication was "Dissertations on the Gout, and all Chronical Diseases," 1764, 8vo.; written in a popular manner, and so generally read, that several large impressions were sold of it. The three principal causes or sources of gout, he says, are indolence, vexation, and intemperance. The book was much cavilled at, and was answered by two or three different writers. It is, on the whole, well written, and the regulations given for the conduct of gouty patients, with the view of mitigating the fit, and preventing frequent relapses, or returns of the complaint, are judicious, and well deserving attention. He was fellow of the college of physicians, and, which is by no means usual, spoke two Harveian Orations, the one in the year 1764, the other in 1793. They were both published. He died at a very advanced age, at his house in George-street, Hanover-square, April 26, 1797.

CADOGNA, in *Geography*, a town of Naples, and province of Principato Ultra; 15 miles N.N.E. of Conza.

CADOLZBURG, a town of Germany, and prefecturate of the same name, in the circle of Franconia, and Margraviate of Anspach; the town is surrounded with walls, and defended by a castle; 18 miles N.E. of Anspach.

CADORE, or PIEVA DI CADORE, a town of Italy in the Trevisan, and capital of the Cadore, or Cadurin, belonging to the states of Venice, and famous for the birth of Titian the painter; 42 miles N.E. of Trent. N. lat. 46° 25'. E. long. 13° 45'.

CADORE, or CADORIN, a small and mountainous district of the Trevisan, or Trevigiana, belonging to Venice; bounded on the north by the bishopric of Brixen; on the east by Friuli; on the south by the Bellunese; and on the west by the Bellunese and bishopric of Brixen; about 25 miles long, and from 10 to 15 broad.

CADOUIN, a town of France, in the department of Dordogne, and chief place of a canton, in the district of Bergerac. The place contains 603, and the canton 5833 inhabitants; and the territory includes 152½ kilometres, and 12 communes.

CADOURS, a town of France, in the department of the Upper Garonne, and district of Toulouse. The town contains 826, and the canton 6962 inhabitants: the territorial extent comprehends 172½ kilometres, and 17 communes.

CADRITES, a kind of religious among the Mahometans; whose founder was Abdul Cadri, a great philosopher and lawyer; whence they take their name, *Cadrites*.

They live in common, and in a kind of monasteries, which, however, they are allowed to quit, if they request it, and to marry, on condition of their wearing black buttons on their garments to distinguish them from the rest of the people.

In their monasteries, they pass the greatest part of every Friday night in running round, holding each other's hand, and

and crying incessantly. *Mai, living*, one of the names of G4: one of the number plays all the time on a flute, to animate them in this extravagant dance.

CADSAND, in *Geography*, an island on the coast of Dutch Flanders, at the mouth of the Scheldt, situated on the south side of the entrance into the West Scheldt opposite to Flushing, so as to command the navigation of that river. It is preserved by elevated dykes constructed at great expense, from the inundations of the sea; and, nevertheless, exposed to danger, when the north-west wind blows with violence. The land is fertile, and yields excellent corn; the meadows are luxuriant, and the farmers make a considerable quantity of good cheese. The persecuted French and Saltburghers found an asylum in this island. The chief town is Cassandria.

CADUCEATOR, in *Antiquity*, a denomination given to heralds or messengers of peace. See CADUCEUS.

CADUCEUS, or CADUCIFUM, Mercury's rod or sceptre; a wand entwined with two serpents, worn by that deity as the ensign of his quality and office: and given to him, according to the fable, by Apollo, for his seven-stringed harp.

The poets attribute wondrous virtues to the caduceus: as that of throwing people into a sleep, raising the dead, &c. It was also used by the ancients as a symbol of peace and concord: the Romans sent the Carthaginians a javelin, and a caduceus, offering them their choice, whether of war or peace.

Among that people, those that denounced war were called *seciales*, and those who went to demand peace, *caduceatores*; because they bore a caduceus in their hand.

The caduceus found on medals is a common symbol signifying good conduct, peace, and prosperity. The rod expresses power, the two serpents prudence, and the two wings diligence.

Wedelius has given a dissertation expressly on *caduceated* medals. Böttiger in his "Griechische Vasengemälde, &c." or "Grecian Paintings on Vases" illustrated (vol. i. p. 2.), Weimar, 1798. has suggested some new and ingenious ideas with respect to the origin of the caduceus. According to this writer, the deity called Hermes by the Greeks, and Mercury by the Romans, owed his imaginary existence entirely to the commercial intercourse of the Phœnicians with the Greeks. At some remote period, the former had mines and factories in many places of Greece. There Hermes was worshipped as the tutelary deity of the industrious Phœnicians; and all the arts, by which the articles of trade are produced, were ascribed by the Greeks to his invention. The Phœnicians, of course, in order to converse with the rude natives, employed interpreters. Hence Hermes was considered as the inventor of articulate sounds, and of numeral figures and signs. The interpreters and heralds were called his sons, and the race of *χιρκοις* is said to have descended from him. The Phœnician traders, wherever they first approached the rude Pelasgic inhabitants of the Grecian coasts, found it necessary to use some manifest token of their having arrived with peaceful intentions; not as pirates, but as merchants and harterers. In such instances, the most natural sign of peace among all nations, even among the inhabitants of the Friendly Islands in the South Seas, has ever been a green branch. The Phœnicians, however, soon found it more convenient, as well as more ornamental, to carry with them a decorticated or even a gilt staff; and, as occasion required, to wind round it green leaves. Such is the wand of Mercury in Homer's Hymn. in Mercur. 529—532.)

CADUCEUS is also a name given to a kind of staff covered with velvet, and decorated with *fleurs de lys*, which the French heralds of arms bear in their hands on solemn occasions. That borne by the king at arms has a golden *fleur de lys* at the end, and is by some called sceptre.

CADUCOUS, in *Botany*, a term employed to express the short duration of one part of a plant compared with another: thus, a caducous calyx falls off before the petals, as in poppy and celandine; a caducous corolla falls off immediately after its expansion, and before the anthers have shed their pollen, as in *actæa* and *thalictrum*. A stipule is caducous, when it falls off before the leaf; and a bracte, when it does not continue as long as the flower. A leaf is also said to be caducous, when it does not remain till the end of the summer. It always implies a shorter duration than is intended by the term deciduous.

CADUCUS Morbus, or FALLING SICKNESS, in *Medicine*. See EPILEPSY.

CADURCI, in *Ancient Geography*, a people of Gaul, who inhabited the town of Divona. Ptolemy. They are mentioned by Cæsar, Strabo, and Pliny. Their territory is the present Quercy, the capital of which is Cahors.

CADUS, an ancient liquid measure of capacity, containing ten, sometimes twelve, *congii*; and sixty, or according to others, seventy-two *sextaries*.

The cadus is the same with what is otherwise denominated *metretes* and *cerameon*. See AMPHORA.

CADUSIA, in *Ancient Geography*, a country of Asia, being part of Atropatene, according to Strabo.

CADUSII, or CADUSIANS, a people who inhabited the district lying to the south of Babylon, between the Tigris and the Euphrates. They were a powerful people, and enemies of the Assyrians; and their alliance was sought by Cyrus, in his war against the king of Assyria.

CADYNA, or CADERIA, a town of Asia Minor, in the mountains of Lycaonia, according to Strabo.

CADYTIS, a town of Asia in Syria, mentioned by Herodotus, and supposed by Reland to have been Gath. As it was near the sea, it could not have been Jerusalem, as M. D'Anville conjectures. Others have supposed it to have been the Cedassa of Josephus, and others refer it to Gaza.

CÆCA, in *Ichthyology*, a species of MURÆNA, apterygious, with the snout somewhat acute. Found in the Mediterranean Sea.

CÆCA, in *Zoology*, a species of NATAIS, with lateral setose warts, and without eyes. Found in the bays of Iceland and Christianland, in Norway.

CÆCA, a species of NEREIS, sub-convex, with two very short tentacula, and the lamellæ of the pedunculi duplicate and ciliate. Fabr.

CÆCÆ *Glandulæ*. See GLANDS.

CÆCIA, in *Ancient Geography*, the name of two isles, which Pliny places in the vicinity of the Spiræan promontory.

CÆCILIA, in *Entomology*, an African insect of the PAPILIO genus, the wings of which are white in the middle, with black dots; posterior ones margined with black, dotted beneath with white. Fabr.

CÆCILIA is also a synonymous name of PAPILIO AMYNATOR of Fabricius, in the works of Cramer.

CÆCILIA, in *Ichthyology*, among old writers, the fish denominated by modern naturalists *syngnathus acus*.

CÆCILIA, in *Zoology*, a genus of serpents distinguished by having wrinkles on the body and tail, and two tentacula on the upper lip.

There

There are only two species of this genus at present known, namely *tentaculata* and *glutirofa*.

**CÆCILIA**, the general name under which several creatures have been described by old writers. *Lacerta chalcidica* is called *Cæcilia major* by them; *Anguis fragilis* of the Linnæan *Fa. Succ.* is named by different writers *Cæcilia vulgaris*, *Cæcilia Gæfneri*, and *Cæcilia typhlus*. *Aldrovandus*, *Rap.* &c. *Cæcilia maculata* of Catesby is the *Anguis ventralis* of Gmelin, &c.

**CÆCILIA CASTRA**, in *Ancient Geography*, probably the **CÆCILIANA** of Antonine, now *Cacres*, a place of Spain in Lusitania, according to Pliny and Ptolemy.

**CÆCILIANA**, in *Botany*, a name used by Pliny and some other authors for the *tulipan*, or *androsimum*. Ger. Emac. Ind. 2.

**CÆCILIUS STATIUS**, in *Biography*, a Latin comic poet, the contemporary and companion of Ennius, was a native of Insubrian Gaul, or, as some say, of Milan, and lived at Rome in a servile condition about the year 177 B. C. As a writer of comedy he was eminent, though Cicero finds fault with his Latinity. Some fragments of his works are collected by Robert Stephens, and published in the "Corpus Poetarum," Lond. 1714. *Nouv. Dict. Hist.*

**CÆCIMACULA**, in *Entomology*, a species of **PHALÆNA** (*Noctua*), with dentated grey wings, two black points at the base, and two cinereous streaks. Fabr.

**CÆCINA**, in *Ancient Geography*, a river of Italy, in Etruria.

**CÆCINUM**, a town of Italy in Brutium, watered by the river *Cæcinus*.

**CÆCUM**, in *Anatomy*. See **CÆCUM**.

**CÆCUS**, in *Zoology*, a species of **COLUBER**, dusky-red, having its scales marked with a white spot.

**CÆCUTIENS**, in *Entomology*, a species of **APIS**, brown, with a smooth ferruginous abdomen, spotted on both sides with black. Fabricius. Found in the gardens of Leipzig.

**CÆDIUS**, in *Ancient Geography*, a river of Sardinia. Ptolemy.

**CÆLATURA**, or **CÆLATURA**, the art of engraving on metals, stones, woods, or the like, with instruments of steel, diamond, &c. See **SCULPTURE**.

**CÆLEBS**, in *Entomology*, a species of **CIMEX** (*Rolundatus*), brownish grey, with three points on the scutellum, and the apex yellowish. Fabricius. Found in New Holland.

**CÆLESTIANS**, the followers of *Cælestius*, a monk, who flourished under the empire of Arcadius, about the year 405, and taught much the same doctrines as Pelagius.

The native country of *Cælestius* is not certainly known; some say it was Ireland; others, Scotland; and others say that he was a native of Campania in Italy. This, however, is certain, that he was descended of an illustrious family, and that, after having applied for some time to the study of the law, he retired from the world and embraced the monastic life. He accompanied Pelagius into Sicily in 408 or 409, and afterwards, in 411, into Africa; from thence he went to Asia, Rhodes, and the neighbouring islands, disseminating the doctrines of Pelagius, so that those who embraced them derived from him the appellation of *Cælestians*. Having been constrained to leave Constantinople in the year 416, he returned to Rome in the following year, and ingratiated himself with pope Zosimus, and obtained a letter in his favour to the African bishops. In 418, however, he was banished from Rome by virtue of a law enacted by the emperor Honorius against the Pelagians; but he afterwards returned, and was again ordered to depart from Italy. Accordingly

he repaired to Constantinople, where for some time he met with a more favourable reception. At length, about the year 431, a memorial was presented against him and his accomplices, by Marius Mercator, to the emperor Theodosius, and they were ordered to depart from the city. Of his subsequent history, and the termination of his life, the ancients have furnished no records. Cave, *Hist. Lat.* t. 1, p. 385. See **PELAGIANS**.

**CÆLESTINE**. See **CÆLESTINE**.

**CÆLESTINI**, in *Ancient Geography*, a people of Italy, in Umbria.

**CÆLESTINUS**, in *Entomology*, a species of **CURCULIO**; æruleous, with the antennæ and legs sanguineous. Found in Germany.

**CÆLETÆ**, in *Ancient Geography*, a people of Thrace, separated by the Hebrus. Some of them lived near mount Hæmus, and others near mount Rhodope.

**CÆLIA**, an episcopal city of Africa, in Numidia.

**CÆLIA**, or **CÆLIUM**, a town of Italy in Apulia.

**CÆLINA**, a town of Italy on a river of the same name.

**CÆLIUS MONS**, a place of Vindelicia, N.E. of *Lacus Brigantius*, and S. W. of *Augusta Vindeliciorum*.

**CÆLIUS MONS**, the name of one of the seven mountains on which the city of Rome was founded, so called from *Cælius*, an Etrurian general.

**CÆLIUS AURICLIANUS**, the only remaining writer of the sect of the Methodists in medicine, is supposed to have been a native of Sicca in Africa, although, as Haller observes, no reference is made to that country in his work. From his style, which is harsh and barbarous, Le Clerc supposes he lived in the 15th century. The work by which he is known is a translation into Latin of the writings of Soranus, an Ephesian physician, the head of the methodic sect, to which he has added observations collected from other writers and some from his own practice. It consists of eight books, three on acute and five on chronic diseases. They were first printed, "Celerum vel acutarum Passionum Libri Tres," Paris, 1529, and "Tardarum Passionum Libri Quinque, Basilee, 1529, both in folio. Dalechamp, in 1567, published the work complete with notes, at Lyons, 8vo. It also enters into the "Medicæ Artis Principes," by Stephens and by Haller. The work has the merit of preserving fragments from the writings of several ancient authors in medicine, which would otherwise have been lost, as well as of imparting a knowledge of their doctrines. The author is very free in his censures on the works he examines, and appears to have been an intelligent and attentive practitioner. He treats of several diseases not mentioned by any earlier writers, and has some observations in surgery peculiar to himself. He mentions an instance of hydrophobia occurring in a person who had not been bitten by any rabid animal, and of hydatids in some kinds of dropsy. He had seen a fit of the gout terminate in apoplexy, in consequence of the too liberal use of bitter and acrid substances. He recommends injections of oil for the cure of ascariæ, or to destroy those worms; and has numerous other observations equally pertinent and ingenious. Le Clerc *Histoire de Med.* Haller. *Bib. Med.*

**CÆMENT**, in a general sense, any composition of a glutinous or tenacious nature, proper to bind, unite, or keep things in cohesion.

The word is also written *cement*, and even *ciment*. It is formed from the Latin *cementum*, of *cedo*, I beat. Though M. Feltheim observes, what the ancient architects called *cementum* was a very different thing from our *cement*. The name *cement*, with them, signified a kind of masonry, or

manner of laying the stones, and even the quality of the stones; as when the walls were built of rude, unequal stones. In reality, the stones were cut for such work, but not squared or uniform; so that *cæmenta* stood opposed to *quadriti lapides*.

CÆMENT is particularly used in *Architecture*, for a strong binding sort of mortar, used to bind or unite bricks or stones together, for some kind of mouldings; or to make a block of bricks, for the carving of scrolls, capitals, &c.

It is of two sorts: the *hot cæment*, which is the most common, is made of resin, bees-wax, brick-dust, and chalk, boiled together. The bricks to be cæmented are heated, and rubbed one upon another, with cæment between.

The *cold cæment* is less used; and is made of Cheshire-cheese, milk, quick-lime, and whites of eggs.

Mortar, solder, glue, &c. are *cæments*. The BITUMEN brought from the Levant is said to have been the *cæment* used in the walls of Babylon.

Equal quantities of powdered glass, sea-salt, and iron filings, mixed with loam, made a very hard and durable *cæment*.

Mr. Boyle informs us, that the best method to close and repair pipes of subterraneous aqueducts is with tobacco-pipe clay pulverized, and mixed with a large quantity of pulverized flocks, and carefully beat up with linseed oil into a stiff paste. See MORTAR and TARRAS.

CÆMENT is also used among *Goldsmiths*, *Engravers*, *Jewellers*, &c. for a composition of fine brick-dust, well sifted, resin, and bees-wax; in use among those artificers to keep the metals to be engraven, or wrought on, firm to the block, &c. as also to fill up what is to be chiselled.

The receiver of an air pump may be fastened to a metal-plate by means of a cæment of bees-wax and turpentine, made with equal parts, for the winter; and three parts of the former to two of the latter, for the summer. We have various receipts for making cæments to mend broken china and glasses: one of the finest, and at the same time strongest cæments for this purpose, is the juice of garlick, stamped in a stone mortar; this, if applied with care, will leave little or no mark. Another cæment for broken glasses, china, or earthen ware, may be prepared by beating the white of an egg very clear, and mixing it with fine powdered quick-lime; or isinglass; powdered chalk and a little lime may be mixed together, and dissolved in fair water; with which the glasses, &c. are to be cæmented, and then set in the shade to dry.

Drying oil with white lead is also frequently used for this purpose; but where the vessels are not exposed to heat or moisture, isinglass glue, with a small quantity of tripoli, or chalk, is better.

Some have recommended a cæment made by tempering quick-lime with the curd of milk, till it become of a proper consistence for use; but as cheese has a greater degree of tenacity than milk, the following composition will be preferable. Let the thin shavings of sweet cheese be stirred with boiling water; and when the tenacious slime has been worked with other hot water, let it be mixed on a hot stone, with a proper quantity of unslaked lime, into the consistence of a paste, and it will prove a strong and durable cæment for wood, stone, earthen-ware, and glass; and it has this advantage, that when it is thoroughly dry, it will receive no injury from water. C. Pajot, of Charmes, lately transmitted to the Philomathic Society and the National Institute of France, small bits of glass, which he had joined and soldered so firmly that the glass would rather break close

to the junction than in the fracture; but he concealed his process for this purpose. However, it is not difficult to be ascertained. By interposing between the broken parts a glass ground like a pigment, but more easily fusible than the pieces to be joined, and then exposing them to such a heat as will fuse the cementing ingredient, the pieces will be made to agglutinate without being themselves fused. A glass fit for the purpose of cæmenting broken pieces of flint glass may be made by fusing some of the same kind of glass, previously reduced to a powder, along with a little red lead and borax, or with the borax only.

A cæment may be prepared for chemical glasses that will bear the fire, by mixing equal quantities of wheat-flour, fine powdered Venice glass, pulverized chalk, with half the quantity of fine brick-dust, and a little scraped lint, in the whites of eggs: this mixture is to be spread upon a linen cloth, and applied to the cracks of the glasses, and should be well dried before they are put into the fire.

Old varnish will likewise answer the same purpose. A very useful cæment for joining alabaster, marble, porphyry, and other stones, may be prepared in the following manner. Melt two pounds of bees-wax, and one pound of resin; add a pound and a half of the same kind of matter pulverized as the body to be cæmented is composed of, and stir them well together; let the mass be kneaded in water, and heated when applied to the heated parts of the body to be cæmented. The colour of this mass may be adapted to that of the body on which it is employed, by varying the proportion of the powdered matter added to the mass of bees-wax and resin.

Jewellers, in joining pieces of precious stone that are accidentally broken in the operation of setting, employ a small piece of gum-mastic applied between the fragments, previously heated so as to melt the interposed gum. They are then pressed together so as to force out the redundant quantity of it. The Turkey cæment for joining metals, glass, &c. is prepared by dissolving five or six pieces of mastic of the size of peas in a sufficient quantity of spirits of wine, and dissolving as much isinglass (previously softened in water) in brandy or rum, as will make two ounces by measure of strong glue; and adding two small bits of gum-galbanum, or ammoniacum, rubbed or ground till they are dissolved; let the whole be mixed with sufficient heat, kept in a stopped phial, and when used set in hot water.

Kastelyn recommends a cæment for filling up cracks and fissures in iron vessels, which consists of six parts of yellow potter's clay, one part of the filings of iron, and a quantity of linseed oil sufficient to form the whole into a paste of the consistence of putty. A durable cement for joining the flanches of iron cylinders, and other parts of hydraulic and steam engines, may be formed by boiling linseed oil, litharge, red or white lead, duly mixed, and applied on each side of a flannel filling the joint, which should be put between the pieces before they are closely united by screws or other fastenings. Another cæment that will stand the action of boiling water and steam, may be prepared by rubbing in a mortar and thus mixing together two ounces of sal-ammoniac, one ounce of flowers of sulphur, and 16 ounces of cast iron filings or borings. When this cæment is wanted for use, one part of the above powder, and 20 parts of clean iron borings or filings, should be intimately blended by grinding them in a mortar, and when used, moistened with water, and applied to the joints with a wooden or blunt iron spatula.

Copper-smiths often apply to the rivets and edges of sheets of copper in large boilers, and in order to secure cocks from leaking, &c. a mixture of pounded quick-lime

lime with ox's blood. This must be used when fresh made; and it is both cheap and durable.

For an account of Higgins's water cæment for building, repairing, and plastering walls, and for other purposes, see *Stucco*.

The best cæment for electrical purposes is made with two parts of resin, two of bees-wax, and one of the powder of red ochre. These ingredients are melted, and mixed together in any vessel over the fire, and afterwards kept for use. This adheres well, is less brittle than resin, and insulates as well. A strong cæment for such purposes may be made by melting one pound of resin over a slow fire, and adding to it as much plaster of Paris, as is necessary to sufficiently harden it; and then adding a spoonful of linseed oil, stirring it during the mixture. A cæment for glass-grinders may be prepared by mixing fine sifted wood-ashes with boiling pitch, and adding a little tallow, as may be found necessary. Shell-lac is a good cæment for holding metals, glass, or precious stones, while they are cut, turned, or ground. Flour paste is used as a cæment by book-binders and paper hangers; and they sometimes mix with the wheaten flour a fifth or sixth of its weight of powdered resin or alum, and if it be desired of a more tenacious consistence, they add gum-arabic, or any kind of size. Japanese cæment, or rice glue, is made by well mixing rice-flour with cold water, and gently boiling it. This is extremely useful on a variety of occasions; particularly in the preparation of curious paper articles, as tea-trays, dressing-boxes, and other such things, which require layers of papers to be cæmented together. With this composition models, busts, statues, and basso-relievos, may be formed; and they admit of a high polish.

For the manner of preparing a cæment to bind together the various embellishments of grottos, see *Grotto*. See also *GLUE*, *LUTE*, *PASTE*, *PUTTY*, *SIZE*, and *SOLDER*.

*CÆMENT*, for *gilding fish*. See *GILDING of fish*.

*CÆMENT*, in *Chemistry*. See *CÆMENT*.

*CÆMENT, calcareous*. See *CÆMENTS, calcareous*.

*CÆMENT, or ziment copper*, is copper precipitated from vitriolic waters by iron. The name is derived, it is said, from a vitriolic water in Hungary, called *ziment*.

*CÆMENT-pots*, in *Assaying*, are vessels made for the cementation of metals. See *CÆMENTATION*.

*CÆMENTARIUS*, in *Entomology*, a species of *CANCER*, (*Aflacus*.) with a smooth cylindrical thorax, obtuse front, and aculeated hand claws. This kind is frequent in the rivers of Chili. *Molin. Hist. Nat. Chili*.

*CÆMENTATION*. See *CÆMENTATION*.

*CÆN*, Lat. *Cadomus*, in *Geography*, a city of France, before the revolution, the capital of Lower Normandy, now the capital of the department of Calvados, seated in a vale at the conflux of the rivers Orne and Odon, and communicating, at the distance of about seven miles from the sea, with the English channel. Its northern and southern suburbs contain 30,900, and its two cantons 36,817 inhabitants; its whole territorial extent comprehends 87½ kilometres, and 12 communes. The four towers of its castle were built by the English; its town-house is a large building with four towers; its royal square, or place royale, is spacious and regular, having fine houses on three sides of it, and in the middle an equestrian statue of Louis XIV. in a Roman habit. The abbey of St. Stephen was erected by William the Conqueror, and he was buried in it. The university of Caen was founded by John, duke of Bedford, regent of France, by the authority of his nephew Henry VI. in 1431, and its establishment, together with the privileges granted by him, was confirmed in 1439, by two bulls of Pope Eugenius IV. Its academy of literature was instituted in 1706.

This city has had good trade, which has principally consisted in cloths and fine linen.

*CÆN*, as a part of Normandy, was formerly subject to the kings of England. In the year 1104 it was seized by Philip the August, king of France, and remained under the dominion of that crown till the year 1246, when it was captured, after a long and destructive siege, by Edward III. In 1417, it was again taken by the troops of Henry V. and remained in the possession of the English till the year 1448, when it was taken by Charles VII. king of France. N. lat. 49° 11' 10". W. long. 0° 21' 47". High water at spring tides at 9 o'clock.

*CÆN*, is also the chief city of Cayenne in South America. See *CAYENNE*.

*CÆNE*, or *CÆNOPOLIS*, in *Ancient Geography*, a town of Peloponnesus in Laconia, placed by Pausanias at the distance of 40 stadia from the promontory of Tænarus, and anciently denominated Tænarum. It had two temples, one dedicated to Ceres, and another to Venus.

*CÆNE*, or *CÆNOPOLIS*, the *Cænæ emporium* of antiquity, a town of Egypt in the Panopolitan nome, mentioned both by Herodotus and Ptolemy, and supposed to be the present *Ghenné* or *Kenné*; which see.

*CÆNE*, a small island in the Mediterranean, between Sicily and Africa. *Pliny*.

*CÆNE*, or *CÆNÆ*, *Senn*, a town of Asia in Mesopotamia, on the bank of the Tigris, overagainst the mouth of Zabus Minor.

*CÆNEUS*, in *Entomology*, a species of *PAPILIO* with very entire suffuscous wings; posterior pair beneath with a red orb consisting of nine spots. This is a native of South America. *Linn. &c.*

*CÆNI*, in *Ancient Geography*, a people of Thrace mentioned by Livy and Steph. Byz., and called *Cenici* by Pliny. They are supposed to have inhabited that part of Thrace, which is contiguous to the Propontis. Their country was called *Cænica regio*, and Pliny places it in the colony Flavio-polis.

*CÆNINA*, a town of Italy on the confines of Latium, and the country of the Sabines, whence some geographers make it a city of the Sabines, and others refer it to the ancient Latium. Cluverius places it on the banks of the Anio next to Rome; but Hoiftenius thinks that it stood on the opposite bank in the vicinity of the present Monticelli. *Fellus* says, that it derived its name from *Cenis* its founder; and *Dionysius of Halicarnassus* informs us, that it was one of the first cities which declared against Romulus. In the contest its king was slain, and the Cæniveses defeated. Their city was rased, and the inhabitants removed to Rome, where they enjoyed the privileges of the most ancient citizens. It afterwards became a Roman colony.

*CÆNIS*, or *SENIS*, a town and promontory of Italy, in Brutium, upon the straits of Sicily, N. of Rhegium, and opposite to Messina or Messina.

*CÆNITARUM insula*, an island mentioned by *Arrian* in his *Periplus of the Erythrean sea*, and supposed to be the *Kavathra* of *Ptolemy*.

*CÆNON*, a place of Asia in Armenia Minor, mentioned by *Strabo* and *Plutarch*.

*CÆNON Hydreuma*, a place of Egypt, in the route from *Coptos* to *Berenice*.

*CÆNOPHRURIUM*, a place of Thrace in the road from Constantinople to Heraclea, according to the Itinerary of Antonine. Here the emperor Aurelian was slain. It is placed by *M. d'Anville* N.W. of *Selympria*.

*CÆNOPOLIS*. See *CÆNE*.

*CÆNOPTERIS*, in *Botany*, (from *κανος*, new, and *πτερις*, a fern),

a fern) Berg. Ad. Petrop. 1782. p. 248. Schreb. 1634. (Dæca, Jul. 15) Class and order, *Cryptogamia Filices*.

Gen. Ch. Fructifications in lateral, nearly marginal, lines; covered with a membrane opening on the outside.

Sp. 1. *C. rhizophylla*, Smith ic. incd. 2. 50. "Frons bipinnate, rooting at the tip; pinnules inversely egg-shaped, somewhat sickle-shaped, petioled; primordial leaves l. b. d." *Stipe* round, brown; common peduncle or rachis round, brown, smooth, elongated at the tip, leafless, bulbiferous, rooting; partial peduncles green, flattened, sometimes winged; pinnules alternate, on short petioles, inversely egg-shaped, one-nerved; fructifying, slightly sickle-shaped, often toothed at the tip, even, the upper ones usually confluent; all dusky green. *Fructifications* in short, solitary, lateral lines, beginning at the nerve towards the base of the pinnules, and covered with an entire scarious brown membrane, opening always on the outside, at length turned back and permanent. When the capsules have emerged from the fructifying chink, numerous forked, brown, glossy threads stand out, which are the expanded rings of the capsules. Found by Thiers in the island of Dominica. 2. *C. japonica*, Thunb. Linnaean Transf. v. 2. p. 341. (Trichomanes japonicum, Thunb. Flor. japon.) "Frons super-decomposita; pinnules cut in three divisions, acute." 3. *C. cicutaria*, Smith (Asplenium cicutarium, Swartz.) See ASPLENIUM 39.

CAENURGIA, in *Geography*, a town of Thrace, placed by Ptolemy in the province of Rhodope.

CAENUS, a river of Galha Narbonensis, supposed to be the *Orc*, which see.

CÆR, in *British Antiquity*, a term which, like the Saxon Chester, denotes castle, and is prefixed to the names of places fortified by the Romans.

CAERDIFF, in *Geography*. See CARDIFF.

CÆRE, in *Ancient Geography*. See AGYLLA.

CÆRESI, a people of Germany, placed by Cæsar (Bell. Gall.) between the Condresi and Pæmani, and referred by d'Anville to the vicinity of the river Chiers, which runs from Luxemburg into the Meuse.

CAERFILLY, CAERPHYLLYON, or CAERPHILLY, a small town of Glamorganshire, South Wales, formerly by traditionary account much larger than it is now, is only remarkable for the ruins of its once extensive castle, and the historical events connected with it. The name Caerphili signifies castle of halles, and it is said that great numbers of hands were employed to raise this fortress with expedition. Its ground plan covered an area of two acres, and its foss was crossed by thirteen drawbridges. At present the ruins, says Mr. Evans, "more resemble the remains of a city, than a single edifice; and when undilapidated, exceeded the enormous site of Windsor castle." The citadel, with circular bastions, a range of apartments round the inner court, the grand hall, some towers, &c. are still remaining, and whether viewed as objects of picturesque beauty, or specimens of ancient castellated architecture, they are highly interesting. Within two moats is the citadel, appearing like a separate castle, with a high Gothic arch, the centre supported by two circular bastions. This great gateway, the western entrance of the ruin, is grand and perfect, and leads to the stupendous structure of the inner court from the well, as the gate with the hexagonal towers does from the cast. The inner court is surrounded by a range of noble apartments, communicating with a long gallery, to which there is an ascent from the mint, and affording a ready intercourse between the guards, who occupied the embattled towers. This corridor remains entire from the extent of about 90 to 100 feet, on the south side, except in the breaks of the stair-cases. The great hall,

which is spacious and complete, exhibits a fine specimen of Gothic grandeur; and the ornamented outline of its four windows and chimney-pieces are hardly to be paralleled, together with several light pillars in triplets, that go round the room, which is about 70 feet by 30, and 17 feet high. The north window of the chapel is not only perfect, but uncommonly light and elegant. The mint is underneath, near the inclining tower, arched in a curious manner, and furnished with two furnaces for melting metal. In the interior court, at the east end, is the *leaning tower*, an object of considerable curiosity and general admiration. It is of a circular shape, about 70 feet high, and inclines full 11 feet out of the perpendicular. About half way down from the summit a fissure divides it, which was probably made when it was undermined. A similar instance of a leaning tower exists at Bridgenorth, others at Corfe castle, and the most considerable we have heard of is that at Pisa in Italy. The immense pile of Caerphilly castle appears to have been erected at different times, and the style of building displayed in some of the exterior works indicate the time of Edward II. Here that ill-fated monarch fixed his dernier resort, when pursued by his unnatural and brutal queen. With his favourite the younger Spencer, he retreated here from the forces belonging to the queen and barons, who besieged the castle, A. D. 1327, but the monarch, however, afterwards escaped. The late Mr. Daines Barrington has offered, in the first volume of the *Archæologia*, some reasons for supposing that Caerphilly castle was built by Edward I. and in his authority many late modern writers have acquiesced. But Mr. Malkin (*ubi infra*) has suggested a variety of circumstances, which invalidate this account; and particularly that of king Edward having no jurisdiction at that time in Glamorgan. From some historical documents, deduced from Welsh authors, it is inferred, that this castle was built, or rebuilt and fortified, in 1221, by John de Bruse, who married the daughter of Llewelin ap Iorwerth, prince of North Wales; and that, after it had been taken and partly ruined, in 1270, at which period it first obtained the name of Caerphilly in the Welsh history, it was rebuilt by Ralph Mortimer, who married Joan of Acres in the time of Edward I. and settled this castle on him and his heirs; and that, in process of time, it was again greatly augmented and strengthened by Hugh Spencer the younger, whose wealth appears to have been fully equal to such an undertaking. Many important public events are connected with the history of this once formidable fortress. The trade of Caerphilly has lately improved in consequence of the establishment of three woollen manufactures; the effect of which is observable in traffic on the roads, and population in the town. "Evans's Tour through South Wales," 8vo. 1804; and Malkin's "Scenery, Antiquities, and Biography of South Wales," 4to. 1804.

CÆRIANA, a town of Spain, placed by Ptolemy in Bætica, in the country of the Turdetani.

CÆRITES, CÆRITUM *tabula*, in *Antiquity*, denote the censors' tables, wherein were entered the names of such persons as, for some misdemeanour, were to lose their right of suffrage in elections at Rome.

The original of the appellation arose hence; that during the captivity of Rome under the Gauls, the Cærites, or inhabitants of Cære, a city in Etruria, preserved their sacred books, and other matters belonging to the worship of the gods; in gratitude for which, the Romans dignified the Cærites with the appellation of Roman citizens, but without admitting them into any part of the administration. See AGYLLÆI.

CAERLEON, in *Geography*, a small town of Monmouthshire, England, is more celebrated for its ancient, than for

for its modern importance. Under the Anglo-Roman dynasty, it was the *Hea Silurum*, the *Caer Legionis Secundi* of Antoninus, and the seat of government in that division of this island called *Britannia Secunda*. During the height of Roman splendour and dominion, this place continued a scene of pomp and luxury, as may be fairly inferred from the following description, by Gyraldus Cambrensis, who wrote in the 12th century. "Many remains of its former magnificence are still visible. Splendid palaces, which once emulated with their gilded roofs the grandeur of Rome, for it was originally built by the Roman princes, and adorned with stately edifices; a gigantic tower, numerous baths, ruins of a temple, and a theatre, the walls of which are *partly* standing. Here we still see, both within and without the walls, subterraneous buildings, aqueducts, and vaulted caverns, and floves so excellently contrived, as to convey their heat through secret and imperceptible pores," &c. In confirmation of the monk's account, various antiquities discovered at different periods bear ample testimony. Earthen vessels of curious workmanship, tessellated pavements, phials, brass fibula, Roman bricks inscribed "L. g. II. Aug.;" an altar to the emperor Aurelius Antoninus; another to Jupiter, under the appellation of Dolichenus, as the patron of iron mines; another, as supposed, to the goddesses *Ailræa*; and many other votive altars, monuments, statues, inscriptions, and Roman coins from Cæsar to Valentinian inclusive; with most of the intermediate emperors.

In several places the walls are still visible, but scarcely sufficient to point out the original extent of the city. While the name of the parish, *Llangattoek juxta Caerleon*, seems to favour the opinion that the old city was wellward of the present town, perhaps most of the buildings on that side were extra-mœnia, and formed suburbs, as appears from the direction of the western wall. Several bagnios and sudatories have been found, with pillars formed of circular bricks, not unlike those used by Palladio in some of the public structures at Venice. North of the town is a high mound of earth, called the *Keep*, said to have had formerly a strong tower on its summit; and a variety of stones lying at its base strengthen the assertion. It was probably a Roman edifice. On a rising ground, about half a mile distant, is a large square encampment, and seven smaller ones are in the vicinity.

Caerleon appears, on a superficial view, to occupy a flat position; but in reality, that portion of the present town, which is inclosed by the Roman walls, is placed on a gentle rise, connected at one extremity with the lower part of the eminence, on which the encampment of the *Lodge* is situated. This rise shelves on the west and south sides towards the *Urk*, and on the east towards the *Avon Llwyd*, and seems to have formed a tongue of land, which, before the draining of the meadows, was probably a kind of peninsula. Hence, the fortress, from its position on a rise between two rivers, and almost surrounded with marshy ground, was a place of considerable strength, and well adapted to become the primary station of the Romans in *Britannia Secunda*. The æra in which this Roman fortress was built, cannot be precisely ascertained; but Horsley supposes, that the Romans first settled here in the reign of Antoninus Pius. It is mentioned in Antonine's *Itinerary*; and the numerous coins of the early emperors, which have been discovered here, seem to confirm this opinion. The walls, however, appear to have been constructed under the lower empire.

According to Richard of Cirencester, Caerleon was a Roman colony, and the primary station in the country of the *Silures*. In a field close to the banks of the *Urk*, and near the south-west side of the wall, is an oval concavity, measur-

ing 7½ yards by 6½, and 6 in depth. The natives call it "Arthur's round table;" but it is, without doubt, the site of a Roman amphitheatre. Within the memory of many persons now living, stone seats were discovered on opening the sides of the concavity; and in 1706 a figure of *Diana*, with her tresses and crescent, moulded in alabaster, was found in this place.

When the Britons had submitted to the Roman power, Caerleon, under the auspices of Antoninus, became the seat of learning and devotion. Three Christian churches were quickly erected; one accompanied by an order of nuns, another by a house of regular Cistercian canons, and a third was honoured with the metropolitan see of *Wales*; and, according to the annals of the church, *Dubricius*, the great opponent of the Pelagian heresy, was the first archbishop. The remains of the monastery may be traced in an old house, and the quadrangle round which the different buildings were arranged is still visible. This city was the birth-place of the great *Amphibalus*, tutor to the martyr *St. Alban*, and the burial-place of *St. Julius* and *St. Aaron*, who preached the gospel here, and suffered martyrdom under the persecuting reign of the sanguinary *Dioclesian*. After that period, Caerleon increased in learning, piety, and consequence. When the Saxons invaded this country, the university was in such a flourishing condition, as to contain, among numerous other students, two hundred philosophers well skilled in geography and astronomy. (Vid. *A. Elsebenis*.) Near the river are the ruins of a castle, probably erected about the time of the Norman invasion, on the site of a British fortress. We do not, however, hear of it till 1171, when Henry took the town, dispossessing *Jorwerth-ap-Owen*, lord of *Gwent*. In 1173, after a noble stand, it was retaken by Owen, and given up to the Welsh in exchange for the prisoners. After several sieges, it was retained by *Llewelyn-ap-Jorwerth*, and his descendants, till the time of Edward I. Vide *Powel's History of Wales*.

The present town consists of two or three small streets, and many of the houses are in a state of dilapidation. The most decent building is a charity-school, for maintaining and educating 30 boys and 20 girls, till they attain the age of 14, when they are apprenticed with a bounty of seven pounds to the former, and four to the latter. They are clothed in a dress of blue cloth, with a badge of white, containing the initials C. W. alluding to the founder, who, as appears from an inscription on the building, was *Charles Williams* esq. a native of the town. The spirit of the place seems in unison with its appearance; being chiefly inhabited by a poor indolent set of people; alike unaffected by the greatness of the past, as inattentive to the advantages of their present condition. The town consists of 148 houses, contains about 660 inhabitants; has a weekly market on Tuesday; and is situated 146 miles W. from London. *Evans's Tour through South Wales*, 8vo. 1804. *Coxe's Historical Tour in Monmouthshire*, 4to. 1801.

CAERMARTHEN is the county town of Caermarthenshire, South Wales. It is large, populous, and tolerably well built; the streets are spacious, but some of them steep and irregular, and many of the houses good; they are generally whitened, and the chimnies are constructed of red brick, which present an unpleasant glare to the eye. Among the public buildings are a handsome church at the end of *Prior-street*, and a new elegant county-hall built of free-stone, with colonnades of the *Ionian* order; the upper part of which is for the transaction of public business, and the under is used as a covered market. Situated upon a small elevation, on a fine navigable river, in the middle of a fruitful vale, and having no town of note in its vicinity; its markets are large

and well supplied; provisions in general are cheap, and fish exceedingly reasonable. A considerable iron foundery and tin-plate manufactory furnish employment to a number of hands. The smelting houses for lead ore, dug in the northern part of the county, belonging to lord Cawdor, are now shut up. Here are a small port and quay for coasting vessels, principally to Bristol and London. The tide rises at the bridge from eight to twelve feet; but, owing to the shallows in the bed of the river below, vessels of much burthen find a difficulty in coming up to the quay. Since the decline of the trade at Kidwelly, that of Caermarthen has increased; and with spirit and property much more might be done. Here is a rope-walk; and a few vessels are built for sale. Adjoining Lamma-street are the walls of a priory of Fratres Grisei: this was a cell in the custody of the abbey of St. Augustine at Bristol. In Priory-street the shell of another religious house is still standing, which was appropriated to Black Friars, or canons of St. Augustine, and founded before the year 1148. The entrance into the court is by a bold gateway, over which are the arms of the founder. The principal apartments are still distinguishable, and the tracery of some of the windows almost entire. Gyraldus mentions it as being, in his time, surrounded with brick walls; some remains of which, towards the river, are still extant. This town is famous for having given birth to Merlin Ambrose, the reputed magician, of whom many fabulous stories have been related. Selden considers Merlin or Merdhin (whence Caerfyrddin) as having derived his name from the town; but the general opinion is, that Caer-Merdin, or Merlin's town, was so called from Merlin's being found there. Not far from the town is a hill, called Merlin's Hill, near the brow of which is a rock, known by the name of Merlin's Chair, in which, it is said, that famous prophet used to sit, when he uttered his prophecies. Caermarthen lays claim to Roman origin. It was the *Mari-dunum* of Antoninus, and long the seat of the South-Wallian princes, where they held their great national councils, or occasional parliaments. Nor is it less conspicuous on the subsequent page of history. It was esteemed of so much importance as to become an enviable object with every hostile party, and repeatedly sacked, pillaged, and burnt, by both friends and enemies. By whom it was fortified, and its castle built, there are no authentic documents to show; nor do we hear much of it, till the æra of difficulty and conflict to the Welsh, occasioned by the unjustifiable invasion and unprecedented cruelty of the Anglo-Normans. On the accession of Henry I. to the throne, Wales became a new theatre for the display of iniquity; and the oppressive measures and alienations of property, which before were chiefly confined to the borders, were extended to the interior: in consequence of which the royal residence was removed to Dinevor, and Caermarthen was rendered a strong fortified post. In 1116 we find it in the hands of the English, held for the king by Owen ap Caradoc. But Gryffydd ap Rys, who well knew the importance of this place, sent spies to survey the works and ascertain their strength: having received a favourable account, he suddenly marched at night, rushed on the town, and by a coup de main took possession. The governor was killed, the garrison fled; and Gryffydd, having burnt the place, and dismantled the castle, returned with his spoils to his residence at Strata Tywy. It was again laid in ashes, in 1137, by Owen Gwynedd; rebuilt and fortified by Gilbert earl of Clare; about the year 1143; taken by Cadell son of Gryffydd ap Rys; and again in possession of the English under William Tuberville, who, when it was besieged by Rhys in 1158, destroyed the bridge, at that time of wood, for its better security and de-

fence. Though Rhys was unsuccessful at this time, he took and despoiled it in 1195, after quelling the unnatural rebellion of his sons. In the reign of John, 1215, it was taken; and the castle was raised in 1222 by Llewelyn, who, taking advantage of the absence of the earl of Pembroke, the governor, took this fortress and Cardigan, putting the garrisons to the sword. We find it soon afterwards in the possession of the English, when the same earl of Pembroke, having confederated with the Welsh, blockaded it ineffectually for three months. The remains of this important fortress are still visible on a rocky eminence: additions have been lately made, and it is now used as the county gaol. When this territory was erected into a principality by the crown of England, the chancery and exchequer courts were held here. Caermarthen was created a borough town, 38 Henry VIII. with the privilege of returning one member to parliament. It contains 945 houses, and 5548 inhabitants, has two weekly markets, Wednesday and Saturday; considerable trade, but no internal manufacture; and is situated 226 miles W. from London. Evans's Tour through South Wales, 8vo. 1804.

CAERMARTHENSHIRE is one of the southern counties of Wales, bounded on the north by Cardiganshire, on the east by Brecknockshire, on the west by Pembrokeshire, and on the south by Glamorganshire and part of the sea. Its extent from east to west is above forty-five miles, and only about twenty in the longest diameter from north to south. The general surface of this tract of country is hilly, which in the northern and eastern parts rise into mountains. As in most hilly territories, the vallies are chiefly narrow, and well watered with mountain streams, which in stormy weather rush down in torrents. Among the vales that of the Tovy or Tawy is the principal: this crosses the whole of the county, and in some places is above two miles in breadth, and abounds with beauties.

The principal rivers are the Tovy, the Taw, the Cothy, the Dulas, and Gwilly: the former has its source among the Cardiganshire mountains, and after its entrance into this county, at the northern boundary, is reinforced by a continual succession of those numerous streams which give beauty and fertility to the landscape. Before the Tovy reaches Caermarthen it receives the Cothy and Gwilly; the Cowen brings with it the Towa and Carkenny; and the Taw receives the Morlas and Cair.

The climate and soil of this county are much celebrated, though the lands are not found favourable to wheat. Barley and oats are the most profitable crops, and great quantities of the latter are annually exported to Bristol. Black cattle and horses are bred in abundance on the hills, and are the chief article of traffic in the neighbouring fairs. Wood, though still plentiful, has suffered great defalcation of late years. The county abounds with limestone, and coal is obtained in many parts of it. Iron-works, tin-works, and lead mines, also abound, which, combining with the local advantages, and with a supply of butter, stone-coal, bark, and oak timber, render the export trade very considerable.

Caermarthenshire is divided into six hundreds, and includes six market-towns, and eighty-seven parishes, which are within the diocese of St. David's and province of Canterbury. It returns two members to the imperial parliament, one for the county, and one for the principal town. Some vestiges of Roman roads, and other monuments of remote antiquity, are remaining visible in this county. Near Whitland is a circle of upright stones; and between the rivers Cowen and Towa is a remarkable barrow, which enclosed a kilnvaen. At Whitland is an encampment supposed to be Roman from the Roman coins that have been found within its vallum.

vallum. The ruins of several castles are still standing in different parts of the county. Malkin's "Scenery, Antiquities, and Biography of South Wales," 4to. 1804. Evans's "Tour through South Wales," 8vo. 1804. Barber's "Tour throughout South Wales," 8vo. 1803.

CAERNARVON, the principal town of Caernarvonshire, is justly the boast of North Wales, for its situation, buildings, harbour, &c.; but above all, for the grandeur of its once magnificent castle. It is situated on the eastern bank of the river Menai, the strait that divides the isle of Anglesea from the other parts of Wales. This was the ancient *Segontium*, mentioned by Antoninus; it was a Roman station in the time of Constantine; and Matthew Paris says, the body of Constantine, the father of that emperor, was found buried here, A. D. 1283. The site of the old city is about a mile distant, by the road to which from Pwllheli it is intersected. The remains of a Roman road are still visible from this place to Dinorwig. It lies on the eastern banks of the Seiont. Some remains of the walls are still to be seen, the cement of which appears as hard as the stone itself. A single stone remains here, with these letters S. V. C. probably for *Segontium Urbs Constantini*; Helen, or her husband Constantine, having built it. It was defended by a fort, erected on the steep western bank of the Seiont, where it forms a curve, about four hundred yards from the present town. The walls are about twelve feet high, and about eighty yards square, with circular parallel holes running the whole length. Where the facings are dilapidated, the peculiarity of Roman masonry is easily discoverable. This town, after the departure of the Romans from the island, was occupied by the Britons, and by them denominated *Caer-ar-fo*n, i. e. a strong hold opposite Mona, which with the insertion of *n* for harmony, made Caernarvon. Gyraldus mentions it as a considerable place in 1138; and a charter, dated 1221, issued by Llewelyn the Great, proves that it did not receive this name from king Edward. At a very early period it was the seat of the British princes. Roderic resided here in 750; and by a posterior Roderic the royal residence was removed to Aberffraw in Anglesea. Out of the ruins of the ancient town arose the present, which by a charter of king Edward I. was made a free borough, governed by a mayor, who is pro tempore deputy-governor of the castle, one alderman, and two bailiffs; there are also a town-clerk and two sergeants at mace. The town sends one member to parliament, who is returned by the joint suffrage of Conway, Pwllheli, Nefyn, and Crickaeth; and the right of voting extends to every person resident in these places. An extraordinary privilege was granted to Caernarvon, that no burges could be convicted of any crime, committed between the Conwy and the Dovy, but by a jury of his townsmen. The town was originally contained within its present walls, but the suburbs are become of greater extent than the town: the streets are at right angles corresponding with the four gates; the houses are well built, and the streets clean, but, as in all other ancient towns, narrow and confined. It is become a place of fashionable resort, during the summer season; the elegant hot and cold baths, erected by the earl of Uxbridge, having added greatly to its celebrity. On the outside of the walls is a broad and pleasant terrace walk along the side of the Menai, extending from the quay to the north end of the walls, which is a fashionable promenade in fine evenings. Caernarvon is in the parish of Llan-Beblic, and the church is situated about half a mile from the town. It contains nothing remarkable, except a marble monument, with two recumbent figures of sir William and lady Griffith of Penrlyn, who died in the year 1587. The service is always performed here in the Welsh language. There is an

English service every Sunday morning and afternoon, in the chapel of ease to this church, situated on the north-west corner of the town: the former is generally very well attended.

The entrance to the port of Caernarvon is rather dangerous, from the extensive sand-banks near; but the harbour is capacious, and vessels of six or seven hundred tons ride in security; and the quay is peculiarly convenient, as large vessels can come close to it, and deliver and take in their cargoes. The trade has of late years been increasing, though at present it consists more of exports than imports. Slates, &c. are sent to Liverpool, Bristol, and London; copper ore from Llanberis and Paris Mountain to Swansea; flannels, webs, stockings, and an ochre found in Anglesea, to America and the West Indies. The imports consist chiefly of Irish cloth, fine wool, hides, tallow, and grocery goods, for the use of the interior. There is a weekly market on Saturday. The county assizes are occasionally held here; and the room over the eastern gateway, formerly used as a custom-house, is converted into the sessions-house, where all the county business is transacted. This was done, as an inscription in front informs us, by the munificence of sir William Wynne, and his nephew Thomas Wynne esq. A. D. 1767. A new custom-house is erected within the walls on the Menai, much more convenient for the commerce. The port is subject in its customs to the comptroller of Beaumaris. Caernarvon is distant from London 244 miles N. W.

CAERNARVON is also a township of America, in the county of Lancaster and state of Pennsylvania.

CAERNARVON *Castle* is the most magnificent fortress in North Wales. It is well situated for natural strength; one side bounded by the Menai, another by the æstuary of Seiont, a third by a creek of the Menai, and the fourth isolated by art. The site was admirably calculated for a strong post, and could not fail to strike a prince of military talents, like Edward, as a proper place to erect a curb for his newly conquered, and consequently dissatisfied, subjects. As the conqueror of the country, there is great reason for supposing that monarch to be the founder of the present edifice, (perhaps on the ruins of one more ancient,) to check the spirit of insurrection that might arise in Snowdonia, as he did on the Denbighshire side by the castles of Conway and Rhuddlan. The observation of Mr. Barrington seems well founded, that the plans of the Welsh castles, erected by Edward I. were borrowed from the Asiatic fortresses which that prince had seen in the Holy Land, because they appear precisely similar to many copied and inserted in the valuable tracts of Le Brun. After the conquest was nearly completed, in 1282, the castle was begun; and in little more than a year this immense building was finished. For still further to subdue the haughty people, already mortified by a foreign yoke, he imposed on them the hateful task of forging chains for their country, and putting the last fatal hand to its independence. The peasantry were compelled to perform the required labour, and their chieftains to defray the expence incurred. It is built of a mixture of lime and grit-stone: some of the materials were furnished by the ruins of the old town, and some were brought from Vaenol. It forms a bold and striking object, and the shell is nearly entire. The entrance into the castle is grand, between two massy towers; in front of which, over the gateway, is placed a statue of the royal founder, with a dagger in his hand, in a menacing posture. This was defended by four portcullises. The form of the castle, inclosing an area of about three acres, is oblong: the towers are elegant, some pentagonal, some hexagonal, and others octagonal; two of these are pre-eminent: and of these, the eagle tower, so called

called from a figure of that bird placed at the top, is peculiarly beautiful, three small angular turrets issuing from it. A magnificent apartment is shewn in this tower, where, by the well known artifice of Edward I. his queen Eleanor was delivered of her son Edward, the first prince of Wales, April 25, 1234. The walls of the eagle tower are ten feet thick, and those of the fortrefs in general eight. A gallery runs all round, with frequent openings for the discharge of arrows on the besiegers. A short time after the erection of the castle, the strength and importance of it were to be tried. A general insurrection was excited in different parts of Wales, in 1204, on occasion of a subsidy levied on the new subjects. Madoc, an illegitimate son of the unfortunate Llewelyn, styling himself prince, put himself at the head of the insurgents of North Wales, and proceeded to Caernarvon, which was crowded with people attending an annual fair. The unarmed multitude were barbarously slaughtered, the town reduced to ashes, and the castle taken. In 1404 this fortrefs was blockaded by Owen Glyndwr's adherents, but was so bravely defended for the king, that the besiegers, finding their efforts fruitless, thought proper to retire. In 1644 the town was taken by captain Swanley, a parliamentarian, who pillaged it of the stores, arms, and ammunition, making four hundred prisoners: the royalists afterwards dispossessed him. While lord Byron was governor, it was besieged by general Mytton in 1646, and surrendered on an honourable capitulation. In 1648, general Mytton and colonel Mason were blockaded by sir John Owen, who, hearing that colonels Carter and Twissleton were advancing to relieve the town, raised the siege and marched to oppose them. The parties met at Llandegai; sir John was defeated and made prisoner, and North Wales soon after submitted to the parliament. This castle, like its rival in strength and grandeur, Conway, is going fast to decay; and the dilapidating hand of time promises soon to deprive the country of one of its principal architectural ornaments. Evans's "Tour through North Wales," 8vo. 1802. Bingley's "North Wales," 2 vols. 8vo. 1804.

CAERNARVONSHIRE, is the name of one of the counties of North Wales. It is the most mountainous district in the whole principality, and assumes a truly rugged and alpine appearance. The most central part of it is occupied by that vast eminence, named Snowdon, with several other subordinate hills. This county is very irregularly shaped, and is bounded by the sea on the west and south, the straits of the Menai, which separate it from Anglesea, to the north, and the counties of Merioneth and Denbigh to the east. This area of country measures about forty miles from north to south, and twenty from east to west. It is divided into seven hundreds, which are again subdivided into seventy-one parishes. The principal places in the county are the city of Bangor, the town of Caernarvon, and the town of Conway. According to the population reports, published by the house of commons, the whole district contains 8433 houses, and 41521 inhabitants, of whom most are employed in agriculture and mining.

All the mountains in this county, as well as some of the low grounds on the western side, are commons; the former are chiefly depastured by sheep, and the latter by black cattle. It is a custom among the farmers to meet annually, and determine what number of sheep each shall send to the mountains; yet in spite of any argument, the pasture is generally overstocked. It is common with some persons to sell this privilege at 4d. per head for the season, which is commonly from May, when the sheep are driven up, until Michaelmas, when they are brought down. In most de-

scriptions of this county, it is stated, that the families go up and wholly live on the mountains in the summer season, to attend their flocks, to make cheese, &c. but this is denied by Mr. Kay in his "General View of the Agriculture of the County," who says, that no such custom prevails. The wethers only are sent up, and the ewes are always kept in the low grounds with their lambs. When the latter are weaned, the ewes are milked for about two months; and the produce of these is mixed with the cows' milk for making of cheese.

The exportation of flates is the principal trade from this county. These are shipped in large quantities from Caernarvon; and it is calculated by Mr. Kay, that above 35,000l. worth are annually sent from this part of the country. Wool is also an object of considerable importance to the farmers and peasantry, many of whom are employed in manufacturing it into cloths, flannels, &c.

Of the rivers in Caernarvonshire, the Conway is the principal. This bounds the eastern side of the county, and is navigable for about 12 miles from the sea up into the interior of the country. Increased by various mountain torrents, it sometimes swells itself into a vast expanse, and in the early part of its course forms some grand cascades. Many of the rivers of this county either proceed from, or form in their course, lakes of various sizes. These are chiefly in the declivities of the mountains, and most of them are abundantly stocked with fish, among which, the char, and the gwyniad, are very prevalent.

The most considerable mountains are Snowdon and Penmaen-Mawr. The former is estimated to measure 3456, or, according to other statements, 3568 and 3600, feet above the level of the sea at Caernarvon Quay. It is connected with a chain of other hills ranging through the county in a direction from N. E. to N. W., extending from Aberconway to the sea, at Aberdaron. The rocks composing the higher part of this chain, are principally porphyry, granite, and granitel of Kirwan; the secondary rocks are chiefly hornblende, schiller-spar, toadstone, schistus-mica, schistus-clay, mixtures of quartz, feld-spar, and mica, with argillaceous schistus in all its varieties. On the western side are a number of basaltic columns on a bed of hornstone, or chert; and large coarse crystals, cubic pyrites, and various mineral bodies are found in the fissures. In the schistose rocks are several slate quarries; and great quantities of stones are cut, and annually sent hence to London, Dublin, &c. Many rare and curious plants are found on these mountains, and on the borders of the lakes. The whole of the county was formerly known by the name of Snowdon, and a great part of it is still distinguished by the appellation of Snowdonia. The mountains between Conway and Caernarvon seem embosomed in one another, and from the Anglesea shore are seen to rise, range after range, in three gradations. The lower valleys and bases are generally very fertile and temperate, and consequently are chosen as the scenes of habitation and cultivation. The second range affords some pasturage and fuel, such as long grass, peat, and furze. The highest ridge is nearly divested of vegetation, and partakes of the temperature of the frigid zone. Snow remains here nearly three quarters of the year; and is often found at the latter end of June.

The scenery of Caernarvonshire is peculiarly grand, romantic, and picturesque. Its narrow glens, expanded lakes, roaring cascades, and "tempest-torn rocks," conspire to render it eminently attractive to the painter, whilst its mineralogical and botanical productions are equally enticing to the mineralogist and to the botanist. For further particulars relating to the history and antiquities of particular places in this

this county, see under the heads BANGOR, CONWAY, CAERNARVON, &c. This county returns two members to parliament. It is in the diocese of Bangor, and province of Canterbury. Kay's "View of the Agriculture of North Wales." A Sketch of the History of Caernarvonshire. Evans's Tour through North Wales. Aikin's Journal of a Tour through North Wales.

CAERSWS, at present a small hamlet, situated on the Severn, above New Town, in Montgomeryshire, North Wales, but formerly a town of considerable antiquity, and probably a Roman station, as is inferred from the fine hewn stones for building, and several bricks common in Roman cities or places possessed by the Romans when in Britain. It had also a castle and a church, and the form of three camps is still discernible in its vicinity. The Roman road, or causeway, called Sarn-Sws, runs here towards Meifod, and may be traced to the banks of the Tyrnwy, near Llyfin.

CÆRULATA, in *Entomology*, a species of PHALÆNA, (*Geometra*) with obscurely green wings, banded with brown, and two cæruleous bands. Fabricius.

CÆRULEA, a species of CHRYSOMELA, of a blue colour with violaceous thorax. Geoffroy. Inhabits France.

CÆRULEA, a species of NECYDALIS, cæruleous, with the hinder thighs clavated and arcuated. Fabricius.

CÆRULEA, in a species of CICINDELA, of a shining blue colour, with the mouth white. Inhabits the great sandy deserts of Siberia. Pallas.

CÆRULEA, a species of PIMELIA, (*Sepidium*), cærulefcent, with a roundish thorax, and striated elytræ. Fabricius.

CÆRULEA, in *Ichthyology*, a species of CORYPHÆNA, wholly cæruleous. Bloch. Found in the American ocean, clothed with large scales, compressed, and above convex.

CÆRULEA, in *Ornithology*, a species of ARDEA, called by Latham the blue heron, and blue bittern of Catesby. The back of the head is crested; colour of the body blue. Brisson calls it canerophagus cæruleus. It is the black and blue gaulding of Ray and Sloane.

There are several distinct varieties of this bird, one of which is blue, with the head and collar of a rufous brown colour; and another has the blue of the body tinged with green, with the chin and throat white. Inhabits America.

CÆRULEA, the species of ALCEDO called by Latham the white-collared kings-fisher; *ispida indica torquata* of Brisson. This bird is of a blue colour, beneath rufous, with the eye brows and collar white. Length seven inches. Inhabits India.

CÆRULEA, a species of PROCELLARIA, bluish cinereous, beneath white, with the beak and legs cinereous; the blue petrel of Latham.

CÆRULEA, a beautiful bird of the CERTHIA, or creeper, genus from Cayenne. The prevailing colour of the plumage is blue, with the band across the eyes, chin, wings, and tail, black. Gmelin, &c.

CÆRULEA, a species of COLUMBA, cæruleous; the beak, legs, and covers of the wings, red; the blue pigeon of Latham, and the tlacapoilotl of Ray. Found in New Spain.

CÆRULEA, the species of MUSCICAPA, called by Latham the azure fly-catcher, cæruleous; with a black spot on the occiput and breast; the abdomen and vent bluish-white, and the feathers of the wings and tail bluish-black. Found in the Philippine Isles.

CÆRULEA, in *Zoology*, a species of NEREIS, smooth and cærulefcent. Fabricius.

CÆRULOCEPHALA, in *Entomology*, a species of CANTHARIS, (*Malachius*), described by Thunberg. The

thorax is red, emarginate; wing-cases fuscous; anterior part of the head red; posterior blue-black. Inhabits Europe.

CÆRULOCEPHALA, a species of BOMBYX, common in various parts of Europe, and in England known by the trivial name of the figure-of-eight moth. The wings are greyish, varied with brown, with a large double irregular whitish spot. Linn. &c. The larva feeds on apple and on other fruit trees.

CÆRULOCEPHALA, in *Ornithology*, a species of ALCEDO, or kings-fisher, found in the island of Madagascar. The prevailing colour is blue above, beneath rufous; throat white; quill-feathers blackish.

The length of this bird is four inches, and it has the bill and legs of a red colour. Buffon calls it martin-pêcheur à tete bleue, and petit martin-pêcheur du Senegal. It is the blue headed kings-fisher of Latham.

CÆRULOCEPHALUS, in *Entomology*, a species of CURCULIO, violet coloured, with the thorax and elytræ testaceous. Found in Saxony.

CÆRULOCEPHALUS, in *Ornithology*, a species of PSITTACUS, cæruleous, with the belly, rump, and tail green, crown yellow, and feathers of the wings and tail red; the red and blue parrot of Willughby and Latham. Found in Guiana.

CÆRULESCENS, in *Entomology*, a species of CANCER, abundant in the seas between the tropics. The colour is bluish; thorax smooth; beak advanced, subulate, and furnished with two teeth. Fabricius. A crab of a small size.—Also, a species of CRYPTOCEPHALUS (*Cistela*), black, with the striated elytræ cærulefcent. Found in Barbary.

CÆRULESCENS, a species of CERAMBYX (*Saperda*) that inhabits Germany. The thorax is unarmed, cylindrical, white-blue; three lines on the thorax and scutell pale. Scopoli Schranck, &c.

CÆRULESCENS, a species of CHRYSOMELA (*Altiua*) of a greenish blue colour, and very glossy; thorax smooth; antennæ and legs rufous; posterior thighs black. Degeer.

CÆRULESCENS, a species of CARABUS, of a blackish blue colour, with the base of the antennæ red. Fabricius. Inhabits Europe.

CÆRULESCENS, a species of NECYDALIS, with a roundish thorax, and cæruleous sub-opaque body. Fabr.

CÆRULESCENS, in *Ornithology*, a species of ANAS, called by Latham and other English writers the BLUE-WINGED-GOOSE. This kind inhabits North America; the colour is fuscous, beneath white; wing-coverts and posterior part of the back bluish. Brisson calls it anser sylvætris fœti Hudsonis; Buffon, l'oie des Esquimaux. Obs. The bill and legs are red; crown yellowish, rest of the head, with the collar, white; shoulders and tail waved with white and grey.

CÆRULESCENS, a species of RALLUS, light-red, beneath bluish, the beak and legs red, the vent white, with black transverse striz on the abdomen; the blue-necked rail of Latham. Found at the Cape of Good Hope.

CÆRULESCENS, in *Zoology*, a species of COLUBER, found in South America and India, smooth, cærulefcent, and an acuminate lead-coloured head.

CÆRULEUS, in *Entomology*, a species of CIMEX, described by Linnæus in his Fauna Succica as being entirely of a blue colour and without spots.

CÆRULFUS, an European species of CARABUS, described by Müller. The colour is black, with cyaneous wing-cases; antennæ, feelers, and legs fulvous.

CÆRULFUS, a species of RHINOMACER, cærulefcent, with the base of the antennæ and legs yellow.

**CÆRULEUS**, a species of **SCARABÆUS**, oblong and wholly cyanous. Found in Siberia.

**CÆRULEUS**, a species of **CUCAJUS**, black, with a filicated thorax, striated cæruleous elytra, and red abdomen. Fabr. Found in Germany.—Also, a species of **CRYPTOCEPHALUS**, azure, with brown antennæ. Found in the equinoctial part of Africa.

**CÆRULEUS**, in *Ornithology*, a species of **CUCULUS**, with a roundish tail and blue body. The beak, legs, and claws, are black; the remiges and tail are green and violet. Found in Madagascar. This is the blue cuckoo of Latham, and taitfon of Buffon.

**CÆRULEUS**, the name of a small species of **PARUS**, called in England the blue-titmouse. The quill-feathers of this bird are bluish; primaries whitish at the outer margin; front white; crown blue. Linn. *Fn. Suec.*

This kind inhabits Europe. Its length is about four inches, frequents gardens, and does considerable damage by bruising the young buds in quest of insects, on which it feeds.

**CÆRULEUS**, a species of **ORIOLEUS**, black or cinereous, with the head, wings, and tail cæruleous. This is the *Xanthornus cæruleus* of Brisson, the small blue jay of Ray, and blue oriole of Latham. The beak is red.

**CÆRULEUS**, a species of **RAMPHASTOS**, cæruleous with a mixture of cinereous; the blue toucan of Latham; found in New Spain.

**CÆRULEUS**, in *Zoology*, a species of **COLUBER**, found in America, cæruleous, with the scales white on one side, and beneath white.

**CÆRULEUS** is also a name given by Solinus to the "great Indian worm," described by Pliny and others as inhabiting the Ganges. It is conceived with much probability that all the accounts we have of this monstrous animal are only false descriptions of the crocodile.

**CAERWENT**, in *Geography*, a village of Monmouthshire, England, about 4 miles from Chepstow, in the road to Newport, was a place of great importance in the Roman times, and is distinguished in the Itinerary of Antoninus by the name of *Venta Silurum*. This station was found, like many Roman military works, with a fortification, assuming in ground plan the parallelogramic shape, with the corners a little rounded. Such figures were called *terriata castra*. Each corner nearly corresponded with the four cardinal points. At the south-west side are three pentagonal bastions; from which circumstance some writers have inferred that the town was founded under the lower empire, as flanking projections were not in use before that period. Other authors refer the building of the walls to the Saxons, but from the mode of constructing them, the size and quality of the bricks, and other evidences, this seems very improbable. The circuit of the rampart, nearly a mile in extent, may still be traced, and in most places is surrounded by a deep foss. The present walls are about nine feet in thickness at the top, and twelve feet at the base. The inclosed area is laid out in fields, and orchards; and a few cottages, with the church, parsonage, &c. occupy the site of Roman mansions and Roman temples. Foundations of these, projecting above the level, and concealed under green hillocks, rise in many places, and columns, tessellated pavements, and coins, are continually discovered in ploughing and digging. A curious tessellated pavement was discovered about 40 years ago, and preserved under a shed constructed for that purpose. It is seven yards long and six broad, within a border of variegated stones; it contains three rows of three circular and spiral figures, not unlike those in many of our Turkey carpets, but

formed of tessellæ of various colours, neatly put together. Some have supposed, that the exploits of Arthur were performed at this place; and that when this was totally destroyed, they were transferred through ignorance or flattery to the other Caerwent or Winchester, at a time when it was one of the most important cities of the island. *Venta Silurum*, afterwards *Caer Gwent*, is supposed to have possessed sufficient consequence to give name to the county of Monmouth, and those parts of Herefordshire and Gloucestershire, which long retained the appellation of *Gwent-Land*. In a MS. of Llandaff, *Caer-Gwent* is mentioned as a place dedicated to learning, and far famed for its academy, which a disciple of St. Germanus governed with great commendation. Evans's *Tour through South Wales*, 8vo. 1804. Barber's *Tour throughout South Wales*, 8vo. 1803.

**CAERWENT**, or **CAER-GWENT**, *q. d. white city*, is also a name given by the first Celtic settlers in South Britain to the present city of Winchester, on account of the chalky cliffs that encompassed it. Under this appellation it has been recognized by the most ancient writers, domestic and foreign, who have recorded the early state of Britain. It was then no more than a collection of long cabins, built of mud, covered with reed and sheltered by the large spreading bows of the contiguous forest, and surrounded with a rampart and ditch for protection from the assault of neighbouring tribes. The adjoining fields were devoted to the fattening of flocks and herds, on the flesh and milk of which the inhabitants subsisted, before they were acquainted with the luxury of bread, and whilst they were averse from the labours of tillage. It was afterwards occupied by the Belgæ, who practised agriculture, and raised corn for the purpose of making both bread and beer, made cheese of their milk, and wore manufactured cloathing instead of the raw hides with which their predecessors were covered. When they took possession of it, it was called "*Venta Belgarum*." In 516, it was taken and almost totally demolished by Cerdic the Saxon commander; and afterwards denominated "*Wintanceaster*," or Winchester, which name expresses its former importance as a Roman station. Miller's *Hist. of Winchester*, vol. i. p. 6. See **WINCHESTER**.

**CAERWYS**, a small town of Flintshire, North Wales, appears to have been a Roman station, and also a place of judicature, or the *eisteddfod* of the ancient Britons. The town now consists of four spacious streets, crossing each other at right angles. Several Roman coins, and an inscribed stone have been found here. In the vicinity of the town are many tumuli; but *Caerwys* is principally celebrated for its *eisteddfod*, where the sessions of bards and minstrels were held for many centuries. Judges were appointed, and bards of acknowledged merit, and minstrels were admitted as competitors for the prize of fame. The judges were nominated by a commission from the provincial prince, till after the conquest of Wales by Edward I., when the English monarchs sanctioned this *eisteddfod*, as an institution calculated to soften the manners of a fierce and warlike people. Previous to this, we find that *Gruffydd ap Cynon*, contemporary with king John, enacted that no person should follow the profession of a bard, or minstrel; who was not regularly admitted by the *eisteddfod*, which was alternately held at the three royal residences, of *Caerwys*, *Aberfraw*, and *Mathravel*. In 1568, a commission was granted by queen Elizabeth, for holding an *eisteddfod* at this place, when 55 degrees were conferred on the most eminent candidates; 17 in vocal, and 38 in instrumental music. From this period the *eisteddfod* was neglected, till 1798, when a meeting was assembled by a public notice from

from the Gwyneddigion, or Vendotian Society instituted in London for the encouragement of Welsh literature. On this occasion the town hall was prepared for the reception of a numerous and respectable company. Twenty bards, eighteen vocal performers, and twelve harpers, assembled here, and each exhibited specimens of his respective profession and talents. The present town consists of 162 houses, contains 773 inhabitants, has a small weekly market on Tuesday, and is 212 miles N. W. from London. Evans's "Cambrian Itinerary," Svo. 1802.

**CÆSALPINIA**, in *Botany*, (named by Plumier in honour of Cæsalpinus, chief physician to pope Clement VIII.) Linn. Gen. 515, 516. Schreb. 701, 703. Willd. 815. Juss. 349. Vent. 376, 377. Gart. 442, 467. Class and order, *decandria monogyna*. Nat. ord. *Lomentaceæ*, Linn. *Leguminosæ*, Juss.

Gen. Ch. *Cal.* perianth of one leaf with five divisions; tube short; segments oblong, deciduous, the lowest longer than the rest, slightly vaulted. *Cor.* petals five, inserted into the throat of the calycine tube, unequal. *Stam.* filaments ten or five, inserted into the throat of the calyx, thread-shaped, woolly or hairy at the base, declining; anthers oblong, decumbent. *Pist.* germ superior, linear-oblong, compressed, attenuated at the base; style thread-shaped, stigma blunt. *Peric.* legume oblong, compressed, one, two, or many-celled. *Seeds* rather egg-shaped, compressed, flat.

Eff. Ch. *Calyx* with five divisions; the lowest segment longer and slightly vaulted. *Stamens* woolly or hairy at the base. *Petals* five. *Legume* compressed.

Obs. These characters are so drawn up as to include Tournefort's Poinciana which has been admitted as a separate genus by Linnæus, Jussieu, Ventenat, Gærtner, La Marck, Bosc, and Poiret, the successor of La Marck in the botanical part of Encyc. Methodique; but as, according to La Marck, Poinciana differs from Cæsalpinia chiefly in the great length of its stamens, and the deep divisions of its calyx, the two genera have been incorporated by professor Martyn and Willdenow.

Sp. 1. *C. brasiliensis*, brasil-wood or brasiletto, Linn. Sp. Willd. Brown Jam. 227. "Stem and leaves without prickles." Linn. "Without prickles; leaflets ovate-oblong; rachis pubescent; calyx downy; stamens shorter than the corolla." Swartz. Observ. 166. This is said by Linnæus and Miller to be the tree which furnishes the brasil-wood, so well known in commerce and the arts. But La Marck, who has entirely omitted this species, asserts that the true brasil-wood is the next species which does not occur in any of the works of Linnæus; and it is worthy of notice that Mr. Miller, in direct opposition to the specific character of Linnæus, describes his *C. brasiliensis* as armed with recurved prickles, corresponding with the descriptions of the brasil-wood given by the older botanists, all of which are quoted by La Marck as synonyms of his *C. echinata*. The synonym of Brown is however an original authority for the existence of a species without prickles; and on this account we have followed Willdenow in admitting the *brasiliensis* of Linnæus as well as the *echinata* of La Marck. 2. *C. echinata*, La Marck, Willden. Pseudofantalum rubrum, five Arbor Brasilia: Bauh. Pin. 393. Rai Hist. 1736. *Acacia* Gloriosa Spinis armata, cujus Lignum Brasilia dictum Tinctoria; Pluk. Alm. 5. Ibirá Pitanga, Marg. Pison. "Stem and branches prickly; leaflets egg-shaped, obtuse; legumens echinated." A large tree. *Branches* long and spreading. *Leaves* alternate, twice-winged; leaflets resembling the leaves of box. *Flowers* in simple racemes, variegated with yellow and red, sweet-scented. *Legumes* dark-brown, oblong, compressed, beset with small points. *Seeds* reddish brown, smooth. The

interior wood is of a red colour, and is covered with so thick an alburnum, that of so vast a tree only a very small part is fit for the use of the dyer. It cannot be used without alum and tartar, and produces only a fugitive colour. Boiled in beer, wine, or vinegar, with the addition of alum, it makes a red ink. By the means of acids it becomes a kind of carmine; and, with different modes of treatment, is the basis of various pigments. It takes a good polish, is very hard and dry, crackles in the fire, and burns with very little smoke. A native of Pernambuco and other parts of Brasil. 3. *C. bahamensis*, La Marck. (Pseudo-fantalum croceum, Sloane, Jam. Hist. 2. p. 184. Catesb. Car. 2. p. 51. t. 51.) "Branches prickly; leaflets inversely egg-shaped, emarginate; flowers white." A shrub or small tree. *Branches* and common petioles armed with short, scattered prickles, which are turned upwards. *Leaves* twice-winged; leaflets smooth on both sides; pale beneath, and of a delicate green above; having, at their base, and at the base of each pinnule, from two to four small, straight prickles. *Flowers* whitish, in straight racemes. *Legumes* oblong, pointed, peduncled, compressed. *Seeds* small, roundish. La Marck observes, that on account of the prickly branches, it cannot be referred to the *brasiliensis* of Linnæus, under which that author quotes the synonyms of Sloane and Catesby. A native of Bahama and Jamaica, whence it is brought to Europe for the use of the dyer. Large quantities of it were formerly cut down in some of the Bahama islands, but it is now nearly extirpated. 4. *C. vesicaria*, Linn. (Colutæa Vera-crucis, Pluk. tab. 165. Senna spuria fabinæ odore, Sloan. Jam. Hist. 2. p. 50. t. 181. f. 2, 3. Rai. dend. iii. No. 18.) "Stem prickly; leaves inversely egg-shaped; racemes spiked, flowers yellow." La Marck. "Leaves inversely heart-shaped, roundish." Linn. A tree. *Stem* about fifteen feet high, nearly the thickness of a man's thigh, rather crooked, covered with an even, whitish bark. *Branches* crooked, prickly. *Leaves* alternate, twice-winged; leaflets obtuse, a little emarginate, those at the summit of the wing a little larger than the rest; with a few hooked prickles at the base of each pair of leaflets, and each pair of wings. *Flowers* yellow in several distinct spikes. *Legumes* oval, nearly obtuse, blackish, furrowed. *Seeds* two or three. La Marck. Legume without valves, nearly filled with a spongy substance; two celled, with a single seed in each cell. Gærtner, 442. tab. 144. Obs. Professor Martyn and Willdenow quote Poinciana bijuga of Linnæus, as a synonym of this species, and suppose that it has inadvertently been described twice, under different names, and placed in distinct genera. Poiret, who retains the genus Poinciana, though, as he himself acknowledges, without sufficient reason, takes no notice of *bijuga*, and therefore seems to be of the same opinion; but in that case he ought to have noticed the omission, as his predecessor La Marck, when he wrote the article *Cæsalpinia vesicaria*, had certainly no idea that the Poinciana *bijuga* is the same plant. Martyn and Willdenow prefer the trivial name *bijuga*, and give the following specific character, "Prickly; leaves doubly pinnate with two pairs of obovate leaflets; they and the calyxes smooth; stamens equalling the corolla." A native of the West Indies. 5. *C. crispa*, Linn. Sp. Pl. *C. polyphylla aculeis horrida*, Plum. gen. 26. t. 68. "Prickly; leaflets oval; racemes simple; calyx smooth; petals egg-shaped, shorter than the calyx; stamens longer than the calyx." A small tree, or rather shrub, about four feet high. *Bark* rather thick, ash-coloured without, red within. *Wood* solid, heavy, easily cleft, of a red colour, with a white alburnum. *Trunk* divided near its summit into several branches, nearly the size of a man's arm; and armed

with numerous, scattered, short, hooked, strong, blackish prickles, each situated on a tubercle. *Leaves* alternate; leaflets smooth, of a pleasant green colour. *Flowers* pale green or whitish, with only five stamens, in upright racemes forming a pyramid. La Marek, from Plumier's MSS. A native of the Antilles, where it is called *brasilletto*, from the resemblance of its wood to that of brazil. 6. *C. sappan*, Linn. Sp. Pl. Roxb. Corom. 1. p. 17. t. 16. Gart. tab. 144. l. 1. La Marek Illust. Pl. 335. fig. 1. (Ligno brasiliano simile, Bauh. Pin. 393. Rai. Hist. 1737. Lignum Sappan, Rumph. Amb. 4. p. 56. t. 21. Thiam pangam, Rheed. Mal. 6. p. 3. t. 2.) "Prickly; leaflets oblong, not equilateral, obtuse, a little emarginate." A small tree. *Trunk* from ten to fifteen feet high. *Leaves* large, twice-winged; pinnules from twelve to fifteen; leaflets numerous, crowded, smooth, finely striated, obliquely truncate at the base. *Flowers* yellow, sweet-scented, in racemes. *Legume* somewhat woody, thick, short, somewhat rhomboidal, beaked, and one-celled, two-valved. *Seeds* about four, large, ovate-oblong, smooth. A native of the East Indies, Siam, the Molucca Islands, and Japan. Its wood is used for cabinet work; and, being very durable in sea water, is excellent for trenails in ship-building; when boiled in water, it yields a blackish colour, which, with the addition of alum, becomes red, and is much used for dyeing woollens and cottons of a beautiful red colour. 6. *C. mimoides*, Willd. La Marek. Pl. 335. f. 2. (Kal-todda-waddi, Rheed. Mal. 6. p. 15. t. 8. Mimosa malabarica, Rai. Hist. 1740.) "Stem, petioles, and peduncles prickly; leaflets, oblong, obtuse, small; legumes woolly." A shrub about four feet high. *Leaves* twice-winged, resembling those of several species of acacia, sensitive, with two or three large prickles at the base of each wing. *Flowers* large, yellow, in a long raceme; petals unequal, rather longer than the stamens. *Legumes* containing one or two seeds. A native of Malabar, communicated to La Marek by Sonnerat. 7. *C. pulcherrima*, Barbadoes flower fence, or Spanish carnation, Willd. Martyn. (Poinciana pulcherrima, Linn. Sp. Pl. Reich. La Marek Pl. 333. Bosc. Nouv. Dict. Pl. M. 26. Poiret Encyc. Meth. v. 5. p. 447. Brown Jam. p. 225. Jacq. Americ. 122. Tourn. Inst. 619. t. 391. Crista pavonis, Breyn. Prod. 2. p. 37. Cent. 61. t. 22. Rai. Hist. p. 901. Erythroxylo ind. Herm. Prod. 333. Senna spuria flore ex luteo & rubro, Sloane Jam. 2. p. 49. Acacia orientalis, Plukn. Al. 5. Tiffetti mandaru, Rheed. Mal. 6. 1. t. 1.) "Prickly; leaflets oblong-oval, emarginate, smooth; calyx smooth; corymbs simple; petals fringed; stamens very long." A shrub about twelve feet high, with a grey, smooth bark. *Branches* spreading, armed at each knot with two short, strong, crooked spines. *Leaves* alternate, twice winged; leaflets from five to ten pairs, a little narrowed at the base, smaller on the upper leaves; emitting, when bruised, a strong odour like favin; with one gland at the base, and another on the upper part of the common petiole, and two small sharp joints a little above the base of the partial petiole. *Flowers* in a terminal, loose corymb, sometimes approaching to an umbel; on simple, smooth peduncles, two or three inches long; leaves of the calyx egg-shaped, concave, deciduous; petals beautifully variegated with red and yellow; stamens at least three times as long as the petals. *Legume* oblong, compressed, coriaceous, many-celled, two-valved; partitions rather thick, composed of rigid bristles, thickly matted together. *Seeds* one in each cell, ovate-quadrangular, thick, flat on both sides, smooth, a little polished, of a chestnut colour. A native of the East and West Indies. In Barbadoes it is planted in hedges, and makes a beautiful fence. In Jamaica its leaves are used as

a purgative, instead of senna. All its parts are thought to be powerful emmenagogues, and are frequently used for that purpose by the negroes. Its wood is said to afford a good dye. 8. *C. elata*, Willd. (Poinciana elata, Linn. Sp. Pl. Forsk. Flor. Ægypt. 86.) "Unarmed; leaflets linear, obtuse with a point; corymbs compound; calyxes coriaceous, downy; petals fringed; stamens very long." A shrub or small tree. *Branches* pubescent. *Leaves* alternate, twice-winged; leaflets in about twenty pairs, minute, almost smooth. *Flowers* in terminal corymbs, on short, stiff, thick, alternate peduncles; leaves of the calyx united at their base, lanceolate, pubescent, a little reflexed. *Legume* almost smooth, often depressed between the seeds, sharp at each end. A native of the East Indies. 9. *C. coriaria*, Willd. (Poinciana coriaria, Jacq. Amer. 123. t. 175. f. 136. Siliqua arboris Guatapanæ, Breyn. Cent. p. 58. f. 5) "Unarmed; leaflets linear, obtuse; racemes panicled; calyxes smooth; stamens twice as long as the corolla." A shrub from twelve to fifteen feet high, much branched, with dark-coloured spotted bark. *Leaves* alternate, twice-winged; leaflets small, smooth, about three lines long. *Flowers* small, yellow, in a terminal, close, spikelike raceme, on short, simple, peduncles, with little smell. *Legumes* elongated, obtuse, short, a little bent, spongy. A native of Curaçoa and Carthage; in salt marshes. The Spaniards and natives use the ripe pods for tanning leather, and call them *libidibi*.

*Propagation and Culture.* As all the species are natives of warm climates, they are cultivated in Europe only as ornamental plants; and though none of them have hitherto flowered in our stoves, the elegance of their foliage, and the singularity of their habit, give them a distinguished place in collections of exotic plants. They can be raised only from seeds sent in the pod from their native country, and afterwards steeped in water till they are swollen, and their envelope a little softened; but if kept dry, will preserve their vegetative power several years. The seeds, when taken from the water, must be sown in pots filled with a mixture of common mould and bog-earth, in nearly equal proportions, and plunged into a hot bed of tanner's bark, kept at a moderate warmth. The plants, if sown at the end of March or beginning of April, will appear in the course of May or June, and when they are three or four inches high, should be transplanted singly into separate pots, with a larger proportion of good mould. In autumn they must be removed from the hot-bed into the stove, and during the first winter must be carefully preserved from cold, humidity, and insects, and furnished with fresh air in the day-time, when the weather is favourable. They succeed better in a light, than a strong argillaceous earth.

CÆSALPINIA, Fl. Zeyl. 157. See GUILLANDINA *Bonduc*.

CÆSALPINOIDES. See GLEDITSCHIA *Triacanthos*.

CÆSALPINUS, ANDREW, in *Biography*, born at Arezzo in Tuscany, in the early part of the 16th century, was educated under Luke Ghines, director of the public garden at Pisa, whence he appears to have taken his taste for botany, which he cultivated with assiduity and success. But he became still more eminent for his skill in anatomy and medicine, and for his intimate acquaintance with the works of Aristotle, whose philosophy he explained and defended, in his "Questionum Peripateticarum Libri Quinque," against the doctrines of Galen, then generally followed. This was published at Venice in 1571, 4to. After taking his degree of doctor, he was made professor in medicine and anatomy in the university at Pisa, and continued in that office several years, until invited to Rome, and made first physician and archiater to pope Clement VIII. He died at Rome, aged 84 years, in 1603. His works are numerous, and give equal proofs of genius and learning.

“De Plantis Libri xvi,” Florent. 1583, 4to. He compares the seeds of plants to the eggs of animals; the seed sowing, he says, to defend and nourish the germ until it has taken root in the earth. He also formed a system of arrangement, dividing the plants into classes, from the fructification; but as there are no engravings, or delineations of the plants, and he only gave the trivial names, the work is of little value at this time. He left a hortus siccus of 750 plants, which is said to be now in being. His speculations in anatomy are still more ingenious. He describes very clearly the circulation of the blood through the heart, and was acquainted with the uses of the valves. Douglas thinks him entitled to equal praise with Harvey, who only completed what he had nearly achieved. He clearly, Douglas says, describes the contraction and dilatation of the heart, which is shewn from the following passage from his fourth book, “*Quæstionum Peripateticarum.*” “*Vasorum in eor definitum quædam intronmittunt contentam in ipsis substantiam, ut vena cava in dextro ventriculo, et arteria venalis in sinistro; quædam educunt, ut arteria aorta in sinistro ventriculo, et vena arterialis in dextro; omnibus autem membranæ sunt appositæ et officio delegatæ ut oscula intronmittentium non educant et educentium non intronmittant. contingit corde contrahente, seu arterias dilatari, et dilatente contrahingi; dum enim dilatatur cor, claudi vult orificia educentium, ut ex corde non influat tunc substantia in arterias, contrahente autem se, influere dehiscens membranæ.*” The pulse, he thinks, depends on an effervescence of the blood in the heart. His works on the practice of medicine have also their portion of merit. “*Quæstionum Medicarum Libri ii.*”; “*De Facultatibus Medicamentorum Libri duo.*” Venet. 1593, 4to. Bleeding can only be advantageously used in the beginning of fever. In putrid fever the cure is to commence with clearing the stomach and bowels. “*Speculum Artis Medicæ Hippocraticæ, exhibens dignoscendos curandosque morbos, in quo multa visuntur, quæ præclarissimis medicis intacta relicta erant.*” Lion. 1601-2-3, 3 vol. 8vo. treating of the *Materia Medica*, fevers, lues venerea, &c. in which disease he very much extols the use of guaiacum. Douglas. Bib. Anat. Specimen. Haller. Bib. Bot. Med. et Anat.

CÆSAR, in *Roman Antiquity*, was a long time used for the heir intended, or presumptive, of the empire; as *king of the Romans* is now used for that of the German empire.

The Cæsars were a kind of adjuncts or associates of the empire, *participes imperii*. They wore the imperial mantle, purple, and diadem, and walked with other marks of the sovereign dignity: they were created, like the emperors, by putting on the purple robe.

The dignity of Cæsar remained the second of the empire, till Alexius Comnenus made Nicephorus Melissenus Cæsar by contract, and it being necessary to confer some higher dignity on his own brother Isaacius, he created him Sebastocrator, with the precedence over Melissenus, ordering that in all acclamations, &c. Isaacius Sebastocrator should be named the second, and Melissenus Cæsar the third.

The title took its rise from the cognomen, or surname of the first emperor, C. Julius Cæsar, which, by a decree of the senate, all the succeeding emperors were to bear. Under his successor, the appellation Augustus being appropriated to the emperors, in compliment to that prince, the title Cæsar was given to the second person in the empire, though it still continued also to be given to the first, and hence the difference between Cæsar used simply, and Cæsar with the addition of Imperator Augustus. Authors are divided as to the origin of the word Cæsar, the cognomen of the Gens

Julia. The more common opinion is, that the word Cæsar comes à *caeso matris utero*; because his mother's womb was cut open to give him birth.

If this opinion be true, she must have survived the operation; for we are told by Tacitus (*Dialog. de Orat.* 28.) that she took care of his education, and by Suetonius (in *Cæs. c.* 26.), that she died when her son was in the war against the Gauls. It is also known that she was alive when he was married to Pompeia. It has been alleged, however, that the words of Pliny (*H. N. lib. vii. c. 9.*), upon which this opinion is founded, have been erroneously applied to Cæsar the Dictator; whereas he meant only to express, that the first person who was surnamed Cæsar had derived his name from this circumstance.

Some pretend that the laurel crown on medals is never given to Cæsars, but only to Augusti; which is overthrown by a medallion of Maximus: not to mention another medal of the lower empire, wherein Crispus Cæsar is crowned with laurel. See AUGUST.

Card. Norris observes, that the years of the Cæsars were frequently marked on their medals; of which we have instances on the medals of Constantine, Chlorus, and divers others, whose years are expressed on their coins, though they were never more than Cæsars.

CÆSAR, CAIUS JULIUS, in *Biography*, the dictator of Rome and founder of its imperial constitution, was a descendant of the Julian family, which boasted its derivation from Venus by Æneas, the son of Anchises, to whom fabulous history ascribes the origin of the Roman state. See ÆNEAS. From the 10th year of the second Punic war, A. U. C. 546, till the time of Caius Julius Cæsar, the emperor's father, some of the family of the Cæsars enjoyed public offices in the commonwealth. The father of Cæsar died suddenly in early life, after having occupied the station of prætor: his mother's name was Aurelia; and his aunt Julia was the wife of the celebrated Caius Marius. He was born at Rome, on the 12th day of the month Quintilis, afterwards called July, A. U. C. 654, B. C. 100; and though he lost his father in his 16th year, his connections were such as to favour his introduction into life in a manner suitable to his talents. In his youth he was betrothed to Cossutia, a rich heiress; but in his 17th year he broke this engagement, and married Cornelia, the daughter of L. Cornelius Cinna; and at this time he was invested with the dignity of *flamen dialis*. When Sylla succeeded in overthrowing the Marian party, to which Cæsar owed his advancement, he was urged by this powerful dictator to divorce the daughter of his enemy; but Cæsar, resisting the injunction, was deprived of the priestly office, as well as of his own patrimony and his wife's portion, and subjected to a decree of proscription. This decree, however, was afterwards reversed, by the intercession of the Vestal virgins and some distinguished persons of his own family; although in granting their petition Sylla admonished them, that they would repent of their interference, as he foresaw in Cæsar many Mariuses. Cæsar, alarmed at his jealousy, retired from Rome, and after a short interval withdrew to the court of Nicomedes, king of Bithynia, where his conduct gave occasion to some suspicions of an infamous nature. At the siege of Mitylene, in which he was employed by Thermus, who was at this time prætor of Asia, he distinguished himself by his military valour, and obtained from his general the honourable recompense of a civic crown. Having served for a short time in Cilicia, under Servilius Isauricus, the death of Sylla made way for his return to Rome; where, declining to concur in the ambitious designs of Lepidus, he devoted himself to the study and practice of eloquence. The mal-administration of Dolabella,

Mella, who had been prætor of Mæcedon, and who had been honoured with the consulate and a triumph, afforded him an opportunity of gaining distinguished reputation among the best orators of his age, although the defence of Hortensius and Cotta, the two most celebrated pleaders of Rome, prevented his success. As at this time he does not seem to have formed, or at least to have matured, those ambitious designs which led him to prefer the career of war and politics to that of an orator, he embarked for Rhodes, with a view of gaining improvement in the art of eloquence from the instructions of Apollonius Molon, one of the most eminent rhetoricians of that period. In his passage thither, he was captured by some pirates who infested those seas; and during his confinement he exhibited those peculiar and extraordinary talents, which were afterwards exemplified in the progress of his life. His captors demanded 25 talents for his ransom, but he informed them that they were not duly apprized of the importance of their prisoner, and engaged to pay them 50; and whilst his domestics were deputed to raise the stipulated sum in the neighbouring cities, he remained in custody, accompanied only by one friend and two attendants, and amused himself with reciting to his barbarous auditors, whom he treated with contempt, some orations and verses which he composed for the occasion; and often, between jest and earnest, threatened them with future tokens of his displeasure, if they disturbed his repose. Having been furnished with the promised ransom by the inhabitants of Miletus, he obtained his liberty, and in that city fitted out some ships, with which he pursued and captured the pirates; and, having conveyed them to Pergamus, he there inflicted upon them the punishment of crucifixion, with which he had threatened them. He then proceeded to Rhodes, and pursued his studies. During his residence in this city, he took occasion to pass over to the continent, and though he had no commission, to raise troops, and with this force to check the progress of Mithridates, who was making depredations on the provinces in alliance with the Romans, and to preserve those cities, which were ready to revolt, steady in their allegiance. At this time he was only 24 years of age, and yet conducted this expedition with a prudence and bravery which would have done honour to the veterans in military service. On his return to Rome, the chief object of his policy was to ingratiate himself with the people, and thus to secure his advancement to those public offices, which would serve him in the accomplishment of the purposes of his ambition. Accordingly he concurred with Cicero in promoting the Manilian law, and in thus securing the favour of Pompey. In the several offices of tribune, quæstor, and ædile, he contrived by his general conduct, and by his unbounded liberality, to attach to himself the affections of the people. He testified his respect in a variety of instances to the Marian party, although by so doing he incurred the censure of the aristocracy, who charged him with meditating designs against the government. He also obtained the consulate for L. Julius Cæsar, one of his own family, who, together with his colleague C. Marcus Figulus, under Cæsar's direction and influence, condemned many of the partisans of Sylla either to banishment or to death. Catiline, however, was spared; and Cæsar is even suspected to have concurred in his conspiracy. When this conspiracy was suppressed, and the senate deliberated on the punishment to be inflicted on those that were concerned in it, he delivered an artful speech in praise of clemency, and his oration, which is still extant, and which, as a composition, has been much admired, made an impression on the assembly, which the severe eloquence of Cato was hardly sufficient to counteract. Cæsar gave a single vote against the death of the conspirators; and his in-

terference in their favour excited such indignation that he escaped with his life by the seasonable interposition of Cicero, whose testimony contributed to his justification, notwithstanding the charges alleged against him of his concern in the plot. During the progress of this contest, Cæsar indulged in the licentious gratifications of intemperance and gallantry; and Servilia, the sister of Cato, avowed her passionate attachment to him, and he was supposed to be the real father of her son Marcus Brutus. See BRUTUS. The success of Cæsar, in his competition for the office of chief pontiff, against two of the chief persons of the republic, served to augment the jealousy entertained of him by the Senatorial party. Notwithstanding the licentiousness of his own life, his pride would not allow him to submit to the suspicion of domestic dishonour; and therefore, upon the discovery of an intrigue between his wife Pompeia, whom he had married after the death of Cornelia, and P. Clodius, (see *BOXA DEA*), he instantly procured a divorce, though he did not succeed so far as to substantiate the charge; alleging in vindication of his conduct, "Cæsar's wife must not be even suspected." At this time he was serving the office of prætor, upon the expiration of which he prepared for assuming the government of Farther Spain, comprehending Lusitania and Bætica, which fell to his lot; but his creditors would have prevented his succeeding to his new province, if Crassus had not satisfied their demands. In his journey, he passed through a miserable village on the Alps; and when one of his companions jealously inquired, "whether there could be any contentions for power and dignity in such a place?" Cæsar, in token of his ruling passion, replied, "I protest that I had rather be the first man here, than the second in Rome." His rapacious disposition, like that of other Roman governors, was manifested on some occasions no less signally than his ambition. He considered his government as affording the opportunity and means of enriching himself; and, therefore, availing himself of pretexts for disputes, he marched into provinces unsubdued by the Roman arms, for the purpose of plunder; and brought back to Rome, in the following year, a sum sufficient for discharging his debts, though they are said to have amounted to 1,600,000*l.* sterling.

Having passed through the subordinate offices of the state, the next object of his ambition was the consulate. In order to the attainment of this dignity, it was necessary for him to connect himself with one of the two parties that divided the power of the state, that of Pompey or that of Crassus. In this dilemma, he determined on reconciling the two rivals; and accordingly he proposed a triumvirate, in which the whole power of the state should be lodged, and this was the first triumvirate established at Rome. See TRIUMVIRATE. By this artful expedient Cæsar by means of the interest of Pompey and Crassus, secured his election to the consulship, A. U. C. 694. B. C. 60. Cato alone foresaw the consequences of this alliance, and opposed the election; exclaiming, that Rome had lost her liberty; but his opinion was disregarded till it was too late to follow his prudent counsel. The only advantage which he and his party obtained was the election of Bibulus as Cæsar's colleague; and for this purpose they were under a necessity of counteracting Cæsar's interest in favour of another candidate, by outbidding him in the purchase of votes. As soon as Cæsar entered upon his office, he confirmed all the acts of Pompey, and proceeded to use all his endeavours for conciliating the affections of the people. With this view he proposed an Agrarian law for the division of certain lands in Campania among such of the poor citizens as had three or more children; but the senators, though they approved the act, withheld

their assent, till at length it was passed by the people, and the senators were constrained to sanction it by their assent; inasmuch that it was jocosely said, that, instead of dating any transaction of this year in the usual mode, during the consulship of Cæsar and Bibulus, it would be more proper to insert "the consulship of Cæsar and Julius." This victory over the senate and Bibulus made Cæsar absolute in Rome; and having secured both the people and knights, he governed with an uncontrollable sway.

As Cicero exclaimed against the triumvirate, and thus provoked the resentment of this body, they resolved upon his ruin, and with this view they promoted Clodius to the tribuneship, which proved eventually the cause of his banishment. The marriage of Cæsar's daughter Julia with Pompey, served to strengthen the connection between these two great men; and by marrying Calpurnia, daughter of L. Calpurnius Piso, the consul of the preceding year, he attached him to his cause.

He also contrived by his influence on the senate and people, together with the assistance of Pompey and Crassus, to procure the government of Transalpine and Cisalpine Gaul, contrary to all law, for five years, with the command of four legions.

Having thus established his interest at Rome, Cæsar found it necessary, in the year B. C. 58, to hasten to Gaul, the province which was the scene of those military exploits, by which he acquired a degree of reputation and influence, that served in the progress of his career to subjugate his country. The Helvetians, having abandoned their country, and burnt their towns and houses, were preparing to enter Gaul by way of Geneva. Cæsar, therefore, by forced marches, reached the banks of the Rhone in eight days, and having refused the Helvetians the liberty they solicited of passing through the country of the Allobroges, prepared, by procuring fresh supplies of troops from Italy, to defend himself against the effects of their resentment. Accordingly, whilst they were embarrassed in passing the Arar, (now Saone), he fell upon them and totally defeated them. Upon their again rallying near Bibracte, the capital of the Ædui, and pursuing him in his retreat, a bloody battle ensued, which terminated, notwithstanding the valour and obstinacy of the Helvetians, in their total overthrow; so that they were obliged, after the loss of their baggage and many prisoners, to supplicate his clemency; and to acquiesce in the obligation which he imposed upon them, of laying down their arms, giving hostages, and returning to their own country. This victory was so complete, that Cæsar received congratulations from all parts of the country, and the Ædui, in particular, implored his protection against Ariovistus, king of the Germans, whom he drove back from the frontiers of Gaul to his own territories. Having succeeded in this enterprise, he put his troops into winter-quarters, and crossing the Alps, returned into Cisalpine Gaul, in order to concert measures for the operations of the next year. In the mean while all the nations of Belgium confederated against the Roman republic, and furnished ample employment for his military exertions in the course of the second year of his government. The fame of his exploits in dissolving their confederacy, and subduing them separately, extended beyond the Rhine, and induced several remote nations to send ambassadors to him, with offers of submission. Having dispatched his troops into winter-quarters, he repassed the Alps, and spent the winter in Insubria. By these conquests, Cæsar effaced the remembrance of Pompey's victories in the East, and by the prodigious sums, which he acquired in Gaul, chiefly by plundering the temples of their treasures, he increased the number of

his friends in Italy. The signal successes of this bloody campaign were honoured at Rome with a *supplicatio*, or religious thanksgiving of the unprecedented interval of fifteen days; and Pompey became jealous of a renown that seemed likely to eclipse his own. In the third year of his administration in Gaul, Cæsar, whilst he was in Illyricum, a part of his province, received information that the Veneti, the ancient inhabitants of Vannes, in Brittany, together with some other neighbouring nations, were making preparations for war; upon which he fitted out a fleet, entrusted the command of it to Brutus, who engaged that of the enemy, and gained a complete victory. The Veneti submitted; but Cæsar put their chief men to death, and sold the rest for slaves. Crassus also, his lieutenant, reduced the whole of Aquitaine.

After some other successful expeditions, Cæsar repassed the Alps, according to his usual custom, and resided for some months in Cisalpine Gaul, whence he directed the operations of his party at Rome, and excited Clodius to commit atrocious acts of violence. He likewise concurred with Pompey and Crassus, who aspired to the consulate, and ordered his agents to spare no expence in purchasing the suffrages of the tribes, so that these two chiefs were unanimously chosen. In the year B. C. 55, Cæsar renewed his military exploits in Gaul; and having driven back some German tribes, which had crossed the Rhine with a design of settling in Belgium; and having passed the Rhine, laid waste the country of the Sicambri, and spread a general alarm through the parts adjacent, he returned into Gaul, resolving to pass over into Britain, and to punish its inhabitants for furnishing the Gauls with continual supplies against the Romans. Accordingly he fitted out a fleet, crossed the channel, and dispersed the natives who opposed his landing. This expedition, however, though the senate decreed him a supplication of twenty days in honour of it, was merely preparatory to that of the following year, in which he collected 800 vessels, and embarked with 5 legions, and 2000 horse, which landed without opposition on the Kentish coast, at the place of his former descent. His progress was for some time interrupted by a storm which damaged his fleet, and required his drawing his forces towards the sea-coast. But having repaired his shattered ships, and properly secured them, he put his troops again in motion, and advanced, notwithstanding the opposition with which he had to encounter, as far as Cowey, near Walton, where he crossed the Thames, although the enemy occupied the opposite bank, and had driven sharp stakes in the only part of the river that was fordable. The Britons fled in consternation; and Cassivelaunus, finding all his efforts of resistance ineffectual, submitted to Cæsar, who condescended to give him peace; after having exacted a great number of hostages, and imposed a certain tribute to be annually paid to the Roman people. Having thus settled the affairs of Britain, he marched back to the sea-side, where he embarked his troops and hostages, and arrived in safety, on the continent. On his return to Gaul, he found the country grievously distressed by a famine, which obliged him to disperse his troops into different quarters for their more commodious subsistence. The natives took this occasion of attacking them in their winter stations; but Cæsar by his singular activity quelled the insurrection, and after the most difficult and glorious campaign of any he had made in Gaul, passed the winter in this country.

