CENTUMVIRATE, among the Romans, a court composed of one hundred magistrates, or judges, appointed to decide private differences between the people. It was instituted some few years after the appointment of the "Prætor peregrinus," about the year of Rome 500, B.C. 234. at the motion of two tribunes of the people, both Æbutii; in order to assist the prætors, who were often obliged to take the field, and could not dispatch all civil affairs, which multiplied in proportion to the enlargement of the republic.

The centumviri were a body of men chosen, three out of each of the thirty-five tribes, so that their number amounted to five more than their name imports, and they were divided into four courts or councils, and sometimes only into two: their business, in subordination to the prætor, was to judge of matters relating to testaments, tutorage, inheritances, and such other matters of lesser weight and moment, as the prætors committed to them. After the time of Augustus, they formed the council of the prætor, and judged, in the most important cases; whence trials before them (judicia centumviri) are sometimes distinguished from private trials; but these were not criminal trials, as some have thought, for in a certain sense all trials were public. Their body was afterwards increased to an hundred and eighty; though they still retained the appellation of centumviri.

The centumviri were called together by setting up a spear; at first, by those who had discharged the office of quæstor; afterwards by the decemviri, who presided in them during the absence of the prætor. Trials before them were usually held in the Basilica Julia; sometimes in the Forum. In important cases, they all judged together; nor could a cause before them be adjourned. They continued to act as judges for a whole year.

CENTUNCULUS, in *Botany*, (the name of a plant in Pliny) *Dill* in Rai. *lyn.* 1. *Linn. gen.* 147. *Schreb.* 189. *Willd.* 224. *Lam. ill.* 226. *Gert.* 278. *Juff.* 95. *Vent.* 2126. *Centenille*. *Fr.* Clafs and order, *tetrandria monogynia*.

ria. Nat. Ord. *Rotaceæ*, Linn. *Lyfsmachiæ*, Juff. *Primulaceæ*, Vout.

Gen. Ch. *Cal.* Perianth four-cleft, fpreading, permanent; fegments lanceolate, acute. *Cor.* monopetalous, wheel-fhaped; tube fhort, fome-what globular; border four cleft; fegments egg-fhaped, fpreading. *Stam.* Filaments four, naked, the length of the corolla; anthers fimplic. *Pyl.* Germ. fuperior, roundifh, within the tube of the corolla; fyle filiform, permanent; figma fimple. *Peric.* Capfule globular, one celled, fplitting horizontally; receptacle free. *Seeds* many, very fmall.

Eff. Char. Calyx four-cleft. Corolla wheel-fhaped, four-cleft, filaments naked, capfule fplitting horizontally, one-celled, many fided.

According to Juffeu it is fometimes petaloudous with a five-cleft corolla, and then in its effential characters does not differ from *Anagallis*; but Dr. Smith is of opinion that the tubular form of the corolla, and the naked filaments, independent of the number, juffify *Dillenium* in making it diftinct.

Sp. C. *minima*, Linn. Mart. Lam. Willd. *Gært.* tab. 50. fig. 2. Lam. Illuf. tab. 83. Flor. dan. tab. 177. Curt. Flor. Lond. tab. 11. *Egg.* bot. 531. (*Anagallis*, Vaill. par. tab. 4. fig. 2. Mentz. *Pugil.* tab. 7. *Anagallidiflorum*, Mich. gen. tab. 18. fig. 2.) Baftard Pimpernel, fmall Chaff-weed. *Root* annual, fibrous. *Stem* one or two inches high, a little branched at the bafe, afcending, leafy, fome-what angular, fmooth. *Leaves* alternate, feffile, fpreading, egg-fhaped, quite entire, fmooth. *Flowers* folitary, axillary, leaflefs, white, expanded only in the moft brilliant funfhine, foon withering, but permanent till forced off by the fwelling capfule. *Capfule* globular, mucronate with the permanent fyle. A native of moift heaths in England, France, Italy, Germany, and Sweden, but often overlooked on account of its minutenefs; it is moft readily difcovered by its capfules.

CENTUNCULUS, Scop. See CERASTIUM.

CENTURI, in *Geography*, a fea-port town of the ifland of Corfica.

CENTURIA, in *Ancient Geography*, or PINTURIA, the name as it variously occurs in Ptolemy's geography, of one of the Fortunate iflands, in the Atlantic Ocean, near the coaft of Africa.

CENTURIAE, an epifcopal city of Africa, in Numidia; probably the fame with *Centurianenfis*, or *Centurionenfis*.

CENTURIAL INSCRIPTIONS, a denomination given by fome to thofe infcriptions inferted in the face of Severus's wall, which make mention of the centuries and cohorts by whom fuch parts of the wall are fuppofed to have been erected. In which fenfe, centurial infcriptions ftand contradiftinguifhed from *legionary*.

CENTURIATA Comitia, in *Antiquity*, thofe affemblies of the Romans, wherein the people gave their votes by centuries. See CENTURY and COMITIA.

CENTURIATORS, an appellation given to certain learned Germans of the city of Magdeburg, who in the early days of the Reformation compofed a body of church hiftory, divided into centuries of years.

Baronius is faid to have written his Annals by way of oppofition to the *centuriators* of Magdeburg.

CENTURINUM, in *Ancient Geography*, a town or burgh, feated at the point of the moft northerly promontory of the ifland of Corfica.

CENTURION, a military officer among the Romans, who with another officer of the fame denomination, commanded a company or maniple, or one of the ten feparate parts, into which the haftati, as well as the principes and

triarrii in each legion, were divided. From each of thefe defcriptions of foldiers, ten men of the moft approved and diftinguifhed merit were firft felected, and after them ten more. Thefe were all called Commanders of companies or maniples. The firft of thefe that was chofen or appointed was called *primipilus*, or *centurio primipili*, and had a feat in the military council. Two of thefe centuries or captains of companies or maniples were appointed to each company. And when both were prefent, he that was firft chofen led the right, and the other the left of the company; but when either of them was abfent, he who remained, conducted the whole of it. In the choice of thefe captains or commanders of companies, thofe who were the boldeft and moft enterprifing were not efteemed the beft, but rather thofe who were fedate and fteady, prudent and fkillful in command. And it was not fo much required of them that they fhould on all occasions be eager to begin an engagement, or to precipitate themfelves into action, as that when hard preffed or even overpowered by fuperior force and numbers, they fhould ftill maintain their pofts, and rather die than defect their ftations. Thefe twenty centuries or commanders of companies chofe twenty other men of diftinguifhed conduct, prudence, and merit; two of whom were affigned to each company to take care of its rear. Be-fides thefe, two of the braveft and flourefcent among the foldiers were appointed by the centuries to carry the ftandards in each company. And it was not without very good reafon indeed, that two captains or centuries were affigned to each maniple or company, as well as two fub-captains or fub-centurions. For as it was impoffible to know or ascertain before-hand what the conduct of an officer would be, or to what accidents he might be expofed; and as excufe or pretext in the affairs of war is inadmiifible, that precaution and arrangement were neceffary to prevent the company from being on any occafion without a leader.

A centurion is generally defined to have been a military officer, who commanded a hundred men. But this is a very erroneous definition. For when the Roman ftate was in its greateft vigour and perfection, which it was about the time of Hannibal's invafion of Italy, the two centuries in a maniple or company of the haftati or principes commanded twice as many men as the two centuries in a maniple of the triarii; as a maniple of each of the former then contained 120 men, whereas a maniple of the latter confifted only of fixty. The legion then confifted commonly of 4200 foot, and 300 horfe. Of thefe 4200 infantry, 600 were triarii, 1200 were haftati, 1200 were principes, and the remainder were velites or light troops.

Anciently and before the war of Hannibal, it was the conflant cuftom of the Romans to raife four legions annually, and to allow to each legion 4000 foot and two hundred horfe, unlefs they were preffed by any great or unufual danger, in which cafe they increafed the number of men compofing it to 5000 foot and 300 horfe. And prior to the battle of Cannæ, they ordered eight legions of 5000 men each to be raifed, independent of an equal number of the allies, an expedient, to which they had never before had recourfe in any of their wars. While the number of foot in a legion thus varied between 4000 and 5000, the number of men commanded by a centurion in the haftati and principes alfo varied, though the number of thofe commanded by a centurion in the triarii continued invariably the fame. For whatever number of men the legion confifted of, that of the triarii continued at 600, or the fame, till it was fo augmented as to equal that of the haftati or principes; towards the time of Julius Cæfar and the clofe of the mixed government of the Romans, during the continuance of which in its vigour and purity the numbers of men commanded refpectively by a centurion in the haftati, or principes, and by a centurion in the triarii,

were in a ratio that frequently varied. During the same period, there were, in every legion, sixty centurions or commanders of companies or maniples, sixty officers chosen by them to take charge of the rear of the companies, who might be denominated sub-centurions or sub-captains, and sixty standard-bearers or ensigns, who were appointed by the captains or centurions.

CENTURIONES, *Ans*, in *Ancient Geography*, a place of Gaul, in the Pyrenæes.

CENTURIPPE, **CENTURIPPI**, now *Centorbi*, a town of Sicily on the eastern coast, at a small distance from *Catana*. This city was de-vernal, and, like *Syracuse*, received its liberty from *Timoleon*. Its inhabitants cultivated the fine arts, particularly sculpture and engraving. In digging for the remains of antiquities, caskets are no where found in such abundance as at *Centurippi* and its environs. The situation of the place is romantic; it is built on the summit of a vast group of rocks, which was probably chosen as the most difficult of access, and consequently the most proper in times of civil commotion. The remains of its ancient bridge afford evidence of its having been formerly a considerable city. *Cicero* speaks of it as such. It was taken by the Romans, plundered and oppressed by *Verres*, destroyed by *Pompey*, and restored by *Octavius*, who made it the residence of a Roman colony. *Houel's Voyage Pittoresque des Îles de Sicile, de Malte, et de Lipari, &c.* See **CENTORBI**.

CENTURY, in French *centurie*, from the Latin word *centuria*, a derivative of *centum*, a hundred. Strictly speaking, it signifies one hundred of any thing, as a hundred years, a hundred men, &c.

The term *centuria*, century, was given to the Roman horsemen or equites that belonged to each tribe, and at first amounted only to a hundred. The term, however, *centuria equestris* was continued after that number was greatly increased. It was anciently the custom of the Romans, in forming their legions, to choose their cavalry, and to add two hundred horsemen to every four thousand of their infantry. But in the time of *Polybius*, the citizens, of whom the cavalry was composed, were appointed by the censors according to the rate of their revenue, and were enrolled before the infantry; and three hundred of them were assigned to every legion.

When the Roman people were assembled in the *Campus Martius* for the purpose of choosing magistrates, establishing laws, or deliberating on public affairs, they were divided into centuries, and voted by centuries to facilitate the taking of their suffrages. These assemblies were called *comitia centuriata*.

The Latin writers sometimes made use of the word *centuria*, to denote a company or the number of men commanded by a centurion, whether it consisted of a hundred, or of more, or of less. Thus the phrase, *pedites centuriati*, means infantry divided into companies or maniples.

In chronology, century signifies a period of one hundred years. Church-history is generally computed by centuries commencing from the incarnation of *Jesus Christ*. In this sense of the word, we say, the first century, the fathers of the second century, the councils of the third century, &c.

CENTUS, in *Ancient Geography*, a town of Arabia Felix. *Ptolemy*.

CENTUSSIS, a Roman coin, containing a hundred asses. See **As**.

CEODES, in *Botany*, *Juss.* 422. *Forst.* tab. 71. *Gen. Ch. Cal.* none. *Cor.* monopetalous, top-shaped; border five-cleft. *Stam.* ten, alternately shorter; anthers roundish. *Pist.* style one; stigma dilated. *Fruit* unknown.

CEORLE. See **CHURLE**.

CEOS, **CEA**, or **CLA**, in *Ancient Geography*, now *Zia*, one of the Cyclades, an island of the *Ægean sea*, lies opposite to the promontory of *Achaia*, called *Sunium*, and is 50 miles in compass. This island is commended by the ancients for its fertility and the richness of its pastures. If we may credit *Pliny* and *Solinus*, the first silk stuffs were wrought in this island; and they were hence called the *Cean manufacture*. *Ceos* was also famous for its excellent figs. It is said to have been first peopled by *Aristæus*, the son of *Apollo* and *Cyrene*, who, being grieved for the death of his son *Actæon*, retired from *Thebes*, at the persuasion of his mother, and went over with some *Thebans* to *Ceos*, at that time uninhabited. *Diodorus Siculus* says, that he retired to the island of *Cos*; but the ancients, as *Servius* (in *Virg. Georg. lib. i.*) observes, called both these islands by the name of *Cos*. However this be, the island of *Ceos* became so populous, that a law prevailed there, commanding all persons upwards of 60 years of age to be poisoned, that others might be able to subsist; so that none above 60 years of age were to be seen in the island, being obliged, after they had attained that age, either to submit to the law or abandon the country, together with their effects. (See *Strabo*, lib. x. *Ælian Var. Hist. l. iii. c. 37.*) In former times *Ceos* had four famous cities, viz. *Julis*, *Carthæa*, *Corefus*, and *Præssa*. The two latter were, according to *Pliny* (*l. xvi. c. 27.*) swallowed up by an earthquake. The other two flourished in the time of *Strabo*. *Carthæa* was seated on a rising ground at the end of a valley, about 3 miles from the sea; and its situation agrees with that of the present town of *Zia*, whence the island derives its name. The ruins both of *Carthæa* and *Julis* are still remaining; those of the latter occupy a whole mountain, and are called by the modern inhabitants "Polis," that is, the city. Near this place are the ruins of a stately temple, with many pieces of broken pillars, and statues of most exquisite workmanship. The walls of the city were of marble, and some pieces are still remaining, about 12 feet in length. *Julis* was, according to *Strabo*, the birth-place of *Simonides*, *Bacchylides*, *Erasistratus*, and *Aristo*. We learn from the *Oxford marbles*, that *Simonides*, the son of *Leoprepis*, invented a sort of artificial memory, the principles of which he explained at *Athens*; and that he was descended from another *Simonides*, who was a poet no less renowned than himself. One of these two poets invented those melancholy verses which were sung at funerals, and are called by the Latins "Nævite." (*Hor. l. ii. od. 1.*) *Strabo* says, that the Athenians having besieged the city of *Julis*, raised the siege upon advice that the inhabitants had resolved to murder all the children under a certain age, that useful persons might not be employed in taking charge of them. *Ceos* was, with the other Greek islands, subdued by the Romans, and bestowed upon the Athenians by *Marc Antony* the triumvir; together with *Ægina*, *Tinos*, and some other adjoining islands, which were all reduced to one Roman province by *Vespasian*.

CEPA, in *Botany*, *C. Bauh. Tourn.* See **ALLIUM**.

CEPA, *Rumph.* See **PANCRATIUM ambouinense**.

CEPA, in *Gardening*. See **ALLIUM**.

CEPÆA, in *Botany*, *C. Bauh.* See **SEDUM Cepæa**.

CEPARUM PROMONTORIUM, in *Ancient Geography*, a promontory of the isle of *Cyprus*, extended into the sea directly towards the north, near the town of *Solz*, according to *Strabo* and *Ptolemy*.

CEPASIÆ, in *Geography*, a town of Italy, in *Venetia*, N. of *Plavis* and W. of *Opitergium*.

CEPEDE, **DE LA**, *Count*, in *Biography*, a French writer on music, who published, in 1785, a treatise entitled "La Poétique

Poétique de la Musique," which contains many excellent reflections and precepts for a young composer of lyric dramas, particularly French, from which the author draws all the illustrations of his principles. The work is extended to 2 vols. 12mo.; is well written and well printed, but contains few precepts to which the present musical critics at the Institute, or serious opera, will subscribe. The taste in music at Paris, from all we can gather in conversing with good judges of the lyric drama, is so much improved since the time of Rameau, and the orchestra so well disciplined by the performance of German symphonies, that, with a better language for the emission of sound, and better fingers, would be very high in the scale of the melodrama.

CEPHA CASTELLI, in *Geography*, an episcopal see of Asia, in Syria.

CEPHALÆDIS, CEFALA, a town on the northern part of Sicily.

CEPHALALGIA, in *Medicine*, from κεφαλή, *head*, and άλγος, *pain*, is the technical term for the disorder, which is, in common language, called head-ache. By some authors this term is applied only to a recent or slight head-ache, or to one which is partial or confined to a particular part of the head; and they employ the word CEFHALÆA, κεφαλαία, to denote the complaint, when it is of longer standing, or more obdurate, or when the whole of the head is affected. These distinctions, however, are generally overlooked at present, and the two terms are used synonymously. Other denominations are also given to head-aches, which are accompanied by other peculiarities of symptoms: thus when they return at regular periods, with certain intervals of ease, they are termed *intermitting* head-aches, and by the vulgar, *agues in the head*; and as in these instances it usually happens that one half of the head only suffers, they are technically described under the term *Hemicrania* (from ἡμισυ, *half*, and κρανίον, *the skull*): see HEMICRANIA. When the pain is confined to a particular point in the face, namely, to the situation of a small hole, through which a nerve passes to the integuments, it has been denominated by the French *Tic Dououreux*. A local and violent pain also occurs occasionally in some part of the head, in hysterical women, which is said to resemble the sensation of a nail driven into the head, and has hence been denominated *Clavus hystericus*. See HYS-TERIA.

Head-ache is a symptom of almost every febrile complaint, as well as of many others of a chronic nature; inasmuch that Dr. Cullen has not included it among the *genera* of idiopathic disease, in his nosology. Although it be, however, in a great majority of instances, symptomatic of a disease in some other part of the body, or of a general febrile state, yet it is frequently the concomitant of some morbid state of the contents, or of the integuments, of the skull.—An acute pain of the head is one of the most obvious marks of inflammation of the brain or its membranes, which is termed *phrenitis*, or *phrenzy*; as well in its common acceptation, as in that form of the disease, which terminates by an effusion of *serum* into the ventricle of the brain, and is then denominated *hydrocephalus*. It also accompanies the various organic diseases, which take place in the different parts of the brain, as may be found among the accounts of dissections, detailed by Morgagni, Haller, Lientaud, &c. Thus after death, which had been preceded by severe and obdurate head-ache, tumours and abscesses have been found seated in, or adhering to, certain portions of the *cerebrum* or *cerebellum*; the different membranes of the brain have been found thickened; the arteries or membranes partially converted into bone; bony projections from the cranium have been discovered piercing or pressing on the brain; and effusions

of blood or serum producing pressure on the external surface, or in the internal cavities, of that organ. Pain in the head is also the consequence of that fulcūs of the vessels of the head, which gives rise to lethargic, apoplectic, and paralytic affections, by pressure on the brain, or by the subsequent rupture of the vessels, and effusion of blood. In persons of full habit of body, therefore, with short neck, large head, and florid complexion, head-ache is usually one of the forerunners of an apoplectic attack.

Further, there are instances of idiopathic head-ache, in which the brain itself does not appear to be affected, but in which the morbid condition is confined to the skull, or its integuments. The integuments of the *cranium* appear to be not infrequently the seat of rheumatic inflammation, which gives rise to a head-ache, tedious and distressing as rheumatism seated in the membranes surrounding the joints, or in other parts of the body. The poison of the venereal disease, when the system becomes thoroughly imbued with it, is liable to excite a peculiar inflammation in the *pericranium*, or membrane investing the skull, and even in the skull itself, which excites a severe head-ache, accompanied by a great soreness or tenderness of the integuments.

The most frequent instances of head-ache, however, are those in which it is symptomatic of disease in some other part of the body, or arises in consequence of the sympathy which exists between the brain and some other organ. These sympathies are numerous, and one of the strongest is that which takes place between the head and the alimentary canal, but especially between the head and the stomach. Hence with almost every derangement of the stomach, the head is liable to suffer. Such is the origin of that common complaint, especially among the high-feeding ranks of society, which is usually termed a *sick* head-ache, and which has been well described and commented on by Dr. Fothergill. (See *Medical Obs* and *Inq.* vol. vi. p. 103.) This learned physician has remarked, that the patients, affected with this species of head-ache awake early in the morning with a pain, which seldom affects the whole head, but one particular part of it only; most commonly the forehead, frequently over one, and sometimes over both eyes. Sometimes it is fixed about the upper part of the parietal bone of one side only; sometimes, and not infrequently, the back part of the head, or *occiput*, is affected: sometimes it darts from one to another of these places. With this is joined more or less of sickness, which is just barely, in many people, not sufficient, without assistance, to excite vomiting. If this pain comes on, as is usually the case, early in the morning, and before any meal is taken, seldom any thing is thrown up but thin phlegm, unless the straining is severe, when some bitter or acid bile is brought up. In this case, the disease begins soon to abate, leaving a soreness about the head, a squaminess at the stomach, and a general uneasiness, which induces the sick to wish to repose. Perhaps, after a short sleep, they recover perfectly well, being only a little debilitated by their sufferings.

The duration of this paroxysm is different in different persons: in some it goes off in two or three hours; in others it will last twenty-four, or longer, and with a violence scarcely to be endured, the least light or noise seeming to throw them on the rack. Its returns are very irregular, as must be the case, since the disease for the most part proceeds from accidental causes. It occurs in persons of almost every habit and complexion; chiefly in the early and middle stages of life, and among the middle and upper ranks in society. Those who use but little exercise, and are inattentive to their diet, both as to the kind and the quantity, are the greatest sufferers.

This,

This, or a similar species of head-ache, is frequently an attendant on a complicated state of the bowels; so that those who are habitually constive, are frequently subject to habitual head-aches, which are readily removed by laxative medicines, or cease on the supervention of a laxity of the intestines from any other cause. Even in the febrile state, when the head-ache may be considered as originating from other circumstances, constipation of the bowels tends to aggravate it greatly. Hence the necessity for the practitioner to attend to the state of the bowels in all cases of head-ache.

A pain in the head frequently occurs, in consequence of its sympathy with the uterine organs, more especially as a symptom of retention or suppression of the catamenia. In the latter case, indeed, it may perhaps be considered as the effect of an increased quantity of blood distributed to the head, rather than a sympathetic pain, since a general plethora is induced by the suppression of an accustomed evacuation. In the same way head-ache is the consequence of the suppression of other habitual discharges, such as old ulcers, and issues, the bleeding piles, or the omission of periodical blood-letting.

Head-ache is a symptom of almost all acute febrile complaints, as well of intermittent as of continued and eruptive fevers. It likewise occurs in certain althenic or debilitated conditions of the body, when it has been called a *nervous* head-ache. This species of head-ache takes place, as Dr. Willan has remarked, "unconnected with any particular febrile disease, from sorrow, fatigue, watching, and from sudden changes of temperature in summer as well as in winter. It is attended with a whiteness of the tongue, and a sensation of weakness or languor. A sharp and quick pulse, in this complaint, produces a throbbing at the temples, and an acute pain through the whole head. When the pulse is slow and feeble, the pain is described as dull and heavy, sometimes girding round the head, sometimes fixed at the nape of the neck. In persons who have constitutionally a very languid circulation of the blood, the latter species of head-ache recurs on every slight occasion, and often becomes periodical, returning every day, or every other day, without any manifest exciting cause." Reports on the Diseases in London, p. 239.

It is obvious, then, that the causes of head-ache may be considered under three heads; namely, whatever compresses or in any manner irritates the contents or the integuments of the cranium itself; whatever irritates or injures those parts with which the head is connected by sympathy, especially the organs of digestion; and, lastly, whatever tends to induce a state of fever or of morbid irritability in the constitution at large. It is frequently extremely difficult, particularly at the commencement of the disease, to ascertain the nature of the cause from which the pain originates. If it arise from inflammation in the brain or its membranes, indeed, it will be easily distinguished by the acute fever, with a quick and hard pulse, the intolerance of light, delirium, and other symptoms of phrensy; and if these occur in children, a termination in hydrocephalus, or dropsy in the head, may generally be anticipated. When the pain attacks those persons who exhibit the marks of plethora before described, and who are affected with great drowsiness, or slight loss of memory, there can be no doubt that the fullness of the vessels of the brain is the immediate cause of the head-ache. And when symptoms of *lues venerea*, or of rheumatism, in other parts of the body, have preceded or accompany the head-ache, it may be pronounced syphilitic or rheumatic accordingly. But it is not only extremely difficult, if not impossible, to determine what the internal organic cause of the head-ache is, or in what part of the brain it is situated,

but also to ascertain whether the cause be really organic, or whether it may arise from sympathy with some other organ, or from the state of the constitution in general. The duration and pertinacity of the pain are often the only source of conjecture as to its organic origin.

With respect to the sympathetic head-aches, the absence of the diagnostic symptoms just enumerated; the obvious condition of the functions of the stomach, bowels, &c.; the known circumstances as to irregularities of diet, &c. which may have preceded the attack; and the feat, the mode, and time of its occurrence, as has been already stated, will contribute to inform us of the nature and origin of the head-ache. And if there be any obvious general debility, languor, or low spirits, with occasional piddings, tremors, and sensations of faintness about the precordia; and, more especially, if grief, watching, fatigue, or such debilitating causes have been acting, the althenic head-ache, before described from Dr. Willan, may be presumed to exist.

After all these circumstances have been duly investigated and considered, the method of treatment to be adopted will readily suggest itself, if the conclusion as to the origin of the complaint be satisfactory. Where the symptoms of phrenitic inflammation are present, general and local blood-letting, blistering, purging, the application of cold, and the whole of the antiphlogistic regimen, must be resorted to. See PHRENITIS. Where there is apparently some internal organic cause, the nature and feat of which cannot be ascertained, the attempt to cure can only be pursued upon general principles; and therefore, upon the supposition that some morbid or preternatural enlargement of some part is taking place, the impetus and quantity of the blood carried to the brain, and the increased action of its vessels, must be diminished by the local detraction of blood, and the application of blisters; which view will also be farther accomplished by the administration of some sedative medicine, such as digitalis, or opium; or with the intention of exciting the activity of the absorbent vessels, by which any morbid growth may be diminished, the use of mercury may be also resorted to. The bowels, in such a case, must be kept regularly open; and every thing which can accelerate the circulation, whether stimulating food or drink, or corporeal exertion, should be carefully avoided. Where the head-ache is apparently syphilitic or rheumatic, it is scarcely necessary to mention that the remedies, which are useful in other forms of syphilis and rheumatism, may be administered with success.

The "sick head-ache," which depends on a disordered condition of the stomach and bowels, occasioned by irregularities of diet, may be readily removed or relieved by emptying the stomach of its ill-digested and noxious contents, by means of an emetic or mild cathartic: but the same paroxysm will be again repeated, unless the causes be avoided. Some persons possess so little self-command, and are so much habituated to indulge in the gratification of the palate, that they pass a great portion of their lives in the constant succession of such attacks. The stomach, however, may be strengthened, and its digestive powers aided, by the use of bitter stomachic medicines, joined with alkalis or preparations of steel; and the remora of the food may be in some degree avoided by the use of rhubarb and magnesia, or the aloetic pills, in moderate quantities. But, as Dr. Fothergill has very judiciously remarked, "whatever process the physician's judgment leads him to pursue, there is one object that will deserve his attention, and will require that of the patient. This disease is not the effect of any sudden accidental cause; it is the effect of reiterated errors in diet, or in conduct, which, by weakening the powers of digestion,

digestion, and otherwise disordering the animal functions, have affected the secretion of those juices, and perhaps the organs themselves, in such a manner, as to require a steady perseverance in the use of such medicines as experience has suggested are most likely to restore them to full health. This change cannot be effected speedily; it requires a patient observance of proper regimen, both in respect to medicine and diet. The former ought, therefore, to be continued, as to be taken without disgust for several weeks together, and to be repeated at proper distances, till the end is obtained, digestion rightly performed, and the bile secreted and discharged as health requires; by which means, all that train of evils, which are the consequences of its detention and disordered state, will be gradually removed. The benefits resulting, in many cases, from the use of the mineral waters, when drank in a proper quantity, and for a proper length of time, are undoubted proofs of the necessity of perseverance in the use of such medicines as may appear, at first sight, of no great efficacy, yet, if well directed and steadily pursued, will at length obtain the most substantial advantages.

"There is another part of our assistance," Dr. Fothergill adds, "which is not less necessary, in this case, than medicine to a perfect recovery, which, perhaps, is too often disregarded both by the patient and the physician; and if I have succeeded in removing many complaints of this nature, where very judicious prescriptions had been used in vain, it has been by entering more minutely into that part of the prescription which depended on the patient's own conduct, than by the use of medicines of greater efficacy than those which had been prescribed by others. We are perhaps too ready, in chronic cases, where digestion is concerned, to confide in the *Materia Medica*, and judge it sufficient to select and enjoin such articles in our prescriptions as are of known use in such cases: but unless the whole plan of diet, both in kind and quantity, is made to conspire with medical prescription, the benefits arising from this are hourly annihilated by neglect or indulgence." *Med. Obs. and Inq.* vol. vi.

It is not easy to point out the articles of diet, or the quantity of food, which should be taken or avoided by different individuals, since what is extremely detrimental to one constitution may be taken in abundance and with impunity by another. Individual experience, if it were carefully attended to, is generally a sufficient monitor. There are some things, however, which, even in small quantities, seldom fail to excite the sick head-ache in many constitutions: such are melted butter, fat meats, and spices; and hence meat pies, which contain all these things united, are a fertile source of this complaint. But perhaps an overloading of the stomach with various things, in themselves even not unwholesome, is one of the most frequent causes of this disorder. By those, therefore, who are liable to this species of head-ache, excess in eating and drinking ought to be studiously shunned.

The asthenic head-ache, which is produced by grief, watching, fatigue, and other debilitating causes, may be soothed by anodyne medicines, and ultimately relieved by the bark, or some other stomachic bitter, which will contribute to restore the strength; and some more diffusible stimulant, such as ammonia (or volatile alkali) in its various preparations, will be used with considerable advantage, especially where the sensations of languor and weakness are very great, and accompanied with giddiness in the head, occasional dimness of sight, &c. The tonic plan, of course, will be also pursued in diet and regimen, and moderate exercise regularly resorted to.

Where the head-ache is a concomitant of general fever, the treatment peculiar to that modification of fever which may be present must be necessarily employed. See FEVER.

CEPHALANTHUS, in *Botany*, (from *κεφαλος*, a head, and *ανθος*, a flower; so called because the flowers grow in a head), button-wood, button-tree, or pond dog-wood, *Linn. Gen.* 113. *Scrb.* 147. *Willd.* 170. *Lam. Illust.* 153. *Juss.* 209. *Vent.* ii. 591. *Gært.* 546. (*Platanoccephalus*, *Vaill.* A. G. 1722.) Class and order, *tetrandria monogynia*. *Nat. Ord.* *Aggregate*, *Linn. Rubiacee*, *Juss. Vent.*

Gen. Ch. Cal. common perianth none; common receptacle globular, villous, collecting numerous florets into a head; proper perianth superior, small, one-lobed, funnel-shaped, angular; border quadrifid. *Cor.* proper monocotyledonous, funnel-shaped; tube slender, longer than the calyx; border quadrifid. *Stam.* filaments four, inserted into the corolla, shorter than the border; anthers globular. *Pistl.* germ inferior; style longer than the corolla; stigma globular. [*Peric.* none. *Seeds* solitary, long, attenuated at the base, pyramidal, woolly, *Linn.*] *Peric.* capsule inferior, crowned with the permanent calyx, inversely pyramidal, four-celled; cells one-seeded, separating from each other as the seed ripens, but without valves, and not opening spontaneously; two of them generally abortive. *Seeds* oblong. *Gært. Lam.*

Gen. Ch. Flowers aggregate, fixed to a globular receptacle. Calyx proper superior, quadrifid. Corolla tubular. Capsule four or two-celled, dividing into four or two parts.

Sp. 1. C. occidentalis, *Linn. Sp. Pl. Mart.* 1. *Lam.* 1. *Willd. Gært.* tab. 86. fig. 7. *Lam. Ill.* tab. 59. (*Scabiosa*, *Pluk.* tab. 77. fig. 4.) "Leaves opposite or ternate; heads terminal, forming a kind of raceme." *Lam.* A shrub, from five to seven feet high. *Stem* a little branched, weak, cylindrical, greyish, leaty, almost its whole length. *Leaves* petioled, egg-shaped, acute, entire, soft, smooth above; the nerves of the lower surface, as well as the petioles, sometimes beset with short hairs. *Flowers* whitish, in small peduncled heads which terminate the stem, three, five or seven together, and form what *La. Marck* calls a kind of raceme, but which, from the terms of his own description, as well as from his figure, is rather an umbel. A native of swamps, in Carolina. A decoction of the wood or root is used as a cure for the bite of venomous animals, and is said to be efficacious in venereal complaints. 2. *C. angustifolius*, *Mart.* 2. *Lour.* *Cochin.* "Leaves lanceolate, linear, opposite." A middle-sized tree, with ascending branches. *Leaves* quite entire. *Flowers* pale, in small terminal heads; common receptacle oblong, villous; segments of the proper calyx awl-shaped, hairy; beset with shining, coloured, peduncled glands. *Fruit* a small compound berry; the acini or component parts roundish, crowned, flaccid, two-celled, inferior; cells one-seeded. A native of *Cochin-China*. 3. *C. procumbens*, *Mart.* 3. *Lour.* "Stem procumbent; leaves ovate lanceolate, alternate." A thick shrub, with many long succulent branches. *Leaves* large, quite entire, tomentous, petioled. *Flowers* violet-coloured, dioecious; in long, interrupted, terminal racemes; the females in a naked globular receptacle, without any perianth, either proper or common; corollas five-lobed, inferior, very many, on long peduncles, forming a ball or head; style capillary, equal to the corolla; stigma simple. *Seed* single, egg-shaped, compressed, naked. A native of *Cochin-China*. 4. *C. montanus*. "Leaves egg-shaped, crenate, alternate." A large tree, with a hempen bark and spreading branches. *Leaves* acuminate, petioled, rough above, tomentous underneath. *Flowers* dioecious, green, on solitary axillary peduncles, forming round-

ish heads, on a naked glohular receptacle; the femals without a corolla; proper perianth almost closed, four-cleft, superior. Seed single, compressed, with a subpappous ring, perhaps from the lacinated tube of the calyx. A native of China. *S. C. flellata*, Mart. 5. Lour. "Leaves stellated, lacinated-linear." A middle-sized tree, with ascending branches. Leaves by threes, quite entire, smooth. *Florsts* white, collected into a ball, with a small egg-shaped receptacle; no common perianth; proper perianth inferior, with fourawl-shaped segments; corolla superior, with a four-cleft reflexed border, four nearly sessile anthers, a long style, and one naked seed. A native of Cochinchina.

We have followed professor Martyn in taking up the last four species from Loureiro, that they might not be entirely omitted; although Loureiro himself confesses that they differ very much from each other, as well as from Linnæus's generic character. The description given by Linnæus of the fruit of his sole cephalanthus is certainly founded on a misconception, and, according to Gærtner, appears to have been made when he was only half awake: fructus negligenter & quasi ex informis descriptit. It is, therefore, entitled to no authority in fixing the generic character. But Loureiro's descriptions of his new species are also in several respects to be confuted, that it is not easy to determine what he means. If, by the fruit of the second species, which he calls a compound berry, we are to understand, as is probably the case, the aggregate fruit of all the proper flowers, it may belong to this genus. What he calls the single naked seed of the fifth, may possibly be a pericarp with three abortive cells, and may not contradict any essential part of the generic character. But the third and fourth seem too refractory to obtain admission. La Marek, in the Encyclopedie, has added to the *C. occidentalis* of Linnæus, two other species, which he calls chinensis and pluliferâ, both communicated by Sonnerat: the former he suspected might be found not to differ from *nauclea orientalis* of Linnæus, but he had then no doubt of its being a real cephalanthus. As, however, he has not inserted them in his subsequent illustrations, he appears to have changed his opinion. See NAUCLEA.

Propagation and Culture. The first species only has been cultivated in England. It has been raised by cuttings and layers, but is chiefly propagated by seeds. These should be sown before Christmas, and will then come up in the next spring: but if they are sown in spring, they generally remain a year in the ground; in which case, the pots should be placed in the shade during the summer, and sheltered under a common frame to protect them from frost in the ensuing winter. The first year, after they come up, they should be shaded from the sun in hot weather; and as they naturally grow in moist ground, should be regularly watered. In the autumn they may be transplanted into sheltered nursery beds, where they may remain a year or two, according to the progress which they have made; and should be finally transplanted in October.

CEPHALAS, in *Ancient Geography*, a promontory of Africa, mentioned by Strabo, situate at the commencement of the great Syrtis. He adds, that it was elevated, and covered with wood. Ptolemy also mentions it. It is thought to be the present cape *Mesurata*.

CEPHALE, a burgh of Greece in Attica, between Prospette and Aphydæ, at some distance from the coast of the Saronic gulf. The Dioscuri, viz. Castor and Pollux, were so highly respected in this place, that they were ranked in the number of the great gods, according to Pausanias. This burgh belonged to the Acamantide tribe.

CEPHALENIA, or CEPHALLENIA, an island of the

Ionian sea, now called CEPHALONIA, which see. It was known in the time of Homer (*Odyss.*) by the names of Samos and Black Epirus, or Epirus Melæna; and had anciently four cities, one of which bore the name of the island, although Ptolemy mentions only two. Strabo tells us, that in his time there were only two cities remaining; but Pliny (*l. iv. c. 12.*) speaks of three; adding, that the ruins of Same, which had been destroyed by the Romans, were still in being. Same was the metropolis of the island, and is supposed to have stood in the place which the Italians call "Porto Guffcardo." The names of the four cities were, according to Theuedides (*lib. ii.*) Same, Prone, Cranii, and Pale.

This island was subdued by the Thebans, under the conduct of Amphitryon, who is said to have killed Pterelas, who then reigned there. While Amphitryon was carrying on the war in Cephalonia, then called Samos, one Cephalus, a man of great distinction at Athens, having accidentally killed his wife Procris in shooting at a deer, fled to Amphitryon, who, pitying his case, not only received him kindly, but made him governor of the island, which from that time was called Cephalonia. After it had been long in subjection to the Thebans, it fell under the power of the Macedonians, and was taken from them by the Ætolians, who held it till it was reduced by M. Fulvius Nobilior, who having gained the metropolis after a four months' siege in the year 189 B. C. sold all the citizens for slaves, adding the whole island to the dominions of his republic. Liv. l. xxxviii. c. 28, 29.

CEPHALICS, in *Medicine*, from κεφαλή, the head, a term given by the older writers on the materia medica, to those articles which relieve the disorders of the head. Under this term were chiefly included certain fragrant, aromatic, and stimulant substances, which, whether applied as odours to the organs of smell, or used as sternutatories, or taken into the stomach, afforded a speedy relief to nervous or asthenic headaches, giddiness, and faintness. In such a condition of the body all cordials would operate as cephalics. The symptoms arise from a languor of the circulation in the vessels of the head, which is accelerated by the general stimulus of cordials taken into the stomach, or the local stimulus of odours or sternutatories applied to the organ of smell, and the headache or giddiness necessarily ceases. The term is now seldom used.

CEPHALIC VEIN, in *Anatomy*, one of the large superficial veins of the upper extremity. See VEINS.

CEPHALOIDES, a denomination given by some writers, who discover virtues in plants from their signatures, to those which bear any resemblance to a human head; such are the poppy, piony, and the like.

CEPHALOMANTIA, from κεφαλή, and μαντíα, divination, an ancient species of divination, or method of foretelling futurity by a dead man's skull.

CEPHALON, in *Ancient Geography*, one of the ancient names of the city of Rome.

CEPHALONIA, or CEFALONIA, in *Geography*, a considerable island of the Levant, in the Mediterranean, near the coast of Livadia to the north-east, and near the coast of Morea to the south-east, opposite to the gulf of Lepanto; about 150 miles in length, and from 30 to 90 at its greatest breadth; anciently called *Cephalonia*, which see. Venice acquired the sovereignty of this island, as a gift from Gaio its lord, in 1224; though it was taken by the Turks in 1479, and held by them for about 20 years. On the fall of Venice, it was seized by the French; and by the 6th article of the treaty of Campo Formio in 1797, renewed and confirmed by the third article of the treaty of Luneville in 1801, his majesty the emperor, king of Hungary and Bohemia, consents that the French republic shall possess, in full sovereignty, the ci-

devant

devant *Venetian islands* of the Levant, viz. Corfu, Zante, Cephalonia, St. Maurice, Cerigo, and other islands dependent thereon; together with Butrinto, Larta, Vouizza, and in general all the ci-devant establishments in Albania, which are situate lower down than the gulf of Lodrino.

The chief articles of commerce in Cephalonia are oil, muscadine wine, and a species of grapes called currants. The air of this island is very warm; the trees are covered with flowers through the winter, and bear ripe fruit twice a year, in April and November; but those which grow in the latter month are smaller than the others. Corn is sown in the winter, and reaped in June. N. lat. $38^{\circ} 10'$ to $38^{\circ} 54'$. E. long. $20^{\circ} 15'$ to $21^{\circ} 30'$.

CEPHALONIA, the capital of the island of the same name; and the see of a bishop united to Zante. N. lat. $38^{\circ} 30'$. E. long. $28^{\circ} 45'$.

CEPHALONNESOS, in *Ancient Geography*, an island of the Euxine sea, in the Carcinite gulf, according to Pliny. It belonged to European Sarmatia, according to Ptolemy.

CEPHALONOMANTIA, compounded of κεφαλον, head, ομοι, ofis, and μαντια, divination, a method of divination, or revealing secrets, by means of an ass's head broiled on the coals. After muttering a few prayers, the names of several persons suspected of a theft, or the like, were repeated over: he at whose name the ass's jaws made any motion, or the teeth began to chatter, was held for convicted.

CEPHALO-PHARYNGEUS, in *Anatomy*, a term applied by some writers to the middle constrictor of the pharynx. See *CONSTRICTORES pharyngis*.

CEPHALOPHORA, in *Botany*, (from κεφαλον, and φεω bearing its flowers in heads.) Willd. 1463. Cavan. Sp. C. tab. 599. Class and order, *syngenesia polygamia equalis*. Nat. ord. *Compositae discoideae*, Linn. *Corymbiferae*, Juss.

Gen. Ch. Cal. common, composed of two rows of linear, acute leaflets; receptacle globular, honey-combed, naked. Cor. florets tubular, hermaphrodite. Seeds solitary, top-shaped, striated, truncated; down composed of six or seven awl-shaped, transparent, chaff-like leaflets.

Eff. Ch. Receptacle naked, hemispherical; down chaff-like, many-leaved; calyx many-leaved, reflexed.

Sp. C. *glauca*. Root perennial. Stem herbaceous, hard, cylindrical, striated, branched. Root-leaves oblong egg-shaped, lessening into a petiole; stem-leaves linear, alternate, sessile, glaucous, rather rough. Flowers terminal, solitary, yellow; peduncles thickened. A native of Chili.

CEPHALOPONIA, from κεφαλον and ποσις, pain, a denomination given by some to the cephalalgia, or head-ache.

CEPHALOTOMI, in *Ancient Geography*, a people of Asia, placed by Pliny towards mount Caucasus, and on the borders of the Euxine sea.

CEPHALOUS, a town of the island of Cyprus, watered by the river ALOS.

CEPHALUS, in *Ichthyology*, the name given by Aristotle, Ælian, Apian, and others to the mullet, *musil cephalus*, which see.

CEPHENE, in *Ancient Geography*, a country of Armenia, more generally called *Sophene*.

CEPHENES, a name anciently given by the Greeks to the Persians.

CEPHENIA, a name which, according to Agathemerus, was given to Ethiopia; and which seems to have been derived from the fabulous Cepheus.

CEPHESIANS, a lake, so called by Scylax, situated on the coast of Africa.

CEPHEUS, in *Astronomy*, a constellation of the northern hemisphere, being one of the 48 old asterisms; whole stars.

in Ptolemy's Catalogue, are 13; in Tycho's, 11; in Hevelius's, 51; in the Britanic Catalogue, 35.

Dr. Herschel has given an account of the lustre of the 35 stars in this constellation, in his third catalogue of the comparative brightness of the stars; (Phil. Trans. for 1797, pt. ii. p. 314.) and he observes that the γ , in the neck of Cepheus, marked δ by Bayer, consists of two stars. Mr. Goodricke infers from a series of observations on the star δ Cephei, that it has a periodical variation of $5^{\circ} 8' 37\frac{1}{2}$, during which time it undergoes the following changes; viz. it is at its greatest brightness about one day and thirteen hours; its diminution is performed in about one day and eighteen hours; it is at its greatest obscurat on about one day and twelve hours; and it increases about thirteen hours. In the first point, it appears as a star of between the 3d and 4th magnitude, though its relative brightness does not seem always to be quite the same. In the third point it appears as a star of between the 4th and 5th magnitude, if not nearer the 5th; and its relative brightness is as follows: nearly equal to ϵ and ζ Cephei, and considerably less than γ Lacertæ. The relative brightness and magnitude of these stars with which the variable one was compared are as follow: ζ Cephei, the brightest, is between the 3d and 4th magnitude; ϵ Cephei, the next brightest, is between the 4th and 4th; γ Lacertæ; is less than ϵ Cephei, and of about the 3d magnitude; ϵ Cephei is between the 4th and 5th magnitude; and ζ Cephei, which is a little less than ϵ , is between the 5th and 4th. The variation of the star δ was corroborated by the observations of Mr. Pigott. Phil. Trans. vol. lxxvi. p. 43, &c.

CEPHEUS, in *Fabulous History*, a king of Ethiopia, father of Andromeda by Calliope. See ANDROMEDA. Cepheus was one of the Argonauts, and after his death, became a constellation. There was another Cepheus, prince of Arcadia, and favoured by Minerva, who transferred to his head a lock from the head of Medusa, by which he was rendered invincible. He is mentioned by Apollodorus as the son of Lycurgus, and hunter of the Caledonian boar. A third Cepheus is said, by the same author, to have been the son of Aleus, an Argonaut, king of Tegea, father of Sterope, and an associate of Hercules, in opposition to Hippocoon.

CEPHISSIA, in *Ancient Geography*, a village of Greece, in Attica, near Athens.

CEPHISSIA, a fountain of Attica, according to Pliny.

CEPHISSIS, or COPAIS *lacus*, a lake of Bœotia, which took its name from the river Cephisus, which discharged itself into this lake. Its name, Copais, was formed from the town of Copes, seated upon its banks. Pausanias says (l. ix. Bœotic. c. 24.) that there were two towns on this lake, viz. Athens and Eleusis, which had been swallowed up by its inundations.

CEPHISSUS, or CEPHEUS, a river of Greece, which had its source in the mountains that separated Phocis from Thessaly, which range of mountains was called Oeta. Its course was from north-west to south-east. In its progress it received several rivers, such as the Lileæ, the Pindus, and the Chicalis; and before it entered Bœotia, it ran at the foot of a mountain, where was the district called Pariopotamus. In Bœotia it received the Heresna and the Melas; and to the south of Orchomene it discharged itself into the lake Copais, or Cephisus. This river was celebrated in fabulous history; as the graces delighted to bathe in it, and were thence styled the goddesses of the Cephisus. This river, or rather river god, is said to have been enamoured of several nymphs, all of whom slighted his passion.

In Attica there were two rivers of this name, one, which

was the most easterly and the most considerable, commenced north of Decelia, ran towards the south as far as Cephalia, and to the south-west on the north of Athens, near the northern wall of the Piræus, and discharged itself in the port of Phalerum. See ATHENS. The other river commenced N. of Phyla, and flowed into the Saronic gulf, near Scirus. Near its mouth were found several statues, and one in particular of a young man, who cut his hair in order to consecrate them to the river, according to the custom of the ancient Greeks. Pausanias, in *Attic. c. 37*.—*Cephalus* was also the name of a river of the Peloponnesus in the Argolide, according to Pausanias.—Ortulus mentions a river of this name in the Isle of Salamine; a river of Greece in Siciloma; and another of the same name in the Isle of Siculus.

CEPHRO, or ΚΕΡΡΟ, a village and desert of Egypt, at the entrance of the deserts of Libya; to which were banished Demetrius of Alexandria, St. Maximus, &c.

CEPHUS, or ΚΕΦΗΥΣ, in *Ornithology*, the name by which the black-headed gull has been described by some writers. See *Larus rubicundus*.

CEPUS, in *Zoology*. See CEPUS.

CEPHYRA, in *Mythology*, daughter of Oceanus, who is fabulously reported to have educated Neptune.

CEPI, in *Ancient Geography*, a maritime place of Asia Minor, placed by Cadrenus at the mouth of the Meander.—Aliso, a town in the island of Coccocondom, upon the Euxine sea, at the entrance of the Cimmerian Bosphorus, according to Pliuy; who lays, it was a colony of the inhabitants of Miletus. Strabo calls it Cepus; and it is denominated Cεπε by Mela and Diodorus Siculus.

CEPI corpus, in *Law*, a ratura made by the sheriff, upon a capias, or other process to the like purpose; signifying, that he hath taken the body of the party.

CEPIANA, in *Ancient Geography*, a town of Spain belonging to the Celtes of Lusitania.

CEPIC, in *Geography*, a town of Istria; 4 miles S. of Pedena.

CEPION, in *Antiquity*, the name of a particular air, invented by a disciple of Terpander, and designed to be played on the CITHARA.

CEPIONIS Turris, in *Ancient Geography*, a place of Spain, in Bætica.

CEPIONITES, in *Natural History*, a name given by Pliny, and other ancient writers, to a species of stone, seeming to approach to the nature of the JASPER. Pliny tells us that there were many kinds of it, some more pellucid than others, and some colourless; others variegated with green and the other colours of the jaspers and agates: they were all used in the ornamenting of houses; and the least beautiful served, when well polished, to make speculums of.

CEPITES, in *Natural History*, a name used by the ancients to express a gem which gave the representation of the several clusters of plants and flowers in the beds of a garden, with naked veins, expressing the walks between. The common text of Pliny is unintelligible, where he gives the description of this stone; but S. Inafius has restored it from some old copies, so as to make it sense, and expressive of this meaning. The stone was probably no other than a peculiar kind of that agate which the ancients called *dendrites*, and we the *MOCCAGONES*.

CEPOLA, in *Ichthyology*, a genus of *theriac* fishes, which have the head roundish, and compr. bed; teeth curved, and placed in a single row; gill membrane six rayed; body ensiform, naked; belly rather shorter than the head.

CEPOLA tenuis, with caudal-fin tapering, wedged; and head very obtuse. It is a native of the Mediterranean sea,

and is sometimes found of the length of three, four, or five feet, but more commonly does not exceed two feet in length. The head is short and rounded; mouth large, and the lower jaw rather exceeding the upper one in length. Both jaws are armed with sharp curved teeth, placed in a single row in the upper, and in a double row in the lower jaw. The tongue is broad and tough; the eyes very large, with silvery iris, and black pupil, and placed vertically in the head. The abdomen scarcely larger than the head; body remarkably long, gradually tapering to the tail, and of extreme thickness in proportion to the length, whence it obtained the name of *imbitus* or ribband-fish among ancient Ichthyologists. The general colour is silvery, hoary on the back, and the fins are speckled, and marked with rather large reddish spots; the lateral fins red-dish, and the fins reddish. This fish is confined to the great neighbourhood of the shores, in order more ready to obtain its food, which consists principally of crabs, and other crustaceous animals. The flesh is scarcely eatable.

CEPOLA vulgaris. Caudal-fin tapering; jaws sharp, pointed, Linn. *Ophidium macrophthalmum*, S. & N. x. *Tanna serpens rubicentis*, Licia, Artedi.

Supplied by Gmelin and others to be, perhaps, a variety of the preceding; it is smaller, and of a pale red colour throughout. It abounds in the Mediterranean, and has been lately discovered on the coast of Devonshire. Vide Linn. Transf. and Donov. Brit. Fishes.

CEPOLA *trachiptera*. Head sloping; both jaws arched; fins precisely, serrated, and rough.

Found in the Adriatic. The lateral line in this species is straight, with a single row of scales.

The hermannian band-fish, *cepola hermanniana* of Dr. Shaw's zoology, appears to differ in so many particulars from the true cepole, that we are of opinion with Cepede, that it ought to form a genus altogether distinct from them.

CEPOLAPITES, in *Natural History*, a name given by some to the stone properly called CEPITES, a kind of *MOCCAGONE*.

CEPPHUS. See CEPHUS.

CEPULA, in *Ichthyology*, a name by which Gesner and some other authors have called the common ribband-fish. It is derived from the Italian word *cepole*, the familiar name of the same fish in the markets of Rome. This is the *cepola tenuis* of modern naturalists.

CEPUS, or ΚΕΦΗΥΣ, in *Zoology*, a name assigned indifferently by old writers to several monkeys of the smaller kind that have more or less green among their other colours. The only monkey so named by modern naturalists is the *monflac, simia cephus* of Schreber.

CERA *prima et extrema*, in *Roman Antiquity*, were terms applied to wills and testaments, from the circumstance of their being usually written on tables covered with wax, because in them a person could easily erase what he wished to alter. Hence *cera* is put for *tabula cerata* or *tabula testamenti*, (Juvenal. l. 6.); and *prima cera* is used for *prima pars tabulae*, the first part of the will, (Hor. Sat. ii. p. 53.); and *cera extrema* or *ima* for the last part, (Cic. Verr. i. 36. Suet. Juvenal. 82.)

CERACE, in *Ancient Geography*, a town of Macedonia, so called by Polybus, seated near the lake Lichorydes.

CERACHATES, in the *Natural History of the Ancients*, the name of a species of agate of a plain yellow colour, and very much resembling yellow wax. We have it from the East Indies, as also from New Spain, and some other parts of America; and our jewellers sometimes work it into toys of small value.

CERAM, in *Geography*, one of the spice islands in the East Indian Sea, about 190 miles in length, and 40 in breadth; low towards the shore, and in the interior parts, which are little known, very mountainous. Several chains of mountains run parallel to one another, in the direction of east and west, and are separated by fertile valleys that support a luxuriant vegetation. Its high mountains, some of which are at least 1,200 toises in perpendicular elevation, and yet frequented by the natives, afford effectual protection to their inhabitants; so that the Dutch have only been able to attach to its government of Amboyna a comparatively small number, settled on the lower parts of the island, near the sea. This island is said to contain 30,000 fighting men. It produces clove-trees, which the policy of the Dutch has induced them to destroy along the coasts, to which their influence extends; and it has also large forests of the fago-tree, which furnishes a considerable article of exportation. S. lat. about 3°. E. long. about 128° to 131°.

CERAM-LAOUT, an island of the East Indian Sea, near the island of Ceram, above five miles long, and scarcely three broad; mountainous, and uninhabited. It has a bay on the north coast.

CERAMBYX, in *Entomology*, a genus of insects in the order COLEOPTERA.

The generic character of the Cerambyces is variously defined by different writers. Linnæus describes it as having the antennæ composed of articulations, which gradually diminish in size as they approach towards the extremity: thorax either gibbous laterally, or armed with spines: wing-cases linear, or of equal breadth throughout; and the feet consisting of four joints.

This Linnæan definition of the genus applies to such a vast number of insects, which, in other particulars, possess an evident generic dissimilarity, that later authors have found it absolutely requisite to divide the Linnæan Cerambyces into several distinct genera. Linnæus was himself aware of the inconvenience of retaining many of his Cerambyces in this genus; but in order to comprise them, divided the genus into five distinct sections. Those families, or sections, so far as they relate to the few species known to the Swedish naturalist, may, perhaps, be found sufficiently comprehensive by the Linnæan entomologist; but when we reflect on the vast number of new species, described by the indefatigable Fabricius, by Olivier, and other still later writers, not to mention the many species that are to be yet found in our cabinets, that have not been described by any author, those subdivisions will at once appear incompetent for their arrangement. We must constitute new genera for their reception, or if we are to follow in servile imitation, we cannot dispense with the institution, at least, of several new subdivisions, to comprise them. The Linnæan subdivisions of the Cerambyx genus stand in the following order:

* Those which have the thorax armed on each side with moveable spines—This is exemplified in *Cerambyx Longimana*. Linn.

** Those in which the thorax is margined, and armed at the sides with spines—As in *Cerambyx cinnamomeus*. Linn.

*** Those having the thorax round, and armed with fixed spines—As in *Cerambyx futor*. Linn.

**** Those with the thorax unarmed and somewhat cylindrical—As in *Cerambyx punctatus*. Linn.

***** Those with the thorax unarmed, roundish, somewhat globose, and flattened on the upper side—As in *Cerambyx violaceus*. Linn.

Two writers of respectability, Geoffroy and Schæffer, form several new genera of the different kinds of Linnæan

Cerambyces. Their genus *Prionus* consists of those which have serrated antennæ placed in the eyes, or surrounded and embraced at their base by the eyes. The true *Cerambyces*, according to these authors, are such as have the antennæ gradually tapering from the base towards their extremity, and are placed in the eye, and have the thorax armed with spines. Those Linnæan Cerambyces, which have setaceous antennæ placed in the eyes, and the thorax cylindrical and unarmed with spines, are referred to their genus *Leptura*; and their genus *Stenocorus* comprehends those which have the antennæ tapering towards the extremity, but have their base originating before the eyes; and the wing-cases diminishing in breadth towards their point. This last genus *Stenocorus* is divided into two families, the first of which only belongs to the Linnæan Cerambyces, being such as have the thorax armed with spines; the other to the Linnæan *Lepturæ*, having the thorax destitute of spines. Scopoli likewise has made some alterations in the *Cerambyx* and *Leptura* genera; his character of the first is, however, vague and indefinite; he assigns it the power of emitting a sound or noise by the friction of the thorax, where it lies close to the body, as a character of the genus, and has, by this means, placed several of the true Cerambyces, which have not this property, among his *Lepturæ*. The remainder of the Linnæan Cerambyces he separates into two divisions, the first containing those which have the thorax armed with spines, and the other those which have the thorax destitute of spines.

Olivier found it requisite to divide the Linnæan Cerambyces into several genera; La Marck and Latreille have done the same; but the most important innovations that have been made on the Linnæan genera are to be found in the different entomological publications of Fabricius. Contrary to the Linnæan method, his characters of genera are taken from parts of the mouth, which cannot readily be so examined as those which Linnæus has taken, or it would be impossible to deny the manifest superiority of the Fabrician genera over those of Linnæus. Notwithstanding that Fabricius constitutes so many genera of the Linnæan Cerambyces, and that his characters are so dissimilar, those genera appear so natural and well selected, that other characters, even after the Linnæan method, may be applied with propriety to nearly the whole of them. This is in particular obvious in the genus *Prionus*, as well as *Lamia* and *Saperda*, each of which possess Linnæan characters, if they may be so expressed, distinct from those which characterize the true Cerambyces, although in the system left us by Linnæus, they could not be referred to any other genus. In a work recently published, on the entomology of New Holland, and the contiguous islands, we have endeavoured, under this persuasion, to reconcile the Fabrician genera, *Prionus*, *Lamia*, *Stenocorus*, and *Saperda* to the Linnæan arrangement, by assigning to each a new generic definition after the manner of Linnæus, and conceive there can be neither difficulty, nor impropriety, in reconciling many other of the Fabrician genera to the Linnæan method in a similar manner. As subdivisions of the Linnæan genera, the Fabrician genera might be eminently useful, should increasing the number of new genera be thought objectionable. It must be regarded as no inconsiderable improvement, in the last edition of the *Système Naturel*, that Gmelin has availed himself, in a great measure, of the Fabrician genera as subdivisions of his genus *Cerambyx*.

The genus *Cerambyx* comprehends an amazing number of the larger and most beautiful of all the coleopterous insects. In the larva state they resemble soft, oblong, slender worms, with a shelly head, furnished with strong jaws,

and six feet on the anterior part. They live principally in trees, the inner part of which they bore through, reducing the wood to powder, and undergo their changes from the larva to the pupa, and thence to the perfect state, in the cavities which they bore. In the larva state, they are sometimes eaten; in the West Indies these larvae are collected by the negroes as an article of luxury for the tables of their owners, and are in great esteem. Many of these insects possess a powerful odoriferous smell similar to that of the European species *Melobatus*. The antennæ, in many of the species, are longer than the body.

In describing the species of this extensive genus, we shall mention those first which stand as true Cerambyces in the Fabrician, as well as Linnean, systems; the other genera *Prionus*, *Lamia*, &c. will be also introduced under the present article for the sake of perspicuity.

Genus CERAMBYX.

Antennæ setaceous: feelers four: thorax spinous or gibbous: wing-cases linear: jaw obtuse and armed with a single tooth. Feelers four, filiform: jaw obtuse, with one tooth: lip bifid: antennæ setaceous. Fabr.

CAPRICORNE. Antennæ setaceous, long, situated in the eyes: feelers four, equal: eyes crescent-shaped: jaws bifid. La Marck.

CERAMBYX GIRAFFA, black: thorax unarmed, elongated, with transverse rugose striæ: wing-cases scabrous at the base, and smooth towards the apex. Donovan. Inf. N. Holland. C. Giraffa, Transf. Linn. Soc.

FICHTELII. Brassy olivaceous: head broad; eyes prominent and divided: wing-cases attenuated, lengthened at the tip, and somewhat bearded. Donovan. Inf. N. Holland. C. Fichtelii, Transf. Linn. Soc.

CERAMBYX MOSCHATUS. Thorax spinous: shining green and purple: antennæ moderate and blue. Linn. Olivier, &c.

This insect is found on the willow in European countries, and is generally known in England by the name of Goat-chaffer, or musk-beetle, which last it merits particularly, the insect emitting a powerful smell of musk when alive. Length, including the antennæ, about three inches.

VIRENS. Thorax rounded, and spinous: body green: thighs rufous. Olivier, &c.

This is a native of Jamaica; the larva is found in the trunk of the amyris balsamifera. Dr. Schwartz. It is observed of this species, by Fabricius, that it varies in having the antennæ longer or shorter than the body, and the thighs toothed or unarmed. These supposed varieties are most probably distinct species.

NITENS. Thorax rounded and somewhat spinous: shining green: thighs clavated, the club of the four anterior ones rufous. *Cerambyx nitens* of Olivier. Inhabits Africa. Mus. Donovan. Described by Fabricius from the Bankian cabinet. The antennæ are twice the length of the body, and of a black colour: the body entirely green and shining: legs black: posterior flanks compressed.

AFFR. Thorax rounded and spinous: body green: antennæ and legs rufous. Fabr. This is *Cerambyx aser* of the Linnean mantilla 532. The front is retuse: antennæ scarcely longer than the body, and rufous: thorax rugose: wing-cases attenuated: four anterior thighs clavated.

VITTATUS. Thorax spinous, shining green: thorax and wing-cases lined with black. Fabr. The antennæ are of a moderate size and black: wing-cases obtuse: thorax with two dorsal black lines: thighs unarmed and rutous, flanks black.

FESTIVUS. Thorax spinous and green: wing-cases violaceous, greenish at the base: thighs ferruginous, and

armed with a frog's tooth. Fabr. Discovered by Mr. Smeathman on the banks of the river Gaboon in Africa. The antennæ are of moderate length, black, with the first joint rufous: two obtuse spines on each side the thorax: thighs ferruginous: flanks brown.

VELUTICUS. Thorax spinous and blackish, with a deep black stripe. Fabr. The antennæ of this insect are of a moderate length: the body black; wing-cases obtuse, with the dorsal stripe velvety; posterior flanks compressed, and spinous at the apex. This kind inhabits America. Dr. Schultz.

SERICUS. Thorax spinous, body black and silky: future and stripe of the wing-cases greenish: thighs rufous. Fabr. This insect inhabits South America. The antennæ are black; head and thorax deep black, velvety, and spotted with shining green.

SUTURALIS. Thorax spinous; body black; future of the wing-cases, and stripe in the middle golden. Fabr. Olivier, &c.

Described by Fabricius from the Hunterian cabinet. It inhabits South America. The abdomen is black, beneath bluish and glossy; legs black; thighs clavated; posterior thighs and flanks compressed.

ELEGANS. Thorax spinous, and, with the head, brassy green and glossy; wing-cases dusky; antennæ long and rufous; legs rufous. Fabr. Inhabits America. The antennæ in this species are twice the length of the body.

LATIPES. Thorax spinous, depressed; body greenish; wing-cases cupreous; flanks dilated and compressed. Fabr. Inhabits the Cape of Good Hope.

LONGIPES. Thorax somewhat spinous, azure; body green; antennæ twice the length of the body; thighs clavated. *Saperda longipes*. Fabr. Mant. *Cerambyx longipes*. Fabr. Ent. Syst. *Cerambyx fufiformis*. Degeer. A native of the Cape of Good Hope. The antennæ are of a blue colour, dusky at the tip; legs long, and of an azure colour.

INTERRUPTUS. Thorax spinous, deep black; wing-cases with three linear white spots; antennæ short. Fabr.

Described by Fabricius from the museum of Olivier. The antennæ are shorter than the body, which last is black; posterior legs longer than the rest, and with the flanks compressed. Native place unknown.

CERDO. Thorax spinous, rugose, black; wing-cases rounded; antennæ long. *Cerambyx Cerdo*. Linn. Inhabits Europe.

HEROS. Thorax spinous, rugose, black; wing-cases somewhat spinous, and pitchy; antennæ long. Geoffr. &c. Found on the oak in Europe.

SPINICORNIS. Thorax somewhat spinous, and black; wing-cases greenish with spinous tips. Fabr.

This insect is described by Olivier, under the name of *Cerambyx torridus*. It inhabits Africa. The antennæ are long and black, with the third, fourth, fifth, and sixth joint spinous at the tip; thorax black, with three tubercles on each side, the lateral ones obtuse; legs black; thighs clavated.

ATER. Thorax somewhat spinous, black; antennæ moderate, and annulated with rufous and black. Fabr. Olivier, &c. Inhabits the Cape of Good Hope. This is much less than the last mentioned species. The body is black; breast cinereous and glossy; legs black; thighs at the base reddish; posterior legs long.

BATUS. Thorax rugose and somewhat spinous; wing-cases spinous at the apex; antennæ long, with hooked spines. *Cerambyx Batus*. Linn. Inhabits South America.

FERRUGINEUS. Thorax armed with sharp spines, rugose

gose and black; wing-cases ferruginous; antennæ long. *Cerambyx ferrugineus*. Linn. Inhabits the East Indies, *Cerambyx gigas* of the Fabrician Mantissa.

ALPINUS. Thorax spinous; head, and four spots on the wing-cases, black; antennæ long. Linn. Found in some parts of Europe, not hitherto discovered in England. Its size is rather less than that of *Cerambyx M-fimbriatus*, or Mistle Beetle.

SCALARIS. Thorax spinous and fuscous, with a white longitudinal line; antennæ long. Fabr. A native of South America, described by Fabricius from the Banksian cabinet. The antennæ are three times the length of the body; head fuscous; orbits of the eyes, and dorsal line white; thorax armed with acute spines, fuscous with a dorsal line of white; wing-cases fuscous with a white dot in the middle and indented future.

EBULINUS. Thorax spinous, green and brassy; wing-cases testaceous; antennæ short. Fabr. This kind inhabits Africa, and was first described by Fabricius, from a specimen in the collection of Dr. Hunter. The antennæ are serrated; thorax uneven, and without spots.

MARIO. Thorax furnished with two spines, rugose and black; antennæ long and ferruginous. Fabr. From the same cabinet, as the preceding. This species inhabits Cayenne. The antennæ are twice the length of the body, cylindrical, and ferruginous, with the first and second joint cuticle; black, and the three next black at the base; thorax rugose, with two spines on each side, the posterior one of which is largest; wing-cases smooth, impressed at the base, and at the tip truncated.

KAEHLERI. Thorax spinous, black; wing-cases fanguineous, with a black spot. Linn. Found in the south of Europe, and varies in being sometimes without the black spot on the wing-cases, and sometimes marked with a rufous lateral spot. Wing-cases notched at the extremity.

LUNDII. Thorax spinous, fanguineous; antennæ, tips of the wing-cases, abdomen, and legs black. Fabr.

Described by Fabricius from the cabinet of Lund, who received it from Tranquebar. Size of C. KaeHLeri. Antennæ short and black; thorax gibbous, spinous, fanguineous, and without spots; scutell black; breast fanguineous; abdomen black, with acute rugous tubercle between the second pair of legs; thighs slightly clavated.

SUCCINCTUS. Thorax rugose, with two spines; wing-cases banded with yellow; antennæ very long and compressed. Linn. Inhabits America and Brasil, and is mentioned by Degeer under the title of *Cerambyx fusco-castaneus*. Infr. 5, 113; &c.

DESFONTAINII. Thorax spinous, fanguineous, spotted with black; wing-cases fanguineous and black at the tip and base; antennæ very long. Fabr.

In the collection of Desfontaines. This kind inhabits Barbary. The head is black; wing-cases smooth, with a small black spot at the base, and a larger one at the apex; body black and without spots.

STRIATUS. Thorax somewhat spinous, rugose, ferruginous; wing-cases striated with yellow; antennæ long. Olivier, Fabr. &c. Inhabits Cayenne. Described from the Hunterian collection. The antennæ are cylindrical, twice the length of the body, ferruginous, and black at the tips. Head ferruginous with three vertical black dots; thorax rugose, with two spines on each side, and dotted with black; scutell black at the tip; wing-cases ferruginous with four yellow streaks; thighs black at the tips.

RUFIPES. Thorax rufous, and armed with two spines; wing-cases smooth and black; antennæ long. Fabr. A native of South America. The antennæ are longer than

the body, and yellowish, with the tips of the joints ferruginous; posterior thoracic spine largest; wing-cases glabrous, with a large impressed dot at the base; legs yellowish with the tips of the thighs black; abdomen black.

DIMIDIATUS. Thorax armed with two spines, and rugged, yellow with black dots; wing-cases black, yellow at the base; antennæ moderate. Fabr.

The head of this insect is yellow, with three vertical black dots; posterior spine on the thorax largest, and yellow with black dots; wing-cases glabrous, black, with the future and base yellow; body yellow with half the abdomen black; legs yellow.

BIOLOR. Thorax armed with two spines, tuberculated and ferruginous; lower half of the wing-cases, and the body black. Olivier, &c. Inhabits Cayenne; first described from the cabinet of Von Rohr. The antennæ are moderate, ferruginous at the base, in the middle yellow, and at the extremity fuscous; head ferruginous; throat prominent and acute; a large impressed dot at the base of the wing-cases; legs ferruginous.

DEPRESSUS. Thorax armed with many spines, depressed, black, variegated with cinereous; wing-cases pointed; antennæ long. Olivier, Vœt, &c.

The head is black with cinereous villous impressed spots; thorax beset on each side, with about four or five short spines; wing-cases striated; legs black.

FASCIATUS. Thorax spinous, azure; wing-cases banded with yellow; antennæ moderate; yellow, blue at the base and tip. Found in Tranquebar by Dr. Koenig. The antennæ are compressed, and blue; the last four joints but one yellow; the last blue; legs blue, the posterior ones compressed. Olivier, Pallas, &c.

BARBICORNIS. Thorax spinous; four first joints of the antennæ bearded with black; body testaceous, variegated with black. Fabr. This species inhabits the East Indies.

NEBULOSUS. Thorax spinous; wing-cases dotted and striped with black; antennæ long. Linn. Inhabits the trunks of pine trees in Europe, and is found in England. Donovan. Brit. Inf. Length half an inch.

OSCURUS. Thorax spinous, villous and fulvous; wing-cases black, with a villous fulvous spot behind; antennæ moderate. Fabr.

Size of the preceding; antennæ length of the body; wing-cases somewhat scabrous; legs black with yellowish flanks. Inhabits the Cape of Good Hope. Lund.

GRISEUS. Thorax spinous and fuscous; wing-cases smooth with grey bands dotted with black; antennæ very long. Fabr.

This species inhabits Germany (Loewenskiold.) It bears a great resemblance to *Cerambyx Nebulosus* but is larger, and has the antennæ three times the length of the body. The head and thorax are fuscous, very slightly spotted; wing-cases with a dusky band at the base, and another in the middle, and also the tip cinereous dotted with black; body cinereous; thighs dotted with black; flanks black at the tip.

COSTATUS. Thorax spinous, grey; wing-cases with elevated lines dotted with black and at the tips fulvous; antennæ very long. Fabr.

Size of the last. The antennæ twice the length of the body, black, with the joints whitish at the base, head and thorax grey, the latter armed with a single spine; wing-cases grey at the base with four elevated lines; legs grey.

HISTIVUS. Thorax spinous; wing-cases whitish at the base, and bidentated at the tip; antennæ of moderate size and hairy. Linn. *Le capricorne à deux dentées*. Geoffr. *Cerambyx fuscicollatus*. Degeer. Inhabits Europe, and is found

from the England. Donov. Brit. Inf. This insect is small, the general colour cinereous, sprinkled with black dots, and marked across the middle of the wing-cases with white.

FASCIATUS. Thorax spinous; wing-cases entire, with three lary dots; antennæ moderate and hairy. Panzer, Hybner &c. Inhabits Germany. The head and thorax of this species are fulvous; wing-cases pale at the base; legs grey.

PILOSUS. Thorax armed with two spines; wing-cases grey with a single tooth at the tip; antennæ moderate and hairy. Olivier.

This kind is found in Saxony. Hybner. It is smaller than *Cerambyx l'hipidus*; wing-cases grey, paler at the base.

BALTEATUS. Thorax slightly spined, and brown; wing-cases banded with fuscous. Linn. Inhabits Portugal.

RUGICOLLIS. Thorax unarmed, very rough and black; antennæ moderate, and with the legs pitchy. Fabr. Inhabits Tranquebar, (Hybner.) The antennæ are compressed; wing-cases black, obtuse at the tip, and nearly truncated; legs pitchy.

BIMACULATUS. Thorax unarmed and rufous; wing-cases testaceous with a black spot; antennæ short. Fabr. Found in the East Indies. This is of the middle size; the antennæ are villous, rufous, and shorter than the body; head and thorax villous, rufous and immaculate; thorax tuberculated, and very slightly spinous; wing-cases dotted; legs testaceous. Mus. Lund.

SPLENDIDUS. Thorax somewhat spinous and rufous; wing-cases testaceous, black-blue at the base; antennæ short. Fabr.

Described from the cabinet of Lund. The species inhabits Tranquebar. It resembles *C. bimaculatus*; the antennæ are rufous at the base, testaceous in the middle, and brown at the tip; head punctured, rufous, and without spots; thorax rounded, dotted and armed with a small short, obtuse spine on each side; wing-cases with three smooth elevated striæ; body villous; abdomen rufous, with a prominent tooth beneath, and correspondent lateral groove in the thorax; legs rufous.

LONGICORNIS. Thorax unarmed; back flat; body varied with grey and fuscous; antennæ very long. Fabr.

Inhabits the coast of Coromandel. Antennæ thrice the length of the body; black, the joints cinereous at the base; head cinereous, base and lateral line black; thorax flat above, and much impressed, brown and cinereous varied; wing-cases with punctured striæ; body cinereous. From the Bankian cabinet.

MARGINALIS. Thorax unarmed; wing-cases somewhat testaceous, and surrounded with a black margin. Fabr. A native of the Cape of Good Hope. Antennæ moderate, and pitchy; head brown; thorax ovate, fuscous, bordered behind and in front with black; wing-cases smooth; legs blackish.

BREVICORNIS. Thorax unarmed, green; wing-cases dusky; antennæ short and black. Olivier &c. From the Bankian cabinet.

Obs. The head is green; antennæ compressed; thorax dotted, green and shining; wing-cases smooth, and greenish; legs black, thighs elevated; the four anterior ones rufous, posterior greenish.

JUVENEX. Thorax unarmed, and rugose; wing-cases pointed, black, with hoary down; antennæ very long. Linn. Inhabits America.

HOLOSERICUS. Thorax unarmed, rugose, griseous; wing-cases armed with a single tooth, silky, with a brown and cinereous hue; antennæ moderate. Fabr.

Inhabits the East Indies. Head grey; body beneath shining. Olivier &c.

CINEREUS. Thorax unarmed, and somewhat rugose, cinereous and without spots. Fabr. From the cabinet of Lund. This is a native of Tranquebar.

Genus PRIONUS.

Antennæ setaceous; eyes reniform, embracing the base of the antennæ; thorax flat, and marginate, the margin often times crenated; body oblong, and depressed. Donov. Inf. N. Holland.

Genus PRIONUS. Feetlers four; filiform; jaw cylindrical and entire; 1 p. short and membranaceous; antennæ setaceous. Fabr.

P. LONGIMANUS. Thorax armed with moveable spines; wing-cases with a single tooth at the base, and bidentated at the tip; antennæ and fore legs very long. Fabr. *Cerambyx Longimanus* Linn. This is an insect of large size, the body exceeding three inches in length, and having the antennæ, and first pair of legs remarkably long in proportion; the colour is pale whitish grey varied with yellow and orange, and a number of black interrupted lines. It is a beautiful species, and inhabits South America.

LEPIDOPTERUS. Pitchy, rufous; wing-cases with grey villous spots and three elevated longitudinal lines; base gibbous, tip truncated. Donov. Inf. N. Holland. *Prionus lepidopterus*. Trans. Linn. Soc.

This insect is of a large size; the species is named *Lepidopterus* from the villous spots on the wing-cases, which, when attentively examined, appear clothed with a sort of scaly down, or feathering, most exactly resembling that which we observe on the wings of lepidopterous insects.

FASCIATUS. Thorax somewhat marginated, and unarmed; black, downy; wing-cases chestnut clouded with yellow, and rounded at the tip, with four elevated lines. Donov. Inf. N. Holland. A new species lately discovered in New South Wales.

FULIGINOSUS. Thorax with crenated margin, armed with one tooth, and marked with an impressed dorsal line; wing-cases with crenated teeth at the tip. Fabr.

Described from a specimen in the British Museum, received from America.

ROSTRATUS. Thorax marginated, armed with one tooth and rufous; jaws inflected and acute; sternum spinous. Fabr.

This species, which is very large, inhabits Siam. The head is black, and grooved; antennæ shorter than the body, the last joint much serrated; thorax glabrous; wing-cases black and obtuse; breast and legs rufous.

BIDENTATUS. Thorax somewhat marginated, unarmed, black and downy; wing-cases chestnut, clouded with yellow, and bidentated at the apex, with four elevated lines. Donov. Inf. N. Holland.

LINEATUS. Thorax with crenated margin, and a single lateral tooth on each side; black, striped with white; wing-cases crenated with teeth at the apex. Fabr. *Cerambyx lineatus* Linn. This species inhabits America.

NITIDUS. Thorax with crenated margin and single lateral tooth each side; brassy azure; wing-cases coppery. Fabr. Described from the Hunterian Museum. Inhabits Brazil. The antennæ are long and blue; head grooved, and brassy green; wing-cases punctured, and obtuse; abdomen brassy-green.

FABER. Thorax marginated with a single spine on each side; wing-cases pitchy; antennæ moderate. Fabr. *Cerambyx Faber*. Linn. Schæffer &c. This is a rare species and inhabits Europe; the thorax of the male has the crenated edges, but is destitute of the tooth.

MUCRONATUS. Thorax marginated, and bidentated; wing-

wing-cafes mucronated and rufous. Fabr. Inhabits America. The front is retufe; antennæ fhort and compressed; thorax with two tubercles on the back; wing cafes velvety and pointed.

DEPSARIUS. Thorax fomewhat margined, armed with a fingle tooth, and downy; body blackifh; antennæ fhort and red. Fabr.

Defcribed from a Swedifh infect in the cabinet of Zilchuck. It is the *Cerambyx depfarius* of Linn.

SCABRICORNIS. Thorax fomewhat margined, and armed with a fingle tooth; fomewhat villous, blackifh with fufcous wing-cafes, and two elevated lines; antennæ moderate. Fabr. *Cerambyx fcarbicornis*, Olivier, and Voell. *Prionus fcarbicornis* of Scopoli. *Leptura Geoffroyi*. A native of the fouthern parts of Europe; the body is very narrow; thorax very flightly margined, and in one fex nearly unarmed.

ARCUATUS. Thorax bidentated; teeth arched and black; wing-cafes obtufe and tefaceous. Fabr. Inhabits Van Diemen's land. Defcribed from the Bankfian Mufcum.

MACULATUS. Thorax margined and three-toothed; black; wing-cafes with cinereous fots. Fabr.

A native of Senegal, defcribed from a fpecimen in the mufcum of the late king of France. This is a large fpecies; the jaws are exerted and dentated; antennæ length of the body and black; thorax armed with three fharp fpines; wing-cafes much variegated with grey. Muf. Donovan.

CERVICORNIS. Thorax margined, with three teeth each fide; jaws advanced and armed outwardly with a fingle fpine; antennæ fhort. Fabr. *Cerambyx cervicornis*. Linn.

This infect is an inhabitant of America; the larva is eaten by the Indians, and is efteemed a delicacy.

SPINICORNIS. Thorax armed on each fide with three teeth; black, glossy; antennæ fhort; exterior joint fpinous at the tip. Fabr. Native country unknown. Muf. Fabr. Obf. This does not appear diftinct from *Prionus buphtalmus* of the fame author, and *Huffarus Ceylonenfis* of Voet. Fabricius defcribes both fpecifically in the fame words "Thorace utrinque tridentato ater nitidus, antennis brevibus; articulis ultimis apice fpinofis."

CORIARIUS. Thorax margined, with three teeth; body pitchy; antennæ fhort. *Cerambyx coriarius*. Linn. *Le Prion*. Geoffr. *Cerambyx Prionus*. Degeer.

This is an European infect, and is rarely found in England. Donovan. Brit. Inf. Lives in the trunks of decayed trees. Fabricius fuppofes the *Cerambyx imbricornis* of Linnæus (Syll. Nat. 2. 624. 5.) to be only a variety of this infect, and entertains a fimilar opinion with regard to the *Lucanus tridentatus* of Linnæus. Syft. Nat. 2. 560. 3.

GIGANTEUS. Thorax armed with two teeth on each fide; body black; wing-cafes ferruginous; antennæ fhort. Fabr.

The Fabricia *Prionus giganteus* is *Cerambyx giganteus* of the Linnæan mantiffa; this kind is of a large fize, as its name implies, and inhabits Cayenne.

CYLINDRICUS. Thorax margined, three-toothed, and dufky; breast and abdomen ferruginous; antennæ fhort. Fabr.

This is the *Cerambyx unicolor* of Drury; inhabits North America. Blackburn. The antennæ are compressed; head and thorax black; wing-cafes pitchy.

ARMILLATUS. Thorax margined, with four fpines on each fide; wing-cafes ferruginous with black margin. Fabr.

This is of a very large fize, and inhabits India. It is the *Cerambyx armillatus* of Linnæus. The front is retufe; jaws

emarginate; thorax rufous at the fides; wing-cafes pointed at the tip.

LUZONUM. Thorax margined with many fpines; jaws advanced, armed with a fingle tooth, and lifid apex; anterior legs elongated. Fabr. A native of South America, defcribed by Pttiver. The antennæ are of moderate length, and black, with the fecond, third, fourth, and fifth joints mucronated beneath; thorax black, ciliated at the edge with twelve fpines; wing-cafes mucronate, pale ferruginous, and flightly punctured at the bafe; anterior legs rough and prickly beneath.

SERRITES. Thorax margined, with many fpines; jaws advanced, and tridentated at the tip; legs fpinous and ferrated. Fabr. A native of Africa.

DAMICORNIS. Thorax margined, and denticulated; jaws advanced, bidentated; antennæ fhort. Fabr.

This is *Cerambyx damicornis* of Linnæus (Mant. 532.). It inhabits America; and the larva is eaten.

BIFASCIATUS. Thorax margined and denticulated; body black; wing-cafes red, with two black bands; antennæ fhort. Linn. Inhabits America, and is the *Cerambyx bifafciatus* of Linnæus.

THOMÆ. Thorax with crenulated margin; body black; wing-cafes glabrous and ferruginous; margin pale yellow. Fabr. *Cerambyx Thomæ*. Acta. Sec. Berol. This is a native of the ifle of St. Thomas in America; wing-cafes rounded at the tip.

BILINEATUS. Thorax with crenated margin and two white lines; wing-cafes ferruginous with yellow margin and fpeckled with white. Fabr. Inhabits America. Muf. von Rohr.

SPINIBARBIS. Thorax with crenated margin; head fpinous below the jaws, which laft are armed with three teeth. *Cerambyx fpinibarbis*. Linn.

This is a native of South America; the jaws are large, thick, three-toothed within, with the tip emarginate.

PALMATUS. Sides of the thorax fcarvous, with many teeth; pofterior tooth palmated; antennæ fhort. Fabr. Inhabits Guinea. The head is grooved and black; antennæ compressed and dufky at the tip; thorax flat and glossy; wing-cafes fmooth, pieceous, and mucronated on the future at the tip; legs ferrated within.

MAXILLOSUS. Thorax with crenated margin; jaws advanced, hairy within, and armed with four teeth. Fabr.

This is the *Cerambyx maxillofus* of Drury, and *Prionus maxillofus* of Olivier. It inhabits South America. The colour is glossy black.

CANALICULATUS. Thorax with crenated margin and a villous white groove down the back; antennæ fhort. Fabr. Muf. Hunter, and Donovan. A native of the American iflands. The antennæ are fhort, compressed, and black; head without fots; fcutel white and villous; wing-cafes rather rough; legs black.

CINNAMOMEUS. Thorax with denticulated margin; jaws advanced and armed with three teeth. Fabr. *Cerambyx cinnamomeus*. Linn. Inhabits South America.

MELANOPUS. Thorax with dentureted margin; jaws advanced and armed with many teeth; wing-cafes mucronated. Fabr. *Cerambyx melanopus*. Linn. *Cerambyx crenulatus*. Drury. From the fame country as the laft.

SPINOSUS. Thorax armed with many teeth, and black; wing-cafes tefaceous and one-toothed. Fabr. Inhabits Tranquebar. Muf. Hybrer.

The head of this infect is grooved; the antennæ fhort, compressed, and black; thorax very flightly margined, cinereous-downy beneath; back grooved.

BARBATUS.

BARBATA. Thorax with entire margin; jaws ferruginous, very bristly; antennae moderate. Fabr.

Described from the Bankian cabinet as a native of South America. The antennae are rough, the last joint constricted and fourth; wing-cases piceous, abdomen villous and white; legs black.

PLUMICORNIS. Thorax unarmed, testaceous; antennae short and pectinated. Olivier.

This inhabits Senegal. The antennae are shorter than the body, and greatly pectinated; jaws exerted, with a single tooth in the middle.

Gnus LAMIA.

Antennae testaceous and elongated; head large, obtuse, declivity; eyes reniform, and embracing the base of the antennae; thorax cylindrical and uneven; wing-cases as long as the abdomen; body cylindrical. Donovan. Inf. N. Holland.

GENUS LAMIA. Feders four, filiform; jaw hairy, and bifid; hip blunt and horny; antennae testaceous. Fabr.

VERMICULARIA. Thorax somewhat tuberculated, black; wing-cases speckled with numerous minute white vermicular characters. Donovan. Inf. N. Holland.

Lamia vermiculata is a new species lately discovered in New South Wales, and described among the insects of New Holland. It is of the middle size, and entirely black, except the vermicular marks.

OBLIQUA. Thorax dented, cinereous; wing-cases spinous, emarginate at the tip, and marked obliquely behind with a whitish band. Donovan. Inf. N. Holland.

This is a small but elegant species, general colour pale testaceous and whitish varied with brown, and beset with numerous small denticulations.

GIGAS. Thorax armed with sharp spines, and rugged; wing-cases cinereous, with a black marginal spot, rough with two tubercles at the base; antennae long. Fabr. Oliv. &c. Mus. Bankii.

This insect, which is of a large size, inhabits the coast of Guinea. The antennae are twice the length of the body, and pale testaceous; body brown; second pair of flanks armed with a single tooth.

TRIBULUS. Thorax four-spined; scutell and wing-cases spinous; antennae longer than the body. Fabr.

Found on the banks of the river Gaboon in Africa. Mus. Donovan. &c. The antennae are longer than the body, brown, with the base of the joints cinereous; head and thorax brown and cinereous varied; spines on the scutell two, and short; wing-cases fuscous as the thorax, and pointed at the tip with a short denticle; a small tubercle at the end of the middle flanks of the legs.

PEDICORNIS. Thorax and wing-cases spinous; anterior thighs conated. Fabr.

Described from the Bankian cabinet. This is a native of New Holland. The colour of the head grey; antennae villous and moderate; thorax grey, rounded, with six dorsal erect spines; wing-cases grey, with lunate, marginal, cinereous spot and band in the middle, and at the base many erect black spines; horns on the anterior thighs long, sharp and curved.

TRIDENTICORNIS. Thorax spinous; a projecting recurved notch at horn in front; antennae long. Fabr. *Cerambyx z-punctatus*. Drury. I. C. Inhabits the Cape. The antennae are long, and brown, and have the joints black at the tips; head brown, with black mandibles; thorax spinous, rather rugged, brown with a broad white line on each side beneath; wing-cases brown, with a few elevated dots at the base, two oscillated black spots in the middle, and a larger whitish one behind; abdomen and legs fulvous.

HYSTRIX. Thorax armed with five spines; wing-cases with tufts of hairs; antennae moderate and serrated. Olivier, Fabr. &c.

This insect is a native of the Cape of Good Hope. The antennae are hairy, deeply serrated towards the extremity, testaceous with the joints rufous at the tips; two raised tubercles before the middle spine on the thorax; wing-cases varied with fuscous colour and brown; body small and cinereous.

CRISTA. Thorax armed with sharp spines, grey; wing-cases with a compressed tridenticulate tubercle at the base. Fabr.

Discovered in New Zealand by Sir Joseph Banks. The antennae are very little longer than the body, cinereous, the joints tipped with black; on each side below the lateral spine a fulvous dot; a small oblique black line on the posterior part of the wing-cases; thighs elevated and black, the club grey; tibiae grey with black tips.

AMBULATOR. Anterior part of the thorax furnished with two spines on each side; body clouded. Fabr.

Described by Pictet as a native of America. The antennae are of a moderate length; thorax and wing-cases clouded with chestnut and cinereous.

TEXTOR. Thorax spinous; wing-cases convex and black; antennae moderate. Fabr. *Cerambyx textor*. Linn. Found in the trunks of trees, and inhabits Europe.

CRUCIFERA. Thorax spinous, black; wing-cases with a cinereous femicircular fillet, and marginal dot; antennae long. Fabr.

Native country unknown. The body is long, and of a dusky black colour; antennae twice the length of the body; on each side of the thorax an oblique faint ferruginous line; in the middle of the exterior margin of the wing-cases a small dot; legs blackish.

VAGINATOR. Thorax spinous, rugged, and black; wing-cases ferruginous and emarginate; antennae moderate. Fabr. Inhabits the East Indies. Linn. The antennae are compressed and ferruginous, festel cinereous, and villous; wing-cases smooth, ferruginous, albous at the base, with emarginate tips; beneath cinereous and villous.

PULCHRA. Thorax spinous, black with green dots on the anterior part and dots behind; wing-cases mucronated at the base. Fabr. *Cerambyx pulchra*. Drury.

The antennae are rather longer than the body, and black; head black with three green spots, those on the side encircling the eyes; wing-cases pointed with two elevated truncated denticles; body varied with black and green; length two inches; inhabits Africa.

REGALIS. Thorax spinous, variegated with green; wing-cases speckled with green, and three fulvous spots on each. Fabr. &c.

This is a species of considerable beauty, and in size and general appearance bears a strong resemblance to the last; and it also inhabits the same country. The antennae are longer than the body and black; head black, crested with green, and marked by each eye with a fulvous spot; thorax black, with three impressed green bands; wing-cases somewhat flattened, and black; body green beneath; on each side of the abdomen a row of fulvous dots.

UNDATA. Thorax unarmed, cinereous; a black wavy band on the thorax and two on the wing-cases. Fabr. *Cerambyx undata*. Gmel.

Native country unknown. Size of the *L. regalis*. Antennae longer than the thorax, and black.

IRRORATA. Thorax spinous, fuscous and ferruginous varied; wing-cases black, speckled with ferruginous; antennae moderate. Fabr. V. et. &c. *Cerambyx irrorata*, Gmel. Inhabits the East Indies. Antennae moderate, greyish;

ish; head fuscous, and ferruginous; mandibles black and glossy; scutell ferruginous; wing-cafes pointed at the tip.

ÆDILIS. Thorax spinous; with four yellow spots; wing-cafes obtuse, grey and brown varied; antennæ very long. *Lamia ædilis*. Fabr. Paykull, &c. *Cerambyx ædilis*. Linn. Gmel. &c.

Found in the trunks of trees in the northern parts of Europe, and is found, though rarely, in England. Donovan. Brit. Inf. p. 72. The antennæ are rather more than three times the length of the body, measuring about three inches, the body better than three fourths of an inch. This species is most frequent in Germany.

ATOMARIA. Thorax spinous, tuberculated, and cinereous; wing-cafes fuscous varied and rough, with black elevated dots; antennæ long. Fabr. *Cerambyx atomarius*. Gmel.

According to Smidt this insect inhabits Germany. It resembles ædilis, but it is rather smaller. The antennæ as long as the body, cinereous and black varied; thorax spinous, with four tubercles on the back; wing-cafes with four raised lines meeting behind, and sprinkled with black dots; body cinereous, speckled with black.

VARIA. Thorax spinous, and tuberculated; body varied with black and cinereous; thighs clavated; antennæ moderate. Fabr. Inhabits the south of Europe. Zischuck. *Cerambyx varius*. Gmel.

The antennæ are cinereous annulated with black; head brown; wing-cafes rounded; body dark brown beneath; flanks black annulated with cinereous.

ARANEIFORMIS. Thorax spinous and tuberculated; wing-cafes porous; antennæ long, with a single tooth on the fifth joint. Linn. Sloane, &c. Inhabits South America.

PUNCTATA. Thorax spinous, fuscous, with white dots. Olivier. *Cerambyx punctatus*. Gmel. A native of Cayenne. Antennæ of moderate length, and black; head black, with two white dots above the lip, and two others placed vertically; thorax tuberculate, with two larger marginal white dots, and two smaller dorsal ones; wing-cafes black speckled with white. Resembles lamia ædilis.

CANCERIFORMIS. Thorax beset with many denticulations; back flat; wing-cafes and anterior thighs with a single tooth. Fabr. *Cerambyx pustulatus*. Drury. Inhabits Jamaica. The antennæ are long; the first joint one-toothed at the tip; thorax cinereous, with five or six small teeth on the margin disposed in two series; wing-cafes cinereous, sprinkled with brown elevated dots; thighs clavated.

NODOSA. Thorax spinous; wing-cafes cinereous, with black spots; antennæ very long, with the third joint gibbous at the tip. Fabr. *Cerambyx nodosus*. Gmel.

Described from a specimen in the British Museum, received from Maryland. The antennæ are four times the length of the thorax; wing-cafes flat, rounded, and dotted at the base.

TUBERCULATA. Thorax spinous and tuberculated; wing-cafes dotted and spined; antennæ long. Fabr. Olivier, &c. *Cerambyx tuberculatus*. Gmel.

Fabricius refers for this species to the Hunterian Museum. It inhabits Jamaica. The body is grey, with an angulated white band on the wing cafes; antennæ fuscous, the joints cinereous at the tips; jaws black; thorax rough, with numerous elevated obtuse dots; wing-cafes beset with many spines, which are sharp and black; legs black, the flanks with a white annulation.

HEBRÆA. Thorax armed with a sharp tooth, and bicarinated on the back; wing-cafes cinereous, striated, and spotted with fuscous. Fabr. *Cerambyx hebraeus*. Gmel.

Found in South America. Antennæ short and black. Thorax cinereous, with a thick and sharp spine on each side; two elevated lines on the back, black and glabrous; wing-cafes rounded, cinereous, with the future and three stripes brown, and between them numerous spots; legs cinereous. Cabinet of Dr. Hunter.

HORRIDA. Thorax acutely spined, cinereous; wing-cafes spinous; antennæ long. Fabr. *Cerambyx horridus*. Olivier. Inhabits Cayenne, and is rare. Muf. Donovan. The antennæ are long, greyish, with the joints black at the tip; thorax greyish, with a thick, somewhat bent, and sharp-pointed spine; wing-cafes spinous and grey.

SCORPIO. Thorax armed with four spines; wing-cafes with granulated tubercles; anterior thighs dilated at the tip. Fabr. *Cerambyx scorpio*. Fabr. Mant. &c. Inhabits South America. Antennæ short, cinereous, with the joints black at the tip; thorax cinereous, the four spines on the thorax black at the tip; wing-cafes cinereous, veined, with black granulated tubercles; legs short.

GLAUCA. Thorax armed with five spines, and glaucous; wing-cafes variegated, the sides and band black; antennæ long. Fabr. *Cerambyx glauca*. Linn. Degeer, &c. This species inhabits America.

Obs. The extremities of the wing-cafes are furnished each with a single tooth.

BIDENTATUS. Thorax somewhat spinous; wing-cafes bidentated, rough, cinereous, varied with fuscous. Fabr. *Cerambyx bidentatus*. Mant. Gmel. &c. Inhabits America. The antennæ are long; thorax unequal, and armed on each side with an obtuse spine; wing-cafes rough, with acute elevated dots; thighs clubbed.

SCABRA. Thorax spinous, and armed with three tubercles; wing-cafes scabrous, with bidentated tip; antennæ very long. Fabr. Olivier, &c. *Cerambyx scabra*. Gmel. &c.

Described by Fabricius from a specimen in the British Museum. The antennæ testaceous, at the base of the tip cinereous; wing-cafes testaceous at the base, with elevated glabrous dots; body cinereous; thighs clavated.

PRÆMORSA. Thorax tuberculated; wing-cafes dotted, cinereous, tip fuscous and bidentated; antennæ long. Fabr. *Cerambyx præmorsus*. Gmel. &c. Inhabits Guadalupe. Cabinet of de Radier. One of the smallest insects in the lamia family. Antennæ twice the length of the body; thorax cinereous, with three dorsal tubercles, and two black spots on each side at the base; a few elevated dots on the wing-cafes; thighs clavated.

SPINIFERA. Thorax spinous, cinereous, and villous; wing-cafes bidentated, and testaceous; antennæ long. Fabr. *Cerambyx spinifer*. Gmel.

This is about the middle size. Antennæ longer than the body, and dusky grey; scutell yellowish; wing-cafes smooth; body villous and grey. Inhabits South America. Muf. D. Pflug.

GRISATOR. Thorax unarmed, and greyish; two tubercles at the base of the wing-cafes; apex spinous; antennæ short and villous. Fabr. Inhabits Tranquebar. Schlanbusch.

ÆDIFICATOR. Thorax spinous and tuberculated; cinereous; wing-cafes with two tubercles at the base; antennæ moderate. Fabr. Inhabits the East Indies. Muf. Lund.

AMPUTATOR. Thorax spinous; wing-cafes cinereous, sprinkled with black, and numerous testaceous spots. Fabr. Inhabits the American islands, and is reported to gnaw round and cut off the larger branches of trees.

STERNUTOR. Thorax spinous; wing-cafes porous at

the base; antennæ moderate. Fabr. A native of Barbadoes. Drury.

Obf. The antennæ are blackish, the extreme joint acute; thorax unequal; wing-cafes obtufe and black; beneath covered with yellow hair.

SPINATOR. Thorax spinous, and, with the base of the wing-cafes, finely wrought; apex grey; antennæ moderate. Fabr. Inhabits the Cape of Good Hope. Mus. Lund.

GUTTATOR. Thorax spinous; wing-cafes testaceous, sprinkled with white; base with elevated glabrous spots. Fabr. Olivier, &c. *Cerambyx guttator*. Gmel.

An African insect, described from the British Museum. The head is testaceous, marked with a black longitudinal line; thorax testaceous, with a transverse ridge in the middle; wing-cafes obtufe, speckled with yellow, and a few elevated red dots at the base.

REPANDATOR. Thorax spinous, dusky; wing-cafes with a whitish serpentine band behind, and elevated black dots at the base. Fabr. *Cerambyx repandator*. Gmel. A native of Cayenne.

NEBULOSA. Thorax unarmed, ferruginous, lined with black; wing-cafes varied with fuscous and ferruginous, and a marginal cinereous spot; antennæ moderate. Fabr. &c. Inhabits Europe, and is found in England. *Cerambyx nebulosa*.

VARIOLATOR. Thorax spinous and lined; wing-cafes fuscous, with a semicircular white line. Fabr. Inhabits the Indies. Antennæ longer than the body; thorax fuscous, with white dorsal and lateral line.

FUTOR. Thorax spinous; wing-cafes black, with ferruginous spots; scutell pale yellow; antennæ very long. Fabr. *Cerambyx futor*. Linn. *Cerambyx atomarius*. De Geer. Inhabits the woods of Europe. The species has been found in England, according to Harris; (Vide Donovan. Brit. Inf. &c.) but is very rare.

SARTOR. Thorax spinous, black, with yellow scutell; wing-cafes immaculate; antennæ very long. Fabr.

This resembles the last, but is larger, and has the front between the antennæ, deeply grooved. Found by Zischneck on the horse-chestnut, &c. in the vicinity of Dresden.

DENTATOR. Thorax spinous, varied with fuscous, and cinereous. Fabr.

This resembles *lamia futor*, and inhabits Carolina. The antennæ are thrice the length of the body, and of a ferruginous colour, but black at the base.

RETICULATOR. Thorax spinous, black; thorax fulvous, and lined with black; wing-cafes fulvous and reticulated with black. Olivier. Donovan. Inf. China. &c. This very rare species inhabits China, and the bordering parts of India. The body is black, and without spots; antennæ of moderate length, and ferruginous, the first joint at the base black, the second gibbous at the base and tip, villous and black. Length of the body about an inch and an half.

SCALATOR. Thorax armed with acute spines, and black; wing-cafes with numerous interrupted white lines; antennæ moderate. Fabr. A native of Louisiana. Size of the last. The head is black; bard above the shield and orbits white; sides of the thorax and two broad lines white; shells black and glossy, the edge and suture ramifying into numerous interrupted streaks; body cinereous and downy.

MOLATOR. Thorax somewhat spinous, dusky, cinereous, with fulvous spots; wing-cafes rufous at the tip. Fabr. Inhabits Cayenne. The antennæ are of moderate size and fuscous; head cinereous, rufous in front; thorax rufous on the anterior and posterior margins; wing-cafes obtufe; abdomen pale, rufous.

VITULATOR. Thorax spinous; wing-cafes cinereous,

clouded with glaucous, and brown; antennæ very long and rufous. Fabr. This is a native of Carolina. The antennæ are red, with the first joint fuscous; on the anterior part of the thorax two very small tubercles; wing-cafes punctured, cinereous, with irregular brown and glaucous spots; shanks of the legs rufous, the second pair with a slight gibbosity.

VITTATOR. Thorax spinous; wing-cafes cinereous, and finely speckled or powdered, with two yellow stripes, and black margin. Fabr.

This is the *Cerambyx incanus* of Forster, Nov. Sp. It is described by Olivier and Pétiver, and has been found on the shores of Campeachy. The antennæ are of moderate size, varied with cinereous and fuscous; head cinereous, powdery, with two glossy black lines; thorax cinereous, with three glossy, black, longitudinal lines; wing-cafes with a few black spots at the base.

OCULATOR. Thorax spinous, black; wing-cafes with four subocellated spots; antennæ long. Fabr. *Cerambyx oculatus*. Degeer. Inhabits the Cape of Good Hope. Thorax marked before and behind with two very thin, yellow, impressed lines; wing-cafes somewhat striated, with four yellow spots encircled by a white ring, that nearest the base large and rounded, the second placed near the exterior margin, the third in the middle, and the fourth near the tip. This is an insect of large size, and very beautiful.

CAPENSIS. Thorax armed with two spines, black; wing-cafes with four rufous bands; antennæ moderate. Fabr. *Cerambyx capensis*. Linn. This, as its name implies, is a native of the Cape of Good Hope.

HOTTENTOTTA. Thorax spinous and rufous; wing-cafes black, with a band and two marginal spots, sanguineous. Fabr. *Cerambyx hottentotta*. Gmel. *Cerambyx hottentota*. Brown's Illust. The antennæ are moderate; thorax scabrous, dusky, rufous; wing-cafes with a braffy tinge; legs black.

FRUGATOR. Thorax spinous, dusky, ferruginous; wing-cafes dusky, greenish, with an interrupted sanguineous stripe; antennæ long. Fabr.

Described from the cabinet of Spengler as an inhabitant of the Cape of Good Hope. The antennæ are black; thorax somewhat rugged, with a small denticulation on each side; wing-cafes punctured, dusky, greenish, and glossy; exterior margin sanguineous; head, body, and legs ferruginous, the latter with black tarsi, and the shanks of the middle legs slightly toothed outwardly.

HUMERALIS. Thorax spinous; wing-cafes yellow, fasciated with black, and mucronated anteriorly. Fabr.

This elegant species is described by Fabricius from a specimen in the cabinet of the late Mr. Drury, now in Mus. Donovan. The native country is unknown, but supposed to be South America. The antennæ are longer than the body, and black; head yellow, with four black lines; thorax yellow, with three black bands; the base emarginate at each side; wing-cafes yellow, with confluent bands; sternum advanced, and bidentated at the tip.

BIFASCIATA. Thorax spinous, and sinuate behind; wing-cafes yellow, with two bands and rhombic spot of blue. Fabr. Inhabits Jamaica. Mus. Brit. The antennæ are rather longer than the body, and black; head yellow, with the orbits of the eye blue; thorax yellow, with blue posterior band; scutell at the base and tip blue; legs pale yellow, with blue thighs.

TRIFASCIATA. Thorax somewhat spinous, black; three yellow bands on the wing-cafes; antennæ moderate. Fabr. *Cerambyx trifasciata*. Gmel. The thorax slightly tuberculated on each side; yellow bands on the wing-cafes broad; legs black, the shanks of the middle ones tuberculated at the tip.

tip. This is a native of Sierra Leona. Herbit. Olivier, &c.

5-FASCIATA. Thorax armed with two spines, and black; wing-cafes with five red bands; antennæ moderate. Fabr. Inhabits the coast of Guinea. Muf. Dr. Ifert. The antennæ of this fpecies are black; thorax feabrous, black, with fhort fpines on each fide; wing-cafes feabrous at the bafe; body black.

NOBILIS. Thorax fpinous and black; margin yellow; wing-cafes black, with three yellow bands, and two white dots. Fabr. A native of Cayenne. The antennæ are of moderate length, and black; head black, with yellow frontal fhots, and two dots between the eyes; thorax velvety, black with yellow margin, and white at the bafe; fpine near the bafe black; wing-cafes velvety, black, with an interrupted yellow band at the bafe, the middle band finate, that at the tip abbreviated; the two white dots fituated between the fecond and third band.

CURCULIONOIDES. Thorax unarmed, fufcous, with four black ocellated fhots on the thorax and body. Fabr. *Cerambyx curculionoides*. Linn. Inhabits the fouth of Europe. Geoffr. Schæffer, &c.

ÆTHIOPS. Thorax fpinous, black; wing-cafes with two yellow bands and a dot at the tip; antennæ moderate. Fabr.

The antennæ are black; head grooved; thorax rather rough; wing-cafes velvety, black, with two yellow bands; the dot at the tip very fmall, and fometimes wanting; legs compressed and black. Muf. Brit. Inhabits the Cape of Good Hope.

VARIATOR. Thorax fpinous and cinereous; thorax and wing-cafes varied with brown; antennæ long. Fabr.

From the Bankian cabinet. Found in Africa. The antennæ are fufcous; head, thorax, and wing-cafes with an intermixture of brown and cinereous; mouth black.

LUSCA. Thorax fpinous, rough, black fprinkled with ferruginous; at the bafe of the wing-cafes a large black ocellar fhot; antennæ very long. Fabr. *Cerambyx lufca*. Gmel.

This inhabits Siam. The antennæ are black; head blackifh, with a few ferruginous dots; thorax fomewhat rough, black, with a feries of ferruginous dots on each fide; wing-cafes obtufe, and nearly truncated; legs black; thanks of the middle pair armed with a fingle tooth on the back.

NOTATA. Thorax fpinous, dufky, two approximate black dots on the wing-cafes. Fabr. *Cerambyx notatus*. Gmel. &c. Inhabits Cayenne. The antennæ are moderate; body above fufcous, beneath black; a feries of impreffed dots on the thorax; wing-cafes dotted, and fufcous. Muf. von. Kohr.

LUGUBRIS. Thorax acutely fpined and black; wing-cafes rough, with obfolete ferruginous; antennæ very long. Fabr. *Cerambyx lugubris*. Gmel. Inhabits Italy. Schlanbifch. The antennæ are twice the length of the body, and black; body black; legs black, with a fmall elevated obtufe tooth at the extremity of each of the four anterior fhanks.

TRISTIS. Thorax fpinous, fufcous, with tough wing-cafes; with two black fhots; antennæ moderate. Fabr.

Is found on the cyprefs in the fouth of France, Olivier. The antennæ in one fex is twice the length of the body, in the other the fame length as the body.

PENESTA. Thorax fpinous, fufcous; wing-cafes fmooth with two black fhots; antennæ fhort. Fabr.

Lives in the fouth of France, chiefly on the Elder. Dr. Broufnet. This is only half the fize of the preceding fpecies.

PUNCTATOR. Thorax fpinous black; wing-cafes dotted with white; antennæ long. Fabr. Donov. Inf. China, &c.

This kind inhabits China, and has been defcribed under feveral names by different writers; it is the *Cerambyx farinofus* of Drury, *Cerambyx punctator*. Olivier. *Cerambyx chinenfis*. Forfter. nov. Sp.—Obf. The antennæ are black, with the joint at the bafe pale; wing-cafes rough at the bafe; legs black.

FASCICULATA. Thorax fpinous and hairy; wing-cafes tufted with hair. Fabr. *Lamia fasciculata*. Oliv. *Cerambyx fascicularis*. Gmel. A native of Cayenne. This fpecies is of the middle fize. The antennæ are of moderate length, black, with the firt articulation yellow and villous; thorax armed with fharp fpines, and thickly covered with palifh hairs; wing-cafes fufcous, with one or more whitifh dots, black elevated futural line, three tufts of hair near the bafe, and two contiguous pair near the apex; legs variegated.

ROTATOR. Thorax fpinous and cinereous; wing-cafes fomewhat falcated; antennæ moderate. Fabr.

The joints of the antennæ are cinereous with fufcous tips; head furrowed, cinereous, with black feelers; wing-cafes cinereous, and fomewhat banded with brown. This fpecies inhabits India.

GLYCYRRHIZÆ. Thorax fpinous, black; wing-cafes bicarinated and lined with white; legs ferruginous; antennæ fhort. Fabr. &c.

Discovered by Pallas in Siberia. Defcribed by Subzer under the name of *Cerambyx ovatus*. Head black, with a whitifh daub at the bafe; antennæ fhort, black, the firt joint ferruginous and black at the tip; three white lines on the thorax; future white; legs ferruginous and white at the tip.

CRUCIATA. Thorax fpinous, black, a white crofs in the middle of the wing-cafes. Fabr.

The antennæ of this infect are fhort and black; head black; thorax black, with a dorsal white line; legs black. Inhabits the fouthern part of Ruffia. Boeber. *Cerambyx cruciata*. Pallas, Leon. &c.

FULIGINATOR. Thorax fomewhat fpined, and black; wing-cafes grayifh; antennæ fhort. Fabr. *Cerambyx fuliginator*. Linn. Geoffr. &c. Inhabits the fouth of Europe. This infect is faid to become gradually darker as it advances in age.

CINERARIA. Thorax fpinous, cinereous; antennæ fhort. Fabr. *Cerambyx cineraria*. Pallas, Icones.

This is a native of Ruffia, and is about half the fize of the preceding fpecies.

CARINATA. Thorax fpinous, black; wing-cafes picuous; elevated lateral ridge whitifh; antennæ fhort. Fabr. *Cerambyx carinata*. Gmel.

This is a Siberian fpecies, defcribed from a fpecimen in the Bankian cabinet. The antennæ are fhort, thick, and black; head and thorax punctured with impreffed middle line; wing-cafes obtufe; body beneath whitifh.

COQUEUS. Thorax fightly fpinous, and hirsute; wing-cafes obtufe, furrowed, black, with the anterior part ferruginous; antennæ moderate. Linn. A native of North America. The thoracic fpines are very minute.

RUFIPATOR. Thorax fpinous, brown, with two ferruginous dots; wing-cafes brown, variegated with cinereous. Fabr. Inhabits Africa. The antennæ are moderate, and fufcous; head fufcous; fcutel ferruginous; wing-cafes obtufe and dotted; body brown.

TORNATOR. Thorax fpinous with four dots; wing-cafes rufous, with four black fhots; antennæ fhort. Fabr. *Cerambyx tetraphtalmus*. Forfter. A native of North

America. The antennæ are black; head rufous with an elevated black dot at the base of the antennæ; thorax obtusely spined at the sides, rufous with four black dorsal dots; body beneath black changeable to cinereous.

BANKII. Thorax spinous grey; wing-cases sprinkled with ferruginous, with two cinereous bands. Fabr. This kind inhabits the Cape of Good Hope. It is of a small size. Antennæ moderate, varied with fuscous and cinereous; thorax with two short spines at the anterior part on each side, and sprinkled with ferruginous.

SALTATOR. Thorax unarmed, greyish; with two abbreviated white bands, composed of three or four white spots, and a white punctured streak behind; antennæ short. Fabr.

Native country of this species unknown. This is of a small size; thorax with a white dorsal line; wing-cases dotted, obtuse, fasciated, and spotted with snowy white.

HISTRIO. Thorax unarmed and yellowish, sprinkled with numerous snowy-white dots; antennæ short. Fabr. Inhabits Tranquebar. Mus. Lund. The antennæ are short and greyish; head punctured, yellowish with obsolete whitish spots; thorax rounded, unarmed, dusky, yellowish, with many distinct snowy dots; wing-cases punctured, yellowish, with numerous snowy dots; body yellowish.

TESTATOR. Thorax spinous, with a short recumbent horn; body testaceous; antennæ short with black tip. Fabr.

The body of this insect is short, villous and testaceous; head large, and flat in front; thorax with a short broad recumbent horn in the middle having the tip retuse; wing-cases villous, striated, and without spots.

PEDESTIS. Thorax spinous and black, with an entire white stripe; antennæ moderate. Fabr. *Cerambyx pedestris*. Linn. Inhabits the south of Europe.

RUFIPES. Thorax spinous, black, suture of the wing-cases white; base of the antennæ and legs rufous. Fabr. Inhabits Hungary. Resembles *L. pedigris* in size and appearance. The antennæ are compressed and black, except the first joint at the base which is rufous; head and thorax rufous and without spots; wing-cases smooth and black, with white suture; legs rufous.

MORIO. Thorax spinous, black; wing-cases of one colour; antennæ short. Fabr. Inhabits the south of Germany, Zischuck. Rather larger than *Lamia pedestrus*; the elytra of one colour, sometimes black, sometimes testaceous; antennæ black, with the first joint usually testaceous.

LINEATA. Thorax spinous black; margins of the wing-cases, and two longitudinal lines, that unite at each end, white. Fabr. *Cerambyx Scopolii*. Herbst. Inhabits Germany. Head and thorax black with a white line on the back; legs black.

MOLITOR. Thorax spinous, and fuscous, with three entire white stripes; antennæ moderate. Fabr. Inhabits India. Described from a specimen in the British Museum. The body is brown above, with three white lines, extending from the head to the extremity of the wing-cases, a small line between the broader one at the base of the latter; thorax with a lateral tubercle.

TUBERCULATOR. Thorax unarmed, grey; wing-cases with two tubercles at the base, and two common white spots; antennæ short. Fabr.

The antennæ are cinereous; tubercles on the wing-cases compressed near the suture; anterior spot large.

MUTATOR. Thorax unarmed, cinereous, with a pale line on each side; body villous; antennæ and legs testaceous. Fabr.

Inhabits Otaheite. From the Banksian cabinet. The antennæ are of a moderate length; wing-cases punctured and obtuse.

RUFUS. Thorax armed with two spines, and bimaculated; wing-cases rough at the base, and mucronated at the base and apex. Fabr. *Cerambyx rufus*. Linn. A native of China, and some parts of India. Donovan. Inf. China.

S-MACULATUS. Thorax spinous and bimaculated; wing-cases spotted with white; at the base rough and mucronated; tip bidentated. Fabr.

Nearly allied to *L. Rufus*, of which it is supposed by some to be a variety. The antennæ are longer than the body, rough and black; thorax unequal, acutely spined, with two lunate impressed yellowish dorsal lines; scutell whitish; wing-cases cinereous, and rough, with black raised dots at the base; in the middle four whitish spots, the second of which is largest, the fourth small and rounded; side white.

SPINICORNIS. Thorax spinous and rough; wing-cases truncated and grey; antennæ compressed, joint at the tip spinous. Fabr.

A native of Africa. The antennæ are moderate, and compressed, joint at the tip acutely spined outwardly; head black; thorax rough and grey; wing-cases smooth, truncated, and somewhat spinous.

SCABRATOR. Thorax spinous, somewhat testaceous; wing-cases with rough black dots at the base. Olivier, &c.

Antennæ moderate, with the joint at the tip black; wing-cases somewhat emarginate at the tip, and pointed at the future. Inhabits the East Indies. Banksian cabinet.

SPENGLERI. Thorax spinous, and tuberculated; cinereous; wing-cases rough, with two lateral black spots. Fabr.

From the cabinet of Spengleri. A native of South America. The antennæ are long, cinereous, with the joints fuscous at the tip; thorax obtusely spined on each side, with three dorsal tubercles.

PUSCATOR. Thorax armed with two spines, and tuberculated; wing-cases three-toothed at the tip, and griseous, with a cinereous band. Fabr.

Inhabits Tranquebar. This is of the middle size. The antennæ are rather shorter than the body, and greyish; thorax unequal, with two spines, the anterior one largest, recurved, and above them a large obtuse tubercle; wing-cases cinereous, or griseous, sprinkled with numerous ferruginous dots; legs grey.

BIDENS. Thorax acutely spinous, grey; wing-cases bidentated at the tip. Fabr. This species inhabits New Holland. The antennæ are long and fuscous, and the legs unarmed.

CRANTOR. Thorax unarmed, cinereous with black dots; wing-cases pale testaceous; tips bidentated, cinereous, with black spots. Fabr.

Inhabits China. Cabinet of Schlanbusch. The antennæ moderate and black; head cinereous with two dots, and small black line at the base; scutell black, with cinereous margin; wing-cases pale testaceous, dotted at the base, and bidentated at the tip, cinereous, with a black spot; body and legs black, with cinereous down.

LEPROSSA. Thorax spinous; wing-cases variolous at the base, with a large lateral spot of black; antennæ long. Fabr. *Cerambyx leprosus*. Gmel.

A native of America. The antennæ are dusky and rufous; thorax uneven on the back; wing-cases with large impressed dots at the base; behind smooth and cinereous, with a small spot in the middle; on each side, at the base of the abdomen, a snowy spot; legs cinereous.

SOLANDRI. Thorax somewhat spinous and black; wing-cafes bidentated, sprinkled with fuscous and cinereous. Fabr.

Inhabits New Holland. The antennæ are moderate and black; thorax somewhat rough, and black with a small acute anterior spine each side; scutell black; wing-cafes dotted, black sprinkled with cinereous; gibbous at the shoulder, and bidentated at the tip; legs black, with the foles of the feet fuscous.

CORNUTOR. Thorax obtusely spined; jaws cornuted at the base; antennæ very long. Fabr.

Inhabits America. It is figured by Olivier from a specimen in the British Museum. The antennæ are black; head grooved and black; jaws advanced, sharp pointed, with a thick horn-shaped elevated tubercle at the base; thorax black and without spots; wing-cafes dotted, black, with yellow spots, a small inflected spine at the base; tip rounded and unarmed.

UNGARICA. Black; head and thorax spinous; longitudinal line, suture, and three lines on the wing-cafes white. Herblt. *Cerambyx Ungaricus*. Gmel.

TRIFASCIATA. Thorax spinous; wing-cafes convex, black, with three interrupted ferslet lines; narrow towards the apex; antennæ long. Gmel.

DAVIESII. Black, thorax spinous, with numerous fulvous dots and spots; wing-cafes somewhat triangular. Swederus, Nov. Act. Stockh. This inhabits the bay of Honduras.

Genus STENOCORUS.

Antennæ long and filiform; eyes reniform, embracing the base of the antennæ; thorax round; wing-cafes length of the abdomen, frequently with two teeth at the apex; body somewhat cylindrical. Donovan. Inf. N. Holland.

Genus **STENOCORUS.** Antennæ four, anterior ones filiform, posterior clavated; antennæ setaceous. Fabr.

PUNCTATUS. Thorax somewhat spinous and fuscous; wing-cafes dotted, anterior part subrugose, apex bidentated, with three yellow spots. Donovan. Inf. N. Holland. A new species recently discovered in New South Wales.

SEMPUNCTATUS. Thorax spinous, and fuscous; anterior part of the wing-cafes rough, with dots, and banded with yellow; posterior part smooth; apex bidentated with two yellow spots. Donovan. Inf. N. Holland. From the same country as the preceding.

LAMED. Thorax pubescent; wing-cafes fastigiate, livid, with a dusky sinuate stripe down the middle. Fabr. *Cerambyx lamed*. Linn. This inhabits Europe.

CYANEUS. Thorax somewhat spinous, azure, with the wing-cafes yellow at the base. Fabr.

This is an Indian species, first described by Forster under the title of *Cerambyx palliatus*. The antennæ are short and blue, with clavated joints; thorax narrow in front, behind somewhat spinous.

BIGUTTATUS. Thorax without spines, and ferruginous; anterior part of the wing-cafes rugose with dots, and spotted with testaceous; posterior part smooth, bidentated, and marked with a yellow spot. Donovan. Inf. N. Holland.

GARGANEUS. Thorax spinous; wing-cafes bidentated, and greyish, with a yellow spot; antennæ very long. Fabr. Described by Fabricius from a specimen in the British Museum. It is a native of Maryland.

FESTIVUS. Thorax armed with two teeth each side; wing-cafes bidentated and greenish, with a yellow lateral line. Fabr. *Cerambyx festivus*. Linn. Common in America.

OSCURUS. Thorax rugose, spinous, fuscous; anterior part of the wing-cafes rough, with dots; posterior part smooth, glossy, and bidentated at the tip. Donovan. Inf. New Holland. A new species.

MARYLANDICUS. Thorax depressed, tuberculated, unarmed; wing-cafes bidentated, clouded with fuscous and cinereous; antennæ moderate. Fabr.

This insect inhabits Maryland. The antennæ are somewhat spinous; body entirely varied with cinereous and fuscous.

SPINICORNIS. Thorax unarmed, tuberculated; wing-cafes bidentated; joints of the antennæ with two spines; body variegated. Fabr.

Inhabits America. The body is cinereous with raised fuscous dots.

BIDENS. Thorax unarmed, and somewhat tuberculated; joints of the antennæ armed with two spines; body testaceous. Fabr. *Cerambyx bidens*. Olivier. Inhabits South America. Paykull.

IRRORATUS. Thorax unarmed and unequal; wing-cafes bidentated and sprinkled with white; antennæ long and aculeated. Fabr. *Cerambyx irroratus*. Linn. A native of America.

GLABRATUS. Thorax unarmed and cinereous, with a glabrous brown line; wing-cafes bidentated. Fabr.

The antennæ of this species are moderate, brown with three joints spinous; wing-cafes varied with grey, and brown. Inhabits the islands of South America. Rohr.

FARINOSUS. Thorax spinous, pitchy; wing-cafes sprinkled with powdery dots; antennæ long. Fabr. *Cerambyx farinosus*. Linn.

6-MACULATUS. Thorax spinous, and ferruginous; wing-cafes pointed, with three yellow spots. Fabr. &c. *Cerambyx sex-maculatus*. Olivier. This insect inhabits Cayenne. The antennæ are moderate, villous, and ferruginous; thorax ferruginous, with a small black spine on each side; wing-cafes with three large, oblong, yellow spots, and black spine at the apex.

5-MACULATUS. Thorax somewhat spinous, and rufous; with four yellow spots; wing-cafes bidentated and rufous; two spots and line at the apex white; antennæ very long. Fabr.

This insect inhabits the island of Guadaloupe. Dr. Isert. The antennæ are ferruginous; head ferruginous with the orbits of the eyes cinereous; thorax rough with lateral line and four dorsal spots pale; scutell whitish; wing-cafes ferruginous with whitish spot, and double yellow pupil; body beneath whitish.

4-MACULATUS. Thorax spinous, and rough; wing-cafes bidentated, with two pair of glabrous spots. Fabr. *Cerambyx quadrimaculatus*. Linn.

A native of South America. Obs. The four posterior thighs are spinous.

MACULOSUS. Thorax spinous, and fuscous; wing-cafes bidentated with two pair of glossy spots; antennæ moderate and black. Fabr. *Cerambyx maculosus*. Olivier.

The head is fuscous with ferruginous lip; thorax spinous, fuscous, and without spots; wing-cafes pale; legs black with rufous thighs.

GEMINATUS. Thorax unarmed, black, with rufous spot on each side; wing-cafes black; with two pair of glabrous spots; antennæ very long. Fabr.

A native of Sierra Leona. Pflug. The antennæ are black; head rufous with a black dot in front; wing-cafes truncated at the tip, and glossed with cinereous; legs black; thighs rufous; the four posterior ones spinous at the tip.

PALLENS. Thorax unarmed and pale; wing-cafes with a single spine and three black dots; antennæ long. Fabr.

This kind inhabits South America. It is of the middle size. The antennæ are long, and pale, testaceous; eyes pallid.

STREPENS. Thorax unarmed, tapering in front, and ferruginous; wing-cafes pale. Fabr. *Cerambyx strepens*. Olivier.

The antennæ are compressed, moderate, and ferruginous; head grooved; wing-cafes smooth, pale yellowish, and immaculate; body ferruginous. Olivier describes this insect as a native of Provence, and observes that it flies by night with a buzzing noise.

LASCIVUS. Thorax unarmed and black; wing-cafes bidentated, testaceous at the base, and at the tip black; with a pulch head. Fabr. Bankian cabinet. *Cerambyx Africana*. Gmel.

This kind inhabits Africa. The antennæ are moderate, and black; head yellow, with three black lines; thorax black above, beneath yellowish; wing-cafes dotted at the base; abdomen testaceous with a yellow spot on each side of the base, and black tip.

COMPLANATUS. Thorax unarmed, ferruginous; wing-cafes single, toothed and testaceous, with two dots and undulated fuscous streak. Fabr. Inhabits Cayenne. Von Rohr. The antennæ are moderate, and ferruginous, wing-cafes testaceous, with sharp, elongated, fuscous tooth at the apex; legs ferruginous.

NANUS. Thorax rounded, unarmed, griseous, with testaceous legs. Fabr.

The country of this species is unknown. The size is small; antennæ moderate, villosus, and cinereous; head and thorax grey, without spots; wing-cafes grey, with two longitudinal abbreviated black lines; legs testaceous with very thick thighs.

IMMACULATUS. Thorax somewhat spinous, with four spots; wing-cafes bidentated, ferruginous, with yellow and cinereous spots. Fabr. A native of America, described from the Bankian cabinet. The antennæ are long and ferruginous; thorax with two tubercles on each side.

ANNULATUS. Thorax lineated; wing-cafes armed with a single tooth; antennæ long, with three white rings. Fabr. *Cerambyx annulatus*. Olivier. *Cerambyx biripes*. Degeer. The antennæ are ferruginous, with the third, fourth, and last joint annulated with white; head fuscous with two white lines; thorax grey with four white lines; wing-cafes grey, with fuscous tip and white margin, truncated and single toothed; legs fuscous, with cinereous rings.

LINEOLA. Thorax spinous, ferruginous; wing-cafes pointed and testaceous, with three small glossy yellow lines. Fabr. *Cerambyx brassilius*. Gmel. A native of Brazil. The head is ferruginous; antennæ longer than the body, black, with the first joint ferruginous; wing-cafes armed with a single spine at the tip; legs black; thighs yellow, the four posterior ones armed with a thick black spine at the tip.

VARIUS. Thorax somewhat spinous; wing-cafes bidentated, cinereous, fuscous, and yellow varied; the base at the angle compressed. Fabr. *Cerambyx cayennensis*. Gmel.

This is an insect of small size. The general colour is cinereous; antennæ longer than the body, cinereous, with the joints fuscous at the tip; thorax black, with yellowish lines and dots; wing-cafes emarginated, and bidentated at the tip.

PUBESCENS. Thorax spinous, and black; wing-cafes with a single spine at the tip, base testaceous; antennæ long. Fabr. *Cerambyx pubescens*. Olivier. A native of Cayenne. This species is small; the antennæ are longer than the body, black and spinous at the joints; thorax spinous and tuberculated.

VILLOSUS. Thorax unarmed, dusky, with cinereous down; wing-cafes bidentated. Fabr. Inhabits Carolina.

DRURYI. Thorax somewhat spinous; wing-cafes truncated, bidentated, ferruginous, with cinereous bands; antennæ short. Fabr.

Described from a specimen in the cabinet of Drury. The

antennæ are shorter than the body, and piceous; thorax armed with a small spine on each side, and marked with a few raised transverse lines; wing-cafes truncated at the tip, bidentated, the outer spine largest, ferruginous, with three cinereous bands, which unite at the future; breast ferruginous, with two large white spots on each side; abdomen with three white dots on each side. Mus. Donov.

UNDATUS. Thorax spinous, cinereous; wing-cafes bidentated, with two waved black lines. Fabr. Inhabits America. The head is cinereous; eyes black; antennæ moderate, villosus, black, with the joints cinereous at the tip; thorax cinereous, with a few dorsal black glabrous spots; wing-cafes dotted, cinereous, with two large waved black bands, the posterior one of which is largest.

RECTICORNIS. Thorax spinous, ferruginous brown; wing-cafes bidentated and palch; antennæ long. Fabr.

An insect of middle size, that inhabits India. The antennæ are longer than the body and fuscous; head and thorax dusky, ferruginous and downy; wing-cafes smooth, paler and bidentated at the apex. *Cerambyx ruficornis*. Gmel.

QUADRIGUTTATUS. Pale testaceous; thorax somewhat spinous; wing-cafes two-spined, with two yellow spots on each; thighs clavated and unarmed. Swedens Nov. Act. Stockh. Inhabits Hoarders.

VITTATUS. Thorax spinous and pubescent; wing-cafes fascigiate, testaceous, sutural and stripe fuscous. Mus. Lesc. A native of Europe.

FERRUGINOSUS. Blackish; wing-cafes ferruginous; antennæ spinous inwardly. Rozier Journ. de Phys. A native of America.

HIPOCRATICUS. Beneath hoary; head and thorax woolly, with a bare space of black; wing-cafes black, glabrous, with five bluish white dots, and ramete future on each side. Pallas. This species inhabits woods in the northern parts of Siberia.

PERFORATUS. Above covered with a whitish powder, beneath with yellow t down; five black dots in the middle of each wing-case. Pallas. Inhabits the same county as the preceding, which it nearly resembles.

Genus CALLIDIUM.

Antennæ testaceous; head ovate-obovate and inserted; eyes lateral, reniform, and embracing the base of the antennæ; thorax flat, with rounded and rather prominent margin; wing-cafes rigid; length of the abdomen; body flattish, somewhat depressed, and often pubescent; legs elongated and formed for running; thighs often clavated.

GENUS CALLIDIUM. Feelers four, clavated; jaw membranaceous and bifid; lip two-clift; antennæ testaceous. Fabr.

OBSCURUM. Thorax somewhat villosus, fuscous; wing-cafes testaceous, varied with cinereous; antennæ moderate. Fabr.

The antennæ are pubescent and fuscous; wing-cafes dusky at the base; legs testaceous.

BAJULUS. Thorax villosus, with two tubercles; body fuscous. Fabr. *Cerambyx bajulus*. Linn. Inhabits Europe.

FENNICUM. Thorax tuberculated and rufous; wing-cafes violaceous; antennæ moderate. Fabr. *Cerambyx fennicum*. Linn. *Leptura atra*. Geoffr. A native of Europe.

RUSTICOLE. Thorax somewhat cylindrical, spinous, and rufous, black; wing-cafes violaceous; antennæ moderate, and pitchy. Fabr. *Saperda rusticollis*. Fabr. Mant. *Cerambyx rusticollis*. Gmel. Inhabits Italy. The head is black, antennæ moderate and pitchy; thorax hairy, and rufous; legs black; thighs somewhat clavated. Fabr.

EBULINUM. Thorax tuberculated and black; wing-cafes violaceous. Fabr. *Cerambyx ebulinus*. Linn.

Found on plants in Africa. Vahl. The antennæ moderate, ferruginous, with the first joint thick, and black; body black; wing-cases smooth, violaceous and glossy; thighs clavated.

ÆNEUM. Fuscous, thorax and wing-cases brassy green; thighs ferruginous. Fabr. From the Hunterian museum.

The antennæ are black; thorax without tubercles, pubescent and brassy; wing-cases pubescent, and glossy; body black; legs black, thighs somewhat compressed and rufous, with the knees black. Inhabits India.

FULCRATUM. Thorax naked and glossy; body black; thighs rufous; antennæ moderate. Fabr. Inhabits Saxony. Hybner. Obf. All the thighs are compressed.

VIOLACEUM. Thorax somewhat pubescent; body violaceous; antennæ short. Fabr.

Linnaeus describes this insect under the name of *Cerambyx violaceus*. It inhabits woods in Europe, and is rarely found in England. Donovan. Brit. Inf. This kind is highly detrimental to timber, especially fir, that has been felled some time, and has not been divested of the bark, beneath which it bores serpentine cavities in the wood in various directions. Transf. Linn. Soc.

FEMORATUM. Thorax naked; body black and opaque; thighs red; antennæ moderate. Fabr. This is *Cerambyx femoratus*. Linn. Inhabits Germany.

SPINOSUM. Thorax spinous, naked, black, antennæ short. Fabr. Inhabits Hungary. Hybner. The antennæ are black; head grooved; thorax flat, naked, smooth, black and without spots, with a sharp spine each side; wing-cases smooth, glossy and black; legs black, thighs thick.

CLAVIFES. Black, opaque, all the thighs clavated; antennæ long. Fabr. A native of Germany. Mus. Hatorff.

AMETHYSTINUM. Pubescent, azure, with rufous legs; thighs clubbed and black. Fabr.

This insect is small, pubescent, azure, and glossy; antennæ short, black, and rufous at the base; legs ferruginous, with all the thighs clavated; club large and black.

BIFASCIATUM. Thorax pubescent, black; wing-cases with two rufous bands.

Described from a South American insect in the Bankian cabinet. Fabr. The antennæ are moderate, with the joints two-spined at the tip; thorax with two tubercles; legs black; thighs somewhat clavated.

ACUMINATUM. Thorax warted and blackish; wing-cases pointed and greenish. Fabr. A native of the Cape of Good Hope. The antennæ are moderate, fuscous, with the tips of the joints spinous; thorax rounded, black, with many elevated tubercles; wing-cases greenish, with blue suture, tip sharp-pointed; legs black; thighs clavated, the club red.

RUSSICUM. Thorax warted, black, wing-cases testaceous, with a black spot in the middle, and black tip. Fabr. Inhabits Russia. Head black, antennæ moderate; legs unarmed and black.

VARIABLE. Thorax glabrous; body fuscous, and brassy; antennæ and legs rufous. Fabr. *Cerambyx variabilis*. Linn. *Callidium ungaricum*. Herb. Inhabits Europe.

RUSTICUM. Thorax naked; body lurid; antennæ short. Linn. Syst. Nat. Inhabits woods in Europe, and is found in England.

SERICUM. Thorax velvety, cinereous; wing-cases testaceous, with red elevated dots, and snowy scutell. Fabr. *Callidium holosericum*. Ross. Fu. Etr. Inhabits Barbary. Vahl. Antennæ moderate, silky; body entirely cinereous velvety; wing-cases testaceous, with many elevated red dots.

TENEROSUM. Thorax tuberculated, dusky, rufous, with black dorsal lines; wing-cases cinereous, depressed, with two elevated black lines. Fabr. Inhabits Cayenne. Olivier.

VITTATUM. Thorax rounded, naked; wing-cases ferruginous, with a black stripe in the middle; antennæ long as the body. Fabr.

The antennæ are ferruginous, second joint long, incurved, and somewhat spinous at the tip; body dusky; thighs clavated.

AGRESTE. Thorax naked, black; wing-cases striated, fuscous; antennæ short. Fabr. Inhabits Saxony. Hybner.

STIGMA. Thorax dotted; body black; wing-cases smooth, with a white stigmatic spot. *Cerambyx stigma*. Linn. A native of America.

FUGAX. Thorax hairy, fuscous; joints of the antennæ rufous at the base. Fabr.

Found in Provence. Olivier. The head is small, entirely black and fuscous; thighs clavated, shanks testaceous.

PYGMÆUM. Thorax naked; body fulvous; antennæ long and yellowish. Fabr. *Saperda minuta*. Fabr. Mant. Inf.

This kind inhabits Italy, and has been found in England; antennæ longer than the body, and yellow; thighs clavated.

EQUESTRE. Thorax unarmed, naked, black, and glossy; wing-cases with a red interrupted band. Fabr. A native of Cayenne. Mus. von Rohr.

FULVICOLLE. Thorax unarmed, fulvous, black, with very long antennæ. Fabr. Inhabits Surinam.

HIRTUM. Thorax rounded and hairy, wing-cases pointed, and pale testaceous. Fabr.

Described from the Bankian cabinet. The antennæ are compressed, and black; legs black.

PUBESCENS. Thorax rounded, pubescent, and testaceous; wing-cases greenish, and at the base testaceous. Olivier, &c. A native of the Cape of Good Hope.

BARBATUM. Thorax rounded, beneath on each side a downy ferruginous spot, antennæ very long and bearded. Olivier. This insect inhabits Tranquebar. Dr. Koenig.

GRISEUM. Thorax rounded and pubescent; body dusky, cinereous; antennæ very short. Fabr. Found in Barbary. Desfontaines.

COMPRESSUM. Thorax smooth, dusky, black; antennæ long and with the legs testaceous. Olivier. *Cerambyx compressus*. Gmel. &c.

Inhabits Siam. Described from the Bankian Cabinet. The head, thorax, wing-cases, and body are smooth; abdomen testaceous; thighs much compressed.

VARIEGATUM. Back of the thorax glabrous, black, with four white lines, and the wing-cases sprinkled with yellow. Fabr. Olivier, &c.

The antennæ are of moderate size, black, with the two extreme joints ferruginous; head black, with two whitish lines, and transverse streak; sides of the thorax sprinkled with yellow; three lines on the wing-cases rather elevated, black, and thickly sprinkled with yellow dots; abdomen black, and speckled with yellow on both sides; legs blackish, with elongated thighs, the posterior ones ringed with white. Bankian Cabinet. Inhabits New Holland.

LINEATUM. Thorax with two white lines, and four on the wing-cases, the middle ones uniting, and abbreviated. Fabr. Olivier, &c.

Antennæ short, with the first joint ferruginous; lip whitish, with three black lines; scutell whitish; wing-cases obtuse; abdomen whitish, in the middle black; legs ferruginous, with black joints. A native of New South Wales. *Cerambyx australis*. Gmel. &c.

SULCATUM. Thorax downy cinereous; wing-cases white, striated with black. Olivier.

This is a native of New Zealand. The antennæ are short

and fuscous; head cinereous, with a black, frontal, elevated line; lines on the wing-cases elevated and glossy; legs grey.

TESTACEUM. Thorax somewhat tuberculated; body testaceous; antennæ moderate and fuscous. Fabr. *Cerambyx testaceus*. Linn. Found in woods in Europe.

SANGUINEUM. Thorax somewhat tuberculated, and, with the wing-cases, fuscous; antennæ moderate. Fabr. *La lepture veloute couleur de feu*. Geoffr.

A Linnæan species, *Cerambyx sanguineus* of that author. Inhabits European woods; once met with in Wales. Muf. Donov.

PILICORNE. Thorax somewhat tuberculated and ferruginous; wing-cases testaceous; antennæ moderate and villous; thighs elevated. Fabr.

Inhabits South American islands. This is of the middle size; head ferruginous; wing-cases smooth; legs testaceous, with the thighs much compressed.

PREUSTUM. Thorax slightly tuberculated and testaceous; wing-cases violaceous at the tip. Fabr. Muf. Alloni.

Perhaps a variety of the Linnæan *Cerambyx testaceus*. The antennæ are moderate, fuscous at the tip; thighs elevated.

LIGNEUM. Thorax tuberculated, villous, and black; wing-cases red, with spot and tip violaceous. Fabr.

The body is black; thorax flat, villous, black, with glossy elevated tubercles; legs black, with compressed thighs. Schulz.

LURIDUM. Thorax somewhat tuberculated, naked, black; wing-cases smooth and testaceous. Fabr. *Cerambyx lurida*. Linn. Inhabits European woods.

FLAVITES. Thorax rounded, pubescent, ferruginous; legs testaceous. Fabr.

A native of the Cape of Good Hope. This is small; antennæ rather longer than the body, and ferruginous; head ferruginous, with the eyes black; thorax rounded, downy, somewhat tuberculated, and ferruginous; wing-cases rather paler.

FUSCUM. Thorax somewhat tuberculated, grooved, and naked; wing-cases striated, dusky, testaceous; antennæ moderate. Fabr. Inhabits Saxony. Hybner.

The antennæ are fuscous; legs black, with short, thick, and compressed thighs.

MACULATUM. Thorax villous, fuscous; wing-cases with two ferruginous spots on each; antennæ long. Fabr.

A native of the island Guadeloupe, and described by Fabricius from the cabinet of Badier. This is of a small size, and dusky; antennæ longer than the body, somewhat ferruginous, and dusky at the base; head and thorax villous and fuscous; legs dusky, ferruginous, with elevated thighs.

HAFNIENSE. Thorax somewhat villous and black, with four white lines, the inner ones abbreviated. Olivier, Fabr. &c. *Cerambyx hævatus*. Linn. Inhabits Europe.

RUFIPES. Thorax smooth and glossy; wing-cases violaceous; flanks rufous; antennæ short. Fabr. *Cerambyx erythropus*. Gmel. &c.

Inhabits Germany. Muf. Hattorff. Antennæ fuscous, and, at the base ferruginous; head and thorax smooth, violaceous, and glossy; body brassy; legs violaceous, with rufous flanks; posterior thighs elevated, and rufous at the base.

STRIATUM. Thorax glabrous; body black; wing-cases striated; antennæ short. Fabr.

This is the Linnæan *Cerambyx striatus*. A native of Europe; is said to have been found in England.

BICOLOR. Thorax glabrous and yellowish; head and wing-cases greenish; antennæ moderate and black. Fabr.

Inhabits South America. Smaller than the last; thorax flat, smooth, and yellow; wing-cases smooth, green; legs black.

LYNCEUM. Thorax rounded, somewhat spinous, villous, and black; wing-cases with a somewhat double fulvous spot. Fabr. *Cerambyx lynceus*. Olivier.

A native of the Cape of Good Hope. Thorax armed on each side with a small spine.

SALICIS. Thorax tuberculated, spinous, and rufous; breast and wing-cases black. Fabr. *Rhagium etruscum*. Rossi. *Stenocorus ruficollis*. Herblt.

Inhabits Europe, and is found on willows. Antennæ short and rufous; wing-cases slightly striated; abdomen and legs rufous.

CYANEUM. Thorax flat, tuberculated, villous, and violaceous, last segment but one ferruginous; antennæ moderate. Fabr. Inhabits Italy. *Cerambyx cyanellus*. Gmel.

PUSILLUM. Thorax rounded, black, with antennæ and flanks testaceous. Fabr. A native of Germany. *Cerambyx pusillus*. Gmel. &c.

BIMACULATUM. Thorax rounded, villous, fuscous, with two ferruginous spots on the wing-cases. Fabr. A native of the Cape of Good Hope. Banksian Cabinet.

FLAVUM. Thorax somewhat rounded; body yellow; thighs elevated; antennæ moderate. Fabr. Inhabits America. Obs. The antennæ are yellow; eyes black; all the thighs thickly elevated.

UNDATUM. Thorax tuberculated; wing-cases black, with two waved white bands, and short antennæ. Fabr. *Cerambyx undatum*. Linn. Inhabits Europe.

COLONUM. Thorax rounded; wing-cases livid, with three fuscous bands; antennæ short. Fabr. Olivier, &c. A native of Carolina.

VARIUM. Thorax rounded and rufous; wing-cases rufous at the base, with two white bands. Fabr. Inhabits North America.

FLEXUOSUM. Thorax rounded, with yellow bands; wing-cases with seven yellow bands, the anterior ones curved upwards, the posterior downwards. Fabr. *Leptura robinie* of Forster. *Leptura picia*. Drury. A native of America. Olivier, &c.

MINUTUM. Testaceous, with an abbreviated white band on the wing-cases. Fabr. Discovered by sir J. Banks in New Zealand.

FLORALE. Thorax globose, and banded with white; five white bands on the wing-cases, the second and third of which are lunated.

FULMINANS. Thorax globose and spotted; wing-cases black, with angulated, waved, white bands. Fabr. Olivier, &c. Inhabits North America.

ATOMARIUM. Thorax globose, with cinereous spots; wing-cases black, with whitish dots, and posterior, flexuous, whitish line. Fabr. Inhabits Saxony.

GAZELLA. Thorax rounded, black; wing-cases black, with yellow bands, the second next; legs ferruginous; thighs black. Fabr. A native of Europe.

MUCRONATUM. Thorax rounded and spotted; wing-cases mucronate and black, with three bent yellow lines and ferruginous base. Fabr. Found in America.

ANGULATUM. Thorax rounded, and mucronated; wing-cases mucronated, with three dorsal spots, and two yellow dots in the middle. Fabr. Country unknown.

ERYTHROCEPHALUM. Thorax rounded, somewhat spinous; wing-cases bidentated and fuscous, with four yellow bands; thighs compressed and elevated. Olivier. A native of America.

GLAUCUM. Thorax rounded, black; wing-cases glaucous, spotted at the base with black. Olivier. Inhabits India.

SEX-FASCIATUM. Black; thorax with two, wing-cases with four yellow bands. Fabr. Described from a specimen in the British Museum.

TRIFASCIATUM. Thorax globose, ferruginous; wing-cases black, with three white bands, the first annular. Fabr. A native of Europe.

ORNATUM. Thorax rounded, fasciated with black; wing-cases greenish, with three entire black bands, the first annular. Fabr. *Callidium ornatum*. Herbit. *Stenocorus duplex*. Scopoli. Inhabits Germany.

4-PUNCTATUM. Thorax rounded, greenish, with four dots on the wing-cases. Fabr. &c. Inhabits France. Geoff.

ANNULARE. Thorax rounded, and spotted with black; wing-cases bidentated, and somewhat greenish, with three black bands, the first of which is annular. Fabr. *Callidium annulare*. Olivier. A Siamese species.

ÆGYPTIACUM. Thorax rounded and ferruginous; wing-cases greyish, with three fuscous bands, the first annular. Found in the East Indies. Forskahl.

VIRENS. Thorax rounded, greenish, with black antennæ, and testaceous legs. Fabr. Inhabits Barbary.

GIBROSUM. Thorax rounded, black; wing-cases fasciated with cinereous; at the base tuberculated, and pointed at the tip. Fabr. Inhabits Italy. Daldorf.

UNIFASCIATUM. Thorax rounded, brown; wing-cases black, with a snowy band in the middle; base chestnut. Olivier, &c. Inhabits Provence.

PICIFES. Thorax globose, black, with an oblique streak on the wing-cases.

Genus CALOPUS.

Antennæ filiform; feelers four, anterior ones clavated; posterior filiform; jaw bifid; thorax gibbous; wing-cases linear. Gmel. &c.

GENUS CALOPUS. Feelers four, anterior clavated, posterior filiform; jaw bifid; lip membranaceous and bifid; antennæ filiform. Fabr.

SERRATICORNIS. Fuscous, with compressed antennæ. Fabr. Gmel. *Cerambyx ferraticornis*. Linn. Inhabits northern Europe.

HISPICORNIS. Somewhat fuscous; joints of the antennæ with a small spine behind. Gmel. Doubtful if of this genus.

PYGMÆUS. Very small and fuscous; antennæ serrated with hairs. Gmel. *Cerambyx pygmaeus*. Degeer.

Genus RHAGIUM.

Antennæ setaceous, elongated, approximate, and inserted between the eyes; feelers four, capitate; jaw armed with a single tooth; eyes rounded; thorax narrow, cylindrical, and spinous each side; wing-cases rigid; legs formed for running; feet formed of four joints.

GENUS RHAGIUM. Feelers four, capitate; jaw single toothed; lip membranaceous, and bifid; antennæ setaceous. Fabr.

MORDAX. Thorax spinous, grey; wing-cases clouded, and somewhat banded with testaceous. Fabr. Inhabits Germany.

INQUISITOR. Thorax spinous, and black; wing-cases clouded, and subsfasciated with testaceous. Fabr. *Cerambyx inquisitor*. Linn. Resembles the last but is rather smaller. Inhabits Europe; not uncommon.

INDAGATOR. Thorax spinous, cinereous; three elevated lines on the wing-cases; specklings and two bands black. Fabr. Degeer, &c. An European species.

VOL. VII.

CURSOR. Thorax spinous; wing-cases rufous; suture and line black. Fabr. *Cerambyx Cursor*. Linn. Inhabits northern Europe.

CINCTUM. Thorax spinous, and black; wing-cases somewhat ferruginous, with a yellow band; posterior thighs with a single tooth. Fabr. Inhabits Germany. Saldoner.

NOCTIS. Thorax spinous, and black; base of the antennæ ferruginous. Fabr. Linn. &c. Bears some affinity to *Rhagium Cursor*, but differs in being entirely black. Inhabits northern Europe.

BIFASCIATUM. Thorax spinous; wing-cases with two oblique yellow spots. Fabr. &c. An European species.

CLATHRATUM. Thorax somewhat spinous; black; wing-cases somewhat reticulated with yellow; legs rufous. Fabr. A native of Austria. Schneider.

ORNATUM. Thorax spinous, and black, wing-cases with a broad yellow band. Fabr. Inhabits Pennsylvania.

MINUTUM. Thorax spinous; wing-cases with elevated striæ, cinereous, waved with black. Olivier, &c. A native of Europe.

MUTICUM. Thorax unarmed, rufous, with two black spots; wing-cases fuscous, with rufous striæ, and bidentated at the tip. Fabr. Found in Sweden. Obs. This is small. The head is cinereous; antennæ brown annulated with white at the base; wing-cases somewhat dotted; body cinereous; legs ferruginous.

Genus SAPERDA.

Antennæ setaceous; eyes lunate, and embracing the base of the antennæ; thorax short, somewhat cylindrical, and unarmed; head retracted; wing-cases as long as long as the abdomen; body elongated, cylindrical, and emarginate. Donov. Inf. N. Holland. &c.

GENUS SAPERDA. Feelers four, filiform; jaw membranaceous and bifid; lip heart-shaped and truncated; antennæ setaceous.

NICROVIRENS. Blackish-green; thorax with rufous characters; wing-cases rough, with a testaceous spot at the base; sides yellow; tip truncated and bearded. Donov. Inf. N. Holland. A species lately discovered in New South Wales.

COLLARIS. Black, thorax encircled with four white rings; side of the wing-cases, spot at the tip, and body beneath covered with white down. Donov. Inf. N. Holland. This also is a new species from the same country as the preceding.

CARCHARIAS. Body grey with black dots; antennæ moderate. Fabr. *Cerambyx carcharias*. Linn. Inhabits European woods.

SCALARIS. Wing-cases with indented sutural yellow line, and dotted with yellow; antennæ moderate. Linn. Inhabits Europe, rarely England. Donov. Brit. Inf.

CANDIDA. White; thorax and wing-cases fulvous, with two white stripes. Fabr. From the Hunterian Museum. Country unknown.

DETRITA. Black with cinereous hairs, and white dorsal line, and a white stripe on the wing-cases; antennæ short. Fabr. Inhabits Barbary.

IRRORATA. Black; wing-cases dotted; antennæ long. Fabr. Found on plants in Africa. Vahl.

MODESTA. Black; head, thorax, and vent ferruginous. Fabr. Inhabits Africa.

ATRICORNIS. Ferruginous; antennæ and tip of the abdomen above black. Fabr. Inhabits China. Schefstedt. Obs. The head and thorax are smooth, glabrous, rufous, and

immaculate;

immaculate; wing-cafes striated with dots, dusky and emarginate at the tip; wings ferruginous with black tip.

OCULATA. Thorax pale yellow, with two black dots: wing-cafes black. Fabr. *Cerambyx oculatus*. Linn. Lives in woods in Europe.

TRICOLOR. Ferruginous; wing-cafes bidentated, striated with dots, and greenish; antennæ moderate and black. Fabr. A native of the East Indies. Mus. Scheff.-dt. Obs. The head is rufous with black eyes; thorax rufous with 3 small dots at the base; body rufous; the legs black at the apex.

HIRTA. Ferruginous with greyish hairs; scutell and orbit of the eyes fulvous. Fabr. Inhabits New Zealand. Head greyish with four yellowish spots at the base; wing-cafes covered with grey hairs; and obtuse at the tip.

UNICOLOR. Testaceous; antennæ and legs same colour; antennæ long. Fabr. Described by Fabricius from a specimen found in Amsterdam island.

LINEARIS. Cylindrical, black, with pale yellow legs; antennæ moderate. Fabr. *Cerambyx linearis*. Linn. Found on the nut tree.

NIGRIPES. Cylindrical, black, with two lines on the thorax and scutell cinereous; legs black. Fabr. Inhabits Hungary.

CYLINDRICA. Cylindrical, black, with the anterior legs pale yellow. Fabr. *Cerambyx cylindrica*. Linn.

TRIPUNCTATA. Cylindrical, black; thorax ferruginous above, with three black dots. Fabr. Inhabits Virginia. Obs. The antennæ are moderate, villous, and black; wing-cafes striated with dots.

MELANOCEPHALA. Thorax rufous, body black; legs rufous. Fabr. Inhabits Africa. Vahl. The antennæ are moderate and black; head and body black.

PILICORNIS. Violaceous, with the first and second joint of the antennæ clubbed, and hairy. Fabr. Inhabits South America. Hybner.

BARBICORNIS. Head and thorax rufous; wing-cafes azure; antennæ moderate, and bearded before the tip. Fabr. Native country unknown. This is of the middle size.

ERYTROCEPHALA. Thorax villous, rufous; antennæ, breast, and wing-cafes black. Fabr. A native of Germany. *Cerambyx erythrocephalus* of Schrank.

RUFICOLLIS. Thorax villous, rufous; antennæ and wing-cafes fulvous. Fabr. A native of Virginia. Obs. The head is rufous, antennæ moderate and black; thorax villous, rufous, and immaculate; wing-cafes villous and fulvous.

FASCIATA. Thorax somewhat spinous, azure; with two yellow bands on the wing-cafes. Fabr. Inhabits Siberia. Obs. The antennæ are moderate and black; body entirely violaceous, slightly glossed with cinereous.

CLAVICORNIS. Green, with three yellow spots on the wing-cafes. Fabr. Inhabits the Cape of Good Hope. From the Banksian cabinet.

LATIPES. Black; thighs clavated and violaceous at the tip; posterior thunks compressed; antennæ long. Fabr. From the same country as the preceding.

Obs. The antennæ are longer than the body, the first and second joint thick and black, the rest rufous with black tips, except the last joint which is entirely black; four anterior legs rufous with clavated thighs.

VITATA. Greyish, with three dentated white stripes; antennæ long. Fabr. *Cerambyx vitinatus*. Linn. Inhabits America. Drury. Obs. First and second joint of the antennæ very finely bearded beneath.

SEX-PUNCTATA. Black, with three yellow dots. Fabr. Inhabits the Cape of Good Hope. Paykull.

The body of this insect is small, black, glossed with blue; wing-cafes rough; legs blue with all the thighs clavated.

LATERALIS. Black; side of the thorax and lateral stripe on the wing-cafes ferruginous. Fabr. Inhabits North America.

LYNCEA. Thorax black, with a ferruginous dot on each side; wing-cafes greyish and pointed. Fabr. A native of New Zealand. Obs. The head is black; scutell ferruginous; wing-cafes grey, striated at the base; body black, abdomen with four ferruginous dots on each side; legs fulvous; thighs clavated.

GRISEA. Greyish; margin of the scutell, and small lines on the wing-cafes yellowish. Fabr. Inhabits New Zealand. Obs. The antennæ are fulvous; wing-cafes somewhat villous; legs fulvous with clavated thighs.

ANALIS. Testaceous; tip of the wing-cafes and vent black. Fabr. A native of Africa.

BIDENTATA. Thorax rounded; with four dots of black; wing-cafes bidentated at the tip. Fabr. Inhabits Guinea. Dr. Hert. This is small; antennæ length of the body, with the third and fourth joint yellow; body and legs yellow.

NIGRICORNIS. Fuscous, thorax lineated; scutell yellow; antennæ long. Fabr. *Cerambyx Cardui*. Linn. Found on thistles in southern Europe. The body is fuscous sprinkled with yellow; lines on the thorax three in number.

SUTURALIS. Cinereous, with lineated thorax; wing-cafes fulvous; antennæ moderate. Fabr. Mus. Lesele. Inhabits Europe.

ANNULATA. Thorax rounded, lineated, greenish; wing-cafes pointed, with white future. Fabr.

Found on plants in Africa. Vahl. The antennæ are moderate; joints white at the base and black at the tip, the first entirely black; head dusky.

LINEATA. Thorax rounded and somewhat spinous; joints of the antennæ white at the base. Fabr. Inhabits South America.

TRISTIS. Thorax rounded, black, with white lines; wing-cafes bidentated, testaceous with whitish lines. Fabr. This kind inhabits Tranquebar. The antennæ are short and fulvous; wing-cafes smooth.

POPULNEA. Thorax lineated with yellow; wing-cafes with four yellow dots; antennæ moderate. Fabr. *Cerambyx populneus*. Linn.

TREBULA. Green, with two black dots on the thorax, and four on the wing-cafes. Fabr. A native of Germany.

PUNCTATA. Green, with numerous black spots; antennæ moderate. Fabr. *Cerambyx punctatus*. Linn. Inhabits the south of Europe.

VIRESCENS. Thorax villous and cinereous; wing-cafes somewhat attenuated and green. Fabr. Inhabits Italy, Dr. Allioni, and France, Broussonet.

LONGICORNIS. Fuscous; legs testaceous; antennæ very long and black with a white ring. Fabr. Inhabits Africa. Banksian cabinet.

FEMORATA. Anterior part of the thorax fulvous, posterior testaceous; three alternate bands of black, and testaceous on the wing-cafes; antennæ very long. Fabr.

VOLVULUS. Above black; thorax and wing-cafes margined with cinereous. Fabr. Inhabits Cayenne.

FERRUGINEA. Thorax somewhat spinous, ferruginous, with antennæ and legs black. *Cerambyx cantharinus*. Linn. Inhabits Germany.

BRUNNEA. Thorax rather spinous, ferruginous; antennæ

terose and legs same colour. Inhabits Germany. Helwig, &c.

TESTACEA. Black with testaceous wing-cases. Fabr. A native of Germany.

VIOLACEA. Body violaceous and immaculate. Fabr. Obs. The antennæ are moderate and black; thorax somewhat pubescent; wing-cases rough; legs black.

EPHIPPUM. Black; dorsal line on the thorax and scutellum cinereous; thighs ferruginous. Fabr. This Inhabits Hungary. Hybner.

PICEA. Pitchy; antennæ and legs ferruginous. Fabr. A South American species of small size.

HIRTA. Black, hairy with long antennæ. Fabr. Saperda Filum Rossi. Inhabits Italy. Dr. Allioni.

SCUTELLATA. Thorax somewhat spinous, black; antennæ, wing-cases and legs greyish; scutellum white. Fabr. A native of Germany. The antennæ are shorter than the body, greyish, with the joints ferruginous at the base; and black at the tip, the first entirely black; head black; wing-cases smooth, and cinereous; thighs dusky ferruginous.

LINCOLA. Black; dorsal line on the thorax, and thighs rufous at the tip. Herbst, &c. Inhabits Italy.

Genus CLYTUS.

Antennæ testaceous; eyes reniform, and embracing the base of the antennæ; thorax globose, and broad as the wing-cases; elytra rigid; length of the abdomen; legs long and formed for walking; thighs compressed; four joints in the feet. Donov. Inf. N. Holland.

THORACICUS. Thorax black, with a rufous spot; wing-cases fulvous; future at the base, and two oblique bands black. Donov. Inf. N. Holland. A lately discovered species. Muf. Fraucilloa.

SEXMACULATUS. Black; thorax covered with livery down; wing-cases with three yellow spots, and somewhat emarginate at the tip. Donov. Inf. N. Holland.

PUNCTULATUS. Brownish-testaceous; wing-cases sprinkled with impressed black dots. Donov. Inf. N. Holland. Discovered by Mr. Bailely the astronomer in Captain Cook's expedition. Muf. Donev.

CERAMIC GULF. *Sinus Ceramicus*, in *Ancient Geography*, a deep gulf of Asia Minor, forming the separation of Caria and Doris, and deriving its name from Ceramus, a maritime town of Caria; which Pliny places in the island of Arconesus, but all other geographers on the continent, between Cnidus and Halicarnassus. This bay is called by some writers the *Ceravian* bay, and the city from which it borrowed its name, *Ceravianus*. In our time this gulf is called the *Gulf of STANCHO*, from the name of the island situate at its entrance. Its site and name are now to be found in a place of little importance, called *Keramo*.

CERAMICUS, so called from Ceramus, the son of Bacchus and Ariadne, the name of a place at Athens, which was surrounded with walls, and in which were to be seen the tombs and statues of all the illustrious men who had died in the service of their country, with inscriptions recounting their praises and exploits. And in order to render these known and familiar to all, to animate every citizen to a love of virtue and of glory, and to excite in youthful minds an ardent desire of imitating those celebrated worthies, it was made a public walk or promenade. There were two places at Athens bearing this name; one in the city, and the other in the suburbs, in which were the academy and other edifices, at the distance of six stadia from its walls; the former was a place of resort for prostitutes, and much frequented on account of its walks; the other was appointed for the burying-place of illustrious men above-mentioned. See **ATHENS**.

CERAMUS, the name of a burgh in Greece, in Attica, belonging to the Acanastide tribe; which was the place called by others the *Outer Ceramicus*.

CERAMIUM, in *Botany*, a genus formed by Roth for some species of sea-weed arranged by Linnæus and other authors under either *fucus* or *conferva*, with the following generic character: filaments membranaceous-cartilaginous, somewhat geniculated; capsules with generally one seed scattered on the *outside* of the branches. His generic character of *fucus*, in contradistinction from the preceding, is, vesicles, aggregate, imbedded in the substance of the frond, furnished with mucilifluous pores; and of *conferva*, small tubes, or *herbacæous* filaments, with granules of fructification scattered on the *inside* coats of the tube. The same name was given by Stackhouse in the first Fasciculus of his "*Nereis Britannica*," to another selection of plants from the genus *Fucus*, which he afterwards called *palmaria*. See *Nereis Brit.* Introd. p. 15, 24, 31, 32. See **PALMARIA**.

CERAMIUM, an ancient measure, answering to what was otherwise called **AMPHORA** and **CADUS**.

CERAMORUM FORUM, in *Ancient Geography*, a town of Asia Minor, which, according to Xenophon, was situated on the confines of Mysia.

CERAMUS. See **CERAMIC GULF**.

CERAMUSSA, or **CERAMUNA**, an episcopal see of Africa, in Numidia, and near Mileva.

CERANÆ, a town of Phrygia, according to Pliny.

CERANGA, a town of India, placed by Ptolemy on this side of the Ganges.

CERANTHUS, in *Botany*, Schreb. Gen. 27. See **CHIONANTHUS inerassatus**.

CERASO affinis, *fructu coccineo*, Sloan. Jam. See **COR-DIA collococa**.

CERASO affinis, *fructu flavo*, Sloan. Jam. See **EBRETTIA tinifolia**.

CERASO affinis, Bauh. Pin. See **PRUNUS malaleb**.

CERASONTE, in *Ancient Geography, a Greek town, situate in the territory of Colchis, on the sea-coast. It was a colony of Sinope, according to Xenophon.*

CERASSON, or **CERASSON**, an episcopal see of Asia, under the metropolis of Bostira.

CERASTES, one of the names of the isle of Cyprus, according to Pliny. Some say that it bore this appellation on account of the ferocious manners of its inhabitants. Others say that it was called *Cerastes* (from *κερας*, horn,) or horned, because it was surrounded with promontories, which projected into the sea, and exhibited the points of rocks at a distance, appearing like horns.

CERASTES was also the name of a people who inhabited this island, and who had an altar dedicated to Jupiter, the Hospitable, and which was always filled with the blood of strangers. Venus, offended at this inhumanity, changed them into bulls.

CERASTES, in *Zoology*, the horned snake. See **COLUBRA cerastes**.

CERASTES was also the name given by the ancient Greeks to a flag when at his full growth, or at the end of his fourth year.

CERASTIUM, in *Botany*, (so called from *κερας*, a little horn, in allusion to the shape of the capsule), Linn. Gen. 585. Schreb. 797. Willd. 621. Gart. 761. Juss. p. 301. Vent. vol. iii. p. 242. (*Myofotis*, *Myrs.* Cl. 6. Gen. 10.) Mouse-ear, or mouse-ear chick-weed. Class and order, *decandria pentagynia*. Nat. ord. *Caryophylli*, Linn. Juss. Vent.

Gen. Ch. Cal. perianth five-leaved; leaflets ovate-lanceolate, acute, spreading, permanent. Cor. petals five, bifid, obtuse, erect-spreading. Stam. filaments generally ten, filiform, shorter than the corolla; alternate ones shorter;

anthers roundish. *Pist.* germ ovate; styles generally five, capillary, erect, the length of the filaments; stigmas obtuse. *Peric.* capsule ovate-cylindrical, or globular, obtuse, one-celled, opening at the tip; orifice toothed. *Seeds* numerous, roundish, (attached to a free columnar receptacle, &c.)

Eff. Cl. Calyx five-leaved. Petals bifid. Capsule one-celled, opening at the tip; orifice toothed.

* *With oblong capsules.*

Sp. 1. *C. perfoliatum*, Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. (*Myofotis orientalis perfoliata*, Lychnidis folio, Tourn. Cor. 18. Dill. Elth. tab. 217. fig. 284.) "Leaves connate, quite smooth, glaucous; petals smaller than the calyx." Lam. *Root* annual. Whole plant smooth, glaucous, with the habit of a lychnis. *Stem* about a foot high, cylindrical, leafy, upright, weak, sometimes simple, more frequently a little branched. *Leaves* opposite, connate, resembling those of *Saponaria vaccaria* or Lobel's catch-fly; lower ones oblong; upper ones short and oval. *Flowers* terminal and axillary, white, on short peduncles; calyx bell-shaped. *Capsule* as long again as the calyx. Discovered by Tournefort in the Levant. Cultivated by Miller in 1731. 2. *C. vulgatum*, Linn. Syst. Nat. Ed. 10. Lightfoot. Flor. Scot. Smith Flor. Brit. Eng. Bot. tab. 789. *C. viscofum*, Hudf. With. Relh. Sibth. Curt. Flor. Lond. tab. 35. *Alfne hirsuta major*, foliis subrotundis dilute virentibus, Morif. vol. ii tab. 23. fig. 10. *A. hirsuta myofotis latifolia praeceocior*, Rai. Syn. 348. *Myofotis arenifolia hirsuta parvo flore*, Vaill. Par. tab. 30. fig. 3.) Broad-leaved mouse-ear chickweed. "Hairy, viscid, forming tufts; leaves ovate; petals equal to the calyx; flowers longer than the peduncle." *Root* annual, fibrous. *Herb* pale green, hairy, viscid. *Stems* several, a span high, round, leafy, paniculate-dichotomous, many-flowered; outer ones diffuse at the base, afterwards erect. *Leaves* broad, ovate, or elliptical, obtuse. *Flowers*, from the divisions of the stem, peduncled, erect; upper ones crowded; peduncles shorter than the calyx, less viscid; leaflets of the calyx lanceolate, acute; inner ones with a scarious white margin; petals oblong, white, scarcely longer than the calyx; filaments all fertile, glandular at the base. *Capsule* cylindrical, twice as long as the calyx, a little incurved. *Seeds* flaked, tubercled, tawny. Dr. Smith. A native of England and other parts of Europe, flowering in April and May. 3. *C. viscofum*, Linn. Sp. Pl. 2. Lightfoot Fl. Scot. p. 240. Smith Flor. Brit. 2. Eng. Bot. Pl. 789. (*C. vulgatum*, Hudf. With. Relh. Sibth. Curt. Lond. Pl. 34.) *Alfne hirsuta altera viscosa*, foliis longis saturatis virentibus, Morif. tab. 23. fig. 11. *A. hirsuta myofotis*, Rai. Syn. 349. Vaill. Par. tab. 30. fig. 1.) Narrow-leaved mouse-ear chickweed. "Hairy, viscid, spreading; leaves lanceolate-oblong." *Root* perennial, fibrous, small. *Herb* deep green, hairy, more or less viscid. *Stems* several, various in their length, diffuse, erect in meadows, round, leafy, paniculate-dichotomous. *Leaves* lanceolate oblong, rather obtuse. *Flowers* from the divisions of the stem; peduncles viscid, nearly twice as long as the calyx; leaflets of the calyx generally scarious at their edges; petals commonly longer than the calyx, inversely egg-shaped; filaments all fertile. *Capsule* cylindrical, nearly double the length of the calyx, a little incurved. *Seeds* rugged. A native of meadows, pastures, walls, and waste places in Eng. and other parts of Europe. In naming the last two species, we have followed Dr. Smith, who is supported by the authority of the Linnæan Herbarium, in opposition to all the English authors, except Lightfoot. The error is said by Dr. Smith, (Eng. Bot.) to have arisen from Linnæus himself, who, in the Species Plantarum, misquoted Vaillant's admirable figures. It must be confessed, however,

that Linnæus has by no means been happy in his specific names; since the latter, as far as our observations have extended, is generally the least viscid of the two. 4. *C. semi-decandrum*, Linn. Sp. Pl. 4. Mart. 4. Willd. 5. Curt. Lond. Pl. 33. (*C. hirsutum minus parvo flore*, Dill. in Rai. Syn. 348. tab. 15. fig. 1. Vaill. Par. tab. 30. fig. 2.) "Hairy, viscid, flower pentandrous. petals emarginate." Smith. *β. C. pumilum*; Curt. Lond. Pl. 30. *Root* annual, fibrous. *Herb* with the habit of the preceding, but smaller and often reddish. *Stems* erect, decumbent only at the base, hairy, viscid near the top. *Leaves* ovate-oblong, lower ones frequently smooth. *Flowers* white; peduncles longer than the calyx, bent down immediately after flowering, finally erect; calyx viscid, dilated at the edge, white; petals generally shorter than the calyx, emarginate; filaments five, rarely more. *Capsule* nearly twice the length of the calyx, incurved. *Seeds* tawny, granulated, compressed. Dr. Smith. A native of England and other parts of Europe, flowering in March and April. The variety, figured by Curtis as a distinct species, was gathered by Mr. Dickson on dry banks near Crocydon, Surry; but is thought by Dr. Smith to have no permanent character which can justify its separation from *C. semi-decandrum*. The last three are considered by La Marck, but surely without reason, as only varieties of one and the same species. 5. *C. pentandrum*, Linn. Sp. Pl. 5. Mart. 5. Lam. 4. Willd. 6. Læfl. it. 142. "Flowers pentandrous; petals entire." Very small, resembling the preceding, but differing from it in its green colour, and in its petals, which are not acutely emarginate. Linn. A native of Spain. 6. *C. anomalum*, Willd. 3. Waidstein and Kitabel, pl. rar. Hung. "Erect, with viscous hairs; leaves linear; petals longer than the calyx; flowers trigynous." Willd. *Root* annual. *Herb* beset with hairs, glandular and viscid at their tip. *Stem* erect, half a foot high and more. *Root-leaves* linear-ovate, petioled; stem-leaves linear, sessile. *Peduncles* one-flowered, in the divisions of the stem. *Petals* a little longer than the calyx, bifid, styles constantly three. *Capsule* oblong, six-toothed. A native of Hungary. 7. *C. refractum*, Mart. 17. Allion. ped. n. 1728. (*C. trigynum*; Villars Dauph. 3. 645. *Myofotis*; Hal. helv. n. 890.) "Leaves lanceolate, smooth; petals broken." *Root* perennial. *Stems* several, a finger's length, smooth, or somewhat hairy, two-flowered. *Peduncles* long; one broken or jointed, with two stipules at the joint. *Corolla* larger than the calyx; petals cleft one third of their length; segments linear; styles sometimes four. *Capsule* conic-polygon, opening by six or seven valves, and parting as far as the middle. A native of mount St. Bernard. 8. *C. tetrandrum*, Curt. Lond. Pl. 31. Smith Flor. Brit. 4. (*Sagina ceratoides*; Smith in Linn. Transf. vol. ii. p. 343. and Eng. bot. Pl. 166.) "Hairy, somewhat viscid; flowers with four petals and four petals; petals bifid, shorter than the calyx." Tetrandrous mouse ear chickweed. *Root* annual, fibrous, branched. *Herb* of a bright green colour. *Stems* numerous, diffuse, leafy, dichotomous, scarcely panicled. *Leaves* elliptic-oblong; upper ones egg-shaped. *Flowers* white, peduncles three times the length of the calyx, at first erect, afterwards bent down; leaflets of the calyx four, hairy, acuminate, scarious at the edges; two inner ones narrower; petals inversely heart-shaped. *Capsule* cylindrical, a little longer than the calyx, with eight teeth. *Seeds* roughish on the outer side. In cultivated plants there are sometimes five filaments and five petals. A native of Scotland, flowering in May and June. First observed by Dr. Smith, in 1782, on walls about Edinburgh, and on Calton hill, and Arthur's seat; afterwards by Mr. Dickson on Inch Keith and Inch Combe in the Firth of Forth, and on the beach

below

below Paefton Pans. 9. *C. arvenfe*, Linn. Sp. Pl. 6. Mart. 6. Lam. 8. Willd. 7. Curt. Lond. Pl. 29. Eng. Bot. Pl. 93. Flor. Dan. tab. 626. (Caryophyllus arvensis hirsutus flore majore; Rai Syn. 348 Myofotis arvensis hirsuta fl re majore; Vaill. par. tab. 30. fig. 4. and according to Haller and Dr. Smith also fig. 5.) Field chickweed. "Leaves linear-lanceolate, obtufe, ciliated at the bafe; petals twice the length of the calyx." Dr. Smith. *Root* perennial, creeping. *Stems* four or five inches high, decumbent, forming thick tufts, pubefcent. *Leaves* linear-lanceolate, often denfely pubefcent, fometimes only ciliated at the bafe. *Flowers* large, white; leaflets of the calyx egg shaped, obtufe, fearions at the edges; petals heart-shaped, veined. *Capsule* cylindrical, ftraight, the length of the calyx; orifice with ten teeth. A native of England and other parts of Europe, on a gravelly or chalky foil. 10. *C. lineare*, Willd. 8. Alion. ped. 2. App. tab. 88. fig. 4. "Leaves linear-lanceolate, acute, pubefcent; petals larger than the calyx, acute, bifid." Willd. *Root* perennial. *Leaves* flaccid, awned. *Peduncles* generally one flowered, tomentous. *Capsules* oblong. A native of mount Cenis and the Piedmontefe Alps. 11. *C. cicbotatum*, Linn. Sp. Pl. 7. Mart. 7. Lam. 2. Willd. 9. (Myofotis hispanica fegetum; Tourn. 245. Lychnis fegetum minor; Bauh. pin. 204. Alfine circinata; Cluf. hift. 2. p. 184.) "Leaves lanceolate; item dichotomous, much branched; capsules erect. Linn. longer than the calyx. Willd. *Root* annual. *Stem* fix or feven inches high, jointed. *Leaves* more than an inch long, narrow-lanceolate, greenifh, flightly hairy. *Flowers* white, at the end of the branches and in the divifions of the ftem; calyx hairy; petals very fmall. *Capsules* twice the length of the calyx, flightly curved. A native of Spain. 12. *C. longifolium*, Willd. 10. (Myofotis orientalis longifimo folio; Tourn. Cor. p. 18.) "Leaves linear-lanceolate; item dichotomous, peduncles, when the fruit ripens, horizontal; capsules the length of the calyx." Willd. *Root* annual. *Stem* erect, round, befet with viscus hairs. *Leaves* the length of the internodes, acute, feffile, hairy on both fides. *Calyx* hairy; leaflets membranous at the edges; petals fhorter than the calyx. *Capsule* oblong, the length of the calyx, with ten teeth. Willd. from a dried fpecimen. 13. *C. alpinum*, Linn. Sp. Pl. 11. Mart. 8. Willd. 11. Eng. bot. Pl. 472. Flor. Dan. tab. 6. (*C. latifolium*; Lightfoot Flora Scot. Pl. 10. Alfine myofotis facie, lychnis alpina, flore amplo nivo, repens; Rai Syn. p. 349. tab. 15. fig. 2.) "Leaves elliptical, naked or clothed with long hairs; panicle dichotomous, few-flowered, bracteate; capsule oblong, recurved." *Root* perennial, creeping. *Stems* from three to five inches high, erect, fimple, dichotomous at the top, fometimes only one-flowered. *Leaves* elliptical, rather obtufe, various in their breadth; on moift ground generally fmooth; in dry fituations clothed with long, foft, jointed afcending hairs. *Flowers* large, white; peduncles about three, one-flowered; bracts oppofite, lanceolate; calyx leaflets fearions at the edges; petals inverfely heart-shaped, half as long again as the calyx. *Capsule* cylindrical, longer than the calyx, recurved. A native of high mountains in Wales, Scotland, and other parts of Europe. 14. *C. dioicum*, Mart. 18. Ait. Hort. Kew. 2. 121. "Hairy, vifcid; leaves lanceolate; flowers dioicous; petals three times larger than the calyx." A native of Spain; cultivated in 1766, in the botanic garden at Oxford.

**** Capsules roundifh.**

15. *C. repens*, Linn. 9. Mart. 9. Willd. 12. "Leaves lanceolate; peduncles branched; capsules roundifh." Linn. *Stems* fveral, trailing, putting out roots at the joints. *Leaves* about two inches long, and little more than half an

inch broad, very hoary; thofe next the root fmaller than the upper ones. *Flowers* white, on fender peduncles. Miller. It is doubted by La Marck and others, whether it be fpecifically different from *C. arvenfe*. Cultivated by Mr. Miller in 1759, and for fome time employed as an edging for borders under the name of fea-pink. 16. *C. fridium*, Linn. Sp. Pl. Marc. 10. Lam. 9. Willd. 13. Alion. ped. n. 1729? (Caryophyllus holofteus alpinus graminos; Bauh. pin. 210. Myofotis; Hall. helv. n. 892.) "Leaves linear, acuminate, fmooth; peduncles one flowered, fomewhat downy; capsules globular." Linn. *Root* perennial. *Stems* from three to five inches long, partly recumbent, pubefcent on their upper part. *Leaves* green, near together. *Flowers* white, few, peduncled, terminal; calyx nearly fmooth. Lam. A native of mountains in Switzerland. 17. *C. fuffruticofum*, Linn. Sp. Pl. 11. Mart. 11. Lam. 10. Willd. 14. (Myofotis tenuiffimo folio rigidio; Tourn. Inft. 245.) "Stems in tufts, knotty, perennial; leaves linear-awl-shaped, rigid, fomewhat pungent; calyx ftriated." Lam. *β*. Alfine orientalis fruticofa, camphoratae folio; Tourn. Cor. 18. The habit of arenaria juniperina. *Root* perennial. *Stems* numerous, from fix to eight inches long, a little decumbent towards the bafe, very fender towards the fummit, flightly pubefcent. *Leaves* five or fix lines long, oppofite, often fasciculated in confequence of the fmaller branches not being developed. *Flowers* white, in a terminal cyme; calyx fmooth; peduncles forked. *Capsules* oblong, a little curved, longer than the calyx. A native of the fouth of Europe. *β*. Leaves about an inch long. A native of the neighbourhood of Smyrna. 18. *C. maximum*, Linn. Sp. Pl. 12. Mart. 12. Lam. 11. Willd. 15. Gmel. Sib. 4. p. 150. tab. 62. fig. 2. "Leaves lanceolate, feabrous; petals crenated; capsules globular." *Root* annual. *Stems* near a foot long, more or lefs erect, hairy towards the bottom, fmooth near the top. *Leaves* in dilant pairs, feffile, very acute. *Flowers* large, difpofed nearly in an umbel; petals toothed or lacinated. A native of Siberia. 19. *C. aquaticum*, Linn. Sp. Pl. 13. Mart. 13. Lam. 12. Willd. 16. Curt. Lond. Pl. 34. Eng. bot. Pl. 538. (Alfine major repens perennis; Rai Syn. 347. Alfine maxima folanifolia; Tourn. Inft. 242. Hall. helv. n. 885.) Water chickweed. "Leaves heart-shaped, feffile, peduncles lateral, folitary, reflexed as the fruit ripens; capsule egg-shaped, orifice five-toothed." Dr. Smith. The habit of ficlaria nemorum. *Root* perennial, creeping. *Stems* two feet long, weak, branched, round, hairy on all fides. *Leaves* acuminate, waved, hairy; lower ones often petioled. *Flowers* white; peduncles lateral, intrafoliaceos, one-flowered; leaflets of the calyx egg shaped, hairy, vifcid; petals generally the length of the calyx, fometimes longer, deeply bifid; fegments fomewhat linear; filamens always ten; ftyles five. *Capsules* egg-shaped, fplitting almoft to the middle into five teeth. *Seeds* kidney shaped, rough, pale brown. A native of moift ground in England and other parts of Europe. 20. *C. latifolium*, Linn. Sp. Pl. 15. Mart. 14. Lam. 5. Willd. 18. Jacq. Coll. vol. 1. tab. 20. Eng. bot. Pl. 473. (*C. tomentosum*; Hudf. Flor. Ang. Ed. 1. Alfine myofotis lanuginofa alpina grandiflora; Rai Syn. 349.) Broad-leaved round chickweed. "Leaves elliptical, feabrous; peduncles terminal, fimple, generally folitary; capsule egg-shaped." *Root* perennial. *Stems* in tufts, fhort, feabrous, one-flowered. *Leaves* fet near together; feabrous, with fhort, rigid, fpreading, and often jointed hairs. *Flowers* white; peduncles as long as the ftem, without bracts. *Capsules* fhort. A native of mountains in Wales, Scotland, Switzerland, and Auftria, flowering in June. 21. *C. tomentosum*, Linn. Sp. Pl. 16. Mart. 15. Lam. 7. Willd. 19. (Myofotis incana repens; Tourn. Inft. 245. Lychnis; Bauh.

pin.

pin. 2: 6. *Ocymoides*; lychnitis, repante radice l. B. 5. 123. Rai hist. 1031. Cul. Pliatub. App. tab. 71. Myofotis; Hal. helv. n. 891.) "Leaves linear, tomentous, hoary; peduncles branched, some what pained." Lam. *Root* perennial, creeping. *Stems* five or six inches long, cottony, branched near the bottom; outer branches procombent, more abundantly leafy or barren. *Leaves* white, from six to eight lines long. *Flowers* white, large, on branched peduncles; calyx cottony, half the length of the corolla. *Capsules* short but cylindrical. A native of Spain, Switzerland, and Italy; and said, but on very dubious authority, to have been found in Ripton wood in Huntingdonshire. 2. *C. monticum*, Linn. Sp. P. 14 Mart. 16. Lam. 17. Willd. 2. (Alpine caryophylloides glabra; Sagn. Veron. tab. 4, fig. 2. Hall. helv. n. 883.) "Smooth; stem stiff; leaves lanceolate; peduncles very long; capsules globular." Linn. The habit of *Stellaria graminea*. *Root* annual, slender. *Stem* half a foot high, commonly simple, sometimes branched. *Leaves* narrow-lanceolate, very acute. *Flowers* white, in a trifid panicle; petals twice as long as the calyx, roundish, entire or slightly emarginate (deeply trifid; Hal.); styles three. *Capsule* with ten teeth. *Seeds* kidney-shaped, wrinkled, brownish. A native of the neighbourhood of Verona in Sylva Mantica, and of the Grisons.

CERASTIUM, in *Gardening*, contains plants of the herbaceous low growing kind; of which the species cultivated are the perfoliate mouse-ear, (*C. perfoliatum*), and the creeping mouse-ear or sea-pink (*C. repens*); but other species may be cultivated.

Of these, the first, which is an annual plant, rises with an upright stalk a foot high; the leaves have much resemblance of some sorts of catch-fly; they are placed by pairs, embracing the stalks; the flowers come out at the top of the stalks, and also from the wings of the leaves in the upper part of them; are white and shaped like those of chickweed; appearing in May and June. It is a native of Greece.

In the second sort many weak stalks are sent out which trail upon the ground, and put out roots at their joints; the leaves are about two inches long, and little more than half an inch broad, very hoary; and the flowers come out from the side of the stalks upon slender peduncles, which branch out into several smaller, each supporting a white flower. It is a native of France, &c.

Method of Culture. These plants are readily increased, either by seeds, slips from the rooting branches, or putting the roots, each of which operations may be performed either in the autumn or spring season, placing them in proper situations in the open ground. The trailing branches root as they extend themselves, at each joint, by which they easily multiply and extend themselves.

From their spreading growth, they are highly useful for covering naked banks, and running over artificial rock works, ruins, grottoes, and other similar parts of pleasure grounds. And the last sort was formerly often used as an edging in gardens or other pieces.

CERASUS, in *Botany*, *capensis*, Petiv.—*Africana*, Pluk. See *CASSINE maurceana*.

CERASUS americana, Pluk. See *MALPIGIA punicifolia*.

CERASUS, Bauh. &c. See *PRUNUS*.

CERASUS, in *Gardening*, the cherry-tree. See *PRUNUS*.

CERASUS, in *Ancient Geography*, a town and gulf of Pontus Cappadocius, on the northern coast of the Euxine sea. It was a handsome Greek city, built by the inhabitants of Sinope in Cappadocia, at the bottom of a bay, between two steep rocks which defended it, according to Piny and

Arrian; and to whom it paid a yearly tribute, according to Xenophon (Cyri Exped. lib. v.). This city was much improved by Pharnaces, grandfather of Mithridates, who gave it his own name, and peopled it with barbarians from Colchis; though Ptolemy distinguishes Cerasus from the city of Pharnaces. It was in this city that the unfortunate M. nima terminated her life, as Sallust informs us in his Fragments. This city was episcopal. From hence, as Piny says, Lucullus first brought cherries into Italy, A. U. C. 685, which were introduced 120 years after into Britain; called therefore by the Latins *Cerisia*. Tour est reports us, that the country is very hilly, and that the hills are covered with forests, in which cherry-trees grow naturally.

CERATA, the name of two mountains of Greece, which separated the territories of Megara and Athens, according to Strabo. Dioscorus Siculus, and Plutarch.

CERATE. See *CERATUM*.

CERATIA, in *Botany*, *Plinii*, C. s. cephr. See *DENTARIA encaphylli*.

CERATIA siliqua, Lch. See *CERATONIA siliqua*.

CERATIA agrestis virginiana, Rai. den. See *CERCIS canadensis*.

CERATIA, Bauh. Pin. See *ERYTHINA*.

CERATIÆ quolan modo affinis, Pluk. See *MIMOSA bigemina*.

CERATIAS, among *Ancient Naturalists*, denotes a horned comet. The word is formed from $\kappa\epsilon\rho\alpha\iota$, a horn. Such is that said to have appeared when Xerxes passed his army into Greece.

CERATINUS, JAMES, a learned Dutchman of the 16th century, whose family name was *Tryng*, but who assumed the name *Ceratinus*, of Greek etymology, from $\kappa\epsilon\rho\alpha\iota$, the appellation of his native place, Horn or Hoorn. He combined singular modesty with distinguished attainments in Greek and the Latin literature, for which he is highly commended by Erasmus. Such was his extreme diffidence, that, upon being examined for priest's orders, a question was put to him from the Latin grammar, to which he generously replied, that he did not recollect a single rule by heart. The consequence was his rejection; but when he acquainted a friend with the reason of it, this friend immediately repaired to the examiners, and told them, that they had dismissed the most learned man in Louvain, who had given ample evidence of his erudition by an elegant Latin translation from Chrysolostom's works. Upon receiving this information, they ran for him again, and ordered him with many apologies for their former rejection of him. Being obliged by the war to quit a priest's office which he held at Tournay, he became a private teacher of Greek at Louvain; and afterwards, on the recommendation of Erasmus to George elector of Saxony, he was chosen to succeed Mosellanus in the university of Leipzig. But returning to Louvain, he died there in 1570, in the prime of life. His works were "A Translation of Chrysolostom's Treatise concerning the Priesthood;" an improved edition of the "Græco-Latin Lexicon," printed in 1524, with a preface by Erasmus; and a treatise "De Sono Græcarum Litterarum," printed in 1529. Gen. Dict.

CERATINUS Sinus, in *Ancient Geography*, a gulf of the Thracian Bosphorus.

CERATION, **CERATIO**, in *Chemistry*, the operation of waxing.

CERATITES, a name given by many authors to the substance more usually called by authors *uncalcified siliqua*, and found in great plenty in the caverns of Hartz forest in Germany.

CERATIUM, or **CERATION**, a name given by the *Ancient*

Ancient Physicians to a small weight. The ceration is properly the name of a tree called the carob, or *siliqua dulcis*, the sweet pipe-tree: this tree bears a long pod, in which are contained several seeds among the pulp: these seeds are also called *ceration* and *jenbut* by the Arabians; and being dried, they were used as a weight to proportion the dos. of medicine. Thus the small weight which took its origin from them, was called *ceration*; as that small weight, which took its origin from a grain of barley, was called *grammum*.

CERATIUM was also a small silver coin, the third part of an *obolus*, and the same with what the Romans called *folius*.

CERATOCARPUS, in *Botany* (from *κερας*, a horn, and *καρπος*, fruit), Linn. gen. 10. 5. Schreb. 1392. Gart. 728. Juss. p. 86. Clafs and order, *monocia monandria*. Nat. ord. *Uloraceae*, Linn. *Atriplicites*, Juss.

Gen. Char. Male flowers. *Cal.* perianth one-leaved, tubular, wider at the top, thin, coloured, bifid (two leaved, Gart.). *Cor.* none. *Stam.* filament single, capillary, scarcely longer than the calyx, inserted into the receptacle; anther two-celled, oval, upright. Female flowers. *Cal.* perianth one-leaved, inversely egg-shaped, compressed, keeled on both sides, permanent, two-horned; horns straight, awl-shaped, divaricated. *Cor.* none. *Pistl.* germ oblong, superior; styles two, capillary; stigmas simple, standing out between the horns of the calyx. *Peric.* none, except the permanent enlarged calyx, inclosing and closely adhering to it. *Seed* single, oblong, lessened at the bottom, compressed.

Eff. Ch. Male. Calyx one-sided, bifid. Corolla none. Female. Calyx one-leaved, keeled, permanent, two-horned. Styles two. Seeds single, compressed, inclosed, and covered by the calyx.

Sp. C. *arenaria*, Linn. Sp. Pl. Mart. Lam. Buxbaum Aët. Petrop. 1. 244. tab. 9. Guldenf. Nov. Act. Petrop. 16. 553. tab. 17. fig. 7—12. Gart. tab. 127. fig. 7. Lam. Illus. Pl. 741. (Ceratoides orientalis major & minor, Tourn. Cor. 52.) *Root* annual. *Stem* about a foot high, branched, vilous. *Leaves* about an inch long, alternate, linear, very acute, vilous. *Flowers* axillary, generally solitary, almost sessile. A native of the sandy deserts in Tartary.

CERATOCEPHALUS, in *Botany*, *ballotes folio*, Vaill. See SPILANTHUS *acmella*.

CERATOCEPHALUS *foliis cordatis*, Vaill. See BIDENTIS *nivea*.

CERATOCEPHALUS *foliis lanceolatis*, Vaill. See COTULA *spilanthus*.

CERATOCEPHALUS *delpheii foliis*, Vaill. See COREOPSIS *coronata*.

CERATOGLOSSUS, in *Anatomy*, is that part of the hyoglossus muscle which arises from the cornu of the os hyoides, and which is described by some anatomists as a distinct muscle. See TONGUE.

CERATOIDES, in *Botany*, *orientalis fruticosa*, Tourn. See AXYRIS *ceratoides*.

CERATOIDES *orientalis major & minor*, Tourn. See CERATOCARPUS.

CERATONALAGMA, a cerate or cerecloth.

CERATONIA, in *Botany* (*κερατονια*, Galea, Paulus Ægineta, so called from its hornlike legume), Linn. gen. 1167. Schreb. 1612. Juss. p. 347. Vent. vol. iii. p. 368. Gart. 852. Clafs and order, *polygamia triaena*. Nat. ord. *Lomentaceae*, Linn. *Leguminosae*, Juss.

Gen. Ch. Hermaphrodite, male and female flowers each on a different plant. Male. *Cal.* perianth small, open, with five divisions. *Cor.* none. *Stam.* filaments five, rarely six or seven, awl-shaped, very long, expanding, opposite to the di-

vision of the calyx, proceeding from the margin of a fleshy disk, which occupies the middle of the flower; anthers large, furrowed, two-celled.

Female. *Cal.* perianth one-leaved, divided by five tubercles. *Cor.* none. *Pistl.* germ superior, in the centre of the fleshy disk or receptacle which covers the inner part of the calyx; style long, filiform; stigma capitate. *Peric.* legume long, obtuse, flattened, tetragonous when dry, smooth, coriaceous, not opening by valves, divided by transverse partitions into many cells. *Seeds* one in each cell, bedded in a fucculent pulp, roundish, compressed, hard, shining.

Eff. Ch. Hermaphrodite. Calyx with five divisions. *Cor.* none. *Stamens* five. *Style* filiform. Legume coriaceous, many-seeded.

Oberv. Fafano, in Aët. Neap. 1787, calls the fleshy disk or receptacle of other authors a permanent corolla.

Sp. C. *siliqua*, Linn. Sp. Pl. Mart. Lam. Illus. Pl. 859. Fafano Aët. Neap. tab. 18. fig. 2. Gart. tab. 146. fig. 1. Dod. Penpt. 787. fig. 1. (*Siliqua edulis*, Bauh. Pin. 402. Blackit. tab. 209.) Carob-tree, St. John's bread. Fr. *Caroubier*. An evergreen tree of a considerable size. *Trunk* rugged. *Branches* crooked, spreading like those of the apple tree. *Leaves* winged, without an odd one; leaflets in six or eight pairs, three inches broad, roundish, entire, thick, rigid, curved, dark green above, paler beneath. A native of the south of France, of Naples, Spain, Egypt, and the Levant. Its fruit, when ripe, has a tolerably pleasant sweetish taste, and is eaten in times of scarcity by the country people, but is apt to purge and gripe the bowels. It is commonly given to cattle. As a medicine, it has the same properties as cassia, but in a less degree. The pulp, which has the consistence of a blackish syrup, mixed with liquorice-root, dry raisins, and several other kinds of fruit, forms the sherbet of the Turks. It was long supposed to have been the food of John the Baptist in the wilderness; but a better acquaintance with natural history has now rendered it nearly certain that the *κερας*, or locust of the evangetic history, is the well-known destructive insect of that name. It is much more probable that the shells of the carob tree were the husks intended by our Saviour in the parable of the prodigal son.

Its leaves are of an astringent nature, and may be used as a substitute for oak-bark in the tanning of hides. Its wood is esteemed in the south of Europe equal to that of the evergreen oak, and is used for the same purposes.

CERATONIA, in *Gardening*, contains a plant of the evergreen, exotic, shrubby kind; of which the species cultivated is the carob-tree, or St. John's bread, (*C. siliqua*), which rises with an upright, thick, woody stem, to the height of 15 or 20 feet in its native situation; the head being divided into many branches; the leaves are pinnate, of a dark green colour, three inches in breadth, and rather more in length; and the flowers small, and of a dark purple colour. It is a native of Syria, &c.

Method of Culture. These plants are increased by sowing the seeds produced from their native situations in pots of light earth in the spring, plunging them in moderate hot-beds; and after the plants have attained sufficient growth, removing them into separate pots, hots, water, and fresh air being occasionally given, and the pots continued in the hot-bed. As soon as the weather becomes fine in the summer, they should be gradually hardened by exposure to the free air, and be placed out till the approach of autumn, when the protection of the green house will be necessary to preserve them during the winter season, free air being given in fine days as much as possible; and afterwards they require only to be managed as other green-house plants, in which situa-

tion they have a good effect by the variety which they afford.

CERATOPETALUM, in *Botany* (from *κερας*, a horn, and *πεταλον*, a petal), Willd. 861. Smith Nov. Holl. 1. p. 9. Clafs and order, *decandria monogynia*.

Gen. Ch. *Cal.* perianth five-cleft, bearing the stamens permanent. *Cor.* petals five, pinnatifid. *Stam.* filaments ten, anthers spurred. *Pist.* germ superior; style one. *Peric.* capsule two-celled, seated in the bottom of the calyx.

Sp. C. *gummiferum*, Smith Nov. Holl. tab. 3. A lofty tree. *Leaves* opposite, petiolar, ternate; leaflets sessile, lanceolate, toothed, veined, smooth. *Flowers* in terminal panicles; calyxes yellow; segments reddish; petals yellow. A native of New Holland.

CERATOPHYLLUM (compounded of *κερας* and *φυλλον*, signifying a horned leaf), Linn. gen. 1265. Schreb. 1439. Juss. 18. Vent. vol. 4. 5. Gart. 258. Clafs and order, *monacia polyandria*. Nat. ord. *Inundata*, Linn. *Najides*, Juss. *Undetermined*, Vent.

Gen. Ch. Male. *Cal.* perianth with many divisions: divisions awl-shaped, equal. *Cor.* none. *Stam.* filaments double the divisions of the calyx, from sixteen to twenty, very short; anthers oblong, erect, longer than the calyx.

Female. *Cal.* and *Cor.* as in the male. *Pist.* germ egg-shaped, compressed; style none; stigma obtuse, oblique. *Peric.* nut small, with a thin, somewhat coriaceous rind, hard, one-celled. *Seed* attached to the bottom of the shell.

Eff. Ch. *Cal.* many parted. *Cor.* none. *Stam.* from sixteen to twenty. *Pist.* one. *Style* none. *Seed* one, coated.

Sp. 1. C. *demersum*, Linn. Sp. Pl. Mart. Lam. Illust. Pl. 775. fig. 2. Flor. Dan. tab. 510. Gart. tab. 44. Eng. Bot. Pl. 947. (*Hydroceratophyllum folio aspero*, Vaill. Act. 1719. tab. 2. fig. 1. *Millefolium aquaticum cornutum*, Rai. Hist. 101.) "Fruit armed with three spines." *Root* perennial. *Herb* branched under water. *Stem* branched, in ead-shaped. *Leaves* about eight in a whorl, dichotomous; segments most frequently four, linear, channelled, toothed on the back, somewhat spiny. *Flowers* axillary, solitary, sessile. *Fruit* elliptical, round, with one long terminal spine, formed of the lengthened style; and two, generally shorter, diverging lateral ones. Dr. Smith. Common in stagnant waters and slow streams, flowering in September. 2. C. *submersum*, Linn. Sp. Pl. Mart. Lam. Illust. Pl. 775. fig. 1. Eng. Bot. Pl. 679. Flor. Dan. tab. 510. (*Hydroceratophyllum folio laevi*, Vaill. tab. 2. fig. 2.) "Fruit destitute of spines." *Root* perennial, the habit of the former. *Leaves* generally more compound, more slender, and often without spines. *Fruit* smaller, egg-shaped. Less common; found by Dillenius in ditches by the road from Chichester to Selsey island, and by Mr. Dawson Turner between Yarmouth and Gorleston.

CERATOPORUM, in *Ancient Geography*, an episcopal see of Asia Minor, in the Paetian Phrygia, according to the acts of the council of Ephesus.

CERATOSANTHES, in *Botany*, (compounded of *κερας* and *ανθος*, denoting a horned flower). Juskieu, p. 396. Vent. vol. iii. p. 518. A genus formed out of the *Trichosanthes* of Linnæus, for such species as have a four-celled fruit and the inner segments of the calyx not ciliated, but divided at the summit into two revolute horns.

CERATOSPERMUM, (compounded of *κερας*, and *σπέρμα*, denoting a horned seed). Lam. Encyc. Mich. nov. gen. 125. Tab. 56. fig. 1. Hal. helv. n. 2212. Clafs and ord. *Cryptogamia Algæ*. A plant acknowledged to be very rare, and to have been seen by few botanists.

It is said to grow on the bark of trees, and to consist of numerous crustaceous, orbicular, distinct warts, charged with a fugacious powder, and containing, in small cavities, oblong, curved capsules resembling little horns. But Dillenius suspects that Micheli imagined more than he saw, and that his *ceratospermum* is no other than *Lichenoides verrucosum* and *ragosum*, *emereum glabrum* of the *Historia Muscorum*; *Lichen pertusus* of Linnæus. *Deprehendat*, quibus poterit, flores Michelio vios, tab. 56. lit. A, B, C, D. *Quidam* plus vident, quam aui, quoniam nempe imaginatione pollent. Hist. Musc. p. 129.

CERATOSTEMA, (*κερας* and *στυμα*, denoting a horned stamen.) Juss. 163. Clafs and order, *decandria monogynia*. Nat. ord. *Campanulaceæ*, Juss.

Gen. Ch. *Cal.* perianth top-shaped, five-cleft; segments large. *Cor.* coriaceous, tubular-cylindrical; border five-cleft, erect. *Stam.* ten, situated on the calyx; filaments short; anthers very long, attenuated at the tip, and ending in two horns. *Pist.* stigma one. *Peric.* Capsule crowned with the segments of the calyx, somewhat downy, five-celled, many-fledged.

Sp. Ch. A shrub. *Leaves* coriaceous, sessile. *Flowers* coriaceous, large, in loose terminal spikes, pedicelled, bracteated. A native of Peru, described from a specimen with unripe fruit in the collection of Jos. Jussieu.

CERATUM, **CERATE**, in the *Materia Medica*, a kind of stiff unguent or liniment, made of oil and wax, with other ingredients; used externally in several diseases, especially those of the skin.

It takes its name from its capital ingredient, wax, called in Latin *cera*.

Its consistence is thicker than that of a liniment; the last having usually two ounces of wax to two of oil; but the cerate four of wax to two of oil; yet it is softer than a plaster.

There are cerates of various kinds, *refrigerative stomaticæ*, &c. *cerate of sulphur*, of *sanders*, *resolvent cerate of bricks*, *divine cerate*, &c.

There is a particular one, called the *refrigerative cerate of Galen*, made of white wax and *oleum rosæ*, *ambacis*.

CERATUM EPULATICUM, a name given to the late London Dispensary to the composition commonly called Turner's cerate, called in the last London Pharmacopœia "Ceratum lapidis calaminaris," and ordered to be made in this manner: take olive oil a pint; yellow wax and prepared calamine, of each half a pound; melt the wax in the oil, expose it to the air, and when the mixture begins to congeal again, sprinkle in the powder of calamine, and continue stirring it till the whole is cold.

CERATUM CANTHARIDIS is prepared by mixing six drams by weight of cerate of spermaceti softened by the fire, and one dram by weight of finely powdered cantharis." This may supply the place of the "Epithema vesicatorium of the former dispensary; and in order to quicken its action, an addition of pulv. cantharid. may be made at discretion.

CERATUM LITHARGYRI ACETATI COMPOSITUM, or compound cerate of acetated litharge, is composed of 2½ ounces by measure of water of acetated litharge, four ounces by weight of yellow wax, nine ounces by measure of olive oil, and half a dram by weight of camphor. Rub the camphor with a little of the oil; melt the wax with the remaining oil, and when the mixture begins to thicken, pour on gradually the water of acetated litharge, stirring it till it is cold; and then mix in the camphor, which was before rubbed with the oil.

CERATUM RESINÆ FLAVÆ, or cerate of yellow resin, is prepared by melting together half a pound of ointment of yellow resin with one ounce by weight of yellow wax.

CERATUM saponis, or soap cerate, is composed of the following ingredients; viz. 8 ounces by weight of soap, 10 ounces by weight of yellow wax, one pound of powdered litarge, one pint of olive oil, and one gallon of vinegar. Boil the vinegar with the litharge by means of a slow fire, constantly stirring, till the mixture unites and thickens; then mix in the other ingredients in order to form a cerate.

CERATUM Spermatici Ceti, or cerate of spermaceti, is prepared by mixing together half an ounce by weight of spermaceti, two ounces by weight of white wax, and four ounces by measure of olive oil, and stirring it till the mixture becomes cold.

CERATUM nervinale, a form of medicine prescribed in the late London Pharmacopœia, and ordered to be made in the following manner: take yellow wax and tried hog's lard, of each half a pound; quicksilver, three ounces; simple balsam of sulphur, a dram: melt the wax and lard, and then add to them gradually the quicksilver, first well divided by the balsam of sulphur.

CERATUS, or **CERATUS**, in *Ancient Geography*, a small river of the isle of Crete, which, according to Strabo, ran near the town of Gnoſſus.

CERAULA, in *Antiquity*, a kind of musician, who blows or plays on the horn.

In which sense, the word amounts to the same with the Latin *cornicem*.

CERAUNIA, in *Ancient Geography*, a town of the Peloponnesus, in Achaia, according to Polybius. It was one of the twelve cities which formed the Achaean state.

CERAUNIA, now *Cerives*, an ancient town on the north coast of the island of Cyprus; which, like Paphos, exhibits nothing but ruins, as a testimony of its past grandeur.

CERAUNIA, **CERAUNIAS**, or **CERAUNIIUS lapis**, in *Natural History*, a sort of flinty figured stone, of no certain colour, but of a pyramidal or wedge-like figure; popularly supposed to fall from the clouds in thunder-storms, and to be possessed of divers notable virtues; as of promoting sleep, preserving from lightning, &c. The word is formed from *κεραυνος*, a thunder bolt. The ceraunia is the same with what is otherwise called the thunder-stone, or thunder-bolt; and sometimes also *ſagitta*, or arrow's head, on account of its shape.

The ceraunia are frequently confounded with the **OMBRIA** and **BRONTIA**, as being all supposed to have the same origin.

The generality of naturalists take the ceraunia for a native stone, formed among pyrites, of a saline, concrete, mineral juice. Mercatus and Dr. Woodward assert it to be artificial, and to have been fashioned thus by tools. The ceraunia, according to these authors, are *ſilices*, or heads of the ancient weapons of war, in use before the invention of iron; which, upon the introduction of that metal, growing into disuse, were dispersed in the fields through this and that neighbouring country.

Mr. Dothes has found, among the worn stones of the Mediterranean shore, javelin-heads of porphyry, jasper, horn-stone, schorl, variolite, &c. probably fabricated by the ancient inhabitants, the Gauls. These javelin-heads, made of jasper, &c. on account of their excessive hardness, of which even the savages of Canada have availed themselves in the construction of such weapons, are commonly known by the name of thunder-stones, and are distinguished by the Lithologists by the name of Ceraunites or Ceraunia.

CERAUNIAS albus, a name given by Pliny to a gem or precious stone, of the nature of the asteria, but somewhat inferior to it in beauty. Pliny tells us that it was a very bright gem, of a crystalline appearance, but

with a cast of bluish; and that it was found in Caramania. Solinus gives us much the same account, but makes Germany the place of its origin. It is, indeed, written Germania in several of the old copies in Pliny, but the most correct have it as it is printed, Caramania; and Caramania was a country from which the Romans had many gems.

CERAUNII, in *Ancient Geography*, a people of Illyria, who, according to Pliny, were divided into 24 decuries. They are also mentioned by Ptolemy.

CERAUNII Montes. See **ACROCERAUNIA**. Pomponius Mela gives this name to a part of mount Taurus, which proceeded from the coast of the Euxine sea, the Palus Maeotis and Tamas.

CERAUNITIA, or **CERAUNIAS**, a town of Italy, which Diodorus Siculus places in the country of the Samnites; and which, he says, was taken by the Romans.

CERAUNITES, in *Natural History*, a name given by several writers to the **BELEMNITES**.

CERAUNIUS, or *Fulminator*, in *Mythology*, an epithet of Jupiter.

CERAUNUS, in *Ancient Geography*, a river of Asia, in Cappadocia, according to Pliny.

CERAUSIUS, a mountain of Peloponnesus, in Arcadia; which, according to Pausanias, formed a part of mount Lycæum.

CERBALITANUS, an episcopal see of the proconsular Africa.

CERBALUS, now *Cervaro*, a river of Italy.

CERBANI, a name given by Pliny to an ancient people of Arabia Felix: called Cerbanitæ by Steph. Byz.

CERBANUM, a town of Italy, mentioned by Procopius.

CERBERA, in *Botany*, (so called from Cerberus, on account of its poisonous qualities), Linn. Gen. 294. Schreb. 415. Willd. 475. Juss. 149. Gert. 708. (Ahouai, Tournef. 434.) Class and order, *pentandria monogynia*. Nat. ord. *Contortæ*, Linn. *Apocine*, Juss.

Gen. Ch. *Cal.* Perianth five-lobed, or five-cleft. *Cor.* monopetalous, funnel-shaped; tube clavated, longer than the calyx; orifice pentagonal, nearly closed by five converging teeth; limb large, five-cleft; segments oblique, obtuse, more gibbous on one side. *Stam.* filaments five, awl-shaped, in the middle of the tube; anthers erect, converging. *Pist.* germ roundish; style filiform, short; stigma capitate, two-lobed. *Peric.* drupe large, roundish, fleshy, hollowed on one side by a longitudinal furrow. *Seed*, a nut, containing one, two, or four kernels.

Eff. Ch. *Corolla* contorted. *Drupe* one-seeded.

Sp. 1. *C. Ahouai*, Linn. Sp. Pl. 1. Mart. 1. Willd. 1. Lam. 1. Illust. Pl. 170. Bot. Mag. Pl. 737. (Ahouai, Thevet. Antard. 66. Tournef. Inſt. 658. tab. 434. Thevetia, Linn. Hort. Cliff. Arbor Americana, foliis pomii, fructu triangulo, Bauh. Pin. 434.) "Leaves egg-shaped, acute." A tree, ten feet high, yielding in all its parts a poisonous milky juice. *Stem* and *branches* irregular and crooked. *Leaves* three inches long, one and a half broad, thick, succulent, bright green, smooth. *Flowers* in clusters at or near the extremity of the branches, cream-coloured; calyx divided half way down into five acute reflexed segments; tube of the corolla dilated in the upper part; orifice closed, marked with five deep furrows; segments of the limb, oval, oblique, with undulated margins; anthers on short filaments, enclosed in the inflated part of the tube; style the length of the tube; stigma bifid, top-shaped, surrounded at the base by a circle of greenish glands, which secrete a colourless, very sweet honey, perfectly free from any acid or nauseous taste. A native of Brazil and the West Indies. Cultivated by

R r, Mr.

Mr. Miller, in 1739. It flowers in July and August, but never produces fruit in England. Its wood has a very offensive smell; and the kernels of the nuts are a deadly poison. 2. *C. ovata*, Willd. 2. Cavan. Ic. iii. p. 35. tab. 270. "Leaves elliptical, obtuse." Leaves feathered, nearly sessile. Flowers terminal, about five together. A native of New Spain. 3. *C. thevetia*, Linn. Sp. Pl. 2. Mart. 3. Lam. 2. Willd. 6. Jacq. Amer. 48. tab. 34. Pl. 20. tab. 47. Lam. Ill. Pl. 170. "Leaves linear, very long, crowded." An elegant shrub, from twelve to fifteen feet high. Stem round, abounding in a poisonous milky juice, dividing at the top into numerous weak branches; branches simple, loose, smooth, marked with the scars of fallen leaves. Leaves on short petioles, feathered, narrow, linear, acuminate, four or five inches long, full of a milky juice. Flowers yellow, large, odorous, generally solitary, nodding, axillary, and terminal; peduncles shorter than the leaves; teeth of the tube dilated; filaments very short; germ five-lobed, surrounded by a yellow, fleshy, nectarous navel. Fruit greenish, round, fleshy, milky, containing an obscurely three or four-cornered nut, which opens by a kind of furrow on one side. A native of Cayenne and the West Indies. Received by Mr. Miller in 1735, by the name of French physic-nut. 4. *C. manghas*, Linn. Sp. Pl. 2. Mart. 2. Lam. 3. Willd. 4. Orb. It. 91. Petiv. tab. 16. fig. 4. (Manghas fructu venenato, Bauh. Pin. 440. Burm. Zel. 150. tab. 70. fig. 1. Arbor lactaria, Rumph. Amb. ii. p. 243. tab. 81. Odollam, Rheed. Mal. i. p. 71. tab. 39.) "Leaves lanceolate; nerves transverse." A milky tree, from eighteen to twenty feet high. Wood white and tender; bark even; branches rather spreading, crooked, cylindrical, marked with scars of fallen leaves. Leaves alternate, but feathered near the ends of the branches, ten or twelve inches long, and three broad, on short petioles, quite entire, smooth, even above, furnished underneath with transverse parallel nerves, which proceed from the midrib, and terminate in a nerve-like cord at the border of the leaf. Flowers white, in terminal, branched, unequal, racemes; calyx five-leaved; leaflets lanceolate, spreading, coloured, deciduous; tube of the corolla longer than the calyx, angular within; lobes of the border egg-shaped, large; filaments very short, inserted into the upper part of the tube; anthers egg-shaped, covered with the down of the tube; germ bifid; style filiform, somewhat shorter than the tube; stigma egg-shaped, cloven. Fruit egg-shaped, the size of a goose's egg, green, marked with minute white spots, compressed on one side, with an obsolete furrow; inclosing two large seeds which resemble chestnuts, and have a poisonous, vomiting quality. A native of the East Indies, and of the Society islands. In the island of Amboina its bark is used as a purgative.

