CHAULIEU, WILLIAM ANFOYE DE, *Abbé*, in *Biography*, a favourite French poet, was born at his father's seat at Fontenay, in 1639, and became by means of his natural genius, excellent education, and lively disposition, the delight of elegant society, and the esteemed friend of the great duke of Vendome, and of his brother the grand prior of Malta. Entrusted with the management of their concerns, he was recompensed by several valuable benefices; which, added to the lordship of Fontenay, enabled him to gratify his inclination by pursuing a life of pleasure. His apartments at the temple in Paris were the resort of learned friends, who were charmed by his amiable qualities and lively conversation. The poetry in which he excelled was a mixture of the voluptuous and sentimental, blending with the gaiety of Anacreon, the philosophical good-humour of Horace. Chapelle was his model, whom he imitated in the easy negligence of his verse and the occasional use of double rhymes; and as a poet he deserves to be ranked with the careless men of genius, rather than with the masters of the art. Notwithstanding several fits of the gout, this lively Epicurean lived to his 81st year; dying at Paris in 1720. The most esteemed of the several editions of his works are that of Amsterdam in 1733, and that of Paris, in 1744, each comprised in 2 vols. 8vo. *Nouv. Dict. Hist.*

CHAULIODONTA, from *χαλαω*, *I put forth*, and *οδον*, *teeth*, among *Ancient Naturalists*, is applied to those animals, the teeth of which grow to a great length out of their mouths, as the boar and the elephant.

CHAULMES, in *Geography*, a town of France, in the department of the Seine and Marne, and district of Melun; $7\frac{1}{2}$ leagues S.S.E. of Paris.

CHAULNES, *the DUKE DE*, in *Biography*, a peer of France, distinguished as an astronomer and mathematician, was born at Paris in 1714, and manifested, in early life, a strong propensity for the study of the sciences. In the tumult of armies and camps he cultivated mathematics, astronomy, mechanics, &c. In 1743 he was named honorary member of the academy; and, at the meetings of this illustrious body, which he regularly attended, he produced various constructions and corrections of instruments in astronomy and dioptrics, and particularly of achromatic telescopes. The result of these researches was a new parallaxic machine of an improved kind, and the mode of applying the micrometer to telescopes, and of accurately measuring the parts of that instrument. Whilst he was prosecuting similar speculations and experiments for the improvement of science, his career was terminated by death in 1769. The *Memoirs* of the Academy of Sciences contain a variety of his communications. In the volume for 1755, we have observations on some experiments in the 4th part of the 2d book of Newton's *Optics*: in that for 1765, observations on the platform for dividing mathematical instruments; also a determination of the distance of Arcturus from the sun's limb at the summer solstice; and observations on some means of perfecting astronomical instruments: in that of 1767, observations on some experiments relating to dioptrics: in 1768, the art of dividing mathematical instruments: in 1769, observations on the transit of Venus in that year; and a new method of dividing mathematical and astronomical instruments.

CHAULNES, in *Geography*, a town of France, in the de-

partment of the Somme, and chief place of a canton in the district of Péronne; 7 miles S. of it. The place contains 1243, and the canton 10,002 inhabitants. The territory includes 165 kilometres and 23 communes.

CHAUM, in *Ancient Geography*, a mountain of Paeponnefus, in the Argolide, in which, according to Pausanias, was the source of the river Erafinus.

CHAUMERGY, in *Geography*, a town of France, in the department of the Jura, and chief place of a canton in the district of Dôle; 3 leagues W. of Poligny. The place contains 306, and the canton 4891 inhabitants: the territory includes 8 $\frac{1}{2}$ kilometres and 17 communes.

CHAUMETTE, ANTHONY, in *Biography*, a surgeon of eminence, was born at Puy, a town on the banks of the Loire, in France, in the early part of the 16th century. In his preface to his *Enchiridion Chirurgicum*, he informs us, he was first sent to Montpellier, where he studied medicine under Rondeletius, and that he went thence to Paris, and having completed his education in anatomy and surgery under Sylvius, he returned to his native country, where he appears to have been in great request. In 1560 he published an abridged practice of physic, to which he added a treatise on the lues venerea; in which he strongly recommends the use of mercurial frictions, which had succeeded, he tells us, when all other methods and medicines had failed. This gained to his work such popularity, that in the space of about thirty years from his first appearance at Paris, editions of it appeared in almost every country in Europe. The title of the work is, "Enchiridion Chirurgicum, externorum morborum remedia, tum universalia, tum particularia brevissima complectens. Quibus morbi veneri curandi methodus probatissima accessit." Parisiis. Eloy. *Dict. Hist. Bib. Cl.*

CHAUMONT, in *Geography*, a town of France, in the department of the Ardennes, and chief place of a canton, in the district of Rethel; 9 miles N.N.W. of it. The place contains 965, and the canton 8217 inhabitants: the territory includes 202 $\frac{1}{2}$ kilometres and 21 communes.

CHAUMONT, a town of France, and principal place of a district in the department of the Upper Marne, seated on a mountain near the river Marne. It has a manufacture of coarse woollen cloth, and considerable trade in deer and goat's skins. N. lat. 46° 7'. E. long. 5° 2'.

CHAUMONT, a town of France, in the department of the Oise, and chief place of a canton in the district of Beauvais; 13 miles S.S.W. of it. It derives its name from an artificial mountain, on which was erected a fortress, which served as a boulevard of France when the English possessed Normandy. The place contains 1088, and the canton 12,717 inhabitants: the territory comprehends 275 kilometres and 39 communes. N. lat. 49° 15'. E. long. 1° 47'.

CHAUMONT, a town of Savoy, in the Genevois, near the frontiers of France; 6 miles N.E. of Seffel.

CHAUMONT, a town of France, in the department of the Forêts and district of Neufchateau; 6 miles S. of Buissonne.

CHAUMONT *sur-Tharonne*, a town of France, in the department of the Loire and Cher, and chief place of a canton, in the district of Romorantin; 17 miles E. of Blois. The place contains 1140, and the canton 5404 inhabitants: the territory includes 41 $\frac{1}{2}$ kilometres and 7 communes.

CHAUMPERT. See CHAMPART.

CHAUMUSSAY, in *Geography*, a town of France, in the department of the Indre and Loire; 12 miles S. of Loches.

CHAUMUZY, a town of France, in the department of the Marne, and district of Reims; 8 miles S.W. of Reims.

CHAUNAY,

CHAUNAY, a town of France, in the department of the Vienne, and district of Civray; 2 leagues N.W. of it.

CHAUNCEY, Sir HENRY, in *Biography*, a topographical writer, was born of an ancient family of Hertfordshire, in that county, and educated at Caius College, Cambridge. In 1649 he entered the Middle Temple, pursued the study and practice of the law, was knighted by Charles II. in 1681, and in 1688 was appointed a Welch judge. He died in 1700. His "Historical Antiquities of Hertfordshire," though burdened with pedantic discussions, and depreciated by meanly-executed engravings, is a work in good estimation. *Biog. Brit.*

CHAUNI, *χαῦνοι*, in *Ancient Geography*, a people of Greece, in Thesprotia.

CHAUNTOR, CHAUNTER. See CHANTOR.

CHAUNTRY, or CHANTRY, was anciently a church, or chapel, endowed with lands, or other yearly revenue, for the maintenance of one or more priests, daily saying or singing mass for the souls of the donors, and such others as they appointed. These *chantries* were dissolved by 1 Ed. VI. cap. 14.

Hence, *chantry-rents*, are rents paid to the crown by the tenants, or purchasers of *chantry-lands*.

CHAUNY, in *Geography*, a town of France, in the department of the Aisne, and chief place of a canton in the district of Laon, seated on the Oise. The place contains 3500, and the canton 14,939 inhabitants: the territory includes 155 kilometres and 20 communes. N. lat. 49° 37'. E. long. 3° 7'.

CHAUP, LA, a town of France, in the department of the Drôme; 5½ leagues E. of Le Buis.

CHAURANA, in *Ancient Geography*, a town of Scythia, placed by Ptolemy on the other side of the Imaus.

CHAURIAT, in *Geography*, a town of France, in the department of the Puy-de-Dôme; 4 miles N.W. of Billom.

CHAURINA, in *Ancient Geography*, a town of Asia, in Aria. *Ptol.*

CHAURUS, or CHORUS, among the Romans, the north-west-wind, or that which blew between the wind called *favonius* and the north.

CHAUS, or SHAUS, in *Geography*, the most easterly and extensive province of Fez; in general mountainous, stony, and unfruitful; but in some parts fertile, and capable of feeding numerous herds of cattle.

CHAUS, in *Ancient Geography*, a river of Asia, towards Pisidia, and near the town of Erizza, according to Livy.

CHAUSSE, MICHAEL ANGELO DE LA, in *Biography*, an able antiquary of Paris, went to Rome at an early age, and fixed in that capital. His "Museum Romanum," published at Rome in 1695, fol. and in 1746, 2 vols. fol. contains a large collection of engravings of unedited antiques, and it is inserted in Grævius's collection of Roman antiquities. He published also "A Collection of Antique Gems," Rome, 1707, 4to. with Italian explanations; and "Picturæ Antiquæ Cryptarum Romanarum et Sepulchri Nasonum," 1738, fol. All his works display erudition and sagacity, and are esteemed by those who are led to study the subjects which they comprehend. *Nouv. Dict. Hist.*

CHAUSSE *trape*, in *Cenobology*, the French name of the Linnean *Murex tribulus*.

CHAUSSE *trapes*, or *Caltrops*, in *Military Language*, are what we call *crocus-fect*. They are iron instruments with four or more spikes, each of them made in such a manner, that whatsoever way any one of them may fall, it will always lie with one of those spikes uppermost. They are well calculated for

defending breaches and passes. For when thrown up and down in them, they are very troublesome to the foot that mount the breaches, or to the enemy's horse that would pass along some narrow places or streets. There are three sorts of them, viz. *small ones*, with spikes about three inches long; *middling ones*, with spikes four inches long; and *great ones*, with spikes four inches in length.

CHAUSSE *trop-haut*, in the *Manege*. A white-footed horse is said to be such, when the white marks run too high upon the legs.

CHAUSSEÉ, or *Rés de chauffée*, an old term for the level of the field, or of the plain ground.

CHAUSSIN, in *Geography*, a town of France, in the department of the Jura, and chief place of a canton in the district of Dôle; 3 leagues S. of it. The place contains 1103, and the canton 7461 inhabitants: the territory includes 190 kilometres and 23 communes.

CHAUTLAN, a town of North America, in the country of Mexico, and province of Chiapa; the inhabitants of which carry on a considerable trade in cocoa, pottery, salt, and dates.

CHAUVEAU, FRANCIS, in *Biography*, was born at Paris in 1613; and, as his father lost his fortune by gaming, he was constrained, after a liberal education, to apply the knowledge of the arts, which he had acquired as a polite accomplishment, to his own support and that of his destitute mother. He was instructed in the art of design by Laurent la Hire, and began with the use of the graver, but soon quitted it for the point, which was better suited to his taste, and the celerity of his execution. He commenced the exercise of the profession which he had assumed at the early age of 15 or 16; and his first essays were copies of the performances of his master; but such was the fertility of his invention, that he soon abandoned this servile labour, and sketched out his own thoughts on paper, as fast as they occurred, and executed his designs in etching with aqua fortis, which he wrought with as much rapidity as force and spirit; he seldom corrected or expunged any part of them afterwards, so that his works are often faulty, and unequal to each other. His house became the resort of some of the first wits of the time; and about the year 1630, they were accustomed to assemble there in order to converse on various subjects. These meetings gave occasion to the establishment of the French Academy. Chauveau was admitted into the Royal Academy of Painting and Sculpture in 1663; and in 1664 he was employed by the king to engrave the series of plates of the Carouai; displaying in the attitudes of his men and horses an admirable variety and animation. By this work he obtained a pension for life. Many of his designs for the romances of the day were executed by way of amusement after supper; the stories were read to him by his children, and fixing upon some of the most striking subjects, he traced his designs upon the plate, and so far completed them as to make them fit for the aqua fortis next morning. The number of his works is almost incredible; some say they amounted to 3000; others say that he engraved 4000 with his own hand, and mostly from his own designs, and that more than 1400 were engraved by other artists after his designs. His small plates, says Mr. Strutt, are executed in a style much resembling that of Le Clerc, founded upon that of Callot. In his large prints, he approaches near to that coarse, dark style, which was adopted by his tutor, La Hire. He furnished drawings not only to painters and engravers, but to chasers, embroiderers, and various other artists. He excelled in painting to such a degree, that Le Brun admired his pictures, and bought several of them. He engraved from Le Brun and many other masters. Among the sets of prints, executed from his own compositions,

compositions, are those for the "Bible History," the "History of Greece," the "Metamorphosis of Benvenuto," the "Jerusalem of Tasso," the "Fables of La Fontaine," "Alaric," or "Rome conquered," and several romances. Among the prints, engraved from other masters, are "Christ with the Disciples at Emmaus," from Tritian, a "Concert," from Doménichino, the "Life of St. Bruno," from Le Sueur, "Apollo and Daphne," from N. Poussin, "A Virgin and Child, with St. John and little Angels," finely etched and finished with much taste, and "Meleager presenting the Head of the Boar to Atalanta." This artist died at Paris in 1776. Moreri. Strutt.

CHAUVÉAU, RENÉ, the youngest son of the preceding, was also an eminent artist, resembling his father in the vivacity of his imagination and facility of his execution. He was born at Paris in 1663, and being left an orphan, he was placed first with a carver in wood, and afterwards with Cañiere, the sculptor, by whom he was employed in modelling trophies for the king. In this situation he attracted the notice and engaged the patronage of Colbert, and several succeeding comptrollers-general of the buildings; and at the age of 25 or 26 was reckoned the first of sculptors for models and sketches. After his marriage, a lodging was assigned to him at the Louvre, but on being deprived of it on some pretext, he was so much offended that he accepted an offer of going to Sweden in the service of Charles XII. under the protection of the baron Tessin. Here he continued seven years, and in his way to France, in 1700, he executed some works at Berlin. Several of the nobility of his country employed him in sculptures and decorations about their seats, and in various works for churches and chapels. Many of his compositions, exhibiting great taste and elegance, were engraved. From several of his employers he received munificent rewards; and particularly from the bishop of Metz, who kept him at work for eight years at his seat at Frescati. Being questioned twice in one day by his last employer, the marquis of Torci, what he expected for his day's work, he was so much piqued, that, without making any reply to a question so degrading, he set out immediately on foot for Paris. Fatigue and chagrin, together with vexation at a loss he sustained by bank-notes, occasioned an illness, which terminated in his death, in 1722. Moreri. Gen. Biog.

CHAUVIGNY, in *Geography*, a town of France, in the department of Vienne, and chief place of a canton in the district of Montmorillon; seated on the Vienne, 4 leagues E. of Poitiers. The place contains 1608, and the canton 7347 inhabitants: the territory includes 217½ kilometres and 11 communes.

CHAVUS, in *Ancient Geography*, a town in the interior of the Tauric Chersonesus, according to Strabo.

CHAUX, in *Geography*, a town of France, in the department of the Charente; 20 miles S.W. of Angoulême.

CHAUX DE FOND, a large and beautiful village of Switzerland, in the principality of Neuchâtel, situate in a broad valley which reaches to Franche Comté, and connected with Lode, by a continued range of delightful cottages, that skirt both sides of the road, and are likewise scattered over the country. La Chaux de Fond and Lode, together with the districts belonging to them, are supposed to contain about 6000 inhabitants, distinguished for their genius, industry, and skill in the mechanical arts. They carry on an extensive traffic in lace, stockings, cutlery, and other articles of their own manufacture; and they particularly excel in watch-making, and every branch of clock-work. All sorts of workmen necessary for the completion of this business, such as painters, enamellers, engravers, and gilders, are found in these villages, where, upon an average, about

40,000 watches are yearly made. On these mountains every individual is sure of obtaining a comfortable maintenance; and as the people have a prospect of soon placing their children in a way of procuring a decent subsistence, they marry early. Not many years ago, the greater part of the valleys was almost one continued forest; but the powers of industry have changed the scene into flourishing villages and fertile pastures. Besides the natural effect of frequent and early marriages in contributing to the increase of population, every stranger, who brings a certificate of his good behaviour, is at liberty to settle, and follow any trade without the least restriction. Here no apprenticeship is necessary, nothing is contraband, and industry exerts itself untaxed. The origin of watch-making in these parts is traced to the year 1679, at which time one of the inhabitants brought a watch from London, when an ingenious artist employed to repair it, examined its mechanism, and after a whole year spent in inventing and finishing the necessary instruments, and six months more in the work itself, completed a watch after this model. Several inhabitants of Chaux de Fond and Lode are well skilled in other branches of mechanical science, besides those already mentioned, and have invented useful mathematical and astronomical instruments. Several automatical figures of a very singular and surprising construction may be enumerated among the inventions of this district, for which the curious are indebted to Jaquet Droz and his son: one of these played upon the harpsichord, another drew landscapes, and a third copied any word presented to it, and wrote down whatever was dictated by any of the company. The inhabitants apply their ingenuity to convert the streams and torrents, descending from mount Jura, to useful purposes. Accordingly in the middle of the subterraneous channels formed by these waters, they have erected mills, which they serve to put in motion; they have also constructed wheels, where it seemed scarcely practicable, invented new modes of scaffolding, and various other contrivances for the accomplishment of their object. The natives are very courteous to strangers, and, in general, well informed in various branches of knowledge; and as they spend their leisure hours in reading, many of the villages contain circulating libraries. The houses are plastered and white-washed; though small, they are commodious and well-built, and furnished with a degree of neatness, and even elegance, peculiarly striking in these sequestered mountains. We shall only add, that ease and plenty reign through these mountains to such a degree, as to exclude poverty and the distress attending it; and thus they afford a pleasing view of the valuable effects of industry under a mild and equitable government. Cox's Switzerland, vol. ii.

CHAW-STICK, in *Botany*. See *GOUANIA*.

CHAYANTAS, in *Geography*, one of the jurisdictions belonging to the new vicerealty of Buenos Ayres in South America, lying about 50 leagues N.W. from the city De la Plata, and extending in some parts about 4½ leagues. This country is famous for its gold and silver mines. The former are not at present wrought, though the old subterraneous passages are still open; and the river Grande, which waters the province, has in its sand considerable quantities of gold dust, and grains of this metal. The silver mines are still wrought to great advantage. According to the statement of Helms, it has 2 gold mines, 3 of silver, 1 of copper, 1 of tin, and 1 of lead. The cattle of this province are barely sufficient for the inhabitants.

CHAYOTA, in *Botany*, Jacq. See *SECCURIA*.

CHAZA, in *Ancient Geography*, a town of the interior of Africa, belonging to Ethiopia, near the Nile.

CHAZAUNI, **CHAUZANÉ**, or **CHAUZANI**, a people of Scythia, according to Ptolemy.

CHAZELET, in *Geography*, a town of France, in the department

department of the Indre, and district of Chateauroux; 7 miles S.S.W. of Argenton.

CHAZELLES, JOHN MATTHEW, in *Biography*, an eminent mathematician and engineer, was born at Lyons in 1657, and educated in the Jesuits' college of his native place, whence he removed to Paris in 1675. M. Du Hamel, secretary to the Royal Academy, introduced him to Cassini, and he was placed in the observatory, where he learned the practical part of astronomy. He afterwards assisted in forming the geographical planisphere, 27 feet in diameter, and in continuing the meridian line of France towards the south. After remaining five years with Cassini, he became tutor in mathematics to the duke of Montemart, who obtained for him the post of geography-professor to the gallees at Marseilles, and in this situation he made many plans of the sea coast; and he performed various other services as hydrographer and engineer, as well as in the astronomical department. He also made a voyage to the Levant, measured the pyramids of Egypt, and ascertained that the position of the four sides of the largest pyramid exactly faced the four cardinal points of the compass. Upon his return, he reported the particulars of his travels to the Academy of Sciences, and was admitted, in 1695, a member of their body. The memoirs of the academy previous to the year 1708, contain many of his communications. He died at Marseilles in 1710. Eloge par Fontenelle. Gen. Biog.

CHAZELLES sur Lyons, in *Geography*, a town of France, in the department of the Loire, and chief place of a canton in the district of Montbrison; 7 leagues W.S.W. of Lyons. The place contains 2364 and the canton 13,441 inhabitants: the territory comprehends 232½ kilometres and 21 communes.

CHAZENA, in *Ancient Geography*, a country of Asia in Mesopotamia, placed by Strabo in the vicinity of Adiabene.

CHAZINZARIANS, or **CHATZINZARIANS**, a sect in Armenia in the seventh century.

The word is formed of the Armenian *chazos*, *cross*. In the Greek text of Nicephorus, they are called *Chazintzarians*, *Χαζίντζαριος*.

They are also called *Staurolatras*, which, in Greek, signifies the same as *Chazintzarians* in Armenian, viz. *admirers of the cross*; they being charged with paying adoration to the cross alone.

In other respects they were Nestorians; and admitted two persons in Jesus Christ. Nicephorus, lib. xviii. cap. 54. ascribes other singularities to them, particularly their holding an annual feast, in memory of the dog of their false prophet Sergius, which they called *Artizitarizes*.

CHE, in *Geography*, a town of China, of the third rank, in the province of Ho-nan; 12 leagues W.N.W. of Se.

CHEADLE, a town of England, in the county of Stafford, situate in a country abounding with coal, and surrounded by copper and brass works. It has a weekly market on Friday; 15 miles N.E. of Stafford, and 146 N.N.W. of London.

CHEAPO, a river of America, which runs into the bay of Panama; 30 miles E. of Panama.

CHEAT, a river of America, which rises in Randolph county, Virginia, and after pursuing a N.N.W. course joins Monongahela river 3 or 4 miles within the Pennsylvania line. It is 200 yards wide at its mouth, and 100 at the Dunkards settlement, 50 miles higher, and is navigable for boats, except in dry seasons. There is a portage of 37 miles from this river to the Potowmack at the mouth of Savage river.

CHEATS, in *Law*, are deceitful practices in defrauding, or endeavouring to defraud, another of his known right by

some artful and dishonest device; as by playing with false cards or dice, by fraudulently obtaining the execution of deeds and trusts, by suppressing wills, by raising money under false pretences, &c.

If any one cheats with false cards or dice, or by false weights and measures, or by selling one commodity for another, an action on the case lies against him for damages; upon the contract which the law always implies, that every transaction is fair and honest. 10 Rep. 56. In contracts likewise for sales, it is constantly understood that the seller undertakes that the commodity is his own; and if it proves otherwise, an action on the case lies against him, to exact damages for this deceit. In contracts for provisions, it is always understood that they are wholesome; and if they be not, the same remedy may be had. Also if he that selleth any thing doth, upon the sale, warrant it to be good, the law annexes a tacit contract to this warranty, that if it be not so, he shall make compensation to the buyer: also it is an injury to good faith, for which an action on the case will lie to recover damages.

Any deceitful practice, whether in trade or otherwise, is punishable with fine, imprisonment, and pillory. 1 Hawk. L. C. 188. And by the statutes 33 Hen. VIII. cap. 1. and 30 Geo. II. cap. 24. if any man defraud another of any valuable chattels by any false token, counterfeit letter, or false pretences, or pawns or disposes of another's goods without the consent of the owner, he shall suffer such punishment by imprisonment, fine, pillory, transportation, whipping, or other corporal pains, as the court shall direct. And by 9 Anne, cap. 14. if any person cheats at play, and at one time wins more than 1*l.* or any valuable thing, he may be indicted thereupon, and shall forfeit five times the value to any person who shall sue for it, and (in case of cheating) shall be deemed infamous, and suffer such corporal punishment, as in case of wilful perjury. Blackst. Com. vol. iv. p. 158, and 173.

CHEBIB, or **TALLITZ**, in *Geography*, a mountain in Africa, in the province of Fez, on which are many towns.

CHEBRECHIN, a town of Poland, in the palatinate of Beskow; seated on the declivity of a hill. The walls are watered by the river Wierpi, which afterwards falls into the river Bog. The Jews in this place are very rich. N. lat. 50° 25'. E. long. 23° 51'.

CHEBUCTO, a bay and harbour on the S.S.E. coast of Nova Scotia. Near the head of this bay on the western side, stands the city of Halifax, the capital of the province. N. lat. 44° 40'. W. long. 63° 31'.

CHECAYA, in *Turkish Affairs*, is the second officer of the janizaries; and synonymous with lieutenant, or the second in any office.

CHE-CHEOU, a town of China of the third rank, in the province of Hou-quang, seated on the river Yang-tse; 11 leagues E.N.E. of Fong.

CHECHMEBAND, a town of Persia, in the province of Segestan; 70 miles N.E. of Zareng.

CHECHMURAT, a town of Persia, in the province of Adheitzan; 200 miles N.E. of Tauris.

CHECK, in *Commerce*, a draft or bill on a banking-house, paid at sight to the bearer.

CHECK, a term in the *game of chess*, used when one party obliges the other either to move or guard his king.

CHECK-mate denotes a movement on the chess-board that kills the opposite men, or hinders them from moving.

CHECK-roll, a roll, or book, containing the names of such as are attendants, and in pay to the king, or other great persons; as their household servants. Stat. 19 Car. II. cap. 1.

It is otherwise called the *chequer-roll*, and seems to take

its etymology from the exchequer. 14 Hen. VIII. c. 13. See ROLL.

CHECK, *clerk of the*, in the king's household, has the *check* and controulment of the yemen of the guard, and all the officers belonging to the royal family; allowing their absence or defects in attendance, or diminishing their wages for the same, &c.—He also, by himself, or deputy, takes the view of those that are to watch in the court, and has the letting of the watch. 33 Hen. VIII. c. 12.

CHECK, *clerk of the*, in the king's dock-yards, is also the name of an officer, who keeps a muster or register of all the men employed aboard his majesty's ships and vessels, and of the artificers and others in the service of the navy, in the port to which he belongs.

CHECK, in *Falconry*, is where a hawk forsakes her proper game, to follow rooks, pies, or other birds that cross her in her flight.

CHECKER. See EXCHEQUER.

CHECKER-course, in *Brick-Making*. See BRICK.

CHECKY, in *Heralry*, is where the shield, or a part thereof, as a bordure, &c. is chequered, or divided into chequers, or squares. Where there is but one row of squares, it is not properly called *checky*, but *coustercomped*.

Checky, according to Colombiere, is one of the most noble and ancient figures in all armory; and ought never to be given, but to persons who have distinguished themselves in war: for it represents a chess-board, which itself is a representation of a field of battle. The pawns and men, placed on both sides, represent the soldiers of the two armies; which move, attack, advance, or retire, according to the will of the two gamblers, who are the generals.

Checky is always composed of metal, and colour. Some authors, however, would have it ranked among the sorts of furs. When the whole escutcheon is chequered, it should ordinarily contain six ranges; there is no need of blazoning to express them; only it must be observed, to begin to blazon by the first square in chief on the dexter side. So that if that be *or*, and the next *gules*, the house, or family, is said to bear *checky, or*, and *gules*.

When the whole shield is not chequered, but only the chief, a bend, cross, or the like, the number of ranges should be expressed.

CHECO, **KECIO**, or **TONG-ROW**, in *Geography*, a town of Asia, and capital of the country of Tonquin, situate on the river Songkoi; 100 miles from its mouth.

CHE-CONG, a town of China, of the third rank, in the province of Setchuen; 20 miles S.E. of Tong-tchouen.

CHECY, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Orleans. The place contains 1533, and the canton 10,087 inhabitants; the territory includes 305 kilometers, and 15 communes.

CHEDABUCTO, or **MILFORD-HAVEN**, a large and deep bay on the eastermost extremity of Nova Scotia, at the mouth of the gut of Canlo. Opposite to its mouth is Isle Madame. Salmon river falls into this bay from the west, and is remarkable for its very great fishery. N. lat. 45° 25'. W. long. 61° 10'.

CHEDDER, a village of England, in the county of Somerset, about 7 miles N.W. of Wells; which though only a village deserves particular mention. This village is situated under the S.W. side of Mendip hill, and yet much elevated above the level of the moor, so that the contrast between the lofty brows of the hills on one side, and the fertile flats on the other, is singularly striking, and seems to render this village and its adjacent scenery peculiarly romantic. The chasm by which the cliffs of Cheddar are

formed does not disclose itself until we approach a mill turned by a rapid brook that gushes out near the entrance and soon afterwards loses itself in the Ax. Proceeding along the side of this brook, we are suddenly struck by a gap, in the side of the mountain, of the extent of which we at first form an erroneous idea, because the rocks project one behind another so that they seem to prevent further progress. After many deceptions, it is at length discovered that this stupendous chasm extends quite through the S.W. ridge of Mendip, from top to bottom; the length being at least 2 miles, at the end of which it divides into two branches, so as to allow an easy ascent, in a winding direction, nearly from S.W. to N.E. to the top of the hill. In several points the cliff rises perpendicularly to the height of 300 feet; some terminating in bold pinnacles, others in irregular fragments like shattered battlements of huge castles, and others inclining with a dreary aspect on the observer passing under them; protecting yews growing in several of the fissures, form shady canopies; and long mantles of ivy covering some of the rocks, and contrasted against the craggy nakedness of others, heighten the picturesque effect of the scene. On the right hand, the cliffs are much steeper than on the left, and for the most part inaccessible; but, in general, the salient angles on one side correspond with the recipient ones on the other. Every circumstance indeed serves to impress a belief that the mountain must have been evidently rent asunder. The inclination of the strata, from one foot to three feet in thickness, is nearly to the S.W., their general direction being from N.W. to N.E.; this is the course of the hills, the height of which seems to increase northward, and particularly near the village of Loxton, where is a prodigious eminence called Crook's Peak. The rocks of Cheddar are on a much grander and bolder scale than those of Dovedale, which resemble them; though they have not the advantage of a beautiful stream, like the Dove, dividing them. Stupendous as these are, there is a contiguous part of Mendip, which is some hundred feet higher, sloping from the top with a gradual descent, and commanding particularly to the W. and S. a most extensive prospect. The Cheddar cliffs produce several of the rarer plants, particularly the *Dianthus cæsius*, (*Cheddar pink*), *D. arenarius*, and *Thalictrum minus*. The first of these plants, the history of which is somewhat perplexed, is distinguished by the stems being mostly single-flowered, the scales of the calyx roundish and short; the petals notched and bearded; and the leaves rough on the margin; this elegant plant, it is said, has never yet been found except on the cliffs of Cheddar, where it was first gathered by Mr. Brewer in the time of Kay. The flowers make their appearance in July, and very luxuriantly decorate the rocks. Mason's Observations relative to the Natural History of the Western Counties of England, made in 1794 and 1796.

Cheddar is famous for its adjacent pastures and a large kind of cheese. In this place it is common for 3 or 4 dairies to join their milk in order to make one great cheese, which generally weighs from 150 to 200 pounds weight, and which is often sold at a very high price.

The goodness of Cheddar cheese is chiefly owing to the land in which the cows feed, as the method of making it is the same with that which is pursued throughout Somersetshire, and the adjoining counties. Thus also the land in the north parts of Wiltshire has a surprising effect both on the butter and cheese.

CHEDUBA, or **SANDIVA**, an island in the bay of Bengal, near the coast of Ava, said to be about 45 miles long and 9 wide. Cheduba and Ramree, called by the Birman, Ma-gou

gou Kioum and Yangg Kioum, are extensive and highly cultivated islands, which, with Arracan and Sandoway, form five distinct provinces, and comprehend the whole of the Arracan empire. See ARRACAN.

A Portuguese, named Sebastian Gonzales, by a combination of successful events, made himself master of the island of Cheduba, which he maintained for some time as an independent principality: his rise was owing to a series of heinous crimes, and his rapid fall is to be ascribed to a similar cause. N. lat. 18° 50'. E. long. 93° 45'.

This fertile island, which belongs to the Birman government, yields abundance of rice, and is governed by a chekey, or lieutenant, who is subject to the maynoon of Arracan. The channel between this island and the main is annually navigated by large trading boats, but does not afford a safe passage for shipping.

CHEEGO HILLS, hills of Hindoostan near the fourth coast of the country of Gutch.

CHEEK, in *Anatomy*, that part of the face situated below the eyes on either side.

CHEEKS, *wounds of the*. See SUTURE and WOUND.

CHEEKS, a general name among *Mechanics*, for almost all those pieces of their machines and instruments that are double, opposite to, and perfectly alike to each other.

The *CHEEKS of a printing press*, are its two principal pieces: they are placed perpendicular, and parallel to each other; serving to sustain the three forms, viz. the head, flukes, and winter, and to bear the spindle, and other parts of the machine.

The *CHEEKS of a turner's lathe*, are two long pieces of wood, between which are placed the *puppets*, which are either pointed, or otherwise, serving to support the work, and the mandrils of the workman. These two pieces are placed parallel to the horizon, separated from one another by the thickness of the tail of the puppets, and joined with tenons to two other pieces of wood, placed perpendicularly, called the *legs of the lathe*.

CHEEKS of the glazier's vice, are two pieces of iron joined parallel at top and bottom; in which are the axis, or spindles, little wheel, cushions, &c. whereof the machine is composed.

In the construction of gun-carriages, the term *checks* is used to denote the strong planks which form their sides. See CARRIAGE.

CHEEKS of a mortar, or BRACKETS, in Artillery, are made of strong planks of wood, bound with thick plates of iron, and are fixed to the bed by four bolts; they rise on each side of the mortar, and serve to keep it at what elevation is given to it by the help of strong bolts of iron which go through both checks, both under and behind the mortar, betwixt which are driven coins of wood; these bolts are called the bracket-bolts, and the bolts which are put one in each end of the bed, are the traverse-bolts, because with handspikes the mortar is by these traversed to the right or left.

CHEEKS, in Ship-Building, are two pieces of timber, fitted on each side of the masts, at the top, serving to strengthen the masts there, and to sustain the frame of the top and top-mast. The uppermost bail or piece of timber in the beak of a ship, is called the check. The knees which fasten the beak-head to the bow of the ship, are called cheeks; and the sides of any block, or the sides of a ship's carriage of a gun, are called checks.

CHEEKS, upper and lower, are those pieces of timber on each side of the trail-board.

CHEEN, in *Geography*, an ancient name of the kingdom of Pegu, as we learn from the Ayeen Akbery, (vol. iii. p. 7.) As this country borders upon Ava, where M. Gousselin, in his Geography of the Greeks analysed, places the

great promontory, the resemblance of names may seem, perhaps, to confirm his opinion, that Sine Metropolis was situated on this coast, or not so far east as the kingdom of Cochinchina, where M. D'Anville places it.

CHEESADAWD, a lake of North America, on the E. end of Slave lake, in the territory of the Hudson's bay company; and about 35 miles long, and the same in breadth. N. lat. 63° 15'. W. long. 106°.

CHEESE, in *Rural Economy*, a well known kind of food prepared from milk by means of coagulation with rennet, and separated from the serum or whey, by pressure in vasa for the purpose, being then dried for use. See DAIRYING.

The use of cheese seems to have been adopted more generally, and at a much earlier period than that of butter. Hippocrates, who was almost contemporary with Herodotus, speaking of the method practised by the ancient Scythians of flaking the milk of their mares in wooden vessels, says, that the heavy and thick part, which subsides, when the fat part rises to the surface, and the whey or serum remains in the middle, being kneaded and properly prepared, is, after it has been dried, known by the name of "hippace," which evidently denotes cheese made of mares' milk. It is not improbable, that the Scythians hastened the separation of the caseous part from the whey by warming the milk, or by the addition of some substance proper for that purpose. Hippocrates, in another place, expressly says, that the Scythians drink mares' milk and eat cheese made of it. Although the word butter does not occur in Aristotle, and his allusion to that substance has even been doubted, yet we find that he gives very proper information respecting milk and cheese which indicates careful observation; and in one place he ascribes to milk only two component parts, viz. the watery and the caseous; but elsewhere he mentions also a fat substance in milk, which, in certain circumstances, resembles oil. Ludolfus, in his History of Ethiopia, acquaints us, that the Habeshimans or Ethiopians made both butter and very good cheese: and the Roman writers, who give an account of the ancient Germans, and say that they lived principally on milk, disagree in one circumstance; viz. whilst many of them inform us, that they used cheese, others affirm that they were not even acquainted with the method of preparing it. Cæsar de Bell. Gall. iv. 1. vi. 22. Strabo, lib. iv. Pliny, however, says, (l. xi. c. 41.) that they did not make cheese, but butter, which they used as a most pleasant kind of food. But the oxygala of which he speaks was evidently a kind of cheese, the preparation of which has been described by Columella. (l. xii. 8.) In order to make it, sweet milk was commonly rendered sour, and the serum was always separated from it. Pliny also mentions, under the above name, a kind of cheese formed from the caseous parts which remained behind in the butter-milk, and which were separated from it by acids and boiling, and were mixed and prepared in various ways. It is not possible from any data that remain to determine whether Tacitus (De Mor. German. c. 23.) by "lac concretum," which, he says, was the most common food of the Germans, meant cheese, or butter. The term *Bovisques*, or *Bovisques*, compounded of *Bovis*, ox, or cow, and *ques*, cheese, seems to intimate, not only that cheese was known at a much earlier period than butter, but that the Grecian and Roman authors considered butter as a kind of cheese, because *ques* once signified any coagulated substance. See BUTTER.

Cheeses are of different qualities and forms, in different districts, and according to the methods in which they are made. Thus, the Cheshire cheeses are mostly thick, large, and of a fine sharp or piquant flavour, whilst those of Gloucestershire are mostly small, thin, and of a pleasant mild taste.

The double Gloucester is a cheese that pleases almost every palate: the best of this kind (says Mr. Hazard of Stony-Littleton) is made from new, or, (as it is called in that and the adjoining counties) "covered milk;" an inferior sort is made from what is called "half-covered milk;" though, when any of these cheeses turn out to be good, people are deceived, and often purchase them for the best "covered milk cheese;" but farmers who are honest have them stamped with a piece of wood in the shape of a heart, by which they may be distinguished.

It will be every farmer's interest if he has a sufficient number of cows to make a large cheese from one meal's milk; this, when brought in warm, will be easily changed or turned with the rennet; but if the morning or night's milk be to be mixed with that which is fresh from the cow, it will be a longer time before it turns, nor will it change sometimes without being heated over the fire, by which it often gets dull, or foot; nor should I forget smok (says this writer) which is sure to give the cheese a very disagreeable flavour.

When the milk is turned, the whey should be carefully strained from the curd, which curd should be broken small with the hands; and when it is equally broken, it must be put by little at a time into the vat, carefully breaking it as it is put in, which vat should be filled an inch or more above the brim, that when the whey is pressed out it may not shrink below the brim; if it does, the cheese will be worth very little. But first, before the curd is put in, a cheese-cloth, or strainer, should be laid at the bottom of the vat, and this should be so large, that when the vat is filled with the curd, the end of the cloth may turn again over the top of it; when this is done, it should be taken into the press, and there remain for the space of two hours, when it should be turned, and have a clean cloth put under it, and turned over as before; it must then be pressed again, and remain in the press six or eight hours, when it should again be turned, and rubbed on each side with salt, after which it must be pressed again for the space of twelve or fourteen hours more; when, if any of the edges project, they should be pared off; it may then be put on a dry board, where it should be regularly turned every day.

It is a good way to have three or four holes bored round the lower part of the vat, that the whey may drain so perfectly from the cheese as that not the least particle of it may remain.

The prevailing opinion of the people of Gloucestershire and the neighbouring counties is, that the cheeses will spoil if they are not scraped and washed when they are found to be mouldy; but I know this (says Mr. Hazard) to be erroneous, and that suffering the mould to remain mellow them, provided they are turned every day; or if they will have the mould off, it should be removed with a clean dry flannel, as the washing them is only a means of making the mould (which is a species of fungus rooted in the coat) grow again immediately.

Some people scald the curd, but this is a bad and mercenary practice; it robs the cheese of its fatness, and can only be done with a view to raise a greater quantity of whey butter, or to bring the cheeses forward for sale, by making them appear older than they really are.

As most people like to purchase high-coloured cheese, it may be right to mix a little *annatto* with the milk before it is turned; no cheese will look yellow without it; and though it does not in the least add to the goodness, it is perfectly innocent in its nature and effects.

Cheshire cheese is much admired, and yet no people take less pains with the rennet than the Cheshire farmers; but their cheeses are so large as often to exceed 100 lbs. weight

each: to this, and also to the age to which they are kept, the richness of the land, and their keeping such a number of cows, as to make such a cheese, without adding a second meal's milk, their excellence may be attributed: indeed, they salt the curd (which may make a difference), and keep the cheeses in a damp place after they are made, and are very careful to turn them daily.

In other counties they likewise vary greatly in these different species, as well as in the manner. Besides the cheeses already mentioned, there are different sorts of cream cheeses, as *thick and thin*, the former known under the name of Cottingham, and the latter under that of Stilton cheese.

The Stilton cheeses, called the Parmesan of England, are usually made in square vats, and weigh from six to twelve pounds each. Immediately after they are made, they should be put into square boxes made exactly to fit them, as they are so extremely rich, that, without this precaution, they would be apt to bulge out, and break asunder. In these boxes they should be daily turned, and kept two years before they are mellowed for sale. Some make them in a net, like a cabbage-net, so that they appear when made like an acorn; but these are never so good as the others, having a thicker coat, and wanting the rich flavour and mellowness of the others. The manufacture of these cheeses is not confined to Stilton and its neighbourhood; as many other persons in Huntingdonshire, and also Rutland and Northampton shires, make a similar sort, sell them for the same price, and give them the name of Stilton cheeses.

It is observed by Mr. Hazard that, though the farmers about Stilton are remarkable for the cleanliness of their dairies, they take very little pains with the rennet; for if they did, they would not have so many faulty and unsound cheeses. The inhabitants of other counties might make as good cheese as that of Stilton, if they would adhere to the same plan, which is this. They make a cheese every morning, and to this meal of new milk they add the cream taken from that which was milked the night before. This, and the age of their cheeses, it is said, are the only reasons why they are preferred to others, their land not being in any respect superior to that of other counties. Excellent cream cheeses are made in Lincolnshire, by adding the cream of one meal's milk to milk which comes immediately from the cow: these are pressed gently two or three times, turned for a few days and then disposed of at the rate of 1s. per pound, to be eaten while new, with radishes, salad, &c.

There is also a sort of green or sage cheese. And we have a cheese brought from abroad under the title of Parmesan. The Parmesan cheese is so called, because Parma and Piacenza were once the countries in which the best was made, though now the district of Lodi is in the highest repute for this kind of cheese. The method of making it is described, from their own observation, by Mr. Benjamin Price, in the 7th volume of the Bath Society's papers, (see also Letters on Agriculture, vol. vi. and Repository, vol. ii.) and by Mr. Arthur Young, in the 2d volume of his Travels in France. These cheeses, how much soever extolled, are made entirely of skimmed milk: that of the preceding evening, mixed with the morning's milk: the former having stood for 16 or 17 hours, and the latter about 6 hours. At 10 o'clock in the morning, $5\frac{1}{2}$ brens of milk, each bren being about 48 quarts, were put into a large copper, which turned on a crane, over a slow wood-fire, made about two feet below the surface of the ground. The milk was stirred from time to time; and about 11 o'clock, when just like-water, and considerably under a blood-heat, (about $81\frac{1}{2}$ of Fahrenheit, the atmosphere being at the same time 70 Fahrenheit, Young,) a ball of rennet, as big as a large walnut,

walnut, was squeezed through a cloth into the milk, which was kept stirring. This rennet was said to have been purchased of a man at Lodi, famous for the composition; but it seemed to have principally consisted of the same part of the calf as we use in England for the same purpose, mixed up with salt and vinegar, (spices and salt, Young,) and also, as Mr. Pryce apprehends, with old cheese. The proportion of rennet, he conceives, was of much greater consequence than the rennet itself. By means of the craze, the copper was turned from over the fire, and let stand till a few minutes past 12; at which time the rennet had sufficiently operated. It was now stirred up, and left to stand a short time, for the whey to separate a little from the curd. At 1 o'clock, says Mr. Young, the cazaro, or dairy-man, (for this is not women's work in Italy) examined the coagulation, and finding it complete, he ordered his *fotto cazaro* to work it, which he did with a stick armed with cross-wires; this operation served instead of cutting and breaking the curd, in the manner it is done in England, free from the whey. When he has reduced it to such a fineness of grain as satisfies the cazaro, it is left to subside, till the curd being quite sink, the whey is nearly clear on the surface. Part of the whey being taken out, the copper was again turned over a fire sufficiently brisk to give it a strongish heat, but below that of boiling; a quarter of an ounce of saffron was put in to give it a little colour; but not so unaturally high as some cheeses in England are coloured; and it was well stirred from time to time, with a wood machine to keep it from burning; the cazaro examining it from time to time, between his fingers and thumb, to mark the moment when the right degree of firmness and solidity of grain was attained. The heat was 124½ Fahrenheit; but it is often 137½ Fahrenheit. When the small, and, as it were, granulated parts, felt rather firm, which was in about 1½ hour, the copper was taken from the fire, and the curd left to fall to the bottom. As soon as a certain degree of subsidence had taken place, the cazaro emptied about ⅓ths of the whey, in order the better to command the curd. He then pours three or four gallons of cold water around the bottom of the cauldron, to cool it sufficiently for handling the curd; and then by a formal kind of operation, he slides a coarse cloth under the curd, and thus brings it up and places it in a tub to clear. When sufficiently drained, it was put into a hoop, and about half an hundred weight laid upon it for about an hour; after which the cloth was taken off, and the cheese placed on a shelf in the same hoop. At the end of two, or from that to three days, it is sprinkled all over with salt. The same process is repeated every second day, for about 40 to 45 days, (or 30 or 40 days, according to the seasons; 30 in summer and 40 in winter. Young) after which no further attention is required. Whilst salting, they generally place two cheeses one upon another; in which state they are said to take the salt better than singly. When these operations are completed, the cheeses are scraped clean, and after that rubbed and turned in the magazine every day, and rubbed with a little linseed oil on the coats, in order to preserve them from all sorts of insects. They are never sold till they attain the age of six months, and the price is 90 livres per 100 lb. of 28 oz.

The morning's butter-milk is then added to the whey, and heated; and a stronger acid used for a fresh coagulation, to make whey cheese, called here "Mascopino." Little ones are kept in wooden cases, in the smoke of the chimney.

In Scotland there is likewise a sort of cheese made from the milk of ewes, which is rich and of a sharp flavour. It is usually known under the title of *ewe cheese*.

Dunlop Cheese, so called from the parish of Dunlop, in Ayrshire, where it was first made, has been long known

and distinguished over Scotland, inasmuch that all the cheese made in the country around is known by that name, and gives a higher price and finds a readier market than any other. The practice of making *swiss milk cheese*, as it is called, was first introduced into the parish of Dunlop, by one Barbara Gilour, whose great grandson is still living, and proprietor of the same farm. Having gone to Ireland to avoid the persecutions which people were then exposed to on account of religion, she is said to have brought the art with her; when she returned about the time of the revolution. Since that period this sort of cheese has been the great and almost only business of Dunlop. Sensible that their situation was more favourable for this than any other purpose, the people bestowed on it the greatest care, and turned it to the best advantage. They have inclosed all their ground, and have but a third or fourth of it in tillage, which is more owing to the custom of the country than the will of the farmer, (as throughout the whole of Ayrshire there can be no more land in each farm in that state than one third); and the rest in pasture, which is always a plentiful crop and of the best quality. They are very attentive to the breed of their cows, which are rather small than otherwise, and generally of their own rearing. They are fed in inclosures, and never brought under a roof, except for milking, from the beginning of May till the end of harvest: the quantity of milk they give is very great and of the finest quality.

The process for making the cheese is extremely simple. The cows are milked twice a day, at six in the morning, and at the same hour in the afternoon. At each of these hours the whole milk, while warm, is collected in a large vessel and thickened or yeared; after it is consolidated into a curd, it is then cut in different directions, and the whey gently pressed out; the curd, after it has acquired sufficient consistency by the pressure of the hand, and by the application of weights over it, is next cut very small by an instrument for the purpose, and salted. For the further compaction of the cheese, various contrivances are used, the most common is a large hewn stone, probably a ton weight; this is fitted to a frame, and lifted up and let down by a screw. Others use levers of various constructions, and thus by the application of a few pounds weight they give any degree of pressure that may be deemed necessary.

Where farms have only a few cows and where it would not be worth while to make a cheese twice a day, two milkings or sometimes more are put together; this may be done two ways, 1st, the milk which has stood over is first creamed and then warmed to the temperature of the new milk, and the whole is coagulated together; the cream is afterwards added, and thoroughly mixed with the two milks. Each mode has been tried, but this is thought to be the most effective in making good cheese; or 2d, the curd of the first milk is reduced to the consistency proper for salting, and thus set aside till a second milking be brought to the same state; when the two are mixed together, and salted and finished in the usual way. It may be proper to observe, however, that there is no cheese so good as that made directly from new milk: it was this kind which was first known by the name of Dunlop cheese. The useless practice of colouring is not known, except by a very few, who make it in imitation of English cheese. From a dozen of good cows a farmer will make from a hundred and fifty to a hundred and sixty stones (provincial weight) of cheese, that is, something more than a ton and a half; this, in the markets of Edinburgh, Glasgow, and Paisley, will bring from 10 to 12 shillings per stone, or from seventy to eighty pounds sterling, for the produce of the season. From the whey after it is pressed out, the most delicious

butter in Scotland is produced. It is also the practice in other places, and particularly in Cheshire, to make butter of the cheese whey.

For the form of the instrument used for cutting the curd before salting, see *Plate Husbandry*.

In the preparation or making of cheese a variety of different circumstances are necessary to be considered by the dairy farmer, such as the season of the year and the mode of conducting the business of milking, the properties of the milk, the manner of giving the necessary colour, the method of preparing the rennet, the mode of breaking and gathering the curd, the management of the cheese in the presses, the process of salting, and the treatment afterwards requisite in the cheese room, as well as some others of less importance. All these, as well as many other points of management that are of consequence in the process of cheese-making, will be fully considered in speaking of the nature of Dairying. See DAIRYING.

It has been observed by Dr. Anderson, that "it is generally supposed that the goodness of cheese depends almost entirely upon its *richness*; by which is meant the proportion of oily matter, whether natural or adventitious, that it contains: nothing, however, is, he says, more certain, than that this is not the case. If, says he, the *sapor*, the pleasant relish to the taste, be adopted as the rule for ascertaining excellence, nothing can be more certain, than that this does not depend upon this circumstance. Parmesan cheese is, he observes, in general, deemed, in respect to *sapor*, among the best kinds of cheese that are made; but it contains no remarkable proportion of oily matter. To many palates, the small round Dutch cheeses are very pleasing to the taste; yet these are, he asserts, made entirely of skimmed milk. And if softness to the feel, and that kind of consistency which appears mellowed and butyraceous, be the rule for ascertaining the richness of cheese, neither will this, says he, be found to depend necessarily upon the proportion of oily matter that they contain. He has seen cheeses made of skimmed milk, that are exactly like the finest kind of cream cheese, which approaches to the taste and consistency of butter; and he has seen cheeses made entirely of cream, which had much less of that buttery taste and appearance than the other. In short, much more, he thinks, depends upon the skill and dexterity of the operator, than on the quality of the materials. Many cheeses are made in England of as rich milk as the Stilton cheeses, which seem not to contain nearly the same proportion of cream; and he had lately occasion to notice, that a great many cheeses are made of the same kind of milk with the Suffolk cheeses, which have nothing of that horny hardness and indigestible quality for which these are remarkable." It is further remarked, "that if the taste and consistence that the cheese acquires when acted upon by heat in the process of salting, be assumed as a criterion for judging of its richness, neither will it be found that this depends upon the proportion of cream that enters into their composition. He has seen very indifferent cheese, that has been made of skimmed milk, which, when toasted, was richer to the taste, and more soft in consistence than Stilton cheese. And he has at this moment in his house a round Dutch skim-milk cheese, that, when toasted, appears richer and more pleasing to the palate of most persons who have tasted it, than very excellent North Wiltshire cheese, which is deemed among the best kinds that are made in this island. From these facts, and many other considerations, he is satisfied, that what we call the richness of cheese depends more upon the particular process adopted in the management, than upon the materials of which the cheese consists. The taste of Gloucester and that of Che-

shire cheeses are very different from each other, though the quality of the milk of which they are made varies very little. The same thing may be said of Stilton and Parmesan cheeses, though the vanity of man, desirous to conceal his own weakness, is, he says, for ever disposed to attribute these peculiarities to soil, or pallurs, or other circumstances, that seem to throw the blame of want of success from off his own shoulders. And this he conceives to be the case in many other instances, as well as that of cheese.

It is observed, that any vegetable or mineral acid, put into milk, will produce a coagulation; with this difference, that the mineral acid affords less cheese or curd than the vegetable; and the various substances used to coagulate milk may perhaps act merely by virtue of the acid they contain. The coagulum which is afforded in all these cases contains a substance of the nature of gluten, which forms the cheese; and another of the nature of oils, which forms the butter. When cheese is prepared for the table, the butter is not separated, because it renders it milder, and more agreeable. The caustic alkalis dissolve cheese by the assistance of heat; but it is not held in solution by an alkali in milk. If one part of cheese newly separated, and not dried, be mixed with eight parts of water slightly acidulated by a mineral acid, and the mixture be boiled, the cheese will be dissolved, though it would not have been sensibly acted upon by a vegetable acid. This is the reason why the vegetable acids separate a much greater quantity of curd from the same quantity of milk than the mineral acids do. The cause why salts, gums, sugar, &c. coagulate milk may be deduced from the greater affinity of the water with these bodies than with the cheese. The earth of cheese is a phosphate of lime, according to Scheele. No substance has a stronger resemblance to cheese than the white of egg boiled. Scheele thinks that the coagulation of white of egg, lymph, and cheese, is owing to the combination of caloric. Ammoniac dissolves cheese more effectually than fixed alkalis. If a few drops be poured into coagulated milk, it quickly causes the coagulum to disappear. Concentrated acids likewise dissolve it. Nitric acid disengages nitrogen. Chaptal's Elem. of Chem. vol. iii.

Cheese of every kind is liable to putrefaction; and, by reason of this quality, it approaches to the nature of animal substances. This opinion is confirmed by the consideration that the matter of which it is formed is, like animal substances, coagulated by acids, alcohol, and heat. It is also said to yield, in distillation, a volatile alkali; though this is a disputed fact. Upon the whole, we may conclude, that as milk contains a portion of animal matter, and as the milk of animals feeding wholly, or for a great part, on vegetables, partakes of their quality, cheese must be an aliment of an intermediate kind between vegetable and animal. However, cheese employed in diet is of very different kinds, partly owing to the state and quality of the milk that is employed, and also of the rennet, and partly to the various practices employed in preparing it, such as the different circumstances of the coagulation, the management of the coagulum or curd, the pressure given to it, the salting and drying of it, and the manner in which it is afterwards preserved. The caseous or coagulable part of milk contains a great, if not the greatest part of the nourishment which milk affords; and, therefore, taken by itself, must be considered as a very nourishing matter. When the coagulum has the whey separated from it, it then becomes a more nutritious substance than the milk from which it was taken, but probably of more difficult digestion. Cheese, in its dried state, made from milk previously deprived of its cream, may still be very nutritious, but it is of very difficult digestion, and fit only for the most robust persons; and even the difficulty of digestion may diminish

nish the nourishment which it might otherwise have afforded. Cheese made of entire milk must be a still more nourishing substance, and, as Dr. Cullen conceives, of much easier digestion; and cheese made of entire milk, with a portion of cream taken from other milk added to it, will be still more nourishing, and hardly of less easy digestion, as the oily parts every where interposed between the parts of the gluten must render the adhesion of this less firm. As cheese is often made of cream alone, the qualities of this will be readily understood from what has been just now said. Cheese is often made of the milk of ewes or goats, and often of a portion of the two latter added to cows' milk. In all these cases, as the milk of ewes and goats contains a larger proportion both of the oily and caseous parts, so in proportion as these are employed, the cheese becomes more nutritious, but at the same time of more difficult digestion. As cheese is employed not only when recent and fresh, but also under various degrees of a certain corruption to which it is liable, it hence acquires new qualities; and, according to the degree of corruption, it becomes more acid and stimulant, partly from the acrimony it has acquired by corruption, and partly by the great number of insects that are very constantly generated in it in that state. In this corrupted condition, cheese can hardly be taken in such quantity as to be considered as alimentary; and with regard to the mode or degree in which, as is commonly supposed, it becomes a condiment influencing the digestion of other food in the stomach, Dr. Cullen professes himself unable clearly to explain. Cheese is often eaten, after having been soaked; or when a portion of its oil is separated, whilst the other parts are united more closely together. Many persons are able to digest this food pretty well; but it is certainly not easily digested by weak stomachs; and for those who can be hurt by indigestion, or heated by a heavy supper, it is a very improper diet. Cullen's Mat. Med. vol. i. pt. 1. c. 2.

Cheese, when new, is found to load the stomach, by reason of its moisture and viscosity; and when too old, it heats and inflames it by its salts. The physicians advise it to be eaten in small quantities: hence that Latin verse,

“Causus ille bonus, quem dat avara manus.”

Dr. Quincy says, it cannot be too old: it is certain, the more it abounds with salts, the more will it contribute to digestion, and the clearing of the stomach of other food. Indeed some condemn all use of cheese: sheltering themselves under that ancient maxim, “Causus est nequam, quia concoquit omnia fe quam.”

The Laplanders make a sort of cheese of the milk of their rein-deer, which is not only of great service to them as food, but on many other occasions. Scheffer's Hist. of Lapl.

CHEESE-board, a circular piece of board, about an inch, or an inch and a half in thickness, upon which the new-made cheeses are placed on the shelves of the cheese-room. Cheese-boards should be made of such sorts of wood as are the least liable to warp, and be planed smooth on both sides, being of sufficient thickness to resist the effects of heat as much as possible.

CHEESE-cloth, the cloth in which the cheese is placed in the press, in order to undergo the operation of squeezing out the whey.