The death of Julia during Cæsar's expedition into Britain dissolved the alliance that had subsisted between him and Pompey, and hastened the revolution which was now approaching. Pompey, however, was not thoroughly apprised,

prised of Cæsar's designs, and dispatched to him two legions in order to recruit the losses which he had sustained. The two next campaigns in Gaul furnished Cæsar with incessant employment, and by completing the work which he had already begun, he reduced the whole country to the state of a Roman province, and extinguished every spark of its independence. The war in Gaul lasted till the year B. C. 51; and it has been computed that, during his several campaigns there, Cæsar took 800 cities or towns, subdued 305 nations, and destroyed by the sword a million of men; "titles sufficient to place him high on the list of conquerors!" The crisis of the Roman state was now speedily approaching. The power of Pompey was supreme in the senate, and as Crassus was dead, and his interest was altogether detached from that of Cæsar, he adopted various measures for mortifying his rival. The enemies of Cæsar were advanced to the chief offices of the state; the legions that had been sent to him were withdrawn; and his request of continuing longer in his government was rejected. Cæsar, however, possessed the affections of the people, and to him the best troops of the state were zealously attached. With a moderation, therefore, real or affected, from which no danger could ensue, he proposed to disband his army, if Pompey adopted the same measure. But Pompey, being less feared by the constitutional party than Cæsar, was supported by it in his refusal to acquiesce in any terms of accommodation. The former was continued in his government of Spain, whilst the like indulgence was refused to the latter, who, having marched with a single legion across the Alps to Ravenna, in order to wait the event, was informed that the senate had issued a decree announcing him an enemy of the republic if he did not give up his command within a limited time. Three tribunes in Cæsar's interest, who had protested against this decree, were driven with violence out of the senate-house; and had fled to Cæsar's camp in the disguise of slaves, where their presence inflamed the minds of the soldiers. In the mean time the fatal decree was issued at Rome, which required the consuls, the pro-consul Pompey, and the consular magistrates, to provide for the public safety: which, in effect, was a declaration of war. It was in the year B. C. 50 that these important events took place, and that the civil war commenced. Two powerful parties were now taking up arms; both pretended to have nothing in view but the defence of their common laws and liberty; whilst their chiefs aimed only at establishing their own power on the ruins of that liberty which they affected to defend. Pompey's party had on their side the forms of the constitution; he was acknowledged as the general of the common-wealth, and the whole senate, with the consuls, followed his ensigns. On the other hand, Cæsar seemed to have the more equitable cause, and the people, with their tribunes, took part with him. The poet Lucan, who was of Pompey's party, without absolutely deciding the question between those two rivals, seems to give the advantage to Cæsar, when he says, that Cæsar, could not bear a superior, nor Pompey an equal.

"Nec quenquam jam ferre potest, Cæsare priorem,  
Pompeiusve parem." Phars. I. 125.

Cæsar, as soon as he received the hostile decree, confiding in the attachment of his soldiers, resolved to begin the war. Accordingly he marched to the Rubicon, a small stream that separated Cisalpine Gaul from Italy. On the banks of this river he for some time paused and deliberated; but at length, crying out "the die is cast," threw himself into the stream. Having passed this river, he became the avowed foe of his country; and therefore "this passage of the Rubicon" has been proverbially used to signify a

desperate decision. Having seized the neighbouring town of Ariminum, he ordered his main army in Gaul to hasten to him, and augmented his forces by new recruits in Cisalpine Gaul. In his march he took possession of Corfinium, in which many senators had sought an asylum, and whilst he triumphed in his conquest, he manifested his moderation by granting them their lives and liberty. By this well-timed act of clemency he served his cause almost as much as by the power of his arms. Rome was in the utmost consternation. The people and all the senators were alarmed; and determined, as they had no sufficient force with which to defend themselves, to retire to Capua. After the reduction of Corfinium, Pompey withdrew from Capua to Brundisium, whither he was followed by Cæsar. From thence he withdrew, whilst his pursuer was investing the place and shutting it up by a mole, to Dyrrachium: and by his flight surrendered the whole of Italy to his rival. Whilst the lieutenants of Cæsar were deputed to take possession of Sicily and Sardinia, Cæsar himself advanced to Rome. On his approach to the city, he sent a message to the senators then in Italy, requesting their counsel in the capital, and quartered his troops in the neighbouring municipia. To the assembled senators he gave an account of his conduct and avowed his moderation and desire of compromising all differences; whilst the people crowded to see the famous conqueror of Gaul, and to congratulate him on his return after an absence of 10 years. With a view of providing for the necessary expences of the war, he repaired to the temple of Saturn and seized the public treasure: and thus supplied with money, he raised troops in every part of Italy, and sent governors into all the provinces subject to the republic. The war was now prosecuted with vigour. Cæsar himself undertook the campaign in Spain, and soon subjugated the whole country; and on his return to Rome the prætor Lepidus nominated him dictator by his own authority. Having exercised this dignity with moderation, he changed it for that of consul. He then pursued Pompey into Greece, and landed with five legions in Chaonia: but the destruction of the greatest part of his fleet by the stronger squadron of Pompey, and the formidable force of his antagonist, induced him to propose terms of accommodation, which, though apparently reasonable, were disregarded. Anxious to effect a junction with that division of the army which was commanded by Antony, he made an attempt, the temerity of which has incurred censure. Disguised like a slave he embarked on board a fisherman's bark for the purpose of crossing over into Italy; the vessel, however, after struggling with contrary winds, was obliged to return, notwithstanding the earnestness with which Cæsar urged the crew to risk the dangers of the voyage. It was on this occasion that he is said to have discovered himself to the terrified master, and to bid him dismiss his fears, as "he carried Cæsar and his fortune." This exploit is related by Plutarch, and poetically described by Lucan; but Cæsar himself takes no notice of it in his Commentaries. Having received the expected succours of Antony, he followed Pompey to Dyrrachium, and determined to invest the town, together with Pompey's camp. In this siege his troops encountered a variety of hardships, which, however, their attachment to their leader induced them to endure with heroic patience. Pompey, reduced to the want of forage, and disdainful to be cooped up by his enemy in such a nook of land, determined to break through the barrier, and at length succeeded. Cæsar, mortified by his escape, retired to Macedonia, whither Pompey followed him; and on the plains of Pharsalia the great contest between these two commanders was decided, B. C. 48. The army

of Pompey was totally routed; and Cæsar equally distinguished himself by his valour and conduct in the battle, and by his magnanimity and clemency after the victory. He dismissed the Roman citizens who were made prisoners; and burned without perusing them, the letters which were contained in Pompey's cabinet. Assiduous and active in pursuing the advantage he had thus gained, he left the plains of Pharfalia on the third day after the battle, and with his cavalry pursued Pompey. Crossing into Asia, and receiving on his passage the submission of a superior fleet of Pompey which he fell in with, he hastened to Rhodes, and embarked for Egypt.

At Alexandria he was informed of Pompey's murder; and the head of his rival, wrapped up in a veil, was presented to him as a token of his final success. He turned his eyes from viewing the bloody spectacle, and reflecting on the fate of this eminent personage, once his friend and his kinsman, shed tears on the occasion; and dismissing the messenger with expressions of displeasure, ordered the head to be buried with due solemnity. As a farther tribute of respect for his deceased rival, he set at liberty all his friends who had been taken on the inhospitable shore of Egypt, and imprisoned by order of the ministers of king Ptolemy. At Alexandria he took up his residence in the royal palace; but by exacting with rigour a sum of money, pretended to be due to the Roman people for their services in restoring to the throne Ptolemy Auletes, father of the present minor king, and also by undertaking to reconcile young Ptolemy with his sister Cleopatra, who, by the will of Auletes, was to have reigned jointly with her brother, but who had been expelled the kingdom, he exercised an authority which offended the Alexandrians. Accordingly they besieged him in his palace, and thus commenced the *Alexandrian war*, in which Cæsar failed to acquit himself either with prudence or justice. In this war part of the famous *ALEXANDRIAN library* was burnt in consequence of a conflagration of some ships of the Alexandrian fleet. Cæsar, who had possession of Ptolemy's person, was at length so hardly pushed as to be obliged to surrender him in order to obtain a cessation of hostilities; but he was relieved by Mithridates, king of Pergamus. Ptolemy, however, continued the war, till he was defeated in two actions, and lost his life in the Nile by attempting to make his escape. In consequence of this event Cæsar settled the affairs of Egypt, by conferring the crown jointly on Cleopatra and a younger brother of Ptolemy. Fascinated by the allurements of this enchanting woman, by whom he had a son, he remained in Egypt in a state of inactivity, till he was called away by the progress of Pharnaces, son of Mithridates the Great, who was expelling the Romans from Asia Minor.

When the news of Pompey's death reached Rome, the senate and people concurred in accumulating honours and prerogatives on Cæsar, the only surviving master of the empire. He was proclaimed consul for five ensuing years, made tribune of the people, and created dictator for a whole year. Having defeated Pharnaces in Asia, whom he pursued with a celerity, emphatically expressed in a laconic epistle to a friend, "*Veni, vidi, vici*," *I came, I saw, I conquered*; and settled the affairs of this province, he returned with only one legion through Greece to Rome, and by the moderation and placability which he exercised on this occasion, dissipated the fears of the vanquished party, and secured the success of his usurpation without shedding one drop of blood. His views were next directed towards Africa, where the remains of Pompey's party maintained a formidable strength under Cato, Scipio, and other renowned leaders; but whilst he was preparing for his expedition into this country, a mutiny

broke out in his favourite tenth legion, which afforded occasion for a display of his distinguished talents as a commander. Having summoned them to the Campus Martius, with no other arms besides their swords, he required them to state the grounds of their complaints. After some pause, occasioned by the awe of his presence, they began tumultuously to demand their discharge, and the rewards to which they were entitled. "Your demands," said he, "are just; you shall have your discharge. Nor shall you be deprived of your reward, as soon as I shall have subdued the rest of my enemies. Go then, *citizens (quirites)*, return to your houses and families." Grieved and mortified at being addressed with an appellation, which implied that they were no longer *soldiers*, they made a fresh tender of their services, and supplicated the honour of being still the companions of his victories. After some suspense, and a suitable speech, he pronounced their pardon, and again addressed them as *fellows-soldiers*. This legion, from this time, uniformly distinguished itself by the ardour of its attachment to him. The *African war* commenced in the year B. C. 46, and was for some time attended with dubious success on the part of Cæsar. However, by the celerity of his operations, he completely defeated the armies of Scipio, Labienus, and Juba; but the town of Utica was still defended by Cato and his "little senate." This true patriot, perceiving that resistance was ineffectual, secured his own freedom by a voluntary death. When Cæsar had settled the government of Africa, and issued orders for the re-erection of Carthage, he returned in triumph to Rome, and was received by the senate and people with unbounded adulation. To the dictatorship, extended to ten years, was added the censorial office. A double guard was assigned him, and his person was declared sacred and inviolable. A thanksgiving of 40 successive days, and four distinct triumphs, were decreed for his victories. His triumphs over Gaul, Egypt, king Pharnaces, and Juba, were conducted with singular splendour: he treated the people with shows, feasts, and donatives, and conferred ample rewards on his soldiers. He also directed his attention to the reformation of the government, and enacted several salutary laws; but he reserved to himself the nomination to all offices and employments. At this time he availed himself of the assistance of Sotigenes, and other men of science, in the correction of the calendar (which see), and in the establishment of the "Julian year."

Whilst Cæsar was thus employed at home, the two sons of Pompey were collecting a considerable force in Spain, and his presence was necessary to restrain their progress. Accordingly, in his fourth consulship he departed for the *Spanish war*, and having reduced several places, he marched to the plains of Munda, where the elder Pompey was encamped. Notwithstanding the superiority of the enemy, he advanced to the attack; and in the battle which ensued, contended for a long time, as he himself acknowledges, not for victory, but for life. So desperate were his circumstances, that, at one period of the conflict, he thought of killing himself: but recovering his self-possession, he exerted himself with such valour as to turn the fortune of the day, and in the event of the contest to annihilate the relics of Roman liberty. After having completed the reduction of Spain, he returned to Rome and received new honours. The dictatorship was established for life; and the title of "Imperator," as head of the empire, and denoting the highest monarchical rank, was conferred upon him, and from him it was transmitted through his successors. Notwithstanding all these accessions of rank and honour, Cæsar retained the affable manners of the first citizen of the republic, and studied to ingratiate himself with the nobles and

people. He pleased the latter by dismissing his guards, restoring the statues of their former favourite, Pompey, and treating them with shows and largesses; and he secured the attachment of the nobles, by the multiplication of offices of dignity and profit. However, he offended the senators, by increasing their number from 300 to 900, and by admitting several persons of low origin to this honourable class. The Romans, who entertained an inveterate prejudice against the name of *king*, were further offended by Antony's offering to Cæsar a royal diadem; for though he refused the gift, he was suspected of being privy to the design. See ANTONY. It has been suggested, indeed, that as Cæsar had formed extravagant schemes of conquest, comprehending an expedition against the Parthians, Hyrcanians, Scythians, and Germans, and was emulous of imitating the exploits of Alexander, he and his friends had imagined that the title of king would be serviceable to him in the execution of these grand and extensive designs, and command reverence among remote and barbarous nations. This and a variety of other circumstances contributed to excite envy, jealousy, and resentment in the minds of several of the first men of Rome; and to concur, with some remains of an attachment to liberty, in producing a conspiracy against Cæsar's life. Cæsar himself was warned of it by his friends; intimations had been circulated, for some time, of the persons concerned in it, and of the time of its execution; and so fully possessed of the reality of the danger was Calpurnia, Cæsar's wife, that she earnestly urged him not to quit his house on the ides of March, the day appointed for the meeting of the senate. In compliance with her intreaties, he determined to remain at home. But Decimus Brutus representing to him the importance of the matters which were to be proposed in the senate, diverted his purpose, and they set out together. In their way thither, a person named Artemidorus put into Cæsar's hand a paper, containing a discovery of the whole plot; but though he was desired to read it, he was prevented by the crowd which surrounded him. On his arrival in the hall of the senate, a number of the conspirators beset him, under the pretext of uniting their supplications with those of Metellus Cimber, on behalf of his banished brother: at this instant Cimber gave the signal, by taking hold of his robe, and pulling it from his shoulders, upon which Casca stabbed him in the neck. The enraged Cassius wounded him deeply in the head; and many others concurred in stabbing him on all sides. Till Brutus appeared, he is said to have resisted his assassins; but upon the sight of the dagger aimed at him by Brutus, he exclaimed, "What! my son Brutus too!" and covering his face with his robe, fell, pierced with 23 wounds, at the pedestal of Pompey's statue. Such was the catastrophe that terminated Cæsar's career, in the 56th year of his age, March 15th, A. U. C. 710. B. C. 44. His death was amply revenged, and his memory was honoured among the tutelary deities of his country; as he left no direct lineage, his adopted heir was the grandson of his sister Julia. See AUGUSTUS.

The person of Cæsar was tall, slender, and fair, and his countenance was sensible and expressive. To the delicacy of his form his first character, which was that of a man of pleasure and gallantry, seems to have been better adapted than his later occupation as a warrior. To this purpose Cicero says of him, "I discovered in all his enterprises, and in his whole conduct, a plan continually pursued for raising himself to the tyranny. But when I saw him so soft in his dress and manner of living, with effeminate gestures, and his hair in such nice order, I could not believe that such a man was capable of forming and executing the design of subverting the Roman commonwealth." But he possessed,

however, a variety of talents, which rendered him capable of attaining to distinguished excellence in any pursuits, to which he chose to devote his time and attention. In the department of oratory, if he had restricted himself to this object, he might have rivalled Cicero; and his knowledge of other branches of literature and science enabled him to publish works on grammar, astronomy, religious polity, history, and poetry. But of his writings, none are extant besides some "Epistles" preferred among those of Cicero, and his "Commentaries on the Gallic and Civil Wars." The latter is reckoned a model of the plain style, and is highly valuable as a repository of facts, and as a directory in the use of the Latin language. Afinius Pollio, at a period when the events which it records were recent, questioned its accuracy and veracity; and it is not improbable that the writer might have accommodated the detail of facts to the advancement of his own reputation. We have various editions of this popular work, the best of which are the "Variorum," by Elzevir, 1661; "Grævius's," Amst. 1697; "Davis's," Camb. 1727; "Clarke's," fol. Lond. 1712; "Oudendorp's," L. Bat. 1737; "Barbous's," Paris, 1755.

In the exercise of his talents, Cæsar possessed such versatility of application, and such a facility of directing his attention to different subjects, that he is said to have dictated dispatches to three secretaries at once. But whatever excellence he might possess as an orator or general scholar, his ruling passion was "ambition;" and to the gratification of this he devoted, in the maturer years of his life, all his mental and corporeal faculties. The influence of this passion marked and discriminated his character; and whilst it exhibits him to view as a successful warrior and useful legislator, possessing many qualities, and performing many services, which entitle him to admiration and respect, it throws a shade over his most illustrious talents and actions, and excites an abhorrence of usurpation and tyranny. "Without pretending to palliate the excesses of his youth, or to justify the schemes of his ambition, he was," says one of his biographers, "one of the most accomplished heroes that ever lived. With the most shining talents for war and legislation, he possessed a liberality of spirit, an elegance of taste and manners, a generosity of heart, a greatness of mind, and an humanity of disposition, which distinguished him from all the other great men of that republic, who were generally cruel, ferocious, and implacable." "Julius Cæsar," as the same writer proceeds, "is accused of having overthrown the liberties of his country. But what liberty did it enjoy before he appeared on the stage, while Rome was desolated by the civil butcheries of Marius and Sylla? and what liberty did she retrieve, when Cæsar, the supposed obstacle, was removed? The truth is, the Romans were become so profligate, vicious, and venal, and such universal corruption of morals prevailed, that they neither deserved to enjoy, nor were they capable of relishing, the blessings of genuine liberty; and Cæsar was the only person, when living, who could restore peace, order, and security, give consistency to their government, and stability to their empire." "He was born," says another writer, "to command mankind, if great qualities were alone sufficient, and superior to right. Had his birth or a regular election placed him on the throne, he would have been an example to be imitated by all sovereigns. But his private conduct would be a very bad model; his whole life being a continued scene of rapine and extortion, luxury, and profusion, and a devotedness to all kinds of scandalous debaucheries." Sueton. Cæs. Plutarch, C. Cæsar, oper. t. i. p. 707, &c. Cæsar's Comment. Anc. Un. Hist. vol. xi. Rollin's Rom. Hist. vols. viii. ix.

CÆSAR, in *Entomology*, a species of *MUSCA*, described by Linnæus

Linnæus as being of a shining green, with black legs. This is a common European insect.

*CÆSAR Augusta*, in *Ancient Geography*, a town of Hither Spain, seated on the river Iberus, formerly called Salduba, and which afterwards became a colony. Augustus gave it to the veteran soldiers of his army, after the war of the Cantabri, whence it obtained its name, the epithet of *immunis*, and the right of coining money; now *Saragossa*.

*CÆSAREA*, a name given to several ancient cities. There were two cities in Palestine of this name, viz. *Cæsarea-Panice* or *Cæsarea-Philippi*, and *Cæsarea-Stratonis*. The former was built by Philip the tetrarch, son of Herod the Great, and made the place of his residence, as it was conveniently situated between Ituræa and Trachonitis. Luke, iii. 1. He built it, says Josephus, (*Antiq.* l. 18. c. 3. l. 20. c. 8.) at Paneas, by the springs of Jordan, and called it *Cæsarea-Philippi*, and *Nerodiada* in honour of Nero. It was seated at the springs of Jordan the Less, not far from Libanus, in the Midland Phœnicia, says Ptolemy, and was a Decapollitan city called *Cæsarea-Panias*, or *Sub-Panjo*, from the name of the mountain Panias, mentioned by Josephus and Eusebius, under which it lies. It is mentioned *Matth.* xvi. 13. *Mark.* viii. 27. and was first called *Lais* or *Lathem*, *Josh.* xviii. 7; and when subdued by the Danites, *Dan.* ib. v. 29. The latter, *Cæsarea-Stratonis*, or the town of Strato, was the metropolis of Palestine, after its re-union to the Roman empire, and the seat of the Roman proconsul. As it was a mart-town, with a very incommo- dious haven, Herod the Great built on the site of it a large city, with many stately marble buildings, a theatre of stone, a capacious amphitheatre, and an admirable haven, with marble edifices and towers. Herod also constructed, on an eminence, a beautiful and magnificent temple of Augustus, and placed there a colossal statue of this prince, on the model of the statue of Jupiter Olympius; and a statue of the city of Rome, equal to that of Juno at Argos. Herod, according to Josephus, called the port *Sebaste*, and the city *Cæsarea*, in honour of Cæsar Augustus, which he annexed to the province of Syria. He also established quinquennial games, and distributed a great number of prizes at the first celebration of them, *A. U. C.* 743. The city was afterwards given to Agrippa, the grandson of Herod the Great, by the emperor Claudius. *Judæa* and the city of *Cæsarea* were re-united to the Roman empire, at the death of king Agrippa, *A. D.* 44; nor were they separated till the invasion of the Arabs, in the 7th century. *Cæsarea* was situated between Doron and Joppa, 35 miles from Jerusalem, and was inhabited partly by the Jews, who had their schools there, but chiefly by the Greeks or Syrians, betwixt whom there were feuds concerning equal privileges; so that the *Cæsareans* killed a great number of Jews, when Florus was procurator of *Judæa*. In this city Peter converted Cornelius and his kinsmen. *Acts.* x. Here lived Philip the evangelist, *Acts.* xxi. 8; and here Paul defended himself against the Jews, and their orator Tertullus. *Acts.* xxiv.

*CÆSAREA*, and in more ancient times called *Mazaca*, and afterwards *Eusebia*, and denominated *Cæsarea* by Tiberius, in honour of Augustus, was the metropolis of Cappadocia, and the residence of its kings. It continued in a flourishing state under the Greek emperors. When it was besieged by Sapor, king of Persia, about *A. D.* 260, it was supposed to contain 400,000 inhabitants. At this time Demollhenes commanded in the place; and when the city was betrayed by the perfidy of a physician, he cut his way through the Persians, who had been ordered to exert their utmost diligence for taking him alive, whilst many of his fellow-citizens were involved in a general massacre. Sapor is accused

of treating his prisoners with wanton and unrelenting cruelty. Deep vallies were filled with the slain; and crowds of prisoners were driven to water like beasts, and many perished for want of food. Zonaras, l. xii. p. 630. After the reign of Heraclius, when the empire was divided into different military departments, Cappadocia, together with *Cæsarea*, its capital, which had surrendered to the Saracens, was comprized in the department of Armenia; but it was, at a period not ascertained in history, ruined by an earthquake. In the 13th century, it was rebuilt about  $\frac{1}{2}$  of a league more to the north than the old city, by a sultan of the Selgioucide race. It is now called *Kaifariéh* and *Kefaria*, and is a city of some note. It is the stage of all the caravans of the east, which here disperse themselves to their respective cities. The bazars are handsome and well stored, and the inhabitants in a considerable degree polished. It was the see of St. Basil, and its archbishop holds the first rank among the prelates who are under the patriarch of Constanti- nople.

*CÆSAREA*, is also a town of Armenia Minor.—*Alfo*, a town of Asia Minor, in Bithynia, according to Ptolemy, who places it between the river Rhyndacus and Mount Olympus, near the sea.—*Alfo*, a large and famous town of Africa, in Mauritania, which was formerly a royal city, and had a magnificent port on the Mediterranean. It gave the appellation *Cæsariensis* to one of the districts into which Claudius divided Mauritania, and it was anciently called *Jol*. It was the residence of king Juba, who enlarged and embellished it, and called it *Cæsarea* in honour of Augustus. Claudius made it a Roman colony. It has been ruined for many ages. It was reduced to ashes *A. D.* 373, by Firmus, who assumed the title of king among the Moors, but who was made to submit by Theodosius, sent to Africa by Valentinian. When it was just recovering itself, it fell under the power of the Vandals, who burnt it. After the destruction of the Vandal government in Africa, it remained in a tranquil state for more than a century under the Greek emperors. This city was encom- passed by mountains to the south, east, and west, and Procopius says, that there was no access to it but by the sea. According to Mela, it was situated at the confluence of the rivers *Milucha* and *Ampfaga*. Sanson, and other geographers, place *Julia Cæsarea* at *Tnifs* or *Tennis*; but Shaw, (*Travels*, &c. p. 18.) adduces several arguments to prove, that it is the present *Sbershell*, which see.—*Cæsarea* is also a name said to have been formerly given to the island of *Jersey*, which see.—*Cæsarea* was also a town of Italy, in Cisalpine Gaul, not far from *Ravenna*.

*CÆSAREAN SECTION*, in *Midwifery*, an operation by which a fetus is extracted from the uterus of the mother, through a wound, made for the purpose, in the abdomen. The term, *cæsarean*, is said to be derived from the operation "*cæso matris utero*;" and Pliny even deduces the title of *Cæsar*, given to the Roman emperors, from one of them having been brought into the world by means of it. Whether this was the case, or not, it seems not improbable, from the prevalence of the opinion, that the operation had been performed prior to his time, although no account of it is to be found in the works of Hippocrates, Celsus, Paulus Ægineta, or Albucañs, who all of them treat largely on the mode of assisting in difficult partition. The only method recommended by these writers, for extracting the fetus when it was too large to pass entire by the natural passage, was to diminish its bulk with scalpels, or other cutting instruments, and then to draw it away with hooks, or crutchets; a method, in fact, which is now followed, but with instruments more artificially constructed,

and thence less likely to injure the women, than the more rude ones contrived by the ancients.

The earliest account we find of the cesarean section in any medical work, is in the *Chirurgia* Guidonis de Cauliaci, published about the middle of the fourteenth century; but the author only speaks of it as resorted to after the death of the woman, as was practised, he says, on the birth of Julius Cæsar. "Si autem contingeret mulierem ipsam esse mortuam; et suspicaveris quod fœtus esset vivus; quia vetat lex regia mulierem pregnantem humari, quousque fœtus vixerit; tenendo mulieris os, et matricam apertam, ut volent mulieres, aperitur mulier secundum longitudinem, cum rasorio, in latere sinistro; quia pars illa est magis libera quam dextra propter hepar; et digitis interpositis extrahant fœtum. Ita enim extractus fuit Julius Cæsar; ut in gestis legitur Romanorum." vide Cap. de extractione fœtus.

Vigo, who was born towards the end of the 15th century, in the short chapter he gives on difficult birth, takes no notice of this mode of delivery; and Paré, who greatly improved the practice of midwifery, thinks the operation only allowable on women who die undelivered. He had heard, he says, not without astonishment, of women who had been more than once subjected to the cesarean section, it not being practicable to deliver them by any other means; but he considered the operation as much too dangerous to be adopted, "cæterum non possum fatis mirari eos qui sibi vias mulieres affirmant, quibus non semel novacula abdomen cum subjecto utero rescissum sit ad fœtum, nunquam alioqui proditurum, extrahendum. Id enim, salva matre, fieri posse mihi persuadere nunquam potui," &c. "De Hominis Generatione," cap. 31. But Roussel, who was contemporary with Paré, having collected accounts of a number of cases in which the operation was said to have been successfully performed, published in 1581, 8vo. "Traité nouveau de l'Hysterotomotokie, ou Enfantement cesarien, qui est l'extraction de l'enfant par incision laterale du ventre et de la matrice de la femme grosse, ne pouvant autrement accoucher; et ce sans prejudicier a la vie de l'un et de l'autre, ni empêcher la fécondité naturelle par apres." But though Roussel speaks with great confidence of the safety of the operation, and is warm in its recommendation, it does not appear that he had ever seen it performed, or that more than one of the six persons, whose cases are related by him, were known to him. The book, however, soon became popular, and being some years after, viz. in 1651, translated into Latin by Caspar Bauhine, with additional cases and observations, it was quickly circulated over Europe. From that time, the operation began to acquire a certain degree of vogue, and to be resorted to in cases of extreme difficulty, particularly on the continent, where it is said to have been not unfrequently performed with complete success. Not so in this country. In five cases in which it has been performed at Edinburgh, three of the children were extracted through the aperture alive, but the women all died. In England, where the operation has been performed ten times, one of the women only recovered. This gives little encouragement for repeating the trials here. But as this almost uniform fatality may be in part attributed to the extremely debilitated state of the women, who had been in labour several days before the operation was determined on, it has been observed, and with apparent reason, that if it had been performed earlier, before the strength of the women had been exhausted, and a feverish indisposition induced, or before the bladder and other soft parts had been injured by distension and pressure, a more favourable termination might have been expected; as to that circumstance, viz. a more speedy, or prompt determination, may be attributed

the superior success with which the operation has been performed on the continent.

Having given this sketch of the history of the Cesarean section, it remains to state the causes rendering it necessary, and to describe the manner of performing the operation.

Whenever any insurmountable impediment exists, rendering it impracticable to bring the child through the natural passage, recourse must be had to the cesarean section, or the woman, and child, must inevitably perish.

The most common impediment is, such a deformed and altered shape of the bones constituting the pelvis, as to leave too small a space for admitting the fingers of the accoucheur to pass between them; disabling him from introducing and directing the necessary instruments for opening and lessening the head, or other part of the child that may happen to present, or lie over the orifice of the uterus.

Abroad, particularly in France, the cesarean section has been performed where no such impediment existed, or, at the least, not to the degree that would be required in this country; as is evident, by the accounts published of women, who after being subjected to the operation, have borne living children by the natural passage, which could not happen, if the pelvis was considerably distorted, or misshapen.

Cases requiring the cesarean section, are very rare in this country; that is, there are very few women whose pelvis are so distorted as not to allow a passage for the fingers of the accoucheur to conduct the necessary instruments for opening the head of the fœtus sufficiently to allow its contents to be squeezed out, and its bones to collapse so far as to allow the operator to fix a hook or crochets, with which it may be gradually drawn down, and extracted. Through how very narrow a space this may be done, we have a remarkable instance related in Dr. Osborne's "Treatise on Laborious Parturition."

Authors mention other causes of impediment to the birth of the child, as coalescence of the os uteri, or of the sides of the vagina; or large tumours filling up that passage; but these may be all removed by operations much earlier and less hazardous than the cesarean section.

Whenever on repeated examination of a woman in labour, the accoucheur finds the pelvis distorted to the degree described above, he should apprise the husband of the dangerous state of the woman, and desire the assistance of one or two of the most experienced persons in the profession, and if on a consultation it should appear that it is impossible to bring the child by the natural passage, the husband should be made acquainted with the nature of the impediment, and informed there remains no hope of preserving the life of the woman and child, but by opening the abdomen of the woman, and extracting the child through the wound. At the same time acquainting him, that the operation, though hazardous, is not necessarily fatal, many women who submitted to it having recovered. That the hope of a favourable termination depends on its being performed early, before fever comes on, or any material injury is done to the uterus or neighbouring parts.

If the husband should be satisfied of the necessity of the operation, the woman should then be apprised of her situation, in the most cautious manner, and having obtained her consent, a glyster is to be thrown up to evacuate the contents of the bowels, and the bladder emptied through a catheter, and a few drops of the tincture of opium given to quiet pain as much as possible, prior to the operation, the manner of performing which, is thus described by Mr. Thompson, late surgeon to the London Hospital. "Medical Observations and Inquiries," vol. 4. p. 271.

An incision is to be made on the right or left side of the navel, whichever happens to be most prominent, six inches in length; the middle of the incision to be about level with the navel, from which it should be distant a hand's breadth. First cut through the skin, then through the tendinous expansion of the abdominal muscles, and the peritonæum. The uterus being now brought to view, a small opening must be made, to enable the operator to pass his forefinger as a guide for the knife, in extending it to the size of the external wound; an assistant must then introduce his hand, and bring away the child, and the placenta. This being effected, an assistant must keep in the bowels, which would otherwise protrude, while the operator makes the gastrography, or future of the belly. Proper bandages are then to be put on, and the woman put to bed. The cure to be conducted in the same manner as after other operations. The subject of the cesarean section is treated in an ample and ingenious manner by Dr. Denham in his "Introduction to Midwifery," and by Dr. John Hull, physician at Manchester, in his "Defence of the Cesarean Operation," 8vo. 1798.

CÆSARIA, *river*, in *Geography*. See COHANZY.

CÆSARIANA, in *Ancient Geography*, a place of Italy, on the Appian way, situate, according to the Itinerary of Antonine, in the route from Rome to Columna, 30 miles from Nerulum, in Lucania.—Also, a place of Pannonia, which, in Antonine's Itinerary, is situate on the route from Sabaria to Acincum.

CÆSARIANS, or CÆSARIENSES, in *Antiquity*, were ministers or officials of the procurator *Cæsar*, to whom belonged the keeping of the fiscal accounts, and taking possession of effects devolving or escheating to the emperor. These were also called *catholici*. From the appellation *Cæsarianus* some deduce the modern word *fergeant*. See SERGEANT.

CÆSARODUNUM, in *Ancient Geography*, a town of Gaul, assigned by Ptolemy to the Turones; now *Tours*, which see.

CÆSAROMAGUS, a town of Gaul, which, according to Ptolemy, was the capital of the Bellovaci; now *Beauvais*, which see.—Also, a station in the 5th route of Antonine, 28 miles from London; the position of which cannot now be exactly ascertained; but by the distance from London, and the direction of this route, it is supposed to have been at, or near, Chelmsford.

CÆSENA, CÆSINA, a town of Italy, in Gallia Cispadana, on this side of the Eridanus, with respect to Rome, according to Strabo and Pliny.

CÆSIA *Sylva*, the Cæsan forest, was part of the Hercynian, placed by Cluverius, partly in the duchy of Cleves, and partly in Westphalia, between Wesel and Koefeld. Germanicus traversed this forest in his march to attack the Marti, whom he found in a defenceless state, and attacked with great slaughter, A. D. 15. Tacitus.

CÆSIAS, or *Kæsiās*, in *Meteorology*, denotes the north-east or N. E. by E. wind; called in the Mediterranean, *vento Græco*, or *Cræo levante*. Pliny calls this wind Hellefontias, as blowing from the Hellespont. See EUROCLYDON.

CÆSTUS, or CÆSTUS, a large leathern gantlet, or glove, made of straps of leather, and plated with brass, lead, or iron, withinside, used in the combats, or exercises of the ancient athletæ, to strengthen the hands of the combatants, and to add violence to their blows. It was called *cæstus, à cadendo*, from *cado*, to strike, or beat.

The cæstus originally consisted of many thongs of leather, or raw hides of bulls, wound about the hand and arm up to the elbow, and seems to have been invented, as well for a

safe-guard to those parts that were most exposed in the first fury of the combat, as for an offensive weapon; though, when it was lined with plates of lead or iron, as it sometimes was, according to Virgil, (*Æn.* v.) it seems to have been intended chiefly for the latter purpose. It is observable, however, that the Greek poets, who have given us a description of the cæstus, have not mentioned plates of lead or iron. By thus binding up the hands of the combatants with thongs of leather, they might also design to prevent their laying hold of each other, or with their fingers and nails ripping open the belly; a circumstance, which occurred in the Nemean games, and which gave occasion for bringing the straps of the cæstus over the fingers, and fastening them upon the wrist; whereas, before this accident, they were tied in the palm, or hollow of the hand. See Pausanias, l. vii. c. 40. This author applies the epithet *μελιχος*, or soft, to the ancient cæstus, probably, because it was composed of raw hides. But it is not unlikely, that as the Grecians began to refine upon the gymnastic exercises, and the science of the athletæ became a kind of profession, the cæstus should from time to time receive several additions: and, that at length, it should be improved by the Romans, who delighted in bloody spectacles, into that terrible weapon described by Virgil. This conjecture will account for the difference observable between that in Virgil, and those described by the Greek poets. The combat of the cæstus was very ancient, and is said to have been invented by Amycus, king of the Bæbrycians, who was contemporary with the Argonauts, as we are informed by Clemens of Alexandria, Stromat. I. It was revived in the 23d olympiad, B. C. 688. But we are informed by Plutarch, (in Alex.) that Alexander never admitted either the cæstus or the pancratium among those games which he exhibited during his war in Asia. Lycurgus also banished these exercises from Sparta, because he would not allow the people to accustom themselves to yield the victory to those with whom they contended, not even in sport. Besides, the combatants in the cæstus fought after, and cherished copulence, or polysarcia, (flatulency) as the Greeks called it, as a sort of covering and defence of their bones and muscles against blows and buffets; but this mode of life was improper for a soldier; for, as Epaminondas observed to a fat fellow, whom for his bulk he turned out of the army, it would require three or four shields to cover and defend a belly that hindered a man from seeing his own knee. However, it was practised by the heroes of the Iliad, and it was one of the games exhibited by Æneas in honour of his father Anchises; and Amycus valued himself so much upon his superiority in this combat, as to compel all strangers who touched upon his coast, to take up the cæstus, and make trial of his strength and skill in the use of this rude instrument of death. See Weik's dissertation on the olympic games, prefixed to his "Odes of Pindar, &c." vol. iii. § 10.

CÆSULIA, in *Botany*, Willd. 1467. Rox. Cor. t. p. 64. Class and order, *syngenesia squar.*

Eff. Ch. *Receptacle* chafly; small involving the seeds. *Down* none. *Calyx* of three leaves.

Sp. 1. *C. axillaris*. "Leaves lanceolate, narrowed at the base, serrated, alternate. Perennial. Stem herbaceous, creeping; branches ascending. Flowers axillary, sessile, solitary. Calyx spreading; leaflets egg-shaped, veined, many-flowered. A native of the East Indies. 2. *C. radicans*. "Leaves lanceolate, narrowed at the summit, very entire, opposite." Perennial. Stem creeping, taking root at the knots. Branches ascending, from half a foot to a foot long. Leaves on short petioles; sometimes, but rarely, with

with one or two teeth. *Flowers*, as well as the general habit of the plant, similar to the preceding. A native of Guinea.

**CÆSURA**, in *Ancient Poetry*, is when, in the scanning of a verse, a word is divided, so that one part seems cut off, and goes to a different foot from the rest; e. gr.

*Menti | ri no | li: nun | quam men | dacia profunt.*

Where the syllables *ri, li, quam*, and *men* are *cæsures*.

Or, it denotes a certain and agreeable division of the words, between the feet of a verse; whereby the last syllable of a word becomes the first of a foot: as in

*Arma virumque cano, Trojæ qui primus ab oris.*

Where the syllables *no* and *je* are *cæsures*.

**CÆSURA**, a *cut*, a *separation*, a *breathing-place*, in *Vocal Music*. The Germans have applied this poetical term to music, with no great analogy, and the French are trying hard to naturalize and adopt it. In the supplement to the fol. edit. of the *Encycl. M. Castillon* has given it an article which in the new 4to. *Encycl. Methodique*, M. Framery has analysed, and controverted in an able manner. The first musical dictionary in which the term occurs, is that of Walther, which, though a small octavo volume only, contains more definitions, explanations, biographical and historical articles, than all the dictionaries that have been published since 1732, when it first appeared in German. Nothing in English expresses so well what the Germans and French mean to enforce by the term *cæsura* in music, as the word *phraseology*, which see. In vocal music, the measure of the verse determines the phraseology of the melody. In instrumental music, a symmetry of phrase, to a certain degree, seems necessary, where either grace or energy is required. As to subject, the first two or three bars give the general cast and character to the whole movement. This is more obvious in Haydn's best symphonies, sometimes even through a seeming wildness and freedom of fancy. If you lose the first idea in the treble, you find it in the base, or subordinate parts, as too much symmetry in the upper part is apt to degenerate into monotony and dulness. An even number of bars, and *cæsura* at equal distances, however, seldom fail to interest and impress the hearer. Metastasio's measures have suggested to composers, and rendered necessary, a greater variety of air, than the epic poetry of Italy, or any other country possessed before. Grace is often obtained by a succession of dactyles and regular resting places.

Vö sölcändö ün mär crüdelë—

Sí üfcä sí dîcë l'ämîcö dövë.—

See **PHRASE**, **CADENCE**, **REST**, **real** or **understood**.

The *cæsura* might have its use in music if well considered and framed into rules; but we pretend not to invent new rules or laws in the arts, so much as to explain those already in use, and established by good authority and successful examples.

**CÆSURE**, in the *Modern Poetry*, denotes a rest or pause towards the middle of a long Alexandrine verse; by which the voice and pronunciation are aided, and the verse as it were divided into two hemistichs. See **PAUSE**.

**CÆTERIS paribus**, a Latin term, in frequent use among mathematical, and physical writers.

The words literally signify, *other things being equal*; which expresses pretty nearly their meaning as a term. Thus, we say, the heavier the bullet, *cæteris paribus*, the greater the range; i. e. by how much the bullet is heavier, if the length and diameter of the piece, and the quantity and strength of the powder, be the same, by so much will the utmost range or distance of a piece of ordnance be greater.

Thus also, in a physical way, we say, the velocity and quantity of blood circulating in a given time, through any

section of an artery, will, *cæteris paribus*, be according to its diameter, and nearness to, or distance from the heart.

**CÆTOBRIX**, in *Ancient Geography*. See **CETOBRICA**.

**CAETSE**, in *Geography*, an island in the Adriatic, or Venetian Sea, which affords anchorage for shipping.

**CAFARA**, a town of Portugal, in the province of Alentejo; 12 miles E. of Moura.

**CAFARO**, in *Biography*, a Neapolitan composer of great abilities, of the old school, perhaps the best, in the ecclesiastical style, after Leo. He was living in 1774; and at that time was thought by many the best composer for the church in Naples. His style was nervous, yet not rude. In his ecclesiastical productions (says a French writer, before the revolution,) he proved that there is a style for religious rites capable of interesting a devout audience, and redoubling fervour, instead of diverting their attention from sacred concerns.

**CAFARTUTHA**, in *Ancient Geography*, a town of Asia, in Mesopotamia; placed in the Nubian geography, between Dara and Alchabur.

**CAFER**, in *Entomology*, a species of **CIMEX**, found in Africa, and described by Thunberg. This insect is of a black colour, with a white band on the thorax: ferruginous wing-cases, and four white spots. See **CAFFER**.

**CAFER**, a species of **SCARABÆUS**, green, with the margin of the thorax and elytræ spotted with white. Fabricius. Found at the Cape of Good Hope.

**CAFER**, in *Ornithology*, a species of **MEROPS**, with grey plumage, a yellow spot near the anus, and very long tail. This is the grey bee-eater of Ethiopia.

**CAFER**, a species of **PICUS**, brown above, beneath grape-coloured, dotted with black, the under part of the wings and the shafts of the wing-feathers, and those of the tail vermilion-coloured. Found at the Cape of Good Hope. Gmelin.

**CAFERISTAN**, in *Geography*. See **KUTTORE**.

**CAFFA**, in *Commerce*, cotton cloths painted with several colours, and of divers designs; they are manufactured in the East Indies, and sold at Bengal. The length and breadth are not the same in all pieces.

**CAFFA**, or *Kassa*, in *Geography*, the ancient and modern *Theodosia*, a sea-port town of Crim Tartary, now called *Taurida*, is situated on the south-east side of the peninsula, and forms a harbour of the Euxine, or Black Sea. It was formerly the capital of the Crimea; and the Tartars distinguished it by the name of Half Constantinople. The Genoese, when they attempted to acquire an independent trade with the East Indies, took possession of it about A.D. 1226, maintained it for more than 200 years, and rendered it the seat of an extensive and flourishing commerce. They adorned the port, strengthened and augmented the fortifications, and embellished the city with many stately edifices, the ruins of which are visible even at this day. Having the dominion of the Black Sea, and thus most commodiously situated for trade, they were furnished with the means of expenditure by the riches accruing from their commerce. But in the year 1475 they were deprived of this port by Mohammed the Great, after they had basely assisted in bringing the Turks into Europe, and in reducing Constantinople, against all the rules of true policy, as well as dictates of religion. After the Genoese were dispossessed of the dominion of Caffa, they still carried on, for a long time, as merchants, a very lucrative commerce with the inhabitants, who, by way of the Caspian Sea, found means to conduct a considerable trade in spices, drugs, cotton, silk, and other Indian commodities. At length the Turks became jealous of the intercourse of the Genoese in these parts, and absolutely excluded them, as well as all other nations, from trading to, or even so much

as entering into, the Black Sea. This exclusion, however, did not immediately terminate the commerce between Caffa and Genoa; for the Tartars were so well apprised of the advantages derived from this commerce, that they prosecuted it for some time in their own vessels; and carried the spices, and other Indian goods, which they received by caravans from Altraean, and which had been brought thither from the opposite side of the Caspian Sea, to Genoa; but the Turks soon put an end to this kind of intercourse, and thus secured themselves from the fears of seeing a Christian fleet in those seas, at least from Italy. Nevertheless, Caffa, notwithstanding all the disadvantages resulting from its subjection to the Turkish government, continued to be a place of considerable trade. Sir John Chardin, who visited it, A.D. 1672, relates, that during his residence of 40 days there, he saw more than 400 ships sailing in and out of this port. He observed also several remains of Genoese magnificence. In 1774, Catherine II. obtained for Russia the possession of the straits of Caffa, together with some other local and commercial advantages; and by the convention of 1783, the whole peninsula of the Crimea was added to the Russian dominions, under the name of the province of Taurida, and the Turks having finally ceded their pretensions to the empress, she declared this a free port in her newly acquired territories, under the appellation of Theodosia. Caffa was formerly one of the best built and richest places of its size in Europe. It stands at the foot of a small hill upon the sea-shore; the buildings extending north and south, with long walls stretching on both sides down to the sea; so that from the port which is large, safe, and commodious, it exhibits a very agreeable appearance. On the south side is a castle, which used to be the residence of the Turkish bashaw. The number of houses have been estimated at 5000 or 6000, and the inhabitants have been computed at 20,000. According to M. Peyssonnel, (*Commerce de la Mer Noire*, tom. i. p. 15.) the number of inhabitants amounts to 80,000. The bay is capable of containing several hundred merchant ships; and the inhabitants are the richest, and drive the most extensive trade in the Black Sea. The productions of Crim Tartary, exported from Caffa and the other towns of the peninsula resorted to by the Greek and Armenian merchants, consist chiefly in corn, wine, wool, fine black and grey lamb-skins, and salt. The imports are fine and coarse linens, printed cottons, nankeen, Russian leather, fine cloths, velvets, taffeties, furs, ropes, paper, salted fish, and caviare, tobacco leaves, copper and tin, hardware, gold and silver thread, beads, and corals, earthen wares, a coarse sort of porcelain, and glass ware, &c. N. lat. 45° 10'. E. long. 35° 20'.

**CAFFA**, *straits of*, the ancient Cimmerian Bosphorus, are the narrow passage, or sound, which forms the communication between the Black Sea to the south, and the sea of Azof to the north. Near the northern entrance of these straits are the fortresses of Kertsch and Yenikalé, which command the passage. They take their name from the port of Caffa. N. lat. 45° 18'. E. long. 35° 45'. See **BOSPHORUS** and **AZOF**.

**CAFFA**, a province or kingdom of Abyssinia, adjoining to the kingdom of Narea, and situate to the south of it. It is wholly mountainous, without any level ground. It is said to be governed by a separate prince, and to have been converted to Christianity in the time of Melec Segued, some time after the conversion of Narea. The inhabitants of these lofty mountains are not so dark in their complexion as Neapolitans or Sicilians. It has been said, that snow has been observed to lie on the mountains of Caffa, as well as on the high ridges called Dyre and Tegla; but the fact is dis-

credited by Bruce; *Travels*, vol. ii. p. 313. About N. lat. 8°. and E. long. 35°. See **NAREA**.

**CAFFABA**. See **KAFFABA**.

**CAFFACA**, **KEFFE-KIL**, in *Mineralogy*, or earth of Kaffa, (corruptly called Caffaca) is a very fine grained white tenacious clayey marl, dug in the Crimea, and formerly shipped from the port of Kaffa to Constantinople, in large quantities for the use of the Turkish women. Being mixed up with water to the consistence of thick cream, it was rubbed by hand among the hair, which, when washed again with water, was thus rendered perfectly clean and of a silky smoothness. For this purpose it was greatly preferable to soap, which, though it cleans the hair, is apt to discolour it, and render it harsh and brittle. When the Crimea was conquered by the Russians, this branch of commerce was stopped, and is not likely to be resumed, Constantinople being now supplied with a white clay from Asia Minor, which is equally good with the earth of Kaffa. *Pallas's Travels in the Crimea*, vol. ii.

**CAFFARELLI**, (**GAETANO MAJORANO**, *detto*) was one of the greatest singers that Italy ever produced. He came to England in 1738, the year after Farinelli's departure. He sung in two of Handel's operas, *Faramond*, and *Alessandro Severo*. But though he afterwards acquired such celebrity on the continent, he was not in high favour here. For though Farinelli, the last year of his performance in this country, had been neglected, no successor would be listened to of inferior fame, or indeed talents; for Caffarelli was never in voice or in good humour, all the time he was in England. The seeds of caprice with which nature seems to have furnished him, began early in life to spring up, and in his riper years, and fame, grew to an amazing height: Many traits of his character were current in Italy, long after he had quitted the stage.

When Gizziello first sung at Rome, his performance so far enchanted every hearer, that it became the general subject of conversation, which not only contributed to spread his fame through that city, but to extend it to the most remote parts of Italy; it is natural to suppose that the account of this new musical phenomenon soon reached Naples, and equally natural to imagine that it was not heard with indifference in a place where so powerful a propensity to musical pleasure prevails. Caffarelli, at this time in the zenith of his reputation, was so far piqued by curiosity, perhaps by jealousy, that he took an opportunity, the first time he could be spared from the opera at Naples, to ride post all night, in order to hear that at Rome. He entered the pit, muffled up in a pellic, or fur-gown, unknown by any one there; and after he had heard Gizziello sing a song, he cried out as loud as he possibly could, "bravo! bravissimo! Gizziello, é Caffarelli che ti lo dice," 'tis Caffarelli who applauds—and, immediately quitting the theatre, he set out on his return to Naples the same night.

When at his best, Caffarelli was thought by many a superior singer in some respects, to Farinelli: among these Porpora, who hated him for his insolence, used to say, that he was the greatest singer Italy had ever produced. At the marriage of the present King of Sardinia, then prince of Savoy, with the infanta of Spain, who had long been a scholar of Farinelli, it was with great difficulty that Caffarelli was prevailed on to go to Turin with the Astrua, to perform at the royal nuptials, in an opera which the King of Sardinia wished to have as perfect as possible. But Caffarelli, who came with an ill-will, by order of the king of Naples, seemed but little disposed to exert himself; declaring before-hand that he had lost a book of clothes on the

road,

ward, and should be able to do nothing. This was told to his Sardini Majesty, who was much perplexed how to treat such impertinence. Caffarelli was not his subject, and had been sent by the king of Naples, out of compliment, on occasion of the wedding. But the first night of performance, the prince of Savoy, in his nuptial dress, went behind the scenes, just before the opera begun, when entering into conversation with Caffarelli, he told him that he was glad to see him there, though the prince of Savoy thought it hardly possible that any one should sing in such a manner as would give her pleasure, after Farinelli. "Now, Caffarelli," says the prince, clapping him on the shoulder, "excite yourself a little, and cure the prince of this prejudice in favour of her master." Caffarelli was penetrated by this consideration in the prince, and cried out, "Sir, her highness shall hear two Farinelli's in one, to-night." And he is said to have sung, on this occasion, better than any one ever sung before. The Altrua was piqued by his great exertions to display all her talents, which, like the collision of flint and steel, only fired them the more.

In a letter which the author of this article received from Garrick, during his tour through Italy, dated Naples, February 5th, 1764, is the following passage concerning this singer who was then turned of sixty: "Yesterday we attended the ceremony of making a nun, she was the daughter of a duke, and the whole was conducted with great splendor and magnificence. The church was richly ornamented, and there were two large bands of music of all kinds. The consecration was performed with great solemnity, and I was very much affected: and to crown the whole the principal part was sung by the famous Caffarelli, who, though old, has pleased me more than all the singers I have heard. He touched me; and it was the first time I have been touched since I came into Italy."

In 1770, we heard Caffarelli ourselves, sing in a room at Naples. He was then sixty-seven; yet, though his voice was thin, it was easy to imagine, from what he was still able to do, that his voice and talents had been of the very first class. He had been so prudent as to provide for old age during youth; and he was now not only living in ease and affluence, in a sumptuous house of his own building, upon which was this inscription: "Amphion Thebas, Ego domum;" but had purchased a dukedom for his nephew after his decease. Caffarelli died in 1783, at eighty years of age; and the nephew, to whom he bequeathed his fortune, is now Duca di Santi Dorato.

**CAFFER.** in *Entomology*, a species of *CERAMBYX*, of a brassy-green colour, with spiny thorax, testaceous wing-cases, and short antennæ. Fabricius. Inhabits the Cape of Good Hope.

**CAFFIR**, in *Zoology*. *BOS CAFFER*, the Cape Ox an animal of the Ox genus, with horns that are broad at the base, then spreading downwards, next upwards, and curving inwards at the tip: mane short. Sparrmann.

It is, as Dr. Shaw very properly observes, to Dr. Sparrmann, Dr. Forster, and Mr. Masson, that we are principally indebted for the particulars relative to the description and natural history of this animal which, though long ago imperfectly known, has but lately been accurately described. Dr. Sparrmann published an account of this animal in the Transactions of the Stockholm Academy for 1779, and Masson in the 56th volume of the Transactions of the Royal Society of London. By these writers this animal is described as being about five feet and a half in height, and far superior in strength and fierceness to the European oxen, which renders it a dangerous creature. It encounters men,

horses, and other even with ferocity, trampling and crushing them to death with its feet, and is so swift that in running up hill it is not easily overtaken by a horse.

This species inhabits the interior parts of Africa, north of the Cape of Good Hope, where it is found in large herds in the more desert parts, retiring by day into the thick forests, and appearing chiefly towards the evening and morning. It is affirmed of this creature, that it will often strip off the skin of such animals as it kills, by licking them with its rough tongue, as recorded by some ancient authors of the Bison. The skin is exceedingly strong, and is on this account in high estimation with the colonists at the Cape, for its superior excellence in making harnesses, and other useful articles, in which the strongest and most durable kind of leather is required.

The body of the Cape Ox is of a black or darkish colour, and the face is covered with long harsh hair: the horns are thick and black, and lie flat upon the head, diverging so widely, that the tips of the two horns are sometimes five feet asunder: the ears are pendulous, and not unfrequently a foot long: tail short, tufted, and black at the tip. The flesh is coarse, and has the flavour of venison.

**CAFFETANS.** are long vests of gold or silver brocade, flowered with silk, which are presented by the grand signior and the visir, to those to whom they give audience: by the grand signior *before*, and by the visir *after* audience. The caffetans of the attendants are more ordinary.

**CAFFILA**, a company of merchants or travellers, or both together, who join company, in order to go with more security through the dominions of the Great Mogul; and through other countries on the continent of the East Indies. In Persia, the caffila differs from a caravan; as the former properly belongs to some sovereign, or to some powerful company in Europe; whereas, the latter consists of a company of particular merchants, each of whom trades on his own account. There are also such caffilas, which cross some parts of the deserts of Africa, particularly what is called the sea of sand, which lies between Morocco, and the kingdoms of Tombut and Gago. This is a journey of four hundred leagues, and takes up two months in going, and as many in coming back; the caffila travelling only by night, because of the excessive heat of the country. The chief merchandize they bring back consists in gold-dust.

The caffila is properly what is called caravan in the dominions of the grand signior, and in other parts of the East. See *CARAVAN*.

On the coast of Guzerat, or Cambaya, it signifies a small fleet of merchant ships.

**CAFFERA**, in *Entomology*, a species of *APIS*, that inhabits the Cape of Good Hope. Fabricius describes it as being hirsute, black, with the posterior part of the thorax, and anterior part of the abdomen, yellow.

**CAFFRA**, in *Ornithology*, a species of *CERTHIA*, of a fuscous colour, with the breast and abdomen pale, and the middle tail feathers longest. Inhabits the Cape of Good Hope.

**CAFFRARIA**, or land of the **CAFFERS**, or **KAFFERS**, in *Geography*, an undefined district in the south-eastern part of Africa; deriving its name from the Cafres, Caffers or Kaffers, who inhabit it. The appellation is derived from the Arabic word *Cafir*, which signifies an *infidel*, and is applied by the Arabs, as a term of reproach, to all those who do not profess the Mahometan religion. The Portuguese taking the name in a more general sense, have denominated all those nations of Africa *Caffres*, who have, or seem to have

have no knowledge of a deity. Geographers have not agreed in assigning the boundaries of that country in the southern part of Africa, to which the appellation of Caffraria has been appropriated. By some, the name has been applied to the whole country that commences at Cape Negro; extending from thence south-easterly to the Cape of Good Hope, thence, north-east to the river Del Spiritu Sancto, which separates it on the north-east from Monomotapa; reaching on the north, almost to the equator, where it borders on the kingdom of Makoko; and bounded on the north-west by Congo, or Lower Guinea, and the kingdom of Benguela. Accordingly, they have divided this extensive country into the kingdom of Mataman, the country of the Hottentots, Terra de Natal, and Terra dos Fumos. Others have divided Caffraria into two parts, viz. Caffraria Proper, and the country of the Hottentots. The inhabitants of Caffraria Proper are generally taller than the Hottentots, more robust, fierce, and warlike, and yet their manners are as inoffensive. Their figure is more graceful, their countenances are not so narrow, nor their cheeks so prominent as those of the Hottentots; neither have they the broad flat faces and thick lips of the inhabitants of Mozambique. If it were not for their colour, many of their females would be deemed beautiful even by the Europeans. They tattoo themselves very much, and wear their hair frizzled. In hot weather they are naked; but in winter they throw a "kros" of calf's or ox's skin over their shoulders, which reaches to the ground. Their huts are larger and more regular than those of the Hottentots; their frames are constructed of wood, and they are plastered within and without with a mixture of cow's dung and clay. The women form vessels of clay, and weave baskets of so close a texture as to be capable of holding milk or water. They are more disposed to agriculture than the others; nor would they wander if they were not compelled by an enemy. Their women principally prepare the fields for receiving seed, which is chiefly miller. Notwithstanding the apparent richness of their pastures, their cattle are much inferior in size to those of their neighbours. Their superior knowledge of agriculture, some dogmas of religion, greater industry, and more address in procuring simple necessaries, indicate, that the Caffres have made greater progress in civilization than the southern people. They practise circumcision, but not as a religious rite. They have elevated ideas of a supreme power, and believe in a state of future retribution; but imagine that the world is eternal. They never pray, nor have any religious ceremonies; but they have faith in sorcery. They are governed by a chief, whose power is very limited: he is deemed the father of the people, and is often less rich than his subjects; for, receiving no subsidies, and being permitted to have as many wives as he pleases, his finances are not always equal to the support of his retinue; and his honour is hereditary. The Caffres are more courageous than their neighbours: they dare to face the enemy, and disdain the use of poisoned arrows. Le Vaillant's Travels into Africa. For a further account of the country and history of these people, supplied by Mr. Barrow, in his "Account of Travels into the interior of southern Africa," see KAFFERS; see also HOTTENTOTS.

CAFRA, a town of Egypt, 2 miles E. of Siut.

CAFRES. See CAFFRARIA.

CAGACO, in *Ancient Geography*, a fountain of Greece, in Peloponnesus, near the town of Gythium, according to Pausanias.

CAGADA, in *Geography*, a small island of the West Indies, near the north-east coast of Porto Rico. N. lat. 18° 33'. W. long. 64° 10'.

VOL. V.

CAGADO *de agoa*, in *Zoology*, the name by which the Portuguese in South America call a species of tortoise, common in that part of the world. The Brazilian name is jurua.

CAGADO *de terra*, is the Portuguese appellation of the jaboti of South America, a remarkable species of tortoise. This is the testudo terrestris of late writers. Kil. Stobæus Act. Litter. et Scient. Succ. 1730.

CAGADOS *rocks*, in *Geography*, are two large rocks that lie between the island of Palmas and Cape Formosa, on the western coast of Africa.

CAGANUS, or CACANUS, an appellation anciently given by the Huns to their kings.

The word appears also to have been formerly applied to the princes of Muscovy, now called CZAR.

From the same also, probably, the Tartar title CHAM, or can, had its origin.

CAGAYAN, or CAGEAN, in *Geography*, a province in the northern part of the island of Luzon or Manila, in the East Indies. It is the largest in the island, being 80 leagues in length, and 40 in breadth. The chief city is New Segovia, which is seated on the banks of a river of the same name, which runs almost across the whole province. In this city is the cathedral church; and here resides the chief Alcayde, with a garrison of Spanish foot. This province commences with the most northerly cape called Del Engano; and after doubling cape Bojador, which is 15 leagues from the capital eastward, and coasting from north to south 20 leagues, the province terminates on the boundaries of that of Illocos. The peaceable Cagayans, who pay tribute, are about 9000, besides those that are not subdued. The whole province is fruitful; the men are robust, employed in agriculture, and of a martial disposition; and the women apply to several works in cotton. In the mountains bees are so plentiful, that the poor burn wax instead of oil; and they abound with brasil, ebony, and other sorts of valuable wood. In the woods are many wild beasts, particularly boars, and also deer, which they kill for their skins and horns, purchased by the Chinese.

CAGE, an inclosure made with wire, wicker, or other matter, interwoven latticewise, for the detention of wild beasts or birds. The word is French, *cage*, formed from the Italian *gaggia*, of the Latin *caveo*, which signifies the same: *a caveis theatralibus in quibus includebantur ferae*. Beasts were usually brought to Rome shut up in oaken or beechen cages, artfully formed, and covered or shaded with boughs, that the creatures, deceived with the appearance of a wood, might fancy themselves in their forest. Those of the fiercer sort were pent in iron cages, lest wooden prisons should be broke through. In some prisons there are iron cages for the closer confinement of criminals. The French laws distinguish two sorts of bird-cages, viz. high, or singing cages, and low, or dumb cages; those who expose birds to sale are obliged to put the hens in the latter, and the cocks in the former, that persons may not be imposed on, by buying a hen for a cock.

CAGES, *caveæ*, denote also places in the ancient amphitheatres, wherein wild beasts were kept, ready to be let out for sport. The *caveæ* were a sort of iron cages different from dens, which were under ground and dark; whereas the *caveæ* being airy and light, the beasts rushed out of them with more alacrity and fierceness than if they had been pent under ground.

CAGE, in *Agriculture*, an inclosure formed of wire or wicker-work, for the purpose of containing different sorts of poultry or other animals. It also signifies a machine for weighing live animals of the sheep, pig, and other small kinds. See MACHINE.

**CAGE**, in *Carpentry*, signifies an outer work of timber, encloſing another within it. In this ſenſe we ſay, the cage of a wind-mill. The cage of a ſtair-caſe denotes the wooden ſides, or walls which encloſe it.

**CAGELO**, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra; 6 miles S.W. of Girace.

**CAGGAR**, or **KENNER**, a river of Hindoſtan, which riſes in the mountains that ſeparate Sirhind from Caliore and Sirinagur, about N. lat.  $30^{\circ} 45'$ , and E. long.  $76^{\circ} 42'$ , and purſuing its courſe to the ſouth-weſt, and uniting with the Surfooty, and other ſmaller ſtreams, diſcharges itſelf into the gulph of Cutch.

**CAGGAW**, in *Botany*, a name given by the people of Guinea, to a plant which they boil in water, and uſe the decoction to waſh the mouth with, as a cure for the tooth-ach. The leaves of this are ſmooth and ſhining, like thoſe of the laurel, but they are thin, and bend like thoſe of the bay. Phil. Tranſ. N<sup>o</sup> 232.

**CAGHNEWAGA**, in *Geography*, the name of a ſmall village or diſtrict on the north-ſide of Mohawk river in the townſhip of Johnſtown, about 24 miles W. of Scheneectady in North America. It might probably have been formerly inhabited by a tribe of Indians of Lower Canada, of the ſame name, ſome of whom are found near Montreal.

**CAGIT**, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a ſpecies of parrot, very common in their woods; it is of a middling ſize, and is all over of a fine green colour.

**CAGLI**, in *Geography*, a town of Italy, in the duchy of Urbino, built near the ruins of the ancient Callum, on the Cantiano; the ſee of a biſhop, ſuffragan of Urbino; 18 miles S. of it. N. lat.  $43^{\circ} 30'$ . E. long.  $14^{\circ} 12'$ .

**CAGLIA**, or **MATAPAN cape**, the ſouth-weſt point of the Morea. N. lat.  $36^{\circ} 33'$ . E. long.  $22^{\circ} 36'$ .

**CAGLIARI**, **PAOLO**, uſually called **PAOLO VERONESE**, in *Biography*, an hiſtorical painter, was born at Verona in 1530, and became a diſciple of his uncle, Antonio Badiglio, a principal artiſt at Verona. His talents diſplayed themſelves at an early period; and at Mantua, whither he was conducted by cardinal Hercules Gonzaga, he was diſtinguiſhed above all his fellow artiſts. At Venice, the prize of a large gold chain, offered by the procurators of St. Mark for the beſt picture painted by ſix eminent artiſts, was adjudged to Cagliari, by Titian and Sanſovino.

Having executed ſeveral ſubjects, chiefly of the light and rural kind, exhibiting the fertility of his invention, and the brilliancy of his pencil, in the Venetian territories, he engaged in larger works for churches at Venice and Verona, which ſerved further to advance his reputation. At Rome, whither he accompanied Grimani, ambaffador from Venice to the pope, he much improved his ſtyle by an inſpection of the works of Raphael and Michael Angelo Buonaroti; and on his return to Venice, the doge conferred upon him the honour of knighthood. Duly ſenſible of the honour to which he attained, in his own country, he declined accepting the invitation of Philip II. to go to Spain, and paint at the Eſcurial, and ſent Zuccherò as his ſubſtitute. Such was the reſpect in which he was held by his brother artiſts, as well as by perſons of diſtinction, that Titian is ſaid to have greeted him with an embrace, whenever they met, and Guido declared, that next to Raphael and Corregio, he would rather be Paolo Veroneſe than any other painter of his time. By the number and value of his performances he acquired not only fame, but wealth: and yet he diſregarded money, and generouſly parted with it, whenever any ſuitable occaſion offered. Of his generoſity, as well as facility in

the exerciſe of his art, the following inſtance is recorded. Having been detained on a journey, and hoſpitably entertained at the houſe of the Piſani family, he ſecretly painted, during his ſtay, a picture of the family of Darius, conſiſting of 20 figures as large as life; and leaving the canvas rolled up under his bed, he informed his hoſts that he had left ſomething behind him towards paying his expences. This artiſt, whoſe ſuperior merit has been univerſally acknowledged, died of a fever at Venice, in 1588, at the age of 58 years, and was buried in the church of St. Sebaſtian, which he had previously decorated by his own hand. The pictures of this maſter were rendered ſingularly beautiful by the excellence of their colouring, by the magic effects of light and ſhade, and by the grace and harmony of compoſition. But in order to produce this kind of beauty, which charmed the eye, he ſacrificed much expreſſion, correctneſs of drawing, propriety of coſtume, and other qualities which ſatisfy the mature judgment. Of his pictures, which are diſperſed all over Europe, ſome of the principal are in the palace of St. Mark at Venice, and in the churches of that city, and of others in the north of Italy. Among his moſt celebrated pieces, are the Four Banquets; and of theſe, the Marriage at Cana, once in the refectory of the convent of St. George at Venice, now in the Louvre, conſiſting of at leaſt 130 figures, is reckoned one of the moſt capital performances in Europe. Many of his works have been engraved by the principal artiſts of their time. For his amuſement he etched ſome few plates, which ſhew the hand of the maſter. Among theſe are “the Adoration of the Magi,” and “Two Saints ſleeping.” His ſons, Carletto and Gabriel, acquired, alſo, eminence as painters. Carletto was born at Venice, in 1570; and poſſeſſed a genius, which, under the inſtruction of his father, manifeſted itſelf betimes, and arrived at an early maturity; ſo that he promiſed to have equalled, if not to have exceeded his father. But by inceſſant application, he impaired his conſtitution, and died in 1596, at the age of 26 years.

*Gabriel* was born at Venice in 1568, and having talents inferior to thoſe of his brother, he turned his attention to commerce. He died 1631.

Theſe brothers finiſhed works, which had been left imperfect by their father; and ſeveral pictures of their own deſign and execution have been aſcribed to him; nor can ſome of them be eaſily diſtinguiſhed from thoſe of this great maſter. They were aſſiſted by their uncle *Beneditt*, or *Benedetto*, who was born at Verona in 1538, and died in 1598. He reſembled his brother Paolo in his ſtyle of painting; but his peculiar excellence conſiſted in the architectural figures, with which he enriched the compoſitions of his brother. At Venice there are ſeveral paintings, deſigned and executed by himſelf, which are much admired. D'Argenville. Pilkington. Strutt.

**CAGLIARI**, or **CALARIS**, in *Geography*, a ſea-port city, and capital of the iſland of Sardinia, is ſituated in the ſouthern part of the iſland, on the declivity of a hill, and has a large and ſecure harbour, ſcreened by a ſmall iſland called “Pietra Laida,” and defended with a caſtle and fortifications. It is large and populous, the number of inhabitants amounting to about 50,000, and carries on a conſiderable commerce. It is the ſee of an archbiſhop, and the reſidence of a viceroy; and contains five churches beſides the cathedral, and 23 convents. In 1708, it ſurrendered, upon an attack of the Britiſh fleet, to the emperor Charles VI.; but in 1717 it was retaken by the Spaniards, and about two years afterwards ceded to the duke of Savoy in lieu of Sicily, who obtained the title of king of Sardinia. N. lat.  $39^{\circ} 12'$ . E. long.  $9^{\circ} 14'$ .

CAGNACCI, in *Biography*. See GUIDO.

CAGNANO, in *Geography*, a town of the island of Corfica; 14 miles N. of Baltia.

CAGNANO is also a town of Italy, in the kingdom of Naples, and province of Abruzzo Ultra; 3 miles N.N.W. of Aquila.

CAGNETE, CANETE, or GUARCO, a town of South America, in Peru, and capital of a jurisdiction of the same name, in the archbishopsric of Lima, near the sea-coast; 80 miles S.E. of Lima. S. lat.  $12^{\circ} 40'$ . W. long.  $73^{\circ}$ .

CAGNETE, or CANETE, a district or jurisdiction of South America, in Peru, beginning at the distance of 6 leagues S. from Lima, and extending along the coast in the same rhumb above 30 leagues. The temperature of the air in this district is the same with that in the valleys of Lima; and the country, being watered by a large river, and other less streams, produces great quantities of wheat and maize. The lands are very much planted with canes, which yield an excellent sugar. In the vicinity of Chilesa, situate about 10 leagues from Lima, is found salt-petre, of which gunpowder is made in that city. It has also a good fishery, which affords a comfortable subsistence to the Indian inhabitants of the town, particularly those situated near the sea-coast; together with plenty of fruits, pulse, and poultry; whence a large trade is carried on between this jurisdiction and Lima.

CAGNI. See BOUFFLERS.

CAGNICOURT, a town of France, in the department of the straits of Calais, and district of Bapaume, 3 leagues N.N.E. of it.

CAGNO, a town of Germany, in the country of Tyrol; 10 miles S.W. of Bolzano.

CAGNOLU, in *Ichthyology*. See SQUALUS ZYGÆNA.

CAGOTS, in *Geography*, a name distinguishing a singular class of people, who inhabit some of the vallies contiguous to the Pyrenées. M. Ramond de Carbonnieres in his "Observations faites dans les Pyrénées," &c. 8vo. Paris, 1789, adopts the opinion of M. de Marca, that this miserable race, whose imbecility of mind and deformity of person have so frequently engaged the attention, and exercised the ingenuity, of philosophical travellers, are the descendants of the Goths and Wisigoths, who were persecuted and dispersed on account of their Arian principles. These heretics were treated with cruelty by the Franks, and driven from the borders of the Loire and the Sevre to the most desolate places. After the destruction of the kingdom of the Wisigoths by the children of Clovis, those who were degenerated by intermarriages, and were not able to follow the warlike Goths into Spain, sunk into contempt on account of their religious tenets. They were excommunicated from the church, and refused Christian burial. They were branded with the names of *Cagots*, *Cabets*, and *Cassos*, which signify, according to Gebelin, "polluted" and "infected." They became leprous, he says, by being, through successive generations, exposed to the most extreme poverty, and by being prohibited from intermarriages with any other families than their own. "Their return to the bosom of the church was not sufficient to remove the stigma of their cast: they ceased from being Arians, without ceasing to be leprous; and they afterwards ceased to be leprous, without being freed from all the evils engendered by a vitiated state of the fluids."

CAGUAN, a district of Terra Firma, with a town of the same name, situate in the southern part of New Granada. The town lies in N. lat.  $3^{\circ}$ . W. long.  $76^{\circ}$ .

CAGUANABO, a town of the island of Cuba; 60 mile N.N.E. of St. Yago.

CAGUANICO, a town of the island of Cuba; 55 miles N.N.E. of St. Yago.

CAGUATUS, MARSILIUS, in *Biography*, born at Verona, about the middle of the 16th century, was educated at Padua, where he acquired so much reputation, that he was invited to teach medicine at Rome. He continued to reside there to the time of his death, in 1610. He was well read in the ancient Greek fathers of medicine, and employed much of his time in commenting on their works, and correcting many errors which time had introduced, often, Haller thinks, happily enough. His works are "Variarum Observationum Libri duo, cum disputatione de ordine ciborum Libri quatuor," Romæ 1581. 8vo.; consisting principally of critical observations on the works of the ancients. In one case, he had seen the bones of a human fœtus which had been voided by the anus. "De Morte, Causa Partus." He contends, contrary to an opinion held by some anatomists, that the ossa pubis do not separate in parturition. "De Sanitate tuenda," 1591. 4to. "De Aeris Romani Salubritate, de Tiberis Inundatione, et de Epidemia Romana, seu de Populari Ægitudine quæ Anno 1591, et de altera quæ Anno 1593, orta est," 1599. 4to. He contends that the air of Rome is not unhealthy, and modern Rome more healthy than the ancient; that Rome abounds with persons of great age; that though the Tiber frequently overflowed its banks, he had never known any epidemic follow from that circumstance. Haller. Bib. Bot. Med. et Anatom.

CAGUI *Minor*, in *Zoology*, the name given by Marcgraave to the species of ape described by late scientific writers under that of *simia jacchus*. Edwards after Marcgraave also calls it *cagui minor*, or langlin. It is the striated ape of Pennant.

CAGUI *Major Brasiliensibus* of Marcgraave is the *simia oedipus* of Gmelin, and little lion monkey of Edwards.

CAGURRIA, in *Geography*, a town of Spain, in Navarre, seated on a small river, which almost furrounds it, and discharges itself into the Ebro; 6 leagues N.W. of Calahorra.

CAHA, a town of Persia, in the province of Irak; 40 miles N.E. of Amadan.

CAHAIGUES, JAMES, in *Biography*, born at Caen in Normandy, about the middle of the 16th century, applied early to the study of medicine, in which he took the degree of doctor at the university of Caen, in 1580. In 1583, he published "Elogiorum Civium Cadomentium Centuria 1;" reprinted in 1609, 4to.; "Brevis facilisque Methodus curandarum Febrium," Cadom. 1616, 8vo. "Brevis facilisque Methodus curandarum Capitis Adfectuum," 1618, 8vo.; "De Aqua Medicata Fontis Hebecrevonii," 1614, 8vo. He also published a translation into French of Julien le Paulmier, "De Morbo Gallico." Haller. Bib. Medica. Eloy. Bib. Hist.

CAHIER, or CAHIR, in *Geography*, a small neat post and market town of the county of Tipperary, province of Munster, Ireland, where there is a bridge over the river Suire, and near it, on an island in the river, is a castle, formerly of great strength, which was twice taken, first by sir George Carew in the reign of queen Elizabeth, and afterwards by Oliver Cromwell. On the bank of the river, opposite to the town, are the ruins of Cahier abbey, which was founded in the reign of king John. Distance S.W. from Dublin 85 Irish miles. N. lat.  $52^{\circ} 22' 30''$ . W. long.  $7^{\circ} 54'$ .

CAHIR is also the name of a fishing-village in the county of Kerry, Ireland, on the coast opposite to Valentia island,

which was formerly much frequented in time of war, because no French privateer ever landed there to plunder, as was usual on other parts of the coast; a privilege said to have been procured by the Roman Catholic bishop of the see from the French monarch. Smith's Kerry.

CAHTE, a small island in the Atlantic ocean, on the west coast of the county of Mayo, Ireland, a little south of the entrance into Clew bay. N. lat.  $53^{\circ} 44'$ . W. long.  $9^{\circ} 53'$ .

CAHIRCONREE, a high mountain, south of Tralee, in the county of Kerry, Ireland, the name of which is supposed to signify *the fortress of king Con*. On the top of it is a circle of masonry stones, laid one on the other, in the manner of a Danish intrenchment, several of them being from eight to ten cubical feet, but all very rude. Different opinions have been entertained respecting this and other ancient monuments of the same kind. Some suppose them to be of eastern origin, and designed for religious purposes in honour of the sun; whilst others maintain that they are of northern origin, and were monuments of some great action performed near the place, or perhaps a sepulchral trophy raised over some eminent person. Mr. Pinkerton, in his account of Stone henge, supposes them to have been introduced by the *Belgæ* or Goths, whom he considers as the Irish *Firbolgs*. These people used them, he says, as circles of judgment, or solemn places where courts were held, of all kinds and dignities, from the national council down to the baronial court, or that of a common proprietor of land, for adjusting disputes between his *villani* and slaves. According to this account they are of greater antiquity than the Danes, though used by this people. The common people, unable to conceive how human strength could possibly raise stones of such a prodigious weight to the summit of a steep mountain above 2000 feet high, get over the difficulty by supposing it to have been the work and labour of a giant. See STONE-HENGE. Smith's Kerry. Collectanea Hibernica. Ledwich's Antiquities. Pinkerton's Geography.

CAHULLO, in *Ichthyology*, a name given by some old writers to the fish they also called *lupus marinus*, or wolf-fish, *anarhichas lupus* of Linnæus.

CAHOKIA, in *Geography*, a settlement in the north-western territory of America, north of Kaskaskias, which see.

CAHORS, a considerable town of France, before the revolution the capital of Quercy, and see of a bishop, now the principal place of a district in the department of the Lot, situate in a vale between mountains on the bank of the river Lot. One part of the town seems to lean against the steep side of a mountain; the other is seated in a small plain, watered by the meandering stream of the river, and finely cultivated, with its corn-fields, gardens, and fruit-trees, particularly the almond. The town is irregularly built, and its streets are narrow. The cathedral church is distinguished by its large cupola, which must in part have been an ancient Roman work: the remains also of a Roman amphitheatre and aqueduct are seen in this place. The number of inhabitants in the north and south districts of the town is 11,728, in the north canton 10,162, and in the south 8,981; the territory comprehends  $142\frac{1}{2}$  kilometres and 10 communes. The lands round the town are very fertile; and the wine of this place has high reputation, and is exported from Bourdeaux as an article of commerce. It is produced by dwarf or ground vines, on steep mountains, and holds a high rank among the red wines of France. This town is fortified and surrounded with thick walls; but it was taken by assault by Henry IV. in 1580, when mortars are said to have been first used. N. lat.  $44^{\circ} 27'$ . E. long.  $1^{\circ} 6'$ .

CAHUSAC, LOUIS DE, in *Biography*, was born at Montauban, and having finished his studies at Toulouse, was admitted an advocate. On his return to Montauban, he obtained the post of secretary of the intendance. He afterwards removed to Paris, and became secretary to the count de Clermont, and after attending him in the campaign of 1743, he devoted himself to literature, and particularly to dramatic compositions. He died at Paris in June 1759. His temper was restless, lively, and arrogant; and his sensibility with regard to his reputation was so acute, that it is said to have produced a degree of derangement, which probably shortened his days. His publications were "Grigri," a romance, 12mo.; "The History of the Dance, ancient and modern," 3 vols. 12mo.; "Pharamond," written in 1736, and the tragedy of the "Earl of Warwick;" two comedies, viz. "Zencide," and the "Algerine;" the "Festivities of Polyhymnia," and of "Hymen," "Zais," "Nais," "Zoroaster," the "Birth of Osiris," and "Anacreon," all operas; besides the "Loves of Tempé," which is also ascribed to him. Biog. Dict.

CAHUSAC, in *Geography*, a town of France, in the department of the Lot and Garonne, and district of Lauzun, and 5 miles E.N.E. from it.

CAHUZAC *sur Verre*, a town of France, in the department of the Tarn, and district of Gaillac, and 2 leagues N. of it.

CAHYS, in *Commerce*, a dry measure for corn, used in some parts of Spain, particularly at Seville and Cadiz. It is near a bushel of our measure.

CAI, in *Zoology*. The Linnæan SIMIA MIDAS is described under this name by Ray in his History of Quadrupeds.

CAJA, in *Entomology*, the species of PHALÆNA, known in England by the name of the garden tiger moth. The anterior wings are whitish, with large fulvous spots: posterior pair red with black spots. *Donov. Brit. Inf.*

CAJA, in *Geography*, a river of Portugal, which runs into the Guadiana, 7 miles E. of Elvas.

CAÏA, in *Ornithology*. Buffon gives this name to the HOODED PARROT, PSITTACUS PILEATUS.

CAÏA, in the *Turkish Military Orders*, an officer serving in the post of a deputy or steward, and acting for the body of the janizaries.

CAÏAC, in *Geography*, a town of Persia, in the province of Irak; 64 miles W.S.W. of Ispahan.

CAJANA, or CAJANEBORG, a town of Sweden in a lehn or district of the same name, and capital of East Bothnia, seated on a lake near the borders of Lapland, and almost surrounded by the river Pyha, which forms a tremendous cataract in the neighbourhood. The district of which it is a part is about 60 leagues long and 16 broad. It was granted as a barony, in 1650, to Peter Brahe, under the title of the sief of Cajana. N. lat.  $64^{\circ} 13' 30''$ . E. long.  $15^{\circ} 50' 47''$ .

CAÏANI, in *Ecclesiastical Antiquity*, a sort of heretics, thus denominated from one Caianus of Alexandria, their leader, otherwise denominated ΑΡΗΘΑΡΤΟΔΟCΕΤÆ.

The same name is sometimes also given to the sect of Cainians or Cainites.

CAÏAON, in *Geography*, a kingdom of the island of Java.

CAÏAPHAS, in *Scripture History*, the high priest of the Jews, at the time of our Saviour's crucifixion. He succeeded Simon, the son of Camithus, A. M. 4029, and after possessing this dignity nine years, till the year A. M. 4038, was deposed by Vitellius, governor of Syria, and  
the

the dignity devolved upon Jonathan, the son of Ananus. It appears that Caiaphas was high priest all the time that Pilate was in Judea. Some have thought, that the phrase, "being high-priest that same year" (John, xi. 49.) implies, that St. John supposed the high priesthood was annual. And on this account, they have been disposed to charge him with a great mistake; for Pontius Pilate was governor of Judæa 10 years, and Caiaphas was put into the priesthood by Valerius Gratus, the predecessor of Pilate, and continued in it, till after Pilate's removal. But the phrase "that year," as it should have been rendered, and not "that same year," denotes no more than "at that time." St. John, therefore, merely says, that Caiaphas was high-priest at that time. It is added, that "being high-priest that year he prophesied." By prophesying we may understand his declaring the event; which it was in a peculiar manner the office of the priest to do, when he was inquired of, or when God was inquired of by him, concerning any important matter under deliberation. Lardner's works, vol. i. p. 387, &c.

CAJARE, in *Geography*, a town of France, in the department of the Lot, and chief place of a canton, in the district of Figcac;  $5\frac{1}{2}$  leagues E. of Cahors. The town contains 1975 and the canton 8,126 inhabitants: the territory includes  $207\frac{1}{2}$  kilometres and 14 communes.

CAIATUS, in *Botany*, (Rumph. amb. iv. 64, t. 24.) See *ÆSCHYNOMENE indica*.

CAIAZACOS, in *Geography*, a town of the island of Cuba; 40 miles W.S.W. of Bayamo.

CAJAZZO, a town of Naples, in the country of Lavora, the see of a bishop, suffragan of Capua, 8 miles N.E. of it.

CAIC, CAIQUE, CAICA, in *Sea-language*, is used to denote the skiff, or sloop, belonging to a galley.

The Cossacks give the same name, *caic*, to a small kind of bark used in the navigation of the Black sea. It is equipped with forty or fifty men, all soldiers; their employment is a kind of piracy. The Turks have also a sort of caics, which some render by *biremes*.

The Caics, or Caiques, that navigate the sea of Marmora, are generally manned by two or three rowers; and they are incessantly employed in crossing the harbour, and proceeding with celerity to all the villages of the Bosphorus, to Scutari, to Prince's islands, and to every place in the environs. These caiques are long narrow boats, extremely light, equipped with one, two, or three pairs of oars, seldom with four. They carry one or two, and even three sails, which are set only in fair weather, or when the wind is not too strong. They are not provided with ballast, and are so buoyant that a somewhat stiff breeze would overfet them, if the boatman did not take care to let go the sheet on the smallest danger, and to throw the boat up in the wind by shifting the helm. These caiques are so numerous, and they divide the water with such velocity, that in some cases the utmost skill of the rowers cannot prevent their running foul of each other, and one of the two from being overfet, especially in bad weather. Such accidents, when they occur, are little regarded. They are no less swift in sailing than elegant in their form. In two hours, with a light breeze, they will sail from Constantinople to Prince's island, distant from 10 to 12 miles; and notwithstanding contrary wind and current, three rowers never take more time for reaching Buyuk-Dere, distant 18 miles. The Caiques belonging to the Sultan are remarkable for their size, their gilding, their elegance, and the number and dexterity of the rowers: they carry 14 pairs of oars, and are manned by 28 boatsteersmen, dressed in white, the boatsteersman being the cockswain, or steersman. The caique

of the grand visier has 12 pairs of oars; those of the principal officers of the Porte, and of the ambassadors of foreign powers, have seven pairs each. In these large caiques one man is required for each oar; while those of private persons are sufficiently narrow for a single man to make use of two oars at a time. When the sultan in summer visits his different palaces on the Black sea, his caique is distinguished by a beautiful crimson awning, spread towards the stern: and he is preceded and followed by a number of others, in which are his principal officers.

CAICANDROS, or CAICANDRUS, in *Ancient Geography*, an island of the Persian gulf, 400 stadia distant from Cataea, and before a place named Ilan, according to the journal of the navigation of Nearchus. It is mentioned also by Arrian. It was a small place and uninhabited.

CAICINUS, a river of Italy in Brutium, near the Epizephyrian Locrians. It was near this river that the Athenians invaded the territory of the Locrians.

CAICO, in *Geography*, a town of the island of Cuba; 25 miles S. E. of Bayamo.

CAICOS, or CAYOS, a cluster of small islands or rocks, called *Little* and *Great CAICOS*, lying between St. Domingo, and the Bahama islands. N. lat.  $21^{\circ} 14'$  to  $22^{\circ} 23'$ . W. long.  $71^{\circ} 40'$  to  $71^{\circ} 50'$ .

CAICUS, in *Entomology*, a species of SPHINX that inhabits Surinam. The wings are fuscous: posterior pair rufous streaked with black: abdomen cinereous with black rings.

CAICUS, in *Ancient Geography*, a small river of Asia Minor, in Mysia, which passed near the frontiers of Lydia, and uniting with other streams, discharged itself into the sea near Elæa; supposed to be the present *Girmalli*.

CAIDBEIA, in *Botany*, (Forst. Ægypt.) See *FORSKOEHLIA*.

CAJELI, or CAGELY, in *Geography*, a bay at the north-east end of the island of Bouru, where the Dutch have a fortress.

CAJELIE, a county of Celebes in India, lying on the western shore of the island, towards the north, between Mandhar Mamoedje and Sinlense, which is the southernmost place belonging to the government of Ternate. By the treaty of Boni, this country was ceded to the king of Ternate; but the government at Batavia afterwards issued orders that it should be considered as belonging to the government of Macassar. It formerly yielded much cocoa-nut-oil; but since the year 1730, it has been so much ravaged, first by the internal dissensions between their own nobles, and afterwards by the Mandharese, that all the cocoa-nut trees were felled; and the land lies now almost uncultivated and desert, and is subject, for the greatest part, to the Mandharese.

CAJEPUT OIL, *Oleum Volatile Melaleuca*. This essential oil is prepared from the dried leaves of the MELALEUCA *Leucodendron*, a tree which grows abundantly in many of the Molucca islands. The oil is brought over in considerable quantity from Amboyna, Batavia, and other Dutch settlements.

Cajeput oil is a very limpid fluid with a slight green tinge, lighter than water, of a very penetrating and peculiar smell somewhat resembling a mixture of ether and camphor, totally evaporable in a moderate temperature when exposed to air, very inflammable and burning without leaving any residue. In chemical qualities it resembles the other *essential Oils*.

To the taste it is highly acrid and stimulating, and it appears to possess valuable medicinal properties as a general stimulant.

Amulant and antispasmodic. Hence it is warmly recommended in flatulent colic, paralysis, chorea, whooping cough, and convulsive disorders in general. The dose is from one to six drops. It is also of considerable use externally applied for the relief of tooth-ach, rheumatic pains, sprains, and the like. This oil was first introduced into the Amsterdam Pharmacopœia about the year 1726, and is retained in the last edition of that of Edinburgh.

Insects have a great aversion from this oil, the vapour of which appears to intoxicate and kill them. A peculiar property of cajeput, in which it excels other essential oils, is, that it is a perfect solvent of *caoutchouc*, from which a perfect drying varnish may be made in the manner described under that article.

CAIET, or CAJET, PETER VICTOR PALMA, in *Biography*, was born in 1525, of poor Protestant parents, at Montichard in Touraine; and after pursuing his theological studies at Geneva, became a domestic in the house of Calvin, and afterwards a minister. However, he left his church to follow the court, and was appointed chaplain to Catharine, sister of Henry IV.; but being addicted to alchemy, he was calumniated as a magician, and charged with publishing a book in favour of the establishment of public stews; and deposed from his ministerial function by a synod. Thus disgraced, he abjured Protestantism, in 1595, and was cordially received by the Roman Catholics, among whom he was ordained priest at the college of Navarre, and made doctor in theology, and appointed royal professor of Hebrew. His zeal, as a new convert, led him to attack the sect he had abandoned in several controversial writings, and in a disputation with Du Moulin. But his principal reputation was founded on his historical compilations. In 1598 he published a relation of the recent war between the Turks and Hungarians; and, in 1605, his "Septenary Chronology," from the peace of Vervins, in 1598, to 1604, to which he afterwards added the history of the nine years' war, terminated at this peace, in his "Novennary Chronology," printed in 1608. He also wrote two works in Latin; one intitled, "Concilium pium de componendo Religionis Dissidio," and the other, "Instructions in the four principal Oriental Languages." He died in 1610. Gen. Dict.

CAJETA, in *Entomology*, the name under which Cramer figures the Gmelinian *NOCTUA FULLONICA*, which see.

CAJETA, in *Ancient Geography*, a sea port town of Italy in Latium, now *Gata*.

CAJETAN, CARDINAL, in *Biography*, so called from the place of his nativity, Cajeta, (his proper name being *Thomas da Vio*), was born in 1469, and entered into the order of Dominicans, among whom he was distinguished for the acuteness of his understanding and his learning. The chapter of his order conferred upon him the degree of doctor in 1494; and after having taught philosophy at Rome and at Paris, he was chosen general of his order in 1508, and raised to the dignity of cardinal in 1517, by Leo X. In the following year he was deputed as legate to the emperor, for promoting the war against the Turks and opposing the Lutheran heresy. At this time he held three conferences with Luther at Augsburg, in the conduct of which he behaved in a manner so imprudent and imperious as to give offence at the court of Rome. Instead of recurring to argument, he used the mere language of authority, and in an overbearing tone insisted on the reformer's giving up his opinions and submitting respectfully to the judgment of the Roman pontiff. Luther's temper could not brook such treatment, and of course the breach was

widened by these conferences. Pope Adrian VI. sent him as his legate to Hungary, and upon his return he was promoted to the see of his native city. When Rome was sacked in 1527, he fell into the hands of the soldiers, by whom he was treated with great indignity, and they insisted on a large sum for his ransom. He closed his life at Rome, where he was assiduously employed in the study of the Scriptures, in 1534. His earlier works were "Commentaries upon Aristotle," and upon the "Summa Theologiæ" of Aquinas. In his "Tractatus de Comparatione Autoritatis Papæ et Concilii," he alleges many frivolous and groundless arguments in favour of the absolute authority of the popes as successors to St. Peter. His theological treatises discuss the most important tenets of the Roman Catholic religion; and in his illustration of the doctrine of indulgences he maintains that they avail only as an absolution from the penances enjoined by the church, but that their benefits extend to souls departed merely in the way of suffrage or intercession. With respect to indulgences he contended, in his conference with Luther, that "one drop of Christ's blood being sufficient to redeem the whole human race, the remaining quantity that was shed in the garden and upon the cross, was left as a legacy to the church, to be a treasure from whence indulgences were to be drawn and administered by the Roman pontiffs."

Cajetan's most considerable work is his "Commentary upon the Scriptures," comprehending the Old and New Testament, except the Song of Solomon, the Prophets, and the book of Revelation. In this performance, he restricted himself to the literal sense of the words of Scripture in the original languages, without regarding the expositions of the fathers. Ignorant of the Hebrew, he employed a Jew and a Christian to furnish him with the exact import of the words according to the letter and grammar, without troubling themselves to give a sense of their own when no sense appeared. In the New Testament he chiefly followed the version of Erasmus. By deserting the vulgar Latin translation, and disregarding the fathers, he incurred the censure of some of his own communion; and, in 1544, the university of Paris issued a decree, condemning his work, as containing false, impious, and even heretical propositions. Some more candid Catholics have vindicated him, though he is justly charged with too scrupulously adhering to the literal version of the rabbins. Many editions of his works have appeared. Those on the Scriptures were printed at Lyons, in 1639, in 5 vols. fol. Dupin's E. H. 16th century. Mosheim's E. H. vol. iv.

CAI-FONG, in *Geography*. See KAI-FONG.

CAILAR, a town of France, in the department of the Herault, and chief place of a canton, in the district of Lodève. The town contains 722, and the canton 3127 inhabitants; the territory comprehends 255 kilometres, and 8 communes.

CAILHAU, a town of France, in the department of the Aude, and district of Limoux;  $3\frac{1}{4}$  leagues S. W. of Carcassonne.

CAILLE, NICHOLAS LEWIS DE LA, in *Biography*, an eminent mathematician and philosopher, was born at Rumigny, in the diocese of Rheims, March the 15th, 1713. The amusements of his father, after withdrawing from the army, in mathematical and mechanical philosophy, led the son, at an early period, to form an attachment to mechanics. Having left school in 1729, he prosecuted his studies at Paris, and applied particularly to theology, in the college of Navarre, with an intention of becoming an ecclesiastic. But his inclination to astronomy diverted his purpose; and, by the friendship of the celebrated Cassini, to whom he was introduced,

introduced, he obtained an appointment in the observatory; and under the instruction of this excellent patron, his natural genius had favourable opportunities for cultivation and exercise, and he acquired the reputation of an able astronomer. In 1739 he was connected with M. Cassini de Thury, in verifying the meridian through the whole extent of France; and in the same year he was appointed professor of Mathematics in the college of Mazarine. In 1741 he was admitted into the Academy of Sciences, and from this year to 1763 inclusive, he enriched every volume of the memoirs with some valuable paper. He also published, at different periods, some useful treatises on geometry, astronomy, mechanics, and optics. He also computed all the eclipses of the sun and moon, from the commencement of the Christian æra, which were printed in the work intitled, "L'Art de verifier les Dates, &c." Paris, 1750, 4to. He also compiled a volume of "Astronomical Ephemerides," for 10 years, from 1745 to 1755; another from 1755 to 1765; and a third, from 1765 to 1775. His excellent work, intitled, "Astronomiæ Fundamenta, novissimis Solis et Stellarum Observationibus stabilita;" was published at Paris in 1759; and in 1760 appeared his correct solar tables, under the title of "Tabulæ solares, quas è novissimis suis observationibus deduxit," N. L. de la Caille.

Having completed a series of seven years' observations in the observatory at the Mazarine college, he formed a project, which was approved by the French court, of observing the southern stars at the Cape of Good Hope; and proceeded upon this expedition in 1750. In the space of two years he observed the places of about 10,000 stars in the southern hemisphere, invisible in our latitude; and determined several other important elements, such as the parallaxes of the sun and moon, and some of the planets, the obliquity of the ecliptic, the quantities of refraction, &c. Previous to his return he engaged in the arduous attempt of estimating the dimensions of the earth by measurement, at the southern parallels, as other astronomers had done near the equator, and in northern latitudes, with a view of deciding whether the former corresponded with the latter. The results of his labours were satisfactory; for having determined a distance of 410814 feet from a place called "Klip-Fontyn" to the "Cape," by means of a base of 38802 feet, three times actually measured, he discovered an unknown secret of nature, viz. that the radii of the parallels in south latitude are not of the same length with those of the corresponding parallels in north latitude. He found that a degree on the meridian in 32° S. lat. contains 342222 Paris feet. In conformity to orders from the court of Versailles, he also determined the situation of the Isles of France and Bourbon. During his abode at the Cape he likewise made some curious meteorological observations; and he particularly observed, when the south-east wind blows, which is often the case, the stars appear larger and seem to dance; that the moon has an undulating tremor; and that the planets have a sort of beardlike comets.

Upon his return to France, after an absence of 4 years, he replied to some strictures, published by the celebrated Euler, relating to the meridian: he afterwards settled the results of the comparison of his own observations, respecting the parallaxes, with those of other astronomers. Accordingly, he fixed that of the sun at 9 $\frac{1}{2}$ ", that of the moon at 56' 56", that of Mars, in his opposition, at 36", and that of Venus at 38". He also settled the laws, by which astronomical refractions are varied by the different density or rarity of the air, by heat or cold, and by dryness or moisture. And he was one of the first promoters of the lunar observations for determining the longitude at sea. In consequence

of the reputation which he had thus acquired and established, he was elected a member of most of the academies and societies in Europe: as London, Bologna, Petersburg, Berlin, Stockholm, and Gottingen.

Independently of his own publications, he edited the memoirs of Father Feuillée, at the Canaries; the journal of the voyage of M. de Chazelle, to the Levant; the manuscript collection of observations of William, Landgrave of Hesse, and Bouguer's treatise on the gradation of light.

Although he was attacked in 1760 with a severe fit of the gout, the energy of his mind was unimpaired: so that besides pursuing his course of studies, he sketched out the plan of a new and large work, proposed to be "The History of Astronomy through all Ages, with a Comparison of the ancient and modern Observations, and the Construction and Use of the Instruments employed in working them." In the year 1761 his constitution gradually declined, without interrupting his studies, in which he persevered to the last: and they only terminated with his life, March 21st, 1762. Mem. of the Paris Academy for 1762.

CAILLE, in *Ornithology*, among the French, synonymous with the English word quail, as for example, *caille de la Louisiane* of Buffon, the Louisiana quail of Latham; *caille de la Chine* of Buffon, the Chinese quail of Edwards; *caille de l'isle de Luçon* of Sonnerat, the Luzonian quail of Latham, &c.

CAILLERE, LA, in *Geography*, a town of France, in the department of the Vendée; 4 $\frac{1}{2}$  leagues N. E. of Luçon.

CAILLOT, in *Biography*, a most pleasing, and almost the only pleasing, theatrical French singer, to the natives of other countries, that France has produced. He continued, during many years, the favourite actor and singer of the comic opera at Paris. His voice, which he could make a base, tenor, or counter-tenor at pleasure, was sweet and flexible. He was an excellent actor, and, in all respects, a most interesting, entertaining, and admirable performer. He first appeared in the part of *Colas*, in *Ninette à la Cour*, in 1760.

CAILLY, in *Geography*, a town in France, in the department of the Lower Seine, and district of Rouen; 3 $\frac{1}{2}$  leagues N. N. E. of Rouen.

CAILO, a small island in the gulph of Persia, 80 leagues W. of Ormus.

CAIMACAN, or CAIMĀCAN, a dignity in the Ottoman empire, answering to that of lieutenant, or vicar, among us. The word is composed of the two Arabic words, *Caim machum*, q. d. *he who holds the place, or discharges the functions of another*.

There are usually two caimacans: one resides at Constantinople, who is the governor thereof: the other attends the grand visir, in quality of his lieutenant. Sometimes there are three caimacans: one constantly attending the grand signior, another the grand visir, and a third constantly at Constantinople, who examines affairs of policy, and regulates them in great measure. The caimacan that attends the visir, only officiates when at a distance from the grand signior; his function ceasing, when the visir is with the sultan. The caimacan of the visir is his secretary of state, and the first minister of his council. The caimacan is properly the substitute of the grand visir, appointed by the sultan, when the former is obliged to absent himself in order to take command of the army. The caimacan discharges his functions, is invested with the same authority, enjoys the same rights, but not the same revenues; his salary is fixed, and the emoluments of the place belong to the visir, to whom the caimacan renders an account of them. It is generally a pacha or bashaw

hathaw with three tails who is appointed to this eminent place.

CAIMAN, in *Geography*. See CAYMAN.

CAIMENI. See KAMMENI and HIERA.

CAIN, קַיִן, derived from קָנָה, to acquire, and denoting acquisition or possession, in *Scripture History*, the eldest son of the progenitors of the human race, Adam and Eve, was born towards the end of the first year of the world, B. C. 4003. From the concise history of Cain that occurs in Genesis, ch. iv. we learn, that he devoted himself to husbandry, and his brother Abel to the keeping of sheep; that when they brought their respective offerings to God, that of Abel was accepted, and that of Cain rejected; that this preference enraged Cain, exciting in his mind jealousy and envy of his brother; and that the indulgence of these wicked passions at length terminated in the murder of his brother. As a punishment of this atrocious crime, God condemned him to be a fugitive and vagabond on earth, and to till an ungrateful soil, which should not recompense his labour with the plenty and increase he had before experienced. Nevertheless he set a mark upon him, or gave him a sign, that none might take away his life in his wanderings. Many ridiculous conjectures have been made both by Jews and Christians concerning this mark. Some have supposed that God stigmatized him with a brand in his forehead, to denote his being accursed; others, that he had a wild aspect and bloody eyes, which rolled in a horrid manner. The fathers, in general, apprehend, that he had a continual trembling of the body, so that he could hardly get his food to his mouth; and this opinion is favoured by the LXX, which render "a fugitive and a vagabond" *εὐνοῦν καὶ τρεῖσαν*, lamenting and trembling. Others say, that wherever he went the earth shook under him; and others again intimate, that he had a horn growing out of his forehead, to warn people to avoid him; and others have indulged him with the sign of the cross. Le Clerc imagines, that God ordered him to wear some distinguishing garment, perhaps of some glaring colour, as a mark or sign upon him for his preservation. To these fanciful conjectures we may add a more probable opinion of Dr. Shuckford (*Conn. vol. i. p. 8.*), who renders the words *לִקְנֵן אוֹת וַיִּשֶׂא יְהוָה*, "God gave to Cain a sign," or token, probably by some apparent miracle, that he would providentially protect him; so that none that met him should kill him. In this sense the word *אוֹת* is used, when the rainbow is called the *אוֹת* oth, that is, the sign, or token, of the covenant which God made with Noah, assuring him that he would drown the world no more. (*Gen. ix. 12—17.*) See also *Judg. vi. 17.* *Psal. lxxxvi. 17.* Dr. Geddes (*Crit. Rem. vol. i. p. 59.*) translates the words above cited, "and the Lord gave a token of security to Cain;" and he observes, that the original cannot admit of the common interpretation, as there is not a single passage in the Bible where *אוֹת* signifies a mark or brand set on one. It always denotes a sign, a token, a wonderful event; but never a mark. And although *שׁוֹם* signifies to place or set, it has often a meaning like that of *נָתַן*; and *אוֹת וַיִּשֶׂא* is here equivalent to *אוֹת יָתַן*, and such is its signification wherever it is connected with the word *אוֹת*. *Pf. lxxiv. 4. lxxviii. 43. cv. 27. Is. lxvi. 19.*

Cain at length settled with his wife and family in the land of Nod, on the east of Eden, where he built a city, calling it after the name of his son, Enoch. But Josephus says (*Ant. l. i. c. 2.*) that instead of being reformed by the punishment inflicted on him, he became more wicked and violent, and headed a band of thieves, whom he taught to acquire riches by oppression and robbery. He is said to have corrupted and changed the simplicity and honesty of the world, and to have invented weights and measures. He was also the first

who set bounds to the fields, and who built and fortified a city.

CAINAN, the son of Enos, was born A. M. 325, B. C. 3679, Enos being 90 years of age. *Gen. v. 9.* At the age of 70 he begat Mahaleel, and died at the age of 910 years, A. M. 1235, B. C. 2769.

CAINAN was also the son of Arphaxad, and father of Salah, whose name does not occur either in the Samaritan or Hebrew text, nor in any of the ancient versions of *Gen. xi. 12, &c.* except the LXX; and hence it has been generally deemed an interpolation. The name, however, occurs in the genealogy of Christ, *Luke iii. 36.*, between Salah and Arphaxad. Dr. Jackson, in the first volume of his "Chronological Antiquities," labours hard to shew, that the reading of the LXX is the true original reading, and that it stood in the original copies till after the Christian era. It must be acknowledged, that it is not easy to determine by what means it could have got into the Septuagint version, if it had not been found in their Hebrew copy; and it is certain, that it must have been in the copy used by St. Luke in forming his genealogy of Christ. It is not easy to conceive, how such an interpolation could have been made, or for what purpose; whereas its having been dropt out of the Hebrew text may be readily accounted for. On the other hand, the conformity of the Samaritan with the Hebrew copies, the silence of Josephus and Philo, and its omission in the chronological computations of Julius Africanus, Eusebius, and Theophilus, are urged as cogent proofs that the passage was not in the original copies of the Septuagint; and Grotius even asserts, that it was not to be found there before the 4th century. But it may be asked, how came it to be inserted? To which it is replied, that it was foisted into St. Luke's gospel by some careless copyist from ver. 37, where it rightly occurs; and this interpolation, being transcribed by other copyists, got imperceptibly into almost all the exemplars; and, on these exemplars, the copies of the LXX were next interpolated, in order to make them agree with the evangelist. This indeed, though not an impossible, is certainly a strange, rapid, and almost incredible process. For we find this same interpolated Cainan in the Syriac, Vulgate, Arabic, and Ethiopic versions. Upon the whole there is reason for inclining to the opinion, that the comma in question stood originally in the Septuagint version, and that Luke drew his genealogy from that version. After all, it is a point, in its connection with Biblical criticism, of no great moment, as the design of the evangelist was only to present us with the genealogy of Christ in its ascent to Adam, which is equally clear, whether we reckon Salah as the immediate descendant of Arphaxad, or whether we consider him as his grandson by Cainan. We must not, however, omit to mention, that the comma is wanting in three of Holmes's MSS. in the Coptic (which indeed has Cainan, but makes him one of the sons of Shem, and places him after Aram), and Armenian, edited copies, and in one Arab. MS. Nor was it read by Theophilus; nor by Jerom in his Heb. Questions; where he expressly says, "Arphaxad genuit Sala."