Swartz has observed that this species would form a genus distinct from the two preceding, if it were not desirable not to multiply genera without absolute necessity. Gærtner asserts that on account of the difference in the structure of the fruit it cannot be associated with them under the same genus. He maintains moreover, that the Arbor lactaria of Rumphius and the Odollam of Rheede, quoted by Linnæus as synonyms, are distinct species strongly marked by the characters of the fruit. He gives the following description of the former from a specimen in the collection of Sir Joseph Banks, and of the latter from a specimen preserved in the museum at Amsterdam. *C. Manghas*, Tab. 123 and 124. fig. 1. *Peric.* Drupes two, dry, large, ovate-oblong, gibbous and obsoletely striated behind, more even with a slightly depressed furrow before; outer cuticle membranous, thin, dark brown; flesh fungous, resembling the dried pith of elder, intermingled

with the filaments of the putamen or shell; putamen woody; consisting of round fibres proceeding from the inner part in a radiate manner towards the circumference, and there changed into new, rather even, longitudinal furrows which form a peculiar woody kind of bark; semi-valved by means of a deficient suture in the anterior part, and continued to the middle of the back; one celled, but divided into two chambers by a moveable membranous partition placed between the valves. Receptacle none, except the weaveable partition, to one surface of which the seed closely adheres its whole length. Seed one, (the other constantly abortive) large, ovate-oblong, lenticularly compressed, attenuated at the tip, of a dull rusty colour.

5. *C. Odollam*, tab. 124. fig. 3. Drupe generally single, elliptic-globular, very convex on one side, greenish yellow; cortical stratum of fibres as in the preceding, woody; fibres broader, more branched and frequently reticulated on the hinder part; putamen semi-valved, one celled, but divided into two chambers; partition free, double, rising from a woody curved peduncle; each part clothed on its inner side (that towards the axis of the fruit) with an irregular tuffe of crooked fibres, and on its outer side bearing the seed. Seed one in each chamber, ovate-acuminate, on one side remarkably convex, flat on the other, and so closely adnate to the partition as to leave only the tip free. Gærtner describes also a seed communicated to him by a friend which appears to belong to another distinct but unknown species. He calls it 6. *C. playfferrmor*, tab. 124. fig. 2. Putamen woody, egg-shaped, mucated on all sides by multiform upwardly incurved fibres, nearly two-valved by means of a suture extended to the base, divided into two very compressed chambers by a moveable partition; partition coriaceous, consisting of two lamellæ opposite to the suture of the valves. Seeds two in each chamber, foliaceous-compressed, free on both sides, unequal; one larger, ovate-spatulate superior; the other smaller, somewhat kidney-shaped, inferior. 7. *C. parviflora*, Willd. 3. Forst. prod. 121. (Ochrosia borbonica; Gmel. Syst. nat. p. 439.) "Leaves bellated, inversely egg-shaped." A native of the friendly Islands and of Savage Island in the Pacific ocean. 8. *C. maculata*, Willd. 5. (Ochrosia borbonica; Juss. O. maculata; Jacq. ic. rar. 2. tab. 321. Dryander in Linn. Transf. 2. p. 227.) "Leaves lanceolate, veined, spotted; cymes axillary, branched, divaricated." It differs from the preceding in the form of its leaves. A native of the Isle of Bourbon. 9. *C. salutaris*, Mart. 5. Lour. Coch. 136. (C. oppositifolia; Lam. 4. Lactaria salubris; Rumph. Amb. 3. 255. tab. 84.) "Leaves and fruit oval." A middle-sized tree, with a milky juice, and spreading branches. Leaves oblong-oval, obtuse, quite entire, shining, crowded at the ends of the branches, on short petioles. Flowers white, inodorous, in small nearly terminal racemes; calyx five-cleft; segments awl-shaped, long, erect; corolla salver-shaped, with a long incurved tube; segments of the border oblong, fleshy, spreading, not contorted; germ egg-shaped, very small; style longer than the filaments, thick, curved, always bursting the tube of the corolla; stigma top-shaped, vertically compressed, truncated. Drupe oval, large, with a smooth skin, yellow on one side, red on the other, containing a fibrous-woody nut, with a single kernel, not poisonous. The want of a contorted corolla renders its genus dubious. A native of Cochin China near the coast, and of the Moluccas. 10. *C. musculiformis*, Lam. 5. (Fructus musculiformis; Rumph. Amb. 2. Append. 185. tab. 60.) "Fruit muscle-shaped." Leaves alternate, feathered, petioled, oval-oblong, obtuse, smooth furnished with lateral transverse nerves, from six to eight inches long and two broad.

Flowers

Flowers in a simple raceme, according to Rumphius resembling those of *C. manghas*, but smaller. *Fruit* oblong, acute, full of a milky juice like the leaves and all other parts of the plant, about three inches long and one broad, a little compressed laterally, with a longitudinal suture, having firm flesh, and containing two or three irregular kernels. The empty dried shell is half split in two on the upper part and bears some resemblance to a muscle. A native of the Moluccas and the Sunda Isles. La Marek judges this as well as the preceding to be a doubtful species.

Propagation and Culture. These plants may be propagated by nuts procured from their native countries, and require the same treatment as other tropical trees and shrubs, but as they abound in milky juice, they should be sparingly watered, especially in the winter season.

CERBERUS, in *Astronomy*, a small northern constellation near Hercules, consisting, in Hevelius's Catalogue, of four stars, which are enumerated under HERCULES in the *Britannic Catalogue*.

CERBERUS, among *Chemists*, denotes MERCURY.

The name *cerberus* is also given by some to a famous purging powder, more usually called *pulvis cornachinus*, and *pulvis comitis Warwicensis*. See CORNACHINE powder.

CERBERUS *chemicus*, in *Chemistry*, a phrase used by Hoffman and others to express the common nitre of saltpetre, which they have called also *sal infernalis*.

CERBERUS, in *Entomology*, *spinos cerberus* of Pallas. See ZYGÆNA caudata of Fabricius.

CERBERUS, in *Mythology*, a name which the ancient poets have given to a dog with three heads and mouths, born of Typhon and Echidna, and stationed at the gate of hell. Those who entered were cared by him; but to such as would return he was more terrible than hell itself; except in the instances of Bacchus and Hercules, and Mercury and Orpheus. The "dog of darkness" of the Edda bears, in some respects, a resemblance of this monster.

Some have supposed that Cerberus is the symbol of the earth, or of all-devouring time; and that its three mouths represent the present, past, and future. Accordingly they derive the name from *κερβερος*, *carnivorous*; it being the property of the earth to devour dead bodies. The victory obtained by Hercules over this monster, denotes the conquest which this hero acquired over his passions. The Platonists consider him as the evil demon, who, as Porphyry expressed it, is found in the three elements, air, water, and earth; whence they derive his three heads. In a monument, preserved by Mont'aucon, Cerberus is represented on a box, with one head of a man, another of a dog, and the third of an ape; and two serpents twirling round him bind together his legs. This figure was brought from Egypt. Hesiod gives to Cerberus 50, and others 100 heads; but he more commonly appears with three. He is said by some to have had the tail of a dragon; and instead of hair a skin, flagg'd over with snakes, whence probably is derived the epithet Medusean.

Dr. Bryant supposes that Cerberus was the name of a place, and that it signified the temple of the Sun; deriving it from *Kir-Abor*, the place of light. This temple was also called *Tor Cap-El*, which was changed to *τρισκεφαλός*; and hence Cerberus was supposed to have had three heads. It was likewise called *Tor-Koren*, *Turris Regia*; whence *τρισκεφαλός*, from *τρεις*, three, and *κεφαλή*, head. Anal. of Mythology, vol. i. p. 409, &c.

CERBIA, in *Ancient Geography*, a town of the island of Cyprus.

CERBICA, *Stekkal*, a town of Africa, situate 18 leagues

S.W. of Capsa, according to Ptolemy. In this place are found some vestiges of the Romans.

CERCALI, in *Geography*, a small island, or rather rock, in the Mediterranean, near the coast of Tuscany, a little to the north of the island of Elva.

CERCAPHUS, in *Ancient Geography*, a mountain of Asia Minor, in Ionia, near the town of Colophon.

CERCARIA, in *Zoology*, a genus of animalcules, defined by writers *vermis nudo oculo inconspicuis, pellucidus, caudatus*, Gmel. *Verms inconspicuis, pellucidus, caudatus*, Müller, &c. A worm, invisible to the naked eye, pellucid, and furnished with a tail.

The animals of this tribe which, from their extreme minuteness, can only be discovered by the assistance of a microscope, are found in vegetable and animal infusions of water, in stagnant waters of every kind, in salt-water, even in pure water, and in spermatic fluids, according to some French writers. The most copious history of these animalcules is to be found in Müller's *Hist. Vermes*, Havnia, 1786. *Om infusibus dyrenes forplantelles-maader*, &c. The following are the principal species of this genus.

* *Depressed.*

PLEURONECTES. Orbicular, the tail consisting of a single bristle. Müll. Gmel. This is membranaceous, rather round, and white. In the fore-part are two blackish points, and in the middle orbicular intestines of various sizes, the larger of which appears remarkably bright. When swimming, it is observed that one edge of the lateral membrane is upwards, and the other folded down. It is found in water that has been kept several months. Müll. Adams, &c.

TENAX. Membranaceous, anterior part rather thick and truncated; tail three times as short as the body. Müll. This appears an oval pellucid membrane, the anterior part thick, and truncated, the posterior acute, or terminating in a short tail; its motion in the water is circular, whirling about in various directions with great velocity.

CYCLIDIUM. Oval, somewhat emarginate behind, with an exertile tail. Müll. Found frequently in pure water. The body is oval, smooth, membranaceous, pellucid, with a black margin; the posterior part is somewhat notched, and furnished with a tail which it thrusts out at pleasure. The intestines are remarkably pellucid vesicles.

** *Subtrigonal.*

TRIPUS. With a pointed, reflected arm on each side. Müll. This kind was discovered in sea-water by Müller. The body is of a somewhat triangular form, with a straight tail.

*** *Tapering.*

LEMNA. Changeable, somewhat flattened, with an annulated tail. Müll. Resembles, in some respects, the *protus* of Baker, though altogether different. The body is capable of being contracted or extended, changing from oblong, or the shape of a pear, to kidney-shape. The tail is short, thick, and annulated. It vibrates, when stretched out, with so much velocity, that it appears double. The intestines are not very distinct. Near the apex is a small pellucid globeule, which Müller supposes to be the mouth. Adams, &c. Inhabit stagnant water.

LUPUS. Cylindrical, thick, and elongated; tail terminating in two spines. Müll. Lives in stagnant waters. This is one of the largest species of its genus. It is full of muscles, which are capable of being contracted or extended. The head is larger than the body, with the apex bent down like a hook. The two spines at the extremity of the tail are very bright, and moveable.

PODURA. Cylindrical, posterior part pointed, and slightly cleft

elft behind. Müll. This species was found by Müller in marshy places in Denmark, covered with lemmas. It appears to consist of a head, a trunk, and a tail; the fore part resembles the head of a herring, the trunk is cylindrical, and is replete with black spiral intestines, and which become more or less ventricose at the pleasure of the animal; when it moves it turns round as up an axis. It is found in the months of November and December.

CATELLUS. Body three-parted, with a forked tail. Müll. Discovered in water where flowers have been kept. This animalcule is more complex in its form than many others. It has a movable head, which appears connected to the body only by a point. The abdomen is not so wide, but twice as long as the head, and is replete with intestines. The tail is shorter than the head, narrower than the belly, and terminating in two bristles, which can unite and separate at pleasure. It moves with great velocity.

GYRINUS. Round, with pointed tail. Müll. *Miscrocerus corpore globoso, cauda crassiore* of Hill. The body is white, gelatinous, without any traces of intestines; fore-part somewhat globular; posterior somewhat globular, long, and pointed. The tail is observed to be in continual vibration while swimming, like that of tad-poles. Met with in animal infusions, and appears very similar to the spermatic animalcules.

*** Varians.

GIBBA. Saboval, convex, anterior part acute; tail rounded. Müll. Adams. This is small, gelatinous, white, opaque, without any visible intestines; the upper part convex or gibbous. Found chiefly in infusions of hay.

ISQUIETA. Changeable, convex, with smooth tail. Müll. Adams, &c. Discovered in salt water.

TURBO. Globular, contracted in the middle, with a brittle-form tail. Müll. Adams, &c. Met with in infusions of duck-weed. This appears to be composed of two globules, the lower one of which is smallest. There are two black points resembling eyes. It sometimes carries the tail perfectly straight, and at others the tail is bent back on the body.

SETIFERA. Cylindrical, the fore-part smallest, posterior pointed. Adams. Rarely found. Inhabits salt water.

HIRTA. Anterior part somewhat truncated; lower obtuse, and terminating in two small points. Adams. This also is found in salt water.

CRUMENA. Cylindrical and ventricose; anterior part obliquely truncated; tail linear, and ending in two diverging points. Adams, &c.

VERMICULARIS. Cylindrical, annulated, with projecting snout; tail two small spines. Adams.

FORCIPATA. Cylindrical, wrinkled with moveable forked protuberans. Adams. Found in marshy places.

LUNA. Orbicular; tail two short spines; anterior part lanced, or crescent-formal. *Cercaria luna*, Adams.

CERCAS, in *Ancient Geography*, a town of Greece, near Aulis, mentioned by Suidas.

CERCASAROPOLIS, a town of Egypt, seated on the left bank of the Nile, at the place where this river divides to form the Delta. It is mentioned by Herodotus and Pomponius Mela. Its eastern branch is the Pelusian arm, and the western, the Canopian. Strabo calls this town *Circiferia*, and places it on the side of Libya.

CERCASI, in the *Eastern Military Orders*, are a body of horse in the service of the grand signor.

CERCEAU, JOHN ANTHONY DU, in *Biography*, was born at Paris in 1675, and entering at the age of 18 years among the Jesuits, distinguished himself in their society by

the vivacity of his talents. Having indulged his taste for Latin poetry, he published a collection of pieces in 1705, which gained him a considerable degree of reputation. He afterwards applied to vernacular poetry, and became an imitator of Marot. But mistaking vulgarity and insipidity for simplicity, his French poems, with a few exceptions, were generally held in no esteem. He afterwards wrote several dramatic pieces, blending in his comedies character and pleantry with many traits of taste and negligence. Among his other productions of different kinds, we may enumerate "Reflections on French Poetry;" "History or the last Revolution in Persia;" "A Critique on Abbé Boileau's History of the Flagellants;" various pieces relating to the society of Jesuits, and its disputes. His "History of the Conspiracy of Riezzi" was one of those performances, among others begun and left unfinished, which was nearly completed, & at father Brumoy put the last hand to it, and published it in 1733. He was the writer of several articles in the *Journal de Trevoux*, particularly on the music of the ancients. He died in 1737, at the seat of the duke of Anguillon near Tours, on his return from a tour with the princeps of Conti. *Navy Dict. Hist.*

CERCIS, in *Mythology*, one of the nymphs called Oceanides, the daughter of Oceanus and Thetis. Hesiod. *Theogon.* v. 55.

CERCELE, in *Heraldry.* A Cross CERCELE, is a cross which, opening at the ends, turns round both ways, like a ram's horn.

The cross cercele differs from the cross ANCHORED, as the latter turns but a little rounding, whereas the former turns quite round.

CERCENA, in *Ancient Geography*, a town of Ethiopia, placed by Diodorus Siculus towards the western ocean; belonging to the Atlantides.

CERCENASCO, in *Geography*, a town of Piedmont, in the marquisate of Saluzzo; 21 miles S.S.W. of Turin.

CERCETAE, in *Ancient Geography*, a people who dwelt to the south of mount Caucasus and the Euxine sea, according to Strabo.

CERCETI Montes, mountains of Thessaly, according to Piny. They are named "Mons Cercetius" by Ptolemy, and "Mons Cercetus" by Livy.

CERCEPICUS Sinus, a gulf placed by Ptolemy on the northern coast of the Euxine sea, to the east of the Adyrias.

CERCINIUS, a mountain of the isle of Samos; Strabo seems to make it a part of mount Ampelos.

CERCIHARO, in *Geography*, a town of Naples, in the province of Calabria Citra; 6 miles N.N.E. of Cassano.

CERCIHARI, a river of Naples, which runs into the gulf of Tarento; 9 miles E.N.E. of Cassano.

CERCLE, in *Ancient Geography*, an island of the Mediterranean, placed by Piny in Asia Minor, on the coast of Ionia.

CERCII, a people of Italy, who were formed by the Romans into a colony under the consulate of Lucius Værius and A. Marcius. *Diod. Sic.*

CERCINA and **CERCINITIS,** now *Querkinis*, two flat and contiguous islands of Africa, situate to the S.E. of Cap-poudia, at the distance of five leagues. Strabo and Piny say, that they were joined by a bridge. Ptolemy mentions also a town of the name of *Cercina*. Agathemer, Strabo, and other ancient geographers, fix the beginning of the Lesser Syrtis at these islands; though, from circumstances

flances mentioned by Shaw (Travels, p. 112) it should rather commence at Ca-poidia.

CERCINA, a mountain of Macedonia, between Paonia and Sittica, according to Thucydides.

CERCINE, a town of Macedonia, at the mouth of the river Pontus in the lake called "Cercinitis palus," which was a marsh extending from well to east, between the town of Cercine and the place called Myrcinus.

CERCINITIS. See CERCINE.

CERCIS, in *Botany*, (*κερκίς*, Theophras.) Linn. 510. Schreb. 696. Willd. 809. Juss. p. 351. Vent. vol. iii. p. 381. Germ. 844. (*Siliquastrum*; Tourn. 414.) Judas tree. Fr. Gainer. Clafs and Order, *decandria monogynia*. Nat. Ord. *Lomentaceæ*, Linn. *Leguminosæ*, Juss. Vent.

Gen. Ch. Cal. Perianth one-leaved, very short, bell-shaped, gibbous below, miferous, with five erect obtuse teeth. Cor. Petals five, inserted into the calyx, papilionaceous; wings bent upwards, affixed by long claws; standard roundish, shorter than the wings, and placed beneath them; keel two-petalled, converging into a heart-shaped form, and containing the stamens and pistil; nectary a slyle-shaped gland under the germ. Linn. (a cavity between the insertion of the stamens and of the pistil. Lam.) *Stam.* Filaments ten, not united, awl-shaped, curved, slightly downy on the inner side of their base, unequal, inserted into the calyx; anthers oblong, incumbent, rising upwards. *Pist.* Germ linear-lanceolate, pedicelled, smooth; style the length of the stamens; stigma obtuse, rising upwards. *Peric.* Legume oblong, obliquely acuminate, one-celled. *Seed.* Several, roundish, attached to the upper future.

Eff. Ch. *Calyx* five-toothed, gibbous below. *Cor.* papilionaceous; standard short, placed beneath the wings; fruit, a legume.

Sp. 1. *C. Siliquastrum*. Common Judas-tree. Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. Lam. Ill. Pl. 308. (*Siliqua sylvæstris rotundifolia*; Bauh. Pin. Arbor Judæ; Dod. Rai. hist.) "Leaves orbicular-heart-shaped, smooth." A tree, from twenty to twenty-five feet high. *Trunk* upright, with a dark-green bark; branches irregular, spreading. *Leaves* alternate, petioled, quite entire, thickish, pale green above, greyish underneath, deciduous, with diverging leaves proceeding from the extremity of the petiole; stipules oblong, membranous, opposite, caducous. *Flowers* red, or bright purplish rose-colour, sometimes white, appearing before the leaves in lateral racemes on the branches, and sometimes on the trunk of the tree. *Legumes* five or six inches long, near an inch broad, resembling the case of a knife, whence their French name is derived. The flowers are grateful to birds, especially sparrows, who often make great havoc among them and prevent the fruit from coming to perfection. On account of their agreeable poignancy they are used by the French as an ingredient in fillads, and are sometimes pickled. A native of the southern parts of Europe, flowering in April and May. Cultivated by Gerard in 1596. 2. *C. canadensis*, Linn. Sp. Pl. Mart. Lam. Willd. (*Ceratia agrestis mucronato folio*, Pluk. Alm. 95.) "Leaves acuminate-heart-shaped, pubescent." *Canada* Judas tree. Red-bud tree of the Americans. Resembling the preceding in habit, but smaller and less beautiful. La Marck asserts that its leaves, as well as those of the common kind, are quite smooth: A native of moist parts of North America. Cultivated by Miller in 1730.

CERCIS, in *Gardening*, contains hardy deciduous trees of the following kind; of which the species are the common Judas-tree (*C. Siliquastrum*), and the Canada Judas-tree, or Red-bud tree (*C. Canadensis*.) The first in its native place rises with an upright trunk to the height of

twenty feet, covered with a dark brown bark, dividing upwards into many irregular branches, with the leaves placed irregularly on the branches, on long foot-stalks; they are of a pale green on their upper, and of a greyish colour on their under side, and fall off in autumn. The flowers come out in the spring, with the leaves, on every side the branches, and many times from the stem of the tree in large clusters, arising from the same point, on short peduncles; and are of a very bright purple colour, being in full beauty before the leaves have attained half their size; and the wood is very beautifully veined with black and green, taking a fine polish. It is a native of the Levant, &c.

It has varieties with white flowers; with flesh-coloured flowers, but without the beauty of the first, and with broader pods.

The second sort grows to a middling size in the places where it is a native; but in this climate rarely rises with a stem more than twelve feet high, but branched out near the root. The branches are weaker than in those of the first sort; the leaves are downy and terminate in points. The flowers are also smaller; but the trees are equally hardy, thriving in the open air. It is a native of North America, where it is known by the title of *Red-bud*, from the appearance of the flower-buds in spring before the leaves come out. And the wood is of the same colour and texture as in the first kind.

Method of Culture. These plants are raised by sowing the seeds in the spring season, as about March, in beds of common ground, to the depth of half an inch. When the plants appear, they should be kept clean, and occasionally watered; and when a sufficient growth be removed into the nursery, planting them in rows at the distance of one foot, and two feet between the rows. After they have remained in this situation for two or three years, they become proper for planting out in the shrubby parts of pleasure grounds.

They are also capable of being raised by layers and cuttings; but they seldom succeed so well in these ways as in the former. They have a highly ornamental effect when planted out in the clumps, borders, and other quarters, among hardy, flowering, deciduous trees of other kinds in the garden or pleasure-grounds.

CERCITÆ, in *Ancient Geography*, a people placed by Ptolemy in Abatic Sarmatia.

CERCLE, *Grand Cercle*, in *Military Language*, is that which the sergeants, and, behind them, the corporals, formed every evening at an appointed hour, to receive orders. After the grand circle, a small one was formed in each regiment, were the orders were renewed or repeated to the sergeants of each regiment, who communicated them to the officers of their respective companies. This form was observed under the old government of France.

CERCODIA, in *Botany*, Soland. La Marek, Juss. Gart. See HALORAGIS.

CERCOPI, in *Ancient Geography*, a name given by Ovid to the inhabitants of the island of Patucefa, —Also, a name given to banditti or robbers, who occupied part of the pass of Anopza, near the Melampyrian rocks, on the confines of the territories of Locris and Melis. See Herodotus. lib. vii. c. 216.

CERCOPIA, a town of Asia, in the Greater Phrygia. Ptolemy.

CERCOPITHECUS, in *Zoology*, a name given by Aldrovandus, Maregraave, and other writers, to several species of the monkey tribe. Gmelin forms a distinct section, in the *Simia* genus, of the Cercopithecæ, or those with elongated tails, after the Κερκοί of Aristotle. *Simia cynosurus*,

urus, Hamadryas, Vetez, and nearly twenty other species are of this family. See SIMIA.

CERCOPONEDRAS, in *Ancient Geography*, a kind of road or pass in Greece, between mount Oeta and the country of the Thracinians, according to Herodotus; which was occupied by the Cercopi. It was by this pass that the Persians advanced to surprize the Greeks who defended Thermopylae. This path commenced at Alopus, continued through an opening of the mountain called Anopous, and having reached the summit of the mountain, terminated near the town of Alpine, the first in the country of the Locrians, on the borders of the Melians, near the rock called Melampyge, where was the habitation of the Cercopi. Count de Choiseul-Gouffier discovered this path in his passage from Athens to Larissa.

CERCOSIS, in *Medicine*, a preternatural extension and tumidity of the female CLITORIS, so as to project beyond the *labia pudendi*.

CERCUS, in *Ancient Geography*, a hill of Asia Minor, in Bithynia.

CERCY LA TOUR, in *Geography*, a town of France, in the department of the Nièvre, and district of Nevers; 8 miles E.N.E. of Décize.

CERDA, JOHN-LEWIS DE LA, in *Biography*, a native of Toledo, who entered among the Jesuits in 1574. His literary fame reached Italy, and gained him the particular esteem of pope Urban VIII. His "Commentary on Virgil," 3 vols. fol. has been several times reprinted, and is a work of minute research, and great accuracy, but devoid of taste. His "Commentary on Tertullian's Works," begun in 2 vols. but not completed, is a work of familiar character to the former. Cerda died in 1643.

CERDAGNE, LA, a country of the Pyrenées, situate partly in Spain, in the province of Catalonia, and partly in France, in the territory formerly called Roussillon; Puycerda is the capital of the former, and Mont-Louis of the latter.

CERDANA, in *Botany*, Bosc. Nouv. Dict. Flor. Peruv. pl. 184. Clafs and ord. *Pentandra Monogynia*.

Gen. Ch. *Calyx* tubular, non-friated, five-toothed. *Corolla* funnel-shaped; tube the length of the calyx; segments of the border oblong, expanded. *Stam.* Filaments five, hairy at the base. *Pistil.* Germ superior; style bifid; stigmas two, bifid. *Peric.* Drupe oblong, striated, covered by the permanent calyx and corolla, four-celled. Seeds oval, one in each cell.

Sp. C. —. A large tree, *Leaves* alternate, petioled, oblong, acute, entire, even, shining. *Flowers* white, with red veins, in much branched terminal panicles. A native of Peru. The wood, when the tree is first cut down, has an extremely fetid smell, resembling that of a fox's urine; it afterwards changes to that of garlic, and finally assumes an agreeable pungent odour. The dried leaves and bark are used by the Peruvians as articles of cookery.

CERDICESORA, in *Ancient Geography*, the name of the place where Cerdic the Saxon leader landed, when he invaded Britain in 495, and where he found the Britons drawn up in battle-array to oppose him. This place, according to Camden, was on the coast of Norfolk; but as this is improbable, some learned men have supposed it to be Calholt or Caldshore at the entrance of Southampton river. Others again seek for it at Charford; and Carte thinks, nor is his opinion improbable, that it was Charmouth in Dorsetshire; a place afterwards famous for hostile invasions.

CERDON, in *Geography*, a town of France, in the department of the Ain; four leagues S.E. of Bourg en Bresse.

CERDONIA, in *Ancient Geography*, *Cerdogoa*, a place of Italy belonging to the Hirpini.

CERDONIANS, in *Ecclesiastical History*, a sect who maintained most of the errors of Simon Magus, Saturninus, and the Manichees.

They took their name from their leader *Cerdo*, a Syrian, who came to Rome in the time of pope Hyginus, about the year 140; and there abjured his errors, but he did this in appearance only; for he was afterwards convicted of persisting in them, and accordingly was cast out of the church again. Cerdo asserted two principles, the one good, and the other evil: between these, he imagined an intermediate kind of deity, of a mixed nature: this last, according to him, was Creator of the world, and the God that appeared under the old law. To his jurisdiction the Jews were subject; and idolatrous nations were under the empire of the evil principle. The good Being, whom he called *unknown*, was the father of Jesus Christ, who, he taught, was only incarnate in appearance, and was not born of a Virgin; nor did he suffer death, but in appearance. He was a great admirer of virginity, and recommended it to his followers. He rejected or despised the Old Testament; but probably received the books of the New Testament as other Christians did. Marcion, his disciple, succeeded him in his errors; whence the MARCIONITES.

CERDYLIUM, in *Ancient Geography*, a place on the confines of Thrace and Macedonia, near a maritime burgh, in the country of the Argiuians, and in the vicinity of the town of Amphipolis, according to Thucydides and Lycophrone.

CERE, *Cera*, in *Ornithology*. See ORNITHOLOGY.

CERE, ST. in *Geography*, a town of France, in the department of the Lot, and chief place of a canton, in the district of Figeac; 10 leagues N.E. of Cahors. The place contains 3798, and the canton 12,169 inhabitants: the territory includes 235 kilometres, and 12 communes. N. lat. 44° 52'. E. long. 1° 47'.

CERE-CLOTH, found of *cere*, *cera*, wax, and *cloth*, denotes cloth smeared over with glutinous matter, for the purpose of being applied to wounds or bruises, or for other uses.

CERA, in *Geography*, a town of Italy, in the Venetian, belonging to the state of Venice; 4 miles W. of Legnano. At this place a battle was fought, in 1796, between the Austrians and French; in which the latter kept the field, and the former lost 100 men killed and 250 prisoners.

CEREALES *adiles*, two officers of ancient Rome, appointed under Julius Cæsar, to have the superintendency of the corn and grain for the provision of the city. They also presided in the *cerealia*. See *ÆDILE*.

CEREALES *ludi*, solemn sports held in honour of Ceres, wherein the matrons represented the grief and lamentation of Ceres for the loss of her daughter Proserpine, and her travels to find her again.

CEREALIA, in *Antiquity*, feasts of Ceres instituted by Triptolemus, son of Cælus, king of Eleusine, in Attica, in gratitude for his having been instructed by Ceres, who was supposed to have been his nurse, in the art of cultivating corn and making bread.

There were two feasts of this kind at Athens; the one called ELEUSINIA, the other THESMOPHORIA.

What both agreed in, and was common to all the Cerealia was, that they were celebrated with a great deal of religion and purity; so that it was esteemed a great pollution to meddle, on those days, in conjugal matters.

It was not Ceres alone that was honoured here, but also Bacchus.

Bacchus. The victims offered were hogs, because of the waste they make in the products of the earth. Whether there was any wine offered, or not, is matter of much debate among the critics. Plautus and Macrobius seem to countenance the negative side; Cato and Virgil, the positive.

The cerealia passed from the Greeks to the Romans: Q. Memmius, the edile, being the first who introduced these rites into Rome, as appears from a coin of this magistrate, on which is the figure of Ceres, holding in one hand three ears of corn, in the other a torch, whilst her left foot trod on a serpent; with this inscription, "Memmius *Ædilis Cerealia primus fecit.*" The Romans held them for eight days successively; commencing, as generally held, on the fifth of the ides of April. The women alone were concerned in the celebration, and were all dressed in white; the men, likewise in white, were only spectators. They eat nothing till after sun-set; in memory of Ceres, who, in search after her daughter, took no repast but in the evening. The festival closed with a banquet and public horse-races.

After the battle of Cannæ the desolation was so great at Rome, that there were no women to celebrate this feast because they were all in mourning, so that it was omitted that year; but after the second Punic war, it was celebrated with an accession of splendour; statues, paintings of chariots, crowns, and rich plunder taken from the enemy, being carried in the procession. According to Macrobius, an egg made part of the shew, being an emblem of Ceres.

CEREALES *femina*, an appellation given by some to what we call *legumina*, or pulse. Dr. Cullen (Mat. Med. vol. i. p. 274.) refers the several farinacea to three different heads, under the titles of *Cerealia*, *Legumina*, and *Nuces oleose*. By this assortment, he takes them to be distinguished as they contain more or less of saccharine and oily matter, or as these are in proportion to one another. In the cerealia he supposes the sugar to be large in proportion to the oil; in the legumina, the oil to be somewhat larger in proportion to the sugar; and in the *nucis oleose*, the proportion of the oil to be still greater. But he is of opinion, that in the several farinaceous seeds the nourishment they afford is in proportion to the oil they contain. Under the title of cerealia are commonly included the seeds of the several gramineous or culmiferous plants, that are employed as the food of men. To this head he refers barley, rye, millet, rice, oats, maize, and wheat; subjoining to his account of each appropriate reflections; and he then enumerates other farinaceous substances which are not of the tribe of gramina, but very much of the same farinaceous nature with these, such as buck wheat, fago, falop, potatoe, and chestnut. See each of these articles.

CEREBELLI INFERIOR, in *Anatomy*, is an artery, which comes off from the vertebral. See **ARTERIES**.

CEREBELLI SUPERIOR, is a branch of the basilar artery. See **ARTERIES**.

CEREBELLIACA, in *Ancient Geography*, *Clabeuil*, a place of Gaul, between Valentia and Anguita.

CEREBELLUM, in *Anatomy*, that portion of the contents of the cranium, which is contained in the lower fossæ of the occipital bone, and covered by the tentorium. See **BRAIN**.

CEREBRI ANTERIOR, is the anterior branch of the internal carotid artery. See **ARTERIES**.

CEREBRI MEDIA, is the large posterior branch of the internal carotid artery, which runs in the fissura Sylvii. See **ARTERIES**.

CEREBRI POSTERIOR, or *profunda*, is a branch of the basilar artery. See **ARTERIES**.

CEREBRITES of Knorr, in *Zoology*, one of the synonyms of **MADREPERA AREOLA**, which see.

CEREBRUM, in *Anatomy*. This term in common language denotes the brain in general; but anatomists confine it to that part of the encephalon, which occupies all the upper part of the cranium: indeed by far the largest portion of the cavity. See **BRAIN**.

CEREBRUM Jovis, in *Ichthyology*, a name given by Ennius the poet to a peculiar fish of the *labrus* kind, called by the generality of authors *scarus*: it is distinguished by Artedi from the other species of the same genus, by the name of the *LABRUS, qui scarus auctorum est*.

CEREFOLIUM, in *Botany*, *foliis glabris*, Hall. See **SCANDIX CEREFOLIUM**.

CEREFOLIUM ANNUM NODIFLUM, Moris. See **SCANDIX NODIFLUA**.

CEREFOLIUM FELIIS TRIPPLICATO-PINNATIS, Hall. See **CHEROPHYLLUM SYLVESTRIS**.

CERETOIUM LAISFOLIUM HIRFUTUM, Morr. See **CHEROPHYLLUM HIRFUTUM**.

CERETOIUM RUGOFO ANGELICÆ FOLIO, Bucc. See **CHEROPHYLLUM AROMATICUM**.

CERETOIUM FOLIIS HIRFUTIS, Hall. See **CHEROPHYLLUM AURUM**.

CEREIS, in *Botany*, a name used by some authors, and supposed to have been used by the ancients for the *fliquastrum*, or *Judas's tree*. See **CERCIS**.

CERELÆUM, a composition of wax and oil.

Some also give the same denomination to the *oleum ceræ*, otherwise called *butter of wax*.

CEREMENTS, cloths dipped in melted wax, with which dead bodies were folded when they were embalmed. Thus the term is used by *Shakspeare*:

"Let me not burit in ignorance, but tell

"Why canonized bones, buried in earth,

"Have burit their cerements?"

CEREMONIAL is used for the set or system of rules and ceremonies which custom has introduced for regulating our behaviour; and which persons practise towards each other, either out of duty, decency, or civility.

CEREMONIAL, in a more particular sense, denotes the manner wherein princes and their ambassadors use to receive and treat one another. The *ceremonial* is a kind of law introduced by compact, custom, prescription, &c. which sovereigns and their ambassadors are to observe at their interviews, that none of them may either receive more or less marks of respect than they are entitled to. Some distinguish three occasions on which the ceremonial is to take place: viz. when princes meet in person; when they write to each other; and when they send ambassadors.

There are endless disputes among sovereigns about the ceremonial: some endeavouring to be on a level, and some to be superior, to others. Numerous schemes have been proposed for fixing the place and rank of each prince; but they have not been accepted of by any, except some alternate princes, as they are called in Germany. See **PRECEDENCY**.

CEREMONIAL is more particularly used in speaking of the laws and regulations given by Moses, relating to the worship of God among the ancient Jews.

In which sense, it amounts to much the same with what we otherwise call *Levitical law*; and stands contradistinguished from the *moral*, as well as the *judicial law*.

It is disputed, whether the observation of the sabbath be a ceremonial or a moral law. See **SABBATH**.

The ceremonial law prescribed the forms, usages, rites, &c. relating to sacred places, utensils, priests, levites, prophets, congregations, garments, feasts, sacrifices, sabbaths, &c.

Most of the ceremonial laws of the Jews had some relation to those idolatrous customs which had been established among them before the publication of the Levitical law.

CEREMONIALE, a book in which is prescribed the order of the ceremonies to be observed in certain actions and occasions of solemnity and pomp.

The ceremonial of the Roman church is called *ordo Romanus*. The Roman ceremonial was first published by the bishop of Coreyra, in 1516; at which the college of cardinals were so scandalized, that some of them voted to have the author as well as book burnt, for his temerity in exposing the sacred ceremonies to the eyes of the profane people.

CEREMONIEUX MILITAIRES, military ceremonies or ceremonials. See **CHEVALIERS**.

CEREMONY, an assemblage of several actions, forms, and circumstances, serving to render a thing more magnificent and solemn. The word comes from the Latin *ceremonia*, quasi *Cereris munia*, an account of the great number of ceremonies used in making the offerings to Ceres; or because the first religious ceremonies were those of Ceres. Hence Cicero calls "Ceremon antiquissimam religiosissimam principem omnium sacerorum quæ apud omnes gentes fuit."

We have an ample and magnificent account of the religious ceremonies and customs of all the nations in the world, represented in figures designed by Picart, with historical explications, and divers curious dissertations, &c. *Ceremonies & Coutumes Religieuses de tous les Peuples du Monde*, 6 tom. fol. Amst. 1723.

M. Porree, in 1646, published a history of ancient ceremonies; tracing the rise, growth, and introduction of each rite into the church, and its gradual advancement to superfluous therein. *Traité des Anciennes Ceremonies*. Amst. 1646, 12mo.

Many of them were borrowed from Judaism; but more, as it should seem, from Paganism.

Dr. Middleton has given a fine discourse on the conformity between the popish and pagan ceremonies; which he exemplifies in the use of incense, holy water, lamps and candles before the shrines of the saints, votive gifts or offerings round the shrines of the deceased, &c. In effect, the altars, images, crosses, processions, miracles, and legends; nay, even the very hierarchy, pontificate, religious orders, &c. of the present Romans, he shews, are all copied from their heathen ancestors. Who then can doubt of the idolatry of popery, when we see the present people of Rome worshipping at this day in the same temples, at the same altars, sometimes the same images, and always with the same ceremonies, as the old Romans? See Middleton's Letter from Rome, and Prefatory Discourse in his Works, vol. iii.

CEREMONY is also applied to those expressions or tokens of respect and honour which people pay to each other, out of mere civility and good breeding.

CEREMONY, *habitus*, denotes the ornaments and external badges of a profession, dignity, or office.

CEREMONY, *officers of*, those whose business is to see the customary ceremonies duly observed in actions of pomp and solemnity. Such are marshals, sergeants at arms, &c.

In our court is a master and assistant of the ceremonies: the French have a grand master of the ceremonies, as well as a master and assistant.

The master of the ceremonies is an officer instituted by king James I. for the more honourable reception of ambassadors and strangers of quality. He wears about his neck a chain of gold, with a medal under the crown of Great Britain, having on one side an emblem of peace, with this motto, "Beati

pacifici," and on the other an emblem of war, with "Dien et mon droit." His salary is 300*l.* per annum. The *assistant master of the ceremonies* executes the office of master in all respects, whenever the master of the ceremonies is absent. He has a salary of 141*l.* 13*s.* 4*d.* per ann. The *master of the ceremonies* is an officer subordinate to both the others, with a salary of 10*l.* per ann. There are also *masters of the ceremonies* in public places, and in private assemblies, &c. whose business it is to direct and superintend the arrangements that are necessary for preserving a due regard to rank and decorum.

In churches of the Romish communion there are also masters of the ceremonies, to see that every thing be performed as prescribed in the ritual.

CEREMONY, in the *Royal Navy*, the form used in receiving the principal officers on board, or in passing any of his majesty's ships; which is as follows. All flag officers are to be received on board his majesty's ships with a guard under arms and beat of drum; which, for the admiral, or flag-officer commanding in chief, is to be a march; for an admiral, three rattles; for a vice admiral, two; for a rear-admiral, one; but the first captain to the admiral, or commander in chief of the fleet or squadron, is to be received on board by a guard only. If any of these officers pass one of his majesty's ships with his flag at the head of his boat, the same ceremony is to be observed.

CERENCES, or **CIRANCE**, in *Geography*, a town of France, in the department of the Manche or Channel, and district of Coutances, 2½ leagues S. of Coutances.

CERENS, a town of France, in the department of the Sarthe; 10 miles S. of Le Mans.

CERENZA, or **GERENZA**, a town of Naples, in the province of Calabria Citra, seated on a rock, with a bishop's see; 10 miles N. of St. Severina. N. lat. 39° 45'. E. long. 17° 5'.

CEREPOLIUM, in *Botany*, a name used by Pliny to express the gingidium, an unbelliferous plant of the nature of the chervil or cerefolium; and it is very probable that this name is only a false spelling of that word. Columella makes the cerepolium and gingidium different; but it may only be that in different ages they applied these names to different species of the same genus of umbelliferous plants. Neophytus tells us, that the gingidium of the ancients was called by the later writers bifacium; a name very well expressing its seeds, which are long and slender, and are pointed at both ends.

CERES, in *Astronomy*, a new primary planet, discovered on the 1st of January 1801, by M. Piazzi, astronomer royal at Palermo in Sicily. This is an intermediate planet between the orbits of Mars and Jupiter, and appears as a star of the 8th magnitude, being probably about the size of the moon. Its distance from the sun is about 2½ times that of the earth, and its periodical time nearly 4 years and 2 months. Since the arc of its orbit through which this planet run during the period it was observed by Piazzi was but small, no great degree of accuracy can be expected in stating the elements of its theory: the following, however, communicated by Dr. Hutton of Woolwich to Mr. O. Gregory, and published in his "Treatise on Astronomy," 1803, are the most exact yet known:

Place of the ascending node	-	-	2° 20' 58" 30"
Inclination of the orbit	-	-	10 47
Place of the aphelium	-	-	2 8 59 37
Time of the passage through the aphelium	-	-	January, 1801 1.33:8

Eccentricity	-	-	0.0364
Log. of the greater semi-axis	-	-	6.4106386
Time of the sidereal period	-	-	4.13 years.

These

These particulars are deduced from calculations made by Dr. Burchardt at Paris on the orbit of this planet considered as an ellipsis, and communicated to the celebrated astronomer M. Von Zach on the 21st of June 1801. This ellipsis, he says, represents, within a few seconds, the longitudes and latitudes of five observations; and he adds, it would have been easy to obtain a greater degree of accuracy; but he thought it quite superfluous, as the arc run through is so small.

Dr. Herschel, who classifies this planet, as well as that discovered by Dr. Olbers of Bremen (see PALLAS), under the new denomination of *Asteroids* (which see), has published, in the Phil. Transf. for 1802, part 2, a variety of observations which he made on these two celestial bodies. Calculating from an observation, in which he had great reason to confide, he inferred that the angle under which Ceres appeared, in the circumstances which he has minutely described, was only $0^{\circ}.2159$ or $0^{\circ}.22$. The mean distance of Ceres from the sun, according to the most recent information, and which he admits as sufficiently accurate for his purpose, is 2.6224; and its geocentric longitude and north latitude at the time of his observation (April 1802), were about $20^{\circ} 4'$, $15^{\circ} 20'$. With these data, Dr. Herschel proceeded to calculate the distance of Ceres from the earth at the time of observation, partly by the usual method, and, when the elements were wanting, by a graphical process, sufficiently accurate for his purpose. The computed distance of Ceres was 1.624; and thence he found, that its diameter, at the mean distance of the earth from the sun, would subtend an angle of $0^{\circ}.35127$, and that, consequently, its real diameter is 161.6 miles. When we consider the size of this new star, there can be no great reason to expect that it should have any satellite. Dr. Herschel made many observations, with a view of ascertaining this point; from the result of which he infers, that two very small stars which he observed may be satellites; but the supposed satellites are so small, that, with a 20-feet telescope they require a power of 300 to be seen; and the planet should be hidden behind a thick wire, placed a little out of the middle of the field of view, which must be left open to look for the supposed satellites. However, the retention of a satellite in its orbit, it is well known, requires a proper mass of matter in the central body, which it is evident these newly discovered stars do not contain. The colour of Ceres is ruddy, but not very deep; though it is much more ruddy than Pallas.

The name of Ceres was given to this planet by M. Piazzi, its discoverer. But other names have been suggested as more appropriate. Some have proposed the name of *Vulcan*; assigning to the god who fabricated the arms of Achilles a place in the heavens near the god of war. Prof. Reimarus of Hamburg is of opinion, that it should be called *Cupid*; for he would be the nearest (reckoning downwards from Venus) to Mars, the lover of Venus. Others suggest that the name of Cupid would be proper, because it conveys an idea of blindness; for the new star has the appearance of a star only of the 8th magnitude, and cannot be seen by the unassisted eyes of man. In Italy it will perhaps retain the name of *Ferdinandus Sidus*, and in France that of *Planeté Piazzi*, till time and circumstances shall have otherwise decided. A friend of M. Von Zach expressed the order of the eight planets (Pallas not being discovered) in the following lines:

“Mercurius primus; Venus altera; Terra deinde;
Mars posthac; quintam sedem sibi vindicat Hera.
Jupiter hanc ultra est. Sequitur Saturnus; et Iulium
Uranus egreditur; non ausim dicere summus.”

Mr. Maclaurin, and other philosophers, expected, about
VOL. VII.

two years ago, that such a discovery as this of M. Piazzi would be made by some diligent astronomer; and the opinion has been lately revived by the ingenious and scientific Mr. Capel Loft. In the “New London Review” for March, 1800, this gentleman, in a critique on the Athenian letters, ventured to offer some conjectures respecting an intermediate planet between Mars and Jupiter. He supposed that the distance of the intermediate planet from the sun would be to that of Mars, either as 33 to 15, or as 23 to 15; the mean of which corresponds nearly with the fact. With respect to its diameter, he conceived it might be to that of Mars, as that of Mars to the diameter of the earth; and then, being not much more than half the diameter of Mars, and at five times the perihæion distance, it would be seen from the earth under an angle of $2\frac{1}{2}''$ or $3''$; while Georgium Sidus would appear under an angle of $4''$. These fortunate conjectures were founded on a certain kind of Pythagorean harmony, and they were ingeniously stated and vindicated by the author.

CERES, in *Mythology*, the daughter of Saturn and Ops or Rhea; who taught men the art of cultivating the earth and of sowing corn, whence she was regarded as the goddess of agriculture; and by metonymy, the appellation of Ceres was used to denote bread and every kind of food. Thus, “Sine Cerere et Baccho friget Venus;” i. e. without bread and wine love grows cold. Terent. Eun. iv. 5, 6. Cic. Nat. Deor. ii. 23.

Sicily, Attica, Crete, and Egypt claim the honour of her birth; but general suffrage favours Sicily, where she had her ordinary residence in a delightful part of the island called “Enna,” in which were beautiful meadows watered with perpetual springs. Accordingly, Le Clerc says, (Bibl. Univ.) that the name of Ceres was Dio, and that she was queen of Sicily, where she rendered her reign illustrious by teaching her subjects the art of agriculture, as well as by establishing several laws concerning policy and the property of lands; that every one might reap what he had sown without molestation; and from these circumstances this queen acquired the honourable distinction of being considered as the goddess of corn and of the earth. In her youth she was extremely beautiful, and as fable reports, her brother Jupiter fell in love with her; and the fruit of the amour, obtained by the deception of transforming himself into the figure of a bull, was Proserpina, or Proserpine, or Hecate. Pluto, falling in love with Proserpine, stole her away, and mounting his chariot drawn by four horses, pursued his way directly to hell, in opposition to the remonstrances of Minerva, who in vain endeavoured to dissuade him from the design. Ceres, apprized of this circumstance, traversed sea and land in search of her daughter; and after having travelled by day, she lighted a torch, as it is said, in the volcano of mount Etna, and continued her search by night. In her fruitless rambles she came near the lake of Syracuse, and perceiving her daughter's veil floating upon the water, she concluded that her ravishers must have made their escape that way. At length she was informed by Arethusa, the nymph of a fountain, whose waters flowing from Elis into Sicily, glide under the bottom of the sea and in the confines of STYX, that she had seen Proserpine, and that she had been ravished by Pluto, who had made her queen of hell. She intreated her at the same time not to indulge any farther resentment against the earth, which had become barren since she had withdrawn her precious gifts. Upon this intelligence Ceres mounted her chariot, and traversing the immense regions of the air, arrived at Olympus, and prostrating herself at the foot of Jupiter's throne, demanded of him her daughter. Jupiter having appeased the anger of Ceres by assuring her that the match of Proserpine with
Pluto

Pluto was not disadvantageous to her, and by decreeing, that Proserpine should remain six months of the year with her husband, and the other six months with her mother, she bethought herself how she might repair the calamities occasioned by sterility and famine. As Attica had been more distressed than other countries, she went to Eleusis, where, after having fostered Triptolemus, the son of Cereus, sovereign of the country, and having instructed him in every thing that related to agriculture, she lent him her chariot, and ordered him to travel through the earth in order to teach its inhabitants this necessary and useful art. Triptolemus, having traversed Europe and Asia, arrived in Scythia at the court of Lynceus, a tyrannical prince, who for attempting to assassinate him was transformed into a lynx, an animal which was the symbol of cruelty. The ancient historians agree with the poets in their account of several particulars above recited. Strabo (l. vii.) mentions the meadows of Enna whence Proserpine was carried off; and Cicero (in Verr.) seems to admit the fact, and has given us an elegant and ornamented description of this place. Diodorus Siculus also says, that Sicily, of all the countries on earth, had been most distinguished by the favours of Ceres, and that the goddess had fixed her ordinary residence in this island. "The Sicilians," says he (lib. v. c. 2.), "hold by tradition from their ancestors, that their island is consecrated to Ceres and her daughter Proserpine; some poets have written, that at the marriage of Pluto with that princess, Jupiter gave them Sicily for a nuptial present; and the historians, who are accounted the most faithful, say, that it was in Sicily that Ceres and Proserpine shewed themselves to men for the first time, and that this island is the first in the world where corn grew." Homer, the most celebrated of the poets, has followed this tradition, when he says, speaking of Sicily:

"The soil untill'd a ready harvest yields,
With wheat and barley wave the golden fields,
Spontaneous wines from weighty clusters pour,
And Jove descends in each prolific shower."

Pope's *Odyss.* ix. 123.

This author proceeds to give a description of the fields of Enna, whence Proserpine was carried off; and relates all the other circumstances of this fable much in the same manner as we have above stated them. He also adds, that the Syracusans have a custom of offering oblations every year, each according to his abilities, near the fountain Cyane, which Pluto made to spring up, when in that place he opened a way to himself with a blow of his trident; and that after those private sacrifices they make a public offering of bulls, whose blood they shed over the same fountain. As Attica, says the same author, was the country, which, next to Sicily, was most honoured with the favours of Ceres, the Athenians instituted, from respect to her, not only sacrifices, but the *Eleusian* mysteries, which became venerable for their sanctity and antiquity. See *ELEUSINIA*. The Sicilians also, beside the sacrifices which they offered at the fountain Cyane, instituted feasts in honour of Ceres and Proserpine; and they celebrated them in a manner suitable to a people on whom these goddesses had conferred so many distinguishing tokens of regard. These feasts they placed in different seasons of the year, in allusion to the different appearances of the corn. The rape of Proserpine was celebrated about the time of harvest, and the feast of Ceres in seed time. The latter lasted six days, with splendid and magnificent accompaniments. Whilst this feast continued, it was also customary to intermix in conversation some wanton expressions, because by such kind of intercourse Ceres had been diverted from her affliction for the loss of her daughter. Besides

the cultivation of corn, Diodorus informs us that Ceres had given laws to the Sicilians; and for that reason she was denominated *Thelephoros* by the people. "It was not possible," adds the historian, "that she could have given men two more valuable presents than the supply of the necessaries of life and instructions how to live virtuously. The rape of Proserpine has been represented by most mythologists merely as an allegory, which had an obvious relation to agriculture. However, some ingenious authors, in the number of whom we may reckon Don Pezron and Le Clerc, relying upon the authority of Diodorus Siculus, have referred this event to real history. Several chronologists, and particularly the celebrated sir Isaac Newton, confiding in the relations of Greek writers, have endeavoured to fix the time when Ceres lived; to determine the date of her expedition from Sicily to Athens; and to mention the year of her death, and the worship that was paid to her not long after. Banier, however, notwithstanding these authorities, is persuaded that we are not to look in Greece for any other Ceres than the Isis of the Egyptians, nor for other mysteries beside those of that goddess. We are unquestionably certain, he says, that almost all the gods of the Greeks and their worship came from the eastern countries, and especially from Egypt, with the colonies that had peopled Greece at different times; and if there be any concerning whose transportation we may be confident, they are Bacchus or Osiris, and Ceres or Isis. Accordingly he thus accounts for the origin of the fable. Greece was infected with a severe famine under the reign of Erechtheus, as we learn from Diodorus Siculus (lib. xviii.), and also from Ovid, who has amply and beautifully described it. The Athenians, whose soil was not very fertile, were more distressed by it than their neighbours. Erechtheus, on this occasion, sent to Egypt for corn; and his messengers brought back with them, not only a supply of corn, but the worship and ceremonies of the divinities who presided over agriculture. The distress they had suffered and the dread of its renewal induced them to adopt the mysteries of a goddess, who was thought competent to secure them from it. Triptolemus at the same time received that worship into Eleusis. Ambitious of being the first priest of Ceres or Isis, he not only enjoyed plenty himself, but took care to assist his neighbours by teaching them the mysteries in which he had been instructed. Sicily had adopted these mysteries some time before, and hence it was said that Ceres had come from Sicily to Athens. It was added, that her daughter had been ravished, because the corn and fruit, indicated by her name, had ceased for some time to yield subsistence. Moreover, it was said that Pluto had carried her away to hell, because the same fruits had remained all that time as it were buried in the earth; and Jupiter's decision of the quarrel between Ceres and Pluto intimated that the earth was again covered with new harvests.

This is the account that is given of the introduction of the mysteries of Ceres into Sicily and Greece. If, however, some learned men, with Diodorus Siculus, incline to maintain, that there really was a Ceres in Italy, who gave instructions and regulations relating to agriculture, we may suppose, for the satisfaction of such, that she, having lost her daughter, and come to Attica in quest of her, taught Triptolemus the mysteries of Isis; and that the Greeks having ranked her afterwards among the deities, her worship was thus at length confounded with that of the goddess of the Egyptians. As Triptolemus was one of those who gave the best entertainment to Ceres when she arrived in Attica, it was hence fabled that this goddess had taught him the art of agriculture, and sent him in her chariot drawn by winged dragons, to propagate this art among mankind. It

was added, that she nursed him with her own milk; thus intimating the care she had taken in the education of this prince. All these mysterious fables, as well as the arrival of Ceres in Attica, which is so finely represented upon a marble tomb, ingeniously explained by M. de Boze, in a dissertation published in the 4th volume of the Memoirs of the Academy of Belles Lettres, have no other foundation, as Banier conceives, but the introduction of the worship of Ceres into Greece, and especially into Attica. Triptolemus, who reigned there, came to Eleusis by sea, in order to carry corn into different countries, where at the same time he taught the mysteries of Ceres, of which he himself was priest. Before he set out, he had sown corn in a field of Attica, as we learn from the 10th era of the Attic Marble; this, according to the author now cited, (Mythology, &c. b. iv. c. 10.) is the key and solution of this whole fable; for it refers to the time when the worship of Ceres, so ancient in Egypt, was received in Greece; and not to that of agriculture, which had been known there long before; unless we chuse to understand it of a new method of cultivating the ground, which the Greeks learned in their travels into Egypt, and reduced to practice at this time. The marbles now quoted fix this date under the reign of Erechtheus; that is, according to the commentators on these marbles, 1426 years B. C. or about 280 before the Trojan war. The Arundelian marbles, however, point out three dates of these events, which are not ranged in the same manner with that of other authors who speak of them. In the first of these eras, viz. the 12th, they represent Ceres as coming into Attica; in the 13th, they say that Triptolemus began to sow corn in the fields of Eleusis; and in the 14th they mention the rape of Proserpine; so that the arrival of Ceres at Athens precedes the rape of her daughter ten years. Blair, in his Chronological Tables, refers the arrival of Ceres in Athens to teach the inhabitants the art of sowing corn, and her sending her son Triptolemus through the rest of Greece, to the year 1383, B. C. Newton, in his "Chronology," refers it to the year 1030, B. C. The hazard to which Triptolemus was exposed in his travels gave rise to the fable of Lynceus, already mentioned; and that of his being drawn in a chariot by winged dragons is taken from an ambiguity in the Phœnician language; in which the word used in this history signifies either winged dragons or a ship adorned with iron beaks, as we are told by Bochart (Hieroz. l. 3. c. 14.), and after him by M. Le Clerc. Banier, however, inclines to the opinion of Philochorus, cited by Eusebius, who says, that this ship was taken for a flying dragon, because it had upon its prow the figure of a dragon.

Besides the amour of Ceres with her brother Jupiter, fable reports, that she had another with Neptune, the fruit of which was the famous horse Arion, or as the Thelpusians and Phigalians relate, a daughter, called by the Arcadians Hera. In reference to this circumstance Pausanias says, (Arcad. lib. viii.) that upon mount Elaius, in Arcadia, 30 stadia from Phigala, Ceres had a cave into which she retired, clothed in mourning, so that she was called black Ceres, and that the Phigalians dedicated to her memory on this spot a wooden image, having the body of a woman, and the head of a horse, and bearing in one hand a dolphin, and in the other a dove. When this statue was accidentally burnt, the Phigalians forgot the worship of Ceres, and neglected her feasts; upon which the goddess punished them with a severe drought. In this distress they consulted an oracle, which informed them, that if they did not re-establish the worship of Ceres, a famine would prevail to such a degree as to oblige them to eat their own children. At length Pan, as he hunted in Arcadia, discovered her retreat, and acquainted

Jupiter with it; and the god, by the intercession of the Parca, appeased her, and restored her again to the world; in consequence of which, as the fable reports, the earth produced corn and fruits. Hesiod (in Theogon.) informs us, that Ceres had another amour with the hero Jason, by whom she had a son, named Plutus, who was born in the island of Crete, and became very powerful both by sea and land; and who, having brought agriculture to perfection, as the means of acquiring wealth, was called the god of riches.

Ceres was distinguished by a great variety of appellations, the principal of which were "Magna Mater," and "Mater Maxima;" and she was honoured in many places with feasts and sacrifices. The most customary offerings presented to this goddess were a pregnant sow and a ram; and they also consecrated to her the crane, the turtle-dove, the sea-fish, called Surnullet, and the winged serpent. Of vegetables, corn was the most usual offering to her, and with this they decorated her images, and her garlands were formed of myrtle and rape-weed; but flowers were prohibited, because Proserpine was carried away whilst she was gathering them. The poppy was sacred to her, not only because it grew among corn, but because in her distress, Jupiter gave it her to eat, that she might sleep and forget her troubles. In spring they crowned her images with the stems of graminous plants; and in her sacrifices they made oblations of wine to her. Cicero mentioned an ancient temple dedicated to her at Catania in Sicily, in which the offices were performed by matrons and virgins only; no male being admitted on this occasion. Ceres, according to the abbé Danier, was usually represented of a tall majestic stature, fair complexion, languishing eyes, and yellow or flaxen hair; her head crowned with a garland of poppies, or ears of corn; her breasts full and swelling; holding in her right hand a bunch of the same materials with her garland, and in her left a lighted torch. When seated in a car or chariot, she is drawn by lions, elephants, or winged dragons. Mr. Spence, in his "Polymetis," observes, that the face of Ceres is a very pretty one, and from some expressions in the poets, he concludes, that she was a beauty of the brunette kind. Her head, he says, is often crowned either with corn or poppies, and her robe falls down to her feet, which, in the language of the statuary, denotes dignity. There is one objection that may be made, says this writer, to the beauty of Ceres; as the figures of her which he has seen generally represent her breasts as none of the smallest. Virgil, in his Georgics, gives us an idea of Ceres, as regarding the laborious husbandman from heaven, and blessing the work of his hands with success. Ceres has been no where exhibited with more beauty than on a medal of Metapontum, in Magna Græcia, and another found at Naples, in the collection of the duke of Caraffa Noia, with the common reverse of an ear of corn, and a mouse on its blade. On these coins, the goddess appears with her veil thrown behind her vestment; her head, besides the ears and blades of corn, crowned with an elevated diadem in the manner of Juno; and her hair over her forehead, in beautiful disorder, rising in front, and hanging freely, as if to indicate her affliction for the rape of Proserpine. She sometimes holds in her hand a vase, and with this attribute she was worshipped by the Achæans, under the name of *ἡσθησι-σσοπος*. (Athen. Deipnos. xi. p. 461.) The drapery of Ceres, in allusion to ripe corn, should be yellow; more especially as she is distinguished by Homer by a corresponding epithet. Ceres is found winged on ancient monuments; with a head-dress in the form of a turban a little elevated, called *πεδύλα*. She is thus exhibited on a mutilated statue in her temple at Eleusis, bearing on her head, according to Pausanias, a circular ornament about two feet in height. Ceres is often seen accompanied by the horse Arion; and she is frequently

frequently found, not only with torches in her hands, but with a modius, the symbol of fertility, and the myrtle garlands of the Eleusinian feasts, placed either on her head or at her sides. On an engraved stone in the collection of Stofch, she is represented in an erect posture over the head of an ox, holding in her left hand ears of corn, and in her right the head of a ram.

The general character of this goddess, Ceres or Damater, says Bryant (*Anal. Anc. Mythol.* vol. ii. p. 357) is innocent and rural, that it might be imagined nothing cruel could proceed from her shrine. Nevertheless, there was a time, when some of her temples were as much dreaded as those of Scylla and the Cyclops. They were courts of justice; whence she is often spoken of as a lawgiver. (Ovid. *Metam.* l. 5. v. 351.) She is joined by Cicero (*Orat.* in *Verr.* 5. sect. ult.) with Libera: and they are called the deities, "a quibus initia vitæ, atque victus, legum, morum, manufactum, humanitatis, exempli hominibus, et civitatis data, ac dispersita esse dicuntur." The deity, to whom she was a substitute, continues Bryant, was Eil, the sun; who was primarily worshipped in their temples. Accordingly Ceres was the deity of fire, according to this learned author; and hence at Chiusus she was called *Ktira*, *Cura*, a title of the sun. Her Roman name *Ceres*, expressed by Hesychius Gerys, was by the Dorians more properly rendered *Garys*; and it was originally the name of a city, called *Nōrys*; as many of the deities were erroneously called by the names of the places where they were worshipped. Chius is Charis, the city of fire. Hence, as a personage, Ceres is made the wife of Vulcan, on account of her relation to fire. Her title of Damater was equally foreign to Greece; and came from Babylonia, and the east. Hence it should seem extraordinary, that she should ever be esteemed the goddess of corn. This notion, says Bryant, arose in part from the Grecians not understanding their own theology. The towns of Ceres were *Purtrain*, or *Πύρραινα*; so called from the fires, which were perpetually preserved in them. The Grecians interpreted this *πύρραινα*; and rendered what was a temple of Orus, a granary of corn. Hence they made it a repository of grain; but this was a secondary use to which these places were appropriated. They were properly sacred houses, where a perpetual fire was preserved. Many of these temples were dedicated to the deity under the name of Proserphone, or Proserpine, the supposed daughter of Ceres. The persons who resided in these temples are represented as persons of great strength and stature; and hence the Cereyonians, whose name was derived from Cteyon, Ker-Cuon, signifying the temple of the deity, and who were famous for manly achievements, such as wrestling, &c. were the priests of Ceres or Damater: who seems to have been tired of their service, and glad to get rid of them, as we are informed by the poet. (Ovid, *Ibid.* v. 411.)

CERES, in the opinions of, in Sculpture. Herodotus in Euterpe, after describing the gods of Egypt, asserts his opinion that Homer and Hesiod first among the Greeks gave names and forms, emplacements and honours to the gods of their country. That this popular theology had its beginning about the time attended by Herodotus, seems very likely; in a variety of collateral evidence. The learned Fabricius, in his *Bib. Græc.* begins by observing that no Greek writer's work is extant, older than Homer. The theology of Homer and Hesiod is totally different from that of the poet, Anacreon, and their practices in philosophy; and such of the orphic remains as bear any resemblance to it are confessedly more modern. The art of sculpture affords testimonies of the time and; many small bronze statues of early Greek workmanship are

barbarous imitations of common nature: and, although it is to be supposed some of them are intended for divinities, few are accompanied by symbols. When writing began to be used, sculpture improved its representations; and the divinities were supplied with emblems of their offices, not very distant from the time mentioned by Herodotus. There are specimens of this early sculpture in the valuable collection of Mr. Paine Knight, one of which appears to be a Ceres, with the modius or calathus on her head. This goddess is also represented on a Greek basso-relievo (lately in the Villa Albani, published in Winkelmann's *Monumenta Inedita*) with the modius on her head, the sceptre in her left hand, and the ears of corn and poppies in her right hand. She is represented on various basso-relievos, and on the Greek vase, with two torches, in relation to the search for Proserpine.

The noble fragment of this goddess's statue, anciently worshipped in her renowned temple at Eleusis, has been brought to England, and placed in the university of Cambridge by the zeal and performance of our countryman Dr. Clark. The fragment is one piece of marble seven feet high from the top of the calathus, which rests on the head, to the bottom, which terminates at the girdle, a little below the breasts. The height of the calathus is about two feet; the head is one foot six inches; the calathus is ornamented with stalks of corn, the lotus, leaves of olive, and a vase. The features of the face are obliterated, the hair is collected in one large tress, which is tied and falls between the shoulders; her tunic is secured by a bandage, crossed between the breasts, and buttoned with a Medusa's head; the zone a little lower terminates the fragment. Stabro says, the temple of Ceres was built by Ictinus, who also built the parthenon or temple of Minerva, in the citadel of Athens, and was the cotemporary of Phidias. The fragment perfectly agrees with this account, and is of the grandest style of Greek sculpture.

CERESIUUS, in *Ancient Geography*, *Trifsa*, a river of Italy in the territory of the Lepontii.

CERESIUUS LACUS, *Lago di Luçano*, a lake of Italy in the same territory.

CERESIOLO, in *Geography*, a town of Italy, in the duchy of Mantua; 13 miles N.W. of Mantua.

CERESSUS, in *Ancient Geography*, a fortified place of Greece in Bœotia, according to Pausanias; belonging to the Thespians.—Also, a town of Spain in the Tarragonensis, in the country of the Jaetani, according to Ptolemy.

CERET, in *Geography*, a town of France, and principal place of a district in the department of the Eastern Pyrenees, situated at the foot of the Pyrenees on the river Tech, over which is a bridge of one arch, supposed to be the highest and boldest in France. The place contains 2382, and the district 624 inhabitants; the territory comprehends 247½ kilometres and 15 communes. At this place the commissioners of France and Spain met, in 1659, to settle the bounds of the two kingdoms. Ceret is 5 leagues S.W. of Perpignan. N. lat. 42° 28'. E. long. 2° 46'.

CERETAPA, in *Ancient Geography*, a town of Asia Minor, in Pactus Phrygia. This town began to strike imperial Greek medals, under the authority of its prætor, in honour of Antonine, M. Aurelius, Commodus, and Severus. Dr. Hunter possessed an Autonomic medal of bronze, with the legend ΚΕΡΕΤΑΠΟΝ, which Dr. Combe ascribes to Ceretapa.

CERULIA, in *Botany*, Pluk. See HYMENÆA.

CERULUS, in *Botany*, Bauh. Sc. See CACTUS.

CERUS, in *Carlsburg*. See CACTUS.

CERFENNIA, a place of Italy on the Valerian way, between Alba Fucentina and Corfinium, according to the Itinerary of Antonine.

CERIGLIANO, or CIGLIANO, in *Geography*, a town of Naples, in the province of Basilicata; 15 miles S. of Tricrano.

CERIGNO, A. LA, a town of Naples, situated on a rising ground, in the province of Capitanata; famous for a victory obtained here, in 1503, by Gonzalvo, over the elector of Nemours, who was slain in the commencement of the battle; 20 miles S. of Muretedonia. It contains about 12,000 inhabitants. Between 50 and 60 years ago an earthquake almost totally destroyed it, and it is not yet thoroughly rebuilt: the streets are crooked and dirty, and the houses are all low, so the owners dare not raise them high for fear of another shock. The eighty-first columna miliaria, inscribed with the name of Trajan, is the only fragment of antiquity observable in this town. The commodities of the place are sheep, horses, and corn; the bread is black and gritty, but well-tasted. The present possessor of this town is Pignatelli, count of Egmont, resident in France, who farms it out at 15,000 ducats a year (28*l.*)

CERIGO, in *Geography*, an island of the Grecian Archipelago, well known under the ancient appellation of CYTHERA, is separated from the Morea by a narrow strait. It is dry, and mountainous, and produces neither corn, wine, nor oil, sufficient for the inhabitants; some of the valleys, however, are fertile; and it abounds with sheep, hortes, quails, turtles, and falcons. Although it had formerly several good towns, it now chiefly serves as a rendezvous for pirates. The circumference is about 50 miles; and the inhabitants are Christian Greeks, subject to the Venetians, who change the government every two years. By the treaty of Campo Formio, in 1797, it was surrendered to the French, together with other Venetian islands. See CEPHALONIA. Cerigo, according to Thevenot, (*Voyage*, t. i. p. 25) was called *Porphyry* in the ancients, on account of the quantities of porphyry found in it.

CERIGO, a town of the above island, seated on its western coast on a sharp rock, surrounded by the sea, and defended by a castle. It has a small harbour, and is the see of a Greek bishop. N. lat. 36° 26'. E. long. 23° 11'.

CERIGO, in *Natural History*, a name by which many authors have called that remarkable American animal called the OPOSSUM.

The Americans in some places call this animal, in their language, *Cariguaya*; and it is probable that this name *Cerigo* is only a corruption of that word, though it be received generally in the world as a proper name, and used as such by Massé, Barlaeus, Nierenberg, and many others.

CERIGOTTO, in *Geography*, a small uninhabited island in the Grecian Archipelago, between Cerigo and Candia, anciently called *Argilia*; about 5 miles in compass. N. lat. 36° 2'. E. long. 22° 13'.

CERILLI, in *Ancient Geography*, a place of Italy in that part of Magna Græcia, called Brutium, situate on the sea-coast, at a small distance S.W. of Pandosia.

CERILLUM, a place of Italy in Lucania, according to Strabo; probably the same with *Cerilli*.

CERILLY, in *Geography*, a town of France, in the department of Aube, and chief place of a canton in the district of Montgo; 7 miles W. of Medinas. The place contains 2400, and the canton 6184 inhabitants; the territory includes 162½ kilonmetres, and 14 communes.

CERKINES, the ancient *Ceramia*, a sea-port town of the island of Cyprus, with decayed walls, defended by a

castle; the see of a bishop, suffragan of Nicosia. N. lat. 35° 22'. E. long. 35° 24'.

CERINI, GIOVANNI DOMENICO, in *Biography*, an historical painter, was born at Perugia in 1606, and studied under Guido and Domenichino; from whom he acquired a very beautiful tone of colouring, and a graceful disposition of his figures; and he particularly excelled in giving elegant and noble airs to his heads. He died in 1681. Pilkington.

CERINTHE, among the *Ancients*, was used by some to express that substance called by others *ambrosia* and *sandarach*, and by some *cribacæ*. See WAX.

CERINTHE, in *Botany*, (*argyros*), Theophr. from *κρησ*, *wax*, so called, according to Pliny, because bees were supposed to obtain from it abundance of wax.) Honey-wort. *Medic.* Fr. Linn. gen. 186. Schreb. 246. Willd. 281. Tourn. cl. i. j. 3. gen. 1. tab. 56. Juss. 150. Vent. vol. ii. 387. Gart. 413. Class and Order, *pentandria monogynia*. Nat. Ord. *Asperifolia*, Linn. *Boraginæ*, Juss. Vent.

Gen. Ch. Cal. Perianth deeply five-cleft, permanent; segments oblong, equal. Cor. monopetalous, campanulate; tube short, thick; orifice naked and previous; border tubular, swollen, a little thicker than the tube, five-cleft at the summit. Stam. Filaments five, very short; anthers acute, erect, long, two-celled, bifid at the base. Pist. Germ. two-cleft; style filiform, the length of the stamens; stigma obtuse. Peric. the permanent calyx. Nuts two, bony, glossy, somewhat egg-shaped, outwardly gibbous, two-celled. Seeds one in each cell.

Eff. Ch. Border of the corolla tubular, swollen; orifice naked. Nuts two, two-celled. Seeds one in each cell.

Sp. 1. *C. major*, Linn. Sp. Pl. 1. Mart. 1. Desfrouffaux in Encyc. 1. Wild. 1. Bot. Mag. Pl. 333. Lam. Illust. Pl. 39. Gart. tab. 67. (C. giabra. Mill. Dict. ed. 6. Pl. 91. C. Flor. rubro purpurascens; Bauh. Pin. 258. Morif. Hill. tab. 29. fig. 3.) Great honey-wort "Corollas embracing the stem; obtuse, spreading, swollen at the apex, campanulate; stamens shorter than the corolla." Root annual. Stems herbaceous, succulent, eighteen inches high or more, round, smooth, branching, leafy. Leaves glaucous, alternate, embracing the stem, oblong-oval, obtuse, from two to four inches long, thin, soft, ciliated. Flowers in short leafy spikes; tube of the corolla yellow; border purple, with very short revolute segments. A native of the south of Europe, and of the coast of Barbary. 2. *C. aspera*. Willd. 2. Roth. catal. bot. 1. p. 33. (C. major. L. Linn. C. flavo flore atepur; Morif. Hill. tab. 29. fig. 2.) "Corollas embracing the stem, obtuse, spreading, cylindrical; stamens as long as the corolla." Leaves prickly, smaller than those of the preceding. Flowers yellow. A native of the south of Europe. Not a variety of *C. major*. Both plants, after many years cultivation, retain their specific differences. Willd. 3. *C. minor*, Linn. Sp. Pl. 2. Mart. 2. Desfrouffaux 2. Willd. 3. Bauh. pin. 258. Morif. tab. 29. fig. 5. Jacq. Flor. Austr. tab. 124. "Corollas embracing the stem, entire; corollas acute, closed." Root biennial. Stems herbaceous, upright, cylindrical, greenish, about two feet high. Leaves similar to those of the two preceding species; but of a deeper glaucous colour, smooth, rarely ciliated, commonly marked with white spots. Flowers in 1, in long leafy terminal racemes, yellow, pedicelled; corolla a little lower than the calyx, contracted at the top and bottom, obscurely five-furrowed, cleft to the middle; segments linear lanceolate, acute, straight, forming a kind of cone; filaments scarcely discernible. A native of the south of Europe. There is a variety with emarginate leaves, described

described by Allioni under the name of *maculata*, and said by him to be perennial.

CERINTHÆ maritima procumbens, Dill. Elt. See PULMONARIA *maritima*.

CERINTHÆ echinoides, Scop. See ONOSMA *echinoides*.

CERINTHÆ, in Gardening, furnishes a plant of the ornamental, hardy, flowering annual kind; of which the species cultivated is the great honeywort (*C. major*), which rises with stems eighteen inches high, and more, round, smooth, branching, and leafy; the leaves are glaucous, becoming blue by age, smooth, without prickles, but ciliated about the edge, and dotted with white: the branches are lax and nodding, with flowers among the leaves, hanging on long peduncles. It is a native of Italy, flowering in June. It has varieties with smooth leaves and purple flowers, and with prickly leaves and yellow flowers.

Method of Culture. These plants may be raised by sowing the seeds annually in the autumn or early spring months in patches, in the borders, clumps, or other parts. The autumn sowings should be made as early as possible. They also often rise from the self-sown seeds; and should be managed as other hardy annuals. They are proper for being planted out about the apiary, or in the final beds or borders in the shrubbery or other parts of pleasure-grounds, where they produce variety.

CERINTHIANs, in Ecclesiastical History, called also *Merinthians*, a sect that took its name from *Cerintus*, contemporary with St. John, towards the close of the first or commencement of the second century; said to have been a native Jew, educated at Alexandria, and to have lived at Antioch; who formed a singular system of doctrine and discipline, by combining the doctrines of Christ with some of the opinions and errors of the Jews and Gnostics. Some learned moderns have represented Cerintus as a vicious person; but Dr. Lardner is of a different opinion; and he says, that nothing of this kind is charged upon him by the writers of heresies; not by Irenæus, nor Epiphanius, nor Theodoret, nor the rest. Cerintus ascribed the creation of the world, and the legislature of the Jews, to a created being, who derived from the Supreme God extraordinary virtues and powers, but afterwards became apostate and degraded. He supposed that *Jesus* was a mere man, born of Joseph and Mary; but that, in his baptism, the Holy Ghost, or the *Christ*, who was one of the *Eons*, descended upon him in the form of a dove; and that he was commissioned to oppose the degenerate god of the Jews, and to destroy his empire. In consequence of which, by his instigation, the man *Jesus* was seized and crucified; but *Christ* ascended up on high, without suffering at all. He recommended to his followers the worship of the Supreme God in conjunction with his Son; he required them to abandon the lawgiver of the Jews; and though they were permitted to retain circumcision and the rites of the Mosaic law, and, according to Jerom, this was the principal error of Cerintus, that he was for joining the law with the gospel; yet they were to make the precepts of Christ the rule of their conduct. For their encouragement, he promised them the resurrection of the body; after which the millennium was to commence: under the government of *Christ* united to the man *Jesus*: and this he represented as consisting in eating and drinking, nuptial entertainments, and other festivities.

Some authors ascribe the book of the Apocalypse to Cerintus, adding, that he put it off under the name of St. John, the better to authorize his revenues touching Christ's reign in the flesh: but it is observed by the bishop of London, in his third Pastoral Letter, p. 58, that his millenary state was not the life of saints, as the Apocalypse represents it, but the life

of libertines: and it is even certain that he published some works of this kind, under the title of Apocalypses.

That Cerintus was a Millenarian is asserted by Theodoret, though neither Irenæus nor Epiphanius makes any mention of it. Nevertheless, Le Clerc seems scarcely convinced that this error is rightly imputed to him. If there be any truth in the accounts of his being a Millenarian, it is highly probable (says Dr. Lardner) that he respected the apostle John, if the Revelation be a work of that apostle. Several writers, who did not like the Millenarian doctrine received by many Catholics, affirmed the book of Revelation, upon which they chiefly built, to be a work not of St. John, but of Cerintus. Theodoret says, that whether he wrote himself in the name of John, or only appealed to it in support of his opinions, it is a proof of his having respected that apostle: and if he did, it is probable he received *his* gospel, and the epistle generally ascribed to him. Irenæus says, that John wrote his gospel to confute the doctrine lately taught by Cerintus, and long before by the Nicolaitans; and St. Jerom has somewhat to the like purpose concerning the occasion of St. John's writing his gospel. Some have asserted, that the Cerinthians received the gospel of St. Matthew to countenance their doctrine of circumcision, from Christ's having been circumcised; but that they omitted the genealogy. This latter assertion is founded on an erroneous interpretation of a passage in Epiphanius; whereas the true meaning of the said passage is, that the Cerinthians preferred this gospel to the others, because of the genealogy; from whence they thought they could prove Christ to be really a mere man, born of Joseph and Mary. It has been said also, on the authority of Epiphanius, that they discarded the epistles of St. Paul, because that apostle held circumcision abolished. Of the truth of this there may, however, be some reason to doubt, from what Epiphanius himself says elsewhere. For he informs us that there was a tradition, that when some of them had died without baptism, others were baptised for them, left at the time when they should be hereafter raised up at the general resurrection, they should be punished for that omission. And it was supposed that St. Paul refers to it in 1 Cor. xv. 29. He afterwards argues against them from Isaiah, and from St. Luke's and St. John's gospels, which seems to imply, that they respected these parts of scripture, as well as the gospel of St. Matthew, some part of St. Paul's writings, and the Revelation of St. John. Upon the whole then, says Dr. Lardner, it is certain, that the Old Testament, and several of the books of the New Testament, were received by Cerintus. This candid and impartial writer questions whether the opinions of the Cerinthians concerning the person of Jesus be rightly represented. They might speak of Jesus as a man only, though they thought him to be born of a virgin. That they allowed this may be argued with considerable force, if they received St. Matthew's genealogy, as it is probable they did. They allowed the Holy Ghost to have descended upon Jesus at his baptism; which is agreeable to our gospels. But by the Holy Ghost they probably did not mean a person but a power, as Epiphanius expressly it; and as to what is said that the Holy Ghost, or the Christ, was impassible, and left Jesus to suffer alone, their real opinion may have been only and no more than this, that the divine nature in Jesus, or the power that came down upon him at baptism, and by which he wrought miracles, did not suffer.

A story has been related concerning Cerintus, of which we shall subjoin to this article a brief account. There are some, says Irenæus, who have heard Polycarp say, that John, the disciple of the Lord, going to bathe at Ephesus, and seeing Cerintus already in the bath, came out again in haste

haste without bathing, saying to those who were with him, "Let us flee hence, lest this bath should fall, while Cerinthus the enemy of the truth is within." The same story is told with different circumstances by Epiphanius. But the truth of it has been questioned. It is observable, that Irenæus, though personally acquainted with Polycarp, does not say that he had it from him; but that there were some who heard him say as much. It is not at all likely, that the apostle John should go to a public bath; and, therefore, Epiphanius says, in order to account for this impropriety, that John was moved by the Spirit to go thither; and Theodoret affirms, that he went thither on account of some indisposition under which he laboured. Irenæus and Theodoret say, it was Cerinthus; Epiphanius that it was Ebiou, who was in the bath. There are other different circumstances in the relations of this matter, and also other objections against the whole story; and, indeed, some of the ancients who mention it speak of it only as an uncertain report, particularly Theodoret. Mosheim's E. H. vol. i. Cave, H. L. vol. i. p. 36. Lardner's Works, vol. ii. p. 86. vol. ix. p. 319, &c.

CERINTHUS, in *Ancient Geography*, a town of Greece, in the island of Eubœa, situated on the eastern coast, N.E. of Chalcis.

CERISAY, in *Geography*, a town of France, in the department of the Two Savoyes, and chief place of a canton in the district of Thouras; $2\frac{1}{2}$ leagues S.E. of Chatillon-sur-Saône. The place contains 928, and the canton 5,244 inhabitants; the territory includes $217\frac{1}{2}$ kilometres and 13 communes.

CERISIERS, a town of France, in the department of the Yonne, and chief place of a canton in the district of Joigny; 4 leagues N.N.E. of St. Florentin. The place contains 1,122, and the canton 9,038 inhabitants; the territory includes $207\frac{1}{2}$ kilometres and 9 communes.

CERISY-LA SALLE, a town of France, in the department of the Channel, and chief place of a canton in the district of C. utantes; 2 leagues E. of Coutances. The place contains 2,445, and the canton 13,498 inhabitants; the territory includes 150 kilometres and 11 communes.

CERITE, in *Conchology*, Adanson's name of *Murex aluco*. See **MUREX**.

CERITES, in *Ancient Geography*, a people of Italy, inhabiting *Cerre*, in Etruria. They received into their cities the Vestals who fled from Rome on the arrival of the Gauls; and the Romans granted them the right of freedom, without that of suffrage.

CERITES, the *wax-stone*, a name used by some old authors for that yellow agate usually called cerachates.

CERIUM, in *Botany*, Bosc. N.-uv. Dict. Loureiro Flor. Coch. Clafs and ord. *Pentandrium monogynia*.

Gen. Ch. *Calyx* permanent, five-cleft; segments awl-shaped, straight. *Corol.* monopetalous, bell-shaped, with five round divisions. *Stam.* five. *Pist.* germ superior; style awl-shaped; stigma thick. *Peric.* berry globular, many-celled. *Seeds* one in each cell. Nearly allied to *Brusselia*.

Sp. C.— *Root annual*. *Stem* five or six feet high. *Leaves* alternate, petioled, large, lanceolate, almost entire. *Flowers* white, peduncled, in long, simple, straight, terminal spikes; bracts filiform. A native of Cochinchina, in cultivated ground.

CERLIER, in *Geography*. See **ERLACH**.

CERMENATI, JOHN DE, in *Biography*, a man of letters: an historian, was a notary and syndic of Milan, and flourished in the earlier part of the 14th century. In 1312 he was deputed by his countrymen as envoy to Guaricri,

vicar of the emperor Henry VII. His history of his native city, comprehending, besides its origin, situation, and the character of its inhabitants, all the occurrences in it from 1307 to 1313, is written with uncommon force and precision, and in a style of unusual elegance for that period. We have two editions of it by Muratori, the last in the 9th volume of his Collection of Italian historians, 17-6. Cermenati was living in 1337. Mur. in Tiraboschi.

CERMORUS, in *Ancient Geography*, the name of a gulf and small town of Macedonia, on the frontiers of Thracæ; placed by Pliny between Amphipolis and Peditium.

CERNA, in *Geography*, a river of Piedmont, which runs into the Sesia, 3 miles N.W. of Verceili.

CERNACHE, a town of Portugal, in the province of Beira; 4 miles S. of Coimbra.

CERNAY, a town of France, in the department of the Upper Rhine, and chief place of a canton in the district of Befort; 5 leagues N.E. of Befort. The place contains 1088, and the canton 9111 inhabitants; the territory includes 140 kilometres and 11 communes.

CERNAY-en-Dormois, a town of France, in the department of the Marne; 10 miles N. of St. Mencheuld.

CERNE, in *Ancient Geography*, an island near which Hanno cast anchor, situate on the coast of Africa, in the Atlantic Ocean. He says, in his Periplus, that it was at an equal distance from the straits of the Colonnes, and from the strait of Carthage. On this island he is said to have built a fort, and established a colony. In the time of Scylax the island of Cerne became a term in navigation for large buildings. The colony of Hanno maintained itself in this island, and it was always the depot of the Carthaginians on the south of Africa. The situation of this island, however, is not clearly ascertained; so that ancient authors have much differed with regard to its position.

CERNE, a town of Ethiopia, near the ocean, according to an ancient scholiast, cited by Casaubon in his notes on Strabo.

CERNE, or *Cerne-Abbas*, in *Geography*, a small town in Dorsetshire, England, consisting of four or five indifferently built streets, is situated in a pleasant valley, surrounded by steep hills, and watered by the river Cerne, from which it derives its name. A market (Wednesday) was granted in the fifteenth of king John, and is well frequented. Three fairs are held here. The trade of the town is chiefly confined to malting and brewing, though some hands are employed in a silk manufactory. The beer brewed here is equal, if not superior, to any in the kingdom. Cerne is only remarkable for the remains of its abbey, which, according to William of Malmshure, Camden, and some others, was founded by St. Augustine, whose zeal in the conversion of the Saxons to the Christian faith is said to have induced him to visit these parts, where, according to the monkish legends, he performed several miracles. There does not appear, however, any decisive evidence that Augustine ever travelled so far from Kent, or that any missionary arrived in the west of England before Birinus, which was 35 years after the time of the English apostle. The most early intimation of any religious foundation here that can be depended upon occurs about the year 870, when Edwald, or Eadwald, brother of St. Edmund the martyr, king of the East Angles, greatly affected by the murder of his unhappy brother by the Danes, declined the crown, and commenced hermit, fixing his retreat near this place, where Ailmer afterwards founded a monastery of the Benedictine order. A gate-house, and some few fragments of the abbey only remain. Cerne is 120 miles W. from London: the population was, under the late act, returned at 847, number of houses 165.

From this town ascends an immense chalk hill, which is crowned by a very large entrenchment, called *Trendle Hill*; on the declivity of this eminence may be traced a gigantic figure, cut in the chalk, in the manner of the famous white horse in Berkshire: though whether of a similar origin and antiquity is doubtful. It represents a man holding a club in his right hand, and extending the other; the whole figure measures about 180 feet in height. Hutchins's *History of Dorsetshire*, fol.

CERNETANI, in *Ancient Geography*, a people of Italy in Campania, surnamed Mariani, according to Pliny.

CERNETZ, in *Geography*, a town of Switzerland, in Lower Engadina, situated on a small rich plain, bounded by two ridges of mountains converging at both extremities, and producing wheat, barley, flax, and abundance of rich pasture; 24 miles S. of Coire.

CERNIA, in *Ancient Geography*, a town of Cyprus, on the northern coast, N. E. of Solæ.

CERNIN, ST., in *Geography*, a town of France, in the department of the Cantal, and chief place of a canton in the district of Aurillac. The place contains 4141, and the canton 8429, inhabitants: the territory includes 230 kilometres and 6 communes.

CERNITIS PALUS, in *Ancient Geography*, a kind of marsh situated in Thrace, near the mouth of the Strymon.

CERNON, in *Geography*, a town of France, in the department of the Marne, and district of Chalons; 8 miles S. of Chalons.

CERNU, a town of Africa, in the kingdom of Morocco; 7 miles from Safa.

CERNUA, in *Ichthyology*, the name of a small fresh water fish of the perch genus, better known by the titles of the ruff, or ruffe, and pope, and among the old writers by that of *abyredo* and *perca minor*. It is caught in several of the English rivers, though far more local than the common perch. This is the *perca cernua* of modern naturalists. See PERCA.

CERNUOUS, in *Botany*, drooping, a term applied by Linnæus to the peduncle of a flower. It denotes a greater and more determinate degree of downward curvature than is expressed by nutans, or nodding; as in *bidens radiata* and *helianthus annuus*.

CERO, in *Geography*, a town of Italy, in the Veronese; 6 miles N. N. E. of Verona.

CEROCHYTOS, in *Antiquity*, a method of painting in wax, melted and coloured with pigments for the purpose, and applied with pencils.

The word is compounded of $\kappa\epsilon\rho\alpha$, *cera*, wax, and $\chi\epsilon\iota\sigma$, *fundo*, I melt down. Plin. Hist. Nat. lib. xxxv. cap. 11. and lib. xxi. cap. 14.

CEROCOMA, in *Entomology*, the name of one of the Fabrician genera of coleopterous insects. See MELOR.

CEROMA, originally denoted a mixture of oil and wax, with which the ancient wrestlers rubbed themselves, not only to make their limbs more sleek, and less capable of being laid hold of, but more pliable, and fit for exercise.

The name *ceroma* is sometimes applied by ancient physicians to a cerote or ceredloth.

The champions, ready to engage in the *palæstra*, having stripped themselves naked, were first anointed with oil, then strewed over with dust, to which was lastly added wax. From the last ingredient, this composition was denominated *cerama*, from *cera*, wax.

CEROMANTIA, an ancient method of divination, by means of wax melted over a vessel of water, and let drop in three distinct spaces; observing the figure, situation, distance, and concretion of the drops.

CERON, in *Ancient Geography*, a country of Asia in Assyria, famous for its odoriferous trees. Josephus says that in his time it presented remains of Noah's ark.—Also, a fountain of Greece, in the Elisiotides, a country of Thely, according to Pliny.

CERONE, DOMINICO PEDRO, in *Biography*, maestro di cappella to the viceroy of Naples, while that city and kingdom were in the possession of the Spaniards: though himself an Italian, and born in the Venetian late, he published, in the Spanish language, the most ample, correct, and useful musical treatise that appeared in any country during the 17th century; entitled "*El Metodo y Maestro*," Naples, 1613, not 1619, as Walter says. See *Druidus Bibl. Exot.* p. 279. It was reprinted at Antwerp in folio, 1619. This scarce and truly valuable work for counterpoint, and all the arcana of fugue, canon, double counterpoint, augmentation, diminution, &c. occupies nearly 1800 folio pages. Though his rules for double counterpoint are good, we shall recommend to the musical student the instructions on this subject given by Padre Martini, as more accessible, if not more clear; and the examples given by Sala, of whom we shall speak hereafter, as most intelligible and elegant. The study of this species of composition is strongly recommended by regular bred musicians, and practised by composers of the first class.

CERONES, in *Ancient Geography*, probably the same people with the *Craones* mentioned also by Ptolemy as inhabitants of the isle of Albion, were, according to Horsley, the most ancient inhabitants of Lochabar, and of part of Rosse.

CERONIA. See CERINES.

CEROPEGIUM, in *Botany*, (from $\kappa\epsilon\rho\alpha\rho\epsilon\gamma\iota\sigma$, a candle-labrum or lamp-stand) Linn. gen. 302. Schr. 431. Willd. 493. Juss. p. 146. Vent. vol. ii. p. 426. Clafs and Order, *pentandria monogynia*, Linn. *Digynia*, Schreb. Lam. Willd. Nat. Ord. *Cantortie*, Linn. *Apocinea*, Juss. Vent.

Gen. Ch. Cal. five-toothed, or five-leaved, permanent. Cor. monopetalous, tubular or campanulate, sometimes swollen at the base; border five-cleft, converging. Stam. Filaments five, in the base of the corolla, small. *Pist.* Style scarcely apparent; stigmas two. *Peric.* Follicles two, very long, cylindrical, erect, one-celled, one-valved. *Seeds* numerous, imbricated, crowned with a pappus.

Eff. Ch. Contorted. Follicles two, erect; seeds feathery; border of the corolla converging.

Sp. 1. *C. candelabrum*, Linn. Sp. 1. Mart. 1. Lam. 1. Willd. 1. (Niota-nodem-valli; Rheed. Mal. 9. tab. 16.)

"Leaves egg-shaped, mucronate; umbels pendulous; flowers erect." *Stems* twining, slender, round, green or reddish. *Leaves* opposite, petioled, egg-shaped, thick, soft, smooth. *Flowers* reddish, in axillary umbels, at first pendulous, afterwards erect the common peduncles continuing pendulous. A native of the East Indies. 2. *C. tuberosa*, Willd. 2. Roxb. Cor. 1. tab. 9.

"Leaves egg-shaped, acute, umbels erect; root creeping, tuberous." A native of waste ground in the East Indies. 3. *C. bulbosa*, Willd. 3. Roxb. Cor. 1. tab. 7.

"Leaves obovate-elliptical, cuspidate; umbels erect; root bulbous." Distinct from the preceding. *Leaves* less and different in form. *Flowers* only half the size. *Bulb* solitary, depressed. A native of dry woods in the East Indies. 4. *C. biflora*, Linn. Sp. 2. Mart. 2. Lam. 2. Willd. 4.

"Leaves egg-shaped; peduncles two-flowered." *Stem* climbing. *Leaves* opposite, quite entire. *Peduncles* axillary, most frequently two-flowered. *Flowers* opposite to the peduncle, not reflexed but extended in a right line. A native of the island of Ceylon. 5. *C. juncea*, Willd. 5. Roxb. Cor. 1. tab. 10.

"Leaves lanceolate, sessile peduncles with about two flowers;

flowers; stem fleshy." *Stem* nearly simple, twining. *Leaves* opposite, distant, appearing like scales. *Flovers* large for this genus, near an inch and half long, very pale green, beautifully variegated with transverse purple streaks. A native of the East Indies, on dry uncultivated ground. 6. *C. acuminata*, Willd. 6. Roxb. *Cor.* 1. tab. 8^o. "Leaves lanceolate, acuminate to a great length; umbels many-flowered, upright; root bulbous." A native of the East Indies in dry woods. 7. *C. squitata*, Linn. Mant. 215. Thunb. prod. 37. (Cynanchum; Burm. afr. 36. tab. 15.) "Umbels nearly sessile; leaves arrow-headed." *Stem* twining, filiform, downy. *Leaves* opposite, on short petioles, revolute at the edges, downy on both sides, paler underneath. *Umbels* axillary, many-flowered, peduncles shorter than the umbel. *Flovers* scarlet; corolla nearly cylindrical, but little swollen at the base; segments very short, mucronate, converging; calyx half the length of the corolla, with five linear acute segments. A native of the Cape of Good Hope. 8. *C. tenuiflora*, Murr. Syst. veg. 211. Mart. 4. Lam. 4. Willd. 8. (Periploca tenuiflora, Linn. Sp. Pl. Cynanchum; Burm. afr. tab. 15? Apocynum; Pluk. Mant. 17. tab. 335, fig. 5. Naru-nindi; Rheed. Mal. 10. tab. 34.) "Leaves lanceolate." *Root* woody. *Stem* climbing, slender, branched, milky, green or reddish, leafy. *Leaves* opposite, narrow, very acute, on very short petioles. *Umbels* axillary, nearly sessile, three or four-flowered. *Flovers* within reddish; on the outside yellowish green. A native of the East Indies. 9. *C. obtusa*, Mart. 5. Lour. Coch. 114. "Leaves blunt." *Stem* twining, filiform, smooth. *Leaves* opposite, oblong, quite entire, flat, few. *Flovers* like those of the first species, but on shorter peduncles. A native of Coch. China. 10. *C. cordata*, Mart. 6. Lour. Coch. 114. "Leaves heart-shaped; umbels pendulous." *Stem* climbing, long, branched, round. *Leaves* opposite, quite entire, smooth, on long petioles. *Flovers* greenish yellow, in large hemispherical axillary umbels, on long peduncles; calyx five-leaved; leaflets egg-shaped, acute, small, spreading; nectary fleshy, upright, five-cleft; with ten oblong glands standing round the pill; filaments none; anthers oblong, converging; germ longish, bifid; style thick, very short; stigma blunt, emarginate. A native of Coch. China in the hedges. All the species are perennial.

CEROPPELLA, in *Ancient Geography*, a place of Thrace, being one of the places which the Romans assigned to the Goths for their dwelling.

CEROPHÆI, a people placed by Ptolemy in Africa Pretria.

CEROSUS, a place in the Ionian sea, between the island of Melita and Macedonia, in the Adriatic sea.

CEROSTROTUM, in *Ancient Writers*, denotes a fort of picture composed of pieces of horn; answering to what among us is called *mosaic work*. Some write the word *cerostratum*, and suppose it primarily to denote a fort of pavement composed of pieces of wood, inlaid and joined with slips of horn, variously coloured and figured. Salmassius will have *cerostrata* to denote a method of painting, or enamelling with wax, otherwise called *cerochytos*.

CEROU, in *Geography*, a river of France, which runs into the Avenir.

CERQUOZZI, MICHAEL ANGILOLO, called *M. A. dell' Battogie*, in *Biography*, a painter of battles, formed himself with regard to style and the selection of his subjects on Bamboccio, but differed from him as to the character and physiognomy of his figures, painting those of Italy instead of Dutch or Flemish mobs. The tints of both are strong and vivid. Whilst Bamboccio excels Cerquozzi in landscape, the latter is superior in the spirit of

his figures. His principal work is in the palace Spada at Rome, in which he has represented an army of fanatic Lazzaroni shouting applause to Mafo Aniello. He died in 1663, at the age of 60 years. Pilkington by Fuseli.

CERRATO, PAUL, a Latin poet, descended of a noble family, was born at Alba in Monterrat, in 1485; and though by profession a lawyer, he acquired very great literary reputation. Several editions were printed of his epithalamium, written in Latin verse, on the nuptials of William marquis of Monterrat and Anne d'Alençon in 1508; but his principal performance was a poem "De Virginitate," in three books, heroic measure. Scaliger the elder reckons Cerrato among the first poets in Italy, though he says that he had so much accustom'd himself to the lofty style, that he could not descend to the familiar, but would describe a fly in terms as elevated as he would a hero. His works are inserted in the "Delicæ Peëtarum;" and the last separate edition of them, with an elegant biographical memoir prefixed, was given by Signo. Joseph Vernazza at Vercelli in 1778. Moreti. Tirabochi.

CERRETANI, in *Ancient Geography*, an ancient people of Spain, who dwelt along the Pyrenées, near the Vasconi. They are mentioned by Strabo, Ptolemy, and Pliny; the latter of whom distinguishes them into *Juliani* and *Augustiani*. Julius Cæsar gave them the right of freedom, and Augustus incorporated them into a small nation, and extended their borders to those of the Vasconi.

CERRI *glans*, and CERRUS, in *Botany*, J. Bauh. Park. and Ray. See *QUERCUS agilops*.

CERRETO, in *Geography*, a town of Italy in the province of Umbria; 15 miles W. of Nursia.

CERRITO, a town of Naples, in the province of Lavora, the residence of the bishop of Telesia, with a cathedral and collegiate church, and three convents; 18 miles N.N.W. of Benevento.

CERRO, a town of Italy, in the duchy of Milan; 18 miles W. of Como.

CERRUS, in *Botany*, See *CERRI glans*.

CERRUS, in *Ichthyology*, a name given by some old writers, Pliny, Martial, and others, to a fish called by other writers *smaris*, and *mæna candida*. They speak of it as being distinguished from the rest of the fishes in the same tribe, by having a black spot in the middle of each side, and the pectoral and tail fins being red. As the fish is certainly of the sparus genus, this description left us by the ancients is not entirely satisfactory, there being at least thirty distinct fishes of this genus, which possess the characteristic lateral spot they mention. Artedi describes the *cerus* as *sparus macula nigra in utroque latere medio, pinis pectoralibus caudaque rubris*. It is generally believed that the *cerus*, and the *sparus smaris* of modern ichthyologists are the same species. See *SPARUS smaris*.

CERSUNUM, in *Ancient Geography*, a town placed by Ptolemy in the interior of the island of Corsica.

CERSUS, or CARsus, a river of Asia, which ran between the desiles of Syria, according to Xenophon.

CERTAINTY. See *CERTITUDE*.

CERTAINTY, in *Law*, denotes a plain, clear, and distinct setting down of things, so that they may be understood. 5 Rep. 121. A convenient certainty is required in writs, declarations, and pleadings, &c. But if a writ abate for want of it, the plaintiff may have another writ; it is otherwise if a deed become void by uncertainty, as the party may not have a new deed at his pleasure. 11 Rep. 25. 121. Dyer. 84. That has certainty enough, which may be made certain; but not like what is certain of itself. 4 Rep. 97. See *PLEADING*. See also *DIFFERENT*, *FINE*, and *WILL*.

CER. ALDO, of CASTRO CARLEDO, in *Geography*, a town of Italy, in the territory of Spina.

CERTALES, in *Zoölog. Geography*, a people who inhabited the northern coast of the Persian sea, between the Taurus, Caucasus and Colchis, and the Aelæus and Zeyx rivers, according to Strabo. They are the *Cercini* of Dionysius Periegetes.

CERTHIA, in *Ornithology*, a genus of birds among the vireæ, which have the bill arched, slender, somewhat triangular, and pointed; tongue acute; feet formed for walking. This is the Gmelinian character of the genus as it stands in the last edition of the Linnean Systema Naturæ. In the General Synopsis by Dr. Latham it is defined rather differently; that writer describes it as having the bill slender, incurved, and sharp pointed; nostrils small in general, but sometimes pretty large; and covered with a membrane; toe ræ in three uncartilag. legs moderately stout; toes placed three before and one behind; back toes large; claws hooked and long; and tail consisting of twelve feathers. The character of the genus certhia in Index Ornithologicus corresponds more closely with that assigned it by Gmelin; namely, bill bent, slender, and pointed; tongue various; feet formed for walking; tail composed of twelve feathers.

The birds of this tribe bear a near resemblance in a variety of particulars, and especially in the splendour, and beauty of plumage, to the *Trachiti* or humming-birds. Some authors have united them as forming only one natural family. This has been objected to because the creepers are not confined to any climate, being found in all parts of the world, while the humming-birds meet with only in the warmer parts of America, the creeps, besides, feed principally on insects, while the food of the humming-bird consists only of the nectaceous juices which it extracts from flowers. There are, indeed, a few species of creepers that have the tongue long and tubular as in the humming-birds, but the greater part of them have the tongue short and pointed; in some it is rather long, and flattened at the tip, and in others the sides of the tongue are ciliated. Their habits and modes of life are different; the creepers, feeding chiefly on insects, are almost constantly observed creeping slowly up and down trees in search of their food, but the humming-bird hovers on the wing over the flowers which furnish its food like the bee; the creepers breed in the hollows of trees and lay many eggs; the humming-birds, on the contrary, rarely lay more than two eggs, and build their nests very differently; preferring the covert of a bush to the hollow of a tree; their nests are generally observed perched on a luscious branch in a low tree, or among the fugacæ; and sometimes among grass and other low herbage.

CERTHIA FAMILIARIS is one of the most universally diffused species in this genus, though generally believed to be no where common; it is found in Asia and America, and in most parts of Europe. The species is of a brownish colour, beneath white; quill feathers luscious, and ten marked with a white spot each. Linn. Fa. Svec.

This is the common or European creeper; it is sometimes called of English authors, a bird which often observed in this country, though perfectly well known as a British species. It is described under various names by authors. Brauer calls it *fulva macul. alba*; Klein, *F. fulva macul. alba*; and in the last edition of Gmelin's Systema Naturæ, under a diversity of the first bird under the title of *Le Gmelin*, which Gmelin calls *2. certhia minor*, and Buffon *Le Grand Grimpereau*. Our common Creeper is about five inches and a half in length. The bill is hooked, the upper mandible brown, and the lower whitish; head and upper

part of the neck brown, streaked with black; rump tawny; wing-coverts varied with brown and bluish; breast and belly silvery white; tail long, and consisting of twelve feathers that slope off to a point; legs and claws grey. It feeds principally on insects, which it finds in the crevices, and holes, in the trunks and branches of trees. The nest is usually built in the hollow of a tree, and contains five or more eggs of an ash colour, marked at the end with spots and streaks of a deep red colour.

VARIETY. Above greenish, beneath varied with pale yellow and green; quill feathers brown, with the outer edge green. Scop. ann. 1. 72. n. 60.

This species is detected by Scopoli as being nearly the same with certain families, of which he supposed it may be only a sexual difference or a variety. We may easily conclude, if his determination be correct, that it is not a sexual difference of the females, but it may be a variety, although not probably of a distinct species. He mentions a blue stripe that passes from the base of the bill, and descends down the middle of the leg, and a rufous spot on the throat; the bill is greenish brown, and the legs black. Inhabits Canada.

PLUMAGE. Green beneath and tail violet; wings, belly, and vent pale brown. Gmel. *Sickle-billed creeper*, Latham.

The length of this species is five inches and a half; the bill is dusky, the base broad, and dusky. The upper parts of the head, neck, and body are green with a gloss of violet on the head; beneath as blue as the breast violet; legs brown with dusky claws. This was first detected by Dr. Latham from a specimen in the British Museum.

PACIFIC. Black beneath dusky; shoulders, lower part of the back, rump, and vent yellow; lower wing-coverts fiery. Gmel. *Great billed creeper*, Latham.

Length eight inch s. Bill an inch and three quarters, brown, and paler at the base; legs black brown. Detected from a specimen in the late Leverian Museum that was brought from the Friendly islands in the South Seas. It is mentioned in the last voyage of Captain Cook under the name of Hoohoo.

OBSCURA. Oivaceous; wing and equal tail dusky edged with green. Gmel. *Ho-billed green creeper*, Lath. Lev. Mus.

The length of this bird is seven inches. Bill an inch and three quarters long, blackish and very much curved; the under mandible a quarter of an inch shorter than the upper. The nostrils covered with a membrane. Between the bill and eye a pale brown streak; plumage olive green, pale beneath, and somewhat yellowish; legs dusky brown, with the feathers just above the knee white.—This species inhabits the Sandwich islands, and is one of those birds the fathers of which are employed by the natives in the manufacture of the sacred vestments of their chiefs. An elegant cloak of this description formed of the feathers of this bird and of creeper, and decorated with a deep border of red and yellow feathers, was brought by our last circumnavigators from Owhyhee, and deposited among the artificial rarities in the late Leverian Museum. This is understood to have been the only article of dress formed of the feathers of this bird by the English, although the gods and other vestments formed of feathers were worn on all occasions of great public ceremony by the chiefs in the Sandwich islands. A greater anecdote is related of this cloak that is so worth repeating, to show the value those islands attach to the feathers of birds composed of the feathers of this bird, while the feathers composed of red and yellow feathers were to be obtained on easy terms. The cloak was the property of one of the chieftain

chieftain warriors of Owhyhee who among others were tempted by curiosity on board English ships; its beauty attracted the notice of an officer in the expedition, Lieutenant Williamson, who wished to purchase it, but the cloak being considered by the owner as extremely valuable, his proposals were rejected. The officer offered him a double barreled gun for it, which was refused; and he afterwards offered his regimental coat which was refused. Some time after, however, the owner of the cloak observed in the corner of the cabin a bottle and basin of common white or Queen's ware, and was so struck with the novelty that he hastily snatched them up in his arms, and throwing his cloak upon the floor without further ceremony jumped overboard, and swam ashore with his prize, which very fortunately he bore off unbroken.

COCCINEA. Scarlet; wings, and tail black. Forster. — *Hook Wood r'd Creeper*, Lath. *Carmosinrothor Honigsauger*, Merrem Lev. Mus.

A beautiful species that inhabits the Sandwich islands, the feathers of which are there principally employed by the natives in the formation of their fine scarlet cloaks, and other parts of dress; and in their grotesque feathered idols. The length is six inches. Bill three quarters of an inch long, and much curved, the colour pale brown. Some birds have the forehead buff coloured, and a mixture of buff and dusky black about the head and neck which are supposed to indicate those not yet arrived at their perfect plumage.

Orn. This is called by Born *Poigtinus*. *Certhia vestitaria*, Lath. In' Orn.

SOVI-MANGA. Green, beneath yellowish; rump olive; breast brown, with two transverse bars, one brown, the other blue; tail black. Gmel. *Certhia, Madagascariensis violacea*, and the *Grimpercau violet de Madagascar*, Buff. *Sovi-manga*, Buff. *Violet creeper*, Lath. *Certhia Madagascariensis*, Lath. Ind. Orn.

Size of a wren; length above four inches; bill three quarters of an inch, long and black; tongue rather longer than the bill, and bifid. The head, throat, neck, upper part of the back, scapulars, and wing-coverts, are shining green with an olive gloss; lower part of the back, rump, and upper tail coverts olive brown; breast brown, with a blue band, and below that another of chestnut; belly and under tail coverts pale yellow. On the shoulders a spot of deep yellow; tail black. The feathers edged with green, except the outer feather, which is grey brown for half its length, and the next tipped at the end with the same. Legs and claws black. The female is smaller than the male, and has the upper parts olive-brown; the under parts yellow with a tinge of olive. Inhabits Madagascar.

MAXILLENSIS. Green, glossed with blue and violet; beneath greyish olive; neck barred with green, blue, violet, and yellow; wings fuscous. Gmel. A native of Manilla; scarcely four inches long. **Orn.** There are two yellow spots between the shoulders, and the upper wing-coverts are brown. This is considered as a mere variety of certain Summanys by Latham. Ind. Orn. Buffon calls it *sovi-manga de Luzon*.

BURBONICA. Green and fuscous; beneath varied with grey; rump yellow; wings and tail blackish. Gmel. *Le Soui-manga de l'Isle de Bourbon*, Buff. *Grimpercau de l'Isle de Bourbon*, Pl. enl. *Yellow rumped creeper* of Latham.

The length of this bird is about five inches. The bill black; upper part of the head and body greenish brown; the rest yellow, inclining to olive; under parts grey and yellow; sides fuscous; tail blackish; legs black. Inhabits the island of Bourbon.

VIOLACEA. Two middle tail feathers very long; body

glossed with violet; breast and abdomen pale yellow. Gmel. *Certhia violacea*, Linn. *Certhia longicauda minor capitis bene spei*, Brill. *Sovi-manga à longue queue et à capuchon violet*, Buff. *Petit grimpercau à longue queue du cap de bonne espérance*, Buff. Pl. enl. *Violet-headed creeper*, Lath.

This is rather more than six inches in length. Bill blackish, and near an inch long. The head, neck, upper parts of the back, scapulars, lesser wing-coverts bright violet, glossed with green; fore part of the neck bluish. Lower part of the back, rump, and upper tail coverts, olive brown; breast, belly, and under tail-coverts bright orange; sides of the body orange, with a mixture of olive; tail blackish brown, wedge-shaped, with the two middle tail-feathers a inch longer than the rest; the colour blackish brown, edged on the outside with olive; legs and claws blackish.

Inhabits the Cape of Good Hope. The nest, which consists of materials of a silky nature, is constructed with great art. Lev. Mus.

FAMOSA. Two middle tail-feathers very long; body glossed with green; arm-pits yellow; lores black. Gmel. *Certhia longicauda capitis bene spei*, Brill. *Certhia famosa*, Bonowick. *Grand soui-manga vert à longue queue*, Buff. *Grimpercau à longue queue du cap de bonne espérance*, Buff. Pl. Enl.

This is a large species. Length nine inches. The bill an inch and a quarter; the plumage is green-gold, with a gloss of coppery; between the bill and eyes a black velvety stripe; under the shoulders a fine yellow spot; greater wing-coverts and quills blackish, edged with green; tail black, the two middle feathers exceed the rest by two inches and a half in length, and are edged with gold, and coppery on both sides; claws and legs black. The female has the head and upper parts of the body of a greenish brown, with a mixture of bright green; rump green, with the quills and tail black brown; body beneath yellowish, with a mixture of green scathe on the breast; two middle tail-feathers nearly as long as in the male, but so narrow as almost to resemble a thread. A native of the Cape of Good Hope.

PULCHRELLA. Two middle tail feathers very long; body glossed with green; breast red. Gmel. *Certhia longicauda finegalensis*, Brill. *Zeelandia abstrahensis sifonari*, Seba. *Sovi-manga vert doré changeant à longue queue*, Buff. *Grimpercau à longue queue de Singaï*, Buff. Pl. Enl. *Beautiful creeper*, Lath.

Length near seven inches and a quarter. Bill two-thirds of an inch, and blackish. The head, neck, back, rump, belly, sides, scapulars, upper and under tail-coverts, and upper wing-coverts are of a fine golden green, glossed with copper, and the breast is a beautiful red; on the lower part of the belly is a mixture of white. The greater wing-coverts and tail are brown; tail blackish, edged on the outside with green gold; two middle tail-feathers rather more than two inches and a half longer than the rest, and very little rounded at the ends; legs blackish. The plumage of the female is tinged with brown above, beneath yellowish, mixed with brown, the under tail-coverts white, sprinkled with brown and blue. This species inhabits S negal.

PHILIPPINA. Two middle tail feathers very long; body greenish grey, beneath yellowish white. Gmel. Linn. &c. *Certhia philippina*, Buff. *Gring rau des Philippines*, Buff. *Grimpercau de l'Isle de Luzon*, S mer. *Philippine creeper*, Lath. The length of this bird is four inches and three quarters; bill and legs, with the claws, black; tongue tubular; two middle tail-feathers black, glossed with gold, the rest blackish, and white at the tip.

CYANEA. Blue, with the occular band, shoulders, wings, and tail black; legs fuscous. Gmel. *Certhia Bristholia carula*, Buff. *Cyanæcula Maregr.* *Guit-guit noir à bleu*, Buff.

Buff. Grimpercau du Brest, Buff. Pl. Enl. *Black and blue creeper*, Edwards, &c.

This species is rather larger than the common creeper; the length four inches and a quarter. Bill two thirds of an inch long, and black, the tongue as long as the bill, and ciliated. The head, throat, fore part of the neck, breast, belly, sides, thighs, lower part of the back, rump, and upper part of the tail, and wing-coverts fine blue; the top of the head a beautiful beryl blue; on each side of the head a black stripe passing through the eyes; hind part of the neck, and upper part of the back velvety black; tail black; under wing-coverts yellowish; legs red. claws black.

This inhabits Brazil and Cayenne, and is observed to vary in the colour of the plumage in some specimens.

ZEYLONICA. Cap green; back ferruginous; abdomen yellow; throat and rump azure, Gmel. *Certhia philippensis* Linnaeus, Buff. *Grimpercau olive des Philippines*, Buff. *Soumanga divise a gorge pourpre*, Buff. Hist. Ois. *Ceylonese creeper*, Lath.

This is the size of a wren. Bill three quarters of an inch long, and black; upper parts of the body dull brownish olive; under parts yellow, except the throat, fore part of the neck and breast, which are of a beautiful deep violet; legs and claws black. Inhabits the Philippine islands.

There is a variety of this bird of a green colour, and white beneath, with the chin, throat, breast, and back fuscous; tail black. Described from a specimen in the British Museum.

LOTENIA. Blue, with golden-red pectoral band; lores black. Gmel. Linn. *Certhia Madagascarensis viridis*, Buff. *Angala-dian*, Buff. *Grimpercau verd de Madagascar*, Buff. *Loten's creeper*, Lath.

The length of this species is five inches and a quarter; bill nearly one inch and a quarter long, and black, and the tongue compressed at the end. The head, neck, back, rump, scapulars, and upper tail-coverts, are green-gold; between the bill and eye on each side is a narrow velvety line; legs black. Buffon tells us this bird makes its nest of the down of plants, in the form of a cup, like that of the chaffinch, in which the female lays generally five or six eggs. Its greatest enemy, he observes, is a spider as large, or larger than itself, which is very voracious, and often seizes on the whole brood. This is the great bird-catching spider, *aranea aricularia*. Loten's creeper is a native of Ceylon and Madagascar, and is named in compliment to governor Loten.

OMNICOLOR. Green, mixed with almost every other colour. Gmel. &c. *Avis zeylonica omnicolor*, Seba. *Falculinus omnicolor zeylonicus*, Klein. *Le soui-manga des toutes couleurs*, Buff. *Green-gold creeper*, Lath.

Length eight inches. Inhabits the same country as the last, and supposed by some to be only a variety, but it differs so materially in size, that Gmelin and Latham are led to think them distinct, and describe them as two species.

SANSIO. Olivaceous; crown of the head somewhat violet; spot on the cheeks white; wings, and slightly furcated tail brown, Gmel. *Macking creeper*, Lath.

This inhabits New Zealand. It has an agreeable note in general, but at times so varies and modulates its voice, that it seems to imitate the notes of all other birds, and hence it was called by the English the mocking bird. The length is seven inches and a quarter. Bill somewhat bent, slender, long, and dusky; nostrils large, and covered with a membrane; tongue sharp; head, especially on the crown, inclining to violet; plumage, in general, olive green, inclining to yellow on the under parts; quills brown, secondaries edged with olive; tail the same, and somewhat furcated; legs dusky blue; claws black, the posterior one longest. Lev. Mus.

AURANTIA. Green, beneath yellowish; throat orange; wings and tail black. Gmel. *Orange-breasted creeper*, Lath.

Discovered by Smeathman in Africa. The length is four inches. Bill about three quarters of an inch long, curved, and black. The head, throat, hind part of the neck, back, and wing-coverts green; quills and tail dusky-black; legs black.

FLAVIPES. Green, beneath blue; wings and tail black. Gmel. *Blue-throated creeper*, Lath.

This kind inhabits Cayenne. The length is four inches and a quarter. Bill nearly an inch long, curved, and black; upper part of the head, sides, and back of the neck, and back green; chin, throat, and breast, deep blue; blue on the belly paler; on each side the neck, between the blue and green, yellowish white; quills and tail black; legs yellow, with black claws.

OCHROCHLORA. Green; cheeks, throat, and abdomen yellow; breast and flanks yellowish-green, spotted with bluish. Gmel. *Yellow-cheeked creeper*, Lath.

Inhabits Surinam. This is about half the size of the common creeper. The head, back, wings, and tail are green.

CARDINALIS. Black; head, collar, breast, and line down the middle of the back red; tail equal. Gmel. *Cardinal creeper*, Lath.

Described from a specimen in the Leverian museum. It is the same size as our common creeper. Bill the length of the head, and curved, black, and whitish at the base; tongue long, and ciliated half way down from the tip; between the bill and eye a streak of black which encircles the eyes; wings and tail black; legs lead coloured, claws black. Inhabits the cultivated parts of the island of Tanna, and is known there by the name of *Kuyameta*. It subsists on the nectareous juices of flowers like the humming-bird.

CARUNCULATA. Olivaceous; chin and throat orange; breast ferruginous; abdomen ash-coloured; at the base of the lower mandible on each side a yellow wattle. Gmel. *Wattled creeper*, Lath.

A specimen of this singular species brought by our navigators from Tonga-Tabu, or Amsterdamsk ile in the South seas, was preserved in the late Leverian Museum. The length was seven inches and three quarters. Bill an inch long, and rather bent; tongue longer than the bill, and divided to half its length into four segments like threads; wattle at the base of the bill surrounded by a patch of yellow feathers which extends under the eye; the plumage brownish olive-green, darkest on the middle of the back; belly inclining to ash-colour; legs blue black; claws black.

FUSCA. Fuscous; throat and breast lined with fuscous and white. Gmel. *Brown creeper*, Lath. Lev. Mus.

The length of this bird is six inches. The bill is an inch long, moderately bent and dusky brown; with a pale orange spot in the middle. General colour of the plumage brown; belly very pale brown; tail brown and even at the end; legs black, claws long and hooked. Inhabits islands in the South seas.

MURARIA. Cinereous; wings with a tawny spot. Gmel. *Certhia muralis*, Buff. *Grimpercau de murarie*, Buff. *Wall creeper* or *spider catcher*, Willughby, Latham, &c.

Inhabits the south of Europe and Asia. Frequents old walls in search of insects, especially spiders; is solitary and migrates in autumn.

PUSILLA. Fuscous, beneath white; eye-brows white; tail fuscous, on the outer feathers white at the tip. *Certhia indica*, Buff. *Soui magna brun et blanc*, Buff. *Little brown and white creeper*, Edwards.

Length three inches and a half. A black streak extend-

ing from the bill to the eye; quill feathers edged with buffy. This inhabits the Cape of Good Hope.

CAPENSIS. Fulvous; tail feathers blackish; outer ones fringed with white on the outside. Gmel. *Certhia capitis bone spici*, Briff.

CARRUCARIA. Olivaceous, beneath yellowish; tail feathers equal. Gmel. *Certhia philippensis*, Briff. *Grimpeau gris des Philippines*, Buff. *Grey creeper*, Lath.

Inhabits the Philippine isles. Length four inches. Bill three quarters of an inch long, and black; tongue forked. Body above olivaceous; under parts yellowish white, deep on the breast; down the middle of the neck as far as the breast a deep violet stripe; upper wing-coverts violet; quills brown; tail feathers black, edged with steely blue, and whitish at the tips; legs and claws black.

JUGULARIS. Somewhat griseous; beneath yellow; throat violaceous; two exterior tail feathers yellow at the tip. Gmel. *Certhia philippensis minor*, Briff. *Petit grimpeau des Philippines*, Buff. *Certhia jugularis*, Linn.

Length three inches and a half. Inhabits the same country as the last, and is supposed by some writers to be only a variety of it.

OLIVACEA. Olivaceous; beneath fuscous; orbits whitish. Gmel. *Certhia olivacea madagascariensis*, Briff. *Soui-manga olive à gorge pourpre*, Buff. *Grimpeau olive de Madagascar*, Buff. *Olive creeper*, Lath.

Length four inches. Bill above half an inch long, and black; colour of the upper parts, from the forehead to the rump, dull olive green, inclining to brown on the forehead and crown; the under parts grey brown; round the eyes whitish; quills and tail brown, with a tinge of olive green; the two outer feathers white at the end; legs pale brown. Inhabits Madagascar.

Dr. Latham suspects this may be the female of the Ceylonese creeper, *certhia zeylonica*.

CERULEA. Blue; ocular band, throat, wings and tail-feathers black. Linn. Scopoli, &c. *Certhia cayanaensis cerulea*, Briff. *Avia boisvillia, papilio vocata* Seba. *Certhia of Guiana*, Bancroft. *Blue creeper*, Edwards.

A native of Cayenne, where, according to Seba it makes its nest with great art in the shape of a retort, which is suspended from some weak twig at the end of a branch of a tree, with the opening downwards. The neck at the entrance is a foot in length, the nest itself being quite at the top, so that this bird has to climb up this funnel-shaped opening to gain access to its nest. The nest being so situation is secure; neither monkeys, snakes, nor lizards, daring to venture at the weak extremity of the branch to the nest as it would not support them. The outside of the nest is composed of dry stalks of grass, the lining of softer materials. This bird is four inches in length. The bill is three fourths of an inch long, and black; the head fine blue; legs yellow, claws black.

BRASILANA. Black; crown of the head gold-green; rump, chin, and throat violaceous; breast purple-tawny. *Certhia brasiliensis violacea*, Briff. *Guit-guit noir et violet*, Buff. *Black and violet creeper*, Lath.

This kind inhabits Brazil. Length three inches and a quarter. Bill rather exceeding half an inch, and black; crown of the head is fine green-gold; sides of the head, hind part of the neck, back and scapulars deep velvety black; lower part of the back and rump, lesser wing, and upper tail coverts violet, with a gloss like polished steel; belly black; thighs chestnut brown; quill black; tail black edged with violet.

VARIEGATA. Waved with blue, black, yellow, and white; beneath saffron coloured; crown red; hind head

blue. Gmel. *Certhia americana varia*, Briff. *Guit-guit variis*, Buff. *Variogated creeper*, Lath.

This species inhabits America. The length is five inches. Bill three quarters of an inch in length. The cheeks, and below the eyes are blue and white mixed; hind part of the neck, back, and rump undulated with blue, black, yellow, and white; scapulars, under-wing, and tail coverts, quills, and tail the same.

CAYANA. Glossy-green, beneath striated with white; tail feathers greenish, the lateral ones blackish within. Gmel. *Certhia viridis cayanaensis*, Briff. *Certhia corpore fusino viridi, gula lutea*, Ruff. Traut. *Guit-guit vert tacheté*, Buff. *Cayenne creeper*, Lath.

Length four inches. Bill three quarters of an inch and black; upper part of the head, neck, back, and rump, fine palish green; scapulars, upper wing and tail coverts the same; throat, and a small spot between the nostrils and eye rufous; cheeks white, each feather margined on both sides with green; under parts of the body green, with a mixture of blue; two middle tail-feathers wholly green, the rest blackish, edged with green; legs and claws grey. The female has the plumage more obscure, and is deltute both of the rufous spot between the nostril and eye, and that on the throat. Inhabits Cayenne.

CHALYBEA Glossy-green; breast red, with a steel blue collar. Gmel. &c. *Certhia torquata capitis bone spici*, Briff. *Soui-manga à collier*, Buff. *Grimpeau du cap de bonne esperance*, Buff. pl. enl. *Purple Indian creeper*, Edwards. *Collared creeper*, Lath.

Length four inches and a half. Bill near an inch long and black. The head, neck, throat, and upper parts of the body green gold, glossed with coppery; breast a beautiful red, neck green, and separated from the red by a steel-blue collar, changeable to green. The belly, sides, thighs, and under tail coverts grey, with a mixture of yellowish on the lower parts of the breast and sides; tail shining black; outer margin of the ten middle tail feathers green gold, and all tipped with grey; legs and claws black. The female differs in having yellow spots on the sides according to Briffon. Buffon thinks this may be a young bird of the Linnæan *Certhia fenegalensis*, and supposes further the Linnæan *Certhia capensis* may be the female. It is a native of the Cape of Good Hope.

SENEGALENSIS. Violaceous-black; crown of the head and chin green gold; breast scarlet. Gmel. Linn. &c. *Certhia fenegalensis violacea*, Briff. *Soui-manga violet à poitrine rouge*, Buff. *Senegal creeper*, Lath.

This species is five inches in length; bill nearly an inch and black; top of the head and throat green gold, glossed with coppery; rest of the body above and beneath violet; feathers on the neck and breast greenish, tipped with red; thighs violet brown; greater wing-coverts, quills, and tail brown; legs and claws blackish. A native of Senegal.

AFRA. Green; abdomen white; breast red; rump blue. Gmel. *Souï manga vert à gorge rouge*, Buff. *Red-breasted green creeper*, Edward. *African creeper*, Lath.

Length about four inches and a half; the bill an inch long, and dusky; head, neck, back, and wing-coverts shining green, glossed with burnished gold and copper; on the breast a bar of red; upper tail-coverts blue; greater wing-feathers and tail dark brown; belly, thighs, and under tail-coverts white; legs black. Inhabits the Cape of Good Hope.

There are two or three varieties of this species, one having the abdomen cinereous; a yellow tuft under the wing; and the tip of the tongue bifid; and another has the chin, throat, and breast blue-purple, with a pectoral red band. Latham

considers the C. melian *Trochilus varus* as a variety of this species.

SPERATA. Purple, beneath scarlet; head, chin, and rump purple. Linn. Gmel. *Certhia philippense purpurina*, Briff. *Soumanga noir a pourpre à poitrine rouge*, Buff. *Crimson on des Philippines*, Buff. Pl. N. L. *R. de la forêt creper*, Lath.

Length four inches; bill two-thirds of an inch long, and black, with the base whitish; tongue forked; head, throat, and fore part of the neck glossy-violet; hind part of the neck, back, and scapulars purple-lilac; lower part of the back, rump, and upper tail-coverts violet changeable to green and gold; lower part of the belly yellowish olive; tail black, with a steel-like gloss, edged exteriorly with violet, and glossed with greenish-gold; legs and claws brown. Female olive-green above, beneath olivaceous yellow. This species inhabits all the Philippine islands, and has a note like that of the nightingale.

Obs. There is a variety of this bird with a violet chin, *♂ C. gula violacea* of Gmelin. It is called by Soumerai *Crimson on troisième de l'isle de Lucien*, and by Buffon *Soumanga à gorge violette et poitrine rouge*.

SPIZA. Green; head and wings blackish. Gmel. *Atacilla spiza*, Linn. Sw. *Certhia americana viridis arvi. ap. li.*, Briff. *Guai-guait vert et bleu à tête noire*, Buff. *Black-headed creper*, Lath.

Size of a chaffinch; length five inches and a quarter; bill three quarters of an inch long and whitish; head and throat velvety black; hind part of the neck, back, rump, scapulars, upper wing, and tail-coverts, and quills fine green; fore part of the neck, breast, belly, sides, and under tail-coverts blue; tail deep green. This species inhabits America, and seems liable to vary considerably; the three following are described as distinct varieties of this species.

Certhia spiza 3, Gmel. Green, with the cap black. This is the *♀* of the first, and has the upper mandible blackish, the lower whitish, and both yellow at the base. In this the throat is not black as in the first, the black passing downwards just below the eye on each side, and as far as the nape behind; legs lead colour. Inhabits Surinam, Brasil, and Guiana. Bancroft calls this the *Green black cap flycatcher*.

♀ Green, with white chin, and crown of the head blue. *Guai-guait vert et bleu à gorge blanche*, Buff. *Blue-headed green flycatcher*, Edwards. Size of the last, but the tip of the head and all the wing-coverts, are blue; the throat white; plumage pale green; legs yellowish; and claws black. Inhabits the same countries as the last.

♂ Entirely green. *Guai-guait tout vert*, Buff. *Crimson on vert à Cayen*, Buff. Pl. N. L. *Bill, rump creper*, Edwards. This is not larger than the rest, with the bill longer, and rather more incurved; tail blackish, and somewhat paler at the base; plumage above green, beneath paler. Found in Cayen, and other parts of South America.

PERUANA. Entirely green. Gmel. *Certhia virginiana purpurea*, Buff. *Atacilla purpurea à la tête noire*, Buff. *Cyan purpur à la ce. grimpeur*, Buff. *Parrot creper*, Lath.

Inhabits Virginia. Length four inches and a half; bill one inch and a half long. This bird is said to sing well.

GUTTURALIS. Blackish; throat glossy-green; breast purple. Gmel. *Grimpeur à gorge verte*, Buff. *Cyan on à la ce. grimpeur*, Buff. H. B. des Ois. *Green-faced creper*, Lath.

Length five inches. Bill an inch long, and black; forehead and throat green; head, upper part of the neck, and rest of the body black; brown; feathers of the breast red at the tip; tail rufous; legs black. Inhabits Brasil.

PINUS. Yellow, above olive, wings blue, with two white bands. Gmel. *Parus arcticus*, Buff. *P. vier des sapins*, Buff. *Pac warbler*, Lath. *Pac creper*, Edward, Catby, &c.

CRENSATA. Bluish-lack; beneath white; crown, neck, back, and rump red. Gmel. *Certhia leucosticta*, Briff. *Soumanga rouge, noir et blanc*, Buff. *Black, white, and red In. an creper*, Edwards. *Red-spotted creper*, Lath.

This kind inhabits Iceland; the length is three inches and a quarter; bill short and black; quill and tail blackish-blue; legs black.

SANGUINEA. Deep-red; wings, and tail black; abdomen dusky; vent white. Gmel. *Crimson creper*, Lath. Length five inches, inhabits the Sandwich islands. The bill is dusky; secondary quill feathers edged with grey; tail-feathers pointed with white shafts; legs black.

VIRENS. Olivaceous-green; wing and tail feathers edged with yellow. Gmel. *Orange-green creper*, Lath.

A native of the Sandwich islands. Length five inches; bill slightly curved, and of a dusky colour, paler at the base; between the bill and eye dusky; quills and tail dusky-green; legs blackish. Lev. M. f. It is supposed by Gmelin and others that this may be the female of *Certhia fusca*.

RUBRA. Red; wings and tail black; vent white. Gmel. *Scarlet creper*, Lath.

Inhabits the islands of the South seas. Length scarcely four inches; the bill half an inch long, very little bent, and black. General colour of the plumage scarlet, except the wings and tail; lower part of the belly and vent white; legs and claws black. Lev. Mus.

FLAVOLA. Black, beneath pale yellow; eye-brows whitish; outer tail feathers tipped with white. Linn. Gmel. *Le grimpeur, ou surcier de la Jamaïque*, Buff. *Black and yellow creper*, Edwards, Lath.

This inhabits Jamaica. Size of a wren; bill black; head, throat, neck, back, scapulars, upper wing and tail-coverts fine black; from the base of the bill extends a white stripe passing over the eyes to the hind part of the head; breast upper part of the belly, sides, edges of the wings, and rump fine yellow; lower part of the belly, with the thighs, and under tail-coverts white; tail black, with all the feathers, except the two middle ones, with white tips; legs and claws blackish. The *yellow-bellied creper* of Edwards is supposed to be the female. Gmelin makes it a var. *♀*.

Several varieties of this bird are described by authors, one of which, the *Bahama tinnyed* of Catby, *Certhia bahamensis*, Briff is rather larger than the first described kind. General colour fulvous, pale yellow beneath, throat pale; lower part of the abdomen and vent brownish; eye-brows white. This inhabits the Bahama islands; and there is another *Certhia bahamensis*, Mus. Carl. of a leaden coloured brown above, beneath yellow; eye-brows yellowish-green; rump greenish; vent whitish; bill, legs, wings, and tail fulvous. Length five inches. These birds subsist entirely on the sweet juices of the fig-tree-cans, which they extract through the crevices of the itass.

CINNAMOMEA. Cinnamon colour; beneath all white. Gmel. *Cinnamon creper*, Lath. Length five inches; bill rather blunt and black; tail formed as in *Certhia f. minor*; legs dusky.

MACASSARIENSIS. Green; beneath blackish-brown. Gmel. *Deuxième mouet*, Buff. *Atacilla à la ce. mouet*, Buff. *Atacilla mouet*, Buff. Inhabits the islands of Banca and Morota in the East Indies.

INDICA. Blue; throat white. Gmel. *Polyantropus indicus*, Buff. *Atacilla caudata indicus*, Sw. *Indica creper*, Lath.

Length four inches and a half. Inhabits India. The bill and legs are black.

AMBINOENSIS. Cinereous; beneath green; head and collar yellow; breast red; wings black. Gmel. *Polystus amboinensis*. Bris. *Acis amboinensis, spoci vel lakopit*, Seba. *Amboina creper.* Lath. Length two inches and three quarters; bill yellowish. A native of Amboina.

MEXICANA. Red; throat green; quill-feathers bluish at the tip. Gmel. *Trochilus coccineus*. Linn. *Avicula mexicana f. Houtteulin*, Seba. *Red creper.* Lath.

The length of this bird is four inches and a half; bill nearly one inch and pale yellow; upper part of the head light shining red; throat and fore part of the neck green; tail deep red; legs and claws pale yellow. Supposed to inhabit New Spain. Seba mentions a variety of this bird with a black head, *avicula de tatar ex Nova Hispania*; *Grimpeau rouge à tête noire du mexique*.

CINEREA. Cinereous; rump and wing-coverts green; wings fuscous, abdomen yell with; vent white; tail black. Gmel. *Cinereous creper.* Lath. Inhabits the Cape of Good Hope. Length nine inches.

NOVÆ HOLLANDIÆ. Black; beneath streaked with white; eye-brows and spot near the ears white; quills and tail-feathers edged with yellow. Lath. Ind. Orn. A native of New Holland.

Size of the nightingale. Bill dusky pale at the tip; nostrils covered with a membrane; tail rounded, with the two outer tail-feathers tipped within with white; legs pale. White's *Hill.* New Holland.

INCANA. Somewhat fuscous; neck and wings hoary. Inhabits New Caledonia and is of a small size. Anderson.

PEREGRINA. Olive, beneath yellow; wings with a pale bluish band; tail somewhat furcated; two exterior tail feathers tipped within with white. Lath. Ind. Orn. Obf. This is of the middle size, and has the bill, wings, and tail dusky. *Lev. Mus.*

VERTICALIS. Olivaceous green; beneath ash coloured; crown green; wings and tail fuscous. Lath. Ind. Orn. *Ash bellied creper.* Gen. Syn. Inhabits Africa.

CANTILLANS. Bluish grey; spot on the back, and under parts of the body yellow. Lath. Ind. Ord. *Orange backed creper.* Gen. Syn. A native of China.

ERYTHROGNCHOS. Olive; body beneath white; wings and tail blackish; bill red. Lath. Ind. Orn. *Red billed creper.* Gen. Syn. Inhabits India.

GRISEA. Greyish; beneath reddish; tail emeated; two middle feathers brown, lateral ones grey; and all barred with black at the tip. Lath. Ind. Orn. Inhabits China. The bill and legs are yellow.

PRASINOPTERA. Black; fore part of the neck purple; wings and tail yellowish green. *Mus. Carl. &c.*

VENUSTA. Gold-green; fore-head, chin, broad pectoral band, and rump violet; wings brown; belly yellow. Shaw. Nat. Misc. Inhabits Sierra Leona.

TABACINA. Two middle tail feathers very long; head, neck, and upper part of the body snuff-coloured, beneath green; tail blackish green. Lath. Ind. Orn. Length eight inches and a half.

CERTIFICANDO DE recognitione staple, in *Lacw.* is a writ commanding the mayor of the staple to certify to the lord chancellor a Statute staple taken before him, where the party himself detains it, and refuseth to bring in the same. *Reg. Orig.* 152. There is the like writ to certify a Statute merchant; and in divers other cases. *Ib.* 143. 151, &c.

CERTIFICATE, a testimony given in writing, to assure

and notify the truth of any thing to a court of justice, or the like. See **TESTIMONIAL.**

A certificate is sometimes made by an officer of the court, where matters are referred to him, or a rule of court is obtained; containing the effect and tenor of what is done. The clerks of the crown, assize, peace, are to make certificates into B. R. of the tenor of indictments, convictions, &c. under penalties by stat. 34 & 35 Hen. VIII. c. 14. 3 W. & M. c. 9.

CERTIFICATE of Assize, in *Lacw.* See **ASSISE** and **CERTIFICATION of Assize.** &c.

CERTIFICATE for costs, relates to the case of the plaintiff, who, in an action of trespass, is allowed no more costs than damages, when the jury give less damages than 40s. unless the judge certify under his hand that the freehold or title of the land came chiefly in question. To this rule there are two exceptions: the one is grounded on stat. 8 & 9 W. III. c. 11. whereby the plaintiff obtains full costs, if the judge certify that the trespass was wilful and malicious. The other exception is by stat. 4 & 5 W. & M. c. 23. which gives full costs against any inferior tradesman, apprentice, or other dissolute person, who is convicted of a trespass in hawking, hunting, fishing, or fowling upon another's land. *Blackit. Com. vol. iii. p. 214.*

Upon this statute it has been adjudged, that if a person be an inferior tradesman, as a clothier for instance, it matters not what qualification he may have in point of estate; but, if he be guilty of such trespass, he shall be liable to pay full costs. *Ld. Raym.* 149.

CERTIFICATE into Chancery. If a question of mere law arises in the course of a cause in Chancery, as whether by the words of a will, an estate for life, or in tail, is created, or whether a future interest, devised by a testator, shall operate as a remainder or an executory devise, it is the practice of this court to refer it to the opinion of the judges of King's Bench or Common Pleas, upon a case stated for that purpose; wherein all the material facts are admitted, and the point of law is submitted to their decision, who thereupon hear it solemnly argued by counsel on both sides, and certify their opinion to the chancellor. And upon such certificate the decree is usually founded. *Blackit. Com. vol. iii. p. 453.* See **CASE stated,** &c.

CERTIFICATE of Bankrupt. See **BANKRUPT.**

CERTIFICATE of the Poor, is an acknowledgment from the parish to which they belong of their being parishioners: which prevents their removal till they become actually chargeable. Such certificated persons can obtain a settlement only by renting a tenement of 10l. per annum, or by serving an annual office in the parish in consequence of a legal appointment; but no apprentice or servant of such persons can gain a settlement by such their service. 8 and 9 W. III. 12 *Ann. stat. 1. cap. 18.*

There is, says Dr. Burn, somewhat of hardship in this matter of certificates, by putting it in the power of a parish officer to imprison a man, as it were, for life; however inconvenient it may be for him to continue at that place where he has had the misfortune to acquire what is called a settlement, or whatever advantage he may propose to himself by living elsewhere. Although a certificate carries with it no testimonial of good behaviour, and certifies nothing but that the person belongs to the parish to which he really does belong; it is altogether discretionary in the parish-officers either to grant or refuse it. A mandamus was once moved for, says Dr. Burn, to compel the church-wardens and overseers to sign a certificate; but the court of King's Bench rejected the motion as a very strange attempt. See **POOR.**

CERTIFI-

CERTIFICATE, trial by, is a mode of trial allowed in such cases, where the evidence of the person certifying is the only proper criterion of the point in dispute.

Thus, 1. If the issue be whether A was absent with the king in his army out of the realm in time of war, this shall be tried by the certificate of the marshal of the king's host in writing under his seal, which shall be sent to the justices. Litt. § 102.

2. If, in order to avoid an outlawry, or the like, it was alleged that the defendant was in prison, *ultra mare*, at Bourdeaux, or in the service of the mayor of Bourdeaux, this should have been tried by the certificate of the mayor; and the like of the captain of Calais. But when this was law (2 Roll. Abr. 583.), those towns were under the dominion of the crown of England. And therefore, by a parity of reason, it should now hold that in similar cases, arising at Jamaica or other places belonging to the crown of England, the trial should be by certificate from the governor respectively.

3. For matters within the realm; the customs of the city of London shall be tried by the certificate of the mayor and aldermen, certified by the mouth of their recorder; upon a surmise from the party alleging it, that the custom ought to be thus tried; or else it must be tried by the country. As the custom of distributing the effects of freemen deceased; of enrolling apprentices; or that he who is free of one trade may use another; if any of these points or others similar to them, come in issue. This rule, however, admits of an exception, where the corporation of London is party, or interested, in the suit; as in an action brought for a penalty inflicted by the custom; which shall be determined by a jury, and not by the mayor and aldermen, certifying by the mouth of their recorder. Co. Litt. 74. 4 Burr. 248. Bro. Abr. t. trial, pl. 96. Hob. 85. But see 1 Term Rep. 423. If the recorder shall have once certified a custom, the court is in future bound to take notice of it. Doug. 380.

4. In some cases, the sheriff of London's certificate shall be the final trial; as if the issue be, whether the defendant be a citizen of London or a foreigner, in case of privilege pleaded to be sued only in the city courts. Co. Litt. 74. Of a nature somewhat similar to this is the trial of the privilege of either university, when the chancellor claims cognizance of the cause, because one of the parties is a privileged person; in which case, the charters, confirmed by act of parliament, direct the trial of the question, with regard to privilege, to be determined by the certificate and notification of the chancellor under seal; to which it has been usual to add an affidavit of the fact; but if the parties be at issue between themselves, whether A is a member of the university or not, on a plea of privilege, the trial shall be by jury, and not by the chancellor's certificate. 2 Roll. Abr. 583.

5. In matters of ecclesiastical jurisdiction, as marriage, general bastardy, excommunication, and orders, these and other like matters, shall be tried by the bishop's certificate. As if it be pleaded in abatement, that the plaintiff is excommunicated, and issue is joined thereon; or if a man claims an estate by descent, and the tenant alleges the demandant to be a bastard; or if in a writ of dower the heir pleads no marriage; or if the issue in *quare impedit* be, whether or not the church be full by institution;—all these, being matters of mere ecclesiastical cognizance, shall be tried by certificate from the ordinary. But in an action on the case for calling a man a bastard, the defendant having pleaded in justification that the plaintiff was really so, this was directed to be tried by a jury; because, whether the

plaintiff be found either a general or special bastard (see *BASTARD*) the justification will be good; and no question of special bastardy shall be tried by the bishop's certificate, but by a jury. Co. Litt. 74. 2 Lev. 250. Hob. 179. Dyer. 79. Ability of a clerk presented, admission, institution, and deprivation of a clerk, shall also be tried by certificate from the ordinary or metropolitan; because of these he is the most competent judge; but induction shall be tried by a jury, because it is a matter of public notoriety, and is likewise the corporal institution of the temporal profits. Resignation of a benefice may be tried either way; but it seems most properly to fall within the bishop's cognizance. 2 Inst. 652. Shaw P. C. 88. 2 Roll. abr. 583, &c. Dyer, 229.

6. The trial of all customs and practice of the courts shall be by certificate from the proper officers of those courts respectively; and what return was made, on a writ by the sheriff or under-sheriff, shall be only tried by his own certificate. BlackR. Com. vol. iii. p. 333, &c.

CERTIFICATE, in the Royal Navy, a certain written instrument, signed by the proper officer or officers, to substantiate, at any time, the validity of any civil transaction on board a ship of war, without having recourse to personal evidence which in all cases would be troublesome, and in many impracticable. The captain gives certificates to the several officers under his command, stating the time they have served on board his ship, or under him, and their behaviour during that period; other certificates are signed by the captain and master captain, master and boatswain, doctor and the purser, &c.

CERTIFICATION of assise of novel disseisin, in Law, anciently a writ granted for re-examining a matter passed by assise before justices. It was used where a person appeared by his bailiff to an assise, brought by another, and has lost the cause; but having something more to plead for himself, not stated by his bailiff, he obtained a writ to the sheriff to call both the party from whom the assise passed, and the jury that was impanelled on the same, before the said justices at a certain day and place, to be re-examined. It was called a *certificate*, because mention is made in it to the sheriff, that upon the party's complaint of defective examination, as to the assise passed, the king hath directed his letters patent to the justices for the better certifying of themselves, whether all points of the said assise were duly examined. Reg. orig. 8vo. F. N. B. 181. Bracton, lib. iv. c. 13. Horn's Mir. lib. iii. This writ is now wholly superseded by the remedy afforded by means of new trials. See *ASSISE*.

CERTIFICATS MILITAIRES, military certificates. These are of various kinds according to the several objects or purposes they relate to, and the different descriptions of persons empowered to grant them, in order to verify or give undeniable proofs of facts, whether they be governors, commanding officers, commissaries of war, officers of detail, staff officers, paymasters, officers of cities, or communities, &c. They are chiefly reducible, however, to the following heads, viz.

A certificate from a field-officer to the commander in chief affirming the eligibility of a young man to a commission in his majesty's service.

The certificate of an officer upon honour, that he does not exceed the regulation in the purchase of his commission.

The certificate of a general officer to affirm and prove the losses, which officers under him may have sustained in the field.

The certificates of colonels of regiments to the board for the admission of proper objects to the hospital at Chelsea.

Certificates from magistrates to identify the persons of recruits, and to affirm that they have enlisted themselves voluntarily into the service, and that the articles of war have been read to them.

Certificates from regimental surgeons, whether men when they join are fit and proper objects to be enlisted.

Certificates from ditto of men's being fit objects to be discharged.

Certificates of commanding officers for stores, &c.

Certificates to enable officers on half-pay to receive it.

Certificates of surgeons and assistant-surgeons to prove that they have passed proper examinations.

CERTIMA, in *Ancient Geography*, a very strong town of Spain, in Celtiberia, which was taken by Gracchus.

CERTIORARI, or CERTIORARI FACTAS, in *Law*, an original writ issuing out of the court of chancery or K. B. directed in the king's name to the judges or officers of inferior courts commanding them to certify, or to return the records of a cause there depending, to the end that the party complaining may have the more sure and speedy justice before the king, or justices assigned by him for determining the cause. *Fitz. N. B. fol. 242.* This writ is either returnable in the king's bench, and then hath these words, *nobis mittitis*, "send to us;" or in the common bench, and then hath *justiciariis nostris de banco*, "to our justices of the bench;" or in the chancery, and then it has in *cancellaria nostra*, "in our chancery, &c." or into the court of parliament, or into that of the lord high steward of Great Britain, in case of indictments against a peer.

A writ of certiorari may be had at any time after indictment found and before trial, to certify and remove indictments, with all the proceedings on them, from any inferior court of criminal jurisdiction into the court of King's bench, the sovereign ordinary court of justice in causes criminal. And this is frequently done for one of these four purposes; and, either, 1. To consider and determine the validity of appeals or indictments, and the proceedings thereon; and to quash or confirm them as there is cause; or, 2. In order to have the prisoner or defendant tried at the bar of the court of King's bench, or before the justices of *Nisi Prius*, where it is furnished that a partial or insufficient trial will probably be had in the court below; or, 3. In order to plead the king's pardon in the court of K. B.; or, 4. To issue process of outlawry against the offender, in those counties or places where the process of the inferior judges will not reach him. 2 *Hal. P. C. 210.* It is at this stage of the prosecution, that indictments found by the grand jury against a peer must in consequence of a writ of certiorari be certified and transmitted into the court of parliament, or into that of the lord high steward of Great Britain; and that in pieces of exclusive jurisdiction, as the two universities, indictments must be delivered (upon challenge and claim of cognizance), to the courts therein established by charter, and confirmed by act of parliament, to be there respectively tried and determined.

A certiorari may be granted at the instance of either the prosecutor or the defendant; the former as a matter of right, the latter as a matter of discretion: and therefore it is seldom granted to remove indictments from the justices of gaol-delivery, or after issue joined on confession of the fact in any of the courts below. On indictments of perjury, forgery, or for heinous misdemeanors, the court will not generally grant a certiorari to remove at the instance of the defendant. But in particular cases, the court will use their discretion to grant a certiorari; as, if the defendant be of good character, or the prosecution be malicious or attended with oppressive circumstances. 2 *Hawk. P. C. c. 27.* 4 *Burr. 749.* Lord Raym.

Vol. VII.

1452. A certiorari lies in all judicial proceedings, in which a writ of error does not lie; and it is a consequence of all inferior jurisdictions, erected by act of parliament, to have their proceedings returnable in K. B. Lord Kaym. 469, 580. A certiorari lies to justices of the peace and others, even in such cases, which they are empowered by statute finally to hear and determine; and the superintendency of the court of K. B. is not taken away without express words. 2 *Hawk. P. C. c. 27.* But a certiorari does not lie to remove any other than judicial acts. *Cald. i. 309. Say. 6.* Where issue is joined in the court below, it is a good objection against granting a certiorari; and if a person does not make use of this writ till the jury are sworn, he loses the benefit of it. *Mod. Ca. 16. stat. 43. Eliz. c. 5.* After conviction, a certiorari may not be had to remove an indictment, &c. unless there be special cause; as if the judge below is doubtful what judgment is proper to be given, when it may. *Stra. 1227. Burr. 749;* and after conviction, &c. it lies in such cases where writ of error will not lie. 1 *Salk. 149.* The court on motion in an extraordinary case will grant a certiorari to remove a judgment given in an inferior court; but this is done where the ordinary way of taking out execution is hindered in the inferior court. 1 *Lill. abr. 253.* In common cases a certiorari will not lie to remove a cause out of an inferior court, after verdict. It is never sued out after a writ of error, but where diminution is alleged; and when the thing in demand does not exceed 5*l.* a certiorari shall not be had, but a writ of error or attain. *Stat. 21. Jac. 1. c. 23. stat. 12. Geo. 1. c. 29.* A certiorari is to be granted in matter of law only; and in many cases there must be a judge's hand for it. 1 *Lill. 252.* Certiorari to remove indictments, &c. are to be signed by a judge; and to remove orders, the fiat for making out the writ must be signed by some judge. 1 *Salk. 150.* Certiorari lies to the courts of Wales, and the Cinque-ports, counties palatine, &c. 2 *Hawk. P. C. c. 27.* But without laying a special ground before the court, it cannot be sued out to remove proceedings in an action from the courts of the counties palatine. *Doug. 749.* It does not lie to judges of oyer and terminer to remove a recognizance of appearance. *Lucas. 278.* Nor to remove a poor's rate. *Stra. 922, 975. Leach's Hawk. P. C. ii. c. 27.*

Things may not be removed from before justices of peace, which cannot be proceeded in by the court where removed, as in case of refusing to take the oath, &c. which is to be certified and inquired into, according to the statute. 1 *Salk. 145.* Where the court which awards the certiorari cannot hold plea on the record, there merely a tior of the record shall be certified; for otherwise, if the record was removed into B. R. as it cannot be sent back, there would be a failure of right afterwards. But a record sent by certiorari into B. R. may be sent after by *mittimus* into C. B. 1 *Danv. abr. 792, 789.* And a record into B. R. may be certified into chancery, and from thence be sent by *mittimus* into an inferior court, where an action of debt is brought in an inferior court, and the defendant pleads that the plaintiff hath recovered in B. R. and the plaintiff replies, "Nul tid record, &c." 1 *Saund. 97, 99.*

There are several statutes which restrain, and many which absolutely prohibit a certiorari; in order to avoid frivolous and unfounded delays in justice. Among these we may specify the following. By 1 *Ann. c. 18.* concerning the repair of bridges, no certiorari shall be allowed. Nor by 8 *Geo. II. c. 20.* for punishing destroyers of tunpicks, nor by 12 *Geo. II. c. 29.* for assising county-rates, nor on 10 *Geo. II. c. 21.* against cursing and swearing. Nor on 23

Geo.

be fixed at $\frac{100}{100}$, it will come to half from the 70th hand; if at $\frac{100}{80}$, from the 60th hand.

For concurring evidences, if two reporters have each $\frac{1}{2}$ of certainty, they will both give an assurance of $\frac{3}{4}$, or of $\frac{3}{4}$ to 1; if three, of $\frac{7}{8}$: and the co-attestation of ten would give $\frac{1023}{1024}$, of certainty. He shews, farther, that if there be six particulars in a narrative, all equally remarkable; and that he to whom the report is given has $\frac{1}{2}$ of certitude for the whole; there is 35 to 1 against the failure in any one certain particular.

He proceeds to compute the certainty of tradition, both oral and written, in whole and part; successively translated, and also co-attested by several successors of transmitters.

The learned Kuittel has availed himself of this hint in his commentary on a fragment of Ulpianus, p. 169—197, where he has examined by mathematical rules the evidence for and against the readings of the Greek Testament, and applied for that purpose even algebraical series. See also an ingenious argument, deduced from the doctrine of chances, and applied to enforce the practice of virtue, in the conclusion to Dr. Price's Review of the principal Questions in Morals.

CERT-MONEY, *Head-money*, a common fine, paid yearly, by the tenants of several manors to the lords thereof; and sometimes to the hundred, *pro certo leto*, for the certain keeping of the leet.—This, in ancient records, is called *certum leto*.

CERTONIUM, in *Ancient Geography*, a town of Asia Minor, between Adramyttium and the river Caicus, according to Xenophon.

CERUANA, in *Botany*, Juss. p. 490. Forsk. Class and Order, *syngenesia, polygamia superflua*. Nat. Ord. *Corymbifera*; Juss.

Gen. Ch. *Florlets* of the ray strap-shaped, linear, three-toothed. *Calyx* many-leaved, equal, converging, cylindrical. *Seeds* wedge-shaped, compressed, crowned with small teeth which terminate in a bristle.

Herb diffuse. *Flowers* some sessile, axillary; others peduncled, terminal; bracts three. Character from Forskål.

CERVANTES DE SAAVEDRA, MIGUEL, in *Biography*, universally recognised as the author of DON QUIXOTE, was born probably of an honourable family, as some say in the province of Andalusia in Spain, or according to others at Madrid, in the year 1549. He seems to have had every advantage of education, and to have been a master in polite learning. But in other respects fortune was not very indulgent to him. He served many years in the army of Mark Antony Colonna in no higher station than that of a private soldier. In that capacity he fought at the battle of Lepanto, under Don John of Austria, in 1571, where he had the misfortune, or, as he rather thought it, the honour to lose his left hand. In this expedition, or in his service as chamberlain to cardinal Aquaviva at Rome, he amassed a certain portion of wealth; for in his captivity at Algiers, during 5½ years, which commenced in 1574, when he was taken by a Barbary corsair, he was then well furnished with money, which he liberally distributed among his fellow-captives. The high price of his ransom and his subsequent free manner of living exhausted his store and reduced him to the distress of penury. However, his reputation for poetical talents had been already established in his own country; and it derived such accessions by the publication, in 1584, of his "Galatea," a poem in six books dedicated to Alcanio Colonna. About the same time he wrote many dramatic pieces, which were acted with applause on the Spanish theatre, and which acquired him both money and fame. But though his supplies were considerable, his want of eco-

nomy and unbounded generosity dissipated them as they occurred; and he had also married a wife, which involved him in additional expence. Accordingly, he was actually confined in prison for debt, when he composed the first part of "The History of Don Quixote;"—a work which every body admires for its humour; but which ought also to be considered as a most useful performance, that brought about a great revolution in the manners and literature of Europe, by banishing the wild dreams of chivalry, and reviving a taste for the simplicity of nature. In this view, the publication of DON QUIXOTE forms an important era in the history of mankind. DON QUIXOTE is represented as a man, whom it is impossible not to esteem for his cultivated understanding, and the goodness of his heart; but who, by poring night and day upon old romances, had impaired his reason to such a degree, as to mistake them for history, and form the design of traversing the world, in the character, and with the accoutrements, of a knight-errant. His disordered fancy takes the most common occurrences for adventures similar to those he had read in his books of chivalry. And thus, the extravagance of these books being placed, as it were, in the same group with the appearances of nature and the real business of life, the hideous disproportion of the former becomes so glaring by the contrast, that the most inattentive reader cannot fail to be struck with it. The person, the pretensions, and the exploits, of the errant-knight, are held up to view in a thousand ridiculous attitudes. In a word, the humour and satire are irresistible; and their effects were instantaneous. This work no sooner appeared than chivalry vanished. Mankind awoke as from a dream. They laughed at themselves for having been so long imposed on by absurdity; and wondered they had not made the discovery sooner. They were astonished to find, that nature and good sense could yield a more exquisite entertainment than they had ever derived from the most sublime phrenzies of chivalry. This, however, was the case; and that DON QUIXOTE was more read, and more relished, than any other romance had ever been, we may infer from the sudden and powerful effects it produced on the sentiments of mankind, as well as from the declaration of the author himself; who tells us, that upwards of 12,000 copies of the first part (printed at Madrid in 1605) were circulated before the second could be ready for the press; an amazing rapidity of sale, at a time when the readers and purchasers of books were but an inconsiderable number compared to what they are in our days. "The very children (says he) handle it, boys read it, men understand, and old people applaud the performance. It is no sooner laid down by one than another takes it up; some straggling, and some intreating, for a sight of it. In fine (continues he) this history is the most delightful, and the least prejudicial entertainment, that ever was seen; for, in the whole book, there is not the least shadow of a dishonourable word, nor one thought unworthy of a good catholic." DON QUIXOTE occasioned the death of the old romance, and gave birth to the new. Fiction from this time divested herself her gigantic size, tremendous aspect, and frantic demeanour; and, descending to the level of common life, conversed with man as his equal, and as a polite and cheerful companion. Not that every subsequent romance-writer adopted the plan, or the manner of Cervantes; but it was from him they learned to avoid extravagance and to imitate nature. And now probability was as much studied, as it had been formerly neglected. The publication of the first part of this work appears to have been the means of liberating the author from prison and obtaining for him from the great a considerable degree of patronage. Nevertheless, the court and kingdom of Spain have by no act of solid bounty exonerated them-

elves from the disgrace of suffering their greatest genius to sink under the depression of habitual indigence. In 1613, he published his "Novels," which are agreeable specimens of that kind of writing, and became popular; they display his inventive and descriptive talents in serious story, as his *Don Quixote* had done in burlesque. While he was preparing for the press a second part of his *Don Quixote*, he was anticipated by an Arragonian writer of mean genius, under the name of Alonso Fernandez de Avellaneda; who not only debased the original by a very insipid and absurd application of its plan and characters, but loaded the author with much personal abuse. Cervantes, however, published, in 1615, a true second part, which contained the character of the first, and which was received with avidity by all who had been interested in the genuine *Don Quixote*. About this time he also published a poem entitled "A Voyage to Parnassus," which was an ironical satire upon the Spanish poetry of his time, and upon the bad taste of patrons. The effect of this publication was to increase the number of his enemies, without acquiring for him any substantial favours from the great. At this period his indigence was such, that he was obliged to sell eight plays and as many interludes to a bookseller, for want of means to print them on his own account. Being on bad terms with the actors, they prevented his producing them on the stage; and the rising reputation of Lope de la Vega had also eclipsed that of Cervantes as a dramatic writer. His last performance was a novel, entitled "The Troubles of Petisile and Sigismunda," which he did not live to print. In this work he relates an adventure which occurred to him in a journey on horseback to Toledo, when a scholar, being informed who he was, leaps in rapture from his ass, and after paying him high compliments, recommends to him a regimen for the dropsy under which he laboured. Cervantes, however, made an apology for not complying with his advice. "My life," says he, "is drawing to a period, and by the daily journal of my purse, which I find will have finished its course by next Sunday at farthest, I shall also have finished my career: so that you are come in the very nick of time to be acquainted with me." An affectionate dedication of this work to his best patron, the count de Lemos, is dated April 19, 1617; and as he mentions in it that he had already received extreme sanction, it is probable that a day or two more finished the scene. In the September following a licence was granted to the widow of Cervantes to print this novel for her own benefit; and it is probable that this was the only property which this literary glory of his country had to leave. Life of Cervantes, prefixed to Smollet's Translation of *Don Quixote*. Beattie's Dissertations, Moral and Critical.

CERVANTESIA, in *Botany*, Bosc. Nouv. Dict. Flor. Peruv. pl. 7.

Class and order. *pentandria monogynia*.

Gen. Ch. *Cal.* perianth bell-shaped, five-cleft. *Cor.* none. Five scales inserted into the middle of the calyx. *Pist.* germ superior; stigma sessile. *Peric.* nut egg-shaped, one celled, surrounded by the calyx, which has increased in size and become fleshy. A shrub; native of Peru. Cavanilles, pl. 475, has figured another species with alternate, petioled, oblong leaves, covered with rust-coloured hairs and small white flower, in terminal and axillary panicles.

CERVARIA, in *Ancient Geography*, a promontory at the extremity of Gallia Narbonensis, on the coast of Spain. Its present name is *Cervera*.

CERVARIA, in *Botany*, Rib. Pent. Gart. i. 105, tab. 21. fig. 10. See *ATHAMANTA cervaria*.

CERVARIA *valerianoides*, Bault. Pin. See *TRACHELIUM caruleum*.

CERVARO, in *Geography*, a town of Naples, in the province of Principato Citra; 9 miles E.N.E. of Pollicastro.

CERVELIERE, in *Military Language*, a sort of casque, helmet, or defensive armour for the head.

CERVELLE, a French word, literally signifying brains. The French make use of the phrase, *mine sans cervelle*, which the miner works in earth so loose and devoid of cohesion, that it will neither stand nor support itself at the sides, nor at the top of the gallery, and he is under the necessity of having recourse to contrivances to obviate this defect.

CERVERA, in *Geography*, a river of Spain, which runs into the Segre, a little above Icarda, in Catalonia.—Also, a city of Spain, and capital of a viceroy, to which it gives name, in the province of Catalonia. It is situated in a most delightful vale, which is extremely fertile, and surrounded by hills, on one side of chalk, on the other of lime stone. This part of the country, between the Noya, which runs into the Lobregat, and the Segre, which joins the Ebro, is the highest land in this part of Catalonia. The university in this city was founded by Philip V. A. D. 1717, and has commonly about 920 under-graduates, chiefly designed for employments in the church and at the bar, with some few for medicine. Cervera is about seven leagues N.W. of Tarragona.—Also, a town of Spain in the province of Catalonia, situated on the coast of the Mediterranean, between Roses and Collioure.—Also, a town of Spain, in New Castile; 6 leagues from Cuenca.—Also, a cape of Spain, on the coast of Catalonia; and another on the coast of Valencia.

CERVETTO, the elder, in *Biography*, an Italian performer on the violoncello, of great merit, who arrived in England in 1738; and was remarkable from several circumstances besides his professional abilities. He was an honest Hebrew, had the largest nose, and wore the finest diamond ring on the fore finger of his low hand; had a son (who is still living) who, during childhood, surpassed his father in tone and expression on the violoncello; and who, in riper years, was as much noticed at the opera for his manner of accompanying recitative, as the vocal performers of the principal characters for singing the airs. The rivalry between the admirable Cressid and the younger Cervetto, in their youth, did them as much good in their struggles for excellence, as in riper years their friendship has done honour to their hearts. Another remarkable circumstance in the history of the elder Cervetto, so long and so well known at Drury-lane play-house, is, that he extended his existence to 100 years complete, with the character, not only of a good musician, but a good man.

CERVI, in *Geography*, a small island of the Grecian Archipelago, near the coast of the Morea, on the east side of the entrance into the gulf of Kolokitta; 6 miles N. of Cerigo.

CERVI cornu. See *HART'S HORN*.

CERVIA, in *Geography*, a modern built town in the state of the church, and province of Romagna, near the Adriatic sea, about half-way betwixt Castiglione and Savio, which, at the beginning of the last century, entirely changed its situation, on account of the insalubrity of the air, having formerly stood a quarter of a mile distant from the sea. The new city is built with beautiful broad streets, which, for the greatest part, are under covering. By an inscription over one of the gates it appears, that popes Innocent XII. and Clement XI. removed the city of Cervia for the benefit of a more salubrious air in the year 1703. Without this gate, situate on the side of the city opposite to Savio or Ravenna,

is a beautiful and broad canal, through which, in June, July, and August, (when the season is hottest and driest), the water is let out into a low piece of ground covered with rushes and weeds, about half a mile in length, and in some places as broad. Here the heat of the sun totally exhales the water, and the salt remains at the bottom and sides, to the great profit of the court of Rome. The papal provinces Urbino, Ferrara, Ancona, Bologna, and Romagna, that lie near the Apennine mountains, derive from these salt-works the greater part of the salt they use. Cervia is the see of a bishop, suffragan of Ravenna, from which it is distant S.S.E. 15 miles, and 144 N. of Rome.

CERVICAL arteries, in *Anatomy*, some arteries which are distributed about the neck. See **ARTERIES**.

CERVICAL nerves, those which come off from the medulla spinalis, where it is lodged in the vertebrae of the neck. See **NERVES**.

CERVICALIS, or **CERVICIS DESCENDENS**, is a slender muscle at the root of the neck, closely connected to the upper part of the sacrolumbaris. It arises from the three or four upper ribs, near their tubercles, and is inserted into the same number of transverse processes of the lower cervical vertebrae. It extends the neck, and at the same time twells it to one side. This muscle is the *transversalis gracilis* of Winslow.

CERVICAPRA, in *Zoology*. See **ANTILOPE pygarga**, the white-faced antelope.

CERVICARIA, in *Botany*, a term used by some authors to express the *staphia* of the shops, or lesser *libanotis* of Theophrastus.

CERVICARIA, is also a name given by some to the *tracheolum*.

CERVICIS transversus, in *Anatomy*, a small muscle at the back of the neck, connected to the upper end of the longissimi dorsi, and lying close to the cervicalis descendens. It arises from the transverse processes of the four or five upper dorsal vertebrae, and is inserted into as many of those of the neck. It is generally connected with the cervicalis descendens and tracheo-mastoideus. Winslow calls it *transversalis colli major*. It carries the neck backwards, and at the same time twells it towards its own side.

CERVIÈRES, in *Geography*, a town of France, in the department of the Rhone and Loire; 6 leagues S.W. of Roanne.

CERVINARA, a town of Naples, in the province of Principato Ultra; 12 miles S.W. of Benevento.

CERVINE Antelope of Pennant, *antelope bubalis*, in *Zoology*, *βουβάλος*; of Oppian and Aristotle, *bubalus* of Pliny, Gesner, Aldrov. and Jonsk. yachmur of the Bible, *bucphalus* of Cuj. op. Gesn. quad. and Ray, *capra dorcas* of Houttuyn, *antelope butilaphus* of Pallas, *bubale* of Buffon, *vache de barbare* of Act. Paris. and Valent, is a species of antelope, whose horns are thick, twisted spirally, annulated, bent in form of a lyre, almost straight, and upright at their ends; the head and tail are somewhat lengthened. Pall. Sp. Zool. Erxleb. lib. Mam. This animal inhabits Africa, especially Barbary, and is also found near the Cape of Good Hope, and in Arabia. It is about four feet high, having an appearance between the general form of the deer and ox tribes, with its head resembling that of an ox; the horns are about 20 inches long, very strong and black, almost close at their bases, and distant at the points; the general colour is a reddish brown, the belly, inner side of the thighs, and a space about the rump are white, with a dark-coloured bed on the ridge of the back, the upper part of the fore-legs, and hinder parts of the thighs; the tail is about a foot long, is terminated by a tuft of longish hairs, and resembles that of an

ass. It feeds solitarily, gallops heavily, and yet very swiftly, and fights on its knees: its flesh is reckoned rather dry. This species, according to Mr. Pennant, is the animal called "Hart-beest," at the Cape; and Sparman describes it under the same name in the Stockholm Transactions; though the figure of the Hart-beest, in his journey to the Cape, differs very considerably in the form of the horns, which bend much backward, at their ends, from which it is more probably the species called *Antelope Koba*.

CERVINI, in *Ancient Geography*, a people placed by Ptolemy on the western coast of the island of Corfica.

CERVIONE, in *Geography*, a town of the island of Corfica, or French department of Golo; 20 miles E. of Corté.

CERVISPINA, in *Botany*, Cord. Hist. See **RHAMNUS catharticus**.

CERVIX, in *Anatomy*, is a Latin term denoting that part of the body which we call the neck. The adjective derived from this term is applied to several parts about the neck; as cervical arteries, cervical nerves, &c.

The word cervix is also used in the anatomical description of various parts of the body, where it indicates some contraction or diminution in size; as cervix of the femur, of the humerus, of the bladder, of the uterus, &c.: for which we refer to the individual articles.

CERUMEN, a thick, viscid, bitter, excrementitious humour, separated from the blood by proper glands placed in the *meatus auditorius*, or outer passage of the ear.

This is also called *cerumen aurium*; in English, *EAR-WAX*. See an account of experiments on *cerumen*, to discover the best method of dissolving it; with the cause of deafness. Lond. Medic. Observ. &c. vol. iv. p. 103.

It is by some ranked in the class of medicines; especially that species of it obtained from the human ears, and which is used both internally and externally.

CERVOCAMELUS, in *Zoology*. See **CAMELUS glama**.

CERVON, in *Geography*, a town of France, in the department of the Nièvre, and district of Clamecy; 3 miles E. of Corbigny.

CERUSE, **CERUSSE**, or **WHITE LEAD**. The mode of manufacturing this article was long made a particular secret, and it still continues so with some manufacturers: the following account is obtained from a visit to the works of a respectable house in that line.

The first operation in making ceruse is melting the blue or metallic lead, (the softer quality is the better for this work) into a case or mould which shall form each sheet nearly two feet long, about five inches broad, and about the sixteenth of an inch thick, that it may with convenience roll spirally up so as to leave the space of half an inch or an inch between each coil, and thus be placed vertically in earthen pots in shape like garden pots, and capable of containing from 1½ pint to six pints each; these pots are made with one projection or more rising within on the middle, so as to prevent the lead rolling on the bottom; on these the coil is placed perpendicularly, and upon its top edge, another piece near one foot across is laid horizontally: about half, or a whole pint, wine measure, according to the size of the pots, of strong vinegar, or other acid liquor, is poured into each pot, but care ought to be taken that it does not quite touch the lower edge of the leaden spiral; the principle acted on here being to expose as much surface as possible to the action of the acid vapour: each pot ought to hold about 2½ pounds avoirdupois weight, and having also a cover of the same metal placed tight upon its mouth, by which means nearly the whole of the steam will have an ob-

fect for its action. A stratum of these pots thus prepared being formed by packing them close to each other in rows, placing them in a layer of horfe dung about two feet thick, which is previously prepared, they are covered with boards, and then they are surrounded on every part with that material; thus is this part of the work continued layer upon layer until it arrives at the height of the building prepared for it, which ought to be perfectly water-tight. These strata (forming what the workmen call a "blue bed," from the lead being placed there in its blue state,) continue undisturbed until the acid is exhaled or evaporated, which is generally in about two or three months. It is supposed that the operation is effected in this state by the vapours of the vinegar (assisted by the tendency of the lead to combine with the pure part of the air which is present) corroding it and converting the external portion into a white calx. At the above time, the boards on being removed exhibit the appearance of being strongly scorched, most probably from the acid steam that may (after all the above care to preserve it) have escaped during the immersion in the dung; or, perhaps, the mere heat by opening and preparing the boards will make them more liable to the action of the acid, even though very little should escape; or indeed the continued heat may be alone sufficient to account for this change in them. At the expiration of the above time the beds are "drawn," that is, the pots are removed and opened, the lead is taken out and thrown together into a large receiver full of cold water, having a partition running across it flattening from the highest part, where it may be only 12 inches from the top towards the lower, and the depth from the top of the receive to the frame or partition may be three feet; this is pierced from its highest to its lowest part with holes of about $\frac{1}{2}$ inch diameter. In many manufactories a workman is employed here, who, with a long pole and a strong head annexed to it, flirs, beats, and breaks the pieces, by which means the corroded lead breaks off in flakes or as dull, and falls through the holes to the bottom of the receiver: in other white lead works this part of the process is accomplished by a machine receiving its motion and strength from the power that turns the mill which is to grind the white lead into powder. The introduction of water into this part of the process has been a great means of preserving the health of the people employed in the works; thus removing a strong objection against apprenticing children to this business. Formerly the lead was uncovered, and the corroded parts broken off without the intervention of water, and the lead dust got upon the lungs of the workmen, from which, owing to the peculiar deleteriousness of this metal in any shape, few lived beyond 40 years. The blue lead left from this part is melted again, with a proper addition of fresh metal, and submitted to the above operations. The white substance is transferred to the mill and ground; the immediate act of grinding being conducted in the wet, almost as soon as ground in the dry state, by a large horizontal wheel, whose power is derived either from horses, steam, wind, or water, with cogs turning from 8 to 16 or more pestle-shaped pieces of metal which revolve in mortars in which the ceruse is put. After being finely levigated it is formed into cakes or "pieces," and dried, in some manufactories, in the same manner that glue, paper, dry colours, &c. are, on laths, in shades placed in the open air, or in a long room, generally the attics of the ware-rooms; but in others, in a circular stove with a stove pan, or cockle, placed in the middle, as hats, &c. are dried. By this last way the operation is effected in a few days, whilst, in the former, some weeks, or even months, as in winter, must elapse before it is completed. When arrived at this state, it is ready for sale.

Many manufacturers have a pair of horizontal stones like those of the flour-mill for the purpose of grinding it in oil.

A patent was obtained in this business by Mr. Richard Fishwick, of Newcastle upon Tyne, to preserve to himself the advantage of substituting exhausted tanner's bark in the place of horfe-litter, or mixing a proportion of the one with the other.

Ceruse makes a beautiful white colour, and is much used by the painter, both in oil and water colours. It makes the principal ingredient in the laces used by the ladies for the complexion. Taken inwardly, it is a dangerous poison; it loosens the solidity, spoiling the breath and teeth, and hastening wrinkles, and all the symptoms of old age. Even the external use of it as a paint or enamel, for it is said that it has been so used, is attended with very disagreeable, and, in the end, with fatal consequences. Its effects in nervous disorders are terrible; witness the case of Mr. Butler at Melow. See a curious account of it, in the Phil. Trans. vol. 1, part 1, N^o 2, an. 1774.

Ceruse is the only white lutheto found fit for painting in oil; the discovery of some other white for this purpose is desirable, not only from the faults of ceruse as a paint, but also from its injuring the health of its manufacturers, and producing a dreadful disease, which lead and all its preparations frequently occasion, called the COLIC of minerals, or the COLIC of painters.

The Chinese make an use of this preparation of lead, which it is easier to see the advantages of, than to comprehend the manner in which they are brought about. The China vessels when they have been baked and finished as to the matter, and even covered with their varnish, will yet receive into their very substance, the colours which those people mix up with an addition of ceruse, and, as some of the old accounts say, of coppers and saltpetre; but though these latter ingredients had used to be added, the ceruse alone supplies their place at this time, at least in very many things. It would be worth while to try an admixture of ceruse with the colours used in the painting of glass; and this, after a second baking, might perhaps be found to incorporate itself in the same manner that it does into China ware, and recover the long secret of letting in the strongest colours, without hurting the transparency.

CERUSE of antimony is a perfect oxyd of antimony, prepared by nitre. See ANTIMONY.

CERUSE, CERUSA ACETATA, in Pharmacy. Both the cerulle, and particularly the acetted cerulle are largely employed in medicinal purposes. An acetted oxyd of lead, somewhat different from the sugar of lead, forms the common *Coulard's Extra*. For an account of the different pharmaceutical preparations of this metal with their respective uses, see the article LEAD.

CERUTI, FEDERIC, in Biography, an Italian philologist, was born at Verona in 1541, educated in France, and at first followed the profession of arms. But being taken to Rome by his first patron the bishop of Agen, who wished to promote him in the church, he declined that mode of life and returned to his native place, where he married, and opened a school, which was much frequented. He became one of the heads of the academy of Moderati, and maintained a correspondence with several persons of the most eminent literary character. In 1585, he published at Verona an edition of Horace, with a paraphrase, and, in 1597, a similar edition of the satires of Perinus and Juvenal. He likewise published a Latin dialogue "On Comedy," and another "De recta Adolescentulorum Institutione;" and a collection of Latin poems. He left in MS. a translation of the "Anthologia." Ceruti died in 1579. Moreri.

CERVULA,

CERVULA, or **CERVULUS**, in *Middle Age Writers*, a kind of goat, celebrated by pagans, and after their example by the Christians, on New-Year's day; when they ran about in masquerade, dressed in imitation of deer, and other beasts. We find divers censures of the fathers, and decrees of councils against the observance of this ceremony. Even litanies were composed, and fasting prescribed for that day, *ad colendum gentium consuetudinum*. D. Cange.

CERVUS, in *Entification*, a sort of forked stake or palisade, planted sometimes in the middle of the ditch, sometimes in the bottom of the same, close to the foot of the inner slope thereof, sometimes on the bank between the inner edge of the ditch and the parapet of the retrenchment to prevent the approach and ascent of the enemy, and to annoy and wound him in attempting to force or carry such a work. Cervi were also sometimes planted in holes, or *trous-de-loup* at some little distance, to impede and prevent the attack of an enemy. Cæsar made use of cervi near Alesia, as appears from the c. 72. of the 7th book of his commentaries De Bello Gallico.

CERVUS, in *Zoology*, a genus of quadrupeds, in the order *Pecora*. The horns are solid, branched, thick-set at tip, covered while young with a downy skin, and annual; front teeth in the lower jaw eight; tusks none, or sometimes one solitary on each side, in the upper jaw.

Species.

PYGÆGUS. No tail; horns trifurcated. Pallas It. and Schreber Sacugth. *Cervus abas*, Gmel.

This is truly an alpine species, inhabiting for the most part the woody summits of the mountains of Ilircania, Russia, and Siberia, in the summer; and descending into the plains only in winter. It is larger than the roe-buck, and is observed to become hoary in winter. At other times the body is of a deep reddish-brown, with the lower part and limbs paler; round the nose, and on the sides of the lower lip black; the tip of the lip, and also the rump, are white. The horns are tuberculated at the base. Ears white, and villous within, fringed with a few long black hairs; and instead of tail, a broad cutaneous excrescence.

ALCES. Horns palmated, without stems; throat carunculated. Linn. Fu. Succ. *Cervus alces*, Briss. *Alces*, Pliny, Johnst. &c. *Alces*, Cæsar Bell. Gall. &c. *Messe*, Laet. *Moose deer*, Dudley, Dav. &c. *Original*, Charlev. *Elan*, Buff. *Elk*, Lawson.

Should the elk of Europe and Asia, and the moose deer of America be the same animal, it will rank as the largest species of the cervine tribe extant at this time, to our knowledge, either in the old or new continent. It has been usual with writers to consider the history of the two kinds together; and, for the sake of perspicuity, it will not be amiss to follow their example, referring to ourselves hereafter an opportunity of stating, in a few words, how far we dissent from this generally received opinion. The elk, when full grown, is scarcely inferior to a horse in size. In shape it is much less elegant than the rest of the deer kind, having a very short and thick neck, a large head, horns dilating almost immediately from the base into a broad palmated form; a thick, broad, heavy upper lip, hanging very much over the lower, very high shoulders, and long legs. The colour is a dark greyish-brown, much paler, or whitish on the legs, and beneath the tail. The hair is of a strong, coarse, and elastic nature, and is much longer on the top of the shoulders, and ridge of the neck, than on other parts, forming together a kind of bushy mane; beneath the neck also the hair is of considerable length, and in some specimens of the animal, a

fort of caruncle, or excrescence, covered with long hair, is pendent from beneath the throat; a circumstance spoken of by Linnæus as part of the specific character of the animal, but which is more visible at some particular seasons than at others, and is sometimes wanting. The eyes and ears are large; the hoofs broad, and the tail extremely short. According to Pennant, the greatest height of the elk is about seven hands, and the weight of such an animal about 1229 pounds. The horns have been known to weigh 50 pounds, and to measure each 32 inches in length. The female is rather smaller than the male, and has no horns. This applies only to the American moose, which is observed to arrive at a greater magnitude than the European kind.

The elk of Europe and Asia is found chiefly in Sweden and Norway, in the woody tracts of the Russian dominions, and in Siberia; but not in the flat countries of the Arctic regions, nor in Kamtschatka. The American moose inhabits the Isle of Cape Breton, Nova Scotia, the western side of the bay of Fundy, Canada, and the country surrounding the great lakes, almost as far south as Ohio; both in the old and new continent these animals preferring the colder climates.

The elk resides principally in the midst of forests, for the convenience of browsing the boughs of trees; because it is prevented from grazing with facility on account of the shortness of the neck, and disproportionate length of the legs. They often have recourse to aquatic plants, which they can readily obtain by wading into the water. Sarrasin tells us they are very fond of the sinking trefoil, *Anagyris fetida*, and will uncover the snow with their feet to procure it. When passing through the woods, they raise their heads to an horizontal position to prevent their horns from being entangled among the branches. Their gait is remarkable; their general pace is described to be a high, stumbling, but very swift trot, the feet being lifted up very high, and the hoofs clattering much during their motion, as is the case also with the rein-deer; in their common walk they lift their feet very high, and will, without difficulty, step over a gate five feet high. They feed principally in the night, and whenever they graze are observed to choose an ascending ground, for the greater convenience of reaching the surface with their lips. They ruminate like an ox. The rutting season is in autumn. The female brings forth two young at a birth, in the month of April, which follow the dam a whole year. During the summer they keep in families. In deep snows they collect in numbers in the forests of pines, for protection from the inclemency of the weather, under the shelter of those evergreens. The elk, though naturally of an inoffensive and peaceable disposition, displays a considerable share of courage when suddenly attacked, defending himself with great vigour not only with his horns, but also by striking violently with his fore feet, in which he is so dextrous, as easily to kill a dog, or even wolf, at a single blow. The flesh of the moose is extremely sweet and nourishing; the Indians say, that they can travel three times farther after a meal of moose, than after any other animal food. The tongues are excellent, but the nose is said to be perfectly marrow, and is considered the greatest delicacy in Canada. The skin makes excellent buff, being soft, strong, and light. The Indians dress the hide, and after soaking it for some time, stretch and render it supple by a lather of the brains in hot water. They not only make their snow-shoes of the skin, but after the chase cover the hull of their canoes with it, in which they return home with the spoils of their elk. The hair on the neck, withers, and hams of a full grown elk is of considerable use in making mattresses and saddles; and the palmated parts of the horns are further excavated by the Indians,

Indians, and converted into ladles, and other culinary articles.

The chase of the moose deer forms an important occupation among the natives of North America, and is performed by them in various methods. The first is the most simple, and is conducted in the following manner. Before the lakes and rivers are frozen, multitudes of the savages assemble in their canoes, and form with them a vast crescent, each horn touching the shore. Another party perform their share of the chase among the woods, surrounding an extensive tract, letting loose their dogs, and pressing towards the water with loud cries. The animals alarmed by the noise, fly before the hunters, and plunge into the lake, where they are killed by the other savages in their boats, who are prepared to receive them with clubs and lances. Another method pursued at times by the hunters is more artful. They enclose a large space of ground with stakes hedged with branches of trees, and forming two sides of a triangle. The bottom space opens into a second space completely triangular. At the opening are hung numbers of snares made of slips of raw hides. The Indians, as before, assemble in great troops, and with all kinds of noises drive into the first enclosure not only the mooses, but the other kinds of deer, which abound in that country. Some forcing their way into the farthest triangle, are caught in the snares by the neck or horns; and those which escape the snares and pass the opening find their fate from the arrows directed at them from all quarters. They are often killed with the gun. When first dislodged, the animal falls down, or squats, as if disabled, for a moment or two, at which instant the hunter fires; if he misses, the moose sets off at a swift trot, making at the same time a prodigious clattering with the hoofs, like the rein deer, and will oftentimes run 20 or 30 miles before he comes to bay, or takes to the water. The usual time for this diversion is the winter. The hunters avoid entering on the chase till the sun is strong enough to melt the frozen crust with which the snow is covered, otherwise the animal can run over the firm surface: they wait till it becomes soft enough to impede the flight of the moose, which sinks up to the shoulders, flounders, and gets on with difficulty, while the sportsman pursues at his ease on his broad rackets, or snow-shoes, and makes a ready prey of the distressed animal. An ancient superstition has prevailed that the elk is naturally subject to the epilepsy, and that it finds its cure by scratching its ear with the hoof till it draws blood; and in consequence of this notion the hoofs of the elk form an article of the ancient *matéria medica*. A piece of the hoof was anciently set in a ring, and worn as a preservative against the complaint above mentioned; and sometimes the hoof was held in the patient's hand, or applied to the pulse, to the left ear, or suspended in such a manner from the neck as to touch the breast. The hoof has been used by the Indians in the falling-sickness; they apply it to the heart of the person afflicted, and make him hold it in his left hand, and rub his ear with it. They also use it in the colic, vertigo, pleurisy, and purple fever, pulverising the hoof, and drinking it in water.

It should be farther mentioned, that, although the synonyms referred to by naturalists for *Cervus alces* are repeated in the above account, we wish to impress on the reader's mind our distrust of their accuracy in some leading points. Perhaps on further investigation, the European elk and the moose deer of America may prove, as we suspect, to be two distinct species. With regard to the enormous palmated, fossified horns that are sometimes dug up in Ireland and other parts of Britain, a more positive opinion may be advanced; they are certainly not the horns of the moose deer,

as most writers imagine. In point of size they vary far exceed the horns of the largest moose, and in their appearance differ so materially that they could not possibly have belonged to that animal; they have long beams to support the palmated part instead of short ones, as in the moose; they are also firmer and thicker, and are commonly from 10 to 12, or sometimes 15 feet from tip to tip! It requires no argument to prove that such stupendous horns cannot be referred to any species of the Cervine race at present known, and that they must of course have belonged to some species either totally extinct, or hitherto undiscovered.

TARANDUS. Horns ramose, recurvated, round, with palmated summits. Linn. Faun. Suec. Amœn. Acad. &c. *Tarandus*, Pinn. Aldr. &c. *Rangifer*, Gesn. Aldr. &c. *Renne*, Buff. *Rein deer*, Penn.

The Rein Deer, when full grown, according to Pennant, is four feet six inches in height, the body of a somewhat thick and square form, and the legs shorter in proportion than those of the common stag. The general colour is brown above, and white beneath, but as it advances in age it often becomes of a greyish white, and sometimes almost entirely black; the hair on the under part of the neck is of much greater length than the rest, and forms a kind of hanging-beard in that part. Both sexes are furnished with horns, but those of the male are much larger and longer than those of the female. The hoofs are long, large, and black, as are also the false or secondary hoofs behind; and these latter while the animal is running, by striking against each other, make a remarkable clattering sound that may be heard at a considerable distance. No animal of this tribe appears to vary so much in the form and length of the horns as the rein deer. In general the horns are remarkable for their great length, and slenderness in proportion, and are furnished at the base with a pair of brow antlers, and at the extremity with widely expanded and palmated tips directed forwards; towards the middle of the horn rises another large branch, which turns upwards, and is branched at the tip; the remainder of the horn runs on to a great length in a backward direction, and is more or less ramose at the extremity. In the young and middle-aged rein deer the horns are remarkably slender. Gesner gives the figure of a full grown male rein deer, which Linnæus has pronounced to be a good representation of the animal, and in this, the horns which extend horizontally along the back even project beyond the tail. The height of the domesticated rein deer is about three feet; of the wild ones, four. It lives to the age of sixteen years. The female goes with young thirty three weeks. The male calls his horns annually at the end of November, the female not till she saws about the middle of May.

The rein deer is celebrated for its services to the simple and harmless inhabitants of Lapland, who, undisturbed by the sounds of war, or the troubles of commerce, lead a kind of pastoral life even within the frozen limits of the arctic circle, and have no other cares than those of providing for their numerous herds of rein deer, and of rearing and supporting their numerous herds of rein deer, which may be said to constitute almost their whole wealth; and which are used not only for the purposes of food, but for travelling occasionally over that frozen country during winter. To the Laplander this animal is considered as at once the substitute of the horse, the cow, the sheep, and the goat. The milk affords them cheese, the flesh food, the skin clothing, the tendons bow-strings, and when split, thread, the horns glue, and the bones spoons. During winter it supplies the want of a horse and draws their sledges with amazing swiftness over the frozen lakes and rivers, or over the snow which at that season covers the

the whole country. A rich Laplander is sometimes possessed of a thousand rein deer. In autumn they seek the highest hills to avoid the Lapland gad-fly, which at that time deposits its eggs in their skin, and in many instances proves fatal to the animal. So dreadful is this scourge, that the moment a single fly appears, the whole herd perceive it, and betray every symptom of terror by their gestures, shaking, and tossing their heads, and running about for shelter, or to avoid the stroke of their diminutive but cruel enemy. The chief food of the rein deer is a species of lichen, commonly called the rein deer moss, which covers vast tracts of the northern regions, and on which these animals particularly delight to browse. In summer they readily procure it in vast plenty, and in winter dig with their feet and brow antlers through the snow to obtain it. The Laplanders devote their whole care to the management of these useful animals, occasionally housing and nursing their herds during winter; and attending them in summer to the tops of the mountains.

The mode of travelling in sledges drawn by the rein deer deserves mention. There are in Lapland two races of the rein deer, the wild and the tame. The latter are preferable for drawing the sledge, to which the Laplander accustoms them betimes, yoking them to it by a strap which goes round the neck and comes down between the legs. The sledge is extremely slight, and covered at the bottom with the skin of a young deer, the hair turned to slide on the frozen snow. The person who sits on this guides the animal with a cord, fastened round the horns, and encourages it to proceed with his voice, and drives it with a goad. The wild breed are by far the strongest, but these often prove refractory, and turn upon their drivers, who have then no other resource but to cover themselves with the sledge, and let the animal vent its fury upon that. But it is otherwise with those that are tame; no creature can be more active, patient, and willing; when hard pushed they will trot nine or ten Swedish miles, it is said, or between fifty and sixty English miles at one stretch; but in such a case the poor obedient creature fatigues itself to death, and if not killed, to relieve it from misery, will die in a day or two after. In general they can go about thirty miles without halting, and without any great or dangerous effort. This, which is the only mode of travelling in Lapland, can be performed to advantage only when the snow is glazed over with the ice; and though it be a speedy method of conveyance, it is inconvenient, dangerous, and troublesome. The Samoeds consider them as animals of draught. The Koreiki, a nation of Kamtschatka who keep immense herds of rein deer, also train them to the sledges. They usually harness two to each carriage, and it is said they will travel 150 versis in one day, a distance equal to about 112 English miles.

The rein deer is a native of the northern regions. In Europe its chief residence is in Norway and Lapland. In Asia it frequents the north coast as far as Kamtschatka, and the inland parts as far as Siberia. In America it occurs in Greenland and does not extend farther south than Canada. The Samoeds, the Esquimaux, and the Greenlanders, all of whom possess this animal, consider it principally as an object of chase. Among the two last people the flesh constitutes their chief article of food. They eat it either raw, dressed fresh, or dried and smoked with the snow lichen. The wearied hunters will drink the raw blood, but it is usually dressed with the berries of the heath. The skin dressed with the hair on is soft and pliant, and is employed in making their dresses, the inner lining of their tents, or as blankets. The tendons serve for bow-strings, and when split are the threads with which they sew their jackets.

Before the Greenlanders became acquainted with fire arms

they were accustomed to take the rein deer by what was called the clapper-hunt; in which the women and children surrounded a large space, and, where people were wanting, set up poles capped with a turf in certain intervals to terrify the animals; they then with great noise drove the rein deer into the narrow defiles, where the men lay in wait, and killed them with harpoons and darts. But they are now become scarce in Greenland. The rein-deers are found in the neighbourhood of Hudson's bay in amazing numbers. Columns of eight or ten thousand are seen annually passing from north to south in the months of March and April, driven out of the woods by mulkoots. They go to rut in September, and the males soon after shed their horns; they are at that season very fat, but so rank and musky as not to be eatable. The females bring forth their young in June, in the most sequestered spots they can find, and then they likewise lose their horns. In autumn the deer with their fawns migrate northward. The Indians are very attentive to their motions, for these animals constitute the chief part of their dress, as well as food. They often kill numbers for the sake of their tongue only; at other times they separate the flesh from the bones, and preserve it by drying it in the smoke. The fat which they also save, they sell to the English in bladders, who use it for frying instead of butter. The skins also are an article of extensive commerce with the English. The Indians kill great numbers of them in the winter, and during the migratory seasons, lying in watch in their canoes, and spearing them while swimming over the rivers, or from one island to another. Authors make several varieties of the rein deer; what is called the Greenland Buck, and Greenland deer, has the horns round, and covered with a hairy skin; *Capra groenlandica*, Ray, and var β *groenlandicus*, Gmel. Another variety, the Caribou of Hudson's bay, has the horns straight with one branch at the base turned backwards, γ *Caribou*, Gmel.

ELAPHUS. Horns branched, round and recurved. Linn. F. S. *Cervus*, Pliny. Geln. Aldr. &c. *Elder Hirsch*, *Wild Oer Uhoer*, Riding. *Cerv*, *liche* et *faon de cerv*, Buß. *Stag*, Penn. &c.

The stag is a native of almost all the temperate parts of Europe as well as Asia. It also occurs in some few parts of Africa, and pretty generally in North America; in which latter country it occasionally arrives at a larger size than in the whole continent, with the exception of Siberia, where Pennant informs us it is found of a gigantic magnitude. The stag varies in different countries very considerably, so much indeed as to induce us to believe that travellers and other writers have oftentimes confounded animals of very different species under this general title in speaking of the productions of distant countries. Most commonly the stag is about three feet and a half high, and of a reddish brown colour, beneath whitish. Sometimes it is of a very dark or blackish brown; sometimes of a pale or yellow brown; and, lastly, instances occur of stags being entirely white, which last are mentioned both by Aristotle and Pliny, but as rare. The horns also vary as to the size and number of ramifications, according to the age of the animal. Erskben mentions three distinct varieties of the stag (*Cervus Elaphus*) independent of the common European kind, namely, First, *Hippelaphus* β . Larger, with the hair on the neck longer. *Cervus Germanicus*, G. Bill. $\Upsilon\pi\omega\lambda\alpha\gamma\eta$, Aristotle. $\Upsilon\gamma\alpha\lambda\lambda\alpha\gamma\eta$, Pliny. *Tragelaphus*, Geln. *Hippelaphus*, β . Gmel. Second, *Cervicanus*, γ . Gmel. *C. minor sulcus*, Ersk. *Cerv de Cervs*, Buß. This is smaller than the last and has the body fuscous. Third, *C. Canadensis*, δ . Gmel. *C. cornutus amplissimus*, Ersk. with very ample horns. *Cervus Canadensis*, Buß. *Stag of Virginia*, Dale. *Stag of Carolina*, Lawson. *Stag of America*, Catesby.

Catsby. The histories of all these varieties are so intimately blended with each other by writers that they can only be considered under one general head.

The stag, says the ingenious Buffon, is one of those innocent and peaceable animals that seem destined to embellish the forest, and animate the solitudes of nature. The elegance of his form, the lightness of his motions, the strength of his limbs, and the branching horns with which his head is decorated, conspire to give him a high rank among quadrupeds, and to render him worthy the admiration of mankind. The size and stature of these animals differ according to the places they inhabit: those which frequent the valleys, or the hills abounding in grain, are larger and taller than those which feed upon dry and rocky mountains. The latter are low, thick, and short; neither are they equally swift, though they run longer than the former: they are also more vicious, and have longer hair on their heads; their horns are commonly short and black, like a stunted tree, the bark of which is always of a darker colour, but the horns of the stags which feed in the plains are high, and of a clear reddish colour, like the wood and bark of trees that grow in a good soil. These little squat stags never frequent the lofty woods but keep constantly among the coppices, where they can more easily elude the pursuit of the dogs. The Corsican race appears to be the smallest of those mountain stags. This kind is scarcely more than half the height of the ordinary sort, and may be regarded as a terrier among stags. His colour is brown, his body squat, and his legs short. Buffon seems convinced, however, that the size and stature of the Corsican stag, and of stags in general, depend on the quantity and quality of their food, for, having reared one of this breed at his house, and fed him plentifully for four years, he was much caller, thicker, and plumper at that age than the oldest stags in his woods, though those were of a very good size. The stag appears to have a fine eye, an acute smell, and an excellent ear. Like that of the cat and the owl, the eye of the stag contracts in the light and dilates in the dark, but with this difference, that the contraction and dilatation are horizontally, while in the first mentioned animals they are vertically. When the stag listens, he raises his head, erects his ears, and perceives the sound from a great distance. When going into a coppice, or other half-covered place, he stops to look round him on all sides, and scents the wind to discover if any object be near that might disturb him. Though rather simple, he has curiosity and cunning. If any one whistles or calls to him from a distance, he stops short, gazes attentively, and with a kind of admiration; and if those who disturb him have neither dogs nor offensive weapons, he commonly passes along quietly, and without altering his pace. He appears to listen with great tranquillity and delight to the shepherd's pipe, and the hunters sometimes make use of this instrument to embolden and deceive them. They will follow the sounds of music for miles, proceeding while they hear it, halting the moment the players cease, and again advancing when the music recommences. In general the stag is less afraid of men than of dogs, and is never suspicious, or uses any arts of concealment, but in proportion as he is disturbed. He eats slowly, selects his food with care, and, after his stomach is full, seeks a place to lie down and ruminate at leisure. He seems to perform the act of rumination with less facility than the ox, and it appears only by violent efforts he can cause the food to rise from his first stomach. This difficulty arises from the length and direction of the passage through which the aliment must pass: the neck of the ox is short and straight, but that of the stag is long and arched, and therefore greater efforts are required in rumination.

In winter and spring the stag does not drink, the dew with which the tender herbage is furnished being then sufficient to satisfy his thirst, but during the parching heats of the summer he frequents the brooks, marshes, and fountains, and in autumn is so over-heated that he searches every where for water to bathe and refresh his body. He then swims with more ease than at any other time, on account of his fatness, and has been observed crossing very large rivers. It has been asserted, that in the season of love, stags will throw themselves into the sea, and pass from one island to another at the distance of several leagues in search of the hinds. Pontoppidan tells us that the Norwegian stags, which are only in the dioceses of Bergen and Dronheim, have been seen to swim in numbers across the straits from the continent to the adjacent islands, resting their heads upon each others' cruppers, and that when those who lead are fatigued they retire behind, and the most vigorous take their places. The stag leaps still more nimbly than he swims, and, when pursued, can readily clear a hedge or paling of six feet height. The aliment of the stags differs according to the seasons. In autumn they search for the buds of green shrubs, the flowers of the heath, and leaves of brambles. In the winter, during the snow, they strip the bark off the trees, and feed upon that, and the moss which they find on the trees; and in mild weather they browse in the corn fields. In the beginning of spring they go in quest of the catkins of the trembling poplar, willow, and hazel, and the flowers and buds of cornel. In summer, when they have abundance and variety, they prefer rye to all other grain, and the black berry bearing alder (*rhamnus frangula*) to all other wood.

Stags, in general, cast their horns sooner or later in the spring, in proportion to their ages. It seldom happens that both horns fall off at the same time, the one generally preceding the other by a day or two. The old stags cast their horns first, which takes place about the middle of February, or beginning of March: those in the seventh year or upwards, do not cast their horns before the middle of March: a stag of six years sheds his horns in April: young stags, or those from three to five years old, shed their horns in the beginning, and those which are in the second year not till the middle or end of May. But in all this there is much variety: for the old stags sometimes cast their horns sooner than those which are younger; and besides, the shedding of their horns is advanced by a mild, and retarded by a severe and long winter. As soon as the stags cast their horns, they separate from each other, the young ones only keeping together. They no longer haunt the deep recesses of the forest, but advance into the cultivated country, and remain among brush-wood during the summer, till their horns are renewed. In this season they walk with their heads low, to avoid rubbing their horns against the branches. The horns of the old stags are not half completed in the middle of May, and acquire their full size and hardness before the end of July. Those of the young stags are in proportion later both in shedding and renewing their horns. When full grown, the animals rub them strongly against the boughs of trees, or any other convenient object in order to free them from the skin which covers them, and is then become useless; and by the beginning of August they begin to assume the full strength and consistence which they retain throughout the remainder of the year.

Soon after the stag has cleared off the exuberant skin from the horns, he evinces an inclination for the female. By the end of August, or beginning of September, they leave the coppice, return to the forest, and begin to search out their favourite hinds; they cry with a loud voice, their neck and

throat swell, they grow restless, traverse the fallow grounds and plains in open day, and dart their horns against the trees and hedges. In a word, they seem transported with fury, and range from place to place till they have found their females, whom they have to pursue and overcome, before they submit to their pleasure. If two flags approach the same hind at this time a combat ensues: if their strength be nearly equal, they threaten, plough up the earth with their paws, make a terrible noise, and dart upon each other with the utmost fury. Their battles are carried on to such extremities, that they often inflict mortal wounds with their horns, nor is the combat ever concluded but by the complete defeat or flight of one of them, when the conqueror enjoys the fruit of his victory, unless another male happens to appear, and then a second combat is sure to ensue. The oldest flags are commonly victorious, because they are keener, and possessed of greater strength than the young ones. The old flags are the most ardent and inconstant, having commonly several females at the same time, and when they have but one they remain attached to her but a few days before they go in search of a second, with whom they remain a still shorter time, and then wander to others. The rutting season lasts about three weeks, during which period they eat but little, and are strangers to all repose; night and day they are on foot, ranging about, fighting with the males, or enjoying the females, and of course when the rutting season is over are so wasted, meagre, and fatigued, that they require a length of time to recover their strength. They then retire to the borders of the forest, and graze on the best cultivated lands, where they find food in abundance, and where they continue till their strength is restored. The rutting season, among the old flags, commences about the 1st, and concludes about the 20th of September; with those of six or seven years old it begins in the middle of September, and ends the beginning of October; with the young flag it begins about the 20th of September, and lasts to the 15th of October, by the end of which month the rutting is all over, except among the prickets, who, as well as the young hinds, are the latest in coming into season: thus, by the beginning of November, the rutting time is entirely finished, and, at that period, the flags, being in the weakest condition, are most easily hunted down. In those seasons, when acorns are plentiful, they recover in a very short time, and a second rut will take place towards the end of October, but this is always of a much shorter duration than the first. In warmer climates, as the seasons are more forward, the rutting season begins sooner. Aristotle tells us, in Greece it commences the beginning of August, and concludes towards the end of September.

The hinds go with young eight months and a few days, and seldom produce more than one fawn, which they bring forth in May or the beginning of June. They take the greatest care to conceal their fawns, and will even present themselves to be chased in order to draw off the dogs, and afterwards return to take care of their young. All hinds are not prolific, and some of them are even barren; these kinds are more gross and fat than the others, and are sooner in heat. It is also said some hinds have horns like the flags. The young are not called fawns after the sixth month, then the knobs begin to appear, and they take the name of knobbers, which they bear till their horns lengthen into spears, and then they are called brocks and prickets. Though they grow very fast, they do not quit the mother all the first summer. In the winter they all resort together, and their herds are more numerous as the season is more severe. In the spring they divide, the hinds retiring to bring forth; and they are only the prickets and young flags which then keep

together. In general the flags are inclined to associate, and it is only from fear or necessity that they are ever found dispersed. At the age of eighteen months the flags are capable of engendering, for those brought forth in the spring of the preceding year will couple with the hinds in autumn. The flag continues to increase in size till he has completed his eighth year. As the flag is very quick at first in his growth, a year does not pass before this redundancy shews itself. If brought forth in May, the horns begin to appear in May following, and continue to increase till the end of August, by which time they are full grown. The longevity of the flag, which became proverbial among the ancients, is in some degree a vulgar error, for though the animal, compared with many quadrupeds, may be justly considered as long-lived, since it is supposed in some instances to arrive at the age of 35 or 40 years, yet it is by no means possessed of the longevity ascribed to it by some of the ancients. Aristotle discountenances this silly prejudice; but it was, as Buffon observes, again revived in the days of ignorance, and supported by the story of a flag that was taken by Charles VI. in the forest of Senlis, with a collar upon the neck bearing this inscription, "Cæsar hoc me donavit;" the people rather choosing to believe this flag had lived a thousand years, and had received his collar from a Roman emperor, than that he came from Germany, where the emperors assumed the name of Cæsar.

In Britain the flag is become less common than formerly; its excessive viciousness during the rutting season inducing most people to dispense with this species, and rear the fallow deer, which is of a more placid nature, in its stead. Some attempts have indeed been made to render the flag domestic, by treating them with the same gentleness as the Laplanders do their rein-deer: and it appears, in the Isle of France, where the Portuguese had introduced the European breed, they had so far succeeded by degrees as to render them quite domestic, many of the inhabitants keeping large flocks of them. But when the French took possession of that island they destroyed most of those domesticated flags. Valmont de Bromare asserts that he saw in Germany a set, or "attelage," consisting of six flags, that were perfectly obedient to the curb, and active to the stroke of the whip; and in the magnificent stables of Chantilly, in the year 1772, were two flags that were occasionally harnessed to a small chariot, in which they carried two persons. The flesh of the old flags is very bad; that of the female is not amiss, but the flesh of the young fawns is still better. The skin and the horns are the most useful parts of this animal. The skin makes a pliable and durable leather, and the horns, being extremely compact, solid, hard, and weighty, make excellent handles for knives, and other instruments. Stags are still found wild in the Highlands of Scotland, in herds of four or five hundred together, ranging at full liberty over the vast hills of the north, some of which grow to a great size. Pennant says, upon the authority of Mr. Fargularson, that one of those wild flags weighed 574 pounds, exclusive of the entrails, head, and skin. Formerly the great Highland chieftains used to hunt with the magnificence of eastern monarchs, assembling four or five thousand of their clan, who drove the deer into the toils, or to the station their lords had placed themselves in. But as this pretence was frequently used to collect their vassals for rebellious purposes, an act was passed prohibiting any assembly of this kind. Stags are likewise met with on the moors that border on Cornwall and Devonshire; and in Ireland on the mountains of Kerry, where they add greatly to the magnificence of the romantic scenery of the lake of Killarney. Pennant is persuaded that the flag is not a native of America, and considers the deer known

in that country by the name of stag as a distinct species. It has been already mentioned that the American stag is a variety, *C. canadensis* of Erxleben. The Americans hunt and shoot those animals, not so much for the sake of the flesh as of the fat, which serves as tallow in making candles, and the skins, which they dispose of to the Hudson's bay company. They are caught principally in the inland parts, near the vicinity of the lakes.

DAMA. Horns branched, recurved, and compressed, with palmated summits. Linn. Fn. Succ. Schreber, &c. *Cervus palmatus*, *Dama*, ♂ *Dama cervus*, Klein. *Cervus platyceros*, Ray. *Damm hirsch*, Ridinger. *Dain et Daine*, Buff.

The fallow deer is considerably smaller than the stag, and is of a brownish-bay colour, varying, in different individuals, to deeper or paler, and is spotted on the back with white; and sometimes, though rarely, the whole of the back is white. Colour beneath, and on the insides of the limbs, whitish. Tail rather longer in proportion than that of the common stag, white beneath, and commonly bounded on each side by a descending streak of black; but the principal mark of distinction between this species and the stag is the form of the horns, which, as in the stag, are peculiar to the male, and are ciliated at the upper part, and palmated or divided into processes which are continued to a considerable distance down the horn. An antler or simple slender process rises from the base of each, and a similar one at some distance above the first, both pointing somewhat forwards. In its general form the animal greatly resembles the stag, but is smaller, and of a more gentle disposition.

The manners of the fallow deer resemble those of the stag, but he is observed to be less delicate in the choice of his food, eating a variety of vegetables which are refused by the other. He also preserves his venison better, and even after the rutting season he does not appear exhausted, but continues in nearly the same state throughout the year. He browses closer than the stag, and is for that reason more prejudicial to young trees. At the second year the fallow buck seeks the female, and like the stag is inconstant in his attachments. The doe goes with young eight months and some days. She commonly produces one fawn, sometimes two, and very rarely three. They are capable of engendering from two years of age till fifteen or sixteen, and seldom live more than twenty.

The horns of the fallow buck, like those of the stag, are shed every year, but at a somewhat later period, happening about fifteen days later. At their first appearance they resemble a pair of soft, tumid knobs, or tubercles, and are covered with a villous skin; they gradually enlarge, lengthen, and widen at the tops, and when full grown, the skin which had served to protect and nourish the young horn becoming useless, is rubbed off by the animal, the impression of the blood vessels still remaining on the complete horn, in the form of so many ramified furrows. During the rutting season they are neither so furious nor so violent in their ardour as the common stag. They never quit their own pastures in search of the females, though they will dispute and fight furiously for the possession of them. It often happens when there is a number in one park, that they will divide into two parties, and engage each other with much resolution; but these contests generally occur from a wish they both have to graze upon some particular spot. Each of these parties has its chief; these lead on the engagement, and the rest follow under their direction. One victory is not sufficient, neither party yielding upon a single defeat; but as the battle is renewed daily, the weakest are at last compelled to retire to some secluded part of the park, and be content with the worst pasturage. This animal is not so universal as the

common stag, and is even rare in some parts of Europe, as in France and Germany. They abound in England, but are chiefly confined to parks. In Spain it is said to arrive at a size nearly equal to that of the common stag. It is found in Greece, Palestine, the north of China, and in Persia. The fallow deer in America have been introduced there from Europe; for the animal called the American fallow deer is of a very different kind, and is peculiar to the new continent.

VIRGINIANUS. Horns ramose, turned forwards, and rather palmated. Penn. quad. *Cervus virginianus*, Gmel. *Dama virginiana*, Ray. *Cervus platyceros*, Sioane. *Chervicall*, Du Pratt. *Fallow deer*, Lawson. *Virginian deer*, Penn.

This animal resembles the fallow deer, but is taller, has a longer tail, and is of a lighter colour; the horns are more slender with numerous branches on the inside, and has no brow antlers. The general colour is a light cinereous brown, the head of a deeper cast, and the belly, sides, shoulders, and thighs whitish, mottled with brown; the tail, which is about ten inches long, is dusky above, and white below. This kind of deer inhabits all the provinces south of Canada, but in greatest abundance in the vast savannas contiguous to the Mississippi, and the great rivers that flow into it, grazing in innumerable herds along with the stags and buffaloes. This species is supposed by some to extend as far as Guiana, and to be the *baicu* of that country, which is said to be about the size of an European buck, with short horns bending forward at their extremities. This opinion is erroneous, the *baicu* being now ascertained to be a very distinct animal (*Cervus mexicanus*, Gmel.) The Virginian deer are sometimes tamed and used by the Indians, after being properly trained, to decoy the wild, especially at the rutting season, within the range of the hunters' markets. Both bucks and does herd from September to March, after which the does secrete themselves to bring forth, and are found with difficulty. From this time the bucks keep separate till the rutting season in September following. The deer begin to feed about twilight; and sometimes in the day-time, but then only in the rainy season, otherwise they rarely venture to quit their haunts. These animals are very restless and always in motion. Those which live near the shores are lean and bad, and are greatly troubled with worms in their head and throat, the larvæ no doubt of various insects that like the *lobani*, and *oelri*, or gad-fly, deposit their eggs in the flesh of the animal. Those which frequent the hills and savannas are better, but the venison of these is dry. In hard winters they are observed to feed much on the different species of *sphæra* or string-moss, which hangs from the trees. These, in common with the other cloven-footed quadrupeds of America, are very fond of salt, and resort eagerly to the places impregnated with it; they are also always seen in great numbers licking the earth in the spots where the ground has been torn by torrents or other accidents. Such spots are called licking places in America, and the hunters are sure to find plenty of game in those situations; for notwithstanding they are so often disturbed they soon return again in droves to their favourite haunts.

The deer are of the first importance to the Indians. The skins form the greatest branch of their traffic, by which they procure from the colonists in exchange many of the articles of life. The flesh is their principal food throughout the year, which they prepare by drying it over a clear gentle fire, after cutting it into small pieces, and, in this state, it is not only capable of long preservation, but is very portable in their sudden excursions, especially when reduced to powder.

powder. That the skins form an article of very extensive commerce will not admit of doubt; so long ago as the year 1764, no less than 25,027 skins were imported, according to Mr. Pennant, from New York and Pennsylvania. The trade is at present still more considerable.