CHEESE colouring, is the material employed to give colour to cheeses, in order to their being more saleable. It is a substance said to be obtained from the skin or pulp of the kernel of the bixa of South America, or of the shrub when cultivated in our gardens. See BIXA. Of the proportion of this matter from the red pulp which covers the seeds, the

following account is given by Mr Miller. The contents of the fruit are taken out and thrown into a wooden vessel, where as much hot water is poured upon them as is necessary to suspend the red powder or pulp, and this is gradually washed off with the assistance of the hand, or of a spatula or spoon. When the seeds appear quite naked, they are taken out, and the wash is left to settle; after which the water is gently poured away, and the sediment put into shallow vessels to be dried by degrees in the shade. After acquiring a due consistence, it is made into balls or cakes, and set to dry in an airy place until it be perfectly firm. Some persons first pound the contents of the fruit with wooden pestles; then covering them with water, leave them to steep six days. This liquor being passed through a coarse sieve, and afterwards through three finer ones, is again put into the vat or wooden vessel, and left to ferment a week; it is then boiled until it be pretty thick, and when cool spread out to dry, and then made up into balls, which are usually wrapped up in leaves. And when of a good quality, it is of the colour of fire, bright within, soft to the touch, and capable of being dissolved in water. But the substance mostly made use of, and which is purchased from the druggists, is a preparation made by them, in which madder is probably a principal ingredient; it is of a brick colour, and a hard compact texture.

In regard to the method of using the soft or genuine sort, it is simply by dissolving such a quantity as is necessary, in a small portion of milk, allowing such particles as will not dissolve to settle to the bottom. The milk thus coloured is then poured off, and mixed with that which is to be made into cheese. But when the hard preparation is used, pieces of it are frequently under the necessity of being rubbed against a hard smooth even-faced pebble or other stone, being previously-wetted with milk to forward the levigation, and to collect the particles as they are loosened. For this purpose a dish of milk is generally placed upon the cheese-ladder; and as the stone becomes loaded with levigated matter, the pieces are dipped in the milk from time to time, until the milk in the dish appears to be sufficiently coloured. The stone and the “colouring” being washed clean in the milk, it is stirred briskly about in the dish, and having stood a few minutes for the unsuspended particles of colouring to settle, is returned into the cheese cowl; pouring it off gently, so as to leave any sediment which may have fallen down in the bottom of the dish. The grounds are then rubbed on the bottom of the dish, and fresh milk added, until all the finer particles be suspended; and in this the skill in colouring principally consists. If any fragments have been broken off in the operation, they may remain at the bottom of the dish: hence the superiority of a hard, closely textured material, which will not break off or crumble in rubbing. The price of this material is usually about ten-pence an ounce; which will colour about twenty thin cheeses of from ten to twelve pounds each. The colouring therefore costs about a half-penny a cheese, or a little more.

CHEESE-cowl, the name of the milk cooler or vessel in which the curd is formed.

CHEESE-knife, a large sort of knife or spatula made use of in some dairies, for the purpose of cutting or breaking down the curd while in the cheese-tub, in order to its being placed in the vat to undergo pressure.

CHEESE-leaf, the bag in which dairy women prepare and keep the rennet for making cheese. See RENNET.

CHEESE-press, an engine or press employed in cheese dairies, for the purpose of forcing the whey from the curd when in the cheese vat, by means of pressure. It is observed by the author of the “Rural Economy of Norfolk,” that in making cheese much depends on the construction and power

of the prefs, the excellency of which arifes from its preffing level. If it have too much play fo as to incline and become tottering or leaning one way or another, and do not fall perpendiculary upon the cheefe-board, one fide of the cheefe will frequently be much thicker than the other; and, what is ill worke, one fide will be thoroughly preffed, while the other is left loofe and foamy. The power of this machine may be given in different ways, as by the fcrew, the lever, or by a dead weight; and it ought always to be proportioned to the fize and thicknefs of the cheefe. The author juft mentioned, found one that was conducted on thefe principles, highly ufeful and convenient, the power of which was a dead weight of ftones contained in a cubical box moving in grooves, fo as to keep its bottom horizontal; the medium weight, one hundred weight and two quarters, but regulated by the ftones agreeably to the thicknefs of the cheefe or cheefes to be preffed. In the vale of Gloucefter, he fays, the preffes are moftly loaded with gravel in cubical boxes, rated by rollers, and made to fall horizontally on the cheefes. At Maberley they ufe, he obferves, a double prefs; each divifion of it holding fix or eight of thefe cheefes. A prefs of the moft general kind is reprefented in *Plats VIII. fig. 1.* in which *a b* is the prefs, *e e* and *f f* levers moveable about the points *d e f g* by applying the hand at *e*; *s*, the ftone or weight, and *h* the cheefe to be preffed. And a prefs upon an improved plan may be feen at *fig. 2.* by which the preffure is given with greater eafe and exactnefs.

CHEESE-rack, a fort of contrivance made for the purpofe of receiving and containing fuch cheefes as have become fufficiently firm and coated. Thefe racks may be conffructed in different ways and forms, but Mr. Marfhall thinks that the plate-rack form, with four or five tiers one above another, is the beft for this purpofe. If the cheefes intended to be placed in it be nearly of one fize, the rack fhould be made of the fame width at the top as the bottom; but if they be of different fizes, it ought to be made narrower at the top than at the bottom; and if they be of different thicknefses as well as of different diameters, the fpaces for the refpective cheefes fhould likewife be varied. A fmall rack may be ftrung with a rope and pulleys at each end of the cheefe-room, fo as to be drawn up and lowered down at pleafore; but a large one is difficult to fting, in a common room, in that manner; it ought therefore to ftand on legs about two feet high, with a broad bare board projecting over the legs, fo as to prevent vermin from climbing up into the racks: this kind faves much labour, he fays, in turning and collecting the cheefe into a final compafs, and putting it out of the way of vermin.

CHEESE-Rennet or *Rennet*, in *Botany*. See *GALIUM verum*.

CHEESE-Rennet or *Rennet*, in *Rural Economy*. See *RENNET*.

CHEESE-Room, a room appropriated for the reception of cheefes while they remain in the hands of the maker. Rooms of this kind are frequently fitted up with fhelves; and in fome an entire lining is put round the walls, with a fpace or two in the middle, gangways being left wide enough to pafs conveniently between them. In one dairy in North Wiltshire, Mr. Marfhall fays, he remarked an admirable arrangement of cheefe-rooms. The fhelf-room was immediately over the dairy-room, and the lofts over the fhelf-room with trap-doors in each floor, to hand the cheefes through. This, he obferves, is a plan which faves much awkward carriage, and which might be adopted with advantage in every way which will admit of it. Thefe rooms fhould always be fufficiently roomy and fituated conveniently for the dairy. See *DAIRY*.

CHEESE-Tongs, a fort of wooden frame placed occafion-

ally on the cheefe-tub, on which the vat is fet in order that the whey may drain from the curd, before it is put into the vat.

CHEESE-Tub, the tub in which the curd is broken and prepared for being made into cheefe. Tubs of this kind are of different fhapes, as round and oval; and of fuch capacities as are requifite for containing fuch quantities of milk as are intended to be converted to the purpofe at one time by the dairy-woman.

CHEESE-Vat, is a fort of ftrong kind of wooden hoop with a bottom, which, as well as the fides, is perforated with holes throuh which the whey efcepes during the time the cheefe is preffing. The cheefe-board is fo formed as to prefs within the hoop part of the vat, and receive the weight or power of the prefs. Dairies, Mr. Marfhall obferves, fhould be well furnifhed with vats of different fizes, as where three or four cheefes are made at each meal, a number of vats become actually neceffary; and, if there be not fome to spare they cannot be fo well fitted to the ftuck of curd which may be had; and keeping a little overplus curd from meal to meal may often, he thinks, fave a whole cheefe.

CHEEVANCE. See *CHEVANCE*.

CHEF. See *CHEVEF*.

CHEF, chief In the *French Service*, this appellation is beflowed in all military rank from the highelt to the lowelt on every individual charged or entrusted with a particular command or a particular infpection or fupervifendance, as well in time of peace as in that of war. Thus the general, who commands an army *en chef*, the officer who commands a corps of the army or a detachment *en chef* or in chief. And the old-ftill folder of a barrack-room, tent, &c. as the corporal or lance-petado, who has the management of the provifions, is called *chef de chambrée*.

CHEF d'efcadre, an officer who commands any divifion of an army or of a fleet. The duty of a naval officer commanding a fquadron at fea is fimilar to that of a brigadier general on fhore. *Chefs d'efcadre* fit on all general courts martial, and rank according to the dates of their commiffions.

CHEF de files. The men, who form the firft or front rank of a platoon, a divifion, a battalion, a company, &c.

CHEF du nom et armes. The chief of the name and arms. When an illuftrious family had feveral branches, he who reprefented the oldelt was diftinguifhed by this appellation, even though the family and its branches were of foreign rank. This diftinction ftill exifts in all nations that have nobles and gentlemen, and unquestionably originated from military fervices and celebrity acquired in arms.

CHEF, St., in *Geography*, a town of France, in the department of the Ifere, and diftrict of La-Tour-du-Pin; 2 leagues N.N.W. from it.

CHEF-d'œuvre. See *MASTER-piece*.

CHE-PANG, in *Geography*, a town of China of the third rank, in the province of Se-tchuen; 10 miles N.W. of Han.

CHEF-ROUTONNE, a town of France in the department of the Two Seves, and chief place of a canton, in the diftrict of Melle; 8 miles S. of Melle. The place contains 1422 and the canton 8787 inhabitants; the territory includes 217½ kilometres and 17 communes.

CHEFATE KAN, a town of Afiate Turkey, in the province of Caramania; 100 miles E. of Cogni.

CHEFFES, a town of France, in the department of the Maine and Loire; 3 leagues N. of Angers.

CHEFONTAINES, CHRISTOPHER DE, (*Lat. A capite Fontium*), in *Biography*, a learned Francifcan, was born in the 10th century in the diocete of Laon in Brittany, entered in early

life among the Cordeliers, and having completed his studies at Paris, commenced preacher in his own country. In the exercise of this office he acquired reputation, and in 1562 became provincial of his order in Brittany. At Rome, whither he afterwards removed, he was guardian of his province, and teacher of divinity in the convent of Ara Cæli. In 1571 he was chosen general of his order, and as such conducted himself during 8 years with great zeal and prudence. Pope Gregory XIII. created him archbishop of Casarea in 1579; and having remained in that diocese for 7 years, he took a journey to Flanders; and at Antwerp converted many heretics by his preaching, and confirmed others that were wavering. Under a charge of deviating from sound orthodoxy, he repaired to Rome in 1587, for the purpose of vindicating his character; and though his peculiar opinions were never formally examined, he was treated with respect by five successive popes. At length he died in a convent at Rome, in 1595, at the age of 63. Chefontaine, during a great part of his life was a hard student: he understood 6 languages besides his native Bas Breton, and was well acquainted with the theology and philosophy of his time. He reasoned strongly and wrote in a good style. One of his first works was a letter in French, afterwards translated into Latin, in defence of free will; but his most curious treatise was entitled "De necessariâ Theologiæ scholasticæ Correctione;" in which he discusses the question whether the words "this is my body, this is my blood," were those by which our Saviour consecrated the bread and wine at his last supper. Having previously asserted in a sermon that the repetition of these words by the priest was insufficient for the consecration of the elements in the eucharist without benediction and prayer, he had incurred the charge of heterodoxy. His other works it is now needless to recite. Du Pin.

CHEGGIO, in *Botany*, a name given to a sort of lactescent plant, common in Cambaya. It is reported by authors and by the people of the country, that those knobs and beads of this plant which grow facing the north, are a very noble medicine in the cure of apoplexics and other nervous disorders, but that those knobs and beads of the same plant which look southward are poisonous. Redi proved some of this famous plant, and gave it several fair trials, but found the history of its nature and effects wholly false.

CHEGIASAR, in *Geography*, a town of Persia, in the Irak-Agemi; 100 miles W.S.W. of Amadan.

CHEGOMEGAN, a point of land about 60 miles in length, on the south side of lake Superior; about 100 miles W. of this cape a considerable river falls into the lake; upon its banks virgin-copper is found in great abundance.

CHEHAW, a town of America, in the state of Georgia; 165 miles W.S.W. of Augusta.

CHEILOCEACE, in *Surgery*, literally signifies the lip-evil. It is a swelling of the lips, to which the inhabitants of northern countries, especially children, are said to be very subject; particularly those in England and Ireland, if we may credit Cassellus.

CHEIRANTHUS, in *Botany*, (from the Arabic *keiri*, altered by Linnæus, without any evident propriety, into a name with a Greek form, *quasi* from *χειρ*, a hand, and *ανθος*, a flower), Linn. Gen. 815. Schreb. 1071. Juss. 238. Vent. vol. iii. 103. Gart 835. Class and order, *tetradynamia filiquosa*. Nat. ord. *Siliquosa*, Linn. *Crucifera*, Juss. Vent.

Gen. Ch. *Calyx* perianth four-leaved; leaflets ovate-oblong, concave, erect, parallel-converging, deciduous; two outer ones gibbous at the base. *Cor.* four petalled, cruciform; petals roundish, longer than the calyx; claws the length of the calyx. *Stam.* filaments six, awl shaped, parallel,

the length of the calyx; two of them gibbous within, the leaflets of the calyx a little shorter; anthers erect, biid at the base, acute, and reflexed at the tip; a nectariferous gland surrounds the base of the shorter filamen on each side. *Pyl.* germ prismatic, tetragonous, the length of the filaments, marked on each side with a tubercle; style compressed; stigma oblong, two, three, or four-cleft; thickish, permanent. *Peric.* filique long, compressed, the two opposite angles obliterated, and marked with a small tooth, two-celled, two-valved, terminated by the style. *Seeds* several, pendulous, alternate, somewhat egg-shaped, flat.

Ess. Ch. Germ furnished on each side with a small glandular tooth. Calyx closed; two of its leaflets gibbous at the base. Seeds flat.

Obs. The little tooth on each side of the germ, in some species, becomes nearly evanescent, in others increases in size.

Sp. 1. *C. erysimoides*, Linn. Sp. Pl. 1. Willd. 1. Jacq. Amft. tab. 74. (*C. sylvestris*, Lam.? *Leucocium luteum sylvestre angustifolium*, Bauh. Pin. 202. *L. sylvestre*, Cluf. Hist. 1. p. 209. Bauh. Hist. ii. p. 873. *Erysimum sylvestre*, Scop. Car. n. 650.) Wild wallflower. "Leaves lanceolate, toothed, naked; stem upright, quite simple; filiques four-cornered." Linn. *Root* biennial. *Stem* in the wild plant usually simple, from six inches to a foot high. *Leaves* linear or oblong lanceolate, acute, generally quite entire, but sometimes furnished with one or two small teeth; petals emarginate; style none. A native of Germany, Switzerland, France, &c. 2. *C. Armeniacus*, Bot. Mag. Pl. 835. "Stem frutescent, divided; leaves aggregate, gash-toothed, broader upwards; filiques four cornered, terminated by the thickened two-lobed stigma." Nearly allied to the preceding, but differs in having a shrubby divided stem, leaves collected in a circle at the extremity of the branch, and more deeply toothed, and flowers in longer racemes. The peduncles of the flowers are horizontal, of the fruit assurgent. *Flowers* sweet-scented. Raised in 1805; by Mr. Lodiges of Hackney, from seeds gathered on mount Ararat. 3. *C. Helveticus*, Mur. Syst. Vcg. p. 597. Mart. 2. Willd. 2. Jacq. Hort. tab. 9. (*C. hoccense*, Allion. Ped. tab. 58. fig. 2. *C. hieracifolius*, B. Lam. 5. Hesperis. Hall. Helv. n. 450. *Leucocium minus angustifolium*, Boec. Mas. tab. iii.) Swift wallflower. "Leaves lanceolate, toothed, naked; stem erect; filique four-cornered, acuminate with the style." *Root* biennial. *Stem* more shrubby than that of *C. erysimoides*, eighteen inches high, erect, somewhat angular. *Leaves* acute, thickish, usually somewhat rugged, nearly sessile, often quite entire, sometimes with a few teeth. *Flowers* smaller than those of *C. erysimoides*, and with less scent; petals not emarginate; stigma separated from the germ by a style. A native of Switzerland, flowering in May and June. 4. *C. Alpinum*, Linn. Mant. p. 93. Mart. 3. Lam. 2. Willd. 3. (*Leucocium angustifolium alpinum*, flore sulphureo, Tourn. Inst. 222. Allion. Pedem. 44. tab. 9. fig. 3.) Alpine wallflower. "Leaves linear, entire, somewhat downy." Linn. *Root* biennial. *Stem* generally simple. *Leaves* sometimes toothed. *Flowers* sulphur-coloured, large. A native of the Alps. 5. *C. lanceolatus*, Willd. 4. "Leaves oblong-lanceolate, quite entire; petals lanceolate; stem covered with soft hairs." *Stem* near a foot high, erect, quite simple, even; covered with wide-spreading hairs. *Lower leaves* oblong, obtuse, petioled; middle ones oblong-lanceolate, obtuse, lessened into a short petiole; upper ones sessile, narrower. *Raceme* with few flowers. A native of Tartary. 6. *C. Cheiri*, Linn. Sp. Pl. 2. Mart. 6. Lam. 1. Willd. 5. (*Leucocium luteum vulgare*, Bauh. Pin. 201.) Common wallflower.

wallflower. "Leaves lanceolate, acute, smooth; branches angular; stem shrubby." *Root* perennial, or biennial. *Stem* a foot and a half high, branched; branches rather upright. *Leaves* scattered, rather narrow, entire, smooth, greenish. *Flowers* yellow; calyx commonly tinged with a reddish brown or violet colour. *Seeds* with a membranous edge. Lam. This species has long been cultivated, and is universally esteemed for the beauty, durability, and fragrance of its flowers. These, as they appear under the head of cultivation, are single or double, larger or smaller, pale or deep yellow, ferruginous, yellow, or bloody; varieties which are perpetuated chiefly by cuttings or slips. A native of Europe. 7. *C. frutescens*, Linn. Mant. 94. Smith Flor. Brit. (*C. cheiri*, Hudf. With. Rehb. Sib. Leucium luteum, vulgo cheiri, Rai Syn. 291. L. luteum minus frutescens, Barrcl. Ic. tab. 1228.) Wild wallflower. "Leaves lanceolate, acute, greyish underneath; pubescence quite simple, pressed close down; stem shrubby; branches angular." *Root* perennial. *Stem* much branched; branches erect, leafy, greyish, bearing flowers near their summit. *Leaves* crowded, petioled, acute, generally quite entire, green above; lower ones somewhat serrated. *Flowers* yellow, sweet-scented; calyx purplish; petals emarginate. *Siliques* erect, roundish, greyish; style short; stigma emarginate. *Seeds* without a membranous edge. It differs from the preceding in having acuter leaves, greyish underneath; smaller petals; and recurved, rather rigid, not flaccid, loosely dependent capsules. Dr. Smith. A native of old walls in England and other parts of Europe. 8. *C. callosus*, Mart. 5. Willd. 7. Linn. jun. Supp. 296. "Leaves lanceolate, entire, callous; stem angular, shrubby." A native of the Cape of Good Hope. Thunb. 9. *C. striatus*, Mart. 4. Willd. 8. Linn. jun. Supp. 296. "Leaves linear, acute, smooth; stem shrubby, erect." Thunb. A native of the Cape of Good Hope. 10. *C. tenuifolius*, Mart. 20. Willd. 9. Hort. Kew. ii. p. 395. L'Herit. Stirp. i. p. 92. Narrow-leaved shrubby stock-gillflower. "Leaves filiform, quite entire, somewhat silky; stem frutescent, branched." *Root* perennial. *Stem* a foot and half high. *Leaves* very narrow, spreading, acute; younger ones greyish. *Flowers* yellow; petals obtuse. *Siliques* linear, erect, terminated by the thick style; stigma obtuse, capitate. A native of Madeira, flowering in May and June. 10. *C. mutabilis*, Mart. 21. Willd. 10. Hort. Kew. ii. p. 395. L'Herit. Stirp. i. 92. Bot. Mag. Pl. 193. Broad-leaved shrubby stock-gillflower. "Leaves lanceolate, acuminate, sharply serrated; stem frutescent; siliques peduncled. *Root* perennial. *Flowers*, at their first opening, white; sometimes inclined to yellow; in a few days becoming purple. A native of Madeira, flowering in March and April. 12. *C. apricus*, Willd. 11. "Hilpid; leaves lanceolate, somewhat toothed at the base; siliques erect." *Root* perennial. Whole plant hilpid, like the asperifolia. *Stems* several from one root, about seven inches high, quite simple, somewhat woody. *Leaves* rather obtuse, sometimes quite entire. *Flowers* purple, peduncles spreading. *Siliques* stiff, smooth, linear, terminated by the thick style and two-lobed stigma. A native of Siberia. 13. *C. Chiusi*, Linn. Sp. Pl. 3. Mart. 3. Willd. 12. (Hesperis chia; Lam. 15. Tourn. Cor. 16. Dill. Elth. tab. 148. fig. 178. Leucium thilapaeos facie; Herm. Par. tab. 193.) "Leaves inversely egg-shaped, veinless, emarginate; siliques awl-shaped at the tip." *Root* annual. *Stems* slender, much-branched, diffuse, prostrate at the bottom, oblique above, zig-zag, hairy. *Leaves* generally entire, sometimes a little serrated, scabrous about the edge. *Flowers* small, reddish, purple, or purple-violet, in terminal racemes; claws of the petals a

little longer than the calyx; expansion short, emarginate. *Siliques* slender, cylindrical, beset with short close-pressed hairs. A native of Greece, Barbary, and Spain. 14. *C. maritimus*, Linn. Sp. Pl. 4. Mart. 9. Willd. 13. Bot. Mag. 166. (Hesperis maritima; Lam. Tourn. Infl. 223. Leucium; Pluk. phyt. 432. fig. 2.) Mediterranean stock, improperly called Virginia stock by the English gardeners. "Leaves elliptical, obtuse, naked, roughish; stem diffuse, rough." *Root* annual. *Stems* much branched, from five to seven inches high, divaricated, diffuse, rather rigid, rough with twin close-pressed hairs. *Leaves* obtuse, somewhat reflexed at the tip, green, rather rigid and rough, on long petioles; upper ones slightly toothed. *Flowers* lively red, changing to bluish purple, in a terminal raceme; calyx close, even; petals inversely heart-shaped; anthers in the throat of the flower. A native of the coast of the Mediterranean. This humble species continuing long in flower, is often used as an edging to borders, and is sometimes sown in patches with other annuals on the beds of the flower-garden, which it enlivens with the splendour of its blossoms. If sown in the autumn, it will come up early in the spring, and by varying the time of sowing it may be made to flower almost the whole summer. 15. *C. parviflorus*, Willd. 14. "Leaves lanceolate, repand-toothed; siliques sessile, horizontal, distant, forked at the tip." *Root* annual. *Stem* about seven inches high, erect, branched. *Leaves* green, pubescent, with stellated hairs, narrowing into a short petiole. *Flowers* pale violet, small, in a very long raceme. *Siliques* two inches long, round, terminated by two long awns with the short obtuse stigma between them. A native of Morocco; described by Willdenow from a living plant. 16. *C. incanus*, Linn. Sp. Pl. 6. Mart. 11. Willd. 17. (Hesperis violaria; Lam. Leucium incanum majus; Bauh. pin. 203. Viola; Lob. Ic. 329. Stock-gillflower. "Leaves lanceolate, quite entire, obtuse, hoary; siliques truncate at the tip, compressed; stem somewhat shrubby." *Root* perennial, sometimes biennial. *Stem* from fifteen to eighteen inches high, branched; branches cylindrical, straight, hoary. *Leaves* scattered, long, soft, clothed with a short down. *Flowers* pale or bright red, variegated or pure white, easily becoming double by culture. Sweet-scented. A native of the sea-coast in France and Spain, but cultivated from a very early period in the English gardens for the beauty and splendour of its flowers. Numerous varieties have in consequence been produced. The principal ones mentioned by Miller are the queen's stock-gillflower, the Brompton stock, the white stock, and the white wall-flower. 17. *C. fenestralis*, Linn. Sp. Pl. 5. Mart. 12. Willd. 18. Jacq. Hort. 2. tab. 179. (Hesperis fenestralis; Lam.) "Leaves crowded in heads, recurved, wavy; stem undivided." Scarcely more than a variety of the preceding. *Root* biennial. *Stem* six inches high or more, shrubby, perfectly simple the first year, but afterwards divided at the top into two or three straight cylindrical branches. *Leaves* broader and shorter than those of the preceding. *Flowers* smaller and less sweet-scented. Native country unknown; first sown in the Upsal garden in 1753. It received its trival name from its peculiar fitness to stand in windows. 18. *C. fallens*, Linn. Mant. 93. Mart. 10. Willd. 15. (Hesperis fallens; Lam.) "Leaves lanceolate, obtuse, quite entire; stem erect; anthers included." *Root* perennial. Similar to *C. incanus*, but eight times smaller. Whole plant smoothly tomentous. *Stems* erect, enduring several years. *Flowers* purple with a yellowish throat; stigma obtuse, thickish, bifid, by no means slender. The seed of *C. incanus*. A native of the salt marshes of Siberia and Tartary. 19. *C. bicuspitatus*, Willd. 16. (Hesperis orientalis

glabrofolio flore magno violaceo; Tourn. Cor. 16.) "Leaves lanceolate, acute, somewhat toothed, pubescent; siliques clove-pressed, bicuspidate." Whole plant pubescent. *Stem* a foot and a half high, erect. *Leaves* sessile. *Flowers* resembling those of *C. incanus*, but the petals are obtuse, more lanceolate and a little longer. *Siliques* round, terminated by the erect two-lamellated stigma. A native of America. 20. *C. annuus*, Linn. Sp. Pl. 7. Mart. 13. Willd. 19. (*Hesperis æstiva*; Lam. *Leucoum incanum minus*; Bauh. Pin. 200.) Annual stock-gillflower, or ten weeks stock. "Leaves lanceolate, somewhat toothed, obtuse, hoary; siliques cylindrical, acute at the tip; stem herbaceous." Nearly allied to *C. incanus*. *Root* annual. *Stem* about a foot and a half high, cylindrical, straight, branched near the top. *Leaves* long, narrowed towards the base. *Flowers* large, red, purple or white, of an agreeable smell, peduncled in terminal racemes; petals a little emarginate. A native of the sea-coast in the south of Europe. Commonly cultivated in gardens, where if sown in succession in February, March, and May, they continue in flower the greatest part of the summer. 21. *C. littoreus*, Linn. Sp. Pl. 10. Mart. 14. Willd. 20. (*Hesperis littorea*; Lam. *H. maritima angustifolia incana*; Tourn. Infl. 223. *Leucoum*; Bauh. Pin.) Sea stock-gillflower. "Leaves lanceolate, somewhat toothed, somewhat downy, somewhat fleshy; petals emarginate; siliques downy." *Root* annual. *Stem* about a foot high, alternately branched, hoary. *Leaves* alternate, channelled, obtuse, hoary. *Flowers* in terminal racemes, purple, peduncled. *Siliques* slender, cylindrical. A native of the sea-coasts in France and Italy. 22. *C. contorpicatus*, Willd. 21. "Root-leaves sinuate-toothed; stem ones lanceolate, obsoletely toothed; siliques revolute, hispid." *Stem* about half a foot high, branched, divaricated, slightly pubescent. *Root* and stem-leaves almost pinnatifid. *Flowers* violet. *Siliques* round, rather obtuse, twisted. A native of Siberia towards Caucasus. 23. *C. leucanthemus*, Willd. 22. "Leaves pubescent; root-ones runcinate, stem ones linear, somewhat toothed; siliques erect." Whole plant hoary. *Stem* a foot high, erect; branches erect. *Flowers* white, filial; siliques round, terminated by the short style, and capitate emarginate stigma. A native of the north of Persia. 24. *C. trifida*, Linn. Sp. Pl. 8. Mart. 15. Willd. 23. Bot. Mag. Pl. 729. (*Hesperis angustifolia*; Lam. *Leucoum*; Barrel. ic. 999. Boec. Mus. tab. 111.) "Leaves linear, somewhat sinuated; flowers nearly sessile; petals waved; stem somewhat shrubby." *Root* perennial. *Stem* five or six inches high, slightly cottony. *Leaves* alternate, sessile, soft, slightly cottony. *Flowers* in a loose raceme, first of a pale russet colour, then dull purple with brown veins; petals curled and somewhat toothed; scentless in the day time, odorous in the evening. A native of the sea-coast in the south of France, Spain, and Italy. 25. *C. trilobus*, Linn. Sp. Pl. 9. Mart. 16. Willd. 24. (*Hesperis triloba*; Lam. *Leucoum maritimum minimum*; Bauh. Pin. 201.) "Leaves lanceolate, obtuse; calyxes smooth; siliques knotted, mucronate, smooth." *Root* annual. *Stems* seven or eight inches high, branched, spreading, hoary. *Leaves* with one or two teeth on each side. *Flowers* rather large, purple. *Siliques* linear, a little cylindrical, torulose, keeled at the sutures. A native of Spain and the isles of Hieres. 26. *C. pulchellus*, Willd. 25. (*Turritis orientalis*; Tourn. Cor. 16.) "Leaves lanceolate, smooth, ciliate-toothed, stem quite simple." *Root* perennial, filiform, creeping, fibrous. *Stems* several, about two inches high, quite simple. *Leaves* alternate, nearly sessile, marked with four lines, attenuated

both ways. *Flowers* yellow, large. A native of Cappadocia. 27. *C. pinnatifidus*, Willd. 26. Whole plant beset with elevated points, and long, white, scattered hairs. *Stem* half a foot high or more, branched near the top. *Flowers* red. A native of Siberia. 28. *C. tricuspidatus*, Linn. Sp. Pl. 12. Mart. 17. Willd. 27. Gært. tab. 143. (*Hesperis tricuspidata*, Lam. pl. 574. fig. 2. *H. maritima latifolia*, Tourn. Infl. 223. *H. marinum*, Cam. hort. tab. 87. Morif. 2. tab. 8. fig. 13.) "Leaves lyre-shaped; siliques three-toothed at the tip." *Root* annual. *Stems* a little declining, cylindrical, whitish, moderately branched, from four or five to eight or ten inches high. *Leaves* deeply sinuated at the edges, hoary. *Flowers* purple violet, in a short terminal raceme, on short peduncles. *Siliques* about two inches long, terminated by three short diverging awl-shaped points or awns. *Seeds* ten or twelve in each cell; egg-shaped, compressed, not margined. Gært. A native of the south of France, Italy, and Spain. 29. *C. tomentosus*, Willd. 28. (*C. ann. littoreus*; Pallas it. 2. app. n. 115. tab. K. fig. 2. Germ. tom. 2. pl. 12. fig. 2, Fr.) "Leaves downy, pinnatifid, obtuse; siliques round, downy, even." Whole plant hoary, and clothed with a thick down. *Root* simple, rigid, a little branched at the top. *Stems* several, about nine inches high, ascending, nearly simple. *Leaves* thickish, oblong; segments obtuse. *Flowers* pale yellow, sweet-scented, peduncled, occupying half the stem. *Siliques* linear, long, sometimes torulose, terminated by the two-lobed stigma; when ripe extremely rigid, almost woody, divaricated. Pallas. A native of the coasts of the Caspian and about the Irifish, flowering early in spring, and ripening its seeds in June. 30. *C. odoratissimus*, Willd. 29. Marshall ab Bieberst. Calc. 116. n. 22. Pall. ind. taur. in Nov. Act. Petrop. 10. p. 314. "Leaves downy, lyrate, sinuated; siliques compressed, downy, even." *Root* perennial. Whole plant hoary with down. *Stem* somewhat shrubby, branched at the base. *Leaves* oblong, very various in shape, generally sinuate-pinnatifid, with obtuse entire segments; sometimes deeply pinnatifid, sometimes unequally toothed; those about the root sometimes quite entire. *Flowers* the colour and size of *Hesperis trifida*, sweet-scented in the evening. *Siliques* terminated by the thick, oblong, bilamellated stigma. A native of naked hills in the north of Persia and Tauris. 31. *C. sinuatus*, Linn. Sp. Pl. 11. Mart. 18. Willd. 30. Eng. Bot. pl. 462. (*Hesperis sinuata*, Lam. *Leucoum maritimum sinuato folio*; Bauh. Pin. 201. Tourn. 221.) Prickly podded stock gillflower. "Leaves downy, obtuse, sinuated; those on the branches entire; siliques prickly." *Root* biennial. Whole plant clothed with hoary, stellated, intricate down. *Stem* two feet high, branched, spreading, round. *Leaves* a little succulent, alternate, oblong, attenuated at the base. *Flowers* reddish lilac or purple, resembling those of the garden stock, but fragrant only in the evening; calyx compressed, purplish; petals emarginate; stigma four-cleft. *Siliques* long, compressed. *Seeds* numerous, flat, with a membranous border. A native of the sea-coasts of Wales, Cornwall, France, and Spain. 32. *C. taraxacifolius*, Willd. (*C. anchius*, Pall. itin. 1. app. n. 116. *Hesperis laxa*, Lam.) "Leaves pubescent, lower ones runcinate-pinnatifid, upper ones sharply toothed." *Stem* a finger's length, quite simple, erect, pubescent. *Leaves* green, clothed with short scattered clove-pressed hairs. *Flowers* violet or purple. Willd. from a dried specimen. La Marck's description is formed from a living plant in the Royal Garden at Paris, which seems to have been rendered larger and smoother by cultivation. *Root* annual. *Stems* two or three feet high, much branch-

CHEIRANTHIUS.

ed. loofe, rigid, quite smooth near the top. *Leaves* smooth on both fides. *Flowers* very small. *Siliques* three inches long, flender, often bowed round, smooth; stigma trifid, but fo final, that its lobes are fcarcely vifible. A native of Tartary, on the banks of the Volga. 33. *C. quadrangularis*, Mart. 2. Willd. 33. L'Herit. flrip. t. tab. 44. (*C. cornutus*; Lam. *C. montanus*; Pallas itin. t. app. n. 115. "Leaves linear, quite entire; filiques fcille, oblong, quadrangular, terminated by a long fyle." *Root* biennial. *Stem* two or three feet high, fimple, but fometimes with a few fhort branches at the top. *Leaves* fcattered, long, narrow, recurved, a little glaucous. *Flowers* pale yellow, in fpike-like racemes, calyx yellowifh white, petals obtufe. *Siliques* not more than half an inch long, hairy, thick, four cornered, two of the angles more elevated; fyle as long as the filique, bifid. A native of Siberia. 34. *C. culpidatus*, Willd. 32. Marfchall ab Bibern. Calp. p. 116. n. 21. ("Turris montana filiquis latis"; Buxb. Cent. 2. tab. 33. fig. 1.) "Leaves lanceolate, toothed; ftem ftraight, fimpie; filiques peduncled, fliffly upright, broadly two-edged, fyle twice the length of the filique." *Root* biennial. *Whole plant* pubefcent. *Stem* fix or fiven inches high. *Lower leaves* petioled. *Flowers* pale yellow, fmallier than thofe of the preceding. *Siliques* hoary, oblong, compressed, four-cornered. A native of hilly patures about the Cafpian Sea. 35. *C. Farfeta*, Linn. Mant. 94. Mart. 19. Willd. 34. Deffont. atl. 2. tab. 160. (*Farfeta Egyptiaca*; Turra. Farfet. Venet. 1765. p. 1. tab. 1. Thilalp. fruticofum ramofum; Pluk. Aln. 395.) "Siliques oval, compressed; leaves linear-lanceolate; ftem fhrubby, erect." *ℓ.* *C. linearis*; Forfk. defcrip. 120. *Root* perennial. *Stem* a foot high, hoary, fliff, branched. *Leaves* alternate, f. file, acuminate, quite entire, hoary, or fometimes filvery. *Flowers* in fomething lateral fliff racemes, the colour of *C. tritilis*, fragrant in the evening; and calyx oblong, green; petals linear, rounded, quite entire, oblique. *Silique* oval, flaty compressed, refembling that of Lunaria. A native of Egypt and Arabia.

CHEIRANTHUS lacurus. See *HESPERIS lacera*.

CHEIRANTHUS turritoides, hieracifolius et paniculatus, Lam.

See *ERYSIMUM cheiranthoides, hieracifolium et repandum*.

CHEIRANTHUS Gron. virg. See *ARABIS lyrata*.

CHEIRANTHUS Africana, Comm. See *MANULEA cheiranthus*.

Obf. The effential character of this genus, like that of moft of the other genera in this natural order, is by no means well-defined. Linnaeus makes it chiefly confift in the glands on each fide of the germ. La Marec confiders this particular as too inconfiderable, and too uncertain to confitute a genus; and afferts, that two diftinct fectons of plants are improperly united by Linnaeus under his *Cheiranthus*. He therefore pays no attention to the glands, and includes under his genus only thofe fpecies which have yellow flowers and four-cornered filiques, removing to *Hesperis* thofe which do not poffefs thefe characters, and admanting fome of Linnaeus's *Eryfima*. Ventenat and Du Tour, in Nouv. Diet. add to the character of *Cheiranthus*, "feeds with a membranous edge," which, according to them, is not to be found in the true *Hesperides*. Du Tour, in confequence of this decifion, determines the colour of the flowers to be of no confequence, and replaces among the *Cheiranthi*, the *incanus*, *feniculatus*, and *annuus*, which have fuch a feed; and fuffers the *fulvius*, *maritimus*, and *chius*, to remain under *Hesperis*, becaufe their feeds have no membranous edge. But in fo doing, he furely feparates plants which nature has ufely united. In the prefent ftate of the fciences, it appears to be noft eligible to adhere to the ar-

rangement of Linnaeus. The confufion cannot be removed till fome matter-hand fhall undertake a thorough investigation of the whole family.

CHEIRANTHUS, in *Gardening*, comprehends plants of the ornamental kind, as the Wall-flower and Stock Gilliflower.

There is a great number of fpecies; but thofe moftly cultivated for ornament are the common wall-flower (*C. cheir*); the queen's ftock-gilliflower (*C. incanus*); the cluster-leaved dwarf ftock-gilliflower (*C. feniculatus*), the annual ftock-gilliflower, or ten week ftock (*C. annuus*); and the dwarf annual ftock-gilliflower, or virgin ftock, (*C. maritimus*). The firft fort has tough fibrous roots and a woody upright durable ftalk divided into many erect angular branches, forming a bufhy head from one to three feet in height, furnifhed with green fpear-fhaped leaves, and terminating in numerous fpike of flowers, varying in colour in different varieties. It is a native of Switzerland.

The chief varieties are, the common dwarf yellow with a low bufhy head; the large yellow with a branchy ftem forming a bufhy head; the large yellow, bloody, with a branchy head; the true bloody, with a branchy ftem; the narrow-leaved fraw-coloured, the variegated-leaved yellow; the winter; and the white, having a very branchy greenifh ftem, and bufhy-headed: the flowers in each variety fingle or double.

The fecond fort has a naked white root, an upright ftrong abiding woody ftem from one to three feet in height, branchy at top, with fpear-fhaped obtufe hoary leaves, and the ftems and branches terminated by fpike of flowers. It is a native of Spain. The flowers vary in their colour; fome being of a pale red, others of a bright red, and fome curioufly variegated, but thofe of the bright red are generally held in the higheft efteem. And there are likewife other varieties, as the *scarlet Brompton ftock*, with a ftrong upright fingle ftem, from one to three feet high, crowned by a cluster of long thick leaves and erect fpike of large fcarlet fingle and double flowers:—the *white Brompton ftock*, with the fame ftem and long erect fpike of large elegant flowers:—the *purple or Tawickenham ftock*, which has a thick ftem a foot and a half or two feet high, very branchy upwards, and all terminated by erect fpike of purple fingle and double flowers, purple blood-fpotted fingle and double flowers, variegated purple and white flowers:—the *wall flower leaved or fhrubby ftock*, which has a fhrubby firm ftem from a foot to a yard high, dividing into many fhort branches, forming a bufhy head, all terminated by erect fpike of pure white fingle and double very fragrant flowers, whitifh flefth coloured flowers, whitifh purple flowers, and whitifh red fpotted flowers.

The third fort has a fhrubby ftem from fix to eight inches in height, and nearly of the thicknefs of the little finger, ftraight, rigid, round, being covered with leaves, hoary with nap, dividing at the top into two or three very fhort alternate branches; the leaves are fcattered, petioled, lanceolate, bending this way and that; the flowers alternate, nearly the fize of thofe in the common ftock, of a purple colour; they appear from May to July.

The fourth fpecies rifes with a round fmoth ftem about two feet in height, dividing into feveral branches at the top, the leaves lanceolate hoary, rounded at the end, nearly oppofite or alternate, or three or four together of unequal fizes; the flowers proceed in loofe fpike at the ends of the branches, placed alternately. It is a native of the fouth of Europe. And of this fort there are varieties with red, purple, white, and ftriped fingle flowers, as well as with double flowers of the fame colours.

The fifth fpecies has the ftalks fix or eight inches in height,

height, very much branched, divaricated, somewhat stiff, rugged, with twin appressed hairs; the leaves oval lanceolate, somewhat reflected at the tip, green on rather long petals, stiffish, obscurely fuberrated in the upper ones; the branches terminated by spikes of red flowers, turning purple. It is a native of the sea coast of the Mediterranean. It is sometimes improperly termed virginia stock.

Method of Culture. These plants are all capable of being raised without much trouble or difficulty.

Method of Culture in the Wall-flower Kind. These plants may be easily increased by seeds, slips, or layers; but, in order to have good flowers, very great care should be taken to have the seeds collected from the best plants; as such as are purchased from the seeds-men can seldom be fully depended upon for the purpose. The seed in this sort is less liable to produce double flowers than in the succeeding kind.

The seed should be sown in the spring season, as in April or the following month, either in the situations where the plants are to remain, or on beds of earth that have not been enriched by manure, being covered lightly in; but the first is the better practice. When the plants appear, frequent waterings should be given to them in dry weather; and when they have attained sufficient growth, where the bed method is practised, they should be thinned out during a wet season in the latter end of summer or beginning of autumn, and be replanted in the situations where they are to flower, or be pricked out in nursery beds, nine inches distant, to remain till the following spring, to be removed with balls of earth about their roots to the places where they are to flower: but the first is the most advisable method, as they do not succeed so well by removing. The bed method is chiefly in use with the market-gardeners, who cultivate the flowers for sale in large quantities. The slip mode of raising the plants is chiefly practised in perpetuating the fine double flowers. The slips are made from the side-shoots that have no flowers, which, after being divested of their lower leaves, are planted in the situations where they are to remain, or in beds, to the depth of three or four inches, any time from April to May, slight waterings and shade being given. In the autumn those in the beds should be removed into separate pots, to have the occasional protection of a frame in the winter, where the weather is very severe.

The young, tender, and more pliable branches may be laid down into the ground in the usual manner any time from May till the end of June, a little water being occasionally given when the weather is dry. They should afterwards be taken off when they are well rooted, and be planted out either where they are to remain, or in pots; or, what is the best practice, in both ways.

These two last methods, however, seldom afford plants that have so good flowers as those raised from seed, being mostly weaker and furnished with shorter spikes of flowers. They should therefore be chiefly confined to those varieties that cannot be raised with certainty from seed.

When these plants are intended for the purpose of ornamenting and affording variety on walls, ruins, and other places of this sort, the seed should constantly be sown upon them in the autumn or very early spring, covering it in with a little earth to the depth of half an inch. They will afterwards propagate themselves by shedding their seed, and continue for a great length of time in such places.

Where they are cultivated in the vicinity of large towns, for the purpose of sale, it is the practice, especially with the market-gardeners around London, to prick the young plants out of the seed-beds into nursery rows at the distance of ten or twelve inches, and nine or ten from plant to plant; and where they grow too luxuriantly in these situations,

they are again removed about August, in order to check their too full growth, and by that means render their heads more bushy. They are usually exposed for sale, with small balls of earth about their roots, when just beginning to put forth bloom, so as that their colours and the properties of their flowers can be discerned in some degree.

And where a blow of the double seedling sort is desired, they should be placed in pots, with balls of earth to their roots as soon as their double flower-buds appear, giving them a little water and proper shade, till they become established again in the earth or mould.

These plants in general succeed best and continue longest, where the soil is of the poor and rather calcareous kind. In rich soils they soon decline and go off.

Method of Culture in the Stock Gilliflower Kind.

In these plants the work of raising them may be performed exactly in the same manner as in the wall flower sort; only the seed should always, as much as possible, be sown where the plants are to remain, or the plants be pricked out into them while they are very young, as in their more advanced growth they never succeed well when removed, or are of so long duration; as their roots are fleshy and but slightly provided with fibres. When the removal of the plants is practised at a late period, it should constantly be done with large balls of earth to their roots, or else they are very apt to be destroyed.

And in the slip or layer methods, as practised for the different varieties, the plants seldom grow so freely or become so fine as those raised from seed. The soils on which they are found to succeed best, are such as are fresh, and which have not been enriched by manure. In rich soils they soon disappear.

But both these species and their varieties, in order to have a good show of flowers, and the best and most perfect plants, should be raised annually in the different modes, as, in whatever way they are increased, they always afford the finest flowers the first season of their complete flowering, continuing to decline afterwards.

And such of the double sorts of the different kind as have been potted, should be protected during the winter season, either in frames for the purpose, or some other contrivance, a free supply of fresh air being always admitted when the weather is suitable.

In order to have good flowers of this sort, great care should be taken to remove all the small and imperfect flowers from the seed-beds at the time of setting the plants out.

Method of Culture in the Annual Stock Kind.

In these sorts of plants the work is accomplished by sowing the seeds at suitable times, so as to produce successions of flowers during the summer and autumn, from the beginning of February till the latter end of May, covering the seed in lightly. The first and second sowings should be made on a very gentle hot-bed, or in pots placed in it, or in frames, to be protected in the night; but the others may in general be performed in the places where the plants are to flower, or in beds, to be afterwards pricked out or removed into pots, or where they are to remain and blow. The former is, however, the best practice where it can be employed, as removing always injures the growth of the plants. And in sowing and planting them out in the borders, or other parts of pleasure grounds, it is usual to put them in, in patches, of five or six in each patch, disposing them in a varied manner, in different parts of them.

The plants of the early sowings will mostly be in a state to be planted out in pots or on the borders in the beginning of May, a little water being given at the time, when the weather

weather is dry. They are always proper to be set out when they have attained three or four inches growth, and have several leaves, and should never be delayed much longer.

In cases where these plants are raised by themselves for show, it is the practice to plant them in beds four feet wide, ten or twelve inches apart each way, care being taken to keep them clear from weeds, and duly watered in dry weather afterwards.

In order to have these plants to flower in the autumn and winter, some of them should be potted about the latter end of July, and placed in a warm situation, occasional waterings being given; and in the beginning of autumn be removed under the protection of the green-house, or good garden frames; due supplies of fresh air being admitted when the weather is suitable.

Much caution is also necessary in the culture of these flowers, not only to chuse good seed, but to remove all the bad and imperfect plants as soon as possible from the beds, or other places where they are grown, as without this the plants are seldom good.

And in the fourth species the plants may likewise be increased by sowing the seeds at different times, as in the above sort, chiefly in the place where they are to flower, and a few in pots to be set out with others of similar growth.

The fifth sort may be raised and managed in the same methods as the two first.

It is advised, in order to provide good seed of the three first species, that great attention should be paid to have it collected from those single plants which have the largest flowers, with the deepest and brightest colours. Some suppose it advantageous to take it from such plants as have rather a tendency to the double kinds. The branches should be separated when dry, as the seeds become perfectly ripened, and be tied up in small bunches, and hung up in a dry airy situation, till the seed is fit to be rubbed out and put up for use, which should always be done as soon as it is in a fit state.

But in the two last species nothing further is necessary but to take it, when perfectly ripened, from the best plants of the respective kinds.

All the species and varieties of these plants are highly ornamental, but particularly the double flowering sorts, being introduced not only in the more open exposures of the clumps and borders of the pleasure-grounds and gardens, where variety is wanted; but in other places contiguous to the house, for the delightful smell they afford while they are in blow, which is a considerable length of time.

And the last species is sometimes made use of as an edging, and the third as an ornamental plant in the windows of bed-chambers, and other places where plants in pots are necessary.

CHEITO, in *Geography*, a town of Persia, in the province of Faristan; 120 miles S. of Schiras.

CHEITORE, a town of Hindoostan, in the province of Oudipour, considered by major Rennel as synonymous with Cheitore, subject to the Rana, or chief prince among the Raj-poots, and reckoned the first among the Raj-poot states. The whole of this province, and the adjacent tract of country in the south of Agimere, consist of high mountains divided by narrow valleys; or of plains environed by mountains, accessible only by narrow passes and defiles; and, in effect, one of the strongest countries. It has, however, an extent of arable land sufficient for the support of a numerous population, and is blessed with a mild climate, being between the 24th and 28th degrees of latitude. It is represented as a country likely to remain for ever in the hands of its

present possessors, and to prove the asylum of the Hindoo religion and customs. Notwithstanding the attacks that have been made upon it by the Gaznavide, Patan, and Mogul emperors, it has never been more than nominally reduced; and such are the strength of its fortresses and the independent spirit of its inhabitants, that every war made on these people, even by Aurungzebe, ended in a compromise, or defeat, on the part of the assailants. It first fell into the hands of the Mahometans in 1295, when Alla had possession of the throne of the Moguls, and began his plan of conquest by the reduction of Guzerat.

Cheitore was the capital of the Rana in the days of his greatness; it was then a fortress and city of great extent, situated on a mountain; but it has been in ruins ever since the time of Aurungzebe in 1681; and had once before experienced a like fate from the hands of Acbar, in 1567. Rennel places it in N. lat. 25° 21'. E. long. 74° 56'. It is 300 miles S.W. of Agra; 76 S. of Agimere; 601 W. of Benares; 547 N. of Bombay; and 1168 by Moorshedabad, and 1063 by Bihoom, N.W. of Calcutta.

CHEIWAN, a town of Arabia; 40 miles S. of Saade.

CHE-KANG, a town of China, of the third rank, in the province of Kiang-nan; 11 leagues E.S.E. of Teli-tcheou.

CHEKAO, in *Natural History*, the name of an earth found in many parts of the East Indies, and sometimes used by the Chinese in their porcelain manufactures. It is a hard and stony earth, somewhat like alum, and the manner of using it is this: they first calcine it in an open furnace, and then beat it to a fine powder. This powder they mix with large quantities of water, and stirring the whole together, they let the coarser part subside, and pouring off the rest, yet thick as cream, they leave it to settle, and use the matter at the bottom, which is found in form of f f paste, and will retain that humidity a long time. This supplies the place of the earth called *baache*, in the manufacture of that elegant sort of China-ware which is all white, and has flowers which seem formed by a mere vapour within its surface. The manner of their using it is this: they first make the vessel of the common matter of the manufacture; when this is almost dry, they paint upon it the flowers, or whatever other figures they please, with a pencil dipped in this preparation of the chekao; when this is thoroughly dry, they cover the whole vessel with the varnish, in the common way, and bake it as usual. The consequence is, that the whole is white; but the body of the vessel, the figures, and the varnish, being three different substances, each has its own particular white; and the flowers, being painted in the finest white of all, are distinctly seen through the varnish upon the vessel, and seem as if traced by a fine vapour only. The hoache does this as well as the chekao, and has beside this the quality of serving for the making of the porcelain ware, either alone, or in the place of the kaolin: the chekao has not this property, nor any other substance beside this hoache, which appears to be the same with our flintstones or soap-rock. See PORCELAIN.

CHEKE, JOHN, in *Biography*, a very learned writer, and an eminent promoter of learning in England, was born at Cambridge, June 16, 1714: he received his grammar learning under Mr. John Morgan, and was admitted into St. John's college about the age of 17, where he was greatly distinguished for his application to study, and particularly to the Greek language, which was then almost universally neglected. At the recommendation of Dr. Butts to Henry VIII. he was made king's scholar, and supplied with money for his education, and for his charges in travelling into foreign

foreign countries. At the age of 26, Mr. Cheke was appointed Greek professor at Cambridge, in which situation he endeavoured to render the study of that language more popular, and to reform the pronunciation of it, which was become almost barbarous. In both attempts he incurred the opposition of that party who set their faces against improvements of every kind. Gardiner, bishop of Winchester, was his chief and most violent opponent: he issued an edict, commanding a strict and rigid adherence to the old and received modes. Cheke justified his own conduct upon the authority of Erasmus, but the bishop adhered to his former resolution. In spite, however, of episcopal mandates, the improved pronunciation gradually made its way into the schools and universities of the kingdom. The reputation of Cheke was so high that, in 1544, he was sent for to court, to assist in the education of prince Edward, and he appears to have had some share in the literary instructions of the princess Elizabeth. When his royal pupil Edward VI. succeeded to the crown, he was rewarded with an annuity of 100 marks, and a grant was made to him of several parcels of land and manors: he was also, by royal authority, made provost of King's college, Cambridge. His interest, at particular periods, seemed to decline at court; he, nevertheless, continued in his post as tutor to the king, who was greatly indebted to him for the knowledge and virtuous principles by which his short life was so honourably distinguished; he became also the patron of religious and learned men, both of his own countrymen and foreigners. In 1551, the king conferred on him the honour of knighthood, and gave him a considerable estate for the maintenance of his rank in life. In the same year he acted as one of the disputants on the Protestant side of the question, at two conferences on the subject of transubstantiation; he at other times displayed his controversial talents, and at the close of the young monarch's reign he had so far succeeded as to be clerk of the council, secretary of state, and privy counsellor. The death of Edward was a fatal blow to the confidence of Cheke: he was anxious to have the crown transferred to lady Jane Grey, to whom, and to her council, he acted as secretary. Upon the accession of Mary to the throne of these realms, he was committed to the Tower, and indicted for high treason; but being stripped of the greater part of his property, he was pardoned and set at liberty. Unable, however, to conform to popery now re-established, he obtained leave to travel in foreign countries for a limited time. He went to Switzerland, and from thence to Padua, where he assisted some of his young countrymen in their studies, and read with them the orations of Demosthenes in the original. He afterwards settled at Strasburgh, where the Protestant forms of worship were openly maintained. His not returning home at the period appointed, afforded his enemies a pretext for confiscating what remained of his estate, so that for maintenance he was obliged to read Greek lectures at Strasburgh. In the beginning of 1556, by the invitation of his former friends, lord Paget and sir John Mason, who had become converts to the new order of things, he was induced to go to Brussels, where his wife was. Degrading the integrity of his old friends, he had recourse to the arts of astrology, to the follies of which he was addicted: these assured him that the intended journey would be prosperous. He was, however, way-laid by orders from Philip II., and carried to the Tower of London, where he was detained a close prisoner till the terrors of a cruel death induced him to recant, and make submission to the pope's legate, cardinal Pole. This humiliation was not sufficient: he was compelled to make a formal renunciation of all his errors in the presence of the

cruel queen, and more cruel and revengeful court. His lands were now restored; but with these no power could restore that peace which rarely attaches itself to those, who, from whatever motives, submit to a dereliction of principle. In many instances he was forced to witness the conviction of Protestants who exhibited that constancy in a good cause which he knew ought to have been shewn by himself. He became a prey to remorse, when he probably, but then too late, envied the feelings of those who expired at the stake, and died at the age of 43, leaving behind him three sons. Sir John Cheke was an accurate and elegant scholar; his most celebrated work is entitled "De Superstitione, ad Regem Henricum," written to excite the king to a complete reformation in religion. He endeavoured to correct the orthography and diction of the English language, and would admit of no words but the genuine English of Saxon and Teutonic origin. Hence he objected to the received version of the Bible, and undertook a new one. He finished the gospel of St. Matthew as a specimen, which is deposited in the library of St. Bene't college, Cambridge. Sir John was an excellent statesman, a sincere Christian, and an ardent friend to the reformation, though he wanted courage to die in its defence. He was beneficent and charitable, and the country is greatly indebted to him for his successful endeavours in reforming the pronunciation of the Greek and Latin languages.

CHE-KIANG. See TCHE-KIANG.

CHEKOUTOMIES, in *Geography*, a nation or tribe of Indians, situate near the south bank of Sanguenai river in Upper Canada.

CHELA, has several significations. It imports a forked probe, mentioned by Hippocrates, lib. ii. De Morbis, used in extracting a polypos of the nose. But in Ruffus Ephefius, cap. iv. *chela* denote the extremities of the *cilia*, which touch each other when the eyes are shut. But the most frequent signification of *chela* is *claws*, particularly those of the crab.

Chela further signify fissures in the heels, feet, or pendants.

CHELÆ, in *Ancient Geography*, a place seated on the southern coast of the Euxine sea, at the distance of 20 stadia from the small island of Apollonia, or Daphnusa, and 124 from the mouth of the river Sangar, according to Arrian.—Also, a port of the Thracian Bosphorus, on the coast of Asia Minor, where was a temple of Diana Dictyne.—Also, two promontories, mentioned by Strabo Italicus, supposed by Ortelius to be the two promontories of Apollo and Mercury, which comprehended the gulf of Carthage.

CHELANDIUM, in *Middle Age Writers*, is used for a kind of vessel or ship. It is also called *chelondrium*, *chelindus*, *chelindra*, *Jalandra*, and *Jalandria*, and by the Byzantine writers *χελωνοειος*. It is mentioned by Ditar as a vessel of great length, carrying oars, and 150 seamen. It seems to have resembled an Italian galley.

CHELANDURUS, a small kind of chelanium.

CHE-LAOU, in *Geography*, a town of China, of the third rank, in the province of Chan-si: 14 leagues S.W. of Fuen-tcheu.

CHELAZIUM, a name used by some authors for a moveable tubercle in the eye lid, commonly called in English a *stibe* or *flye*.

CHELIDON, in *Icthyology*, a name by which many of the old Greek writers distinguish the Linnaean *Trigla birundo*, or tub-fish of Ray. Sec TRIGLA *birundo*.

CHELIDONTIA, among the Romans, a name given to the wind more commonly called *favonius*.

It was only called chelidonia for a fortnight in the middle

of February, because at that time the swallow makes its first appearance.

CHELIDONIA, in *Antiquity*, a festival celebrated at Rhodes, in the month Boedromion, when the boys went from door to door begging and singing a song called "Chelidonia," because it began with an invocation of the chelidon, or swallow. It is said to have been composed by Cleobulus the Lindian, as an artifice to get money in a time of public calamity.

CHELIDONIA, in *Botany*, C. Bauh. See **RANUNCULUS ficaria**.

CHELIDONIAE INSULÆ, in *Ancient Geography*, rocks of the Mediterranean sea, upon the coast of Lycia, in Asia Minor, according to Ptolemy. Strabo places them at the commencement of the coast of Pamphly, and he says there are three mountainous islands, about five stadia from one another, and six from the land. M. d'Anville has placed them to the south of "Sacrum Promontorium."