CAINAS, in *Ancient Geography*, a navigable river of Asia, which discharged itself into the Ganges; mentioned both by Pliny and Arrian.

CAINITES, or CAINIANS, in *Ecclesiastical History*, a sect of ancient Gnostics, that sprung up towards the close of the second century, and paid extraordinary honours to those persons represented in Scripture as the worst of mankind; so called from Cain, whom they esteemed their patriarch, and the chief object of their veneration. They held that Cain, Efav, Core, Dathan, and Abiram, and those of Sodom, were born of a most eminent celestial virtue; that

Abel, on the contrary, was born of a virtue much less eminent: to Cain, and others of the same order, who, according to them, had a mighty knowledge of all things, they associated Judas, whom they held in so much esteem, that they had a book among them called the gospel of Judas. S. Epiphanius, who seems to have borrowed his account from Irenæus, relates, and at the same time refutes, their errors.

Irenæus and Epiphanius concur in their accounts of the gross errors and atrocious wickedness of these people. Dr. Lardner, however, disputes the credibility of their relation. The wickedness ascribed to them, he says, is incredible; as it is not easy to conceive, that any number of persons calling themselves Christians should honour Cain, Core, and Judas, and all who lie under just condemnation in the scriptures, both of the Old and New Testament, for the most notorious wickedness; and besides, the account is inconsistent with itself; for it is not possible that men should be extremely wicked in principle and practice, and at the same time be concerned about the salvation that is by the cross of Christ, and honour Judas for his love of truth, and solicitude for the salvation of the world and the general good. Moreover, the rise of this denomination of Cainites may be accounted for another way, without making a particular sect. It might arise from the SETHIANS, those who called themselves by that name, and extolled their ancestor. Seth could not well avoid declaiming against Cain; and they might sometimes say of those in a different course of life from themselves, that they acted as if they were the children of Cain, who was of the evil one; and seemed to shew themselves kindred of Core, and Dathan, and even Judas himself. From this circumstance, or mode of speaking, some persons, who were disposed to multiply heresies, took occasion, or by mistake were led to talk of a sect under the denomination of Cainites. Lardner's Works, vol. ix. p. 456. See SETHIANS.

CAINITO, in *Botany* (Plum. Gen. 10. ic. 69.). See CHRYSOPHYLLUM *Cainito*.

CAINON, Κανων, the *new court*, in *Antiquity*, a civil court of justice at Athens, sometimes called παραβυσον μεσον, which took cognizance of trifling matters, not exceeding in value one drachm. The judges in this court were the eleven magistrates. See ATHENS.

CAINS, in the island of Candia, denote Greeks revolted, and retired to the Venetians, either at Suda or Spina Longa; who, in time of war, burn, pillage, and commit all manner of cruelties on their ancient brethren under the Turks. When a Cain, or false brother, is taken, there is no mercy for him; they either impale him, or put him to the gancbe.

CAINUM, in *Ancient Geography*, a town of Asia, in Mesopotamia. Not. Imp.

CAJORI, in *Geography*, an island near the mouth of the Gangs, at the bottom of the bay of Bengal, on the west side of the river.

CAJOU, CASHEW, or CASSU. See ANACARDIUM.

CAIPHA, CAIAPHA, or HEPPHA, in *Ancient Geography*, a town at the foot of Mount Carmel, to the north, on the gulf of Ptolemais; its ancient name was Sycaminos, or Porphyreon. It was separated from Acco, or Ptolemais, by a large and beautiful harbour. The distance from Acco to Caiapha, or Capha, by sea, is not above 15 miles; but it is twice as much by land.

CAIRA, in *Geography*, a river of South America, which runs into the Oronoko, or Orinoco. N. lat. 7° 16'. W. long. 65° 1'.

CAIRINA, in *Ornithology*, the Muscovy duck, ANAS MOSCHATA, according to some authors.

CAIRN. See CARN.

CAIRNEY, in *Geography*, a town of Scotland, in Aber-

deenshire, into which the linen manufacture has lately been introduced, and where it is likely to flourish; 8 miles W. of Aberdeen.

CAIRNGORM, a mountain in the Highlands of Scotland, and north-east part of the county of Inverary, 4060 feet high, called also the Blue Mountain, which is clothed with almost perpetual snow, and which is remarkable for quartz of different colours, chiefly the smoaky kind, well known to lapidaries.

CAIRO, FRANCESCO, called CAVALIÈRE DEL CAIRO, in *Biography*, a painter of history and portrait, was born at Milan, in 1598, and instructed in his art by Morazzone, whose style he for some time imitated; but in consequence of pursuing his studies at Rome, he altered his manner, and evinced his improvement by composing with judgment, designing in an elevated style, and giving correctness, grace, and harmony to his compositions. In the Venetian school, he farther acquired a strong and lively manner of colouring, and a talent of execution which has occasioned some of his pictures, particularly his portraits, to be ascribed to Titian, and Paolo Veronese. He is said to have adopted three manners of painting, the Milanese, Roman, and Venetian; and by this variety he obtained extensive employment and applause. At the court of the duke of Savoy, Victor Amadeus I., whither he was invited, he was honoured with a pension, and with the order of knighthood. His "Theresa," at Venice, is much admired for its colouring and expression; and his picture in the chapel of the Chartreux, at Pavia, representing the Virgin, St. Catherine of Siena, and another saint, is excellently designed, and beautifully coloured in a style resembling that of Rubens. This artist died in 1674. Pilkington.

CAIRO, or GRAND CAIRO, in *Geography*, the chief city of Egypt, and reckoned the second capital of the East, and the metropolis of Africa, is seated on the east of the Nile, and distant from it about one quarter of a league: but connected with it by the suburbs, called Mistr, or Mafir el Attiké, and Bulak, or Boulac, which see. This city was founded in the year 358 of the Hegira, A. D. 968, by Jauhar, or Giavhar, general of Moaz, the first caliph of the race of the Fathimites. Having subjugated Egypt, he built this town for the accommodation of his victorious soldiers, and a palace for the residence of the emperor. Four years after Moaz himself removed from Barbary to this place, completed the building of the city, and established the empire of the Fathimites. As the foundation of the city was laid at the instant when the planet Mars passed the meridian, and this planet was denominated by the Arabian astronomers *Cabér*, q. d. victorious, it obtained from this circumstance the appellation *El Caberah*, *Kaberah*, or *Kabira*. This new city was erected near *Old Cairo*, formerly called *Mafir*, and now *Fostat*, which see; and farther from the Nile, which rendered its situation less advantageous for trade. When the French, under king Lusignan, had extended their conquests in Syria, and carried their victorious arms even into Egypt, they proceeded, in the year of the Hegira 564, A. D. 1168, to Belbeis, and having taken it by storm, they advanced towards Grand Cairo, which they also captured. Schaouar, king of Egypt, fearing lest Fostat should also fall into their hands, set fire to it; and the inhabitants, being thus reduced to the necessity of abandoning it, took refuge in the new town, which assumed the name of "Mafir," or "Mistr," attached to the capital of Egypt. Salah Eddin, or Saladin, being nominated governor of Egypt, in the year 564 of the Hegira, successfully resisted the Franks, almost entirely expelled from the eastern countries, and established in Egypt, of which he acquired the sovereignty.

sovereignty, the dynasty of the Aïoubites. In the year 572 of the Hegira, A. D. 1176, he built the walls that encompass Grand Cairo, and the castle situated on Mount Mokattam. It is said to be about 29,300 cubits (3 leagues) in circumference;  $1\frac{1}{2}$  league from north to south, or, according to Browne's estimate, about 3500 yards, and  $\frac{3}{4}$  of a league from east to west. To the south-east and east of Grand Cairo is a ridge, called Mokattam, of the extensive chain, which runs along the course of the Nile to Upper Egypt, sometimes receding and leaving a plain about a league broad, and at other places opposing its barrier to the stream. This mountain is totally without verdure, and presents nothing to the eye but a dry sand and stones calcined by the sun, which of course reflect a suffocating heat upon the town, whenever the northerly wind does not blow. To the north of the city a plain extends to the Delta, which it resembles in soil and productions. Immediately under the mountain is the castle, now incapable of defence, though esteemed of great strength, before the invention of artillery. As it is commanded by the neighbouring mountain, it could not sustain a battery from thence for two hours. It is more than a quarter of a league in circumference: and the access to it is by two very steep passages, cut out of the rock on which it stands, which lead to two gates, entrusted to the guard of Aflass (no longer existing) and Janizaries. The former occupied the lower part of the fortress, and the others, the part called the citadel. The interior of the castle contains the palace of the sultans of Egypt, almost buried under their ruins. In one of the halls of these ruined buildings, exhibiting only some shattered remains of their ancient magnificence, is fabricated the rich carpeting, or embroidered cloth, which the Emir Hagg, or bey, who is prince of the caravan, carries every year to Mecca, for the purpose of covering the Caaba. The pacha's apartments in the castle are mean and inconvenient; the audience-hall, where the divan is held three times a week, is a long room stained with the blood of the beys, massacred by order of the Porte. At the extremity of the place called "Cora Maïdan," is the mint (the only one for Egypt), where they coin in gold mahbûbs, and half-mahbûbs, the first being worth about 5 shillings each; and in copper washed with silver the small coins worth about a half-penny, called in Turkish "paras," in Arabic "diwani," "fuddha," or "maidi;" and by European writers, "aspers," and "medines." On one side is the name of the reigning sultan, and on the reverse "Misr," and the date. The sequins are worth about 6s. 3d. English, and are made of the gold-dust brought from Abyssinia, which furnishes annually upwards of four millions. One of the most curious monuments in the castle is the "Well of Joseph," hewn out of the rock, which, according to Pococke, was sunk about 700 years ago by a vizir, called Joseph, by order of sultan Mahommed, son of Calaoun. The Egyptians ascribe it to Salah Eddin. It is hardly necessary to observe, that fabulous tradition attributes it to Joseph the patriarch, whose palace this castle is said to have been. The well is 280 feet deep, and 42 in circumference. A stair-case of gentle descent winds round it. Within this well, at a considerable depth, is an esplanade with a basin; where oxen turn the wheel that raises the water from the bottom of the lower well; other oxen, placed above, raise it from this reservoir by the same mechanism. The water proceeds from the Nile, and, as it filters through a sand impregnated with salt and nitre, it is brackish. From the saloon of the palace of Salah Eddin, situate in the quarter of the Janizaries, and existing only in ruins, the view extends over an immense horizon, including the whole extent of Grand Cairo, a multitude of mosques and minarets, the river,

and on the side of Boulac, a rich country covered with harvests, and interspersed with groves of date-trees. Mafr Fostat appears to the south-west, and the plains of the Said, or Upper Egypt, when overflowed by the Nile, present to view different hamlets, built on eminences, now converted into islands. The landscape is terminated by the pyramids, which, like the tops of mountains, lose themselves in the clouds. This castle commands the town, which forms an immense crescent around it. The streets of this famous city are narrow, crooked, and unpaved, intersected here and there with large vacancies, which become lakes during the increase of the Nile, and are gardens during the rest of the year. In the month of September they are passable by boats; but in April they are covered with flowers and verdure. The narrowness of the streets, however, affords protection from the fierce effulgence of the meridian sun.

The "Chalige," "Khalig," or canal, which traverses Grand Cairo from north to south, and which is opened every year with great solemnity, takes its rise near Mafr el Atiké, or Fostat, fills the lakes of the city, and loses itself four leagues beyond it, in the "Birque" (large piece of water,) of the pilgrims of Mecca. Mr. Shaw calls this the canal of Trajan. Pococke, and other modern writers, ascribe the construction of it to this emperor; and it has been commonly denominated "Annis Trajanus." Macrili says it was built by the emperor Adrian. Elmacin, cited by Savary, says, that this grand project was executed by Amrou, who, having announced the capture of Alexandria to Omar, received his instructions to cut a khalig, by which the produce of Egypt might be transported into the sea of Colzoum (or Red Sea), and from thence to the port of Medina. It was called "the river of the prince of the faithful;" and boats, passing from Fostat, conveyed the commodities of Egypt into the Red Sea. Through the negligence of succeeding caliphs it has been choked up, so that it no longer conveys its waters to the Red Sea. By opening this important communication with the Red Sea, a project which engaged the attention of Bonaparte during his short abode in Egypt, Grand Cairo would again become the richest and most commercial capital in the world. For a further account of it, see CANAL. At different seasons of the year, this canal, in its passage through Cairo, assumes various aspects; but its most permanent character is that of a dung-hill, or public receptacle for all kinds of offal. Before the rise of the Nile, it is cleaned, and becomes a street; it is then filled by the increase of the river, and exhibits the appearance of a canal covered with boats. The kites shriek wildly over this canal; and the city is infested with its usual herds of dogs; while the turtle-doves, unmolested by men or children, breed in the houses, building their nests under the projecting beams.

The principal street of Cairo runs parallel to the "Chalige." And on this canal are all the houses of the Europeans, notwithstanding the stench that proceeds from it, and that is said to produce the pestilence, to which, however, that order of men is least subject. Within the walls of Grand Cairo are more than 300 mosques, most of which have several minarets, or high steeples, of a very light architecture, and surrounded with galleries. These elevated structures give to the city an agreeable variety, which would otherwise appear too uniform, on account of the flatness of the roofs, all of them being in the form of terraces: and they seem, also, to accommodate the public criers, who call the people to prayers at the hours prescribed by the Mahometan law. About 800 voices may be heard at the same instant in every quarter of the town, reminding the people of the seasons of devotion.

Four or five of the mosques at Cairo far exceed the rest in splendour. One of the most magnificent is called "Iama el Az-her;" it is ornamented with pillars of marble, and Persian carpets, and has attached to it immense property. A sheikh, being an ecclesiastic of the highest order, presides over the establishment, which also supports a number of persons distinguished for their profound skill in theology, and accurate knowledge of literal Arabic. It is furnished with a large collection of MSS.; and lectures are read on all subjects which are here called *scientific*, though commonly very remote from real science. This is also a very considerable eleemosynary establishment, supplying chiefly poor ecclesiastics, to the amount of some thousands, with broth, and other articles. At Cairo, most of the mendicants are ecclesiastics, who plead their studies as an excuse for idleness. The other mosques most frequented are, that of "Sultin el Ghornn," el Hassancin," and, of later date, that erected by "Mohammed Bey Abudhahab." For the construction of this latter, the most costly materials were provided, and it is esteemed a chef-d'œuvre of oriental magnificence.

The city abounds with large and sumptuous reservoirs, which supply passengers with water; and also with commodious and magnificent baths. See BATH. The "Okals," or warehouses, for wholesale goods, are spacious, strongly built, convenient and clean; the bazars, for retail commodities, are extensive buildings, with convenient shops, each trade being appropriated to its allotted quarter, and furnishing a plentiful supply of every commodity. Most of the houses are built with soft stone from the adjoining mountain; many of them are constructed with earth, or bricks badly burnt; and they are two, or sometimes three stories high, with flat roofs, or terraces of stone or tiles. The windows of the upper stories are latticed; the ground-floor being either a shop, or having no windows to the street. Sometimes they content themselves with lattices; some few have paper windows, and some of the rich have glass. The houses of the great chiefly surround "Birket-el-sil," or Birque, already mentioned, a pool which receives the water of the Nile from the "Chalige." The palace of a bey contains a square court, having one or two sides occupied by his Mamlukes. Apart is the *Harem*, which see. The room in which the bey generally sits in summer, has a contrivance in the roof for admitting a copious supply of fresh air. In the halls of houses belonging to persons of superior rank, are marble basins, which receive spouting water; the paved floor, inlaid with marble and coloured earthen ware, is covered with mats and mattresses, and over all is spread a rich carpet, on which they sit cross legged. Around the wall is a sort of sofa, with cushions, to support the back and elbows; and above, at the height of 7 or 3 feet, a range of shelves, decked out with China or Japanese porcelain. The walls are shequered with sentences extracted from the Koran, and painted foliage and flowers, with which, also, the porticos of the beys are covered. Fire is only employed at Cairo for cookery; the effects of cold being sufficiently obviated by warmer clothing. The mean annual heat of Cairo, according to the estimate of Mr. Kirwan, is 73°. The apartments of the women in this city are furnished with the finest and most expensive articles; but those of the men are distinguished by plainness and neatness. The houses, in general, are irregular, but substantial and commodious.

The population of Cairo consists of the Arabs, or lower class of Mahometans, who form the body of the people; of the Coptic Christians, who are numerous; of Mamlukes, whom Browne estimates at no more than 10 or 12 thousand; of Greeks, Syrians, and Armenians; and of Muggrebins,

from Tripoli, Tunis, and Morocco, to whom an appropriate quarter is assigned, who are remarkable for industry and frugality, and are attracted hither by the great profits of trade. Besides those above recited, there are other Mahometans from Arabia Proper, and countries farther east. There are few Turks who are permanent inhabitants, but they occasionally resort hither on business, and return to Constantinople. Jews were once numerous: but they are now on the decrease. Exclusively of negro slaves in every house, there are blacks from Nubia, who act as porters at the gates of the rich, and sometimes sell eatables. It is not easy to calculate the precise amount of the whole population, because the Turks have no registers of births, deaths, or marriages; and if the number of houses were known, it would furnish no sufficient datum for computing the number of inhabitants, as in Egypt a large proportion of the people have no visible dwelling. Baron de Tott states the whole number at Cairo, and the adjacent port Boulac, on the authority of an officer of the customs, at 700,000; and Volney, admitting with Niebuhr, that the circumference of Cairo is 3 leagues, and comparing it with Paris, after proper allowances, estimates the number at 250,000. Browne thinks it cannot be less than 300,000. The women of Cairo are, in general, well-formed, but not tall. Those of the upper ranks are tolerably fair, in which quality, and fatness, consist the chief constituents of beauty in the Egyptian climate. They marry at 14 or 15, and at 20 are passed their prime. The Coptic women have interesting features, large black eyes, and a genteel form. See COURTS.

Life at Grand Cairo, says Savary, is more a passive than an active existence: the body during nine months of the year being oppressed with excessive heat, and the mind partaking of this state of indolence. The Mamlukes breakfast before sun-rise, make their second meal at ten, and the third about five in the afternoon. They have plenty of animal food, and in the middle of the table appears a large dish of pilau, surrounded with small dishes of meat, fish, and fowl. Before they dress their meat, they cut it in small pieces. Their drink is water, which is brought from the Nile into the houses, and put into jars, called "hammam," previously rubbed in the inside with a kind of palle, made of bitter almonds. Thus preserved, it becomes quite clear and limpid in two hours. But it is often drunk in its muddy state, without any ill effects. After the meal, coffee is served; and at the tables of the great sherbet is introduced. A fermented liquor made of maize, millet, barley, or rice, pleasant to the taste, but in the hot season spoiling in the course of the day, is drunk at Cairo, as well as in Saïd, in considerable quantities. The native Christians mostly distil for themselves, from dates, a liquor called by the general name of "araki;" it is also made from currants, or the small grapes imported from Cerigo.

The principal diseases to which the inhabitants of Cairo are subject, are defluxions in the eyes, sometimes terminating in blindness; the disorder called by the vulgar the "blessed evil," or Neapolitan disease, as the syphilis has been sometimes improperly called, hydrocele, malignant fevers, and the plague.

Among the amusements of Cairo, we may mention its dancing girls, (see ALMÉ) and rope-dancers; its chief games are chess, and Polish drafts: on solemn occasions, fire-works are exhibited; and on Friday, a mosque without the walls is frequented by the ladies as a pilgrimage of pleasure. Parties are also formed for sailing in light boats, like Venetian gondolas, on the increase of the Nile.

Before the discovery of the passage to India by the Cape

of Good Hope, the commerce of Cairo was very extensive; but though it has since declined, this city may still be regarded as the metropolis of the trade of eastern Africa, as Tripoli chiefly possesses that of the west. From Yemen are imported coffee, odours, gems, and some useful drugs: from Surat, and other neighbouring parts of India are obtained muslins, and various articles of cotton manufacture; from Ceylon, spices; and shawls from Cashmere. A few slaves are brought from Abyssinia by the way of Jidda and Mecca. Caravans passing to and from Sennaar, Darfur, and Fezzan, bring slaves, gold-dust, ivory, horns of the rhinoceros, ostrich feathers, gum, and drugs. See CARAVAN. From Tunis and Tripoli are brought oil, red caps, for which Tunis is famous, and fine flannel; from Syria arrive cotton, silk, soap, tobacco, and glass beads; from Constantinople they obtain white slaves, male and female, and all kinds of brags, copper, and iron manufactures. Numerous negro slaves pass from Cairo to the more northern Mahometan countries.

"Two powerful causes," says Volney, "have contributed to render Cairo the seat of an extensive commerce: the first of which is, that all the commodities consumed in Egypt are collected within the walls of that city; and all the persons of property, that is, the Mamlukes and lawyers, are assembled there, and draw thither their whole revenues, without making any return to the country from which they receive them. The second is the situation, which makes this city a centre of circulation, while, by the Red Sea, it corresponds with Arabia and India; by the Nile, with Abyssinia and the interior parts of Africa; and by the Mediterranean, with Europe and the empire of Turkey. Every year, a caravan from Abyssinia arrives at Cairo, and brings from 1000 to 1200 black slaves, as also elephants' teeth, gold dust, ostrich feathers, gums, parrots, and monkeys; while another, destined for Mecca, leaves the extremities of Morocco, and receiving pilgrims, even from the river of Senegal, coasts along the Mediterranean, collecting those of Algiers, Tripoli, and Tunis, and arrives by the desert at Alexandria, consisting of not less than three or four thousand camels. From thence it proceeds to Cairo, where it joins the caravan of Egypt. They then jointly set out for Mecca, whence they return one hundred days after."—"The lading of these caravans consists in India stuffs, shawls, gums, pearls, perfumes, and the coffee of Yemen." "The same commodities arrive by another route at Suez, to which port the southerly winds bring, in May, 26 or 28 sail of vessels from Djedda." "Small caravans also arrive from time to time from Damascus, with silk and cotton stuffs, oils, and dried fruits." Besides, "there are always some vessels in the road of Damietta, unloading hogheads of tobacco from Latakia, the consumption of which in Egypt is enormous. These vessels take rice in exchange, whilst others arrive successively at Alexandria, bringing clothing, arms, furs, passengers, and wrought silk, from Constantinople. Vessels come likewise from Marseilles, Leghorn, and Venice, with cloths, cochineal, Lyons' stuffs and laces, grocery, paper, iron, lead, Venetian sequins, and German dollars. All these articles conveyed by sea to Rosetta in barks called "djerm," are first landed there, then re embarked on the Nile, and sent to Cairo." From this account, it appears, that we need not hesitate to admit the report of the commissioner general of the customs, who asserted, that in 1783, Cairo had traded to the amount of near 150 millions of livres, or six millions 250 thousand pounds sterling.

Among the manufactures are sugar, of a bad quality, sal ammoniac, which is very good, glass lamps, salt-petre, coarse

gun-powder, red and yellow leather, and linen cloth, made of the fine Egyptian flax. The only manufacture in any degree of perfection is silk stuff; but the workmanship is less highly finished, and the price much greater than in Europe. Their mercery, their hardware, their gun and pistol barrels are all imported from foreign countries. It is difficult to find at Cairo one watchmaker who has skill enough to repair a watch, and he too is an European. Jewellers, indeed, are more common here than at Smyrna and Aleppo; but they know not how properly to mount the simplest rose. For the mode of hatching eggs at Cairo without incubation, see HATCHING.

The government of Cairo, and of Egypt in general, is vested in one of the 24 beys (see BEY): and the chief judicial authority in the city is delegated to a "Mulla," who is annually appointed from Constantinople; but his jurisdiction is principally directed to cases of doubt and difficulty. There are, besides this officer, "Cadis" in all the districts, which, in this great city, amount to more than 200. There are also "Imams," or priests of the four sects, each having the direction of the adherents of his sect. The revenue of the cadis arises from a tenth of the value of the thing litigated. See CADY.

In Cairo every trade or profession has its sheich or leader, who has great authority over the rest of the class to which he belongs; and this circumstance much contributes to the good order of the city. The gates also, which are at the end of every street, impede the progress, and render difficult the escape of ill-intentioned persons. Notwithstanding these forms of government and subordination, Cairo affords no security either for life or for property; and, therefore, the stranger on his arrival is struck with the universal appearance of squalid wretchedness. Indeed, he often meets with horsemen richly clad; but this display of luxury only renders the contrast of indigence the more shocking. Every thing that he sees or hears, reminds him that he is in the country of slavery and tyranny. The chief subjects of conversation are intestine dissensions, the public misery, pecuniary extortions, bastinadoes, and murders. "The blood of men," says Volney, "is shed like that of the vilest animals. Justice herself puts to death without formality. The officer of the night in his rounds, and the officer of the day in his circuit, judge, condemn, and execute in the twinkling of an eye, without appeal. Executioners attend them, and, on the first signal, the head of the unhappy victim falls into the leathern bag, in which it is received, for fear of soiling the place."—"Without any other reason than the avarice of a powerful chief, or the information of an enemy, a man is summoned before some bey, on suspicion of having money. A sum is demanded of him, and if he denies that he possesses it, he is thrown on his back, and receives 2 or 3 hundred blows on the soles of his feet, nay, sometimes is put to death."

To the north-east of Cairo are gardens, and large houses, to which persons of rank and opulence occasionally retreat; and the Mamlukes also perform their military evolutions, and exercise their horses, in an open space appropriate to this purpose. The ground under the mountains to the east is filled with tombs. The gates of Cairo are numerous; but the most remarkable are two at the northern extremity of the city, called "Bab-el-Nasr," and "Bab-el-Fitusch," which present a splendid display of Saracenic architecture. N. lat. 30° 2' 44". E. long. 31° 18' 16". Cairo by the mean of several accounts is about 59 geographical miles W. of Suez, equal to 1° 8' of longitude; and accordingly, Cairo should stand at 31° 20' of longitude. Savary's Egypt, vol. i. Volney's Travels, vol. i. Sonnini's Travels. Browne's Travels in Africa. See EGYPT.

**CAIROAN**, or **KAIR-WAN**, the *Vicus Augusti* of the Itinerary, a walled city of Africa, in the ancient Bizacium, or modern kingdom of Tunis, inferior in trade and in number of inhabitants only to Tunis, is situated in a sandy barren plain, 8 leagues W. of Susa, and about the same distance S.W. of Herkla. In this city and its vicinity are several fragments of ancient architecture. Its present name seems to be synonymous with "Caravan," and might originally denote the place where the Arabs had their principal station in conquering this part of Africa. It is said to have been founded for this purpose, and colonized by Akbah, or Hueba, in the 50th year of the Hegira, A.D. 670. Notwithstanding the inconveniences of its situation, which renders it necessary to obtain vegetable food from a great distance, and to collect a precarious supply of rain-water in cisterns or reservoirs, Akbah encompassed it with a wall, enclosing a circumference of 3600 paces; and in the space of five years, the governor's palace was surrounded with a sufficient number of private habitations; a spacious mosque was supported by 500 columns of granite, porphyry, and Numidian marble; and Cairoan became the seat of learning, as well as of empire. Under the government of Ibrahim Ben Aglab, from whom was derived the dynasty of the Aglabites, in the year 184 of the Hegira, A.D. 800, its buildings and inhabitants were very considerably augmented; and its inland situation, 12 miles westward of the sea, protected it from the Greek and Sicilian fleets. In the year of the Hegira, 956, A.D. 1549, it had its own sovereign, who was an Arab; but he was despoiled of part of his dominions by Dragut, who commanded in the city of Tripoli for Soliman II. emperor of the Turks. N. lat. 35° 37'. E. long. 10° 13'.

**CAISIOMU**, a town of the island of Cuba; 30 miles E.S.E. of Villa del Principe.

**CAISSON**, in *Architecture*. The practice of building in caissons is a method sometimes adopted in laying the foundation of bridges in very deep or rapid rivers. There are large hollow vessels framed of strong timbers, and made water-tight, which being launched and floated to a proper position in the river where the ground has been previously excavated and levelled, are there sunk. The piers of the bridge are then built within them, and carried up above, or nearly to the level of the water, when the sides of the caisson are detached from the bottom, and removed; the bottom, composed of a strong grating of timber remaining, and serving for a foundation to the pier.

The most considerable work, which has come to our knowledge, where caissons have been used, is in the building of Weltmüller-bridge; of these, therefore, a particular account may be acceptable. Each of the caissons contained 150 loads of fir timber, and was of more tonnage than a man of war of 40 guns; their size was nearly 80 feet from point to point, and 30 feet in breadth; the sides, which were 10 feet in height, were formed of timbers laid horizontally over one another, pinned with oak trunnels, and framed together at all the corners, except the salient angles, where they were secured by proper iron-work, which being unferewed would permit the sides of the caisson, had it been found necessary, to divide into two parts. These sides were planked across the timbers inside and outside with 3-inch planks, in a vertical position. The thickness of the sides was 18 inches at bottom, and 15 inches at top; and in order to strengthen them the more, every angle, except the two points, had three oaken knee timbers properly bolted and secured. These sides when finished were fastened to the bottom or grating, by 28 pieces of timber on the outside, and 18 within, called straps, about 8 inches broad,

and about 3 inches thick, reaching and lapping over the tops of the sides; the lower part of these straps were dove-tailed to the outer curb of the grating, and kept in their places by iron wedges. The purpose of these straps and wedges was that when the pier was built up sufficiently high above low-water-mark, to render the caisson no longer necessary for the masons to work in; the wedges being drawn up gave liberty to clear the straps from the mortices, in consequence of which the sides rose by their own buoyancy, leaving the grating under the foundation of the pier.

The pressure of the water upon the sides of the caisson was resisted by means of a ground timber or ribbon, 14 inches wide, and 7 inches thick, pinned upon the upper row of timbers of the grating; and the top of the sides was secured by a sufficient number of beams laid across, which also served to support a floor on which the labourers stood to hoist the stones out of the lighters, and to lower them into the caisson.

The caisson was also provided with a sluice to admit the water. The method of working was as follows: A pit being dug and levelled in the proper situation for the pier of the same shape as the caisson, and about five feet wider all round; the caisson was brought to its position, a few of the lower courses of the pier built in it, and sunk once or twice to prove the level of the foundation; then being finally fixed, the masons worked in the usual methods of tide work. About two hours before low water, the sluice of the caisson, kept open till then, left the water, flowing to the height of many more feet on the outside than the inside, should float the caisson and all the stone work out of its true place, was shut down, and the water pumped low enough, without waiting for the lowest ebb of the tide, for the masons to set and cramp the stone-work of the succeeding courses. Then when the tide had risen to a considerable height, the sluice was opened again, and the water admitted; and as the caisson was purposely built but 16 feet high to save useless expence, the high tides flowed some feet above the sides, but without any damage or inconvenience to the works. In this manner the work proceeded till the pier rose to the surface of the caisson, when the sides were floated away to serve the same purpose at another pier. (Labelye's Description of Weltmüller-bridge.)

**CAISSON**, in the *Military Art*, is sometimes used for a chest; and in particular for a bomb-chest.

The caisson is considered as a superficial mine, or *fourneau*.

**CAISSON** is also a covered waggon to carry bread, or ammunition.

**CAISTOR**, in *Geography*. See **CASTOR**.

**CAISTRUS**, in *Ancient Geography*, *Kaiser*, a small river of Asia Minor in Ionia, formed by the union of two branches, which had their sources in mount Tmolus, and flowing by the south-west, watered Metropolis or Ephesus, near which it discharged itself into the sea. It is called at present by the Turks "Kitchik Meander," or the Little Meander. Virgil refers to it,

"Jam varias pelagi volucres, et quæ Asia circum  
Dulcibus in stagnis rimantur prata Caystri."

Georg. l. 1.

**CAITAIÀ**, in *Zoology*, the name under which Marcgræve notices *finia sciurea* of Gmelin.

**CAITHNESS**, in *Geography*, sometimes denominated the shire of Wick, is the most northerly county of Scotland. Its S. W. border unites with the county of Sutherland, and the remainder is washed by the waters of the Pentland-frith, and the German Ocean. This district, includes an area of about 35 miles from N. to S. by 22 miles from east to west. Mr. Pennant describes the country as a large morass inter-

spersed

species with some fruitful patches which produce barley and oats. The coast is rocky, and abounds with bays and promontories. The principal of these are, Sandside head, pointing to the opening of Pentland-frith; Orcas, or Holborn-head, and Dunnet-head, both pointing northward to the north. South-bay is a good harbour for shipping. There are two other smaller bays, named from the contiguous places, Rice and Thurso. The only island annexed to this county is Stroma, which is situated in the Pentland-frith; the property of which was formerly claimed by the earls of Orkney, but was afterwards attached to Caithness. The cause of this reversion is said to have resulted from a curious experiment. The earls of Orkney and Caithness contended for the property of this island, it being situated about midway between their respective districts. Instead of resorting to the sword in this dispute, they mutually agreed to abide by the issue of a more inoffensive trial. As venomous animals would not live in the Orkneys, some were conveyed to Stroma, and finding that they continued to thrive in the island, it was determined that it naturally belonged to Caithness, and was adjudged to that earldom accordingly. This county is well watered, and contains a few birch plantations; but the soil and the climate are unfavourable to the growth of timber. At some parts of the coast, the sea is generally very impetuous, being continually agitated by violent counter tides, currents, and vortices. Fish are caught in great abundance, but from the above named causes, and the want of convenient harbours, the proprietors do not derive much advantage from an exportation. The rocks round the shore are perforated into numerous caves, which are frequented by an abundance of seals. Many of these are destroyed by the inhabitants. Eagles, hawks, and a vast quantity of sea-fowl frequent these rocks.

Caithness is well peopled with a race of hardy, athletic inhabitants, whose chief employ, and source of livelihood are fishing, and breeding sheep and black cattle. Of the latter it has been recorded, that from 1000 to 2000 head have been sent from this county in one year. In bad seasons, the farmers molly kill and salt them for home consumption and for exportation. Great numbers of swine are also reared here, but according to the opinion of Dr. Morison, (Sir John Sinclair's Statistical Account, viii. 150.) "the damage they do in the winter to the grass and corn lands, as they are allowed to roam at large, far exceeds any advantage that can accrue from them." These animals are rather peculiar in character and species: they are short, high-backed, long-bristled, sharp, slender, and long nosed, have high erect ears, and are very wild in aspect. Barns and granaries are unknown to this county; the corn is thrashed out and preserved in the chaff in byres, which are flacks in the shape of bee-hives, and thatched quite round. Much salmon is taken in the rivers of this county, particularly at Castle-hill, Dunnet, Wick, and Thurso. At the last place there was "a miraculous draught taken within the memory of man; not less than 2500 being caught at one tide." (Pennant's Tour in Scotland, i. 202.) Caithness is divided into ten parishes, and contains one royal borough, Wick, and the town of Thurso. It sends a member to Parliament alternately with the county of Bute. The principal landholders are the earl of Caithness, Sir John Sinclair, bart. Sir Benjamin Dunbar, and — Sinclair. esq. all of whom possess seats in the county. Many monuments of antiquity are still remaining in Caithness, most of which are of a military nature. Of the more ancient kind are the Cairns, Duns, and Tumuli; which are scattered over many parts of the county. Some ruins of castles are still left at Castle-Sinclair, Germengo, Auchnavern, Dirlet, and Lochmore. In

mineralogy, Caithness possesses some articles of value, as excellent free-stone and lime stone; also, copper, lead and iron ores. At the N. E. point of Caithness is Dunsby-head, the most extreme northern promontory of Britain. At this place the breadth of the frith does not exceed twelve miles, and is the most usual ferry or passage to the Orkney Islands. In the forests of Moravins and Berudals, are abundance of red deer, roe-bucks, &c. and the county abounds with grouse, heathcocks, plover, hares, and most other game. Birds of a peculiar species, called Snow-sleets, frequent this county, in large flocks, about the middle of February, and depart in April. They are about the size of a sparrow, and esteemed very delicious in flavour. The last private war in Scotland was occasioned by a dispute relating to this county. Pennant's Tour in Scotland. Sir John Sinclair's Statistical Account of Scotland.

CAIUS, POPE, in *Biography*, succeeded Eutychianus in the pontificate A. D. 283, and held it till A. D. 296. The church of Rome reckons him among her martyrs; but history informs us, that, having concealed himself under the persecution of Dioclesian, he died in peace A. D. 296. To him is ascribed a decree that bishops should pass through the seven inferior orders of the church before they assumed the episcopal office. Bower.

CAIUS, or GAIUS, an ecclesiastical historian, who flourished, according to Cave, about the year 210. Photius says, "that he was ordained bishop of the nations," i. e. as some have interpreted the phrase, that he was ordained to preach the gospel to infidel countries, without the allotment of any particular diocese. Fabricius reads, instead of "nations," Athens; and accordingly supposes, that, having been at first a presbyter of the church of Rome, he was afterwards made bishop of Athens. It has been asserted by many writers, but upon disputable authority, that he was a disciple of Irenæus. Three or four books are ascribed to Caius, viz. "A dialogue or disputation with Proculus or Proclus," a follower of Montanus; "Of the Universe;" the "Labyrinth;" and a treatise against the "Heresy of Artemon." Some fragments of these works are still extant. The first, however, is, in Dr. Lardner's opinion, the only piece justly ascribed to him. In his dialogue are some passages that indicate the author's respect for the ancient scriptures generally received by Christians; though he seems to have thought, the epistle to the Hebrews was not written by St. Paul, and that the book of the Revelation was not genuine, but probably an imposture of Cerintius. Cave, H. L. T. i. p. 100. Lardner's Works, vol. ii. p. 371, &c.

CAIUS, BERNARD, born at Venice towards the end of the 16th century, where he received his education, published, in 1606, "De Vesicantium Ufu." He entirely rejects blisters in all acute diseases, as adding greatly to the malady by irritating the system. He also published in 1608, "De Alimentis, quæ cuicque naturæ conveniunt, de Voluptate, Sapore, Frigida Potione, Viribus Salis Nitri ad refrigerandum," 4to, republished in 1610. Haller Bib. Med.

CAIUS, KAYE, or KEY, JOHN, an ingenious and learned physician, was born at Norwich, October 6th, 1510. After passing through the usual school education at Norwich, he was admitted a student in Gonvil Hall in Cambridge, Sept. 10th, 1529, and having distinguished himself by his proficiency in literature, he was made fellow of that community in 1533. His thirst for knowledge, and his desire of perfecting himself in the different branches of medicine, determined him to visit the Continent, and to pass some time at Padua, then famed for the celebrity of its professors, particularly in that branch of science. He here studied under John Baptista Montanus, having Vesalius for his fellow student.

dent. His progress here in Greek and Latin, as well as in the knowledge of anatomy and medicine, equalled the promises of his early years; as was evinced by his translations and commentaries on various parts of the works of Hippocrates, Galen, Scribonius La gus, &c. correcting the errors of the translators, and elucidating and explaining the more difficult passages. With the view of hearing other professors, and of examining ancient manuscripts, he visited most of the principal cities of Italy. At Bologna he resided some time, and there took his degree of Doctor of Medicine, in 1541. He then returned to Padua, and in conjunction with Realdus Columbus, read lectures on the Greek text of Aristotle. In 1544, he came to England, and for some time read lectures in anatomy to the corporation of surgeons in London. He afterwards practised medicine at Shrewsbury, where he was at the time when the sweating sickness made its appearance in 1551; of which he published a popular account, with the view of instructing his countrymen in the nature of the complaint, and of the methods he thought most proper for opposing its progress. This he afterwards, in 1556, published again in Latin, much enlarged and improved, under the title of "De Ephemera Britannica." As it contained an accurate description of the disease, whatever might be the value or the efficacy of the practice, it was thought deserving of being preserved, and was reprinted in 1721, 12mo. His reputation for learning and abilities being established, he was admitted a fellow of the College of Physicians in 1547. He was also appointed physician to King Edward the Sixth, and in succession to the queens Mary and Elizabeth. To the College of Physicians he was a warm and strenuous friend, and on the death of Lincæ, under whom it was founded, he was appointed president, which office he held for seven years. During this time, he revised their laws, appointed insignia for the president, and, to encourage the study of anatomy, he obtained a grant of the bodies of two malefactors every year, to be dissected under the direction of the College. He also drew up their annals in Latin, or an account of their institution, with a journal of their proceedings, which he left with the College. Mindful of his alma mater, he obtained from Queen Mary a power of erecting Gonvil Hall into a College, adding to its endowments, provisions for three fellows, and twenty scholars. He added an entire new court to the College, and built three gates. They cost him together 1834l. The improvements were begun in 1557; when completed he was made master of the College, and continued in that post until a short time before his death, when he resigned it to Dr. Legge, but still resided as a fellow commoner; and died there in 1573, aged 63 years, having in his last illness supported himself by woman's milk. On his tomb, by his direction, was engraved, "Fui Caius." Besides his versions from the Greek, and the "Ephemera Britannica," he published "De Cambus Britannicis," 1570, inserted entire by Mr. Pennant in his British Zoology; to which were added "Historiæ rariorum Animalium," originally printed in Gesner's collection: also, "De Libris propriis," and "De Antiquitate Cantab. Academix;" and from numerous unedited manuscripts, appears to have projected various other works. Haller's Bib. Med. et Anat. Aikin's Biog. Mem. of Medicine in Great Britain.

CAJUS, in *Entomology*, a species of PAPILO (*Hesperia* Fabr.), having entire brown wings, with a bluish disk: beneath, varied with cinereous and white, with brown ocellar dots. Inhabits India.

CAIX, in *Geography*, a town of France, in the department of the Somme; 12 miles E. of Amiens.

CAKE, a finer sort of bread, denominated from its flat,

round figure. We meet with divers compositions under the name of cakes; as seed-cakes, made of flour, butter, cream, sugar, coriander and caraway-seeds, mace, and other spices and perfume, baked in the oven; plum-cakes, made much after the same manner, only with fewer seeds, and the addition of currants; pan-cakes, made of a mixture of flour, eggs, &c. fried; cheese-cakes, made of cream, eggs, and flour, with or without cheese-curd, butter, almonds, &c.; oat-cakes made of fine oat flour, mixt with yeast, and sometimes without, rolled thin, and laid on an iron or stone to bake over a slow fire; sugar-cakes, made of fine sugar beaten and searced with the finest flour, adding butter, rose-water, and spices; rose cakes, *placenta rosacea*, are leaves of roses dried and pressed into a mass, sold in the shops for epithems. See EPITHEM.

CAKE of *Copper*, denotes a quantity from 14lb. to one hundred-weight.

CAKE, in *Rural Economy*, a term applied by farmers to the substance which remains after the oil has been expressed from flax and rape seeds. Cakes made from the first of these seeds, are much employed in the feeding and fattening of bullocks, and other sort of cattle. These substances have likewise, sometimes, been made use of for the purpose of manure, especially when made from the latter material. See OIL-CAKE.

CAKE-wax, a denomination sometimes given to the white or virgin-wax.

CAKE-soap, stands distinguished from soft-soap and ball-soap. See SOAP.

CAKET, in *Geography*, a town and capital of a country in Asia, in the northern part of Persia, near mount Caucasus, trading principally in silk. N. lat. 43° 2'. E. long. 46° 4'.

CAKILE, in *Botany*, (*Tournefort*, Gærtner, and Ventenat.) See BUNIAS.

CALA, in *Geography*, a town of Spain, in the country of Seville, on the borders of Estremadura; 14 miles S. of Larena.

CALA. See EL CALLAH.

CALABA, in *Botany*. (*Plumier*.) See CALOPHYLLUM.

CALABAR, or CALBARI, in *Geography*, a country of Africa in the kingdom of Benin, or Upper Guinea, usually distinguished into New and Old Calabar, with a river of the same name in each. The entrance into New Calaba is in N. lat. 4° 30'. W. long. 9° 10'. That into Old Calabar is in N. lat. 4° 32'. W. long. 10° 28'. The Dutch carry on a considerable trade with this country. See BENIN.

CALABASH, in *Botany*. See CUCURBITA *Pepo*.

CALABASH-tree. See CRESCENTIA.

CALABASH, *African*. See ADANSONIA and BAOBAB. The word is Spanish, *calabaza*, which signifies the same. The Indians, both of the North and South sea, put the pearls they have fished in *calabashes*, and the negroes on the coast of Africa do the same by their gold-dust. The smaller calabashes are also frequently used by these people as a measure, by which they sell these precious commodities to the Europeans.

CALABASH-bay, in *Geography*, lies on the S.W. side of the island of Jamaica, between Flint bay on the east, and Swift's river on the west, and affords good anchorage.

CALABER, QUINTUS, in *Biography*, a Greek poet, supposed to have flourished under the emperor Anastasius I. about the year 491, and to have derived his name from Calabria, though he resided chiefly at Smyrna. He is known as the author of a poem, consisting of 14 books, on the "Paralipomena" of Homer, or the events of the Trojan war, not related by that poet, and commended for its elegant versification. It was discovered by cardinal Bessarion,

in a monastery near Otranto in Apulia. Two of the books, describing the capture of Troy, were published separately by Neander, in his "Opus Aureum," Leipf. 1577. Editions of the whole have been given at Hanau, 8vo. 1604; and by Paw at Leyden, 8vo. 1734. Voff. de Poet. Græc.

CALABEZA, in *Geography*, a town of South America, in Terra Firma, on Orinoko river.

CALABITE, a small island of the East Indian ocean, being one of the Philippines, between Mindoro and Luban.

CALABRIA, in *Ancient Geography*, a name supposed to have been received from the oriental "calab," or pitch, on account of the resin obtained from the pines of this country, and corresponding to that part of Italy more generally denominated "Messapia," and the present Calabria.

CALABRIA, in *Geography*, a country of Italy, in the kingdom of Naples, divided into Calabria Citra. and Calabria Ultra, or Hither and Farther Calabria. The former is bounded on the north by Basilicata, on the east by the gulf of Taranto, on the south by Calabria Ultra, and on the west by the Mediterranean, and a small part of Principato Citra. Swinburne estimates its extent at 1,605,463 moggie, (five moggie being equal to four English acres) and the number of inhabitants at 315,330. It abounds in excellent fruits, corn, wine, oil, hemp, cotton, flax, saffron, honey, salt, wool, silk, and manna. It has some mines of gold and silver, lead and iron, together with sulphur, alabaster, and rock-crystal. Hogs and sheep are numerous. Its coasts are defended by towers. Its principal towns are Cozenza, Paola or Paula, Bisignano, Cassano, Scalea, Cariati, Rossano, Umbriatico, Strongoli, Carenza, Martorano, and Amantea. Its chief rivers are the Cochile, Crate, Lao, Celano, Trionto, Aquanile, and Bato. Calabria Ultra is bounded on the north by Calabria Citra, and on the east, west, and south, by the Mediterranean sea. The productions are nearly the same with those of Calabria Citra. The extent, according to Swinburne, comprehends 1,901,878 moggie; and the number of its inhabitants is 460,392. The principal towns are Catanzaro, Cotrone, St. Severina, Isola, Taverna, Nicastro, Belcastro, St. Eufemia, Squillace, Tropea, Nicotera, Mileto, Oppido, Gerace, Reggio, and Bova. The chief rivers are the Alli, Angitola, Tacina, Alaro, Alice, Amato, Metauro, and Metramo.

In Calabria all the oxen are white, large, and long-horned, except those of the red breed, which have been introduced from Sicily by the princes of Cariati and Gerace. The buffaloes are black; and most of the goats, sheep, and hogs are of that hue. The last species have no hair, but their hides are as sleek as those of elephants. In some parts of this country dormice are accounted delicate game, as they were in ancient Rome, where they were kept in warrens, and fattened for the tables of the most refined epicures. They are smoked out of their nests in hollow trees, and caught with sharp hooks. Their skins make very fine leather. The Calabrian horses are pretty, spirited, and brilliant in their motions; but generally low, and seldom free from vice. All live animals in Calabria are taxed. Six carlini (or about 2s. 3d.) are paid for an ox, 4 grains (10 of which make a carlino) for a sheep; and therefore it is no wonder that the graziers should be indigent, and that the cottagers should keep no beast of any kind, and that they should live upon casual and unsubstantial nutriment, instead of milk, cheese, and other wholesome diet, which the rich pasturage of the country ought to afford them. Arable land is ploughed four times; but instead of laying down their fallows with hay seeds, clover, or any of those rich artificial grasses, which are sown in England to produce fine meadows and pastures, the Calabrian farmer thinks he

does his farm ample justice if he ceases to plough it for two or three years, and leaves the good grass, accidentally produced there, to make its way, as well as it can, through the matted fibres of various sorts of rank weeds. The Calabrian foresees no amelioration of his condition from any of his efforts; and he is discouraged by the apprehension that increasing activity and produce on his part would subject him to an additional weight of taxes and oppression.

The Zingari, or gypsies, of Calabria do not contract alliances with any other class of inhabitants, but marry among themselves. They have no permanent property, nor any fixed habitation. They subsist by the profits of little handicrafts, and chiefly by trucking asses and horses, which they do for the smallest trifle to boot. They generally work in iron, and make trivets, knitting-needles, and bodkins, and baubles of that kind. Their dress is very mean; they shave their chins, but wear long hair, to which they apply neither comb nor scissors. Their religion is altogether mysterious; and though they occasionally conform to the ceremonies of the Roman Catholic church in marriage, burials, &c. they often perform these functions according to their own customs, which resemble those of the heathens. At their weddings they carry torches, and have paronyms to give away the bride, with many other unusual rites. With regard to their conduct, they are depraved and licentious; and are universally accounted to be pilferers, cheats, faithless, shameless, and abandoned to all manner of dissoluteness. They accustom themselves to tell fortunes, and to play juggling-tricks, as they do in other countries. In 1560, they were banished the kingdom as thieves, cheats, and spies for the Turks. In 1569 and 1585 the order was renewed; but not being enforced, it had little effect. They make use of two languages, one Calabrian, with a foreign accent and pronunciation; the other peculiar to themselves, which, in sound, bears a great affinity to the oriental tongues, and is spoken by them whenever they have secrets to impart to each other.

There is a visible difference in the dress and manners of the two Calabrias; the inhabitants of the south part resemble the Sicilians; and, like them, the men wear bonnets; but north of Rogliano, the boundary of the provinces, hats are universally worn. The Sicilians, it is supposed, even now betray strong marks in their character of their ancient connection with the Africans, and the North Calabrese have in their disposition much German solidity, arising perhaps from colonies transplanted thither by the Swabian princes; and in the southern Calabrese, and Neapolitans, particularly the latter, there are evident traces of Grecian manners and temper. Calabria is in bad repute with respect to the safety of travellers; and yet the people seem perfectly honest with regard to one another; for their houses have no bolts or bars to their doors; and during the owners' absence, they are left to the mercy of every passenger. Swinburne's Travels in the Two Sicilies, vol. ii. and iv.

Calabria, formerly possessed by the Brutii and other Greek colonies, has been in all ages convulsed and desolated by earthquakes. In 1638 and 1659 the two provinces of Calabria were almost utterly destroyed; and that of 1744, though not equally injurious, was very calamitous and distressing. The dreadful effects of the successive earthquakes of 1783 are particularly described by count Ippolito and sir William Hamilton. The part of Calabria, according to sir William's account, which was most affected, is comprehended between the 38th and 39th degree; and the greatest force of the earthquake seemed to have exerted itself from the foot of those mountains of the Apennines, called the Monte Diio, Monte Sacro, and Monte Caulone, extending westward to the Tyrrhene sea. The towns, villages, and farm-houses, nearest

nearest these mountains, situate either on hills or in the plain, were totally ruined by the first shock of the 5th of February; and the farther removed towns and villages were from this centre, the less they suffered. Indeed, the face of the earth of that part of Calabria above-mentioned was entirely altered; many openings and cracks had been made in the ground; some hills had been lowered, and others quite levelled; roads were rendered impassable by the chasms that had been produced in the plains; huge mountains had been split asunder, and parts of them driven to a considerable distance; deep vallies had been filled by the severed mountains; the course of some rivers had been altered; new springs broke forth in dry ground, and other springs totally disappeared; and in one place the surface of two whole tentements, on which grew large olive and mulberry trees, were detached by the earthquake, and transplanted, whilst the trees remained in their places, to the distance of about a mile from their former situation; and from the spot on which they formerly stood, hot water sprung up to a considerable height, mixed with ferruginous sand; and near this place some countrymen and shepherds had been swallowed up with their teams of oxen and their flocks of goats and sheep. "From the city of Amantea," says sir William "situate on the coast of the Tyrrhene sea, in Calabria Citra, and along the westward coast to cape Spartivento in Calabria Ultra, and then up to the eastern coast as far as the cape d'Alice (a part of Calabria Citra) on the Ionian sea, there is not a town or village, either on the coast or land, but what is either totally destroyed, or has suffered more or less, amounting in all to near 400 of what are called here "Paefes;" a village containing less than 100 inhabitants is not counted as a "Paefe." At Casal Nuovo, the princess Gerace, and upwards of 400 of the inhabitants, lost their lives; at Bagnara, the number of dead amounts to 3017; Radicina and Palmi count their loss at about 3000 each; Terra Nuova about 1400; Seminari still more. The sum total of the mortality in both Calabrias and in Sicily, by the earthquakes alone, according to the returns in the secretary of state's office at Naples, is 32,367;" but sir William conceives that the whole number amounted at least to 40,000. In the accounts from Calabria Ultra, two singular phenomena are mentioned. "At about the distance of 3 miles from the ruined city of Oppido, there was a hill (the soil of which is a sandy clay) about 500 palms high, and 1300 in circumference at its basis. It was said that this hill, by the shock of the 5th of February, jumped to the distance of about 4 miles from the spot where it stood, into a plain called the Campo di Bassano. At the same time the hill on which the town of Oppido stood, which extended about 3 miles, divided into two, and as its situation was between two rivers, its ruins filled up the valley, and stopped the course of those rivers; two great lakes are already formed, and are daily increasing, which lakes, if means are not found to drain them, and give the rivers their due course, in a short time must infect the air greatly." For a farther detail, see Phil. Transf. vol. 73. part i. See EARTHQUAKE.

**CALABRINI**, in *Botany*, a name by which some authors call the rough SPLENWORT, or *lonchitis aspera*. Ger. Emac. Ind.

**CALABRITA**, in *Geography*, a town of European Turkey, in the Morea; 38 miles W. of Corinth.

**CALABRITO**, a town of Naples, in the province of Principato Citra.

**CALABURA**, in *Botany*, (Pluk.) See MUNTINGIA.

**CALACHERIN**, in *Geography*, a town of Persia, in the province of Irak; 125 miles W. of Amadan.

VOL. V.

**CALACINE**, or **CALACHENE**, in *Ancient Geography*, a province or district of Assyria, bounded on the north by the mountains of Armenia and Arrapachitis, on the west by the Tigris, on the east by the Lycus, and on the south by Adiabene. It contained the following cities, viz. Marde, Calash, Bessara, and Resen.

**CALACTA**, a maritime town, seated on the northern coast of Sicily. Ptolemy.

**CALADE**, in the *Manege*, a descent or slope in a riding-ground, by which to bring a horse to bend his haunches, and form his stop, with the aids of the calves of the legs, bridle, and cavesson, seasonably given.

The *calade* is also called, by the French, *basse*. They say to ride or gallop down the *calade*.

**CALADIUM**, in *Botany*, a name given by Rumphius to a plant which Linnæus afterwards called *Arum esculentum*. Ventenat has separated it from *Arum*; and uniting it with the ovatum, the sagittæfolium and arborescens of Linnæus, and the bicolorum of Aiton, with two others less known, has formed a new genus under the original name given it by Rumphius, with the following general character. *Spathæ* swelling, folded in its lower part. *Spathæ* or ament shorter than the spathe, simple, straight, cylindrical, with the male flowers on the upper part, and female on the lower. *Anthers* sessile, disposed in a spiral form, with twelve furrows full of pollen in molecules agglutinated together, and terminated at the top by a flat surface in the shape of a lozenge, which is sprinkled with shining dots, and crenulated at its border. *Germens* numerous, orbicular, concave. *Stigma* sessile, umbilicate; full of a viscous liquor. The space between the stamens and pistils occupied by four rows of oblong, obtuse, elevated glands. *Fruit* similar to that of *Arum*. Its essential character, according to Ventenat, is founded on the situation and structure of the anthers, and even of the pollen itself, on the direction and form of the glands, and on the umbilicated stigmas. See *ARUM*.

**CALADUNUM**, in *Ancient Geography*, a town of Spain, assigned by Ptolemy to the "Callaici Braccarii" in the Taragonensis, and situate, according to M. d'Anville, to the north-west of Aquæ Flavæ.

**CALÆI**, islands of the Indian ocean, placed by Arrian at the mouth of the Persian gulf.

**CALÆNUS**, a fountain of Asia Minor in Lycia. Steph. Byz.

**CALAF**, in *Botany*, (Alpinus Ægypt.) See *SALIX ÆGYPTIACA*.

**CALAF**, in *Geography*, *Karaghén-Souï*, a stream of Asia in Mesopotamia, which, running from west to east, discharges itself into the Tigris, near Amida.

**CALAGORINA**, a town of Spain, attributed by Ptolemy to the Vascones.

**CALAGORRIS**, *CAZÈRES*, a place of Gaul, belonging to the "Volcæ Tectosages," at some distance S.W. of Tolosa, and comprehended within the Narbonnensis Prima.

**CALAGUM**, *CHAILLI*, a place of Gaul, belonging to the "Meldi," S.E. of Meldi or Iatinum (Meaux.) It was included in the Lyonnensis Quarta.

**CALAGURIS**, now *CALAHORRA*, a town of Hispania Citerior, seated on the Iberus, belonging to the Vascones. Also, a town of Spain, belonging to the Hérgertes, according to Ptolemy; now *Lubarre*. It was situated N. W. of Osca.

**CALAH**, or **CALE**, in *Ancient Geography, one of the four cities built by Ashur, of which we have an account in Gen. x. 11, 12. This is supposed to be the Calach, situate about*

the springs of the river Lycus, and mentioned by Strabo as the capital of a province called Calachene, seeming to be the same with Ptolemy's Calacine, above Adiabene, towards mount Niphates.

**CALAHORRA**, in *Geography*, an episcopal town of Spain, in Old Castile, seated on the south side of the Ebro, on the borders of Navarre; 62 miles N.W. of Saragossa. N. lat.  $45^{\circ} 18'$ . W. long.  $2^{\circ} 7'$ .

**CALAIS**, a sea-port town of France, and chief place of a canton, in the department of the Straits of Calais, and district of Boulogne; the place contains 6,750, and the canton 15,266, inhabitants; the territory includes 165 kilometres, and 12 communes. Calais has a citadel on the N.W. side, and near the sea, as large as the town, with one entrance, and is strongly fortified; but its chief strength depends upon its situation among the marshes, which may be overflowed at the approach of an enemy. It is encompassed, except for a short space towards the harbour, by a moat and wall, which latter serves as a public walk. It is a regular well-built town, with a spacious and handsome square, and its streets are tolerably clean and well paved; and has several churches and monasteries. Its harbour, formed by a small rivulet, is too much obstructed by sand to admit of large vessels, or even common merchant ships, except at high water. This haven ebbs dry at every tide; but at high water, with a common flow, it has not less than 3 fathoms. The flood sets in N.E. by E. The harbour commences at the gate of the town, where a fine massive quay terminates in two long wooden moles, which extend far into the sea. Calais is a trading town, and in time of peace regular packets for the mail sail from and to England; and other passage boats form a constant intercourse between this place and Dover, from which it is distant 22 miles S.E. Some have supposed that an isthmus formerly joined Calais and Dover; and that the rupture of it was occasioned by an earthquake, and has been gradually widened by tides and currents. Calais communicates by means of canals with St. Omer's, Gravelines, Dunkirk, &c.

About the close of the 12th century, Calais was only a fishing village; but from the success of its inhabitants in the herring fishery, it soon acquired so much importance as to attract the notice, and excite the rapacity of the church; for in the year 1180, we find that pope Alexander III. granted the tithe of all the herrings there taken to the abbey of St. Bertin, recorded for its immense wealth, for the luxurious and dissolute lives of its monks, and for the worthlessness of its abbot. The honest fishermen, not readily comprehending the pope's right to give away their property, declared that they would sooner decimate the monks than suffer their herrings to be decimated. They were, however, reduced to obedience by the count of Flanders, who was then their regent, as guardian to Ida, countess of Boulogne. Its walls and castle were built in the year 1228 by Philip count of Boulogne, brother of Lewis VIII.; but its municipal laws and privileges are supposed to have been granted by the countess Ida, and her fourth husband, Renaud de Dammartin, in the year 1191. From these laws it appears that the city was governed by its own magistrates elected by the citizens, and by a bailiff appointed by the count. Among its privileges we find that, if a woman offered to take, as her husband, a man condemned to death for theft, she might demand and obtain his pardon. In 1347, Calais was taken by Edward III. of England, after having been reduced to extreme distress by famine. Edward, having been detained under its walls for eleven months by the obstinate resistance of its defenders,

conveyed a messenger to the governor, who informed him that he would grant them no terms; but that they must surrender at discretion. At length, in consequence of the spirited remonstrances of the governor, and the intercession of sir Walter Manny, whom he had deputed as his messenger, Edward consented to grant their lives to the garrison and its inhabitants, except six of the principal burghesses, who were required to deliver to him the keys of the city, with ropes about their necks. In this extremity of deep distress, Eustace de Pierre, one of the most wealthy merchants of the place, voluntarily offered to be one of those six victims; and his example was soon followed by five others of the richest citizens. These illustrious patriots, barefooted and bareheaded, with ropes about their necks, were attended to the gates by all the inhabitants with tears, blessings, and prayers for their safety. When they were introduced into the presence of Edward, they laid the keys of the city at his feet, and, falling upon their knees, supplicated his mercy in strains so moving, as to melt the spectators into tears. The queen enforced their intercession, and implored and obtained their lives. Having thus succeeded, she conducted them into her own apartment, entertained them honourably, and dismissed them with presents. Edward, having taken possession of the city, found it necessary to turn out all the ancient inhabitants, and to people it with English. Calais remained from this time in subjection to England till the reign of queen Mary, when it was retaken by the duke of Guise. The duke obliged all the inhabitants to abandon the place, and conferred the government of it upon Des Termes, who was soon after made a marshal of France. By the treaty at Chateau Cambresis, it was agreed, that Calais should, after the expiration of 8 years, be restored to England; and, at the expiration of that term, queen Elizabeth dispatched some troops to recover it; but the surrender was refused, because, five years before, the English had taken Havre, and violated the terms of the treaty. In the year 1596, it was taken by the Spaniards, under the conduct of the archduke Albert, but was restored two years after by the peace of Vervins. In 1694, it was bombarded by the English, under sir Cloudesly Shovel, but without sustaining much damage. Calais is distant 7 leagues from the South Foreland, and 40 from Dunnofe; 5 posts S.W. from Dunkirk, and  $34\frac{1}{2}$  N. from Paris. N. lat.  $50^{\circ} 57' 31''$ . E. long.  $1^{\circ} 50' 56''$ . High water  $11^{\circ} 30'$ .

**CALAIS**, *Sz.* a town of France, and principal place of a district in the department of the Sarthe; 6 leagues E.N.E. of Chateau du Loir. The place contains 3,630, and the canton 13,749, inhabitants; the territory comprehends  $307\frac{1}{2}$  kilometres and 14 communes. N. lat.  $47^{\circ} 56'$ . E. long.  $0^{\circ} 39'$ .

**CALAIS**, a township of Caledonia county, and state of Vermont, in America; 105 miles north-easterly of Bennington; containing 45 inhabitants.

**CALAMA**, in *Ancient Geography*, *Gelma*, or *Kalma*, an episcopal town of Africa, in Numidia; situate to the south-west of Hippo-regius. St. Augustine mentions a disturbance that happened in this place, A.D. 408, or 409; and that soon succeeded a law enacted by Honorius in 407, or 408, expressly prohibiting the solemnities of the Gentiles.

**CALAMA**, the name of a village of Asia, in Carmania, or Gedrosia, according to Arrian.

**CALAMA**, in *Geography*, a town of Naples, in the province of Calabria Ultra; 6 miles N. E. of Reggio.

**CALAMÆ**, or **CALAMES**, in *Ancient Geography*, a burgh of Peloponnesus, in Messenia, seated on the river Aris, and mentioned by Polybius and Pausanias.

**CALAMA**—

**CALAMAGROSTIS**, in *Botany*, (Trag. ic. Dalech. Hist.) See *TRIGLOCHIN palustre*. Linnæus has given it as a trivial name to a species of *Agrostis*, and also to one of *Arundo*. Dr. Withering has made it a generic appellation for such species of *Arundo* as have only one floret in a calyx: but, as Dr. Smith justly observes, (Flor. Brit. vol. i. p. 145.) the very natural genus *arundo* ought not to be broken merely on account of a difference in the number of florets, and, if that were not the case, the term *calamagrostis* is not admissible, as a generic name, on the established principles of the Linnæan Nomenclature.

**CALAMANCO**, in *Commerce*, a woollen stuff manufactured in Brabant and in Flanders, particularly at Antwerp, Lisle, Tournay, Turcoin, Roubaix, and Lannoy.

It is commonly woven wholly of wool; there are some, however, wherein the warp is mixed with silk, and others with goat's hair. There are calamancos of all colours, and diversely wrought. Some are quite plain, others have broad stripes adorned with flowers; some with plain broad stripes; some with narrow stripes; and others watered. This has been also no inconsiderable branch of the woollen manufacture in England, both for home wear and exportation; but of late it has declined.

**CALAMRACUM**, in *Ancient Geography*, a place of Italy, in Magna Græcia, between Petitia, and the marsh of Lucania.

**CALAMARIA**, in *Botany*, (Dillen. Musc.) See *ISOETES lacustris*.

**CALAMARIE**, one of the natural orders of Linnæus, nearly allied to the grasses, and having commonly the same kind of leaves, but differing from them in not having a two-valved glume. The calamariæ have a culm which is generally triquetrous, rarely cylindrical, often leafless, or bearing only a few leaves. The leaves are generally more rigid and rough, and the flowers are often disposed in an imbricated manner. The genera enumerated in the *Systema Naturæ* are, *bobartia*, (but the genus is now abolished; see *BOBARTIA*;) *scirpus*, *cyperus*, *eriophorus*, *carex*, and *schænus*; with a doubt, whether *flagallaria*, *juncus*, and *scheuchzeria* should not be added. In the posthumous lectures of Linnæus, as published by Giseke, they stand thus: *sparganium*, *typha*, *eriophorum*, *scirpus*, *carex*, *scleria*, *cyperus*, *schænus*, *restio*, *galinia*, *kyllingia*, *fuirena*. The genus *scleria* is added by Giseke.

**CALAMARIUS**, in *Zoology*, a species of *COLUBER*, having 140 abdominal plates, and 22 caudal scales. Linn. Mus. Ad. Fr.

This kind inhabits America: general colour livid with linear brown streaks and dots: beneath tessellated with brown.

**CALAMATA**, in *Geography*, a town of European Turkey, in the Morea, seated on the river Spinazza; taken by the Venetians in 1685, but since retaken, together with the rest of the Morea, by the Turks; 13 miles W. of Mistra.

**CALAMBA**, or **CALAMBAC**, in *Commerce*, a kind of wood brought from China, usually sold under the denomination of *lignum aloes*, or *AGALLOCHUM*.

Sir Phil. Vernatti makes calambac and *lignum aloes* synonymous. Others seem to distinguish, restraining calamba wood to the best sort of aloes wood, growing chiefly in Malacca, and Sumatra; and much used in India for making of beads and crucifixes. Phil. Trans. N<sup>o</sup> 43. p. 863.

**CALAMENTHA**, or **CALAMINTHA**, in *Ancient Geography*, a town of Africa, in Libya, belonging to the Phœnicians.

**CALAMIANES**, in *Geography*, a cluster of islands in the Indian Sea, among those called the "Philippine Islands,"

situate at a small distance from the northern cape of Paragua, and west from Manilla, and giving name to a province or government. They are reckoned twelve in number, which are all small, and inhabited by peaceable Indians, who pay tribute. The chief product of their mountains is wax, which they gather twice in the year. The rocks over the sea afford some of the esteemed birds' nests, and on the coast are fine pearls.

**CALAMIDES**, a cluster of islands, amounting to about seventeen, situate in the Indian Ocean, 14 or 15 leagues S. W. of Luban, and forming a province; the largest of which is Paragua, which see.

**CALAMIFEROUS**, in *Botany*, a denomination given by some to those otherwise called *CULMIFEROUS* plants.

**CALAMINA**, in *Ancient Geography*, a lake of Asia, in Lydia; in which, according to Pliny, were floating islands, which, during the Mithridatic war, served as a place of refuge for the Roman citizens.

**CALAMINE**, or **LAPIS CALAMINARIS**, is an ore of ZINC, which see. The lapis calaminaris, calcined, powdered, and sifted, forms a heavy brownish-yellow powder, which when mixed with wax and oil forms the "ceratum lapidis calaminaris," (ceratum epuloticum of the old dispensaries,) the most commonly used of all the simple unguents. Calamine is much used for taking off films from the eyes of horses, &c.

**CALAMINE**, in *Rural Economy*, an ore of zinc, having a white-gray brown, or red colour, and varying in hardness. It is found in Derbyshire, and some other districts, and is supposed by some writers to be capable of being made use of in agriculture with advantage, from its containing oxygen in a large proportion, as one of its constituent principles. Too few experiments have, however, yet been made with this material to fully ascertain its utility in this application.

**CALAMINT**, in *Botany*, (Smith Flor. Brit.) See *THYMUS Calamintha*, and *Nepeta*, removed by Dr. Smith from *Melissa*.

**CALAMINTHA**, (Pluk. Mant. 34. t. 344. fig. 1. Morif. Hist. iii. p. 413. S. 11. t. 19. f. 7.) See *CUNILA mariana*.

**CALAMINTHA arvensis verticillata**, (Bauh. Pin. 229.) See *MENTHA arvensis*.

**CALAMINTHA aquatica belgarum**, (Lob. ic. 505.) See *MENTHA exigua*.

**CALAMINTHA hederacea**, (Scop.) See *GLECHOMA hederacea*.

**CALAMINTHA magno flore**, (Bauh. Pin. 229. Riv. Mon. 43.) See *MELISSA grandiflora*.

**CALAMINTHA vulgaris**, (Bauh. Pin. 228.) *montana*, (Dod. Pemp. 98. Riv. t. 46. Blackw. t. 166.) See *MELISSA calamintha*, Linn. Thymus. Dr. Smith.

**CALAMINTHA pulegii odore**, (Bauh. Pin. 228.) *montana præalta*, (Bocc. Mus. 2. p. 45. t. 40 & 38. Riv. t. 47. Kniph. Cent. 7. n. 27.) See *MELISSA nepeta*, Linn. Thymus. Smith.

**CALAMINTHA incana**, (Bauh. Pin. 228. Pulegii odore minor Bar. ic. 1166.) See *MELISSA cretica*.

**CALAMINTHA hispanica frutescens**, (Pourn. Inst. 194.) *Montana incana minor*. (Morif. Hist. 3. p. 413. n. 3. See *MELISSA fruticosa*.)

**CALAMINTHA tertium genus**, (Fuch. Hist. 436.) See *INULA dysenterica*.

**CALAMINTHA**, in *Ancient Geography*, a town of Libya, probably of Mauritania, taken notice of by Herodotus and Hecataeus, whose situation is unknown; but supposed by Bochart, from the etymology of the name in the Phœnician

Phœnician language, to be seated on an eminence, and of Phœnician original.

**CALAMISSUS**, a town of Greece, in the country of the Locri Ozolii, situated, according to Pliny, on the Crifean gulf, and placed by M. D'Anville, under the name of Cala, to the west of Naupactus.

**CALAMITA** *florax*. See **STORAX**.

**CALAMITES**, in *Natural History*, a name given by some to the olleocola, which, when in small pieces, sometimes pretty exactly resembles the barrel of a quill; others have called some of the fossil coralloides by this name, there being frequently in them the resemblance of several quills cemented together in stone.

**CALAMITIS** is used for a species of artificial *cadmia*, found adhering to the sticks, ladles, and other utensils where-with they stir the copper when in fusion in the furnace. It is denominated *calamitis*, from the Latin *calamus*, a reed, on account of its resemblance to the figure of a reed cloven in the middle.

**CALAMO**, in *Geography*, sometimes called *Calmina*, or *Calimena*, an island in the Archipelago, near the coast of Asia, not far from Mitylene, about 5 or 6 leagues in circumference. The ancients called it *Claros*: Pliny also distinguishes it by the name of *Calydna*, and Ovid has extolled the abundance of honey which it produced: "Fœcundaque melle Calydnæ." Metam. l. viii. On this island are some lofty mountains, an inconsiderable population, and the remains of an ancient town on the west coast, and, on the other side, a village, called *Calamo*, built on the summit of a mountain, and near it a tolerable good harbour. This island is poor and incapable of providing subsistence for its inhabitants; and it is therefore chiefly occupied in procuring foreign resources by a carrying trade. Its mountains contain minerals, which, under the Turkish government, are a source of oppression and ruin.

**CALAMOCHA**, a town of Spain, in Arragon, seated on the Xiloca; 14 miles S. of Daroca.

**CALAMON**, or **CALAMOS**, in *Ancient Geography*, *Kalamony*, a town of Phœnicia, situate on the sea-coast, at the southern extremity of mount Carmel. Pliny says, that it was burnt by Antiochus the Great.

**CALAMOTI-SINUS**, the gulf of Propontis, in Asia Minor, at the entrance of the Thracian Bosphorus, south-east of Byzantium.

**CALAMUS** is commonly used to denote the same with *arundo*, a reed, rush, cane, or flag.

**CALAMUS**, in *Botany*, (*Καλαμος*, the usual name among the Greeks for a reed, and applied by them to several plants, chiefly aquatic, with hollow stems. See Theophrastus, Hist. Plant. lib. iv. cap. 12.) Linn. gen. 436. Schreb. 589. Willd. 669. Gært. Bot. tab. 139. Lam. Illust. pl. 770. Juss. 37. Vent. vol. ii. 122. Rotang. Eneye. Meth. and Nouveau Dict. Rattan. Class and order, *hexandria monogynia*, Linn. Gært. Vent. *Monacia hexandria*, Lam. to which disposition Jussieu also inclines. Nat. Ord. *Tripetaloides*, Linn. *Palme* Juss. Vent.

Gen. Ch. *Cal.* permanent, of six leaves, or in six divisions; the three outer ones shorter and broader; the three inner ones longer, narrower, and acuminate. *Cor.* none. *Stam.* filaments six, capillary, longer than the calyx, (often separate from the pithil, Poir.) anthers round. *Pist.* germ superior, roundish: style trifid, round, spiral, thread-shaped; stigmas three, simple. *Peric.* membranous, top-shaped, or globular, covered with scales imbricated backwards and obtuse, one-celled, at first pulpy, afterwards dry. *Seeds* one, two, or three, globular, fleshy.

Ess. ch. *Calyx* of six leaves, or with six divisions. *Co-*

*rolla* none. *Fruit* a one-celled berry covered with scales imbricated backward.

Obs. The three inner leaflets of the calyx have the appearance of petals, and it is not easy to determine why they were not considered as such by Linnæus. The division of the style and the three stigmas make it probable that these are naturally the rudiments of three germs, but two of them generally prove abortive. Jussieu observes that this genus forms the connecting link between the palms and the grasses, having the flower of the former and the habit of the latter. The sago palm so nearly resembles *calamus* in its parts of fructification that it scarcely seems a distinct genus. The only difference between them, according to Gærtner, is that the flowers of the former are monoicous, and of the latter hermaphrodite; and that the embryo of the former is on the side, and of the latter at the base of the seed. As the flowers, at least of one species of *Calamus*, are now allowed to be monoicous, the former difference vanishes; and whether the latter alone be a sufficient generic distinction, may justly be doubted in the present imperfect state of our knowledge.

Linnæus makes only one species, but mentions eight varieties, all taken up from Rumphius, who calls them *Palmijunci* from their similarity to the palms in their fructification, and to the junci, or rushes, in their flexibility. Loureiro has distinguished and described six species. Willdenow has enumerated eight, at the same time acknowledging that he cannot identify the *scipionum*, *amarum*, and *dioicum* of Loureiro. Poirer has extended them to twelve, from the descriptions of different authors, but without being absolutely certain that his synonyms are in all cases exact. As he is the latest writer on the subject, we shall take him for our guide.

Sp. 1. *C. petraeus*, Lour. (Rotang. Willd. var. and Linn. *Arundo zeylanica spinosissima*: Burm. zeyl. 36. Flor. 468. Thieru-tiesel: Rheed Mal. v. 12. p. 12, t. 64. *Palmijuncus calapparius*: Rumph. Amb. v. 5. p. 97, t. 51.) "Stem thick, set with prickles; prickles erect; spadix erect." Willd. *Stems* more than a hundred feet high, and at least the thickness of a man's arm: internodes cylindrical, unequal, furrowed, spotted, about a foot long, downy towards the summit. *Leaves*, or fronds, in terminating tufts, alternate, winged; leaflets sword-shaped, long, straight, beset with numerous, straight, long, very sharp prickles. *Spadix* nearly straight, moderately branched. *Calyx* with six divisions. *Berry* rather egg-shaped, acuminate. A native of the East Indies and Cochinchina, where it is used for making long pikes. The inner part of the young shoots, stripped of the bark, is eaten either boiled or roasted on the hearth. The fruit is pleasantly acid. 2. *C. rotantum*, Lour. (*C. rotang* var.  $\gamma$  Linn. *Palmijuncus albus*: Rumph. t. 53.) "Prickles of the stem reflexed; spadix divaricated, straight." Willd. *Stems* very tough, not more than an inch thick, but rising by the means of trees, and passing from one tree to another, sometimes to the length of more than five hundred feet; internodes nearly equal, round, a foot and a half long. *Leaves*, long, winged, reflexed; common petiole lengthened into a naked, pendant, prickly filament; leaflets, short, straight, acuminate, downy, terminated by a long bristle. *Spadixes*, large, spreading out in a loose panicle. *Flowers*, numerous, nearly sessile. *Berries*, very small. It is one of the most common species, and is used instead of ropes to bind untame elephants, to draw heavy loads, and to make cables for ships. 3. *C. scipionum*, walking cane, rattan. Lour. (Katutisuel: Rheede. *Arundo rotang dicta*: Pison mant. 188, La Marek illust. pl. 770. f. 1.) "Internodes of the stem, very long, awl-shaped, shining;

shining; prickles recurved, spadix thick, with short branches". Poir. *Stems* smooth, glossy, marked with dark spots: internodes three feet long, or more, unequal. *Leaves*, winged: leaflets, sword shaped, acuminate; armed, as well as the petioles, with short, recurved, prickles. *Flowers*, few, but rather crowded on the branches of the spadix. *Berry*, globular, of a moderate size, and a clear yellow colour. *Seed*, one, globular. It grows abundantly on both sides of the straits of Malacca, whence it is exported into China and Europe; and on account of its long internodes and glossy surface, has been long preferred for walking canes. 4. *C. verus*, Lour. (*Palmijuncus verus*: Rumph. t. 54, rotang var. 3. Linn.) "Prickles of the stem horizontal; spadix erect; three of the leaflets of the calyx very long." Willd. *Stem*, single and not, as in other species, several from the same root; more than a hundred feet high, and about the thickness of a man's finger; very flexible, and of a yellowish brown colour: internodes very long, almost equal. *Leaves* long, winged; leaflets ovate lanceolate, three-nerved. *Spadixes* racemed. *Spathes* oblong, prickly. The three interior leaflets of the calyx whitish, having the appearance of petals. *Berry* rather large, brown: common in forests in the East Indies. Its stem cut into thongs, is used to make cables and other ropes, cane chairs, and many kinds of household furniture. 5. *C. secundiflorus*, Beauvois, t. 9, 10. "Leaves, winged, flexible, reflexed, gibbous at the base, cultrate at the margin; leaflets prickly at the base." A shrub. *Leaves*, long, winged, without leaflets at their summits, but armed with several pairs of large prickles; opposite, almost triangular without, flat, or a little concave within; leaflets prickly at their edges. *Calyx*, with three short exterior divisions in the form of scales; the three inner ones longer. *Stigma*, capitate, almost trifid. *Berry*, nearly globular. A native of Africa, in the kingdom of Benin. By the means of the prickles on the edges of its leaflets, it firmly attaches itself to other plants; and its own leaves, which hang down to the ground, are so closely entangled together, that each shrub forms an impenetrable bush, which affords a sure defence to the smaller animals against their numerous enemies. M. Beauvois has seen the nests of the termites in the kingdom of Benin so completely covered by these shrubs, as scarcely to leave a passage for the smallest bird. 6. *C. amarus*, Lour. "Prickles crowded, short; leaflets linear; spadixes remote; spathes partial." *Stems*, about the thickness of a finger, about sixty feet high, hardish, even, pale-coloured; internodes long, round, almost equal. A native of Cochinchina. It is used for the same purposes as the preceding, and is more durable. 7. *C. draco*, Willd. (rotang var. 8, Linn. *Palmijuncus Draco*, Rumph. t. 58. f. 1.) "Prickles of the stem pressed close to it; of the leaves spreading; spadix erect." Willd. *Internodes* from two to three feet long, of the thickness of a finger, unequal. *Leaflets* alternate, linear, acuminate, narrowed at their base, beset with a few hairs. *Spadix* branched into small, short racemes. *Berries* egg-shaped, about the size of a hazel nut, terminated by a blunt point. *Seed* one, smooth, oval. From this species is obtained the gum, commonly called Dragor's blo d. 8. *C. niger*, Willd. (var. 2, Linn. *Palmijuncus niger*, Rumph. t. 22.) "Prickles of the stem and of the leaves horizontal; spadix compact, pendulous." Willd. *Stems* thick, armed with prickles, which enter easily into the skin and then break off. *Leaves* very long, alternate, winged; leaflets alternate, straight, narrowed almost into a petiole at their base, acuminate. *Spadixes* axillary, in tufted racemes. *Berries*, globular, scarcely the size of a small pea. A native of the East Indies. Its items do not easily split, and are so irregular in their shape, that

they are not of the same use as several of the other species. 9. *C. viminalis*, Willd. (rotang var. 1, Linn. *Palmijuncus viminalis* Rumph. t. 55.) "Prickles of the stem spreading; of the leaves, distant, reflexed; spadix nodding." Willd. *Stems*, about the thickness of a goose-quill: internodes, about a foot long on the lower part, shorter near the summit, where they are armed with straight, horizontal, very fine prickles. *Leaves* alternate, distant, winged; petioles lengthened beyond the leaflets; leaflets straight, long, acuminate, armed with reflexed prickles. *Spadixes* axillary, branched in rather spreading racemes. *Flowers* peduncled, almost opposite. *Berries* very small. A native of moist forests in Java and the Celebes Islands. Its stems answer the purposes of ozier, and divided into shreds, make several kinds of household furniture. 10. *C. equifolius*, Willd. (rotang, var. 3 Linn. *Palmijuncus equifolius*, Rumph. t. 56. and t. 57. f. 1.) "Prickles of the stem erect, spreading; of the leaves hooked: leaflets elliptic; spadix erect." Willd. *Stems* slender, very supple: internodes short, equal, smooth, furnished near their summit with alternate, winged leaves: *Leaflets*, alternate, from eight to ten inches long; petioles extended beyond the leaflets, but prickly to the end. *Berries* round, about the size of a pea. A native of humid, rocky places, in the island of Amboina. It is in general use in the East Indies as a riding cane. 11. *C. dioicus*, Lour. "Stem very slender; leaves and prickles shorter; flowers dioicous." Nearly allied to the two preceding. It may possibly be only a variety of one of them: or it perhaps is an intermediate species. *Stems* slender, scarcely the thickness of a goose-quill, twenty feet high, very flexible and regular, pale and glossy; internodes a foot long; leaves winged. *Calyx* with six unequal divisions; the three inner ones resembling petals, white, ovate-lanceolate, striated. A native of Cochinchina, on the banks of rivers. 12. *C. zalacca*, Willd. Gært. Tab. 139. f. 1. Lam. Pl. 770. fig. 2. copied from Gærtner. (*C. rotang*, var. 2, Linn; *Zalacca*, seu rotang zalak, Rumph. t. 57. f. 2. Fructus Baly insula: pyriformis, J. Bauh. Hist. p. 401, with a figure.) "Prickles spreading; spadix radical." Willd. *Stem*, none. *Leaves*, in a tuft, from the crown of the root, from ten to twelve feet long, winged; leaflets long, acuminate; petioles strong, straight, spreading, prickly. *Spadixes* racemed, nearly radical. *Berries* rather large, top-shaped, of an irregular form from their pressure against each other; rind thin, papery; scales somewhat cartilaginous; the upper ones erect, linear; the rest pressed close, imbricated downward; marked with a raised line along the middle, and a little reflexed at the tip, so as to make the berry rough to the touch. *Seeds* three, fixed to the bottom of the berry, two generally abortive, nearly globular, with a small umbilical fungous, thick, rather heart-shaped lobe affixed to them below. Gært. Fruit rather larger than a pear, of a pleasant acid flavour, which has been compared to that of the pineapple. They are eaten either raw or pickled, and are a general sea-store. A native of Java, and other parts of the East Indies. This species has the habit of a palm, and connects the others with the Sago Palm. See SACUS.

CALAMUS, in *Ancient Geography*, a place situated on the Thracian Bosphorus, which is said to have taken its name from the quantity of roses which grew there.

CALAMUS aromaticus, in *Botany*. See ACORUS Calamus.

CALAMUS aucupaterius, or calamus struicus, among *Fowlers*, signifies a bird call.

CALAMUS indicus petrificus, in the *Natural History of the Ancients*, a name given to a substance found often in the fossil kingdom usually of about three inches long, half an inch broad, and one third of an inch thick, and covered all

over its surface with large round figures in form of radiated stars within. This very much resembled in external appearance the root of our common *calamus aromaticus* of the shops turned into stone, and seems to have been vulgarly supposed to be that substance petrified. The more accurate among the early writers, however, have by no means countenanced so wild a conjecture; and Theophrastus, though he records the substance under that name, as it had no other in his time, yet joins it to the corals, which, he says, grow in the sea, and are vegetables; and adds, that those and this substance are properly the substance of another treatise, not of a history of stones.

This author's placing it among the CORALS is perfectly right, since the specimens of it now found are plainly no other than corals of the stellated kinds, which have been long buried in the earth.

*CALAMUS odoratus*, Mathioli, in *Botany*. See ANDROPOGON *nardus*.

*CALAMUS pastoralis*, in *Musæ*, the shepherd's pipe; an ancient musical instrument, the origin of the flute; at first, made of a straw or reed; *avena* and *calamus*. It should seem as if the *μονολοι*; *monoloi*, with holes to produce different tones, must have been suggested by the syrinx, or Pan's pipe, an instrument in which pipes of different lengths, of one tone each, without ventiges, produced the scale by moving them over the lips; but afterwards it was discovered, (as it is said, by Minerva,) that one single pipe, perforated, would furnish as great a variety of sounds, and more conveniently, than all the pipes of the *ffistula Panis*. Flutes were improved and multiplied, almost to infinity. See Pl. of ancient musical instruments, and Hist. vol. i. pp. 408, and 412. According to Horace, the flute had undergone various changes and improvements from its first invention:

Tibia non, ut nunc, orichalco victa, tubæque

Æmula; sed tenuis simplexque, foramine paucò,

Aspirare.—

A. P. 202. See FLUTE.

*CALAMUS scriptorius*, properly denotes a reed or rush to write with, answering to the use of the ancient stylus and modern pen. The ancient Egyptian calamus was a sort of *arundo aquatica* growing plentifully about Memphis, and on the banks of the Nile; whence it was also called *calamus Memphiticus*, *Niloticus*, &c.

*CALAMUS scriptorius*, in *Anatomy*, is a dilatation of the fourth ventricle of the brain; so called from its figure, which resembles that of a quill. See BRAIN.

*CALAMUS* also denotes a sort of measure otherwise called CANNA, CANE, or REED.

CALAMY, EDMUND, in *Biography*, an eminent divine among the English Nonconformists of the 17th century, was born in London in the year 1600, and educated at Pembroke Hall in the university of Cambridge; where he took his degrees of bachelor of arts, and bachelor of divinity, but on account of his hostility to the Arminian party, he was prevented from obtaining a fellowship in that society, to which his standing, talents, and literary acquirements entitled him. His studious disposition and religious character, however, recommended him to Dr. Felton, bishop of Ely, who made him his domestic chaplain, and gave him the vicarage of Swaffham prior in his neighbourhood. In this situation, he studied at the rate of 16 hours a day, and acquired that large fund of solid and useful learning, which enabled him to discharge, with great ability, the several offices which he afterwards occupied. After the death of the bishop in 1626, he was chosen one of the lecturers at Bury St. Edmund's, and resigned his vicarage. During his 10 years' residence in this place, he distinguished himself for the most part as a strict conformist: but when bishop

Wren's articles, and the reading of the book of Sports were enforced, he avowed his dissent, made a public apology for his conduct from the pulpit, and, from this time, was regarded as an undisguised and active nonconformist. Being much in favour with the earl of Essex, he was presented by his lordship with the rectory of Rochford in Essex, which, though a valuable preferment, was, on account of the insalubrity of its situation, the occasion of permanent injury to his constitution. In 1639, he was chosen minister of St. Mary, Aldermanbury, and removed to London, where he took an active part in the controversy concerning church-government, which was then agitated. In 1640, he engaged with other writers in the composition of the famous book, entitled "Smectymnus," from the initials of the names of those that were concerned in it; viz. Stephen Marshall, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Spurstow. This treatise, though written with a considerable degree of asperity, has been considered, not only by the Nonconformists, but by Dr. Wilkins, bishop of Chester, as a capital work against episcopacy. Calamy himself says of it, that it gave the first deadly blow to this system of church government. In 1641, Mr. Calamy was appointed by the house of lords a member of the sub-committee, which ineffectually attempted to accommodate the differences that subsisted with regard to religion. And he afterwards distinguished himself, by his learning and moderation, in the assembly of divines. He was also at this time one of the most eminent preachers in the city of London, and held in high estimation, particularly by the Presbyterian party. With this party he concurred in opposition to the Independents and Sectaries, and in testifying his disapprobation of the violent measures that brought on the king's death, an event which he ardently deprecated. During the usurpation of Cromwell, he withdrew from all public concerns; but he boldly opposed the project of his single government, which he undertook to prove to be both unlawful and impracticable. As soon as a favourable opportunity occurred, he was active in promoting the restoration of Charles II.; and he was one of the divines delegated to compliment the king in Holland on the occasion. In 1660, he was appointed one of his majesty's chaplains; and he was offered the bishopric of Litchfield and Coventry, which, after previous deliberation, he declined accepting. As soon as the act of uniformity was passed, he conscientiously discontinued his public sermons in the church, and preached his farewell sermon at Aldermanbury, August 15, 1662. He joined several of his brethren, however, in a petition to the king for liberty to retain their public functions, and on the occasion made a long and moving speech; but this last effort for toleration proved ineffectual. After he had ceased to officiate in the church, he attended its public service; and one time, viz. December 28, 1662, when the appointed preacher did not appear, he was urged by some of the principal parishioners to take his place; but taking occasion to speak with freedom concerning the parish, and the situation to which he was then reduced, he was arrested by the lord mayor's warrant, and committed to Newgate. Doubts, however, occurred as to the legality of his confinement; and the hardship of his case being duly considered, he was liberated in a few days by the king's order. After the fire of London, he was driven over its ruins in a coach on his way to Enfield; and the sight so much affected him, that he died within two months afterwards, October 29, 1666.

Mr. Calamy was well acquainted with the subjects appropriate to his profession: as a preacher, he was plain and practical; and he boldly avowed his sentiments on all necessary occasions. Several of his sermons, delivered on particular

ticular occasions, were printed separately; and a set of five sermons, entitled "The godly Man's Ark, or a City of refuge in the Day of Distress," was published in 1683, 12mo, and became a very popular book in those times. Biog. Brit.

CALAMY, BENJAMIN, a divine of the church of England, of the 17th century, was the son of the preceding by a second wife, and having received the rudiments of education at St. Paul's school, he completed his course at Catharine Hall, Cambridge, of which he became a fellow, and an eminent tutor. In 1677, he was chosen minister of St. Mary, Aldermanbury, and soon after appointed one of his majesty's chaplains in ordinary; and in 1680, he took his degree of doctor in divinity. The attention of the public was very much engaged by "A Discourse about a scrupulous Conscience," which he published in 1683. It was dedicated to sir George Jefferies, afterwards the chancellor of notorious memory, whom he compliments as his friend and patron. This discourse, which was designed to shew the crime and danger of separating from the established church on the pretext of a tender conscience, and which inculcates the notion, that "such wayward, skittish consciences, as doubt of and suspect the rights of the crown, ought to be well bridled and restrained," was much decried by one party, and extolled by the other. Mr. Thomas de Laune, a Non-conformist school-master, published a warm reply to this discourse, for which, and some other intemperate publications, he was committed to Newgate, and sentenced to pay a fine, which he was unable to discharge; so that the event proved fatal to himself, his wife, and children. It is alleged, however, in vindication of Dr. Calamy, that he exerted himself in favour of this antagonist; and that though he avowed himself a strenuous advocate for the principle of religious intolerance, and was unfortunate in the selection of his patron, he was far from possessing the spirit of a persecutor: and it is further said, that his opinions on this topic underwent some change before his death. In consequence of the high estimation in which he was held by the best men of all parties in the city of London, he obtained in 1683 the vicarage of St. Lawrence, Jewry, and in 1685, a prebend in the cathedral church of St. Paul. Towards the close of the year 1685, his health declined in consequence, as it is said, of the calamitous state of public affairs, by which he was deeply impressed, and he died of a pleuritic complaint in January, 1686. He was distinguished by his zealous attachment to the government and church of England; and at the same time respected and esteemed for his piety and charity, by persons of different denominations. As a preacher, he was much applauded: and some of his posthumous sermons, published by his brother, have been frequently reprinted, and are at this day read and admired. Biog. Brit.

CALAMY, EDMUND, an eminent dissenting divine, was grand-son of the first Edmund Calamy, by a father of the same name, and born in London, in 1671. After a previous course of education in some private and public schools, he was placed under the tuition of Mr. Samuel Cradock, by whom he was instructed in logic, metaphysics, and natural philosophy. In 1688, he removed to the University of Utrecht, where he distinguished himself by his proficiency in philosophy and law, under De Vries, Vander Muyden, and Grævius, some of the most learned professors in their respective departments at that period. In these several stages of education, Mr. Calamy recommended himself to his tutors by the diligence of his application, and to all his associates by the sweetness of his temper, and the urbanity of his manners. Having declined the offer of a professorship in the college of Edinburgh, he returned from Hol-

land to England, and spent some time at Oxford, without becoming a member of the university, availing himself of the patronage and counsel of Dr. Pocock, and Dr. Edward Bernard, and also of the instructive conversation of Mr. Henry Dodwell. Determining to devote himself to the profession of divinity, he directed his course of studies to this object; and having deliberately investigated the grounds of the controversy between the established church and the Separatists, he resolved to connect himself with the latter; and in 1692, he commenced the regular exercise of his ministry at a meeting-house in Black-fryars, London. In 1694, he was ordained; and this was the first instance of the kind that was performed among the dissenters, after the passing of the act of uniformity: and in 1703, he was chosen pastor of a large and respectable congregation in Westminster. To the dissenters he performed an acceptable service, by publishing "Baxter's History of his Life and Times," which he afterwards abridged, annexing an account of many of the ejected ministers, and an apology for their non-conformity. Baxter's history terminated with the year 1684; but Calamy's continuation extended to the year 1691; and was published in 1702, 8vo. A new edition of this work was published in 1713, in 2 volumes 8vo.; in which the history of the Non-conformists is continued through the reign of king William and queen Anne, to the time of passing the occasional bill. The first edition of this work was, as we may reasonably imagine, very differently received by persons of different parties and opinions; and it occasioned a controversy of some extent and continuance, which, however, was carried on with a greater degree of candour and moderation than most controversies of a similar kind. In Scotland, which Mr. Calamy visited in 1709, he was received with singular respect; and each of the three Universities of Aberdeen, Glasgow, and Edinburgh, presented him with the degree of doctor in divinity. In 1718, he wrote a vindication of his grandfather, and several other worthy persons against the reflections of Archdeacon Eachard, in his History of England. About this time the question of subscription to the first article of the Church of England, relating to the Trinity, began to be agitated among the dissenters; Dr. Calamy, however, remained neutral, and he has incurred reproach among the present race of dissenting clergy, for not having joined those 73 ministers who carried it against 69 for the Bible, in opposition to human formularies. As to the belief of the doctrine he was decidedly orthodox, which was also the case with several others; and he published a set of sermons in defence of it, which was dedicated and presented to the king, and for which he received from his majesty a gratuity of 50l. and likewise the thanks of several dignitaries of the church. In 1727, he completed his great design of preserving the history of ministers, &c. ejected and silenced, after the restoration, in a work intitled, "A Continuation of the Account of the Ministers, Lecturers, Masters, and Fellows of Colleges, and Schoolmasters, who were ejected and silenced after the Restoration in 1660, by, or before the Act of Uniformity, &c." 2 vols. Lond. 1727. This is a work of laudable industry and labour, and contains a valuable collection of memoirs, which would have been otherwise lost. In 1775, the rev. Mr. Samuel Palmer of Hackney published in two large volumes 8vo. under the title of "Non-conformists' Memorial," an abridgement, with corrections, additions, and new anecdotes, of Dr. Calamy's 4 volumes, concerning the ejected and silenced ministers; and a new edition of this work, with improvements, has been lately reprinted. Dr. Calamy distinguished himself by other learned and useful writings, consisting chiefly of sermons and controversial pamphlets. Of his publications, besides those already notice-

ed, we may mention his "Inspiration of the Holy Writings of the Old and New Testament, in 14 Sermons;" and "His Defence of moderate Nonconformity," in 3 parts. The introduction to one of these tracts, representing the true state of the controversy between the Church and the Dissenters, was so much approved by Mr. Locke, that he sent a message to our author informing him, that he thought it such a defence of nonconformity as could not be answered; and that, in adhering to the principles thus laid down, he had no occasion to be afraid of any antagonist. After an honourable course of professional services for which he was much esteemed, and after sustaining a character which was much respected, not only among dissenters, but also among the moderate members of the established church, both clergy and laity, with many of whom he lived in great intimacy; he closed his life June 3, 1732, in the 60th year of his age. In his funeral sermon by Mr. Mayo, his character is very justly delineated, as "a person of sound judgment, extensive learning, sincere piety, of a candid and benevolent temper, and very moderate with regard to differences in points of religion." *Biog. Brit.*

**CALANDA**, in *Geography*, a town of Spain in Arragon, on the river Guadaloupe; 3 leagues W. S. W. of Alkanitz.

**CALANDRA**, in *Ornithology*, a bird of the ALAUDA, or lark genus, called by some the calandre lark, and which appears to be a general inhabitant of Sardinia, Italy, the South of France, Syria, Russia, and Tartary, and also of America. This is the calandra of old authors. Brisson calls it *alanda major* f. *calandra*: it is the calandra of the arctic zoology, of Aldrovandus, Willughby, and Edwards, and *grosse alouette* ou *calandre* of Buffon. The length of this bird is about seven inches and a quarter. It builds its nest on the ground: sings finely, and imitates the notes of other birds extremely well. It is specifically distinguished by having the first exterior tail feather on each side white on the outer web; second and third tip with white: pectoral band brown. *Gmel. &c. Obs.* The bill and legs are pale grey: body above varied with brown and grey: chin white: throat with a white crescent, and beneath that a whitish band spotted with black: belly white: quill feathers dusky edged with white; the lesser ones tip with white: tail black.

**CALANDRE**, in *Natural History*, a name given by the French writers to an insect that does vast mischief in granaries. It is properly of the scarab class.

The female lays a considerable number of eggs, and the increase of these creatures would be very great, but nature has so ordered it, that while in the egg state, and even while in that of the worm, they are subject to be eaten by mites; these little vermin are always very plentiful in granaries, and they destroy the far greater number of these larger animals.

**CALANDRO**, in *Geography*, a town of Asiatic Turkey, in the province of Caramania; 100 miles S. of Cogni.

**CALANGAY**, in *Natural History*, a name given by the people of the Philippine islands to a species of parrot very common there; it is all over white, and has a crest of white feathers on its head; it is of the size of a pigeon, and is easily kept tame, and learnt to talk. It is called also in some of the Philippines *catatua* and *abacay*.

**CALANNAS**, in *Geography*, a town of Spain, in the county of Seville, near the river Odiel; 40 miles N. W. of Seville.

**CALANTIGAS**, an island of the East Indian ocean, not far from Lingen, which see.

**CALANUS**, in *Biography*, a brachman or Indian phi-

losopher, who followed Alexander the Great, in his expedition to India. Having passed 83 years without sickness, a fit of the colic made him impatient of life, and he resolved to render his exit as ostentatious as possible. Accordingly, having obtained permission of Alexander to burn himself, a funeral pile was erected and strewed with perfumes; and the whole army was arranged round it in battle array: upon which, Calanus, magnificently dressed, ascended the pile with a composed air, and saw the flame applied without emotion. When he was asked if he had any message to Alexander, he only replied, "I shall soon see him again at Babylon:" which declaration some have interpreted as presignificative of his death in that city; and the last words he uttered were, "Happy hour of departure from life, in which, after the mortal body is consumed, the soul shall go forth into light." This event took place on the frontiers of Susiana, B. C. 325. See ALEXANDER.

**CALAO**, in *Ornithology*, synonymous with the modern Latin *Buceros*, and *Hornbill* of the English. Petiver called the Philippine hornbill (*Bicornis* Linn.) Calao, and since that period, the French have adopted the expression as a general name for the other species of the same tribe. Thus, Buffon has calao d'Abyssinie, calao d'Afrique, calao de Malabar, calao à casque rond, calao à bec rouge de Senegal, &c. all which refer to the corresponding synonyms, Abyssinian hornbill, African hornbill, Malabar hornbill, Helmet hornbill, red-billed hornbill, &c.

**CALAEON**, in *Ancient Geography*, a river of Asia Minor, in Ionia, near the town of Colophon.

**CALAPADA**, in *Geography*, a cape on the north side of the isle of Candia, to the east of cape Meleche, and about one-fourth part of the length of the island from the west end.

**CALAPIS**, in *Ancient Geography*, a colony of Asia Minor, in Bithynia; established, according to Strabo, by the inhabitants of Heraclea.

**CALAPIZZATI**, in *Geography*, a town of Naples, in the province of Calabria Citra; eight miles N.W. of Cariati.

**CALAPPA**, in *Botany*, Rumph. See *Cocos nucifera*.

**CALAPPA**, in *Entomology*, a species of CANCER that inhabits America. The thorax is crenulated, with the posterior angles dilated, and very entire: hand-claws crested. Fabricius.

**CALASCIO**, in *Geography*, a town of Naples, in the province of Abruzzo Ultra; eight miles E. of Aquila.

**CALASCIONE**, a musical instrument much in use by strolling and street musicians throughout the kingdom of Naples. It is a species of guitar, with only two strings, tuned 5th to each other. It has a very long neck, which is fretted. See FRET. The Turks have an instrument of the like kind, with three strings, called in Arabic, *dambura*. Sometimes the strings are struck with a plectrum, and sometimes with a quill. See PLECTRUM. The tone is rough and coarse; the neck is sometimes six feet long. The frets amount to 15 or 16. But the Neapolitans have a smaller sort called *calascioncina*. See *Mus. Pl.* of mod. instr.

**CALASH**, or **CALESH**, a small light kind of chariot, or chair, with very low wheels, used chiefly for taking the air in parks and gardens.

The word is French, *caleche*, which Menage derives from the Latin, *carrus*, *carri*, *cariscus*, *carrisca*, *carrisca*, *calesea*, *caleche*.

The calash is for the most part richly decorated, and open on all sides, for the conveniency of the air, and prospect; or at most enclosed with light mantlets of waxed cloth, to be opened or shut at pleasure.

In the Philosophical Transactions, we have a description of a new sort of calash going on two wheels, not hung on traces, yet easier than the common coaches; having this farther advantage, that whereas a common coach will overturn if one wheel goes on a surface a foot and a half higher than that of the other, this will admit of a difference of three feet and one third, without danger of overturning. Add that it would turn over and over, that is, after being turned so as that the spokes are parallel to the horizon, and one wheel flat over the head of him that rides in it, and the other flat under him, it will turn once more, by which the wheels are placed in *statu quo*, without any disorder to the horse, or rider. N<sup>o</sup> 172. p. 1028.

CALASIO, MARIUS DE, in *Biography*, a Franciscan, professor of Hebrew at Rome, and author of a "Concordance of the Hebrew Words in the Bible," in four volumes folio, printed at Rome in 1621, and at London in 1747. This Concordance has been highly approved both by protestants and papists; and contains, besides the Hebrew words occurring in the Bible, the Latin version, and, in the margin, the variations between the LXX version, and the Vulgate. Besides, at the beginning of every article, there is a kind of dictionary, which gives the signification of each Hebrew word; and it furnishes an opportunity of comparing it with other oriental languages, *viz.* the Syriac, Arabic, and Chaldee.

CALASIRII, in *Ancient Geography*, the denomination of a people, who, according to Herodotus, formed a class of Egyptians, amounting in number to 250,000 persons, devoted, from father to son, to the profession of arms, without being attached to agriculture, or to any art. The kings of Egypt had always one thousand of them among their guards.

CALASIRIS, or CALASSIS, in *Antiquity*, a linen tunic worn by the Phœnician, Ægyptian, Roman, and other priests. We also find mention of the calasiris as worn by the soldiers and by women. In which last sense, it seems to have been a knot in the women's gown, whereby it was drawn about the neck.

CALASTRI, in *Geography*, a town of Hindooستان, in the Carnatic; 15 geographical miles E.N.E. from Tripetty, and 61 from Arcot; but major Rennell has some doubts concerning the accuracy of its position.