Axis. Horns ramose, round, and erect; summit bifid; body spotted with white. Erxleb. Schreber, &c. *Axis*, Plin. Ray, &c.

This animal, which is known by the name of the Ganges stag, is one of the most beautiful species of this genus. Its size is nearly that of the fallow-deer, and its colour an elegant light rufous brown, distinctly and beautifully marked with numerous white spots; the under parts are paler, and a line of white generally separates the colour of the upper from the lower parts; the tail resembles that of the fallow-deer, and is reddish above and white beneath. The species is said to be very common in some parts of India, about the banks of the Ganges, and in the island of Ceylon. It is described by Pliny, among the animals of India, and is said to have been sacred to Bacchus. It has been introduced into Europe, and is occasionally seen in parks and menageries. They are readily tamed and seem to suffer little from a change of climate.

Pennant makes two varieties of the spotted Axis, the middle Axis and great Axis. The middle Axis is described as being of a light rufous colour, but never spotted. Sometimes, however, it is said to vary into white, and in that state is considered as a great rarity. It inhabits dry hilly forelands in Ceylon, Borneo, Celebes, and Java, where it is found in very numerous herds. The flesh is much esteemed by the natives, and is dried, and salted for use. The existence of the great Axis is ascertained from a pair of horns in the British Museum, resembling those of the former in shape, but of a larger size. They measure two feet nine inches in length, are of a whitish colour, and strong, thick, and rugged. Pennant conjectures they were brought from Ceylon or Borneo, having been informed by Mr. Loten, who had long resided in the former of those islands, that a very large kind of stag as tall as a horse, and of a reddish colour, with trifurcated horns, existed there as well as in Borneo. In the latter island, where they are said to frequent low marshy tracts, they are called water stags.

Porcinus. Horns slender, trifurcated; body above fuscous, beneath cinereous, Schreber. *Porcine deer*, Penn.

The length of this animal is three feet and a half; height two feet and a half; horns thirteen inches long, and the tail eight inches. The body is thick and clumsy, the legs fine and slender; the colour on the upper part of the neck, body, and sides brown; of the belly and rump lighter. Mr. Pennant's description of this species was taken from a specimen in the possession of the late Lord Clive, and was brought from Bengal. It is also said to be found in Borneo, where it is called the hog-deer from the thickness of its body. Of their feet, Mr. Pennant says, are made tobacco-pippers in the same manner as of those of the smaller kinds of antelopes and musks.

Africanus. Horns slender and trifurcated; limbs short, thick, and brown; body above fawn-coloured with white spots, beneath whitish. *Cerv-Cochon*, Buff. suppl. *Spotted Porcine deer*, Shaw. Gen. Zool.

This animal, which is described by Buffon under the name of Cerv-cochon or Hog-deer, is a native of the Cape of Good Hope. Dr. Shaw considers it as a probable variety of *C. Porcinus*, and the French writers of the present day think it only a variety of the common stag. If

the descriptions of this little known animal be correct, we should however rather incline to admit it as a distinct species, and under this idea name it Africanus. It is the same size as the last, but the limbs are not fine and slender as in that animal; they are on the contrary short and thick; the legs and hoofs are very small; the fur fawn coloured, darkest on the back, and spotted like the Axis with white; the eyes are black; and the upper eyelids furnished with long black hairs; the nose is black; head reddish-white intermixed with grey; ears large with white hairs within; and the tail fawn-coloured above, beneath white.

Mexicanus. Horns trifurcated at the tip and turned forward; body rufous. Penn. Gmel. *Cervus major, corniculis brevissimis, Biche des bois*, Barrer. *Teulal maçame*, Hernandez. *Baicu*, Bancroft, Gui. *Chevreuil d'Amérique*, Buff.

This species is the size of the common or European Roe-buck, and of a reddish colour, but when young, is often spotted with white. The horns are thick, strong, and rugged; they bend forward, are about ten inches long, and trifurcated at the upper part, but vary sometimes in the number of processes. The head is large: eyes large and bright, and the neck thick. The flesh is said to be far inferior to the venison of Europe. This inhabits Mexico, Guiana, and Brazil.

Capreolus. Horns ramose, round, erect, and bifid at the summit; body reddish brown. Linn. Fu. Sacc. Schreber. Erxleben, &c.—*Cervus capreolus*, Briff. *Caprae*, Plin. Ald. &c. *Capreolus*, Geln. Jonst. *Dorcas*, Charlet. *Chevreuil et chevrete*, Buff. *Rebock*, Geln. *Ridinger*, &c. *Roe*, Penn. &c.

The stag, says Buffon, as being the noblest inhabitant of the wood, occupies the most secret shades of the forest, and the elevated ridges of mountains, where the spreading branches form a lofty covert, while the roe, as if an inferior species, is content with an humbler residence, and is seldom found but among the thick foliage of the younger trees, and brush-wood. But if he is inferior to the stag in dignity, strength, and stature, he is endowed with more grace, vivacity, and courage. He is superior in gaiety, neatness, and sprightliness. His figure is more elegant and handsome: his eyes more brilliant and animated. His limbs are more supple, his movements quicker, and he bounds seemingly without effort, with equal vigour and agility. His coat or hair is always clean, smooth, and glossy. He never wallows in the mire, like the stag. He delights in dry and elevated places, where the air is purest. He possesses also more cunning and finesse, conceals himself with greater address, is more difficult to trace, and derives superior resources from instinct, for though he has the misfortune to leave behind him a stronger scent than the stag, which redoubles the ardour and appetite of the dogs, he knows how to withdraw himself from their pursuit by the rapidity with which he begins his flight, and by his numerous doublings. He never delays, like the stag, to practise his address till his strength fails him, but as soon as he finds the first efforts of a rapid chace unsuccessful, he repeatedly returns by his former steps, and after confounding by these opposite movements the direction he has taken, after intermixing the last emanations to those of the former course, he rises from the earth by one great bound, retreats to one side, where he lies down flat on his belly, and in this situation allows the whole troop of his deceived pursuers to pass close to him without attempting to move.

The roe differs from the stag and fallow deer, in disposition, temperament, manners, and almost every natural habit.

Instead

Instead of herding together, they live in separate families; the fire, dam, and young form a little community, and never admit a stranger into it. They are constant in their amours, and never unfaithful like the stag. During the period in which they are engaged in the task of nursing a new family, they drive off the former brood, as if to oblige them to yield their place to those which are to succeed, and to form new families for themselves; but when this season is passed, the fawns again return to their mother, and remain with her some time; after which they separate entirely, and remove to a distance from the place which gave them birth.

The female goes with young five months and a half, and brings forth about the end of April or beginning of May. The hinds, or female stags, on the contrary, go with young above eight months, and this difference is alone sufficient to prove that these animals are so remote from each other in species as to prevent their ever intermixing or producing an intermediate race. By this difference, as well as that of figure and size, they approach the goat, as much as they recede from the stag, and go with young nearly the same time. The female, when about to bring forth, retires to the deep recesses of the forest. In ten or twelve days the fawns acquire sufficient strength to enable them to follow her. When threatened with danger, she hides them in a close thicket, and to preserve them allows herself to be the object of pursuit. But notwithstanding all her care and anxiety, the young are sometimes carried off by men, dogs, or wolves. This is, indeed, the time of their greatest destruction. As the roes love hills, or plains on the tops of mountains, they never stay long in the deep recesses of the forest, nor in the middle of extensive woods, but give the preference to the skirts of woods which are surrounded with cultivated fields, and to open coppices which produce the berry-bearing alder.

About the end of the first year, when the fawns are separated from their parents, the first horns begin to appear, in the form of two knobs, much less than those of the stag. Contrary to those of the stag, which are cast in the spring and renewed in the summer, the horns of the roe fall off at the end of autumn, and are replaced in the winter. When the roe-buck has renewed his horns, he rubs them against the trees, like the stag, in order to free them from the velvety skin with which they are covered, and this commonly happens about the month of March, before the trees begin to shoot. The second horns of the roe have two or three antlers on each side; the third three or four; the fourth four or five, and after this their horns are seldom furnished with a farther number of antlers. The horns of the old ones are distinguished after this by the thickness of their stems, the largeness of the bar, pearlings, &c. As long as the horns continue soft, they are extremely sensible: of this Buffon describes a striking example. The young shoot of a roe-buck's horn was carried off by a ball, the animal was stunned, and fell down as if he had been dead. The shooter, who was near, seized him by the foot; but the roe-buck suddenly recovering his senses and strength dragged the man, though he was strong and alert, thirty paces into the wood. After killing him with a knife, it was discovered that the roe had received no other wound.

As the female roe goes with young only five months and a half, and as the growth of the fawn is more rapid than that of the stag, the duration of her life is much shorter, seldom extending perhaps beyond twelve or fifteen years. They are delicate in their choice of food, and require a great deal of exercise, free air, and much room, which is the reason they are unable, after the first year of their growth, to resist the inconvenience of domestic life. They may be tamed,

but can never be rendered obedient or familiar. They always retain a portion of their natural wildness, are easily terrified, and then run with such violence against the walls that they often break their limbs. However tame they may be apparently, they are not to be trusted, and the males in particular, being subject to dangerous caprices; they take aversion to certain persons, and make furious attacks with their horns, the blows of which are sufficient to throw a man on the ground, after which they continue to trample on him. The roe-buck bellows, but less frequently than the stag, neither is his voice so strong or loud. The young ones utter a short and plaintive cry, *mi mi*, by which they indicate their want of food. This sound is easily imitated, and the mother, deceived by the call, will come up to the very muzzle of the hunter's gun.

In winter the roes frequent the thickest coppices, and feed upon brambles, broom, heath, and the catkins of the hazels and willows. In spring they repair to the more open brush-wood, and eat indiscriminately the buds and young leaves of other trees. They never drink except in the very height of summer, when the weather is hot in the extreme, the moist dews with which the herbage at other times abound being sufficient to allay their thirst. The flesh of the roe is excellent when in good order, but the quality of the venison depends much on the country they inhabit; and even the best countries produce good and bad kinds. The flesh of the brown roe is preferred to that of the red fort. All the males after the age of two years have the flesh hard and ill-tasted, but that of the females though farther advanced in age is more tender. That of the fawns, when very young, is loose and soft, but at the age of eighteen months, it is in the highest state of perfection. Those which live in plains and valleys are not good; those which come from moist countries are still worse: those brought up in parks are insipid; and, lastly, there are no good roes but those of dry elevated countries, interperfed with hills, woods, cultivated and fallow land, where they enjoy plenty of air, food, freedom, and solitude; for those which have been often disturbed are meagre, and the flesh of those which have been hunted is insipid.

The roe was formerly very common in Wales, in the North of England, and in Scotland, but at present the species exists in no other part of Great Britain beside the Scottish Highlands, and even there are far from common at this period. In France they were more frequent, but for the last fifty years their numbers have been rapidly diminishing. They are found in Italy but very rarely, and they are much scarcer in Sweden and Norway than formerly. According to Pennant, the first that are to be met with in Great Britain are in the woods on the south side of Loch Rannoch, in Perthshire; and the last in those of Langval, on the southern borders of Caithness, but they are most numerous in the beautiful forests of Invercauld, in the middle of the Grampian hills. In Ireland they are unknown.

The usual size of the roe is three feet nine inches from the nose to the tail; the height before two feet three inches, but behind two feet seven inches. The tail is about an inch long; the horns six or eight inches long; the general colour of the animal reddish brown, with the rump white. Like other quadrupeds it is sometimes found perfectly white, and Buffon mentions upon the authority of Count Melin, a race of coal black roes that exists in a very small German district called the forest of Luca, in the dominions of the king of England as duke of Lunenburg. This variety is said to be constantly the same, resembling the common sort in size, and every other particular except in colour.

MUSTJAC. With trifurcated horns originating from a cylindrical

cylindrical hairy base, and the upper fork hooked; from the horns to the eyes three longitudinal furrows; upper tusk projecting. *Cervus Muntjac*, Gmel. Schrebr. *Ribfaced deer*, Penn. *Le Chevreuil des Indes*, Buff.

This species, which is somewhat smaller than the common Roe-buck, and of a thicker form like the porcine deer, is a native of Java and Ceylon. The bony processes upon which the horns are placed, are elevated three inches from the skull, and covered with hair; but what seems principally to distinguish this animal is the appearance of three longitudinal ribs extending from the horns to the eyes. It also differs from most species of the same genus in having a tusk in the upper jaw. The animal was first described by Pennant, who informs us it is called by the Javans Munt-jak, whence its specific name, and in the Malay tongue Kidarg. Mr. Pennant further adds, that the pedicels or pillars on which the horns stand grow thicker as the animal advances in age, and the margins swell out all round, so that if the horns are forced off the pedicels, the surface of the last has the appearance of a rose. In Allamand's description of this species it is added, that the tongue is so extremely long, the animal can extend it even beyond the eyes. Vide Buff. T. 6. suppl.

GUINEENSIS, Grey, beneath blackish. *Cervus Guineensis*, *griseus*, *subtus nigriscans*, Linn. Mus. Ad. Frid. *Grey deer*, Pennant.

Described by Linnæus as being the size of a cat; the colour grey, with a line of black above the eyes, and on each side of the throat another black line pointing downwards; the middle of the breast black; fore legs and sides of belly as far as the hams marked with black; tail beneath black; ears rather long. As the horns were wanting in the specimen described by Linnæus, it is doubtful whether this obscure animal be of the cervine tribe, or not. It is mentioned as a native of Guinea.

CERVUS volans, in *Entomology*, the name given by certain authors to the insect called in England the itag-beetle, *Lucanus cervus* of Linnæus, *cerv volant* of the French. See **LUCANUS CERVUS**.

CERYCIUS Mons, in *Ancient Geography*, a mountain of Greece, in Bœotia, according to Pausanias, who adds, that Mercury was said to be born there. From his description, it appears that this mountain was comprised in the town of Tanagra.—Also, a mountain of Asia Minor, in Ionia, near the town of Ephesus.

CERYNEA, a mountain of Peloponnesus, in Arcadia, according to Pausanias.

CERYNEA, or **CERINÉ**, a town of Achaia, N.W. of Bura, and near the gulf of Corinth. It had its name, says Pausanias, from the small river *Cerynite*, which flowed from a mountain of the same name, and passed near it. The inhabitants of Mycenæ retired to this city, when they were compelled by the fierce jealousy of the Argians to quit their own country. At Ceryne was a temple of the Eumenides, said to have been founded by Orætes.

CERYNIA, a town in the northern part of the island of Cyprus, E. of Lapathus.

CERYX, in *Antiquity*. The *ceryces* were a sort of public ministers appointed to proclaim or publish things aloud in assemblies.

The *ceryx*, among the Greeks, answered to the **PRÆCO** among the Romans.

Our cryers have only a small part of their office and authority.

There are two kinds of *ceryces*, *civil* and *sacred*.

CERYCES, *civil*, those appointed to call assemblies, and make licence therein; also to go on messengers, and do the office of our heralds, &c.

CERYCES, *sacred*, were a sort of priests, whose office was to proclaim silence in the public games and sacrifices, publish the names of the conquerors, proclaim feasts, and the like. The priesthood of the *ceryces* was annexed to a particular family, and the descendants of Ceryx, son of Eumolpus. To them it also belonged to lead solemn victims to slaughter. Before the ceremonies began, they called silence in the assembly, by the formula, *Εὐχρηματε στυγ ἀπὸς τῶν αἰῶν*; answering to the *Facete linguas* of the Romans. When the service was over they dismissed the people with this formula, *Ἄκου ἀδελφί, Ἴτε μίσση εἶψ*.

CERYX, in *Conchology*, a name by which Pliny and other old authors have called a variety of shells in the *buccinum* and *murex* genus.

CESALPINI. See **CÆSALPINUS**.

CESANO, in *Geography*, a small stream of Italy, in the duchy of Urbino, between which, and the river Misa, which runs through Senegaglia, are some ancient ditches marking the limits of the Roman camp; and on the other side of the Cesano some antiquarians imagine they have discovered the traces of the Carthaginian camp. It is certain, however, that Afrubal (whose name a neighbouring mountain still bears), brother to Hannibal, lost both his army and his life in a battle fought in these parts.

CESAR. See **CÆSAR**.

CESARE, in *Logic*, a mode of syllogisms in the second figure wherein the major proposition and conclusion are universal negatives, and the minor an universal affirmative. Such is,

CE *No man who betrays his country deserves praise.*

SA *Every virtuous man merits praise.*

RE *Therefore no man who betrays his country is virtuous.*

CESAREA, in *Geography*, a town of Asiatic Turkey, in the province of Caramania; 40 miles S. E. of Yurcup.

CESARI, **GIUSEPPE**, in *Biography*. See **ARFINAS**.

CESARIA. See **COHANZY**.

CESARIAN scilicet. See **CÆSARIAN scilicet**.

CESARINI, **JULIAN**, in *Biography*, a cardinal of Rome, was born of an ancient but indigent family in this city towards the latter part of the 14th century; and having studied at Perugia, Padua, and Bologna, he taught canon law for some time at Padua. Accompanying cardinal Branda da Castiglione as secretary upon his legation to Bohemia, he was distinguished by his skill in the conduct of public affairs. On his return to Rome, he was deputed by pope Martin V. as his nuncio first to France, and then to England, maintaining in both countries, with great firmness, the claims of the holy see, and establishing his character for integrity by refusing all presents. As a recompence he was raised to the purple in 1426; and then sent to Bohemia, in order, by arguments and arms, to oppose the heresy of the Hussites. As his success was not equal to his zeal, he was recalled by Eugenius IV. and deputed to preside at the council of Basil, where he gained singular reputation by his learning and eloquence. He first took part with the synod against the pope in their disputes; but at length he was gained over, and sent to the papal synod at Ferrara. Here he distinguished himself in his controversy with the Greek schismatics. After the termination of this council, he was sent by Eugenius as legate to Hungary, in order to induce Ladislaus, king of Hungary and Poland, to break the treaty of peace which he had made with sultan Amurath. His reasoning prevailed against the arguments of the hero Huniades; and he solemnly absolved Ladislaus from his oath to the Turkish monarch. The consequence was the fatal battle of Varna, in 1444, in which the Christians were defeated with great slaughter, and Ladislaus was killed. Cesarini also fell a victim

victim on this occasion to his own counsel. Of his letters, orations, and disputations, many are published in the acts of the councils to which they belong. Du Pin's E. H. of the 15th century, vol. xiii. p. 87. Moreri.

CESARINI, VIRGINIO, the descendant of a noble family, was born at Rome in 1595, and at an early age perfected himself in almost every kind of literature, so that he was regarded as an universal genius. He was not only learned in the Greek and Latin languages, but profoundly skilled in philosophy, altronomy, history, geography, medicine, jurisprudence, oratory, and poetry. Cardinal Bellarmine compared him to the famous Pico della Mirandola, and he was honoured with a medal which bore the head of Pico and his own united under a crown of laurel. He was a very distinguished member of the academy of Lyncei, and intimate with prince Frederic Cesi, its founder. Urban VIII. made him one of his chamberlains, and designed him for the cardinalate; but his course of honour terminated in 1624, at the early age of 30 years. His admirable intellectual qualities were united with modesty, civility, and private worth. His only publication was a collection of Latin and Italian poems, the former of which display singular elegance and amenity, though the style was not rendered perfect for want of time. Several of them are printed in a collection, entitled "Septem Illustrium Virorum Poemata," Antwerp, 1662, and since reprinted. At the request of cardinal Bellarmine, he had undertaken an ample demonstration of the immortality of the soul, which, with some other works, remained incomplete. His bust, in marble, was placed in the capital with a pompous eulogy. Favoriti, a learned prelate, wrote his life. Moreri. Gen. Biog.

CESARIO, Sr. in *Geography*, a town of Naples, in the province of Otranto; four miles W.S.W. of Lecce.

CESATA, in *Ancient Geography*, a town of Spain, between Arriaca and Seguntia, according to the Itinerary of Antonine. Ptolemy, who calls it *Cesata*, says, that it was a town of Celtiberia, in the Tarragonens.

CESBEDIUM, a temple of Asia, in Pamphylia. Ptolemy says, that it was dedicated to Jupiter, and that it served as a citadel to the town of Selga.

CESCUM, a town of Asia, in Cilicia, according to Pliny.

CESENA, in *Geography*, a town of Italy, in the province of Romagna, seated on the road from Rimini to Ravenna, on the riv. r Savio, at the foot of a hill, on which stands a ruined citadel. The see of a bishop suffragan of Ravenna. It has good churches and convents, and the houses are generally well built; 18 miles S. of Ravenna. Near it, on a hill, stands a Benedictine convent, to which belongs the church of Sta. Maria del Monti de Cesena.

CESENA, an ancient town of Gallia Cispadana, situate to the S.E. of *Forum Livii*. It is said to have been founded by the Galli Senones, 391 years B. C. It remained under the power of the Hieruli, and was besieged without effect by Theodoric. This prince, however, gained possession of it after the death of Odovac, when Liberius, the commandant, surrendered it to him, A. D. 493. Having suffered much in different wars, it was partly consumed by a fire.

CESENATICO, a small sea-port of Italy, inhabited chiefly by fishermen, in the Adriatic, in the province of Romagna, which has an excellent harbour and commodious canal, with a bridge, erected in 1716. near which are two fine marble pillars of the Corinthian order; 3 miles N.E. of Cesena.

CESI, a town of Italy, in the province of Umbria; seated on the edge of a lofty mountain, or rock, exposed to the sun during its whole course from its rising to its setting.

CESION, or **CEDES**, in *Ancient Geography*, a town of Judea, in the tribe of Issachar, according to the book of Joshua. It was given to the Levites of this tribe, who were of the family of Gerthen.

CESIS, in *Botany*, a name by which some authors express the common *daucus sylvestris*, wild carrot, or bird's nest.

CESLES, in *Geography*, a town of Hungary; 5 leagues N.N.E. of Stul-Weissenburg.

CESPEDES, PABLO (PAOLO or PAUL) DE, in *Biography*, an eminent historical painter of Spain, was born at Cordova, of which he was afterwards dignitary, between the years 1530 and 1540. He was a man of extensive talents and profound erudition, so that, by the Spanish writers, he has been extolled as an universal genius. He travelled twice to Rome in order to perfect himself in the art of painting, to which he was peculiarly addicted; and he formed his style after that of Michael Angelo, whom he also imitated in uniting architecture and sculpture with painting. During his residence at Rome, he supplied a head to a famous antique trunk of Seneca in white marble; and when the original head was afterwards discovered, that of Cespedes was thought to be superior. He also painted in fresco at the Trinita Monti at Rome and in other places. On his return to Spain he adorned with his performances the churches of Seville and other cities in Andalusia; but his principal pictures are found at Cordova. His Last Supper in the cathedral is singularly famous, both for variety of expression and tone of colouring, in which last quality he is thought to have approached the manner of Corregio. His drawing, anatomy, and perspective, are eminently correct. The circumstance in which he was held by Federico Zuceari is evinced by the following anecdote. When this artist was applied to by the bishop and chapter of the cathedral of Cordova for an altar piece, he peremptorily declined the commission, alleging that while Paolo de Cespedes was in Spain, there would be no occasion to send into Italy for pictures. As an author, Cespedes wrote a treatise on the antiquities of the church of Cordova, proving it to have been a temple of Janus. Some of his works on painting are lost. His moral character was exemplary. He died at his native place in 1608, and was buried in the cathedral. Pilkington by Fuseli. Cumberland's Anecd. of Spanish Painters, vol. 1.

CESPITOSE, in *Botany*, producing several stems from the same root, so intermingled and matted together as to form a turf.

CESSAIRES, in *Geography*, a territory northward of Patagonia in South America, in the 48th degree of S. lat. inhabited by a mixed tribe of that name, descended from the Spaniards, being the crews of three ships that were wrecked on this coast in 1540.

CESSAT Executio, in *Law*. In trespass against two persons, if it be tried and found against one, and the plaintiff takes his execution against him, the writ will abate as to the other; for there ought to be a *cessat executio* till it is tried against the other defendant; 15 Edw. iv. 11.

CESSTATION, the act of intermitting, discontinuing, or interrupting the course of any thing, work, action, or the like.

CESSTATION of arms, in a *Military Sense*, signifies a total discontinuance or suspension of warlike operations or acts of hostility for a limited time during a state of warfare. See **CAPITULATION**.

CESSTATION, Cessatio à divinis, in the *Romish Church*, is a penalty inflicted for any notorious injury to the church, by putting a stop to all divine offices, and the administration

tion; the former living is, *ipso facto*, void; and this kind of avoidance of a living is called cession. See DISPENSATION.

In case of a cession under the statute, the church is so far void upon institution to the second living, that the patron may take notice of it, and present if he pleases: but it seems that a lapse will not incur from the time of institution against the patron, unless notice be given him; but it will from the time of induction. 2 Will. 205. 3 Burr. 1504.

What is called cession in other benefices, is called *consecration* in relation to a bishoprick; for if an incumbent be made a bishop, his benefice is said to be *void by consecration*: and to such benefice or benefices the king shall present for that time, whoever is patron of them; in the other case the patron may present. See COMMENDAM.

CESSIONARY, a bankrupt. Sometimes it denotes an assignee.

CESSITANUS, in *Ancient Geography*, an episcopal town of Africa, in Mauritania Caesariensis.

CESSOR, in *Law*, one delinquent and delinquent in his duty, or services, and who thereby incurs the danger of the law, and is liable to have the writ *cessavit* brought against them. When it is said the tenant *cessavit*, it means he ceaseth to do his duty, or service, to which he is bound.

CESTAYROLS, in *Geography*, a town of France, in the department of the Tarn; 3 leagues N. of Alby.

CESTI, IL PATRE MARCO ANTONIO, d'Avanzo *Minor Conventuale e Cavaliere dell' Imperatore*, in *Biography*, an Italian vocal composer of music, of considerable eminence in the 17th century. He set an opera for Venice, in 1643, called *Orontea*, which was revived at Milan, with the same music, in 1662; at Venice, 1666; at Bologna, 1669; and again at Venice, 1683; always *colla Musica stessa*, during 34 years!

It has been extremely difficult to find any of the music of the early operas that was not printed. Luckily, a scene of Cesti's celebrated opera of *Orontea*, composed in 1649, and afterwards so frequently revived, was found in the music-book of Salvator Rosa, in that painter's own hand-writing. (See Hist. Mus. vol. iv. p. 67.) This air is supposed to have been the first Italian in measured melody that was introduced at the termination of a scene of recitative.

Cesti is said to have been a disciple of Carissimi, which is hardly reconcilable with the date of this opera, as Carissimi did not begin to be known at Rome till after the year 1640. Adami says, that Cesti was admitted as a tenor singer in the Pop's chapel, 1660; and that "the most celebrated of all his operas, of which five were composed for Venice, was *La Doris, il lumi maggiore dello stil Teatrale*." This opera first appeared at Venice, 1667, and was not only revived there in 1669, and 1671, but frequently performed with great applause in the other principal cities of Italy. Songs have, since these times, been so much composed to display the peculiar talents and abilities of singers, that operas can never be successfully revived but where the same performers, who sang in them originally, happen to survive, and to be engaged at the same theatre; which is not likely to happen at the distance of many years. Indeed, it is contrary to the chances against it, such a concurrence of circumstances should take place, twenty or thirty years generally make such havoc with fine voices, fine taste in singing, and fine feelings in judging, that it is by no means certain that they would then please the same critics as much as formerly.

The number of cantatas that *Cesti* produced, seems incalculable; as in every old library or collection of Italian old vocal music, that we have examined abroad and at home,

we find more of his cantatas than of any other author. At Christ Church, Oxford, in the collection of Dr. Aldrich, in the British Museum, in the d'Arcy collection of the late Earl of Holderness, in that of Lord Keeper North, of Sir Roger Peltreange, and of all the ancient families who cultivated music in the 17th century, we found innumerable cantatas by Cesti; and it appears in these cantatas, that he was a great inventor of recitative. See OPERA, CANTATA, and RECITATIVE.

CESTLE, in *Ancient Geography*, a town of Italy, in Liguria, at a small distance E. of Quadrata, and N. of Rigomagus.

CESTISSA, a town of Lower Pannonia, according to Ptolemy. The Itinerary of Antonine marks it on the route from Annona to Sirmium, between Leuconum and Cibale.

CESTRATUM, a work enamelled, or painted with a cession. The word is also written *cestrostrum* and *cestrostratum*.

CESTREUS, or rather CESTRUS, in *Ichthyology*, the name of a fish described by old writers as being of the mullet kind, but having a much smaller and narrower head, and its sides variegated with much shorter longitudinal lines. From the description we suspect the Gmelinian *Gobius Gronovii* must be intended, a fish which Ray describes as mullet (*Mugil Americanus*), and Klein as *Cefelus argenteus*, griseis lineis intertextis, oculis ellipticis, pinnis albicantibus, pinna dorsali maxima. See *Gobius Gronovii*.

CESTRI, in *Ancient Geography*, an episcopal town of Asia, in Isauria.

CESTRINA, a small country of Epirus.

CESTRON, in *Antiquity*, the instrument wherewith they painted or enamelled, in horn, or ivory.

CESTROPHENDONUS, or rather CESTROSPHENDONE, from *κείρα*, or *κερας*, *tragula*, and *σφειδον*, *fundula*, a sort of military engine with a sling, for throwing barbed darts or javelins. Also, the dart or javelin itself, which took its name from the sling with which it was thrown, and is said to have been balanced with feathers like an arrow, and pointed at both extremities. It was made use of by the Macedonians, under Perseus, against the Romans.

CESTROS, or CESTRUS, in *Ancient Geography*, a river of Pamphylia.

CESTRUM, in *Botany*, (*Κεστρον*, Diosc. and Gal. a name supposed to be given by those writers to *Betonica*.) Linn. gen. 302. Schreb. 431. Willd. 387. Juss. p. 126. Vent. vol. 2. p. 376. Gart. 493. Clafs and Order, *pentandria monogynia*. Nat. Order, *Luride*, Linn. *Solanaceae*, Juss. Vent. *Bastard jessamine*. *Cestrum*, Fr.

Gen. Ch. Cal. one-lobed, tubular, very short, five-toothed, erect. Cor. monopetalous, funnel-shaped: tube cylindrical, very long, slender, orifice roundish; border five-lobed, spreading, short; segments equal. Stam. filaments five, filiform, attached longitudinally to the tube of the corolla, in some species furnished with a little tooth in the middle or towards the base; anthers roundish, within the tube. Pist. germ superior, cylindrical, egg-shaped; the length of the calyx; style filiform, the length of the filaments or longer; stigma thickish, obtuse. Peric. berry egg-shaped, one-celled. Linn. Gart. two-celled, Adanson. Lam. Seeds several, angular, affixed to a thick receptacle in the middle of the berry.

Ess. Ch. Calyx short, five-toothed. Corolla tubular. Berry one-celled. Seeds affixed to a thick receptacle in the middle of the berry.

Obs. Gærtner observes, that though there may possibly be two cells in the germ, there are no traces of a partition

in the ripe berry. It appears to us that La Marck considers the receptacle as a partition, which he ought not to have done, unless that receptacle had been so extended through the middle of the berry, as to cut off all communication between its sides.

Sp. 1. *C. nocturnum*, Linn. Sp. Pl. 1. Lam. Encyc. and Ill. 1. Pl. 112. fig. 1. Mart. 1. Willd. 2. Gart. tab. 77. fig. 9. (*Jasminoides*, Dill. Elth. tab. 153. fig. 185.) "Flowers peduncled, somewhat racemed, greenish; filaments toothed; berries white." A shrub from six to nine feet high, branched in its upper part. Branches cylindrical, smooth, dotted, generally inclining to one side. Leaves near four inches long, one and a half broad, alternate, petioled, ovate-lanceolate, smooth, green, sometimes spotted with yellowish white. Flowers in axillary bunches. Berries a little smaller than a pea. A native of the island of Cuba, flowering in August and September, where, on account of its yielding a pleasant smell in the evening, it is called the Lady of the Night. Cultivated long since by the Duchesse of Beaufort at Badminton and thence known by the name of Badminton Jasmine. It does not ripen its berries in England. 2. *C. Parqui*, Mart. 7. Lam. Ill. 2. Willd. 3. L'Herit. Strp. 4. tab. 36. (*C. Jamaicaense*, β . Lam. Encyc. Parqui, Penill. obs. 3. tab. 32.) "Leaves narrow-lanceolate, stipuled; flowers somewhat racemed, fasciated, yellowish green; berries violet." A fetid shrub, about six feet high. Stems several, upright, round; branches alternate, spreading, round, with a few tubercles. Leaves alternate, lanceolate, very acuminate at each end, entire, somewhat waved, smooth, bright green on both surfaces, spreading; petioles very short; stipules linear. Flowers sessile or nearly so, smelling sweet in the night; bracte linear, acute, spreading; calyx two lines long, smooth, permanent; corolla inserted into the receptacle, almost naked; tube eight lines long, club-shaped at the top; segments of the border lanceolate, acuminate, spreading and finally turned back; filaments closing the tube with their teeth, pubescent at the base, the length of the tube; anthers two-celled, yellow; stigma oblate-spheroidal, excavated, large. Berry small, egg-shaped. Seeds three or four, angular. A native of Chili. Introduced at Paris from seeds sent by Dombey. 3. *C. auriculatum*, Mart. 6. Lam. Ill. 3. Willd. 4. L'Herit. Strp. tab. 35. (*C. hediunda*, Lam. Encyc. 2. Hediunda, Pcuill. obs. tab. 20. fig. 3.) "Flowers peduncled, somewhat panicled; stipules eared, surrounding the branch." A fetid shrub, about fifteen feet high. Branches round, olive green or ash-colour, almost smooth. Leaves alternate, four inches long, one inch and a half broad, petioled, oblong-lanceolate, acute, smooth, entire, green, but paler underneath; stipules axillary, of the same form with the leaves. Flowers greenish, with a tinge of dull red, nearly sessile, in terminal and axillary clusters; bractes few, linear; calyx somewhat hairy, pressed close; corolla somewhat hairy on the outside; tube swelling at the top; divisions of the border linear-lanceolate, very sharp, two-furrowed, spreading; filaments very short, without teeth. Berry with about five seeds. A native of Peru, where it is used externally to cleanse foul ulcers, and internally in the venereal disease. It is also regarded as a pectoral. According to Father Fenné, it yields, during the night, a pleasant smell, resembling that of musk, which, as soon as the sun rises, is changed into a highly offensive odour, and so continues during the whole day. Dombey observed it in wet places about Lima. It was introduced into this country about 1774, but has rarely flowered, and never borne fruit. It flowers in winter. 4. *C. vespertinum*, Linn. Mant. 266. Mart. 2. Lam. Ill. 4.

Willd. 6. (*C. Jamaicaense*, Lam. Encyc. 2. *Jasminum*, Burm. Amer. tab. 157. fig. 1. *Ixora alternifolia*, Jacq. Amer. tab. 177. fig. 8.) "Flowers fasciated, nearly leaf-like; border acute; berries ovate-shaped, dark violet." A tree, twelve feet high. Stem not very strong. Leaves alternate, on short petioles, length double the breadth, acute, quite entire, green on both sides, concave, with the edges raised and waved. Flowers crowded, in nearly sessile racemes, greenish-white, often tinged with purple or violet, alternate, diverging, separated by ovate-oblong bractes; tube very slender; border with five acute expanding segments; filaments without a tooth. Berries resembling an olive, but only half the size, nearly black. Seeds four, oblong. A native of the West Indies. Cultivated by Miller in 1759. 5. *C. pallidum*, Lam. Encyc. 4. Ill. 5. (*Jasminum laurinus foliis*, Sloan, Hist. jam. 2. p. 96. tab. 204. fig. 2. *Syringa laurifolia* *Jamaicensis*, Pluk. Alm. 359. tab. 64. fig. 3.) "Racemes compound, axillary; flowers small, pale; berries inversely egg-shaped, dark blue." The synonyms are referred by Linnæus to *C. nocturnum*, but La Marck asserts, that it is a perfectly distinct species resembling *C. laurifolium* in the form of its leaves, and *C. vespertinum* in the colour of its fruit, and clearly distinguished from all the three by the smallness of its flowers. A shrub, seven or eight feet high. Branches smooth, thick set with leaves near the summit. Leaves alternate, petioled, oval-acute, an inch and half broad, smooth, dark green. Flowers scarcely six lines long, pale or yellowish, smooth; border expanded; segments short, rather acute. A native of Jamaica, described by La Marck from a dried specimen in the herbarium of Jussieu. 6. *C. scandens*, Willd. 5. Vahl Eclog. 1. p. 24. "Filaments toothlets; leaves egg-shaped, attenuated, smooth; racemes axillary, somewhat compound; branches climbing." A native of St. Martha. 7. *C. birtum*, Willd. 10. Mart. 5. Swartz prod. 49. Flor. ind. occident. 1. p. 478. "Flowers somewhat spiked, axillary; leaves somewhat heart-shaped, acute, hairy underneath; branches hairy." Nearly allied to *C. nocturnum*, but distinguished from it by its leaves, which are broader, larger, wrinkled, and hairy underneath; and by its flowers, which are somewhat spiked and crowded. 8. *C. latifolium*, Lam. Ill. 6. Willd. 11. Vahl eclog. 1. p. 25. "Racemes very short, axillary; leaves egg-shaped, smooth; bractlets and petioles somewhat downy." It differs from the preceding in having its leaves not at all heart-shaped, and not hairy underneath; the segments of the corolla acute, not obtuse; and its stigma capitate, not b. d. Swartz and Willd. 9. *C. laurifolium*, Mart. 5. Lam. Ill. 7. Willd. 1. L'Herit. Strp. nov. 69. tab. 34. Smith spicil. tab. 2. (*C. venenatum*, Lam. Ill. 5. *Laurolea*, Pluk. alm. 209. tab. 95. fig. t.) "Flowers nearly sessile, axillary, fasciated; border obtuse; leaves elliptical, coriaceous, quite smooth." A shrub, from six to nine feet high. Stem erect, round, with a rugged ash-coloured bark. Branches alternate, stiff, in the upper part somewhat angular, leafy, many-flowered. Leaves alternate, an inch and half broad, elliptic-oblong, a little pointed, entire, obscurely veined, very smooth and shining, paler beneath, always short, smooth, flat above, dark purple; stipules none. Flowers pale yellow, or marked with a gold-coloured streak, rather short; bractes four, egg-shaped, obtuse, hairy, small, deciduous; calyx bell-shaped, minutely ciliated on the margin, permanent; corolla four times longer than the calyx; segments of the border, obtuse, spreading; filaments nearly as long as the tube, attached to it by more than half their length, and joined where they separate from it, frequently furnished with a tooth-like protuberance; anthers roundish, two-

lobe-d, incumbent, half within the tube; germ superior, egg-shaped, five-channeled, smooth, on a rather large five-cornered receptacle; style somewhat thickened at the top, rather shorter than the stamens; stigma obtuse, impressed. Dr. Smith and La Marck. 10. *C. venentum*, Willd. 8. Thunb. prod. 36. "Leaves lanceolate-oblong, coriaceous; flowers sessile." It seems nearly allied to the preceding, but distinct. Willd. 11. *C. tomentosum*, Linn. jun. supp. 150. Mart. 4. Lam. Enc. 7. Ill. 8. Willd. 9. "Flowers crowded, terminal, sessile; branches, leaves, and calyxes downy." The form of the flowers and leaves the same as in *C. diurnum*, but, in addition to the difference expressed in the specific character, the calyxes are larger, the corollas coloured, the tube shorter, and the border more ample. 12. *C. diurnum*, Linn. Sp. Pl. 2. Mart. 3. Lam. Encyc. 8. Il. 9. Willd. 7. L'Herit. florp. nov. 74. (Jasminoides, Dill. elth. 186. tab. 154. fig. 186.) "Fascicles peduncled; corollas white; border obtuse, reflex d; leaves ovate-lanceolate." *Stem* from ten to twelve feet high, slender, with a cinereous bark, dividing at the top into many smaller branches. *Leaves* alternate, petioled, near three inches long, one and a half broad, oval-oblong, acute, smooth, deep green above, pale underneath, shining, evergreen, in consistence resembling those of spurge laurel. *Flowers* small, white, smelling sweet in the day-time, and thence called *Lady of the Day*, growing almost in umbels; common peduncles axillary, from one to three inches long; corolla five lines long; segments short, oval, reflexed, waved, and almost crisped at their edges; filaments toothless. A native of Chili and the West Indies. 13. *C. oppositifolium*, Lam. Ill. 10. Pl. 112. fig. 2. flowers ill-drawn. "Leaves opposite, lanceolate, nerved, somewhat coriaceous; flowers fascicled, sessile, axillary." A native of Africa, observed by Sonnerat. 14. *C. nersosium*, Mart. 9. Miller 3. "Leaves opposite, lanceolate, with transverse peduncles branched." *Stem* shrubby, five or six feet high, covered with a brown bark, and dividing at top into very small branches. *Leaves* about four inches long, little more than one broad, smooth, light green. *Flowers* white, axillary, towards the ends of the branches, four or five on each peduncle, without scent; tube of the corolla swelling at the base just above the calyx, contracting towards the mouth; segments of the border broad, flat. Sent to Mr. Miller from Carthagea, in New Spain. Nearly allied to the preceding, if not the same.

CESTRUM, in *Gardening*, affords plants of the shrubby exotic flowering kind: of which the species are, the night-smelling *Cestrum*, (*C. nocturnum*;) and the day smelling *Cestrum*, or *Balfard Jasmine*, (*C. diurnum*;) and other more tender species may be cultivated for variety.

The first of these rises with an upright stalk, about six or seven feet high, covered with a greyish bark, and divides upward into many slender branches, which generally incline to one side, and are garnished with leaves placed alternate, near four inches long, and one and a half broad, smooth on their upper side, of a pale green, and, on their under side, they have several transverse veins, and are of a sea-green colour, having short foot-stalks; the flowers are produced at the wings of the leaves, in small clusters standing upon short peduncles, each sustaining four or five flowers, of an herbaceous colour, appearing in August, but which are not succeeded by berries in this climate. It is a native of the island of Cuba, &c.

And the second species rises with an upright stalk to the height of ten or twelve feet, being covered with a smooth light green bark, dividing at top into many smaller branches, with smooth leaves near three inches long, and one and a

half broad, of a lively green colour, and the consistence of those of the spurge laurel; these are ranged alternately on the branches. Towards the upper part of the shoots come out the flowers from the wings of the leaves, standing in clusters close to the branches, which are very white, shaped like those of the first sort, and smell sweet in the day-time, whence it had the appellation of *Lady of the Day*. The berries are smaller than in the first sort. It flowers in the autumn, and is a native of the Havannah, &c.

Method of culture. In these plants the mode of increase is either by seeds or cuttings; but as the former cannot be easily procured, the latter is the more common method of practice. The seeds should be sown in pots filled with light friable fresh earth in the early spring season, and plunged in a gentle hot-bed. After the plants are sufficiently strong, they should be removed into separate pots, shade and a little water being given occasionally, till they are well root'd again, and become perfectly established.

The cuttings must be made from the side shoots, the length of five or six inches, and be planted in pots of fresh earth in the former season, plunging them in a bark hot-bed, a little water and shade being given till they have stricken firm root; and in both methods the plants require to be kept afterwards in pots filled with light earth in the stove of the hot-house.

The evergreen flowery nature and fragrance of these plants afford a fine effect, when placed in assemblage with other live exotics.

CESTUI, a French term, literally signifying *he or him*; frequently used in our law writings. Thus,

CESTUI que trust, is he in trust for whom, or to whose use or benefit, another person is enfeoffed or seized of lands or tenements. By stat. 29. Car. II. c. 3. lands of *cestui que trust* may be delivered in execution.

CESTUI que vie, one for whose life any lands or tenements are granted.

CESTUI que use, he to whose use another man is enfeoffed of land or tenements. 1 Rep. 137.

Enfeoffers to uses were formerly deemed owners of the lands; but now the possession is adjudged in *cestui que use*, and without any entry he may bring assise, &c. Stat. 27 Hen. VIII. c. 10. Cro. Eliz. 46. See *Uses*.

CESTUS, among *Ancient Poets, a fine embroidered girdle worn by Venus, endowed with a faculty of charming, and conciliating love. The abbé Winckelmann observes, that this goddess, when dressed, has always two cinctures; one immediately beneath the breast, and the other round the lower part of the body, above the hips. In proof of this observation, he refers to the Venus of the Capitol, and the statue of the goddess in the possession of lord Egremont. It is the lower cincture which is properly the *cestus* of Venus. When Juno, wishing to inflame the heart of Jupiter, solicited and obtained the loan of this mysterious girdle, she put it, according to Homer, not upon the ordinary cincture, immediately under her breast, but where Venus wore it, *below*: for that such is the true sense of $\tau\omega\ \delta\epsilon\ \iota\ \nu\epsilon\ \kappa\alpha\theta\ \alpha\ \nu\epsilon\ \rho\ \nu\epsilon\ \alpha$, (Il. l. 14. v. 219.) is evident from the context, which informs us, that Juno was already encompass'd with a zone, profusely adorned with fringe. (v. 181.) Of this mystic *cestus* Homer has given the following description, (l. 14. v. 215—218.) which we shall here subjoin in the words of his translator:*

"In it was ev'ry art, and ev'ry charm,
To win the wisest, and the coldest warm;
Fond love, the gentle vow, the gay desire,
The kind deceit, the kill-reviving fire,

Perfusive

Persuasive speech, and more persuasive sighs,
Silence that spoke, and eloquence of eyes."

Pope.

This fiction, which is extremely beautiful, has been happily imitated by Tasso, in his magic cincture of Armida.

The cincture of virginity, *zona virginea*, or *cingulum virginium*, which was worn at Rome by females newly married, before they surrendered themselves to their husbands, was also called *cestus*. It was formed of wool, and served as the symbol and defence of the modesty of the married female; and it was reserved for the bridegroom to untie this mylærian cincture. Whence *zonam solvere* was used to denote being married. Thus Catullus (67. 14.);

"Quod possit zonam solvere virgineam."

The expression of untying the cincture signified, among the Greeks, the first mutual access of the married pair. Accordingly, the scholiast of Apollonius, (Argon. i. 2St.) says, that the females of Athens consecrated at this period their cinctures to Diana, who had in this city a temple, where she was honoured under the title of *ἄρτεμις*, or the deity who untied the cincture.

The word is also written *cestum*, and *ceston*: it comes from *κίτος*, a *girde*, or other thing embroidered, or wrought with a needle; derived, according to Servius, from *κεῖται*, *pungere*: whence also *incestus*; a term used at first for any indecency by undoing the girde, &c. but now restrained to that between persons near akin. See *INCEST*.

CÆSTUS, *CÆSTUS*, *CESTE*, in *Antiquity*, a large leathern gantlet loaded with lead or other metal, which the ancient Athletes used in their exercises for disputing the prize of pugilism. The Greeks had four kinds of *cestus*. The first was of an ox hide not dressed, and dried, and was called *ἰπαις*, or *ἰπαιστῆρος*. The second was loaded with metal, and called *Μυρμυρῆς*. The third was made of fine and soft thongs, leaving the fist and fingers uncovered. And the fourth was the large globular gantlet first mentioned, and called *Στάσις*. See *CÆSTUS*.

CESURE, or *CÆSURA*, in *Poetry*. See *CÆSURA*.

CETACEOUS Animals, in *Zoology*. See *CETE*.

CETÆUM, in *Ancient Geography*, a promontory of India, in that part which was S. E. of the island of Taprobana, according to Ptolemy.

CETARIA, a town placed by Ptolemy on the western coast of Sicily.

CETE, in *Zoology*, the seventh order of mammalia, in the Linnæan System of Animals, including the four genera, *MONODON*, or narwal; *BALÆNA*, whale; *PHYSETER*, cachalot; and *DELPHINUS*, dolphin. The cetaceous tribe has one or more spiracles placed on the fore part of the skull; no feet; pectoral fins without nails, and tail horizontal.

It is well observed by the late Mr. Hunter, in one of his papers on the whale (Phil. Transf.), that the cetaceous order of animals has nothing peculiar to fish, except living in the same element, and being endowed with the same powers of progressive motion as those fishes which are intended to move with considerable velocity. The popular idea of cetaceous animals being fishes is so strongly impressed on the public mind, that it can never, perhaps, be entirely removed, for the critical observations of naturalists appear too absurd to be generally examined, and of consequence to be commonly understood. The cetaceous tribes live in the same element as fishes, and, partaking somewhat of their external figure, will ever be considered as appertaining to that class of animals by the less informed portion of mankind. Ray and Willughby, and, after their example, Pennant, are the only writers of any moment who acquiesce in this popular preju-

dice, with the exception of the earlier authors. The writings of Ray and Willughby appeared before the time of Linnæus, or it is likely they would have been reconciled to the arrangement of the latter: it was through the observations of Linnæus chiefly that the world became acquainted with the true distinction between the animals of the cetaceous tribe, and fishes, as founded on anatomical investigation. Pennant was acquainted with the circumstances that induced Linnæus to place them with the mammalia, but notwithstanding considered it more natural to follow Ray, and place them in the rank of fishes, because, as Ray observes, "the form of their bodies agrees with that of fish: they are entirely naked, or covered only with a thin skin; and they live entirely in water, and have all the actions of fish." Much as we respect the talents of our illustrious countryman, Ray, it is difficult to perceive, in the present instance, sufficient reasons for preferring his arrangement to that of Linnæus. The first is founded on a vague resemblance in external figure between cetaceous animals and fishes, without regard to their internal organization, while the latter rests on an unshaken basis; it was the result of much anatomical investigation, and a due consideration of the nature, habits, and affinities of these two tribes of animals. We need only add, on this point, that the recent observations of that great comparative anatomist, Mr. Hunter, have perfectly evinced the accuracy of the Linnæan distribution of these animals, and that it has obtained the further countenance of Pallas, Schreber, Fabricius, Muller, Bonnaterre, and most other naturalists of distinguished celebrity in Europe at the present day.

Cetaceous animals, or, as Dr. Shaw expresses them, "fish-formed mammalia," have lungs, intestines, and other internal organs formed on the same principle as in quadrupeds; and, indeed, on strict comparison, the principal differences that exist between them will not be found very considerable; one of the most material seems to consist in their want of posterior legs, the peculiar structure of the tail supplying that defect, this being extremely strong and tendinous, and divided into two horizontal lobes, but which has no internal bones. Like quadrupeds, they have a heart furnished with two auricles, and two ventricles, and their blood is warm and red: they breathe by their lungs, and not by means of gills, as in true fishes. In their amours they agree with quadrupeds; the female produces her young alive, which rarely happens among fishes, and she suckles them with her teats, as in the true mammalia. The structure of their brain, their sexual organs, stomach, and liver resemble those of mammiferous animals. Their skin is smooth, or not covered with scales; and their tail is placed in a position the very reverse of fishes, in being always flat and horizontal, instead of vertical. The cetaceous animals of the cachalot and dolphin genera have the mouth armed with conic teeth; the whales with bony laminae in the upper jaw; and the narwal with teeth, or tusks of enormous length. They are neither sanguinary nor ferocious. Their stomachs are large, and divided into chambers to the number of five, as in the whale and porpoise, or even seven, as in the narwal. In the last particular they seem to constitute an intermediate link between carnivorous and herbivorous animals, approaching nearly to ruminating quadrupeds; but differ in subsisting on animal food, as they live chiefly on actiniae, medusæ, and other zoophytes, on crustaceous animals, and on small fish. See the articles *MONODON*, *BALÆNA*, *PHYSETER*, and *DELPHINUS*.

CETERACH, in *Botany*, Bauh. Pin. See *ASPLENIUM Ceterach*.

CETERACH,

CETERACH, in the *Materia Medica*, an officinal, agglutinant plant; the same with what is otherwise denominated *asphacium* and *subopendicum*. See **ASPLENIUM**.

This plant stands recommended as an excellent diuretic, and a promoter of the *menfes*. The whole plant is to be used, and should be gathered in the month of September. It is given by some in jaundices, in quartan agues, and in obstructions of the spleen; but it is much neglected in the present practice. In some parts of Essex, where it is common on the walls of their churches, and on the tombs in the church-yards, the common people tell us wonders of its effects in the stone.

CETERIS paribus. See **CATERIS paribus**.

CETHUS, in *Ancient Geography*, a river of Asia, in Carmania.

CETHU, a people of Asia Minor, in Mysia; mentioned by Homer, and Strabo. The latter says, that Euryppilus, their king, had his territories about the Caius, near Chicia. They probably took their name from the river Cetium, which traversed their country, and discharged itself into the Caius.

CETINA, in *Geography*, a town of European Turkey, in Dalmatia; 50 miles W.N.W. of Moflar.

CETIS, or **CITIS**, in *Ancient Geography*, a country of Asia Minor, in Cilicia-Trachea. It was the seat of a priesthood founded by Ajax, son of Teucer, and of which the pontiff was also the sovereign.

CETIUM, a place of Norica, between Comagenus and Arlape, according to the Itinerary of Antonine.

CETIUS, a mountain of Norica, according to Ptolemy; and in the Itinerary of Antonine marked between Vindebona and Arlape. Buefching suppos'd that the ancient Cetius is a ridge extending from near the source of the river Save, towards the Danube, about 9 British miles on the west of Vienna, where it is called Leopoldsbürg. The general name is the *Kalenberg*; which see.

CETOBRIGA, **SERUVAL**, denoting the town of fishes, and inhabited by fishermen, belonged to Lusitania. Without tracing the origin of this city, with some fanciful antiquaries, to Tubal, who say that he came into Spain in the year from the creation, 1801, we may affirm, with greater probability, that it had suffered much about 33 years B. C. by an African pirate or sovereign (Bogud), who, having landed at Portus Annibali, and pillaged the adjacent dwellings, doubled the Promontorium Sacrum (Cape St. Vincent), and took possession of the town by surprise. The inhabitants were put to the sword, without distinction of age or sex; and the town was then sacked, its walls destroyed, and its buildings set on fire. Other Portuguese authors say, that Marcus Portius Cato, after having conquered the Spaniards, destroyed Cetobriga. Another opinion has prevailed, which ascribes the destruction of this ancient city to an earthquake. In its vicinity, to the extent of more than a league, there have been found the ruins of many buildings, and abundance of antiquities; and as no medals have been found belonging to the period immediately subsequent to that of Hercules, it is probable that Cetobriga was destroyed either in his time or soon after.

CETON, in *Geography*, a town of France, in the department of the Orne, and district of Mortagne; 10 miles S. E. of Belleme.

CETRA, in *Ancient Italian Language*, a short buckler or short square target, which was very light, and used by the Africans and Spaniards, and was made, as some say, of the lizard's hide; and as others, of elephant's skin, but occasionally, it is probable, of both. From the great resemblance

of the cetra to the pelta Livy gave the name of cetati to the Macedonian pelicans.

CETRIBONI, in *Ancient Geography*, a people of India, who, together with the *Gopi*, occupied the territory between the river Janan and the gulf of Parale, according to Ptolemy.

CETRON, a town of Palestine, which appears, from the books of *Judith*, to have been situated in part to the tribe of Zabulon; but they were unable to take possession of it from the Canaanites, to whom it belonged.

CETRÆ, a town of Greece, in Attica; which pertained to the Leontidee tribe, according to Strabo.

CETTE, in *Geography*, a sea-port town of France, in the department of Herault, and chief place of a canton, in the district of Montpellier, where the canal of Languedoc commences; 14 miles S.W. of Montpellier. The place contains 7700, and the canton the same number of inhabitants; the territory includes 404 kilometres, and one commune. N. lat. 43° 21' 51". E. long. 3° 41' 7".

CETUMA, in *Ancient Geography*, a town placed by Ptolemy in Ethiopia, near Egypt.

CETUS, in *Astronomy, the *Whale*; a large constellation of the southern hemisphere (being one of the 48 old asterisms) under Pisces, and next the water of Aquarius. The Greeks pretend that it was the sea-monster, sent by Neptune to devour Andromeda, but was killed by Perseus.*

The stars in the constellation *Cetus*, in Ptolemy's Catalogue, are twenty-two; in Tycho's, twenty one; in Hevelius's, forty-five; in the Britannic Catalogue, ninety-seven.

The star α Ceti, in the neck of the Whale, is subject to great variations in its lustre and apparent magnitude; appearing brighter and fainter by turns, which changes may be owing to the alternate revolution of its bright and dark sides towards us, as it turns on its axis, or else to the star's having a flattish figure. The period assigned by Bouillaud to these changes is 333 days; but Dr. Herschel, who has shewn from various observations the great range of its lustre, remarks that the above period does not agree with present observations compared with those of Fabricius made on the 13th of August, 1596, when this star was in its greatest lustre. M. Cassini also found, that his observations, in the beginning of August, 1703, when the star was brightest, did not agree with the interval of 333 days; and therefore, supposing the star to have changed 117 times since the epoch of Fabricius, he gave it a period of 324 days. This, however, says Dr. Herschel, will not agree with the present time of the changes; and it appears now that M. Cassini ought to have assumed 118 instead of 117 variations, which would have pointed out a period of 321 days and some hours. That this is probably very near the real time of the star's variation will be perceived, when we admit it to have undergone 214 changes between the 13th of August, 1596, and the 21st of October, 1793; by which one interval we obtain the period of 321 days, 10 hours, 19 minutes. The different determinations of the length of this period assigned by different authors, may be accounted for by admitting the star to be subject to considerable alterations in the emission of light from some parts of its surface, which being more copious sometimes in one place, and sometimes in another at some small distance, will give a different result to the observations of the time of its maximum; while, notwithstanding, the general period of its changes will not be considerably affected by it. We have a similar instance in the variation of Jupiter, which seems to vary on account of the little stability of its spots. See Phil. Trans. 1781. pt. 1. p. 123 to 128. Hevel.

Hevel. in Phil. Transf. N^o 66. p. 2028. Marsh. in Mem. Acad. Scienc. Ann. 1719. p. 122. seq. Phil. Transf. for 1792. vol. lxxxii. p. 24. &c. Id. for 1756. pt. ii. p. 464. p. 479.

CEVA, in *Geography*, a city and fortress of Italy, in the principality of Piedmont, and con. é. of Aiti, the capital of a marquisate, situated on the Tanaro; in a plain surrounded by hills, at the extremity of the country, which extends from the Appennines to the Tanaro, and from thence to the northern part of the marit. m. Alps. It was anciently celebrated for its cheese, made of ewe's milk. This cheese, called by the Italians "Rubiola," is much esteemed, even at present, and sold not only into Piedmont and the Milanese, but other more distant parts. The hills about Ceva also produce excellent wine; great quantities of chestnut grow at the foot of the mountains, and excellent truffles are found on the neighbouring plains. It was formerly an independent state; but in 1295 a great part of the domain was sold to the town of Aiti, whence, in 1521, it came to the house of Savoy. In 1543, it was besieged unsuccessfully by the French: and in 1584, a sudden inundation beat down a great part of the walls, destroyed the bridges, houses, and churches, and drowned many of its inhabitants; and in 1625, and the five following years, a pestilential disease carried off the greater number of the survivors. Ceva was taken by the French, in the month of April, 1796. It has one collegiate church, and three convents. It is distant 40 miles W. from Genoa, and 25 S.S.E. from Turin. N. lat. 44° 20'. E. long. 7° 51'.

CEVADILLA, SEBADILLA, or SARADELLA, i. e. *Hordelum*, little barley, in *Botany*, the South American name of the *Hordelum* exoticum causticum of Caspar Bauhin, taken up by him, Ray, and Parkinson, on the authority of Nicholas Monardes, who attributes to it the habit of the European barley, with a seed not larger than that of the common flex, but possessed of highly acrid qualities, of which the inhabitants of New Spain avail themselves in the cure of gangrenes and other foul ulcers. He says they have the same effects as corrosive sublimate, or the actual cautery; and that the mode of using them is to sprinkle a little of the powdered seed upon the part, or for the greater safety, to dilute it with water liquors, and apply lint dipped in the mixture. In Linnæus's "Amœntates Academicæ," they are said to be the most effectual of all medicines for destroying cutaneous insects in children. In our country they are very rarely met with, but in France they have been ranked among the officinals and obtained the name of the Capuchin powder. They have been administered internally for the expulsion of worms; but caution is necessary in the use of them. See Murray's Apparatus Medicamentum, vol. v. p. 166. &c.

CEVUDUM, or CEVELUM, in *Ancient Geography*, a place of Bætic Gaul, marked in the table of Ptolemy on the route from Noviomagus to Atuaca or Atuataca, and supposed by M. D'Anville to be the present Cuié.

CEVENNES, in *Geography*, the principal center of the primitive mountains of France, arising to the west of the Rhone, seeming to run from north to south, and sending out various branches towards the east and west. The principal branch runs along the river Ardeche towards Ales. Another traverses the Rhone, on the side of Tournon and Vivane, towards the plains of Dauphiné. Another branch forms the mountains of Beaujolais, passing by Tarare, Autun, &c. till it be lost at Auxen. This is about 70 leagues in length, but in breadth sometimes not more than a league; it contains the copper mines of Chess and St. Bel, and some lead mines. Coal is also found in the declivities. A fourth branch separates the basin of the Loire from that of the

Allier, and forms the mountains of Forez. It passes Roanne on the one side and Thiers on the other, and is lost towards St. Pierre le Montier. The plain of Mombriouff is bounded by this and the last granitic branches. A fifth branch separates the basin of the Allier from that of the Cher, and passes by Clermont to Montlucan. A sixth stretches towards Limoges; another from the Dordogne towards the Charente; and an eighth branch divides Dordogne from the Garonne. These mountains are naturally dry and barren, and are a most entirely formed of steep rocks; and yet labour and industry have converted them into fertile lands, so that a soil which in past ages would not have afforded subsistence for one family of savages, does at this moment support two or three hundred thousand inhabitants. M. Chaptal has described two processes, which are practised for this purpose. It is a well known fact that the waters which flow down the sides of a mountain carry the earth along with them, and wear furrows or ravins of a greater or less depth, according to the hardness of the rock and steepness of the descent. By a series of these progressive degradations the hardest rock is laid bare, deep ravins are cut in the face of it, and every resource of which the cultivator might avail himself is utterly destroyed. The inhabitants of the Cevennes have found means to correct this double effect of the waters. In order to fill up a ravine, they begin by raising at the foot of the mountain a wall consisting of loose stones quite across the ravine, and of a height corresponding to its depth. This wall forms a kind of dyke, opposing its flank to the current of the waters, and suffering them to pass through while they are clear; but when, after a storm or sudden shower, they become turbid, and bring down earth and stones, these substances are deposited against the wall, while the waters escape through the stones nearly pure. By the continuance of this process, the triangular space above the wall at length is filled. At the other extremity of this plat of new formed ground, another such wall as the first is built, and this in the same manner detains the earth and vegetable mould, thus forming a second piece of ground. By a succession of similar operations, other platforms are produced; till at length the whole ravine is inverted, even to the summit of the mountains, into a number of plateforms of good ground, forming steps one above the other. Under these circumstances, the waters no longer run in destructive torrents down the sides of the mountains, but flow gently along the level ground, or are filtered through the porous earth deposited against the walls that detain and support it. Thus the mountain, which formerly presented to view a scene of desolation, is made to exhibit amphitheatres of vegetable ground capable of the richest cultivation. When these natural difficulties are overcome, the husbandman plants the vine against the upper part of the wall; or on the small platforms above described he plants mulberry-trees, and cultivates potatoes, Indian corn, and every kind of grain; varying his culture to the greatest advantage on this virgin soil, which is well watered, and in general of the highest fertility. The vines, trees, and other vegetable products render the ground firm, and defy the floods of subsequent times.

By another process the inhabitants of the Cevennes give fertility to the slope of a calcareous mountain. Most of these mountains are formed by beds of stone about half a yard in thickness; and the different strata consist of themselves one above another, corresponding to the inclination of the mountain. The cultivator, in order to render all these stages of equal breadth, breaks away the rock, and employs the fragments in constructing a low wall on the edge of the platform itself. He then fills the cavity with a bed of vegetable earth, taken out of the clefts of the rock, or conveyed

veyed on his back from the foot of the mountain, where it has been gradually deposited by the waters. In this manner, after unremitting labour, the side of the mountain becomes covered with low walls parallel to each other, which confine beds of vegetable earth from one to three yards in width. When these beds of earth are removed, and the walls overlet by a violent storm of wind or rain, the inhabitant of the Cevines exert himself in preventing or repairing the destructive ravages of the elements. At the first indications of an approaching fire, he clothes himself in a long garment of oil cloth, with an enormous hat of tinned iron, firmly fixed by means of straps. Thus defended, with a mattock in his hand, he directs the water to the feet of his trees, and collects the fungus in cavities, which he had previously formed in the rock itself. By these laborious exertions he constantly prevents inundations, and procures water for his grounds at times when the burning heats rendered them necessary. Such instances of agricultural exertion are not unfrequent in the Cevennes; and by such methods one of these mountains is converted, from a state of absolute barrenness to a high degree of fertility, and covered from its base to the summit with trees, fruits, grain, and other useful productions. This practice of converting the sides of mountains into platforms for the purposes of agriculture is common in China, and gives a singular aspect to the country around Canton; but by the inhabitants of the Cevennes the barren mountains themselves instead of being left in a state of nature, are rendered fertile.

CEVERTA, a town of Naples in the province of Calabria Ultra; 10 miles N.N.E. of Bova.

CEURAWATH, the name of a particular sect of Banians in the East Indies, who hold the metempsychosis with so much superstition, that they will not kill the least insect; their priests carry a piece of linen over their mouth, that no flies may enter. All the other sects of Banians have an aversion for this; and continually exhort their auditors to shun all discourse and conversation with them. See BANIANs.

CEUTA, in *Geography*, a sea port town of Africa, in the kingdom of Fez, and province of Gurb, on the south coast of the Mediterranean, belonging to the Spaniards, and serving as a harbour for small vessels. It is the see of a bishop, suffragan of Lisbon. This place corresponds with the Exilissa of Ptolemy, and probably with the Septa and Arx Septentis of Procopius, who intimates, as others have done, that this latter name was derived from the seven hills in its neighbourhood, called by Mela Septem Pares. It has been conjectured, that it was built by the Carthaginians, and afterwards belonged to the Romans, by whom it was colonized. In the time of the Gens, it was a station of great eminence; being the metropolis of the places which they held in Hispania Transfretana. It was afterwards abandoned to the Arabs and the Moors by Count Julian; and taken from the Moors in 1409 by J. III. king of Portugal, and continued annexed to that crown till the revolution in 1640, when it fell to Spain, and was finally ceded to that country by the treaty of Lisbon in 1588. It has been no less considerable for its advantageous situation at the entrance of the Mediterranean on a rising ground, which is the nearest point to the Spanish coast, than for the beauty of its public buildings and the strength of its walls and bulwarks; and it has still a good palace and noble cathedral. The Moors laid siege to it in 1607, and have occasionally kept it in a state of blockade since that time. It is distant from Gibraltar about 3 leagues. N. lat. 35° 48'. W. long. 5° 25'.

CEYLON, an island of the East Indian ocean, that lies between 6° 51' and 9° 52' N. lat.; and between 79° 43' and 81° 56' E. long. It is situated at the entrance of the bay

of Bengal, by which it is bounded on the north. On the north-west it is separated from the Coromandel coast by the gulf of Manaar, a narrow strait, full of shoals, and impassable by large ships. It is distant about 60 leagues from cape Comorin, the southern point of the peninsula of India, which divides the Coromandel and Malabar coasts. Its circumference is computed to be about 900 miles; and its length from point Pedro at the northern extremity (6° 52' N. lat.) to Donderhead or Dundra Head at the southern (5° 51' N. lat.) is about three hundred miles. Its breadth is very unequal, being in some parts only from 40 to 50 miles, while in others it extends to 60, 70, and even 100. Towards the southern parts it is much broader than in the northern, and nearly resembles a ham in shape; and the peninsula of Jafnapatam has received from the Dutch the name of "Hamshiel," and point Pedro they call "Hamshiel's" point. Major Rennell (See Memoir, p. 449.) has collected a variety of observations, tending to ascertain the true figure of this island.

Ceylon is the Taprobana of the ancients; though they very much differed in fixing its position. Prior to the age of Alexander the Great, the name of Taprobane was unknown in Europe. In consequence of the active curiosity with which he explored every country that he subdued or visited, some information concerning it seems to have been obtained. From his time almost every writer on Geography has mentioned it; but their accounts of it are so various, and often so contradictory, that we can scarcely believe that they are describing the same island. Strabo, the earliest writer now extant, who has given any particular account of it, affirms that it was as large as Britain, and situated at the distance of 7 days according to some reports, and according to others, of 20 days sailing from the southern extremity of the Indian peninsula; from which, contrary to what is known to be its real position, he describes it as stretching towards the coast above 500 stadia. (Geog. l. ii. 124. 180. 192. l. xv. 1012.) Pomponius Mela, the author next in order of time, (De Situ Orbis l. iii. c. 7.) is uncertain, whether he should consider Taprobane as an island, or as the beginning of another world; but as no person, he says, had ever sailed round it, he seems to incline toward the latter opinion. Pliny (Nat. Hist. l. 6. c. 22.) though his description of this island is more ample, involves every thing relating to it in additional obscurity. After enumerating various and discordant opinions of Greek writers he informs us, that ambassadors were sent by a king of that island to the emperor Claudius, from whom the Romans acquired the knowledge of several particulars, which were formerly unknown; particularly that there were 500 towns in the island, and that in the center of it there was a lake 200 miles in circumference. These ambassadors were astonished at the sight of the Great Bear and Pleiades, which were constellations that did not appear in their sky; and they were still more amazed when they beheld their shadows pointing towards the north, and the sun rising on their left hand and setting on their right. They also affirmed, that in their country the moon was never seen until the eighth day after the change, and continued to be visible only to the sixteenth. Such are the particulars, some of which are totally groundless, which Pliny relates, and in which he acquiesces without animadversion. Ptolemy, though living near the age of Pliny, seems to have been altogether unacquainted with his description of Taprobane, or with the embassy to the emperor Claudius. He places that island opposite to Cape Comorin, at no great distance from the continent, and delineates it as stretching from N. to S. no less than 15 degrees, two of which he supposes to be S. of the equator; and if his representation of its dimensions had been just, it was well entitled

From its magnitude to be compared with Britain. (Ptol. l. vii. c. 4.) Agathemerus (lib. ii. c. 8. apud Hudfon. Geogr. Minor. vol. ii.) who wrote after Ptolemy, and was well acquainted with his geography, confiders Taprobana as the largell of all iflands, and affigns to Britain only the fecond place. Miled by thefe accounts of the ancient geographers, the moderns have entertained very different fentiments concerning the ifland in the Indian ocean, which was to be confidered as the fame with the Taprobana of the Greeks and Romans; and therefore fome learned men have erroneouly maintained that Sumatra was the ifland correſponding to the description of Pli-y and Ptolemy. The opinion more generally received is, that the Taprobana of the ancients is the ifland of Ceylon; and not only its vicinity to the continent of India, but the general form of the ifland, as delineated by Ptolemy, as well as the poſition of ſeveral places in it, mentioned by him, eſtabliſh this opinion with a great degree of certainty. Under the emperor Juſtinian, Cosmas, an Egyptian merchant, in the courſe of his traffic, made ſome voyages to India, whence he acquired the ſurname of Indicoopleukis; and from him we learn, that the ifland of Taprobana, which he ſuppoſes to lie at an equal diſtance from the Perſian gulf in the weſt, and the country of the Sinae on the eaſt, had become, in conſequence of this commodious ſituation, a great ſtaple of trade; that into it were imported the ſilk of the Sinae and the precious ſpices of the Eaſtern countries, which were conveyed thence to all parts of India, to Perſia, and to the Arabian gulf. To this ifland he gives the name of "Sicediba" (lib. xi. 336.) nearly the ſame with that of "Selendib" or "Serendib," by which it is ſtill known all over the eaſt. Cosmas further informs us, that in moſt of the cities in India he found chriſtian churches eſtabliſhed, in which the functions of religion were performed by prieſts ordained by the archbiſhop of Seleucia, the capital of the Perſian empire, and who continued ſubject to his juuriſdiction. According to his account, however, none of theſe ſtrangers ſettled in India, were accuſtomed to viſit the eaſtern regions of Aſia, but were ſatisfied with receiving their ſilk, their ſpices, and other valuable productions as they were imported into Ceylon, and conveyed thence to the various parts of India. Theſe churches were eſtabliſhed by the Neſtorians, who ſent miſſionaries from Perſia into India, and particularly into Ceylon. Our knowledge of this ifland, and other parts of India, was further extended by means of the commercial ſpirit and ſucceſſive voyages of Marco Paolo, a Venetian of noble family, who, about the middle of the 13th century, explored many regions of the eaſt, which no European had ever viſited. He alſo viſited in perſon Java, Sumatra, and ſeveral iflands contiguous to them, the ifland of Ceylon, and the coaſt of Malabar as far as the gulf of Cambay; to all which he gives the names they now bear.

In the traditiary accounts which are current among the Ceylonſe, nothing occurs beſides a mere catalogue of ſome of their princes, accompanied by a long liſt of high-founding titles, and ſome uninterſtling details of their petty wars and commotions. From ſome of theſe accounts, which have been recorded in MS. we learn, that Lankaw Petti Mahadafyn, or the much beloved offspring of the always moving fun, who lived at a diſtant period, was ſovereign of the whole ifland. His two grandſons, however, quarrelled about the poſſeſſions which had been left them, and at laſt compromiſed their diſputes by dividing the ifland between them: to the one were allotted the interior parts which form the preſent kingdom of Candy (ſee CANDY), and to the other the whole of the low country bordering on the ſea-coaſts. This diviſion gave riſe to a long ſeries of civil wars, and ſet the exam-

ple of partitioning the kingdom among the children of the ſovereign; and hence we find that there were not leſs than fix or ſeven princes who reigned at the ſame time over ſeparate diviſions of Ceylon. After a variety and ſucceſſion of quarrels between its princes, Ziralde Darma Seria Adafeyn ſubdued all his competitors, and firmly eſtabliſhed himſelf as its ſole monarch. He married his couſin, who was fo famed for her perſonal charms, as to acquire the name of "Roke Wandiggie," or the beautiful queen. From this union ſprung the princes who ruled over Ceylon, when it was firſt viſited by the Portugueſe.

The earlieſt period at which we can look for any authentic or intereſting information, is that of the arrival of the Portugueſe under Almeyda, in the year 1505 or 1505. Being accidentally forced by ſtorms of weather into one of the harbours of Ceylon, he was hofpitally received by the inhabitants; and perceiving the advantages that might reſult from the ſituation of the ifland, and its valuable productions, he thought it an object worthy of his attention to cultivate a cloſer connection with the natives, to which they were alſo inclined, with the view of defending themſelves againſt the attacks of the Arabs. Almeyda, upon being introduced to the king of Ceylon, found no difficulty in perſuading him to pay an annual tribute to the Portugueſe, on condition of their proteſting his coaſts from external invasion, with which he was then threatened by the Zamarin of Cochlin on the Malabar coaſt, and a rajah who reigned on that part of the Coromandel coaſt oppoſite to Ceylon. At this time the inhabitants conſiſted of two diſtinct races of people. The ſavage Bedas (ſee BEDAS) then occupied, as they do now, the large foreſts, particularly in the northern parts; and the reſt of the ifland was in the poſſeſſion of the Cingleſe. The towns of the ſea-coaſt were not raviſhed from the latter people by foreign invaders; and their king held his court at Columbo (ſee COLUMBO), which is now the European capital of Ceylon. Cinnamon was even then the principal product, and the ſtaple commodity of the ifland, as appears by the tribute paid by the king to the Portugueſe, which conſiſted of 250,000 pounds weight of cinnamon. Almeyda, whoſe attention was attracted by the rich harveſt which the cinnamon of Ceylon preſented to commerce, ſoon endeavoured to ſecure theſe advantages by forming a Portugueſe ſettlement on the ifland; but this conduct rouſed the jealousy and indignation of the native princes. The reigning ſovereign was a Brahmin, and encouraged a trade which his ſubjects then carried on with the Moors and Malabars of the continent; and they, fearing leſt their traffic would be cut off by theſe ſtrangers, began to foment jealousies between the king and the Europeans. Although Almeyda had obtained the monarch's permiſſion to traffic with the natives, and to build a fort at Columbo, the Moors contrived to induce the king to repent of his grants, and to revoke them. After a vigorous conteſt, and in conſequence of ſome internal troubles which then diſtracted Ceylon, the king was obliged, in 1522, to renew the original treaty, and to grant full permiſſion to build a fortrefs at Columbo. A conteſt, however, enſued, in which the Ceylonſe were completely defeated; and the Europeans acquired ſuch ſuperiority, that the king, deſpairing of recovering Columbo, only thought of preventing the Portugueſe from extending their poſſeſſions. With this view he erected a ſtrong fortrefs at Sittavacca, 35 miles from Columbo, and ſecured the paſſes of Cuddavelli and Garawaddi, which led into the interior of his dominions. The Portugueſe, on the other hand, began to foment internal diſſenſions among the natives. The king was weak and irresolute; and as the encroachments of the Portugueſe increaſed, and they began to treat the natives with great cruelty, an

ambitious person of low birth, named Raja Singa, seized the advantage of the moment, and by his talents and impetuous rise to the highest rank and power. Such was his ascendancy over the king, that most of the nobles were seduced in order to satisfy his jealousy and ambition; and he terminated his career by murdering the king himself, and usurping the throne. Raja Singa granted the people by a long course of implacable hostilities against the Portuguese; but the natives themselves soon found that the tyranny and cruelty of this usurper knew no bounds. At length his subjects of the low lands, exasperated by his barbarities, sought relief from the Portuguese, who readily availed themselves of the occasion. It was at this time they had at first an opportunity of exploring the N.W. parts of the island. Among those who sought the protection of the Portuguese, were two sons of Vinna, who, in consequence of an insurrection excited by him against Raja Singa, had made himself master of several of the internal provinces. These young men, having escaped the usurper, were kindly treated by the Portuguese, converted to their own religion, and baptised under the names of Don Juan and Don John. One of them was to be appointed king, and the other generalissimo; and in return for these promised benefits, they were to marry Portuguese ladies, and to own subjection to the crown of Portugal. In the mean while it was publicly announced, that Don Juan was to marry Donna Catherina, the daughter of the late king Adaseyn, who had been murdered by Raja Singa. As this princess was the lawful heirress of the whole empire, the Portuguese, who were her ostensible and avowed protectors, were enabled to form a powerful party among the natives against the usurper, and to obtain over him a decisive victory. Upon this, they immediately crowned Don Juan king, and put him in possession of Candy. Don John, however, offended by this preference of his brother, contrived to poison him, and to seize the royal authority. The Portuguese auxiliaries were now summoned to quit the dominions of Candy; and Raja Singa taking the field, threatened Don John and his adherents with the most cruel death. A desperate battle was fought between the two usurpers, and the issue was the complete overthrow of Singa, who soon after died. After his death, Don John found another competitor in his minister Janiere Wandaar, who, having taken possession of his master's treasures, proclaimed himself king, and applied to the Portuguese for succours, which were readily granted him. The Portuguese, who had received a reinforcement from Goa, marched against Don John, gave him a complete overthrow, and obliged him to take refuge in the woods. In consequence of this advantage, they began to tamper with the inferior princes, and attempted to persuade the Ceylonese to acknowledge the sovereignty of the king of Portugal; but the natives were unanimous and urgent in their request, that Donna Catherina, the daughter of their beloved emperor, should be placed on the throne. The Portuguese consented to this proposal, hoping that her youth would allow them to exercise an uncontested government under the mask of her authority. During the festivities that took place on her return from Manaar to Candy, Don John, in the disguise of a beggar, attempted to set fire to Candy; but frustrated in his object, a reward was offered for apprehending him, and he escaped with difficulty. The Portuguese thinking their power secure, renewed the exercise of their wonted perfidy and cruelty. The natives, incensed by the injuries they suffered, formed a league against their oppressors, at the head of which was Janiere, who had been deluded by the Portuguese with the promise of marrying Donna Catherina, after she had been quietly seated on the throne; and who resented the delusion by opening a

negotiation with Don John, to whom he offered the dominion of the low lands, provided he was allowed to retain undisturbed possession of the interior. The Portuguese, on discovering their correspondence, caused Janiere and his attendants to be murdered in the palace of Candy, where he then resided: upon which all the other princes, with their troops, immediately fled from the Portuguese camp, and the young queen herself loudly declared her abhorrence of the murder, threatening the Portuguese with the effects of their treachery. Accordingly the Portuguese, against whom the natives combined, were obliged to leave Candy, and to retreat towards the coast. They were pursued, however, by the Ceylonese, and in the end overpowered. Don John, availing himself of the victory, made himself master of the forts of the interior; compelled the princes, who had joined the Portuguese, to sue on their knees for mercy; and completed his career by marrying Donna Catherina, then 12 years of age. After many fruitless conquests, the Portuguese were overpowered by the natives; but they had contrived at an early period to secure the most important part of the island, viz. the sea coasts, where the valuable spices were produced. Under Albuquerque, the successor of Almyda, the rich low lands around Colombo and to the southward of it already formed a part of their dominions, and the natives from that time forward only obtained possession of them during some accidental incursions. Albuquerque extended his views to other parts of India; and Ceylon, instead of being made the centre and guardian of the Portuguese possessions in that part of the globe, continued to be cultivated by them chiefly on account of its own natural productions. The Portuguese conducted their government in a manner that alienated instead of conciliating the attachment of the natives; and beside other acts of insult and oppression, they treated their religious opinions with contempt, and persecuted those who held them with the most wanton cruelty. At length their religious bigotry of the Portuguese completely triumphed over their real interests; and the Cinglese regarded with horror strange gods, who seemed to delight in blood, and chose rather to leave the sea-coasts to their enemies, and to seek refuge for themselves and their grotesque idols in the mountains of the interior. Thither they were pursued by their tyrannical invaders; and in return the Cinglese made frequent incursions on the sea-coasts, and often destroyed the richest plantations of the Portuguese. This desultory warfare continued for almost a century, with much bloodshed, and no real advantage to either party. As the jurisdiction of the interior was at this time parcelled out among a variety of petty princes, each of whom was the sovereign of his particular tribe, or separate valley, the policy of the Portuguese led them to stir up animosities among them, and to prevent their making a common cause for the deliverance of their country. By acts of this kind they gradually extended their dominions into the interior of the island; and wherever they became masters, their avarice and bigotry prompted them to perpetrate such cruelties as have ever since rendered the name of an European hateful to the ears of a Cinglese. In this state of distress, the Cinglese were offered powerful assistance by the Dutch, whose admiral, Spilbergen, in the year 1602, ventured to approach the coasts of Ceylon; and the natives, from their hatred of the Portuguese, gave him a very favourable reception. At the time of their arrival, Don John was looked upon as emperor of the island; and to him Spilbergen was introduced, with the assurance that he and his countrymen were the inveterate foes of the Portuguese, and that they would effectually aid the Ceylonese in expelling the Portuguese from their island. The king of Candy received this proposal with great joy: "Tell your countrymen," said

said he, "that if they will only be willing to build a fort in this island, myself, my wife, and my children will be the first to supply them with the necessary materials." The Dutch lost no time in availing themselves of the advantages that were offered; and next year Sebald de Wert and Van Werweck arrived with seven ships, and in a conference with the king, proposed to conclude a treaty. A serious dispute, however, occurred, and Don John, under the sudden impulse of resentment, caused the Dutch commander, De Wert, and his attendants, to be instantly murdered. The king soon repeated of this rash act; and it is said that to the day of his death, which happened soon after, he lamented the murder of the Dutch. After the death of Don John, the inferior princes, hitherto awed by his authority, began to assert their independence; and the prince of Ouvé, the most powerful among them, openly aspired to the supreme dominion. The empress Donna Catherine, however, soon succeeded, by her activity and address, in reducing these disturbances. She refused an alliance with the Portuguese, and afterwards married Conveirat, a kinsman of the late king, and sent a deputation to the Dutch, requesting their assistance against the Portuguese. The Dutch speedily complied; and in 1612 Marcellus de Bouchover arrived at Candy as ambassador from the States of Holland, and was received with every possible mark of distinction; a chair of gold being prepared for him, and also robes of white, which is the royal colour. He concluded with the king a treaty, consisting of 33 articles. Among other stipulations, it was agreed that a permanent peace should be established between the Dutch and Candians; and in case of an attack by the Portuguese, the Dutch agreed to resist them with all their forces. In return, the king allowed the Dutch to build a fort at Cottiarum. They were also allowed to erect at Candy warehouses for goods. The king likewise engaged to convey all the merchandise of the Dutch to Candy, and whatever they purchased in his dominions to Cottiarum at his own charge. All his subjects were to be at liberty to traffic with the Dutch, who were allowed to export all sorts of merchandise free of duty. He also engaged to deliver to them all the cinnamon grown in his country, to be paid for in goods at the usual exchange rate. The king stipulated further not to grant free commerce to any European nation, without the express consent of the Dutch. The customs agreed upon by both parties were to be shared equally by the contracting powers. The king agreed to furnish the Dutch with timber, and other materials for ship-building, at a moderate rate, and he obliged himself to dispose of all his precious stones and pearls to the Dutch, at a fair rate; and they, on their part, stipulated to supply him with set jewels and other valuable ornaments. The king alone was to have the power of coining money, or to fix its value; and any subjects of either power who were convicted of coining base money were to be put to death. All the officers of the Dutch company were to be exempt from his majesty's jurisdiction, and to be tried for any offence by their own countrymen; and the same privilege was reciprocally extended to the subjects of the king. All prizes taken on the coast of Ceylon were to be shared equally between the contracting parties, provided the prisoners be ransomed and not put to death. Passes were to be granted by the Dutch officers to such of his majesty's subjects as intended to trade in the parts possessed by the company, and the same from the king to the Dutch subjects intending to traffic in his dominions; and all who traded without such passes were liable to be seized, and to have their goods confiscated. The contracting parties engaged to do their utmost to preserve inviolate the stipulations of this treaty, the principal of which have been above recited.

and to give full satisfaction for any damages incurred by the violation of them, as well as to inflict severe punishments on those who were guilty of infringing them. This treaty, which was concluded in the name of the king of Candy and the prince of Orange, displayed much seeming moderation on the part of the Dutch; and it would have been happy even for their own interests if they had maintained the same moderation in their transactions with the natives, after having gained a firm footing in the island, as while they were attempting to obtain a settlement by the arts of seduction. The Portuguese were alarmed at this alliance, and attempted to prevent its effect; but their efforts, though renewed with vigour for several successive years, proved ultimately unsuccessful. In 1656 the Portuguese were reduced to the necessity of surrendering Colombo to the Dutch, after a siege of seven months, and a loss to the combatants of not fewer than 3000 lives. By the fall of this place, an end in fact was put to the dominion of the Portuguese, about a century and a half after their first arrival. In 1658 the Dutch, under Vander Gocns, took Manaar, and the Portuguese were shut up in Jafnapatam, the only fort remaining in their possession. At length, after an obstinate defence, a Portuguese fleet, which attempted to relieve the place, being defeated, and no hope of success being left, the garrison surrendered, and the Portuguese were thus totally driven from the island.

The joy of the Ceylonese, on being rescued from the yoke of these tyrannical invaders, and their gratitude to their deliverers, at first knew no bounds. The king of Candy voluntarily paid the expences of their armaments in cinnamon; and conferred upon his new allies the principal possessions, from which he had by their assistance expelled the Portuguese. Among these were the port of Trincomalee, and the fortrefs of Colombo. The former of these, which lies on the N.E. part of the island, is that harbour which renders Ceylon the most valuable station in the Indian Ocean. Colombo was originally built by the Portuguese in the S.W. of the island, in the heart of that tract most celebrated for the production of cinnamon, as the most commodious for collecting that staple production of the country. Along with this port, the king of Candy also bestowed on the Dutch the towns of Nigumbo and Point de Galle in the same quarter, together with a large tract of rich land adjoining to them. The Dutch appeared exceedingly grateful to the Candian monarch for all these concessions; they assumed only the humble appellation of "Guardians of his coasts;" and began to fortify the different stations put into their hands, merely, as they said, for his security; and the Candians were so well convinced of the good intentions of their new allies, that they assisted them to the utmost of their power in completing their operations. The Dutch took this opportunity of increasing the strength of their principal port at Colombo; enlarging the town and rendering the fortifications as complete as possible. Their port of Trincomalee they also endeavoured to secure against any attack either from an external or a domestic enemy. Their numbers in the mean while were daily increasing by the access of new adventurers from Europe. The parts assigned to them were the best fitted for cultivation in the island; and they lost no time in turning them to the best account. By means of these prudent measures, and persevering industry, the colony was soon brought into a flourishing state, and was able to depend upon its own internal resources. During this period, they maintained the most friendly intercourse with the natives, and this conduct, besides favouring the uninterrupted prosecution of their plans of improvement, was also of very considerable benefit to their commerce. If the

Dutch had persisted in the same wise and moderate policy, it is probable that Ceylon would, in process of time, have become as profitable to them from their intercourse with the natives, as if it had been wholly possessed by Dutch settlers. But the ruling passion of the Dutch, their avarice, soon began to over-reach itself; and by rapaciously seizing every opportunity of gain, they quickly disgusted and alienated the natives. By pushing their posts farther and farther into the interior, and fixing upon every spot that seemed to be fit for cultivation; and at the same time by increasing their demands on the king for the protection they afforded him; the king soon found that all the cinnamon which grew in his dominions was insufficient to gratify the "Guardians of his coasts." At length, enraged by their repeated exorbitations, he fell suddenly upon their settlements, and committed the greatest devastations. This breach between the Candians and the Dutch was succeeded by a long course of hostilities, which occasioned the shedding of much blood, and afforded no permanent advantage to either party. The Dutch, however, were the greatest losers. Their successes in the interior, amidst woods and desiles, were dearly purchased; whilst the incursions of the natives into their cultivated possessions on the coasts, though in general easily repulsed, often destroyed the labour of years. Several of the Dutch governors were induced by these considerations to attempt the restoration of tranquillity, rather by conciliating the natives than by ineffectual struggles with them. Accordingly they sent ambassadors to the Candian king, with rich presents, and with various expressions of respect. They wrapped their letters to him in silk embroidered with gold and silver, and their ambassador carried them all the way on his head, the highest token of respect known in that country; and in these letters, they dignified the king with the high-sounding titles usually conferred upon an eastern monarch. Such conciliating measures, though not often adopted, produced effect. The renewed oppressions of the Dutch were the constant signal for the renewal of hostilities between them and the natives, in which the Dutch were frequently great sufferers; though European discipline and Dutch perseverance generally surmounted all difficulties, occasioned by the woods and fortresses to which the natives retired. The Dutch, however, suffered much from the climate, which, in the interior parts, is exceedingly unwholesome to Europeans. See CANDY. Indeed, the behaviour of the foreign nations, which have successively invaded Ceylon, has tended greatly to nourish sentiments of independence and of allegiance and attachment to their native kings among the inhabitants, and the cruelties of the Portuguese and Dutch have so exasperated them against all Europeans, that it will require much pains to reconcile their minds to far as that any confidence can be rep fed in them. These and similar causes combined to frustrate the attempts of the Dutch at forming a settlement in the interior of the island; whilst the difficulties which they encountered made them affect to despise the advantages which they could not attain. But notwithstanding they seem to have been convinced that it was impracticable to retain possession of the interior, yet their own misconduct had sown so many seeds of jealousy between them and the Candians, that they were often obliged to have recourse to arms. The last great war which they carried on with the natives was about the middle of the last century. In 1764 they penetrated into the heart of the king's dominions, and made themselves masters of Candy. But after experiencing great hardships from the climate, and from the activity of the natives, they were at last obliged to evacuate the capital. Notwithstanding the disasters which they suffered, they continued to harass the king of Candy;

and, particularly, by depriving him of salt at pleasure, they compelled him to comply with all their demands. In 1766, he was under a necessity of acceding to a treaty which greatly curtailed his dominions, and reduced him almost to the condition of a prisoner at large in those that remained to him. All those parts of the sea-coast, which had not formerly belonged to the Dutch, were now ceded to them, with the addition of several other advantageous tracts. They insisted that the king should have no intercourse with any other power, and that he should deliver up all foreigners or subjects of other princes, who should happen to come into his dominions. All cinnamon which grew on the coasts was deemed as exclusively Dutch property; and the natives, by way of special privilege, were all-wed quiet'y to cut and carry it to the several Dutch factories in the island. The cinnamon that grew in the woods was allowed to be, in some degree, the property of the natives: they were obliged to peel and sell it to the Dutch at a six-dolar per pound; that is, a coin of nominal value, which exchanges for about the worth of two shillings sterling of their copper-money. Independently of cinnamon, the other productions of the island were not over-looked; but the king of Candy was also obliged to stipulate, that his subjects should gather the pepper, cardamoms, coffee, and cotton growing in the interior, and sell them to the Dutch at certain very low prices. A certain proportion of elephant's teeth, areka nut, and betel-laf, together with a share of the precious stones found in the country, formed part of the tribute imposed on the natives. The number of elephants to be delivered up was 50 in the two seasons; which the Dutch transported to the opposite coast of the continent, and sold to the native princes there at very high prices, as the elephants of Ceylon are accounted superior to all others. The pearl-fisheries on the well and north-west shores, where the pearl-barks are situated, formed another acquisition to the Dutch by this treaty. Several persons from the Malabar coast, and other parts of the continent, had established cotton manufactories in the northern towns of the island, particularly at Jambapam: all of which were now given up to the Dutch. In return for all these valuable acquisitions, the Dutch acknowledged the king of Candy to be the emperor of Ceylon, with a long string of other sounding titles, which served only by their meanness to aggravate his mortification; and under which magnificent appellations, they engaged, as his dutiful subjects, to pay him a tribute, and to send ambassadors yearly to his court. The most important stipulation, on the part of the Dutch, was that of supplying his people with salt, free of expence, and in such quantity as to equal their consumption. The article of tribute was soon infringed; and, indeed, scarcely one stipulation of the treaty was fulfilled with good faith. By this treaty the Dutch obtained a monopoly of all the valuable productions of the island, and left to the king and his subjects only the hard condition of aiding them in availing themselves of their acquisitions. Such degrading and harsh terms naturally exasperated the Candians and cherished in their breasts the most rooted and inveterate hatred to their oppressors. The consequence was a renewal of hostilities; and about 20 years ago the Dutch again penetrated into the king's country; but they were so vigorously attacked by the natives that general de Muron, then a colonel in the Dutch service, narrowly escaped being cut off with a large detachment near Situwacca, and got safe to Colombo. At length hostilities, which were unavailing, were discontinued by mutual consent. The Dutch were chiefly anxious to prevent any connection from being formed between the natives and foreigners; and the king of Candy was resolved to prevent any intercourse between his subjects and a nation,

which he found ready on every occasion to deprive him of his rights in order to gratify their own avarice. A few articles of no great value, such as betel-leaf, arca, and coconuts, were occasionally smuggled by the natives down to the Dutch provinces; but these practices, when discovered, were severely punished by the king.

Such was the situation in which affairs stood between the Dutch and the native Ceylonese, towards the commencement of the late war. It was now about 140 years since the Portuguese had been finally expelled, and no other European power had since that time been able to acquire a permanent footing on the island. Soon after the expulsion of the Portuguese, about the year 1672, the French seemed inclined to dispute the possession of Ceylon. Accordingly they appeared off the island with a large fleet, entered into a treaty with the native prince, and avowed their determination to expel the Dutch. But their enterprise without wisdom was executed without spirit, and imaginary obstacles prevented the French from even attempting to gain a settlement on the island. Towards the conclusion of the American war the English made a more formidable attempt against the power of the Dutch in Ceylon. A fleet, under the command of Sir Edward Hughes, having on board a detachment of land-forces, commanded by Sir Hector Munro, was dispatched about the beginning of the year 1782, to attempt the reduction of this island. This enterprise, which commenced prosperously, by gaining possession of fort Ollenburg, a strong fort in the vicinity of the bay of Trincomalee, afforded an encouraging prospect of speedily reducing the whole island; and Lord Macartney, then governor of Madras, determined to lose no time in securing and improving this valuable acquisition. But dilatory measures, always incompatible with success in military operations, afforded to the French admiral Suffren an opportunity of taking possession of Trincomalee, and of mooring in the bay a fleet of thirty sail of the line. Although the British fleet, after being refitted in the roads of Madras, arrived off Trincomalee, and notwithstanding its inferiority in number, attacked and routed the French; the latter found a secure retreat under the cannon of those forts, which their activity, and the want of precaution on the part of their enemies, in not leaving a garrison and stores sufficient to undergo a siege, had suffered to fall into their hands. Thus, the attempts of the English to attain possession of Ceylon were, for this time, frustrated. As the harbour of Trincomalee, which is equally secure at all seasons, offered to the English the means of obviating disadvantages to which the coast of Coromandel is subject, it must be evident that, on the first rupture with the Dutch, our countrymen would again attempt to gain possession of it. Accordingly, the junction of the Dutch with the French republic in the late war was the signal for the commencement of our operations against their colonies in the East. In 1795, a body of troops was detached for the conquest of Ceylon; and this enterprise was crowned with success, after a course of military operations which will be detailed in describing the several places where they were carried on.

After this abstract of the history of Ceylon, we shall now proceed to give a particular account of the island itself; which is become of peculiar importance to this country, since, by the fifth article of the treaty of Amiens in 1802, the Batavian republic has ceded and guaranteed, in full property and sovereignty, to his Britannic majesty, all the possessions and establishments in the island of Ceylon, which, previous to the war, belonged to the republic of the United Provinces, or to the Dutch East India Company.

In approaching this island from the sea, it presents to

view a fresher green, and more fertile appearance than most parts of the Malabar and Coromandel coasts. All the flat tracts on the sea-shore are bounded by beautiful *Aspes*, or groves of cocoa nut trees, while the intermediate plain is covered with rich fields of rice; and the prospect commonly terminates in woods, which cover the sides of the mountains, and display a verdant foliage through every season of the year. The eastern coast appears bold and rocky, and a few reefs of rocks run out into the sea on the S.E. between Point de Galle and Batacolo. The deep water on the eastern shore admits the access of the largest vessels in safety; and if that side of the island be the least fertile, its other defects are amply compensated by the harbours of Trincomalee and Batacolo. The north and north-west coast from point Pedro to Colombo is flat, and indented with considerable inlets of the sea; the largest of which extends almost quite across the island from Mullipatti to Jahnapatam, on the N.W. point of the island, forming the peninsula of Jahnapatam. Several of these inlets form small harbours, accessible to vessels of small size. The interior of the island abounds with steep and lofty mountains, covered with forests and full of almost impenetrable jungles. The woods and mountains completely surround the dominions of the king of Candy; and the island is divided by the most lofty range of mountains nearly into two parts, so completely separated from each other, that both the climate and seasons on either side are essentially different. These mountains also terminate the effect of the monsoons, which set in periodically from their opposite sides; so that not only the opposite sea-coast, but the whole country in the interior, suffers very little from these storms. The monsoons set in much sooner on the western than on the eastern side of the island. On the west side, the rains prevail in the months of May, June, and July, and this is the season when they are felt on the Malabar coast. This monsoon is very violent, being accompanied with dreadful forms of thunder and lightning, together with vast torrents of rain, and violent south-west winds. In the meanwhile, the northern parts of the island are very little affected, and are even generally dry. In the months of October and November, when the opposite monsoon sets in on the Coromandel coast, the north of Ceylon is affected, and scarcely any impression is felt in the southern parts, with the exception of some partial rains. These monsoons pass slightly over the interior of the country, which nevertheless experiences dreadful storms. During its own periodical season, in March and April, the rain descends in torrents, and the thunder and lightning are extremely awful. The days and nights in this island, lying near the equator, are of nearly equal length: the variation, during the two seasons, not exceeding fifteen minutes. The seasons are more regulated by the monsoons than by the course of the sun; the coolest season being at the summer solstice, while the western monsoon prevails. The spring commences in October, and the hottest season is from January to the beginning of April. The heat, in the day, is much the same throughout the whole year; but in the rainy season, the nights are much cooler. Upon the whole, the climate is much more temperate than on the continent of India; as the heat is saned by the constant sea-breezes, and it is not annoyed by the hot and suffocating land-winds. The shade of the houses furnishes a tolerably cool retreat. In the interior of the country, however, where thick and close woods and the hills crowd upon each other, the heat is greater by many degrees than on the sea-coast, and the climate is often very sultry and insalubrious.

The principal harbours in the island for large ships are Trincomalee and Point de Galle; and they also anchor, and
from

from the beginning of December to the latter end of March moor securely, in the roads of Colombo. Smaller coasting vessels find shelter in several other inferior ports; such as Batacolo, Matura, Dambareen, and Calura, on the S.E.; and on the N. and W., Nigunbo, Chilon, Calpenteen, Manaar, and Point Pedro. At all these places are rivers of greater or less magnitude, that empty themselves into the sea; and these rivers, which are generally broad, deep, and navigable to some distance for small craft, are very beneficial to the inhabitants of the parts that are adjacent to the sea-coast, as they furnish a cheap and easy conveyance of their produce and merchandise to places where the European vessels wait to receive them. See CANDY. Besides the rivers with which Ceylon abounds, it has many lakes and canals of considerable extent communicating with them, particularly in the neighbourhood of Colombo and Nigunbo. Among the coasts there are roads and stations for travellers; but they are, in many places, rugged and steep, and incommoded with large tracts of heavy sand; and, besides, they are rendered dangerous by the multitude of wild hogs, buffaloes, and elephants, which infest them. These animals are met with particularly from Chilon to Manaar on the west side of the island, and from Matura to Batacolo on the east. Since the English have had possession of the island, the roads have been greatly improved. The soil of Ceylon is, in general, sandy, with a small mixture of clay. In the S.W. parts, however, particularly about Colombo, there is much marshy ground, very rich and productive; which is chiefly occupied with cinnamon plantations. The island does not produce rice enough for the use of its inhabitants, but requires annual supplies from Bengal, and other places on the continent. The culture of rice, however, has increased since March 1800; and many tracts on the west coasts, hitherto wild, marshy, and uncultivated, have been applied to this purpose.

The island of Ceylon was originally divided into a number of distinct petty kingdoms, separated by rivers and mountains, and subject each to its own independent sovereign. In process of time it was reduced under the dominion of the king of Candy, who divided it into a few large provinces, from which were derived several of the numerous titles which he still retains. These provinces were Candy, Coiton, Matura, Dambadar, and Sittivacca, which included the rich districts on the west coast. The chief of these was *Candy*, which see. These provinces were subdivided into districts, known by the name of "Corles," and corresponding to our shires or counties. These subdivisions are still continued in the parts wrested from the natives by the Dutch; and the government of each is given to the civil and military officers, who hold posts in their vicinity. The great divisions of the island are now reduced to two: the one comprehending those parts that are under the dominion of Europeans, and the other those which still remain in the possession of the natives. The European dominions, it is observed, like a ring, completely encircle the territories of the king of Candy. The capital of the European dominions is *Colombo*; which see; though Trincomalee (see TRINCOMALEE), is of much superior importance, on account of its excellent harbour. The next port to Trincomalee on the N.W. is *Malaitivee*; which see; and beyond, in the northern direction, the extremity of the island is stretched out into an oblong peninsula, by a branch of the sea, which penetrates across the island, except that a small strip of land remains, which is nearly inundated at high water. This district is named *Jafnapatam*; which see. Dependent upon the district of Jullua, and at a small distance in the sea to the N.W. of Point Pedro, are several small islands, which the Dutch have named Delft, Haerlem,

Leyden, and Amsterdam. These islands they employed in breeding horses and cattle, as from their excellent pasturage they are better adapted to this purpose than any part of Ceylon; and the English government has adopted the same system. The woods, toward the interior, separating this district and others from the king of Candy's dominions, are inhabited by a race of savages, supposed to be the aboriginal inhabitants of the island, and denominated *Dahls*; which see. The narrow sea which lies between the side of the island and the continent is called the gulf of *Manaar*; which see. Between Manaar and Rangoon (which see) is the Coromandel coast, is a line of sandbanks, called "Adam's bridge," (which see), and Ranas bridge, from a tradition that the god of this name came by this way into Ceylon. This tradition is connected with a variety of others that subsist among the natives, who universally believe that Ceylon was either the paradise in which the remainder of the human race resided, or the spot on which he first touched on being expelled the celestial paradise. Accordingly, Adam's bridge is, in their opinion, the way by which he passed over to the continent; and some imagine, that the gulf of Manaar, like the Red Sea, in scripture-history, closed after him to prevent his return. But waving these traditionary tales, it is an almost universally received opinion, that Ceylon at some distant period formed a part of the continent, and was separated from it by some great convulsion of nature. Nor is this improbable, if we consider the narrowness of the intervening space, and the numberless shallows with which it abounds. Besides, the appearance of the soil and the surface of the country, on the west coasts of Ceylon, and the opposite continent, very much resemble one another. A stratum of flat calcareous rocks seems to run quite across Adam's bridge; and it is found to the water's edge on both shores, and in the low islands that lie on the passage. In proceeding along the coast of Ceylon from Manaar, the country is sandy, wild, and barren; equally destitute of accommodation and provisions. The woods are so much infested with wild animals, that it is very dangerous to travel this way without a proper guard. Here are none of those lofty eminences which diversify the N.W. and S.E. parts of the island. The sea is skirted by a tract of low flat land; but farther inland there are rice and paddy fields, with some scattered houses. This appearance continues about 30 miles to the southward of Manaar, when the wood and jungle again begin to approach the shore, and to cover the whole surface of the country; till at Chilon the cinnamon woods shew the commencement of the district of Nigunbo. About twelve miles onward from Manaar is the village of Arippe, where the civil and military officers who attend the pearl-fishery reside during the season. For their accommodation they have built here a "Cloutry," or inn-barracks, which also serves for the reception of occasional travellers. Arippe is the only place in this quarter where good water can be procured. Here is also a chapel for persons of the Roman Catholic persuasion, consisting chiefly of the Parawas and Malabars, who resort hither during the season of the pearl fishery. It is their constant practice devoutly to offer up their vows and offerings before they commence diving for the oysters. In the neighbourhood of Arippe the woods are full of deer and wild fowls, which are brought by the Cinglese-peasants to the officers stationed here during the season of the fishery. About twelve miles from Manaar lies the bay of *Chiltra*; which see. In passing along from Manaar to Colombo, a distance of about 150 miles, the coast presents in general nothing but the most desert and barren appearance, except where it is covered by almost impenetrable jungles. Detachments are posted in

some few places for the protection of travellers; but the road is for the greatest part extremely bad, and the country is much infested with buffaloes and elephants. At Pomparipo is a broad lake, which cannot be passed during the rainy season; and besides, there occur in the way two or three broad rivers, as the Mofulee and MaJragar, which issue from the mountains in the interior. The first post at which you arrive is *Calpenten*; which see. For an account of *Patalom*, *Chilou*, and *Nigumbo*; see these articles. From Nigumbo southward the road is extremely pleasant; being shaded the whole way, and provided with a number of resting places for travellers. About half-way to Colombo is a very large "Choultry," or barrack, to which the officers of the garrison frequently resort on shooting parties. It is situated on a very delightful spot in the midst of a picturesque country, abounding with fowls and several species of game. For an account of Colombo, the capital of the Dutch dominions in Ceylon; see **C O L U M B O**. The country round this capital is, for several miles, flat and very rich; diversified with fields of rice and pasture, and a variety of groves, in which the cocoa-tree is most conspicuous; and embellished with gentle eminences, together with a number of small rivers, lakes, and canals. Shady roads every where intersect the country, which presents to view country seats and gardens; and on the banks of the river Mutwal is an elegant building, in which the governor resides; and there are also on the same banks and in the adjoining groves several temples of the natives. Cinnamon trees abound, both wild in the woods and cultivated in the gardens. The road from Colombo lies by the sea-side for six miles, as far as Galkiell, a small village, in which is a church for the accommodation both of the Dutch and Cinglese; and from hence to Pantura, a distance of 12 miles, the road is well shaded, and agreeably diversified by a part of the cinnamon gardens, which crosses this tract. From Pantura to *Caltura*, (which see), an interval of 10 miles, the whole country seems to be one delightful grove; and the road appears like a broad walk through a shady garden. In tracing the eastern coast, we find *Barbareen* and *Bentot*, (see **C A L T U R A**), and at length arrive at *Point de Galle*, for an account of which, see that article. About 20 miles to the south is *Billegamme* or *Bolligam*, seated on a bay formed by an indenture of the coast, and inhabited by fishermen; and at the distance of 30 miles from *Point de Galle* lies *Matura*; and about four miles from *Matura* is the most southern point of Ceylon, called *Dondre-head*. See **M A T U R A** and **D O N D R E - H E A D**. For an account of the principal places in the European dominions on the eastern side of the island; see **B A T A C O L O** and **T R I N C O M A L E E**.

It appears, from the survey of this island, made by captain R. Percival, and delineated in a manner no less entertaining than instructive in his "Account of the Island of Ceylon," which has enabled us to enrich this article with interesting information, that the internal wealth, as well as the population of "the European dominions," lies on the west and south-west coasts; while that secure station for shipping, which renders Ceylon of so much importance to our other East Indian dominions, lies at the opposite side, and in the most barren quarter of the island. The present state of the roads is such as almost entirely to preclude all intercourse by land between the opposite sides of the island, which are thus prevented from imparting their advantages to each other. In time, however, these defects may in a great measure be remedied; and many beneficial plans have already begun to be executed by the intelligent officers who at present command in the island. It is probable also, that in time the poorer lands in the north

and east parts may be employed to raise the necessaries of life, while the rich plains around Colombo are entirely devoted to its valuable spices.

The inhabitants of the sea-coasts of Ceylon are composed of a variety of different races. At Colombo, in particular, the natives of every country in India appear to have their representatives; and the manners and customs of these distinct tribes are such as belong to their native countries. Besides the native Ceylonefe, who live under the dominion of the Europeans, and who are denominated Cinglese, the coasts are chiefly inhabited by Dutch, Portuguese, and Malays. The *Dutch*, who are born and reside in India, are very different in their habits and modes of life from those of Europe. The chief trait that distinguishes their original Dutch character is their fondness for gin, and tobacco. In other respects they adopt the customs and listless habits of the country. A Ceylonefe Dutchman rises about six, and begins the day either with a walk, or with sitting down by his door in a loose robe and night-cap to smoke a pipe. This, with a glass of gin, fills up the first hour. At 7, a dish of coffee is handed to him by his slaves, and his lounging posture and pipe are again resumed. He afterwards dresses, and either goes to business or to pay visits, in which he usually takes a pipe and glass at every house where he calls; and in his salutations on these occasions he is very ceremonious. If he prolongs his visit, he throws aside part of his dress, and puts on a night-cap, and then he and his companions smoke and talk till noon. At 12 he sits down to dinner, regaling himself with very gross and heavy food. After dinner he resumes his smoking in an undress, and then sleeps for an hour. As soon as he is again dressed, he pays visits abroad or receives company at home; and this, with another pipe, occupies the interval till the hour of nine announces supper. Capt. Percival represents them as proverbially indolent and lazy, ignorant and stupid, without capacity, and without desire of acquiring excellence by exertion. Their children are commonly neglected, and committed to the care of slaves. Their own minds become selfish and contracted, callous to the feelings of humanity, and prone to treat their slaves with severity upon the slightest provocation, and often from mere caprice. Their women are generally treated with neglect; nor can it be expected that, in such circumstances, they should much study the art of pleasing. In the forenoon their dress is slovenly; but at their evening parties they appear decked out in abundance of finery. The culture of their minds occupies as little of their attention as the adorning of their persons; their education is disregarded; and from their infancy they imbibe manners and superstitious notions from the female slaves to whose management they are entrusted, of which they can never afterwards divest themselves. Neglected by the men they associate with their slaves; and thus their morals are as destitute of dignity or virtue, as their manners are of politeness. After marriage, much as they are disregarded by the men, they treat their husbands with great veneration and affection; consider their carefess as a high honour, and are therefore extremely jealous of their favour. The Dutch ladies, while young and unmarried, dress well, and are tolerable in their persons, and many among them are pretty, and even handsome; but as towards they contract such indolent habits that they become coarse, corpulent, and dirty in their persons; and their dress during the day is slovenly and negligent to excess. In such a climate as that of Ceylon, and with such habits, we must not look for the bloom of health and the red and white of European complexions. There are for the most part of a pale deadly white, with some exceptions. Those who have a mixture of the native

Food, are easily distinguished by a tinge in the colour of the skin, and their strong thick black hair; marks which are not removed in the course of many generations. The women of this mixed race, of whom there are many in the Dutch settlements, sooner begin to look old than those who are wholly of European extraction. The Dutch ladies have a custom of cracking their joints, and rubbing them over with oil, which renders them uncommonly supple. The principal amusement of the younger females is dancing; and that of the married and elderly ladies consists in paying formal and ceremonious visits; on which occasions they are attended by a number of slave girls, dressed for the purpose, and walking after them, with their betel boxes, or bearing umbrellas over their heads. Their chief vanity consists in these female attendants, and their splendour is estimated by the number of them which they can afford to keep. Neither the persons nor the apartments of the women are in general very cleanly. Many of the elderly ladies, and most of the lower orders, chew the betel-leaf and arka nut, with a mixture of "china" or lime made of burnt shells, in order to render it hotter and more pungent to the taste. In every house, therefore, they have a number of brass vases which are used as spitting pots for the women who chew these substances, and for the men when they smoke. The women are generally very neat and exact in the arrangement of their sitting-rooms, and when they receive company; these are kept remarkably clean, and the tiled floors are highly polished: but their inner apartments, and other parts of their houses, are quite the reverse.

Another class of the inhabitants of Ceylon consists of a race known by the name of *Portuguese*. They are not the descendants of the European nation whose appellation they bear; but they derive their name from the spurious descendants of that people by native women, who were scattered in great numbers over this island and all their other settlements in India. But both the manners and colour of these original Indian Portuguese are now equally lost among that race which now bears their name. The present Portuguese of Ceylon are a mixture of the spurious descendants of the several European possessors of that island, by native women; joined to a number of Moors and Malabars. A colour more approaching to black than white, with a particular mode of dress, half Indian and half European, is sufficient to procure the appellation of a Portuguese. These people are found in all the European settlements in India, particularly in those belonging to the Dutch, who often form intermarriages with them. The manners of the Portuguese inhabitants differ from those of the Moors, Malabars, and other Mahometans. They affect to adopt those of the Europeans. Although the black Portuguese universally profess the Christian religion, and are commonly Roman Catholics, they nevertheless retain many Pagan customs, and their religion may be considered as a compound of both. The Dutch have allowed priests and other missionaries to go among them; and many of them profess the Protestant religion and frequent the churches of the Dutch. They are in general somewhat fairer than the Moors and Malabars; but complexions of all sorts are found among this mongrel race, from a jetty black to sickly yellow, or tawny hue. Their hair, which is black or dark brown, is worn long, and usually hid, contrary to the custom of the Mahometans. Some of their women are pretty, and much admired for their figure. The men are about the middle size, slender, lank, and ill-made. They are fond to excess of shew and finery in their dress, and never stir out without putting on their best clothes. They are lazy, treacherous, effeminate, and passionate to excess; and retain so much of the character of their boasted

progenitors, as to be distinguished for a ridiculous pride. They have no regular call, and are usually esteemed the worst race of people in India. Originally a ferocious and outcast brood, they retain only the blemishes which tarnished the characters of their ancestors; and they combine all the vices of the Europeans and Indians, without any of their virtues. From these black Portuguese were derived the troops, now known by the name of "Topassies;" so called from their wearing hats instead of turbans, the word *topaz* or *chapez*, seeming to be a corruption of the French *chapeau*, being used in their language for a hat. They were never reckoned good soldiers, being neither so hardy nor so brave as the Sepoys, and therefore they were seldom employed in the English service: the French, however, had very generally corps of them at Pondicherry, and in their other settlements.

The *Malays* are another race, who form a considerable proportion of the inhabitants of Ceylon. This ferocious race is widely scattered over the eastern parts of India. Their original empire lies in the peninsula of *Malacca* (which see); and they have extended themselves from thence over Java, Sumatra, the Moluccas, and Philippines, and a great number of other islands in the Archipelago of India. The era of their first introduction into Ceylon is not easily ascertained; but the Dutch have been so accustomed for many years to introduce them to this and their other settlements in Asia and Africa, for the purpose of carrying on various branches of trade and manufactures, and also to employ them as soldiers and servants. The religion, laws, manners, and customs of the Malays, as well as their dress, colour, and persons, differ very much from those of all the other inhabitants of Asia. Those of the various islands or settlements differ also among themselves, according to the habits and appearance of the nations among which they are dispersed. For, although they intermarry with the Moors and other casts, particularly in Ceylon, and thus acquire a much darker colour than that which is natural to a Malay, their characteristic features are still so strikingly predominant, that they cannot be mistaken. Those who are born and brought up in the European colonies naturally contract more of the habits of civilized society; but they never entirely get rid of their natural ferocity, though they become much less cruel and vindictive than those of their race who reside in the peninsula of the Malacca and their other native possessions. The men are of a middling stature, remarkably well proportioned, and of a strong and muscular constitution. Their legs and arms are particularly well-shaped and very slender at the wrists and ankles. They are of a light brown or yellow colour, approaching, in old age, or when much exposed to the sun, to a copper hue. Their forehead is broad and flat; their eyes are small, black, and very deep sunk in their orbits: their nose is flatish, broad towards the nostrils, with a sort of curve at the extremity approaching the lip. Their hair is long, coarse, and black, and always moistened with a quantity of cocoa-nut oil; some of the poorer sort bind it up with a coloured handkerchief. The Malays of a higher rank wear a wide Moorish coat or gown, called *badjour*, resembling our dressing-gowns, and composed of rich flowered silk, or party-coloured cotton; and their under dress is a veil of silk or calico, called *basjou*, worn close to the body, with loose wide drawers of the same stuff. The dress of their head is of a singular shape, and is often elegantly ornamented. Their shoes or sandals are like those of the Moors. The dress of the poorer sort consists of a piece of cotton wrapped round their waists, with one end drawn between their legs, and tucked up at the lower part of the back: the arms are left completely bare. Some wear

wear a kind of vest or jacket without sleeves; but most of the slaves in the service of Europeans, instead of the piece of cloth, wear breeches of coarse stuff. None of the Malays suffer their beards to grow, but, in conformity to their religion, pluck out the hairs as soon as they appear. The dress of the poorer classes of the women consists merely of a large piece of coarse calico, or cotton, called a *Sarow*; which is folded and wound round the body above the bosom, and reaches down to the ankle, or middle of the leg; the upper part is tucked up and fastened under the arm-pits. Their hair is twisted up like that of the men, and fastened with a fillet or with pins or skewers, called *condés*. The dress of women of a superior situation is selected with taste, and is very splendid. Instead of the upper garment, called *badjow*, resembling that of the men, some use the *salendang*, which is a piece of silk or muslin about five feet long, thrown loosely around the neck and shoulders, falling down before, and brought across the waist backwards. On the crown and back part of the head are stuck three or four tortoise-shell combs with plates of gold. About their necks and arms they wear chains or filigree, and are all provided with earrings. The Malays make very beautiful filigree work in gold, which they use as ornaments for their persons.

The faces of the Malays are generally very ugly; and their features indicate their ferocious, treacherous, and revengeful dispositions. Some, however, have comely countenances; and many of the women might be considered as beautiful, if they were not much exposed to the sun, and had not their noses compressed. It is a common practice among them to break by compression the grille of the upper part of their noses in infancy; a flat nose being regarded as a symbol of beauty. The men are extremely jealous, particularly of the decided preference which the women give to Europeans; nor do they ever pardon infidelity in a wife. The passions of the women are no less violent than those of the men, and they are equally capable of taking the most terrible revenge; either by stabbing the objects of their resentment, or dispatching them by poison. The Malays go naked till about 12 years of age, and are soon after married. As they are of the Mahometan religion, those of the higher casts marry as many wives as they can maintain, while the poverty of those of the lower classes restricts them to one wife. Their usual food consists of fowl, fish, rice, and vegetables. The better sort eat also beef and mutton, when killed by one of their own race, and prepared in their own manner. They hold swine in such abhorrence, agreeably to the prejudices of their religion, that they will not so much as touch their flesh; nor will several of the Malay casts carry a plate which has ham or bacon on it. Their common drink is water, or the juice of the *palmyra*; though some will not scruple to drink arrack when they can procure it. They are constantly chewing betel, or penang, and they smoke *bang*, from which herb they extract a kind of opium, that is used by them in great quantities for exhilarating their spirits.

The amusements of the Malays are suited to their dispositions, and are either bold, vigorous, or ferocious. Both men and women are much addicted to bathing, which they use several times in a day. Their select amusements are gaming and cock-fighting; and they are so inordinately fond of gaming, that the poorer sort will sell themselves and their families to procure the means of gratifying their passion for play; and after having lost their last stake, they often sacrifice themselves and their lucky antagonist to their despair.

The Malays have a great variety of musical instruments, which are usually employed in a band or concert, at their religious ceremonies, their marriages, and their feasts. One

of their principal instruments is the *gong-gong*, which consists of a hollow plate of a compound metal, so contrived as to emit a very loud noise when struck. The *tom tom* is a drum of a peculiar form; and they have other instruments, made of bamboos bound together with iron wire, somewhat in the shape of a dulcimer.

The Malays universally profess the Mahometan religion; though with regard to some inferior points and duties, the several classes differ among themselves. They have temples and mosques dedicated to their saints and their dead, where they attend with great devotion. They value themselves much on their skill in medicinal herbs, and the application of them in the cure of diseases; and they are fond of gardening, to which they are addicted from their infancy, and in which they excel. In all sorts of cane-work, and in rattanning couches and chairs, they are singularly ingenious; and they are accounted capital builders of *bungaloes*, or houses of the cocotree. In other respects, such as the manner of eating their victuals, and their modes of salutation, they much resemble the natives of the Malabar and Coromandel coasts; though they are sufficiently distinguished from the other natives of India, by the difference of their constitutions, and the peculiar ferocity of their dispositions.

The government, under which the Malays live in their own country, resembles in some degree the ancient feudal institutions of Europe; and, consequently, war is the business of the nation. Their arms are all suited to their savage and sanguinary dispositions. These consist of a kind of dagger, called a *krisse*, or *CRISSE* (which see), in the use of which they are particularly dextrous. Before they enter upon any desperate enterprise, or act of revenge, the Malays take a quantity of opium, or, as they express it, *bang* themselves. (See *BANGUE*.) Having thus previously prepared themselves, and poisoned their crises, they rush headlong into the street, stabbing every one indiscriminately that comes in their way, and at the same time vociferating *amok, amok*, or kill, kill, whence this horrid mode of revenge is termed by Europeans "running a muck." (See *AMOK*.) This ferocious practice was repressed by the Dutch government at Ceylon, by the severest punishments; a reward of one or two hundred rix-dollars having been offered for the destruction or capture of those who ran a muck, and those who were taken alive having been put to death with the most excruciating torments. Since the arrival of the English at Ceylon, this barbarous practice has been almost unknown; and a few private murders committed on the Sepoys and black people in the Pettah, were the only crimes of this nature attributed to the Malays during Capt. Percival's stay at Columbo. The Malays, however, in their present late, are, from their ideas of morality, almost incapable of being admitted into social life; they have no idea of revenge being a crime, and they triumph in shedding blood on such an occasion. It is hoped that the introduction of Christianity among these people will meliorate their disposition; and it is consequently of great moment that the Malays in our settlements should embrace this religion. It would serve, not only to soften their temper, but to unite them by the firmest bond with this country. The Dutch government of Ceylon had always a regiment of Malays in their service; and this corps constituted the strength of their garrisons, as they were the only troops which maintained discipline, or displayed any sort of bravery in the field. They seemed, however, to have imbibed, by the ungenerous policy of the Dutch, such a rooted aversion from the English, that there was at first little appearance of their ever becoming our friends. Soon after the arrival of governor North on the island, he new-modelled this corps, and put it on a larger and more respectable establishment; and

and it has now obtained a place among our other regiments of the line. The Malay troops are armed and clothed much in the same manner as the European, with the exception of shoes, the wearing of which is contrary to their religion; instead of these they use a particular sort of sandal. Along with their other arms they always wear their krees by their sides; and in the heat of an engagement they often throw down their musket and bayonet, and rushing upon the enemy with these krees, carry terror and destruction wherever they come. The patience with which the Malays submit to the sentence of their courts martial, compelled, by the new regulations introduced among them, of their own native officers, who are acquainted with their language and customs, and their refraining from revenge when they are assured that justice is intended them, afford reason for concluding, that mild and generous treatment will in the end have the effect of subduing their natural ferocity.

The far greater proportion of the inhabitants of Ceylon consists of the native *Ceylonese*, who have submitted to the dominion of the Europeans. These retain their original appellation of "Cingalese," while those who live in other parts which acknowledge only the authority of their native princes, are distinguished by the name of "Candians," from the country they inhabit. In most points these two classes continue to resemble each other, though they are respectively distinguished by some peculiar characteristics. Whether the Cingalese were the original inhabitants of the island, or from what other country they came, and at what period they settled there, are points of which we have no distinct account, either from them or from other persons. The distance is so small between Ceylon and the continent, that it is the most probable, and the most generally received opinion, that it was peopled either from the Coromandel or Malabar coasts. Some circumstances, however, are suggested by Capt. Percival, which seem to indicate that they have migrated from a greater distance. Their complexion, features, language, and manners are so similar to those of the Maldivians, as to afford reason for concluding that both were of the same stock. The Maldivian islands are only two or three days' sail from Ceylon; and from the dissimilarity of the habits found among them to those of the Indians on the continent, it might be argued that the natives of these islands have not directly originated from those of Hindostan.

The Ceylonese are of a middling stature, about five feet eight inches, and rarer in complexion than the Moors and Malabars on the continent; but they are neither so well made nor so strong, and in appearance much resemble the Maldivians. The Candians are rarer, better formed, and less effeminate than the Cingalese in our service. The women are proportionably less tall than the men, are much fairer, and approach to a yellow or mulatto colour. They continually anoint their bodies with cocoa nut oil, with which also they madden their hair. Both sexes are remarkably clean and neat in their persons and their houses: and in dressing their vicinals they are scrupulously nice. In order to avoid touching the vessel from which they drink with their lips, they hold it at some distance over their heads, and pour the liquor down their throats. In their diet, they are very abstemious; fruits and rice constituting the chief articles of their food. They use some fish when it is abundant, but flesh is scarcely any where eaten. They are courteous and polite in their demeanour, and in many qualities much superior to other Indians. They neither steal nor lie; their disposition is generally mild; but when their anger is roused, it is proportionably furious and lasting. Their hatred is excessive and invincible, inasmuch

that they will frequently destroy themselves in order to obtain the destruction of the object they detest. It a Ceylonese cannot obtain money due to him by another, he goes to his debtor, and threatens to kill himself, if he is not instantly paid. This threat, sometimes executed, obliges the debtor to comply immediately, if it be in his power, with the demand; as by their law, if any man causes the loss of another's life, his own is the forfeit. "An eye for an eye, and a tooth for a tooth," is a proverbial expression which is continually in their mouths. This dreadful spirit of revenge is still cherished among the Candians; but it is mitigated, in a great degree, among the Cingalese by their intercourse with Europeans. Among the Ceylonese the distinction of rank is maintained with scrupulous exactness; and extends to the dimensions and appearance of their houses; so that the Candians are not allowed to widen their houses, nor to cover them with tiles, which is a royal privilege, and reserved solely for the great king. The Ceylonese never employ nails in their houses, either from the remains of a tyrannical prohibition, or a superstition arising from the danger of the electrical fire in their climate. Their huts are small and low, consisting of one story, and fastened with withes of rattan or coya rope. They are constructed of slender pieces of wood or bamboo, daubed over with clay, or covered with rice-straw, or leaves of the cocoa-tree. Round the walls are banks or trenches of clay, on which they sit and sleep; and these benches, as well as the floors of their houses, are covered with cow-dung for keeping away vermin and preserving the surface smooth and clean. Their furniture is of the most simple kind; consisting of a few earthen pots for cooking their rice, and one or two brass basins out of which they eat it; a wooden mortar and pestle for grinding it, with a flat stone on which to pound pepper, turmeric, and chillies for their curries; a *kenony*, or kind of grater, being an iron instrument like the rind of a spur fixed on a piece of wood like a boat-jack, and used in rasping their coco-nuts. They use neither tables, chairs, nor spoons; but placing themselves on the ground, eat their food with their hands. The houses of the Candians are neater and better constructed than those of the Cingalese, whose minds have been reduced to an abject state, by the successive tyranny of the Portuguese and Dutch. Their villages and towns appear like a number of distinct huts scattered in the midst of a thick wood or forest. When they are in danger of being besieged with reptiles, or overwhelmed by inundations, they erect their huts on the summits of high rocks, or on the tops of high trees. Some of them fix poles in the ground, and place upon them a sort of hurdle, which serves for their nightly habitation. In order to preserve themselves from the extreme heat of the sun, they have an oval or the large leaf of the tahpot-tree carried over their heads.

The Ceylonese are extremely polite and ceremonious: and as a token of respect and friendship, present each other with the betel-leaf, which is chewed by persons of all ranks, and supplies the defect in all their entertainments. They mix with it tobaccos, areca-nut, and the lime of burnt shells. The black stain occasioned by this mixture, which is indelible on the mouth, lips, and teeth, is considered as an addition to their beauty; but it renders them toothless at an early age. The Ceylonese manifest a surprising degree of gravity in conversation, even among relations and intimate friends; sitting for a long time mute and chewing betel-leaf. In their conversations they are very punctilious, using the form common among the Indians of bringing the palms of the hands to the forehead, and then making a *janam*, or low bow. The natives of Ceylon are more continent: with
regard

regard to women than the other Asiatic people, and they treat their females with greater attention. Mr. Knox has drawn a picture of their total disregard to chastity, or any bounds to sexual intercourse, which is extremely abhorrent to the ideas not only of an Asiatic, but even to the inhabitants of the most dissolute metropolis in Europe: and Captain Percival is convinced, from his own observations among the Cinglese, and from all the accounts which he could obtain of the Candians, that he has not in many instances exaggerated their licentiousness. A Cinglese husband is neither jealous of his wife, nor particularly offended at her infidelity, unless she be caught in the fact; in which case he thinks himself warranted in executing the rights of an Asiatic husband. Many of the men have only one wife, while others have as many as they can maintain. The ease with which promiscuous intercourse is carried on, and with which marriages are dissolved, is, together with their poverty, the true cause why polygamy is not more general among them. The marriage ceremony is better regarded among the Ceylonese, and marriages are often contracted by the parent while the parties are in a state of childhood, for the purpose of matching them according to their rank; and they are often dissolved by consent almost as soon as consummated. It is also customary for those who intend to marry, previously to cohabit and try each other's temper; and if they find they cannot agree, they break off without the interference of the priest or any further ceremony. When they have agreed to marry, the man presents his bride with the wedding clothes, consisting of a piece of cloth, 6 or 7 yards long, for the use of the bride, and another piece to be laid on the bed. Presents are delivered by the bridegroom in person, and the following night he is intitled to cohabit with the bride. On this occasion a day is appointed for bringing her home, and celebrating the wedding with festivities. On this day he and his relatives repair to the bride's house, and carry with them what they are able to contribute to the marriage feast. The bride and bridegroom, in the presence of this assembly, eat out of the same dish, to denote that they are of the same rank. Their thumbs are then tied together, and the ceremony is closed by the nearest relations, or the priest, when he is present, cutting them asunder. For a more firm and indissoluble union, the parties are joined together with a long piece of cloth, folded several times round both their bodies; and water is then poured upon them by the priest, who always officiates at this ceremony, although rarely at the former. After the ceremony is performed, the parties pass the night at the bride's house; and in the morning the husband brings her home, accompanied by her friends, who carry with them provisions for another feast.

The Cinglese women are much more pleasant in their manners, and more elegant in their persons, than those of the other Indian nations.

The Ceylonese are fond of bathing, like other inhabitants of warm climates, and plunge into the water several times a day. Gravity is their characteristic quality: they imbibe from their infancy superstitious fears, that haunt or torment them through life; and sports and diversions are almost totally unknown among them.

During the wet season, they are subject to a variety of diseases; leprosy appears to be very prevalent; but their apprehensions are chiefly excited by the small-pox, and if any one dies of it, he is looked upon as accursed, and his body is denied the rites of burial. Every man in Ceylon is his own physician; and a plaster of herbs, or cow-dung, is universally applied to the part affected.

The language of the Ceylonese seems to be almost wholly peculiar to this island, and, as Captain Percival says,

is most nearly allied to the Maldivian. Of this language there are two dialects, which differ considerably from each other and have each a separate grammar. The poetic or court language, called the "Candian Sanfrit," or more properly the "Paulee" or "Mangada," is retained in those parts, where the language may be supposed to be preferred in its greatest purity; it contains a considerable mixture of Arabic, and is accounted the most elegant as well as the most smooth and sonorous. Among the natives it is a current opinion, that Arabic is their original language, and that some mixture of the Sanfrit was introduced by a colony who came over by Adam's bridge from the continent of India. Among the Cinglese on the coasts, the vulgar dialect, denominated "Cinglese," is spoken; and it appears to have been greatly corrupted by the introduction of foreign words, so that it has lost in a great degree that melody and force, which are attributed to the language of the interior. In the pronunciation of the Ceylonese there is something peculiar, as they hurry out the first part of a sentence without commanding any attention, and dwell with a loud and long accent on the concluding syllables. *Te* or *ab* forms the last syllable of a great number of their words, and with this they are fond of closing. The language universally spoken among the Cinglese who have any intercourse or connection with Europeans is the low Portuguese; and this is also spoken by the Moor and Malabar servants.

The Ceylonese divide their time nearly as we do: except that their year commences on the 25th of March; and they allow for leap-year or any odd portions of time by beginning this year a day sooner or later, or by adding a day to the former year. Their months, like ours, are divided into weeks of 7 days: Wednesday and Saturday are the days on which they perform their religious ceremonies. The day, which is reckoned from sun-rise to sun-set, is divided into 15 hours, and the night also into as many; and in this latitude the length of the day and night is subject to little variation. Before the arrival of the Europeans on the island, it does not appear that the Ceylonese had contrived even the rudest species of dial. On any particular occasion, they employed a vessel with a hole in the bottom, that let out the water with which it was filled in one hour according to their division; but this rude instrument was seldom employed except at court ceremonials. The learning of the Ceylonese consists chiefly in some pretended skill in astrology; although it appears from certain inscriptions on the ruins of some of their temples, that they formerly possessed some literature, as well as some refinement in the arts. Reading and writing are no ordinary accomplishments among the natives of Ceylon. Among the Candians they are chiefly confined to the learned men of the sect called "Gonies," who are retained by the king to execute all the writings of state, and those which respect religious affairs: and the Arabic is the character employed on these occasions. For writing, as they do not understand the manufacture of paper, they use the leaf of the talipot tree: and from these leaves, which are very large, they cut out slips, about a foot to a foot and a half long, and about two inches broad. These slips are smoothed; and the letters or characters are marked on them with a fine-pointed steel pencil, like a bodkin, set in a wooden or ivory handle; and in order to render the characters more visible and distinct, they are rubbed over with oil mixed with charcoal powder. Several of these slips are strung together by a piece of twine passed through them, and they are attached to a board as we see our newspapers. Palm leaves are sometimes employed for the same purpose; and they occasionally use a sort of paper made of the bark of a tree. Some of the talipot-books or files, called by the natives "Olics," are richly ornamented, and bound in tin-lacquered boards of ivory, or

even silver and gold. Letters or dispatches sent by the king formerly to the Dutch, and now to the English governor, are enclosed in leaves of beaten gold like those of the cocoa-leaf, rolled up in a cover richly ornamented, and almost hid in a profusion of pearls and other precious stones. The whole is enclosed in a box of silver or ivory, which is sealed with the Emperor's great seal.

The progress of the Ceylonese in the other arts of life bears proportion to their literature. Their agriculture remains in the rudest state; and the Ceylonese are naturally indolent in the extreme. Their soil, where it can be watered, yields, with little cultivation, a sufficient quantity of rice for their subsistence, and with this they are satisfied. Their plough consists merely of a crooked piece of wood, shaped so that one end serves for a handle, while the other, shod with iron, ploughs, or rather tears up the ground. After a first ploughing, the fields are flooded, and some time after they are again ploughed. The other tools employed in their agriculture are a board for smoothing their fields, which is dragged over them edgewise with their oxen; and a piece of board fastened to the end of a long pole, which serves instead of rakes. At the season of ploughing, each village makes it a common concern; every one attending with his plough and his oxen till the whole of the field belonging to that society is finished. The same method is pursued in reaping the corn. Seed-time and harvest are seasons of general industry and good fellowship. The women are not employed in either of these laborious operations; their business being to gather the corn after the reapers, and to assist in sowing it. Oxen are employed both in ploughing and in treading out the corn. For unhusking their rice, they beat it in a mortar, or more frequently on a hard floor; and if it be of a brittle sort, they boil it before they beat it. The only manure they think requisite is water. Although the labour required for the cultivation of their rice is inconsiderable, many of them let their ground to their neighbours, less indolent than themselves, for a certain proportion of grain, which is commonly about one-third of the produce. A considerable proportion of grain is carried off by the priests for the service of their temples, or is offered up for protection and thanksgiving, both on account of the blessings they have received, and in the hope of farther assistance.

The religion of the Ceylonese forms a very prominent and distinguishing feature of their character; and there are few people, if any, that are more under the influence of superstitious fears. Omens regulate their whole conduct, and even determine their destiny from their birth. When a child is born, they immediately call the astrologer, who pronounces whether it is destined to be fortunate or unfortunate. If he declares that it was born to misfortune, they often anticipate its future evils by destroying it. By various omens they determine whether the business they undertake will be prosperous or unsuccessful. A white man, or a woman with child, when they present themselves in the morning, are very favourable omens; but a beggar or deformed person is accounted a grievous mischance, and the sight of him will prevent their proceeding on that day with any business proposed, if it be in their power to avoid it. Under the impression of superstitious fears, the poor Ceylonese considers storms of thunder and lightning, which frequently occur, as a judgment from heaven, and as directed by the souls of bad men who are sent to torment and punish him for his sins; and the frequency of their occurrence is regarded as a proof that the island is abandoned to the dominion of devils. The Ceylonese conceive fiends without number to be hovering round them, and they ascribe every disease or trouble

that afflicts them to the immediate agency of the demons that are sent to punish them; while, on the other hand, they regard every blessing and every instance of success, as coming directly from the hands of the beneficent and supreme God. In order to guard themselves against the power of inferior deities, whom they consider as wicked spirits, they wear various amulets, and employ charms and spells, imagining that they may thus ward off the influence of witchcraft and enchantments by which they think themselves best on all sides. Many even of those who have been converted to Christianity, still labour under their original terrors; though they believe them to be delusions. Some of the Cinglese, when their desires are disappointed and their prayers disregarded, quarrel with their deities, revile them, and even trample their images under foot. The inhabitants of the more mountainous parts of the country are distressed by their superstitious terrors to such a degree, as to be driven to madness by their disturbed imaginations. The progress of civilization, and the removal of these superstitious fears, are greatly opposed by the interested arts of their priests, who contrive to direct their operation to their own emolument. The devotion of the Ceylonese towards supernatural beings derives its peculiar character from their superstitious fears, and consists of various ceremonies created by them. With regard to what may be properly termed their religion, a difference of opinion has prevailed. Some have said that with a slight variation of names and forms, it is the same with that of the Hindoos; but there is little reason to question its being founded on a different system of idolatry from that practised among the Hindoos. Many of their notions seem to be borrowed from the latter, and with these they have blended a considerable mixture of Mahometanism. In one point, it is said, they agree with both, as well as with Christians; viz. in acknowledging one Supreme Being who made and governs all things; but they differ from the Mahometans and rigid Hindoos in another respect; for though they are unable to conquer their original superstitions, they entertain the highest reverence for the Christian religion, and some of the Cinglese have been converted without incurring scarcely any censure from others for their apostasy. Nevertheless, whilst these people adore one Supreme Being, more powerful than all others, they offer up their devotions to devils, animals, and the very productions of the earth. Besides the one Supreme Being, who is worshipped as the creator and ruler of heaven and earth, the Ceylonese acknowledge a number of inferior deities, as well as tormenting demons: the former, who watch over them for their good, are supposed to be the souls of good men, and the demons the spirits of the wicked; but both are regarded as acting by the permission of the Supreme Being. The object of their immediate worship is Buddou, or BOODH (which see), who is represented under a variety of different forms and images. Some have supposed that the worship of Buddou was introduced into Ceylon about 40 years after the Christian era; at which time, as it is said, a violent quarrel took place between the Brahmins and the votaries of Buddou, who then formed one of the religious sects on the continent. The Brahmins, as they say, prevailed, and the Buddites were compelled to take refuge in Ceylon. The Buddites are said to have been originally a class of hermits, who led a wandering solitary life, remarkable for chastity, renouncing all the pursuits of the world and all attention to property, and contented with the practice of devotion amidst the extremest poverty. Others, however, have traced the religion of Buddou to a much higher origin; and pretend that it was introduced in the reign of Vegarajah, who came with his people to Ceylon in the 6th century before Christ; and that

Goutama Buddou, the fame that is now worshipped, was supposed to have made his appearance 542 years before the birth of Christ. Accordingly it has been supposed, that the worship of Buddou originated in Ceylon, and that it spread from thence to ancient Hindoostan, to exterior India, Tibet, and even to China and Japan. See Водна. Between the priests of Buddou and the Brahmins, three principal distinctions have been noted: the former may lay down the priesthood; they eat flesh, but will not kill the animal; and they form no cast or tribe, but are selected from the mass of the people.

The priests of Buddou or Buddou are in Ceylon accounted superior to all others. They are called "Trinaxxes," and are held in high estimation at the court of Candy, where they are entrusted with the chief management of affairs. The king has no authority over them, but endeavours to gain their good will by respecting their immunities, and conferring upon them numerous distinctions. The followers of Buddou believe in the immortality of the soul, and its transmigration into various bodies before it reaches Nimban or the region of eternity. The persons of the Trinaxxes are held sacred; and the king of Candy, although his power be absolute, cannot take away their lives, or in any way punish them even for conspiring against his own life. They chuse their own superiors; and their chief priest is invested with the prerogative of settling all religious disputes. They are exempted from all taxes; but they are totally debarred from wine or women. They never eat meat, or any thing that has had life. To their girdles they suspend strings of beads made of a brownish or black wood, and mutter prayers as they go along. Their dress consists of a large loose piece of yellow cloth thrown over their left shoulder, and fastened round the waist by a girdle of the same. The right shoulder, the arms, the head, and the feet, are completely bare. In one hand they carry a painted cane, and in the other an umbrella of the broad end of the talipot leaf. The temples of Buddou are superior to those of all the other deities; for they never dedicate temples to the Supreme Being, nor represent him by any image. In the temples of Buddou, are figures of men habituated like his priests, and placed in various postures: some of them are seen sitting cross-legged on the ground with long bushy heads of hair like their women, while others recline at full length on the ground. In various parts of the island a number of images of the god Buddou are found, which by their extraordinary size indicate the great reverence in which he is held. It would be endless to describe these images, and the various temples in which they are found. He has a temple at Calane, 6 miles N.E. of Colombo; another at Oozulboda, 6 miles from Caltura, which is much frequented; and in Bilizamme Corle is an immense figure of a man 6 yards high, which stands about 10 miles N. from Matura, and is said to represent the Cotta Raja, an ancient prince who taught them the planting and use of the cocoa-nut, and instructed them in its various salutary qualities. In the interior of Ceylon, there are many ruins of pagodas and temples, of hewn stone, and of much superior workmanship to those in the lower parts of the country. Several of them are in a state of perfect preservation; and when compared with those that have been erected in later times, they afford the strongest proof either that the Ceylonese had formerly attained a much higher state of civilization, or that the island had anciently been inhabited by a different race from its present possessors. But many of them have suffered much from the ravages of the Portuguese.

The temples dedicated to the inferior gods are poor, mean, and contemptible, being usually constructed of clay and wood; and mere huts, one story high, without windows, and

covered with cocoa-tree leaves. Without are elephants' heads of earthen ware, little pots, &c. in which passengers deposit their oblations; and at the doors is a pole or flag, near which sits a priest who remains there the whole day; and within are "swammies" or sacred images of different construction, such as gigantic figures of men with boars' heads, representations of beasts, birds, and pieces of consecrated armour, and some very indecent figures of men and women. The priests of the inferior deities, called "Comes," are easily distinguished from the Trinaxxes by the little respect that is paid to them. They are continually met with in their wandering excursions over the island, and are a set of lazy, impudent vagabonds, who live well on the extortions which they practise on the people.

The superstition of the Ceylonese supplies ample provision for the support of their religious establishments. The Candians allow certain portions of land and particular taxes to maintain their priests and religious houses; whilst the inferior priests support the temples and themselves by their own dexterity. As all diseases are accounted immediate indications of the divine wrath, a time of sickness is the season when the temples are thronged, and when the priests expect their principal harvest. There are several particular festivals which are held by the Ceylonese in honour of their gods, and for the purpose of conciliating their favour. In the month of June or July at the new moon, called "perah," a solemn and general concourse takes place to the various religious resorts on the island. At Candy this festival is celebrated with great pomp, and is attended by the king with his whole court. In November, at the time of full moon, there is another festival, which is celebrated in the night. These festivals, which are more solemn and splendid in the dominions of Candy than among the Cinglese of the coast, are very numerous, amounting in the whole to 48. Those in honour of Buddou are not held in the temples, where he is usually worshipped, but on a high hill, called "Hammalleh," or Adam's peak, one of the highest in Ceylon, and at a distance of about 50 miles to the N.E. of Colombo, and at a consecrated tree, denominated the "Bogaha," which see. Notwithstanding the many religious ceremonies and superstitions that prevail among the Ceylonese, they are far from being such devotees and zealots as any of the sects on the continent. They are firm believers in the doctrine of the immortality of the soul, and the resurrection of the body. It is their opinion, that the souls of the just are immediately after death admitted into the rank of gods, and that their ancient prophets and good kings are long since employed in exercising the powers of this station; while, on the other hand, the souls of the wicked, particularly of unjust tyrants and impious priests, are supposed to have passed into wild beasts and reptiles. The Ceylonese are rigid predeterminers, and believe that people are born to their peculiar destinies, whether good or bad, which they are incapable of avoiding or altering. They imagine, however, that their calamities may be alleviated by spells and charms, and they place considerable reliance on giving alms; and hence the Ceylonese are very liberal in the distribution of charity. Presents to their priests and alms to their beggars are considered by them as essential acts of goodness. The Cinglese in our service, whose natural ferocity is in a great measure subdued, reserve a certain proportion of their fond for the poor; nor do they withhold relief from the Malabar or Moor who asks it. They extend their compassion even to the brute creation; so that during certain festivals or seasons of devotion, they refrain from killing any living creature, and subsist wholly in herbs and fruits. The Cinglese, who are naturally abstemious, frugal, and free from covetousness, are

are never tempted by indigence to purloin the property of their neighbours; but the Candians, though endued with much more pride and spirit, are by no means so conscientious or honest. The burials among the Ceylonese are not attended with any particular religious solemnity. Mr. Knox states, that in his time it was customary to burn the dead, particularly the bodies of persons of distinction. But this practice, if it still continues in any part of Ceylon, has escaped the researches of captain Percival: and it must therefore be rare, and confined to the remotest parts of the interior. The ceremonial of burial is very simple; the body being wrapped in a mat or piece of cloth, and carried to some infrequented spot, where it is deposited.

Captain Percival has pointed out, with his accurate discrimination, some particular shades of difference which arise between the Candians and Cinglese, both from the nature of the country they respectively inhabit, and from the more frequent intercourse of the latter with foreigners. These chiefly relate to their political situation, and their forms of administering justice, which, among the Cinglese, are of course considerably assimilated to those of the people who hold them in subjection. The Cinglese, he says, are a quiet inoffensive people; exceedingly grave, temperate, and frugal. In their application to labour, though their bodies partake of the indolence of their minds, they are capable, when roused, of considerable active exertion; but being less robust than the Moor or the Malabar race, they never make good palankeen bearers, or coolies to carry burdens. They are gentle, charitable, and friendly, and have scarcely any of the false, treacherous, and designing arts, which are often found among the Candians. The countenance of the Candian is erect, his look haughty, his mien lofty, and his whole carriage marked by the pride of independence. The humble yielding deportment of the Cinglese, on the other hand, with the patient or rather abject endurance which is depicted in their faces, plainly denotes the dependent and helpless state to which they are reduced. A mild and equitable government, with a strict administration of justice, cannot fail to conciliate the minds of these people who have already been trained to submission, and an unbounded reverence for Europeans. As the natural disposition of the Cinglese are mild and humane; their morals except in the promiscuous intercourse of the sexes, are far from being depraved. The Candians, who have acquired warlike habits, are thus induced to look with contempt on the Cinglese, who are almost entirely unacquainted with the use of arms.

The dress of the poorer sorts of the Cinglese indicates their indolence and want of neatness; and the women of this class are employed in performing all kinds of servile work, and in bringing the fruits and vegetables to market. Persons of superior rank pay particular attention to their dress. They wear a piece of calico wrapped round their waists, which either hangs loose down to their ankles, or is drawn together between the legs, in the form of wide trousers. The body is covered by a jacket with sleeves, having the appearance of a shirt and waistcoat, and s buttoned at the neck and wrists. The buttons are numerous, and they are either of silver, gold, or precious stones. To their ears they fix enormous ear-rings, which are adapted for receiving them by applying pieces of wood to the orifices in their infancy. The shoulders and body are left completely bare. On their heads they wear caps of various shapes, and others of them coloured handkerchiefs, as fancy suggests, or the rules of their cast prescribe. The dress of the higher rank of women is similar to that worn by the black Pongucle ladies; and that of the young Cinglese females is no elegant, nor are their appearance and manners disagreeable.

The Cinglese are ingenious and expert artificers, and display their dexterity in gold, silver, and carpenters' work. The number of persons employed in all sorts of handicraft work renders furniture, and other similar articles, both good and cheap. The Cinglese supply the English garrisons with beef, fowls, eggs, and other such articles, at a very moderate rate, as they seldom use them for their own consumption; beef, in particular, they never taste, as the cow is an object of their worship. Some of them drink arrack, and all ranks use toddy, both as a medicine, and for the sake of the liquor itself. The vessels which they use for holding the juice of the palmyra and cocoa-tree is a kind of the betel-tree, resembling in colour and texture bleached sheep-skin, and being as strong and better adapted for retaining liquor. Fowls are plentiful, and sold at from 4d. to 8d. each; eggs at 2d. a dozen; and a good dish of fish may be bought at from 1d. to 2d.

As the Cinglese live under the protection of the British government, they are subject to our laws and forms of administering justice, except in very few points, with regard to which they are permitted to retain their ancient customs. The same laws of inheritance remain among all the Ceylonese: the lands descend to the eldest son, if the father makes no will; but a certain proportion of the property must always be appropriated to the maintenance of the widow and the younger children. The Cinglese under the British dominion are governed by the native magistrates, the controlling power residing always in the servants of the British government. All our possessions in the island are divided into corles and districts, the subordinate superintendance of which is assigned to the "Moodeliers," or native magistrates, who are always chosen from among the class of the nobles styled "Hondrews," and "Mahondrews." The nobles, or "Mahondrews," from whom the Moodeliers are chosen, form a particular cast completely distinct from the others, and their appearance, dress, and manners indicate superiority to the rest of the natives. These Mahondrews are fairer than the other Cinglese, from their being less exposed to the sun; when they go abroad, they are entitled, by their rank and wealth, to be carried in coolies or palankeens; or when they go on foot, their attendants hold over their heads the leaf of the talipot. In public their servants carry their umbrellas and betel-boxes, which latter are usually made of ivory, tortoise-shell, silver, or calamander wood inlaid. In their own hands, they carry a small silver box, like a watch, to hold their chumam. In their manners they are very affable, and much more polite and engaging than the natives of the continent of India. They are partial to the Europeans, who have been accustomed to treat them with confidence and gentleness; and on all occasions they have manifested a desire of copying the manners of the Europeans. Their dress is very rich, and combines the ancient European with the Asiatic. They are fond of magnificence, and particularly at their wedding-feasts they are anxious to exhibit their splendour.

Many of the Cinglese have been converted to the Christian faith; and whilst some profess to be Roman Catholics, others attend the Calvinist and Lutheran worship; but the fundamental principles of Christianity are understood by scarcely any one of them. The natives of Ceylon, says Capt. Percival, belonging to our settlements, are already become much attached to the English; and there is every reason to expect that their prejudices against foreigners will soon be done away by our liberal conduct towards them. For an account of the Candians, see CANDY. Of another class of the inhabitants of Ceylon, a brief account has already been given under the article Bedahs. These Bedans, or Vaddahs, are scattered

over the woods in different parts of the island; but they are most numerous in the province of Bintan, which lies to the N. E. of Candy in the direction of Trincomalee and Batacolo. Here they are completely savage, and have never entered into any intercourse with the other natives, or have scarcely ever been seen by them. They acknowledge no authority beside that of their own chiefs and religious men. Those that border on the district of Jafnapatam, and the tribes that inhabit the W. and S. W. quarters of the island, between Adam's peak and the Raygam and Paddam coles, are the only Bedahs who have been seen by Europeans; and they are much less wild and ferocious than those who live in the forests of Bintan. The Bedahs, as they acknowledge no power but that of their own chiefs, adhere, from generation to generation, to their own laws and customs, without the slightest variation. They subsist entirely by hunting deer and other animals, with which their forests supply them. The flesh of these animals, and the fruits that grow spontaneously, compose their whole food. They sleep either in trees, or at the foot of them; and in the latter case secure themselves from wild beasts by placing thorns and bushes all round them. As soon as the least noise rouses the apprehension of a Bedah, he climbs up the tree with the utmost expertness and celerity. The dogs of the Bedahs are remarkable for their sagacity, and not only readily trace out game, but also distinguish one species of animals from another. These faithful animals constitute their chief riches. When their daughters are married, hunting-dogs form their portion; and a Bedah is as unwilling to part with his dog as an Arabian with his horse. Those Bedahs who converse with the other natives are represented to be courteous, and in address far beyond their state of civilization. Their religion is little known; they have their inferior deities, corresponding to the demons of the Cinglese, and observe certain festivals. On these occasions victuals of various sorts are placed at the foot of a tree, and the ceremonies of the festival consist in dancing around them. Their origin has never been traced; but they are supposed to have been the aboriginal inhabitants of the island, who, upon being overwhelmed by their Cinglese invaders, preferred the independence of savages to a tame submission. For another account of them, see BEDAHs.

At the head of the class of quadrupeds in this island, and superior to those of the same species found in any other part of the world, are its elephants. See ELEPHANT. Of the animals applied to domestic purposes Ceylon produces but few. The horse and sheep are not natives of this island, and can scarcely be made to thrive when imported. The horses, which are bred on the small islands beyond Jafnapatam are a mixture of the Arab and the common horse of the Carnatic. They are chiefly used for drawing gigs and other light vehicles for pleasure: the Manila, Pegu, and Acheen horses are also used for these purposes. Sheep, as well as horses, are much dearer here than in any other part of India. Sheep, in particular, sometimes fetch 10 and even 20 times the price they bear on the opposite coast of Comorandel. In Ceylon horses are never employed in servile work, or for drawing burthens. As they are scarcely ever castrated, they are so spirited and vicious as in some degree to be unfit for these purposes. The oxen of Ceylon are remarkably small, generally of a black colour, and scarcely exceed in size our calves of a year old; the beef, however, is fat, and tolerably good. The price of an ox is about 11. 5s. sterling. These bullocks, though small, are very useful, and are employed in drawing artillery, and conveying burthens which are too large for the coolies to carry, and which they draw in carts, known in the island by the name of "badies." These are long, narrow clumsy vehicles, with the body

resting on a beam, which projects like the pole of a carriage, to the end of which is attached cross-wise a piece of wood, very thick, and about six feet long. Under it are hoops for the necks of the oxen, which are kept fast by pegs; so that the whole weight of the load rests on the neck and shoulders of the cattle, while they drag the cart along. The sides of the cart are composed of thin boards, the skins of buffaloes, or split bamboos; while a strong post of wood is placed at each of the four corners to give it shape or hold it firm. The bottom is formed of boards, or interwoven bamboos: the axle tree and wheels resemble those of the Irish trinkles, or cars, being blocks of wood rounded. Buffaloes, which are much larger and stronger than the oxen, are much more frequently employed in drawing burthens. These animals are found in great numbers on the island, both wild and in a tame state, and are all of the same species and appearance. See BUFFALO. The markets of Ceylon are well supplied with pigs, which may be always had at a moderate price from 5s. to 10s. The forests of this island are rendered dangerous by beasts of prey and noxious reptiles of various kinds. Varieties of deer and elks are every where met with in the woods and jungles. Hares, like the common ones of Europe, abound in every quarter of the island. The wild hog is more esteemed than the tame; and the wild bears, which are large and fierce, add much to the dangers of the Ceylonese forests. The smaller species of tiger infests the woods; but the larger kind, called the royal tiger, is not an inhabitant of the island. Ceylon has also the tiger-cat, the leopard, jackals, the hyæna, and bear, great number of monkeys of several species, and a variety of porcupines, racoons, armadillos, squirrels and mungooses; the ichneumon, stormoise, or flying-fox, several species of rats, and the ant-eater are also animals found in this island. The birds of Ceylon form a very numerous class. All sorts of our domestic poultry, turkies excepted, are natives of this island; and there are few birds found in our marshes that do not abound here. Ducks, geese, pheasants, parrots, and parroquets, are found in great numbers, both wild and tame, and usually in flocks. Snipes are also plentiful in the wet season, which is the best time for shooting them. The florican, which is a species of the crane kind, about the size and weight of a large capon, lives among the woods, and is esteemed excellent for food. The banks of the rivers and lakes abound with storks, cranes, herons, and water-fowl of various descriptions. Wood-peckers are also found with beautiful top-knots of a golden colour. Pigeons, both wild and tame, form a principal part of the birds of Ceylon and the cinnamon pigeon, in particular, which is of a beautiful green colour, and as large as our common fowl, swarms in Ceylon at all seasons of the year. There are a few partridges of the small red-legged kind, which are found on the west coasts between Nungumbo and Manaar. Among a great variety of smaller birds, the honey bird and tailor bird attract particular notice. The crows are here, as in every other part of India, exceedingly impudent and troublesome, and are with difficulty excluded from the houses. Here also kites and vultures, the Indian roller, the yellow-crowned species of peacock, and the jungle-fowl, which resembles in size our common fowl, but presents a much more beautiful plumage and is distinguished by its double spurs. The reptiles and insects of Ceylon are very numerous, and there are several species very little known. Serpents also abound to the great annoyance of the inhabitants; among which we may reckon the covra capello or hooded snake, from 6 to 15 feet long, the covra manilla, the most dreadful of all snakes, about two feet long, whose bite proves instantly fatal; the whip-snake and grass-

snakes, both poisonous, the water-snake, wood-snake, and a few other species among old ruins that are perfectly harmless. The rock-snake extends to 30 feet in length, and inhabits chiefly the rocky banks of rivers. Alligators of an immense size infest all the rivers of Ceylon, and render them every where very dangerous. The guana resembles the alligator, but is perfectly harmless. It lives in holes in the ground, is esteemed good food by the natives, and makes excellent curry, or rich soup. An immense number of toads, lizards, blood-suckers, chameleons, and a variety of others of the same class, abound every where throughout the island. Besides the leeches which are employed in the materia medica, there is another species which infests the woods and swampy grounds of Ceylon, particularly in the rainy season, to the great annoyance of passengers. The insects of Ceylon are very numerous; but the most mischievous is a species of ant, called the white ant, which is equally destructive in the fields and the dwelling houses. Land tortoises abound in many parts of the island. The black scorpion of Ceylon is a very dangerous insect, and its sting is frequently mortal. The centipedes, or common large spider, and an overgrown beetle, called the carpenter, from its boring large holes in timber, are met with in Ceylon. Fish of every sort, in great abundance, are found in the lakes and rivers of Ceylon, as well as in the surrounding seas. Many excellent kinds of fish are caught all round the coasts of this island, and form a principal article of the food and traffic of the natives.

Ceylon is particularly prolific in plants. Except in one or two species, the mangoes of Malleson, and the mandarine orange of China, this island maintains an undeniable superiority over all our settlements on the continent of India. Among the fruits which grow spontaneously are found pine-apples, oranges, pomegranates, citrons, limes, melons, plums, pumpkins, water-melons, squashes, figs, almonds mulberries, raisins, bilberries, bog-berries, &c. We might also mention Mangoe, Shaddock, Malacca rose-apple or Malacca apple, the cushoo apple, the katapa resembling our walnut, the papua or papaya of the size of a melon, and resembling it in taste and smell, the custard apple, the tamarind, the plantain, two species of the bread-fruit tree, the cocoa tree, the betel-tree, several sorts of pepper, cardamoms, coffee, the palm or palmyra tree, the sugar-tree, the tea-plant, the talipot-tree, the bnyan tree, the cotton-tree, the tickwood tree, or oak of Ceylon, nando wood, fatin-wood, calamander, manjapauram, morinda, sindric-mal, used by the natives to supply the want of clocks, as it continues open from four in the evening till four in the morning, and remains shut during the other twelve hours, limes, the manghas tree, the true ebony, zamboge, ambergris and coral, gum-lac, the sugar-cane, the nepenthes, known among the Cinglese by the name of Badura, the champaca, rice, corocan, which is a small tree, like our mustard, beat in a mortar and formed into cakes, and tanna, a prolific grain that requires hardly any cultivation. But the most valuable and important of all the vegetable productions of Ceylon is its cinnamon. See CINNAMON.

Ceylon has long been famous for its precious stones, of which it furnishes no less than 20 different sorts. The ruby, topaz, and diamond of Ceylon or Matura, are not so valuable as those of Golconda or the Brazils: but the sapphire, amethyst, aquamarine, and tourmalin are equal to those of any other country. To the class of minera we may refer the diamond, the ruby, the hyacinth, garnet, cinnamon-stone, agate, amethysts, fardonys, emerald, jaser, tourmalin, red, green, blue, and yellow, topaz, blue and green sapphire, blood stone, nephrytus, or kidney stone, white, yellow, brown, and black crystals, cat's eye, and cornelians. For the pearls of

this island; see FEARL. Lead, tin, and iron ores are found in the interior, but they are never wrought or applied to any purpose. Several mines of quicksilver were wrought by the Dutch in Ceylon. Mineral waters of various kinds are supplied by springs and wells in this island.

The revenue of Ceylon is an article of great importance to the British government. In 1795, the expence of Ceylon to Holland was 57,924*l*. sterling. But this deficiency was easily made up by the cinnamon, cardamoms, coffee, and other articles sent from the island to Europe, as well as by the profits of the pearl-fishery, and the imposts laid on the several articles imported into Ceylon from other parts of India. As to the sources of the revenue of the island, Capt. Percival observes, that the cinnamon and pearl fishery together produce an annual revenue of about 350,000*l*. sterling. All calicoes, cottons, and other Indian manufactures, must be stamped on importation into the island, and pay a duty of 5 per cent. The fisheries, the betel-nut, and the manufacture of arrack are annually farmed out to the black merchants, and the revenue derived from them amounts to at least 50,000*l*. per annum. From pepper, cardamoms, elephants, ivory, precious robes, and a few other articles of native produce, such as cocoa-nut oil, coya-ropes, &c. government derives an annual revenue of about 800,000*l*. Something is also derived from a tax imposed on the rice imported for the use of the troops. Out of this revenue the salaries of the civil officers and the pay of the troops are defrayed, as well as the other incidental expences of the island, such as the erection and repair of public works.

The natural strength of the island of Ceylon, and the few points at which it can be safely approached, seem to promise it a great degree of security; nevertheless a considerable military establishment is necessary to protect it completely against a powerful or an enterprising enemy. The force formerly maintained by the Dutch on the island consisted of about 3000 Europeans, and 2000 Malays, Topasses, and native Cinglese. This military establishment, rarely exceeding 5000 men, was found sufficient to repel the attacks of the native princes, and from the nature of the country, of baffling the attempts of any European force that did not much exceed in number the troops stationed at any particular point. But it is not merely the defence of the island itself, that renders it necessary to maintain a powerful force here. Its situation is such, that it affords the best points for stationing those troops that are destined to protect our several establishments in India, and to act as a constant check on the native princes. Troops may be sent to any of our possessions in the peninsula of India from Ceylon at a less expence, and in much shorter time, than from either of the presidencies of Bombay or Madras. The smallest establishment, as Captain Percival apprehends, which can be appointed to this island, must consist of at least three European regiments, and seven or eight battalions of native troops for the garrisons of Trincomalee, Colombo, and the Point de Galle alone; without including the fort of Jafnapatam, Manaar, and the other subordinate posts round the island, which will require garrisons proportioned to their importance. The tranquillity and prosperity of the island, after it has been sufficiently secured by a proper military establishment, must depend upon the arrangement of the civil department, and the due administration of justice. Whilst it remained in subjection to the Dutch, its governor was absolute with regard to the affairs of the island, but subordinate to the governor of Batavia, who was considered as the governor-general of all the Dutch settlements in India. The governor of Ceylon was assisted by a council, composed of the most respectable Dutch gentlemen residing at Co-

lumbo.

Jumbo. The members of this council were nominated by the governor, and confirmed in their appointments by the government of Holland. For the administration of justice, a high court was established at Colombo, to which the ultimate decision in all capital cases belonged. At Trincomalee, Jafnapatam, and Point de Galle, there were subordinate civil magistrates. And in all the inferior forts and stations through the island, there were petty courts called "landrads," for the more speedy administration of justice, and matters of less importance. In these the military commanders of the district usually presided. An appeal lay from all these inferior courts to the high court of justice at Colombo. The whole Dutch civil establishment, independent of the military who acted as civil magistrates, was computed to amount to 450 persons, comprehending all who were anywise attached to it. According to the estimate of the Dutch, Ceylon ranked only as their eighth Indian government. For some time after the English took possession of Ceylon, the government was necessarily a military one, till the arrival of governor North, when the civil establishment took place. He abolished the office of provost-marshal, and the jurisdiction of the military courts, and restored the civil establishment nearly to the same form which it bore under the dominion of the Dutch. He re-established the supreme court of justice at Colombo, with a civil magistrate to superintend the police of the fort, and another in the Black Town. The various officers necessary for these departments were also appointed at the same time; and similar regulations were adopted through the other parts of the island. The petty courts in the distant parts of the country still continue to be presided over by the commanding officer of the nearest post. The government of Ceylon was for some time dependent on that of Madras, but is now only subject to that of the mother country, and entirely unconnected with the East India Company. For the conduct of military affairs, there is a military board established at Colombo, consisting of six members selected from the commanding officers of the several corps stationed in Ceylon. The commander in chief of the forces in the island is president of this board, and the commandant of Colombo for the time being, vice-president. To it are attached a secretary, clerks, &c. with suitable salaries. Robertson's Hist. Disquisition concerning India, 8vo. 1799. Perceval's Account of the Island of Ceylon, 4to. 1805. Asiatic Researches, vol. vi.

CEYRAS, a town of France, in the department of Herault; 7 miles E. of Lodève.

CEYSERIEP. See CEYSERIEAT.

CEYSERIEU, a town of France, in the department of the Ain, and district of Bellay; 5 miles N. of Bellay.

CEYSSAC, a town of France, in the department of the Gironde, and district of Blaye; ten miles S. E. of Blaye.

CEZE, a river of France, which runs into the Rhone, 2 miles W. of Caderouffe.

CEZIMBRA, a small sea-port town of Portugal, seated on the Atlantic, in a hollow surrounded by steep, rocky, naked summits, and close to the sea; 10 miles west of Setuval. The harbour is small and badly protected: and close behind the town is an old castle situate on a mountain and visible to a great distance. The town is supported by the fishery, and sends a great quantity of fish to Lisbon. In former times, Cezimbra was more considerable.

CEZY, a town of France, in the department of the Yonne, and district of Joigny; three miles N. W. of Joigny.

CHA, in *Commerce*, a silk stuff very thin and light, made in China, which most commonly serves the inhabitants

for a summer dress; it is somewhat like our taffeties, or lustrings.

CHA, in *Geography*, a town of China of the third rank, in the province of Fo-kien; 25 miles S. S. W. of Yen-ping.

CHAAA, in *Botany*, Bauh. Pin. See THEA.

CHAA, in *Ancient Geography*, a town of Peloponnesus in Triphylia, towards the N. W. of Mæcitis. It was pretended in the time of Strabo, that it was designated by Homer under the name of Pheia, and that it was the subject of a war between the Arcadians and Pelians.

CHAAILLA, a town of Arabia Felix. Strabo.

CHAAALONS, in *Geography*. See CHALONS *sur Marine*.

CHABACA, in *Ancient Geography*, a town of Cappadocia, placed by Strabo in the country called Silène.

CHABALA, a town of Albania, according to Ptolemy.

CHABALON, or CHABAL, a town of Palestine, placed by Josephus S. of Tyre, and in the vicinity of Ptolemais.

CHABANOIS, in *Geography*, a town of France, in the department of the Charente, and chief place of a canton, in the district of Confolens; three leagues S. of it. The place contains 1,444 and the canton 10,366 inhabitants. The territory comprehends 310 kilometers and eleven communes.

CHABANON, M. in *Biography*, *Ci-devant* member of the *Acad. des Inscrip. et Belles Lettres* at Paris: a peccaudainegamous writer on various subjects of literature and criticism. But we allow him a place here only as a writer on music. In 1780 he published a work of considerable merit, entitled, *Observations sur la musique et principalement sur la métaphysique de l'art*. "Observations on music and chiefly on the metaphysics of the art." This was only the first part of his plan; but in 1785, the work came out entire, under the following title: *De la musique considérée en elle-même, dans ses supports avec la parole, les langues, la poésie, & le théâtre*; "Concerning music, considered in itself, and in its connexion with speech languages, poetry, and the theatre." In which he discovers a refined taste, nice discernment, much meditation and knowledge of the subject, and an uncommon spirit of investigation.

Though our sentiments are not always *in tune* with the opinions and reasoning of M. de Chabanon, yet there are such enlarged views and luminous and elegant observations in analysing the sensations which music excites, in assigning reasons for the pleasures which this art communicates to ears that vibrate true to musical intervals and concordant sounds, that its useful will generate reflexions on the art, and set the mind of a musician at work, who had never before regarded music but as a mere object of sense.

M. Chabanon has proved that music has its metaphysics, as well as philosophy and languages. This work therefore requires less knowledge of practical music in the reader than a mind accustomed to reflexion. The author himself says that "he writes more for intelligent readers, ignorant of music, than for musicians who neither know how to reflect nor how to think," and we are there are such to be found sometimes, even among great performers.

M. Chabanon informs us, that he has studied music theoretically and practically—execution and composition—has played out of the same books with the greatest masters of all countries; and has reflected on the subject more than 30 years. Indeed, his work seems to have been the fruit of long experience and observation, and so totally independent of the variations which music has experienced of late years, that the changes in taste, style, and execution leave his observations still in force.

The author confines his reasoning to what he calls the most essential part of music, melody; perhaps too pertinaciously, as music now can never be regarded as complete but by the union of melody and harmony. By his definition of music, he seems to regard harmony as unnecessary to its existence. This ingredient, so essential in modern music, though deemed unnecessary in high antiquity, and though still unknown in three quarters of the globe, would loudly be called for in Europe, by obtuse northern ears (according to Rousseau) which want stimulants to put them in vibration, awaken attention, and excite pleasure.

When the author says it is impossible to conceive an agreeable melody, whence a base and chords may not be deduced, we cannot entirely agree with him: for melody is so far from always arising from harmony, that the contrary is frequently true. There are many delicate and pleasing passages in melody that cannot receive an accompaniment without injury. The Italians, whose taste and feeling in music seem more refined and acute than the people of any other country, are so sensible of this, that they frequently leave a score thin rather than crowd it with notes of no other effect than to destroy the beauty and expression of the melody.

The superiority which the author gives to melody over harmony will please the extremes of ignorance and retirement; but the middle class of half-bred judges and exclusive lovers of harmony, will be scandalized at the impetuosity of the decision which annihilates the chief merit of their favourite old masters, and excommunicates psalmody from good music, if not from the church.

The author discusses the question, whether music is an imitative art? and whether its original object was imitation? but throws a doubt on its power of imitation, as well as censures the attempt, except in some very few instances. Nothing so true as that situation gives energy and meaning to dramatic music, which taken out of its niche seems insipid or absurd. In a theatre the scenes, dresses, action, and previous business, prepare the mind of an auditor and spectator for illusion, and enable it to assist the poet, composer, painter, and performer to deceive itself.

We can subscribe to this author's opinions, refinements, and metaphysics, concerning music, and allow them to be not only ingenious, but just; except when, in order perhaps to flatter his nation, he prefers French singing to Italian. While he confined himself to instrumental music, he reasoned like a man of knowledge, taste, and candour; but in speaking of singing, his opinions are so totally different from those of every nation in Europe, except France that we cannot help regarding them as national prejudices. "The Italians (he says) either in swelling their tones, or by a stronger aspiration, introduce that exaggeration in their singing with which we are so much displeas'd. I remember having heard 20 years ago *Voi amanti*, when first sung a Paris by Signora Piccinelli to the original Italian words, & pleas'd so much, that the audience murmured at a music so barbarous, or at least so different from our own; till French words were ingeniously applied to the same air which had so displeas'd before; when it soon became, by a more sober and mitigated manner, when sung by a native of Paris, so familiar and popular, that we began to doubt whether it could ever have been sung to Italian words." All this defence of French vocal expression, or rather attack of the Italian, is a proof that this ingenious author, with all his study, practice, and experience in instrumental music, was very ill qualified to erect the public opinion concerning vocal.

M. Chabanon's book was written in the midst of the war of musical opinions between the Gluckists and Piccinists. The author, who died in 1800, had but very little good

singing, and was less able to judge with decision on that art than of any other musical faculty or excellence. He is said to have been not only an excellent judge of instrumental composition and performance, but, among distant, to have ranked high as a performer on the violin.

CHABAQUIDDICK *Ile*, in *Geography*, an isle of America, belonging to Duke's county in the Massachusetts. It lies near to, and extends across the east end of Martha's vineyard island.

CHABEUIL, or CHABEUIL, a town of France, in the department of the Drôme, and chief place of a canton, in the district of Valence; 2 leagues S.E. of Valence. The place contains 4,050, and the canton 11,107 inhabitants; the territory includes 285 kilometres, and 12 communes.

CHABERIS, or CHABERUS, in *Ancient Geography*, a river of India, in the peninsula on this side of the Ganges, according to Ptolemy; which discharged itself by a great number of branches into the sea on the eastern side, N. of the promontory of Caligicum, and near it. See *CAVERY*.

CHABERIS, *Caveri-Patnam*, a town of India, in the eastern part of the peninsula, on this side of the Ganges, and at the northern mouth of the river of the same name, according to Ptolemy.

CHABINUS, a mountain wholly covered with wood, according to Diodorus Siculus, who places it in Arabia Felix, upon the coast of the Red Sea.

CHABIS, in *Geography*, a town of Persia, in the province of Kerman, at the edge of a desert, on the confines of Segestan; 115 miles N. of Sirgian.

CHABLAIS, *duchy of*, a province of Savoy, which stretches along the southern bank of the lake of Geneva, as far as the Valais, which bounds it on the east; on the south it is bounded by Faucigny; and on the west by the republic of Geneva. The country, though mountainous, exhibits a delightful variety of fields, meadows, vineyards, and woods, and is well cultivated and populous. Its capital is Thonon.

CHABLASH, in *Ancient Geography*, a people of Arabia Felix, who inhabited a district in the vicinity of the Nabatheans.

CHABLEAU, a middle-sized rope for tracking and drawing bateaux up rivers. It is impossible to row large boats loaded with provisions, &c. up violent rapids, such as those of the river St. Laurence above Montreal, or to take them up, indeed, with setting poles. Each bateau, therefore, employed in carrying provisions, ammunition, &c. from La Chine, about 12 miles higher up that river than Montreal, to the upper posts, has a rope fastened to its bow. And as it is extremely difficult for the crew of one boat to take her up some of the rapids with the assistance both of the rope and setting-poles, the bateaux, when loaded, generally start from that place in divisions or brigades, and when they reach the foot of a bad rapid, the crews of two or three of them join together, and first take up one of them, then another, and so on.

CHBLER, to fasten a heavy parcel, bundle, burthen, or weight to a rope, in order to haul and raise it up, as they do in store-houses and work-houses.

CHABLIS, in *Geography*, a town of France, in the department of the Yonne, and chief place of a canton, in the district of Auxerre, celebrated for its excellent white wine; 3 leagues E. of Auxerre. The place contains 2,223, and the canton 7736 inhabitants: the territory includes 181½ kilometres, and 13 communes.

CHABNAM, or ROSEE, in *Commerce*, a kind of muslin or cotton linen, very clear and fine: it comes from the East Indies, particularly from Bengal.

CHABNO,

CHABNO, in *Geography*, a town of Poland, in the palatinate of Volhynia; 68 miles N.E. of Zytmiers.

CHABON, or CHERBON, in *Ancient Geography*, a town of Palestine, so called by Eusebius and Jerom, who place it in the tribe of Juda.

CHABONS, in *Geography*, a town of France, in the department of the Iſere, and district of La Tour-du-Pin; 30 miles S.E. of Lyons.

CHABOR, or CHABORA, in *Ancient Geography*, a strong place of Asia, in Mesopotamia, situated at the confluence of the Chabor and Euphrates, according to Ptolemy.

CHABOR, or CHABORAS, *Chabou*, a river of Asia, in Mesopotamia, springing, according to Ptolemy, from mount Masius. It ran towards the S.W., passed near the town of Anemusia, and discharged itself into the Euphrates, in the strait on which were situated the towns of Chabor and Cerecum. Julian is said to have crossed this river on a bridge of boats. Strabo and Ammianus Marcellianus call this river Aboras. See ABORAS.

CHABORA, a town of Mesopotamia, placed by Ptolemy near the Euphrates.

CHABORAS, a mountain of Assyria, which, according to Ptolemy, lay on the borders of Media.

CHABOT, in *Ichthyology*, the common French name of the small fish, vaguely called by the English fishermen the *miller's thumb*. See *Cottus gobio*.

CHABOTTES, in *Geography*, a town of France, in the department of the Higher Alps, and district of Gap; 7 miles N. of Gap.

CHABRIA, a town of Perſia, 60 miles N.E. of Aſtera-bat.

CHABRILLAND, a town of France, in the department of the Drôme, and district of Crest; 3 miles W. of Crest.

CHABRIS, a town of France, in the department of the Indre, and district of Issoudun; $7\frac{1}{2}$ leagues N.N.W. of Issoudun.

CHABRIUS, in *Ancient Geography*, a river of Macedonia, which had its source in mount Beticus, ran towards the south, watered the town of Anthemusia, and discharged itself into the sea. Ptolemy.

CHABURA, a fountain of Asia in Mesopotamia, mentioned by Pausanias, Athenæus, and Pliny; the latter of whom says that its waters were naturally perfumed.

CHACA-HAMAR, in *Geography*, a town of Chinese Tartary. N. lat. $44^{\circ} 50'$. E. long. $92^{\circ} 37'$.

CHACAL, in *Zoology*, the French name of the animal we denominate jackal, *canis mesomelas*, Linn. Buffon calls it *chacal*, and likewise calls the *canis aureus* of Schreber and Gmel. *chacal adive*.

CHACAMEL, in *Ornithology*, the name given by Buffon to the crying curassow, *crax vociferans*, Gmel. It is also called *chacalacamel* in the Hist. New Spain. Fernand. &c.

CHACANGA, in *Geography*. See CHICANGA.

CHACA-TERGASO, a town of Asia, in the country of Tibet, 42 miles N.N.E. of Tchouten.

CHACAO, a port town of South America, in the island of Chiloe, where the governor usually resides.

CHACE. See CHASE.

CHACE, *La Chasse*, French, *Ala Caccia*, Ital. in *Musick*, all equally imply a *hunting-piece*, or movement, in which the French horn, fiddle, and flute chiefly prevail. "With early horn," an admirable long in the hunting style, accompanied by the French horn, composed by Galliard for a pantomime entertainment at Covent Garden, 60 years ago, was in such favour during the middle of the last century,

that Beard and Lew hardly ever escaped being called upon every night, for a long time, to sing it at the theatres between the acts, or in the play and farce. One of the most animated and pleasing of Haydn's symphonies is called "La Chasse." Schobert, Kotzeluch, Clementi, Duffec, Steibelt, Cramer, and other great players and eminent composers for the harpsichord and piano forte, have severally published a chaffe that has never failed to please whenever well played. See RUSSIAN MUSIC.

In the "Almanac de Gotha" for 1772, there is an abridged history of music in Russia, well drawn up, and allowed by the natives themselves to be authentic. In this sketch of musical history we have an account of a band which attends some of the grandees of that empire in the chase of so extraordinary a kind, that it was long regarded as fabulous by the rest of Europe, till the late coronation of the present emperor Alexander, at Moscow, at which splendid solemnity many of our countrymen were present, who have sent and brought hither a description of the extraordinary performance of this band, which exactly tallies with, and confirms that in the Gotha almanac 30 years ago. We shall, therefore, under the present article on the music of the chase, give our readers, in our own language, a translation of this part of the history of Russian music.

"The lovers of the chase in Russia formerly knew no other musical instrument than an ordinary brazen horn of a strait conical form, a little curved.

"These clumsy and ill-shaped horns in themselves resembled each other in length and caliber, and, consequently, produced the same tone in tuning them together. It was not music which they produced, but a kind of frightful scream, fit at best but to terrify and start game. The grand vizier, Nariskin, undertook to reform this music, or, at least, to render its effects less barbarous. With this view, he applied to one of the huntmen of the court, named Maralch, a name which ought to be recorded in the history of music. This inventive spirit began by having 37 horns made of the same kind, but of different length and diameter; so that by each producing a different tone, he acquired a series of sounds, extending to three complete octaves. These 37 horns were distributed to as many young men of the hunt, who were taught to blow them in such a manner as to produce the clearest and sweetest tone possible. After this, they were taught musical measures, and to count the time not only of sounds but of silence, so as to know precisely when the tone of their instrument would be wanted, and for what duration, in proportion to the measure of the air or piece of music that was to be executed. This was certainly the most difficult part of the task; but the Russians accustomed to discipline and obedience, and manful docility, and a disposition for so pleasing an art, by a little patience on the part of the master, and great perseverance in the pupils, the undertaking was crowned with success. The rest was the business of the composer, who distributed the several parts to the performers of each note, with the rells in whole bars and fractions, which they had to count between every two notes in their part. From this singular invention, in a short time, these young chaffurs were able to perform whatever was put before them, and they are at present in such high practice, that they play marches, airs, entire symphonies, with their allegros, andantes, and prestos, executing with astonishing precision the most difficult compositions, crowded with semiquavers, and even demi-semiquavers. During performance every one holds a paper in his hand, on which the notes, or rather the repetition of the single tone of his instrument is marked, as well as the rests which he has to count, in order to be ready at the instant his

tone is wanted, either loud or soft, short or long, according to the pleasure of the author.

“The ear of the auditor is so deceived, that he imagines passages to be played by one instrument, which, if no one note is repeated, is performed by as many different instruments as there are notes in the melody.

“This music has the most astonishing effect, particularly in the open air, where it has room to expand without the vibration being reflected back by the echoes which these sonorous instruments excite. The effect is at once grand, majestic, and pleasing: indeed, it is impossible to form an accurate idea of it without hearing it. Twenty-four or thirty common French-horns may, perhaps, if united, something approach to the same effect; but always of an inferior kind to the astonishing harmony of these Russian-horns, which, by the undulation and vibration of full and round tones, which no one instrument can produce in succession with that equal force, at once astonishes the ear and the hearer.”

At Petersburg, this music is often heard in a fine evening on the Neva, where it generally precedes the barges of the court; and we have been assured by good judges of music with nice ears, that they have not discovered, till they were told, how this music was produced: and that, as in a bell, where no ringer has more than one bell or note to his share, so here a man's whole life is devoted to one and the same sound or note.

CHACE, of a gun. See *CANNON*.

CHACE, order of, or grand order of Wurtenburg, was instituted by Eberard Lewis, Duke of Wurtenburg, in 1702, in addition to his being grand elector of the empire. The ensign is a cross of gold of eight points, enamelled red, with an eagle displayed, and beryl horns. On the centre is the letter W, and over, a ducal hat of the empire. The cross is worn pendent to a scarlet ribbon, from the left shoulder to the right side: on the left breast of the coat is a silver star, and the motto in a green circle is “*Amicitie virtutisque fœdus.*”

CHACE, in *Geography*, a town of France, in the department of the Mayne and Loire, and district of Saumur; one league S. of Saumur.

CHACHALACAMETL, in *Ornithology*. See *CHACAMEL* and *CRAX vociferans*.

CHACHAPOYAS, in *Geography*, a jurisdiction of South America, in Peru, in the diocese of Tuxilla. As it lies without the Cordilleras, its temperature is hot, and towards the east its territories have a low situation. It is of great extent and thinly inhabited; and the products of the earth are only such as naturally flourish in such a climate. The Indians here are very ingenious in making cottons, particularly tapestry, which, by the liveliness of the colours, and dexterity of the work, exhibit an elegant appearance; these, together with the fine cloth, yield great profits to the country, as they are highly valued in the other provinces.

CHACING. See *CHASING*.

CHACK, in the *Manege*, is taken in the same sense as *beat upon the hand*; it is applied to a horse when his head is not steady; but he takes up his nose, and shakes it all of a sudden, to avoid the subjection of the bridle. Turkish horses have this fault frequently. We say, they beat upon the hand; and neither the best bits, nor the best hand, can ever fix their heads. Croats, or Croatian horses, are also subject to beat upon the hand; which proceeds from this, that the bars are too sharp and ridged, or edged, so that they cannot bear the pressure of a bit, though ever so gently. If a horse had not too sensible, or too tender a mouth, he would not beat upon the hand; but in order to fix and secure his head, you need only put under his nose-band a

small flat band of iron, bent archwise, which answers to a martingale. This will hinder him to beat upon the hand, but will not break him of the habit; for as soon as the martingale is taken off, he will fall into the same vice again.

CHACO, L. r. in *Geography*, a province of South America, in the country of Buenos Ayres, reckoned 200 leagues in length, and 5 broad, on the west side of the river La Plata, and bounded on the east by a chain of mountains: it is inhabited by Indian nations that are little known.

CHACONNE, French, a serious and splendid dance to music formerly written on a ground base; but that restraint has of late been given up. The measure, however, is invariably that of 3, and there are frequent returns to the subject or first strain, after episodes and excursions into new modulations and styles.

The word is formed of the Spanish *chacóna*, which may probably be derived from the Persian *shack*, a king, thus intimating, that this might have been a royal dance; not, as others pretend, from the Italian *Cecane*, a blind man, the inventor.

CHACRELIAS, the name of a race of people, according to Buffon, who, like the Bedas of Ceylon, are of a white colour, and inhabit the island of Java. Similar to these are the white Indians of the isthmus of Darien, and the white negroes of Africa. Some have supposed that these people form a distinct race, inhabiting the isthmus of Darien, the negro country, and the island of Ceylon, all which are under the same parallel. Others imagine, that they are individuals who have accidentally degenerated from their original stock. To this last opinion Buffon inclines. The production of whites by negro parents, he says, which sometimes happens, adds great force to this theory. In the history of the French Academy we have descriptions of two of these white negroes; and Buffon adds, that they are very frequent among the negroes of Africa. This variation of nature, which is a singular circumstance, takes place from black to white only, and not vice versa: and it is no less singular, that all the people in the East Indies, in Africa, and America, where these white men appear, are under the same latitude.

CHACTAW Hills, in *Geography*, hills of America, situate in the N.W. corner of Georgia river.

CHACTAWS, or *flat-heads*, a powerful, hardy, subtle, and intrepid race of Indians, who inhabit a fine and extensive tract of hilly country, intermixed with large and fertile plains, between the Alabama and Mississippi rivers, and in the western part of the state of Georgia, in America. To this nation belonged, not many years ago, 43 towns and villages, in three divisions, containing 12,123 inhabitants, of which 4,041, or, as some say, 6,000, were warriors. They are called by the traders Flat-heads; all the males having the fore and hind part of their skulls flattened when young. These men, unlike the Muscogoges, are slovenly and negligent in every part of their dress; but they are said to be ingenious, feribile, and virtuous men; bold and intrepid, and yet quiet and peaceable. Some late travellers, however, have observed, that they pay little attention to the most necessary rules of moral conduct, or at least, that unnatural crimes are too frequent among them. Different from most of the Indians bordering on the United States, they have large plantations, or country farms, in which they employ most of their time in agricultural improvements, after the manner of the white people. Although their territories are not one-fourth so large as those of the Muscogogee confederacy, the number of inhabitants is greater. The Chactaws and Creeks are inveterate enemies to each other.

CHADACA,

CHADACA, in *Ancient Geography*, a town of Albania, placed by Ptolemy, between the Albanus and the Cassius.

CHADÆI, a people who inhabited the eastern part of Arabia Felix, according to Pliny.

CHADAGHI, in *Geography*, a town of Persia, in the province of Farhitan, five miles W. of Sehiras.

CHADARA, in *Botany*. Forsk. See *GREWIA populifolia*.

CHADBOURNE'S *River*, in *Geography*, a river of America, in the district of Maine, called by some Great Works river, about 30 miles from the mouth of the Bonnebeag pond, from which it flows. It is said to have derived its latter name from a mill with 18 saws moved by one wheel, erected by one Ledors; but the project was soon laid aside. The former name is derived from Mr. Chadbourne, one of the first settlers, who purchased the land at the mouth of it, of the natives, and whose posterity possess it at this day.

CHADCHOD, in *Jewish Antiquity*. Ezekiel mentions *chaboch* among the several merchandizes which were brought to Tyre. The old interpreters, not very well knowing the meaning of this term, continued it in their translation. St. Jerom acknowledges that he could not discover the signification of it. The Chaldee interprets it pearls; others think that the onyx, ruby, carbuncle, crystal, or diamond, is meant by it. Ezek. chap. xxvii. ver. 16. Calmet. Dict. Bibl. in v. c.

CHADDEIR, in *Ornithology*, a name given by the French to the *MEROPS ÆGYPTIUS*.

CHADER, in *Geography*, an island of Asia, formed by a river which runs from the Euphrates to the Persian gulf, and extends from Bassora nearly to El Catif, 240 miles long, and 30 wide.

CHADISIA, in *Ancient Geography*, a river of Cappadocia, which runs between the town of Amilus and the river Lyeale.

CHADRANOTITÆ, or *Cathranotæ*, (Ptol.) a people of Arabia Felix, who inhabited the southern coast opposite to the Indian ocean, near the strait in which the river P'riç discharges itself.

CHEANOITÆ, a people mentioned by Strabo, and placed in Asiatic Sarmatia.

CHEDENI, a people placed by Ptolemy in Scandianavia.

CHELEÆ *Cancerorum*. See *CRAW'S CLAW*.

CHEMÆ, in *Ancient Geography*, a people of Germany, who inhabited the districts near the river Amaluis, according to Ptolemy.

CHENIDES, a people of Asiatic Sarmatia, according to Ptolemy; supposed to be the same with the Chanoitæ of Strabo.

CHERCELA, a town of Africa, in Cyrenaica.

CHERETAPÀ, a town of Asia Minor, in Phrygia.

CHEROPHYLLO *similis*, in *Botany*, Bauh. pin. See *APHANES*.

CHEROPHYLLUM, (from *χωρῶς*, rejoicing; and *φυλλον*, leaf; alluding to the luxuriance and beauty of its leaves.) Linn. gen. 358. Schreb. 490. Juss. p. 220. Clafs and order, *pentandria digynia*. Nat. Ord. *Umbellata*, Linn. *Umbellifera*, Juss. Vert.

Gen. Char. *Cal. Umbel universal spreading; partial nearly equal in the number of its rays. Invol. universal generally none; partial five-leaved or more; leaflets lanceolate, concave, reflexed, about the length of the partial umbel. Perianth proper scarcely discernible. Cor. universal nearly uniform; florets of the disk often abortive. Profer, petals five, inflexed, heart-shaped, with an inflexed point, flatish; outer ones a little larger. Stam. Filaments five, simple, the length of the little umbel; anthesis roundish.*

Pist. Germ inferior; styles two, reflexed; stigmas obtuse. *Peric.* none. *Fruit* oblong, acuminate, even, divisible into two. *Seeds* two, oblong, attenuated upwards, convex on one side, flat on the other.

Ess. Ch. Involucere reflexed, concave. Petals inflexed, heart-shaped. *Fruit* oblong, even.

Sp. 1. *C. sylvestris*, smooth cow-parsley, or wild chervil. Linn. Sp. Pl. 1. Mart. 1. Willd. 1. Lam. 8. Jacq. Ault. tab. 149. Curt. Flor. Lond. tab. 25. Eng. bot. tab. 752. (*C. sylvestris* perenne, *cicutæ folio*; Tourm. Juss. 314. *C. refolium*; Hall. helv. n. 748. Riv. tab. 43. Myrrhis; *Cyvetris*, *feminibus laevibus*; Bauh. pin. *Cicutaria vulgaris*; Dod. pempt. 70. B. u. h. hist. p. 181. Rai. Syn. 207.) "Stem striated, slightly swelling below the joints." *Root* perennial, spindle-shaped, slightly milky, but little branched. *Stem* about three feet high, erect, branched, leafy, round, downy towards the bottom, almost always void of pubescence above.

Leaves triply pinnated, deeply cut, rough at the edge, petioles short, dilated, ribbed. *Flowers* whitish; umbels erect, terminal; leaves of the partial involucre egg-shaped, membranous, fringed with thick-set white hairs; petals more or less emarginate, rarely entire. *Fruit* oblong, somewhat elliptical, roundish, very slightly striated, quite smooth. Common in meadows and pastures in most parts of Europe; flowering in April. The whole herb has a sweetish carrot-like smell and taste; and is eaten by domestic cattle. Dr. Smith. John Bauhin mentions instances of two families having been poisoned by eating a small quantity of the root; and a few years since there was an account in the public papers of a similar disaster with respect to some children in the neighbourhood of Chester. 2. *C. bulbosum*, Linn. Sp. Pl. 2. Mart. 2. Lam. 4. Willd. 2. (Myrrhis; Hall. helv. 752. Pluk. tab. 206. fig. 2. Barrel. Ic. 555. *Cicutaria bulbosa*; Bauh. pin. 161. *Scandix bulbosa*; Roth. germ. 1, 123, 2, 318.) "Stem even swelling at the joints, rough, with hairs at the base." *Root* biennial, fleshy, succulent, of a pleasant taste. *Stem* six feet high, marked with reddish-brown spots. *Leaves* triply pinnated, deeply cut, the upper surface smooth, the petioles and midrib beset with scattered white hairs underneath. *Umbels* small, terminal; leaflets of the partial involucre awl-shaped, unequal, a little united at the base. *Petals* white, inversely heart-shaped, unequal. Some of the florets of the disk abortive. *Seeds* slightly striated. A native of hedges and wood sides in France, Switzerland, Hungary, and Norway; flowering in June and July. The roots taken up early in the spring are eaten boiled with oil, salt, and vinegar. Gmelin asserts that both these and the seeds occasion vertigoes; but this is probably in a more advanced time of the summer. 3. *C. arifolium*, Murray Syst. 288. Willd. 3. Thurb. jag. 119. "Stem even, swelling at the joints; seeds rough with hairs, two-awned." *Stem* round, striated, smooth, erect. *Leaves* twice pinnated, villous; sheaths of the petioles striated. *Umbels* terminal, compound; general and partial involucre awl-shaped, reflexed. *Seeds* oblong, awned with the divaricated styles, rough with white hairs. Thurb. 4. *C. imulium*, rough cow parsley, or rough chervil. Linn. Sp. Pl. 3. Mart. 4. Willd. 4. Lam. 9. Curt. Flor. Lond. tab. 24. Jacq. Flor. Ault. tab. 65. Eng. bot. tab. 1501 (*C. sylvetic*; Bauh. pin. 152. Myrrhis; Hall. helv. 750. Riv. tab. 68. M. annua femine striato lvi; Morf. Umb. 44. Tou n. Int. 315.) "Stem rugged, joints swelling." *Root* biennial, spindle-shaped, often divided. *Stem* about three feet high, erect, branched, leafy, round, slightly furrowed, marked with purple spots. *Leaves* slightly hairy, twice pinnated, pinnatifid and lobed, pale underneath. *Umbels* drooping before the opening of the flowers; rays rough. *Flowers* white;

white; petals irregular, deeply cloven. *Fruit* slightly striated, quite smooth. A native of hedges in England and other parts of Europe, flowering in June and July. The whole plant has a sweetish aromatic taste, and is eaten by cattle. Dr. Smith. Its trivial name is derived from its supposed narcotic or inebriating quality. Linnæus, and numerous authors after him, have spelt it *temulum*; but as there is no such Latin word, Dr. Smith has very properly changed it into *temulentum*. 5. *C. cæneæ*, Willd. 5. Thunb. prod. 51. "Stem even, equal; seeds furrowed; leaflets trifid, smooth." A native of the Cape of Good Hope. 6. *C. feabrum*, Mart. 9. Willd. 6. Thunb. jap. 119. (Jaime Ninin; Kämpf. anouv. p. 882.) "Stem equal; leaflets gashed, acute, rough with hairs; peduncles scabrous." *Root* fibrous. *Stem* a foot high, somewhat zigzag, erect, angular, striated, smooth near the bottom, hairy above; branches alternate, spreading, somewhat foliately. *Leaves* twice-pinnated. *Umbels* terminal. *Seeds* ovate-oblong. It differs from the following in having smaller and more divided leaflets, sheath not dilated, and smaller umbels. 7. *C. hispidum*, Linn. Sp. Pl. 5. Mart. 5. Willd. 7. Jacq. Flor. Austr. tab. 148. (*C. palmifera*; *β. Lam.* 3. Myrrhis; Hall. helv. n. 751. Riv. pent. 50. *Cicutaria palmifera laetifolia*; Bauh. pin. 161. *Cerefolium*; Morif. hist. 3. tab. 10. fig. 6.) "Stem equal; leaflets gashed, acute; fruit two-awed." *Root* perennial. *Stem* round, very rough, with rigid hairs. *Leaves* thrice pinnated or pinnatifid. *Umbel* convex, nodding before it flowers. *Flowers* white, not radiate; many of them barren. *Fruit* somewhat cylindrical, slightly striated; awns straight, bluish, more rigid than in *C. aromaticum*. A native of Switzerland, Germany, and Caroliæ; cultivated by Mr. Miller in 1768. 8. *C. aromaticum*, Linn. Sp. Pl. 6. Mart. 6. Willd. 8. Lam. 2. Jacq. Austr. tab. 150. (*Myrrhis orientalis angelicæ folio*; Tourn. Cor. 22. M. fol. podagræ; Riv. pent. tab. 53. *Angelica*; Bauh. pin. 156. n. 4. *Cerefolium*; Boec. Mus. 2. tab. 19.) "Stem equal; leaflets heart-shaped, ferrated; fruit two-awed." *Root* perennial, aromatic. *Stem* about two feet high, branched, reddish, beset with distant hairs. *Leaves* twice pinnated; petioles hairy. *Umbels* terminal. *Flowers* white, small, not radiate, many of them barren; leaflets of the partial involucre from seven to nine, lanceolate, reflexed. A native of Lusatia, Silesia, Austria, and the Levant; cultivated by Mr. Miller in 1758. 9. *C. aureum*, Linn. Sp. Pl. 4. Mart. 4. Lam. 5. Willd. 10. Jacq. Austr. tab. 54. (*Cerefolium*; Hall. helv. n. 749. Myrrhis minor; Bauh. p. 160.) "Stem equal; leaflets gashed; seeds furrowed, coloured, awnless." *Root* perennial, thick, branched. *Stems* two or three feet high, angular, striated, spotted, hairy near the bottom, not hollow. *Leaves* twice pinnated, pale, smooth above, hairy underneath; leaflets gashed, acute, upper ones confluent. *Flowers* white, externally reddish. *Fruit* spindle-shaped. *Seeds* yellow, with four obtuse remote furrows. A native of Germany and Switzerland. 10. *C. coloratum*, Linn. Mant. 57. Mart. 7. Lam. 6. Willd. 9. Jacq. hort. tab. 51. (Myrrhis; Morif. 3. tab. 10. fig. 6. Pluk. tab. 100. fig. 5) "Stem equal; leaves thrice pinnated; partial involucre coloured." *Root* perennial. *Stem* a foot and half high, cylindrical, striated, hairy towards the bottom. *Leaves* thylidly beset with hairs; petiole dilated, membranous. *Flowers* yellow, in loose umbels; partial umbels small; leaflets of the partial involucre six or seven, oval acute, yellowish as in the buxurians, the length of the pedicels. *Fruit* as in the preceding species, but more finely striated. A native of Ulyria. 11. *C. arboreum*, Linn. Sp. Pl. 7. Mart. 10. Lam. 7. Willd. 11. (*Cicutaria arborescens*; Rai Supp. 257. Pluk. mant. 49.) "Shrubby." *Stem* woody. *Leaves*

resembling those of *C. sylvestris*, large, triply pinnate; pinnules expanding, smooth, gashed and toothed; umbels small. *Flowers* white, all fertile. A native of Virginia.

Obf. In this, as in all other very natural families, authors differ very much from each other in the formation of genera. La Marcq unites the chærophyllum and feandix of Linnæus, and asserts that they make a well-defined genus, which ought by no means to be broken; and which has for its essential character; *fruit* slender, elongated like the beak of a bird, either even or striated, smooth or hairy. Ventenat, on the other hand, has distributed the species into three genera. 1. Chærophyllum, including chærophyllum sylvestre; with feandix cerefolium, nodosa and anthracis of Linnæus, with the following generic character. *Cal. entire. Cor. Petals* heart-shaped or emarginate, unequal. *Fruit* cylindrical, awl-shaped, smooth, either smooth or rough with hairs. 2. Myrrhis, a name revived from the old botanists, including feandix odorata, with chærophyllum hirsutum, aureum, bulbosum, temulum, aromaticum, and coloratum; under the following character; *fruit* oblong, attenuated at the summit into a short point, either even or furrowed, smooth or hairy. 3. Scandix, including feandix petea, anthracis and grandiflora, with the following character; *fruit* terminated by a long point, finely striated, either smooth or rough with hairs. Gærtner had before made the same division, and had founded his generic characters on the comparative length of the nucleus and the whole seed. According to him the nucleus of feandix is scarcely a quarter of the length of the seed, chærophyllum three quarters, and myrrhis the whole length. Under the first he figured the fruit of feandix petea; under the second, of feandix cerefolium; and under the third, of feandix odorata, chærophyllum aureum, *C. temulum*, and *β. canadense*. See SCANDIX.

CHÆRUS, in Ichthyology, a name given by Strabo and other old writers to the Caprifiscus or goat-fish of later writers. See BALISTES monoceros.

CHÆTÆ, in Ancient Geography, a people placed by Ptolemy in Scythia, on the other side of the Imaus.

CHÆTANTHERA, in Botany, Boec. Nouv. Dict. Flor. Peruv. pl. 23. Class and order, *frugifera polygamia superflua*.

Gen. Ch. *Cal.* common, many-leaved; outer leaflets lanceolate, ciliated; intermediate ones linear, ciliated at the summit; inner ones linear, scarious, sphaecellated, terminated by a bristle. *Receptacle* naked. *Seeds* oval; down capillary. There are two species, natives of Peru.

CHÆTTA, in Zoology. This is the name under which Dr. Hill describes that kind of intestinal vermes, which the English call Hair-worm. Vide Hill, Hist. Anim. p. 14. It is a species of Gordius, the *seta* of Müller, and *ayenticus* of Linnæus. See GORDIUS aquaticus.

CHÆTOCRATER, in Botany. (from χεῖρα, the mane of a horse, and κρατήρ, a cup.) Boec. Nouv. Dict. Flor. Peruv. pl. 35. Class and order, *decandria monogynia*.

Gen. Ch. *cal.* perianth bell-shaped, with five oval segments. *Cor.* none; a wide tube surrounding the germ, crowned by ten bristles. *Sperm.* filaments ten, alternately shorter, inserted into the edge of the tube. *Pist.* germ superior, trigonous; style short; stigma three, capitate. *Peric.* capsule three-celled. A tree, native of Peru.

CHÆTODON, in Ichthyology, a genus of Thoracic fishes. The head is small, mouth small; lips tetra-ble; teeth numerous, close set, equal, setaceous, flexible, and movable; eyes round, small, vertical, and furnished with a distinct membrane; gill membrane, with from three to six rays. Body broad, compressed, body and generally furnished;

ated; dorsal and anal fin thick, fleshy, scaly, and commonly spinous.

The fishes of this numerous genus are, with very few exceptions, extremely beautiful, their colours remarkably vivid, and their variegations consisting generally of stripes, lines, bands, or spots; their body covered with strong scales, which are finely denticulated at the margin; and the dorsal and anal fin remarkably broad.

CHÆTODON aureus, *La Bandoulière dorée*, of French writers, and *Golden Chæton* of the English, is one of the most brilliant species of this genus. The colour is golden yellow, with a spine near the cheek bone. Bloch. Gmel.

This beautiful fish was figured by Bloch from one of Plumier's drawings, as an inhabitant of the Antilles. The body is oval, and except the pectoral and ventral fin, the whole is covered with scales. The colour of the body is fine golden yellow; the fins are yellow at the base, and green at the extremity; the pectoral and caudal fins are both rounded, the rest falcated. The pectoral fin contains twelve rays; ventral six; anal nineteen, caudal fifteen, and dorsal thirty-six. Length of this fish about twelve or fourteen inches.

CHÆTODON imperator. Yellow, with numerous longitudinal streaks, and about fourteen dorsal spines. *C. Imperator*, *longitudinaliter striatus*, *aculeis dorsibus* 14. Bloch. *L'empereur du Japon*, & *la couronne*, ib. Ruysch, &c.

The head of this fish is large, the iris golden, and partly surrounded by a blue arch; mouth small, with the lips large, and the jaws equal; gill membrane of two parts marked with a blue streak; lateral line near the back, and bending down at the end of the dorsal fin. This is a most splendid fish, about the same length, or rather larger than *C. aureus*, and has the body also of an oval form. It is a native of Japan, where, according to Ruysch and Renard, it is in high esteem as an article of food, and is said to be richer and superior in flavour to the salmon, called, by the late writers, *der Kaiser von Japan*.

CHÆTODON fasciatus. Body falcated; abdomen armed with seven spines. Bloch. *La Bandoulière rayée*, ib. *Chæton Dux*, Gmel. *Ikan sengadji malakka*, Valent. *Dou-eung batard d'Haroké*, et *Gbietsevitch*, Renard. *Fasciated Chæton*.

First described by Valenty, who informs us the Dutch in India call it *Molukse Herog*. The body is whitish with a silvery hue, rather dusky on the back; and is barred across with nine broad bands of deep blue, each of which is margined on both sides with a narrow streak of brown; the dorsal fin is edged with a blue stripe, and the anal fin marked posteriorly with four nearly equidistant lines of the same colour. The iris is white; mouth narrow; jaws equal; gill-cover of one piece; lateral line near the back, and bending at the end of the dorsal fin: pectoral fin short, pellicud and rounded. The dorsal fin contains about thirty-seven rays, the first fourteen of which are spinous. This inhabits the Indian seas.

CHÆTODON guttatus. Body spotted; ventral spines two. Bloch. Gmel. &c. The body is long, narrow, covered with minute scales, above cinereous, beneath white, and spotted with tawny. The eyes are large and round, with dusky yellow iris; mouth large; jaws conal; gill-cover of one thin long piece; fins destitute of scales, with the rays branched; pectoral fin yellow-brown; dorsal and anal cinereous; tail yellow, with cinereous spots. The dorsal fin contains thirty-seven rays; pectoral fifteen; ventral seven; anal twenty-three; and the tail sixteen. This species inhabits Japan, and was first described by Bloch.

CHÆTODON paru. Dorsal spines ten, anal five. Bloch. Gmel. *Paru*, Marcg. *La Bandoulière Noire*, Bloch.

This fish inhabits South America, where it subsists on smaller fishes, insects, and other aquatic animals; it is found throughout Brasil, and in Jamaica. The body is black, but at the sides grey, and the edge of each scale is large and edged with yellow. The eyes are small, with golden irides; lower jaw longest; gill cover of two pieces terminating downwards in a spine, and covering the membrane; vent in the middle of the body; pectoral and tail-fins short, rounded; the rest long, and falcated; before the pectoral fin a yellow spot. Described by Marcgrave as being from nine to ten inches long, but according to the manuscripts and drawings of Prince Maurice preserved in the royal library at Berlin, the length is more than sixteen inches.

CHÆTODON paru. Dorsal spines fourteen; body oblong. Bloch. Gmel. &c.

The head large, and with the breast yellow-brown, spotted with blue and marked near the gills with blue lines; iris greenish-white; mouth small; gill cover of one piece, the membrane loose; lateral line parallel with the back, and interrupted at the end of the dorsal fin; vent in the middle of the body; rays of the fin branched. This species is described by Bloch as a native of the East Indies, probably from a drawing, as he observes he is unable to determine its size; he adds that it is of the number of carnivorous fishes, and that the display of beautiful colours which pervade it induced him to name it *paon de l'Inde*, Indian Peacock Chæton.

CHÆTODON vespertilio. Dorsal and anal fin broad; band on the tail black. Gmel. &c.

This species inhabits India. The body is cinereous, beneath paler, very thin, and covered with minute scales. The head is destitute of scales; iris silvery and yellowish; mouth small; lips thick; gill-covers of two pieces; lateral line arched; fins cinereous, with branched rays; scaly part of the dorsal and anal fins yellowish. This species is in particular distinguished by the extreme length and breadth of the dorsal and anal fin, both which are of a somewhat triangular shape, and nearly equal the body in point of size; the depth from the opposite tips of the dorsal and anal fins is about six inches and a half, but that of the body from the front of the head to the extremity of the tail four inches. Supposed to be the sea-bat of Willughby. The French call it, *la Bandoulière à larges nageoires*.

CHÆTODON unimaculatus. On each side, near the back, an oval black spot; dorsal spines about thirteen. *Chæton unimaculatus*, Gmel. Bloch, &c. A native of India: the body is of a roundish ovate form; the colour greyish-white, with transverse brown lines; back cinereous; scales large; over the eye is a black band; jaws equal; lateral line parallel with the back, and nearly approaching it; fins yellowish; tail brown at the base. The dorsal fin contains about forty-eight rays; pectoral four, ventral six, anal thirty-six, and caudal sixteen. *La Bandoulière à tache*. Bloch.

CHÆTODON marginatus. Fins margined and pointed; dorsal spines about twelve. Gmel. Bloch, &c. *La Bandoulière bordée*, ibid.

Inhabits the gravelly shores of the Caribbee islands near the mouths of the rivers. The body is yellow; head and lower parts whitish, with eight pale brown bands; scales large. The eyes are oblong, with silvery irides; vent nearest the tail; fins without scales, and with the rays branched, yellow on the anterior, and cinereous on the posterior

posterior part; tail forked and entirely yellow. Flesh good.

CHEOTODON macrolepidotus. Tail entire; dorsal spines eleven, the fourth filiform, and very long, Gmel. *Bandoulère à larges écailles*, Bloch, &c. *Ikan-Pampus* and *Tercloe*, Valent, &c.

This species inhabits the East Indies, where it grows to a considerable size. Renard assures us it is found in the isle of Illila, not far from Amboyna, of the weight of twenty or twenty-five pounds. According to Valentyn the fish is fat, and of a very good flavour, resembling that of the sole. The body is silvery, with two brown bands, and coated with larger scales towards the tail. The head is small, with the jaws of unequal length; eyes round, with black pupil and bluish irides; before each eye a brown spot, and another over each; the gill cover consists of a single plate; the lateral line is arched; vent situated near the middle of the body; tail truncated. The dorsal fin contains eleven spiny, and about thirty-four soft rays; pectoral sixteen; ventral seven; anal twenty-seven; tail sixteen.

CHEOTODON taira. Body with three black bands; dorsal and anal fins very long, Bloch, Gmel, &c. *Cbetadon*, corpore rhombico fuscescente, fascia transverse duplici obsecuriis; pinnis ventralibus, ani et caudæ falcatis corpore longioribus, Forst. *Bredesinnige kipvisch*, Mus. Schwenck. *Ikan-Kamling*, Valent. *Cambung*, Renard. *Zeeboje*, Ruysch. *Bandoulère à nageoires noires*, Bloch, &c.

This species inhabits the Arabian and Indian seas. The Arabians call this fish when small *Taira*, or *Teyra*, whence its specific name is derived, and when large *Daakar*. Forstael tells us it grows to the length of three feet, and is an edible fish. Its principal food consists of coral- and testaceous animals. The body is white, broad, long, and sloping at the head; scales small and denticulated; irides white, tinged with reddish; the gill covers consist of a single piece, lateral line much bent, and composed of white dots: vent situated near the ventral fins which are black; the other fins white. The dorsal fin contains five spiny and thirty-four soft rays; pectoral eleven; ventral one spiny, and six soft rays; anal three spiny and twenty-six soft rays, and the tail seventeen rays.

CHEOTODON cornutus. Tail bifid; dorsal spines three, the last extremely long. *C. Cornutus*, cauda bifida spinis pinnæ dorsalis 7, radio dorsali tertio longissimo, Linn. *Gelandender Trompeter*, *Ikan Parochi*, *Alferca Djawa*, Valent. *Ikan Schwangi*, Ruysch. *Bzaantje Klipvisch*, *Speervisch*, *Moorsehe Afscholt*, Renard, &c. *Heron de Mer*, Bloch.