CHELIDONII, a people of Ilyria.

CHELIDONIUM, in *Botany* (from *χελιδων*, a swallow, said to be called from a popular tradition in Greece that swallows make use of its juice to cure their young of blindness, but more probably because it flowers about the time when those birds make their first appearance in spring). Linn. Gen. 647. Schreb. 880. Willd. 1014. Juss. 236. Vent. 3. p. 92. Gert. 677. Class and order, *polyandria monogynia*. Nat. ord. *Rhœadææ*, Linn. *Papaverææ*, Juss. Vent.

Gen. Ch. Cal. two-leaved; leaves roundish, concave, caducous. Cor. Petals four, roundish, flat, spreading. Stam. filaments numerous (from twenty to thirty), shorter than the corolla; anthers oblong, compressed, erect, two-celled. *Pistil*. Germ cylindrical, the length of the flaments, superior; style none; stigma bifid or trifid. *Peric.* Capsule resembling a silique, many-seeded, one or two celled, two or three-valved.

Eff. Ch. Stigma not more than bifid or trifid. Capsule slender, linear, resembling a silique.

Sp. 1. *C. majus*, Linn. Sp. Pl. t. Mart. 1. Lam. 1. Willd. 1. Bauh. Pin. 144. Tourn. Inst. 231. Flor. Dan. tab. 542. Lam. III. tab. 450. Woody. Med. Bot. Supp. tab. 263. Eng. Bot. pl. 1581. (*Papaver chelidonia dictum*. Rai. Syn. 309.) Common or greatcelandine, so called in contradistinction to *Ranunculus ficaria*, which was called by the old botanists the lessercelandine. "Peduncles in umbels." β C. laciniatum, Dill. in Rai. Syn. 309. Miller, pl. 92. fig. 2. Flor. Dan. tab. 676. "Leaves resembling those of the common oak." The whole plant yields a yellow or saffron-coloured, acrid juice. *Root* perennial, spindle-shaped. *Stem* near two feet high, branched, terd-r, sometimes a little hairy. *Leaves* green above, glaucous underneath, alternate, large, soft, unequally winged, lobed, and notched; petioles hairy. *Flowers* yellow, in axillary and solitary umbels; general and proper peduncles hairy. *Capsules* about two inches long, slender, somewhat tapering at each end, one-celled, two-valved. *Seeds* small, black, shining, obsoletely pitted, crowned with a white, compressed, glandular crest, which, when fallen off, leaves an oblong scar; receptacle filiform, placed at the junction of the valves on each side, and furnished with a double row of seeds. A native of hedges and uncultivated grounds, among rubbish and under walls in the neighbourhood of villages in England, and other parts of Europe. The variety β is very hairy; its leaves are divided into long, narrow, segments, deeply jagged at their edges; and, what is most remarkable, its petals are lacinated or cut into several parts. La Marek thinks it a distinct species. It is mentioned by Clusius, Bauh. and several other of the old bo-

tanists, was found plentifully in the former part of the last century, among the ruins of the duke of Leob's seat at Wimbledon, and, as we learn from La Marek, was cultivated in the royal garden at Paris, a little before the French revolution. Both kinds agree in their sensible qualities. The whole plant has a taint, unpleasant smell, and a durable, bitterish, acrid taste, which is considerably stronger in the root than in the leaves. Both water and rectified spirit extract nearly the whole of the pungent matter. The juice of the leaves is yellow, and gives a green tincture to rectified spirit; that of the roots is of a deep saffron colour, and tinges the same menstruum with a brownish-yellow. Its pungency is not of the volatile kind, little or nothing of it rising in distillation either with water or spirit; it is nevertheless greatly abated by drying the plant itself, or by inspersating with a gentle heat the spirituous or watery infusion. Its virtues have been highly extolled by some of the moderns, as well as by the ancient physicians, in the removal of obstructions of the liver and the other viscera, in promoting expectoration and curing intermittents; but though they have gained it a place in the Edinburgh Pharmacopœia, it appears to have been greatly overrated; its use, in the jaundice, in particular, was probably suggested by the old absurd doctrine of signatures. The juice, however, certainly possesses active powers, and may be employed with advantage to destroy warts, clean foul ulcers, and remove obstructions of the cornea. See Woodville's Medical Botany. 2. *C. japonicum*, Mart. 5. Willd. 2. Thunb. Jap. 221. "Peduncles one-flowered; leaves petioled, winged, egg-shaped." *Stem* herbaceous, upright, weak, striated, smooth. *Leaves* alternate, petioled, unequally winged; leaflets three or five, opposite, on short petioles, ovate-oblong, acute, gashed, unequally serrated with acute ciliated serratures, smooth, pale underneath, an inch or an inch and a half long, the terminal lobe always longer. *Flowers* yellow, axillary; peduncles capillary, nearly the length of the leaves; calyx smooth; corolla a little larger than the calyx; four times the length of the flaments. A native of Japan. 3. *C. glaucum*, Linn. Sp. Pl. 2. Mart. 2. Lam. 2. Willd. 3. Flor. Dan. tab. 585. Eng. Bot. pl. 8. (*Glaucium flore luto*; Tourn. Inst. 254. G. flavum; Crantz. aukt. 141. G. luteum; Scop. Carn. 2. n. 63. Gert. vol. 2. 176. Vent. 3. 92. Smith Flor. Brit. 2. 563. *Papaver corniculatum*; Bauh. Pin. 171. Lob. ic. 270.) Sea Celandine, or yellow horned-popp. "Peduncles one-flowered; leaves embracing the stem, scolloped; stem smooth." Whole plant glaucous. *Root* perennial. *Stems* several, near two feet high, branched, weak, spreading, of an even surface. *Leaves* alternate, a little fleshy, rough with short hairs; root ones lyrate-pinnatifid. *Flowers* yellow large, axillary and terminal; calyx hispid. *Capsules* from ten to twelve inches long, slender, curved, often rough with tubercles, two-valved, two-celled; partition fungous, produced by an enlargement of the receptacle. *Seeds* numerous, seated in deep excavations within the substance of the partition or receptacle; pitted. A native of the sea-coast in England and other parts of Europe. 4. *C. phanicum*, (*C. corniculatum*; Linn. Sp. Pl. 3. Mart. 3. Lam. 3. Willd. 4. *Glaucium phanicum*; Tourn. 254. Gert. 2. 165. tab. 115. Smith. Flor. Brit. 2. 564. Eng. Bot. pl. 1433. Curt. Lond. Educ. 6. tab. 3. *Papaver*; Bauh. Pin. 171.) Scarlet horned-popp. "Peduncles one-flowered, leaves sessile, pinnatifid; stem hispid; capsule bristly." *Root* annual, spindle-shaped. *Stem* two feet high, branched, clothed with horizontal hairs. *Leaves* glaucous, hairy; root ones lyrate pinnatifid; stem ones deeply pinnatifid, jagged and toothed, half embracing the stem. *Flowers* scarlet, half the size of those of the preceding species. *Capsule*

ful rough with longish rigid close bristles, two-valved, two-celled with a partition or receptacle resembling that of the preceding species. *Seeds* pitted. A native of Germany and the south of France. Its right to be received as a British plant rests entirely on the authority of Stillingfleet, who sent it from Norfolk to Hudson, but it has not been found there by any other person. In Chelsea garden it has come up as a weed from time immemorial. 5. *C. fulvum*. (Glaucium fulvum; Smith. Exot. Bot. tab. 7.) "Peduncles one-flowered; Stem-leaves rounded, valved, capsule rough; flowers nearly sessile." Raised by Dr. Smith from seed originally obtained from the Cambridge garden by the name of *C. comiculatum*, and presumed to be a native of the south of Europe. Whole herb of a more blue cast. *Root* annual. *Flowers* orange, twice as large as those of *C. phœniceum*. 6. *C. violaceum*, (*C. hybridum*; Linn. Sp. Pl. 4. Mart. 4. Lam. 4. Willd. 5. Eng. Bot. pl. 201. Glaucium violaceum; Juss. 236. Smith. Flor. Brit. vol. 2. p. 565. Papaver; Bauh. Pin. 172.) "Peduncles one-flowered; leaves pinnatifid, with linear segments." *Root* annual. *Stem* a foot high or more, slender, branched smooth, green. *Leaves* two or three pinnatifid, deep green, smooth. *Flowers* rather large, violet, with a darker spot at the base of each petal; stigma trid. *Capsules* two or three inches long, three-valved, one-celled; receptacles three; fixed to the valves, but not so far extended as to render the capsule three-celled. *Seeds* pitted. A native of Spain and the south of France. It has been found nowhere in Great Britain but in Cambridgeshire and Norfolk. Linnæus supposed it to be a hybrid plant between Papaver Argemone and some species of Chelidonium; but there does not appear any sufficient reason for the opinion. *Obs.* The Chelidonium of Linnæus comprehends the Chelidonium and Glaucium of Tournefort, which were separated from each other by that great botanist, partly on account of the difference in the number of the cells of the capsule, but chiefly because the petals of Chelidonium majus, his only species, appeared to him to be properly cruciform, whereas those of the other species are rather rosaceous, and therefore according to the principles of his system, belong to a different class. Gærtner, Jusseau, Ventenat, and Dr. Smith, all agree in restoring Tournefort's original genera, principally on account of the different number of cells; their Chelidonium being only one, and their Glaucium two. But unfortunately their Glaucium violaceum, which cannot be separated from their *C. luteum* and phœniceum, has only one cell, in direct contradiction to the generic character. Ventenat, who seems to have felt this difficulty, has dropped all consideration of the number of cells in his essential character of Glaucium, observing that the capsule of Phœniceum and Luteum (Chelidonium comiculatum and Glaucium of Linnæus) appears two-celled, because the space betw. the two receptacles is filled with a thick fungous substance. It is indeed so different in its consistence from the usual dissepiment or partition, that Jusseau could scarcely prevail upon himself to call it by that name. Its form in *C. violaceum* sufficiently demonstrates its true nature, and affords a connecting link between *C. majus* and the other species. It is with much diffidence that we dissent from such high authorities; but for the reason assigned, we cannot but think Linnæus fully justified in uniting Tournefort's two genera. The credit of seed introduced by Gærtner and Dr. Smith into their essential character of Chelidonium; and the capitate stigma introduced by Ventenat into that of Glaucium, are, we apprehend, separately considered, of too little consequence to constitute generic distinctions.

CHELIDONIUM, Sloan. Jam. See *BOCCONIA frutescens*.

CHELIDONIUM *majus canadense*; Cord. Morif. Ray. See SANGUINARIA *canadense*.

CHELIDONIUM *minus*. See *RANUNCULUS ficaria*.

CHELIDONIUM *Promontorium*, in *Ancient Geography*, a promontory of Asia, in Pamphylia; probably the same with the Sacrum Promontorium.

CHELIDONIUM, in *Natural History*, a stone pretended to be found in the stomachs of young swallows; much esteemed by some for the falling sick; &c.

The word is formed from *Χηλιδων*, a swallow. See SWALLOW-STONE.

CHELLIFER, in *Entomology*, a generic name assigned by Geoffroy and De Geer to the *Acanus Canceroides* of Linnæus, *Phalargium Canceroides* of Scopoli and Gmelin; which latter see.

CHELLES, in *Geography*, a town of France, in the department of the Seine and Marne; 4 leagues W.S.W. of Meaux.

CHELLUS, in *Ancient Geography*, a town of Palestine, mentioned in the Apocryphal book of Judith.

CHELM, in *Geography*, a town of Poland, in Red Russia, and capital of a palatinate of the same name; the see of a Roman bishop, suffragan of Lemberg, and a Greek bishop, suffragan of Kiow. The palatinate is partly subject to Russia and partly to Austria. The town is in a state of decay; 108 miles S.E. of Warsaw and 396 E. of Briellaw. N. lat. 51° 10' E. long. 24°.

CHELMER, a river of England, in Essex, which runs into the sea a little below Malden.

CHELMIEZ, a town of Lithuania, in the palatinate of Minsk; 50 miles E. of Mozyr.

CHELMON, in *Ancient Geography*, a town of Palestine, over-against Eufraeton, according to the book of Judith. Holofernes encamped before this city when he went to besiege that of Bethulia.

CHELMSFORD, in *Geography*, the shire town of Essex, England, is pleasantly situated near the centre of the county, at the confluence of the rivers Chelmer and Cann, from the ancient ford over the former of which it evidently derives its name. Camden, without any authority but its distance from the supposed site of the Roman station of Camalodunum, which he places at Malden, fixes Canonium here, though every circumstance, it is observed by Mr. Gough, "is against assigning such antiquity to this town; there was not even a road near it till Henry the First's time, when Maurice, bishop of London, to whose see it always belonged till Bonner's time, built a bridge over the Chelmer." Maurice possessed the episcopal dignity about the year 1100, and to his bridge this town owes its importance, as it occasioned the great road which before passed through Writtle, a village two miles to the west, to be brought to Chelmsford; and from that time the latter increased in buildings and population. In the first year of king John, William de Sancta Maria, bishop of London, procured the grant of a weekly market, and other privileges; these were afterwards confirmed by Edward I. In the eleventh of Edward III. four members were sent from Chelmsford to a council held at Westminster. The town is chiefly formed by four respectable streets. Near the centre is the shire-hall, an elegant, commodious, and well-designed structure, erected at the expence of the county, from designs and under the immediate direction of J. Johnson, architect, who having completed it to the satisfaction of his employers, and at a less expence than the original estimate, was presented, in pursuance of a vote passed at the quarter sessions in 1792, with an elegant silver cup. The front of the building

building is of white stone with a rusticated basement, and ornamented with four three-quarter columns supporting a pediment. The corn exchange, apartments for the courts of assize and sessions, an assembly room, and other convenient offices, are within the walls of this building. Contiguous to it is a neatly sculptured conduit; to which the water is brought from a spring about a quarter of a mile distant. When the original conduit was built is unknown; the present was erected a few years ago chiefly from subscription of the inhabitants, to which the Sun and Royal Exchange fire offices contributed 1000 each. The church is a spacious handsome building, dedicated to St. Mary; the body is modern, and was erected from designs by Mr. Johnson, in place of the more ancient part, which fell to the ground on the night of January 17th, 1800. At the west end is a square flint tower with pinnacles. When the original church was founded is uncertain; but from an inscription which was placed on the fourth side of the centre aisle, it appears to have been repaired by subscription, anno 1424. In this town is a free grammar-school, founded and liberally endowed in 1552 by Edward VI., on the petition of Sir William Petre, knight; Sir Walter Mildmay, knight, then one of the general supervisors of the court of augmentations; Sir Henry Tyrrell, knight; and Thomas Mildmay, esq. The governors were at the same time constituted a body corporate. The school-house was rebuilt 1782 by R. Benyon, esq. then acting governor, on the site of a more ancient one, which was erected by Sir John Tyrrell, bart. The education of youth is further provided for by two charity schools supported by voluntary subscription; one founded August 17, 1713, for fifty boys; the other in April 1714, for twenty girls. The school-house stands at the north east corner of the church-yard; adjoining to it are three almshouses for decayed families. The bridge, erected by bishop Manrice, over the Chelmer, having greatly decayed, was rebuilt with one arch in 1787 from a design by Mr. Johnson. This bridge unites the hamlet of Moultham with Chelmsford. Near it, on the Moultham side, stands the county-gaol, a spacious and well-arranged stone building, which was commenced in 1773, by an architect named Helyard, but has since been much improved and completed by Mr. Johnson. The front is formed by a commodious house occupied by the gaoler; from which, westward, extends a large paved yard, terminated by the hospital or ward for female criminals, and a very neat and convenient chapel. On the north side, next the river, is a double range of cells; and beyond, another large yard, secured by a wall and iron palisades, appropriated to the use of the convicts employed in picking oakum and making ropes. On the fourth side, extends a range of separate cells for condemned criminals, behind which, on the opposite side of a paved yard, are apartments for debtors, conveniently disposed. Every yard is provided with excellent spring water, which, with the general attention to cleanliness, greatly contributes to the health of the prisoners. The population of Chelmsford as returned under the late act was 3755, the houses 653. The surrounding country is extremely pleasant and fertile: the soil consists principally of a deep rich loam, intermixed with veins of gravel. Several flourishing plantations of hops are established in the neighbourhood. Within the last seven years, two extensive ranges of barracks, with accommodations for upwards of 4000 troops, have been erected in this parish; the largest at the west end of the town, the other on the southern side. At a small distance west of the latter begins a line of embankment for defending the approach to the metropolis, consisting of star batteries and parapets. It has been carried a considerable way in a south-east direction,

but is not yet completed to the extent proposed. This line is one among the numerous works now carrying on in this country to protect the metropolis in case of invasion. Chelmsford is 9 miles from London; has a weekly market on Fridays and annual fairs. About one mile from this town is Moultham-hall, the seat and manor of the Mildmays, which, prior to the Norman conquest, was parcel of the possessions of the abbey church of St. Peter's Westminster. Morant's History of Essex, 2 vols. fol. Salmon's History of Essex, vol. II. History of Essex, 6 vols. 8vo.

CHELMSFORD, a township of America, in the county of Middlesex and state of Massachusetts, situated on the fourth side of Merrimack river, 26 miles N.W. from Bolton, and containing 1144 inhabitants. This town is connected with Dracut by a bridge over the river at Pawtucket falls, of ingenious construction. The course of the Middlesex canal, designed to connect the waters of Merrimack with those of Boston harbour, will be southerly through the east part of Chelmsford.

CHELONE, in Botany, (from *χελών*, a tortoise) Linnæus 748. Sæb. 1007. Willd. 1176. 1140. Juss. 177. Vent. 2. 362. Gært. 18. Galane Fr. Clafs and Ord. *Diphyanæ* and *Spermat. Nat. Ord. Porifera*, Linn. Vent. *Bryozoa*, Juss.

Gen. Ch. *Cell. Perianth* permanent, one leafed, five cleft; segments erect, egg-shaped. *Cor.* monopetalous, ringent; tube cylindrical, very short; throat inflated, oblong, convex above, flat below; border closed, small; upper lip obtuse, emarginate; lower lip nearly equal to the upper, slightly trifid. *Stam.* filaments concealed under the back of the corolla; four fertile, with the rudiment of a fifth. *Pist.* Germ. superior, egg-shaped; style filiform, the length of the filaments; stigma obtuse. *Peric.* Capsule egg-shaped, two-celled, two-valved, longer than the calyx. *Seeds* numerous, roundish.

Ess. Ch. Calyx five-cleft, rudiment of a fifth stamen. Capsule two-celled.

Ulf. In most species the partition of the cells is double, formed by the inflexed margins of the valves, and not connate with the receptacle; but in *C. penstemon* it is parallel to the valves, and not connected with them.

* *Barren filament fringed.*

Sp. 1. *C. glabra*, Linn. Sp. Pl. 1. Excluding part of the synonymy, Mart. 1. Lam. 1. Willd. 1. (*C. aculeiflora* flore albo; Tourn. Aët. 1706. tab. 7.) White Chelone, or Humming-bird tree. "Leaves petioled, lanceolate, obsoletely serrated; upper ones opposite." Root perennial, thick, fibrous, creeping. *Stems* three feet high, erect, nearly simple, cylindrical, or obscurely four-cornered, early fringed, green, stiffish, on short petioles. *Flowers* white, almost sessile, in short close terminal spikes; lower lip valvate like the back of a tortoise, whence the generic name. *Seeds* surrounded with a membranous bark. A native of North America. 2. *C. albigera*, Mart. Willd. (*C. glabra*, Gært. tab. 54. fig. 6. *C. glabra* Lam. *C. floribus*, culture rose damascena; Gron. Virg. Mul. Ic. tab. 93. *Digitalis maritima*; Rai. Supp. 197. Pluk. Mant. tab. 148. fig. 3.) Purple Chelone. "Leaves petioled, lanceolate, ciliques, deeply serrated; all opposite." *Roots* perennial, less creeping. *Flowers* bright purple. A native of Virginia and Carolina, flowering in August. La Marek asserts, contrary to all other authors, that there is not the rudiment of a barren anther in either of the two preceding species. 3. *C. mollisoides*, Linn. jun. Supp. 279. Lam. 4. Willd. 3. Fort. Comment. Goett. p. 9. 35. (Oursin; Juss. 100. Commerce.) "Root-leaves petioled, egg-shaped, serrated; stem ones opposite, embracing the stem; peduncles long; calyxes ciliated."

ated." *Root* perennial. *Stem* decumbent, scarcely longer than the root leaves. *Leaves* cinereous underneath, slightly veined. *Flowers* purple. *Peduncles* axillary, one-flowered; corolla curved; rudiment of a fifth stamen, resembling an obtuse point between the smaller stamens in the upper part of the corolla. A native of the Straits of Magellan. Jusseu, not being able to find the rudiment of the fifth stamen in the dried specimen sent by Commerson, formed for it his genus *ourita*. 4. *C. barbata*, Willd. 4. *Cavan.* icon. 3. tab. 242. (*C. formosa*, Wendl. Obs. 51. *C. ruellioides*, And. Rep. tab. 34.) " *Root-leaves* petioled, spatulate-lanceolate, quite entire; stem ones lanceolate, sessile; peduncles long; lower lip of the corolla bearded." *Root* perennial. *Leaves* opposite. *Flowers* scarlet, nodding, in a terminal panicle; partial peduncles two, three, or four-flowered; segments of the calyx obtuse; lower lip of the corolla with three acute reflexed segments; inner part of the throat clothed with a dense yellow pubescence. A native of Mexico.

* * * *Barren filament, bearded near the top.*

5. *C. pubescens*. *C. Pentstemon*, Linn. Sp. pl. 3. Mant. 415. Mart. 4. Lam. 2. Illust. pl. 528. *Pentstemon*, Mitch. gen. 14. *Pentstemon pubescens*, Willd. 2. *Draconcephalus*, Morif. Hist. 3. tab. 21. fig. 2, 3. *Cynorynchium*, Pluk. Mant. 62.) " *Stem* pubescent; leaves embracing the stem; panicle dichotomous." *Root* perennial. *Stem* a foot and half high, cylindrical, branched in its upper part. *Leaves* opposite, lanceolate, entire, or very obscurely toothed; lower ones narrowing into a petiole. *Flowers* purple, whitish about the throat in a terminal panicle with opposite ramifications; tube the length of the calyx; upper lip short, obtusely bifid, reflexed; lower lip three-lobed, reflexed at the sides; barren filament broader toward the top, longitudinally bearded. *Seeds* without a membranous border. A native of Virginia. It varies in having broader or narrower leaves. 6. *C. bifida*, Linn. Sp. Pl. 2. Mart. 3. Lam. 3. (*Pentstemon bifida*, Willd. 1. *Digitalis Virginiana*, Pluk. Mant. 64.) " *Stem* and leaves hairy." According to Miller nearly allied to *C. glabra*, differing chiefly in the hairiness of the stem and leaves, and superior whiteness of the flowers. Linnæus, on the other hand, suspects it to be a variety of the preceding. 7. *C. levigata*. *Pentstemon levigata*, Willd. 3. *Chelone*, Ardun. Spec. tab. 5. *Digitalis perfoliata*, Morif. Hist. 2. tab. 8. fig. 6.) " *Stem* smooth; lower leaves quite entire." *Root* perennial. *Lower leaves* ovate-acuminate, petioled; *upper ones* embracing the stem, lanceolate, toothed. *Flowers* violet. A native of North America. 8. *C. campanulata*, Mart. 5. *Cavan.* ic. 1. tab. 29. (*C. campanuloides*, And. Repos. tab. 40. *Pentstemon campanulata*, Willd. 4.) " *Stem* smooth; leaves lanceolate, acuminate; all sharply serrated." *Root* perennial. *Stems* a foot and half high, cylindrical. *Leaves* opposite, sessile, or embracing the stem, green above, paler underneath. *Flowers* purple or violet, in a long loose terminal spike; peduncles axillary, single; lower ones two-flowered. A native of Mexico.

Off. The *Pentstemon* of Willdenow differs from his *Chelone* in nothing but the bearded barren filament, a character certainly too trifling to constitute a generic distinction. Every one must be glad to get fairly rid of so harsh and indiscriminating a name.

CHELONE, in *Ancient Geography*, a promontory of the island of Cos, so named by Pausanias.

CHELONIDES, a maish of Africa in interior Libya, according to Ptolemy. This was a lake formed by the river Gir.

CHELONISCUS, in *Zoology*, the name given by Co-

lunna to the species of Armadillo, called *Dipsos quadrinciatus* by Gmelin, which see.

CHELONITES, in *Ancient Geography*, a promontory of the Peloponnesus, in the territory of Elis, according to Ptolemy. Strabo calls it *Chelonates*. It is supposed by some to be the present Cape Tomese.

CHELONITES SINUS, a gulf placed by Ptolemy on the western coast of the Peloponnesus; commencing at the promontory *Iebthys*, and terminating at *Jardani Sepulchrum*.

CHELONITES, a stone said to be found in the Indian tortoises, and to have the faculty of resisting poison.

The word is formed from *χελων*, a tortoise.

Some confound the chelonites with the bufonites, or toad-stones.

CHELONITIDES, or **ΚΑΤΑΘΡΑΞ**, in *Ancient Geography*, two small islands of the Red Sea, according to Ptolemy; who places them above the port called "Theon Soterion."

CHELONOPHAGI, a people of Arabia, inhabiting the deserts that lie between Egypt and the Persian gulf, according to Mela. Strabo says that they call their dead into the sea.—Also, a people of Asia, who inhabited a corner of Caramania, according to Pliny and Ptolemy.—Also a people of Ethiopia, who not only used the flesh of tortoises for food, but likewise covered their huts or cottages with the shells of these animals. As in size and figure they shells resembled a small fishing vessel, the Chelonophagi employed them as boats on some occasions.

CHELSEA, in *Geography*, a large and populous village of England in the county of Middlesex, situate in the vicinity of London on the north side of the Thames, and famous for its college or hospital. See **HOSPITAL**.

CHELSEA, called by the ancient natives "Winnisimet," a town of America, in Suffolk county and the state of Massachusetts, containing 472 inhabitants. Before its incorporation in 1735 it was a ward of the town of Boston. It is situated north-easterly of the metropolis, and separated from it by the ferry across the harbour, called Winnisimet.—Also, a township of Orange county in the state of Vermont, having 239 inhabitants.—Also, a district of the town of Norwich in Connecticut. See **NORWICH**.

CHELTENHAM, a town of Gloucestershire, England, more celebrated for the salubrity of its medicinal water than for any other circumstance, is supposed to have derived its name from the river Chilt or Chelt, which flows on the south side in its passage to the Severn at Wainlode. By a peculiar custom of the manor confirmed by act of parliament, though lands descend as by common law, yet the eldest female inherits solely. The situation of Cheltenham is extremely pleasant: open to the vale on the south and west; but sheltered on the north-east by the immense amphitheatre formed by the Cotswold hills, which terminate abruptly at the distance of two miles to the north-east. The houses are principally ranged in one street, which extends nearly a mile in length. Since the commencement of the last century, when the fanative qualities of the springs were first noticed, the buildings have progressively improved, both in appearance and numbers, and especially within the last twelve years. Many neat mansions have also been erected in the vicinity, the principal of which is *Bays-Hill Lodge*, an elegant building, erected for the late Earl of Fauconberg, in the year 1781; and distinguished as the residence of their present majesties during their visit to Cheltenham in the summer of 1788. The Spring or Spa, as it is called by way of distinction, was first observed to possess medicinal virtues in the year 1716: the discovery of its qualities appears to have arisen from accident, but the immediate cause is uncertain.

tain. It rises about six feet below the surface of a meadow, which is about half a mile south of the town; and according to the experiments of Dr. Short, the water is "a neutral, purgative chalybeate." It continued open for two years from its discovery, but was then railed in; and in 1721, was let by the then owner, Mr. Mason, for the sum of 6*l.* per annum. In 1738 it became the property of captain H. Shillicoorne, in right of his wife, the daughter of Mr. Mason: this gentleman erected a brick pavilion or dome, on four arches, over the well; formed several contiguous walks, and built a commodious room for the reception of the company. About the same time a long avenue of lime trees was planted. Several similar improvements have been since made. The beneficial effects of this spring have proved an increasing source of wealth to the town; its visitors, however, have been so numerous, that it was feared the waters would not have been sufficient to supply the increasing demand. In 1788, at the depth of about 50 feet, a spring was discovered, and was found to possess all the specific medicinal qualities of the other, and to be much more copious: a circumstance which enabled the proprietor to afford a more constant supply for every necessary occasion. A new spring was discovered, in 1803, by Dr. Thomas Jamieson, who has described the water as somewhat resembling that at Harrogate, in Yorkshire, and containing rather a greater proportion of sulphureous gas than the other wells. The amusements of Cheltenham are similar to those of most other places of public resort: the season is from May to the end of November. The assembly-rooms are spacious and handsome; and a new theatre has been lately completed on an enlarged plan, under the direction of Mr. Watson. The hotel and principal lodging-houses are handsomely and conveniently fitted up. The church, situated near the center of the town, on the south side, is a large and elegant fabric dedicated to St. Mary, and for the most part, of the architecture of the middle ages. An hospital for six poor men and women, and a free school, were founded here, in the year 1574, by Richard Pate, Esq. Queen Elizabeth increased the endowments. By a subsequent benefaction, two scholars educated at the free school are sent to Pembroke college, Oxford. Some other schools are also established in this town; and a peculiar charity was instituted, about the year 1800, called the "Cheltenham repository, for the reception and sale of works of ingenuity and industry, for the benefit of the sick and industrious poor." This establishment originated with the fair sex, and is principally managed by a committee of females. The population of this parish was stated in the late return to be 3074; the number of houses 710. Cheltenham is 94 miles N.W. from London, has a market on Thursdays, and three annual fairs.

About two miles from Cheltenham, in the parish of Bishop's Cleeve, is *Southern House*, a venerable and far-famed mansion, now the property of Thomas Bagshott de la Bere, Esq. whose father, William Bagshott, Esq. of Presbury, assumed the name de la Bere, in pursuance of the will of his uncle, Kynard de la Bere, Esq. who, dying without issue in 1735, bequeathed to him this estate. Leland mentions this house as recently built by Sir John Huddleston, at the time he made his survey by command of Henry VIII.; and it yet retains as much, or more, perhaps, of its original form, as any other domestic building in England of that era. Atkins's History of Gloucestershire, fol.

CHELVA, or XELVA, a town of Spain, in the province of Valencia; 6 leagues S.W. of Segorba.

CHELUM, a river of India. See BEHAT.

CHE'LY, ST, D'AUBRAC, a town of France, in the department of the Aveyron, and chief place of a canton in the district of Espalion; 7 leagues N.E. of Rodez. The place contains 1475, and the canton 3503 inhabitants: the territory comprehends 137½ kilometers, and 5 communes.

CHE'LY, ST., D'ARCHER, a town of France, in the department of the Lozère, and chief place of a canton in the district of Marcols; 7 leagues N.N.W. of Mende. N. lat. 44° 48'. E. long. 3° 10'.

CHELYDOREA, in *Ancient Geography*, a mountain of the Peloponnesus, which belonged partly to Arcadia, and partly to Achaia. This mountain separated the territory of the Phenazians from that of the Pelleneans, according to Pausanias, l. viii. Arcad. c. 7.

CHELYS, among the *Ancients*, a musical instrument of the stringed kind, said to be invented by Mercury, and formed of a shell found in the river Nile, at the time of low water. This was a species of guitar, either thrummed with the fingers, or twanged with a quill.

CHELYSMA, in *Antiquity*, a thick piece of wood which the Greeks fixed to the keels of their ships, to save them from being worn or broken. It was also called *cuneus*.

CHEMA, according to Biancard, is the name of a certain measure sometimes mentioned by the Greek physicians, and which he thinks contains two spoonfuls.

The determined weight of this quantity cannot be accurately ascertained, in consequence of the different specific gravities of different substances: just as, at present, the word *spoonful* is used in a vague and undetermined sense, especially with respect to substances, of which it is a matter of indifference whether a little more or a little less be used.

CHEMACH, or KEMACH, in *Geography*, a town of Asiatic Turkey, in the southern part of Caramania.

CHEMAL, a town of Persia, in the province of Chufistan; 120 miles S. of Sulter.

CHEMAZZE, a town of France, in the department of Mayenne, and district of Chateau-Gontier; 1½ league S.W. of it.

CHEME, among the Romans, was a liquid measure, containing the fifth part of a CYATHUS.

CHE-MEN, in *Geography*, a town of China, of the third rank, in the province of Tche-kiang; 20 miles S.S.W. of Ki-hing.

CHEMENS, in *Mythology*, a denomination given by the inhabitants of the Caribbee islands to a sort of genii or spirits, who are supposed by them to watch over the concerns of men: every man, in their apprehension, having a Chemen to himself. They present to these Chemens offerings of their first-fruits, which they place on a table made of rushes at the corner of their huts, where these genii, as they conceive, assemble to partake of the oblation.

CHEMERE, in *Geography*, a town of France, in the department of the Mayenne, and district of Laval; 4½ leagues S.E. of it.

CHEMERY, a town of France, in the department of the Ardennes, and district of Sedan; 7 miles S. of it.

CHEMIA, in *Ancient Geography*, a name given by the Egyptians, in their sacrifices, to Egypt, according to Plutarch.

CHEMICAL *glass*, how to cement when cracked. See CEMENT.

CHEMICAL *vessels*. See VESSELS.

CHEMILLE, in *Geography*, a town of France, in the department of the Maine and Loire, and chief place of a canton, in the district of Beaupréau; 3½ leagues N.E. of Chollet.

Chollet. The place contains 3112, and the canton 10,386 inhabitants; the territory includes 310 kilometres, and 10 communes.

CHEMIN, Couvert, Covert, or Covered Way, in Fortification. is a space five or six toises broad, adjoining to the counterescarp of the ditches, and going quite round the works of a fortification. It is covered by the inner part of the glacis, which serves as a parapet to it, and is raised from 6 to 7½ feet high. The glacis terminates in an easy slope towards the field, at the distance of about 20 toises from the crest of it. The covert way is generally palisaded throughout its whole extent; has traverses to prevent its being exploded from without, and has places of arms in its re-entering angles.

CHEMIN Creux, a hollow way. See RAVIN.

CHEMIN des Rondes, a space left between the rampart and the upper part of the revetement of masonry in a fortified place, as a passage for the rondes or rounds. The old works at Portsmouth, to wit, those round the town, having a complete revetement, have also a *chemin des rondes*; whereas the new works round the Common and the Dock-yard, having only a demi-revetement, have no *chemin des rondes*.

CHEMIN, in Geography, a town of France, in the department of the Jura, and chief place of a canton, in the district of Dôle. The place contains 242, and the canton 6952 inhabitants; the territory includes 130 kilometres, and 16 communes.

CHEMINAIS, TIMOLEON, in Biography, a celebrated French preacher, was born at Paris in 1652, and entered among the Jesuits in 1667. After having taught the languages and rhetoric for some time in their school at Orleans, he gained great applause by preaching at Paris and Versailles; and before the appearance of Mafillon, was reckoned the most pathetic of the French preachers. But his health declined at an early period of his life; and when he was unable to preach, he went every Sunday, as long as he was able, into the country, for the purpose of instructing the poor. His course of service, however, was terminated in his 38th year. After his death, three volumes of his sermons were published by Bretonneau, and have been several times reprinted. He also wrote "Les Sentimens de Piété," 1691, 12mo.; and he is said to have had a talent for light and familiar poetry. *Nouv. Dict. Hist.*

CHEMINON, in Geography, a town of France, in the department of the Marne; 10 miles E. of Vitry-le-François.

CHEMISE, SHIRT. This word is not much in use as a military term; but when it is employed as one, it most frequently denotes a thin wall or revetement against the inner slope of a work, to prevent the earth from tumbling down. The same word is also used sometimes for expressing the exterior revetement of the rampart of a work.

CHEMISE de coup de main de surprise, a number of shirts of linen, or cloth well whitened, which a general or commanding officer sometimes makes use of for his troops, when he attempts a *coup de main*, or surprise, in order to enable them, in a mixture or mêlée, to distinguish one another from the enemy.

CHEMISE de feu, a French sea-term, employed to denote several pieces of old sails of different sizes, which, after they have been well pitched and thoroughly soaked in other combustible matter, as oil of petrol, camphor, &c. may be nailed to an enemy's ship on boarding her, and when set on fire to consume her.

CHEMISE de maille, or de mailles, a shirt of mail, or a sort of body-hing made of several scales or rings of iron, which was worn under the coat as a kind of defensive armour to

protect the body of a man. To this *chemise* they also gave the name of *gallette*.

CHEMISTRY. The science of chemistry may be defined, a knowledge of those attractions which take place at insensible distances between the heterogeneous particles of matter. The attraction of gravitation takes place not only between heterogeneous but homogenous bodies, between masses as well as particles, between bodies that are at a distance from each other as well as those that are in contact; hence magnitude, form, and distance, or, in other words, the elements of mathematical investigation must be the basis of all inquiry into the phenomena of gravitation. The case is very different with regard to chemical inquiries: the subjects of these are particles of matter, both the magnitude and form of which, and the distances within which they act on each other, are wholly incapable, on account of their extreme minuteness, of being appreciated. The elements, therefore, of mathematical calculation cannot be applied to this branch of knowledge.

The science of chemistry is comparatively of late origin, although many chemical arts, such as metallurgy, pharmacy, cookery, the preparation of vinous liquors, dyeing, tanning, glass-making, &c. can boast of a very high antiquity. Neither among the ancient Egyptians, Greeks, or Romans, till after the age of Constantine, are there any traces of chemistry, unless some obscure and idle speculations about the four elements, as entering into the composition of natural bodies, may be dignified with this appellation. For this a double cause may be assigned: in the first place, it was not the habit of the age to make experiment precede theory; and in the second place, hardly any of the agents that are even the most indispensable in chemical inquiries were as yet discovered. None of the acids were known except the aceticus; and of the alkalies, soda was the only one of which even a very imperfect knowledge had as yet been obtained. The conquests of the Saracens, in the seventh and eighth centuries, destructive as they were to the religion and civilization of those countries which they occupied, appear to have given the first serious impulse to the study of chemistry in the west. Rhazes, Avicenna, Geber, and other Arabian physicians, introduced to the notice of Europe many pharmaceutical preparations, both vegetable and mineral, and made great improvements in the mode of conducting processes, particularly distillations. The three mineral acids were discovered, the vegetable and mineral alkalies were distinguished from each other, the preparation of alcohol was made known, the activity of the newly-discovered menstrua was directed upon the metals, and the golden age of alchemy commenced.

The conversion of the baser metals into gold was now the object that for the most part occupied the attention of chemists for several centuries, and an immensity of time, labour, and ingenuity was wasted in this visionary pursuit: it was attended, however, with this incidental advantage, that a considerable dexterity of operating was thus acquired, and many new substances and valuable facts were discovered, which perhaps, without this strong incentive, would have remained much longer in obscurity. In the 15th century, when the ardour of alchemy began to decline, a fresh motive for chemical pursuits began to be developed, by the happy application of them to the improvement of medicine. This was chiefly owing to a German monk, of the name of Basil Valentine, who, in his "Curus Triumphalis Antimonii," communicated to the public a number of valuable antimonial medicines, and discovered the volatile alkali. The success attending these new preparations, the controversy which they occasioned, and the recent discovery of the art of

printing, all contributed to give a vigour to chemistry which it had never felt before; and from this period its progress was rapidly accelerated. Isaac Hollandus, though deeply tinged with alchemical notions, eminently contributed to direct the attention of his contemporaries and successors to the improvement of metallurgical processes, and cleared the way for George Agricola, whose masterly work, "De Re Metallica," liberated metallurgy for ever from the trammels of alchemy, and may be considered as the basis of all the splendid discoveries by which this branch of chemical art has since been illustrated. Among the immediate successors of these three able men occur the memorable names of Lazarus Ercker, Zwelfer, Glaser, Cassius, Poterius, Van Helmont, Kunckel, Glauber, Kircher, and Conringius, to whom is owing the discovery of a multitude of new substances, principally among the class of compound salts, as well as many improvements of apparatus, and of those arts, such as glass-making, which are now strictly chemical. A similar praise is due to Becher, who is still further worthy of notice as the author of certain speculations on inflammable earth, which suggested to Stahl the first hint of that theory which has rendered his name immortal in the annals of chemistry.

A multitude of chemical facts had been by this time discovered, but, from the state of disorderly confusion in which they were, their real value was much misunderstood, and their mutual connexion, as parts of a system, had not even begun to be appreciated. The first traces of a philosophical arrangement of chemical facts occur in the "Exercitium Chemicum" and "Chemia Philosophica" of Barner, the former published in 1670, and the latter in 1689, which long continued to be the text books of lecturers in chemistry, in the most celebrated schools of Europe. In 1675, Bohn, professor at Leipzig, wrote a valuable treatise, shewing that the prevalent opinion of acid and alkaline ferments was insufficient to account for a large number of chemical phenomena, and therefore could not be received as the foundation of a philosophical theory of this science; and in 1670, Wedel published a work, entitled "Non Entia Chémica," also with the view of exploding some of the most popular Platonian notions with which chemistry was at this time infected. The way being thus in some degree cleared, and the spirit of experimental investigation gaining ground rapidly, the illustrious Stahl proposed his theory of phlogiston or inflammable earth, in his "Specimen Becherianum," published in 1703, and still more fully in his "Fundamenta Chémie," in 1723, and thus established himself for nearly 80 years as the acknowledged head of the chemical world. A few modifications of the Stahlian theory, of no great importance, were successively introduced by Boerhaave, Junker, and Machy, and with these chemists rested content, till the discovery of the gasses and the foundation of pneumatic chemistry by Hales, Black, Scheele, Cavendish, Priestley, Bergman, and Berthollet. An immense crowd of new and highly interesting facts was now offered to the attention of chemists, many of which appeared wholly irreconcilable to the phlogistic theory; and the philosophic genius of Lavoisier, demonstrating the falsehood of the popular system, founded a new and more comprehensive one on the affinities and combinations of oxygen with the various substances in nature, which, after a reasonable discussion, has been generally acquiesced in, as explaining a great number of phenomena in a manner much more consonant to the general laws of chemical facts than any other, though by no means entirely free either from difficulty or error.

The system of Lavoisier has been represented by many of his zealous partizans as a general theory of the science; and

oxygen, in one form or other, has been considered as the great agent of chemical composition and decomposition. It is manifest, however, that this substance has nothing to do with the mutual action of the metals, the earths, the alkalies, and the simple inflammables, into none of which oxygen enters as an ingredient; not to mention some of the acids and compound inflammables, in which the presence of this principle is rather inferred than demonstrated. It is, therefore, to the higher and more abstract inquiries concerning chemical affinity that we must have recourse for the philosophy of the science, the general principles applicable to the chemical action upon each other of all the substances in nature.

The above sketch is not intended as a history of chemical discoveries, for to give any satisfactory account of these would require more minute detail than would be proper in this place: we have accordingly distributed this part of the subject among the several chemical articles contained in this work, by which much repetition has been avoided, and the historical notices respecting each particular subject and substance have been brought together in one point of view.

The subjects of chemical science are so prodigiously extensive as to require some classification, in order that we may be duly aware of their very magnitude. They may be conveniently arranged under the eight following heads:

1. *General Chemistry, both theoretical and practical.* The theoretical includes the philosophy of chemistry, or chemical affinity, and those extensive, but not, properly speaking, general systems, by which ingenious men have at different times, and with various success, endeavoured to link together a large number of chemical phenomena. The practical part comprehends, in general, the action of all the simple substances on each other.
2. *Pneumatic Chemistry,* the investigation of which requires a peculiar set of apparatus, and includes all the particulars relative to those substances that exist in a state of elastic fluidity.
3. *Metallurgical Chemistry,* which treats of the assay of metallic ores, and their reduction to the reguline state, both in the small and great way.
4. *Mineralogical Chemistry,* or the method of analysing minerals, including under this term both the stony minerals and mineral waters.
5. *Animal Chemistry,* including the analysis and properties of all the products of animalization, and the consideration of those vital functions which, like respiration, appear to be for the most part decidedly chemical.
6. *Vegetable Chemistry,* comprehending not only an acquaintance with the products of vegetation, but with such parts of the physiology of plants as can be explained or illustrated by the chemical action of their food, and those atmospheric influences to which they are exposed.
7. *Meteorological Chemistry,* including the chemical analysis of the atmosphere, and the whole subject of endiometry, as well as the connexion of chemical agency, with all the meteoric phenomena.
8. *Technical Chemistry,* or the principles and processes of those arts and manufactures which are for the most part purely chemical, such as dyeing, bleaching, the manufacture of glass, porcelain, and pottery, tanning, and the preparation of spirituous fermented liquors.

Besides a reference to each chemical substance, for the history of its discovery, and the particular theory connected with it, we beg leave to direct the notice of the reader, who wishes for further and more general information, to the articles ACIDS, AFFINITY, CHEMICAL, ALCHEMY, EARTHS, GAS, HEAT, METALS, and METALLIZATION, OXYGEN, and PHLOGISTON.

CHEMMIS, in *Ancient Geography*, a town of Egypt, situated on the east bank of the Nile, and at a full half league from it. The Greek name is Panopolis, and Chemmis, the Egyptian name. It subsists in that of *Behminin* or *Achmin*. The remains of the ancient city are yet to be seen to the eastward, and near the walls that surround the modern town. An ancient mosque is still the object of the veneration of the Christians, who pretend that it was formerly one of their churches. The Copts falsely assert that it had been built upwards of 1000 years; but the edifice is falling, and its unstable construction sufficiently proves, that it is not the workmanship of a period when buildings possessed greater solidity. The temple is spacious, and has several entrances; its periphery is lighted by a line of contiguous windows. The interior, like that of all the mosques in this country, is a large, empty, and naked enclosure; but the small granite pillars by which it is supported, and which were taken from among the ruins of Panopolis, excite admiration. This town in its present state, like all those of Egypt, contains a crowd of priestesses addicted to the most disgusting sensuality, and who, like our street-walkers in Europe, make a trade of selling the semblance of pleasure. The Nile, says Sonnini, in the vicinity of this town, furnishes fish in great abundance. That which is most common is the *bayatte*, a species of Silurus, which grows to a great size without acquiring any additional flavour. See **ACHMIN**.

CHEMNITZ, **MARTIN**, in *Biography*, an eminent Lutheran minister, was born in 1522, at Britzen in the Marche of Brandenburg, and educated under Melancthon at Wittenburg, after whose death he became the most celebrated divine of the Angustan confession. Besides his skill in theology, he was also well acquainted with mathematics and astronomy. His counsel and services were much sought by the Protestant princes in all ecclesiastical affairs. His "Examination of the Decrees of the Council of Trent," published at Frankfort in 1585, was held in estimation as a historical and theological work. He also composed a "Harmony of the Gospels," and several other works. At Brunswick, where he died in 1586, he was 30 years a professor. *Mosheim*. E. H. vol. iv.

CHEMNITZ, **BOCESLAUS-PHILIP**, grandson of the preceding, was born at Stettin in 1605, followed the profession of arms, and having entered first into the service of Holland, and afterwards into that of Sweden, was raised by his merit to the posts of counsellor of state and historiographer. Queen Christina ennobled him, and presented him with the estate of Holstædt in Sweden, where he died in 1678. His principal work was a "History of the Swedish Wars in Germany," 2 vols. fol. 1648 and 1653, bringing down the history to 1636, and much esteemed, particularly the second volume, which was compiled from materials furnished by count Oxenstiern. To Chemnitz is attributed another work entitled "De Ratione Status Imperii Romano-Germanici," printed at Stettin in 1640, under the feigned name of Hippolytus a Lapide, and impugning the claims of the House of Austria. *Moreri*.

CHEMNITZ, in *Geography*, a town of Germany, in the circle of Upper Saxony, and marquise of Meissen, containing three churches and an hospital; 36 miles W. S. W. of Dresden, and 32 S. W. of Meissen.

CHEMNITZ. See **KAMNITZ**.

CHEMOSH, in *Mythology, an idol of the Moabites, mentioned in Scripture. St. Jerom supposes that Chemoh and Baal-Peor, (which see) were both names of one and the same idol, not very different from Priapus, which is inferred from the indecent ceremonies used in their worship. Others, however, deny this charge. Dr. Hyde derives Che-*

mosh from the Arabic *chamash*, which signifies *gnatz*, (though in the particular dialect of the tribe of Hodail), supposing it to have been an astrological talisman in the figure of a gnatz, made to drive away those insects: and Le Clerc, who takes this idol for the Sun, deduces it from *Camsis*, a root in the same tongue signifying *to be swift*.

CHEMOSIS, in *Surgery*, an inflammation of the eye, accompanied with an effusion of serous fluid, &c. under the *tunica conjunctiva*, which causes the white of the eye, as it were, to overtop the transparent *cornea*; and thus to produce a sort of *χρημα* or gap, at their place of union. Galen calls this disease a red and fleshy inflammation of the *cornea*, as it seems to be, when the blood-vessels are greatly distended.

Lightly astringent and sedative applications should be employed in this case; and, if the vessels be very turgid, it may be proper to puncture them freely with a lancet, or even to remove a portion of the protruding membrane. Dr. Burghart, in a *Chemist* where the cornea was burst, dilated the opening, and extracted the crystalline lens, which had come forward before the iris. The elevation of the tunica conjunctiva will sometimes be so considerable, as absolutely to prevent the shutting of the eye-lids. See **OPHTHALMIA**.

CHEMPVALLAN, in *Geography*, a beautiful city of Mexico, situated on the coast of the gulf of Mexico, and remarkable for being that by which the Spaniards entered the Mexican empire.

CHEMUNG, a name sometimes given to the western branch of Suquannah river. See **TIOGA river**.

CHEMUNG, a township of Tioga county in the state of New York. It lies Newton W. and Owego E., about 150 miles N. W. from New York city. By the state census in 1796, 81 of its inhabitants were electors.

CHEN, in *Ancient Geography*, a town, which according to Steph. Byz. was the country of Mysor, or Muson, one of the seven wife men of Greece. He placed it in the Peloponnesus, in Laconia.

CHENALOPEX, in *Ornithology*, the name given by Moehring to the great Auk, *Alca impennis* of Linnaeus, Alca major of Brisson, and Grand Pingouin of Buffon.—This bird has the bill fulcated and compressed, and an oval spot of white on each side of the head before the eyes. It is about three feet long, and inhabits Europe and America.

CHENAY, in *Geography*, a town of France, in the department of the Two Seves, and chief place of a canton, in the district of Melle; 8 miles S. E. of St. Maixent. The place contains 1036, and the canton 9475 inhabitants: the territory includes 205 kilometres and 14 communes.

CHENCE, in *Old Customs*, seems to be much the same as **AMABYE**.

CHENCOUR, or **CHEMQUO**, in *Geography*, a town of Armenia, on the frontiers of Gurgistan, which has a beautiful castle, grand caravan-series, and several mosques; 100 miles N. E. of Erivan.

CHENDI, or **CHANDI**, a large village of Abyssinia, the capital of its district, in the province of Atbara, the governor of which is called in discourse Mck el Jahelen, prince of the Arabs of Beni Korcish, who are all settled about the bottom of Atbara, on both sides of the Magiran. In this place there is a tradition, that a woman, whose name was Hendaquë, once governed all that country; whence one might imagine that this was part of the kingdom of Candace; for writing this name in Greek letters, it would be no other than Hendaquë, the native, or mistress, of Chendi or Chandi. This was once a town of great resort, being the place of rendezvous for all the caravans of Sennaar, Egypt, Suakem, and Kordofan, especially since the Arabs have cut off the road by Don-

gola, and the desert of Bahiana. Here every thing is cheaper and better than at Sennaar, the article fuel excepted, for wood is much dearer here than in any part of Athara, so that the people burn camel's dung; but fire, indeed, would be unnecessary, if it were not for dressing victuals, for the heat is so great that in the month of October the thermometer was once so high as 119° ; and in the months of August and September, the weather was so sultry that many persons dropped down dead with heat, both in the town and the villages round it. Chendi has about 250 houses, two or three of which are tolerable, but the rest are infernal hovels built of clay and reeds. The women of Chendi are esteemed the most beautiful in Athara, and the men the greatest cowards. N. lat. $16^{\circ} 38' 35''$. E. long. $33^{\circ} 24' 45''$.

CHENDOUL, a river of Asia in the province of Cabul, which may be regarded as a branch of the Bijore river, and runs into the Kamch, about 25 miles E. of Pashawur.

CHENE, a town of France, in the department of Leman, and district of Geneva; $2\frac{1}{2}$ miles E. of Geneva.

CHENE, LE, a town of France, in the department of the Ardennes, and chief place of a canton in the district of Vouziers; 15 miles S. of Mezieres. The place contains 1154, and the canton 7248 inhabitants; the territory includes 215 kilometres and 18 communes.

CHENENGO, a river of America, being a branch of the Susquehanna.

CHENENGO, a post town of America, one of the chief towns of Tioga county in the state of New York; lying about 40 miles N.E. from Tioga point, between Chenengo river, and the Susquehanna. It was detached from Montgomery county, and in 1795 had only 45 inhabitants. By the state census in 1796, 169 of its inhabitants were electors; it is 125 miles N.W. from New York, and 375 N.W. from Philadelphia. N. lat. $42^{\circ} 8'$. W. long. 76° .

CHENERAILLES, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Aubusson; 9 miles N. of it. The place contains 709, and the canton 8018, inhabitants. The territory includes $207\frac{1}{2}$ kilometres and 12 communes.

CHENESSEE, or GENESSEE, a river of America, which takes its name from a lofty hill in the Indian territory, near which it passes, called by the Indians Genessee, a word signifying in their language, a grand extensive prospect. It rises in Pennsylvania, near the spot which is the most elevated ground in that state. About 50 miles from its source there are falls of 40 feet, and 5 miles from its mouth, of 75 feet, and a little above that of 96 feet. These falls furnish excellent mill-seats, which are improved by the inhabitants. After a course of about 100 miles, mostly N.E. by N. but only navigable for the last 40 miles, at the time of its inundations; it discharges itself into lake Ontario $4\frac{1}{2}$ miles E. of Irondequat or Rundagat bay, and so E. from Niagara falls. The settlements on this river are Hartford, Ontario, Wadsworth, and Williamsburgh. When the western canals and locks are completed, there will not be a carrying place between the city of New York and Williamsburgh. The portages at present are as follow, viz. from Albany to Schenectady 16 miles; from the head of the Mohawk to Woodcreek, one; Oswego falls, two; Chenellee falls, two; so that there are but 21 miles of land carriage necessary, in order to convey commodities from a tract of country capable of maintaining several millions of people. The famous Chenessee flats, lying upon the border of this river, are about 20 miles long, and about 4 wide, and are situated, in their present state, to be worth

200,000l. These flats are the property of the Indians; and are reckoned among the richest lands that are to be met with in North America, to the east of the Ohio. Wheat, indeed, will not grow upon them; but the soil is not impoverished by the successive crops of Indian corn and hemp that are raised upon them year after year. Their great fertility is owing to the regular annual overflowing of the Chenessee river, whose waters are very muddy, and leave a considerable quantity of slime behind them before they return to their natural channel. The high lands in the vicinity of this river are stony, and not distinguished for their fertility; but the vallies are all extremely fruitful, and abound with rich timber. This river is bordered with the richest woods imaginable; and may be seen from an adjoining hill for many miles, meandering through a fertile country; and beyond the flats, on each side of the river, appear several ranges of blue hills rising one behind another in a very fanciful manner, and forming a most beautiful landscape. See GENESSEE.

CHENET, a town of Asiatic Turkey, in the province of Caramania; 100 miles S.W. of Cogan.

CHEN-IN, a town of Asia, in the kingdom of Corea; 30 miles N.W. of Tim-tcheou.

CHENISCUS, from $\chi\eta\sigma$, a goose; among the Ancients, an ornament in the form of little geese, used on the prows and sterns of their ships.

CHENIUS, in *Ancient Geography*, a mountain in the country of the Maeroni, in the vicinity of the district of Colehis and the Euxine sea. Diod. Sic.

CHENOBOSCIA, a town of Egypt, situate in the Canopite nome. Ptol. This place is marked in the Itin. of Antonin between Coptos and Thoma; and in the Not. Imp. it is called *Chenoboscium*, and placed in the Thebaide.

CHENOCOPRUS, *Goose-dung*, in *Medicine*, is accounted very acrimonious and resolvent, and therefore prescribed with success in the jaundice. The greenish dung is esteemed the best. It is gathered in the meadows in spring time, and being dried with a moderate heat, and pulverised, is given from half a dram to a full dram at a dose. It is recommended also in the scurvy, and other diseases.

CHENOLEA, in *Botany*, Schreb. 206. Willd. 464. Thunb. Nov. Gen. 9. Class and ord. *Pentandria monogynia*. Nat. ord. *Holoraceae*, Linn. *Atriplices*, Juss. *Chenopodiaceae*, Vent.

Gen. Ch. Cal. perianth one-leaved, globular, somewhat fleshy, five-cleft; segments inflexed. Cor. none. Stam. filaments five, filiform, erect-inflexed, the length of the calyx, and inserted into its base; anthers minute. Pist. germ superior; style filiform, very short; stigmas two, simple, awl-shaped, acute, spreading, reflexed, a little longer than the style. Peric. capsule round, somewhat depressed, unilocular, one-celled. Seed solitary, roundish, bifid at the tip; smooth.

Eff. Ch. Calyx one-leaved, globular, five-cleft. Capsule one-celled. Seed solitary bifid at the tip.

Nearly allied to *Salsola*, to which genus Jusseu, in conformity with L'Heritier, thinks it really belongs, though it has not a spiral seed. Willdenow asserts that in its fructification it is perfectly distinct, and cannot be united with *Salsola*.

Sp. C. *disjuncta*, Mart. Willd. Thunb. Prod. 48. (*Salsola fericea*, Hort. Kew. t. 317.) Stems several, filiform, herbaceous, diffused, covered with leaves, purple, smooth, at the bottom, somewhat downy at the top; the ends upright; branches alternate, scattered, few, very short. Leaves opposite,

file, ovate-lanceolate, obtuse, with a fleshy point, flat above, convex underneath, silvery-downy; upper ones imbricated. *Flowers* axillary, solitary, or in pairs, sessile in the axil of every leaf towards the top of the branches. A native of the Cape of Good Hope, on the low coast; flowering in August and September; cultivated by Miller in 1758.