CALATABELLOTA, formerly the *Crimifus*, a river of Sicily, with the waters of which the inhabitants overflow their beautiful rice grounds; and also a town of Sicily in the valley of Mazara; six miles S.E. of Sciacca.

CALATA-FIMI, a town of Sicily, in the valley of Mazara; 19 miles E.S.E. of Trapani. It is built on a ridge between two vallies, and its inhabitants are estimated at 10,000.

CALATA-GIRONE, or CALAGIRONE, a royal city of Sicily, in the Val di Noto, situate about 20 miles from the sea, on the summit of a very high insulated hill, embosomed in thick groves of cypresses, and containing about 17,000 inhabitants, who live by agriculture and the manufacture of potters-ware. The road to it, though paved, is very steep, and difficult of passage for any animal except a mule or an ass. The inhabitants of this city are deemed the politest people in the island, and many of them live in a very elegant style. The natives have an idea that this city is very ancient, and that it figured as a republic among the Sicilians, during the zenith of Grecian glory, under the name of inland Gela or Gelone. The Saracens fortified it, but the Genoese wrested it from them; however, their force was dwindled into a shadow when the Normans arrived. Earl Roger availed himself, on many occasions, of the trusty va-

lour of the Calatageronese, and rewarded them liberally with estates, which are still in their possession, and render the corporation one of the richest in Sicily. De Non says, this city, in which ancient coins are still found, must have been the "Hybla-hærea" of antiquity. Swinburne's Travels in the Two Sicilies, vol. iv. De Non's Travels in Africa, &c. p. 292.

CALATA-NISSETA, a town of Sicily, in the valley of Mazara; 27 miles E.N.E. of Girgenti.

CALATA-SCIBELTA, a mean town of Sicily, in the Val di Noto, built on the point of a rock, about three miles from Castro-Giovani.

CALATAIUD, a city of Spain, in Arragon, situated at the foot of a hill, at the conflux of the Xalon and X'loca, defended by a castle placed upon a rock. It contains 13 parishes, and 15 convents; 37 miles S.W. of Saragossa. N. lat. 41° 22'. W. long. 2° 9'.

CALATHE, in *Ancient Geography*, Galata, an island of the Mediterranean, on the coast of Africa. See GALATA.

CALATHIAN VIOLET. See GENTIANA *Pneumonanthe*.

CALATHIFORMIS, a term in *Botany*, denoting bowl-shaped, or hemispherical and concave.

CALATHIŌN, in *Ancient Geography*, a mountain of Peloponnesus, in Messenia, situate to the east of Gerania; on which was a temple dedicated to Calathea, with a grotto having a very narrow entrance.

CALATHUA, or CALATHUSA, a town of Arabia Deserta. Ptolemy.

CALATHUS, in *Antiquity*, a kind of hand-basket made of light wood, or rushes; used by the women sometimes to gather flowers, but chiefly after the example of Minerva to put their work in. The figure of the calathus, as represented on ancient monuments, is narrow at the bottom, and widening upwards like that of a top. Pliny compares it to that of a lily. Hist. Nat. lib. xxi. cap. 5. The calathus, or work-basket of Minerva, is no less celebrated among the poets than her distaff.

CALATHUS is also used to denote a drinking cup. Pliny seems likewise to use it for the CALYX of a flower. Hist. Nat. lib. xxv. cap. 7.

CALATHUSA, in *Geography*, a town of Pontus. Steph. Byz.

CALATIA, a town of Italy, situate in Campania Felix. In the war of Hannibal, it submitted after Capua; and in that of the allies, Sylla assigned it to the colony of Capua. Julius Cæsar established in it a colony of veterans.

CALATIS, or CALLATIS, a town of Lower Mysia, in Europe, where, according to Strabo, was a colony of the inhabitants of Heraclea. It is mentioned by Sallust, who places it on the western part of the Euxine Sea, between Iltropolis and Byzone. In the Periplus of Scylax, it is called Callabis.

CALATOR, in *Antiquity*, a crier, or officer appointed to publish something aloud, or call the people together. The word is formed from *καλλω*, *I call*. Such ministers the pontifics had, whom they used to send before them when they went to sacrifice on *ferie* or holidays to advertise the people to leave off work. The magistrates also used calatores, to call the people to the *COMITIA*, both *curiata* and *centuriata*. The officers in the army also had *calatores*; as had likewise many private families to invite their guests to entertainments.

CALATRAVA, in *Geography*, a town of Spain, in New Castile, and province of La Mancha, situate near the Morena mountains, on the river Guadiana; 50 miles S. E. of Toledo. N. lat. 39°. W. long. 4° 20'.

CALATRAVA, *Knights of*, in *History*, a military order instituted in 1153, by Sancho III, king of Castile, on the following occasion. When the Moors proposed to attack the little city Calatrava, the Templars, who held it, surrendered it up to the king, on a suspicion of their inability to defend it; upon this, Diego Velasquez, a Cistercian monk, but a man of quality, persuaded Raymond, abbot of Fitero, a monastery of Cistercians, to beg Calatrava of the king. He obtained it; and Raymond and Diego put themselves in it; being followed by a great number of people who joined them out of zeal, for the defence of Calatrava. The Moors abandoning the enterprise, many of those who came to the defence of the city, entered the order of the Cistercians; and that under a habit more fit for military than monastic exercise. Accordingly, they began to make excursions on the Moors; and this was the rise of the order of Calatrava.

The first grand master was Gracias; under whose government the order was approved by Alexander III. in 1164, and confirmed by Innocent III. in 1198. In 1489, Ferdinand and Isabella, with the consent of pope Innocent VIII, reunited the grand mastership of Calatrava to the Spanish crown: so that the kings of Spain are now become perpetual administrators, or grand masters of this order. The badge of the order is a cross fleury gules, which is worn at the stomach pendant to a ribbon.

Their rule and habit were originally those of the Cistercians, but their dress was a little shortened, on account of their exercises; and in process of time they were permitted a secular habit. The present habit of ceremony of the order is a mantle of white silk tied with a cordon and tassels, like those of the garter: and on the left arm, a cross fleury embroidered gules. Mariana observes, that this noble institution has gradually degenerated: the commanderies, which were formerly the reward of military merit, being frequently bestowed on minions and favourites. The order is said to have at present 34 commanderies, and eight priories, which produce an annual revenue of 120,000 ducats.

As the order of St. James is distinguished by the epithet of the rich, and that of Alcantara is styled the noble, this of Calatrava is entitled the gallant.

Aiphonfus IX. having recovered Alcantara from the Moors, in the year 1212, committed the custody and defence thereof, first to the knights of Calatrava; and two years afterwards to the knights of the Pear-tree, or of St. Julian, another military order instituted at Pereira, in 1156, under the protection of Ferdinand II. king of Leon, and ratified as a religious order under the title of St. Benedict, by pope Alexander III. in 1177, at the request of Gomez Fernandez, the first prior or grand master; upon which, they changed their name, and assumed the denomination of the knights of Alcantara. The king of Spain is sovereign of this order, which is in high estimation in that kingdom: the mantle worn by the knights of this order is of red silk, with a star of five points embroidered in silver on the left breast. The badge is a cross fleury of gold, enamelled vert, and worn at the stomach with a broad ribbon.

The religious order of Calatrava for ladies was instituted by Don Gonzalez Yannes in 1219. The badge of the order is the same as that worn by the knights of Calatrava, only embroidered on the front of the ladies' habits.

CALATUM, in *Ancient Geography*, a town of Britain, in the country of the Brigantes, according to Ptolemy. It is placed by Horsley at Appieby, and by Baxter at Kirkbythore in Westmoreland. But both the name, and the relative situation assigned to it by Ptolemy, might incline us to

place it in or near the Galaterium Nemus, now the forest of Galters in Yorkshire. In the itinerary of Antonine, it is denominated Galacum, and placed 47 miles from Bremetonaëis.

CALAU, in *Geography*, a town of Lefatia, which carries on a large trade in wool; 15 miles N.W. of Cotbus.

CALAU-CENE, a town of Egypt; 12 miles S. of Abu Girgé.

CALAVON, a river of France, which runs into the Durance, about 8 miles W. of Cavailon.

CALAURES, in *Ancient Geography*, a river of Asia Minor, in Phrygia, which ran, according to Livy, between Cibra and Mandropolis.

CALAURIA, one of the Greek islands in the Argolic bay, situate, according to Strabo, in the bay of Hermione, over against Troezen, a maritime city of Argia, from which it was distant four furlongs, being itself 30 in compass. It was famous for a temple consecrated to Neptune, and an asylum. Demosthenes was an exile in this island, and was buried in the temple, after having poisoned himself, because he would not surrender to the order of Antipater. In the time of Pausanias, the inhabitants and strangers paid great respect to the memory of this illustrious orator. This island was also denominated Irene, Anthedonia, Hyperia, and Possidonia; however, Pliny distinguishes Irene from Calauria. Ancient tradition reports, that Latona gave this island to Neptune in exchange for that of Delos, whence the proverb, "Pro Delio Calauria." A fort of litharge, denominated "Calauritis," was brought to the Greeks from this island, and applied by them to medical purposes.

CALAURIA, a town of Sicily, mentioned by Plutarch.

CALAUWE, in *Geography*, an inhabited island of the Indian Ocean, near Saleyer, (which see), and belonging to it. It is chiefly inhabited, as well as Bonarete in its vicinity, by Bruginese.

CALBARI, or CALABAR, the name of two rivers, as well as of a district in Africa, east of Cape Formosa. See CALABAR.

CALBARIA, a province of Africa, adjoining to Rio Real, or Royal River, called also *Calabar*; deriving its name from that river, which, though broad, is too shallow to be navigated by ships of burden. Near the coast, on the west bank of it, is a town called by the Dutch, Wyndorp, and by the negroes, from the great quantity of wine, Toke; two branches spread to the east and west from the river, whose course runs constantly north. In the west branch is a road, three or four leagues long, for trading vessels; and the town Calbaria is situated on the north side of this arm, and it is a place of great trade with the Dutch, enclosed with palisadoes, watered on the south by the river, and defended on the north by a boggy wood. On the south of this rivulet is an island of an oval figure, at a distance from the continent, from which it is divided only by a shallow canal, the land low and covered with woods. About 12 leagues westward of Calbaria, lies Belli, governed by one captain; and 20 leagues above the mouth is an arm of Rio Real, running east-north-east, and many other rivers are near the banks. The province of Krike, bordering on the west of Moco, lies about 20 miles from the coast; on the back of Rio Real, southward of Moco, towards the coast, is the province of Bani, whose chief town is Culeba, the principal of this country, which extends westward from the river Calbaria, as far as Sangma, and has ten under officers. The cannibal negroes, inhabitants of the eastern banks of Calbaria, circumcise the women that are marriageable, eat only the slain, and sell the prisoners of war at Calbaria. The canoes used by the Calbarian negroes are pointed at both ends,

ends, 60 feet long and six broad, with a fire-place in the centre for dressing victuals, and planks across for rowers. Near each rower hangs a quiver of arrows, in case of an attack: these nations living in continual war. The canoes carry 80 persons: the slaves only are exposed to the damps of the air, the masters being sheltered in the night by reed mats spread upon poles, and fixed in the form of tents. At the east end of Loitomba river, called by the Portuguese Rio do Santo Doniago, which is three leagues from the mouth of Rio Real, is a large town inhabited by negro traders, who traffic in slaves, which they bring from distant countries. Next to Loitomba is Old Calabria, or Calborg river. The interjacent country is unprovided with water: the coast from Rio Real to ancient Calborg is 24 leagues in extent, north-north-east. See CALABAR.

CALBE, a town of Germany, in the circle of Lower Saxony, and duchy of Magdeburg, on the Saal; 20 miles S. of Magdeburg.

CALBE, or KALBE, a town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg; 8 miles from Gardeleben.

CALBERGA, a town of Hindoostan, in the country of Hydrabad, formerly a large city, and the stated residence of the kings of the Deccan; but now less populous, since it ceased to be the seat of royalty; 83 miles W. of Hydrabad, and 110 E. of Villapour. N. lat.  $17^{\circ} 25'$ . E. long.  $77^{\circ} 25'$ .

CALBIS, a town of Egypt, 3 miles N. of Rosetta.

CALBIS, in *Ancient Geography*, a river of Asia Minor, in the Doride, according to Ptolemy, and in Caria, according to Pomponius Mela. Pliny calls it Indus, and says that it springs from the mountains of Cbyra, and that it received in its course 60 rivers, and more than 100 torrents. Its mouth was in the north-west part of the gulf of Glaucus, W. of the promontory of Pedalium.

CALBONGAS, in *Geography*, the inhabitants of a country in Africa, which lies near the source of the river Rio do Rey, or the King's River, and borders on Biafra, at a distance from the coast. They are described as a wicked, deceitful, and filthy people, who are naked, except that they cover their private parts, and who brand their bodies with various colours, and figures traced on their foreheads. They are represented as destitute of natural affection, as well as sincerity, inasmuch that parents sell their children, husbands their wives, and brothers their sisters. In this country, those criminals are declared innocent, who make an incision and suck the blood out of their arms. See RIO DO REY.

CALBUCO, a town of South America, in the kingdom of Chili, and military government of Chiloe, on the coast of the South Pacific Ocean, inhabited by Spaniards, Mellizos, and Indians, with one parish church, a convent of Franciscans, another of the Fathers of Mercy, and a college of Jesuits. In this town resides a Corregidor, who is nominated by the President of Chili. It is situate 180 miles S. of Valdivia. S. lat.  $42^{\circ} 40'$ . W. long.  $73^{\circ} 37'$ .

CALBUM, in *Entomology*, a species of CURCULIO found in Europe, and described by Scopoli. This insect is varied with copper and black, and is particularly distinguished by having an incurved line on the wing-cases at the base, next to the external angle.

C. ALBUM, is also the specific name of a well known species of the European PAPILIONES, called in England the comma butterfly. This insect has the wings angulated, fulvous spotted with black: posterior wings beneath marked with a white curved line resembling the letter C, whence its name.

CALCADA, in *Geography*. See CALZADA.

CALCAGIUM, in *Middle Age Writers*, a tax or contribution paid by the neighbouring inhabitants towards the making or repairing of a common causeway.

CALCAGNINI, CRISTO, in *Biography*, a learned Italian, was probably the illegitimate son of the apostle Paul Prothonotary at Ferrara, and born in 1579. Having borne arms, after the completion of his studies, under the emperor Maximilian, and pope Julius II, he was employed in various embassies, and honourable commissions. On his return from Hungary, whither he accompanied cardinal Hippolito d'Este in 1518, he was made professor of belles-lettres in the university of Ferrara, which office he held till his death in 1541. He was distinguished by his promotion of the Academy, "Degli Elevati," in that city; and by the liberal donation of his valuable library, and collection of mathematical instruments to the Franciscans of Ferrara, on condition of their preserving them for public use. He wrote much both in prose and verse. His prose works were collected by Frobenius at Basil in 1544. Among those that relate to antiquities are, the 3 books, "Quaestiones in Epistolarum," and his treatises, "De Rebus Aegyptiacis," "De Re Nautica," and "De Talorum, Tesserarum, et Calculorum Ludis." Others relate to philosophy, morals, and politics. Before Copernicus published his system, he wrote a book to prove, "Quod Caelum stat, Terra moveatur." Erasmus highly applauds this author; though others condemn his style as laboured and overwhelmed with quotations. His poetical style was more elevated. Three books of his Latin poems were published at Venice in 1553, with those of Signa and Ariosto. Tiraboschi.

CALCANEUM, or CALCANEUS, in *Anatomy*, the same as calx, os calcis, calcar, or the heel bone.

It lies under the astragalus, to which it is articulated by ginglinus; behind it is a large protuberance, which makes the heel, and into which the tendo achillis is inserted.

CALCANTHUM, in *Mineralogy*. See VITRIOL.

CALCAR, in *Anatomy*, the same with CALCANEUM.

CALCAR, or KELKAR, JOHN, in *Biography*, a painter of history and portrait, was born at Calcar in 1499, and he excelled so much as a disciple of Titian, that several of his designs and paintings have been ascribed even by Goltzius to this eminent master. Sandrart affirms, that he also imitated the works of Raphael so exactly, that some of his productions have been esteemed to be Raphael's own. His "Nativity," which was a much admired composition, and which exhibited the light proceeding from the infant, was in the possession of Rubens; and after his death purchased by Sandrart, and sold to the emperor Ferdinand, by whom it was very highly prized. Calcar designed all the heads for the works of Vasari, and the anatomical figures in those of Vesalius. He died in 1546. Pilkington's Dictionary by Fuseli.

CALCAR, in *Botany*, a conic projection from some part of a flower resembling a cock's spur. Tropaeolum, the nasturtium, or Indian cress of the gardeners, is an instance of a calcarate or spurred calyx; delphinium, or larkspur, of a calcarate corolla; and orchis of a calcarate nectary.

CALCAR, in *Conchology*, a species of TURBO, the shell of which is somewhat imperforated and depressed; whorls scabrous: spines above compressed and hollow. Linn. &c. This is the Calcar of Rumphius and Argenville. Chemnitz gives several distinct varieties of this shell from India, the South Seas, and the Mediterranean.

CALCAR, a species of NAUTILUS, found in the Adriatic Sea, and described by Plancus among his microscopic shells

shell. It is distinguished specifically by the aperture being of a linear form, and having the joints of the whorls elevated. This is a minute shell of an opaque white colour, and has been found on the shore of Sheppy island.

**CALCAR**, in *Entomology*, a species of **CURCULIO**, the colour of which is black: thighs with a single tooth: antennæ and feet testaceous. Fabricius. This is a small insect, and inhabits Germany.

**CALCAR**, in *Geography*, a town of Germany, in the circle of Westphalia, and duchy of Cleves, about 5 miles from the Rhine. It contains two convents and two churches, one for Roman Catholics, and one for Protestants, and all other sects are tolerated; 5 miles S. E. of Cleves. N. lat.  $51^{\circ} 47'$ . E. long.  $5^{\circ} 41'$ .

**CALCAR**, in *Glass-making*, is the name of a small oven, or reverberatory furnace, in which the first calcination of sand and salt of pot-ashes is made, for the turning them into what they call FRIT.

**CALCARATA**, in *Entomology*, a species of **BUPRESTIS** that inhabits Germany. The wing-cases are bidentated, and somewhat striated: flanks of the middle pair of legs toothed: body coppery. Schall. Herbit gives this the name of *Buprestis æruginosa*.

Obs. This is of a small size, with four striæ on the wing-cases, and a single black blue line on the thorax.

**CALCARATUS**, an European species of **CERAMBYX**, of a violaceous-black colour, with rufous thighs, the posterior ones dentated. Scop. Ann. Hist.

**CALCARATUS**, a species of **CIMEX**, of a fuscous colour, with the abdomen sanguineous above, and the posterior thighs six-toothed. Fabricius. Inhabits Europe.

**CALCAREOUS**, something that partakes of the nature and qualities of **CALX**, or lime.

**CALCAREOUS cements**. See **CEMENTS calcareous**.

**CALCAREOUS earth**. See **LIME**.

**CALCAREOUS earth**, in *Agriculture*, a sort of earth in which calcareous matter abounds. Earths of this kind have the following properties in common:—They become friable when burnt in the fire, and afterwards fall into a fine white powder, which is promoted, if after being burnt, they be thrown into water, by which a strong heat arises, and a partial solution takes place. They cannot be melted by themselves into glass in a close fire; but when burnt, they augment the causticity of pot-ashes, and they are dissolved in acids with effervescence. This earth is found pure, in the form of a powder, in some places, and called by chemists *lac luna*. It is of a white colour, and is met with in some moory situations, at the bottoms of lakes, and in the fissures of free-stone quarries, in some of the midland districts. In some countries, as Sweden, the colour varies to red and yellow. This is supposed to be lime-stone washed from the rocks, and pulverized by the motion of the water. It is, however, found in quantities too small to admit of any applications to agricultural purposes. It is frequently met with in a friable or compact state in the form of chalk. The white chalk is the purest, yet it contains, according to lord Dundonald, a little siliceous, and about two *per cent.* of argillaceous earth. There is more fixed air in chalk than in any other calcareous earth, generally about forty *per cent.* It is also seen in a hard or indurated state in lime-stone; and united with the sulphuric or vitriolic acid, in the form of gypsum, selenite, or what is generally termed plaster of Paris. It is likewise combined with clay in the form of marl. See **LIME-STONE**, **GYPNUM**, and **MARL**.

It is maintained by lord Dundonald, in his treatise on the "Connection of Agriculture with Chemistry," "that it constitutes not only the surface, or soil, but likewise the under

stratum of many countries to a very great depth; and that under this general name of calcareous matter are included chalk, marble, lime-stone, coral, shells, &c. The three first mentioned are frequently mixed with iron, and with different proportions of the simple earths, but are considered as calcareous when the proportion of that earth predominates. This material is capable of absorbing, and of retaining moisture, though in a considerably less degree than clay. By the action of the fire it becomes lime, and returns again to the state of chalk or calcareous matter, by exposure to the air or atmosphere." And it is stated by Dr. Fordyce, in his "Elements of Agriculture and Vegetation," that when combined with gas or fixed air it is termed *nil*, but that when free from it, it is *caustic*; that calcareous earth, when mixed with clay, gives a greater friability to it than sand does; that it unites with sulphur, forming *hepar sulphuris*; and with animal and vegetable substances, forming a soap. It prevents putrefaction. It attracts acids more strongly than volatile alkali or magnesia. If it be exposed to the air, it attracts from it the fixable air, and reverts to the state it was in before it was burnt. Mild calcareous earth forwards putrefaction. It is soluble in water, and when reduced to the state of a powder, and applied to a soil, it is apt to be washed through it. Caustic volatile alkali will not precipitate calcareous earth, if dissolved in an acid; but fixed vegetable alkali will. This distinguishes it from the other earths. Vitriolic acid will not dissolve it, so as to form a clear solution; and if this acid be added to a solution of it in any other, it will make a precipitation.

It is suggested by the author of *Phytologia*, that one great use of calcareous earth consists "in its uniting with the carbon of the soil in its pure or caustic state, or with that of the vegetable or animal recements, during some part of the process of putrefaction; and thus rendering it soluble in water, by forming an *hepar carbonis*. somewhat like an *hepar sulphuris* produced by lime and sulphur, by which process, it is supposed, the carbon is rendered capable of being absorbed by the lacteal vessels of vegetable roots. The black liquor which flows from dunghills is, it is thought, probably a fluid of this kind; but the author speaks hypothetically, as he has not verified it by experiment; and the carbon may be simply supported in the water by mucilage, like the coffee drunk at our tea tables; or may be converted into an *hepar carbonis* by its union with the fixed alkali of the decaying vegetable matter, or by the volatile alkali which accompanies some stages of putrefaction." And a second mode by which it is believed to assist the purpose of vegetation "is by its union with carbonic acid, and rendering it thus soluble in water in its fluid state, instead of its being expanded into a gas; and thus a great quantity of carbon may be drunk up by vegetable absorbent vessels. In the practice newly invented of watering lands by driving streams over them for many weeks together, it has been said, that water from springs is generally more effectual, in promoting vegetation, than that from rivers; which, though it may in part be owing to the azotic gas, or nitrogen, contained in some springs, as those of Buxton and of Bath, according to the analysis of Dr. Priestley, and of Dr. Pearson, yet it is supposed to be principally owing to the calcareous earth, which abounds in all springs, which pass over marly soils, or through calcareous strata; and which does not exist in rivers, as the salts washed into rivers from the soil all seem to decompose each other, except the marine salt, and some magnesian salt which are carried down into the ocean. The calcareous earth likewise, which is washed into rivers, enters into new combinations, as into gypsum, or perhaps into siliceous sand, and subsides." And a still farther mode in which

which calcareous earth may promote vegetation is, it is conceived, "by its containing phosphorus, which by its union with it may be converted into an *hepar*, and thus rendered soluble in water without its becoming an acid, by the addition of oxygen. Phosphorus, it is supposed, is probably as necessary an ingredient in vegetable as in animal bodies; which appears by the phosphoric light visible on rotten wood during some stages of putrefaction; in which, it is supposed, the phosphorus is set at liberty from the calcareous earth, or from the fixed alkali, or from the carbon of the decomposing wood, and acquires oxygen from the atmosphere; and both warmth and light are emitted during their union. But phosphorus may, perhaps, more frequently exist in the form of phosphoric acid in vegetables, and may thus be readily united with their calcareous earth, and may be separated from its acid, by the carbon of the vegetable during calcination, and also during putrefaction, which may be considered as a slow combustion. The existence of a solution of phosphoric acid and calcareous earth in the vessels of animals is proved by the annual renovation of the shells of crab-fish, and by the fabrication of the egg-shells in female birds; and is occasionally secreted, where it cements the wounds made on snail shells; or where it joins the present year's growth of a snail shell to the part where a membranous cover had been attached for the protection of the animal during its state of hibernation; and lastly, it is further evident from the growth of the bones of quadrupeds, and from the deposition of callus to join them when they have been broken." It is therefore contended, that "many arguments may be adduced to show, that calcareous earth, either alone, or in some of the states of combination, mentioned above, may contribute to the nourishment and support of both animals and vegetables. First, because calcareous earth constitutes a considerable part of them, and must of course be either received from without, or formed by them, or both; and secondly, because from the analogy of all organic life, whatever has composed a part of a vegetable or animal, may again, after its chemical solution, become a part of another vegetable or animal; such, it is observed, is the transmigration of matter. See LIME and MANURE.

**CALCAREOUS manures**, are all such as abound in calcareous matter. Chalk, pounded lime-stone, lime, calcareous marl, shells, and various other substances of a similar kind are of this description. They are found particularly beneficial on all the stiffer sorts of soil when made use of in due proportions.

**CALCAREOUS soils**, such as are constituted of this sort of material in a large proportion. From their dry and friable nature, soils of this nature are in general well suited to the growth of most sorts of grain, as well as some plants of the artificial grass kind, such as clover, saint-foin, &c. See SOIL.

**CALCAREOUS spar**. See LIME-STONE.

**CALCARIA**, in *Ancient Geography*, thought by some to be *Calissane*, a city of Gallia Narbonnensis, upon the Aurelian way, west of Aqæ Sextie.

**CALCARIA**, a town of Ancient Britain, 9 miles from Eburacum and 20 miles from Cambodunum, according to the Itinerary of Antonine, placed by some at Tadcaster, by others at Newton-kyme.

**CALCAYLARES**, in *Geography*, a jurisdiction of South America, in the country of Peru, situate between Cusco and the sea, and commencing 4 leagues west of the city of Cusco. The air in this jurisdiction excels that of all the other provinces, and accordingly it produces an exuberance of all kinds of grain and fruits. In the hottest parts called "Lares" were formerly very large plantations of sugar canes, but for want of hands to cultivate them,

they are now so diminished, that instead of 60 or 80,000 arobas which they annually produced, they are now reduced to less than 30; but the sugar is of such an excellent kind, that without any other preparation than that of the country, it is equal both in colour and hardness to the refined sugar of Europe. This diminution of its sugar has greatly lessened the principal branch of its commerce.

**CALCEARIUM**, or **CALCIARIUM**, in *Antiquity*, a donative, or largess bestowed on the Roman soldiers for buying shoes. In the monasteries, *calcearium* denoted the daily service of cleaning the shoes of the religious.

**CALCEDONIANS**, a denomination given by Copt writers to the MELCHITES, on account of their adherence to the council of Calcedon. See СОИТИ, МОНОФИЗИТЫ, &c.

**CALCEDONIUS** is a term used by the jewellers for a defect in some precious stones, when, in turning them, they find white spots, or stains, like those of the *calcedony*, or chalcodony. This defect is frequent in granates and rubies. The lapidaries usually remedy it by hollowing the bottom of the stone.

**CALCEDONY**. See CHALCEDONY.

**CALCENA**, in *Geography*, a town of Spain in Arragon; 14 miles S. of Tarragona.

**CALCENA**, a term used by some medicinal writers to denote a morbid tartareous humour in the body.

**CALCEOLARIA**, in *Botany*, (from *Calceolus*, a little slipper.) Slipperwort. Linn. Mant. 171. Reich. 32. Schreb. 39. Willd. 51. Gært. 374. La Marcq. Illus. 36. Juss. p. 120. Vent. vol. ii. p. 297. Class and order, *diandria monogynia*. Nat. Ord. *Corydalis*; Linn.? *Scrophulariæ*, Juss. *Rhinanthoides*, Vent.

Gen. ch. *Cal.* one-leaved, with four, equal, spreading divisions; permanent. *Cor.* monopetalous, bilabiate, inverted: upper lip very small, contractedly globular; lower lip large, inflated, concave, slipper-shaped, gaping before. *Stam.* filaments two, very short, within the upper lip; anthers incumbent, two-lobed. *Pist.* germ superior, roundish; style very short; stigma rather obtuse. *Peric.* capsule somewhat conic, two-furrowed, two-celled, two-valved. *Seeds* numerous, egg-shaped.

Ess. ch. *Calyx* with four equal divisions. *Corolla* ringent; lower lip inflated, concave. *Capsule* two celled.

Sp. 1. *C. pinnata*. Linn. Mant. 171. Aët. Stock. 1770. t. 8. Feuil. Peruv. 3. 12. t. 7. Curt. Mag. t. 41. Gært. tab. 62. f. 4. Lam. Illust. Pl. 15. f. 2. "Leaves winged." Annual. *Stem* erect, two feet high, round, branched, pubescent, slightly swelling at the knots. *Leaves* opposite, without stipules, brittle, pubescent, soft, spreading, longer than the internodes, unequally winged, of a delicate green colour; leaflets nearly opposite or alternate, sometimes, as represented in Curtis's figure, so united as to make the leaf only pinnatifid; sometimes, as in a specimen now before us, from a plant raised by R. A. Salisbury, eq. completely separate, bluntly serrated, narrowed at their base, and frequently decurrent on the common petiole. *Flowers* yellow, axillary and termin'ing. *Capsule* thin, swelled at the base, and diminishing to a pyramidal top, deeply furrowed; mature valves bifid at the tip; partition contrary to the valves. *Seeds* small, pale, marked with about six longitudinal, crenulated furrows. A native of Peru: introduced into England in 1773 by sir Joseph Banks, Bart. 2. *C. integrifolia*, Willd. Smith icon. ined. t. p. 3. *C. falvæ folio*, Feuil. Peru. 3. t. 7. *C. ferrata*, Lam. "Leaves lanceolate, wrinkled, serrated; flowers in terminal panicles." Smith. *Root* fibrous. *Stem* branched, round, two or three feet high. *Leaves* opposite, sessile, bright green above, pubescent and pale beneath.

neath. *Flowers* yellow, peduncled. A native of Peru and Chili. — *C. ovata*, Smith icon. ined. 1. t. 3. *C. dichotoma*. La Marek. *C. integrifolia*, Linn. Supp.? “Stem branched; leaves egg-shaped, scolloped.” Smith. Pubescent in all its parts. *Root* annual, fibrous. *Stem* slender, round, dichotomous, seven or eight inches high. *Leaves* small, opposite; upper ones sessile, acuminate; lower ones petioled and rather obtuse. *Flowers* small, yellow, on simple peduncles, axillary and terminating. Found in Peru by Dombey. It flowered in the royal garden at Paris in 1781. 4. *C. peruviana*, Linn. Sup. Mutis. Amer. v. 1. t. 3. Smith icon. med. 1. t. 4. “Leaves perfoliate, arrow-shaped, downy on both sides.” Smith. A handsome plant, very different in its appearance from all the other species. *Stem* about a foot and half high, round, pubescent, branched. *Leaves* opposite, triangular, or almost arrow-shaped, irregularly toothed, woolly and white beneath. *Flowers* yellow, large, in bundles at the tops of the branches, on simple or branched peduncles. *Calyx* large. *Bracts* resembling the leaves, but egg-shaped and sessile, not perfoliate. Found in New Granada by Mutis, and in Peru by Joseph Jussieu. 5. *C. crinita*, Willd. La Marek. “Leaves sessile, oblong, acute, scolloped; flowers in cymes terminating the stems and branches.” *Stem* about two feet high, downy. *Leaves* opposite, almost embracing the stem, resembling those of *Rhinanthus crista galli*, green above, downy and pale beneath. Found in Peru by Joseph Jussieu. 6. *C. r. smaragdina*, Willd. La Marek. “Leaves linear, very entire, reflexed at the margin, downy beneath; stem smooth.” *Stem* about a foot and half high, round, more or less branched. *Leaves* opposite, smooth and viscid above, especially when young. *Flowers* yellow; in terminating cymes on smooth, viscid peduncles. Found in Peru by Joseph Jussieu. 7. *C. plantaginea*, Willd. Smith icon. ined. 1. t. 2. La Marek. “Scapes with few flowers; leaves rhomb-shaped, ferrated.” *Leaves* only from the root, veined, smooth, fringed with jointed hairs, narrowed at their base into petioles, about two inches long. *Scapes* two or three, as long again as the leaves, with two yellow flowers. Found by Commerfon at the Straits of Magellan. 8. *C. nana*, Willd. Smith icon. ined. 1. t. 1. *C. uniflora*, La Marek. Pl. 15. f. 3. “Scapes one-flowered; leaves egg-shaped, very entire.” Smith. *Leaves* all radical, scarcely an inch long, smooth, narrowed into a petiole at their base. *Scapes* as long again as the leaves. *Flowers* large, yellow, spotted with red; upper lip very short, vaulted; lower lip elongated, pendulous, and swelling; edge membranous, folded back, angular. Found at the Straits of Magellan by Commerfon. 9. *C. Fothergillii*, Willd. Anton. Kew. 1. t. 1. La Marek. Pl. 15. f. 1. copied from Hortus Kewensis. “Leaves spatulate, very entire; peduncles in the form of scapes, one flowered.” Biennial. *Stems* scarcely an inch high, subdivided near the root. *Leaves* scarcely an inch long, opposite, many-nerved, obtuse, hairy above, narrowed into petioles. *Peduncles* solitary or in pairs, twice the length of the leaves. Divisions of the *calyx* acute, bent in at the end, hairy without. Upper lip of the *corolla* yellow, erect, vaulted, a little shorter than the calyx; lower lip descending, four times as long as the upper, dilated in front, inflated, pale yellow underneath, above red at the sides, in front yellow with red spots, near the palate yellow; aperture large, open; filaments inserted into the sides of the corolla at the base of the aperture; anthers roundish, large; style thick, the length of the stamens; stigma thickened, flat. A native of Falkland islands, introduced by Dr. Fothergill in 1777.

*Propagation and Culture*.—The first and the last are the only ones hitherto cultivated in England. The first may

be easily raised from seeds sown on a gentle hot-bed in the spring: the seedlings, when of a proper size, may be transplanted into the borders of the flower garden, where they will flower, ripen, and scatter their seeds; but being a delicate plant, it appears to most advantage in a tan-herb, in which, as it will grow from cuttings, it may be had in flower all the year, by planting them in succession. Curtis.

*CALCEOLARIA* (Læf.). See *VIOLA Calceolaria*, and *Oppositifolia*.

*CALCEOLUS*, a genus formed by Tournefort corresponding with cypripedium of Linnaeus. Tournefort's name is that of nearly all the old authors.

*CALCEOLUS Lapponeum* (Schæff. Lap.). See *ACONITUM Lycodonum*.

*CALCEOLUS Philippensis* (Petiv.). See *KEMPFERIA Galanga*.

*CALCHAS*, in *Falculus History*, a famous diviner, who followed the Greek army to Troy. He is said to have predicted, that the siege of Troy would last ten years, and that the fleet, which was detained in the port of Aulis by contrary winds, would not set sail till Agamemnon's daughter had been sacrificed to Diana. After the capture of Troy, he is said to have retired to Colophon, and to have died there with grief, because he could not divine what another man of his own profession, called Mephus, discovered; thus fulfilling a prediction mentioned by Sophocles, according to which, Calchas was to die as soon as he should meet with his master in the art of divining. If Suidas is to be credited, one of the Sibyls was Calchas's daughter; her name was Lampasa; he calls her the Colophonian; and ascribes to her some oracles in verse. Gen. Dict.

*CALCHOPHONOS lapis*, among the ancients, a name given to a stone of a black colour and considerable hardness, which when cut into thin plates, and struck against by any other hard body, gave a sound like that of brass; it seems to have been one of the hard black marbles.

*CALCIANA*, in *Geography*, a town of Naples, in the province of Basilicata; 16 miles S.E. of Acerenza.

*CALCIFRAGA*, in *Botany*, (Lobel.) See *CRITHMUM maritimum*.

*CALCIFRAGUS*, *stone-breaking*, an appellation given by some to the *scelopendrium*; by others to pimpernel, on account of their lithontriptic quality.

*CALCIMURITE*, in *Mineralogy*, a species of earth or stone, in which magnesia is mixed with a notable proportion of calcareous earth and some iron. The colour is blue or olive-green, of the consistency of clay: the latter contains no argil, but merely calcareous earth and magnesia tinged with iron: the former contains a larger proportion of calcareous earth. Both are found near Thionville: the former is used by potters. Kirwan's El. Min. vol. i. p. 146.

*CALCINARA*, in *Geography*, a town of Italy, in the duchy of Tuscany; 12 miles E. of Pisa.

*CALCINATION*. In general, a substance is said to be calcined when it has been exposed to heat of a sufficient intensity to drive off every thing volatile, but short of that requisite for its fusion. A calx, therefore, was understood by the ancient chemists, to be a pulverulent substance no longer combustible or capable of further alteration by fire than that of vitrification.

As most of the metals were found to be reducible to such a form by a continuance of a melting heat, the term *calces of metals* was long particularly appropriated to them, and is still partially retained, though it has been chiefly supplanted by the more characteristic appellation of *oxyd*, which expresses the peculiar change that occurs in calcining metallic bodies by the absorption of oxygen. *Calcination*, therefore, expresses

presses the *mode* (or at least one mode), by which, in metals, this change is produced, and oxidation the *circumstance* of change. It is, however, obviously improper to consider the term calcination as synonymous with oxidation, even in speaking of metals, since the true original sense of the former term implies the agency of fire; whereas, oxidation may be produced as well by the action of acids, as by heat and air. Of the calces, or calcined bodies, in which the change is totally independent of the absorption of oxygen, *calcined flints*, *calcined plaster of Paris*, and *calcined hartshorn*, are common examples.

*CALCINATION of gold and silver by electricity*, was effected by Mr. Canton, who, by the heat of electrical explosions, produced numberless beautiful globules of transparent glass, and also others tinged with all the varieties of colour from those metals. He made it also probable that the black dust discharged from the brass chain, and other pieces of metal in such experiments, is the calx or glass of the metal reduced to smaller particles than the laws of optics require to produce colour. Hist. of Elect. edit. 1775, vol. ii. p. 292. See *ELECTRICAL Battery*.

*CALCINATO*, in *Geography*, a town of Italy, in the Bergamasco; seven miles S. E. of Bergamo.

*CALCINATO*, a town of Italy, belonging to the state of Venice, in the Bressan, where the Imperial troops were defeated by the duke of Vendôme, in 1706; eight miles S. E. of Brescia. N. lat. 45° 25'. E. long. 9° 55'.

*CALCINELLA*, in *Conchology*, the name given by Adanson to the *Mastra piperata* of Poirct. See *PIPERATA*.

*CALCINELLE of Adanson*, the *Gmelinian Venus DEALBATA*.

*CALCIS Os*, in *Anatomy*. See *Os calcis*.

*CALCITRAPA*, in *Botany*. (Hal. Helvet. p. 193, 194.) See *CENTAURIA foliifolia* and *calcitrapa*.

*CALCITRAPA lutea*. (Vahl. act. 1718, p. 212.) See *CENTAUREA eriophora*.

*CALCITRAPOIDES*, (Inn. Paris, 1719, 9.) See *CENTAUREA Isuardi*. The calcitrapæ form a section in the genus *centaurea* of Linnæus, which consists of such species as have the spines of the calyx compound. Jussieu has formed a distinct genus for them, in which he has been followed by Gærtner, Ventenat and Bosc. The name is a hybrid production from the Latin calx, the sole of the foot, and the Greek *τροπῶ*, which signifies to turn, and was suggested by the resemblance of the calyx, in these plants, to a machine used in war, consisting of sharp spikes, which turn on an axle when touched with the foot. It is called by the French *chauffe-trape*. See *CENTAUREA*.

*CALCUA*, or *NALCUA*, in *Ancient Geography*, a town of the *Atrebatii*, in Ancient Britain, generally agreed to have been the same with the *Calleva*, in the Itinerary of Antonine, placed 22 miles from *Venta Belgarum*, or Winchester. Antiquaries are much divided about the precise situation of this place. See *ATREBATII*.

*CALCULARII*, in *Antiquity*, a sort of jugglers who practised slight of hand. Their art consisted in laying several calculi, or counters on the table, then covering them with cups, and shifting and changing them with dexterity, like what is practised by our jugglers.

*CALCULARY of a pear*, a congeries of little stony knots dispersed through the whole parenchyma of the fruit.

The calculary is no vital or essential part of the fruit; the several knots whereof it consists being only so many concretions or precipitations out of the sap, as we see in urines, wines, and other liquors.

*CALCULATION*, the act of computing several sums, by adding, subtracting, multiplying, or dividing. See

*ARITHMETIC*: An error in calculation is never protected, or secured, by any sentence, decree, &c. In listing accounts, there is always understood, *salvo errore calculi*.

The word *calculus* is used in this sense, in allusion to the practice of the ancients, who used *calculi*, or little stones, in making computations, in taking suffrages, and in keeping accounts, &c. as we now use counters, figures, &c.

A merchant or trader is said to have been mistaken in his calculation or accounts, when he has happened to take false measures, and has not succeeded in his undertakings so well as he expected.

*CALCULATION* is more particularly used to signify the computations in astronomy and geometry, for making tables of logarithms, ephemerides, finding the times of eclipses, &c.

*CALCULATION of clock and watch work*. See *CLOCK* and *WATCH-WORK*.

*CALCULATION, in music*. D'Alembert, and many other theorists, and eminent mathematicians, are of opinion, that the *calculation* of ratios is of no use in practical music; supposing that a good ear and strong hand on instruments, where the tone depends on the performer, are a musician's best guides for true intonation. In the prelim. disc. to his *Elem. de Mus.* 2d edit. the great mathematician cautions theoretical musicians against the admission of mathematical or metaphysical principles in music. On this subject, he says: "it would be absurd to expect what is called *demonstration*: it is an achievement of no small importance, to have reduced the principal facts to a system consistent with itself and firmly connected with its parts; to have deduced them from one single experiment (the harmonies of a single string or sounding body), and to have established, on that foundation, the most common and essential rules of the art. In digesting and compressing M. Rameau's principles, I had no desire to multiply his calculations: I rather wished to suppress them as much as possible; so much was it to be feared that the generality of readers would be led into a belief, that all this arithmetic was necessary to form a practical musician. Calculation may, indeed, facilitate the intelligence of certain points in theory, such as the relation between the tones of the gammut and temperament; but the calculation necessary for treating these two points is so simple and trifling, that it merits no display. Let us not, therefore, imitate those musicians who believe themselves geometers, or those geometers who fancy themselves musicians, and, in their writings, heap figures on figures, imagining, perhaps, that this display is necessary to the art. The ambition of giving to their productions a scientific appearance, imposes only on the ignorant, and has no other effect than to render their treatises more obscure, and less instructive."

*CALCULATOR*, a machine contrived and constructed by Mr. Ferguson, in the shape of an orrery, for exhibiting the motions of the earth and moon, and resolving a variety of astronomical problems. See an account of the construction, figure, and use of this machine, in Ferguson's *Astronomy*, 4to. p. 283, &c.

*CALCULATORES*, in *Antiquity*, accountants who reckoned their sums by *calculi*. There were several servants under this denomination in great families. Children also at school were taught to practise the same. In the ancient canons we find a sort of diviners, or enchanters, censured under the denomination of *calculatores*.

*CALCULUS*, primarily denotes a little stone, pebble, or counter, anciently used in making computations, taking of suffrages, playing at tables, and the like. Hence the phrase *ponere calculos*, to denote a series of reasons, and a multitude of others alluding to the use of these calculi in accounts.

Computists were by the lawyers called *calculones*, when they were either slaves, or newly freed men; those of a better condition were denominated *calculatores*, or *numerarii*: ordinarily there was one of these masters in each family of distinction; the title of whose office was a *calculus*, or a *rationalibus*.

The Roman judges anciently gave their opinions by *calculi*, which were white for absolution, and black for condemnation. Hence *calculus albus*, in ancient writers, denotes a favourable vote, either in behalf of a person to be absolved and acquitted of a charge, or elected to some dignity or post; as *calculus niger* did the contrary. This usage is said to have been borrowed from the Thracians, who marked their happy or prosperous days by white, and their unhappy by black pebbles, put each night into an urn. Hence also the phrases, *signare, notare aliquid albo, nigrove lapillo seu calculo*.

Besides the diversity of colour, there were some also which had figures or characters painted or engraven on them; as those which were in use in taking the suffrages both in the senate and at assemblies of the people. The letters marked upon these *calculi* were U. R. for *uti rogas*, and A. for *antiquo*; the first of which expressed an approbation of the law, the latter a rejection of it. Afterwards the judges, who sat in capital causes used *calculi* marked with the letter A. for *absolvo*, C. for *condemno*, and N. L. for *non liquet*; signifying a more full information was required.

We may also mention another species of *calculi* used at the public games, whereby the rank and order in which the athletes were to fight were determined. If for instance they were twenty, then twenty of these pieces were cast into an urn; each ten were marked with numbers from one to ten, and the law was, that each of those who drew, should fight him who had drawn the same number. These were called *calculi athletici*.

CALCULUS is also used in *Ancient Grammatic Writers* for a kind of weight equal to two grains of cicer. Some make it equivalent to the *siliqua*, which is equal to three grains of barley. Two *calculi* made the *ceratium*.

CALCULUS also denotes a certain method of performing mathematical investigations and resolutions. Thus, we say the antecedental calculus, the arithmetical or numeral calculus, the algebraical calculus, the calculus of derivations, the differential calculus, the exponential calculus, the fluxional calculus, the integral calculus, the literal or symbolical calculus, &c. See the following articles.

CALCULUS, *Antecedental*. This is a geometrical method of reasoning without any consideration of motion or velocity, applicable to every purpose, to which fluxions have been or can be applied. It was invented by James Glenie, esq. A. M. and fellow of the Royal Societies of London and Edinburgh, as early as 1774, but not published till the year 1793, when it was printed in London for G. G. I. and I. Robinsons, Paternoster-row. As he derived it from an examination of the antecedents of ratios, having given consequents and a given standard of comparison in the various degrees of augmentation and diminution, which they undergo by composition and decomposition, he denominated it the Antecedental Calculus. It is certainly founded on principles admitted into the very first elements of geometry, and repeatedly made use of by Euclid himself. The inventor of this calculus does not in imitation of modern mathematicians talk of the powers of magnitudes and quantities, but considers every expression in it as truly and strictly geometrical, or rather as universally metrical in a geometrical form. For although the general formulæ in his universal comparison, from which it is derived in an easy, simple, direct, and con-

cise manner, are established on the same principles with those of Euclid's elements of geometry, and are deduced in a demonstrative way from an application of some of the truths contained in those elements to the doctrine of ratios or proportion, they are, strictly speaking, generally metrical, and extend not only to geometry, but also to algebra and arithmetic, when the standard of comparison is supposed to become 1 or arithmetical unity. The transitions from them in their geometrical forms to their algebraic and numerical ones, are as Mr. Glenie has observed, so natural, so scientific, and so beautiful, that they cannot fail to furnish the mind with the highest pleasure and satisfaction, in pointing out, as it were, at one general view the connexion between these different sciences, and unfolding the reasons of their various operations, from the same indisputable and mathematical principles. He has not, like other mathematicians, in considering ratio confined himself to any particular modification of it; but he has regarded it as a magnitude possessing all the measurable affections of any other magnitude, viz. addition, subtraction, multiplication, division, and ratio or proportion, or, as admitting, like other magnitudes, of augmentation or diminution, of increase or decrease. He is the first person, that we know of, who has roundly and expressly considered ratio or proportion as an affection of ratio, which it most unquestionably is. And by applying the elements of geometry to this consideration of it, he has extended the geometrical analysis indefinitely farther than any one before him, either among the ancients or moderns, as far as we are able to discover, has carried it. That he formed the design of applying geometry to ratios under this conception of them, as magnitudes *sui generis*, capable of all the possible degrees of increase and decrease, though they know no diversity of dimension in respect of kind, being homogeneous, and differing not in kind, but only in degree, and actually made such an application of it when he could not have been above eighteen or twenty years of age, is evident from his own performances. For in a short introduction to a paper read before the Royal Society of London, the 6th of March, 1777, and published in their transactions, which is entitled, "The general Mathematical Laws, that regulate and extend Proportion universally; or a Method of comparing Magnitudes of any kind together, in all the possible Degrees of Increase and Decrease," he makes use of the following words:

"The doctrine of proportion laid down by *Euclid* and the application of it given by him in his elements, form the basis of almost all the geometrical reasoning made use of by mathematicians both ancient and modern. But the reasoning of geometers with regard to proportional magnitudes have seldom been carried beyond the triplicate ratio, which is the proportion that similar solids have to one another, when referred to their homologous linear dimensions. This boundary however comprehends but a very limited proportion of universal comparison, and almost vanishes into nothing when referred to that endless variety of relations, which must necessarily take place between geometrical magnitudes in the infinite possible degrees of increase and decrease. The first of these takes in but a very contracted field of geometrical comparison; whereas the last extends it indefinitely. Within the narrow compass of the first, the ancient geometers performed wonders; and their labours have been pushed still farther by the ingenuity and indefatigable industry of the moderns. But no author, that I have been able to meet with, gives the least hint or information with regard to any general method of expressing geometrically, when any two magnitudes of the same kind are given, what degree of augmentation or

diminution any one of these magnitudes must undergo, in order to have to the other any multiply or submultiply *ratio* of these magnitudes in their given state; or any such ratio of them, as is denoted by fractions or surds; or (to speak still more generally) a *ratio*, which has to the *ratio* of the first-mentioned of these magnitudes, to the other the *ratio* of any two magnitudes whatever, of the same but of any kind. Neither have I been able to find, that any other author has shewn geometrically, in a general way, when any number of *ratios* are to be compounded or decomposed with a given *ratio*, how much either of the magnitudes in the given *ratio* is to be augmented or diminished, in order to have to the other a *ratio*, which is equal to the given *ratio*, compounded or decomposed with the other *ratios*. To investigate all these geometrically, and to fix general laws in relation to them, is the object of this paper; which, as it treats of a subject as new as it is general, I flatter myself will not prove unacceptable to this learned society. It would be altogether superfluous for me to mention the great advantages that must necessarily accrue to mathematics in general, from an accurate investigation of this subject, since its influence extends more or less to every branch of abstract science, when any *data* can be ascertained for reasoning from. I shall in a subsequent paper take an opportunity of shewing, how from the theorems afterwards delivered in this, a method of reasoning with finite magnitudes geometrically may be derived without any consideration of motion or velocity, applicable to every purpose, to which fluxions have been applied." He then defines magnitude to be "that which admits of increase or decrease," and quantity to be "the degree of magnitude," observing, that "by magnitude he means, beside extension, every thing which admits of more or less, or what can be increased or diminished, such as *ratios*, velocities, powers, &c.

In a short performance of his, printed in Latin, in 1776, entitled "Leges Metaphysicæ, seu Principia Mathematica, quæ Omnia fere ad Magnitudinum Rationes, Rationumque Relationes spectantia universaliter gubernant et indefinite proferunt," he gives the same metaphysical definitions of magnitude and quantity, with a declaration of what he means by magnitude, *viz.*

"Magnitudo est id, quod augeri vel diminui potest."

"Quantitas est gradus magnitudinis."

"Per magnitudinem, præter extensionem, omnia, quæ augeri vel diminui possunt, sicut rationes, velocitates, vires, &c. intelligo."

And in his Universal Comparison itself he says, "When I speak of magnitude, I mean to be understood as taking it in its general, abstracted, unlimited, and metaphysical acceptation, *viz.* to be whatever admits of more or less, of increase or decrease; and by quantity I mean the degree of magnitude." And to prevent any misconception of his meaning or intention, in regard to his mode of expressing magnitudes geometrically, and connecting them together by means of the customary signs, he makes use of the following words:—"When I mention the sum of magnitudes, or speak of them as additive or subtractive, I only mean that they are to be taken with or from other magnitudes of the same kind. The signs plus and minus are only intended to denote such aggregates and differences, or to connect magnitudes together in these relations, and by no means to convey any numerical ideas in the following theorems or formulæ, or to imply in themselves any sort of mystery, or even meaning, independent of the magnitudes thus connected. By

$A \cdot \frac{C-D}{D}$ ,  $A \cdot \frac{A-B}{B}$ ,  $A \cdot \frac{A-B}{B}^2$  &c. I mean a fourth pro-

portional to D, C-D, and A; a fourth proportional to B, A-B, and A; a fourth proportional to B, A-B, and  $A \cdot \frac{A-B}{B}$ , &c. respectively. I am obliged to have re-

course to such expressions in the formulæ, which ought not on any account to be considered as algebraic, as it is impossible to express them by means of geometrical schemes or figures in such a way, as to be sufficiently or clearly understood."

As both the differential and fluxionary calculi are immediately, and with the greatest facility derivable from this calculus when the expressions in it are supposed to become numerical, or the standard of comparison to be 1, or arithmetical unity, and in forms too altogether unexceptionable, and as it is itself chiefly derived from the 1st and 5th formulæ in theorem 3 of the universal comparison, it is perhaps necessary to prove the truth of these formulæ, by means of what is delivered in the paper first herein above-mentioned, that was read before the Royal Society of London in 1777, in which, among other things, it is demonstrated geometrically, that if *n* be any whole or integral number whatsoever, and A and B be any two homogeneous magnitudes,

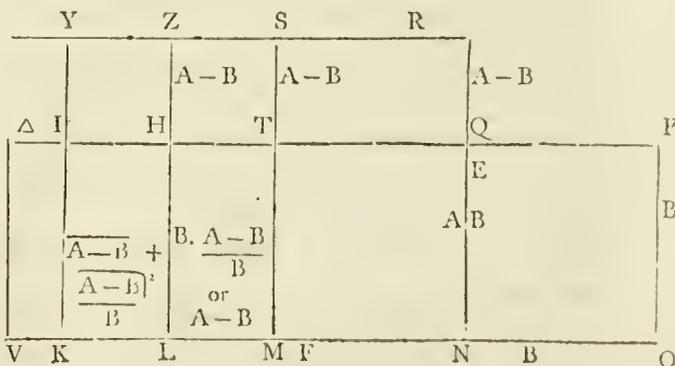

$$A + \frac{n-1}{1} \cdot A \cdot \frac{A-B}{B} + \frac{n-1}{1} \cdot \frac{n-2}{2} \cdot A \cdot \frac{A-B}{B}^2 + \&c. \text{ to } A \cdot \frac{A-B}{B}^{n-1}$$

has to B, such a multiply *ratio* of A to B, as is expressed by the number *n*. Now if in this geometrical expression for A, we substitute its equal  $B + \frac{A-B}{B}$

we get the following expression:  $B + \frac{n}{1} \cdot \frac{A-B}{B} + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{A-B}{B}^2 + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \cdot \frac{A-B}{B}^3 + \&c. \text{ to } \frac{A-B}{B}^{n-1}$  hav-

ing also to B such a multiply *ratio* of A to B as is expressed by the number *n*. This expression may also be easily derived geometrically by means of Euclid's elements, in the manner pursued by Mr. Glenie in that paper. For let MN, NO, and OP be each equal to, or represent B, and let NR represent A. Let OP, NR be drawn perpendicularly to VO, or otherwise, if in the same angle; and let the rectangles or parallelograms MR, NP be completed. Let LM be a fourth proportional to OP, MN, and NR-OP, and let the rectangle or parallelogram LQ be completed.

Then (14. E. 6.) LT is equal to TR, and since MT is equal to TQ by construction, LM is equal to QR, or A-B, and LN to A or B +  $\frac{A-B}{B}$ . And since by (23. E. 6.) MR has to NP the *ratio* compounded of the *ratios*

of MN to NO and NR to OP, the magnitude LN, which has to B the ratio compounded of the ratio of A to B, and the ratio of equality B to B is expressed by  $B + \frac{A-B}{B}$ . In like manner if PI, RY be parallel to VO and KY to NR, and KL be a fourth proportional to OP, QR, and LN, or to B, A-B, and  $B + \frac{A-B}{B}$ , it will be equal to  $\frac{A-B}{B} + \frac{A-B}{B}$  and KN will be equal to  $B + \frac{2}{1} \cdot \frac{A-B}{B}$ .

$$\frac{A-B}{B} + \frac{2}{1} \cdot \frac{2-1}{2} \cdot \frac{A-B}{B}$$

Again, if VK be a fourth proportional to OP, QR, and KN, or to B, A-B, and  $B + \frac{2}{1} \cdot \frac{A-B}{B} + \frac{2}{1} \cdot \frac{2-1}{2} \cdot \frac{A-B}{B}$ , it will be equal to  $A-B + 2 \cdot \frac{A-B}{B} + \frac{A-B}{B^2}$  and VN will of course be equal to  $B + 3 \cdot \frac{A-B}{B} + 3 \cdot \frac{A-B}{B^2} + \frac{A-B}{B^2}$  or to  $B + \frac{3}{1} \cdot \frac{A-B}{B} + \frac{3}{1} \cdot \frac{3-1}{2} \cdot \frac{A-B}{B} + \frac{3}{1} \cdot \frac{3-1}{2} \cdot \frac{3-2}{3} \cdot \frac{A-B}{B^2}$ . Wherefore the

magnitude of the same kind with A and B, which has to B the triplicate ratio of A to B, or, which comes to the same thing, the ratio, that arises by compounding the triplicate ratio of A to B, with the ratio of equality B to B, is geometrically expressed by  $B + \frac{3}{1} \cdot \frac{A-B}{B} + \frac{3}{1} \cdot \frac{3-1}{2} \cdot \frac{A-B}{B^2}$ .

And universally by the same geometrical reasoning it is found that  $B + \frac{n}{1} \cdot \frac{A-B}{B} + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{A-B^2}{B^2} + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \cdot \frac{A-B^3}{B^3} + \dots$

&c. to  $\frac{A-B^n}{B^{n-1}}$  has to B such a multiple ratio of A to B, or of  $B + \frac{A-B}{B}$  to B, as is expressed by the number n. And as A-B may be equal to any magnitude C of the same kind with A and B the expression  $B + \frac{n}{1} \cdot C + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{C^2}{B} + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \cdot \frac{C^3}{B^2} + \dots$

is a magnitude of the same kind with C and B, that has to B such a multiple ratio of B + C to B as is expressed by the number n. The foregoing expressions are obtained geometrically when A is greater than B. But if A be less than B, and be represented by EN or FN, we have FM equal to B-A, and by proceeding in an exactly similar manner we get the geometrical expression  $B - \frac{n}{1} \cdot \frac{B-A}{B} + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{B-A^2}{B^2} - \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \cdot \frac{B-A^3}{B^3} + \dots$

to  $\pm \frac{B-A^n}{B^{n-1}}$  for the magnitude of the same kind with A and B, that has to B such a multiple ratio of A to B, or of  $B - \frac{B-A}{B}$  to B, as is expressed by the number n. And, as  $B - \frac{B-A}{B}$  may be equal to any magnitude C, of the same kind with A and B,  $B - \frac{n}{1} \cdot C + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{C^2}{B} - \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \cdot \frac{C^3}{B^2} + \dots$

with A and B,  $B - \frac{n}{1} \cdot C + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{C^2}{B} - \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \cdot \frac{C^3}{B^2} + \dots$  to  $\pm \frac{C^n}{B^{n-1}}$  has to B such a multiple ratio of B-C to B as is expressed by the number n.

That  $B + \frac{nr}{q} \cdot \frac{A-B}{B} + \frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{A-B^2}{B^2} + \dots$  has to B such a multiple ratio of  $B + \frac{r}{q} \cdot \frac{A-B}{B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{A-B^2}{B^2} + \dots$  to B as is expressed by the number n is thus shewn. Let B + D be equal to  $B + \frac{r}{q} \cdot \frac{A-B}{B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{A-B^2}{B^2} + \dots$  (r and q having to each other the ratio of any two homogeneous magnitudes whatever). Then  $B + \frac{n}{1} \cdot D + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{D^2}{B} + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \cdot \frac{D^3}{B^2} + \dots$

to B (by what is above demonstrated) such a multiple ratio of B + D to B, as is expressed by the number n. Now if the term, in which A-B is found in the value of D be multiplied by  $\frac{n}{1}$  the co-efficient of D we get  $\frac{nr}{q} \cdot \frac{A-B}{B}$  for the second term of the expression, (in terms of n, r, q, and A-B). And if the term, in which  $\frac{A-B^2}{B^2}$  is found in the value of D, be multiplied by  $\frac{n}{1}$  the co-efficient of D, and the term, in which  $\frac{A-B^3}{B^3}$  is found in the value of  $\frac{D^2}{B^2}$ , be multiplied by  $\frac{n}{1} \cdot \frac{n-1}{2}$  the co-efficient of  $\frac{D^2}{B^2}$ , these taken together will give us  $\frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{A-B^3}{B^3}$  for the third term. And by thus proceeding we get  $B + \frac{n}{1} \cdot D + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{D^2}{B} + \frac{n}{1} \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \cdot \frac{D^3}{B^2} + \dots$  equal to  $B + \frac{nr}{q} \cdot \frac{A-B}{B} + \frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{A-B^2}{B^2} + \dots$

whatever be the ratio of r to q. Precisely in the same manner it is proved that the ratio  $B - \frac{nr}{q} \cdot \frac{B-A}{B} + \frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{B-A^2}{B^2} - \dots$  is a multiple by n of the ratio  $B - \frac{r}{q} \cdot \frac{B-A}{B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{B-A^2}{B^2} - \dots$ .

This then being premised, it can be generally, and at the same time very briefly proved, that  $B + \frac{r}{q} \cdot \frac{A-B}{B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{A-B^2}{B^2} + \dots$

is a multiple by n of the ratio  $B + \frac{r}{q} \cdot \frac{A-B}{B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{A-B^2}{B^2} + \dots$

and at the same time very briefly proved, that  $B - \frac{r}{q} \cdot \frac{B-A}{B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{B-A^2}{B^2} - \dots$

$$\frac{r-q}{2q} \cdot \frac{A-B}{B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{r-2q}{3q} \cdot \frac{A-B}{B^2} + \&c.$$

has to B such a ratio, as has to the ratio of B + A - B to B, or of A to B, the ratio of r to q, be the ratio of r to q what it may, by taking any multiples whatsoever of these ratios and the same multiples of r and q. For the sake of perspicuity let these magnitudes, and their multiples, stand in the following manner:

The magnitudes.	Their multiples.
1st. . . . . r	Of the 1st. . . . . nr
2d. . . . . q	Of the 2d. . . . . mq
3d. $B + \frac{r}{q} \cdot \overline{A-B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{A-B}{B} + \&c. : B$	3d. $B + \frac{nr}{q} \cdot \overline{A-B} + \frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{A-B}{B} + \&c. : B$
4th. $B + \frac{m}{1} \cdot \overline{A-B} + \frac{m}{1} \cdot \frac{m-1}{2} \cdot \frac{A-B}{B} + \&c. : B$	

Now it is evident, that if nr be equal to mq, by substituting mq for nr, the ratio  $B + \frac{nr}{q} \cdot \overline{A-B} + \frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{A-B}{B} + \&c. : B$  is equal to, or becomes the ratio  $B + \frac{m}{1} \cdot \overline{A-B} + \frac{m}{1} \cdot \frac{m-1}{2} \cdot \frac{A-B}{B} + \&c. . . .$  to  $\frac{A-B}{B} : B$ .

It is equally evident, that if nr be greater than mq, the antecedent  $B + \frac{nr}{q} \cdot \overline{A-B} + \frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{A-B}{B} + \&c.$  is greater than  $B + \frac{m}{1} \cdot \overline{A-B} + \frac{m}{1} \cdot \frac{m-1}{2} \cdot \frac{A-B}{B} + \&c.$  to  $\frac{A-B}{B} : B$  since . . .

$$\left. \begin{array}{l} \frac{nr}{q}, \frac{nr}{q}, \frac{nr-q}{2q}, \&c. \\ \frac{mq}{q}, \frac{mq}{q}, \frac{mq-q}{2q}, \&c. \\ \text{or than } \frac{m}{1}, \frac{m}{1}, \frac{m-1}{2}, \&c. \end{array} \right\}$$

and the ratio  $B + \frac{nr}{q} \cdot \overline{A-B} + \frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{A-B}{B} + \&c. : B$  is, of course, a greater ratio of greater inequality than the ratio  $B + \frac{m}{1} \cdot \overline{A-B} + \frac{m}{1} \cdot \frac{m-1}{2} \cdot \frac{A-B}{B} + \&c. : B$  is. And it is no less evident that, if nr be less than mq, the antecedent  $B + \frac{nr}{q} \cdot \overline{A-B} + \frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{A-B}{B} + \&c.$  is less than the antecedent  $B + \frac{m}{1} \cdot \overline{A-B} + \frac{m}{1} \cdot \frac{m-1}{2} \cdot \frac{A-B}{B} + \&c.$

$$\left. \begin{array}{l} \frac{m-1}{2} \cdot \frac{A-B}{B} + \&c. \text{ since } \dots \frac{nr}{q}, \frac{nr}{q}, \frac{nr-q}{2q}, \&c. \\ \text{are then respectively less than } \dots \frac{mq}{q}, \frac{mq}{q}, \frac{mq-q}{2q}, \&c. \\ \text{or than } \dots \frac{m}{1}, \frac{m}{1}, \frac{m-1}{2}, \&c. \end{array} \right\}$$

and the ratio  $B + \frac{nr}{q} \cdot \overline{A-B} + \frac{nr}{q} \cdot \frac{nr-q}{2q} \cdot \frac{A-B}{B} + \&c. : B$  is then, of course, a less ratio of greater inequality than the ratio  $B + \frac{m}{1} \cdot \overline{A-B} + \frac{m}{1} \cdot \frac{m-1}{2} \cdot \frac{A-B}{B} + \&c. : B$  is.

Here then are four magnitudes, and any equimultiples being taken of the 1st and 3d, and also any equimultiples being taken of the 2d and 4th, it is proved that, if the multiple of the 1st be equal to the multiple of the 2d, the multiple of the 3d is also equal to the multiple of the 4th; if greater, greater; and if less, less. Wherefore (5. Def. E. 5.) the magnitudes themselves are proportional, or the ratio B +  $\overline{A-B} : B$  as r : q whatever be the ratio of r to q.

Having thus fully explained the doctrine of proportion, on which this calculus is grounded, we will briefly illustrate Mr. Glenie's derivation of it from the same, and then shew, with how much ease and facility both the differential and fluxionary calculi may be derived from the same source, and in a manner too altogether unexceptionable.

If for R and Q we substitute r and q in the 1st and 5th formulæ, in the 3d theorem of his Universal Comparison, they become respectively  $A + \frac{r-q}{q} \cdot A \cdot \frac{A-B}{B} + \frac{r-q}{q} \cdot \frac{r-2q}{2q} \cdot A \cdot \frac{A-B}{B^2} + \frac{r-q}{q} \cdot \frac{r-2q}{2q} \cdot \frac{r-3q}{3q} \cdot A \cdot \frac{A-B}{B^3} + \&c.$  and  $B + \frac{r}{q} \cdot \overline{A-B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{A-B}{B} + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{r-2q}{3q} \cdot \frac{A-B}{B^2} + \&c.$  the last of which is immediately derived from the first, by substituting for A in it, where it stands unconnected with B by the sign minus, B +  $\overline{A-B}$ , which is equal to A, and is the very magnitude, which we have just proved to have to B a ratio, which has to the ratio of B +  $\overline{A-B} : B$  or of A to B the ratio of r : q, even when r has to q the ratio of any two homogeneous magnitudes whatsoever.

Mr. Glenie, however, takes the 1st of these two formulæ, and supposes A + N to be in the first place substituted in it every where for A. By this substitution he gets  $A + N + \frac{A^2 - B^2 + N^2}{B}$  for the magnitude, which has to B the duplicate ratio of A + N to B, exceeding the magnitude  $A + A \cdot \frac{A-B}{B}$ , which has to B the duplicate ratio of A to B, by  $\frac{2AN + N^2}{B}$ . In like manner he gets the ex-

# CALCULUS.

excess of the magnitude, which has to B the triplicate ratio of A + N to B above the magnitude, which has to B the triplicate ratio of A to B, equal to the geometrical expression  $\frac{3A^2N + 3AN^2 + N^3}{B^3}$ . And he thus finds, in general,

that the excess of the magnitude, which has to B such a ratio, as has to the ratio of A + N to B the ratio of r to q, (when r has to q any given ratio whatever,) above the magnitude, which has to B such a ratio, as has to the ratio of A to B, the same ratio of r to q is geometrically expressed by  $\frac{r}{q} \cdot A^{\frac{r-q}{q}} \cdot N + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot A^{\frac{r-2q}{q}} \cdot N^2 +$

$$\frac{\frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{r-2q}{3q} \cdot A^{\frac{r-3q}{q}} \cdot N^3 + \&c.}{B^{\frac{r-1}{q}}}$$

Precisely in the same manner he makes it appear, that the excess of the magnitude, which has to B such a ratio, as has to the ratio of A to B the ratio of r to q, above the magnitude, which has to B such a ratio, as has to the ratio of A - N to B the ratio of r to q is geometrically expressed by

$$\frac{\frac{r}{q} \cdot A^{\frac{r-q}{q}} \cdot N - \frac{r}{q} \cdot \frac{r-q}{2q} \cdot A^{\frac{r-2q}{q}} \cdot N^2 + \frac{r}{q} \cdot \frac{r-q}{2q} \cdot \frac{r-2q}{3q} \cdot A^{\frac{r-3q}{q}} \cdot N^3 - + - \&c.}{B^{\frac{r-q}{q}}}$$

$$\frac{\frac{r-q}{2q} \cdot \frac{r-2q}{3q} \cdot A^{\frac{r-3q}{q}} \cdot N^3 - + - \&c.}{B^{\frac{r-q}{q}}}$$

But if A + N and A - N stand to A in relations nearer to that of equality than by any given or assigned magnitudes of the same kind, each of these general expressions becomes

$$\frac{\frac{r}{q} \cdot A^{\frac{r-q}{q}} \cdot N}{B^{\frac{r-q}{q}}}$$

Thus he calls the antecedent of the

magnitude, which has to B such a ratio, as has to the ratio of A to B the ratio of r to q.

Now if N, the antecedent of A, be denoted by  $\overset{r}{A}$  or  $\overset{q}{A}$  (for the notation does not at all alter the case) the antecedent

$$\frac{\frac{r}{q} \cdot A^{\frac{r-q}{q}} \cdot N}{B^{\frac{r-q}{q}}}$$

becomes  $\frac{\frac{r}{q} \cdot A^{\frac{r-q}{q}} \cdot \overset{r}{A}}{B^{\frac{r-q}{q}}}$

or  $\frac{r}{q} \cdot \frac{A^{\frac{r-q}{q}}}{B^{\frac{r-q}{q}}} \cdot \overset{r}{A}$  and has to  $\overset{r}{A}$  or  $\overset{q}{A}$  the ratio of

$$\frac{r}{q} \cdot \frac{A^{\frac{r-q}{q}}}{B^{\frac{r-q}{q}}} : B.$$

If  $q = 1$  and  $r = 2, 3, 4, \&c.$  it gives

$$\frac{2A \overset{2}{A}}{B}, \frac{3A^2 \overset{3}{A}}{B^2}, \frac{4A^3 \overset{4}{A}}{B^3}, \frac{5A^4 \overset{5}{A}}{B^4}, \&c. \text{ respectively. If}$$

$$r = 1 \text{ and } q = 2, 3, 4, \&c. \text{ it gives } \frac{A^{-\frac{1}{2}} \overset{2}{A}}{2B^{-\frac{1}{2}}}, \frac{A^{-\frac{2}{3}} \overset{3}{A}}{3B^{-\frac{2}{3}}},$$

$$\frac{A^{-\frac{3}{4}} \overset{4}{A}}{B^{-\frac{3}{4}}}, \&c. \text{ respectively. And if } q = 1 \text{ and } r = \sqrt{2},$$

$$\sqrt[4]{3}, \sqrt[4]{4}, \sqrt[4]{5}, \&c. \text{ it gives } \sqrt{2} \cdot \frac{A^{\sqrt{2}-1} \overset{2}{A}}{B^{\sqrt{2}-1}}$$

$$\frac{\sqrt[4]{3} \cdot A^{\sqrt[4]{3}-1} \overset{3}{A}}{B^{\sqrt[4]{3}-1}}, \frac{\sqrt[4]{4} \cdot A^{\sqrt[4]{4}-1} \overset{4}{A}}{B^{\sqrt[4]{4}-1}}, \&c. \text{ respec-}$$

tively, and so on.

Mr. Glenie then makes use of the last of these two formulæ, which is the 5th of theorem 3d, to come at the same conclusions. By it, when A stands to B in a relation nearer to that of equality than by any given or assigned magnitude of the same kind, the excess of the magnitude, (which has to B such a ratio as has to the ratio of A to B the ratio of

r to q), above B is generally expressed by  $\frac{r}{q} \cdot \overset{r}{A - B}$  or

by  $\frac{r}{q} \cdot \overset{a}{A}$  or by  $\frac{r}{q} \cdot \overset{q}{A}$ , since in this relation of (A to B),

A - B may be denoted by  $\overset{a}{A}$  or  $\overset{q}{A}$ ; which expression is always as the measure or quantity of the ratio, that the said formula has to B, whatever be the relation of A to B. For

in the simple, duplicate, triplicate ratios, &c. it gives  $\overset{2}{A}$ ,  $2\overset{2}{A}$ ,  $3\overset{2}{A}$ , &c. and in the subduplicate, subtriplicate ratios, &c.  $\frac{\overset{2}{A}}{2}$ ,  $\frac{\overset{2}{A}}{3}$ , &c. or  $\frac{\overset{a}{A}}{2}$ ,  $\frac{\overset{a}{A}}{3}$ , &c. But if the ratio of  $\frac{r}{q}$ .

$\overset{r}{A}$  to  $\overset{q}{A}$  or  $\frac{r}{q} \cdot \overset{a}{A}$  to  $\overset{q}{A}$ , which denotes the relation be-

tween the quantities of the ratios, that the magnitude expressed by this formula and A have respectively to B, be compounded with the ratio of these magnitudes themselves, when A has to B any ratio whatever, or with that of

$$\frac{\overset{r}{A}}{B^{\frac{r-q}{q}}} \text{ to } A \text{ we get the ratio } \frac{r}{q} \cdot \frac{\overset{r}{A}}{B^{\frac{r-q}{q}}} \overset{r}{A} \text{ to } A \cdot \overset{q}{A}, \text{ which}$$

is equal to the ratio of  $\frac{r}{q} \cdot \frac{A^{\frac{r-q}{q}}}{B^{\frac{r-q}{q}}}$  to B the ratio of the

antecedents of  $\frac{\overset{r}{A}}{B^{\frac{r-q}{q}}}$  and A as found above.

It is certainly worthy of remark, that the antecedent of

any such magnitude as  $\frac{\overset{r}{A}}{B^{\frac{r-q}{q}}}$  is a fourth proportional to B

the standard of comparison, the magnitude itself, and the antecedent of the magnitude of the ratio, which it has to the standard B. Thus a fourth proportional to B, A, and

$\frac{B \cdot \overset{r}{A}}{A}$  is  $\overset{r}{A}$  or  $\overset{q}{A}$  the antecedent of A; a fourth pro-

portional

# CALCULUS.

portional to B,  $\frac{A^r}{B}$ , and  $\frac{2B \cdot \overset{a}{A}}{A}$  is  $\frac{2A \cdot \overset{a}{A}}{B}$ ; and a fourth

proportional to B,  $\frac{\overset{r}{A}}{B^{\frac{r-q}{q}}}$ , and  $\frac{r}{q} \cdot \frac{B \cdot \overset{a}{A}}{A}$  is  $\frac{r}{q}$ .

$\frac{\overset{r-q}{A} \cdot \overset{a}{A}}{B^{\frac{r-q}{q}}}$ . Also  $1 : A^2 :: \frac{2A}{A} : 2A \cdot \overset{a}{A}$ ; and  $1 :$

$$A^3 :: \frac{3A}{A} : 3A \cdot \overset{a}{A}.$$

By means of the first formula in theorem 1 of his Universal Comparison, which expresses the magnitude, that has to B such a ratio, as arises by compounding any number of ratios C to D, E to F, &c. with the ratio of A to B, he

determines the antecedental of  $\frac{A \cdot C}{D}$  to be  $\frac{AC + CA^a}{D}$  or

$\frac{AC + CA^a}{D}$ , and that of  $\frac{A \cdot C \cdot E}{D \cdot F}$  to be  $\frac{AC \cdot E}{DF} +$

$\frac{AE \cdot C}{DF} + \frac{CE \cdot A}{DF}$  or  $\frac{ACE + AEC + CEA^a}{DF}$ , and

so on, supposing the consequents D, F, &c. of the ratios to be invariable. And it is observable, that the antecedental of  $\frac{AC}{D}$  is equal to a fourth proportional to B, the mag-

nitude  $\frac{AC}{D}$  itself, and the antecedental of the magnitude of the ratio of A to B, together with a fourth proportional

to D, the magnitude  $\frac{AC}{D}$  and the antecedental of the

magnitude of the ratio of C to D; that the antecedental of  $\frac{ACE}{DF}$  is equal to a fourth proportional to B,  $\frac{ACE}{DF}$  and

the antecedental of the magnitude of the ratio of A to B, together with a fourth proportional to D,  $\frac{ACE}{DF}$ , and the

antecedental of the magnitude of the ratio of C to D, together with a fourth proportional to F,  $\frac{ACE}{DF}$ , and the

antecedental of the magnitude of the ratio of E to F; and so on.

He makes use of the first formula in Theorem 2, Universal Comparison, which expresses the magnitude, that has to B such a ratio, as arises by decomposing any number of ratios C to D, E to F, &c. with the ratio of A to B to determine the antecedental of  $\frac{AD}{C}$ ,  $\frac{ADF}{CE}$ , and so on for any number of ratios.

And here it is also observable, that the antecedental of  $\frac{AD}{C}$  or  $\frac{CDA^a - ADC^a}{C^2}$  or  $\frac{CDA^a - ADC^a}{C^2}$  is equal to the

excess of a fourth proportional to B,  $\frac{AD}{C}$ , and the antecedental of the magnitude of the ratio of A to B above a fourth proportional to D,  $\frac{AD}{C}$ , and the

antecedental of the magnitude of the ratio of C to D; and so on.

And it is easily shewn, from the principles he has laid

down, that the antecedental of  $\frac{\overset{r}{A}}{B^{\frac{r-q}{q}}}$  is  $\frac{\overset{r}{A}}{B^{\frac{r-q}{q}}} \times$

$\left(\frac{VM + MV^a}{B^2}\right)$  or  $\frac{\overset{r}{A}}{B^{\frac{r-q}{q}}} \times \left(\frac{VM + MV^a}{B}\right)$  or that the antece-

dental of  $\frac{A^v}{B^{v-1}}$  is  $\frac{A^v}{B^{v-1}} \times \left(\frac{M + M^a}{B}\right)$ . For, if M denote

the magnitude of the ratio A : B to the standard of comparison B, vM will be the magnitude of the ratio of  $\frac{A^v}{B^{v-1}}$  to B. But  $\frac{A^v}{B^{v-1}} : B ::$  the antecedental of  $\frac{A^v}{B^{v-1}} :$

the antecedental of vM ( $vM + M^a$ ). Wherefore the ante-

cedental of  $\frac{A^v}{B^{v-1}}$  is  $\frac{A^v}{B^{v-1}} \times \left(\frac{vM + M^a}{B}\right)$  or  $\frac{A^v}{B^{v-1}} \times$

$\left(\frac{vM + M^a}{B}\right)$ .

The antecedents and their antecedentials will therefore stand thus, B being the standard of comparison.

Antecedent. Antecedental.

Fluent.	Fluxion.
$\frac{r}{x^q}$	$\frac{r-q}{x^q} \cdot x^q$
$xy$	$xy + y^2$
$\frac{xy}{b}$	$\frac{xy + y^2}{b}$
$xyz$	$xyz + xzy + yzx$
$\frac{x}{y}$	$\frac{yx - xy}{y^2}$
$a + x + y$	$a + y$
$x^m$	$x^m \times (m + mv)$ putting $m$ for the magnitude of the ratio of $x$ to 1
&c. &c. &c.	&c. &c. &c.

Thus it is manifest that the fluxionary and differential calculi are legitimately derivable from one and the same source, viz. general arithmetical proportion, and are in fact a branch of it, differing only from each other in words and in the methods of notation. Sir Isaac Newton has not determined

the fluxion of  $x^{\frac{r}{q}}$  when  $r$  has to  $q$  any ratio whatsoever. Neither has Mr. Leibnitz determined the differential of  $x^{\frac{r}{q}}$  when  $r$  and  $q$  are not integers but have to each other the ratio of any two homogeneous magnitudes whatsoever. But they are obtained immediately by this method of deriving these

calculi, and of course the fluxion and differential of  $x^{\frac{r}{q}}$  in every possible relation, that  $r$  can stand into  $q$ , whether it be that of two integers, two surds, two lines, two surfaces, or two solids, &c.

CALCULUS, *Arithmetical*, or *Numeral*, is the method of performing arithmetical computations by numbers. See ARITHMETIC.

CALCULUS, *Algebraical*. See CALCULUS *literals* and ALGEBRA.

CALCULUS of *derivations*, denotes a general method of considering quantities, deriving themselves one from the other, particularly developed and illustrated by M. L. F. A. Arbogast, of the National Institute of France, and professor of mathematics at Strasburgh, in a treatise entitled "Du Calcul des Dérivations," &c. 4to. Strasburgh, 1800. "To form an idea (says the author) of these derivations, it is to be observed that quantities or functions, which are deduced the one from the other, by a uniform process of operations, are derived quantities; such are the successive differentials. This idea may be extended, by considering quantities that are derived one from another, not in themselves, but solely in the operations which collect and bind them together; the quantities themselves being any whatsoever, arbitrary and independent. Thus, on the supposition that, out of many different letters, the first enters solely into a function, while the two next enter into the derivative of that function; that the first three, by the same law, enter into the derivative of the derivative, and so on; we shall have the derivatives in the extended sense which I have given to them. In my theory, the quantities designated by different letters are not derived one from another; and the derivatives which I consider are less the derivatives of quantities than of operations; as algebra is less a calculus of quantities than of operations, arithmetical or geometrical, to be performed on quantities. Derivation is the operation by which a derivative is deduced from that which precedes it, or from the function. The method

of derivations, in general, consists in seizing the law that connects together the parcels of any quantities whatever; and in making use of this law as a method of calculation for passing from derivative to derivative."

In order to form the algorithm of derivations, the author has introduced new signs. Accordingly, as Leibnitz has appropriated the symbol  $d$  to denote the operation for obtaining the differential of a quantity, M. Arbogast employs the symbol  $D$  in the process for obtaining the derivative of a quantity: thus,  $D(x^m) = m x^{m-1}$ ,  $D(a^x) = a^x$ ; and the development of a function,  $F(x+x)$ , is therefore thus expressed:

$$F_x + \frac{DF_x}{1} x + \frac{D^2 F_x}{1.2} x^2 + \&c.$$

which, according to the notation in the differential calculus, is

$$F_x + \frac{d^1 F_x}{dx} x + \frac{d^2 F_x}{1.2.2.d^2 x} x^2 + \&c.$$

To avoid writing the factors, 1. 2. 3. &c. in the denominators,

let  $D^n$  generally represent  $\frac{D^n}{1.2.3...n}$ ; then,

$F(x+x) = F_x + DF_x x + D^2 F_x x^2 + D^3 F_x x^3 + \&c.$  This is the known form for the development of the function of a binomial; and the object of the primary articles of the present treatise is to find a form for the development of the function of a polynomial; viz.  $\alpha + \beta x + \gamma x^2 + \delta x^3 + \&c.$  The method of obtaining it may be thus briefly explained:—When  $\alpha$  is variable, and  $D\alpha = \beta$ , write  $D.\phi\alpha$  for the derivative: when  $\alpha$  is variable, and  $Dx = 1$ , write  $D^2\phi x$  for the derivative: therefore,

$$\phi F(x + \beta x) = \phi(F_x + D.F_x x + D^2.F_x x^2 + \&c.):$$

$$\text{but } \phi F(x + \beta x) = \phi F_x + D.\phi F_x x + D^2.\phi F_x x^2 + \&c.$$

put  $F_x = a$ ,  $DF_x = D.a$ , &c. and  $\phi(a + D.a.x + D^2.a.x^2 + \&c.) = \phi a + D.\phi a.x + D^2.\phi a.x^2 + \&c.$

Now, to determine  $D.\phi a$ ,  $D^2.\phi a$ , &c. we have  
 $D.\phi a = D\phi a.D.a$   
 $D^2.\phi a = D.(D.\phi a) = D(D\phi a.D.a) = D^2\phi a.D^2.a + D^2\phi a.(D.a)^2$ , and so on.

To find  $\phi(x + \beta x + \gamma x^2 + \&c.)$ , put it =  $\phi x + D.\phi x.x + D^2.\phi x.x^2 + \&c.$ ; develop  $D.\phi x$ ,  $D^2.\phi x$ , &c.; and after development put  $D.a = \beta$ ,  $D^2.a = \gamma$ ,  $D^3.a = \delta$ , &c. Hence it appears that  $\phi(x + \beta x + \gamma x^2 + \&c.)$  may be converted into a series of the form  $A + Bx + Cx^2 + Dx^3 + \&c.$ ; and the first term  $A$  will =  $\phi x$ .

The coefficient of the second term will =  $D.\phi x$ , or  $D.A$ .  
 The coefficient of the third term will =  $D^2.\phi x$ , or  $D^2.A$ .

The coefficient of the  $n + 1$  will =  $D^n.\phi x$ , or  $D^n.A$ ;  
 provided that, after the derivations have been made, we put in the results  $\beta$  for  $D.a$ ,  $\gamma$  for  $D^2.a$ , &c.  $B$  for  $D.A$ .  $C$  for  $D^2.A$ , &c.

The coefficient of  $x^n$  or  $A^n$  in the series  $A + Bx + \&c.$  equals  $D^n.\phi x$ , which is =  $D^2\phi a.D^{n-1}.\beta + D^2\phi a.D^{n-2}.\beta^2 + \&c.$  —  $D^n.\phi a.\beta^n$ .

The method of proof is this:—  
 put  $\pi = \beta + \gamma x + \delta x^2 + \&c.$   
 then  $\phi(x + \beta x + \gamma x^2 + \&c.) = \phi(x + \pi x)$   
 =  $\phi x + D^2\phi a.\pi x + D^3\phi a.\pi^2 x^2 + \&c.$   
 but  $\pi, \pi^2, \pi^3 \dots \pi^n$  are functions of the polynomial,  $\alpha + \beta x + \gamma x^2, \&c.$   
 $\therefore$  generally  $\pi^n = \beta^n + D.\beta^n x + D^2.\beta^n x^2 + \&c. (2)$

Write, therefore, in series (1), for  $\pi, \pi^2, \pi^3 \dots \pi^n$ , the values resulting from (2); collect the terms affected with the same power of  $x$ ; and it will easily appear that the coefficient of  $x^n$ , or  $A^n$ , is such as we have stated it to be.

In this method is comprehended, as is evident, the form for the development of a polynomial raised to any power

which was first given, but without satisfactory demonstration, by De Moivre, in the Transactions of the Royal Society, and in his "Miscellanea Analytica," p. 87. The above form of M. Arbogast has many advantages; it exhibits compendiously the law of the coefficients by means of the symbol D; and, when the operations indicated are to be actually performed, the coefficients easily result in terms of the polynomial quantities.

The formula for the function, being general, manifestly serves for the development of expressions, such as

$$\alpha x + \beta x + \gamma x^2 +, \&c., \text{ fin. } (\alpha + \beta x + \gamma x^2 +, \&c.) \&c.$$

After having exhibited the general form for  $\phi(\alpha + \beta x + \gamma x^2 +, \&c.)$  M. Arbogast shews how from one term to deduce the next succeeding, and likewise how to calculate any term whatever of the development, independently of all the others. The length and intricacy of the calculations render it impossible for us to give details of these methods.

In the latter part of the first article, the author applies his method of derivation to assign the sum of the powers of the roots of an equation, in terms of the coefficients of the equation; and the formula which he deduces is remarkable for the simplicity of the law by which the coefficients are expressed. Vandermonde (Memoirs of the Academy, 1771, p. 373.), Euler (Comms. Pat. 15 vol.), La Grange (Memoirs of Berlin, 1768), and Waring (Meditationes Algebraicæ, p. 1.), having given general formulæ for the sum of the powers of the roots of an equation, M. Arbogast compares his own with the demonstration of those, and shews how they follow from it. Whoever will take the trouble of examining those several formulæ will find them not only less simply expressed than that of the present author, but less evidently and less rigorously demonstrated.

The author proceeds to the development of functions of two or more polynomials, arranged according to the powers of the same letter. Suppose the series  $a + bx + cx^2 +, \&c.$  and  $\alpha + \beta x + \gamma x^2 +, \&c. \&c.$  are to be multiplied together; then the product is  $\left. \begin{matrix} \alpha\alpha + \alpha\beta \\ + \beta\alpha \end{matrix} \right\} x +, \&c.$  or making  $b = D. a, c = D^2. a, \&c. \beta = D. \alpha, \gamma = D^2. \alpha, \&c.$  the coefficients of the terms affected with  $x, x^2, x^3, \&c.$  will be  $(a. D. \alpha + D. a. \alpha). (a. D^2. \alpha + D. a. D. \alpha + D^2. a. \alpha),$  or  $D(a. \alpha), D^2(a\alpha),$  and the coefficient of the term affected with  $x^n$  will be  $D^n(a\alpha),$  which may easily be developed.

Hence the form for the product of any number of series, arranged according to the powers of  $x,$  may be determined. In four series, for instance, of which the first terms are  $a, a', a'', a''',$  the origin of the derivations will be  $aa', a'', a''';$  and the coefficient of the term affected with  $x^n,$  will be  $D^n(a' a'' a''').$

In the development of the product of any two functions whatever of polynomials, for instance, of  $\phi(a + bx +, \&c.)$  and  $\phi(\alpha + \beta x + \&c.),$  the coefficient of the term affected with  $x^n$  will be  $D^n(\phi\alpha. \phi a);$  which, by foregoing methods, may be easily developed.—Since  $\frac{1}{A}$  and  $A^{-1}$  are equivalent ex-

pressions, by the foregoing methods, fractions such as  $\frac{a + bx + cx^2 +, \&c.}{\alpha + \beta x + \gamma x^2 +, \&c.}$  may be converted into series of the form  $A + Bx + Cx^2 + Dx^3 + \&c.$

M. Arbogast, having applied his method to such fractions as have been already mentioned, shews how to deduce the form for the development of  $\phi(a + bx + cx^2 +, \&c., \alpha + \beta x + \gamma x^2 +, \&c.)$  and assigns the form for the coefficient of the term affected with  $x^n.$  The law by which these forms are regulated is simple, and easily comprehended.

This author's next object is the development of functions of one or more polynomials, arranged relatively to the powers and to the products of two or more different letters, into series arranged in the same manner. Accordingly he reduces it to the following general problem. "Any function whatever of one or more simple, double, or triple polynomials being given, to write immediately the series of the development of this function; and, moreover, to write immediately the development of any term whatever of this series, independently of the other terms." He then proceeds to various applications of derivations to recurring series, as well simple as double, or triple, &c. of any order whatever.

The authors who have treated of recurring series are De Moivre, in his "Miscellanea Analytica, and Doctrine of Chances;" Euler, in his "Introductio in Analyt. Infinitorum;" La Grange, in "Melanges de Turin," in Memoirs presented to the Academy of Paris, and in the Berlin Memoirs; and La Place, in Memoirs presented to the Academy of Paris, and in the Memoirs of the Academy. To the subject of the researches of these great mathematicians, M. Arbogast applies his method of derivations; and he certainly obtains by it, in our opinion, expressions very admirable for their simplicity, and for the facility with which they can be expanded. In the methods of the authors above mentioned, in order to find the general term, the denominator of the generating fraction is resolved into its factors; which is done by finding the roots of the denominator put = 0; consequently, if the denominator exceeds an equation of the fourth degree, the general term cannot be found;—but, by the method of derivations, the general term is assigned in terms of the coefficients of the denominator of the generating fraction and other quantities; thus, if the gener-

ating fractions be  $\frac{\alpha + \beta x + \gamma x^2}{a + bx + cx^2 + dx^3},$  the expression for the general term of the resulting recurring series is  $D^m(\alpha a^{-1}),$  or  $\alpha D^m. a^{-1} + \beta. D^{m-1} a^{-1} + \gamma. D^{m-2}. a^{-1}, (D^3. \alpha, D^4. \alpha, \&c. \text{ being } = 0).$

In the course of this article, M. Arbogast shews how to find at once a part of the general term of a recurring series, proceeding from several equal factors in the denominator of the generating fraction: thus, let  $\frac{P}{Q}$  be the generating fraction, and  $N \times (a-x)^m = Q;$  in  $\frac{P}{N},$  put  $a$  for  $x,$  and suppose  $\frac{P'}{N'}$  to be what this fraction becomes: then the required part

of the general term will be  $D^{m-1} \left[ \frac{P' - n - 1}{N'^a} \right],$  and  $D\alpha = -1$  and  $n + 1$  the index of the term.

M. Arbogast determines the sine and cosine of any multiple angle in cosines of the simple angle E. His demonstrations for the forms expressing the sines, cosines, &c. are clear and rigorous. He also directly discusses the difficult and complicated subject of double and triple recurring series. The next article of his treatise contains applications of the calculus of derivations to the general reversion of series; and this part of his work is executed with singular ability. His next object is the use of derivations in the differential calculus, which he considers as a particular case of the calculus of derivations. The 7th article of the author's work consists of three divisions: the first containing the application of the formulæ of derivation, to the development of the functions of polynomials, containing sines, cosines, &c.: the second gives the application of the derivative calculus to

the product of factors in arithmetical progression; and the third shews the application of the separation of the scales of operations to the direct and inverse method of differences. For a further account of this subject, we must refer to the author's elaborate treatise. See, also, an analysis of it in the Monthly Review (New Series), vol. xxxvi. p. 524—532.

*Calculus differentialis* is a method of differencing quantities, or of finding an infinitely small quantity, which, being taken infinite times, shall be equal to a given quantity: or, it is the arithmetic of the infinitely small differences of variable quantities.

The foundation of this calculus is an infinitely small quantity, or an infinitesimal, which is a portion of a quantity incomparable to that quantity, or that is less than any assignable one, and therefore accounted as nothing; the error accruing by omitting it being less than any assignable one. Hence two quantities, only differing by an infinitesimal, are reputed equal.

Thus, in *Astronomy*, the diameter of the earth is an infinitesimal, in respect of the distance of the fixed stars; and the same holds in abstract quantities. The term infinitesimal, therefore, is merely relative, and involves a relation to another quantity; and does not denote any real ens, or being.

Now infinitesimals are called differentials, or differential quantities, when they are considered as the differences of two quantities. Sir Isaac Newton calls them *moments*; considering them as the momentary increments of quantities; v. g. of a line generated by the flux of a point; or of a surface by the flux of a line. The differential calculus, therefore, and the doctrine of fluxions, are the same thing, under different names; the former given by M. Leibnitz, and the latter by Sir Isaac Newton: each of whom lay claim to the discovery.

There is, indeed, a difference in the manner of expressing the quantities resulting from the different views wherein the two authors consider the infinitesimals; the one as moments, the other as differences: Leibnitz, and most foreigners, express the differentials of quantities by the same letters as variable ones, only prefixing the letter *d*: thus the differential of *x* is called *dx*; and that of *y*, *dy*: now *dx* is a positive quantity, if *x* continually increase; negative, if it decrease.

The English, with Sir Isaac Newton, instead of *dx*, write *z* (with a dot over it); for *dy*, *y*, &c. which foreigners and others object against, on account of that confusion of points, which they imagine arises, when differentials are again differenced; on account of the ambiguity of the fluxionary expressions, owing to the position of the index; because the fluxionary expression cannot be so readily extended as the differential notation; and, besides, the printers are more apt to overlook a point than a letter.

Stable quantities are always expressed by the first letters of the alphabet *da = o*, *db = o*, *dc = o*; wherefore  $d(x+y-a) = dx + dy$ , and  $d(x-y+a) = dx - dy$ . So that the differencing of quantities is easily performed, by the addition or subtraction of their compounds.

To difference quantities that multiply each other; the rule is, first, multiply the differential of one factor into the other factor, the sum of the two factors is the differential sought: thus, the quantities being *xy*, the differential will be  $x dy + y dx$ , i. e.  $d(xy) = x dy + y dx$ . Secondly, if there be three quantities mutually multiplying each other, the factum of the two must then be multiplied into the differential of the third: thus, suppose *vxy*, let  $vx = t$ , then  $vxy = ty$ ; consequently  $d(vxy) = t dy + y dt$ : but  $dt = v dx + x dv$ . These values, therefore, being substituted

in the antecedent differential,  $t dy + y dt$ , the result is,  $d(vxy) = v x dy + xy dx + xy dv$ . Hence it is easy to apprehend how to proceed, where the quantities are more than three.

If one variable quantity increase, while the other *y* decreases, it is evident  $y dx - x dy$  will be the differential of  $\frac{x}{y}$ .

To difference quantities that mutually divide each other; the rule is, first, multiply the differential of the divisor into the dividend; and, on the contrary, the differential of the dividend into the divisor; subtract the last product from the first, and divide the remainder by the square of the divisor; the quotient is the differential of the quantities mutually dividing each other. See *FLUXIONS* and *FUNCTIONS*, under which article will be stated La Grange's method of divesting the principles of the differential calculus of all reference to infinitely small or evanescent quantities.

M. La Croix in his "Treatise on the Differential and Integral Calculus," considers the differential calculus in precisely the same point of view in which M. La Grange regarded it in the Berlin *Actis* for 1772, and subsequently in an express and formal treatise on the subject. An ingenious anonymous writer has given the substance and spirit of M. La Croix's reasoning, without adhering closely to his notation and method.

Let  $u = fx$  be any function of *x*; then, if for *x* we substitute  $x + b$ , the development of  $f(x + b)$  will be of this form:

$$f(x+b) = fx + f'xb + \frac{f''x^2b^2}{1 \cdot 2} + \&c.$$

the coefficients  $f'x$ ,  $f''x$ , &c. being derived from the primitive function  $fx$ , and independent of *b*.

$$\text{Hence } f(x+b) - fx = f'xb + \frac{f''x^2b^2}{1 \cdot 2} + \&c.$$

which quantity represents the difference between  $fx$  and what  $fx$  becomes when *x* is increased to  $x + b$ . Let the first term of this difference be called the differential, and be denoted by the expression  $dfx$ ; hence we have  $dfx = f'xb \therefore f'x = \frac{dfx}{b}$

Hence to have  $f'x$ , divide the difference between two successive values of  $fx$  by the increment: but, since  $f'x$  is independent of *b*, *b* must disappear by this division, and may be represented by any symbol at pleasure. Hence, for the sake of uniformity in the signs, let *b* be represented by  $dx \therefore f'x = \frac{dfx}{dx}$ . Hence to find  $dfx$ , or the differential of  $fx$ ,

write in  $fx$ ,  $x + dx$ , for *x*, develop  $f(x + dx)$  as far as the terms affected with the first power of  $dx$ , and subtract  $fx$ —

$$\text{Since } f(x+dx) - fx = f'x dx + \&c.$$

$$f'(x+dx) - f'x = f''x dx + \&c.$$

$$f'x dx = dfx, \quad f''x dx = df'x$$

$$\text{therefore } f''x = \frac{df'x}{dx} = d\left(\frac{dfx}{dx}\right)$$

But since  $dx$  is invariable,

$$f'(x+dx) dx - f'x dx = f''x dx^2$$

$$\text{hence } df'x dx = f''x dx^2$$

but  $df'x dx = ddfx = d^2fx$  (*d* not meaning a symbol *d* squared, but denoting the second differential of  $fx$  to be taken): hence

it appears, since  $f''x = \frac{d\left(\frac{dfx}{dx}\right)}{dx}$  and  $\frac{d^2fx}{dx^2}$ ; that  $\frac{d\left(\frac{dfx}{dx}\right)}{dx} =$

$\frac{d^2fx}{dx^2}$ ; and thus the derived functions  $f'x, f''x, f'''x, \&c.$

may be represented by the quantities  $\frac{d^2fx}{dx^2}, \frac{d^3fx}{dx^3}, \frac{d^4fx}{dx^4}, \&c.$

so that the development of  $f(x+b)$  takes this form,

$$fx + \frac{d^2fx}{dx^2}b + \frac{d^3fx}{1.2.d^2x^2}b^2 + \&c.$$

the celebrated theorem of Taylor.

CALCULUS, *differential-differential*. is a method of differencing differential quantities. As the sign of a differential is the letter  $d$  prefixed to the quantity, so that  $dx$  is the differential of  $x$ , that of a differential of  $dx$  is  $ddx$ , and the differential of  $ddx$  is  $ddd$ ,  $\&c.$ ; similar to first, second, and third,  $\&c.$  fluxions,  $\dot{x}, \ddot{x}, \dddot{x}, \&c.$ : thus we have degrees of differentials. The differential of an ordinary quantity is a differential of the first order or degree, as  $dx$ : that of the second degree is  $ddx$ ,  $\&c.$  The rules for differentials are the same with those for fluxions. See FLUXIONS.

CALCULUS *exponentialis*, is a method of differencing exponential quantities, or of finding and summing up the differentials or moments of exponential quantities; or at least bringing them to geometrical constructions.

By exponential quantity, is here understood a power, whose exponent is variable; v. g.  $a^x, x^r, ay^x, x^y, \&c.$  where the exponent  $x$  does not denote the same in all the points of a curve, but in some stands for 2, in others for 3, in others for 5,  $\&c.$

To *differenciate an exponential quantity*: there is nothing required but to reduce the exponential qualities to logarithmic ones; which done, the differencing is managed as in logarithmic quantities.—Thus, suppose the differential of the exponential quality  $x^y$  required, let

$$\begin{aligned} x^y &= z \\ \text{Then will } y \ln x &= \ln z \\ \ln x \, dy + \frac{y \, dx}{x} &= \frac{dz}{z} \\ \ln x \, dy + \frac{z \, y \, dx}{x} &= dz \end{aligned}$$

That is,  $xy \ln x \, dy + xy \, dx = dz$ . Bernoulli Opera, tom. i. p. 183. See EXPONENTIAL.

CALCULUS *fluxional*. See FLUXIONS.

CALCULUS *integralis*, or *summatorius*, is a method of integrating, or summing up moments, or differential quantities; i. e. from a differential quantity given, to find the quantity from whose differencing the given differential results.

The integral calculus, therefore, is the inverse of the differential one: whence the English, who usually call the differential method, *fluxions*, give this calculus, which ascends from the fluxions, to the flowing or variable quantities: or, as foreigners express it, from the differences to the sums; by the name of the *inverse method* of FLUXIONS.

Hence, the integration is known to be justly performed, if the quantity found, according to the rules of the differential calculus, being differenced, produce that proposed to be summed.

Suppose  $f$  the sign of the sum, or integral quantity; then  $\int y \, dx$  will denote the sum, or integral of the differential  $y \, dx$ .

To *integrate, or sum up a differential quantity*. It is demonstrated, first, that  $\int dx = x$ : secondly,  $\int (dx + dy) = x + y$ : thirdly,  $\int (x \, dy + y \, dx) = xy$ : fourthly,  $\int (m \, x^n - 1$

$dx = x^n$ : fifthly,  $\int (n : m) x^{\frac{n-m}{m}} dx = x^{\frac{n}{m}}$ : sixthly,  $\int (y \, dx - x \, dy) : y^2 = x : y$ . Of these, the fourth and fifth cases are the most frequent; wherein the differential quantity is integrated, by adding a variable unity to the exponent, and dividing the sum by the new exponent multiplied into the differential of the root; v. g. the fourth case, by  $m - (1 + 1) dx$ , i. e. by  $m \, dx$ .

If the differential quantity to be integrated, doth not come under any of these formulas, it must either be reduced to an integral finite, or an infinite series, each of whose terms may be summed.

It may be here observed, that, as in the analysis of finites, any quantity may be raised to any degree of power; but *vice versa*, the root cannot be extracted out of any number required: so in the analysis of infinites, any variable or flowing quantity may be differenced; but, *vice versa*, any differential cannot be integrated. And as, in the analysis of finites, we are not yet arrived at a method of extracting the roots of all equations; so neither has the integral calculus arrived at its perfection: and as in the former we are obliged to have recourse to approximation; so in the latter we have recourse to infinite series, where we cannot attain to a perfect integration.