According to Valentyn this is an edible fish of excellent quality. The shape of the body is somewhat orbicular, thin, coated with fine scales, white, and marked with three transverse blackish bands, one passing through the eye, the second nearly parallel, and touching the base of the pectoral fin, and the third broader and situated near the tail. The tail also, which is somewhat lunated, is black, with a black transverse bar of white. The snout is rather produced, and above each eye is a small horn-like pointed process. Bloch is persuaded that Linnæus was either mistaken in regard to the number of spiny rays in the dorsal fin of this fish, or that an error has crept into the Syst. Nat. in printing, as he could not, in either of the three specimens he examined, observe more than three such spiny rays instead of seven as Linnæus describes. *C. Cornutus* is a native of the Indian seas.

CHEOTODON vesibratus. Tail entire; dorsal spines nine; fin with a black ocellated spot; snout cylindrical, Gmel. &c. *Bandoulère à bec*, Bloch.

The body is of a roundish ovate form, with the snout so greatly lengthened into a tubular form as to afford an excellent criterion of the species; the irides are yellow; jaws equal; lateral line near the back and arched. The body is whitish, with a dusky tinge on the back, and marked across with five transverse, and nearly equidistant brown bands, the edges of which are milky-white. The dorsal and anal fin are very broad at the hinder part, and the former is marked with a large black spot, encircled with white; the gill-covers are fealy, and without spines; the tail with a black band edged with white. This fish lives in all the seas of India. According to M. Hommel, inspector of the hospital at Batavia, it resides principally in the deeper parts of the sea, or the mouths of rivers, the last of which it may be supposed to visit like many other fishes during the spawning season. The manner in which this species takes its prey, though not entirely peculiar to this fish, is rather extraordinary. It lives principally on the smaller kinds of insects that fly near the surface of the water, and when it observes any one of these hovering or gliding near it, darts from its tubular snout a drop of water with an aim to steady and certain, as to bring the insect down with it into its jaws. If the fly, or other insect which it singles out for its object, be at rest on some aquatic plant, the fish cautiously approaches within the distance of four, five, or six feet before it ejects the water, which, even at this distance, is almost certain of bringing the insect down to the surface of the water. When kept in a state of confinement in a large vessel, it is said to afford considerable entertainment by its dexterity in taking the insects placed at a convenient distance within its reach. M. Hommel informs us, that they are preferred in the gardens and houses of the great men in India, in very large vases, for the amusement of their ladies. The fish is eatable, and the fish is usually taken with the hook and line.

CHEOTODON orbis. Body orbicular, bluish; second, third, and fourth dorsal fin elongated and bristle-formed. *C. orbis*, orbicularis, pinnæ analis radiis 19, Bloch. *Schibe* of the German; *L'Orbe* of the French writers. *Orb cbetadon*.

A native of India. The head large and sloping; irides golden; gill-cover long, narrow, covering the membrane; lateral line composed of many straight, interrupted lines running together into an obtuse angle towards the back; vent in the middle of the body; upper part of the body bluish-green; belly white; ventral fins long, narrow, and falcated. The dorsal fin contains about 37 rays; pectoral 14; ventral 7; anal 26; and caudal 14.

CHEOTODON nigricans. Tail bifid, with a spine on each side. *Cbetadon nigricans*, Gmel. Tail somewhat bifid, with a spine on each side; dorsal spines nine. Andre in Phil. Trans. 1784. *Acaruna*, Ruysch. *Philosophe & Cautérie* of Verkenkop, Renard. *Ikan batoe bomo*, ib. *Pesikan*, Bloch, &c.

Inhabits the Indian-Ocean and Red Sea. The length is two feet; body blackish, at the sides brown, and beneath white. The eyes are large; teeth in the upper jaw 16; in the lower 10; gill-cover long and narrow; lateral line nearest the back and continued parallel with it; pectoral and caudal fin cincereous, ventral black, dorsal and anal white at the base, the rest brownish. Maregrave found this species in Brazil, Hafselquist in the Red Sea, and Valentyn in the East Indies. It grows to the length of eighteen inches and rarely to two feet.

CHEOTODON argus. Body spotted with brown; anal spines four. *Cbetadon*, spinis dorsibus 11 corpore punctis nigris plurimis, cauda integra. Brunniche. Gmel. *Sironde*, Ruysch. *Ikan taci*, Renard. *Cacaocla belang*, Valent. *L'Argus*, Bloch, &c.

The *Argus chetodon* inhabits the fresh waters of India, living principally in swampy places, where it finds an abundance of insects, on which it feeds. Valentyn speaks of it as a fish of excellent flavour. The body is nearly square, of a silvery grey colour, and violet on the upper parts; fins yellow; the whole body and also part of the fins are marked with numerous round spots, of a dark brown colour. The irides are golden; jaws equal; gill-cover large; membrane loose; lateral line arched; vent nearly in the middle of the body; tail even at the end.

CHÆTODON vagabundus. Mouth cylindrical; dorsal spines 13; body striated. *C. vagabundus*, Gmel. &c. Linn. Mus. Ad. Frid. *Ikan sagadij, Ikan poetri, & Japansche prins*, Valent. *Douwing prins, Douwing royal, & Douwing berisgin*, Renard. *Prinseffe*, Ruych. *Le vagabond*, Bloch. *Wandering chetodon*.

This species is mentioned as a native of all the Indian seas, and is esteemed an excellent fish for the table. The body is yellow, lined with brown; above the eyes runs a black band, which Bloch considers as one of the leading particulars of its specific distinction. There is also another black band at the end of the body, near the base of the tail, which runs both into the dorsal and anal fins; and a third black band across the middle of the tail. The head is covered with small scales, but those on the body are large. The gill-covers are of two pieces, the membrane loose; vent nearer the tail; fins yellow, with branched rays, the dorsal, anal, and caudal fins edged with black.

CHÆTODON ciliaria. Gill-covers spinous; scales ciliated. *Chetodon*, cauda integra, squamis pinnæ dorsalis 14, operculis spinosis, squamis ciliatis. Linn. *Sparus saxatilis*, Olf. *Platiglossus*, &c. Klein. *Acaroua altera major*, Ray.

The body is white, with six black bands. The eyes are large; aperture of the gills very large, the membrane loose; lateral line interrupted at the dorsal fin; fins large and thick; tail forked. Length eight inches. Inhabits the coral reefs on the shores of Brazil, India, and Araba.

CHÆTODON striatus. Tail entire; dorsal spines twelve; body striated; snout prominent. Gmel. Linn. &c. *Ikan kato melia, Høstlykke klipsfisk*, Valent.

The body is yellow, fasciated with brown, one band passing in a semicircular direction transversely through the eyes, a second nearly parallel from the back to the belly, across the pectoral fin, a third intermediate between that and the tail, a fourth at the base of the tail, and the fifth across the tail; extremity of the caudal fin, and posterior end of the anal and dorsal fins brown. Found in Japan, and other parts of India. The French call this *L'ongre*, or *Le zèbre*.

CHÆTODON arcuatus. Tail bifid; dorsal spines twelve; body barred with brown. *C. arcuatus*, cauda bifurca, fasciis 3 fuscis. Linn. Mus. Ad. Frid. *Boute duisse*, Valent. *Bourgonse*, Renard.

The body is silvery, cinereous on the back, with deep brown bands, one on the head, another on the breast, and a third passing from the dorsal to the anal fin. The head is large, the mouth narrow, jaws equal, gill-cover of one piece and mucronated in the middle; ventral fins long, and with the anal black; tail and dorsal fin cinereous.

CHÆTODON capistratus. Tail entire; dorsal spines twelve; a purple spot surrounded with white near the tail. *Chetodon capistratus*, &c. Linn. *Tetragnopterus levis*, &c. Klein.

The body is covered with rather large scales; colour white, with brown lines. The eyes are very large; band through the eyes black, and edged with white; gill-cover sea-green, and consisting of two pieces; fins yellowish; the rays branched; dorsal and anal fin brown at the edge; spines

sea-green; near the tail a black band. Length three inches. Inhabits Jamaica.

CHÆTODON rotundus. Dorsal spines twenty-three; body with five pale bands. Linn. Inhabits South America and India. The body is cinereous and rounded.

CHÆTODON lineolatus. Tail entire; body with three bands, one across the eye, another across the breast, and a third extending from the anterior dorsal fin to the tail. Gmel. *Gurperu*, Edwards. A native of India. Form of the body lanceolate. The bands are black, edged with grey.

CHÆTODON chieruus. Dorsal spines fourteen, caudal one. Bloch. *Le chieruus & Nanderz*, ib.

This species inhabits the seas surrounding the Caribbee islands, and is described by Bloch from one of Plumier's drawings and manuscripts. The colour of the body is yellow, with five narrow violet bands, and beneath bluish. The head is large, and of a violet colour, with a black spot on the mouth and checks. Its upper jaw is longer than the lower; vent nearer the mouth than the tail; fins without scales; pectoral, ventral, and anal fin violet, the last barred with yellow; dorsal fin, varied with yellow and violet; tail yellow at the base, and violet towards the edge. In Plumier's drawing, above-mentioned, the dorsal fin contained 14 spiny and 26 soft and branched rays; pectoral fin 16 rays; ventral 1 spine and 6 soft rays, 3 spines and 20 soft rays, and the tail 16.

CHÆTODON rhomboides. Dorsal spines five; anal three. Bloch. *La bandoulière rhomboidé*, ib.

A beautiful species, described, like the preceding, on the authority of a drawing by father Plumier, and which is supposed to attain to a considerable size. It is a native of the American seas. The body is of a rhombic form, deep green on the upper parts; the sides greenish, below which, near the belly, are three green lines, and three intermediate lines of white; belly yellow. The head is silvery, truncated anteriorly, with the eyes large, and mouth still larger in proportion; teeth small; gill-covers consist of two semilunar pieces, with the membrane loose; lateral line slightly curved, vent in the middle of the body; dorsal fin green; pectoral and ventral yellow at the base, and edged with violet; margin of the anal and caudal fin green.

CHÆTODON Plumieri. Dorsal fins two; head without scales. Bloch.

This also is an elegant species, described by Bloch from the designs of father Plumier, and named in compliment to that collector. The fish inhabits the stony shores of the American seas, and is of the number of edible fishes held in most esteem for the table. The body is of an oblong form, coated with small scales. The colour brownish above, cinereous at the sides, beneath white, and marked with six greenish-black bands. The head is brown above, at the sides white; lateral line arched; fins much fasciated, green, at the base yellow, and without scales; all the spines of the first dorsal fin yellowish. In Plumier's figure are delineated 5 spines in the first dorsal fin, and 35 soft rays in the second; pectoral 14; ventral 1 spine and 5 soft rays; anal 2 spines and 25 soft rays; and tail 12 rays.

CHÆTODON Curaçao. Dorsal spines 13; anal 2. Bloch. *La bandoulière de Curaçau*, ib. *Angel-fish* of Curaçao.

A native of South America. The head is large, the jaws of equal length, and the lips thick; the gill-covers are broad, violet, and covered with large scales. The body is thick, brownish, with the sides silvery, and the scales edged with violet. The lateral line is composed of oblong white scales, and is broken, or interrupted at the dorsal fin; vent in the middle of the body; fins yellow, with branched rays; tail forked.

CHÆTODON Mauritiæ. Dorsal spines eleven; anal three. Bloch. *La bandoulière du prince Maurice*, ib.

The Brazilian name of this fish, according to the above author, is *Jagacaguare*. He describes it from one of Plumier's drawings, and informs us, on the authority of prince Maurice, that it inhabits Brazil, grows to the length of two feet, and that the flesh is white, and of a good flavour. The body is long, and covered with small scales; blue on the back, and the sides paler blue, and belly white. From the back descend six narrow black transverse bands, which terminate about the middle of the body. The sides are yellowish-silvery; the mouth and aperture of the gills large; the back rather arched, with the lateral line contiguous; vent nearest the tail; rays of the fins ramose; ventral fin yellow; pectoral dusky; and the rest pale blue. This is named in compliment to the memory of the celebrated prince John Maurice of Nassau-Sigen, under whose conduct the Dutch, in 1637 and 1638, became possessed of the richest part of Brazil, and who afterwards, while governor of that country, amused his leisure hours in taking drawings and descriptions of its zoological productions.

CHÆTODON Bengalensis. Body fasciated; dorsal spines thirteen; anal two. Bloch. *La bandoulière bengalensis*, ib.

This fish inhabits Bengal. The body is large, whitish, with a bluish back, and marked across with five bay-coloured bands. The irides are yellowish-white; aperture of the gills large; lateral line slightly arched near the back, and interrupted at the extremity; vent nearest the tail; fins brown at the base and edged with blue.

CHÆTODON olivofasciatus. Body with eight brown bands; dorsal spines eleven; anal three. Bloch, Gmel. &c.

The head is small, and rather advanced, with the lower jaw projected beyond the upper. Its body is nearly round, of a whitish colour, except on the back, which is violet, and the whole marked transversely from the back to the belly with nearly equidistant brown narrow bands; the dorsal and anal fins are both edged with brown, the rest of the fins grey. This species is a native of the East Indies.

CHÆTODON annularis. Brownish, with obliquely curved longitudinal streaks, and a blue ring on the lateral line behind the gills. *Chætodon annularis*, Bloch, Gmel. &c. *Ikan batoo*, *Jang aboo*, and *Ikan pampus Cambodia*.

A native of India. The body is ovate, and brownish, with about five blue lines. The irides are silvery; gill-covers of two pieces; the anterior one toothed and spinous; lateral line parallel with the back; vent in the middle of the body; dorsal fin pointed; anal rounded, both dark brown, banded with blue, the rest of the fins white. The dorsal fin contains fourteen spinous rays, and forty-one soft; pectoral sixteen; ventral one spine and six soft rays; anal three spines and twenty-eight rays, and caudal sixteen rays.

CHÆTODON collare. Head with two white and three black bands; dorsal spines twelve; anal seven. Bloch. *Le collier*, ib.

This kind is a native of Japan. The body is of a round ovate form; colour bluish on the upper parts, and yellowish beneath. The scales are very large. The head is sloping, of a brown colour, marked with two white, perpendicular stripes, and three black ones; the mouth is white; eyes large, with the iris blue; lateral line bending in an obtuse angle at the dorsal fin, and interrupted at the end; pectoral fins yellow; ventral cinereous; the rest yellowish edged with brown; the dorsal fin is marked with a yellow band, and the tail across the middle by a brown one. Figured by Seba, who describes it to be about six inches long.

CHÆTODON mesoleucus. Head fasciated with a single band; gill-cover one spined; dorsal spines twelve; anal three. *Chætodon mesoleucus*, Bloch. *Le mulat*, ib. *Chætodon mesomelas*, Gmel.

Shape of this fish roundish-ovate; the anterior part bluish-white, the hind part black; and the whole body covered with very small scales; gill-covers consist of two pieces, and are armed with one large and several small spines; the opening of the gills large; the lateral line runs near the back; vent situated in the middle of the body; all the fins are white, except the dorsal and anal fins, which are black. Inhabits Japan.

CHÆTODON faber. Body fasciated; the third dorsal spine very long. Bloch, &c. *Le forgeron*, Brouff. uet.

This species was first described by Brouffon, and under the name of *Forgeron*. It inhabits the Indian and American seas; and from a drawing of father Plumier's, referred to by Bloch, is said to grow to the length of eleven inches. The body is silvery, ornamented with six bands of deep blue. The iris of the eye is yellow; the lateral line is arched to the form of the back, running parallel and contiguous; the vent is in the middle of the body. The ventral and pectoral fins are black, and the rest deep blue. This is an edible fish, and in much request for the table in South America.

CHÆTODON Suratensis. Dorsal and anal fin armed with many spinous rays; body banded with fuscous; a black semilunar mark at the base of the pectoral fin. *Chætodon Suratensis*, *La bandoulière de Surate*, Bloch.

Form of this fish ovate; colour silvery-grey, darkest on the back and fins; head and body marked with seven brown bands; dorsal and anal fin rather broader behind, and with the tail yellow, with a broad violet border. Received from one of the Danish missionaries in Surat by Chemnitz at Copenhagen.

CHÆTODON canfensis. Tail bifid; dorsal spines two, third ray very long; mouth bidentate. Gmel. &c. Described and figured in the work of Seba as *Chætodon canfensis*.

The colour of the body is greyish, and covered with very small scales. Inhabits the American and Indian seas.

CHÆTODON alpinotus. Tail bifid; dorsal spines three; no ventral fin. Gmel. Linn. &c.

Communicated to Linnæus by Dr. Garden. This inhabits the seas of Carolina. The body is of a rhombic form, without scales; upper parts bluish; jaws with a simple row of teeth; lateral line parallel to the back, and dotted; dorsal and anal fins falcated.

CHÆTODON acuminatus. Tail entire; dorsal spines three; third ray very long. Gmel. Linn. Inhabits South America and India. The body is marked with three brown bands; dorsal fin setiform. Linn. Mus. Ad. Fr.

CHÆTODON pinnatus. Tail entire; dorsal spines four; dorsal and anal fins very long. Gmel. *Greysib Chætodon*, with frontal band and tip of the tail white. Linn. This is a native of South America and India, and is remarkable for the extraordinary size of the fins.

CHÆTODON chinensis. Anal fin eighteen-spined. Bloch. This inhabits China. The body is oblong, marked with fuscous bands, and a round spot on the gill-cover.

CHÆTODON argenteus. Tail bifid; eight spinous rays in the dorsal fin, and two ventral spines instead of fins. Linn. Amœn. Acad. Found in the Indian seas. Obs. The ventral spines are short, and the first dorsal fin so small as to be scarcely visible.

CHÆTODON Boddaerti. Body with brown and blue bands; spines of the ventral fins two. Seb. der berl. Naturf. Gesn. Gmel. &c. Native place unascertained.

CHÆTODON punctatus. Spines in the dorsal fin eight; pectoral fin falcated. Gmel. A species of a whitish or silvery colour, dotted with fuscous; eyes large, red; lateral line curved; three first rays of the anal fin distant.

CHÆTODON arcuatus. Tail entire; dorsal spines eight; body with four white arched bands. Gmel. Length four inches. This species inhabits Brasil.

CHÆTODON leucurus. Tail entire; dorsal spines nine. the first recumbent; body black; tail white. Gmel. This is of a small size, and inhabits America. Obs. The ventral fins are pointed.

CHÆTODON lineatus. Tail bifid; dorsal spines nine, and one on each side of the tail. Gmel. Figured by Seba, and is an inhabitant of the South American and Indian seas.

CHÆTODON triostegus. Tail somewhat bifid; dorsal spines nine; branchiostegous membrane three-rayed. Linn. Mus. Ad. Fr. *Chatodon*, corpore cingulato, pinnae dorsales spinis 9, caudæ utrinque 1, dentibus apice ferratis. Broussonet.

CHÆTODON bicolor. Upper half of the body brown; lower and tail white. *Chatodon bicolor*, Bloch. *Chatodon bicoloratus*, Mus. Schwenk. *Acaraua maculata*, Seeligm. *Ikan koelar*, Valent. *Ekorkouing*, *Color soufouam*, &c. Renard.

This inhabits South America and India. Its form is oblong; the head is thick; eyes large, with silvery iris; gill-cover large, spinous serrated, and of one piece; fins rigid, with branched rays; dorsal and anal fins entirely covered with scales; ventral fins small; pectoral pellucid; dorsal spines fifteen, anal three.

CHÆTODON glaucus. Lateral line straight; dorsal spines five. Bloch. *Glaucus des anciens*, Gautier, &c.

Described from the drawings and MS. of Plumier. It is a native of the American seas, and grows to the length of a foot and a half. The body is of an oblong form, and covered with moderately sized scales, above blue, and beneath silvery, with six short narrow brown streaks; flesh good, Plumier. Obs. The eyes are small with yellow iris; mouth large; lips thick, with many bones; aperture of the gills narrower, the gill-membrane loose; fins with branched rays; ventral very small, and terminating in a long narrow point, and with the pectoral fin whitish, the rest blackish; anal fin without spines.

CHÆTODON Chilienfis. Golden, with five coloured bands; tail even; dorsal spines eleven. *Chatodon Chilienfis*, aureus fasciis 5 difcoloribus, cauda integra, spinis dorsaliibus 11. Molin. Hist. Nat. Chili.

Length twelve inches; the snout is lengthened; the body oval, coated with minute scales, and marked with five distinct bands; the first black, two next cinereous, and the two last black and cinereous. Nostrils two, and placed near the eyes; aperture of the gills arched, the cover of three pieces; lateral line arched and scarcely visible; vent near the middle of the body; pectoral fins small, and, like the ventral, pointed; dorsal fin large and yellow; tail silvery, edged with yellow, and a black oval spot near the tail.

CHÆTODON longirostris. Snout cylindrical; tail unarmèd; dorsal spines eleven. Broussonet.

Inhabits the Pacific Ocean. The body is compressed, and citron-coloured; beneath striated and coated with unequal obliquely imbricated scales; the head is sloping and brownish; beneath silvery flesh-colour; pupil brownish; iris pale glaucous; mouth large and oblong; jaws nearly equal, with a few small unequal teeth; tongue and palate smooth; lateral line straight; vent nearly in the middle of the body; dorsal and anal fins citron-coloured, with a black

line on the posterior part, and another edged with whitish, the last with a black spot near the tip; ventral fins citron, edged exteriorly with brownish; tail and pectoral fin pale blue, the latter yellowish at the base.

CHÆTODON orbicularis. Body somewhat roundish; cinereous brown; no dorsal spines. Forsk. Fn. Arab.

Inhabits the stony shores of Arabia. Length about twelve inches; body resembling a flat fish, spotted with black; beneath whitish; behind yellowish; scales round and entire.

CHÆTODON auriga. Whitish, with about sixteen oblique brown bands; fifth ray of the dorsal fin long and filiform, Forsk. Fn. Arab.

Inhabits the shores of Arabia. Length five inches; shape nearly rhomboidal, and coated with rhombic scales; the head is flat above, scaly, of a reddish-white colour, and marked with four transverse tawny bands; iris of the eye black; mouth compressed and conic; lips rounded and equal; dorsal fin black at the posterior edge; anal varied with black and yellowish white.

CHÆTODON mesoleucus. Anterior part of the body white; posterior brown, with twelve black bands. *Chatodon* parte anteriore albus, posteriore fuscus, fasciis nigris. Forsk. Fn. Arab.

Found by Forskal on the shores of Arabia. The length is three inches; the body ovate, with large rhombic ciliated scales; head conic and narrow, with a black band through the eye; lateral line curved; pectoral fins glaucous; ventral white; dorsal and anal brown; tail black, with a broad hyaline stripe at the tip.

CHÆTODON asfur. Black, with a transverse yellow lunar-cuneated band, Forsk. Fn. Arab. *Chatodon Asfur*, Gmel.

Observed by Forskal on the shores of Arabia. The body is oval, and covered with rhombic scales, disposed in a quincunx order, and finely toothed; the teeth are numerous, filiform, and flexible; anterior gill-cover furnished with a strong spine, nearly half an inch in length. The general colour is black, with a transverse and somewhat lunar yellow band in the middle of the body, having the horns pointing backward; the lateral line is curved and nearest the back; dorsal and anal fins horizontal and falcated; tail rounded, tawny, and edged with black. Forskal describes another fish, which Gmelin and others consider as a variety β of the last mentioned species. "*Chatodon carulefcens* lituris et fasciis obliquis, lineolis violaceis." Bluish *Chatodon*, with oblique bands, blotches, and fine violet lines. This is a native of the Arabian shores, where it is chiefly found among corals; the flesh is bitter.

CHÆTODON maculosus. Cinereous, with transverse blue spots; anterior gill-covers armed with a single spine. Forsk. Fn. Arab.

Inhabits the Arabian shores. The body is an ovate oblong, covered with serrated scales; behind the middle of the head a large transverse golden spot; the front between the eyes is elevated, flat, and scaly; gill-cover scaly on the fore part, and serrated behind; lateral line near and parallel with the back; pectoral fins oval; ventral lanceolate; dorsal falcated behind; anal triangular; tail fin entire, rather rounded, cinereous, and dotted with yellow.

CHÆTODON fordidus. Oval; ash-coloured brown, with four obsolete transverse bands. Forsk. Fn. Arab.

This species, which is found among the coral beds on the coast of Arabia, is about a span in length; the body is covered with broad scales, which are membranaceous at the edge; the gill-cover is bidentated at the posterior edge; lateral line near the back; fins ash-coloured brown; pectoral

fin oval, ventral pointed; anal and dorsal fin rounded behind; tail short, ye lowish, divided into two lobes, and marked with a black spot.

Chaetodon unicornis. Front horned; tail with two elevated ridges on each side. Fork. Fn. Arab.

Very abundant on the Arabian coast, where it is seen swimming in shoals of two or three hundred each, and feeding on sea weeds. It grows to the length of three feet or more; the body is of an oblong oval form, rough, and of a shining grey colour; the front is flat, with an horizontal straight horn before the eyes; the teeth are rigid and disposed in one row, the middle one larger; lips obtuse; lateral line parallel with, and nearer the back; aperture of the gills short; pectoral fins pointed, oval; tail truncated. *Alonoceros minor*, Willoughby. *Le Nisjan Licornet*, Cope. *Leser Unicorn fish*, Grew.

Chaetodon jobar. Tail with a bony carina, situated in a red cavity on each side. Fork. Fn. Arab.

Inhabits the deep waters of the Arabian shores; the body is of an oval form, about three spans long, of a brown colour, with longitudinal violet lines; beneath whitish; the head is scaly; the teeth contiguous, crenated, and disposed in one row; lips equal; gill-cover entire; lateral line obsolete; fins coriaceous, violet; pectoral fin with a yellow spot; tail truncated in the middle. This is nearly allied to *Chaetodon lineatus*.

Chaetodon nigrofasciatus. Black fuscous; tail two lobed, with a recumbent spine each side. Fork. Fn. Arab.

This species was observed by Forkal in the Arabian seas, where they live in deep waters. A variety of this species, is described under the title of *gabni*, as being of a black colour, with the base of the tail violet. The length of this fish is five inches; first spine of the dorsal and anal fin covered by the skin; posterior edges of the tail whitish, two-lobed, and the lobes falcated; lateral spine somewhat subulate and moveable.

Chaetodon bifasciatus. Tail bifid, yellow, with two black bands on the head. Fork. Fn. Arab.

Body of an oblong oval form, and fleshy; the crown is wrinkled; iris silvery; jaws full of hemispherical callosities; upper lip longest; anterior gill-cover serrated behind; posterior with a bony point or process on the back part; ventral fins black; dorsal fin and tail yellow; pectoral ones half yellow, the other white; lateral line curved and nearer the back. Gmel. Inhabits the Arabian coasts.

Chaetodon pictus. Whitish, with oblique violet lines; ocular band and tail black. Fork. Fn. Arab.

Nearly of a rectangular form; the body covered with broad, serrated, obliquely imbricated scales, and marked with about eighteen violet lines, disposed in an oblique direction; on the crown of the head are five transverse tawny lines; the snout is prominent; lips equal; lateral line curved; dorsal fin black, and rounded behind; tail truncated, marked with a golden crescent in the middle, and edged with brown.

Chaetodon trifasciatus. Head with three black bands; body with sixteen longitudinal dusky streaks. Transf. Linn. Soc.

Discovered by Mr. Mungo Park on the coast of Sumatra, and described in the third volume of the Transactions of the Linnean Society. The length is three inches; colour pale brown, or brownish, and covered with rather large ciliated scales; on the dorsal fin is a black band edged with yellow; another at the base of the anal fin, and a third through the middle of the tail; the iris brown; mouth very small; gill-cover of two pieces; lateral line near the back, and interrupted or broken at the end of the

dorsal; vent nearest the tail; fins yellow; tail somewhat rounded.

Chaetodon canaliculatus. All the spines of the fins grooved. Linn. Transf.

The body is greenish yellow above; beneath whitish with paler spots; scales small, oboval; the iris silvery-yellow; gill-cover of two pieces; lateral line parallel with the back; vent nearer the head; fins greenish and with ant spots; tail bifid. Observed at the same place as the preceding species.

Chaetodon ocellatus. A black band across the eyes; dorsal fin with twelve spines, and an ocellated spot; anal spines twelve. *Chaetodon ocellatus*, Bloch.

Found in India. The body is yellow above; beneath white, and covered with large scales; the jaws are equal and prominent; lips thick; gill-cover consisting of one short golden lamina; lateral line straight, interrupted at the dorsal spot; fins cinereous, with branched rays.

Chaetodon flajfir. A very long setiform ray, and black annular spot in the dorsal fin. *Chaetodon flajfir*; *Le Seton*, Bloch.

The body of this fish is of a roundish ovate form, with the head rather taper and produced; the colour is purplish-red on the back, and a tinge of red and intermixture of yellow pervade the rest of the body, which is transversely fasciated with about nine oblique crimson stripes; through the eye passes a broad black transverse band, margined on both sides with white; the fins are yellow, with a brown marginal stripe on the anal and dorsal fin, and three stripes of the same colour across the tail. A native of the Indian seas.

Chaetodon falcata. Back with two black falciform spots, edged with white. *Chaetodon falcata*, *La Fau-cille*, Bloch, &c.

This inhabits the coast of Coromandel. In its general properties this resembles the last; it has a similar ocular band of black, but the colours are paler, more inclining to yellow; the transverse bands violaceous, paler and less angulated, and the dorsal fin has neither the black spot encircled by a white ring, nor the remarkable setiform ray, like the last species.

Chaetodon tricolor. Anterior part of the body yellow; posterior black; tail and border of the dorsal and anal fins yellow, edged with red.

Dufamel was the first author who published a figure of this superb fish. He speaks of it as a native of Gaudeloupe. Bloch describes it as a Brazilian species, on the authority of Prince Maurice. It is of a more elongated figure than the generality of *Chaetodon*, and seems to agree better in this respect with the *Labrus* genus. The head and first part of the body are of a fine golden yellow, the posterior part deep black, and the two colours separate abruptly in an obliquely incurved direction, leaving the lower half of the pectoral fin, and the belly down to the vent, fine yellow. The bed of black passes without interruption into the anal fin, and posterior end of the dorsal fin, in both of which it forms a subtriangular disk with the yellow border of these fins. The tail is much furcated.

Chaetodon Alini. Head marked with an ocular band; dorsal fin seventeen-spined.

First described by Klein, and named after that author by Bloch. This fish is of an orbicular form. The opening of the mouth very small; the nostrils simple; iris white; gill-cover consisting of two plates; lateral line bent, and situated near the back; the back is yellowish, inclining to olive-brown; the belly silvery; fins yellowish. Figured by Bloch, from a large specimen in the collection of Linke, at

Leipzig: its general size in the East Indies, the seas of which it inhabits, is not exactly known.

СНЕТОДОН bimaculatus. Head marked with an ocular band; an annular spot and half spot on the dorsal fin. *Chatodon bimaculatus*, La Bandolière a deux taches, Bloch.

This fish is of a roundish form, the back very gibbous, and the abdomen flattish; the head is sloping, lengthened, and tapering; the back is brown; sides whitish, tinged with grey; pectoral and ventral fins are red; the rest yellow at the base, and greyish at the extremities: band across the eyes edged with white; and the black spot on the dorsal fin is encircled with a white ring; the half spot bounded on one side with a semicircular white line. Inhabits the Indian seas.

СНЕТОДОН bicaucatus. Two spined below the eyes. *Chatodon bicaucatus*, La Bandolière a deux aiguillons, Bloch.

The body of this fish is of an elongated form; the head is yellow; the back blue; and the belly white. Across the head, behind the eyes, is a transverse brown streak; another passes across the middle of the body, and a third between the extremity of the dorsal and anal fin, near the tail. The posterior one of the two spines below the eyes is much larger than the other; all the fins are grey. This is a native of the East Indies.

СНЕТОДОН fargoides. Golden yellow; head and six transverse bands violet. *La Chatodon Sargoide*, Cedepe.

Described by La Cedepe from the drawings and manuscripts of Plumier. The dorsal fin contains thirteen spiny rays; pectoral fin one: there is a depression before the eyes; the opening of the mouth is small, and the upper lip thick; gill-covers rounded. This is a native of the American seas.

СНЕТОДОН Lamarkii. Golden yellow, with three longitudinal dusky stripes. *Chatodon La Mark*, Cedepe.

The description of this species is taken by Cedepe from a specimen in the museum of the Prince of Orange, the native country of which is unknown. The lower jaw is longer than the upper; the scales rounded, striated, and denticulated; fifteen spiny rays, and sixteen soft ones in the dorsal fin; three spiny, and twenty soft ones in the anal fin; gill-covers armed with a very long spine.

СНЕТОДОН constrictus. Yellowish grey, with numerous black bands, and body constricted in the middle. Shaw, N. Holland. Zool.

The length of this species is about eight inches; the shape of the body inclining to an oblong square, and remarkably contracting in diameter about the middle, so as to appear constricted in that part; scales of moderate size; colour yellowish-grey, tinged on the back and part of the fins with blue; across the body eight black bands, that in the middle narrowest, on the back two very distinct fins, the rays of the first being all spiny; tail inclining, though very slightly, to a lunated form. Native of the Indian seas, and observed about the coast of New Holland.

СНЕТОДОН armatus. Slivery, with seven transverse black bands, lengthened head and two dorsal fins. Shaw Gen. Zool.

The length of the specimen described in White's Journ. New South Wales, was about four inches; the colour silvery-white, darker, and with a bluish tinge on the back; head of a somewhat lengthened form; across the body seven black bands; on the back two distinct dorsal fins, of which the first consists of very strong spiny rays, the third exceeding the rest in length; tail very slightly inclining to a lunated form at the extremity. Observed about the coast of New Holland.

СНЕТОДОН, in *Ancient Geography*, a people placed by Ptolemy in the Higher Germany, among the Curiones.

СНАФАЛЛА, in *Geography*, the first large body of water which leaves the Mississippi, and falls, by a regular and separate channel, into the gulf of Mexico. It leaves the Mississippi in the westernmost part of the remarkable bend just below the boundary, and has every appearance of having been formerly a continuation of the Red River, when the Mississippi washed the high land from Clarksville to the Bayou Tunica, or Willing's creek, the traces of which are yet visible by the lake, through which a large current still passes, when the river is high. The distance on a straight line from Clarksville to the Bayou Tunica is not more than eight miles; but by the present course of the river, it is supposed to be not less than 50 miles. If the Mississippi should break its way by a shorter course, which is not improbable, the Chafalia will again become a part of the Red River. When the Mississippi is high, the draught into the Chafalia is very strong, and has frequently carried rafts, and likewise some few flats or Kentucky boats down it, which are generally lost. This branch, notwithstanding its size, is not navigable to the gulf of Mexico, on account of an immense floating bridge, or raft, across it, of many leagues in length, and in some places so firm and compact that cattle and horses are driven over it. This astonishing bridge, or raft, is constantly augmented by the trees or rubbish, which the Chafalia draws out of the Mississippi.

СНАФЕ, or *СНАФИН* of a rope, in *Sea-Language*, is said of a rope that is galled or fretted, or when the rope runs against any thing. *The cable is chafed in the hawse*, signifies that it is fretted or begun to be worn out there.

СНАФЕ-ВАХ, or *СНАФЕЕ-ВАХ*, an officer in chancery, whose business it is to fit the wax for the sealing of writs, patents, and other instruments issued thence.

СНАФЕР, in *Geography*, a town of Persia, in the province of Farfahan; 50 miles S. of Schiras.

СНАФ, in *Agriculture*, the husky substance of corn, which is separated by threshing and winnowing. It also sometimes signifies the rind of corn: thus, barley that has a thick rind is said to be thick-chaffed; and it likewise implies straw, &c. cut small for the purpose of being given to horses and other cattle, mixed with corn. This substance, whether obtained by the dressing of grain or made from straw and other matters by cutting, is highly useful in the feeding of horses and many other animals, as saving much other more valuable food. Besides its advantage in the common feeding of animals, it is of vast utility in the fattening of different sorts of animals, where much luxuriant green food is given, as a dry meat; as without some sort of material of this nature they never go on well.

It has been remarked by Mr. Young, that the practice of cutting both hay and straw for all sorts of stock is one that has been found very important by many practical and intelligent cultivators of great experience; and though he admits that general observations are not equally satisfactory with that of comparative experience, there can probably be little doubt of the advantage of this mode of applying it. Besides, there are but few persons who have opportunity, time, and power, to make comparisons between the food and labour of different teams fed in the common way with hay, and with cut chaff, half or one-third straw. The opinions of the best informed and most practical persons are, however, decidedly in support of the latter method. It is, therefore, conceived by the above intelligent writer, that the practice of giving hay cut with a mixture of straw, instead of feeding in the common way with hay, is at all events to be advised to as great an extent as can be effected,

as the saving is unquestionable; and he thinks that it should not only be practised for the teams, but likewise for all the other sorts of stock that consume hay. He adds, that Mr. Page of Cobham, in feeding his flock, gives no hay or straw but what is cut into chaff before it is used.

The same author thinks that if racks are permitted in a stable, it is not an easy matter to prevent horse-keepers from cramming them full of hay, and especially at night. The best contrivance he has heard of to supply the place of racks was that of Mr. Vancouver, who made, he says, a sort of hopper the whole length of the manger, which delivered chaff from a loft above it gradually, as the horses moved the lower lip of the hopper with their noses; in this manner supplying themselves. But a very intelligent nobleman, he observes, on trying it, found that it would not deliver regularly. This might arise, he thinks, from the dimensions not having been sufficiently attended to; for if the hopper be not of a due breadth, the chaff might arch above the moveable board, and not come down: the aperture in the manger through which it passes must necessarily, he imagines, be of a certain size, neither too wide nor too narrow. It certainly seems, in his opinion, to be a practical idea, and very capable, after some trials and regulations, of being fully applicable to common practice. It well deserves attention, especially as the expense of an experiment for one fall could not be considerable. He has often determined to try it himself, but has always been prevented by some journey or excursion taking him from home, at the moment when he could otherwise have given the requisite attention. He conceives that it would demand a manger from four to six inches wider than common ones, to render it perfect for this purpose.

In the use of this substance for sheep, considerable attention is necessary to the troughs in which it is given, to see that they be so secured by boards that it is not blown out of them. This is effected, according to Mr. Young, in lord Clarendon's sheep-yard in Hertfordshire, by a semicircular boarding of thin materials, which covers the heads of the animals while they are feeding in the troughs.

It has been suggested by the same writer, in the third volume of the *Annals of Agriculture*, that when chaff is made to undergo the process of fermentation in the houses where it is deposited, by slightly watering it, it is rendered "much more nutritious than when used in the common way."

CHAFF, in *Botany*, a name given to the scales or dry membranous substances, interposed between the florets of some aggregate and compound plants, as in *Dipacus*, *Hypochaeris*, &c. In that case the receptacle is said to be chaffy.

CHAFF-Cutter, in *Rural Economy*, an implement constructed for the purpose of cutting hay, straw, and other substances into chaff. Instruments of this sort consisted formerly simply of a box and a cutting blade; but they are at present much improved, being made of different forms and constructions, so as to perform the work with greater economy and dispatch. Mr. Cook has invented one, which, by means of a man and boy, will cut one hundred quarters a week; and when fixed to a large wheel, and turned by an animal, such as a pony or ass, will cut half the above quantity per day. Another contrived by Mr. Nairn is capable of cutting three quarters an hour, by the assistance of two men, and costs about ten guineas. An instrument for this purpose, made by Mr. James Pihe, is likewise both cheap and of the most simple construction. It is fixed on a wooden frame, which is supported with four legs; and on this frame is a box for containing the straw, four feet six inches long, and about ten inches broad: at one end are

fixed across the box two rollers, inlaid with iron, in a diagonal line, about an eighth of an inch above the surface; on the ends of these rollers are fixed two strong brass wheels, which take one into the other. On one of these wheels is a contract wheel, whose teeth take in a worm on a large arbour; on the end of the arbour is fixed a wooden wheel, two feet five inches diameter, and three inches thick. On the inner part of this wheel is fixed a knife, and at every revolution of the wheel the knife passes before the end of the box, and cuts the chaff, which is brought forward between the rollers, which are about two inches and a half asunder. The straw is brought on by the worm taking one tooth of the wheel every round of the knife: the straw being to be pressed between the rollers, the knife cuts off the chaff with so great ease, that twenty-two bushels can be cut within the hour, and makes no more noise than is caused by the knife passing through the chaff. It consists of the box into which the straw is put, and an upper roller, with diagonal projecting ribs of iron; the whole moving by the revolution of the brass wheel, on the axis of which it is fixed. Another brass wheel has upon it a face wheel, whose teeth take into the endless screw on the arbour, while the teeth on the edge of this wheel enter between those on the edge of the other wheel. On the axis of the latter brass wheel is a roller with iron ribs, similar to the above, but hid within the box. The arbour has one of the ends of which it is composed made square, and passing through a mortise in the center of the wooden wheel, which is fastened by a strong screw and nut; the other end of this arbour moves round in a hole within the wooden block; and the knife is made fast by screws to the wooden wheel, and kept at the distance of nearly three quarters of an inch from it, by means of a slip of wood of that thickness, of the form of the blade, and reaching to within an inch of the edge. The handle is mortised into the outside of the wooden wheel.

An improved machine of this sort has been invented by Mr. Robert Salmon, of Woburn, Bedfordshire, and described in the *Transactions of the Society for the Encouragement of Arts, &c.* With it the chaff is cut by two knives, fixed on the inside of the folies to two wheels, which are strongly connected together; the edge of the knives being at an angle of about forty-five degrees from the plane of the wheel's motion. These knives are so fixed as to be forced forward by springs on the wheel, which springs are formed to adjust, and act more or less, as occasion may require, so as to give the knives as much pressure against the box as may be requisite to cut the straw. The knives are prevented from coming too forward, and occasioning unnecessary friction, by wedges being put in under the staples; which wedges, as the knives wear, must be drawn out so as to admit the knives to come more forward. With the before-mentioned provisions, it will be found very easy at any time to put on new knives, as the springs, &c. will always adjust them to their work.

On one side of the wheel is fixed a round block of wood, in which there are four holes and a moveable screw: to this block is screwed one end of the feeding-arm, running nearly horizontally to the cross bar at the end of the box; to which cross bar there is a pin, moveable to five different holes, by means of which, and the four holes in the block before described, twenty changes in the length of the chaff may be obtained. The straw is brought forward by the rollers in the box, the form of which has been just described, which rollers are turned from the outside by the triggers or ratchet-wheels on each side of the box, which move more or less, according to the stroke given to the cross-bar by the feeding-arm and wheel. By this mode of feeding, the straw is perfectly

feebly at rest, and does not press forward at the time of the knife cutting; and, by means of the pins being taken out of the cross-bar, the feeding is instantly thrown off. although the wheel and knives may continue their motion. Under the box is suspended the pressing weight, which may be made more or less powerful by shifting the weight on the bearer to which it hangs, and also may be thrown on either side, more or less, as occasion may require; which will be found useful, in order to force the straw towards the knife, and to counterbalance the ratchet-wheel of the upper roller. Near the fulcrum of this bearer is fixed a chain, the upper end of which is suspended from a roller; at each extremity of which is a small bar of iron, joined to the end of the upper spiked roller, by which means the straw is always equally pressed in passing the two-spiked rollers. The winch by which the machine is turned is of the common kind, and the frame of the machine is to be made very firm and strong.

In order to apply this implement to the best advantage, the inventor proposes a second box, to be placed at the end of the first; which box may be of any length, and suspended by a line and counter-weight, whereby the end of it is brought down level whilst filling with straw, and then drawn up, so as to give the box a declivity, to make the straw more easily come forward.

It is supposed that much advantage may be derived in this instrument from its cutting various lengths, resting during the cut, the knives being adjusted to their work by regulating springs, the feeding being readily thrown off, and the pressure moveable to either side. It is also well calculated to be applied to any power which may be occasionally fixed to the opposite side to that on which it is turned by hand; and, by the additional box, when used by hand, the workman will be enabled to cut for some continuance, without stopping to feed.

Where threshing machines are in use, these implements may frequently be attached to them with great advantage. There are many other instruments of this sort constructed in different ways; but those which are the least complex, and can be afforded at the cheapest rate, are the most adapted to the purpose of the farmer. See CUTTING-BOX.

The above machine, as considerably altered and improved by Mr. Rawntree, is seen in *Plate VII.* on *Agriculture*, in which *fig. 1.* is a side, and *fig. 2.* an end view of it. The advantages of this implement are, 1st, Its great simplicity; 2^d, Its cutting the chaff of various lengths; 3^d, The straw being at rest while the knives are making the cut; 4th, The friction being less, more work of course may be done with equal labour.

A, is the handle.

B, B, the fly-wheels on which the knives are fixed.

C, the ratchet-wheels, and rollers for drawing the straw forwards.

D, the rods to work the ratchet-wheels, connected with the lever and crank.

E, the box for containing the straw.

F, the lever and weight for pressing the straw.

G, the knives.

H, the crank for regulating the cut.

I, the frame.

At *fig. 3.* is represented Mr. M'Dougali's patent chaff-cutter, which is a very useful instrument of this kind. In this machine the inventor has been particularly careful so to construct it, that, in case it should be accidentally broken, it might be easily repaired by any common mechanic. The substance to be cut into chaff may be pressed as hard as the workman shoofs, by simply placing the weight near to the

end of the lever. But the chief excellence of the instrument consists in the inventor having judiciously applied a spiral groove in the room of the endless screw, commonly used by other agricultural instrument-makers, by means of which he has in a great degree got rid of friction; and the lever may rise to any height, without putting the machine out of work.

It has been remarked by Mr. Young, that the number of machines which have been invented of late years for this purpose, most of which perform their work with sufficient accuracy, leaves no farmer in the kingdom under the necessity of employing the common chaff-box, which is worked by those only who have acquired the art of making use of it, and who commonly make much greater wages per day than the ordinary pay. He observes that there is a very good machine of this sort made at Thetford, which only costs eight guineas. It has been observed by a late practical writer, that as the principal objects aimed at in the construction of these machines are those of expedition and the lessening of manual labour, it is evident that many of those of the improved kind must answer such purposes much more effectually than such as were formerly in use, especially where they are attached to any great power, such as that of horses, water, &c. as in the case of threshing machines, or other mills, to which they are in general well suited, as has been noticed above.

Mr. Page of Cobham has, according to Mr. Young, at the trifling expence of only five pounds, added a mill-wheel to his chaff-cutter, by which means a boy and a little pony cut twenty bushels of chaff per hour.

Chaff-House, a place constructed for the purpose of containing chaff. It should be situated as near to the barn, threshing machine, and stable, as possible, in order that it may receive it with the least possible labour and trouble. And in order to prevent danger, where the chaff is suffered to undergo the process of fermentation, it should be constructed of brick work. The dimensions must be suitable to the extent of the farm, or the quantity of live stock that are kept and fed with it.

CHAFFER, or COCKCHAFFER, in *Entomology*, the common English name of the beetle, called by LINNÆUS, *SCARABÆUS melolontha*, and by Fabricius *MELOLONTIA vulgaris*. See SCARABÆUS.

CHAFFERCONNERS, in *Commerce*, printed linens manufactured in the Great Mogul's dominions. They are imported by the way of Surat; and are of the number of those linens prohibited in France.

CHAFFERS, in our *Statutes*, seem to signify wares or merchandise. 3 Edw. IV. c. 4.

The original French of the statute is *chaffares*.

CHAFFERY, or CHAFERY, in the *Iron-Works*, the name of one of the two principal forges. The other is called the *finery*. When the iron has been wrought at the finery, into what is called an *ancony* or square mass, hammered into a bar in its middle, but with its two ends rough, the business to be done at the chaffery is the reducing of the whole to the same shape, by hammering down these rough ends to the shape of the middle part.

CHAFFINCH, in *Ornithology*. See FRINGILLA *Casels*.

CHAGAIN, in *Geography*, a city of the Birman empire seated on the north side of the Irawaddy, and opposite to the ancient capital Ainga-hung, or Awa, in N. lat. 21° 56'. E. long. 96°. This city, which was once the seat of imperial residence, is situated partly at the foot and partly on the side of a rugged hill that is broken into separate eminences, and on the summit of each stands a spiral temple. These

These temples, rising irregularly above one another, form a beautiful assemblage of objects, the effect of which is increased by their being carefully white-washed and kept in repair. Cha-ning is the principal emporium to which cotton is brought from all parts of the country, and where, after being cleaned, it is embarked for the China market. The operation of clearing it from the buds is performed by females, by means of double cylinders turned by a lathe, which a woman works with her foot, while she applies the cotton with her hands. This city is become a place of religious resort, from the number of praws or temples erected in its neighbourhood: as well as on account of its being the principal manufactory of images or statues of the divinity, Gaudma, which are sculptured of fine marble obtained in a quarry at Maenong about 12 miles distant. Birmanis are forbidden to purchase the marble of which these images are made, but they are allowed and even encouraged to buy figures of the deity actually manufactured, and to carry them to the remotest corners of the empire. Exportation of these marble divinities out of the kingdom is strictly forbidden.

CHAGNON, a town of France in the department of the Rhone and Loire, 6 leagues S. of Lyons.

CHAGNY, a town of France, in the department of the Saône and Loire, and chief place of a canton in the district of Châlons-sur-Lône; 10 miles N.N.W. of it. The place contains 2214, and the canton 10,204 inhabitants; the territory includes 137½ kilometres, and 13 communes.

CHAGRE, a river of North America, in Terra Firma, which opens into the North Sea, in 6° 18' 40" N. lat. and W. long. 81°; 30 miles W.S.W. of Porto Bello; and has its source in the mountains near Cruces. It was formerly called Lagartos from the number of alligators in it, and was discovered by Lopez de Olano. Diego de Alviles discovered that part of it where Cruces is situated; but the first Spaniard who failed down it, so as to reconnoitre it to its mouth, was Captain Hernando de la Serina, in the year 1527. Its entrance is defended by a fort, seated on a steep rock on the east side near the sea-shore. This fort is called San Lorenzo de Chagres, and has a commandant and a lieutenant; and the garrison is draughted from Panama. The fort was taken by admiral Vernon in 1740. About eight toises from the fort is a town of the same name. The houles are principally of reeds, and the inhabitants Negroes, Mulattoes, and Mellizos. They are a brave and active people, and occasionally take up arms to the number of triple the usual garrison of the fort. Opposite, on a low and level ground, stands the royal custom-house, where an account is taken of all goods conveyed up the Chagre. Here the breadth of the river is about 120 toises, but it becomes gradually narrower as you approach its source. At Cruces, the place where it begins to be navigable, it is only 20 toises broad; and the nearest distance between this town and the mouth is 21 miles, and the bearing N.W. 7° 24' westerly; but the distance measured along the several windings of the river is no less than 43 miles. It breeds a great number of Caymanes or alligators, creatures often seen on its banks, which are impassable, both on account of the closeness of the trees, and the bushes, which cover the ground, as it were with thorns. Some of these trees, especially the cedar, are used in making the canoes or banjas, employed on the river. The passage of the river is obstructed by the trunks of the trees that fall into it; and also by the swift currents over the shallows. The barks employed on this river are the chatas and bongos, called in Peru, bonques. The first are composed of several pieces of timber, like barks, and of a great breadth, that they may draw but little water:

they carry six or seven hundred quintals. The bongos are formed out of one piece of wood, some of them being 11 Paris feet broad, and conveniently carrying four or five hundred quintals. Both forts have a cabin at the stern for the convenience of passengers, and a kind of awning or lining to the head, with a partition in the middle continued through the whole length of the vessel; and over the whole, when the vessel is loaded, are laid hides, that the goods may not be damaged by the rains, which are frequently violent. Each of these requires, besides a pilot, at least 18 or 20 robust negroes, for without such a number, they would not be able, in going up, to make any way against the current. All the forests and woods near this river are full of wild beasts, and especially different kinds of monkeys, the flesh of which is highly valued by the negroes. They are also eaten by the Creoles and the Europeans.

CHAGREEN, or **CHAGERIN**, in *Commerce*. See *SILVERGREEN*.

CHAHAGNE, in *Geography*, a town of France in the department of the Sarthe, and district of St. Clais; 5 miles N.E. of Chateau du Loir.

CHA-HO, a town of China in the province of Pe-teli-li; 7 miles S. of Chun-te.

CHA-HO-TCHAN, a town of Chinese Tartary; 30 miles S.W. of Ning-yuen.

CHALA, a river of Siberia, which runs into the Oby; 20 miles N.E. of Obdorskoi.

CHAIBAR, or **KAIKAR**, a strong town of Arabia, taken from the Jews by Mahomet, in the 7th year of the Hegira, A.D. 678; 152 miles N.E. of Medina.

CHAILARD, LE, a town of France, in the department of the Ardèche, and chief place of a canton, in the district of Tournon; 4½ leagues N.W. of Privas. The place contains 1722, and the canton 9,993 inhabitants; the territory includes 167½ kilometres, and 13 communes.

CHAILLAC, a town of France, in the department of the Indre, and district of Chateauroux; 4 leagues S.S.W. of Argenton.

CHAILLAND, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Laval; 10 miles N. of it. The place contains 2559, and the canton 15,166 inhabitants; the territory comprehends 2,37½ kilometres and 9 communes.

CHAILLE-LES-MARais, a town of France in the department of the Vendee, and chief place of a canton in the district of Fontenay-le Comté; 3 leagues W.S.W. of it. The place contains 1749, and the canton 7,547 inhabitants; the territory comprehends 235 kilometres and 7 communes.

CHAILLE' SOUS-LES-ORMEAUX, a town of France, in the department of the Sarthe; 10 miles E. of Sablé.

CHAILLEVETTE, a town of France, in the department of the Lower Cherente; 5 miles S. of Rennes.

CHAILLONE, a town of France in the department of the Orne, and district of Alençon, containing about 1100 inhabitants; one league N. of Sees.

CHAIN, in French *chaines*, an instrument composed, or consisting of links, and commonly made of iron, though it may be made of other metals. There are different chains for different purposes; as dratt chains, hending chains, canting chains, mill-chains, measuring chains, neck chains, &c. &c.

A *port-chain*, or *chaîne de port*, is a strong iron chain, reaching across the entrance of the port to prevent vessels from sailing or getting into it. Of these there are sometimes several at the entrance of one and the same port; and when

when it is wide they are supported on piles from distance to distance.

A *foraging chain*, or *chaîne du fourrage*, is the placing, by means of a chain of soldiers, or a military communication and arrangement of troops, those who are charged with foraging in a state of security against any attack or incursion of the enemy; those forming the chain being commanded to keep a constant and careful look out on all sides.

The Romans, when they went to war, carried with them a great number of chains, declined for those that might become their prisoners. They had them made of different metals; a great many of iron, others of silver, and some even of gold. And they were distributed or made use of according to the rank and quality of the prisoners. Before the battle at the Thrafymene lake, between Hannibal and Flaminius, the latter, who, though altogether unfit for the management of military affairs, was vain, arrogant, and presumptuous; was singularly formed by nature for the gaining of popularity; was a plausible prater or declaimer, and so persuasive a public speaker, that he filled the people with such confidence of victory and success, that the multitude of those, who followed his army for the sake of booty, as Polybius informs us, exceeded even the number of his troops; and carried with them chains, fetters, and other implements of the same kind in great quantities and abundance.

The arms of the kingdom of Navarre are, *chains, or, in a field, gules*. The occasion hereof is referred to the kings of Spain leagued against the Moors; who having gained a celebrated victory against them in 1212, in the distribution of the spoils, the magnificent tent of Miralumin fell to the king of Navarre; as being the first that broke and forced the *chains* thereof.

CHAIN, a gold, is one of the ornaments or badges of the dignity of a lord mayor of London; and remains to the person, after his being divested of that magistrature, as a mark that he has passed the chair.

Something like this, Chorier observes, obtained among the ancient Gauls: the principal ornament of their people in power and authority was a gold chain, which they wore on all occasions; and even in battle, to distinguish them from the common soldiers. Hist. de Dauph. lib. iii. p. 130.

CHAIN also denotes a kind of string, or twisted wire; serving to hang watches, tweezer cases, and other valuable toys upon. The invention of this piece of curious work was owing to the English: whence, in foreign countries, it is denominated the *English chain*. It was some time before foreigners undertook to imitate them, and at last with no extraordinary success: those of Paris have come nearest. These chains were at first usually either of silver or gold, some of gilt copper; the thread or wire of each kind must be very fine.

For the *fabric, or making of these CHAINS*; a part of the wire is folded into little links of an oval form; the longest diameter about three lines; the shortest, one. These, after they have been exactly soldered, are again folded into two; and then bound together, or interwoven, by means of several other little threads of the same thickness; some whereof, which pass from one end to the other, resemble the warp of a stuff; and the others which pass transversely, the woof. There are at least 4000 little links in a chain of four pendants; which are, by this means, bound so equally, and withal so firmly together, that the eye is deceived, and takes the whole to consist of one entire piece.

Plate Mechanics, fig. 1, represents the chain used for common purposes with oval links; the ends of which are welded or soldered together.

Fig. 2, is the chain used for slight purposes, as scales, &c.

VOL. VII.

the links are formed of wire, and the ends are sometimes folded to the middle.

Fig. 3, is a chain nearly the same as the last, except that the ends of the links are hooked into one another instead of being soldered.

Fig. 4, shews a chain invented by Mr. Hancock, for which he received a premium of 50 guineas from the Society of Arts, and is described in their Transactions. The two ends of the wire of which this link is composed are hooked to the middle of it. This chain is used in Baker's patent mangle, and answers the purpose very well.

Fig. 5, is a double wire chain; the ends of which are soldered together. This is very ancient, being described in a book of Agricola "De Re Metallica," printed in 1624, p. 122.

Fig. 6, shews a very simple chain formed of bunches of small wire.

Fig. 7, is a flat chain; it has a wire link, the ends of which are bent into an eye, *ab*, to receive the parts, *e, d*, of another link; this chain may be used to great advantage in turning wheels instead of a strap or rope, as coggs may be fixed on the edge of the wheel, which go into the spaces, *A, A, A*, of the chain, and prevent its slipping. This is also described in Agricola de Re Metallica, pages 133 and 162.

Fig. 8, is another for the same purpose; it has two kinds of links; one, *a*, is of wire bent into a square, the other, *b*, is made of copper or iron plate bent and rivetted.

Fig. 9, is the chain used in watches and spring clocks, also in beam engines: this is composed of two thin pieces of steel plates, *a, a*, between which is the other, *b*, of twice the thickness; they are held together by a pin, which makes the joints.

CHAIN is also a kind of measure in France, applied to fowle-wood, sheaves of corn, in estimating the tythes, hay, and horses. These measures are divided variously, according to the uses for which they are intended.

CHAIN, in Geography, an island of the Pacific Ocean, discovered by captain Cook in 1769, about 4 leagues long and two wide. S. lat. 17° 22'. W. long. 145° 54'.

CHAIN, or CURB, in the *Mangee*. See *Bits*.

CHAIN, in Surveying, is a measure, consisting of a certain number of links of iron wire, usually a hundred; serving to take the dimensions of fields, &c. This is what Mericane takes to be the *arsipendium* of the ancients.

The chain is of various dimensions, as the length or number of links varies; that commonly used in measuring land, called *Gunter's chain* is in length four poles or perches; or 22 yards; or 66 feet, consisting of a hundred equal links; each link being $\frac{7}{32}$ of a yard, or $\frac{5}{16}$ of a foot, or 7.92 inches long; that is nearly eight inches or $\frac{2}{3}$ of a foot. Whence it is easy to reduce any number of those links to feet, or any number of feet to links.

This chain is entirely adapted to English measure; and its chief convenience is in finding readily the numbers contained in a given field. Where the proportions of square feet and acres differ, the chain, to have the same advantages as Gunter's chain, must also be varied. Thus, in Scotland, the chain ought to be of 74 feet, or 24 Scots ells, if no regard be had to the difference between the Scots and English foot; but if regard be had to this difference, the Scots chain ought to consist of 74 $\frac{2}{3}$ English feet, or 74 feet four inches, and $\frac{2}{3}$ of an inch. This chain being divided into a hundred links, each of these will be 3 $\frac{2}{3}$ inches. See *1000 and ACRE*.

That ordinarily used for large distances is in length a hundred feet; each link one foot.

For small parcels, as gardens, &c. is sometimes used a small chain of one pole, or sixteen feet and a half in length; each link one inch $\frac{3}{8}$ in. In measuring towns, a chain of 50 feet in length, consisting of 50 links, is the most commodious, with an off-set-staff of 10 feet in length.

Some in lieu of chains use ropes; but these are liable to several irregularities; both from the different degrees of moisture, and of the force which stretches them. Schwenkerus, in his Practical Geom.etry, tells us, he has observed a rope 16 feet long, reduced to 15 in an hour's time, by the mere falling of a hoar frost. To obviate these inconveniences, Wolfius directs, that the little strands whereof the rope consists be twisted contrary ways, and the rope dipped in boiling hot oil; and when dry, drawn through melted wax. A rope, thus prepared, will not get or lose any thing in length, even though kept under water a day.

Sir George Shuckburg observes (Phil. Trans. vol. lxviii. p. 518.), that the common Gunter's chain of the shops is always subject to spring and stretch considerably. That which he used in his measurement for ascertaining the height of mountains was made of hard red steel, on purpose to avoid this defect. It, however, still preserved some degree of elasticity: for when pulled with a force of about 10 pounds, it seemed = 0.12 inch longer than when laid gently on the floor without being stretched at all. He corrected its length by allowing for its expansion by heat at $13\frac{1}{2}^{\circ}$.05 inch.

Use of the CHAIN in Surveying.—The manner of applying the chain in measuring lengths, is very obvious. Having provided a chain, with 10 small arrows, (see ARROW), two persons take hold of the chain, one at each end of it, and all the 10 arrows are taken by one of them, who is to go foremost, and is called the leader; the other, for direction's sake, being called the follower. A picket, or station-staff, being set up in the direction of the line to be measured, if there appear no natural marks in that direction; the follower stands at the beginning of the line, holding the ring at the end of the chain in his hand, while the leader drags forward the chain by the other end of it, till it is stretched straight, and laid or held level, and the leader directed, by the follower's waving his hand, to the right or left, till the follower see him exactly in a line with the mark or object of direction to which the measure is to be extended: then both of them stretching the chain straight, and the follower so as to hold it level, the leader having the head of one of his arrows in the same hand by which he holds the end of the chain, let him then stick one of them down in it while he holds the chain stretched. This being done, he leaves the arrow in the ground, as a mark for the follower to come to, and advances another chain forward, being directed in his position by the follower standing at the arrow, as before; as also by himself now, and at every stretching chain's length, by moving himself from the other side, till he bring the follower and the hind mark into a line. He then stretches the chain, and stuck down an arrow, as before, the follower takes up his arrow, and they advance again in the same manner another chain-length. And thus they proceed till all the 10 arrows are employed, and are in the hands of the follower; and the leader, without an arrow, is arrived at the end of the 10th chain-length. The follower then sends or brings the 10 arrows to the leader, who puts one of them down at the end of his chain, and advances with the chain, as before. And thus the arrows are changed from the one to the other at every chain's length, till the whole line is finished: when the number of chain-lengths of the arrows shews the number of tens, to which the follower adds the arrows he holds in his hand, and the number of links of another

chain over to the mark or end of the line. So that if there have been three changes of the arrows, and the follower holds six arrows, and the end of the line cut off 45 links more, the whole length of the line is set down in links, thus, 3645. In entering down the dimensions taken by the chain, the chains and links are separated by a dot: the former being integers, and the latter decimals: thus a line 65 chains 75 links long, is written 65.75. If the links be short of 10, a cypher is prefixed; thus 10 chains, 8 links, are written 10.08. It is usual, however, to set down the length of lines, measured with a chain, in links as integers, every chain or length being 100 links; and not in chains and decimals.

To find the area of a field, &c. of an uneven value, &c. given in CHAINS and LINKS. An acre of land is equal to 10 square chains, i. e. 10 chains in length and one chain in breadth: or, $10 \times 10 = 100$ square yards; or, $4 \times 4 = 1600$ square poles; or, $100 \times 100 = 10000$ square links. And, when an acre is divided into four parts, called roods, and a rood into 40 parts called perches, which are square poles, or the square of a pole of $\frac{1}{4}$ yards in length, or the square of $\frac{1}{4}$ of a chain, or of 25 links, which is 6.5 square links. So that the divisions of land measure will be thus:

6.25 square links = 1 pole or perch.
40 perches = 1 rood.
4 roods = 1 acre.

Consequently, 1st, Multiply the links by one another, according to the rules for the area, and thus the content will be found in square links; and from the product cut off five figures towards the right, which is nothing more than dividing by 10,000 the number of square links in an acre: the five remaining on the left will be acres. 2dly, Multiply the five figures cut off, which are decimals, by four, the number of perches in an acre; and cutting off five again from the product on the right, those remaining on the left will be roods. Lastly, Multiply the five thus cut off by 40, the fourth part of the square perches in an acre; and cutting off five, as before, on the right, those remaining on the left are square perches. E. G. Suppose the length of a rectangular piece of ground to be 792 links, and its breadth 355; to find the area in acres, roods, and perches:

792
355

78,200

Ans. 7 acres, 0 rood, 7 perches.

To take an angle, D A E (Plate I. See page 78) &c. by the CHAIN. Measure a small distance from the vertex A along each leg, v. g. to d and e; then measure the distance d e: to lay it down, draw A E at pleasure, and from your scale set off the distance measured on it. See SCALE.

Then, taking in your compasses the length measured on the other side, on the vertex A, as a center, describe an arc d e; and on the point A, as a center, with the measured distance of e d, describe another arc a b. Through the

the point where this intersects the former arc, draw a line A D. So is the angle plotted; and its quantity, if required, may be measured on a line of chords. See CHORD.

To survey a triangular field, A B C, (fig. 4.) Having set up marks at the corners, if no natural marks occur; measure with the chain from A to P, where a perpendicular would fall from the angle C, and set up a mark at P, noting down the distance A P. Then complete the distance A B by measuring from P to B. Having set down this measure, return to P, and measure the perpendicular P C. And thus, having the base and perpendicular, the area is easily found. Or, having the place P of the perpendicular, the triangle is easily constructed. Or, measure all the three sides with the chain, and note them down; hence the content is easily found, and the figure constructed. Or again, two sides A B, A C, may be measured, as well as the included angle A; or, one side A B, and the adjacent angles. A and B, may be measured; and then the figures may be easily planned. Then by measuring the perpendicular C P on the plan, and multiplying it by half A B, we shall have the content.

For an example of the application of this problem, let A P be 794, A B 1321, and P C 826: Then,

$$\begin{array}{r}
 1321 \\
 826 \\
 \hline
 7926 \\
 2642 \\
 \hline
 10568 \\
 2)10.91146 \\
 5.45573 \\
 \hline
 4 \\
 \hline
 1.82292 \\
 40 \\
 \hline
 32.91680
 \end{array}$$

Ans. 5 acres, 1 rood, 33 perches nearly.

To measure a four-sided field, A B C D (fig. 5.) Measure along a diagonal, as A C, and either of the two perpendiculars D E, B F, as in the last problem; or else the sides A B, B C, C D, D A. From either of which the figure may be planned, and its contents computed. Otherwise, measure on the longest side the distances A P, A Q, A B, and the perpendiculars P C, Q D. (fig. 6.) Or, measure the diagonal in fig. 5; and the angles C A B, C A D, A C B, A C D. Or, measure the four sides, and any one of the angles, as B A D.

Ex. 1. Let A E be 214, A F 362, A C 592, D E 210, and B F 326. Then,

$$\begin{array}{r}
 516 \text{ sum of perpendiculars} \\
 592 \quad \quad \quad A C \\
 \hline

 \hline
 .21883 \\
 40 \\
 \hline
 8.75520
 \end{array}$$

Ans. 3 acres, 0 rood, $8\frac{1}{2}$ perches.

Or, in fig. 6. Let A P be 110, A Q 745, A B 1110, P C 352, and Q D 595. Then,

P C 352	P C 352	Q D 595	Q D 595
A P 110	Q D 595	Q B 365	
2 A P C 38720		sum 947	2975
	P Q 675	3570	
		1785	
	4735		
	2841	217175 = 2 Q D B	
	5682	601345 = 2 P C D Q	
		38720 = 2 A P C	
2 P C D Q 601345			
		28.57240 = double the whole.	
		4.2862	
		4	
		1.1443	
		40	
		5.7920	

Ans. 4 acres, 1 rood, $5\frac{1}{2}$ perches.

To survey any field by the CHAIN only. Having set up marks at the corners, where necessary, of the proposed field A B C D E F G, (fig. 7.) Form a judgment, by walking over the ground, how it may best be divided into triangles and trapeziums; and measure them separately as in the two last problems. In this way it will be proper to divide it into as few separate triangles, and as many trapeziums as may be, by drawing diagonals from corner to corner; and so as that all the perpendiculars may fall within the figure. Thus, the figure is divided into the two trapeziums A B C G, G D E F, and the triangle G C D. Then, beginning with the first at A, measure the diagonal A C, and the two perpendiculars G m, B n; then the base G C, and the perpendicular D g; lastly, the diagonal D F, and the two perpendiculars E p, C o. All which measures write against the corresponding parts of a rough figure drawn to resemble the figure to be surveyed, or set them down in any other form at pleasure.

A m 135	130 m G
A n 410	180 n B
A C 550	
C g 152	230 g D
C G 440	
F o 206	120 o G
F P 288	80 p E.
F D 520	

Or thus; measure all the sides A B, B C, C D, D E, E F, F G, and G A; and the diagonals A C, C G, G D, D F.

Otherwise; many pieces of land may be very well surveyed, by measuring any base line, either within or without them, together with the perpendicular let fall upon it from every corner of them. For they are then divided into several triangles and trapezoids, all whose parallel sides are perpendicular to the base line; and the sum of these triangles and trapeziums will be equal to the figure proposed, if the base-line fall within it; if not, the sum of the parts which are without being taken from the sum of the whole which are both within and without, will leave the area of the figure proposed. In pieces that are not very large, it will be sufficiently exact to find the points, in the base-line, where the several perpendiculars will fall, by means of the *cross*,

(See *CROSS*), and from thence measuring to the corners for the lengths of the perpendicular. And it will be most convenient to draw the line to as that all the perpendiculars may fall within the figure. This, in fig. 8, beginning at A, and measuring along the line A G, the distances and perpendiculars, on the right and left, which will be as follows; viz.

A b	315	350	b B
A c	440	70	c G
A d	585	320	d D
A e	710	50	e E
A f	990	42	f F
A G	1020	—	—

— See *SURVEYING*.

By the *CHAIN* to find the distance between two objects inaccessible in respect of each other. From some place, as C (fig. 1), whence the common distance to each object, A and B, is accessible in a right line; measure the distance C A, which suppose fifty chains; and continue the line to D, viz. fifty more; measure also B C, which suppose thirty chains; and produce the line to E, viz. thirty more. Thus will be formed the triangle C D E, equal and similar to the triangle A B C; consequently the distance D E, being measured, will give the inaccessible distance required.

By the *CHAIN* to find the distance of an inaccessible object, v. g. the breadth of a river. On one side place a pole, four or five feet high, perpendicularly, having a slit at top, with a straight piece of wire, or the like, two or three inches long, put through the same. This is to be slipped up or down, till, looking along it, you find it point full on the other side of the river; then turning the pole with the wire in the same direction, observe the point on the dry land to which it points when looked along as before: measure the distance from the pole to this last point; it is the same with that of the first required.

CHAIN bar, in *Cannals*, is a coping of metal-cramps, sometimes let into the top-course or coping of locks and walls to tie them together.

CHAIN-boat, a large boat fitted with a davit over its stem, and two windlasses, one forward and the other aft, in the inside. It is used for getting up mooring-chains, anchors, &c.

CHAIN-Plates, in *Ship building*, thick iron plates bolted to the ship's sides, and to which the chains and dead-eyes that support the masts by the shrouds are connected.

CHAIN-Pump. See *PUMP*.

CHAIN-Shot. See *SHOT*.

CHAIN-Top. See *TOP-chain*.

CHAIN-Wales, of *CHANNELS*, in *Ship building*, are thick planks projecting horizontally from the sides of a ship, to which they are bolted, and also confined thereto by chains, or chain-plates, and hence the name. The lower ends of the chain-plates are bolted into the ship's sides, and the upper pass through notches in the chain-wales, and contain the dead-eyes, immediately above. To tie these dead eyes, those at the lower ends of the shrouds are connected by lariards, each to each; and the chain-wales are of a breadth sufficient to keep the shrouds clear of the gunwale. Two chain-wales belong to each mast, one upon each side of the ship, and they are so placed that the fore dead-eye in each, and the mast to which they belong, are nearly in the same straight line; and of length sufficient to contain as many dead-eyes, at proper intervals, as there are shrouds: by this disposition, the mast is supported laterally, and from abaft, by the shrouds and back-stays; and the other stays support it forward.

CHAINGY, in *Geography*, a town of France, in the department of the Loiret, 5 miles W. of Orleans.

CHAINS, *Catenæ*, in *Ecclesiastical History*, denote collections of such theological opinions and scriptural interpretations as had been received by the ancient doctors of the church. See *CATENA*.

CHAINS, *lunging in*, a kind of punishment inflicted on murderers. By stat. 25 Geo. II. c. 37. the judge shall direct such to be executed on the next day but one, unless Sunday intervene; and their bodies to be delivered to the surgeons to be dissected and anatomized; and he may direct them afterwards to be hung in *chains*. During the interval between sentence and execution, the prisoner shall be kept alone, and sustained only with bread and water. The judge, however, hath power to respite the execution, and relax the other restraints of the act. Blackst. Com. vol. iv. p. 202.

CHAINS, in *Ship building*, are those irons by which the shrouds of the masts are made fast to the *chain-wales*.

CHAIR, *Cathedra*, was anciently used for the pulpit, or fuggellum, whence the priest spoke to the people.

It is still applied to the place whence professors and regents in universities deliver their lectures, and teach the sciences to their pupils: thus, we say, the professor's *chair*, the doctor's *chair*, &c.

CHAIR, *Curule*, was an ivory seat placed on a car, when in were seated the prime magistrates of Rome, and those to whom the honour of a triumph had been granted.

CHAIR, *Sedan*, a covered vehicle for carrying a single person supported by two poles, and borne by two men, hence denominated chairmen. They were first introduced in London in 1674, when Sir Sanders Duncomb obtained the sole privilege to use, let, and hire a number of the laid covered chairs for 14 years. The first sedan chair, says Hume (Hist. vol. vi. p. 168, 8vo.) seen in England, was in the reign of James I., and was used by the duke of Buckingham; to the great indignation of the people, who exclaimed, that he was employing his fellow-creatures to do the service of beasts. In 1694 they were first taxed by act of parliament (5 and 6 W. and M. c. 22.): and by 9 Anne, c. 23. § 8. 200 hackney-chairs were licensed, at 10s. per annum; and no person was obliged to pay for a hackney-chair more than the rate allowed by the act for a hackney-coach driven two-third parts of the said distance. By the said act every chair shall have a distinct mark on each side, and altering such mark incurs forfeiture of 5l. half to the informer and half to the king. Nor shall any person carry for hire in a hackney chair, without licence, on pain of 40s.

In the following year, by 10 Ann. c. 19. chairs were increased to 300; and by 12 Geo. I. c. 12 to 400, on account of the great increase of buildings to the westward. By 7 Geo. III. c. 44. § 13. a chairman may take for any distance not exceeding one mile, 12d.; for any distance above one mile and not exceeding one mile and four furlongs, 1s. 6d.; for every further distance not exceeding four furlongs, 6d.; and by the hour 18d. for the first hour, and 6d. for every half hour after. By 9 Ann. c. 23. a chairman, guilty of misbehaviour, by demanding more than his fare, or giving abusive language, or otherwise behaving rudely, shall, on conviction on oath forfeit not exceeding 20s. to the poor, or be committed for 7 days to Bridewell or some other house of correction; and by 7 Geo. III. c. 44. the commissioners may revoke his licence, or inflict on him a penalty not exceeding 5l. to the poor; and on non-payment, he shall be committed to hard labour in some house of correction for 30 days. See *HACKNEY-COACHES*.

CHAIR is also applied by the Romanists to certain feasts, held anciently in commemoration of the translation of the see, or seat of the vicarage of Christ, by St. Peter.

The perforated chair, wherein the new-elected pope is placed, F. Mabillon observes, is to be seen at Rome: but the origin thereof he does not attribute, as is commonly done, to the adventure of pope Joan; but says there is a mystery in it; and it is intended, forsooth, to explain to the pope those words of Scripture, that *God draws the poor from out of the dust and mire*.

CHAIRMAN, the president, or speaker of an assembly, company, &c. We say, the *chairman* of a committee, &c.

CHAISE, a sort of light open chariot, or calash. See **COACHES**.

Aurelius Victor relates, that Trajan first introduced the use of post-chaises: but the invention is generally ascribed to Angulus; and was probably only improved by Trajan, and succeeding emperors. Goth. in Cod. Theodol. tom. ii. p. 506, &c.

CHASE, FRANCIS DE LA, in *Biography*, a distinguished ecclesiastic of France, in the reign of Lewis XIV. was born in the chateau of Aix in 1624, and entered the society of Jesuits at their college of Roanne, where he had been educated. He was employed for several years in teaching the belles-lettres, philosophy, and theology in different colleges of his order, and at length became provincial of the province of Lyons. From hence he was drawn to court, in 1675, by Lewis XIV. to fill the important post of his confessor, for which he possessed many necessary qualifications. As his figure was commanding, his manners polite, and his disposition to luxury and splendour such as suited the taste of Lewis, he acquired a powerful and permanent influence. To him was committed the distribution of benefices; and he maintained an absolute independence of mad. de Mairnon. The jealousy and dislike with which she regarded him were expressed in her letters; but her unfavourable representations of his temper and character were counteracted by those of the duke of St. Simon, who describes him as mild and moderate, humane and modest, possessed of honour and probity, and though much attached to his family, perfectly disinterested. This panegyrist adds, that he valued himself on his birth, and loved to favour nobility; and this circumstance served to induce a partiality on the part of this nobleman in his favour. Attached to his own order, he promoted its triumph over Jansenism; nevertheless, his treatment of the Jansenists may be reckoned very moderate compared with that of his successor Le Tellier. In his 86th year, sensible of the decline of his faculties, he wished to retire, and with these wishes the Jesuits concurred; but the king would not allow it. Even when he was broken down by infirmities, and had lost his memory, the king, as M. de St. Simon emphatically expresses it, had the *carcass* of his confessor brought to him for the purpose of transacting the usual business. He retained this office till his death, at the age of 85, in 1709. He was one of the first members of the Academy of Inscriptions, to which rank he was entitled by his knowledge of medals and of ancient history. Nouv. Dict. Hist. Gen. Biog.

CHASE, LA, or LACHEZE, in *Geography*, a town of France, in the department of the North coasts, and chief place of a canton in the district of Loudeac; 5 miles S.E. of Loudeac. The place contains 458, and the canton 11,828 inhabitants; the territory includes 212½ kilometres and 7 communes.

CHASE-DIEU, LA, a town of France, in the department of the Upper Loire, and chief place of a canton in the district of Brioude, 13 miles from Brioude, and 18 N.N.W. of Le Pay. The place contains 1322, and the canton 6042 inhabitants; the territory comprehends 230 kilometres and 14 communes.

CHASS-LE-VICOMTE, LA, a town of France, in the de-

partment of the Vendée, and district of Montaigu; 5 miles E. of La-Roche-sur-Yon.

CHAJUK, a town of Asia, in the country of Charâm, on the frontiers of the Greater Bucharia.

CHAKEN KAN, a town of Asiatic Turkey, in the province of Caramania; 20 miles N.N.E. of Tarsus.

CHAKENI KOUZEY, a town of Asia, in the kingdom of Candahar; 120 miles E.N.E. of Candahar.

CHALA, a small sea-port of South America, in the Pacific Ocean, near the river Arequipa.

CHALA, in *Ancient Geography*, a town of Asia, in Assyria; placed by Hicore de Charax in the Chalontis.

CHALAAMA, a river of Asia, in Syria.

CHALABRE, in *Geography*, a town of France, in the department of the Aude, and chief place of a canton, in the district of Limoux; 10 miles S.W. of Limoux. The place contains 1820, and the canton 8513 inhabitants; the territory includes 205 kilometres and 16 communes.

CHALACH, in *Ancient Geography*, the capital of Chalacene, near the springs of the river Lycus. Strabo places the Chalacene in the vicinity of Adiabene.

CHALADRA, CHARADRA, or GALADRA, a town and marsh of Macedonia.

CHALÆON, a port of Greece, in the Locride, 7 miles from Delphi, according to Pliny, who ascribes it to the Locriani-Ozoli.

CHALAIN, or LA POTHERIE, in *Geography*, a town of France, in the department of the Mayne and Loire, and district of Segré; 7 leagues N.W. of Angers.

CHALAIS, a town of France, in the department of the Charente, and chief place of a canton, in the district of Barbezuc; 5 miles W. of Aubeterre. The place contains 385, and the canton 7728 inhabitants; the territory comprehends 130 kilometres and 16 communes.

CHALAMONT, a town of France, in the department of the Ain, and chief place of a canton, in the district of Trevoux; 4 leagues N.N.E. of Montluel.

CHALAK, a town of Persia, in the province of Gedrosia.

CHALAN, a town of Persia, in the province of Faristan; 40 miles N.W. of Schiras.

CHALANÇON, a town of France, in the department of the Aude; 3 leagues N. of Privas.

CHALAPA, in *Botany*, and the *Materia Medica*, is a name given to jalap.

CHALAPU, in *Geography*, a mountain of the Cordilleras, in South America; which has, in its neighbourhood, the town of Hambato, and its skirts diversified with seats and farms; but its declivity is very steep. On this mountain the French mathematicians erected one of their signals, in measuring the length of an arc of the meridian.

CHALARONNE, a river of France, which runs into the Saône, near Toissey.

CHALASTIC Medicines, are such as have the faculty of relaxing the parts; when, on account of their extraordinary tension, or swelling, they occasion pain.

The word comes from *χαλασ*, I relax.

Of this kind are butter, and many oils, &c.

CHALASTICUM SAL, in the *Materia Medica*, a name given by some writers to the sal gem.

CHALASTRA, in *Ancient Geography*, a town of Macedonia, placed by Eliny, in the Thermaean gulf. Herodotus and Strabo call it *Chalystra*.

CHALAU, or KALAU, in *Geography*, a town of Lusatia; 46 miles S.W. of Frankfort on the Oder.

CHALAUTRE, a town of France, in the department of the Seine and Marne; 2½ leagues E. of Provins.

CHALAZA,

CHALAZA, among *Naturalists*, a white knotty kind of string at each end of an egg, formed of the plasma of the fibres of the membranes, whereby the yolk and white are connected together.

Its use, according to Harvey, is to be as it were the poles of this microcosm, and the connection of all the membranes twisted and knit together; whereby the liquors are not only conserved, each in its place, but also in its due position to the rest.

Mr. Derham adds, that they also serve to keep one and the same part of the yolk uppermost, let the egg be turned which way it will; which is done by the following mechanism: the *chalazæ* are specifically heavier than the whites wherein they swim; and being braced to the membrane of the yolk, a little out of the axis, they cause one side of the yolk to be heavier than the other. The yolk being thus by the *chalazæ* made buoyant, and kept swimming in the midst of the two whites, is, by its own heavy side, kept with the same side always uppermost: which uppermost side he imagines to be that whereon the cicatrix lies.

CHALAZA, in *Botany*, a name given by Gertner to a particular part of the internal membrane which belongs to most feeds. It has the form either of a small deep-coloured spot, or of a small, spongy, callous tubercle, proceeding from the extremities of the internal umbilical vessels, or from the dry remains of the chorion, and appearing on the outer surface of the membrane. It is found in many, but not in all feeds; and is situated either near the external umbilicus, or directly opposite to it. The first situation is not very common, but exhibits a variety of forms. The chalaza is a black spheacelated spot in eleusine, a thick fungous excrecence in zecynthis, and a small spongy scale in the feeds of hibiscus, lavatera, and other malvaceous plants. When it is situated, as it most frequently is, opposite to the umbilicus, its form is always round, with a moderate convexity; as in cetrus, myrobalanus, bixa, protea, flaphylla, alchemilla, and very many others; in all which the deep colour of the chalaza, and its close connection with the internal membrane, are clearly discernible. See Gertner de Fructibus, vol. i. Introd. p. 135.

CHALAZIAS, or **CHALAZITES**, in *Natural History*, the name of a small stone, described by Pliny and other ancient writers, and said to have been of the size and colour of a common hail-stone, and of the hardness of the diamond. It was probably no other than the small prismatic crystals of the Tachis, which are at this time frequent on the shores of rivers there, from the bigness of a large pea's head to that of a pea; and as they lie in great clusters together, without any other stones among them, they make a sort of coarse sand, which much resembles a cluster of hail-stones.

CHALCA, in *Ancient Geography*, a town of Africa, according to Strabo.

CHALCANTHUM, in *Natural History*. This term, together with chalcis, thaly, acanteria, and sory, was applied by the ancients, without much scientific discrimination, to signify iron and copper pyrites in a state of greater or less decomposition, and therefore approaching more or less to native vitriol. See *Irons*, July 27.

CHALCANTHUM, in *Chemistry*, the same with vitriol.

Some have added the *chalcantem* contrary for *chalcantem*, or *chalcantem rubrum*.

CHALCANTHUM MELANIS, in the *Matric Medica*, a name given by some of the old Greek writers to the *melanteria*, a yellowish vitriolic mineral, which turned black on being wetted with common water.

CHALCIS, in *Botany*. Linn. s. **MIRRAYA**.

CHALCEDON, in *Ancient Geography*, an ancient town of

Africa, in Libya, according to Steph. Byz.—Also, a town placed by this geographer in Phoenicia.—Also, a town situate in the territory of Larissa.—Also, an island of the Mediterranean, on the coast of Asia Minor, near Rhodes, according to Pliny; called also *Chalcia*.

CHALCEDA, a town of Asia, in Caria.

CHALCEDON, or **CALEDON**, in *Ancient Geography*, a famous city of Bithynia, seated on the Bosphorus, and built, as it is said, by the inhabitants of Megara, some years before Byzantium. It was anciently known by the names of Procerallis and Colbasa. It was taken by the Athenians 47 years B. C.; and 74 years before the same era, it was besieged by Mithridates, king of Pontus, but succoured by the consul L. Lucullus. The emperor Justinian repaired it, and gave it his own name. It afterwards became very powerful. Pliny, Strabo, and Tacitus call it "the City of the Blind," alluding to the answers which the Pythian Apollo gave to the founders of Byzantium, who, consulting the oracle in relation to a place where to build a city, were directed to choose that spot which lay opposite to "the habitation of the blind;" that is, as it was then understood, to Chalcedon; the Chalcedonians desiring that epithet for having built their city on a barren and sandy soil, without perceiving that advantageous and pleasant spot on the opposite shore, which the Byzantines afterwards chose. The emperor Julian erected a tribunal in this city, for trying and punishing the evil ministers of his predecessor Constantine. In the suburb of this city, furnished "the Oak," Rufinus, the infamous minister of the emperor Theodosius, built a magnificent villa; to which he added a stately church, consecrated to the apostles St. Peter and St. Paul, and continually sanctified by the prayers and penance of a regular society of monks. A numerous and almost general synod of the bishops of the Eastern empire was summoned to celebrate, at the same time, the dedication of the church and the baptism of the founder; and this double ceremony was performed with extraordinary pomp. Chalcedon became famous in Christian times for the council held there in 451 against Eutyches, which is reckoned the fourth general or œcumenical council. At this council Eutyches, who had been already banished, and deprived by the emperor of his sacerdotal dignity, was condemned, though absent; and the following doctrine was indicated upon Christians as the object of faith, viz. "that in Christ two distinct natures were united in one person, and that without any change, mixture, or confusion." The emperor Valens caused the walls of this city to be levelled with the ground, for siding with Proteropius, and the materials to be conveyed to Constantinople, where they were employed in constructing the famous Valentinian aqueduct. This city was taken after a long siege, A. D. 616, by Chosroes II. king of Persia. Chalcedon is at present a poor place, known to the Greeks by its ancient name, and to the Turks by that of *Chalcedi*, and *Kadi-keri*, or the Judges-town.

CHALCEDONIUS, the name of a medicine described by Galen; and directed by him to be infused into the ears, in inordinate disorders of that part.

CHALCEDONY, in the *Glass Trade*. See *GLASS-CHALCEDONY*.

CHALCEDONY, in *Natural History*. Of this mineral there are two following subspecies:

1. *Common Chalcedony*. Its colour is bluish-grey, passing into milk-white and faint blue; also greenish-grey, passing into apple and olive-green; or yellowish grey, passing into wax and ochre-yellow, yellowish and blackish-brown, and brownish-black. Two or more of these colours are often found in the same specimen, of which one generally forms

the ground, while the others are distributed over its surface in dots, clouds, or stripes. When white and yellowish-brown stripes alternate with each other, the stone is called an *onyx*, and is highly esteemed by the lapidaries. The grey varieties, with thick prismatic distinct concretions, when transversely cut, present iridescent colours when held to the light, and have hence been named *rainbow chalcodony*. The translucent milk-white variety is called *cabalony*. The green and small-blue varieties are the rarest: the dark coloured ones, when cut thin and held to a strong light, appear blood-red.

It is found massive, or forming veins, or in round balls of various sizes called *geodes*; also kidney-shaped, botryoidal, lalactic, mammillated, and impressed by various organized bodies, such as turbitis, &c. Certain crystalline forms, especially those of quartz, have also been attributed to chalcodony; but these appear to be nothing more than crystals of quartz coated over with chalcodony. It possesses little or no lustre; its fracture is perfectly even, passing into fine-splintery and flat-conchoidal: it breaks into indeterminate sharp-edged fragments; it frequently exhibits concentric, lamellar, or angular distinct concretions; it is commonly semi-transparent, but the darker-coloured varieties are only translucent; it is somewhat harder than flint, and much less brittle. Sp. gr. 2.58 to 2.65. It is infusible *per se*, before the blow-pipe, but becomes milk-white and opaque. According to Bergman, the chalcodony from Ferroe consists of

84 Silic.

16 Alumine and a little iron.

100

It occurs in veins and geodes in amygdaloid; also in veins, accompanied by quartz, pyrites, &c. in porphyry.

It was anciently procured from Chalcedon, in Lesser Asia (whence its name); but at present it is found principally in Saxony, Hungary, Iceland, Scotland, and the adjacent islands, Cornwall, and various parts of Asiatic Russia.

2. *Cornelian*. The usual colour of this mineral is blood-red, whence it passes into flesh-red, reddish-white, milk-white, orange and honey-yellow. Two or more colours often occur in the same specimen, disposed in zones, stripes, and arborizations. It occurs in veins and rounded pieces, has a conchoidal fracture, and a slight degree of lustre: in other respects it agrees with the common chalcodony. The variety with alternate red and white stripes is called *jadonyx*.

Cornelian is found in various parts of Europe; but the most beautiful and valuable pieces are brought from Arabia, and Surat, and Cambay in India. Cornelian, from its beauty and hardness, has always been much sought after by lapidaries. Some of the finest antique cameos are made of it.

The coloured chalcodony passes into *agate*, which see.

CHALCEMOLON, in *Antiquity*, a ship, the rostrum of which was of brass.

The word is compounded of *χαλκος*, *brass*, and *μολος*, *rostrum*.

CHALCEPOS, in *Botany*, Dalch. See *Εχινός* *Spherocephalus*.

CHALCETORES, in *Ancient Geography*, a name given by Strabo to a place of Asia Minor, in Caria.

CHALCETORIUM, a town of the island of Crete. Steph. Byz.

CHALCIDENE, an inland province of Syria, bounded by Antiochene or Seleucia, on the west; Cyrrhestica, on the north; Chalybonis, on the east; and by Apamene and Cæsalyria, on the south. It took its name from its metropolis *Chalcis*. This was reckoned one of the most fruitful provinces of Syria, and was seized by Ptolemy, the son of Memnus, during the troubles of Syria, and by him made a separate kingdom. Ptolemy himself is styled by Josephus and Hegeippus only prince of Chalcis; but his son Lyfianis is honoured both by Josephus and Dio with the title of king.

CHALCIDENSES, a people of Asia Minor, placed by Strabo in Ionia.—Also, a people situate, according to Diodorus Siculus, about the river Phasis.—Also, a people of Thrace, in the country where were situated the towns of Tinda and Milcorus. They are mentioned by Aristotle and Thucydides.

CHALCIDIC, **CHALCIDICUM**, or **CHALCEDONIUM**, in the *Ancient Architecture*, of a large magnificent hall belonging to a tribunal or court of justice.

Festus says, it took its name from the city Chalcis; but he does not give the reason. Philander will have it to be the court, or tribunal, where affairs of money and coinage were regulated; so called from *χαλκος*, *brass*, and *δικη*, *justice*. Others say, the money was struck in it; and derive the word from *χαλκός*, and *οικος*, *house*.

In Vitruvius, it is used for the auditory of a **BASILICA**: in other of the ancient writers, for a hall, or apartment, where the heathens imagined their gods to eat.

CHALCIDICA LACERTA, in *Zoology*, a reptile described as a sort of serpent, and so called from its resemblance in colour to the chalcodony. Its bite is succeeded, they tell us, by a pellicul tumour, which has a shining blackness at the margin; and drank in wine, it cures its own bite, according to Paulus Ægineta. This animal is no other than the **LACERTA Chalcides** of Linnæus, which see.

CHALCIDICE, or **CHALCITIS**, in *Ancient Geography, a country of Macedonia, according to Ptolemy, which comprehended the mountains S. E. of Apollonia, and the peninsula which lay between the Toronaic, Singitic, and Strymonic gulfs. In this country was the famous mount **Αἴθος**, which see. Ptolemy reckoned in this country only five cities; but Seidas says, that Philip took here 32 towns. Among these we may mention Augæa, Singus, Chalcis, and Zæcanthus, now Eritto.*

CHALCIDICUM, in *Antiquity, sometimes denoted a dining-room. See **CHALCIDIC**.*

CHALCIDICUS Mons, in *Ancient Geography*, a mountain of Sicily, according to P hybius and Steph. Byz.

CHALCIDIUS, in *Biography*, a Platonic philosopher, concerning whose time and character writers have entertained different opinions. Some have supposed that he was deacon or arch-deacon in the church of Carthage; others think that he was an heathen. According to Hady he was a Gentile, well acquainted with Christian writings. Beaufobre calls him a Christian philosopher, and says, that he joined Christianity with Platonism. Cave is doubtful whether he was a Gentile or a Christian. Fabricius represents him as a Christian writer of the fourth century; but Mosheim hesitates. Dr. Lardner suggests some difficulties; such as his seeming to approve of the divinations of Gentilism, and allowing them to be of use for discovering futurities. He quotes Moses as a wife man, but seems to express a doubt whether he possessed divine inspiration, as well as human knowledge. Upon the whole, his manner of

writing does not clearly show whether his religion was Christianity or Gentilism. Lardner, with his usual modesty, inclines to the opinion that he was a polite Platonic philosopher, who wished to be upon good terms with Christians, whose religion prevailed at that time; and he supposes with Cave, that he flourished about the year 330. Chalcidius translated into Latin the former part of the Timæus of Plato, and added a polished commentary, in which he shews much learning and good skill in the sentiments of the ancient philosophers. This work is ascribed to Osius, or Iodius, supposed to be the bishop of Corduba in Spain, and a principal member of the council of Nice in 325. He refers to the history of St. Matthew (chap. ii. 1); and whether he was a Christian or a heathen, this passage is a valuable testimony to St. Matthew's gospel, and to the history which he writes. If the commentary be considered as the work of a Gentile philosopher, the several quotations of the Old Testament and of the New that occur in it afford proof that the Scriptures were then well known in the world. Lardner thinks with Cave, that the style of the paragraph which he has cited is that of a Gentile, not of a Christian writer. Lardner's Works, vol. viii. c. 42. Cave, H. L. vol. i. p. 129.

CHALCIS *Χαλκίς*, in *Ancient Geography*, a town of Greece, and reckoned the capital of Eubœa, was built in the western part on a small peninsula, which seemed to join the island. The name of Chalcis, which was common to the island of Eubœa, and its capital, Stephanus derives from the daughter of Alcus, king of Bœotia; called Combe, and surname Chalcis, from her having first invented brazen armour; whence Pliny deduces it from a Greek word *χαλκος*, signifying brass or copper, which he supposes to have been first used here. The Chalcidians, in their better days, were renowned for their skill in navigation; but they were very generally reproached, on account of the dissoluteness of their manners; and their avarice was a topic of ridicule among the ancient Armenians. They sent colonies into Thrace, Macedonia, Sicily, the island of Coreyra, Lemnos, Italy, &c. See *ΕΥΒΟΙΑ*. Chalcis was one of the three cities which Philip, son of Demetrius, called "the fetters of Greece." Strabo says, that it was joined to the continent of Bœotia; and Pliny thought that Eubœa was united with the continent by this place, which is not improbable. The small strait which separates the island from the continent is called Euripus, and by the modern Greeks Euripo, whence by corruption is derived Egripo, the name given to the island.

CHALCIS, a town of Macedonia in Chalcidice. It was situated between Olynthus, the Singitic gulf, and Apollonia. Thucydides and Steph. Byz. refer it to Thrace, because the boundaries of this country were sometimes changed.

CHALCIS, a mountain of Greece, in Ætolia, according to Strabo, who says, that it extended along the eastern bank of the Evrusus, from the mouth of this river to the northern extremity of Ætolia.

CHALCIS, a town of Greece, in Ætolia, seated on the fore-mentioned mountain.—Also, a town of Greece, in Bœotia, according to Hefychius.—Also, a river of Greece, in the Peloponnesus, which, according to Strabo, ran to the confines of Triphylia and the Pisadite territory, near Sarnicum.—Also, a river of Asia Minor, in Bithynia, which watered the city of Chaleedon, and discharged itself into the Thracian Bosphorus.—Also, a maritime burgh, with a port, in Asia Minor, upon the southern coast of Ionia, N. of the ile of Samos, and near Teos.—Also, one of the islands called Echinades, which were Grecian islands on the

coast of Ætolia.—Also, a town of Asia, in Syria; seated on the northern bank of a lake, whence sprung the river Chelcis, and which gave its name Chalcedone to the country. The Notitia of Hierocles distinguishes it as an episcopal city of Syria Prima, and the Itinerary of Antonine places it W. of Bœotia.—Also, a town of Arabia Felix, which Pliny says was founded by the Greeks, but destroyed by the war.—Also, a town of Scythia, mentioned by Steph. Byz.

CHALCIS, in *Entomology*, a genus of Hymenopterous insects established by Fabricius, and included by Gmelin in the Linnaean arrangement between the *TIPHIA* and *CHRYSIS*.

The genus *Chalcis* consists, with the exception of one, or, at most, two species, of insects discovered since the time of Linnaeus, and which cannot, with propriety, be reduced to any of the Linnaean genera. It approaches both the *Spilix* and *Vespa* tribe; it is to the *Vespa* Linnaeus refers *Chalcis minuta* of Fabr., and if the insect described in his *Fauna Suecica*, n. 1657, be the *Chalcis Siffes*, as commonly believed, the latter stands in his genus *Spilix*. The Fabrician character of the genus *Chalcis* is Palpi quatuor aqualis: Antennæ breves, cylindricæ, fere fusiformes: articulo primo subcylindrico. Fabr. Ent. Syst. The following generic character after the Linnaean method is proposed for *Chalcis*, in the eleventh volume of the *Natural History of British Insects*. Mouth with a horny, compressed, and sometimes elongated jaw; feelers four, equal; antennæ cylindrical, fusiform, first joint rather thickset; thorax gibbous, lengthened behind, and obtuse; abdomen small, rounded, and subpetiolate; posterior thighs thickish. *Donov. v. 11. p. 57. t. 379.*

SPECIES.

CHALCIS *siffes*. Black; petiole of the abdomen, and posterior thighs yellow. Fabr. mant. *Spilix siffes*, Fabr. Sp. Inf. *Spilix nigripes*, Subz. *Vespa*, &c. Geoff. A native of Europe.

Obs. The posterior thighs are clavated, and toothed, of a yellow colour, and marked with a large spot of black; those of the female simple.

CHALCIS *clavipes*. Black; thighs of the hind-legs thick, and rufous. *Donov. Brit. Inf. Fabr. Hybner, &c.*

Size of the last; colour black and glossy, except the posterior thighs. According to Hybner this insect inhabits Saxony; it has been taken rarely in England. Latreille, who describes it under the name of *Chalcis clavipede*, mentions it as a scarce insect in France.

CHALCIS *minuta*. Black; posterior thighs thick, and yellow at the tip. Fabr. *Vespa minuta*, atra geniculis pedum luteis, femoribus posticis ovatis fuscis muricatis, Linn.

This species is small, and has the posterior thighs serrated, and thanks incurved, yellow, and tipped with black. Fabricius describes this as a German insect. Latreille informs us it is not uncommon in France, in the vicinity of Paris, and it may be considered, we believe, as a native of this country.

CHALCIS *punctata*. Yellow, dotted with black; posterior thighs clavated and toothed; abdomen conic. Fabr. Ent. Syst. *Chalcis punctata*, Sp. Inf.

This kind inhabits the South American islands. The thorax is yellow, with black spots and dots; abdomen somewhat petiolate, yellow, tipped with black; posterior thighs with a black dot at the base and tip; wings white, and without spots.

CHALCIS *apiformis*. Cinerous; abdomen black; posterior

rior legs thick, testaceous, with a tooth at the base of the foot. Fabr.

Native country unknown. Described from the collection of Lund. The antennæ are black, with ferruginous base; head villous and cinereous; lip rounded, yellow, with a black streak; thorax cinereous; abdomen black; wings white.

CHALCIS podagrica. Black; posterior thighs thick, serrated, and ferruginous, with a white spot at the tip. Fabr. Inhabits Tranquebar. Small; antennæ short and thick; head and thorax black, with a callous dot before the wings; abdomen short, rather compressed, black and without spots; legs white; thighs black; posterior pair, with a large white spot above; the franks incurved, white, and in the middle black.

CHALCIS leuca. Black; abdomen conic, black, and glossy; posterior thighs thick, and without spots. Fabr. *Chalcis leuca*, Rossi.

This is a native of Italy. The size is small, and the colour entirely black, except the white wings; posterior thighs very thick.

CHALCIS pulchra. Glossy black; posterior thighs thick, with a white dot at the tip. Fabr. Resembles the last, but is only half the size. Inhabits Saxony. Hybner Natur.

CHALCIS annulata. Black; posterior thighs thick and serrated, with a white dot at the tip; franks white, fringed with black. Fabr.

Inhabits South America, and appears, from the account of Dr. Pflug, to be of the parasitic kind like the Ichneumon, being found in the pupa of moths. It may be added, that as we are unacquainted with the Chalcis tribe in general, except in the winged state, the whole of them may be of the parasitic kind, depositing their ova, and being nourished in the larva state in the bodies of other insects. The size of *Chalcis annulata* is the same as the preceding; the head and antennæ are black; thorax somewhat villous, black, with a snowy white dot before the wings; abdomen conic, smooth, and without spots; wings white; thighs of the posterior legs thick; franks incurved.

CHALCIS flavipes. Black; posterior thighs thick, serrated, with a yellow spot at the tip; legs yellow. Fabr.

Described from the cabinet of Dr. Pflug as a native of the South American islands. Resembles the last in size and appearance. The head is black; thorax dotted, with a yellow callous dot before the wings; abdomen conic, black, and glossy; wings hyaline; legs yellow; thighs black at the base.

CHALCIS maculata. Yellow, spotted with black; segments of the abdomen ferruginous at the base; posterior thighs elevated and immaculate. Fabr. Rohr.

Inhabits Cayenne. The body is small; antennæ short, black, the first joint testaceous; head yellow, with a central black line, and four vertical black dots; thorax yellow, anterior spot, dorsal line, and dot on each side black; legs yellow; thighs black at the base; posterior thighs serrated.

CHALCIS, in *Ichthyology*, a name by which some have called the pilchard; called by others *celerinus*, and *Apua membrae*. See *CLUPEA pilchardus*.

CHALCIS was also the name given by Aristotle, Ælian, Appian, and other Greek authors, to the common herring. See *CLUPEA harengus*.

CHALCIPARIUM, in the *Materia Medica of the Ancients*, a name given by the Greeks of the middle ages to the *colubar*, or *calcanthum*. Some have applied it to the *CHALCITIS* alone, but others make it express the vitriols in general. It is derived from the Arabian word *colubar*.

CHALCITIS. See **CHALCANTHUM.**

CHALCITIS, in *Ancient Geography*. See **CHALCIDICE**.

CHALCITIS, an island of the Propontis, at the entrance of the Thracian Bosphorus, and over against Byzantium. It is said to have had mines of copper.—Also, a country of Asia in Mesopotamia.—Also, a country of India, beyond the Ganges, according to Ptolemy, in which they had mines of copper.—Also, a country of Asia Minor in Ionia. Pausanias says that it was in the vicinity of Erythrae.

CHALCO, in *Geography*, a town of North America, in the province of Mexico, near a lake to which it gives name; 18 miles S.E. of Mexico.

CHALCOCONDYLES, LAONICUS, an Athenian, who flourished in the 15th century, about 1470, and wrote in Greek, a "History of the Turks," from 1268 to 1462; which was translated into Latin by Conrad Clauter of Zurich: a Louvre edition of it was given in Gr. and Lat. in 1650, fol.; and a French translation by Vigenere and Mezeray, with comments, was published in 1662. *Nouv. Dict. Hist.* Fabr. Græc. t. vi. p. 474.

CHALCODONIUS Moss, in *Ancient Geography*, a mountain of Greece, in that part of Thessaly, called Pelasgia, above Phera.

CHALCODONTIDE, a name given by Homer (Iiad B.) to the Eubæans, and derived from Chalcodor, who succeeded his father Abas, the first king who reigned in Eubæa. This Chalcodon made war upon the Thebans, reduced their city, and compelled them to pay an annual tribute; but he was afterwards overcome and killed by Amphiphion, the father of the Theban Hercules; after which the Thebans regained their liberty.

CHALCOGRAPHY, the art of engraving on copper and brass. See **ENGRAVING**.

CHALCOLIBANON, a word mentioned in the Apocalypse of St. John, and very much misunderstood by the interpreters, who generally render it *brass*; but the word will bear no such signification. When the name of a metal is prefixed to some other word it only denotes the thing mentioned after the metal to be of the colour of that metal. This word is formed of *χαλκος*, *brass*, and *λίβανον*, *frankincense*. We have many parallel compounds, and all understood in the same way, the name of the metal only expressing the thing to be of its colour: thus *chrysolimela* is applied of the colour of gold, &c. This, therefore, can only signify frankincense of the colour of brass, that is, yellow.

CHALCONDYLES, DEMETRIUS, in *Biography*, a learned modern Greek, was a native of Athens, and having arrived in Italy, about the year 1447, resided for some time at Rome, and afterwards settled at Perugia, as teacher of the Greek language. About the year 1471 he was invited to Florence by Lorenzo de Medici, as successor in the Greek professorship to Argyropolus. Angelo Poliziano, who at this time taught Greek and Latin at Florence, succeeded by his rivalry and intrigues in removing Chalcondyles from his station as professor; though he was still respected by Lorenzo for his learning, and also for the worth and simplicity of his character. In 1492, the year of Lorenzo's death, he left Florence, and in consequence of the invitation of Lewis Sforza, settled at Milan; where he was famous as a teacher, and attended by a great number of scholars for many years. His erudition has been highly commended, and he has been ranked among the principal of the Greeks, who introduced the study of their language into Italy. He died at Milan in 1511, at the advanced age of 87 years. His only publication was a Greek grammar, first printed without date of year or place, but afterwards reprinted at Paris in 1525,

and at Basil in 1556. He also assisted in editing some Greek authors. Moreri. Fabr. Bib. Græc.

CHALCOPHTHONGUS, in *Natural History*, a word used by Pliny, and other writers, as the name of a peculiar species of mable, which was very hard, and of a deep black colour, and when struck upon, sounded like brass.

CHALCORYCHIAN MOUNTAINS of Ptolemy, are mountains of Africa, in that part of Mauritania Cæsaricensis, which belonged to the Tingitanians or Western Moors, between Mons Durus and the river Malva or Mulloobah. They were inhabited by the ancient Herpiditani, and now by a tribe of Kabyles, called Beni-zeneff, who, secure in their number and situation, have not hitherto submitted to the Tingitanian.

CHALCOS, in *Coinage*, a coin of brass, eight of which were contained in the silver obolus, and supposed to have been the first kind of Greek coin. At first it was regarded as of so little moment that it afforded occasion for a proverb; so that to say a thing was not worth a chalcos, was the same with saying that it was worth nothing. As the Greeks became poor, however, even this diminutive coin was subdivided into 2, 4, or even 8 $\delta\epsilon\lambda\tau\alpha$ or small coins. Pollux, and Suidas after him, tell us, that there were seven lepta to one chalcos; but this kind of division, from the unsuitableness of seven for proportional subdivision, is not likely to have occurred. But both these writers are too late as authorities: Pliny says that there were ten chalci to the obolus, Diodorus that there were six, and Hidorus that there were four; and as these writers differ about the larger denomination, it may well be imagined that the smaller equally varied in different states. Most of the Greek copper coins which are now extant consist of chalci; the lepta being small, and more liable to be lost. All the brass coins of Athens published by Dr. Coombe are reducible to four sizes, which may be the $\lambda\epsilon\pi\tau\alpha$, $\delta\iota\lambda\epsilon\pi\tau\alpha$, $\tau\epsilon\tau\lambda\epsilon\pi\tau\alpha$, or $\delta\epsilon\mu\iota\chi\alpha\lambda\cos$, and chalcos. The first is not above the size of one of king James I.'s farthing tokens: the last about that of our common farthing. See **MONEY**.

CHALCOSMARAGDUS. Almost every green mineral of a spathose texture was called by the ancient Naturalists smaragdus. The chalcosmaragdus or copper emerald was found in the copper mines of Cyprus, and therefore was probably some spar tinged green by carbonat of copper.

CHALCUTOS, *Los*, in *Geography*, a town of North America, in the country of Mexico, and province of Zatecas.

CHALCUS, in *Ishlyts egg*, a name given by the ancient Greeks to the fish we call *Loxy*, *John Dorée*, or *Dorée*. It seems to have obtained both these names from its colour; the one from the word *chalcos*, brass; and the other from *doree*, gilded. See **ZEUS JULER**.

CHALCUS, among the *Ancient Greek Physicians*, a weight of about two grains, the same as *areolus* or *arcolum*.

CHALDÆA, in *Ancient Geography*, an appellation at first and generally used as synonymous with *Babylonia*; which see. But in process of time, it was restricted to the country, that was situated to the S.W. of Babylonia towards the Persian gulf, and towards the S. of the Euphrates. In Chaldaea, properly so called, Ptolemy places the cities Spunda, Batacharta, Shalatha, Altha, and Teridon, all on the Tigris; in the inland country he enumerates Chuduca, Chumana, Bethiana, Orchoe, Biramba, and several others, equally unknown.

CHALDÆANS, a name never given by Xenophon in his Retreat of the Ten Thousand, nor in his Cyropædia, to the people of Babylonia; but it properly belonged to a

family or tribe of people who from their infancy devoted themselves to the study of nature, to the observation of the stars, and to the worship of the gods, much after the same manner with the Magi of Persia and the Brachmans of India. The Chaldæans or Chaldees, properly so called, were the priests and learned men of Babylonia, whose whole science seems to have been subservient to the purposes of superstition. These Chaldæans were, perhaps, more distinguished from the people than the clergy are from the laity with us; and were as much revered in their country, as the Egyptian priests were in theirs; and they are said to have enjoyed the same privileges. See **CHALDÆAN Philosophy**.

Xenophon (*ubi supra*) gives also the same name of Chaldæans to the people who inhabited that branch of mount Caucaus, where the Tigris, the Euphrates, the Araxes, and the Cyrus had their source. These people are denominated *Chalybes* in the geography of Herodotus, and he places the Chaldæans in Babylon. Strabo says (*lib. x. and xi.*) that the people anciently called Chalybes were, in his time, named Chaldæans; and the emperor Constantine Porphyrogenitus, who calls the provinces by the name of the people who inhabited them, gives that of Chaldia to the country, of which Trebizond was the capital, and which extended very far to the south and to the east of this city, comprehending a great part of the two Armenias. He adds that this name was derived from the Persians. Strabo describes the Chaldæans as a people almost savage, who dwelt in the mountains of Colchide.

The Chaldæans, says the learned Bryant, (*Observ. and Inq. p. 253.*) were the most ancient inhabitants of the country called by their name; nor are there any other principals, to whom we may refer their original. They seem to have been the most early constituted, and settled, of any people upon earth; and from their situation, and from every other circumstance, it appears, that Chus was the head of their family, and Nimrod their first king. They seem, he says, to have been the only people, that did not migrate at the general dispersion; and the centre of their province was at Ur, not far from the conflux of the Tigris and Euphrates. From hence they extended themselves under the names of Cusæans and Arabians, as far as Egypt west, and eastward to the Ganges; occupying to the south all the Asiatic sea-coast, and the whole of the large continent of Arabia; and from thence they passed the Erythræan gulf, and penetrated into Ethiopia. They were continually encroaching upon those that were nearest to them; and even trespassing upon their own brotherhood. In process of time they got full possession of Egypt, and the whole coast of Africa upon the Mediterranean even to the Atlantic Ocean, as far as Fez and Tassilt; and are to be found within the tropics almost as low as the Gold coast. Upon the Gambia is the king of Barsally, of Arabian extraction, as are all the Phooly natives; who retain their original language, and are of the religion of Mahomet.

CHALDÆAN PHILOSOPHY claims attention on account of its very high antiquity. The most ancient people, next to the Hebrews, among the Eastern nations, who appear to have been acquainted with philosophy, in its more general sense, were the Chaldæans; for though the Egyptians have pretended that the Chaldæans were an Egyptian colony, and that they derived their learning from Egypt, there is reason to believe, that the kingdom of Babylon, of which Chaldaea was a part, flourished before the Egyptian monarchy; and that the Egyptians were rather indebted to the Chaldæans than the Chaldæans to the Egyptians. Nevertheless, the accounts that have been transmitted to us,

by the Chaldæans themselves, of the antiquity of their learning, are blended with fable and involved in considerable uncertainty. At the time when Callisthenes was requested by Aristotle to gain information concerning the origin of science in Chaldæa, he was informed that the ancestors of the Chaldæans had continued their astronomical observations through a period of 470,000 years; but upon examining the grounds of this report, he found that the Chaldæan observations reached no farther backward than 1903 years, or that of course (adding this number to 331 B. C., the year in which Babylon was taken by Alexander) they had commenced in the year 2234 B. C. Besides, Ptolemy mentions no Chaldæan observations prior to the æra of Nabonassar, which commenced 747 years B. C. Aristotle, however, on the credit of the most ancient records, speaks of the Chaldæan Magi as prior to the Egyptian priests, who, it is well known, cultivated learning before the time of Moses. There are other circumstances, independently of the antiquity of the Chaldæan philosophy, which render our knowledge of it imperfect and uncertain. We derive our acquaintance with it from other nations, and principally from the Greeks, whose vanity led them to despise and misrepresent the pretended learning of barbarous nations. The Chaldæans also adopted a symbolical mode of instruction, and transmitted their doctrines to posterity under a veil of obscurity, which it is not easy to remove. To all which we may add that, about the commencement of the Christian æra, a race of philosophers sprung up, who, with a view of gaining credit to their own wild and extravagant doctrines, passed them upon the world as the ancient wisdom of the Chaldæans and Persians, in spurious books, which they ascribed to Zoroaster, or some other eastern philosopher. Thus, the fictions of these impostors were confounded with the genuine dogmas of the ancient eastern nations. Notwithstanding these causes of uncertainty, which perplex the researches of modern inquirers into the distinguishing doctrines and character of the Chaldæan philosophy; it appears probable, that the philosophers of Chaldæa were the priests of the Babylonian nation, who instructed the people in the principles of religion, interpreted its laws, and conducted its ceremonies. Their character was similar to that of the Persian Magi, and they are often confounded with them by the Greek historians. Like the priests in most other nations, they employed religion in subserviency to the ruling powers, and made use of imposture to serve the purposes of civil policy. Accordingly Diodorus Siculus relates, (lib. ii. p. 31. compared with Dan. ii. 1, &c. Eccles. xlv. 3.), that they pretended to predict future events by divination, to explain prodigies, and interpret dreams, and to avert evils, or confer benefits, by means of angury and incantations. For many ages, they retained a principal place among diviners. In the reign of Marcus Antoninus, when the emperor and his army, who were perishing with thirst, were suddenly relieved by a shower, the prodigy was ascribed to the power and skill of the Chaldæan soothsayers. Thus accredited for their miraculous powers, they maintained their consequence in the courts of princes. The principal instrument, which they employed in support of their superstition, was astrology. The Chaldæans were probably the first people who made regular observations upon the heavenly bodies (Cic. de Divin. l. i. Strabo l. xv.), and hence the appellation of Chaldæan became afterwards synonymous with that of Astronomer. Nevertheless all their observations were applied to the sole purpose of establishing the credit of judicial astrology; and they employed their pretended skill in this art, in calculating nativities, foretelling the weather, predicting good and bad fortune, and other practices usual with impostors of this class. (Sext. Emp. adv.

Math. l. v. §. 2. Aul. Gell. l. xiv. S. 1. Strabo, l. c.) While they taught the vulgar that all human affairs are influenced by the stars, and professed to be acquainted with the nature and laws of their influence, and consequently to possess a power of prying into futurity, they encouraged much idle superstition, and many fraudulent practices. Hence other professors of these mischievous arts were afterwards called Chaldæans, and the arts themselves were called Babylonian arts. Among the Romans these impostors were to trouble some, that, during the time of the republic, it became necessary to issue an edict, requiring the Chaldæans, or mathematicians (by which latter appellation they were commonly known) to depart from Rome and Italy within 10 days, and, afterwards, under the emperors, these soothsayers were put under the most severe interdiction. (Valer. Max. l. i. c. 3. Diod. Sic. l. xvii. p. 622. Sueton. in Tiber.)

We may further add, that the Chaldæan philosophy consisted, not in a free and diligent examination of the nature of things, but merely in the transmission of certain settled opinions from father to son. To this purpose Diodorus Siculus, (l. ii. p. 81.) deviating widely from the character of a true philosopher, commends the Chaldæans for having taken up their opinions upon the authority of their ancestors, and says "that, in this respect, they acted much more wisely than the Greeks, who, addicting themselves to disputation, were ever ready to embrace new opinions; and thus obliged their disciples to wander through their whole lives in perpetual uncertainty." Accordingly, the mysteries of Chaldæan philosophy were revealed only to a select few, and studiously concealed from the multitude; and thus a veil of sanctity was cast over their doctrine, so that it might more easily be employed in the support of civil and religious tyranny. Another circumstance which contributed to produce the same effect, was the care taken by the Chaldæan priests to prevent the spreading of religious and philosophical knowledge among the people; and with this view they confined the dissemination of it to a certain tribe and district. They also issued their dogmas under the disguise of symbols; thus reserving to themselves the prerogative of varying the popular system according to the exigencies of the times, or the pleasure of the ruling powers, without danger of detection. The implicit credit which the Chaldæan priests obtained among the people by these artifices is particularly noticed by Juvenal: (Sat. vi. 552.)

"Chaldæis sed major erit fiducia, &c.

"More credit, yet, is to Chaldæans given;
What they foretell is deem'd the voice of heaven:
Their answers as from Hammon's altar come;
Since now the Delphian oracles are dumb.
And mankind ignorant of future fate,
Believe what fond astrologers relate."

DRYDEN.

From the above account of the Chaldæans, it must appear, that they had but a very slight title to the appellation of wise men; and that, instead of ranking with philosophers, they belonged to the class of impostors. The knowledge they possessed was applied by them to the purposes of superstition; and little regard is due to the encomium passed upon this race of sages by some ancient writers, particularly Philo (De Nomin. Mutat. oper. p. 1046); and still less to the general admiration, which, at a very early period, they obtained in the east. Among the Chaldæans, however, there was some variety of opinions. We learn from the authority of Strabo (l. xvi. p. 509) and Pliny (Hist. Nat. l. vi. c. 26.) which is confirmed by the testimony of the Jewish prophets, that there were in Assyria and Chaldæa, different schools or sects, which probably differed from each other chiefly in the mode

of practising the arts of divination and astrology; and whose knowledge of nature extended little further than to the discovery of the supposed magical uses of certain natural bodies, particularly minerals and herbs. (Plin. Hist. Nat. l. xxxvii. c. 10.) Moreover, the tenets or institutions of each sect, whatever they might be, were transmitted implicitly from father to son; and the followers of one sect very rarely revolted to another.

Among the ancients it is universally acknowledged, that Zoroaster was the founder of the Chaldean philosophy. But much confusion and contradiction have occurred in the accounts that are given of this celebrated person. See ZOROASTER. It is probable, that besides Zoroaster, who was a Perso-Median, and who flourished in the time of Darius Hytaspes, there was another of the same name who lived in a much more remote period among the Babylonians, probably towards the beginning of the Babylonian empire; who taught them astronomy, and who was the father of Chaldean astrology and magic. (Plin. H. N. l. vi. c. 16.; xi. 43.; xxx. 1. Justin. l. i. c. 2. Recognitiones Clementis, l. iv. c. 27.) The Chaldean magic was, indeed, a very different thing from a knowledge of the real properties of bodies; and, though some acquaintance with the motions of the heavenly bodies was necessary for astrological calculations, it cannot be inferred, either from their magical or astrological arts, that the Chaldeans were eminent masters in any branch of natural science. All the writings, which have been ascribed to the Chaldean Zoroaster, are unquestionably spurious.

Among the Chaldean philosophers we may mention Belus, who promoted the study of astronomy among the Assyrians, probably with a design of applying their faith in astrological predictions to political purposes, to whose memory Semiramis is said to have erected a lofty tower used afterwards by the Chaldeans as an astronomical observatory, and elevated after his death to the rank of divinities. (See BELUS). See also BEROSUS.

The Chaldean philosophy, notwithstanding the obscurity that has rendered it difficult of research, has been highly extolled, not only by the Orientals and Greeks, but by Jewish and Christian writers: but upon recurring to authorities that are unquestionable, there seems to be little or nothing in this branch of the Barbaric philosophy which deserves notice. The following brief detail will include the most interesting particulars: From the testimony of Diodorus, and also from other ancient authorities, collected by Eusebius (Præp. Evang. l. iv. c. 5.) it appears, that the Chaldeans believed in God, the lord and parent of all, by whose Providence the world is governed. From this principle sprung their religious rites, the immediate object of which was a supposed race of spiritual beings or demons, whose existence could not have been imagined, without first conceiving the idea of a Supreme Being, the source of all intelligence. The belief of a Supreme Deity, the fountain of all the divinities which were supposed to preside over the several parts of the material world, was the true origin of all religious worship, however idolatrous, not excepting even that which consisted in paying divine honours to the memory of dead men. Besides the Supreme Being, the Chaldeans supposed spiritual beings to exist, of several orders; gods, demon, heroes: these they probably distributed into subordinate classes, agreeably to their practice of theurgy or magic. The Chaldeans, in common with the eastern nations in general, admitted the existence of certain evil spirits, clothed in a vehicle of grosser matter; and in subduing or counteracting these, they placed a great part of the efficacy of their religious incantations. (Plut. de Defectu Orac.)

These doctrines were the mysteries of the Chaldean religion, in part only to the initiated. Their popular religion consisted in the worship of the sun, moon, planets, and stars, as divinities, after the general practice of the east. (Job, xxxi. 27.; Diod. Sic. ubi supra; Herod. l. i. c. 181.; Selden de Diis Syris. Præf. c. 3.) From the religious system of the Chaldeans were derived two arts, for which they have long been celebrated, viz. magic and astrology. Their magic, which should not be confounded with witchcraft, or a supposed intercourse with evil spirits, consisted in the performance of certain religious ceremonies or incantations, which were supposed, by the interposition of good demons, to produce supernatural effects. Their astrology was founded upon the chimerical principle, that the stars have an influence, either beneficial or malignant, upon the affairs of men, which may be discovered, and made the certain ground of prediction, in particular cases; and the whole art consisted in applying astronomical observations to this fanciful purpose, and thus imposing upon the credulity of the vulgar. (See Sext. Emp. a. iv. Math. l. v. p. 339. Diod. Sic. l. ii. p. 83. Manilius, l. ii. v. 456. Jacobbich de Myster. §. 8. c. 4. Fabr. Bib. Græc. v. ii. p. 494. Vossius de Theolog. Gent. l. ii. c. 47.) Upon this subject, Horace (lib. i. od. xi. 1.) makes the following sensible reflection:

“Tu ne quaesiveris (scire nefas) quem mihi, quem tibi
Finem Dii dederint, Leucome, neu Babylonios
Tentaris numeros. At melius, quiddid erit, pati.”
“Ask not—’tis impious to inquire—what date
The limit of your life is fix’d by fate;
Nor vainly Babylonian numbers try;
But wisely wate your lot, to live or die.”

The Chaldeans, whilst they were occupied in these and other arts of divination, contributed very little to the promotion of true science. We have scarcely any remains of their astronomical observations and opinions. The loss, with respect to the latter, is not much to be regretted, as far as we may judge by the following specimens.

According to Plutarch and Vitruvius, who quote Beresius, it was their opinion, that an eclipse of the moon happened, when that part of its body which is destitute of fire is turned towards the earth. (Plut. de Placit. Phil. l. ii. c. 26. Comp. Euseb. Præp. l. 15. c. 51. Vitruv. l. ix. c. 4.) From the same authority Seneca (Quæst. Nat. l. iii. c. 29.) gives it as a notion of the Chaldeans, that when all the planets shall meet in Cancer, the world will be consumed by fire; and that when they shall meet in Capricorn, it will be destroyed by an inundation. They thought the form of the earth to be that of a boat. (Diod. Sic. loc. cit.)

The sum of the Chaldaic cosmogony, as it is given by Beresius, in his “Babylonica,” preferred by Syncellus (Chronic. p. 28.), divell’d of allegory, is, that in the beginning all things consisted of darkness and water; that Belus, or a divine power, dividing this humid mass, formed the world, and that the human mind is an emanation from the divine nature. CHALDAISMS, in *Biblical History*, denote certain expressions and modes of expression, derived from the Chaldee language, that occur in the scriptures of the Old Testament. Besides those parts of the Old Testament which are written in Chaldee, viz. the book of Daniel, from the 4th verse of the 2d chapter to the end of the 7th chapter; the book of Ezra, from the 8th verse of the 4th chapter to the 27th verse

of the 7th chapter; and the 11th verse of the 10th chapter of the book of Jeremiah; there occur in the Hebrew text some single words that are merely Chaldaic. Such is the Chaldaic word **רַב־יֶן**, *fon*, which is used instead of the Hebrew **רַב**; as in Prov. xxxi. 2. Psa. ii. 12. Such are also **כֶּרְמֵי־בָרָה**, *golden*, for the Hebrew **מִזְבֵּחַ־זָּהָב**, *gold*, in Isaiah, xiv. 4.; and **רַעְיוֹן**, in Pi. cxxxix. 17. translated by the vulgar *thy friends*; in the Hebrew sense of the term, but in Chaldaic **רַעְיוֹן** signifies *thoughts*, and therefore most persons render it *thy thoughts*. Independently of these whole words, there are some Hebrew terms, which nevertheless are formed after the Chaldaic manner, and at that account differ from the Hebrew. Thus, the plural masculine nouns in Hebrew terminate in **ים**; but in Chaldaic, and also in Syriac, in **ין**; as **כַּלְיִן** (Job, xii. 11.) for **כַּלְיִים** *swords*, **הַיִּין** (Job, xxiv. 22.) for **הַיִּים** *life*, &c. &c.: nouns also which in Hebrew end in **ה**, close with **א** in the Chaldaic and Syriac; thus, **תְּהָרָה** (Exod. xxviii. 32. and xxxix. 23.) for **תְּהָרָה** (Roth, i. 2.) **שֵׁנָה** (Pi. cxvii. 7.) for **שֵׁנָה**, &c. &c.; the Chaldaic **רַעְיוֹן** occurs (Ez-k. xxxiii. 30.) for the Hebrew **רַעְיוֹן**, &c. Chaldaic affixes are also joined to Hebrew nouns, as **הַמְבֹרָה** (Pi. cxvi. 12.) for **תְּנַבְּלוֹן**, where the affix **וֹה** is used for **ן**; the characteristic of the conjugations Hiphil and Hithpaal, which in the Hebrew is **ן**, is in the Chaldaic and Syriac **א**: hence **אֲחַלְתִּי** (II. lxiii. 3.) for **הֲחַלְתִּי**, &c.: and the characteristic of the future in Hebrew destroys the characteristic of the conjugation Hiphil, which is not the case in Chaldaic and in Syriac; thus we read **יִהְיִילְךָ** (II. lii. 5) for **יִהְיִלְךָ**, &c.: the middle radical of the verbs **ן** in Chaldaic and Syriac is often changed into **א**: thus **וְכָאֵם** (Hof. x. 14.) for **וְכָאֵם**, &c.: among the Hebrews the preterite participle, or "Paoul," has **ן** for the penultimate; but among the Chaldeans and Syriacs, it has **א**, and is therefore called "Pehil;" hence **קָרְיָא** (Numb. i. 16.) for **קָרְיָא**; the Chaldaic and Syriac **ן** to the **ן** of the gerund, thus **כַּלְבָּיָא** (Amos, vi. 14.) for **כַּלְבָּיָא**; the Chaldeans and Syriacs insert the letter **ן** in small words borrowed from the Hebrews, e. g. **אָתָּה**, *thou*, they make **אָתָּתָה**; and read **קַנְיָא** (Job. xviii. 2.) for **קַנְיָא**, &c. See Mallet's Gram. Heb. vol. i. cap. xxiii.

CHALDEE, or **CHALDAIC language**, that spoken by the Chaldeans or people of Chaldaea; which was anciently used throughout all Assyria, Babylonia, Mesopotamia, Syria, and Palestine, and is still the language of the churches of the Nestorian and Mironite Christians in those eastern parts, in the same manner as the Latin is the language of the popish churches in the west. The Chaldaic is a dialect of the Hebrew, and so nearly allied to it, that the forms, names, pronunciation, and divisions of the letters are the same; and, therefore, this language is easily acquired by those who are acquainted with the Hebrew. See **HEBREW**.

CHALDEE Paraphrase, in the Rabbinical style is called **Targum**.

There are three Chaldaic paraphrases in Walton's Polyglot; viz. that of Onkelos, that of Jonathan son of Uzziel, and that of Jerusalem. See **PARAPHRASE**.

CHALDESAYGUES, in *Geography*, a town of France, in the department of the Cantal; 4 leagues S. of St. Flour.

CHALDONE, in *Ancient Geography*, a promontory of Arabia Felix, near the place where was the ancient mouth of the Euphrates, according to Pliney.

CHALDRON, **CHALDER**, or **CHAUDRON** of *coals*, a dry English measure, consisting of thirty-six bushels heaped up, according to the sealed bushel kept at Guildhall, London.

The Chaldron should weigh about 28 cwt. or 3136

pounds. On ship-board, twenty-one chaldrons of coals are allowed to the fore. By act of parliament a Newcastle chaldron is to weigh 52½ cwt. or 3 waggons of 17½ cwt. or 6 carts of 8¾ cwt. each, making 52½ cwt. to the chaldron. The statute London chaldron is to consist of 36 bushels heaped up; each bushel to contain a Winchester bushel and one quart, and to be 19½ inches diameter externally. And as it has been found by repeated trials, that 15 London pool chaldrons are equal to 8 Newcastle chaldrons, if we reckon 52½ cwt. to the latter, we shall have 28 cwt. to the former, or 3136 pounds to the London chaldron. Dr. Hutton found this estimate nearly confirmed by experiment. For weighing one peck of coals, he found that it amounted to 21¾ lbs. and 4 × 21¾ gives 87 lbs. for the weight of the bushel; and 36 × 87 gives 3132 for the weight of the chaldron; to which if the weight of the odd quart be added, or 3 lb. nearly, we shall have 3135 lbs. for the weight of the chaldron, or only one pound less than that which is given by statute. But the chaldron, or chaldron, ultimately delivered to the consumer, is still less than the chaldron in the pool, and hence it appears that the word chaldron conveys very different ideas, and that this confusion in the use of the term must open a door to deception and fraud. The monthly supply of coals for the metropolis is estimated at 300 cargoes, of 220 chaldrons each, or 66,000 chaldrons: and it has been alleged as no improbable supposition, that (with some exceptions) 50,000 chaldrons, on an average, remain exposed to deprivations in open craft on the river all the year round. See Macnab's Letter to John Whitmore, Esq. on the Coal-Trade.

CHALEF, in the *Botanical* writings of the ancient Arabs, the name of a tree often occurring, and seldom explained. The best account we have of the *chalef* or *chalis*, is in the writings of Prosper Alpinus on the Egyptian plants, who tells us, that it is a kind of willow, growing in Egypt and in Mesopotamia. It is probably a species of *Salix*.

CHALENCEY, in *Geography*, a town of France, in the department of the Upper Marne, and district of Langres; 13 miles S.S.W. of Langres.

CHALEOS, in *Ancient Geography*, a town of Greece, situated in the gulf of Corinth, in the country of the Locrian Ozoles, according to Ptolemy.

CHALES, **CLAUDIUS FRANCIS MILLIET DE**, in *Bio-graphy*, was born of an ancient and illustrious family at Chambery, in Savoy, in the year 1621, and belonged to the society of Jesuits. In early life he applied to the study of the belles lettres, and acquired a considerable knowledge of the Latin and Greek languages; but his favourite studies, and those in which he eminently excelled, were mathematics, mechanics, and astronomy. He was appointed by Lewis XIV. royal professor of hydrography at Marseilles, and he gained great reputation as a teacher of mathematics at Trinity College in Lyons. It was probably on account of his distinguished reputation that the Superior of his order appointed him teacher of theology in the same college, for which office he was less qualified than for any other. Charles Emanuel II, duke of Savoy, remarked on this appointment, that it was unwisely made, and that the attention of such a person as Chales should never have been diverted from the course of study and employment to which he was attached. Accordingly, he was called off from this situation to Paris, where he was engaged for several years in teaching the mathematics. He died at Turin in 1678, and the following eulog was inscribed on his monument: "Hic jacet Claudius Franciscus Milliet de Chales, genere, sapientia, virtute notus omnibus; ignotus sibi." His works are "Cursus seu Mundus Mathematicus," first printed in 1674, at Lyons, in 3 vols,

vols. fol. and afterwards in 4 vols. in 1680, by Amati Varcin, who augmented and improved this edition by several valuable treatises found among his MSS. To this edition is prefixed an historical account of the progress of mathematical science from the age of Thales the Milesian to the author's own time. De Chales's "Treatise of Navigation," and "Researches on the Center of Gravity," are much esteemed. See the funeral oration of father Hyacinth Ferrerius prefixed to Varcin's edition.

CHALESTRA. See CHALASTRA.

CHALETTE, in *Geography*, a town of France, in the department of the Aube, and district of Arcis; 12 miles S.E. of Arcis.

CHALEURS, a deep and broad bay on the W. side of the gulf of St. Lawrence. From this bay to that of Verte, on the S. in the S.E. corner of the gulf is the N.E. sea-line of the British province of *New Brunswick*; which see.

CHALI, in *Ancient Geography*, a people of Germany, placed by Ptolemy on the eastern coast of the Cimbric Chersonesus.

CHALI, a town of Asia, in Phœnicia, placed, in the book of Joshua, in the tribe of Asher.

CHALIA, a town of Greece, in Dœotia, near Hyria.

CHALIAI, a town of Asia, in the Corduene, situate on the bank of the lake Arfissa, at the extremity of the N. and W. parts.

CHALICE, the cup or vessel used to administer the wine in, in the eucharist; and by the Romanists, in the mass.

CHALIDRIS, CHALIDRIS NIGRA, in *Ornithology*, the name given by Aldrovandus and others to *tringa litorea*; which see.

CHALIGE, *Canal of*, in *Geography*. See CAIRO.

CHALIGNY, a town of France in the department of the Meurte; 5 miles S.W. of Nancy.

CHALIM, a town of Portugal, in the province of Trasillos-Montes; 20 miles S. of Bragança.

CHALIM-POU, a town of Chinese Tartary. N. lat. $41^{\circ} 12'$. E. long. $121^{\circ} 54'$.

CHALIN, a river of Russia, which runs into the Karfskoi sea. N. lat. $73^{\circ} 5'$. E. long. $71^{\circ} 14'$.

CHALINAQUES, a town of France, in the department of the Cantal; 12 miles N. of St. Flour.

CHALINDREY, a town of France, in the department of the Upper Marne, and district of Langres; 5 miles S.E. of Langres.

CHALINOS, in *Antiquity*, the bit, or that part of a bridle which is put into the mouth of a horse. But it was, among the ancient physicians, also used to express that part of the checks, which, on each side, is contiguous to the angles of the mouth.

CHALISCUTELI HILLS, in *Geography*, hills of Hindoostan, which lie between the western desert and the Setlegee.

CHALISIA, in *Ancient Geography*, a maritime town of Africa, in Libya.

CHALIZÁ, in the *Jewish Customs*, the ceremony whereby a woman who is left a widow, pulls off her brother-in-law's shoes, who should espouse her, and by this means is allowed to be at liberty to marry whom she pleases. The word signifies *extrahio vel exuvio*.

CHALK. The colour of this mineral is yellowish white, more rarely snow-white, or greyish white: when contaminated with iron it has more or less of an ochery tinge. It occurs generally in mass, sometimes disseminated, or investing other minerals. It is without lustre, is opaque, has a fine

earthy fracture, and breaks into blunt-edged angular fragments. It stains the fingers, gives a white streak, and, when pure, is very soft, and almost friable. It has a meagre feel, and adheres to the tongue. Sp. gr. 2.3. It effervesces violently with acids. When mixed with iron it is both harder and heavier.

In a state of purity, chalk appears to be composed only of water, lime, and carbonic acid; but Mr. Kirwan obtained from the analysis of a specimen,

53	Lime
42	Carbonic acid
3	Water
2	Alumine
<hr/>	
100	

Chalk, considered geologically, is among the most recent in formation of the several varieties of carbonat of lime. It occurs in thick beds nearly horizontal, alternating with thin layers of flint nodules, and with the same irregularly dispersed through its substance. It contains in abundance the relics of marine organized bodies, such as sponges, glosioptræ, pectinites, &c.; and also, not unfrequently, the hard parts of amphibious and land animals, such as the heads and vertebrae of crocodiles, and teeth of elephants.

Beds of chalk are of frequent occurrence in the east and south parts of England, also in the north east of France. Chalk is also met with in some of the Danish islands in the Baltic, and in Poland.

The uses of chalk are very great. The more compact varieties are employed as building-stone, and are burnt to quicklime: it is also largely used in polishing metals and glass, in constructing moulds to cast metals in; by carpenters and others as a material to work with, and by stonemasons and chemists to dry precipitates on.

CHALK, in *Agriculture*, is a calcareous substance, which, when pure, is of a white colour, moderate consistence, and dull surface; stains the fingers; adheres slightly to the tongue; does not harden when heated, but, on the contrary, in a strong heat burns to lime, and loses about four-tenths of its weight. It effervesces with acids, and dissolves almost entirely in them. It may also be added, that this solution is not disturbed by caustic volatile alkali, as this is a circumstance that distinguishes it from magnesia. It has the property of promoting putrefaction. In its native state it is useful as a manure, upon the same principle as limestone; but it is more easily pulverized, and lighter, or more porous in its nature. Nearly the whole of this material is calcareous earth, whereas none of the marles contain more than a fourth part of that substance. It is in high esteem in the more southern counties of England, where it abounds very much. Its best effects are produced upon deep soils which contain no calcareous earth. It is observed to have but very little effect upon lands where the substratum is chalk; and if the soil be thin, it does mischief in such cases. When used upon light thin soils, it is mostly made into composts with earth and dung, or some other similar material. When these are well mixed together, and duly proportioned, they produce valuable crops; and their influence is said to continue many years, in such instances.

The common method of using this sort of compost is either by laying it upon fallows for wheat, and mixing it intimately with the soil by ploughing and harrowing, or upon grass as a top-dressing: in both cases it has been found to answer well; and in the latter it is found capable of destroying moss, rushes, and all coarse aquatic plants that grow

in heavy, four, or wet lands; while, in the former, it opens and pulverizes the soil, and never fails to produce good crops of that grain, or other kinds.

In making use of it, it has been recommended that it should be broken as small as possible. It should be dug from the pit near the end of autumn, and be laid on the land immediately; as at that season the air is generally moist, the moisture will of course be absorbed by the chalk. This will occasion it to swell, and break down into pieces; and if frost should come on, it will much accelerate the business: but when it is dug in summer, it loses its moisture, and acquires a hardness, which in a great measure prevents it from being of any use. It should in no case be ploughed in till its parts are properly broken down and separated, and then it should be completely harrowed in and mixed well with the soil, or mould of the land.

If the soil be thin and light, a certain proportion of dung will, it is said, be useful; but if it be heavy, the dung is asserted to lessen the operation of the chalk. It is generally thought that lands which have been completely chalked will not bear a repetition of it for some time. A compost of it, however, may be used to great advantage. In the southern counties a field has been, it is observed, chalked, and dressed with chalk and dung mixed, in portions alternately; and the former has been found to produce very bad crops, but the latter very good ones. It is asserted, that laid on beyond a certain quantity, it will not only cease to operate as a manure, but even prove hurtful to the land. It ought, therefore, to be used with caution, and due pains be taken not only to ascertain the strength of the chalk, but the quality of the soil on which it is to be laid, before the application is made.

But there can be no doubt that chalk is a lasting manure, when applied on suitable soils; which are those of a cold, four nature, such as stiff untractable clays. Pliny has remarked that it was the custom of the ancient Britons to chalk their lands, by which they received a great and lasting improvement in the fertility of them.

In regard to the different kinds of chalk which should be distinguished by the farmer, the hard, dry, and firm sort is much the fittest for burning into lime; but that of the fat and unctuous kind by far the best to be used in the crude state.

It has been stated that in some parts of Essex they lay from five to eight waggon loads of chalk on an acre, either upon a clover lay while feeding, or on a summer fallow; and that the effect of a very thin dressing of it is seen immediately to an inch, like that of rotten dung, and lasts twenty years, fifteen in good heart. The soil is a loam; they have also a little clay, and no sand: on gravels the effect is but slight. They bring the chalk from Malden, whither it is brought by sea from Kent, and a waggon load costs mostly ten shillings at the quay. It is rather hard; the sharpest frosts leave many lumps unbroken; these they break with pick-axes. The effervescence with vinegar is pretty considerable, but in water it scarcely falls at all. It is also a general opinion in that county, that land which has been once chalked will not take it again; they acknowledge, however, that when mixed with earth and dung it is then excellent. They observe, that laying a slight dressing of chalk and earth, or dung, on a field never chalked, will take so much effect, that the same field will not answer to chalk completely. They observe also, that the chalk presently gives the land a red colour. And they are of opinion, that chalk is a great enemy to good grass; and affirm, that a field which, before chalking, will run of itself to a fine head of white clover, no longer does it after chalking.

There is no saying any thing against experience: we should not, however, draw general conclusions from partial experiments. Much of the effect of manures depends upon the soil on which they are laid. About Enfield, as observed in a paper in the Annals of Agriculture, the same chalk does wonders, which at North Mimms has very little effect: the one is a rich loam, the other a poor gravel. And near Sandwich, in Kent, chalk has been found in a very high degree to improve a sandy soil, giving it tenacity, and totally exterminating that pernicious weed the corn marigold, which is provincially called *yellow bottle*, *buddle*, or *golds*, and so abundant in sandy soils. They lay on forty loads of forty bushels each to an acre. Upon pasture land they think it does nothing. In Hertfordshire it is thought that chalk makes the land plough much better, and renders all manures much more effectual. If a field be divided into parts, one chalked, a second chalked and manured with dung or foot, ashes, &c. and a third dunged or ashed without chalk; although chalk alone has no effect, yet the other manure on the chalked part will have a much greater effect than on the part where no chalk is laid. Facts of this sort are highly interesting, but want to be more correctly made.

It has been remarked by the author of the Synopsis of Husbandry, who has had much experience in a district where it abounds, that this manure, though it falls infinitely short of marl in its fertilizing quality, is nevertheless possessed of virtues which deservedly entitle it to the esteem of the farmer. By a proper application of this substance, the most tenacious clays are, he says, rendered friable and mellow; and thus their native stubbornness and adhesion being overcome, the several particles of the soil are enabled to imbibe the full benefit of the different changes of the atmosphere; and hence they are brought to work kindly under the several operations of the plough, harrow, &c. and to produce ample crops of grass or corn, which, before the application of this manure, they were incapable of bringing to perfection. So great are the benefits accruing from this manure, when laid on a stiff clayey soil, that the Essex farmers find their account in freighting barges from the chalk cliffs in Kent, and afterwards carrying it with their teams several miles up the country; all which, though attended with a heavy expence, is found to answer the purpose extremely well, as it would, he think, be impossible to reduce these stubborn clays to a proper tilth without the previous application of this manure. Nor is it on clays only where chalk may be laid to advantage: gravels, especially those which lie near the springs, and all wet soils, may, he supposes, be dressed with this manure, which will never fail to meliorate and sweeten the ground, and enable it to retain longer the virtues of the dung that may be applied, which, on these hungry soils, is liable to disappear in a short time: nay, so partial are some farmers to the use of this manure, that he has known it carried on soils where the chalk lay within a few inches of the surface.

It has been stated, that the action of chalk on the soil is either chemical or mechanical. It acts chemically as an absorbent, contributing to preserve dry those lands which are poachy and wet; and by its attraction for acids it may hasten the putrefaction of vegetables. It acts mechanically, by entering into the composition, and totally altering the nature of clay, converting it by proper pulverization into a species of marl. By insinuating itself between the particles of clay, it destroys their adhesion; thus preventing it from becoming too hard in summer, and too wet in the winter season.

It is observed by Mr. Bannister that there are two methods of obtaining chalk. The first is by uncalowling a piece of ground,

ground, and making it convenient for a pit, where the carts may be drawn into it, and filled: this is on a presumption that the chalk lies near the surface, and that the pit is within a small distance of the field on which the manure is to be laid. The other method is to sink pits in the field where the chalk is intended to be laid as a manure, and which, in his opinion, is far preferable to that of drawing it in carts as before mentioned. In this case, a number of pits are to be sunk according to the extent of the field. These pits are to be made in the form and circumference of a well, with an apparatus at the top, and a bucket to draw up the chalk. The people who undertake this business, having been brought up to it from their infancy, perform it, he says, with great facility, and without any timidity, though attended with much danger. A person is employed at the top to draw up the contents of the pit, shoot the chalk into the cart, and wheel the same on the land. When the labourer has arrived at the chalk, which takes up a longer or less interval of time according to the depth at which it lies, and has dug some little time therein in the perpendicular form wherein he began the pit, he proceeds to form apertures in different horizontal directions; so that where the chalk is good, and the pit stands firm, large tracts of ground are undermined for this purpose. The price for digging chalk is, he says, 1s. per foot till the chalk be found, after which for the chalk 1s. per load, which is twelve baskets; and a penny per load for wheeling the chalk on the land, the farmer providing a horse and cart for that purpose. The quantity usually laid on an acre is from eighty to a hundred loads.

From this description of chalk-drawing, he says, "it is evident that much care and inspection are required to prevent any deceit being imposed on the farmer by the workmen, to which their eagerness of acquiring large wages will be a powerful inducement."

He adds, that "the best chalk is that which is white and hard; and the deeper it lies beneath the surface, the more efficacious is the dressing supposed to be, as partaking less of the nature of the soil whereon it is to be applied as a manure; indeed on a clayey soil it is seldom to be met with, but at a considerable distance beneath the surface of the field. The most eligible season, he says, for the performance of this work is in the early part of the winter, as the chalk which is laid out at that season will, by aid of the succeeding frosts, be, in a great measure, meliorated and reduced to crumbs at the time of following in April; whereas, should the business be deferred till the spring, no inconsiderable portion of the chalk will remain in lumps till the next winter. From this neglect, a twelvemonth will be lost in point of time, as this manure will lie on the ground without answering any good purpose till the lumps shall have been slackened by moisture and frosts; and that chalk is always most highly esteemed which yields soonest to the effect of the weather in falling into crumbs. This manure may be laid on the ground in the summer, without any other inconvenience than what has been before mentioned; contrary to the opinion of some people, who think that such chalk, having remained on the surface during the summer months without rurning, will, on that account, be less susceptible of the frosts in the succeeding winter: but this idea is erroneous; and as it may often suit the economy of the farmer to lay this chalk out in the summer, either from a neighbouring draw-pit, having at that time little other employment for two men and horses, or if he may be inclined to sink a pit in the field at that time; in either of these contingencies, the business may, he thinks, be safely ventured upon in that season; and it would be far better to suffer the ground, which is thus summer chalked, to lie unploughed till the succeeding spring, than

to crop it with wheat at the autumn after the manure is applied; for, having enjoyed the benefit of the frosts in the following winter, the ground will come in properly for a wheat season in the next year: and this may be generally effected, he says, where a person is inclined to lay on his chalk in the summer. For instance, suppose a lay ground be intended for a fallow the next year, this may be chalked in the summer time, with very little inconvenience or injury to the farmer, as the frosts which would have been produced from it between midsummer and the following spring could have turned to little account."

It is concluded by the same writer, "that when land is dressed with chalk, the surface ought to be pretty thickly covered over, otherwise it will fail to answer the end of pulverization, in which consists the chief virtue of this manure: and though the expense of chalking may appear considerable to those who are unacquainted with its effects, the good consequences accruing to the future crops will be found in the end amply to compensate the primary charges, and from whatever cause this improvement arises, whether an immediate fertility be conveyed to the soil by the chalk, or whether this dressing acts on the soil by destroying its adhesion, and thus disposes it to work more kindly, and to part with its vegetative particles, which were before too closely united as not to be drawn forth by any other means: in whichever of these ways the chalk acts upon the land it matters, he thinks, very little to the farmer, so that the intention be accomplished, namely, the acquisition of a more abundant crop. For his own part, he is inclined to think that the chief virtue of the chalk resides in its power of correcting the adhesion of stiff soils, and in its meliorating quality, and that it is much inferior to dung, in point of accelerating the growth of the crop; so that where a field has been well dressed with this manure, which is said to be of so lasting a nature as to shew its good effects at the distance of twenty years, it is by no means to be understood, that this field is not to be dunged, or to have any further addition of manure during this interval: on the contrary, such ground ought never to lose its turn of the dung-cart; and, indeed, on farms of a clayey soil, those fields only can be dunged to advantage which have been previously chalked; for experience hath demonstrated, that, without the application of this manure, dung will be of but small avail on these stiff soils."

It is remarked further by the same practical writer, "that on gravelly soils, where the springs lie within a small distance of the surface, it often happens that the water flows in before the chalk is found, and thus all further endeavours at that spot are rendered abortive, and another pit must be sunk in a different part of the field. Obstacles to this work sometimes, he says, fall out from the light texture of the soil, which does not unfrequently give way to the destruction of the chalk-drawer. To the farmer, it may be of some consequence to consider the nature of his land, ere he embarks in this scheme of husbandry; as, if from circumstances above-mentioned, he may have reason to think that his pit will not stand firm, it would be a matter of prudence to desist from any further thoughts of sinking a perpendicular pit, and change the mode of operation, by bringing his chalk from an uncalled-for pit: but where it can be obtained at a moderate expense, and with a tolerable certainty of success, the preceding method is, he thinks, certainly the most eligible." See CALCAREOUS Earth, and MANURE.

In the chalking of land, the method pursued in Herefordshire, where the persons employed in it follow it as a trade, is the following, according to Mr. Walker: "a spot is fixed upon, nearly central to about 5x acres of land,

to be chalked. Here a pit, about four feet in diameter, is sunk to the chalk, if found within twenty feet from the surface; if not, the chalkers consider that they are on an earth pillar, fill up the pit, and sink in fresh places, till their labour is attended with better success. The pit from the surface to the chalk is kept from falling in by a sort of basket-work, made with hazel or willow rods and brushwood, cut green and manufactured with the small boughs and leaves remaining thereon, to make the basket-work the closer. The earth and chalk are raised from the pit by a *jack-rawl* on a frame, generally of very simple and rude construction. To one end of the rowl is fixed a cart wheel, which answers the double purpose of a fly and a stop. An inch rope of sufficient length is wound round the rowl, to one end of which is fixed a weight, which nearly counterbalances the empty basket fastened to the other end. This apology for an *axis in peritrochio*, two wheelbarrows, a spade, a shovel, and a pick-axe are all the necessary implements in the trade of a company of chalkers, generally three in number. The pit-man digs the chalk and fills the basket, and his companions alternately wind it up and wheel its contents upon the land; when the basket is wound up to the top of the pit, to stop its descent till emptied, the point of a wooden peg, of sufficient length and strength, is thrust by the perpendicular spoke in the wheel into a hole made in the adjoining upright standard of the frame to receive it. The pit is sunk from 20 to 30 feet deep, and then chambered at the bottom; that is, the pit-man digs or ruts out the chalk horizontally, in three separate directions; the horizontal apertures being of sufficient height and width to admit of the pit-man's working in them with ease and safety. One pit will chalk six acres, laying 60 loads on an acre. If more be laid on, and to the full extent of chalking, viz. 100 loads, then a proportionable less extent of land than six acres is chalked from one pit. Eighteen barrow-fuls make a load, and the usual price for chalking is 7d. per load, all expenses included; therefore the expence of chalking at 60 loads per acre is 11. 12s. 6d.; and at 100 ditto, 21. 18s. 6d. As the chalk is considered to be better the deeper it lies, and the top chalk, particularly if it be within three or four feet from the surface, very indifferent, and only fit for lime, or to be laid on roads, gateways, &c. the chalkers must be directed to lay by the chalk for the first three or four feet in depth, to be applied to the above purposes; or, if not wanted, to be again thrown into the pit when filled up; and also to pick out the flints from the chalk before it is carried on the land, for, if they are not narrowly watched, they will chalk with both."

It is added, that "Mr. John Hill of Coddicott farms upwards of 1200 acres in the adjoining parishes of Coddicott and Kimpton, a considerable part of which is his own estate. He has chalked many acres of land, and approves much of the practice. He chalked a field of strong clay land in the autumn of 1793, laid on sixty loads to an acre, and the chalk where the pits were sunk lay about ten feet from the surface. Mr. Walker viewed the field the 7th of August 1794; it had borne a crop of peas since it was chalked, and was then under the plough, preparatory for a crop of wheat. The chalk was good, and the land appeared to work well, though the chalk was not then thoroughly incorporated with the soil. Mr. Hill never lays more than 60 loads of chalk on an acre; this he finds will not only make the land work much better, with less strength of cattle, but also, with a light coat of dung, or spring dressings occasionally laid on to quicken the vegetation, produce abundant crops for ten years; he then chalks again with equal success."

This sort of work should proceed with dispatch during the summer months in all cases, and in the autumnal ones in many situations where there is no danger of poaching the

ground. Mr. Young suggests, that much advantage may be derived, in performing this sort of business, from the use of small three-wheeled carts, as the third wheel affords a support for the cart and load while filling, without the fill horse, and of course one horse may be sufficient for two carts, one being discharged upon the land while the other is loading. CHALK-stone, in Medicine, a white chalky substance which is secreted in the inflamed joints and ligaments in inveterate gout. It is one of the peculiarities of gouty inflammation to terminate by the production of this substance (where it does not end in resolution), and not in suppuration, or the production of pus, like the common species of inflammation.

The chalk-stone (as its name imports) was formerly considered as composed of some calcareous matter, and in particular of phosphat of lime; but accurate chemical analysis has now proved that it does not contain lime in any form, but is a neutral insoluble salt, consisting of the *lithic* or *uric* acid saturated with soda. Dr. Wollaston has proved this point by the following experiments. If a small quantity of dilute sulphuric acid be added to gouty chalk-stone, part of the alkali is separated from its combination, and crystals of sulphat of soda are produced. Muriatic acid in a similar way produces common salt. A greater quantity of either acid totally separates the alkali, and leaves an insoluble matter, which is found to be lithic acid by the following characters; viz. when distilled *per se* it yields a little ammonia, some prussic acid, and an acid sublimate similar to the sublimed lithic acid; when dissolved in dilute nitric acid, it tinges the skin of a rose colour, and leaves, on evaporation, a rose-coloured residuum; when thrown into caustic pot-ash it dissolves therein, but is separable thence by an acid. The chalk-stone, when calcined, gives the usual products of animal matter, and leaves a white salt, which is carbonate of soda. Caustic pot-ash dissolves the chalk-stone entirely. Boiling water dissolves a small portion of the stone, and the solution is lithiat of soda. When a little muriatic acid is added to this solution, as it cools it deposits lithic acid in minute red crystals.

The analysis of this concretion by Fourcroy, agrees very closely with that of Dr. Wollaston. M. F. remarks, that a hundred parts of water dissolve nine-tenths of the chalk-stone by boiling, forming a saponaceous liquor, of a faint animal smell, from which sulphuric acid precipitates brilliant needed crystals of lithic or uric acid.

To the solubility of these arthritic concretions in the alkalies, chemists have attributed the great relief often experienced by gouty persons from a course of alkaline remedies long continued; and it certainly remains an interesting question to determine whether this disease is attended with any defect or excess in the natural quantity of uric acid in the urinary secretions. (For a fuller account of the properties of the lithic or URIC acid, see this article.) See Phil. Transf. for 1797, pt. 2. Fourcroy *Système des Connoss. Chim.* &c.

CHALKI, in Geography, an island of the Grecian Archipelago, visited by Spallanzani, where he made known to the

Turns a mine of copper, the existence of which they had never suspected.

CHALKING, in the *Arts*. See **DRAWING**.

CHALKING, in our *Old Laws*, seems to be some duty laid on merchandize; what it was particularly we do not find: but in the rolls of parliament it is said the merchants of the staple require to be eased of divers new impositions, as *chalking*, ironage, wharfage, &c.

CHALKY LAND, in *Agriculture*, denotes such sorts of land as are much impregnated with the chalky material, and which from their white appearance are sometimes denominated white lands.

It has been remarked, by the author of the *Synopsis of Husbandry*, that "chalky lands or soils differ from each other very essentially in point of fertility: for as there are some of them which, by good husbandry, may be brought to produce large crops, and do with great reason take the lead in point of fertility of every other light soil; to there are others which, from the superficial depth of mould over the chalk, are of the most barren species, and scarcely worth the expence of tillage. A chalky soil (says he) with a due covering of mould, so as to admit the plough to enter a reasonable depth, is perhaps the most kindly one to work upon, except a loam, and capable of the greatest improvement from the several operations of husbandry; having neither the tenaciousness of the clay, the burning quality of the gravel, nor the extreme porous texture of the sand: as it possesses a much greater share of humidity than the two latter soils, free from the inconvenience of springs, so will it be less injured by a dry summer, whilst a moist and dripping season will be most favourable to the crops growing on it, when those on a clayey soil are in that case too frequently destroyed or rendered of little worth." And Lord Dunsford, in his *Treatise on the connection of Agriculture with Chemistry*, remarks, that a pure unmixed chalky soil, like a pure or lean clayey one, is infertile; and that the fertility of this sort of land, like all others, depends on its containing a due admixture of other earths, with the requisite quantity of vegetable or animal matter. A chalky loam, or mixture of chalk with clay, is frequently a very fertile soil, and well adapted to the culture of beans and wheat.

Such, says the writer we have first quoted, "are the advantages attending these soils, where the chalk is not mixed in an undue proportion with the mould: but it rarely happens that a farmer is possessed of any great quantity of land of this description: for, in countries where chalky land abounds, there is on every farm a larger proportion of poor land than of that which he has described; and the management of these thin chalks will demand the highest exertion of industry and skill in the husbandman; for although the crops raised on these soils are less subject to be injured by the scorching heat of the sun than those on gravels, yet where there is but a small proportion of mould, so that the chalk forms the greatest part of the cultivated soil, with a bed of the same hard substance for its under stratum, intermixed with large flints and chalk stones scarce less solid; on such grounds, the crops (he says) suffer greatly in a dry summer, and for this reason, an early Lent season is always to be preferred on these soils, in order that the surface of the ground may be covered before the dry weather lets in." And he adds that "these chalky soils possess another very material advantage over gravels, namely, the power of resisting longer the heat of the summer; and therefore the crops on this soil often recover after a kindly rain, when those on the gravels, unable to withstand the preceding drought, are burnt up; indeed, on a chalky soil, the crops, when injured by the parching heat of the weather, cannot so properly be said to burn, as to die away. To the evil propensities incident to chalks of every

kind, may (he says) he subjoined their disposition to blast, a misfortune not easily to be guarded against; and in this respect they differ materially from gravels, where the corn generally yields well, if not injured by the dry weather during its growth. To this may be added (he says) another defect attached to chalky soils, which is their hilly situation, since in a tract of land of 200 acres, it is odds but many of the fields are mountainous and uneven." The ingenious nobleman just mentioned further remarks, that chalky lands produce a short sweet herbage, and for the most part are more proper for a sheep pasture than for tillage. There are no soils that receive more benefit from artificial watering, as they are apt at certain seasons to be parched by drought. Chalky soils that produce short sweet herbage, should not (he thinks) in general be broken up, or converted into arable lands; a practice which will be attended with injury to the soil, and loss to the farmer, unless they are cropped with moderation, well-manured, and afterwards properly laid down with pasture-grass.

And Mr. Bannister further well observes that "there is one species of grass which may be raised to great advantage on a chalk, and this is faintoin, cinquefoil, or holy grass. The small expence required in the culture of this grass, its natural relation to a chalky soil, the constant demand for the hay at market, and the small charges required in making it, (says he) all combine to enforce its cultivation on the most barren chalks: which, by any other course of husbandry, could not have been brought to pay the expence of tillage: by these means the farmer will (he thinks) have it in his power to bestow a greater attention on the more fertile part of his land, will require a less number of horses and servants, and will generally insure to himself plentiful crops of grain from that part of the farm which is kept in constant tillage; whilst the most barren spots will produce a yearly increase to the faintoin at a trifling expence in the culture."

Chalks are (he thinks) of all other lands least subject to be molested with couch-grass; and hence a person who hath not been accustomed to this kind of land is often deceived on a cursory view of the surface, which being totally free from couch-grass, and not greatly infested with weeds of any denomination, he is led to conceive that the ground is in good heart, and disposed for the reception of any kind of grain; whereas the contrary is often the fact; for a soil of this description, especially the more barren species, which, with a very slight proportion of earth, is made up of a crumbly kind of chalk, and when wet wears the appearance of mortar, will not naturally produce couch: and perhaps on this sort of ground it would be no easy task to make this grass thrive in it though the experiment were attempted; and even on the best and most kindly chalks, couch-grass is an enemy not to be dreaded. The weeds which seem indigenous to this sort of land are poppy, bare-foot, crow-foot, charlock, callock, or kirk, cammock, and thistles. Where the last-mentioned weed prevails it is a manifest indication that the ground is not of itself unkindly to the growth of corn; and that when the crops turn defective, this proceeds less from any defect in the land, than an improvident management in the cultivation of it."

In what regards the tillage on this sort of land, "though chalk may, he says, be numbered among the lighter kinds of soil, a much greater strength of horses, he says, is required in the tilling of them, than either on gravels or sands: not only on account of their hilly situation, the superior depth of mould, and of the large flints which are generally to be met with beneath the surface, but from the impenetrable quality of the under stratum, which deadens the draft of the plough, and causes it to work much heavier; to which may be added, the resistance from the roots of the cammock, which

which is so powerful as frequently to obstruct the course of the plough. For these reasons, a six-horse team, on a chalky soil, is of great utility, nor, indeed, can the business be advantageously prosecuted with four horses to a plough. Another reason why a more powerful strength of cattle is requisite on this than on any other light soil, is its disposition to hang to the gears; so that in wet weather the plough is increased to nearly double its own weight, by the additional load of mould adhering to it. These are circumstances which do not immediately strike the attention of a farmer, whose knowledge in husbandry has been acquired by working on a kindly loam. On the first view of a chalky soil, he concludes that little strength of cattle is required; for, having been accustomed to land where the staple is much deeper, he rationally infers, that more work may be done, in a given distance of time, with a less number of horses on a chalk than on a loam; of this truth, he is, in his own mind, so thoroughly convinced, that nothing less than ocular demonstration can drive him from his opinion."

Having enforced the necessity of maintaining a sufficient strength of cattle for the tillage of this sort of land, he advises the ploughing it to a good depth, where the staple of the land will admit of the practice; "for, on the very light chalky grounds which abound in many places, and of which some parts of every chalky farm consist, this caution is unnecessary;" such land being ploughed with little strength, the plough must necessarily be set to go shallow. But on his other grounds, where there is a thick covering of mould, the farmer, he thinks, will always find his account in ploughing it to its utmost depth, so that the ploughman may feel the point of the share grate on the chalk beneath, without bringing up any part of it to mix with the mould. On this soil the blacksmith is, he observes, a perpetual retailer to the farm. The vicinity of the chalk, together with the number of large flints usually met with on this kind of ground, operating very forcibly in his favour, the eye of the farmer is, therefore, on no occasion more necessary, he thinks, than in a strict and daily examination of the plough-irons, since he may be materially injured either by a too frequent application to the smith, or too great a neglect of him. The point of the share for ploughing chalks to advantage, especially when infested with thistles or cammocks, ought to be hammered to the breadth of four inches, which will tear the roots up to a considerable depth. As these grounds are seldom injured by wet, there is scarcely any part of the year but the plough may be kept at work, save only when the land is locked up by frost, or the surface covered with snow. The breaking up of clover lays in the summer, in order to sow with wheat in the autumn, is often attended with great inconveniences on chalky soils, as the drought of the season frequently causes the ground to be extremely hard, so as to render the operation of the plough a matter of great difficulty, and, in some instances, the soil is totally impervious at this season, and mud remain to be softened by the autumnal rains. But, in this case, the farmer has generally other work to attend, and, therefore, need not suffer his men and horses to lie unemployed. But although, for these reasons, there is generally more perseverance required in breaking up a clover lay at Midsummer to sow at Michaelmas with wheat, than usually falls to the share of a common ploughman; yet the master ought not to be discouraged, since he will most assuredly reap the good effects of corn sown on a stale furrow, where the land is chalky, and, indeed, on any other land of a light texture."

Where folding is practised, it is added, that "a very judicious method at the breaking up of a clover lay, is to plough one day's work, which will employ a fold of 300

sheep eight nights; and when that is finished, to plough another day's work, and fold on the same, which course is to be pursued till towards autumn: by this mode the farmer reserves great part of the feed on the lay, which, though not very considerable, is, nevertheless, of some consequence, where a large flock is maintained; and, in truth, without a flock of sheep, little profit can be expected to accrue from the cultivation of these soils: besides which, he avoids the ill effects of ploughing up the whole field at autumn, and sowing it immediately with wheat; as he supposes, in this case, the greatest part of the field will have been folded on before seed-time, and the remainder may be finished after the corn is sown, or trodden with sheep, both of them instances of excellent husbandry. But though there be no folding flock kept on the farm, this method of ploughing up the clover-lays at Midsummer ought to be pursued for the reason above mentioned: and at this time the farmer is generally at leisure to prosecute this work, having completed his saintfoin harvest and turnip season, and not meeting with any hindrance from the sowing of summer fallows, a piece of husbandry which is rarely practised on these sorts of land."

And "the like method of ploughing should, (he says,) be pursued, in order to obtain a crop of turnips, on a chalky soil, as is recommended on a gravel; and though the land be of a very light texture, and not much infested with weeds, the several operations of the plough, harrow, and roll, ought by no means to be dispensed with, for the reason which is offered in treating of the tillage required on a gravelly soil. On a chalky soil, properly managed for turnips, and where a good crop of this root has been fed off, there need be no fear of a plentiful return of barley or oats, provided such corn be sown at an early period, which is particularly to be attended to at the spring season, as the crop of Lent corn on these soils will generally fail, if the seed-time be protracted so late as is usual on loams." And "on this kind of land, as on gravels, (says he) the farmer possesses the advantage of varying his manure as often as he chooses; having, besides yard dung, which may be tilyed a general dressing for every soil, the whole tribe of manures, except chalk, to select from. For wheat, there is no application so efficacious as the fold, which, when properly conducted, rarely fails of increasing the crop. For turnip ground, dung, mould, rabbit dung, woollen rags, &c. may be laid on to advantage; and to further the growth of clover, saintfoin, and meadow grass, coal ashes, foot, and malt dust, are very proper applications: of these the two last, if sown over the green wheat in the spring, or harrowed in with the barley at the time of sowing that grain, are excellent substitutes for the more lasting kind of manures, where these cannot be procured in a sufficient abundance."

It has been remarked by lord Dundonald, that clay is the fittest substance to be applied with a view to alter the arrangement of the parts of a chalky soil. Peat is a good application to lands of this nature, which are frequently termed hungry soils, and very deficient in vegetable matter. And as a sufficiency of dung is not to be procured to manure fully every part of a farm, peat may be applied in one or other of the states of preparation mentioned under that head. See PEAT. Unfortunately for the improvement of chalky soils, says he, neither clay nor peat is to be found but at the extremities or outskirts of the extensive tracts of chalky countries; but wherever they are to be had, the application of them should not be neglected. Calcareous or chalky lands, which have long been under the plough, contain a large proportion of phosphate or oxalate of lime. These insoluble saline matters may, he says, be rendered serviceable to vegetation by alkalies, vitriolic acid, vitriolic neutral salts,

fats, (especially if superacidulated), and by pyritous and aluminous substances. Even green vitriol, which has hitherto been considered as unfriendly to vegetation, will, when applied in a proper manner to lands like this, considerably improve and promote the growth of pasture-grass. More experiments are, however, wanting fully to ascertain the utility of these chemical substances on grounds of this as well as other kinds. The principal disadvantage, says he, attending chalky lands, is, that of their being too dry and parched at certain seasons; but possibly this defect, when they are under pasture, may be counter-balanced by the more early grass they produce in the spring, as well as the luxuriant herbage that succeeds the autumnal rains.

It has been remarked, that the best produce of the grain kind, in chalky lands, is barley and wheat; but oats will likewise do well on them. Their natural produce in weeds is *poppies*, *May-weed*, &c. For grass-feed, *saint-foin*, *trefoil*, and, if rich, *clover*. The best manure for these lands is rags, dung, folding of sheep, &c. as has been seen above. In these lands, if rain happen to fall on them just after sowing, before the corn gets up, it will frequently cause the earth to bind so hard, that it cannot get through it; but may be much helped by a light harrowing, or other means of a similar nature. In breaking uplands of this nature from grass, too great a depth of furrow should, in moist cases, be avoided.

Under the class of chalky lands, a very large proportion of the grounds of this country may, it is observed, be comprehended.

The Hertfordshire farmers manage these lands for grain in the same manner as they do their clay-lands; but in Oxfordshire they commonly manure them with half-rotten dung, which, they say, prevents the binding of it; and some mix it with fand which causes it to work short, especially if in any degree dry. They commonly sow them with wheat, *linsey*, and *barley*; and, after wheat, *pease*, or *vetches*: in doing of which they are obliged particularly to take care to have fine weather, because of the lands binding so greatly. See *SOIL*.

CHALKY Soil, that sort of land which is principally constituted of chalky materials. Soils of this nature abound very much in different parts of the kingdom. See *SOIL*.

CHALLANS, in *Geography*, a town of France, in the department of the Vendee, and chief place of a canton, in the district of Les Sables-d'Olonne; 7 leagues N. of it. The place contains 3000, and the canton 16,262 inhabitants; the territory includes 292½ kilometres and 9 communes.

CHALLANT, a town of Piedmont, in the duchy of Aosta; 11 miles E.S.E. of Aosta.

CHALLENGE, a cartel, or invitation to a duel, or other combat. The word challenge was anciently translated *calumnia*. It may very properly be called a provocation or summons to fight, when an affront in derogation of honour has been offered.

Challenges to fight either by word or letter, or bearing such challenges, are punishable by fine and imprisonment, according to the circumstances of the offence; and barely endeavouring to provoke another to send a challenge, or to fight, as by dispersing letters full of reflections, and insinuating a desire to fight, &c. is a high offence. (1 Hawk. P. C. 135, 138.): and if challenges arise from gaming, the offender shall forfeit all his goods to the crown, and be imprisoned two years. 9 Ann. cap. 14.

It is now the customary and frequent practice of the court of King's Bench to grant informations against persons sending

challenges to justices of the peace, and in other heinous cases.

CHALLENGE, in *Law*, is an exception taken either against persons or things: in the former instance, against jurors, any one or more of them: and in the latter, as in the case of felony, by the prisoner against things, as a declaration, &c. *Terms de la ley*, 109. The former is the most frequent signification of the term.

Challenge to the jurors, is either made to the array, or to the poll to the array, as when the whole number is excepted against, as partially impanelled, or arrayed in the *panel*, or little square *pane* of parchment, on which the jurors' names are written. If the sheriff be of affinity to either of the parties; or if any one or more of the jurors are returned at the nomination, or under the direction of either party, or for any other partiality, the array shall be quashed. To the polls, or *in capita*, as when particulars are excepted against, as not indifferent. These may be challenged, 1. *Propter honoris respectum*, as when a lord of parliament is impanelled. 2. *Propter defectum*, as in the case of an alien born, which is defect of birth; or of a slave or bondman, which is defect of liberty; or in case of insufficient estate. This latter exception has undergone several alterations by different statutes: but by 4 and 5 W. and M. cap. 24. the qualification is 10*l. per annum*, in England, and 6*l.* in Wales, either of freehold or copyhold lands: and by 3 Geo. II. cap. 25. the holder of a lease on life or lives, or for the term of five hundred years absolute, of the clear yearly value of 20*l. per annum*, over and above the rent reserved, is qualified to serve on juries. 3. *Propter affectum*, or on suspicion of partiality: and this kind of challenge is *principal* or *to the favour*, in the former case the cause of suspicion is obvious, as, that a juror is of kin to either party within the ninth degree (Finch, L. 401.); that he has been arbitrator on either side; that he has an interest in the cause; that an action is depending between him and the party; that he has taken money for his verdict; that he has formerly been a juror in the same court; that he is the party's master, servant, counteller, steward, or attorney, or of the same society or corporation with him:—and in the latter case, when only some probable circumstances of suspicion are pleaded, which are to be determined by triers. 4. *Propter delictum*, or on account of some crime, which disqualifies the juror, by affecting his credit, as conviction of treason, felony, perjury, or conspiracy; judgment of the pillory; branding or whipping, outlawry or excommunication; attainment of false verdict, or forgery, &c.

Challenge to the jurors, is also divided into *challenge principal*, and *challenge pur cause*: i. e. upon cause or reason alleged.

Challenge principal, otherwise called *challenge peremptory*, is what the law allows without cause alleged; or farther examination: thus, a prisoner at the bar, arraigned on felony, may peremptorily challenge twenty, one after another, alleging no cause but his own dislike; and they will be set aside, and new ones chosen in their room. 22 Hen. VIII. cap. 14. and 1 and 2 Ph. and Mar. cap. 10. This privilege of peremptory challenges, distinguishing the tenderness and humanity of the English laws, thought granted to the prisoner, is denied to the king by stat. 33 Edw. I. st. 4. which enacts, that the king shall challenge no jurors without assigning a cause certain, to be tried and approved by the court. However it is held that the king need not assign his cause of challenge, till all the panel is gone through, and unless there cannot be a full jury, without the persons so challenged. And then, and not sooner, the king's counsel must shew the cause: otherwise the juror shall be sworn. 2 Hawk.

2 Hawk. P. C. 413. 2 Hal. P. C. 271. In case of high-treason, no challenge *peremptory* was formerly allowed; but by stat. 7. W. III. liberty is given *peremptorily* to challenge thirty-five.

Yet there seems to be a difference between challenge *principal* and challenge *peremptory*; the latter being only in matters criminal, and without any cause alleged; the former mostly in civil cases, and with assigning some such cause, as being found true, the law allows: v. g. if either party allege, that one of the jurors is the son, brother, cousin, or tenant, of the other, the exception is good. Also in the plea of the death of a man, or in any action real or personal, where the debt or damages amount to forty shillings, it is a good challenge to a juror, that he cannot dispend forty shillings *per annum* of freehold.

Challenge is also a term given or applied to an objection made to a member of a court martial on the score of either real or presumed partiality. The prisoner, however, must in this case assign his reason for or cause of challenge, of the relevancy, propriety, and validity of which the members are themselves the judges. Peremptory challenges, then, though practised and admitted in civil cases, are not acknowledged by military law, or allowed at courts martial. The privilege of challenging is enjoyed equally by the prisoner and the prosecutor.

Challenge *upon reason or cause*, is when the party does allege some such exception as is sufficient upon acknowledgment of the truth of it; v. g. if the son of the juror have married the daughter of the other party, or the like.

Challenges to the polls, or exceptions to particular jurors, seem to answer the "*recusatio judicis*," in the civil and canon laws; by the constitution of which a judge might be refused upon any suspicion of partiality. By the laws of England, also, in the times of Bracton and Fleta, a judge might be refused for good cause; but now the law is otherwise, and it is held that judges and justices cannot be challenged. (Co. Litt. 294.) For the law will not suppose a possibility of bias or favour in a judge, who is already sworn to administer impartial justice, and whose authority greatly depends upon that presumption and idea. And should the fact at any time prove flagrantly such as the delicacy of the law will not presume before-hand, there is no doubt but that such misbehaviour would draw down a heavy censure from those to whom the judge is accountable for his conduct. Blackl. Com. vol. iii. p. 361.

CHALLENGE, in *Hunting*. When hounds, at first finding the scent of their game, presently open and cry, the huntsmen say, "they challenge."

CHALLIN, in *Geography*, a town of France, in the department of the Mayne and Loire; 5 leagues W. of Angers.

CHALLONOIS, the name of a small country of France before the revolution, in the environs of Châlons-sur-Saône.

CHALO, a river of Asia, which rises near Lassa or Baratola, in Tartary, passes through the province of Yunnan in China, the country of Laos and Tonquin, and discharges itself into the gulf of Cochín-China, in the Eastern sea, opposite the island of Hainan.

CHALONER, Sir THOMAS, in *Biography*, a learned writer and foreign minister in the reign of queen Elizabeth, was born in Lond. about the year 1515, and educated at Cambridge, where he distinguished himself by his talent for Latin poetry. Having been sent by Henry VIII. in the train of the ambassador to Charles V. emperor of Germany, he accompanied that prince in his unfortunate expedition against Algiers, where he was shipwrecked and narrowly escaped drowning, by keeping hold of a cable with his teeth,

many of which he lost on the occasion. On his return, he became a favourite of the regent, duke of Somerset; and in consequence of his distinguished valour at the battle of Musselburgh, he received the honour of knighthood. When his patron was disgraced, and during the reign of queen Mary, he lived in retirement; but on the accession of Elizabeth, he was appointed, by the interest of Cecil, ambassador to Ferdinand, emperor of Germany; and having acquired great reputation in this office, he was sent in 1561 in a similar capacity to Philip, king of Spain. In this mission he encountered several difficulties, which, notwithstanding the relief derived from literary occupations, occasioned a fit of sickness that obliged him to request his recall; and this he is said to have obtained by addressing the susceptible heart of Elizabeth with an elegy written in the style of Ovid. Upon his return towards the close of the year 1564, he published the first part of his principal work "On the right ordering of the English commonwealth." But his constitution was so much impaired, that he died in October, 1565, at his house in Clerkewell Close; and as he was equally great in arms, science, and arts, he was much lamented, and his funeral was honoured by an interesting and affectionate attendance to St. Paul's cathedral; Sir William Cecil officiating as chief mourner. He was no less distinguished for his talents and integrity as a statesman, than for his literary endowments. Of his writings the principal are, that already mentioned, which, in its complete form, was printed at London in 1579, 4to. under the title of "De Republica Anglorum insularanda, lib. x.;" and a collection of his poetical pieces entitled "De Illustrium quorundam Encomis Miscellanea cum Epigrammatis ac Epitaphiis nonnullis." Biog. Brit.

CHALONER, Sir THOMAS, a philosopher and technical chemist, was the son of the preceding by his wife Ethelreda, born in 1559, and educated under the care of lord treasurer Burleigh, first at St. Paul's school, and afterwards at Magdalen college, in the university of Oxford. At college, though he took no degree, he established his character for abilities and learning. About the year 1580 he visited several parts of Europe, and particularly Italy, where he prolonged his stay, and prosecuted many curious inquiries in natural philosophy and chemistry, together with a variety of experiments. On his return home some time before the year 1584, he was much noticed at court for his polite behaviour and accomplishments; and about this time married the daughter of sir William Fleetwood, recorder of London, by whom he had several children. In 1591 he was knighted; and some years afterwards discovered the first alum mines which were ever known to be in this kingdom, on his estate near Gisborough in Yorkshire. As during his foreign travels he had paid particular attention to the alum works at Puteoli or Puzzoli, he found means to introduce that profitable manufacture into England, much to the advantage of his country. The discovery of a mine in England was made about the year 1600, and for rendering it practically useful, workmen were brought from foreign parts; and at this period it was adjudged to be a mine-royal, and was taken possession of by the crown. It was then granted to sir Paul Pindar, at a rent of no less than 14,740 pounds sterling; nevertheless the undertaking proved extremely lucrative. By the long parliament it was voted to be a monopoly, and the alum works were restored to their original proprietors. In the latter end of queen Elizabeth's reign, sir Thomas Chaloner visited Scotland, and was favourably received by king James; so that in 1603, he was entrusted with the education of prince Henry. He was likewise confidentially employed by queen Anne. By a second wife he had children, to whom he is said to have left a considerable estate in Buckinghamshire. He died on the 17th of November, 1615, and was buried

ried at Chiswick in Middlesex. His eldest son, William Chalon, was created a baronet by king James in 1620; but the title became extinct in 1681. *Biog. Brit.*

CHALONITIS, in *Ancient Geography*, a country of Asia, the most southerly province of Assyria. It extended along the left bank of the Tigris, S.W. of mount Tagros, which separated it from Media. It is said to have derived its name from the town of *Chala*; and the inhabitants were called *Chalonites*. This province, from its situation, was at all times the seat of war between potent empires and nations; and it is now become a desert, excepting some few small spots that may be cultivated about the inconsiderable towns which stand within its borders.

CHALONNE, in *Geography*, a town of France, in the department of the Mayne and Loire, and chief place of a canton in the district of Angers, situated near coal-mines; 4 leagues S.W. of Angers. The place contains 4022, and the canton 10,888 inhabitants; the territory includes 115 kilometres and 15 communes.

CHALONNE, an island in the Loire, a little below the town of the same name, about 3 miles in length, with a village.

CHALONS-sur-Marne, or **CHAALONS**, a city of France, and capital of the department of the Marne; before the revolution, the see of a bishop, suffragan of Rheims, and chief place of the generality of Champagne; situated between two fine meadows on the river Marne, containing 13 parishes, and partly subsisting by its manufactures of shalcons and coarse woollen cloth. The place contains 11,120, and the canton 15,563, inhabitants; the territory comprehends 260 kilometres and 16 communes. Chalons, or Duro-Catalaunum, afterwards Catalauni, formerly made a part of the territory of Rheims, from which it is distant only 27 miles. It is famous for a battle between the Romans and Attila, king of the Huns, in which the former, after an obstinate and sanguinary contest, in which the number of the slain amounted, as some say, to 162,000, or, according to other accounts, to 300,000 persons, proved victorious, and Attila was obliged to retreat. At Chalons there is an academy of sciences, arts, and belles-lettres. It is 40 miles S.W. of Verdun, and 95 E. of Paris. N. lat. 48° 57'. E. long. 4° 22'.

CHALONS-sur-Saone, a city of France, in the department of the Saône and Loire, and principal place of a district, seated on the river Saone, and, before the revolution, the see of a bishop, suffragan of Lyons. It is surrounded by walls, and defended by a citadel. It is the staple of iron for Lyons and St. Etienne, and of wines for exportation, which, as well as corn and wood, form its principal commerce. The city contains the Old Town, the New Town, and the suburbs of St. Lawrence. In the first is the court of justice, a modern structure, the cathedral, and the hotel-de-ville. The great Roman way from Lyons to Boulogne passed by Chalons; and it exhibits various traces of Roman magnificence, particularly the ruins of an amphitheatre. N. lat. 46° 47'. E. long. 4° 57'.

CHALOSSE, a small country of France before the revolution, in the environs of St. Sever.

CHALTAPITES, or **CHALAPETES**, in *Ancient Geography*, a division of Susiana, according to Ptolemy.

CHALTARON, in *Geography*, a town of Asia, in the country of Thibet; 10 miles W.N.W. of Coucha.

CHALVANCA, or **CHUMBIVILCAS**, a town of South America, and principal place of the jurisdiction of Chumbivilcas, in Peru.

CHALUS, a town of France, in the department of the Upper Vienne, and chief place of a canton in the district of

St. Yrieix; 15 miles S.S.W. of Limoges. The place contains 1204, and the canton 6264 inhabitants; the territory includes 22 $\frac{1}{2}$ kilometres and 7 communes. At this place Richard I. of England received a mortal wound, which he was reconnoitring it, previously to an assault for the purpose of recovering a treasure withheld from him by the viscount of Limoges.

CHALUS, in *Ancient Geography*, *Kocis*, a river of Asia, in Syria. Xenophon reports, that this river was full of large fishes, which the Syrians regarded as gods, and carefully preserved. It had its springs in the mountains W. of the town of Zeugma, ran S.W. to Chalybon, and from thence S. till it discharged itself into a lake, on the banks of which was built the town of Chalcis. Xenophon places it at the distance of 25 leagues from the desile which lay between Syria and Cilicia.

CHALYBEATES, in *Medicine*. A chalybeate medicine is one in which iron or steel (*chalybs*) is a principal ingredient. See IRON (in *Medicine*).

Chalybeate waters form a very large and important class of mineral waters, which will be more fully described under the article *WATERS, mineral*. It will be sufficient here to observe, that there are two principal classes of chalybeate waters; 1st, those in which the iron is held dissolved by the carbonic acid, and, 2d, those in which the sulphuric acid is the solvent. The former class is by much the most frequent. Of these, some waters contain little other foreign, and no other medicinal ingredient than the carbonat of iron, of which kind is the Tunbridge water; but others contain several neutral purging salts, of which the Cheltenham spring is an example. In all, the iron is totally precipitated in the form of a yellow light ochre, by boiling for a few minutes. The chalybeate waters holding the sulphat of iron generally can be traced to some pyritical source, and very often also contain sulphat of alumine. They are more astringent to the taste than the former, and the oxyd of iron is only partially separable by boiling, which therefore forms a ready test to distinguish the two species.

The chalybeate waters are found to be highly valuable medicines, though the actual quantity of iron taken in the usual doses is much smaller than in any other form in which this metal is given.

CHALYBIANS, in *Ancient Geography, a people of Scythia, who are said to have derived their name from Chalybs, the son of Mars. Others say, that they were so called from their iron manufactures. Strabo is of opinion, that they were the same with the Alyzonians, mentioned by Homer, and that the poet either wrote Chalybes, or that the inhabitants were originally called Alybians. If so, Homer leads us to imagine, that they were as famous for their silver, as they were, at that time, for their iron mines. They occupied that part which lay between the Taoticans and Seythians. Diodorus Siculus calls them Chalceians; and they were the most valiant people the 10,000 Greeks in Xenophon's retreat had to encounter with. They were fierce and warlike; equally able to engage on the plains as on the mountains; they followed the Greeks all the way through their country, and terribly annoyed them on their march. This powerful nation extended itself to other parts, and occupied part of Pontus, which lay between Armenia Minor, the Maerons, the Molyneccians and Tibarencians. Their country was mountainous and barren; but furnished abundance of iron, which the inhabitants manufactured, and which, besides supplying their own wants, afforded a considerable article of commerce. In the time of Xenophon, this country was much reduced, and the Chalybians were subject to the Molyneccians. But in more ancient times it extended*

extended beyond the boundaries above-mentioned, between Amiflus and Sinope, and comprehended a considerable territory on this side of the Halys. The Chalybes were the last people subjugated by Cræsus. See Herodotus, l. i. c. 28.

CHALYBIANS, an ancient people placed by Pliny in Africa, in the Troglodite territory.

CHALYBON, a considerable town of Asia, in Syria, situated in the midst of a large plain, on the bank of the river Chalus, N. of Chalcis. See **ALEPPO**.

CHALYBONITIS, a country of Asia, in Syria, which extended from Cæleſyria to the Euphrates, and which was so called from Chalybon, the only city contained in it worthy of notice. Some supposing Chalep to be an abbreviation of Chalybon, conclude Akppo, Chalep, and Chalybon to be the same city; but Chalybon is placed by Ptolemy at the 35th degree of latitude and 71st of longitude, and consequently far south of the present Aleppo.

CHALYBS, now *Cabe*, a river of Spain, the banks of which were occupied by a people called *Cholybes*, according to Justin. The waters of this river were reputed to give an excellent temper to steel.

CHAM, or **KHAN**, the title given to the sovereign princes of Tartary.

The word, in the Persian, signifies *mighty lord*; in the Slavonic, *emperor*. Speringius, in his Dissertation on the Danish term of majesty, *konig, king*, thinks the Tartarian *cham* may be well derived from it; adding, that in the north they say *kam, konnen, konge, konning*, &c. The term *cham* is also applied, among the Persians, to the great lords of the court, and the governors of provinces.

M. de Peyssonnet, in his *Strictures* on Baron de Tott's *Memoirs* (its vol. ii. p. 187.) observes, that no such word as *cham* exists; the true orthography being *Khan*. It is not, he says, a title exclusively assumed by the sovereign of the Tartars, since the Turkish emperors take it likewise. Of this the Ottoman money is a sufficient proof, the legend of which is "Soultan ibn el Soultan Abdulhamid, *Khan* dame mukhow," i. e. Sultan, son of Sultan Abdulhamid, *Khan*, whose reign be everlasting. The title of *Khan* is certainly equivalent in signification to that of *Shah*, which means king; and yet the most absolute Persian monarchs, who have never assumed any other title than that of *Shah*, have permitted the governors of provinces in their empire to take that of *Khan*. Even in our time the governors of the provinces of Guedja, Guilan, Mazandran, &c. who have no more authority in Persia than the Pachas in Turkey, take the title of *Khan*.

CHAM, in *Geography*, one of the provinces of Cochinchina.

CHAM, a town or parochial village of Swisserland, in the Canton of Zug, on the S. side of the Lake of Zug.

CHAM, or *Chamb*, a town of Germany, in the circle of Bavaria, seated on the Regen, at its conflux with a river called *Ampl* or *Kampf*; 84 miles N. of Saltzburg.

CHAM de Couca, a town of Portugal, in the province of Estramadura; 6 leagues N. of Thomar.

CHAMA, in *Conchology*, a genus of shells. The *Chamae* are of the bivalve order, and are distinguished by having the shells rather rude or coarse; the hinge with a callous gibbosity, obviously inserted in an oblique hollow: anterior slope of the shell closed. *Fulva clausa absque nymphis*. Linn.

The animal inhabitant of these shells is of the *Tethys* genus, having the body furnished with two small apertures on the left side of the neck: the body rather oblong, fleshy, without peduncles; and the mouth with a terminal cylindrical proboscis under an expanded membrane or lip.

CHAMA cor. Shell roundish and smooth; beaks recurved; anterior slope with a gaping fissure.—*Tefla subrotunda levi*; *nutilus recurvatus, rima hians*, Linn.

This shell when full grown is about the size of a large orange. It inhabits most of the seas in the S. of Europe, and is rarely discovered as far northwards as the British isles, one or two instances only of its having been found in our seas are on record. *Novov. Brit. Shells*. The French call it *Cœur de bœuf*, in allusion to its general figure, which bears some resemblance to that of a bullock's heart. The English collectors distinguished it by the name of heart Cockle. When in high perfection, this shell is of a delicate cream-coloured white, tinged and varied with pale reddish, and testaceous; and is covered with an epidermis of a dusky brown colour.

CHAMA gigas. Shell plaited, with arched scales; posterior slope gaping.—*Tefla plicata fœnicato-squamosa; ano hians*. Linn. *Chama squamata*, Rumpf. *Imbricata*, Argenv.

There is much propriety in the specific name *gigas* assigned by Linnæus and other naturalists to this shell, for it is very much larger than the rest of the *Chamae*, and indeed of a size very far superior to any other of the testaceous productions hitherto discovered. Shells of this species weighing from one hundred to one hundred and thirty or forty pounds the pair are not very unusual; such occur in most public museums of Natural History in Europe. One individual of the *Chama gigas* is recorded by Conchological writers that weighed five hundred and thirty two pounds, including both the shells and the animal; and the latter was so large as to furnish one hundred and twenty men with food for a meal, and strong enough by the sudden collapsing or snapping its valves close, to cut asunder a cable rope, and lop men's hands off. This enormous species inhabits the Indian seas. Those of the largest size we are acquainted with, are from the seas contiguous to the island of Borneo, from whence they are occasionally brought as objects of curiosity into Europe, and kept as ornaments in gardens. During the early part of the last century they were in much request for the decorations of fountains, grottoes, and reservoirs of water, especially in Italy, the more modern Italians emulating in some manner the classic taste of the ancients. This gigantic shell was perfectly familiar to the poets, and sculptors of antiquity; Venus is fabled to have risen in one of them from the bottom of the sea, an allegory in itself extremely beautiful, and which has afforded matter for several of the most exquisite compositions of ancient, as well as modern artists; the former is obvious in a variety of remains of ancient sculpture, and of the latter we need only instance one, Barry's inimitable picture of "Venus rising from the sea," the impressive and sublime effect of which is recent in the mind of every admirer of the modern arts. On gems and cameos of antiquity, Venus under various characters, Amphitrite, Deis, and other goddesses and nymphs in the train of Oceanus, frequently appear upborne upon the waves, or driving through the foaming billows in a chariot formed of the *chama* shell.

CHAMA antiquata. Shell somewhat heart-shaped, grooved longitudinally and striated transversely. Linn. &c.

A native of the American, Atlantic, and Indian seas. This shell is inequilateral, and is marked with brown or ferruginous spots; the ribs are from nineteen to twenty-two in number; the margin of the shell toothed; beaks inflected back; anterior margin with a deep closed fissure.

CHAMA hippopus. Shell plaited, muricated; posterior slope

slope retuse, closed, and toothed.—*Chama hippopus*, Linn. *Chama aspera obtusa*, Rumpf. *Folium brassicae*, Argenv.

This is a broad, and towards the beaks gibbous shell, of a white or whitish colour varied with spots of red, or sometimes purple, and very rarely yellow, and at the hinge are yellow callosities. The size is various, but seldom exceeds six inches from the beak to the margin, and nine inches in breadth; commonly one fourth less in size. Inhabits the Indian Ocean.

CHAMA trapezia. Shell trapeziform, gibbous, with longitudinal crenulated grooves. Müll. Zool. Dan. A native of the Norway seas. This is of a gibbous form, about the size of a pea, of a white colour mixed with brown towards the margins, which last are crenated; the striae nearly twenty in number rugged with unequal obtuse knots; beaks rather recurved; posterior slope ovate, heart-shaped, the anterior slope oblong, flat, and crenated on the outside. Schrott. Gmel. &c.

CHAMA semiorbiculata. Shell somewhat orbicular, compressed, coarse, with striae crossing each other. Linn. &c. This shell is longitudinally striated and imbricated with scales; posterior slope with a whitish lobe; hind margin crenated. Country unknown.

CHAMA calyculata. Shell oblong, with imbricated grooves; anterior part retuse. Gmel. &c. *Jafon*, Adanson. Found in the Atlantic, American and Indian seas. The colour is white, or when young, inclining to brownish; hinge with two teeth; exterior margin serrated, interior smooth.

CHAMA gryphoides. Shell orbicular, muricated; one valve rather flattened, the other with a somewhat spiral produced beak. Linn. &c. *Concha rugata*, Rondelet. *Jataron*, Adanson. Inhabits the Mediterranean, American, and Indian seas, where it occurs affixed to rocks. Authors enumerate six or more varieties of this shell, the colours of which are variable, as yellow varied with reddish or white; red varied with yellow and white, or white varied with red and yellow. The scales also in some specimens are more foliaceous, and sometimes are arched and muricated.

CHAMA cordata. Shell heart-shaped, and transversely striated; one side elongated and compressed. Linn. Inhabits the Red and Indian seas. Colour ferruginous, or chestnut. Obs. *Chama reniformis* of Quorr is considered as a variety of this shell.

CHAMA fusiata. Shell subrotund, with toothed grooves intermixed with dots; posterior slope retuse. Gmel. Native place unknown. Shell white, reddish on the outside; grooves elevated, longitudinally toothed, and alternately shorter; margin crenulated; posterior slope heart-shaped.

CHAMA oblonga. Shell oblong, the anterior part angular, with acute teeth in front. Linn.

Inhabits the shores of Guinea, where it is scarce; it resembles *mytilus modiolus*; the shell is somewhat diaphanous, white, with very fine striae crossing each other; the colour within citron; margin very entire; hinge with three middle teeth and an oblong acute lateral one locking into a hollow between two teeth on the opposite valve. Figured by Chemnitz, T. 7. 50.

CHAMA Lazarus. Shell imbricated, with jagged lamellae; beak a little spiral obliquely. Linn.—*Placenta foliacea*, Argenville.

Adheres to rocks. This shell is yellow, or white, with red beaks, and glabrous within; the upper valve is rather less and flatter than the lower, and in the hinge of the latter is an obtuse, thick, broad callosity crenated on each side, with an oblique contiguous hollow. A native of India.

CHAMA bicornis. Shell with conic valves, and horn-shaped oblique tubular beaks longer than the valve. Gmel. This bears a great affinity to *Chama gryphoides*; colour in general yellow, and red or white on each side, with imbricated lamellae. Inhabits the Indian and American Oceans, and also the Mediterranean sea.

CHAMA arcinella. Shell grooved, muricated, with excavated dots; hinge with a feeble callosity. Gmel.

Breadth two inches and nearly the same in length; colour white with sometimes rosy spines, within yellowish; margin crenated; posterior excavation large, heart-shaped, warty, wrinkled, with an appendage commonly on one side. A native of the American Ocean, but is rare.

CHAMA molikiana. Shell chiefly triangular, equilateral, platted; anterior slope elevated, with oblique plaits and striae. Chemnitz, &c.

This species, which is about the size of a hazel nut, resembles *Chama Cor.* It is milk-white and opaque; the beaks rather dilant; hinge with a rounded narrow tooth under the beaks, and an adjoining hollow for the insertion of the tooth in the opposite valve; anterior to this is another long deep hollow between two teeth, and a little further back another round dilated tooth. Country unknown.

CHAMA concamerata. Shell with transverse wrinkles crossing the broad longitudinal striae; in the middle of each valve within an additional chamber. Walch. Gmel. &c.

This is a shell of small size, whitish, and very rare. Inhabits the American Ocean.

CHAMA foliacea. Shell white, with foliaceous serrated transverse striae, the interstices crenated; beak recurved. Gmel. Inhabits the Mediterranean, and American seas; it is said to be found in a fossil state in Campania in France, but the latter is probably distinct though nearly allied to *Chama foliacea*.

CHAMA arata. Shell rounded, white undulated with brown; ribs triangular, perpendicular, and wrinkled; margin unequal. Bonann. Found on the shores of Syracuse. Gmelin supposes it may be of the *Cordium* instead of *Chama* genus.

CHAMA fusca. Shell wrinkled, oblong, narrow and brown; lower valve with a projecting, rounded, and somewhat incurved beak. Gualt. Country unknown.

CHAMA citrea. Shell roundish, ventricose, inequalve, and muricated with scattered unequal scaly spines. Regenf. Conch. This is of a citron colour, and inhabits America.

CHAMA thaca. Shell roundish, longitudinally striated; posterior slope retuse. Gmel. &c.

Described in Molina's Natural History of Chili as a native of the Chilese shores, where it buries itself in the sands. The shell is white violet and yellow on the outside, within elegant purple; diameter about four inches. The animal rich and agreeable food.

CHAMA rugosa. Shell somewhat orbicular, and very deeply sulcated; the wrinkles slightly imbricated; margin doubly folded. Linn. Mant.

This is about the size of a man's finger, gibbous, and thick, with thirty grooves; the outer margin with concave prominent projections from the wrinkles, the inner margin obtuse platted; hinge with two or three oblique grooves declining towards the anterior side. Native country unknown.

CHAMA gryphica. Shell oblique, with a lateral oblique depression or hollow; callosity of the hinge dentated. Linn. Mant.

Resembles *Anomia gryphi*. This species inhabits Barbary; the shell is pondrous and thick, about the size of a fist; beaks obliquely curved backwards; anterior slope longitudinally

dinally grooved and oblique towards the beaks; posterior slope longitudinally concave.

CHAMA coralliphaga, Shell cylindrical, white, diaphanous, with decussating striæ, the transverse striæ arched and imbricated. Chemnitz. Country unknown.

CHAMADE, in *Military Language*, a conference or parley. *Battre la chamade*, is to beat a parley, or to make a signal by beat of drum, for a conference when any thing is to be proposed. This signal is sometimes made by found of trumpets, as well as by beat of drum. When the besieged are hard pressed or reduced to extremity, they beat the *chamade*; and when either the besieged or besiegers wish for a truce or short cessation of arms, for the purpose of withdrawing their wounded, or burying their dead, or of any reclamation whatsoever, they beat the *chamade*: the besieged on the part of the rampart nearest to the attack, and the besiegers at the most advanced part of their approaches.

CHAMÆLEON, or **CAMELEON**, in *Zoology*, a small and curious animal of the lizard tribe, celebrated from the remoter days of classical antiquity, for the faculty it was imagined to possess of changing its colours at pleasure, and assimilating to that of any situation, or object near it. In the Linnæan system of animals it stands in that particular tribe of the *Lacerta* (see article *LACERTA*), which have the feet furnished with five toes, some only of which are connected, and the tail short, rounded, and incurved; the *Chamæleontes* of Gmelin. The French naturalists, as Brongniard and Lacepede, separate the *chamæleontes* from the *lacertæ*, and constitute a new genus of this natural tribe of animals, under the name of *cameleo*, *camæleon*, in which they include six distinct varieties or species, as will appear in the sequel.

The only kind of *Chamæleon* with which the ancients seem to have been acquainted, is the common sort found in India,

Africa, and the hotter parts of Europe; as for instance, Portugal and Spain. This is specifically distinguished by the cinereous colour of the body, and the head being flat. Of this species there are two, or more, supposed varieties, or, as the French writers believe them, distinct, though very analogous species. One of these varieties has the body white, which is the *Cameleo candidus* of Laurenti; and another, *Cameleo capite praeagrando*, has the head of a remarkably large size: this last is described by Dr. Parfons in the Philosophical Transactions for 1768. Besides these, the *Cameleo mexicanus* of Laurenti is considered only as a variety. Linnæus was induced to admit all the different races of the chamæleon tribe as varieties of this individual species; in the Gmelinian edition of the Systema Nature, the two kinds, Africana and Pumila, are very properly removed from the former, and described as distinct.

The general length of the common chamæleon is about ten or twelve inches, measuring from the tip of the nose to the beginning of the tail; and the tail is nearly of a similar length. Its figure and proportions are uncouthly singular. The head is large, flat above, and of a subtriangular form: the posterior part of its body seems crippled, and the legs ill-shaped and long. Its motions are slow, except when in the act of climbing trees in search of its prey, which consists of insects, when it ascends and defends with some facility, by means of its legs, which are well adapted for climbing, while at the same time it never fails to secure its hold more firmly by coiling its tail round the smaller branches. When it walks on the ground, it moves with a ludicrous air of gravity and circumspection, in a regular and even pace, which it will not hasten, even at the approach of danger. The fecundity of this animal is supposed to be very great, being, from the slowness of its motions and mode of life, incessantly exposed to the attacks of voracious birds, serpents, and various other animals, without any means of defence, and being yet found in vast numbers in the countries they naturally inhabit. The term of this animal's life is unknown; it thrives best in hot countries. Even in Lower Egypt, and on the coast of Barbary, when the weather is not very hot, the chamæleon seems to lose its ordinary share of activity, and oftentimes, in the winter season, they are found in those parts concealed under heaps of stones, where they lie overpowered by the cold in a perfectly motionless state, without being asleep. The Africans and Indians regard the chamæleon as a most useful animal; they see them enter their habitation with pleasure, and endeavour as much as possible to domesticate them, the chamæleon destroying mosquitos, ants, and a host of other winged insects, with which they are tormented.

The chamæleon by the power it possesses, like most of the amphibia, of inflating its lungs, and retaining the air for a considerable time, can alter the appearance of its body at pleasure; sometimes appearing of a plump or fleshy aspect, while at other times, upon expelling the air from the lungs, and keeping them in a collapsed state, the whole animal assumes the most lank and miserable aspect imaginable. At such times the skeleton seems scarcely more than covered with a thin skin, the back bone and ribs becoming distinctly visible on each side under the contracted skin. This inflation affects not only the body, but also the legs and tail, the tendons of which may be clearly traced in its extended state through the skin. When thus puffed out, the animal can remain so for the space of an hour or two, or even so long as six hours, the parts being speedily inflated, but the compression being effected gradually, and thus by an almost insensible sinking of the parts, the inflated animal assumes the sagacious condition before related. The skin in every part of

the animal is of a granulated structure, the granules differing in size on various parts, from that of a small pin's head to the diameter of the tenth of an inch, or more, especially about the projecting parts of the head and jaws, and on each side of the belly. Down the back is a series of obtuse denticulations, forming a subacute ridge from the head to the base of the tail, and decreasing in size towards the latter. The feet consist of five toes each, the anterior pair have the two outward toes united together by a common skin, and the three inner ones connected in a similar manner; the reverse of which is observed in the feet of the posterior legs: those having the three outer toes, and the two inner ones, connected.

The mouth is wide, and the bones of the jaws denticulated, so as to represent small teeth. Lælius mentions these effeminate denticulations, and supposing they could be of no service to the creature in eating, since it subsists on flies, which it swallows whole, utters they must be intended by nature for its defence, and gravely affirms, that by means of these the chamæleon holds a stick crossways in its mouth to prevent its being swallowed by serpents! The tongue is of a very extraordinary form, being composed of a white solid flesh, about ten lines long and three broad, round, a little flattened towards the end, hollow, and open, somewhat like the end of an elephant's proboscis. This tongue is fastened to the os hyoides by means of a sort of trunk, shaped like an intestine, six inches long, and a line broad, having a membrane without, and a nervous substance within, which is solid and compact, though soft, and not easily divisible into fibres. This trunk serves to cast out the tongue, which is fastened to it, by extending it, and to draw it back by contracting it, which motion it is enabled to perform by a kind of cartilaginous stylius, to which its invelling membrane is attached, and over which it is plated like a silk stocking on the leg: this stylius is an inch long, and takes its origin from the middle of the base of the os hyoides, as in the tongues of several birds, and a number of blood vessels are distributed over it. This tongue is finely adapted for the purpose of seizing its prey, which consists of insects, forming a missile body with a dilated and somewhat tubular tip, by means of which the animal seizes them with the greatest ease, darting it out in the same manner as the wry-neck, or the woodpecker, and retracting it instantaneously with the prey secured at the tip. The structure, form, and motion of this creature's eyes are very peculiar: they are remarkably large, being nearly half an inch in diameter, of a spherical form, and projecting in the living animal full half of their diameter: these are covered with only a single eyelid or skin, pierced in the middle with a small hole, through which the bright and vivid pupil appears, surrounded by a golden yellow iris. The eyelid is granulated like the rest of the animal, and the fore part of the eye is attached to it in such a manner that the eyelid follows all the motions of the eye. The motions of the eye are not less singular than its structure, since it can turn them so as to see whatever passes either far backward, on either side, or directly behind it, without at all moving the head. Sometimes one of these eyes will move while the other is at rest, or turn forwards while the other is directed backwards; or upwards, while the other is turned downwards. By extending the skin of the orifice cross-ways, the chamæleon can close its eyes, the holes then becoming a longitudinal fissure. The brain is extremely small: the heart is also small, truncated at the tip, and furnished with large auricles, especially the left. The lungs are very large when inflated, and divided into several fascial subdivisions.

The Promethean-like faculty of the chamæleon, to charge

its colour, has excited curiosity in all ages. That it depended in a very considerable degree on the will of the animal to exert this power was too apparent to be denied; but in what manner this effect was produced and operated on the frame of the chameleon was referred for the investigations of later naturalists to determine with competent accuracy. Seneca mistimed it was effected by insolation; Solinus, by reflection; and others, as the Cartesians, by the different disposition of the parts that compose the skin, which give a different modification to the rays of light. Kircher ascribes the change of colour in the chameleon to the power of imagination in the animal, because it loses it when dead. Dr. Goddard attributes it to the grains in the skin, which, in the several postures, he thinks, may show several colours, and when the creature is in full vigour, may have, as he terms it, *ratiorem speculæ*, or effect of mirrors, and reflect the colours of the bodies adjacent. That the colours are not by any means determined by surrounding objects, has been the aim of late observers to demonstrate; that they change with frequency and rapidity is admitted, but it is not true that they are influenced by the colour of any object in contact with it. The changes of colour which this animal exhibits vary according to the state of its health, the temperature of the weather, to age or sex, and a variety of other subordinate circumstances, all which tend to operate a change in the variable aspect of this singular creature. These transitions consist chiefly in the alteration of the shades from the natural green, or bluish-grey of the skin into pale yellowish with irregular spots and variegations of dull red; or dusky inclining to blackish. The epidermis of this animal is transparent, the skin beneath yellow, and the blood of a lively violet blue. The transitory combination of these colours therefore becomes apparent externally when the blood of the heart is impelled to the surface of the skin and the extremities, changing to violet, yellow, blue, and green, in a variety of hues as the blood circulates near the superficies. When the animal is sick it turns to a greyish dirty yellow, or brownish, like a decayed leaf, this being the true colour of the skin when the blood is withdrawn; but expose him to the rays of the sun, the genial heat revives and invigorates his whole system, and setting the blood, before torpid, in motion towards the skin, the violet and bluish prevail again, and by their intermixture with the yellowness of the skin the green will also re-appear. Return him again into the cold, the blood is withdrawn from the surface of the skin inwardly, and these colours, which depend on the immediate presence of the blood, will naturally fade away. Thus it happens also, that the colours of the chameleon are paler in the night time, or in the dark, as Oponville and Golberry have shewn. The same effect, and depending on the same causes as in the chameleon, is also observable in the lizard called *Lacerta bullaris* by Gmelin and Linnæus, with this difference only, that the transitions of colour are not so decidedly evinced as in the chameleon; but this latter animal which, exposed to the sun-shine is of a clear green, changes to a dusky blackish green, or yellowish, and in the cold to grey blending into brown; this animal, like the chameleon, possessing the faculty of impelling its blood to the surface of the skin, or withdrawing it, and by that means of varying its tints at pleasure. The same circumstances are to be remarked in a still less degree in several other animals of the lizard tribe.

Chameleons have been sometimes brought alive into this country. In the year 1780 a specimen of this animal was kept in a living state for some time in the company of apothecaries' physic garden at Chelsea, which, though in a comparatively sickly state, exhibited those transitions of colour from bluish-ash to green, or yellowish spotted with brown before

mentioned. Several chameleons have been preserved alive at different times in Paris. One of these afforded the French Academicians a favourable opportunity of investigating the manners and structure of this curious animal. The results of their inquiries are interesting, and serve to throw considerable light upon the history of the chameleon. The following passages in particular seem to merit particular attention. "The colour of all the eminences (say those writers) of our chameleon, when it was at rest in the shade, and had continued a long time undisturbed, was a bluish grey, except under the feet, where it was white inclining to yellow, and the intervals of the granules of the skin were of a pale and yellowish red. This grey, which coloured all the parts exposed to the light, changed when in the sun; and all the places of its body which were illuminated, instead of their bluish colour, became of a brownish grey. The rest of the skin, which was not illuminated by the sun, changed its grey into several brisk and shining colours, forming spots about half a finger's breadth, reaching from the crest of the spine to the middle of the back; others appeared on the ribs, fore legs, and tail. All these spots were of an isabella colour, through the mixture of a pale yellow, with which the granules were tinged, and of a bright red, which is the colour of the bottom of the skin, visible between the granules: the rest of the skin not enlightened by the sun, and which was of a paler grey than ordinary, resembled a cloth made of mixed wool; some of the granules being greenish, others of a minime-grey, and others of the usual bluish grey, the ground remaining as before. When the sun did not shine the first grey appeared again by little and little, and spread itself all over the body, except under the feet, which continued of the same colour, but a little browner; and when in this state some of the company handled it, there immediately appeared on its shoulders and fore legs several very blackish spots about the size of a finger nail, and which did not take place when it was handled by those who usually took care of it. Sometimes it was marked with brown spots, which inclined towards green. We afterwards wrapt it up in a linen cloth, where having been two or three minutes, we took it out whitish; but not so white as that of which Aldrovandus speaks, which was not to be distinguished from the linen on which it lay. Ours which had only changed its ordinary grey into a very pale one, after having kept this colour some time, lost it insensibly. This experiment made us question the truth of the chameleon's taking all colours but white, as Theophrastus and Plutarch report; for ours seemed to have such a disposition to retain this colour, that it grew pale every night; and when dead it had more white than any other colour; nor did we find that it changed colour all over the body, as Aristotle reports; for when it takes other colours than grey, and disguises itself to appear in masquerade, as Aelian pleasantly says, it covers only certain parts of the body with them. Lastly, to conclude the experiments relative to the colours which the chameleon can take, it was laid on substances of various colours, and wrapped up therein; but did not take them as it had done the white, and it took that only the first time the experiment was made, though it was repeated several times on different days. In making these experiments, we observed, that there were a great many places of its skin which grew brown, but very little at a time; to be certain of which, we marked, with small specks of ink, those granules which to us appeared the whitest in its pale state; and we always found that when it grew brownest, and the skin spotted, those grains which we had marked were always less brown than the rest."