CHENONCEAU, in *Geography*, a town of France, in the department of the Indre and Loire; 2 leagues S.E. of Amboise.

CHENOPODÆ, in *Botany*, the name given by Ventenat to that natural order which Justen calls Atriplices. It consists of plants which are most commonly herbaceous, sometimes shrubby, with fibrous roots. *Stem* almost always upright. *Leaves* generally alternate. *Flowers* almost always hermaphrodite; calyx one-leaved, often deeply divided; stamens of a determinate number, inserted into the base of the calyx; germ simple, superior; styles commonly more than one, of a determinate number; stigma one to each style, rarely two. *Seed* generally one, either naked, or covered by the calyx, or enclosed in a pericarp; perisperm farinaceous, central, surrounded by the embryo, which is circular or rolled up in a spiral; radicle inferior. Ventenat places under it the following genera. 1. Fruit a berry; phytolacca, rivinia, salvadora, bosca. 2. Fruit a capsule; petiveria, polycnemum, camphoroma. 3. Seed covered by the calyx; stamens five; basella, fallola, spinacia, beta, chenopodium, atriplex. 4. Seed covered by the calyx; stamens one or two; blitum, salicornia. 5. Seed naked; corilpernum.

CHENOPODIUM (from *χην*, a goose, and *πους*, a foot), goosefoot. Fr. Anserine or Patte d'oye, Tourn. Cl. 15. §. 2. gen. 4. Linn. Gen. 309. Schreb. 435. Willd. 497. Juss. p. 85. Vent. 2. 259. Gart. 468. Clais and order, pentandria digyna. Nat. ord. Holocarceæ, Linn. Atriplices, Juss. *Chenopode*, Vent.

Gen. Ch. Cal. perianth five-leaved, concave, permanent. Cor. none. Stam. filaments five, awl-shaped, opposite to the leaves of the calyx, and of the same length; anthers roundish, didymous. Pist. germ superior, orbicular; style short, bifid, or trifid; stigmas obtuse. Peric. the closed calyx, with five compressed angles, deciduous. *Seed* solitary, lenticular.

Eff. Ch. Calyx five-leaved, finally shutting close, and becoming a five-angled pericarp. Corolla none. *Seed* one.

Species.

* With angular leaves.

1. *C. Bonus Henricus*, good king Henry, wild spinach, English mercury, or algood. Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. Flor. Dan. 579. Lam. Ill. pl. 181. fig. 1. Curt. Flor. Lond. Fasc. 3. tab. 17. Eng. Bot. 1033. "Leaves triangular-arrow-shaped, entire; spikes compound, leafless." *Root* perennial, fleshy, branched, yellowish within. *Stems* a foot high, cylindrical, spreading from the base, then erect, branched below, striated, leafy. *Leaves* alternate, petioled, a little undulated, acute, green above, covered with an unctuous meanness underneath. *Flowers* green, mealy, some of them frequently destitute of stamens; spikes numerous, axillary and terminal, erect, dense; calyx bordered with an abrupt membrane; styles often three, awl-shaped, spreading, pubescent. *Seed* kidney shaped. A native of church-yards and waste places in England and other parts of Europe, flowering from May to October. The young leaves are sometimes boiled and eaten as a substitute for spinach, for which purpose the plant is cultivated in some parts of England. The young shoots, peeled and boiled, may also be eaten asparagus, and are greatly laxative. 2. *C. mucronatum*, Willd. 2. Thunb. Prod. 48. "Leaves tri-

angularly-halberd-shaped, obtuse, mucronate; racemes leafy." A native of the Cape of Good Hope. 3. *C. triandrum*, Mart. 2. Willd. 3. Forst. Prod. 1. 9. "Leaves heart-arrow-shaped; spikes terminal, leafless, interrupted." A native of New Zealand. 4. *C. urticum*, upright goosefoot. Linn. Sp. 2. Mart. 2. Lam. 2. Willd. 4. Eng. Bot. 717. (Pointed blite, Pet. H. Brit. tab. 8. fig. 8.) "Leaves triangular, toothed; racemes crowded, stiff and straight, approaching the stem, very long, almost leafless." *Root* annual. *Stem* stiff and straight, simple or branched, angular, marked with red lines. *Leaves* deltoid-oblong, somewhat halberd-shaped, scarcely lengthened out at the base. *Flowers* green; racemes axillary and terminal. *Seeds* about the size of rape-seed. A native of waste places, about towns and villages. 5. *C. atriplexis*, Linn. Jun. Supp. 171. Mart. 3. Willd. 5. Hort. Kew. 1. 311. (*C. purpurefcens*, Lam. 14. Jacq. Hort. 3. tab. 80. *C. punctulatum*, Mart. 2. Scop. Infus. 26. tab. 11 ?) "Leaves rhomb-ovate, lanceolate; lower ones sinuate toothed; panicles axillary, branched; stem erect." *Root* annual. Whole plant with the habit, height, colour, and leaves of the red garden atriplex or orach. *Stem* simple, scarcely mealy, striated near the top. *Leaves* alternate, petioled, somewhat toothed, red underneath. *Panicle* terminal, more and more crowded upwards; little racemes simple, intermingled with small linear leaves. *Flowers* red, sessile, from three to five in a raceme. A native of Siberia and China. 6. *C. rubrum*, red goosefoot. Linn. Sp. Pl. 3. Mart. 4. Lam. 3. Willd. 6. Lam. Ill. Pl. 181. fig. 2. Curt. Flor. Lond. Fasc. 6. tab. 21. (*Blitum pes anserinus* dictum. Rai. Syn. 154. *Atriplex sylvestris latifolia*, Bauh. Pin. 119. Sharp-pointed blite, Pet. H. Brit. tab. 8. fig. 6.) "Leaves rhomboid-sinuate-toothed; racemes erect, compound, leafy." *Root* annual. *Stem* a foot and a half high, always erect, except on dunghills, or in a soil too loose to support it, when it becomes decumbent, and sometimes lies close to the ground; somewhat branched, smooth, grooved, becoming reddish as the seeds ripen. *Leaves* alternate, petioled, shorter than those of *C. urticum*, and ending in a shorter point, smooth above, a little mealy underneath. *Flowers* reddish, in axillary and terminal, rather dense racemes. *Seeds* not larger than grains of writing sand. A native of waste places, flowering in August. 7. *C. murale*, nettle-leaved goosefoot. Linn. Sp. Pl. 4. Mart. 5. Lam. 4. Willd. 8. Curt. Flor. Lond. Fasc. 6. tab. 20. (*Blitum pes anserinus* dictum acutiore folio, Rai. Syn. 154. *Atriplex sylvestris latifolia acutiore folio*, Bauh. Pin. 119. Thick shining blite, Pet. H. Brit. tab. 8. fig. 5.) "Leaves egg-shaped, shining, acute, toothed; racemes much branched, cymous, leafless. *Root* annual. *Stem* much branched, feeble. *Leaves* not mealy, triangularly egg-shaped, lengthened out at the base, sinuate-toothed; teeth acuminate, somewhat incurved. *Racemes* somewhat divaricated. *Seeds* minutely dotted with points. Whole plant generally of a deep green colour, and unpleasant smell. A native of waste places, under walls, and by road sides, flowering in August and September. 8. *C. guineense*, Willd. 7. Jacq. Ic. Rar. ii. tab. 345. Collect. ii. p. 346. "Leaves egg-shaped, uncinately toothed, acute; racemes somewhat branched, naked, erect; stem simple, erect." Nearly allied to the preceding. *Root* annual. *Leaves* not shining. *Racemes* spreading, not cymous. A native of Guinea. 9. *C. Quinoa*, Willd. 9. Feuille Peruv. tab. 10. "Leaves triangularly egg-shaped, obsoletely toothed; the younger ones mealy; racemes crowded, shorter than the petioles." *Root* annual. *Stem* three feet high, erect, branched. *Leaves* alternate, furnished on each side of the base with a large tooth, and thence apparently triangular, sometimes but rarely with one or two smaller

teeth above. A native of Chili. It is generally cultivated in Peru, where the leaves are eaten as spinach or sorrel, and the seeds, as millet. Mixed with the latter, it makes a pleasant kind of beer. Dombey, on his return from Peru, was lavish in its praise as a valuable eulent, and took great pains to naturalize it in France. The seeds which he brought into Europe failed; but the Spaniards are said to have imported some in a better state of preservation, which are likely to gratify the wishes of the public-spirited naturalist.

10. *C. feretinum*, Linn. Sp. pl. 5. (*C. hispanicum* procerius, folio deltoide, Tourn. 666, but not blitum ficus folio of Ray's Synopsis.) "Leaves deltoid, sinuate-toothed, wrinkled, smooth, uniform; racemes terminal." *Root* annual. A native of Spain. 11. *C. album*. White goose-foot, Linn. Sp. pl. 6. Mart. 7. Lam. 6. Willd. 11. (*Atriplex sylvetris* folio sinuato candicante, Bauh. Pin. 119. Fuschl. Hist. tab. 119. Frost blite, Pet. H. Brit. tab. 8. fig. 2.) "Leaves rhomboid-egg-shaped, gnawed, entire behind; upper ones oblong entire. *Seeds* not uneven, with hollow dots." *β.* with a roundish leaf, Dill. in Rai Syn. p. 155. Buddle's round blite, Pet. H. Brit. tab. 8. fig. 4. *γ.* *Leaves* green, or less white, narrower. *Racemes* looser. *C. viride*, Linn. Sp. pl. 7. *δ.* Branched with entire leaves, Dill. in Rai Syn. 155. *ε.* With the thick obtuse leaf of the olive. Dill. in Rai Syn. 156. *Root* annual. *Stem* branched, sometimes reddish. *Leaves* unoblong-mealy; upper ones narrower, without teeth. *Racemes* branched, erect, almost leafless. A native of dung-hills and corn-fields, flowering in July and August. 12. *C. ficifolium*. Fig-leaved goose-foot, Smith, Flor. Brit. i. 276. (*C. viride*, Curt. Flor. Lond. Fasc. 2. tab. 16. *C. feretinum*, Hudf. 106. Sibth. 88. *Blitum ficus folio*, Dill. in Rai Syn. 155. Buddle's fig blite, Pet. H. Brit. tab. 8. fig. 3.) "Leaves halberd-sinuated, gnawed, entire behind; upper ones oblong, entire; seeds dotted." *Root* annual. It differs from the preceding in being of a greener colour, purplish at the axils of the branches, and in having halberd-shaped lower leaves; but chiefly, as Curtis has observed, in the surface of its seeds, which are uneven, with hollow dots. A native of dung-hills and waste places, flowering in August. Dr. Smith assures us, that the feretinum of Linnaeus differs from this species in having a stem five times higher; and larger, deltoid, scarcely halberd-shaped leaves. It also flowers later. The seeds he has not seen. 13. *C. hybridum*. Maple-leaved goose-foot, Linn. Sp. pl. 8. Mart. 9. Willd. 13. (*C. angulosum* Lam. 8. *C. stramonii* folio, Dill. in Rai Syn. 154. Vail. Paris. tab. 7. fig. 2.) "Leaves heart-shaped, angularly toothed, acuminate; racemes much branched, somewhat cymous, divaricated, leafless." *Root* annual. *Stem* slender, branched. *Leaves* large, bright green, spreading, perfectly heart-shaped (not lengthened out at the base), with three angles on each side. Whole herb of an even surface, fetid. *Seeds* marked with larger dots. A rather rare native of moist uncultivated ground. 14. *C. Botrya*. Cluster, or ear-leaved goose-foot, oak of Jerusalem, Linn. Sp. pl. 9. Mart. 10. Lam. 9. Willd. 14. (*C. ambrosioides* folio sinuato, Tourn. Inst. 506. *Botrys ambrosioides vulgaris*, Bauh. Pin. 138.) "Leaves oblong, sinuated; racemes leafless, multiseed." *Root* annual. *Stem* from six to ten inches high, upright, branched towards the base, rather rigid, thinly clothed with down. *Leaves* petioled, oblong, greenish on both sides. *Flowers* in very short axillary racemes, giving the summits of the stem and branches the appearance of leafy terminal racemes. A native of uncultivated places in the south of Europe. The whole plant is replete with a resinous viscous juice, which stains the hands. Its leaves emit a strong odour when

bruised, somewhat like that of ambrosia, for which it is sometimes cultivated in gardens. 15. *C. ambrosioides*, Mexican goose-foot, or tea of Mexico, Linn. Sp. pl. 10. Mart. 11. Lam. 10. Willd. 15. (*Botrys ambrosioides Mexicana*, Bauh. Pin. 138. 516. *Atriplex odora*, Morif. Hist. tab. 31. fig. 8.) "Leaves lanceolate, toothed; racemes leafy, quite simple." *Root* annual, oblong, fibrous. *Stem* about a foot and a half high, striated, leafy its whole length, branched, thinly clothed with a fine down, which almost resembles powder. *Leaves* alternate, attenuated both ways, sessile; upper ones narrow, and quite entire. *Flowers* greenish, in axillary and terminal racemes. The whole plant has a strong, but not disagreeable smell, and an aromatic taste similar to that of cumine. A native of Mexico. This and the preceding species are said to possess considerable fudoric, diuretic, emmenagogue, carminative, and stomachic qualities. The proper menstruum of their active matter is rectified spirit, but they give it also to boiling water. 16. *C. multifidum*, Linn. Sp. pl. 11. Mart. 12. Lam. 14. Willd. 16. Dill. Elth. tab. 66. fig. 77. "Leaves multifid; segments linear; flowers axillary, sessile." An ever-green undershrub. *Stem* two feet high, much branched, striated, clothed with very short hairs. *Leaves* alternate, close set, small, oblong, smooth, not so odorous as those of the preceding species. *Flowers* sessile, in small axillary clusters; calyx somewhat longer, and not so deeply cut as in the other species, and embracing the seed less closely. A native of Buenos Ayres. 17. *C. anthelminticum*, Linn. Sp. pl. 12. Mart. 13. Lam. 12. Willd. 17. Dill. Elth. tab. 66. fig. 76. "Leaves ovate-oblong, toothed; racemes leafless." *Root* perennial. *Stem* three feet high, erect, stiff, striated, slightly hairy, branched about the middle. *Leaves* alternate, narrowed into a petiole, green on both sides, somewhat hairy underneath, of an unpleasant smell. *Flowers* greenish, in small axillary racemes. A native of Buenos Ayres, and of Pennsylvania, and New Jersey. In North America, it is called Jerusalem oak, or worm-feed, and is said to be an excellent vermifuge. 18. *C. glaucum*, Linn. Sp. pl. 13. Mart. 14. Lam. 13. Willd. 18. Eng. Bot. 1454. (*C. angustifolium laciniatum minus*, Tourn. Inst. 506. Dill. in Rai Synop. 155. *Atriplex* Bauh. Hist. ii. tab. 473. Tabern. Ic. 427.) "Leaves all oblong, with a deeply-waved edge, glaucous underneath; racemes compound and dense, leafless." *Root* annual. *Stems* from two inches to two feet high, thickish, branched, and spreading, often prostrate, striated with green and white. *Leaves* alternate, petioled, uniform, bluntish, green, and smooth above, mealy, and white underneath. *Flowers* green, in small axillary and terminal racemes. *Seeds* blackish, very minutely dotted. A native of several parts of Europe, flowering in August. In England found chiefly about the neighbourhood of London. In rich ground it grows extremely rank, losing its delicacy of colour, and much of those contracted hues of green, red, and glaucous white, which, in a poor soil, render it more elegant in appearance than most of its family. Smith Eng. Bot.

* *Leaves* entire.

19. *C. oblongum*, Curt. Flor. Lond. Fasc. 5. tab. 20. Withering, i. 273. Smith Flor. Brit. i. 277. Eng. Bot. pl. 1034. (*C. vulvaria*, Linn. Sp. pl. 14. Mart. 15. Willd. 19. Woodw. Med. Bot. pl. 145. *C. fetidum*, Lam. 15. Tourn. Inst. 506. *Atriplex*, Bauh. Pin. 119. *Vulvaria*, Dalech. Hist. 543. Tabernamont. 428. Blackw. tab. 100. Garofmus Dod. Pemp. 616.) Stinking goose-foot. "Leaves egg-shaped, somewhat rhomboid; flowers in dense, clustered spikes." *Root* annual, small. *Stems* several, eight or ten inches high, spreading or prostrate, branched,

branched, whitish. *Leaves* alternate, petioled, small, covered, especially underneath, with a whitish unctuous meal. *Flowers* small. A native of waste places in England and other parts of Europe, especially near the sea shore; common about London and Yarmouth; flowering in August. The whole plant in its recent state has a nauseous taste, and a strong offensive smell, resembling that of putrid salt fish, and remaining long on the hands after touching the herb. To this remarkable factor its medicinal qualities are ascribed by Dr. Cullen, who says that it has been employed with advantage in Scotland as a powerful antispasmodic, and particularly in hysterical affections. He adds that, as it loses all its sensible qualities when it becomes dry, it can be used only in its recent state, when the most convenient formula is that of a conserve. It can, therefore, be only occasionally procured, and in many situations is altogether unattainable. On this account it has been expunged from the *Materia Medica* of the London Pharmacopœia, though it is still retained in that of Edinburgh. 20. *C. polyspermum*, Linn. Sp. Pl. 15. Mart. 16. excluding some of the synonyms. Lam. 16. Willd. 20. Eng. Bot. Pl. 1480. (*Blitum polyspermum*; Bauh. pin. 118. *Polysporon cassiani*; Lob. hist. 128. Allseed Blite; Pet. Fl. Brit. tab. 7. fig. 10.) Round-leaved Goosefoot. "Leaves egg-shaped, obtuse; racemes forming cymes, divaricated, leafless." *Root* annual, branched. *Stems* several, prostrate, widely spreading, mostly simple, roundish, striated, leafy from the base to the extremity. *Leaves* alternate, petioled, generally very obtuse, sometimes a little wavered in their outline, of a deep grass-green colour. *Flowers* green, in large, axillary, repeatedly subdivided, sessile racemes. *Seed* black, kidney-shaped, minutely dotted. A native of cultivated ground in England and other parts of Europe. 21. *C. acutifolium*, Smith, Eng. Bot. Pl. 1481. (*C. polypermum*; Curt. Flor. Lond. fasc. 2. tab. 17. With. 273. Hull. 57. Reh. 120. Sibth. 80. *Atriplex sylvestris* five *Polypermum*, Ger. em. 325.) "Leaves egg-shaped, acute; stem erect; racemes somewhat cymous, elongated, leafless." *Root* annual. *Stem* nearly upright, much branched, leafy, square. *Leaves* rather paler than those of the preceding species. *Racemes* numerous, axillary; the larger ones somewhat cymous and spreading; the rest rather spiked. *Seed* orbicular, blackish, scarcely dotted. A native of England and Switzerland; flowering in July and August. 22. *C. caudatum*, Willd. 21. Jacq. ic. 2. tab. 344. Collect. 2. p. 325. "Leaves egg-shaped, obtuse; panicle leafless, terminal, elongated; stem simple, erect." *Root* annual. A native of Guinea. 23. *C. laterale*, Hort. Kew. 1. p. 513. Mart. 23. Willd. 22. "Stem-leaves lanceolate, obtuse; one of the branches oblong; peduncles lateral, solitary, one-flowered." *Root* annual. Native country unknown; introduced at Kew in 1781 by Dr. Broussonet. 24. *C. scoparia*, Linn. Sp. Pl. 16. Mart. 17. Lam. 17. Willd. 23. (*C. linifolia*; Tourn. Inst. 506. *Linaria scoparia*; Bauh. Pin. 212. *Linaria Belvidere*; Bauh. hist. 3. 462. *Olyris*; Dod. Pempt. 101.) Flax leaved goosefoot, Belvidere or Summer Cypress. "Leaves linear-lanceolate, flat." *Root* annual. *Stem* three feet high or more, upright, slender, clothed with short hairs, furnished with short branches its whole length, and assuming a regular pyramidal form, so as to appear like a cypress tree in miniature. *Leaves* narrow, two or three inches long, and two lines broad, of a fine green, sessile, acute, ciliated. *Flowers* greenish, in small sessile clusters. A native of Italy, Greece, China, and Japan. It is sometimes cultivated in gardens on account of its pleasant verdure and elegant mode of growth. In Italy it is used to make beacons. 25. *C. villosum*, Lam. 18. "Leaves linear, flat, hairy, very soft, greyish; racemes woolly." Resembling the *Salifolias* in habit.

Root annual. *Stems* three feet high, upright, branched, almost cylindrical, hairy; woolly, and very white at the summits of the branches. *Leaves* half the length of those of the preceding species, whitish when young, afterwards greenish, and almost simply ciliated. *Racemes* sessile, short, leafy. Described by La Marek from a living plant in the royal garden at Paris. Native country unknown. 26. *C. maritimum*, Linn. Sp. Pl. 17. Mart. 18. Lam. 19. Willd. 24. Fior. Dan. tab. 489. Eng. Bot. pl. 633. (*Kali minus album*; Bauh. Pin. 289. Morif. hist. 2. tab. 33. fig. 3.) Sea Goosefoot or white Glasswort. "Leaves awl-shaped, semi-cylindrical." *Root* annual, fibrous, small. *Stem* eight or nine inches high, erect, branched, roundish, leafy. *Leaves* alternate, rather acute, smooth, succulent, abounding with a salt juice. *Flowers* green, sessile, from two to four together in small clusters, with a pair of bractes to each. *Seeds* finely striated, of a deep shining black. A common native of the sea-coast in various parts of Europe. It has the habit of a *Salifolia*, like many other plants abounds with alkaline salt, and is one of those which are indiscriminately collected in the warmer parts of Europe, for the manufactory of glass. 27. *C. oppositifolium*, Linn. jun. Supp. 172. Mart. 20. Willd. 25. (*Salifolia oppositifolia*; Pall. it. 2. 735. tab. O. Germ. Ed. 2. 545. pl. 14. Fr. Ed.) "Leaves opposite, lanceolate awl-shaped, very short." *Stem* somewhat woody, cylindrical, much branched, nearly erect; branches erect-spreading, opposite, striated with reddish lines. *Leaves* half-embracing the stem, somewhat fleshy, acute, scarious at the edges. *Flowers* in axillary leafy clusters. A native of Siberia about the river Jaick. The younger Linnaeus observes, that it differs in habit from the *Chenopodia*, and may perhaps be a *Polycnemum*. 28. *C. aristatum*, Linn. Sp. Pl. 18. Mart. 19. Lam. 20. Willd. 26. Gmel. Sib. 3. tab. 15. fig. 1. "Leaves lanceolate, somewhat fleshy; corymbs dichotomous, awned, axillary." *Root* annual. *Stem* from two to five inches high, much branched, smooth; branches panicled, spreading. *Leaves* alternate, sessile, green or reddish, narrowed at their base, terminated by a weak point. *Flowers* small, greenish; corymbs or panicles composed of very slender, ramified dichotomous peduncles; each ramification terminated by a strong laticaceous awn, with a sessile flower within each fork, and alternate ones when the bifurcation ceases. A native of Siberia. Linnaeus mentions a variety said to be found in Virginia without awns.

CHENSERS, in our *Statutes*, is used for such as paid tribute or *cenfe*, quit-rent, or chief rent.

CHEN-SI, or SHEN-SSE, in *Geography*, a province of China, bounded on the east by Hoang-ho, which separates it from Chan-si, or Shan-see; on the south by the provinces of So-tcheou and Hou-quang; on the north by Tartary, and the great wall; and on the west by the country of the Monguls. Chen-si is one of the most extensive provinces of the empire, and is divided into two parts, the eastern and western, containing *S fou*, or cities of the first class, and 106 of the second and third. Its capital is Si-ghian-sou. Its population consists of 18,000,000 persons, and the extent of this province, together with that of Kan-sou, comprehends 154,008 square miles, or 9,556,120 acres. The revenue from the land and taxes amounts to 1,700,000 taels or ounces of silver. It had formerly three viceroys; but at present it has only two, besides the governors of So-tcheou and Kan-tcheou, which are the strongest places in the country. This province is in general very fertile, commercial, and rich. It produces little rice; but the inhabitants have plentiful crops of wheat and millet: it is, however, subject to long droughts, and clouds of locusts sometimes destroy every thing that grows in the fields: these insects are boiled and eaten by the Chinese. This country abounds with drugs,

rhubarb, musk, cinabar, wax, honey, and coals, of which it contains inexhaustible veins: it has also rich gold-mines, which, for political reasons, are not opened; gold dust is washed down in such abundance among the sands of the torrents and rivers, that many people derive their whole subsistence from what they gain by collecting it. Travellers remark, that the natives of this country are more polite and affable to strangers, and possess greater genius, than the Chinese of the other northern provinces.

CHEN-TANG-CHAUNG, a river of China, which takes its rise in a range of mountains that surround the town of Chan-fan-shen on several sides. The whole course does not exceed 200 miles, being generally through a hilly or little frequented country; and it has no communication with any considerable road, river, or canal, until it reaches Han-choo-foo. The tide, when full, increases the breadth of this river to about 4 miles opposite the city; and for the distance of somewhat more than 60 miles from the eastern sea, into which it discharges itself, it is crowded with vessels of every kind. At low water near Han-choo-foo there is a fine level strand about 2 miles broad, which extends towards the sea as far as the eye can reach. By this river Han-choo-foo receives and exports great quantities of merchandise to and from the southern provinces. The goods are shipped and unshipped by means of four-wheeled waggons, placed in a line, and forming a convenient pier, capable of being easily lengthened or shortened, by increasing or diminishing the number of waggons, according to the distance of the vessels from the shore.

CHEN-YANG, or CHIN-YANG, one of the three districts or governments into which the country of the Mandshurs or Mantchew Tartars in Chinese Tartary is divided by the Chinese. It comprises what was called Leao-tong, and extends as far as the great wall, which bounds it on the south; and on the east, north, and west, it is enclosed by a palisade, which is better adapted to the defence of the country against the nocturnal invasions of robbers, than for stopping the march of an army. It is constructed only of stakes 7 feet high, without any bank of earth, ditch, or fortified work: the gates are of the same kind, and are guarded only by a few soldiers. This country has many mountains, some of which abound with metals and wood. The land is fertile, and produces wheat, millet, leguminous plants, and cotton. The valleys are covered with herds of oxen and flocks of sheep. The chief town of this district is called Chen-yang.

CHEN-YANG, or CHIN-YANG, called *Moungden* by the Mandshurs, is the capital of the above government, seated on an eminence, and still a considerable place, with a mausoleum of Kuei-chi, who is regarded as the conqueror of China, and the founder of the reigning family. The Mantchew Tartars have taken great pains in ornamenting it with public edifices, and providing it with magazines of arms and storehouses. They consider it as the principal place of their country; and since China has been subject to their dominion, they have established several tribunals similar to those of Peking, composed only of Tartars, whose determination is final; and in all their acts they use the Tartar characters and language. Chen-yang may be considered as a double kind of city, one of which is enclosed within the other: the interior city contains the emperor's palace, hotels of the principal mandarins, sovereign courts, and the different tribunals:—the exterior city is inhabited by the common people, tradesmen, and those who by their employments or professions are not obliged to lodge in the interior. The latter city is almost a league in circumference, and the walls that enclose both are more than three leagues in circuit: they were entirely rebuilt in 1637, and frequently repaired since that

time. This city is 54 miles E.N.E. of Peking. N. lat. $41^{\circ} 52'$. E. long. $123^{\circ} 17'$.

CHEZINI, or CHINTING, a town of Poland, in the palatinate of Sandomirz; near which are mines of silver and quarries of marble; 10 miles E. of Malagoz.

CHEOU, a town of China, of the second rank, in the province of Kiang-nan; 455 miles S. of Peking. N. lat. $32^{\circ} 34'$. E. long. $116^{\circ} 23'$.

CHEOU-QUANG, a town of China, of the third rank, in the province of Chang-tong; 5 leagues N.E. of Tchén tcheou.

CHEOU-TCHING, a town of China, of the third rank, in the province of Fo-kien; 62 miles N.E. of Kien-ninghi.

CHE-OU-TCHANG, a town of China, of the third rank, in the province of Tchek-kiang; 5 leagues S.W. of Yen-tcheou.

CHEOU-TCHANG, a town of China, of the third rank, in the province of Chang-tong; 9 leagues N.E. of Po.

CHEOU-YANG, a town of China, in the province of Chan-ki; 70 miles E. of Tai-yuen.

CHE-PAU, or PAU A PIERRES, a fort of machine for throwing stones employed at sieges by the Tartars when they conquered the northern part of China in 1732.

CHEPELLO, in *Geography*, a small island, about a league in circuit, of South America, in the bay of Panama and province of Darien; 3 miles from the town of Panama, which supplies it with provisions and fruits. N. lat. $8^{\circ} 46'$. W. long. $80^{\circ} 45'$.

CHEPEWYAN FORT, a fort of North America, at the south-western extremity of the lake of the Hills, at about 8 miles from the discharge of the river Elk into the lake, in the territory of the Hudson's Bay company. N. lat. $58^{\circ} 40'$. W. long. $110^{\circ} 30'$. The old establishment formed at the distance of about 45 miles from the lake, by Mr. Pond, in the year 1778-9, which was the only one in this part of the world till the year 1785, was transferred in 1785 to this fort, as a place much better situated for trade and fishing, the people here having recourse to the fishery on the lake for their support. Mr. Mackenzie made this place his head quarters for 8 years, and from hence he took his departure on both his expeditions, in the years 1789 and 1793, towards the Pacific and Frozen oceans. He has particularly described the manner of carrying on the fur-trade here, as well as the mode of fishing on the lake. The laden canoes, he says, which leave lake La Plue about the first of August do not arrive here till the latter end of September or the beginning of October, when a necessary proportion of them is dispatched up the Peace-river to trade with the Beaver and Rocky-mountain Indians; others are sent to the Slave river and lake, or beyond them, and traffic with the inhabitants of that country. A small part of them, if not left at the fork of the Elk river, returns thither for the Kniteneaux, while the rest of the people and merchandise remain here to carry on trade with the Chepewyans. During their stay, these voyagers live wholly upon fish caught in the lake, without even the quickening flavour of salt, or the variety of any farinaceous root or vegetable. Salt, however, if their habits had not rendered it unnecessary, might be obtained in this country to the westward of the Peace-river, where it loses its name in that of the Slave-river, from the numerous salt ponds and springs to be found there, which would supply any quantity, in a state of concretion, and perfectly white and clear.

When the Indians pass that way, they bring a small quantity to the fort, with other articles of traffic. During a short period of the spring and fall, great numbers of wild fowl frequent this country, and they furnish a very gratifying food after such a long privation of flesh meat. It is remarkable, however, that the Canadians, who frequent the

Peace, Saskatchewan, and Assiniboine rivers, and live altogether on venison, have a less healthy appearance than those whose sustenance is obtained from the waters. At the same time the scurvy is wholly unknown among them. In the fall of the year the natives meet the traders at the fairs where they barter the furs or provisions which they may have procured; they then obtain credit and proceed to hunt the beavers, and do not return till the beginning of the year, when they are again fitted out in the same manner, and come back the latter end of March or the beginning of April. They are now unwilling to repair to the beaver hunt until the waters are clear of ice, that they may kill them with fire-arms, which the Chepewyans are averse from employing. The greater number of the latter return to the barren grounds, and live during the summer with their relations and friends in the enjoyment of that plenty which is derived from numerous herds of deer. But those of that tribe who are most partial to these pursuits, cannot remain there in winter, and they are obliged, with the deer, to take shelter in the woods during that rigorous season, where they contrive to kill a few beavers, and send them by young men, to exchange for iron utensils and ammunition.

Till the year 1782, the people of Athabasca sent or carried their furs regularly to Fort Churchill in Hudson's bay; and some of them have, since that time, repaired thither, although they could have provided themselves with all the necessaries which they required. The difference of price set on goods here and at that factory, made it an object with the Chepewyans to undertake a journey of 5 or 6 months, in the course of which they were reduced to the most painful extremities, and often lost their lives from hunger and fatigue. At present, however, this traffic is in a great measure discontinued, as they were obliged to expend in the course of their journey that very ammunition which was its most alluring object. See the next article.

CHEPEWYANS, or *Chippewas*, a numerous tribe of Indians, in North America, who consider the country between the parallels of N. latitude 60° and 65°, and W. longitude 100° to 110°, as their lands or home. They speak a copious language, of which Mr. Mackenzie (*ubi infra*) has given a specimen, very difficult to be attained, and furnishing dialects to the various emigrant tribes which inhabit the immense tract of country, the boundary of which is as follows. It begins at Churchill and runs along the line of separation between them and the Kaulencaux, up the Mississippi to the isle la Croix, passing on through the Buffalo-lake, River-lake, and Portage la Loche; from thence it proceeds by the Elk river to the lake of the Hills, and goes directly W. to the Peace river, and up that river to its source and tributary waters; from thence it proceeds to the waters of the river Columbia, and follows that river to N. latitude 52° 24', and W. long. 112° 54', where the Chepewyans have the Atnah or Chin nation for their neighbours. It then takes a line due W. to the sea-coast, within which the country is possessed by a people who speak their language, and are consequently descended from them, so that there is no doubt of their progress towards the east. A tribe of them is even known at the upper establishments on the Saskatchewan, and they also follow the Rocky mountains to the east. The number of those who trade with the English does not exceed 800 men, and they have a smattering of the Knistencaux tongue, in which they carry on their dealings. Those who inhabit the coast of the lake Superior and the islands in that lake furnished about 30 years ago 1000 warriors. Other tribes of their nation inhabit the country round Saginaw or Sagara

bay and lake Huron, the Puau bay, and a part of lake Michigan.

Of the number of the Chepewyans it is not possible to form a just estimate; but it bears no proportion to the immense extent of their territories, which may, in some degree, be attributed to the ravages of the small-pox. These people entertain singular ideas of the creation. They conceive, that, at first, the globe was a vast ocean, inhabited merely by a bird of large size, whose eyes were fire, whose glances were lightning, and the clapping of whose wings was thunder. On his descent to the ocean, and touching it, the earth instantly rose, and remained on the surface of the waters. This omnipotent bird called forth the whole variety of animals from the earth, except the Chepewyans, who were produced from a dog; and this circumstance occasioned their aversion to the flesh of that animal, as well as the people who eat it. The great bird, having finished his work, made an arrow, which was to be preserved with great care, and untouched; but the Chepewyans carried it away, and thus enraged the bird to such a degree, that he has never since appeared. They have also a tradition among them, that they originally came from another country, inhabited by very wicked people, and that they had traversed an extensive lake, narrow and full of islands; and that in their voyage they had encountered many hardships from ice and deep snow, as it was always winter. Upon their first landing at the Copper-nine river, the ground was covered with copper, under a bed of earth, to the depth of a man's height. They farther believe, that their ancestors lived till their feet were worn out with walking, and their throats with eating. They describe a deluge, where the waters spread over the whole earth, except the highest mountains, on the tops of which they preserved themselves. It is their opinion, that immediately after death, they pass into another world; and that, when they arrive at a large river, they embark in a canoe of stone, and are carried with a gentle current to an extensive lake, in the centre of which is a most beautiful island; in the view of which they receive that judgment for their conduct during life, which decides their final and unalterable state. If their good actions predominate, they are landed in the island, and commence an eternal happiness, consisting in the enjoyment of sensual pleasures and carnal gratifications. But if their bad actions weigh down the balance, the stone canoe sinks at once, and leaves them up to their chins in water, to behold and regret the reward enjoyed by the good, and eternally struggling, with ineffectual efforts, to reach the blissful island, from which they are for ever excluded. They have also some faint notion of the transmigration of the soul.

The Chepewyans are sober, timorous, and vagrant, with a selfish disposition, which has occasioned suspicions of their integrity. With regard to their stature, they are seldom corpulent, but sometimes robust. Their complexion is swarthy, their features coarse, and their hair lank, but not of a dingy black; nor have they universally the pleasing eye which generally animates the Indian countenance. The aspect of the women is more agreeable than that of the men; but they acquire an awkward gait, from their being accustomed, for nine months in the year, to travel in snow-shoes, and to drag sledges from 2 to 400 lbs. in weight. To their husbands, who are sometimes jealous, they are very submissive; and yet, for trivial causes, the brutal men treat them with such cruelty as sometimes to occasion their death. They are frequently objects of traffic; and the father possesses the right of disposing of his daughter. However, they do not feel them as slaves, but as companions to

those who are supposed to live more comfortably than themselves. The men, in general, extract their beards; though some prefer a bushy black beard to a smooth chin. They cut their hair in various forms, or leave it to its natural long flow, as caprice or fancy suggests. The women wear their hair of great length, and well arranged; unless the jealousy of their husbands cause them to despoil it of its tresses, which they consider as a worse punishment than manual correction. Persons of both sexes have blue or black bars, or straight lines, from one to four, on their cheeks or forehead, by which they distinguish the tribe to which they belong. These marks are either tattooed, or made by drawing a thread, dipped in the necessary colour, beneath the skin. Their dress in winter is composed of the skins of deer and their fawns, and prepared with as much care as the chamois leather in the hair. In summer, their apparel is the same, except that it is prepared without the hair. When they are completely dressed, they will lie down on the ice in the middle of a lake, and repose in comfort; though in the morning they find some difficulty in disencumbering themselves from the snow which has drifted on them in the night. When they are in want of provision, they cut a hole in the ice, and seldom fail of catching some trout or pike, the eyes of which they scoop out, and then eat as a great delicacy; but if their appetite is not satisfied, they finish their meal with the fish in its raw state; though they generally prefer the dressing of their victuals, when circumstances admit the necessary preparation: but the want of wood for fuel sometimes reduces them to this exigency, though they generally dry their meat in the sun. The provision called "pemican," on which the Chepewyans, as well as the other savages of this country, chiefly subsist in their journeys, is prepared by cutting the lean parts of the larger animals in thin slices, and placing them on a wooden grate over a slow fire, or exposing them to the sun or to the frost. When the flesh is dry, it is pounded between two stones; and it may then be kept with care for several years. The fat of the inside, and of the rump, is melted and mixed, in a boiling state, with the pounded meat, and then put in baskets or bags, for the convenience of carriage. This becomes a nutritious food, and is eaten without any further preparation. Another sort is made, with the addition of marrow and dried berries, which is of a superior quality.

The women, when they are travelling, carry their infants on their backs within the folds of their loose garments, in a position convenient for being suckled; nor do they discontinue to give their milk to them till they have another child. They have a singular custom, when they are delivered, of cutting off a piece of the navel string of the new born child, and hanging it about their necks, and they decorate it with porcupines' quills and beads. The women, though absolutely subject to the men, are always consulted, and possess a considerable influence in the traffic with Europeans, and other important concerns. Plurality of wives is very common among these people; and marriage is a very simple ceremony. The girls are betrothed at a very early period to those whom their parents think best able to support them; nor is the inclination of the female considered. When a separation takes place, it altogether depends on the pleasure of the husband. In common with the other Indians of the country, they have the custom of secluding women in their periodical state from society; they are not allowed in travelling to keep the same path as the men; and it is considered as highly indecorous for a woman in such circumstances to touch any utensils of manly occupation. The subsequent use of such desiled utensils would, in their

apprehension, be followed by certain mischief or misfortune.

The Chepewyans are not remarkable for their activity as hunters, which is owing to the ease with which they snare deer and spear fish. They make war on the Esquimaux, who cannot resist their superior numbers, and put them to death, as it is a principle with them never to make prisoners. Nevertheless they tamely submit to the Kniteneaux, who are not so numerous as themselves, when they treat them as enemies. As these people are not addicted to spirituous liquors, they always possess a degree of understanding, which enables them to perceive and to pursue their own interest, and this disposition occasions their being sometimes charged with fraudulent habits. They submit with patience to the most severe treatment when they are conscious of deserving it; but they will never forget or forgive any wanton or unnecessary rigour. Mr. Mackenzie represents them as the most peaceable tribe of Indians known in North America. They have among them conjurers and high priests, who operate by their ceremonies on the imaginations of the people in the cure of certain disorders. Their principal maladies are rheumatic pains, the flux, and consumptions. The venereal complaint is also very common: and though its progress is slow, it gradually undermines the constitution, and brings on premature death. For the cure of these disorders they have recourse to superstitution, and charms are their only remedies, except the bark of the willow, which, being burned and reduced to powder, is strewn upon green wounds and ulcers, and places contrived for promoting perspiration. Of the use of simples and plants they have no knowledge; as their country does not produce them.

Although they have no regular government, every man being absolute lord in his own family, they are influenced more or less by certain principles which conduce to their general benefit. In their mutual quarrels they rarely proceed to any greater degree of violence than is occasioned by blows, wrestling, and pulling of the hair; and their abusive language consists in applying the name of the most offensive animal to the object of their displeasure, and adding the term ugly, and chiai, or still born.

Their arms and domestic apparatus, besides those which they procure from the Europeans, are spears, bows and arrows, fishing nets, and lines made of green deer-skin thongs. They have also nets for taking the beaver as he endeavours to escape from his lodge when it is broken open.

Their snow-shoes are of superior workmanship, the inner part is straight, the outer one is curved, and it is pointed at both ends, with steel in front turned up. They are also very neatly lined with thongs made of deer-skin. Their sledges are formed of thin slips of board turned up in front, and are highly polished with crooked knives, in order to slide along with facility. The best wood for this purpose is that which is close grained; but theirs are made of the red or swamp spruce fir-tree. The chief vegetable substance produced by the thin soil of their country is the moss, on which the deer feed; and a sort of rock-moss, which, in times of scarcity, prefers the lives of the natives. When boiled in water, it dissolves into a clammy glutinous substance, that affords very sufficient nourishment. Notwithstanding the barrenness of their country, these people, with proper care and economy, might live with great comfort, as their lakes abound with fish, and their hills are covered with deer. However, in the dead of winter, they are under the necessity of retiring to their scanty stunted woods. To the westward they might find the musk-ox, but they do not recur to it as an article of subsistence. They have also

also large hares, a few white wolves peculiar to their country, and several kinds of foxes, with white and grey partridges, &c. The beaver and moose-deer they do not find till they come within 60° of N. latitude; and the buffalo is known to frequent an higher latitude to the westward of their country. These people find on the surface of the earth a beautiful variegated marble, which is easily wrought, leaves a fine polish, and hardens with time; it also endures heat, and is manufactured into pipes or calumets, as they are very fond of smoking tobacco, a luxury which was communicated to them by the Europeans.

Their amusements are few. Their music is so inharmonious, and their dancing so awkward, that they seldom practise either. They shoot at marks, and play at the games that are common among them; but they prefer sleeping to any recreation, and their time is spent either in procuring food or in resting from the toil that is necessary for obtaining it.

Their disposition is querulous; and they express their complaints by a constant repetition of the word "eduiy," it is hard, in a whining and plaintive tone of voice. They are extremely superstitious; and almost every action they perform, however trivial, is influenced by some whimsical notion. Mr. Mackenzie never observed among them any particular form of religious worship; but as they believe in a good and evil spirit, and a state of future rewards and punishments, he thinks they cannot be altogether without religious impressions.

The Chepewyans have been accused of abandoning their aged and infirm people to perish, and of not burying their dead; but these, says Mr. M., are melancholy necessities which proceed from their wandering way of life; and they are by no means universal. In their own country they cannot bury their dead, because the ground never thaws; but when they are in the woods, they cover them with trees. Besides they manifest no common respect to the memory of their departed friends, by a long period of mourning, cutting off their hair, and never making use of the property of the deceased. Nay, many frequently destroy or sacrifice their own, as a token of regret or sorrow. The barrenness of their country might be supposed to lead them to the horrid practice of cannibals; but this is a suspicion from which Mr. M. amply vindicates them. "In all my knowledge of them," says he, "I never was acquainted with one instance of that disposition; nor among all the natives which I met with in a route of 5000 miles, did I see or hear of an example of cannibalism, but such as arose from that irresistible necessity which has been known to impel even the most civilized people to eat each other." Mackenzie's Voyages, &c. Introduction.

CHE-PING, a town of China, of the third rank, in the province of Koei-tcheou; 5 leagues W. of Tchi-yaen.—Also, a city of China, of the second rank, in the province of Yon-nan; 410 leagues S.S.W. of Peking. N. lat. 23° 49'. E. long. 102° 24'.

CHEPO, CHEPOOR, or ST. CHRISTOVAL DE CHEPO, a small Spanish town of South America, in the country of Terra Firma, and province of Darien, seated on a river of the same name; 1 league from the sea, and 9 E. of Panama; N. lat. 10° 42'. W. long. 77° 50'.

CHEPSTOW, a town of Monmouthshire, England, is seated partly in a deep hollow, and partly on the steep side of a hill, thence to the river Wy. This river makes a considerable curve here, and at the distance of about two miles, south-west, unites with the Severn. The situation and scenery of Chepstow are extremely picturesque and romantic. From some eminences the masts and sails of

vessels seem to rise in the midst of an immense quarry; which, with the town crouching in a deep dell, and rising a precipitous hill, form a singularly interesting mixture of buildings, vessels, cliffs, water, and woods. The natural features of this place are described by Mr. Cox in the following terms: "The eminences which tower over the town are thickly overpread with wood; among which the rich groves of Piercefield rise conspicuous. The romantic cliffs of the Wy are here extremely picturesque, particularly the ridge which forms the left bank of the river below the bridge; it is lofty, perpendicular, of a concave shape, and tinted with various hues; white, grey, red, and yellow are beautifully blended, while green is interperded by the foliage of the oak that skirts the top and shades the sides, or by large clusters of ivy starting from the crevices at all heights, and twining in all directions. The ponderous remains of the castle form a grand and permanent feature in this diversified scenery; they cover a large tract of ground, and stretch along the brow of the perpendicular cliff which impends over the Wy."

The Romans probably occupied the site of Chepstow as a position commanding for several miles the only passage of the Wy, and we may infer from its name that it was not overlooked by the Saxons. But this part of Monmouthshire, which was then included in the county of Gloucester, came, soon after the conquest, into the possession of the Normans, and the castle of Estrigoiel or Striguil, by which name Chepstow was then known, was erected by Wilhelmus Comes, who is supposed by Camden and Dugdale to be William Fitzosborn earl of Hereford. He was killed in 1070; and his third son, the heir to this castle, being doomed to perpetual imprisonment, it was probably transferred to the illustrious house of Clare, in whose possession we find it in the reign of Henry I. Isabella, the daughter and heiress of Richard Strongbow, earl of Pembroke, conveyed, on the death of her father in 1176, the castle and manor of Striguil, with all his other possessions, to her husband William, earl marshal of England, who, on the death of king John, became protector of the realm, and was created, in right of his wife, earl of Pembroke and Estrigol or Striguil. By this illustrious nobleman, who, in a period of warfare, exhibited the most heroic prowess, and in an age of rebellion the most unshaken loyalty, the tottering crown of John was supported, the confederacy of the barons who had sworn allegiance to the Dauphin was dissolved, young Henry was fixed on the throne of his ancestors, and his distracted country blessed with peace. The Earl's five sons dying without issue, his eldest daughter Maud transferred the castle and borough of Striguil to her husband Hugh Bigod earl of Norfolk. But their grandson Roger having surrendered to the crown all the honors and estates of his family, they were granted by Edward II. to his brother Thomas de Brotherton; after whose death the castle and manor of Chepstow descended to the Mowbrays, and were sold by John, duke of Norfolk, to William Herbert, earl of Pembroke, with whose other estates they were conveyed by marriage to Sir Charles Somerset, and are now in the possession of his descendant the duke of Beaufort.

The town of Chepstow was formerly fortified; and the ruined walls, which were strengthened by round towers, reach from the bank of the river below the bridge to the castle, which, at one period, surpassed, in extent as well as importance, any fortrefs in this part of Great Britain. Its ruins stand on a precipice which overhangs the west bank of the Wy; the northern side, being built close to the edge, appears part of the cliff, and the ivy by which the walls are overpread,

overspread, twines and clusters about the unwieldy fragments, and down the perpendicular side of the rock: towards the land a moat defended it, and it was flanked by lofty towers. A very considerable space is occupied by the area, which is divided into four courts: the first contains the shells of the kitchens, grand hall, and other numerous apartments; from the second, which is now a garden, a passage leads into the third, and to a building called the chapel; there was formerly a communication from the third, which is also a garden, to the fourth, to which now the only access is by creeping through a fall-port in the wall. The characteristic style of the architecture appears, from a general survey, to be Norman: the shell seems to have been constructed on one plan and at the same period; but the other buildings have been altered and enlarged by later proprietors. Great importance attached to this fortress during the civil wars, when it was at first garrisoned for the king, till colonel Morgan, aided by the mountaineers, took possession of the town, and forced the galle to surrender. It was recaptured by the loyalists under Sir Nicholas Keynes, who, with only 160 men, made a courageous stand against the assaults of Cromwell; but after a laborious siege, it was stormed, and Sir Nicholas and forty of his brave adherents, perished in the attack. At the south-eastern extremity of the first court of the castle is a tower, remarkable as the prison of the celebrated regicide Harry Marten. An early assertor of republican principles, he zealously co-operated with Cromwell in the abolition of monarchy; and on the trial of the king he sat as one of the judges. From the dissolution of the long parliament until the restoration, he remained in obscure retirement, when he surrendered on the king's proclamation: he was arraigned and condemned for high treason, but his sentence was commuted for perpetual imprisonment, and he was removed to Chepstow castle, where he was treated with great lenity, was allowed the possession of his whole property, and the privilege of visiting the neighbouring gentry. In the twentieth year of his abode here, an apoplexy terminated his confinement and life, at the age of seventy-eight. He was buried in the chancel of the church of Chepstow, where a stone with an inscription of his own writing, was placed over his remains: but the zeal of the vicar not suffering the monument of a regicide to pollute the vicinity of the altar, it has since been removed into the body of the church.

Chepstow is about three miles from the passage over the river Severn at Ault ferry; five from the new passage at Black Rock; fifteen from Monmouth; sixteen from Bristol, and 135 from London.

The tide of the Wy flows with great rapidity up to the town. It frequently rises at the bridge to 36 feet, and in January 1768 it arose about 70 feet; a phenomenon occasioned by the projection of the rocks at Beachley and Ault, which turns the tide with great violence into this river. The floor of the bridge, constructed similar to that of Caerleon, is level; and was formerly supported by wooden piers, about the height of 40 feet, which the counties of Gloucester and Monmouth jointly contributed to keep in repair. They remain in their original state on the Gloucestershire side, but stone piers have been substituted on the opposite shore. Part of it belongs to the county of Gloucester, and part to Monmouthshire.

Chepstow contains no manufactories; but supplies Herefordshire and this part of Monmouthshire with the necessary imports by the Wy, and exports the native productions, which are principally timber, grain for the Bristol market, coal, grind and mill-stones, iron, oak-bark, and cyder.

A considerable foreign trade is carried on during peace; and some vessels are built here. An alien priory for Benedictine monks (of which scarcely any traces remain) was founded here soon after the conquest, by one of the proprietors of the castle. The parish church was part of the priory chapel, and displays a curious specimen of Norman architecture. Its western entrance is a magnificent portal, enriched with the mouldings peculiar to the Saxon and Norman styles. In the neighbourhood are the remains of several religious houses. A pleasant eminence to the west of the town was occupied by St. Kynemark's priory; the walls of which, still visible, enclose the garden and yard of a farm-house, called St. Kynemark's farm. The foundations of St. Lawrence's chapel may also be traced. The traveller, in passing to this spot along the fine Newton road, and along the fields, commands a singular and beautiful prospect of Chepstow and its environs. The remains of several other chapels still exist. In the garden belonging to a house in Bridge-street, is a well, remarkable for good water, which at high tide becomes perfectly dry: a little before which it begins to subside, and soon after the ebb it returns; neither wet nor dry weather affects it, but its increase and decrease regularly correspond with the tide. The well, which is thirty-two feet deep, has frequently fourteen feet of water.

About two miles north of Chepstow is *Pierrefield*, a seat of much celebrity, and a just theme of a descriptive encomium to the tourists and topographers of Monmouthshire. The grounds are extensive, and embrace much diversified scenery of wood, lawn, rock, and river. Stretching along the irrisuous banks of the Wy, from the castle at Chepstow, to a lofty perpendicular rock called the Wynd-cliff, is a walk of about three miles in length: the prospects from which, and its accompanying scenery, are described in the following terms by Mr. Cox. "On entering the grounds at the extremity of the village of St. Arvans, and at the bottom of Wynd-cliff, the walk leads through plantations, commanding on the right a distant view of the Severn, and the surrounding country; it penetrates into a thick forest, and conducts to the Lover's Leap, where the Wynd-cliff is seen towering above the river in all its height and beauty, and below yawns a deep and woody abyss. It waves almost imperceptibly in a grand outline, on the brow of the majestic amphitheatre of cliffs impending on the Wy opposite to the peninsula of Laneant, then crosses the park, runs through groves and thickets, and again joins the Wy, at that reach of the river which stretches from Laneant to the castle of Chepstow. From the Lover's Leap the wall is carried through a thick mantle of forests, with occasional openings, which seem not the result of art or design, but the effect of chance or nature. This bowry walk is consonant to the genius of Pierrefield; the screen of wood prevents the uniformity of a bird's eye-view, and the imperceptible bend of the amphitheatre conveys the spectator from one part of this fairy region to another without discovering the gradations. Hence the Wy is sometimes concealed, or half obscured by overhanging foliage, at others wholly expanding to view is seen sweeping beneath in a broad and circuitous channel; hence at one place the Severn spreads in the midst of a boundless expanse of country, and on the opposite side to the Wy; at another, both rivers appear on the same side, and the Severn seems supported on the level summit of the cliffs which form the banks of the Wy. Hence the same objects present themselves in different aspects, and with varied accompaniments; hence the magic transition from the impervious gloom of the forest to open groves; from meadows and lawns to rocks and precipices,

pieces, and from the mild beauties of English landscape to the wildness of Alpine scenery."

The house erected on this estate is a magnificent pile of building, of freestone, and stands nearly in the centre of the park. Piercefield was long the property of the Waters family, till the year 1736, when it was sold to colonel Morris, father of Valentine Morris, Esq. who afterwards possessed it, and to whose taste and liberality it is indebted for its chief artificial beauties, and its long established celebrity. In 1784 it was bought by George Smith, Esq. who again sold it in 1794 to Colonel Wood, formerly chief engineer at Bengal. This gentleman has recently disposed of Piercefield to — Wells, Esq.

For the most recent account of this seat, of Chepstow, and this county, see Cox's "Historical Tour in Monmouthshire." 2 vols. 4to.

CHEQ, CHERIF, or SHERRIFFE, the prince, or high-priest of Mecca; sovereign pontiff of the Mussulmans; and owned as such by all the sects into which they are divided.

The grand signior, soppies, mogols, khans of Tartary, &c. send him yearly presents; especially tapetry, to cover Mahomet's tomb, and tents for himself; for the cheq has a tent near the mosque of Mecca, wherein he lives during the seventeen days of devotion in pilgrimage to Mecca. The tapetry and tent are changed every year, and pieces thereof sent to the princes who furnish new ones.

His dominions are extensive; and his revenue is very considerable, consisting of presents made by the Mahometan princes, and pilgrims, to the mosque of Mecca and Medina. See SHERRIFFE.

The cheq subsfills all the pilgrims during the seventeen days of devotion; on which account he is every year furnished with a very considerable sum of money from the grand signior: the better to obtain this, he makes him believe, that there are constantly, during this time, seventy thousand pilgrims; and that, should the number fall short, the angels, in form of men, would make it up.

CHEQUETAN, or SEGUATANEO, in *Geography*, a town of North America, on the coast of Mexico, in the province of Mechochian, 7 miles W. of the rocks of Seguetancio. Between this and Acapulco towards the east is a sandy beach, 18 leagues in extent, against which the beating of the sea is so violent as to prevent boats from landing; nevertheless there is a good anchorage for shipping at a mile or two from the shore, during the fair season. The harbour of Chequetan, though hard to be traced, is very important to vessels that cruise in these seas; as it is the most secure in a vast extent of coast, yields plenty of wood and water, and may be defended by a few men. When lord Anson touched here, the place was uninhabited.

CHER, a river of France, which rises near Auzanic, in the department of the Creuse, passes by Moutluçon, Ainay-le-Vieux, St. Amand, Chatauneuf, St. Florent, Vierzon, Meneton, Villefranche, Chabris, Selles, St. Aignan, Montrichard, Blere, &c. and joins the Loire a few miles below Tours.

CHER, a department of France, deriving its name from the river Cher, which traverses a part of it, and bounded on the north, by the departments of Loire and Cher. Loiret and Nièvre; on the east, by that of Nièvre, from which it is separated by the Allier; on the south, by those of Creuse, Allier, and Indre; and on the west, by those of Indre, Loire, and Indre and Cher. This department is formed of part of the province of Berry, and its capital is Bourges. The territorial extent comprehends 7385 kilometres, or about 740,125 hectares, or 1,450,134 square acres; and is distributed into three districts, contain-

ing 29 cantons and 307 communes. The population was estimated in the 11th year of the French æra at 218,297 persons; its contributions to various purposes amounted to 1,742,031 francs; and the expences charged upon it for administration, justice, and public instruction, were 260,525 francs 79 cents.

CHERA, a river of South America in the province of Quito, in Peru, passing near Colan, and supplying Paiza with its fresh water.

CHERKEUS, in *Ancient Geography*, a small town of Lower Egypt, situate upon the Nile, from which a canal passed to Alexandria, that served to discharge the water of the lake Moeris.

CHERAMIS, in *Antiquity*, a medical measure. According to Erotian on Hippocrates, it was the hollow of a shell-fish called *myax*, and took that name from *χερμοις*, which signifies a hollow place. It frequently occurs in Hippocrates, and seems not much different from the *chama*, which in Galen's Exegeſis is expounded by it. Cornavius also explains *cheramis* by the measure of a *CHAMA*; and Calvus on another passage expounds it by a *pugil*.