The first traces of the integral calculus are to be found in the arithmetic of infinites of Dr. Wallis. The author, by summing series of rational ordinates, was enabled to assign the quadratures of the curves to which they belonged. Newton, the inventor of the fluxionary method, advanced far beyond Wallis, and assigned the quadrature of curves to which the ordinates were irrational. What this great man performed with regard to the doctrine of finites, or the integral calculus, is to be found in his treatise, "De Quadratura Curvarum." In his "Principia" he concealed his analysis, and adhered to the manner of the ancients. It does not appear by what method he solved the 34th proposition of the 2d book of the "Principia" concerning the solid of least resistance; whether he effected it by a particular artifice, or whether he really possessed the calculus of variations, of which Leibnitz and the Bernouillis are now esteemed the inventors. The mathematicians to whom the integral calculus is chiefly indebted for its improvement, are John Bernouilli, who integrated rational fractions; James Bernouilli, who integrated the fluxional equation,  $y' + P y = Q x$ ; Cotes, who published in 1714, "Theoremata tum Logometrica tum Trigonometrica"; Riccati, who integrated the fluxional equation  $y' + a y^2 x = Q x$ ; Maclaurin, author of a treatise in 2 volumes, 4to.; Simpson, Fontaine, Clairaut, D'Alembert, and Euler, whose researches on the integral calculus occur in the volumes of the academies of Paris, Berlin, Turin, and Petersburg. The last author published in 1768 his "Institutiones Calculi Integralis," highly enriched with original inventions; and in the same year Le Seur and Jacquier published a work in two volumes, 4to. which superseded a work of M. Bougainville, published in 1754, intended as a supplement to the "Analyse des Infiniment Petits of the Marquis de L'Hospital. Condorcet, La Grange, La Place, Monge, and Le Gendre, have also made considerable additions to the integral calculus. M. La Croix has likewise published a comprehensive and valuable treatise on the differential and integral calculus (Traité du Calcul Differential, &c. 2 vols. 4to. Paris). In the plan of this work it is proposed to comprehend and systematize all that has been written on the differential and integral calculus. It commences with a history of the subject which properly originates with the times of Euclid and Archimedes; because the methods of ex-

functions and limits rest on the same foundation. The questions that led to its discovery have been discussed since the earliest æra of geometry. The 12th proposition of the 12th book of Euclid's Elements is a problem of this kind, and the first that has come down to us. Archimedes, by similar methods, advanced to the solution of more difficult problems, than that which investigated the relation of circles to one another; such as the relations between the surfaces and solid contents of the cylinder and sphere, the quadrature of the parabola, and the proportion of spirals. M. La Croix then proceeds in his history of the differential calculus, as connected with the several discoveries made by Cavalieri, Roberval, Descartes, Fermat, Hugenius, Gregory de St. Vincent, Pascal, Wallis, Barrow, Leibnitz, and Newton. See FLUXIONS.

M. la Croix's treatise consists of two parts: the first part gives an account of the differential calculus; and the subject of the second part is the integral calculus. This part begins with the integration of functions of one variable quantity; and the author has furnished various formulæ for integrating rational and irrational functions, logarithmic and exponential functions, circular functions, &c. and he then applies the integral calculus to the quadrature and rectification of curves, to the quadrature of curve surfaces, and to the content of the solids comprehended by them. He subjoins an exposition of the methods which Euler employed in his researches concerning curves that are quadrable, rectifiable, &c. His next object is the integration of differential equations of two variable quantities; and in reference to this he has collected all that has been written on this intricate subject. Accordingly this chapter of his work contains methods for separating the variable quantities in differential equations of the first order; for investigating a factor proper to render a differential equation of the first order integrable; for integrating differential equations of the first order; in which the differential quantities pass the first degree; for obtaining particular solutions of differential equations of the first order; for resolving by approximation, differential equations of the first order; for constructing, geometrically, differential equations of the first order; for integrating differential equations of the second order by means of transformations; for investigating a factor proper to render differential equations of the second order integrable; for resolving, by approximation, differential equations of the second order; and for integrating differential equations of orders superior to the second. The subject of the next chapter is the integration of fractions containing two, or a greater number of variable quantities. The fifth and last chapter treats of the method of variations.

The calculus of variations originated from certain problems concerning the maxima and minima of quantities having been proposed by John Bernoulli, to the mathematicians of Europe. Such a problem was that in which it was required to find, of all curves passing through two fixed points, and situated in the same vertical plane, that one down which a body would descend from the highest to the lowest point in the least time possible. The first geometers, remarking that nothing was obtained by putting

the differential of the time,  $\frac{dz}{x} = 0$ , found that they could obtain a solution by making the time a minimum for two successive elements of the curve; thus, if  $x, x', x''$  were three vertical abscissas, and  $y, y', y''$  the corresponding ordinates, the time would be expressed by

$$\frac{\sqrt{(x'-x)^2 + (y'-y)^2}}{\sqrt{x}} + \frac{\sqrt{(x''-x')^2 + (y''-y')^2}}{\sqrt{x'}}$$

the differential of which being taken, and put  $= 0$ , gave a

resulting equation  $\frac{dy}{\sqrt{x} \sqrt{dx^2 + dy^2}} = b$  a constant

quantity; and consequently proved the curve to be a cycloid.—Euler, with far greater analytical knowledge than John Bernoulli, next treated these problems in a general manner, in his tract intitled, "Methodus inveniendi lineas curvas maximi minimive proprietate gaudentes; sive solutio problematis isoperimetici latissimo sensu accepti." M. La Grange afterward gave greater generality to this calculus, by making variable not only  $y, dy, dy'$ , &c. but  $x$ .

The explanation of M. La Croix affords a clear idea of the calculus of variations:

"Suppose (says he) the variable quantities at first connected together by an equation, or by any other dependence, to change by reason of the form of the equation, or of the relation that results from the dependence established between them ceasing to be the same; this circumstance cannot be expressed in a more general manner, than by regarding the increments of  $x$  and  $y$ , as absolutely independent of each other; since, in effect, this hypothesis, not designating any particular relation between  $x$  and  $y$ , comprehends all. It follows thence, that the calculus of variations can only be employed for expressions, to which the differential calculus has already been applied; and it differs from the last only by the independence which it supposes between the variable quantities, which before were considered as connected by constant relations. The following

example will illustrate this notion. The expression  $\frac{y dx}{dy}$ ,

which belongs to the subtangent of a curve, represents a determinate function of  $x$ , when  $y$  is considered as a function whose composition in terms of  $x$  is known: and if this last changes, the first changes also. There will be, perhaps, some difficulty in conceiving how we can submit to calculation the variability of a function which is only the abstract dependence in which several quantities are with regard to each other: but this difficulty is removed, by considering that the connection between the quantities  $y$  and  $x$  changes, if the first be made to vary independently of the second. Thus, in the example before us, if we suppose  $x$  to remain the

same, and  $y$  and  $\frac{dy}{dx}$  to change, the relation between  $x$  and  $y$  must necessarily have changed also, since these quantities are the immediate consequences of that relation:  $\frac{dy}{dx}$ , in the

form  $\frac{y dx}{dy}$ , may alone be made to vary, since it depends only on one value of  $y$ : but, if an expression affected by the sign  $\int$  be considered,  $y$  and  $\frac{dy}{dx}$  must be made to vary at the same

time; for it follows from the theory for the formation of integrals, that the value of a like function depends on the consecutive values of  $y$  which are deduced from those of  $\frac{dy}{dx}$ .

"It is evident that, to take under this point of view the differential of any expression whatever, it is sufficient to make  $y, dy, dy'$ , &c. vary without altering  $x$ : but, in treating this latter quantity, as variable as the first, we arrive at results more general and symmetrical than what are otherwise obtained, and which lead to very interesting remarks on the nature of the differential forms. For these reasons, we shall adopt in this chapter the method of making  $x, dy, dy'$  vary. That the symbols of this new species of differentiation, in which  $x$  and  $y$  are considered as independent, may not be confounded with the symbols of the first,

first, in which one of the variable quantities is regarded as a function of the other, we shall employ, after the manner of La Grange, the characteristic  $\delta$ ; and we shall suppose, with him, that, when  $y$  changes only by virtue of the change of  $x$  which becomes  $x + dx$ , its differential is  $dy$ : but that, when the relation of  $y$  and  $x$  varies, these two quantities become respectively  $x + \delta x$ ,  $y + \delta y$ ; and we note by the name of variations, the increments  $\delta x$  and  $\delta y$ .

“Hence it follows that, as  $du = \frac{du}{dx} dx + \frac{du}{dy} dy$ ,

$u$  being a function of  $x$  and  $y$ ,

$$\text{so, } \delta u = \frac{\delta u}{\delta x} \delta x + \frac{\delta u}{\delta y} \delta y.$$

“In applying this to the example  $\frac{y dx}{dy}$ , we must regard

$\frac{dx}{dy}$  as a function of  $x$  and  $y$ ; whence it results that

$$\delta \frac{y dx}{dy} = \frac{dx \delta y}{dy} + y \delta \left( \frac{dx}{dy} \right)$$

$$\text{and } \delta \left( \frac{dx}{dy} \right) = \frac{dy \delta dx - dx \delta dy}{dy^2} = \frac{dy \delta dx - dx \delta dy}{dy^2}$$

for  $\delta dx = \delta \delta x$ ,  $\delta dy = \delta \delta y$ .—”

M. La Croix then proves  $\delta dx = \delta \delta x$ , &c. After the methods for finding the variations of any function whatever, is given the application of the calculus to the problems of maxima and minima.

**CALCULUS literalis**, or *literal CALCULUS*, is the same with specious arithmetic, or algebra, so called, from its using the letters of the alphabet: in contradistinction to numeral arithmetic, which uses figures.

In the literal calculus, given quantities are expressed by the first letters,  $a, b, c, d$ ; and quantities sought by the last  $z, y, x$ , &c. Equal quantities are denoted by the same letters. See **ALGEBRA**.

**CALCULUS**, in *Medicine*, the disease of the stone in the bladder or kidneys. The calculus in the bladder is called *lithiasis*; and in the kidneys, *nephritis*. See **STONE**.

**CALCULUS, Biliary**. Small, hard, roundish, concrete substances are often found in the gall bladder, or in the ducts leading from the liver and gall-bladder to the intestine, which occasion in their passage most acute pain to man, and probably other animals, and have attracted some attention from chemists.

Biliary calculi (or *gall-stones*, as they are also termed) vary both in external appearance, and in chemical properties. The colour is generally green or yellowish-brown, sometimes, though rarely, white; in shape they are mostly oblong, often tuberculated. When cut through, they most frequently consist of a radiated semi-crystalline mass, internally often resembling spermaceti, coated with several concentric laminæ. The radiated part is mostly white and tasteless; the laminated is sometimes bitter.

Gall-stones are distinguished for their lightness and inflammability, few of them being so heavy as to sink in water; and when put to a lighted candle, most of them melt like wax, and burn with a very bright flame, and very little ammoniacal smell. From the infinite minute varieties in gall-stones, no natural arrangement is indicated, but the most important differences, shewn by chemical analysis, rest upon the proportion of the radiated, crystallized, central part, and the general lightness and inflammability.

The radiated gall-stones are largely soluble in oil of turpentine, and in all the essential oils by heat. Alcohol when cold has but little action, but when boiling it dissolves almost all the inflammable part of the calculus, leaving an earthy

residue behind. On cooling, this solution deposits very copious specular crystals, strongly resembling those of spermaceti treated in this way, and this singular substance forms by far the most curious part of these morbid concretions. Poulletier and Fourcroy have both attended minutely to this matter. The former discovered similar crystalline concretions in a piece of liver long hung up in a dry air.

When the hot alcoholic solution of this concrete is dropped into a large quantity of water, a white stacculent precipitate is formed, which when dried is found to be of a resinous nature. The supernatant liquor by saturation with muriatic acid and evaporation gives muriat of soda, by which it is evident that the soda of the bile remains in union with its resin during its conversion into biliary calculus; but the chemical nature of this conversion is very obscure.

Ether dissolves the spermaceti-like concrete as well as oil of turpentine, and deposits the greater part on cooling. Hot nitric acid is decomposed on it, and nitrous gas is given out, and when cool, a white oil is found concreted on the surface of the acid, now no longer of a crystalline texture, but altered in its properties, being brittle and friable like a resin, and when re-dissolved in alcohol it has lost its power of crystallizing by cooling. It is still, however, insoluble in water. Ether dissolves this altered concrete as it did when in its natural state, but water now separates it in the form of drops of oil. Saunders on the Bile. Fourcroy. *Bostock in Phil. Journ.* vol. vi.

**CALCULUS Minerva**, among the *Ancient Lawyers*, denoted the decision of a cause, wherein the judges were equally divided. The expression is taken from the history of Orestes, represented by Æschylus and Euripides; at whose trial, before the Areopagites for the murder of his mother, the votes being equally divided for and against him, Minerva interposed, and gave the casting vote, or calculus, in his behalf.

M. Cramer, professor at Marburg, has a discourse expressive, “*De Calculo Minervæ*,” wherein he maintains, that all the effect an entire equality of voices can have, is to leave the cause *in statu quo*.

**CALCULUS Tiburtinus**, a sort of figured stone, formed in great plenty about the cataracts of the Anio, and other rivers in Italy; of a white colour, and in shape oblong, round, or echinated. They are a species of the *stria lapidea*, and generated like them; and so like sugar-plums in the whole, that it is a common jest at Rome to deceive the unexperienced by serving them up at deserts.

**CALCULUS, urinary**. See **URINARY calculi**.

**CALCUTTA**, in *Geography*, a city of Hindoostan, and capital of Bengal, and of all the British possessions in India, is situated on the river Hoogly, the western arm of the Ganges, at the distance of about 100 miles from the sea; and the river is navigable up to the town, for the largest ships that visit India. Its citadel is placed in N. lat. 22° 33'. E. long. 88° 27' 45". It is comparatively a modern city, having been built towards the close of the 17th century on the site of the village called Govindpour. The English factory obtained leave to remove hither from Hoogly in the year 1689 (see **BENGAL**), when Mr. Channock was agent in Bengal; and who fixed upon this spot for the British emporium, though from several circumstances it was at that time the most unhealthy he could have chosen. For 3 miles to the north-east there was a salt-water lake, that overflowed in the months of September and October; and in the two following months, when those floods withdrew, prodigious quantities of fish were left dry, the putrefaction of which was supposed to affect the air; and this, together with the fetid putrid exhalations from the ooze and slime, conveyed by the north-east wind to Fort William, occasioned a yearly mortality.

lity. During the rapid increase of this town, diseases were fatal to thousands, and particularly, according to the testimony of Dr. Lind, among such as had lately arrived from Europe. Hamilton mentions an instance, from his own knowledge, of 400 burials in six months, at a period when all the English resident here did not exceed 1200. Besides, when this spot was chosen, every man was allowed to build as best suited his convenience and taste, without regard to the disposition of the whole; and, therefore, the different houses bore no resemblance to one another either in their position or architecture. From this small and unpromising beginning, Calcutta is now become a large, populous, and in many respects, an elegant city. The quarter inhabited by the English is composed entirely of brick buildings, many of which appear more like palaces than private houses; and though they add much to the beauty of the place, they would have a much better effect if the streets were laid out with greater symmetry and order: but the rest of the city, and, indeed, much the greater part of it, consists of houses like those of the other Indian cities; all of which are constructed on the same plan, with very narrow, confined, and crooked streets, in which are interspersed an incredible number of reservoirs and ponds, and a great many gardens. Some few streets are paved with brick. The houses are variously built; some with brick, others with mud, and a still greater proportion with bamboos and mats; and these different kinds of edifices, being intermixed with one another, form a motley appearance. Those of the latter kind are invariably of one story, and covered with thatch. The brick houses seldom exceed two floors, and have flat terraced roofs. The two former classes far outnumber the last, which are often so thinly scattered, that fires, which frequently happen, do not sometimes meet with the obstruction of a single brick house through a whole street. The structure of the European houses serves to secure them from fire; as only a small portion of wood enters into the materials, for the partition-walls, as well as the flat roofs, are chiefly constructed of brick and mortar, which last article, under the denomination of "Chunnam," the natives have brought to great perfection. The buildings of the place extend full 3 miles along the river, and about half as much in breadth from it. Within the last 30 or 40 years, Calcutta is wonderfully improved, both in appearance and in the salubrity of its air; for by draining the streets and filling up the ponds, they have removed a vast surface of stagnant water, the exhalations of which were particularly injurious. The local situation of Calcutta, as we have already observed, is not fortunate; for it has some extensive muddy lakes, and a vast forest close to it. More still remains to be done before Calcutta can merit the character of a healthy town. In the middle of the city a large open place has been left, in which there is a spacious tank or reservoir, covering upwards of 25 acres of ground. It was dug by order of the government, to provide the inhabitants of Calcutta with water; as in the dry season the water of the Ganges becomes brackish by the influx of the tide, while that in the tank is very sweet and pleasant. The number of springs which it contains preserves the water always nearly at the same level. It is railed round, nor is any person suffered to wash in it; but all are at liberty to take as much water from it as they like. Near this tank is a handsome obelisk, erected by Mr. Holwell, one of the few survivors in the tragic scene of the black hole, of which we shall subjoin an account; it is about 50 feet high, inscribed with the names of the persons who died on this execrable occasion, and whose bodies were promiscuously thrown, the next morning, into the ditch of the fort. A little farther is the court-house, over which are two handsome assembly-rooms. Close to the court-house is a theatre,

where plays are sometimes performed. Beyond this is an Armenian church, which is a large and noble building, with a handsome steeple. There is also an English church of modern construction. The citadel, called "Fort William," is situated about a quarter of an hour's walk from the city, by the side of the Ganges, in an extensive plain. This citadel is superior in every point, as it regards strength and correctness of design, to any fortress in India; but it is formed on too extensive a scale to answer the useful purpose intended, that of holding a post in case of extremity; since the number of troops required properly to garrison it, could keep the field. It was begun in the year 1757, immediately after the victory at Plassey, which insured to the British an unlimited influence in Bengal; and it was the intention of lord Clive to render it as permanent as possible, by providing for all times a tenable post. However, he had no foresight of the vast expence attending it, which may perhaps, have been equal to two millions sterling. It is a regular pentagon, with several outworks. The ramparts are built of brick, half-way up, finished with clay, and faced with gazons. Both the body of the fortress and the outworks are surrounded by a wet ditch, which has a small cunette, 6 or 7 feet deep, in the middle. The water from the Ganges may be let into the moat, to the height of 8 feet, by means of flood-gates, of which there are two to each outwork, constructed in such a manner, that if an enemy be master of one, he cannot prevent both the main ditch, and those of the other outworks, from retaining their water. If all the works were mounted with cannon, there would be room for 600 pieces of artillery. Within the fort are bomb-proof barracks for 10,000 men. All the works are guarded by mines and countermines. No ship can pass up or down the Ganges without being exposed to the fire of this fort; nor can any enemy approach by land without being discerned at the distance of 3 or 4 leagues. The population of Calcutta is supposed to amount at present to more than half a million of inhabitants; and their different aspect and manners present a very picturesque and interesting scene. The black Hindoo, the olive-coloured Moor or Mahometan, contrast with the fair and florid countenances of the English; and the charms of the European damsel receive a foil from the dark Hindoo beauties. "The mixture of European and Asiatic manners," says a traveller in India, "which may be observed in Calcutta, is curious; coaches, phaetons, single-horse chaises, with the palankens and hackeries of the natives, the passing ceremonies of the Hindoos, the different appearances of the Fakirs, form a sight more novel and extraordinary than any city in the world can present to a stranger." "To the luxuries of the Asiatic (says Mr. Pinkerton) are added the elegance and science of the English life. Even the newspapers are drawn up with care, and printed with elegance;" and the Asiatic Society, instituted by the late admirable sir William Jones (in January 1784), may perhaps rival the Academy of Inscriptions at Paris, if the papers of the latter were adopted as a model. "The Asiatic Researches, which are the productions of this society, form a noble monument of British science in a distant country."

Calcutta is eminently distinguished as the emporium of Bengal, and the residence of the governor-general of India. It is also the seat of justice, under four judges, who dispense judgment according to the laws of England. Its flourishing state may be ascribed, partly, among other causes and circumstances that have contributed to it, to the unlimited toleration which it affords to all forms of religion; the Pagans being suffered to carry their idols in procession, the Mahometans not being discountenanced, and the Roman Catholics being allowed a church.

The police of the city is chiefly committed to a superintendent

tendant of police, and several inferior justices of the peace, with certain stated salaries. Before these all petty delinquencies are tried, and by them they are punished. "Tannids," or guard-houses, are erected in the different districts of the town; and the peace is maintained by a few companies of native soldiers who patrol the streets, and prevent disturbance from quarrels, robbery, or theft. Offences of a higher nature, committed by either Europeans or natives, are cognizable by the supreme court of judicature, which, about 25 years ago, was substituted in place of the mayor's court, with superior authority, and more extensive jurisdiction. The powers of this court extend not only to the company's territories in this part of India, but also to every case civil or criminal, that may occur between the Coromandel and Malacca coasts. Its jurisdiction, however, does not extend to the higher stations; nevertheless in these, all the European settlers enter into an engagement to be amenable to its authority.

The commerce of Calcutta is very considerable in salt, sugar, opium, yielded by the poppy particularly cultivated in the province of Bahar, silks, muslins, &c. Musk, borax, and other commodities, used to be imported from Thibet, in exchange for European cloths, and hardware; but this trade is probably interrupted since Thibet became subject to the jealous Chinese. On the Ganges are transported to Assam cargoes of salt, in exchange for gold, silver, ivory, musk, and a particular kind of silky cotton. The cowry shells, used as a small coin, are imported from the Maldives in exchange for rice. The fine muslins are chiefly fabricated in the rainy season, from May to September, and with callicoes form a great part of the exports to Europe.

The merchants and agents of this capital are by no means confined to transactions with their constituents employed in different branches of the service: they engage largely in foreign commerce to every port of note either in Asia or in Europe. In some houses, the extent of their dealings has been estimated, probably by an account somewhat exaggerated, at two crores of rupees annually, or above two millions sterling. Nevertheless, no mercantile house has accumulated sums equal to the fortunes acquired by many individuals in the service. The charges of clerks, freight, insurances, and other circumstances, particularly house-rent, must deeply affect the profits arising from every concern not uncommonly lucrative. The extent of the private trade of Calcutta cannot be estimated justly, either from the number or the burden of the ships belonging to that port. In a period not very remote, there were only 60 that properly belonged to the British merchants here, and their burden was about 27,000 tons. But their concern in foreign ships is very considerable. The Dutch, Danish, and French settlements on the river afford opportunities for indirect trade to any extent; nor are they negligent in availing themselves of this advantage. The company affords considerable employment to the country-built ships, independently of the merchants. It possesses a marine establishment, under the direction of a board instituted for that purpose. During war, cruizers are frequently employed; as well as transports, and store-ships, for its own troops. These transactions fall under the direction of the marine board, consisting of five members, and a number of subordinate officers and clerks. It also superintends the pilot-service, which is an important part of the marine establishment in a river of such dangerous navigation as the Hoogly, in which sand banks formed by the sand and mud washed down this branch of the Ganges during the rains, are continually fluctuating in their size and position. Constant attention is, therefore, necessary to place the different buoys so that they shall not mislead the mariner.

Freight in this climate is high; and yet commerce appears to be as adventurous as in any part of the world. The freight of boats in the inland trade upon the river is far from being low; and this is owing to the time necessary for performing a moderate voyage on that winding stream. The larger boats upon the Ganges carry from 300 to 600 mauns; and their hire per month amounts to 20, 30, or even 60 rupees, according to their different sizes. Budge-rows (see BUDGE-ROW), for the accommodation of gentlemen and their families, are to be had of all sizes from 8 to 24 oars; the rate of hire for the first is 60 rupees per month; for the largest, 230. The pinnace is another kind of travelling boat, still more expensive than the budge-row. It has superior accommodation, and from its resembling European craft in its structure, both in its hull and rigging, it is better fitted for encountering a gale in the great river. Besides the high rate of freight charged in the inland, and maritime trade, the merchants in Calcutta pay a considerable commission on the purchase of goods by their agents; and this on most articles is 5 per cent. The masters of the country built ships, or the supercargoes, are the immediate agents by whom the trade of this part of the world is conducted; and they are an enterprising body of men, and in general better informed than those of the same profession in Europe. With the common Malays, and a mixture of Chinese, and Bengalese seamen, who never become very expert and intelligent in their profession, the country ship-masters perform voyages in those dangerous seas with astonishing security. These vessels are termed "Donies"; and their enterprises at sea are chiefly to be ascribed to the example of Europeans; for, before their appearance, the Hindoos were hardly known as navigators. In Calcutta there are six different assurance-companies; which cover the property of individuals from the risks of the sea, perhaps at as low a rate of insurance as it can be done in Europe. Of the ships already mentioned belonging to Calcutta, there is not a single one commanded by a native. The internal navigation is, indeed, conducted by the natives. See GANGES.

The Armenians are the most respectable, and perhaps the most numerous body of foreign merchants in this capital. They carry on an extensive trade from China, and most of the sea-ports to the eastward, and also to the west, as far as the Persian gulf. Their information from all the different quarters is deemed the most accurate and minute of any body of men in their profession. They are attentive, regular, and diligent in business; their houses are of old standing; and many of them are possessed of large capitals. As members of society, they are peaceable and loyal, polite and inoffensive. Some few priests of their persuasion are maintained by them, not only in affluence, but in some degree of splendour. In their fondness for shew and elegance, the Armenians approach nearer to the English than any merchants at Calcutta; but they are more guarded in their expenditure.

The Mogul merchants are the next body of strangers, who have indeed long resided in this country; they have 13 different mercantile houses of considerable note, besides many other counting-houses of inferior importance. Some individuals among the Moguls are very wealthy, and are inferior in riches only to some of the native rajahs, banians, and shroffs: of these some are more opulent than the first noblemen in England. A million sterling, or even half of that sum, which several of them are said to possess, yields a revenue of three times the amount of any capital in Britain, from the exorbitant rate of interest at which these people lend their money. In the dress and table of the Hindoo, little is devoted to the purposes either of elegance or magnificence.

nificence. The greatest drains upon his income are his pious contributions, and the expences of his Zenana. The notches, marriages, and religious festivals furnish occasions of profusion; but these ceremonies are under the direction of the Bramins; and, according to the ideas which these spiritual guides have formed of his wealth, must be the otto, rose-water, and other perfumes, and sweetmeats served in vessels of gold, under a large canopy illuminated with beautiful lights, to many hundreds of guests of all ranks and denominations. On such occasions the Hindoo is gratified by the appearance of a large company; and deems himself particularly honoured by the attendance of Europeans. Although the notches are intended to do honour to some deity, who is supposed to preside over the festival; yet they seem of all institutions least calculated to excite religious ideas. Part of the ceremony consists in listening to the music of the singing girls, who draw out their monotonous ditties with a non-chalance and dulness which can only be equalled by the sluggish dance, and inanimate gestures with which they are accompanied. Of all entertainments an Hindoostance notch is probably the most insipid; and they are sometimes accompanied with pantomimical performances of no delicate nature.

The number of Greek merchants in Calcutta is not considerable; they, however, maintain one clergyman, who performs religious worship according to the rites of that church. Portuguese houses of agency are, with respect to number, next to those of the English. A very considerable number of the descendants of that nation by native women, reside at Calcutta. No people in Europe seem to have assimilated themselves so closely to the manners of the country. Many of this class are held in low estimation. With a complexion darker than that of the Hindoos, with habits so similar, and with full possession of the language, it is strange that none of these have been able to make converts from the Heathen to the Roman Catholic faith. This circumstance evinces the compleat dominion, which the Bramin superstition possesses over the minds of the common people; for no denomination of Christians can be more devoted to the work of conversion than the church of Rome.

The British merchants at Calcutta are a numerous and respectable body of men. Several of them have acquired large fortunes, and in the acquisition of these fortunes they have displayed those mercantile talents, and that enterprising spirit which distinguish their character in every part of the world. At Calcutta the peculiar habits of their profession have in no degree encroached on the liberality of their minds or the elegance of their equipage and tables. They here display an expence and splendour in their mode of living seldom aspired after by the same order of men in any part of the world; and it redounds much to their honour, that their acts of charity and munificence to indigent persons have, perhaps, never been equalled by any similar number of men of any rank whatever. Few of these gentlemen are engaged in the service. The service of the company attaches to itself certain ideas of rank and consequence, which often produce ludicrous effects upon the intercourse of society. All persons in civil and military departments affect a degree of superiority over such as are not in the service, which is frequently ill supported by their talents, birth, or character.

Among the various classes of the mercantile part of the community, we have made no mention of the Jews. Few of that nation ever settle in India, and Calcutta is perhaps the only opulent town in which they are not to be found. The native Banians, Sarkars, and Writers, carry on the greatest part of the retail trade of Calcutta. They go about hawking

commodities from morning to night, or searching after cheap purchases. To this class of the Hindoos appertain that low cunning, stratagem, and deceit, which characterise the money-transactions of persons of narrow intellects. With all their propensity to cheat, the native shop-keepers generally sell their goods on lower terms than those on which they are to be obtained in the European ware-rooms; but they are commonly neither of the best fashion nor best quality. Their house-rent is another cause of their under-selling the Europeans. The shops of the natives, though better than their houses, are mean and disagreeable; and from their situation in the common bazars, are much cheaper than the larger and more splendid rooms in which the British merchants expose their wares. House-rent and servants' wages are the most expensive parts of the charges of house-keeping in Calcutta. The common articles of provision are much cheaper than in Europe; but house-rent till lately, has been a very exorbitant charge. Only a few years ago, a house sufficient to accommodate a genteel family could not be procured under 600 or 800 pounds a-year; and many even let at a larger sum. The number of servants necessary in a private family, to persons resident in this country, exceeds all belief. This is an evil which admits of no remedy as long as the superstition of the natives shall deter them from performing service beyond one specific kind of work. The wages vary according to the different stations they occupy, from 4 rupees per month to 20. The salary of servants, added to the house-rent, and the incidental charges of a family, will enhance its expenditure to 3, 4, and 5 thousand rupees a-year, according to its number.

The maintenance and education of the children belonging to Europeans in India have, on account of their increasing number, become objects of great importance. With a view to these objects, several persons have done honour to themselves and to their country, by establishing schools for the relief of the orphan children of the military servants of the company. Two institutions have been formed for this purpose: one for the children of officers, and the other for those of private soldiers. Each is provided with teachers of both sexes, qualified to instruct the children in such branches of knowledge and industry as seem to be adapted to their rank and prospects in society. The fund for the support of these institutions is supplied by a fixed contribution raised from the military, or by the donations of the benevolent. Besides the two institutions already mentioned, there are seven or eight others for the education of boys; and nearly an equal number for girls. Besides these foundations, there are some others of inferior note, equally laudable, established by the munificence of the inhabitants of Calcutta. A free-school, which provides for the education of nearly 200 children, under the management of the vestry, is, in part, supported by voluntary contributions only. Two lacks of rupees were originally devoted to the education of the children of the poor. The interest of that sum continues to be applied for that purpose. Another school, equally numerous, has been added to this upon a fund raised merely by casual benefactions. An oratorio has lately been performed annually to aid its funds, which promises a considerable supply of revenue. To these institutions, so creditable to the humanity and benevolence of the inhabitants of Calcutta, the native hospital must be added. This institution is also supported by voluntary contribution, and was formed for the relief of natives, who, from accident or disease, might need medical aid. A very expensive establishment for the education of the junior servants of the company has lately been instituted; but as it is for business, and not for education, that these gentlemen are sent to

India, the utility of this measure has been questioned, and the expence of it must have been enormous. Instruction, in the native dialect, is, in general, the only requisite to qualify them for the exercise of their duty, and this they have hitherto received from "Moonfaces" at the leisure hours that are not employed in their different vocations. Accordingly the court of directors have abolished this college; and they are at this time forming an establishment at home which is likely, under proper conduct, to answer the purpose at a much less expence.

Notwithstanding the perfection to which the medical art has arrived by long experience, and its happy effect in preserving the lives of many Europeans; and the knowledge that has been acquired with respect to the fevers and the whole train of bilious complaints that are incidental to the country, and with respect to the most efficacious mode of treating them; the climate of India proves a severe trial to every European constitution. Many fall sacrifices to its first attacks; many more linger on in a state of increasing debility, and painful disease; and others, who for years continue to combat its influence, apprehending that the conflict must terminate fatally, are glad to retreat to Europe, there to eke out, or to husband the remains of life. A fallow and livid complexion is so universal in Bengal, that when you behold a face of the roseate hue, you may venture to pronounce that its owner is newly arrived. Even in the ordinary health of persons not supposed to be materially injured by the climate, they are capable of little exertion or fatigue; and in the hot season of hardly any at all. It is not uncommon to find, at that period, all the officers of a battalion, except perhaps one or two, incapable of doing duty; and this without any extraordinary or alarming complaint. The fair sex are almost equally liable with the men to suffer by the climate. Their regularity is often more uniform, and their exposure to the weather less frequent; yet there is hardly a single female complexion in Bengal that retains the bloom of health. Formerly female adventurers in India were few; but highly successful. Emboldened by their success, and encouraged by their example, such numbers have embarked in this speculation, as threaten to defeat its purpose. The irregularities of our government, which formerly afforded an opportunity to some of rapidly accumulating wealth, and enabled them to marry, are now in a great measure done away. Few comparatively find themselves in circumstances that invite to matrimonial engagements; and on this account a number of unfortunate females are seen wandering for years in a single and unconnected state. Some are annually found to abandon the forlorn hope, and return to Europe, after the loss of beauty, too frequently their only property.

Having mentioned the "black hole" at Calcutta, which is become proverbial among Englishmen for a place of insufferable torment, we shall now recite some further particulars concerning the tragic event to which we have referred. When Surajah Dowlah in 1756 reduced Calcutta, the English prisoners to the number of 146, of whom Mr. Holwell was one, were confined in the black hole prison. It was about eight o'clock when these 146 unhappy persons, exhausted by continual action and fatigue, were thus crammed together into a dungeon about eighteen feet square, in a close sultry night in Bengal; shut up to the east and south, the only quarters from whence air could reach them, by dead walls, and by a wall and door to the north; open only to the west by two windows. Strongly barred with iron, from which they could receive scarce any circulation of fresh air.

They had been but few minutes confined before every one fell into a perspiration so profuse, that no idea can be

formed of it. This brought on a raging thirst, which increased in proportion as the body was drained of its moisture. Various expedients were thought of to give more room and air. Every man was stripped, and every hat put in motion: they several times sat down on their hams; but at each time several of the poor creatures fell, and were instantly suffocated or trod to death.

Before nine o'clock every man's thirst grew intolerable, and respiration difficult. Efforts were again made to force the door; but still in vain. Many insults were used to the guards, to provoke them to fire in upon the prisoners, who grew outrageous, and many delirious. "Water, water," became the general cry. Some water was brought: but these supplies, like sprinkling water on fire, only served to raise and feed the flames. The confusion became general, and horrid from the cries and ravings for water; and some were trampled to death. This scene of misery proved entertainment to the brutal wretches without, who supplied them with water, that they might have the satisfaction of seeing them fight for it, as they phrased it; and held up lights to the bars, that they might lose no part of the inhuman diversion.

Before eleven o'clock, most of the gentlemen were dead, and one third of the whole. Thirst grew intolerable: but Mr. Holwell kept his mouth moist by sucking the perspiration out of his shirt-sleeves, and catching the drops as they fell, like heavy rain, from his head and face. By half an hour after eleven, most of the living were in an outrageous delirium. They found that water heightened their uneasiness; and "Air, air," was the general cry. Every insult that could be devised against the guard, all the opprobrious names that the viceroy and his officers could be loaded with, were repeated, to provoke the guard to fire upon them. Every man had eager hopes of meeting the first shot. Then a general prayer to heaven, to hasten the approach of the flames to the right and left of them, and put a period to their misery. Some expired on others; while a steam arose as well from the living as the dead, which was very offensive.

About two in the morning, they crowded so much to the windows, that many died standing, unable to fall by the throng and equal pressure round. When the day broke, the stench arising from the dead bodies was insufferable. At that juncture, the Soubah, who had received an account of the havoc death had made among them, sent one of his officers to inquire if the chief survived. Mr. Holwell was shown to him; and near six, an order came for their release.

Thus they had remained in this infernal prison from eight at night until six in the morning, when the poor remains of 146 souls, being only 23, came out alive; but most of them in a high putrid fever. The dead bodies were dragged out of the hole by the soldiers, and thrown promiscuously into the ditch of an unfinished ravelin, which was afterwards filled with earth. See BENGAL. Rennell's Memoirs, Pinkerton's Geog. vol. ii. Tennant's Indian Recreations, vol. i.

CALDA, or CALDUM, in the *Ancient Diet*, denotes hot water, used much among the Romans, anciently, as a drink, partly for pleasure, and partly for health.

The word is formed from *calidus*, hot; *aqua* being understood; *caldā*, q. d. *calida aqua*.

Lipsius, Callalio, Mercurialis, Baccius, and Freinshemius, have treated largely *de potu caldā*, or *caldi*. Act. Erud. Lips.

CALDAO, in *Geography*, a river of Portugal, which runs into the sea, at Setuval.

CALDARA, ANTONIO, in *Biography*, and *Musical History*, was a native of Venice, a great harmonist and com-

poser of the old school, and extremely voluminous both for the church and the stage. His first opera, *Argine*, was composed for his native city, in 1689, and after furnishing different parts of Italy with 12 operas and oratorios, in 1714, he went to Vienna, where he was appointed second Maestro di Capella, under Fouchs, to the Imperial court, and where his grave style of writing pleased the emperor Charles VI. so much, that he hardly ever employed any other composer of sacred or secular music than Caldara, till after his decease in 1736. So that he not only set most of Apostolo Zino's operas for the first time, but 13 of his oratorios; and was the first composer of Metastasio's operas and oratorios, during the first six or seven years of his residence at Vienna.

The masses and motets that we have seen of his composition, are admirable; a gravity of style, a purity of harmony, learning, facility, and correctness in the texture of the parts, are manifest in them all; but with his secular music, we are little acquainted; Metastasio, in his letters, seems to complain of his want of invention, taste, and elegance, in setting his dramas; and he first set seven of his best productions for the Imperial theatre.

Metastasio began his Imperial laureatship at Vienna in 1731, by writing an oratorio, *Sant' "Elina in Calvario."* His first operas were "Adriano in Syria;" the second, "Demetrio;" then "Olimpiade," "L'Alfio d'Amore," "Le Grazie," "Demoteonte," "La Clemenza di Tito," "Ciro riconosciuto," and "Zenobia." All these were set to music by Caldara; but there must have been some material deficiency of style or invention, which prevented this music from penetrating into the rest of Europe; for these admirable dramas were never heard of till they had been set by other composers.

CALDARADI CARAVAGGIO, POLIDORO. See POLIDORO.

CALDARIA *Judiciaria*, the method of trial, or *purgation* by boiling water. See ORDEAL.

CALDARIUM, in the *Ancient Baths*, denoted a brazen vessel or cistern, placed in the hypocaustum, full of hot water, to be drawn thence into the *piscina*, or bath, to give it the necessary degree of heat.

In this sense, the *caldarium* stood contradistinguished from the *tepidarium* and *frigidarium*.

CALDARIUM also denoted the stove, or sudatory, being a clove vaulted room, wherein by hot dry fumes, without water, people were brought to a profuse sweat.

In which sense, *caldarium* was the same with what was otherwise denominated *vaporarium*, *sudatorium*, and *laconium*; in the Greek baths, *hypocaustum*, *ὑποκλυστήριον*.

CALDARIUM *es*, denotes POT-metal.

CALDAS, in *Geography*, a small town of Portugal, in the province of Estremadura, a league from Obidos, and 13 miles E. of Peniche; much frequented for its sulphureous waters. The town is built in an irregular quadrangular form, and the houses are small, generally consisting merely of a ground-floor, and only a few of them have windows. To this place the rich merchants and principal nobility of Lisbon resort twice a year, *viz.* in May and September. Over the warm spring is a spacious and handsome bathing-house, and adjoining to it an hospital for poor patients. Besides the springs used for drinking, three others supply four baths; and the united water from all the springs turns a mill near the bathing house.

CALDAS de Rey, a town of Spain, in Galicia, 20 miles south of Santiago.

CALDER, a town of Mid-lothian in Scotland, is situated in a pleasant country, at the distance of 12 miles west of Edinburgh. Here are two annual fairs, and a weekly market; but there are no manufactories, the population

is but small. In 1792, it amounted to 562 inhabitants. A short distance west of the town, is *Calder-house*, the seat of lord Torphichen. This mansion is memorable in the ecclesiastical history of Scotland, as the place where the Sacrament was first administered after the reformation. The ceremony was performed by John Knox, the celebrated reformer; a portrait of whom is preserved in the house.

CALDER, a river of England, which runs into the Aire, about two miles N. of Pontefract in Yorkshire. It is navigable to Halifax. Also a river, which runs into the Ribble, three miles S. of Clitheroe in Lancashire.

CALDER Water, a river of Scotland, which runs into the Clyde, about five miles above Glasgow.

CALDERA, a sea-port of South America, in the country of Chili, on the coast of the Pacific Ocean, two leagues N.E. from the lee of an island at the mouth of the river Copiapo. S. lat. 27°. W. long. 7°.

CALDERINI, DOMITIO, in *Biography*, an eminent philologist, was born about the year 1446, at Torri, in the territory of Verona, and at the age of 24 years, he was invited, in consequence of the recommendation of cardinal Bessarion, by pope Paul II. to the professorship of belles lettres at Rome. In this office he continued, under Sixtus IV. and died in 1478, in the flower of his age. All his scholars attended him to his grave in mourning. He was much distinguished by the assiduity of his literary labours, and printed commentaries upon Martial, Juvenal, Virgil, Ovid, Statius, and Propertius, and several others of the Latin poets: he also published a translation of the two first books of Pausanias, into Latin. He, moreover, cultivated jurisprudence, philosophy, and mathematics, and exercised himself successfully in Latin poetry. He is reckoned one of the literary wonders of his age. Tiraboschi.

CALDERINO, in *Geography*, a place of Italy, in the Veronese, celebrated for its baths, called "the baths of Verona."

CALDERO, a remarkable mountain in the gulf of Venice, which is a guide at sea for the harbour Rovigno, which see.

CALDERO, *Cape*, lies on the north coast of South America, W. of Otchier bay, and about 12 leagues E. by S. from the Caracas fort, called the White Cape. It lies nearly S. or a little westward from the west end of Margarita Island, on the coast of the Spanish main.

CALDERON, DE LA BANA, DOM. PEDRO, in *Biography*, a celebrated Spanish dramatic writer, flourished about the year 1640, and after having borne arms, and sustained the rank of a knight of the order of St. James, became an ecclesiastic, and a priest and canon of Toledo. Turning his attention to the theatre, he acquired the reputation of the most copious and esteemed writer for the stage, in Spain, and was sometimes denominated the Spanish Shakspeare. The fertility of his invention, and the taste of his age and country, rendered him incorrect in the observance of the rules of the drama, and very unequal in his style and composition. His characters are unnatural, and his diction inflated. His chief excellence consisted in the contrivance of plots, which are full of business, and abound in intricacies happily resolved in the catastrophe. Most of his works were collected and published at Madrid, in nine vols. 4to. 1689; the three first containing his comedies, and the six last, a number of dramatic pieces on religious subjects, like the Old Mysteries, under the title of "Autos Sacramentales." His scanty knowledge of history has betrayed him into several blunders. *Nouv. Dict. Hist.*

CALDERON, in *Geography*, lies on the coast of Coromandel, in India, six leagues N. from Tranquebar.

**CALDESBURG**, a township of Orleans county, in the state of Vermont, America, about 151 miles N.E. from Bennington, and 11 miles W. of Connecticut river.

**CALDERWOOD, DAVID**, in *Biography*, a presbyterian divine of the church of Scotland, was the descendant of a good family in that kingdom; and being early destined to the ministry, he acquired, in the course of his education, an extensive acquaintance with those subjects that were peculiarly appropriate to his profession. About the year 1604, he was settled at Crelling near Jedburgh. Zealously attached to the Presbyterian establishment, he disapproved the project formed by king James I. of Great Britain, for bringing the church of Scotland to a nearer conformity with that of England; and when Mr. James Law, the bishop of Orkney, made a visitation of the presbyteries of Merse and Tivodale, as a preliminary towards assuming episcopal powers, he declined his jurisdiction by a paper under his hand, dated May 5, 1608. Thus did he commence that resistance to the measures of the king and episcopal party, which uniformly directed and influenced his future conduct. Accordingly, he did not assist at the general assembly held at Glasgow, June 8. 1610, in which lord Dunbar, the high-treasurer of Scotland, presided as commissioner; and it appears from his writings, that he regarded all the transactions of this assembly as null and void. He also excepted against the proceedings of another general assembly held in 1616, at Aberdeen. When a parliament was held by the king in the following year at Edinburgh, and the clergy met, at the same time, in one of the churches, in order to confer with the bishops, thus contriving an assembly which was intended to resemble the English convocation; Mr. Calderwood, though he attended, publicly declared, that he did not consider any such meetings as resembling a convocation: and when he was informed that a bill was depending to empower the king, with the advice of the archbishop, bishops, and such a number of the ministry as his majesty might think proper, to consider and conclude as to matters decent for the external policy of the church, not repugnant to the word of God; and that such conclusions should have the force of ecclesiastical laws; he concurred, with other ministers, in a formal protest against the measure, for reasons which were subjoined. This protest was presented; and though the clerk-register refused to read it before the states in parliament, it had its effect; for although the bill had the consent of parliament, yet the king thought fit to set it aside, and soon after called a general assembly at St. Andrew's. In consequence of this protest, Mr. Calderwood was summoned before the high-commission court at St. Andrew's, on the charge of mutinous and seditious behaviour. The king was present, and examined him in person; but Calderwood defended himself with such spirit and presence of mind, persisting in his refusal to acknowledge that he had been guilty of any crime, that he was first committed to prison; and then sentenced, by the privy council, to banish himself out of the king's dominions, and not to return without licence. All his efforts for mitigating this sentence proving ineffectual, he retired to Holland, where he steadily maintained his former principles, and in 1623, published his famous book, entitled "Altare Damascenum, seu Ecclesiæ Anglicanæ Politia, Ecclesiæ Scoticanæ obtrusa, à Formalista quodam delineata, illustrata et examinata." This work contains a close and rigorous examination of the polity of the English church, under various heads, in which the origin and authority of episcopacy, and all the other points of difference, between that and the Presbyterian churches, are discussed. King James is said to have expressed a high opinion of this work, though he was extremely displeas'd with

it; and it is certain, that it made a great impression in England, and was very much admired by all avowed Puritans, and by such as were well-wishers to their opinions. The modern dissenters, however, would not concur in many of the author's sentiments; nor would they contend for the "Jus Divinum" of Presbyterianism. Soon after the publication of this work, Mr. Calderwood returned to Scotland, and lived privately for several years. As his situation was unknown, and he had been afflicted in 1624, with a long and dangerous fit of sickness, a person, whose name was Patrick Scot, taking it for granted that he was dead, wrote a recantation in his name, purporting, that before his decease, he had changed his sentiments; but when this imposture was detected, he went over to Holland, and made diligent search for him, with a design, as Mr. Calderwood believed, to have dispatched him. During his retirement, it is not unlikely, such were his talents and temper, that he wrote several books against the proceedings of the clergy in Scotland. But it is more certain that he employed himself in diligently collecting all the memorials relative to the ecclesiastical affairs of that kingdom, from the commencement of the reformation to his own time. These he digested and methodized with great care, and the whole is extant in MS. in the library of the University of Glasgow, in six folio volumes. Of these, an extract has been published, under the title of "The true History of the Church of Scotland," printed in 1618, which comes down to the death of king James. Although the perusal of this work, on account both of its spirit and style, cannot be agreeable, and the representations contained in it must have acquired a strong tinge from party; it has, nevertheless, been always regarded as a source of much authentic information. How much longer the author survived is not known; but it seems probable, from his mentioning the death of Robert Bruce, which happened in 1631, that he lived pretty far in the reign of Charles I.; and we find that he was minister of Pencaithland, near Edinburgh, in 1638. *Biog. Brit.*

**CALDONAZZO**, in *Geography*, a lake of Germany, in the county of Tyrol; 8 miles E.S.E. of Trent.

**CALDRON**, a large kitchen utensil, commonly made of copper; having a moveable iron handle, whereby to hang it on the chimney-hook.

The word is formed from the French *chaudron*, or rather the Latin *caldarium*.

**CALDRONS, boiling in, caldarius decoquere**, is a capital punishment spoken of in the middle age writers, decreed to divers sorts of criminals, but chiefly to debasers of the coin.

One of the torments inflicted on the ancient Christian martyrs was boiling in caldrons of water, oil, &c.

**CALDUBA**, in *Ancient Geography*, a town of Spain, placed by Ptolemy in Bætica, in the territory of the Turdetani.

**CALDUENDO**, in *Geography*, a town of Spain in the province of Guipuscoa; 8 leagues east of Vittoria.

**CALDY**, a small island in the great bay of Carmarthen, in South Wales; on its west side, at S.S.E. from Tenby, forming an inner limit on that side to the bay, though it stretches out circuitously to St. Gowan's point. It is about 3 miles from Tenby, and 5 leagues almost west from Worms-head, and has upon it a white tower appearing at a distance like a white sail, and serving to shew where the land lies. Ships may anchor on every side of this island, and be sheltered from all winds. N. lat. 51° 33'. W. long. 5° 19'.

**CALE**, or **KALE**, in *Botany*. See **BRASSICA**, **BORECOLE**, and **CRAMBE**.

**CALE**, in *Scripture Geography*. See **CALAH**.

**CALEA**, in *Botany*, Linn. gen. 941. Schreb. 1277-Willd. 1466. Juss. p. 185. Gart. 975. Class and order, *Syngenesia*

*Syngenesia polygamia equalis*. Nat. ord. *Compositæ oppositifoliae*, Linn. *Corymbiferae*, Jusseu.

Gen. Ch. *Cal.* imbricated; scales oblong, rather loose. *Cor.* uniform; florets hermaphrodite, numerous, equal, funnel-shaped; border five-cleft. *Stam.* filaments five, capillary, very short; anthers forming a cylindric tube. *Pist.* germ a little oblong; style thread-shaped, the length of the corolla; stigmas two, recurved, acute. *Peric.* the permanent calyx. *Seeds* solitary, oblong; down simple or none. *Receptacle* chaffy; scales a little longer than the calyx, standing out conspicuously among the florets.

Eff. Ch. *Calyx* imbricated. *Receptacle* chaffy. Sp. 1. *C. jamaicensis*, Linn. (*Santolina subhirsuta*, &c. Brown. Jam. 315. 8. *Conyza fruticosa*, &c. Sloane Jam. 124. hist. 1. p. 257. t. 151. f. 3.) "Flowers about three, peduncled; leaves ovate oblong, somewhat serrated, petioled." Perennial. *Stems* six or seven feet high, shrubby, slender, round, slightly downy. *Leaves* opposite, hairy, rugged, three-nerved. *Flowers* terminating, yellow with a red tinge: calyx coloured: chaffy scales of the receptacle coloured, the length of the calyx; down rugged, as long as the flower. A native of Jamaica; in woods. Obs. As several other species are natives of Jamaica, the trivial name is a bad one. 2. *C. aspera*, Willd. Jacq. ic. rar. 3. t. 583. Collect. 2. p. 290. "Flowers solitary, peduncled, axillary; leaves oblong, trebly nerved, unequally serrated, rough." Willd. Annual. *Stem* four-cornered; leaves opposite. A native of the warmer parts of America. 3. *C. oppositifolia*, Linn. (*Santolina erecta foliis linearibus*; Brown. Jam. 315. 4. *Acmella jamaicensis*; Sloane hist. 1. p. 256. *Coipatlis*, Hern. 36.) "Corymbs close; peduncles very long; leaves lanceolate; stem herbaceous." *Stem* two feet high, upright, rather stiff, striated, pubescent; branches opposite. *Leaves* opposite or ternate, nearly sessile, entire or slightly toothed, nerved, acuminate, soft. *Flowers*, white. *Seeds* without down, (with three or four very minute awns, Swartz). Inner scales of the receptacle longer than the rest. A native of Jamaica. 4. *C. Amellus*. Linn. (*Amellus ramosus*, &c. Brown. Jam. 317.) "Flowers somewhat panicle; calyxes short; seeds naked; leaves ovate-lanceolate, petioled." *Stem* shrubby, branched. *Leaves* opposite. *Flowers* yellow. A native of Jamaica. Willdenow suspects that it does not differ from *Bidens scandens* of Linnæus. This and the preceding were cultivated by Mr. Miller in 1768. 5. *C. lobata*, halbert-weed, Willd. Gært. Tab. 174. fig. 5. (*Conyza lobata*; sp. pl. *Conyza arborescens*, Plum. Spec. 9. ic. 96. *Santolina erecta subhirsuta floribus comosis*, Brown Jam. 315. 2. *Virga aurea major*, five Doria; Sloane Jam. 125. Hist. 1. 260. tab. 152. fig. 4) "Corymbs close; leaves alternate; upper ones ovate-lanceolate; lower ones halbert-shaped, sinuate-serrated." Swartz. Perennial. *Stem* four or five feet high, leafy, branched. *Flowers* yellow. Sloane. *Receptacle* rather convex; scales similar to those of the calyx. *Seeds* small, oblong, smooth; down simple, a little toothed, shorter than the scales of the receptacle, but equal in length to the flower, caducous. Gært. Brown speaks of it as an excellent bitter, and says that a spirituous infusion of the tops is kept in most plantations, and administered as an active stomachic. Introduced into England by Dr. Houlton before 1733. 6. *C. pinifolia*, Willd. Martyn. Forst. prod. 288. "Flowers somewhat umbellate, terminating, close; leaves nearly smooth, alternate, linear, revolute at the margin; stem shrubby; branches pubescent," Willd. Perennial. Peduncles short, one-flowered. A native of New Zealand. 7. *C. leptophylla*, Willd. Martyn. Forst. Prod. 287. "Flowers somewhat umbellate, terminating; leaves growing by fours, spreading, linear, obtuse, revolute at the margin,

down underneath; stem shrubby; branches downy." Willd. Perennial. Younger leaves imbricated, adult ones spreading; old ones rather reflexed. A native of New Zealand. 8. *C. scoparia*. See *SERGILUS Scoparius*.

Obs. A seed with a simple down forms part of the generic character of *Calea*, as drawn up by Linnæus; and yet that character is found in only one of his own species. We have therefore found it necessary to exclude it from the essential character, in order to admit the *oppositifolia* and *amellus*; as Martyn and La Marek had already in some degree done; though we confess that, with the omission, the genus is not sufficiently discriminated from some others. The whole class *Syngenesia* certainly stands in need of accurate investigation and cautious reform. But this is a task on which we have not leisure to enter. We apprehend that we discharge our duty to the public, if we lay before it the present state of the science, and point out such deficiencies as occur to our notice. The *scoparia*, which Linnæus at first made a *chrysocoma*, having a naked receptacle, cannot be a *calca*. As it differs from *chrysocoma* in the structure of its down, we have adopted the genus formed for it by Gærtner.

*Propagation and Culture.* These plants may be propagated by seeds, treated like other natives of warm climates.

CALEAL, in *Geography*, a town of Persia, in the province of Aiderbeizan, 142 miles S.E. of Tauris.

CALEB, in *Scripture History*, the son of Jephunneh, one of the messengers deputed by Moses to explore the land of Canaan. Caleb and Joshua returned with a favourable report, revived the dejected spirits of the Israelites, and assured them of success in their projected invasion of the country. On this account it was predicted by Moses that they were the only two persons of all the people that came out of Egypt, who should live to enter the land of Canaan. Caleb was at this time 40 years old. After the Israelites, under the command of Joshua, had taken possession of Canaan, B. C. 1451, he divided the land in the year B. C. 1455; upon which Caleb obtained for his portion the mountains and city of Kirjath-Arba, or Hebron, a district possessed by the three sons of Anak. Finding it difficult to expel them from the town of Debir, he promised his daughter Achsah as wife to any one who should take it. This was effected by Othniel, the son of Kenaz, Caleb's younger brother, who accordingly married Achsah. Caleb then settled at Hebron, and is said to have lived in peace to his 114th year. Numb. xiii. xiv. Joshua xv. Judges 1.

CALEB, in *Scripture Geography*, a district of Judah, in which were the cities of Kirjath-Sepher, and Hebron, belonging to the family of Caleb. 1 Sam. xxx. 14.

CALECASIA, in *Geography*, a market town of Corsica, in the district of Niolo.

CALED, or KHALED, EBEN AL WALID, in *Biography and History*, one of the most valiant, successful, and ferocious of Mahomet's captains, belonged to the tribe of Koreish, and began his military career with opposing the pretended mission of the prophet: and at the battle of Ohod, contributed by means of the wing which he commanded to the defeat of the Moslems. Being afterwards converted, he became a principal champion in the impostor's cause, and obtained from Mahomet the honourable title of "one of the swords of God." This title was conferred upon him in consequence of the battle of Muta, A. D. 630, in which, after the fall of three successive commanders of the Moslems, he assumed the standard, and by his valour withstood and repulsed the superior numbers of the Christians. Upon the accession of Abubeker, he was deputed with a small army to counteract the revolt of several Arabian tribes, whom he completely

plenty of food. He afterwards obtained a more important victory over the emperor Mosefama, who fell in the battle, and whose flying followers were compelled to embrace the religion of Mahomet. In his subsequent invasion of Irak, the ancient province of Babylon, he was eminently successful, and terminated his expedition by the capture of the city Hieropolis, the Euphrates, and the extinction of the kingdom, which took its name from that capital. From thence he was summoned into Syria to support the Moslems under the command of Abu Obeidah, who had met with several checks from the Greeks; and being appointed to supersede that general, he soon changed the aspect of affairs. Having relieved the detachment that besieged Bostra, he recaptured this place, and, aided by treachery, took it. To the inhabitants who sued for quarter, he shewed himself unusually merciful, and restrained the carnage which they were suffering. On his arrival before Damascus, he vanquished by his personal valour two Christian commanders, and on their refusal to embrace Islamism, put them to death in cold blood. Having collected a powerful body of Moslems at Amardin, in the year 633, he totally discomfited Werdan, the general of Heraclius, and destroyed the greatest part of his army. During the progress of the siege of Damascus, many exploits of valour were performed by both parties; at length, however, the siege having been prolonged 70 days, the inhabitants sought refuge in the mild and generous disposition of Abu Obeidah from the fury of Caled, and stipulated to surrender the place on moderate terms. In the mean while Caled interposed, prevented the execution of the treaty, and with savage ferocity, put to the sword all that came in his way; and meeting with Abu Obeidah, who was peaceably entering the city, a contest ensued; one insisting on the right of the sword, and the other urging the sacredness of a capitulation. Caled in the issue yielded to the pleas of mercy and true policy; and the sword was sheathed, on condition of admitting to tribute and toleration of religion those inhabitants who chose to continue in the city. The adherents of Thomas, however, who had fought under his banner in the defence of the city, embraced the alternative of poverty and exile. Accordingly in an adjacent meadow they formed an encampment of priests and laymen, of soldiers and citizens, of women and children; and being allowed to take with them their most precious moveables, and arms necessary for their defence, they prepared to abandon their native homes. Caled, whose inflexible soul was not touched by the spectacle of their distress, halted and incommoded their departure; and sternly declared, that after a respite of three days, they might be pursued and treated as the enemies of the Moslems. Unfated with blood and vengeance, and further urged by the intreaties of Jonas, a noble Damascene, whose betrothed spouse had accompanied the fugitives, Caled at the head of 4000 horse, in the disguise of Christian Arabs, undertook the pursuit. Accordingly he traced their march across the mountains of Libanus, encountering incredible hardships, to the vicinity of Laodicea, and in a pleasant valley where they had pitched their tents, rushed on the promiscuous multitude, insufficiently provided with arms, and already vanquished by sorrow and fatigue. In consequence of this furious onset and indiscriminate slaughter, the Arabs enjoyed the satisfaction of believing, that not a Christian of either sex escaped the edge of their scymetars; and all the rich spoils of the victims fell into the hands of the conquerors. In the tumult of the battle Jonas found the object of his pursuit; but her resentment was inflamed by the last act of his perfidy; and as Eudocia struggled in his hateful embraces, she struck a dagger to her heart. Caled had penetrated, on this occasion, about 150 miles into the Roman territory; and having

completed this bloody tragedy, which has afforded a striking subject both to history and poetry, he returned to Damascus with the same secrecy and speed.

On the accession of Omar, who succeeded Abubeker in the caliphate, Caled was removed from the command; and it was again transferred to the more gentle and conciliatory Abu Obeidah. The army expressed their dissatisfaction with this change; but Caled, notwithstanding the characteristic ferocity of his temper, submitted to it with magnanimity; and having caused Omar to be proclaimed caliph at Damascus, resigned his command without hesitation, declaring his readiness to serve the Mussulman cause in any post which it should please the head of the religion to assign him. Soon afterwards his activity and enterprise were of signal service in relieving a party of the Moslems, who had incautiously marched to plunder a famous monastery in the neighbourhood of Abyla, and who were surrounded by a much superior force. Caled himself had been relieved in similar circumstances of danger, on a reconnoitering party, by a detachment sent by Abu Obeidah. Under this chief Caled served in Syria and Mesopotamia, and he always distinguished himself in seasons of peculiar difficulty and peril. Of his subsequent exploits the most eminent was the victory obtained by him in the battle of Yermuk, A. D. 636; on which interesting occasion the public voice, and the modesty of Abu Obeidah restored the command to him, who was esteemed the most deserving of the Moslems. The combat was obstinate and bloody; 4030 of the Moslems were buried in the field of battle; and the skill of the Armenian archers enabled 700 to boast that they had lost an eye in that meritorious service. The Syrian veterans acknowledged that it was the hardest and most doubtful of the days which they had seen; but it was likewise the most decisive. Many thousands of the Greeks and Syrians fell by the swords of the Arabs; many were slaughtered, after the defeat, in the woods and mountains; many, by mistaking the fords, were drowned in the waters of the Yermuk; and however the loss may be magnified, it was undoubtedly very great. Abu Obeidah, in his letter to the caliph, states the number killed to have been 150,000, and the prisoners at 40,000. This computation exceeds all belief. Such was the success of the Saracens, that the Greek army durst no longer appear in the field; and the conquest of Jerusalem was the speedy result. In 638, Caled took Aleppo, and he carried his victorious arms beyond the Euphrates. He survived about three years the pestilence of 639, which proved fatal to many Mussulman chiefs; but no account remains of the time or manner of his death. His tomb is shewn in the neighbourhood of Emefa. The valour of this champion was supported by fanaticism; for as long as he wore a cap, which had been blessed by Mahomet, he deemed himself invulnerable. *Mod. Un. Hist. vol. i. Gibbon's Hist. vol. ix.*

CALEDON, in *Geography*, a small town of Ireland, in the county of Tyrone, and province of Ulster, near the river Blackwater, 70 Irish miles N. by E. from Dublin.

CALEDONIA, in *Ancient Geography*, an appellation by which that part of Great Britain now called Scotland was formerly distinguished. See SCOTLAND. The etymology of this name, as well as the precise boundaries of the country to which it has been applied, have been variously assigned. According to Camden, the appellation of Caledonia is derived from the Celtic or British *kaled* or *caled*, hard; whence Caledonii, signifying a people, *hardy*, *uncivilised*, and *ruffic*. Buchanan derives it from the old Scottish word, *calden*, denoting a hazle-tree. Others (See Preface to Ossian's Poems, vol. ii. p. 4.) compound it of the two British words *call* and *dun*, which signify the Gauls or Britons of the mountains,

tains. Accordingly it is said, that this was a very proper name for the real Caledonians of Badenoch, Braidalbin, and the adjacent tracts, which are the most mountainous parts of Scotland, and not very unsuitable to the other nations, to whom it was given by the Roman authors. Others again affirm, that *Gael-doch* is the only appellation, which the Scots, who speak the Gaelic language, know for their own division of Britain: And *Gael-doch* is a compound of *Gael* or *Carl*, the first colony of the ancient Gauls who transmigrated into Britain, and *doch*, a district or division of a country. The Romans, by transposing the letter *l* in *Gael*, and softening into a Latin termination the *ch* of *doch*, formed the well known name of Caledonia.

The ancient Caledonia comprehended all that country which lay to the north of the rivers Forth and Clyde; or, as others state its boundaries, from the wall of Severus, connecting the east coast near Fiumouth with the Solway Firth, at Boulnefs, on the west coast, to the northern shore. The Caledonii of Ptolemy possessed that extensive tract of country which reached from the Lelannonian bay, or Loch-fenn, on the west, to the estuary of Vara or Firth of Tayne on the east coast, and included Badenoch, Braidalbin, the inland parts of the shires of Murray, Banff, Aberdeen, and Perth. The Greek and Roman historians and poets, who flourish in the first, second, and third centuries, when they have occasion to mention the affairs of Britain, give the general name of Caledonii to all the British nations without the limits of the Roman province, and that of Caledonia to their country. The reason of this might be, that the Caledonii were the most powerful or warlike of those nations, and maintained some kind of superiority over the rest, who were contented to fight under their conduct against their common enemies, the Romans and provincial Britons. Hence the name of the Caledonii, from being the proper name of one nation, became the common denomination of many.

Caledonia seems to have been unknown to the Romans till Agricola entered it with his army, in his third campaign, A. D. 80. Marching from south-west towards the north-east, he traversed the territories of several British tribes, and penetrated to the river Tay, without opposition. The Caledonii seemed to have retired, hoping to recover in the winter, after the retreat of their enemies, what they had lost in the summer. But Agricola disappointed their expectations by employing the remainder of the season in building forts in the most convenient situations for keeping possession of the country. As soon as these forts were finished and stored with provisions, he put his army into them for their winter-quarters, that his troops might be every where at hand to check the attempts of the natives to shake off the yoke. Tacitus does not inform us, whether Agricola spent this winter in Caledonia, or in the more southern parts of Britain. See AGRICOLA.

When Adrian arrived in Britain A. D. 121, he actively employed himself in securing the frontiers of the Roman possessions against the incursions of enemies. With this view he erected his famous rampart or wall, as the boundary of the Roman province, from the mouth of the river Tyne on the east, to the Solway firth on the west, near the track where Agricola had built his first chain of forts. See ADRIAN. Under the reign of Antoninus Pius, A. D. 138, Lollius Urbicus was governor of Britain; and in order to secure the peace of the Roman province in this island, it was found necessary to enlarge its limits. Accordingly Lollius Urbicus defeated the Mœatæ in several engagements, and recovered the country as far as the isthmus between the firths of Forth and Clyde. In order to secure his con-

quest, and to keep the Caledonians at a greater distance, Urbicus, by direction of the emperor, raised another strong-rampart, in imitation of that of Adrian, between those two firths, along the line of forts which had been constructed there by Agricola. This rampart, with its ditch and forts, was intended for the utmost boundary of the Roman empire in Britain. In the year 180, the Caledonians, having broke through the wall of Antoninus, and being joined by the Mœatæ, invaded the Roman province. To repel this invasion, the government of Britain was bestowed upon Ulpius Marcellus, who, having first restored the discipline of the Roman troops, led them against the enemy, and defeated them in several battles. During the contest which took place on the accession of Septimus Severus to the imperial throne, Britain became a scene of great confusion, A. D. 198. The Mœatæ and Caledonians, observing the defenceless state of the Roman province, made incursions into it, and spread desolation in their progress. When Lupus was deputed by Severus to repel these invaders, he found himself unable to accomplish this object by force, and therefore bribed the plunderers to retire, by purchasing their prisoners with a sum of money. Their incursions, however, were renewed with greater violence for several years; and it was found necessary for Severus himself to visit Britain in person. The news of his arrival, A. D. 207, alarmed the Mœatæ and Caledonians, and induced them to send ambassadors to promise submission, and sue for peace. Severus, however, dismissed the ambassadors without any satisfactory answer, and advanced northward at the head of a very large army. When he had passed the wall of Adrian, he encountered many difficulties and dangers. His army was harassed with continual skirmishes, and decoyed into many ambushes; and in his progress, he was obliged to employ one part of his army in cutting down woods, draining lakes and marshes, making roads, and casting bridges over rivers, whilst the other part defended the labourers from the enemy. In this expedition Severus lost no fewer than 50,000 men, though he fought no battle, and saw no enemies in a body. At length he penetrated into the very heart of Caledonia, and struck such terror into its inhabitants, that they renewed their supplications for peace, which was at last granted them, on condition of relinquishing a part of their country, and delivering up their arms. Having concluded a peace with the Caledonians, and conducted his army back into the northern parts of the Roman province, he employed his troops for about two years in constructing his famous wall. Towards the disastrous decline of his life, A. D. 210, the Mœatæ and Caledonians took advantage of his weakness and the distraction of his family, and renewed the war in hopes of recovering that part of their country which they had been obliged to resign. The aged emperor, who had retired to York, became peevish by his complicated sufferings, was enraged by the news of this revolt, and issued orders for exterminating these two nations, without sparing the very infants in their mothers' wombs. The execution of these cruel orders was prevented by the emperor's death. His eldest son Caracalla, as soon as he heard of his father's death, concluded a peace with the Mœatæ and Caledonians, and soon after left Britain.

When the emperor Severus invaded Caledonia, A. D. 207, we are told (Xiphilin. ex Dio Nicæo in Sever.) "that the Mœatæ and Caledonians (who possessed all the island beyond the wall of Adrian), inhabited barren uncultivated mountains, and desert marshy plains; that they had neither walls, houses, nor cultivated lands; but lived on the milk and flesh of their flocks and herds, on what they got by plunder, or caught

by hunting, and on the fruits of their trees." Having been obliged by Severus to surrender part of their country to the Romans, this indolent people, in the course of the third century, built several towns and stations, constructed high-ways, cut down woods, drained marshes, and introduced agriculture into the country between the walls, many parts of which are very level, fertile, and fit for tillage. Although the Romans never formed any large or lasting establishments to the north of the wall between the Forth and Clyde; yet many of them, and of the provincial Britons, retired into Caledonia at different times, and on various occasions, particularly about the end of the third century, in order to escape from the Diocletian persecution. It is, therefore, highly probable, that these refugees instructed the people among whom they settled, not only in their religion, but also in their arts, particularly agriculture. The eastern coasts of Caledonia were remarkably fit for cultivation, and the Picts, who inhabited these coasts, were very early acquainted with agriculture, which they undoubtedly learned from the Romans, or the provincial Britons. The name which was given to the Caledonians on the east, by those of the west, was "Cruitnich," which signifies wheat or corn cakes; a proof that they were husbandmen, and expressing the contempt or envy of the carnivorous highlander. There is also reason to believe, that the Caledonians of the west, who, in the fourth century, began to be called "Scots," denoting, in the Celtic language, wanderers or vagrants, though they were of a more restless and wandering disposition than those of the east, and their country was more mountainous, and not so fit for cultivation, were not altogether ignorant of agriculture at this period. The vicinity of the Hebrides, profusely scattered along the western coast of Scotland, tempted the curiosity of these western Caledonians or Scots, and improved their skill; and they acquired, by slow degrees, the art, or rather the habit, of managing their boats in a tempestuous sea, and of steering their nocturnal course by the light of the well-known stars. The ancient Caledonians, and other Britons, educated in the midst of arms, and accustomed from their infancy to hear nothing admired or celebrated but valiant deeds in war, looked upon every profession but that of arms as dishonourable; and every employment but war as unworthy of a man of spirit. To such an extravagant height did they carry these absurd and pernicious notions of honour, that they imagined that those who followed any other employment, except that of arms, not only lived despised, and died unlamented; but that their souls, after death, hovered in the lower regions, among fens and marshes, and never mounted the winds, nor mingled with the souls of warriors in the airy halls. Dio and Herodian seem to intimate, that the Mœtæ and Caledonians were naked in the beginning of the third century, when they were invaded by the emperor Severus. But these authors probably meant no more than that these people were very imperfectly clothed, or almost naked; and they use expressions which admit of this interpretation. As the Romans never conquered the Caledonians, or northern Britons, they cannot be supposed to have made any material change in their language; which is still spoken by their posterity, in the highlands, and western islands of Scotland, with less variation from the original Celtic (if we may believe some of the best judges in these matters,) than in any other part of Europe.

As early as the reign of Constantine, the inhabitants of Caledonia were divided between the two great tribes of the "Scots," and of the "Picts;" the former possessing, as we have observed, the western; and the latter, the eastern division of that country. The power, and almost the me-

mony of the Picts have been extinguished by their successful rivals; and the Scots, after maintaining for ages the dignity of an independent kingdom, have multiplied, by an equal and voluntary union, the honours of the English name. Macpherfon's Introd. to the Hist. of Great Britain and Ireland, Lond. 1773. 4to. Henry's Hist. vol. i. and ii. Gibbon's Hist. vol. iv. See ATTACOTTI, HIGHLANDERS, PICTS, and SCOTLAND.

CALEDONIA, a town in the country above described; which, according to Buchanan, gave name to the country, the people, and adjacent ocean.

CALEDONIA *Sylva*, a large forest in the same country, covered with lofty trees, and affording shelter to wild and fierce beasts.

CALEDONIA, in *Geography*, a sea-port settlement, on the north-west side of the isthmus of Darien, near the gulf of Mexico, founded in 1698, by some Scots families; but which, by the influence of the East India Company, they were obliged to abandon, in the year 1700. N. lat. 9° 30'. W. long. 77° 36'.

CALEDONIA, a county of Vermont, in America, containing 24 townships, and having to the S.E. Connecticut river; to the N.W. Orleans and Chittenden counties; to the N.E. Essex-county; and to the S.W. Orange-county, of which, till of late, it formed a part.

CALEDONIA, *Nova*, a large island of Australasia, in the Southern Pacific Ocean, extending from 19° 37' to 22° 30', S. lat.; and from 163° 37' to 167° 14', E. long. Its length from north-west to south-east is about 80 leagues; but its greatest breadth does not exceed 10 leagues. It was discovered by captain Cook, in 1774. He explored the north-western part of this island, and says that this district was called "Balade;" but D'Entrecasteaux, who commanded the expedition fitted out by the Constituent Assembly of France in search of La Perouse, in 1791—1794, visited its south-western coast. The reefs by which this part is bounded, are generally from 25 to 30,000 toises from the land; and it is rendered still more dangerous by the south-west winds that blow in that quarter. Many mountainous islands and detached rocks stretch from N.N.E. to E.N.E. and render this extremity of the island more dangerous than the southern part. Some of these islands are several hundred toises in extent; they are very numerous, and encircled with reefs. These islands seem to be a continuation of the mountains of the large island; their bases being covered by the sea, and their summits rising above it, and forming so many little islands. The gradual diminution of the height of these mountains affords reason to suppose, that in these seas, shoals extending to a great distance contribute to augment the dangers of navigation. The reefs that abound in the vicinity of this island, are coral rocks, the well-known work of polypi. The land of New Caledonia, which is low towards its southern extremity, rises into mountains of moderate elevation, in a south-east or north-west direction, inclining towards the north. Hills, almost destitute of vegetation, rise like an amphitheatre towards the principal chain of mountains, and appear to be at least 900 toises in perpendicular height, and directed towards the north-west. D'Entrecasteaux and his companions observed three ranges of mountains of different degrees of elevation, and hollows apparently formed by the fall of the rains, which were continued to the summits of the most arid mountains. Behind these high mountains they saw about 20,000 toises within the land, which seemed to tower above all the rest, and to be at least 1200 toises in perpendicular elevation. From the middle of one of these ravines or hollows

Tows issued a torrent, which appeared at a considerable distance white with its foaming waters; and trees are found growing in the bottoms of the ravines with which the hills are furrowed. These torrents are numerous, and, in some places, form fine cascades; and they serve also to fertilize the plains and valleys that are interspersed among the barren mountains, and which exhibit traces of culture and population. The soil of the plains is a sandy black mould: the sides of the hills are yellow clay with mica; and the higher parts consist of quartz and mica, tinged red, or orange, with iron. Garnets are also found in petro-silex, and in several places white transparent quartz; with layers of gold, coloured mica, blended with serpentine, hornblende, talc, and garnets. New Caledonia differs from all the other islands yet discovered in the South Sea, by being entirely destitute of volcanic productions. Every part of the coast seems to be inhabited; and the plantations in the plains are cultivated with much labour. On the sides of the mountains small walls are raised above one another to prevent the rolling down of the ground which was cultivated. But as the country is for the most part rocky and barren, the inhabitants chiefly subsist on roots and fish. Some of them eat the earth called steatite, which they probably make choice of to allay their hunger, because it is soft and crumbles, and is easy of digestion. They also boil, and eat a species of spiders, which are found in the woods. Like many other savages, they feed on the flesh of their enemies, which they previously broil on a fire of charcoal. This horrible practice of eating human flesh is confirmed by several facts recited by D'Entrecasteaux; notwithstanding the favourable accounts given of these islanders by captain Cook and Dr. Forster. They preferred water to wine or brandy; and in drinking it, inclined their heads at about two feet distance above the surface of the water, and then threw it up against their faces with their hands, opening their mouths very wide, and catching as much as they could.

The bread-fruit and cocoa-nut are scarce, and obtained with difficulty; although in some of the interior vallies there are considerable plantations of these, as well as of bananas, Caribbee cabbages (*arum esculentum*), yams, sugarcanes, &c. but the island furnishes several new plants, birds, and fishes. The natives seem to be altogether unacquainted with goats, hogs, dogs, or cats, as they had not any name by which to distinguish them. The inhabitants are stout and tall, some of them measuring six feet four inches, and generally well proportioned; their features mild; their hair black and woolly; but many, who seemed to be desirous of having the appearance of long hair, fastened to their own locks two or three tresses, made with the leaves of some plants of the grass kind, and covered with the hair of the Vampire bat, which hung down to the middle of their backs. Some of them cropped their hair short, and used a kind of comb, formed of a number of slicks of hard wood, generally about 20, which they fastened together at one end, and parallel to, and nearly one tenth of an inch from one another; and these combs they always wore in their hair, on one side of the head; on their heads they wore a kind of concave, cylindrical black cap, made of strong paper, which they seemed to consider as an ornament, and which, it was supposed, was worn only by the chiefs and warriors. The custom of pulling out their beards by the root is very general, although some of them let their beards grow. Their skin is nearly of as deep a black as that of the inhabitants of Diemen's Cape, whom they very much resemble in the cast of their countenance. These islanders are wholly naked, except that they wear round the middle pieces of coarse stuff, made of bark, or large leaves of trees.

In some cases, pieces of this kind of cloth were fastened by a string round the neck, and to this string were hung small round beads of a pale green stone. They were not destitute of coarse garments made of matting, but they never seemed to use them except in their canoes, and when unemployed.

The women in this island seemed to be in a subordinate and servile state, and employed themselves in various kinds of labour. Their colour is generally a dark chestnut, or a mahogany brown; their stature is middle-sized, rather tall, and their whole form stout and clumsy. They had no other garment besides a kind of fringe, made of the filaments of the bark of trees, which served them as a girdle and passed several times round the waist. Their character of chastity is superior to that of the females in the other isles of the Pacific; nor did any instance occur of their permitting any indecent familiarity with an European during capt. Cook's stay at the island. But the account of their chastity given by D'Entrecasteaux is not so much to their reputation. The lower lobe of the ears, both of males and females, perforated with a very large hole, hung down to their shoulders; and into these holes some introduced leaves of trees, others a piece of wood, in order to stretch them bigger. Several had this lobe jagged; probably from having been torn either in battle, or in running through the woods. Their general ornaments are ear-rings of tortoise-shells, necklaces, or amulets, made both of shells and stones, and some of twilled threads, suspended from which they usually carried at the end of a string a small piece of human bone, or hard stone, indifferently carved; and bracelets made of large shells, which they wear above the elbows. By the account of Cook and Forster, the Caledonians are represented as different from the other natives of the South Sea islands, with regard to their honesty and the inoffensiveness of their disposition and manners. This account is not confirmed by D'Entrecasteaux. He says, that whilst they asked for stuffs and iron in exchange for their effects, they soon gave evidence of their being audacious thieves; and he mentions several instances of the ferociousness of their dispositions, such as their feeding on the flesh of children, &c. Of their being cannibals there is no doubt; and they are furnished with an instrument, made of stone, with sharp edges, for cutting up the limbs of their enemies, which they divide among them after a battle. Their houses or huts are circular, formed in the shape of bee-hives, about 1½ toise in height, and as-much in breadth, close and smoky, as there is no passage for the smoke but through the door. Some of these huts are scattered at the distance of three or four hundred paces from each other, and overshadowed by a few cocoa-trees. Some of them are surrounded by palisades 1½ yard high, and 3½ feet from the borders of the hut, with a narrow walk before the door. The door, about a yard high and half a yard wide, is sometimes closed by a piece of the limb of a cocoa tree, the leafy branches of which are interlaced. Of these doors some had two posts, at the upper extremity of which a man's head was rudely carved. The lower part of these huts is erected perpendicularly to the height of a yard, and then tapered off in a pretty regular cone, and terminated by the upper end of a post, fixed in the centre of the floor. The frame of the hut consists of poles, bearing against the upper end of the post, which rises from the middle of the floor, and is near three inches in diameter at the bottom. A few pieces of wood bent to an arch, render these little habitations sufficiently strong. They are covered with straw to the thickness of two or three inches; and the floor, on which the natives are perfectly sheltered from the weather, is laid with mats. Within the hut on one side is a board, fastened with cords in an horizontal position, about a yard from the ground, on which

which they deposit any thing out of the way. The musquitos, however, are so troublesome in these huts, that they are obliged to light fires to drive them away when they go to sleep; and as there is no vent for the smoke, except at the door, they must be extremely incommoded by it. Near some of these dwellings are little hillocks of earth, 12 or 14 inches high, with a very open trellis in the middle, of the height of two or three yards, called by the natives "Nbouet," which are the graves in which they bury their dead. Those in which their chiefs, slain in battle, are interred, are decorated with spears, darts, paddles, &c. stuck upright in the ground about them. Their canoes are made of two trees, hollowed out, having a raised gunnel about two inches high, and closed at each end with a bulk-head of the same height; so that the whole resembles a long square trough about three feet shorter than the body of the canoe. Two canoes thus fitted are fastened to each other about three feet asunder, by means of cross-spars, which project about a foot over each side, and form a platform. Their matt is fixed at an equal distance from the two canoes, and towards the fore-part of the platform, by which they are joined together. On the platform they have a fire-hearth, and generally a fire burning. They are navigated by one or two latteen sails, extended to a small latteen yard, the end of which is fixed in a notch or hole in the deck. Each canoe has a large stone, fastened to a long rope, which serves as an anchor. These canoes, however, are not so skilfully constructed as those of the Friendly islands, to which they are much inferior in point of sailing. As the Caledonians are a warlike people, they are furnished with a variety of offensive weapons, as clubs, spears, darts, and slings for throwing stones. Most of these islands are armed with spears and clubs, and carry at their waist a little bag full of stones, cut into an oval shape, which they throw with slings. Their clubs are of different forms; and, as well as their darts and spears, are curiously carved, neatly constructed, and highly polished. Their javelins, which are commonly 15 feet long, are not more than  $2\frac{1}{2}$  inches in circumference at the middle. They are peculiarly dextrous in their mode of throwing them, and of accelerating their motion. For this purpose they employ a very elastic cord, made of the covering of the cocoa-nut and fish-skin, one extremity of which they fix to the end of the fore-finger, and the other which terminates in a sort of round button, is twisted round the end of the dart, but in such a manner as to quit its hold as soon as that weapon is thrown into the air. It is somewhat surprising that they are unacquainted with the use of bows and arrows. Their language is different from that of the Friendly islands, though some of their terms resemble those used by the inhabitants of the other islands. D'Entrecasteaux has annexed a vocabulary of their language. Their vocal music, however agreeable to themselves, is harsh and discordant to the ears of Europeans. The only musical instrument, which they seem to possess, is a kind of whistle, formed of a little polished piece of brown wood about two inches long, shaped somewhat like a bell, suspended with a rope fixed at the small end; it has two holes near the base, and another near the insertion of the rope, all which communicate with one another; by blowing in the uppermost, a shrill sound, like whistling, is produced. These islands set less value on nails and hatchets than any other inhabitants of the South sea islands. They appeared, however, to be acquainted with iron, for they had a term for expressing it; but as they used hard stones for purposes to which iron instruments might be applied, this metal was less important to them than to some of the other islands. The variation of the needle in this island was  $9^{\circ} 30'$  towards the east. The mercury in the

barometer never rose above 28 inches, 2 lines, and 2-10ths, and never fell below 28 inches, 1 line, and 4-10ths. Notwithstanding the excessive heat which the French voyagers felt on the coast, Reaumur's thermometer never exceeded  $25^{\circ}$ , and on board never rose above  $21^{\circ}$ . The tides were not observable above once a day; the flood taking place at half past six, and the waters, rising in perpendicular height, 4 feet 7 inches. Of the government and religion of the Caledonians nothing is known. Labillardiere's Voyage in search of La Perouse.

CALEDONICA, in *Ornithology*, a species of ARDEA, called by Latham the Caledonian night heron, from its being a native of New Caledonia. The general colour of the plumage is ferruginous, and beneath white: crest on the hind head of three feathers; frontlet black; eye-brows white.

Obs. This bird is an inhabitant of various parts of the Australasian regions as well as New Caledonia. Its length is 22 inches; bill black; area of the eyes green; legs yellow.

CALEFACIENTIA, in *Medicine*, are those substances which, when taken internally, increase the temperature of the body, or produce a sensation of local or general warmth. In the language of the present day, they are denominated cordials or stimulants. They may produce a sensation of warmth by their immediate impression on the nerves, without any actual increase of temperature; but they also tend to accelerate the circulation, and therefore to augment the actual heat. For it has been ascertained that the animal temperature is generated by the chemical changes which take place in the blood in the course of circulation, in consequence of the absorption and evolution of different gaseous fluids. Whenever, therefore, the rapidity of the circulation at large is increased by general stimulants; or the vessels of any particular part are, by a local stimulus, excited to greater action, and transmit a larger proportion of blood; the evolution of heat will necessarily be augmented; there will be a sensation of warmth in the general system, or in the particular parts respectively. See STIMULANT and CARDIAC.

CALEFACTION, denotes the production of heat in a body by the action of fire; or the impulse which the particles of a hot body impress on other bodies around it.

The word is particularly used in pharmacy; where calefaction is distinguished from coction: the first being applied where the thing is only heated, without boiling.

CALETTA, or CALELIA, in *Geography*, a fishing village of Catalonia in Spain, 4 leagues from Matara. Its population consists of 886 persons, and it employs near 50 fishing-boats.

CALEMUT. See SALAMANIE.

CALENBERG, a principality of Germany, in the circle of Lower Saxony, which takes its name from an ancient castle, now in ruins, situated on the Leine, about 11 miles S. from Hanover. Calenberg is divided into two parts by a portion of the principality of Wolfenbittel; of which the northern part is surrounded by the principality of Luneburg, the diocese of Hildesheim, the principality of Wolfenbittel, the counties of Pyrmont, Lippe, Schauenberg, and Hoya, and the principality of Muiden; and the south part by the principalities of Wolfenbittel and Grubenhagen, and the territories of Eichsfeld and Lower Hesse. This principality constitutes a part of the duchy of Brunswick, and is chiefly formed of counties, lordships, and ecclesiastical states. The country is in some parts mountainous, in some marshy, and in others sandy, but generally fertile; producing wheat, rye, barley, oats, lentils, peas, beans, vetches, buck-wheat, excellent garden-stuff, tobacco, hops, flax, and plenty of good fruit.

fruit. It has likewise forests of oak, beech, alder, pine, birch, &c. which afford timber for the building of ships and houses, and also wood for fuel and other uses. It also supplies large breeds of horses, black cattle, and sheep, together with venison and fish. In several places are marble-pits, quarries of free-stone, and mill-stones, with brick-kilns, turf and coal-pits, rich iron ore, and salt springs. It has also numerous manufactories of woollen and linen, cotton and silk, oil-skins and carpets, leather and paper, and stone ware, both for home consumption and for exportation. Its foreign trade is greatly facilitated by means of the Weser, and the country where the Leine has been rendered navigable. In this principality are 19 cities, the principal of which are Hanover and Gottingen, 17 market-towns, 210 Lutheran parochial churches, 5 Calvinistic, 6 Catholic, 2 Lutheran abbeys, one Catholic monastery, 5 Lutheran convents for ladies, and 24,170 taxable hearths. Several of the cities possess both the civil and criminal jurisdiction, but in these appeals lie from the magistrate to the upper courts of justice. The other cities are entirely dependent on the bailiwick. The states of the country are composed of the prelates and nobility, which are divided into three departments: viz. those of Hanover, Gottingen, and Hameln, with the department of Lavenau. These states have their syndic and other officers, but of the nobility of each department two provincial deputies are elected. This principality has a vote both in the imperial college of princes and the diets of Lower Saxony. Its matricular assessment is 22½ horse and 140 foot; or 686 florins. All the rivers in this principality discharge themselves either into the Leine or the Weser.

The bailiwick of *Calenberg* is 4 German miles in length, and 3 broad, extending as far as Hanover. The culture of grain and flax is the principal occupation of the inhabitants. In the whole bailiwick are one town, viz. Gehrden, and 60 villages.

**CALENDAR, CALENDARIUM, or KALENDAR,** a distribution of time, accommodated to the uses of life; or a table, or almanac, containing the order of days, weeks, months, seasons, &c. happening throughout the year. See **ALMANAC, TIME, MONTH, YEAR, &c.** It is called *calendar* from the word *calendæ*, anciently wrote in large characters at the head of each month. See **CALENDS.**

The days in calendars were originally divided into octoades, or eighths; but afterwards, in imitation of the Jews, into hebdomades, or sevenths; which custom, Scaliger observes, was not introduced among the Romans till after the time of Theodosius.

There are divers calendars, according to the different forms of the year, and distributions of time, established in different countries. Hence the Roman, the Jewish, the Persian, the Julian, the Gregorian, &c. calendars.

The ancient Roman calendar is given by Ricciolus, Struvius, Danet, and others; by which we see the order and number of the Roman holy-days, and work-days.

The three Christian calendars are given by Wolfius in his Elements of Chronology.

The Jewish calendar was fixed by rabbi Hillel, about the year 360, from which time the days of their year may be reduced to those of the Julian calendar.

**CALENDAR, the Roman,** owed its origin to Romulus; but it has undergone various reformations since his time. That legislator distributed time into several periods, for the use of the people under his command: but as he was much better versed in matters of war than of astronomy, he only divided the year into ten months, making it begin in the spring, on the first of March: imagining the sun made his course

through all the seasons in three hundred and four days. According to Plutarch, (in Numa,) these months had no certain or equal number of days, some consisting of 20, some of 35, and some of more. But Macrobius informs us, (Saturn. l. i. c. 12.) that Romulus settled the number of days with greater equality, allotting to March, May, Quintilis, and October, 31 days; and to April, June, Sextilis, September, November, and December, 30; making up in all 304 days. From a passage in Plutarch, (ubi supra,) it appears, that two intercalary months were added to every year; for he says, that the Latins, not understanding the difference between the solar and lunar years, nevertheless provided, that the year should contain 360 days. But these intercalary months were not inserted in the calendar. To these no names were affixed until the succeeding reign.

The calendar of Romulus was reformed by Numa, who, at first, intended to make a complete lunar year of 354 days. With this view, he added 50 days to the 304, which had been divided into 10 months. From every one of the months of 30 days, he borrowed one day, which he added to the 50 already mentioned: of these 56 days he composed two months, calling the one January, and the other February. Not long afterwards, he added one day to January; and thus made his year to consist of 355 days; adding one odd day more than he ought to have done, merely out of superstition, to make the number fortunate. However, he would not allow more than 28 days for February; and, therefore, that month was always accounted unlucky. Moreover, he transferred the beginning of the year from March to January, reckoning March the second, April the third, &c.; placing February in the end of the calendar. (Ovid. Fast. l. ii. v. 47.) In order to adjust the lunar year to the solar, he added 90 days in eight years; because the latter is 11¼ days greater than the former, and 11¼ × 8 = 90. Of these 90 days, four months were composed, consisting of 22 and 23 days alternately; and one was intercalated every two years; i. e. to the second year 22 days were added; to the fourth 23 days; to the sixth 22 days; and to the eighth 23 days; in all 90 days. The intercalary month formed of these days was called "Mercedius," or "Mercedonius," from the Latin word "merces," signifying wages, probably, because this time was appointed for the payment of workmen and domestics; and it was inserted after the 23d of February; and the remaining five days of that month were subjoined. By these intercalations, the quantity of the year became too great; and the excess in eight years amounted to 8<sup>d</sup> 1<sup>h</sup> 29' 56" nearly. To cut off this excess, it was proposed, in every third octennial period, that is, from 16 to 24 years, to insert not 90, but 66 days, or three months of 22 days, a quantity still too great by 4<sup>h</sup> 28' 20"; but sufficiently accurate for all the purposes of common life. The year of Numa admitted of no alteration until the year B. C. 452, when the decemviri changed the order of the months, reckoning January the first, February the second, March the third, &c. This arrangement has never been disturbed.

However, the intercalations above mentioned being ill observed by the pontiffs, to whom Numa committed the care of them, occasioned great disorders in the constitution of the year, which Julius Cæsar, with the advice and assistance of Sosigenes, a celebrated mathematician of Alexandria in Egypt, undertook to rectify, A. U. C. 708. B. C. 46. He found that the months had considerably receded from the seasons to which they had been adjusted by Numa, and that the dispensation of time in the calendar could never be settled on any sure footing, without having regard to the annual course of the sun. In order to bring forward the

months to their proper places, he took into the account 90 days which had been lost by the former method of reckoning, and formed a year of 15 months, or 445 days, which, on account of its quantity and design, has been called "the year of confusion." This year terminated, and the Julian year commenced on the 1st day of January, B. C. 46. From this epoch, the civil year and months were regulated by the course of the sun. The year of Numa being 10 days shorter than the solar year, two days were added by Julius Cæsar to each of the months of January, August, and December, and one to April, June, September, and November. Moreover, as the annual revolution of the sun is completed in 365 days, and about six hours, he made the year to consist of 365 days for three years successively, and every fourth year, of 366, in order to comprehend the odd six hours. Accordingly, he ordained, that an intercalary day should be added every fourth year, to the 23d of February; that is, the 24th day, or sixth of the calends of March, was to be twice reckoned; and hence this year was called *Bissex-tile*, which see. It is also styled "Leap-year," from its leaping a day more than that year, than in a common year. Hence it appears, that the Roman, called also the *Julian Calendar*, from its reformer Julius, is disposed into quadriennial periods; of which the first three years, which he called *communis* or common, consist of 365 days; and the fourth *bissex-tile*.

The regulations which Julius Cæsar had established were misapplied by those who had the direction of the calendar. They intercalated every third, instead of every fourth year; so that, in the interval of 36 years, three days more than the due number were inserted. This error, however, was soon perceived. For the correction of it, Augustus ordained, that the intercalations should be omitted in the following years; viz. in the 41st, 45th, and 49th of the Julian æra. This form of the year, thus corrected, was adopted in Italy, and in several other provinces of the Roman empire. By some nations, the lunar year was retained, and the days and months were reckoned by the course of the moon. Modern chronologers have used the Julian year, being a measure of time extremely simple, and sufficiently accurate: and to this standard they refer all events that have happened from the beginning of the world.

The Julian year, however, though admirably adapted to common use, was still imperfect: for as the time in which the sun performs his annual revolution is not exactly 365 days six hours, but 365 days five hours, 48 minutes, and  $45\frac{1}{2}$  seconds, the civil year must therefore have exceeded the solar year by 11 minutes,  $14\frac{1}{2}$  seconds; which, in the space of about 130 years, amounted to a whole day; and, consequently, in 47450, years the beginning of the year would have advanced forwards through all the seasons; and in half this interval of time, the summer solstice according to the calendar, would have fallen in the midst of winter, and the earth have been covered with frost, when the bloom of vegetation was expected. It cannot be imagined that Sotigenes was totally unacquainted with this error: though he probably thought it much smaller than it is, and therefore neglected it. Among the first of those who discovered the imperfections of the Julian calendar, were the venerable Bede, about the year 730, Johannes de Sacro Boico, about 1232, and Friar Bacon, about 1255. These great men had observed, that the true equinox preceded the civil one by about a day in 130 years. Sotigenes, in the reign of Julius Cæsar, had observed the vernal equinox on the 25th day of March. At the council of Nice, held in 325, it was fixed on the 21st of March; and from that time to the year 1582, when the next reformation was effected, the error,

accumulated by this means, amounted to about 10 days; so that the vernal equinox was now found to happen on the 11th of March, instead of the 21st, as it ought to have done, if the Julian account had agreed with the course of the sun. This constant anticipation of the equinox, which, in the course of more than a thousand years, had become too considerable not to be noticed, was first represented to the councils of Coultance and Latran by two cardinals, Petrus ab Alliaco, and Cusa, who showed the cause of the error, and the means of correcting it. In the year 1474, pope Sixtus IV. being convinced of the necessity of a reformation, sent for Regiomontanus, a celebrated mathematician of that period, to Rome, and presented him to the archbishopric of Ratisbon, in order to engage him in this undertaking. But a premature death preventing his assistance, and no one being thought worthy to be his successor, the project was, for that time, suspended. Although the necessity of some alteration was acknowledged, it was after the lapse of 100 years that pope Gregory XIII. had the honour of accomplishing what several preceding pontiffs and councils had attempted in vain. He invited to Rome a considerable number of mathematicians and astronomers, employed 10 years in the examination of their several formulæ, and, finally, gave the preference to the plan proposed by Aloisius and Antoninus Lilius, two brothers of Verona. He transmitted copies of this plan, A. D. 1577, to all catholic states, academies, &c. A council of the most learned prelates was convened by the pope, and the subject being finally settled, a brief was published in the month of March, A. D. 1582, by which the use of the ancient calendar was entirely abrogated, and the new one substituted in its stead, called, from the pope's name, the **GREGORIAN CALENDAR**, or **NEW STYLE**.

The first object of the reformers was to correct the errors of the former method of reckoning, and to make the length of the year agree more exactly with the course of the sun. For this purpose it was agreed, that the 10 days which had been gained by the old account, should be taken from the month of October of the year then current, and the equinox brought back to the 21st of March, as it had been settled by the council of Nice. And, in order to prevent the future recurrence of a similar variation, it was ordered, that, instead of making every hundredth year a bissex-tile, as was the case in the former method, every four-hundredth year only should be considered as a bissex-tile, and the rest be reckoned as common years. The length of the solar year, and the time of the vernal equinox, were by these means very accurately settled; for as a day was gained by the former method of reckoning, in every interval of 130 years, this was nearly equivalent to a gain of three days in every interval of 400 years; and, consequently, by making the years 1700, 1800, and 1900, to be common years, instead of leap-years, the error arising from the odd time would be properly corrected. The great difficulty, however, consisted in making the lunar year agree with the solar one, and in settling the true time for the observance of Easter and other moveable feasts, which had been subject to no fixed rule. It had been ordered by the Council of Nice, that Easter should be celebrated upon the first Sunday, after the first full moon, following the vernal equinox. And in order to the due observance of this rule, it became necessary to know the days when the full moons would happen, in the course of every year. But this knowledge was not easily obtained; for the period of Meton, which made 19 years exactly equal to 235 lunations, or revolutions of the moon, was found to be too long by about one hour and thirty-two minutes; and, consequently, after 16 of these periods

periods, the true phases of the moon would precede those shewn by the calendar, by more than a whole day. At the time when the Gregorian Calendar was first introduced, the error thus occasioned amounted to four days; and if the old method of computation had continued, the calendar, in time, would have announced the full moon at the time of the change, and Easter would have been celebrated at a period directly opposite to that established by the church. It was necessary, therefore, to devise some method for correcting these errors; and Lilius was so fortunate as to discover, that the 19 years or cycle of Meton had a particular property, which would render it subservient to the purposes required. The new and full moons, which, according to Meton, were imagined to happen at the same time precisely as they had occurred 19 years before, were usually indicated in the following manner: they observed on what day of each calendar month the new moon fell in each year of this period, and against those days they placed the number answering to that year, reckoning from 1 to 19, through all the years of the cycle. These numbers were called "Primes," or, "Golden Numbers" (which see); but as Lilius found them to be erroneous and inconvenient, he rejected them from his system, and made use of others, called "Epaëts," in their stead. See EPAËT. These epaëts, being placed against the days of the month in the calendar, on which the new moons fell in each year, would have answered the same purpose with the golden numbers; and if the Metonic cycle had been complete, the form would have required no alteration: but this is not the case, for after about 16 of these periods, or 300 years, the new moons arriving sooner by 24 hours, would happen on the preceding day; and, therefore the epaëts answering to those new moons ought to be augmented by unity. For, supposing that the second year of the lunar cycle had 11 for the epaët, then, because the new moon, in the preceding year, arrived 11 days before the end of December, after 300 years, the same new moon, of the first year of the cycle, would arrive 12 days before the end of the year; and, consequently, the second year ought now to have 12 for the epaët. This number 12, therefore, will be the index of the new moons in that second year; and it is easy to perceive, that all the new moons which happen sooner by a day will take place upon the day preceding that which in the former period was marked 11. After 300 years more, the epaët will be 13, which will be a day still preceding that in the latter period: and the same will happen with all the other epaëts of the cycle. It was this kind of analysis that suggested to Lilius the idea of placing the epaëts in their natural order against the days of the new moons in every year, for the first 300 years; and after that period, to place them in the order 1, 12, 23, 4, 15, 26, 7, 18, 29, 10, &c. instead of the former one; and so on.

This arrangement was simple and ingenious; but the omission of 3 days in every 400 years was a circumstance that occasioned some embarrassment. These years having a day less than in the Julian account, the new moons would happen a day later, and, consequently, the epaët, at the end of the year, must be diminished accordingly. But as this order is only interrupted once in 100 years, Lilius imagined, that by subtracting unity from each of the epaëts belonging to those new moons, they might be made to serve for the subsequent century. And as there are only 30 possible series of these numbers, it was sufficient to shew by a table, what series belonged to every century, by which the times of the new moons might be readily discovered.

When pope Gregory had reformed the calendar in the manner above stated, he ordered all the ecclesiastics under his jurisdic-

tion to conform to this new method of reckoning, and exhorted the Christian princes to adopt it in their dominions. Accordingly it was immediately introduced into all catholic countries. In Spain, Portugal, and part of Italy, it was received on the same day as at Rome; but it was not admitted in France until the month of December, when the 10th was reckoned the 20th day, according to letters patent of king Henry III. dated the 3d of November preceding. The catholic states in Germany adopted the Gregorian calendar, A. D. 1583. But the protestant states at that time refused it. The reformed religion was in its infancy; the zeal of its professors was violent, and their opposition to the pope unbounded. Whatever bore the appearance of his authority was rejected as an unwarrantable encroachment upon their newly-acquired liberties; and though the propriety of the alteration was acknowledged, it was condemned on account of its originating with a party so extremely obnoxious to them. Hence arose a difference of 10 days between the methods of reckoning afterwards used in Catholic and Protestant countries. When a bifextile was suppressed, the difference amounted to 11 days. This difference between the old and new style, as the Julian and Gregorian accounts are generally called, occasioned great confusion in the commercial affairs of the different states of Europe; and therefore the Gregorian style was, at length, generally received. The Protestant states in Germany reformed their calendar in Feb. A. D. 1700. The new style was introduced into Denmark about the same time; and into Sweden, March 1753. In Great Britain the inconvenience arising from these two modes of reckoning was much felt, and several attempts were made to introduce the reformed calendar. But popular prejudices were for a long time too obstinate to be easily overcome. The mathematicians, indeed, more influenced by scientific considerations than by cavils about points of religion, incessantly urged the necessity of some correction, and proposed various methods of effecting it, which might be adopted without inflaming the minds of the multitude. Among others it was proposed, that an act should be passed, declaring that there should be no leap-year for 40 years to come, by which means, the 10 days that had been gained by the old account would have been imperceptibly lost, and the old style reduced to the new, without any sensible variation in the fixed times of feasts and other observances. A proposal of this kind was sent to Dr. Wallis, professor of geometry at Oxford, for his opinion; but the doctor, with a degree of prejudice altogether inconsistent with his extensive erudition, observed, that the proposal was specious enough in appearance; but that the hand of Joab might be perceived in it. He imagined it to have originated with the papists; and though he acknowledged the propriety of it, he was afraid of its being adopted, lest it should open the door to further encroachments. But though all proposals were at that time rejected, those who wished for a reformation still renewed their applications; and in 1752, an act of parliament, after much debate, was obtained for this purpose. As 170 years had elapsed since the Gregorian alteration took place, the old style had consequently gained above a day more upon the course of the sun than it had at that time: it was therefore enacted, that, instead of cancelling 10 days, as the Pope had done, 11 days should be left out of the month of September; and, accordingly, on the 2d day of that month, the old style ceased, and the next day, instead of being the third, was called the 14th. See STYLE. By the same act, the beginning of the year was changed from the 25th of March to the 1st of January. Russia is the only civilized state of Europe that now retains the old style.

# CALENDAR.

**CALENDAR, Julian Christian,** is that wherein the days of the week are determined by the letters A, B, C, D, E, F, G, by means of the solar cycle; and the new and full moons, especially the paschal full moon, with the feasts of Easter, and the other moveable feasts depending thereon, by means of golden numbers, rightly disposed through the Julian year. See the preceding article. See also **CYCLE**, and **Golden NUMBER**.

**CALENDAR, Gregorian,** is that which, by means of epacts, rightly disposed through the several months, determines the new and full moons, and the time of Easter, with the moveable feasts depending thereon, in the Gregorian year. The Gregorian calendar, therefore, differs from the Julian, both in the form of the year, and in that epacts are substituted in lieu of golden numbers; for the use and disposition whereof, see **EPACT**.

Though the Gregorian calendar be preferable to the Julian, yet it is not without its defects (perhaps, as Tycho Brahe and Cassini imagine, it is impossible ever to bring the thing to a perfect justness). For, first, the Gregorian intercalation does not hinder but that the equinox sometimes succeeds the 21st of March, as far as the 23d; and sometimes anticipates it, falling on the 19th; and the full moon, which falls on the 20th of March, is sometimes the paschal; yet not so accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the 22d of March the paschal; which yet, falling before the equinox, is not paschal. In the first case, therefore, Easter is celebrated in an irregular month; in the latter, there are two Easters in the same ecclesiastical year. In like manner, the cyclical computation being founded on mean full moons, which yet may precede or follow the true ones by some hours, the paschal full moon may fall on Saturday, which is yet referred by the cycle to Sunday; whence, in the first case, Easter is celebrated eight days later than it should be; in the other, it is celebrated on the very day of the full moon, with the Jews and Quartodeciman heretics, contrary to the decree of the council of Nice. Mællin, Vieta, Scalliger, Calvinius, and other mathematicians, shew other faults in the Gregorian calendar, arising from the negligence and inadvertency of the authors.