The popular error, of the chameleon living on air alone,

is thought to have arisen from the long abstinence which this animal can occasionally support; instances having, it is said, occurred of its passing several months without any apparent nourishment. This, though asserted by respectable writers, is contradicted by the observations of the ingenious Sonnini, who, during his travels in Egypt, had an opportunity of ascertaining this circumstance, and actually did bestow some pains, as appears from his writings, to determine this point to his satisfaction. "It is now well known (says Sonnini) that the changing of the colours in the chameleons is not to be ascribed to the objects presented to them; that their different affections increase or diminish the intensity of the tints with which the very delicate skin which covers them, is, as it were, marked; that they are not satisfied with nourishment to subsist as *ars*; that they require more solid aliment, and swallow flies and other insects; and that, finally, the marvellous stories which have been told respecting this species of lizard, are merely a tissue of fictions which have disgraced the science of nature down to this day. I have preferred some chameleons, not that I was tempted to repeat the experiment of Cornelius le Bruyn, who, after having gravely assured us, that the chameleons which he kept in his apartment at Smyrna, lived on air, adds that they died one after another in a very short space of time, but I wished to satisfy myself to what a point they would subsist without food. I had employed every precaution to prevent entirely their having any without ceasing to be exposed to the open air. They lived thus for 20 days; but what kind of life? From being plump as they were when I caught them, they soon became extremely thin. With their good plight they gradually lost their agility and their colours; the skin became livid and wrinkled; it adhered close to the bone, so that they had the appearance of being dried before they ceased to exist."

We shall now enumerate those species of the Linnæan hæcetes, which approach so near the common chameleon as to have been confounded with its varieties.

AFRICAN CHAMELEON. *Lacerta africana*. Gmel. *Le caméléon d'Afrique*, of the French writers, is specifically distinguished by being of a blackish colour, and having the crown of the head carinated. *Chameleo ex Africa colore nigricante, at pedine albo supra dorsum decoratus*, Seba.

This, according to Seba, is from the coast of Barbary, and is the largest chameleon known: along the back to the end of the tail, runs a pure white stripe bounded by a blackish border or band; the rest of the animal is varied with pale cinerous undulations. In manners this resembles the last, and all the prominent parts are white.

LITTLE CHAMELEON. *Lacerta pumila*. Gmel. With the body bluish on the sides, and marked with two yellowish lines. *Le Caméléon vain* of Bosc and others. *Chameleo Promontorii Bone Spæ, caruleo alboque colore marmoris insular variegatus* of Seba.

This kind inhabits the Cape of Good Hope, and has the head somewhat flatter than the former, though still elevated towards the middle part, and has the margin on each side denticulated. The body is of a bluish colour, marbled or variegated with white.

Besides the common chameleon, *Le Caméléon commun*, and the two last-mentioned species, the French admit three others as species of their genus caméléon; *Le Caméléon du Sénégal*, *Le Caméléon du Cap de Bonne-esperance*, and *Le Caméléon Fourchu*. The first, or Senegal chameleon, is smaller than the common chameleon; the helmet or head-piece is elliptical, and flat above; and the denticulations on the back and carina are less prominent. That from the Cape, the second species, has the head-piece almost flat above, with a

line of large tubercles behind each eye; and the denticulations of the back and ridge of the collar are more dispersed and are not continued so far under the belly and the tail. *Le caméléon fourchu* is certainly a very distinct species from the rest. This has the muzzle advanced or projecting and terminated in two lengthened compressed processes. The top of the head is flat, and is denticulated in its outline. In size and general aspect it resembles the common chameleon. It is was brought from Java, and was figured by Brongniard in the French *Bulletin des Sciences*, and is repeated in Latreille's recent *Hist. Nat. des Reptiles*.

In the year 1666, Claude Perrault published a work entitled "Description Anatomique d'un Caméléon." "Præfide, Differtatio de Vetus aëreo, cum mirabilis potius inedia Chamæleontis," &c. by Hæroto appeared in 1681; and in 1707 "Differtatio de Chamæleonte," by Kalmud. Besides these, and the works before mentioned, there are none of material interest on the chameleon. The paper by Dr. Parousin in the 5th volume of the Philosophical Transactions entitled "An Account of a particular Species of Chamæleon," appeared again in French as the "Relation d'une Espèce particulière de Chamæleon;" (*Journ. de Physique*) but contained nothing new. "Nachricht von einer betondern gattung des Chamæleons," and "Beschreibung eines Chamæleons," are tracts upon the same subject.

CHAMELEON, Mineral, in Chemistry, a substance produced by subjecting one part of black oxyd of manganese to ignition in a crucible with three parts of pure nitrat of pot-ash, until the mass ceases fusing, and assumes a dry earthy appearance. If a portion of this powder be put in a glass containing clear pump-water, the fluid becomes first green, then violet, afterwards reddish, and at last again totally discoloured: the metallic oxyd falling then to the bottom with a black colour. But if it be preserved in a bottle quite filled with boiled, distilled water, and well stopp'd, the green colour lasts longer, changes gradually to blue, and a yellow ochreous oxyd of iron precipitates. To explain these changes of colours, it may be observed, that the nitre is decomposed by the calcining heat, and alkalinized by the loss of its acid; that the black manganesian oxyd is brought by ignition to the state of a mere imperfect oxyd, and that, therefore, its alkaline solution may appear blue. But as the black oxyd of manganese contains some admixed oxyd of iron, the blue colour of the solution is changed into a green by the yellow tint of the oxyd of iron. The oxyd of iron subsides by repose, and then the blue colour re-appears. The manganesian oxyd absorbs again, by degrees, more oxygen from the atmospheric air; it assumes, therefore, a brown red tinge, becomes at last black, and precipitates at this period. Gren's Principles of Modern Chemistry, vol. ii. p. 410.

CHAMÆRIPS, (from *χαμαί*, and *ρῖψ*, implying a low shrub), Linn. Gen. 1289. Schreb. 1688. Juss. 39. Vent. vol. ii. 125. (*Chamæripes*, Gart.) Class and order, *polygama diacia*. Nat. ord. *Palmæ*, Linn. Juss. Vent.

Gen. Ch. Hermaphrodite. *Cal.* spathe universal, compressed, bifid; spadix branching; perianth proper, small, three-cleft, Linn. (six-leaved, Gær.) *Cor* petals three, or one, longer than the calyx, egg-shaped, coriaceous, erect, acute, inflexed at the tip. *Stam* filaments fix. (from six to nine, Gart.) awl shaped, compressed, scarcely cohering at the base, didymous, adhering to the interior side of the filaments. *Pyl.* germs three, roundish; styles three, distinct, permanent; stigma acute. *Peric.* drupes three, globular, one-celled. *Seeds* solitary, globular. Male on a distinct panicle. Calyx and corolla as in the hermaphrodite. *Stamen*, fix, not distinctly perforated, standing on a gibbous receptacle.

Sp. 1. *C. humilis*, dwarf fan-palm, or palmetto, Linn Sp. Pl. Savigny in Eucy. Mart. L. m. Illust. Pl. 602. fig. 1. (Palm minor, Bauh. Pin. 506. Chamæripes, Dod. Pempt. 820. Pont. Anth. 147. tab. S. C. major, Gart. tab. 9. fig. 4.) "Frons palmatè d. plaited, stipis thorny." In its wild state generally without a trunk; but in Valencia wild plants are found with trunks from twenty to thirty feet high, their usual height in the Paris gardens. In its trunkless state, as the lower leaves of the plant decay, their vestiges remain, and form a short stump above ground, similar to that of polypodium filix mas, our common male fern, from which the spadix is produced. *Trunk*, when present, cylindrical, five or six inches in diameter, upright, quite simple; naked at its base, but marked with circular scars; beset upwards with triangular scales, which are the bases of the petioles of fallen leaves. *Leaves* from thirty to forty, on the crown of the root, or the top of the trunk, from nine to eighteen inches long, near a foot broad, digitated, or deeply palmated; outer ones horizontal, or reflexed, inner ones less expanding as they approach the center; divisions or leaflets from twelve to fifteen, narrow, and sword-shaped, keeled, acute, finely serrated, longitudinally nerved, smooth, or slightly pubescent, quite entire, of a rather glaucous green colour; at first closed together like a fan when shut, and fastened to each other by strong fibres, which run along their borders; afterwards, spread open, the broken fibres hanging from the sides and ends; stipes or petioles thick, smooth, flat, with two sharp edges; armed with strong, short, acute, oblique, lateral spines. *Spathes* from six to eight inches long, much compressed, curved, opening at one of their edges. *Spadix* panicle, thick, flat. *Flowers* small, yellow. *Fruit*, drupes nearly globular, obscurely trigonous at their base, dark brown; with pale, callous, elevated dots; rind thin, somewhat coriaceous; flesh thickish, fibrous, separate from the seed; when old, cork-like, hard, inodorous. *Seed* smooth, elliptic-spheroidal, with a small lateral papilla below the middle, which covers the embryo. A native of Italy, Sicily, and Spain, covering the ground in the same manner as fern does in the more northern part of Europe. The leaves are tied up into boms for sweeping. They are also used for making baskets and thatching buildings. The pith near the root is sweetish and tender, and is sometimes eaten in deserts. β *C. glabra* Miller. "Leaves fan-shaped, very large; stipes 10 ooth." A native of the West Indies, where it never rises with a stem; the stipes are rounder than those of the European fan palm, and have no spines on their sides. It seems to be a distinct species. γ. *C. minor*, Gart. Drupes cylindrical.

lindrical-ovate, fleshy, smooth; rind very thin; flesh soft, easily yielding to the pressure of the finger even when old, fibrous within, adhering on all sides to the seed. *Seed* shorter and rounder than that of *C. major*, furnished with two papillæ; one superior, entirely foetid; the other inferior, smaller, covering the embryo. 2. *C. excelša*, creeping-rooted fan palm, or ground-ratan. Murray Syst. 984. Mill. Thunb. Jap. 130. (Rhapis flabelliformis, Mart. Hort. Kew. vol. vi. 473. MSS. of Linn. jun. Salisb. Prod. 254. L'Herit. Sturp. Nov. tab. 100.) "Frons palmated, plaited; plaits and edges serrated or prickly, with small teeth; stipæ unarmed." A lofty tree. *Leaves* smooth, pale underneath; leaflets cohering at the base, linear, cloven at the end, serrated, with rugged veins; petioles three-cornered, entire, the length of the leaves. *Flowers* in a decomposed spreading panicle, sessile on the outmost pedicels. A native of China and Japan. Introduced about 1774 by Mr. James Gordon. Befoms are made of the thin netted bark of the trunk. 3. *C. arundinacea*, simple-leaved fan-palm. (Rhapis arundinacea, Mart. Mill. Hort. Kew. vol. iii. p. 474.) "Frons two-parted; lobes acute, plaited; plaits somewhat rugged." A native of Carolina. Introduced in 1745. 4. *C. cochinchinensis*, Mart. Lour. Cochin. 657. "Frons palmated, plaited; stipæ thorny; spathe partial; corollas monopetalous." *Trunk* eight feet high, an inch in diameter, straight, equal. *Stipæ* long, slender, with short, straight, feathered spines. *Frons* turbinate; segments small, oblong, blunt, many-plaited. *Spadix* short, upright. *Spathe* universal none; *partial* lanceolate, shorter than the spadix; calyx three-leaved; leaflets short, upright, acute, curved; corolla monopetalous, cup-shaped, three-cornered; border very small, triid, inflexed; filaments very short, placed on the border of the corolla; anthers roundish, minute. *Drupes* egg-shaped, small, juiceless, not eatable. A native of the woods of Cochin-China. The fronds are used for covering houses and making umbrellas.

Obs. Although a new genus has been formed for the second and third species, and adopted by very high authorities; yet, as nothing is known of their fructification, besides a one-leaved triid perianth, a one-petalled triid corolla, and six filaments, there seems no sufficient reason for separating them from chamærops.

CHAMÆROPS, in *Gardening*, comprises a plant of the perennial exotic kind; of which the species cultivated is the dwarf fan palm or palmetto. (*C. humilis*), which never rises with an upright stem, but the foot-stalks of the leaves proceed immediately from the head of the root, and are armed on each side with strong spines; are flat on their upper surface, and convex on their under side: the centers of the leaves are fastened to the foot-stalk, and spread open like a fan, having many foldings, and at the top are deeply divided like the fingers of a hand: when they first come out they are closed together, like a fan, when shut, and are fastened together by strong fibres, which run along the borders of the leaves; and when the leaves spread open these fibres or strings hang from the sides and ends: the borders of the leaves are finely sawed, and have white narrow edgings: they are from nine to eighteen inches long, and near a foot broad in their widest part: from between the leaves comes out the spadix or club, which sustains the flowers. This is covered with a thin spathe or hood, which falls off when the bunches open and divide. It grows naturally in Italy, &c.

Method of Culture. These plants may be raised by seeds, and slide slips from the head of the roots. In the first method, the seeds procured from abroad should be sown in pots of light sandy earth, and plunged in a hot-bed of tan-

ner's bark, occasional waterings being given. In the autumn or spring following, the plants will be in a proper state to be pricked out in separate pots. In this culture much depends on having good feeds, as when these are not well prepared they often fail.

In the second mode, the slips of the crown of the roots or slide-offers, must be separated with the root fibres, and planted out in pots filled with sandy earth, and plunged in a hot-bed. But the plants are stronger from seeds than when raised in this way. Modly in ten or twelve months the plants will be fit to be removed into other pots, which should be done in such a manner as not to injure their roots, as when that is the case they are liable to be destroyed or become feeble in their growth.

These plants mostly require the protection of a stove while in their young growth; but when become sturdy by gradual exposure to the air, they are capable of succeeding in a full exposure in summer, and in a green-house in winter; but must always be kept in pots of light sandy earth, and be frequently watered in summer, but more moderately when the weather is cold than in the summer season.

In above-collections they have a good effect by their curious appearance.

CHAMÆRUBUS, in *Botany*, Buh. Pin. See **RUBUS** *fixatilis* and *Chamæmorus*.

CHAMÆSYCE, Bauh. Pin. Clus. See **EUPHORBIA** *chamaesyce*.

CHAMÆSYCE, Sloan. See **EUPHORBIA** *maurula*.

CHA-MA-HI, in *Geography*, a town of Asia, in the island of Formosa, N. lat. 22° 10'. E. long. 129° 14'.

CHAMAILLER is to fight against an enemy armed cap-a-pé.

CHAMAILLE'RE, in *Geography*, a town of France, in the department of the Puy-de-Dôme, and district of Clermont; 1 mile S.W. of Clermont.

CHAMANA, in *Ancient Geography*, a country of Asia, in Cappadocia, according to Ptolemy.

CHAMANIM, in the *Jeuxib Antiquities*, is the Hebrew name for that which the Greeks call *pyraia*, or *pyrateria*; and St. Jerom in Leviticus (ch. xxvi. 30.) has translated *simulacra*, in Isaiah (ch. xxvii. 9.) *delubra*.

These chamanim were, according to rabbi Solomon, idols exposed to the sun upon the tops of houses. Abenezra says, they were portable chapels or temples, made in the form of chariots in honour of the sun.

What the Greeks call *pyraia*, were temples consecrated to the sun and fire, wherein a perpetual fire was kept up. They were built upon eminences, and were large enclosures, without covering, where the sun was worshipped. Herodotus (lib. i. p. 87.) and Strabo (lib. xv.) speak of them; and the *gubres*, or worshippers of fire, in Persia and the Indies, have still these *pyraia*. Strabo says, that in his time there were many of these temples to be seen in Cappadocia, consecrated to the goddess Anaita, and the god Homanus. Anaita is, in all probability, the moon, and Homanus the sun.

The word *chamanim* is derived from *chaman*, which signifies to warm. Calmet.

CHAMARANDE, in *Geography*, a town of France, in the department of the Sene and Oise, and district of Etampes; 5 miles N.N.E. of it.

CHAMARIM, a word mentioned in several places of the Hebrew Bible, and generally translated the *priests of the idols*, or *priests clothed in black*, because *chamar* signifies black or blackness.

Chamar, in Arabic, signifies the moon; Isis is the same deity. Grotius thinks the Roman priests called *camilli*, came

came from the Hebrew *chamarim*. They, among the heathens, who sacrificed to the infernal gods, were dressed in black.

“Vidi egomet nigra fuccinctam vadere pallā
Canidiam pedibus nudis, passivo capillo.”

Hor. l. b. i. sat. 8. v. 23.

CHAMAVI, in *Ancient Geography*, a people of Lower Germany, placed by Ptolemy to the south of the *Bruderii*. M. d'Anville places them N.E. of the *Tencterii*. They occupied the parts adjacent to the Rhine.

CHAMAZLE, in *Geography*, a town of France, in the department of the Mayenne, and district of Château-Gouhier; 4 miles S.W. of it.

CHAMBE, a town of Armenia; 120 miles S.E. of Erivan.

CHAMBER, in *Architecture*, a member of a lodging, or piece of an apartment, ordinarily intended for sleeping in; and called by the Latins *cubiculum*.

The word comes from the Latin *camera*; and that, according to Nicod, from the Greek *καμαρα*, vault or curve; the term *chamber* being originally confined to places arched over.

A complete apartment is to consist of a hall, antechamber, chamber, and cabinet.

As to the proportions of *chambers*, their length should be to the breadth as $1\frac{1}{2}$ to 1, or some small matter less, but ought never to exceed that proportion; and, as for the height, it should be three-fourths of the breadth. The height of the chambers of the second story, should be a twelfth part less than the height of those below: thus, if the height of the first story be sixteen feet, that of the second will be fourteen feet eight inches. As to the height of the third story, it should be only three-fourths of the second.

In building bed-chambers, regard should be had as well to the situation of the bed, as to that of the chimney. For which reason, the chimney ought to be placed just in the middle, but distant from it about two feet, or two and an half, in order to make room for the bed, which prevents this inequality from being discerned. See *Bed-Chamber*.

CHAMBER Music, compositions for a small concert-room, a small band, and a small audience; opposed to music for the church, the theatre, or a public concert-room. See *Musica di CAMERA*.

CHAMBER, privy.—*Gentlemen of the Privy-CHAMBER* are servants of the king, who are to wait and attend on him and the queen at court, and in their diversions, progresses, &c.

Six of these are appointed by the lord-chamberlain, together with a peer, and the master of the ceremonies, to attend all ambassadors from crowned heads in their public entries. Their number is fifty.

Their institution is owing to king Henry VII. As a singular mark of favour, they are empowered to execute the king's verbal command, and without producing any written order; their person and character being deemed sufficient authority.

Mr. Pegge (in his “*Curialia*,” 4to. 1782) has a dissertation on the original nature, duty, &c. of the king's most honourable privy chamber. From this we learn, that the most ancient mention of “gentlemen” of the privy-chamber, is said to be in the “*Liber Niger domus Regis Angliæ*,” in the time of Edward IV. They are called “*esquires of household*,” in number 40.; “20 of them to be continually at court, in riding and going, at all times,

and to help to serve his table, &c.” A salary was appointed of 7½*d.* daily, while in waiting, and clothing winter and summer, or else 40*s.* The salary, afterwards enlarged, was taken off, early in the reign of James I., from which time the office appears to have been merely a post of honour.

It is conjectured their title was changed from “*esquires of the household*” to that of “*gentlemen of the privy-chamber*” in the reign of Henry VII., or early in that of Henry VIII. “From being anciently near, and almost,” says Mr. Pegge, “companionable officers to the royal person, they are now become the most remote, and seldom visible in their proper sphere, and scarcely distinguishable as such, above *triche* in a reign.” As no salary or emolument whatsoever attends the post at present, it may be asked, why it is so much sought after? The answer, as Mr. Pegge, observes, is very easy, and almost in *omnium ore*. “It is an exemption from serving the office of herald, and also from an arrest, without leave first obtained, together with other like immunities belonging to the royal servants.”

CHAMBER, in policy, is used for the place where certain assemblies are held; also for the assemblies themselves.

Of these there are various kinds; some established for the administration of justice; others for matters of commerce, &c. Of the first kind among us was the

Star-CHAMBER. See *COURT of Star-Chamber*.

CHAMBER, Imperial, is a court or jurisdiction held anciently at Spire, but since transferred to Wetzlar; in which are determined the differences arising among the princes and cities of the empire.

It was at first ambulatory: in 1473, it was fixed to Augsburg, then removed to Frankfort on the Maine, and thence to Worms, in 1495, where a diet was held by Maximilian I. to which period some have referred the institution of the Imperial Chamber, possessing supreme jurisdiction to judge without appeal in every question brought before it, and established with these powers, in order to terminate the right of private war: afterwards it was removed to Nuremberg and Ratisbon; again to Worms and Nuremberg; and from this last to Ellingen; thence, in 1527, to Spire; where Charles V. rendered it sedentary, in 1530: and here it continued above a century and a half. It is now fixed at Wetzlar.

At its first institution by Maximilian, it consisted of a president, who was always a nobleman of the first order, one of 16 assessors, or judges. The president was appointed by the emperor, and the judges partly by him, and partly by the states, according to forms which it is here unnecessary to describe. A sum was imposed, with their own consent, on the states of the empire, for paying the salaries of the judges and officers in this court. In consequence of the reformation, the number of assessors was increased. By the treaties of Westphalia, particularly that of Osnabrug, in 1648, it was decreed, that the Imperial Chamber should be composed of a Catholic judge, and four presidents, named by the emperor, two of each religion, and 50 counsellors, 20 of whom are Catholics, and the rest Protestants. But this chamber has been since reduced to a much smaller number of officers, being composed of the Elector of Trier, who is judge as bishop of Spire, of one Catholic and one Protestant president, and eight Catholic and seven Protestant counsellors. This court takes cognizance of all questions concerning civil right between the states of the empire, and passes judgment in the last resort, and without appeal. To it belongs likewise the privilege of judging in criminal causes, which may be considered as connected with the preservation of the public peace. Although the sentences of this, and also of the Aulic council, are final, there are, nevertheless, some cases in which the parties may appeal to the emperor,

and demand a revision of the process, particularly in those causes which regard to duchies, principalities, counties, and other immediate fiefs of the empire. In both these tribunals the emperor presides as sovereign judge, and when he is present, pronounces sentence; and in his absence, he, who represents his person as judge, has a right to wear an imperial sceptre as a badge of his dignity. Processes in the Imperial Chamber are almost endless, on account of the infinite number of ceremonies and formalities with which they are embarrassed. This court is frequently afraid to pronounce sentence, for fear of exposing its awards to some disgrace: the princes sometimes not permitting such to be executed as displease them.

CHAMBER of accounts, a sovereign court in France before the revolution, where accounts were rendered of all the king's revenues; inventories and avowals thereof registered; oaths of fidelity taken, and other things relating to the finances transacted. The French had also

CHAMBERS, ecclesiastical, which judged, by appeal, of differences arising on the paying of tithes: of these ecclesiastical chambers there were nine; viz. at Paris, Bourdeaux, Rouen, Lyons, Tour, Tholouse, Bourges, Pau, and Aix: they usually consisted of the archbishop of the place, as president; other archbishops and bishops, a deputy of each of the dioceses, and three counsellors of parliament. The chamber chose as many counsellors out of the clergy as it thought proper; as also a promoter.

CHAMBER, apostolical, at Rome, is that wherein affairs relating to the revenues and domains of the church and the pope are transacted.

CHAMBER of audientes, or grand CHAMBER, a jurisdiction that subsisted in each parliament of France. At the first institution of their parliaments, there were two chambers, and two kinds of counsellors; the one the *grand chamber* for audiences, the counsellors whereof were called *jugesurs*, who only judged; the other the *chamber of inquests*, the counsellors whereof were called *rapporteurs*, who only reported processes by writing.

CHAMBER, direction, is a court instituted in Old Spain, for the regulation of divers affairs relating to their commerce to the Spanish West Indies.

CHAMBER of the edict, or My-parti, was a court established by virtue of the edicts of pacification, in favour of those of the reformed religion: wherein the number of judges of either religion was the same; and to which recourse was had in all affairs wherein any of the protestants were concerned. This chamber is now suppressed.

CHAMBER of London. See CHAMBERLAIN.

CHAMBER of assurance, in France, denoted a society of merchants and others, established by a decree of the council of state in 1683, for conducting the business of insuring; but in Holland, it signifies a court of justice, where causes relating to insurances are tried.

CHAMBER of book-sellers, in Paris, denoted a society consisting of a syndic and assistants, elected by four delegates from the printers, and twelve from the book-sellers, whose business it was to superintend and regulate the trade of printing and selling books, prints, &c. In the visitation of books, performed by at least three persons of the society, all books are under the honour of God, and the welfare of the state; and all books printed in violation of their regulations and privileges, were confiscated.

CHAMBERS of commerce, are assemblies of merchants and dealers, where they treat about matters relating to commerce. Of these there were several, established in most of the chief cities of France, by virtue of an arret of the 30th of August, 1701. Indeed there were some before this

general establishment, particularly one at Marfeilles, and another at Dunkirk.

CHAMBERS of the king, regia camera, in our old records, are used for the havens or ports of the kingdom.

CHAMBER, in French, *chambre*, of a *battery*, in *Fortification*, is a dry place sunk under ground, and secured against rain or moisture, for holding and preserving powder, loaded shells, and fuses.

CHAMBER of a mine, is, strictly speaking, the place where the powder is lodged for springing it with. There one end of the fascion, by means of which the powder in the mine is fired, terminates. There are mines, that have only one chamber; and there are others that have several. The chamber of a mine has a platform (ceiling or top) of strong planks, supported on four upright timbers or posts, behind which planks are also fixed, for shutting up the sides and preventing the earth from tumbling down. A mine is sometimes excavated into the form of a parallelepiped, but generally into one resembling that of a cube; and it is not, perhaps, improper to observe, that there should not be any vacant or open spaces left in it, or any vent communicating with it, for these would occasion a great diminution of the effect of the powder employed for springing the mine.

CHAMBER of a port, is that part of the basin of a seaport, which is the most retired, and of the least depth, and to which damaged or dismantled vessels are carried in order to be repaired.

CHAMBER of a cannon, in *Military Language*. See CANNON.

CHAMBER of a mortar, is the place which contains the charge of powder. The chambers of mortars are of various and very different forms as well as dimensions, for an account of which see the article CANNON.

CHAMBERS, iron, in a *FIRE-ship*, are ten inches long, and 3.5 in diameter. They are breeched against a piece of wood fixed across the ports, and let into another a little higher. When loaded, they are almost filled with corned powder, and have a wooden tompon well driven into their muzzles. They are primed with a quick match thrust through their vents into the powder, with a part of it hanging out. When the ship is fired, they blow open the ports; and the port-lids either fall downward, or are carried away, and thus give vent to the fire out of the sides of the ship.

CHAMBER of a lock, in *Inland Navigation*, is the space within the gates, through which a boat rises or sinks, from one level to another of a canal or river. See *Plate of Canals*, V. fig. 36 and 37.

CHAMBERS of the eye, in *Anatomy*, are those spaces in front of the eyeball, which contain the aqueous humour.

The *anterior chamber* is the interval between the posterior surface of the cornea, and the iris.

The *posterior chamber* is the interval between the uvea and the front of the crystalline lens. For a further description of these, see *EYE, anatomy of*.

CHAMBERDEKINS, in our *Old Statutes*, a denomination for certain Irish beggars, which by statute 1 Hen. V. cap. 7 and 8. were to leave England within a certain time. They were called in the statute *chamber-deekyns*, and said to be clerks mendicants. Blount says they are called *chamber-deekins* in the parliament-roll.

CHAMBERET, in *Geography*, a town of France, in the department of the Correez, 15 miles N. of Tulle.

CHAMBERLAIN, an officer who has the managing or direction of a chamber.

The word *chamberlain*, according to Ragueau, originally signified a gentleman who was to sleep in the king's bed-chamber, at his bed's feet, in the absence of the queen.

There

There are almost as many kinds of *chamberlains* as chambers: the principal are as follow:

CHAMBERLAIN of England, Lord Great, an officer of great antiquity and honour; being ranked the sixth great officer of the crown: a considerable part of his function is at the coronation of a king; when he dresses him, carries the coif, sword, and gloves, to be used on that occasion; the gold sword and scabbard to be offered by the king; and the robe royal and crown; he also undresses him, and waits on him at dinner; having for his fee the king's bed, and all the furniture of his chamber, the night-apparel, and the silver basin wherein the king washes, with the towels.

To him likewise belongs the provision of every thing in the house of lords, in the time of parliament; to which end he has an apartment near the lords house. He has the government of the palace of Westminster, and issues out warrants for preparing, sitting out, and furnishing Westminster-hall, against coronations, trials of peers, &c.

He disposes of the sword of state, to be carried by whom he pleases; and when he goes to parliament, is on the right hand of the sword, the lord marshal being on the left. On all solemn occasions, the keys of Westminster-hall, of the Court of Wards, and Court of Requests, are delivered to him.

To him belong livery and lodging in the king's court; and he has certain fees from every bishop at his doing homage to the king, and from every peer at his creation. Under his command are, the gentleman-usher of the black rod, the yeoman-usher, and door-keepers.

The office of lord great chamberlain of England is hereditary; and where a person dies seized in fee of this office, leaving two sisters, the office belongs to both sisters, and they may execute it by deputy; but such deputy must be approved of by the king, and must not be of a degree inferior to a knight. 4 Bro. P. C. 146, 8vo.

This honour was long held by the earls of Oxford; viz. from the time of Henry I. by an estate-tail, or inheritance; but in later coronations by the marquis Lindsey, afterward duke of Ancaster, by an estate or inheritance from a daughter and her general; and settled in that family.

CHAMBERLAIN of the household, Lord, an officer who has the oversight and direction of all officers belonging to the king's chamber, except the precinct of the *bed-chamber*, which is absolutely under the groom of the stole.

He has the oversight and direction of the officers of the wardrobe, of the removing wardrobes, beds, tents, revels, music, comedians, hunting, messengers, trumpeters, drummers, handierasts, and other tradesmen retained in the king's service: as also of all sergeants at arms, physicians, apothecaries, surgeons, barbers, the king's chaplains, &c. and administers the oath to all officers above stairs. Under him is a vice-chamberlain; and both are always privy-counsellors. There is also a *Lord Chamberlain* of her majesty's household.

There were formerly *CHAMBERLAINS of the king's courts*, 7 Edw. vi. c. 1.; and there are *chamberlains* of the Exchequer, who keep a controlment of the pells, of receipts and exits: they also have in their custody the leagues and treaties with foreign princes, many ancient records, and the two famous books of antiquity, called Domesday Book, and the Black-book of the Exchequer; and also the standards of money, and weights and measures are kept by them. There are also *Under-chamberlains* of the Exchequer, who make searches for all records in the treasury; and are concerned in making out the tallies, &c. The office of chamberlain of the Exchequer is mentioned in the stat. 32 and 35 Hen. VIII. c. 14. Besides these, we read of a *chamberlain*

of North Wales, Stowe, p. 641. There is also a *chamberlain* of Chelster, to whom it belongs to receive the rents and revenues of that city; and when there is no prince of Wales, and earl of Chelster, he hath the receiving and returning of all writs coming thither out of any of the king's courts. See *COUNTRY-palatine*.

CHAMBERLAIN of London. This officer keeps the city-money, which is laid up in the chamber of London, an apartment in Guildhall: he also presides over the affairs of masters and apprentices; and makes free of the city, &c.

His office lasts but for a year, being chosen annually on Midsummer-day: but the custom usually obtains to re-choose the same person; unless he has been chargeable with any misdemeanor in his office.

CHAMBERLAIN, vice. See *VICE-Chamberlain*.

CHAMBERLAYNE, EDWARD, in *Biography*, the descendant of a good family at Odington, in Gloucestershire, was born in 1616, and educated in St. Edmund's Hall, Oxford, where he was graduated M. A. in 1641. During the civil wars, he travelled through most of the countries of Europe; and after the restoration was made one of the fellows of the Royal Society, then founded. In 1669 he was secretary to the earl of Carlisle, and sent to Stockholm with the order of the garter to the king of Sweden: in the following year he was graduated LL.D. at Cambridge; and in 1679 he was appointed to instruct George prince of Denmark in the English language. He died at Chelsea in 1703. Dr. Chamberlayne was the author of several pieces, political and historical, relating to the circumstances and events of his time; but he has been principally known by his "Anglice Notitia, or the Present State of England, with divers reflections upon the ancient state thereof;" Lond. 1668, 8vo.; of which a second part was published in 1671, 8vo. This was a popular work, and often reprinted during the author's life. It was enlarged by his son, and has been occasionally reprinted, so as to have arrived several years ago, at the 36th edition. A harmless instance of the author's vanity was recorded on his monument, viz. "That he caused some of his own books wrapped in cere-cloth to be buried with him, as they might possibly be of use to a remote age." The son of the former, *John Chamberlayne*, was educated at Trinity-college, Oxford, and became an industrious translator of works from foreign languages, of which he is said to have understood sixteen. His principal translations were "Otfervald's Arguments of the Books and Chapters of the Old and New Testament;" "Fontenelle's Lives of the French Philosophers;" Nieuweny's Religious Philosopher;" Brandt's History of the Reformation;" "The Lord's Prayer in 100 Languages;" "Dissertations, historical, critical, theological, and moral, on the most memorable events of the Old and New Testament." To the Royal Society, of which he was a member, he communicated those pieces, which are inserted in the Philosophical Transactions. After an useful and well-spent life he died in 1724.

CHAMBERLEN, HUGH, a celebrated accoucheur, was a native of London, and born about the middle of the 17th century. His father, Paul Chamberlen, and two of his brothers, were also practitioners in midwifery. They invented among them an instrument, the oblique forceps, with which they were enabled to deliver women with safety, in cases where, before this discovery, the life of the child was usually lost. Of this instrument Hugh Chamberlen gives the following account. "My father, brothers, and myself, (though none else in Europe that I know) have, by God's blessing, and our industry, attained to, and long practised a way to deliver women,

when the head, on account of some difficulty, or disproportion, cannot pass, without any prejudice to them or their infants; though all others (being obliged, for want of such an expedient, to use the common way) do and must endanger, if not destroy, one or both with hooks. By this manual operation, a labour may be dispatched, on the least difficulty, with fewer pains, and sooner, to the great advantage, and without danger, both of woman and child." Pref. to Chamberlen's *Transl. of Mauriceau*.

But though he attributes the merit of the discovery to his father and brothers conjointly with himself, yet as the father did not appear to have been acquainted with the instrument in the year 1665, when he published his "Midwives' Guide," a very indifferent performance; and the brothers have left no memorials of themselves; their names are little noticed. After establishing the reputation of the instrument here, Dr. Hugh went, in the year 1672, to Paris, expecting to gain equal credit there, and intending, it is supposed, to sell the invention; but undertaking to deliver a woman whose pelvis was too narrow to admit the head of the child to pass, without mutilating it, and the woman dying, as Mauriceau, who had seen her before, had predicted, he found himself so degraded, that he thought it advisable to quit Paris, and go to Holland. Mauriceau was not a little pleased at his discomfiture, of which he gives an account in the 2d vol. of his "Obl. sur la Grossesse," Obl. 26. Addressing himself to Dr. Chamberlen, he tells him, "he must not think the Parisian women were to be delivered with the same ease as the English." "Lui faisant entendre qu'il s'étoit bien trompé, en croyant trouver autant de facilité à accoucher les femmes à Paris, comme il avoit pu trouver à Londres."

In Holland he is supposed to have been more successful, and to have imparted the secret to Ruysh and Roonhuyfen, then in high reputation at Amsterdam, and to have received for his invention a considerable reward. He now returned to London, where he soon acquired a considerable fortune. "Not so much, Mauriceau says, from the use of his forceps, as from the information he had obtained by reading, and translating his "Observations sur la Grossesse." We have no doubt but Chamberlen obtained much information from Mauriceau's book, which was the best treatise then extant on the subject of midwifery; but his forceps had its share in raising him to the high rank he attained in his profession, and which he continued to enjoy to the end of his days. In 1683, he published his translation of Mauriceau's observations, which was received with great avidity, and has since been frequently reprinted. We have not been able to learn at what time Dr. Chamberlen died. His forceps, simplified, and improved by Smellie, and further varied and altered by other teachers, continues to be esteemed as one of the most valuable instruments used in the practice of midwifery, and deservedly gives the inventor a distinguished rank among the improvers of the art. Haller Bib. Chir. Sur Essais sur l'art des accouchemens.

CHAMBERRY, or CHAMBERY, in *Geography*, formerly the chief city of Savoy, now the capital of the department of Mont Blanc, and principal place of a district, is situated in a pleasant valley on the river Leise. It has a castle seated on an eminence, and is surrounded with mountains, but not fortified. Under most of the houses are piazzas, where people may walk without being incommoded in the worst weather. Its suburbs are large and handsome, and in the center of the town is the ducal palace. It contains two parochial churches, and 10,000 inhabitants; the north canton contains 14,565, and the south 14,989; the former contains 147½ kilometres and 12 communes, and the latter 195 kilometres and 17 communes. This town was taken by

the French in 1752. The height of the first floor at St. Jean Baptiste is 352 feet below the lake of Geneva, or 873 feet above the Mediterranean. It is 27 miles N.E. of Grenoble, and 85 N.W. of Turin. N. lat. 45° 35'. E. long. 5° 50'.

CHAMBERS, EPHRAIM, in *Biography*, a person whose name deserves to be particularly recorded in a work of this kind, as he was the first, who, in this country, formed the plan, and undertook the execution of a scientific dictionary, that might be said to comprehend the whole circle of the arts and sciences; and in this respect it differed from Harris's *Lexicon Technicum* which preceded it, and which furnished many of the mathematical articles. The few particulars that are known concerning him are collected and arranged by Dr. Kippis, in the last edition of the *Biographia Britannica*. The place of his nativity was Kendal, in the county of Westmoreland; but the time of his birth and the duration of his life, cannot, from any documents that remain, be precisely ascertained. His parents were Quakers; but when he came into the world, he does not seem to have manifested any attachment to their profession. In his education he probably enjoyed no advantages besides those that were necessary to qualify him for trade. At a proper age he was bound apprentice to Mr. Senex, the globe-maker; and during his residence with this skilful mechanic he acquired that taste for literature and science, which marked the progress and directed the occupation of his future years. At this early period he formed the design of his grand work, the "Cyclopædia;" and it is said, that some of the first articles of it were written behind the counter of Mr. Senex. Appreh that the execution of the plan which he had conceived was incompatible with the avocations of trade, he quitted business; and having made such arrangements as were necessary to procure for him a subsistence in the prosecution of it, he took chambers at Gray's-inn, where he chiefly resided during the remainder of his life. The first edition of the *Cyclopædia*, which must have been the result of many years' intense application, appeared in 1728, in two volumes, folio. It was published by subscription, at the price of four guineas, and the list of subscribers was very respectable. The dedication to the king is dated Oct. 15th, 1727. The reputation which Mr. Chambers acquired by the execution of this undertaking, procured him the honour of being elected into the Royal Society, Nov. 6, 1729.

In less than 10 years, a second edition became necessary, which was accordingly printed, with corrections and additions, in 1738. Instead of a new edition, the proprietors had proposed to give a new work. Mr. Chambers had actually prepared a considerable part of the copy with that view; and more than 20 sheets were printed off. In pursuance of this plan, it was their intention to have published a volume in 1737, and to have proceeded annually in supplying an additional volume, till the whole was completed. But they were diverted from executing their purpose, by a bill which passed in the House of Commons, though it was rejected in the House of Lords, and which obliged the publishers of all improved editions of books, to print the improvements separately. Whilst this edition was in agitation, Mr. Bowyer, the learned printer, had formed some extensive ideas of improving the dictionary; but the plan, whatever it was, did not appear to have been reduced to practice. About this time Mr. Bowyer had a dispute with Mr. Chambers concerning the title of the work, proposing to substitute "Encyclopædia" for "Cyclopædia." Mr. Chambers vindicated the title he had adopted, and persevered in retaining it. See the article CYCLOPÆDIA. The second edition of Mr. Chambers's dictionary was so favourably received by the public,

lie, that a third was called for in the very next year, 1737; a fourth, in 1741; and a fifth, in 1746. This rapid sale of a work, so large and expensive, must be considered, not only as a striking testimony of the general estimation in which it was held, but likewise, as a strong proof of its real utility and merit.

Although the Cyclopædia, denominated by Mr. Bowyer, "the pride of bookfellers, and the honour of the English nation," was the grand business of Mr. Chambers's life, and may be regarded as almost the sole foundation of his fame, his attention was not wholly confined to this undertaking. He was concerned in a periodical publication, entitled "the Literary Magazine," which was begun in 1735; and he also engaged, in conjunction with Mr. John Martyn, F.R.S. and professor of botany at Cambridge, in preparing a translation and abridgement of the "Philosophical History and Memoirs of the Royal Academy of Sciences at Paris." This work, which was comprised in 5 volumes, 8vo., did not appear till the year 1742, some time after our author's decease. Mr. Martyn, in a subsequent publication, has severely censured Mr. Chambers's part in this abridgement. The only other work ascribed to Mr. Chambers, is a translation of the "Jesuit's Perspective," from the French, in 4to., which has been several times reprinted. The indefatigable industry which Mr. Chambers employed in his literary and scientific collections, may be inferred from the account given by Mr. Airey, his amanuensis, who asserts that, between the years 1728 and 1733, he copied nearly 20 folio volumes, so large as to comprehend materials, which, if they had been printed, would have formed 50 volumes of the same size. Mr. Chambers, however, acknowledged, that, if they had been printed, they would neither have been sold nor read. Mr. Chambers, by his incessant application, so far impaired his health, that he was obliged to retire, occasionally, to a lodging at Canonbury-house, near Ilington; and to make an excursion to the south of France. At his return to England, he died at Canonbury-house, and was buried in Westminster Abbey, where the following inscription, written by himself, is placed on the north side of the cloisters of the abbey:

" Multis pervulgatus,
Pancis notus;
Qui vitam, inter lucem & umbram,
Nec eruditus, nec idiota,
Litteris deditus, transiit; sed ut homo
Qui humani nihil à se alienum putat.
Vita simul, & laboribus functus,
Hic requiescere voluit,
EPHRAIM CHAMBERS, R.S.S.
Obiit XV. Maii, M.DCC.XL."

" Heard of by many,
Known to few;

Who being neither very celebrated nor yet obscure,
Neither very learned nor yet ignorant,
Passed a life devoted to study;
And passed it as a man
Who was not inattentive

To any of the offices of humanity;
Having ended his days and his labours together,
Here wished to repose,
EPHRAIM CHAMBERS, F.R.S.
He died on the XVth of May,
M.DCC.XL.

The above narrative supplies us with no facts by which we may fix the age of Mr. Chambers. Supposing him to have been apprenticed at the age of 14, and to have quitted his service at 21; and conjecturing that he might be 60

years old when he died, there will remain a chasm of 27 years, from the termination of his apprenticeship to the year 1723, of which we have no account; but we may infer, from the extent of his work, which occupied his attention during this period, that he was fully employed. The intellectual character of Mr. Chambers seems to have been facility and attention. Indefatigable as a man of business, he had no leisure to pursue discoveries with the ardour of a philosopher. The whole occupation of his life seems to have consisted in collecting and communicating knowledge; and he undoubtedly possessed distinguished talents for the arrangement and illustration of the materials which he collected. His temper was cheerful, but impetuous; his mode of life reserved, solitary, economical, and regular. His literary labours unquestionably entitled him to more than he received; but the compensations which authors received from bookfellers, were, at that period, far inferior to what, in certain instances, they have lately risen.

It may not be improper, for gratifying the curiosity of the readers of this article, to terminate it with a brief account of the "Cyclopædia," or the effects which it has produced in the literary world. Whilst a sixth edition was preparing, the proprietors thought that the work might admit of a supplement in two additional folio volumes. This business was committed to the late George Lewis Scott, esq.; but he was prevented from proceeding far in it, by being appointed sub-preceptor to his present majesty, when Prince of Wales. The chief management was then committed to Dr. John Hill, so well known by his voluminous and hasty publications. In his name, together with that of Mr. Scott, the supplement was published; and though it contained a number of valuable articles, it was far from being uniformly conspicuous for judgment and due selection. The proprietors afterwards determined to combine the whole into one work; and after several ineffectual efforts for accomplishing their plan, the business devolved on the editor of this Cyclopædia, who derived from the favour of the public, and the singularly rapid and extensive sale of the work, a recompence, which, independently of every other consideration, he reckoned amply adequate to his labour. This edition began to be published in weekly numbers, in 1778, and the publication was continued without a single interruption, till it was completed in the year 1785. The work was dedicated and presented to his majesty. The popularity of the "Cyclopædia," gave rise to a variety of similar publications; of many of which it may be truly said, that most of the articles which compose them, are extracted verbatim, or at least with very few alterations and additions, from this dictionary; and that they manifest very little labour of research, or of compilation. One defect seems to have been common to them all, with hardly any exception; and that is, that they do not furnish the reader with references to the sources from which their materials are derived, and the authorities upon which they depend. This charge was alleged by the editors of the French Encyclopédie, with some justice, but at the same time with unwarrantable acrimony against Mr. Chambers. The editors of that work (see ENCYCLOPÆDIA) while they pass high encomiums on Mr. Chambers's Cyclopædia, blend with them censures that are unfounded. They say, e. g. that the "merited honours it hath received would, perhaps, never have been produced at all, if, before it appeared in English, we had not had in our own tongue those works, from which Chambers has drawn without measure, and without selection, the greatest part of the articles of which his dictionary is composed. This being the case, what must Frenchmen think of a mere translation of that work? It must excite the indignation of the learned, and

give just offence to the public, to whom, under a new and pompous title, nothing is presented but riches of which they have a long time been in possession?" They add, however, after appropriate and justly deserved commendation; "We agree with him, that the plan and the design of his dictionary are excellent, and that, if it were executed to a certain degree of perfection, it would alone contribute more to the progress of true science, than one half of the books that are known." However, what their vanity has led them to assert, viz. that the greatest part of Chambers's Cyclopædia is compiled from French authors, is not true. When Mr. Chambers engaged in his great undertaking, he extended his researches for materials to a variety of publications, foreign and domestic, and in the mathematical articles he was peculiarly indebted to Wolfius; and it cannot be questioned, that he availed himself no less of the excellent writers of his native land than those of France. As to the imperfections of which they complain, they were, in a great measure removed, as science advanced, by subsequent improvements; nor could the work, in its last state, be considered as the production of a single person. Nevertheless it cannot be conceived, that any scientific dictionary, comprised in four volumes, should attain to the full standard of human wishes, and human imagination. The proprietors, duly sensible of this circumstance, and of the rapid progress of literature and science in the period that has elapsed since the publication of Chambers's Cyclopædia, have undertaken a work on a much larger scale, which, with the encouragement already received and further reasonably expected, will, it is hoped, preclude most of the objections urged against the former dictionary. We shall here only add, that the compilers and editors of the French Encyclopædia, in their relative capacity, have produced a work, which, though entitled to the highest praise, is very far from being exempt from the imperfections of every human production. Of this the French themselves have not been unapprized: for notwithstanding the improvements successively made in the Paris Encyclopædia since its first appearance, it has been thought necessary to adopt a new plan, and to form upon it a work of immense bulk, which is gradually proceeding, and is not likely to be soon completed. See ENCYCLOPÆDIA and CYCLOPÆDIA. Biog. Brit.

CHAMBERSBURG, in *Geography*, a port-town of America, and the capital of Franklin county, in Pennsylvania. It is situated on the eastern branch of Conogochague creek, through which might be opened an easy communication with the Potowmac river; and principally consists of two large streets, intersecting each other at right angles, and leaving a public square in the center. It contains about 250 houses, handsomely constructed of brick or stone, two Presbyterian churches, a brick court-house, and a stone gaol. There is a printing-office in the town, and a paper-mill in its vicinity. The situation is favourable to trade and manufactures, and it has a lively and thriving appearance. The adjacent land is rich and fertile, and is highly cultivated. It is 157 miles W. of Philadelphia. N. lat. 39° 53'. W. long. 77° 30'.

CHAMBLEE, or **CHAMBLEY**, a handsome and well-built fort on a river of the same name in Canada, about 12 or 15 miles S.W. from Montreal, and N. of St. John's fort. This castle, built by the French, stands close to the rapids on the river, and at a little distance has a grand appearance; the adjacent country being very beautiful, and the whole together forming a most interesting scene. It is in tolerably good repair, and a garrison is constantly kept in it. It was taken by the Americans in 1775, and retaken by the British in 1776.

CHAMBLEE, or *Sorelle River*, a river of Canada, issuing from lake Champlain, and running to the river St. Lawrence near the island of St. Peter; 300 yards wide when lowest, shoal in dry seasons, and yet of sufficient breadth for rafting timber, &c. at the spring and fall.

CHAMBLIS, or **CHAMBLEY**, a town of France, in the department of the Oise, and district of Senlis; 13 miles W. S. W. of Senlis.

CHAMBOIS, a town of France, in the department of the Orne, and district of Argentan; 2 leagues N. E. of Argentan.

CHAMBON, a town of France, in the department of the Creuse, chief place of a canton in the district of Bouffiac; 8 miles E. of Gueret. The place contains 1482, and the canton 7143 inhabitants; the territory includes 255 kilometres and 16 communes.

CHAMBON, **LE**, a town of France, in the department of the Loire, and chief place of a canton, in the district of St. Etienne; 1 league S. W. of St. Etienne. The place contains 1245, and the canton 9805 inhabitants; the territory comprehends 137½ kilometres, and 12 communes.

CHAMBONLIVE, a town of France, in the department of the Correze, and district of Tulle; 5 miles E. of Uzerche.

CHAMBOSE, a town of France, in the department of the Rhone and Loire; 7 miles W. of Villefranche en Beaujolois.

CHAMBRANLE, in *Architecture* and *Joinery*, the border, frame, or ornament of stone, or wood, surrounding the three sides of doors, windows, and chimneys.

The chambranle is different in the different orders: when it is plain, and without mouldings, it is called, simply and properly, *band*, *case*, or *frame*.

The chambranle consists of three parts; the two sides, called *ascendants*; and the top, called the *traverse*, or *super-cilium*.

The chambranle of an ordinary door is frequently called *door-case*; of a window, *window-frame*.

CHAMBRE, **LA**, in *Geography, a town of Savoy, or of the department of Mont Blanc, and chief place of a canton, in the district of St. Jean-de-Maurienne, situated on the Here; 23 miles N. E. of Chambéry. The place contains 430, and the canton 4308 inhabitants, who are very subject to the goitre, or swelling of the neck; the territory includes 110 kilometres, and 9 communes.*

CHAMBRE, in *Military Language*, a defective concavity sometimes found in the thicknels of the metal in pieces of ordnance. *Un canon chambré* is a cannon badly cast, and liable to burst when fired.

CHAMBRER, or *faire chambrée*, is to put or collect together several soldiers or military people in one and the same chamber, in the same tent, or in one and the same barrack, for the purpose of eating, sleeping, and reposing themselves there.

CHAMBROIS, in *Geography*, a town of France, in the department of the Eure, and chief place of a canton, in the district of Berny; 5 miles W. of Berny. The place contains 1000, and the canton 11,262 inhabitants; the territory includes 225 kilometres, and 26 communes.

CHAMBRON, a town of the Netherlands, in the county of Hainaut, on the Dendre; 8 miles S. E. of Ath.

CHAM-CHOU-POU, a town of Chinese Tartary; 8 miles N. N. E. of Ning-yuen.

CHAMCHOUZ, a town of Armenia; 145 miles E. of Erivan.

CHAMEAU, in *Zoology*. The Bactrian camel is described

scribed under this name by Buffon. See *CAMELUS Bactrianus*.

CHAMEAU-Léopard, the French name of the camel-leopard, *CAMELOPARDALIS Giraffæ*, which see; called also by some late French writers *Chameau moucheté*.

CHAMEAU-Marin, in *Ichthyology*, the French name of *OSTRACION Turrillus*, Linn. which see.

CHAMEIASME, in *Botany*, Pluk. See *HOUSTONIA carnea*.

CHAMEIRAT, in *Geography*, a town of France, in the department of the Corveze, and district of Tullus; 3 miles S. W. of Tullus.

CHAMELET, a town of France, in the department of the Rhône, and district of Villefranche; 3 leagues W. of Villefranche.

CHAMELOT, in *Commerce*. See *CAMBLET*.

CHAMFER, or *CHAMFERET*, in *Architecture*, an ornament consisting of half a scotia; being a kind of small furrow, or gutter, on a column; called also *strix*, and *stria*.

CHAMFERING, or *CHAMFRAINING*, is used for cutting the edge, or end of any thing aloof, or BEVEL.

CHAMFRAIN, in *Military Language*, a sort of armour, that served as a defence for a horse in combats. It was made of metal or boiled leather. It covered the fore part of the head, in the form of an adjusted mask. The chamfrain had on the middle of it an adjusted piece of iron, round, and sufficiently large, terminating in a point, for piercing every thing opposed to it. The chamfrain of the count de St. Pol, at the siege of Harfleur in 1449, under Charles VII. was valued at fifty thousand crowns of the money of that time; and that of the count de Foix, at the taking of Bayonne, was valued at fifteen thousand crowns of gold.

CHAMIER, DANIEL, in *Biography*, a French protestant divine, was a native of Dauphiné, and, after having been long minister of Montelimart, went, in 1612, to occupy the post of professor of theology at Montauban. He was much employed by his party in political negotiation with the court, and on all occasions manifested inflexible resolution. He is said to have drawn up the famous edict of Nantes, and he presided in several synods, having an excellent talent for the conduct of public business. Nor was he less distinguished for learning. Among his works we may enumerate a treatise, "De Oecumenico Pontifice," commended by Scaliger; and his "Jesuits' Letters," or epistles addressed to him by fathers Coton and Armand, with his observations. But his greatest work was entitled, "Catholica Panitratia, or the Wars of the Lord," in 4 vols. 4to., left incomplete, and containing a detailed view of the controversies between the Papists and Protestants, and a refutation of cardinal Bellarmine. It was printed at Geneva, with a preface by Turretin; and an abridgment of it was published by Spanheim in 1643, in one vol. fol. He also wrote a "Corpus Theologicum," printed at Geneva in 1653. He united the functions of the divine and of the soldier, and was killed by a cannon ball at the siege of Montauban, in 1621. Gen. Dict.

CHAMILL, in *Geography*. See *HAMI*.

CHAMILLARD, STEPHEN, in *Biography*, an eminent antiquarian, was born at Bourges in 1656, entered among the Jesuits at Paris in 1673, and took the vows in 1690. He was for some years a teacher of the belles lettres and philosophy in the schools of the society, and a distinguished preacher for 20 years. His erudition in the science of medals is certified by two judges of unquestionable authority, viz. Vaillant and Ezechiel Spanheim. He wrote several dissertations on particular medals preserved in his own

and other cabinets, some of which were inserted in the *Mémoires de Trevoux*, and some collected in a volume, entitled "Dissertations sur plusieurs Médailles, Pierres gravées, & autres Monuments d'Antiquités," Paris, 4to, 1711. He is said, however, to have been imposed upon with respect to two medals, a Pacatianus and an Anna Faustina, which, after exercising his erudition and talent at conjecture in two elaborate dissertations, were proved to be fictitious. Father Chamillard published a learned edition of "Prudentius, in Usum Delphini," Paris, 1687, 4to. Moreri.

CHAMIR, in *Geography*, a fortified town of Arabia, in the country of Yemen; 50 miles N. E. of Loeha. It is situated in the middle of the territories of the confederates of Hafchid-u-Bakili, and it has cost the Imam no small trouble to retain possession of it. N. lat. 17° 15'. E. long. 43° 5'.

CHAMIRA, in *Botany*, Thuub. See *HELIOPHILA circaoides*.

CHAMITIS, Gært. from the MSS. of Solander, in the possession of Sir Joseph Banks. Clafs and order, *pentandria digynia*. Nat. ord. *Umbellata*, Linn. *Umbellifera*, Juss.

Gen. Char. *Umbel* none, or simple. *Invol.* none, or about eight-leaved. *Cal.* superior, five-toothed, permanent. *Cor.* petals five, ovate-oblong, obtuse, quite entire. *Stam.* filaments five. *Pist.* styles two, filiform; stigmas thickish; *Peric.* none. *Fruit* inferior, crowned with the calyx, divisible into two. *Seeds* two, egg-shaped, with three elevated lines on one side, flat on the other.

Sp. 1. *C. integrifolia*, Gært. tab. 22. fig. 4. Herb. of Sir Joseph Banks. "Leaves entire." *Stems* very short, branched, forming dense tufts. *Leaves* crowded, sheathing, linear-lanceolate; upper ones ovate-acuminate; sheaths egg-shaped, open, two-awned. *Flowers* white, solitary, terminating the little branches; peduncles capillary. *Fruit* small. Gærtner observes that this genuine umbelliferous plant is singular, not only on account of its solitary flowers, but also of its fruit, which is frequently divisible into three; as if the author of nature had compensated the defect of its umbel by the unusual number of its seeds. 2. *C. trifurcata*, Gært. tab. 22. fig. 4. Banks's Herb. "Leaves three-forked." *Leaves* crowded about the root, broad-linear, three-forked at the summit; segments divaricated, mucronate; sheaths broad, embracing the base of the stem. *Stem* quite simple, about two inches high, naked, or furnished with one sessile tricuspitate leaflet. *Invol.* shorter than the umbel; leaflets six or eight, linear, acuminate, permanent. *Umb.* simple, equal; rays from eight to ten. *Fruit* four times larger than that of the preceding species, narrowed above, somewhat compressed. Both species are natives of Terra del Fuogo.

CHAMITSCHÉ, in *Geography*, a town of Russia, in the government of Mogilev, on the borders of Poland; 40 miles S. S. W. of Mogilev.

CHAMKA, or *ЧЕМАКА*, a town of Asia, in the country of Thibet; 220 miles S. E. of Lassa.

CHAMMANÉNA, or *CAMMANÉNA*, in *Ancient Geography*, a district of Cappadocia Minor, which lay towards the west, and was watered by the river Haly.

CHAMNEISKOI, in *Geography*, a fortress of Russia, on the confines of China; 108 miles S. W. of Verch-Udinskoi.

CHAMOIS, in *Zoology*, a species of antelope, *Antilope rupicapra* of Pallas, Schrebers, Erxleben, and Gmelin; *Caprarupicapra* of Linnæus; *Rupicapra* of Pliny; *Le Chamois* of Buffon; *Grms* of Gesner; *Genus Aeliani et Herodoti Chobart*; and *Chamois Antelope*, Pennant. This animal is specifically known by having the horns erect, round, smooth, with the tips hooked backwards.

The chamois is about the size of the common goat. The head is of a whitish fawn colour, with a black, or brownish band, on each side. The hair of the body is short, like that of the stag, except in winter, when it becomes longer and thicker. It varies in colour according to the seasons of the year; in spring it is of a greyish ash-colour, in summer of a reddish fawn colour, in autumn of a fallow-brown mixed with black, and in winter of a blackish brown; the cheeks, chin, throat, outer parts of the ears, and the belly, whitish in general; and along the back is a narrow line of a blackish colour. The horns are about six inches long, or rather more, of a slender form, and placed nearly upright, with the tips unincurred, or bent backwards; these horns are slightly wrinkled towards the base, but have no appearance of annulations as in the rest of the antelope tribe. At the base of each horn, at the back part, is a longitudinal orifice in the skin, or lachrymal pit similar to that observed under the eyes of the common antelope. The tail is short, like that of the goat, and of a blackish colour.

Buffon's opinion of the chamois is well known. He believed the chamois, the wild, and the domestic goat to be only constant varieties of a single species, but all the later writers concur in separating the chamois from the goat; they have not only separated them as species, but divided them into two distinct genera, and not without sufficient reason. The chamois differs from the goat in having the horns small, almost smooth, and resembling that of the antelope in being destitute of the longitudinal ridge, so conspicuous in the horns of the goat tribe. The horns of the female goat are sometimes smaller than those of the chamois, but still possess the same longitudinal ridge or angle as those of the male. The lachrymal openings in the skin behind the horns distinguish also from the goat. The goat, in a state of nature, inhabits the very summits of the highest mountains; the chamois is an inhabitant of alpine regions, but only those of the second stage, and is rarely found in the loftier elevations. The chamois is also rather smaller, and less active than the goat; it is destitute of the beard, which in the goat is very long; and the hair of the goat is always long and thick, or bushy, while the chamois is very bare of hair, like the antelope during the summer season.

The chamois is the only species of antelope, except the saiga, that is found in Europe. It inhabits the mountains of Dauphny, Piedmont, and Germany, the alps of Switzerland and Italy, the Pyrenean mountains, several parts of Greece, and the mountains Caucasus and Taurus. It is an animal of a social nature, as four, five, or six are usually found in company together. Sometimes it appears in troops of fifteen or twenty together. There are certain times when they assemble in still greater numbers, and then again disperse in small parties over the mountains. The full-grown males have a strong and unpleasant odour, which is yet more powerful than that of the male goat during the coupling season, which is in September and October: the female brings forth its young in April and May. A young female chamois is in maturity at the age of eighteen months: they bring forth two or rarely three at a birth. The small ones follow the mother till September, or sometimes longer, if the hunters or the wolves do not disperse them. They are supposed to live 20 or 30 years.

During the summer the chamois prefers the sides of the more inaccessible mountains that are thickly clothed with forests, and which, by that means, are protected from the heat of the sun: it goes to pasture early in the morning, and in the evening only. It is also said to be an extremely timid animal, for when several of the chamois are as-

sembled together, one is placed as a centinel to warn the herd of the approach of any danger. Those who have observed the manners of the chamois attentively, affirm that it is only while they eat, that one of the herd is on the watch for this purpose, and in that case they agree with the mountain sheep, and various other animals; the centinel chamois gives the alarm of danger with a sharp hiss, upon which the whole herd flies off with the utmost rapidity. The flight of the chamois is very penetrating, and his scent remarkably acute. When it sees a man, it fixes its eyes upon him for an instant, and then flies off immediately. If the situation will admit, the animal retreats to the rocks, or some elevated point from which it can observe the objects of its apprehension, and again pursues its course, pausing at intervals, again to look back and notice the route of its pursuers, till it effects its escape, or is either overtaken or shot. In the chase it evinces every mark of extreme agitation and timidity. It feeds on herbs, making choice of the most delicate and tender parts, such as the flowers and young buds, especially those of an aromatic nature.

The flesh of the chamois is tolerable as an article of food, when in season; but is said, by its great heat, to engender fevers. The blood is extremely hot; they pretend that it possesses the same medicinal virtues as the blood of the ibex; the hunters sometimes mix the blood of the two animals together, and sell it for that of the ibex, which is in much request; or often tell that of the chamois alone for the blood of the latter. The skin of the chamois, when dressed, forms a kind of strong and supple leather of considerable utility for wearing apparel, as it takes a good dye either of yellow, brown, or black, and is remarkably durable.

The chase of the chamois is yet more dangerous than that of the ibex: even the mountaineers, who are accustomed from their infancy to climb the Alps, pursue them over the most desperate precipices at the peril of their lives, and accidents often happen to them, either in falling from the crags, or slipping on the ice in the pursuit. The hunters sometimes follow them with dogs; but the chamois often retreats to the rocky eminences sheltered with woods, where it would be impossible for the dogs, and difficult for the men, to approach them. The hunters occasionally assemble together, and dividing themselves into small parties, betake themselves to different stations; one party ascending the rocks by means of scaling ladders in the most convenient places near the steeper eminences, while another party is waiting in the route it is supposed the chamois will take when disturbed from its more inaccessible position; and other parties are again stationed in different avenues to intercept the animals, should they attempt to deviate from their usual track. In this manner many of the chamois are taken. They likewise kill them in the night time, or early in the morning when they quit the shelter of the woods to go out to graze. Most commonly, however, in the Alps, when the hunters discover a troop of the chamois, they rally out armed with their carbines, which they handle with much more facility than the fusil of the common huntsman, and pursuing the most secret ways over the rocks in different directions towards one rallying point, they come upon the herd by surprise, and kill them with little difficulty.

CHAMOMILE, in *Botany*. See MATRICARIA and ANTHEMIS.

CHAMOMILE, in *Gardening*. See ANTHEMIS.

CHAMOND, *St.*, in *Geography*, a town of France, in the department of the Loire, and chief place of a canton, in the district of St. Ltienne. The place contains 4067, and the canton 14,030 inhabitants. The territory includes 187½ kilometres, and 8 communes.

CHAMONIX,

CHAMONIX, a town of the department of Lemane, and chief place of a canton, in the district of Bonneville. The place contains 1511, and the canton 3426 inhabitants; the territory includes 385 kilometres, and 4 communes.

CHAMOS, or **CHAMOSH**, the idol or god of the Moabites.

The name of *Chamos* comes from a root, which, in Arabic, signifies to make haste; for which reason many believe *Chamos* to be the fun, whose precipitate course might well procure it the name of swift or speedy.

Further particulars may be seen in Calmet's Dissertation on Baal Peor and *Chamos*, prefixed to his comment on the Book of Numbers.

CHAMO-TAO, in *Geography*, a small island, near the coast of China, in the Eastern Sea. N. lat. 37° 58'. E. long. 120° 50'.

CHAMOUNY, or **CHAMOUNI**, a valley, and also a town or village, that lie at the foot of **MONT BLANC**, which see. The inhabitants of this valley still retain a considerable share of that peculiarity in their manners, for which they have long been noted. The men are solely employed in hunting the wild-goat, in searching for crystals, and in acting as guides to strangers, whose civility leads them to ascend and explore the eminences of **Mont Blanc** and its adjacent summits; while all other work, domestic and agricultural, is left to the women. Since this valley has attracted so many travellers, the inhabitants of "Prieuse" affect genteel expressions in conversation, which form a glaring contrast with their natural rusticity. They load the stranger with civilities; and it is surprising to hear these rough mountaineers make use of the polite language. Almost a century has elapsed since the famous Pocock first visited the valley of Chamouny. The inhabitants were then wild and rough as the mountains surrounding them; but purity of manners and innocence graced their unfrequented huts: now, it is said, gold and vice have found their way to them. The ground-floor of the inn at Chamouny, near the foot of **Mont Blanc**, is elevated 3367 feet above the Mediterranean. For an account of the glaciers of Chamouny, see **MONT BLANC** and **GLACIERS**.

CHAMOUX, a town of Savoy, or department of **Mont Blanc**, in the county of Maurienne; $4\frac{1}{2}$ miles N.W. of **Argentina**.

CHAMP DE BATAILLE, *Field of Battle*, in *Military Language*, is the ground on which an action is fought. The enemy, who obliges his adversary to quit this ground and abandon it to him, obtains the victory.

A good general must be sensible that the victory depends, in a great measure, on the nature of the field of battle; he is, therefore, always studious to derive primary advantages from the ground. The army that enjoys a superiority of position can act with so much the greater impetuosity against the enemy, who has to contend both with it and the advantages of ground.

A general who reckons chiefly on his infantry, against troops superior in cavalry, should choose positions that are broken, uneven, mountainous, steep, above all, enclosed; but if, on the other hand, he wishes to oppose his cavalry with advantage to infantry, he should endeavour to find ground a little elevated, but smooth, open, and not embarrassed or interrupted with woods, morasses, ditches, or enclosures.

CHAMP Clos. This was, from the commencement of modern history, and long afterwards, a place authorized by the laws made by sovereigns for the purpose, and consecrated to particular combats between those who wished to determine, in that manner, either a law-suit or dispute of

honour. This name was also given to the place destined or set apart for tournaments.

CHAMP de Mars, the *Field of Mars*, an open place or field in the neighbourhood of Paris, where the kings of France used frequently to review their troops, and where the French held their festivals after the revolution.

CHAMPS de Mars et de Mai, *Les*, in *Antiquity*, denoted those annual assemblies, which were held in the early period of the French monarchy, and in which whatever related to the general welfare of the nation was submitted to public deliberation, and determined by the suffrage of the people. These assemblies were called "Champs," because, according to the custom of all the barbarous nations, they were held in the open air, in some plain capable of containing the vast number of persons who had a right to be present: and they were denominated "Champs de Mars and de Mai" from the months in which they were held. Every freeman seems to have had a right to be present in these assemblies. In them every thing that concerned the happiness of their country, every thing that could be of benefit to the Franks, was considered and enjoyed. Clotharius II. describes the business and acknowledges the authority of these assemblies; "they are called," says he, "that whatever relates to the common safety may be considered and resolved by common deliberation; and whatever they determine, to that I will conform." The statutory clauses, or words of legislative authority in the decrees issued in these assemblies, run not in the name of the king alone. "We have treated," says Charlebert, in a decree A. D. 532, "in the assembly of March, together with our nobles, concerning some affairs, and we now publish the conclusion, that it may come to the knowledge of all." "We have agreed," says he elsewhere, "together with our vassals." Again, "it is agreed in the assembly in which we were all united." The Salic laws, the most venerable monument of French jurisprudence, were enacted in the same manner. In their charters, the kings of the first race are careful to specify that they were granted with the consent of their vassals. The historians likewise describe the functions of the king in these national assemblies in such terms, as imply that his authority there was extremely small, and that every thing depended on the court itself. These general assemblies also exercised supreme jurisdiction over all persons, and with respect to all causes. Moreover when any extraordinary aid was granted by freemen to their sovereign, it was purely voluntary. In the annual assembly of March or May, it was the custom to make the king a present of money, of horses or arms, or of some other thing of value. This custom was ancient, and derived from their ancestors the Germans. These gifts were considerable, and seem to have made no small part of the royal revenue. See on this subject the authorities cited by Dr. Robertson in his Hist. of Ch. V. vol. i. p. 431. &c.

CHAMPA, in *Geography*. See **CIAMPA**.

CHAMPACAM, in *Botany*, Romph. See **MICHELIA**.

CHAMPADA, in *Natural History*, the name of a tree common in the woods of Malacca, and bearing a fruit much valued by the natives. It is a large tree, very full of branches, and these are very knotty, and, when cut, throw forth a thick and acrid juice like that of the tithymal. The fruit grows on the trunk and thick branches of the tree: the first appearance toward this is a large button or bud; this by degrees opens into a flower consisting of a great number of leaves, among which, when open, are seen the rudiments of the fruit; this appears very small at first, but it soon grows to a very considerable bigness, being, when ripe, twelve or fourteen inches long, and as much in circumference; it is shaped much like a melon. The rind is green, and is all

over divided into small pentagons, in the center of each of which is a small black spot. The pedicle is thick and woody, and entering into the substance of the fruit, it divides itself into several branched fibres, which run through the whole substance of it, and meet in a point at the end. Within this large fruit there are contained a large number of kernels of the size of our common chestnuts, all hanging together in bunches, so as to resemble a cluster of grapes; these are confined in a narrow compass, being pressed firmly upon one another while the fruit is whole, but as soon as this is cut or burst open, they fly farther asunder, and hang to the stalks like grapes that are placed at a distance on the bunch, as some of our oblong kinds are. The people of Malacca are very fond of this fruit; they suck the pulpy matter which surrounds the kernels, and which is of a sweet and luscious taste, but of a disagreeable raw smell. The Indians are very fond of this fruit, as well for its qualities as its taste, for it is very heating, and when taken in large quantities, will inebriate people in the same manner as strong liquors. The kernels are much of the nature of our chestnuts, but of a less agreeable taste; they are eaten by way of food rather than as a delicacy, and the common way of eating them is boiled in water. Mem. Acad. Scienc. Par. 1699. p. 640.

CHAMPAGNAC-DE-BELAIR, in *Geography*, a town of France in the department of the Dordogne, and chief place of a canton in the district of Nontron; 12 miles N. of Périgueux. The place contains 784 and the canton 6117 inhabitants; the territory includes 107½ kilometers, and 12 communes.

CHAMPAGNE, PHILIP DE, in *Biography*, an eminent painter of history, portrait, and landscape, was born at Brussels in 1602, and received his earliest instructions from Bouillon and Michael Bourdeaux, two ordinary painters, and afterwards became a disciple of Fouquieries, under whose tuition he studied landscape. At the age of nineteen he visited Paris in his proposed journey to Rome, and by the practice of portrait painting with one L'Allemant, he made great progress in that branch of his art, as well as in history and landscape. During his residence at Paris, he formed an acquaintance and friendship with Nicolo Poussin, which were of great importance to him; and these artists were conjointly employed in painting the ornaments of the Luxembourg palace. On the death of Duchesne, whose daughter he married, he was appointed director of the queen's paintings, with a pension of 1200 livres a year, and apartments in the palace. At and near Paris he painted several historical pieces for churches and palaces, and several times took the portraits of the royal family, and of cardinal Richelieu. At the establishment of the Academy of Painting in Paris in 1648, he was one of the original members, and afterwards became professor and president. His assiduity in the exercise of his profession was such, that he arose at 4 in the morning, and in the course of the day allowed himself very little time for recreation. He painted with great facility, and paid particular attention to the subsequent correction of his pieces. Upon the arrival of Le Brun from Italy, though he had previously entertained the expectation of being first painter to the king, he manifested no dissatisfaction; but retiring from public business, indulged himself in the practice of his favourite art for his own amusement. He died in 1674. Champagne was correct in his designs, agreeable in his colouring, though it wants brilliancy, and well acquainted with the principles of perspective and architecture: nevertheless he partook of the coldness of his country, which had not been animated with the fire of Italy. De Piles observes, that all his knowledge consisted in a servile imitation,

in the performance of which he neither followed his genius, nor obtained the rules of art. His moral and sober character prevented his painting naked figures, indulging freely in fable, and painting even the portraits of the first nobility in France on a Sunday, though at other times he was very fond of getting money. His works, several of which have been engraved by the best masters, are very numerous in France; but a most capital picture of Champagne is Lewis XIII. kneeling before the Virgin and offering his crown. Pilkington. D'Argenville.

The nephew of the former, *John Baptist Champagne*, was born at Brussels in 1645, or, as some say, in 1643, and died in 1688. Having received instruction from his uncle, he visited Italy for the advantage of studying the works of the great artists. He adopted the style and manner of his uncle without deviating from them; but was inferior to him in design and execution. While he possessed many of his excellencies, he had also many of his defects. Pilkington.

CHAMPAGNE, in *Geography*, a town of France, in the department of the Ain, and chief place of a canton, in the district of Belley, 10 miles N. of Belley. The place contains 375, and the canton 6629 inhabitants; the territory includes 155 kilometers and 19 communes.

CHAMPAGNE, a town of France in the department of the Dordogne, and district of Ribera; 10 miles N. of Ribera.

CHAMPAGNE, before the revolution, a province of France, bordered on the E. by Lorraine and Franche Comté, on the S. by Burgundy and Nivernois, on the W. by the Isle of France and Picardy, and on the N. by Flanders; about 65 leagues long, and 45 broad: the land is fertile, and produces the celebrated wine called after its name, with much grain and pastoralage. It contained two archbishoprics, Reims and Sens, and four bishoprics, Langres, Chalons, Troyes, and Meaux. The principal rivers are the Seine, the Marne, the Aube, the Meuse, and the Aisne. The capital was Troyes. Champagne now comprehends the departments of Marne, Ardennes, Aube, and Haute Marne.

CHAMPAGNE, in *Heraldry*, a name given by Ferne, and some other writers, to the line differing from the common lines, and called also *urde*, and by Upton *ere*, from its resemblance to the ends of the figures of that sort of fur which is called *vair* by heralds.

CHAMPAGNE-Mouton, in *Geography*, a town of France, in the department of the Charente, and chief place of a canton, in the district of Confolens; 10 miles W. of Confolens. The place contains 1155, and the canton 6584 inhabitants; the territory includes 300 kilometers and 8 communes.

CHAMPAGNEY, a town of France, in the department of the Upper Saone, and chief place of a canton, in the district of Lure. The place contains 1968, and the canton 7691 inhabitants; the territory comprehends 180 kilometers and 9 communes.

CHAMPAGNOLE, a town of France, in the department of the Jura, and chief place of a canton, in the district of Poligny; 3 leagues S. E. of Poligny. The place contains 1474, and the canton 9906 inhabitants; the territory includes 300 kilometers, and 31 communes.

CHAMPAIN. See **CAMPAIGN**, and **CHAMPION**.

A Point CHAMPAIN, in *Heraldry*, is a mark of dishonour in the coat of arms of him who kills a prisoner of war after he has cried quarter.

CHAMPANS, in *Navigation*, are small flat-bottom vessels, used by the Chinese and Japanese. They have one main rigged in the same manner as the main-mast of a junk, with a single sail made of cane; they seldom exceed 80 tons burthen; are constructed without iron or nail, and are

unfit

unfit for rough weather. See *Sampans* under the article *BOAT*.

CHAMPART, in our *Old Customs*, a duty, or tenure by which the tenant was to pay part of the fruits of the ground to the lord. It is also written *champert*, and in the middle age Latin is called *campipars*, *camparcium*.

CHAMPARTORS, or **CHAMPERTORS**, are those who move pleas, or suits, or cause them to be moved, either by their own procurement or others; and sue them at their proper costs, to have part of the land, or other matter in variance: against whom lies a writ of *champarty*.

CHAMPARTY, or **CHAMPERTY**, *campipartitio*, in *Loes*, a maintenance of any man in his suit, upon condition of having part of the thing in question, be it lands or goods; in case it be recovered.

The word comes from the French, *champ*, field, and *parti*, divided; the field, or thing contested for, being supposed to be divided between the *champartor* or maintainer, who carries on the party's suit at his own expence, and the person in whose right he sues. 1 Hawk. P. C. 257.

Thus, *champarty*, in the French law, signifies a similar division of profits, being a part of the crop annually due to the landlord by bargain or custom. In our sense of the word, it signifies the purchasing of a suit, or right of suing;—a practice so much abhorred by our law, that it is one main reason why a *chose* in action, or thing of which one has the right but not the possession, is not assignable at common law; because no man should purchase any pretence to sue in another's right. These pests of civil society, says judge Blackstone, that are perpetually endeavouring to disturb the repose of their neighbours, and officiously interfering in other men's quarrels, even at the hazard of their own fortunes, were severely animadverted on by the Roman law: "qui improbe coeunt in alienam litem, at quicquid ex condemnatione in rem ipsius redactam fuerit iure eos communicantur, lege Julia de vi privata tenentur;" (P. 48. 7. 6.) and they were punished by the forfeiture of a third part of their goods and perpetual infamy.

This seems to have been an ancient grievance; for notwithstanding several statutes against it, and a form of writ accommodated to them in the time of Edward I. yet in that of Edward III. and also of Hen. VIII. it was enacted, that whereas redress on the former statute was only to be had in the King's Bench, which then followed the court: for the future it should likewise be cognizable by the justices of the Common Pleas, justices of assize, and justices of peace in their quarter-sessions: and this offence is punishable by common law and statute: the stat. 33 Edw. I. ft. 3. makes the offenders liable to three years imprisonment, and a fine at the king's pleasure. By stat. 28 Edw. I. c. 11. it is ordained, that no officer, nor any other, shall take upon him any business in suit, to have part of the thing in plea; nor shall any upon covenant give up his right to another; and if any do, and be convicted thereof, the taker shall forfeit to the king so much of his lands and goods as amounts to the value of the part purchased. The giving part of the lands in suit, after the end of it, to a counsellor for his reward, is not *champarty*, if there be no preceding bargain relating to such gift; but if it had been agreed between the counsellor and his client before the action brought, that he should have part for his reward, then it would be *champarty*. Bro. Champert. 3. And it is dangerous to meddle with any such gift, since it carries with it a strong presumption of *champarty*. 2 Inst. 564.

To this head may be referred the provision of the statute 32 Hen. VIII. c. 9. that no one shall sell or purchase any pretended right or title to land, unless the vendor hath received the profits thereof for one whole year before such grant, or hath been in actual possession of the land, or of the reversion or remainder; on pain that both purchaser and vendor shall each forfeit the value of such land to the king and the professor. Bl. Com. vol. iv. See *MAINTENANCE*.

CHAMPÇON, in *Geography*, a town of France, in the department of the Mayenne; 2 leagues N.E. of Mayenne.

CHAMPDENIERS, a town of France, in the department of the Two Sèvres, and chief place of a canton, in the district of Niort; 10 miles N. of Niort. The place contains 1193, and the canton 6410 inhabitants; and the territory includes 169 kilometres and 13 communes.

CHAMPDIEU, a town of France, in the department of the Rhone and Loire; one league N. of Montbrison.

CHAMPEAUX, WILLIAM DE, Lat. *Campellensis*, in *Biography*, a famous scholastic philosopher and divine, was born in the 17th century, at Champeaux, a village of Bril near Melun, and studied under Anselm of Lyon at Paris, in the church of which metropolis he was made archdeacon and scholastic. His reputation in teaching philosophy attracted many scholars, and particularly the celebrated Abelard. For an account of the jealousy excited by the merit of Abelard, see the article *ABELARD*. When the contentions occasioned by this jealousy terminated, De Champeaux retired, in 1113, to his bishopric of Chalons sur-Marne. Soon after his removal to this see, he was called upon to give his benediction as abbot to St. Bernard, with whom he contracted an intimate friendship. He was present at many councils, and distinguished himself by his religion, zeal, and knowledge of the scriptures. He died in 1121. He wrote several treatises on logical and theological subjects, and also a book of sentences; but the only work which has been printed was a small tract on the "Origin of the Soul," published in the 5th volume of D. Marten's *Treasure of Anecdotes*. MORERI.

CHAMPEAUX, in *Geography, a town of France, in the department of the Seine and Marne; 7 miles N.E. of Melun.*

CHAMPEIX, a town of France, in the department of the Puy-de-Dôme, and chief place of a canton, in the district of Issoire; 2½ leagues N.W. of Issoire. The place contains 1924, and the canton 10,762 inhabitants: the territory comprehends 155 kilometres, and 17 communes.

CHAMPIER, SYMPHORIEN, called also *Camparius*, and *Campesius*, in *Biography*, was born, as he informs us in one of his numerous productions, at St. Saphorise, a castle in the Lyonnais, in the year 1472. Of the course of his studies we have no information, but that he early attached himself to books, and that he was versed in the works of Plato, Aristotle, and the most abstruse of the writers then in vogue, the titles of many of his works shew. Such as "Symphonia Platonis cum Aristotele, Galei cum Hippocrate," &c. "Cribatio; Lima, et Annotamenta in Galeni, Avicennae et conciliatoris Opera;" and many similar trifles, which serve to shew the bad taste of the writer, and that he fell in with the humour of the times in which he lived. Champier took his degree of doctor in medicine at Pavia in the year 1515, and in 1520, he was made consul at Lyons, an honour he again enjoyed in the year 1533, on returning from Italy, where he had been attending on Anthony duke of Lorraine. That he was in great credit at this time, is shewn by his having for his correspondents the principal physicians and philosophers of the age, and by his having sufficient interest to found a college of physicians at Lyons, which was existing at the time of the revolution

n France. He died in 1535. For the titles of his works, and little more than the titles are now known, see Haller Bih. and Eloy. Dict. Histor. His son Claudes was author of a work "Sur les Singularités des Gaules."

CHAMPIGNELLE, in *Geography*, a town of France, in the department of the Yonne, and district of Joigny; 9 miles N. of St. Fargeau.

CHAMPIGNON, in *Gardening*. See AGARICUS.

CHAMPIGNY SUR VEUDE, in *Geography*, a town of France, in the department of the Indre and Loire; 2½ leagues S. of Chinon.

CHAMPION, properly signifies a person who undertakes a COMBAT, in the place or quarrel of another: though the word is also sometimes used for him who fights in his own cause.

Hottoman defines *champion*, *certator, pro alio datus in duello à campo dictus, qui circus erat decertantibus definitus*: hence also the word *camp-fight*.

Du-Cange observes, that champions, in the strict and proper sense of the word, were persons who fought in lieu of those who, being obliged by custom to accept the duel, had yet a just excuse for dispensing with it, as being too old, or infirm, being ecclesiastics, or the like. He adds, that the champions were usually retained or hired for sums of money, and were held infamous. There were also some vassals, who, by the faith and homage sworn to their lord, were obliged to fight for them in case of necessity.

Some authors maintain, that any person was allowed the benefit of a champion, excepting parricides, and those accused of very heinous offences.

This custom of deciding differences by combat, was derived from the northern parts of Europe; whence it passed into Germany, and, with the Saxons, into England, and insensibly through the rest of Europe. See DUEL.

When two champions were chosen, the one on the part of the accuser, and another on that of the accused, it was always required there should be a decree of the judge to authorize the combat. When the judge had pronounced sentence, the accused threw a gage, or pledge, ordinarily a glove, or gauntlet; which being taken up by the accuser, they were both taken into safe custody till the day of battle appointed by the judge. If either of them fled after this, he was declared infamous, and deemed to have committed the crime in question. Nor were the accuser and accused now allowed to make up the matter; at least, not without the consent of the judge; which was never granted, without making the lord satisfaction for the right of inheritance to the effects of the vanquished.

Before the champions took the field, their heads were shaved, and they made oath, that "they believed the person who retained them was in the right; and that they would defend his cause to the utmost of their power." Each of them also swore with his hand on the crucifix "on his faith in baptism, on his life, on his soul, and on his honour, that he verily believed he had good and just cause of quarrel, and that he had not besides either on himself, or on his horse, or in his arms, any herbs, charms, paroles, supplications, conjurations, pacts, or incantations, of which he wished to avail himself." The weapons they generally used in a combat were a sword and buckler; some say, in England, only a club and buckler: when on horseback, they were armed at all points. In a civil combat, on a writ of right, the only weapons allowed them were *bestons*, or staves, of an ell long, and a four-cornered leather target. Their weapons were blessed in the field by the priest, with great ceremony.

On the morning of the day appointed for the combat,

the two combatants set out on horseback with the visor taken off, and made their arms, both offensive and defensive, be carried before them. They proceeded slowly and slowly, having each of them in his hand the image of the saint, to whom he addressed his devotion, and in whom he placed confidence. Philippe-le-Bel, in authorizing combats, ordered the lists to be eighty paces long and forty broad. But in civil combats it was customary to make them only about sixty feet square. On one side of the list, a court was erected for the judges of the court of common pleas, who attended in their scarlet robes. That court was to sit by sun-rising; and proclamation being made, the champions were introduced by two knights, and were dressed in a suit of armour, with red sandals, bare-legged from the knee downwards, bare-headed, and with bare arms to the elbows.

The action then began; at the sound of a trumpet they were to go to blows; after the number of blows or rencounters expressed in the cartel, the judges of the combat threw a rod into the air, to advertise the champions that the combat was ended. If it lasted till night, or ended with equal advantage on either side, the accused was reputed victor.

The punishment of the vanquished was that which the crime merited, whereof he was accused: if it were a capital crime, the vanquished was disarmed, led out of the field, and immediately executed, together with the party whose cause he maintained. If the conquered champion fought in the cause of a woman, she was burnt.

In civil combat, the combatants were bound to fight till the stars appeared in the evening; and if the champion of the tenant was able to defend himself till the stars appeared, the tenant prevailed in his cause; or if victory declared itself for either party, by the death of the other, which seldom happened, or by his proving *recrants*, and pronouncing the word *CRAVEN*, judgment was finally given in his favour. Black. Com. book iii. p. 339. &c.

Combats, from the very commencement of the French monarchy, and for a number of centuries afterwards, were lawful acts, ordered by their kings, demanded and solicited by bishops, or prescribed by the same bishops, who had courts *ad hoc* within the interior of their cloisters, ornamented and prepared for each combat at the expense of the champions, whilst the same prelates excommunicated kings and whole families for marriages contracted in even the seventh degree of consanguinity. Pope Eugenius III. when consulted respecting these combats, answered by a bull, that ancient usage must be complied with and submitted to. It can therefore hardly be supposed, that such pontiffs, though the successors of St. Peter, were much guided or directed by the Holy Spirit.

CHAMPION of the king, is an officer, whose business is, at the coronation of the king of England, to ride into Westminster-hall, armed cap-a-pié, when the king is at dinner, and throw down his gauntlet by way of challenge; pronouncing by a herald, "That if any man shall deny, or gain say the king's title to the crown, he is there ready to defend it in single combat, &c." Which done, the king drinks to him, sending him a gilt cup with a cover, full of wine; which the champion drinks, and has the cup for his fee.

This office, ever since the coronation of Richard II. has been continued in the family of Dymocke, who held the manor of Scivelby in Lincolnshire, hereditary from the family of the Marmions, who had it before, by grand serjeanty; on condition that the lord thereof should be the king's champion. Accordingly, Sir Edward Dymocke performed

performed this office at the coronation of king Charles II. And a person of the name of Dymocke performed it at the coronation of his present majesty George III.

CHAMPION de Justice, a military order called *Angeliques Dorés de Saint Georges*. This order owed its institution to Constantine the Great, converted to the Catholic faith after a great victory, which he gained over the enemies of the Christian religion near *Miscence*. Wishing to confide the care of the *labarum*, which he had adopted for a banner, in place of the eagle of the former Romans, to intrepid defenders, he chose from amongst those of his officers, who had distinguished themselves most in that celebrated battle, fifty gentlemen, who were to constitute the number of knights or chevaliers, that were by his regulation to be charged with the care of the *labarum*, when he took the field. The mark of the order was a golden cross with eight points hemmed and enamelled with gules, marked with flower-de-luces, and carrying on one side of it these four letters, I. H. S. V. *in hoc signo vinces*, and on the reverse the image of Saint George piercing the dragon. The knights were subject to the same rules and restrictions as those of the order of Malta, except in the article of celibacy. This order rendered itself so celebrated by its exploits, and particularly at the battle of Lepanto in 1571, that it had thirty grand masters of the imperial house of Comnenus. A good many kings and sovereign princes requested to become knights, among whom were John Sobiesky, king of Poland; Ferdinand Marie, elector of Bavaria, the Emperor Leopold First, and the Emperor Charles the Fifth, who declared himself chief of that body, and chose that his son should carry the banner at the battle of Lepanto, in which the Mahometans lost thirty thousand men, and had 400 galleys sunk.

CHAMPION, or rather *CHAMPAIN-lands*, are lands not inclosed; or large fields, downs, or places without woods or hedges.

CHAMPL, in *Geography*, a river of Germany, in the circle of Bavaria, which runs into the Regen at Cham.

CHAMPLAIN, SAMUEL DE, in *Biography*, the principal founder of the province of Canada, was a native of Saintonge, and made his first voyages in the reign of Henry IV., as lieutenant to the Sieur de Monte. He visited all the harbours of Acadia, ran up the river St. Lawrence, gave a beginning to Quebec and Montreal, advanced to the lake still called by his name, and assisted the neighbouring savage tribes against the Iroquois. In another voyage he proceeded further up the river, and defeated the Iroquois in their own country. After his return to France in 1611 for the purpose of obtaining succours, he was sent back with the commission of king's lieutenant in 1612, and with proper requisites for fortifying Quebec. Here he remained, and was continued in his office under the associated company of Canada formed in 1628. But, in 1631, he was expelled with his other countrymen by the English; but, upon its being restored at the peace, he returned thither as governor-general in 1634, in which year he died. He maintained the character of an upright, courageous, active, and zealous officer in promoting the interest of his country, and of the settlement. He wrote, "Voyages and Travels in New France, called Canada," 4to. 1632, in which are many curious observations intermixed with instances of credulity. *Nouv. Dict. Hist.*

CHAMPLAIN, in *Geography*, a lake of North America, so called from the name of the subject of the preceding article, who first discovered it in 1608, whereas it was before his time called Corlaer's lake. This lake is next in size to lake Ontario, and lies nearly east from it, forming part of the line that

divides the states of New York and Vermont. The length from N. to S., says Morfe, is 80 miles; its breadth, where it is widest, 14; but according to Mr. Weld, (*Travels through North America*, vol. i. p. 299.) it is about 120 miles long, and of various breadths: for the first 30 miles, that is from South River to Crown Point, it is nowhere more than two miles wide; beyond this, for the distance of 112 miles, it is five or six miles across; then again it narrows, and at the termination of a few miles, again expands. That part called the "Broad Lake," because it is broader than any other, commences about 25 miles N. of Crown Point, and is 18 miles across in the widest part. Here the lake, which is said to occupy about 500,000 acres, is interperfed with a great number of islands, the largest of which, formerly called "Grand Isle, now "South Hero," says Weld, "North Hero," according to Morfe, is 15 miles long, and at a mean about four in breadth. The soil of this island is fertile, and it is said that 500 people are settled upon it. The other principal islands are North Hero, and Merte island. They reckon in the whole not less than 60. The Broad lake is nearly 50 miles in length, and gradually contracts till it ends in a large river called Chamby, Richelieu, or South Sea Chamblee. The foundings of lake Champlain, except at the narrow parts which terminate its extremities, are generally very deep; in many places 60, and 70, and in some 100 fathoms. In proportion to its breadth and depth, the water is more or less clear; in the broad part it is as pure and transparent as possible. On the west side as far as Cumberland Bay, the lake is, for the greatest part, bounded by steep mountains, close to the edge of the water; at Cumberland Bay the ridge of mountains runs off to the N. W., and the shore becomes low and swampy. The east, or Vermont shore, is not, in general, much elevated: at the distance, however, of 12 miles from the lake, is a considerable mountain; the shores on both sides are very rocky; the islands are almost encompassed with rocks, so that it is dangerous to approach them within one or two miles in particular parts. In sailing along the shore when a breeze is blowing, a hollow murmuring noise is heard from the waters splashing into the crannies of the rocks. There are many streams which fall into the lake; the mouths of these on the western side are obstructed by falls, so that none of them are navigable; some few of these on the eastern or Vermont side, are navigable by small boats to a short distance. The scenery along various parts of this lake is extremely grand and picturesque, particularly beyond Crown Point; the shores are there beautifully ornamented with hanging woods and rocks; and the mountains on the western side rise up in ranges one behind the other in a very magnificent manner. This lake is well stored with fish, particularly salmon, salmon-trout, sturgeon, and pickerel; and the land on its borders, and on the banks of its rivers, is fertile and productive. At Ticonderago, which lies near the southern part of the lake, it receives the waters of lake George from the S.S.W., which is said to be 100 feet higher than this lake. The waters in lake Champlain generally rise from about the 20th of April to the 20th of June, from four to six feet, the greatest variation being not more than eight feet. It is seldom shut up with ice, until the middle of January, and the ice generally goes off very rapidly between the 6th and 15th of April.

CHAMPLAIN, the most northerly township of Clinton county, in the state of New York, takes its name from the lake to which it is adjacent. It was granted to some Canadian and Nova Scotia refugees, who were either in the service of the United States during the war, or fled to them

for protection. The indigence or ill habits of these people occasioned the breaking up of the settlement; and it is now occupied by a better class of inhabitants. The lands are fertile; and through it run two rivers, well stored with fish. It has 575 inhabitants, and three slaves. By the late census of 1796, 76 of the inhabitants are electors.

CHAMPLÉMY, a town of France, in the department of Nièvre, and district of Clamecy; four leagues S.S.W. of Clamecy.

CHAMPLIÈTE, a town of France, in the department of the Upper Saône, and chief place of a canton in the district of Gray; 12 miles N. of Gray. The place contains 2654, and the canton 9758 inhabitants; the territory includes 230 kilometres and 20 communes.

CHAMPROND, a town of France, in the department of the Eure and Loire, and district of Nogent-le-Rotrou; 15 miles W. of Chartres.

CHAMPROUENT, a town of Savoy; nine miles N. of Chambéry.

CHAMPS, a town of France, in the department of the Cantal, and chief place of a canton, in the district of Mauriac; the canton contains 5219 inhabitants; the territory comprehends 133 kilometres, and five communes.

CHAMPTERCIER, a town of France, in the department of the Lower Alps, and district of Digne; three miles W. of it.

CHAMPTOCE, a town of France, in the department of the Mayne and Loire, and chief place of a canton in the district of Angers; four leagues W.S.W. of Angers.

CHAMTOCEAUX, a town of France, in the department of the Mayne and Loire, and chief place of a canton in the district of Beaupreau; the place contains 1113, and the canton 8397 inhabitants; the territory includes 220 kilometres and 8 communes.

CHAMPVANS, a town of France, in the department of the Jura, and chief place of a canton in the district of Dole; one league S.W. of it.

CHAMPVANT, a town of France, in the department of the Upper Saône, and chief place of a canton in the district of Gray; one league south of it.

CHAMTA, or **TCHAMTA**, a town of Asia, in the country of Thibet; 107 miles E. of Lassa.

CHAMTOA, a town of Asia, in the country of Thibet; 75 miles N.N.W. of Cont-choudsong.

CHAMUNY, a town, mountain, and valley of Savoy, in the lordship of Faucigny. See **CHAMOUNY**.

CHAMUSCA, a town of Portugal, in the province of Estremadura; three leagues N.E. of Santarem.

CHAMUTI, a river of Naples, which runs into the sea, six miles S.S.E. of Gracco.—**ALIO**, a town of Naples, in the province of Calabria Ultra; five miles S.S.W. of Gracco.

CHANA, or **CHANE**, in *Ancient Geography*, a navigable river of Asia, which discharged itself into the Cyrus, according to Strabo.

CHANAC, in *Geography*, a town of France, in the department of the Lozère, and chief place of a canton in the district of Marvejols, 2½ leagues S.W. of Mende. The place contains 1902, and the canton 5224 inhabitants; the territory includes 147½ kilometres and six communes.

CHANALD, a small island of Scotland, near the S.W. extremity of the island of Ila.

CHANAS, a town of France, in the department of the Isère, and chief place of a canton in the district of Vienne; four miles S.S.W. of Vienne.

CHANCALLO, a sea-port of South America, in the Pacific Ocean, on the coast of Peru; N.W. of Lima. S. lat. 12° 5'.

CHANCAY, a town of South America in Peru, and principal place of a jurisdiction belonging to that of Guana, in the archbishopric of Lima; situate about 10 leagues S. of Lima, in S. lat. 11° 35' 47". The town consists of about 300 houses and Indian huts: is very populous, and among other inhabitants, can boast of many Spanish families, and some of distinguished rank. Besides a parish church, it has a convent of the order of St. Francis, and an hospital chiefly supported by the benevolence of the inhabitants. The corregidor usually resides at Chacay, and appoints a deputy for Guana. The adjacent country is naturally very fertile, and every where well watered by canals, cut from the river Pissimayo, which runs about a league and a half to the southward of the town. These parts are every where sown with maize, for the purpose of fattening hogs, in which article is carried on a very considerable trade; the city of Lima being furnished from hence.

CHAN-CBAN, a town of Asia, in the kingdom of Corea; 12 miles S.W. of Loug-Kouang.

CHANCE, a term we apply to events, to denote that they happen without any necessary foreknown or intending cause: or it is used to denote the bare possibility of an event, when nothing is known either to prevent or hinder it.

Our aim is, to ascribe those things to chance, which are not necessarily produced as the natural effects of any proper cause, which we can discover; but our ignorance and precipitancy lead us to attribute effects to chance, which have necessary and determinate causes.

When we say a thing happens by chance, we really mean no more, than that its cause is unknown to us: not, as some vainly imagine, that chance itself can be the cause of any thing. Although Aristotle in his *Ethics* (l. iii. c. 3.), enumerating the active, efficient causes of events, mentions chance as one of them; these several causes, he says, are nature, necessity, and chance; and besides these, mind or intellect, and whatever operates by or through man. However, from the consideration that chance itself cannot be the cause of any thing, Dr. Bentley takes occasion to expose the folly of that old tenet, "the world was made by chance."

The case of the painter, mentioned by Plutarch, (*apud Tuxes*) who, unable to express the foam at the mouth of a horse he had painted, threw his sponge in despair at the piece, and, by chance, did that which he could not before do by design, is an eminent instance of the force of chance: yet, it is obvious, all we here mean by chance is, that the painter was not aware of the effect; or that he did not throw the sponge with such a view; so that with respect to him it was fortuitous, because he did not design or foresee such an effect: not but that he actually did every thing necessary to produce it; inasmuch that, considering the direction wherein he threw his sponge, together with its form, specific gravity, the colours wherewith it was smeared, and the distance of the hand from the piece, it was impossible, on the present system of things, that the effect should not follow.

Chance, says Dr. Bentley (see Boyle's *Lecture Sermons*, vol. i. p. 44.), is but a mere name, and really nothing in itself; a conception of our own minds, and only a compendious way of speaking, by which we would express, that such effects as are commonly attributed to chance, were really produced by their true and proper causes, but without their designing to produce them. And in any event called casual, if you take away the real and physical causes, there remains nothing but a simple negation of the agent's intending such an event; which negative being no real entity, but a conception only of man's intellect wholly extrinsic to the action, can have no title to a share in the production. The

DOCTRINE OF CHANCES.

adequate meaning of chance, as this ingenious writer observes, is a bare negation, signifying no more than this, that any effect among inanimate bodies, ascribed to chance, is really produced by physical agents, according to the established laws of motion, but without their consciousness of concurring to the production, and without their intention of such an effect. So that chance, in its true sense, is the same with nature, and both words are used promiscuously by some ancient writers (see Plato X. de Legibus) to express the same thing.

Chance is frequently personified, and erected into a chimerical being, whom we conceive as acting arbitrarily, and producing all the effects, whose real causes do not appear to us: in which sense the word coincides with the *Τύχη*, and *Fortuna*, of the ancients. See FORTUNE.

Chance is confounded with *Fate* and *Destiny*; and the word is also used for the manner of deciding things, the conduct or direction of which is left at large, and not reducible to any determinate rules or measures; or where there is no ground for preference; as at cards, dice, lotteries, &c.

The ancient *fortes*, or *chance*, M. Placette observes, was instituted by God himself; and in the Old Testament we find several standing laws, and express commands, which prescribed its use on certain occasions: hence the Scripture says, the *lot*, or chance, *fell on St. Matthias*; when it was in question who should fill Judas's place in the apostolate.

Hence also arose the *fortes sanctorum*, or method of determining things among the ancient Christians, by opening some of the sacred books, and pitching on the first verse they cast their eye on, as a sure prognostic of what was to befall them. The *fortes Homericae, Virgilianae, Prænestinae*, &c. used by the heathens, were with the same view, and in the same manner. See SORTES.

St. Augustine seems to approve of this method of determining things future, and owns that he had practised it himself; grounded on this supposition, that God presides over chance, and on Proverbs xvi. ver. 33.

Many among the modern divines hold chance to be conducted in a particular manner by Providence, and esteem it an extraordinary way which God uses to declare his will, and a kind of immediate revelation.

CHANCES, *doctrine of*. This subject, no less useful than it is curious, does not appear to have engaged the attention of mathematicians in former times so much as its importance required. Until the beginning of the last, or, at least, the middle of the preceding century, little is to be found in any of their writings concerning it. Of the few problems which they had been accustomed to investigate, they withheld the solutions both from the public and from each other, and they seem to have considered the doctrine of chances rather as an exercise for their ingenuity, than as capable of being applied to any useful purpose. Before Mr. Huygens published his book "De Ratiociniis in Ludo Aleæ," no person had treated the subject methodically, and, with the exception of Messrs. Pascal and Fermat, who had solved a few problems of no great importance or difficulty, he appears to have been the first who attempted either to give rules for the solution of any question, or to lay down the principles from which those solutions might be deduced. To him, therefore, we are indebted for the first regular tract on this subject; although even his work, from the comparatively few problems which it contains, and the want of demonstrations to some of them, can hardly be regarded as an *elementary* treatise. To this work succeeded a small anonymous tract "on the Laws of Chance," which was published in

London in 1692, and a French publication of not much larger size, entitled, "L'Analyse des Jeux de Hazard," which was written by M. Mommort, and published in the year 1708. In this latter work, the author having chiefly insisted on the same mode of reasoning with Mr. Huygens, in the solution of his problems, Mr. de Moivre, (who considered such reasoning as neither genuine nor natural,) was induced, in his celebrated work on the Doctrine of Chances, (which was first published in 1717,) to adopt a plainer and less exceptionable mode, in which he has proceeded from the most simple to the most complicated cases; so that, by the variety of his problems as well as by the improvements and additions which he has made in two subsequent editions, he has rendered his work one of the best and most copious that has ever been written on the subject. In the year 1740, Mr. Thomas Simpson, in consequence, as he observes, of the high price of the preceding, and the imperfections of other books on the subject, was led to publish a small treatise on "the Nature and Laws of Chance," which, like his other publications, is not only clear and concise, but contains some problems, whose solutions had either never been attempted, or, at least, never before communicated to the public. Prior, however, to the two last-mentioned publications, a posthumous work of Mr. James Bernoulli was published in the year 1713, entitled, "De Arte Conjectandi," containing an explanation of Mr. Huygens's tract, and the solution of a great variety of other problems deduced from the general principles of combination. The second part of this valuable work has lately been translated into English by Mr. Baron Maseres, with copious notes and commentaries, and it is to be regretted that the other parts had not been given to the public in the same manner.

In the first volume of his Mathematical Repository, published in the year 1748, Mr. Dodson has introduced the solution of several questions in the doctrine of chances; but chiefly with the view of applying them to the doctrine of annuities and survivorships, which constitutes the principal part of his work. In the year 1765, and at other times, M. D'Alembert in his *Opuscules*, &c. wrote different essays; and about 15 years ago M. Condorcet published a small treatise on the same subject. But as these works are almost wholly confined to the investigation of events, whose probability or improbability can be ascertained by no computation, they serve more to shew the ingenuity of the authors than to answer any useful purpose. In addition to these, which are the principal publications on this subject, may be noticed a small tract, "De Mensura Sortis," given by Mr. De Moivre, in his "Miscellanea Analytica," and some papers written by him, by Messrs. Bernoulli, Euler, and others, in the *Actes de Leipzig*, the *Journal des Savans*, the *Philosophical Transactions*, &c. among which may be particularly mentioned an "Essay on the Method of calculating the exact probability of all Conclusions founded on Induction, and a 'Supplement' to that essay:—the one preserved from the papers of the late Rev. Mr. Bayes, and communicated, with an appendix, by Dr. Price to the Royal Society in the year 1762; the other chiefly written by Dr. Price, and communicated in the following year. These tracts contain the investigation of a problem, the converse of which had formerly exercised the ingenuity of Mr. Bernoulli, De Moivre, and Simpson. Indeed, both the problem and its converse may justly be considered not only as the most difficult, but as the most important that can be proposed on the subject; having (as Dr. Price well observes) "no less an object in view than to shew what reason we have for believing that there are in the constitution of things fixed laws, according to which events happen; and that, there-

fore,

DOCTRINE OF CHANCES.

fore, the frame of the world must be the effect of the wisdom and power of an intelligent cause; and thus to confirm the argument taken from final causes for the existence of the Deity." While the solution of these problems require and display the highest mathematical skill, their application proves how much those are mistaken who have insinuated that the "doctrine of chances is of trivial consequence and unworthy of any serious inquiry." In truth, there is no part of the mathematics of more consequence, at least in this country, where the valuation of an immense property, and the future provision of many thousands entirely depend on a right knowledge of the subject. In addition to the tracts and papers already mentioned, it may be observed, that the last communication of Dr. Waring to the Royal Society, in the year 1791, contains the solutions of two theorems on this subject; but as the chief design of the present article is to explain the general principles on which all solutions in the doctrines of chances are founded, rather than to give a minute history of what has already been done, or an analysis of every particular case, it will be improper to proceed further with this account.

In order the more rightly to understand the subject it will be necessary to begin with the following definitions.

DEFINITION I. The *probability* of an event is the ratio of the chance for its happening to all the chances for its happening or failing: thus, if out of six chances for its happening or failing, there were only two chances for its happening, the *probability* in favour of such an event would be in the ratio of 2 to 6: that is, it would be a fourth proportional to 6, 2, and 1, or $\frac{1}{3}$. For the same reason, as there are four chances for its failing, the *probability* that the event will not happen, will be in the ratio of 4 to 6, or, in other words, it will be a fourth proportional to 6, 4, and 1, or $\frac{2}{3}$. Hence, if the fractions expressing the probabilities of an event's both happening or failing be added together, they will always be found equal to unity. For let a be the number of chances for the event's happening, and b the number of chances for its failing, the probability in the first case being $\frac{a}{a+b}$, and

in the second case $\frac{b}{a+b}$, their sum will be $= \frac{a+b}{a+b} = 1$.

Having therefore determined the probability of any event's either happening or failing, the probability of the contrary will always be obtained by subtracting the fraction expressing such probability from unity.

DEFINITION II. The *expectation* of an event is the present value of any sum or thing which depends either on the happening or on the failing of such event. Thus, if the receipt of one guinea were to depend on the throwing of any particular face on a die, the *expectation* of the person entitled to receive it would be worth 3s. 6d.; for since there are six faces on a die, and only one of them can be thrown to entitle the person to receive his money, the probability that such a face will be thrown being $\frac{1}{6}$ (according to Definition I.), it follows that the value of his interest before the trial is made, or which is the same thing, that his *expectation* is equal to *one-sixth* of a guinea, or 3s. 6d. Were his receiving the money to depend on his throwing either of two faces, his *expectation* would be equal to *two-sixths* of a guinea, or 7s. And, in general, supposing the present value of the money or thing to be received to be A , the probability of the event's happening to be denoted by a , and of its failing by

b , the *expectation* will be either expressed by $\frac{Aa}{a+b}$, or by

$\frac{Ab}{a+b}$, according as it depends either on the event's happening, or on its failing.

DEFINITION III. Several events are *inconsistent*, when, if one of them happens, none of the rest can: thus, if the sum S were to be received on throwing either an ace or a deuce with a single die, it is evident that the expectation in this case would depend on either of two events which are *inconsistent* with each other; for if one particular face is thrown it is impossible that the other should be turned up at the same time. And since the value on the ace's being thrown is $\frac{S}{6}$, and its value on the deuce's being thrown is also $\frac{S}{6}$, it follows that the whole expectation will be equal to S multiplied into the sum of the probabilities of the two events, or $\frac{1}{3}$; and this is universally true, whatever be the number of such events.

DEFINITION IV. Two events are *contrary*, when one or other of them must, and both together cannot happen.

DEFINITION V. An event is said to be *determined*, when it has either happened or failed.

DEFINITION VI. Events are *independent*, when the happening of any one of them does neither increase nor lessen the probability of the rest. Thus, if a person undertook with a single die to throw an ace at two successive trials, it is obvious (however his expectation may be affected) that the probability of his throwing an ace in the one is neither increased nor lessened by the result of the other trial.

THEOREM.

"The probability that two subsequent events will both happen, is equal to the product of the probabilities of the happening of those events considered separately."

Suppose the chances for the happening and failing of the first event to be denoted by b , and those for its happening only to be denoted by a . Suppose, in the same manner, the chances for the second event's happening and failing to be denoted by d , and those for its happening only by c ; then will the probability of the happening of each of those events,

separately considered, be, according to Definition I. $\frac{a}{b}$ and $\frac{c}{d}$ respectively. Since it is necessary that the first event

should happen before any thing can be determined in regard to the second, it is evident that the expectation on the latter must be lessened in proportion to the improbability of the former. Were it certain that the first event would happen,

in other words, were $a = b$ or $\frac{a}{b} = 1$, the expectation on

the second event would be $= \frac{c}{d}$. But if a is less than b , and

the expectation on the second event is restrained to the contingency of its having happened the first time, that expectation will be so much less than it was on the former supposition as $\frac{a}{b}$ is less than unity. Hence we have $1 : \frac{a}{b} = \frac{c}{d}$

$:\frac{ac}{bd}$ for the true expectation in this case.

Corollary. By the same method of reasoning it will appear, that the probability of the happening of any number of subsequent events is equal to the "product of the probabilities of those events separately considered," and therefore if a always denote the probability of its happening, and b the probability of its happening and failing, the fraction

$\frac{a^n}{b^n}$ will express the probability of its happening n times successively, and (by Definition I.) the fraction $\frac{b-a}{b^n}$ will express the probability of its failing n times successively.

Remark. It should be observed that, in some instances, the probability of each subsequent event necessarily differs from that which preceded it, while in others it continues invariably the same through any number of trials. In the one case the probabilities are expressed, as in the theorem, by fractions, whose numerators and denominators continually vary; in the other they are expressed, as in the corollary, by one and the same invariable fraction. But this perhaps will be better understood by the following examples.

1. Suppose, that out of a heap of counters, of which one part of them are white and the other red, a person were twice successively to take out one of them, and that it were required to determine the probability that these should be red counters. If the number of the white be 6, and the number of the red be 4, it is evident, from what has already been shown, that the probability of taking out a red one the first time will be $\frac{2}{5}$; but the probability of taking it out the 2d time will be different; for since one counter has been taken out, there are now only nine remaining; and since, in order to the 2d trial, it is necessary that the counter taken out should have been a red one, the number of those red ones must have been reduced to 3. Consequently, the chance of drawing out a red counter the 2d time will be $\frac{3}{9}$, and the probability of drawing it out the 1st and 2d time will (by this theorem) be $\frac{4 \times 3}{10 \times 9} = \frac{2}{15}$.

2. Suppose next, that with a single die, a person undertook to throw an ace twice successively: in this case the probability of throwing it the first, does not in the least alter his chance of throwing it the second time, as the number of faces on the die is the same in both trials. The probability, therefore, in each will be expressed by the same fraction, so that the probability, before any trial is made, will, by the preceding corollary, be $\frac{1}{6} \times \frac{1}{6} = \frac{1}{36}$. On these conclusions depend all the computations, however complicated and laborious, in the doctrine of chances. But this perhaps will be more clearly exemplified in the following problems, which, containing the solution of some of the most difficult and important cases, will serve to explain the principles on which every other investigation is founded in this intricate and exhausting subject.

PROBLEM I.

To determine the probability that an event happens a given number of times and *no more*, in a given number of trials.

Solution. 1. Let the probability be required of its happening only once in two trials, and let the ratio of its happening to that of its failing be as a to b . Then since the event can take place only by its happening the first, and failing the second time, the probability of which is $\frac{a}{a+b} \times \frac{b}{a+b} = \frac{ab}{(a+b)^2}$, or by its failing the first and happening the second time, the probability of which is $\frac{ba}{(a+b)^2}$, the sum of these two fractions, or $\frac{2ab}{(a+b)^2}$ will be the probability required.

2. Let the probability be required of its happening only twice in three trials. In this case the event, if it happens,

must take place in either of three different ways. 1st. By its happening the first two, and failing the third time, the probability of which is $\frac{a^2b}{(a+b)^3}$; 2dly. By its failing the first and happening the other two times, the probability of which is $\frac{b^2a}{(a+b)^3}$; or, 3dly. By its happening the first and third, and failing the second time, the probability of which is $\frac{aba}{(a+b)^3}$.

The sum of these fractions, therefore, or $\frac{3baa}{(a+b)^3}$, will be the required probability. By the same method of reasoning, the probability of its happening only *once* in three trials; or, which is the same thing, of its failing twice in three trials, may be found equal to $\frac{3bb^2a}{(a+b)^3}$.

3. Let the probability of the event's happening only once in four trials be required. In this case it must either happen the first and fail in the three succeeding trials—or happen the 2d and fail in the 1st, 3d, and 4th trials—or happen the 3d and fail in the 1st, 2d, and 4th trials—or happen the 4th and fail in the 1st, 2d, and 3d trials. The probability of each of these being $\frac{ab^3}{(a+b)^4}$, the required probability will be $\frac{4ab^3}{(a+b)^4}$; and for the same reason the probability of its happening three times and failing only once in four trials will be $\frac{4b^3a}{(a+b)^4}$.

4. Let the probability be required of its happening twice and failing twice in four trials: here the event may be determined in either of six different ways. 1st. By its happening the 1st and 2d, and failing in the 3d and 4th trials—2dly, by its happening the 1st and 3d and failing the 2d and 4th trials—3dly, by its happening the 1st and 4th and failing the 2d and 3d trials—4thly, by its happening the 2d and 3d and failing the 1st and 4th trials—5thly, by its happening the 2d and 4th and failing the 1st and 3d trials—or, 6thly, by its happening the 3d and 4th and failing the 1st and 2d trials. Each of these probabilities being expressed by $\frac{a^2b^2}{(a+b)^4}$, it follows that the sum of them, or

$$\frac{6a^2b^2}{(a+b)^4}$$

will express the probability required.

By proceeding in the same manner, the probability in any other case may be determined. But if the number of trials be very great, these operations will become exceedingly complicated, and therefore recourse must be had to a more general method of solution.

Supposing n to be the whole number of trials, and d the number of times in which the event is to take place, the probability of the event's happening d times successively, and failing the remaining $n-d$ times, will be $\frac{a^d}{(a+b)^d} \times \frac{b^{n-d}}{(a+b)^{n-d}} = \frac{a^d b^{n-d}}{(a+b)^n}$. But as there is the same probability of its happening any other d assigned trials and failing in the rest, it is evident that this probability ought to be repeated as often as d things can be combined in n things, which, by the known rules of combination, are $\frac{n!}{d! \times \frac{n-d!}{1} \times \frac{n-d!}{2} \times \frac{n-d!}{3}}$

DOCTRINE OF CHANCES.

continued to d terms; the general rule therefore will be $\frac{a^d b^{n-d}}{a+d}^n$ multiplied into $n \times \frac{n-1}{2} \times \frac{n-2}{3} \times \frac{n-3}{4}$ con-

tinued to d terms.
Example. Supposing a person with six dice undertakes to throw two aces and no more; or, which is the same thing, that he undertakes with one die to throw an ace twice, and no more, in six trials, it is required to determine the probability of his succeeding, a being in this case = 1, $b = 5$, $n = 6$, and $d = 2$, the above expressions will become = $\frac{5^4}{6^6}$, multiplied into $6 \times \frac{5}{2} = \frac{6 \times 5 \times 15}{4 \times 3 \times 2} = \frac{15}{2}$ very nearly. Hence, since there are only two chances for his succeeding, while there are eight for his failing, the odds against him will be as four to one.

PROBLEM II.

To determine the probability that an event happens a given number of times in a given number of trials; supposing, as in the former problem, the probability of its happening each time to that of its failing to be in the ratio of a to b .

Solution. It will be observed that this problem materially differs from the preceding, in as much as the event in that problem was restrained to that it should happen neither more nor less often than a given number of times, while in this problem the event is determined equally favourable by its happening either as often or oftener than a given number of times, so that in the present case there is no further restriction than that it should not fall short of that number.

1. Let the probability be required of an event happening once at least in two trials.—If it happens the first, and fails the second time, or fails the first and happens the second time, or happens both times, the event will have equally succeeded. The probability in the first case is $\frac{ab}{a+b}$, the prob-

ability in the second is $\frac{ba}{a+b}$, and the probability in the

third is $\frac{aa}{a+b}$; hence the probability required will be = $\frac{2ab + aa}{a+b}$.

2. Let the probability be required of its happening once in three times. Provided it has happened once at least in the first two trials, the event will have equally succeeded, whether it happens or fails in the third trial, and therefore $\frac{a^2 + 2ab}{a+b}$ will represent the probability in this case. But it may have failed in the first two and happened in the third trial, the probability of which is $\frac{bb}{a+b}$; adding this to the

preceding fraction, we have $\frac{a^3 + 3a^2b + 3ab^2}{a+b}$ for the probability required. In like manner the probability of its happening once at least in four trials will be $\frac{a^4 + 4a^3b + 6a^2b^2 + 3ab^3}{a+b}$

+ $\frac{a^4}{a+b}$ = $\frac{a^4 + 6a^3b + 6a^2b^2 + 4ab^3}{a+b}$, and the probability of its happening once at least in n times will be = $\frac{a^n + b^n}{a+b}$. In other words, since the event must happen

once at least, unless it fails every time, the probability required (by Def. 1.) will always be expressed by the difference between unity and $\frac{b^n}{a+b}$.

3. Let the probability be required of an event's happening twice at least in three trials. In this case it will succeed if it happens the 1st and 2d, and fails the 3d time, if it happens the 1st and 3d and fails the 2d time, if it happens the 2d and 3d and fails the first time, or if it happens each time successively. The first three probabilities are $\frac{a^2b}{(a+b)^3}$ and

the 4th is $\frac{a^3}{(a+b)^3}$; therefore the probability required will

be = $\frac{a^3 + 3a^2b}{(a+b)}$. If the event is to happen twice at least

in four times, the probability of its happening during the first three times has been already found. Let it be supposed to have happened only once in these times, the probability of which, by the preceding problem, is $\frac{3abb}{(a+b)}$; then will the probability of its happening the 4th, after having happened

once in the three preceding, be $\frac{3a^2b^2}{(a+b)}$, and therefore the

whole probability will be $\frac{a^4 + 3a^3b}{(a+b)}$ + $\frac{3a^2b^2}{(a+b)}$ =

$\frac{a^4 + 4a^3b + 6a^2b^2}{a+b}$. By proceeding in the same manner,

it may be found that the probability of an event's happening twice at least in five trials, will be = $\frac{a^5 + 4a^4b + 6a^3b^2}{a+b}$

+ $\frac{a}{a+b} \times \frac{4a^2b^2}{(a+b)}$ = $\frac{a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3}{a+b}$.

And if the probability of the event's happening twice in 4, 5, 6, &c. trials be required, they may, by pursuing the same

steps, be found = $\frac{a^6 + 4a^5b + 10a^4b^2 + 20a^3b^3}{a+b}$, &c. respectively. Hence

it follows, that if the binomial $a+b$ be raised to the n th power, the probability of an event's happening at least d times in n trials

will be = $\frac{a^n + na^{n-1}b + n \cdot \frac{n-1}{2} \cdot a^{n-2}b^2 + \dots + b^n}{(a+b)^n}$

that is, the series in the numerator must be continued till the index of a becomes equal to d .

Corollary. From this solution it appears that the series $b^n + n b^{n-1}a + n \cdot \frac{n-1}{2} b^{n-2}a^2$ to d terms, will express the

probability of the event's not happening so often as d times in n trials.

Example. Supposing a person with six dice undertakes to throw two aces or more in the first trial, what is the probability of his succeeding? In this case a, b, n , and d being respectively equal to 1, 5, 6, and 2, the above expression will become = $\frac{1 + 30 + 15 \times 25 + 20 \times 125 + 15 \times 625}{6^6}$

= $\frac{12,281}{46,656}$. Hence the odds against his succeeding will be as

34375 to 12,281, or very nearly as 2.8 to one.

DOCTRINE OF CHANCES.

PROBLEM III.

To determine the number of trials in which it shall become an equal chance, that an event happens d times; supposing fill the ratio of the event's happening to that of its failing in any single trial to be as a to b .

Solution. Let n be the number sought: then since it appears, from the preceding corollary, that the probability of the event's not happening d times in n trials is equal to $b^n + n b^{n-1} a + n \cdot n-1 a^2 b^{n-2} a^2 \dots (d)$

and since this expression, $\frac{b^n + n b^{n-1} a + \dots}{a + b^n}$, and since this expression, from the nature of the problem, must be $= \frac{1}{2}$, it follows

that the series $1 + \frac{na}{b} + \frac{n \cdot n-1 \cdot aa}{2 \cdot b \cdot b} + \dots (d)$ will be $= \frac{1 + \frac{a}{b}}{2}$, and therefore in order to obtain a solution of this problem, it will be necessary to find the unknown quantity n .

If a is $= b$, or, in other words, if the chances of the event's happening or failing are equal, the series will become simply $= 1 + n + n \cdot \frac{n-1}{2} + n \cdot \frac{n-1 \cdot n-2}{2 \cdot 3} \dots (d) = \frac{1 + 1^n}{2}$.

But the first half of the terms of the binomial $(1 + \frac{a}{b})^n$ are equal to the rest of the terms, or half the whole power, and the whole number of terms, in any binomial, raised to the n th power, is $= n + 1$. Hence it follows, that the exponent, n , in this case will always be $= 2d - 1$; so that supposing a counter to have a black and a white face, and that it were required to determine the number of throws which would be necessary to make it an equal chance, that either face should be turned up, 3, 4, 5, &c. times, the number thus required will be 5, 7, 9, &c.

If, on the contrary, instead of being equal, the ratio of b to a is indefinitely great, or, which is the same thing, if the fraction $\frac{a}{b}$ is indefinitely small; let this fraction be made

$= p$, then we have $1 + \frac{np}{1} + \frac{n^2 \cdot p^2}{2} + \frac{n^3 \cdot p^3}{2 \cdot 3} \dots (d) = \frac{1 + p^n}{2}$.

If, let d be $= 1$, then will the above equation become $a \times \log. 1 + p = \log. 2$; that is, (since $p = \frac{p}{2} + \frac{p^2}{3}$)

$-\&c.$ is equal the hyp. log. of $1 + p$) $n \times p - \frac{p^2}{2} + \frac{p^3}{3} - \&c. = \text{hyp. log. of } 2$, and consequently, in as much as p is indefinitely small, $n p = .69314$ &c. or $\frac{1}{2}$ very nearly.

2dly. Let d be $= 2$, and the equation in this case will be $1 + n p = \frac{1 + p^n}{2}$, or (making $n p = d + x$ and $a = d + 1$) hyp. log. of $2 + \text{hyp. log. of } a + x = n p$. But the fluxion of the hyp. log. of $a + x$ is $\frac{x}{a} - \frac{x \cdot x}{a^2} + \frac{x^2 \cdot x}{a^3} - \&c.$ whose fluent corrected is the hyp. log. of $a + \frac{x}{a} - \frac{x^2}{2a^2}$

$$+ \frac{x^3}{3a^3} + \&c.$$

VOL. VII.

Let s be made $=$ the hyp. log. of $2 + \text{hyp. log. of } a$, then will $d + x$ be $= s + \frac{x}{a} - \frac{x^2}{2a^2} + \&c.$ and $x + \frac{x^2}{2a \cdot a - 1} - \frac{x^3}{3a^2 \cdot a - 1} + \&c. = \frac{a \cdot s - d}{a - 1} = \frac{a \cdot s - d}{d}$. But this

series converges so extremely fast, that it will be necessary to take only the first term of it, and consequently x will be $= \frac{a \cdot s - d}{d}$, or $-.31237$. Hence $d + x (= n p)$ will be $= 2 - .31237 = 1.68763$ nearly.

3dly. If d be $= 3$, or $\frac{1 + p^n}{2} = 1 + \frac{np}{1} + \frac{n^2 \cdot p^2}{2}$, let $d + x$ as in the former case be $= n p$ and $a = d + 1$; let m also be $= 1 + d + \frac{d \cdot d}{2}$, then will $n p = \text{hyp. log. of}$

$2 + \text{hyp. log. of } m + a x + \frac{x^2}{2} = \text{hyp. log. of } 2 +$

Flu. $\frac{a \cdot x + x \cdot x}{m + a x + \frac{x^2}{2}} = \text{hyp. log. of } 2 m + \frac{a x}{m} + \frac{m - a \cdot a \cdot x^2}{2 m^2}$

$+ \frac{2 a a - 2 m - m a}{6 m^3} \cdot x^3 + \&c.$ or (making $s = \text{hyp. log.}$

$2 m$) $x + \frac{a a - m \cdot x^2}{2 \cdot m \cdot m - a} + \frac{2 m + m a - 2 a a \cdot x^3}{6 m^2 \cdot m - a} + \&c. = \frac{m \cdot s - d}{m - a} = \frac{2 m \cdot s - d}{d d}$, or, (neglecting all the terms in

this series except the first) $x = \frac{2 m \cdot s - d}{d d} = .-.3168$.

Hence we have $n p = 3 - .3168 = 2.6832$. By proceeding in the same manner when d is $= 4$, the value of x may be found $= \frac{1 \cdot 2 \cdot 3 \cdot m \cdot s - d}{d^3}$ (m being in this case

$= 1 + d + \frac{d d}{2} + \frac{d^3}{6}$). And universally if m be made $= 1 + d + \frac{d d}{2} + \frac{d^3}{6} + \&c. (d)$ and $s =$

the hyp. log. of $2 m$; the value of x will always be $= \frac{1 \cdot 2 \cdot 3 \cdot 4 \dots d - 1 \cdot m \cdot s - d}{d^{d-1}}$, which, in every case, may

be found very nearly equal to $-\frac{3}{10}$; so that when the ratio of b to a is indefinitely great n will always be very nearly $= \frac{d - 3}{d} \times \frac{b}{a}$; and since it is $= 2 d - 1$ when b and a are equal, it follows that the true value in all intermediate cases

must be between these limits, or nearly $= \frac{b}{a} \times d - .3 + \frac{d - 1}{d} \cdot .7$. If d , however, be a great, and $\frac{a}{b}$ a small number, the value will be expressed with sufficient accuracy by the

fraction $\frac{b \cdot d}{a}$.

Example 1. In how many throws with four dice may it be undertaken to turn up the four aces.

Ans. The number of chances for the event's failing in any single

DOCTRINE OF CHANCES.

single trial being $6^4 - 1 = 1295$, while there is only one chance for its happening, $\frac{b}{a}$ will be $= \frac{1295}{1}$, and the number required will be $= 1295 \times 1 - .3 + 1 - .3 = 997$.

Example 2. In how many throws with four dice may it be undertaken to turn up 15 points twice?

Ans. The number of chances for throwing 15 points with 4 dice being 140 (see Prob. VII.), and the number of chances for missing being $6^4 - 140 = 1156$, $\frac{b}{a}$ will be equal to $\frac{1156}{140}$, and therefore the number required will be $= \frac{1156}{140} \times 2 - .3 + 2 - .3 = 15$ nearly.

Example 3. Supposing a lottery, like that for the present year (1806), consisting of 25,000 tickets, of which 20 are to be prizes of 1000l. and upwards; how many tickets must be bought in order to make it an equal chance that the purchaser has one of those prizes?

Ans. In this case $\frac{b}{a}$ is $= \frac{24980}{25}$, and, therefore, the number required will be $= 1249 \times 1 - .3 + 1 - .7 = 875$ nearly.

It may be observed, that in this lottery the whole number of prizes of every description being 5210, it may be found by the preceding rule that it will be necessary to buy about 3 tickets, in order to make it an equal chance that the purchaser has a prize.

PROBLEM IV.

Suppose a given number (n) of counters of the same shape and size, but marked with different colours, (of which a are white, b are red, c are blue, &c.) to be mixed promiscuously, and that a given number (m) of them were to be taken out at random; it is required to determine the probability that there shall be precisely p white, q red, r blue, &c.

Solution. By the well known rules of combination, the number of ways in which a things may be combined, so that there shall be p things in each parcel, is $= \frac{a \cdot a - 1 \cdot a - 2 \cdot a - 3 \dots (p)}{1 \cdot 2 \cdot 3 \cdot 4 \dots (p)}$; the number of ways in which b things may be combined, so that there shall be q things in each parcel, is $= \frac{b \cdot b - 1 \cdot b - 2 \dots (q)}{1 \cdot 2 \cdot 3 \dots (q)}$; the number of ways in which c things may be combined, so that there shall be r things in each parcel is $= \frac{c \cdot c - 1 \cdot c - 2 \dots (r)}{1 \cdot 2 \cdot 3 \dots (r)}$, and so on.

The number of ways, therefore, in which, $a, b, c, \&c.$ things may be combined, so that there shall be p of the 1st, q of the 2d, r of the 3d, $\&c.$ will be $= \frac{a \cdot a - 1 \cdot a - 2 \dots (p)}{1 \cdot 2 \cdot 3 \dots (p)} \times \frac{b \cdot b - 1 \cdot b - 2 \dots (q)}{1 \cdot 2 \cdot 3 \dots (q)} \times \frac{c \cdot c - 1 \cdot c - 2 \dots (r)}{1 \cdot 2 \cdot 3 \dots (r)} \times \&c.$ But the number of ways in which n things may be combined, so that there shall be m things in each parcel, without any restriction as to their being composed of any particular sort, is $= \frac{n \cdot n - 1 \cdot n - 2 \dots (m)}{1 \cdot 2 \cdot 3 \dots (m)}$. It follows, therefore, that in taking out m (or $p + q + r + \&c.$) counters,

the probability that there shall be precisely p of white, q of red, r of blue, &c. will be expressed by the fraction
$$\frac{a \cdot a - 1 \cdot a - 2 \cdot \&c. (p) \times \frac{b \cdot b - 1 \cdot b - 2 \cdot \&c. (q) \times \dots \times \frac{n - 1}{2} \times \frac{n - 2}{3} \times \frac{n - 3}{4} \times \dots \times \frac{c \cdot c - 1 \cdot c - 2 \cdot \&c. (r) \&c.}{1 \cdot 2 \cdot 3 \cdot \&c. (m)}}{1 \cdot 2 \cdot 3 \cdot \&c. (m)}$$

Example. Supposing that out of a heap of 30 cards, consisting of 12 diamonds, 10 spades, and 8 clubs, 3 be taken out; it is required to determine the probability that there shall be one of each sort. Because n , the number of things, is $= 30$; m , the number of things taken out, $= 3$; $a = 12$, $b = 10$, $c = 8$, and $p, q,$ and r each $= 1$, the above expression will be $= \frac{12 \times 10 \times 8}{30 \times \frac{2}{2} \times \frac{28}{3}} = \frac{48}{203}$.

Hence, the odds are as 155 to 48, or rather more than three to one against the contingency above-mentioned. If nine were taken out, of which four were to be diamonds, three spades, and two clubs, the odds against their being taken in that order would be very nearly 22,250 to one.

Corollary. If only counters of one colour are to be taken out, the fraction will be simply $= \frac{a \cdot a - 1 \cdot n - 2 \cdot a - 3 \dots (m)}{n \cdot n - 1 \cdot n - 2 \cdot n - 3 \dots (m)}$.

If counters of two colours, m will become $= p + q$, and the fraction expressing the probability will be $= \frac{a \cdot a - 1 \cdot a - 2 \dots (p) \times \frac{b \cdot b - 1 \cdot b - 2 \dots (q)}{1 \cdot 2 \cdot 3 \dots (m)}}{n \cdot n - 1 \cdot n - 2 \cdot n - 3 \dots (m)}$. But if either p or q , and consequently a and b are very large numbers, the great multitude of terms involved in the operation will render it almost impracticable, and therefore it becomes necessary to have recourse to some method of reducing the labour.

Since the denominator $\frac{n \cdot n - 1 \cdot n - 2 \dots (m)}{1 \cdot 2 \cdot 3 \dots (m)}$ is $= \frac{n \cdot n - 1 \cdot n - 2 \dots (a)}{m \cdot m - 1 \cdot m - 2 \dots (p)} \times \frac{n \cdot n - a \cdot n - a - 1 \dots (a)}{1 \cdot 2 \cdot 3 \dots (a)}$ $\frac{n \cdot n - a \cdot r \cdot \&c. (m - a)}{m \cdot m - 1 \cdot m - 2 \dots (p)}$ $\frac{b \cdot b - 1 \cdot b - 2 \dots (m - a)}{1 \cdot 2 \cdot 3 \cdot 4 \dots (q)}$, the fraction will be $= \frac{a \cdot a - 1 \cdot a - 2 \dots (p) \times \frac{b \cdot b - 1 \cdot b - 2 \dots (q)}{1 \cdot 2 \cdot 3 \dots (a)} \times \frac{n \cdot n - 1 \cdot n - 2 \cdot n - 3 \dots (m)}{1 \cdot 2 \cdot 3 \dots (m)} \times \frac{a \cdot a - 1 \cdot a - 2 \dots (p) \times b \cdot b - 1 \cdot b - 2 \dots (q)}{n \cdot n - 1 \cdot n - 2 \dots (a)}$ $\&c. (g) \times m \cdot m - 1 \cdot m - 2 \dots (p)$. But the last factor $\times \frac{b \cdot b - 1 \cdot b - 2 \dots (m - a)}{1 \cdot 2 \cdot 3 \dots (m - a)}$

of b , $b-1$, $b-2$ &c. $(m-a)$ is $b-m+a+1$, therefore the first and following terms of the fraction $\frac{b \cdot b-1 \cdot b-2 \dots (q)}{b \cdot b-1 \cdot b-2 \dots (m-a)}$ will be $a+b-m$, $a+b-m-1$, &c. or (making $a+b-m=v$) $v \cdot v-1 \cdot v-2$ &c.; hence the required probability will be $\frac{a \cdot a-1 \cdot a-2 \dots (p) \times v \cdot v-1 \cdot v-2 \dots (a+q-m)}{1 \cdot 2 \cdot 3 \dots (n \cdot n-1 \cdot n-2 \dots)}$

$\frac{\times m \cdot m-1 \cdot m-2 \dots (p)}{n-3 \dots (a)}$ If counters of three colours are taken out, the fraction expressing the probability that there shall be p of a fort, q of b fort, and r of c fort, will, by pursuing the same steps, (and making $d=a+b+c-m$) be reduced to $\frac{a \cdot a-1 \cdot a-2 \dots (p) \times b \cdot b-1 \cdot b-2 \dots (q) \times c \cdot c-1 \cdot c-2 \dots (r)}{1 \cdot 2 \cdot 3 \dots (n \cdot n-1 \cdot n-2 \dots)}$

$\frac{\cdot b \cdot b-2 \dots (q) \times d \cdot d-1 \cdot d-2 \dots (a+b+r-m) \times m \cdot m-3 \cdot m-4 \dots (a)}{n-3 \cdot n-4 \dots (a+b)}$ which will also greatly lessen the labour, provided a , b , p , and q are not very large, and that r be always put to denote the highest number.—In short, if only one set of counters or things be very numerous, and the others inconsiderable, an expression will always be obtained by proceeding in this manner which shall give the probability required with very little trouble.

Example. Supposing a lottery like that of the present year (1806) to consist of 25000 tickets, of which three are to be prizes of 20,000. each, and three of 10,000. each; and that a person had purchased 3000 of those tickets.—What is the probability of his having among them one prize of 20,000. and one prize of 10,000? In this case n is equal to 25,000., $a=3$, $b=3$, $p=1$, $q=1$, $m=3000$, $r=2998$, and $d=22,000$; hence the above expression becomes $\frac{3 \times 3 \times 22000 \times 21,999 \times 21,998 \times 21,997}{25,000 \times 24,999 \times 24,998 \times 24,997 \times 24,996 \times 24,995 \times 24,994} = .0777$. The odds therefore *against* his having those two prizes will be as 9,223 to 777, or nearly as 12. to 1.

PROBLEM V.

Suppose a given number (n) of counters marked a , b , c , d , e , &c. to be mixed promiscuously and taken out at random; to determine the probability that none of them shall come out in the order of the alphabet.

Solution 1. Let it be required to determine the probability that neither of the two counters marked a and b shall come out in the right order. The probability that any of the counters is taken out at any particular trial is compounded of the probability of its having previously failed, and of the probability of its being taken out at that particular trial. Now since the chance of b 's being taken out the first is $\frac{1}{n}$, and the chance of its being taken out the second (when

there are only $n-1$ counters remaining) is $\frac{1}{n-1}$; the probability that it is taken out the second, after having failed the first trial, will be $= 1 - \frac{1}{n} \times \frac{1}{n-1} = \frac{1}{n}$; the probability of its being taken out the third, after having failed the first two trials, will in like manner be $= 1 - \frac{1}{n} \times \frac{1}{n-1} \times \frac{1}{n-2} = \frac{1}{n}$; and universally the probability of its being taken out at any other trial, after having failed in the preceding ones, will be $= \frac{1}{n}$. The probability therefore, that it will *not* be taken out at any particular trial will be $1 - \frac{1}{n}$; hence the probability that b is *not* taken out the second will be $1 - \frac{1}{n}$. And since the only case in which the condition of the problem can be defeated, when b is the second taken out, is by a 's having been taken out the first; if this probability or $\frac{1}{n} \times 1 - \frac{1}{n}$ be subtract-

ed from $1 - \frac{1}{n}$ (or from the probability of b 's *not* being taken out the second without any restriction as to a) the remainder or $1 - \frac{2}{n} + \frac{1}{n \cdot n-1}$ will be the probability that b is not taken out the second, and that a is taken out at any other trial than the first: that is, the fraction $1 - \frac{2}{n} + \frac{1}{n \cdot n-1}$ will express the probability that neither of the counters marked a and b will be taken out in their right order. 2. Let it be required to determine the probability that neither of the three counters marked a , b , and c , shall come out in their right order.—By reasoning as above, and *supposing the first trial to have been made*, the probability that the counters marked b and c shall not come out the second and third will be $= 1 - \frac{2}{n-1} + \frac{1}{n-1 \cdot n-2}$. The probability therefore that a is the first taken out (or $\frac{1}{n}$) being multiplied into this expression will give $\frac{1}{n} - \frac{2}{n \cdot n-1} + \frac{1}{n \cdot n-1 \cdot n-2}$ for the probability of the only event (when b and c have not been taken out in their right order) which can defeat the condition of the problem. This being subtracted from $1 - \frac{2}{n} + \frac{1}{n \cdot n-1}$ (or the probability that b and c have not been taken out second and third without any restriction as to a) will give $1 - \frac{3}{n} + \frac{3}{n \cdot n-1} - \frac{1}{n \cdot n-1 \cdot n-2}$ for the probability that neither of the three counters shall be taken out in their proper order.

III. In the same manner if $\frac{1}{n} - \frac{3}{n \cdot n-1} + \frac{3}{n \cdot n-1 \cdot n-2} - \frac{1}{n \cdot n-1 \cdot n-2 \cdot n-3}$ be subtracted from $1 - \frac{3}{n} + \frac{3}{n \cdot n-1}$

the probability that neither of the three counters shall be taken out in their proper order.

III. In the same manner if $\frac{1}{n} - \frac{3}{n \cdot n-1} + \frac{3}{n \cdot n-1 \cdot n-2} - \frac{1}{n \cdot n-1 \cdot n-2 \cdot n-3}$ be subtracted from $1 - \frac{3}{n} + \frac{3}{n \cdot n-1}$

DOCTRINE OF CHANCES.

we shall have $1 - \frac{4}{n} + \frac{1}{n \cdot n - 1} - \frac{1}{n \cdot n - 1 \cdot n - 2} + \frac{1}{n \cdot n - 1 \cdot n - 2 \cdot n - 3} - \dots$ for the probability that neither of the four counters marked *a, b, c, d*, shall be taken out in their right order. Hence it is manifest, if the number of counters to be taken out be *m*, and *A, B, C, D*, &c. be the several co-efficients of the binomial whose exponent is *m*, that the probability that neither of the counters come out in their right order will be expressed by $1 - \frac{A}{n} + \frac{B}{n \cdot n - 1} - \frac{C}{n \cdot n - 1 \cdot n - 2} + \frac{D}{n \cdot n - 1 \cdot n - 2 \cdot n - 3} - \dots$, &c. (*m* + 1).

Corollary 1. If out of a given number of counters taken out, it were required to determine the probability that the first *k* of them should be in their right order, and the remaining *m* ones in the contrary, it will follow, since the fraction expressing the first of these contingencies is

$\frac{1}{n \cdot n - 1 \cdot n - 2 \cdot n - 3 \cdot \dots \cdot (k)}$ and the fraction expressing the second or the contingency that none of the *m* counters shall come out in their proper order) is $1 - \frac{A}{n - k} + \frac{B}{n - k \cdot n - k - 1} - \dots$, &c. that the required probability in

this case will be $\frac{1}{n \cdot n - 1 \cdot n - 2 \cdot \dots \cdot (k)}$ multiplied into $1 - \frac{A}{n - k} + \frac{B}{n - k \cdot n - k - 1} - \frac{C}{n - k \cdot n - k - 1 \cdot n - k - 2} + \dots$, &c. (*m* + 1).

Corollary 2. If it be proposed to take out the whole of the *n* counters, or, in other words, if *n - k* be = *m*, then will the probability that the first *k* counters come out in their proper order, and all the remaining ones in the contrary be

expressed by $\frac{1}{n \cdot n - 1 \cdot n - 2 \cdot n - 3 \cdot (k)}$ multiplied into $1 - \frac{1}{2} + \frac{1}{2 \cdot 3} - \frac{1}{2 \cdot 3 \cdot 4} + \dots$, &c. (*m* + 1). If *m* + 1 be a large number, this last series may be considered as infinite; and since, thus continued, it is known to be the number whose hyp. log. is - 1, the reciprocal of which is the number whose hyp. log. is + 1. Deducting 1 therefore from *n* 2.3025851 (or the hyp. log. of 10) the remainder 1.3025851 will be the hyp. log. of the number .367878. Hence the above probability in this case will be nearly = $\frac{.367878}{n \cdot n - 1 \cdot n - 2 \cdot n - 3 \cdot (k)}$

Corollary 3. Supposing *n - k* to be still = *m*, and it were required to determine the probability of taking *k* things in their proper order, without any restriction as to the rest, it is evident that the above expression ought to be repeated as many times as *k* things can be taken in *n* things, or

$n \cdot \frac{n - 1}{2} \cdot \frac{n - 2}{3} \cdot (k)$ times, and consequently that the probability required will be very nearly = $\frac{.367878 \cdot \dots}{1 \cdot 2 \cdot 3 \cdot (k)}$

Hence, if .367878 &c. be put = $\frac{\pi}{2}$, and *k* be expounded by *o, 1, 2, 3* &c. we shall have $\pi, \frac{\pi}{2}, \frac{\pi}{2 \cdot 2 \cdot 3}$, &c. for the several

probabilities of taking out *o, 1, 2, 3*, &c. counters in their proper order; and $1 - \pi, 1 - 2\pi, 1 - 2\pi + \frac{\pi}{2}$, &c. for the several probabilities that *o, 1, 2, 3*, &c. or a greater number, will not be taken out in their proper order.

Corollary 4. If instead of one there be *p* counters marked with each of the letters *a, b, c, d*, &c. and it were required to determine the probability that *k* forts shall come out in the order of the alphabet, and *m* forts in the contrary order, the solution in this case will be easily obtained from that of the preceding problem. For since the permutations are = $p \cdot p - 1 \cdot p - 2$, &c. it follows that the probabilities of all the *a*'s being taken out first will be = $\frac{1 \cdot 2 \cdot 3 \cdot \dots \cdot (p)}{n \cdot n - 1 \cdot n - 2 \cdot (p)}$

or (making $1 \cdot 2 \cdot 3 \cdot (p) = b$) = $\frac{b}{n \cdot n - 1 \cdot n - 2 \cdot (p)}$. Hence the probability that all the counters of any particular class shall not be taken in succession will be = $1 - \frac{b}{n \cdot n - 1 \cdot n - 2 \cdot (p)}$; and by pursuing the same steps

as in the solution of the preceding problem, the probability that the *a*'s do not come out first nor the *b*'s next will be = $1 - \frac{2b}{n \cdot n - 1 \cdot (p)} + \frac{b}{n \cdot n - 1 \cdot n - 2 \cdot (p)} \times \frac{b}{n \cdot n - 1 \cdot n - 2 \cdot (p)} = 1 - \frac{2b^2}{n \cdot n - 1 \cdot n - 2 \cdot (p)}$ + $\frac{b^2}{n \cdot n - 1 \cdot n - 2 \cdot (p)}$, and the probability that neither

the *a*'s, *b*'s, *c*'s, *d*'s, nor any other class will come out in their proper order (putting *A, B, C*, &c. for the quantities in Corollary I. of this problem), will be = $1 - \frac{A b}{n \cdot n - 1 \cdot n - 2 \cdot (p)} + \frac{B b^2}{n \cdot n - 1 \cdot n - 2 \cdot (2p)} - \frac{C b^3}{n \cdot n - 1 \cdot n - 2 \cdot (kp)}$ +, &c. Now since $\frac{1}{n \cdot n - 1 \cdot n - 2 \cdot (p)}$ is the probability that *k* forts shall be taken out in their right order; if this be multiplied into the foregoing series, &c.

(as in Corollary I.) we shall have $\frac{1}{n \cdot n - 1 \cdot n - 2 \cdot (kp)}$ into $1 - \frac{A b}{n \cdot n - 1 \cdot n - 2 \cdot (kp)} + \frac{B b^2}{n \cdot kp \cdot n - k p - 1 \cdot (kp + p)}$ +

$\frac{C b^3}{n \cdot kp \cdot n - k p - 1 \cdot (kp + 2p)} - \frac{D b^4}{n \cdot kp \cdot n - k p - 1 \cdot (kp + 3p)} + \dots$, &c. (*m* + 1) for the probability that *k* forts of counters are taken out in their proper order, and *m* forts in the contrary order.

PROBLEM VI.

Supposing a solid with *n* regular faces to be thrown in continued succession by *A, B*, and *C*, and that the sum *S* be paid to the person who shall first throw any assigned face; to determine the value of the several expectations, or the probability of their obtaining this sum.

Solution. By the condition of the problem, *A* is to have the 1st, 4th, 7th, &c. throws; *B* the 2d, 5th, 8th, &c.; and *C* the 3d, 6th, 9th, &c. The probability of *A*'s throwing it the 1st time is $\frac{1}{n}$; the probability of his throwing it the 4th time depending on the contingency of his having missed it the first, and of *B*'s and *C*'s having missed it the

2d and 3d times, may be found by reasoning as in the solution of the preceding problem, $= \frac{n-1}{n} \times \frac{1}{n}$; the probability of throwing it the 7th time, depending on the contingency of his having missed it the 1st and 4th, of B's having missed it the 2d and 5th, and of C's having missed it the 3d and 6th times, may be found $= \frac{n-1}{n} \times \frac{1}{n}$, and so on.

In like manner the probability of B's throwing it the 2d, 5th, &c. times, will be $= \frac{n-1}{nn}, \frac{n-1}{n^3}$, &c. and the probability of C's throwing it the 3d, 6th, &c. times will be $= \frac{n-1}{n^3}, \frac{n-1}{n^6}$, &c. Hence the whole expectation of A

will be $\frac{S}{n} \times 1 + \frac{n-1}{n} + \frac{n-1}{n} + \frac{n-1}{n} + \dots$, &c. $= \frac{S \cdot nn}{n^2 - n - 1}$, the whole expectation of B $= \frac{S}{n} \times$

$\frac{n-1}{n} + \frac{n-1}{n} + \dots$, &c. $= \frac{S \cdot n \cdot n - 1}{n^2 - n - 1}$, and the whole expectation of C $= \frac{S}{n} \times$

$\frac{n-1}{n} + \dots$, &c. $= \frac{S \cdot n - 1}{n^2 - n - 1}$.

Corollary 1. If the solid be a cube, the odds in favour of A against B will be as 36 to 30, and the odds in his favour against C will be as 36 to 25. And supposing the sum S to be 101, the values of their respective expectations will be 31. 17s., 31. 6s., and 21. 15s.

Corollary 2. If, instead of a cube, the solid be a counter with two faces, n in this case will be $= 2$, and the odds in favour of A against B will be as 2 to 1, and the odds in his favour against C will be as 4 to 1; that is, their respective expectations in the sum S (supposing it to be 101.) will be 51. 14s., 21. 17s., and 11. 6s. nearly. If, on the contrary, the solid have a great number of faces, the chances will be nearly equal. Hence the advantage of having the priority in the throws will be greater or less in proportion as the faces are few or many in number.

Corollary 3. If instead of three there be d persons to throw the solid successively, the expectation of the 1st will be

$\frac{S \cdot n^{d-1}}{n^d - n - 1}$; of the 2d $= \frac{S \cdot n^{d-2} \cdot n - 1}{n^d - n - 1}$; of the 3d $= \frac{S \cdot n^{d-3} \cdot n - 1^2}{n^d - n - 1^2}$; of the 4th $= \frac{S \cdot n^{d-4} \cdot n - 1^3}{n^d - n - 1^3}$ of the

$$\frac{S \cdot n^{d-1}}{n^d - n - 1} = \frac{S \cdot n \cdot n - 1^{d-1}}{n^d - n - 1^{d-1}}$$

PROBLEM VII.

To determine the chances of throwing any given number (p) of points with any number (m) of solids, having a given number (n) of regular faces.

Solution 1. Let the chances be required of throwing on two common dice any given number from 12 to 2. In order to throw 12, the two fixes must turn up together, and therefore there can only be one chance for this number. In order to throw 11, the fixes and fives may be changed alternately, and therefore there will be two chances for this number. The next number may be thrown by the two fives, or by a fix and four, and as these last may be alternately turned up, it follows that there are three chances for succeeding in this case. In the same manner nine points may be thrown by the turning up of the four and five, or of the six and three; and since each of these admit of being alternately changed, the chances for throwing this number will be four. Again, eight points may be thrown by the two fours, the three and five, or the two and six coming up; and since the two last pairs admit of being changed alternately, the number of chances in this case will be five. For throwing seven points, the chances will be six; for either the three and four, the two and five, or the ace and six may be turned up, each pair of which admit of being alternately changed. The chances for six points are only five; consisting of the two alternate throws of an ace and five, or a four and duce, or of the single throw of two trays. The chances for throwing five points consist of the two alternate throws of an ace and four, or of a duce and tray, and therefore are just four. The chances for throwing four points consist of the alternate throws of an ace and tray, and of the single throw of two dices, and are therefore only 3. The chances for throwing three points consisting of the alternate throw of an ace and duce are no more than two; and the chance for throwing two points being limited to the two aces being turned up together must be a single one. Hence the chances for throwing 12, 11, 10, . . . 2 points being respectively 1, 2, 3, 4, . . . 1; if either of these be divided by 36, or the number of all the changes upon two dice, the quotient will give the probability for any number of points required.

By proceeding in the same manner, the chances may be determined when there are any greater number of dice, or when the solid has a greater number of faces than the common die. But the following computations, when three and four dice are thrown, will explain the process better than a more minute detail of it.

	5. 5. 5. 3	12	56					6. 4. 4. 1	12					

The chance for turning up 13, 12, 11, &c. points being the same with those for turning up 15, 16, 17, &c. points respectively, it will be unnecessary to proceed with the operation. The whole number of changes on 3 dice being $6 \times 6 \times 6 = 216$, and on 4 dice $6 \times 6 \times 6 \times 6 = 1296$, the probability of throwing any given number of points will be the fraction, whose numerator is given above, and whose denominator is either 216 or 1296, according as 3 or 4 dice are used; thus the probability of throwing 9 points with three dice is $\frac{25}{216}$, and the probability of throw-

ing 15 points with 4 dice is $\frac{140}{1296}$; that is, the odds in the 1st case against throwing them are as $7\frac{2}{3}$ to 1, and in the second case as 8 to 1.

If the solids have more faces than a cube, or if their number be much greater than is stated above, these operations will be rendered too complicated and laborious, and

therefore it becomes necessary to have a more general solution of the problem. Suppose a single solid to have n sorts of faces, of which one is marked A, r marked B, r^2 marked C, r^3 marked D, and so on to n terms, then will $1 + r + r^2 + r^3 + \dots + r^{n-1}$, represent the whole number of chances on such a solid, and each term of the series, divided by the whole, will represent the chance that any particular face will be turned up.

If there be m such solids, (since the sum of the series is $\frac{1-r^n}{1-r}$) the whole number of chances on all those solids will be $= \frac{1-r^n}{1-r} = \frac{1-r^n}{1-r} \times 1-r^{n-1} = 1 + m r$

+ $\frac{m \cdot m + 1}{2} r^2 + \frac{m \cdot m + 1 \cdot m + 2}{2 \cdot 3} r^3 + \&c.$ multiplied into $1 - m r^n + \frac{m \cdot m - 1}{2} r^{2n} - \frac{m \cdot m - 1 \cdot m - 2}{2 \cdot 3} r^{3n} + \&c.$

DOCTRINE OF CHANCES.

+ &c. Now since the smallest number of points that can be thrown with those solids is m , the next $m + 1$, the third $m + 2$, and so on: it follows that the first term of the product of these two series, or unity, will represent the number of chances for throwing m points, the second term the number of chances for throwing $m + 1$ points, the third term the number of chances for throwing $m + 2$ points, &c. and that the term of the series, in which the exponent of r is $p - m$, will represent the number of chances for throwing p points.

But since this term arises from such terms of the first series, in which the exponents of r being $= p - m$, $p - m - 1$, $p - m - 2$, &c. are respectively multiplied into the first, second, third, &c. terms of the second series, and since the last factor of the co-efficient of the term, whose exponent is $p - m$, is both in the numerator and denominator $= p - m$, it is evident that the whole co-efficient may be divided into $\frac{p-1 \cdot p-2 \cdot p-3 \dots (m-1)}{1 \cdot 2 \cdot 3 \dots (m-1)} + \frac{p-m \cdot p-m-1 \cdot p-m-2(m)}{m \cdot m+1 \cdot m+2 \dots p-m \dots}$

and therefore that the term itself will be $= \frac{p-1 \cdot p-2 \cdot p-3 \dots (m-1)}{1 \cdot 2 \cdot 3 \dots (m-1)} \times r^{p-m}$. In the same manner the co-efficient of the term in which the exponent of r is $p - m - 1$ will be $= \frac{p-m-1 \cdot p-m-2 \cdot p-m-3 \dots (m-1)}{1 \cdot 2 \cdot 3 \cdot 4 \dots (m-1)}$, and the co-efficients of the terms in which the exponents of r are $p - m - 2$, $p - m - 3$, &c. will be $\frac{p-2 \cdot p-3 \dots (m-1)}{1 \cdot 2 \cdot 3 \dots (m-1)}$, $\frac{p-3 \cdot p-4 \dots (m-1)}{1 \cdot 2 \cdot 3 \dots (m-1)}$, $\frac{p-4 \cdot p-5 \dots (m-1)}{1 \cdot 2 \cdot 3 \dots (m-1)}$, &c. Hence, if the first of the terms just mentioned be multiplied into 1; the second into $-m r^n$; the third into $\frac{m \cdot m-1}{2} r^{2m}$ and $p - n$ be made $= d$, $p - 2 = e$, $p - 3 = f$, &c. the number of chances for throwing exactly p points will be equal to $\frac{p-1}{1} \times \frac{p-2}{2} \times \frac{p-3}{3} \dots (m-1) \times r^{p-m} - \frac{d-1}{1} \times \frac{d-2}{2} \times \frac{d-3}{3} \dots (m-1) \times m \cdot r^{p-m} + \frac{e-1}{1} \times \frac{e-2}{2} \times \frac{e-3}{3} \dots (m-1) \times \frac{m \cdot m-1}{2} r^{p-m} - \frac{f-1}{1} \times \frac{f-2}{2} \times \frac{f-3}{3} \dots (m-1) \times \frac{m \cdot m-1 \cdot m-2}{2 \cdot 3} r^{p-m} + \&c.$ which series are to be continued

till they either vanish or become negative. But if r be $= 1$, or, which is the same thing, if there be only one face of a sort on each die, the chances will be expressed simply by $\frac{p-1}{1} \times \frac{p-2}{2} \times \frac{p-3}{3} \dots (m-1) - \frac{d-1}{1} \times \frac{d-2}{2} \times \frac{d-3}{3} \dots (m-1) \times m + \frac{e-1}{1} \times \frac{e-2}{2} \times \frac{e-3}{3} \dots (m-1) \times \frac{m \cdot m-1}{2} + \&c.$

Since it appears from the preceding computations, that the chances continually increase till the number

of points required becomes a mean between the greatest and least possible number that can be thrown on the solids, and that they then as regularly decrease till the number of points required be the least than can be thrown on those solids; it will be best, if the number required be nearer the lesser than the greater extreme, to use, instead of the former, a number equally distant from that greater extreme. Thus, the greatest number that can be thrown on three common dice is 18, and the least is 3. If therefore the required number be 6, it will lessen the labour to find the number of chances for throwing 15; the latter being as much less than 18 as the former is greater than 3: if the chances for throwing 11 points on 4 dice be required, it will be most convenient to find the chances for throwing 17 points, the latter being as far distant from 24, the greatest, as the former is from 4, the least number that can be thrown on 4 dice.

Example. Let it be required to determine the chances for throwing precisely 24 points on 6 dice. In this case n is 6, $p = 24$, $r = m = 6$, $d (= p - n) = 18$, $e (= p - 2n) = 12$, $f (= p - 3n) = 6$, $g = 0$. The above expression therefore becomes $= 23 \times \frac{22}{2} \times \frac{21}{3} \times \frac{20}{4} \times \frac{19}{5} - \frac{17}{1} \times \frac{16}{2} \times \frac{15}{3} \times \frac{14}{4} \times \frac{13}{5} \times 6 + \frac{11}{1} \times \frac{10}{2} \times \frac{9}{3} \times \frac{8}{4} \times 7 \times 6 \times \frac{5}{2} - \frac{6 \times 5 \times 4}{2 \cdot 3} = 343$ and since 6^6 (or the number of all the changes on 6 dice) is 46,656; the odds against throwing exactly 24 points will be as $12\frac{1}{2}$ to one; which also are the odds against throwing 18 points; these two numbers being equally distant, the one from the greater, the other from the lesser extreme.

PROBLEM VIII.

To determine the probability that an event shall happen p times successively in n trials, when the ratio of its happening to that of its failing is as a to b .

Solution. The probability that it happens the first p times is $\frac{a^p}{a+b}^p$. The probability that it happens p times after

having failed the 1st time is $\frac{b}{a+b} \times \frac{a^p}{a+b}^p$, and since

the probability of its failing any assigned time, without any restriction, as to its having either failed or not in the preceding time, is constantly $\frac{b}{a+b}$, the probability of its happening

p times successively, after having failed either the $p + 1$, $p + 2$, $p + 3$, ..., $2p - 1$. preceding time, will be either $\frac{a^p}{a+b} \times \frac{b}{a+b}$ or $\frac{a^p}{a+b} \times \frac{3b}{a+b}$ or $\frac{a^p}{a+b} \times \frac{4b}{a+b}$ &c.; so that if $\frac{a^p}{a+b}^p$ be made $= c$ and $\frac{bc}{a+b} = d$, the

probability of its happening p times successively, after having failed in the preceding $p - 1$ trials will be $p d$, and the whole probability of its happening during the first $2p$ trials will be $= c + p d$.

In order to its happening p times successively at the end of $2p + 1$ trials, it must have failed upon the whole during the first p trials, and also in the $p + 1$ th trial. The probability, therefore, of its happening the next p trials after having failed in the first $p + 1$ trials will be $= 1 - c \cdot d$; which being added to $c + p d$ (the probability of its happening in the preceding $2p$ trials) will make the whole probability

probability of its happening p times in $2p+1$ trials $= c - cd + p + 1 \cdot d$.

In like manner the probability of its happening p times successively at the end of $2p+2$ trials will depend upon its having failed upon the whole during the first $p+1$ trials, and also in the $p+2$ trial. The probability, therefore, in this case, will be $1 - c - d \times d = d - cd - dd$; which being added to $c - cd + p + 1 \cdot d$ (the probability of its happening p times in $2p+1$ trials) will give $c - 2cd + p + 2 \cdot d - dd$ for the whole probability of its happening p times successively in $2p+2$ trials. The probability of its happening p times in $2p+3$ trials may be found, by proceeding in the same manner, to be $1 - c - 2d \cdot d + c - 2cd + p + 2 \cdot d - dd = c - 3cd + p + 3 \cdot d - 3dd$.

The probability of its happening p times in $2p+4$ trials to be $1 - c - 3d \cdot d + c - 3cd + p + 3 \cdot d - 3dd = c - 4cd + p + 4 \cdot d - 6dd$. The probability of its happening p times in $2p+5$ trials to be $1 - c - 4d \cdot d + c - 4cd + p + 4 \cdot d - 6dd = c - 5cd + p + 5 \cdot d - 10dd$. Therefore since the $p-1$ th term of the figurate numbers 1, 3, 6, 10, &c. is $\frac{p \cdot p - 1}{2}$, the probability of the event's happening p times successively in $3p$ trials will be $c - pcd + 2pd - \frac{p \cdot p - 1}{2} \cdot dd$.

The probability of its happening p times in $3p+1$ trials will depend on the chance of its having failed during the first $2p$ trials, and also in the $2p+1$ th trial, and of its having succeeded in the next p trials; the probability of which being $1 - c - pd \cdot d$, and the probability of its happening p times in $2p$ trials being $c - pcd + 2pd - \frac{p \cdot p - 1}{2} dd$, the whole probability of its happening p times in $3p+1$ trials will be $c + 2p + 1 \cdot d - p + 1 \cdot c \cdot d - \frac{p \cdot p - 1}{2} + p \cdot dd$.

By proceeding in this manner, the probability of its happening p times in $4p$ trials will be found $c - 2pcd + \frac{p \cdot p - 1}{2} \cdot cdd + 3pd - \frac{2p \cdot 2p - 1}{2} dd + \frac{p \cdot p - 1}{2} \cdot d^3$. The probability of its happening p times in $5p$ trials $c - 3pcd + \frac{2p \cdot 2p - 1}{2} cdd - \frac{p \cdot p - 1}{2} \cdot d^3$. The probability of its happening p times in $6p$ trials $c - 4pcd + \frac{3p \cdot 3p - 1}{2} dd + \frac{2p \cdot 2p - 1}{2} \cdot d^3$. The probability of its happening p times in $7p$ trials $c - 5pcd + \frac{4p \cdot 4p - 1}{2} dd + \frac{3p \cdot 3p - 1}{2} \cdot d^3$, and so on. Hence it follows, that if the number be r the probability required

$$\text{will be } = c - r - 2 \cdot pcd + \frac{r - 3 \cdot p \cdot r - 3 \cdot p - 1}{1} cdd + \frac{r - 4 \cdot p \cdot r - 4 \cdot p - 1 \cdot r - 4 \cdot p - 2}{2 \cdot 3} cdd^2 + \dots$$

$$+ \&c. + \frac{r - 1 \cdot p \cdot d - r - 2 \cdot p \cdot r - 2 \cdot p - 1}{2} d^2 + \frac{r - 3 \cdot p \cdot r - 3 \cdot p - 1 \cdot r - 3 \cdot p \cdot r - 3 \cdot p - 2}{2 \cdot 3} d^3 + \dots$$

d^3 , &c. Let n be $= r \cdot p$ then will $n - p = r - 1 \cdot p$
 $n - 2p = r - 2 \cdot p$, $n - 3p = r - 3 \cdot p$, &c. and if
 $\alpha, \beta, \gamma, \delta$, &c. be put for $n - p$, $n - 2p$, $n - 3p$, $n - 4p$,
 &c. respectively, the probability that the event happens p
 times successively in n trials will be $= c - \beta cd + \frac{\gamma \cdot \gamma - 1}{2} cdd - \frac{\delta \cdot \delta - 1 \cdot \delta - 2}{2 \cdot 3} cdd^2 + \dots + \alpha d - \frac{\beta \cdot \beta - 1}{2} d^2 + \dots$

Example. In 30 throws with a single counter, having one side white and the other black, what are the odds that the white does not come up ten times successively? In this case c is $\frac{1}{2^{10}} \cdot d = \frac{1}{2^{11}}$, $n = 30 \cdot p = 10$, $\alpha (= n - p) = 20$, and $\beta (= n - 2p) = 10$. The foregoing expression therefore becomes $\frac{1}{2^{11}} - \frac{10c}{2^{11}} + \frac{20}{2^{11}} - \frac{10 \times 9}{2 \times 2^{11}} = .00106$. Hence the odds against the white side's coming up ten times successively, will be as 99894 to 106, or nearly as 942 to one. If, instead of a counter, a single die had been thrown up, the odds against the ace, or any assigned face coming up ten times successively in 30 trials would have been nearly as 50 millions to one.

Scholium. By the assistance of the 3d Problem, "the number of trials necessary to make it an equal chance that an event shall happen p times successively" may be found to be nearly $= \frac{7}{10} \times \frac{a + b^p - a^p}{a^p} \times 1 + \frac{a}{a + b} + \frac{a \cdot a}{a + b^2} + \frac{a^2}{a + b^3} + \dots + \frac{a^{p-1}}{a + b^p} = \frac{7}{10} \times \frac{a + b^p - a^p}{a^p} \times 1 + \frac{a}{a + b} - \frac{a^p}{a + b^p} = \frac{a + b^p - a^p}{a^p} \times \frac{a + b^p - a^p}{b \cdot a + b^p - 1} \times \frac{7}{10}$; and therefore if c and f respectively represent the first and second fractions, the required number will be nearly $= cf \times \frac{7}{10}$. Thus, let it be required to determine how many trials are necessary to make it an equal chance, that an event shall happen 6 times successively, supposing the probabilities of its happening and failing to be the a to c . Since a and b are each $= 1$, and $p = 6$, the above expression will become $= \frac{2^6 - 1}{1} \times \frac{2^6 - 1}{2^6} \times \frac{7}{10} = 63 \times \frac{63}{32} \times \frac{7}{10} = 86.8$.

Hence the number of trials will be between 87 and 86. Had the probability of the event's happening to that of its failing been in the ratio of 1 to 5, the number of trials necessary in the above case would have been $= \frac{6 - 1}{1} \times \frac{6 - 1}{5 \times 6^5} \times \frac{7}{10} = 46,655 \times \frac{46,655}{5 \times 7776} \times \frac{7}{10} = 37,190$.

PROBLEM IX.

Supposing A and B to play with equal skill; to determine the

DOCTRINE OF CHANCES.

the odds when each of them wants a given number to win the game.

SOLUTION. If only *one* can be reckoned at each party, the probability that either of them is the winner at the end of it will be $= \frac{1}{2}$. Hence if A wants 2, and B only one of being up; the former, in order to be the winner, must gain twice successively, and therefore his chance will be $= \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$, and the chance of the latter $= 1 - \frac{1}{4} = \frac{3}{4}$. Consequently the odds against A, or in favour of B are as 3 to 1.

If A wants 3, 4, 5, 6, or any other number of being up, while B wants only one, his chance of winning in these cases must always depend on his succeeding in every party without intermission, and therefore the probability when he wants 3 will be $\frac{1}{2^3} = \frac{1}{8}$, when he wants 4 it will be $\frac{1}{2^4} = \frac{1}{16}$, when he wants 5 it will be $\frac{1}{2^5} = \frac{1}{32}$, and so on; so that the odds against him in these cases respectively will be 7 to 1, 15 to 1, 31 to 1, 63 to 1, &c.

If A wants 3, and B wants 2 of being up; the former may win in either of 4 different ways.—1st. By gaining the 1st, 2^d, and 3^d games.—2^{dly}. By gaining the 1st, 2^d, and 4th, and losing the 3^d game.—3^{dly}. By gaining the 1st, 3^d, and 4th games, and losing the 2^d;—and 4^{thly}. By losing the 1st, and gaining the 2^d, 3^d, and 4th games. The proba-

bility of the 1st is $\frac{1}{8}$, and the probability of each of the rest is $\frac{1}{2} \times \frac{1}{8} = \frac{1}{16}$. Hence the sum of the 4 probabilities will be $= \frac{1}{8} + \frac{3}{16} = \frac{5}{16}$. Consequently the odds against him will be as 11 to 5, or rather more than 2 to one. When A wants 4, B still wanting 2 of being up, if he gains the first game (the probability of which is $\frac{1}{2}$) he will be in the same situation as in the preceding case, and his expectation on such an event will be $\frac{1}{2} \times \frac{5}{16} = \frac{5}{32}$.—If he loses the 1st game (the probability of which is also $\frac{1}{2}$) he will then want 4 while B wants only one of being up, and his expectation in this case will be $\frac{1}{2} \times \frac{1}{16} = \frac{1}{32}$; therefore the sum of these probabilities being $\frac{6}{32}$, it follows that the odds against him are as 26 to 6.—In the same manner the odds may be found when he wants 5 of being up, to be as 57 to 7; when he wants 6 of being up, to be as 120 to 8, and so on when he wants any other number, B being always supposed to want only 2 of being up.

When A wants 4 and B wants 3 of being up, the former may win in either of the 15 following different ways:

1 st . by gaining the 1 st 2 nd 3 ^d 4 th game, the probability of which is $\frac{1}{16}$					
2 ^d . by gaining the 1 2 3 5 and losing the 4 th .					
3 ^d . " " " 1 2 4 5 " " " 3 ^d .					
4 th . " " " 1 3 4 5 " " " 2 ^d .					
5 th . " " " 2 3 4 5 " " " 1 st .					
6 th . by gaining the 1 2 3 6 and losing the 4 th 5 th .					
7 th . " " " 1 2 4 6 " " " 3 ^d 5 th .					
8 th . " " " 1 2 5 6 " " " 3 ^d 4 th .					
9 th . " " " 1 3 4 6 " " " 2 ^d 5 th .					
10 th . " " " 1 3 5 6 " " " 2 ^d 4 th .					
11 th . " " " 1 4 5 6 " " " 2 ^d 3 ^d .					
12 th . " " " 2 3 4 6 " " " 1 st 5 th .					
13 th . " " " 2 4 5 6 " " " 1 st 3 ^d .					
14 th . " " " 2 3 5 6 " " " 1 st 4 th .					
15 th . " " " 3 4 5 6 " " " 1 st 2 ^d .					

} the probability of each of which is $\frac{1}{16} \times \frac{1}{2} = \frac{1}{32}$.

} the probability of each of which is $\frac{1}{16} \times \frac{1}{4} = \frac{1}{64}$.

Adding all these probabilities together, we have $\frac{1}{16} + \frac{4}{32} + \frac{10}{64} = \frac{22}{64}$ for the probability required, and hence the odds against A's winning will be as 42 to 22.

By proceeding in the same manner when A wants 5 of being up, the odds against him will be found to be as 219 to 37. But these operations become more and more laborious in proportion as the number wanted by each party becomes more considerable, and therefore it will be better to have recourse to the rules of combination, which will greatly reduce the labour in those cases. Thus; let B want 4 and A want 5 of being up. The probability here of A's winning will be expressed by $\frac{1}{2^5} + \frac{1}{2^6}$ multiplied into the number of ways in which 6 things may be combined by 5 of a fort $+ \frac{1}{2^7}$ multiplied into the number of ways in which 7 things

may be combined by 5 of a fort $+ \frac{1}{2^8}$ multiplied into the number of ways in which 8 things may be combined by 5 of a fort $= \frac{1}{2^5} + \frac{5}{2^6} + \frac{15}{2^7} + \frac{35}{2^8} = \frac{93}{256}$, that is, the odds against A's winning the game are 163 to 93.

In like manner, if B wants 5 and A wants 6 of being up, the probability of A's winning will be expressed by $\frac{1}{2^6} + \frac{6}{2^7} + \frac{21}{2^8} + \frac{56}{2^9} + \frac{126}{2^{10}} = \frac{386}{1024}$; or in other words, the odds against his winning the game will be as 638 to 386.

If instead of *one* only, either *one* or *two* may be reckoned at each party, such as in the game of bowls, quoits, &c. the investigation of the problem will be rather different. In this case, the chance of just gaining one in two trials may be considered as the same with that of taking two out of four things of two forts, so that the first may come out of the 1st fort, and the second out of the contrary; and the chance of

DOCTRINE OF CHANCES.

gaining two, in two trials, may be considered as the same with that of taking two out of four things of two sorts, so that both may be of the same sort. The chance of taking the proper sort the first time is $\frac{2}{4}$; the chance of missing it

the second time is $1 - \frac{1}{4-1}$, the probability therefore of

the event first mentioned is $\frac{2}{4} \times 1 - \frac{1}{4-1} = \frac{1}{3}$. The chance of taking out the same sort twice in succession is $\frac{2}{4} \times \frac{1}{3} = \frac{1}{6}$. Hence, if A wants 2 and B only 1 of being up, the latter may win at the end of the first party, either by reckoning one or two (the probability of which is $\frac{1}{6} + \frac{1}{3} = \frac{1}{2}$); or he may also win by having lost only one

at the end of the first party, and gaining one at the end of the second. Now if A has gained one at the end of the first party, the expectation of each at the beginning of the second will be equal, and therefore B's chance of winning in the second, after having lost in the first party will be $= \frac{1}{3} \times \frac{1}{2} = \frac{1}{6}$. Hence the whole probability of his

winning will be $= \frac{1}{2} + \frac{1}{6} = \frac{2}{3}$, and A's chance will be the remaining $\frac{1}{3}$; that is, the odds against A will be as 2 to one.

Let A want 3, B still wanting only 1 of being up. If A gains one in the first set, he will be in the same situation as

in the preceding case. If he gains 2 he will be on an equality with B. His expectation on the first event is $\frac{1}{3} \times \frac{1}{3} = \frac{1}{9}$, and his expectation on the second $= \frac{1}{6} \times \frac{1}{2} =$

$\frac{1}{12}$. His whole expectation, therefore, is $= \frac{1}{9} + \frac{1}{12} = \frac{21}{208} = \frac{7}{36}$; that is, the odds against him are as 29 to 7.

In like manner, when A wants 4, B still wanting only 1 of being up. If he gains one he will be in the same situation as in the foregoing case; if he gains two he will be in the same situation as in the first case; hence, his expectation

will be $= \frac{1}{3} \times \frac{7}{36} + \frac{1}{6} \times \frac{1}{3} = \frac{13}{108}$, and the odds against

him will be as 95 to 13. By proceeding in this manner, the odds may be found when A wants any greater number, B being always supposed to want only one of being up; nor will the reasoning, indeed, be different when B wants more than one; or when the game is of such a nature as that either A or B may reckon 3, 4, or any greater number at each party.

It would be as tedious as it is unnecessary to proceed further with these operations, and, therefore, it will be sufficient to observe, that the following table has been deduced from a similar method of reasoning with that which has been used in the preceding cases, and that it is inserted principally with the view of shewing the manner in which the odds are constantly lessened in proportion as the number to be reckoned at each party is increased.

When One may be reckoned at each Party.			When Two may be reckoned at each Party.			When Three may be reckoned at each Party.			When Eleven may be reckoned at each Party.		
A wants	B wants	Odds against A	A wants	B wants	Odds.	A wants	B wants	Odds.	A wants	B wants	Odds.
2	1	as 3 to 1	2	1	as 2 to 1	2	1	as $1\frac{1}{5}$ to 1	2	1	as $1\frac{7}{10}$ to 1
3	1	7 to 1	3	1	$4\frac{1}{2}$ to 1	3	1	$3\frac{1}{2}$ to 1	3	1	$2\frac{7}{10}$ to 1
4	1	15 to 1	4	1	$7\frac{1}{2}$ to 1	4	1	6 to 1	4	1	$4\frac{1}{2}$ to 1
5	1	31 to 1	5	1	$12\frac{1}{2}$ to 1	5	1	$10\frac{1}{2}$ to 1	5	1	$6\frac{1}{10}$ to 1
6	1	63 to 1	6	1	$21\frac{1}{2}$ to 1	6	1	$15\frac{1}{2}$ to 1	6	1	$8\frac{1}{10}$ to 1
3	2	$2\frac{1}{2}$ to 1	3	2	$1\frac{1}{2}$ to 1	3	2	$1\frac{1}{3}$ to 1	3	2	$1\frac{1}{5}$ to 1

5	2	8 to 1	5	2	$5\frac{1}{2}$ to 1	5	2	$4\frac{1}{2}$ to 1	5	2	$3\frac{2}{5}$ to 1
6	2	15 to 1	6	2	$8\frac{1}{2}$ to 1	6	2	6 to 1	6	2	$4\frac{1}{5}$ to 1
4	3	$1\frac{9}{10}$ to 1	4	3	$1\frac{3}{5}$ to 1	4	3	$1\frac{1}{3}$ to 1	4	3	$1\frac{9}{10}$ to 1
5	3	$2\frac{3}{5}$ to 1	5	3	$2\frac{1}{3}$ to 1	5	3	2 to 1	5	3	$2\frac{1}{5}$ to 1
6	3	6 to 1	6	3	$4\frac{1}{3}$ to 1	6	3	$3\frac{2}{3}$ to 1	6	3	$2\frac{3}{5}$ to 1
5	4	$1\frac{2}{3}$ to 1	5	4	$1\frac{1}{2}$ to 1	5	4	$1\frac{1}{2}$ to 1	5	4	$1\frac{2}{5}$ to 1
6	4	3 to 1	6	4	$2\frac{1}{2}$ to 1	6	4	$2\frac{1}{2}$ to 1	6	4	2 to 1
6	5	$1\frac{1}{3}$ to 1	6	5	$1\frac{1}{5}$ to 1	6	5	$1\frac{1}{5}$ to 1	6	5	$1\frac{1}{5}$ to 1

Were the game of such a nature as to admit of an indefinite number to be reckoned at each party, the expectations would be nearly equal, or, in other words, the odds would be indefinitely small, whatever number were wanted on either side of being up. This, indeed, appears from the preceding table, where the odds are continually lessened as the number to be gained at each party increases. It is also to be observed, that, except in one instance, the odds in those tables are never inverted as the numbers wanted of being up; and that particularly in the last column, where

11 may be gained at each party, those odds vary from this ratio more than in any other.

Hence it follows, that in the game of whist, which admits of 11 being gained in a single deal, it would be very wrong to proceed on such principles in determining the odds; for, although whist may not be strictly of the same nature in every respect with the game supposed in the table, yet it is to be remarked, that the circumstances in which it differs, especially when less than three are wanted of being up, only serve to increase the errors of such a mode of computation.

This, however, if any doubt can remain on the subject, will be more clearly explained in the following problems.

PROBLEM X.

To determine in the game of whist, the chance of any particular player (A) having one or more honours.

Solution. Let A be the dealer, and let the chance be required of his having the $\frac{1}{2}$ honours. Supposing it certain that an honour is turned up, it then becomes necessary to find the chance of his taking 3 particular cards in 12 out of a pack containing 51. By the corollary to the 4th problem this probability is expressed by

$$\frac{a}{1} \cdot \frac{a-1}{2} \cdot \frac{a-2}{3} (p) \cdot v \cdot v-1 \cdot v-2 \dots n \cdot n-1.$$

$\frac{(a+q-m)m \cdot m-1 \cdot m-2 \dots (p)}{n-2 \cdot n-3 \cdot n-4 \dots (a)}$, where n represents the number of cards, a the number of honours, p the number to be taken, m the whole number to be taken out of n ; $v = a + b - m = n - m$, and (since $m - q$ in this case is $= p$) $a + q - m = a - p$. Here then we have $n = 51$, $a = 3$, $p = 3$, $m = 12$, $v = 39$, and $a - p = 0$,

and the fraction expressing the required probability = $\frac{12 \times 11 \times 10}{51 \times 50 \times 49} \times \frac{4}{13}$; which, being multiplied into $\frac{4}{13}$, or the probability that the honour turns up, will become = $\frac{44 \times 4}{13 \times 4165}$.

Supposing it certain, on the contrary, that the honour is not turned up, the chance of having four (making a and p each = 4) will be $\times \frac{12 \times 11 \times 10 \times 9}{51 \times 50 \times 49 \times 48}$;

which, being multiplied into $\frac{9}{13}$, (or the probability that an honour is not turned up) will become = $\frac{9 \times 33}{52 \times 4165}$.

Hence the whole chance of A's having the four honours will be $\frac{16 \times 44 + 9 \times 33}{52 \times 4165} = \frac{11}{2380} = .00462$.

If A is not the dealer, the chance of his having the four honours will be found by proceeding in the same manner, = $\frac{13 \times 12 \times 11 \times 10}{51 \times 50 \times 49 \times 48} \times \frac{9}{13} = \frac{33}{16600} = .00198$.

The chance of his having three honours and no more may also be found either = $\frac{792 + 495}{20825} = .0618$, or $\frac{143}{4165} = .03433$ according as he is or is not the dealer.

The chance of his having two honours and no more may in like manner be found = $\frac{(11,115)}{41,650} = .26684$, or

$\left(\frac{8151}{41,650}\right) = .1957$, and the chance of his having one honour and no more = $\left(\frac{9139}{20,825}\right) = .43884$ whether he is or is not the dealer.—The chance also that he has n honours may in the first case be found = $\frac{37962}{166,600} = .22785$; and in

the second case = $\frac{712,842}{52 \times 41,650} = .3291$.

Nor is the method of proceeding different when it is required to determine the chance of any two partners at whist having either four or three or two honours between them; the computation in this case being made on 25 or 26 instead of 12 or 13 cards, according as the honour is or is not sup-

posed to be turned up. The chance of the dealer and his partner having four honours between them appears to be

= $\frac{115}{1660} = .06903$; the chance of their having three honours, or reckoning two, = $\frac{468}{1660} = .28202$; and the chance of their having two, or not reckoning any thing by honours = $\frac{650}{1660}$.

The chance of the eldest hand and his partner's having four honours between them appears also to be = $\frac{69}{1666} = .04142$; the chance of their having three honours,

or reckoning two, = $\frac{364}{1665} = .21849$, and the chance of their having two, or not reckoning any thing by honours = $\frac{650}{1665}$, or the same as in the case of the dealer and his partner.

Corollary. Since the chance of the dealer's having three honours or more is $.0618 + .0046 = .0664$, and the chance of his having two honours or more is $.0664 + .2668 = .3332$, it follows that the odds against his having three or more honours are as 14 to 1, and that the odds against his having two or more honours are as 2 to 1. On the other hand, the chance of his having one honour or more being $.4388 + .3332 = .772$, the odds for his having one or more honours will be as $3\frac{1}{2}$ to 1. These chances in the case of the eldest or any other single hand being $.0363$, $.233$, and $.6708$ respectively, the odds against such hand's having three or more honours will be as $26\frac{1}{2}$ to 1; the odds against his having two or more honours will be as $3\frac{1}{2}$ to 1; and the odds for his having one or more honours will be as 2 to 1. The chance of the dealer and his partner having three or more honours between them being $.06903 + .28093 = .35$ nearly, and the chance of the eldest hand and his partner having the like number between them being $.04142 + .21849 = .26$ nearly; the odds against the former partners reckoning any thing by honours will be nearly as 2 to 1, and the odds against the latter will be nearly as 3 to 1.

PROBLEM XI.

To determine, in the game of whist, the chance of getting the odd or any number of tricks.

Solution. Let the chances of getting and losing a single trick be to each other in the ratio of a to b , then will the probability of getting n tricks be represented by $\frac{a^n}{a+b}$, the probability of getting

$n-1$ tricks by $\frac{n a^{n-1} b}{a+b}$, the probability of getting $n-2$

tricks by $\frac{n \cdot n-1}{2} a^{n-2} b^2$, and so on. In the present case

the chances of losing or winning a trick being equal, a will be equal to b , and the chance of winning 13 tricks, or reckoning 7, will be = $\frac{1}{2^5} = \frac{1}{8192}$, the chance of winning 12 or

reckoning 6 tricks will be = $\frac{13}{8192}$, and the chance of reck-

oning 5, 4, 3, 2, and 1 trick will be $\frac{78}{8192}$, $\frac{286}{8192}$, $\frac{715}{8192}$,

$\frac{1287}{8192}$, and $\frac{1716}{8192}$, respectively.

Corollary. Hence the chance of reckoning 6 or more tricks =

DOCTRINE OF CHANCES.

tricks is $\frac{1 + 13}{8192} = .001709$; the chance of reckoning 5 or more tricks is $\frac{14 + 78}{8192} = .01123$; of reckoning 4 or more tricks $\frac{92 + 286}{8192} = .04614$; of reckoning 3 or more tricks $\frac{378 + 712}{8192} = .13342$; of reckoning 2 or more tricks $\frac{1093 + 1287}{8192} = .29053$, and of reckoning one or more tricks $\frac{2380 + 1716}{8192} = \frac{1}{2}$.

PROBLEM XII.

To determine the respective chances at whist, when two of the partners have eight and the other two have nine of the game.

Solution. The party who reckon eight may win the game in the first deal either by having three or more honours between them, or by getting two or more tricks without reckoning any honours. Or, if they do not win the game in that deal, they may, however, reckon one by getting the odd trick, in which case they will be on an equality with their opponents. Supposing them therefore to be the dealers, the probability of their having three or more honours, by Cor. Prob. X. is .35; the probability of their getting two or more tricks, by Prob. XI. is .29053, and the probability of their not having three or more honours is $1 - .35 = .65$. Hence the chance of their getting the game in the first deal is $.35 + .29053 \times .65 = .53882$. Again, the probability of their getting one trick and no more by Prob. XI.

is $\frac{1716}{8192} = .20947$, which being multiplied into .65 produces .13617 for their chance of reckoning only one in the first deal; and as their expectation in this case will be equal to that of their adversaries, it will of course be expressed by $.13617 \times \frac{1}{2} = .068085$, and their whole chance of winning will be $.53882 + .068085 = .6069$. If they be not the dealers, their chance of winning may be found, by reckoning in the same manner $.25 + .29053 \times 1 - .26 + .20947 \times \frac{1 - .26}{2} = .5428$. Hence the chance of

their winning in the first case is as 3 to 2, and in the second case as 6 to 5 nearly. But if it be not considered whether they are, or are not the dealers, their chances of winning will be one with another, very nearly as 7 to 5.

Corollary. Were these two partners only seven, their chance of winning the game might be found by the help of the two preceding problems and their corollaries, equal either to .3867 or .3809 according as they were, or were not the dealers, and their chance of winning if they were only six might in like manner be found equal either to .3252 or to .3211, that is, the odds against the two partners who reckon only seven while the other partners reckon nine, are as 8 to 5, and the odds against them when they reckon only six are as 21 to 10 or a little more than two to one.

By pursuing the same steps the odds may be determined in every circumstance of the game; but the labour of such a computation would be very great, as the operations become more and more complicated in proportion as the game is further from being terminated.

PROBLEM XIII

A undertakes to play a match with B of three or five games, in winning the greater number of which he becomes of course the winner of the match. A has an advantage in

all the games but one equivalent to the odds of b to a —in that one game B has the same advantage against A. It is required to determine the respective chances of A and B; and whether it is material that the games should be played in any particular order.

Solution 1. Let the number of games be three, and let A be supposed to play the two games, on which he has the advantage of b to a , *first*, and the game on which he has the chance only of a to b , *last*. Either A or B may become the winner by obtaining the superiority over his adversary in the following order: 1, 2, 1, 3, 2, 3. A's chance for winning in this order is expressed by the fractions $\frac{bb}{a+b} + \frac{baa + aab}{a+b} + \frac{b + bba + 2baa}{a+b}$, and consequently B's chance will be $\frac{a^3 + aab + 2ab^2}{a+b}$. If A

be supposed to play the game *first*, on which he has only the advantage of a to b , and the other two games *last*, the fractions expressing the probability of his winning will be $\frac{ab}{a+b} + \frac{a^2b + b^2}{a+b} = \frac{b^2 + bba + 2baa}{a+b}$ as before.

Hence it follows that in this case it makes no difference in what order the games are played.

2. Let the number of games be five, and let A be supposed to play the four games on which he has the advantage of b to a , *first*, and the game on which the odds are against him, as b to a , *last*. Either party may become the winner, by succeeding in the following order: 1, 2, 3, 1, 2, 4, 1, 2, 5, 1, 3, 4, 1, 4, 5, 1, 3, 5, 2, 3, 4, 2, 3, 5, 2, 4, 5, or 3, 4, 5. A's chance for winning in this order is expressed by the fractions $\frac{b^4}{a+b} + \frac{3ab^3}{a+b} + \frac{6a^2b^2}{a+b} + \frac{b^5 + 5b^4a + 4b^3a^2 + 6b^2a^3}{a+b}$, and B's chance will,

in consequence, be $\frac{a^5 + 5a^4b + 4a^3bb + 6a^2b^3}{a+b}$.

If A be supposed to play the game *first*, in which the odds are against him, the several fractions expressing his chance of winning may be found $\frac{a^4b}{a+b} + \frac{b^3 + 2a^2b^2}{a+b} + \frac{3a^2b^2 + 3ab^3}{a+b} + \frac{b^4 + 5b^3a + 4b^2aa + 6bb^2a^2}{a+b}$. It is evident therefore

that in this, as well as in the former case, it is not in the least material in what order the games are played.

Example. Supposing A and B to play a match at piquet of five games, on the particular condition that B is to be the dealer in all the games except one, which gives an advantage to A in four of the games equivalent to the odds of 5 to 2. It is required to determine their respective chances of winning the match.—In this case $a = 4$, and $b = 5$; and hence the above expression denoting A's chance becomes $\frac{5 \cdot 2^5 + 12 \cdot 5^3 + 8 \cdot 2^4 + 9 \cdot 6^3}{59 \cdot 047} = \frac{317 - 25}{59 \cdot 047}$ and the ex-

pression denoting B's chance becomes $\frac{2 \cdot 5^5 + 24 \cdot 4^4}{59 \cdot 047} = \frac{24 \cdot 824}{59 \cdot 047}$. The odds therefore in favour of A are as 14 to 11 nearly. If they had played a match of only three games, and B was to have been the dealer in two of them, the odds against him would have been as 385 to 44, or nearly as 19 to 17.

PROBLEM XIV.

To determine the chances in the game of *Maçao*.

Solution. In this game two packs of cards are shuffled together, from which three cards are dealt to each of the players,

DOCTRINE OF CHANCES.

players, who are generally five in number. The tens being always deducted from the aggregate number on the faces of the three cards, the remaining numbers will of course be either 9, 8, 7, 6, 5, 4, 3, 2, 1, or 0. If the first of these numbers is turned up, the person having it is entitled to 3 stakes; if the second, he is intitled to 2 stakes; if either a 7, or any of the lower numbers, he is intitled to 1 stake; but if a 0 is turned up, he is intitled to no stake. The question, therefore, to be solved is, the chance of having either 9, 8, 7, 6, 5, 4, 3, 2, 1, or 0.

The number of changes on n things when taken 3 and 3, being $= n \cdot \frac{n-1 \cdot n-2}{1 \cdot 2 \cdot 3}$, it follows that all the changes of this kind on two packs, or 104 cards, will be $= \frac{104 \times 103 \times 102}{6} = 182,104$, and, consequently, that

the sum of all the chances for having either 9, 8, 7, &c. points must be equal to this number. In order to find the chances for having *nine*, let it be enquired in how many ways 19 may be dealt; 1st, by having 1, 8, and 10. As there are 8 aces, 8 eights, and 52 tens, the different ways in which 19 may be dealt in this case will be $8 \times 8 \times 32 = 2048$. 2dly, 19 may be dealt by 2, 7, 10, 3, 6, 10, or 4, 5, 10; and as there are 2048 chances for dealing each of these, the whole number of chances for dealing 19, when one of the faces is a 10, is $= 2048 \times 4 = 8192$. But 19 may also be dealt by 1, 9, 9, 2, 9, 8, 3, 9, 7, 4, 9, 6, 9, 5, 8, 8, 3, 8, 7, 4, 8, 6, 5, 7, 7, 5, or 7, 6, 6. The number of ways in which the cards under *ten* may be

combined, when two of them are of a fort, is $\frac{8 \times 7 \times 8}{2} = 224$, and the number, when they are all different is 81 = 512. Hence, the number of combinations in the preceding case is $224 \times 5 + 512 \times 5 = 3680$; and, consequently, all the chances for dealing 19 are $8192 + 3680 = 11,872$. The number of ways in which all the *tens* may

be combined two and two, is $\frac{32 \times 31}{2} = 496$; therefore, the number of ways in which 29 may be dealt, is $496 \times 4 = 3984$. The number 9 also may be obtained by dealing either of the three following cards: 1, 1, 7, 1, 2, 6, 1, 3, 5, 1, 4, 4, 4, 2, 2, 5, 2, 3, 4, or 3, 3, 3. The chances for obtaining the last of these being $\frac{8 \times 7 \times 6}{1 \cdot 2 \cdot 3}$

$= 56$, the chances for obtaining any of the whole of them are $56 + 224 \times 3 + 512 \times 3 = 2264$. Hence, all the chances for obtaining a *nine*, according to the rules of the game, are $11,872 + 3984 + 2264 = 18,104$.

By proceeding in the same manner, the chances for obtaining *eight* may be determined; thus, 18 may be had by 1, 7, 10, 2, 6, 10, 3, 5, 10, 4, 4, 10 $= 3 \times 2048 + \frac{8 \times 7 \times 32}{2} = 7040$; or it may be had without

a *ten*, by having 9, 8, 1, 9, 7, 2, 9, 6, 3, 9, 5, 4, 8, 7, 3, 8, 6, 4, 8, 5, 3, 8, 8, 2, 7, 7, 4, 7, 6, 5, or 6, 6, 6 $= 7 \times 512 + 3 \times 224 + 56 = 4312$. Hence, all the chances for having 18 are $7040 + 4312 = 11,352$; 28 may be obtained, either with an 8 and 2 tens, or with 10 and 2 nines. These chances are $8 \times 496 + 28 \times 32 = 4864$. Lastly, an *eight* may be had by 6, 1, 1, 5, 2, 1, 4, 3, 1, 4, 2, 2, or 3, 3, 2 $= 3 \times 224 + 2 \times 512 = 1696$. The sum, therefore, of all the chances for having *eight*, according to the rules of the game, is $11,352 + 4864 + 1696 = 17,912$.

By pursuing the same steps, the chances for having 7, 5, 3, and 1, may be found to be the same with those for having 9; and the chances for having 6, 4, and 2, the same

with those for having 8; but the chances for having 0 will be found to be $= 19,936$. In other words, the sum of all the chances for having each of the odd numbers is 18,104; the sum of all the chances for having each of the even numbers is 17,912; and the sum of all the chances for having a blank is 19,936; which, being added together, make up the number 182,104, and, therefore, prove the truth of the solution.

Corollary. It appears from this problem that the odds *against* the number 9 being turned up are nearly as 9 to 1; *against* the number 8, as 9½ to 1; *against* a blank, as 8½ to 1; and for *either* of the other numbers, as 2½ to 1. If, therefore, each stake (as is generally the practice in this game), be five guineas, the expectation of the player on the number 9 will be worth 1l. 11s. 4d.; his expectation on the number 8 will be worth 1l. 8s. 8d., and his expectation on all the remaining numbers together will be worth 3l. 12s. 8d., making in the whole the sum of 6l. 4s. 8d.

Innumerable other problems might be added for determining the laws of chance, as well in the preceding games, as in those of *Hazard*, *Pharoan*, *Piquet*, &c. &c.; but the solution of them (were the subject of much more importance than it appears to be), would swell beyond all due limits, an article whose chief design has been to give a clear idea of the principles on which the doctrine of chances is founded, together with the solution of such general problems as may admit of the most extensive application. Those, however, who wish for further information respecting the games of chance, may have recourse to the writings of De Moivre, James Bernoulli, Thomas Simpson, &c., but particularly to those of the former, which are not surpassed, and, perhaps, not equalled by any other work on this subject.

In addition to the problems given in this article, two others should be noticed, which are not only the most abstruse, but the most important in the whole doctrine of chances; the first of them solved by James Bernoulli, and afterwards, to greater exactness by De Moivre; the second, communicated by Dr. Price to the Royal Society, from the papers of the late Mr. Bayes, as hath been already observed in the beginning of this article. In regard to the former of these problems, Mr. James Bernoulli introduces his solution of it with observing, "Hoc est illud problema, quod vulgandum hoc loco proposui, postquam jam per vicennium pressi, & cujus tum novitas, tum summa utilitas cum pari adjuncta difficultate omnibus reliquis hujus doctrinæ capitibus pondus & pretium superaddere potest." Such, therefore, being the opinion of that eminent mathematician concerning this problem, perhaps the present article ought not to be concluded without giving the solution of it, more particularly as M. De Moivre, though he pursued the investigation to a greater degree of accuracy, has contented himself with stating the rules, without giving any demonstration of them.

PROPOSITION I.

Supposing a very great number of trials to be made concerning any event, it is required to determine the probability there is that the proportion of the number of times it will happen to the number of times it will fail in these trials will differ less than by very small assigned limits from the probability of its happening to the probability of its failing in a single trial.

Solution. Let the probabilities of happening and failing be equal, and the number of trials be n . Let L , and L also be the two terms equally distant from the interval $\frac{1}{2}$, and the middle term of the binomial $1 + \frac{1}{2}$, and s the sum of the terms included between L and L , together with the extremes; then if n be a very great number, the probability that the event happens neither more frequently than $\frac{1}{2}n + L$

DOCTRINE OF CHANCES.

nor more rarely than $\frac{1}{2}n - l$ times will be $= \frac{s}{2^n}$. But if the probability of its happening to the probability of its failing in any one trial be as a to b , let L and R be the two terms equally distant by the interval l from the greatest term included in the binomial $a + b^n$, and let S be the sum of the terms included between L and R , together with the extremes, then will the probability that the event happens neither more frequently than $\frac{an}{a+b} + l$ times, nor more rarely than

$$\frac{an}{a+b} - l \text{ times be rightly expressed by } \frac{S}{a + b^n}.$$

These are the rules given by M. De Moivre for the solution of this very difficult proposition, which, he observes, are founded on the common principles of the doctrine of chances, and therefore require no demonstration. This is certainly true, so far as regards the general principles of the solution, but the method of determining the values of s and S are by no means obvious. In this, indeed, consists the whole difficulty of the solution; and as M. De Moivre has omitted the process by which he obtained those values, it will be necessary to supply the omission by inserting the following lemmas, which are chiefly derived from Mr. Simpson's treatise "On the Nature and Laws of Chance."

Lemma 1. To find the sum of the series $1 \times 2 \times 3 \times 4$ continued to x terms.

Solution. Let the series be $= P$, and its hyp. log. $= x - a \cdot \log. x + Ax + B + \frac{C}{x} + \frac{D}{x^2}$, &c. then will

$$x + 1 - a \cdot \log. x + 1 + A \cdot x + 1 + B + \frac{C}{x + 1} + \frac{D}{(x + 1)^2}, \text{ \&c.} = \log. 1 \cdot 2 \cdot 3 \dots x \cdot x + 1 = \log. P + \log. x + 1, \text{ and } x - a \log. \frac{x + 1}{x} + A + C \cdot \frac{1}{x + 1} -$$

$$-x^{-1} + D \cdot \frac{1}{(x + 1)^2} - x^{-2} + \frac{1}{x^3}, \text{ \&c.} = 0. \text{ But the fluxion of the log. of } \frac{1 + x}{x} \text{ is } \frac{-x}{x^2 + x^3}, \text{ whose fluent is } x^{-1} - \frac{x^{-2}}{2} + \frac{x^{-3}}{3} - \frac{x^{-4}}{4} + \text{\&c. The above series, there-}$$

fore, converted into simple terms will be $1 - \frac{x^{-1}}{2} + \frac{x^{-2}}{3} - \frac{x^{-3}}{4} + \text{\&c.} - ax^{-1} + \frac{ax^{-2}}{2} - \frac{ax^{-3}}{3} + \frac{ax^{-4}}{4} + \text{\&c.} + A - Cx^{-2} + Cx^{-3} - Cx^{-4} + \text{\&c.} - 2Dx^{-3} + 3Dx^{-4} - 4Dx^{-5} + \text{\&c.} - 3Ex^{-4} + 6Ex^{-5} - \text{\&c.}$ Hence, by equating the homologous terms, A will be found

$$= -1, a = -\frac{1}{2}, C = \frac{1}{3 \cdot 4}, D = 0, E = -\frac{1}{3 \cdot 4 \cdot 5 \cdot 6}, F = 0, G = \frac{1}{5 \cdot 6 \cdot 6 \cdot 7}, \text{ \&c. and consequently the above expression will be changed into } \frac{1}{x} + \frac{1}{2} \log. x - x + B + \frac{1}{12x} - \frac{1}{360x^3} + \frac{1}{1260x^5} - \text{\&c.} = \log. P. \text{ If } x \text{ be sup-}$$

posed $= 1$, this equation will become $= -1 + B + \frac{1}{12} - \frac{1}{360} + \frac{1}{1260} - \text{\&c.} = 0$. Hence B will be $= 1 - \frac{1}{12} + \frac{1}{360} - \text{\&c.}$ and therefore the log. $P = x + \frac{1}{4} \log.$

$x - x + 1 - \frac{1}{12} + \frac{1}{360} - \text{\&c.} + \frac{1}{12x} - \frac{1}{360x^3} + \frac{1}{1260x^5} - \text{\&c.}$ Now the number whose hyp. log. is 1 is

$$= 2.71828 \text{ \&c.}, \text{ the number whose hyp. log. is } \frac{1}{12x} = \frac{1}{360x^3} + \frac{1}{1.60x^5} - \text{\&c.} \text{ is } 1 + \frac{1}{12x} + \frac{1}{288x^2} - \frac{1}{51840x^3} + \text{\&c. (see Cotes's Harm. Menf. Prop. I. Schol. 2), and}$$

the number whose hyp. log. is $1 - \frac{1}{12} + \frac{1}{360} - \text{\&c.}$ is easily found to be 2.5756 &c. which Mr. Stirling has proved to be the square root of the circumference of a circle, whose radius is unity. Let this circumference be denoted by c , the series $1 + \frac{1}{12x} + \frac{1}{288x^2} - \text{\&c.}$ by d , and the num-

ber 2.71828 &c. by m , then we shall have $\frac{x^{x+\frac{1}{2}} \sqrt{c}}{m^x} \times d = P$. But when x is a very great number, the series denoted by d becomes inconsiderable, and P in this case will be nearly $= \frac{m^x}{x} \times \sqrt{c} \cdot x$.

Lemma 2. To find the ratio which any given term of a binomial, raised to an infinite or very great power, bears to the whole series.

Solution. Let the binomial be $a + b$, and n the index of its power. Let l be the distance of the given term from the first, and s be made $= n - l$. In this case the term proposed will be $= \frac{n \cdot n - 1 \cdot n - 2 \dots n - l + 1}{1 \cdot 2 \cdot 3 \dots l} a^l b^{n-l}$, or (multiplying the numerator and denominator equally by

$$1 \cdot 2 \cdot 3 \dots s) = \frac{n \cdot n - 1 \cdot n - 2 \dots 3 \cdot 2 \cdot 1 \cdot a^l b^s}{1 \cdot 2 \cdot 3 \dots l \times 1 \cdot 2 \cdot 3 \dots s}, \text{ which by}$$

$$\frac{\left(\frac{n}{m}\right)^n \times \sqrt{cn} \times a^l b^s}{\frac{l!}{m} \times \sqrt{cl} \times \frac{s!}{m} \times \sqrt{cs}}$$

the preceding lemma is $= \frac{n^{n+\frac{1}{2}} a^l b^s}{l! s! \sqrt{cls}}$, hence the ratio required is $= \frac{n^{n+\frac{1}{2}} a^l b^s}{l! s! \sqrt{cls} (a + b)^n}$.

Corollary. Since the greatest term of the binomial $a + b^n$ is that in which the exponents are to each other as a to b , if s be taken to l in that proportion, or, in other words, if l be made $= \frac{bn}{a+b}$, and $s = \frac{an}{a+b}$, and if these expressions be substituted in the values given above, the ratio of the greatest term to the whole power will become $= \frac{a+b}{\sqrt{abcn}}$, or if a

and b are equal, it will become $= \frac{2}{\sqrt{cn}}$, which are the very expressions given by M. De Moivre in those cases respectively.

Lemma 3. To find the ratio which the greatest term of a binomial raised to an infinite, or very great power, bears to a given number of terms next to it.

Solution. The same symbols being retained, as in the preceding lemma, let y be the greatest term, and ρ the number of terms to be taken on either side of it. Now since $\frac{sby}{l+1 \cdot a}$ is the next term to y , $\frac{s \cdot s - 1 \cdot b^2 y}{l + 1 \cdot a}$ the next following,

DOCTRINE OF CHANCES.

following, $\frac{s \cdot s-1 \cdot s-2 \cdot b^2 y}{l+1 \cdot l+2 \cdot l+3 \cdot a^2}$ the third term, and fo
 on, it follows that the term whose distance from the greatft
 is p , will be $\frac{s \cdot s-1 \cdot s-2 \cdot s-3 \dots s-p+1}{l+1 \cdot l+2 \cdot l+3 \dots l+p} \times \frac{l^p y}{a^p}$, and

$$+ \left\{ \begin{array}{l} -\frac{1}{2} - \frac{1}{2s} - \frac{1}{3s^2} - \frac{1}{4s^3}, \&c. \\ -\frac{2}{3} - \frac{4}{2s^2} - \frac{8}{3s^3} - \frac{16}{4s^4}, \&c. \\ -\frac{3}{4} - \frac{9}{2s^2} - \frac{27}{3s^3} - \frac{81}{4s^4}, \&c. \\ \&c. \text{ to } p-1 \text{ series.} \end{array} \right.$$

But since al is $= bs$, $p \cdot \log. bs - \log. al$ will vanish
 out of the equation; and since the numerators of the remain-
 ing terms are series of powers whose roots are in arith-
 metical progression, their sum may be easily obtained (by the
 11th Proposition in Stirling, *De Summatione Serierum*); and hence
 the foregoing expression will be found $= \log. y -$
 $\frac{p-1}{2s} + \frac{p-1}{2 \cdot 2s} - \frac{2 \cdot p-1}{12s^2} - \frac{3 \cdot p-1}{12s^2} - p + 1$

$- \&c.$, $-\frac{p \cdot p + p}{2l} - \frac{2 \cdot p^2 + 3 \cdot p \cdot p + p}{12 \cdot ll} - \&c.$ But p

being very small in respect of l and s , all the terms except
 the first in which l and s are denominators may be omitted,
 and consequently the log. of the term whose distance from
 the greatest is denoted by p will be very nearly $= \log. y -$
 $\frac{p \cdot p}{2l} - \frac{p \cdot p}{2s}$, or substituting $\frac{na}{a+b}$, and $\frac{nb}{a+b}$ for
 their equals s and l , $= \log. y - \frac{p \cdot p \cdot a + b^2}{n \cdot 2ab}$. Let this term
 be denoted by T , and let d be $= \frac{a+b^2}{2ab}$, then will log.

$$T = \log. y - \frac{d \cdot p \cdot p}{n} \text{ and } T = y \times 1 - \frac{d \cdot p^2}{n} + \frac{d^2 \cdot p^4}{2 \cdot n^2} - \frac{d^3 \cdot p^6}{2 \cdot 3 \cdot n^3} + \frac{d^4 \cdot p^8}{2 \cdot 3 \cdot 4 \cdot n^4} - \frac{d^5 \cdot p^{10}}{2 \cdot 3 \cdot 4 \cdot 5 \cdot n^5} + \&c. \text{ (See Cotes's Harm. Menf. Prop. 1. Schol. 2.)}$$

By proceeding in the same manner the $p-1$ th, $p-2$ d, $p-3$ d, &c. terms may be found; so that the sum of all the terms between y and T , including the last, will be $= y$ into $1 - \frac{d \cdot p^2}{n} - \frac{d \cdot (p-1)^2}{n} - \frac{d \cdot (p-2)^2}{n}$, &c. $+ \frac{d^2 \cdot p^4}{2 \cdot n^2} + \frac{d^2 \cdot (p-1)^4}{2 \cdot n^2} + \&c.$ which, as in the

former case of the p th term being series of powers whose roots are in arithmetical progression, the sum of the whole, neglecting in each series all the terms except the first, will be obtained (by the proposition just referred to) $= y \times$

$$p - \frac{d \cdot p^2}{3n} + \frac{d^2 \cdot p^4}{2 \cdot 5 \cdot n^2} - \frac{d^3 \cdot p^6}{2 \cdot 3 \cdot 7 \cdot n^3} + \&c. \text{ or if } p \text{ be made}$$

$$= v \sqrt{n} = y \text{ into } v \sqrt{n} - \frac{d \cdot v^3 \sqrt{n}}{3} + \frac{d^2 \cdot v^5 \sqrt{n}}{2 \cdot 5} - \frac{d^3 \cdot v^7 \sqrt{n}}{2 \cdot 3 \cdot 7} + \frac{d^4 \cdot v^9 \sqrt{n}}{2 \cdot 3 \cdot 4 \cdot 9} - \frac{d^5 \cdot v^{11} \sqrt{n}}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 11} + \&c.$$

Corollary 1. The sum of the terms between the p th and the greatest term being given above, the ratio which this

therefore that its hyp. log. will be $= \log. y + p \cdot \log. b - p \cdot \log. a$ + the fluent of $\frac{i}{s} + \frac{i}{s-1} + \frac{i}{s-2} (r-p+1)$
 - the fluent of $\frac{i}{l+1} + \frac{i}{l+2} + \frac{i}{l+3} (l+p) = \log. y$
 $+ p \cdot \log. bs - p \cdot \log. al +$

$$+ \left\{ \begin{array}{l} -\frac{1}{7} + \frac{1}{2 \cdot ll} - \frac{1}{3 \cdot ll^2} + \frac{1}{4 \cdot ll^3}, \&c. \\ -\frac{2}{7} + \frac{4}{2 \cdot ll} - \frac{8}{3 \cdot ll^2} + \frac{16}{4 \cdot ll^3}, \&c. \\ -\frac{3}{7} + \frac{9}{2 \cdot ll} - \frac{27}{3 \cdot ll^2} + \frac{81}{4 \cdot ll^3}, \&c. \\ \text{to } p \text{ series.} \end{array} \right.$$

sum bears to all the terms, will be $= \frac{y}{a+b}$ into $v \sqrt{n} -$
 $\frac{d \cdot v^3 \sqrt{n}}{3} + \frac{d^2 \cdot v^5 \sqrt{n}}{2 \cdot 5} - \&c.$ But $\frac{y}{a+b}$ (being the ratio
 which the greatest term has to all the terms) has been
 proved in the corollary to the preceding lemma to be $=$
 $\frac{a+b}{\sqrt{abcn}}$; the above ratio therefore will be $= \frac{a+b}{\sqrt{abc}} \times v$
 $\frac{d \cdot v^3}{d \cdot v^3} + \frac{d^2 \cdot v^5}{2 \cdot 5} - \frac{d^3 \cdot v^7}{2 \cdot 3 \cdot 7} + \frac{d^4 \cdot v^9}{2 \cdot 3 \cdot 4 \cdot 9} - \frac{d^5 \cdot v^{11}}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 11} + \&c.$

Corollary 2. If the probabilities of happening and failing
 are equal, $a+b$ will be $= 2$, and $d (= \frac{a+l^2}{2ab})$ will also
 be $= 2$, hence the series in the preceding corollary will be-
 come $= \frac{2}{\sqrt{c}}$ into $v - \frac{2 \cdot v^3}{3} + \frac{4 \cdot v^5}{2 \cdot 5} - \frac{8 \cdot v^7}{2 \cdot 3 \cdot 7} +$
 $\frac{16 \cdot v^9}{2 \cdot 3 \cdot 4 \cdot 9} - \frac{32 \cdot v^{11}}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 11} + \&c.$ which is given by M.
 De Moivre for determining the ratio between the sum of as
 many terms immediately succeeding the greatest as there
 are units in $v \sqrt{n}$, to the whole power of the binomial
 $1 + v^n$.