CHERASCÒ, in *Geography*, a town of Italy, in the principality of Piedmont, and capital of a county of the same name, on the borders of that of Aiti, seated on a mountain, at the conflux of the Stura with the Tanaro. It is said to have been built by some inhabitants of Alba, Manzaon, Miana, &c. who were expelled their towns by the tyranny of their lords, and surrounded with walls. It was afterwards fortified in the modern manner with bastions, fosses, and out-works, by order of Christina of France, duchess of Savoy. Since that time it has been considered as the key and bulwark of the estates of Savoy, being situated on the frontiers of Piedmont, Montserrat, and the duchy of Milan, and strong both by nature and art. It was at first a republic, governed by its own laws, but professing dependence on the emperors of Germany. Cherasco continued in this flourishing state till the year 1266, when its allegiance was transferred to Charles I. of Anjou, king of Naples and Sicily; and it remained subject to that crown till the reign of Jane I. queen of Naples, when, left destitute of her protection, it was voluntarily surrendered to Amadeus VI. count of Savoy, and Jaques de Savoy, prince of Achaia. In a few years it became successively subject to other powers, till at length it was possessed by Charles V. who gave it, in 1530, to Charles III. duke of Savoy, surnamed the Good, in consideration of his marriage with Beatrice of Portugal. After having been taken in the same century by the Austrians and the French, it was restored by the peace of Cambray, in 1559, to Emanuel Philibert, son of Charles. Victor Amadeus gave it the title of city, and made it the capital of a province and residence of a governor. It has, together with the whole of Piedmont, at a late period, fallen into the hands of the French. See PIEDMONT. This town is in the diocese of Aiti, and has 7 parish churches, 4 within the walls, and 3 without. The county, of which it is the capital, is about 9 miles in diameter; the land is fertile; the plains produce great plenty of corn, and the hills of various heights yield good wine for exportation. It is 20 miles S. E. from Turin, and 15 miles E. from Saluzzo. N. lat. 44° 33'. E. long. 7° 41'.

CHERAW HILL, a mountain of North America, in the state of South Carolina; 40 miles N. N. E. of Quebeckborough.

CHERAWS, a district in the upper county of North Carolina, bounded on the north and north-east by North Carolina; on the south-east by George-town district; and on the south-west by Lynche's creek, which separates it from Camden district. Its length is about 83 miles, and its breadth 63; and it is subdivided into the counties of Darling-

ton, Chatterfield, and Marlborough. By the census of 1797, the number of inhabitants appeared to be 10,706, of whom 7,618 were whites, and the rest slaves. It sends to the state legislature six representatives and two senators, and in conjunction with George-town district one member to Congress. This district is watered by Great Pecke river and other smaller streams; on the banks of which the land is populationly settled and well cultivated. The chief towns are Grenville and Chatham.

CHERBOURG, a sea-port town of France, in the department of the Channel, and chief place of a canton in the district of Valognes; situated at the bottom of a large bay, between Cape Barileur and Capela Hogue. The place contains 11,389 and the canton the same number of inhabitants. The territory comprehends 17½ kilometres and one commune. Before the revolution, Cherbourg was the seat of a governor and an admiralty. The chief employment of the inhabitants consists in building small vessels, and manufacturing woollen stuffs. In 1758 this town was taken and plundered by the English; the port destroyed, and the ships burned in the harbour. The French have always considered this port as of great importance in the navigation of the English Channel; and they have expended immense sums on the erection of piers, deepening and enlarging the harbour, and erecting fortifications. Vessels of 900 tons can be admitted in high-water, and in low-water those of 250 tons. N. lat. 49° 38' 26". W. long. 1° 38' 11".

CHERCHESENE, a town of Asiatic Turkey, in the province of Curdistan; 62 miles S. of Kerkuk.

CHEREF, or SHARIF, a title assumed by the emperors of Morocco.

CHEREM, among the Jews, is used to signify a species of ANNIHILATION.

The Hebrew word *cherem* signifies properly *to destroy, exterminate, devote, anathematize*.

CHEREM is sometimes likewise taken for that which is consecrated, vowed, or offered to the Lord, so that it may no longer be employed in common or profane uses. There are some who assert, that persons thus devoted were put to death; whereof, they say, Jephtha's daughter is a memorable example. Judg. xi. 29, &c.

CHEREM is also used for a kind of excommunication in use among the Jews. See NIDDUI.

CHEREN, in *Ornithology*, the Arabian name of the king-fisher, *ALCEDO Ispida*.

CHEREN *tabanan*, in *Geography*, a town of Chinese Tartary. N. lat. 41° 32'. E. long. 119° 31'.

CHERIBON, one of the four empires or kingdoms into which the island of Java is divided: the other three are Bantam, Jacatra, and Soefochoenam. Cheribon is under the dominion of three different princes, who are independent of the Dutch, and sovereigns in their respective districts. Whilst the company possessed power in the east, the princes of Cheribon were their allies, and bound, by treaty, to sell the whole produce of their territory exclusively to the company, and not to permit any other nation besides the Dutch, to enter their dominions. For the due maintenance of which conditions, the company took care to guard and garrison their sea-ports. The company, on former occasions, has exercised a kind of despotic power over these princes; de-throning one, and establishing another in his room. An instance of this kind occurred in the commencement of the year 1769; when one prince was set aside and banished to the castle Victoria, in the island of Amboyna, and the elevated prince constrained to furnish a certain sum of money annually, for the support of his imprisoned predecessor.

CHERIC, in *Ornithology*; the Gmelinian *Metacilla Ma-*

dagafariensis is so called by Buffon; named by Latham the white-eyed Warbler.

CHERI-KIAMEN, in *Geography*, a port of Chinese Tartary; 15 miles S.E. of Petourei Hotun.

CHERI-OUJOU, a town of Chinese Tartary; 8 miles S. of Gelo.

CHERIPPE, an inconsiderable village of S. America, in Terra Firma, which furnishes the weekly market of Panama with provisions.

CHERIWAY, in *Ornithology*. See FALCO.

CHERILLRIA, in *Botany*, (so called in honour of J. Henry Cherler, son-in-law and assistant to John Bauhin), Hall. opusc. 300. Linn. gen. 570. Schreb. 775. Willd. 808. Juss. 301. Vent. vol. 3. 243. Class and order, *dendrodia virginica*. Nat. ord. *Caryophyllee*, Linn. Juss. Vent.

Gen. Ch. Cal. Perianth five-leaved; leaves lanceolate, concave, keeled, lirate, expanding. Cor. Petals none, Hall. Linn. Lam. Smith. (five, strap-shaped, green, Segn.) Nectaries five, very small, emarginate scales. Stam. Filaments ten; five attached to the scales of the nectary; five alternating with the calyx-leaves, inserted into the receptacle between the scales. Pist. Germ superior, styles three. Peric. Capsule egg-shaped, twice as long as the calyx; three-valved, three-celled, with three seeds. Linn. Lam. &c. (one-celled, with many seeds, Smith.) Seeds angular.

Eff. Ch. Calyx five-leaved; nectariferous glands five, emergent; capsule superior, three-valved.

Sp. C. *sedoides*, Hall. Helv. tab. 21. Segn. tab. 4. fig. 3. Jacq. Aust. tab. 284. Lam. Illust. tab. 379. Eng. Bot. 1212. (Lychnis Alpina; Pluck. Alm. tab. 42. fig. 8. Sedum montanum; Morif. Hist. tab. C. fig. 14.) Root perennial, long, somewhat woody, much divided. Stems forming a tuft, an inch long, thickly beset with leaves. Leaves awl-shaped, obtuse, three-nerved underneath. Flowers yellowish, green, erect. Peduncles solitary, axillary, towards the top of the stem, one flowered, with two connate bracts about the middle. A native of moist places near the summits of high mountains in the highlands of Scotland, Carniola, &c. flowering in July and August. First observed in Great Britain by some of Dr. Hope's travelling pupils.

CHERMANSICK, in *Geography*, a town of Asiatic Turkey, in the province of Natoha; 30 miles N.N.E. of Milct.

CHERMES, in *Entomology*, a genus of hemipterous insects. The snout is placed in the breast, and contains three inflected bristles; antennæ cylindrical, and longer than the thorax; wings four, deflected; thorax gibbous; posterior legs formed for leaping.

There are many species of the chermes genus, some of which are peculiar to particular plants, while others inhabit a variety of plants indiscriminately. The females are furnished with a sharp tubular instrument at the extremity of the abdomen, with which they pierce the leaves of the willow, ash, oak, fir, and other trees, in order to deposit their eggs beneath the surface, and by these punctures occasion the swellings or excrescences of various sizes, which are commonly known by the name of tree-galls. These galls contain the infant brood of chermes, both in the larva and pupa, as well as egg state: the larva has six feet, and is generally covered with a kind of hairy or woolly substance, and the pupa is distinguished by two protuberances of the thorax which contain the embryous wings. In the perfect or winged state the chermes leap or spring with great agility.

Gersfroy, who names several of this tribe of insects Pfylla, observes, that both in the larva and pupa state they eject from the vent a sugar-like substance of a white colour, and much re-

sembling

feembling manna: sometimes this matter occurs in the form of small white grains upon the leaves of plants, and is often seen attached to the posterior extremity of the insect's body. The galls occasioned by these insects are useful for various purposes. Some late French writers comprehend the two Linnæan genera, chermes and coccus, under one, denominat- ed Kermes.

Species.

GRAMINIS. Found on grasses, particularly the *aira flexu- ota*, Linn. Inhabits Europe.

ULMI. On the *ulmi campestris*, Linn. Fr. Succ. Found in the curled leaves of this tree.

CERASTII. On the leaves of the *cerastium viscosum*, Linn. Fr. Succ.

PYRI. On the leaves of the *pyrus communis*, Linn. Fr. Succ. *Cbermes pyri* of Degeer. This is of a brownish-green colour, with dusky spots and bands; and has the wings spotted with brown.

SORBI. On the *Sorbus aucuparia*, Fabr. Above varied with black lines and characters; beneath greenish; thorax yellow, with two dots in front, and four black lines behind.

PERSICÆ. On the *amygdalus persica*, Fabr. *Cbermes persica oblongus*, Geoffr. *Le kermes oblong du pêcher*. This is chiefly on the branches of the amygdalus persica; the body is oblong and ferruginous.

CALTHÆ. On the flowers of *caltha palustris*, Fabr. Antennæ black at the tip; thorax rufous with three black curves; wings white, with yellowish veins and a brown dot.

BUXI. On the box, and other ever-greens, Fabr. &c. This is of a green colour, with fetaceous antennæ, and the wings yellowish brown. The punctures of this insect make the leaves bend in towards each other at their extremity, forming a hollow knob in which the larvæ are enclosed.

URTICÆ. On the *urtica dioica*, Linn. Fr. Succ. This is of a green or fuscous colour with the sides of the abdomen spotted with white.

BETULÆ. On the branches of the *betula alba*, Linn.

ALNI. On the *betula alni*, Linn. *Cbermes alni lanata viridis*, Degeer. *Vermis fuciorius alni*, Frisch. The antennæ are varied with white and black; snout white tipped with black; body whitish; wings white with brown veins.

QUERCUS. On the oak, Linn. Fr. Succ.

FAGI. On the *fagus sylvatica*, Linn. Fr. Succ.

ABIETIS. On the branches of *pinus abies*, Linn. f. Cappon, &c. *Psylla pallide flavescens oculis fuscis, alis agris*, Geoffr. *Insectum tuberculi moricæ carbonis taxii*, Fr. h. *Picea pumila*, Chuf. This species occasions by its puncture enormous fealy swellings or protuberances at the end of the branches of the pine.

SALICIS. On various species of *salix* found in Europe, Fabr.

FRAXINI. On the *fraxinus excelsior*, Linn. This is of a black colour varied with pale yellow.

ACERIS. On the branches of *acer platanoides*, Linn. The body is yellowish, beneath green; tail awl-shaped and brownish.

FIGUS. On the *figus carica*, Fabr. The body is brown; antennæ thick and hairy; wings with brown nerves.

LICHENIS. On various species of lichens, Gmel. &c. This is of a fuscous colour dotted with black, and has the antennæ longer than the body; the wings are spotted with brown.

PINI. Linn. Inhabits pines. It is not perhaps distinct from *C. abietis*.

CASTANÆ. Fuscous; antennæ fetaceous and smooth; wings nervous, Geoffr. &c. Inhabits various plants.

FUBRÆ. Red; wings nervous, Geoff. Inhabits various plants.

VOL. VII.

PRUNI. On the *prunus domestica*, Scop. The abdomen is red, with dots, and lateral bands of brown.

CRATÆGI. On the *cratægus oxyacantha*, Scop. The larva is of a plumbeous green, with a fold down the middle of the abdomen.

EUCONYMI. On the *euconymus europæus*, Scop. Colour black, legs pale.

SENECIONIS. On the *senecio vulgaris*, Scop. The body is of a greenish yellow colour; the last joint of the antennæ is the thickest.

CHERMITES, or CHERMITES, in the *Natural History of the Ancients*, a name given by many to a species of very bright and white marble or alabaster, which seems to have been the same with that called afterwards LYGDONUM *har- mor*.

CHERNIBS, derived from $\chi\epsilon\iota\varsigma$, the *hand*, and $\mu\epsilon\tau\alpha$, *to wash*, in *Antiquity*, a vessel wherein people used to wash their hands before they went to attend religious service.

CHERO, in *Geography*, a small island of European Turkey in the Archipelago. N. lat. $36^{\circ} 53'$. E. long. $25^{\circ} 40'$.

CHEROKEES, a nation of Indians in N. America, once powerful and flourishing, but now declining. They reside in the northern parts of Georgia, and the southern parts of the state of Tennessee; having on the east the Appalachian or Cherokee mountains, which separate them from north and south Carolina; on the north and west the Tennessee river; and on the south the Creek Indians. Their country, extending westward to the Mississippi and northward to the Six nations, was surrendered, by treaty at Westminster, in 1729, to the crown of Great Britain. The present line between them and the state of Tennessee is not yet settled. A line of experiment was drawn in 1792 from Clinch river across Holston to Chilhowe mountain; but the Cherokee commissioners not appearing, it is called a line of experiment. The complexion of the Cherokees is brighter than that of the neighbouring Indians. They are robust and well made, and taller than many of their neighbours; being generally six feet high. Their women are tall, slender, and delicate. The talents and morals of the Cherokees are held in high estimation. They were formerly a powerful nation; but by their continual wars with the northern Indian tribes, and with the whites, they are now reduced, as some say, to 1500, or, according to others, to 3000 warriors; and they are becoming feeble and pusillanimous. They have 4; towns now inhabited.

CHERON, ELIZABETH-SOPHIA, in *Biography*, the daughter of Henry Cheron, painter in enamel, was born at Paris in 1648, and instructed by her father, who observed her passionate fondness for the art of painting, in design and colouring. Her improvement was very rapid, and she soon acquired great reputation by her performances; particularly by her portraits, which, besides plenty of their striking resemblance, were elegantly disposed, well-coloured, and neatly finished; she also painted history, and her portraits were executed in the historical style; she employed herself much in drawing from the antique, and excelled in copying the figures on gems. Her father was a Calvinist; but from her mother she received early impressions in favour of the Catholic religion; and at a mature age she abjured Calvinism, and thus facilitated her admission into the Academy of Painting, in 1677, by the recommendation of Charles Le Brun. Her genius comprehended music and poetry, as well as painting; and many of her compositions in verse were much esteemed by J. Bapt. Rousseau. These productions obtained for her a seat in the Academy of Ricovrati at Padua; and as she played well on the lute, and had

occasional evening concerts, her house was frequented by persons of taste and literature. At the age of 60 she married M. Le Hay, engineer to the king, who was also advanced in years; and soon after, viz. in 1711, died at Paris, aged 63. This lady amused herself with engraving; and we have a series of gems partly from her own design, but mostly from the antique; and of these, three were etched by herself, viz. Bacchus and Ariadne, Mars and Venus, and Night scattering her poppies. She also engraved a "Descent from the cross," and a "Drawing book," consisting of 36 prints in folio. D'Argenville. Pilkington. Strutt.

CHERON, LOUIS, the youngest son of the preceding lady, was born at Paris in 1665; and having acquired the first principles of painting in his own country, he was enabled by the liberality of his father to visit Italy and remain there 18 years. His models were the works of Raphael and Julio Romano; but though he composed with facility and drew correctly, he never attained the grace of the Italian masters; his heads having a ferocious air and his figures being too muscular. As he adhered to the Calvinistic profession, he was obliged to leave France, and in 1695 he sought a refuge in England, where he found some patrons, and particularly the duke of Montagu. He was a man of enlarged ideas and also of correct morals; so that he refused to paint for a nobleman a licentious subject. He died at London in 1713. He engraved with great taste the following prints, from his own composition; viz. "St. Peter healing the lame man at the gates of the temple," "The death of Ananias and Saphira," and "St. Paul baptizing the Eunuch." Pilkington. Strutt.

CHERONÆA, in *Ancient Geography*, a town of Greece in Beotia; formerly called Arne, and situated in the environs of Lebadea. On the plains of Cheronæa are two trophies, which are said to have been erected by the Romans and Sylla, in commemoration of a victory obtained over the general of the army of Mithridates. The Thebans who perished in their contest against Philip were buried near Cheronæa; and over their tomb was placed a lion. The principal divinity of the Cheronæans was the sceptre which Vulcan made for Jupiter, called "the lance;" from Jupiter it was transferred to Mercury, and at length it descended to Agamemnon, and is celebrated by Homer. This deity had no temple, but a priest waited on him, and daily sacrifices were offered to him.

CHERONNAC, in *Geography*, a town of France, in the department of the Charente; 15 miles S. of Confolent.

CHEROPOTAMUS, in *Zoology*, one of the synonyms of the hippopotamus.

CHEROY, in *Geography*, a town of France, in the department of the Yonne, and district of Sens; 10 miles W. of it.

CHERONESUS, or CHERRURA, in *Ancient Geography*, a town of Africa in Libya. Steph. Byz.—Also, a promontory of Asia Minor in Lycia.—Also, a town of Asia Minor, in the Doride, near the town of Cnidus. Id.—Also, a town of Spain near Sagonte. Strabo.—Also, an island in the vicinity of that of Crete.—Also, a part of Thrace, in the Euxine sea, between Apolloniades and Thyniades, according to Arrian.—Also, a town in the western part of the Tauric Cherfonesus, at the distance of 20 stades from that of Bosphorus in the eastern part. It was also called "Cherfonesus" or "Cherfone." Pliny says, that it was also called "Megarice," and that it was made free by the Romans. Scylax reckons it in the number of the Greek cities. and Strabo makes it a colony of the inhabitants of Heraclæa of Pontus; and says, that it was built by the Greeks

on the gulph of Carcinitis, now the gulph of Nigropoli, on the west coast of the Cherfonesus. It was freely surrendered to Mithridates. Procopius says, that it was the last frontier of the Roman empire; and that the country between the two towns was possessed by the Huns. Pevfonius says that the Cherfonites were faithful subjects to the emperors of the east; and that they were governed by an officer called "Proteron," who had a council of senators or old men, denominated the fathers of the city; and that in process of time they sent them praetors. He adds, that they were very commercial, and possessed the whole trade of the Black sea. He moreover says, that when Constantius, who had employed the Cherfonites against the Bosphorians, became emperor, he availed himself of their assistance against the Scythians, and in acknowledgment of their services granted them many exemptions and privileges. At length there was a conspiracy of the Bosphorians against the Cherfonites, which was discovered by a young woman called "Gycia," to whom were erected statues, upon the pedestals of which were inscribed an abstract of this adventure.

CHERRONISO, in *Geography*, a town of European Turkey, on the N.E. coast of the island of Negropot; 25 miles E. of Negropot.

CHERRY-TREE, in *Botany*. See *PRUNUS Cerasus*. This tree is called *Cerasus*, according to Servius, from the name of a city in Pontus, which Lucullus destroyed; and the fruit of it was brought by him to Rome, A. U. C. 680, and into Britain about 100 years afterwards, or A. D. 55. Soon after it was spread through most parts of Europe.

CHERRY, *Barbadoes*. See MALPIGHIA.

CHERRY, *Cornelian*. See CORNUS.

CHERRY, *Dwarf*. See LONICERA.

CHERRY, *Hottentot*. See CELASTRUS lucidus.

CHERRY, *Winter*. See PHYSALIS Alkekengi.

CHERRY brandy, a drink made of brandy, with the addition of cherries.

The cherries commonly used for this purpose, are of the black kind: with these, a bottle being half filled, is filled up with brandy, or spirits. The whole is to be shaken up now and then; and in a month's time it becomes fit for use.

To sweeten it, and improve the flavour, some choose to put in sugar, with a quantity of raspberries.

CHERRY-water is made by bruising 20 pounds of black cherries with the kernels, and drawing off by distillation, with as much pure water as is sufficient for avoiding empyreuma, 20 pounds. This water has been formerly used as a vehicle in preference to other distilled waters, and has been kept for this purpose in the hops. But it has been found by various experiments, that the kernels of cherries communicate to distilled water a poisonous quality; and the water has therefore been laid aside by both the London and Edinburgh colleges.

CHERRY-wine is made by adding two pounds of sugar to every two gallons of the juice of cherries. The liquor is afterwards put into a vessel to ferment; and after standing about two months in the cask, is bottled off with a little sugar for use.

In Russia they make cherry-wine by crushing about 5 or more vedros (each vedro being 13½ pints) of ripe cherries in a tub, so that even the stones are broken: and then adding 1, 1½, or 2 pounds of honey, and a quarter or half a quart of good brandy or wine, with some yeast to make it ferment. When it has done fermenting, it is cleared of the yeast and poured into kegs or bottles, and then placed in a cool cellar. Wine and brandy are often omitted, and a greater quantity of honey used in lieu of it, by which the wine proves sufficiently

ciently strong. The same process is used with other fruits.

CHERRY-valley, in *Geography*, a post town of America, in the county of Otsego and state of New York, at the head of a creek of the same name, about 12 miles N. E. of Cooperstown, and 18 southerly of Conjohary, 61 W. of Albany, and 336 from Philadelphia. It contains about 30 houses, a Presbyterian church, and an Academy. The township is very large, and extends along the east side of Otsego lake, and its outlet to Adiquatangie creek. By the late census of 1796, it appears that 629 of its inhabitants were electors.

CHERSA, called also *fecula*, in some medical writers, signifies a root reduced to a farinaceous powder. This way of preparation some condemn, as exhaulting the virtues of the drug, and rendering it good for nothing; others defend it.

CHERSÆA, *earthy*, from *Χηρσα*, earth; an epithet of the three species of ASPs, mentioned by Galen, and *Ægina*.

CHERSETUM, in *Old Customs*, is used for *cheshiffet*. See **CHURCH-SCOT**.

CHERSEUS, in *Ancient Geography*, a river placed by Ptolemy in Phœnicia; the mouth of which, according to him, lay between Dora and Cæsarea of Strabo, which were towns of Palestine.

CHERSO, in *Geography*, an island of the Adriatic, on the coast of Croatia, about 150 miles in circumference. It is mountainous and stony; nevertheless it yields much wood, cattle, wine, oil, and honey. It belongs to the Venetians, who send a nobleman as governor every two years, with the title of count or captain, who resides at the capital, situated in the centre of the island, which has the same name, and contains about 2500 inhabitants. N. lat. 45° 10'. E. long. 14° 26'.

CHERSON, or **KHERSON**, a town of Russia, in the province of Catherinefsk, seated on the Dnieper, about 14 miles below the mouth of the Ingulitz, and a little above the mouth of the Bog, in the neighbourhood of the Liman, a swampy lake, the entrance of which is guarded by the fortrefs of Kimburn, and is about a mile over. This lake has depth sufficient for the reception of large vessels; but they very quickly decay in it, as the water is fresh. The ancient city of Cherfon was situated some miles to the south-west of the spot, where the Russians have built Swastopl. The present Cherfon was founded by Catharine II. in 1773; it is chiefly built of hewn stone, and the completion of it was much accelerated by the activity of Prince Potemkin. It was intended to be the principal mart for all the commodities of export and import; but if an extensive trade should take place in this quarter, the great depository for the merchandize would be more conveniently fixed on some spot below the bar of the Dnieper, and 12 miles S. of Cherfon. In 1783 Cherfon contained 40,000 inhabitants within its walls: and from its dock were launched not only vessels for the purposes of commerce, but ships of war defined to strike terror into the Ottoman empire. A new town, however, called Nicolaiof, now the principal dock, was built by Potemkin, on the confluence of the Ingul and the Bog. The port and city of Cherfon have not perhaps been equalled with regard to celebrity, prosperity, and importance, if we consider its recent standing, by any colony of modern times. Artisans, manufacturers, and merchants, have poured into it from all quarters, and the time seems not to be distant when it shall rank as the second port in the extensive empire of Russia. Its commerce was, if we may be allowed the expression, guaranteed and secured to the empress by the cession of

Kimburn, which lies opposite to Oczakow, at the mouth of the Dnieper. Cherfon is celebrated as the place where the empress Catharine principally resided during her memorable journey to the Crimea, when she took possession of the provinces conquered from Turkey, and where she was visited by the emperor Joseph II. It is also on record as the place where the illustrious Mr. Howard closed his career of humanity and benevolence on the 20th day of January 1760. It is distant about 70 leagues from Oczak w and 2000 versts from Petersburgh. N. lat. 46° 40'. E. long. 32° 54'.

CHERSONESUS, *Χερσονησος*; of *Χηρσα*, land, and *νησος*, island; which signifies the same, in *Geography*, as peninsula; or a continent almost encompassed round with the sea, only joining to the main land, by a narrow neck, or isthmus.

This term is used by the moderns, in compliance to the ancients, who called all their peninsulas by this name: accordingly such places as were hereby distinguished among them retain the name among us: as the Chersonesus of Pœoponnesus, of Thrace, Chersonesus Cimbrica, Aurea, &c.

CHERSONESUS Aurea, the *golden Chersonese*, in *Ancient Geography*, a peninsula delineated by Ptolemy as if it stretched directly from north to south, and having at its southern extremity Sabana Emporium, the latitude of which he fixes at three degrees beyond the line. To the east of this peninsula he places what he calls the Sinus Magnus, or great bay; and in the most remote part of it the station of Catigara, the utmost boundary of navigation in ancient times, to which he affixes no less than 8½° of southern latitude. Beyond this he declares the earth to be altogether unknown, and asserts that the land turns thence to the westward, and stretches in that direction till it joins the promontory of Prassum in Ethiopia, which, according to his opinion, terminated the continent of Africa. M. D'Anville, who has attempted to bring order out of the confusion in which this part of the geography of Ptolemy is involved, assigns to the peninsula of Malacca the position of the golden Chersonese of Ptolemy; but, instead of the direction which he has given it, we know that it bends some degrees towards the east, and that cape Romania, its southern extremity, is more than a degree to the north of the line. This geographer considers the gulf of Siam as the great bay of Ptolemy; but the position on the east side of that bay, corresponding to Catigara, is actually as many degrees to the north of the equator as Ptolemy supposed it to be south of the line. Major Rennell has given the sanction of his approbation (Introd. p. 39.) to the geographical ideas of M. D'Anville, and they have been generally adopted. But M. Goffelin has lately published "The Geography of the Greeks analyzed, &c." in which he differs from M. D'Anville, with respect to many of his determinations. According to M. Goffelin, the Magnus Promontorium, which M. D'Anville concludes to be cape Romania, is the point of Bragu (which see), near to which he places Zaba, supposed by M. D'Anville to be situated on the Strait of Sincapura or Malacca. The Magnus Sinus of Ptolemy he maintains to be the same with the gulf of Martaban, and not the gulf of Siam; and the position of Catigara corresponds, as he attempts to prove, to that of Mergui, a considerable port on the west coast of Siam. Thinz or Sinez Metropolis, which M. D'Anville removes as far as Sim-hoa in the kingdom of Cochin-China, is situated, according to M. Goffelin, on the same river with Mergui, and now bears the name of Tana-ferim. The Ibadii insula of Ptolemy, which M. D'Anville determines to be Sumatra, is, by Goffelin's arrangement, one of that cluster of small isles which lie off

this part of the coast of Siam. M. Goffelin conceives, that the ancients never sailed through the straits of Malacca, had no knowledge of Sumatra, and were altogether unacquainted with the eastern ocean. With regard to the golden Chersonese of Ptolemy in particular, he observes that what chiefly characterizes it is the mouth of a large river, which there divides itself into three branches before it joins the sea. These channels appeared so considerable that each of them bore the name of a river, the Chrysoana, the Palandar, and the Attabara. It does not appear that Ptolemy knew the source of this river, or that he had any knowledge of the interior of this country, as he does not determine the position of any place. Without detailing the other arguments of M. Goffelin, we may observe, that upon comparing Ptolemy's map with that of the country, there seems little reason to doubt that the Golden Chersonese is the southern part of the kingdom of Pegu, which may be considered as disputed. In the southern part of the Malayan peninsula, which has hitherto been regarded as the Golden Chersonese, the river Johr is so small a stream, that it could never have supplied the three important mouths noted by Ptolemy; and his delineation of the country of the Sines, stretching along a western sea, palpably corresponds with Tana-ferim; while M. D'Anville's map so much contradicts that of Ptolemy as to place the sea on the east of the Sines, and proceeding towards the north instead of the south. Moreover, the rivers laid down by Ptolemy, between the mouths of the Ganges and the Delta of the Golden Chersonese, amount to five; of which three appear in our maps, but we are ignorant of the southern part of Arracan, which probably contains the other two. The three chief mouths of the Irrawaddy, in the map of Mr. Dalrymple, sensibly correspond, even in the form and manner of division, with those in the Golden Chersonese of Ptolemy; and the bay to the south of Dalla seems to be the Perimulicus Sinus of the Greek geographer, the small river to the east of which is that of Sirian or Pegu. If the Malayan peninsula had been the Golden Chersonese of the ancients, the ancient geographer could not have been wholly ignorant, as he seems to have been, of the straits of Malacca, and of the northern part of the great island of Sumatra. Many have thought, but without sufficient reason, that the Ophir of Solomon was situated in the Golden Chersonese. See OPHIR.

CHERSONESUS *Cimbriica*, a peninsula of Europe to the north of Germany, supposed to have derived its appellation from the Cimbr who came from thence, and now called *Jutland*; which see. From this peninsula, bounded by the river Elbe on the south, by the German ocean on the west, and by the Baltic sea on the north and east, those people came into Britain, from whom the great body of the English nation is descended. When the unhappy Britons formed the fatal resolution of calling in foreign auxiliaries to preserve them from that destruction with which they were threatened by the Scots and Picts, they could find none nearer than the inhabitants of that country, who were likely to afford them necessary succour and protection; for their nearest neighbours and natural allies, the Gauls, who spoke the same language, and professed the same religion with themselves, were in no condition to give them any assistance; having been invaded, and almost conquered by the Franks, another German nation. The country above-mentioned, to which the Britons directed their views for relief in their distress, was at that time inhabited by three nations, which were called Saxons, Angles, and Jutes; who sent armies into Britain, and here obtained settlements. From these three nations the English in general derive their origin; though

several other nations, particularly Danes and Normans, have since mingled with them in very great numbers. See ANGLES, JUTES, and SAXONS.

CHERSONESUS *Magnus*, a part of Africa, in Marmarica, near the port called Pithia. Scylax places it opposite to the isle of Crete. The great Chersonesus of Ptolemy is supposed by some to be the present Cape Raceallino in the kingdom of Barca: so called because it forms a peninsula. M. D'Anville places it on the coast N.W. of Marmarica, at some distance S.E. from the promontory Drepanum.

CHERSONESUS *Parva*, a port or caille of Egypt, mentioned by Ptolemy and Strabo; and placed by the latter at the distance of 70 stadia S.W. from Alexandria, on a part of the coast which formed a small promontory.

CHERSONESUS *Taurica*, *Crimea*, a considerable peninsula of Europe, lying between the Euxine sea, the Palus Mæotis, and the Bosphorus Cimmerius; extending, according to Sir John Chardin, 60 leagues from east to west, and about 35 from north to south; and joined to the continent by a narrow isthmus about a mile broad. In very remote times this peninsula was governed by its own sovereigns. Its most ancient inhabitants were the Tauri, or Tauriscythæ, as Pliny and Ptolemy call them, and from them it derives its appellation. The mythologists refer to these remote times the first voyage of the Greeks into Taurica. In process of time the Greeks traded here and founded cities. Mithridates, king of Pontus, possessed the peninsula, and it is said, drew from it annually a tribute of 220,000 measures of grain, and 200,000 talents in silver. It was conquered by the Romans, and given by them to the kings of Bosphorus. Some of the eastern tribes of Asia, known to us by the name of Huns, established themselves here, and many of them remained till the time of the emperor Julian. It afterwards passed to the princes of the family of Genghiskan. The cities of note in former times were Taphræ or Taphrus on the isthmus, where Præcep or Precep now stands; Chersonesus, or Cherson; Theodosia, afterwards called Cassa, but now known by its ancient name; Nymphæum, Lagyra, and Chabax, seated on the Euxine sea; and Panticapæum on the Bosphorus. See CRIMEA.

CHERSONESUS *Thracia*, the Chersonesus of Thrace, a peninsula enclosed on the south by the Ægean sea, on the west by the gulf of Melas, and on the east by the Hellespont, and joined on the north to the continent by a neck of land, about 37 furlongs broad. In former times this peninsula was separated from the continent by a wall called in Greek "Macrontichos." The isthmus, connecting with the continent, was, according to Herodotus, 36 stadia; according to Strabo, 400. The length of the isthmus, says Herodotus, was 480 stadia; but Scylax says, that it was 400. It contained the following cities, viz. Cardæ, Agora, Panormus, Alopeconnæus, Eleus, Sclæus, Madytus, Ciffa, Callipolis, Lytmachia, and Paçtye. The Athenians were for some time in possession of this peninsula. By the counsel of the oracle at Delphos, it is said by Cornelius Nepos, they sent thither Miltiades, the son of Cimon, at the head of a colony; but the account of Herodotus is different. The Doloncer, he says, a people of Thrace, had possession of this peninsula; but having carried on an unfavourable war with the Abinthians, they sent to consult the oracle. The Pythian recommended their obtaining a colony under the conduct of the first person who offered them an asylum. Accordingly having sent deputies to Athens, where Pisistratus reigned, they were hospitably treated by Miltiades, the son of Cypselus, a rich and powerful man in that city. Upon their being thus kindly treated, they informed him what was

the opinion of the oracle, which they had consulted. Upon this, Miltiades engaged a number of the Athenians to accompany him to the Chersonesus, and the Doliones immediately invested him with the sovereign power. He began his reign with erecting the wall which separated the peninsula from the continent. At his death, he bequeathed the sovereignty to his nephew Stelagoras, who was assassinated; and when this disastrous event occurred, the Persians seized Miltiades, the son of Cimon, and brother of Stelagoras, to take possession of the government of the Chersonesus. At length the Athenians lost this peninsula; and under the kings of Macedonia, after Alexander, it belonged to Thrace, and made part of their kingdom.

CHERSYDRUS, *Χερσιδρύς*, an amphibious serpent; so called, because it lives first in watery places, whence it is called *hydrus*; after which it shifts its habitation, and lives on dry ground, and thence has its compound appellation *cherisydrus*.

CHERT, in *Mineralogy*. See *HORN stone*.

CHERTODALUS, in *Ancient Geography*, a town of Upper Pannoni, situated near the Danube.

CHERTSEY, in *Geography*, a town of England, in the county of Surrey, situated near the banks of the Thames; 20 miles W.S.W. of London. This town was formerly the residence of some of the Saxon kings, and the first burial place of Henry VI. who was afterwards removed to Windsor. Here was formerly an abbey, founded in 1064; of which, only part of the walls now remains. It has a weekly market on Wednesday.

CHERUB, or **CHERUBIM**, a celestial spirit, which, in the *Hierarchy*, is placed next in order to the seraphim. The word is formed of the Hebrew כְּרֻב, *cherub*; the plural whereof is *cherubim*. In Hebrew, this term is sometimes taken for a calf or an ox. In Syriae and Chaldaee, the word cherub signifies to till or plough, which is the work of oxen. It also denotes strong and powerful, implying the strength of an ox. According to Grotius, the cherubim were figures resembling a calf. Bochart and Spencer think they were similar to the figure of an ox. Josephus merely says, that they were extraordinary creatures, whose figure was unknown to mankind. Clemens of Alexandria is of opinion, that the Egyptians imitated the cherubim of the Hebrews in their sphinxes and hieroglyphical animals. The figure of the cherubim was not always uniform, since they are differently described in the shapes of men, eagles, oxen, lions, and in a composition of all these figures put together. Moses likewise calls these symbolical or microglyphical representations, which were represented in embroideries upon the veils of the tabernacle, cherubim of costly work. Such were the symbolical figures which the Egyptians placed at the gates of their temples, and the images of the generality of their gods, which were commonly nothing but statues composed of men and animals.

The two cherubim that covered the mercy-seat are represented by Moses as extending their wings on both sides, and looking upon one another with their faces turned towards the mercy-seat, which covered the ark. It would afford our readers little instruction or entertainment to introduce in this article the fanciful conjectures of the Hutchinsonians, with regard to the form or import of the Hebrew cherubim; or to detail the result of the researches of Mr. Parkhurst in his Hebrew lexicon on this subject, who has minutely traced in the cherubic figures emblems or representations of the three persons in the Trinity. That the cherubim were hieroglyphic or emblematical figures, composed of the various parts of different animals, is unquestionable. Each cherub had four heads or faces; viz. those of a man,

of a lion, of an ox, and of an eagle. Their bodies, at least in the upper part, resembled the human form. The prophet Ezekiel describes the cherub as having four wings: the seraph of Isaiah had six wings. They had four hands or arms; and their lower part from the rim of the belly downwards was composed either of human thighs, legs, and feet, to which were appended behind, the body and hinder legs of an ox, or, more probably, the body and four legs of an ox, out of which the human part seemed to rise, so that the whole below the rim of the belly was in the form of an ox, and that above this division was human. As to the services which they were designed to perform, it has been suggested (see Fragments annexed to the last edition of Calmet's Dictionary) that, as the vision of Ezekiel and also of Isaiah was that of the likeness of a moveable throne or chariot of immense size, in which the conductor was supposed to sit, the wheels annexed to it were such as were joined to the royal travelling or military thrones of the Persian kings, and the four cherubim occupied the places of four horses for drawing this capacious machine. As to the eyes in the wheels and the cherubim it has been conjectured, that they were spots or streaks embellished with brilliant colours. After all the suggestions and conjectures of ingenious and learned persons, it still remains to be determined, what these emblematical figures were intended to represent. It is certain that they are very ancient, and that they have been adopted in other countries besides that in which they were originally introduced. Symbolical figures resembling cherubim embellished part of the palace of Peseopolis; and they are thus described by Sir John Chardin. In the front of each pilaster is a figure of monstrous size, whose head and feet stand out in whole relief, and make the front of the pilaster. The relief is two inches high. Those figures, which look towards the plain, have their faces mutilated, that it cannot be known, whether they represented horses, lions, rhinoceroses, or elephants. Those figures which look towards the mountains are more entire; and represent monstrous creatures, whose body is, e. g. that of a winged horse, with the head of a man covered with a high cap, having a crown upon it. The figures delineated by Chardin have at least three parts of the cherubic composition, the bird, the ox, and the man.

CHERUB, in *Heraldry*, a child's head between two wings, or between three pair of wings. We shall here observe, that the word, כְּרֻב, formed of כּ, or כִּי, *as*, and רֻב, or רְבִיאִי, *a child*, denotes *as a child*.

CHERUBIM, was also the name of an ancient military order in Sweden, otherwise called the *order of Scraphim*. It was instituted by Magnus II. in 1334. in memory of the siege laid to the metropolitan city of Upsal, and abolished by Charles IX. upon the change of religion which happened in Sweden: but it was revived Feb. 11th, 1748, by Frederic I. king of Sweden. It took its denomination from the golden figures of cherubim, whereof the collar of the order was composed.

The *habit* of the order is a white satin jacket, trimmed with black lace, and lined with black; white breeches, shoes, and stockings, trimmed with black, and black ribbons; a black satin short cloak lined with white, and a black cape, trimmed with black lace; a hat of black satin, bound with white, having on the left side four white ostrich feathers, and in the middle one black feather. Upon the left breast of the cloak is a set of 8 points embroidered in silver; and upon the jacket on the same side is the like star, somewhat less in size. The *collar* of the order is composed of eleven golden heads of Scraphim, with wings expanded, and 11 blue patriarchal crosses, enamelled in gold, all joined with chains of

the last. To the collar is suspended the *ensign* of the order: viz. a star of 8 points, enamelled white, the centre blue, with the arms of Sweden, and the initial letters I. H. S.; over the H. a cross; the arms enclosed with 4 heads of Seraphs, as in the collar; in the arms, under the bottom crown, the passion-nails. The Seraphs heads are between the double points of the star, and over the upward points is the regal crown of Sweden, by which it is pendent to the collar. The *ensign* is also pendent to a broad sky-blue watered ribbon, worn scarf-wise, and brought over the right shoulder, and under the left arm.

CHERUBIN, *Father*, of Orleans, in *Biography*, an astronomer and philosopher, concerning whom little is known. He flourished about the year 1650. Having acquired a competent knowledge of the languages, he was admitted a capuchin friar in the convent at Orleans. His large work, entitled, "Dioptrique Oculaire," on the theory, use, and mechanism of telescopes, is adorned with engravings of instruments designed by himself, and was printed at Paris 1671, fol. Another work, supposed by some to be an enlargement of the former, and entitled, "La Vision Parfaite," was published in 2 vols. fol. in 1677 and 1681. Moreti.

CHERVES, in *Geography*, a town of France, in the department of the Charente; one league N.W. of Cognac.

CHERVEUX, a town of France, in the department of the Two Seves, and district of Niort; $2\frac{1}{2}$ leagues N.E. of it.

CHERVIL, in *Botany*. See *SCANDIA cerasifolium*, *CHEROPHYLLUM sylvestre*, and *TAMULENTUM*.

CHERUSCI, in *Ancient Geography*, a powerful people of Germany, who were situated near the Hercynian forest. They had the Cauchi to the south, and were separated from the Catti by the forest Baceni. Tacitus and Cæsar mention them.

CHESAPEAKE, in *Geography*, one of the largest and best bays in the United States. Its entrance is nearly E.N.E. and S.S.W. between Cape Charles, N. lat. $37^{\circ} 12'$, and Cape Henry, N. lat. 37° , in Virginia, 12 miles wide; and it extends 270 miles to the northward, separating Virginia from Maryland. Its breadth is from 7 to 18 miles, and general depth about 9 fathoms: it affords many convenient harbours, as well as a safe and easy navigation. It has many fertile islands, particularly along the eastern side, and some on the western shore. A number of navigable rivers, and other streams, discharge themselves into it: the chief of which are Susquehanna, Patuxent, Patuxent, Potowmack, Rappahannock, and York, all which are large and navigable. This bay has also many excellent fisheries of herring and flad, as well as of very good crabs and oysters. It is the resort of swans, and of a species of wild duck, called "Canvasbacks," much admired for its richness and delicacy. In a commercial view, Chesapeake bay is of very considerable advantage to the neighbouring states, and particularly to Virginia.

CHESELDEN, WILLIAM, in *Biography*. By the assistance of Mr. Bowyer's biographical anecdotes, we are enabled to give a pretty distinct account of the life of this celebrated surgeon and anatomist. He was of a respectable family in Rutlandshire, and born at Burrow-on-the-Hill, in Leicestershire, in the year 1688. After such acquirements in Latin, as might be picked up at a neighbouring grammar-school, he was put apprentice, in 1703, to Mr. Wilkes, a surgeon at Leicester, and at the end of his apprenticeship, he came to London, and was admitted a pupil in St. Thomas's hospital, under Mr. Ferri, whom he afterwards succeeded. In anatomy he was instructed by Cowper, at whose house he resided. The progress he made under these preceptors

was so considerable and rapid, that he commenced lecturer in surgery and anatomy as early as the year 1711, when he was only 22 years of age. The same year he was elected fellow of the Royal Society. In 1713, he published his "Anatomical Description of the Human Body," in 8vo. with plates, to which were added some select cases in surgery, and a syllabus of his lectures. Cheselden had the pleasure of seeing this work pass through six editions, each more improved than the former one. To the fourth and subsequent editions the author added an appendix, in which he gave a short history of the operation of cutting for the stone in the bladder. He performed the operation in the manner recommended by Dr. James Douglas, on nine patients in St. Thomas's hospital, with success; but failing in some subsequent trials, he resorted to the mode recommended by Rau, which he so much improved, that the first 27 patients, whom he cut by that method, all recovered. Notwithstanding the candour with which Cheselden had acknowledged the improvements made by Dr. Douglas in the method of performing the high operation, yet he did not escape censure: an anonymous pamphlet, supposed to have been written by the Douglases, being addressed to him, under the title of "Lithotomus castratus." But his character, both as a lithotomist and as a surgeon in general, was too well established to be injured by so feeble an attack. To the same edition of his anatomy he added some curious observations, made by a patient, who had been blind from his infancy, and whom he restored to his sight. The case was first published in the Philosophical Transactions. In 1729, he was elected a corresponding member of the Royal Academy of Sciences at Paris; and in 1732, he was made foreign associate to the Royal Academy of Surgery, then newly instituted. He had before been appointed principal surgeon to queen Caroline, to whom he dedicated his splendid work on the bones, published in 1733, in folio. The bones are given on a large scale, and are beautifully, and the large ones correctly, delineated. Some errors in delineating the small bones of the head, drew upon him the censure, much too severe, of his opponent and rival, Dr. Douglas. In 1738, Mr. Samuel Sharp dedicated to him his treatise on the operations in surgery, acknowledging the great improvements he had made in the art. Cheselden had the year before been appointed surgeon to Chelsea hospital, to which place he retired, to enjoy a comparative state of leisure, from the hurry and bustle of public practice. Besides the works we have mentioned, some of his lucubrations on subjects of anatomy and surgery, were published in the Philosophical Transactions, and he furnished 21 valuable plates, and some useful observations, to Gataker's translation of Le Druan's treatise on the Operations in Surgery. Towards the end of the year 1751, he was seized with a stroke of palsy, which induced him to go to Bath, where he appeared for a time to have received some benefit, but this was of short duration, as he died in a fit of apoplexy, on the 11th of April, in 1752, aged 64 years.

Cheselden was strongly attached to his profession, and was always ready with his advice, and assistance, to young practitioners. He was of a social and cheerful disposition, and among other acquaintance, was intimate with Mr. Pope, who appears to have had a great esteem for him. To his patients he was tender and humane, and he is said to have felt a considerable depression of spirits, when about to perform an operation, but this never proceeded so far as to occasion any wavering, or unsteadiness of his hand, which the success of his practice, and the high character he enjoyed, abundantly testify. It was probably to cure himself of this weakness, that he became a frequent attendant at the places

where prize-fighting and other athletic exercises were performed. With so much acknowledged ability, that there should be mingled some portion of vanity, and being allowed to decide on subjects of surgery, that he should sometimes expect the same attention to be paid to his opinion, on subjects with which he was not so well acquainted, should excite no surprize. Some stories of the kind, which we shall not contribute to propagate, have been handed down. He left only one child, a daughter, who had been married to Charles Coates, M. D. of Woodcote, in Shropshire, member of parliament for Tamworth, in Staffordshire. She became a widow in 1748, and removed to Greenhithe, in the parish of Swanfcombe, in Kent, where she died several years after her father, leaving no issue.

CHESELEPH-TABOR, or **CARTHA**, in *Ancient Geography*, a town of Judæa, in the tribe of Zabulon. Joshua gave it to the Levites of this tribe, who were of the family of Merari. It was situated on the side of Mount Tabor. Eusebius and Jerom call it Cafalas or Exalus, and place it 10 miles E. from the S.W. part of Diocesærea.

CHESHAM, in *Geography*, a small but populous town of England in Buckinghamshire, situated in a pleasant and fertile valley, and consisting of three streets, which are principally occupied by shoe-makers and lace-makers, and the manufacturers of wooden articles, in the respective branches of round, hollow, and Tunbridge ware. The tannery goods produce a considerable sum annually; and the number of shoes made every week has been computed at a thousand pair. The inhabitants are for the most part dissenters; and the town has 4 places of worship, besides the parish church. There is also a free-school for the education of the children of the poor. Chesham has a weekly market on Wednesday. It is 29 miles W. N. W. from London.

CHESHIRE, one of the western counties of England, was included by the Romans in the division named Flavia Cæleriensis; but on the final departure of that people from the island, it reverted to the Britons, who continued in possession till about the year 607, when it was conquered by Ethelfrith, the Saxon king of Bernicia, who defeated the army of Brocmael Ykithroc, king of Powys, near Chester. On this occasion, Ethelfrith is said to have slain 1200 defenceless monks, whom Brocmael had called from the neighbouring monastery of Bangor, and stationed on a neighbouring hill, that they might assist him with their prayers. It was afterwards wrested from Bernicia by the Mercians, and continued a part of their kingdom till the reign of Egbert, who united it with the other Saxon states under one government. Canute the Dane, who obtained this division of the kingdom by his famous partition treaty with Edmund Ironside, invested the administration of this county in the earls of Chester; three of whom enjoyed that dignity prior to the conquest; Leofric the son of Leofwin; Algar, his son; and Edwin, son of the latter; in whom ended the race of the Cheshire earls of Saxon blood. On the conquest, the provinces of Britain which had hitherto been governed by a few great men, were divided into lesser portions, and distributed as rewards among the followers of the Norman king. Cheshire was bestowed on Gherbod, a valiant Fleming; and after him on Hugh de Aorange, better known by the name of Hugh Lupus. To him the monarch delegated a surfeit of power; made this a county palatine, and gave it such a sovereign jurisdiction, that the ancient earls kept their own parliaments, and had their own courts of law, in which any offence against the dignity of the sword of Chester was as cognizable as the like offence would have been at Westminster against the dignity of

the royal crown; for William allowed Lupus to hold this county "tam liberè ad gladium, sicut ipse rex tenet Angliam ad coronam." The sword with which he was invested is still to be seen in the British Museum, inscribed Hugo Comes Cæstris. As soon as Lupus was firmly established, he began to exert his regal prerogatives. He formed his parliament by the creation of eight barons, who were obliged to pay him attendance, and to repair to his court to give it the greater dignity. They were bound in all wars between this county and Wales, to find, for every knight's fee, a horse with caparison and furniture, or two without furniture, for the division of Cheshire. Their knights and freeholders were to have corselets and habergeons, and were to defend their lands with their own bodies. This species of government continued from the conquest till the reign of Henry III., a period of 171 years, when in 1237, on the death of John Scot, the seventh earl of the Norman line, without male issue, Henry took the earldom into his own hands, and gave the daughters of the late earl other lands in lieu; unwilling, as he said, that so great an inheritance should be parcelled out among distaffs. The king bestowed the county on his own son Edward, who did not assume the title, but afterwards conferred it on his son Edward of Caernarvon. Since that time the eldest sons of the kings of England have always been earls of Chester as well as princes of Wales. The palatinate was governed by the earls of Chester as fully and independently for nearly three centuries after this period, as it had ever been by the Norman earls; but Henry VIII. by authority of parliament, made it subordinate to the crown of England. Yet notwithstanding this restraint, all pleas of lands and tenements, and all contracts within the county, are to be heard and determined in it; and all determinations out of it are deemed void, "et coram non iudice," except in case of error, foreign plea, and foreign voucher; and for no crime but treason can an inhabitant of this county be compelled to be tried out of it. Thus being solely under the jurisdiction of its own earls, and considered in a certain degree as a separate kingdom, representatives to the national parliament were never sent, either for the shire or city, till the year 1549, the third of Edward VI. when upon the petition of the inhabitants, two members were summoned from each.

Cheshire is bounded on the north by the rivers Mersey and Tame, which separate it from Lancashire; on the east by the counties of Derby and Stafford, the division between which is chiefly marked by a chain of hills and by the rivers Goyt and Dane. The southern side unites with Shropshire and Flintshire; and the western border is skirted by Denbighshire, Flintshire, and the estuary of the Dee. The dimensions of the county are estimated by Mr. Wedge, in the "General View of the Agriculture of Cheshire," at about twenty-two miles and a quarter, on a medium, in width, and nearly forty miles in length from W. S. W. to E. S. E. Its form is rather oval, with two projecting necks of land; one about twenty miles in length, and six in breadth, running out into the Irish sea, between the estuaries of the Dee and Mersey, and called the Wirral. The other forms part of Macclesfield hundred, and extends about fifteen miles in length from Stockport, between the counties of Derby and York; but rarely exceeds four miles in width. Alfred divided this county into seven hundreds, exclusive of Chester which is a county in itself; it contains one city, twelve towns, 670 villages, about 35621 houses, and 191,751 inhabitants.

Cheshire is in general a flat country, though some considerable hills rise near its eastern borders, and connect with those of Derbyshire and Staffordshire. These ex-

terd about twenty-five miles in length from Congleton to the north-eastern corner of the county. An interrupted ridge of high ground also crosses it from north to south, on the western side, beginning near Frodsham, where a bold promontory overhangs the Mersey. After crossing the large tract of heath, called Delamere Forest, it exalts itself in the towering rock of Beclon, near the middle of the county. About Macclesfield are a few other hills, and some on the Shropshire side. Another chain runs north and south through the peninsula of Wirral. The rest of the county is nearly level; and the principal part of it consists of arable, meadow, and pasture land. A variety of soil is found in this county; but clay, sand, black moor, or peat, seem to predominate; and the under soil is commonly clay, or marl. The red grit rock is the most prevalent stone of the county, and of this most of the towns and villages are built. There are few large woods in the county; yet, as the generality of farms abound with hedge-rows, a considerable quantity of timber is produced, and particularly a great number of oak trees, from which the tanners derive a supply of that invaluable antiseptic, oak bark. Cheshire was formerly distinguished for its numerous yeomanry; and though they have decreased for the last hundred years, they are still very considerable. In the vicinity of manufacturing towns, and particularly on the borders of Lancashire and Yorkshire, many parcels of land have been purchased by tradesmen and appropriated to small farms; but the greatest portion of the county is retained and cultivated by gentlemen who reside on their own estates. The evil of congregating farms has in a limited degree extended into Cheshire; and the possessions that furnished support, and gave independence, to several families, have been thus confined to one. The tenure is almost universally freehold; yet in the manors of Macclesfield, Halton, and some others, there are a few copyholds, or what may be denominated customary freeholds, paying fines and rents certain. Leasing for lives, which was formerly a very constant and general practice, is yet continued by a few landholders; but the most common term of leases is eleven years, with a reversion on the tenant to a certain quantity of tillage (usually about one-fourth of his farm) and a particular rotation of crops. The extent of farms is, on the average, from 150 to 200 acres; but some few contain upwards of 500.

The Dairy is the principal object of attention with the Cheshire husbandman; yet it is rather a singular fact, that though the county has for many ages been famed for its cheese, it was formerly as celebrated for its wheat. Strabo and Pliny have affirmed, that cheese-making was introduced into this country by the Romans; but this is improbable, from various circumstances; and we are certain that the Roman armies on the continent received a great supply of cheese from this country soon after they had secured its possession. The quality and flavour of *Cheshire cheese* are almost universally known; yet as few persons, comparatively speaking, are acquainted with the process of its manufacture, we shall give a brief detail of the chief particulars. A dairy farm of one hundred acres is usually divided in the following proportions: from ten to fourteen acres of oats, from six to eight acres of fallow-wheat, and the like quantity of summer fallow; the remainder is appropriated to pasture and hay, the latter occupying about twelve acres. The judicious dairy farmer is more attentive to the size, form, and produce of the udder of his cows, than to any fancied beauty of shape. Utility to him is preferable to fashion. The consideration induces him to be scrupulous in the breeding and rearing of calves, and in the management of his cows during the winter and

summer seasons. The annual quantity of cheese made from each cow varies from 50 to 500lb. and upwards; the produce being governed by the nature of the land, the quality of the pasture, the seasons, and the mode of wintering the flock. On the whole, the average produce may be stated at about 200lb. from each animal. The quantity of milk, according to the climate, yielded daily by each cow, during the milking season, is about eight quarts, which is commonly supposed to produce one pound of cheese. The Cheshire cheese is generally made with two meals' milk; though often, towards the latter end of the season, which continues nearly twenty-two weeks, with four, five, or six: for as the cheeses are usually made very large, it is necessary to have a sufficient quantity of milk to make one at a time; though in some of the dairies two are made in a day. The most common size for a cheese is sixty pounds; a weight susceptible of every excellence to be found in the cheese of this county. It is usual to preserve the evening's milk till the next morning, when it is skimmed, heated, and incorporated with the new milk; and after being mixed in a large tub, together with the cream, the dairy woman puts in a proper quantity of rennet and colouring, and then leaves it for about an hour and half to coagulate or curdle. The colouring should be Spanish annatto; but, from the high price of that article, an adulterated colouring is often substituted. In making cheese of the best quality, the milk used is as pure as it comes from the cow, not robbed of any cream; though the practice of making a certain quantity of fresh butter weekly, frequently occasions an appropriation of that cream to the churn which properly belongs to the cheese-tub. After the cheese is "come," or when the milk is properly coagulated, the dairy-maid breaks the curd into very small particles, which are then left to subside, and the whey skimmed off. This process is repeated till the whey is nearly expelled, when the curd is placed in a vat, and occasionally sprinkled with salt. Some dairy women use about three handfuls to a cheese, and make it a rule to put the greatest quantity near the middle. The vat is filled very full, and the whey repeatedly squeezed out before it is pressed in the press; as it is very material to expel all the whey, and also to keep the vat quite full of curd. The cheese is commonly taken twice or thrice from the vat, to place fresh cloths, pare off the edges, and turn it; and sometimes it is immersed in hot whey, which is supposed to harden its coat. After remaining in the press two or three days, it is next conveyed to the salting house, where it is placed in a salting-tunnel or tub, in which it continues about three days more, and is next placed on the benches for about eight days, being well salted all over, and turned every day. After this process it is turned twice daily for six or seven days, and then washed in warm water, and wiped dry with a cloth; and when dry, smeared over with whey butter, and placed in the warmest part of the cheese-room, where it is left to assume its proper age and consistency.

The principal mineral productions of Cheshire are *salt* and *coal*. Of the latter, a considerable quantity is found on the eastern side, and some is obtained from the hundred of Wirral. The former is more abundant in this county than in any other part of England. The immense trade earned on in this article, and vast revenue derived from it, render it an object of considerable local and national importance. The principal salt-works are at *Nantwich*, *Middlewich*, *Winsford*, and *Northwich*. See *NANTWICH* and *SALT*.

The *wool* business, next to the manufacture of salt, seems to be the most considerable. This flourishing branch of trade has lately been extended from Lancashire, and some of the bordering counties, over many parts of Cheshire. Exclusive

of these, manufactures of leather, ribbon, thread, gloves, buttons, and shoes, are carried on at Nantwich, Macclesfield, Congleton, Knutsford, and some other places.