Clavius, to whom the conduct of this business was assigned, after the death of Lilius, composed in 1603 a large work in vindication of it, and successfully combated its adversaries. Defects, it is acknowledged, are to be found in this calendar; but the reformers deserve praise for what they actually did, in an undertaking which does not admit of perfection. Dr. Playfair, in his "System of Chronology," p. 19, observes, that the method of intercalation used in the Gregorian calendar is not the most accurate. Ninety-seven days, or 100.3, are inserted in the space of four centuries. This supposes the tropical year to consist of 365<sup>d</sup>, 5<sup>h</sup>, 49', 12". On this supposition, the interpolation would be exact, and the error would scarcely exceed one day in 268,000 years. But the reformers of the calendar made use of the Copernican year of 365<sup>d</sup>, 5<sup>h</sup>, 49', 20". Instead, therefore, of inserting 97 days in 400 years, they ought to have added, at proper intervals, 41 days in 169 years, or 90 days in 371 years, or 131 in 540 years, &c.

Recent observations have determined the quantity of the tropical year to be 365<sup>d</sup>, 5<sup>h</sup>, 48', 45<sup>1</sup>/<sub>2</sub>". Admitting this to be the true quantity of it, the intercalations ought to be made as follows:

+	-	+	-	+	+	+	+	+
4	17	33	128	545	673	801	929	1057
1	4	8	31	132	163	199	225	256

+	+	-	-	-	+	-
1185	1313	1441	2754	4067	9447	53302
287	318	349	667	985	2288	12425
+	-					
60749	172800					
14713	41851					

; that is, one day ought to be intercalated in the space of 4 years, or rather 4 days in 17 years, or 8 days in 33 years, &c. If 41,851 days were intercalated in 172,800 years, there would be no error. The signs + and - indicate, that the number of intercalary days above which they are placed is too great or too small. Every succeeding number is more accurate than that which goes before. As this method of interpolation is different from that now in use, it is obvious that the Gregorian calendar must be corrected after a certain period of years. The correction, however, will be inconsiderable for many ages, as it will amount only to a day and a half, which is to be suppressed in the space of 5000 years.

**CALENDAR, reformed, or corrected,** is that which, setting aside all apparatus of golden numbers, epacts, and dominical letters, retrenches 11 days from the calendar, and determines the equinox, with the paschal full moon, and the moveable feasts depending thereon, by astronomical computation, according to the Rudolphine tables of Kepler, agreeably to the first council of Nice. The person who projected this plan was Erhard Weigel.

Upon the death of Weigel in 1699, the project was submitted by the diet to the consideration of Sturmius, professor of mathematics at Altdorff; Hamberger, professor at Jena; and Meyer, professor at Ratibon. In consequence of their report, this calendar was introduced among the protestant states of Germany, in the year 1700, when 11 days were at once thrown out of the month of February; so that in 1700, February had but 18 days; by this means the corrected style agrees with the Gregorian. This alteration in the form of the year they admitted for a time, in expectation that the real quantity of the tropical year being at length more accurately determined by observation, the Romanists would agree with them on some more convenient intercalation.

**CALENDAR, French or Republican.** Soon after the government was changed in France, it was decreed on the 2d of January 1792, that this year should be denominated the fourth of liberty on their coins, and in their acts. After the death of Louis XVI. in 1793, it was determined that this year should be called the first of the republic, and this suggested the idea of a republican calendar. Accordingly, on the 12th of January, 1793, the deputy Romme, president of the committee of public instruction under the convention, applied to the Academy of Sciences for a commission to deliberate on this subject; but M. de la Lande protested against the change of the calendar. He was obliged, however, to acquiesce, and to prepare a new calendar. After the example of the Egyptians, he preferred 12 equal months, with five intercalary days, and he adapted their denominations to the climate of Paris, which Fabre d'Églantine expressed by the following terms, viz. *Vendémiaire*, or vintage month; *Brumaire*, or foggy month; *Frimaire*, or sleety month; *Nivôse*, or snowy month; *Pluviose*, or rainy month; *Ventose*, or windy month; *Germinal*, or budding month; *Floreale*, or flowery month; *Prairial*, or meadow month; *Messidor*, or harvest month; *Thermidor*, or hot month; and *Fructidor*, or fruit month. The first month begins September 23; the second, October 23; the third, November 22; the fourth, December 23; the fifth, January 21; the sixth, February 20; the seventh, March 22;

# CALENDAR.

the eighth, April 21; the ninth, May 21; the tenth, June 20; the eleventh, July 20, and the twelfth, August 19; making in all 360 days. The remaining five days are called the complementary days; of which the first is the 18th of September; the second, the 19th; the third, the 20th; the fourth, the 21st; and the fifth, the 22d of September, being the last day of the French year.

The first decree was issued the 5th of October 1793; and it was followed by another on the 24th of November, or the 4th of Frimaire, in the second year of the republic, settling the commencement and organization of the year, and the names of the days and months. The decree of the national convention comprehends four articles, viz. That the French era should be reckoned from the foundation of the republic, September 22, 1792, of the vulgar era, on the day when the sun arrived at the true autumnal equinox, in his entrance into the sign Libra, at 9<sup>h</sup> 18' 3" in the morning, according to the observatory at Paris: that the vulgar year should be abolished in all civil concerns: that each year should commence at midnight with the day on which the true autumnal equinox falls, according to the observatory at Paris: and that the first year of the French republic had actually commenced at midnight of the 22d of September, 1792, and terminated at midnight, between the 21st and 22d of September, 1793. The decree for adopting a rule of intercalation, in order to preserve the seasons at the same epochs of the year, comprises the following four articles: viz. that the fourth year of the republican era should be the first sextile; that it should receive a sixth complementary day; and that it should terminate the first franciade: that the sextile, or leap years, should succeed one another every four years, and mark the end of each franciade: that the four following secular years in succession should be excepted from the last article; namely, the first, second, and third secular years 100, 200, 300, which should be common; and that the fourth should be sextile: and that this should be the case every four centuries until the 40th, which should close with a common year, the year 4000.

In this new calendar or almanac, the months consist of 30 days each, and are divided into three decades. The days of each decade are known by the names of *Primidi*, *Duodi*, *Triidi*, *Quartidi*, *Quintidi*, *Sextidi*, *Septidi*, *Octodi*, *Nonodi*, and *Decadi*. The day, which begins at midnight, is distributed into ten parts, and these are decimally divided and subdivided. To the five supernumerary days in common years, and six in leap years, was applied the absurd appellation of *Sans Culottides*, borrowed from a term of reproach (*Sans Culotte*), which had been originally bestowed on the republican party, on account of the meanness of their rank and fortune; but which the same party afterwards attempted to render honourable and popular; and this appellation also serves to distinguish the leap years.

TABLES for reducing the Dates of the new French Calendar to the Dates of the Gregorian Calendar.

TABLE I.

Of the new French Calendar compared with the Gregorian Calendar for 40 years; that is, from 1802 to 1841.

Year of the Republic.	Gregorian Year.	Franciade.	Commencement of the French Year.

b signifies *bisextile*, or leap-year—s *sextile*, or French leap-year—c common year of 365 days—m morning—a afternoon.

The French decree does not determine the proper rule for fixing the leap-year: the necessity for determining this rule will happen in 1811. The most convenient method appears to be the common one, when after 7 Franciades of 4 years, a Franciade of 5 years occurs: according to this regulation, the 5th and 13th Franciades are of 5 years each. The *Bureau des Longitudes* will doubtless ascertain this point with more accuracy.

TABLE II.

CALENDAR, *Perſian*, is founded on the Perſian æra, called "Yeẏdegerd," or "Jeẏdegerd," which derives its name from the laſt king of the race of Saffanians, or 5th dynasty, that reigned in Perſia. Some ſuppoſe the ancient Perſian æra to have been eſtabliſhed by Gemſhid, one of the Piſhadian kings, about 800 B. C. On the day when the ſun entered Aries, he is ſaid to have made his public entry into Perſepolis, which he had juſt finiſhed, and to have ordained the æra to commence from that time, in honour of the ſun, and in commemoration of the building of his capital city. He divided the year into 12 months of 30 days each; to the laſt of which 5 ſupplementary days were added. But no attention was beſtowed on the odd quarter of a day, till aſtronomers, in the reign of Yeẏdegerd, obſerving that the beginning of the year had moved in a retrograde direction from Aries to Piſceæ, corrected this error, and appointed one month to be inſerted at the end of every 120 years, and the intercalary month of 30 days reſtored the integrity of the ſolar year. By this reformation of the calendar a new æra was produced, which is ſtill adopted in many parts of Perſia. All, however, do not agree in the epocha of its commencement. Some refer the date of it to the beginning of Yeẏdegerd's reign, which they place on the 16th of June, in the 11th year of the Hegira, A. D. 1632. Of this opinion are Ulugh Beigh and Herbelot (Bib. Orient.) Others compute from the time of his defeat by the Arabs at Cadefia, A. D. 636. Some few reckon from his death, A. D. 651 or 652, among whom are Alfraganius, Scaliger, &c. The beſt modern chronologers have adopted the firſt of theſe opinions, which is moſt conformable to the teſtimony of the eaſtern writers. In vindication of which it may be obſerved, that Yeẏdegerd had lived as a private perſon, as his father had always done, till the Perſians, underſtanding how juſt a title he had to the kingdom, ſet him upon the throne. The Arabs ſay, this was done with the conſent of their caliph, who therefore regarded him as his tributary, reckoning the kingdom of Perſia among the reſt of his dominions from this time, and conſidering the ſubſequent reduction of that country not as a conqueſt, but as the re-union of that part of his empire which had been ſeſtered from it by a rebel. This is plainly the cauſe why the commencement of this æra is and ought to be fixed at the acceſſion of Yeẏdegerd. The years of this æra are Naboffarean; for each year conſiſts of 365 days, or 12 months of 30 days each, with the addition of 5 intercalary days to the month Aban, or to the end of the year.

Befides this form of the year, Perſian aſtronomers uſe the Gelakæan year, ſo called on account of the title "Gelakædin," which was conferred on Malekſchah, ſultan of Khorafm. This great prince, A. D. 1074, aſſembled the moſt celebrated aſtronomers of his time, in order to reform the calendar, which he found imperfect, to aſcertain the vernal equinox for aſtronomical purpoſes, and for the regulation of their ſolemn feſtival "Neuruz," or new-day, and to change the order of the months, under the idea of reſtoring the ancient mode fixed by Gemſhid. The year, as he reformed it, was twofold, civil and aſtronomical. He fixed the beginning of both on the 14th of March, the ſeaſon of the equinox, A. D. 1074, or, according to Zacuti, a Jewiſh author, A. D. 1079. In the correction of the civil year, beſides five intercalary days, in every fourth year he added, fix or ſeven times in ſucceſſion, a ſixth day; after which the intercalation was not to occur more frequently than once in five years. The Perſian aſtronomical year was of the ſame form, and nearly of the ſame quantity with the ſolar tropical year; for it conſiſted of 365<sup>d</sup> 5<sup>h</sup> 49<sup>m</sup> 53<sup>s</sup>. From theſe frequent reformations of the Perſian calendar, there has ariſen no ſmall diſagreement among different writers with regard to the ſeaſons and

and days when several festivals were to be celebrated, which it would be difficult to reconcile. Playfair's Chronology, p. 55. See EPOCHA and YEAR.

CALENDAR, *construction of a, or almanac.* See ALMANAC.

CALENDAR is also applied to divers other compositions respecting the twelve months of the year.

In this sense, Spencer has given the shepherd's calendar, Evelyn and Miller the gardener's calendar, &c.

CALENDAR is used for the catalogue, or fasti, anciently kept in each church, of the saints, both universal, and those particularly honoured in each church; with their bishops, martyrs, &c. Calendars are not to be confounded with martyrologies, for each church had its peculiar calendar; whereas the martyrologies regarded the whole church in general; containing the martyrs and confessors of all the churches. From all the several calendars were formed one martyrology; so that martyrologies are posterior to calendars. See MARTYROLOGY.

CALENDAR is also extended to an orderly table, or enumeration of persons or things. Lord Bacon wishes for a calendar of doubts. A late writer has given a calendar of the persons who may inherit estates in fee-simple.

CALENDAR, *Kalendarium*, originally denoted among the Romans a book containing an account of monies at interest, which became due on the calends of January; the usual time when the Roman usurers let out their money. Senec. de Benef. lib. vii. c. 10. Idem. lib. i. c. 2. Ejsd. Epist. 14. Idem. Ep. 87. Fab. Thef. p. 413.

CALENDAR *months*, the solar months as they stand in the calendar, viz. January 31 days, &c.

The number of days in each month may be suggested to the memory by the following canon:

“Thirty days hath September,  
April, June, and November,  
February has twenty-eight alone,  
And all the rest have thirty-one.”

CALENDAR, *astronomical*, an instrument engraved upon copper-plates printed upon paper, and pasted on board, with a brass slider which carries a hair, and shews by inspection the sun's meridian altitude, right ascension, declination, rising, setting, amplitude, &c. to a greater exactness than our common globes will shew.

CALENDAR *of prisoners*, is a list of all their names, with their separate judgments in the margin, which the judge signs, and the execution of which is committed to the respective sheriff. In the case of a capital felony, the words “hang by the neck” are annexed to the prisoner's name, instead of “*sus. per col.*” for *suspendatur per collum*, which was the ancient form. Judge Blackstone well observes, that the execution of a man seems to be too important and terrible a task to depend on a marginal note. Blackst. Com. vol. iv. p. 396.

CALENDAR-*glass*, *vitrum calendare*, a name formerly given by some writers to a thermometer, or graduated tube, whereby to measure the degrees of heat.

CALENDAR-*brothers*, *fratres calendarii*, a sort of devout fraternities, composed of ecclesiastics as well as laymen; whose chief business was to procure masses to be said, and alms distributed, for the souls of such members as were deceased. They were also denominated *calend-brothers*, because they usually met on the calends of each month, though in some places only once a quarter.

CALENDARIO, PHILIP, in *Biography*, a celebrated architect and sculptor, flourished at Venice in the time of Martin Faletri, doge of that republic in 1354. He constructed those beautiful porticos supported by marble columns, which surround the place of St. Mark, above which

are seen superb buildings ornamented with bas-reliefs and rich paintings. By these works he established both his fame and fortune. Moreri.

CALENDARIUM *festum*. The Christians retained much of the ceremony and wantonness of the calends of January, which for many ages was held a feast, and celebrated by the clergy with great indecencies, under the names *festum kalendarum*, or *hypodiatonorum*, or *stultorum*, that is, the feast of fools; sometimes also *libertas decembrica*. The people met masked in the church, and in a ludicrous way proceeded to the election of a mock pope, or bishop, who exercised a jurisdiction over them suitable to the festivity of the occasion: fathers, councils, and popes long laboured to restrain this licence, to little purpose. We find the feast of the calends in use as low as the close of the fifteenth century. Du Cange.

CALENDER, a machine used, in the manufactories, for pressing certain stuffs, silks, calicoes, and even linens; to make them smooth, even, and glossy. It is also used for watering, or giving the waves to tabbies and mohairs.

The word is formed from the French *calandre*, or Spanish *calandra*, which signify the same; and which some derive further from the Latin *cylindrus*; because the whole effect of the machine depends upon a cylinder. Borel derives the name from that of a little bird, of the swallow kind; on account of the agreement between the feathers of the bird, and the impression of the machine.

The calender consists of two large wooden rollers, round which the pieces of stuff are wound: these are put between two large, close, polished planks of wood, or plates of iron, the lower serving as a fixed base, and the upper moveable, by means of a wheel like that of a crane; with a rope, fastened to a spindle, which makes its axis: this upper part is of a prodigious weight, sometimes twenty or thirty thousand pounds. It is the weight of this part, together with its alternate motion, that gives the polish, and makes the waves on the stuffs, by causing the cylinders on which they are put to roll with great force over the lowest board. The rollers are taken off, and put on again, by inclining the machine.

At Paris they have an extraordinary machine of this kind, called the *royal calender*, made by order of M. Colbert; the lower table or plank of which is made of a block of smooth marble, and the upper lined at bottom with a plate of polished copper.

This is called the great calender; they have also a small one with two tables of polished iron or steel.

There are also calenders without wheels, which are wrought by a horse harnessed to a wooden bar, which turns a large arbor placed upright; at the top of which, on a kind of drum, is wound a rope, the two ends of which being fastened to the two extremities of the upper plank of the engine, give it motion. But the horse calender is in less esteem than the wheel kind, as the motion of this latter is more equable and certain.

We read of calendering worsteds. To improve linen farther, the drapers get several sorts of their cloths calendered; whereby their threads are made to lie flatter and smoother.

CALENDER also denotes the workman who manages the machine above described; applying the cloth or stuff underneath, after having first wound it on the rollers.

CALENDERS is also the name of a sort of dervises spread through Turkey and Persia, whose order is not in general esteem among the Mahometans, as being reputed less abstemious and strict in morals than some other orders. They derive their name from Calenderi, their founder, who went barchaded,

bareheaded, without a shirt, and with the skin of a wild beast thrown over his shoulders. Before, he wore a kind of apron, the strings of which were adorned with counterfeit precious stones. In Persia and Arabia these dervises were called *Abdals* or *Abdallat*, i. e. Persons consecrated to the service or honour of God. They preach in the market-places, and live upon alms. See *DERVIS*.

**CALENDS, CALENDÆ**, in the *Roman Chronology*, the first day of every month.

The word is formed from *καλεω*, *I call*, or *proclaim*; because, before the publication of the Roman Fasti, it was one of the offices of the pontifices to watch the appearance of the new moon, and give notice thereof to the *Rex Sacrificulus*; upon which a sacrifice being offered, the pontiff summoned the people together in the capitol, and there, with a loud voice, proclaimed the number of *calends*, or the day whereon the nones would be; which he did by repeating this formula, as often as there were days of *calends*: *Calo Juno Novella*. Whence the name *calendæ* was given thereto, from *calo, calare*. This is the account given by Varro. Plutarch, and after him Gaza, derive the word from *clam*; *Quia luna calendis clam fit*: but this is far fetched. Others derive the appellation hence: that the people being convened on this day, the pontifex called or proclaimed the several feasts or holidays in the month; a custom which continued no longer than the year of Rome 450, when C. Flavius, the curule ædile, ordered the fasti, or calendar, to be set up in public places, that every body might know the difference of times, and the return of the festivals.

The *calends* were reckoned backwards, or in a retrograde order: thus, v. g. the first of May being the *calends* of May; the last, or thirtieth of April, was the *pridie calendarum*, or second of the *calends* of May; the twenty-ninth of April, the third of the *calends*, or before the *calends*: and so back to the thirteenth, where the *ides* commence; which are, likewise, numbered invertedly to the fifth, where the *nones* begin; which are numbered after the same manner to the first day of the month, which is the *calends* of April. See *IDES* and *NONES*.

The rules of computation by *calends* are included in the following verses:

“Prima dies mensis cuiusque est dicta *calendæ*;  
Sex Maius nonas, October, Julius, & Mars;  
Quatuor at reliqui: habet idus quilibet octo.  
Iude dies reliquos omnes dic esse *calendas*;  
Quas retro numerans dices a mense sequente.”

To find the day of the *calends* answering to any day of the month we are in; see how many days there are yet remaining of the month, and to that number add two: for example; suppose it the 22d of April; it is then the 10th of the *calends* of May. For April contains 30 days; and 22 taken from 30, there remains 8; to which 2 being added, the sum is 10.

The reason of adding *two* is, because the last day of the month is called *secundo calendæ*, the last but one *tertio calendæ*, &c.

The Roman writers themselves are at a loss for the reason of this absurd and whimsical manner of computing the days of the month: yet it is still kept up in the Roman chancery; and by some authors, out of a vain affectation of learning, preferred to the common, more natural, and easy manner.

**CALENDS, Kalendæ**, are also used in *Church-History* to denote conferences anciently held by the clergy of each deanery, on the first day of every month, concerning their duty

and conduct, especially in what related to the imposition of penance. Du Cange.

**CALENDS of January**, in *Roman Antiquity*, was a solemn festival consecrated to Juno and Janus; wherein the Romans offered vows and sacrifices to those deities, and exchanged presents among themselves, as a token of friendship.

It was only a melancholy day to debtors, who were then obliged to pay their interests, &c. Hence Horace calls it *trifles calendæ*. Lib. i. Serm. Sat. 3.

**CALENDULA**, in *Botany*, (according to Martyn, a diminutive from *Caltha*, the name of the most common species in old authors; Venetian derives it from *Calendæ*, the Latin term for the first day of every month, because it continues long in flower, whence one of its Italian names *Fiore d'ogni Mese*.) Linn. gen. 990. Schreb. 1339. Willd. 1559. Gært. 991. Juss. p. 183. Vent. v. 2. p. 545. Marigold. Class and order, *Syngenesia polygamia necessaria*. Nat. ord. *Compositæ discoidæ*. Linn. *Corymbiferae*, Juss. Vent.

Gen. Ch. *Calyx* simple, nearly upright, with numerous linear-lanceolate, nearly equal divisions. *Cor.* radiate: florets of the *disk* numerous, tubular, semiquinquefid, the length of the *calyx*; the *ray* strap-shaped, very long, three-toothed, hairy at the base, without nerves, with pistils only. *Stamens* of the *disk*: filaments five, capillary, very short; anthers the length of the floret, united in a hollow cylinder. *Pist.* of the *disk*: germ oblong; style thread-shaped, scarcely the length of the *stamens*: stigma obtuse, bifid, straight. *Pistil* of the *ray*: germ oblong, three-cornered; style thread-shaped; stigmas two, oblong, acuminate, reflexed. *Pericarp*, the permanent *calyx* converging and depressed. *Seeds* in the centre of the *disk* none; in the circumference, sometimes but rarely solitary, membranous, inversely heart-shaped, compressed; in the *ray*, solitary, larger, oblong, incurved, triangular, with membranous angles, marked on the outside longitudinally with the figure of a vegetable. *Down* none. *Recep.* naked, flat.

Ess. Ch. *Receptacle* naked. *Down* none. *Calyx* with many divisions. *Seeds* in the circumference of the *disk* membranous.

Obs. As the seeds in the circumference of the *disk* are very different in form from those of the *ray*, Linnæus was in doubt whether they were not abortive; but Gærtner asserts that both kinds are fertile.

Sp. 1. *C. arvensis*, Linn. Sp. Pl. (*Caltha arvensis*, Bauh. Pin. 275. minima, Bauh. Hist. 3. p. 105: officinalis, Scop. Carn. 1040.) “Seeds boat-shaped, mucicated, incurved, outer ones erect, lengthened, and standing out,” Linn. (lanceolate-awl-shaped, mucicated on the back, Willd.) Annual. *Stems* slender, branching, spreading near the ground. *Leaves* narrow, spear-shaped, hairy, half surrounding the stem at their base. *Flowers* pale yellow, small, terminating the branches, on long peduncles. La Marck. *Seeds* of the *disk* curved inwards, so as to form a semi-circle; by no means boat-shaped or margined, but roundish; compressed in the belly part to a sharp edge, convex on the back, and mucicated with short, harmless prickles: of the *ray* longer, upright, crooked, lessened upward, and lengthened into a lamellate, two-lobed beak, with little prickles on the outside, smooth within, and augmented near the base with a lamellate process. Gært. Tab. 168. fig. 4. A native of cultivated fields in the South of Europe. 2. *C. Stellata*, Willd. Cav. ic. 1. p. 3. tab. 5. Desf. atl. 2. p. 304. “Seeds boat-shaped, incurved, mucicated; five outer ones ovate-lanceolate, membranous, and toothed at the margin, mucicated on the back.” Willd. Annual. *Stem*, as well as the whole plant, rugged; three feet high, herbaceous

herbaceous, striated, much branched. *Leaves* ovate-oblong, toothed in a sinuate manner, somewhat ciliate, thick, bright green. *Flowers* yellow, terminating: florets of the *ray* about sixteen, equal in number to the divisions of the calyx: of the *disk* few, barren. A native of Barbary, cultivated by Cavanilles in the garden of the Duke del Infantado, near Madrid, from seeds sent by Lemonier. It flowers and perfects its seeds there from June to August. 3. *C. sancta*, Linn. Sp. Pl. "Seeds pitcher-shaped, inversely egg-shaped, even; calyxes a little mucronated." Annual. Whole plant smooth. *Leaves* rugged at the edge. Similar to the *arvensis*, but the calyx is mucronated on the outside, the seeds belly out more, and are not at all mucronated; nor are the seeds of the *ray* prickly. Linn. A native of Palestine. 4. *C. officinalis*, Linn. Sp. Plant. (*Caltha vulgaris*: Bauh. Pin. 275. "All the seeds boat-shaped, incurved, mucronated." Annual. *Stem* loftier, and more divaricated than that of *C. arvensis*, angular, downy. *Leaves* sessile; lower ones spatula-shaped; upper ones lanceolate. La Marck. *Seeds* of the *disk* boat-shaped; divided on their concave side by a longitudinal partition, and marked on the middle of their convex side with an elevated mucronated furrow: those of the *ray* roundish, bent in a femicircular manner, mucronated on the outside, smooth within, and often furnished near the base with an erect, lamellated process. Gært. tab. 168. fig. 4. A native of cultivated ground in the south of Europe. Flowering most part of the summer. It was cultivated by Gerard in 1597, and is still one of the most common annuals in our gardens, where numerous varieties have been produced in the colour and luxuriance of its flowers. The florets of the *ray* are in many parts of England boiled in broth; and numerous medical virtues were formerly attributed to it, which have now lost their credit. 5. *C. suffruticosa*, Willd. Vahl. Symb. 2. p. 94. "Seeds boat-shaped, incurved, mucronated; outer ones lanceolate-awl-shaped, mucronated, erect: leaves lanceolate, toothed in rather a sinuate manner, rough. *Stem* somewhat shrubby." Perennial. *Branches* ascending, terminated by a single flower on a long peduncle. *Flowers* and *Seeds* like those of *C. arvensis*. A native of the coast of Barbary. 6. *C. incana*, Willd. (*C. tomentosa*, Desf. atl. 2. p. 305. tab. 245. *Caltha maritima lusitanica lanuginosa*. Tourn. Inst. 499. Vail. act. 1720. p. 289.) "Seeds boat-shaped, even; outer ones awl-shaped, erect, a little mucronated; leaves oblong-spatula-shaped, downy on both sides." Willd. Annual. Whole plant white with down. *Flowers* yellow. A native of Morocco and Portugal on the sea coast. 7. *C. pluvialis*, Linn. Sp. Pl. (*Caltha africana*, Morif. tab. 3. fig. 8. Tourn. Inst. 499.) "Leaves lanceolate, toothed in a sinuated manner; stem leafy; peduncles thread-shaped." Annual. *Stems* declining, from six to eight inches long; upper part very slender. *Flowers* single, terminating; *disk* purple; *ray* of a violet colour on the outside, and a pure white within, opening when the sun shines, and shutting in cloudy weather and in the evening. *Seeds* of the *disk* roundish, heart-shaped, compressed, surrounded with a swelling rim of a pale straw colour: of the *ray* oblong, inversely pyramidal, three or four-cornered, mucronated with tubercles on the sides and angles. Gært. Tab. 168. fig. 4. A native of the Cape of Good Hope, cultivated by Mr. Miller in 1726. 8. *C. hybrida*, Linn. Sp. Pl. (*Caltha africana femine majore*, oblongo: Breyn. tab. 14. fig. 2. *Cardispermum* af. pubescens: Act. Paris. 1724. 39. tab. 2.) "Leaves oblong-lanceolate, toothed; stem leafy; peduncles thickened at the top." Annual. *Leaves* much longer than those of *C. pluvialis* and broader at the end. *Flowers* smaller, but of the same colour. Miller. *Seeds* of the *disk* also similar, but a little larger, elliptic heart-shaped,

and not tumid at the edge; of the *ray* three-cornered; the sides rather convex and smooth; the angles compressed and toothed in a serrated manner. Gært. 9. *C. amplexicaulis*, Willd. Thunb. prod. 164. "Leaves embracing the stem, oblong-halbert-shaped, toothed; stem herbaceous, erect." 10. *C. pinnata*, Willd. Thunb. prod. 164. "Leaves winged." 11. *C. scabra*, Willd. Thunb. "Leaves elliptic-lanceolate, toothed, rugged; stem herbaceous, erect." 12. *C. parviflora*, Willd. Thunb. "Leaves sessile, lanceolate, toothed; stem herbaceous, rough with hairs." 13. *C. decurrens*, Willd. Thunb. "Leaves lanceolate, decurrent, very entire, smooth; stem herbaceous." 14. *C. nudicaulis*, Linn. Sp. Pl. (Bellis, Comm. hort. 2. 66. ta. 33.) *Caltha* afr. femine plano cordato, Boerh. Lugd. 1. 113.) "Leaves lanceolate, toothed in a sinuate manner; stem nearly naked." Annual. *Stem* perfectly simple, erect, leafy near the bottom. *Leaves* spatula-shaped, entire, or rarely furnished with a tooth, rugged. *Seeds* orbiculate, Linn. 15. *C. tomentosa*, Linn. Sup. Thunb. "Leaves inversely egg-shaped, downy; scape with a single flower." The last nine are all natives of the Cape of Good Hope. 16. *C. pumila*, Willd. Thunb. "Leaves orbiculate, toothed; petioles ciliated; scape with one flower." Willd. Perennial. *Leaves* half an inch long. *Petioles* twice as long as the leaf. *Flower* resembling that of the common daisy, but four times smaller. *Seeds* oblong, incurved. A native of New Zealand. 17. *C. magellanica*, Willd. (*C. pumila*  $\beta$ . Forst. Comment. Goett. 9. p. 40. After nudicaulis, Lam. encyc. 1. 305. Illust. tab. 681. fig. 4.) "Leaves wedge-shaped, toothed near the end; scape with one flower." Perennial. *Root* thread-shaped, creeping. *Leaves* narrowed at the base into a petiole, not ciliated. *Scape* furnished with one or two thread shaped bracts. A native of the Straits of Magellan. 18. *C. graminifolia*, Linn. Sp. Pl. (*C. africana surrecta*. Pluk. mant. 35. tab. 370. fig. 7. *Caltha africana foliis croci*, Boerh. Lugd. 1. p. 113. *Dimorphotheca*, Vail. act. 1720. p. 280. *Bellis africana foliis angustis*, Comm. hort. 2. p. 67. tab. 34.) "Leaves linear, nearly entire; stem almost naked." Perennial. *Stem* dividing near the root into several tufted heads with long grassy leaves coming out on every side without order. *Peduncles* one-flowered, axillary, about nine inches long. *Florets* of the *disk* purple; of the *ray* purple without, pure white within. It is in the greatest beauty in April and May, but continues to flower late in the autumn. A native of the Cape, whence it was brought to Holland in 1698. It has been long in the English gardens, but is not so common as it deserves. Miller. 19. *C. Tragus*, Willden. Ait. hort. Kew. 3. 271. Jacq. hort. Schænb. 2. p. 14. tab. 153. "Leaves linear, somewhat toothed, mucronated with small points beneath; seeds nearly orbiculate; stem somewhat shrubby." Perennial. *Leaves* alternate. *Ray* of the *corolla* large, purple without, white within. 20. *C. oppositifolia*, Willd. Ait. hort. Kew. "Leaves opposite, linear, entire, somewhat fleshy, smooth." Perennial. 21. *C. glabrata*, Willd. Thunb. "Leaves elliptic, entire, smooth; stem shrubby, erect." Perennial. 22. *C. fruticosa*, Linn. Sp. Pl. "Leaves inversely egg-shaped, somewhat toothed; stem shrubby, decumbent." Perennial. *Stem* seven or eight feet high, slender, and requiring support; branches numerous, hanging downwards. *Leaves* on short petioles of a shining green colour on their upper surface. *Flowers* terminating the branches on short naked peduncles. *Seeds* heart-shaped, flat. Sent to Mr. Miller by Dr. Van Royen about 1759. 23. *C. arborescens*, Willd. Jacq. ic. rar. 3. tab. 596. (*C. rigida*, Ait. Martyn. C. alpera. Thunb.) "Leaves oblong, toothed, rugged; seeds nearly orbiculate; stem shrubby, panicled." Perennial. *Flowers*

yellow, erect; in fruit nodding. *Rims* of the seeds semiorbicular." 24. *C. muricata*, Willd. Thumb. "Leaves oblong, ruged with papillary tubercles; the lower ones toothed, upper ones entire; stem shrubby." Perennial. 25. *C. muricata*, Willd. Thumb. "Leaves wedge-shaped, fleshy, toothed." Perennial. The last eight are all natives of the Cape of Good Hope.

*Propaganda and Culture*.—The seeds of the *arvensis*, *fancata*, *obscuris*, *pluvialis*, *hybrida*, and *nudicaulis*, should be sown in the spring, and will afterwards sow themselves without farther trouble. The last three should not be transplanted. The *graminifolia* does not often produce good seeds in Europe, but is easily propagated by slips taken off from the head, in the same manner as is practised for thurst. They may be planted any time in summer, in pots filled with light fresh earth, and plunged in a moderate hot-bed, or placed in the common earth under a melon frame, and occasionally, but not plentifully watered. When they have taken root, they should be transplanted and kept during the summer in the open air, and in a shady situation. In winter they require protection from frost and heat, but do not thrive in artificial heat. The *fruticosa* is also easily propagated by cuttings in light poor earth, and must be treated in the same manner as the *graminifolia*. Miller.

*CALENDULA*, in *Cornifol. gr.*, a species of *MOTACILLA* that inhabits North America, the *Ruby crowned wren* of Latham, *rotelet rubis* of Buffon, and *calendula pennsylvanica* of Brisson. The colour is greenish-ash; crown with a ruby (sometimes deep yellow) line; abdomen and wings beneath yellowish. Gmel. &c.

This is a small bird. The female has no ruby line on the crown, but has a scarlet lunule most commonly on the nape, which is not observable in the male.

*CALENDULA*, in *Zoology*, according to Gmelin, a sort of *HYDRA*, called by Hughes in his "Natural History of Barbadoes," the animal flower. Authors are divided in opinion as to the genus to which this animal-flower ought to be referred. Gmelin expresses a doubt of its being truly of the hydra kind, although he places it in that genus. Ellis considers it as an actinia; and later writers entertaining the same idea, it stands at present as *actinia calendula*. Notwithstanding this, we have, however, no hesitation in believing it to be neither of the genus *hydra*, nor *actinia*, but a species of *tubularia*. This we must presume from its analogy to the tubularia magnifica, and some other accurately defined species of that genus. The original figure of this animal is that which appears in the "Natural History of Barbadoes" by Hughes. Ellis and Solander have a figure of it in their work on zoophytes, but which is copied from the above mentioned publication, as is also the description that accompanies it. We must therefore have recourse to the account given of it by Hughes, as being the best to be obtained at present of this curious animal. This writer describes it as having the appearance of fine radiated flowers, of a pale yellow, or bright straw colour, slightly tinged with green; each surrounded by a circular border of thick-set petals about the size of, and much resembling, those of a single garden marigold; except that the whole of this seeming flower is narrower at the discus, or setting on of the leaves (petals) than any flower of that kind. Mr. Hughes observes, that these animals, on being disturbed, sink into holes; he also remarked four dark coloured threads, somewhat like the legs of a spider, rise out from the centre of what he calls the flower, with a quick spontaneous motion from one side to the other of the circular border of leaves (petals); and these in reality, he says, were so many arms or feelers, closing together in imitation of a forceps, as if they had

hemmed in their prey, which the yellow border soon surrounded, and closed to secure. He attempted to pluck one of these from the rock to which they were affixed, but never could effect his design, for as soon as his fingers came within two or three inches of it, the animal would immediately contract its border of tentacula, and shrink back into the hole of the rock; but if left undisturbed for about four minutes, it would come gradually into sight, expanding, though at first very cautiously, its petals or tentacula, till it would at length appear again as before, like a flower in full blossom. As often as his hand came within a certain distance of it, the animal would again recoil from his approach in the same manner. He also tried the same experiment by attempting to touch it with his cane, and a small slender rod, but the effect produced was the same.

Ellis calls this the sea marigold, from its near resemblance, when the tentacula are expanded, to the flower of the common marigold. It may be specifically defined in the words of Gmelin: stem somewhat turbinated: disk surrounded by petal-shaped tentacula, or rays.

*CALENS*, in *Entomology*, a Siberian species of *CHRYSRIS* of a large size, described by Fabricius. The prevailing colour is glossy blue; abdomen golden; tail blue and armed with four teeth. *Obj.* The legs and tip of the antennæ are fuscous.

*CALENS*, a species of *CIMEX* found in India. The head, thorax, and wing-cases are black, with a fulvous scutell. Gronovius, &c.

*CALENTES*, in *Logic*, a sort of syllogism in the fourth, commonly called *Galenical*, FIGURE, wherein the major proposition is universal and affirmative; and the second or minor, as well as the conclusion, universal and negative. This is intimated by the letters it is composed of, where the A signifies an universal affirmative, and the two E's as many universal negatives. E. gr.

CA Every affliction in this world is only for a time,  
LEN No affliction, which is only for a time, ought to disturb us.  
TES No affliction ought to disturb us, which happens in this world.

The Aristotelians not allowing the fourth figure of syllogisms, turned this word into *CELANTES*, and make it only an indirect mood of the first figure.

*CALENTIUS*, *ELISIUS*, in *Biography*, an ingenious writer both in prose and verse, was born in Apulia, and became preceptor to prince Frederick, the son of Ferdinand I. king of Naples, whom he endeavoured to inspire with sentiments of justice and humanity, congenial to his own. He was an enemy to capital punishments, and proposed various substitutes for them in different cases. He was much addicted to agriculture, and practised it with skill. Although his circumstances were narrow, he lived on terms of intimate friendship with the most eminent scholars of his time, and was a member of the Neapolitan academy. He was the author of several works, both in prose and verse, which were printed in 1503, about the time of his death; the principal of these was his poem on the "Battle of the Frogs and Mice," imitated from Homer. He declined writing the history of the war carried on by Charles the Bold against the Swiss, alleging, that it was not safe to speak ill of princes, and that an honest man ought not to publish falsehoods.

*CALENTUM*, in *Ancient Geography*, a town of Spain, on the other side of the Ebrus. Pliny says, that bricks were made in this place of an earth resembling pumice-stone, which would not sink in water.

**CALENTURE**, from *calere*, to be hot, in *Medicine*, a species of disease, formerly said to be common to seamen during their voyages in tropical climates, and to be characterized by a peculiar delirium, in which the patient imagined that he saw green fields and groves in the sea, and was desirous of leaping over-board in order to walk in them. This affection is not mentioned by recent authors, who have written on the diseases of seamen in hot climates; and the accounts which have been transmitted to us, leave the cause of this hallucination in some obscurity. According to Dr. Stubbs, who has briefly related two cases, which occurred during a voyage to Jamaica, it was a transient delirium, independent of fever, and produced by fordes in the stomach and bowels, and was therefore quickly removed by an emetic. (Philosoph. Transact. N<sup>o</sup> 36.) Other writers describe the calenture as a febrile disease, attended with a furious delirium, inasmuch, that six men could scarcely restrain the patient from leaping into the sea: and bleeding and other evacuations are said to be the proper remedies by these authors. (Shaw's Practice. Allen's Synopsis.) In consequence of these different accounts of the disorder, Sauvages has described two genera of the calenture; one of which he classes with the simple hallucinations, under the title of *Paraphrosyne Calentura*; and the other he considers as a species of *Phrenitis*, or inflammation of the brain. (Nosolog. Method. Class iii. Ord. 2. and Class viii. Ord. 3.) It is probable that the disease in all instances depended upon some degree of inflammation in the head, excited by the heat of a vertical sun; and the instinctive feelings, which, in many cases of febrile delirium, prompt the patient to plunge into cold water, to relieve his sufferings from inordinate heat, may possibly have been mistaken for a conception, that the sea was a plain or an orange grove.

**CALEPINO**, or **DA CALEPIO**, **AMBROSE**, in *Biography*, a celebrated grammarian, descended from the counts of Calepio, was born at Bergamo about the year 1435. He entered into the convent of Augustines in his native place, and chiefly devoted himself to the study of languages. His "Vocabulary of the Latin Tongue" became so famous, that books of a similar nature were long familiarly termed "Calepines." After many additions and improvements by Passerat, Lacerda, Chifflet, and others, this work, first printed in 1503, has become a polyglott dictionary, of which the best editions are that of Chifflet at Lyons in 1681, 2 vols. fol. and a later one by Faccioliati of Padua. Calepino became blind before his death, which happened in 1511. *Nouv. Dict. Hist.*

**CALEPIO**, in *Geography*, a town of Italy, in the Bergamasco.

**CALERES**, in *Modern History*, the denomination of a kind of banditti in India, who inhabit the thick forests of Tundeman, between Tanjore and Madura. They are distinguished from other Indians by their ferocious aspect and manners, as well as by the dingy colour of their skin, which is covered with dust, and seldom washed. Their common arms are long pikes, cudgels, and sabres. They are said to massacre all who fall into their hands, and particularly Europeans.

**CALERZANO**, in *Geography*, a town of Corsica; six miles S. E. of Calvi.

**CALES**, in *Ancient Geography*, a small river of Bithynia, between the Elæus on the west, and the Lycus on the east, south-east of Heraclea. The emporium at its mouth, mentioned by Arrian, is called by Marcian of Heraclea, Caleps.

**CALES**, **CALVI**, a town of Italy, in Campania, upon the Appian way, S. E. of Theanum, and N. W. of Cazma.

It was celebrated for its wine, called "Calenum." In its ruins are discerned a theatre and amphitheatre.

**CALES**, in *Geography*. See **CADIZ**.

**CALETÆ**, or **CALITES**, in *Ancient Geography*, a people placed by Cæsar, and also by Strabo, in Belgic Gaul; but Augustus comprises them in Celtic Gaul, or Gallia Lyonnensis; their chief town was "Julibona." M. d'Anville suggests that they probably occupied the diocese of "Caux." The promontory "Caletorum," was situated in Lyonnensis Secunda, at the mouth of the Seine; now called "Cape Caux."

**CALETURE**, in *Geography*. See **CALTURA**.

**CALETURE** lies also on the coast of Coromandel, north-easterly from Pullicat or Palliakate.

**CALF**, one of the smaller Orkney islands, about one mile to the north of Eda. Also, another small island of the same groupe, about a mile north of Plata.

**CALF**, a rock near the coast of Ireland, about half a mile from the south-west end of Dursley isle in the county of Cork, at the entrance into Bantry bay. N. lat. 51° 31'. W. long. 10° 6'.

**CALF of Man**, a small island in the Irish sea, near the south-west coast of the Isle of Man. N. lat. 54° 1'. W. long. 4° 43'.

**CALF Sound**, lies on the coast of Sweden, four leagues south from Maellstrand, and as much north from Wingo island. It abounds with dangerous rocks.

**CALF**, in *Rural Economy*, the young of the cattle kind of animals. Calves are distinguished, according to the difference of sex, into male and female, or *bull* and *cow*, *why*, or *qui* calves. There are considerable differences in the management of these animals in different districts of the kingdom, both in the rearing and fattening; the advantages of which still remain to be decided by the test of experiment.

**CALVES**, *Rearing of*. It is by this practice that the farmer is to raise his cattle flock; it should, of course, be attended to with a great degree of care. Where he is anxious to have a good cow flock, the best cow calves should be carefully selected from such cows as are the most tractable, afford the best milk, are the most hardy, and best suited to the state of the farm; afterwards rearing them with the most careful attention to the nature and quantity of food, as well as other circumstances.

There can be little doubt but that the best and most natural mode of rearing the young of this, as well as most other kinds of animals, is, that of allowing them to suck their dams at least for some length of time after they are brought forth. The usual method in Yorkshire is, however, that of giving them milk to drink, there being few instances where they are allowed to suck. For the first two or three weeks, they mostly get milk warm from the cow; but for the next two or three weeks, half the new milk is withdrawn, and skimmed milk substituted in its stead: and at the end of that period of time, the new milk is wholly withdrawn; they are then fed on skimmed milk alone, or sometimes mixed with water, till they are able to support themselves by eating grass, or other food of that, or other sorts which are provided for them.

But in Cheshire, the practice is to allow the calves to suck for the first three weeks. They are then fed on warm green whey, or scalded whey and butter-milk mixed; with the green whey, water is frequently mixed, and either oatmeal, or wheat and bean-flour added. A quart of meal or flour is thought sufficient to mix with forty or fifty quarts of liquid. Oat-meal gruel and butter-milk, with an addition of skimmed milk, are also used for the same purpose. Some one of

these prepared kinds of food is given night and morning for a few weeks after the calves are put on that diet, but afterwards, only once a day, till they are three months old or more, and become perfectly strong.

The calves in Gloucestershire are not allowed to suck above two or three days; they are then fed on skimmed milk, which is previously heated over the fire. When they arrive at such an age as to be able to eat a little, they are allowed split beans or oats, and cut hay, water being mixed with the milk at the time of giving it.

And the method practised in Suffex differs materially from any of these. It is common, in that district, to allow the calves either to suck for ten or twelve weeks, or to wean them at the end of three or four, and to give them a liberal allowance of skimmed milk for six or eight weeks longer when necessary. The Suffolk farmers adopt the practice of letting the calves suck the cows a month, six weeks, or more, coarse pollard and oats being then given in mixture with skimmed milk and water: some nice green hay being constantly placed before them, till the period of their being turned out into the pastures. In this method, carrots would probably supply the place of the oats, and greatly lessen the expence.

The method pursued by the farmers in Scotland for rearing calves seems well adapted to the purpose: they are two. The first is, by giving them a pailful, containing about a gallon, of milk, warm from the teat of the cow, morning and evening, for eight or ten weeks. The second, which is certainly the most agreeable to nature, and therefore to be preferred to any other that can be adopted, is, to allow the calf to suck its dam, as is sometimes done in the county of Suffex, and some other districts, as in some parts of Lancashire.

The Norfolk husbandmen permit their early calves to suck twice in the day for about a fortnight, and afterwards to have the pail in the same manner for an equal length of time; then once a day for a month or more, according to circumstances; turnips, cut hay, &c. being placed in the mangers before them, at the time.

Where it is the custom to rear calves with skim-milk, it should always be boiled, and suffered to stand until it cools to the temperature of that first given by the cow, or in a trifling degree more warm, and in that state be given to the calf. Milk is frequently given to calves when warmed only; but that method will not succeed so well as boiling it. If the milk be given over-cold, it will cause the calf to skit or purge. When this is the case, put two or three spoonfuls of rennet in the milk, and it will soon stop the looseness. If, on the contrary, the calf is bound, bacon-broth is a very good and safe thing to put into the milk. One gallon, or rather more, of milk per day will keep a calf well till it be thirteen weeks old. A calf may then be supported without milk, by giving it hay, and a little wheat bran, once a day, with about a pint of oats. The oats will be found of great service, as soon as the calf is capable of eating them, in promoting its growth. The bran and oats should be given about mid-day: the milk in equal portions, at eight o'clock in the morning, and four in the afternoon. But whatever hours are chosen to set apart for feeding the calf, it is best to adhere to the particular times, as regularity is of more consequence than is generally supposed. If the calf goes but an hour or two beyond its usual time of feeding, it will find itself uneasy, and pine for food.

It is always to be considered, that calves, reared in this manner, are to be enticed to eat hay, or some other similar material, as early as possible; and the best way of doing this,

is, to give them the sweetest hay in your possession, and but little at a time. Turnips or potatoes are very good food, as soon as they can eat them; and they are best cut small, and mixed with the hay, oats, bran, and such articles, at the time of their being given.

It may be observed, that it is not absolutely necessary to give milk to calves after they are one month old; and to wean them gradually, two quarts of milk, with the addition of linseed boiled in water to make a gruel, and given together, will answer the purpose, until, by diminishing the milk gradually, the calf will soon do entirely without. Hay-tea will answer the purpose, with the like addition of two quarts of milk, but is not so nutritious as linseed. It is a good method of making this, to put such a proportion of hay as will be necessary into a tub, then to pour on a sufficient quantity of boiling water, covering up the vessel, and letting the water remain long enough to extract the virtues of the hay. When bacon or pork is boiled, it is also a good way to preserve the liquor or broth, and mix it with milk for the calves.

In summer, calves may sometimes be reared on whey only. But when reared in winter, they must be fed with hay; and clover-hay is probably the best of any sort for this use. Calves may also be raised with porridge of different kinds, without any mixture of milk at all.

It has been suggested to be sometimes a good convenient plan, to bring up calves under a sort of foster mother; an old cow, with a tolerable stock of milk, will suckle two calves, or more, either turned off with her, or at home, keeping them in good condition, until they are old enough to shift for themselves: they ought to suck the first of their mother's milk, for two or three days, although many are weaned without ever being suffered to suck at all. Calves, whether rearing or fattening, should always suck before milking, the cow being milked afterwards, as the first and thinnest of the milk is sufficiently rich for them. Old milk often scours very young calves; but the effect generally goes off without any ill consequence. Skimmed milk and second flour are sometimes made use of. The large, short-horned breed of calves mottly consume daily, at three meals, three quarters of a pound of flour each, boiled up in skimmed milk or other liquid.

The proper degree of warmth for the skimmed milk, on which calves are weaned, is a little above that fresh from the cow.

In the Rural Economy of Norfolk, it is remarked, by Mr. Marshall, that some farmers bring up all the year round, rearing every calf they have dropped. Others rear in winter only, fattening their summer calves for the pea-markets; or at a distance from them for the butcher. Norfolk farmers, in general, begin early in winter to rear their calves, some so early as Michaelmas; in common, if their cows come in before Christmas, not only as being fully aware of the advantage of rearing early, but in order that they may rear as many of their own calves as possible, drove calves being always hazardous, and sometimes scarce. No distinction is made as to sex; males and females are equally objects of rearing, and are both occasionally subject to castration, it being a prevailing custom to spay all heifers intended to be fatted at three years old, but such as are intended to be finished at two years old are, it is believed, pretty generally left "open," as are, of course, such as are intended for the dairy. There are two reasons for this practice; they are prevented from taking the bull too early, and thereby frustrating the main intention; and by this precaution may be more quiet, and are kept from roving at the time of fattening.

This

This may be one reason why spayed heifers are thought to fatten more kindly at three years old, and to be better fleshed than open heifers. The method of treatment depends, in some measure, on the time of rearing; the winter calves require more milk than the later-dropt ones.

“Here the general treatment of a calf dropt at Christmas may be said to be this; sucks twice a day the first fortnight, has the pail twice a day for the next month or six weeks, and once a day for a month or six weeks longer, with hay in a rack and turnips in a manger, and sometimes with oats and beans among the turnips, which last, after a calf has taken freely to them, serve as both meat and drink. In this consists the chief peculiarity of the Norfolk method of rearing calves, which may be said to be with milk and turnips; the last a species of food, which, in every other part of the kingdom is, it is believed, entirely neglected or unthought of. As soon as the weather gets warm enough, the calves are turned out in the day among the fattening bullocks, or on to a patch of turnips, or upon a piece of wheat, or a forward grass-piece, and housed again at night, until the days growing long and the nights warm, and the clover and darnel have risen to a full bite, when they are turned out altogether, and continue to have the first bite of every thing which is good and palatable to them throughout the summer. This may be called the general treatment of calves dropt at Christmas; but the management of no two farmers is exactly the same.”

*CALVES, weaning of.* The most suitable season for this business is the early part of the spring, as such calves as are weaned at a late period seldom attain any great size. The best means of accomplishing this is by gradually taking them from the cow, and afterwards diminishing the quantity and quality of the milk, or other liquid with which they are fed, until they become capable of being supported on grass alone, or with some sort of cut food. The method of management in these cases is thus stated by the author of the “*Synopsis of Husbandry*,” “having a cow suited to the purpose which drops a calf, let it be suckled in the usual mode, till it hath completed the third week of its age; when, instead of turning it to the cow, it is to be suckled by thrusting its head into a pail of new milk, and the finger of the person who directs the business is to supply the place of a teat. At first the calf may be rather awkward at sucking the finger, but this will soon become familiar, and after a while a lock of hay may be substituted for the teat; and as the calf advances in age it will suck the milk out of the pail without any assistance. The milk should at first be given, as observed before, free of adulteration; but, at the end of the first month, a little milk pottage may be added to each serving. This method should be continued till the calf is twelve or fourteen weeks old, lowering the milk pottage by degrees, till at length it will be brought to simple water only. At the season when the calf is thus weaned from the teat, it ought to be turned abroad in the day-time into a small close or orchard near the yard, where there is a good bite of grass, which may be expected at the time of the year when the weaning calves are of this age; and as there will generally be more than one calf weaned in a season, they will each be company for the other, and become in a short time reconciled to their situation. It is to be observed, that this pasture should be at some distance from that whereon the dams are turned, and that there be neither ponds nor ditches, nor any annoyance which might endanger the lives of these youthful animals; and in order to habituate them still more to their pasture, the milk-pottage should be carried clean to them at each of their feeding hours. For the first month or six weeks the calves ought every night to be brought out of the

meadow and lodged in the pens; but, after this time, they may be left in the pasture as well in the night season as in the day, and at this time their food may be lowered by degrees, till, as was before observed, it be at length reduced to simple water only, for when the calves get to the age of twelve or fourteen weeks, they will no longer require the aid of this sustenance, but will be able to satisfy their appetites by grass. Care, however, must be taken throughout the summer, that they be frequently shifted from one pasture to another, in order that they may be kept up in good flesh, and enabled to grow away with the utmost celerity. At Michaelmas, or soon after, the calves should be taken into the yard; and if they were allowed the indulgence of a small close to themselves, it would be still better. And here their taste must be gratified with the best and sweetest hay that can be procured, with an outlet on a dry pasture, where in fine open weather they may be suffered to enjoy themselves; and it would redound greatly to their welfare, if, on the approach of winter, a shed was to be erected for them to repose in during the night, and for shelter in tempestuous days. So essential are warmth and good living to young animals of every denomination, that the care which has been taken of them in their early days will be manifest in every state of their future growth. Nor is there any flock which will pay better for this cautious management in their youth than those of the cow kind: for if they are stinted in their feed, or carelessly attended whilst in their growing state, they will never arrive to that size which they would otherwise have done, and consequently the loss will be perpetually felt by the farmer who attempts to raise milk kine of his own breed, without giving them a due attendance in the first year. When the calves have attained their first year, they are called *buds*, or *yearlings*; and though at this time they may be able to mix with the herd, yet he thinks it would be most prudent, if not attended with too great an inconvenience, to suffer them to remain in a pasture by themselves. But if this cannot be done, let them be turned out with the dry flock, and not permitted to run with the cows, as this might probably be the occasion of their taking bull; a measure which should at this time be cautiously guarded against, as such buds which propagate at this early age will receive a check in their growth on this account; and if, during the succeeding winter, they were to be managed as before directed, he is of opinion that their future growth would be found to pay ample interest for the fodder that is now given them; only this is to be observed, that as their strength is now considerably augmented, a less valuable fodder may suffice, and good pea-straw may well supply the place of hay. Such farmers who have low rushy meadows, where there is frequently a length of *tril* in the winter, may in this second year turn the calves into them, and here they will meet with plenty of nourishing food, whilst the weather is fair and open. At two years old the heifer may be suffered to take bull; but it would in his opinion be still better for the cow, and more to the interest of the farmer, if he were to wait a year longer ere the business be completed.”

From the great scarcity of milk, various substitutes have been proposed for the early periods of weaning, some of which seem well calculated for the use they are designed. The method proposed by the duke of Northumberland is to take one gallon of skimmed milk, and to about a pint of it add half an ounce of common treacle, stirring it until it is well mixed; then to take one ounce of linseed-oil cake, finely pulverized, and with the hand let it fall gradually in very small quantities into the milk, stirring it in the meantime with a spoon or ladle, until it be thoroughly incorporated; then let the mixture be put into the other part of the milk,

milk, and the whole be made nearly as warm as new milk when it is first taken from the cow, and in that state it is fit for use. The quantity of oil-cake powder may, from time to time, be increased, as occasion may require, and as the calf becomes inured to the flavour of it. But Mr. Crook's method is to make a jelly of one quart of linseed, boiled ten minutes in six quarts of water, which jelly is afterwards mixed with a small quantity of the best hay-tea; on this he rears many calves without milk.

Mr. Donaldson observes, that calves when dropt during the grass-season should be put into some small home-clofe of sweet rich pasture, after they are eight or ten days old, not only for the sake of exercise, but also that they may the sooner take to the eating of grass. When they happen to be dropt during winter, or before the return of the grass-season, a little short cut hay, straw, or sliced turnips, should be laid in the trough or stall before them. By means of linseed made into a jelly by boiling in water, calves have been weaned without any milk at all, in the trials of Mr. Crook. The author of Practical Agriculture suggests that potatoe meal has been found to be useful in this intention, "as it mixes well with milk, water, or weak broth, and is highly nutritious."

Male calves that are intended to be kept should constantly be castrated or cut at an early period, as in the first week or fortnight, the danger being considerably less when done early.

*CALVES, suckling of.* In this practice the produce of the cow can in many situations be brought to great advantage; as in the vicinity of large towns. The method most commonly employed in fattening calves, is to allow them to suck; as by this method the object is probably not only sooner, but more effectually attained than by any other means. The period which is necessary for fattening calves must be different, according to circumstances, but it is generally from seven to nine weeks; however, in the dairy districts, where milk is considered a valuable article, scarcely half that time is allowed. There is another method, which is to give them the milk to drink; and when that is done, it is given them morning and evening warm from the cow, and the quantity increased according to their age and strength. In whatever way they may be managed, they should be kept in pens in a clofe well aired house, and well littered.

The author of the Synopsis of Husbandry observes, "that as it is necessary that the calves should lie always quiet, in order that they may indulge in sleep at those times when they are not employed in suckling; it seems proper that the cow-house should be situated in the most retired part of the yard, and that the pens should be kept as dark as possible. But notwithstanding this caution, the calves should by no means be suffered to lie too hot in the summer time, which would be apt to induce a sickness amongst them. To admit, therefore, an occasional draught of fresh air, let a window be cut in each pen, with shutters adapted to the fame, and let these windows be opened whenever the closeness of the atmosphere indicates it to be necessary. In the summer season they should rarely, if ever, be closely shut, and when it is required, the stream of air may be increased by opening the cow-house door at the opposite end of the building. Each calf should have a collar round his neck, to direct him in his suckling, but should never be fastened up in the pen. It is necessary that the pens be constantly well littered with the cleanest wheat straw, a proportion of which should be thrown in to them every day; cleanliness being a most essential article in the fattening of every animal, and not more necessary to any than the calf, which, but for this precaution, would in a short time demonstrate the ill effects of lying on his accu-

mulated dung, which of all other animals is the most offensive, and of a quality highly septic. Still as the calves are weaned, they are to be taken into the pens, and suckled on their own dams, which at first will yield a far greater quantity of milk than is necessary for their offspring, so that another calf may be suckled thereon; or the cow may be milked, and the cream be reserved for butter, or applied to any other use that the owner may think proper. As the calf increases in size it will require a larger quantity of milk; but whilst they are young, one good cow will yield a noble supply for two calves; and when the produce is demanded for one calf, another new milch cow should be provided, and these two cows will abundantly supply the three calves with milk till the oldest is fit for the butcher; after which, if necessary, a fresh suckler may be bought in, and the business be carried on progressively by keeping the house constantly supplied with calves, so that the whole milk may be suckled; as the different branches of the fatted calf and the dairy cannot be so conveniently united."

"For many of the southern parts of the kingdom, Smithfield Market is the most convenient place to apply for sucklers, so as to be on a certainty of procuring them, this being the general receptacle where the milk-men vend their calves; and these having been bred from the larger Staffordshire or Holderness cows, do generally turn out to good account for the suckler, such large boned calves, when fattened, arising to a weight much more considerable than the ordinary produce of the country dairy-men; and as to the superior quantity of milk required in fattening the larger breed of calves, this is amply recompensed by the greater increase of weight. The only hazard attending this Smithfield bargain is, the accident which may happen to the creature on the road, if the drift has been of any length; for, besides the cow-men above-mentioned, many sucklers are sent to this market from the vale of Aylesbury, and these sometimes meet with accidents, either from the lengthened journey, or want of milk. From the former, the quiet of the pens generally recovers them, and the ill consequences of inanition may be obviated by stinting the creature to a short allowance for a few meals, till the cause is removed. With these precautions, it will, he believes, very rarely be found that any fatal consequences succeed either of these evils. However it sometimes happens that, in spite of all our care, the suckler dies in consequence of imprudent management in the vender; but as these accidents are not frequent, they ought not to deter the farmer from replenishing his pen by the London markets, where his vicinity to the metropolis will allow of the practice.

"Young calves," he says, "when permitted to suck their fill, are often seized with a lax or scouring. To prevent which, the calves for the first fortnight or three weeks may be stinted in their allowance; at the same time due regard should be taken that they do not pine or decrease in flesh for want of milk. But after this age, they should be allowed to suck as long as they choose, and every means ought to be made use of to increase their appetite, and render them more eager after their food. Chalk may be given for this purpose, as well as for giving to the flesh a delicate whiteness. Salt sprinkled in the troughs will likewise act as a stimulus to the appetite; besides which, it is a common practice with some people to cram their calves with balls compounded of flour, pounded chalk, and milk, with the addition of a small quantity of common gin. Of these they give two, about the size of a walnut, once a day, or oftener, to each calf. These balls being very nutritious, in some degree, supply the place of milk, and at the same time the spirituous mixture operates on the creature as a soporific;

rific; and thus, by composing them to sleep, increases their disposition to fatten. But where milk can be had in sufficient abundance, it is never worth while to have recourse to these factitious aids. When the demands of the calf, however, are beyond the ability of the cow, these balls come seasonably to their relief. In order that the calves may be provided with sufficient store of milk, the pastures should still be changed, whenever the cows are found to be deficient in this particular; and in the winter time, such food as is of a succulent nature, as grains, turnips, &c. should be always at hand to supply the want of grass: and these, with a due allowance of the sweetest hay, should be their constant aliment during the time that the cows are confined to the yard.

“The prices of suckling calves vary according to the goodness of the young animal, and the time of year wherein the purchase is made. In general, sucklers fetch the largest price in summer, when veal sells the cheapest; and the reason of this arises from the smaller number to be met with at that time than in the spring. A good suckler in London can seldom be bought for less than 20s., and is often sold for 25s. or 30s. The business of suckling was formerly reckoned to turn out to good advantage, when each calf throughout its fattening brought a profit to the farmer of three shillings a week; but now (1799) so considerably have provisions of every kind been advanced in price within these few years, the profit on the article of suckling is much greater.

“When calves are slaughtered at six weeks or two months old, the veal is seldom of a good colour; neither has the flesh of these young calves a taste equal to that where the animal has been suffered to live a few weeks longer. To attain both the ends of colour and flavour it is necessary that the calves should be maintained with plenty of milk, and regulated under such management as before directed, till they arrive to the age of eight or ten weeks, according to the season of the year, the more or less kindly state of the calf, the particular demand of the markets, or other eventual circumstances. In the summer season, it may be proper to dispose of them at an earlier period than in the winter; not only on account of their growing away with greater celerity in warm weather, but likewise because of the increased demand for small veal, which is then most saleable. During the last three or four weeks, blood should frequently be drawn from the calf, which will be a likely means towards rendering the veal of a colour delicately white; a circumstance so much attended to by the butcher, that he will commonly depreciate such calves, which from the appearance of their eyes are likely to *die black*, as they term it, though in other respects not to be despised.

“Such calves as are suckled on their own dams will, generally speaking, fatten in a shorter time than those which are afterwards bought in to supply their places. The first obvious reason for this difference in their favour is their not having been removed from the places where they were first dropped, and having always continued to suck the milk of their parent animal, which must in all reason be supposed of a more nutritious quality to them than that of any other cow. Secondly, the cow having so lately calved, the aliment nourishes and fattens in a higher degree than when the creature becomes stale milked. Cow calves are observed to fatten more kindly than the male or bull calves; and these last are much more coarse grained, and their flesh less delicate in taste than the former. Calves of the largest size are fattened in Essex, where the business of suckling seems to be better understood, and more properly conducted than in any other county, and where the farmer keeps

the calves to a greater age than in any other part of the kingdom.”

Mr. Marshall is clearly of opinion, that “to suckle calves in general after they are ten weeks old is bad management; for his account in this respect is uniform—those of nine or ten having paid as much a week as those of twelve or thirteen, and although a calf of six weeks old may suck nearly as much milk as a calf of twelve weeks old, yet the first month or five weeks the quantity is considerably less, and this advantage of their infancy is doubly as valuable to nine as it is to twelve weeks.”

In some districts, barley-meal, linseed boiled into a kind of jelly, and such-like articles, are given to calves in the course of fattening; but the methods above described are greatly superior, although it must be allowed that they may sometimes be considerably more expensive.

It is of the greatest importance in this practice to have good breeds of cows, to keep them constantly well fed, and the suckling houses airy, spacious, and perfectly clean from all sorts of filth.

**CALF-pen**, a place formed for the purpose of receiving calves for the practice of fattening them.

In most places it is the custom to have the calf pens annexed to the cow-houses. The only reason, Mr. Beaton observes, in his useful paper in the communications to the Board of Agriculture, “that he can assign why calf-pens should be within the cow-house is, that it saves a little trouble to the dairy-maid, by having a shorter distance to carry the milk. In general, however, it is a plan not to be recommended, as every person who has had any experience among cows must know how naturally and how forcibly a new calved cow expresses her attachment to her calf; with what care and anxiety, if permitted, she licks it all over, and uses every exertion to protect it from injury; how the tender calf clings to its affectionate mother, as if sensible that to her alone it can trust for protection: and yet the poor helpless creature (says he) is dragged away, and placed perhaps within its mother’s view, or at least within her hearing, as if on purpose to augment the pain of her sufferings. Its doleful cries keep alive the pangs of the unhappy cow; she struggles to break the chain that binds her fast, and seems restless and uneasy whenever approached. In such a state of agitation it is impossible she can either feed well, or give that quantity and quality of milk she would otherwise furnish. Where there are many cows kept, and perhaps several of them lately calved, a single calf may keep them all in this restless state: to remedy which, the best way (says he) is to have the calves at such a distance, or at least so thick a wall betwixt them, that the cows cannot hear their cries. The cow will then soon forget her calf, and will both feed and milk the better for it; therefore they should be as near as conveniently may be, without being liable to the above objections.

“To lie dry and warm is of the greatest consequence in the rearing of calves, as is evident from what has been already advanced on the subject. Some think it necessary to accustom a calf to be bound with a halter from the hour of its being calved; others again turn them quite loose into the pen, and allow them to range and run about as much as they please. Which of these is the best method is here of little consequence. The principal thing to be observed in the construction of calf-pens is the laying of the floor, which should be made of laths or spars, about two inches broad, laid at the distance of an inch from each other upon joists, so as to make the floor above one, two, or three feet from the ground, as the situation will admit. This not only keeps them quite dry, by allowing all the moisture to

pass immediately away, but has the advantage of admitting fresh air below the bedding, and thereby preventing that unwholesome disagreeable smell too often found among calves; for, it is to be understood, that this place below the floor should frequently be cleaned, as well as the floor itself, whenever it becomes wet or dirty; but it is not right to allow the litter to increase to a great thickness, otherwise the moisture will not so easily pass through. Calf-pens are, however, too often made without this sparred floor, and the fresh litter always laid on the old, till the calves are removed, which is a slovenly practice, and not by any means to be recommended.

“Stalls, or divisions, are but seldom made in calf-pens: at the same time it would certainly be much better to keep the calves separate from each other; by which means they will be more easily fed, and less liable to accidents. Partitions, about three feet high, of thin deal nailed on small posts, might be so contrived as to be moveable at pleasure, to increase or diminish the stall if necessary, according to the age and size of the calf. This may be done as represented in the plate on calf-pens, *fig. 1.* which is the ground-plan of a double calf-pen for ten calves; *a* is the door; *b* the passage betwixt the pens; *c c c*, &c. are the pens, shewing the situation of the partitions; *d d d d* are four joists, in which are several holes, as shewn on the plan, for receiving iron pins, at the bottom of the partitions, to keep them in their place; *e* is a window or door, besides which there should be some other windows or air-holes as high up as possible. If it be thought unnecessary to make the partitions, there might be a small round trough, in a circular frame, fixed in the corner of each pen, as at *f*, for holding the milk, and a door in the next adjoining corner. A small slight sack for holding a little hay, placed at the upper part of the pen, might also be useful. The troughs should be round, that the calves may not hurt themselves upon them, which they might probably do on the angles if they were square. *Fig. 2.* is a section of these pens, in which *rr* shews the position of the racks. The advantages of this kind of calf-pens are, that the calves are all kept separate in a small compass, and cannot hurt each other, as the stronger ones sometimes do the weaker, when confined promiscuously; and their food may be much more easily and equally distributed when they are not suckled.

“If a great number of calves are feeding, as thirty or forty, or more, it might be so contrived in such pens, by pipes communicating with the troughs, that one person might give all the calves their milk at the same instant of time; and that any given quantity of milk, and no more, can go into each trough; but as this method would probably be but rarely required by the farmer, it is unnecessary, in a general point of view, to enter into an explanation of it.”

In Gloucestershire, Mr. Marshall says, “the calf-pens are of an admirable construction; extremely simple, yet singularly well adapted to that intention. Young calves, fattening calves more especially, require to be kept narrowly confined: quietness is, in a degree, essential to their thriving. A loose pen, or a long halter, gives freedom to their natural fears, and a loose to their playfulness. Cleanliness, and a due degree of warmth, are likewise requisite in the right management of calves. A pen which holds seven, or occasionally eight calves, is of the following description:—The house, or roomstead, in which it is placed, measures twelve feet by eight: four feet of its width are occupied by the stage, and one foot by a trough placed in its front; leaving three feet as a gangway, into the middle of which the door opens. The floor of the stage is formed of laths,

about two inches square, lying lengthways of the stage, and one inch asunder. The front fence is made of staves, an inch and a half in diameter, nine inches from middle to middle, and three feet high: entered at the bottom into the front bearer of the floor (from which cross joists pass into the back wall), and steadied at the top by a rail; which, as well as the bottom piece, is entered at each end into the end wall. The holes in the upper rail are wide enough to permit the staves to be lifted up and taken out, to give admission to the calves; one of which is fastened to every second staff, by means of two rings of iron joined by a swivel; one ring playing upon the staff, the other receiving a broad leathern collar, buckled round the neck of the calf. The trough is for barley-meal, chalk, &c. and to rest the pails on. Two calves drink out of one pail, putting their heads through between the staves. The height of the floor of the stage, from the floor of the room, is about one foot. It is thought to be wrong to hang it higher, lest, by the wind drawing under it, the calves should be too cold in severe weather. This, however, might be easily prevented by litter, or long strawy dung thrust beneath it.” It is observable, that these stages are fit only for calves which are fed with the pail, not for calves which suck the cows.

*CALF-stage*, in *Rural Economy*, a term employed in some districts to signify the same as pen, probably from the floor being somewhat raised.

*CALF skins*, in the *leather manufacture*, are prepared and dressed by the tanners, skimmers, and curriers, who sell them for the use of the shoe-makers, fadlers, bookbinders, and other artificers, who employ them in their several manufactures.

*CALF-skin dressed in fumach*, denotes the skin of this animal curried black on the hair side, and dyed of an orange colour on the flesh side by means of fumach, chiefly used in the making of belts. The English calf-skin is much valued abroad, and the commerce thereof very considerable in France and other countries; where divers attempts have been made to imitate it, but hitherto in vain. What is likely to baffle all endeavours for imitating the English calf in France is, the smallness and weakness of the calves about Paris; which, at fifteen days old, are not so big as the English ones when they come into the world.

*CALF, Golden*, in *Scripture History*. See *GOLDEN CALF*.  
*CALF, Sea*, in *Zoology*. See *PHOCA VITULINA*, and *SEA-CALF*.

*CALF* also denotes the young of the *WHALE*.

*CALF*, among *Sportsmen*, is used for a male hart or hind of the first year.

*CALFS-snout*, in *Botany*. See *ANTIRRHINUM ORONTIUM*.

*CALFAT*, in *Ornithology*, a species of *EMBERIZA*, the red-eyed bunting of Latham, a bird that inhabits the isle of France. This is smaller than the common sparrow: colour hoary; beneath vinaceous: head, throat, and margin of the tail, black: bill, legs, and orbits rosy. *Gmel. &c. Obs.* This is *Le Calfat* of Buffon.

*CALHETA*, in *Geography*, a small town of Madeira, in the district of Funchal.

*CALI*. See *KALI*.

*CALI*, in *Geography*, a town of South America, in a department of the same name, in the province of Quito, and government of Popayan, built by Sebastian de Belalcazar. N. lat. 3° 15'. W. long. 73° 16'.

*CALIACH-HEAD*, a cape of Scotland, on the north-west coast of the island of Mull.

*CALIAVARI, LUCA*, in *Biography*, a painter, was born at Udine, in Italy, in 1665, and acquired his skill by

studying and copying the works of eminent masters. His chosen subjects were sea-ports and landscapes, especially views about Rome and Venice, which he designed and executed with truth, nature, and elegance. His volume of perspective views of Venice, etched with aqua-fortis, evince his taste and abilities. He died in 1715. Pilkington.

**CALIBER**, or **CALLIPER**, in a general sense, denotes the extent of any round thing in thickness, or diameter.

In which sense we say, a column is of the same *caliber* as another, when they are both of the same diameter.

**CALIBER** more particularly denotes the bore, or width of a piece of ordnance, or other fire-arms; or the diameter of the mouth thereof; or the ball it carries.

The *caliber* is the rule by which all the parts of a cannon, or mortar, as well as of its carriage, are proportioned.

**CALIBER-compasses**, a sort of compasses made with arched legs, to take the diameter of convex or concave bodies.

**Caliber-compasses** are chiefly used by gunners, for taking the diameters of the several parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular, and move on an arch of brass, whereon are marked the inches and half-inches; to shew how far the points of the compasses are opened asunder.

Some are also made for taking the diameter of the bore of a gun or mortar.

The gaugers also sometimes use *calibers* to embrace the two heads of any cask, in order to find its length.

The *caliber*, used by carpenters and joiners, is a piece of board notched triangular-wise in the middle, for the taking of measure.

**CALIBER**, **CALIBER-rule**, or **Gunner's CALLIPERS**, is an instrument, wherein a right line is so divided, as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first as the diameters of balls of two, three, four, &c. pounds, are to the diameter of a ball of one pound. The *caliber* is used by engineers, from the weight of the ball given to determine its diameter, or *caliber*; or *vice versa*.

The gunner's callipers consist of two thin plates of brass joined by a rivet, so as to move quite round each other: its length from the centre of the joint is between six inches and a foot, and its breadth from one to two inches: that of the most convenient size is about nine inches long. Many scales, tables, and proportions, &c. may be introduced on this instrument; but none are essential to it, except those for taking the *caliber* of shot and cannon, and for measuring the magnitude of salient and entering angles. The most complete callipers is exhibited *Tab. Gunnery, fig. 2.* the furniture and use of which we shall now briefly describe. Let the four faces of this instrument be distinguished by the letters A, B, C, D; A and D consist of a circular head and leg; B and C consist only of a leg.

On the circular head adjoining to the leg of the face A are divisions denominated *shot diameters*, which shew the distance in inches and tenths of an inch of the points of the callipers when they are opened; so that if a ball not exceeding ten inches be introduced between them, the bevil edge E marks its diameter among these divisions.

On the circular bevil part E of the face B is a scale of divisions distinguished by *lb. weight of iron shot*. When the diameter of any shot is taken between the points of the callipers, the inner edge of the leg A shews its weight in avoirdupoise pounds, provided it be lb.  $\frac{1}{2}$ , 1,  $1\frac{1}{2}$ , 2, 3, 4,  $5\frac{1}{4}$ , 6, 8, 9, 12, 16, 18, 24, 26, 32, 36, or 42; the figures nearest the bevil edge answering to the short lines in the scale, and those behind them to the longer strokes. This scale is constructed on the following geometrical theorem.

viz. that the weights of spheres are as the cubes of their diameters.

On the lower part of the circular head of the face A is a scale of divisions marked *bore of guns*; for the use of which, the legs of the callipers are slipped across each other, till the steel points touch the concave surface of the gun in its greatest breadth; then the bevil edge F of the face B will cut a division in the scale shewing the diameter of the bore in inches and tenths.

Within the scales of *shot* and *bore* diameters on the circular part of A, are divisions marked *founders*: the inner figures  $\frac{1}{2}$ ,  $1\frac{1}{2}$ , 3,  $5\frac{1}{4}$ , 8, 12, 18, 26, 36, correspond to the longest lines; and the figures 1, 2, 4, 6, 9, 16, 24, 32, 42, to the short strokes. When the bore of a gun is taken between the points of the callipers, the bevil edge F will either cut or be near one of these divisions, and shew the weight of iron shot proper for that gun.

On the upper half of the circular head of the face A are three concentric scales of degrees; the outer scale consisting of 180 degrees numbered from right to left, 10, 20, &c. the middle numbered the contrary way, and the outer scale beginning at the middle with 0, and numbered on each side to 90 degrees. These scales serve to take the quantity of an angle, either entering or salient. For an entering, or internal angle, apply the legs of the callipers so that its outward edges coincide with the legs of the given angle, the degree cut by the bevil edge F in the outer scale shews the measure of the angle sought: for a salient, or external angle, slip the legs of the callipers across each other, so that their outward edges may coincide with the legs forming the angle, and the degree marked on the middle scale by the bevil edge E will shew the measure of the angle required. The inner scale will serve to determine the elevation of cannon and mortars, or of any oblique plane. Let one end of a thread be fixed into the notch on the plate B, and any weight tied to the other end: apply the straight side of the plate A to the side of the body whose inclination is sought, hold it in this position, and move the plate B, till the thread falls upon the line near the centre marked *Perp.* Then will the bevil edge F cut the degrees on the inner scale, shewing the inclination of that body to the horizon.

On the face C near the point of the callipers is a little table shewing the proportion of troy and avoirdupoise weights, by which one kind of weight may be easily reduced into another.

Near the extreme of the face D of the callipers, are two tables shewing the proportion between the pounds weight of London and Paris, and also between the lengths of the foot measure of England and France.

Near the extreme on the face A is a table containing four rules of the circle and sphere; and geometrical figures with numbers annexed to them: the first is a circle including the proportion in round numbers of the diameter to its circumference; the second is a circle inscribed in a square, and a square within that circle, and another circle in the inner square: the numbers, 28, 22, above this figure, exhibit the proportion of the outward square to the area of the inscribed circle; and the numbers 14, 11, below it, shew the proportion between the area of the inscribed square and the area of its inscribed circle. The third is a cube inscribed in a sphere; and the number 89 $\frac{1}{2}$  shews that a cube of iron, inscribed in a sphere of 12 inches in diameter, weighs 89 $\frac{1}{2}$ . The fourth is a sphere in a cube, and the number 24 $\frac{1}{2}$ , expresses the weight in pounds of a sphere inscribed in a cube whose size is 12 inches: the fifth represents a cylinder and cone of one foot diameter and height: the number in the cylinder shews, that an iron cylinder of that diameter

and height weighs 364.5 lb. and the number 121.5 in the cone expresses the weight of a cone, the diameter of whose base is 12 inches, and of the same height: the sixth figure shews that an iron cube, whose side is 12 inches, weighs 474 lb. and that a square pyramid of iron, whose base is a square foot and height 12 inches, weighs 154 $\frac{2}{3}$  lb. The numbers which have been hitherto fixed to the four last figures were not strictly true; and therefore they have been corrected in the figure here referred to; and by these the figures on any instrument of this kind should be corrected likewise.

On the leg B of the callipers, is a table shewing the weights of a cubic inch or foot of various bodies in pounds avoirdupois.

On the face D of the circular head of the callipers is a table contained between five concentric segments of rings: the inner one marked *Guns* shews the nature of the gun, or the weight of ball it carries; the two next rings contain the quantity of powder used for proof and service to brass guns, and the two outermost rings shew the quantity for proof and service in iron cannon.

On the face A is a table exhibiting the method of computing the number of shot or shells in a triangular, square, or rectangular pile. Near this is placed a table containing the principal rules relative to the fall of bodies, expressed in an algebraic manner: nearer the centre we have another table of rules for raising water, calculated on the supposition, that one horse is equal in this kind of labour to five men, and that one man will raise a hogshead of water to eight feet of height in one minute, and work at that rate for some hours. N. B. Hogsheads are reckoned at sixty gallons.

Some of the leading principles in gunnery, relating to shooting in cannon and mortars, are expressed on the face B of the callipers. Besides the articles already enumerated, the scales usually marked on the sector are laid down on this instrument: thus, the line of inches is placed on the edge of the callipers, or on the straight borders of the faces C, D: the logarithmic scales of numbers, sines, versed sines, and tangents, are placed along these faces near the straight edges: the line of lines is placed on the same faces in an angular position, and marked *Lin.* The lines of plans or superficies are also exhibited on the faces C and D, tending towards the centre, and marked *Plan.* Finally, the lines of solids are laid on the same faces tending towards the centre, and distinguished by *Sol.* See farther on the construction and use of this instrument, Robertson's Treatise of Mathematical Instruments, &c. Appendix.

CALICA, in *Mythology*, an Indian goddess, which seems to have possessed the attributes of the Grecian Hecate. Mr. Blaquier, with a view of ascertaining the fact, that human sacrifices were offered to this horrible deity, examined the Purana which bears her name. Birds, tortoises, alligators, fish, nine species of wild animals, buffaloes, bulls, he-goats, ichneumon, wild boars, rhinoceroses, antelopes, guanias, rein-deers, lions, tygers, men, and blood drawn from the offerer's own body, are looked upon as proper oblations to the goddess Chandica, &c. The following injunction afterwards occurs: when the sacrifice of lions, of tygers, or of the human species is requelled, let the three first classes act thus: having formed the image of the lion, tyger, or human shape, with butter, pastry, or barley meal, let them sacrifice the same as if a living victim, the axe being first invoked by the text "Nomo;" that text is as follows: "Cali! Cali! O horrid-toothed goddess: eat, cut, destroy all the malignant: cut with this axe; bind, bind, seize, seize; drink blood, tear, tear; secure, secure; salutations to Cali!" Among other exceptions, with regard to human

victims, those that are unwilling are expressly prohibited. Asiatic Researches, vol. v. p. 371, &c.

CALI-CALIC, in *Ornithology*, the Madagascar Shrike, *Lanius Madagascariensis*, stands under this name in Buffon's Natural History of Birds.

CALICO, in *Geography*, a river of European Turkey, which runs into the gulf of Salomki; 14 miles S.W. of Saloniki.

CALICOULAN, COYLAN, or QUILON, a Dutch factory on the western coast of Malabar, about 14 geographical miles to the N.N.W. or N.W. of Anjengo, or Anjenga, placed by major Rennell in N. lat. 8° 39'. E. long. 76° 40'.

CALICULA, in *Ancient Geography*, a town of Spain, placed by Ptolemy in the Tarragonensis, and assigned to the Turduli.—Also, another town of Spain, which Ptolemy places in the territory of the Turdetani.

CALICUT, in *Geography*, a country of Asia, and a very extensive state on the coast of Malabar. Its chief assumed the title of king of kings. The last of these princes, called Sarana Parimal, having embraced Mahometanism, retired to end his days at Mecca, and dividing his dominions between the princes of his own blood, received, as it is said, a space of 12 leagues for one of these princes, or a favourite page, who was to have the title of Samorin, and to whom the others were to render homage. The Samorin built a city on the spot whence Parimal took his departure, and called it "Calicut." He who afterwards governed Calicut, inhabited a palace of stone, and annexed some appearance of grandeur to his court. In former times, the inhabitants of this district had several strange customs, some of which are still retained. Accordingly it is said, that the Samorin's wife must be first enjoyed, for three nights if he pleases, by the high priest. The nobles permit the other priests to take the same liberty; but the lower people are debarred from this honour. A woman may marry a number of husbands; each of whom has her by turns for ten days or more, as they agree among themselves; and during that time he provides for her all necessaries. When she proves pregnant, she names the father of the child, who, after it is weaned, takes care of its education. The "Naires" of Calicut form a band of nobles, whose only profession is that of arms. These men, though of an olive colour, are comely and handsome; they are tall and hardy, very valiant, and dextrous in the use of their weapons. They lengthen their ears to such an extent, that they hang down on their shoulders, and sometimes lower. These Naires are allowed only one wife, but the women of rank may have as many husbands as they chuse, whom they regard as slaves subjected to their beauty. Women of inferior condition supply the defect of the privilege appropriated to ladies of rank, by indiscriminate commerce with strangers, from which their husbands cannot restrict them. The mothers prostitute their daughters even before they arrive at a proper age. The "Naires," or nobles of Calicut seem to be of a different race from the burgesses; for the latter, both males and females, are of a smaller stature, and are worse shaped, and more ugly. Among the "Naires" there are some men, as well as women, whose legs are as thick as the body of an ordinary man. This deformity is not the effect of disease, but commences from their birth. The skin of these legs is hard and rough like a wart; and, nevertheless, the persons affected with it are nimble and active. This race of men with thick legs, has not multiplied greatly; either among the "Naires," or the other Indians. However, they appear in other places, and especially in Ceylon, where they are said to be of the race of St. Thomas. Du Buffon's Nat. Hist. vol. iii. p. 99, Eng. Ed. The people of this country have no pens, ink, or paper;

paper; but write with a bodkin on flags that grow by the sides of the rivers, which are so strong as to be durable for many years. The district called Calicut is about 63 miles long, and nearly as many broad. The air is salubrious, though it has many woods, rivers, and marshes; the soil is fertile, but it does not produce much grain; it is subject to inundations from the sudden descent of the mountain-rivers; and the sea also has made such ravages on the coast as to oblige the Samorin to transfer his residence from Calicut to Paniany. Along the sea coast, the land is low and sandy, and produces a number of cocoa-trees. The higher grounds produce pepper and cardamoms of a good quality. The country also supplies timber for building, white and yellow sanders, cassia lignea and fistula, nux vomica, and cocculus indicus. The forests abound with parrots and monkeys, and various sorts of game: they have plenty of fish, and their mountains yield iron. The Samorin is said to be able to raise an army of 100,000 men.

CALICUT, the capital of the country above described, is situate on the coast of Malabar. This city is remarkable for being the first Indian port visited by European shipping. Vasco de Gama, having doubled the Cape of Good Hope, and pursuing his navigation along the south-east of Africa, arrived at the city of Melinda; and conducted by the pilots of this civilized and commercial city, he sailed across the Indian Ocean, and landed at Calicut, on the 22d of May 1498. This was at that time the most flourishing place on the Malabar coast. The Samorin, or monarch of the country, astonished at this unexpected visit of an unknown people, whose aspect, arms, and manners, bore no resemblance to any of the nations accustomed to frequent his harbours, and who arrived in his dominions by a route hitherto deemed impracticable, received them, at first, with that fond admiration which is often excited by novelty. But in a short time, as if he had been inspired with foresight of all the calamities now approaching India by this fatal communication opened with the inhabitants of Europe, he formed various schemes to cut off Gama and his followers. But from every danger to which he was exposed, either by the open attacks, or secret machinations of the Indians, the Portuguese admiral extricated himself with singular prudence and intrepidity, and at last sailed from Calicut with his ships loaded, not only with the commodities peculiar to that coast, but with many of the rich productions of the eastern part of India.

Calicut, though much fallen in its consequence, is still a large town, containing about five or six hundred houses, built of wood, or bricks baked in the sun, in the midst of which are beautiful gardens. Thus circumstanced, it is three leagues in circumference, including a large village or suburb, inhabited by fishermen. It is governed by a viceroy, but wants a regular police; and its commerce, which is still not inconsiderable, on account of a convenient river by which teak-wood is brought down from the neighbouring mountains, is much oppressed by burdensome duties, generally farmed by Mahometans. The coast is low, and affords no shelter, and the only access to it is in small flat-bottomed boats. But though it has no harbour, it affords to the ships that visit it good riding in the open sea, at the distance of three leagues from the shore. The English factory, which formerly subsisted in this place, is removed to Tellicherry. N. lat. 11° 18'. E. long. 76° 4'.

CALIDRIS, in *Ornithology*, a species of SCOLOPAX that inhabits Europe and America, and well known in this country by the name of red-thank. The bill is straight and red; legs scarlet; secondary quill feathers white. Kramer. This is the totanus of Brisson, scolopax totanus of the Fauna Suecica, rotbien of Frisch, &c.

*Obs.* A variety of this species is found in China, the body of which is grey above, and beneath white; lower part of the neck, and side of the breast, spotted with blackish; rump and tail barred with black and white. Latham, &c.

CALIDRIS, a species of TRINGA, the bill and legs of which are blackish; body beneath olivaceous; rump variegated. Gmel. This is the dusky sandpiper of Latham; calidris of Brisson; rusticola sylvatica of Gesner and Aldrovandus; and maubeche of Buffon. Inhabits the maritime parts of France and Germany. Length nine inches and an half.

CALIDRIS, a species of MOTACILLA, called by Latham the hang-nest warbler; and American nightingale of Edwards. The plumage is greenish-brown above; beneath, fulvous; ocular line, and another beneath it, black. Gmel. This is sicedula Jamaicensis major of Brisson; and grand squier de la Jamaïque of Buffon.

This bird is of the size of a robin, and builds a hanging nest; it inhabits Jamaica, and is supposed to be the watchy picket, Spanish nightingale, or American hang-nest of Sloane.

CALIDRIS *nigra*, the name under which Aldrovandus describes TRINGA gambetta, the red legged horseman of Albin, and gambet of other English writers.

CALIDRIS *grisea* of Brisson is the Gmelinian TRINGA *grisea*; and CALIDRIS *grisea minor* of the same author: TRINGA *arcnaria* of Gmelin. Brisson also describes tringa *nævia* of Gmelin under the name of calidris *nævia*. Calidris bellonii of Aldrovandus is scolopax calidris of Kramer, &c.

CALIDRIS, a species of CHARADRIUS, called in England the sanderling or curwillet. The bill and legs of this bird are black; lores and rump greyish; body beneath white, without spots. Georg. It inhabits the sandy coasts of England and North America. Length eight inches.

*Obs.* There is a variety of this species in which the front, and body beneath is cinerous white.

CALIDUCTS, from *calor*, heat, and *duco*, I lead; a kind of pipes, or canals, disposed along the walls of houses and apartments; used by the ancients for the conveyance of heat to several remote parts of the house, from one common furnace.

The ancient caliducts seem both for thrift and use preferable to the German stoves; and might even challenge the advantage over our own fashion, were it not that the very sight of a fire adds something of lustre to a room.

CALIDUS, in *Entomology*, a species of CIMEX of the middle size, found in Africa. The colour above is fuscous; beneath, testaceous, with black antennæ. Fabricius.

CALIES, in *Geography*, a small town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg, chiefly inhabited by weavers of woollen cloth; 16 miles E. of Retz.

CALIFORNIA, a tract of country, formerly thought to be an island, but now ascertained to be a peninsula, on the western coast of North America, bounded on the north by the continent, with which it is connected, on the east by the province of New Mexico and the gulf of California, or the Vermilion Sea, which separates it towards the southern part from the continent, and on the south and west by the great Pacific Ocean. This peninsula terminates on the south at Cape Lunar or Lucas, in N. lat. 22° 10', and W. long. 110°, and extends northward to limits that have not been precisely ascertained. Some have fixed its northern extremity at Cape St. Sebastian, in N. lat. 43° 30'; whilst others have extended it to 46°, and have made its length 600 leagues, and its breadth at different places, 10, 20, 30, and 40 leagues. North California, indeed, of which the most northern settlement is San Francisco, in N. lat. 37°

25, has a other bounds, according to the statement of La Pérouse, founded on the opinion of the governor of Monterey, than those of America itself.

To the enterprising spirit of Cortes, the Spaniards, were first indebted for the discovery of the extensive peninsula of California. Having fitted out several small squadrons for the purpose of protecting such voyages of discovery as he could make, from the ports of New Spain in the South Sea, which either perished in the attempt, or returned without any success of importance: this adventurous conqueror of Mexico determined to take the command of a new armament in person; and, after enduring incredible hardships, and encountering every kind of danger, he at length, viz. in 1536, discovered this peninsula, and surveyed the greater part of the gulf which separates it from New Mexico. During a long period, however, this country was so little frequented, that even its form was unknown, and in most charts it was represented as an island, and not as a peninsula. In 1540, Mendoza, viceroy of Mexico, dispatched Francisco Alarçon to search towards the west for the pretended strait of Anian; but he advanced no higher than the latitude of  $36^{\circ}$ , and made no discovery. This same project was renewed in 1542, by Rodrigues de Cabrillo: but this whole expedition served only to explore a cape in the latitude of  $41^{\circ} 30'$ , which was denominated *Capo Mendocino*, in honour of the Mexican viceroy. In 1578, sir Francis Drake found, that in the latitude of  $48^{\circ}$ , there existed lands and men; and after having reconnoitered the coast through an extent of 220 leagues, which terminates in  $37^{\circ}$ , he called the country which he had discovered "New Albion," and took possession of it in the name of Elizabeth, queen of England. In the latitude of  $38^{\circ} 30'$ , he discovered the harbour where he made some stay, and which has preserved his name. From an account of Drake's voyage, published in a treatise entitled "The World encompassed by Fletcher," London, 1653, 4to. it appears, that he gave to the country which he discovered the name of "New Albion," for two reasons; first, because from the nature of the rocks and shoals with which the coast is skirted, it presents the same aspect as that of England; and secondly, because it was reasonable and just, that this land, till then unknown, should bear the name of the country of the first navigator who landed there. In 1592, a Greek of the island of Cephalonia, Juan de Fuca, in the service of Spain, discovered towards the 49th parallel, a large strait by which he pretended to have reached the Atlantic Ocean. Fuca's strait, or inlet, has been found again in our days; but the communication of the two oceans is neither better proved, nor more probable, and might perhaps exist only in his account. See *Fuca's Strait*. In 1595, a galleon was sent to make discoveries on the shore of California; but the vessel was unfortunately lost in Port des los Reyes. In 1602, the Spanish admiral, Sebastian Viscaïno, or Biscaino, was charged by count de Monterey, viceroy of New Spain, to explore, to the north of California, a harbour that might afford an asylum to the galleons on their return from Manila: he discovered a commodious one, safe and well situated, in the latitude of  $36^{\circ} 40'$ , to which he gave the name of the viceroy Monterey, and which is since become the principal settlement of the Spaniards on the N. W. coast. It is asserted, that a small vessel belonging to his squadron, commanded by Martin de Aguilar, found between  $40$  and  $44$  degrees, the mouth of a great river which bears his name on the geographical maps. It is added, that, having succeeded in doubling cape Mendocino, which, till then, had only been perceived, he discovered on the 13th of January 1603, 30 leagues more to the northward than this cape, in

the latitude of  $43^{\circ}$ , a second cape or point, to which he gave the name of *Capo Blanco*, and that the navigable inlet or large river which he discovered is near this cape, and that it is a strait which leads to a great city, named "Quivira;" but that he was prevented by the rapidity of the current from ascending the river. The navigators of later times have procured no information respecting either this inlet of Aguilar, or the great city of Quivira. La Pérouse, who, in 1786, got a distant view of *Capo Blanco*, and of the parts of the coast which are nearest to it to the northward and southward, saw nothing of Aguilar's inlet; but as he was then at a considerable distance from the land, and as he did not make a particular search for this inlet, no conclusion can be drawn from his account against its existence. Most of the geographical and hydrographical charts place Aguilar's inlet or river to the southward of *Capo Blanco*; but Tomas Lopez, in his general chart of America, published in 1772, lays it down 20 leagues to the northward of that cape, in the latitude of  $44^{\circ}$ , with this simple indication, "Rio que corre a Poeste," river that runs to the west; and he makes no mention of the great city Quivira. In 1640, admiral Bartolomeo de Fuente, or De Fonte, is said to have discovered, towards the parallel of  $53^{\circ}$ , the archipelago of San Lazaro, the river of Los Reyes, some great lakes, &c. and an easy passage of communication between the Great Ocean and the North Atlantic Ocean. This discovery, inserted in an account, the authenticity of which has been contested, and in which truth is blended with falsehood, has been confirmed by modern navigators, as to what regards the archipelago of San Lazaro, and perhaps an interior sea; but the communication of the two oceans is not better established than that which had been opened by Juan de Fuca. About the middle of the last century, Joseph Nicolas de Lisle, and Philippe Buache, published learned dissertations and ingenious syllems for the purpose of reconciling the discoveries of De Fuente on the N. W. coast of America with what is known besides of that northern part of the new continent. Other geographers and learned persons have considered the account of De Fuente as counterfeit and apocryphal; and among the latter is Dr. Reinhold Forster, who, with his son George Forster, accompanied captain Cook in his second voyage, and to whom we are indebted for an excellent "History of the Voyages and Discoveries, made in the North." M. de la Pérouse also expresses his thorough disbelief of the narrative ascribed to admiral de Fuente, and of the reality of any discoveries in the contested channel of San Lazaro, or St. Lazarus. Mr. Milet Mureau, on the contrary, acknowledges himself one of the strongest partisans for the existence of a north-west passage. Indeed, when we consider, that since the question first arose concerning a north-west passage from Europe into the Pacific Ocean, many scientific and capable men have been constantly on the watch, and eager to pursue the inquiry, it is not at all probable that such voyages as are related by Mureau, if really made, should not have been fully verified; and that there should remain no other traces of them than a kind of vague tradition.

During almost a whole century, if we except the contested voyage of De Fuente, the west coast of North America was not visited by any of the nations by which it was conquered, or by any of those which have been since called thither by the allurements of commerce. But although Spain made no maritime expedition, she did not neglect to push by land her discoveries towards the north; and the excursions which she planned and ordered, at different periods, led to a discovery, to the eastward of California, of the rich

rich provinces of Sonora and Cinaloa, which see. In 1684, the marquis de la Laguna, viceroy of Mexico, dispatched two ships with a tender, to make discoveries of the lake of California, of which he brought back but an indifferent account; though he was among the first who ascertained its being joined to the continent of America, and contiguous to that of Asia. It is said, however, that we owe to father Caino, a German jesuit, the absolute certainty that California is a peninsula, joining to the continent of New Mexico, and the more northern parts of South America. He landed on the former from the island of Sumatra, and passed to the latter without crossing any other water than the river Azal, into which the Rio Colorado falls, in about the 35th degree of north latitude. Dr. Robertson observes, that the uncertainty of geographers with respect to this point is remarkable, as Cortes seemed to have surveyed its coast with great accuracy. The archbishop of Toledo has published from the original, in the possession of the marquis del Valle, the descendant of Cortes, a map drawn in 1541, by the pilot Domingo Castillo, in which California is laid down as a peninsula, stretching out nearly in the same direction which is now given to it in the best maps, and the point where Rio Colorado enters the gulf is marked with precision. Towards the close of the 17th century, the jesuits, who had great merit in exploring the neglected province of California, and in civilizing its rude inhabitants, imperceptibly acquired a dominion over it as complete as that which they possessed in their missions in Paraguay, and they laboured to introduce into it the same policy, and to govern the natives by the same maxims. In order to prevent the court of Spain from conceiving any jealousy of their designs and operations, they seem iludiously to have depreciated the country, by representing the climate as so disagreeable and insalubrious, and the soil as so barren, that nothing but a zealous desire of converting the natives could have induced them to settle there. Several public-spirited citizens endeavoured to undeceive their sovereigns, and to give them a better view of California; but without effect. At length, on the expulsion of the Jesuits from the Spanish dominions, the court of Madrid, as prone at that juncture to suspect the purity of the order's intentions, as formerly to confide in them with implicit trust, appointed don Joseph Galvez, whose abilities afterwards raised him to the high rank of minister for the Indies, to visit that peninsula. His account of the country was favourable; he found the pearl-fishery on its coasts to be valuable, and discovered mines of gold of a very promising appearance. From its vicinity to Cinaloa and Sonora, it is probable, that if the population of these provinces should increase to the degree that may reasonably be expected, California may, by degrees, receive from them such a recruit of inhabitants, as to be no longer reckoned among the desolate and useless districts of the Spanish empire. To this intelligent minister, Spain is indebted for a new distribution of government in its American provinces, and for several important alterations in the state of their police and revenue, as well as a general reformation of the tribunals of justice in America. Since the limits of the viceroyalty of New Spain have been considerably circumscribed, four of its most remote provinces, viz. Sonora, Cinaloa, California, and New Navarre, have been formed into a separate government; and in time, the beneficial effects of this arrangement may be very considerable. Under the immediate inspection of a governor, to whom these rich provinces are specially committed, they must rise into importance and prosperity; and in common with many other districts of America, long depressed by the languor and feebleness natural to provinces which compose the extremities of an

over-grown empire, they may be animated with vigour and activity, when brought to near the seat of power as to feel its invigorating influence.

It was not till the year 1741, that Beering and Tchirikow, in the service of Russia, discovered the north-west coast of America; the former, towards the 58th parallel; the latter, towards the 56th. Since that period, the discoveries of the Russians have extended from the parallel of 56° to the most northern part of the west coast; and they have comprised, in the surveys which they have made of it, the peninsula of Alaska, and the long chain of the Aleutian islands, both belonging to the continent of America.

After a period of 167 years of lethargy, the spirit of discovery, and the taste for expeditions to the north, revived among the Spaniards. Accordingly, in 1719, vessels were dispatched from the port of San Blas, under the command of don Vincente Vila, in order to establish a presidio at the harbour of San Diego, in N. lat. 33° 40', off the isthmus of California; and another at that of Monterrey in N. lat. 36° 38' 25"; but this expedition afforded no discovery; however, after a whole year of researches and fatigue, the Spaniards succeeded in finding again the harbour of Monterrey, the latitude of which had been indicated to them by Viscaino in 1602. Discoveries in higher latitudes were suspended at this time; because an object of greater importance, and for the accomplishment of which, Don Joseph Galvez had been commissioned from Spain, occupied the whole attention, and all the efforts of government. In 1775, a second expedition, under the direction of Don Juan de Ayala, and of his pilot Don Francisco Antonio Maurelle, effected the discovery of some capes, and of some bays and harbours between the 47th and 57th parallels. This voyage made known the harbour of Trinidad in N. lat. 41° 7'; Cape Mesari, in 45° 50'; Cape St. Augustin, in 55°; port Bucarelli, in 53° 17'; mount San Jacinto, and Cape del Engaño, in 57° 2'; Guadalupe bay, in 57° 11', in its north part; the harbour of Los Remedios, in 57° 18'; and sir Francis Drake's harbour of Francisco, in 38° 18'. A third and a fourth voyage in 1778 and 1779, made no additional discovery; and the second merely afforded the assurance that the Russians had formed fixed settlements on several points of the high latitudes. But, as far back as 1778, while the Spaniards were employed in a minute survey of their port Bucarelli (see BUCARELLI), the first of navigators, as he is deservedly denominated by M. Fleurieu, Captain Cook, carried his talents, experience, and information, towards the north-west coast of America; and Europe owes to his laborious researches the first certain knowledge that she has had of the west part of the new world. He made the land on the 7th of March 1778, in the latitude of 44°. Thwarted by the winds, he could only distinguish a few capes or points of land, called Cape Gregory, Cape Perpetua, and Cape Foulweather: the first of the three, or Cape Gregory, which he places in 43° 10', appears to be Aguilar's Capo Blanco, so called by him in 1603. He lost the land again till he reached it in 48°, where he perceived, at a distance, in 48° 15', a cape which he named Cape Flattery. At length, after long struggling with adverse winds, he ran in for the land, in the latitude of 49° 36', and anchored in a bay which he first called King George's Sound, and known among the inhabitants of the country by the name of "Nootka." This Nootka Spain claimed in 1790, as an integral part of her American dominions. Having examined a few points above the 56th parallel, he discovered, in 60°, Prince William's Sound, and Cook's river; and having rounded the peninsula of Alaska, he visited some of the Aleutian islands (see ALEUTIAN), and thence advancing to the highest latitudes

which

which the European navigators to reach, he blended his discoveries with those which the Russians had made since the year 1741. Cook's voyage made known to England the new and valuable articles which those lands offered to her commerce; it shewed the possibility of rivalling the Russians in the fur trade, and of sharing with them the great profits that may be obtained in farther with the empire of China, by the skins of animals, which are the treasures of the forests of north-west America; in short, "he opened a new career to the ever-increasing activity of a nation, whose commercial operations embrace the two hemispheres throughout the whole circumference of the globe." In 1786, La Pérouse directed his course towards the N.W. coast of America, and made the land on Beering's mount St. Elias, in the latitude of  $69^{\circ}$ ; he ranged along the lands of the continent for an extent of 270 leagues from that parallel to the harbour of Monterrey, and particularly applied himself to the examination of those parts of the coast from which captain Cook had been repelled by contrary winds; he discovered a fine harbour in N. lat.  $58^{\circ} 37'$ , which he called "Port des Français," (which see); and in the course of his surveys, which were both minute and accurate, he verified and confirmed some of the discoveries of 1775, which the Spaniards had scarcely indicated.