Corollary 3. Since the log. of the p th term from the
 greatest, or log. T , is $= \log. y - \frac{p \cdot p \cdot a + b^2}{n \cdot 2ab}$ this equa-
 tion, when a and b are equal, will be log. $T = \log. y -$
 $\frac{2 \cdot p \cdot p}{n}$. But the greatest term of the binomial $1 + v^n$ is the
 middle term, the log. of y , therefore, in this case, will be the
 log. of the middle term; hence will the log. of the ratio
 which T has to the middle term be expressed, as M. De
 Moivre has observed, by $-\frac{2 \cdot p \cdot p}{n}$.

Corollary 4. In this lemma it is to be observed, that
 the ratio only of the p terms next succeeding the greatest
 term is given. But the ratio of the p terms preceding
 the greatest term may be determined in the same man-
 ner. For since the p th term which precedes y is
 $\frac{l \cdot l-1 \cdot l-2 \dots l-p+1}{s+1 \cdot s+2 \dots s+p}$, it may be found by pursu-
 ing the same steps as have been taken in this lemma, that the
 expression denoting the ratio, in this case, is $= \log. y -$
 $\frac{p-1}{2l} - p + 1 - \frac{2 \cdot (p-1)^2}{2l} - \frac{3 \cdot (p-1)^3}{2l} - p + 1 - \&c.$

$$-\frac{p \cdot p + p}{2s}$$

DOCTRINE OF CHANCES.

$\frac{l^2 b + b^2}{2s} - \frac{2lp + 3p^2 b + p^3}{12 \cdot 3s^2} - \&c.$ which, on account of the smallness of p compared with s and l , is $\approx \log y - \frac{lp}{2s} - \frac{2p^2}{2l}$, or the very same with the ratio of the p th term *following* the greatest. Hence, agreeable to the observation of M. De Moivre, when n is a very great number, L and R, and consequently the sum of the p terms from the greatest, whether they precede or succeed it, will be equal.

By the assistance of these lemmas and their corollaries, the solution of this proposition may now be obtained without much difficulty.

First, supposing the probabilities of the event's happening and failing to be equal, let v be taken $= \frac{1}{2}$, then will the sum of the p terms included between L and the middle term (by Corollary 2, Lemma 3d) be $= \frac{2^{n+1}}{\sqrt{c}} \times \frac{l}{2} - \frac{2}{24}$

$+ \frac{1}{320} - \frac{8}{33760} + \&c. = \frac{2^{n+1}}{\sqrt{c}} \times .427812$, and $S = \frac{2^{n+1}}{\sqrt{c}} \times .853624 \&c.$ hence we have $\frac{S}{2^n} = \frac{2}{\sqrt{c}} \times .853624 \&c. = \frac{2}{2.59092 \&c.} \times .853624 \&c. =$

$.68269 \&c.$ If, therefore, the number of trials be infinite, the probability that the event will happen neither more frequently than $\frac{1}{2}n + \frac{1}{2}\sqrt{n}$ times, nor more rarely than

$\frac{1}{2}n - \frac{1}{2}\sqrt{n}$ times will be to the contrary as .68269 to $(1 - .68269) = .31731$, or nearly as 28 to 13. But it is by no means necessary that the number of trials should be infinite; if they be 3600, or even 1600, the probability that they happen neither more frequently than 1830, nor more rarely than 1770 times in the first case; nor more frequently than 820, nor more rarely than 780 times in the second case will be very nearly in the proportion given above. Nay, M. De Moivre asserts, that he has, by repeated trials, found this rule tolerably correct, when the number is even so low as 100.

Secondly, let the probabilities of the event's happening and failing be unequal, suppose as 1 to 2, and let v , as in the former case, be $= \frac{1}{2}$, then will the sum of the terms included between L and the greatest term (by Corollary 1, Lemma 3)

be $= \frac{2^{n+1}}{\sqrt{2c}}$ into $\frac{1}{2} - \frac{3}{2} + \frac{8}{5120} - \frac{243}{114,688} + \frac{243}{1048,576} - \&c. = \frac{3^{n+1}}{\sqrt{2c}} \times .42183 \&c.$ Hence, L + R (by

Corollary 4, Lemma 3) $= S = \frac{2^{n+1}}{\sqrt{2c}} \times .842366 \&c.$ and

$\frac{S}{(a+b)^n} = \frac{3 \times .842366 \&c.}{\sqrt{2} \times .62831 \&c.} = .7129 \&c.$ The probability, therefore, that in a very great number of trials the events will happen neither more frequently than $\frac{na}{a+b} +$

l , nor more rarely than $\frac{na}{a+b} - l$ times, will be to the

contrary as .7129 to .2871, or very nearly as 5 to 7. If the probability of the event's happening to that of its failing in one trial be as 3 to 1, the probability that it happens neither more frequently than $\frac{na}{a+b} + l$, nor more rarely

than $\frac{na}{a+b} - l$ times, may be found to be as .9163 to

.0837, or nearly as 11 to 1. The less, therefore, the ratio of the probability of the event's happening is to that of its failing, the greater will be the probability that in an indefinite number of trials, the event will happen neither more frequently nor more rarely than the number of times limited

in this problem. Thus, if $a = 1$, $b = 2$, $v = \frac{1}{3}$ and $n = 3600$, the probability that the event happens neither more frequently than 1220, nor more rarely than 1170 times, is as 5 to 2 nearly, but if $a = 1$ and $b = 3$, the probability that it happens neither more frequently than 930, nor more rarely than 870 times is nearly as 11 to 1.

If v , instead of $\frac{1}{2}$, be $= 1$, the above series will converge more slowly, and therefore Mr. De Moivre has recourse in this case to the quadrature of curves, by means of equidistant ordinates, in order to obtain the sum of it. Thus, supposing a and b equal, and l to be successively denoted by $\frac{1}{6}\sqrt{n}$,

$\frac{2}{6}\sqrt{n}$, $\frac{3}{6}\sqrt{n}$, $\frac{4}{6}\sqrt{n}$, $\frac{5}{6}\sqrt{n}$, $\frac{6}{6}\sqrt{n}$, then the logarithm of the ratio which the term distant from the middle by the intervals $\frac{1}{6}\sqrt{n}$, $\frac{2}{6}\sqrt{n}$ &c. has to the middle term, will (by

Corollary 3, Lemma 3d), be respectively equal to the logarithms $-\frac{2}{30}$, $-\frac{8}{360}$, $-\frac{18}{540}$, $-\frac{32}{540}$, $-\frac{50}{360}$, and $-\frac{72}{360} =$

$-\frac{1}{18}$, $-\frac{2}{9}$, $-\frac{1}{2}$, $-\frac{8}{9}$, $-\frac{5}{6}$, and $-\frac{2}{3}$, whose corresponding numbers being .94569, .80073, .60633, .41111, .24925, and .12534, may be considered as so many equidistant ordinates of a curve; and if the last four of them be taken, the area of the curve contained between these ordinates

will be $\frac{.60633 + .24925 + 3 \times .41111 + .12534}{6} \times \frac{1}{2}$

$= .27160$. Adding this to .82688, or the area of the curve contained between the ordinate when l is interpreted by $0\sqrt{n}$, $\frac{1}{6}\sqrt{n}$, $\frac{2}{6}\sqrt{n}$, and $\frac{3}{6}\sqrt{n}$, we have .95429 for the probability required. In other words, the probability that

the event happens neither more frequently than $\frac{1}{2}n + \sqrt{n}$

times, nor more rarely than $\frac{1}{2}n - \sqrt{n}$ times, will be to the probability that the contrary happens as .95429 to .04571, or, as 21 to 1 nearly.

If v be taken $= \frac{3}{2}$, the area contained between the ordinates, when l is interpreted by $\frac{6}{6}\sqrt{n}$, $\frac{7}{6}\sqrt{n}$, $\frac{8}{6}\sqrt{n}$, and $\frac{9}{6}\sqrt{n}$, will be found $= .0502$, which, being added to .95429 found above, will give .9833 for the probability in this case; that is, the probability that the event happens neither more frequently than $\frac{n}{2} + \frac{3}{2}\sqrt{n}$ times, nor more rarely than $\frac{n}{2} -$

$\frac{1}{2}\sqrt{n}$ times, will be to the probability that the contrary happens very nearly as $3+1$ to 1. If l were interpreted by a higher number, or, in other words, if the limits were extended, the probability might be increased, till it amounted almost to a certainty, yet the extension of those limits would bear but an inconsiderable proportion to the whole when n is very great, and none at all when it is infinite. Whence it follows, as M. De Moivre properly observes, that, "although chance produces irregularities, still the odds will be infinitely great, that in process of time those irregularities will bear no proportion to the recurrency of that order, which naturally results from original design." The truth of this observation, though undeniable, will, perhaps, be more fully confirmed by the following proposition, which is the converse of the preceding one, but rather more difficult in its solution, and more direct in its application to the arguments above-mentioned.

PROPOSITION II.

The number of times an unknown event has happened or failed being given, to find the chance that the probability of its happening should lie somewhere between any two named degrees of probability.

Solution. The solution of this proposition being not only very long and laborious, but given at full length in the Philos. Transactions (vols. 53 and 54), it will be unnecessary to enter further into it at present, than to give a general idea of the manner in which it has been investigated, and of the principles on which the demonstration is founded.

If the probability of an event's happening in each single trial be a , and that of its failing be b , the probability of its happening p times, and failing q times in $p+q (=n)$ trials, will be $= a^p b^q$ multiplied into the co-efficient of the term in which $a^p b^q$ occurs when the binomial $a+l$ is expanded. Or, denoting this co-efficient by E , the probability will be $= E a^p b^q$.

If the ball O be then thrown $p+q (=n)$ times, and if it resting between A D and o , after a single throw, be called the happening of the event M in a single trial, then will the probability that the point o falls between any two points in the line B A be the ratio of the distance between these two points to the whole line B A; and if the ball W has been thrown, and the line os be drawn, the probability of the event M in a single trial will be the ratio of A o to B A. Hence, if on the base B A, a figure B g n e m A be described, whose property is this; that the base being divided into two parts, as Δb and B b , and at the point of division b , a perpendicular being erected and terminated by the figure in m, y, x, r , respectively represent the ratio of $b m, A b$, and B b , to B A and y be $= E x^p r^q$ (E being the co-efficient of the term in which $a^p b^q$ occurs); then, before the ball W is thrown, the probability that the point o shall fall between f and b , and also that the event M shall happen p times, and fail q times in $p+q$ trials will be the ratio of $f g m b$ to C A, or the square upon B A. Supposing now, before any thing is discovered concerning the place of the point o , that it should appear that the event M had happened p times, and failed q times in $p+q$ trials, and from hence, that it were guessed that the point o lay between any two points f and b , in the line B A, and consequently, that the probability of the event M, in a single trial, was somewhere between the ratio of Δb to B A, and that of A f to B A; then would the probability that this guess were right be the ratio of $f g m b$ to B A.

Having demonstrated the truth of these propositions, nothing further remained to complete the solution than to determine the area of the figure described above, and of the several parts of it separated by the ordinates perpendicular to B A. For this purpose B A being made $= 1$, and the equation of the curve $y = x^p r^q$, the area of the figure A $b m$, and consequently its ratio to C A $= 1$, is found $=$

$$\frac{x^{p+1}}{p+1} - \frac{q \cdot x^{p+2}}{p+2} + \frac{q \cdot q - 1 \cdot x^{p+3}}{2 \times p+3} - \&c.$$

the area of the figure B $b m$, and its ratio to C A, $= \frac{r^{q+1}}{q+1} - \frac{p \cdot r^{q+2}}{q+2} +$

$$\frac{p \cdot p - 1 \cdot r^{q+3}}{2 \times q+3} - \&c.$$

the area of the whole figure A m B, and its ratio to C A $= \frac{1}{n+1} \times \frac{1}{E}$. Hence the

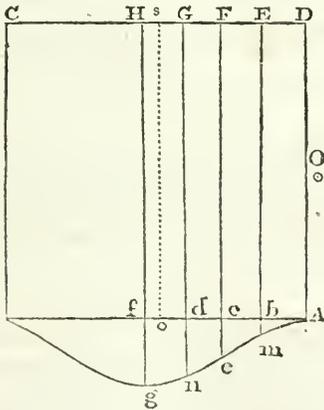

ratio of A $b m$ to the whole figure is $= \frac{n+1}{n+1} \cdot E \times \frac{x^{p+1}}{p+1}$

$- \frac{q \cdot x^{p+2}}{p+2} + \&c.$, and if, as x expresses the ratio of A b to B A, z expresses the ratio of A f to B A, the ratio of A $f g$ to the whole figure will be $\frac{n+1}{n+1} \cdot E \times \frac{z^{p+1}}{p+1} - \frac{q \cdot z^{p+2}}{p+2} +$

$\frac{q \cdot q - 1 \cdot z^{p+3}}{2 \cdot p+3} - \&c.$, and consequently the ratio of $f g m b$ to A m B will be $= \frac{n+1}{n+1} \cdot E$, multiplied into the difference between these two series. Or, in other words, if nothing is known concerning an event, but that it has happened p times, and failed q times in $p+q$ trials; and it be guessed, that the probability of its happening in a single trial, lies somewhere between z and x ; the chance of being right in this case, will be $\frac{n+1}{n+1} \cdot E$, multiplied into the difference

between the series $\frac{z^{p+1}}{p+1} - \frac{q \cdot z^{p+2}}{p+2} + \frac{q \cdot q - 1 \cdot z^{p+3}}{2 \cdot p+3} -$

$$\frac{x^{p+1}}{p+1} - \frac{q \cdot x^{p+2}}{p+2} + \frac{q \cdot q - 1 \cdot x^{p+3}}{2 \cdot p+3} - \&c.$$

Suppose BCDA to be a plane perfectly level; the line A B to be divided into equal parts A $b, b c, c d$, &c. and the perpendiculars $b E, c F, d G$, &c. to be erected. If a ball W be thrown upon this plane, the probability that it rests between any two of the parallel lines will be equal. Supposing it, therefore, to be thrown for the first time, and a line os to be drawn through the point on which it has rested.

DOCTRINE OF CHANCES.

&c. and the series $\frac{x^{p+1}}{p+1} - \frac{q \cdot x^{p+2}}{p+2} + \frac{q \cdot q - 1 \cdot x^{p+3}}{2 \cdot p+3} -$

When p and q are very large numbers, it will be impossible to apply this rule to practice on account of the multitude of terms contained in the two series. Mr. Bayes, aware of this difficulty, attempted with great labour and ingenuity, to remedy the defect; but although he considerably improved the rule, he did not succeed so far as to give the required chance within limits sufficiently narrow. His friend and editor, Dr. Price, has therefore pursued the inquiry with equal labour, and the result of an investigation, which occupies too many pages to admit of its being inserted here, has been the following rule.

If nothing is known concerning an event, but that it has happened p times and failed q times in $p+q$, or n trials, and from hence it be guessed, that the probability of its happening in a single trial lies between $\frac{p}{n} + z$, and $\frac{p}{n} - z$, the chance to be in the right, if either p or q exceed 1, is less than 2Σ , and greater than $\Sigma + \Sigma \times \frac{1 - 2 E a^p b^q - 2 E a^q b^p}{1 + E a^p b^q + \frac{E a^q b^p}{n}}$

If either p or q exceed 10, this chance is less than 2Σ , and greater than $\Sigma + \Sigma \times \frac{1 - 2 E a^p b^q - 2 E a^q b^p}{1 + \frac{1}{2} E a^p b^q + \frac{E a^q b^p}{2n}}$; but in

all cases, where z is small, and also where the disparity between p and q is not great, the chance is very nearly 2Σ . In this rule, it is to be observed, that (supposing $m^2 = \frac{n^2}{2pq}$, K = the ratio of the quadrantal arc of a circle to its

radius, and H = the ratio, whose hyp. log. is $\frac{2^2 - 1}{2n} - \frac{2^4 - 1}{360n^2} + \frac{2^6 - 1}{1260n^3} - \frac{2^8 - 1}{1680n^4} + \&c.$) Σ is made $= \frac{n+1}{n} \times \frac{\sqrt{2pq}}{n} \times E a^p b^q$ into the series $\frac{Hn}{n+1} \times \frac{\sqrt{K}}{\sqrt{2}} - \frac{n}{n+2} \times \frac{1 - \frac{2m^2 z^2}{n}}{2mz} + \frac{n^2}{n+2} \times \frac{1 - \frac{2m^2 z^2}{n}}{n+4 \cdot 4m^3 z^3} - \frac{3n^3}{n+2} \times \frac{1 - \frac{2m^2 z^2}{n}}{n+4 \cdot 6m^3 z^3} + \frac{1 - \frac{2m^2 z^2}{n}}{n+4 \cdot n+6 \cdot 8m^3 z^3} + \frac{3 \cdot 5 \cdot n^4}{n+4} \times \frac{1 - \frac{2m^2 z^2}{n}}{n+4 \cdot n+6 \cdot n+8 \cdot 16m^7 z^7} - \&c.$ and $E a^p b^q = \frac{1}{2 \sqrt{Kpq}}$ multiplied into the ratio,

whose hyp. log. is $\frac{1}{12} \times \frac{1}{n} - \frac{1}{p} - \frac{1}{q} - \frac{1}{360} \times \frac{1}{n^3} - \frac{1}{p^3} - \frac{1}{q^3} + \frac{1}{1260} \times \frac{1}{n^5} - \frac{1}{p^5} - \frac{1}{q^5} - \frac{1}{1680} \times \frac{1}{n^7} - \frac{1}{p^7} - \frac{1}{q^7} + \frac{1}{1188} \times \frac{1}{n^9} - \frac{1}{p^9} - \frac{1}{q^9} - \&c.$

From the preceding investigation, it appears that the first rule gives a direct and perfect solution in all cases, and that the second rule is only a method of approximating to the solution, when the labour of applying the first rule becomes too great. If either p or q are nothing, or very small, it is

evident that the first rule gives an easy and correct solution; but, in all other cases, recourse must be had to the approximation in the second rule; which, however, may be generally computed without any great difficulty. Indeed, what principally recommends the solution of this proposition is, that giving complete information when either p or q are small, it gives it in those cases where it is most wanted, and where M. de Moivre's solution of the inverse proposition can afford little or no direction. In the other cases, where p and q are very great, and where only the approximation is wanted, the required chance may be obtained with tolerable accuracy by the assistance of M. de Moivre's proposition. But in order to give a distinct idea of the nature of the present proposition, it will not be improper to conclude this account with the following examples: observing, however, previously, that both Mr. Bayes and Dr. Price, having omitted to state the value of E in the first rule, it may be

found $= \frac{n^n \sqrt{n}}{p^p q^q + \sqrt{Kpq}}$ multiplied into the ratio, whose

hyp. log. is $\frac{1}{12} \times \frac{1}{n} - \frac{1}{p} - \frac{1}{q} - \frac{1}{360} \times \frac{1}{n^3} - \frac{1}{p^3} - \frac{1}{q^3} - \frac{1}{1260} \times \frac{1}{n^5} - \frac{1}{p^5} - \frac{1}{q^5} - \frac{1}{1680} \times \frac{1}{n^7} - \frac{1}{p^7} - \frac{1}{q^7} + \&c.$

1. Supposing an event to have happened about the probability of which nothing further is known than that it has happened *once*, and that it be inquired what conclusion should be drawn from hence with respect to the probability of its happening on a second trial. In this case q in the first rule becomes $= 0$ and $p = 1$, and if the limits z and x be

put respectively $= 1$, and $\frac{1}{2}$ the expression in that rule, or $\frac{1}{n+1} \cdot \frac{z^{p+1}}{p+1} - \frac{x^{p+1}}{p+1} \left(= 1 - \frac{1}{2} \right)$ will give $\frac{3}{4}$ for the

answer; which shews that it is 3 to 1 that the chance lies somewhere between 1 and $\frac{1}{2}$, or that the odds are 3 to 1, that it is somewhat more than an even chance that it would happen on a second trial. In the same manner, if the event has

happened twice, the expression will be $1 - \frac{1}{2^3} = \frac{7}{8}$; if thrice, $= 1 - \frac{1}{2^4} = \frac{15}{16}$. That is, the odds will be 7 to

1 if it has happened twice, and 15 to 1 if it has happened thrice, for *more* than an equal chance that it will happen on further trials. Again, if the event has happened ten times without failing, and inquiry be made what reason we have to think we are right if we guess that the probability lies

somewhere between $\frac{3}{4}$ and $\frac{2}{3}$, or between 3 to 1 and 2 to 1, the answer in this case will be $\frac{3}{4} - \frac{2}{3} = .3067$; that is, the odds are greater than 2 to 1 against our being right.

If we had guessed that the probability lay between $\frac{16}{17}$ and $\frac{2}{3}$, or between 16 to 1 and 2 to 1, the chance would have

been nearly equal that we had guessed right.

2. Supposing nothing further is known beyond of an event than that it happened ten times and failed once, and that a person guessed from thence that the ratio of the probability of the event's happening in a single trial to that of its failing, lay somewhere between the ratio of 9 to 1

11 to 1; then would the chance of his being right in his guesses be expressed by $\frac{n}{n+1}$. E multiplied into the difference between $\frac{x^{p+1}}{p+1} - \frac{q x^{p+2}}{p \times 2}$ and $\frac{x^{p+1}}{p+1} - \frac{q x^{p+2}}{p+2}$. Now

since x is $= \frac{11}{12}$, $x = \frac{9}{10}$, $p = 10$, $q = 1$, $n = 11$, and E

also = 11, this expression may be easily found = .07699 &c.; so that there would be the odds of 923 to 77, or 12 to 1 nearly against his being right. If the event had happened 20 times and failed twice, the required chance would

$$\text{be } 23 \times 231 \times \frac{11^{21}}{12} - 2 \times \frac{11}{12} + \frac{11^{21}}{12} - \frac{9^{21}}{10} -$$

$$2. \frac{9^{21}}{10} + \frac{9^{21}}{10} = .10843 \text{ \&c. The odds, therefore,}$$

against his being right are less than in the former case, being here only 892 to 108, or 9 to 1 nearly.

3. Lastly, supposing an event to have failed 1000 times, and to have happened 100 times in 1100 trials; or, in other words, supposing a person to have known nothing more of a lottery than that he had just seen 1100 tickets drawn of which 1000 were blanks, and 100 were prizes; and that in consequence he guessed that the proportion of the blanks to the prizes in the lottery lay somewhere between $\frac{10}{11}$ -

$\frac{1}{110}$, and $\frac{10}{11} + \frac{1}{110}$. In this case the first rule would require so many terms as to render it impracticable, and therefore recourse must be had to the second rule, by which the question may be determined in the following manner:

Since p is = 1000 . q = 100 . n = 1100 . x = $\frac{1}{110}$ and m

$\left(\frac{\sqrt{n^2}}{2 \sqrt{p q}} \right) = 81.578$, $E a^p b^q$ may be found = .0418545

and $\Sigma = .3531$; hence 2Σ will be = .7062 and $\Sigma + \Sigma \times$

$\frac{n}{1 + \frac{1}{2} E a^p b^q + E a^p b^q} = .6758$, so that the chance of

his being right in his conjecture lies somewhere between .7062 and 6758, or between the odds of 240 to 100, and 208 to 103, or nearly between 12 to 5 and 10 to 5.

CHANCE, in *Law*. Where a man commits an unlawful act, by misfortune or chance, and not by design, it is an instance of deficiency of will. In this case the will observes a total neutrality, and does not co-operate with the deed; and it therefore wants one main ingredient of a crime. It may here be observed, that if any accidental mischief happens to follow from the performance of a *lawful* act, the party stands unexcused from all guilt: but if a man be doing any thing *unlawful*, and a consequence ensues which he did not foresee or intend, as the death of a man or the like, his want of foresight shall be no excuse; for, being guilty of one offence, in doing antecedently what is in itself unlawful, he is criminally guilty of whatever consequence may follow the first misbehaviour. 1 Hal. P. C. 39. See the next article.

CHANCE-MEDLEY, formed of *Fr. chance*, and *meler*, miscere, the accidental killing of a man in self-defence. This self-

defence is that by which a man may protect himself from an assault, or the like, in the course of a sudden brawl or quarrel, by killing him who assaults him.

This kind of killing (*fr. defendendo*) is what the law expresses by the word *chance-medley*, or (as some write it) *chaut-medley*; the former of which, according to its etymology, signifies a *casual* affray, the latter, an affray in the *heat* of blood or passion; both of these being much of the same import: but the former is in common speech too often erroneously applied to any manner of homicide by misadventure: whereas it appears by the Statute 2 Hen. VIII. c. 5. and our ancient books (Staufd. P. C. 16.), that it is properly applied to such killing as happens in self-defence, upon a sudden encounter. (3 Inst. 55. 57. Foll. 275, 276.) This right of natural defence does not imply a right of attacking; for, instead of attacking one another for injuries past or impending, men need only have recourse to the ordinary tribunals of justice. They cannot, therefore, legally exercise this right of preventive defence, but in sudden or violent cases; when certain and immediate suffering would be the consequence of waiting for the assistance of law. Therefore, to excuse homicide by the plea of self-defence, it must appear, that the slayer had no other possible (or, at least, probable) means of escaping from his assailant. It is frequently difficult to distinguish this species of homicide (upon *chance-medley* in self-defence) from that of manslaughter, in the proper legal sense of the word. (3 Inst. 55.) But the true criterion between them seems to be this: when both parties are actually combating at the time when the mortal stroke is given, the slayer is then guilty of manslaughter; and if the slayer hath not begun to fight, or (having begun) endeavours to decline any further struggle, and afterwards, being close pressed by his antagonist, kills him to avoid his own destruction, this is homicide excusable by self-defence. (Foll. 277.) See HOMICIDE. In chance-medley the offender forfeits his goods, but hath a pardon of course. See Stat. 6 Edw. I. c. 9.

CHANCEFORD, in *Geography*, a township of America, in York county, Pennsylvania.

CHANCEL, is properly that part of the choir of a church, between the altar or communion-table, and the balustrade, or rail that encloses it; where the minister is placed at the celebration of the communion.

The word comes from the Latin *cancelus*, which in the lower Latin is used in the same sense, from *canceli*, *lattices*, or *cross-bars*; wherewith the *chancels* were anciently encompassed, as they now are with rails.

The right of a seat and a sepulchre in the chancel, is one of the privileges of the founders of a church. The repairs of the chancel belong by usage, in most parishes, to the rector or vicar, or both.

CHANCELADE, in *Geography*, a town of France, in the department of the Dordogne; one league N.W. of Périgueux.

CHANCELLOR, an officer, supposed originally to have been a notary, or scribe, under the emperors, and named *cancellarius*, because he sat behind a lattice, called in Latin *cancelus*, to avoid being crowded by the people.

Naupe says, it was the euphror himself who sat and rendered justice within the lattice; the chancellor attending at the door thereof, whence he took his title.

Others say, he had it from this, that all letters, addresses, petitions, &c. to the king, being first examined by him, were *cancelled*, where amiss: others, as Sir Edward Coke (4 Inst. 83.) because all patents, commissions, and warrants, coming from the king, were examined and *cancelled* by him, which granted contrary to law, which is the highest point of

his jurisdiction. Others, because he *cancelled* and annulled the sentences of other courts.

Du-Cange, by Joannes de Janua, fetches the original of the word chancellor from Palestine, where the houses being flat, and made in form of a terrace, with parapets or pali-fadoes, called *cancelli*; those who mounted these houses to rehearse any harangue, were called *cancellarii*; whence the name passed to those who pleaded at the bar, which he calls *cancelli forenses*, and at length to the judge who presided; and lastly to the king's secretaries.

The office, and also the name of chancellor (however derived), was undoubtedly known to the courts of the Roman emperors; where it originally seems to have signified a chief scribe or secretary, who was afterwards invested with several judicial powers, and a general superintendency over the rest of the officers of the prince. Under the emperor Carinus, one of his door-keepers, with whom he entrusted the government of the city, was denominated *cancellarius*; and from this humble original, says Mr. Gibbon, (Hist. Rom. Emp. vol. ii. p. 91) the appellation has, by a singular fortune, risen into the title of the first great office of state in the monarchies of Europe. From the Roman empire it passed to the Roman church ever emulous of imperial state; and hence every bishop has, to this day, his chancellor, the principal judge of his consistory. And when the modern kingdoms of Europe were established upon the ruins of the empire, almost every state preserved its chancellor, with different jurisdictions and dignities, according to their different constitutions. But in all of them he seems to have had the supervision of all charters, letters, and such other public instruments of the crown, as were authenticated in the most solemn manner; and therefore, when seals came into use, he had always the custody of the king's great seal.

This officer is now in great authority in all countries: the person who bears it with us, or the

Lord High Chancellor of England, is the first lay person of the realm, next after the king and princes of the blood, in all civil affairs. He is the chief administrator of justice next the sovereign, being the judge of the court of chancery; and to him belongs the appointment of all the justices of peace in the kingdom.

All other justices are tied to the strict rules of the law; but the chancellor has the king's absolute power to moderate the rigour of the written law, to govern his judgment by the law of nature and conscience, and to order all things *secundum equum & bonum*. Accordingly, Stamford says, the chancellor has two powers, the one absolute, the other ordinary; meaning, that though by his ordinary power he must observe the same form of procedure as other judges, yet in his absolute power he is not limited by any written law, but by conscience and equity.

Although Polydore Virgil, in his History of England, makes William I. called the Conqueror, the founder of our chancellors; yet Dugdale has shewn, that there were many chancellors of England long before that time, who are mentioned in his "Origines Juridicales," and catalogues of chancellors; and Sir Edward Coke (4 Inst.) says, it is certain, that both the British and Saxon kings had their chancellors, whose great authority under their kings were probably derived from the reasonable customs of neighbouring nations, and the civil law. The offices of lord-chancellor and lord-keeper, by the statute 5 Eliz. cap. 18. were invested with the same power; till that time they were different, and frequently subjoined at the same time in different persons; sometimes the lord-chancellor had a *vice-chancellor*, who was

Since that statute, there cannot be a lord-chancellor and

a lord-keeper at the same time; but before, there might, and had been. King Henry V. had a great seal of gold, which he delivered to the bishop of Durham, and made him lord-chancellor; and also another of silver, which he committed to the bishop of London to keep. Lord Bridgman was lord-keeper, and lord chief justice of the common pleas, at the same time; which offices were held not to be inconsistent. (4 Inst. 78.) By stat. 1 W. and M. cap. 21. commissioners appointed to execute the office of lord-chancellor, may exercise all the authority, jurisdiction, and execution of laws which the lord-chancellor, or lord-keeper, of right might use and execute, &c.; since which statute this high office hath been several times in commission. The keeper was created *per traditionem magni sigilli*, but the lord-chancellor by patent, though now that he has the keeper's office, he is created in like manner by the mere delivery of the king's great seal into his custody; whereby he becomes, without writ or patent, an officer of the greatest might and power of any now subsisting in the kingdom, and in point of precedence superior to every temporal lord. And the act of taking away this seal by the king, or of its being assigned or given up by the chancellor, determines his office. (1 Sid. 338.) The chancellor is a privy-counsellor by his office, and according to lord-chancellor Ellesmere, prolocutor of the house of lords by prescription. See PARLIAMENT.

Though he be sole judge of the court of chancery, yet in matters of much difficulty, he sometimes consults the other judges, though they have no share whatever of the judicial authority; so that this office may be discharged by one who is no professed lawyer, as anciently it commonly was by an ecclesiastic, who presided over the royal chapel, and became keeper of the king's conscience; visitor, in the king's right, of all hospitals and colleges of royal foundation; patron of all the king's livings, under the value of 20 marks per ann. in the king's books, (38 Ed. III. 3. F. N. B. 35) though Hobart (214) extends this value to 20 pounds; guardian of all infants, idiots, and lunatics; and general superintendent of all charitable institutions; and all this, over and above the vast and extensive jurisdiction which he exercises in his judicial capacity in the court of chancery, wherein, as in the exchequer, there are two distinct tribunals; the one ordinary, being a court of common law, the other extraordinary, being a court of equity. See COURT of Chancery.

The lord chancellor, as there is now no lord high steward, is accounted the first officer of the kingdom; and he not only keeps the great seal, but all patents, commissions, warrants, &c. from the king, are perused and examined by him, before they are signed; and he annuls the king's letters patent when contrary to law. See this article *supra*. By his oath he swears well and truly to serve the king, and to do right to all manner of people, &c. The stat. 25 Ed. III. c. 2. declares it to be treason to slay the chancellor (and certain other judges), being in their places doing their offices; and it seems, that the lord-keeper and commissioners of the great seal are within this statute, by virtue of stat. 5 Eliz. c. 18. and 1 W. and M. c. 21. See TREASON.

The lord-chancellor, in his judicial capacity, has twelve assistants or coadjutors, anciently called *clerici*, as then being in holy orders, now *Masters in Chancery*, and the *Master of the Rolls*. See MASTER of the Rolls, MASTERS in Chancery, &c.

Besides these superior officers, he has other assistants. The *five clerks* in chancery transact and file all proceedings by bill and answer; and also issue out some patents that pass the great seal; which business is done by their under clerks, each

each of whom has a seat there; of whom every one of the six clerks has a certain number in his office, usually about ten; the whole body being called the *sixty clerks*.

The *custos* of the court, 24 in number, make out all original writs in chancery, which are returnable in C. B., &c. and among these the business of the several counties is severally distributed. The *registrar* is an office of great importance in this court, under whom are several deputies, who take cognizance of all orders and decrees, and enter and draw them up, &c. The *master of the subpoena office* issues out all writs of subpoena. The *examiners* are officers who take the depositions of witnesses and examine them, and make out copies of the depositions. The *clerk of the affidavits* files all affidavits used in court, without which they will not be admitted. The *clerk of the rolls* sits constantly in the Rolls, to make searches for deeds, offices, &c., and to make out copies. The *clerks of the petty-bag office*, three in number, have a great variety of business belonging to their respective departments, in making out writs of summons to parliament, *congé d'elres* for bishops, patents for customers, *liberates* upon extent of statute- staple, and recovery of recognizances forfeited, &c.; and also relating to suits for and against privileged persons, &c. These clerks have several subordinate clerks. The *usher of the chancery* had formerly the receiving and custody of all money entered to be deposited in court, and paid it back again, by order; but this business was afterwards assumed by the masters in chancery: till by stat. 12 Geo. I. c. 32. a new officer was appointed, called the *accountant general*, which see. There is also a *serjeant at arms*, to whom persons standing in contempt are brought up by his substitute as prisoners. A *warden of the fleet* receives such prisoners as stand committed by the court, &c. Besides these officers there are several others; such as a clerk of the crown in chancery; clerk and controller of the hanaper; clerk for in-rolling letters patent, &c., not employed in proceedings of equity, but concerned in making out commissions, patents, powers, &c. under the great seal, and collecting the fees thereof; a clerk of the faculties, for dispensations, licences, &c.; clerk of the presentations for benefices of the crown in the chancellor's gift; clerk of appeals, in appeals from the courts of the archbishop to the court of chancery; and various other officers, who are constituted by the chancellor's commission.

CHANCELLOR of a cathedral. His office is thus described in the Monasticon; viz. to hear the lessons and lectures read in the church, either by himself, or his vicar; to correct and set right the reader when he read amiss; to inspect schools, to hear causes, apply the seal, write and dispatch the letters of the chapter, keep the books, take care there be frequent preachings, both in the church, and out of it, and assign the office of preaching to whom he lists.

CHANCELLOR of a diocese, or of a bishop, is a person appointed to hold the bishop's courts, held in the respective cathedral of each diocese, and to assist the bishop in matters of ecclesiastical law. This officer, as well as all other ecclesiastical ones, if lay or married, must be a doctor of the civil law to created in some university. Stat. 37 Hen. VIII. c. 17. He was anciently called *ecclesiasticus*, and *ecclesiasticus iustitialis*, the church-lawyer. See *Bishop's COURT*.

CHANCELLOR of the duchy of Lancaster, is an officer before whom, or his deputy, the court of the duchy chamber of Lancaster is held. It is his business to judge and determine all controversies between the king and his tenants of the duchy-land; and otherwise to direct all the king's affairs relating to that court. See *Duchy COURT*.

CHANCELLOR of the exchequer, is an officer, supposed by

some to have been created for moderating extremities in the exchequer. He sometimes sits in that court and the exchequer-chamber, and, with the rest of the court, orders things to the king's best benefit. He is always in commission with the lord-treasurer for letting lands accruing to the crown by dissolution of abbies, and otherwise: he has power (by stat. 33 Hen. VIII. c. 39), with others, to compound for forfeitures on penal statutes, bonds, and recognizances entered into to the king. He has a great authority in managing the royal revenue, &c. and this seems of late to be his chief business; accordingly he is commonly the first lord commissioner of the treasury. The court of equity in the exchequer-chamber, which was intended to be holden before the lord-treasurer, chancellor, and barons, is usually held before the barons only. When there is a lord-treasurer, the chancellor of the exchequer is under-treasurer. See *COURT of EXCHEQUER*.

CHANCELLOR of the order of the garter, and other military orders, is an officer who seals the commissions and mandates of the chapter, and assembly of the knights, keeps the register of their deliberations, and delivers acts thereof under the seal of the order. This office is annexed to the see of Salisbury. See *GARTER*.

CHANCELLOR of an university, is he who seals the diplomas or letters of degrees, provision, &c. gives the university.

The chancellor of Oxford is their chief magistrate, elected by the students themselves; his office is *durante vita*, to govern the university, preserve and defend its rights and privileges, convoke assemblies, and do justice among the members under his jurisdiction.

Under the chancellor is the *vice-chancellor*, who is chosen annually; being nominated by the chancellor, and elected by the university in convocation. His business is to supply the chancellor's absence.

At his entrance upon his office, he chooses four *pro-vice-chancellors* out of the heads of colleges, to one of whom he deposes his power in his absence. See *OXFORD*.

The chancellor of Cambridge is, in most respects, the same with that of Oxford; only he does not hold his office *durante vita*, but may be deposed every two years.

He has under him a commissary, who holds a court of record of civil causes, for all persons of the university under the degree of master of arts.

The vice-chancellor of Cambridge is chosen annually by the senate, out of two persons nominated by the heads of the several colleges and halls. See *CAMBRIDGE*. See also *UNIVERSITY COURTS*.

CHANCERY. See *COURT of Chancery*.

CHANCHA, in Geography, a town of Egypt; 2 leagues E. of Cairo, at the entrance of a desert which leads to mount Sinai.

CHANCRE, in Surgery, is a term originally derived from the Greek word *καρκίνος*, CANCER, CANKER, or (agreeably to the French orthography) CHANCRE. This word, among the Romans, signified an eroding ulcer of any kind, *ulcus canerosum*; such, for example, as may be often seen in the inside of the cheeks or lips, where the cuticle is extremely thin, as it is upon the glans penis, and interior part of the prepuce. "Si quando autem ulcera oris cancer invadit, primo considerandum est, num malum corporis habitus sit, eique occurrendum." Celsus, de Med. lib. vi. cap. 15. The translators of Celsus, in this passage, and in lib. v. cap. 26. § 31. 35. have not improperly rendered the term *cancer* by the word *gangrene*; and so, conversely, the Greek term *γανγκρημία* has been translated *cancer* in the Latin vulgate bible, and *canker* in the authorized English version.

z Tim. ii. 17.—because a gangrene is of an eroding or spreading nature. In this sense, the word may be used metaphorically :

“ Yet writers say, as in the sweetest bud

The eating canker dwells ; so eating loe

Inhabits in the finest wits of all.” SHAKESPEARE.

French writers do not confine the term *chancre*, as most of the modern English authors have done, to sores arising from a venereal cause ; although they, too, are getting more into that habit : but the French use this word to denote the little eating ulcer of the mouth, before noticed ; and they even apply the same term to vegetables, e. g. “ Cet aigre la est une chancre.”

The older medical authors, especially those of the middle age, employed the words *cancerana* and *carolis*, likewise, to signify that kind of eroding malignant sore which arises from impure sexual intercourse ; and it is this local disorder, almost exclusively, to which modern surgeons are accustomed to apply the epithet *chancre*. Indeed, we seldom hear the word, without annexing the idea of its originating in a venereal cause ; and from this association, we are very apt to forget the true etymology of the term, and that it was in use even before the existence of lues venerea.

The old Italian words *carolo*, a canker-worm, and *caroloso*, worm-eaten, were, perhaps, derived from *caries*, which signifies rottenness. Hence, the Italians write, in their ancient idiom, “ *bubones di caroli*,” that is, bubones ex carie : Vide Welfsch. Obs. Med. Syllog. in Marc. Cumani, 4to. p. 38. Hence again, Fracastorius and others say, “ *caries penis*,” where we should say, “ *chancre penis*.”

Marcellus Cumanus, who wrote in the year 1495, during the invasion of Italy by Charles VIII. tells us, he cured many persons afflicted with venereal chancres : “ *Vidi quendam patientem carolos in virga, in parte præputii interna ;*” and in another place, he says, “ *Ego infinitos bubones causatos ex pustulis virgæ, & ex nimia fatigatione & labore curavi.*” That he means the same disease in both cases is evident, from the following observations : “ *Ut resolvatur bubo in principio & augmento, a causa primitiva, vel à carolis fiat hoc, &c.*”—and again, “ *Aliquando incipiebat pustula una in modum vesiculæ parvæ sine dolore, sed cum pruritu, fricabant, et inde ulcerabatur tanquam formica corrosiva ; et post aliquot dies incurrebant in angustis propter dolores in brachiis, cruribus, pedibus, cum pustulis magnis.*” This is the very best description on record of what we now denominate VENEREAL CHANCRES : (See LUES VENEREA and SYPHILIS.) The next authors who noticed this symptom of *lues*, were Torrella, Almenar, and John De Vigo.

The most common characters of a chancre, in its incipient state, are a red, painful, and itching pimple, containing a small quantity of subserous serum, which readily bursts into a little ulcer, having hard, thickened, and slightly elevated edges. But this very same kind of sore may arise in other parts of the body, thinly covered with cuticle ; and it appears to be, in a great measure, owing to the structure of the affected part, what characters the ulcer shall assume, rather than to the peculiar nature of the efficient cause. We do not, at present, enter into the subject of the cure of chancres ; as this belongs to the article SYPHILIS or LUES VENEREA : but we may here observe, that medical men have generally obscured this subject in their writings, and too generally have supposed all chancres to be venereal ; from which erroneous doctrine, they have further concluded, that all chancres require mercury for their cure ! See Mr. Blair’s “ *Essays on the Venereal Disease*,” Part II. sub finem ; where this question is considered, in reference to the

medical use of nitric acid. Mr. Abernethy has also, of late, thrown out some useful hints on the same subject, in his “ *Surgical Observations*,” Part I. p. 108, &c.

CHANDA, in *Geography*, a considerable city of Hindoostan, in the country of Berar, belonging to Nagpore, and about 70 geographical miles to the south of it. N. lat. 19° 48'. E. long. 80° 2'.

CHANDACE, in *Ancient Geography*, a fortified town of the island of Crete.

CHANDAIL, a circar or district of Hindoostan in the territory of Allahabad, S. W. of the country of Benares.

CHANDANA, in *Ancient Geography*, an ancient town placed by Steph. Byz. in Japygia.

CHANDANACA, a town of Asia, in Persia. Steph. Byz.

CHANDELEUR islands, a cluster of islands in the gulf of Mexico, near the coast of West Florida. N. lat. 29° 30'. to 29° 45'. W. long. 88° 48'. to 88° 58'.

CHANDELIER signifies a candlestick, lamp, &c. which see. Illuminated chandeliers form an important addition to a collection of works in pyrotechny, and are much admired by the Italians. They have the advantage of being easily made ; and in a grand exhibition illuminated pieces of this kind should be fired after every two or three wheels, or fixed pieces of common and brilliant fires. For the construction of an illuminated chandelier, let it be made of thin wood, consisting of a stem and arched branches, and surmounted with a crown. In the front of the branches, in the body, and in the crown at the top, bore as many holes for illuminations as they will contain, at the distance of three inches from one another : and in these insert illuminations formed with white, blue, or brilliant charges. Having fixed the port fires, clothe them with leaders, so that the chandelier and crown may be illuminated together. See PYROTECHNY.

CHANDELIERS, or CHANDELEERS, in *Fortification*, are upright stakes raised on one or more pieces of wood to support planks, boughs, fascines, and, in general, all that can help to cover the besiegers, and prevent the enemy from seeing what is doing behind them. When the besiegers are under the necessity of opening any trenches that are enfiladed, they must take such precautions and raise a parapet every now and then to cover part of such a trench. Chandeliers sometimes serve as a moveable parapet.

CHANDEGEREE. See KANDEGERI.

CHANDEREE, in *Geography*, a very ancient city of Hindoostan, capital of a circar or district in the province of Malwa, near the river Bewah. It once contained, according to the Ayin Acbare, 14,000 stone houses ; and, although, like most of the ancient cities of Hindoostan, it is fallen into decay, it is still the residence of a principal rajah : 242 miles N. E. of Ougain, and 302 N. W. from Nagpore. N. lat. 24° 48'. E. long. 73° 43'.

CHANDERNAGORE, a town of Hindoostan, in the country of Bengal, formerly a French settlement, but now possessed by the English, situated on the western bank of the Ganges, about an hour’s walk below Chinsurah, and somewhat more than 10 miles from Calcutta. It is built, about a mile in length, along the Ganges, in a straight line, with two parallel and several cross streets behind it, which have some good buildings. The ruins of the fort, demolished by the English, are at the north end of the place, and sufficiently shew its former strength. The French governor built a handsome house, and laid out an elegant garden about four miles below the town, affording a charming prospect along the Ganges. This place was taken by the English,

English, under the conduct of colonel Clive and admiral Watson, in March 1757; restored to the French at the peace of 1763; taken again during the American war, and restored in 1783; and since taken in 1793, and retained. N. lat. 23° 51' 26". E. long. 88° 29' 15".

CHANDIEU, a town of France, in the department of the Rhône and Loire; 1 league N. of Montbrison. N. lat. 46° 10'. E. long. 1.5° 14'.

CHANDIROBA, in *Botany*. Marcgr. Sloan, Plum. See FRUILLEA.

CHANDLER, SAMUEL, in *Biography*, an eminently learned nonconformist divine, was born in 1693 at Hungerford, in Berkshire, where his father was pastor of a congregation of protestant dissenters. His academical education was commenced under Mr. Moore of Bridgewater, and completed under the learned Mr. Samuel Jones of Tewksbury, where his fellow students were Butler and Secker, afterwards distinguished prelates in the church of England. Having acquired in this excellent seminary a very considerable share of critical, biblical, and oriental learning, he first began to preach in 1714; and in 1716 he settled with a dissenting congregation at Peckham, near London. But being married, and having an increasing family, and losing his whole fortune in the South Sea scheme in 1720, the income derived from his office was inadequate to his support; so that he was under the necessity of opening a bookseller's shop in the Poultrey, which he kept two or three years, until he continued to discharge his duty as a minister. At this time he was appointed to preach a weekly evening-lecture at the meeting-house in the Old Jewry, where he delivered a course of sermons on the miracles of Christ and the truth of the Christian religion. These sermons, which were published in 1725, in the form of a treatise, in 8vo, and entitled "A Vindication of the Christian Religion, in two parts," the first containing a discourse on miracles and the second an answer to Collins's "Grounds and Reasons of the Christian Religion," were very favourably received by the public, and occasioned his being chosen, about the year 17-6, minister of the congregation in the Old Jewry, to which he officiated with a high degree of reputation, first as assistant and afterwards as pastor, for 40 years. As a preacher, he was eminently instructive and animated; and he was assiduous in the exercise of his pastoral office. In 1727, he published "Reflections on the Conduct of the modern Deists, in their late Writings against Christianity," with a preface in favour of the rights of private judgment, in answer to some remarks of Dr. Rogers; and, in the following year, he published "A Vindication of the Antiquity and Authority of Daniel's Prophecies, and their Application to Jesus Christ." Whilst he thus ably and strenuously defended the truth of revealed religion, he displayed his abhorrence of the persecuting spirit which has been too often manifested by its erroneous advocates, in a translation of "The History of the Inquisition, by Philip à Li. borch." in 2 vols. 4to. 1731; and to this translation he prefixed "A large Introduction, concerning the Rise and Progress of Persecution," which involved him in a controversy with Dr. Berriman, and occasioned the publication of two or three pamphlets on each side. In the prosecution of the subject of religious liberty, he published, in 1732, a letter to Dr. Gibson, bishop of London, concerning the repeal of the test act, entitled "The Dispute better adjusted about the proper Time of applying for a Repeal of the Corporation and Test Acts, by shewing that some Time is proper." Having formed a design of writing a commentary on the Hebrew prophets, he began by publishing, in 1735, "A

Paraphrase and critical Commentary on Joel." 4to.; but whilst he was proceeding with the book of Isaiah, he was convinced, by the MS. lexicon and lectures of Schultens, which fell into his hands, that he did not possess a sufficient acquaintance with the Oriental tongues for the execution of his plan; and he, therefore, abandoned his design. In 1736 he republished his introduction to the history of the Inquisition, in an enlarged form, under the title of "The History of Persecution, in 4 parts: 1. Amongst the Heathens; 2. Under the Christian Emperors; 3. Under the Papacy and Inquisition; 4. Among Protestants; with a Preface, containing Remarks on Dr. Rogers's Vindication of the civil Establishment of Religion," 8vo. In the course of this publication he endeavoured to prove, that the things for which Christians have persecuted one another have generally been of small importance; that pride, ambition, and covetousness, have been the grand sources of persecution; that the decrees of councils and synods are of no authority in matters of faith; that the imposition of subscriptions to human creeds is unreasonable and pernicious; and that the Christian religion absolutely condemns persecution for conscience-sake. In 1741, he renewed his controversial warfare with deism, by a "Vindication of the History of the Old Testament," which was followed, in 1742, by his "Defence of the Prime Ministry and Character of Joseph," both written in answer to Dr. Thomas Morgan, who, according to Dr. Leland, he clearly convicted of falsehood and misrepresentation. In 1744, he published "The Witness of the Resurrection of Jesus Christ re-examined, and their Testimony proved entirely consistent," which, in the judgment of Dr. Leland, was "a valuable treatise," containing, particularly in the last chapter, a very clear and judicious summary of the evidence for the resurrection of Jesus. His next publication, in 1748, was "The Case of Subscription to explanatory Articles of Faith, as a Qualification for Admission into the Christian Ministry, calmly and impartially reviewed; in answer to, 1. A late Pamphlet, entitled, the Church of England vindicated in requiring Subscription from the Clergy to the 39 Articles; 2. The Rev. Mr. John White's Appendix to his third Letter to a dissenting Gentleman; to which is added, the Speech of the Rev. John Alphonso Turretine, previous to the Abolition of all Subscription, at Geneva, translated from a MS. in the French," 8vo. About this time he accompanied his friend, the earl of Finlatter, into Scotland, and accepted, what he had before declined, the honour of a doctor's degree in divinity, which was conferred upon him without solicitation, and with every token of respect, by the two universities of Edinburgh and Glasgow. He had likewise the honour of being afterwards elected a fellow of the Royal Society and of the Society of Antiquaries. Upon the death of king George II. in 1760, Dr. Chandler published a funeral sermon, containing an eulogy of that prince, and comparing him to king David. This occasioned a pamphlet, entitled "The History of the Man after God's own Heart," in which the author calumniated the character of David, and censured the parallel which the preacher had delineated between him and the British monarch, as an insult to the latter. This wanton and illiberal attack was repelled, on the part of Dr. Chandler, by a publication, entitled "A Review of the History of the Man after God's own Heart, in which the Falsehoods and Misrepresentations of the Historian are exposed and corrected." Without attempting to vindicate the Jewish prince from all the accusations of his adversary, the author, by means of his skill in the Hebrew language, and his extensive acquaintance with biblical learning, detected and exposed the misrepresentations of his puny antagonist, who had chiefly availed

himself of Bayle's article of "David" in his dictionary, by shewing that he had paid no regard to scripture criticisms, to the various readings of particular passages, and the opinions of expositors and commentators. This gave occasion to a very learned and elaborate publication, in 2 vols. 8vo. entitled "A critical History of the Life of David; in which the principal Events are ranged in order of time, the chief Objections of Mr. Bayle and others against the Character of this Prince, and the Scripture Account of him, and the Occurrences of his Reign are examined and refuted; and the Psalms which refer to him explained." This work, trivial as was the occasion which gave rise to it, did great honour to the judgment and sagacity, as well as the erudition, of Dr. Chandler; and contained explications of several psalms, and commentaries upon them, particularly that on the 68th psalm, which has been much admired. This was the last of Dr. Chandler's productions; and the greatest part of it was printed off at the time of his death, which happened on the 8th of May 1766, in his 73d year. In early life he had been subject to frequent and dangerous fevers, which induced him to restrict himself for 12 years to a vegetable diet; and this had so good an effect on his constitution, that although he afterwards returned to the usual mode of living, he enjoyed an uncommon share of spirits and vigour till the age of 70 years. During the last year of his life he was afflicted with frequent returns of a very painful disorder, which he endured with a great degree of Christian fortitude and resignation. Under repeated paroxysms of his complaint he often declared, "that to secure the divine felicity promised by Christ was the principal, and almost the only thing that made life desirable: that to attain this he would gladly die, submitting himself entirely to God, as to the time and manner of his death, whose will was most righteous and good; and being persuaded that all was well which ended well for eternity." He had several children, two sons and a daughter who died before him, and three daughters who survived him; one of whom was married to the Rev. Dr. Harwood. The eminent abilities and extensive learning of Dr. Chandler commanded respect and esteem not only from the dissenters, with whom he was immediately connected, and among whom he had a very considerable degree of influence, but from several dignitaries and other persons of rank belonging to the established church.

He is said to have had liberal offers of preferment in the church: nor is this at all unlikely, considering his early acquaintance with the prelates Butler and Secker, and his connection with several persons of high rank in the state; but he declined every proposal of this kind, because he did not choose to conform: preferring a steady adherence to the dictates of conscience to any secular advantage which he might thus have obtained. Amongst the dissenters his talents and character gave him that influence, which must have been gratifying to his mind; and he exerted himself on a variety of occasions, by his acquaintance with persons in power, and by the respect with which he was held among persons of his own profession, in assisting individuals, and in promoting the general interest of his brethren. Accordingly he was principally instrumental in establishing the fund for the relief of the widows and orphans of poor dissenting ministers, which has been eminently useful, and has been long supported with distinguished liberality.

Besides the works which we have already noticed, Dr. Chandler printed a number of single sermons and pamphlets, on occasional subjects. After his death, 4 volumes of his sermons were published by Dr. Amory, in 1768, according to the directions of his will; and, in 1777, Mr. White, his immediate successor as pastor of the congregation in the

Old Jewry, published in 1 vol. 4to. "A Paraphrase and Notes on the Epistles of St. Paul to the Galatians and Ephesians, with doctrinal and practical Observations; together with a critical and practical Commentary on the two Epistles of St. Paul to the Thessalonians." He also left an interleaved bible, containing a large number of critical notes, which merited publication; but by some accident or other, though they were intended for the press by gentlemen who purchased them, the design was never executed.

Mrs. Mary Chandler, the sister of Dr. Chandler, was celebrated for her literary acquisitions and poetical productions. As she was somewhat deformed in her person, in consequence of an accident in her childhood, she used to say, "that as her person would not recommend her, she must endeavour to cultivate her mind, in order to render herself agreeable." She was born at Malmesbury in Wiltshire, in 1687, and, after an excellent education, settled in business at Bath, where she was highly esteemed by all who knew her, among whom were several persons of rank and eminence in the literary world. She published several poems; but that which she wrote on Bath was the most popular, and passed through several editions. Having long struggled with the infirmities of a valedictory constitution, she died in 1745. Dr. Chandler drew up an account of her, which is inserted in "The Lives of the Poets," published under the name of Theophilus Cibber. Our author had also a brother, Mr. John Chandler, who was for many years eminent in his profession as an apothecary in the city of London, and much respected among his acquaintance. He published a pamphlet on colds and catarrhs, which was well received. Amory's Preface to Dr. Chandler's Sermons. Biog. Brit.

CHANDOR, in *Geography*, a town of Hindoostan, in the country of Baglana; 52 miles N.E. of Nassiuk, and 50 N.W. of Aourangabad.

CHANDOUL, a town of Persia, in the province of Adirbeizan; 150 miles N.E. of Tauris.

CHANE, in *Ichthyology*, a name given by Aristotle, Athenæus, and the other Greek writers, to the fish called by other authors *hiatula*, *chauna*, and *chaunus*. This fish appears to be the labrus hepatus of modern writers, a species common in the Mediterranean, and which has the lower jaw longest, and the sides traversely lined with black. See LABRUS *Hepatus*.

CHANFRIN, in the *Manege*, is the fore part of a horse's head, extending from under the ears, along the interval between the eye-brows, down to his nose.

CHANG, in *Geography*, a town of China, of the second rank, in the province of Chen-si; 495 miles S.W. of Peking. N. lat. 33° 50'. E. long. 109° 31'.

CHANGA, or XANCA, a small island, in the Indian Sea, near the coast of Africa, at the mouth of the river of the same name. S. lat. 10° 45'. E. long. 39° 50'.

CHANGAMAIL, a fortified place of Hindoostan, in the country of Mysore, situated in the valley of Vaniam Laddy or Barra-maul, directly distant from Trinomaly about 10½ miles.

CHANGAPRANG, a town of Asia, in the country of Tibet, 242 miles W. of Lassa, and 195 N.N.E. of Catmandu. N. lat. 31° 0'. E. long. 86° 52'.

CHANGASARI, a town of Russia, in the government of Viborg; 85 miles W.N.W. of Viborg.

CHANGAY, a mountain of Asia; being a branch of the Asian chain. See ALTAI.

CHANG-CHA, a city of China, of the first rank, in the northern part of the province of Ho-quang.

CHANG-CHE, a city of China, of the second rank, in the

the province of Quang-fi; 403 leagues S.S.W. of Peking, N. lat. 23° 6'. E. long. 109° 17'.

CHANG-CHEW, a city of China, of the first rank, in the southern part of the province of Fo-kyen; situate on a river which ebbs and flows; over which is a stately bridge, consisting of 36 very high arches, broad enough to admit shops on both sides, which are stored with all sorts of rich merchandize, both of China and the Indies. Its vicinity to *Amy* (which see), a place of vast commerce, occasions a constant traffic to be continually carried on between them. The neighbouring mountains yield the finest crystal, of which they make buttons, seals, figurines of animals, &c.—Also, a district of the province of King-nan or Nanking.

CHANG-CHOU, a town of China, of the third rank, in the province of Honan; 15 leagues S.E. of Hiu.

CHANGE, in *Commerce*. See **EXCHANGE**.

CHANGE, in *Geography*, a town of France, in the department of the Mayenne; one league N. of Laval.—Also, a town of France, in the department of the Sarthe; one league S. of Le Mans.

CHANGE, in the *Manege*. To *change* a horse, or *change* hand, is to turn or beat the horse's head from one hand to the other, from the right to the left, or from the left to the right. You should never *change* your horse without pushing him forward upon the turn; and after the turn, push him on straight, in order to a step.

CHANGE of crops, in *Agriculture*, is that part of husbandry which relates to the mode of changing, distributing, and cultivating different sorts of crops, on any kind of soil, in order to prevent its being exhausted in the least possible degree. This is an improvement of considerable importance; and which modern cultivators have attended to in a particular manner. It has been observed that "experience soon taught men, that even the most fruitful soil cannot constantly yield the same grain; and that this of course laid them under a necessity of seeking for some means to remedy the defect. They found that the plough was then the most ready, and perhaps the most effectual; and hence all the ancient writers so highly recommend a thorough ploughing. At the same time the apparent loss of the produce of the ground, during the year of fallow, put them upon inquiring how this inconvenience might be prevented, consistently with keeping the land in good heart. Repeated observations convinced the Romans, the most attentive of all nations to every thing relative to husbandry, that, besides the alternate resting of the land, what might, as is observed by Piny, be sown after lupines, vetches, beans, or any other plant which has the quality of fertilizing and enriching the soil."

A judicious change of crops must therefore, without doubt, be of great importance in the common tillage husbandry, as it enables the farmer to save the expence and loss of a crop in the fallow year; and to get quit of weeds, by attacking them at different seasons of the year, and in different periods of their growth; both from the nature of the crops cultivated, and where the intermediate crops are hoed, as those of beans, peas, and many other similar seeds. It has been well remarked by cultivators, that in the change of crops that are cultivated for the purpose of preventing the exhaustion of land, by the repeated sowing of the same kinds of grain, attention should always be had, both to the nature of the soil, and the intentions of the farmer; as it is only in this way that the most advantageous changes can be adopted and introduced in the different situations and conditions of land. But this method of operating, though a practice of infinite consequence in agriculture, and which was much examined and attended to at an early period of the art, seems to have been much overlooked and neglected, until lately, when the

culture of turnips probably furnished the useful hint, and led the farmer to perceive that his land, instead of being impoverished by that valuable root, was greatly enriched, and prepared to yield a better crop of barley in the spring, than would otherwise have been the case. This might likewise suggest to him, that other succulent plants, which shade and cover the earth much with their leaves, might have the same effect; and the success which has followed has answered his utmost expectation, as it is now found that a fallow does not become necessary in several years; the ground being kept clean from weeds and in heart by a variety of green and other crops, when rightly timed and properly managed in respect to their introduction and culture afterwards.

It has been discovered by modern cultivators that some sorts of crops, such as peas, beans, clover, and all plants of the pulic kind, are enrichers and cleaners of the earth; while wheat, oats, barley, and the whole tribe of vegetables, whose roots are fibrous and spread far, impoverish and rob the ground. The latter also let it become foul, by giving way to weeds and grass, which, being the natural products of every soil, are more readily nourished by it than such plants as it does not spontaneously produce. It is therefore evident, that by judiciously interposing such green or other enriching crops as are adapted to the soil between the grain-crops, the farmer may not only, in a great measure, avoid the necessity and expence of fallowing, but frequently be enabled to reap better crops. Besides, under this system of management, he may be enabled to keep a much larger flock of cattle, and consequently produce a much larger quantity of manure, the advantages of which are very great. See **GREEN CROPS** and **COURSE of CROPS**.

CHANGE of seed, denotes the practice of sowing seed taken from a different soil, in order to prevent the land from becoming tired with the same kind of grain.

This is a custom pretty common among farmers, though experience has not yet shown how far it is well founded. Great importance has been attached to this practice by some cultivators, probably from adopting imperfect notions of the nature of vegetation itself, or from pursuing false analogies in respect to the breeding of animals; but it is evident, a cultivator of much experience observes, from the trials that have been made in the cultivation of grain, and from what happens in particular cases of gardening, that it will be of no utility to have recourse to the change of seed, provided it is properly adapted to the soil, except it be for an improved kind. The only thing necessary, is that of collecting and preserving the best of the different kinds, and by that means preventing a degeneracy. "It is hardly, he observes, to be supposed that the soil can become tired of, or be improper for, producing a sort of grain for which it is adapted, since it may be observed that the same sorts of plants are frequently propagated on the same spots of ground, for a vast length of time, without any manifest injury in respect to their quality."

A great objection to the practice is also found by some on the ground of the expence.

It is observed by Mr. Middleton, in the *Agricultural Report of Middlesex*, that the changing of the seed of corn every two or three years, though extremely general, is done at an extra expence of from *6d.* to *1s.* a bushel on wheat, and half these sums on other kinds of grain. This practice is, he thinks, as little founded on propriety, as a change of live-stock once in every two years would be, and never will be the means of advancing corn to a high pitch of excellence. On the contrary, when corn farmers become wise enough to apply Bakewell's method of improving cattle to the raising of seed grain, the advance will be rapid indeed, and its improvement

provement will go on towards the mark of perfection, in a degree which, in the present state of things, can scarcely be conceived. The method he wishes to recommend to those cultivators who desire to excel in the article of grain, is, he says, the following: namely, a few days before harvest, to walk through their fields of corn, to select and gather the prime samples of every species of seed, and ever afterwards to continue the same practice, by repeating the operation of collecting the most perfect grain from the crops produced from such selected seed. The same observations, he asserts, apply to every variety of cultivated crops.

However this may be, we are inclined to believe, from observing what takes place in respect to the curl, a disease in potatoe crops, that a change of seed may sometimes be useful, though, perhaps, much less frequently than is the practice of farmers in general.

But it is added by the first of these writers, on the authority of Mr. Donaldson, that "as some of the varieties of the same sort of grain or seed, when sown under similar circumstances of soil and climate, are, however, often found by the cultivators of land to be of a much more early growth than others, as well as of a more or less hardy and vigorous nature; it may be of utility to change them in these respects, the early kinds being always cultivated on the colder and more backward descriptions of land, while those of the later are sown upon the dry and more warm soils. In this way the crops may often be considerably improved, as, in so far as regards themselves, they will enjoy the advantages of more genial soils and climates." Another advantage may be gained in this method, as by employing such early kinds of seed, the farmer may, in some cases, delay the putting in of his seed for several days, without the danger of the crop being injured thereby, or of its not being reaped at the usual time. He may likewise, in the late soils, thus obviate the difficulties and inconveniences attending bad seed times, as by such a change the seed, though put in later, may be equally early at the harvest." And it has also, he says, been remarked, that "there is an advantage resulting from changing seed from soils of opposite natures, which cannot be depended upon when the change is made from similar soils. Some weeds will grow only in strong deep lands, while others are peculiar to light and sandy soils. When, from whatever cause, grain abounds so much with the seeds of weeds as to render it improper for sowing, by procuring seed from a soil of an opposite nature the farmer is to a great degree certain that no dangerous weed-seeds will be introduced by the change. The sowing of such grain as contains the seeds of weeds should, however, never be practiced, except where perfectly clean seed cannot be procured, as, though the above may be the case in regard to particular sorts of weeds, it does not by any means extend to all." It is also found from experience, "that grain, like all other feeds and plants, when brought from a warmer to a colder climate, gradually degenerates, till, by being frequently cultivated, it becomes natural both to the soil and climate." And "experience has shown that it degenerates sooner, and to a greater degree, in mountainous districts, than in the level and better sheltered parts of the country. At the same time, it is well known, that many vegetables introduced from other countries, and which it was once thought would not come to maturity in this, have, by proper care and attention, been brought to a great degree of perfection. It is certain, too, that the introduction of better sorts of grain has soon become effectual in removing the poor kinds that were originally cultivated. This has been the case in respect to oats in some parts of Scotland: which is a circumstance that, the writer just mentioned thinks, proves how much the quality of grain may be

improved by proper attention; and further, that frequent and judicious changes of seed, in the way stated above, are of the greatest importance in effecting this improvement." And it is further concluded, that from the long established practice, and the acknowledged advantages derived from annually importing seed-wheat from England into all the districts in Scotland, where that species of grain is cultivated, which are well known; as well as from the practice being no less general, although more local, for the farmers in Banffshire, where deep strong cold soils prevail, to procure, in unfavourable seasons, a great portion of the oats necessary for seed from the light dry sandy soils in the adjoining county of Moray; and also the practice of many other districts where improved agriculture is to any considerable degree established; it will, he thinks, be found that frequent changes of seed, for some or other of the reasons mentioned above, are not only highly proper but indispensably necessary." But the author of *Phytologia* on the whole concludes, "that, as the varieties of plants are supposed to be produced from different soils and climates, which varieties will afterwards continue through many generations, even when the plants are removed to other soils and climates, it must be advantageous for the agriculturist to inspect other crops as well as his own; and thus, wherever he can find a superior vegetation, to collect seeds from it; which is, he thinks, more certain to improve his crops than an indeterminate change of seed. And that where seed-corn is purchased without a previous observation of its superior excellence, perhaps it would be more advantageous to take it from better kinds of soil, and from somewhat better climates; as the good habits acquired by such seeds may be continued long after their removal to inferior situations. But on the contrary, care should be taken not to collect a change of worse seeds from worse climates or inferior soils, unless the agriculturist is previously certain that they are of a superior kind or quality." See SEED and SOWING.

CHANGEABLE *Rice*. See HIBISCUS.

CHANGER, or CHAUNGER, an officer belonging to the king's mint, who changes money for gold or silver bullion. See MINT.

CHANGER, *Money*, is a banker who deals in the exchange, receipt, and payment of notes.

CHANGES, in *Arithmetic*, &c. the permutations, variations, or alternations of any number of quantities; with regard to their position, order, &c.

To find all the possible changes of any number of quantities, or how oft their order may be varied.

Suppose two quantities *a* and *b*. Since they may be either wrote *ab* or *ba*, it is evident, their changes are $2 = 2 \times 1$. Suppose three quantities *a, b, c*: their changes *c a b* will be as in the margin; as is evident by combining *a c b* first with *ab*, then with *ba*; and hence the number of changes arising $3 \times 2 \times 1 = 6$. If the quantities be four, each may be combined four ways with each order of the other three: whence the number of changes arising $4 \times 3 \times 2 \times 1 = 24$. Wherefore, if the number of quantities be supposed *n*, the number of changes will be $n \times n - 1 \times n - 2 \times n - 3 \times n - 4$, &c. to $n - n$. If the same quantities occur twice, the changes of two will be found *bb*, of three *bab, abb, bbb*; of four *cbab, beab, babc*. And thus the number of changes in the first case will be $1 = (2 \times 1) \div 2 \times 1$; in the second, $3 = (3 \times 2 \times 1) \div 2 \times 1$; in the third, $12 = (4 \times 3 \times 2 \times 1) \div 2 \times 1$.

If a fifth letter be added, in each series of four quantities, it will beget five changes, whence the number of all the changes will be $60 = (5 \times 4 \times 3 \times 2 \times 1) \div 2 \times 1$. Hence if

if the number of quantities be n , the number of changes will be $(n \times n - 1 \times n - 2 \times n - 3 \times n - 4, \&c.) \div 2 \times 1$. From these special formulæ may be collected a general one; viz if n be the number of quantities, and m the number which shews how oft the fame quantity occurs; we shall have $(n \times n - 1 \times n - 2 \times n - 3 \times n - 4 \times n - 5 \times n - 6 \times n - 7, \&c. (\rightarrow) m - 1 \times m - 2 \times m - 3, \&c.)$; the series being to be continued, till the continual subtraction of unity from n and m leave 0. After the same manner we may proceed farther, till putting n for the number of quantities, and $l, m, r, \&c.$ for the number that shews how oft any of them is repeated, we obtain an universal form $(n \times n - 1 \times n - 2 \times n - 3 \times n - 4 \times n - 5, \&c.) \div (l \times l - 1 \times l - 2 \times l - 3 \times l - 4, \&c. m \times m - 1 \times m - 2 \times m - 3, \&c.) r \times r - 1 \times r - 2 \times r - 3, \&c.$

Suppose, for instance, $n = 6, l = 3, r = 3$. The number of changes will be $(6 \times 5 \times 4 \times 3 \times 2 \times 1) \div 3 \times 1 \times 2 \times 3 \times 2 \times 1 (= 6 \times 5 \times 4) \div 3 \times 2 = 2 \times 5 \times 2 = 20$.

Hence, if it be proposed to assign how many different ways 6 persons might be placed at table, the answer would be $6 \times 5 \times 4 \times 3 \times 2 \times 1 = 720$. For 13 persons we shall find the number $13 \times 12 \times 11 \times 10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 6227020800$.

If it were required to find how many changes may be rung on seven bells, the answer would be $1 \times 2 \times 3 \times 4 \times 5 \times 6 (= 720) \times 7 = 5040$. On 12 bells, it would be $12 \times 11 \times 10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 479001600$. Supposing 10 changes to be rung in one minute, that is, 10 x 12 or 120 strokes in a minute, or two strokes in each second of time, then, according to this mode of computation, it would take upwards of 91 years to ring over all these changes on the 12 bells. If two more bells were added, so as to make the whole number 14 bells, it would require, at the same rate of ringing, about 16575 years to ring all the changes on 14 bells but once over. And if the number of bells were 24, it would require more than 117,000,000,000,000 years to ring all the different changes upon them. See ALTERNATION.

In this manner may all the possible anagrams of any word be found in all languages, and that without any study. Suppose, v. g. it were required to find the anagrams of the word *Roma*, the number of changes will be $4 \times 3 \times 2 \times 1 = 24$. Thus,

Roma orna mrao arom
oram oram mrao armo
mrao omra mora armr
rmao omar mrao armr
raom o-rim mrao auro
ramo oamr maor amor

The anagrams therefore of the word *Roma*, furnishing any word of known signification in the Latin tongue, are seven; viz. *Roma, ramo, oram, mora, maro, armo, amor*. Wallis's Algebra, p. 117. See ANAGRAM and COMBINATION.

Whether this new method of anagrammatizing be likely to prove of much service to that art, is left to the poets.

CHANGES of insects. See AURELIA, and transformation, &c. of insects in article ENTOMOLOGY.

CHANGEWATER, in Geography, a town of America, in the state of New Jersey; 25 miles W.S.W. of Morristown.

CHANG HAI, a town of China, of the third rank, in the province of Kiang-nan, or Nan-king; 6 leagues S.E. of Song-kiang.

CHANG-HIANG, a town of China, of the third rank, in the province of Fo-kien; 50 miles S. of Ting-tcheou.

CHANG-HIA-TONG, a town of China, of the second

rank, in the province of Quang-fi; 400 leagues S.S.W. of Peking. N. lat. 22° 27'. E. long. 106° 4'.

CHANG-HO, a town of China, of the third rank, in the province of Chang-tong; 6 leagues S.W. of Vou-tung.

CHANGI, a gulf in the northern part of the Chinese sea, which is in the most advanced and narrow part of a great bay, which begins at the island of Fungma, and terminates at the frontiers of the province of Peking, about 50 leagues from the capital of the Chinese empire.

CHANG-IN, a town of China, of the second rank, in the province of Quang-fi; 385 leagues S.S.W. of Peking. N. lat. 23° 3'. E. long. 106° 24'.

CHANG-KAO, a town of China, of the third rank, in the province of Kiang-fi; 10 leagues W.S.W. of Chou-tcheou.

CHANGLASSE, a town of Asia, in the county of Thibet, near the river Sanpoo; 204 miles W. of Lassa, and 190 N.E. of Catmandu.

CHANG-LIN, a town of China, of the third rank, in the province of Quang fi; 6 leagues N.W. of Ping.

CHANG-LING, a town of Asia, in the kingdom of Corea; 5 miles S.S.W. of Hoang.

CHANG-NAN, a town of China, of the third rank, in the province of Chen-fi; 14 leagues S.E. of Chang.

CHANG-SE, a town of China, of the second rank, in the province of Quang-fi; 1180 miles S.S.W. of Peking. N. lat. 22° 18'. E. long. 107° 14'.

CHANG-TCHEOU, a town of Asia, in the kingdom of Corea; 20 miles W. of Loug-Kouang.

CHANG-TCHING, a town of China, of the third rank, in the province of Honan; 8 leagues S.S.E. of Kouang.

CHANG-TE, a city of China, of the first rank, in the southern part of the province of Hu-quang.

CHANG-TE, a city of China, of the first rank, in the province of Ho-nan.

CHANG-TI, or TIEN, in *Ancient Mythology*, a deity of the ancient Chinese, whom, according to Du Halde, they worshipped as the supreme being: the name is said by some to denote the spirit which presides over the heavens; but in the opinion of others it is only the visible firmament.

CHANG-TSAI, in Geography, a town of China, of the third rank; 6 leagues N. of Yun-hing.

CHANG-YEON, a town of China, of the third rank, in the province of Kiang-fi; 10 leagues N.N.E. of Nanchan.

CHANG-YU, a town of China, of the third rank, in the province of Tcheking; 6 leagues E.S.E. of Chaou-king.

CHANGY, a town of France, in the department of the Rhone and Loire; 3½ leagues N.W. of Roanne.

CHANIERES, a town of France, in the department of the Gironde; 12 miles E. of Blayc.

CHANIEWEZZE, a town of Lithuania, in the palatinate of Novogrodek; 56 miles S.W. of Novogrodek.

CHAN-LIN, a town of China, of the third rank, in the province of Quang-fi; 8 miles N.N.W. of Ko-hoa.

CHANMANNING, a town of Asia, in Thibet, where the grand Lama occasionally resides; 116 miles W. of Lassa, and 266 N. of Catmandu; about 167 geographical miles of horizontal distance from Paridrong, in the Lania's map.

CHANNA, in *Ichthyology*, the name of a fish, said to be caught in great plenty in the Mediterranean, and brought to market in Italy and elsewhere, among the sea perch, which it nearly resembles. It is not sufficiently clear that

the above species is the same with the Gmelinian *labrus channus*, as some imagine.

CHANNADELLA, a name given by Bellonius and others to a species of *labrus*, apparently the *chane* of the elder writers. See *LABRUS hepatus*.

CHANNEL, in *Anatomy, Surgery, &c.* See CANAL.

CHANNEL, in *Architecture*. See GUTTER.

CHANNEL, or bed of a river. See RIVER.

CHANNEL of the *larmier*, is the hollow socket of a cornice, which makes the *pendant mouchette*. See *LARMIER*.

CHANNEL of the *volute*, in the Ionic capital, is the face of its circumsolution, inclosed by a fillet. See *VOLUTE*.

CHANNEL, in *Geography*, the English name of one of the French departments, called *La Manche*. This is one of the five departments formed of Normandy, and the north part of Perche. It is bounded on the north by the Channel; on the east by the Channel and the department of Calvados; on the south by those of Mayenne, and of Ille and Vilaine; and on the west by the ocean. Its superficies is about 1,323.9 2 square acres, or 675,713 hectares, and comprehends 68,500 kilometres; its population consists of about 528,912 persons. It is divided into five communal districts, 48 cantons, and 669 communes. The general total of its contributions amounts to 5,314,741 francs, and the expenses charged upon it are 572,112 francs. Its chief town is Coutances.

CHANNEL is also applied to divers arms of the sea, where the waters run within the land; or to certain narrow seas confined between two adjacent continents, or between an island and a continent.

In this sense we say, St. George's Channel, the British Channel, the Channel of the Black Sea, or Constantinople, &c.

CHANNEL, in the *Mangee*, is used for that concavity in the middle of the lower-jaw of a horse, where the tongue lies. This hollow being bounded on each side by the bars, terminates in the grinders or maxillary teeth. The barbles grow in this channel.

CHANELLINGS. See FLUTINGS.

CHANNI OUDOU, in *Geography*, a town of Chinese Tartary, in the country of the Moguls. N. lat. 42° 51'. E. long. 114° 14'.

CHANON, in *Zoology*. Adanson calls the Linnæan *Mylus Hirundo* by this name.

CHANONAT, in *Geography*, a town of France, in the department of the Puy de Dôme, celebrated for its mineral waters.

CHAN-SAN-SHEN, a town of China, seated on the river Chen-tang-cheung, which at this place ceases to be navigable. See CHEN-TANG-CHAUNG.

CHANSCHENA-POU, in *Botany*, Rheed. See BAUHINIA.

CHAN-SI, XANSI, SHAN-SI, or SHAN-SEE, a province of China, bound on the east by Pe-che-li; on the west by Shen-si; on the south by Ho-nan; and on the north by the Chinese wall, which separates it from Tartary. It extends from 1° to 6° 23' W. long. from Pe-king, or 115° 27' 30" E. long. to 113° 24' 30" E. long.; but from north to south, from 34° 37' to 40° 50' of latitude. It is a tradition among the Chinese, that this was the first inhabited province of the whole empire. The climate, though the country is mountainous, is mild and favourable; of the mountains, some are lofty and rugged, and others are well cultivated, by means of terraces, cut from the top to the bottom, which produce plenty of corn and other grain. The plains are fertile, though not so well watered as the other provinces. The vines yield excellent grapes, which, instead of being applied to the

purpose of making wine, are dried, and in this state sold in the other provinces. This province furnishes great quantities of musk, porphyry, marble, and Jasper; it has also mines of iron-stone, which affords iron that is fabricated into a variety of utensils. The mountains supply an abundance of coal, which is pounded and mixed with water, and formed into small cakes; thick, though not very inflammable, affords a strong and lasting fire. The people are athletic in their frame, and obliging in their disposition; but illiterate: the women are much admired for their slender shape and beauty. The number of inhabitants is estimated at 27,200,000; occupying an extent of territory of 55,268 square miles, or 35,3371,520 acres. The revenue received into the royal treasury at Peking from this province, and derived from the land, salt, and other taxes, amounts to 3,722,000 taels, or ounces of silver. Chan-si contains five cities of the first rank, viz. Tay-ywen, the metropolis of the province; Ping-yang; Lu-nghan; Feven-chew; and Tay-fing; and 85 of the second and third rank.

CHANSON, *French*, a song; a short lyric poem on familiar subjects, of love, wine, joy, sorrow, &c. put to an easy melody for social occasions: at table, to a mistress, to friends, and even to yourself when alone, in order to drive away care, anxiety, low spirits in the rich, and to alleviate fatigue and indigence in the poor.

A *song* of this kind is totally distinct from what is called an *air* in a musical drama, which, as a poem when taken out of its niche, has neither beginning, middle, nor end. See SCOLIA, SONG, AIR, BALLAD, and NATIONAL MUSIC. French songs, not dramatic, or *chançons à table*, turn chiefly on love and wine, addressed by their votaries to *Venus* and *Bacchus*.

There are in France, likewise, numerous *satirical songs*, under the denomination of *Faudeuxes*, which see.

The ancient historians and poets of France mention their *military songs* of very remote antiquity, in which were celebrated the heroic deeds of their favourite chiefs and most gallant commanders. These used to be sung in chorus by the whole army in advancing to attack an enemy; a custom probably derived from their German ancestors, as the privilege of leading off this kind of *war chorus* usually appertained to the bard who had composed it. Charlemagne had a great passion for these heroic songs, and, like our Alfred, not only had them collected, but knew them by heart. However, the achievements of this victorious prince and his captains obliterated those of their predecessors, and gave birth to new songs. One of these, in praise of Roland, the *Orlando innamorato* and *furioso* of Boiardo, Danti, and Ariosto, was longer preserved than any of the rest. This, the French historians tell us, was begun at the battle of Hasting, where William became the conqueror of the English nation, by a knight called Taillefer, on whom this honour was conferred for his strong and powerful voice. Here he performed the office of *herald minstrel* (*mangrlier hochler*) at the head of the Norman army, and was among the first that was slain in the fight.

The song upon Roland continued in favour among the French soldiers as late as the battle of Poitiers, in the time of their king John; who, upon reproaching one of them with singing it at a time when there were no Relands left, was answered, that Rolands would still be found if they had a Charlemagne at their head. But however popular this song may have been in the fourteenth century, it is not come down entire to the present times.

Concerning the heroic song called *l'Homme armé*, on the melody of which all the first great contrapuntists composed masses of the most elaborate kind; nothing is more probable

than that the tune of this song was the famous *Cantilena Rolandi*, or melody to the song which the French armed champion used to sing at the head of the army, in honor of their hero Roland, in advancing to attack an enemy.

CHANSONS de Geste. Songs on heroic, historical, and chevaleresque subjects. This kind of song was called in England during the Norman dynasty, *chant royal*; and Chaucer, in speaking of the musical talents of the poor scholar Nicholas, in the Miller's Tale, says:

And after that he fong the *King's note*;
Full often blessed was his merry throat.

The *Chançon de Geste* was distinguished from common songs, according to Alberici, by the title of *Heroica Cantilena*. These historical songs or ballads must have been sung to very short and simple tunes, such as our *Chevy-Chace*, or such as is used by the *Improvisatori* of Italy in accompanying their inspirations, which frequently amount, in length, to many hundred stanzas.

Though the rest of Europe is not partial to the music of France, the words of their songs, from the time of the Troubadours to the present, must be allowed to abound in wit, irony, *badinage*, and elegant, warm, and ingenious praises of love and war, more than these of any other country.

CHANSONNETTE, *French*. The diminutive of *chançon*, a little song.

CHANT, in our cathedral service, bears very little resemblance to the *canto fermo*, or *plain-chant* of the Roman Catholics, which is chiefly pronounced, rather than sung by the priest alone, without base; whereas our *chants* are short phrases of *melody*, sung antiphonally from side to side, in four parts, accompanied by the choir organ, except in the first verse and *Gloria Patri*. Some of our chants are as ancient as the reformation; and perhaps still more ancient, as they resemble, in length, facility, and counterpoint, those used in Italy during the middle of the XVth century. Several composed by Palestrina and his contemporaries have been preserved in an ancient MS. procured in Italy, called *Studi di Palestrina*, and believed to be the autography of that father of ecclesiastical harmony.

CHANT, *Ambrosian*. See **AMBROSIAN Chant**.

CHANT, *Gregorian*. See **GREGORIAN Chant**.

CHANT, *French*, is equivalent to melody, or the principal or treble part in a musical composition. See **CANTO**; **CANTILENA**, *Ital*.

CHANT, *Cantus*, is used for the vocal music of churches. In church history we meet with divers kinds of *chant* or *song*: the first is the *Ambrosian chant*, established by St. Ambrose.

The second, the *Gregorian chant*, introduced by pope Gregory the Great, who established schools of *chanters*, and corrected the church song.

This is still retained in the church under the name of *plain song*: at first it was called the *Roman song*.

The *plain*, or *Gregorian chant*, is where the choir and people sing in unison, or altogether in the same manner. See **CHORAL Service**.

CHANT sur le livre, *French*, is discant, or singing extempore in the plain song in the cathedral service of the Romish Church; which is done by three or four fingers on the Gregorian notes, in the mass book on the desk in the middle of the choir, so that, except the *canto fermo* in the missal, which is generally sung by the tenor, the fingers have nothing to guide them. However, there are choral fingers, so versed in counterpoint, that they even lead off and pursue subjects of fugue and canon on this foundation, without confusion, or violating the rules of harmony. See **DISCANT**, **CONTRAPUNTO alla monte**, or **AL'IMPROVISO**.

CHANTABOUN, in *Geography*, a sea-port town of the kingdom of Siam, on the frontiers of Camboja.

CHANTADA, a town of Spain, in the province of Galicia; 20 miles N. of Orense.

CHANTAGIR, a river of Siberia, which runs into the Enisei; N. lat. 51° 50'. E. long. 91° 34'.

CHANTELLE-le-château, a town of France, in the department of the Alier, and chief place of a canton in the district of Gannat, three leagues N. of Gannat; the place contains 1334, and the canton 11,916 inhabitants: the territory includes 225 kilometers and 20 communes.

CHANTAUNAY, a town of France, in the department of the Lower Loire, and chief place of a canton in the district of Nantes; two miles west of it.—Also, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of Le Mans; 15 miles W.S.W. of it.

CHANTER, *French*, to sing. We shall not go to France for instructions in this art; though Messrs. Framery and Ginguené have adopted and given in the *Encycl. Meth.* some very useful precepts from the Italian school, which we apprehend will not be generally received or put in practice by their countrymen for some time. We acknowledge, however, that Mr. Framery has discussed this subject with delicacy, discrimination, and good taste.

Rouffeur's definition of the verb *chanter*, is clear and precise: it is, in its general application, the forming with the voice such sounds as are appreciable. See **MELODY**. But it is more commonly understood to imply the producing, by vocal inflexions, a variety of such tuneable sounds as are agreeable to the ear, and by intervals admitted in harmony, and consonant to the rules of modulation. A finger passes in proportion as the voice is clear and well toned, the ear perfectly accurate, the organs flexible, the taste well formed, and when instruction and practice have polished and improved the gifts of nature. To which, in imitative and theatrical music, should be added that degree of sensibility which impresses others with the sentiments which we affect to feel. From observations in hearing great vocal performers, many rules have been formed for facilitating and perfecting a vocal student; but many discoveries still remain to be made on the most easy, short, and certain path to perfection in this difficult art.

CHANTEREAU-LE-FEVRE, **LOUIS**, in *Biography*, a learned antiquary of France, was born at Paris in 1588; and became eminent no less for the qualities of his heart than for those of his understanding. He distinguished himself by his knowledge of jurisprudence, history, politics, and belles-lettres, and was advanced by Lewis XII. through successive posts to that of intendant of the finances of the duchies of Bar and Lorraine. He compiled from original records, "Historical Memoirs of the Houses of Lorraine and Bar;" the first part of which only was published at Paris, 1642. fol. He also published other works on detached parts of French history; and after his death, his son published his "Treatise on Fiefs," 1662, fol. in which he maintains an opinion, which has been thought to be erroneous, viz. that hereditary fiefs commenced only after the time of Hugh Capet. He died at Paris in 1658. Nouv. Dict. Hist.

CHANTERELLE, *French*, the first string of a violin, tenor, or violoncello.

CHANTIER, in *Military Language*, a square piece of wood, which is used for raising any thing upon, as, for instance, for raising barrels of gun powder on, or for proving cannon without the assistance of gun carriages.

CHANTILLY, in *Geography*, a town of France, in the depart-

department of the Oise, and chief place of a canton, in the district of Senlis. The prince of Condé had, before the revolution, a magnificent palace in this place, with beautiful gardens, a managery, extensive park, and curious water-works. The stable was reckoned superior to any in France, and the forest for the preservation of game extended many miles in circumference: $1\frac{1}{2}$ league W. from Senlis, and 4 S.S.E. from Clermont.

CHANFLATE, in *Building*, a piece of wood fastened near the ends of the rafters, and projecting beyond the wall, to support two or three rows of tiles so placed to prevent the rain-water from trickling down the sides of the wall.

CHANTONG, CHAN-TUNG, SHAN-TONG, or XAN-TUN, in *Geography*, a province of China, bounded on the west by part of Pe-che-li, Chan-ki, and Honan; on the south, by Kiang-nan; on the east, by the Yellow Sea, and on the north, by the same sea and part of Pe-che-li. It extends from $34^{\circ} 50'$ to 33° N. lat. and from 1° to $6^{\circ} 25'$ of east longitude from Peking, or $117^{\circ} 47' 30''$ to $122^{\circ} 2' 30''$ E. long.; and 't is reckoned one of the most fertile provinces and finest climates in China. One crop is said to afford the inhabitants, who are not so numerous as those of some other provinces, several years' sustenance. Besides the grand imperial canal, which traverses some part of this province, it has several lakes, rivers, and brooks, which contribute to fertilize and enrich it; though it frequently suffers from drought, as it seldom rains here. It is much infested by locusts, wolves, and gangs of robbers, who beset travellers in the highways over the mountains, and often descend to the plains, plundering and ravaging the villages and open towns. The inhabitants are strong and healthy, and are employed in manufacturing great quantities of silk; besides the common sort produced by the silk-worms, they find another sort upon trees and bushes in great plenty, which is spun by a kind of worm not unlike our caterpillars. This last kind, though coarse, is stronger than the other; and with this they carry on a great trade, by means of their rivers and canals. The barks that come from the southern parts to Peking pass along the imperial canal; and the tribute of the merchandize they thus convey has been computed to amount to a very large sum. Among other fruits produced in this province, they have one which is called Se-tse, a kind of figs, which ripen about the beginning of autumn, and being dried, contract a crust of candied sugar, that gives them a delicious flavour. This province is rendered particularly venerable among the Chinese by a tradition, that their great philosopher Kongtunse, commonly called by us Confucius, drew his first breath in it. Chantong is divided into six districts, which contain six cities of the first rank, that are very populous and flourishing. These again include no less than 114 towns of the second and third rank, besides a great number of towns and villages, fifteen fortresses, some of them very large, and all of them built to guard the entrances of their ports and the mouths of their rivers. There are likewise several islands scattered along the gulf, extremely well peopled, affording convenient harbours for Chinese transports, and a quick and easy passage to and from Corea and Leao-tong. The cities of the first rank are Tsinan or Cinnan, the metropolis of the province, Yeng-chew, Tong-chang, Ting-chew, Ten-chew, and Lio-chew. The population of Chang-tong consists of twenty-four millions, occupying a territory in extent 65,144 square miles, or 41,667,500 acres. The revenue of this province, transmitted to the treasury at Peking from the land, salt, and taxes, amounts to 3,600,000

talents or ounces of silver, besides 360,000 measures of rice and other grain.

CHANTONICE, in *Ancient Geography*, a country of Asia, which made part of Carmania, according to Ptolemy.

CHANTONNAY, in *Geography*, a town of France, in the department of the Vendée, and chief place of a canton, in the district of Fontenay-le-Comte; 44 leagues W. from La-Châtaignoraye. The place contains 1421, and the canton 8,28 inhabitants; the territory includes $26\frac{1}{2}$ kilometres and 15 communes.

CHANTOR, in the *Jews' Antiquities*. In the temple of Jerusalem there was a great number of Levites, who were employed in singing the praises of God, and in playing upon instruments before his altar. In the reign of David there were four thousand singing men, with their heads and president.

The chantors and Levites who were employed in singing, playing upon instruments, and other functions of the Temple, had no habits distinct from the rest of the people. Nevertheless, in the ceremony of removing the ark to the Temple of Jerusalem built by Solomon, the chantors appeared dressed in tunics of byssus, or fine linen. Josephus remarks, that in king Agrippa's time they obtained the favour from that prince of wearing a linen robe in the Temple, like the priests. Agrippa believed it would be for the honor of his reign, to signalize it by so considerable a change as this. The other Levites, employed in different exercises under the command of the priests in the Temple, procured likewise commission to learn to sing, to the end that they might enjoy the same privileges with their brethren.

CHANTOR, or CHAUNTOR, a person who sings in the choir of a cathedral.

All great chapters have chantors and chaplains to read and assist the canons, and officiate in their absence.

St. Gregory first instituted the office of chantors, erecting them into a body, called *schola cantorum*: though Anastasius seems to attribute their rise to pope Hlary, who lived an hundred years before Gregory. But the word grows obsolete in this sense, and instead of it the word choir-man or singing-man is now used.

CHANTOR is used, by way of excellence, for the precentor or master of the choir; which is one of the dignities of the chapter.

The chantor bears the cope and the staff at solemn festivals; and gives tone to the rest at the beginning of psalms and anthems. At St. David's in Wales, where they have no dean, he is next in dignity to the bishop.

The ancients called the chantor, *primicerius cantorum*.

To him formerly belonged the direction of the deacons, and other inferior ministers.

CHANTRIGNE, in *Geography*, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Mayenne; 24 leagues N. of it.

CHANTRY, or CHAUNTRY. See CHAUNTRY.

CHAN-YN, a town of China, of the third rank, in the province of Chan-ki; 25 miles E.N.E. of Sou.

CHAO, one of the classes into which the late Mr. Muller arranged the islands between Kamtschka and America; comprehending eight islands; viz. Immek, Kiska, Tiliaghina, Ava, Chavia, Tlagulak, Usagabina, and Amthigda, or the more distant Aleutans.

CHAOASES, an order of horse in the service of the grand signor. These and the *musferrikor* were originally the guards of the sultans in Egypt, and their leaders were his two vizirs, that always accompanied him. They now constantly go out with the bassaw.

The body of the chaos seems originally to have been the guard out of which the fultan used to send persons to execute his orders.

CHAO-HING, a city of China, of the first rank, in the province of Tche-kiang; 673 miles S.S.E. of Peking. N. lat. $36^{\circ} 10'$. E. long. $120^{\circ} 14'$.

CHAO-IM, a town of Chinese Tartary; 8 miles S. of Chao.

CHAO-KEOUNG, a town of China, in the province of Chang-tong; 35 miles S.E. of Tei-nghin.

CHAOLLOGY, the history or description of the chaos.

Orpheus, in his Chaology, sets forth the different alterations, secretions, and divers forms, which matter went through till it became inhabitable; this amounts to the same with what we otherwise call cosmogony, or the creation of the world. See **COSMOGONY**.

Dr. Burnet likewise gives us a chaology, in his Theory of the Earth. He represents the chaos, as it was at first, entire, undivided, and universally rude and deformed; or the *tabula bobæ*; then shews how it came divided into its respective regions; how the homogeneous matter gathered itself apart from all of a contrary principle; and lastly, how it hardened, and became a solid habitable globe.

CHAO-MA-ING, in *Geography*, a town of Asia, in Thibet; 10 miles N. of

CHAO-MA-ING HOTUN, is a town of Thibet, 285 miles E. of Hami.

CHAOMANTIA, among the *Enthusiastical Chemists*, is the art of making prelates from observations on the air.

CHAON, in *Ancient Geography*, a mountain of the Peloponnesus, situated to the left of the route from Argos to Tegæa, the lower part of which was planted with fruit trees. Hence proceeded the river Erasinus, which supplied that of Stymphalus in Arcadia. Bacchus and Pan were honoured with sacrifices at the fall of the water which formed the Erasinus, and a feast was celebrated in honour of Bacchus, which was denominated *tybæ*. Pausan. Corinth. l. ii. c. 24.

CHAONES, or **CHAONII**, the name of a people who had the sovereignty of the whole of Epirus before the Moloss, according to Strabo. Virgil (*Æn.* l. iii.) supposes that they were more ancient than the war of Troy; and in another place he says that Ceres and Bacchus introduced the use of wheat instead of the acorn of Chaonia. It is more natural however to trace the descent of the Chaonians from the ancient Pelasgi than from the Trojans, as the greater number of the people of Greece and its environs had originated from the Pelasgi; and Steph. Byz. reports that Chaonia in particular had been formerly called *Pelagide*. Plutarch seems to have assigned the time of their establishment, and the chiefs of their colony, when he says, that the historians related, that after the deluge of Deucalion, Phæton, one of those who accompanied Pelasgus into Epirus, was the first king of the Thesprotii and Molossi, that is, of the Chaonians, the predecessors of these people. If the establishment of the Pelasgi in Chaonia soon followed the deluge of Deucalion, this last event serves to fix the *origin* of the Chaonians; for although we cannot precisely ascertain the period of this deluge, it is known that Deucalion lived 200 years before the siege of Troy, and that some of his descendants assisted at this siege. The deluge happened about the close of his reign, and therefore could not have preceded the Trojan war, more than about five generations, or 150 years; or, according to sir Isaac Newton, four generations,

or about 133 years, reckoning with the ancients three generations to 100 years. The establishment of the Chaonians, which immediately followed the deluge, must therefore have taken place about three or four generations, or from 100 to 133 years, before the Trojan war. Upon this supposition, we may determine who was the Pelasgus that conducted the Chaonians into Epirus. He could not have been the ancient Pelasgus, who lived before the flood of Deucalion, according to the history of his posterity, traced out by Pausanias; but he had a grandson of the same name, who, according to the relation of Plutarch, conducted a colony to Epirus after the deluge of Deucalion. Steph. Byz. mentions a Pelasgus, the son of Lyeacon, and father of Thesprotus, and he also mentions his descendants, who inhabited Epirus. We have reason, therefore, to believe, that this is the Pelasgus to whom Plutarch refers, since a period near the deluge of Deucalion corresponds to the time of a son of Lyeacon; and we learn from Apollodorus (l. iii. c. 8. § 2.) that Deucalion's flood occurred in the reign of Nyctimus, the successor of Lyeacon. Moreover, Pausanias (l. viii. c. 3.) informs us, that the sons of Lyeacon, amounting in number to not less than 24, dispersed themselves in Greece. The oracle of Dodona in Epirus was of Pelasgic origin; and since the Pelasgi were not settled in Epirus till after the deluge of Deucalion, this oracle could not have been established at an earlier period, or till after the settlement of the Chaonians, and hence we may infer that it was probably of Chaonian origin. Herodotus (l. ii.) assures us, that the ancient Pelasgi invoked the divinity in general, without ascribing to him those appellations which afterwards distinguished the gods and goddesses, whose worship was not yet introduced into Greece. This author adds, that the Pelasgi consulted the oracle of Dodona. The Pelasgi, according to Herodotus, were more ancient than the gods of Greece, and more ancient than the other Greeks, who, according to Strabo, cannot be traced to a higher antiquity than the Trojan war, since Pelasgus, their chief, was a descendant in the 8th degree of those who assisted in the war, according to Pausanias. The scholiast of Aristophanes says, that the Chaones were descended from the Thracians; but Aristotle traces them to the Oenotrii, one of the most ancient nations of Italy.

CHAONIA, a country of Greece, the most northern part of Epirus, so called from its ancient inhabitants the Chaones. It was bounded on the north by the Oresside territory and part of the country of the Pœnices; on the south-west, by the Mediterranean sea; on the south, by Thesprotia; and on the east, by the country of the Antitantes. The Acro-cæcæonian mountains bound'd it to the north. The most noted cities in this part of Epirus were, according to Ptolemy, Oricum or Oricus, Cassiopa or Cassiope, Antigonis, founded by Antigonus Planeris, Hecatœpœdum, Omphalium, Eleus, and the strong town, or, as Pliuy calls it, castle of Chimæra, much frequented on account of its hot baths. See **EPHRUS**.

CHAONIA, a town of Asia, in Syria, situated at the confluence of two small rivers, S.W. of Zeugma. Ptolemy places it in Comagene, a country of Syria.

CHAONITES, a small country of Asia, in Assyria, E. of the Tigris; more properly *Chalonitis*, which see.

CHA-OU-FOU, in *Geography*, a town of China, of the first rank, in the province of Fokien; 775 miles S. of Peking. N. lat. 22° . E. long. $117^{\circ} 19'$.

CHAO PAI, a town of Chinese Tartary. N. lat. $42^{\circ} 13'$. E. long. $124^{\circ} 42'$.

CHAO-PING, a town of China, of the third rank, in the

the province of Quang-si; 5 leagues S.E. of Yong-nghai.

CHAORA, one of the smaller Cape Verd islands.

CHAOS, among the *Ancient Philosophers*, was described a dark, turbulent kind of atmosphere; or a disorderly system, or mixture, of all sorts of particles together, without any form or regularity; out of which the world was formed.

Chaos is every where represented as the first principle, ovum or seed of nature, and the world. All the ancient poets, sages, naturalists, philosophers, theologians, and poets, hold that chaos was the eldest and first principle, *το αρχαιος χος*.

The Bubarians, Phœnicians, Egyptians, Persians, &c. all refer the origin of the world to a rude, mix'd, confused mass of matter. The Greeks, Orpheus, Hesiod, Menander, Anaxagoras, Euripides, and the writers of the *Æolic Poems*, all speak of the first chaos: the Ionic and Protonic philosophers build the world out of it. The Stoics hold, that as the world was first made of a chaos, it shall at last be reduced to a chaos; and that its periods and revolutions in the mean time are only transitions from one chaos to another. Lastly, the Latins, as Ennius, Varro, Ovid, Lucretius, Statius, &c. are all of the same opinion. Nor is there any sect or nation whatever, that does not derive their *δυσωμοσις*, the *fracture of the world*, from a chaos.

The opinion first arose among the Barbarians, whence it spread to the Greeks, and from the Greeks to the Romans, and other nations.

Dr. Burnet observes, that besides Aristotle, and a few other pseudo-Pythagoreans, nobody ever asserted, that our world was always, from eternity, of the same nature, form, and structure, as at present: but that it had been the standing opinion of the wise men of all ages, that what we now call the terrestrial globe, was originally an unformed undigested mass of heterogeneous matter, called chaos; and no more than the rudiments and materials of the present world.

It does not appear who first broached the notion of a chaos. Moses, the eldest of all writers, derives the origin of this world from a confusion of matter, dark, void, deep, without form, which he calls *tohu bobu*; which is precisely the chaos of the Greek and Barbarian philosophers. Moses goes no further than the chaos; nor tells us whence it took its origin, or whence its confused state; and where Moses stops, there precisely do all the rest.

Dr. Burnet endeavours to shew, that as the ancient philosophers, &c. who wrote of the cosmogony, acknowledged a chaos for the principle of their world; so the divines or writers of the theogony, derive the origin or generation of their fabled gods from the same principle.

Mr. Whiston supposes the ancient chaos, the origin of our earth, to have been the atmosphere of a comet; which though new, yet all things considered, is not the most improbable assertion. He endeavours to make it out by many arguments, drawn from the agreement which appears to be between them.

So that, according to him, every planet is a comet, formed into a regular and lasting constitution, and placed at a proper distance from the sun, revolving in a nearly circular orbit; and a comet is a planet either beginning to be destroyed, or re-made: that is, a chaos, or planet, unformed, or in its primordial state, and placed as yet in an orbit very eccentrical. See *COSMOGONY*.

CHAOS, in the phrase of Paracelsus, imparts the air. It has also some other significations among the alchemists.

CHAOS (*redivivum*) &c. of Linn. in the 12th edit. of *Syst. Nat.* is the *Vibrio glutinis* of Goetze and Gmelin.

CHAOURCE, in *Geography*, a town of France in the department of the Aube, and chief place of a canton in the district of Bar-sur-Seine; 5 leagues S. of Troyes. The place contains 1630, and the canton 12,339 inhabitants: the territory comprehends 415 kilometres and 26 communes.

CHAP, in *Ornithology*, denotes either of the mandibles of a bird's bill, which are distinguished by the epithets *upper* and *lower*. The term mandible is most commonly that adapted by modern ornithology.

CHAP. See *CHILBLAIN*.

CHAPALA, in *Geography*, a lake of North America, in Mexico, and the province of Guadaluajara; 18 leagues long and 5 broad: 15 miles S of Guadaluajara.

CHAPARANG, or DSAPRONG, a town of Asia, in the country of Tibet, situate near the head of the Ganges; 140 miles N.N.E. of Srinagur. N. lat. 35° 10'. E. long. 79° 22'.

CHAPARRAL, a town of Spain in the province of Granada; 5 leagues from Antequera.

CHAP, the metallic part put on the end of a scabbard to prevent the point of the sword or bayonet from piercing through it.

CHAPEAU, in a general sense. See *HAT*.

CHAP, arm is sometimes also used to denote the cap, or coronet, armed with ermine borne by dukes; and of late frequently met with above an helmet instead of a wreath under gentlemen's or noblemen's crests. See *CAP of Arms*. The crest is borne on the chapeau: and by the chap au the crest and coat are separated; it being a rule, that no crest must touch the shield immediately.

CHAPEAU, Fr. literally means a hat; but in music it implies the femicle over two or more notes which we call a slur, \frown ; and by which a singer understands that all the notes under r or over this form-circle or slur are to be sung to one syllable; and in violin music to be played with one bow.

CHAPEAU de Blincur. See the article *CHASSES de galerie*.

CHAPEL, or CHAPPEL, a kind of little church, served by an incumbent properly under the denomination of a *chaplain*. The word chapel, according to some, comes from *caput*, little tents, or booths, set up by traders in fairs, to shelter them from the weather. Papias derives it both from the Greek and Latin, *quasi capiens* *ovos* or *populum*, vel *laudem*: others derive it from the *chape*, or cope, which served to cover the body: others, à *pellibus caprarum*; because these places were anciently covered with goat-skins. Rebuff derives it from *capra*, St. Martin's cope, which the kings of France carried to war with them as their standard, and preserved very carefully in particular tents, thence called chapels. There are two kinds of chapel, the one consecrated, and held as benefices: the other secular, being of the nature of oratories. The first are built apart, and at a distance from the parish church; being neither parishes, cathedrals, nor priories, but subsisting of themselves. These are called by the canonist *sub dio*, and by us *chapels of ease*; as being erected at a distance from the mother-church, where the parish is large and wide, for the ease and convenience of some of the parishioners who reside far off. They are served by some inferior pastor, provided either by the rector of the parish, or by those for whose ease and benefit they are intended, by prayers or preaching merely. Some of these are also parochial, having the parochial rights of christening and burying, and differing from a church only in the want of a rectory and endowment.

The second kind are frequently built in, or adjoining to a church, as a part thereof; having only a clerk, &c. to

read

read prayers in; and in the Romish churches, an altar, &c. to celebrate mass on; but without any baptistry, or font. Their the canonists call *sub lecto*. They are generally erected by some considerable person for the use of their own families; *ut ibidem familiaria sepulcra sibi constituent*. The twenty-first canon of the council of Agda, held in 1066, allows private persons the use of chapels; but with prohibition to all clerks to officiate in them without leave from the bishop.

CHAPELS, *free*, are those chapels of *cess* which have a settled revenue for perpetual maintenance of a pastor, &c. by charitable donations of lands, or rents bestowed on them; so as not to be any charge either to the rector, or the parishioners; and they are thus called because they are free from all ordinary jurisdiction.

There are several collegiate churches in France, which they call *saints chapelles*, *holy chapels*; as those of Paris, Dijon, Bourges, Bourbon, &c. These are so denominated, from being repositories of certain relics.

Hence, all those places where relics were preserved came to be called chapels; and the persons who had the care of them, chaplains.

CHAPEL is also a name given to a printer's workhouse; because, say some authors, printing was first actually performed in chapels, or churches; or, according to others, because Caxton, an early printer, exercised the art in one of the chapels in Westminster Abbey. In this sense they say, the orders, or laws of the chapel, the secrets of the chapel, &c.

CHAPEL, *knights of the*, an order of knights instituted by King Henry VIII. in his testament, to the number of thirteen; though these have been increased to the number of twenty-six; they are called *poor knights*.

These are not knights of the order of the Garter; but are, as it were, their assistants or deputies, serving to discharge all their offices in the funeral services of the kings of England.

They are subject to the office of the canons of Windsor, and live on pensions which the order assigns them.

They bear the blue or red cloak, with the arms of St. George on the left shoulder; but the cloak is only cloth, and they wear no sort of garter: which distinguishes them sufficiently from the knights of the Garter.

CHAPEL Royal Establishment. We have an account of this establishment in the "Liber niger domus Regis," in the time of King Edward IV. in which there is likewise a list of the several musicians retained in that monarch's service, as well for his private amusement as for the duties of his chapel.

As this seems the origin of those establishments, of the chapel royal and king's band, which still subsist, we shall give the account of them, and their several employments, at full length from this ancient book, as well as from N^o 233 of the Harl. MSS. in the British Museum, and N^o 1147, 2. 3. 11. of the Aihmol. Collect. Oxf. for *Ordinances touching the King's household*, made in the time of Edward II. as well as in that of Edward IV.

"Mistresses thirteene, thereof one is Virger, which directeth them all feistyvall dayes in their stayones of blowings and pypyns to such offyces as the offyces might be warned to prepare for the King's meate and soupers; to be more redyere in all services and due tyme; and all this sytyng in the hall together, wherof some be trompets, some with the shalmes and small pypes, and some are strange mense coming to this Court at fyve feastes of the year, and then take their wages of Household, after iij. ob. by daye, after as they have byne presente in Courte, and then to avoyd after the

next morrowe after the feaste, besydes their other rewardes yearly in the King's Exchequer, and clothyng with the Household, wintere and soper for eiche of them xxx. And they take nightleye amonge the them all iij galons ale; and for wintere feaste the candles waxe, vj candles pich, iij talc steds [fire-wood cast and cut into litlets]; lodgyng susteynente by the Harbengere for them and their horses nightleye to the Courte. Also having into Courte ij servants to bear their trompets, pypes, and other instruments, and to take for wintere nightes, whilst they blow to innore of the chandry; and alway two of these perlones to contynewe styll in Courte at wage by the cheque rolle whyles they be presente iij ob. dayly, to warne the King's rydunge household when he goeth to houbacke as oft as it shall require, and that his household mene may followe the more redyere after by the blowinge of their trompets. Yf any of the two Mistresses be lte bloode in Courte, he taketh two loves, ij messe of greate meate, one galone ale. They part not at no tyme with the rewardes given to the Household. Also when it please the King to have ij Mistresses continuinge at Courte, they will not in no wyse that thes Mistresses be so familiarlye to aske rewardes.

"Children of the Chappelle vij, founden by the King's private Coffers for all that longeth to their apparell by the hands and oversyghte of the Deane, or by the Master of Songe assigned to teache them, which Mestere is appointed by the Deare, chosen one of the pounder of the fellowshipe of chappelle after reheard, and to drawe them to other Schooles after the form of Sacotte, as well in Songe in Organes and other. These Children eate in the Hall dayly at the Chappell bord, nexte the Ycomane of Ueltery; takinge amonge them for hyerye daylye for brekefaste and all nighte, two loves, one messe of greate mete, ij galons ale; and for wintere feaste iij candles pich, iij talcsteds, and lytter for their pallets of the Serjaute Uher, and carryage of the King's coite for the competente beddinge by the oversyghte of the Comptroller. And amonge them all to have one servante into the court to trusse and bear their harness and lyerye in Court. And that day the King's Chappelle remoueth every of thes Children then present recceuth iij. d. at the Grene Clothe of the Comptyng-houfe for horsire dayly, as long as they be jurneing. And when any of thes Children comene to xvij years of age, and their voyces change, ne cannot be preferred in this Chappelle, the nombre beinge full, then yf they will assente the King assynethe them to a College of Oxford or Cambridge of his Foundation, there to be at syndyng and studye bothe iustlytely, tyll the King may otherwise advaunce them."

In the *Liber niger*, there is likewise not only an account of the gentlemen and children of the chapel, but of the "Deane's person and establishment, with that of the xxiiij Chaplens and Clerkes of the Chappelle by the Deane's electyone or demonymatione," &c.

The establishment of cardinal Wolfey's chapel, and of Henry Algernon Percy, fifth earl of Northumberland, was still more numerous and splendid.

CHAPEL-in-the-Frith, in *Geography*, is a small town of Derbyshire, England. It stands on the side of a high convex hill, which rises from a contracted vale, formed by some high mountains. The church was erected at the commencement of the fourteenth century. Here are some small cotton manufacturies which furnish employ to part of the lower class of inhabitants. This town is 166 miles N.W. from London, and has a small weekly market on Thursdays.

CHAPELAIN, JOHN, in *Biography*, a poet and man of letters was born at Paris in 1595, and having com

his education under the best masters, became tutor to the children of the marquis de la Trouffe, grand marshal of France, and afterwards steward to this nobleman. During an abode of 17 years in this family he translated "Guzman d'Alfarache," from the Spanish, and directed his particular attention to poetry. In this art he acquired reputation by a critique on the Adonis of the cavalier Marino, prefixed to a Paris edition of that poem, in 1625. By an ode addressed to cardinal Richelieu, a critique on the Cid, and other performances, he obtained the credit of an oracle in matters of taste. Conceiving himself capable of producing an original work, he undertook the composition of an epic poem on the subject of John d'Arc, but when the first 12 books of his "Pucelle, ou la France delivree," appeared in 1656, ushered into the world with all the advantages of typography and engraving, and published by court influence through five editions, in eight months, the expectations of the public were disappointed, and the author's fame sustained a deadly blow, so that the name of Chapelain as a poet was regarded in France much in the same manner with that of Blackmore in England. The harshness of the Ryle and verification of this poem became a subject of contemptuous satire; and Boileau, Racine, and la Fontaine are humorously said to have imposed upon themselves the penance, for committing any fault in language, of reading a certain number of pages of this poem. The learned Huet, in vain endeavoured to vindicate and extol the Pucelle against the more effectual censures of Boileau and others; and thus the 12 additional books have ever since remained in MS. in the king's library. His interest at court, however, remained undiminished; and as his pensions were more ample than those of any other literary man, Boileau calls him "le mieux renté de tous les beaux-espirts." The list of pensioners, recommended by Colbert to Lewis in 1662, was formed by Chapelain; and this distinction secured him a degree of homage which counterbalanced the failure of respect which he had incurred as a poet. His private character was held in high estimation; and though he was not wholly exempt from the charge of avarice, he was not ambitious of posts of eminence, and wisely declined the office of preceptor to the first dauphin, to which he had been nominated by Moutauffer. Boileau himself is constrained to bear an honourable testimony to his moral qualities. He died in 1674, leaving property which few poets of far superior merit have acquired. His works, besides those already noticed, are, a few odes, a "Dialogue on the reading of old Romances," and some miscellaneous pieces on literary subjects. *Nouv. Dict. Hist.*

CHAPELET, in the *Manège*, a couple of stirrup-leathers, mounted each of them with a stirrup, and joining at top in a sort of leather buck, called the head of the chapellet, by which they are made fast to the pommel of the saddle, after being adjusted to the rider's length and bore. They are used both to avoid the trouble of taking up or letting down the stirrups every time that a gentleman mounts on a different horse and saddle, and to supply what is wanting in the academy saddles, which have no stirrups to them.

CHAPELET, armour of iron forming a circle with three branches of the same metal, by means of which the noyau of the mould of a piece of ordnance is fastened to the chape. They also give this name to a pump or chain pump. It is likewise given to an hydraulic engine for drawing water out of a wet or inundated foundation, where people are going to erect a masonry or other work.

CHAPELLE, CLAUDE EMANUEL L'HULLIER, in *Biography*, a French wit and poet, was the natural son of Francis

Hullier, master of the accounts, and received his name from the village of La Chapelle, between Paris and St. Denis, the place of his nativity. His education was liberal, and he learned philosophy under the famous Gassendi. His genius, however, inclined to poetry of the light and easy kind, and he excelled in double rhymes. His disposition was convivial, and his habits were those of a man of pleasure. His "Journey to Montpellier," written jointly with Lauchumont, and consisting of a mixture of prose and verse, is a "model of that pleasurable fatiety which is more rare than correctness and elevation." Without availing himself of his connections and interest in order to obtain any posts of honour or profit, he was content with a moderate amusey, and prolonged a life of ease and indigence to the age of 70 years. He died at Paris in 1676. A new edition of his "Journey" was published by Le Fevre de St. Marc, in 1777, 2 vols. 1 mo. To this edition are also annexed some "Fugitive Pieces," in verse and prose. *Nouv. Dict. Hist.*

CHAPELLE, JOHN DE LA, a member of the French academy, was born at Bruges in 1655, and obtained by his father's purchase the post of receiver-general of the finances at Ronelle. Abandoning the career of business, he became a dramatic writer, after the manner of Racine, whom he studied to imitate, but could not rival; and his performances owed their success in a great degree to the acting of Baron, and a due attention to the stage effect. The subject of the most popular was Cleopatra. A piece entitled "Les Carroffs d'Orléans," maintained its place at the theatre. In 1687 La Chapelle became secretary to the prince of Conti, and he was dispatched by his patron to Switzerland on business of importance to his house. He was also employed by the king on public affairs; and he gave evidence of his patriotism and political knowledge in a series of "Letters from a Swiss to a Frenchman, on the true Interest of the Powers at War," the object of which was to dissuade Europe from its league against the French monarch. As a member of the French academy, into which he was admitted in 1688, and in the chair at its public sittings, which he often occupied, he conducted himself so as to gain applause. Although he incurred the displeasure of Despreaux, who was a formidable adversary, he was so well supported as to escape injury; and his private conduct was such as to conciliate general esteem. He died at Paris in 1727, at the age of 68 years. He wrote, besides the works above mentioned, "Historical Memoirs of the Life of Armand Bourbon, Prince de Conti," printed in 1699; and the "Lives of Catullus and Tibullus," forming 2 separate works, the basis of which are the facts and fortunes delineated by those poets. D'Alibert, *Hist. des M. de l'Acad. Fr.*

CHAPELLE *Amn. La*, in *Geography*, a town of France, in the department of Puy-de-Dôme; 5 miles N. of Ambert.

CHAPELLE *d'Angillon, La*, a town of France, in the department of the Cher, and chief place of a canton in the district of Sancerre; 16 miles N. of Bourges. The place contains 531, and the canton 478 inhabitants; the territory includes 315 kilometres and 5 communes.

CHAPELLE *Aubry, La*, a town of France in the department of the Maine and Loire, 8 miles S. of St. Florent.

CHAPELLE *Biffe, La*, a town of France in the department of the Lower Loire; 9 miles N. E. of Nantes.

CHAPELLE *Egdes, La*, a town of France, in the department of the Seine and Marne, and chief place of a canton in the district of Fontainebleau. The place contains 83 and the canton 6920 inhabitants. The territory comprehends 255 kilometres and 20 communes.

CHAPELLE la Erliée, a town of France, in the department of the Ille and Vilaine, and district of Vitré; $1\frac{1}{2}$ league E. of Vitré.

CHAPELLE sur Erdre, La, a town of France, in the department of the Lower Loire, and chief place of a canton in the district of Nantes; 5 miles N. of Nantes. The place contains 1997 and the canton 7913 inhabitants: the territory includes $92\frac{1}{2}$ kilometres and 6 communes.

CHAPELLE de Guichay, La, a town of France, in the department of the Saône and Loire, and chief place of a canton in the district of Mâcon; 2 leagues S. of Mâcon. The place contains 1376 and the canton 8176 inhabitants: the territory comprehends $77\frac{1}{2}$ kilometres, and twelve communes.

CHAPELLE la Moche, La, a town of France, in the department of the Mayenne; $4\frac{1}{2}$ leagues N.W. of Vilaine.

CHAPELLE sur Orreuil, La, a town of France, in the department of the Yonne; 2 leagues S. of Sens.

CHAPELLE St. Laurent, La, a town of France in the department of the Two Sèvres; 11 miles N.W. of Parthenay.

CHAPELLE St. Mefmin, La, a town of France in the department of Loiret, and chief place of a canton, in the district of Orleans; 3 miles W. of Orleans.

CHAPELLE Tailléfert, a town of France, in the department of the Creule; $1\frac{1}{2}$ league S. of Gueret.

CHAPELLE La Thivoult, a town of France, in the department of the Two Sèvres, and chief place of a canton, in the district of Parthenay; $4\frac{1}{2}$ leagues W.S.W. of Parthenay.

CHAPELLE en Tercors, La, a town of France, in the department of the Drôme, and chief place of a canton in the district of Die; 13 miles N. of Die. The place contains 1526 and the canton 4834 inhabitants: the territory includes 155 kilometres and five communes.

CHAPELLING, in *Seamanship*, is bringing a ship to the same tack she was previously on, when in a light breeze of wind, and close-hauled, she had taken a-back, either through a sudden shift of wind, or want of attention or skill in the person at the helm. This is usually done by instantly bracing sharp round the head sails, and keeping fast the jib and stay-sail sheets.

CHAPELNESS, in *Geography*, a cape of Scotland, on the coast of the county of Fife, in the Firth of Forth; $1\frac{1}{2}$ mile W. of Elie Ness.

CHAPELRY, *Capellania*, is used for a certain precinct belonging to a chapel, having the same relation to it that a parish has to a church.

CHAPERON, *CHAPERONNE*, or *CHAPERON*, properly signifies a bonnet garnished with a sort of hood, or covering of the head, having a tail hanging down in a point behind, anciently worn both by men and women, the nobles, and the populace, and afterwards appropriated to the doctors; and licentiates in collages, &c. It was worn of different stuffs divided into two colours. During the time of the famous league, which terminated with the accession of Henry of Navarre to the crown of France, the different parties made themselves known and distinguished by the colours of their Chaperons. And the same sort of distinction took place during the great disputes between the Dukes of Orleans, Bourgogne, and Armagnac.

Hence the name passed to certain little shields, and other funeral devices, placed on the foreheads of the horses that drew the hearse in pompous funerals, and which are still called *chaperons*, or *shafferoons*; because such devices were originally fastened on the *chaperons*, or hoods, worn by those horses with their other coverings of state.

CHAPERON of a *bit mouth*, in the *Manege*, is only used for scatch-mouths, and all others that are not cannon-mouths, signifying the end of the bit that joins to the branch just by the banquet. In scatch mouths the chaperon is round, but in others it is oval: and the same part that in scatch and other mouths is called chaperon, is in cannon-mouths called *froncon*. See *BITT*.

CHAPETE, or *CHARPOTE*, in *Ancient Geography*, a strong place of Asia, in Melitarama.

CHAPETONES, a denomination distinguishing these Spaniards who arrive from Europe to America, and who are the first persons in the country with respect to rank and power. As the Chapetones are raised to such pre-eminence in America by the conspicuous predilection of the court, they look down with disdain on every other order of men. The interior traffic of every colony, as well as any trade which is permitted with the neighbouring provinces, and with Spain itself, are carried on chiefly by the Chapetones who, as the recompence of their industry, amass immense wealth; while the Creoles sunk in sloth, are satisfied with the revenues of their paternal estates.

CHAPETEAU d'une piece d'artillerie, is composed of two small pieces of boards or planks joined together in such manner, as to form the figure of a tent, or of a roof with a pitch, and serves to cover the vent or touch-hole of a piece of Ordnance.

CHAPITERS, in *Architettura*, the crowns or upper parts of a pillar. See *CAPITAL*.

CHAPITERS with mouldings, are those which have no ornaments, as the Tuscan and Doric.

CHAPITERS with sculptures, are those which are adorned with leaves and carved works, the finest of which is of the Corinthian order.

CHAPITERS, in *Law*, were anciently a summary of such matters as were to be inquired of, or presented before justices in eyre, justices of assize, or of the peace, in their sessions.

Chapters are now taken for articles delivered by the mouth of the justice, in his charge to the inquest: though it appears from Bacon and Britton, they were formerly written exhortations given by the justices for the good observation of the laws, and the king's peace; first read in open court, then delivered in writing to the grand inquest: which the grand jury, or inquest, were likewise to answer to upon their oaths, either affirmatively or negatively.

CHAPLAIN properly signifies a person provided with a chapel; or who discharges the duty thereof.

CHAPLAIN is also used for an ecclesiastical person, in the house of a prince, or a person of quality, who officiates in their chapels, &c.

With us there are forty-eight chaplains to the king, who wait four each month, preach in the chapel, read the service to the family, and to the king in his private oratory, and say grace in the absence of the clerk of the closet. While in waiting they have a table, and attendance, but no salary.

An archbishop may retain eight chaplains: a duke or a bishop, six; a marquis or earl, five; a viscount, four; a baron, knight of the Garter, or lord chancellor, three; a duchess, marchioness, countess, baroness, the treasurer and comptroller of the king's house, the king's secretary, dean of the chapel, almoner, and master of the rolls, two each; the chief justice of the king's bench, one: all of whom may purchase a licence or dispensation, and take two benefices with cure of souls. Stat. 22 Hen. VIII. c. 13.

Every judge of the king's bench and common pleas, the
chancellor

chancellor and chief baron of the exchequer, the attorney and solicitor general, may each of them have one, entitled to one benefice with cure, and non-resident. Stat. 25 Hen. VIII. c. 16.

And also the groom of the beds, treasurer of the king's chamber, and chancellor of the duchy of Lancaster, may retain each one chaplain. Stat. 23 Hen. VIII. c. 28. A chaplain must be retained by letters testimonial under hand and seal, or he is not a chaplain within the statute: and a chaplain thus qualified may hold his living, though disfranchised from attendance, during life; nor can a nobleman, though he may retain other chaplains in his family, qualify any of them to hold pluralities whilst the first are living. 4 Rep. 90.

The first chaplains are said to have been those instituted by the ancient kings of France, for preserving the capes, or cape, with the other relics of St. Martin, which the kings kept in their palace, and carried out with them to the war. The first chaplain is said to have been Gul. de Mesfius, chaplain to St. Louis. Prelates to and at the last war each regiment had its chaplain. Regimental chaplains were afterwards reduced and put on half pay during the war. There remained however of the establishment, a chaplain general, who directed the performance of church service, throughout the army.

CHAPLAIN *in the order of Malta*, is used for the second rank, or class, in that order: otherwise called *thames*. The knights make the first class, and the chaplains the second.

CHAPLAINS *of the pope*, are the auditors, or judges, of causes in the sacred palace; so called, because the pope anciently gave audience in his chapel, for the decision of causes from the several parts of Christendom.

He hither summoned as assessors the most learned lawyers of his time; and they hence acquired the appellation of *capellani, chaplains*.

It is from the decrees formerly given by these, that the body of decretals is composed: their number pope Sixtus IV. reduced to twelve.

Some say, the shrines of relics were covered with a kind of tent, *cape*, or *capillus*, i. e. *ditto, capis*; and that hence the priests, who had the care of them, were called *chaplains*. In time these robes were repaired in a little church, either contiguous to a larger, or separate from it; and the same name, *capillus*, which was given to the cover, was also given to the place where it was lodged; and hence the priest who superintended it came to be called *chaplain*.

CHAPLET, or *CHAPLETARY*, a string of beads, used in the Romish church, to keep account of the number of Paternosters and Ave-Maries, to be recited in honour of God and the Holy Virgin.

CHAPLETS are otherwise called *Pater-nosters*. A ROSARY is a chaplet of fifteen beads of Ave-Maries.

MENAGE derives the word from *menage au chat*; because of the resembling the thing bears to a husband and wife of roses, *chapman de roses*. The word in Latin is called *capellanus*; the Italian more frequently *capellano*.

LARRY and P. VIRT attribute the first invention of the chaplet to Peter the Hermit, well known in the history of the crusades.

There is a chaplet of our Saviour, consisting of 33 beads, in honour of his 33 years living on earth, instituted by father Michael, the Camaldulan.

The Orientals have a kind of chaplets which they call *CHAINS*, and which they use in their prayers, rehearsing one of the perfections of God on each link or bead. The

great mogul is said to have 18 of these chains, all of precious stones, some diamonds, others rubies, pearls, &c.

The Turk's have like wife chaplets, which they bear in the hand, or hang at the girdle: but father Daubni observes that they differ from those used by the Romants, in that they are all of the same bigness, and have not that distinction into beads; though they consist of six decads, or 60 beads. The beads, that the muslims have presently run over the chaplet, the prayers being extremely short, as containing only these words, *Præterito Calis*: or these, *Chryso Galy*, for each bead.

Beside the common chaplet, they have likewise a larger one, consisting of 100 beads, when there is some distinction, as when they pray for their *Præterito Calis*, i. e. *Chryso Galy*, for 100 beads; or another, *Præterito Calis*, i. e. *Chryso Galy*, for 100 beads, for the dead. *Præterito Calis*, i. e. *Chryso Galy*, for 100 beads, for the living. These three prayers, making only 300 beads, the number of beads, they add other papers for the beginning of the chaplet.

He adds, that the Muscovite chaplet appears to have had its origin from the *Præterito Calis*, i. e. *Chryso Galy*, which the Jews are obliged to recite daily, and which we find in their prayers; and that the Jews are said to be having this in common, that they feel not do any thing without pronouncing some laud or benediction.

CHALET, or CHALEIFF, in *Archæology*, a little mouldering, cut or carved into round beads, pearls, oysters, or the like.

A chaplet, in reality, is little else but a baguette enriched with sculpture. See BAGUETTE.

CHAPMAN, GEORGE, in *Biography*, an early English dramatic writer, and the first translator of all the works of Homer, was born in 1557, and partly educated at Trinity College, Oxford, where he was distinguished for classical erudition. From Oxford he removed at an early age to the Metropolis, and cultivated an acquaintance with the wits of that period, Shakspeare, Saunter, Marlow, Daniel, &c. In 1595, he publicly commenced his art, by printing a poem entitled "Ovid's Banquet of Sarcasms." Before this time he must have been engaged in his translation of Homer, as his several books of that Poet appeared in 1596. Fifteen books were printed in 1602, and the whole poem, though published without date, appears by the dedication to prince Henry, not to have been later than 1603. Before this period he was a writer of comedy, and for several years he supplied the public with dramatic pieces, both tragic and comic, many of which were popular. He was a joint writer with Jonson, and rivalled him in fame. In 1614, he published his version of the Odysses, and soon after completed his translation of all Homer's works by the Batrachomyomachia and Hymns. He also translated Mæcus and Hesiod; but some doubt exists whether the latter version was ever printed. Many other works were produced by him in the course of his laborious life, which terminated in 1634, at the age of 77 years. A monument of Grecian architecture was erected to him by his friend, Imigo Jones, in the church of St. Giles's in the Fields, which was destroyed with that edifice. Chapman was not esteemed his country for his poetical and dramatic talents, and though he may now be ranked among our exact poets, his merit in introducing Homer to the knowledge of our countrymen ought ever to rescue his name from oblivion. His translation of that poet, though made at an advanced age, and rendered obscure by a protracted measure of lines of 14 syllables, are not destitute of spirit, and afford several examples of the naturalization of the

the Homeric compounded epithets, which have been happily employed by his successors. Waller, as Dryden says, could never read Chapman's Homer without transport; and Pope has derived advantage from the attentive study of it. His critical additions furnish no favourable specimen of an accurate acquaintance with the Greek language. Biog. Brit.

CHAPMAN, EDMUND, an eminent surgeon, and accoucheur, had the merit of giving the first delineation and account of the oblique forceps, invented by the Chamberlens, more than 60 years after their being first used by that family. Of this intelligent and ingenious practitioner, we have only been able to learn, that he was born about the end of the seventeenth, or the beginning of the last century, and after being well instructed in his profession, in some neighbouring county, where he is said to have practised a few years, he came to London, and soon distinguished himself by his superior skill and adroitness, in conducting difficult labours. The management he adopted consisted in turning the child and delivering by the feet, when it presented any other part than the head to the uterine orifice, and in some cases, when the head was the presenting part; and in using the forceps in many difficult births, in which it had been usual before to deliver with the crochet.

The Chamberlens, to whom, by general consent, the invention of the forceps is attributed, guarded the secret with so much caution, that they avoided calling it an instrument, lest it should lead to a discovery. "My father, brothers, and myself, Dr. Hugh Chamberlen says, (preface to his translation of Mauriceau's Midwifery) "have attained to, and long practised a way of d-livering women," &c. From Mauriceau we learn, that these fortunate deliverers were achieved by means of an instrument, but of what kind he was not able to inform us, and it remained concealed, or at the least no account of it was given to the public, until Chapman published his "Treatise on the Improvement of Midwifery, chiefly with regard to the Operation, with Cases," &c. 1732, that is, nearly seventy years from the time they were first used by the Chamberlens. Chapman's Treatise is a work of considerable merit. It contains a delineation and description of the forceps, in which he had made considerable improvements, with an ample account of the cases, in which they might be advantageously employed. Sometimes, he tells us, he made use of a fillet, but on the whole, he prefers the forceps. He condemns the practice of pushing back the os coccygis, in difficult births, which was recommended by Deventer, as well as the opinion, so strongly insisted on by that writer, that labour is frequently rendered tedious and difficult, by the uterus being placed obliquely in the pelvis. Chapman is also author of a small work, "A Reply to Douglas's short Account of the State of Midwifery in London," &c. 1777, in which he ably defends the cause of the men-midwives (or mid-men, as Douglas calls them) against the severe strictures of their adversary. Hæd. Bib. Chirurg.

CHAPOTENSIS, in *Writers of the Middle Age*, a kind of coin. We do not find any certain account of its value. Du-Cange inclines to think it the same as the CHATUS.

CHAPPAR, a courier of the king of Persia, who carries dispatches from court to the provinces, and from the provinces to the court.

The word, in the original Persian, signifies *courier*.

The polls, M. Tavernier tells us, are not established and regulated in Persia as among us: when the court sends out a chapparr, the soplhi's master of the horse furnishes him with a single horse, how long soever his journey be, and a man to run after him. when his horse is weary, he takes that of the

first horseman he meets with, who dares not make the least refusal, and sends his own horse by the man who follows him.

As for the master of the new horse he has taken, he must run, or at least, send after the chapparr, to retake him, when the chapparr dismounts some other horseman to charge him.

CHAPPE, in *Heraldry*, the partition of an escutcheon, by two lines drawn from the middle point in chief to the two base angles of the shield.

The sections of the fides are to be of a different colour from the rest. Mackenzie calls it, *A chief party per bend dextr. or finisler*, or both.

CHAPPE D'AUTEROCHE, JOHN, in *Biography*, a French astronomer, was born at Mauriac, in Upper Auvergne, in 1728. His parents, who were persons of rank and opulence, afforded him every advantage of education, and placed him first in the Jesuits' College at Mauriac, and afterwards removed him to the College of Louis le Grand at Paris. In his earliest years he manifested a taste for mathematics and design; and employed his leisure hours in drawing plans and making calculations. In acquiring the elements of mathematics and astronomy, he was assisted by a Carthusian, named don Germain; and to the latter of these studies he was so ardently devoted, that he spent a considerable part of such nights as were favourable for his purpose in observing the heavenly bodies. Father de la Tour, who was then president of the college, conceived a high opinion of his talents and performances, and recommended him to M. Cassini, as a young person who deserved peculiar encouragement. Accordingly, this celebrated astronomer employed him in drawing a general map of France, and in the French translation of Halley's tables, which were published, with considerable additions, in 1752. In the following year, he was engaged by the French government in surveying the county of Bitche in Lorraine, and in ascertaining the true position of that town, in order to complete the local geography of the district to which it belonged. Having accomplished this undertaking to the satisfaction of his employers, he was elected a member of the Royal Academy at Paris, and in 1759, he was appointed assistant astronomer in the room of M. Lalande, who had been promoted to the rank of associate. In 1760, he was occupied in making observations on the two comets, which then appeared, and in forming, by means of his observations, a theory of their orbits. He communicated to the academy at the same time, an account of the zodiacal light, and of the aurora borealis, which he had a favourable opportunity for observing. At this period he prepared for an expedition to Tobolsk in Siberia, in order to observe the transit of Venus over the sun, which was to happen on the 6th of June, 1761; and after encountering many difficulties, and pursuing a route of about 800 leagues from Petersburg, arrived at the destined place of observation on the 16th of April. M. Hmaeloff, the governor of the town, to whom he presented the order of the empress, received him with respect, and afforded him every necessary assistance in accomplishing the object of his expedition. He lost no time in constructing an observatory, and in fixing and adjusting his instruments; and by means of a solar and lunar eclipse, he was enabled accurately to settle the longitude of the place. His observations of the transit, which were made with great precision, in the presence of M. Hmaeloff, count Pouchkin, and the archbishop of Tobolsk, were speedily transmitted both to Petersburg and Paris. The severity of the climate, which injured the abbe Chappe's health, and other circumstances, induced him to hasten his return; and having vi-

fited the mines at Catharineburgh, of which he has given an interesting account, he proceeded to Casan, and at length, after a journey of much fatigue and danger, arrived at Peterburgh. Declining the offer which the empress made him of the place that had been occupied by Mr. de Lull, he returned to France in 1762, after an absence of two years. In the course of his peregrination to and from T. b. l. l. l. he availed himself of such opportunities as occurred for investigating the nature of the soil and its productions; the rivers, mountains, volcanoes, animals, and minerals; the manners and customs of its inhabitants; and for collecting such particulars of information as might serve to improve an acquaintance with the extensive empire of Russia. Upon his return he applied with diligence to the arrangement of the various materials which he had collected; and from these he formed a narrative of his travels, illustrated with charts and several engravings of different kinds, and comprehended in a work, which appeared in 1768, in 3 vols. 4to. He was no less industrious in the discharge of his official duties, as assistant astronomer. In the prospect of the transit of the sun in June 1769, it was so reasonably supposed, that it might be advantageously observed in the north west part of Europe; but it was necessary to obtain a series of observations to the fourth-vee, at the extreme point of California, viz. at Cape St. Lucar. The abbé Chappé offered his services, and requesting to C. d. z. set sail in a small vessel manned by eight persons only, for Vera Cruz; and from thence proceeded to Mexico, and reached California 19 days before the computed day of observation. At this time an alarming disorder prevailed in the district of California, where he proposed to make his observations, and he was advised to remove out of the reach of danger. But his zeal for the promotion of science was such, that before his departure from France, he replied to those who apprized him of the infallibility of the climate, "That if he were sure of dying the day after making the proposed observation, that assurance should not deter him." Accordingly, he determined to remain at the village of St. Joseph, where he completed his observations in the most satisfactory manner. Three days after the transit, he was attacked with the disorder, which had before seized his companions; but his resolution was invincible. On the 18th of June, when he was thought to be in a state of convalescence, he insisted on sitting up to observe a lunar eclipse, and this occasioned a relapse. During the progress of his disorder, and as it approached to the fatal crisis, which he declared his conviction that he should not survive, he also expressed his satisfaction, that the object of his mission had been accomplished before his death, which happened August 14, 1769, in his 42d year. His papers were transmitted by M. Parli, a French engineer, the only survivor of this expedition, to the French Academy, and afterwards published under the direction of the younger Cadini. The Abbé Chappé was of a lively, cheerful, social disposition, upright in his views, and candid in his conduct; devoted to the pursuit of science, and in a great degree regardless of all considerations of private interest. The brief history above given evinces his unconquerable firmness and intrepidity.

CHAPPEL, or CHAPEL. See CHAPEL.

CHAPPEL, WILLIAM, in *Biography*, a pious and learned prelate, was born in 1582 at Lexington in Nottinghamshire, and educated at Christ's college, in the university of Cambridge, of which he became fellow in 1607. Having no prospect of advancement, he continued at college and devoted himself to the business of tuition, for which his talents, disposition, and general character peculiarly qualified him. As a disputant he was skilful and formidable; and it is said that

on occasion of an act performed when king James visited the university in 1624, he pushed his respondent, Dr. Roberts of Trinity college, so hard, that, unable to maintain the contest, he fainted away. The king attempted to support him, but without success; upon which he declared himself happy that so respectable a champion was at the same time to good a subject. By the interest of Laud, bishop of London, he was promoted, in 1633, to the deanery of Cashel in Ireland; and to the provostship of Trinity college, Dublin, in 1634. Subservient to the views of government in opposing that puritanical spirit, which very much prevailed in both kingdoms, he conducted himself with that temper and steadiness of discipline which answered the purpose of his appointment; and in recompence of the services which he performed, he was promoted, in 1638, to the bishopricks of Cork, Cloyne, and Ross, and was allowed also to hold his provostship till the year 1642. Approbative, however, of the gathering storm, he wished to exchange his Irish preferments for some small bishopric in England. In 1641, articles of impeachment were exhibited against him before the lords, to which he was unable to give a satisfactory reply; and that his conduct, whatever might be the general tenour of it, was in some degree censurable, we may reasonably presume from the circumstance of his leaving, for his two warm advocates private Ulster and Dr. Mellers, bishop of Meath, and also from his avowed complaisance for his great patrons, Laud and Wentworth. At length he obtained leave to embark for England; but at Tenby, soon after his arrival, he was committed to gaol, on account of his having left Ireland without licence, and detained in custody for seven weeks. His misfortunes were further aggravated by the loss of the ship in which most of his property and his books were embarked. Thus reduced almost to a state of indigence, he retired to his native county; and having afterwards fixed his residence at Derly, he died there in 1649. Although he was a man of acknowledged learning, his publications were few. His "Methodus Concionandi," was printed at London in 1648, 8vo., and an English translation, entitled, "The true Method of preaching," appeared in 1656. His other works were "The Use of Holy Scripture," Lond. 1653, 8vo., and his own life "Vita G. G. H. Chappel," twice printed. Biog. Brit.

CHAPPEL HILL, in *Geography*, a post-town of America, in Orange county, N. Carolina, seated on a branch of Newhope creek, which discharges itself into the N. W. branch of Cape Fear river. This spot has been selected for the seat of the university of North Carolina, which was opened for students in 1796. This town is placed on a beautiful eminence, and commands an extensive prospect of the surrounding country; 12 miles S. by E. of Hillsborough, and 472 S. W. of Philadelphia. N. lat. 35° 40'. W. long. 79° 6'.

CHAPPEES, in *Geography*, a town of France, in the department of the Aube, and district of Bar-Sur-Seine; 10 miles S. E. of Troyes.

CHAPPEES, or CHAPES, in *Military Language*, are barrels that are made use of for covering others filled with powder, the better to preserve it, and to prevent any of it from being lost by passing or finding its way through between the staves of the barrels containing it when they are moved, shaken, or jostled. The name of *chappe* or *chape*, is also given to a plaitering of cement, which is spread all over the vaults of fortifications, bomb-proofs, and magazines, to prevent any moisture or humidity from penetrating. This appellation is likewise given to a composition of earth, horse-dung, and hair, that is employed for covering the mould of a cannon or mortar.

CHAPPOY, in *Geography*, a town of France in the département of Sura; $2\frac{1}{2}$ leagues S. E. of Salins.

CHAPRARAL, a town of South America, in the country of Chili, and jurisdiction of Coquimbo.

CHAPTALIA, in *Botany*, Ventenat. See PERDICUM.

CHAPTER, *Capitulum*, a community of ecclesiastics belonging to a cathedral, or collegiate church.

The chief or head of the chapter, is the dean; the body consists of canons, or prebendaries, &c. See DEAN.

The chapter has now no longer any share in the administration of the diocese, during the life of the bishop; but succeeds to the whole episcopal jurisdiction during the vacancy of the see.

The origin of the chapters is derived from hence, that anciently the bishops had their clergy residing with them in their cathedrals, to assist them in the performance of sacred offices, and the government of the church; and even after parochial settlements were made, there was still a body of clerks who continued with the bishop, and were indeed his family, maintained out of his income. After the monastic life grew into request, many bishops chose monks rather than seculars for their attendants.

These bodies, either of monastics or seculars, then had the same privilege of choosing the bishop, and being his council, which the whole clergy of the diocese had before; but, by degrees, their dependence on the bishop grew less and less; and then they had distinct parcels of the bishop's estate assigned them for their maintenance; till at last, the bishop had little more left than the power of visiting them. On the other hand, these capitular bodies by degrees also lost their privileges; particularly that of choosing the bishop, for which the kings of England had a long struggle with the pope: but at last Henry VIII. got this power vested in the crown; and now the deans and chapters have only the shadow of it.

The same prince likewise expelled the monks from the cathedrals, and placed secular canons in their room; those he thus regulated, are called *deans and chapters of the new foundation*; such are Canterbury, Winchester, Worcester, Ely, Carlisle, Durham, Rochester and Norwich: forch also are the chapters of the four new sees, of Peterborough, Oxford, Gloucester, and Bristol.

CHAPTER is also applied to the assemblies held by religious and military orders, for deliberating on their affairs, and regulating their discipline.

Papias says they are so called, *quod capitula ibi legantur*.

The establishment of general chapters of religious orders is owing to the Cistercians, who held the first in 1116, and were soon followed by the other orders.

CHAPTER is also used for a division of a book; contrived for keeping the matters treated thereon more separate, clear, and distinct.

The ancients were unacquainted with the division of books into chapters and sections. Papias says, the name chapter, *caput*, arose hence, *quod sit altorius sententia caput*, or *quod capiat totam summam*. St. Augustine compares chapters to inns, inasmuch as these refresh the reader, as those the traveller.

The division of the Bible into chapters is attributed by some to Stephen Langton, archbishop of Canterbury, in the reigns of king John and Henry III. But it was really done by Cardinal Hugo, who flourished about the year 1240, the author of the first Scripture concordance, with a view of rendering this work an useful index to the Scripture. See BIBLE and CONCORDANCE. The chapters were again subdivided, not into verses, but by the letters A, B, C, D, E, F, G, placed in the margin at an equal distance from each

other, according to the length of the chapters. In some, all the seven letters were used; in others fewer, as the length of the chapters required. In 1225, Rabbi Nathan, a famous Rabbi among the Western Jews, finished a Concordance to the Hebrew Bible, in the manner of Hugo's above mentioned; and introduced the division of the Hebrew Bible into chapters: he also in proved on his plan, by using the ancient division into verses, and by numbering them, fixing the numerical letters in the margin at every fifth verse. Athias, in his edition of the Bible, 1661 and 1667, introduced the Indian figures, and placed them at every verse. Vatablus published a Latin Bible, in which the same kind of division was adopted; though some say this division and distinction by numbers were first used in R. Stephens's Latin Bible, published at Paris, 1557. R. Stephens made the same division of the chapters of the New Testament into verses, for the sake of a concordance to the Greek Testament, which was printed by his son H. Stephens.

CHAPTERS, *the three*, is a phrase famous in *Ecclesiastical History*, signifying a volume published by Theodoret, an adherent of Nestorius, against St. Cyril; consisting of a letter of Ibas priest of Nedsa, to Maris a bishop of Persia; of extracts from the works of Diodorus of Tarsus, and Theodore of Mopsuestia, wherein the same doctrines were taught, that were contended for by Nestorius; and of two pieces of Theodoret, the one against the council of Ephesus, the other against the anathemas of St. Cyril.

These make the famous three chapters; which were first condemned by an edict of Julianian, A. D. 544. and since by various councils, and many papes.

CHAPTEREL. See IMPOST.

CHAPUZEAU, SAMUEL, in *Biography*, a native of Geneva, who became preceptor to William III. king of England, and afterwards governor of the pages of George, duke of Brunfwick-Lunenbug, in which situation he died "old, blind, and poor," at Zell, in 1701. Of his various works in history, politics, and belles lettres, we shall mention his "Description of Lyons," 1656; "An Account of Savoy;" "L'Europe vivante," or political state of Europe, in 1666; "Present State of the electoral House of Bavaria," 1673; "Le Theatre Francois," 1674; several comedies under the title of "La Muse enjouée, ou le Theatre comique." His arrangement and publication of Tavernier's voyages and travels, first printed in French, 1675, 4to, may be reckoned among his most useful labours. In 1694, he published the plan of an "Historical, Geographical, and Philosophical Dictionary," to which he had devoted 15 years; but it never appeared. He complained that Morel had made great use of his MSS. in compiling his own dictionary. Gen. Biog.

CHAQUILON, in *Geography*, a town of Persia, in the province of Segellan, now in ruins; 90 miles N. E. of Zareng.

CHAR, a town of Arabia; 140 miles N. W. of Mecca. —Also, a river of France, which runs into the Boutoune, near St. Jean d'Angeli.

CHAR, in *Ichthyology*. See SALMO alpinus, or CHARR, or CHARRE.

CHAR de Neptune, in *Natural History*, one of the numerous synonymous names of MADREPORA muricata, which see.

CHAR of lead, denotes the quantity of thirty pigs.

CHARA, in *Astronomy*, the name of one of the CANES venatici.

CHARA, in *Botany*, (supposed to be fancifully derived from *χαρμη*, because, says Professor Martyn, it is the joy or delight of the water; or rather, if it be worth while to add one uncertain conjecture to another, because it delights in water)

ter.) Linn. gen. 56. Schreb. 1797. Juss. 18. Vent. vol. 2. 71. Gart. 528. Cal. and order, *cryptogamia*, *Mon.* Linn. Sp. Pl. *Monandra monogynia*, Linn. Syst. Nat. *Monandra monogynia*, Smith Flor. Brit. Nat. Ord. *Anandale*, Linn. *Najas*, Juss. *Al. 16 Filix*, Vent.

Gen. Ch. Male. *Cal.* none. *Cor.* none. *Stam.* Filament none; anther globular, projecting before the germ, and placed rather beneath it, at the outside of its calyx, one-celled, not opening. Female. *Cal.* Perianth four-leaved; leaflets awl-shaped, unequal, permanent; sometimes none. *Cor.* none. *St.* Germ top-shaped, usually striated; style none; stigma five, simple. *Pist.* Berry ovate-oblong, spirally flattened, one-celled, containing the seeds with in a very slender crust. *Seed.* Very rare, very small, spherical. Schreb.

Ess. Ch. Male. *Cal.* and *Cor.* none; anther beneath the germ, beneath. Fem. Cal. four-leaved. *Cor.* none. *Stigma* five. Whole herb constantly immersed in water.

Obf. Authors are much at variance with respect to the structure of this flower. Haller and Gartner are of opinion, that the yellowish or red globules which are found near the germs, cannot answer the purpose of the anther. "O' what use, inquires the latter author, can be a cellular anther which never opens? What effect can be produced by pollen which is not dispersed, and which, if it were dispersed, is so light and oleaginous, that it cannot remain on the germ, but must instantly rise to the surface of the water? It is therefore sufficiently evident, that these globules are not real anthers; but are either mere air-vessels, designed to enable the plant to float on the water, or abortive germs filled with unimpregnated seeds." See Gart. de fruct. vol. 1. Introduct. p. 74. Dr. Smith acknowledges that as the plant flowers under water, there can be no wonder if the nature of its anther and pollen be obscure; but he has not a doubt with respect to the part in question being a proper anther, and recommends to farther inquiry the opinion of the very able Mr. Correa, who thinks that the impregnation may be performed within the fruit, by a chundelic communication between the anther and germs, and that the five leaves which crown the germs, are not (as has been supposed) the stigma, but the tips of a five-leaved calyx closely enfolding that part in a spiral manner. The analogy of Hippuris, to which this genus is nearly allied, induces him, also, to conceive that the flower is really a naked one, and that the four leaflets which have been thought to constitute the calyx of the female flower, and which are sometimes wanting, are no other than proper leaflets of the plant. Under this persuasion he has removed the genus to *Monandra Monogynia*, with the following essential character: Cal. none. Cor. none. Anther sessile. Style none. Berry with many seeds. See Eng. Bot. 379, and Flor. Brit. vol. 1. p. 4. Gartner calls the fruit a one-celled, many seeded nut; and accordingly thus describes that of the most common species. "Panicarp, a nut clothed with a membranous integument, which never splits or separates spontaneously from the nut; shell ovate-globular, erucicaceous, brittle, rather thick considering the size of the nut. *Seed.* bedded in a pale, friable, herbaceous fleshy substance, which fills the whole cavity of the nut." But from this description the fruit is properly a berry.

Sp. 1. *C. vulgaris*, Linn. Sp. Pl. 2. Lam. 1. Mart. 2. Hedwig Theor. tab. 32, 33. Eng. Bot. tab. 336. Lam. Ill. Pl. 742. fig. 1. (*Equisetum tetradium* fide aqua repens; Bauh. Prodr. 45. Ger. emen. 1115.) "Stem without prickles, striated; leaves awl-shaped, jointed." Whole herb tetrad, brittle. *Stem* a foot long, thread-shaped, twisted. *Leaves* about eight in a whorl, erect-spreading, acute, compound, channelled above, bearing the flowers. *Anther* naked, sessile, depressed, fleshy,

in its decay cracking into chinks. *Corm* surrounded by four leaflets adjoining to the anther, egg-shaped, five toothed at the tip. *Berry* with a thickish bark. This, in common with the other species, is often clothed with a greyish gritty matter, which has been supposed to consist of the part of the plant, but is rather more to be an idiosyncrasy secretion of cal areas, which deposited from the water, which is never found on plants growing in clean spots or very pure grounds. The plant in its natural state is smooth and of a light green colour, and is the *C. vulgare* of Dr. Smith, and the *Chara minor* caudata & *Chara tenuifolia* of Ray's Synopli. The *Chara* in 2000. *Bata* was derived from a specimen covered with the same as above. 2. *C. flexilis*, Linn. Sp. Pl. 2. Lam. 2. Mart. 3. Eng. Bot. Pl. 467. Lam. Id. Pl. 7. Ed. 3. (*Equisetum* 4. Hippuris multifida; Puk. Min. 179. 180. 5.) "Prickles on the stem capillary, crowded." Linn. "Stem and leaves spinous-lipped." Linn. "Stem narrow, leaves awl-shaped, jointed; leaflets which are prickles on the stem flattened, and defflexed." Dr. Smith. Habit of the former, but larger; with a *stem* often five times as thick, rather firm, wood firm, prickly chiefly on the upper part. *Flowers* smaller than those of *C. vulgaris*. 3. *C. tenuifolia*, Linn. Sp. Pl. 1. (*Equisetum fragile*; Morl. Min. 1. tab. 29. fig. 4. F. S. Hippuris lacustris; Puk. alio. tab. 2. fig. 2.) "Prickles on the stem egg-shaped." The English names which have been referred to this species by Hudson, Watering, and Schimper, are supposed by Dr. Smith to be only a variety of the preceding. We have specimens now before us, gathered many years since in the outlet of Malham farm, in the Craven district of Yorkshire, which appear to us to be the *C. tenuifolia* of Linnaeus, but the plant is so masked by its calcareous crust, that we will not venture to pronounce it specifically distinct from *C. hispida*. 4. *C. flexilis*, Linn. Sp. 4. Lam. 4. Mart. 4. Eng. Bot. tab. 1070. minor. Lam. Ill. Pl. 742. fig. 2. major. "Joints of the stem without prickles, the spines, broader upwards." Linn. "Without prickles, etc., transparent; leaves cylindrical, obtuse, somewhat mucronate." Dr. Smith. Whole plant smooth, not striated. There are two varieties figured by Vaillant (Act. Paris. 1717. tab. 3. fig. 8, 9.) one larger and the other smaller. Specimens of both are before us, both gathered, we believe, in some part of Yorkshire; and it appears to us that Linnaeus formed his specific character from the former; Dr. Smith his, from the latter. All the species are annual, and grow in ponds and flow ditches, flowering in July and August.

CHARABASA, in *Ancient Geography*, a town in Africa Propia, according to Ptolemy.

CHARADAUN, or TSIERIBON, in *Geography*, a seaport town on the north coast of the island of Java, situated in a country which produces abundance of rice, sugar, coffee, pepper, cotton, &c. which is purchased by the Dutch at a low price: about 130 miles east of Batavia. N. lat. 6° 5'. E. long. 105° 4'.

CHARABE, or CARABE, is sometimes used for *ambur*, (which see); as also for the juice of the poplar-tree.

CHARABEY, in *Geography*, a town of Persia, in the province of Mazanderan; 50 miles W. of Asterabat.

CHARACENE, in *Ancient Geography*, a country of Asia, being the southern district of Sittacia. According to Ptolemy, it was the territory of the town of *Charax*, which see.

CHARACENI, a denomination given by Flavius to the inhabitants of Charax, on the southern coast of the Tauric Cherfonesus.

CHARACINA, a small country of Asia in Cilicia, in which Ptolemy places the town of Flaviopolis.

CHARAC-

CHARACITANI, in *Ancient Geography*, a people of Spain, plac'd by Plutarch in the Tarragonese district. He adds, that they inhabited deep caverns, near the Tagus, into which they retired when they were pillaged by their neighbours.

CHARACOMA, a town of Laconia, situated on the road that passes from Arcadia to Sparta, and to the north of that city.

CHARACOMA, a name given by Ptolemy to a town of Arabia Petraea. Some have denominated it *Characomba*.

CHARACTER, in a general s'ense, signifies a mark or figure, drawn on paper, metal, stone, or other matter, with a pen, graver, chisel, or other instrument, to signify, or denote any thing. The word is χαρακτες; formed from the verb χαρασσω, *insculpere, to engrave, impress, &c.*

The various kinds of characters may be reduced to three heads, viz. *literal characters, numeral characters, and abbreviations.*

CHARACTER, literal, is a letter of the alphabet, serving to indicate some articulate sound, expressive of some idea, or conception of the mind. See **ALPHABET**.

These may be divided, with regard to their nature and use, into *nominal, real, and emblematical.* *Nominal characters* are those we properly call *letters*; which serve to express the names of things. See **LETTER**.

Real characters are those that, instead of names, express things and ideas. *Emblematical, or symbolical characters*, have this in common with real ones, that they express the things themselves; but they also have this further, that they in some measure personate them, and exhibit their form: such are the hieroglyphics of the ancient Egyptians. See **HIROGLYPHIC**.

CHARACTERS, literal, may be again divided, with regard to their invention and use, into *particular and general, or universal.*

Particular characters, are those peculiar to this or that nation; or that have been so: such are the Roman, Italic, Greek, Hebrew, Arabic, Gothic, Chinese, &c. characters. See each of these articles.

Universal characters, are also *real characters*, and make what some authors call a *philosophical language*.

The diversity of characters used by the several nations to express the same idea, is found the chief obstacle to the advancement of learning: to remove this, several authors have taken occasion to propose plans of characters that should be universal, and which each people should read in their own language. The character here is to be real, not nominal; to express things and notions; not, as the common ones do, letters, or sounds: yet, to be mute, like letters, and arbitrary; not emblematical, like hieroglyphics.

Thus, the people of every nation should retain their own language, yet every one understand that of each other, without learning it; only by seeing a real or universal character, which should signify the same thing to all people; by what sounds soever each expressed it in their particular idiom.

For instance, by seeing the character destined to signify to drink, an Englishman should read to *drink*; a Frenchman, *boire*; Latin, *bibere*; a Greek, *πιωω*; a Jew, *חָמַם*; a German, *trinken*; and so of the rest: in the same manner as seeing a horse, each people express it after their own manner; but all mean the same animal. This real character is no chimera; the Chinese and Japanese have already something like it. They have a common character which each of those nations understand alike in their several languages; though they pronounce it with such different sounds, that

they do not understand a tittle of the speech of one another.

The first, and most considerable attempts for a real character, or philosophical language, in Europe, are those of bishop Wilkins, and Dalgarnie: but these, with how much art soever they were contriv'd, have yet proved ineffectual.

M. Leibnitz had some thoughts the same way: he thinks those great men did not adopt the right method; and adds, it was probable, indeed, that, by this means, people, who do not understand one another, might easily have a commerce together; but that they have not fixed on true real characters.

According to him, the characters should resemble those used in algebra: which, in effect, are very simple, yet very expressive; without any thing superfluous or equivocal; and contain all the varieties required.

The real character of bishop Wilkins has its just applause: Dr. Hook recommends it, on his own knowledge and experience, as a most excellent scheme; and, to engage the world to the study of it, published some fine inventions of his own relating to it. See **LANGUAGE**.

M. Leibnitz tells us, he had under consideration an *alphabet of human thoughts*; in order to a new philosophical language, on his own scheme; but his death prevented this from being brought to maturity.

M. Lodwick, in the Philosophical Transactions, gives us a plan of an *universal alphabet*, or character of another kind: this was to contain an enumeration of all such single sounds, or letters, as are used in any language; by means whereof people should be enabled to pronounce truly and readily any language; to describe the pronunciation of any language that should be pronounced in their hearing; so that others accustomed to this language, though they had never heard the language pronounced, should at first be able truly to pronounce it: and, lastly, this character is intended to serve as a standard to perpetuate the sounds of any language. *Abridgm. vol. iii. p. 373.*

In the Journal Litteraire, an. 1720, we have a very ingenious project for an universal character: the author, after obviating the objections that might be made against the feasibility of such schemes in the general, proposes his own: his characters are to be the common Arabic, or numeral figures. The combinations of these nine are sufficient to express distinctly an incredible quantity of numbers, much more than we shall need terms to signify our actions, goods, evils, duties, passions, &c. Thus is all the trouble of framing and learning any new characters at once prevented; the Arabic figures having already all the universality required.

The advantages are immense: for, 1. We have here a stable, faithful interpreter; never to be corrupted or changed, as the popular languages continually are. 2. Whereas the difficulty of pronouncing a foreign language is such as usually gives the learner the greatest trouble, and there are even some sounds which foreigners never attain to; in the character here proposed, this difficulty has no place: every nation is to pronounce them according to the particular pronunciation that already obtains among them. All the difficulty is, the accustoming of the pen and the eye to affix certain notions to characters that do not, at first sight, exhibit them. But this trouble is no more than we find in the study of any language whatever.

The inflexions of words are here to be expressed by the common letters: for instance, the same character shall express a *jilly* or a *colt*, a *horse* or a *mare*, an *old horse* or an *old mare*, as accompanied with this or that distinctive letter, which shall shew the sex, youth, maturity, or old age: a letter is

also to express the bigness or size of things: thus, v. g. a man with this or that letter, to signify a *great man*, or a *little man*, &c.

The use of these letters belongs to the grammar, which, when once well understood, would abridge the vocabulary exceedingly. An advantage of this grammar is, that it would only have one declension, and one conjugation: those numerous anomalies of grammarians are exceeding troublesome, and arise hence, that the common languages are governed by the populace, who never reason on what is best: but in the character here proposed, men of sense introducing it, would have a new ground whereon to build regularly.

The difficulty, however, is not in inventing the most simple, easy, and commodious character, but in engaging the several nations to use it; there being nothing they agree less in than the understanding, and pursuing of their common interest. The consideration of an universal language, with respect to the mode of its formation, as well as its advantages and practicability, will be resumed under the article LANGUAGE.

CHARACTERS, *literal*, may be again divided, with respect to the nations among whom they have been invented, and used, into *Greek characters*, *Roman characters*, *Hebrew characters*, &c.

The character now ordinarily used throughout Europe, is the *Latin character* of the ancients, which was formed from the Greek, and that from the Phœnician, which Cadmus brought into Greece.

The Phœnician character was the same with that of the ancient Hebrew, which subsisted to the time of the Babylonish captivity; after which they used that of the Assyrians, which is the square Hebrew, now in use; the ancient being only found on some Hebrew medals, commonly called "Samaritan Medals."

Potellus and others shew that, beside the Phœnician, the Chaldee, Syriac, and Arabic characters were likewise formed from the ancient Hebrew.

The French were the first who, with the Latin of St. Gregory, admitted the Latin characters. And in a provincial synod, held in 1091, at Leon in Spain, the use of the Gothic characters invented by Ulilas was abolished, and the Latin ones established.

Medallists observe, that the Greek character, consisting only of majuscule letters, has preserved its uniformity on all medals as low as the times of Gallienus; there being no alteration found in the turn of the character, notwithstanding the many considerable ones both in the use and pronunciation. From the time of Gallienus, it appears somewhat weaker and rounder: from the time of Constantine to Michael, the space of 500 years, we find only Latin characters; and after Michael, the Greek characters recommence, but from that time they began to alter with the language, which was then a mixture of Greek and Latin.

The Latin medals preserve both their character and language as low as the translation of the seat of the empire to Constantinople. Towards the time of Decius, the character began to alter, and to lose of its roundness and beauty: some time after it retrieved itself, and subsisted tolerably till the time of Justin; when it fell into the last barbarity mentioned under Michael; though it afterwards grew worse, and degenerated into the Gothic: so that the rounder and better formed the character is on a medal, the greater pretence it has to antiquity.

CHARACTERS, *numeral*, are those used to express numbers. *Numeral Characters* are either *letters*, or *figures*, otherwise called *digits*. The kinds now chiefly in use, are the Common and the Roman: to which may be added the Greek,

and another called the French character; as also the letters of other alphabets which have been made use of to express numbers. The common character is that ordinarily called the *Arabic*, as supposed to have been invented by the Arab astronomers; though the Arabs themselves call it the *Indian character*; as if they had borrowed it from the people of India.

The *Arabic characters* are ten, viz. 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; the last is called *cipher*.

The Arabic character is used almost throughout Europe, and that on almost all occasions; in commerce, in measuring, in astronomical calculations, &c.

The *Roman character*, consists of the majuscule letters of the Roman alphabet: whence probably its name: or, perhaps, from its being used by the ancient Romans on their coins, and in the inscriptions of their public monuments, erected in honour of their gods and great men; on their sepulchres, &c.

The numeral letters that compose the Roman character are in number seven, viz. I, V, X, L, C, D, M. The I denotes one, V five, X ten, L fifty, C a hundred, D five hundred, and M a thousand. The I, repeated twice, makes two, II; thrice, three, III; four is expressed thus, IV, I before V or X, taking an unit from the number expressed by each of those letters. To express six, an I is added to a V, VI; for seven, two, VII; and for eight, three, VIII: nine is expressed by an I before X, IX; agreeably to the preceding remark.

The like remark may be made of the X before L or C, except that the diminution is by tens, not units: thus, XL signifies forty, and XC, ninety; an L followed with an X, sixty, LX, &c. The C before D or M, diminishes each by a hundred.

Besides the letter D, which expresses five hundred, that number may also be expressed by an I before a C inverted, thus, ID; and thus, in lieu of the M, which signifies a thousand, is sometimes used an I between two C's, the one direct, the other inverted: agreeable to this, six hundred may be expressed IDC; and seven hundred, IDCC, &c.

The addition of C and D before, or after, raises CIO by tens, thus, CCICD, 10000; CCCICD, 100,000, &c.

This is the common way of notation, formerly used by the Romans; who also expressed any number of thousands by a line drawn over any numeral less than a thousand; e. g. \overline{V} , 5000; \overline{LX} , 60,000: so likewise \overline{M} is 1,000,000; \overline{MM} is 2,000,000, &c.

Besides which, (I.) certain liberties or variations have been admitted, at least by some modern writers; e. g. IIX, 8; IICIX, 9. (II.) And certain characters have been used, which seem to have been derived from the letters; e. g. M, by which they express (Mille) 1000, was formed from CXD, or CID; half of which, viz. ID, stood for 500. (III.) And for the easier writing of these characters, 1. ID seems to have been altered into D; 2. IDC into Δ , or ∇ ; 3. CID into ∞ or \times ; whence Ψ Υ , 1000; Ψ Ψ , 200, V. X.

In Roman inscriptions, we meet with the characters \textcircled{D} and $\textcircled{\infty}$, used to express a thousand. The usual note of a thousand, is either I between two CC's (direct and reversed) thus, CIO; or else X, thus, CXD. The former figure, when closed at top, exactly resembles an ancient M, thus, \textcircled{D} ; and the latter, when shut up, the figure of 8, inclined thus $\textcircled{\infty}$.

We also find in some inscriptions, the character $\textcircled{\times}$, which is X between two C's, but closed on all sides. But the learned Dr. Taylor seems to suspect the accuracy of the copy

CHARACTERS.

copy of the inscription from whence this character is taken. See Phil. Trans. N^o 482. § 2.

As to the origin and use of the character X, so often met with on the coins, utensils, and manuscripts of the ancients; see X.

Greek numerals. The Greeks had three ways of expressing numbers. (I.) The most simple was, for every single letter, according to its place in the alphabet, to denote a number from α 1 to ω 24; in which manner the books of Homer's Iliad are distinguished. (II.) Another way was by dividing the alphabet into, (1.) 8 Units: α 1, β 2, &c. (2.) 8 Tens: ρ 10, κ 20, &c. (3.) 8 Hundreds: ϕ 100, σ 200, &c. N. B. Thousands they expressed by a point, or accent under a letter, e. g. ϕ 1000. β 2000, &c. (III.) A third way was by six capital letters, thus, I [ι z for $\mu\alpha\zeta$] 1, II [$\omega\pi\tau\iota$] 5, Δ [$\delta\epsilon\kappa\alpha$] 10, H [$\eta\epsilon\kappa\alpha\tau\omega\tau$] 100, X [$\chi\iota\lambda\iota\alpha\zeta$] 1000, M [$\mu\alpha\lambda\iota\sigma\tau\alpha$] 10000; and when the letter II inclosed any of these, except I, it shewed the inclosed letter to be five times its own value, as [Δ] 50, [Π] 500, [χ] 5000, [M] 50000.

N. B. 6,50,900 are expressed by the character π .

Hebrew numerals. The Hebrew alphabet was divided into 9 units: \aleph 1, \beth 2, &c.—9 tens: \aleph 10, \beth 20, &c.—9 hundreds: \aleph 100, \beth 200, &c. \aleph 500, \beth 600, γ 700, δ 800. ζ 900.—Thousands were denoted, 1. By two points, or acute accents, marked above the letters, which, without such points, would express unities; e. g. \aleph or \aleph 1000, \beth 2000, γ 4000, δ 10,000, ζ 100,000. 2. By the letter \aleph with two points marked above it, which letter \aleph is an abbreviation of the word \aleph or \aleph , signifying one thousand or thousands, to which other letters were prefixed, expressing the number of thousands at pleasure: e. g. \aleph 1000, \beth 2000, γ 4000, δ 10,000, ζ 100,000. From these complete or round numbers, if they may be so called, they formed compound numbers, as in the following table:

\aleph	11	\aleph	110
\beth	12	\beth	134
γ	13	γ	348
δ	14	δ	652
ζ	25	ζ	868
η	36	η	987
θ	47	θ	1001
ι	58	ι	1071
κ	69	κ	1162
λ	72	λ	4004
μ	84	μ	10007,4
ν	96	ν	64008
ξ	101	ξ	1727

It is to be observed, that the number 15 was never expressed by \aleph , according to the above mode of notation, \aleph signifying 10, and \beth 5, because they reckoned it indecorous to use one of the names of the deity for a number; but they denoted 15 by \beth : \beth being 6 and \aleph 9, the sum of which is 15. For the same reason, γ 9 and 7 is used instead of \beth 10 and 6, to express 16.

The 22 Hebrew letters express numbers as far as 400; and the 5 remaining hundreds, under one thousand, are expressed

by different forms of 5 of the letters, which seem to have been invented on purpose to express them.

It has been above observed, that five letters of different forms, called the final letters, were invented in order to assist or complete the Hebrew numeration. This scarcely admits of a doubt, when it is considered, that as 5, and only 5, of the several hundreds wanted each a single letter, and as 5, and only 5, of these different forms were invented; therefore these forms were invented to express those remaining hundreds. The different forms of these 5 letters have been used at the end of words, perhaps, ever since their first invention. It is therefore probable, that if we could fix the age of these final letters, we might then fix the time, when the Bible numbers were expressed by single letters. These finals are not known to the Samaritans, and as they are not at all wanted to express words, and yet are used in the Bible, we may hence conclude, that they were first introduced into the Bible for the purpose of numbers. This is the use made of them by the Jews in their own writings; and indeed they are admitted, even now, into the Jewish Commentaries, as printed with the Hebrew text. See H. S. Jarchi on Gen. xxv. 8. As the age of these finals tends to fix the age of these numeral letters; it may be observed, that the final Mem is mentioned in the Talmud of Babylon; and that the authors of both Talmuds speak of the five finals as of great antiquity, even in their time. St. Jerom also, in his preface to the book of Kings, mentions the finals as equally in use with the 22 letters; and as his Hebrew MSS. might be 200 years old, if the finals were in his MSS. it follows, that they must have been used soon after the time of Christ. If, therefore, we may infer from Jerom, that the finals were used in the Hebrew MSS. at the latest, about 200 years after Christ, we may infer from the Greek version, that they were not used in the Hebrew MSS. till about 100 years before Christ. Dr. Hody tells us, that the book of Jeremiah was translated into Greek about 130 or 140 years before Christ, and from this version of Jeremiah, (ch. xxxviii. 8.) it seems clear that the finals were not then in the Hebrew text. For in that verse the 7 letters \aleph \beth γ (which are here 2 words, and properly signify $\epsilon\upsilon$ $\alpha\upsilon\tau\eta\iota\varsigma$ $\tau\upsilon\zeta$ $\lambda\omicron\varsigma$) are rendered in all the copies of the Greek version $\epsilon\upsilon$ $\tau\omicron\zeta\eta$. But such a rendering, being the proper Greek of \beth γ , which is one word only, shews that the \beth was not then (\beth) mem final; since the final would have divided the letters into two words, and prevented such a wrong translation. Dr. Kennicott has applied these observations to the purpose of accounting for the corruption of the Hebrew text in its numeral letters. See his second dissertation on the state of the printed Hebrew text, &c. p. 212.

CHARACTER, French, so called, because invented, and chiefly used by the French, is more usually denoted, *character of account, or finance.*

It consists of six figures; partly taken from the letters of the usual current hand, and partly invented by the contriver; the six characters are j , b , s , L , C , γ . The j consonant standing for one, the b for five, the s for ten, the L for fifty, the C for a hundred, and the last character γ for a thousand.

This character is only an imitation of the Roman character; and in its use in most respects the same, particularly in what relates to the combination of certain letters, which placed before or after others, diminish or increase their value. Indeed it has these things peculiar in it, that when several things occur successively, only the last is expressed. adly, That sixty, and the following numbers to one hundred,

are expressed, thus, jjj^{xxx} , ninety; jjj^{xxx} , ninety one; jjj^{xxx} , &c.

It is principally used in the chambers of accounts, in the accounts given in by treasurers, receivers, farmers, and other persons concerned in the management of the revenue.

CHARACTERS, in *Printing*, denote the letters or types, by the various arrangement whereof are composed forms; whence impressions are taken, by means of a press, on paper. For the method of casting these *Characters*, see *Letter Foundry*. For other characters in *Printing*, see *CORRECTION*.

CHARACTER, is also used in several of the arts, for a symbol, contrived for a more concise, immediate, and artful conveyance of the knowledge of things.

In this sense of the word, Paulus Diaconus refers the invention of characters to Eunius: who, he says, contrived the first eleven hundred. To these were many more added by Tyro, Cicero's freedman, and by Philagyrus, Faunius, and Aquila, freedmen of Mæcenas.

Lastly, L. Annæus Seneca made a collection of them, reduced them into order, and increased their number to five thousand. Tyro's notes may be seen at the end of Gruter's inscriptions.

Valerius Probus, a grammarian, in the time of Nero, laboured to good purpose in explaining the notes of the ancients. P. Diaconus wrote an ample treatise of the explication of the characters in law, under the reign of the emperor Conrad I.; and Goltzius another for those of medals.

Characters, or symbols, are now chiefly affected in the several parts of mathematics; particularly in algebra, geometry, trigonometry, and astronomy: as also in medicine, chemistry, music, &c. The principal of each kind we shall here subjoin.

CHARACTERS used in *Arithmetic and Algebra*.

a, b, c , and d , the first letters of the alphabet, are the signs or characters that denote given quantities; and x, y, z , &c. the last letters, are the characters of quantities sought. Some for the former, use consonants, or large letters; and vowels, or small ones, for the latter.

Stifelius first used the capitals A, B, C, &c. for the quantities, unknown or required. Afterwards, Vieta used the capital vowels A, E, I, O, U, Y, for quantities, unknown or required, and the consonants B, C, D, &c. for known or given numbers. Harriot changed Vieta's capitals into the small letters a, e, i, o, u , for unknown, and b, c, d , &c. for known quantities. And Des Cartes changed Harriot's vowels for the latter letters x, y, z , &c. and the consonants for the first letters, a, b, c, d , &c.

Note, Equal quantities are denoted by the same character.

For the method of expressing the powers of quantities. See ALGEBRA.

m, n, r, s, t , &c. are characters of indeterminate exponents, both of ratios and powers: thus x^m, y^n, z^r , &c. denote indeterminate powers of different kinds; $m x, n y, r z$, different multiples, or submultiples of the quantities x, y, z , according as m, n, r , are either whole numbers or fractions.

+ the sign of addition, is called the *affirmative*, or *positive* sign, and is read *plus*, or *more*; thus $9 + 3$, is read *9 plus 3*; or *9 more 3*: that is, the sum of 9 and 3, equal to 12.

When this character is set before any single quantity, it denotes that it is an affirmative or positive quantity; when it is set between two or more quantities, it denotes their sum, shewing that the latter are to be added to the former. It is not easy to ascertain when, or by whom, this sign was first introduced; but we owe it probably to the Germans,

and it seems to have been first used by Stifelius in his arithmetic printed in 1544. The early writers on algebra used the word *plus* in Latin, or *piu* in Italian, for addition; as they used *minus*, or *meno*, or merely the initial m , for subtraction: and thus these operations were denoted in Italy by Lucas de Burgo, Tartalea, and Cardan, while the signs + and — were employed much about the time in Germany by Stifelius, Scheubelius, and others, for the same operations.

— Before a single quantity, shews the quantity to which it is prefixed to be a negative quantity.

Between quantities, it is also the sign of subtraction, and is read *minus*, or *less*; thus $14 - 2$, is read *14 minus*, or abating 2; that is, the remainder of 14, after 2 has been subtracted, viz. 12. This sign first occurs in Stifelius.

= Is the sign of equality: thus, $9 + 3 = 14 - 2$; signifies 9 plus 3, to be equal to 14 minus 2.

This character was used by Robert Recorde, and after him by Harriot: Des Cartes in lieu of it uses \propto .

Wolffius, and some other authors, use the same character, \equiv , for the identity of ratios; or to denote the terms to be in a geometrical proportion; which most authors express thus ::

\times Is the sign of multiplication, denoting the quantities on either side to be multiplied into one another, and was introduced by Oughtred; thus, 4×6 , is read 4 multiplied by 6; or the factum, or product of 4 and 6 = 24; or the rectangle between 4 and 6.

Ordinarily, however, in algebra, the sign is omitted, and the two quantities put together: thus $b d$ expresses the product of the two numbers denoted by b and d , which suppose 2 and 4, the product whereof is 8, signified by $b d$.

Wolffius, and others, make the sign of multiplication a dot (.) between the two factors: thus $6 \cdot 2$ signifies the product of 6 and 2 = 12.

Where one or both the factors are compounded of several letters, they are distinguished by a line drawn over them: thus, the factum of $a + b - c$ into d , is wrote $d \times a + b - c$.

Guido Grandio, and after him Leibnitz, Wolffius, and others, to avoid the perplexity of lines, in lieu thereof distinguish the compound factors, by including them in a parenthesis, thus $(a + b - c) d$.

The parenthesis (), as a vinculum, was invented by Albert Girard, and used in such expressions as these $\sqrt[3]{72 + \sqrt{5120}}$, and $B(bq + Cq)$, both for universal roots, and multiplication, &c. The straight-lined vinculum — was used by Vieta for the same purpose: thus $\overline{A} - \overline{B}$ in $\overline{B} + \overline{C}$.

\div Is the character of division, and was introduced by Dr. Pell: thus, $a \div b$ denotes the quantity a to be divided by b .

Indeed, ordinarily, in algebra, the quotient is expressed fraction-wise; thus, $\frac{a}{b}$ denotes the quotient of a divided by b .

Wolffius, &c. make the sign of division ($:$) thus, $8 : 4$ denotes the quotient of 8 divided by 4 = 2.

If either the divisor or dividend, or both, be composed of several letters, v. g. $a + b$, divided by c ; instead of writing the quotient fraction-wise, thus, $\frac{a + b}{c}$, Wolffius, &c. include the compound quantities in a parenthesis; thus, $(a + b) : c$, or $(a + b) \div c$.

\otimes Is the character of *involution*, or of producing the square of any quantity, by multiplying it by itself.

CHARACTERS.

↳ *The character of evolution*, or of extracting the roots out of the several powers, the reverse of ☉. Both these characters were used by Dr. Pell.

7 Is the sign of *majority*, or of the excess of one quantity beyond another: some use this ☐, or this 7.

∠ Is the sign of *minority*. These two characters were first introduced by Harriot, and have been since used by Wallis and Lamy. Other authors use others; some this ☐.

∞ The sign of *similitude*, commended in the Miscellanea Berolinensia, and used by Leibnitz, Wolius, and others; though the generality of authors use none.

The same character is used by other authors for the difference between two quantities, while it is yet unknown which is the greater. It was introduced for this purpose of denoting a general difference by Dr. Wallis.

√ Is the character of radicality, and shows that the root of the quantity, to which it is prefixed, is extracted, or to be extracted: thus $\sqrt{25}$, or $\sqrt[3]{25}$, denotes the square root of 25, viz. 5; and $\sqrt[3]{25}$, the cube root of 25. This sign is derived from the initial R or r of radix or root, which was used at first by Pacioli, Cardan, &c. The character √ seems to have been first used by Stifelius in 1544, and by Robert Recorde in 1557. At first they used the initial of the name after it, to denote the several roots: as √g the quadrate or square root, and √c the cubic root. But the numeral indices of the root were prefixed by Albert Girard, just as they are now used, viz. √, √, √, the 2d, 3d, or 4th root. See Root.

This character sometimes affects several quantities distinguished by a line drawn over them, thus, $\sqrt{b + d}$, denotes the square root of the sum of *b* and *d*.

Wolffius, &c. in lieu hereof, includes the roots composed of several quantities in a parenthesis, adding its index: thus, $(a + b - c)^2$ denotes the square of $a + b - c$, ordinarily written $a + b - c^2$.

∴ Is the character of arithmetical proportion disjunct; thus, 7 . 3 : 13 . 9, intimates 3 to be exceeded by 7; as much as 9 by 13; viz. by 4.

∴ This is the character of identity of ratio, and geometrical proportion disjunct; thus, 8 : 4 :: 30 : 15, expresses the ratio of 30 to 15, to be the same with that of 8 to 4; or that the four terms are in geometrical proportion, viz. 8 to 4, as 30 to 15. This character was introduced by Oughtred.

Wolffius, in lieu hereof, uses the character of equality =; which he prefers to the former, as being more scientific and expressive.

∴ The character of geometrical proportion continued, implying the ratio to be carried on without interruption: thus, 2, 4, 8, 16, 32, ∴ are in the same uninterrupted proportion. This mark was introduced by Oughtred.

When one or more terms in an equation are wanting, their places are usually marked with one or more asterisks;

$$as, y^2 + py + \frac{1}{2}p^2 \left. \vphantom{as} \right\} = 0. y^2 * - \frac{1}{2}p^2 + q = 0. \text{ See } \\ - py + q \left. \vphantom{as} \right\}$$

ALGEBRA and ARITHMETIC.

CHARACTER of Decimals. See SEPARATRIX.

CHARACTERS used in Astronomy.

- ♃ Herschel, or Georgian planet.
- ♃ Venus.
- ♄ Saturn.
- ♃ Mercury.
- ♃ The Sun.
- ♃ Jupiter.
- ♃ The Moon.
- ♃ Mars.
- ♁ The Earth, or 3.

- ♈ Aries.
- ♉ Taurus.
- ♊ Gemini.
- ♋ Cancer.
- ♌ Leo.
- ♍ Virgo.
- ♎ Libra.
- ♏ Scorpio.
- ♐ Sagittarius.
- ♑ Capricornus.
- ♒ Aquarius.
- ♓ Pisces.

The characters for the Sun, Moon, Mars, Mercury, Jupiter, Venus, and Saturn, are used to denote the days of the week, viz. Sunday, Monday, &c.

With regard to the mythological signification of these characters, we may observe, that antiquaries and astrologers, according to whose opinion the planets were first distinguished by them, considered them as the attributes of the deities of the same name. The circle, in the earliest periods, among the Egyptians, was the symbol of divinity and perfection, and seems with great propriety to have been chosen by them as the character of the sun; especially as, when surrounded by small strokes projecting from its circumference, it may form some representation of the emission of rays. Some have thought, however, that the character of the sun, ☉, is the picture of a buckler; the middle point of which represents the umbo or boss; and it is observed, that the bucklers of the ancients used to be bright, in order to dazzle the eyes of their enemies, (vid. Plautum, art. i. fe. 1.) Hyde, (de Rel. Vet. Perf. p. 106.) informs us, that the Persians often call the sun by a word which signifies a buckler; and in MSS. the character is often a buckler, seen in a side view; often a cone, which was sacred to the sun, (Porphy. ap. Euseb. Præp. Evang. p. 68.) A circle is mentioned as an Egyptian character of the sun, by Clemens of Alexandria, (Strom. l. v. p. 657. ed. Potteri.) The semicircle is, in like manner, the image of the moon, the only one of the heavenly bodies that appears under that form to the naked eye; and accordingly it is thus mentioned by Clemens, (ubi supra.) As to the characters of the planets, the common opinion is, that they were taken from the symbols of those deities whose names they bear: thus, the character of Mercury ☿ is his caduceus or wand, with serpents twining round it; that of Venus ♀, a looking-glass, with a handle; that of Mars ♂, a lance and buckler; that of Jupiter ♃, his thunderbolt; or, as others more generally agree, the first letter Z of his name in Greek, with a stroke through it, as a mark of abbreviation; and that of Saturn ♄, a sickle or scythe. (Riccioli, Almag. vii. c. 1. voi. x. p. 480.) Salmassius, (Plin. Exercit. p. 1237.) supposes, that all the characters are the initial letters of the Greek names of the planets. Kircher, somewhat fancifully, (Œdip. Egypt. t. ii. pars 2. p. 402.) compounds the characters of the planets out of ☉ and ♀, a cross +, the mark used for the four elements, and ♁, the character of Aries, which, he says, denotes fruitfulness.

CHARACTERS of the Aspects, Nodes, &c.

- S or ♀ Conjunction. Bq Biquintile.
- SS Semisextile. Vc Quincunx.
- * Sextile. * Opposition.
- Q Quintile. ☿ Scorpiou's head, or ascending node.

- Td Tridiecle.
- Δ Trine.

CHARACTERS of Time.

A. M. (*ante meridiem*) or M. morning.

O. or M. noon.

P. M. (*post meridiem*) or A. afternoon.

CHARACTERS, Chemical. The reasons that have chiefly led

CHARACTERS.

led to the invention and use of chemical characters, are the two following; namely, their conciseness, and the facility which they afford of concealing from the uninitiated the knowledge of valuable or curious facts. The latter reason is that by which the ancient chemists were for the most part influenced; the former is that which has induced some modern chemists to their adoption.

In the early ages of chemistry, or rather of alchemy, this science was intimately connected with astrology; and, being cultivated chiefly by the Alexandrian Greeks, and the Saracens after their conquest of Egypt, it is no wonder (especially when the supposed importance of the study is taken into consideration) that hieroglyphics should be adopted, to express both the substances of experiment, and the processes to which they were subject.

The extensive destruction of chemical books in Egypt, by order of Dioclesian, and the combustion of the Alexandrian library by the Arabs, in all probability occasioned the loss of many curious facts and processes, and the characters in which they were recorded: the utter incomprehensibility also of many of the early manuscripts on these subjects that are yet extant, (especially those written in Greek or Arabic), has considerably diminished the number of characters which it is at all worth while to be at the trouble of representing.

In the table of ancient chemical characters, *Plate Chemistry*, are comprehended all that are to be found in the printed works of chemists, from the time of Roger Bacon to Bergman. It is obvious, even on a cursory inspection, that some of these are borrowed from the science of astronomy; that others are mere arbitrary signs; and that others are rude types or hieroglyphics: the whole being destitute of any uniform system, and very little applicable to the use of chemistry, after it had assumed a scientific form.

Bergman, being aware of the uselessness of the old signs, has rejected all except those employed to denote chemical substances: to these he has added others to represent those bodies which were unknown to the older chemists; and has formed the whole into a system, capable of expressing in a tabular form, with brevity and clearness, the results of single and compound affinity, which was the only purpose to which they were applied by this eminent chemist.

When Lavoisier had invented the system of chemistry which is at present received, and had reformed the nomenclature in conformity with it, two of his countrymen, Messrs. Hassenfratz and Adet, chose to employ themselves in the formation of a species of stenography to correspond with the terms of the new system; but the good sense of the age being convinced that to add to the necessary difficulties of the most comprehensive of all sciences was wholly needless, has so unanimously rejected the fetters which these gentlemen have taken the trouble to forge, that any criticism upon the subject would be entirely superfluous.

CHARACTERS in Commerce

<i>D</i> Dto, the same.	℔ Pound weight.
<i>N</i> Num. ro, or number.	<i>C</i> . or <i>ᶒ</i> Hundred weight, or 112 pound.
<i>F</i> Folio, or page.	<i>q</i> ? Quartets.

A. B. Artium Baccalaureus, Bachelor of Arts.

F. R. S. Fellow of the Royal Society.

F. A. S. Fellow of the Antiquarian Society.

CHARACTERS used in the Arithmetic of Infinites.

The character of an infinitesimal, or fluxion; thus, $x \dot{y}$, &c. express the fluxions, or differentials of the variable quantities x and y ; two, three, or more dots, denote second, third, or higher fluxions. See *FLUXION*.

This method of denoting the fluxions, we owe to Sir Isaac Newton, the inventor of fluxions: it is adhered to by the English; but foreigners generally follow M. Leibnitz, and in lieu of a dot prefix the letter *d* to the variable quantity; on pretence of avoiding the confusion arising from the multiplication of dots, in the differencing of differentials.

d The character of a differential of a variable quantity, thus, $d x$ is the differential of x ; $d y$ the differential of y . The character was first introduced by M. Leibnitz; and is followed by all but the English. See *CALCULUS Differentialis*.

CHARACTERS among the Ancient Lawyers, and in Ancient Inscriptions.

 suit's Bark.

CHARACTERS used in Music.

Characters of the musical notes, with their proportions.

	A Large	8.		
	A Long	4.		
	Breve	2.		
	Semibreve	1.		
	Minim	$\frac{1}{2}$.		
	Crotchet	$\frac{1}{4}$.		
	Quaver	$\frac{1}{8}$.		
	or Semi-quaver	$\frac{1}{16}$.		
	or Demisemi-quaver	$\frac{1}{32}$.		

※ Character of a sharp note. This character at the beginning of a line or space, denotes all the notes in that line or space to be taken a semitone higher than in the natural series. And the same affects all their octaves, above and below, though not marked.

When the character is prefixed to any particular note, it shews that note alone to be a semitone higher than it would be without such character.

b. Character of a flat note. This character, at the beginning of a line or space, shews, that all the notes in that line or space are to be taken a semitone lower than in the natural series; affecting, in like manner, all the octaves, both above and below. When it is prefixed accidentally to any note, it shews that note alone to be a semitone lower than it would otherwise be.

n. Character of a natural note. Where, in a line or series of artificial notes, marked at the beginning for either sharps or flats, the natural note happens to be required, it is denoted by this character.

C. Character of treble clef.

M. Mean clef.

F. Base clef.

CHARACTERS of Time.

$\frac{2}{2}$, or $\frac{3}{2}$, or $\frac{4}{2}$, characters of common or duple time, signifying the measure of two crotchets to be equal to two notes; of which four make a semibreve.

C *C* Characters that distinguish the movements in common time; the first implying slow, the second brisk, third, very quick.

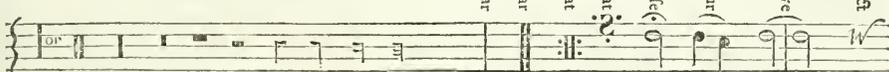

$\frac{3}{4}$, $\frac{3}{8}$, $\frac{3}{16}$, $\frac{3}{32}$, $\frac{3}{64}$, characters of the simple triple time, whose measure is equal either to three semibreves, or to three minims, &c.

$\frac{6}{8}$, or $\frac{9}{8}$, or $\frac{12}{8}$, characters of mixed triple time, where the measure is equal to six crotchets, or six quavers, &c.

$\frac{9}{16}$, or $\frac{6}{16}$, or $\frac{12}{16}$, or $\frac{3}{8}$, or $\frac{6}{8}$, characters of compound triple time.

$\frac{12}{16}$, or $\frac{12}{8}$, or $\frac{12}{4}$, or $\frac{12}{2}$, characters of the fourth species of triple time; called the measure of twelve times.

XP. A character found on ancient monuments, about the meaning whereof authors are not agreed. See *CATACOMB.*

CHARACTERS, in *Secret Writing.* See *CIPHTR.*

CHARACTERS, in *Swift Writing,* or short-hand. See *STENOGRAPHIA.*

CHARACTER is also used for a certain manner, air, or assemblage of qualities, resulting from several particular marks, which distinguish a thing from any other, so as it may be known thereby.

Thus, we say, the character of Achilles; generosity and greatness of mind formed the character of the Romans; Cicero had a character of politeness, which is wanting in Demosthenes; every passion has its peculiar character.

The writers of characters are, Theophrastus, whose fragments are still extant; Du Moulin, in his *Exemplar Morum*; Paschal, in his *Characteres Virtutum & Vitiatorum*; M. de la Chambre, in his *Characteres of the Passions*; and De la Bruyere, in his *Characters and Manners of the Age.*

The drawing of characters is one of the most splendid, and, at the same time, one of the most difficult ornaments of historical composition. For characters are generally considered as professed exhibitions of fine writing; and an historian, who seeks to shine in them, is frequently in danger

of carrying refinements to excess, from a desire of appearing very profound and penetrating. He brings together to many contrasts, and subtle oppositions of qualities, that we are rather dazzled with sparkling expressions, than entertained with any clear conception of a human character. A writer, who would characterise in an instructive and masterly manner, should be simple in his style, and should avoid all quaintness and affectation; at the same time not contenting himself with giving us general outlines only, but descending into those peculiarities which mark a character, in its most striking and distinctive features. The Greek historians sometimes give eulogiums, but rarely draw full and professed characters. The two ancient authors who have most laboured this part of historical composition, are Sallust and Tacitus. In describing characters, as well as in relating transactions, the historian should always shew himself to be on the side of virtue. To appear neutral and indifferent with respect to good and bad characters, and to affect a crafty and political, rather than moral turn of thought, will, besides other bad effects, derogate greatly from the weight of historical composition, and will render the strain of it much more cold and uninteresting. See HISTORY.

CHARACTER, is a term in common with all the arts, implying something peculiar and original. In *Music*, perhaps more than in any other art, this term is wanted; as a movement or composition, said to be of a distinct cast or character, implies invention. Without some specific stamp or impression, to awaken in the hearer the idea of some passion, affection, or sensation, it is of no character, but resembles Shakspeare's "Fellow without mark or likelihood."

It is but in modern times that this kind of stamp has been aimed at or expected. Neither Corelli nor Geminiani stamped the melodies of their movements with any thing but a kind of waver feal, regularly barred indeed. Pure and sweet harmony, masterly figures, and pleasing effects are produced in most of their productions; but that innate and striking cast of melody, which is instantly felt, which distinguishes a movement from all others, and which, without learned modulation, studied combinations, or ingenious arrangement of the parts, seizes the attention, impresses itself on the hearer's memory, never to be effaced, is wanting.

Handel has choruses of every species of character, and more songs than any composer of his time. "Return, O God of Hosts," is a sublime supplication. "He was despised and rejected," is impressed with a deep and dignified sorrow. "He shall feed his flock like a shepherd," has a true pastoral cast.

Pergolesi, Jomelli, Piccini, and Sacchini, have produced airs of character so frequently, that it is now formed into a principle by men of original genius, such as Paisiello, Cimarosa, and Sarti in Italy, and Emanuel Bach, Haydn, and Mozart in Germany, who have seldom let a movement go out of their hands ere they have affixed their seal to it.

Gluck produced great effects by harmony, energy, and bold modulation; but his melodies have seldom any peculiar mark of pathos, grace, or novelty.

CHARACTER, in *Poetry*, especially the *epopea* and *drama*, is the result of the manners, or that which each person has peculiar and singular in his manners, whereby he is distinguished from others. In the *drama* characters are chiefly displayed by means of sentiments and passions; but in the *epopea*, or *epic poetry*, which comprehends a greater compass of time and action, and which therefore allows a more full display of characters, they are displayed chiefly by means of actions.

As it is the business of an *epic poet* to copy after nature, and to form a probable interesting tale, he must study to give all his personages proper and well supported characters; such as display the features of human nature. This is called by Aristotle giving manners to the poem. It is by no means necessary that all his actors be morally good; imperfect, nay, vicious characters may find a proper place; though the nature of *epic poetry* seems to require, that the principal figures exhibited should be such as tend to raise admiration and love, rather than hatred and contempt. But whatever the character be which a poet gives to any of his actors, he must take care to preserve it uniform, and consistent with itself. Every thing which that person says or does, must be suited to it, and must serve to distinguish him from any other. Poetic characters may be divided into two kinds, general and particular: the former are such as are wise, brave, and virtuous, without any farther distinction; the latter express the species of bravery, of wisdom, of virtue, for which any one is eminent; they exhibit the peculiar features which distinguish one individual from another, which mark the difference of the same moral quality in different men, according as it is combined with other dispositions in their temper. In drawing such peculiar characters, genius is chiefly exerted. In this part Homer has particularly excelled; Tasso approaches the nearest to Homer; and Virgil has been the most deficient.

It has been the practice of all *epic poets* to select some one personage, whom they distinguish above all the rest, and make the hero of the tale. This is considered as essential to *epic composition*, and is attended with several advantages. It renders the unity of the subject more sensible, when there is one principal figure, to which, as a to a centre, all the rest refer. It tends to interest us more in the enterprise which is carried on; and it gives the poet an opportunity of exerting his talents for adorning and displaying one character with peculiar splendour. It has been asked, who then is the hero of *Paradise Lost*? The Devil, it has been answered by some critics; and in consequence of this idea, much ridicule and censure have been thrown upon Milton. But these critics have mistaken that author's intention, by proceeding upon a supposition that, in the conclusion of the poem, the hero must needs be triumphant. Whereas Milton followed a different plan, and has given a tragic conclusion to a poem, otherwise *epic* in its form. For Adam is undoubtedly his hero; that is, the capital and most interesting figure in his poem. Blair's Lectures on Rhetoric, &c. vol. iii.

The poetical character, Bossu observes, is not properly any virtue or quality in particular; but it is a composition of several, mixed and combined in various degrees, according to the occasions of the fable, and the unity of the action. All the single qualities that enter this compound, must not have the same rank, nor be equal to each other: since, in that case, one prevailing on one occasion, and another on another, the character will appear changeable; and the poem, as well as the hero, will seem animated with several souls.

There must, therefore, be one to reign over all the rest; and this must be found in some degree in every part: just as the same hero, in several paintings, should have the same lines and features, how different sivever his postures and passions may be.

This first quality in Homer's Achilles, is wrath; in Ulysses, dissimulation; and in Virgil's Æneas, mildness: each of which may, by way of eminence, be called the character of those heroes.

These are never to go alone, but always are to be accompanied

panied with others, to give them the greater lustre; either by hiding their defects, as in Achilles, whose anger is palliated by great courage; or by making them center in some solid virtue, as in Ulysses, whose dissimulation makes a part of his prudence; and Æneas, whose mildness is chiefly employed in a submission to the will of the gods.

These secondary qualities of courage, prudence, and submission, make the goodness of the characters of those heroes, and even of the poems.

Bosiu adds, that the quality of courage must always have a share in the character of a hero, to serve as a support to the rest: the heroic character, therefore, he makes a compound of three kinds of qualities. Those of the first kind are necessary and essential to the fable; those of the second are the supplements, or embellishments of the first; and courage, which sustains the other two, makes the third.

The first, which is the chief, is to be some universal quality, to have place on all occasions, and to distinguish the hero wherever he is found.

For the unity of character, we have Horace's express command, *Sit quodvis simplex duntaxat & unum*. Bosiu adds, that the character is not less the soul of the hero, and the whole action, than the fable is of the poem; and of consequence the unity must be as exact in the one as the other: which accordingly we find observed both by Homer and Virgil.

The unity of character is somewhat different from that of the manners: in the latter, the unity or equality consists in not giving contrary sentiments to the same person; which is not sufficient to the unity of character: but to this must be added, that the same spirit must always appear on all occasions, whether contrary or otherwise: thus, Æneas shewing great goodness in the first part of the poem, and much valour in the second, but without discovering any of his former piety, and gentleness; there had been no offence against the evenness of the manners, but much against the unity of the character.

So that besides the qualities which have their particular place on different occasions, there must be one to have place throughout, and to reign over all the others. Without this there is no character: as would be the case, should a poet give his hero the piety of Æneas, and the courage of Achilles, without considering the severity of the one, and the mildness of the other.

A hero, it is true, may be made as brave as Achilles, as mild, or pious, as Æneas, and, if the writer thinks proper, as prudent as Ulysses; but it would be a mere chimera to imagine a hero, with the particular courage of Achilles, the piety of Æneas, and the prudence of Ulysses, at the same time.

The unity of character is not only to be kept in the hero, and the several other persons of the piece; but also in that of the poem itself: that is, all the characters, how opposite soever, must center and re-unite in that of the hero; and be so swayed by it, as that this alone may seem to govern throughout the whole. Thus Homer makes wrath prevail throughout the whole Iliad; and artifice and dissimulation throughout the Odyssey; the hero's character is perceived every where, has its full sway, and is favoured by the similitude of the characters of some of the other persons. Virgil had a great difficulty to grapple with to preserve his unity; because of the direct opposition between the humours of his hero, and those of some other of his persons, as Turnus, Mezentius, Dido, &c. He therefore takes care not to carry those opposite characters to their full length, but moderates and restrains them: and as that moderation could not flow naturally from the persons themselves, it is produced either by some passion, as in Dido; or some dependence, as

in Turnus and Mezentius. To this artifice he adds episodes, accommodated to the general character, by which he interrupts the particular actions, which require an opposite character.

Claudian's conduct, in this respect, is unpardonable; for the horrible characters of Pluto and the Furies, with all the terrors of hell, he passes to the gaiety and pleasures of the Graces, gilded palaces, flowery fields, &c. He has as many different prevailing characters in his three books, as Homer and Virgil in their sixty. See DRAMA and EPOPEA. For the characters in Comedy and Tragedy; see these articles.

CHARACTER is also used for certain visible qualities, which claim respect or reverence to those who are vested with them.

The majesty of kings gives them a character which procures respect from the people. A bishop should sustain his character by learning and solid piety rather than by worldly lustre, &c.

CHARACTER is also used among Divines, especially those of the Romish church, for an indelible mark, or impression, which certain sacraments are supposed to leave behind them in those who receive them. The sacraments that leave this character are incapable of being repeated. The character is generally supposed to be something physical. The sacraments of baptism, confirmation, and ordination, in particular, leave such indelible character.

CHARACTER, in *Natural History*, is synonymous with the definition of the genera of animals, plants, &c.

CHARACTERISTIC, in the general, is that which characterizes a thing or person, i. e. constitutes its character, whereby it is distinguished from all others.

CHARACTERISTIC is peculiarly used in *Grammar*, for the principal letter of a word; which is preserved in most of its tenses and moods, its derivatives and compounds.

The characteristic frequently shews its etymology; and ought constantly to be retained in its orthography; such is the letter *r* in *course, fort, &c.*

The characteristics are of great use in the Greek grammar, especially in the formation of the tenses; as being the same in the same tenses of all verbs of the same conjugation, excepting in the present tense, which has several characteristics; and the future, the aoristus primus, the preterperfect, and the plusquam perfect tense of the fourth conjugation, which have two characteristics. The characteristics of the conjugations in the Hebrew grammar are the letters prefixed to, or inserted between, the radical letters: e. g. \aleph of Niphal, \aleph and \daleth of Hiphil, \aleph of Hophal, and \daleth of Hithpael. These technical terms have obtained such long possession in Hebrew grammar, that it would be difficult, and perhaps improper to expel them, or to substitute others in their room. The chief inconvenience attending them is, that they represent only the position or situation of the letters in the different modes or voices, but give no intimation of the meaning conveyed by these modes.

CHARACTERISTIC of a *Logarithm*, is its index or exponent. This term was first used by Briggs in his *Arithmetica Logarithmica*, to denote the integral or first part of a logarithm towards the left hand; and this expresses *one* less than the number of integer places or figures in the number corresponding to that logarithm, or how far the first figure of this number is removed from the place of units: thus, 0 is the characteristic of all numbers from 1 to 10; 1 the characteristic of all from 10 to 100; 2 of all from 100 to 1000, &c. See LOGARITHM.

CHARACTERISTIC *triangle of a curve*. See CURVE.

CHARADE, is the name of a new species of composition, or literary amusement. It owes its name to the Ilder

who invented it. Its subject must be a word of two syllables, each forming a distinct word; and these two syllables are to be concealed in an enigmatical description, first separately, and then together. The exercise of charades, although it may not be very instructive, is innocent and amusing; and may serve to try the inventive talents of children, and to occupy their intervals of leisure.

CHARADRA, in *Ancient Geography*, a town of Greece, in the Phocide, according to Herodotus. It was seated on an eminence, below which flowed the river Charadrus, about 20 stadia from Lileæ, according to Pausanias. Notwithstanding the vicinity of this torrent, the inhabitants were in frequent want of water.—Also, a place of Greece, in Epirus, situate, according to Polybius, near the gulf of Ambracia.—Also, the name of one of the towns founded by Pelops, according to Strabo, situate in Messenia.

CHARADRIUS, in *Ornithology*, a genus of the *grallæ* order, in which the bill is roundish and obtuse; nostrils linear; feet three-toed, and formed for running.

Species.

HIATICULA. Breast black; front blackish, with a white band; crown fuscous, legs pale yellow. Linn. Fa. Suec. *Pluvialis torquata minor*, Briff. *Gavia littoralis*, Klein. *Iaticula cetti*. *Petit pluvier à collier*, Buff. *Sea lark*, Albin, Wilughby, &c. *Ringed plover*, Penn. Lath. Donovan. &c.

The length of this bird is from six to seven inches; the bill is of an orange colour; at the base, and at the tip, or anterior half, black; the upper mandible is also black at the base, and a black space extends from thence through the eyes to the ears; the forehead is white, and behind this is another mark of black. The chin, throat, and broad collar extending backwards from thence are white, and beneath this is another collar of black, encircling the neck behind. Its breast and under parts are white; back and wing-coverts pale brown; quills dusky; the two middle feathers of the tail are greyish brown, becoming almost black towards the ends, the three next on each side the same, but having the tips white, the last but one white, with a brown band, the outer one white, marked with a single spot. The plumage of the male inclines more to ash colour, and the white on the forehead occupies a greater space than in the female.

These birds inhabit Europe and America: they migrate into England in the spring, and leave us in autumn. They lay four eggs an inch and an half in length, and of a pale ash-colour, spotted, and blotched with black, upon the ground under some shelter, for they make no nest. They run very fast, sometimes taking short flights, and twittering loud at the same time, then alight and run again, and, if still disturbed, will either fly away, or secrete themselves in some holes till the danger is over.

A variety of this bird, β , is described as an inhabitant of Spain; the plumage is greyish, with the collar and abdomen white. Another, γ , is mentioned as a native of America; the colour of this is greyish-ash, the front and collar white; lower half of the tail black, tipped with ferruginous. This last kind was brought from Owhyhee.

PLUVIALIS. Body black, spotted with green; beneath whitish; legs cinereous. Linn. Fa. Suec. *Pluvialis viridis*, Raii. *Pluvialis aurea minor*, Briff. *Gavia viridis*, Klein. *Piviere*, Cetti. *Kleiner brauch vogel*, Wirfing. *Le pluvier doré*, Buff. *Golden or green plover*, Albin, Penn. Lath. Donovan. &c.

This species inhabits almost every part of the world. On the European continent they are met with chiefly in hilly or mountainous situations, in Sweden, Denmark, Lapland, Iceland, and as far south as Aleppo. It breeds on several of

the unfrequented mountains of Britain, and especially in the heathy hills of the Scottish islands. In America, it appears on the coast of Labrador and Hudson's bay, and from thence to New York, as low as Carolina. It has been observed in China, and in some of the islands of the South Seas; and a supposed variety of it, *pluvialis dominicensis aurea* of Brisson, is mentioned as a native of St. Domingo. The length of this bird is ten inches and a half; the bill is about one inch, and of a dusky colour; the irides dull red. The upper part of the plumage is dusky, spotted with greenish yellow; round the eyes and the chin almost white; sides of the head and body, together with the neck, fawn as the upper parts, but paler; middle of the belly dusky yellow; the greater quills are dusky; tail barred, dusky, and dull yellow; legs black. In some individuals the belly is black, in others black and white. The male and female differ very little. In young birds the spots are not of a full yellow colour, as in the adults, but incline more to grey. The supposed variety before noticed as a native of St. Domingo, has the body blackish, varied with yellowish, and beneath white; and the lower part of the neck and breast pale grey; tail brown, having the margins of the feathers spotted with yellowish white.

RUBIDUS. Red, varied with black spots, and sprinkled with white; two middle tail-feathers fuscous, with ferruginous margins, the rest whitish, Lath. Gmel. *Ruddy plover*, Lath.

Inhabits Hudson's bay. The bill of this bird is straight and black; the head, neck, breast, and scapulars, with the wing and tail-coverts, of a ruddy colour, spotted with black, and powdered with white; the outer webs of the first four quills are brown; the inner white, tipped with brown; the rest white above and brown beneath; legs black; toes divided at their origin. At Hudson's bay it is known by the name of *Mijlebayebektsawehijls*.

HIMANTOPUS. White; back and wings black; bill black, and longer than the head; legs red, and very long, Scopoli, &c. *Charadrius himantopus*, Linn. *Charadrius autumnalis*, Hasselquist. *Himantopus*, Briff. *L'Echasse*, Buff. *Long-legged plover*, Penn. Lath. Donovan. &c.

This singular bird is distinguished by the remarkable disproportion of the legs, compared with the body, the former being nearly eighteen inches in length, while the body, measuring from the tip of the bill to the extremity of the tail, is only thirteen inches. The bill is two inches and a half long, slender, and black; irides red; the forehead, round the eye, and all the under parts are white; the crown of the head, back, and wings, glossy black; the hind part of the neck marked with dusky spots; rump white; tail the same, inclining to grey, the outer feathers quite white; legs red; the outer and middle toes connected at the base. The species inhabits the south of Europe, Africa, Asia, and America; rarely visits England. Donovan. Brit. Birds.

CALIDRIS. Bill and legs black; lores and rump greyish; body beneath white, and without spots, Georg. It. *Calidris grisea minor*, Briff. *Le sanderling*, Buff. *Sanderling*, or *Curavilleit*, Penn. Lath.

The sanderling inhabits Europe, Asia, and America. In England it inhabits the sea-coasts of Cornwall chiefly. The length of this bird is eight inches. The bill one inch long, and black, the fore part of the head, sides under the eyes, and beneath, from the chin to the vent, white; through the eyes a greyish streak; the upper part of the head, neck, and body streaked with black; back and scapulars brownish grey, edged with dirty white; wing-coverts and quills dusky; tail ash-colour, with pale margins; legs black. The plumage of the female is paler in some parts than the male.

A variety

A variety of this species is found in Newfoundland, which has the upper parts of a brownish ash-colour, mixed with brown, and streaked with black; forehead and under parts cinereous white; lesser and middle wing-coverts black, fringed with ash-colour; the greater cinereous with whitish edges; quills tail dusky; legs black.

AFRICARIUS. Breast and abdomen black; body dotted with fuscous, white, and pale yellow; legs cinereous, Lath. *Charadrius africanus*, Linn. *Pluvialis aurca fredi Huttonis*, Briss. *Le pluvier doré à gorge noire*, Buff. *Spotted plover*, Edwards. *Alwargrim plover*, Arct. Zool.

Size of the golden plover. The plumage above black, spotted with orange; at the base of the upper mandible the feathers are black; front, eye-brows, lower eye-lid, flanks, and vent white; wings and tail with brown and black bands; legs black. This inhabits the northern parts of Europe, as Sweden, Denmark, Iceland, and Greenland.

RUBRICOLLIS. Cinereous; body beneath white; head and neck black, with a large, square, rufous-chestnut spot on each side, Lath. *Charadrius rubricollis*, Gmel. *Red-necked plover*, Lath.

This inhabits the South Seas. The bill is flesh-coloured, at the tip black; the upper part of the plumage is ash-colour, with a slight mixture of white, the breast and under parts are white; quills and tail dusky; legs flesh-colour. Length about seven inches and a half.

ALEXANDRINUS. Fuscous; front, collar behind, and abdomen white; lateral tail feathers on each side white; legs black, Lath. *Pluvialis torquata*, Briss. *Le Pluvier à collier*, Buff. *Alexandrine Plover*, Lath. Gen. Syn.

Inhabits Egypt near the Nile. This is the size of a lark; the bill is black; forehead white, passing backwards in a streak over the eye; from the base of the bill a streak of black runs through the eye and reaches behind to the ears; top of the head, back, and wings brown; round the neck a collar of white; belly white; quills blackish grey; four middle tail feathers dusky brown; tail much rounded; legs black.

The Linnæan *Charadrius egyptius* is considered as a variety of this species. This is distinguished by having a black band on the breast; eye-brows white; tail-feathers with a black band, and white tip; and legs blue. This bird inhabits the sunny plains of Egypt, and feeds on insects. Another variety, called the red-eyed plover, has the crown of the head black, and the legs red.

PHILIPPINUS. Fuscous; region of the eyes, collar, and tail black; front, body beneath, and tip of the tail-feathers white. *Petit Pluvier à collier de Luçon*, Sonnini, &c. Size of the last, and is a native of the Philippines.