Molt of the rivers and streams which wind through this county direct their currents northward, and empty themselves into the Mersey or the Dee. The former divides Cheshire from Lancashire for a course of nearly 60 miles, about 35 of which, from Liverpool to the mouth of the river Irwell, are navigable for vessels of considerable burthen. The Mersey derives its source from a conflux of small streams at the junction of the county with Derbyshire, and flowing in a westerly direction, receives in its course the waters of the Goyt, the Tame, the Bollin, the Irwell, and the Weaver. After its junction with the latter, it swells into a broad estuary, and taking a north-western course, soon unites with the Irish channel. The Dee was held in great veneration by our British ancestors, and its waters regarded as sacred and purifying. It derives its origin in the mountainous district of Merionethshire, and after forming the large lake of Pemblemere, passes through a series of very picturesque and grand scenes, and approaches the western border of this county, to which it forms a boundary from Worthenbury to Aldford. It then passes on to Cheller, whose walls it nearly encircles, and afterwards flows to the west, through an artificial channel, which was formed, at an immense expence, by a body of gentlemen, called The River Dee Company. This river also forms a large sandy estuary between the county of Flint and the hundred of Wirral, and joins the Irish sea about 14 miles N.W. from Cheller. The Weaver, deriving its source from Ridley Pool, close to Cholmondeley Hill, passes the towns of Nantwich, Minshull, Weaver, Winsford, and Northwich, where it is joined by the Dane, from the northern parts of Staffordshire, and two or three other streams from the central parts of the county. Hence it proceeds to Warcham, Acton-Bridge, and Frodsham, where it falls into the swelling basin of the Mersey. The Weaver receives several tributary streams in the course of its progress; and from Winsford to Frodsham it has been rendered navigable by means of various locks. See CANAL. Several other rivers meander through this county, the principal of which are the Goyt, the Bollin, the Dane, and the Whirllock. Cheshire also abounds with broad sheets of water, denominated meres, lakes, and pools. The principal are Oak-Mere, Rosthern-Mere, Mere-Mere, Tattow-Mere, Comber-Mere, Broad-Mere, and Bag-Mere; Petty-Pool, Rookery-Pool, and Ridley-Pool. Molt of these waters abound with fish.

The county is intersected by portions of four canals, which allow a very constant and cheap intercourse between the towns of Cheller, Liverpool, Manchester, the north of England, Staffordshire, Shropshire, and adjacent counties. See CANAL.

The diocese of Cheller comprehends all Cheshire and Lancashire, and various parts of Westmoreland, Cumberland, Yorkshire, Denbighshire, and Flintshire, and is divided into two archdioceses. Cheshire returns four members to parliament, viz. two for the shire, and two for the city of Cheller: pays seven parts of the land-tax, and furnishes the militia with 360 men. Gower's Sketches towards a History of Cheshire. Leigh's Natural History of Lancashire and Cheshire.

CHESHIRE, a county of America, in New Hampshire, on the E. bank of Connecticut river, bounded on the S. by the state of Massachusetts, on the N. by Grafton county, and by Hillborough county on the E. It contains 34 townships, the chief of which are Charlestown and Steine, and 28,772 inhabitants, including 16 slaves.

VOL. VII.

CHESHIRE, a township in the county of Berkshire and state of Massachusetts, famous for its good cheese; 140 miles N. westerly from Boston.—Also a township of New-Haven county in the state of Connecticut; 13 miles N. of New-Haven city, and 26 S.W. of Hartford. It contains an episcopal church and academy, and three congregational churches.

CHESINEN, a town of China of the third rank, in the province of Chen-si; 15 leagues N.W. of Hio-ngan.

CHESINUS, in *Ancient Geography*, a river of European Sarmatia. Ptolemy.

CHESIUM, a small town of Asia Minor, in Joria. Steph. Byz.

CHESLEY, in *Geography*, a town of France, in the department of the Aube; 9 miles S.E. of Eivy.

CHESLON, in *Ancient Geography*, a town of Palestine, in the tribe of Juda.

CHESNE. See LA CHENE.

CHESNE, ANDREW DU, in *Biography*, called "the Father of French History," was born in 1583, at Isle-Bouchard, in Touraine. His historical and geographical researches were very various, and his productions, considering that his life was not very extended, were astonishingly numerous. In these he appears rather the diligent and laborious compiler, than a judicious writer. His premature death in 1649, was occasioned by an accidental injury.

He wrote "A History of England," 2 vols. fol. 1634; "A History of the Popes," 2 vols. fol. 1633; "A History of French Cardinals;" "The Genealogies of several great Families of France," 7 vols. fol.; "History of the Dukes of Burgundy," 2 vols. 4to.; "A Bibliotheque of Authors who have written on the History and Topography of France." He was also the editor of the works of several other authors, as Abelard, Pasquin, &c.: and he issued proposals for printing a large collection of French historians, in 24 vols. fol. of which 2 volumes, comprising the period from the origin of the nation to the time of Hugh Capet, were published in 1636; and other two volumes, in the press at the time of his death, together with a fifth, bringing the History down to Philip the Fair, were published by his son, Francis du Chesne, who was also a learned man. Moreri.

CHESNE, or QUENEF, called also QUERCETANUS, an eminent practitioner and voluminous writer in medicine, which he practised successfully many years in Germany, was born in the county of Armagnac in Gascony, about the middle of the sixteenth century. Applying himself to the study of medicine, particularly of chemistry, in which he acquired a considerable proficiency, he was admitted to the degree of Doctor at Balle, about the year 1573. In the latter part of his life, he removed to Paris, and was made one of the physicians in ordinary to the king, Henry IV. As he affected great mystery, and was a professed admirer and follower of the doctrines of Paracelsus, he drew upon himself the censures of many of his contemporaries; among them, Riolan was one of the most formidable of his opponents. We also find Guy Patin, who flourished some years at Berlin, treating his doctrines with great severity, and in fact, whatever popularity his works might enjoy in the lifetime of the author, they are long since deservedly forgotten. Haller has given the titles of them, and analyses of the principal of their contents. The most celebrated among them, which passed through the greatest number of editions, is his *Pharmacopœa Dogmaticorum restituta, præcisiois, selectisque Hermeticoꝝ Floribus illustrata*. Gisse Hefs. 1607. This is said to have been recommended by Boerhaave to his pupils. Schroder, in 1643, published a volume, in quarto,

under the title of *Quercetanus redivivus*, containing an abridgement of his diseases. He died at Paris in 1659. Haller. Bib. Elec. Dict.

CHESNEAU, NICHOLAS, a physician of Toulouse, was born at Marillac, where he took his degree of Doctor in Medicine, in the early part of the seventeenth century. He appears to have had a large share of practice in his profession, and was author of several useful publications. The principal of them is his "Observationum Medicinalium Libri quatuor. Quibus accedit ordo Remedium alphabeticum ad omnes febres confcriptus," &c. 8vo. Parisiis, 1672. This work has passed through several editions, and in 1719, was printed at Leyden in 4to. Haller has given an abridged account of its contents. Amidst some insignificant and some incredible accounts of cures, there are contained in it many useful practical observations. Haller Bib.

CHESNUT, in *Botany*. See *FAGUS castanea*.

CHESNUT, horse. See *ÆSCULUS hippocastanum*.

CHESNUT Hill, in *Geography*, a township of America, in the county of Northampton and state of Pennsylvania.

CHESNUT creek, a branch of the Great Kanaway, in Virginia, where it crosses the Carolina line. Here, it is said, are iron mines.

CHESNUT hills, part of the Alleghany mountains, in Pennsylvania, westward of Greenbrough.

CHESS, an ingenious game performed with little round pieces of wood, on a board divided into sixty-four squares; where skill and address are so indispensably requisite, that chance has no place; and a person never loses but by his own fault.

Sarasin has a precise treatise on the different opinions of the origin of the Latin *scacchi*; whence the French *echecs*, and our *chess*, is formed. Menage is also very full on the same head. Leunclavius takes it to come from the *yscoches*, famous Turkish robbers. P. Sirmond from the German *schacke*, *schess*; and that from *calculus*. He takes *chess* to be the same with *ludus latruncularum* of the Romans, but mistakenly. This opinion is countenanced by Vossius and Salmassius, who derive the word from *calculus*, as used for *latrunculus*. Some derive it from the Hebrew סִיג, *sejag*, *sepe*, whence *vallare*, *vallavit*; וְ מוֹרִי, *mut, mori, moruus*; others again from שָׁחַק, *seok, lusus*, and מוֹרִי, *mori*; whence *chess* and *chess-mate*. Fabricius says, a celebrated Persian astronomer, one Schatrenscha, invented the game of *chess*; and gave it his own name, which it still bears in that country. Nicod derives it from *schegue*, or *seque*, a Moorish word for *lords, king, and prince*: Lochart says, that *schach* is originally Persian, and that *schachmat*, whence our *chess-mate*, in that language, signifies the *king is dead*.

The learned Hyde has undertaken to shew, from undoubted authorities, that this game was first invented in India, and passed from thence to Persia before the year of Christ 576, and from Persia to Arabia. He adds, that the antiquity of this game is traced much higher, or to the middle of the second century, in an Irish chronicle, the authenticity of which is doubtful. And he shews, that *shab*, i. e. *rex*, was a term much in use among the orientals, whilst engaged in this play; and that they used it to caution the king against any danger; and hence the Europeans and others have denominated the game *schackindium* and *schakildium*, and in English *chess*, from this circumstance. He also derives the word *mat* from the Persian *manit, lassutus est*; and says that it was used in play; when any of the men was fixed in its place, or taken captive. See *Historia Shahiudii* apud Syntagma Dissertationum, &c. Hyde, editum a Doctore Sharpe, vol. ii. p. 1. &c.

Sir William Jones concurs in opinion with the learned

Hyde, and ascribes the invention of this game to the Hindoos. "If evidence were required to prove this fact," says this excellent writer, whose knowledge of the eastern languages, combined with indefatigable industry in his researches, and a correct judgment and taste gives a kind of decisive authority to his opinion, (See *Asiatic Researches*, vol. ii.) "we may be satisfied with the testimony of the Persians; who, though as much inclined as other nations to appropriate the ingenious inventions of a foreign people, unanimously agree, that the game was imported from the west of India in the 6th century of our era. It seems to have been immemorably known in Hindoostan by the name of "chaturanga," i. e. the four *angas*, or members of an army; which are these, *elephants, horses, chariots, and foot soldiers*; and in this sense the word is frequently used by epic poets, in their descriptions of real armies. By a natural corruption of the pure Sanscrit word, it was changed by the old Persians into *chaturang*; but the Arabs, who soon after took possession of their country, had neither the initial nor final letter of that word in their alphabet, and consequently altered it further into *shatranj*, which found its way presently into the modern Persian, and at length into the dialects of India, where the true derivation of the word is known only to the learned. Thus has a very significant word in the sacred language of the Brahmins been transformed by progressive changes into *axedraz, scacchi, echecs, chess*; and, by a whimsical concurrence of circumstances, has given birth to the English word *chess*, and even a name to the *Eschequer* of Great Britain."

It is confidently asserted, that Sanscrit books on chess exist in Bengal; but Sir William had seen none of them when he wrote the memoir which we have quoted. He exhibits, however, a description of a very ancient Indian game of the same kind, but more complex, and in his opinion more modern, than the simple chess of the Persians. This game is also called "Chaturanga," but more frequently "Chaturaji," or the four kings, since it is played by four persons representing as many princes, two allied armies combating on each side. The description is taken from a book called "Bhawishya Puran;" in which the form and principal rules of this facetious warfare are thus laid down: "Eight squares being marked on all sides, the red army is to be placed to the east, the green to the south, the yellow to the west, and the black to the north. Let the elephant (says the author of the Puran) stand on the left of the king; next to him the horse; then the boat; and before them all, four foot-soldiers; but the boat must be placed in the angle of the board."

"From this passage (says the president,) it clearly appears, that an army with its four *angas* must be placed on each side of the board, since an elephant could not stand, in any other position, on the left hand of each king; and Radhacant (a Pandit) informed me, that the board consisted, like ours, of 64 squares, half of them occupied by the forces, and half vacant. He added, that this game is mentioned in the oldest law-books, and that it was invented by the wife of a king, to amuse him with an image of war, while his metropolis was besieged in the second age of the world. A ship or boat is absurdly substituted, we see, in this complex game for the "rath," or armed chariot, which the Bergalce pronounced "rot'h," and which the Persians changed into "rokh;" whence came the rook of some European nations; as the virge and fol of the French are supposed to be corruptions of *ferze* and *fil*, the prime minister and elephant of the Persians and Arabs."

As fortune is supposed to have a great share in deciding the fate of a battle, the use of dice is introduced into this game to regulate its moves; for (says the Puran) "if cinque

be thrown, the king or a pawn must be moved; if quatre, the elephant; if trois, the horse; and if deux, the boat. The king passes freely on all sides, but over one square only; and with the same limitation the pawn moves, but he advances straight forward, and kills his enemy through an angle. The elephant marches in all directions as far as his driver pleases; the horse runs obliquely, traversing the squares; and the ship goes over two squares diagonally." The elephant, we find, has the powers of our queen, as we are pleased to call the general or minister of the Persians; and the ship has the motion of the piece to which we give the unaccountable appellation of bishop, but with a restriction which must greatly lessen its value.

In the Purán are next exhibited a few general rules and superficial directions for the conduct of the game. Thus, "the pawns and the ship both kill and may be voluntarily killed; while the king, the elephant, and the horse may slay the foe, but must not expose themselves to be slain. Let each player preserve his own forces with extreme care, securing his king above all, and not sacrificing a superior to keep an inferior piece." Here (says the president) the commentator on the Purán observes, that the horse, who has the choice of eight moves from any central position, must be preferred to the ship, which has only the choice of four. But this argument would not have equal weight in the common game, where the bishop and tower command a whole line, and where a knight is always of less value than a tower in action, or a bishop of that side on which the attack is begun. "It is by the overbearing power of the elephant (continues the Purán) that the king fights boldly; let the whole army, therefore, be abandoned in order to secure the elephant. The king must never place one elephant before another, unless he be compelled for want of room, for he would thus commit a dangerous fault; and, if he can slay one of two hostile elephants, he must destroy that on his left hand."

All that remains of the passage which was copied for Sir William Jones relates to the several modes in which a partial success or complete victory may be obtained by any one of the four players; for, as in a dispute between two allies, one of the kings may sometimes assume the command of all the forces, and aim at a separate conquest. First, "When any one king has placed himself on the square of another king (which advantage is called "sinhasana" or the throne) he wins a stake, which is doubled, if he kill the adverse monarch when he seizes his place; and, if he can seat himself on the throne of his ally, he takes the command of the whole army." Secondly, "If he can occupy successively the thrones of all the three princes, he obtains the victory, which is named "chaturaji;" and the stake is doubled if he kill the last of the three, just before he takes possession of his throne; but if he kill him on his throne, the stake is quadrupled. Both in gaining the "sinhasana" and the "chaturaji" the king must be supported by the elephants, or by all the forces united." Thirdly, "When one player has his own king on the board, but the king of his partner has been taken, he may replace his captive ally, if he can seize both the adverse kings; or if he cannot effect their capture, he may exchange his king for one of them, against the general rule, and thus redeem the allied prince, who will supply his place." This advantage has the name of "riparsihata," or recovered by the king. Fourthly, "If a pawn can march to any square on the opposite extremity of the board, except that of the king or that of the ship, he assumes whatever power belonged to that square." Here we find the rule, with a slight exception, concerning the advancement of the pawns, which often occasions a most interesting struggle at our common chess; but it appears that, in the opinion of one ancient writer on the Indian game, this

privilege is not allowable when a player has three pawns on the board; but, when only one pawn and one ship remain, the pawn may advance even to the square of a king or a ship, and assume the power of either. Fifthly, According to the people of Lanca, where the game was invented, "there could be neither victory nor defeat if a king were left on the plain without force; a situation which they named "vacacahat'ha." Sixthly, "If three ships happen to meet, and the fourth ship can be brought up to them in the remaining angle, this has the name of "vinnhanauca;" and the player of the fourth seizes all the others."

The account of this game in the original Sanscrit is in verse, and there are two or three couplets still remaining, so very dark, either from an error in the manuscript, or from the antiquity of the language, that Sir William Jones could not understand the Pandit's explanation of them, and suspects, that even to him they gave very indistinct ideas. It would be easy, however, he thinks, if it be judged worth while, to play at the game by the preceding rules; and a little practice would perhaps make the whole intelligible.

The Honourable Daines Barrington, in his elaborate "Historical Disquisition on the Game of Chess," (See Archaeologia, vol. ix.) asserts, and maintains the claim of the Chinese as inventors; though, he says, Hyde inclines against it, chiefly because they have some additional pieces, which differ from ours, both in their form and powers. This single circumstance, he thinks, is by no means conclusive; because, in all countries where any game hath been of long continuance, the players will make innovations, though in substance it remains the same. Du Halde cites a Chinese treatise, by which it appears that it is the favourite game of that country, and, as such, is sometimes depicted upon Chinese paper. Indeed, in China, it makes a considerable part of the education of their females, and seems to take the place of dancing among us. The origin of this game has been traced to China, in a letter from Eyles Irwin, Esq. to the Earl of Charlemont, published in the 5th volume of the Transactions of the Royal Irish Academy. During a long residence in the East Indies, where the game of chess is generally supposed to have originated, Mr. Irwin has often heard of its existence in China, though on a different footing, as well in respect to the powers of the king, as to the aspect of the field of battle. A tradition of this nature obtained among the Brahmins, who excel in this game. When a young Mandarin was shewn an English chess-board, he informed Mr. Irwin, that the Chinese had a game of the same nature; and he specified the difference that subsisted in the pieces and the board. Upon farther investigation of the subject, the young Mandarin, named Tinqua, brought a Chinese MS. which contains an account of the origin of the game of chess in that country. From this MS. it appears, that 379 years after the time of Confucius, or 1967 years ago, Hung Cochu, king of Kiangnan, sent an expedition into the Shenxi country, under the command of a mandarin, called Hanfing, to conquer it. After one successful campaign, the soldiers were put into winter quarters; where, finding the weather much colder than what they had been accustomed to, and being also deprived of their wives and families, the army, in general, became impatient of their situation, and clamorous to return home. Hanfing, upon this, revolved in his mind the bad consequences of complying with their wishes. The necessity of footing his troops, and reconciling them to their position, appeared urgent, in order to finish his operations in the ensuing year. He was a man of genius, as well as a good soldier; and having contemplated some time on the subject, he invented the game of chess, as well for an amusement to his men in their va-

ent hours, as to inflame their military ardour, the game being wholly founded on the principles of war. The Stratagem succeeded to his wish. The soldiery were delighted with the game, and forgot, in their daily contests for victory, the inconveniencies of their post. In the spring the general took the field again, and, in a few months, added the rich country of Shenü to the kingdom of Kianguan, by the defeat and capture of its king, Choupayuen, a famous warrior among the Chinese. On this conquest Hung Cochu assumed the title of emperor, and Choupayuen put an end to his own life in despair.

From the above extract from the Concum, or Chinese annals, it appears, that the institution of this game forms a principal era in the Chinese history; since, by the conquest of Shenü, the kingdom was first connected in its present form, and the monarch assumed the title of emperor. Mr. Irwin observes, that the confined situation and powers of the king, resembling those of a monarch in the earlier parts of the world, countenance the supposition of the Chinese origin of chess; and that, as it travelled westward, and descended to later times, the sovereign prerogative extended itself, until it became unlimited, as in our state of the game. The agency of the princes also, in lieu of the queen, points out the nature of the Chinese customs, which exclude females from every kind and degree of influence and power; and these princes, in the passage of the game through Persia, were changed into a single vizier, or minister of state, with the enlarged portion of delegated authority that exists there; instead of whom, the European nations, with their usual gallantry, adopted a queen on their board. The river between the parties is expressive of the general face of this country, where a battle could hardly be fought, without encountering an interruption of this kind, which the soldier was here taught to overcome; but, on the introduction of the game into Persia, the board changed with the dry nature of the region, and the contest was decided on terra firma. Moreover, with the Indians, this game was designed by a Brahmin, to cure the melancholy of the daughter of a rajah. But with the Chinese, it was invented by an experienced soldier, on the principles of war; not to dispel love-sick vapours, or instruct a female in a science that could neither benefit nor inform her; but to quiet the murmurs of a discontented soldiery, to employ their vacant hours in lessons on the military art, and to cherish the spirit of conquest in the bosom of winter quarters. Its age is traced by the Chinese actually on record near two centuries before the Christian era; and among the numerous claims for this noble invention, that of the Chinese, who call it by way of distinction, *Chong-Ke*, or the royal game, seems to Mr. Irwin to be indisputable.

In Thibet and the Birman empire, as well as throughout Bengal and Hindoostan, the game of chess is held in high estimation. The board used by the Birmans, as we learn from Symes's Embassy to Ava, (vol. iii. p. 283) is exactly similar to ours, containing 64 squares, and the number of their troops the same, 16 on each side; but the names, the power, and the disposal of them differ essentially, the king and his minister (a queen being never introduced by the orientals) are mounted on elephants; these are defended by two castles, two knights on horseback, two officers on foot, and eight foot soldiers; the forces of each party are arranged in three lines, by which eight squares remain unoccupied; none of the pieces possess equal force with our queen: and this restricted operation renders the Birman mode of playing more complex and difficult than ours. The Birmans affirm that it is a game of high antiquity, and that it is acknowledged and authorized by their sacred writings, although every play

of chance is prohibited. The name of this game, viz. "Chreedren," bears some resemblance to the name which is given to the game in most other parts of the world. Col. Symes infers from this detail, that chess was invented in India, according to the opinion of sir William Jones, and that it is not of Persian origin. Others may probably concur with the honourable Mr. Barrington, Mr. Irwin, &c. in deducing it from the long civilized empire of China, and tracing its progress westward through Thibet and Hindoostan to Persia. If indeed this most interesting game had been known in Persia, whilst Alexander or his successors continued there, they would undoubtedly have introduced it into Greece, and its name would certainly have been transmitted to us, together with its pieces and their moves.

Chess is unquestionably a very ancient, as it has been a very general, game. The opinion maintained by some learned writers, and which has much prevailed, ascribes the invention of it to Palamedes at the Siege of Troy. Most of the passages relied upon in proof of this opinion may be found in Stephens's Thesaurus, Art. Πισσις, or pebble. Mr. Barrington says, that he has examined all these passages, and that he can venture to affirm, that none of them relate to chess, because there is not the most distant allusion to the putting of the enemy's king in such a situation that he cannot be extricated, which is the great object of each player. From a line in the first book of the *Odyssy* it has been inferred that Penelope's suitors amused themselves with this game before the gates of Ulysses's palace. The game played by Penelope's suitors, and called *παιζμα*, is particularly described by Athenæus in his 11th book of the *Deipnosophiste*, on the authority of a native of Ithaca, and it differs most materially from chess, as the pieces were in number 108 instead of 32. The principal authority for Palamedes's having been the inventor of chess is a line from Sophocles,

Εὐχεται (sc. Palamedes) πισσιος, κυβου τις, τριτητον αρχης ακου.

But nothing more can be inferred from this line than that he invented some game which was played with pebbles, *πισσιος*. The game called *παιζμα* in Greek, was by the Romans termed *calculi* or *latrunculi*; and Ovid (*de Art. Am.* l. iii. 357-366) has so described the mode of playing it, that no person who is acquainted with the moves even at chess, can read it with attention, and conceive that it alludes to this game. Mr. B——n has also examined a passage cited from Lucan, in order to prove that chess was known to the Romans, and shown that it is not justly applicable to this game, supposing that the passage is genuine or ancient. Donatus, on Terence's *Eunuch*, observes, that Pyrrhus, the most knowing and expert prince of his age, ranging a battle, made use of the men at chess to form his designs; and to shew the secrets thereof to others. Vopiscus, in his life of Proculus, informs us, that one of the Roman emperors had the title *Augustus* given him, because of his gaining ten games at chess successively.

Amiriaz is also succeeded as a very expert gameller at chess.

It appears from Mr. B——n's historical account, that the game of chess, called by the Persians *Σαζαζ*, and by the Constantinopolitans *Σκακισ*, was a common game at Constantinople in the 12th century, when Anna Comnena flourished; and this will probably account for its introduction into Europe. The first crusaders, before the destruction of the eastern empire, often remained for some time at Constantinople, and thus probably became acquainted with this bewitching game, which, on their return, they introduced into their respective countries. Among the European nations it was first known to the Italians, as we may conclude from

from their being nearer to Constantinople than others, and from their early trade with the eastern ports of the Mediterranean. Accordingly we find by Boccace, who lived in the 14th century, that it was a most common amusement at Florence, and that there was a celebrated player, who (like Philidor) could beat two antagonists without seeing either of the chess-boards. Of its first introduction into Italy we have further evidence in the term *gamba*: at chess, now known in most European languages, which is confessedly of Italian origin; for *dare il gambetto* signifies to throw down your adversary in wrestling, by placing your foot against his. Chess thus introduced, became the favourite game throughout Europe till it was given up for cards; but before cards had banished chess, it was in such vogue that the kings both of Spain and Portugal pensioned the great players, whilst they also staked considerable sums on the event of the game. We find that three Italians set out from Naples for the court of Philip II., in which was a famous player, and by concealing their skill won very large sums. Hence it happened that as it was impossible to form a just estimate of the abilities of an antagonist, no one would play at chess for money, which, therefore, like drafts, fell into disuse. Italy, however, continued to produce the greatest proficient at this game, till the middle of the 17th century. The Italians are said to have been so much devoted to chess, that a father, who had died before the conclusion of a game, has bound his son to finish it; and the same custom is also said to obtain among the Germans. See Hyde, *ubi supra*, p. 7, 8. As Italy was the country from which Europe in general derived its knowledge of chess, Spain seems to have had the next claim for having produced at an early period players of eminence; and it has been said that in this country whole cities have challenged each other at this game. As to the time of its introduction into England, the learned Hyde supposes that it was known in our country about the time of the conquest, because the court of exchequer was then first established. See EXCHEQUER. Mr. Barrington, however, is of a different opinion; and though he allows it possible that chess might have been known in England in the next century after the first crusade had taken place, he rather supposes that it was introduced during the 13th century, upon the return of Edward I. from the Holy Land, where he continued so long and was attended by so many English. The Turks, who never change their habits, are still great players at this game, which well suits both their sedentary disposition and their taciturnity. Many of them were often prisoners in the Christian camp, as were also the Christians to the Saracens, so that they had many favourable opportunities in all these ways of obtaining instruction. The first mention which Mr. Barrington makes met with of chess being known in England is in a MS. of Simon Aylward, said by Hyde to be in the library of Magdalen college. The same learned writer cites another MS. of Lydgate, monk of St. Edmund's Bury, who calls it the "game royal," in which are the following lines:

" Was of a *Fers* so fortunate,"
 " Into a corner drive and mazz,"

which lines are very intelligible, if we suppose that the preceding line relates to the piece called the king; and they will then have the following meaning; "the king was by a fortunate queen (of the adversary) driven into a corner of the chess-board, and check-mated," which of course concludes the game.

We find in Gale's edition of Hist. Ramefins. (c. 85.) that when bishop Ætheric obtained admission to Canute the Great about midnight, upon some urgent business, he found the king and his courtiers engaged at play, some at dice, and

others at chess. From Hist. Olai Magni (p. 572.) we learn, that when a young nobleman applied to a father for permission to pay his addresses to his daughter, the parent, as it is said, commonly made a trial of his temper, by playing with him at dice and chess, before he gave him an answer.

It is certain that our ancestors played much at chess before the general introduction of cards, as no fewer than 26 English families have emblazoned chess-boards and chess-rooks in their arms, and it must therefore have been considered as a valuable accomplishment. Hyde moreover states, that chess was much played both in Wales and in Ireland; and that in the latter country some of their best elites depended upon it, and that it was a condition by which two noble families enjoyed their lands, that the one should engage the other every year at this game. Barrington, however, expresses his doubts as to these facts, because neither of these countries was scarcely civilized till the latter end of the reign of Henry VIII. With respect to both Ireland and Wales he apprehends, that they have no term for this game in their respective languages. From a treatise, entitled "the Game at Chess," and published by Caxton in 1474, it appears, that this game was not uncommon during the reign of Edward IV.; and it is certain also that it was a fashionable amusement in most houses of rank in the time of Richard III.

From the time of Edward IV. chess continued to be played by our ancestors, till cards became the more general amusement. We have reason to believe that queen Elizabeth was a chess player. Charles I. was also supposed to have been a player at this game; though in the *Essai sur Louis*, ascribed to him, he advises his son against it, because it is over-wise. In the last century Stamma, who was a native of Aleppo, and resided some time in England as translator of Oriental dispatches, published some select games at chess, together with a few instructions; and after him Hoyle taught how to open the game at a crown per lesson.

In France this game seems to have been known at an earlier period than in England. The traces of its antiquity, however, are few and faint. The historian Carte gives us the following account of a chess-match between Henry I. before his accession to the throne of England and Louis le Gros, son to Philip of France; which took place at Philip's court in 1087. Louis lost several games to Henry, and a considerable sum of money, by which he was so much irritated, that he threw the chess-men at Henry's head. Henry retaliated the affront by striking Louis with the board, so that he was laid bleeding on the floor, and Henry would have killed his antagonist, if his elder brother Robert had not interposed. This is without doubt a very early instance of the game being known in France; but Barrington says, it is much to be wished that Carte had stated the term used in the Norman chronicle to which he refers, and which he has translated chess, as the game of drafts was very ancient, bears a considerable affinity to chess, and equally requires a chequered board.

John of Salisbury relates, that in a battle between the French and English in 1117, an English knight seizing the bridle of Louis le Gros, and crying out to his comrades, *the king is taken*, that prince struck him to the ground with his sword, saying, *Ne fais tu pas qu'aux echees on ne prend pas le roy? Dois thou not know, that at chess the king is never taken?* The reason is, that when the king is reduced to such a pass, that there is no way for him to escape, the game ends, without exposing the royal piece to further assault. This fact is said to be related in John of Salisbury's book "De Nugis Curialium;" but Mr. Barrington has not been able to discover it. In the reign of Charles V. of France, the king, as Froissart relates, played at this game with the duke of Burgundy. Chess is alluded

to in the Romance of the Rose, which ascribes the invention of it to an Attalus; and many of the French families bear in their arms a chess-*rook*. In the sixteenth century it was much played in this kingdom; and in the seventeenth century the treatise intitled "The Calabrian" was translated from the Italian into French, and might have contributed to revive the game after it had been supplanted, as it has been with us, by the more general amusement of cards. At a later period, and even in our own times, Philidor, who was born at Droux, was the most distinguished champion in this game; and considerable subscriptions were made towards bringing him over to England, that the amateurs of chess might have an opportunity of perceiving his decided superiority. It is well known, that he could play two games against able adversaries, and generally beat them, without seeing either of the boards. Great chess-players must necessarily bear in their minds several moves which are probably to ensue, both on their own part and that of their adversary; and he, who, like Philidor, can do this throughout the whole game, even with a single antagonist, must commonly be the victor.

With regard to Germany Mr. Barrington has not been able to obtain much information; but he says, that Selenus, duke of Brunswick, wrote a treatise on that subject, and named one of his towns from it. In Muscovy it is said to be in great vogue among the shop-keepers and common people, who play before the doors of their shops or houses; and it is highly probable that they received it, together with their profession of faith, from the eastern empire, whilst the Greek sovereigns resided in Constantinople. The Russians are said to be great proficient in chess. With them the queen has, in addition to the other moves, that of the knight, which, according to Philidor, spoils the game, but which renders it more complicated, and of course more interesting. The Russians play also at chess with four persons at the same time, two against two: for which purpose the board is longer than usual, contains more men, and is provided with a greater number of squares. This mode, it is said, is more difficult, but more agreeable, than the common manner. Hyde informs us, that this game is not unknown even in Iceland; and it would undoubtedly be a very convenient game for occupying their very long nights during the winter. As the Mahometan religion forbids gaming for money, the Moors of Africa, particularly in the empire of Morocco, are only allowed by the government publicly to play at chess, which is in itself a game sufficiently interesting without the assistance of wagers.

Cardinal Cajetan, and other casuists, rank chess in the number of prohibited games, as requiring too much application; and Montaigne blames it as too serious for a game.

Hyde (*ibid supra*) has given a copious account of the names of the several pieces used in this game, as they occur in different languages. The honourable Daines Barrington has also made some remarks on this subject. Conceiving that the game was originally Chinese, and that it was transferred from their country to Thiber, Bengal, Hindoostan, and Persia, he thinks it highly probable that the pieces did not differ materially in these several countries, either in name or figure. But when the Turks had learned it from the more eastern inhabitants of Arabia, they of course made the pieces destitute of any particular form or figure, as they understand the second commandment in its most literal and rigid sense. The Greeks and Crusaders, becoming adepts in this game by their long continuance in Palestine, took the liberty of giving any name or form to the pieces at their own pleasure; and consequently they often differ in the several parts of Europe where chess hath been introduced. It was natural, therefore, that their principal

piece should be a *king*, both in form and name, and this seems to have obtained also in the more eastern parts of Asia. In most of these governments, however, the kings are rather indolent monarchs, and consequently this piece scarcely moves at all, but is merely to be defended from attacks. The emperor himself, being thus indolent, necessarily requires a minister or general, who can protect his matter by vigorous and extensive motions, against distant insults, in the most remote parts of the board. Accordingly the piece of the greatest powers was by the Persians styled "Pherz," or general. Chiefs having been universally considered as an engagement between two armies, and the piece of the greatest importance being termed the general, the allusion is properly pursued. When the game, however, was introduced into Europe, the Christians did not trouble themselves about the Asiatic names for the pieces, and styled the "Pherz" (or general) *queen*, probably because she is placed near to the king, as the general was among the Asiatics; but this does not keep up so properly the idea of a military conflict, as when the "Pherz," or general, is placed in the same situation. Another impropriety arises from the *Parwan's* becoming a queen, when he hath reached the last square of the adversary's camp; as it is a suitable reward to the Pawn (or foot-soldier) to make him a general, if he penetrates so far through the enemy's troops; but certainly no pawns on his part can entitle him to be transformed into a queen. The French, and after them the English, in the middle ages, called the queen *sergeant*, *sergent*, &c. from the eastern word "Pherz;" but the title Queen is of considerable antiquity. The next piece in power to the "Pherz," or *Queen*, is that which we sometimes call the *Rook*, but more commonly the *Castle*. Mr. Douce (Archæologia, vol. vii.) suggests, that the European form of the castle was copied in part from some ancient Indian piece of the elephant with a castle on his back. Mr. Barrington conceives this term to be derived from the Italians, the first Europeans who played at chess; as *rocca* in their language not only signifies a rock but a fortress, which was generally placed on such an eminence. Hence, he adds, our phrase at chess, "the King castles," or puts himself in a state of security, by exchanging, in some measure, places with the castle, which then becomes more exposed to the enemy. The piece, which we call the *Bishop* has been termed by English writers *alphin*, *aufin*, &c. from an Arabic word, signifying an elephant; sometimes it was named an *archer*; by the Germans the *bound* or *runner*; by Russians and Swedes the *elephant*, by Foles the *prigg*; and by the French at a very early period the *feu* or *foot*. The reason of this last appellation seems to be, that as this piece stands on the sides of the King and Queen, some way of the times, Mr. Barrington suggests, from this circumstance, styled it the fool, because anciently royal personages were commonly thus attended, from want of other nears of thus amusing themselves. But it is not so easy to account for our term *Bishop*, as our kings and queens have never had any such constant attendants. When it was first introduced cannot be exactly ascertained; as in Caxton's time this piece was styled the *Elphyn*. Probably the change of name took place after the reformation. The top of this piece which was exhibited to the Antiquarian Society by Mr. Barrington, among those chess-pieces that belonged to Charles I. somewhat resembles a bishop's mitre. The *Knight* has always retained this distinction, says Mr. Douce, on the French and English chess-board: the Germans, from the nature of their motion, give them the appellation of *knights*, and the Russians call them *kniser*. The *Parwan* are supposed to receive their name from *padones*, a barbarous Latin term for foot-soldiers. The Germans, Danes, and Swedes have converted

converted them into *peonsants*. The writers of the middle ages, in speaking of the chiefs men, universally style them *familie*. In this game each player has eight dignified pieces, viz. a king, a queen, two bishops, two knights, and two rooks, and also eight pawns, which were anciently called *peachs*, q. d. *militas*, and made in different figures, and of various materials, mostly of wood or ivory. These pieces are distinguished by being painted in white and black colours.

As to their disposition on the board, the white king is to be placed on the fourth black house from the corner of the board, in the first and lower rank: and the black king is to be placed on the fourth white house on the opposite, or adversary's side of the board. The queens are placed next to the kings, on houses of their own colour. Next to the king and queen, on each hand, place the two bishops; next to them, the two knights; and last of all, on the corners of the board, the two rooks. As to the pawns, they are placed, without distinction, on the second rank of the house one before each of the dignified pieces.

Having thus disposed the men, the onset is commonly begun by the pawns, which march straight forward in their own file, one house at a time, except the first move, when they may advance two houses, but they never move backwards: the manner of their taking the adversary's men is sideways, in the next house forwards; where, having captured the enemy, they move forward as before. The rook goes forward or crows-ways through the whole file, and back again. The knight skips backward and forward to the next house, save one, of a different colour, with a sidling march, or allope, and thus kills his enemies that fall in his way, or guards his friends that may be exposed on that side. The bishop walks always in the same colour of the field which he is placed in at first, forward or backward, allope or diagonally, as far as he pleases. The queen's walk is more universal, as she takes all the steps of the fore-mentioned pieces, excepting that of the knight; and as to the king's motion, it is one house at a time, and that in any direction. As to the value of the different pieces, next to the king is the queen, after her the rooks, then the bishops, and last of all the knights. The difference of the worth of pawns is not so great as that of noblemen; however, the king's bishop's pawn is the best, and therefore particular care is taken of him. It ought also to be observed, that, whereas any man may be taken, when he falls within the reach of any of the adversary's pieces, it is otherwise with the king, who, in such a case, is only to be saluted with the word *check* (*back*), warning him of his danger, out of which he must move; and if he cannot move without exposing himself to a similar inconvenience, it is *check-mate*, and the game is lost.

CHESS-TREES, or **CHEST-TREES**, in *Ship-Building*, are two small pieces of timber with a hole in them, bolted on each side of the ship, and placed as far before the main-mast as the length of the main-beam; their use is to confine the clue of the main-sail, and for this purpose a rope passes through, that usually extends the clue of the sail to windward.

CHEST, in *Anatomy*, that part of the body which contains the heart and lungs. See **BREAST** and **THORAX**.

CHEST, in *Commerce*, a kind of measure, containing an uncertain quantity of several commodities.

A *chest of sugar*, v. g. contains from ten to fifteen hundred weight; a *chest of glass*, from 200 to 300 feet; of *Cassile soup*, from two and a half to three hundred weight; of *Indigo*, from one and a half to two hundred weight; five *coores* to the hundred.

CHEST at *Chatham* was established in 1758, for the benefit

of maimed and superannuated English mariners, out of which pensions are paid to such for their lives. This fund was at first raised by a voluntary monthly contribution of the mariners out of their pay, and afterwards made perpetual by queen Elizabeth.

By 43 Geo. III. c. 119, this institution was removed from Chatham to Greenwich, denominated "The Chest at Greenwich," and committed to the management of a body corporate, consisting of the lord high admiral of Great Britain and Ireland, the comptroller of his majesty's navy, the governor of the Greenwich hospital, and the auditor of the same hospital, and denominated "The Supervisors of the Chest at Greenwich." These supervisors are empowered to appoint five persons out of the lieutenant governor, captains and lieutenants belonging to the Greenwich hospital, to be directors of the said chest, together with subordinate officers and clerks, with suitable salaries. This act contains several provisions, for the management of the funds of the institution, and ameliorating the condition of the pensioners.

CHEST of viols. See **BASE-VIOL**, **SIX-STRINGED BASE**, and **VIOL di Gamba**.

CHESTER, or **WEST-CHESTER**, in *Geography*, an ancient city of Cheshire in England. From its proximity to the Welsh principality, and its peculiar local character, its annals embrace much curious history: and hence we shall find it necessary to give a more copious account of this than of the generality of topographical articles. This respectable city is situated near the southern boundary of the county, on a rocky eminence, above the river Dee, and is half encircled by a sweep of that river; a circumstance that occasioned the Roman geographers to name it *Deva* or *Deunana*; an appellation that has been relinquished by later historians for that of *Cellria*, or *Cæstra*; from *castrum*, a camp or military station, which it seems to have been made previous to Agricola's expedition to Scotland. That commander made it the head-quarters of the twentieth Roman legion, whence the Britons gave it the name *Cætr Llan wæter*, or the camp of the great legion on the Dee. The Saxons styled it *Legaceaster*, and *Legceaster*; but its denomination *West-Chester* was obtained through its relative situation to other places which have the name of *Chester* with some addition. Its Roman occupation is illustrated by the frequent discoveries that have been made of remains of antiquity belonging to that nation, such as coins, statues, altars, and hypocausts, and many of them with correlative inscriptions. The walls of the present city determine the limits of the ancient; and the form in which the buildings are disposed is evidently the same as that of the Roman camp. Chester principally consists of four streets, running from a centre towards the points of the compass, and each was formerly terminated by a gate. These streets were excavated from a stratum of rock, and are sunk several feet beneath the surface, a circumstance that has been the cause of a singular construction in the houses. On the level of the streets are low shops or warehouses, and above them a gallery on each side, reaching from street to street, open in front, and ballustraded. These galleries, called the *rows* by the inhabitants, appear exceedingly curious to strangers, who, when walking in them, can hardly divest themselves of the idea of their being up one pair of stairs. Along the rows are ranges of shops, and above them the higher stories, which project to the streets, and form a line with the warehouses beneath. The whole appears as if the first stories of the fronts of all the houses were laid open and made to communicate with each other; pillars only being left for the support of the superstructure. "These rows," says Mr. Pennant, "appear to me to have been the same with the ancient vestibules, and to have been

a form of building preserved from the time that the city was possessed by the Romans. They were built before the doors, midway between the streets and the houses, and were the place where dependents waited for the coming out of their patrons, and under which they might waffle away the tedious moments of expectation. Plautus, in the third act of his *Miles Gloriosus*, describes both their situation and use:

—Videntur *vestibulum ante ædes et amicularum ejusmodi.*

The shops beneath the rows were the *crypta* and *apotheca*; magazines for the various necessaries of the owners of the houses. The streets were once considerably deeper, as is apparent from the shops, whose foundations lie far below the present pavement; and in digging foundations for houses, the Roman pavement is often discovered at the depth of four feet below the modern. The Roman modes of fortification are still evident in the remains of military architecture which surround the city. The walls are in many parts guarded by towers, mostly of a round form, and so placed as not to be beyond bow-shot of each other, that the arrows might reach the enemy who should attempt to scale the walls. From Domestry Book it appears, that in the reign of Edward the Confessor, Chester contained 431 houses that were taxable, besides 57 that belonged to the bishop. It had a *guild mercatorum*, analogous to a modern corporation; so that no person that was not of that society, could exercise any trade, or carry on any commerce, within its precincts. The privileges of the guild were maintained by two overseers, who were selected from the principal citizens, and who received, for the use of the city, the customs paid by strangers. A supreme officer, called the *procurator regis*, or provost, had the superintendance both of the civil and commercial interests. Some peculiar usages prevailed in this city at that period, among which, whenever the king came there, he claimed from every ploughland 200 *heshis* or capons; one *cuna* or vat of ale; and one *rusca* of butter; and whoever made bad ale, were either to pay four shillings, or sit in a tumbrel or dungcart. The commerce of Chester, according to Lucian the monk, who lived near the time of the Norman conquest, was even then very considerable. "The beautiful river on the south side," he remarks, "serves as a harbour for ships from Gascoign, Spain, Ireland, and Germany, who, by the guidance of Clind, and the industry and prudence of the merchants, supply and refresh the heart of the city with abundance of goods; so that, through the various consolations of the divine favour, we have wine in profusion from the plentiful vintages of those countries." The principal exports were horses and slaves: to the latter issue a traffic the Saxons were much addicted; and the situation of Chester, and the frequent war carried on with the Welsh, caused it greatly to flourish in this city. The chief of the other commodities exported were lead, copper, hides, horns, and cheese, which the people of Cheshire had been celebrated for making even from the time of the Romans. Chester, for two or three centuries from the conquest, was the place of rendezvous for troops employed in the Welsh expeditions, and frequently suffered during the contest between the two nations. Llewelyn ap Gwilydd, in revenge for the cruel insults his subjects had received from Geoffrey Langreys, who acted as lieutenant to prince Edward, (afterwards Edward I.), carried fire and sword to the gates of the city, and destroyed every thing round it. These ravages were committed in 1255; and with in two years, king Henry summoned his nobility to attend him at Chester with their vassals, that he might invade Wales, and repay the injuries sustained by his people. This city afterwards was appointed by Edward I. in 1275, to receive the homage of Llewelyn; a degradation to which that high-

spirited prince refused to submit, and was in consequence involved in the war which proved so fatal to him and to his country: his subjects being obliged to acknowledge the sovereignty of England, and make personal homage and fealty of their lands to Edward of Caernarvon, prince of Wales, who received their submission in this city in 1300. Richard II. converted Chester into a principality; and having annexed to it the castle of Holt, with several lordships in Wales, and on the borders, made an act that it should only be held by the king's eldest son; but this was rescinded by Henry IV., who, in 1399, seized the city and castle, when on his way to Flint, where Richard was then imprisoned, through the treachery of those in whom he had confided. The ravages of the plague and sweating-sickness rendered the sixteenth century memorable in this city. During the unhappy civil war in the time of Charles I. Chester was particularly distinguished for its loyalty, and consequently sustained many sieges, bravely resisting the parliamentary forces for three years, till the siege being converted into a regular blockade, and the garrison reduced by famine to the utmost distress, and compelled to feed on horses, dogs, cats, &c. they surrendered on honourable terms February 2, 1645-6. Within two years the city was visited by a dreadful pestilence, which carried off more than 2000 persons, and reduced the place almost to a desert. In the reign of William III. Chester was one of the six cities appointed for the residence of an assay-master, and permitted to issue a coinage of silver.

In reviewing the ecclesiastical state of this ancient city, it may be necessary to premise, that the kingdom of Mercia was divided into the five bishoprics of Litchfield, Worcester, Lyndcester, Dorchester, and Chester. About the year 783 the latter became incorporated with Litchfield, though its annual payments to the pope amounted to 5000 shillings, while that see only advanced 3000. This, and other evidences of its prosperity, attracted the attention of Peter, bishop of Litchfield, who removed his episcopal seat to Chester, in 1075, and during the remainder of his life made use of the church of St. John for his cathedral. This translation was but of short continuance; for his successor established himself in the former diocese, and Chester remained without a bishop till after the suppression of the monasteries, when it was restored to its pristine honour by Henry VIII. who, in 1543, made it one of the six sees that were then formed. At this period, the church of the dissolved abbey of St. Werburgh was converted into a cathedral. A very important alteration in the concerns of this diocese was effected by the death of the new bishops, John Bird, whose vehement opposition to papal supremacy had recommended him to the favour of the rapacious Henry, who removed him from Bangor, the see he had before occupied. His disposition harmonized with the spirit of the times; in 1546 he granted the manors and demesnes of the bishopric to the king, and accepted impropriations and rectories in exchange. The see was thus deprived of all its possessions; and, with the exception of the single acre on "which the palace stands, and the court before it; another house adjacent, a little orchard called the Woodyard, two houses near St. John's church, a few small tenements in the city of York, and some lands in Boughton and Childer Thornton, bequeathed in 1705," is completely divested of its temporalities, and though the greatest in extent of any in England, is of the smallest value. *St. Werburgh's abbey*, from whose possessions this see was formed, was of great and unquestionable antiquity, but its origin is enveloped in the obscurity of tradition. It is generally supposed to have been a nunnery, founded in 660 by Wulfherus, king of Mercia, in accordance with the wishes of his daughter St. Werburgh; and it seems probable

probable that it was ruined by the Danes, when they possessed themselves of Chester, in 895. In place of the nuns, a society of canons regular was established in the reign of Athelstan, by Ethelreda, the heroic daughter of Alfred. These were suppressed by Hugh Lupus, on his accession to the earldom of Chester, and a colony of Benedictines introduced in their stead. Liberal grants were made to the abbey, which continued to flourish till the general dissolution. Various remains of its buildings are yet standing.

The *cathedral* is a spacious irregular pile, become ragged through the decay of the mouldering flue with which it is built. The lower part of the wall has a row of arches now filled up, and appears to be the oldest part of the present building; though not any of it can boast of a remote date. All the labours of the Saxons, and almost all of its restorer, Hugh Lupus, are now lost. Simon Ripley, elected abbot in 1487, finished the middle aisle and the tower, and the initials of his name are interlaid in cyphers on the capitals of some of the pillars. The columns are thick, surrounded by pilasters, with small rounded arches. Above is a gallery, with a neat fine balustrade in the parts where it is entire, and a row of large and broad pointed windows, which is the general style. With the exception of these slight fragments, most of the present structure seems to have been built in the reign of the three last Henrys. The beautiful west end was begun in 1508, and the first floor laid with much ceremony. The window over the door is filled with elegant tracery; and the door-case enriched with figures and other sculpture. The descent into the church is by several steps, whence it is reasonably inferred that the present was erected on the foundation of the ancient church, which was originally on a level with the old streets. Besides the cathedral and St. Oswald's which forms a part of it, Chester contains *eight parish churches*; but St. John's only is entitled to particular notice. This structure stands without the walls, on the east side of the city, and is reported to have been founded by king Ethelred in 689, on being admonished in a vision to erect it on a spot where he should find a white hind. It was a collegiate church, and, at the dissolution, was possessed by a dean, seven canons, seven vicars, two clerks, four choristers, and various servants.

Chester *castle*, which stands within the walls on the south-west, seems to have been rebuilt by the Conqueror, and enlarged considerably beyond the space it occupied when possessed by the Saxons. It consists of an upper and lower ward; the entrance to each is defended by a gate and round tower.

Within the castle precincts is the new *county goal*, which is scarcely exceeded by any other in the kingdom. It is built with white free-stone, and contains five yards, with a working-room and two day-rooms in each. The apartments for the women and debtors are separate from the others. The number of solitary cells for condemned criminals is fourteen. The principal charge incurred in building this fabric was defrayed by the income arising from the river Weaver navigation. The castle is garrisoned by two companies of invalids; and has a governor, lieutenant-governor, and constable. The latter holds his place for life, and is the keeper of the prison, but appoints a deputy. The punishment of pressing to death, or the *peine forte et dure*, for standing mute when arraigned, is said, by Mr. Pennant, to have originated within the walls of the old goal. The statute for the purpose was made by Edward II. in whose fourth year, Adam, son of John, of the Woodhouses, was charged with burning his own houses, and carrying away the goods. He stood mute; and, a jury having decided that he could speak if he thought proper, he was imprisoned *ad dictum*. This was an ironical term, expressive of the sustenance allowed, which, on the first day, was three morsels of the work bread; on the second three

draughts of water out of the next puddle; and so alternately till the sufferer died. This Adam's death being certified, the statute for pressing was made, as being less horrible than starving. The superior wisdom and humanity of modern times have again altered the law, and a refusal to plead is now considered the same as pleading guilty. The walls round Chester are, in circuit, one mile three quarters, and one hundred and one yards. They are the only entire specimens of ancient fortification, those of Carlisle excepted, in Great Britain, but are now only preserved for the purposes of recreations. The continued walk on the top affords a great variety of prospect. "The Welsh mountains, the Cheshire hills of Braxton, and the insulated rock of Beclon, crowned with its castle, the rich flat interposed, and the perpetually changing views of the river," are the most prominent and striking objects in this favourite tour. The expense of the repairs is defrayed by certain imposts, called *murage-duties*, collected at the custom-house, on all merchandize brought from beyond sea into the port of Chester. The whole annual duty is about 200*l.*, great part of which arises from Irish linsens, though the sum levied is only two-pence for one hundred yards. The gates were anciently under the protection of the Earls of Shrewsbury, Oxford, and Derby, and the principal magistrates of the city; the guard was maintained by tolls, exacted from strangers at each entrance. The Norman earls invested Chester with great privileges, which were confirmed by Henry III. in whose reign its government assumed the form of a regular corporation. The succeeding sovereigns granted various charters and immunities. The date of the last charter is 1676, temp. Charles II. The corporation of Chester consists of a mayor, recorder, two sheriffs, twenty-four aldermen, and forty common-councilmen, two of whom are *leave-lookers*, whose office it is to inform of all persons exercising trades within the city without being freemen. The two senior officers are *murageurs*, or receivers of the *murage-duties*, for repairing the walls; and two are *treasurers*, who are generally next in succession to the mayor. There are likewise a sword-bearer, mace-bearer, and other inferior officers. The principal charitable institution is the *Blue-coat School*, which is situated near the north gate, and was founded, in 1706, by Bishop Stratford, and endowed for the complete maintenance of thirty-five boys for four years: a sufficient sum was allowed to bind them apprentices at the expiration of that time. Various alms-houses are dispersed through the city: the chief of these is for forty decayed freemen, aged sixty years or upwards, who are allowed 4*l.* annually, and a gown every third year. The infirmary is a handsome structure, situated in an airy spot, on the west side of the city. Chester is distinguished as a sort of provincial metropolis, being a place of occasional residence to many of the gentry of the neighbouring counties. The only manufacture of consequence is that of gloves, which are made in vast numbers, chiefly by women. Additional employment is supplied by a small manufactory of tobacco-pipes, an iron-foundery, snuff-mills, and some establishments for ship-building. The latter business is carried on to great advantage; many vessels, from 100 to 500 tons, being built yearly. These, in point of strength and beauty, are reckoned as complete and durable as those built in any part in the kingdom: the materials are entirely of British oak. A shot manufactory was likewise established in 1801. The maritime business of Chester chiefly consists of the Irish and coasting trades. Great quantities of linen cloth are imported from Ireland; and, for the better accommodation of the merchants, a new hall was erected in the year 1778: this is a handsome square brick building, inclosing a spacious area, and containing 111 shops. Besides linen, the com-

modities imported are, wood, hides, tallow, feathers, butter, provisions, and other articles, from Ireland; groceries, from London; timber, hemp, flax, iron, and tallow, from the Baltic; kid and lamb-skins, from Leghorn; fruit, oil, vanilla, and cork, from Spain and Portugal; and from the latter, a large quantity of wine. The exports are, coal, lead, lead-ore, calamine, copper-plates, cast-iron, and vast quantities of cheese, with which vessels are laden at stated times for London from the large cheese warehouse on the river. The limits of the port extend, on the Cheshire side of the Dee, to the end of the Wirral; and on the Flintshire side to the mouth of the river Clwyd; yet the number of ships is but small in proportion to the extent of the commerce. The port of Chelster was much improved during the last century. The great breadth of the estuary of the Dee, and the comparative smallness of the body of water flowing through it, rendered it liable to be choked up with the sand brought in by the tide; and this gradually so increased, that in the year 1674, vessels of twenty tons could scarcely reach the town; and ships of burthen were obliged to lie under Neston, ten miles lower, which was the origin of that assemblage of houses on the adjacent shore, called Park Gate. In that year a plan was formed by Mr. Andrew Yarranton, to make a new channel for the river, and at the same time to recover, by embankment, a large tract of land from the sea. Between the years 1730 and 1750, a company was established to execute this project; and different powers were granted from time to time by parliament; but the first operations were so expensive, that many subscribers were obliged to sell their shares at 90 per cent. loss; but the concern, by that means falling into the hands of fewer and wealthier persons, was at length nearly effected. A fine canal was made, protected by vault banks, in which the river is confined for the space of ten miles, with such a depth of water as to allow vessels of 350 tons to come up to the quays at spring tide. The cross embankments made at the same time, have preserved a considerable quantity of land from the sea; and flourishing farms now occupy the space that was formerly bare sand, covered every tide by the water. Two ferries across the canal, or New River, preserve the communication with the opposite counties of Wales. The population of this city, in 1781, was found to be 14,860; of which 6339 were males, and 8521 females; and, by various calculations from the bills of mortality, its proportional healthiness appears considerably to exceed that of most other towns in England: for which, independent of the salubrity of the air, two especial causes may be assigned; the situation of the buildings on a dry sand-stone rock, and the far less proportion of poor inhabitants, than that of places where manufactures are the chief support. Under the act of 1801, the number of inhabitants returned was 15,052, of houses 3104. Chelster is situated 184 miles N.W. from London; has markets on Wednesdays and Saturdays. Among the more eminent natives of this city, were Dr. William Cowper, a physician, who made some collections towards a history of Chelster, and published a few tracts on the subject: the Rev. John Downham, author of the Christian Warfare; and those distinguished mathematicians, Edward Brewwood and Samuel Molyneux; the former, born 1565, had the honour of being the first Gresham professor of astronomy; the latter, born 1639, devoted great attention to the same science, and to the improvement of telescopes; he was also secretary to George II. when Prince of Wales, and afterwards a commissioner of the admiralty. Two newspapers are published weekly at Chelster. A concise History of the County and City of Chelster, 12mo. 1791. Aikin's Description of the

Country round Manchester, 4to. Pennant's Tours in Wales, and Tour from Chelster to London.