Of Monterrey, and the adjacent country, La Pérouse has given a particular account, of which we shall avail ourselves under that article. This is the place of residence of the governor of the two Californias, the northern and southern, or the New and Old. This government is subordinate to the vice-royalty of Mexico; and La Pérouse informs us, that it extends to more than 800 leagues in circumference, for the maintenance of which 282 soldiers of cavalry are found sufficient. These garrison five small forts, and furnish detachments of four or five men to each of the 25 missions, or parishes, into which the provinces of Old and New California are divided. These small guards suffice to keep in subjection about 50,000 wandering Indians, who often change their residence according to the fishing and hunting seasons, and who are spread over this vast extent of the American continent. Of these, about 10,000 have embraced Christianity. These Indians are generally little and feeble, and evince no signs of that love of independence and liberty, which characterises the northern nations, to whose arts and industry they are strangers. Their complexion very nearly resembles that of those negroes, whose hair is not woolly: that of this nation is long, and very strong, and they cut it four or five inches from the roots. Several of them have beards, while others, according to the missionaries, never had any; though this is a point not decided in the country itself. The governor, who had travelled much in the interior part of the country, and had lived with the savages during 15 years, assured La Pérouse that those who had no beard, had extracted it with bivalve shells, used as pincers. The president of the missions, however, who had resided as long in California, maintained the contrary. These Indians are very expert in the use of the bow, but they rarely pull the bow till they creep within 15 paces of their prey. In hunting, they crawl on the ground, with stags' heads fixed on their own, and thus approach a herd of stags, till being within reach of them, they kill them with their arrows. Loretto is the only presidio or military fort of Old California, on the eastern coast of that peninsula. Its garrison consists of 54 cavalry men, and furnishes detachments to the 15 following missions, of which the functions are performed by the Dominican monks, who have succeeded the Jesuits and Franciscans. These last, however, remain in undisturbed possession of the ten missions of New Califor-

nia. The 15 missions of the department of Loretto are, San Vincente, S. Domingo, El Rosario, S. Fernandez, S. Francisco de Borgia, S. Gertrude, S. Ignacio, La Guadalupe, Santa Rosalia, La Concepcion, S. Josef, S. Francisco Xavier, Loretto, S. Josef de Cabo Lucar, and Todos los Santos. About 400 Indian converts, collected round these 15 parishes, are the only fruit of the long apostleship of the various religious orders, who have successfully undertaken this painful duty. As yet there is only one Spanish village. Indeed, the climate is unhealthy, and the province of Sonora, which forms the boundary of the Vermilion sea to the westward, and California to the northward, is much more attractive to the Spaniards, who find there a fertile soil, and abundance of mines; which are, in their estimation, more important objects than the pearl fishery of the peninsula, which requires a considerable number of slaves who can dive, and whom it is difficult to procure. Yet North California, notwithstanding its great distance from Mexico, appears to combine much greater advantages. For an account of its presidios, see NEW ALBION. The Franciscans established their first mission here in 1770: and they have now ten, comprehending 5143 converted Indians. The piety of the Spaniards has kept up the presidios at a great expence, apparently from no other motive than that of converting and civilizing the Indians of these countries. But from later discoveries, a new branch of commerce may procure to Spain more solid advantages than the richest mines of Mexico; and the salubrity of the air, the fertility of the soil, and the abundance of furs, for which they have a certain market in China, give to this part of America the most important advantages over Old California, whose unwholesomeness and sterility cannot be compensated by a few pearls collected from the bottom of the sea.

Before the Spaniards settled in this country, the Indians of California only cultivated a little maize, and almost entirely subsisted on fishing and hunting. No country abounds more with all sorts of fish and game. Hares, rabbits, and stags, are very common; otters and sea-wolves abound towards the north; and in winter they kill a great number of bears, foxes, wolves, and wild cats. The coppices and plains are full of small, crested partridges, which flock together in covies of 3 or 400: they are fat and well flavoured; and the trees afford lodgment to a vast variety of birds and fowl. As to the fertility of the soil in the country adjoining to the presidio of Monterrey, it exceeds conception. The harvests of maize, barley, wheat, and peas, can only be compared to those of Chili; and the average produce of corn is from 70 to 80 fold. Fruit trees are hitherto scarce; but the climate is well adapted to them, being nearly that of the southernmost provinces of France. The cold is never more severe, and the heats of summer are much more moderate, in consequence of the perpetual mists, which fecundate the earth with constant moisture. The forests contain the pine-apple fir, cypress, ever-green oak, and western plane-tree. La Pérouse pays a tribute of singular respect to the monks of this presidio; and contracts their disposition and conduct, very much to their advantage, against those of the monks of Chili.

The huts of the Indian villages, in both Californias, are the most miserable that can be conceived. Their form is circular, and six feet in diameter by four feet high. Some stakes about the size of the arm being fixed in the ground, and brought together in an arch at top, compose their frame, and eight or ten trusses of straw, badly arranged upon these stakes, defend the inhabitants more or less from the rain and wind. The Indians adhere to this mode of constructing their habitations, notwithstanding the exhortations of

of the missionaries, alleging, that they love the open air, and that they can easily let fire to their houses when they are too much annoyed by fleas, to which vermin they are subject, and then rebuild them in an hour or two. Besides, these habitations are most suitable to those independent Indians who are perpetually changing their abode. The colour of these Indians, the house of the monks, their magazines built of brick and plastered, the threshing floor on which they tread out their corn, the cattle, the horses, and, in short, every thing presented the appearance of a plantation in St. Domingo, or any other colony. The men and women are assailed by the sound of a bell, and a monk leads them to work, to church, and to all their employments. The monks are the temporal, as well as spiritual superiors, and the whole produce of the earth is committed to their management. The day is divided into seven hours of work, and two of prayer; but four or five on Sundays and feast-days, which are wholly devoted to rest and religious worship. Corporal punishments are inflicted on the Indians of both sexes, who neglect their pious exercises; and many crimes, which in Europe are referred to divine justice, are punished with chains or the stocks. As soon as a new convert is baptized, he is under the obligation of a perpetual vow; and if he desert the religious society, and return to his relations, he is summoned three times to come back; and if he refuse, a party of soldiers is sent by the authority of the governor, to force him away from his family, and conduct him to the missions, where he is condemned to receive a certain number of lashes. The Indians, like the missionaries, rise with the sun, and then go to prayer and to mass. During this time, barley-meal is boiled in a cauldron, and the mess, which the Indians call "atole," and which they much like, is seasoned neither with butter nor salt. This repast occupies about three-quarters of an hour, after which, all go to their respective occupations, under the superintendance of one or two monks. The employment of the women, besides that of conducting their household affairs, is the management of their children, and the roasting and grinding of their grain; they also spin their wool, and manufacture some coarse stuffs. At noon the bells ring for dinner, and the Indians partake of a mess similar to that of their breakfast, called "pouffole," except that it is thicker, and contains, besides the corn and maize, peas and beans. From two o'clock they return to work till four or five, and close the day with prayers, and with another mess of atole. The distribution of these messes is faithfully made; and the least dishonesty is punished by the lash, which is ordered by Indian magistrates, called "Caciques." The punishment inflicted on the women is private; but that of the men is public, that it may serve as an example. Their rewards consist in small distributions of grain; and on feast days, their mess is beef, which many eat raw.

Such is their honesty, that no example occurs of their robbing one another, though they have no other door than a truss of straw laid across the entrance when the whole family is absent. The men in these missions have sacrificed more to Christianity than the women; for to them polygamy was allowed, and it was even the custom to marry all the sisters of a family. The monks make themselves the guardians of female virtue; for, about an hour after supper, they lock up all those whose husbands are absent, as well as all girls above nine years old, and place them under the care of matrons during the day; but all these precautions are in some cases insufficient. The converted Indians retain all their ancient customs, that are not forbidden by their new religion; the same hus, the same games, and the same dresses. The richest wear a cloak of otter-skin, covering

the bins, and reaching below the middle: others wear only a piece of cloth to cover their nakedness, and a little cloak of rabbit skin, covering the shoulders, and reaching to the loins, and tied with a pack-thread under the chin. The women's dress consists of a cloak of stag's skin badly tanned. Young girls, under nine years old, have only a girdle round the loins, and the boys are wholly naked. The hair of both men and women is cut four or five inches from the roots. The Indians of the "Rancherias," or villages of independent Indians, having no iron utensils, perform this operation with fire-brands, and paint their bodies red, which they change into black when in mourning. They retain an affectionate remembrance of their deceased friends, and are easily melted into tears by the mention of them: nevertheless, children scarcely know their own father, because they desert his hut as soon as they are able to provide for themselves; but they are more durably attached to their mother, who brings them up with care and tenderness. The old men of the Rancherias, who are no longer able to hunt, live at the joint expence of the whole village, and are treated with general respect. Their arms are the bow and arrow, pointed curiously with a flint. These Indians neither eat their prisoners, nor their enemies killed in war; although when they have conquered, and put to death some chiefs, and very brave men in the field of battle, they eat some morsels of their bodies, thus doing homage to their valour, and apprehending that such food would increase their courage. They are accustomed, like the Canadians, to take off the scalp of the vanquished, and to tear out their eyes, which they have the art of preserving from corruption; and it is their practice to burn their dead, and to deposit their ashes in a morai. The mixed government exercised in the missions of California is, with regard to the Indians, a real theocracy; for they are taught to believe that their superiors hold an immediate and constant intercourse with God, and that they bring him down each day upon the altar. Under favour of this opinion, the fathers live in the midst of the villages in perfect security, nor do they shut their doors during the night. Murder is very uncommon even among the independent tribes, and is punished only by general contempt; but if a man falls under the united attack of several assailants, he is supposed to have deserved his fate, as he had drawn upon him so many enemies. M. la Pérouse observes, that the sense of taste is that which these people most delight in gratifying; and the word "Missich," which in their language signifies a good man, likewise denotes savoury food. Among other peculiarities of these people is their gaming; less remarkable for the ingenuity of their games than for the nature of the stakes. Among the Indians of the missions, the common stake is beads; but among the independent Indians, the favours of their women are the prizes. New California, we are told, cannot yet reckon a single settler, notwithstanding its fertility; except a few soldiers who are married to Indian women. La Pérouse observes, that the admittance of the villages converted to Christianity would be more favourable to population, if property and a certain degree of liberty formed its basis. However, since the establishment of the ten different missions of North California, the holy fathers have baptized 7,01 Indians of both sexes, and have buried only 2,88. Almost all the Franciscan missionaries are Europeans, and they have a college and monastery at Mexico, whose guardian is, in America, the general of his order; and this house has its superior in Europe.

The sea-otter skins are as common in the northern parts of California, as in any other part of America; they are to

land as far to the southward as 28° N. lat. ; but the southern skins are inferior in quality to those in the seas that are frequented by the Russians. The eastern and southern coasts of Old California are much richer in the varieties of its shells than the New, and furnish oysters, whose pearls are equal in beauty and size to those of Ceylon, or the Persian gulf.

There is, perhaps, no country where the various languages of the inhabitants are so extremely multiplied as in North California. The numerous tribes that divide that country live in an insulated manner, although situate very near each other, and have each a separate language. Monterrey, and the mission of San Carlos, which is dependent upon it, comprehend the country of the Achastlians, and the Ecclémachs. The languages of these people, partly united in the same mission, would soon form a third, if the converted Indians discontinued their intercourse with those of the Racherias. As the Achastlians have few abstract ideas, they have very few words to express them ; nor do they appear to distinguish by different names all the species of animals, or of common vegetables. They distinguish the plural from the singular, and conjugate some tenses of verbs ; but they have no declensions, and their substantives are much more numerous than their adjectives. They never use the labials P and B, nor the letter X. The most common initial consonants are T and K ; but their terminations are very various. They use their fingers in counting as far as ten ; few of them being able to do it by memory, or without the assistance of some external sign. The country of the Ecclémachs extends above twenty leagues to the eastward of Monterrey. Their language is totally different from all those of their neighbours, and has even a greater resemblance to the languages of Europe than to those of America. The dialect of this tribe, however, is more copious than that of the other nations of California, though it cannot be compared with the languages of civilized nations. Should it be inferred from hence, that the Ecclémachs are foreigners in this part of America, it must be at least admitted, that they have inhabited it for a long time ; since they differ neither in colour, in countenance, nor in their general form and external appearance, from the other nations of that country. La Pérouse instituted a comparison between the Aborigines of California, and those of Chili, situate at the same distance from the line in the southern with that of the others in the northern hemisphere ; and he observes, that the Californians are taller, and the muscles more strongly marked ; but they are not so courageous or intelligent. They have low foreheads, black and thick eye-brows, black and hollow eyes, a short nose depressed at the root, and their cheek-bones projecting. They have a mouth rather large, thick lips, strong and fine teeth, and a chin and ears of the common form. They are extremely indolent and incurious, and almost stupid. In walking they turn in their toes, and even their step, and by their infirm and tottering gait indicate their characteristic pusillanimity. The women have some qualities peculiar to themselves, and not observable in those of Chili. They are taller, and their limbs are more regularly formed ; their figure is generally better defined, and their countenance less forbidding. The hair of the people of both these countries is nearly similar ; but the Californians have it in greater abundance than the natives of Chili. Many of the men, however, are devoid of beard, and the women have very little hair on any part of the body ; but this is said to be the effect of art, as both the men and women pluck off the hair with bivalved shells or a cleft stick.

These Americans paint their skin by way of ornament.

They also pierce their ears, and wear in them trinkets of various kinds and fashions. Their skin is tawny, and their nails of a lighter colour than those of the inhabitants of Chili. At Chili and California the appearance of the beard and the change of the voice announce the age of puberty in males about their 13th year. The girls attain to puberty about the age of eleven or twelve. These nations have nearly the same passions, the same sports, and the same mode of living ; and they are equally violent in the expression of joy and anger, which the slightest occasion is sufficient to excite. Their food is commonly game or fish ; and their times of eating are sometimes determined by their appetite ; but in general each family assembles at the close of the day to their common repast. The Californians make no use of vegetables, except a few pine-nuts, and other summer fruits, which, however, constitute no essential part of their food. Idleness makes them abstemious, but an abundance tempts, and they become voracious gluttons. These nations are divided into hordes ; each of which commonly forms a little hamlet ; and their habitations are huts or cabins of different shapes, and constructed of different materials. Polygamy is allowed among them, and their marriages last no longer than is agreeable to both parties. To the exclusive possession of their women they attach little importance, often endeavouring to make a market of their favours, which they sell for a piece of old iron, or a few glass beads. Each family seems to possess a government peculiar to itself ; and has its chief, its huts, its canoes, its implements for the chase and for fishing, and, indeed, all the various means of defence or subsistence. Some chiefs seem to have the command of several families. These chiefs excel the other inhabitants in stature, strength, and courage : they are generally covered with large scars, as tokens of their valour, and distinguished by a kind of extraordinary decoration in their head-dress and habiliments. The dress of the women consists of a leathern shift, descending to the middle of the leg, and a mantle of skins, which covers them from the shoulders to the knees. The men wear a similar mantle, and have a shirt of leather, and buskins of seal's skin ; but their feet are commonly naked. As great changes of temperature are experienced in California at different seasons of the year, the inhabitants are subject to diseases peculiar to the country. Sore throats, catarrhs, pleuritis, and peripneumonics, are the ordinary diseases of the winter season ; for which they recur to decoctions made of plants, and applied to the parts affected. Ephemeral and intermittent fevers, and dyspepsia, are chiefly prevalent in spring and autumn ; and as remedies they excite vomiting by forcing the finger down the throat, and procure copious sweats by a kind of stove baths. The diseases most general in summer are fevers of various kinds, putrid, petechial, inflammatory, and bilious, together with the dysentery. To one or other of these the patient generally falls a victim, unless the efforts of nature are sufficient to produce a salutary evacuation, by stool, urine, or perspiration. Besides these diseases, the inhabitants of California are liable to nervous fever, rheumatism, prurient eruptions, ophthalmia, syphilis, and epilepsy. Syphilis seems never to have been introduced among the natives of California till after their communication with the Europeans, who settled in that part of the continent. The means of cure in which they most confide are the sand-bath, which they call " tamaseul," and a decoction of sudorific plants taken alternately. The women, though liable to similar maladies with those of the men, suffer little inconvenience during the time of gestation, and are almost always delivered with ease. As soon as the infant is born, the midwives tie the umbilical cord, plunge the

child into cold water, and cleanse it from the viscid humour with which its body is covered. The moment the mother is delivered, she bathes in the sea or a neighbouring river, and is then seated on a hot stove, and covered with furs. When the sweats subside, and the stove cools, she plunges herself again in cold water, and sometimes repeats this process for several successive days. The time of suckling is unlimited; but it commonly extends to eighteen or twenty months; and the infants are swaddled by wrapping them up in furs, after having previously stretched out their arms and legs at full length, and fixed them in that situation by several bandages of leather. They then place the infant in a piece of bark, proportioned to its size, and of the form of a hollow tile, to which he is fastened by straps or bandages of leather.

As to the religion of the Californians it is not easy to determine concerning it; but it seems most probable that before their intercourse with the Europeans they had no temples, altars, oratories, nor any other place set apart for religious exercises. No outward profession of religion appeared in festivals, prayers, vows, or expiations. It is probable, however, that they had some confused notion of an invisible being; but to what extent their speculations carried them, it is impossible to say, as all our first relations concerning them have been transmitted to us by the jesuits and other missionaries. In a country so extensive, and comprehending so many degrees of latitude, the climate must be very various; and the soil and its productions must depend on collateral circumstances connected with their situation, as it is nearer to the sea and to rivers, or more remote from them. In California, there falls in the morning a great quantity of dew, which, settling on the rose-leaves, candies, and becomes hard like manna, having all the sweetness of refined sugar, without its whiteness. In the heart of the country, there are also plains of salt, quite firm, and clear as crystal, which, considering the vast quantities of fish on its coasts, might render it an invaluable acquisition to an industrious nation. The pearl-fishery on its coasts, and its interior mines of gold, might also supply materials for a profitable commerce. The chief town of California is St. Juan; and the number of its inhabitants has been estimated at 300,000; but every calculation of this kind must be very vague and uncertain. For a further account of this country, and of the western coast of North America. see *NEW ALBION*. See also *FRANCAIS*, *FRANCESCO*. *FUR-trade*, *MONTERREY*, *NOOTKA*, *NORFOLK Sound*. &c. *Marchand's Voyage by Fleureau*, vol. i. *La Pérouse's Voyage*, vol. i. and ii.

*CALIFORNIA*, *gulf of*, called also *purple*, *vermilion*, or *red sea*, seems to be an æstuary of two large rivers, and separates California in part from Mexico. The coasts of the peninsula, towards this gulf, are covered with inhabited islands; such as those of St. Clement, Paxaros, St. Anne of Cedars, so called from the number of these trees of a large size which it produces, St. Joseph, and a multitude of others. But the islands best known are three lying off cape St. Lucas, towards the Mexican coast, which are called Les Tres Marias, or the "Three Marias." These are small, but supply good wood and water, salt-pits, and abundance of game; and therefore the English and French pirates have sometimes wintered there, when they have been bound on cruises in the South seas.

*CALIGA*, in *Roman Antiquity*, was the proper soldier's shoe, made in the sandal fashion, without upper leather to cover the superior part of the foot, though otherwise reaching to the middle of the leg, and fastened with thongs. The sole of the caliga was of wood, like the Sabot of the French peasants, and its bottom stuck full of nails; which clavi are supposed to have been very long

in the shoes of the scouts and sentinels; whence these were called by way of distinction, "caligæ speculatoriæ;" as if by mounting the wearer to a higher pitch, they gave a greater advantage to the sight: though others will have the "caligæ speculatoriæ" to have been made soft and woolly, to prevent their making a noise. *Plin. Nat. Hist. lib. ix. cap. 18. lib. xxxiv. cap. 14. Hard. Suet. in Calig. cap. 9. and cap. 52.*

From these caligæ it was that the emperor Caligula took his name, as having been born in the army, and afterwards bred up in the habit of a common soldier; hence called "Caligatus."

A sort of caligæ was also worn by monks and bishops, when they celebrated mass pontificaly. *Du Cange.*

*St. Jerome (Ad Eustochium, de Custod. Virg. l. i. p. 140.)* uses the word "caliga" to express that covering for the feet which Christ forbade his disciples to wear, when he sent them to preach the gospel in his life-time, and which is opposed to "sandals," *Mark vi. 9.*; though *St. Jerome*, in the impetuosity of his zeal, supposes the apostles were to walk at times absolutely barefoot. These caligæ then seem to mean buskins, or rather short boots, designed to cover the feet so entirely, as to guard them, as well as the lower part of the leg, from injury by stones, thorns, &c.; whereas sandals consisted merely of soles at the bottom of the feet, fastened by leathern thongs, which left the foot very much uncovered, and exposed to injuries. *St. Jerome* annexes to these "caligæ" the epithet "lateæ," broad, which does not seem to be appropriate; and, therefore, some have supposed a corruption in the present reading of *late* for *lutea*, yellow; and this is the colour of the leather of which the Arabs make their boots.

*CALIGATI*, an appellation given by some ancient writers to the common soldiers in the Roman armies, by reason of the caliga which they wore.

The caliga was the badge, or symbol of a soldier; whence to take away the caliga and belt, imported a dismissal or cashiering.

*CALIGINOSUS*, in *Entomology*, a species of *CÆRATUS* that inhabits America, the colour of which is black; thorax square and smooth; antennæ pitchy. *Fabr. &c. Obs.* This insect is further distinguished by having two impressed dots on the head.

*CALIGO*, or *CALIGATIO*, in *Medicine*, an opacity, or cloudiness of the anterior surface of the crystalline, causing a dimness or suffusion of sight. The caligo is the same with what the Greeks call ἀχλὺς, achlys.

*CALIGULA*, *CAIUS CÆSAR*, in *Biography*, the fourth Roman emperor, was the son of Germanicus and Agrippina, born A.U.C. 765, A.D. 12; and derived his surname from "caliga," a kind of military boot, which he wore in conformity to those of the common soldiers, and with a view of engaging their affections. At an early period he was a complete master of dissimulation; he concealed his natural ferocity under an assumed modesty; nor did he manifest any signs of sorrow or resentment, when his mother was condemned, and his brothers were exiled and imprisoned. In his 20th year he was the favourite of the people from the respect they entertained for the memory of his father; and on this account he was hated by Tiberius. Of this he was well apprized; and, therefore, during his residence with him at Capræ, he had recourse to every art for vanquishing the prejudice which the emperor had conceived against him, and for conciliating his favour. With this view he studied the taste, the humours, the language, and even the tone of voice of Tiberius, changing, as occasions seemed to require, both his countenance and conduct, in order to fix his attach-

ment; nor was he wanting in his endeavours to secure the interest of all who had access to his grandfather. As a counterbalance to the power of S<sup>er</sup>janus, who had sunk in the domination of Tiberius, and whom he determined to disengage, he resolved to advance his obsequious grandson; and having allowed him to assume the "toga virilis," he invested him with the dignity of pontiff, and intimated to the senate his design of appointing him his successor to the empire. Tiberius, however, well knew the natural ferociousness of his temper; but he hoped that his passion for music and dance, and the debauchery to which he was addicted, would be the means of softening his savage disposition. His hopes indeed were delusive; and he therefore augured the injuries he would commit, and called him a public pest, that level to plague him and mankind. To this purpose he described him as "a serpent that would be fatal to the Romans, and a Phaeton that would set fire to the universe." In a conversation about Sylla, when young Caius ridiculed his character, Tiberius, whose natural penetration led him into a thorough acquaintance with his character, observed to him; "You will have all Sylla's vices, and not one of his virtues." And, on another occasion, when he had his two grandsons before him, he embraced Gemellus, with tears in his eyes, and said to Caius, whose countenance manifested displeasure, "You will slay him, and another shall slay you." The first wife of Caius was Claudia, the daughter of Marcus Silanus, a senator of distinction; but his debauchery in his youth was such, that he was detected by his grandmother Antonia, in scandalous familiarities with his own sister Druffilla. Upon the death of Claudia, he intrigued with Ennia, the wife of Macro the praetorian prefect, who concurred in this infamous business, and, in consequence of it, assisted him by his influence in securing the succession. Although Tiberius, notwithstanding his declared intention, hesitated about the appointment of a successor, inasmuch that he is said by will to have joined with Caius his other grandson Tiberius Gemellus, as co heir; Caius was acknowledged and proclaimed emperor immediately on the death of his grandfather by the Praetorian guards, and Macro was sent to the senate with Tiberius's will in order to have it annulled. In order to accomplish this purpose, he represented, on the part of Caius, that Tiberius was not found in his understanding when he made it, and that this plainly appeared by his appointing a child to govern them, who was not yet old enough to sit among them. The senators who hated Tiberius thought these reasons sufficient, and accordingly set aside the will. This event happened A. U. C. 790, A. D. 37. The sequel of this reign was marked with a variety of transactions, which indicated absolute insanity. At its commencement, indeed, it was the occasion of universal joy and congratulation; so that in three months after the accession of Caius to the empire, no less than 160,000 victims were sacrificed in thanksgiving to the gods; and nothing was seen for several months but feasting and rejoicing through the whole extent of the Roman empire. Caius began his reign by several popular acts, which seemed to encourage these high expectations. He professed great respect for the senate, released all that had been imprisoned by the orders of Tiberius, recalled all exiles, abolished for the time to come all accusations of high treason, and put a stop to all proceedings that had already began. He pretended to burn all papers relating to charges of this kind, left by Tiberius; but in the issue it appeared, that, whilst he preserved the originals, he burnt only copies. He also displayed a pious and affectionate respect to the memory of all his deceased relations, and treated those who survived with every token of honour. He discharged all the legacies that had been be-

queathed by Tiberius and Livia; and exhibited his generosity, as it was called, in largesses to the people, and in public spectacles which were conducted with extraordinary splendour and magnificence. He even affected a regard for liberty, by restoring to the people the right of election to certain offices of which Tiberius had deprived them, and by allowing the works of several patriotic writers to be freely circulated; and with a pretended zeal for morals, he banished all the ministers of the infamous debaucheries of his predecessor. This conduct was in a high degree gratifying to the people; and a dangerous illness, with which the emperor was attacked at this period, caused general alarm and produced expressions of concern and wishes for his recovery. As soon as he was restored to his usual health, his conduct appeared to be quite changed, and to mark a character the most depraved and detestable. The first act by which he discovered his natural ferocity was the death of the young and inoffensive Gemellus; and this was soon succeeded by that of his father-in-law Silanus, and of his benefactors Macro and his wife. Many senators and persons of distinction were also sacrificed to his political jealousy; and others became victims either to the mere wantonness of sport, or his innate love of cruelty. Of his incestuous passion he gave proof by marrying his sister Druffilla, on occasion of whose death he abandoned himself to the phrenzy of grief. As an instance of his insanity, we may mention his claim of divine honours, together with his institution of priests and erection of temples for the worship of his own divinity; whilst he hurled defiance against Jupiter. Similar to this and more extravagant in degree was the honour he paid to his horse "Incitatus;" for which he erected a palace, assigned domestics, and a public table, and constructed a marble stable and ivory rack, giving him gilt barley and wine out of a golden cup, and swearing by his health and fortune; and, besides, he is said to have designed him for consul. He married and repudiated several wives, and at length his attachment was permanently fixed to Caesonia, who, without youth and beauty, and although she had been the mother of three children by another husband, contrived to engage his affection by a corresponding dissoluteness of manners. Notwithstanding innumerable enormities, which rendered him the just object of detestation, and for which the only plea must be that of insanity, the Roman senate and people disgraced themselves by their base adulation and servile submission. Such was the degree of infatuation and depravity which this monster of folly and iniquity displayed on a variety of occasions, that he seemed to have lost all sense of shame; and to have manifested, without disguise, his hatred of all human kind. He even lamented that his reign was not distinguished by any of those public calamities, which had happened under his predecessors; and he openly uttered that most execrable wish "that the Roman people had but a single neck, which he might cut off at a blow."

His public transactions corresponded in the main tenor of them with his private conduct. In imitation of Xerxes, the eastern despot, he caused to be built, at an immense expence, a bridge of boats across the neck of the bay from Baiae to Puteoli. When he had twice triumphantly passed it at the head of his troops, the whole structure was demolished. Resolving on an expedition into Gaul and Germany, he assembled a large army; but having passed the Rhine, and marched a few miles into Germany, he hastily returned, and under an apprehension of danger, which was altogether unfounded, he was conveyed over the heads of the crowd that covered the bridge, and thus reached the other side in safety. On another occasion he caused his troops to sound a false alarm, and rallying to the forest from which the noise proceeded,

ceeded, he employed his men in cutting down trees for erecting trophies on account of his signal victory. After his return he oppressed the province of Gaul with enormous exactions and confiscations, in order to fill his exhausted treasury. In a pretended expedition against Britain, he marched his whole army to the coast opposite to the island, and having advanced in a magnificent galley to a small distance from the shore, he suddenly returned and ordered a signal of battle to be given; after which the soldiers, who were astonished at this face, were directed to fill their helmets with cockle-shells; and the whole ended in a trifling donative to the victorious troops. This folly was succeeded by a very serious design of cruelty, which was that of massacring or at least of decimating all the legions of the German army, which had mutinied, in his infancy, against his father Germanicus; but the legionaries, suspecting his intention, took up their arms; and the savage fled hastily to Rome, and wreaked his vengeance on the passive senate. His natural ferocity was exasperated by the discovery of a plot, which had been formed against him, for which many persons suffered death, and his soldiers were banished and despoiled of their property. At length he seems to have resolved upon the death of the whole senate and principal knights; but his designs were rendered abortive by the resentment of Cassius Chærea, tribune of a prætorian cohort, whom the emperor had made the subject of his indecent jests and raillery; accordingly he determined to dispatch the monster, and to make an effort for the restoration of a free government. Availing himself of the concurrence of some persons of superior rank, who had been insulted and injured by the emperor, a conspiracy was formed, of which Chærea was the principal agent. The games annually exhibited in January to the honour of Augustus were chosen for the season of execution. While the emperor was passing from the theatre to the palace, in a gallery leading to the baths, Chærea gave him a wound in the neck. The other conspirators then rushed on, and with redoubled blows dispatched the monster, in whose defence no person appeared. His mangled body remained on the spot till night, when his wife, or his friend, king Agrippa, caused it, half burnt, to be deposited in the earth. In order completely to finish the race of the tyrant, Chærea deputed an officer to put to death his wife Cæsonia, and his infant daughter, who was said to resemble her father in ferocity. An universal hatred of the tyrant manifested itself immediately after his death. His statues were demolished, his acts abrogated, and his memory as much as possible extinguished. After a reign of three years and ten months, A. D. 41, Caligula perished, and left behind him a character universally detested. It is said that his form, countenance, gesture, and manners, exhibited traces that were shocking and portentous. Destitute of natural talents and education, he merely applied with some degree of diligence to the study of elocution; but his chief attention was directed to the arts of music, dancing, gladiatorial exercises, and public spectacles. He was capricious and mutable to a degree bordering on madness; and was constant only in preserving some form of vice or extravagance. Seneca observes of him, "that he seems to have been brought forth by nature for the express purpose of shewing how much mischief could be effected by the greatest depravity, supported by the highest power." Sueton. Dio. Cassius. Crevier. Gen. Biog.

**CALIGUS ARCTUS**, in *Entomology*, the name by which Müller distinguishes the species of *MONOCULUS*, *ZISCINUS*. The Caligi of this writer consist of those *Monoculi* which have the eyes marginal, two setaceous antennæ, and from eight to ten legs.

**CALILAYA**, or **TAYALAS**, in *Geography*, a province of the island Luzon or Manila in the East Indies, adjoining to Balayan and Canaries, and extending to Cape Bundo, and up the country to Mauban, on the opposite coast of the island. It is larger than Balayan and is more populous.

**CALIMERE**, *Point or Cape*. See **CALYMETE Point**.

**CALIMNA**. See **CALMINA**.

**CALIMUS**. See **CALLIMUS**.

**CALIN**, the name of a sort of mixed metal, seemingly composed of lead and tin. It is prepared by the Chinese, and they make several utensils of it, as tea-cannisters, coffee-pots, and the like. In some places also they cover their houses with it as we do with Lead.

**CALINACRON**, in *Ancient Geography*, a promontory of Bithynia, at a small distance from the Thracian Bosphorus; called also *Mélona*.

**CALINDA**, or **CALYDNA**, a maritime town of Asia Minor, in Caria; seated on a small navigable river at some distance from the sea. It gave name to mountains situate on the N. W. of the town.

**CALINDOLA**, a town of Macedonia, in Mygdonia. Also, a town of India, on this side of the Ganges. Ptolemy.

**CALINEA**, in *Botany*. (Aublet, Juss.) See **DOTTIO-CARPUS**.

**CALINGÆ**, in *Ancient Geography*, a people of India, on the north-east coast, on this side of the Ganges, mentioned by Pliny, and pertaining to the Braehmans.

**CALINGÆ GANJARIDÆ**, a people of India, different from the former, on this side of the Ganges, whose capital was Parthalis. Pliny.

**CALINGAPATAM**, in *Geography*, a town of Hindoostan, in the circle of Cicacole, 12 miles E. N. E. of Cicacole. N. lat. 18° 18'. E. long. 84° 20'.

**CALINGH**, in *Ancient Geography*, a people of Arabia Felix, whose capital was Mariaba. Pliny.

**CALINGON**, *Segogora* or *Ponta de Palmeiras*, a promontory of India, on this side of the Ganges, S. W. of the most westerly mouth of the Ganges, on the confines of the country of the Calingæ. Pliny places it at 625 miles from the mouth of the Ganges.

**CALINI**, or **CALYNUDDI**, in *Geography*, a river of Hindoostan, which joins the Ganges near Canoge.

**CALINIPAXA**, in *Ancient Geography*, a town of India, on this side of the Ganges, mentioned by Pliny, and probably the same with **CANOGE**, which see.

**CALJONG-CAMPANY**, in *Geography*, a town of the island of Borneo.

**CALIORDI**, in *Ancient Geography*, a people of the Tauric Chersonesus. Pliny.

**CALIPH**, or **KHALIF**, denotes a successor of Mahomet, vested with sovereign dignity and absolute authority, in the spiritual as well as temporal empire erected by that legislator. The word is originally Arabic, "khalifah;" which properly signifies a successor or vicar. The caliphs among the Mahometans bear a near affinity to the popes among the Christians who profess the catholic religion. After the death of Mahomet, who left no directions concerning a successor, or at least none but which were known to his wives, who were in the interest of Omar, very warm debates arose between the Mohajerin and the Ansars about the right of electing a khalif. The former claimed that right from their having attended Mahomet in his flight to Medina, and from having declared themselves in his favour before any of the other Arabs joined him; but the latter

founded their claims on their having supported him, when he was expelled his native city, and in their having enabled him to prevail against his enemies, when he and his followers were in a state of persecution. At length one of the Ansans proposed to compromise this difference by requesting that each of the contending parties might be allowed to choose a khalif. The proposal, however, was not cordially approved by the Mohajerin; and Abubeker recommended two persons, Omar Ebn Al Khattab and Abu Obeidah, to their choice, and proposed that they should recognize the one of these two persons who obtained the suffrages of both parties. Omar, however, terminated the dispute by swearing fealty to Abubeker, and his example was followed by all the moslems that were present: upon which, Abubeker was saluted khalif by both the Mohajerin and the Ansans, and acknowledged as rightful successor of Mahomet. Abubeker, having been thus elected by the Mussulmans, would assume no other title but that of *Khalifah rissoul Allah*, that is, vicar of the prophet, or messenger of God. But Omar, who succeeded Abubeker, represented to the Mahometan chiefs, that if he took the quality of vicar, or successor of Abubeker, the vicar or successor of the prophet, the appellation of vicar would, in course of time, be repeated and multiplied without end; and, accordingly, at the motion of Mogairak, Omar assumed the title of *Emir al Moumenin*, that is, lord or prince of the believers; which appellation has been accepted and borne by all the legitimate caliphs or successors of Mahomet, from that time; though they still retained the title of caliph, without any other addition.

After the election of Abubeker, Ali Ebn Abu Taleb, who, by hereditary right, ought to have succeeded Mahomet, expressed his dissatisfaction at the choice; but finding that the people in general were prepossessed in his favour, he acquiesced and opposed his resignation of the government. The Shiites, however, maintain, that the supreme authority, both in spiritual and temporal concerns, rightfully belonged to the descendants of Ali, and they do not acknowledge the three first successors of Mahomet, viz. Abubeker, Omar, and Othman, as legitimate. The government of Abubeker commenced in the year of the hegira 11, A. D. 632; and terminated A. D. 634; when he was succeeded in the regal and pontifical dignity by Omar. This caliph, before his decease, appointed 6 persons to deliberate concerning the election of a successor; all of whom had been intimately acquainted with Mahomet, and were styled, by way of eminence, his "Companions." After his death they assembled for the choice of a new caliph; and Abdalrahman renounced his pretensions on condition of being allowed to nominate one of the 5 remaining companions as emperor of the faithful. To this proposal all agreed except Ali, who thought himself injured, because he was not the immediate successor of the prophet; and Othman was declared caliph, in the 24th year of the hegira, A. D. 644. Upon the death of Othman, Ali was unanimously elected to succeed him, in the 35th year of the hegira, A. D. 655. The seat of government during the 3 preceding caliphates had remained fixed at Medina from the death of Mahomet; but Ali removed it to Cufa. Ali was succeeded in the caliphate by his son Hafan in the 40th year of the hegira, A. D. 660; but after a reign of about six months, he abdicated the government, and was succeeded in the 41st year of the hegira, A. D. 661, by Moawiyah I. the first caliph of the house of Ommyyah; who transferred the seat of government to Damascus in Syria. The race of Ommyades terminated with Merwan II. in the 127th year of the he-

gira, A. D. 744; and was succeeded by the Abassides. The first caliph of this family was Abul Abbas al Saffah, who ascended the throne of the Moslems in the 132d year of the hegira, A. D. 749, and who removed the seat of government first to Cufa, then to Anbar, a city on the confines of Chaldaea and Arabia, and last of all to Hafehemiyah, a city built by himself near the Euphrates, not far from Anbar, and so denominated in honour of Hafehem, uncle of Mahomet, and one of his ancestors; and from this circumstance the Abassides obtained the appellation of Hafehemites. Abul Abbas was succeeded by his brother Abu Jaafar al Mansar, who was proclaimed caliph in the imperial city of Anbar, then the capital of the Moslem empire, in the 138th year of the hegira, A. D. 754. He built the city of Bagdad, which afterwards became the customary residence of the Abasside caliphs, his successors. This race terminated with Al Mostafem Billah, who was put to death by the Tartars, in the year of the hegira 656, A. D. 1258, when they captured the city of Bagdad.

At the end of the first century of the hegira, about A. D. 718, the caliphs were the most potent and absolute monarchs of the globe. Their prerogative was not circumscribed, either in right or in fact, by the power of the nobles, the freedom of the commons, the privileges of the church, the votes of a senate, or the memory of a free constitution. The regal and sacerdotal characters were united in these successors of Mahomet; and the Koran was the rule of their actions. They were the supreme judges and interpreters of that book held to be divine. They reigned by the right of conquest over the nations of the east, to whom the name of liberty was unknown, and who were accustomed to applaud in their tyrants the acts of violence and severity that were exercised at their own expence. Under the last of the Ommyades, the Arabian empire extended 200 days' journey from east to west, from the confines of Tartary and India to the shores of the Atlantic Ocean. And if we retrench the sleeve of the robe, as the long and narrow province of Africa was styled by their writers, the solid and compact dominion from Fargana to Aden, from Tarsus to Surat, will spread on every side to the measure of 4 or 5 months of the march of a caravan. Under the reign of the Ommyades, the studies of the Moslems were confined to the interpretation of the Koran, and the eloquence and poetry of their native tongue. But the caliphs of the race of Abassides, after their civil and domestic wars, encouraged literature and science. See *ALMAMON* and *ALMANSOR*.

After the period of the destruction of the caliphate by the capture of Bagdad, there were persons who claimed the caliphate, under a pretence of belonging to the family of the Abassides, and to whom the sultans of Egypt paid great respect at Cairo, as the true successors of Mahomet; but this honour was merely titular, and the rights they claimed were only acknowledged in the province of religion; and though they bore the title of caliphs, they were nevertheless subjects, and dependents of the Sultans. In the year of the hegira 361, A. D. 971, a kind of caliphate was erected by the Fatimites in Africa and Egypt, and lasted till Saladin suppressed it by order of Nouredin, sultan of Syria. There was also a caliphate in Africa and Spain, which commenced under the reign of Josef. Historians also speak of a caliphate in Yemen or Arabia Felix, established by some princes of the race of the A'oubites, or Jobites. The emperors of Morocco assume the title of "grand cherifs" and pretend to be the true caliphs, or successors of Mahomet, though under another name. Since

the destruction of the caliphate, the Mahometan princes have a particular officer appointed in their respective dominions, who sustains the sacred authority of caliph. In Turkey he is denominated Mufti, and in Persia Sadre.

One of the principal functions of the caliph, in quality of Imam or chief priest of the Mussulman religion, was that of beginning the public prayers every Friday in the chief mosque, and of delivering the *khotbab*, which was a kind of sermon. In later times they had deputies or assistants who performed the second service; but the first was always appropriated to the caliph in person. He was also obliged to conduct the pilgrims to Mecca, and to march at the head of the armies of his empire. The caliphs also granted letters-patent of investiture, as well as swords, standards, robes, &c. to the Mahometan princes, who, though they had thrown off the yoke of the caliphate, nevertheless held of it as vassals.

The caliphs usually went to the mosques mounted on mules; and the sultans Selgiucides, although masters of Bagdad, held their stirrups, and led their mules by the bridles for some distance on foot, till such time as they received intimations from the caliphs to mount on horse-back. At one of the windows of the caliph's palace, there always hung a piece of black velvet, 20 cubits long, which reached to the ground, and was called the "caliph's sleeve;" and the grandees of his court never failed to kiss it with great respect every day. The honours paid to the caliphs were excessive, and produced in them a degree of pride, of which they did not cease to exhibit tokens, even when their authority had declined and was reduced to its lowest state of degradation. In the period of their power, they affected very extraordinary magnificence and splendour. Abulfaragius relates, that the caliph Motazem had 700 women in his seraglio, and 300 eunuchs to guard them. But this splendour was much diminished, and, indeed, almost annihilated during the reign of the Bouides in Persia, who stripped them of every thing, depriving them of their visits, and allowing them to retain no officer of higher rank than a secretary to take care of their affairs. At length, and particularly under the reign of Radi Billah, the 20th caliph of the Abassides, A. D. 934, the territories of the Mahometan empire were so dismembered and divided, that this caliph was reduced to the sole dignity of the caliphate, and the possession of the city of Bagdad. But Bassora, Vassith, and Ahouaz, were under the dominion of the Bouides. They occupied the whole of Persia; the Hamadanites reigned in Mosul and Mesopotamia; Akshid was master of Egypt and Syria; the Fatimites possessed Africa; the Omniades governed Spain; the Samanides had Khorasau; the Carmathii were in peaceable possession of Arabia Felix and Arabia Petraea; and the caliphs paid them tribute for the security of the pilgrims of Mecca; and, moreover, the Dilemites were the sovereigns of Georgia and Tabristan. Such was the state of the caliphate in the 325th year of the hejira, A. D. 936. After the Bouides made themselves masters of Bagdad, they were reduced to the mere exercise of the functions of the mosque; and these princes advanced or dethroned them at their pleasure. At length, the period of their total overthrow by the Tartars, under the caliphate of Motazem, arrived, as we have already related; and their temporal power became extinct. Herbelot, Bib. Or. Gibbon's Hist. vols. ix. x. xi. Mod. Un. Hist. vols. i. ii. iii.

CALIFOS, or CALIPUS, in *Ancient Geography*, *Sadao*, a river of Lusitania, which rose to the south of the mountains on the northern boundary of Cuneus, and running northwards, watered the town of Salaria, and then turning to the west, discharged itself into the sea.

CALIPPIA, an island of the Ægean Sea. Antonia. Marit. Itin.

CALIPPIC period, in *Chronology*, a series of seventy-six years, perpetually recurring; which elapsed, the middle of the new and full moons, as its inventor Calippus, an Athenian, imagined, returns the same day of the solar year.

Meton, a hundred years before, had invented the period, or cycle, of nineteen years (see *Metonic Cycle*); assuming the quantity of the solar year  $365^d 6^h 18^m 56^s 53 31^t 34^u$ ; and the lunar month  $29^d 12^h 45^m 47^s 26^t 48^u 30^v$ ; but Calippus, considering that the Metonic quantity of the solar year was not exact, multiplied Meton's period by four, and thence arose a period of 76 years, called the Calippic.

At the end of this term it was necessary to retrench a day; so that his period was composed of four of those of Meton, three of which consisted of 6940 days each, and one of 6939 days. For this purpose, it was sufficient to change in the revolution of four periods one of the months from 30 to 29 days. The effect of this correction was to retard the anticipation of the new moons for more than 300 years, and at the same time to render the whole period more correspondent to the motion of the sun. The Calippic period, therefore, or the interval of four Metonic or lunar cycles, diminished by a day, contains 27759 days; and since the lunar cycle contains 235 lunations, and the Calippic period is quadruple of this, it contains 940 lunations, consisting of about 27758 days  $18^h 8^m$ ; and 76 revolutions of the sun compose a sum of about 27758 days  $10^h 4^m$ . The Calippic period began in the third year of the 112th olympiad, or the 4384th of the Julian period, B. C. 330, the 7th year of the 10th Metonic cycle. It is demonstrated, however, that the Calippic period itself is not accurate; that it does not bring the new and full moons precisely to their places:  $8^h 5' 52^m 60^s$ , being the excess of 940 lunations above 76 solar years; but brings them too late, by a whole day, in 225 years.

This period was adopted by astronomers, and is frequently mentioned by Ptolemy. It corresponds to our lunar cycle, combined with our Julian years, 76 of which form the Calippic period; and the anticipation of the moon is the same in both. This anticipation, together with that of the equinoxes, gave rise to the reformation of the calendar, A. D. 1582. See *CALENDAR*. The ancients were not unapprized of the defect of the Calippic period: at least, it did not escape the penetrating sagacity of Hipparchus, who undertook to correct it. His observations led him to perceive, that the solar and lunar years were somewhat less than Calippus had supposed them to be; and pursuing his calculation, which he conceived to be sufficiently exact with regard to the moon, but more erroneous with respect to the sun, he found that the anticipation of the one and of the other was about a day in four periods. He therefore quadrupled the cycle of Calippus, and retrenched from it the day which he had found in excess during four revolutions. This new period had the advantage of corresponding more exactly with the motion of the moon, which was not retarded more than half an hour in 304 years. But it anticipated the motion of the sun about a day and a quarter, which was an error only equal to that of Calippus in a double interval. However, this invention shared the fate of many others, no less useful and alike neglected. The Grecians, accustomed to the cycles of Meton and of Calippus, disregarded that of Hipparchus, although it was more perfect.

CALISIA, in *Ancient Geography*, a town placed by Ptolemy in the eastern part of Germany, and supposed by Cluvier to be Kalisch in Poland.

CALISPERMUM, in *Botany*, ( $\kappa\alpha\lambda\omicron\varsigma$ , beautiful, and  $\sigma\tau\epsilon\mu\alpha$ ,

—, feed.) Bosc. Nouv. dict. Loureiro, Cochin. Class  
and, *pet. white, monogynous.*

C. Ch. *Calyc.* with five equal divisions, permanent.  
C. P. petals five, ovate, concave. *Stamens* five. *Pist.* germ  
superior; style one, stigma thick. *Pedic.* Berry nearly  
round, one-celled, many-seeded.

Elf. Ch. *Corolla* five-petalled. *Berry* one-celled, many-  
seeded.

Species. *Calispermum scandens.* A climbing shrub.  
*Leaves* alternate, ovate, lanceolate, falcated, smooth.  
*Flowers* white, in nearly terminal racemes. A native of  
Cochin-China. We suspect, but not having Dr. Smith's  
work at hand, have not the means of ascertaining, that Lou-  
reiro's plant is the *bilardiera scandens* of our excellent coun-  
tryman figured by him in his plants of New Holland, and  
adopted by Willdenow. As that article has not been in-  
serted in our work in its proper place, we shall supply the  
omission by giving it here.

*Bilardiera scandens*, Willd. n. 440. Smith New Hol. 1.  
p. 1. Tab. 1. *Petals* five, alternating with the leaflets of  
the calyx. *Nectary* none. *Stigma* simple. *Berry* superior,  
many seeded. *Peduncles* solitary, one-flowered. *Leaves*  
somewhat hairy. If the plants should turn out to be differ-  
ent, they ought certainly to be referred to the same genus,  
and the trivial name which we have ventured to give to  
Loureiro's plant must be altered.

CALISSÆ, in *Ancient Geography*, a people of India on  
the other side of the Ganges. Play.

CALISTA, in *Fabulous History*, the daughter of Ly-  
caon, king of Arcadia, and one of the nymphs of Diana.  
Being beloved by Jupiter, he assumed the form of the god-  
dess of chastity, and thus debauched her: but whilst she  
was toiling with her patroness, her disgrace was revealed,  
and the incensed deity converted her and the son with whom  
she was pregnant into bears; upon which Jupiter, as the  
fable reports, compassionating her sufferings, took them up  
into the heavens, and made them the constellations Ursa Ma-  
jor, and Ursa Minor.

CALISTE, in *Conchology*, a species of VENUS, the shell  
of which is beset with acute transverse striæ, becoming mem-  
branaceous in front; anterior slope short, and the posterior  
aperture inconspicuous. Gmel. Schroet. &c. Inhabits the  
Red Sea.

CALITÆ, in *Ancient Geography*, a people of Africa in  
interior Libya. Pliny.

CALITTOOR, in *Geography*. See CALTURA.

CALIUR, in *Ancient Geography*, a town of India,  
placed by Ptolemy on this side of the Ganges.

CALIX. See CALYX and CHALICE.

CALIXTINS, in *Ecclesiastical History*, a name given to  
those among the Lutherans, who follow the sentiments of  
George Calixtus, a celebrated Lutheran divine, who was  
born near Sleswick in Holstein, in 1586; and having stu-  
died at most of the protestant schools in Germany, was made  
professor of theology at Helmstadt in 1614, where he died  
in 1656. He was distinguished by his zeal for forming an  
union between the Romish, Lutheran, and Reformed  
churches; or, at least, for joining them in the bonds of mu-  
tual forbearance and charity. Calixtus was the first person  
that reduced theology into a regular system, and gave it a  
truly scientific and philosophical form. As he had imbibed  
the spirit of the Aristotelian school, he arranged the sub-  
stance of Christianity according to the method of the Stag-  
irite; and divided the whole science of divinity into three  
parts, viz. the end, the subject, and the means. He was  
also the first who separated the objects of faith from the du-  
ties of morality, and exhibited the latter under the form of

an independent science. These innovations rendered him  
the object of much censure and opposition. In his attempt  
to reunite the several bodies of Christians, and to compre-  
hend the different churches in one profession of religion, he  
was a principal promoter of that system, which was called  
syncretism. See SYNCRETISTS. The controversy which  
was thus occasioned, subsisted long after his death; and  
though he seemed, in his efforts for comprehension, to give  
advantage to the Romish church, no one attacked its ty-  
ranny and corruption with greater vigour. He was the au-  
thor of many works, which it is now needless to enumerate.  
Mosheim, Eccl. Hist. vol. v.

The Calixtins are esteemed a kind of SEMI-PELAGIANS.

CALIXTINS also denote a sect in Bohemia, derived from  
the Hussites, in the fifteenth century, A.D. 1420, who  
asserted the use of the cup as essential to the eucharist.  
And hence their name; which is formed from the Latin *calix*,  
a cup.

The Calixtins are not ranked by Romanists in the list of  
heretics, since in the main they still adhered to the doctrine  
of Rome. The reformation they aimed at terminated in the  
four following articles.

1. That the word of God should be explained to the peo-  
ple in a plain and perspicuous manner, without the mixture  
of superstitious comments or inventions. 2. That the sacra-  
ment of the Lord's supper should be administered in both  
kinds. 3. That the clergy, instead of employing all their  
attention and zeal in the acquisition of riches and power,  
should turn their thoughts to objects more suitable to their  
profession, and be ambitious of living and acting as became  
the successors of the holy apostles. 4. That transgressions  
of a more heinous kind, or "mortal sins," should be pu-  
nished in a manner suitable to their enormity. In the two  
great factions of Calixtins and Taborites, into which the  
multitude was divided, there were some subordinate sects,  
who differed in several other points. Mosheim, Eccl. Hist.  
vol. iii. See TABORITES.

CALIXTUS, GEORGE. See CALIXTINS.

CALIYUG, in the *Astronomy* of the Hindoos, a period  
of time, the commencement of which forms an epoch, in  
which the planets were supposed to have been in a line of  
mean conjunction, in the beginning of Aries. The Caly  
yug is supposed to have begun 3102 years before the com-  
mencement of the Christian æra, or 3101 years before the  
year of Christ's birth; or at the instant of midnight, be-  
tween Thursday the 17th, and Friday the 18th of Febru-  
ary, O. S. in the year of the Julian period 1612, when the  
planets were supposed to have had this aspect on the meri-  
dian of Lanka, about 75° 50' E. of Greenwich: and the  
epoch founded on its commencement appears to have been  
fixed on by Varaha, the reputed author of the Suryá Sid-  
dhánta, and some other Hindu astronomers since his time;  
for though the planets were not then actually in a line of  
mean conjunction, yet, the differences between their re-  
spective positions, and that which was assumed, when di-  
vided among the years expired from that epoch to the time  
of Varaha, were considered as too small to cause any con-  
siderable difference between the mean annual motions, and  
those which it would be necessary to assume, so as to give  
the positions of the planets at that time, or even to cause  
any sensible error in their computed places deduced from  
thence for many years. For a farther account of this astro-  
nomical cycle, and its application to the Hindu chronology,  
&c. see Bentley on the Antiquity of the Suryá Siddhánta,  
in the Asiatic Researches, vol. vi. p. 540, 8vo. See also  
SURYA' SIDDHÁNTA.

CALKA, in *Geography*. See KALKA.

**CALKING, or CAULKING, in Sea-Language, &c.** See CAUKING.

**CALKING, in Painting.** See CALQUING.

**CALKINS, or CALKERS,** a part prominent from a horse-shoe, intended to secure the heel from sliding.

The calkins are the end or extremity of horse-shoes, turned or bent downwards, and forged to a sort of point, to make the heel step more safe and steady on the ice.

The inconvenience of calkins is, that they hinder the horse from treading evenly on the ground, and thus occasion wrenches on the foot, or strains in the sinews; especially in stony ways, where the hardness of the bottom will not suffer the calkins to penetrate: besides, they are apt to make a horse cut.

Calkins are either single or double, *i. e.* at one end of the shoe, or at both; the latter are reputed less hurtful, as they allow the creature to tread more even; some are made large and square; the best are in form of the point of a hare's ear.

**CALL,** among *Fowlers*, means the noise or cry of a bird, especially to its young, or its mate in coupling time.

The *call* of a bird, says the hon. Daines Barrington, in his Experiments, &c. on the Singing of Birds (Phil. Transf. vol. lxxiii. p. 250), is that sound which it is able to make when about a month old: it is, he says, in most instances, a repetition of one and the same note, is retained by the bird as long as it lives, and is common, generally, both to the cock and hen.

One method of catching partridges, is by the natural call of a hen trained for the purpose, which drawing the cocks to her, gives opportunity for entangling them in a net.

Calls are also a sort of artificial pipes, made to catch several sorts of birds, by imitating their notes. Different birds require different sorts of artificial calls; but they are most of them composed of a pipe or reed, with a little leathern bag or purse, somewhat in form of a bellows, which, by the motion given thereto, yields a noise like that of the species of bird to be taken. The call for partridges is formed like a boat, bored through, and fitted with a pipe, or swan's quill, &c. to be blown with the mouth, to make the noise of the cock partridge, which is very different from the call of the hen. Calls for quails, &c. are made of a leathern purse in shape like a pear, stuffed with horse hair, and fitted at the end with the bone of a cat's, hare's, or coney's legs, formed like a flageolet: they are played by squeezing the purse in the palm of the hand, at the same time striking on the flageolet part with the thumb to counterfeit the call of the hen quail.

In some countries hares are very numerous, and from May until August are taken with a call, which entices them within a proper distance of the sportsman. This call is a squeaking sound, first slow and then quicker, and is supposed to resemble the call between the male and the female. In the country about Naples, where this practice obtains, both hares and partridges are so tame, that they will run under the carriage-wheels.

**CALL, in Hunting,** signifies a lesson blown upon the horn, to comfort the hounds.

**CALL, in Mineralogy,** an English name for the mineral called Tungsten, or Wolfram, by the Germans.

**CALL, in Sea language,** a sort of whistle or pipe, of silver or brass, used by the boatswain and his mates to summon the sailors to their duty, and direct them in their several employments. It is sounded to various strains, adapted to the different exercises, as hoisting, heaving, &c. and the piping of it serves the same purposes among sailors, as the beat of the drum among soldiers.

**CALL of the house,** in a parliamentary sense, has been sometimes practised, to discover whether there be any in the house not returned by the clerk of the crown; but more frequently to discover what members are absent without leave of the house, or jail cause.

In the former case, the names of the members being called over, every person answers to his name, and departs out of the house, in the order whereof he is called. In the latter, each person stands up uncovered, at the mention of his name.

**CALL of the plaintiff, in Law.** See NON-SUIT.

**CALLA, in Botany,** (derived, according to some authors, from *καλλος*, beauty; but professor Martyn says, from *καλλων*, the wattles of a cock; the name occurs in Pany.) Linn. gen. 1230. Schreb. 1388. Gært. 522. Juss. p. 24. Vert. vol. ii. p. 85. (Provençalia, Petit. gen. 45. Anguina, Trew.) Class and order, *gynandri polyandria*, Linn. *monœcia monandria*, Schreb. *monœcia polyandria*, Dr. Smith, as appears from his remarks on Arum in his Flora Britannica, and English Botany. Nat. ord. *piperitæ*, Linn. *Archie* Juss. and Ventenat.

Gen. ch. *Cal.* spathe one-leaved, acuminate, spreading, permanent; spadix simple, erect, covered with fructifications. *Cor.* none. *Stam.* either placed above or intermingled with the pistils; anthers sessile, simple, truncate. *Pist.* germ roundish obtuse; style simple, very short; stigma acute; with several permanent, compressed, truncate filaments intermixed with the germs. *Peric.* berry tetragonally-globular, one-celled (many celled, Gært.); seeds from six to twelve, erect, cylindrical, obtuse at both ends.

Ess. Ch. Spathe spreading, spadix covered with florets; corolla none. Berries many-seeded.

Sp. 1. *C. atbiopica*, Linn. Sp. Gærtner, Tab. 84. fig. 2. La Marek, Pl. 737, fig. 2. (Arum Æthiopicum; Comm. hort. 1. p. 95, Tab. 50. Arum Africanum; Tournef. 159. Rai. Sup. 576.) "Leaves arrow-heart-shaped; spathe cowed; stamens placed above the pistils." Perennial. *Root* thick, fleshy, with a brown skin, and strong, fleshy fibres. *Leaves* in clusters from the root, eight or nine inches long, of a shining green, ending in a sharp point, which turns backwards on petioles more than a foot long; furrowed, and sheathing at their base. *Scape* longer than the leaves, round, herbaceous, smooth, green. *Spathe* white, a little fleshy, twisted at the bottom, but spread open at the top, suddenly contracting, and ending in a point. *Spadix* cylindrical, yellowish, about half the length of the spathe. *Stamens* above, *pistils* below set so closely together that they are not easily distinguished. *Seeds* roundish, dark brown, smooth, having on the inner side a protuberant, compressed eye extending from the umbilical aperture to the top of the seed. Miller, La Marek, and Gærtner. A native of the Cape of Good Hope, sent to Commelin in 1687, and cultivated by Mr. Miller in 1731. It flowers from January to May. 2. *C. palyflris*, Linn. Sp. Pl. Flor. dan. Tab. 422. (Dracunculus palustris. Bauh. pin. 195. D. aquatilis. Dod. pempt. 331. Rai. Hist. 1210. Barcl. ic. 574. Anguina aquatica, Lob. ic. 600.) "Leaves heart-shaped; spathe flat; stamens and pistils intermingled with each other." Perennial. *Root* creeping, from six to eight inches long, fixing itself to the earth by capillary fibres from its knots, and throwing out leaves and scapes at different distances. *Leaves* petioled, acuminate, green, smooth, alternately embracing the stem. *Stipules* two, bluntnish-egg-shaped at the base of the petioles. *Scape* round, thick, succulent, smooth, bright green. *Spathe* roundish-egg-shaped, rolled up at the end into a bluntnish spine, yellowish-green below, white and smooth above. *Spadix* egg-shaped, obtuse. *Stamens* white.

Berries

*Berries* small, four or five-cornered, or round, wrinkled about the edge, smooth, soft, flat at the top, crowned with a short style. *Seeds* from six to nine, sometimes only from one to three, in a viscid mucilage. A native of marshes in Holland, Germany, and the whole north of Europe. Its roots are very acrid; but Linnæus informs us, that the Lapplanders extract from them a fecula of which they make bread. 3. *C. orientalis*, Linn. Sp. Pl. (Arum Carfaami, Rauw. itin. 117. A. minus occidentale, Mor. Hist. 3. 544. Rai. Sup. 580.) "Leaves egg-shaped." Perennial. *Petioles* long. *Stems* about six inches high; *flowers* white. A native of the mountains about Aleppo. This species rests entirely on the authority of Rauwolf; and, though admitted by Linnæus into his Species Plantarum, does not appear in the last edition of his Systema Nature, and has since been rejected by most of the editors of the Systema Vegetabilium. 4. *C. umbra*, Martyn's Miller. Loureiro Cochinch. 532. "Leaves heart-egg-shaped; spathe spiral; spadix with anthers and filaments intermingled at the bottom; anthers only at the top." Perennial. About a foot high, with scarcely any stalk. *Leaves* many, smooth, diffusid; with long channelled petioles, dilated at the base, embracing the inner ones. *Spathe* long, concealing the flowers even in their state of maturity. *Spadix* oblong. *Stigma* concave, trifid, sessile. *Berry* three-lobed, three-celled, yellow, containing many seeds. A native of Cochinchina in moist places.

*Propagation and Culture.* The Æthiopia propagates very fast by offsets, which should be taken off about the end of August, and each planted separately in a pot filled with kitchen-garden earth. They may be kept in the open air till winter, and then should be removed under cover. The plant will live in the open air in mild winters, without any cover, in a warm border and dry soil; and may always be preserved with a little shelter from hard frost. The palustris must be planted in an artificial bog, or the mud of a pond, or tub set in water. Miller.

*CALLA-Sufung*, in *Geography*, a town and capital of the island of Bouton, in the Indian sea, seated about a mile from the coast, on an eminence surrounded with cocoa-nut trees. It has a bad harbour with a rocky bottom. The inhabitants are Mahometans, and speak the Malay language.

CALLABASH-BAY. See CALABASH.

CALLAC, a town of France in the department of the North Coasts, and chief place of a canton in the district of Guingamp;  $3\frac{1}{2}$  leagues N. of Rostrenau. The place contains 1,543, and the canton 10,532 inhabitants; the territory includes  $327\frac{1}{2}$  kilometres, and 9 communes.

CALLACALLES, a river of Chili which falls into the South Sea at Baldivia.

CALAF, or CALAF, in *Botany*. (Alpin.) See SALIX ÆGYPTIACA.

CALLAH, or GELLAH, in *Geography*, a town of Africa, in the country of Algiers, 50 miles S. of Bona.—Also, a town of Africa, in the country of Algiers; 35 miles W. of Suç.

CALLAH, EL, a town of Africa, in the western province of Algiers, Tlemcen or Tremecen, situate 5 leagues to the N. E. of Mascara, and 40 miles E. of Oran, on an eminence, as the Arabic name imports, and in the midst of other mountains, which form part of Mount Atlas. It is larger than Mascara, but a dirty ill-contrived town, without drains, pavement, or causeways. It is the greatest market of this country for carpets and burmooses. There are several villages of the same nature, and alike situate round about it, all of which are profitably employed in the same woollen manufactures. The Turks have here a small garrison and citadel;

and, from some few large stones and pieces of marble of ancient workmanship, we may infer that it was formerly a city of the Romans; perhaps the "Giltui," or "Apfar," of Ptolemy.

CALLAICI, or CALLÆCI, in *Ancient Geography*, a people of Spain, who inhabited the north-western part of the country. Their name seems to have been formed from "Calle," which was that of one of their ports. There were several different people comprehended under this denomination; such as the Bracarii; Cælerini, Gravii, Simici, Querquerni, Artabri, and others. Ptolemy divides them into the "Callaici Bracarii," and "Callaici Lucenses." The former extended themselves from the Durius to the Minius; and the latter from the Minius to Astures. Their principal rivers were the Uia, Minius, and Durius; and their chief towns were Brigantium, Adrobicum, Lucus Augusti, Iria Flavia, Tyde, Bracara Augusta, Calle, and Aquæ Flavia.

CALLAN, a mountain in the county of Clare, Ireland, near the Western Ocean, remarkable for a large stone or monument, supposed to have an inscription in the *Ogham* or *Ogum* characters. An account of it may be found in the 1st vol. of the Transactions of the Royal Irish Academy, and in the 7th volume of the Archæologia; and some remarks on it in Ledwich's Irish Antiquities.

CALLANORE, or KULLANORE, a town of Hindoostan, in the county of Lahore, seated on the Rauvee, about E.  $30^{\circ}$  N. from Lahore, or distant from it 35 common miles. N. lat.  $32^{\circ} 30'$ . E. long.  $74^{\circ} 40'$ .

CALLAO, a sea-port town of Spanish South America, in Peru, seated on a river of the same name near the Pacific Ocean, and serving as a port to the city of Lima, from which it is distant about 5 miles. The harbour of Callao is the largest, most beautiful, most convenient, and most secure in the South Sea; and the Spanish government has, at different periods, expended large sums in improving and strengthening it. The largest vessels may lie with perfect safety in the road of this port, as the water is very deep, without rocks, and always tranquil. Two islands, named St. Lawrence and Callao, and the peninsula which nearly reaches them, defend vessels, from the south wind; and though the road is open to the north and north-north-west, these winds so seldom blow here, or with such inconsiderable force, that no danger is apprehended. The island of St. Lawrence breaks off the sea from the S. W. to the S. E. In this port every necessary commodity which vessels need, may be procured. The small river that comes down from Lima, and discharges itself into the sea under the walls of Callao, furnishes plenty of good water; and a mole, on which cranes are erected, makes it easy for ships to load and unload. The town, which the Spaniards have considered as almost impregnable, was, before the calamity, which it suffered by an earthquake, fortified by bastions and some batteries, which have never been thoroughly repaired; and it is defended by a garrison. There are two faubourgs inhabited by Indians. The trade of Callao is considerable, in consequence of its convenience as a port, and its vicinity to Lima, which see. This place, as well as the adjacent country, has frequently suffered much from earthquakes. The most dreadful earthquake, however, seems to have been that which commenced in 1746, and continued at intervals till 1747. On this occasion the port of Callao was totally submerged; nothing remained except a piece of the wall of the fort of Santa Cruz, as a memorial of this terrible devastation. Of 23 ships and vessels, great and small, which were then in the harbour, 19 were wholly sunk, and the other four were carried by the force of the waves to a great distance up the country. Of the number of inhabitants, amounting to about

4000, 200 only escaped; and 22 of these were preserved by means of the above-mentioned fragment of a wall. Since that time Callao has been rebuilt upon the same plan, but a little farther from the sea. S. lat.  $12^{\circ} 1' 53''$ . W. long.  $76^{\circ} 58'$ .

CALLAO, as it is called by its inhabitants, but more generally known to Europeans under the name of CAMPELLO, is an island which lies opposite to, and about 8 miles to the eastward of, the mouth of a considerable river on the coast of Cochin-china, on the banks of which is situated the town of Fairfoo, a place of some note, not far from the harbour of Turon. The bearing of the highest peak of Callao from this harbour is about S. E. at the distance of 30 miles. The extreme points of the island lie in N. lat.  $15^{\circ} 53'$ . and  $15^{\circ} 57'$ . The greatest length is from N. W. to S. E. about 5 miles, and the mean breadth 2 miles. The only inhabited part is on the S. W. coast, on a slip of ground rising gently to the east, and contained between the bottom of a femilunar bay, and the mountains on each side of it. These mountains, at a distance, appear like two distinct islands. The southern mountain is the highest, and is about 1500 feet. The lower grounds contain about 200 acres. This small but enchanting spot is beautifully diversified with neat houses, temples, clumps of trees, small hills swelling from the plain, and richly decorated with shrubbery and trees of various kinds; among which the elegant arca, rising like a Corinthian column, is eminently conspicuous. A rill of clear water, oozing from the mountains, is carried along the upper ridges of the vale, whence it is occasionally conveyed through sluices, for the purpose of watering the rice grounds, and for which it seems to be amply sufficient. The houses, in general, were clean and decent: a few were built with stone, and covered with tiles. One, probably the mansion of the chief person of the island, was inclosed by a stone wall, and the access to it was through a gate-way between two stone pillars. The house was divided into a number of apartments, arranged with taste and convenience. This building stood at the head of the principal village, consisting of about 30 habitations built of wood, chiefly the bamboo. Behind the village, and on the side of the hill, was a cave, accessible only by one path through a range of rocks; and within the cave, near its mouth, was a small temple, commanding a view of the whole vale. Several other temples were dispersed over the plain, all of which were open in front, with a colonnade before them of round wooden pillars, painted red and varnished. The number of houses on the island scarcely exceeded 60. Behind every house, not immediately in the principal village, were inclosures of sugar-canes, tobacco, and other vegetables, growing in great luxuriance. The mountains were covered with verdure, and seemed well calculated for rearing goats, of which the island produced a few. Beside the principal bay, there were several sandy inlets, in any of which boats might easily land; but a communication between them by land is very difficult, if not impracticable, on account of the steep and rugged ridges which separate them from each other. Hence it appears that very slight works, and an establishment of a few men would be sufficient for the defence of the island; a great part of its coast being impregnably fortified by nature. The depth of water in the bay and road is sufficient for ships of any burden, and it affords perfect shelter from every wind except the S. W. to which quarter it was directly open. The French, it is said, aware of the insecurity of trading to Tung-quin and Cochin-china without some independent settlement, had formerly in contemplation to purchase the small island of Callao, lying a few miles to the

southward of Turon. But the want of shelter in the S. W. monsoon would soon induce them, if they were once in possession of Callao, to seek for a further settlement near it, upon the main-land of Cochin-china. Embassy to China, vol. 1.

CALLARIAS, by some called *afellus calarius*, in *Ichthyology*, a fish of the truttaceous kind, called by Aldrovandus *sinca marina*, and by Rondeletius and G. Swer *physis*. It usually grows to about a foot in length, and is in shape something flattish; it is covered with small scales, and is of a greyish colour, but somewhat purple on the head; its tail is roundish, not forked; it is a very well tasted fish, and is common in the Mediterranean, and brought to market at Rome, Venice, &c.

CALLAS, in *Ancient Geography*, a river of Greece, in the island of Euboea.

CALLAS, in *Geography*, a town of France, in the department of the Var, and chief place of a canton in the district of Draguignan,  $1\frac{1}{2}$  league N. E. of it. The place contains 2,108, and the canton 8,186 inhabitants: the territory comprehends  $272\frac{1}{2}$  kilometres, and 7 communes.

CALLATI, and CALLANTII, in *Ancient Geography*, a people of India, who have the custom, according to Herodotus, of eating their parents.

CALLATIS, CALATIS, or CALANTRA, a town seated on the western coast of the Euxine sea, south of the mouth of the Ister, and 300 stadia distant from Tomi. See CALATIS.

CALLE, JOHN FRANCIS, in *Biography*, a French mathematician, was born on the 25th of October 1744, at Versailles, where he received a good education, and acquired an early taste for the mathematics. In 1768 he came to Paris, where he had an opportunity of being more thoroughly instructed. In 1774 he formed some distinguished pupils for the school of engineers, where the examinations were strict, and admission difficult to be obtained. In 1779 he gained the prize proposed by the Society of Arts at Geneva, for escapements. In 1783 he completed his edition of "Gardiner's Tables of Logarithms," which were exceedingly convenient, of great utility, and very correct; and which possessed advantages above all the others. In 1788 he was appointed professor of hydrography at Vannes, afterwards at Dunkirk; and in 1792 he returned to Paris, and was for a few years professor *des ingenieurs geographes* at the depôt of war. This place having been suppressed, he continued to teach in Paris, where he was always considered as one of the best mathematical masters to whom pupils could apply.

In 1795 he published the new stereotype edition of the "Tables of Logarithms," considerably enlarged with logarithmic tables of the sines, according to the new decimal division of the circle. These are the first which ever appeared. Towards the end of 1797 he presented to the National Institute the plan of a new telegraph and a telegraphic language, accompanied with a dictionary of 12,000 French words adapted to it by a combination worthy of so able a mathematician.

These labours had injured his health; he had been a long time athletic, and, notwithstanding his condition, he published, that year, an excellent memoir on finding the longitude at sea, under the modest title of "A Supplement to the Trigonometry and Navigation of Bezout." He died on the 14th of November 1798, leaving behind him a daughter, born at Vannes in 1793. According to a tradition in the family, he was descended from Descartes. Lalande's Hist. Astron. for 1798.

CALLE, in *Ancient Geography*, *Porto*, a town of Hispania Citerior, to the south, near the mouth of the river Durus, on the frontiers of Lusitania. This town, at first a small port, became afterwards considerable among the Cal-

laci, to whom it belonged. It is now called Puerto by the Portuguese, and Port-a-Port, or Porto by the French. From this name Calli, and that of Portus, the appellation of Portugal is said to be derived.

**CALLI.** *See* *Geography*, a town of Africa, in the province of Callantia, surrounded on three sides by the sea, and defended on the fourth side by a strong wall. This place is inhabited by 3 or 400 Corsicans and Provençals; and it is the chief factory of the French African company on this coast. The edifices belonging to the company are the only regular buildings; the rest of the inhabitants, composed of the scum of the populace of Marseilles, live in wretched huts. They are employed in packing and unpacking of goods, in the coral fishery, and in taking care of the cattle; they likewise perform military duty, and daily mount guard. Besides the advantage of the coral fishery, and of the whole trade of the circumjacent country, the French have also at Bona, Tuckush, Szigata, and Cull, the monopoly of corn, wool, hides, and wax; for which they pay yearly to the government of Algiers, to the kaide of Bona, and to the chiefs of the neighbouring Arabs, 30,000 dollars, *i. e.* about 5000 guineas of our money.

**CALLEGAES**, a name anciently given by the Spaniards to the Abipons, on account of their singular practice of eradicating the hair over their foreheads, so as to produce the appearance of baldness: but their features resemble the European, and the nose is commonly of an aquiline form. They carefully eradicate the beard, and mark their foreheads and temples with particular scars, by way of ornament. The males are accustomed from childhood to the use of the bow. Hunger alone dictates the time to eat; and they consume vast quantities of animal food. They preserve cleanliness by frequent bathing in the lakes and rivers. They have no idea of a monarch, but are ruled by many caciques, which they call "capitas," from a Spanish term. They seldom marry till the husband and bride have exceeded their twentieth year; and the lady is purchased from her relations at the price of four horses, and woollen cloths of various colours, somewhat resembling Turkey carpets. They pretend to expedite the birth by a mixture of cabbage juice and wine; and on the birth of a cacique's eldest son they observe many ceremonies. They chiefly bury their dead under the shade of trees; and the horses of a chief or warrior are sacrificed on the occasion. The bones are afterwards disinterred, and carried to a considerable distance. For other particulars concerning them; see **ABIPONIANS**.

**CALLEN**, a post-town of the county of Kilkenny, province of Leinster, in Ireland. It was a borough before the union, and was often distinguished for the violence of the contests, having been of the kind called potwalloping, in which every housekeeper has a right to vote. It is of great antiquity, having been made a borough by William, earl Maréchal, a descendant of Strongbow, in 1217, but it does not appear to have been ever a town of much importance. The present number of houses is 582, of which 46 only pay the window tax; the population is about 3500, which is a considerable increase since 1731. It has no manufacture, except a distillery, and some lace made there, yet it has fine streams of water, and is in the neighbourhood of a bog, which supplies abundance of fuel. There are seven fairs, some of which are remarkable for the sale of horses, and others of turkeys, which are bought up here to be sent to Bristol. The liberties of the town include 3660 acres of rich ground, with a lime-stone bottom, of which 1400 acres only are productive. The crops of wheat grown here are very fine. A common of 1500 acres formerly belonged to the town's people, which has been reduced by encroach-

ments to about half the number, and the enclosure of the rest on a just plan would be of great use. Indeed a resident and improving landlord might render this town very flourishing. Though the adjoining country is fertile and populous, the whole district of Callen, with five adjoining parishes, are united under one rector, who resides near Callen, the old church of which is in good preservation. These six parishes contain 41 protestant families, most of which live in the town. There are the ruins of an abbey, and three castles, with some vestiges of walls, which are said to have been destroyed by Cromwell. There is also a moat, the perpendicular height of which is 40 feet, and the flat summit 138 feet by 72. A curious charter given to this town by William earl Maréchal, may be seen in Coxe's history of Ireland; the privileges conferred by which, though said to be of all kinds which it became burghesses to possess, and the granter to bestow, were less than those now enjoyed by the meanest subject of the United Kingdoms. Some other particulars might be collected from Tighe's Account of Kilkenny, and the old histories, if it were necessary. Callen is on the road from Dublin to Cork, being 65½ Irish miles, S. W. from the capital. N. lat. 52° 32'. W. long. 7° 34'.

**CALLEN**, the name of a river in the county of Armagh, in Ireland, near which the city of Armagh is situated, and which flows through a remarkably fertile country. It joins the Blackwater near Moy.

**CALLENBERG**, a town of Germany, in the circle of Upper Saxony, and lordship of Schönburg; 4 miles N. E. of Zwickau.—Also, a chain of mountains of Germany, commencing about 5 miles from Vienna, and traversing the duchy of Stiria.

**CALLENDER**, in *Geography*, a town of Scotland, in the county of Perth, seated on the river Teith; 11 miles N. W. of Stirling, and 30 W. S. W. of Perth.

**CALLENDER**, in *Manufactures*. See **CALENDER**.

**CALLET**, in *Ancient Geography*, a town of Spain, in Bætica, and in the jurisdiction of Alligi, according to Pliny.

**CALLEVA ATREBATUM**, a town of Britain, in the country of the *Atrebatii*, placed, in Antonine's Itinerary, in his seventh route from Regnum to Londinium, between Venta Belgarum and Pontibus, 22 miles from the former, and at the same distance from the latter. Dr. Stukley places it at Farnham; and Mr. Horsley at Silchester.

**CALLIÆ**, a town of Peloponnesus, in Arcadia. *Pausanias*.

**CALLIAGH-CRUM**, in *Geography*, a rock near Binyhead, in the county of Mayo, in Ireland. N. lat. 54° 21'. W. long. 9° 35'.

**CALLIAN**, a town of France, in the department of the Var; 10 miles N. E. of Draguignan.

**CALLIAN**, or *Gallian*, a river of Hindoostan, the mouth of which is on the side of the sound, formed by Bombay, Salfette, and the neighbouring shores of the continent, opposite to the fort of Tannah. The ruins of Callian, noticed by Fryer, are probably those of the Calliana of the *Peiplus*. *Mar. Eryth.*

**CALLIANEE**, a town of Hindoostan, in the country of Dowlatabad. It is large and populous, consisting of one long street filled with shops; the houses are constructed of rose-wood, and covered with thatch; 65 miles W. of Beder, and 85 E. of Vissapour. N. lat. 17° 45'. E. long. 76° 54'.

**CALLIAQUA**, a town and harbour at the S. W. end of the island of St. Vincent, in the West Indies. The harbour is the best in the island, and draws thither most of the inhabitants and the greatest part of the trade.

**CALLIBER**, or **CALLIPER**. See **CALIBER**.

**CALLI-**

**CALLIBLEPHARA**, from *καλλος*, *beauty*, and *βλεφαρον*, *eye-lid*, in the *Medicinal Writings of the Ancients*, a name given to certain compositions intended to make the eye-lids beautiful; and as the eye-lids are subject to be deformed several ways, there were several different sorts of these medicines.

**CALLIBOGIE SOUND**, in *Geography*, lies to the N.E. from the nearest entrance into Savannah river, in the state of Georgia, in North America, behind Hilton-head island. The latitude there is  $32^{\circ} 4' N.$  W. long.  $81^{\circ} 12'$ .

**CALLICA**, in *Ancient Geography*, a town of Asia, in Bithynia, placed by Ptolemy at some distance from the Euxine Sea.

**CALLICARIA**, a promontory of India, on this side of the Ganges, according to Ptolemy.

**CALLICARIS**, a town of India on this side of the Ganges. Ptolemy.

**CALLICARPA**, in *Botany*, (so named from its beautiful fruit.) Linn. gen. 135. Schreb. 175. Willd. 209. La Marck, Ill. 183. Gært. 588. Juss. p. 107. Vent. v. ii. p. 318. Class and Order, *tetrandria monogynia*. Nat. Ord. *Dumosa*, Linn. *Vitices*, Juss. *Pyrenacea*, Vent.

Gen. Ch. *Cal.* perianth one leaved, bell-shaped, four-cleft, or four-toothed. *Cor.* of one petal, tubular, short; border four cleft, obtuse. *Stam.* filaments four, longer than the corolla; anthers egg-shaped. *Pist.* germ superior, roundish; style thread-shaped; stigma thickish, obtuse. *Peric.* berry globular, smooth. *Seeds* four, oblong, rather compressed, callous.

Ess. Ch. *Calyx* four-cleft; *corolla* four-cleft; *berry* four-seeded.

Sp. 1. *C. americana*, Linn. Sp. Gært. Tab. 94. fig. 5. La Marck Illust. Pl. 69. f. 1. (Johnsonia, Miller; Iphondylococcus, Mitch. eph. nat. cur. 8. 208. Burchardia, Duham. arb. 1. 111. Tab. 44. Pluk. alm. Tab. 136. fig. 3. Catesb. Car. 2. Tab. 47. Gron. virg. 138.) "Leaves egg-shaped, acute, serrated, rather downy beneath; berries glomerated." Lam. A shrub from three to six feet high. *Branches* round, or a little compressed, pubescent, and somewhat cottony near the summit. *Leaves* opposite, petioled, green above, but downy on the nerves, and entirely covered with a short, whitish down beneath, from four to five inches long, and two inches broad. *Flowers* small, reddish, or purple, in small, axillary, branched, opposite corymbs scarcely longer than the petioles, with downy peduncles. *Berry* superior, the size of a small pea, globular, pulpy; at first red, afterwards deep purple; one-celled. Lam. and Gært. A native of Carolina, and professor Martyn says, also of Cochinchina, but quotes no authority. The seeds were sent to Miller by Catesby, in 1724; and the plants raised from them flourished in the open air till the severe frost of 1740, when most of them perished. They are easily raised from seeds on a moderate hot-bed; but as the young plants are tender, they should be placed under a frame before the first autumnal frosts, and should be kept sheltered during the winter, having fresh air whenever the weather is mild. The following spring they should be transplanted into fresh pots or into the nursery bed in a warm situation; in three or four years they will have acquired strength enough to live in the open air through the winter; but in severe frosts the surface of the ground about their roots should be covered with old tan, and their tops protected by straw or fern. Miller. 2. *C. cana*, Willd. (*C. tomentosa*, La Marck, Encyc. i. 556.) "Leaves ovate-lanceolate, serrated, very white, with down underneath; berries small, distinct." A shrub very distinct from the preceding, but so much resembling it, that La Marck found it difficult to form a satisfactory specific character. *Flowers* smaller, but more numerous, and in looser corymbs. *Stamens* twice as long as the

corolla. A native of the East Indies, communicated to La Marck by Sonnerat. 3. *C. lanata*, Willd. La Marck, Illust. (*C. tomentosa*, Murray, Syst. Veget. p. 153; Gmel. p. 246. Gart. Tab. 94. f. 5. *C. foliis integerrimis lanatis*, Mant. 331. *Tomex tomentosa*, Linn. Sp. Pl. p. 172. *Arbor malabarica*, Illa dicta. Burm. Zyl. 26. ind. 36. *Cornutia corymbosa*, La Marck, Encyc. vol. i. p. 54.) "Leaves egg-shaped, entire, downy, underneath; smaller branches, petioles and peduncles woolly." Lam. *Branches* obtusely four-angled. *Leaves* opposite, large, petioled, acuminate, green, and a little wrinkled above, resembling those of viburnum lantana, but more pointed. *Flowers* small, white, with a tinge of red, in short axillary and terminating corymbs. *Corolla* scarcely a line long; *calyx* very woolly; obscurely four-toothed, spreading. *Berries* small, blackish, half bedded in the permanent calyx. A native of the East Indies, communicated to La Marck by Sonnerat. 4. *C. macrophylla*, Willd. Vahl. Symb. 3. p. 13. Tab. 57. "Leaves lanceolate-elliptical, scolloped, attenuated, wrinkled above, white, with down underneath; branches downy." Perennial. A native of the East Indies. 5. *C. ferruginea*, Willd. Martyn. Swartz, prod. 31. "Leaves broad-lanceolate, serrated, rather rugged underneath: cymes terminating, and axillary." Perennial. A native of Jamaica. 6. *C. reticulata*, Willd. Martyn, Swartz, 31. "Leaves elliptic-lanceolate, a little serrated, wrinkled, white, with down underneath." Perennial. A native of Jamaica. 7. *C. longifolia*, Willd. La Marck, Pl. 69. fig. 2. "Leaves long, lanceolate, a little toothed, green on both sides; corymbs, or rather panicles, small, axillary." Perennial. Leaves seven or eight inches long, an inch and a half broad, opposite, petioled, acuminate, thin, nearly smooth, except when young. *Calyx* short, but slightly four-toothed; filaments twice the length of the corolla. *Style* as long as the filaments; stigma truncate. A native of Malacca, communicated by Sonnerat. 8. *C. integrifolia*, Willd. Jacq. am. 15. Tab. 173. fig. 7. "Leaves egg-shaped, acute, very entire, a little downy underneath; racemes dense, axillary and terminating; tube of the corolla four times longer than the calyx." Perennial. A native of woods about Carthagea, in South America. 9. *C. villosa*, Willd. Vahl. Symb. 3. p. 14. "Leaves oblong-egg-shaped, very entire, reticulated beneath with downy veins; racemes axillary; pedicles many-flowered." Perennial. It differs from all the other species in its long peduncles, not dichotomously branched. 10. *C. japonica*, Willd. Thunb. jap. 60. "Leaves oblong, acuminate, serrated in the middle, smooth." *Stem* shrubby, erect, smooth; branches opposite, round, smooth, purple, divaricated. *Leaves* opposite, on short petioles, green above, pale underneath, nerved, two inches long. *Flowers* white, axillary, panicled, very small, panicle trichotomous, supra-decompound, somewhat fastigiate; bractes linear; peduncles half an inch long, with very short pedicles; filaments inserted into the germ, very short; anthers oblong; germ superior; style awl-shaped, shorter than the corolla; stigma simple, acute. A native of Japan. 11. *C. umbellata*, Martyn's Miller, Lour. Cochinch. 70. "Leaves between top and egg-shaped, smooth, alternate; umbels sessile." A middle sized tree with ascending branches. *Leaves* quite entire, reflexed at the edge. *Flowers* small, in five-flowered umbels, almost at the end of the branches; calyx bluntly four-cleft; corolla bell-shaped, with a short tube; filaments and stigma sessile. *Berry* fleshy, roundish, small. A native of Cochinchina in woods. 12. *C. triloba*, Martyn's Miller, Loureiro, Coch. 70. "Stem climbing; leaves three-lobed; peduncles dichotomous." A long branching shrub, climbing by hisid tendrils. *Leaves* serrated, smooth, on long petioles. *Flowers* axillary, pale. *Berry* round.

roundish. A native of CochinChina and China. 13. *C. paniculata*, La Marck, Encyc. "Leaves oblong, lanceolate, very entire, downy underneath; flowers very numerous, in terminating panicles." Branches woody, slightly four-angled; two of the opposite sides larger than the others, clothed with a short down to the summit. Leaves opposite, petioled, smooth, and wrinkled above, downy, and white underneath, three or four inches long, six or seven lines broad. Flowers small; calyx short, downy; corolla a little larger than the calyx; filaments a little longer than the corolla; germ superior; style very short; bracts very small, straight, pointed, one at each division of the peduncles. A native of Africa, about the Cape of Good Hope. Communicated by Sonnrat. As La Marck is unacquainted with the fruit, he does not absolutely pronounce it a callicarpa, but observes, that if it should be not a four-seeded berry, it will probably prove a buxidia. In the Illustrations of genera, published afterwards, he expresses a doubt whether it be not *Scoparia arborea* of the Supplementum Plantarum; but in that case, the leaves must be alternate, and not opposite, as he has described them.

CALLICHORUM, or CALLICHORUS, in *Ancient Geography*, a river of Asia Minor; placed by M. D'Anville in the eastern part of Bithynia, with a northern course into the Euxine Sea, to the east of Heraclea, among the Caucones.

CALLICHTHYS, in *Ichthyology*, a species of SILURUS, distinguished by having the second dorsal fin one-rayed, a double row of scales on the sides, beards four. Linn. Gronov. &c. *Plecoistomus ciris 4 longis* of Seba. This fish inhabits small running streams in Europe, and it is affirmed, that when these are dried up, they crawl across meadows in search of water.

CALLICOCCA, in *Botany*, Schreb. 316. Brotero, Linn. Transf. v. vi. p. 137. (*Cephaelis*, Willd. 357. *Tapogomea* Lam. Illust. 412. Pl. 152.) Class and order, *pentandria monogynia*. Nat. ord. *Rubiacea*, Juss.

Gen. Ch. Cal. involucre of one or more leaves, inclosing numerous sessile flowers on a chaffy receptacle; perianth five-toothed, superior. Cor. monopetalous; tube cylindrical, swelling upwards; border five parted, spreading. Stam. filaments five or four, capillary; anthers oblong, erect. Pist. germ inferior; style capillary, bifid; stigmas obtuse. Peric. Berry angular or wrinkled, one-celled. Seeds two, flat on one side, convex on the other, angular.

Ess. Ch. Flowers in heads, involucre. Corolla tubular. Berry angular below, or wrinkled, two-seeded. Receptacle chaffy, nearly allied to morinda.

Sp. 1. (*Cephaelis violacea*, Swartz prod. 45. fl. ind. occ. i. p. 439. *Tapogomea violacea*: Aubl. Guian. i. p. 157. Tab. 60.) "Heads globular, terminal; involucre five-leaved; leaves oblong, smooth." Willd. Leaves nerveless. Flowers and fruit of a violet colour. A native of Guiana and the West Indies. 2. *C. tomentosa*, (*Cephaelis*, Vahl. eclog. i. p. 19. *Tapogomea* Aubl. Guian. i. p. 160. Tab. 60.) "Heads globular in terminal corymbs; involucre two-leaved; leaves oblong, pubescent." Willd. Leaflets of the involucre large, heart-shaped, acuminate, of a purplish violet colour. A native of woods in Guiana and the Island of Trinidad. 3. *C. punicea*, (*Cephaelis glaberrima*, Vahl. eclog. i. p. 19.) "Heads terminal, erect; involucre two-leaved; leaves lanceolate-elliptical, smooth and glossy on both sides." Branches roundish, perfectly smooth, of a pale purple colour. Leaves opposite, petioled, narrowed at the base and the summit, acute, perfectly entire, nearly veinless above, slightly veined underneath. Stipules tubular, short, entire. Peduncle four inches long, stiff, terminal between two little branches, a little thicker than the

lateral branches, angular, purple. Head the size of a walnut. Involucre large, heart-egg-shaped, scarlet, scarcely veined. Outward chaffy leaflets larger than the others, oblong. Vahl. A native of Jamaica. 4. *C. data*, (*Cephaelis* Swartz.) "Heads globular, terminal; peduncles elongated; involucre two-leaved; leaves smooth." Such is the specific character given by Swartz, and copied by Willdenow; but it certainly does not give a sufficiently distinct difference from the preceding. A native of the high mountains in Jamaica. 5. *C. axillaris*, Swartz. "Heads axillary, sessile." A native of St. Kitts. 6. *C. purpurea*, (*Tapogomea purpurea*, Aubl. Guian. t. 63. p. 3.) "Heads terminal, naked; leaves oblong, coloured, pubescent underneath; stem creeping, downy." Willd. Leaves with a white line above, and a reddish pubescence underneath. A native of woods in Guiana. 7. *C. alba*, (*apogomea*, Aubl. Tab. 64. fig. 4.) "Heads terminal, naked; leaves egg-shaped, pubescent underneath; stem creeping, smooth." Willd. A native of woods in Guiana. 8. *C. glabra*, (*Tapogomea*, Aubl. Tab. 63.) "Heads terminal, naked; leaves oblong, smooth; stems erect; little branches pubescent." Willd. Heads of the flowers hirsute. Aubl. A native of Guiana. 9. *C. carapichea*, (*Cephaelis involucreta*, Willd. *Carapichea guianensis*, Aubl. Tab. 64. *Tapogomea*, Lam. Illust. Pl. 152. f. 3.) "Heads terminal, globular; involucre four-leaved, unequal; leaves oblong, acuminate." A shrub five or six feet high. Stem cylindrical, knotty, branched. Leaves opposite, petioled, entire, smooth. Stipules intrafoliaceous, lanceolate, acuminate, with two small glands at their base. Flowers small, white; peduncle curved; filaments exerted; two leaves of the involucre very long, lanceolate. Fruit an angular, two-celled, two-valved capsule, with a single seed in each cell. Lam. A native of Guiana. The trivial name *involucrata*, given by Willdenow, is grossly improper in a genus in which most of the species are involucreless. 10. *C. evea*, (*Cephaelis tetrandra*, Willd. *Evea guianensis* Aubl. Tab. 39. La Marck. Illust. 154. Pl. 59. Encyc. 2. 399.) "Heads axillary, globular, peduncled; involucre four-leaved; flowers tetrandrous." Willd. A shrub seven or eight feet high, branched from the bottom. Branches opposite, knotty, four-cornered. Leaves opposite, ovate-lanceolate, acuminate, entire, smooth, even, on short petioles. Stipules intrafoliaceous, short, pointed, caducous. Heads of flowers opposite, situated rather above the axils of the leaves. Leaves of the involucre oval, pointed; the two outward ones larger. Scaly leaflets six or seven, between the involucre and the flowers. Fruit unknown. A native of Guiana. As there is another tetrandrous species we have changed the trivial name. 11. *C. patabea*, (*Cephaelis sessiliflora*, Willd. *Patabea coccinea*, Aubl. Tab. 43. La Marck. Illust. 173. Pl. 65. Poir. Encyc. 5. 52.) "Heads terminal, globular, sessile, naked; flowers tetrandrous." Willd. A shrub four or five feet high. Branches compound, opposite, knotty. Leaves opposite, entire, smooth, acuminate. Stipules intrafoliaceous, awl-shaped, rather large. Heads of the flowers terminal, situated in the axils of the upper pair of leaves; corolla red; filaments short. Fruit unknown. A native of Guiana. We have changed the trivial name of this as well as of the two preceding, and for a similar reason. 12. *C. ipecacuanha*, Brotero, Linn. Transf. vol. vi. Tab. 2. (*Ipecacuanha fusca*, P. Raf. p. 101. It. Marg. Raf. p. 17.) "Stem ascending, somewhat shrubby, farinaceous; leaves ovate-lanceolate, a little pubescent underneath; stipules deeply laciniated; head terminal, peduncled; involucre four-leaved, leaflets a little heart-shaped; corolla five-cleft; chaffy bracts large." Root simple or a little branched, roundish, most frequently per-

pendicular; sometimes, but rarely, slightly oblique; from two to four inches long, or more; slender upwards, the thickness and form of the stem; two or three lines thick below, irregularly bent, brown without; divided into numerous prominent, unequal, somewhat wrinkled rings; of an acrid, bitter taste, but scarcely any smell; when dry the bark is thick, hard, brittle, brown without, white within, of a gummy resinous nature, inclosing a small, woody, white, nearly insipid, mucilaginous fibre, from which it is easily separated into numerous rings, which are smooth at their edges. *Stem* somewhat shrubby, first procumbent, then erect, sometimes creeping at the base, round, about the thickness of a common quill; smooth and without leaves below, brown, and knotty with the scars of fallen leaves, the internodes upwards gradually decreasing in length; near the top pubescent, green, leafy; for a year or two simple; then throwing out a few leaflets, rather crooked, knotty runners, taking root irregularly at the knots, and producing one or two new stems about half a foot from each other. *Leaves* from four to eight near the summit of the stem, opposite, spreading, three or four inches long, one or two broad, perfectly entire; deep green above and besprinkled with roughish points, smooth, or rarely beset with a few scattered hairs; underneath pale green, and somewhat pubescent; with a rather elevated rib, and alternate, nearly parallel, lateral veins curved at the end; petioles short, channelled, a little hairy. *Stipules* two, extrafoliaceous, pressed close to the stem, deeply cut into awl-shaped divisions, slightly adhering to the petioles, about equal to them in length, and with them sheathing the stem, shrivelling. *Flowers* aggregate in a solitary head, peduncled, terminal, and a little drooping; peduncle round, pubescent, about half an inch long; florets sessile, from fifteen to twenty-four, separated by chaffy leaflets or bractes; bractes the length of the involucre and florets, pubescent, very entire, sessile, green, varying in form, sometimes longish-egg shaped, sometimes rather obtusely lanceolate, and sometimes, but rarely, in size and figure resembling the leaflets of the involucre. *Involucre* four-leaved; leaflets a little heart shaped, acute, entire, almost sessile, slightly wavy, hairy; the two outer ones largest, and all a little longer than the florets. *Calyx*, perianth, superior, permanent, membranous, white, very short, with five blunt teeth. *Corolla* monopetalous; tube cylindrical, long, a little swelling upwards, woolly about the throat; border shorter than the tube; with five egg-shaped, acute, recurved segments. *Stamens*, filaments five, capillary, short, inserted on the upper part of the tube; anthers oblong, linear, erect, projecting beyond the top of the tube. *Pistil*, germ egg-shaped, not angular; style thread-shaped, the length of the tube, furrowed at the base with a short, nectariferous rim; stigmas two, oblong, rather thick, blunt, the length of the anthers. *Pericarp*, berry one-celled, with two seeds, roundish, neither furrowed nor angular, crowned with the calyx, purplish red, soft, and finally becoming wrinkled and black. Those which fall before they are ripe, when they grow dry, have a single furrow on each side, occasioned by the separation of the seeds, as they lie with their flat sides towards each other. *Seeds* two, elliptical, smooth, a little twisted; flat on one side, with a longitudinal, somewhat elevated line running down the middle; convex on the other, with a furrow near the apex. A native of moist woods in Pernambuco, and other provinces of Brazil, flowering from November to March, and ripening its berries in May. Described by Felix Avellar Brotero, professor of botany at Coimbra, with the assistance of observations made in Brazil on living plants, by Bernard Gomes, a resident medical botanist. It is

called ipecacuanha by the natives in some parts of Brazil; poaia do matto by those of the southern provinces; and cipo by others, which is the name often given it by the Portuguese settlers.

Though the root of this plant has been known in Europe about 150 years, and has been in general use as a valuable medicine nearly as long; and though figures of it were early published by Piso and Margraave, modern botanists have known little of its botanical characters, and were long unable to determine the genus to which it ought to be referred. Linnæus, in a paper published in the third volume of "Amenitates Academicæ," gave it as a trivial name to a species of Euphorbia, a native of Virginia and Carolina, the root of which is there used as an emetic; but this was soon discovered not to be the real ipecacuanha. In his second Mantissa, he gave the same trivial name to a species of Viola, a native of Brazil, the root of which he supposed to be the white ipecacuanha of the shops. Decandolle, in a paper published in the "Bulletin des Sciences par la Société Philomatique," and republished entire in the "Nouveau Dictionnaire d'Histoire Naturelle," says, there are three species of Viola which produce the white ipecacuanha: the *calceolaria* of the species Plantarum, a native of Guiana and the Antilles; the *ipecacuanha* of the Mantissa, and the *parvispora* of the Supplementum Plantarum, both natives of Brazil. The roots of these, and especially the last, are sometimes mingled in commerce with the true or brown ipecacuanha; but they are a fraudulent adulteration, and do not possess its active properties. They may be distinguished by their colour; but most certainly by the size of the woody part, which in these is always considerably thicker than the bark; whereas, in the true ipecacuanha, it is much less; and, as described by Brotero, is only a fibre (filum). The roots of some species of Aclepias, Cynanchum, Dorstenia, and Ruellia, have likewise received the name of ipecacuanha, on account of their possessing some of the same qualities; but in this there is no deception, as they have been honestly called false or spurious ipecacuanhas.

Some time before the year 1781, Mutis, then travelling in South America, sent to the younger Linnæus a description formed from a specimen in full flower, which the governor of the province of Girong had received from Canaverale on the river Magdalena, and which an empiric of the country, to whom it was shewn by Mutis, positively asserted to be the genuine ipecacuanha, having frequently gathered it in the neighbourhood of Simites, where it grows wild in great abundance, and whence it is regularly shipped at Mompoxia, as an article of commerce for Europe. From this description, Linnæus judged it to be a species of Psychotria, a genus formed by his father for two or three plants that are natives of the East and West Indies, and published it as such in the "Supplementum Plantarum;" at the same time expressing a doubt whether it were really the ipecacuanha of Piso and Margraave; but also adding, that, from its resemblance to their figures, he was rather inclined to believe it the same.

In the year 1793, Dr. Woodville was favoured by Sir Joseph Banks with a specimen preserved in spirits, which had been sent from Brazil. A drawing taken from it was engraved and published in his Medical Botany. It was without a flower, but as its root was entire, there was no doubt of its being the real plant. Its genus, however, still remained in a state of uncertainty; for Dr. Woodville was of opinion that he could not "implicitly follow the authority on which Mutis received the information." The lovers of natural history are, therefore, highly obliged to professor Brotero for his satisfactory monograph on the subject, read at a meeting

meeting of the Linnean Society in February 1801; and which, as to description of the plant has hitherto appeared in English, we have translated with little abridgment from the original Latin. Mr. Brotero does not seem to have been acquainted with the communication of Mutis to the younger Linneus; or, if we suppose that he must have formerly seen it in the *Supplementum Plantarum*, a work in the hands of every botanist, he had certainly forgotten it when he composed his dissertation. On comparing the two descriptions, there appear one or two important, and a few slighter differences; but there is so great a general resemblance, as to make it evident that they are very nearly allied to each other, and to render it probable that they belong to the same natural genus, and possess the same qualities in perhaps an equal degree.

In the description given by Mutis, there is no mention of an involucre; and the bractes which separate the florets are said to be so small as to be scarcely discernible. The first affects the genus as it has hitherto been characterized by all authors; and as we, in conformity with them, have given it above. The other is only a specific difference; but we suppose it will be acknowledged to be a strongly marked one. The stipulæ in Mutis's plant are awl-shaped and horizontal; in that of Brotero, they are deeply lacinated, and pressed close to the stem. In the former, the flowers are stated to be axillary, and to have only from two to five flowers, which are not described as forming a head: but a simple inspection of Brotero's figure will make it manifest that they may be called either terminal or axillary with nearly equal propriety; and their number may be a variable circumstance depending on soil and situation; or, if constant, may be introduced with advantage into the specific character. In all other respects, they are so much alike that the description of one will serve for the other. The credit of the Brazilian empiric, which seems to have suffered in the estimation of a regular European physician, by that degrading appellation, is therefore established. The stipules of Sir Jol. Banks's plant, as figured by Dr. Woodville, agree in shape with those described by Mutis, and are strikingly different from those figured by Brotero; the root also of the former is more knotted and irregular in its surface. It may then, we apprehend, be fairly concluded, that there are at least two distinct species; and nothing forbids their being placed under the same genus, as nature certainly dictates, but the want of an involucre in that described by Mutis. The presence or absence of an involucre is, however, a circumstance which ought not to enter into the essential part of a generic character. The genus *Cornus* might be cited as a familiar case in point; but *callicoea* itself, as it actually now stands in authors, is a sufficient instance. For though Schreber, La Marck, and Willdenow, all agree in ascribing to it an involucre, as an essential character, Schreber inconsistently adds, in a note, that it is in some cases without one, and of Willdenow's 12 species, four are expressly said, to have naked heads or to be destitute of an involucre. Whether La Marck includes in his *tapogomea* any species of a similar description we cannot determine, as the alphabetical part of the *Encyclopedie* is not so far advanced; and though he has figured it in his *Illustrations*, and given what he thought its essential character in the synoptic table, at the head of the class, the enumeration of the species remains unpublished. The three species figured by him have a very conspicuous involucre. Two of them we have not ventured to quote; of the *carapichea*, Willdenow's *involucrata*, there can be no doubt. Upon the whole, it seems to be evident, that the involucre ought to be excluded from the generic character. The essential differ-

ence between it and *morinda* will then entirely rest on its flat, chaffy, or, as it might perhaps better be called, bracteated receptacle; which, at least as far as precedent goes, will be deemed a sufficient distinction. *Psychotria* differs from both in not having the flowers in heads on a common receptacle. Mutis in his description of his *psychotria emetica* does not mention a common chaffy receptacle; but the sessile flowers on a common peduncle, with a bractea to each flower, clearly imply it, and shew that the species is properly a *callicoea*. We shall therefore add, 14. *C. mutisii*, (*psychotria emetica*, Linn. jun. Sup. Pl. p. 144.) "Heads naked, peduncled, few-flowered; leaves lanceolate, smooth; stipules entire, awl-shaped; corolla five-lobed; chaffy bractes very small." A native of Brazil. All the known species are perennial.

We have followed Schreber and Willdenow with little hesitation in uniting the *tapogomea*, *patabea*, and *evea* of Aublet, though La Marck has kept them separate. A difference merely in number cannot warrant the construction of a new genus. Of the *carapichea* we have much doubt, on account of the important difference in the fruit. La Marck made it a distinct genus in the alphabetical part of the *Encyclopedie*, but has figured it as a species of his *tapogomea* in the *Illustrations*, which must be considered as his latest decision on the subject. Nor can the genus of *patabea* and *evea* be absolutely fixed, till we become acquainted with their fruit.

**CALLICOE**, in *Manufactures*, a species of cotton cloth, originally imported from the East Indies, from the kingdom of Calicut, on the coast of Malabar, whence the name *Callicoe* is derived.

The term is now generally applied to cotton cloths of English manufacture, and comprehends many varieties of fineness and texture. English callicoes were first manufactured at Blackburn in Lancashire, about 30 years ago, and have since become one of the leading articles of national industry, affording employment in the various details of spinning, weaving, bleaching, dying, &c. to a considerable portion of the population of that county. See **COTTON MANUFACTURES**.

**CALLICOE-PRINTING**. See **PRINTING**.

**CALLICOLONA**, in *Ancient Geography*, a hill of Asia Minor, in the Troade, and in the vicinity of Simois, according to Homer. It is mentioned by Strabo.