NOVÆ SÆLÆ IDÆ. Green-ash, face and collar black; annular stripe on the head, band on the wings, and body beneath white. *Charadrius Novæ Selandiæ*, Gmel. *New-Zealand plover*, Lath. Inhabits New-Zealand. It is known in Queen Charlotte's Sound by the name of *Dooloorna itoo*. This is rather larger than the ringed plover; the bill is of a red colour tipped with black; legs red.

GREGARIUS. Cinereous, beneath white; breast with a black semicircle, on the hind part rufous; tail-feathers white, with a black band. *Charadrius gregarius*, Pallas. *Gregarious Plover*, Lath.

Described by Pallas as being common in the fields about the Volga, Jaick, and Samara, where it appears in flocks; it is not seen farther north than 54 degrees; and is by some called the "Hen of Steppes." This is the size of a lapwing. The bill in shape and size the same as in that bird; crown of the head brown, mottled with white; forehead white, passing in a streak over each eye to the hind head; through the eyes a black streak. The body is of an ash-

colour, somewhat approaching to that of the turtle; tail even at the extremity; legs furnished with an imperfect back toe.

ASIATICUS. Greyish fuscous; front, eyebrows, throat, and abdomen white. *Charadrius Asiaticus*, Pallas. *Asiatic plover*, Lath.

Inhabits the salt lakes in the deserts of Tartary; and is a rare and solitary bird. In size it rather exceeds the ringed plover. The crown of the head, back, and wings are greyish ash-coloured brown; tail brown, with the feathers whitish at the edges, and tipped with black; legs red.

TARTARIUS. Collar cinereous; breast ferruginous; band on the chin and breast black; abdomen white; wings and tail fuscous. Pallas, &c. Observed near the salt lakes of southern Tartary. Supposed by some to be a variety of the dotterel.

MONGOLUS. Cinereous fuscous; front beneath white; throat and breast ferruginous; chin with a black semicircle. Pallas, &c. *Mongolian plover*, Lath. This inhabits the salt lakes about the Mongolian country in tolerable plenty. It is the size of the common dotterel.

VOGIERUS. Bands on the breast, neck, and front of the cheeks black; tail pale yellow, with a black band; legs yellow. Gmel. Linn. *Pluvialis virginiana torquata*, Briss. *Le Pluvier à collier de Virginie*, Briss. Kilder Buf. *Chattering plover or kill-deer*, Catesby. *Noisy plover*, Arct. Zool.

The length of this bird is nine inches and three quarters. Bill an inch long and black; eye-lids red; the forehead is white; between the eyes, across the head, a bar of black passing on each side to the hind head; the chin and fore part of the neck white; at the lower part of the neck, the white encircles it like a ring, and is accompanied by a bar of black all round; on the breast is another black bar, and, except those, all the under parts are white. The hind part of the head, neck, and upper part of the body and wings, are dusky brown; rump and tail rufous orange; the latter much rounded in shape, tipped with white, and barred near the end with black; legs pale yellow. This species inhabits America; it is a clamorous and restless bird. In Virginia it is called the kill-deer, from its note resembling the pronunciation of that word. There is a variety of this species which has the breast varied with black; front white; crown and collar black; bill and legs bluish; three outer tail feathers tipped with white. This is the *Charadrius torquatus* of Linnæus, and *Pluvier à collier de St. Domingue*, Buff. Pl. Enl.

JAMAICENSIS. Dusky fuscous, beneath white; breast spotted black and white; tail varied with whitish, rufous, and black; bill black; collar and legs white. Gmel. *Pluvialis jamaicensis torquata*, Briss. *Large grey snipe*, Brown. *Collared plover*, Lath.

Size rather less than that of the noisy plover; length eight inches; bill an inch long, and black; upper part of the head, neck, body and wings, dull brown; throat, fore part of the neck, belly, thighs and vent, white; at the lower part of the neck the white passes round as a collar; quills dull brown; tail whitish, varied with rufous and blackish. Inhabits Jamaica, where it frequents the banks of rivers.

MORINELLUS. Breast ferruginous; band over the eyes, and line on the breast white; legs black. *Charadrius Morinellus*, Linn. &c. *Petit Pluvier, ou le Guignard*, Buff. *Dotterel*, Penn. Albin. Lath. &c.

The Dotterel is from nine to ten inches in length. The bill an inch long, and of a black colour; the forehead an intermixture of dusky and grey; over the eyes is a white band which bends downwards, and passes to the hind head; the sides of the head and throat are white; the hind part of the neck, the back and wings, greyish brown; the feathers margined with pale ferruginous, but those of the lower part

of the back and rump incline to grey; fore part of the neck cinereous olive mixed with a little white next the throat; the lower part of the neck is bounded with a line of black, beneath which is another of white; the breast and sides are of a pale dull orange; middle of the belly black; lower parts and thighs rufous white; tail olive brown, with a black band, and white tip; the two outer feathers edged with white; legs black. The female differs in being rather larger, in having the black on the belly mixed with white, and the general colour of the plumage more obscure.

These birds are common in the northern parts of Europe, where they may be supposed to breed. Linnæus says they are very frequent in Dalmatia and the Lapland Alps, and that they visit Sweden in May. They are known to breed in the north of Russia and Siberia. In England, they occur in greatest plenty in the counties of Cambridgeshire, Lincolnshire, and Derbyshire. With us they are migratory, appearing in flocks of eight or ten in number the latter end of April, and stay till the end of May or June, when they are very fat, and are much esteemed for the table. It is supposed they breed in the mountains of Cumberland and Westmoreland, as they appear there in May, and are not observed there after the breeding season. We are informed in the Flora Scotica, that they breed on several of the Highland hills. The manners of the Dotterel prove it a silly bird. There is a variety of this bird which has the crown varied with white, grey brown and yellowish mixed with white, with the two middle tail-feathers brown, and the lateral ones white.

FALKLANDIUS. Brown-clouded; front, neck beneath, and abdomen white; annular stripe on the head ferruginous; breast and band on the crown black. Lath. *Rufy-crowned Plover*, Portlock Voy.

This species, which is about seven inches and a half in length, inhabits the Falkland islands. The bill and legs are blackish; body beneath white; stripe encircling the head of the male resembling a crown.

SIBIRIUS. Front varied with black and white; crown barred with blackish; breast brown, terminated by a white band; belly ferruginous. Lepech. It. *Charadrius Sibiricus*, Gmel. A native of Siberia.

OBSCURUS. Black, beneath ochraceous; front and chin whitish; collar dusky with pale stripe. Gmel. &c. *Dusky Plover*, Lath.

This was found by the English circumnavigators in Dusky Bay, New Zealand, where the natives call it *Hapohoëra*. In point of size, it rather exceeds the common snipe. The bill is black; forehead pale reddish white; plumage on the upper part dusky, edges of the feathers paler; chin and fore part of the neck dusky white; lower part of the neck, breast, and under parts, dusky yellow ochre colour, with a tinge of red; red marked with pale and dusky streaks, and transversely mottled on the sides with narrow lines; legs bluish; claws black.

FULVUS. Above blackish, the feathers edged with tawny; beneath whitish; breast fulvous spotted with black; wings with a white band. *Charadrius Fulvus*, Gmel. *Fulvous Plover*, Lath.

This bird inhabits the shores and marshy places of Otaheite. The size is rather less than that of the lapwing; the bill is dusky; irides bluish black; its forehead and throat are dusky white; belly dusky white spotted with black; wing coverts black, spotted with fulvous, the lower order brown black, tipped with white; quills brownish black, with white shafts; tail brown, with whitish bands; legs blue; claws black and blunt. A variety of this bird, in the late Leverian Museum, had the bill brown, legs yellowish, and the wings destitute of the white band. This was probably

a young bird, the length being only eight inches; while that before described measured twelve inches and a half; the plumage on the upper part was brown, and had the feathers margined with golden yellow; the under part of the body was white, except the breast, which was of a dusky pale brown. The quills were brown, having the end half of the shafts white; the secondaries as long as the quills, and both of them reaching to the end of the tail and concealing it; the tail was two inches long, brown, and marked with obscure pale brown spots on each side of the webs; legs about two inches long, and of a pale yellow colour. The native place of this variety could not be ascertained.

LEUCOGASTER. Fulvous; body beneath, front, white line above and beneath the eyes white; legs pale blue. Gmel. &c. *White bellied Plover*, Lath.

Described from a specimen in the late Leverian Museum. The length six inches; bill one inch; the plumage on the upper part dirty brown; secondaries and prime quill feathers of equal length; some of the first white for half their length from the base, with white shafts; six of the middle tail feathers brown, the next white at the tip and base, the three exterior ones white, the last but one with a brown spot on the inner web near the tip, and the third black at the extremity. Native place unknown. Lath. &c.

SPINOSUS. Quill feathers, breast, and legs black; hind head crested; tail feathers half white; spurious wing armed with a spur. Lath. *Charadrius Spinifus*, Linn. *Pluvialis Senegalensis armata*, Brisson. *Le Pluvier a aigrette*, Buff. *Spur-winged Plover*, Lath.

This corresponds in size with the golden plover; the bill is an inch long, and black; irides red; crown of the head and throat are black, passing a little way down the neck before. The back part of the neck, and upper part of the body and scapulars are grey; sides of the head, and all the under part from the throat to the vent yellowish white, except a crested of black on the breast, the convex part uppermost. The lesser wing-coverts are black, the middle ones grey, the greater yellowish white. On the fore part of the wing just within the bend, is a slightly incurvate black spur, about half an inch in length. The tail is yellowish white, tipped with black, and legs are black. This singular bird inhabits the marshy places of Lower Egypt. Sonnini, speaking of the natural productions of Rosetta, tells us the most numerous and generally diffused of all the aquatic birds in this part were the spur-winged plovers; "roisy animals (adds this writer) which might likewise be called manneily, for they have a hasty and almost continual movement of the head and neck, drawing them up briskly, and then quickly stretching them forward almost as if they were making hasty and eager bows." Hasselquist acquaints us it inhabits the marshy places of Lower Egypt in the month of September, and that it is also found in other parts of the neighbourhood, and is called *Dominican*, the neck being black, with white sides, and not inaptly resembling the collar part of the habit of that order of religious.

A variety of the spur-winged plover found in Russia, and which is frequent near Aleppo, about the river Coic, is of a chestnut-colour above, with the neck and lower part of the belly white; and the breast, wings, and tip of the tail black. This is the black-breasted Indian plover of Edwards, p. 47. The spur-winged plover of Edwards, p. 280, is supposed to be the female. Another kind of spur-winged plover, *Le pluvier armé de Cayenne*, is inserted by Dr. Latham in his General Synopsis as a variety of this bird; and also appears as such in the Gmelinian edition of the *Système Naturel*. In Latham's Ind. Ord. this is, however, determined as a distinct species, under the title of *Charadrius Cayanus*.

CAYANUS. Head, back part of the neck, and pectoral band

band black; annular band on the hind-head, fore part of the neck, belly, and base of the tail white; spurious wing armed with a spur. Lath. Ind. Orn.

This is a native of Cayenne. Its length is nine inches; the bill an inch long, of a dusky colour; back part of the head and nape of the neck white mixed with grey; the fore parts and sides black, passing back to the nape, and occupying all the hind part of the neck, and thence extending forward on the fore part above the breast; space between this and the chin white; the middle of the back and wings are rufous grey; scapulars and quills black; under parts from the breast white; legs yellowish.

PILEATUS. Crested; front carunculated; body above rufous grey, beneath white; crown, chin, and tip of the wings, and tail black, Lath. *Charadrius pileatus*, Gmel. *Pluvier coiffé du Senegal*, Buff. *Hooded plover*, Lath.

The length of this bird is ten inches and a half; the bill is yellow, red towards the end, and black at the tip. The forehead is covered with a carunculated yellow membrane passing round the eyes; the head and jowl the contiguous part of the neck is black. The hind-head is furnished with a few short pointed feathers, pendent like a small crest, beneath which the hind-head is white. Above the plumage is rufous grey, all the under parts are white, with a few dusky dashes down the fore part of the neck; the quills and end of the tail black; legs red. This inhabits Senegal.

CORONATUS. Rufous, head above black, circle on the crown, belly, greater wing-coverts and tail white; the last with a broad black band near the tip. *Charadrius coronatus*, Gmel. *Pluvier couronné du cap de Bonne Esperance*, Buff. *Wreathed plover*, Lath.

This bird inhabits the Cape of Good Hope. Its length is twelve inches. The bill is reddish, and dusky towards the point; the hind part of the neck, and upper part of the body are brown, glossed with greenish purple; as far as the neck the breast is grey; belly white; quills black; legs rust-colour.

BILOBUS. Rufous grey; eye-brows, abdomen, and band across the wing white; crown of the head, and bar on the wings and tail black; front with a pendent wattle. *Charadrius bilobus*, Gmel. *Le pluvier a lambeaux*, Buff. *Le pluvier de la côte de Malabar*, Pl. Enl. *Wattled plover*, Lath.

This bird, which inhabits the coast of Malabar, is the size of the golden plover. The bill is yellow; on the forehead is a bare skin hanging down in a pointed flap on each side of the jaw; and the legs are pale yellow.

MELANOCEPHALUS. Cærulean grey; head, hind part of the collar, and back black; eye-brows, neck in front, and breast pale rufous. Lath. *Charadrius melanocephalus*, Gmel. *Le pluvier du Senegal*, Buff. *Black-headed plover*, Lath.

A native of Senegal. The length is seven inches. The bill black, and an inch in length; upper part of the head black; all the tail-feathers, except the two middle ones, marked with black near the ends, with the extreme tips white. The under parts from the chin pale rufous, deepest on the breast, where it is mottled with transverse dusky markings, and towards the vent nearly white; legs cinereous grey; claws black.

INDICUS. Brown, beneath white; breast with two brown bands; tail-feathers white at the base. Lath. *Le petit pluvier des Indes*, Buff. *Indian plover*, Lath.

Inhabits India; and is about the size of the common lark.

CURONICUS. White; bill blackish; band on the nape and frontal lunate mark black; cap cinereous; ocular band waved with blackish; back, wings, and tail cinereous; legs reddish. *Charadrius curonicus*, Beke, Sch. der Berl.

Naturf. Gef. vii. p. 463. Gmel. &c. A native of Curonia.

NÆVUS. Above varied with cinereous, black, and white; beneath white; band below the eye dotted with black; bill and legs blackish. Naturf. Gef. vii. p. 464. Native place unknown.

Gmelin describes two other birds as species of the charadrius genus, namely, *gallicus*, and *coromandelicus*, both which are referred by Dr. Latham in his Ind. Orn. to the new genus cursorius, those having the bill roundish, incurvated at the tip, and terminating acutely, besides differing in other general particulars from the charadrius. See CURSORIUS.

CHARADRUS, in *Ancient Geography*, a river of Greece, which passed near the town of Charadra, and soon after discharged itself in the Cephissus, according to Pausanias.—Also, a river of the Peloponnesus in Messenia.—Also, a torrent of the Peloponnesus in the Argolide, in the route from Argos to Mantinea. It ran south of Hylia, and flowed into the Argolic gulf. Another torrent of the same name passed N. W. of Hylia, and discharged itself into the river Inachus.—Also, a torrent of Achaia, the course of which was from south to north. Its mouth was near the promontory of Rhium. The waters of this stream were said to aid the females of animals that drank them in the act of conception, and therefore they were brought from a great distance for this purpose.—Also, a torrent of Arcadia, which ran at a small distance to the north of Orchomeno, and discharged itself into a lake not far distant towards the east.—Also, a strong and ancient place of Asia in Cilicia; situate on the sea-coast, in the vicinity of mount Cragus, according to Strabo.

CHARAG, the tribute which Christians and Jews pay to the grand signior.

It consists of ten, twelve, or fifteen francs *per ann.* according to the state of the party. Men begin to pay it at nine, or at sixteen years old; women are dispensed with, as also priests, rabbins, and religious.

CHARAGIO, in *Geography*, a town of the island of Corfica, or department of Golo, two miles S. of Cervione.

CHARAIMS, a sect of the Jews in Egypt. They live by themselves, and have a separate synagogue; and as the other Jews are remarkable for their eyes. So these are for their large noses, which run through all the families of this sect. These are the ancient Essenes. They strictly observe the five books of Moses, according to the letter, and receive no written traditions. It is said that the other Jews would join the Charaims, but those not having observed the exact rules of the law with regard to divorce, they think they live in adultery.

CHERAMOKOTAN, in *Geography*, one of the small Kurile islands in the Northern Pacific Ocean. N. lat. 49° 53'. E. long. 154° 54'.

CHARANCY, a town of France, in the department of the Moselle, and district of Longwy; 3½ leagues W.S.W. of Longwy.

CHARANDAS, in *Ancient Geography*, a place of Asia, situate on the Bosphorus of Thrace, and called also Delphinus.

CHARANDRA, a gulf of the Red Sea, in which Ptolemy Philadelphus built a town, called *Arfinae*, which see.

CHARANTIA, in *Botany*, Dod. See MEMORDICA *Balsamina*.

CHARAS, MOSES, in *Biography*, early distinguished by his skill in chemistry and pharmacy, was born at Uzès, a town in Upper Languedoc, about the year 1618. He first settled at Orange, but at the end of a few years, in the hope of being able to exhibit his talents to more advantage, he removed to Paris. In this expectation he was not disappointed, as he was soon fixed on to read the lectures on chemistry,

chemistry,

mistry, at the Royal Garden there. This office he filled for nine years, until October 1685, when having embraced the doctrine of Luther, he was obliged, by the revocation of the edict of Nantes, which took place at that time, to quit France. He came thence to London, and was received by our king Charles II. with great kindness. After residing five years in England, he went to Holland, took his degree of doctor in medicine at Leyden, and at length, on the pressing solicitation of the Spanish envoy, he went to Madrid, invited thither to undertake the care of the health of the king of Spain. What success he had with his patient, we are not told; it was probably not considerable, as he suffered him to be imprisoned in the Inquisition, where he was detained four months, and did not escape, until he had made a full recantation of his errors. He was now upwards of seventy-two years of age. He then returned to Paris, and was admitted a member of the Royal Academy. At Paris he continued until January 17th, 1695, when he died, aged eighty years.

In 1668, he published, in 8vo. "A Chemical Analysis," of the famous electary; the "Theriaca Andromachæ," with an account of each of the ingredients entering the composition of that heterogeneous compound. He had the good sense to attribute its salutary powers to the opium and spices contained in it, and therefore, contrary to the then received opinion, determines that age impairs, and not improves its efficacy. "Nouvelles Experiences pour la Vipere, les effets de son venin," &c. 1669, 8vo. Paris. A drop of the oil of tobacco infused into a wound inflicted on the viper, kills it immediately. He gives a neat anatomical description of the viper, and even describes the bag, the repository of the poison, but insists the liquor only becomes poisonous when the animal is irritated; contrary to the experiments of Sig. Redi, who had shewn that the liquor taken from a dead viper, and distilled into a wound through a quill, is as malignant as when inserted by the bite of the enraged animal. Redi defended his experiments, and was answered by Charas in 1672, who still retained his opinion. The same year he published, "Pharmacopœia royale galenique, et chimique," which, as well as his other works, have passed through several editions. Haller Bib. Med. Eloy Dict. Hist.

CHARASM, in Geography. See KHARASM.

CHARATZAIKA, a fortress of Siberia, on the confines of China; 84 miles S.W. of Silengisk.

CHARAVARI. This appellation is given by the Poles to a sort of very large breeches, which take in the tails and greatest part of all their clothes, when they set out on horseback on a long journey or march, or when it rains, or the roads are bad and dirty. These are buttoned over the stomach, and reach quite down to their heels. This sort of culotte forms an essential part of the attire or dress of a Hulan.

CHARAVEND, a town of Persia, in the province of Irak-Agemi; 120 miles S.E. of Ispahan.

CHARAUNI, or CHAURANCEI, in Ancient Geography, a people of Scythia, on the other side of the Imaus. Ptolemy assigns to them a town called *Carouna*. They correspond to the *Kauria* or *Karia* of the present times.

CHARAX, CHARA-CATA, a promontory of the Tauric Chersonesus, N.E. of Criuemetopon, and W. of the promontory Corax, mentioned by Strabo and Pliny.—Also, a commercial port, placed by Strabo in Africa Propria, and called by Ptolemy *Pharax*.—Also, a town of Asia Minor in Caria, said by Steph. Byz. to have been called, in his time, *Trallis*.—Also, a town of Asia, situate in the interior, and between the mountains of the Lesser Armenia, according to Ptolemy.—Also, a town or burgh of Asia in Parthia, according to Ptolemy.—Also, a commercial place of Asia Minor in Bithynia, placed by Steph. Byz. in the gulf of Nicomedia.—

Also, a promontory of the isle of Crete.—Also, a place of Asia Minor in Phrygia, placed by Nicetas, cited by Ortelius, between Lampis and Grafolaga.—Also, a town of the island of Corfica, mentioned by Strabo.—Also, a town of Susiana, situate between the Tigris and the Eufrates, upon the banks of a canal which connected these rivers.

CHARAX, in Ichthyology, a name given by Ælian, Appian, and many other Greek writers to the fish called by later writers *Carassius*. *Cyprinus Carassius* of Linnæus, who distinguishes it by having ten rays in the anal fin, and the lateral line straight. See *CYPRINUS Carassius*.

CHARAX *Joris leviser convexus*, *pinna ani radius 31*, is the name and character given by Gesner to the Bimaculated Salmon, *Salmo bimaculatus*, which see.

CHARBANUS, in Ancient Geography, a mountain of Asia, in Media, which, according to Piny, lay in the road from Babylon to Ecbatana. It is supposed to have been a part of mount Zagrus.

CHARBON, in the *Manege*, signifies that little black spot or mark that remains after a large spot, in the cavity of the corner teeth of a horse. About the seventh or eighth year, when the cavity fills, the tooth being smooth and equal, it is said to be raised.

CHARBONNIER, in Zoology, the name under which Buffon describes the Brant-fox, *Canis Alpeus* of Gmelin. It is distinguished by having the tail straight, and tipped with black. The species inhabits Europe, Asia, and Chili in South America.

CHARBONNIERE, in Ornithology. The Great Titmouse or Ox-eye of English writers is described by Buffon under the name of Charbonniere and *Grosse Mefange*. See *PARUS major*. Buffon also describes the Colemouse under the name of *Petite Charbonniere*. See *PARUS ater*.

CHARBUISOOKA, in Geography, a river of Kamtschaka, which runs into the Penzinkoi gulf; 70 miles S.S.W. of Tigilkoi.

CHARCAS, *Audience of*, a province of South America, regarded before the grand alteration in 1778, as a dependency of Peru, is equal in the extent of its jurisdiction to that of Lima, but with this disadvantage, that many parts of it are not so well inhabited; some abounding with immense deserts and impenetrable forests, while others are full of extensive plains, which are intercepted by the stupendous heights of the Cordilleras. The denomination of Charcas formerly included many populous provinces of Indians, whom the Inca Capai Yupanque subjected to his empire; but he carried his arms no farther than the provinces of Tityras and Chaqui, where he terminated his conquests towards Callafuyo. On the death of this monarch, his son Inca Roca, the sixth in the succession of those emperors, pushed his conquests farther in the same part, till he became sovereign of all the intermediate nations to the province of Chuquisaca, where was afterwards founded the city of Plata, at present the capital of the whole province of Charcas. See *PLATA*. The jurisdiction begins on the north side at Villacota, belonging to the province of Lampis, in the diocese of Cusco, and reaches southward to Buenos Ayres. Eastward it extends to Brazil, being terminated by the meridian of demarcation; and westward, part of it reaches to the South Sea, particularly at Atacama, the most northern part of it; on this side the remainder of Charcas borders on the kingdom of Chili. These vast tracts of land give one archbishop, and five bishops his suffragans, viz. the archbishop of Plata, and the bishops of La Paz, Santa Cruz de la Sierra, Tucuman, Paraguay, and Buenos Ayres. See these articles.

CHARCHA, or BETH SOLOKE, KARK, or ESKI-BATINAD, in Ancient Geography, a town of Asia, seated on the left bank of the Tigris; S.E. of Birtha.

CHARCOAL,

C H A R C O A L .

CHARCOAL, in *Chemistry*. Under the article **CARBON** are mentioned the chemical properties of charcoal; nothing further therefore remains to be described except the method of preparing the substance and a few other particulars intimately dependent upon it.

Charcoal is prepared either by burning or distillation; of these the first is the simplest, most ancient, and usual method, on which account we shall begin with it.

The business of charcoal burning takes place during the whole of the summer months, and is for the most part carried on in the woods to save the expence of carriage. Two or three families commonly unite for this purpose, dwelling in tents or temporary huts during the time in which they are thus employed for the convenience of being near their business. After they have felled the timber, and it is become sufficiently dry, the process of converting it into charcoal is begun by raising a plot of ground a little higher than the surrounding surface, and bringing it to a slightly convex form by beating it, and thus forming a hard, dry, and solid floor. In the center of this area is placed a circle of sticks adjoining each other and composing a vertical hollow cylinder from three to four inches in diameter, and about six feet high. Round this interior cylinder are ranged successive concentric circles formed by truncheons from one to ten inches in diameter, care being taken that the truncheons in any one circle are of the same diameter, and that one built of the largest wood be always succeeded by one of the smallest wood, in order that there may be as few interstices as possible. The outermost circle is composed of brush-wood. When the pile measures from twenty to thirty feet in diameter, it is sufficiently large; a coating is now laid on of turf, the grassy side next to the wood, and dry earth is heaped up round the bottom of the pile, and well rammed in order to prevent the admission of air. Three or four screens formed of large hurdles well stuffed with brushwood, are also prepared in order to protect the pile from the violence of the wind. All the preparations being now completed, the pile is kindled by dropping lighted chips down the hollow cylinder in the center, which, in proportion as they are consumed, are supplied by others during the first three or four days, at the end of which period, the kindling of the pile is completed. The top of the cylinder is now closed, and a row of holes, each about two inches in diameter, is pierced at the

base of the pile, by which the requisite quantity of air is supplied, and a passage is afforded for the smoke and vapours. When the smoke nearly ceases to issue from these holes, a second row is opened, about six or eight inches above the first, which are now closed; in this manner the fire is conducted to the top of the pile in about a fortnight; at which time the pile is covered up with earth as accurately as possible, till the fire is completely extinguished. Those pieces that are found not to be sufficiently charred are called *brands*, and are employed as fuel for the next fire.

Although charcoal prepared by the above method is fully adequate to all the purposes of fuel to which this substance is applied, yet in the manufacture of gunpowder, and for some other uses, it is of essential importance to procure a charcoal of greater purity than common. This was formerly done by selecting the items of willow, alder, and some other of the aquatic trees, and charring them in the usual manner, but with peculiar care. Of late, however, a considerable improvement in the preparation of the finer charcoal has taken place, by charring or distilling the wood in closed iron cylinders. For this purpose a large cylinder of cast iron fixed in masonry over a grate, and furnished at one end with a door capable of being accurately closed, and terminating at the other in a curved pipe, is filled with the chips of any kind of wood; the door being then closed, and a fire lighted in the grate, the empyreumatic acid and all the other volatile parts of the wood are driven off by the heat, which is increased till the contents of the cylinder are red hot. The fire is then withdrawn, the cylinder is allowed to cool, and a black shining and remarkably pure charcoal (in greater proportion also to the quantity of wood employed than by the usual way) is procured, admirably fitted for the use of the gunpowder-makers, and apparently possessed of the same qualities from whatever kind of wood it is made.

The proportion of charcoal yielded by particular woods is liable to be so materially affected by the age, and the dryness of the wood, as to render it almost impossible to obtain any correct result in the great way. The following table, from experiments in the small way by Mr. Muthet, will, however, be found to be interesting, as all the woods before being charred were thoroughly dried and prepared, as nearly as possible in the same circumstances.

100 Parts of Lignum vitæ afforded	26.0	of Charcoal of a greyish colour resembling coak
Mahogany	25.4	- - tinged with brown, spongy and porous
Laburnum	24.5	- - velvet black, compact, very hard
Chestnut	23.2	- - glossy black, compact, firm
Oak	22.6	- - black, close, very firm
Holly	19.9	- - dull black, loose and bulky
Sycamore	19.7	- - fine black, bulky, moderately firm
Walnut	20.6	- - dull black, close, firm
Beech	19.9	- - dull black, spongy, firm
Norway pine	19.2	- - shining black, bulky, very soft
Elm	19.5	- - fine black, moderately firm
Sallow	18.4	- - velvet black, bulky, loose and soft
Ash	17.9	- - shining black, spongy, firm
Birch	17.4	- - velvet black, bulky, firm
Scottish pine	16.4	- - tinged with brown, moderately firm

The author of the Rural Economy of the midland counties observes, that in making charcoal, men accustomed to the business cut and cord in wood in the winter, and burn during the summer season. The minutiae of the process of which are there, he says, these. The site, or hearth, being determined upon, the sward is pared off, and the sods

laid on one side. The wood usually about the cord is then laid in a ring, somewhat wider than the intended hearth; beginning on the outer circumference of the ring with the smallest of the round-wood, laying the larger pieces of top-wood, and the cloven roots, or but-ends, towards the center. With these last, some of them nearly as large as bush-

blocks,

blocks, they begin to make their pile, leaving a kind of chimney in the middle, (a vertical aperture, from a foot to eighteen inches wide), and round this core of roots set up the top-wood, (which has previously been cut at the time of cording, in such a manner, that no forkedness or other awkward crookednesses are left; or, if not cut in this manner, or cut improperly, it is prepared by the colliers themselves, previous to laying it ready for setting), joining the blocks, or rather fitting them in, as close to each other as possible; placing the convex side of the logs outward, forming the pile in the shape of an inverted bowl, nearly hemispherical. The pile being formed, it is covered over with fods, which are pointed, to keep in the heat the better, and the seams are filled up with fine pulverised mould. The chimney is now filled with short pieces of dry wood; near the top a live coal is put; over this one layer more of dry pieces; and upon these a close cap of fod is placed; nevertheless, this one coal, not larger than the fist, and excluded from the open air, is sufficient to set the whole pile on fire. As the pieces in the chimney burn away, they are replaced by fresh ones: thus feeding the fire with fresh fuel. Paled hurdles are placed on the windward side of the heap, to prevent the fire from acting partially.

When the fire begins to work itself out, at the outward joints of the bottom of the pile, it is known that the coal is fully burnt, (or rather the wood sufficiently charred), which it will be, in a pile of ten cord, in fine dry weather, in seven or eight days. The fire, during the whole time, is carefully kept from breaking out, by throwing mould or ashes upon the weak parts: so that, though the fire passes through every part of the wood, little or none of the matter of heat escapes. It is observable, he says, that notwithstanding the intense heat, no part seems to be consumed; not the bark only, but even the moss upon it, comes out as entire as when it went in: the only apparent change is, in its being rendered friable and of a black colour. Wood that is charred, seems, he says, to be only very lightly dried. It shrinks considerably during the process of charring; but there is no visible derangement of parts. One of the smaller pieces, which is not broken in the drawing, appears as entire when it comes out as when it went into the pile. The brittleness after charring, however, shows that the texture of the wood is altered by the action of the fire. As soon as the fire is out of the coal, on the outside of the heap, the workmen begin to draw; which is done by running a peel between the coal and the hearth, raising up the coal in such a manner as to let the mould and ashes of the fods fall through between the pieces, upon the inward parts, fill full of fire. If this makes its appearance in any particular spot, a peel full of ashes is immediately thrown against it. Having got sufficiently near to the fire, the coals raised by the peel are raked off with long, wide-toothed, iron rakes; the teeth about a foot long, and standing about six inches apart; the handle and head of wood, except a plate of iron on the back, with which the small coal is gathered together. No sieve, nor any rake with finer teeth than the above, is used. The coal being light, it is readily brought to the surface of the ashes and dirt; and, when there, is easily collected with the back of the rake. The side, thus drawn, being rounded up and secured with ashes, another, the cooler part, is drawn in the same manner. The drawing is an infernal business: the men working among fire and heat enough to suffocate Satan himself. Such pieces as fill retain fire, after they are drawn, are quenched with water; which the workmen have in plenty standing by them, in pails. If a large piece contain much fire, (which hides itself chiefly in the

chinks of the large pieces), it is plunged bodily into the water. If the heap itself prove too refractory to be kept under by the ashes alone, a sufficient quantity of water is thrown upon it, to keep the fire under. Such large pieces as are suspicious are laid on one side, in order that those which take fire may be the more readily discovered. A waggon attends to take away the coal as fast as it is drawn: for, if it take fire, or get wet in the hands of the burners, it is at their risk; and, while in the waggon, it is at the risk of the waggoner. Every particle burnt is so much entire waste.

The quantity of ashes arising from a charcoal hearth, he says, is considerable. There were four cart loads taken up from two small hearths, and a load or two more left remained.

The duit of charcoal has been found, by repeated experience, to be of great benefit to land, especially to such soils as are stiff and four. It is to be used in the same manner as foot and wood-ashes. See ASHES and SOOT.

And the author quoted above observes, that charcoal ashes are in good esteem in the midland districts as a manure, particularly for turnips, and for sowing grass land. They arise principally from the fods used in covering, but in part from the bits of coal which break off in raking it out of the ashes. There cannot be any doubt but that all the refuse of charred materials that become reduced into a powdery state during the process of drawing the coal, is highly beneficial, when applied on the more stiff and heavy sort of land as a manure, as much advantage has been derived from it in the experience of different cultivators.

The microscope discovers a surprising number of pores in charcoal: they are disposed in order, and traverse it lengthwise; so that there is no piece of charcoal, how long soever, but may be easily blown through. If a piece be broken pretty short, it may be seen through with a microscope. In a range the eighteenth part of an inch long, Dr. Hook reckoned one hundred and fifty pores; whence he concludes, that in a charcoal of an inch diameter, there are no less than five millions seven hundred and twenty-four thousand pores.

It is to this prodigious number of pores that the blackness of charcoal is owing: for the rays of light, striking on the charcoal, are received and absorbed in its pores, instead of being reflected; whence the body must of necessity appear black, blackness in a body being no more than a want of reflection.

Mathematical instrument makers, engravers, &c. find charcoal of great use to polish their brass and copper plates, after they have been rubbed clean with powdered pumice-stone. Mr. Boyle says, that the more curious burn it a second time, and quench it in a convenient fluid. Plates of horn are polishable the same way, and a gloss may be afterwards given with tripoly.

Charcoal and foot-black are the two most durable and useful blacks of the painter, and the varnish-maker. Those of the former kind are used both as pigments and pencils; and charcoal crayons prepared from the willow are preferred on account of their softness. See concerning them Lewis's *Commercium Phil. Techn.* p. 536.

Charcoal tinges glass in fusion yellow, reddish, &c. and by baking stains it yellow. See *ibid.* p. 628. See also his observations on the differences of different charcoals, &c. and of the manner of distinguishing between the vegetable and animal, *ibid.* p. 336. and seq.

Charcoal was anciently used to distinguish the bounds of estates and inheritances; as being supposed incorruptible, when let very deep within the ground. In effect, it preserves

serves itself so long, that there are many pieces found entire in the ancient tombs of the northern nations.

M. Dodart says, there is sometimes found charcoal made of corn, probably as old as the days of Cæsar: he adds, that it has kept so well, that the wheat may be still distinguished from the rye; which he looks on as a proof of its incorruptibility.

CHARCUON, in *Geography*, a town of Persia, in the province of Farfahan; 70 miles S.E. of Schiras.

CHARD, an ancient town of Somersetshire, England; is situated in the southern part of the county, and consists of 248 houses, which are disposed in two streets intersecting each other. This place was anciently denominated *Cerdie*, which name, according to Mr Collinson, it obtained from *Cerdie*, a Saxon chief, who was repeatedly engaged against the Britons in this part of the island. Two or three springs rise in the immediate vicinity of the town, and this part of the county is so high, that the streams of water may be turned either north into the Bristol channel, or south into the British channel. Chard, in the reign of Edward I. was made a free borough, and sent members to parliament nine times; but it afterwards lost this privilege. A market was formerly kept here on Sundays, but the market day is now Monday, and is well supplied with corn, and vast quantities of potatoes. Collinson's *History of Somersetshire*, 4to. vol. ii.

CHARDIN, JOHN, in *Geography*, the son of a jeweller at Paris, of the Protestant persuasion, who distinguished himself as a traveller. He was born at Paris in 1643, and followed the profession of his father. At the age of 21, he set out on his travels, and remained for a considerable time in Persia. After his return in 1670, he printed at Paris an account of the coronation of Soliman III. king of Persia, together with the principal events that introduced his reign. In the year 1671 he again departed for the east, and having spent several years in Persia and the East Indies, he collected various particulars of curious information concerning the state of those countries, which he published after his return to Europe. In 1681 we find him in London, where he was knighted by Charles II. and appointed his majesty's jeweller. He married the daughter of a French refugee in London, and died in this city in the year 1713. A collection of his travels was published in 10 vols. 12mo. in 1711, and in 4 vols. 4to. in 1735, at Amsterdam. They were translated into English, German, and Flemish: and as they contain authentic and valuable information, with regard to the religion, manners, products, and commerce, &c. of the countries he visited, they obtained an extensive circulation. Among other curious particulars, he records several medical facts; and particularly an account of his own case, when he was attacked with a dangerous fever at Gombroon, and cured by the country physicians, who employed the repeated affusion of cold water. This fact has suggested an useful hint to modern practitioners.

CHARDIN. See JARDYN.

CHARDOGNE, in *Geography*, a town of France in the department of the Meuse, and district of Bar-le-Duc; 4 miles N. of it.

CHARDON, in *Conchology*. The French distinguish a species of ray by this name, the *Raja fullonica* of Linnaeus, which see.

CHARDON pour monter a Passant, in *Military Language*. When the use of crampons (creepers or clamp-irons) was not at all known, the soldier, to avoid slipping down in mounting the breach, or to the assault, took off one shoe. At present he makes use of a *crampon*, or *chardon* of iron, which is fastened with a strap and buckle, or by means of a screw to the heel of the shoe. But this last method does not

seem to be sufficiently firm or solid, particularly for assaults of much danger.

CHARDONS, points of iron, like those of darts, placed on the top of a grate, or the coping of a wall, to prevent any person's getting over them.

CHARDONNERET, *Chardonneret jaune*, &c. in *Ornithology*, the name under which Buffon and other French authors describe *Fringilla tristis*, which see.—Called by Pennant and Latham the American Goldfinch.

CHIARDS, in *Gardening*, is a term which is applied to different parts of different sorts of vegetables after they have undergone a sort of blanching, and are become tender by being tied up or covered in some way or other. Thus in the *artichoke* they are the leaves, which have been wrapped up during the autumn and winter with straw bands, the tops of the plants being only just left out. And in the *whitè beet* they are the downy shoots of the tops of such plants as have been covered with long dry dung during the winter season.

CHARE CULLOU, in *Geography*, a town of Asia, in the province of Cabul; 42 miles S.W. of Cabul.

CHARENTE, a river of France, which rises in the department of the Upper Vienne, passes by, or near to, Civray, Ruffec, Vertheuil, Mansle, Angoulême, Jarnac, Cognac, Saintes, Rochefort, &c. and discharges itself into the sea, about eight miles below Rochefort, opposite to the isle of Oleron.

CHARENTE, department of, a district or division of France, taking its name from the river Charente, which passes through it, and formed of Angoumois, and a part of Saintonge. It is bounded on the north by the departments of Upper Vienne, and the Two Seves; on the east by those of Upper Vienne and Dordogne; on the south by those of Dordogne, and Lower Charente, which bounds it also on the west. Its length from N.E. to S.W. is about 56 miles, its average breadth 30 miles, its territorial extent about 6310 kilometres, or about 1,153,684 square acres, and its population about 321,477 persons. It is divided into five communal districts, which comprehend 28 cantons, and 455 communes. Its capital is Angoulême. This department, in the 11th year of the French æra, contributed 2,978,059 francs, and was charged with an expence towards the support of administration, justice, and public instruction, of 279,619 francs, 66 cents.

CHARENTE, Lower, department of, is situated on the sea-coast, north of the river Gironde, and takes its name from the river Charente, which crosses it near its center: it is composed of Aunis and a part of Saintonge. It is bounded on the north by the departments of La Vendée, and the Two Seves; on the east, by a part of that of the Two Seves, and by that of Charente; on the south, by the departments of Dordogne and Gironde; and on the west by the ocean. Its length is somewhat more than 80 miles, and breadth unequal, being towards the south about 10 miles, towards the north about 20, and in some parts nearly 40. Its territorial extent is 7247½ kilometres, or about 3,404,460 square acres, or 716,814 hectares: its population consists of about 402,105 persons: it is divided into six communal districts, comprehending 37 cantons, and 506 communes; its contributions amount to 4,105,914 francs, and it is charged with expences to the administration, judiciary, and public instruction, amounting to 331,035 francs, 66 cents. The capital is Saintes.

CHARENTENAY, a town of France, in the department of the Yonne, 7 miles S. of Auxerre.

CHARENTON, JOSEPH NICHOLAS, in *Biography*, a French Jesuit, was born at Blois in 1659; and having spent 15 years as a missionary in Persia, settled at Paris, and pursued his studies till his death in 1735. Besides a translation of two devotional pieces of Thomas a Kempis, he also published "The General History of Spain, by Father Mariana,

translated into French, with historical, geographical, and critical notes, medals, and maps;" 5 vols. 4to. Paris 1725; to which he has added a valuable preface. This work is held in considerable estimation.

CHARENTON, in *Geography*, a town of France, in the department of the Cher, and chief place of a canton, in the district of St. Amand; 5 miles E. of it. The place contains 1148, and the canton 5307 inhabitants; the territorial extent comprehends 255 kilometres, and 11 communes.—Also, a town of France in the department of the Seine, and chief place of a canton, in the district of Sceaux. The place contains 826, and the canton 7773 inhabitants: the territorial extent includes 68 $\frac{7}{10}$ kilometres, and 11 communes.

CHARERA, *La*, a town of the island of Cuba; 5 miles W. of Havana.

CHARERI, a town of the kingdom of Naples, in the province of Calabria Ultra; 9 miles S. of Girace.—Also, a river of Naples, which runs into the sea 10 miles S.S.E. of Girace.

CHARES, in *Biography*, a famous statuary, was a native of Lindus, and a disciple of Lyfippus; and his name is transmitted to us as the fabricator of the Rhodian Colossus of the Sun, which was a metal statue of an immense bulk. See COLOSSUS.

CHARES, in *Ancient Geography*, a river of Peloponnesus, in the Argolide, near which, according to Plutarch, was fought a severe battle between Aratus and the tyrant of Argos.

CHARGE, in *Electricity*, in a strict sense, denotes the accumulation of the electric matter on one surface of an electric, as a pane of glass, Leyden phial, &c. whilst an equal quantity passes off from the opposite surface: or, more generally, electrics are said to be charged, when the equilibrium of the electric matter on the opposite surfaces is destroyed, by communicating one kind of electricity to one side, and the contrary kind to the opposite side; nor can the equilibrium be restored till a communication be made by means of conducting substances between the two opposite surfaces. And when this is done, the electric is said to be discharged. The charge properly refers to one side, in contradistinction from the other; since the whole quantity in the electric is the same *before* and *after* the operation of charging; and the operation cannot succeed, unless what is gained on one side be lost by the other, by means of conductors applied to it, and communicating either with the earth, or with a sufficient number of non-electrics. In order to facilitate the communication of electricity to an electric plate, &c. the opposite surfaces are coated with some conducting substance, usually with tin-foil, within some distance from the edge; in consequence of which the electricity communicated to one part of the coating is readily diffused through all parts of the surface of the electric in contact with it; and a discharge is easily made by forming a communication with any conductor from one coating to the other. If the opposite coatings approach too near each other, the electric matter forces a passage from one surface to the other, before the charge is complete. And some kinds of glass have the property of conducting the electricity over the surface, or of being permeable to it, so that they are altogether unfit for the operation of charging and discharging. Mr. Canton supposes that this quality of glass is owing to its unvitrified parts. If, indeed, the charge is too high, and the glass plate or phial too thin, the attraction between the two opposite electricities forces a passage through the glass, and makes a spontaneous discharge, and the glass becomes unfit for farther use. See CONDUCTORS, ELECTRICS, LEYDEN PHIAL, &c.

CHARGE, in *Military Affairs*, has chiefly these three meanings, viz. an attack, an accusation, and a load or quantity of powder. The French make use of it technically in the first of these general meanings, in two different senses, using the

terms *charge précipitée*, and *charge a volonté*. The charge précipitée is given when the four times are precisely marked, as *charges vos arms, un, deux, trois, quatre*; and is chiefly applicable to the drill. The charge a volonté is executed in the same manner as the charge précipitée with this difference only, that the soldiers do not wait for the specific words.

It was a maxim with most of the ancients to charge with vault shouts, mixed with their martial music. The Gauls, the Germans, the Parthians, and all the barbarians in general, observed this custom. The Turks have preserved it, and march towards the enemy with the most terrible howlings: they believe, and not without reason, that these howlings animate the soldier, divert his thoughts from the dangers which surround him, and strike a terror into the enemy. The Romans, and some of the Grecians, such as the Argians, the Mantinæans, and the Macedonians, did the same; but they did it by rule; so that what was among the Barbarians, no better than a confused noise, excited by an impetuous motion, was among the others a matter of discipline. As soon as they came in sight of the enemy, they gave a general shout before they advanced nearer to him; and this shout was called "the shout of battle;" and it was from the manner in which it was given, the general formed his judgment of the disposition of his troops. The Samnites and the Etrurians had the same custom as the Romans. In an engagement between the latter and the Samnites, which terminated in the retreat of both, they kept looking at each other a long time, before either gave the shout; neither being willing to give it first. Crassus, as we are informed by Plutarch, after being harassed by the Parthians during a whole day, resolved to charge them with all his forces. He ordered the shout of battle; but he could perceive, by the feebleness with which it was given, that his soldiers were not in spirits; and that, therefore, he could entertain but little hope of success; accordingly, he was entirely defeated. The first shout used to be given by a signal from the trumpets, which soon after sounded to charge; the troops then put themselves in motion; and ran up to the enemy, exciting each other from time to time with repeated shouts. The Romans at the same time druck their javelins, or swords, against their targets, which still augmented the noise, and carried with it a very terrible air. If they happened to be repulsed, they set up a new shout every time they returned to the charge, but it was never given by the party which attacked. The second line, when it did not charge with the first, kept its shout till its turn for setting off came; as did likewise the reserve. These troops gave louder and louder shouts, in proportion as they redoubled their efforts. Some of the Greeks did not shout in charging, but only sung a kind of air, which they called "the hymn of battle." We still find traces of this custom among the Arnavuts, inhabitants of Macedonia, at present subject to the Turks. These people, stout and bold like their ancestors, engage with a rapid pace: the chief sings, and his troops answer, while they press forward with an accelerated velocity. These hymns should be short, and consist of short verses, set to a lively air. Horace speaks in one of his odes of a poet called Tyrtæus, who, in the wars of Messina, animated by his verses the Lacedæmonians to such a degree, that they thereby gained a complete victory. The Lacedæmonians, however, did not always follow this custom. In the time of Theucydides, they marched, in silence, to the sound of flutes, and by its cadence regulated their steps, the better to preserve their ranks. This, without doubt, suggested to marshal Saxe the first idea of marching to time, which much contributed to the perfection of the military art. Although the step of the Romans was not only regulated, but animated by the sound of warlike instruments, they thought the shout necessary

necessary at the time of their charging the enemy. As they charged running, the rapidity of their motion, joined to the noise of their own shouts, and of the trumpets and horns, inflamed them, and filled them with a sort of fury, which their leaders nevertheless knew how to moderate by the exactness of their discipline. Plut. in Crassum. Livy, l. x. c. 2. Cæsar de Bello Civili, lib. iii.

CHARGE de mine, or Charge of a mine, is the quantity of powder that is put into its chamber for the purpose of springing it, or making it explode.

CHARGE of powder, in Artillery Matters, is the quantity of powder put into a piece of ordnance for saluting, sealing, proving, or rejoicing; or for propelling, projecting, or throwing from it shot, bullets, shells, grenades, &c.

Various charges of powder are best adapted to the different uses to which artillery is applied, as field service, battering in breach, garrison-service, firing *en ricochet*, &c. &c.

The charge of powder for proving guns is equal to the weight of the ball; but for service the charge is one-half, or one-third of the weight of the ball, or even less; and, indeed, in most cases of service, the quantity of powder is too great for the proposed execution.

In the British navy, the allowance for thirty-two pounds is but seven-sixteenths of the weight of the bullet. But a late author is of opinion, that if the powder in all ship cannon whatever was reduced to one-third weight of the ball, or even less, it would be a considerable advantage, not only by saving ammunition, but by keeping the guns cooler and quieter, and at the same time more effectually injuring the vessels of the enemy. With the present allowance of powder, the guns are heated, and their tackle and furniture strained, and this only to render the bullet less efficacious. For a bullet which can but just pass through a piece of timber, and loses almost all its motion thereby, has a much better chance of rending and fracturing it, than if it passed through with a much greater velocity. See Robins's Tracts, vol. i. p. 290, 291.

Professor Euler concludes, from certain calculations, by means of which he has formed a table, representing the charges for the greatest velocity, that those assigned by Mr. Robins are much too great. See True Principles of Gunnery investigated and explained, &c. 1777. p. 129, 266.

Mr Robins observes, that the charge is not to be determined by the greatest velocity that may be produced; but that it should be such a quantity of powder as will produce the least velocity necessary for the purpose in view; and if the windage be moderate, no field-piece should ever be loaded with more than $\frac{1}{2}$, or at the utmost $\frac{2}{3}$ of the weight of its bullet in powder; nor should the charge of any battering piece exceed $\frac{1}{2}$ of the weight of its bullet. Tracts, &c. vol. i. p. 266, &c.

Different charges of powder, with the same weight of ball, produce different velocities in the ball, which are in the subduplicate ratio of the weights of powder; and when the weight of powder is the same, and the ball varied, the velocity produced is in the reciprocal subduplicate ratio of the weight of the ball; and this corresponds both to theory and practice. See Dr. Hutton's paper on Gun-powder, in the Phil. Trans. for 1778. p. 50. and his Tracts, vol. i. p. 266. This, however, is on a supposition that the gun is of an indefinite length; whereas, on account of the limited length of guns, some variation from this law occurs in practice, as well as in theory; in consequence of which it appears, that the velocity of the ball increases with the charge only to a certain point, which is peculiar to each gun, where the velocity is the greatest; and that, by farther increasing the charge, the velocity is gradually diminished, till the bore is quite full of powder. By an easy fluxionary process, it

appears, that, calling the length of the bore of the gun l , the length of the charge, producing the greatest velocity, ought to be $\frac{b}{2.718281828}$ or about $\frac{1}{3}$ of the length of the

bore; where 2.718281828 is the number whose hyperbolic logarithm is 1. But for several reasons, says Dr. Hutton, in practice, the length of the charge, producing the greatest velocity, falls short of that above mentioned, and the more so as the gun is larger. From many experiments, he has found the length of the charge, producing the greatest velocity, in guns of various lengths of bore, from 15 to 40 calibres, as follows:

Length of bore in calibres.	Length of charge for greatest velocity.
15	— $\frac{1}{3}$
20	— $\frac{2}{5}$
30	— $\frac{1}{2}$
40	— $\frac{2}{3}$

See CANNON.

CHARGE, in Gunnery, implies not only the quantity of powder put into a piece of ordnance for firing it with, but also the shot, shells, grenades, &c. with which it is loaded.

The success of a campaign, of a siege, or defence, often depends on the skilful and judicious application of artillery. But in almost every application of it, there is more powder than is either proper or necessary made use of; and our pieces of ordnance have in general by far too much windage.

CHARGE, in Military Language, denotes an attack either of infantry or of cavalry.

CHARGE bayonet, is a word of command given to infantry to rush on the enemy and attack them at the point of the bayonet.

CHARGE, to sound a, is a signal given by sound of trumpet for cavalry to commence the attack.

CHARGE, in Military or Martial Law, is the specification of any crime or offence, for which a commissioned officer, non-commissioned officer, or soldier, is tried by a court-martial. In all charges of this nature, the time and place, or when and where the crime or offence was committed, must be set forth with accuracy and precision.

CHARGE, in Heraldry, is applied to any figures or things which occupy the field of a shield of arms, and are placed either throughout the whole superficies of the escutcheon, or else in some special part of the same, whether it be animal, vegetable, or any other matter. Anciently, arms were simple and plain, consisting of few figures, distinctly placed in the field: the heralds of those times, as we find by their writings, being of opinion, that the less that appeared in a coat, the more honourable it was. As coats of arms increased in number, a deviation from their original plainness soon became unavoidable; and a conspicuous variation from each other was absolutely requisite, in order to their making a due armorial distinction between families. This was at first effected, either by a repetition, on the same escutcheon, of some one or other of those particular figures, which had before been used as charges, or by placing in the field two or more distinct bearings. This mode, however, was soon found to be inadequate to the purpose; for the continual multiplication of arms had exhausted all the variations that could be made with respect to the figures then used in heraldry, and required additional marks of distinction. Hence was introduced, from time to time, such a multitude of new charges, that there is scarcely any thing, either natural or artificial, that either is not, or hath not been, represented in the coat-armour.

Charges peculiar to the art and usage of armory, as the cross, chief, pale, fesse, &c. are called *proper charges*; and frequently ordinaries.

Bloom restrains the term charges to those additions, or re-wards

wards of honours, frequently placed on escutcheons, as cantons, quarters, grions, blasques, &c.

CHARGE, in *Law*, denotes the instructions given to the grand jury with respect to the articles of the inquiry, by the judge who presides on the bench.

CHARGE, also signifies a thing done that bindeth him who doth it; or that which is his to the performance of it; and **DISCHARGE** is the removal of that charge. Lands may be charged in various ways; as, by grant of rent out of it, by statutes, judgments, conditions, warranties, &c.

Lands in fee-simple may be charged in fee; and where a man may dispose of the land itself, he may charge it by a rent, or statute. Lit. sect. 648. Moor. Ca. 129. Dyer 10. If one charge land in tail, and land in fee-simple, and die, the land in fee only shall be chargeable. Bro. Cha. 9. Land intailed may be charged in fee, if the estate-tail be cut off by recovery: if tenant in tail charge the land, and afterwards levy a fine or suffer a recovery of the lands, to his own use; this confirms the charge, and it shall continue. 1 Rep. 61. If one joint-tenant charge land, and afterwards release to his companions, and die, the survivor shall hold it charged; but if it had come to him by survivorship, it would be otherwise. 6 Rep. 76. 1 Shep. Abr. 325. He that hath a remainder, or reversion of land, may charge it; because of the possibility that the land will come into possession, and then the possession shall be charged. But where one leases land for life, and grants the reversion or remainder over to A. B. who charges the land, and dies, and the tenant for life is heir to the fee; in this case he shall hold it discharged, for he had the possession by purchase, though he had the fee by descent. Bro. 11. 16. 1 Rep. 62.

If a rent be issuing out of a house, &c. and it falls down, the charge shall remain upon the soil. 9 E. IV. 20. But when the estate is gone upon which the charge was grounded, then, generally, the charge is determined. Co. Litt. 349. And in all cases where any executory thing is created by deed, then, by consent of all the parties, it may be, by deed, defeated and discharged. 10 Rep. 29.

CHARGE, in the *Mangee*, a sort of unguent, made of oil, honey, grease, turpentine, and sometimes of lees of wine, and other matters, applied externally to a horse, &c. for the cure of strains, bruises, and swellings.

CHARGE, a military term for a few detached passages for trumpets, side-drums, and kettle-drums, performed when on the point of charging or attacking the enemy. "Sound the charge" is the command given to the trumpets; "Beat the charge" to the drums.

CHARGE, Fr. loaded, crowded with parts. This is said of *Musick*, when the subordinate parts are so loud and busy that the principal melody cannot be heard through them. See **CARICATA**, which has the same meaning in Italian. Rameau and Gluck have been accused of this redundancy of notes in their operas; the former from a systematic determination to give to every base its full harmony; the latter, perhaps, from a desire to please the French in their own way, by pursuing the method of Lulli and Rameau, but he likewise gratified his own taste in manifesting his ingenuity by giving to each part a different subject in the accompaniment, and also in giving way to the force and fire of his own genius. Piccini, in his early productions, put the instrumental performers in his operas to hard labour by giving them so many notes to execute, that he has been said at Naples, "to put the orchestra in flames." But this was in his comic operas, full of quarrels and *imbroglios*. The *Buona figliuola maritata* required more rehearsals than any opera that was ever performed in this country. But he did not crowd his score from pedantry or system, but to produce effects by the instruments

which it would have been ridiculous for even comic fingers to attempt. When Piccini gave way to his native fire and invention, it was for something ingeniously planned, and which when well executed, interested and delighted the audience.

CHARGE, or rather **OVERCHARGE**, in *Painting*, is an exaggerated representation of any person, wherein the likeness is preserved, but at the same time ridiculed.

Few painters have the genius necessary to succeed in these charges: the method is, to select and heighten something already amiss in the face, whether by way of defect or redundancy; thus, v. g. if nature have given a man a nose a little larger than ordinary, the painter falls in with her, and makes the nose extravagantly long; or if the nose be naturally too short, in the painting it will be a mere stump; and thus of the other parts.

De Piles observes, that there are charged outlines which please, because they are above the lowliness of ordinary nature, and carry with them an air of freedom, with an idea of a great taste, which deceives most painters, who call such excesses the grand manner. And although, to such persons, who have a true idea of correctness, simplicity, and elegance of nature, these excesses may seem superfluous, as they only adulterate the truth, yet one cannot forbear to commend some things that are overcharged in great works, when the distance whence they are to be viewed softens them to the eye; or when they are used with such discretion as makes the character of truth more apparent. It ought, however, to be remarked, that, in the antique statues, which are allowed to be the rule of beauty, nothing appears charged, nothing affected; nor is there any thing of that kind in the works of those who have always imitated them; as Raphael, Domenichino, Nicolo Poussin, and some others.

CHARGE of lead, is thirty six pigs. See **LEAD**, **PIG**, &c.

CHARGE, in *Sea-Language*, is sometimes used for burden; thus, a *ship of charge* is such as draws much water, or swims deep in the sea: though sometimes an unwieldy ship, that will not ware nor steer, is called a ship of charge.

CHARGED, in *Heraldry*. A shield, carrying on it some figure or impress, is said to be charged therewith.

So, also, when one bearing, or charge, has another figure added upon it, it is properly said to be charged. This was the ancient method of blazon; but it is now laid aside.

CHARGED cylinder, in *Gunnery*, is that part of the gun which contains the powder and ball.

CHARGEUR, a charge for great guns.

CHARGERS, are also either bandoleers, or little flasks that contain powder for charging and priming.

CHARGER, in *Military Language*, is likewise a term made use of to denominate a horse which an officer is mounted on in action.

CHARGER un Canon un Mortier, un Fusil, &c. is to put into it the powder, the ball, the shell, the cartridge, &c.

CHARGER l'ennemi, to charge the enemy; is to march towards the enemy directly in front, receiving his first fire, but reserving your own. You are then sure to fight to advantage, as you have gained ground, a circumstance that seldom fails to ensure success to the assailants, and to discourage those who are attacked. This phrase is also employed to denote the pressing upon, pursuing an enemy, and the obstructing and shutting up his communications, ways, and passages.

CHARGER l'épée à la main, to charge sword in hand. Before the use of the bayonet, the soldier took his musket by its rest in his left hand, and charged the enemy with his sword

sword in his right; which method of charging must have been very inconvenient, fatiguing, and difficult. M. le maréchal de Puységur, in his art of war, derives this phrase from the time when the musket was used without the bayonet.

CHARGES MILITAIRES; all employments, offices, or appointments by brevet, from a field-marshal of France down to the lowest subaltern officer, were called *charges militaires*. But the office or appointment of intendant general of stores and provisions, and all those of a similar nature, constituting the suite of an army, and part of its staff, do not come under the denomination of *charges militaires*.

CHARGEUR, an artificer, whose duty or business it is to charge or load the cannon.

CHARGEY, in *Geography*, a town of France, in the department of the Upper Saône, and district of Gray; 1 league N. of Gray.

CHARIDEMUM PROMONTORIUM, in *Ancient Geography*, *Gabo del Gata*, a promontory of Spain, at the extremity of the coast of Bætica.

CHARIENTISMUS, in *Rhetoric*, a figure wherein a taunting expression is softened by a jest.

CHARILLOS, *Los*, in *Geography*, a town of South America, in Peru, and in the jurisdiction of Lima.

CHARIN, or **CARIN**, **LEWIS**, in *Biography*, an eminent scholar and physician, was born at Lucern in Switzerland, in the beginning of the 16th century. In the early part of his life he was preceptor to part of the family of the Fuggers. In Basse, where he died in 1569, he was in considerable repute for his skill in the practice of medicine; but his name is recorded principally for having left by his will provision for founding, and supporting for ever, three scholarships in the university of that city. Eloy. Dict. Hist.

CHARINA, in *Ancient Geography*, a place of Asia, in Chabadenæ, to the east of mount Zærus in Media.

CHARINDAS, a river of Asia, in Media, according to Ptolemy.

CHARIOPOLIS, a place situated towards Thrace and Macedonia.

CHARIOT. See **COACH**. Chariots were used both for military purposes, and in the Olympic games. *War-chariots* were very generally used by the ancient inhabitants of various nations. We learn from Homer, and from the Sacred Writings, that they were used in many parts of the eastern world for military purposes. Among the Medes and Persians they had chariots with two wheels, which were generally drawn by four horses a-breadth, with two men in each; one of distinguished birth and valour who fought, and the other only for driving the chariot. Cyrus, however, thought this method very expensive, and of little service; because the equipment of 300 chariots required 1200 horses and 600 men, of whom only 300 fought; the other 300 who were persons of distinction, and capable of performing signal service, being occupied merely as charioteers or drivers. To remedy this inconvenience, he altered the form of the chariots, and doubled the number of fighting men that rode in them, by putting the drivers into a condition to fight, as well as the others. He caused the wheels of the chariots to be made stronger, so that they might not be so easily broken; and their axle-trees to be made longer, that they might thus become more firm and steady. At each end of the axle-tree he caused fesythes to be fastened that were three feet long, and placed horizontally; and he caused others to be fixed under the same axle-tree with their edges turned to the ground, that they might cut in pieces men or horses, or whatever the impetuous violence of the chariots should overturn. It appears from several passages in ancient

authors, that, in after times, they armed the beam or pole to which the horses were fastened with pikes, having iron points which projected forward; the yokes of the horses had also pointed irons three cubits in length; and the hinder part of the chariot was armed with several rows of sharp knives to hinder any force encountering behind. Between the spokes of the wheels were placed javelins, and even the fellyes of the wheels were furnished with fesythes, which tore every thing they met with to pieces. The driver of one of these carriages was called the charioteer; and his seat was a kind of little tower, made of very solid wood, and raised breast high. Sometimes the tower was large enough to hold several armed men, who threw showers of darts and arrows at the enemy. Chariots of this kind were in use for many ages in all the eastern countries. They were regarded as the principal strength of the armies, as the most certain instruments of victory, and as an apparatus the best adapted to strike the enemy with consternation and terror. In proportion, however, as the military art improved, the people found the inconveniences attending them, and at length laid them aside. For, in order to obtain any advantage from them, it was necessary to fight in immense plains, where the ground was very even, and where there were no rivulets, grottoes, woods, or vineyards. Several methods were also contrived, in process of time, to render them absolutely useless. A ditch was cut in their course which was sufficient to stop their progress. Sometimes an able and experienced general, as Eumenes in the battle which Scipio fought with Antiochus, attacked the chariots with a detachment of fencers, archers, and spearmen, who, spreading themselves on all sides, poured such a shower of stones, arrows, and lances upon them, the whole army shouting at the same time so loud, that they terrified the horses of the chariots, and occasioned such disorder among them, as often made them turn round, and run foul upon their own forces. At other times they rendered the chariots ineffectual and inactive, only by marching over the space which separated the two armies, with an extraordinary swiftness, and advancing suddenly upon the enemy. The strength and execution of the chariots depended on the length of their course; and this gave impetuosity and rapidity to their motion, without which they were feeble and insignificant. It was after this manner that the Romans under Sylla, at the battle of Chærona, defeated and put to flight the enemy's chariots by raising loud peals of laughter, as if they had been at the games of the circus, and by crying out that they should send more. Diod. Sic. l. xvii. Q. Curtius l. iv. Xenoph. Cyrop. lib. vi. Livy, l. xxxvii.

In the western world war-chariots were much used in ancient times. Accordingly we find that those who fought from chariots of this kind, constituted the most remarkable corps in the armies of the ancient Britons. This formidable corps seems to have been chiefly composed of persons of distinction, and the very flower of their youth. As this singular art of war was, at the period to which we now refer, almost peculiar to the ancient Britons, and they greatly excelled and delighted in it, we shall give a brief description of the different kinds and constructions of their war-chariots, and of their way of fighting from them. Before Britain was invaded by the Romans, if we consider the imperfect state of some of the most necessary and useful arts in the country, we could hardly expect to find in it wheel-carriages of any kind, much less chariots for land. For pleasure, and for war, of various forms, and of elegant and curious workmanship. It appears, however, from the concurring testimonies of many writers of the most unquestionable credit, that there were such chariots in prodigious numbers, even in the most remote and uncultivated parts of this island in these ancient times.

times. (Tacit. vit. Agric. c. 12. 36. Cæf. de Bell. Gall. l. iv. c. 24. 32. l. v. c. 16. 19. Xiphilin. ex Diore in Sever. Dio Cassius l. ix. Mela. l. iii. c. 5. Strabo. l. iv. p. 200. Diod. Sicul. l. v. c. 346.) The wheel-carriages and war-chariots of the ancient Britons are mentioned by Greek and Roman authors under several different names, particularly the following six, viz. *Benna*, *Peloritum*, *Carrus*, or *Carrus*, *Corvus*, *Effellum*, and *Rheda*. The *Benna* seems to have been a kind of carriage used rather for travelling than for war. It contained two or more persons who were called *Commenones*, from their sitting together in the same machine. It probably derived its name from the British word *Benn*, head or chief; and these carriages might have obtained this appellation from the high rank of the persons who used them. The *Peloritum* seems to have been a larger kind of carriage than the former, and is thought to have derived its name from having four wheels, as *p.lear* in the British language and *p.ors* in the Æolic dialect of the Greek tongue, (which was spoken by the people of Marseilles in Gaul) signify four. The *Carrus*, or *Currus*, was the common cart or waggon, used by the ancient Britons in time of peace, for the purposes of agriculture and merchandise, and in time of war, for carrying their baggage, and wives and children, who commonly followed the armies of all the Celtic nations. The *Corvus* was a war-chariot, and a very terrible instrument of destruction; being armed with sharp scythes and hooks for cutting and tearing all who were so unhappy as to come within its reach. This kind of chariot was made very slight, and had few or no men in it besides the charioteer; being designed to drive with great force and rapidity, and to do execution chiefly with its hooks and scythes. The *Effellum* and *Rheda* were also war-chariots, probably of a larger size, and more strongly made than the *corvus*, and designed for accommodating a charioteer for driving it, and one or two warriors for fighting. The greatest number of the war-chariots of the ancient Britons were of this kind.

Two circumstances respecting these war-chariots are very remarkable; viz. their number and the admirable dexterity with which they were managed and conducted. Cæsar acquaints us (De Bell. Gall. l. v. c. 19) that after Cassibelanus had dismissed all his other forces, he still retained no fewer than 4000 of these war-chariots about his person. The same illustrious warrior and writer, who was an attentive observer of every thing of this kind, gives us (De Bell. Gall. l. iv. c. 23) the following account of the dexterity with which the Britons managed their war-chariots: "Their way of fighting with their chariots is this: first, they drive their chariots on all sides, and throw their darts; inasmuch that by the very turn of their horses, and noise of the wheels, they often break the ranks of the enemy. When they have forced their way into the midst of the cavalry, they quit their chariots and fight on foot. In the mean while the drivers retire a little from the combat, and place themselves in such a manner as to favour the retreat of their countrymen, in case they should be overpowered by the enemy. Thus in action they perform the part both of nimble horsemen and of stable infantry, and by continual exercise and use have arrived at that expertness, that in the most steep and difficult places, they can stop their horses upon full stretch, turn them which way they please, run along the pole, rest on the harness, and throw themselves back into their chariots, with incredible dexterity." War-chariots had also been used by the people of Gaul in former times; but they seem to have laid them aside before they were engaged with the Romans under Julius Cæsar; (Diod. Sic. l. v. p. 352. Liv. Hist. l. x. c. 28.) for that general makes no mention of them in

any of his battles with the Gauls. It is probable, therefore, that in Cæsar's time chariot-fighting was known and practised only in this island, and continued to be so until it was subdued by the Romans, and longer in those parts of it that were not conquered. When we consider what a singular and formidable appearance to prodigious number of these war chariots, driven with such rapidity, and managed with such dexterity, must have made in advancing to the charge, we need not be surpris'd that the Roman soldiers, though the bravest and most intrepid of mankind, were so much disconcerted, as we are told they were, by this way of fighting. Cæf. de Bell. Gall. l. v. c. 15, 16.

Chariots were used in the celebration of the Olympic games; and they were introduced into these games in the 25th olympiad. Indeed it appears, from the story of Oenomaus and Pelops, that the chariot-race was known in Elis, even before the institution of the Olympic games; and therefore it seems to have been discontinued on account of the great scarcity of horses throughout all Greece, not only at the time of the revival of these games, but for many olympiads after, and also on account of the great expence that attended the breeding and managing of horses, and perhaps from the little estimation in which the Olympic games were held at their re-institution. In process of time they acquired extraordinary celebrity, and the introduction of the chariot-race, as well as the race of riding-horses, admitted in the 33d olympiad, served to encourage those who excelled in the breeding and managing of horses, and thus to excite an emulation which tended to supply Greece with a flock of these animals, which were so much wanted. Accordingly we find that the rich and noble became competitors in the chariot-race; and Alcibiades in particular outshone not only all his competitors, but all who either before or since contended for the honour, in the number and magnificence of his chariots, and in the victories obtained by them: for he brought at once seven chariots into the course, and carried off at the same time, the first, second, and fourth prize, according to Thucydides (l. vi.), or third, according to Isocrates and Euripides; the last of whom composed an ode upon the conqueror, part of which is quoted by Plutarch. In this ode the poet compliments Alcibiades upon his having gained at once three prizes; a thing, says he, which no Greek had ever done before him. The Eleans, when they introduced the chariot-race into the Olympic games, were particularly desirous of inducing the wealthy to aspire after the Olympic olive, as they alone were able to support the great expence that necessarily attended the breeding, keeping, and managing of horses; and, therefore, they wisely made the conditions of obtaining the prize as easy as possible, by exempting them from the trouble and danger of driving their own chariots. No one, however, was prohibited from driving his own chariot; and the office of charioteer was anciently far from being dishonourable; besides, the skill of managing the horses, which were then used only in chariots, was reckoned among the accomplishments of a hero; but when chariots came to be laid aside in war, which seems to have happened soon after the heroic ages, the usefulness, and consequently the reputation, of that art began to decline by degrees, whence it soon came to be lodged in inferior hands. Although the master of the horses was proclaimed the conqueror, and received the crown, the horses had a share of the honour, and were crowned and the congratulations and applauses of the whole assembly. A crown was also given to the charioteer, to whose skill and courage the victory was always in a great measure owing. Skill and courage were indispensably necessary to finish happily a course, which the many short turnings round the pillars, and the number of

CHARIOT.

chariots which sometimes ran together, rendered extremely difficult and dangerous. Alcibiades, we have already said, brought at one time for his own share seven chariots, and he must have had competitors who disputed the crown with him. Sophocles speaks of 10, and Pindar of no less than 40 chariots, which contended at the same time. The number, therefore, of carriages must have embarrassed the competitors on these occasions; more especially when attention is given to the course itself. See HIPPODROME.

When we consider the form of the chariots, the attitude of the drivers, the rapidity of the motion, and the accidents that were likely to occur, arising from the nature of the course, and the number of chariots that frequently ran together, we have less occasion for wonder at their being thrown out of their chariots and put in danger of their lives, than at their maintaining their posts amid so many difficulties, and coming off with safety and success. These chariots, by some figures of them upon ancient medals, &c. seem to have been very low, open behind, but closed up before and on the sides, with a kind of parapet, which was sometimes enriched with various ornaments. There does not appear to have been any seat for the driver, who is therefore always represented standing, and leaning forward to the horses. They had but two wheels, and consequently the fore part of them must have been supported by the horses, which inevitably rendered their motion very unequal, and made it so difficult for the charioteer to keep upon his legs, that nothing but a long course of practice could insure a man from falling in such a situation. Nero, manifesting folly equal to his vanity, exposed himself to the danger of this exercise. He entered the Hippodrome in a chariot drawn by ten horses, which he undertook to drive himself, and was thrown out of his chariot, to the great hazard of his life; and though he was put into it again, he found himself unable to finish the race, and desisted. Nevertheless, he was proclaimed conqueror, and honoured with the Olympic crown. In return for the compliment, at his departure, he presented the Hellenodics, or judges of the games, with the sum of 250,000 drachmas, or about 8000 *l.* and all Greece with her liberty.

Upon the day of the race, the chariots, at a certain signal, marched out of the lodges in which they stood, and entering the course according to the order before settled by lot, were there drawn up in a line; but whether a-breast, or one behind another, is a question among the learned.

At the sound of a trumpet they all, sometimes to the number of 40, started from the barrier, and all pressed with ardour and emulation towards the same point or pillar.

“See’st thou not how, when from the goal they start,

The youthful charioteers with beating heart
Rush to the race, and panting fiercely bear
Th’ extremes of fervid hope and chilling fear;
Stoop to the reins, and lash with all their force;
The flying chariot kindles in the course.

And now a bow, and now aloft they fly,
As borne thro’ air, and seem to touch the sky.

No itop, no stay; but clouds of sand arise,
Spurn’d and cast backward on the follower’s eyes:

The hindmost blows the foam upon the first:
Such is the love of praise, an honourable thirst!”

Virg. Georg. III. Dryden.

Sophocles, in his tragedy of *Electra* (v. 700, &c.) has given a noble description of a chariot race in all its forms, of which we have a translation by Mr. West, (*ubi infra*).

Of chariots for the race, there were different kinds, subject to the same laws and customs, excepting that the length of the race was diminished for some of them. The chariot first introduced into the Olympic Hippo-

drome, was the *τελικον αρμα*, or complete chariot, so named either because it was drawn by full-aged horses, or because it was drawn by four horses, which number seems to have made a complete set among the ancients. These four horses were all ranged a-breast; the two middle ones only were harnessed to the chariot by the yoke; the two side horses were fastened either to the yoke or some other part of the chariot by their traces. Erichonius, according to Virgil, (*Georg.* l. iii.) was the first that drove with four horses, and, according to Manlius (l. i. l. 22.) he was for that invention honoured with a place among the heavenly bodies. Pagondas of Thebes had the honour of first obtaining the prize of this sort of chariot race in the Olympic games, as Erichonius had in the games called Panathenæa. In the 93d olympiad was added the race of the chariot called “Synoris,” which was drawn by a yoke, or one pair only of full-aged horses. The “Apené” was a chariot, drawn by two mules, and was introduced into the Olympic games by one Amandastus; but, as mules were held in abomination by the Eleans, and not allowed to be bred in their country, this race was abolished within a very few olympiads after its first admission. Pausanias (l. v. c. 9.) informs us, that it was introduced in the 70th olympiad, and abolished by proclamation in the 84th. In the 96th olympiad was introduced the *παλικον αρμα*, which was a chariot drawn by four colts, and the *Συναρ; τειλον*, or chariot drawn by two colts, which was introduced, according to Pausanias (l. v. c. 8.) in the 129th olympiad, and he says that Belistiché, a Macedonian lady, was the first that carried off the crown in that race. Mr. West has, by passages from Pindar, assigned to each species of the chariots above described, the different lengths of the race appropriated to it. The whole course or round, *Δρομος*, being equal to four stadia, it is inferred, that the two pillars, viz. that from which the horses started, and that round which they turned, which divided the course into two equal lengths, were two stadia distant from each other; consequently the whole length of the race of the *τελικον αρμα*, or chariot drawn by full-aged horses, consisting of 12 rounds, amounted to 48 stadia, or six Grecian miles; and that of the *παλικον αρμα*, or chariot drawn by colts, consisting of eight rounds, to 32 stadia, or four Grecian miles: and a Grecian mile, according to Arbuthnot’s computation, was somewhat more than 800 paces, an English mile being equal to 1056. For farther particulars, see West’s “*Dissertation on the Olympic Games*” in his translation of the Odes of Pindar, vol. iii. sect. 13. See also an elaborate dissertation on the ancient chariot, both for war and the race, by Mr. Pownall, in Berenger’s “*Art of Horsemanship*,” vol. i. p. 271, &c.

CHARIOT *a canon*, in *Military Language*, a car or carriage solely made use of for carrying and transporting the body of a piece of ordnance. Such chariots relieve the gun-carriages, require fewer horses, and get more easily along bad roads in the field and on a campaign.

CHARIOTS *d’une armée*, the chariots or carriages of an army. These may, in a variety of circumstances, be rendered of the greatest assistance and advantage by an able general, who sees himself followed or almost surprized by superior forces. He can employ them for covering his march; supporting his columns; and for preventing his being harassed by the enemy. He may make use of them to cover his camps whilst he is hurrying on his entrenchments. By shutting up the avenues to a single village, that an enemy wishes to take possession of, he may, by means of a proper disposition of them for that purpose, prevent a great effusion of blood.

When Alexander Far... was leading an army of Spaniards from... he marched with

with both flanks of his columns covered by his baggage-waggons and carriages. He found his security in that measure, and could not be attacked by Henry IV. who followed him with the intention of giving him battle.

CHARIOTS, in *Sylphology*, were sometimes consecrated to the sun: and the Scripture observes, that Josiah burnt those which had been offered to the sun by the kings his predecessors. This superstitious custom was an imitation of the heathens, and principal of the Persians, who had horses and chariots consecrated in honour of the sun. Herodotus, Xenophon, and Quintus Curtius, speak of white chariots, crowned, which were consecrated to the sun, among the Persians, and in their ceremonies were drawn with white horses, consecrated to the same luminary.

CHARIPHEON, in *Ancient Geography*, the name of the fourth mouth of the river Indus, in passing from the west towards the east, according to Ptolemy.

CHARIQUIL, in *Geography*, a town of Persia, in the province of Irak Aghem; 90 miles S.E. of Amadan.

CHARIS, in *Ancient Geography*, the name of a navigable river of the Colchide territory, according to Pliny. By Ptolemy it is called *Cheriffos*, and by Strabo *Choris*. Arrian denominates it *Chariets*, and places it between the Phasis and the Chobus, about 90 stadia from the one and the other. It is now named Tamasa.

CHARIS, a town of Asia, placed by Appian in Parthia.

CHARISASAR, in *Geography*, a town of Asia, in the country of Candahar; 15 miles N.E. of Candahar.

CHARISIA, in *Ancient Geography*, a town of Peloponnesus, in Arcadia. The ruins, according to Pausanias, lay between Scia and Tricoloni.

CHARISIA, in *Pagan Theology*, a wake or night-festival instituted in honour of the Graces. It continued the whole night, most of which time was spent in dancing; after which, cakes made of yellow flour, mixed with honey, and other sweet-meats, were distributed among the assistants. The word is also used to signify the sweetmeats distributed on such occasions.

CHARISIUS, **SOSPATER**, in *Biography*, a Roman grammarian, who flourished, according to Baillet, in the time of the emperor Honorius. He published five books of observations on grammar, still extant.

CHARISIUS, in *Pagan Theology*, a surname given to Jupiter. The word is derived from *χαρις*, favour; he being the god by whose influence men obtain the favour and affection of one another. On which account the Greeks used at their meals to make a libation of a cup to Jupiter Charisius.

CHARISPA, in *Ancient Geography*, a town of Bactriana, according to Ptolemy. The interpreters of his text suppose that it ought to have been Zarispa, which is the same with Bactra.

CHARISTIA, a family-feast celebrated among the Romans, on the eleventh of the calends of March; i. e. on the thirteenth of February, in honour of the goddess *Concord*.

The word comes from *χαρις*, grace, favour; a. d. a day of reconciliation, or of restoring into favour. It was also called *dies chara cognationis*. Vigenere, on Livy, calls it the *day of good cheer*.

The *charistia* was instituted to re-establish peace and unity in families embroiled, or at a variance among themselves. It consisted in a great entertainment made in each family, to which no strangers were admitted; but only relations and kindred. The joy and freedom inspired by the repast was looked upon as a proper means to reunite divided minds; to which the good offices of so many friends would greatly contribute.

CHARISTICARY, *Commentary*, or *Donatory*, a person to whom is given the enjoyment of the revenues of a monastery, hospital, or benefice.

The *charisticaries*, among the Greeks, were a kind of donatories, or commendatories, who enjoyed all the revenues of hospitals and monasteries, without giving an account the cost to any person.—The original of this abuse is referred to the Iconoclaste, particularly Conlantine Cepronvans, the avowed enemy of the monks, whose monasteries he gave away to strangers.

In after-times, the emperors and patriarchs gave many to people of quality, not by way of gift, to reap any temporal advantage from them; but to repair, beautify, and patronize them. At length avarice crept in, and those in good condition were given, especially such as were rich; and at last they were all given away, rich and poor, those of men and of women; and that to laymen, and married men.

M. Cotelier, in his *Ecclesiæ Græcæ Monumenta*, gives us the form of these donations: they were granted for life, and sometimes for two lives. See **ABBOT**.

CHARISTUS, in *Ancient Geography*, a river of the Colchide territory, according to Ptolemy; but his interpreter substitutes *Charus*.

CHARIT, in *Geography*, a town of Arabia; 24 miles N. of Sana.

CHARITABLE USES, in *Law*. See **COMMISSION** and **MORTMAIN**.

CHARITATIVE, in the *Canon Law*. A *charitative aid*, or *subsidy*, is a moderate allowance, which a council grants a bishop upon any urgent occasion; e. g. when his revenues will not bear his expences to a council.

CHARITE, **LA**, in *Geography*, a town of France, in the department of Nevre, and chief place of a canton in the district of Corne, seated on the Loire, in which are manufactures of woollen and hardware; 13 miles N.N.W. of Nevers. The place contains 4011, and the canton 11,827, inhabitants: the territorial extent comprehends 270 kilometres and 14 communes. N. lat. 47° 11'. E. long. 2° 55'.

CHARITIES, in *Law*, are subject in this country to the general superintendance of the king, as *patens patriæ*; which he exercises by the keeper of his conscience, the chancellor. And, therefore, whenever it is necessary, the attorney-general, at the relation of some informant (who is usually called the "relator"), files *ex officio* an information in the court of chancery to have the charity properly established. By statute, also, 43 Eliz. c. 4. authority is given to the lord-chancellor, or lord-keeper, and to the chancellor of the duchy of Lancaster, respectively, to grant commissions under their several seals, to inquire into any abuses of charitable donations, and rectify the same by decree; which may be reviewed in the respective courts of the several chancellors, upon exceptions taken thereto. But though this is done in the petty bag office in the court of chancery, because the commission is there returned, it is not a proceeding at common law, but treated as an original cause in the court of equity. The evidence below is not taken down in writing, and the respondent, in his answers to the exceptions, may allege what new matter he pleases; upon which they go to proof, and examine witnesses in writing upon all the matters in issue; and the court may decree the respondent to pay all the costs, though no such authority is given by the statute. And, as it is thus considered as an original cause throughout, an appeal lies of course from the chancellor's decree to the house of peers, notwithstanding any loose opinions to the contrary. Blackl. Comm. vol. iii. ch. 27. Lands that are given to alms and alienee, may be recovered by the donor. 13 Edw. I. c. 41. Lands, &c. may be given for the maintenance

nance of houses of correction, or of the poor. 37 Eliz. c. 7. § 27. Money given to put out apprentices, either by parishes or public charities, pays no duty. 8 Ann. c. 9. § 40.

CHARITY, one of the three grand theological virtues; consisting in the love of God and our neighbour.

Charity is the habit or disposition of loving God with all our heart, and our neighbour as ourselves. It has two material objects, therefore, as the school expresses it; viz. God and our neighbour.

CHARITY is also used for the effect of a moral virtue, which consists in supplying the necessities of others, whether with money, counsel, assistance, or the like.

CHARITY *briefs*. See BRIEF.

CHARITY, *brothers of*. See BROTHERS.

CHARITY, *frags of*. See AGAPE.

CHARITY-*schools*, are schools erected and maintained in various parishes, by the voluntary contributions of the inhabitants, for teaching poor children to read, write, and other necessary parts of education.

In most charity-schools the children are likewise clothed, and put out to trades, services, &c. on the same charitable foundation.

Charity-schools have spread throughout most of the considerable towns of Great Britain and Ireland; and do honour to the benevolent and patriotic spirit of the country, whilst they contribute, in a variety of ways, to the relief and advancement of individuals, and to the general prosperity and welfare of the nation.

In Scotland the establishment of parish schools has taught almost all the common people to read, and many of them to write and account. In England and Wales the establishment of charity-schools has had a similar effect, though not so universally, because the establishment has not been so universal; though liberal provision has been made, by private bequests and donations, for extending this public benefit. If in those little schools the books by which the children are taught to read were a little more instructive than they commonly are; and if, instead of a smattering of Latin, which the children of the common people are sometimes taught there, and which can scarcely ever be of any use to them; they were instructed in the elementary parts of geometry and mechanics, the literary education of this class of people would perhaps be as complete as it can be. There is hardly a common trade which does not afford some opportunities of applying to it the principles of geometry and mechanics, and which would not therefore gradually exercise and improve the common people in those principles, the necessary introduction to the most sublime as well as to the most useful sciences. The people might easily be led to encourage these most essential parts of education, by giving small premiums and little badges of distinction to the children of persons in the inferior ranks of life who excel in them. And the public might impose upon almost the whole body of the people the necessity of acquiring those most essential parts of education, by obliging every man to undergo an examination or probation in them before he could obtain the freedom in any corporation, or be allowed to set up any trade either in a village or town corporate.

It was in this manner, by facilitating the acquisition of their military and gymnastic exercises, by encouraging it, and even by imposing upon the whole body of the people the necessity of learning those exercises, the Greek and Roman republics maintained the martial spirit of their respective citizens. They facilitated the acquisition of those exercises, by appointing a certain place for learning and practising them, and by granting to certain masters the privilege of teaching in that place. Those masters do not ap-

pear to have had either salaries or exclusive privileges of any kind. Their rewards consisted in what they got from their scholars; and a citizen who had learnt his exercises in the public gymnasia, had no legal advantage over one who had learnt them privately, provided the latter had learnt them equally well. These republics encouraged the acquisition of such exercises, by bestowing little premiums and badges of distinction upon those who excelled in them. See more on this subject, on the importance and utility of the instruction of the poor, in Smith's *Wealth of Nations*, vol. iii. See also *SCHOOL* and *CHARTER-SCHOOLS*.

In London we had formerly a *charitable corporation* for the relief of the industrious poor, erected under queen Anne; for enabling indigent manufacturers and traders to take up money at common and legal interest; there being a sum of 30,000*l.* raised for that end.

The money was lent to the industrious poor at 5*l.* per cent. interest, on pawns and pledges, to prevent their falling into the hands of pawn-brokers; and hence the society derived its appellation: but they likewise took 5*l.* per cent. for the charge of officers, warehouses, &c. In the 5th year of king Geo. II. the chief officers of this corporation, by connivance of the principal directors, absconded and broke, and defrauded the public proprietors of great sums; and for relief of the sufferers, as to part of their losses, several statutes were enacted. See *stats.* 5 Geo II. c. 31. c. 32. 7 Geo. II. c. 11.

CHARITY, *order of*. There are several religious orders which bear this title: one instituted by St. John de Dieu, for the assistance of the sick: this institute was approved of in 1520, by Leo X. and confirmed by Paul V. in 1617. The religious of this order apply themselves wholly to the service of the diseased. See BROTHERS of Charity.

CHARITY of the *Holy Virgin*, is a religious order established in the diocese of Chalons, by Guy lord Joinville, &c. towards the close of the 13th century, approved under the rule of St. Augustine, by the popes Boniface VIII. and Clement VI.

In each parish of Paris, there was a society of women, who applied themselves to find out and relieve the wants of the poor of the parish; and on this account called, *Dames de la Charité*, and *Seurs de la Charité*.

CHARKE, RICHARD, in *Biography*, was a dancing-master, an actor, a man of humour, and a performer on the violin, with a strong hand. He was leader of the band at Drury-lane theatre. As a composer, he only distinguished himself by being supposed the first who produced that species of musical buffoonery called a "Medley Overture," wholly made up of shreds and patches of well-known vulgar tunes. But we believe that this very early species of pleatantry was first suggested by Dr. Pepusch, in the overture to the Beggar's Opera, brought on the stage in 1728, and Charke's medley overture bears date 1735. There is a slang horn-pipe under Charke's name, which used to be a favourite among the taw. We believe him to have been a facetious fellow, gifted with a turn for b. g. humour, of which, and of his tricks and stories, Dr. Arne, in moments of jocularity, used to give specimens.

He was married to Charlotte, the youngest daughter of Colley Cibber, a female not without talents as an actress; but of such an eccentric and indecorous character, that the memoirs of her life, though written and softened by being her own biographer, could never be read by persons of her own sex, not wholly abandoned. For many years of her life she never appeared on or off the stage in a female dress. Mademoiselle d'Leon's male habits during many years, were a real disguise and concealment; but Mrs. Charke's

fixed person being well known, her dress was no disguise, but a publication of her impudence.

As long as Charke was the leader of Drury-lane band, his concerto on the violin was the lure in the second music, two or three times a week; which many lovers of music used to go into the theatre to hear, who never laid till the curtain was drawn up, before which time their money was returned, if demanded. His debts obliged him to leave his cara spota; and, retiring to Jamaica, he there, in a short time, and in the prime of life, ended his days. Though this couple was allowed to possess talents of various kinds, there was nothing in which they manifested more ingenuity than in plugging each other.

CHARKINA, in *Geography*, a fortress of Russian Tartary, on the Don, in the government of Caucasus; 200 miles N.E. of Astrachan.

CHARKING, or **CHARRING**, the burning of wood to make charcoal.

CHARKLIQUEU, in *Geography*, a town of Asiatic Turkey, chiefly inhabited by tanners, who manufacture the beautiful morocco leather. The caravans stop here two or three days. The town is situated between Erzerum and Tocat.

CHARKOV, or **KHARKOF**, a government of Russia, formerly comprised in the government of Ukraina Slovdostia, and containing 15 districts. It is bounded on the north by Kursk, on the east by Voronetz, on the south by Catherineof, or Ekatherinofslaf, and on the west by Tchernizof and Kiof; about 180 miles in length, and from 40 to 80 in breadth.

CHARKOV, or **KHARKOF**, the capital of the above government, seated on the Uda, which falls into the Donetz, and forming one of the 15 districts of the government of the same name. It contains 10 churches, 2 convents, and several public seminaries; 350 miles S. of Moscow, and 640 S.S.E. of Petersburg. N. lat. 50° 25'. E. long. 35° 54'.

CHARKS, pit-coal charked, or charred. See **COAL**.

CHARLATAN, or **CHARLETAN**, an empiric or quack, who retails his medicines on a public stage, and draws the people about him with his buffooneries, feats of activity, &c.

The word, according to Calepine, comes from the Italian *celetano*, of *Cæretum*, a town near Spoleto, in Italy, where these impostors are said to have first risen. Menage derives it from *charlatano*, and that from *circulatorius*, of *circulator*, a quack.

CHARLEMAGNE, or **CHARLES I.** in *Biography*, king of France, and emperor of the West, was born in the year 742. By the death of his father Pepin the Short, in 768, and at the express desire of the dying monarch, Charles, in conjunction with his younger brother Carloman, succeeded to the throne of France. At first they appeared to rule the empire with equal and undivided authority: the partition of power, however, soon threatened mischief similar to those that had been experienced under the earlier sovereigns of France; but the death of Carloman, in 771, at the moment when he was meditating an open rupture with his brother, ensured the public tranquillity. Charles, thus rendered sole monarch of the Franks, was endowed by nature with all those qualities which could conciliate the affections of his subjects, by whom, it is said, he was equally beloved and revered. Unlike his father, he was tall in stature; his air was courteous and dignified; his body robust, and finely formed; his eye keen and penetrating, and his countenance open and prepossessing.

Having become, by the death of his brother, sovereign of a mighty empire, and freed from every thing that might shackle his genius, or set bounds to his ambition, his first object was to infuse a military spirit into the nation; he re-established the ancient assemblies of the field of Mars, and,

bestowing on them the title of parliaments, delegated to them a portion of his authority, by constituting them members of the legislation. In referring to this measure of state policy, he felt no apprehension for his own security: the force of his genius and the greatness of his talents placed him beyond the dread of any rival; he endeavoured, therefore, to infuse into all ranks of his subjects a thirst for military glory. By these means Charles was enabled to double the extent of his empire. The whole of Gaul, Italy, the vast territory which extends from the Rhine to the Vistula and to the Baltic, together with a great part of Spain, fell under his powerful dominion.

Previously to the death of Carloman, Charles had divorced his wife and married Bertha, daughter to Didier, king of the Lombards; this prince, however, granting an open protection to the widow and children of Carloman, with a view, no doubt, of possessing a part of his dominions, excited the jealousy of Charles, who obtained a second divorce. Didier, enraged at the humiliation, sought an alliance with pope Adrian, but having failed in the attempt, he attacked the papal territory, and endeavoured to seize on the person of the pope. Adrian solicited the succour of Charles, who instantly crossed the mountains, entered Italy, defeated his adversary, and thus put an end to the kingdom of the Lombards in Italy, which had lasted 206 years. Charles immediately took possession of the vacant throne, and was declared by the pope king of Italy, and patrician of Rome. In his first visit to the capital, the newly acknowledged sovereign was received with all the honours which had formerly been paid to the representative of the emperor; and these honours obtained new decorations from the gratitude of pope Adrian. No sooner was he informed of the approach of the monarch, than he dispatched the principal people of Rome to meet him, with the banner, about thirty miles from the city. At the distance of one mile, the Flaminian way was lined with the schools, or national communities of Greeks, Lombards, Saxons, &c.: the Roman youth under arms, and the children of a more tender age, with palms and olive branches in their hands, chaunted the praises of their great deliverer. At the sight of the crosses and other holy emblems, he dismounted his horse, led the procession of his nobles to the Vatican, and, as he ascended the stairs, devoutly kissed each step of the threshold of the apollie. The pope was waiting for him at the head of his clergy in the portico: they embraced as friends and equals, but in their march to the altar, the king assumed the right hand of the pope; nor was he content with a vain shew of respect. In the twenty-six years that elapsed between the conquest of Lombardy and his imperial coronation, Rome, which had been delivered by his sword, was subject, as his own, to the sceptre of Charles.

Previously to these successes in Italy, Charles had been called on to exhibit his military talents in a contest with the Saxons, who were inimical to the government and religion of the Franks. They rejected with contempt the servile obligations of tribute, and in successive engagements displayed a ferociousness of courage which could only be repelled by the superior skill and intrepidity of the troops of Charles. A decisive victory, after various less important defeats, obtained over them at Osnaburg, by which they lost their capital, their temple and their god Irmenful, obliged their leaders to sue for peace, and to accept of such terms as were imposed on them by the conqueror.

Scarcely had Charles returned, from receiving the oaths of allegiance and other marks of homage from his new subjects in Lombardy, where he had caused himself to be crowned, when another revolt of the Saxons recalled him to their country. They had already assumed a formidable appearance,

pearance,

pearance, and had recovered Erisbourg near the Weser, which had been wrested from them in a former campaign. Before the victorious arms of the French monarch this city was again compelled to submit, and the Saxons were obliged to purchase a peace by delivering up some of their principal people as hostages. It was, however, nearly thirty years, before he could completely subdue the free spirit of the Saxons; these hardy warriors possessed a courage equal to his own, by which they were rendered impatient of a foreign yoke. Charles, apprehending that Christianity would be an infallible means to subdue their bold and impetuous character, had no sooner brought them under some degree of subjugation than he sent missionaries among them; but they considering every attempt to convert them to a new religion as snares intended to enslave them, resisted all the persuasions and entreaties of the priests sent to offer them the rites of baptism. As they were not to be influenced by the milder arts of expostulation and reasoning, and as they could not for a single day be depended on by reason of any oaths or treaties in which they occasionally engaged; Charles, though naturally generous and humane, at length resorted to acts of the most savage cruelty. Four thousand of them who refused to submit were butchered in one day, on the banks of a small river which discharges itself into the Oder. At another time, besides ravaging their country with fire and sword, he had decimated in cool blood all the inhabitants for their revolts, and had obliged them, by the most rigorous edicts, to make a seeming compliance with the Christian doctrine and ceremonies. By these and several other acts, that have indelibly stained the character of the hero, did Charles finally subdue the proud and lofty spirit of the Saxons.

In the year 778, the protection of Charles was sought by some of the Moorish princes in the north-western parts of Spain: to their entreaties he lent a ready ear, assembled an army, crossed the Pyrenées, marched to Saragossa, which he took, and received the submission of the Saracen leaders. His victories in Spain were very important, but on his return, the rear guard of his army was defeated in the Pyrenean mountains; and many of the principal people attached to his person and court were cut off in this disaster, among whom was his nephew Rowland, whose untimely death laid the foundation of Ariosto's celebrated poem, entitled "Orlando Furioso."

In the year 779, Charles, with his queen, and two infant sons, Carloman and Lewis, re-passed the Alps, reposed during the winter at Pavia, and on the approach of the spring entered Rome amidst the triumphant acclamations of the inhabitants, who regarded him as the protector of their city and rights. In that city, and in the presence of the Roman pontiff, on Easter-day, when he was yet but 39 years of age, he divided his dominions between his sons, conferring on Carloman, who then received the name of Pepin, the kingdom of Lombardy, and on Lewis that of Aquitain. The latter he conducted in person to his dominions, and at the same time received the homage of Tassillon, duke of Bavaria, who had on former occasions openly shewn himself the friend and ally of the rebellious Saxons. Notwithstanding the professions of this prince, he took every means secretly of attacking the power and influence of Charles, till, at length, he was convicted of having entered into a rebellious confederacy with the French monarch's own subjects: the evidence of his guilt was incontrovertible, and having fallen into Charles's power, he was condemned to lose his head: the punishment was, however, commuted into perpetual imprisonment, and the principality of Bavaria was annexed to the dominions of Charles.

The fate of Tassillon did not crush the designs of his confederates, the Huns and the emperor of the East; but their enterprises served only to augment the glory of Charles, and his commanding genius triumphed over the Greeks in the plains of Italy. The latter renounced for ever the fortunes of Adalgive, the son of Didier; and with the young prince, the hope also of restoring the kingdom of the Lombards: but the former still continued their desultory incursions, and provoked the victorious king of the Franks to retahate the calamities which they had inflicted on Bavaria. At the head of a formidable army, he invaded the country of the Huns, forced their intrinchements in an obstinate engagement, and penetrated as far as Raal on the Danube.

The dissensions of the Moorish chiefs invited Charles to the conquest of the islands of Majorca and Minorca; but the satisfaction which he felt from this expedition was more than balanced by the tumults which prevailed at Rome, on account of the election of Leo III. as successor to Adrian. The cause of Leo against his rival was zealously espoused by Charles, who sympathized in all the sufferings of the pontiff, and, what was of more importance to his situation, rendered him every assistance that his case required.

Charles had been accustomed to pass annually from the Pyrenées into Germany, and thence to Italy. At the latter end of the year 799, as he was approaching Rome in one of these journeys, pope Leo dispatched a messenger to meet him, with the keys of St. Peter, and the standard of the city; thus rendering him every respect, religious and civil, of which he was capable. On the festival of Christmas, which was then the first day of the new year, Charles appeared in the church of St. Peter; and to gratify the vanity of Rome, he had exchanged the simple dress of his country for the habit of a patrician. After the celebration of mass, at which the king had devoutly assisted, the pope suddenly placed a precious crown on his head, and the dome of the church resounded with the acclamations of the people. "Long life and victory to Charles, the most pious Augustus, crowned by God the great and pacific emperor of the Romans." The pope immediately consecrated the monarch, and conducting him to a throne, paid him those marks of respect which had been claimed by the ancient Cæsars. Charles from this time indissolubly blended, in the name of Charlemagne, the appellation of *Magnus*, the Great. In a familiar conversation with his secretary and son-in-law, Eginhard, he protested his ignorance of the intentions of the pontiff: if, however, he did not seek or even expect the honours devolved upon him, he nevertheless was ambitious in maintaining them, and insisted on being recognized as emperor of the West, by all those princes with whom he had any correspondence.

Among the ambassadors who came to congratulate the good fortune of the emperor, were those of the caliph Harun-Al-Raschid, who ceded to him the sepulchre and the sacred places of the city of Jerusalem. But a still more interesting negotiation was intrusted to the ministers of Irene, the empress of the East, who, having rendered herself odious to her subjects, by the murder of her own son, endeavoured to secure the protection of Charlemagne, by a proposal of marriage. The emperor entertained the idea, and dispatched ambassadors to the Byzantine court to arrange the necessary preliminaries to so important a treaty. In the mean time she was dethroned by Nicephorus, who ascended the throne, and exiled the late empress. The new sovereign, anxious to reserve to himself the title of emperor of the East, consented to acknowledge in Charlemagne the dignity of Augustus, and to settle with him the mutual boundaries of their empires in Italy.

From this period the talents of Charlemagne were employed

played in repressing the incursions of the Danes and the Normans under their leader Godfrey, who menaced with their fleets and armies the tranquillity of the west. Peace was at length established from motives of mutual convenience, and it was agreed that the subjects of Charlemagne were on no account to violate the Norman territory, and Godfrey promised to respect the dominions of the emperor of the West.

The empire of Charlemagne in Europe began to rival that of ancient Rome, and a new æra is dated from his restoration of the western empire. This prince was at the same time sovereign in France, Spain, Italy, Germany, and Hungary. The Roman province of Gaul had been transformed into the name and monarchy of France, but its limits were contracted by the independence of the Bretons, and the revolt of Aquitain. Charlemagne pursued and confined the Bretons on the shores of the ocean: after a long contest, the rebellion of the dukes of Aquitain was punished by the forfeiture of their province, their liberty, and lives. The Saracens had been expelled from France by the grandfather and father of Charlemagne, but they still possessed the greatest part of Spain, from the rock of Gibraltar to the Pyrenæes: these he dispossessed of their powers, and made himself master of the infant kingdoms of Navarre and Arragon. As king of the Lombards, and patrician of Rome, he reigned over the greatest part of Italy. Charlemagne was the first who united Germany under the same sceptre: and by his conquest of the Avars, he obtained possession of Hungary, Transylvania, Iliria, Croatia, and Dalmatia, with the exception of the maritime towns, which his moderation left under the real or nominal sovereignty of the Greeks.

In the year 806 Charlemagne assembled the princes and nobles of his empire at Thionville, in whose presence he made the final distribution of his kingdoms. In 810 his son Pepin died, whose natural son, Bernard, then only an infant, Charlemagne caused to be proclaimed king of Italy; and in the course of only a very few months the unhappy monarch witnessed the death of his eldest son, Charles. The increasing weight of public cares suggested to him the necessity of associating his surviving son, Louis, to the imperial purple; the ceremony was performed at Aix-la-Chapelle, and the aged sovereign inculcated on the mind of his son, by every motive which long experience could suggest, the maxims by which he had advanced the grandeur and happiness of his subjects. Early in the following year his increased and rapidly increasing infirmities warned him of his approaching dissolution. He was attacked in the middle of January by a fever, which was followed by a pleurisy: the pressure of affliction he bore with firmness and resignation. On the 27th a fainting fit announced a speedy termination to his life, and on the following day this great prince expired, in the 47th year of his reign, and the 72d of his age; carrying with him the sincere regret of all his subjects. He died at Aix-la-Chapelle, and was buried in the church of Notre Dame in that city, which he had himself built.

From this sketch of the career of Charlemagne, it is not difficult to appreciate the various merits of his character. As a warrior and politician, he has been rarely excelled. He was indefatigable in his attention to public business, and in the performance of all the duties attaching to his high situation. Considering the times in which he flourished, he did much to improve the condition of his subjects; he suppressed mendicancy; he composed a series of occasional edicts for the correction of abuses, and the reformation of manners, among the people at large; and he attended to the economy of his own immediate household. He established a fixed and invaluable price of corn, in the hope of enabling the meanest of

his subjects to supply their wants. These, and various other regulations, though not characteristic of the true principles of legislation, did honour to his attempts to meliorate the state of society. It is said, that among other improvements which he contemplated for the good of his country, he formed the vast project of a canal which should unite the Danube and the Rhine, and thus establish a free communication between the ocean and the Euxine sea. He shewed himself the friend of learning and learned men, and made such efforts to promote the interests of literature, as entitle him to great praise. He invited to his court learned men from all nations, with a view, no doubt, of inspiring his people with a thirst for knowledge; among these was our countryman, Alcuin, a clergyman celebrated for his literary attainments, who received the highest tokens of respect and honour from the emperor, and who even became his companion and preceptor in the sciences. He founded schools in various parts of his dominions, and instituted within the boundaries of the court a kind of learned society, every member of which was called by some celebrated name of antiquity. He collected all the ancient songs relative to the history of his country, and so attentive was he to the improvement of his mind, that he caused passages of interesting works to be read to him during his meals. His own literary attainments were probably not of the first order; his education had been neglected, and the studies of mature life were laborious and imperfect: he did not even acquire the practice of writing till he had attained to manhood; but the encouragement which he afforded to learning, and the marked respect and reverence which he shewed to men of literary talents, reflect the highest lustre on the character of the emperor of the West. He was highly esteemed for his regard to religion, and to the clergy; but the authority with which he invested that aspiring body laid the foundation of their tyrannical claims over his less enlightened and less able successors. As a man, Charlemagne was simple in his dress, easy in his manners, and temperate in his mode of living. His morals are stained with the charge of incontinence, to which the number of his wives and concubines bear irrefragable evidence. As a statesman, his conduct has been arraigned by the measures of dividing his kingdom, during his own life, among his sons. His many wars prove that he little valued the lives of his subjects, in a cause in which his ambition was concerned. His humanity stands impeached by the extinction of his nephews, the sons of Carloman, and by the cruelties frequently exercised upon the valiant Saxons, whose attachment to freedom and their country merited a very different kind of treatment. These are blemishes in the character of Charlemagne which time cannot obliterate; but, after every allowance for his frailties, it must be admitted, that the title of *Great*, which has been bleaded with his name for more than ten centuries, has seldom been awarded upon fairer claims: and it is to be regretted that in the lapse of a thousand years so few have been ambitious of attaining to that degree of celebrity which attaches to the virtues of Charles the Great. Gibbon, Hume, Du Fresnoy, Modern Univ. Hist.

Charlemagne has merited a place in musical history, by his good taste in preferring the *canto fermo* of the Romans to the Gallic *plain-chant*. We have from contemporary writers, the relation of a serious quarrel between Gallic and Roman musicians, so early as the time of Pope Adrian and Charlemagne, concerning superiority of taste and knowledge; a quarrel which has been since often renewed, but which, had it been left to the reference of unprejudiced and intelligent judges of other nations, would have been soon determined without ever coming to a second trial or combat.

combat. The French, however, after every defeat, revive with still greater clamour, their pretensions to a titular sovereignty, without having the least claim to it, either from inheritance, conquest, or former possession.

The story of this ancient musical quarrel is somewhat long, but the necessity of inserting it here at full length seems the greater, as it not only shews the antiquity of the ridiculous rivalry and hatred still subsisting between French and Italian musicians, but is a convincing proof that the English were not the only people obliged to the Romans for the method of chanting the Psalms, and singing their hymns in their cathedral service. See biographical article *BENE, venerabile*. Musical missionaries were sent, at this time, from Rome to other parts of Europe, to instruct the converts to the gospel in the church service; which accounts for that similarity and almost identity of melody, observable in the sacred music of all the countries of Europe at the time of the reformation, till which period, little other music was known or practised than that of the church.

“The most pious king Charles having returned to celebrate Easter at Rome, with the apostolic lord, a great quarrel ensued, during the festival, between the Roman and Gallic singers. The French pretended to sing better, and more agreeably, than the Italians; and the Italians, on the contrary, regarding themselves as more learned in ecclesiastical music, which they had been taught by St. Gregory, accused their competitors of corrupting, disfiguring, and spoiling the true chant. The dispute being brought before our sovereign lord the king, the French, thinking themselves sure of his countenance and support, insulted the Roman singers; who, on their part, emboldened by superior knowledge, and comparing the musical abilities of their great master, St. Gregory, with the ignorance and rusticity of their rivals, treated them as fools and barbarians. As their altercation was not likely to come to a speedy issue, the most pious king Charles asked his chantors, which they thought to be the purest and best water, that which was drawn from the source, at the fountain-head, or that, which, after being mixed with turbid and muddy rivulets, was found at a great distance from the original spring? They cried out, unanimously, that all water must be more pure at its source; upon which, our lord the king said, Mount ye then up to the pure fountain of St. Gregory, whose chant ye have manifestly corrupted. After this, our lord the king applied to pope Adrian for singing-masters, to correct the Gallican chant; and the pope appointed for that purpose Theodore and Benedict, two chantors of great learning and abilities, who had been instructed by the disciples of St. Gregory himself: he likewise granted to him *Antiphonaria*, or choral books of that saint, which he had written himself in Roman notes. Our lord, the king, at his return to France, sent one of the two singers, granted to him by the pope, to Metz, and the other to Soissons; commanding all the singing-masters of his kingdom to correct their *Antiphonaria*, and to conform in all respects to the Roman manner of performing the church service. Thus were the French *Antiphonaria* corrected, which had before been vitiated, interpolated, and abridged, at the pleasure of every choir-man; and all the chantors of France learned from the Romans that chant which they now call the French chant. But as for the beats, trills, shakes, and accents of the Italians, the French were never able to execute or express them; nor, for want of sufficient flexibility in the organ of voice, were they capable of imitating in these graces, any thing but the tremulous and guttural noise of goats. [*Chevrolet, et fix una tesse di capra*, are expressions applied in France and Italy to such singers as have a bad shake. John Diaconus, in his Life of St. Gregory, gives in

queer and barbarous Latin, scarcely to be translated, a serious account of the vocal abilities of the ancient Germans and French, who, in attempting to sing the Gregorian chant, were wholly unable to express its sweetness; “injuring it by barbarous changes, suggested, says he, either by their natural ferocity or inconsistency of disposition. Their figures were gigantic, and when they sang, it was rather thunder than musical tones. Their rude throats, instead of the inflexions of pleasing melody, formed such rough sounds, as resembled the noise of a cart jolting down a pair of flairs.” *Questi ploustra per gradus confuse sonantia, rigidus voces jactant.* Vita S. Greg. cap. 2.] The principal school of singing was established at Metz, and in the same proportion as the Roman chant exceeded that of this city, the singers of Metz surpassed all those of other French schools. The Roman chantors likewise instructed those of France in the art of organizing, and our sovereign lord Charles having, besides, brought with him into France masters in grammar and arithmetic, ordered those arts to be cultivated throughout his dominions; for, before the reign of the said lord the king, the liberal arts were neglected in France.” [*Et reversus est Rex piissimus Carolus, &c.* Vide Annal. & Hist. Francor. ab an. 708, ad an. 990. Scriptores Coctaneos. Impr. Francofurti 1594. Sub vitâ Caroli magni.]

The abbé Velley, who, in his Hist. de France, tom. i. p. 53, gives the same account of the establishment of the Romish chant in France, adds; that “the monarch was likewise desirous of introducing into his churches the liturgy, or mass, as used at Rome; but here he met with greater difficulties. The French clergy, jealous of their ancient usages, opposed, in a body, this measure, as an innovation; the royal authority, however, at length prevailed.” After such an account of Charlemagne, it is hardly possible to read the following passage without amazement. “Charles confirmed the instrument with his hand, that is to say, by making his mark; for it is to be observed, that this prince, one of the most learned men of his age, at that time could not write!” According to Mezeray, the addition to the signature of this prince, at the bottom of each treaty, must have been engraved; for he there says, “I have signed it with the pommel of my sword, and promise to maintain it with the point.”

In Charlemagne's time, *listrines*, mimes, and actors of farces, were very numerous in France; and, according to the abbé Vertot (Mem. de Litt.), this prince made a collection of ancient Gallic songs; and Eginhard, his historian, observes that these songs, which were chiefly military, like those of the Germans, constituted the principal part of the History of France, and comprised the most heroic actions of her kings.

In the history of France there have been eight other monarchs of the name of Charles, besides Charlemagne; they, however, are not sufficiently renowned to induce us to give separate articles of each. The reign of the second Charles, surnamed the *Bald*, was disastrous to the country as well as unfortunate to the sovereign. France, under this sovereign, was perpetually subject to hostile invasions and internal commotions. He was the grandson of Charlemagne, and was poisoned by his physician after a long reign of 38 years.—The character of Charles III, who wholly surrendered himself to his minister Haganon, a man of talents, but of infamous principle, is sufficiently expressed by his surname the *Simple*. He died in 929, after a reign of more than 30 years. In the reign of Charles IV, who was son to Philip the Fair, a fierce war raged between France and England, which ended in the concession of the province of Guienne to England; he died in 1328, after a short reign of six years.—Charles V is celebrated

brated for his love of learning; he made a large collection of books, and died in 1380.—Charles VI. began his administration with such effectual reforms for the alleviation of the public burthens, that he became extremely popular, and obtained the appellation of *Well-beloved*. His reign was very unfortunate, owing to the bad management of his ministers, and the contentions of the dukes of Orleans and Burgundy. Henry V. of England taking advantage of the internal commotions of France invaded and conquered a great part of it. This prince was subject to fits of insanity, but his intentions were always good; he was beloved by his people for his many excellent qualities; on account of his misfortunes he was the object of commiseration, and the regrets of many accompanied him to the grave, in 1422, after a reign of 42 years.—Charles VII. called the *Victorious*, regained his kingdom which had been lost in the former reign. By his activity the English were driven from all their possessions, except Calais. Under this prince the militia was dismissed, and a standing army was first instituted, for the maintenance of which the perpetual taille was granted. From this reign France dates several of those institutions which always tend to make a nation great. This sovereign died in 1461.—Charles VIII. ascended the throne in 1483, at the age of 13. In 1494, contrary to the representations of his counsellors, he set out with a determination to conquer Naples, though he was scantily supplied with troops and money. His progress was unreflected. In six weeks he traversed Italy, and entered Naples in triumph, and in a fortnight after he was master nearly of the whole kingdom. He died in 1498.—Charles IX. ascended the throne in the year 1662, when he was only ten years old. To his mother Catherine de Medicis was given the regency, a trust that he abused in a most shameful manner. To her it is to be imputed that indelible disgrace to the reign of Charles IX. the infamous massacre of Paris on St. Bartholomew's day, 1572. It has been said, that at the approach of the fatal hour, the king shewed signs of compunction for the orders that he had been induced to give, but upon being reproached by the savage Catherine for his want of decision, he exclaimed, "Well, then, let not one be left to upbraid me with breach of faith." He betrayed no symptoms of pity during the execrable deed; but even fired with his own hand on the miserable wretches endeavouring to escape across the river. His dissimulation before, and his cruelty during this horrible transaction, fix his character, and rank him among the Neros and Domitians of the world. He died in May 1574, a prey to all the horrors of remorse, having probably never enjoyed an hour's peace after the massacre he had sanctioned.

CHARLEMONT, in *Geography*, a town of the Netherlands, in the county of Namur, ceded to France by the treaty of Nimuegen. It was built by Charles V. in 1555, not far from Givet, on a mountain near the Meuse. It is small but well fortified; 8 leagues S.W. of Namur, and 7 N.E. of Rocroy.

CHARLEMONT, a village of the county of Armagh, Ireland, on the banks of the Blackwater, where there is a fort, which, though now neglected, has a governor regularly appointed. It was built by Lord Montjoy, lord deputy at the latter end of queen Elizabeth's reign, to guard the passage over the Blackwater, and was called from his christian name. It was surprized by the Irish under Sir Phelim O'Neil, in 1641, and the governor and garrison put to death, after which it remained for some years in the possession of the Irish. Previous to the Union it was a borough, but has now lost its privilege. Of late it has been remarkable only for having given title to that respectable and popular nobleman, who was general of the volunteers of Ireland in 1780, and who was first president of the Royal Irish Academy, which

was in great measure established by his exertions. Charlemont is 69 miles N. by W. from Dublin. Ware's Antiquities.

CHARLEMONT, a township of America, in Hampshire county, Massachusetts; 16 miles W. of Deerfield, containing 665 inhabitants.

CHARLEKROY, a town of France, in the department of the Jemappes, and principal place of a district, is situated on the confines of Hainaut, on the north side of the river Sambre, in a place formerly called Charoy. It was fortified and became a city in 1678, assuming the name of Charleroi, in honour of Charles II. king of Spain. In 1792, it changed its name to *Charles-sur-Sambre*. At the peace of Aix-la-Chapelle, in 1648, it was given to France; by the treaty of Nimuegen it was ceded to Spain; and in 1693 taken by the French. In 1697 it was restored to Spain; by the peace of Utrecht it was surrendered to the States-General; in 1716 it was granted to the emperor by the barrier treaty; and in 1746 again surrendered to France. It carries on a considerable trade in iron-works and foundery. The place contains 1744, and the two cantons 24,527 inhabitants. The territorial extent comprehends 180 kilometres and 24 communes. N. lat. 50° 26'. E. long. 4° 16'.

CHARLES I. third son to James the Sixth of Scotland, and First of Great Britain, by Anne of Denmark, was born in Scotland, in the year 1600, and succeeded his brother Prince Henry as Prince of Wales, in 1612. In 1623, the king of England, anxious to consult the dignity of his son in marriage, warmly pressed an alliance with the court of Madrid. Philip, equally zealous for the establishment of his sister, listened to his overtures with pleasure. Besides the portion of six hundred thousand pounds, he offered with the infanta the restitution of the palatinate to Frederic. When all measures were agreed to between both parties, and nothing was wanting but the dispensation from Rome, this connexion, so honourable and advantageous to England, was broken by a romantic enterprize, originally conceived with a design of hastening the proposed alliance. The sole recommendation of personal accomplishments had raised George Villiers, from an obscure lot in life to the rank and title of duke of Buckingham. His influence over James was unbounded. To ingratiate himself equally with the son, he proposed to the prince of Wales to break through the forms of royalty, and, travelling to Madrid in disguise, to introduce himself to the infanta as an ardent and devoted lover. This proposal was in unison with the spirit of gallantry natural to Charles's time of life. The son was obliged to retreat, and the favourite to reproach, before a reluctant consent could be extorted from James; when the prince of Wales, accompanied by Buckingham, quitted London privately, and crossed over to Calais. They even ventured on their journey to visit the French court in disguise, where the prince's Henrietta, sister to Lewis, made a serious and permanent impression on the heart of the young prince. Though Charles and the duke were received at Madrid with every mark of respect and attention, yet the volatile manners and dissolute pleasures of the latter but ill accorded with the gravity and dignity of the Spanish court. His pride was peculiarly offensive to Olivarez; and their rising hatred had already shewn itself in mutual expressions of contempt. when Buckingham, influenced by caprice or disgust, determined to return without accomplishing the object of his journey. He easily obtained the acquiescence of Charles. A plausible pretence was furnished by the delay of the dispensation from Rome; but his real motive was more openly proclaimed in his last conversation with Olivarez. He declared it was his intention to promote

promote every measure which could cement the friendship of England and Spain; but he added with his usual haughtiness, "with regard to you, Sir, in particular, you must expect from me all possible enmity and opposition." The count replied, with becoming dignity, that he accepted of what was proffered. The first part of the duke's speech, however, was not dictated by the same sincerity as the last; and immediately on his arrival in England he prevailed on the king and prince, first to suspend, and afterwards to break off the negotiation with Spain.

As it would be impossible to enter in detail on so extended a field of narration, on which whole libraries have been written, as so late a period of our history would open to our view, and as a mere table of contents of this and the succeeding reign would swell our pages without adding to the information of our readers, who must all be supposed to have heard of ship-money, long parliaments, civil wars, commonwealths, and martyrdoms, we have resolved on the course of giving a character, rather than an history of our own Charles's. We have given at some length the account of the circumstances attending the rupture of the Spanish, and consequent accomplishment of the French marriage, because it was on this occasion that the first Charles, ill-fated and misguided, appeared upon the public scene; and by observing his conduct and character on this occasion, we can be at no loss to account for the progress of his career through life, and the consequences in which he was involved at the close. Among all the varying representations, to which party and prejudice have given occasion, what is generally considered as a bad natural character has rarely, if ever, been attributed to him. But a habit of confidence in the advice of persons, whose judgment was no better, and their desires infinitely worse than his own, began in the instance which we have just produced, and continued to the end, gaining strength from time, from increasing difficulties, from obstinacy inflamed by opposition, from the necessity of the approaching crisis and the mad excess to which some principles were carried by the contrary party. Charles acceded to the throne with the impetuous Buckingham for his minister; and this very circumstance impressed on the palate of the nation a foretaste of suspicion and disgust. Felton's knife removed the minister, but the natural inclination of doing as he liked had been impressed on Charles, and he was at no loss to find seeming friends, who were willing to exchange the hazardous office of telling him the truth, for the no less dangerous task of carrying his views into execution, in spite of popular opinion and the rising force of parliamentary power. Strafford was a minister of great abilities, whose severity might have curbed the spirit of resistance, had it been less deeply rooted. Even he, austere as he was, might have been borne in civil affairs, had not Laud's superstition and intolerance been so extremely offensive in the management of the ecclesiastical jurisdiction. Yet, had Charles been faithful to his misleaders, he might have saved himself. But the fate of his victims appeared to be the watch-word for an attack upon his own person, through the medium of a civil war, in which it was difficult for an innocent individual to avoid ranging himself under the equally detestable banners of the coalizers or the round-heads. The events of the war had little connection with the personal character of the king. But his conduct whether in prison, on trial, or at the scaffold, was firm, unaffected, and decent; so that those, whose views of his political and religious case are the farthest from granting him the palm of martyrdom, may creditably feel a sentiment of commiseration, not unallied to the sympathy excited by those who have really been martyrs. His private

virtues were unquestionable, and even the repulsive feature of his character as a man rather added dignity to his deportment as a monarch. He was respectable both in literature, politeness, and the arts. He was destitute neither of abilities for the functions of government, of regularity in the conduct of life, nor of amiable temper in his personal and domestic relations. Had he relied more on himself and less on others, he might possibly have prospered better; though it is much to be questioned whether personal character could at all have interfered with the trial of the great question, agitated between the contending parties. If we regard him as an author, the "Eikon Basilike" would secure to its author a very considerable reputation among the writers of the age; but it must still be strongly doubted whether king Charles had any claim to the credit of the performance. But we cannot perhaps illustrate the character of Charles more fully and fairly, than by transcribing the summary of his virtues and vices, portrayed in the opposite delineations of Hume and Mrs. Macaulay.

The character of this prince (observes Mr. Hume), as that of most men, if not of all men, was mixed; but his virtues predominated extremely above his vices, or, more properly speaking, his imperfections: for scarce any of his faults rose to that pitch as to merit the appellation of vices. To consider him in the most favourable light, it may be affirmed that his dignity was free from pride, his humanity from weakness, his bravery from rashness, his temperance from austerity, his frugality from avarice: all these virtues in him maintained their proper bounds, and merited unreserved praise. To speak the most harshly of him, we may affirm that many of his good qualities were attended with some latent frailty, which, though seemingly inconsiderable, was able, when seconded by the extreme malevolence of his fortune, to disappoint them of all their influence: his beneficent disposition was clouded by a manner not very gracious; his virtue was tinged with superstition; his good sense was disfigured by a deference to persons of a capacity inferior to his own; and his moderate temper exempted him not from hasty and precipitate resolutions. He deserves the epithet of a good, rather than of a great man; and was more fitted to rule in a regular established government, than either to give way to the encroachments of a popular assembly, or finally to subdue their pretensions. He wanted suppleness and dexterity sufficient for the first measure: he was not endowed with the vigour requisite for the second. Had he been born an absolute prince, his humanity and good sense had rendered his reign happy and his memory precious: had the limitations on prerogative been in his time quite fixed and certain, his integrity had made him regard, as sacred, the boundaries of the constitution. Unhappily, his fate threw him into a period when the precedents of many former reigns favoured strongly of arbitrary power, and the genius of the people ran violently towards liberty. And if his political prudence was not sufficient to extricate him from so perilous a situation, he may be excused; since, even after the event, when it is commonly easy to correct all errors, one is at a loss to determine what conduct, in his circumstances, could have maintained the authority of the crown, and preserved the peace of the nation. Exposed without revenue, without arms, to the assault of furious, implacable, and bigotted factions, it was never permitted him, but with the most fatal consequences, to commit the smallest mistake; a condition too rigorous to be imposed on the greatest human capacity.

Some historians have rashly questioned the good faith of this prince: but for this reproach, the most malignant scrutiny of his conduct, which, in every circumstance, is now thoroughly

thoroughly known, affords not any reasonable foundation. On the contrary, if we consider the extreme difficulties to which he was so frequently reduced, and compare the sincerity of his professions and declarations; we shall allow, that probity and honour ought justly to be numbered among his most shining qualities. In every treaty, those concessions which he thought he could not in conscience maintain, he never could, by any motive or persuasion, be induced to make. And though some violations of the petition of right may perhaps be imputed to him; these are more to be ascribed to the necessity of his situation, and to the lofty ideas of royal prerogative, which, from established precedents, he had imbibed, than to any failure in the integrity of his principles.

This prince was of a comely presence; of a sweet, but melancholy aspect. His face was regular, handsome, and well complexioned; his body strong, healthy, and justly proportioned; and being of a middle stature, he was capable of enduring the greatest fatigues. He excelled in horsemanship and other exercises; and he possessed all the exterior, as well as many of the essential qualities, which form an accomplished prince.

History (says M. s. Macaulay) is called upon to scrutinize with exactness his principles, conduct, and character; since, from the false colourings which by designing men have been thrown on these, and the rancour with which his opponents have been falsely aspersed, have been deduced consequences destructive to the security and welfare of man, and highly injurious to the reputation of patriot citizens.

In the character of Charles, as represented by his panegyrists, we find the qualities of temperance, chastity, regularity, piety, equity, humanity, dignity, condescension, and equanimity; some have gone so far as to allow him integrity; and many writers, who condemn his political principles, give him the title of a moral man. In the comparison of this representation with Charles's conduct, accurately and justly described, it is discernible that vices of the worst tendency, when flayed by a formal and plausible carriage, when concordant to the interests of a faction and the prejudices of the vulgar, assume the appearances of, and are imposed on the credulous world as virtues of the first rank. Passion for power was Charles's predominant vice; idolatry to his regal prerogatives his governing principle. The interests of his crown legitimated every measure, and sanctified in his eye the widest deviation from moral rules. His religion was to this a secondary and subordinate affection: the prelates of the church of England paid him an impious flattery: they inculcated a slavish dependence on the regal authority; the corruptions in their ecclesiastical discipline fostered superstition; superstition secured their influence over the people; and on these grounds, and to these ends, they kept an interest in the king's heart, which continued to the last period of his life. If Charles had an higher estimation of the faith in which he had been educated than of popery, it was because the principles of popery acknowledged a superior allegiance to their spiritual than their temporal prince; but regarding that superstition to be more favourable to the interests of monarchy, he preferred it to the religion of any differing sect, and publicly avowed his wish, that there never had been a schism in the church. Neither gratitude, clemency, humanity, equity, nor generosity, have place in the fair part of Charles's character. Of the virtues of temperance, fortitude, and personal bravery, he was undeniably possessed. His manners partook of the dissipation, and his conversation of the indelicacy, of a court. His chastity has been called in question by an author of the highest repute; and were it allowed, it

was tainted by an excess of uxoriousness, which gave it the properties and the consequences of vice. The want of integrity is manifest in every part of his conduct; which, whether the corruption of his judgment or heart, lost him fair opportunities of reinstatement in the throne, and was the vice for which, above all others, he paid the tribute of his life. His intellectual powers were naturally good, and so improved by a continued exercise, that, though in the beginning of his reign he spoke with difficulty and hesitation, towards the close of his life he discovered in his writings purity of language and dignity of style; in his debates, elocution, and quickness of conception. The high opinion he entertained of regal dignity occasioned him to observe a flatness and imperiousness of manner, which, to the rational and intelligent, was unamiable and offensive; by the weak and the formal, it was mistaken for dignity. In the exercise of horsemanship he excelled; had a good taste, and even skill in several of the polite arts; but, though a proficient in some branches of literature, was no encourager of useful learning, and only parrotized adepts in the jargon of the divine right and utility of kings and bishops. His understanding in this point was so depraved by the prejudices of his education, the flattery of priests, and the affections of his heart, that he would never endure conversation which tended to inculcate the principles of equal rights in men; and, notwithstanding the particularity of his situation enforced his attention to doctrines of this kind, he went out of the world with the same fond prejudices with which he had been fostered in his nursery, and enjoined in the zenith of his power.

Charles was of a middle stature; his body strong, healthy, and justly proportioned; his face was regular, handsome, and well complexioned; and his aspect melancholy, yet not unpleasing. His surviving issue were three sons and three daughters. He was executed in the 49th year of his age, and buried, by the appointment of the Parliament, at Windsor, decently, yet without pomp. The duke of Richmond, the marquis of Hertford, the earls of Southampton and Lindsay, at their express desire, were permitted to pay the last duty to their master, but were denied (by colonel Whitchcot, the governor of Windsor-castle) the use of the burial service, according to the book of Common-Prayer.

Lord Lyttelton, speaking of Charles I. makes the following observations. He had many better qualifications than his father, but as wrong a judgment, and greater obstinacy. He carried his affection for the clergy, and abhorrence of the puritans to an excess of bigotry and rage. He agreed so ill with his parliaments, that he soon grew weary of them, and resolved to be troubled with no more; none were called for twelve years together, and all that time he governed as despotically as the soppis of Persia. The laws were either openly infringed or explained in the manner he directed: he levied money upon his subjects against privileges expressly confirmed by himself. In short, his passion for power might have been fully gratified, if his more prevailing one to bigotry had not engaged him in a senseless undertaking, of forcing the same form of worship upon his subjects in Scotland, as he had declared himself so warmly for in England. It is safer to attack men in their civil rights, than their religious opinions: the Scots, who had acquiesced under tyranny, took up arms against persecution. Their insurrection made it necessary to call a parliament; it met, but was instantly dissolved by the intemperate folly of the court. All hopes of better measures were put an end to by this last provocation. The Scots marched into England, and were received by the English, not as enemies, but as brothers and allies. the king, unable to oppose them,

them, was compelled to ask the aid of another parliament. A parliament met, exasperated with the oppressions of fifteen years: the principal members were men of the greatest capacity, courage, and virtue, firmly united among themselves, and whom the court could neither corrupt nor intimidate. They resolved to make use of the opportunity, to redress their grievances, and secure their liberty; the king granted every thing that was necessary to either of those ends, except such securities as might have been turned against himself; but what, perhaps, was really concession, had the appearance of constraint, and therefore gained neither gratitude nor confidence: the nation could no longer trust the king; or, if it might, particular men could not; and the support of those particular men was become a national concern: they had exposed themselves by serving the public; the public therefore judged that it was bound in justice to defend them. Nor indeed was it possible, when the work of reformation was begun, after so long a denial of justice, to keep a people sore with the remembrance of injuries received and satisfaction refused, within the bounds of a proper moderation. Such a sobriety is much easier in speculation than it ever was in practice. Thus, partly for the safety of their leaders, and partly from a jealousy of his intentions too justly conceived, the parliament drew the sword against the king: but the sword, when drawn, was no longer theirs; it was quickly turned against them by those to whose hands they trusted it: the honestest and wisest of both parties were outwitted and overpowered by villains; the king perished, and the constitution perished with him.

This prince, during the life of his father, had received instructions in music from Copercario, an Englishman whose name was Cooper; but who having been in Italy, wished to pass for a native of that country. According to Playford, Charles, while prince of Wales, had made a considerable progress under this master on the viol da Gamba; and when he ascended the throne, he not only discovered a great affection for music in general, but manifested a particular attention and partiality to compositions for the church. [Playford (Pref. to his Introd.) speaking of the musical skill of our princes of the house of Tudor, says, "Nor was his late majesty Charles I. behind any of his predecessors in the love and promotion of this science, especially in the service of Almighty God, and with much zeal he would hear reverently performed, and often appointed, the service and anthems himself, especially that sharp service composed by Dr. William Child being of (from) his knowledge in music, a competent judge therein; and would play his part exactly well on the base-viol, especially of those incomparable fancies of Mr. Copercario to the organ."] In his private concerts he is said to have condescended to honour with his notice several of his musical servants, who had the good fortune to be frequently in his presence; and to gratify them in a way the most flattering and agreeable to every art of great talents, with smiles and approbation, when either their productions or performance afforded him pleasure. And, indeed, whatever political crimes may be laid to the charge of this prince, he was certainly a most liberal and gracious master to his domestics, and possessed a singular power of attaching them to his person by kindness and condescension, still more than by royal bounty and munificence.

In the beginning of his reign, Nicolo Lanieri, (a real Italian) was appointed master of the king's band; (see Lanieri) and in Rymer's Fœdera, (tom. xviii. p. 228,) is recorded a grant to him and the rest of the royal band for their several annuities and yearly pensions. The names,

however, of such musicians as were in a more peculiar manner honoured with this prince's notice, afterwards, do not appear in the grant; as it was observed, that his majesty was particularly delighted with the choral compositions of Dr. Child; the performance on the lute of Dr. Wilton; and the music of William and Henry Lawes, which was introduced in the masques that were exhibited at court.

The productions for the church during this reign, though superior in excellence to those of any other species, yet if we except those of Dr. Giles and Elway Bevin, who more properly belong to the reign of King James, are so few in number, that the augmentation they make to our former stock lies in a very small compass.

This prince, however his judgment or that of his counselors may have erred, appears to have been possessed of an invariable good taste in all the fine arts; a quality which in less morose and turbulent times would have endeared him to the most enlightened part of the nation: but now his patronage of poetry, painting, architecture, and music, was ranked among the deadly sins, and his passion for the works of the best artists in the kingdom, profane, pagan, popish, idolatrous, dark, and damnable. But however gloomy state-reformers may execrate this prince, it would be ungrateful in the lovers and professors of any of the fine arts, to lose all reverence for the patron of Ben Jonson, Rubens, Vandycy, Inigo Jones, and Dr. Child.

William and Henry Lawes were early established in the favour of this monarch, and indeed in that of the whole nation, to a degree for which their musical productions do not clearly enable us to account. William, taking up arms early in the grand rebellion in defence of his royal patron, was killed by an accidental shot at the siege of Chester in 1645. Henry was always a loyalist, though he long enjoyed the favour and friendship of Milton; but this was previous to the political life of our great poet. Henry Lawes set Comus to music in 1634, and survived not only the rebellion, but the interregnum and restoration, extending his life to the year 1662.

Though the early part of Charles the First's reign was favourable to the fine arts, particularly to music of the dramatic kind in the frequent and splendid masques that were performed at court and in the mansions of the principal nobility; yet from the breaking out of the civil war in 1642, nothing but havoc and confusion reigned. In 1643 the cathedral service was totally suppressed, which gave a grievous wound to sacred music; not only checking its cultivation, but annihilating as much as possible the means of restoring it, by destroying all the church books, as entirely as those of the Romish communion had been at the time of the reformation.

During such a period, what leisure or disposition could there be for the culture of arts which had no connexion with the reigning interests and passions of men? The fine arts have been truly and emphatically called the arts of peace, and the celebrated periods in which they made the most considerable strides towards perfection, were calm and tranquil.

Musicians, who previous to those unhappy times had employment either in the chapels royal, cathedrals, or public exhibitions in the capital, were forced to seek about the country, and solicit an asylum in the houses of private patrons, whose mansions, and abilities to protect them, in it have been very precarious. And, indeed, if they could have been rendered permanent, they would not so much have contributed to the advancement of the art, as the pride, effort, and emulation of working for a severe and fastidious public would have done. Many a man of creative genius and gigantic abilities, has been manacled by idleness,

vanity, and self-applause in a private station, where safe from rivals, and certain of the approbation of a small, and perhaps ignorant and partial circle of friends, he has degenerated into littleness, conceit, and affectation.

CHARLES II. king of Great Britain, was the son of Charles I. and Henrietta-Maria of France, born in 1630. At the time of his father's execution, he was a refugee at the Hague. During the time of the commonwealth, he was a wanderer and a dependant, and was one of the various characters which presented themselves at the memorable treaty of the Pyrenæes. His impertunate necessities reduced him to the assistance of Mazarine and Don Lewis de Haro. The former refused so much as to see him. The latter received him with a generosity and ancient hospitality, which was ever the characteristic of his nation, and relieved his personal wants by the present of a considerable sum of money. But the powers of the continent were wisely cautious of interfering in the internal constitution of England, and paused before they enlisted themselves for the support of royalty and its hazardous claims. Even after the death of Cromwell, the commonwealth, though sickly, yet survived, and there was at least a possibility that it might recover under an able regimen and superintendance. Indeed, the constitution of parliament appeared to be so much better a speculation than that of royalty; and Charles, whose condition, like that of a patient in the crisis of a fever, never seemed so desperate as at the precise period of a change to convalescence, that the court of Madrid ordered the royal exile to quit the territories of Spain. This was undoubtedly a servile attempt to conciliate the friendship of a party, which must have been liated in a country the principles of whose government were so diametrically opposite to those of republicanism. But practical statesmen, who are not infected with a spirit of political quixotism, will applaud and justify the prudence which dictated an unpalatable acquiescence, however unfortunate it might have been in point of time and preference. It happened, in point of fact, that a very short time intervened between the order in question and the restoration of the exiled monarch. England, wearied out with contending factions, impatiently waited for the re-establishment of her ancient constitution, and looked to that event as to the consummation of her happiness. The wishes of the people were seconded by the loyal declarations of general Monk, who marched from Scotland at the head of an attached, brave, and well-disciplined army. Charles was invited once more to grace the palace of his ancestors with his presence. So strong was the torrent of returning allegiance, that he took possession of his kingdom without the smallest effusion of blood. It were to be wished that he had been duly impressed with the circumstances, far more favourable than he could reasonably expect, under which he retrieved the situation to which he was destined by birth, but from which fortune had displaced him. Conciliation and prudence might have carried both the king and the people to a height of external prosperity and domestic happiness, beyond what Great Britain had ever experienced. But he erred most grievously in remembering on the throne the disquits he had experienced in adversity, whether at home or abroad. He forgot the generosity of Don Lewis de Haro, but he remembered his banishment from the dominions of Spain; and the subsequent alliance he concluded with Portugal, may, in a great measure, be ascribed to his resentment at the neglect of the court of Madrid. It was not indeed till a later period of his reign, that he avowed and exhibited the disgust he had cherished against the Presbyterians and the friends of liberty; but when it did appear, it hurried him into excesses of tyranny, incongenial with the gay and social tendencies of his natural

temperament. But even these virtues, little as they weigh in the estimate of a public character, were converted into bane and poison by the licentiousness into which they suffered a monarch of dissolute temper to fall, who nearly drew into his own vortex whatever remained of purity and propriety, from times which, though too precise and formal, erred on the side of safety in sacrificing the waywardness of will and pleasure to rigid, though sometimes mistaken duty. Dissipation was attended by expence, as its necessary and natural consequence; and exorbitant expence involved the king and government in pecuniary embarrassments, disgraceful negotiations, and the venal barter of national honour and vital interests. The sale of Dunkirk was unpopular; and the exploit of the Dutch at Chatham disgraceful. A mistress was able so far to enslave the heart of Charles, as to make him lose sight of his own honour and his people's welfare in a blind attachment to the politics and alliance of France. Arbitrary measures, and demonstrations of an inclination towards Popery, began to be more unequivocally manifested; and though the firm remonstrances of the English parliament occasionally compelled a suspension of the intercourse with Lewis, and a more moderate and temporising policy at home, it seemed from the complexion of the times, that there was no alternative between an arbitrary government and a renewal of civil hostilities. There was, however, notwithstanding all his obliquities, a better feeling about Charles II. which prevented him from driving things to extremity. It is even supposed, that, tired with combating the free spirit of his parliament, he became uneasy under the plan of government he had adopted, and meant to pursue a different system; and if so, the house of Stuart had the most serious reasons to lament that his life was not further prolonged. But Charles the second of England, so celebrated in the annals of politics, wit, gallantry, and prosfugacy, was cut off from the opportunity of reformation and repentance, if ever such a scheme had seriously taken possession of his thoughts. He died at variance with his parliament, and despised by his people. Had the misfortunes of his father served to restrain the arbitrary principles and dissolute conduct of Charles, or the rash zeal and blind obedience of James for the church of Rome, the revolution would never have taken place: but the laws of the country were violated, and the established religion was fought to be subverted, in a greater or less degree, more openly or more covertly, according to the circumstances of the times, but uniformly, from the period of the restoration to that of the revolution; and the issue was, that the subjects of Great Britain were ultimately compelled to seek their safety in revolt, and in the protection of the prince of Orange.

With respect to the general character of Charles, it seems most candid, as in the instance of his father, to place in opposition the different, and often opposite, determinations of Hume and Mrs. Macaulay.

During the few days of the king's illness, says Hume, clergymen of the Church of England attended him; but he discovered a total indifference towards their devotions and exhortations. Catholic priests were brought, and he received the sacrament from them, accompanied with the other rites of the Romish church. Two papers were found in his cabinet, written with his own hand, and containing arguments in favour of that communion. The duke had the imprudence immediately to publish these papers, and thereby both confirmed all the reproaches of those who had been the great enemies to his brother's measures, and afforded to the world a specimen of his own bigotry.

If we survey the character of Charles II. in the different lights, which it will admit of, it will appear various, and

give rise to different and even opposite sentiments. When considered as a companion, he appears the most amiable and engaging of men; and indeed, in this view, his deportment must be allowed altogether unexceptionable. His love of railery was so tempered with good breeding that it was never offensive. His propensity to satire was so checked with discretion, that his friends never dreaded their becoming the objects of it: his wit, to use the expression of one who knew him well, and who was himself a good judge, could not be said so much to be very refined or elevated, qualities apt to beget jealousy and apprehension in company, as to be a plain, gaining, well-bred, recommending kind of wit. And though perhaps he talked more than strict rules of behaviour might permit, men were so pleased with the affable, communicative deportment of the monarch, that they always went away contented both with him and themselves. This, indeed, is the most shining part of the king's character; and he seems to have been sensible of it: for he was fond of dropping the formality of flate, and of relapsing every moment into the company.

In the duties of private life, his conduct, though not free from exception, was, in the main, laudable. He was an easy, generous lover, a civil, obliging husband, a friendly brother, an indulgent father, and a good-natured master. The voluntary friendships, however, which this prince contracted, nay, even his sense of gratitude were feeble; and he never attached himself to any of his ministers or courtiers with sincere affection. He believed them to have no motive in serving him but self-interest; and he was still ready, in his turn, to sacrifice them to present ease or convenience.

With a detail of his private character we must set bounds to our panegyric on Charles. The other parts of his conduct may admit of some apology, but can deserve small applause. He was indeed so much fitted for private life, preferably to public, that he even possessed order, frugality, and economy, in the former: was profuse, thoughtless, and negligent, in the latter. When we consider him as a sovereign, his character, though not altogether destitute of virtue, was in the main dangerous to his people, and dishonourable to himself. Negligent of the interests of the nation, careless of its glory, averse to its religion, jealous of its liberty, lavish of its treasure, sparing only of its blood; he exposed it by his measures, though he ever appeared but in sport, to the danger of a furious civil war, and even to the ruin and ignominy of a foreign conquest. Yet may all these enormities, if fairly and candidly examined, be imputed, in a great measure, to the indolence of his temper: a fault which, however unfortunate in a monarch, it is impossible for us to regard with great severity.

It has been remarked of Charles, that he never said a foolish thing nor ever did a wise one: a censure which, though too far carried, seems to have some foundation in his character and deportment. When the king was informed of this saying, he observed, that the matter was easily accounted for: for that his discourse was his own, his actions were the ministry's.

If we reflect on the appetite for power inherent in human nature, and add to it the king's education in foreign countries, and among the Cavaliers, a party which would naturally exaggerate the late usurpations of popular assemblies upon the rights of monarchy; it is not surprising, that civil liberty should not find in him a very zealous patron. Harassed with domestic faction, weary of calumnies and complaints, oppressed with debts, straitened in his revenue, he sought, though with feeble efforts, for a form of government, more simple in its structure, and more easy in its management. But his attachment to France, after all the

pains which we have taken, by inquiry and conjecture, to fathom it, contains still something, it must be confessed, mysterious and inexplicable. The hopes of rendering himself absolute by Lewis's assistance seem so chimerical, that they could scarcely be retained with such obstinacy by a prince of Charles's penetration: and as to pecuniary subsidies, he surely spent much greater sums in one season, during the second Dutch war, than were remitted him from France during the whole course of his reign. I am apt therefore (says Hume) to imagine, that Charles was, in this particular, guided chiefly by inclination, and by a prepossession in favour of the French nation. He considered that people as gay, sprightly, polite, elegant, courteous, devoted to their prince, and attached to the Catholic faith; and for these reasons he cordially loved them. The opposite character of the Dutch had rendered them the objects of his aversion; and even the uncourtly humours of the English made him very indifferent towards them. Our notions of interest are much warped by our affections; and it is not altogether without example, that a man may be guided by national prejudices, who has ever been little biassed by private and personal friendship.

The character of this prince has been elaborately drawn by two great masters perfectly well acquainted with him, the duke of Buckingham and the marquis of Halifax; not to mention several elegant strokes given by Sir William Temple. Dr. Welwood likewise, and bishop Burnet have employed their pencil on the same subject: but the former is somewhat partial in his favour; as the latter is by far too harsh and malignant. Instead of finding an exact parallel between Charles II. and the emperor Tiberius, as asserted by that prelate, it would be more just to remark a full contrast and opposition. The emperor seems as much to have surpassed the king in abilities, as he falls short of him in virtue. Provident, wise, active, jealous, malignant, dark, sullen, unforgiving, reserved, cruel, unrelenting, unforgiving; these are the lights under which the Roman tyrant has been transmitted to us. And the only circumstance in which it can justly be pretended he was similar to Charles, is his love of women, a passion which is too general to form any striking resemblance, and which that detestable and detested monster shared also with unnatural appetites.

Mrs. Macaulay observes, that nature had bestowed on Charles II. powers, which if properly exerted, might have constituted an heroic character; but which, by an adverse fate, enabled him to exceed in wickedness and folly all the princes who had ever sat on an English throne.

The unhappy fate of Charles I. and the adversity into which it necessarily threw his son, by depriving him of the advantages of parental care, and exposing him, at a time of life when the passions are the strongest and the judgment the weakest, to the perfidious licentiousness which prevailed in the court of France, gave such strength and power to the natural bias of his disposition, as totally to efface every vestige of that moral sense which helps to form the mixt character of the generality of mankind, and which is seldom entirely lost, even by the most flagitious. If with the jaundiced eye of prejudice we can excuse, and even applaud the mean hypocrisy used by Charles, during his abode with the Scotch covenanters, the breach of his oaths, and the barbarity with which he afterwards treated this people, when exalted to a kind of despotic power over them, with the persecutions with which he repaid the services of the English presbyterians; what can even the voice of faction say to the ingratitude with which he treated the ancient and faithful friends of the fortunes of his family; and the dismissing all those with ignominy who endeavoured to reconcile the prerogative of the king with the safety of the nation, and the

existence of the constitution? What can the voice of faction say to the palpable neglect which this prince, in several instances, paid to his father's memory; and in particular, in the accepting a sum of money for the expense of his funeral, and the pocketing of it for his private use? What can the vice of faction say to the treatment of their avowed and heady patron, the earl of Clarendon; what to the king's behaviour to the duke of Ormond, in the case of Blood, &c. and what to the indifference with which he treated the memory of a sister, whom he pretended to love with the highest degree of affection? If with the men of pleasure, and the thoughtless companions of the bottle, we view with complacency, and even with applause, the licentious manners of a prince infected with the vices of every country which had yielded an asylum to his wandering steps, is it possible not to reflect, that Charles was totally deficient in that kind of sympathy and indolent good nature which often accompany the effeminacy of a luxurious life; and that the unjust severity and even cruelty with which he treated all those whom he regarded as his enemies, are blemishes not to be excused when united to the severest manners and the highest rectitude of principle.

If with the Papists, we applaud the king for the pious design he had entertained of restoring the British empire to the church of Rome; what can we say to the easy manner in which he abandoned this design, and the whole party, to their inveterate enemies? What can we say to the breach of the promise he had made to this body, that he would declare his conversion, and avow his patronage after the receiving a sum of money for this purpose from the court of France? And what can we say to the mean manner in which he concealed his predilection to Popery till the hour of his decease, in which he vainly hoped to secure a safe passage to the regions of eternal bliss, from the merits of a submission extorted by the terrors of an affrightened conscience? And if, with the zealous churchmen, we regard him as the patron of the restored privileges of that holy body, what excuse can we make for the deep designs he had entered into, of sacrificing all those sacred rights to the ambition of Papists, and the interests of the papal chair?

In the duties of private life, we are told by the panegyrists of Charles, that his conduct, though not free from exception, was in the main laudable: but though a large measure of indulgence is to be given to the foibles, the infirmities, and even the vices of every man or woman, who has not received the benefits which arise from a perfect form of education, yet we cannot possibly trespass so highly on our sense of propriety, decency, and the inestimable virtues of sobriety, as to rank that facility with which the king became the constant dupe of his amorous incinations and passion for variety, among the good qualities of a rational agent; nor can we agree to the observation, that Charles was a civil and obliging husband, merely on the merit of his not having sacrificed an innocent woman to the venom of party spirit. On the contrary, setting aside the advantages of affluence, and the splendor of rank, the queen's situation must be considered as equally mortifying to that in which every other female is involved, whom a severe fate unites in the indissoluble bonds of matrimony with a profligate rake. On the subject of the king's constancy to the duke of York's interest, it is observable, that a coldness and mutual jealousy prevailed between the two brothers till the period of the first French treaty; a circumstance which rendered all future dissension dangerous to the peace and happiness of both. Burnet asserts, that Charles both hated and feared his brother; and Sir John Kersey, who has manifested the highest

degree of partiality to the conduct of the king, allows that it was motives of policy alone which were the grounds of his inflexible patronage: as on this single instance, therefore, thus circumstanced and opposed by the whole tenor of Charles's public and private conduct, it is impossible to agree with the duke of Buckingham, that this prince was even inclined to justice; or with the rest of his panegyrists, to found on the merits of the act of indemnity, extorted from the necessity of the times, a propensity in his disposition to clemency and forgiveness; we must conclude, that the harsh picture drawn of Charles II. by bishop Burnet, is a just likeness, viz. that he had enormous vices without the tincture of any virtue to correct them; that, under the appearance of gentleness, he concealed a cruel and unrelenting heart; and under the mask of sincerity, the highest degree of hypocrisy and dissimulation; that he was void, not only of every princely, but every manly sentiment; that he was as incapable of friendship as of integrity; that he considered power and the trusts which accompany it, in no other light, than as the means to gratify his criminal and selfish passions; that he acted as the foe rather than the protector of his people; and that it was lewdness, indolence, and the love of ease, which were the single correctors to that rage for absolute power which infects almost all princes; and which, but for the predominancy of less exalted passions, Charles would have pursued with a vigilance equal to the importance of the undertaking; and which, notwithstanding the unconquerable indolence of his temper, the depravity of the times had, in a great measure, enabled him to effect.

Lord Lyttelton speaks of this monarch in the following terms. The methods pursued by Charles the Second, in the conduct of his government, were in many respects different from his father's, though the purpose of both was much the same. The father always *bullied* his parliaments; the son endeavoured to *corrupt* them: the father obstinately refused to change his ministers, because he really esteemed them as honest men; the son very easily changed *his*, because he thought they were all *alike* dishonest, and that his designs might as well be carried on by one *knave* as by another: the father was a tool of the clergy, and a persecutor, out of zeal for his religion; the son was almost indifferent to religion, but served the passions of his clergy against the dissenters from motives of policy: the father desired to be absolute at home, but to make the nation respectable abroad; the son assisted the king of France in his invasions on the liberties of Europe, that, by his help, he might master those of England; nay, he was even a pensioner to France, and, by so vile a prostitution of his dignity, set an example to the nobility of his realm, to sell *their honour likewise for a pension*; an example, the ill effects of which have been felt too sensibly ever since.

Yet, with all these vices and imperfections in the character of Charles the Second, there was something to bewitching in his behaviour, that the charms of it prevailed on many to connive at the faults of his government: and, indeed, nothing can be so hurtful to a country, which has liberties to defend, as a prince who knows how at the same time to make himself *despotic* and *agreeable*: this was eminently the talent of Charles the Second; and, what is most surprising, he possessed it without any great depth of understanding.

But the principal instrument of his bad intentions, was a general depravity of manners, with which he took pains to infect his court, and they the nation. All virtues, both public and private, were openly ridiculed; and none were allowed to have any talents for wit or business, who pretended to any sense of honour, or regard to decency.

His majesty had once a wish, in order to compare styles, to hear the lingers of several nations, German, Spanish, Italian, French, and English, perform together on the court stage, at Whitehall. The Italians performed the celebrated trio of Carissimi, *Che dite, che fate*; and the English brought up the rear under great disadvantage, with *I pass all my hours in a shady old grove*; for though the king chose that song as the best, others were not of his majesty's opinion.

The old way of concerts was laid aside by this prince immediately after his restoration, when he established his band of 24 violins, after the French model, and the style of music was changed accordingly. So that French music became in general use at court, and in the theatres; indeed, performers on the violin had a lift into credit before this period, when Baltzar, a Swede, came over, and did wonders upon it by swiftness and double stops. But his hand was accounted hard and rough, though he made amends for that by often tuning in the lyra way, and playing lessons conformable to it, which were very harmonious, as is manifest by many of his pieces still extant.

During the first years of king Charles's reign, all the music in favour with the beau-monde, was in the French style; which, at this time, was rendered famous throughout Europe, by the works of Baptit Lulli, a frenchified Italian, and master of the court music at Paris, who enriched the French music by Italian harmony, which greatly improved their melody. His style was theatrical, and the pieces called *branes*, or *ouvertures*, consisting of an *entrée* and a *courante*, will ever be admired as the most stately and complete movements in music. All the composers in London strained hard to imitate Lulli's vein. However, the whole tendency of the *ayre*, affected the foot more than the ear; and no one could listen to an *entrée*, with its starts and leaps, without expecting a dance to follow.

The French instrumental music, however, did not make its way so fast as to bring about a revolution all at once; for, during a great part of this king's reign, the old music was still used in the country, and in many private meetings in London; but the treble viol was discarded, and the violin took its place."

The taste of Charles II. seems to have been French in all things, but particularly in music; for he had French operas; a band of twenty-four violins, in imitation of the French band at Paris; French masters of his band, Cambert, and, afterwards, Grabu; he sent Pelham Humphrey to study under Lulli, and young Banister to learn the violin at Paris. Indeed, though we have since had better models for our musical studies of all kinds, from Italy and Germany, music, as well as every other liberal art, was at this time in a higher state of cultivation in France than in England. But though Lulli carried Italian dramatic music into France, it was such as had been produced during the infant state of the art in Italy; yet, notwithstanding the subsequent improvements it received in its native country, from innumerable masters, particularly since they were furnished with lyric poetry by Metastasio, near a century elapsed before our neighbours the French perceived it possible to compose better music than that of Lulli.

Our merry monarch, (as he is called in the Spectator, No. 462) certainly loved music, and had an accurate ear, particularly for time; nor would he allow any composition to be music, to which he could not beat the measure; which is, in general, a very good criterion of clearness, accents, and rhythm; but there being all wanting in the music of Lulli, excites a wonder at his majesty's partiality for French music. But,

"What can we reason but from what we know?"

He had heard little or no Italian music, and the German music of his time was rude and unpolished in melody, though in harmony and fugue very learned. But these our gay and voluptuous sovereign would not give himself the trouble to analyse, or even to hear. Purcell, the nation's darling, born in 1658, was but two years old at the restoration; and at the death of Charles but 24; at which time his fame had scarcely taken wing.

CHARLES V. This celebrated prince was born at Ghent, on the 24th February, 1500. He had not completed his sixteenth year, when the rich inheritance of Castile, of Arragon, and Navarre, of Naples, Sicily, and Sardinia, devolved on him, by the death of his maternal grandfather, Ferdinand. His early youth had been formed by Margaret of Austria, his aunt, and Margaret of York, the widow of Charles the Bold. These two princesses were distinguished equally by their virtue and abilities. On the death of his father, Philip, William de Croy, Lord of Chievres, and Adrian of Utrecht, were the persons appointed by his grandfather Maximilian, for the purpose of carrying forward his education, and forming his sentiments and principles. It was the whim of Adrian, however improbable its success, to involve his young mind in all the vexatious mazes of metaphysical theology; but the more authoritative and more acceptable instructions of Chievres led him from monastic speculations to the robust exercises of military life. The arts of government were no less acceptable study, connected with the history of his own kingdom, and of those neighbours with whom he had most frequent intercourse. From his fifteenth year, when he assumed the government of Flanders, Charles was accustomed to business. It was a part of his discipline to peruse state papers, to preside at the deliberations of his council, and to propose in person those questions on which he wished for advice. From such an education, his habits and manners assumed a character disproportioned to his years. Yet his outset was marked by no feats of superior genius. His figure and address, his graceful and manly accomplishments, were flattering to the vanity of his subjects; but there was a certain temporizing deference, which seemed to lay him open to the artifices of courtiers, and a tone of passion which prepared him for a dupe, and his people for a prey.

Ferdinand, his grandfather, died in 1516; on which event Charles claimed the title of king, while his mother Joanna was yet alive. The times were difficult; but Ximenes was equal to the crisis. The Pope, as head of the church, and the Emperor, as head of the empire, concurred in confirming the dignity, as of their own right; and on these grounds was Ximenes intrusted to press the claim on the Spanish nation. Yet, by the laws of Spain, the sole right to the crowns of Castile and Arragon belonged to Joanna; nor had any public act, declaring her incapacity, reconciled the pretensions of Charles, either to the delicacy of filial forbearance, or to the privileges of the two nations. Ximenes protested against the principle, but was prompt and vigorous in carrying his orders into execution. The title was recognised at Madrid, in spite of discontent; though the states of Arragon were obnoxious, under the irrefolte administration of the archbishop of Saragossa. The Arragonians waited for the king's arrival in Spain, before they would acknowledge any other title than that of prince.

The war which had arisen from the holy league had been transmitted by Ferdinand to his grandson, who, as king of Spain, was in actual hostility against France. But Chievres, conscious of the advantage which his countrymen, the Flemings, derived from their commerce with the French, warmly recommended an accommodation, and obtained the manage-

ment of the treaty. The king of France listened with joy to the first overtures. The principal articles of the treaty were, that Francis should give in marriage to Charles his eldest daughter, an infant of a year old, with all his claims and pretensions to the kingdom of Naples, for her dowry. In consideration of Charles's being already in possession of Naples, he was to pay 100,000 crowns a-year to the king of France until the accomplishment of the marriage, and the half of that sum annually as long as the prince's had no children. When Charles should arrive in Spain, the heirs of the king of Navarre might represent to him their right to that kingdom; and in default of due satisfaction, Francis was at liberty to assist with his forces. Charles probably would never have signed such conditions, but for the purpose of securing a safe passage into his Spanish dominions. Yet such was the ascendancy of his Flemish favourites, and their jealousy of Ximenes, that after a year's delay, nothing but the repeated remonstrances of the cardinal, and the murmurs of the Spaniards, prevailed on him to embark. No sooner was Ximenes informed of his arrival, than he advanced to meet him. But his journey was stopped by illness, which some attributed to poison, though it seems naturally accounted for, by extreme old age and unseasonable fatigue. The neglect of his counsels, and the cold formality with which the king, as a matter of form, allowed him to retire, produced an effect equal to any poison, in his almost immediate death. Charles received the news of it with indifference; but he had scarce entered Valladolid, before he was sensible of his loss. The cortes of Castile insisted on his mother's name appearing first in all public acts, and on the reservation of her authority, in case of her recovery. They were liberal in their grants; yet was the discontent loud; to which the king's hesitation in speaking Spanish, and attachment to Flemish favourites, not a little contributed. These events took place in the years 1518 and 1519.

Before his departure from Arragon, Charles sent his brother Ferdinand into Germany, and thus obviated his intrigues. He found the cortes of Arragon highly refractory; the assembly of Catalonia still worse; and the Castilians were taking those measures, in defence of their privileges against strangers, which laid the foundation of that memorable union among the commons of Castile. With respect to the restitution of Navarre, neither the monarch nor his Castilian nobility were inclined to part with it; and the conference at Montpellier was abortive. The death of Maximilian vacated the imperial throne; and the European princes had learned, from the Italian wars, the advantages which might be derived from that dignity. The previous negotiations of Maximilian, and the situation of his hereditary dominions with respect to the Turks, had predisposed the former towards the elevation of Charles. But he was opposed by a formidable rival in Francis, who pressed it on the consideration of Europe, that the crown was elective, and ought not to be made, by prescriptive custom, hereditary in the house of Austria. His emissaries contended besides, that the person who held the crown of Naples was excluded by a fundamental constitution. To their arguments were added horrid loads of treasure, and unlimited promises.

The electors directed their views to Frederick Duke of Saxony; but he rejected their proposal, and at the same time effectually turned the scale in favour of Charles, who received the news of his election at Barcelona. But his Spanish subjects were sullen and refractory, refusing to grant any subsidy to an absent sovereign. Charles, in his turn, countenanced the association of the "brotherhood," which proved the source of much calamity to the kingdom. The cortes of Castile were not less violent than the Valencian ba-

rons. Opposition and artifice united could with difficulty extort a donative, to enable him to appear with becoming splendor in Germany.

Conscious of the rivalship which still subsisted between himself and the king of France, Charles was desirous of courting the alliance of Henry VIII. of England, whose possession of Calais gave him a great degree of influence with both monarchs. Henry had agreed to an interview with the French king between Guines and Ardrès; but Charles adroitly pre-occupied his favour, by steering directly from Corunna to Dover, and, by a visit of only four days, at once made a favourable impression on the king of England, and attached Wolsey to his interest, by a pension of 7,000 ducats, and the lure of his future succession to the apostolic chair. After the interview with Francis at Guines, Henry returned the visit of Charles at Gravelines, who effected, by his seeming deference, the impressions which the conduct of his rival had made.

From the Low Countries, Charles pursued his route to Aix-la-Chapelle, where he was invested with the crown of Charlemagne. Germany was now his by election; Castile, Arragon, Austria, and the Netherlands, by succession; Naples and Granada inherited by the right of conquest; Mexico added to his resources by Fernando Cortes. Yet his territories were distant and disjointed; his authority was limited; his subjects were strangers to each other, and reluctant in their obedience to him.

Luther had now declared the pope to be Antichrist. The first act therefore of the emperor's administration was to appoint a diet at Worms, to check these new and dangerous doctrines. These events occupied the years 1520 and 1521.

In the mean time, the discontents in Spain had gathered to a head. The citizens of Toledo, Segovia, Burgos, Zamora, were all influenced by the same spirit. Adrian trembled in Valladolid at the rapid progress of insurrection; but he forced his naturally lenient disposition, and ordered a body of troops to proceed against the delinquents. Charles, though he had received accounts of these transactions, could not return immediately to Spain, without endangering the imperial crown. He therefore promised, to those who continued faithful, not to exact the subsidy granted by the late cortes; and engaged, that no office should be conferred in future, but upon native Castilians. At the same time he wrote to the nobles, to excite them to the defence of their own rights, and those of the crown, against the commons. He appointed the high admiral and the high constable of Castile, whose abilities and influence would be highly useful in an appeal to arms, to act as regents in conjunction with Adrian. But the junta, relying on an unanimous support, now aimed at a more extensive reform of political abuses. They demanded that the king should return, and reside in his Spanish dominions: that he should not marry without the consent of the cortes; nor appoint a foreign regent in case of unavoidable absence. That no stranger should be naturalized; and that those who already held public offices should resign them. A reduction of the taxes, an extended and reformed representation in all future cortes, which were to assemble as matter of right once in three years, were the other objects to which their remonstrances were directed.

These internal factions encouraged Francis to take up arms. A body of troops, under Andrew de Foix, invaded Navarre, in behalf of Henry d'Albret. The Castilian nobles heard of the irruption with indifference; but when the enemy presumed to invest Lagrogno, a small town of Castile, all parties were roused at once; they took the French general prisoner, and brought Navarre back to its obedience.

Charles,

Charles, having entered into an alliance with pope Leo, determined on open war. The progress of this treaty, to contrary to his inclinations, had been concealed from Chievres. The chagrin of the latter, on the discovery, shortened his days, and left the royal pupil to the uncontrolled exercise of his own powers. Robert de la Mark had ravaged the open country of Luxembourg, and laid siege to Vinton. Charles, at the head of 20,000 men, overwhelmed the territories of Robert, and reduced him to sue for mercy. The count of Nassau was commanded to invest Mezieres; but the chevalier Bayard, the knight, without fear, and without reproach, managed his slender resources with such skill and gallantry, that the imperialists abandoned the siege with considerable loss. At this time, Francis, at the head of a superior army, from excess of caution, missed the opportunity of a personal engagement with his rival, suggested by the constable Bourbon, which might have been fatal to the future grandeur of Charles, who from effaced the disgrace of his retreat by the reduction of Tournay, and secured an important advantage in the alliance of Henry, king of England.

In the mean time, Francis, deserted in Italy, had renewed the war on the side of Spain. Navarre was again invaded, and Fontarabia, a strong town of Biscay, was taken by Bonivier, admiral of France. This loss determined Charles to re-visit his Spanish dominions. On his way, he staid at London six weeks, received the garter, confirmed his alliance with Henry, and again espoused Wolfey with distant hopes of succeeding Adrian. The emperor's first attention was directed, on his arrival in his Spanish dominions, to heal the wounds of faction. He rejected the bloody suggestions of his council, and excepted only fourscore persons from the general pardon. When an officious courtier offered to inform him where one of the most considerable rebels was to be found, he replied, with a smile, "you had better let him know I am here, than tell me where he is." Thus, by his magnanimity and address, he established an ascendancy over the Spaniards, of which he availed himself to obtain pecuniary grants and military support, equal to the prosecution of all his enterprizes. Among these, his mysterious correspondence with Charles, duke of Bourbon, was not the least important. That nobleman was equally entitled to favour by his birth and services. But Louisa, the king's mother, had contracted a violent aversion to the house of Bourbon, and had communicated her prejudices to her son. The death of the duke's wife revived Louisa's passion; but her advances were rejected, and her affection again converted into hatred. She commenced a suit against him for the estates of his deceased consort, and he was stripped of his fortune by an openly netarious sentence. This political intrigue was brought to bear in the year 1523. But the conspiracy was discovered and disconcerted. The confederates were repulled in three separate attempts to invade France, and lost half the Milanese. But the wealth of Mexico prompted Charles to new enterprizes, and purchased him new allies. He opened the campaign of 1524, with the siege of Fontarabia, which he took while the magazines were yet full, and the walls entire. Charles received the intelligence of the victory of Pavia at Madrid, with an air of the most perfect composure and moderation: but the projects which he entertained on this unexpected success, were most extensive and ambitious. Yet his own embarrassments were scarcely inferior to those of the prince his prisoner, from the limited condition of his revenues, and the universal jealousy of his neighbours. In the mean time France was filled with consternation by the defeat at Pavia: the king sent the first news of it to his mother, in these words: "Madam,

all is lost, except our honour." Henry now began to tremble for the balance of power, and his minister Wolfey resented the fallacious promises of the papacy. The former therefore secretly assured Louisa of his support, but in his language to the emperor, offered to invade Guienne with a powerful army, on condition that Francis should be delivered to him, and the monarchy of France extinguished. These extravagant proposals were designed to disgust the emperor, on whose rejection of them the king of England found a decent pretext for withdrawing from his alliance.

The low state of the emperor's finances preventing him from penetrating into France with the forces of Spain and the Low Countries, he proposed terms to Francis of a rigorous nature, that the latter, drawing a dagger, exclaimed, "It is better that a king should die thus."

The removal of Francis from Italy had equally enraged Bourbon and Pescara. The discontent of the latter had reached Jerome Morone, vice-chancellor of Milan, whose genius for intrigue was inflamed by the hope of delivering Italy from the yoke of foreigners. He tempted Pescara with the throne of Naples; and the latter acceded to the proposal: but, on reflection, he deemed it either most honourable, or most safe, to reveal the whole conspiracy to the emperor, who had been already apprised of it by his spies. He commanded Pescara to continue the negotiation. The latter invited Morone to a last interview; but Antonio de Leyva had been concealed in the apartment, and, appearing suddenly, arrested Morone, and committed him to the castle of Pavia. Sforza was declared to have forfeited all title to the duchy of Milan, which was seized in the emperor's name. But the emperor's recent acquisitions in Italy were more than counterbalanced by his increasing dangers. The health and even the life of Francis, whose captivity was expected to prove so advantageous, had been endangered by six months of harsh treatment. Charles, therefore, hastened from Toledo to Madrid, and inspired his prisoner with the hopes of speedy deliverance; but he relapsed into his former dilance and indifference, as soon as he had produced the effect intended, which was soon counteracted by the arrival of Bourbon in Spain. Charles met the rebellious subject without the gates of Toledo, though he had with difficulty been prevailed on to visit the king. But the Spaniards detested Bourbon's crime, and thinned all intercourse with him.

In the year 1526, the two monarchs came to an agreement, by which the French king was to restore Burgundy to the emperor in full sovereignty, as soon as he was left at liberty, delivering at the same time the Dauphin and the duke of Orleans, or twelve of the principal nobility in lieu of the last, as hostages. In confirmation of this agreement, Francis was to marry the emperor's sister, the queen dowager of Portugal. The treaty was signed about the middle of January, and on the return of the ratification from Paris some weeks after, the marriage was consummated, and Francis took leave of his new brother-in-law with disssembled demonstrations of regard. In the course of the same year, Charles married Isabella, the sister of John III. king of Portugal, a choice equally acceptable to the Cortes of Castile and Arragon, and pleasing to the court of Lisbon.

On the death of Lewis II. king of Hungary and of Bohemia, on the field of Mohaoz, those kingdoms were claimed by the archduke Ferdinand, as inheriting the ancient pretensions of the house of Austria, and in right of his wife, the sister of the deceased monarch. The Vayvode of Transylvania was a competitor; but the personal merit of Ferdinand, and the influence of the emperor now laid the

foundation of that pre-eminence, which has rendered the house of Austria so formidable to the rest of Germany, since these acquisitions became hereditary in their family. Having experienced the danger of awakening the fears of mankind, Charles affected to disclaim the enterprize of Bourbon against the pope's liberty. But Europe was not to be cajoled by prayers and processions, and Francis rushed to action. The Milanese had been drained of the imperial forces, by the expedition against Rome, and the Italians received Lautrec with open arms. The whole duchy, as well as Alexandria and Pavia, must have been restored to France, had not Lautrec feared the jealousy of the confederates. He, therefore, marched towards Rome, where the pope was still a prisoner in the castle of St. Angelo. The Imperial army demanded their arrears; and Charles, who could depend neither on their fidelity, nor the liberality of the cortes, sold Clement his freedom for three hundred and fifty thousand crowns. Part of this sum was distributed among the Imperial troops, who then quitted Rome, and pointed their retreat towards Naples.

In the year 1539, while the contending parties were fluctuating in their counsels, a negotiation, undertaken between Margaret of Austria, the emperor's aunt, and Louisa, the mother of Francis, terminated in the peace of Cambray, by which Francis was to pay two millions of crowns for the ransom of the dauphin and the duke of Orleans; to restore the towns he still held in the Milanese; to renounce his claims to Naples, Milan, Genoa, and all beyond the Alps; to abandon the Venetians, the Florentines, and the duke of Ferrara; in a word, to sacrifice every object of the war, and to purchase the indulgence of his parental feelings at the expense of his character as a public man and a sovereign. Henry VIII. acceded to the peace of Cambray; so that this interval of tranquillity gave Charles an opportunity of visiting his Italian and German dominions. Before his embarkation, a question having arisen whether the inhabitants of Barcelona should receive him on his entry, as emperor or as count of Barcelona, he instantly decided for the latter title, and was rewarded for his flattering dispositions by an oath of allegiance from the states of the provinces to his infant son Philip. In Italy, he appeared in all the pomp of military and civil state; and took infinite pains to efface every unfavourable prepossession from the minds of the natives, by the equity and moderation with which he adjusted the concerns of the country. But in the year 1539, the affairs of Germany called for his immediate attention. Though Solymán had been obliged to abandon the siege of Vienna with disgrace, the religious disorders of the empire demanded the presence of its head. Several of the German princes, who had embraced the opinions of Luther, had not only established in their territories that form of worship, but had entirely suppressed the rites of the Romish church. Many of the free cities had imitated their conduct. Nearly one-half of the Germanic body had revolted from the papal see, and its authority was considerably weakened in the other half. The Imperial influence began to be weakened by these divisions, to suppress which, the diet of Augsburgh was called, and attended by all the princes of the empire, especially those who had protested against the decree of a late diet at Spire, for the celebration of mass. The principal of these Protestants were the electors of Saxony, the marquis of Brandenburg, the Landgrave of Hesse, the dukes of Lunenburg, and the prince of Anhalt. They conducted themselves with decency, but defended their opinions with fortitude. Their tenets were, however, condemned by the majority of the diet, whose decree induced them to confederate more closely, and produced the league of Smalkalde. In the year 1532, the emperor marched against Solymán;

but the campaign wore out without any remarkable event. He afterwards sailed against Tunis, and took the Goletta, garrisoned by six thousand Turkish soldiers, under the command of Sinan, a renegade Jew, which led to the defeat of Barbarossa. But before Charles could give the necessary orders for protection against military violence, the soldiers had precipitated themselves on the city of Tunis, where thirty thousand inhabitants perished in one day, and Charles's victory was stained by the excesses of lust and avarice. Muley Hasen took possession of the throne, and consented to do homage for the crown of Tunis; to set all Christian slaves at liberty without ransom; to allow the emperor's subjects the free exercise of their religion; to exclude the Turkish corsairs from his harbours; to deliver up the Goletta and all his fortified posts, and to pay twelve thousand crowns annually for the subsistence of the garrison. The lustre of this expedition dazzled Europe, and 20,000 slaves, freed from bondage, and clothed at his expense, traced his return to Spain; after which, in the year 1536, he improved his leisure in providing funds and forces for a new war. He drew money from Naples and Sicily, troops from Germany, and then threw down the gauntlet to the king of France, in presence of the pope and cardinals. His confidence of success was so great, that, notwithstanding the remonstrances of his ministers and generals against the plan of his campaign, he desired the historian, Jovius, to make a large provision of paper to record his impending victories. But Francis had discovered his design of penetrating into the southern provinces of France, and left it to the Marshal Montmorency to defeat the plan; who executed the trust by making a descent from the Alps to Marcellis, and from the sea to the confines of Dauphiné. Charles waited two months in Provence, and then, having lost half his troops by disease or famine, gave the signal for a reluctant retreat; and nothing could have saved the Imperialists from destruction, but the adherence of Montmorency to his favourite maxim, that a bridge of gold should be made for a flying enemy.

In the year 1538, the two monarchs, listening to the exhortations of the Roman pontiff, extended their truce of ten months to ten years. A few days after signing the treaty, the emperor, on his passage to Barcelona, was driven by contrary winds on the coast of Provence, and invited by Francis to a personal interview, at which the two rivals seemed to have buried all animosity, and to contend only for superior candour and liberality. Charles had no sooner landed in Spain, in 1539, than he was acquainted with the sedition of his troops, who had plundered the Milanese, and were only to be quieted by the address of the imperial generals, who borrowed and extorted money to discharge their arrears, and then disbanded the greater part of them. Before the success of his plan was ascertained, the emperor had endeavoured to rouse the liberality of his Castilian subjects; but the nobles pleaded exemption from any tax, and presumed to urge on Charles a constant residence in Spain. They were dismissed with indignation, and were not afterwards called to the assembly of the Cortes. But they still asserted their personal privilege. On the return of the emperor from a tournament, one of the sergeants struck the duke of Infantado's horse, who drew his sword and wounded the officer. Charles ordered the judge of the court to arrest the duke; but the countable of Castile claimed the right of a jurisdiction over a grantee, and conducted Infantado to his apartment, attended by all the nobles present. The emperor perceived the hazard of irritation, and prudently sent to the duke of Infantado, offering to punish the person who had insulted him; but the duke forgave the officer, and gave him a compensation for his wound.

In the year 1540, Charles, having negotiated a safe conduct by deceitful assurances, passed through France with a small but splendid train of about an hundred persons, and meeting the king at Châtellerault, proceeded with him to Paris, where he staid only six days, and pleading the necessity of his presence in the Low Countries, was accompanied as far as St. Quentin by his generous and unsuspecting rival. The citizens of Ghent were incapable of resistance; and he received their ambassadors with a declaration, that he would appear among them as their sovereign, with the sceptre in one hand, and the sword in the other. He entered the city on his birth-day, and put twenty-six of the principal citizens to death, and thus set an example of severity, which might bridle the seditious spirits of his other subjects in the Netherlands. In the year 1541, he summoned a diet at Ratibon, in which while he confirmed the papal authority, he privately assured the reformers of his protection, and thus induced them to grant him a liberal supply of men and money for the war against the Turks. The remembrance of the glory he had acquired in his late expedition to Africa inflamed him with the desire of conquering Algiers. After a tedious and tempestuous navigation, at an advanced season of the year, against the advice of Andrew Doria, he anchored off the coast of Africa, to experience a series of calamities, which neither prudence could contract nor exertion overcome. On the second day after his landing, there arose a tempest which overflowed the camp during the night, and the next morning at day break they were attacked by the enemy, who were with difficulty repulsed. His ships were most of them wrecked, and eight thousand men perished in an hour, either in the sea or by the hands of the Arabs. The next day Doria sent him word that he had borne away with the remnant of the fleet to Cape Metafuz, which was three days march from the present camp. Pressed by sickness and by wounds, by famine and the Arabs, they at length reached Metafuz, and Charles by these disasters, gained a credit for fortitude and humanity, which prosperity had hitherto allowed him no opportunity of claiming. He flured in the hardships of the meanest soldier; he exposed his person, and animated his fellow-sufferers; and though a body of Arabs hovered about his rear, he was the last to quit the shore. On his return to Spain he was attacked on various sides. In the year 1542, five formidable armies invaded his dominions, but they only consumed their strength in fruitless enterprises. In 1543, he obtained a liberal supply from the Cortes, borrowed a considerable sum from John, king of Portugal, on the security of the Molucca isles, negotiated a marriage between his son Philip, and Mary the daughter of that monarch, obtained donations from the states of Arragon and Valencia, and a valuable consideration from Cosmo de Medici for withdrawing his garrisons from the citadels of Florence and Leghorn, and prevailed with Henry of England to declare on his side. Under these circumstances, it might have been expected that Charles would have opened the campaign of 1544 with vigour; but after providing for the security of Spain, and detaching a body of Spanish troops into the Netherlands, he passed into Germany, and preferred the intrigues of the diet to engaging in the operations of the field. He at length signed his last treaty with Francis, in which, besides the public articles, there was a private agreement for the extermination of the protestant heresy. He now summoned the diet to Ratibon, whither the Protestants sent deputies, though the Roman catholic members appeared in person. The emperor, while the elector of Saxony and the landgrave of Hesse were hesitating whether to renounce their homage and prefer war, had been reinforced by Paul's quota of troops, and some of his own

Spanish forces. He determined, however, to wait within his lines till the protestant force should be dissolved by disunion and necessity. As soon as Maurice of Saxony, with whom he was in secret league, had by an irruption withdrawn the elector to the relief of his subjects in Saxony, the emperor put his troops in motion in the winter of 1547, and reduced the duke of Wurtemberg, the cities of Ulm, Augsburgh, and Straßburgh, to submission. At this period, by that good fortune which has been called the star of the house of Austria, Francis died at Rambouillet, in the thirty-third year of his reign. Freed from this source of inquietude, the emperor crossed the Elbe, leading his cavalry in person, together with the flower of his army, routed the Saxons, and took the elector prisoner. Having now dispersed his enemies in the field, Charles summoned a diet at Augsburgh, and in the year 1548 proposed that system of doctrine, known by the name of the Interim, which was considered by both parties as an unsatisfactory and insidious compromise. But the power of the author ensured its reception every where, but in Magdeburg, Bremen, Hamburg, and Lubeck. On the death of Paul, and the succession of Julius the Third to the apostolic chair in 1550, the emperor began to cherish the ambitious design of transmitting the German empire to his son, as well as the kingdom of Spain, and his dominions in Italy and the Low Countries. But he met with a powerful obstacle in the jealousy of his brother Ferdinand. The Germans were besides disgusted with the reserve and haughty manners of Philip, and alarmed at the concentration of so much power in the head of the empire; so that Charles was reluctantly compelled to drop the scheme. He therefore refused the enforcement of the interim, and would probably have succeeded completely, had he not been deceived by Maurice, whose intricate plan of policy blinded the most quick-sighted prince in Europe. In 1551, the diet appointed Maurice out as the most proper general to enforce the reception of the interim, and Charles approved of the recommendation. His credulity could not fail of placing him at length in a most embarrassed situation, and he tried the effect of negotiation. The danger of the emperor at Inprack and his sudden retreat by torch-light are well known; and these two masters of success soon came to a better understanding, which terminated in a peace, and the establishment of the protestant church in Germany, by the treaty of Passau in 1552.

But the German princes, engrossed by their own concerns, took little care of the French, who were exposed singly to the resentment of Charles. Emerging from his retreat, he affected to march towards Hungary, but turning suddenly to the right, and being joined by Albert of Brandenburg, invailed Metz at the head of eighty thousand men. His intentions having been anticipated, the city was ably defended by Francis duke of Guise; and notwithstanding the emperor's perseverance even to obituary, finding himself deserted by his soldiers, whose spirits had been exhausted by hardships, and whose numbers had been thinned by a pestilential disease, he yielded to the solicitations of his generals, and retreated. His disappointment extorted from him a severe sarcasm against fortune, whom he likened to other females, in her preference to young men, and inconsistency to her earlier favourites.

In 1553, however, he effaced in some measure the disgrace of his repulse at Metz, by the capture of Terouanne and Hesdin.

In 1554, the French king determined to act vigorously both in the Low Countries and Italy, that he might compel Charles to an equitable peace. He ravaged Hainault, Liege, and Artois; reduced Marienburg, took Bouvines, and Dinant by assault, and invailed Renß, to the relief of
which

which the emperor marched notwithstanding his infirmities. He wished to avoid a decisive action, but a dispute about a spoil brought on a general engagement, in which the Imperialists were repulsed, and might have been completely routed, but for the tardiness or jealousy of the enemy. The emperor, on his retreat, entered Picardy, and took his revenge for the ravage of Hainaut and Artois. In Italy, his general, the marquis of Merignano, defeated the Florentine exile, Strozzi; Siena was besieged, and capitulated on honourable terms; and Charles was in hopes of recovering Metz by an intrigue with the father guardian of a convent of Franciscans in the city. But in this design he was disappointed by a discovery on the very day of execution. The death of pope Julius the Third, and the exaltation of cardinal Carafa, the inveterate enemy of his house, augmented his chagrin, and he now, at the early age of fifty-six, detested to retire from public life. Both his constitution and mental powers began to be seriously impaired by the increasing severity and duration of the gout; the complication of his political concerns, extending to every nation of Europe, was beyond his strength to manage, and he had a natural distrust of ministers. He therefore thought that he should better consult his fame by a voluntary retreat than by continuing to struggle against the tide of more active and vigorous competition. On the twenty-fifth of October, 1555, when the States of the Low Countries were assembled at Brussels, Charles seated himself for the last time in the chair of state, and explained, by the president of the council, his intention in calling the meeting. He then rose from his seat, and leaning on the prince of Orange's shoulder, took a solemn review of his own administration, and pathetically detailed his reasons for retiring. He addressed his son in a strain of serious and dignified exhortation, in which he enjoined him to prove his gratitude by consulting the welfare of his people. Exhausted by this long address, he sunk into his chair, more honoured and beloved by his subjects in his new character of a philosopher, than when dazzling their eyes by the pomp of state, and swelling their pride and his own by conquest and aggrandisement.

In the beginning of the next year, he resigned the crown of Spain, and all its dependencies, reserving nothing to himself but an annual pension of an hundred thousand crowns, for domestic expences and charity. His last public act was the negotiation of a long truce with France, by which he secured his son an interval of peace, and finding it hopeless to tamper with his brother for the transfer of the imperial dignity to Philip, he closed all by formally transferring his claims of allegiance from the Germanic body to the king of the Romans. On his way to the place of his retreat, he visited Ghent, the place of his nativity, and after a prosperous voyage, arrived at Laredo in Biscay. As soon as he landed, he prostrated himself on the earth, and said, "Naked I came out of my mother's womb, and naked I now return to thee, thou common mother of mankind." He felt mortified at the thin attendance of Spanish nobility at Burgos, and was still more afflicted at his son's ingratitude and dilatory payment of his pension. His retirement was fixed at the monastery of St. Justina's, a few miles from Piacenzia in Estremadura, with which spot he had been struck in passing by it some years before. It was esteemed the most healthful and delicious situation in Spain; and an architect, whom he sent before him, had accommodated the arrangements to the simplicity of his future habits. His plan of life was that of a private gentleman, from which all ceremonious forms were discarded. He never inquired after the politics of Europe, but occupied himself with the cul-

tivation of his garden, and the exercise of riding on a little horse, the only one he kept. He occasionally entertained a few neighbouring gentlemen at his table, and studied mechanical principles with Turriano, an ingenious artist, who accompanied him in his retreat. A considerable portion of his time was reserved for religious exercises, and in this dignified leisure did he pass the first year of his seclusion. But the debility arising from a broken constitution, and the natural tendency of a superstitious faith and practice, at length degraded his sinking mind to the servility and infamy of monastic penances. Prompted by the monks, to whose direction he had resigned himself, he resolved to celebrate his own obsequies, which he did with all the solemnity of a real funeral. The awful impressions which the ceremony, however absurdly and improperly devised, had left upon his mind, hastened the event which he had so frequently anticipated. On the following day he was seized with a fever, and expired on the twenty-first of September, 1558, in his fifty-ninth year.

The character of his mind was rather that of careful and deliberate attention than of brilliant talents or rapid conception. He preferred business to pleasure, and made public concerns at once his study and amusement. But his promptitude in execution was equal to his patience in deliberating; he was at once sagacious in devising measures, and fruitful in resources for carrying them forward. Though he devoted himself more to the cabinet than to the field, he never appeared at the head of his armies without entitling himself to rank with the greatest generals of the age. But his principal excellence consisted in the felicity with which he applied the important science of human nature to the choice of fit agents and the adaptation of abilities to situation and office. If his manners were less pleasing than those of his rival, his virtues were at least as solid, and his adherents as faithful and attached. His confidence in his generals was unbounded; he rewarded their services munificently; he neither envied their glory, nor mistrusted their intentions. But his ambition was insatiable, and his policy too often ungenerous; while his contemporaries, Francis the First and Henry the Eighth, with numberless vices from which he was exempt, were characterized by an openness and credulity, which made them more popular, principally because it rendered them less dangerous.

Charles seems to have lived more in the Netherlands, than either in Spain or Germany. And it was during his reign that so many great composers flourished in that country, as to incline musical historians to assign to them the invention of counterpoint. Rabelais, in the prologue to the 3d book of his Pantagruel, written in 1552, names *60 autres joyeux musiciens*, whom he had heard perform, the chief of whom were Netherlands. Sandoval in his life of the emperor Charles V. tells us that he was a great friend to the science of music, and after his abdication, would have the church-offices only accompanied by the organ, and sung by fourteen or fifteen fryers, who were good musicians, and had been selected from the most expert performers of the order. He was himself so skillful, that he knew if any other singer intruded, and if any one made a mistake, he would cry out, such an one is wrong, and immediately mark the man. He was earnest too, that no seculars should come in; and one evening, when a contralto from Placentia stood near the desk with the fingers, and sung one verse with them eminently well, before he could sing another some of the barbarians ran and told the prior to turn him out of the choir, or at least bid him hold his tongue.

The emperor understood music, felt and tasted its charms; the fryers often discovered him behind the door, as he sat

his own appearance, so that his stars, beating time and marking in parts with the performers; and if any one was out, they could overhear him call the offender names, as redheaded blockhead, &c. A composer from Seville, of his own acquaintance, continues his biographer, whose name was Guerrero, presented him with a book of motets and masses; and when one of these compositions had been sung as a specimen, the emperor called his confessor, and said, see what a thief, what a plagiarist, is this son of a —! why here, says he, this passage is taken from one composer, and this from another, naming them as he went on. All this while the fingers stood aloofed, as none of them had discovered these thefts, till they were pointed out by the emperor.

CHARLES VI. fifth son of the emperor Leopold, was born 1685, declared king of Spain by his father in 1705, and crowned emperor in 1711. Though we never heard, from good authority, that this prince was a poet, a musical composer, or performer, his retaining Apollonio Zino and Metastasio for many years in his service, chiefly to furnish dramas for music, and employing the best composers of the time, of whatever country, to set them; and every great vocal performer of good morals to sing in them, prove him to have been an intelligent, munificent, and dignified patron of the musical art, in all its higher departments, sacred and profane. See OPERA and ORATORIO.

CHARLES XII. king of Sweden, was born in 1682, and succeeded to the crown on the death of his father Charles XI. in 1697. According to the laws of that country, he was not entitled to the reins of government till he had attained the age of 18, but he speedily emancipated himself from the restrictions by which the will of the late king intended him to be bound. In very early life he had been trained to violent and martial exercises; and had in a thousand instances shewn an impracticability of disposition, which no force could conquer, but which was always alive to suggestions of military glory. He was incited to the study of Latin, because his contemporaries, the kings of Poland and Denmark, were reputed to be well versed in that language. From reading the history of Alexander, by Quintus Curtius, his passions were inflamed with a desire of imitating that renowned conqueror, and of becoming himself another Alexander in feats of martial prowess. With this view, he, in a short time after his father's death, gained over a party in the council to deprive the dowager regent of her authority, and to surrender to him the reins of government without any limitations. An early day was fixed for his coronation; but he, unwilling to wait for the usual forms that long custom had rendered necessary on such solemn occasions, scornfully snatched the crown from the hands of the archbishop of Upsal, and placed it on his own head. At first the young king seemed little ambitious of entering into the details of government; he was fond of amusements, and attached to those who were subservient to his pleasures; but to others, however high their rank, and respectable for talents and wisdom, he exhibited a proud and sulken reserve.

The inexperience of Charles encouraged the kings of Poland, Denmark, and the czar of Russia to enter into a confederacy against him, for the purpose of wresting from him a part of his dominions, which had been ceded to his father and grandfather. The youthful monarch was not disconcerted at the news of this powerful league; he seemed rather to rejoice that an opportunity would be afforded him of displaying his hitherto latent courage and abilities. When their designs were certainly known, a Swedish council was convened, at which the king attended, for some time, the silent spectator of their proceedings; in the midst, however,

of their discussions, respecting the measures to be pursued, he rose, and with a dignified air declared that he had determined never to engage in an unequal war, but having been drawn into one by the ambitious views of an enemy, he would never desist till he had humbled and routed him. "It is," says he, "my resolution to go and attack the first who shall dare to avow his designs; and when I have conquered him, I trust the others will be intimidated." This declaration, so unexpected on the part of his council, was followed by a total change of conduct. He gave up all his former amusements, and renounced those habits and indulgences that might seem to withdraw his attention from the more important business of his country. In his domestic concerns he enjoined, by sanctions not to be slighted, the strictest economy; he laid aside all the exterior splendor of dress; and prepared to exhibit in his own person the statesman and the hero.

The Danes, commanded by the duke of Wirtenburg, attended by the king in person, commenced the attack, by invading the duchy of Holstein, which belonged to the brother-in-law of Charles. The Swedish sovereign at first sent a body of troops to his succour, and some attempts were made at a negotiation between the parties; but the Danish king, instead of listening to the still voice of peace, excited the sovereign of Poland to invade Livonia with a Saxon army, to draw off the attention of the Swedes from assisting the duke. The king was no sooner informed of this circumstance, than he drew his sword, determining never to sheathe it till he had brought the invaders into a state of complete humiliation. He quitted his capital in May 1700, to revisit it no more; and, embarking his troops at Carlscroon, sailed for Denmark, and proceeded at once to Copenhagen. As soon as the vessel in which he was touched the ground, he leaped into the sea, sword in hand, followed by his guards and great officers; and advancing in the midst of a shower of musket-shot, he asked of the general who stood next him, what the whistling was which he heard: "It is the noise of the bullets fired at you," replied the general. "This then," said the king, "shall henceforth be the music in which I will delight." At the same moment the general was wounded, and a lieutenant fell dead by his side. The Danish entrenchments were speedily forced, and Charles approached Copenhagen without further opposition. The king of Denmark had taken refuge with his army in Holstein. Under these circumstances, Charles resolved to finish the war at once, and prepared to besiege Copenhagen by land, while the fleet blockaded it by sea. The citizens, deserted by their sovereign, and terrified at the preparations making by Charles, besought him not to destroy the town; and the king on horseback, and at the head of his regiment of guards, received the deputies, who fell on their knees, and whose request he granted, on the consideration of their paying a certain sum of money. The king of Denmark, finding his capital gone, and himself without the means of extricating his country from the power of the Swedes, was glad to listen to almost any terms that might be offered. The victorious monarch assured him that he required nothing but justice to be done to the duke of Holstein, which must include a complete indemnification for all his losses, as well as a restitution to all his possessions. Thus, in a few weeks, did a youth only 18 years of age conclude a war on terms the most honourable to himself, and to the total discomfiture of the aggressor. In the mean time Riga, the capital of Livonia, had been so bravely defended, that king Augustus of Poland, in despair of taking it, raised the siege. At this period, the Swedes, after the example of their king, were seized with an enthusiasm

for military glory, that allowed no time for reflexion. Taxes, which are the sinews of war, were considered and readily granted as an honorary tribute; and every family was ambitious of furnishing a soldier. The troops soon became habituated to the toils and privations connected with a military life, and were contented with the coarsest fare, and that even in small quantities.

No sooner had Charles concluded a treaty with the king of Denmark, than he turned his arms against the Russians who had undertaken the siege of Narva, with 80,000 men. The Swedish monarch, though at the head of 20,000 troops, advanced to the relief of the place with less than half that number. When he was within sight of the Russian vanguard, he was urged to reflect upon the great disparity of numbers; to which he replied, "Do you doubt whether the king of Sweden, with 8000 men, can beat the czar of Russia, who is at the head of 80,000 men?" The Russians at first flood the shock with firmness; but, after an engagement of three hours, their entrenchments were forced with great slaughter, and Charles entered Narva in triumph. The Swedes captured many times their own number of prisoners, besides all the enemy's artillery; but the king only retained the principal officers, whom he treated with great kindness. On this occasion the czar, who was absent from this battle, said, "I knew that the Swedes would beat us; but, in time, they will teach us to become in our turns the conquerors."

A close alliance was now formed between the czar and the king of Poland; and the latter engaged to furnish a large succour of Germans. Charles having passed the winter at Narva, entered Livonia, and appeared in the neighbourhood of Riga. He passed the Dwina, on the banks of which were posted the Poles and Saxons; whom the Swedish monarch attacked with great bravery, and after an obstinate and bloody engagement, gained a complete victory. He then advanced to the capital of Courland, from whence he passed into Lithuania, and entered in triumph the town of Bergen, where the czar and the Polish sovereign had a few months before planned his destruction. The king of Sweden now determined to dethrone the sovereign of Poland; the intrigues formed in that country facilitated the enterprise; and Augustus finding little resource in the attachment of his subjects, attempted to negotiate, and employed for the purpose the countess of Königsmark, one of the most captivating women of the age; but all her seductions were useless against him who had renounced pleasure, and who, as a farther security to his virtue, constantly refused an interview. Aware also of the discontents of the Poles, he entered into a secret correspondence with the malcontents, and marched into Warsaw, which opened its gates to him at the first summons. He was soon waited upon by the leaders of the discontented party, to whom the Swedish monarch gave the most positive assurances that he would never give the Poles peace till they had deposed a new king. Augustus, being informed of these proceedings, assembled all his troops, which were at least double the number of those under his opponent. The contending kings met in a plain between Cracow and Warsaw: the attack was begun by the Swedes, and though the battle was fought with the greatest valour on the part of Augustus, yet victory declared itself for Charles. It cost him, however, the life of his friend and relation, the duke of Holstein, over whom he shed tears of unfeigned affection. The king of Sweden marched to Cracow, which immediately surrendered; and Augustus fled into Saxony; in the pursuit of whom Charles unfortunately fell from his horse, and broke his thigh, an accident which detained him some weeks in a state of inactivity. A second victory obliged the Polish sovereign

to provide for his security by retiring into Saxony. At length the Poles resolved to depose their sovereign, which was effected in February 1704; and Stanislaus Leckinski was chosen his successor on the 12th of the following July, and by the interest of Charles he was crowned at Warlaw the 4th day of October.

The czar sent 60,000 Russians to attack the Swedes in their conquests; they entered Poland in separate armies, and were joined by a great number of Saxons and Cossacks. Charles attacked and defeated the Russian troops, and nothing could impede the progress or equal the celerity of the victorious Swedes. If a river interposed, they swam over it; and the Swedish monarch, at the head of his cavalry, marched 30 leagues in 24 hours. Struck with consternation and dismay at these rapid movements, the Russians retired beyond the Boristhenes, and left Augustus to his fate; who was, in a short time after, compelled to renounce his pretensions to the crown of Poland, and to acknowledge Stanislaus lawful sovereign of the kingdom. He renounced, at the same time, his alliance with the czar, his most powerful friend, and gave up all the subjects of Charles who had withdrawn their allegiance, and especially Patkul, who at the time bore the character of ambassador to the czar. While the treaty was pending, Charles and Augustus had an interview: during which the dethroned sovereign received marks of studied civility from the conqueror, but he was nevertheless obliged to submit to his will, even to the writing a letter of congratulation to his rival and successor Stanislaus. Such conduct on the part of the Swedish monarch cannot be justified on any principle, and the savage treatment of the virtuous Patkul, whom he caused to be broken on the wheel, with every circumstance of ignominy and severity, will for ever render him, on that account, worthy of general indignation.

Charles, now in the zenith of power and reputation, compelled the emperor of Germany to make some very humiliating concessions in favour of his Protestant subjects in Silesia, of whose interests he declared himself the protector. But his heart was principally occupied in measures of revenge against the czar, whom he determined to dethrone, as he had done Augustus: for this purpose he marched at the head of 43,000 men from Saxony. The czar was at Grodno in Lithuania, whither Charles followed him, in the depth of winter, and entered the city at one gate as the czar went out of the opposite one. Determined on his object he pursued the Russians and drove them across the Dnieper. In his way, with the advanced guard alone he defeated a large body of them entrenched behind a morass. The czar Peter began now to be seriously alarmed for his empire, and caused proposals of peace to be made; to which the haughty king answered, "I will treat with the czar at Moscow." To this the czar replied with diffidence, but in the tone of a prediction, "My brother Charles is determined always to act the Alexander, but I flatter myself he will not find me a Darius." In the month of October, 1708, he had arrived within 100 leagues of the Russian capital, when impassable roads and a scarcity of provisions induced him suddenly to turn aside into the Ukraine. A rigorous winter now commenced, which to the Swedes, who were unprovided with proper clothing and necessaries, was so far insupportable that in one march two thousand of them perished with cold. Charles, however, shared with his soldiers all the hardships incident to the situation, and thus inspired them with principles of patience and fortitude scarcely to be expected. In April, 1709, the whole army under the Swedish monarch was reduced to about 30,000, and in a few weeks the king penetrated to the town of Pultowa on the eastern frontier of the Ukraine. Here the czar had laid up

his magazines; it was therefore of the utmost importance to Charles to gain possession of the place. He accordingly invested it, but his operations were interrupted by the approach of the czar at the head of 70,000 men. Charles always unwilling to trust to another what he could himself perform, went to reconnoitre the enemy, and was wounded by a musket shot, which broke the bone of his heel. No change in his conduct betrayed the wound to his attendants, and he continued six hours longer on horseback giving his orders with the greatest tranquillity. He was, at length, carried to his tent in excessive agonies, and such was the nature of the wound that the surgeons were of opinion that the king must lose his leg. Another mode was, however, adopted, and the king, during a very painful operation, kept his leg steady with both hands, looking on like an indifferent spectator. The czar having collected all his forces, was advancing, and to the Swedes a retreat seemed impossible. Without calling a council of war, Charles refused to wait for the enemy in his entrenchments, but ordered a general attack for the next day, and then went to sleep. On the 8th of July, 1709, he fought the celebrated battle of Poltawa which decided the fate of the Swedish king: he caused himself to be carried in a litter, at the head of his infantry, and after the combat of cavalry, which was disastrous to his cause, he advanced against the Russian line, defended by a formidable artillery. One of the first volleys killed the two horses of his litter, by another, two fresh horses were killed, and the litter dashed to pieces. He was then carried by his life-guards, and of these twenty-one were destroyed out of twenty-four. The Swedes began to give way on all sides; their principal officers were killed or made prisoners, nine thousand were left dead on the field of battle, and their camp at Poltawa was forced. Even in this extremity the king refused to fly. By the orders, however, of Poniatowky, he was placed on horseback, notwithstanding the pain occasioned by his wound, and about five hundred horse rallied around him, by whose exertions he was conveyed safe through ten Russian regiments, and brought to his baggage. At length he reached the Dnieper, whither Lewenhaupt had arrived with what remained of the army, amounting to about sixteen thousand men of various countries. These were closely pursued by the Russians, to whom they eventually surrendered, with the exception of the king, who was conveyed across the river in a small boat, a few of his officers who accompanied him, and about three hundred Swedish horse, with a number of Poles and Cossacks, who ventured to swim across. With these Charles escaped to Bender, a Turkish town in Moldavia. Here he was received with every mark of respect, and remained in a state of inaction, employing himself partly in military exercises, partly in reading, and playing chess. The Turks and neighbouring Greeks, having heard of his exploits, flocked in crowds to see him. His inflexible resolution to abstain from wine, and his great regularity in conforming to their customs, and in attending at their religious services, made the Mahometans consider him as a true believer, and inspired them with an ardent desire of marching under him to the conquest of Russia.

While thus at a vast distance from his kingdom, his enemies were busied in pulling down all the fabric of power which he had raised by his conquests. Augustus returned into Poland, and repossessed himself of his throne. The czar took Wiburgh, and all Carolia, poured his troops into Finland and laid siege to Riga. The king of Prussia invaded Swedish Pomerania; and the king of Denmark made a descent on Schonen, and took the town of Helsingburg. The Swedes however, remained firm; and the disasters of their king rather inflamed their loyalty and patriotism than dispirited

them. The idea of dethroning the czar of Russia was still uppermost in the mind of Charles: he solicited the assistance of the Ottoman Porte, and Achmet III. the reigning sultan, sent him a present of a thousand ducats, while the grand vizier said to his envoy, "I will take your king in one hand, and a sword in the other, and conduct him to Moscow at the head of 200,000 men." The czar's money, however, changed the sentiments of the Turkish minister, who laid aside all thoughts of war. The military chest which Peter had taken at Poltawa furnished him with new resources against the vanquished Charles, whose treasures were turned against himself. The hopes which the sultan king had entertained against his enemy being thus frustrated, he accused the grand vizier with corruption, who in his turn procured an order for him to leave the Turkish dominions, but with this he refused to comply. By some unexpected changes in the Ottoman court, his interest again prevailed, and liberal offers were made of sending him home with a large escort, and provisions for all his wants. With this even he was not contented, but persisted in demanding an army for his conveyance; and at length he refused to go at all, though he had received 4200 purses from the grand vizier to pay his debts and defray his expenses. An order was signed to compel him to depart, but Charles determined to resist the whole Ottoman power with 300 Swedes, and actually began fortifying his camp in the face of an army of 25,000 Turks and Tartars. No entreaties against this mad project had any avail, he conceived his honour concerned, and no considerations of prudence or humanity had weight with him. The Janizaries unwilling, from a respect for his character, to proceed to extremities, sent a deputation of their leaders to propose terms of accommodation, but instead of listening to them, he threatened to cut off their beards, if they did not depart. "Let the iron-head then perish, if he will perish," they indignantly replied, and the attack immediately commenced. The little camp was soon forced, and the 300 Swedes were made prisoners. Charles sought refuge in his house, together with a few general officers and domestics. With these he fired from the windows upon the Turks, 200 of whom he killed, and bravely maintained himself till the edifice was in flames. In this extremity, a centinel had the presence of mind to observe that the charity-house, which was at the distance of fifty yards, had a stone roof, and was proof against fire, and in which they might defend themselves to the last. "There is a true Swede," exclaimed the monarch, rushing out, like a madman, at the head of a few desperadoes. From respect to the person of the king, the Turks at first recoiled, but recollecting their orders, they made him prisoner, and carried him, by main force, to the tent of the bashaw. That officer sent the Swedish monarch in a chariot to Demotica, a small town at the distance of ten leagues from Adrianople where the emperor then resided with his court. Here he remained a considerable time, and lest the Turks should not pay him the respect due to his royal person, or should be tempted to exact from him any thing beneath his dignity, he feigned illness, and confined himself to his bed for the space of ten months. It was generally believed throughout Europe that he was dead, and the senate of Sweden, no longer expecting his return, requested his sister to undertake the regency. She seemed at first willing to comply, but finding it was their intention to put an end to the wars which were ravaging their country, she refused to act, and sent her brother word of her proceedings. He indignantly wrote to the senate, that if they pretended to interfere with public affairs, he would send one of his boots to govern them.

Wearied of the state of inactivity in which he lived, he obtained

tained permission to return to his own dominions. He took a formal leave of the Turkish court by a very splendid embassy. He set out on his return in October 1714, and after sixteen days incessant travelling, he arrived in the night at Stralsund: he was admitted with difficulty, but as soon as he made himself known, the whole city was in a blaze of illumination for joy at his arrival. Charles found his affairs in a very disastrous state; but without giving himself time to reflect upon this, he dispatched orders to his generals to renew the war with fresh vigour. Intoxicated by the phrenzy of glory, all the young men crowded to the standard of their king, and scarcely any were left for the labours of agriculture but the aged and infirm, who were little qualified to save Sweden from a famine, with which she was threatened. On opening the campaign, Charles was surrounded by so many enemies, that valour could be of little service, without a greater force. The combined army of Prussians, Danes, and Saxons, invested Stralsund, in hopes that the king would there perish, be taken prisoner, or be compelled to make peace. The Isle of Rugen being possessed by the enemy, it was of importance to dislodge them; Charles made a desperate attempt for that purpose, but was repulsed. He returned to Stralsund, sustained the siege in person, and performed, as usual, prodigies of valour. The fall of the city was, however, inevitable, and fearing lest he should come into the hands of the enemy, he embarked in a small vessel, and by favour of the night, passed safely through the Danish fleet, and was landed in Sweden. The next day the town capitulated. He wintered at Carlscroon, refusing to visit his capital till he could appear there under more prosperous circumstances. He levied new troops, and in the following spring made an irruption into Norway with twenty thousand men. He pushed on as far as Christiania, but for want of provisions, was obliged to return to Sweden. He now, through his minister, the baron de Goetz, effected a peace with Russia, and began to devise means for the dethronement of George I. of England, and the restoration of the Stuart family. Another object of his ambition was to re-establish Stanislaus in Poland. To effect these purposes, an alliance was formed between Sweden and Russia, by the intervention of cardinal Alberoni, an Italian, a man of considerable activity and enterprise. The impetuosity of Charles, the alliance which he had formed, and the ambition of his minister, seemed ready to overturn the system of Europe. In the interval, however, of preparing for this vast enterprise, the Swedish monarch, as if willing to lose no time, invaded Norway, in order to wrest it from the king of Denmark, and thus indemnify himself for the provinces which he had ceded to the czar. He formed the siege of Fredericks-Hall, in the month of December, regardless of the cold of a Norwegian winter, which not unfrequently froze the sentinels to death on their posts. To animate his troops, the Swedish sovereign exposed himself to all the rigour of the climate, and to the dangers of the siege; and, covered only with his cloak, usually slept in the open air. Anxious to finish the siege, he, on the evening of the 11th of December, visited, with his principal engineer, the trenches that had been formed. He was resting with his elbows upon the parapet, attending to the workmen who were opening the ground by star-light. Almost half his body was exposed to the battery of the enemy, which was firing grape shot at the very spot in which he stood. He had been in that dangerous situation some time, with no one near him except the chief engineer, and an aide-de-camp, when he was seen to fall upon the parapet, heaving a great sigh. He was taken up dead, with his forehead beat in by a cannon shot, and his right hand grasping the hilt of his

sword. Such was the end of this extraordinary character, though there have been historians who maintain that he was assassinated by the French aid-de-camp, Siguer; but after investigating all the circumstances that attended the event, there is no good reason for believing otherwise than that he received his wound from one of the Danish batteries.

Charles died at the age of 36 years and 6 months, after a reign of 21 years. His military talents may command admiration, but there was little in his character to awaken in the feelings any emotions of attachment or esteem. He possessed many eminent, but few, if any, amiable qualities. He was a mere soldier; in person he was well formed: in conversation he was awkward and bashful; he was just, but rarely exhibited any traits of kindness. Charles seems never to have known what it was to fear, and the bluntness of his feelings rendered him insensible to hardships and dangers for himself and others. His wonderful intrepidity and perseverance in whatever he undertook; his fortitude under misfortune; his contempt of danger, and his passion for glory, will for ever rank him foremost among military heroes, but no king was ever more lavish of human blood, or ever less consulted the real interests and happiness of his people. *Univ. Hist. de Charles XII. Du Fresnoy. Coxe's Travels, vol. 4.*

Of the other eleven Charleses of Sweden, there is little to be said to entitle them to separate articles in this work. Charles Canutus, the eighth of that name, from grand marshal in the reign of Eric, made himself sovereign in the year 1454. In the exercise of his office he was twice compelled to renounce all pretensions to the crown. He retired to Finland, where his credit was so low, that the archbishop refused him a small loan. His retreat did not give peace to his distracted country; he was accordingly recalled, and put in possession of all the honours of sovereignty; and in 1470, he closed an eventful life, resigning his kingdom to his nephew Sten Sture. By the historians of his country he is praised for his regard to justice, as well as for political talents: he is said also to have been versed in philosophical and mathematical knowledge.—Charles X. was born in 1622, and very early engaged in military service. His rank and high reputation as a military commander caused him, in 1648, to be appointed general in chief of the Swedish forces. In 1655, he succeeded to the crown. He immediately revived the martial spirit of the country, and during the six years of his reign was engaged continually in war. He died in 1660, of a fever, leaving behind him a considerable reputation for private virtues, which were wretched compensations for the disasters which he inflicted on his country, by an inordinate ambition, and a fondness for martial glory.—His son, Charles XI. though a minor, at the death of his father, concluded an advantageous peace with his neighbours. In a few years he made himself absolute, after which one of his first measures was to raise the nominal value of the coin, in order to liquidate the public debts. Such a step is always unjust, and in general, very injurious to the state that adopts it. He forbade the exercise of any religion except the Lutheran, and performed many other acts of despotic authority. His subjects remonstrated against his assumed arbitrary power by means of deputies; these he caused to be prosecuted and convicted of high treason, among them was Patkul, who pleaded the cause of his country with energy and manly eloquence, for which a sentence of capital punishment was passed against him, which he avoided by flight. The character of this monarch was stern, inflexible, and unfeeling; in reply to his queen, who was interceding in behalf of some of his subjects grievously oppressed, he said, “Madam, we have taken you to bring us children, not to give

give us advice." This sovereign was chaste, temperate, economical, vigilant, and active: he was a patron of literature; severe, yet not implacable: prone to anger, but easily softened. His love of peace, and the reputation of his character, gave him an ascendancy in Europe, and he was considered as the principal mediator at the treaty of Ryfwick. In his endeavours to effect a general pacification he died in April, 1697. Univerf. Hill. Coxe's Travels.

CHARLES EMANUEL I. duke of Savoy, surnamed the Great, was born in 1562, and succeeded to the throne of his country in 1580. This prince was of a bold and enterprising spirit, and during a long reign engaged in many actions which could not be justified upon any principles of justice. During the reign of Henry III. of France, he invaded that country, and wrested from it the marquisate of Saluces, thereby gaining a frontier for Turin his capital, which before was exposed to the inroads and insults of his enemies. It was on this occasion that the duke struck a medal in commemoration of the event, with the word *opportune* as a motto; intimating that he had hit upon the lucky moment for the enterprise. Acting upon the same maxim, he seized upon some other provinces of France, during the reign of Henry IV.; he even aspired to the crown of that kingdom, but his plans were defeated, and he was obliged to give up a part of his own territory in exchange for the marquisate of Saluces which he had formerly gained by force of arms. Another act of glaring injustice he committed upon the Genevefe, whose capital he attempted to take in the midst of a profound peace. The body of his troops destined to scale the walls, obtained their object unperceived, but on an alarm being made, the inhabitants, long famed for their ardent attachment to the rights of independence, attacked the invaders before the troops came up who were ordered to co-operate with them. Some prisoners taken by the Genevefe were severely hanged as common robbers. A representation of the fact was laid before the several states of Europe, and the duke was obliged eventually to make ample satisfaction to the city. Charles afterwards attacked the Genoeve and took many of their towns. He aspired to the imperial crown at the death of Matthias. He projected also the conquest of the isle of Cyprus, and was desirous of accepting the sovereignty of Macedonia, offered to him by the oppressed inhabitants; but in none of these projects was he successful. In a contest with the French he lost the strong fortrefs of Pignerol, the disgrace of which is supposed to have hastened his death in July 1630, after a turbulent reign of fifty years. This prince had many shining qualities: he was an able commander and a sagacious statesman: he was a patron of literature and the arts: he was deemed pious on account of the several churches that he built: he was, however, licentious in his private character, unbounded in his ambition, faithless, and distrustful, so that it has been said "his heart was as inaccessible as his country." He gained reputation by his valour, but lost all pretensions to rectitude by his invasion of the law of nations, and of the rights of independent states.