CHESTER, a township of Nova Scotia, in Lunenburg county, in Mahone bay, first settled by a few families from New England. The road from this place to Windsor is 25 miles.—Also, a small plantation of Lincoln county, in the district of Maine; 9 miles from Titcomb.—Also, a township of Hampshire county, in the state of Massachusetts, adjoining Westfield on the E. and about 20 miles N.W. of Springfield. It contains 177 houses, and 1119 inhabitants.—Also, a large and pleasant township of Rockingham county, in New Hampshire; 21 miles in length, with a lake on the west side, the waters of which flow into Merrimack river. This township was incorporated in 1722, and contains 1202 inhabitants, chiefly farmers. It is situated on the E. side of Merrimack river, 14 miles N.W. of Haverhill; 35 W. by S. from Portsmouth, and 6 N. from Londonderry. This is a post town, and contains about 60 houses and a congregational church.—Also, a township of Windsor county, in the state of Vermont, 11 miles W. by S. from Charlestown, in New Hampshire, containing 581 inhabitants.—Also, a borough and post-town in Pennsylvania, and the capital of Delaware county; pleasantly situated on the west side of Delaware river, near Marcus hook, and 13 miles N.E. of Wilmington, and contains about 60 houses, a court-house, and a gaol. The first colonial assembly was convened here in December, 1682. This place is the resort of much company from Philadelphia, the metropolis, distant 20 miles by water, and 15 N.E. by land, in the summer season. It was incorporated in December, 1795, and is governed by two burgesses, a constable, a town-clerk, and three assistants.—Also, a county in Pennsylvania, W. of Delaware county, and S.W. of Philadelphia; about 45 miles long, and 30 broad; containing 33 townships, of which West-Chelster is the third town, and 27,937 inhabitants, of whom 145 are slaves. In the northern parts of this county is found iron ore, which employs six forges, and producing about 1000 tons of bar-iron annually.—Also, a court-house in South Carolina, 22 miles S. of Pinckney court-house, and 58 N.W. of Columbia.—Also, a navigable river on the eastern shore of Maryland; rising two miles within the Delaware state from two sources, Cypress and Andover creeks, which unite at Bridge-town; pursuing its course nearly S.W. after passing Chelster S. nearly three miles, when it receives S.E. creek, and 15 miles further in a S.W. direction; and discharging itself into Chesapeake bay, at Love point. At its mouth it forms an island, and by a channel on the E. side of Kent island communicates with Eastern bay. It is proposed to cut a canal, about 11 miles long, from Andover creek, $\frac{1}{2}$ mile from Bridge-town, to Salisbury, on Upper Duck creek, which falls into the Delaware at Hook island.—Also, a small town in the county of Shannandoah and state of Virginia, situate on the point of land that is formed by the junction of Allen's, or North river, and South river, which form the Shannandoah; 16 miles S. by W. from Winchester. N. lat. 39° 2'. W. long. 78° 22'.—Also, a county of Pinckney district, in South Carolina, lying in the S.E. corner of the district on Wateree river, and containing 6866 inhabitants, of whom 5866 are whites, and 938 slaves. It sends two representatives, but no senator, to the state legislature.—Also, a town in Cumberland county, Virginia, situate on the S.W. bank of James river; 15 miles N. of Blandford, and 6 S. of Richmond.

CHESTERFIELD is a large but irregularly built town, situated on the west side of the river Rother, in Derbyshire, England. Its name decidedly implies that it originated

originated from a Roman station; as all places whose appellations begin or terminate with "Chester" were occupied by the Romans during their residence in Britain. The Rev. Mr. Pegge, in the 12th vol. of the "Archæologia," observes, that the Roman road from Derby to York passed this way; and that the fortress, or camp, was on the hill called Tupton or Topton, but distinguished in several ancient writings by the name of Castle-hill. Chesterfield, at the time of the Norman Survey, appears to have been of so small importance as to be noticed in Domesday Book only as a bailiwick, belonging to Newbold, which is now a small hamlet at a short distance to the north. After this period, it rapidly increased, both in size and population: a church, erected here towards the end of the eleventh century, was given by William Rufus to the cathedral at Lincoln. In the reign of king John, the manor was granted to William de Briwere, or Bruere, his particular favourite, through whose influence with the king the town was incorporated, and an annual fair of eight days continuance and two weekly markets obtained. The Stanhopes derive the title of earl from this town. Chesterfield has been particularly distinguished from a battle fought here in 1266, temp. Hen. III. between Henry, the king's nephew, and Robert de Ferrers, earl of Derby. After the discomfiture of the barons at Everham, this earl bound himself by an oath to a forfeiture of his estate and honours, if ever he joined their party again; but after some proceedings in the parliament held at Northampton in 1265, which were obnoxious to the barons, he, in the spring of the ensuing year, again assembled his followers in his castle at Duffield, and being strengthened by several disaffected nobles, advanced and took post at Chesterfield; where he was surprised by the forces of Henry, and, after a severe conflict, defeated and taken prisoner. The church, which is said to have been dedicated in the year 1232, is a spacious handsome building, in the form of a cross, but more particularly remarkable for the appearance of its spire, which rises to the height of 230 feet; and is so singularly twisted and dilorted, that it seems to lean in whatever direction it may be viewed. An hospital for lepers was founded in this town previous to the tenth of Richard I., and continued till the time of Henry VIII. Here was also a guild, dedicated to St. Mary and the Holy Cross: several other guilds are mentioned in ancient writings belonging to the corporation: from the chapel of one of them, called St. Helen's, the grammar-school is supposed to have received the name Chapel-school, by which it is generally known. This school was founded in the reign of queen Elizabeth, and was formerly the largest in the north of England: both the master and other are clergymen. The present school-house was erected in 1710. In the market-place, a neat town-hall was built a few years ago, under the direction of Mr. Carr of York: on the ground-floor of which is a goal for debtors, and a residence for a gaoler; and on the second floor a large room for holding the sessions, &c. Several alms-houses have been endowed in different parts of the town. The charter, granted by king John, has been confirmed and enlarged by several succeeding sovereigns. The government of the town till the reign of Elizabeth appears to have been exercised by an alderman and twelve brethren; but the charter of incorporation granted by her, vests it in a mayor, six aldermen, six brethren, and twelve capital burgesses; who are assisted by a town clerk. By an enumeration made in 1788, it was found that Chesterfield contained 801 houses, and 3626 inhabitants. Since that time its size and population have increased, as appears from the returns under the late act, by which the number of houses was ascertained to amount to 920, and of residents to 4267. The support of the lat-

ter is principally derived from the iron-works of the town and vicinity, and the manufacture of stockings. Some additional employment arises from three potteries for coarse earthen-ware; from a carpet manufactory; and from the making of shoes, of which a large quantity is annually sent to the metropolis. Chesterfield is 150 miles N.W. from London.

CHESTERFIELD, a township of America, in the county of Hampshire, and state of Massachusetts, 14 miles N.W. of Northampton, containing 180 houses, and 1183 inhabitants.—Also, a township in Cheshire county, New Hampshire, on the east bank of Connecticut river, having Wellmoreland to the north, and Hinsdale to the south. This township was incorporated in 1752, and contains 1905 inhabitants. It lies about 25 miles S. by W. from Charlestown, and about 90 or 100 W. from Portsmouth. West river mountain in this township has frequently alarmed the inhabitants with explosions and columns of fire and smoke; and in two places the rocks bear marks of having been heated and calcined.—Also, a county in South Carolina, in the district of Cheraws, in the N. Carolina line; 30 miles long, and 29 broad.—Also, a county in Virginia, situated between James and Appamatox rivers, about 30 miles long, and 25 broad; containing 14,214 inhabitants, of whom 7487 are slaves.—Also, an inlet on the western side of Hudson bay, in New South Wales, upwards of 200 miles in length, and from 10 to 30 in breadth; full of islands.

CHESTER-LE-STREET is pleasantly situated in a valley to the west of the river Wear, and on the Roman military way leading to Newcastle. It is supposed by Camden to be Conderec n of the Romans; by the Saxons it was called Cuneageter, and under that name became the parent of the see of Durham; as it is only 5 miles north of Durham, and 10 south of Newcastle, lying immediately on the high road, and in the neighbourhood of numerous coal works, it has risen to importance, and promises to become still more important: its ancient and modern history will, therefore, be not uninteresting.

In 882 the body of St. Cuthbert was first removed from Holy Island, the ancient Lindisfarne, and, after a variety of misfortunes to his followers, was carried to a settlement appointed for them by the interposition of such miracles as a conjurer of the present date would refuse to own. These, however, bishop Eardulf pretended were sufficient to stop the wanderings of the religious party which attended the body, and whilst the place afforded a secure asylum to the sacred remains, these, in their turn, procured a respectability and reverence for the situation. Eardulf died in 900. Eighteen of the last years of his life were spent in Chester-le-Street. The faint becoming afterwards an object of more general devotion, Athelstan, in the 10th year of the pontificate of Wigred, who succeeded Eardulf, visited the tomb in his expedition to Scotland, enriched the church by a multitude of gifts, and ordered, should he fall in the undertaking he was entering upon, that his body might be buried as near the relics as possible. In 947 Sexhelme usurped the bishopric; but so addicted was he to the love of riches, that he oppressed not only the people, but the very persons who were officiating in the sacred duties. We are told by Symeon, that the bishop was admonished by dreams against practices so debasing to his holy functions, and those visions were so deeply impressed upon his mind, and were attended with such afflictions of body, that at length he retired from the see in the greatest distress, and was not restored till he got without the limits of St. Cuthbert's "circle of power." In the year 995, the see, which had been enjoyed by Chester, was removed from it, perhaps for ever; the remains of St. Cuthbert, with every

other sacred relics, as well as all other kinds of riches, were removed. The incessant troubles which disturbed the province of Northumberland from the time the fee was settled at Cneller, gave little opportunity for the progress of literature, arts, sciences, or manufactures. The bishops too, whilst they were studious of miracles, appear to have left good works and real piety out of their view. Architecture had made few improvements, for the cathedral of Lindisfarne, from whence the relics of St. Cuthbert had been originally transported, was built of stone, though the monasteries of Jarrow and Monkwearmouth were also erected with the same materials. Yet with all its splendour of priestly miracles, and princely homage, that of our present subject still remained of wood. All the lands between the Tyne and the Wear, comprehending the present county of Durham, were in the possession of these ecclesiastics, and obtained the title of "Saint Cuthbert's Patrimony," (after the example of St. Peter's Patrimony at Rome) and the inhabitants were reconciled to the claim, by the idea that they were consequently freed from every sort of military duty except that of fighting in defence of their patron saint. Nothing particular in the history of this place occurs, until the re-assumption of the bishopric by Eggleic, at which time it is said by Symeon, that when the workmen were digging a deep foundation for the new church of Chester, a very great treasure was discovered, hidden, it was presumed, by the officers of the avaricious Sexhelme, who being obliged to abscond, left it there; but it is very probable it was a more ancient concealment; be that as it may, the bishop removed it to Peterborough, and withdrew himself from the see to that place. Unlike, however, the generality of priests of that day, he employed the treasure upon objects, not of munificence only, but of general utility, as bridges, causeways, and other public accommodations; it is therefore no wonder this good man should be persecuted by the rest of the clergy. In 995, the fee being removed to Durham, this place lost its consideration and weight, and it is only lately that it has obtained a new importance. The present church is a handsome stone edifice, with a nave, side aisles, and tower; the base of the latter is of a square form, but above the roof of the church it assumes an octagonal shape apparently more modern, and is terminated by a very elegant stone spire, second only to that of Reyton, (a village up the Tyne) in the north of England. The entire height is 156 feet. The interior of the church is neat, and well preserved; it contains a singular arrangement of monuments, with effigies of the deceased ancestors of the noble family of the Lumleys. The deanery house, now the seat of the ancient family of Hedworth, commands a fine view of Lumley castle, and is surrounded by excellent meadow grounds. The manor of Chester deanery is copyhold, belonging to the bishop, and its jurisdiction is very extensive: it has a coroner, and gives name to the ward. The township, as returned under the late act, contains 1662 inhabitants, and 259 houses; most of the latter are of stone, and they are chiefly arranged in one street, nearly a mile in length.

CHESTERTOWN, a port town of America, and the capital of the county of Kent, in Maryland, seated on the west side of Chester river, 16 miles S.W. of George town, 35 E. by S. from Baltimore, and 81 S.W. of Philadelphia; and containing about 140 houses, a church, college, court-house, and gaol. The college was incorporated in 1782, by the name of Washington; and in 1787, it had a permanent fund of 1250*l.* a year settled upon it by law. N. lat. 39° 12'. W. long. 75° 57'.

CHESTNUT. See **CHESTNUT**.

CHEST-ROPE, in a ship, is the same with the guff or gilt-ropes, and is added to the boat-ropes when the boat is

towed at the stern of the ship, to keep her from sheering, i. e. from swinging to and fro.

CHEST-TREES. See **CHESS-TREES**.

CHEULLOTH, in *Ancient Geography*. See **CHESE-LETH**.

CHETA, in *Geography*, a river of Siberia, which runs into the Charanga. N. lat. 70° 20'. E. long. 107° 29'.—**Alfo**, a river of Russia which runs into the Enfen. N. lat. 69° 42'. E. long. 85° 14'.

CHE-CHOU-OUEI, a town of China, in the province of Hou-quang; 700 miles S.S.W. of Peking. N. lat. 30° 16'. E. long. 108° 54'.

CHE-TCHING, a town of China, in the province of Quang-tong; 8 leagues W.S.W. of Hoa.—**Alfo**, a town of China, of the third rank, in the province of Kiang-li; 30 leagues S.E. of Ki-ngan.

CHETECAN-HEAD, a cape on the west coast of the island of Cape-Breton. N. lat. 46° 40'. W. long. 60° 45'.

CHEṬIB and **KERI**, in *Biblical Literature, the one derived from כֶּתִיב, to write, and the other from קֶרֶן, to read, are terms frequently used by Jewish authors to express the difference between the reading of the MSS. and that of the printed copies of the Old Testament. The Cheṭib is the word adopted in the text, and is marked with a small circle above it, which refers to a different reading in the margin, named the Keri, commonly distinguished by the letter *koph* \aleph , and sometimes written in Rabbinical characters. These different readings are supposed to have been inserted by Ezra and the other 119 men of the great synagogue. With regard to the introduction of the *keri* and *cheṭib*, the celebrated R. Dav. Kimchi observes, that during the captivity, the sacred books were lost or dispersed, and wise men, who excelled in the knowledge of scripture, were dead. Hence it happened, that the men of the great synagogue, who restored the law to its former state, found varieties in different books, and employed the knowledge they possessed in adjusting them. But in those instances, with regard to which their knowledge failed, they wrote one word, without pointing it, or wrote it in the margin, without inserting it in the text; and they wrote one word in the margin, and another in the text. Kennicott's Differt. General, p. 10.*

CHEMACHAS FORK, in *Geography*, an outlet of the river Mississippi in Louisiana, about 30 leagues above New Orleans, which, after running in a southerly direction about 8 leagues from that river, divides into two branches, one of which runs south-westerly, and the other south-easterly, to the distance of 7 leagues, when they both discharge their waters into the Mexican gulf. On the Chemachas, six leagues from the Mississippi, there is a settlement of Indians of the same name; and thus far it is uniformly 100 yards broad and from two to four fathoms deep, when the water is lowest. At its mouth in the Mississippi some drifted logs have formed a shoal which it would not be difficult to remove; and the Indians say that no impediment to navigation occurs between their village and the gulf. The banks are higher than those of the Mississippi, and so elevated in some places as never to be overflowed. The productions are the same as those of the banks of the Mississippi; but the soil, from the extraordinary size and compactness of the canes, is superior. By proper attention the most prosperous and important settlements in that colony might be formed upon its banks.

CHEMACHAS, *grand lake of*, a lake of Louisiana, near the mouth of the Mississippi, 24 miles long, and 9 broad. Lake de Portage, which is 13 miles long, and 1½ broad, communicates with this lake at the northern end, by a Strait ½ of a mile wide. The country bordering on these

Lakes is low and flat, producing cypresses, ivy and other kinds of oak; and on the eastern side the land between it and the Chafalaya river is divided by a great number of navigable streams, occasioning as many islands. Neatly opposite to an island, at a small distance from the south-eastern shore of the lake of Chetimachas, there is an opening which leads to the sea, about 150 yards wide, and having 16 or 17 fathoms of water.

CHEFRAN, a town of Arabia, 6 miles south of Kalaba.

CHE-TSIEN, a city of China, of the first rank, in the province of Koci-tcheou, 875 miles S.S.W. of Peking. N. lat. 27° 30'. E. long. 105° 44'.

CHE-TSUEN, a town of China of the third rank in the province of Se-tchuen; 20 miles N.E. of Mao.

CHE-TSUNG, a city of China, of the second rank, in the province of Yun-nan; 340 leagues S.S.W. of Peking. N. lat. 24° 56'. E. long. 103° 38'.

CHETTÆA, in *Ancient Geography*, a maritime town of Africa, in Marmarica; situate, according to Ptolemy, in the nome of Libya.

CHETTENHAM, in *Geography*, a township of America, in the county of Montgomery, and state of Pennsylvania.

CHEVAGE, or **CHIEFAGE**, in *Law*, formed of the French, *che-f, head*, according to Bracton, signifies a tribute by the head; or a kind of poll money, anciently paid by such as held lands in villainage, or otherwise, to their lords, in acknowledgment.

The word seems also to have been used for a sum of money yearly given to a man of power, for his patronage and protection, as to a chief, head, or leader; but lord Coke says, that it is a great misprision for a subject to take sums of money, or other gifts, under the name of chevage, in this sense of the term. Co. Litt. 140.

In the first sense, Coke observes, there is still a kind of chevage subsisting in Wales, called *anabyr*; paid to the prince of Wales for the marriage of his daughters; anciently by all, now only by some. Lambard writes it *chivage*.

The Jews allowed to live in England, long paid at Easter chevage, or poll-money: viz. threepence per head, as appears by Pat. S. Ed. I. par. 1.

CHEVAGNES, in *Geography*, a town of France, in the department of the Allier, and chief place of a canton, in the district of Moulins, 9 miles east of it. The place contains 850, and the canton 6873 inhabitants: the territory includes 370 kilometres, and 11 communes.

CHEVAL, in *Zoology*. See *EQUUS Caballus*, horse.

CHEVAL marin. See *HIPPOPOTANUS amphibius*. Cheval marin is also the name given to the *Syngnathus hippocampus*, by Belon.

CHEVAL de Bois, in *Military Language*, a wooden horse. It is commonly formed of two planks nailed to treffles, on which the French used to put their horsemen when they wished to punish them for some slight offence, as well as girls of a debauched and bad life, when they were found with the soldiers.

CHEVAL de Frise, in *Fortification*, a large piece of wood, or beams, generally from 15 to 18 feet long, stuck full and traversed with wooden pins or flakes from 5 to 6 feet long, pointed and armed each of them with iron at both ends. Chevaux de frise are made use of for stopping up breaches, and securing the avenues or passages to a camp against the assaults both of infantry and cavalry; for rendering the passage along gullies, ravines, and narrow places impracticable. They are sometimes mounted on wheels with artificial fires to roll down in an assault on the assailants, and at other times they are used instead of retrenchments, as also in front of ditches in lieu of *abatis*. On the medal of Licinius, is found a kind of cheval de frise, made with spikes interposed; serving to express a fortified camp.

CHEVALER, in the *Mænes*. A horse is said to chevaler, when, in passing, upon a walk or a trot, his far fore-leg crosses or over-laps the other fore-leg, every second time or motion.

CHEVALERIE. This word signified formerly what was afterwards and is now called *robustie*, and took its origin from this circumstance, that the principal exercises of the nobles were war, jills, and tournaments, which were carried on or performed by them on horseback. Chevalerie has, perhaps properly enough, been distinguished into four kinds; namely, *La militaire, La regulaire, L'honoraire*, and *La sociale*.

La chevalerie militaire, was that which was acquired by arms, and was a mark of distinction that was conferred with the observance of several military ceremonies, as the girding of a sword on him who was honoured with the title of chevalier, the putting of gilded spurs on him, the recommending to him the punctual and manly fulfilment of the duties and functions of his profession, and so forth.

La chevalerie regulaire was that order of chivalry or knighthood in which one engaged to wear a certain habit, and to carry arms for the defence of religion, and the protection of pilgrimages to holy places, &c.

La chevalerie honoraire was that order of chivalry or knighthood which princes bestowed on each other, and on the first and favourite seigniors of their courts.

La chevalerie sociale was only a particular constitution of people who associated themselves under that title for different purposes.

CHEVALET, in *Fortification*, an assemblage of several pieces of timber for supporting a bridge of fascines or planks, to enable a body of troops to cross a small river. *Chevalets* are also used for bridges of communication in the ditch of a fortified place between detached works.

CHEVALET d'armes, in *Military Language*, a sort of bell-tent, that was formerly used in the French Service. It was conical and somewhat resembled the wigwag of an Indian.

CHEVALIER, ANTOYNE-RODOLPH, LE, in *Biography*, a learned French Protestant, was born in 1507, at Mont-champs, near Vire in Normandy, and studied Hebrew first at Paris under Vatable, and then at Oxford under Fagius. He was tutor in the French language to princes, afterwards queen Elizabeth, and remained in England till the death of Edward VI. He then removed to Germany, and having married the daughter-in-law of Tremellius, he perfected himself in the oriental language under his direction. From Strasburg, whither he was invited in 1559, he went to Geneva; where he taught Hebrew, and published an improved edition of Pagninus's Thesaurus. He afterwards settled at Caen, but the civil wars obliged him to take refuge in England, and was kindly received by queen Elizabeth. However, as soon as the termination of the religious differences at Caen allowed of it, he returned thither; but the fatal day of St. Bartholomew again expelled him; and in his voyage to England he was seized with a disorder, which terminated his life at Guernsey, where he was lauded, in 1572, at the age of 65. He translated from Syriac into Latin the "Targum Hierosolymitanum," and St. Paul's epistle to the Galatians; and his accurate Hebrew grammar, entitled " Rudimenta Hebraicæ Lingvæ," 4to., was printed at Wittenberg in 1574. He had undertaken a bible in four languages, but died before it was finished. More-i. Gen. Biog.

CHEVALIER, formed of the French *cheval*, horse, and that of the Latin *callus*, in a general application, signifies a knight or horseman.

From the most remote period of modern history the title of chevalier has been very eminent and of high consideration. The noviciate necessary for arriving at it was long and trou-

blesome. It was requisite, in order to obtain it, to pass through the first or principal degrees that conferred nobility, and to be irreproachable in point of morals and behaviour, as well as in point of bravery and courage. The admission or reception of a chevalier was very august and magnificent; it was accompanied by a degree of pomp altogether extraordinary. It even attracted the presence of stranger kings and emperors, whose children were not born chevaliers, and could not be received as such, but subject to the formalities prescribed for esquires and gentlemen. When all these things began to decline and get into disuse, sovereigns established different orders of chivalry. See the articles *ECUYER*, and *ORDRES de chevalerie militaire*.

It is used, in *Heraldry*, to signify any *cavalier*, or horseman armed at all points; by the Romans called *cataphratus equus*, now out of use, and only to be seen in coat armour.

CHEVALIER, in *Ornithology*, *chevalier aux pieds rouges* of Buffon. See *SCOLOPAX caudris*, the red-shank.

CHEVALIER of *Fern. Surin*, the spur-winged waterhen. See *PARRA jacana*.

CHEVALIER vert, of Buffon. See *RALLUS bengalensis*, Bengal water-rail.

CHEVALIERS d'armes, ou *chevaliers serfans*, form the third rank in the order of Malta. See the article *SERVANS d'armes*.

CHEVALIERS errans, knights errant. These were worthies, who were constantly wandering along the roads and ways in search of fine adventures and giving challenges and challenges.

CHEVAN. See *CHIAN*.

CHEVANCY LE CHATEAU, in *Geography*, a town of the Netherlands, in the duchy of Luxemburg, about 12 miles from Montmedy.

CHEVANTIA, in our *Old Law Writers*, is used for a loan or advance of money upon credit.

CHEVAUX de Frise. See *CHEVAL de Frise*.

CHEVAUX bien dressés, in *Military Language*, horses well broken. See *CAVALIER* and *CAVALRY*.

CHEVAUX de troupes légères, the horses of light troops. They ought to be as well conditioned as the horses of the heavy cavalry, though they may not be so tall and powerful. They should however be neat, active, and light, as the duty and employment of those, who mount them, are to harass the enemy incessantly, and to drive him before them when they have an advantage over him; as also to render a retreat long and troublesome when the enemy is superior.

CHEVAUX légers. This was a corps of cavalry consisting of 200 men called *maîtres* (masters), who formed part of the guard of the kings of France. It is remarked, to the honour of this corps, that they never lost either their kettle-drums or standards. It owed its formation to Henry IV., and was originally composed of men of arms of Navarre.

CHEVÈCHE, in *Ornithology*, Grande Chevèche of Buffon, one of the synonymous names of the Short-eared Owl, *STRIX brachyotus*. The great Brown Owl, *STRIX Ulula*, is also called Grande Chevèche by some French authors.

CHEVELLE, a term used by the *French Herald*s to express a head where the hair is of a different colour from the rest of the head.

CHEVERNY, in *Geography*, a town of France, in the department of the Loire and Cher; 7 miles S. of Blois.

CHEVET du canon, in *Gunnery*, a billet, block, or quoin, sufficiently strong for supporting the breech of a cannon.

CHEVET du mortier, a wedge placed between a mortar and its bed or carriage for elevating it with.

CHEVETAINE, a *Military Term*. The French cavalry as well as infantry were anciently conducted by *chevetaines*,

that is to say, captains or *connetables*, who held not their commands for life, but by commission during the continuance of a war or of a particular expedition.

CHEVILLE d'osier, in *Gunnery*, an iron bolt or pin, which serves to bind together the whole of a gun-carriage by traversing or running across through it. These that have iron buckles, haps, or itapes, are called *chevilles à oreilles*.

CHEVILLE Ouvrière, a large nail or bolt, by means of which the lumber is placed below the carriage of a piece of artillery.

CHEVILLES de travaux militaires, artillery nails of different sizes, to suit the purposes for which they are used.

CHEVILLON, in *Geography*, a town of France, in the department of the Upper Marne, and chief place of a canton in the district of Wassy. The place contains 856 and the canton 5108 inhabitants; the territory includes 137½ kilometres and 15 communes.

CHEVILLY, a town of France.

CHEVILS, or *KEYELS*, in *Ship-building*. See *KEYELS*.

CHEVIN, a name used in some parts of England for the chubb. See *CARPIO*, and *FISHING*.

CHEVIOT HILLS, in *Geography*, hills of England in the county of Northumberland, near which was a tree chafe, called Cheviot, corruptly "Chevy Chase," the scene of the encounter between the Piercys and the Douglases, celebrated in the ancient popular song: 6 miles from the borders of Scotland, and 18 S. of Berwick. These hills form a regular ridge, running from the S.W. where they join those of Galloway on the N.E., and stretching from near Berwick to the Solway frith, constitute a kind of natural rampart between the two kingdoms.

CHEVIRE, a town of France, in the department of the Mayne and Loire; 5 miles N.W. of Baugé.

CHEVISANCE, in the *Law of England*, is said to be an agreement, or composition, or bargain between a creditor and debtor; but it seems chiefly to denote an indirect gain, in point of usury, &c. In our statutes it is often mentioned, and most commonly used for an unlawful bargain or contract. See the statutes against usury, anno 12 Anne. In the stat. 13 Eliz. c. 7. it is used simply in the sense explained by Dutreine, for making contracts.

The word is said to be derived from the law French *chevir*, to come to the end, or finish any thing; in the same sense as the modern French use *achever*.

CHEVITIÆ and *CHEVISEÆ*, denote in *M. M. Angl.* heads of ploughed lands.

CHEVRE, a crab or gin. A machine for raising stones, large pieces of timber, and pieces of artillery. See *CRAB* and *GIN*.

CHEVRE, in *Zoology*, the goat among French writers; *CHEVRE sauvage* of Tavenier is the Caucasian Ibex. See *CAPRA Agagrus*.

CHEVREGNV, in *Geography*, a town of France, in the department of the Aisne, and district of Laon; 5 miles S. of it.

CHEVRES, a town of France, in the department of the Charente; 18 miles E. of Angoulême.

CHEVRETTE, in *Artillery*, an engine to raise guns or mortars into their carriages; it is made of two pieces of wood of about four feet long, standing upright upon a third, which is square: they are about a foot asunder, and parallel, and are pierced with holes exactly opposite to one another, having a bolt of iron, which being put through these holes, higher or lower at pleasure, serves with a hand-spike, which takes its poise over this bolt, to raise any thing by force.

CHEVRETTE, and *CHEVREUM*, in *Zoology*, the name given by French writers to the Roe. See *CERVUS Capreolus*.

CHEVREUIL, the name under which Du Pratz describes

cribes the *CERVUS virginianus*. *CHEVREUIL* is likewise the French name of the Roe, *CERVUS capreolus*.

CHEVREUSE, in *Geography*, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Versailles; 8 miles S.W. of it. The place contains 1730 and the canton 10,326 inhabitants; the territory includes 210 kilometres and 21 communes.

CHEVRON, or *CHEVERON*, in *Heraldry*, one of the honourable ordinaries of a shield, formed of two-fold lines placed pyramidically, and representing two ratlers of a hoise joined together, without any division.

It descends from the chief towards the extremities of the coat, in form of a pair of compasses half open. Thus, he bears gules, a chevron argent. See *plates, Heraldry*.

The chevron is the symbol of protection, say some; or of coailtancy, according to others: some say, it represents the knight's spurs; others, the head-attire of priestesses; others, a piece of the lit, or the barrier or fence of a park.

When it is alone, it should take up the fifth part of the field, according to Leigh; and according to others, a third part: when it is accompanied with any other bearings, its breadth must be adjusted thereby.

It is borne divers ways; sometimes in chief, sometimes in base, sometimes enarched, sometimes reversed, &c.

The chevron is sometimes charged with another chevron, one third of its own height.

Two chevrons are allowed in the same field, but no more: when they exceed that number, they are called *chevronwise*, or *chevronels*. There are chevrons of several pieces. The diminutions of the chevron are the chevronel, which is half the chevron, and a couple clofe, which is in space half the chevronel. See *CHEVRONEL* and *COUPLE-CLOFE*.

A chevron is said to be *abased*, when its point does not approach the head of the chief, nor reach farther than the middle of the coat; *mulitaded*, when it does not touch the extremes of the coat; *cloven*, when the upper point is taken off, so that the pieces only touch at one of the angles; *couched*, when one branch is separated into two pieces; *couch-ed*, when the point is turned towards one side of the escutcheon; *divided*, when the branches are of several metals, or when metal is opposed to colour; and *inverted*, when the point is towards the point of the coat, and its branches towards the chief.

A coat is said to be *chevroned*, when it is filled with an equal number of chevrons, of colour and metal.

Counterchevroned, is when it is so divided, as that colour is opposed to metal, and *vice versa*.

Per CHEVRON, or *Party per CHEVRON*, is when the field is divided by only two single lines, rising from the two base points, and meeting in a point above, as the chevron does.

CHEVRONEL, a diminutive of *chevron*; and, as such, only containing half a chevron. Morgan and Guillim tell us, that when there are more than five chevronels in a coat, they should be called couple-clofes; but Edmondson says, that if there are 6, 7, 8, 9, or 10 in a coat, and they are placed at equal distances from each other, they ought to retain their name of chevronels; but in case they are placed in pairs, then, and then only, they are to be called couple-clofes. The same writers also assert, that a chevron between two chevronels should be termed "A chevron between two couple-clofes;" but Edmondson is of opinion, that a chevron cottised, or a chevron between two chevronels, would be a truer blazon, and much better understood.

CHEVRONNE, or *CHEVRONNY*, signifies the parting of the shield, several times *chevronwise*: Gibbon says, *chev-ronne of six*.

CHEVROTAIN, in *Zoology*, Buffon calls the Musk

of Guinea, *Moschus pygmaeus* of Erxleben, *Chevrotain des Indes Orientales*. See *MOSCHUS pygmaeus*.

CHEVROTINE, in *Military Language*, a leaden ball of a small diameter, of which there are sometimes from 66 to 166 to a pound.

CHEVROTTER, in *French Music*, is a term given, in derision, by musicians to a bad shake: when a finger, instead of a rapid vibration on two distinct sounds at the distance of a whole tone or a semi-tone, flutters only on one, and the same note. The Italians call this pretended kind of shake, *l'esse di capra*, "a goat's cough." Early in the 17th century, before finging had been much cultivated, while a true shake was little known, it was common to write down, and even to print, an iteration of the same note at a clofe, as a grace, when a real shake was afterwards required, as at a clofe in F:

This appears in the *Septe Musfiche* of Claudio Seracini of Sienna, printed and published in 1624. We should have supposed this to have been the caprice of an individual, had we not found it elsewhere; but the same monotonous trill occurs, expressed in notes, not only in songs of this period, but is recommended to the practice of students in singing, by the celebrated Caccini, in his *Nuove Musfiche*, printed at Venice, 1615.

CHEUX, in *Geography*, a town of France, in the department of Calvados, and district of Caen; two leagues W. of it.

CHEWASE, a town of America in the Tennessee government; 24 miles S.W. of Tellico.

CHEWING-BALLS, in *Farriery*, a sort of balls contrived for horses to chew, not swallow at once; not intended as food, but as incentives to appetite; and on other medicinal occasions very useful to the creature. The receipt now most esteemed for these balls is this: take liver of antimony, and of assa fetida, of each one pound; wood of the bay-tree, and juniper wood, of each half a pound; pellitory of Spain, two ounces: let all these be powdered together; then add as much fine grape-verjuice as is necessary to make the whole into a paste. This is to be formed into balls of about an ounce and a half weight, which are to be dried in the sun. These are the *cheving*-balls, and are to be used one at a time in the following manner. The ball is to be wrapped up in a linen rag, and a thread is to be fastened to this, in such a manner that it may be tied to the bit of the bridle, and kept in the mouth: when the bridle is taken off, the horse will immediately eat; and when one ball is consumed, another is to be tied up, and put in its place, till the intent is answered.

CHE-YAM-HOEI-HOTUN, in *Geography*, a town of Asia, in the kingdom of Corea; 437 miles E.N.E. of Peking.

CHEYNE, GEORGE, in *Biography*, a native of Scotland, where he was born in the year 1670, was at first intended for the church, but attending the lectures of Dr. Archibald Pitcairne, he became a proselyte to his doctrines, and determined on practicing medicine. Having taken his degree of doctor, about the year 1700, he came to London, and soon after published his theory of acute fevers, in which he attempts to explain the doctrine of secretion, on mechanical principles. His next work, on fluxions, was published in 1705, and procured his election into the Royal Society. Arrived at a maturer age, he calls this a juvenile production, and acknowledges it was justly censured by De Moivre, to whom, and to Dr. Oliphant, he makes an apology in the

preface to his "Essay on Health and long Life," for having treated their censures with rudeness. This was followed soon after by his "Philosophical Principles of Natural Religion," containing the elements of natural philosophy, and the proofs for natural religion, arising from them. This was dedicated to the earl of Roxburgh, for whose use it appears to have been written.

As Cheyne was a voluptuary, the disposition to compulency, which he inherited from nature, had so increased, by the time he attained a middle age, that he was become unwieldy, short-breathed, and lethargic; alarmed at these appearances of a broken constitution, he determined on altering his mode of living, to which he justly attributed the evil; accordingly he confined himself to a milk and vegetable diet, and submitted to a total abstinence from fermented liquors. The experiment succeeded, and he was soon relieved from the most distressing symptoms of his complaints. Struck with the benefit he had received, he published in 1722, an "Essay on the true Nature and due Method of treating the Gout," together with the nature and quality of Bath waters, and the nature and cure of most chronic diseases. As he had resided for some years, during the summers, at Bath, and drank the waters, he attributed much of the benefit he had received to them.

His next publication, which appeared in 1724, was his famed "Essay on Health and long Life," 8vo. In this he inculcates the necessity of a strict regimen, particularly in the article of diet, both in preventing and in curing diseases. It was dedicated to Sir Joseph Jekyll, master of the rolls, who had been under the author's care. In the preface the author gives an account of his former works, which he censures, where faulty, with great freedom. He is particularly severe on his own conduct, wherever he has treated other writers with levity or disrespect.

Although so much benefited by an abstemious course of living, he had not been able, it seems, to continue it, after his complaints were subdued; he once more therefore became a free liver, and indulged himself in wine, and other luxuries, but finding his complaints returning, he had again recourse to a milk and vegetable diet, and with such manifest advantage, that he continued it for the remainder of his life, which was extended to the year 1742, when he died at Bath, being 72 years of age. He had several years before, viz. in 1733, published his "English Medley," or treatise on nervous diseases of every kind, as spleen, vapours, lowness of spirits, hyleric and hypochondriac diseases, which he thought were more frequent, if not confined, to this country. This work became very popular. In it is contained a candid and judicious narrative of the author's case, which may be read with advantage, particularly by persons who, by intemperance, have impaired their health. For the titles and accounts of a few other productions, see Haller's Bib. Med., and the Gen. Bing. from which much of the above is taken.

CHEZE, LA, in *Geography*, a town of France, in the department of the North Coasts, and district of Loudeac; $\frac{1}{2}$ league S.E. of it.

CHEZERY, a town of Savoy, ceded to France in the year 1760.

CHEZY L'ABBAVE, or CHEZY-SUR-MARNE, a town of France, in the department of the Aisne, and chief place of a canton in the district of Chateau Thierry; $\frac{1}{2}$ league S.S.W. of it. The place contains 1280 and the canton 11,938 inhabitants; the territory includes 25 $\frac{1}{2}$ kilometres and 20 communes.

CHIA TERRA See TERRA Chia.

CHIABRERA, GABRIEL, in *Biography*, a celebrated

Italian poet, was born at Savona in 1752. He passed his elementary studies at Rome, and was received into the Roman college. He was a youth of unbounded passions, and was concerned in many disputes, one of which forced him to become an exile for many months. He at length found means to appease all animosities, and devoted himself to his literary pursuits. He was first noticed on account of some Latin verses, but he afterwards turned his talents to Italian poetry, of which he became a voluminous and highly admired author. His reputation as a poet caused him to be invited to the courts of several princes. By Ferdinand I. grand duke of Tuscany, he was munificently rewarded on account of verses composed for a dramatic exhibition given to the prince of Spain, and for others written in honour of the marriage of the princess Mary, who became queen of France. Charles Emanuel, duke of Savoy, pressed him to reside at Turin; and on his refusal, made him magnificent presents, and liberally paid his expences whenever he visited that capital. Vincent Gonzaga, duke of Mantua, was another of his patrons, and assigned him an annual pension. But nothing conduced so much to his reputation as the notice taken of him by the cardinal Barberini, himself a poet; who not only addressed to him an ode, but when pope, under the title of Urban VIII. honoured him with a brief filled with praises and high compliments. The republic of Genoa, of which he was a subject, conferred on him many honours and privileges, one of which was that of being covered when he addressed the senate college. Chiabrera lived universally respected to the age of 86; he married a wife at 70, but left no children. As a poet he filled up the interval between the most flourishing and declining ages of Italian poetry. He aimed at originality, and used to declare, that, like his countryman Columbus, "he was resolved to find a new world, or perish in the pursuit." This is perhaps to be chiefly understood of his lyrical productions, in which, it is said, that he naturalized the graces of Anacreon and the sublime flights of Pindar. He enriched the Italian verse by the introduction of various new measures. He was likewise an elegant prose writer; his "Familiar Letters" possess the graceful ease fitted to that species of composition. A collection of his most esteemed poems was published at Rome, in 3 vols. in 1718.

CHIACA, or CIACA, in *Ancient Geography*, a place of Asia in Armenia, between Dufcula and Menicne. It had a Roman garrison, according to the Notitia Imperii.

CHIAGORAS, a river of Africa, considered by the ancients as one of those which contributed to form the Nile.

CHIAJA BECH, or KIAYA-Bey, among the Turks, an officer whose duty or business is to serve the Aga of the Janizaries in quality of first *maître d'hôtel* in the name of all the corps. See KIAYA-Bey.

CHIAJA-BOCH, or second lieutenant general, is the third general officer of the Janizaries. He yields in nothing to the second general officer or first lieutenant general, who is called *Seymer Bashi*, in point of privilege, authority, and command. Some judgment may be formed of the great power of the Aga, or chief of the Janizaries, from the rights and authority of this second lieutenant general, who is captain of the richest company, namely that of *Bhuc-Dary's*, and governs it despotically. He is heir to such of his soldiers as die without children and parents, and he bestows at his pleasure on his subaltern or subordinate officers the governments of the cities of war or the offices called *Kehars*.

CHIAIS, a sect of Mongols or Moors, inhabiting Surat in the East Indies, w.c.o. as well as the modern Persians.

Persians belonging to the same class, do not consider Abubeker, Omar, and Osmyn as the lawful successors of Mahomet, but as usurpers; esteeming Ali, the son-in-law of Mahomet, as the person who ought to have immediately succeeded to the place of the prophet; whereas the Turks, who are called "Sunmites," or "Sonmites," believe the contrary. This difference of belief is the cause of an irreconcilable hatred between these people, which is encouraged and cherished by the princes on both sides. See SHITES.

CHIALISH, in *Geography*, called also Yulduz, and by the Turks Karashar, or the black city, a town of Little Bucharia.

CHIAMETLAN, a province of North America in Mexico, bounded on the north by Culican, on the east by the Zacatecas, on the south by Xalasco, and on the west by the Pacific ocean. It is said to be 37 leagues from north to south, and as wide from east to west. The soil is fertile; many mines of silver are found in the country; and it produces a great quantity of honey and wax. The native Indians are well made and warlike. The river St. Jago discharges itself into the sea here; N.W. from the point of St. Blas. The chief town is St. Sebastian.—Also, a town of Mexico in the province of the same name; 325 miles N.W. of Mexico. N. lat. 23° 40'. W. long. 105° 11'.

CHIAMETLAN-Islands, a cluster of small islands in the Pacific Ocean, near the coast of Mexico. N. lat. 22° 20'. W. long. 104° 26'.

CHIAMPA, a small maritime country of Asia, bounded on the north by the desert of Cochinchina, on the east and south by the Indian sea, and on the west by Cambodia, from which it is separated by a ridge of mountains. Mr. Pennant, after M. d'Anville, calls this tract Ciampa; and Sir George Staunton (*Emb. vol. i. p. 364.*) substitutes Tsiampa, and says that it appears from the sea, as a sandy tract interfectured with rocks. Mr. Pennant informs us from an old French narrative, that the people of this country are called Loyes; and are large, muscular and well made, and have a reddish complexion, rather flat nose, and long black hair; their dress is very slight. The king resides at Feneri, the capital: and was tributary to Cochinchina. The productions of the country are cotton, indigo, and bad silk. Their junks are well built, and much employed in fishing.

CHIAN Marble. See MARBLE.

CHIANA, in *Geography*, a river of Italy, which joins the Tiber, about 10 miles S. of Orvieto.

CHIANNI, a town of Italy, in the duchy of Tuscany; 16 miles E.S.E. of Leghorn.

CHIANTLA, a town of Mexico, in the province of Chiapa; 100 miles S.E. of Chiapa dos Espagnols.

CHIAOUS, among the Turks, are officers in the corps of Janizaries. They are of three kinds or descriptions, and are distinguished by different surnames. The first of these is the *bas-chiaous*, who as captain of the second *Olda*, or company, has the charge of registering those who enter into the corps of Janizaries. He receives them by taking them by the ear and giving them a cuff. He inflicts punishments on the guilty, and ranges the soldiers in a line, when the Aga is going to pass, in order that each of them may have it in his power to bless him, by repeating some words of the Alcoran.

This *bas-chiaous* commands two others, who are subordinate to him, each of whom is called *Porta-chiaous*. Neither of these is a captain, but rather a sort of lieutenant or captain-lieutenant. But their duty is to cause the sentences of the captains against delinquent soldiers to be carried into execution. For the soldiers of that corps have the singular privilege of being judged by their own proper officers, or those of their own companies. It is also the

duty of the *Porta-chiaous* to direct the order of march for the infantry, and more especially to salute the first with hands joined when it passes before the general. Every *bas-chiaous* then, or captain of a company of Janizaries, has two captain-lieutenants, or lieutenants under his orders.

CHIAOUS, an officer in the grand signior's court, doing the business of an usher.

The word, in the original Turkish, signifies *envoy*.

He bears arms offensive and defensive, and has the care of prisoners of distinction. His badge is a staff covered with silver; and he is armed with a scimitar, bow, and arrows. The emperor usually chooses one of this rank to send as ambassador to other princes. The *chiaous* are under the direction of the *chiaous-bajehi*, an officer who assists at the divan, and introduces those who have business there.

CHIAPA, in *Geography*, a province of Mexico or New Spain in North America; bounded on the north by the province of Tabasco, on the south-east by Vera-paz, on the south by Guatemala, on the south-west by Soconusco, and on the west by Guaxaca. It is about 85 leagues from east to west, and its breadth, where it is narrowest, is about 30, and in some parts nearly 100. This country abounds with forests of pine, cyprus, cedar, oak, walnut, and wood vines; with aromatic gums, balsam, liquid amber, tacamahaca, copal, and other articles, that yield excellent balsams; and also with corn, cocoa, cotton, and wild cochineal; together with fruits of various kinds, as pears, apples, quinces, &c.; and achiotte with which the natives colour their chocolate. Chiapa has also a great variety of cattle; and it is particularly famous for a fine breed of horses, in such estimation, that they send their colts to Mexico, at the distance of 500 miles. This province teems with beasts of prey, and also with foxes, rabbits, and wild hogs. In the hilly parts, more especially, are snakes of different sorts, some of which are said to be 20 feet long, others of a red colour, and streaked with white and black; which the Indians tame and even coil round their necks. The inhabitants of this province are of a fair complexion, courteous in their disposition and manners, well skilled in music, painting and mechanics, and respectful to their superiors. The country is well watered; its principal river is Chiapa, which running from the north through the country of the Quelenes, falls into the sea at Tabasco. This river enables the Chiapese to carry on a considerable trade with the neighbouring provinces, which consists chiefly in cochineal and silk; and of the last commodity the wives of the Indians manufacture handkerchiefs of all colours; which are purchased by the Spaniards and sent to Europe. Chiapa is reckoned by the Spaniards as one of their poorest provinces, because it has no mines or sand of gold, nor any harbour on the South sea, yet in size it is inferior to none except Guatemala. To the Spaniards it is of great importance, because the strength of their empire in America very much depends upon it; and it may be easily entered by the river Tabasco, Puerto Real, and its vicinity to Yucatan.

CHIAPA, the name of two towns in the above province: the one is sometimes called "Civdad Real," or the royal city, and the other "Chiapa de los Indos," inhabited by Spaniards. The former is a bishop's see, and the seat of the judicial courts. It is delightfully situated in a plain, surrounded with mountains, and almost equally distant from the North and South seas, and 100 leagues N. from Guatemala. The bishop's revenue is 5000 ducats a year. The town is neither populous nor rich; and the Spanish gentry who reside in it are proverbially proud, poor, and ignorant. It has several monasteries, a cathedral of elegant structure, about 400 Spanish families, and a faubourg, containing about 100 Indian families. The city is governed by magistrates

trates chosen among the burgeses of the town, in consequence of a peculiar privilege granted to them by the king of Spain. The principal commerce of this place is cocoa, cotton, and cochineal. N. lat. 17°. W. long. 96° 40'.

The other town, called "Chiapa de los Indios," belonging to the Indians, is the largest they have in this country, and lies in a valley near the river Tabasco, about 12 leagues N.W. of "Ciudad Real." The celebrated Bartholomew de las Casas was the first bishop of Chiapa. See the biographical article *CASAS*. The town is large and rich, with many cloisters and churches; and no town has a greater number of Indians valuing themselves on their rank than Chiapa. On the river they have several boats, with which they often exhibit sea-fights and sieges. In the environs are several farms well stocked with cattle, and some sugar plantations. Wheat is brought hither from the Spanish Chiapa; and of this they make hard biscuit, which the poorer Spaniards and Indians carry about and exchange for cotton, wool, and such trifling things as they want. In this town there are about 20,000 Indians. The heat of the day is extreme, but the nights are cool.

CHIAPPEN, in *Mythology*, an idol of the savages in the valley of Tunia, near Panama; being their Mars, or god of war. Before they set out for battle, they sacrifice slaves and prisoners in honour of him, and besmear the body of the idol with the blood of the victims. In moll of their enterprises they consult Chiappen; and they previously undergo a penance for two months, abstaining from the use of salt and all commerce with women.

CHIARENZA, or CLARENCE, in *Geography*, a town of European Turkey, on the west coast of the Morea, not far from the Mediterranean, near the river Sillus; once a considerable place, but now almost ruined; 84 miles S.W. of Livadia, and 80 W. of Corinth.

CHIARENZA, *Ital.* Clearness; a *Musical Term*, one of the most essential requisites in a musical composition. The definition of good music, by that spirited and inventive vocal composer, *Galuppi*, more frequently called *Buranello*, though short, is very comprehensive. It consists (he told the author of the Present State of Music in France and Italy) in *vaghezza, chiarezza, e buona modulazione*.

Clearness in music is a very different quality from clearness in literature. In prose, verse, or reasoning, *vivâ voce*, when a thought has been presented in the most appropriate terms, exempt from all extraneous matter, but accompanied with the accessories necessary to its development, and intelligibility, it is clear; endeavouring to be too concise obscures obscurity, and in trying to be clear, we become diffused:

— *Brevitas esse laboro,*

Obscurus fio.

In literature, the greatest secret of the art, is not the saying all that may be said, but to let that be clearly conceived which is not said. It is totally different in music: the moment we become diffused, we cease to be clear; so that as the opposite to clearness in literature, is obscurity; the opposite to clearness in music, is confusion.

A musical idea, apart from all expression, is not an operation of the mind. It arises from a kind of instinct, or, if you please, from a sentiment which taste only directs; and just as it springs from the head of the musician, it is received by the audience, without the least obscurity. We speak here of simple melody. But if harmony is added to it, each part increases complication, obscures the principal idea, and it is then that clearness is wanted.

Each phrase in music should have a character, and this character arises from the melody. If the accompaniment

to this melody forms another melody of a different character from the principal part, and is interesting, to which should we attend? there will then be a confusion.

To make use of a term in painting, upon these occasions, when there are many melodies in motion at once, we should aim at *transparency*; the several parts should be heard through each other.

M. Framery, in the *Encycl. Meth.*, has extended this article, and pointed out the several causes of confusion and obscurity; one of which he says, and perhaps with truth, is the present rage for *modulation*, which destroys the *unity of melody*, and calls off the attention from the melody to the harmony; breaks the chain of thought, and drives from the mind the original *motive*, and like sauce that is too acid, or too sweet, totally destroys the favour of the principal viand. See *TRANSPARENCY, MELODY, MODULATION, CHARGÉ, and LABOURED ACCOMPANIMENT*.

Though *clearness* is a common epithet, and well understood in common things, it is peculiarly necessary to be explained as applied to music. In compositions of many parts, when the principal melody is not dilarded by the too great complication or activity of the subordinate parts; when not only the principal melody is heard through the rest, but that every part carrying on a particular design, can be distinguished without confusion; here it is that the word *transparent* might be usefully admitted into the musical technicæ. However numerous the parts, the principal, the best or most interesting melody should be respected, to whatever part it may be assigned. When many designs are carried on at the same time, as in double fugues with counter subjects, in writing which, as the composer's task is difficult, so is that of the hearer; as the science of the one is on the stretch, so is the attention of the other.

The composer should never forget the place and the audience for which he is at work. In productions for the church, where tranquillity and profound attention are supposed to reign, learning and complication are more likely to be understood than in a theatre, where the interest of the drama, the beauty of the poetry, the gestures of the actors, and the pomp of representation, all conspire to attract the attention of the audience from the labours of the musical composer. These considerations not only furnish an apology for a thin score in opera songs, but render it an object of praise. *Clearness* in dramatic music is so much more necessary than in that of the church or even chamber, as the objects that distract the attention of the audience are more numerous.

CHIARI, FABRIZIO, in *Biography*, a painter and engraver of considerable reputation in his profession, was born at Rome in 1623, and died in 1695. He made several etchings from Poussin, which, though slightly executed and incorrectly drawn, manifest the hand of a master; among others are the following, viz. "Mars and Venus in a Landscape," "Venus and Adonis," and "Venus with Mercury and several children." Strutt.

CHIARI, GUISEPPE or JOSEPH, an eminent historical painter, was born at Rome, in 1654, and having studied the arts of design under Galliani, placed himself under the celebrated Carlo Maratta, whose style he copied and with whom he so ingratiated himself, that he was entrusted to finish several of his pictures and designs, and recommended to other employment. As he advanced in reputation, he was engaged in many great historical works for churches and palaces, while he exercised himself in fancy compositions. His pictures, in which he exhibited delicacy of touch, an agreeable tone of colouring, and elegance and correctness of drawing, have been held in

high estimation. What he wanted in genius, says Mr. Fuffeli, he ftrove to fupply by induftry, moderation, and judgment. He died at Rome in 1727.

CHIARI, in *Geography*, a town of Italy, in the Breffan, between Brefcia and Crema; 12 miles W. of Brefcia.

CHIARO SCURO, & OSCEURO, among *Painters*. See *CLAIR obscure*.

CHIAROMONTE, in *Geography*, a town of Sicily, in the valley of Noto; 25 miles W. of Syracufe.

CHIASCIO, a river of Italy, which runs into the Tiber, near Torficiano.

CHIASSELLI, a town of Italy, in the country of Friuli, belonging to the ftate of Venice; 7 miles W. of Palma-la-Nuova.

CHIASMOS, in *Ancient Greek Medical Writers*, is the concoufe or meeting of any two things under the form and figure of a crofs, or the letter X *chi*, whence it is named. The adverbs *χιαστος*, and *χιαστικος*, fignify the fame thing: thus the optic nerves are faid to meet *χιαστικος*, fo as to crofs each other.

CHIASTOS, the name of a bandage in Oribafius, fo called from its refembling a crofs, or the letter X.

CHIASTOS, in *Rhetoric*, the fame with what is otherwife called *diastilos*.

CHIAVAN, in *Geography*, a town of Perfia, in the province of Ghilan; 120 miles N.W. of Refhd.

CHIAVARI, a town of Genoa; 15 miles W.N.W. of Brugnato.

CHIAVENNA, COUNTY OF, a country of Swifferland, in alliance with the Grifons, fituated at the foot of the Rhætian Alps, N. of the lake of Como; about 8 leagues long and 6 wide. This county is fertile in wine and paftures; the inhabitants raife a confiderable quantity of filk, but not corn fufficient for their wants, which they procure from their neighbours for cattle, wine, and filk. The inhabitants are Catholics, and dependent in fpiritual matters on the bifhop of Como. The county of Chiavenna came under the fovereignty of the Grifons at the fame time and in the fame manner with the Valteline. During the war of the Valteline, it frequently changed its mafters; but at the peace of Milan, was finally reftored to the Grifons. It is ruled, like the other provinces, by a Grifon governor, under the name of commiffary, whose power in fome inftances is lefs limited than that of the judges of the Valteline. The criminal court of juftice is formed by the commiffary and the affeffor, who is appointed by the commiffary, from three candidates nominated by the county. He mult attend all examinations, concur in ordering torture for the conviction of a criminal, be prefent when it is inflicted, and ratify the final fentence; but as the affeffor owes his place to the commiffary, and fhares in his exactions, he is a mere cypher, and feldom ventures to exert his right of interpofing a negative. This circumftance renders the courts of juftice in Chiavenna more uniformly iniquitous than even thofe of the Valteline; for the clofe union between the commiffary and affeffor almofl precludes a chance of redrefs, and gives unbanded fcope to oppreffion. The mode of proceeding eftablifhed in this court of juftice is fimilar to that of the *Valtelline*, which fee. In civil caufes the commiffary receives 5 per cent. of the contelted property, and an appeal from his decifion may be fubmitted to the fyndicate.

CHIAVENNA, the capital of the above county, is fituated at the foot and upon the fide of a mountain, and contains about 3000 perfons. The inhabitants carry on but little commerce. The principal article of exportation, excepting the ftone-pots called "Lavazzi," is raw filk, of which the whole county produces about 3600 pounds. A manufacture of filk ftockings, the only one in the town, has been

lately eftablifhed. The neighbouring country is covered with vineyards: but the wine is of a meagre fort, and only a fmall quantity of it is exported. The great fupport of Chiavenna is the tranfport of merchandife;—this town being the principal communication between the Milanefe and Germany, and from hence the goods are fent either by Coire into Germany, or through Pregaia and the Engadinas into the Tyrol. A duty is laid by the Grifons upon all the merchandife which paffes through Chiavenna; but it is fo fmall, that the whole cuftoms, including thofe in the Valteline, are farmed for 17,000 florins, or about 1260*l.* per annum.

The principal object of curiofity in the environs is the fortrefs in ruins, feated upon the fummit of a rock, which overlooks the town, once celebrated for its almofl impregnable ftrength. The ftrongeft part of the fortrefs was conftituted upon an inflated rock, rent, as fome fuppofe, from the contiguous mountain, by a violent convulfion of nature. Others fuppofe that the feparation of this rock was the work of art, and aferibe it to the order of Galeazzo Vifconti, in 1343. The length is above 250 feet, the height about 200, and the greateft diftance from the adjoining rock about 20. Clofe to Chiavenna is a rock of *afteffor*. Coxe's Travels, &c. vol. iii.

CHIAULISA, a town of Mexico, in the province of Tlafcala; 20 miles S. W. of Puebla de los Angeles.

CHIAVORIO, a town of Germany, in the duchy of Carinthia; 8 miles S. of Tarvis.

CHIAUSI, among the Turks, officers employed in executing the vizirs, bafhaws, and other great men; the orders for doing which the grand feignior fends them wrapped up in a black cloth, on the reception of which they immediately perform their office. See *CHIAOUS*.

CHIBARA TAI KIAMEN, in *Geography*, a port of Chinefe Tartary; 6 leagues N. of Geho.

CHIBI, in *Zoology*, the name of the domeftic cat in Paraguay, according to Mr. d'Azara, in his hiftory of the quadrupeds of that country. It is alfo called by others *mbaracaya*.

CHIBICOUAZON, or MBARACAYA-GOUAZOU, the great cat, the name by which the people of Paraguay diftinguifh the ocelot, according to M. d'Azara.

CHICA, or CHICHA, liquor ufed by the Indians of South America, in the provinces of Quito, Peru, &c. in the times of the Incas, and ftill very common. The method of making it is this: they fteep the maize in water till it begins to fprout, and then fpread it in the fun, where it is thoroughly dried; after which they roaft and grind it, and of the flour they make a decoction of any ftrength at pleafure. It is then put into jars or casks, with a proportional quantity of water. On the fecond or third day it begins to ferment, and when that fermentation is completed, about two or three days more, they deem it fit for drinking. It is reckoned very cooling; and it is alfo inebriating. Among other medical properties that are aferibed to it, they fay it is diuretic; and to the ufe of this liquor the Indians are fuppofed to be indebted for their being ftangers to the ftangrany or gravel.

CHICABEE, in *Geography*, a mountain of N. America, in the ftate of New England.