**CALLICRATES** of *Tyre*, in *Biography*, an historian who flourished under Aurelian, and wrote his life; but he is said to have dwelt too much in trifling incidents. Vespasian styles him the most learned of all the Greek historians of his time.

**CALLICRATES**, an Athenian architect and sculptor, who lived about 472 years before Christ. He is said to have engraved some of Homer's verses on a grain of millet, and to have made an ivory chariot which might be concealed under the wing of a fly, and an ant of ivory in which all the members were distinct. Ælian, however, justly censures him for employing his talents in performances so trivial and useless, and yet so difficult.

**CALLICRATIDAS**, a Lacedæmonian general, who succeeded Lysander in the command of the Athenian fleet. He was eminently distinguished not only for his valour and military skill, but for his simplicity, integrity, and magnanimity. When he arrived at Ephesus to take the command, Lysander adopted every base and treacherous method in his power to embarrass him; and with this view sent back to Cyrus, the ally of Sparta, the money which he had given to him for the naval service, and, at parting, he said to his successor with a sneer: "Let us now see, Callicratidas, how

you can defray the charges of your army." This hostile measure involved him in difficulties, more especially as he could not recur to those means of relief which Lysander did not scruple to adopt. At length, when all his resources were exhausted, he repaired to the court of Cyrus in order to solicit pecuniary assistance. But, treated with neglect, and disappointed in his expectations, he returned to Ephesus; determining, however, not to procure relief, urgent as his necessities were, by doing any thing that would entail disgrace on his country or on himself. Cyrus, on subsequent deliberation, sent after him a supply of money for the payment of his troops, together with presents for himself. The former he retained, but returned the latter with this memorable message: "That there needed no private friendship between Cyrus and him, because as long as the king observed the conditions of his treaty with the Lacedæmonians, he should think himself bound by it." He then attacked and defeated Conon the Athenian general, and besieged him in Mitylene. Hearing afterwards that the enemy's grand fleet was at Arginusæ, opposite to Lesbos, where he was stationed, he resolved to engage it. Whilst he was sacrificing in the morning, the soothsayer informed him, that, if he fought, the fight would in the issue be prosperous, but that the admiral would lose his life; to this declaration he replied, without any apparent concern; "Let us fight then; Sparta will not lose much in losing me; but she would forfeit her honour, if I retired in the sight of the enemy." An obstinate engagement ensued, in which Callieratidas was sunk with his ship; B. C. 425; and, notwithstanding the soothsayer's prediction, the Lacedæmonians were defeated with great loss. Anc. Un. Hist. vol. v. p. 454.

**CALLICULA MONS**, in *Ancient Geography*, a mountain of Italy in Campania.

**CALLIDROMUS**, a mountain in the Locride at the foot of which was the passage of Thermopylæ.

**CALLIDRYS**. See **CALIDRIS**.

**CALLIDRYS**, in *Ornithology*, a name given by Bellonius and some other authors, to our common red-shank; **SCOLOPAX CALIDRIS**.

**CALLIDRYS nigra**, of Bellonius, supposed by some to be the same bird as *Tringa canutus* of modern ornithologists, or what we call the knot, but this is doubtful.

**CALLIFÆ**, in *Ancient Geography*, a town of Italy in Samnium, in the country of the Hirpini. Livy.

**CALLIGA**, a town of India, on this side of the Ganges. Ptolemy.

**CALLIGICUM**, a promontory of India, in the peninsula on this side of the Ganges, which terminated the Argaric gulf to the north-west.

**CALLIGONUM**, in *Botany*, (from *καλλος*; and *γονυ*, implying a beautiful jointed structure,) Linn. Gen. 680. P'Heritier in Linn. Transf. vol. i. p. 177. Willd. 961. (Pallasia. Schreb. 834.) Class and order, *dodecandria tetragynia*. Nat. ord. *Holoraceæ*, Linn. *Polygonæ*, Juss.

Gen. Ch. *Cal.* perianth one-leaved, top-shaped at the base, with a five-parted border; segments nearly equal, roundish, spreading, finally a little reflexed, permanent; the two outer ones a little smaller than the others. *Corol.* none, unless the calyx be considered as such. *Stam.* filaments about sixteen, diverging, capillary; pubescent, and a little thickened near the bottom; slightly united at their base in the form of a nectary; anthers roundish, two-celled, peltate. *Pist.* germ superior, egg-shaped, four-sided, acuminate; styles four, sometimes only three, thread-shaped, spreading, a little united at the base, scarcely longer than the filaments; stigmas capitate. *Peric.* none, except the

crust of the nut. *Seed*, nut with a juiceless inseparable crust or shell, oblong, four-sided, four-winged, one-celled, without valves; wings either membranaceous, longitudinally two-parted, toothed, and curled; or rough with branched bristles, kernel of the same form.

Est. Ch. *Calyx* five-parted, *corolla* none, filaments about sixteen, a little united at the base, germ superior, four-sided, styles three or four, nut four-winged, one-celled. P'Herit.

Sp. 1. *C. polygonoides*, Linn. Sp. Pl. (*polygonoides*, Tourn. Corol. 47. Tab. 478. Itin. Orient. vol. ii. p. 536. with a figure.) "Fruit latticed; bristles branched, rigid." P'Herit. A shrub three or four feet high. Stem as thick as the human arm, zigzag, hard, brittle, covered with a reddish bark, divided and subdivided into many similar branches, which at length put out numerous jointed twigs of a sea-green colour, an inch or fifteen lines long, and half a line thick, which Tournefort calls leaves, and says are so like those of Ephedra, that it is not possible to distinguish them without seeing the flowers. *Flowers* at the joints of the upper ramifications, on slender, short peduncles, pale green in the middle, white at the edges, permanent; filaments white; anthers purple. *Fruit* half an inch long, four lines thick, conical, deeply furrowed lengthwise: angles terminated by wings cut into fine fringes. La Marek calls it a capsule. Found by Tournefort near the river Araxes in Armenia. 2. *C. comosum*, Willd. P'Heritier in Linn. Transf. "Fruit latticed; bristles branched, soft." P'Herit. Perhaps only a variety of the preceding. They exactly resemble each other, except in the bristles of the fruit, which in this are softer, and implicated or bushy; whereas in the preceding they are more rigid and perfectly distinct. Found by Lippi in Egypt, and by Louiche Desfontaines in Barbary. 3. *C. pallasia*, Willd. P'Heritier. Linn. Transf. vol. i. and Stirp. vol. ii. p. 37. La Marek Illust. Pl. 410. (*Pterococcus aphyllus*. Pallas, Voyag. ii. p. 738. Tab. 8. French Translation, p. 473, and 549. Pl. xvi. Pallasia caspica, Linn. Supp. 252. Savigny in Encyc. Pallasia Pterococcus. Pallas Fl. Ross. ii. p. 70. Tab. 77, 78.) "Wings membranaceous, curled, toothed," P'Herit. A shrub three or four feet high. *Root* thick, woody, an inch and half in diameter, striking deep into the sand, with a tuberoso head. *Stems* numerous, about the thickness of a finger, erect, branched, spreading, dichotomous, brittle, with a grey, striated bark. *Branches*, alternate, round, zigzag, jointed, a little knotty, without leaves; putting out every spring, at each joint, from six to ten close set, herbaceous, rush-like shoots, sometimes simple, sometimes branched, of a fine green, and nearly glaucous colour, a few of which survive the winter, and are hardened into branches; the rest perish, and leave a knotty scar. *Stipula* membranaceous, obscurely trifid, thrivelling, surrounding the joint as in the polygonums. *Leaves* alternate, sessile, solitary, at each joint of the herbaceous shoots; round, awl shaped, fleshy, resembling the shoots, half an inch long. Pallas says there are no leaves, but P'Heritier affirms that they were actually present in plants cultivated by himself, which flowered and ripened their fruit. *Flowers* numerous in clusters, from three to five together; lateral or axillary within the stipules, on the young or woody branches, as well as on the herbaceous shoots; white, with a greenish tinge in the middle. *Stamens* ten, the length of the calyx, and withering with it as the fruit increases, without falling off; filaments bristle-shaped, thickest at the base, downy; anthers nearly globular, two-celled. *Germ* conical, four-sided, rarely three-sided, the bifid angles prolonged so as to form the wings of the fruit. *Wings* somewhat oval, of a cinnamon colour, striated and split near the edges, spread-

ing on each side, so as to conceal the nut. When the root is cut across there exudes from it copiously a clear gum, which has the properties of gum tragacanth. Infused in water it swells and is changed into a sweetish mucilage, which does not soon grow dry; and if exposed to heat, ferments in a few days and acquires a vinous flavour. Found by Pallas in the sandy deserts between the Volga and the Taick. It was at first thought by him to be a new genus; but afterwards recollecting the genus calligonum of Linnæus, he fell into the opposite error, and supposed it to be the same species with the Armenian plant found by Tournefort. The younger Linnæus also took it for a new genus, and in honour of Pallas called it *pallasia*. They both attribute to it not a one-leaved, calyx, but a five-petalled corolla. It is called *nympheki* by the inhabitants of the country between the Volga, the Taick, and the Caspian Sea; and *torluk* by the Kalmuck and Kirkitian Tartars, who make tobacco pipes of its long internodes. L'Heritier and Pallas. These three species are so similar to each other in their general habit and structure, that their specific difference can be taken only from the fruit. 4. *C. asperum*, Martyn's Miller. Lour. Cochlin. "Leaves egg-shaped, rough; racemes subdivided; fruit double." *Stem* shrubby, climbing, but without tendrils, long, branched. *Leaves* entire, alternate. *Flowers* white, in terminating racemes. *Calyx* five-leaved, green, tipped with red; leaves roundish, concave, spreading. *Corolla* commonly none, but sometimes there are four, round, concave, spreading petals. *Stigma* sessile, blunt, deeply two-parted. *Stamens* numerous on the receptacle. *Fruit*, a berry, sometimes single, sometimes double, one-celled, with many seeds. A native of Cochinchina in woods. We have placed it here rather than omit it, but from its fruit and general habit, it does not appear to be a calligonum; nor ought a variable circumstance to form part of the specific character.

CALLIGRAPHUS, anciently denoted a copyist, or scrivener, who transcribed fair, and at length, what the notaries had taken down in notes or minutes. The word is compounded of *καλλος*, *beauty*, and *γραφω*, *I write*. The minutes of acts, &c. were always taken in a kind of cypher, or short-hand; such as the notes of Tyro in Grueter: by which means the notaries, as the Latins called them, or the *σμηνογραφοι* and *ταχυγραφοι*, as the Greeks called them, were enabled to keep pace with a speaker, or person who dictated. These notes, being understood by few, were copied over fair, and at length, by persons who had a good hand, for sale, &c. and these were called calligraphi: a name frequently met with in the ancient writers. In the *Palæographia* of Montfaucon (lib. i. c. 8.), we have a catalogue of all the known calligraphi.

CALLIGRAPHY, the art of fair writing.

Callicrates is said to have written an elegant distich on a fefamum seed. Junius speaks of a person, as very extraordinary, who wrote the apostles creed, and beginning of St. John's Gospel, in the compass of a farthing. What would he have said of our famous Peter Bale, who in 1575 wrote the Lord's prayer, creed, ten commandments, and two short prayers in Latin, with his own name, motto, day of the month, year of the Lord, and reign of the queen, in the compass of a single penny, inclosed in a ring and bordure of gold, and covered with a crystal, all so accurately wrought, as to be very legible?

CALII, in *Ancient Geography*, a promontory of Africa, in Marmarica; and also a village situate towards the north-east of this promontory. Ptolemy.

CALLIMACHUS, in *Biography*, a celebrated architect, painter, and sculptor of Corinth, flourished about the year

B. C. 540. To him is ascribed the invention of the Corinthian order. See ABACUS. He also made a golden lamp for the temple of Minerva at Athens, which he furnished with a wick of asbestos, that it might burn without wasting. Callimachus acquired the name of *καλλίζο-τεχνος*, from being unable to please himself by his works.

CALLIMACHUS, a celebrated poet, grammarian, and critic, was a native of Cyrene in Libya, flourished in the reigns of Ptolemy Philadelphus and Ptolemy Euergetes, being one of the keepers of the Alexandrian library, and died about the year 244 B. C. He was the son of Battus and Mcfatme, whence Ovid denominates him "Battiades." Strabo (lib. xvii.) informs us, that he claimed descent from king Battus, who was the founder of Cyrene. He was a disciple of Hermocrates the grammarian, and excelled no less as a critic than a poet. Before he was recommended to the favour of Ptolemy Philadelphus, he taught school at Alexandria, and had the honour of educating Apollonius, the author of the Argonautics. His poetical compositions were chiefly short pieces, as hymns, elegies, and epigrams; and when it was objected to him by his enemies that his Muse could not undertake any considerable work, he made use in reply of the saying which has become proverbial "A great book is a great evil." His powers, however, were manifested by two works of greater extent, entitled "Hecate," and "Aitia." The characteristics of those poems of Callimachus, which have reached our times, are elegance and polish, and choice of expressions; and these correspond to the character given of him as a poet by Ovid (*Amor. eleg. 15. lib. 1.*):

"Battiades toto semper cantabitur orbe;

Quamvis ingenio non valet, arte valet."

"The strains of Battus' son shall ne'er depart;

If not in genius, he excels in art."

Quintilian, in his "Institutiones Oratoriæ" (l. x. c. i.), applauds Callimachus as the prince of elegiac poets, among the Greeks. Mad. Dacier, in the preface to her edition of his poems, says, that, among the writings of ancient Greece, there is nothing more elegant and polite than these compositions of our author. To the same purpose her father, Tanaquil Faber, in his "Abregé des Vies des Poetes Grecs," declares, that Callimachus's manner of writing is neat and strong; and that Catullus and Propertius frequently imitate him, and sometimes translate him. Accordingly the "Coma Berenices" of the former is a translation from Callimachus. Of the various editions of this writer we may mention Mad. Dacier's, 4to. Paris, 1674; Bentley's, 8vo. London, 1741; Grævius's, 8vo. Utrecht, 1697; Ernesti's, 8vo. L. Bat. 1761; Lœfner's, 8vo. Lips. 1774. We have a translation of the works of Callimachus into English verse, with notes, &c. by Dr. Tytler, 4to. Lond. 1793. Gen. Dict.

CALLIMUS, in *Physiology*, a stony substance found in the cavity of the ætites, or eagle stone.

The word is also written *calimus*, and in some copies of Pliny *calainus*; which latter reading Salmasius receives.

The callimus fills the hollow of the ætites, much as the yolk does the white of an egg.

The geodes, instead of a callimus, or solid stone, have a loose, sandy, chalky, or earthy substance, and the enhydri a liquid substance.

CALLINGER, in *Geography*, a town of Hindooostan, in the circar of Bundelcund; 72 miles W. S. W. of Allahabad.

CALLINGTON, is an ancient small borough town of Cornwall, England. Its situation is low, the surrounding country bleak and barren, and its houses are mostly small indifferent buildings.

buildings. Here is a cloth manufactory, which furnishes employ to some of the poor inhabitants. It has a weekly market on Wednesday, and two annual fairs. Callington being only a member of the parish of South-hill (where the church is situated) has a chapel of ease within the precincts of the town. The earliest mention of this place on record occurs in the time of Henry III. who in the 52d year of his reign granted the privilege of a market to Reginald de Ferrars, who was then lord of the manor. The town was constituted a borough in the 27th year of Elizabeth, when it obtained the privilege of sending two members to parliament, which right has continued to the present time. The borough is governed by a portreeve, but it does not possess any charter of incorporation. The elective franchises of the inhabitants are not clearly ascertained; but the present custom limits the right of election to the burgage-tenures paying scot and lot, and the number of voters is about fifty.

On the highest part of Hengeston-downs near Callington is St. Kit's-hill, which consists entirely of granite. Near the top, a shaft has been sunk for digging tin, and it is found that the lode of ore is impregnated with wolfram united with quartz. Callington contains 145 houses, and 819 inhabitants. It is 216 miles W. from London.

**CALLINICON**, or **CALLINICUM**, in *Ancient Geography*, called also *Leontopolis*, a town of Asia, situate on the left of the Euphrates, near Nicephorium. Procopius informs us, that Cosroes, king of Persia, took and razed this place.

**CALLINICUS**, in *Biography*, a native of Heliopolis in Syria, who deserted from the service of the caliph to that of the emperor, and who imparted the secret of compounding and directing the Greek fire, to which the deliverance of Constantinople in the two sieges, A. D. 716—718, has been ascribed. See *Greek FIRE*.

**CALLINICUS**, surnamed *Sutorius*, was a native of Petra in Arabia; but spent the greatest part of his life at Athens. He wrote the history of Alexandria in 10 books, quoted by Jerome, and published several other pieces on various subjects. He flourished in the reign of Antoninus. Suidas, vol. ii. p. 232.

**CALLINUS** of Ephesus, a very ancient Greek poet, said to be the inventor of elegiac verse; some specimens of which are to be found in the collection of Stobæus. He flourished about 776 years B. C.

**CALLINUSA**, in *Ancient Geography*, a promontory of the isle of Cyprus, according to Ptolemy, marked on the chart of M. d'Anville on the northern coast towards the west. In some charts it is called "Capo Eleni," and in others "Alexandretta."

**CALLIONYMUS**, in *Icthyology*, a genus of fishes, in the order *Pisces jugulares*, the character of which is as follows: upper lip doubled, or folded in two plaits; eyes approximate; branchiostegous, or gill membrane, with six rays; aperture for breathing in the neck; gill covers shut up; body naked; ventral fin very remote.

The species of this genus are *lyra*, *dracunculus*, *indicus*, *baikalenus*, *ocellatus*, *lagitta*, and *japonicus*; which see respectively.

**CALLIOPE**, in *Entomology*, a South American species of *PAPILIO*, described by Linnæus, and delineated in Clerk's *Icon.* t. 41. and also by Seba and Cramer. The wings of this insect are yellow, with three streaks on the anterior pair, and three bands on the posterior ones of black.

**CALLIOPE**, in *Ancient Geography*, a town of Asia in Syria, which was one of the principal fortresses of the Parthians against the Medes, according to Pliny.

**CALLIOPE**, in the *Pagan Mythology*, the chief of the nine

Muses, called by Horace *Regina*. The distinguishing office of this Muse was to record the worthy actions of the living; and accordingly she is represented with tablets in her left hand.

Such may be seen on the marble apothecosis of Homer, and upon the sarcophagi of the capitol and of the Mattei palace, which represent the Muses. To Calliope, represented by some writers as the mother of the Corybantes and Syrens, but more commonly as the mother of Orpheus, is ascribed the invention of heroic poetry; and her name, according to Diodorus (*Bib. Hist.* l. iv. & vii.), was derived from her fine voice, *από τῆς καλλῆς ὀπῆς*. From this etymology it has been inferred that Calliope is the symbol of rhetoric and eloquence; but Eustathius (*H. A.* v. 1.) asserts that she was the emblem of heroic poetry, the most noble and most ancient species of poetry. As to her fine voice, she possessed this talent in common with her other sisters. Upon the medals of the Pomponian family, she is designed by a head crowned with laurel, with a roll or volume from which strings are suspended, in the field of the medal.

**CALLIPÆDIA**, the art of getting or breeding fine and beautiful children. The word is formed from *καλος*, *fair*, and *παις*, *puer*, either boy or girl. We find divers rules and practices relating to this art, in ancient and modern writers.

The Jews are said to have been so solicitous about the beauty of their children, that care was taken to have some very beautiful child (such as was Jochanan, the disciple of Judah, author of the *Mischna*) placed at the door of the public baths, that the women at going out, being struck with his appearance, and retaining the idea, might all have children as fine as he. The Chinese take great care of their breeding women, to prevent uncounted objects of any kind from striking their imagination: and musicians are employed at night to entertain them with agreeable songs and odes, setting forth the duties and comforts of a conjugal and domestic life, that the infant may receive before its birth good impressions, and come forth not only well-formed in body, but suitably disposed in mind.

Callipædia, nevertheless, seems to have been first created into a just art by Claude Quillet de Chinon, a French abbot, who, under the fictitious name of Calvidus Lætus, has published a fine Latin poem, in four books, under the title of *Callipædia, seu de pulchra prole habende ratione*; wherein are contained all the precepts of the art. Paris, 1656, 8vo. & Lond. 1708, 8vo. It was translated into English verse; by Mr. Rowe.

**CALLIPHAE**, in *Mythology*, one of the Ionides.

**CALLIPIA**, in *Ancient Geography*, a fountain of Ephesus so called by Pliny, and denominated "Alitea" by Pausanias.

**CALLIPIDÆ**, a people of Scythia near the Palus-Mæotis. According to Herodotus they were a colony of Greeks, established in Scythia. Pomponius Mela assigns them the space that lay between the Axiaces and Hypanis or Bogus.

**CALLIPOLIS**, denoting *beautiful city*, a name given to several towns, on account of the peculiar advantages of their situation or structure. Thus, Callipolis was the name of a city on the Chersonesus of Thrace, near the Hellepont, and opposite to Lampacus. See **GALLIOLI**.—Also, a town of Sicily, on the eastern coast, north of Catania and of the river Acis.—Also, a town of Caria.—Also, a town of Magna Græcia, at the extremity of a peninsula in the country of the Salentins, in the gulf of Tarento.—Also, a town of Peloponnesus.—Also, a town of Greece in Ætolia, separated from Naupacta by a high mountain, called "Corax."—Also, a town of Asia, towards Galatia and Armenia.

—Also, a town of Spain, near the Mediterranean sea, between mount Sallus and Tarracona.

**CALLIRHOE**, formed of *καλός*, beautiful, and *ῥῆμα*, to flow, a fountain of Greece at the gate of Calydon, in Aetolia.—Also a fountain of Attica, called “Enneacrunos,” from its 9 springs or channels.—Also, a lake of Asia in Mesopotamia, near which was seated the city of Antioch.—Also, a mineral fountain of Palestine, before the town of that name, and the fortress Macherus, according to Pliny.—Also, a town of Arabia, included in the territory of Moab, situated near the Asphaltite lake, and famous for its warm baths. According to Josephus, Herod the Great, in his last illness, was conveyed thither. Ptolemy places it on the east of Jordan and of the Dead Sea.

**CALLIRHOE**, in *Entomology*, a Fabrician species of *Papilio*, (*Dart. Camd.*) peculiar to Asia. The wings are entire, with the tip of the anterior pair, and six spots on the posterior ones, black.

**CALLISTA**, in *Botany*, Linn. 63. Schreb. 87. Lam. Illust. 84. Juss. 47. Class and order, *triandria monogynia*. Nat. ord. *Engelm.*, Linn. *Junci*. Juss.

Gen. Ch. *Cal.* perianth three-leaved: leaves linear-lanceolate, keeled, erect, permanent. *Corol.* petals three, lanceolate, acuminate, erect, spreading at the top, the length of the calyx. *Stam.* filaments three, capillary, longer than the corolla, dilated at the top into a roundish lamina: anthers double, globular, fixed to the inside of the lamina. *Pist.* germ superior, oblong, compressed: style capillary, the length of the stamens: stigmas three, spreading, pencil-form. *Peric.* capsule, egg-shaped, compressed, acute, two-celled, two-valved; valves contrary. *Seeds* two, roundish. Nearly allied to commelina, and differing from it chiefly in the want of the three barren filaments, tipped with cross-shaped glands, called nectaries by Linnæus.

Ess. Ch. *Calyx* three-leaved. *Petals* three. *Anthers* double. *Capsule* two-celled.

Sp. 1. *C. repens*, Linn. Sp. Pl. Læf. it. 305. Lam. Illust. Pl. 35. fig. 1. (Hapalanthus, *απάλανθος*, tender flower, Jacq. Amer. 11. tab. 11. second edition: 12. tab. 14.) “Flowers axillary, nearly sessile; stem smooth.” Lam. Illust. *Root* annual. *Stem* herbaceous, tender, creeping from the joints, rather erect at top, a little branching at the base. *Leaves* alternate, egg-shaped, acuminate, somewhat heart-shaped at the base, sheathed, thickish, shining, growing near together as they approach the top of the stem. *Flowers* small, generally three together from each sheath of the upper leaves, tender, greenish. 2. *C. umbellulata*, Lam. Pl. 35. fig. 2. “Little umbels lateral and terminal; stem downy near the top; peduncles downy.” *Stem* branched. *Leaves* egg-shaped, acuminate, petioled; but those near the top of the stem sessile and lanceolate, sheathed. *Umbels* simple, from two to five-flowered, but the flowers are occasionally single; flowers on rather long peduncles, diandrous. Description torned from La Marek’s figure. Both the species are natives of South America and the West Indies. The first was introduced into England in 1776 by Dr. Fothergill.

**CALLISTA**, in *Botany*, a genus formed by Loureiro for a parasitical plant which grows on the trunks of old trees, and which might have been referred to *Epideudrum*. He gives it the following character. Class and order, *gynandria monandria*. *Cal.* none, but instead of it several ovate-lanceolate scales. *Cor.* petals five, spreading: three sessile ovate-oblong: two opposite, unguiculated, larger, swelling at their base. *Nectary* tubular, within the petals and attached to their base, large, two-lipped: upper lip, oblong, fleshy, with two horns at its base; lower lip, entire, downy, funnel-shaped. *Stamen* one, attached to the upper extremity of the

nectary; anther operculated, two-lobed. *Pist.* germ inferior, twisted, thread-shaped: style and stigma none, unless we consider as such a furrow which passes from the stamen to the germ. *Fruit* generally abortive. *Root* a linear bulb. *Stems* thick, furrowed. *Leaves* alternate, lanceolate, entire, striated, thick, hard, sheathing. *Flowers* white, in long, lateral, drooping, simple racemes. Bose. Nouv. Dict.

**CALLISTA**, in *Ancient Geography*, a name formerly given to an island of the Grecian Archipelago, afterwards called *Thera*, and now *Santorin*, which see.

**CALLISTHENES**, in *Biography*, a Greek philosopher and historian, was a native of Olynthus, and a disciple and kinsman of Aristotle. By the influence of this philosopher he was appointed to attend Alexander in his expedition to the east; but his free spirit and republican sentiments, together with a considerable degree of self-importance, and of austerity of temper, rendered him very unfit for the attentions and obsequiousness of a courtier. Aristotle had taken pains to soften the severity of his disposition; his efforts, however, were ineffectual; and therefore, foreseeing the pernicious consequences that would unavoidably result from the liberty he assumed of speaking his mind on all occasions, he frequently repeated to him the following verse of Homer, (ll. xviii. v. 95.)

“Ὁ κύμορος δὴ μοι, τέκος ἔσσειαι, οἷ ἄγορεύεις.”

“My son, thy freedom will abridge thy days.”

This prediction was verified by the event. Having frequently offended Alexander by his unseasonable reflections and remonstrances, he rendered him altogether implacable by opposing his frantic assumption of divine honours. Callisthenes not only abstained from joining with Anaxarchus and the servile throng who flattered his pretensions and bent before him the supple knee, but remonstrated on the subject in a speech full of strong argument and liberal sentiments. “If,” said he, “in the land of barbarians, their modes of thinking are to be adopted, I beseech you, Alexander, to recollect Greece, for the sake of which the conquest of Asia, and this whole expedition have been undertaken! Consider, whether, on your return, you will compel the free Grecians to adore you, or exempting them from the dishonour, will load with it your Macedonians alone; or shall the Greeks and Macedonians pay you only human honours, while the barbarians worship you according to their barbarous customs?” See the whole speech in Arrian’s Exped. Alex. lib. iv. p. 165, &c. ed. Gronovii. This spirited remonstrance was unpardonable. A pretext was soon found in the conspiracy of Hermolæus for implicating Callisthenes in a charge of treason, though probably he had furnished no other occasion for it besides that of unguarded language against tyranny. He was immediately arrested with the other persons that were accused, though his fate was for some time suspended. Historians are not agreed as to the mode in which his life terminated; but most of them concur in informing us that he was carried about with the army as an object of terror. Aristobolus says that under this ignominious treatment he died of a disease: Ptolemy relates that he was tortured and crucified: and Justin represents him as being disgraced and confined in an iron cage with a dog for his companion, till Lyfimachus freed him from his suffering by giving him poison. However this be, his death, in consequence of the charge brought against him, is certain, B. C. 328; and it fixes on the memory of Alexander an indelible stain. The “History of the Actions of Alexander,” written by Callisthenes, is cited by many of the ancients, and seems to have been the production rather of an orator, than of a judicious historian. Polybius charges him with a total ignorance of tactics in his description of the

the battle between Darius and Alexander. He composed many other historical works, which are not now extant. The most considerable was, a "History of Greece," comprehending 30 years from the peace of Antaleidas. He also wrote a "History of the Trojan War." A "Periplus," "Persics," "Macedonics," "Thracics," and "Metamorphoses," are also ascribed to a writer of his name. His "Apophthegms" are also mentioned; among which was a saying formerly famous in the schools—"that human life is governed by fortune, not by wisdom." Arrian, ubi supra. Plutarch in Alex. apud oper. t. i. p. 675, &c. Quintus Curtius. Justin. Voss. Hill. Græc. Fabr. Bib. Græc. Gen. Biog.

**CALLISTIA**, Καλλιστία, in *Antiquity*, a Lesbian festival, wherein the women presented themselves in Juno's temple, and the prize was assigned to the fairest.

The word is formed from κάλλος, *beauty*, q. d. beauty's rewards. The like contest of beauty was held at the festival of Ceres Eleusinia, among the Parrhasians, first set on foot by Cypselus, whose wife Herodice was honoured with the first prize. Another obtained among the Elians, where the contest was among the men, the most beautiful of whom was presented with a suit of armour, which he consecrated to Minerva, to whose temple he walked in procession, adorned with ribbons, and crowned with a myrtle garland; Pott. Arch. Græc. lib. ii. cap. 20.

**CALLISTRATIA**, in *Antient Geography*, a town of Asia in Galatia, according to Ptolemy; but it rather belonged to Paphlagonia. It was situated on the coast of the Euxine sea, S. E. of the promontory of Cerambis, and S. of that of Zephyrium.

**CALLISTRATUS**, in *Biography*, an Athenian orator who flourished about the year B. C. 340. After having acquired great reputation and authority in the government of his country, he shared the fate of others of a similar description, and was banished. He is probably the same person that is mentioned by Demosthenes (Orat. adv. Polyclem.) who was banished to Methone in Mesopotamia, and whom the Athenians had twice condemned to death. The success of his pleading in a public cause of importance, which Demosthenes attended in his youth, and the glory acquired by it, induced this young disciple of Plato to abandon the study of philosophy, and to devote himself entirely to that of oratory. Callistratus is said to have manifested great abhorrence when, under a sentence of exile, some person expressed a wish, that the Athenians might soon be obliged to restore the exiles. Similar to this was the conduct of Rutilius, who retorted against one who proposed to comfort him by representing to him, that a war would soon break out, which would occasion all the exiles to return; "What have I done to thee, that thou shouldst wish me a return worse than my banishment? I chuse rather that my country should blush at my banishment, than mourn at my return." Plut. in Demosthen. apud opera, t. i. p. 847. Seneca de Benef. l. vi. c. 37. Gen. Dict.

**CALLISTUS**, JOHANNES ANDRONICUS, a learned Greek philosopher, was a native of Thessalonica, and settled at Constantinople, where he was a professor of the Peripatetic philosophy, and acquired a high reputation for learning. Upon the capture of this city in 1453, he fled with many others into Italy, and fixing his first residence at Rome, taught the Greek language and read lectures upon Aristotle's philosophy. From hence, for want of due encouragement, he removed to Florence, where he had a vast concourse of disciples. After spending several years in Italy, he closed his life in France. Callistus was one of those learned Greeks to whom we are indebted for the introduction of learning

into the west. Some Greek MSS. bearing his name are still extant; and particularly one in the royal library at Paris, entitled, "A Morody upon the Miseries of Constantinople." Some philosophical and moral pieces in MS. are also ascribed to him. Biog. Dict.

**CALLITRICHÉ**, in *Botany* (from κάλλος; and τριχίς, fine hair, but there does not appear any peculiar propriety in the appellation). Linn. Sp. Pl. Class and order, *monantheria digynia*. Nat. ord. *Heloræza*, Linn. *Naiades*, Juss. *Incertæ sedis*, Vent.

Gen. Ch. *Cal.* none. *Cor.* petals two, incurved, acuminate, channelled, opposite. *Stam.* filament one, long, recurved; anther simple. *Pist.* germ roundish; styles two, capillary, recurved; stigma acute. *Peric.* capsule roundish, quadrangular, compressed, four-seeded. Lam. Juss. *Peric.* none; unless the proper tunic of the seeds be so called. *Seeds* four, naked, semi-elliptical, lenticularly compressed, furnished on the outer side with a broadish membranaceous margin, disposed in a kind of compressed cross so as to appear in pairs, of a pale bay colour. Gært. Dr. Smith.

Ess. Ch. *Calyx* none. *Petals* two. *Stigmata* acute. *Seeds* four, compressed, with a winged margin on one side.

Obs. The corolla of Linnaeus and the English authors, is considered by La Marek, Jussieu, &c. as a two-leaved calyx.

Species, *C. aquatica*, Huds. 439. Smith Flor. Brit. v. i. p. 8. Eng. Bot. Pl. 722. Lam. Il. pl. 5. (*C. verna* and autumnalis, Linn. *Stellaria*, Rai. Syn. 289. *Alfina*, Ger. cm. 614. *Lenticula*, Loes. Pruff. 140. tab. 38.) Water-starwort, or star-headed water-chickweed. Annual. *Roots* fibrous, simple. *Stems* slender, branched, leafy, smooth; floating by means of its thickest broad upper leaves, till the impregnation is accomplished; then each flower sinks, by the elongation of the top of the stem, where new ones are produced, and finally the whole herb subsides to the bottom, takes root there, ripens, and sows its seeds. The young plants soon rise to the surface, and appear to be nourished from the water by simple slender roots from each joint of the stem, which do not reach the ground till the plant subsides. The earlier leaves are opposite, spatula-shaped, entire, three-nerved; but those produced in autumn, after the herb sinks, are linear, single-nerved, and emarginate, which occasioned the distinction of this species into two. *Flowers* axillary, solitary, sessile, small, whitish. Dr. Smith. If the class Polygama were preserved, as established by Linnaeus, this plant would indisputably belong to it, some of its flowers being hermaphrodite, others with only stamens, and others with only pistils. Linnaeus states the flowers of his autumnalis to be all hermaphrodite, but, according to Dr. Smith, the plant does not flower in that state. Dillenius seems to have been the first that doubted whether there were more than one species. See his edition of Ray's Synopsis. Very common in England, and the greater part of Europe, in ditches and standing waters.

**CALLITRICHE**, in *Zoology*, the name under which the green ape of the English writers (*Simia sabæa* of Schreber Sacugth) is described by Buffon.

**CALLITRICHUM**, in *Botany*. (J. Bauh. Morif. Ray.) See *MELISSA pyrenaica*.

**CALLITRICHUS**, in *Zoology*, synonymous with **CALLITRICHE**, a sort of monkey of a yellowish green colour, with black flattish face, called by Pennant the green monkey. This is the animal named *simia sabæa* by Schreber. See **SIMIA SABÆA**.

**CALLITRIX**, in *Zoology*, *Simia callitrix* magnitudine *magnorum cynocephalorum*, Alpin. Aeg. See **SIMIA SILENUS**.

**CALLIXENE**, in *Botany*. (La Marck, Juss.) See **ENARGEA**.

**CALLIXTUS**, or **CALLISTUS**, I., pope, in *Biography*, succeeded Zephyrinus in the year 219. Some have said that he built a church to the memory of the Virgin Mary, which is now known by the name of Santa Maria in Transvere, or St. Mary beyond the Tiber: but it is more certain that he inclosed a large piece of ground in the Appian way as a burying-place for the Christians. The story of his martyrdom, with its attendant circumstances of cruelty, is not very probable, as Alexander Severus was tolerant and favourable to the Christians. He died in 223. Bower's Hist. of the Popes, vol. i.

**CALLIXTUS** II., pope, was Guy of Burgundy, the son of William the Great, count of Burgundy, and nearly related to the emperor Henry. Before his election to the papacy he was archbishop of Vienne; and on the death of Gelasius at Clugni, in 1119, he was unanimously chosen to succeed him by all the cardinals, except those who were of the emperor's party, who adhered to the anti-pope Maurice Burdin, or Gregory VIII. This was a happy choice both for the church and state. Soon after his election, Callixtus held a council at Rheims, in which the emperor, who refused to renounce the right of investiture, was solemnly excommunicated. From Rheims the pope repaired to Gisors in Normandy, in order, by means of an interview with Henry, king of England, to mediate a reconciliation between him and Louis king of France; but his conciliatory efforts were ineffectual.

From Normandy he passed over into Italy, and having obtained some forces from the Norman princes in Apulia, he besieged his rival Burdin, who had retired to Sutri, took him prisoner, and thus terminated the schism. Earnestly desirous of peace with the emperor, he sent legates into Germany, and a peace was concluded at a general diet held at Worms, in 1122. The emperor was allowed the right of receiving an oath of allegiance from bishops and abbots elect, and of conferring on them the regalia, for which they were to do him homage; whilst he consented to surrender the ceremony of investiture by the ring and crozier, which was regarded as an emblem of the conveyance of spiritual authority. The articles of agreement, settled by the pope and emperor, were approved by the general council held at Lateran in the following year, and remain still in force. After a pontificate of nearly six years, this pope died in 1124, and left a great character for moderation and liberality, and a strict observance of the canons. Thirty-six letters of this pope are preserved; and other works in MS. on the miracles of saints, &c. are attributed to him. Bower, vol. vi. Mosheim, Eccl. Hist. vol. iii.

**CALLIXTUS** III., pope, was advanced to the pontifical chair in 1455, at the age of 76 years. His name was Alphonso Borgia; he was descended of an ancient family, and born at Xativa, in Spain. Before his election he was secretary to Alphonso king of Arragon, and employed in terminating the schism occasioned by the anti-pope Clement VIII.; and for this service he was preferred by pope Martin to the see of Valencia. Immediately after his elevation to the papacy, he exerted himself in restraining the progress of the Turks under sultan Mahomet II., who had taken Constantinople, and threatened all Christendom. For this purpose he fitted out a small fleet, which retook some of the islands of the Archipelago; and by means of a crusade, which he caused to be preached throughout Europe, he raised a considerable army, which was committed to the conduct of the famous Hunniades. Notwithstanding a victory obtained at Belgrade in 1456, which obliged Mahomet

to raise the siege of that city, and the remembrance of which the pope immortalized by ordering the festival of the "Transfiguration of Christ" to be religiously observed throughout all the western world, the Turkish army proceeded in its conquests. The pope's attention was soon occupied by other concerns. Having ambitious designs in favour of his nephew, whom he had created duke of Spoleto, he quarrelled with his former patron the king of Arragon, and refused to grant to his natural son Ferdinand the investiture of the kingdom of Naples. On the decease of Alphonso, he declared openly against Ferdinand, and would have kindled a civil war in the kingdom, if his death, which happened in 1458, had not prevented it. Callixtus is represented by contemporary writers as a man of abilities, of great address and experience, and one of the best canonists of his time: but like other popes, he was betrayed into improper conduct by nepotism. His only literary remains are some epistles and bulls. Bower, vol. vii. Mosheim, vol. iii.

**CALLO**, in *Geography*, a plain in the jurisdiction of Quito, South America, so called from a palace of the Incas, which bears this appellation, and the ruins of which are still seen at the extremity of the plain running northward from Latacunga. See **QUITO**.

**CALLO-port**, lies on the coast of Chili, in the south Pacific Ocean, four leagues N. from Solango island. S. lat.  $1^{\circ} 10'$ . W. long.  $80^{\circ} 9'$ .

**CALLONIANA**, in *Ancient Geography*, a town of Sicily, according to the Itinerary of Antonine, thought to be the same with the Caulonia of Steph. Byz.

**CALLONITIS**, in *Geography*, a country of Asia, in Assyria, on the confines of Media, near mount Zagrus.

**CALLOO**, a fortress of the Netherlands, on the Scheldt, where the Dutch were defeated by the Spaniards in 1638; five miles W. of Antwerp. N. lat.  $51^{\circ} 15'$ . E. long.  $4^{\circ} 10'$ .

**CALLOSA**, in *Entomology*, a species of *Apts* of a shining black-blue colour, with a white lip, and callous dot of the same on each side of the thorax, before the wings. This is an insect of small size, and inhabits Italy. Fabricius.

**CALLOSITY**, in *Surgery*. See **CALLUS**.

**CALLOSUM corpus**, in *Anatomy*, denotes a whitish, hard substance, joining the two hemispheres of the brain, and appearing when the two hemispheres are drawn back. See **BRAIN**.

**CALLOT**, JAMES, in *Biography*, a celebrated draughtsman and engraver, was descended from a noble family, and born at Nancy in Lorraine, in 1593. His passion for the arts was so strong, and discovered itself at so early a period of his life, that at the age of 12 years, he secretly left his father's house, and determined to seek improvement in Italy. But being destitute of money, he joined a company of Bohemians (or of strolling gypsies), with whom he travelled as far as Florence. Here he was taken notice of by an officer of the grand duke, and placed for instruction under Remigio Canta Gallina, who was both a painter and engraver. When he left Gallina, he pursued his journey to Rome; but meeting with some merchants from Nancy, who knew him, they took him back to his family. Soon after he made a second elopement, and from Turin he was brought home by his brother. At length, his father finding that his inclination for the arts was invincible, acquiesced in his indulgence of it, and sent him to Rome; where he assiduously applied to drawing, under Giulio Parigi. Being desirous of acquiring a facility in handling the thover, he put himself under the instruction of Philip Thomassin, and having made considerable improvement, he afterwards went to Florence,

rence, where he was employed, and particularly encouraged by the great duke Cosmo II. At this city he first began to etch, and he executed several small subjects with great success. Upon the death of the duke, for whom he performed many curious works, he returned to Nancy, married, and became a great favourite with the duke of Lorraine, who granted him a pension. In this interval of his life, he designed and engraved the siege of Breda; and at Paris he engraved for Louis XIII. the sieges of Rochelle and of the island of Rhé, and several others. On occasion of the troubles of Lorraine, which terminated with the siege and capture of Nancy, he determined to return with his wife to Florence; but death prevented the execution of his purpose, March 28, 1635. After the reduction of Nancy in 1631, he was desired by Louis XIII. to draw and engrave the siege of that place; but this business he declined, alleging, that he did not think it consistent with the respect which he entertained for his prince, and the love which he bore to his country, to represent any thing that should appear to their disgrace. When a courtisan insisted on his gratifying the king's wishes, and enforced the requisition with a menace, that he should be compelled to obey, he boldly replied, "I will sooner disable my right hand, than be constrained to do any thing contrary to my honour." The king was pleased with this magnanimous reply, and offered him a pension of 3000 livres if he would attach himself to his service. Callot gratefully refused the offer, preferring the love of his country to the amassing of a fortune.

This artist engraved in several styles; the first of which was an imitation of his master Canto Gallina. He afterwards worked altogether with the graver; but without success. His next style was the mixture of the point and the graver, with coarse broad hatchings in the shadows. But his best manner is that, which appears to have been executed with the greatest freedom, by which he has expressed, as we may say, with a single stroke, variety of character, and correctness of design. He is said to have been the first who used hard varnish in etching, which has been found much superior to that which was before adopted. The fertility of invention, and the vast variety, found in the works of this excellent artist, are astonishing. It could hardly have been supposed possible to combine so great a number of figures together as he has done, and to vary the attitudes, without forced contrast, so that all of them, whether single figures or groups, may be easily distinguished from each other, even in the masses of shadow; more especially when it is considered, that they are often exceedingly minute. On a cursory view of some of his most admired pieces, the whole appears confused and without harmony; but a careful examination discovers the richness, the beauty, the taste, and the judgment which are bestowed on the disposition of the figures, the management of the groups, and the variety and propriety of the attitude. The works of this master are very numerous and various. In representation of all the varieties of human life, from beggars and peasants to knights and nobles, he excelled; characterising all with the nicest touches of nature. Of his subjects many are of the most painful and shocking kind, such as public executions, the miseries of war, and the like; many are grotesque and fanciful, and exhibit a strong imagination.

The number of Callot's works is said to amount to 1500 prints. His etchings are most esteemed, and collections of them are deemed very valuable. Strutt enumerates the following prints; viz. "The Murder of the Innocents," of which that engraved at Florence is the most rare; a fine impression of it being found with difficulty;—"The Marriage

of Cana in Galilee," from Paolo Veronese;—"The Passion of Christ," the first impressions of which are very scarce;—"St. John in the Island of Palma;"—"The Temptation of St. Anthony;"—"The Punishments," exhibiting the execution of several criminals; and—"The Miseries of War;"—"The great Fair of Florence;"—"The little Fair;" otherwise called "The Players at Benti," one of the finest of Callot's prints;—"The Tilting, or the New Street at Nancy;"—"The Garden of Nancy;"—"View of the Pont Neuf;"—"View of the Louvre;" and "Four Landscapes." Callot was very regular in his mode of living, and exact in his religious observances. Felibien. Strutt.

CALLOUS, in *Surgery*, denotes indurated or hardened. See CALLUS.

CALLOUS eggs, *ova callosa*, the longer and better sort, supposed to contain male chicks; having a denser white, and richer flavour than the rest. See EGG.

CALLULO, in *Geography*, a town of Asiatic Turkey, in the province of Diarbekir; 60 miles N.W. of Rabba.

CALLUNBORG, or KALLUNBORG, a town of Denmark; 60 miles W. of Copenhagen.

CALLUS, in *Surgery*, is a preternatural hardness or induration of any fleshy part of the body; and, not unfrequently, this term is applied to the substance by which fractured bones are spontaneously united to each other. In this latter sense, we say "the callus has not formed;" *i. e.* the bony union is incomplete: "the callus is exuberant;" *i. e.* the ossific matter is very abundant.

A callosity, or preternatural hardness of the skin takes place either from external friction (as in the formation of CORNS), or from an internal cause, which probably consists in a morbid action of the exhalent arteries. In the hard and thickened state of the skin which constitutes the disease named a CORN (which see), there is found to be an accumulation of dry cuticular substance, in numerous layers, somewhat resembling an onion. The lamina of horny cuticle which forms on the hands and feet of hard-working people, is entirely devoid of sensation, and may therefore be scraped or cut with impunity.

Mr. Leewenhoeck examining the callus formed on the hands and feet, observed that it was a substance composed of several layers of particles so loosely connected, that it was a wonder they could hang together; on putting a piece of this into fair water, after it had stood a considerable time to steep, he found that the particles of which it was composed, would easily separate from one another with a little touch of a quill, and these separated particles put into a drop of water, and examined before the microscope, were found to be all of the same regular shape, which was like that of a weaver's shuttle, being broad in the middle, and pointed at each end, with a line in the middle like those upon the uppermost, or outside skins of fruits, or of our bodies, but generally irregular. These pieces were thick in proportion to their size; and when they are put into water, and separated again, they naturally form a great number of other particles, all of which are of the same regular figure with the original piece. Phil. Trans. N<sup>o</sup> 373. p. 160.

By this we see the reason of the increase of thickness of the skin of the hands of those who labour hard, and of the feet of such people as walk much, which is wholly owing to the addition of a vast number of these shuttle-like particles, which form combinations together; but these so loosely, that it is no wonder they are so easily separated on moistening.

The way to avoid such callosities of the skin is to wash

and the cuticle very frequently; and there can be no doubt that even corns might be generally prevented, if persons would always use easy shoes from their infancy. Women, we find, are chiefly troubled with such painful callosities of their feet, from wearing tight shoes, and allowing their toes to press one upon another.

Surgeons apply the term *callus*, aJECTIVELY, to the edges of old ulcers, when they are become thickened and indented. This kind of induration is unfavourable to a cure, and should be removed by the knife or cautery, if it cannot be touched by cruet, or penicill, &c. See ULCER.

*CALLUS*, when spoke of bone, is in reality nothing more than the new ossific substance formed by a process of nature very similar to the growth of any other part of the body; but the ancients had an idea of bony callus being formed by the effusion and gradual consolidation of a glutinous matter, like the white of an egg; and they supposed that all fractured bones were soldered, as it were, by the intervention of this jelly, as two boards are glued together by a carpenter. See OSSIFICATION.

It is not always in the power of surgeons to restrain or command the growth of callus; for sometimes a broken bone, for want of due action in its vessels, will remain several months disunited; and, at other times, the callus becomes so exuberant as to cause an unsightly enlargement of the bone, around the broken extremities. One of the most effectual modes of restraining the growth of callus, is to keep a considerable degree of pressure over the part, by means of a bandage; which, by diminishing the diameters of the blood-vessels, will lessen their action. See FRACTURE.

To facilitate the growth of callus on the union of broken bones, the patient should take strengthening remedies, and be put on a generous diet; and if this does not produce the intended effect, the broken extremities of the bones may be rubbed together, or friction may be kept up externally, so as to cause a moderate degree of inflammation. Several surgeons, on finding that a fractured bone would not unite, have made an incision down to the bone, and sawn off a portion of it, or rasped it with a rough file, in order to excite the vessels to action; in some of these cases the ossific process has been revived, and a union has taken place, but generally this experiment has failed, as the growth of bone is more slow and difficult to produce than the regeneration of soft parts, on account of their difference in structure.

*CALLYCHTHIS*. See *CALLICTHYS*.

*CALLYDIUM*, in *Ancient Geography*, a strong castle of Asia Minor, seated on one of the summits of mount Olympus in Phrygia.

*CALLYONIMUS*, in *Botany*. (Cf. Hor.) See *CONVALLARIA majalis*.

*CALLYSIND*, in *Geography*, a river of Hindoostan, which runs into the Chumbul, in the circar of Kotta.

*CALM*, in *Sea Language*, that state of the air and water when there is no wind stirring. A calm is more terrible to a sea-faring man than a storm, if he has a strong ship and sea-room enough; for under the line excessive heat sometimes produces such dead calms, that ships are obliged to stay two or three months without being able to stir one way or other. Two opposite winds will sometimes make a calm. This is frequently observed in the gulf of Mexico, at no great distance from the shore, where some gulf or land wind will so poise the general easterly wind, as to produce a perfect calm.

Calms are never so great in the ocean as in the Mediterranean, by reason the flux and reflux of the former keep the water in a continual agitation, even where there is no wind; whereas there being no tides in the latter, the calm

is sometimes so dead, that the face of the water is as clear as a looking-glass; but such calms are almost constant presages of an approaching storm. On the coasts about Smyrna, a long calm is reputed a prognostic of an earthquake.

When a ship is close under the lee of another, the windward vessel is said to *becalm* the leeward.—A ship is also said to be *becalmed* when near the land, which keeps the wind from it.

It is not uncommon for the vessels to be calmed or becalmed, as the sailors express it, in the road of the constant Levantine winds, in places where they ride near the land. Thus between the two capes of Cartooche toward the main, and cape Antonio in Cuba, the sea is narrow, and there is often a calm produced by some gulf of a land-wind, that poises the Levantine wind, and renders the whole perfectly still for two or three days.

In this case, the current that runs here is of use to the vessels, if it sets right; when it sets easterly, a ship will have a passage in three or four days to the Havannah; but if otherwise, it is often a fortnight or three weeks sail; the ship being embayed in the gulf of Mexico.

When the weather is perfectly calm, no wind at all stirring, the sailors try which way the current sets by means of a boat which they send out, and which will ride at anchor, though there is no bottom to be found, as regularly and well as if fastened by the strongest anchor to the bottom. The method is this: they row the boat to a little distance from the ship, and then throw over their plummet, which is about forty pounds weight; they let this sink to about two hundred fathom; and then, though it never reaches the bottom, the boat will turn head against the current, and ride as firmly as can be.

*CALM Latitudes*, are situated in the Atlantic ocean, between the tropic of Cancer, and the latitude of 29° N.; or they denote the space that lies between the trade and variable winds, because it is frequently subject to calms of long duration.

*CALM Point*, in *Geography*, lies on the N.W. coast of North America, within Bristol bay, on the north side.

*CALMAR*, a sea-port town of Sweden, in the province of Smaland or Smoland, near the Baltic Sea, separated from the isle of Oeland by a strait, about seven miles broad in the narrowest part, and strongly fortified by walls, ditches, a castle, and redoubts. It is about a mile in circumference, and contains 450 houses. The streets cross each other at right angles. The inhabitants carry on a small trade, exporting chiefly planks, alum, and hemp, and possess, besides small craft, about 70 vessels, from 100 to 300 tons burthen. Near the town is the castle, standing on an eminence, and the only remains of its ancient magnificence. The building has been constructed at different intervals, and exhibits a motley mixture of Gothic and Grecian architecture. Over one of the doors is an inscription, John III. 1568. But part of the mansion must be much older, as the apartment in which the deputies of the three kingdoms, Sweden, Denmark, and Norway, used to assemble for the election of their common sovereign still subsists: it is 64 feet long and 30 broad. This palace, once the residence of the celebrated Margaret, and remarkable in the history of this country, is converted into a distillery. Calmar is celebrated for the union, which took place in it, in 1397, and which stipulated, that the same monarch should rule over Denmark, Sweden, and Norway, and be chosen by the deputies from the states of the three kingdoms assembled at Calmar. During the whole period in which these regulations subsisted, Sweden was a tributary kingdom to the sovereigns of Denmark;

mark; the union was upheld by the vigour and abilities of Margaret; but under her weak and unwarlike successors, it entailed on Sweden all the horrors of foreign invasion and intestine discord. From this state of alternate oppression and anarchy, it was rescued by the valour and prudence of Gustavus Vasa, on whom the gratitude of the Swedes conferred the dominion of the country which he had delivered: they renounced, in his favour, the right of electing their kings, and declared the crown hereditary in his male issue, A.D. 1546. See SWEDEN. N. lat.  $56^{\circ} 40' 30''$ . E. long.  $16^{\circ} 21' 45''$ .

CALMET, DON AUGUSTIN, in *Biography*, a celebrated commentator on the Bible, was born near Commerci, in Lorraine, in 1672, and became a Benedictine of the congregation of St. Vannes, in 1688. Having passed through the usual course of philosophy and theology, he was employed in teaching them to the younger part of the community, till in 1704 he settled as sub-prior in the abbey of Munster, in Alsace, where he presided over an academy of 8 or 10 monks devoted to the study of the Scriptures. There he composed his commentaries on the Scriptures, published in French from 1707 to 1716. In 1718 he was appointed to the abbacy of St. Leopold in Nancy; and in 1728 he was elected abbot of Senones. The title of a bishop *in partibus* was offered him, but he declined accepting it. After a course of literary labour, in which he displayed great erudition and industry, though not always equal taste and judgment, he died, highly esteemed, in 1757. His principal works are, "A Literal Commentary on all the Books of the Old and New Testament," 23 vols. 4to. reprinted in 26 vols. 4to. and 9 vols. folio; and abridged by Rondet, in 14 vols. 4to. "The Dissertations and Prefaces of these Commentaries, printed separately, with 19 new Dissertations," 3 vols. 4to.; "The History of the Old and New Testament," 2 vols. 4to.; reprinted in 4 vols. 4to., and 7 vols. 12mo.; "Historical, critical, and chronological History of the Bible, with Figures," 4 vols. folio; in which the matter of the commentaries is reduced to alphabetical order, in the form, and under the title of a dictionary, published in 1730, in 4 vols. folio. Although the author's commentaries did not escape censure, and were treated by father Simon with a considerable degree of asperity and contempt, yet, being distinguished by moderation and exemption from polemical disputes, they were perused by Protestants as well as Roman Catholics; the work became very popular; and within a few years after its publication, there were several editions of it in French, Latin, Dutch, Italian, Spanish, English, and other languages; and it is still considered as a standard work. It has been much and deservedly valued on account of many excellent elucidations which it contains of difficult passages in the Holy Scriptures, beautiful delineations of Oriental manners, and lively, entertaining histories extracted from authors little known even among the learned. A new and valuable edition of it with considerable retrenchments and additions, and a new set of plates, under the direction of Mr. C. Taylor, appeared in London in 1797, &c. The additions form a separate volume under the title of "Fragments," with a great variety of appropriate and well executed engravings. Other works of Calmet are "Ecclesiastical and civil History of Lorraine," 3 vols. folio, reprinted in 5 vols.; "Catalogue of Writers of Lorraine, folio; "Universal History, sacred and profane," 15 vols. 4to.; "Dissertations on the Apparitions of Angels, Demons, and Spirits, and on the Vampiers and Ghouls of Hungary," a small collection of reveries; and "Literal, Historical, and Moral Commentary on the Rule of St. Benedict," 2 vols. 4to. containing much curious in-

formation on ancient customs. Calmet deserves notice also as a writer on Hebrew music in his commentary on the psalms: as a small volume, intitled "Trefor d'Antiquitez," compiled from his sacred writings, not only concerning the music of the Hebrews, but ancient music in general, with representations of musical instruments, was published at Amsterdam, in 1722.

Ancient music, in general, is almost become an unprofitable and hopeless study; but that of the Hebrews, the most ancient of all, is now included within the confines of conjecture; and Don Calmet's conjectures are, perhaps, as probable as those of any one of the numerous authors who have written on the psalms, and exercised their sagacity and ingenuity in expounding and defining what some have long since thought involved in eimimerian darkness. However, Kircher, Merliennus, and Don Calmet, have thought otherwise; but whether they have taught their readers to see in the dark, as some animals are supposed to do, we are unable to say.

CALMENDA, in *Geography*, a town of Portugal, not far from Braga.

CALMINA. See CALAMO.

CALMINERA, CAPE, lies on the coast of Coromandel, in N. lat.  $10^{\circ} 15'$ . E. long.  $79^{\circ} 45'$ . a few leagues S. of Negapatnam.

CALMINT, a town of France, in the department of the Upper Garonne; 7 leagues S.S.E. from Toulouse.— Also, a town of France, in the department of the Aveyron;  $2\frac{1}{2}$  leagues S. of Rhodéz.

CALMUCS. See KALMUCS.

CALN, EAST and WEST, two townships of Chester county, Pennsylvania, in North America.

CALNE, a market and borough town of Wiltshire, in England, is situated on the banks of the Marlen river. This ancient borough was endowed with peculiar privileges, previous to the Roman conquest, and according to the domesday-book it never yielded or paid taxes, "so that it is not known how many hides are therein." The kings of the West Saxons had a palace here; and from the names of Castle street and Castle-field, it is generally imagined that a castle reared its massive walls in the neighbourhood of the town. Here was also an hospital of black canons, dedicated to St. John, and valued, at the dissolution, at 2l. 2s. 8d. per annum. Calne is an ancient borough by prescription, and sends two members to parliament, who are elected by fifteen voters; the first return was made in the reign of Edward I. The corporation consists of two guild stewards, who are chosen annually, and an unlimited number of burgesses. Previous to February 25, 1723, the privilege of election was vested in all the inhabitants having right of common; but it was then determined, that the power of choosing members resided with the ancient burgesses only; and that the right of returning members was in the guild stewards. The manor, prebend, and parsonage of Calne, are held by leases for several lives, from the dean, chapter, and treasurer of Sarum. In the reign of Edward the martyr, a great synod or convocation was held here, at the instigation of Dunstan, archbishop of Canterbury, to determine the controversy between the monks and secular priests, which had commenced in the synods at Winchester, and Catlege, in Cambridgeshire. From the importance of the question, the principal nobility, as well as the bishops and seculars, attended. During the debate, while bishop Beornhelm was pleading for the priests, the timbers of the assembly room gave way, and the structure fell to the ground; most of the seculars were buried beneath the ruins; but

but the seat of Dunstan, president of the synod, and chief advocate for the monks, alone stood firm. This circumstance, in that age of superstition, was construed into an interposition of Heaven in their favour; but subsequent writers have assigned a more natural reason, and have not hesitated to assert, that Dunstan had caused the beams to be sawn asunder, taking care that his own seat should remain fixed. This account seems, from the sanguinary disposition of Dunstan, to be most probable. Calne has, of late years, greatly increased in size and population; it contains 781 houses, and 3767 inhabitants, most of whom are employed in the manufacture of broad cloth, serges, and other articles of the clothing business. Here are three meeting-houses for Presbyterians, Anabaptists, and Quakers. The church is a large structure, dedicated to St. Mark, with a handsome square tower at the north-east end. The town is plentifully supplied with water from two streams, one issuing from the foot of the hills near the village of Callton, the other from Cherill; these rivulets unite, and run through the centre of the town, giving motion to many fulling and grist-mills. A free-school was founded here by John Bentley, esq. of Richmond in Surrey; who, by his will, dated September 20, 1650, gave certain lands, called Prickett's Fields, adjoining to Lincoln's Inn, then worth about 500*l.* for its erection and maintenance for ever. By the donations of Sir Francis Bridgman, knight, certain exhibitions are established at Queen's College, Oxford, for the benefit of boys born in the county of Wilts, and educated in this free-school. "The master to keep a regular grammar school, and teach seven boys the Latin and Greek tongues, and otherwise qualify them for the University."

About three miles east of Calne, on the side of the London road, is a monument, which attracts not only the notice of all travellers on this road, but also the observation of people over the north part of Wilts, and many parts of the adjoining counties. This is the figure of a large WHITE HORSE, that was formed by paring off the turf from the side of the chalk-hill; the horse is represented in a trotting position, and executed with a pretty correct outline; it was cut at the expence of Dr. Allsup, of Calne, about twenty-five years ago, and measures from the head to the tail about 157 feet.

About two miles west of the town is BOWOOD, the seat of the marquis of Lansdown. The house is a large, commodious, but irregular structure, and contains some fine pictures, among which is a valuable collection of portraits of eminent characters. The park and pleasure grounds are extensive, and diversified with much beautiful scenery. A distinguished feature, and ornament of these grounds, is a large lake, which winding beneath some fine hanging woods, constitutes an interesting object; at the head of this lake is a singularly picturesque cascade, which, though wholly artificial, is justly admired for its approximation to the irregularities of nature.

CALNEH, in *Scripture Geography*, a city in the land of Shinar, built by Nimrod, and at one time the seat of his empire (Gen. x. 10.); supposed to be the Chalno or Calno of Isaiah, (ch. x. 9.) and the Channeh or Canneh of Ezekiel, (ch. xxvii. 23.) These prophets join it with Haran, Eden, Assyria, and Chilmad, which traded with Tyre; and hence it is inferred, that it must have been situated in Mesopotamia. It is said by the Chaldee interpreters, and also by Eusebius and Jerom, to be the same with Ctesiphon, which was seated on the Tigris, about three miles distant from Seleucia, and for some time the capital of the Parthians. This opinion is confirmed by the name Chalonitis, evidently derived from Chalce or Chalno, which was given

by the Greeks to the country about Ctesiphon. Wells's Geog. of the Old Testament, vol. i. p. 229.

CALOBRA, in *Geography*, the most considerable harbour in the island of Majorca, both for its secure entrance, and the fine country that surrounds it; as well as for the springs of fresh water that are near it.

CALODENDRUM, in *Botany*, (*καλος*, beautiful, *δενδρον*, a tree.) Schreb. gen. 384. Thunb. gen. 41. Willd. 437. Juss. 427. Class and order, *pentandria monogynia*. Nat. ord. *incertæ sedis*, Juss.

Gen. Ch. *Cal.* perianth one-leaved, permanent, five-parted; segments egg-shaped, acute, beset with strong hairs on the outside; the edges slightly revolute. *Cor.* petals five, lanceolate, obtuse, spreading, channelled, keeled, waved, pubescent, three times the length of the calyx: nectaries five, fixed to the receptacle within the petals, and shaped like them, linear-lanceolate, awl-shaped at the tip, terminated by a gland, smooth, silvery-glandular, narrower than the petals, but of the same length. *Stam.* filaments five, equal, the length of the corolla, one of them generally barren: anthers egg-heart-shaped, furrowed, fixed longitudinally to the filaments. *Pist.* germ pedicelled, capitate, beset with sharp points, superior: style fixed to one side of the germ, thread-shaped, the length of the stamens; stigma simple obtuse. *Peric.* capsule peduncled, egg-shaped, bluntly five-angled, beset with strong points, five-furrowed, five-celled, five-valved. *Seeds* in pairs, somewhat triangular, convex on the back, smooth.

Ess. Ch. *Calyx* five-parted. Petals five. Nectaries five. Capsule five-celled, five-angled.

The corolla, nectary, and stamens, all vary in the number of their parts, which are sometimes four, generally five, and very rarely six; so that in fact the capsule alone forms the essential character.

Sp. C. *capense*, Thunb. Diff. p. 43. La Marek in Journ. Hist. Nat. pl. 3. (*Dictamnus capensis*, Linn. Supp. Vahl. Symb. 3. p. 58.) A tree. Branches opposite, or three together. Leaves opposite, petioled, egg-shaped, entire, evergreen. Flowers in terminal panicles, on opposite, one-flowered peduncles. A native of the Cape of Good Hope. La Marek, in the Journal d'Histoire Naturelle, has noticed its near affinity to *dictamnus*, under which genus the younger Linnæus and Vahl have placed it.

CALOGERI, *Καλογεροι*, or CALOYERS, monks, or religious, in Greece, both male and female; inhabiting particularly mount Athos, but disseminated also throughout all the churches of the East. They follow the rule of St. Basil, and make vows like the western religious. Tournefort says, the females are most of them only a more moderate sort of Magdalens, who, as they grow old, make a vow to practise those virtues they had much neglected in their youth; and retire into convents to lead a life somewhat less scandalous than before, under the eyes of a superior or *hegumenissa*, who is far from being too severe.

Amongst these monks, whatever their name imports, it is not uncommon, says Sonnini, (*Travels in Greece*, p. 228.) to meet with young boys, from 10 to 12 years old, clothed in their habit, which consists of a plain, long, black gown, confined by a girdle. These friars, he says, are very dirty, and very ugly, from the habit which they contract of neglecting their exterior, and of taking care neither of their beard nor hair. Their character, he adds, is formed of hypocrisy, haughty and gross ignorance, meanness and treachery; though they wish to be reckoned to possess great knowledge, and a reputation for sanctity, in order to secure from the people attention and respect. Their vows are obedience, chastity, and abstinence. The first and last of these

tows are observed with sufficient exactness; but the second is more generally disregarded; and some of them are accused of a degree of brutality, in the infringement of laws which nature, more powerful than all the institutions of convents, disavows. The Caloyers, in some places, are divided into Cœnobites, Anachorites, and Ascetics, or hermits; the life of which last is the most severe and reclusive.

The Turks also use the word Caloyers for their dervises, or religious mufflemen. See DERVIS.

CALOGERIZA, in *Geography*, a town of European Turkey, in the province of Bulgaria; 64 miles E. of Sofia.

CALOGERO, ST. a town of Sicily, in the valley of Mazara; 24 miles E. of Mazara, and 2 N. E. of Sacca or Saccia.—Also, a mountain of Sicily, one of the highest in the island, next to Ætna, on the summit of which is a residence of hermits.

CALOGURO, ST. a cape on the east coast of Sicily; 9 miles E. of Lentini.

CALOIERA, a small Greek island in the Archipelago; 5 leagues south of Andros.

CALOITIAM, in *Zoology*, a species of TRICHODA of a broadish oblong shape, with shining horns on the anterior part. *Mill. Hist. Verm.* This kind is found in water where-in vegetables have been infused. It is flat, obtuse at both ends, with a black spot and a few bristles near the posterior extremity.

CALOMEL, in *Pharmacy*. See MERCURY.

CALONE, in *Ancient Geography*, a place of Germany, on the route from Lugdunum Batavorum, to Argentoratum, between Gulduba and Vetera. Itin. Anton. Cellarius places it at Kalen-Hasen; but M. d'Anville refers it to a passage of the arm of the river Kelnor or Kendel. It was near the Rhine in Germanica Secunda, S.E. of Colonia Trajana.

CALONERY POINT, in *Geography*, a cape on the east coast of the island of St. Vincent; one mile S. of Young Point.

CALONI, a town of European Turkey, in the island of Metelin, in a gulf to which it gives name, in which are two Greek convents.

CALONNEA, in *Botany*. (Buchoz.) See GALARDIA.

CALONOSOS, in *Ancient Geography*, a mountain of Arabia, at the entrance of the Persian gulf. Arrian.

CALOO SAND, lies on the coast of Holland, between the Bodkil to the southward, and the east Gat channel to the northward.

CALOPHYLLUM, in *Botany*, (*καλλος* beautiful; *φυλλον*, a leaf.) Linn. gen. 658. Schreb. 1587. Willd. 1026. GRÆT. 242. Juss. 258. Lam. Illust. Pl. 459. (Calaba, Plum. gen. 18. La Marck, Encyc. vol. i. p. 552. Bosc. Nouv. Dict. vol. iv. p. 99.) Clafs and order, *polyandria monogynia*, Linn. *Polygamia monœcia*, Schreb. Nat. ord. *Guttifera*, Juss.

Gen. Ch. *Cal.* four, two or one-leaved; leaves roundish, concave, coloured, deciduous, sometimes wanting. *Cor.* petals four, roundish, concave, spreading. *Stam.* filaments numerous, thread-shaped, short; anthers oblong, erect. *Pist.* germ superior, roundish; style thread-shaped, the length of the stamens, or none. *Peric.* drupe globular, fleshy. *Seed*; nut globular, rather acuminate, large.

Eff. Ch. *Cor.* four-petalled. *Cal.* four-leaved, coloured. *Drupe* globular.

Sp. 1. *C. inophyllum*, Linn. Sp. Pl. Gært. Tab. 43. fig. 1. La Marck, Pl. 459. (Ponna or ponna-maoam, Rheed. mal. 4. Tab. 38. Rai. Hist. 1525. Bintangor maritima, Rumph. amb. 2. Tab. 71. Arbor indica, mali medicæ amplioribus foliis, Pluk. alm. 41. Tab. 147. fig. 3. Inophyl-

lum, Burm. Ley. 170. Tab. 60. *C. calaba*, Jacquin. Amer. 267. Tab. 165.) "Leaves inversely egg-shaped, obtuse; fruit spherical, yellowish." Lam. A large tree. *Trunk* thick, covered with a blackish, cracked, almost scaly bark, and supporting a vast umbrageous head. *Young branches* quadrangular. *Leaves* four or five inches long, and nearly three inches broad, opposite, obtuse, sometimes emarginate, entire, smooth on both sides, shining, coriaceous, on short petioles, and remarkable for the numerous, extremely fine, lateral, parallel nerves, which Burman fancied to resemble the fibres of a muscle dissected longitudinally, and thence called the tree inophyllum. *Flowers* white, fragrant, growing on the small branches in short, opposite, axillary racemes, or rather, if La Marck's figure be accurate, umbels; some with only stamens mixed with the others in the same raceme or umbel. *Fruit* very resinous or oily; kernel at first sweet, afterwards bitter. La Marck observes, that the calaba of Jacquin can scarcely be called a variety, differing only in being rather smaller in all its parts, and, as Jacquin suspected, having none of the peculiar characters of the next species, to which it has been erroneously united by Linnæus. When the bark is wounded, there exudes a viscous, yellowish fluid, which thickens and hardens in the air, and is the resin imported by the French from Madagascar, and the Isle de France, under the name of Tacamaque. It is also called green balsam, or balsam of the Virgin Mary, and is used as a vulnerary. According to Dutour (Nouv. Dict.), that which is produced by the West Indian variety is of a deeper green colour. A native of the East and West Indies, and of the Society Isles, and New Caledonia. 2. *C. calaba*, Linn. Sp. Pl. (Tsjerou-ponna, Rheed, Mal. 4. p. 81. Tab. 39. Rai. Hist. 1537.) "Leaves egg-shaped; fruit inversely egg-shaped, very red." *Leaves* only half as large as those of the preceding species, more finely veined, not inversely egg-shaped. *Fruit* a little elongated, resembling that of the cornus mas, or cornelian cherry. It is eaten by the natives, and an oil is expressed from the kernel, which serves for lamps. A native of the East Indies. 3. *C. acuminatum*, La Marck, Enc. (Bintangor sylvestris, Rumph. Amb. 2. p. 26. Tab. 72?) "Leaves oblong-egg-shaped, acute; fruit egg-shaped, acuminate." It differs from the two preceding in the shape of the fruit, and of its leaves, which are also less smooth, and less finely veined. A native of Java, and the Molucca Islands.

CALOPHYLLUM *foliis tripedalibus*, Brown, Jam. 245. See *GRIS cauliflora*.

CALOPHYLLUM *nagassivium*, Burm. ind. 121. See *MESUA ferrea*.

CALOPINACO, in *Geography*, a small river of Naples, in Farther Calabria.

CALOPUS, in *Entomology*, a genus of COLEOPTERA, having filiform antennæ; feelers four, the anterior pair clavated, and those behind filiform; thorax gibbous; wing-cases linear.

This is one of the new Fabrician genera, including three species of the Linnæan cerambyces, serraticornis, hispicornis, and pygmaeus, which see respectively.

CALOR, in *Ancient Geography*, *Calore*, a river of Italy, in Samnium, which rose in the mountains of the Hirpini, passed Beneventum, and discharged itself into the Volturnus.—Also, a river of Italy, in the country of the Picentini, probably between Tanager and Silurus.

CALORIC, a name originally given by the authors of the new French Chemical Nomenclature, to that substance by whose influence the phenomena of heat are produced, and which had before been distinguished by the terms *igneous fluid*, *matter of heat*, and other analogous denominations.

There are perhaps few subjects respecting which a more remarkable variability of general opinion has been evinced, than with regard to the existence or non-existence of this principle. Are the physical effects of heat produced by the operation of a material fluid *sui generis*, or is heat merely an affection of matter, consisting in internal vibrations and collisions of its particles, or in some other mode of corpuscular action of which we are ignorant;—and is there consequently no such thing as caloric?

Zeno, it appears, conceived that heat was material. We have a curious dissertation on this subject in Cicero's book, "De Naturâ Deorum," consisting of a dialogue between an epicurean, a platonist, and a stoic, respecting the Supreme Power, which the latter supposes to reside principally in the sun; and it is remarkable that the author has made him speak of the materiality and nature of heat very nearly as we do at the present day. "That heat is combined with water," he says, "its liquefaction itself sufficiently proves, nor can it either freeze or congeal into snow or hoar-frost without suffering that heat to escape." \* \* \* \* "Even the air, however cold it may be, is by no means devoid of heat; indeed it is combined with a great deal of heat;" and more to this effect.

This indeed appears to have been the most general notion respecting this part of the subject till about the time of Lord Chancellor Bacon, who in his treatise "De Formâ Calidâ" considers heat as the effect of an intestine motion or mutual collision of the particles of the body heated; an expansive undulatory motion in the minute particles of the body, by which they tend with some rapidity towards the circumference, and at the same time incline a little upwards; which idea was also with some modification adopted by Descartes, Newton, Boyle, and the other mechanical philosophers of that and the succeeding age. The chemists, however, whose opinions, at least, possess that degree of authority which arises from their being most used to the observation of the effects of this agent, seem to have still retained a strong notion of the materiality of heat, which, in consequence of our improvement in chemical science, again became general, and continued so till the experiments of Count Rumford, which appeared to shew that it was imponderable and capable of being produced ad infinitum, from a finite quantity of matter, again threw some doubt on this question.

It is known that when water freezes, a portion of heat is given out by it during the congelation, which is so considerable, that if we were to conceive it to be transmitted to and imbibed by an equal quantity of water at the temperature of 32° of Fahrenheit's thermometer, the latter would be heated no less than 140°, or to 172°. If, therefore, heat were a ponderable substance, it might be imagined that a given quantity of water would become lighter when frozen in a vessel hermetically sealed. Count Rumford accordingly made this experiment with great care by the help of a balance of extreme accuracy; but the result was, that the ice produced appeared to be of precisely the same weight as the water had originally been of at the temperature of 61°, viz. 4214.28 grains; from which he infers, that all attempts to discover any effect of heat on the apparent weights of bodies will be fruitless.

The other deduction, of the possibility of producing an inexhaustible supply of heat from a given quantity of matter, was made from the following experiment. The Count caused a cylinder of brass to be turned 7½ inches in diameter, and 9.8 inches long, which was bored like a cannon with a calibre 3.7 inches in diameter, and 7.2 deep, so that the bottom was 2.6 inches in thickness. The hollow cylinder

contained 385½ cubic inches of brass, and weighed 113.13 lbs. avoirdupoise. By means of the engine used for boring cannon in the arsenal of Munich, a blunt borer or flat-piece of hardened steel, 4 inches long, 0.63 inch thick and 3½ inches wide, was kept with one of its extremities, whose area was about 2½ square inches, pressed against the bottom of this hollow cylinder on the inside with a force of about 10000 lbs. avoirdupoise, whilst the latter was turned about its axis with a velocity of 32 revolutions in a minute. The cylinder was in one experiment covered on the outside with a coating of thick flannel to prevent the access of heat from the atmosphere; in another the borer was made to work through a collar of leathers so as to prevent the access of air also to the interior of the bore; in a third, the whole cylinder was immersed in water, the borer still working through a collar of leathers so as to prevent its access to the interior of the bore; in a fourth, the collar of leathers was removed, and the water had access to the bottom of the interior of the cylinder where the friction took place. The result was, that in all these cases heat was generated by the friction in sufficient quantity to cause about 26½ lbs. of ice-cold water to boil in two hours and a half, or at about the same rate as that at which it would have been produced by 9 large wax candles; the capacity of the brass for heat, or its power of producing it by friction, did not appear to be diminished, and it seemed as if this generation of heat would have gone on for ever if the friction had been continued: the source was inexhaustible. Now, as any thing which an insulated body or system of bodies can continue to supply without limitation cannot possibly be a material substance, the Count's inference is, that heat is not of this description, but that it must be an effect arising from some species of corpuscular action amongst the constituent particles of the body.

We will confess, however, that we conceive neither of these experiments nor any other with which we are at present acquainted to be conclusive in favour of the immateriality of caloric. Omitting the question, whether gravitation is essential to matter, we may observe that there may be an indefinite series of material substances, each a million of times rarer than the preceding, of which, though the weight of the heaviest be imperceptible by our nicest balances, the lightest may still be ponderable. Any instruments which we at present possess would scarcely enable us to detect the weight of a fluid which was only a thousand times lighter than atmospheric air.

The other experiment affords an argument against the materiality of this principle, to which it is perhaps somewhat more difficult to give a distinct and decisive answer; and yet, notwithstanding the precautions which were taken, it is by no means demonstrative, that the heat which was evolved was not derived ab extero, for there is no absurdity in supposing, that a body may be receiving caloric in one state or at one part of it, and giving it out in another. We have an instance of the simultaneous attraction and emission of a subtle fluid, the materiality of which is admitted by every one, in the case of an excited electric, which at the same time receives the fluid from the rubber, and communicates it to the conductor. In Count Rumford's experiment we must recollect, that the whole apparatus was immersed in a great bath of caloric, the atmosphere.

With regard to this part of our subject, we ought also not to omit, that in another experiment of the same author, heat was found to be communicated through a Torricellian vacuum. Now it is manifest, that in such a vacuum there could be nothing to communicate or propagate motion. Heat therefore must be material: the conclusion is almost physically certain.

Without

Without further insisting, however, that we can conclusively demonstrate the existence of caloric, it at least appears upon the whole, that, in the present state of our knowledge, we ought rather to consider it as a material substance, because of the two theories, that which supposes it to be so is infinitely the most intelligible, the most agreeable to the analogy of nature, and the least exceptionable; and we shall accordingly regard it as an elastic fluid sui generis, capable of pervading with various degrees of facility, all the solid bodies with which we are acquainted, and of being imbibed and retained by them in different proportions according to their respective degrees of specific attraction or capacity for it. See CAPACITY.

It will easily be conceived that from the elasticity and power of pervading other substances, which we have attributed to this fluid, it must necessarily follow, that whenever a body is by any means charged with a larger quantity of it than is proportional to its mass and capacity, when compared with those of other bodies in its vicinity, the surplus will be communicated to those other bodies, until the density of the fluid in every body in the system becomes equal; in like manner as a quantity of air thrown into one of a number of vessels communicating with each other will pass from it to the others, until it becomes distributed amongst the whole of them in proportion to their respective capacities, or till it becomes of equal density in all of them. This state of density or compression of the caloric, contained in a body, constitutes what is called its *temperature*; see this article.

The celerity and facility with which this fluid pervades different substances are however extremely various, as may be shewn by the following experiment. Take a small cylindrical earthen or wooden vessel, between three and four inches in diameter, and insert into it, through holes drilled in its bottom for that purpose, several wires, about an eighth of an inch in diameter, and six or seven inches long, of equal size in every respect, but of different metals, as gold, silver, copper, iron, brass, and zinc; and also two small rods, one of glass and the other of wood, of equal dimensions with the wires, so that they may each of them project about half an inch on the inside of the vessel, the rest of them being on the outside, and forming a kind of stand for it. Dip a portion of the inferior extremities of these wires and rods into melted wax, so that they may become equally coated with it. When the wax has cooled, fill the vessel with a heated fluid, as boiling water or melted lead, and observe the intervals between the time of filling it and the melting of the wax, which intervals will indicate the relative conducting power of the substances. Dr. Ingenhousz tried this experiment, though in a somewhat different manner, with wires of silver, copper, gold, tin, iron, steel, and lead, whose conducting powers he conceived to be in the order in which we have enumerated them, though he found some differences in the results, except with regard to the silver and lead, of which the former always appeared to be the best, and the latter the worst conductor. In the experiment which we have described it will be found, that the conducting powers of glass and wood are almost infinitely smaller than those of any of the metals which are the best conductors known. Fluids of every kind are almost perfect non-conductors; and light spongy substances, or such as contain fluids in their interstices, conduct heat with great slowness and difficulty.

This difference in the conducting powers of various substances is the source of many practical conveniences and inconveniences. The cellular texture of organized substances enables them to withstand the effects of change of temperature in the atmosphere, by resisting the passage of this fluid, and the wooden handle of a tea-pot, and the cloth made use

of for handling hot irons, are familiar examples of the economical application of this property. An iron door to a furnace will be red hot before the furnace itself, if of any earthy composition, is heated in any considerable degree. Large iron bars or cylinders are made to pass from the fire for the purpose of communicating heat to those ovens which are constructed at the side of kitchen-ranges, and a poker put into a low fire improves it by promoting a similar communication amongst the different portions of the fuel through which it passes.

We will, in the next place, consider very shortly the effects arising from the condensation or rarefaction of this fluid in bodies. By the former their temperature is elevated, or they are heated; by the latter it is depressed, or they become cooled.

In our investigation of the most universal operations of nature we generally find that the more immediate instruments employed for the production of the effects which we perceive are two counteracting powers, by whose co-operation and mutual counterpoise the necessary equilibrium is preserved, and the purposes of their creation effected with greater regularity than would probably result from the employment of a single agent. Thus, gravity is, as we know, counteracted by inertia, that tendency which all bodies have to continue in a state of rectilinear motion, when once they are thrown into it by the impulse of force. The effects of cohesion, a no less universal principle than gravity, are in like manner restrained and modified by the agency of caloric; and, as without inertia all the celestial bodies would be drawn together into some one part of extended space, so, without heat all the matter in the universe would become a congealed and concrete mass; and fluidity, organization, vegetation, and life could have no existence. Solids become first expanded, and then liquified by its influence, and liquids assume the æriform state. It is essential to the idea of a solid body, that it should in a certain degree resist both compression and dilatation, that is, that its particles should repel each other when brought nearer together, and attract each other when farther separated within certain limits, and it is incontrovertible, that they can only remain in a quiescent state by the equilibrium of these opposite forces. The latter of these constitutes cohesion, and the existence of the former is, perhaps, attributable to the substance of which we are now speaking. Be this as it may, it is at least a fact, that the repulsive energies of these corpuscles are increased, and the sphere of action enlarged by its influence, for the body becomes expanded; that is, this equilibrium no longer takes place, unless its molecular are removed farther from each other than when it was at a lower temperature. Elevate its temperature still farther, and the body fuses; that is, the attractive power of its particles becomes annihilated or wholly counteracted, and they are only kept together like a quantity of shot by the action of gravity, operating independently on each. Increase still the action of heat on the body, and the sphere of repulsion of its particles, or the distance, to which this power operates, again becomes much farther extended, perhaps infinitely so; it is now sufficient to overpower the action of gravity, and the body becomes resolved into an elastic fluid. We know of no substance which is capable of resisting the power of this universal solvent. Gold itself may be expanded into vapour by the action of heat, and as these effects are always producible by the same cause, so is it, at least, probable, that the converse of this is also true; that whenever a substance is formed in a state of fluidity it is attributable solely to this cause, and that the abstraction of the caloric, by which it is holden in solution, would again reduce it to a solid. Mercury is, we know,

know, capable of congelation, and the atmosphere itself would probably become a concrete, if we could deprive it of all or the greater part of its heat. We have therefore arrived at a very distinctive and appropriate definition of caloric; that it is that substance or affection of matter which is the cause of fluidity in all or the greater part of the bodies which we met with in that state.

Several writers on this subject appear to us to have involved it in no inconsiderable degree of obscurity, by an unwarrantable distinction between *latent* and *free* or *sensible* caloric. There seems to be no such distinction in nature: caloric is always sensible and never latent. The proportion of it in any body is always sufficiently indicated either by its temperature or its state with regard to the counterpoise of those attractive and repulsive powers of which we have been speaking, and so change can take place in that proportion without its occasioning a concomitant change in one or the other of these affections.

We have thus traced the outlines of that part of the doctrine of heat which relates to the existence of this fluid, and which we conceived to belong to the present article; fuller details of the effects of this powerful agent, and the other parts of the theory connected with them, will be found under HEAT, and the other articles to which we have already referred.

CALORIMETER. See HEAT.

CALOTES, in *Zoology*, a species of LACERTIA, with a round long tail, and the fore part of the back, and hinder part of the head dentated. Gmelin. This is the iguana calotes of Laur. Amph. Its body is caruleous, with acute scales beneath, and lanceolated spines on the back. Found in Asia, particularly in the island of Ceylon.

CALOTO, in *Geography*, a town and department belonging to the jurisdiction of Popayan in South America. The extent of this department is considerable; it is also rich, and abounds in the products of the earth; the soil being fertile, and the country every where interspersed with farms. But of all the parts in this jurisdiction, it is the most subject to tempests of thunder and lightning. This has brought into vogue "Caloto bells," which are used under a persuasion that they have a special virtue against lightning; and of which we have the following account. The town of Caloto, the territory of which contains a great number of Indians, of a nation called "Paezes," was formerly very large; but these Indians, suddenly assaulting it, forced their way into it, set fire to the houses, and massacred the inhabitants. Among the slain, was the priest of the parish, who was the particular object of their rage, because he exposed the folly and wickedness of their idolatry, and the turpitude of their vices; nor did the bell of the church escape their rancour, as by its sound it reminded them of the hours for receiving religious instruction. After many fruitless endeavours to break it, they determined to bury it under ground, that they might not any more be reminded of their duty, and abridged of their liberty. On the news of their revolt, the Spaniards, in the neighbourhood of Caloto, took arms, and having avenged themselves of the insurgents in a battle, they rebuilt the town, and having taken up the bell, placed it in the steeple of the new church; since which event, the inhabitants, to their great astonishment and joy, observed, that when a tempest appeared to be blowing in the air, the tolling of the bell dispersed it. The news of this imagined miracle induced many persons to solicit pieces of it to make clappers for little bells, in order to enjoy the benefit of its virtue, which, in a country peculiarly subject to tempests, was deemed highly advantageous. To this circumstance

Caloto owes its reputation for bells. Adams's *Voyage to South America* by Juan and Ulloa, vol. i. p. 342.

CALOTTE, a cap, or coif of hair, fatten, or other stuff; used first for necessity, but now become an ecclesiastical ornament in France,

It was first worn by cardinal Richlieu: the red calotte is a badge of a cardinal.

CALOTTE, in *Architecture*, a round cavity, or depression in form of a cup, or cap, lathed and plaitered, used to diminish the rise, or elevation of a chapel, cabinet, alcove, &c. which, without such an expedient, would be too high for other parts of the pile.

CALOUDE, in *Geography*, a town of Hindoostan, in the foubah of Dowlatabad; four miles W. of Carballa, and 210 N.W. of Hydrabad.

CALOVIVS, ABRAHAM, in *Biography*, a Lutheran divine, was born in 1612, at Morungen, in the duchy of Brunswick, and became doctor in theology at Rollock, in 1637, and theological professor in that University. In 1643, he was made rector of the college at Dantzick: and in 1650, professor of theology at Wittenberg. He was the most rigid divine of his party, and distinguished himself on a variety of occasions by his disputes with the reformed ministers, and particularly with Calixtus, of whom an account is given under the article CALIXTINS. Such was the part he took in this controversy, that those who enlisted under his banner were denominated "Calovians." He exercised the office of superintendent-general of the Lutheran churches, and continued his controversial warfare till his death in 1686. His works were numerous; they were chiefly polemical, and are now forgotten. Moreri. Moheim, E. H. vol. v.

CALP, in *Mineralogy*, a black quarry stone of Dublin, a species of basalt, found in large masses, of a bluish black, or dark-greyish blue colour, variously intersected with veins, of white calcareous spar, and often invested with the same. In the direction of its strata it easily splits into large flags. Sp. gr. from 2.646 to 2.70. It effervesces with mineral acids; and at 130° melts into a black compact glass; contains 50 per cent. mild calx, the remainder being silica, argil, and iron. This mineral seems to be the calcareous trap of Laffius, Hartz. 170. Kirwan's *El. of Min.* vol. i. p. 233.

CALPAS, in *Ancient Geography*, a river of Asia Minor in Bithynia, at a small distance W. of Sangarius. Strabo and Ptolemy.

CALPAS, or CALPE, a sea-port of Asia Minor, in the Euxine sea, between Heraclea, and Byzantium in Bithynia.

CALPE, a mountain of Spain, in that part of Bætica which is now called Andalusia, opposite to that in Africa, which bore the name of Abyla, and one of those which were called the "Columns of Hercules." At the foot of this mountain, towards the sea, stands Gibraltar. Calpe is styled by Strabo a famous ancient Spanish sea-port; whereas, Pliny, Ptolemy, Mela, and others, only call it a mountain: whence the learned Bochart and Casaubon have thought, that the Calpe of Strabo was inserted, by the mistake of some transcriber, for Carteia. But it has been inferred by some learned persons, from an inscription on a medal, with these letters, C. I. CALPE, and "Colonia Julia Calpe," that Strabo's text is correct; and they further allege, that Octavius overtook Cæsar near the city of Calpia, which is the same with Calpe. We may therefore conclude, either that there were several cities situate at the mouth of the strait, on account of its advantageous situation, one of which was called Calpe, or Calpia; or else that the Carteia, which was situate near the promontory of Calpe, had likewise taken that name from it.

CALPE, in *Grecian Antiquity*, a race performed by mares, which

which constituted one of the Olympic games. This race was instituted in the 71st Olympiad, and, together with the "Apené," abolished in the 84th. In this race, the riders were accustomed, like the Anabatæ, to leap from the backs of the mares towards the last stage or period of the course, and laying hold of the bridles, they finished the race in that manner. West's Pindar, vol. iii. p. 143.

CALPENTEEN, in *Geography*, an island in the Indian sea, near the west coast of the island of Ceylon, about 40 miles long and six broad. N. lat. 8°. E. long. 79° 50'. —Also, a town of Ceylon, opposite to this island. N. lat. 8° 15'. E. long. 79° 50'. Percival, in his "Account of the Island of Ceylon," (p. 107.) informs us, that a company or two of Malays is stationed here, and that when he left the island, it was commanded by a Dutch officer, who had entered into the English service, and who received this appointment from governor North. This, he adds, is one of the best places on the whole island for game; and between this and Putallom, at a small distance, the coast is remarkable for its salt-pans, which are formed by an arm of the sea which overflows part of the country between these two places. The Dutch manufactured, on this part of the island, a large quantity of salt, which they considered as very important to their interests, and the most formidable weapon which it was in their power to employ against the native king, who could not procure any salt but by their means. Since the English took possession of the island, this manufacture has been almost wholly neglected. It is capable, however, of being rendered very profitable, as it is the only one of the kind on this side of the island, and the most conveniently situated for supplying the king of Candy's dominions.

CALPENY, one of the Laccadive islands, in the Indian Sea. N. lat. 10° 5'. E. long. 73° 29'.

CALPOLALPAN, a mountain in New Mexico, which abounds with quarries of jasper and marble of different colours.

CALPRENDE, GAUTIER DE COSTES, in *Biography*, a respectable writer of romances, was born in the diocese of Cahors, and educated at Toulouse. In 1632, he entered into the regiment of guards at Paris, obtained a pension from the queen, and became gentleman in ordinary of the king's bed-chamber. The first pieces by which he made himself known as a writer, were composed for the theatre, and his "Mithridates" appeared in 1635. He was, however, chiefly distinguished by his romances, in the composition of which he has the merit of invention. These were his "Cassandra," "Cleopatra," and "Pharamond," each consisting of 10 or 12 large volumes in 8vo., which by their novelty, and the variety of adventures contained in them, attracted attention for some time, but gradually sunk by their prolixity into oblivion. He also wrote tragedies, the best of which is his "Earl of Essex," from which Boyer copied some scenes in his tragedy of the same title. His character was respectable, and he was employed in some foreign negotiations. His death was occasioned by an accident in August 1663. Nouv. Dict. Hist.

CALPURNIAN LAW, in *Roman Antiquity*, a law proposed by L. Calpurnius Piso, tribune of the people, in the beginning of the third Punic war, during the consulship of L. Marcius Censorinus, and M. Manilius, A. U. 604; and wisely designed to restrain the avarice and injustice of the Roman magistrates, by which the states, whom the governors of provinces had oppressed and plundered, were authorized to apply to the judges for restitution of what had been unjustly taken from them: hence called "de pecuniis repetundis." In consequence of this law, the tribune Calpurnius

probably acquired the honourable surname of "Frugi," or honest man.

CALPURNIANA, in *Ancient Geography*, a town of Spain, placed by Ptolemy in Bætica, in the territory of the Turduli, and mentioned in the Itinerary of Antonine.

CALPURNIUS, or CALPHURNIUS, TITUS, in *Biography*, a Latin Sicilian poet, who lived about the latter part of the third century, under the emperors Carus, Carinus, and Numerianus. Seven of his eclogues are extant; the first of which was composed on the accession of the emperor Carus, in which we may peruse, with pleasure and contempt, the effusions of congratulation and flattery. Two shepherds, avoiding the noon-tide heat, retire into the cave of Faunus. On a spreading beach they discover some recent characters. The rural deity had described, in prophetic verses, the felicity promised to the empire, under the reign of so great a prince. Faunus hails the approach of that hero, who, receiving on his shoulders the sinking weight of the Roman world, shall extinguish war and faction, and once again restore the innocence and security of the golden age. The design of this eclogue is preferred by Fontenelle to that of Virgil's Pollio. But notwithstanding some agreeable description of rural objects, which marks these eclogues, they manifest the declining taste of the age by a want of purity in the style, and of nature in the sentiments. Editions of them have been given by Barthius, Hanov. 8vo. 1613; in the "Poetæ Rei Venat." Leyd. 1728, 4to.; and in the "Poetæ Latini minores," Leyd. 1731, 4to. Voss. Poet. Lat. Nouv. Dict. Hist. Gibbon's Hist. vol. ii. p. 93.

CALPY, in *Geography*, a town of Hindoostan, in the country of Agra, seated on the south bank of the Jumna river; 98 miles S.W. from Lucknow; 115 N.W. from Allahabad; 160 S.E. of Agra; 239 miles N.W. of Benares; 277 S.E. from Delhi; 821 N.E. of Bombay; 804 N.W. from Calcutta by Moorshedabad; 715 nearly N. from Hydrabad. N. lat. 26° 7' 15". E. long. 80° 4'.

CALQUING, or CALKING, a term in *Painting*, &c. used where the backside of any design is covered with black lead or red chalk; and the strokes or lines traced through on a waxed plate, wall, or other matter; by passing lightly over each stroke of the design with a point, which leaves an impression of the colour on the plate or wall. This method of *off-tracing* may likewise be performed by pricking the original print, or drawing, and transmitting coloured powder through the punctured holes, in order to mark the outlines of a new ground; or, by dissolving part of the printing ink by means of soap, and impressing it in that state on a fresh ground. See DESIGNING.

CALTAGE'NONE, in *Geography*. See CALATAGIRONE.

CALTARO, a town of Dalmatia, in the republic of Ragusa; 24 miles N. of Ragusa.

CALTHA, in *Botany*, (supposed to be derived from *καλθα*, a basket, alluding to the shape of the flower.) Linn. gen. 703. Schreb. 957. Willd. 1090. Gært. 691. Juss. 234. (Populago, Tourn.) Class and order, *polyandria polygynia*. Nat. ord. *Multifloræ*, Linn. *Ranunculacæ*, Juss.

Gen. Ch. *Cal.* none. *Corol.* Petals five or more, egg-shaped, flat, spreading, deciduous. *Stam.* Filaments numerous, thread-shaped, shorter than the corolla; anthers erect, obtuse, compressed. *Pistl.* germs superior, from four to fifteen or sixteen, erect, oblong, compressed; style none, stigma simple. *Peric.* Capsules short, acuminate, spreading, opening at the upper or inner suture. *Seeds* numerous, oblong, egg-shaped, smooth, affixed to the upper suture in a double row.

Ess. Char. *Calyx* none. *Petals* five or more. *Nectaries* none. *Capsules* several, many-seeded.

*C. calyculata*, Linn. Sp. Curt. Flor. Lond. fasc. 5. Tab. 4. F. g. Bot. 536. Flor. Den. 668. Gart. Tab. 118. Linn. Id. Pl. 500. Marsh marigold, or meadow-bowts; in Yorkshire, water-blobs. "Stem erect; flowers yellow, large." Poir. in Encyc. Root perennial, fibrous. Stems a foot and half high, hollow, a little branched, leafy, roundish, furrowed. Leaves between heart and kidney-shaped, acutely scolloped, veined, smooth, of a deep shining green; root-leaves on long, hollow, semi-cylindrical petioles, sometimes entire; the others alternate, and nearly sessile. *Stipules* brown, membranous, withering. Flowers in all their parts of a golden hue, axillary, solitary, on simple peduncles; the inner row of filaments with broad anthers; the outer twice as long, club-shaped, with compressed anthers. The young buds are pickled as a substitute for capers, which they greatly resemble in form, and according to Dr. Smith, perhaps equal in merit; for both are aerial, and only rendered eatable by the acid pickle. The true caper buds are easily distinguished by their simple germ. There is a double variety frequent in gardens; but the flower in its single form is larger, and, as Dr. Smith justly observes, to the admirer of genuine nature, much more beautiful. Its only advantage is that it is more durable. The juice of the petals, boiled with alum, stains paper yellow. A native of England and of all the northern parts of Europe, Asia, and America. 2. *C. natans*, Willd. Poir. in Encyc. vol. v. p. 568. Gmel. Sibir. 4. p. 192. Tab. 82. "Stem procumbent, floating; flowers smaller, white, red at the edge." Poir. It agrees in general habit with the preceding species, but is less in all its parts. Capsules triangular. Perennial. Found by Gmelin and Pallas in Siberia.

*CALTHA alpina*, Tabern. ic. 336. See *ARNICA montana*.

*CALTHA*, Burn. Zeyl. Tab. 22. fig. 1. See *VERBESINA calendulacea*.

*CALTHA officinalis*, Scop.; arvensis, C. Bauh.; minima, J. Bauh. See *CALENDULA arvensis*.

*CALTHA vulgaris*, C. Bauh. See *CALENDULA officinalis*.

*CALTHA maritima*, Tourn. inst. 499. See *CALENDULA incana*.

*CALTHA africana flore extus ferrugineo*, Morif. hist. 3. Tab. 3. fig. 8. See *CALENDULA pluvialis*.

*CALTHA femine majore oblongo*, Breyn. Tab. 14. fig. 2. See *CALENDULA hybrida*.

*CALTHA femine plano cordato*, Boerhav. Lugd. See *CALENDULA nudicaulis*.

*CALTHA foliis croci angustis*, Boerhav. Lugd. See *CALENDULA graminifolia*.

*CALTHÆ*, in *Entomology*, the species of *CHERMES* that feeds on the flowers of the caltha palustris, whence its name. Linn. Fn. Suec.

Obf. The antennæ are black at the tip; thorax rufous with three black curves; wings white with yellowish veins, and a brown dot.

*CALTHELLA*, a species of *PHALÆNA*, in the *Tinea* family, the anterior wings of which are entirely golden; and the head ferruginous. Linn. Fn. Suec. Frequent in Europe, on the flowers of caltha palustris. Its size is small. This is *tinea rufimetalla* of the Vienna catalogue.

*CALTIORISSA*, in *Ancient Geography*, a town of Asia, in Lesser Armeria, according to Ptolemy, marked in the Itinerary of Antonine on the route between Nicopolis and Satala.

*CALTROP*, or *CALTHROP*, in *Military Language*, an instrument with four iron points, each three or four inches long, disposed triangularwise; so that there are always three points bearing on the earth, the fourth being in the

air. Several of these, fixed in the ground, or thrown into breaches where the cavalry is to pass, stick into the horses feet and embarrass them.

An instrument of this kind with three iron spikes is used in Siberia, &c. in hunting the wolf.

*CALTROPS*, in *Botany*. See *TRIBULUS*.

*CALTROPS*, water. See *TRAPA*.

*CALTURA*, in *Geography*, a fortress of the island of Ceylon, at the mouth of a river, which is one of the largest branches of the Malivaddy, and is here about a mile broad. It washes two sides of the fort which commands it, and is navigable by boats to the sea. The eminence on which the fort stands overhangs the river, and commands an extensive and most picturesque prospect. This fort from its situation is capable of being rendered a very strong post. The commanding officer presides in the court of justice, and determines all disputes among the peasants. The sea, the esplanade, and the village on the outside of the fort, as well as the beautiful surrounding country, render Caltura a very delightful scene. Some tracts of cinnamon are scattered up and down in the vicinity of it; and a little way south of it is the termination of that fertile district of Columbo which contains so great a proportion of the wealth of Ceylon. About 10 miles from Caltura is a temple of "Buddou," built on a flat space, cut out of a small hill. It is a small square building, constructed of brick, with a sloping tiled roof, and a gallery surrounding it. In an apartment of this temple, the image of the deity, about 12 feet long, lay reclining on his side, with his right hand under his head: the place was illuminated with lamps, and flowers in abundance were spread around. The walls were daubed with streaks of red, black, and white paint; and on them were marked some Cinglese characters. Near the temple were a few huts for the priests. The country about Caltura abounds with game, and certain native manufactures are carried on to a considerable extent around it. A great quantity of arrack is made from the groves of cocoa trees, which extend several miles in every direction, forming from Columbo to Caltura, and several miles beyond it, one continued grove. Here is also a large plantation of sugar-canes, and a distillery of rum is carried on by some Dutchmen, who reside in the village and neighbourhood; but this rum is much inferior in quality to that of the West Indies. Six miles onward from Caltura lies "Barbareen," a small village, with a fort of harbour formed by a projection of land where the river runs into the sea. This is almost the only place where the high surf and rocky shore on this coast allow ship-boats of European construction to land. At Barbareen there is a considerable manufactory of cordage and cables from the cocoa-tree. Large quantities are sent from hence to Columbo and Point de Galle, to supply the vessels which trade to these ports. A few miles further lies "Bentot," only remarkable for producing the best oysters on the island, and almost the only species used on the island as food. Caltura is distant about 28 miles from Columbo. N. lat. 6° 34'. E. long. 79° 50'. Percival's Ceylon. See *COLUMBO* and *POINT DE GALLE*.

*CALVA SERPENTIS DIADEMA*, in *Testaceology*, one of the synonyms of *CHITON PUNCTATUS*, *Eph. Nat. Cur.* &c. See *PUNCTATUS*.

*CALVADOS*, in *Geography*, a ridge of rocks, near the coast of France, 12 miles in length. N. lat. 49° 22'. W. long. 0° 51' to 0° 32'.

*CALVADOS*, one of the five departments so called from the long ridge of rocks above-mentioned, formed of Normandy and the north part of Perche. It is bounded on the north by the Channel; on the east by the department of Eure;

on the south by that of Orne, and part of the department of the Channel, which also bounds it on the west. It extends from the mouth of the Seine easterly, to the river Vire westerly, about 50 miles, and 30 miles from north to south; its superficies is about 1,117,643 square acres, or 570,427 hectares: its population consists of about 484,212 persons; and it is divided into six communal districts. Its capital is Caen.

CALVARIA, or CALVA, the scalp, or upper part of the head; so called from its growing bald first. See BALDNESS. The external parts of the calva are the *syncliput*, *occiput*, *vertex*, and temples; all invested with the hair, and the common integuments of the body.

The calvaria in adults consists of eight bones, one of the forehead, another of the *occiput*, two of the *syncliput*, two of the temples, and two others common also to the upper jaw, viz. the *cuneiforme* and *spongiosum*.

CALVART, DENIS, in *Biography*, a painter of history and landscape, was born at Antwerp in 1555. He began with painting landscapes; but as he wished to adorn them with human figures, he determined to seek improvement for this purpose in Italy. In his way to Rome he stopped at Bologna, where he became the disciple of Prof-

pero Fontana. During his residence in this city, he applied with diligence to the study of his art, and copied the works of Correggio and Parmigiano. He then accompanied Lorenzo Sabattini to Rome; and perfected himself in design, perspective, architecture and anatomy. From Rome he returned to Bologna, where he opened an academy, which was much frequented, and which produced, besides a number of other excellent artists, Guido, Albano, and Domenichino. He lived with his pupils on terms of easy familiarity, and took great pains in improving them; though his character was degraded by passion and avarice. His own works were simple in their design, correctly drawn, well disposed, coloured in a grand style, and touched with freedom and elegance; but they are not altogether free from a Gothic air, which he brought from his own country. His principal performances are at Rome and Bologna; in the latter place there is a fine picture, representing two hermits, which is correctly designed, beautifully coloured, and delicately pencilled; and in the Pembroke collection at Wilton, there is a nativity painted by this master. Some of his works have been engraved. Calvart died at Bologna in 1619. D'Argenville. Pilkington.