The Second Duke of Savoy of this name, was a friend to peace, and an ardent lover of his country. His great ambition was to maintain terms of friendship with surrounding states, and to improve his own by grand and useful projects. He adorned his capital with some of its most magnificent edifices, and he is celebrated for penetrating the rock Monte Viso, with an arched road 500 paces in length, and admitting two laden mules to walk abreast, for transporting goods to and from France and Italy. He died in 1675, after a reign of 38 years.

CHARLES EMANUEL III. is, however, by much the most celebrated of the dukes of Savoy. He succeeded to the throne, by the voluntary resignation of his father, in 1730, with the titles of duke of Savoy and king of Sardinia, his predecessor having, at a general peace in 1713, been given Sicily, with the title of king; this, in four years after, he exchanged with the emperor for Sardinia, which it was agreed he should enjoy with the regal title. This prince, in 1735, united with France and Spain in a war against Austria; and in 1742 he allied himself with the queen of Hungary. During the several wars in which he was engaged, he experienced various reverses of fortune, but was for the most part successful. When he had obtained a peace, he devoted himself to the establishment of such regulations as might be beneficial to his subjects: he was particularly anxious to pay the debts which had been incurred by the war. When he had accomplished that favourite object of his heart, he exclaimed, "This day is the happiest of my life; I have just now suppressed the last of the extraordinary taxes." "How few," says a contemporary writer, "of the occupiers of thrones, have been capable of feeling such a pleasure!" His moderation and attachment to his country kept him free from the war of 1756, and in 1763 he enjoyed the felicity of acting as mediator between the contending powers. He zealously promoted every thing that could render his kingdom prosperous. He corrected the abuses of law by a new code, which was afterwards published at Paris, in 2 vols. 12mo. By his example, as well as by edicts, he sanctioned the principles of economy and good morals. He died on the 22d of February, 1773, leaving behind him the character of a wife and good king. Du Fresnoy. Univerf. Hill. Smollett.

CHARLES, *Cape*, in *Geography*, a cape on the east coast of Labrador, N. lat. 52° 25'. W. long. 55° 20'.—Also, a cape of America on the coast of Virginia, at the east side of the mouth of the Chesapeake. N. lat. 37° 12'. W. long. 75° 58'.

CHARLES *River*, a river of America, in the state of Massachusetts, anciently called *Quinobegon*, the principal branch of which rises from a pond bordering on Hopkinton. It passes through Holliston and Belingham, divides Medway from Medfield, Wrentham, and Franklin, and proceeding to Dedham, forms, by a curious bend, a peninsula of 900 acres of land. A stream, called "Mother Brook," runs out of this river in this town, and falls into Neponset river, forming a natural canal, uniting the two rivers, and affording a number of excellent mill-ferns. From Dedham the course of the river is northerly, dividing Newton from Needham, Welton, and Waltham, passing over romantic falls: it then bends to the N.E. and E. through Watertown and Cambridge, and passing into Boston harbour, unites with the waters of Myrick river at the point of the peninsula of Charlestown. It is navigable for boats 7 miles to Watertown. The most remarkable bridges on this river are those which connect Boston with Charlestown and Cambridge. On this river are 7 paper mills, besides other mills.

CHARLES *County* lies on the western shore of Maryland, between Potowmack and Patuxent rivers. Its chief town is Port Tobacco, on a river of that name. Its extreme length is 28 miles, and breadth 24; and it contains 20,611 inhabitants, including 10,485 slaves. The country has low hills, is generally low and sandy, and produces tobacco, Indian corn, sweet potatoes, &c.

CHARLES, a cape on the S.W. part of the strait entering into Hudson Bay. N. lat. 62° 40'. W. long. 75° 15'.

CHARLES

CHARLES City, a county of America in the state of Virginia, lying between Chickahominy and James rivers. It formerly contained part of what now forms Prince George's county. It has 5588 inhabitants, including 3141 slaves.

CHARLES-fort, a fort on the west coast of the island of Barbadoes; one mile S. of Bridge Town.—Also, a fort on the west coast of the island of St. Christoph; one mile S.E. of Sandy Point town.

CHARLES-fort, a fort on the east side of the bay of Kinfalee, county of Cork, Ireland. It was begun by the earl of Orery in 1670, and was finished at the expence of 73,000*l*. The duke of Ormond, on visiting it in 1681, called it Charles-fort in honour of the reigning monarch. It is a regular fortification, with a strong citadel to the land side, and is so situated, that all ships coming into the harbour, must fall within pistol shot of the battery. It has always a regiment in garrison, and another regiment is quartered in the town of Kinfalee, about a mile and a half distant.

CHARLES Island, an island in Hudson's Straits. N. lat. $62^{\circ} 40'$. W. long. $72^{\circ} 55'$.—Also, a small island in that part of the straits of Magellan, called Royal Reach.

CHARLES, St. a lake of Canada, about twelve miles distant from Quebec; about $4\frac{1}{2}$ miles in length, and about $\frac{3}{4}$ of a mile in average breadth. It consists of two bodies of water nearly of the same size, communicating by a narrow pass, through which a current sets towards Quebec. The views on the upper part of this lake are highly picturesque, exhibiting rocks and trees beautifully blended, and shores that are bold and richly ornamented with hanging woods. Towards the upper end the view is terminated by a range of blue hills, which appear at a distance peeping over the tops of the tall trees. The depth of the water in the lake is, at an average, about 8 feet. The water is clear, but not well tasted; and as several streams fall into it, to supply what runs off by the river St. Charles, it is kept in a constant state of circulation. The shores abound with bull-frogs.

CHARLES, St. a river that flows from the above-mentioned lake into the basin near Quebec; at its mouth it is about 30 yards wide, but not navigable for boats, except for a few miles, on account of its numerous rocks and falls. In the spring of the year, when it is swollen by the floods, rafts have been conducted down the whole way from the lake; but the passage is difficult and tedious, as there are several portages. The distance from the lake to Quebec being so short, land carriage must always be preferred to a water conveyance along this river, except for timber. The course of the river is very irregular, and the views upon it extremely romantic, particularly in the neighbourhood of Lorette, a village of the Huron Indians, where the river, after falling in a beautiful cascade over a ledge of rocks, winds through a deep dell, shaded on each side with tall trees.

CHARLES'S Wain, in *Astronomy*, seven stars in the constellation *Ursa Major*. This figure is also called *Davis's Chariot*, the *Plough*, &c. These appear to have altered in brightness with respect to each other, since the time they were marked by Bayer. For if their present apparent order in splendour be denoted by the first seven figures, α answering to that of the highest magnitude; then α , which was the brightest according to Bayer, is now the fourth in order of brightness; β , which was the second in brightness, is the fifth in the present order; γ answers to the sixth; δ to the seventh; ϵ to the first; ζ to the third; and η , which was the last in order according to Bayer, is apparently the second in brightness. Upon the 3d of December, 1786, M. de La Lande observed a change in the above order.

VOL. VII.

CHARLESTON, in *Geography*, a post town of Cecil county, in the state of Maryland, near the head of Chesapeake bay; 6 miles E.N.E. from the mouth of Susquehanna river; 10 W.S.W. from Elkton, and 50 S.W. by W. from Philadelphia. N. lat. $39^{\circ} 34'$. In this place there are about twenty houses, chiefly inhabited by people who are employed in the herring fishery. Beyond it the country is much diversified with hill and dale; and the soil being of an indifferent quality, the lands are so little cleared, that in many parts the road winds through uninterrupted woods for four or five miles together. The scenery in the neighbourhood is highly interesting. Near Charleston there is a small foundry for cannon, which are bored by water, and of which two 24 pounders are manufactured every week. The iron is extremely tough, so that few of the guns built on being proved.

CHARLESTON, a district in the lower country of South Carolina, lying between Santee and Combahee rivers, and divided into 14 parishes. To the state legislature it sends 48 representatives and 13 senators, and to congress one member. It contains 66,986 inhabitants, of whom 16,532 are free; and pays taxes amounting to 21,473*l*. 14*s*. *cd*. sterling.

CHARLESTON, the most considerable town, though not the present seat of government, in the state of South Carolina, situate in a district of the same name, on a tongue of land formed by the confluent streams of Ashley and Cooper, two large and navigable rivers, though not of great extent. By their union below the town they form a spacious and convenient harbour, which communicates with the ocean at a distance of about 7 miles below Sullivan's island. The tide in these rivers which commonly rises about $6\frac{1}{2}$ feet, has the singular property of uniformly rising 10 or 12 inches more in the night.

The situation of the town is flat and low, and the water brackish; but the agitation occasioned by the tides, and the refreshing sea breezes contribute to render it more salubrious than any part of the low country in the southern states. The streets, though too narrow for a place so large, and so warm a climate, are regularly formed; running from E. to W. and from river to river, they open in beautiful prospects, and they are kept clean and healthy by means of subterraneous drains. The streets are intersected at right angles by others, which distribute the town into a number of squares. The modern houses are chiefly constructed with brick and have tiled roofs; and many of the buildings are neat, elegant, and airy. The public edifices are, an exchange, a state-house, an armoury, a poor house, and an orphan's house. Besides several respectable academies, here is a college adapted to the accommodation of a number of students. The two banks of Charleston are a branch of the national bank, and the South Carolina bank, established in 1792. The places of public worship are, two episcopal churches, two for Independents, one for Scotch Presbyterians, one for Baptists, one for German Lutherans, two for Methodists, one for French Protestants, one for Quakers, a Roman Catholic chapel, and a Jewish synagogue. The adjacent country abounds with poultry and wild ducks; fish are rare in the market; and with regard to the beef, mutton, and veal, they are not generally esteemed of the best kind. Charleston was incorporated in 1783, and divided into 13 wards, in which are as many wardens, chosen by the inhabitants, one of whom is elected intendant of the city, by whom and the wardens is formed the city council, which is empowered to make and enforce bye-laws for the regulation of the police. The number of inhabitants was estimated in 1787, at 15,000, including 5400 slaves, and occupying 1602 houses;

houses; but in 1791, the inhabitants amounted to 16,359, of whom 7684 were slaves. This town has often suffered by fire, and particularly in June 1796. The value of exports from the port of Charleston in the year ending Nov. 1787, amounted to 505,279*l.* 19*s.* 5*d.* sterling, and the number of vessels cleared in that year from the custom-house was 957, of which 735 were American, and the rest belonging to Great Britain, Ireland, Spain, France, and the United Netherlands. In 1794, the value of exports amounted to 3,846,392 dollars. The light-house of this town lies in N. lat. 32° 41' 52". White point at the fourth end of the town, in N. lat. 32° 44' 30". W. long. 80° 39' 45".

CHARLESTOWN, a township of Montgomery county, in the state of New York, on the fourth side of Mohawk river, about 32 miles W. of Schenectady; 496 of the inhabitants, being by the state census of 1796, electors.—Also, a township of Mason county in Kentucky, situated on the Ohio at the mouth of Lauren's creek; 6 miles N. of Washington, and 60 N.E. of Lexington. N. lat. 38° 43'.—Also, a township in Chester county, Pennsylvania.—Also, a post town in the county of Cheshire, and state of New Hampshire, on the E. side of Connecticut river, 30 miles S. of Dartmouth college, 116 N. of W. of Bolton, and 43 N.N.E. of Philadelphia; incorporated in 1753, and containing about 100 houses, a congregational church, a court-house, and an academy. Through this town the road passes from Boston to Quebec. N. lat. 43° 16'. W. long. 72° 19'.—Also, the principal town in Middlesex county, Massachusetts, called by the aboriginal inhabitants "Misshawun," connected with Boston by Charles river bridge. This town is built on a peninsula, formed by Mytic river on the E. and a bay from Charles river on the W. It is advantageously situated for health, navigation, trade, and almost all kinds of manufactures. The adjoining hills, celebrated in the history of the American revolution, afford delightful prospects of Boston and its variegated harbour of Cambridge and its colleges, and of an extensive tract of highly cultivated country. It contains within the Neck or parish about 250 houses, and 2000 inhabitants. The principal public buildings are a congregational church and an almshouse. Its chief manufactures are those of pot and pearl-shes, ship-building, rum, leather, silver, tin, brass, and pewter. Its houses, population, trade, and navigation, have greatly augmented within a few years past. This town is a port of entry in conjunction with Bolton. At the head of the Neck is a bridge over Mytic river, connecting Charlestown with Malden.—Also, a village in Berkeley county, Virginia, situate on the great road leading from Philadelphia to Winchester; 20 miles from Winchester.—Also, a township in Washington county, Rhode island, having the Atlantic to the S. and separated from Richmond towards the N. by Charles river, a water of Pawcatuck, 19 miles W. of Newport; containing 2022 inhabitants, including 12 slaves.—Also, a town on the island of Nevis, one of the Caribbees, belonging to Great Britain. It has large houses and well-furnished shops, and is defended by Charles-fort. Near the town is a high mountain, the altitude of which, taken from a quadrant in Charlestown bay, is said to be 1½ mile perpendicular, and from the bay to the top 4 miles. N. lat 16° 55'. W. long. 62° 42'.—Also, one of the principal towns in the island of Barbadoes called Ollins.

CHARLETON, in *Biography*. See CHARLTON.

CHARLETON ISLAND, or *Charles Island*, in *Geography*, an island situated at the bottom of James's Bay, in New South Wales, on the coast of Labrador, and exhibiting a beautiful prospect of trees and branches, which are spread over the island.

The air at the bottom of the bay, though in N. lat. 51°, is excessively cold for nine months of the year, and very hot for the other three, except on the blowing of a N.W. wind. The soil, on both the east and west sides, bears all kinds of grain; and about Rupert's Bay are some fruits, as gooseberries, strawberries, and dewberries. N. lat. 52° 30'. W. lon. 82°.—Also, a township in Saratoga county, New York. By the state census of 1796, 268 of its inhabitants were electors.—Also, a township in Worcester county, Massachusetts, incorporated in 1754, and till that time forming the western part of Oxford; 60 miles S.W. of Bolton, 15 S. W. of Worcester; containing 1965 inhabitants.

CHARLEVAL, CHARLES FAUCON DE VEY, *lord of*, in *Biography*, a polite scholar and poet, was born in 1613, and, notwithstanding the feebleness of a peculiarly delicate constitution, lived to the advanced age of 80 years. Of his conversation and writings, it is said, they were characterized by sweetness and refinement; and Scarron said of him, "that the Muses fed him only with blanc-mange and chicken-water." He was not only personally attached to polite literature, but a liberal patron of literary merit. Upon being informed that M. and Monf. Dacier were retiring from Paris to the country, in order to avoid expence, he pressed them to accept of 10,000 livres in gold. His death was occasioned by a fever, which his physicians thought that they had subdued by frequent bleedings. On saying to one another, in the presence of Thevenot, the king's librarian, "the fever is going at last;" he interposed, and observed, "O no, it is the patient that is going;" and he died in three hours. A small collection of his poems, consisting of stanzas, epigrams, songs, and sonnets, which are easy and elegant, but feeble in thought and style, appeared in 1759. *Nouv. Dict. Hist.*

CHARLEVAL, in *Geography*, a town of France, in the department of the Eure, and district of Les Andelys; 10 miles S.E. of Rouen.

CHARLEVILLE, a market and post town of the county of Limerick, Ireland, situated on the border of the county of Limerick. It is in many respects a flourishing town, and its trade is daily increasing. It was formerly called Rathgogan; but the first Lord Orrey, better known by his former title of Broghill, being the possessor of it, changed its name to Charleville, in honour of the king; made it the seat of his government, as president of Munster, and had it erected into a borough, so that it sent two members to parliament, till the union deprived it of this privilege. Lord Orrey also established a free school there; and one of his successors gave ground for a charter-school, for the reception of 50 children. The country round about is very fertile; the soil is a light brown earth lying deep on a lime-stone bottom. Mr. Young speaks of 30 booms for making serge being in this town. It is 112 miles S.W. from Dublin, and 29 N. from Cork. *Smith.*

CHARLEVILLE, a town of France, in the department of the Ardennes, and chief place of a canton in the district of Mezieres, from which it is separated by the Muse. Before the revolution, it belonged to the prince of Coëde, being exempt from the general taxes of the kingdom. The place contains 7400, and the canton 12,567 inhabitants: the territory includes 13½ kilometers and 12 communes.

CHARLEVOIX, PETER-FRANCIS-XAVIER DE, in *Biography*, a writer of voyages and travels, was born at St. Quentin, in 1684; and having entered the Society of Jesuits, taught the languages and philosophy with reputation. After returning from his foreign missions, he was engaged for 24 years in the conduct of the "Journal de Trevoux," and was much esteemed by his brethren of the society for the purity

ity of his morals and the extent of his knowledge. He died in 1761. His works are, "A History of the Island of St. Domingo," 2 vols. 4to. 1730. "A History and Description of Japan," 1736, 2 vols. 4to. and 6 vols. 12mo. in which work is contained every thing that is true and interesting in Kemper's account of Japan; "History of Paraguay," 6 vols. 12mo. "General History and Description of New France," 1744, 3 vols. 4to. containing the result of his own observations on the manners and customs of the native Americans, during his residence in Canada, and in the course of his journey from Quebec to New Orleans, which are peculiarly valuable. Nouv. Dict. Hist.

CHARLIER, JEAN, an eminent ecclesiastic, born in 1563, at Gerçon, in France, from whence he takes the name Gerçon, by which he is more commonly known than by that of Charlier. He received his education at Paris; after which he studied divinity ten years under Peter d'Ailly and Giles Deschamps, and received the degree of doctor in 1592. Three years after, he was appointed to the chancellorship and canonry of the church at Paris. At this period, the violent disputes between the dukes of Orleans and Burgundy, and the schism in the papal see, rendered Charlier's office very difficult to be executed. He went as a deputy, with others, in 1406, to Gregory and Benedict, the competitors for the papal see, with a view of persuading them to restore union to the church; and was afterwards highly instrumental in the deposition of both, and in the election of Alexander V. On the assassination of the duke of Orleans, by the order of the duke of Burgundy, in 1408, he inveighed publicly and loudly against the foul crime, by which he incurred the greatest danger from the triumphant party. He attacked the propositions written by John Petit in defence of the action committed by the duke of Burgundy; procured the censure of them by the faculty of theology at Paris, and supported their condemnation at the council of Constance, where he appeared in the capacity of ambassador from the king of France, and deputy from the university of Paris. At that council, he spoke on all matters of doctrine and discipline with so much eloquence, and conducted the cause in which he had embarked so ably, that he obtained the highest applause from cardinal Zabarella, and the titles of *evangelical* and *most christian* doctor were conferred upon him. At the instance of Gerçon alone, the council of Constance decreed, that Petit's principle was heretical, seditious, authorising treason and perjury; and they farther decreed, that whoever maintained it should be considered as obnoxious heretics. On every occasion he displayed the purest and most enlightened zeal for the reformation of manners, and his own example proved the sincerity of the motives by which his conduct was actuated. His noble indignation against the infamous principles avowed and defended by Petit, drew upon him the malice of the Burgundian faction, so that he dared not, upon the breaking up of the council, return immediately to France, but remained in Germany in the disguise of a pilgrim. At length he undertook the humble occupation of a schoolmaster at Lyons, in which he continued some years, and died in 1429, aged 66. Gerçon was author of many works, which were collected in 1706, and published at Antwerp, in five volumes folio. To him has sometimes been ascribed the celebrated treatise "On the Imitation of Christ;" but Du Fresnoy, and other French historians, have determined that this was not written by Gerçon. To the Antwerp edition of his works is prefixed a piece entitled "Gerçoniana," containing a multitude of curious biographical anecdotes of the author, Peter d'Ailly, and other contemporary divines. According to the testimony of Du

Fin, the church never had an author of greater reputation, more profound knowledge, and more solid piety, than Gerçon. His style, though harsh and sometimes careless, is methodical, and his arguments are generally conclusive. "He defends the truth," says the ecclesiastical historian, "upon all occasions, with an admirable and undaunted courage. He suffered a cruel persecution for a righteous cause, and died in exile for maintaining it with vigour." Du Fresnoy, Du Pin. Priestley's Ecl. Hist.

CHARLIEU, in *Geography*, a town of France, in the department of the Loire, and chief place of a canton, in the district of Roanne; 12 miles N.W. of Lyons, and 3 N. of Roanne. The place contains 2829, and the canton 10361 inhabitants: the territory includes 147½ kilometres and 15 communes.

CHARLOCK, in *Botany*. See *SINAPIS arvensis*, and *RAPHANUS raphanistrum*.

CHARLOCK, in *Gardening*, (*Sinapis nigra*), is a weed too generally known to the farmer to require a minute description. It is frequently called *chadlock*, *callock*, *corlock*, and *white rape*. Almost the whole plant is covered with pellucid hairs.

There are, according to some, two sorts of charlock, one bearing white and the other yellow flowers; but they are said to be only a variety of the same plant.

And it is observed by the author of the Staffordshire agricultural report, that the "yellow-flowered weed termed chadlock by the farmer, is not one individual, but three separate and distinct plants, each species more or less abounding in different places, and which are as follow: 1. The rough-leaved chadlock, or wild mustard, (*sinapis nigra*); 2. the smooth-leaved or wild rape, (*brassica napus*); and the rough-leaved wild radish with white flowers, (*raphanus raphanistrum*). These plants are all annuals, produced entirely from seeds, which they bear in great abundance, and which seeds will lie in a clod as safe as in a granary, and vegetate at the end of twenty years, when ploughed up and exposed to moisture. These intruders are only to be extirpated by ploughing them under when the field is fallow, or by weeding them out of the crop before their seed shall have been ripened; for if suffered to perfect and shed their seed, each single plant will produce an hundred; the farmer should therefore carefully prevent this by weeding or hoeing them out in time. The increase of the above and some of our field weeds, when they are permitted to shed their seed, is, he says, beyond all calculation."

The young plants of charlock, are said to nearly to resemble those of turnips that they are not easily distinguished but by the taste; the charlock being hot and bitter, and the turnip mild. Farmers should therefore be very careful in weeding their turnips lest they mistake them for charlock. Mr. Lisle has suggested that cold wet lands are always more subject to charlock than white or chalky lands; and that by an experiment which he made in sowing charlock seed and turnip-seed at the same time, he found that the turnips appeared in three days, but the charlock not in less than ten.

It has been remarked that sheep are fond of eating these weeds; and that of course advantage may be derived from feeding them down in the spring by sheep. See WEEDS.

CHARLOTTA, in *Geography*, a town on the E. shore of St. John's river in East Florida, seated on a high bluff, 15 or 20 feet in perpendicular ascent from the river, and half a mile or more in length. The aborigines of America seem, from the remains of great tumuli and conical mounds of earth and shells, and other traces of a settlement, to have

had a large town in this place. The river for an interval of about 12 miles above the town, is divided into many channels by a number of islands.

CHARLOTTE, a considerable township on the east side of lake Champlain, and the fourth-westernmost in the county of Chittenden and state of Vermont. It is separated on the north from Burlington by Shelburne, and contains 6,35 inhabitants.

CHARLOTTE, a county of Virginia, lying S. W. of Richmond on the head waters of Staunton river, and containing 10,078 inhabitants, of whom 4816 are slaves. The court-house is distant 21 miles S. S. W. from Prince Edward court-house, and 379 in about the same direction from Philadelphia.

CHARLOTTE'S Bay, a bay on the south-east of Nova-Scotia. N. lat. $44^{\circ} 35'$. W. long. $58^{\circ} 50'$.

CHARLOTTE, Cape, a cape at the south extremity of New Georgia. S. lat. $54^{\circ} 32'$. W. long. $36^{\circ} 11'$.

CHARLOTTE Fort, a fort of America, in the state of South Carolina, near the town of Petersburg in the state of Georgia.

CHARLOTTE'S, QUEEN, Isles, a group of islands on the N. W. coast of America, bounded towards the south by Cape St. James, and to the north by Cloak Bay, North Island, and Dixon's Straits; and situate between N. lat. $51^{\circ} 48'$ and $54^{\circ} 12'$, and W. long. $134^{\circ} 30'$ and 130° . The inhabitants of these islands consist, according to captain Dixon's account, of several tribes of Indians, who are in their disposition and manners ferocious and savage, so that they are frequently in a state of hostility with one another, and least on the bodies of their enemies that are slain in battle, whilst they preserve the heads as trophies of victory. However, they carry on by means of their canoes, a very considerable trade in furs of an excellent quality. They appeared to be much addicted to plunder, and with this view they not only permitted, but urged their females to go on board the English ships whenever invited, availing themselves of the opportunities which these visits afforded them of stealing, with singular dexterity, whatever fell in their way. Although every tribe in these islands is governed by its respective chief, they are nevertheless divided into families, each of which appears to have regulations, and a kind of subordinate government of its own.

The chief usually trades for the whole tribe, but sometimes each separate family, disapproving his method of barter, has claimed a right to dispose of its own furs, and the chief has always complied, though it is uncertain whether he receives in consideration of his compliance any emolument. The number of sea-otter skins collected by captain Dixon at these islands was no less than 1821, many of which were very fine; other furs are found in less variety here than in many other parts of the sea-coast; racoons, pine-martins, and seals, being the only kinds that were seen. Portlock and Dixon's Voyages, &c. p. 228, &c. Svo. Vancouver's Voyage, vol. i. p. 369, &c. It has been disputed to whom we are indebted for the first discovery of Queen Charlotte's Islands: captain Meares, (Voyages, p. 53,) says, that captains Lowrie and Guyse, who commanded two vessels that were fitted out at Bombay in 1780, and which arrived at Nootka Sound on the 29th of June, where they remained till the 27th of July, indisputably discovered that land to which Mr. Dixon gave the name of Queen Charlotte's Islands; which he is said to have done merely from conjectural opinion, as they were never proved to be such, till captain Douglas, in the Iphigenia, sailed through the channel which separates them from what was then supposed to be the American continent. M. Fleureau, in his intro-

duction to Marchand's voyage, does not presume to dispute with the English this last discovery; for he says that La Perouse, who had rightly presumed that these lands must be an island, had not an opportunity of satisfying himself in this particular; but he contends with captain Meares the priority of the discovery attributed to captains Lowrie and Guyse. It is not known, he says, at what precise period they saw Queen Charlotte's Islands, nor how the discovery was made, nor what portion of these lands they examined; but we certainly know, that La Perouse discovered them on the 10th of August of the same year; that he followed and examined the coasts of them for 10 days, and ranged along them from north to south, over an extent of 50 leagues. After all, on whatever side the priority lies, the two discoveries must be nearly contemporary; and it is alleged, that on both sides the honour is equal. Captain Dixon continuing his rout in 1787, from the space included between the parallels of 56° and 55° to the S. S. E. discovered on the 11th of July, land in $54^{\circ} 24'$, which was the north part of those islands that are now laid down in the English charts under the name of Queen Charlotte's Islands, and of which La Perouse had been the first discoverer the preceding year. Dixon ranged along the Archipelago, as La Perouse had done, by the western shore, to its southern extremity, doubled it to the southward, and stood again to the northward, ranging along the east shore, as far as $53^{\circ} 10'$. He afterwards ran down the east coast of these islands, as he had ascended it, without pushing his researches towards the continent. Captain Duncan in 1788 anchored and traded in several harbours of the east coast of Queen Charlotte's Islands, examined and visited them, from the latitude of 52° to 54° . Captain Douglas, who made a voyage to the N. W. coast of America in 1788, in company with captain Meares, running down the coast, visited some ports which had not been known, and one among others, towards the latitude of 55° , to which he gave the name of Port Meares. That harbour is situated on the northern side of the strait, which to the northward separates from the continent the lands discovered in 1786 by La Perouse, and called Queen Charlotte's Islands. It appears that captain Douglas is the first known navigator who passed through this strait, and thus penetrated by the north side into the gulf or channel which is situated between the islands to the west and the archipelago of San Lazaro. Douglas ranged along this channel throughout its whole length, without ever ceasing to see land on both sides, the arm of the sea that separates the islands from the continent not being more than 20 leagues wide; and he ran down as far as Nootka Sound, where he rejoined captain Meares. The two ships of these commanders carried to Canton the furs which they had procured on the different parts of the coast that they had visited. See Marchand's voyage by Fleureau, vol. i. Intro.

CHARLOTTE'S, QUEEN, Sound, a sound of New Zealand, visited by captain Cook in 1774; the situation of which was minutely ascertained by the observations of Mr. Wales, to be in N. lat. $41^{\circ} 5' 50.5''$. E. long. $174^{\circ} 25' 7.5''$.—Also, a sound on the western coast of N. America, in N. lat. about 51° , and E. long. 128° .

CHARLOTTE'S Town, a town of the island of Dominica, on the west coast, formerly called Roseau. N. lat. $15^{\circ} 25'$. W. long. $69^{\circ} 24'$.

CHARLOTTE'S Town, a town of the island of St. John, in the gulf of St. Lawrence, situate about the center of the island, towards the south coast. N. lat. $46^{\circ} 15'$. W. long. $62^{\circ} 50'$.

CHARLOTTEBURG, a town of America, in the county of Brunswick and state of North Carolina, seated on an island, and having an inlet and found of the same name, a little to the south of it. N. lat. $35^{\circ} 18'$. W. long. 81° .

CHARLOTTENBERG, a town of Germany, in the circle of Westphalia, and county of Holzapfel, built by the French refugees; 4 miles S.W. of Holzapfel.

CHARLOTTEBURG. See BERLIN.

CHARLOTTEBURG, a town of America, in the state of Jersey, and county of Bergen; 12 miles N. of Morris town.

CHARLOTTENLUND, a town of Denmark, in the island of Zealand; 4 miles N. of Copenhagen.

CHARLOTTEVILLE, or **CHARLOTTE**, a post town of America in Salisbury district and state of North Carolina, and the chief town of Mecklenburg county, seated on Steel creek, which joins the Sagaw, and falls into Catabaw river, about 10 miles N. of the South Carolina boundary, and 44 S. of Salisbury, containing about 40 houses, a court-house, and a gaol.

CHARLOTTEVILLE, a town of America, the capital of Albemarle county in the state of Virginia, lying on the post road from Richmond to Danville in Kentucky; and containing about 45 houses, a court-house, and a gaol; 86 miles W.N.W. of Richmond, and 40 S.E. by E. of Staunton.

CHARLTON, **WALTER**, M. D. in *Biography*. Of this learned and ingenious physician, and of his numerous writings, Anthony Wood, who was cotemporary with him, has given a long account, from which the following is principally taken. He was born at Shepton Mallet, in Somersetshire, on the second of February 1619, and received the rudiments of his learning under his father, who was rector of the place. In 1635, he was admitted a commoner in Magdalen Hall, Oxford, and put under the tuition of Mr. John Wilkins, afterwards bishop of Chelsea, under whom he made considerable progress in logic and in philosophy. His disposition leading him to the study of medicine, he soon became conspicuous for his proficiency in that art, and in 1642 he was created doctor in medicine by the favour of the king, Charles the first, and appointed his physician in ordinary. With this title he came to London, was admitted a fellow of the college of physicians, and continued to enjoy a considerable share of credit during the troublesome times that followed. On the restoration of king Charles the second, he was made one of his physicians in ordinary, and a member of the newly formed royal society, about which time his first publication appeared, "Spiritus Gorgonicus exutus, seu de causis, signis, et sanatione Lithiææ." 8vo. Luz. Bat. 1650, in which he adopts the opinion of Van Helmont, as to the cause of the generation of urinary calculi, and recommends the feed of the wild carrot as a powerful lithontriptic. "Exercitationes pathologicae, in quibus morborum pene omnium natura et causa ex novis anatomicorum inventis inquiruntur." London, 1661, 4to. In this, as well as in the rest of his medical lucubrations, there is little new; but they tended to spread the knowledge of the many improvements in anatomy and physiology which had been made by the Bartholines, by Harvey, Glisson, &c. "Natural History of Nutrition, Life, and voluntary Motion, containing all the new Discoveries of Anatomists." 4to. London, 1658. But his inquiries were not confined to medical subjects. He wrote "The Darkeness of Atheism discovered by the Light of Nature." "The Ephesian and Cimmerian Matrons; two remarkable

examples of the power of love and wit." In 1660, to shew his loyalty, which had perhaps been suspected, from his living about the court of Oliver Cromwell, he circulated a sheet, containing a character of his most sacred majesty, Charles the Second; and in 1663 he published "Chorea Gigantum; or the most famous Antiquity of Great Britain, vulgarly called Stone Henge, standing on Salisbury Plain, restored to the Danes." 4to. Iuigo Jones had supposed it was a Roman temple. Charlton, instructed, Wood says, by Olaus Wormius, the Danish antiquary, insisted, that the stones were placed there by the Danes, but they were supposed, with more propriety, to be Druidical remains. We have also by him an Harveian oration, printed in 1680: Lectures on the structure of the heart, the course of its motion, &c. read before the college on the 19th, 20th, and 21st, days of March, 1682, with numerous other pieces, for titles of which see Wood's *Athenæ Oxon.*, Haller's *Bib. General Biography*, &c. In 1689, he was made president of the College of Physicians, which office he held two years. It is probable, however, that he never had any very considerable share of practice, as we find him soon after this retired to the island of Jersey, "where he now is, Ant. Wood says, viz. 1695, a learned and unhappy man, aged, and grave, yet too much given to romances." Wood gives a list of more than twenty publications by Charlton, and he is known to have intended many more, the manuscripts being now in the British museum. The greater part of his publications and writings were alien to the practice of medicine, and must therefore have tended rather to obfuscate, than forward his acquisition of fortune. He died in the year 1707, in the 88th year of his age.

CHARLTON, in *Geography*, an island in the southern part of Hudson's bay. N. lat. $52^{\circ} 8'$. W. long. 80° .

CHARLY, a town of France, in the department of the Aisne, and district of Chateau-Thierry, 2 leagues S.W. of it.

CHARM, derived from the Latin *carmen, versæ*, a magic power, or spell, by which with the assistance of the devil, sorcerors and witches are supposed to do wondrous things far surpassing the powers of nature. See MAGIC.

Phylacteries, hegures, &c. are, all, kinds of charms.

CHARMANDA, in *Ancient Geography*, a nation of Asia, placed by Xenophon on the other side of the Euphrates.

CHARMES, in *Geography*, a town of France, in the department of the Volges, and chief place of a canton, in the district of Mirecourt, $2\frac{1}{2}$ leagues N.E. of it. The place contains 2686, and the canton 10743 inhabitants; the territory includes $21\frac{1}{2}$ kilometres and 27 communes.

CHARMIDAS, in *Biography*, the companion of Philo of Larissa (see PHILLO), and celebrated for the compass and fidelity of his memory, and for his moral wisdom. Cic. *Tusc. Quæst. l. i.* Plin. H. N. l. x. c. 16. Stobæus, fern. 212.

CHARMIS, a native of Marcellis, but for his great skill in the practice of medicine invited to Rome, where he flourished in the time of the emperor Nero. Having succeeded in restoring some of the principal men there to health, by means of the cold bath, he soon found himself at the head of the profession, and was thence enabled to acquire a large property. He is said to have charged one of his patients 200 sesterces, a sum equal, Le Clerc says, to 20,000 livres, or 800*l.* sterling, for a single cure. He derided, Pliny says, the practice of his brethren; though he might have recollected, that the cold bath, by the use of which he acquired his reputation, had been recommended by Ant. Musa. He invested

an antidote, to which he gave his name; the formula is preserved by Galen, but it has been long out of use. Le Clerc. Hist. de la Med.

CHARMIS, in *Ancient Geography*, a small town of the island of Sardinia, founded, according to Steph. Byz. by the Carthaginians.

CHARMOGOL, in *Geography*, a town of Persia, in the province of Chorasan: 200 miles N. of Herat.

CHARMONT, a town of France, in the department of the Marne; 14 miles N.E. of Vitry.

CHARMOSYNA, in *Mythology*, a festival at Athens; and, according to Plutarch, in Egypt.

CHARMOTAS, in *Ancient Geography*, a sea-port of the Arabic gulf, the entrance of which, according to Strabo, was strait and dangerous.

CHARMOUTH, in *Geography*, a village of England, on the coast of the county of Dorset, at the mouth of a small river called *Char*, where the Danes made a descent, and ravaged the country, in the years 833 and 840; 3 miles E. of Lime.

CHARMUT, in *Ichthyology*. The Linnaean *Silurus anguillar*, which inhabits the Nile, and other rivers of Asia, is known among the Arabians by the name of Charmut. See *SILURUS anguillar*.

CHARMUTH, *Silurus charmuth niloticus* of Hasselquist is the Linnaean *Silurus anguillar*, which see.

CHARMUTHA, in *Ancient Geography*, a peninsula of the Arabic gulf, on the coast of Arabia Felix, according to Diodorus Siculus.

CHARNEL, a portico, or gallery, anciently near the church-yard; over which were disposed the bones of the dead, when the flesh was consumed.

The charnels, or charnel-houses, are now usually contiguous to the church.

CHARNEZAY, in *Geography*, a town of France, in the department of the Indre and Loire, and district of Loches; 10 miles S. of it.

CHARNUB, in the *Materia Medica*, a name given by some of the ancient writers to the *siliqua dulcis*, or carob-tree. The Arabian physicians mention two kinds of this; the Syrian, and Nabathæan: the first they call *aljembut*, and the other *alubabat*. Avicenna tells us, that the first of these was a purge, and was given with success in pains of the bowels; and the other an astringent, given in profluvia of the menses.

CHARNY, in *Geography*, a town of France, in the department of the Meuse, and chief place of a canton in the district of Verdun; one league N. of Verdun. The place contains 615, and the canton 9011 inhabitants: the territory comprehends 215 kilometres and 21 communes.

CHARNY, a town of France, in the department of the Yonne, and chief place of a canton in the district of Joigny; 10 miles N.W. of Auxerre. The place contains 513, and the canton 13,141 inhabitants: the territory includes 287½ kilometres and 21 communes.

CHAROLLAIS, a small country of France, before the revolution; so called from Charolles, the capital.

CHAROLLES, a town of France, in the department of the Saône and Loire, and chief place of a district. The place contains 240, and the canton 10,811 inhabitants: the territory includes 190 kilometres and 14 communes.

CHARON, a town of France, in the department of the Lower Charente; 3 leagues N. of Rochefort.

CHARON, in *Mythology*, the ferryman of hell; son of Erebus and Nox, according to the theogony of Hesiod, whose province it was to carry in his boat, over the waters of

Acheron, Styx, Coeytus, and Phlegethon, the souls of the dead; particularly of those who were buried; or persons who were not interred were supposed to wander about the shores for 100 years before they were carried over. Thus Virgil (*Æn. vi.*) describes their state:

“Centum errant annos, volitant hæc litora circum:
Tum denum admitti flagna exoptata revivunt.”

A hundred years they wander on the shore,
At length, their penance done, are wafted o'er.

However, Charon was first paid his fare, which was never less than one obolus, nor more than three, which was put into the mouths of persons interred. Some mythologists have derived his name from *Achæron*, sine gratia, formed of *α*, priv. and *χρησις*, gratia, denoting the ungracefulness of his aspect. Others say, that *Charon*, in the old Egyptian, signified simply a ferry-man. The Arabian historians describe Charon as a person of great power; who could load several camels with the keys which opened the numerous apartments that contained his treasures. Perhaps in Egypt the name of Charon was a dignity bestowed on the boatmen who conveyed the bodies of the Pharaohs over the lake Mæris to deposit them in the cells of the labyrinth, of which he was the keeper. Without doubt, the person who performed the same office on the lake of Memphis, with respect to the inhabitants of that city, had the same title. It this conjecture be founded, we discover the reason why the Greeks, borrowing from the Egyptians, gave the name of Charon to the boatman of hell; and why the Arabs call the lake of Mæris, “birkut Caroun,” and ruins in its vicinity “balad Caroun,” the burgh of Charon, and “cafr Caroun,” the palace of Charon. The present inhabitants of Egypt have a kind of traditionary fable, that Charon was a person of mean extraction, who placed himself near this lake, and demanded a certain sum for every corpse that was ferried over to be interred; which impost on he continued for several years without any authority; but as he insisted upon receiving the usual fare for the king's son, the fraud was discovered and discontinued. The king, however, as the fable reports, perceiving the advantage of this impost, confirmed it by royal authority, and appointed Charon to the post he had before occupied, which he rendered the most lucrative office in the kingdom. It is also said that he became so rich and powerful, as to assassinate his sovereign, and ascend the throne in his stead. To this fanciful narration we may subjoin the account given by Tzetzes, who, representing the Fortunate islands as British, observes, that the souls of the dead are reported to be carried thither; and that on the shore of the ocean, which washes the island called Britain, men subsist by fishing, who are subject to the Franks, but pay them no tribute, because, as it is reported, they transport the souls of the dead to the coast of Britain, which is reckoned among the islands of the blessed, and the habitation of deceased persons, conveyed thither by these fishermen. Charon is represented by the poets as a fat, squalid, old man, with a long grey beard, and rheumatic eyes, clad with tattered rags, that scarcely covered his nakedness. Virgil describes him as possessing the vigour and firmness of old age, meanly clad, with a long beard, grey matted hair, and fixed fiery eyes. Thus,

Portitor has horrendus aquas et flumina servat
Terribili squalore Charon: cui plurima mento
Sanctius inculca jacet; itant lumina, flammæ:
Sordidus ex humeris nodò dependet amictus.

Ipse ratem conto subigit, velisque ministrat,
Et ferruginea subvestat corpora cymba,
Jam senior; sed eruda Deo viridisque senectus."

Æn. vi. v. 298, &c.

There Charon stands, who rules the dreary coasts:
A fordid god: down from his hoary chin
A length of beard descends, uncom'd, unclean;
His eyes like hollow furnaces on fire;
A girle, foul with grease, binds his obscene attire.
He spreads his canvas, with his pole he steers,
The freights of sitting ghosts in his thin bottom bears.
He look'd in years; yet in his years were seen
A youthful vigour, and autumnal green.

CHARONDAS, in *Biography*, a native of Catania in Sicily, flourished about 446 years B. C. and is supposed to have been a disciple of Pythagoras. He was distinguished both as a philosopher and a legislator; and is said to have framed a code of laws for his own native place and several other cities of the Chalcidians, and also for the Magii; and they were afterwards adopted by the inhabitants of Thurium in Magna Græcia, rebuilt by the Sybarites, when they established their republic. Some of these laws were such as follow: Persons who married a second time, if any children by their first wives were living, were excluded from the senate, and from all public employments, because bad fathers, as the legislator conceived such to be, would make bad magistrates. All false accusers were carried through every part of the city crowned with heath or broom, and thus exposed to public ignominy, as the vilest of men. All those were persecuted and fined who formed a correspondence, or contracted a friendship with wicked men. Conceiving ignorance to be the greatest evil and the source of vice, Charondas enjoined, that the children of all the citizens should be instructed in literature and the sciences. Instead of putting delinquents and those who fled in the day of battle to death, he sentenced them to appear for three days in the city, dressed in the habit of women. To prevent the rash and hasty abrogation of his laws, he enjoined, that those who proposed to alter or amend them, should appear in the public assembly with a halter about their necks, and if the alteration proposed did not pass, they were to be immediately strangled. Charondas did not long survive his own laws. Returning one day from pursuing some thieves, and finding a tumult in the city, he came armed into the assembly; though he himself had prohibited any person's doing so by an express law. When a person observed him and reprimanded in severe terms on account of the violation of his own laws, "I do not violate them, says he, but thus seal them with my blood;" and having thus spoken, he plunged his sword into his bosom, and expired. Diod. Sic. Diog. Laert.

CHARONIUS, *Charonæus*, is used as an epithet for caves, some of which are found in Italy, and in other parts of the world, where the air is so loaded with a poisonous vapour, that animals cannot live in them even a few moments.

CHAROST, in *Geography*, a town of France, in the department of the Cher, and chief place of a canton in the district of Bourges, seated on the river Arnon; four leagues S.W. of Bourges. The place contains 1250 and the canton 8635 inhabitants: the territory includes 322½ kilometers, and 13 communes.

CHARPE, in *Military Language*. This consists of two ropes or cables fastened together, somewhat crossways from one ponton to another, as also to the banks or sides of a river, when you wish to make a bridge across it, in order to keep the pontons steady in their places.

CHARPENTIER, FRANCIS, in *Biography*, a native of

Paris, where he was born in 1620. Although he was originally intended for the bar, his love of retirement, and attachment to literature, diverted him from this pursuit, and induced him to rank himself among the men of letters. His reputation and connections caused him, in 1654, to be elected a member of the French Academy; and after he had been employed by the minister Colbert, in recommending to the nation the proposed establishment of an East India company, he was chosen, under the sanction of the minister, a member of the new-instituted Academy of Inscriptions and Belles Lettres, for which distinction his knowledge of the ancient languages peculiarly qualified him. M. Charpentier, however, though conversant with ancient writers, and though he had commenced his career by the translation of Xenophon's *Cyropædia* and *Memorabilia*, was very far from indulging a bigotted attachment to antiquity; and in the dispute that agitated the literati concerning the comparative merit of the ancients and moderns, he took part in favour of the latter. In 1676, he wrote "A Defence of the Use of the French Language for the Inscription on the Triumphal Arch;" and in 1683, he published two volumes "On the Excellence of the French Language." These publications excited the avowed enmity of Boileau, who satirized him with an unwarrantable severity; although it must be allowed that his taste was unequal to his vivacity and learning. The inflated style of the inscriptions placed under the pictures of Le Brun in the gallery at Versailles, such as "The incredible passage of the Rhine," and "The miraculous capture of Valenciennes," incurred just censure, and the epithets were erased by the king's order. In his adulation of the king he exceeded his contemporaries, even at a period when they were vying with one another in this kind of panegyric. Charpentier was ambitious of displaying his rhetorical powers, which he possessed in an eminent degree, on various occasions; and particularly in the meetings of the French Academy, at which he was assiduous in his attendance. His last work, entitled "A Dissertation on the Excellence and Utility of Academic Exercises," was published in 1695. As to his private character, it was eminently mild and honourable. Whilst he retained the grateful remembrance of benefits which he received, he soon forgot injuries, and never cherished rancour against any of his adversaries. He died in 1702; and long after his death some literary fragments were published under the title of "Carpentaria," that are held in no great estimation. D'Alemb. Hist. des Memb. de l'Acad. Fr. Gen. Biog.

CHARPENTIER, in *Military Language*, a carpenter. Such workmen are absolutely necessary in the suite of an army. Without their assistance the miners can do nothing. For all military operations in general their services are indeed more or less necessary. Care should be taken, that such of them, as follow an army, are strong and robust.

CHARPENTIER *jaune*, in *Ornithology*. See *Picus exalbidus*.

CHARPEY, in *Geography*, a town of France, in the department of the Drôme; 3 leagues E. of Valence.

CHARPOTE, in *Ancient Geography*, a town of Asia, situate between the mountains, in the valley through which passed the river Arsanias in its course to the Euphrates.

CHARR, CHAR, or as some-times called *Charræ*, in *Ichthyology*, the common name of the Alpine salmon, *Salmo Alpinus* of Linnaeus. This fish is found in the lakes of Westmorland, and the mountainous parts of northern Europe. It is esteemed an excellent fish for the table, and ported is considered an article of luxury. In England we distinguish more than one kind of charr, though they are generally believed to appertain to a single species only. Mr. Pennant, upon

upon the authority of the Rev. Mr. Farnish of Carlisle, erroneously creates the *Cypr' charr*; the *Gelt charr*, or one which has not spawned the preceding season, and is on that account reckoned to be in the greatest perfection; and the *Red charr*, which last is distinguished in Westmorland by the name of Red charr, because in dressing the flesh assumes a higher colour than the others. The same circumstance is observable in the trout. With respect to the *Torgoch* of the Welch, or "*Red belly*," a kind of charr found in one of the Snowdonian lakes, we are not satisfied that it is of the same species as the charr of Westmorland, though uniformly described as such by authors. This we shall notice more particularly under the article *Salmo Alpinus*, observing only in this place, that the fish spawns at a different time of the year from the former, that it is smaller, and brighter instead of paler in colour when in season than the red charr of the Westmorland lakes. Vide Donovan. Brit. Fishes; and article *Salmo alpinus*.

CHARRÉE, or CHARRHĀ, in *Ancient Geography*, a town of Asia, in Mesopotamia, situate near the river Scyrus, now called "Harra," and thought to be the same that bears this appellation in the history of Abraham's peregrinations.

CHARRARA, in *Geography*, a town of Persia, in the province of Farhitan: 48 miles N.W. of Schiras.

CHARRES, a town of Arabia; 9 miles N.N.E. of Sana.

CHARRETTE, a cart. Every one knows the meaning of this word. But it is proper to introduce it, as charrettes are extremely useful in matters of artillery. They serve the purpose of carrying and transporting ammunition; and vary in their forms or figures in different departments thereof, as the lieutenant generals and commanding officers of artillery have them constructed each according to his own method, to suit the countries they serve in.

CHARRIÈRE, JOSEPH, DE LA, in *Biography*, a surgeon of eminence of Ancey, in Savoy. After residing several years in Paris, and receiving the instruction of the best masters there, he returned to Ancey, where he soon distinguished himself by his superior attainments. In 1690, he published, as the result of an extensive practice, "*Traité des Operations de Chirurgie*," 12mo. Paris. He gives the descriptions of each of the diseases, with the reasons for, and the manner of performing the operations; and though this treatise was superseded by the *Institutions Chirurgicæ* of Heister, as Heister's has been by the works of later writers, it enjoyed, in its time, no small share of reputation, as appears by its having been reprinted six or seven times in the space of twenty years. "Anatomie nouvelle de la tête de l'homme," 12mo. 1703. Paris. The parts are minutely and with sufficient accuracy described, but with no addition to what was before known on the subject. Hall. Bib. Anat. et Chir. Eloy. Dict. Hist.

CHARRING of Poles, in *Rural Economy*, the practice of reducing that part of the surface of poles which is to be put into the ground to somewhat of the state of charcoal, so as to render it more durable and lasting. This method of preparing poles is highly useful where they are to be placed in wet situations, or to stand between wet and dry. The practice is common in Norfolk; where, according to Mr. Marshall, it is thus performed: "A trench is dug eighteen inches wide, eighteen inches deep, and six feet long, and aired by burning some straw and a faggot or two in it previously to laying down the poles. This being done, three poles are laid across the trench; placing the part to be burnt, namely, the part proposed to stand between air and moisture, immediately over the fire; thrusting the fuel (dry oven faggots) in at the windward end of the trench. As one side becomes charred, another is turned downward;

and, to prevent the fire from spreading too wide (reaching too high up the post), the part not intended to be burnt is wetted by means of a wet straw band, tied round the post, on the part where the fire ought to be checked, pouring water from time to time upon the twisted faggot. The poles having been repeatedly turned on all sides, until white ashes begin to form on the surface of a black coat of coal, about one-tenth of an inch thick, they are removed, and their places supplied by others. Chips, he says, are preferable to faggots, as fuel, in this operation; as they can be dript in between the poles wherever an increase of fire is wanted."

From the great scarcity of hop-poles it has been suggested that this method may likewise be useful in preserving the bottom parts of them from decaying. As 3000 of these poles are required for an acre of land, this is conceived to be an object of great moment to the hop planter.

CHARROÏ, *Carriage*, or *Wainage*, in *Military Language*. This word ought to be regarded as extending in its meaning to all carriages, horses, mules, and, in general, to every thing destined for the transport of all kinds of provisions and ammunition for the use of armies.

CHARRON, PETER, in *Biography*, was the son of a bookseller, at Paris, and born in 1541. He was educated for the law at Orleans and Bourges, and in the university of the latter place he took his doctor's degree. He practised as an advocate in the parliament of Paris for five or six years; but renouncing the profession in disgust, he directed his attention to theology, took priest's orders, and became a celebrated preacher. His reputation was such, that he was solicited to accept the office of canon to several churches, and he served as such to several cathedrals; he was also nominated by queen Margaret her preacher in ordinary, and he was in the retinue of Cardinal d'Armagnac, legate at Avignon. After a long absence from Paris, he returned thither in 1588, and made an attempt to gain admission first among the Cartusians, and then among the Celestines, but he was refused, on account of his being too old to adopt their discipline; he therefore resolved to retain the office of a parish priest. At Bourdeaux, he contracted an intimate friendship with the famous Michael Montagne, and imbibed his philosophical sentiments. Their mutual affection was such, that Montagne gave by his will to Charron the privilege of bearing his arms, and Charron made the brother-in-law of Montagne his residuary legatee. In 1594, Charron published his treatise, entitled "Three Truths," proposing to maintain, 1. That there is a God and a true religion; 2. That of all religions the Christian is the only true one; and 3. That among Christian communions the Roman-Catholic is the only true church. This orthodox treatise procured for him from the bishop of Cahors the dignity of grand-vicar, and a theological canonship; and in 1595 he was deputed to the general assembly of the clergy, and made secretary to that body. In 1600, he printed a volume of "*Christian Discourses*," and in 1601 appeared the first edition of his "*Treatise on Wisdom*." In 1603, he went to Paris to print a second edition of this work, and there died suddenly in the street. This book, though his character was unblemished, and his sincerity in his religious profession unquestionable, occasioned his being ranked among the most dangerous free-thinkers. Attached from his infancy to a system of faith inconceivable to reason, he seems to have thought it necessary, in vindication of his opinions, to depreciate the conclusions of mere reason. Hence he was led to suggest, that strength of mind inclines to Atheism; and also to assert, that the immortality of the soul, though an universal dogma, is founded on very weak natural arguments. He likewise gave offence by maintain-

ing that, although all religions derive their origin from heaven by divine inspiration, yet all have been received by human hands and means. In the second edition he excepted the Christian religion. He was also charged with laying unduc stress on the differences that have always subsisted among Christians, together with the evils resulting from them; and the strength and fairness with which he stated the arguments against revelation were disapproved by some of his adversaries. On these accounts the second edition of his work excited great alarm and opposition among theologians, and the impression was allowed, after some alteration in the work itself, by particular favour. Although the author in this treatise, which was evidently formed on the principles of Montaigne's essays, has introduced many original and ingenious observations, he exhibits upon the whole a gloomy picture of human nature and society. Charron himself, however, was of a gay and cheerful disposition; ready in conversation; and liberal, considering the age in which he lived, as to his mode of philosophizing. Gen. Dict. Nouv. Dict. Hist. Brucker's Phil. by Enfield, vol. ii.

CHARRONS, cartwrights, workmen very necessary in the suite of an army, and particularly of the artillery.

CHARROUX, in *Geography*, a town of France, in the department of the Allier, and district of Gannat; 5 miles N. of Gannat.

CHARROUX, a town of France, in the department of the Vienne, and chief place of a canton, in the district of Civray, $1\frac{1}{2}$ league E. of it. The place contains 1581, and the canton 6808 inhabitants: the territory includes $27\frac{1}{2}$ kilometres and 9 communes.

CHART, of HYDROGRAPHICAL MAP, in *Navigation*, is a representation, in *plano*, of a part, or of the whole of the water on the surface of the globe, and the adjacent coast. There are various kinds of charts, as Plane, Mercator, &c.

Charts were first introduced into the marine by Prince Henry, duke of Visco, son of John I. king of Portugal, about the year 1400. These were of the kind denominated plane charts, and continued in use for many years, and for very small portions of the coast, even to the present time. For any considerable extent, charts of this construction were soon found to be very erroneous; and their errors were successively exposed by Martin Cortes, a Spaniard, in his treatise, intitled *Breve Compendio de la Sphera, y de la Arte de Navegar con nuevos Instrumentos y Reglas*, printed at Seville in the year 1556: by Petrus Nonius, a Portuguese, in his treatise *de Arte et Ratione Navigandi*, printed at Basil in 1587: by Mr. Edward Wright, in his *Certain Errors in Navigation detected and corrected*, of which the first edition was printed at London in 1599; and by others. These errors, as enumerated by this last author, in his own words, are the following. "1. Error in the proportion of the length and breadth of places in the common sea chart. 2. Error in finding out the difference of longitude by the common sea chart. 3. Error in the lying and bearing of places one from another, in the common sea chart. 4. Error in setting of places out of the common sea chart into the globe. 5. Error in shewing the distances of places in the common sea chart."

In order to correct these errors of the plane chart, Gerard Mercator, in the year 1556, published a chart, in which the meridians and parallels of latitude are straight lines, as in the plane chart; but in order to compensate the errors arising from the parallelism of the meridians, he increased each degree or portion of the meridian with its distance from the equator. It, however, appears, that his charts had no claim to accuracy; for the intervals between the parallels of each

ten degrees of latitude in the chart, as given by Blundeville in his *Exercises*, page 756, do not agree with the differences of the corresponding meridional parts of those parallels. Thus, the difference, according to the chart, between the parallels of 50 and 60 degrees, is $14\frac{1}{2}$ less than the difference of the meridional parts of those parallels; and that between the parallels of 70 and 80 degrees is upwards of 4 degrees less than the truth. It is hence evident Mercator had no certain fixed rule for dividing the enlarged meridian. The discovery of a rule for this purpose was left to Wright, who published the first table for that purpose in his book above mentioned; in the preface to which he expresses himself as follows: "But to come to those that may perhaps object, I doe but *adum agere*, in doing no more then hath bin done already by Gerardus Mercator in his univerrall mappe of the world many years since. I must answer, that indeed by occasion of that mappe of Mercator, I first thought of correcting so many, and grosse errors, and absurdities, as I have already touched, and are hereafter at large shewed in the common sea-chart, by increasing the distances of the parallels from the æquinoctial towards the poles, in such sort, that at every point of latitude in the chart, a small part of the meridian might have the same proportion almost to the like part of the parallel, that it hath in the globe. But the way how this should be done, I learned neither of Mercator, nor of any man else. And in that point I wish I had been as wise as he, in keeping it more charily to myself. For so perhaps it might have been more beneficial to me."

In the above paragraph, we have Wright's express declaration, that no man taught him the true method of enlarging the meridian line; and as all charts prior to his discovery were erroneous in this increase of the degrees of latitude, he, consequent'y, was the first discoverer of the true method of constructing this kind of a chart. We cannot omit mentioning, in this place, Wright's very ingenious idea of transferring the several circles, &c. on the globe to a plane surface. "Suppose," says he, a spherical superficies, with meridians, parallels, rumbes, and the whole hydrographically description drawn thereupon, to be inscribed into a concave cylinder, their axes agreeing in one.

Let the spherical superficies swell like a bladder, (whiles it is in blowing), æqually always in every part thereof (that is, as much in longitude as in latitude) till it apply, and joyn itself (round about, and all along till towards either pole) unto the concave superficies of the cylinder: each parallel upon this spherical superficies increasing successively from the æquinoctial towards either pole, until it come to be of equal diameter with the cylinder, and consequently the meridians still widening themselves, till they come to be so far distant every where (each from other as they are at the æquinoctial). Thus it may most easily be understood, how a spherical superficies may (by extension) be made a cylindrical, and consequently a plain parallelogram superficies; because the superficies of a cylinder is nothing else but a plain parallelogram wound about two equal equidistant circles that have one common axis perpendicular upon the centers of them both, and the peripheries of each of them equal to the length of the parallelogram as the distance betwixt those circles, or height of the cylinder is equal to the breadth thereof. So as the nautical plainisphere may be defined to be nothing else but a parallelogram made of the spherical superficies of an hydrographical globe inscribed into a concave cylinder, both their axes concurring in one; and the spherical superficies swelling in every part equally in longitude and latitude, till every one of the parallels thereupon be inscribed into the cylinder, (each parallel growing as great as the æquinoctial), or till the whole spherical superficies

cies touch and apply itself every where to the concavity of the cylinder.

In this nautical planisphere thus conceived to be made, all places must needs be situate in the same longitudes, latitudes, and directions or courses, and upon the same meridians, parallels, and rumbes, that they were in the globe, because that at every point between the æquinoctial and the pole, we understand the spherical superficies whereof this planisphere is conceived to be made, to swell equally as much in longitude as in latitude (til it joyn itself unto the concavity of the cylinder) so as hereby no part thereof is any way distorted or displaced out of his true and natural situation upon his meridian, parallel, or rumbo, but only dilated and enlarged: the meridians also, parallels, and rumbes, dilating and enlarging themselves likewise, at every point of latitude in the same proportion.

Now then let us diligently consider of the geometrical lineaments, that is, the meridians, rumbes, and parallels of this imaginary nautical planisphere, that we may in like manner expresse the same in the mariners chart. For so undoubtedly we shall have therein a true hydrographical description of all places, in their longitudes, latitudes, and directions, or respective situations each from other, according to the points of the compass in all things correspondent to the globe, without either sensible or explicable error.

Since, in this projection, the parallels are all made equal to the equator, it is evident they are enlarged in the proportion of the radius to the co-sines of their respective latitudes: wherefore, the meridian, in order to preserve every its proportion to the several parallels thus increased, must, at the latitude of each parallel, be enlarged in the proportion of the radius to the co-sine of the latitude, or so that the length of a minute of the true or proper meridian, which upon the globe is the same in all latitudes, and equal to the length of a minute of the equator, may be to the length of a minute on the enlarged in any latitude, as the co-sine of the latitude to radius; or, which is the same, as radius to the secant of the latitude: Therefore, the length of a minute on the proper meridian must be to the length of a minute on the enlarged meridian, at any latitude, as radius to the secant of that latitude. Hence, a table of natural secants, to every degree and minute of the quadrant, and whose radius is 1, will expresse the several lengths of the enlarged meridian at the latitudes belonging to those secants respectively. And, hence, the sum of the secants of all the minutes from the beginning of the quadrant, to the degree and minute of any parallel's latitude, will be, in minutes of the equator, or nautical miles, the length of that part of the enlarged meridian which is contained between the equator and the given parallel. In this manner Mr. Wright constructed his "Table of Latitudes for graduating a Meridian in the general Sea-Chart," to every degree and minute of the quadrant, which has since obtained the general name of "A Table of Meridional Parts;" and by the French, that of "Latitudes Croissantes."

The above method of dividing the meridian is not strictly geometrical; and, in order to shew that Wright knew this to be the case, we cannot avoid extracting the following paragraph from his *Correction of Certain Errors*, &c. p. 12. But in this table it was thought sufficient to use such exactness, as that thereby (in drawing the lineaments of the nautical planisphere) sensible error might be avoided. He that listeth to be more precise, may make the like table to decades or tonnes of seconds, out of "Joachimus Rhæticus his Canon Magnus Triangulorum." Notwithstanding, the geometriean that desireth exact truth, cannot be satisfied neither: for whose sake and further satisfaction, I thought

good to adjoyn also this geometrical conceit of dividing a meridian of the nautical planisphere."

"Let the *æquinoctial* and meridian be drawn upon a globe: Let the meridian (divided into degrees, minutes, seconds, &c.) run upon a straight line, beginning at the *æquinoctial*, the globe swelling in the mean time in such sort, that the semidiameter thereof may be alwaies equal to the secant of the angle, or arch contained between the *æquinoctial* and semidiameter, insinuating at right angles upon the foresaid straight line: the degrees, minutes, and seconds, &c. of the meridian, noted in the straight line, as they come to touch the same, are the divisions of the meridian in the nautical planisphere. And this conceit of dividing the meridian of the nautical planisphere may satisfy the curious exactness of the geometriean; but for mechanical use, the table before mentioned may suffice."

The above paragraph seems to have induced several eminent mathematicians to: endeavour to discover a more accurate method of enlarging the meridian: and, in the year 1645, a method, strictly accurate, was published, as an addition to Norwood's Epitome of Navigation, by Mr Henry Bond. This method appears to have been discovered by chance; but neither the name of the discoverer, nor the time when it was discovered, are known. The demonstration of this method was still wanting: this, however, was given, for the first time, by the excellent Mr. James Gregory of Aberdeen, in his *Exercitationes Geometricæ*, published in the year 1668, but not without a long train of reasoning: and in the year 1690, a more concise demonstration was given by Dr. Halley in the Philosophical Transactions of London, N^o 219. vol. xix. Both these demonstrations are reprinted in the 2d volume of Baron Maferses' *Scriptores Logarithmici*, printed in the year 1791.

In Dr. Halley's demonstration, it is shewn, that if, "in the common tables of logarithmic tangents, the indices alone be considered as integers, and all the rest of the places as decimals: then the difference between the logarithm of the radius, and the logarithmic tangent of half the complement of any given latitude, divided by 0.000 126 3; 1 14, &c. will be the meridional parts corresponding to that latitude." For the demonstration of this proposition, the reader is referred to the article *MERIDIONAL PARTS*. Dr. Halley has shewn various other methods of constructing a table of meridional parts.

CHART, globular, is a projection so called from the conformity it bears to the globe itself. This projection was proposed by Mess. Senex, Wilson, and Harris, in which the meridians are inclined, the parallels equidistant and curvilinear, and the rumb-lines real spirals, as on the surface of the globe. From this last property, it is evident it can be of very little use in navigation; as a map, however, it has its advantages.

CHART, reduced, is that in which the meridians and parallels are represented by straight lines; these last are parallel to, and equidistant from, each other; but the former being directed to the pole, are not parallel: and hence a rhumb-line on this chart is a curve, and, therefore, it is of little use in navigation. The degrees of latitude are equal, but those of the extreme and intermediate parallels are unequal; the length of each extreme parallel being equal to the length of a degree on the meridian, multiplied by the cosine of the corresponding parallels. A chart of this kind will answer tolerably well for the equatorial parts of the earth, but not for parts distant from the equator, unless for a small country, and then only as a map.

CHART, spheroidal, a chart adapted to the spheroidal figure of the earth. In Mercator's chart, the figure of the earth

earth is supposed to be that of a perfect sphere: but theory confirmed by observation has shewn it to be an oblate spheroid. Sir Isaac Newton, from theory, found the ratio of the equatorial to the polar axis to be as 230 to 229. By comparing mensurations made at different parts of the earth, this proportion has been found to vary considerably, some making it more, and others less, than what Sir Isaac Newton assigned. From a comparison of the measure of a degree in France with that at the polar circle, the diameter of the equator to the axis of the earth was found to be as 178 to 177. Vide *Degree du Meriden*, &c. Paris, 1741, p. lvi. According to Don George Juan, this proportion is as 266 to 265; and agreeable thereto he calculated a table of meridional parts for the spheroid. Again, M. Du Séjour, from a comparison of the lengths of pendulums vibrating seconds in different latitudes, concludes the proportion to be as 321 to 320. *Traite Analytique*, tom. ii. p. 270. And, agreeable to this proportion, J. De Mendoza Rios, esq. calculated a table of meridional parts for the spheroid, which is inserted in the *Connoissance des Temps pour l'année 1793*.

In the year 1758 Mr. Benjamin Martin published the first spheroidal chart, in his “*New Principles of Geography and Navigation*,” adapted to don George Juan’s proportion of the equatorial diameter of the earth’s axis. These charts have not, however, come into general use.

CHART, variation, a Mercator’s chart, upon which are laid down curve lines, representing the variation of the compass at those places through which they pass. This chart was first constructed by Dr. Halley, in the year 1700, with a view to find the longitude. Since the variation at the same place is liable to an annual change, the above chart, in a few years, became almost useless. In the years 1744 and 1756, it was republished in London by Messrs. Mountain and Dodson, from nearly one hundred thousand observations. It was also published at Paris, in 1765, by M. Belling, and again at London in the years 1788 and 1794. Variation charts, adapted to different years, have been published by Mr. Samuel Dunn. Vide Dr. Mackay’s *Longitude*, vol. i. p. 264. For the method of finding the longitude at sea by this method, the reader is referred to the article **LONGITUDE**; see also **VARIATION**.

CHART of the Inclination, or Dip of the Magnetic Needle, contains curve lines expressing the quantity of the inclination or dip of the needle at those places through which they pass. A chart of this kind, for a small portion of England and France, was published by Mr. William Whiston, in his treatise entitled “*The Longitude and Latitude found by the Inclinator or Dipping Needle*,” printed at London in 1721. In the year 1768, M. Wilcke of Sweden published a general chart, exhibiting the lines of equal dip, in the most frequented parts of the globe. This chart was re-published by M. Le Monnier, in his treatise “*Loix du Magnetisme*,” printed at Paris in 1776.

It has been proposed to find the latitude by means of a chart of the inclination of the needle; and by both inclination and declination of the needle, the latitude and longitude might be found, provided the theory of the variation was known, and instruments could be constructed to shew the quantity of the variation and dip, with sufficient accuracy.

CHARTS, Construction of.

I. *Of the plane chart.*

The number of degrees of latitude which the chart is intended to contain, and the extent from east to west being fixed upon; a line is to be drawn near the side or end of a sheet of paper, in length equal to the whole length of the chart, from north to south; and this line is to be divided

into degrees, and numbered accordingly. From each end of this line perpendiculars are to be drawn, and made equal to the intended extent of the chart from east to west, and their extremities are to be joined by a straight line. If the chart is to commence at or near the equator, and to extend only a few degrees of latitude, the divisions of the parallels may be equal to those of the meridian: but if the chart begins at any considerable distance from the equator, it will conduce to accuracy to make the length of each degree of the parallel equal to the cosine of the mean latitude, the radius being 60 minutes; or, the extreme parallels may be divided according to the above proportion, and in that case it will become a *reduced* chart. Meridians and parallels are there to be drawn at convenient distances.

A scale is now to be made of stiff paper or pasteboard, equal in length to the extent of the chart from east to west, and divided and numbered accordingly. By this scale, the positions of those places contained within the limits of the chart are very easily laid down, by placing the divided edge of the scale over the latitude of the given place; and under the given longitude, a mark being made will represent the position of the place on the chart.

A compass is to be inserted in any convenient place of the chart, an arrow shewing the direction of the flood tide or current. The times of high water at full and change are to be marked in their proper places, expressed in Roman characters; soundings and quality of the ground at bottom, the leading marks to avoid dangers, &c.

II. *Of a Mercator’s Chart.*

A Mercator’s chart, for any given portion of the surface of the globe, is constructed as follows:

The limit of the proposed chart is first to be determined, that is, the number of degrees of latitude and longitude which it is to contain, and the degree of latitude and longitude of its commencement.

Find the meridional parts answering to each degree of latitude within the intended limits of the chart, and take the difference between each, and that corresponding to the least degree of latitude in the chart; and reduce these differences to degrees, by dividing by 60.

A parallel, representing that of the least latitude, is to be drawn; upon which the number of degrees in the proposed difference of longitude, from a scale of equal parts, is to be laid off, and divided into degrees, and smaller portions if convenient, and numbered at each fifth or tenth degree. From each end of this parallel a perpendicular is to be drawn, and made equal to the difference of the meridional parts of the extreme latitudes taken from the divided parallel; and the ends of these meridians are to be joined by a straight line, which will represent the other extreme parallel, and which is to be divided and numbered in the same manner as the first drawn parallel; the meridians are then to be divided into degrees, and numbered at every fifth or tenth degree.

Take the meridional difference of latitude between the beginning of the chart, and the next fifth or tenth degree of latitude from the divided parallel, and lay it off from the first parallel on each of the scale meridians, and join these points by a straight line. In like manner, the meridional difference of latitude answering to each successive interval of five or ten degrees, is to be taken from the first drawn parallel and laid off, and the corresponding parallels are to be drawn and numbered accordingly, and the intermediate spaces are to be subdivided. If the chart is upon a large scale, the meridional difference of latitude answering to each degree, is to be laid off from the least parallel. If

If the chart is intended to be upon a larger scale, equi-multiples of the intervals are to be taken, such as will answer to the proposed extent of the chart.

A slip of strong paper is to be divided and numbered in the same manner as the first drawn parallel. Now, each place within the limits of the chart is to be laid down, by placing the slip of paper so that its extreme points of division may be at the latitude of the given place on each meridian; then, under the longitude of the place a mark is to be made, which will represent the position of that place. In like manner, all the places on the coast are to be laid down and connected by observations made on the coast; or if no sketch had been previously made, the contour of the coast is to be drawn agreeable to the best charts. Meridians and parallels are to be drawn through every fifth or tenth degree of latitude and longitude and extended to the coast.

A compass is to be inserted in some convenient part of the chart, and the points extended to the land: an anchor is to be drawn where there is good anchoring ground, and in places where it is safe only to stop a tide, an anchor without a stock is to be laid down. The soundings, the quality of the ground, the times of high water at full and change, &c. are to be marked in their proper places.

For the method of laying down a Mercator's chart by means of a scale of logarithmic tangents, the reader is referred to Dr. Mackay's Treatise on Navigation, from which the greater part of the preceding, and also the remaining part of this article are extracted.

III. Of the Variation Chart.

Having constructed a general chart according to Mercator's projection, mark down with dots all the places in which the declination of the magnetic needle has been ascertained; then draw lines through those points having the same declination. These lines, or arcs, are called *lines of declination*; and by proceeding in this manner as far as the variation is known the chart will be completed.

CHARTS, manner of using.

The principal use of a chart is, to find the course and distance between any two places within its limits, and to lay down the place of a ship on it, so that the position of the ship with respect to the intended port, the adjacent land, islands, &c. may be readily perceived.

As it is incompatible with the plan of the present work to insert large charts, therefore, in performing the following examples, it is supposed, the practitioner has the necessary charts beside him.

I. USE OF THE PLANE CHART.

PROBLEM I.

To find the Latitude of a Place, on the Chart.

Rule.—Take the nearest distance between the given place and the nearest parallel of latitude, which being applied the same way on the divided meridian, from the point of intersection of the parallel and meridian, will give the latitude of the proposed place.

Example.—Required the latitude of Port Louis, in the Isle of France.

The least distance between Port Louis and the nearest parallel being laid the same way on the meridian, from the extremity of that parallel, will reach to 20° 8' S. the latitude required.

PROBLEM II.

To find the Course and Distance between two given Places on the Chart.

Rule.—Lay the edge of a scale over the given places, and

take the nearest distance between the center of any of the compasses on the chart and the edge of the scale, move this extent along, so as one point of the compass may touch the edge of the scale, and the straight line joining the points may be perpendicular thereto; then will the other point shew the course, and the interval between the places being applied to the scale, will give the required distance.

Example.—Required the course and distance from Cape St. André to Cape St. Sebastian, both in the island of Madagascar?

The edge of a scale being laid over the two places, then, by moving the compass as directed, the course will be found to be N.E. $\frac{1}{2}$ E. and the interval between them will measure 105 leagues.

PROBLEM III.

The Course and Distance sailed from a known Place being given to find the Ship's Place on the Chart.

Rule.—Lay the edge of a scale over the place sailed from, parallel to the given course; then take the given distance from the scale on the chart, and lay it off from the given place by the edge of the scale, and it will give the point on the chart representing the place of the ship.

Example.—The correct course of a ship from Cape St. Maria, on the N. side of the entrance of the river La Plata, was N.E. by E. and the distance 238 leagues. Required the place of the ship on the chart?

The edge of the scale being laid over Cape St. Maria, in a N.E. by E. direction, and the distance 238 leagues, laid off from Cape St. Maria by the edge of the scale, will give the place of the ship, which will be found to be in latitude 28° 15' S.

PROBLEM IV.

Given the Latitude in, and Meridian Distance, to lay down the Place of the Ship on the Chart.

Rule.—Through that place from which the meridian distance is reckoned, let a meridian be drawn, then lay a scale over the given latitude, and the meridian distance being taken from the scale on the chart, and laid off by the edge of the scale from the point of its intersection with the meridian, will give the ship's place.

The manner of performing this problem is obvious; and the various other problems that may be resolved on the plane chart, require no further explanation, being only the construction of the remaining problems in plane sailing.

II. USE OF MERCATOR'S CHART.

PROBLEM I.

To find the Latitude of a Place with the Chart.

Rule.—This is performed in the same manner as Problem I. on the plane chart.

PROBLEM II.

To find the Longitude of a Place on the Chart.

Rule.—Take the least distance between the given place and the nearest meridian, which being laid off on the equator, or divided parallel, from the point of intersection of the parallel and meridian, will give its longitude.

Example.—Required the longitude of Funchal in the island of Madeira?

The least distance being taken between Funchal and the nearest meridian, and laid off from the intersection of that meridian with the divided parallel, will give 17° 6' W. the longitude required.

PROBLEM

PROBLEM III.

To find the Course between two given Places on Mercator's Chart.

Rule.—For the manner of performing this problem, the reader is referred to the use of the plane chart, Problem II.

PROBLEM IV.

To find the Distance between two given Places on the Chart.

1. When the given places are under the same meridian.

Rule.—Find the latitude of each; then, the difference, or sum of their latitudes according as they are on the same, or on opposite sides of the equator, will be the distance required.

Example.—Required the distance between the nearest extremities of the islands of Grenada and Gaudaloupe?

Latitude of southernmost extremity of Gaudaloupe	-	-	-	15° 52' N.
Latitude of northernmost extremity of Grenada	-	-	-	12° 14' N.
Distance	-	-	-	338 = 218 M.

2. When the given places are under the same parallel.

Rule.—If that parallel is the equator, the difference, or sum of their longitudes, found by Problem II. is the distance between them. If not, take half the interval between the given places, lay it off on the meridian on each side of the given parallel, and the intercepted degrees will be the distance between the places.

If the given parallel is near the north or south extremity of the chart, the following method may be used. Take an extent of a few degrees from that part of the meridian where the given parallel is the middle of the extent; then the number of extents, and parts of an extent, contained between the given places, being multiplied by the length of an extent, will give the required distance.

Example.—Required the distance between Cape Cautin and Funchal, both lying nearly in the same parallel?

By proceeding as directed above, the distance will be found to be 6° 44', or 134 $\frac{2}{3}$ leagues.

3. When the given places differ both in latitude and longitude.

Rule.—Find the difference of latitude between the given places, and take it from the equator, or graduated parallel; then, lay the edge of a scale over the given places, and move or slide one point of the compass along the edge of the scale, until the other point just touches a parallel. Now, the distance between the place where the point of the compass rested, and the point of intersection of the edge of the scale and parallel being applied to the equator or divided parallel, will give the distance between the places in degrees and parts of a degree; which, multiplied by 60, will give the distance in miles.

Example.—Required the distance between Cape Finisterre and Porto Santo?

Take the difference of latitude between the given places, viz. 6° 54', from the graduated parallel, and move one point of the compass along the edge of the scale, laid previously over these places, until the other point just touches a parallel; now, the interval between the place where the point of the compass rested, and the point of intersection of the scale and parallel, being applied to the divided parallel, will measure 11° 24', or 228 leagues.

Remark.—To some charts a set of scales is adapted to

each degree of latitude within the limits of the chart; by which the distance between any two places is easily measured, by applying that distance to the scale answering to the middle parallel of latitude of the two places.

PROBLEM V.

Given the Latitude and Longitude in, to find the Ship's Place on the Chart.

Rule.—Lay the edge of a scale over the given latitude and lay off the given longitude from the first meridian, or the difference of longitude from the nearest meridian, by the edge of the scale, and the ship's place will be obtained.

Example.—The latitude is 47° 30' N. and longitude 12° 15' W.; it is required to lay down the ship's place on the chart?

Lay the edge of the scale over the latitude 47° 30' N.; then take, from the divided parallel, the interval between 10° and 12° 15', which laid off by the edge of the scale from the meridian of 10°, will give the ship's place.

PROBLEM VI.

Given the Course steered from a known Place, and the Latitude in, to find the Ship's Place on the Chart.

Rule.—Lay the edge of a scale over the place sailed from, in the direction of the given course, and its intersection with the parallel of latitude arrived at will be the place of the ship.

Example.—A ship from the Lizard sailed S.W. by S. and by observation is in latitude 45° 20' N. Required the place of the ship on the chart?

The edge of a scale being laid over the Lizard, parallel to the S.W. by S. rhumb, will intersect a parallel drawn through the given latitude, 45° 20' N. in the ship's place.

PROBLEM VII.

Given the Course steered, and Distance run from a known Place, to lay down the Ship's Place on the Chart.

Rule.—Lay the edge of a scale over the place sailed from, in the direction of the given course; then, take the distance from the equator, put one point of the compass at the intersection of any parallel with the edge of the scale, and the other point of the compass will reach to a certain place by the edge of the scale; now, this point remaining fixed, draw in the other point of the compass, until it just touches the above parallel; apply this extent to the equator, or divided parallel, and it will give the difference of latitude. Hence, the latitude come to will be known; and the point of intersection of the corresponding parallel with the edge of the scale, will be the place of the ship.

Example.—A ship from Cape St. Vincent sailed S.S.W. 300 miles. Required the ship's place on the chart?

Lay the edge of a scale over Cape St. Vincent, parallel to the S.S.W. rhumb. Take the distance five degrees from the divided parallel; place both points of the compass close to the edge of the scale, so that one of them may be at the intersection of a parallel with the edge of the scale, and the other on that side of the parallel on which is the acute angle formed by the scale and parallel. Now this last point of the compass remaining in the same position, diminish the extent of the compass, until the other point touches the parallel, and this extent applied to the divided parallel, will measure 4° 37'; hence, the latitude in, is 32° 25' N.; and a parallel drawn through 32° 25', will intersect the edge of the scale in the place of the ship.

PROBLEM VIII.

Given the Latitude and Longitude sailed from, the Course steered, and Longitude come to; to find the Ship's Place on the Chart.

Rule.—Draw a meridian through the longitude come to; then,

then, lay the edge of a scale over the place sailed from, in the direction of the course, and its intersection with the meridian will be the place of the ship.

Example.—The true course of a ship from Cape St. Bernard, in the island of Bourbon, was N.E. $\frac{1}{2}$ N. and the longitude come to $59^{\circ} 46'$ E. Required the ship's place on the chart?

The edge of a scale laid over Cape St. Bernard, in a N.E. $\frac{1}{2}$ N. direction, will intersect a meridian drawn through the given longitude $59^{\circ} 46'$ E. which will represent the ship's place; the latitude of which is $15^{\circ} 18'$ S.

CHART, *Biographical*, See BIOGRAPHY. See also Flayfair's *Chronology*, p. 247.

CHART, *Chorographic*, is a delineation of particular countries.

CHART, *Heliographic*, a description or delineation of the body of the sun and of the maculæ or spots observed on it.

CHART, *Historical*. See HISTORY.

CHART, *Selenographic*, a representation of particular appearances of the spots of the moon, or of her appearance and maculæ.

CHART, *Telegraphic*, a description or delineation of the telegraph on paper.

CHART, *Topographic*, is a specific delineation of military posts and positions in given tracts of country. This ought always to be as correct as possible in regard to their relative distances of the positions and more especially with regard to their relative heights. It is in this respect particularly that military surveys and reconnoissances are defective. The French have formed companies of topographers for the purpose of correctly and expeditiously pointing out to generals and other commanding officers all the leading points and relative situations of ground and locality. A general, however, should not rely implicitly on their reports or delineations, but ought if practicable to examine the principal positions himself, particularly those that he fixes on for his encampments.

CHARTA primarily signifies a sort of paper made of the plant papyrus or bibulus.

CHARTA *emporetica*, in *Pharmacy*, &c. a kind of paper made very soft and porous, and used as a filter.

CHARTA, is also used in ancient customs for a charter or deed in writing. See CHARTER.

CHARTA *de foresta*. See CHARTER of the forest.

CHARTA *magna*, the great charter, is an ancient instrument, containing several privileges, and liberties, granted to the church and state, by Edward the Confessor, together with others relating to the feudal laws of William the Conqueror, granted by Henry I., all confirmed by the succeeding princes about thirty times. See MAGNA *charta*.

CHARTA *mercatoria*, a charter or declaration of protection and privileges granted to foreign merchants, first published by Edward I. in 1203; who also ascertained the customs or duties, which those foreign merchants, in return for the said charter, were to pay on merchandize exported and imported. Upon the grounds of this famous charter, historians agree that this king was the first who established the great customs on merchandize. This charter was confirmed by Edward III. in 1328.

CHARTA *pardonationis se defendendo*, is the form of a pardon for a person's killing another man in his own defence.

CHARTA *pardonationis utlogaria*, is the form of a pardon of a man who is outlawed.

CHARTA *simplex*, is a single deed, or deed-poll. See DEED.

CHARTA, in *Ancient Geography*, a place of Asia in Mesopotamia, where the Romans had a garrison.—Also, a town of Palestine, mentioned in the book of Joshua as belonging to the tribe of Zebulun; it was granted to the Levites of the family of Merari.

CHARTAGNE, in *Military Language*, a solid retrenchment almost always withdrawn from the enemy's view, that is thrown up in a wood or forest for the defence of an important pass.

CHARTAIA, in *Ancient Geography*, a large and rich town of Asia, situated to the east of Hircania.

CHARTAN, a town of Palestine, in the tribe of Nephtali. It was granted to the Levites of this tribe, who were of the family of Gershon.

CHARTANI, a people of Africa, placed by Ptolemy in Libya near Egypt.

CHARTARIUS, the same with CHARTOPHYLAX.

CHARTEL. See CARTEL, CHAMPION, COMBAT, DUEL, &c.

CHARTER, *Charta*, in *Law*, an instrument or written evidence of a thing under the seal of a prince, lord, church, chapter, or community.

The word charter comes from the Latin *charta*, anciently used for a public or authentic act; from *Χαρτεν*, thick paper or pasteboard, whereon public acts were used to be written.

Brañon says, donations are sometimes made in charters, in *perpetuum rei memoriam*; and Brutton, in his 39th chapter, divides charters into those of the king and those of private persons.

CHARTERS of *community*, were certain privileges first obtained by violence, or purchase, and afterwards freely bestowed by emperors, kings, and barons; whereby the inhabitants of towns and cities were enfranchised, all marks of servitude abolished, and these cities, &c. were formed into corporations and bodies politic, to be governed by a council and magistrates of their own nomination. The first person who conferred these privileges, was Lewis the Gros in France, about the beginning of the twelfth century; and his example was soon very generally followed. These charters convey a very striking representation of the wretched condition of cities previous to the institution of communities, when they were subject to the judges appointed by the superior lords of whom they held, and had scarcely any other law but their will. Each concession in these charters must be considered as a grant of some new privilege which the people did not formerly enjoy, and each regulation as a method of redressing some grievance under which they formerly laboured. The charters of communities contain likewise the first expedients employed for the introduction of equal laws and regular governments. For an account of the most important articles in these charters ranged under the two general heads, of such as respect personal safety, and such as respect the security of property; See Robertson's Ch. V. vol. i. p. 348. &c. See CITIES.

Among royal charters granted to communities, it appears that in the reign of Edward IV. by his letters patent under the great seal of his realm of England, bearing date the 24th of April, 1469, in the ninth year of his reign, this prince, did "for him and his heirs, give and grant licence unto Walter Holiday, Marshall, John Cuff, and Robert Marshall, Thomas Grane, Thomas Calthorne, William Cliff, William Chillian, and William Eynesflam, then mistrels of the said king, that they by themselves should be in deed and name one body and cominality, perpetual and capable in the law, and should have perpetual succession; and that as well the mistrels of the said king, which then were, as other mistrels of the said king and his heirs which should be afterwards,

wards, might at their pleasure, name, chuse, and ordaine, and successively constitute from among themselves, one marshall, able and fit to remain in that office during his life, and also 2 wardens every year to govern the said fraternity and guild."

The original charter is preserved in Rymer's *Fœdera*, tom. xi. *Pro fraternitate ministrorum regis*. James the First, upon what beneficial principle it is now difficult to discover, by letters-patent incorporated the musicians of the city of London into a company, and they still continue to enjoy privileges in consequence of their constituting a fraternity and corporation; bearing arms azure, a swan argent, within a tressure counter-flure; or, in a chief, gules, a rose between two lions, or: and for their crest the celestial sign Lyra, called by astronomers the Orphean Lyre. Unluckily for the *bons-vivans* of this tuneful tribe, they have no hall in the city for festive delights! However, on days of great *gourmandise*, the members of this body are generally too busily employed in exhilarating others, comfortably to enjoy the fruits of good living themselves. And here historical integrity obliges us to say, that this company has ever been held in derision by real professors, who have regarded it as an institution as foreign to the cultivation and prosperity of good music, as the train bands to the art of war. Indeed the only uses that have hitherto been made of this charter seem the affording to aliens an easy and cheap expedient of acquiring the freedom of the city, and enabling them to pursue some more profitable and respectable trade than that of fiddling; as well as empowering the company to keep out of processions and city feasts every street and country dance player of superior abilities, to those who have the honour of being styled the waits of the corporation.

The charter granted by Charles I. to the musicians of the city of Westminster, had lain dormant from that time till the restoration; but immediately after that event, the persons named in it, who were still living, determined to rescue music from the disgrace into which it had fallen, and exert their authority for the improvement of the science, and interest of its professors. Fifty-two musicians, consisting of the king's band and other professors, natives and foreigners, the most eminent of the time, were enrolled in this charter as the king's musicians; "and all such as are, and shall be the musicians of his majesty, his heirs and successors, shall from henceforth for ever, by force and virtue of the said grant, be a body corporate and politic, in deed, fact, and name."

The other powers granted by this charter, allowed the corporation to meet from time to time, in order to make bye-laws and impose fines on such as transgressed them, "which fines they shall have to their own use."

In pursuance of these powers, the corporation hired a room in Durham Yard, in the Strand, within the city and liberty of Westminster. Their first meeting was on the 22d day of October, 1661, Nicholas Lanier then being marshall; from which day they proceeded to make orders, summoning, fining, and prosecuting the first professors who dared "to make any benefit or advantage of musique in England or Wales," without first taking out a licence from their fraternity. Among the instances of the exercise of their power, Jan. 13th, 1663, it was "ordered that Matthew Lock, Christopher Gibbons, Dr. Charles Colman, and William Gregory, do come to the chamber at Durham Yard, on Thursday next, at two of the clock in the afternoon, and bring each of them ten pounds, or shew cause to the contrary."

This seems to have been one of the most oppressive and unmeaning monopolies with which the Stuarts had long vexed the nation. Such a tyranny as this over the professors of a liberal art, there is reason to fear, would be abused in

whatever hands it was lodged. The College of Physicians, which superintends the disquisitions of life and death, may have its life by preventing or detecting *Charlatanerie*; but that the minister of our innocent amusements should be subject to any other controul than that which the common law of the realm is empowered to exercise over men of all ranks and degrees in the state, seems at best but a wanton and useless, if not a noxious delegation of power, which was less likely to benefit the public, or accelerate the progress of the art, than to enable artists to torment and harass each other.

It appears by the transactions of this corporation, the minutes of which are extant in the British Museum among the Harleian MSS. No. 1911, that the meetings of its members continued no longer than 1679; when finding themselves involved in law suits and incapable of enforcing the power they assumed, and penalties they threatened, it was thought most advisable to leave the art and artists to the neglect or patronage of the public.

The fund for the support of decayed musicians or their families, established in 1738, and formed into a regular society of musicians, after the commemoration of Handel, in 1784, having been honoured by his majesty's immediate countenance and protection, and graciously allowed to assume the title of Royal Society of Musicians, had a charter granted them. See *Commentation of HANDEL*, and *FUND for decayed Musicians and their families*.

CHARTER of the forest, is that wherein the laws of the forest are comprised and established. In the time of king John, and that of his son, Henry III. the rigours of the feudal tenures and the forest laws were so warmly maintained, that they occasioned many insurrections of the barons or principal feudatories; which at last produced this effect, that first king John, and afterwards his son, consented to the two famous charters of English liberties, *magna carta*, and *carta de foresta*. The latter, in particular, was well calculated to redress many grievances and encroachments of the crown in the exertion of forest law. This charter, as well as the other, was established, confirmed, and settled in the reign of Edward I. See *FOREST*.

CHARTER, Great, Magna charta. See *MAGNA charta*.

CHARTERS of immunity or franchise, were granted to some towns and villages by the lords on whom they depended, long before the institution of communities in France. But these are very different from such as became common in the 12th and 13th centuries. They did not erect these towns into corporations; they did not establish a municipal government; they did not grant them the privilege of bearing arms; they contained nothing more than a manumission of the inhabitants from the yoke of servitude; an exemption from certain services which were oppressive and ignominious; and the establishment of a fixed tax or rent which they were to pay to their lord in lieu of impositions which he could formerly lay upon them at pleasure. Two charters of this kind to two villages in the county of Rouffillon, one A. D. 974, the other A. D. 1025, are still extant. Such concessions, it is probable, were not unknown in other parts of Europe, and may be considered as a step towards the more extensive privileges conferred by Lewis the Great on the towns within his domains. See *CHARTERS of community*.

CHARTERS of the king, are those whereby a king makes a grant to a person or community; v. gr. a *charter of exemption*, that a person should not be impanelled on a jury, &c. See *LETTERS patent*.

CHARTER of pardon, is that whereby a person is forgiven a felony, or other offence against the king's crown and dignity, of which there are several sorts. See *PARDON*.

CHARTERS

CHARTERS of private persons, are deeds and instruments for the conveyance of lands, &c. And the purchaser of lands shall have all the charters, deeds, and evidences as incident to the same, and for the maintenance of his title. Co. Litt. 6. Charters belong to a feeoffee, although they be not sold to him, where the feeoffee is not bound to a general warranty of the land; for there they shall belong to the feoffor, if they be sealed deeds or wills in writing; but other charters go to the tenant. Moor. Ca. 687. The charters belonging to the feoffor, in case of warranty, the heir shall have, though he hath no land by descent, for the possibility of descent after. 1 Rep. 1.

CHARTER governments in the British colonies, are in the nature of civil corporations, with the power of making bye-laws for their own interior regulation, not contrary to the laws of England; and with such rights and authorities as are specially given them in their several charters of incorporation. The form of government is borrowed from that of England. They have a governor named by the king (or in some proprietary colonies by the proprietor), who is his representative or deputy. They have courts of justice of their own, from whose decision an appeal (as some say, in the nature of a reference by way of arbitration) lies to the king in council here in England. Their general assemblies, which are their house of commons, together with their council of state, being their upper house, with the concurrence of the king, or his representative, the governor, make laws suited to their own emergencies. But it is particularly declared, by stat. 7 and 8 W. III. c. 22. that all laws, bye-laws, usages, and customs, which shall be in practice in any of the plantations, repugnant to any law, made or to be made in this kingdom, relative to the said plantations, shall be utterly void and of none effect. These are called *charter governments*, by way of distinction from the *provincial establishments*, the constitutions of which depend on the respective commissions issued by the crown to the governors, and the instructions attending them; under the authority of which, provincial assemblies are constituted, with the power of making local ordinances, not repugnant to the laws of England; and also from *proprietary governments*, granted out by the crown to individuals, in the nature of feudatory principalities, with all the inferior regalities, and subordinate powers of legislation, which formerly belonged to the owners of counties palatine. See farther Blackstone's Comm. vol. 1. p. 108.

CHARTERER is in some places, as Cheshire, used for a freeholder.

CHARTER-HOUSE. See CHARTREUSE.

CHARTER-LAND, in *Law*, is such as a man holds by charter, that is, by evidence in writing; otherwise called freehold. This the Saxons called *bock land*; which Lambard renders, *terra ex scripto*. See BOCK-LAND.

It was held on more easy conditions than the folk-land, or *terra sine scripto*, held without writing: the former being *hereditaria libera & immunis*; whereas the latter *consuetudinibus annuum, atque officiorum quadam servitute erat obligatus*. This kind of land was held by deed under certain rents and free services, and in effect was in no respect different from free socage lands; and hence have arisen most of the freehold tenants who hold of particular manors, and owe suit and service to the same.

CHARTERPARTY, in *Commerce*, denotes the instrument of freightage, or articles of agreement for the hire of a vessel. This, among merchants and sea-faring men, is commonly called "a pair of indentures," containing the covenants and agreements made between them, touching their merchandize and maritime affairs. 2 Inst. 673.

The charterparty is in writing; and it is to be signed both by the proprietor, or the master of the ship, and the merchant who freights it.

The charterparty is to contain the name and the burden of the vessel; those of the master and the freighter; the price, or rate of freight; the time of loading, and unloading; and the other conditions agreed on.

It is properly a deed, or policy, whereby the master, or proprietor of the vessel, engages to furnish immediately a tight sound vessel, well equipped, caulked, and stopped, provided with anchors, sails, cordage, and all other furniture to make the voyage required, as equipage, hands, victuals, and other munitions; in consideration of a certain sum to be paid by the merchant for the freight. Lastly, the ship, with all its furniture, and the cargo, are respectively subjected to the conditions of the charterparty.

The charterparty differs from a *bill of lading*, in that the first is for the entire freight, or lading, and that both for going and returning; whereas the latter is only for a part of the freight, or at most only for the voyage one way.

The common law contrives charterparties, as near as may be, according to the intention of them, and not according to the literal sense of traders, or those that merchandize by sea: but they must be regularly pleaded. In a case of covenant by charterparty that the ship should return to the river of Thames by a certain time, "dangers of the sea excepted," and afterwards, in the voyage, and within the time of the return, the ship was taken upon the sea by pirates, so that the master could not return at the time mentioned in the agreement: it was adjudged that this impediment was within the exception of the charterparty, which extends as well to any dangers upon the sea by pirates and men of war, as dangers of the sea by ship-wreck, tempest, &c. Stile 132. 2 Rol. Abr. 248. A ship, freighted at a certain premium per month of the time that she shall be out, and covenanted to be paid after her arrival in the port of London, is cast away in coming up from the Downs, but the lading is all preserved; in this case the freight shall be paid, for the money becomes due monthly by the contract, and the place mentioned is only to ascertain where the money is to be paid; and the ship is entitled to wages, like a mariner that serves by the month, whose executors, if he dies in the voyage, are to be answered "pro rata." *Milloy de Jur. Marit.* 260. If a part-owner of a ship refuse to join with the other owners in the fitting out of the ship, he shall not be entitled to his share of the freight; but by the course of the Admiralty, the other owners ought to give security if the ship perish in the voyage, to make good to the owner standing out, his share of the ship. Sir L. Jenkins, in a case of this nature, certified that by the law marine and course of the Admiralty, the plaintiff was to have no share of the freight; and that it was so in all places: for otherwise there would be no navigation. *Lex Mercat. See FRIGHT and INSURANCE.*

The president Boyer says, the word comes from hence, that *per medium charta incidebatur, & sic fiebat charta partita*; because in the time when notaries were less common, there was only one instrument made for both parties: this they cut in two, and gave each his portion, and joined them together at their return, to know if each had done his part. This he observes to have been practised in his time; agreeable to the method of the Romans, who, in their stipulations, used to break a staff, each party retaining a moiety thereof as a mark.

CHARTER-SCHOOLS, are schools in Ireland, of which there are 38, designed for the instruction of the children of the Papists and other poor natives, in the English tongue and the

the principles of morality and true religion; besides two called the "Ranelagh Schools," which admit only the children of Protestants. The excellent Mr. Howard, in his journey to Ireland, examined the state of these schools, and made a report upon them to the committee of the House of Commons in 1788. He has given a particular account of them, with appropriate remarks in his "Account of the principal Lazarettos in Europe," &c. p. 101, &c. See SCHOOL.

CHARTIER, ALAIN, in *Biography*, a native of Bayeux, one of the first French citizens who aspired to elegance, flourished about the year 1430. He was secretary to the kings Charles VI. and VII. and employed in several embassies. His compositions in prose exceeded those that were poetical, and he spoke as well as he wrote, so that he was esteemed the father of French eloquence. The following curious anecdote relating to him is recorded. Margaret of Scotland, first wife to the dauphin, afterward Lewis XI., as she passed through the Louvre, observed Alain asleep, and went and kissed him. When her attendants expressed their surprize that she should thus distinguish a man remarkable for his ugliness, she replied, "I do not kiss the man, but the mouth that has uttered so many charming things." His works were published by the elder Du Chesne, in 1617, in 4to.: the first part consisting of his works in prose, viz. the "Curial," a "Treatise on Hope," the "Luadilogus Invecitif" against Edward III.; and others, partly spurious; and the second part containing his poems, which are, for the most part, obscure and tedious. Alain Chartier died at Avignon in 1449. *Nouv. Dict. Hist.*

CHARTIER, JOHN, brother of the preceding, was a Benedictine monk, and chanter of St. Denys. He was the author, at least the compiler, of a dry work, displaying much credulity and inaccuracy, entitled the "Great Chronicles of France," commonly called "Chroniques de St. Denys," from Pharamond to the death of Charles VII., 3 vols. fol. Paris, 1493. His "History of Charles VII.," was published at the Louvre, in 1651, fol. by the learned Godefroid, who enriched it with his notes and several unedited pieces. *Nouv. Dict. Hist.*

CHARTIER, RENÉ, born at Vendome, where he received the rudiments of his education. He was sent thence to Paris, and having completed his studies, was made doctor in medicine on the 14th of August 1608. He was soon after appointed by the faculty of medicine professor in surgery and pharmacy. In 1612, he was made physician in ordinary to the king, and to the princesses of France. With one or other of the princesses, in their turn, he visited the courts of Spain, Savoy, and England. Returning at length, and settling at Paris, his whole time seems to have been employed in forming the splendid edition of the works of Hippocrates and Galen, which goes under his name, and in which he is said to have expended so large a sum of money, (cinquante mille ecu, his biographer says) as to reduce himself nearly to a state of indigence. The work is printed in 13 volumes, though usually bound in 9, and the volumes came out at different times, but not in the order of their numbers. Of the ten volumes, which were published in the life-time of the editor, the first six, the eighth, and the thirteenth, appeared in the year 1639, the seventh and the eleventh ten years after, viz. in 1647; the ninth, the tenth, and the twelfth volumes, which completed the work, were printed under the care and direction of doctors Blondel and Le Maine, and did not appear until the year 1672. Though the editor spared neither labour nor expence in his endeavours to give perfection to the work, and has arranged his materials to that any of the treatises, by either writer, may

be turned to with facility; yet in the opinion of Freund, and Mack, to which Haller also accedes, the works of Hippocrates, as here exhibited, are more imperfect than in some earlier editions.

Chartier also edited "Ludovici Dureti Scholia ad Jacobi Hallerii Librum, de M rbis internis," Parisiis, 1611, 4to. "Bartholomai Perdulcis, Univerfa Medicina," ibidem, 1630. 4to. His son John, who was created doctor in medicine in 1634, published, translated from the Greek, "Palladii de Febribus, publica Synopsis," 1646, 4to., and in 1651, "La Science du Plomb sacra des Sages, ou de l'Antimoine, ou font decrites ses rames et particulieres virtus, puiffances, et qualitez," 4to. This work gave great offence; the faculty of medicine at Paris, with Guy Patin at their head, being particularly hostile to antimonial medicines. To ridicule their foolish prejudices, Chartier placed at the head of his book the figure of an owl, with the following lines:

"Le hibou fuit la clarte vivifique
Et bien qu'il ait lunettes et flambeaux,
Il ne peut voir les secret les plus beaux
De l'antimoine, et du vin emetique."

John Chartier was also professor in surgery, and physician in ordinary to the king, in which honour he was succeeded by his younger brother Philip, who was created doctor in medicine in the year 1656. *Haller Bib. Med. Eloy Dict. Hist.*

CHARTIER, in *Geography*, a township of America, in the county of Washington and state of Pennsylvania.

CHARTIER, ST. a town of France, in the department of the Indre, and district of La Châtre; $\frac{1}{2}$ league N. of it.

CHARTIER'S CREEK. See CANONSBRAY and MORGANZA.

CHARTIS *reddendis*, a writ which lay against him that had charters of feoffment intrusted to his keeping, and refused to deliver them to the owner. *Reg. Orig.* 159.

CHARTOPHYLACIUM, a place where records were kept.

CHARTOPHYLAX, an officer in the church of Constantinople, intrusted with the custody of the archives.

The word is formed from *χαρτα*, and *φυλαξ*, *custodius*; and signifies *charter-keeper*.

Codin calls the *grand chartophylax* the judge of all causes, and the right arm of the patriarch. He adds, that he was the depositary or keeper of all the *charters* relating to the ecclesiastical rights; and that he presided over matrimonial causes, and was judge of all the clergy. He drew up all sentences and decisions of the patriarch, who signed and sealed them: he presided in the grand council of the patriarch: he took cognizance of all matters and causes ecclesiastical and civil, whether among the clergy, the monks, or the people.

He took place of all the bishops, though himself only a deacon; and, on occasion, discharged the functions of the priests: he had twelve notaries under him.

The chartophylax was much the same at Constantinople with the *chartulary* at Rome.

There were, in reality, two officers who bore this title; the one for the court, the other for the patriarch; the first was called also *registiator*, and the latter *scriiniarius*: though the two are usually confounded together. Leuloclavius, and others, confounded *chartophylax* with *chartulary*.

CHARTRAIN, in *Geography*, a small county of France, so called before the revolution, in the environs of Chartres, its capital.

CHARTRE, LA, a town of France, in the department of the Sarthe, and chief place of a canton in the district of St. Calais; two leagues E.N.E. of Chateau-du-Loir. The place

place contains 1751 and the canton 10,152 inhabitants: the territory includes 1,5 kilometres and 9 communes.

CHARTRES, a city of France, and principal place of a district in the department of the Eure and Loire, one of the most ancient towns of the country, and before the revolution, the see of a bishop, suffragan of Paris. Its cathedral is esteemed one of the most beautiful churches in the kingdom. It is situated on the Eure, over which is a bridge, constructed by the celebrated Vauban. Its principal trade is in corn. The place contains 14,400, the north canton 16,783, and the south canton 16,321 inhabitants: the territory includes 467½ kilometres and 35 communes. N. lat. 28° 46' 49". E. long. 1° 28' 55".

CHARTRES, a fort built by the French on the eastern side of the Mississippi, three miles northerly of La Prairie du Rocher, or the Rock-Meadows, and 12 miles northerly of St. Genevieve, on the western side of that river. It became untenable on account of the constant washings of the high floods of the Mississippi, and was abandoned in 1772. South of the fort is a village which was very inconsiderable in 1778; above this is another village, settled by 170 warriors of the Porias and Mitchigamias tribes of Illinois Indians, who are idle and debauched.

CHARTREUSE, a celebrated monastery of Carthusians; so called from the name of a steep rocky place, in a frightful desert, five leagues from Grenoble in France; where St. Bruno retired from the world, and first instituted the order of *Carthusians*, which see.

The name has since passed to all houses of Carthusians; and that near Grenoble is now distinguished by the name of the *Great Chartreuse*.

That of London, corruptly called *Charter-house*, was before the suppression of monasteries by Henry VIII. a priory belonging to that order, and from the powers by which it was first erected into an hospital, it was denominated "The Hospital of king James." On occasion of a dreadful plague which filled all the common burial grounds with the dead, Walter de Manny, a Flemish nobleman, purchased in 1349, of the master and brethren of St. Bartholomew's Hospital in Smithfield, 13 acres and a rod of land, denominated "The Spital Croit," and appropriated the same, after it had been inclosed and consecrated, as a common cemetery for the accommodation of such deceased persons as could not have place in their respective parish grounds. A chapel was also erected in the said cemetery by the right honourable proprietor, in which many liberal oblations were made for several successive years. In 1371, Manny founded in this place a Carthusian monastery; and the revenues of this convent amounted, at the time of its suppression in 1538, to 642*l.* 4*s.* per annum, which was conferred upon Sir Thomas Audley, speaker of the House of Commons, and from him descended to Thomas, earl of Suffolk, who disposed of it to Thomas Sutton, esq. by the name of "Howard-house," commonly called the "Charter-house," consisting of divers courts, a wilderness, orchards, walks, and gardens, &c. for which he paid the sum of 13,000*l.* in 1611. By letters patent obtained in this year, the hospital was established, and confirmed by parliament, in 1628.

The charge of the establishment for the admission of pensioners and scholars, together with the original purchase-money, amounted to 20,000*l.* Besides this sum, Sutton endowed his hospital, called "Sutton's Hospital," with 15 manors, and other lands, to the amount of 4493*l.* 19*s.* 10½*d.* per annum. After considerable losses, which this hospital sustained in 1623, 1624, and 1649, Sir Richard Sutton, one of the founder's executors, improved the estate belonging to the foundation to much, that in the year 1673, it amounted

to 5391*l.* 13*s.* 8*d.* yearly. It has since amounted to about 12,000*l.* This establishment is to consist of decayed gentlemen, soldiers, and merchants; eighty of whom have a plentiful maintenance of diet, lodging, and instead of apparel, a gown once in two years, and 1*l.* per annum, physic, &c. living together in a collegiate manner: and of scholars, or youths, forty of whom are taught, and supplied with necessaries, and such of them as are fit for the university sent thither, with an exhibition of 40*l.* per ann. for the first four years, and 60*l.* for the four last, on condition of constant residence, viz. eight months in the year; the rest are put to trades, with a premium of 40*l.* each. As a farther encouragement to the scholars brought up in this foundation, there are several ecclesiastical preferments in the patronage of the governors, who, according to the constitutions of the hospital, are to confer them upon those that were educated in this school.

For the superintendency of this hospital there are sixteen governors, generally of the prime quality; vacancies being supplied by the election of the remaining governors. The ordinary officers are, a master, preacher, registrar, treasurer, school-master, &c.

CHARTREUX, religious of the order of St. Bruno, called also *CARTHUSIANS*.

CHARTREUX, *poudre des*. See *KERMES mineral*.

CHARTULARY, *Chartularius*, a title given to an ancient officer in the Latin church, who had the care of charters and papers relating to public affairs.

The chartulary presided in ecclesiastical judgments, in lieu of the pope.

In the Greek church, the chartulary was called *chartophylax*; but his office was there much more considerable; and some even distinguish the *chartulary* from the *CHARTOPHYLAX* in the Greek church.

CHARUS, in *Ancient Geography*, a river of Asia, in that part of the Colchide which was to the right of the Phasis. Strabo says, that the town of Sebastopolis or Dioscuria, was situated near this river.

CHARWELL, in *Geography*, a river of England, which runs into the Thames, at Oxford.

CHARYBDIS, a supposed whirlpool in the strait of Messina, between the coast of Calabria and that of Sicily, and thought in ancient times to be very dangerous to navigators. According to the fables of the poets, Scylla (which see) and Charybdis were two sea-monsters, whose dreadful jaws were continually dislended to swallow unhappy mariners; the one situated on the right, and the other on the left extremity of the strait of Messina, where Sicily fronts Italy. Thus Virgil describes them:

"Dextrum Scylla latus, levum implacata Charybdis
Obidet, atque imo barathri ter gurgite vastos
Sorbet in abruptum fluctus, rursusque sub auras
Erigit alternos, et sidera verberat unda:
At Scyllam cæcis cohibet spelunca latebris
Ora exertantem, et naves in saxa trahentem.
Prima hominis facies et pulchro pectore virgo
Pube tenus; postrema immani corpore pridis
Delphinium caudas utero commissa luperum."

Æn. lib. iii.

"Far on the right her dogs foul Scylla hides;
Charybdis roaring on the left presides,
And in her greedy whirlpool sucks the tides.
Then spouts them from below; with fury driv'n
The waves mount up, and wash the face of heav'n.
But Scylla from her den, with open jaws,
The sinking vessel in her eddy draws,

Thea

Then dashes on the rocks : a human face,
And virgin bosom, hide her tail's disgrace ;
Her parts obscure below the waves descend,
With dogs inclos'd, and in a dolphin end." Dryden.

Charybdis is situated within the strait, in that part of the sea which lies between a projection of land named "Punta Secca," and another projection on which stands the tower called "Lanterna," or the light-house ; a light being placed at its top to guide vessels which may enter the harbour by night. The ancient and modern authors who have written concerning Charybdis, have all (Spallanzani excepted) supposed it to be a whirlpool. Homer is the first writer who has represented Charybdis as a monster which three times in a day drinks up the water, and three times emits it forth.

— δια Χαρυβδίδος ἀναγέρουσι μέλαινα ὕδαρ,
Τρις μὲν γὰρ τ' ἀνοίσι ἐν' ἡμέλῃ, τρις δ' ἀναγέρουσι
δαίσι." Hom. *Odyss.* xii.

Behemoth Charybdis holds her hoisterous reign
'Midst roaring whirlpools, and absorbs the main :
Thrice in her gulphs the boiling seas subside,
Thrice in dire thunders she refunds the tide. Pope.

The description of Virgil, above cited, differs from that of Homer only in placing a deep gulph below. Strabo, Hicodorus, Tzetzes, Helychius, Didymus, Eustathius, &c. concur in the same opinion. The Count de Buffon adopts the idea of Homer in full confidence, and places Charybdis among the most celebrated whirlpools of the sea. "Charybdis," says he, "absorbs and rejects the water three times in 24 hours." Strabo tells us, (ib. vi.) that the fragments of ships swallowed up in this whirlpool are carried by the current to the shore of Taorminum (the present Taormina) 30 miles distant from Charybdis. In confirmation of this tradition, an amusing though tragical anecdote is related of one Colas, a Messinean diver, who had acquired, from his being able to remain a long time under water, the surname of "Pescè" the fish. It is reported, that Frederic, king of Sicily, who came to Messina on purpose to see him, tried his abilities by throwing a golden cup into Charybdis, which, if he brought up, was to be the reward of his resolution and dexterity. The hardy diver, after having twice astonished the spectators by remaining for a long time under water, plunged into it a third time and appeared no more : but, some days after, his body was found on the coast near Taormina. Spallanzani determined to investigate, by his own observation, the truth of the opinion which had been entertained with respect to Charybdis.

It is distant from the shore of Messina about 750 feet, and is called by the people of the country "Calofaro," from *καλος* and *φάρος*, i. e. "the beautiful tower," from the light-house erected near it for the guidance of vessels. The phenomenon of the Calofaro is observable when the current is descending ; for when the current sets in from the north, the pilots call it the "descending rema," or current ; and when it runs from the south, the "ascending rema." The current ascends or descends at the rising or setting of the moon, and continues for 6 hours. In the interval between each ascent or descent there is a calm which lasts at least a quarter of an hour, but not longer than an hour. Afterwards at the rising or setting of the moon, the current enters from the north, making various angles of incidence with the shore, and at length reaches the Calofaro. This delay sometimes continues 2 hours. Sometimes it immediately falls into the Calofaro, and then experience has taught that

it is a certain token of bad weather. Spallanzani, apprised by the pilots that there was no danger in visiting the Calofaro, approached it in a bark managed by some expert mariners, who assured him of his safety. When he observed Charybdis from the shore, it appeared like a group of tumultuous waters, which became more excessive and more agitated in his near access to it : but upon being carried to the edge he was convinced that what he saw was by no means a vortex or whirlpool. Hydrologists teach us, that by a whirlpool in a running water we are to understand that circular course which it takes in certain circumstances ; and that this course or revolution generates in the middle a hollow inverted cone, of a greater or less depth, the internal sides of which have a spiral motion. But nothing of this kind was perceived in the Calofaro. Its revolving motion was circumscribed within a circle of at most 100 feet in diameter, within which limits there was no incurvation of any kind, nor vertiginous motion, but an incessant undulation of agitated waters, which fell, beat, and dashed against each other. Yet these irregular motions were so far placid that nothing was to be feared in passing over the spot ; though his little bark rocked very much from the continual agitation ; so that the mariners were obliged constantly to make use of their oars to prevent its being driven out of the Calofaro. Substances thrown into the stream that were heavier than the water, sunk and were no more seen ; those which were lighter remained on the surface, but were seen driven out of the revolving circle by the agitation of the water. Spallanzani, thus convinced that there was no gulph under the Calofaro, because in that case there would have been a whirlpool, which would have carried down into it the floating substances, founded the bottom with a plummet, and found that its greatest depth did not exceed 500 feet. From these facts he concluded, that at the time of his observation, there was no whirlpool in Charybdis ; though it might have been different when the sea was tempestuous. In order to satisfy himself concerning this circumstance, he questioned the pilots who had frequently seen Charybdis in its greatest fury, and obtained from them the following account : When the current and the wind are contrary to each other, and both in their greatest violence, especially when the south wind blows, the swelling and dashing of the waves within the Calofaro are much more impetuous and extensive. It then contains three or four small whirlpools, or even more, according to the degree of its extent and violence. If at this time small vessels are driven into the Calofaro by the current or the wind, they are seen to whirl around, rock, and plunge ; but are never drawn into the vortex. They merely sink when filled with water by the waves beating over them. When vessels of a larger size are forced into it, whatever wind they have they cannot extricate themselves ; their sails are useless ; and after having been for some time tossed about by the waves, if they are not assisted by the pilots of the country, who know how to bring them out of the course of the current, they are furiously driven upon the neighbouring shore of the Lanterna, where they are wrecked, and the greater part of their crew perish in the waves. Spallanzani having evinced the erroneoussness of the opinion with respect to Charybdis, that has been transmitted from Homer to the present time, further observes, that Homer was not exact with regard to the situation of Charybdis. The ancient poet, probably misled by the account which he had received from others, and not having had an opportunity of observing it himself, places Charybdis near Scylla : the distance from one of these rocks to the other, being an arrow's flight, which does not at all accord with the present situation

of Scylla. Although within the present century the strait of Messina has become narrower, yet we know from various and unquestionable testimonies that, long before this event, Charybdis was situated where it is at present, on the side of Sicily, a little beyond Messina. Our ingenious writer proceeds to inquire what foundation there is for the proverbial saying,

“Incidit in Scyllam, cupiens vitare Charybdin:” i. e. he who endeavours to avoid Charybdis, dashes upon Scylla; which proverb was applied by the ancients to those who, while they sought to shun one evil, fell into a worse. The Messinese pilots informed him, that this misfortune, though not always, yet frequently happens, unless proper measures are taken in time to prevent it. If a ship be extricated from the fury of Charybdis, and carried by a strong southerly wind along the strait, towards the northern entrance, it will pass out safely; but should it meet with a wind in a nearly opposite direction, it will become the sport of both these winds, and, unable to advance or recede, be driven in a middle course between their two directions, that is, full upon the rock of Scylla, if it be not immediately assisted by the pilots. They added, that in these hurricanes a land wind frequently rises which descends from a narrow pass in Calabria, and increases the force with which the ship is impelled towards the rock. If it be asked, how it happens that Scylla and Charybdis are now less dangerous than they were in former times, as Scylla still remains such as it was in the time of Homer, and Charybdis must at present be more perilous because the strait of Messina is become narrower; the answer is, that the difference arises from the improvement of the art of navigation which, formerly in its infancy, dared not launch into the open sea, but only ventured to creep along the shore; but time, study, and experience, have rendered her more mature, better informed, and more courageous; so that she can now pass the widest seas, brave the most violent tempests, and laugh at the fears of her childhood. See Spallanzani’s Travels in the Two Sicilies, vol. iv. Thucydides (lib. xi.), and some other approved historians, use the term Charybdis to signify the whole strait betwixt Sicily and Calabria.

CHARYBDIS, a place of Syria, between Antioch and Apamea. Strabo says, that the river Orontes is lost in this place, and that it rises again to view about 40 stadia below it.

CHARYBDIS is also a word used by Dr. Plott to express certain openings which he supposes in the bottom of the sea, by which its waters are received and conveyed by a subterranean circulation to the origin of fountains and springs. The *fluxus mofchonicus*, or *maalfrome* on the coast of Norway, is supposed to be owing to some such subterranean draught; and it is advanced also, that the Mediterranean sea could not be emptied of the vast quantities of waters which it receives, but must overflow the land of Egypt, unless swallowed by some such *charybdis*, which is either in some part of the basin of that sea, or near the mouth of it; in which case, it may be the occasion of that strong under-current, described by all those who have treated of this sea. An immense *charybdis*, placed near the strait’s mouth, may be hid under the immensity of waters there; but as it would absorb the deep waters continually, and that in large quantities, it would necessarily cause such an under-current there. See VAPOUR.

CHARYBDIS, in *Mythology*, was a female robber, who, according to the fable, stole the oxen of Hercules, for which she was struck with a thunder-bolt by Jupiter, and turned into a whirlpool dangerous to strangers.

CHASE, in *Agriculture*, is a word sometimes employed

to denote a row or rank of thorns, &c. Thus, in the planting of quicksets, a single chase signifies a single row; and a double chase a row planted below the first, not immediately underneath the upper plants, but under the middle of intermediate spaces or vacant parts.

CHASE, or *Chace*, in *Law*, is used for a driving of cattle to or from any place; as to a distress, a foistlet, &c.

CHASE, or *Chace*, in a general sense, denotes a great extent of woody ground lying open, and privileged for wild beasts and wild fowl; the beasts of the chase comprehending not only the buck, doe, fox, martin, and roe, but, in a common and legal sense, all the beasts of the forest. Co. Litt. 233. A chase differs from a park in not being inclosed, and also in this particular, that a man may have a chase in another person’s ground, as well as in his own; it being indeed the liberty of keeping beasts of chase or royal game therein, protected even from the owner of the land, with a power of hunting them there. Bl. Comm. vol. ii. 38. But if a man have a chase within a forest, and he kill or hunt any stag, or red deer, or other beasts of the forest, he is finable. 1 Jones’s Rep. 278. A chase is of a middle kind, between a forest and a park; being usually less than a forest, and not possessed of so many privileges; but wanting, v. gr. courts of attachment, swainmote, and justice-feat. Yet it is of a large extent, and stocked both with a greater diversity of wild beasts, or game, and more keepers, than a park. Crompton observes, that a forest cannot be in the hands of a subject, but it forthwith loses its name, and becomes a chase; in regard all those courts lose their nature when they come into the hands of a subject; and that none but the king can make a lord chief justice in the eyre of the forest.

By the common law, no person is at liberty to take or kill any beasts of chase, but such as hath an ancient chase or park; unless they be also beasts of prey.

Yet the same author adds, that a forest may be granted by the king to a subject, in so ample a manner, as that there may be courts equivalent to a court of attachment, swainmote, and justice-feat. It is not lawful to make a chase, park, or warren, without licence from the king under the broad seal. See FOREST, GAME, and PARK.

CHASE, *beasts of*. See BEASTS.

CHASE, or *Chace*, *wild geese*, a term used to express a sort of racing on horse-back, used formerly, which resembled the flying of wild geese, those birds generally going in a train one after another, not in confused flocks as other fowls do. In this sort of race, which is never used except in *matches*, the two horses, after running twelve score yards, had liberty, which horse soever could get the leading, to ride what ground the jockey pleased, the hindmost horse being bound to follow him within a certain distance agreed on by articles, or else to be whipped in by the tryers or judges who rode by; and whichever horse could distance the other, according to the interval settled when the match was made, won the race. If the horse which at the beginning was behind, can get before that which first led, then he is likewise bound to follow, till he can either get before, or else the match be lost or won. This sort of racing was not long in common use, for it was found inhuman and destructive to good horses, when two such horses were matched together. For in this case neither was able to distance the other, until they were both ready to sink under their riders, and often two very good horses were both spoiled, and the wagers forced to be drawn at last. The mischief of this sort of racing soon introduced the method now in use, of running only a certain quantity of ground, and determining the plate or wager, by the coming in first at the post. It is well known that

this chase still preserves its name in a common proverb, and "that many people follow" it, "without knowing" that they do so.

CHASE, in *Sea-Language*, signifies a vessel pursued by another, apprehended or known to be an enemy. Hence, to *chase* is to pursue a ship; which is called also *giving chase*.

A vessel that chases another ought to have the advantage of sailing; because, if the ship that is chased were as good a sailer as the chaser, she could never come up with her, if they manœuvred equally and at the same time. It is therefore useless to chase a ship, with respect to which you have not the superiority in sailing, unless it be found that she does not know how to take the benefit of her equality. In order to ascertain whether or not your ship sails quicker than your adversary, you must get in the same track, under the same sails, and keep the same course with the vessel you wish to chase, and set her exactly with a compass. If you fail best, the chase will soon be drawn a point more ast; but if she has the advantage, you will in a short time bring her a point farther forward: if you fail equally, she will remain in the point you set her at first.

In chasing at sea, the following rules are to be observed, as the ship that is chased is either to windward or leeward of the chaser. When the chaser is to leeward of the vessel he means to pursue, he ought to veer on the same tack as the enemy, till he brings her to bear exactly perpendicular to his course, if he has not already passed that point: then tack, and continue the second board till he brings the chase again perpendicular to the direction on which he is standing by the wind, and he must then heave about again; always continuing the same manœuvre, by tacking every time he brings the chase perpendicular to his course on either board. In this manner, the chaser will, by the superiority only of his sailing, join the other by the shortest method. You continue on the same tack as the enemy, when first seen, in order to lose no time; because you will always bring the ship you are in chase of right on your beam, when you have a superiority of sailing, whatever may be the tack she is on, provided you are careful not to pass that point; but, if perchance you should, you must get on the other tack with all possible dispatch. The chaser heaves about as soon as the vessel he is in pursuit of is on his beam; because she is, at this time, at the shortest possible distance, if he chases on the same tack, and steers the same course with the vessel chased. If the chaser runs on a different tack from the vessel chased, he is still to tack when the latter is on his beam, because the distance is the least possible between them on the different boards they hold. This mode is preferable to all others; it not only being the shortest, but because you force the chase to fly from you close upon a wind, pressing her more and more from the leeward, by never passing the point at which the distance between the two vessels, in plying to windward, is the shortest possible. The weather ship, which flies, will always be joined by the chaser, since it is granted she does not sail so well as the pursuing vessel. It is therefore her advantage constantly to keep one course, without losing time to heave about, as tacking cannot be so favourable to her as to her adversary, whose sailing is superior. If the chaser should mistakenly stand on a long way, and tack in the wake of the chase, the best thing she can do is to heave in stays, and pass to windward of him on the other tack, unless you suppose your vessel would have a large superiority. If the chaser persists in tacking in the wake of the other ship, the chase will be very much prolonged.

When the ship you wish to chase is to leeward, or when you are to windward of her, keep the ship away, to

cut her off; and, steering continually on that course, you come at last together at the point where the courses run by the two vessels intersect each other. This will be exactly executed by the chasing ship, if, in the course she has chosen, she constantly keeps chase in the same degree of the compass as at the beginning of the pursuit. This principle applies equally to all the courses which the retreating ship steers; for overtaking can only be obtained by keeping in a straight line, which is the shortest possible that can be drawn between any two points. If you take another course than that which keeps you in the same point of bearing you were in with respect to the vessel pursued, at the beginning of the chase, you would fail, by being either too far a-head or too far a-sterm; that is to say, if the chaser keeps his wind too close, he will be too much a-head, and consequently prolong the chase; and, if he keeps too much away, he will be too far a-sterm. These are the only two considerations to be regarded for the performance of this manœuvre; considerations which are easily observed, and corrected with an azimuth compass; for when you see that, at the end of a certain time, you bring the chase more ast than the first point of bearing, it is evident you keep your wind too much; if, on the contrary, you draw her forward, it is a proof that you keep too much away. These errors are easily corrected, by steering, for the first case, so as to see that the chase is always kept exactly on the same degree of the compass; and, for the second, you keep your wind a little more, till you see that you rest in the same point of bearing with respect to one another. Then, it is evident you chase by the shortest and most certain method, since you reach the chase, in running on a straight line.

The vessel that is to leeward, and chased, ought to run in the course that will carry her most immediately from the chaser. Some vessels have greater advantage in going large than others: some with the wind right ast; and others again are to be found which go best close-hauled. Attention should therefore be paid to the known qualities of a ship, in order to take the most advantageous and most convenient directions capable of effecting a retreat. It is however almost certain, that if the chase does not fail at least at an equal rate with the chaser, whatever manœuvre she may practise, she will at length be overtaken by a skilful chaser adhering to principles. If the chase be found right a head, and to the chaser be put to a stern-chase, then the best sailer shall carry it, if there be sea-room and day-light. Being come up close with the chase, endeavour to cross her fore-foot; and by that means you will both hinder her way, and avoid the fury of her ordnance (except those in her chase), and use your own, if required, to more advantage; and that as well your chase-pieces, at your first getting up within reach, as your broad-side and quarter-pieces, as you pass thwart her bow, and scour her decks from stem to stern. If she makes away from you, ply your guns, as many as possible, at her sails, yards, masts, and general tackling; and, being near, spare not your chase-shot, or cross-bar-shot, to make the greater damage.

CHASE, stern, is when the chaser follows the chased a-sterm, directly upon the same point of the compass.

To lie in a ship's fore-foot in a chase, is to sail, and meet with her by the nearest distance, and so to cross her in her way, or to come across her fore-foot.

A ship is said to have a *good chase*, when she is so built forward on, or a-sterm, that she can carry many guns to shoot forwards, or backwards; according to which, she is said to have a *good forward*, or *good stern-chase*.

CHASE-guns, are such whose ports are either in the head called *bow-chases* (and then they are used in chasing of others);

or in the stern, called *stern-chafes*, which are only useful when they are pursued or chased by any other ship.

CHASE of a gun. See CANNON.

CHASE *astragal, fillets, and girde*. See CANNON.

CHASE-LAND, in *Agriculture*, is such sort of waste land as was formerly in the state of chafe. There are still large tracts of this sort of land in different parts of the kingdom, though much within these few years has been cleared and brought into a state of cultivation. It has been observed by the author of the Middlesex Agricultural Report, in speaking of a tract of this sort of land, in the vicinity of London, that has lately been attempted to be brought into a state of improvement, that it abounded with trees and rushes, which rendered it necessary for the cultivators to dig up the soil and stock out the roots, before any of the ordinary operations of husbandry could take place. These were works which not only required, he says, much labour to effect, but also a very large expediture of money, for which there was no immediate prospect of return. Oats was the only article which found a ready sale. The very unusual and extraordinary supply of stack-wood and bawns, to far exceeded the demands for these articles, that the price fell far below the woodman's labour. Inexperienced farmers became alarmed at these circumstances, and in consequence set themselves about trying confined, partial, and penurious, experiments, certainly very ill-calculated to succeed on a raw crude soil, which had from the earliest ages been shut up by a thick foliage in an excess of damp, excluded from the benign influence of the solar rays, and every other power of evaporation. It is added, that the wood in the first instance, being only cleared away from small patches of land at a time, such cleared ground was necessarily still left surrounded on all sides by woods, which by the redundancy of damp they occasioned, continued the disorder under which the soil naturally laboured. Again, the stocking up the roots, and digging the soil, as before-mentioned, would unavoidably bury a great part of the surface mould, which was by much the best, and in its stead turn up a worthless clay, a perfect enemy to the whole vegetable world: or at least it would mix so much bad soil with the small portion of good, as to produce together a new surface, certainly much inferior to the one destroyed by this operation. It ought not therefore, he thinks, to excite surprise, that, "under all these disadvantages, the soil should, as it were suddenly and reluctantly, yield back again even so much as the seed sown. In fact, it could not otherwise happen till such time as the woods being more generally cleared, the superabundant water drained off, and the excessive damps evaporated, the soil should obtain a proper degree of dryness. Nor even then could great returns be expected, without the application of some stimulating ingredient, as turf-ashes, lime, marl, &c. to correct the natural acidity and crudeness of the soil. But in order to make it permanently productive, manure should have been dealt with a liberal hand.

At length, however, the fire-wood being grubbed, and marketed in less quantities, increased its price; and by the money it produced opened the way for a more extended clearing of the soil. The half-yard wood, which was originally given as a recompence to the labourer for clearing the ground, now yielded to the proprietor seven shillings a stack; the spikes twenty-four shillings; the bawns, when drawn to town, from sixteen to twenty-four shillings per hundred; and the spray, being made up into what they called pimps, several shillings profit.

The account between the proprietor and the labourer therefore now stood thus, viz.

	Labourer.	Sold by the Proprietor for
	£. s. d.	£. s. d.
To one stack of half-yard wood, 14 feet long, 3 feet high, and 3 feet wide - - - - -	0 4 0	0 16 0
Ditto yard wood ditto - - - - -	0 2 0	0 16 0
To 100 spikes - - - - -	0 1 6	0 6 0
To 100 bawns - - - - -	0 2 0	0 8 0
Roots, and collier's ware, per stack, the same measure as the half-yard wood - - - - -	0 8 0	0 12 0
Ditto, rough roots - - - - -	0 7 0	0 11 0
Pimps per hundred - - - - -	0 1 6	0 6 0
Together	£ 1 6 0	£ 3 15 0

On this it is well remarked that "this rise in the value of the above articles plainly evinced, that, though under a parsimonious management the soil refused to repay the toils and expence of husbandry on the produce of grain, it would at least for a short time, yield, in the value of fire-wood, sufficient to answer the demands of the crown for rent. This circumstance no doubt was the means of its being cleared from wood. But unfortunately, the occupiers not knowing how to cultivate this kind of soil to advantage, and without being apprehensive of incurring a considerable loss by any mistake in the management of it, let it lie in a state of waste for several years; and it would probably have continued to till this time had not the more spirited and well-directed exertions of a few enterprising and intelligent individuals shewn the way to success." And it is stated as a matter of some doubt, "whether the best mode of improving such a soil as that of this chafe, was then known in this part of England; but it is certain that it was not practised. It is also clear to demonstration, that unless a well-digested system be pursued, the profit must be precarious, and the success of the undertaking uncertain.

It is added, that "if the parties concerned in the cultivation of it had set out upon a liberal and judicious plan, in the first instance, and began by felling the timber in the proper season, and disposing of it at the best market; next pared the old sward, and stocked out all the roots; and, as soon as they were dry burn the roots, bushes, and sward, into ashes; then ploughed these ashes in with a very thin furrow (in order to avoid bringing up to the surface the wretched sub-soil); after this, spreading lime, and harrowing it in; had, he says, this method been adopted by the first cultivators of the chafe, he thinks he may venture to assert, that he should not now have heard complaints against the soil, or that it would be called fullen and unproductive. At least, it would have grown tares and perhaps cole, which should have been eaten by stock on the land which produced them. This should have been annually repeated, and the land plentifully supplied with manure brought from town, (if nigh such) and the farm-yard, until the soil had acquired a sufficient degree of richness to be laid down to permanent grass."

The land of this chafe is, he says, in its nature too stubborn to answer in a course of aration, particularly as it is so nigh the metropolis, and where the expence of horse-keep and men's labour are so high that they would consume all the produce of such land. It should therefore be only pared, burnt, ploughed, drained, limed, and manured, and then laid down clean and in good heart, to permanent grass. Indeed, wherever there is a clean skin of good plants already, it will be sufficient that it be well drained and manured, in which case the grasses will be sure to improve, and in a few years become good meadow."

These remarks shew the vast importance of beginning upon a good plan in the cultivation and management of this sort of waste land, as it is only in this way that advantage can be gained, or encouragement held out to the cultivation of such ground.

CHASIDÆANS, or **ΑΣΙΔÆANS**, in *Ancient Geography*, so called on account of their great zeal for the law, and their voluntary engagement to observe it more rigidly than other men, were a valiant people of Judæa, who, after the settlement of the Jewish church on the return of the Jews from the Babylonish captivity, superadded to the law the constitutions and traditions of the elders, and other rigorous observances, to which, by way of supererogation, they voluntarily devoted themselves; and who, from the superior degree of holiness to which they aspired, were called *Chasidim*, i. e. the Pious. These persons were distinguished for their valour, and joined Mattathias and his companions when they fled from Jerusalem to the mountains and deserts of Judæa, in order to avoid the persecution of Antiochus. The Chasidæans reckoned it one of the chief points of that piety which they professed, to fight zealously for their religion, and the defence of the temple and its worship, which had been profaned by the Heathens. They concurred with Mattathias in his efforts for purging the land of the idolatry which the persecutors had imposed upon it, and re-establishing the true worship of God.

CHASING, a method of working, or enriching, gold, silver, &c. properly called enchasing.

CHASIRA, in *Ancient Geography*, a town of Asia in Armenia Minor, according to Ptolemy.

CHASLEU. See **CISLEU**.

CHASLUHIM, in *Ancient Geography*. See **CASLUHIM**.

CHASM, *Χασμα*. See **GROTTO** and **HIATUS**.

CHASME, or **CHASMO**, among *Ancient Physicians*, denotes occlusion or gaping. Hippocrates informs us that long respiration is a cure for continual occlusion.

CHASPHON, **CHASPHORA**, or **CHASBONA**, in *Ancient Geography*, a town of Palestine, in the country of Galaad, according to the book of Maccabees and Josephus. It was taken by Judas Maccabæus.

CHASSAIR, or **CASAIR**, in *Geography*, a town of Africa, in the kingdom of Morocco, about 6 leagues from mount Atlas, near which are mines of lead and antimony, which the inhabitants dispose of at Fez.

CHASSE, in *Military Language*, a charge of powder roughly bruised, which is put at the bottom of a cartridge, the better to force and throw out the materials with which it is filled.

CHASSE-COQUINS. See **BANDOLER**.

CHASSE-CRAPAUD, in *Ornithology*, the European goat-sucker, *caprimulgus Europæus*, is described under this name by Salerne.

CHASSELAY, in *Geography*, a town of France, in the department of the Rhone and Loire, and district of Campde-Lyon; 2 leagues N. of Lyons.

CHASSENEUIL, a town of France, in the department Charente, and district of Angoulême: 11 miles N.E. of La Rochefoucault.

CHASSENEUX, **BARTHOLOMEW DE**, in *Geography*, an eminent lawyer, was born at Ipi l'Evêque, near Autun, in 1480; and after finishing his studies with a view to the law in Italy, was made master of requests to Charles d'Amboise, governor of the Milanese, who employed him at the court of Rome. In 1531, he was appointed counsellor of the parliament at Paris, and in the following year president of the parliament of Provence. He occupied this post

in 1540, when this body issued its sanguinary decree against the Vaudois of Merindol and Cabrières. These people, whose general character appears under another article, incurred, for deviating in their sentiments, worship, and practice from the prescriptions of the church of Rome, the charge of being peñitential heretics, and it was determined to extirpate them by fire and sword. Chasseneux, it is thought, did not in his judgment approve these severities, though he was officially obliged to sign the parliamentary decree. He contributed, however, by a variety of humane artifices to delay the execution of it, whilst he lived; and his death, in 1541, has been ascribed to those who wished to see the commencement of the bloody persecution. The works of Chasseneux are, "A Latin Commentary on the Customs of Burgundy, and of almost all France," fol. printed five times during his life, and more than fifteen times since; the last edition being that of president Bonhier, at Paris, 1717, 4to; "Catalogus Gloriz Mundi," Lyons, 1529, fol. "Conflia," Lyons, 1531, fol. "Les Epitaphes des Rois de France, jusqu'à François I. en vers, avec leur Effigies," and the same in Latin. Nouv. Dict. Hist.

CHASSENSAL, in *Geography*, a river of France, which runs into the Ardeche, not far from its source.

CHASSER L'ENNEMI, in *Military Language*. This phrase is of the same import as the word *deposer*, to drive an enemy before you, forcing him to quit a post that he occupies.

CHASSERADES, in *Geography*, a town of France, in the department of the Lozere, and district of Mende; 8 miles N. of Villefort.

CHASSEURS. See **CAVALRY**.

CHASSIERS, in *Geography*, a town of France, in the department of the Ardeche; 10 miles W. of Viviers.

CHASSIRON, *Tower of*, a light-house on the north point of the island of Oleron, near the coast of France, which has two fires by which it is distinguished from the tower of Cordovan.

CHASSIS DE GALERIE, in *Military Language*. These are small beams, or posts of different heights, which the miners make use of for supporting the earth, in proportion as they advance in the gallery. These support other pieces of timber laid transversely upon them, which hinder the tumbling down of the earth; and this is what is called *chapeau du mineur*, or the miner's hat.

CHASTE-TREE, in *Botany and Gardening*. See **VITEX**.

CHASTELAIN, **CLAUDE**, in *Biography*, was born at Paris in 1639; and occupied the office of canon in the cathedral of his native city. With a view of studying the usages peculiar to each church, he travelled through France, Italy, and Germany, and acquired an extensive acquaintance with liturgies and religious rites and ceremonies. Accordingly Harlay, archbishop of Paris, placed him at the head of a commission for preparing formularies for the use of his diocese, and he was also employed by other bishops in correcting and altering their breviaries and church books. He likewise composed the offices for several religious orders. The "Hætiological Dictionary," which he published, was inserted by Menage in his etymologies of the French tongue; and he bears this testimony to his profound and various knowledge; viz. "Castellanum sæculum suum non intellexit;"—His own age did not comprehend his merit; and an intelligent person, who visited Rome 17 times, affirmed that Chastelain shewed him more curiosities, and taught him more facts than he had gained any knowledge of in all his other visits. In 1705, Chastelain published his "Roman Martyrology," translated into French, &c. 4to; containing

ing only the two first months of the year. In 1709, he published "An Universal Martyrology," upon the same plan. The Bollandists who wrote the lives of the saints, were thus led to seek his acquaintance, and they dedicated to him one volume of their work. He died in 1712, leaving among various other works in MS. a journal of his own life. Moret.

CHASTELET, GABRIELLE EMILIE DE BRETEUIL, marchioness of, was born in 1706; and became celebrated both for the beauty of her person, and the culture of her mind. In the course of her education, which was of a superior kind, she acquainted herself with the best ancient and modern authors; but her attention was more particularly directed to mathematics and natural philosophy. She began her literary career, with an institute of the philosophy of Leibnitz, under the title of "Institutions de Physique," 8vo.; but she afterwards transferred her respect from the reveries of the German philosopher to the discoveries and reasonings of Newton. Accordingly, she translated the Principia, and added a commentary; which were published after her death under the superintendance of the celebrated Clairaut. She died in 1749, at the palace of Luneville. Although she was a mathematician and philosopher, she was far from being a recluse; for she conversed with persons of her own rank with such a degree of freedom and ease, and partook so much of their pleasures, that even the ladies who had the honour of associating with her had no reason to suspect that she was the commentator of Newton. Her memory was singularly retentive, her eloquence ready and impressive, her taste for poetry correct and lively, and she manifested that indifference to popular applause, which is the usual characteristic of a great mind. But notwithstanding these various mental qualities and attainments, it is generally admitted, that she had no pretensions to the character of chastity. Nouv. Dict. Hist.

CHASTELET, in *Geography*, a town of Germany, in the circle of Westphalia, and bishopric of Liege, situate on the south side of the Sambre; 30 miles S.W. of Brussels, and 30 W.S.W. of Liege.

CHASTELLAN, a town of Savoy; $8\frac{1}{2}$ miles N.E. of Chambery.

CHASTELLUX, *Le Chevalier de*, in *Biography*, brigadier des armées du roi at the time of the revolution, was born 1734, and received in the French Academy in 1775. He had early in life a strong passion for poetry and music. His professional employment, as a military officer, has never impeded the successful cultivation of those talents. Many of his comedies, written for private theatres, and heard with transport, would have been sure of success if represented on a public stage, had he had courage sufficient to make the experiment. But his "Essay on the Union of Poetry and Music" is the chief production which entitles him to a place here as a musical writer. This little book, which first appeared in 1765, is but a pamphlet of about 90 or 100 pages 12mo. Yet next to Rousseau's "Lettre sur la Musique Française," it is the best piece of musical criticism in the French language. It called the attention of persons of taste to Italian poetry and music, which the abbé Arnaud and M. Suard had attempted before; but we think with less knowledge of the subject and more party-spirit. M. De Chastellux luckily produced his tract before the Gluck and Piccini factions had birth, and seems to write from feeling and zeal for the musical drama, apart from all contention for victory over writers of opposite opinions. He has many ideas concerning ancient as well as modern music, which were new, at least in France, when his tract appeared, and which have been since adopted by subsequent musical writers, and rendered com-

mon: such as symmetry of air, not only in the number of bars, but in the general cast of each bar, which is a rule of much the same tendency as Rousseau's "Unity of Melody." In speaking of ancient music, the author thinks, though inferior to the modern, that the great effects of its modes were produced by their being severally confined to particular keys and measures. If a whole nation were to hear a particular melody in a particular key only on occasions of religious ceremonies, and another was confined to military purposes, their effects would be greatly heightened. If, for instance, in the midst of a tumult, a band of good musicians was to play a religious air in its usual key, it would excite piety and respect in the most turbulent. And if, during a religious ceremony, a military air was unexpectedly to be performed in its original key, there can be little doubt but that the people would immediately fly to arms. The effect of the ancient Greek music must greatly have depended on its appropriation; as in China, from time immemorial, particular musical airs have been confined to particular purposes. This is only applicable to instrumental music; but for vocal, the author wishes poets to become musicians, and musicians poets, otherwise they have different interests, and mutually injure and degrade each other. On this subject, he says, most truly, that the lyric poet should never forget that he is writing for music; that he should sacrifice wit and point to sentiment and effect. Though there is a constant jealousy between poetry and music, he says it is impossible to deny that music is the principal object in an opera. Metastasio, whose dramas were justly admired and respected as poetry, never was jealous of the applause which composers and singers acquired, or thought it was at his own expence. The French perhaps do wisely in allowing few airs in their operas, and those, short, easy, and simple; having no singers capable of performing *bravuras*, and still less airs in a grand style of *cantabile*: but why Italy, and all Europe who have Italians, or singers of the Italian school, capable of performing in all styles, should conform to the present plan of French operas, and banish good singing from their lyric theatres, or be accused of ignorance of the true style of dramatic music, we know not. That a people just emerging from barbarism in music of all kinds, should arrogantly dictate to nations long polished, refined, and accustomed to perfection, gives but too just grounds for imagining, that presumption, though confined to individuals in some countries, is, in others, a national vice.

The chevalier Chastellux seems the first writer in the French language (after Rousseau) who truly comprehended the merit of Italian vocal music and performance, and felt the merit of Metastasio. He seems to have a correct idea of dramatic poetry, and words to be set to such music as will display the abilities of a composer as well as singer. He says very truly, that to obviate, or at least to soften, the radical evil of mixing song with declamation, the poet, in going from speech to song, can only render the contrast and unnatural mixture bearable, by increase of interest or passion, which seems to call for a different expression. He should avoid the introduction of airs, in cold and uninteresting situations; or in the midst of a dialogue, before the characters are sufficiently animated; and by this means avoid the being too lavish of those airs which should be retained for occasions of passion, and the termination of scenes.

CHASTISEMENTS, OR CORRECTIONS, in the *Morale*, are the severe and rigorous effects of the aids; for when the aids are given with severity, they become punishments. See CORRECTION.

CHASTITY, a virtue deified by the Romans. On the reverse of a medal of Faustina the younger, it is represented sitting,

sitting, and dressed in the habit of a Roman matron, holding a sceptre in her hand, with two doves at her feet. They called her, says Mr. Spence, the goddess "Pudicitia," and exhibited her in the form of a Roman matron, with her veil, in the modest attitude of pulling it over part of her face. Juvenal speaks of her personally, and humorously observes, "that he believes he was once upon our earth in the reign of Saturn, but that she quitted it when Jupiter began to have a heard." At Rome there were two of this name, viz. "Pudicitia Patricia," and "Pudicitia Plebeia."

The Roman law justifies homicide in defence of the chastity either of one's self or relations (Ff. 48. 8. 1.); and according to Selden (De Leg. Heb. lib. iv. cap. 3.) the law in the Jewish republic had the same latitude. The English law also justifies a woman in killing one who attempts to ravish her. Bac. Elem. 34. Hawk. P. C. 71. And the father or husband may justify killing a man, who attempts a rape upon his wife or daughter: and the forcible attempt of a more detestable crime may be equally redited by the death of the unnatural aggressor. Blackst. Comm. vol. iv. p. 181.

In China, at the death of the sovereign, all his women are removed to a separate building, called by a term, which divested of its metaphor, implies the "Palace of Chastity," where they are doomed to reside during the remainder of their lives.

CHASUARI, or CHATTUARI, in *Ancient Geography*, a people of Germany, who formed part of the Chatte. They are mentioned by Tacitus, Strabo, and Ptolemy.

CHASZAVENICA, a place which had a Roman garrison, under the orders of the commandant of Armenia, mentioned in the Not. Imp.; but its situation is not ascertained.

CHAT, CAPE, in *Geography*, a cape on the south coast of the river St. Lawrence. N. lat. 49° 10'. W. long. 66°.

CHAT, Cat, in *Gunnery*, a piece of iron with one, two, or three very sharp prongs or claws, which, when it has three of them, are arranged in a triangular form or shape. This piece of iron is fixed to a shaft or handle. It is used for searching and examining a piece of ordnance. By being introduced into the bore, it shews or discovers whether it is honey-combed, damaged, or otherwise defective.

There is another sort of chat, that differs a little from this. It consists of two branches of iron fixed to one end of a piece of the same metal, which have each of them two steel prongs or claws. One of these branches has a hinge with a spring so fixed, that when the chat is put into the bore, the smallest cavity releases the spring, and the defect is immediately discovered. This invention does credit to the inventor. Founders who do not like it, call the common chat the *diabole*, or the devil, and the one with two branches the *malice du diable*, the malice of the devil.

CHAT. Also a sort of tower, that anciently was made use of in France for carrying soldiers at the besieging of places.

CHAT, in *Zoology*. See CAT and FELIS *catus*.

CHAT-bisaam, of Volmaer, &c. See VIVERRA *tigrina*.

CHAT cervier, the lynx. See FELIS *lynx*.

CHAT d'Espagne of Ridinger, and Chat de Constantinople. See VIVERRA *genetta*.

CHAT-huant, in *Ornithology*, the brown owl, STRIX *stridula*, Linn. Chat-huant is also the common name of owls in general.

CHAT manou, in *Zoology*. See FELIS *manul*.

CHAT-pard. See PARDUS.

CHAT rochier, in *Ichthyology*, the name given by Broussonet and others to the greater cat-fish. See SQUALUS *fel-laris*, Linn.

CHATA, in *Geography*, a town of America, in the Tennessee government; 22 miles S.S.W. of Knoxville.

Vol. VII.

CHATABOUCHEE, or CHATABUTHE. See CHATAUCHE.

CHATA-HATCHI, or HATCHI, a river of America, the largest which falls into St. Rose's bay in West Florida. It is also called Pea River, and runs from N.E. entering the bay by several mouths, but so shoal, that they can only be passed by a small boat or canoe. About 25 leagues up this river, Mr. Hutchins found a small settlement of Coushatt Indians. The soil and timber on its banks very much resemble those of Escambia.

CHATAIGNERAYE, LA, a town of France, in the department of Vendée, and chief place of a canton in the district of Fontenay-le-Comte; 15 leagues S.E. of Nantes, and 34 N. of Fontenay-le-Comte. The place contains 1045 and the canton 15,006 inhabitants; the territory includes 350 kilometres and 21 communes.

CHATAISKA, a river of Siberia, which runs into the Enisei, near Turuchansk.—Also, a town of Siberia, on the east side of the Enisei, 156 miles N. of Turuchansk.

CHATANGA, a river of Russia, which runs into the Frozen sea; extending itself by the addition of many rivers into a large gulf at its mouth. N. lat. 74° 40'.

CHATAS, a name given to one sort of barks employed on the river Chagre in America, those of the other sort are called bongos. See CHAGRE.

CHATAUCHE, or CHATABOUCHE, in *Geography*, a river of America, which rises in the Apalachian mountains, on the borders of the Tennessee government, traverses the state of Georgia, and uniting with the Flint in N. lat. 31°, forms the *Apalachicola*, which see. It is about 30 rods wide, very rapid, and full of shoals. The soil on its banks is light and sandy, and the clay of a bright red colour. The lower creeks are settled in dispersed clans and villages from the head to the mouth of this river. Their huts and cabins resemble, by the colour of the clay, clusters of new-burned brick-kilns. The distance from this river to the Talapose river is about 70 miles, by the war-path, which crosses at the falls, just above the town of the Tuckabatche.

CHATAUGHQUE, a lake of America, in the county of Ontario and state of New York, about 18 miles long and 3 broad. It is connected with Alleghany river by the river Conewango, which runs a S.E. course. This lake serves to form an easy communication between lake Erie and the Ohio: there being water sufficient for boats from Fort Franklin in the Alleghany, to the N.W. corner of this lake; and from thence there is a portage of nine miles to Chataughque harbour in lake Erie over ground capable of being made a good waggon road. This communication was once used by the French.

CHA-TCHEOU, or QUATCHEOU, a town of Asia, in the country of Thibet; 100 miles S.S.E. of Hami. N. lat. 40° 22'. E. long. 95° 19'.

CHATE, in *Botany*, Alp. See CUCUMIS *chate*.

CHATEAU, CASTLE, in *Military Language*, a place fortified either by nature or art, in a town or city, or in a district or tract of country, the passage through which it is wished to defend. A castle, unless it be naturally strong and peculiarly situated, cannot at present make much resistance. Castles, however, are still preserved in certain places, as serving like citadels to furnish retreats for prolonging capitulations, or overawing towns in cases of popular sedition.

CHATEAU ARNOUX, in *Geography*, a town of France, in the department of the Lower Alps, and district of Sisteron; 7 miles S. of Sisteron.

CHATEAUBELAIR BAY, a bay on the west coast of the island of St. Vincent in the West Indies. N. lat. 13° 14'. W. long. 61° 17'.

CHATEAU-BOURG, a town of France, in the department of the Ile and Vilaine, and chief place of a canton in the district of Vitré; $2\frac{1}{2}$ leagues W. of Vitré. The place contains 1242 and the canton 7255 inhabitants; the territory includes $102\frac{1}{2}$ kilometres and 10 communes.

CHATEAU-BRIANT, a town of France, in the department of the Lower Loire, and principal place of a district; 11 leagues N. of Nantes, and 9 S.S.E. of Rennes. N. lat. $47^{\circ} 44'$. E. long. $1^{\circ} 29'$. The place contains 3049 and the canton 7068 inhabitants; the territory comprehends $157\frac{1}{2}$ kilometres and 4 communes.

CHATEAUBRUN, JOHN BAPTIST VIENNE DE, in *Biography*, was born at Angoulême in 1689, and became steward of the household to the duke of Orleans, member of the French Academy, and a writer of tragedy. His first publication in 1714, was a piece entitled "Mahomet II." His best work, written soon after, was "Les Troyennes," which was not acted for 40 years, and the reason he alleged for delaying the exhibition of it, was the fear of giving offence to the devout prince, his master. He also wrote the tragedies of "Philoctetes" and "Alyanax," which, though feeble in poetry, abound with sentiment, and are conducted with skill. He was admitted into the academy in 1753, and died in 1755. His taste was formed by the study of the Greek and Latin poets. His private character was that of a true philosopher, mild, virtuous, tolerant, and disinterested. *Nouv. Dict. Hist.*

CHATEAU-CAMBRESIS, in *Geography*. See CATEACAMBRESIS.

CHATEAU-CHALONS, a town of France, in the department of Jura, and district of Poligny; 2 leagues N. of Lons-le-Saunier.

CHATEAU-CHINON, a town of France, in the department of the Nièvre, and principal place of a district, situate near the source of the Yonne. It has a considerable trade in cloth, leather, wood, and wool; 11 leagues E. of Nevers, and $5\frac{1}{2}$ W.N.W. of Autun. N. lat. $47^{\circ} 3'$. E. long. $3^{\circ} 49'$. The place contains 3156, and the canton 12837 inhabitants; the territory includes 395 kilometres, and 14 communes.

CHATEAU-CORNET, a fortress of the island of Guernsey.

CHATEAU-DAUPHIN, a strong fortress of Piedmont, in the marquisate of Saluzzo, ceded to the duke of Savoy by the treaty of Utrecht. It was taken by the combined armies of France and Spain in 1744; 15 miles W. of Saluzzo, and 30 S.S.W. of Turin. N. lat. $44^{\circ} 33'$. E. long. $6^{\circ} 58'$.

CHATEAU-DUN, a town of France, in the department of the Eure and Loire, and principal place of a district; 25 miles S. of Chartres. N. lat. $48^{\circ} 4'$. E. long. $1^{\circ} 15'$. The place contains 6146, and the canton 13,467 inhabitants; the territory includes $302\frac{1}{2}$ kilometres, and 19 communes.

CHATEAU-FORT, a town of France, in the department of the Seine and Oise; 1 league N.E. of Cnevreufe.

CHATEAU-GAY, a town of France, in the department of the Puy-de-Dôme; 1 league S.W. of Riom.

CHATEAU-GERARD, a town of France, in the department of the Yonne, and district of Tonnerre; 14 miles S.S.E. of Tonnerre.

CHATEAU-GIRONS, a town of France, in the department of the Ile and Vilaine, and chief place of a canton, in the district of Rennes; $2\frac{1}{2}$ leagues S.E. of it. The place contains 1413, and the canton 11,761 inhabitants; the territory includes $157\frac{1}{2}$ kilometres, and 10 communes.

CHATEAU-GOMBERT, a town of France, in the

department of the mouths of the Rhone, and district of Marseilles; 4 miles N.E. of Marseilles.

CHATEAU-GONPILIER, a town of France, in the department of Mayenne, and principal place of a district, seated on the Mayenne. It has a manufacture of linen and woollen. The place contains 4656, and the canton 17,776 inhabitants; the territory includes 250 kilometres, and 17 communes. It is distant 5 leagues S. from Laval, and 5 W. from Sable. N. lat. $47^{\circ} 57'$. W. long. $0^{\circ} 49'$.

CHATEAU-D'IF, a fortress and three small islands near the coast of France, in the Mediterranean; about 3 miles W.S.W. of Marseilles.

CHATEAU-JOUX, a fortress of France, in the department of the Doubs, near Pontarlier.

CHATEAU-LANDON, a town of France, in the department of the Seine and Marne, and chief place of a canton in the district of Fontainebleau; $2\frac{1}{2}$ leagues S. of Nemours. The place contains 1960, and the canton 8,193 inhabitants; the territory comprehends $292\frac{1}{2}$ kilometres, and 16 communes.

CHATEAU-LAUDREN, a town of France, in the department of the North coasts, and district of St. Brieuc; $2\frac{1}{2}$ leagues N.W. of St. Brieuc. The place contains 869, and the canton 13,085 inhabitants; the territory includes $132\frac{1}{2}$ kilometres, and 9 communes.

CHATEAU-LIN, a town of France, in the department of Finisterre, and principal place of a district. The place contains 3172, and the canton 13,583 inhabitants; the territory includes $207\frac{1}{2}$ kilometres, and 11 communes. This town has a considerable trade in slates for tiling houses; and in its vicinity are a medicinal spring, and some mines of copper and iron. It is four leagues N. of Quimper. N. lat. $48^{\circ} 11'$. W. long. $4^{\circ} 11'$.

CHATEAU-DU-LOIR, a town of France, in the department of Sarthe, and chief place of a canton, in the district of St. Calais. The place contains 2652, and the canton 13,082 inhabitants; the territory includes $187\frac{1}{2}$ kilometres, and 14 communes. A considerable quantity of claret-wine is manufactured in the vicinity of this town. It is distant 7 leagues N.N.W. from Tours, and 7 S.S.E. from Le Mans. N. lat. $47^{\circ} 42'$. E. long. $0^{\circ} 20'$.

CHATEAU-LOMBARD, a fortress of Asiatic Lombardy, in the province of Caramania.

CHATEAU-EN-MARCHE, a town of France, in the department of the Lower Seine; 2 leagues N. of Montivillers.

CHATEAU-MEILLANT, a town of France, in the department of the Cher, and chief place of a canton, in the district of St. Amand, having an ancient castle, which is said to have been built by Julius Cæsar. The place contains 2238, and the canton 9101 inhabitants; the territory comprehends 325 kilometres, and 11 communes. It is $10\frac{1}{2}$ leagues S. of Bourges. N. lat. $46^{\circ} 34'$. E. long. $2^{\circ} 0'$.

CHATEAUNEUF, L'Abbe DE, in *Biography*, author of an agreeable little book on the music of the ancients, entitled "Dialogue sur la Musique des Anciens," published anonymously in 1725, but seemingly written about 1705, during the heat of the controversy between the exclusive admirers of the ancient and modern literature, and not long after "The Battle of the Books." The interlocutors are composed of *Erastes* on both sides, and the author seems to have assumed the office of *Moderator*.

CHATEAU-NEUF, in *Geography*, a town of France, in the department of the Higher Alps; 10 miles S. of Serres.—Also, a town of France, in the department of the Charente, and chief place of a canton, in the district of Cognac; 10 miles W.S.W. of Angoulême. The place contains

contains 2184, and the canton 9981 inhabitants: the territory includes 165 kilometres, and 18 communes.—Also, a town of France, in the department of the Cher, and chief place of a canton, in the district of St. Amand. The place contains 1719, and the canton 6499 inhabitants: the territory includes 230 kilometres and 12 communes.—Also, a town of France, in the department of the Côte d'Or, 17 miles S.W. of Dijon.—Also, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the district of Dreux: the place contains 1271, and the canton 10,744 inhabitants: the territory includes 272½ kilometres, and 29 communes.—Also, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of St. Malo; 7 miles S. of it. The place contains 539, and the canton 9629 inhabitants: the territory includes 127½ kilometres, and 7 communes.—Also, a town of France, in the department of Loiret, and chief place of a canton, in the district of Orleans; 12 miles E. of it. The place contains 3127, and the canton 7444 inhabitants: the territory comprehends 267½ kilometres, and 10 communes.—Also, a town of France, in the department of the Mayne and Loire; 13 miles N. of Angers. The place contains 916, and the canton 9985 inhabitants: the territory includes 265 kilometres, and 15 communes.—Also, a town of France, in the department of the Saone and Loire; 3 leagues E.S.E. of Marcigny.—Also, a town of France, in the department of the Upper Vienne, and chief place of a canton, in the district of Limoges; 17 miles S.E. of it. The place contains 1136, and the canton 9039 inhabitants: the territory includes 267½ kilometres, and 10 communes.—Also, a town of France, in the department of the Var, and district of Grasse; 3 miles N.E. of Grasse.

CHATEAUNEUF du Faou, a town of France, in the department of Fimiteur, and chief place of a canton, in the district of Chateaulin; 16 miles N.E. of Quimper. The place contains 2163, and the canton 13,596 inhabitants: the territory includes 330 kilometres, and 11 communes.

CHATEAUNEUF de Galauré, a town of France, in the department of the Drôme; 13 miles N. of Romans.

CHATEAUNEUF de Maxene, a town of France, in the department of the Drôme; nine miles east of Montelimart.

CHATEAUNEUF du Pape, a town of France, in the department of the Mouths of the Rhône; 3 leagues N. of Avignon.

CHATEAUNEUF de Randon, a town of France, in the department of the Lozere, and chief place of a canton in the district of Mendé; 4 leagues N.E. of it.

CHATEAUNEUF de Rhône, a town of France, on the E. side of the Rhône, opposite Viviers.

CHATEAUNEUF-au-Fal de Bargis, a town of France in the department of the Nièvre; 10 miles N.E. of La Charité.

CHATEAU D'OLERON, a town of France in the department of the Lower Charente, and chief place of a canton in the district of Marannes. The place contains 2116 and the canton 5151 inhabitants; the territory includes 102½ kilometres, and 3 communes.

CHATEAU-PONSAC, a town of France, in the department of the Upper Vienne, and chief place of a canton in the district of Bellac; 18 miles N. of Limoges. The place contains 3950 and the canton 10,297 inhabitants; the territory includes 185 kilometres and 7 communes.

CHATEAU-PORCIEN, a town of France, in the department of the Ardennes, and chief place of a canton, in the district of Rethel: 2 leagues W. of it. The place con-

tains 1972 and the canton 8695 inhabitants; the territory includes 230 kilometres and 17 communes.

CHATEAU-REGNAULT, a town of France, in the department of the Indre and Loire, and chief place of a canton in the district of Tours; 5 leagues N.E. of Tours. The place contains 2518 and the canton 2534 inhabitants; the territory comprehends 297½ kilometres, and 17 communes.

CHATEAU-RENARD, a town of France, in the department of the Loiret, and chief place of a canton in the district of Montargis; 4½ leagues E. of it. The place contains 2388 and the canton 9454 inhabitants; the territory includes 250 kilometres, and 10 communes.—Also, a town of France, in the department of the Mouths of the Rhone, and chief place of a canton in the district of Tarasiori; 9 miles N.E. of Tarascon, and celebrated for its excellent white wine.—Also, a town of France, in the department of the Ardennes; 10 miles N.W. of Sedan.

CHATEAU-ROUX, a town of France, in the department of the Higher Alps; 5 miles N. of Embrun.—Also, a town of France, in the department of the Indre, and principal place of a district; seated on the Indre in a fruitful country, and having a large woollen manufacture. The place contains 8148 and the canton 14,960 inhabitants; the territory includes 362½ kilometres, and 11 communes. N. lat. 46° 49'. E. long. 1° 35'.

CHATEAU-SALINS, a town of France in the department of the Meurth, and principal place of a district, deriving its name from its extensive salt-works; 5 leagues N.E. of Nancy. N. lat. 48° 49'. E. long. 6° 24'.

CHATEAU-THIERRY, a town of France, and principal place of a district, in the department of the Aisne, seated on the Marne, and having in its vicinity a medicinal spring. The place contains 4160 and the canton 12,918 inhabitants; the territory includes 187½ kilometres and 21 communes. N. lat. 49° 3'. E. long. 3° 18'.

CHATEAU-LA-VALLIERE, a town of France, in the department of the Indre and Loire, and chief place of a canton in the district of Chinon; 5 leagues N. of Langeais. The place contains 686 and the canton 10,092 inhabitants; the territory comprehends 240 kilometres, and 16 communes.

CHATEAU-VILLAIN, a town of France, in the department of the Upper Marne, and district of Chaumont, 5½ leagues W.N.W. of Langres.—Also, a town of France, in the department of the Iser; 16 miles E. of Veneuc.

CHATEEN, a town of Little Bocharia.

CHATEL, or CHATE, a town of France, in the department of the Ardennes; 5 miles S.E. of Grandpré.

CHATEL, a town of France, in the department of the Vosges, and chief place of a canton in the district of Epinal. The place contains 1165 and the canton 9178 inhabitants; the territory includes 257½ kilometres, and 28 communes.

CHATEL-CENSOY, a town of France, in the department of the Yonne, and chief place of a canton, in the district of Avalon; 4 leagues W. of it.

CHATEL-GUION, a village of France, in the department of Puy-de-Dôme, celebrated for its mineral water; one league N. of Riom.

CHATEL-DE-NEUVE, a town of France, in the department of the Allier, and district of Moulins; 10 miles S. of Moulins.

CHATELARD, a town of France, in the department of Mont Blanc, and chief place of a canton in the district of

Chambéry. The place contains 1000 and the canton 10,412 inhabitants; the territory includes 237½ kilometres, and 13 communes.

CHATELON, a town of France, in the department of Puy-de-Dôme, and chief place of a canton in the district of Thiers; 6 leagues E.N.E. of Riom. The place contains 1587 and the canton 6558 inhabitants; the territory comprehends 157½ kilometres, and 6 communes.

CHATELET, was anciently a small chateau or fortress, and the officer who commanded in it was called *châtelain*.

The word is a diminutive of *chateau*, formed from *castellum*, a diminutive of *castrum*; or from *castellatum*, a diminutive of *castellum*, *castle*. The term in later times has been used at certain courts of justice established in several cities of France: the *grand châtelet* in Paris, v. gr. was the place where the prefdial, or ordinary court of justice of the prévot of Paris was kept; consisting of a prefdial, a civil chamber, a criminal chamber, and a chamber of policy. The term signified the fame at Montpellier, Orleans, &c.

The *little châtelet* at Paris was an ancient fort which served as a prison.

CHATELET, LE, in *Geography*, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Melun; 2 leagues E. of Melun. The place contains 1004 and the canton 8970 inhabitants; the territory includes 237½ kilometres, and 16 communes.

CHATELLERAULT, a town of France, in the department of the Vienne, and principal place of a district, seated on the Vienne; and principally employed in the manufacture of clocks and cutlery. The place contains 8426, and the canton 12,728 inhabitants; the territory includes 102½ kilometres and 8 communes.

CHATELLET, a town of France, in the department of the Cher, and chief place of a canton, in the district of St. Amand; 2 leagues N.N.E. of Chateau-Meillant. The place contains 1107, and the canton 5202 inhabitants; the territory comprehends 180 kilometres, and 8 communes.

CHATELLUX, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Bouffac; 4 leagues S.W. of Bouffac. The place contains 776 and the canton 8536 inhabitants; the territory includes 187½ kilometres, and 12 communes.

CHATELLUX-LE-MARCHIEUX, a town of France, in the department of the Creuse, and district of Bourgneuf; 5 miles N.E. of it.

CHATENAY, a town of France, in the department of Paris; 2 leagues S. of Paris.

CHATENOIS, a town of France, in the department of the Vosges, and chief place of a canton in the district of Neufchâteau; 2 leagues S. of it. The place contains 1379 and the canton 9839 inhabitants; the territory includes 175 kilometres, and 26 communes.—Also, a town of France, in the department of the Lower Rhine; one league W. of Schelehatt.

CHATHAM, in *Geography*, a town of Kent, England, is celebrated for its naval arsenal; and is joined to the ancient city of Rochester. This town has been mostly built since the reign of queen Elizabeth. The houses united with those of Rochester, and the village of Stroud, make one long street, of more than two miles in length, through which the high road passes from London to Dover. Many of the houses extend along the banks of the river: and, like most sea-ports, the streets are narrow, disagreeable, and ill built.

The victualling-office, some officers' houses in the dock-yard, two breweries, and a few private houses, are however commodious and handsome. At the east end of the town is the parish workhouse, which was built on a large and extensive plan in 1725; but the principal objects of this place, and from which it has obtained its present population and importance, are the docks, victualling-offices, and other naval establishments. Among these is a foundation called *the Chapel of Chatham*, which was instituted in 1558, when the seamen in the service of queen Elizabeth agreed to allow a portion of each man's pay for the relief of their fellow-sailors, who had been wounded in the battle with the Spanish armada. The same custom has been continued to the present time, and many wounded sailors have derived temporary relief and comfort from this fund. See **CHESH.** Here are two docks respectively denominated the *Old Dock*, and the *Royal Naval Dock*. The former, with its connected wharf, storehouses, &c. are the places of deposit for royal stores and ordnance. The guns belonging to the royal shipping are collected and ranged on this wharf in long tiers, and large pyramids of cannon-balls, shells, &c. are accumulated here to be ready for service. In a continued range of storehouses are deposited the carriages for the guns, and almost every other article of naval stores. In one apartment is a small armoury furnished with muskets, pistols, cutlasses, pikes, pole axes, and other warlike instruments, classed and arranged in regular order. The whole of this department is under the management of a storekeeper, who has a good house, a clerk of the survey, and clerk of the checque, who have each handsome salaries, and separate offices. Beside these, here are two extra clerks and some inferior officers, labourers, &c. *The Royal Naval Dock-Yard* connects with the former, and ranges along the eastern bank of the river for nearly one mile in extent. The increase of the navy during the reign of Elizabeth occasioned these docks to be enlarged, and in the subsequent reigns of James and Charles I. they were considerably extended; within the last fifty years, they have been greatly enlarged and improved; and within the fortified walls are now concentrated almost every requisite for the fitting out, repairing, &c. of a fleet. The storehouses, shops, and most of the buildings are extremely spacious and commodious; whilst those belonging to the commissioner and other principal officers are provided with every comfortable and elegant accommodation. One of the storehouses is six hundred and sixty feet long; and the sail-loft, where sails are made, is two hundred and nine feet in length. A new rope-house measures 1140 feet in length; in this the cables are manufactured, some of which are one hundred and twenty fathoms long, and twenty-two inches round. Some of the masts made here are one hundred and thirty-six feet in length, and thirty-six inches in diameter. Here are two spacious basins of water, where the timber for masts, &c. is kept continually floating till wanted for use. The smith's shop contains twenty-one forges, which are almost constantly in use, in making anchors, &c. Some of these weigh nearly five tons each. In this yard are four spacious docks for docking and repairing vessels belonging to the royal navy; in these there are six slips or launches, on which ships are constantly building. Among the large vessels that have issued from this yard are the *Victory* of 110 guns, the new *Royal George* of 100 guns, finished in 1788; this was the first ship of that rate ever launched from a slip; the *Royal Charlotte* of 100 guns was launched here in 1790, and the *Ville de Paris* of 110 guns, with some others of larger dimensions, have been finish-

ed here since that period. The whole of this yard, except on the side of the river, is guarded and environed by a high thick wall; it is entered through a large handsome gateway, which is flanked by two towers. In time of war every stranger is precluded access within the walls, unless he has a satisfactory passport.

The business of this yard is transacted by a commissioner, who has three clerks under him; a clerk of the cheque, storekeeper, master-shipwright or builder, clerk of the survey, and two master-attendants, master shipwrights' assistants, master caulker, clerk of the rope-yard, master ropemaker, a boatswain, purveyor, surgeon, and several other inferior officers. To provide greater security to this national arsenal, two acts of parliament were obtained in the reign of queen Anne for vesting certain lands and tenements in trustees, for the purpose of fortifying and giving additional security to this dock; among others, a large quantity of contiguous land, with many houses, was accordingly purchased for the crown; but nothing further was done till 1758, anno 31 George II. when the French having threatened to invade this country, it was deemed necessary to put these acts in force relating to the dock-yards. Another act was however passed that year for purchasing more lands, &c. and extensive lines of fortifications were immediately formed round the land side of this dock, with ramparts, palisades, and a deep broad ditch. These extended from the river above the o.d. dock, to the same again below the dock at Gillingham, about one mile in length. Large and commodious barracks were also erected within the lines sufficient to accommodate five regiments of soldiers, and a battalion of artillery, which have been constantly quartered here; these fortifications have been progressively augmented and repaired; a new redoubt has been made, and other collateral works have been added. Another act was passed in 1782, for vesting other lands on the south side of the town in the crown.

At the entrance of Chatham from Rochester, is the *Vic-tualing Office*, containing a cooperage, pickling, baking, cutting, slaughtering, and store, houses. A new wharf has been added to it, and additional buildings have been erected for the convenience and service of this department of the navy.

In digging for the fortifications round the dock, various Roman coins, pateræ, &c. were found. The present church was erected in 1788, and is constructed mostly with brick. Chatham and the contiguous hamlets are extremely populous. Here is a large market on Saturdays; and two annual fairs of three days each. Chatham is 30 miles E. from London; it contains 1729 houses and 10505 inhabitants. Hailes's History of Kent, 12 vols. 8vo. 1798, vol. iv.

CHATHAM, a maritime township of America, in the county of Barnstable and state of Massachusetts, seated on the exterior extremity of the elbow of Cape Cod, conveniently for the fishery, in which the inhabitants have usually about 40 vessels employed. It has 1140 inhabitants, and lies 95 miles S.E. of Boston. See *Cape Cod*.—Also, a township in Grafton county, New Hampshire; incorporated in 1767 and 1790, containing 58 inhabitants.—Also, a flourishing township in Middlesex county, Connecticut, on the eastern bank of Connecticut river and opposite Middletown city; it was a part of the township of Middleton till the year 1767.—Also, a township in Essex county, New Jersey, seated on Passaic river; 13 miles W of Elizabeth town, and nearly at the same distance from Newark.—Also, a township of Columbia county, New York. By the state census in 1796, 380 of its inhabitants were electors.—

Also, a county in Hillsborough district, North Carolina, about the center of the state. It contains 9221 inhabitants, of whom 1632 are slaves; the chief town is Pittsburgh. The court house is a few miles W. of Raleigh, on a branch of Cape Fear river.—Also, a town of South Carolina in the Cheraws district, situate in Chesterfield county on the west side of Great Pee Dee river. Its situation, in a highly cultivated country and at the head of a navigable river, promises to render it a place of great importance.—Also, a county in the lower district of Georgia, lying in the north east corner of the state, having the Atlantic ocean on the east, and Savannah river in the north-west. It contains 10,769 inhabitants including 8201 slaves. The chief town is Savannah.—Also, a large bay called Punjo bay, on the west side of the fourth end of the promontory of East Florida. It receives North and Delaware rivers.

CHATHAM island, a small island in the Indian ocean, within the harbour of the island of Andaman on which is situated the settlement of Port Cornwallis: the utmost length of this small island does not exceed two miles, and its breadth is little more than half a mile; the southern extremity terminates in a narrow neck of land, fordable at low water to the main.

CHATIGAN, a town of Asia, in the kingdom of Bengal, on the most easterly branch of the river Ganges; which is now a mean place, although it was the first in which the Portuguese established a settlement. It has a few cotton manufactures, and furnishes excellent timber. The inhabitants are so suspicious of each other, that they always go armed with a sword, pistol, and blunderbuss. It is subject to the Great Mogul. N. lat. 23°. E. long. 91° 10'.

CHATILLOIN, a large town of France, in the department of the Côte-d'Or, and principal place of a district, built on both sides of the Seine, and having iron forges in its vicinity. The place contains 3700, and the canton 14,287, inhabitants: the territory comprehends 450 kilometres and 29 communes; 38 miles N.N.W. of Dijon.—Also, a town of France, in the department of the Drôme, and chief place of a canton in the district of Die; 3½ leagues N.W. of Lyons. The place contains 1380, and the canton 6533, inhabitants: the territory includes 355 kilometres and 10 communes.—Also, a town of France, in the department of the Indre, and chief place of a canton in the district of Châteauroux; 3 miles S.W. of it. The place contains 2609, and the canton 8139, inhabitants: the territory comprehends 247½ kilometres and 10 communes.—Also, a town of France, in the department of the Marne, and chief place of a canton in the district of Reims; 9 miles W.N.W. of Epernay. The place contains 1002, and the canton 7702 inhabitants: the territory includes 165 kilometres and 21 communes.—Also, a town of France, in the department of the Seine; 1½ league S.S.W. of Paris.—Also, a town of Savoy, in the department of Leman, and district of Geneva; 3 miles S.E. of St. Julien.—Also, a town of Piedmont, in the duchy of Aosta, seated on the Doria Balca; 9 miles S.E. of Aosta.

CHATILLOIN-en-Bazois, a town of France, in the department of the Nièvre, and chief place of a canton in the district of Château-Chinon; 8 miles N.W. of Moulins. The place contains 663, and the canton 9138, inhabitants: the territory includes 332½ kilometres and 16 communes.

CHATILLOIN-sur-Chalaronne, a town of France, in the department of the Ain, and chief place of a canton in the district of Trevoux. The place contains 3119, and the canton 10,876, inhabitants: the territory includes 187½ kilometres and 15 communes.

CHATILLOIN-sous-le-Côtes, a town of France, in the depart-

ment of the Meuse, and district of Verdun; 6 miles E. of Verdun.

CHATILLON-sur-Couvincie, a town of France, in the department of Jura, and district of Lons-le-Saulnier; $2\frac{1}{2}$ leagues E. of it.

CHATILLON-les-Dombes, a town of France, in the department of the Ain; 4 leagues S.W. of Bourg-en-Bresse. N. lat. $46^{\circ} 7'$. E. long. $4^{\circ} 51'$.

CHATILLON-sur-Loire, a town of France, in the department of Loiret, and chief place of a canton in the district of Montargis; 4 leagues S. of it. The place contains 1996, and the canton 8489, inhabitants: the territory comprehends $322\frac{1}{2}$ kilometres and 13 communes.

CHATILLON-sur-Loire, a town in the same department with the last, and chief place of a canton in the district of Gien; 3 leagues S.E. of it. The place contains 1989, and the canton 6595, inhabitants: the territory includes $227\frac{1}{2}$ kilometres and 6 communes.

CHATILLON-de-Michaëles, a town of France, in the department of the Volges; 3 leagues S.S.E. of La Marche. The place contains 1279, and the canton 8171, inhabitants: the territory includes $157\frac{1}{2}$ kilometres and 16 communes.

CHATILLON-sur-Saône, a town of France, in the department of the Volges; 3 leagues S.S.E. of La Marche.

CHATILLON-sur-Sevre, a town of France, in the department of the Two Seves, and chief place of a canton in the district of Thouars; 7 leagues W. of it. The place contains 512, and the canton 6842, inhabitants: the territory includes $317\frac{1}{2}$ kilometres and 13 communes.

CHATILLON-en-Vendelois, a town of France, in the department of the Ille and Vilaine, and district of Vitré; 2 leagues N. of Vitré.

CHATIMENS MILITAIRES, *military punishments*. These, generally speaking, consist in the execution of sentences pronounced by courts-martial on military delinquents. But, in our service, military punishment more particularly means the inflicting of a certain number of lashes upon a reduced non-commissioned officer or on a private man. Military punishments have been different in different ages, and in different countries, as they are at present. The Romans had some institutions respecting them; which, though they are truly admirable, have not been adopted by any of the moderns. The Turks never inflict them but in the night. A janizary condemned to death is delivered up into the hands of civil justice, after having his name struck out of the register of the corps, who pretend to be exempt from the rigour of punishment. Those in our service are simple, and in general very summary, particularly with regard to officers. In some foreign services it is customary to send officers, found guilty of certain offences, from their regiments to garrisoned towns for certain periods, during which they lost all the advantages of promotion. Hence the phrase *être envoyé en garnison*, to be sent into garrison, implies a species of military chastisement.

A judicious application of punishments contributes much to the preservation of discipline, a punctual obedience of order, and the success of military operations, both in garrison and in the field.

CHATONNAY, in *Geography*, a town of France, in the department of the Ière, and district of Vienne; 5 leagues E. of it.

CHATRACHARTA, in *Ancient Geography*, a town of Asia, in Bactriana, near the Oxus, according to Ptolemy.—Also, a town of Asia placed by Ptolemy in Assyria.

CHATRAËL, a people of India, placed by Ptolemy on this side of the Ganges.

CHATRAMIS, a country of Arabia Felix, over against Persia.

CHATRAMMITÆ, a people of Arabia Felix, on the borders of the Erythrean sea. Ptol.

CHAUFRE, LA, in *Geography*, a town of France, and principal place of a district in the department of the Indre; which has a woollen manufacture, and carries on a large trade in cattle. The place contains 2465, and the canton 14,427, inhabitants: the territory includes $462\frac{1}{2}$ kilometres and 21 communes; 6 leagues S.S.E. from Chateauroux. N. lat. $46^{\circ} 35'$. E. long. $1^{\circ} 53'$.

CHATS, in *Agriculture*, a term employed in some districts to signify the keys of the ash, fycamore, and some other trees.

CHATS, Lake, in *Geography*, a lake of Lower Canada, on the north side of the river Utawas, between the Grand Caumont and the lake Des Chaudieres. At the extremity of the latter is the "Portage des Chats," over which the canoes and lading are carried with great difficulty 274 paces. The river is here barred by a ridge of black rocks, rising in pinacles, and covered with wood, which, from the small quantity of soil that nourishes it, is low and stunted. The river makes its way over these rocks, in numerous channels, falling 15 feet and upwards. From hence two trips are made through a serpentine channel, formed by the rocks, for several miles, when the current slackens, and is accordingly called the "Lake des Chats."

CHATSWORTH, a town of America, in the state of Virginia; 4 miles S.E. of Richmond.

CHATTÆL, in *Ancient Geography*, a people of Germany. Ptol.

CHATTENIA, a country of Arabia Felix, near the Erythrean sea, attributed by Steph. Byz. to the Gerrzans.

CHATTELS, *Catalis, Catalia*, in *Law*, a Norman term which primarily signified only beasts of husbandry, or (as we still call them) *cattle*; but in its secondary sense comprehended all moveable goods. In the grand Coutumier of Normandy, (c. 87.) a chattel is described as a mere moveable, but at the same time it is set in opposition to a fief, or feud; so that not only goods, but whatever was not a feud, were accounted chattels.

Spelman defines *chattels* to be *bona quæcumque mobilia & immobilia; propriè tamen ea bonorum pars, quæ in animalibus consistat, à quorum capitibus res ipse, alias capita, alias capitalia dicte sunt.*

In the modern sense of the word, chattels are all sorts of goods moveable or immoveable, except such as are in nature of freehold, or parcel thereof: and they are either *personal* or *real*.

CHATTELS personal, are such as do either belong immediately to the person of a man, as his horse, sword, &c. or such things as being injuriously withheld from him, a man has no way to recover but by personal action: or, strictly speaking, they are things *moveable*, which the owner may carry with him from one place to another; such as animals, household furniture, money, jewels, corn, garments, and every thing that is capable of being removed.

Chattels personal are, immediately upon the death of the testator, in the actual possession of the executors; whereas **chattels real** are not in his possession till he hath made an entry, or recovered them. An owner of chattels is said to be possessed of them; but a person is said to be *seised* of a freehold. See PROPERTY.

CHATTELS real, are either such as do not appertain immediately to the person, but to some other thing, by way of dependence; or such as necessarily issue out of some immoveable thing to a person; as a lease, or rent for years.

Sir Edward Coke observes (1 Inst. 118.) that chattels real are such as concern, or favour of, the realty: as terms for years of land, wardships in chivalry, (while the military tenures subsisted), the next presentation to a church, estates by statute-merchant, statute-staple, elegit, or the like. These are called *real* chattels, as being interests issuing out of, or annexed to, real estates; of which they have one quality, viz. immobility, which denominates them *real*: but want the other, viz. a sufficient, legal, indeterminate duration, and it is this want that constitutes them *chattels*. The utmost period for which they can last is fixed and determinate, either for such a space of time certain, or till such a particular sum of money be raised out of such a particular income: so that, in the eye of the law, they are not equal to the lowest estate of freehold, a lease for another's life. Their tenants were considered upon feudal principles, as merely bailiffs or farmers; and the tenant of the freehold might at any time have destroyed their interest, till the reign of Henry VIII. (See *ESTATE for years*). A freehold, which alone is a real estate, and seems to answer to the fief in Normandy, is conveyed by corporal investiture and livery of seisin; which gives the tenant so strong a hold of the land, that it never after can be wrested from him during his life, but by his own act of voluntary transfer or of forfeiture; or else by the happening of some future contingency, as in estates "per autre vie," and certain determinable freeholds. (See *ESTATES for life*, and *FREEHOLD*.) And even these, being of an uncertain duration, may by possibility last for the owner's life; for the law will not presuppose the contingency to happen before it actually does, and till then the estate is to all intents and purposes a life-estate, and therefore a freehold interest. On the other hand, a chattel interest in lands, which the Normans put in opposition to fief, and we to freehold, is conveyed by no seisin or corporal investiture, but the possession is gained by the mere entry of the tenant himself; and it will certainly expire at a time prefixed and determined, if not sooner. Thus, a lease for years must necessarily fail at the end and completion of the term; the next presentation to a church is satisfied and gone the instant it comes into possession, that is, by the first avoidance and presentation to the living; the conditional estates by statute and elegit, are determined as soon as the debt is paid; and so guardianships in chivalry expired of course the moment that the heir came of age. And if there be any other chattel real, it will be found to correspond with the rest in this essential quality, that its duration is limited to a time certain, beyond which it cannot subsist. Blackst. Com. Book II.

CHATTER *les pieces*, in *Gunnery*, to search pieces, or to probe and examine pieces of ordnance with a *chat*, in order to discover whether there are any defects on the inside of it, or within the bore.

CHATTERER, in *Ornithology*; the Bohemian or Waxen chattering, *AMPELIS garrulus* of Linnæus. This bird is about eight inches in length. It is distinguished by having the hind part of the head crested, and the secondary quill-feathers tipped with red horny appendages. This is an inhabitant of Europe, America, and the north of Asia.

CHATTERPOUR, in *Geography*, a town of Hindoostan, in the country of Allahabad; 212 miles S.S.E. from Agra, 150 miles S.W. from Allahabad, 237 from Banares, 747 N.E. from Bombay, 803 N.W. from Calcutta by Moorhedab, and 698 by Bi boom, 623 N.E. from Hyderabad, 17 S.W. from Lucknow, 975 N. from Madras. N. lat. 25. E. long. 80°.

CHATTERTON, THOMAS, in *Biography*, a youth of very extraordinary genius, was born after the death of

his father, at Bristol, on the 26th of November, 1732. The life of this young man was short but eventful: it began and terminated in indigence and misfortune. His mother, by the loss of a husband, was left in poverty, and the son, owing to the same unfortunate event, was deprived of that attention which might have conducted his early years through all the difficulties that circumstances, and an untoward disposition opposed to the attainment of knowledge. He could not be persuaded to learn his letters, till he fell in love, as Mrs. Chatterton expressed herself, with the illuminated capitals of a musical manuscript in French; the afterwards taught him to read from an old black-lettered bible. When he was about eight years old he was admitted into a charity school, where he might learn the elements of reading, writing, and common arithmetic. The first years of his residence at this seminary passed without notice, and with scarcely any effort on his part. When he was about ten years of age, he acquired a taste for reading, which became from that period a kind of ruling passion, and out of the trifle allowed him by his mother for pocket-money, he began to hire books from a circulating library. His disposition as well as his taste differed much from what was observable in other children. He was grave, pensive, and not unfrequently of a melancholy cast. At times he seemed lost in contemplation, and for days together scarcely spoke to any one. His intimates in the school were few, and those of the most serious cast. Before he was 12 years old, he drew up a catalogue of the books which he had read, and which amounted to more than 70; soon after this, it is certain that he had composed some verses, and he now began to exhibit that ardour of mind by which he was afterwards so strongly characterized. At fifteen he was bound apprentice to a scrivener at Bristol, in which situation his leisure allowed him ample time to follow his literary pursuits. He had not continued in this course of life for more than a year, before he began to attract public notice, by the publication of an article in the *Bristol Journal*.

In the church of St. Mary Redcliffe, Bristol, which was founded or re-built by W. Canynge, an eminent merchant, during the reign of Edward IV. there is a room containing several large chests, in one of which, called Canynge's coffer, were deposited some title-deeds; these, about the year 1727, were wanted, and an order was given to break open the chest. The deeds were taken, but the other manuscripts were left exposed as of no value. Many of them were carried away, but Chatterton's father, who was nephew to the sexton, removed several baskets full of parchments, which he put to no better use than that of covering copy-books and bills for the school over which he presided. Young Chatterton, soon after the commencement of his apprenticeship, was struck with one of these parchments converted into a thread paper; he soon got possession of all that were left of the hoard, and from this period, at least, he seems to have formed the design of converting them into a system of literary forgery. Upon the opening of the new bridge at Bristol, an article appeared in Farley's Bristol Journal, in 1768, entitled, "A Description of the Fair's first passing over the Old Bridge, taken from an Ancient Manuscript." This was traced to Chatterton, who, after much equivocation, avowed that it came from the old chest. He next caused a rumour to be propagated, that certain ancient pieces of poetry had been obtained from the same place, the authors of which were Thomas Canynge, and the friend of Sir Thomas Rowley, a priest. The report gained credit, and he was applied to by some respectable inhabitants of Bristol, whom he presented, with out any kind of reward, with various poetical pieces, under the name of Rowley.

In 1759 he wrote to the Hon. Horace Walpole, offering to furnish him with accounts of several eminent painters, who had flourished in early times at Brillol, inclosing in the same packet, two specimens of the old poems, with a relation of their discovery. By the poets Mason and Gray, to whom they were shewn, these were instantly pronounced to be forgeries, and were, after a considerable lapse of time, returned.

Chatterton, prior to this, had commenced a correspondence with the Town and Country Magazine, and had inserted in that work various articles relative to antiquity, of extracts from the pretended Rowley, and of pieces entitled "Saxon Poems, written in the Style of Ossian." He also became a writer of Satire, particularly of the poetical kind, in which he did not spare even those who had been his friends. His character began now to be developed, and it did not appear in the most favourable light. The confidence which he felt in his own powers rendered him proud and impatient of controul. Whatever plan he adopted he entered upon with an almost unexampled earnestness. Poetical enthusiasm was never more strongly exhibited than in Chatterton. He fancied he could writ with effect, only at particular seasons, and the full of the moon was the time when he imagined his genius was in perfection; at this period, as if the immediate presence of that luminary added to the inspiration, he frequently devoted a considerable portion of the night to composition.

London was become the first object of his views, the only proper place, as he thought, for the display of his talents: yet he knew not how to free himself from his indentures. At length, having avowed himself an unbeliever in the Christian religion, he threatened to put an end to his life, on Easter day, 1770; his master, on learning this fact, immediately dismissed him from his service. Chatterton now set out for the metropolis, and in an answer to some inquiries from a friend, was given an exposition of his plans. "My first attempt," said he, "shall be in a literary way: the promises I have received are sufficient to dispel doubt; but should I, contrary to my expectation, find myself deceived, I will, in that case, turn methodist preacher. Credulity is as potent a deity as ever, and a new sect may be easily devised. But if that should fail me, my last and final resource is a pistol." From a young man of 17, who could deliberately avow such sentiments, much moral worth was not rationally to be expected. A contempt for the truths of revealed religion is almost always succeeded by a laxity of principle very inauspicious to real and progressive improvement. Upon his arrival in London he engaged in many projects with the bookellers; a history of England, and another of the metropolis; essays in a magazine, and in the newspapers, and songs for places of public entertainment were among his projected plans.

He was particularly attached to party politics, and connected himself with what was deemed the popular side of the question: he was introduced to the Lord Mayor Beckford, who received him kindly, but from whom, it appears, Chatterton was not able to get any remuneration for his exertions in the cause which his heart espoused. Stung with disappointment, he observed, *that he must be a poor author who could not write on both sides.* Upon this maxim he acted; but prosperity was not the attendant upon his dereliction of principle. For some time indeed he indulged the most sanguine hopes of attaining to distinction, and even affluence, by the exertions of his pen; and, to his honour be it spoken, no circumstance, with these prospects in anticipation, gave him more pleasure than the hope of being

able to assist his widowed mother and beloved sisters in their need. From his first earnings, scanty as they were in comparison of what he had fancied they would prove, he devoted a part for presents to his relations at Brillol. Within a very short time after he had boasted of his prospects with regard to the future, he experienced some change in his expectations. The reverse was sudden, and the dream of hope was speedily converted into the anguish of despair. The particular cause of this depression of spirits has never been exactly ascertained. He perhaps perceived that he had nothing to hope from the patronage of the great; and he felt, that a subsistence depending on bookellers must be scanty, and hardly earned. He had anticipated celebrity and affluence: he had a taste for dissipation, and public amusements seemed necessary as food to his existence: ill prepared, therefore, was he for regular and habitual industry. His pride was mortified, and he was disgusted with the labours of a literary life. He determined to quit the scene of his disappointment, and made an ineffectual attempt to be sent out a surgeon's mate to the coast of Africa: his last hope was blasted; and from this time he fell into a state of extreme indigence, which cannot be accounted for but on the presumption that he preferred death to the moderate exercise of those talents with which he was endowed. He was reduced to the want of necessary food; yet his pride even at that period was too great to allow him to accept of a dinner from the person with whom he lodged, the day before his death. In these desperate circumstances, his mind reverted to what he had been accustomed to regard as his last resource: on the 24th of August 1770 he swallowed a quantity of arsenic in water, which proved fatal to him in a few hours. He was interred in the burying-ground belonging to the work house in Shoe Lane. Thus terminated the life of the unfortunate Chatterton, before he had completed eighteen years. What mult increase our regret for this rash step, is the circumstance, that Dr. Fry of Oxford went to Brillol within two or three days of the unhappy catastrophe, in order to search into the history of Rowley and Chatterton, and to patronise the latter if he appeared to deserve and stand in need of assistance—*wheu alas!* all the intelligence he could procure was, that Chatterton had, within a few days, destroyed himself.

The authenticity of the poems ascribed to Rowley was at first defended by persons of considerable rank in the antiquarian literary world: but the advocates for this opinion have long since been silenced, and Chatterton is almost universally admitted to be the author; and the measure of his reputation, as an author and a poet, is taken from them. They consist of pieces of all the principal classes of poetical composition; tragedies, lyric and heroic poems, pastorals, epistles, ballads, &c. &c. Many of them abound in sublimity and beauty, and display wonderful powers of imagination and facility of composition. They are however very unequal in merit; yet, after all their defects, they must ever be regarded as very extraordinary productions for a mere lad of 15 or 16 years of age. The other writings of Chatterton display many excellencies, but they are inferior to these.

The person of Chatterton, like his genius, was premature. He had a manliness and dignity beyond his years: and there was about him something remarkably prepossessing. He had an uncommon ardour in the pursuit of knowledge, and a great facility in the attainment of it. His ruling passion, that which governed his whole conduct, was the desire of literary distinction. This passion intruded itself in his letters, and in his conversation it seemed to absorb all his attention. It was his favourite maxim, that "man is equal

to any thing, and that every thing might be achieved by diligence and abstinence." His ambition was evident to all who knew him, from his earliest youth. His melancholy was extreme on some occasions, and then he was ever eager to argue in favour of suicide. The natural gloominess of his disposition was probably increased by the principles of scepticism which he had unfortunately imbibed; and to these may be attributed his death. He has been charged with licentious conduct, and with indulging strong resentments against those who had offended him. His faults have been probably exaggerated; at any rate, they are much exceeded by the good qualities that have been fairly attributed to him. His temperance was exemplary; he was a lover of truth from the earliest dawn of reason; but the most amiable feature in his character was his generous attachment to his mother and relations. Every favourite project for his advancement in life was accompanied with promises and encouragement to them. In this respect his whole conduct is deserving the imitation of those in more fortunate circumstances, and under the influence of better principles than this unfortunate young man cherished. Biog. Brit.

CHATUGA, in *Geography*, a town of America, in the Tennessee government; 3 miles S.W. of Tellico.

CHATUS, in *Middle Age Writers*, a kind of gold coin. **CHATUS** was also called, by some French writers, *maillies aubait*.

Du Cange makes it a question, whether the *chatus* was the same coin as the *chapotenses*, and supposes that the latter might be formed from *chati Pidavenfes*; in French, *chats de Poulou*.

CHATZAN, in *Geography*, a town of Asia, in the Moultan country, W. of the Indus; 90 miles W. of Moultan. N. lat. 21° 8'. E. long. 69° 45'.

CHAVABEDA, a principality of Arabia Deserta, whose chief towns are Chavabeda, Tangia, Merah, and Megiarah. This principality, and also that of Argia, are in all respects unknown to us, except in the Arabian tables.

CHAVAGNES, a town of France, in the department of the Maine and Loire; 4 leagues S. of Angers.

CHAVANAY, a town of France, in the department of the Rhone; 7 leagues S. of Lyons.

CHAVANGES, a town of France, in the department of the Aube, and chief place of a canton, in the district of Arcis-sur-Aube; 6 leagues S. of Arcis. The place contains 974, and the canton 3871 inhabitants: the territory includes 152½ kilometres, and 14 communes.

CHAVANNE, a town of France, in the department of the Ain, and district of Bourg; 8 miles W. N.W. of it.

CHAVARIGHTS, a sect of Mahometans, who deny that God ever sent a prophet that was infallible; and who had a commission to give a law to mankind: they pretend likewise that if such an office should ever become necessary, it would not be confined to a single family, but that every man of probity and virtue would be capable of that honour.

CHAUBI, in *Ancient Geography*, a people of Lower Germany, placed by Strabo near the ocean, between the Bructeri and Sicambri.

CHAUCER, GEOFFREY, in *Biography*, the earliest English classic poet, was born, it is generally supposed, in the year 1328. Of his parentage and early youth little is known, except that he was born and brought up in London. It should seem, from circumstances discovered by his biographers, that he was exposed to the inconveniences of a narrow fortune, but that he received all the instruction which the metropolis could then afford. It is admitted that he studied in both the English universities, first at Cambridge, then at

Oxford, and probably at Paris also. It is evident, from his various writings, that he acquired a large acquaintance with the scholastic learning of the age. To him the Greek classics were inaccessible; but he successfully studied the Latin, French, and Italian. Virgil was his favourite author. The adventures of romance and the songs of the minstrels Chaucer listened to with avidity. Tales of chivalry, of enterprise, and heroic adventure, had a double interest with him, because he knew that, when he went forth into the world, the men of whom he read, a race now extinct, would be the objects of his observation and intercourse. The whole world was then romantic, scenic, and sublime. This was the age of reformers and robbers. Pilgrimages and crusades invited the consent of the pious. Chaucer had also a particular turn for subjects of humour. At college he contracted a friendship with Gower and Strode, two young Oxonians of great learning and talents, and upon his return from the continent, whither he went for improvement, by travels through France and the Low Countries, he is supposed to have studied the law at the Temple. He was, for a short time, a soldier as well as a lawyer, but he quitted each of these professions after a short trial, and his final destination was the court, where he first obtained the post of *vadlatur*, or yeoman to Edward III. He had already distinguished himself as a poet, a quality that was likely to recommend him to a prince who was the patron of letters. Chaucer was a courtier in the best sense of the word, not depending upon ministers, but associating with princes; he seems, however, to have placed the chief hopes of his fortune on the friendship of John of Gaunt, duke of Lancaster; with whose family he formed an intimate connection, though not of the most creditable kind. The duke entertained as governors to his children, Catherine, the widow of sir Hugh Swynford. This lady was also the favourite mistress of John of Gaunt, by whom he had several children. She had a sister, to whom the duke and duchess were also attached, who recommended her to Chaucer for a wife. He married her in 1360, and from that time he speedily advanced at court. He received the gift of a house almost contiguous to the royal palace at Woodstock; and he was gratified with an annuity from the Exchequer of twenty marks, which sum was doubled on his being appointed gentleman of the king's privy-chamber. In 1372, he was sent, with other persons, as a commissioner to Genoa, on a matter of public concern; and it is affirmed by Froissart, that Chaucer was the principal in the unsuccessful attempt to negotiate a marriage for Richard, prince of Wales, with a daughter of the French king. He was made comptroller of the customs, and various other lucrative employments were conferred upon him, which enabled him to live in a dignified style. It was the custom of that age for the great public officers to keep their own accounts, and Chaucer was enjoined to perform the duties of his office with his own hand. He was rarely absent from business, for one and one only written leave of absence to him for a month is formally recorded upon the patent rolls. Of himself, he says, that he had no opportunity for the pleasures of study, "till he had made an end of all his reckonings," and the business of the day was concluded. He did not, however, renounce the pursuits of literature, for several of his poems were written during the period of his prosperity and attendance upon the court. Still he regarded the duke of Lancaster as his peculiar patron, whose political schemes he felt himself bound to promote. The duke having espoused the cause of Wickliffe, Chaucer employed his pen in exposing the vices and ignorance of the clergy. On the succession of Richard to the crown, the duke of Lancaster

for a time obtained a chief share in the administration of affairs; and a renewal of some of the grants to Chaucer was among the arrangements in this reign; but he seems to have been deprived of his most lucrative office as comptroller of the customs. His affairs soon fell into disorder, and he was obliged to have recourse to the sovereign's protection against his creditors.

In a few years the duke, his patron, became unpopular, both in and out of the court, by his adherence to the followers of Wickliffe, who were considered as the authors and abettors of the commotions that disturbed the kingdom. London itself was divided into two parties, one favouring the reformation, the other adhering to the established clergy. Chaucer sided with the former, and thereby rendered himself obnoxious to the officers sent to suppress the disturbances, and who would have been apprehended had he not escaped first to Hainault, and thence to Zealand, where he lived in concealment till his distresses forced him back to London. He was, however, immediately seized and sent to prison, where he was treated with the greatest severity. As in exile he was nearly destitute of all the necessaries of life, so in prison he experienced the savage triumph of his enemies, and was probably the witness of many barbarous executions. The terms upon which he was liberated from confinement, after five years of oppression and difficulty, were such as no honourable man ought to have complied with. For the sake of pardon he disclosed all he knew of the designs of the party whose cause he had formerly defended; thus did Chaucer obtain his liberty, accompanied with a heavy load of merited obloquy. Upon his restoration to liberty Chaucer was appointed clerk of the works, a situation which he occupied only a very short time: he was in truth reduced to such a state of penury, that he sold his pensions and retired to Woodstock. Here he calmly employed himself in reviling and correcting his various writings, and of applying to practical purposes those stores of philosophy which study and reflection had enabled him to accumulate. In this retreat, after he was sixty years of age, he planned and composed his *Canterbury Tales*, which have been deemed one of the most extraordinary specimens of active genius and various talent that England has produced. The two last years of his life he spent at Donnington castle. The return of the duke of Lancaster to court, and his marriage with Catharine Swynford, his old mistress, were favourable circumstances to Chaucer, who obtained a renewal of his annuity, and a grant of a pipe of wine annually, from the customs of the port of London. Chaucer lived to see his sovereign deposed, and the son of his patron John of Gaunt usurp the government. In addition to his former grants, were conferred upon him 40 marks per ann. during life: but it is to the praise of Chaucer, that as he was too old to oppose the pretensions of the usurper, or to contribute to redress the wrongs which he deplored, yet all the benefits of the new king, and all his connexions with, and obligations to, the father of that monarch, could not extort from him a line of congratulation. Soon after the commencement of the new reign, his own affairs required him to visit the metropolis, but he was too old to bear the fatigues attendant upon the journey. He died in a house that he had hired at Westminster, October the 25th, 1400, at the age of seventy-two. His remains were interred in Westminster-abbey.

From this sketch Chaucer appears to have been a man of the world as well as a scholar, and to the variety of the scenes in which he engaged, is to be ascribed the varied character of his writings. As a courtier, a traveller, and a man of pleasure, he acquired an air of gallantry, and

a talent for rich and elegant description, which distinguishes him from all other writers of that period: at the same time a fund of serious reading, joined to the impressions which the scenes of adversity had made upon his mind, rendered him well calculated to sustain the part of the moralist and philosopher. His works are numerous: his fame ranks high as an original poet, and his industry is no less conspicuous as a translator and imitator from the French and Italian writers. He enriched his native language by new forms of diction and versification; but there is nothing in which he excels his contemporaries more than in possessing that true poetical character of which they were almost wholly void. In many of his tales are to be found fine figures and splendid imagery displayed in glowing and elegant language. The most considerable and celebrated work of this poet is his "*Canterbury Tales*," which are a set of stories connected by the fiction of their being told by a company met at an inn in Southwark, for the purpose of a pilgrimage to the shrine of St. Thomas-a-Becket, at Canterbury. These tales are various in their subject; heroic, and romantic; satirical, humorous, and moral; and the prologue by which they are introduced, is one of the most curious memorials of the age. It contains a description of all the personages forming the company, among whom are individuals of the most remarkable characters both male and female, of which society is composed. These are delineated with a strength and precision that can scarcely be surpassed, and form a group highly interesting to the observer of human nature; in short, they exhibit a review of the private life of the fourteenth century. The *Canterbury Tales* have been handsomely published by Mr. Tyrwhitt in five volumes 8vo., but the editions of Chaucer's other works do no credit to the lovers of ancient English poetry. *Biog. Brit. Godwin's Life of Chaucer.*

CHAU-CHEW, in *Geography*, one of the 10 jurisdictions into which the province of Quang tong or Canton, in China is divided, and also a city of that jurisdiction.

CHAU-CHOO-FOO, or CHAO-TCHOU-FOU, the second city of the province of Canton, in China, situate at the confluence of the river Pe-kiang, with another considerable stream proceeding from the N.W. The environs of this city are pleasant and romantic. The plains are sown with rice and tobacco, and the rising grounds are planted with cotton and the *sesuqua*. The pastures are covered with numberless flocks, and the coasts teem with fish. The boats which ply from one part of the city to another, are chiefly managed by females, who are generally young and neatly dressed, with an evident intention of attracting the attention of passengers. At this city the concurrence of two navigable rivers occasions a concourse of male strangers. The frail females in the boats had not combined this double occupation, after having quitted their parents, or on being abandoned by them on account of their misconduct; but the parents themselves, taking no other interest in the chastity of their daughters than as it might contribute to an advantageous disposal of them to wealthy husbands, feel little reluctance, when no such prospect offers, to devote them to one employment with a view to the profits of another. The distinction which this city has acquired is owing to a celebrated monastery of the Bonzes which lies in its vicinity. Its situation is singularly delightful: from the middle of a mountain called Nan-hoa, where it stands, there is a charming prospect of a desert, stretching out into an immense plain, which is bordered with hills, on the summits of which fruit trees are planted in regular order, intermixed here and there with groves, the foliage of which is always green. The country about the town belongs to the monastery, the
origin

origin of which is traced back 8 or 900 years. The Bonzes pretend that its founder practised the most edifying austerities, an example, however, which they do not chuse to follow, as they abandon themselves to every kind of debauchery. The people who formerly visited this place as pilgrims, complain much of their theft and robberies; but these abuses have been corrected, and the devotees of the province may now visit the place in safety. The air of this city, however delightful its situation, is insalubrious; and contagious distempers, generally prevailing here from the middle of October to the beginning of December, sweep off every year a great number of inhabitants. This city has under its jurisdiction 6 other cities of the third class; near one of which grows a kind of black reed, of which various instruments are made that cannot be distinguished from those that are made of real ebony. Emb. to China, vol. ii. Grosier's Descript. of China, vol. i.

CHAUCI, CAUCI, or CAUCHI, in *Ancient Geography*, a people of Germany, whose territory commenced with the Frisii, occupied part of the sea-coast, and had behind it the Chamavi, Angriarii, Dulgibini, &c. according to Tacitus. This author, as well as Ptolemy and Pliny, distinguished them into great and small. Strabo says, that Drusus Germanicus was the first of the Romans who, crossing the sea, penetrated into their territory, after having gained a naval victory over the Ansbarii, and subjugated the Frisii. Tacitus says, that Tiberius subdued these two nations. They rebelled against the Romans under the empire of Claudius; but were defeated by Gabinius, who hence obtained the appellation of "Caucian," according to Suetonius. Tacitus says, that they routed their neighbours, the Ansbarians, under the empire of Nero, and during the troubles of Vitellius's reign, they united with the Batavi and Frisii, and spread themselves over the empire; but they were again restored to favour. They remained in tranquillity till the reign of Aurelius, when they invaded the territory of the Batavi, but Didius Julian stopped their progress.

CHAUD-MEDLEY, in *Laws*, according to its proper etymology, denotes an affray that happens in the heat of blood or passion. See *CHANCE-Medley*.

CHAUDEBURG, a village of France in the department of the Moselle, near Thionville, celebrated for its medicinal waters.

CHAUDÉS-AIGUES, a town of France in the department of the Cantal, and chief place of a canton in the district of St. Flour, deriving its name from its medicinal spring, and trading chiefly in skins and glue; 12 miles S. of St. Flour. The place contains 2040, and the canton 8158 inhabitants; the territory comprehends 340 kilometres and 14 communes.

CHAUDIERE, a river of Canada, which rises in Lincoln and Hancock counties in the district of Maine, and joins the river St. Lawrence, about 7 miles above Quebec. The fall in this river is not half that of Montmorenci, or about 120 feet high; but it is no less than 250 feet broad. However the scenery round this cataract is in every respect much superior to that in the neighbourhood of Montmorenci. The banks of La Chaudiere are covered with trees of the largest growth, and amidst the piles of broken rocks which lie scattered about the place, you have some of the wildest and most romantic views imaginable. As to the fall itself, its grandeur varies with the season; when the river is full, a body of water rushes over the rocks in a manner that astonishes the observer; but in dry weather, and, indeed, during the greater part of the summer, the quantity of water is inconsiderable. The carrying place from boatable waters in

the Chaudiere to similar waters in the Kennabec, is not more than five miles.

There are several portages on the north side of the river Utawas in Lower Canada, called Portages de Chaudiere; at the first portage of this name, the body of water falls 25 feet, over cragged excavated rocks, in a wild and romantic manner. At a small distance below, is the river Rideau on the left, falling over a perpendicular rock near 40 feet high, in one sheet, assuming the appearance of a curtain; from which circumstance it derives its name. To this extent the lands have been surveyed, and are very fit for culture. Many loyalists are settled upon the river Rideau, and have thriving plantations. Some American families, preferring the British territory, have also established themselves along a river on the opposite side, where the soil is excellent; and it is apprehended, that at no very distant period, the lands will become settled from this vicinity as far as Montreal. Over this portage, which is 643 paces long, the canoe with its whole lading is carried. The rock is so steep and difficult of access that it requires 12 men to take the canoe out of the water; it is then carried by 6 men, two at each end on the same side, and two under the opposite gunwale in the middle. From hence to the next is but a short distance, in which they make two trips over the second Portage de Chaudiere, which is 700 paces, to carry the loading alone. From hence to the next and last Chaudiere, or Portage des Chenes, is about six miles, with a very strong current, where the goods are carried 740 paces, the canoe being towed up by the line, when the water is not very high. The next remove is to the Lac des Chaudières, computed to be 30 miles in length; but though it is called a lake, it has a strong draught downwards, and its breadth is from 2 to 4 miles. At the end of this is the Portage des Chats. See *CHATS*.

CHAUDIÈRES, or CHAUDIÈRES de Magasins, are vessels made use of in military magazines, to boil pitch in for various purposes. They are necessary in all places and particularly during sieges.

CHAUDRON, in *Geography*, a town of France in the department of the Maine and Loire; 15 miles S.W. of Angers.

CHAVES, a town of Portugal, in the province of Trallos-Montes, near the confines of Spain, defended by a castle, walls, and bastions, seated on the Tamega, and founded by the emperor Trajan: several traces of its ancient magnificence still remain; 12 leagues W. of Braganza. N. lat. 41° 42'. W. long. 6° 31'.

CHAUFFAGE MILITAIRE, in *Military Language*, is an allowance of fire-wood regulated by particular orders or ordinances to officers and soldiers whether they are in barracks or not, during the continuance of cold weather.

CHAUFFAILLES, in *Geography*, a town of France in the department of the Saône and Loire, and chief place of a canton in the district of Charolles, 4 leagues E. of Marcigny; the place contains 2155, and the canton 7292 inhabitants; the territory includes 142½ kilometres and 9 communes.

CHAUFFE. A spot where the wood is collected and burnt in a foundry. The chauffe is three feet below the furnace, over every part of the inside of which the flames spread, and by their intense heat dissolve the metal.

CHAUFFE-WAX. See *CHAUFFE-wax*.

CHAO-KING, CHAO-KING, or CHAO-KEUNG, in *Geography*, one of the 10 capital jurisdictions into which the province of Quang-tong, or Canton in China is divided; and also the chief city of the jurisdiction, and the residence of the viceroy. See *CHAO-KEUNG*.

CHAUKUNDA, a town of Africa, near the river Gambia, in the kingdom of Jemurrow.

CHAUL, a town of Hindoostan on the coast of Malabar, with a good port, and defended by a citadel, taken in 1507 by the Portuguese; 6 leagues S. of Bombay.