CHICAL, in *Zoology*. According to Haffelquift this is the name of the common jackal in Turkey.

CHICALY, or CHICALY-CHICALY, in *Ornithology*, a bird very common in the woods of the ifthmus of Panama. It is defcribed by Wafer. (Dampier's Voyage) as a bird of great beauty. Bachelier alfo fpeaks of it (Voy. aux Indes Occidentales). The note of this bird, according to thefe writers, approaches that of the cuckoo; but fha per,

and more rapid. The plumage is elegantly diversified with a variety of lively colours, as red, blue, &c.: the tail is long, and the bird carries it in a straight direction like the cock. It lives on wild fruits, inhabits trees, and is rarely seen on the ground. Some ornithologists have imagined this to be a species of *Ara*, but the true genus does not appear to be correctly ascertained.

CHICAMA, in *Geography*, a river of South America in the kingdom of Peru, and jurisdiction or intendency of Truxillo; the water of which is distributed to the adjacent country by canals, and serves to render them productive, in great plenty of sugar-canes, grapes, and fruits of different kinds, both European and Creole, and particularly maize. From the banks of the river Lambaycque to Choco, sugar-canes flourish near all the other rivers; but none of them equal in goodness or quantity those near the river Chicama.

CHICANE, or **CHICANERY**, in *Law*, an abuse of judiciary proceeding, tending to delay the cause, and deceive or impose on the judge, or the parties.

Some derive the word from *chicum*, the skin of a pomegranate; whence the Spaniards formed their *chico*, little, slender; *chicane* being conversant about trifles.

The French call solicitors, attorneys, &c. *gens de chicane*.

CHICANE is also applied in the schools, to vain sophisms, distinctions, and subtilities, which immortalize disputes, and obscure the truth: as, the *chicane* of courts does justice.

CHICANES de fossee, chicanery of the ditch or fossée, in *Military Language*, very serious and sometimes very bloody contrivances, stratagems, and attempts between the besiegers and the besieged, when the former endeavour to make themselves masters of the covert-way and the ditches. Besides intrepidity and resolution on the part of both, a good deal of coolness, intelligence, and invention is required in those who conduct, on such occasions, either the attack or defence. The night is generally chosen for such enterprises.

CHICANGA, or **CHACANGA**, in *Geography*, a kingdom of Africa, which was formerly a part of the country of Monomotapa, rich in gold mines. It is called "Manica" from the principal town, which is situated on the river Sofala, in S. lat. 20° 15'. E. long. 28°.

CHICAPEE, or **CHICKABEE**, a small river of North America, in the state of Massachusetts, which rises from several ponds in Worcester county, and running S.W. unites with Ware river, and 6 miles farther it discharges itself into the Connecticut at Springfield.

CHICAS, **CHICHAS**, or **TARIJA**, a jurisdiction of South America, in the audience of Charcas, and belonging to the archbishopric of Plata, about 30 leagues S. of Plata; the greatest extent of which is about 35 leagues. This is now a province of the new viceroyalty of Buenos Ayres. The temperature of this district is various, some parts of it being hot and others cold; and hence it has the advantage of producing corn, fruits, and cattle. This country every where abounds in mines of gold and silver; and especially that part called Chocayas. Between this province and the country inhabited by wild Indians, runs the large river Tipuanys, the sands of which, being mixed with gold, are washed like those of the river Caravaga. The gold mines in Chicas and Tarija, by the statement of Helms, are 4; the silver mines 5; and it has 1 lead mine.

CHICCAMOGGA, a large creek of North America, which runs north-westerly into Tennessee river. Its mouth is 6 miles above the Whirl, and about 27 S.W. from the

mouth of the Hiwassee. N. lat. 35° 18'. The Chiccamogga Indian towns lie on this creek and on the bank of the Tennessee. See **CHICKAMAGES**.

CHICHA. See **JESSE**.

CHICHACOTTA, a post on the frontier of Bootan, in the track from Bengal to Tibet; which was rendered famous by being an object of contest between the British troops, and the people of Bootan, in the war carried on upon their frontier in the year 1772. As a fortification, it was then, as it is at this day, a large oblong square encompassed by a high bank, and thick blockade. The Bootans defended it with obstinacy, and a battle was fought in its vicinity, in which they displayed much personal courage; though it was impossible they could long contend against the superior advantage of firelocks and cannon over matchlocks, the sabre, and the bow. But though they were compelled to give way, they made Chichacotta, for a considerable time after, a post of danger and alarm, which the British troops were obliged alternately to possess and relinquish, till they were finally driven back, and pursued beyond Buxadewar or Passaka. It was restored at the close of the war, and now constitutes the Bootan frontier. The house in the fort, to which captain Turner was conducted in his embassy to Tibet, was of a totally different construction from any in Bengal. The first apartment, to which the ascent was by a wooden ladder, was elevated about 8 feet from the ground, and supported on forked posts: bamboos, resting on the forks, served as beams: the floor of one room was formed by mats of split bamboo, that of the other by pieces of plank from 3 to 6 feet long, and 1, or 1½ broad, hewn by the axe, and laid on beams of fir. A prop rose from the center of the ground-floor to the roof, which was of thatch; and the sides of the room were encompassed by split bamboos, interwoven lattice-wise, so as to leave interstices for the admission of light and air. The apartments were divided by reeds placed upright, confined at top between two flat pieces of bamboo, and resting at bottom in a groove. In the whole fabric there was no iron; the thatch was very low, projecting considerably beyond the walls; so that the rooms were equally defended from the rain and sun. N. lat. 26° 35'. E. long. 89° 35'. Turner's Embassy, &c. p. 19.

CHICHE, a town of France, in the department of the Two Seves, and the district of Thouars; 6 miles S.E. of Breffuire.

CHICHEROBE, a town of America in the state of Georgia; 20 miles N. of Tugeloo.

CHICHESTER, a city of Sussex in England, is raised on the site of a Roman station, on ground a little elevated in the midst of a very level tract of country. The four principal streets, which are tolerably wide, and paved, branch off at right angles from the center of the city, in lines bearing direct towards the four cardinal points of the compass. At the end of each of these streets was formerly a fortified gateway: but these have been destroyed, and of the ancient embattled wall which formerly environed the city, only some portions remain. The principal of them is on the north side, where a spacious terrace was raised about the year 1725. This being covered with fine gravel and shaded by a row of lofty elm trees, affords an ornament to the city, and a pleasant promenade to the inhabitants. The whole circumference of this place within the walls is about 422 perches, or 6963 feet, embracing an area of between 100 and 101 acres of land.

That Chichester was a Roman station appears evident from the termination of its present name, and from several relics peculiar to the Romans that have been found here at different times. In the year 1727 a tessellated pavement

was discovered near the episcopal palace; and Mr. Hay, in his recent History of Chichester, says it was the residence of the Roman prætor, and that a heathen temple was erected here. On a place called the Revle, near the city, are the vestiges of a large encampment, the earth-works of which, according to Mr. Hay, extend about three miles in length, by one in breadth; but the Chichester guide states with more probability that it is an oblong square, of about half a mile in length, and half as much in breadth. The Roman name of this station was Regni or Regum.

During the Saxon dynasty the name was changed to Cissa-celter, from Cissa, a king of the South Saxons, who, after a long reign of 74 years, died A.D. 577. From this period Cissa-celter continued the seat of the monarchs of this district for above 300 years, and was attacked at different times, by the kings of Wexsex, and by the piratical Danes. At the Roman conquest, there were, according to the domestic book, one church and above 100 dwelling houses within the walls; and soon after that event, Hugh de Montgomery was created by the conqueror, earl of Chichester and Arundel. To secure himself in these possessions he raised castles, and augmented the fortifications of the former place. Camden states that Chichester was taxed at this time with 15*l.* per annum for the king, and 10*l.* for the earl. The latter having obtained leave of his monarch to establish a see in his newly acquired town, granted the whole fourth west quarter of it to Stigandus, who was the twenty-second abbot or bishop of Selsea, and the first of Chichester. It appears that two or three churches were erected here, and successively destroyed, before the present cathedral was founded. This is stated by Mr. Hay to have taken place during the prelacy of Bishop Seffrid, who, "afflicted by six other prelates, consecrated the church on the second of the ides (i. e. the 12th day) of September A. D. 1189." (*History of Chichester*, 8vo. p. 417). Judging from the styles of architecture which prevail in this building, and from some auxiliary circumstances, we should rather coincide with dean Littleton, in attributing to bishop Ralph the "greatest part of the inside walls of the nave, choir, and transept." This bishop was installed in 1091; he began the church in 1115, and died in 1123. He signalized himself not so much for his build-ings, as for his energy and spirit in resisting the papal encroachments which were then attempted to be made under the legation of Cardinal de Cresua, whose shameful exit from this kingdom is noticed, and justly reprobated by Hume, Henry, &c. in their histories of England. Bishop Ralph appears to have been liberally assisted in the progress of his cathedral by Henry I. In the year 1187, a devastating fire destroyed nearly the whole city of Chichester; and the wood work with some other parts of the cathedral was consumed, or considerably injured. This damage was, however, repaired by Bishop Seffrid and his immediate successors; one of whom was the famous bishop Poore, who was translated from this see to that of Sarum in 1217, where he exerted and displayed his knowledge of, and taste for, architectural science in designing the present magnificent fabric at the latter city. It is extremely probable that the principal additions of Chichester cathedral, which are easily distinguishable by pointed arches and their corresponding decorations, were completed about this time. The spires of this, and that at Salisbury are traditionally said to have been built by the same person, and their general resemblance seems to justify the conclusion. Both of these are, however, of a date much later than any other parts of the fabrics, but are both trifling variations of that style which prevailed during the long and pious reign of Henry III. when the artificers and ecclesiastics were animated by the same enthusiastic ardour

of emulation. The ornaments of the interior of this cathedral, the stalls of the choir, and the tasteless paintings on the ceilings, appear to have been executed in the time of bishop Sherburn, who was translated to this see in 1503. This prelate was employed many years by Henry VII. in a diplomatic capacity, and he is said to have brought into England an Italian artist of the name of Bernardo, who was commissioned to produce an historical painting on large panels of oak, and which were to occupy both sides of the south transept of Chichester cathedral. It was intended to represent the founders and benefactors of the church. This picture, or these pictures, though extremely bad as works of art, are very curious specimens of early portrait painting, and may perhaps be considered among the earliest examples of the kind in this country. The east end of this cathedral has totally lost its original character: as the chapel of the virgin is converted into a library beneath which are large vaults for the Richmond family, and for that of Waddington; also a cemetery for that of Mil'ar. A large number of monuments is affixed to different parts of the cathedral, many of which are not only ugly in themselves, but are highly injurious to the stability and beauty of the building. One monument among these deserves particular notice, as a memorial to genius, and a specimen of English talent. This was erected by a subscription raised among the citizens, to commemorate the name and character of Collins the poet, who was a native of this place. The monument is by Mr. Flaxman, who has displayed his usual taste and talent in its design and execution. Here are some other marble monuments by the same artist. The size, &c. of Chichester cathedral may be estimated by the following measurements. From east to west, 410 feet; cross aisles, or transept from north to south, 131 feet; breadth of body and aisles at the west end 91 feet; height of the central tower and steeple 270 feet, which is 134 feet less than that of Salisbury; height of towers at west end 95 feet, and of another tower, which stands on the N.W. side of the church, 107 feet; height of the roof, or vaulting 61 feet. The four sides of the cloisters are respectively 120, 100, and 103 feet.

The walls of the city inclose six parishes: and without the walls are two other parishes. Besides the churches here is a fine ancient *market cross*, a guildhall, a market-house, and council chamber, a work house, a theatre, a custom-house, the bishop's palace, a free school-house, and some chapels: The cross, an elegant octangular structure, highly ornamented, was built by bishop Story, who was advanced to this see in 1475. "There is a degree of grandeur in the design, and elegance of execution in this cross, superior to any other structure of the same class in England." A Plan with details, &c. of it is given in the *Archæological Antiquities of Great Britain*, vol. i. 410. The guildhall is a spacious ancient building, situated in a retired part of the city: here was a nunnery, founded by William dean of Chichester, in the reign of Henry II. It is now converted into an hospital under the patronage of the dean and chapter, and is supported by revenues from several valuable estates. Within its walls is a neat chapel. The bishop's palace is a large pile of building, and the gardens are spacious. The river Havant nearly encircles the city, and is navigable for small vessels: but the quay or harbour is about two miles from the city walls. In the reign of king James I. an act was obtained to widen and deepen the river up to the city; but this has not yet been effected.

Chichester sent members to parliament in the twenty-third year of Edward I.; and by charter granted, in the reign of James II. A.D. 1685; it is governed by a mayor, recorder,

recorder, and 33 common councilmen. It sends two members to parliament, who are elected by the inhabitants paying foot and lot, and certain freemen, in all amounting to about 620 voters. Besides the mayor, who is elected from the aldermen, here are four justices of the peace, before whom and the mayor moit of the petty causes and litigations are tried.

Here are two weekly markets, on Wednesday and Saturday: and every Wednesday fortnight the market is very large. Here are also five annual fairs. This city is 62 miles S.W. from London: and contains 831 houses, and 4744 inhabitants. Hay's History of Chichester, 8vo. 1804.

About two miles and half N. of Chichester is the village of *Lavant*, near which is a feat belonging to the duke of Richmond, who has another at *Rawmire*, and another at *Goodwood*, about 4 miles from the city. Four miles N.E. of Chichester is *West Stoke*, the cheerful residence of lord George Lenox. A short distance hence is *West Dean* the feat of Lord Selsea.

CHICHESTER, *Upper and Lower*, two townships of America, in the state of Pennsylvania, and county of Delaware.

CHICHESTER, a small township of Rockingham county in New Hampshire, about 35 miles N.W. of Exeter, and 45 from Portsmouth. It lies on Suncook river; was incorporated in 1727, and contains 401 inhabitants.

CHICHICHOCO, a mountain of South America, in the province of Quito, being a branch of the snowy mountain of Carguairalo, and one of the stations in the Cordilleras of the Andes, where the Spanish astronomers fixed a signal in measuring the degree of a meridian. Whilst they were in this station, an earthquake occurred, which reached 4 leagues round the country.

CHICHICTLI, in *Ornithology*. See *STRIX ebichiali*. Lam.

CHICHLTOTOTL, the Mexican name of the silver-beaked tanager, *tanagra lœc d'argent* of Sonnini.

CHI-CHOW, in *Geography*, an island of the China sea, not far from Formosa, which in reality consists of two small islands close to each other. The fourth coast of this island, on Dalrymple's chart, is in N. lat. 22° 13', but by the observations of captain Marchand, who anchored in the Solide under this island, its S. coast is in N. lat. 22° 4' or 5'.

CHICHELEY, HENRY, in *Biography*, an English bishop, born of obscure parents at Higham Ferrers, in Northamptonshire. He was educated at Winchester school, from whence he was admitted at New college, Oxford, where he took the degree of doctor in civil and canon law. He was afterwards chaplain to Robert Medford, bishop of Salisbury, by whom, in the year 1402, he was promoted first to the archdeaconry of Salisbury, and in two years afterwards to the chancellorship of that diocese. His various talents brought him into notice, and he was employed by Henry IV. and V. in various important negotiations. He was sent ambassador to pope Gregory XII. to congratulate him on his advancement to the papacy; the bishopric of St. David's becoming vacant during his absence, he was promoted to that see by the pope, who consecrated him with his own hands. In 1414, he was translated to the see of Canterbury. The commons having addressed the king to seize upon the revenues of the church, archbishop Chicheley employed his talents to divert the storm. He advised the clergy to grant the king a large subsidy, and then enflamed the ambition of the monarch to lay claim to the provinces of France which had belonged to his predecessor. He went over to France with the king, and on his return before his sovereign,

he caused abundance of processions to be made for obtaining the favour of heaven upon his arms, and, at the many synods which he held, exhorted his brethren to open their purses freely in support of so just and necessary a war. He was frequently with the king in his camp, and was present with him at Paris after the surrender of that capital. In 1421, he crowned queen Catherine in London, and during that year he baptized prince Henry, who, when he came to the crown, ever treated him with a sort of filial respect. During the minority of that prince he was nominated first privy-counsellor, but never exhibited any inclination to engage in matters of state, confining himself to his ecclesiastical functions. He founded a noble college and large hospital at his birth-place, and endowed them with ample revenues, which were considerably augmented by his two brothers, who were aldermen of London. In 1426, pope Martin V. exhibited some tokens of displeasure against the archbishop for having vigorously opposed certain encroachments made by the see of Rome. The prelate was obliged to make his concessions before he could be restored to favour. He was a liberal benefactor to the university of Oxford, and was the founder of the college of All Souls, one of the noblest foundations in the university. He likewise displayed much munificence by contributing large sums in adorning and improving the cathedral at Canterbury, and for building Croydon church, and the bridge at Rochester. This prelate, who was greatly respected, died in 1443, and was buried in a monument which he had himself erected in Canterbury cathedral.

CHINCINE, in *Geography*, a town of Lithuania; 8 miles N. of Rohaczow.

CHICK *Pea*, in *Botany*. See *CICER*.

CHICKAHOMINY, in *Geography*, a small navigable river of America, in Virginia. At its mouth in James river, 37 miles from Point Comfort, in Chesapeak bay, is a bar, which has only 12 feet water at common flood-time. Vessels of six tons burden may go 32 miles up the river.

CHICKAMACOMICO, a creek of America, in the state of Maryland, and county of Dorchester, which runs southerly between the towns of Middle-town and Vienna, and discharges itself into Fishing bay.

CHICKAMAGES, a denomination given to part of the Cherokee nation of Indians in America, which occupies five villages on the Tennessee river. See *CHICKAMOGGA*.

CHICKASAW, an American creek, which falls from the East into the Wabash, a little below fort St. Vincent. — Also, a river which discharges itself into the Mississippi, on the east side, 104 miles N. from the mouth of Margot and 67 S.W. of Mine-àur. The lands here are excellent, and covered with a variety of useful timber, canes, &c. This river may be ascended, during high floods, upwards of 30 miles, with boats of several tons burden.

CHICKASAW *Bluff* lies on the eastern bank of the Mississippi, within the territories of the United States, in N. lat. 35°. In 1795, the Spaniards suddenly built a strong fort in this place; but it was given up by a treaty of 1796.

CHICKSAWS, a famous nation of Indians, who inhabit the country on the east side of the Mississippi, on the head branches of the Tombigbee, Mobile, and Yazoo rivers, in the N.W. corner of the state of Georgia, and N. of the country of the Chactaws. This territory is an extensive plain, tolerably well watered from springs, and of a pretty good soil. They have seven towns, the central one of which is in N. lat. 34° 23'. W. long. 89° 30'. The number of persons, formerly occupying this district, was reckoned to be 1725; and of these 575 are said to have been warriors.

CHICKEN,

CHICKEN, in *Ornithology*, the young of the gallinaceous order of birds, and especially of the common hen. Chickens require no meat for two days after they are hatched: and they are first fed with snail oat meal, dry or steeped in milk, and the crumbs of white bread: and as they acquire strength, with curds, cheese-parings, &c. Green clives chopped with their food will preserve them from the rye, and other diseases of the head: and care should be taken to furnish them with a proper supply of clean water. In order to have fat crammed chickens, they should be cooped up when the hen forsakes them, and fed with wheat-meal mixed with milk, and made into a paste: this diet will fatten them in about a fortnight. See **COCK**, **FOWL**, and **HATCHING**.

CHICKEN-POX, in *Medicine*. See **VARICELLA**.

CHICKWEED, in *Botany*. See **ALSINE** and **ARENARIA**.

CHICKWEED, *Byzard*. See **BUFONIA**.

CHICKWEED, *Water*. See **CALLITRICHE**.

CHICLANA, in *Geography*, a town of Spain, in the province of La Mancha; 22 miles N. of Ubeda.

CHICOCA, in *Mythology, an idol of the African negroes, supposed to be the guardian of the dead. His statue, composed of wood, is erected near their burial-places.*

CHICOMUZELO, in *Geography*, a town of Mexico, in the province of Chiapa; remarkable for a cave which has a narrow entrance, but is spacious within, having a stagnant lake, of clear water, two fathoms deep towards the banks.

CHICOMXEN, a town of America, in the state of Maryland; 38 miles S.S.W. of Annapolis.

CHICORACEOUS, in *Botany*. M. Vaillant divides plants with composite flowers into three classes or families; the *cynarocephalous*, the *corymbiferous*, and the *chicoraceous*.

CHICORÉE, in *Conchology*, the name given by the French collectors to a variety of shells which are furnished with foliated processes, as in the *Murex ramifolius* of Linnæus. The collectors in this country distinguish the same kind of shells by the general appellation of *endives*, which literally have the same meaning as the French *chicorée*. With scientific collectors such indistinct terms are not however adopted, as shells of very different genera are comprehended under this title, although the greater number of them are murices.

CHICOVA, in *Geography*, a kingdom or district of Africa, having on the north, Butua; on the west, Bororos, and on the south Mocaranga, called Monomotapa. This kingdom is reported by travellers to abound with silver mines. The capital of the same name is seated on the river Zambezi, which inundates the country like the Nile, except in the month of April. S. lat. 15 40'. E. long. 29° 30'.

CHICOYNEAU, MICHEL, in *Biography*, a native of Blois, studied medicine at Montpellier, and was admitted doctor in that faculty on the 6th of October, 1652. In 1659, on the death of James Durant, he succeeded to the professorship of medicine; to this post was soon afterwards added, those of anatomy and botany, with the superintendance of the royal botanical garden, much to the regret of his brethren, who were sufficiently mortified, Astruc relates, to find a young man occupying such important posts, which had hitherto been bestowed as rewards for age and merit. Their opposition however did not prevent his being soon after made chancellor and counsellor of state. Knowing the enmity of his opponents he was careful, by diligence in the discharge of his duties, to render their efforts to get him dispossessed of his offices, ineffectual. Chicoyneau became blind towards the latter part of his life, which was extended to the year 1702. He had three sons, one of whom only, his second son, survived him.

CHICOYNEAU, FRANCIS, was born at Montpellier, in

1672. In March, 1693, he was made doctor in medicine, and his father had interest sufficient to procure him the reversion of the several offices he held on his death, and getting appointed his substitute, to perform the duties of them, when from loss of sight he was rendered incapable of executing them. The diligence he used in performing the duties imposed on him, and the suavity of his manners, gained him the esteem both of his colleagues and pupils. As he had distinguished himself equally as a practitioner and teacher in medicine, he was appointed one of the physicians who were sent to Marseilles, in the year 1720, to assist in putting a stop to the dreadful ravages of the plague, which in the end almost depopulated that city; M. Chirac, his father-in-law, who was first physician to the regent, having recommended him as qualified for that office. The attention and zeal he shewed in this situation, gave complete satisfaction to the inhabitants, and was rewarded on his return to Montpellier, by a pension; and in 1731, on the death of M. Chirac, he was chosen to succeed him as first physician to the king; he was also made counsellor of state, and honorary member of the Academy of Sciences. He died in 1752, being 80 years of age. In 1721 he published "Observations et Réflexions touchant la Nature, les Evénements, et le Traitement de la Peste de Marseilles," 12mo. It was the joint work of himself, and Messrs. Verno and Deidier, who had been joined with him in the commission. Its principal trait is the opinion contained in it, that the plague is not contagious. Influenced by that opinion they had boldly entered the apartments of the diseased, and fortunately escaped infection; but the confidence thence inspired, probably contributed in spreading the disease, and making it more general, by inducing the inhabitants to neglect separating the sick from the healthy. Having received orders from the king to collect the opinions of different physicians on the plague, and particularly all the facts and observations that had been published on the subject of the plague at Marseilles, he published his collection under the title of "Traité des Causes, des Accidns, et de la Cure de la Peste, avec un recueil d'observations, et un détail circonstancié des précautions qu'on a prises pour le souvenir aux besoins des peuples affligés de cette maladie, et pour le prévenir dans les lieux qui en sont menacés." Paris, 1744, 4to. This work is drawn up with candour, and is valuable from the number of useful facts contained. His son,

CHICOYNEAU, AIME FRANÇOIS, born in 1699, was made doctor in medicine at Montpellier in 1722. After receiving the rudiments of his education under his father, he went to Paris, and was farther instructed by his grandfather, Chirac, Du Verny, Winflow, and Vaillant. Returning to Montpellier, he was first made demonstrator in botany, an office he filled with such credit, that he obtained the reversion of the places occupied by his father, and supplied his place when he was at Marseilles, and afterwards, on his being appointed physician to the king. As he was particularly attached to botany, which he cultivated with zeal, he set himself with diligence to repair and almost renew the botanical garden, which had been founded by Henry IV. His father having procured him the office of counsellor in the court of aids, he applied himself to the study of the law, and with such success that he was soon enabled to discourse on the subjects which came before him in that department as readily as on those in medicine. He was an elegant Latin scholar, and his orations were admired for the purity of the language, as well as for their neatness and peripatuity. But all these good qualities were soon lost to the world, as he died in 1740, aged only 38 years. Haller's Bib. Eloy, Dict. Hist. Gen. Biog.

CHICQUERA,

CHICQUERA, in *Ornithology*. See *FALCO Chiquera*.

CHICUALTI, the name of a kind of snipe found in the mountainous parts of India; the exact species is not distinctly known: perhaps the same with the *Nodua canora* of Nierenberg, the Indian name of which according to that author is Chicuatli. Its beak, he says, is long, black, and slender; its head is marked with undulated streaks of yellow near the eyes; the breast and belly of a whitish colour, and the throat with some black feathers intermixed with white ones; the back variegated with black, yellow, and grey. This bird is found principally among the mountains, where it generally runs on the ground. It is easily bred in cages, and feeds indiscriminately on various kinds of food.

CHIDNEI, in *Ancient Geography*, the name of an ancient people who inhabited the vicinity of the Euxine sea.

CHIDRIA, a place in the Thracian Chersonesus, whither some of the Athenians, after the defeat at Ægos-Potamos, made their escape.

CHIEF, a term denoting head, or a principal thing or person. The word is formed of the French, *chef*, *head*.

We say the *chief* of a party; the *chief* of a family. &c.

Agamemnon was the *chief* of the Greeks who besieged Troy. The Romans sometimes refused triumphs to their victorious general, because the conduct of the *chief* was not answerable to his success. The abbots that are *chiefs* of their order are all regular; and it is there the general chapters are held.

CHIEF *baron*. See *BARONS* and *COURT of exchequer*.

CHIEF, in *Heraldry*, is the upper part of the escutcheon, reaching quite across, from side to side.

The arms of France are three golden fleurs de lys, in a field azure: two in *chief* and one in point.

CHIEF is more particularly used for one of the honourable ordinaries, drawn horizontally across the face of the shield, and containing the uppermost third part of the escutcheon. *Plate, Heraldry*. When the escutcheon is cut in stone, or in relievo, the chief stands out prominent beyond the rest; and is supposed to represent the diadem of the ancient kings and prelates; or the casque of the knights.

It is frequently without any ornament; sometimes it is charged with other bearings; sometimes it is of a colour of metal different from that of the coat.

The line that bounds it at the bottom is sometimes straight, sometimes indented, engrailed, embattled, lozenged, &c. Thus, say they, the field is gules, a chief argent, &c. Again, he bears, gules, a chief crenelle, or embattled, argent.

Sometimes one chief is borne on another; expressed by a line drawn along the upper part of the chief; when the line is along the under part, it is called a fillet. The first is an addition of honour, the second a diminution.

The chief is said to be *abased*, when it is detached from the upper edge of the coat, by the colour of the field which is over it; and which retrenches from it one-third of its height. We also say a chief is *chevroned*, *paled*, or *bended*, when it has a chevron, pale, or bend, contiguous to it, and of the same colour with itself. A chief is said to be *supported*, when the two thirds at top are of the colour of the field, and that at bottom of a different colour.

CHIEF, *in*. By this is understood any thing borne in the chief part, or top of the escutcheon.

CHIEF *justice*, in *Law*. See *JUSTICE*.

CHIEF *justiciary* of England. See *JUSTICIARY*.

CHIEF *lord*, denotes the feudal lord, or lord of an honour, on whom others depend.

CHIEF, *holding in*, or *tenants in*. See *CAPITE* and *TENURE*.

CHIEF *pledge*, is the same as *headborough*, which see.

CHIEF *point*. See *POINT*.

CHIEF *rents*, *Reditus capitales*, in *Law*, denote the rents of freeholders of manors; called also *quit-rents*, quieti reditus, because by them the tenant gets quit and free of all other services. See *QUIT-rents* and *RENTS*.

CHIEF-TAIN, the chief leader, or general of an army; or the lieg.

CHIELEFA, in *Geography*, a town of European Turkey, in the Morea, near the gulf of Coron. It was taken by the Venetians in the year 1685.

CHIELEVISCH, in *Ichthyology*, one of the names under which Renard describes the *chaetodon dux*, which see.

CHIEM-SEE, in *Geography*, a lake of Germany, in upper Bavaria, about 14 miles long and 5 broad; sometimes styled the sea of Bavaria. It contains several islands, particularly Herrenward and Frawenward; the former being the see of a bishop, suffragan of Saltzburg, founded in the 17th century.

CHIEN DE MOUSQUET. See the article *SERPENTIN*.

CHIEN-VOLANT, in *Zoology*, the name under which Daubenton describes the great ternate bat, *vespertilio vampyrus*, which see.

CHIENGTUENDEN, the Persian name of the rhinoceros, according to Pietro della Valle.

CHIENTO, in *Geography*, a river of Italy, in the Ecclesiastical State, which runs into the Adriatic, between Fermo and Recanati.

CHIERI, a town of Piedmont, seated on the declivity of a hill, in a pleasant country, where the air is soft and salubrious: the hills on the north and east are covered with vines, and those on the west and south present to view fruit-trees of various kinds: the land is fertile, and the inhabitants are industrious, and employed in manufactures of cloth and silk. The ancient name of this town was "Cherium," or "Carium;" and by the French it is called "Quiers." Frederic Barbarossa destroyed it by fire in 1154, but it was soon after rebuilt. It is encompassed by an ancient wall, defended by towers, with a fosse; and formerly had a fortress, called "Rochetta," which was demolished in the 16th century. It has six gates, and four grand squares or palaces, many churches, and religious houses, though it has only two parishes within the walls, and one without: 6 miles E. of Turin. N. lat. 44° 45'. E. long. 7° 39'.

CHIERS, LA, a river of France, which runs into the Meuse, between Mouzon and Sedan.

CHIESA, LA, a river of Italy, which runs into the Oglio at Caneto, in the Mantuan territory.

CHIETI, a city of Naples, and capital of the province of Abruzzo Citra, the see of an archbishop, erected by pope Clement VII.; 75 miles E.N.E. of Rome. N. lat. 42° 22'. E. long. 14°.

CHIETTA, LA, a town of France, in the department of the Jura and district of Orgelat; 11 miles N.E. of it.

CHIEVRES, a town of France, in the department of Jemappe, and chief place of a canton, in the district of Mons. The place contains 2083, and the canton 12,520 inhabitants: the territory includes 120 kilometres and 21 communes.

CHIEUTI, a town of Naples, in the province of Capitanata: 13 miles S.S.E. of Termola.

CHIFFIR, or CHIEFIR, according to Libavius, in the preparation of the philosopher's stone, is called *lapis animalis*, as the mineral is called *chaos mineralis*. Johnson says, that the *chiefir mineralis* is by some interpreted *gold*, but that he rather takes it to be any sulphur of the metallure kind.

CHIFFLET,

CHIFFLET, JOHN JAMES, in *Biography*, equally celebrated for his political and for his medical lucubrations, was born at Befançon, the 12th of January, 1588. Having received such education as his native city could afford him, and been introduced to the study of medicine by his father, who was in high reputation there, he went to Paris, and, in succession, to Montpellier, Padua, and other of the principal schools, diligently attending the lectures of the professors in the different branches of medicine. In 1614 he returned to Befançon, and was appointed physician and counsellor to the city, in the place of his father, now far advanced in years. His reputation increasing, he was sent on an important mission to the arch-duchess Isabella-Clara-Eugenia, governess of the Low Countries, and performed his commission with so much skill, as to attach that princess to him, who retained him as her physician in ordinary. Some time after, he was sent by his mistresses to Philip IV. of Spain, who made him his physician, and engaged him to write the History of the Order of the Golden Fleece. He also wrote the History and Antiquities of Befançon, which was published at Lyons in 1618, 4to.; but the work which has been most noticed, was his *Vindicie Hispanicæ*, in which he attempts to prove that the race of Hugh Capet does not descend in the male line from Charlemagne, and that the female branch of the house of Austria precedes it. This work gave great offence; he rather, that Chifflet, being a Frenchman, should set up the house of Austria before that of his native sovereign. He was answered by Blondel, Le Tanneur, and other writers, who treated him with great asperity, which he was not backward in returning. Quitting Spain, he was appointed physician to Cardinal Ferdinand, who had succeeded Isabella as governor of the Low Countries in 1633. He enjoyed the same post under the arch-duke Leopold, and his successor, and died there in 1663, aged 73 years. He wrote also *de Ampulla Remeri*, laughing at the fable of the holy vase of oil, used in the coronation of the kings of France, and published a collection of treaties of peace between France and Spain. His writings, in this way, were collected and published at Antwerp, in folio, in 1659. His principal works in medicine were, "*Singulares ex curationibus et cadaverum sectionibus observationes*. Paris, 8vo. 1611." He supposes many diseases to be produced by the influence of the stars. There are nevertheless some useful and valuable observations in this volume. "*Pulvis febrifugus orbis Americani ventilatus*. Lorain, 1653, 4to." Intermittents that had been stopped by taking the Peruvian bark, frequently, he says, return, and with increased violence: he therefore dissuades from using it. He had three sons, an uncle, and three brothers, who were all writers, and distinguished for learning and abilities. Haller, Bib. Med. General Biog.

CHIFFRER, *French*, in *Musik*, to figure a base, to indicate the chords in thorough base, and point out the harmony of a composition to an accompaniment on a harp, lute, or keyed instrument.

CHIFUNG, among the Chinese, the name of an herb found about Canton, by which the sailors pretend to know how many storms will happen every year. This they compute from the number of knots or joints; and from the distances of the knots from the root, they determine what month the storms will fall in.

CHIGGARON, in *Geography*, a river of Asia, which rises in Persia, and runs into the Caspian sea, a little to the north of Amol.

CHIGGRE, a small narrow valley of Africa, in the desert of Nubia, closely covered up and surrounded with barren and pointed rocks. The wells in this valley are ten in

number; and the narrow gorge which opens to them is not ten yards broad. The springs, however, are very abundant, and furnish a grateful supply to those who travel in this dreary and sandy desert, where they are found. Whenever a pit is dug five or six feet, it is immediately filled with water. The principal pool is about forty yards square, and five feet deep; but the best tasted water issues from the cleft of a rock, about thirty yards higher, on the west side of the narrow outlet. This valley is the haunt of the wandering Arabs; particularly of the Bishareen of the tribe of Abou Betran, who, though they do not make it a station, because there is no pasture in the neighbourhood, yet find it one of the most valuable places of refreshment, on account of its great quantity of water; being also nearly half way, when they drive their cattle from the borders of the Red sea to the banks of the Nile; as well as in their expeditions from south to north, when they leave their encampments in Barbary to rob the Ababdé Arabs on the frontiers of Egypt. N. lat. 20° 58' 30". E. long. 34° 30'.

CHIGNAC, *Saint-Pierre des*, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Périgueux. The place contains 536, and the canton 8,547 inhabitants: the territory includes 242½ kilometres and 16 communes.

CHIGNECTO, a town of Nova Scotia, on the coast of the bay of Fundy.

CHIGNECTO *Channel*, the north-western arm of the bay of Fundy, into which Petitcodiac river falls. The spring tides rise here 60 feet.

CHIGY-*sur-Vance*, a town of France, in the department of the Yonac; 2½ leagues E.S.E. of Sens.

CHIHEMECOMÉT, or CHICK-MINOCK-CUMINOCK, an island on the coast of North Carolina, between Roanoke island and the northern entrance into Pamlico sound.

CHI-HING, a Quang of China of the third rank, in the province of Quang-tong; 6 leagues S.W. of Nan-yong.

CHIHOOEKI, an Indian nation confederate with the Lenapi or Delawares, who inhabited the western banks of Delaware river, anciently called by their name. Their southern boundary was Duck creek, in Newcastle county.

CHIKAGO, a river that discharges itself into the S.W. end of lake Michigan, where a fort formerly stood. Here the Indians have ceded to the United States, by the treaty of Greenville, a tract of land six miles square.

CHILACOTHAC, a town of America, in the territory N.W. of the Ohio, beautifully seated on the Scioto river, about 40 miles from its junction with the Ohio. This town, though it began to be established about the year 1797, is already become a considerable place. Scioto used to be the most dangerous part of the western country for Indians, and travellers passed it with terror. The settlements are now wonderfully extended and scattered over the whole country.

CHILAN, or CHILLAN, a jurisdiction of South America in the kingdom of Chili. The capital of the same name, is a small place, though it has the title of city; the number of families not exceeding two or three hundred, consisting mostly of Indians, as there are few Spaniards among them. Chilan is 75 miles N. of Concepcion.

CHILAPAN, a town of New Spain, in the country of the Colimaucas. Between this and Teotlylan is an entire mountain of loadstone.

CHILARA, a river of Naples, which runs into the Candelaro.

CHILBLAIN, in *Surgery*, is a local disorder arising from cold. When the body is exposed to cold, it acts in a more

immediate manner upon its surface, where it first excites a kind of erysipelatous inflammation of the skin, which becomes red and painful. When the operation of the cold is violent and long continued, the skin becomes pale and insensible, an uncommon degree of anxiety and languor is produced, and at last an unconquerable inclination to fall asleep; which, if the patient does not resist it with all his powers, brings on a complete apoplexy and insensibility, that finally terminates in death. Persons, who are obliged to expose themselves to extreme cold, ought, therefore, in order to avoid the impending danger, particularly to shun the immoderate use of spirituous liquors, to keep themselves constantly in motion, never stand or sit still, or rest themselves in any manner whatever; and as soon as they perceive languor and inclination to sleep come on, they should exert their strength to the utmost, in order to accelerate their motions, and preserve the circulation of blood in the extreme arteries.

As a frozen limb may be recovered and revived by warming it, the same may also be done with the whole body, when it has been apparently deprived of life by the operation of cold. In the latter case, however, it is not sufficient to warm the body, but the vital motions must also be restored. When, therefore, any of these actions still subsist in the heart and larger vessels of a body that has been frozen, they communicate themselves, as soon as the body is warmed, to the other parts of the system, and the patient is restored to life. But when all the vital actions have entirely ceased, and the blood in the heart itself is congealed, the body may indeed be thawed, but scarcely restored to life. And as this circumstance can never be foreseen, by the surgeon, he ought never to omit trying every possible means for restoring the patient's life; nor should he be induced to relinquish the attempt by the long duration of the apoplexy (or state of insensibility) as frozen bodies, that have remained for four and even six days apparently lifeless, have in some instances been restored to life. See article ASPHYXIA.

It is necessary however, that the warming of a frozen body or limb should be performed in a very gradual manner. For when a limb that has only been exposed to a violent degree of cold, (without being actually frozen,) is suddenly warmed, it becomes affected with the most violent inflammation, swells to a great degree, becomes red and blue; and intolerable pungent and throbbing pains are produced in it. The consequences, when in a slighter degree, are chilblains: in a more violent degree, real inflammation, effusion of the fluids into the cellular substance, and suppuration: suppose it be in the lungs, for example, a cough and catarrh will ensue; in the fingers, paronychia or whitlow, &c. But when a limb that is actually frozen is suddenly warmed, the same symptoms appear in a more violent degree, and mortification speedily and inevitably ensues. Of a similar kind and origin are the changes that take place in the whole body of a person who suddenly goes into a very warm place after having been previously exposed to extreme cold. The skin swells and becomes red; a burning and pricking sensation is felt; red spots appear, which proceed from small extravasations of blood; languor, vertigo, syncope, hæmoptysis, anxiety, inflammation of the lungs, &c. are produced, all in consequence of the sudden relaxation of the surface of the body and lungs, and the violent influx of the fluids into the vessels of those parts. When a person frozen to death is suddenly warmed, all hopes of restoring him to life are annihilated, and putrefaction speedily ensues.

The best method of warming a frozen limb gradually is to rub it with snow, till it recovers its powers of sensation and motion; but this must be done with caution, for fear of destroying its continuity, which may easily happen when

the part is not supported by a bone, for example, the tip of the nose and ears. Or it may be sufficient to plunge the frozen part into ice-cold-water; and in order to keep the water sufficiently cold, lumps of ice should now and then be thrown into it. When the powers of sensation and motion have been completely restored, we may wash the part with cold brandy, or oil of turpentine, camphorated spirits, hartshorn drops, and such like stimulating fluids; or we may apply electrical sparks, upon which it generally soon recovers its natural warmth. When this has been done, it is very serviceable to administer some gentle diaphoretic remedy, such as warm tea or wine-whey; to lay the patient in bed in a chamber without a fire, and to let him remain there for two or three hours, till a gentle perspiration takes place.

When a frozen limb has been too suddenly warmed, and is very much swelled, painful, red, blue, nay even black, and to all appearance already gangrenous in several places; it may nevertheless sometimes still be completely restored, and all the above mentioned symptoms removed, by plunging it immediately into ice-cold water. But it must be suffered to remain in the water, till after all the symptoms have disappeared; upon which we may rub it, as above-mentioned, with brandy, &c. and gradually warm it. This treatment now and then succeeds in cases where it could scarcely have been hoped for. No benefit, however, can be expected from it, when it has been so long deferred, that mortification has already actually taken place, which must then be treated in the usual manner. See GANGRENE.

The body of a person who has been frozen must be treated in the same manner as a single member. He must be brought into a cold chamber, laid in snow, or in a vessel filled with ice-cold water, with his nose and mouth above the surface: the necessary caution should be also used, lest any frozen part might break; and in this situation he is suffered to remain till he begins to exhibit signs of life. As soon as these are observed, strong stimulants and sternutories are to be applied to his nose; air must be blown into his mouth; tobacco-smoke should be injected into the rectum; the fauces are to be irritated with a feather, a cloth dipped in cold vinegar and camphorated spirits is to be laid over the pit of the stomach, &c. If the jaws are firmly closed, they must be rubbed with the above mentioned spirituous and stimulating remedies. When the body has thawed, and more signs of life appear, the patient must be taken out of the water, rubbed with water or brandy, less cold than the former, and brought gradually into a warmer atmosphere; gentle sudorifics are also to be administered, for example, an infusion of lemon and orange-peel with a little vinegar; and after he has been carefully wiped dry, he must be laid in bed, where he should remain till a gentle perspiration comes on. If, after he has been revived, a violent inflammatory fever comes on, it is necessary to draw blood from the arm. When the patient still remains insensible; when his face and the veins of the neck are swelled, so that an apoplexy is to be apprehended, the jugular vein must be opened. If after he has been revived, any part of the body exhibits appearances of being still frozen, continuing rigid, hard, inflexible and without sensation; we must cover or rub such part with snow, or with cloths dipped in cold water, till its powers of sensation and motion are restored; but on no account, use hot applications to it.

Chilblains are typical inflammations, which produce symptoms more or less troublesome in proportion to the violence of the inflammation. In its slighter degree, a chilblain is a swelling attended with a moderate redness of the skin, which produces a sensation of heat and itching, and after
some

some time spontaneously disappears. In a more violent degree, the swelling is larger, redder, and sometimes of a dark blue colour; and the heat, itching, and pain are so violent, that the patient cannot use the part. In the third degree, small vesicles arise upon the tumour, which burst and produce an excoriation; soon becoming an ill-conditioned ulcer that sometimes penetrates as deep as the bone, discharges a thin acrid fluid, and generally proves very obdurate. In the most violent degree, the inflammation goes on to mortification, which is frequently distinguished by vesicles filled with blood that appear upon the tumour.

Chilblains seem most frequently to arise from the sudden application of heat to a part that has been exposed to cold; and, *vice versa*, from the sudden exposure of a part, that has previously been heated, to the cold. Hence they frequently appear upon those parts which are most exposed to sudden transitions from one degree of temperature to another; for example, the nose, ears, lips, hands, and feet. They are more certainly produced, when the part which is suddenly exposed to cold is not only warm, but at the same time moist and sweating. Sometimes appearances much resembling chilblains, are left behind in limbs that, after having been frozen, have been restored to sensation and motion; especially if they have not been treated with proper caution. Chilblains are more apt to be produced, the more sensible and tender the skin is, and the less it is used to the cold: hence the people most frequently afflicted with them are children, young persons, women, those who have been bred up in a delicate manner, and are used to keep themselves unnaturally warm; or those who avoid exposure to the free air, and sweat much on the feet. But even when none of these causes are present, some weakly persons are extremely subject to chilblains, and in them their production seems to be favoured by some peculiar morbid predisposition.

Chilblains almost always make their appearance in the winter. During the summer they disappear, but return the succeeding winter. Some persons are attacked with them in the autumn, and some not till the spring. With some they continue only a few weeks, with others during the whole winter. When they are violent, they frequently deprive the patient of the use of the affected limb; and even excite a fever, by which the patient is confined to his bed. Suppurating chilblains frequently penetrate to the bone, and produce caries, and sometimes death. Suppurating chilblains are (from long habit) converted into a kind of issue; nature thus accustoms herself to the discharge and irritation, which at length are supposed to be necessary to health.

The most certain means of guarding against chilblains, consists in using the skin to a moderate degree of friction, and hardening it; in not exposing oneself to heated rooms, or keeping the body too warm; in adapting the quantity and kind of cloathing to the state of constitution, so as to avoid extremes, either in summer or winter; in washing the body frequently with cold water; in using oneself to regular exercise in the open air, even in all weathers; and in taking especial care not to go suddenly into a warm chamber, or very near the fire, out of the cold atmosphere.

A chilblain, in the first and second degrees, is a pure topical inflammation; which, however, cannot be removed by the general antiphlogistic remedies, but requires means adapted to its peculiar nature. Amongst the various remedies of this kind, there is none which always proves successful: one remedy cures one patient, another remedy succeeds with another. In relaxed and feeble habits, spirituous applications are generally serviceable; and in rigid constitutions oily and emollient substances. All these remedies, indeed, only re-

move the chilblains for the time, and do not prevent their return the ensuing winter. When the inflammation is so violent as to excite feverish symptoms, the application of leeches and internal antiphlogistic medicines are often necessary; but leeches applied to the affected part are particularly serviceable in such cases.

One of the most effectual remedies against chilblains in the milder degrees, is water reduced to the freezing point of temperature. The affected part should be dipped in it several times in the day, and kept there till the heat and itching abate, or the chilblain entirely disappears. After the part has been bathed in this manner, it should be well dried by rubbing it with a coarse cloth; then covered with leather or flannel, or a diachylon plaster, and carefully guarded against the external air. Instead of water, we may also use snow, with which the affected limb should likewise be rubbed for some minutes several times in the day, till the chilblain disappears. With some persons, who are not used to exposure to the cold, who have very irritable skins, or who are much inclined to cough and colic pains, the application of cold water and snow does not agree, and with some it even increases the inflammation; so that we must be guided in a certain measure by its effects. Exposing the part affected to an extreme heat and actually scorching it, has now and then proved efficacious; but it is too painful to be prudently adopted, as a general practice.

In one case, in which the pains were not relieved by the application of cold water, (see Richter's Chirurg. Bibliothek.) Mr. Schneider used a bath of quick-lime, in which the patient was directed to hold his hands for the space of half an hour every morning and evening; after which the ulcerated hands and fingers were dressed with an ointment, consisting of *sev. cervin. ol. laur. & ol. terebinth.* spread upon linen. As soon as the mortified part had separated, and the remaining ulcer was clean and sensible, he dressed it with Goulard's cerate, till the cure was completely accomplished. The bath was prepared by plunging a piece of quick-lime, about the size of a man's fist, into four quarts of boiling water, and stirring it till the water was reduced to a lukewarm temperature.

In some cases, *ol. petræ. ol. terebinth. butter of cacao, sev. cervin. bals. Peruvian. bals. capiva*, either alone or mixed with the yolk of eggs; a cataplasm of rotten apples, or bruised house-leek, or fresh turnips bruised with eggs and myrrh; or an ointment of hog's lard, olive oil, yellow wax, and pitch melted together; or frozen turnips, scraped and fried with linseed oil; or squills applied with hot oil or soft turpentine, &c. have been found very serviceable. These remedies are partly applied fresh twice a day, and partly rubbed into the affected limb, if it be not ulcerated.

In other cases, strengthening and astringent remedies prove more serviceable; and in Germany it is common to employ Theden's vulnerary wash, which is particularly serviceable when the chilblains swell as the frost sets in. This remedy is applied cold to the part, which is kept for some days constantly moistened with it. Persons who are subject to annual attacks of chilblains, may guard themselves against them by washing their feet and hands every morning and evening, during the autumn, with this mixture: only it is said to be inadmissible with those who have arthritic tumours upon their limbs, as these might thereby be repelled. It has also been recommended to wash the chilblains with water boiled with flour and mustard-seed; also with marine acid, diluted in water; with hot salt water; spirits of wine, or soap liniment; the fumes of hot vinegar, a decoction of turpentine peel in water with a sixth part vinegar: the lower orders of people employ hot urine, either alone or with lime-water.

Æc. These remedies are to be applied to the affected part several times in the day: after they have been used, the part must always be well dried, and guarded against the external air, by means of gloves, or socks of thin leather, woolled, or flannel. Sometimes all these remedies are of no service, unless the patient abstains from using the affected limb.

For the cure of suppurating chilblains, an appropriate strengthening regimen, and a course of medicines, will be generally required. See **ULCER** and **GANGRENE**.

CHILBY, in *Ichthyology*, sometimes *felibilly*, the Arabian name of a fish found in the Nile, which is figured and described by Sonnini in his Travels in Upper Egypt. This is a fish of the silure genus, *Silurus mytus* of Forskål; *Silurus mytus*, *pinna dorsali unica*, *radius sex*, *cirrhis octo*, Artedi and Linn. Hasselquist also describes it. Sonnini observes, that it is not such bad eating as some other fishes of the Nile. This writer has nothing to add to the Linnæan description above quoted, and for which Linnæus was indebted to Hasselquist, except that the upper jaw of the chilby has two rows of little sharp-hooked teeth; that the lower jaw has but one row of those recurved teeth; and that it is all over of a pretty uniform blackish grey colour, deeper above the lateral line than below, with a few tinges of red on the nose, and at the base of the pectoral, anal, and caudal fins; and lastly, that the iris of the eye is of a golden colour. See **SILURUS mytus**.

CHILCA, in *Geography*, a town of South America, in the vice-royalty of Peru, archbishopsric of Lima, and jurisdiction of Canete, is situated about 10 leagues from Lima, and celebrated for its saltpetre, of which gunpowder is made in that city. It has also a good fishery, together with plenty of fruits, pulse, and poultry, which supply a large trade between the jurisdiction of Canete and the capital. S. lat. 12° 31'. W. long. 76° 5'.

CHILCANAUTHLI, in *Ornithology*, the Mexican name of the St. Domingo teal, *anas dominica*: called also *colcanaubili*.

CHILD, a word of Saxon origin, meaning the young offspring of the human species, and expressing relation to parent.

We say **NATURAL** child, **LEGITIMATE** child, **PUTATIVE** child, **BASTARD** child, **ADOPTIVE** child, **POSTHUMOUS** child, &c.

Dr. Derham computes, that marriages, one with another, produce four children, not only in England, but in other parts also. See **MARRIAGE**.

It is well known that children, for some time after they are born, see but very imperfectly; and M. Petit, (Ac. Paris, 1727. H. p. 14.) after taking a great deal of pains to investigate the cause of it, found it to be owing in part to the thickness of their cornea, and the small quantity of their aqueous humour. Not that the mere thickness of the cornea could have this effect; but because the thickness is owing to its not being well stretched, and consequently, laying wrinkles and inequalities on its surface, which occasion an irregular refraction of the light. On the same account also the cornea has not a sufficient degree of convexity to bring the pencils of rays to a focus firm enough. All these defects, he shews, are remedied by the increase of the aqueous humour. M. Petit ascribes this imperfection of sight in infants to their eyes being compressed by the fluid in which they are immersed in the womb. He also gratified his curiosity by inquiring into this circumstance respecting various new-born animals, as dogs, cats, rabbits, calves, and hogs; and he found in all of them that the cornea was thick and flaccid, and the aqueous humour not sufficiently copious. It is possible, that, besides the small quantity,

and want of transparency, which some writers also mention in the aqueous humour, vision in new-born infants may be obstructed by the remains of the *membrana pupillaris*, which is a production of the *uvea*, and closes the pupil in the fœtus.

Dr. Jurin observes, (see Essay upon Distinct and Indistinct Vision), that in children the pupil is usually more dilated than in grown persons. This is easily seen; for in grown persons the pupil seldom appears equal to the breadth of the ring of the uvea on either side of it; that is, is seldom equal to one-third of the breadth of the cornea, and is often much less, especially in a good light. But in children the diameter of the pupil scarcely ever appears so little as one-third of the breadth of the cornea, and often exceeds half that breadth. The reason of this, Dr. Jurin apprehends to be, that in children the cornea is extremely flexible, so as to be very easily bent by its muscular ring into any curvature that is necessary for seeing distinctly in reading, and consequently, their pupil has less occasion to contract for distinct vision. Children can read at a much nearer distance than grown persons; for which two reasons are assigned; viz. that their eyes are smaller, and the least distance at which any eye can see distinctly is proportional to the length of the eye; and also their cornea, being very flexible, is easily accommodated to a less distance; and at a less distance the print appears larger, and is more easily read than at a greater.

Bartholine, Paré, Licetus, and many other writers, give an account of a *perfrigid child*, which has seemed wholly incredible to some people. The child, however, which they describe, is still in being, and is kept as a great rarity in the king of Denmark's museum at Copenhagen. The woman who went big with this, lived at Sens in Champagne in the year 1582; it was cut out of her belly, and was universally supposed to have lain there about twenty years. That it is a real human fœtus, and not artificial, is evident to the eye of any observer; and the upper part of it, when examined, is found to be of a substance resembling the gypsum or stone of which they make the plaster of Paris; the lower part is much harder; the thighs and buttocks being perfect stone, of a reddish colour, and as hard as common quarry-stone: the grain and surface of this part appear exactly like that of the calculi, or stones taken out of human bladders: and the whole substance examined ever so nearly, and felt ever so carefully, appears to be absolute stone. It was carried from Sens to Paris, and there purchased by a goldsmith of Venice; and Frederick III., king of Denmark, purchased it at Venice of this man for a very large sum, and added it to his collection of rarities. See Dr. Pricletley's Hist. of Vision, &c. 4to. p. 187. Phil. Trans. N° 285. p. 1400. See **INFANTS**.

Child, as we have already observed, is a term that denotes relation to a parent; and this relation devolves on children corresponding duties. There is an interval of eight or nine years, between the dawning and maturity of reason, in which it is necessary to subject the inclination of children to many restraints, and direct their application to many employments, of the tendency and use of which they cannot judge: for which cause, the submission of children during this period must be ready and implicit, with an exception, however, of any manifest crime which may be commanded them. After they have attained to manhood, if they continue in their father's family, they are bound, beside the general duty of gratitude to their parents, to observe such regulations of the family as the father shall appoint: contribute their labour to its support, if required; and confine themselves to such expences as he shall allow.

After

After children have attained to manhood, and have left their father's family, their duty to parents is simply that of gratitude; in kind not different from that which we owe to any other benefactor, but in degree so much exceeding other obligations, as a parent has been a greater benefactor than any other friend. The services and attentions, by which filial gratitude may be testified, cannot be distinctly enumerated. It will shew itself in compliances with the will of parents, however contrary to the child's own taste or judgment, provided it be neither criminal nor totally inconsistent with his happiness: in a constant endeavour to promote their enjoyments, prevent their wishes, and soften their anxieties, in small matters, as well as in great; in assisting them in their business; in contributing to their support, ease, or better accommodation, when their circumstances require it; in affording them our company, in preference to more amusing engagements; in waiting upon their sickness or decrepitude; in bearing with the infirmities of their health or temper, with the peevishness and complaints, the unfashionable, negligent, austere manner, and offensive habits, which often attend upon advanced years: for where must old age find indulgences, if it do not meet with it in the piety and partiality of children? In all contentions between parents and children, and more especially those that occur in relation to marriage, or the choice of a profession or business, it is the parent's duty to represent to the child the consequences of his choice and conduct; and this should be done with fidelity, moderation, and candour. Parents, however, are forbidden to interfere, where a trust is reposed personally in the son; and where, consequently, the son was expected, and by virtue of that expectation is obliged, to pursue his own judgment, and not that of any other; as is the case with judicial magistrates in the execution of their office; with members of the legislature in their votes; and with electors, where preference is to be given to certain prescribed qualifications. In these and similar cases the son may assist his own judgment by the opinion and advice of his father; but his own judgment ought finally to determine his conduct.

The duties of children to their parents arises from a principle of natural justice and retribution. For to those, who gave us existence, we naturally owe subjection and obedience during our minority, and honour and reverence ever after: they, who protected the weakness of our infancy, are entitled to our protection in the infirmity of their age; they who by sustenance and education have enabled their offspring to prosper, ought in return to be supported by that offspring, in case they need assistance. The Athenian laws carried this principle into practice with a scrupulous kind of nicety; obliging all children to provide for their father, when fallen into poverty: with an exception to spurious children, to those whose chastity had been prostituted by consent of the father, and to those whom he had not put in any way of gaining a livelihood. Our laws agree with those of Athens with regard to the first only of these particulars, the case of spurious issue. In other cases the law does not hold the tie of nature to be dissolved by any misbehaviour of the parent; and, therefore, the child is equally justifiable in defending the person, or maintaining the cause or suit of a bad parent as a good one; and is equally compellable, (Stat. 43 Eliz. c. 2.) if of sufficient ability, to maintain and provide for a wicked and unnatural progenitor, as for one who has shewn the greatest tenderness and parental piety.

The duty of children to their parents was thought worthy to be made the subject of one of the ten commandments; and, as such, is recognized by Christ, together with the rest of the moral precepts of the decalogue, in various places of the gospel. The same divine teacher's sentiments concern-

ing the relief of indigent parents appear sufficiently from that manly and deserved indignation, with which he reprehended the wretched casuistry of the Jewish exploiters, who, under the name of a tradition, had contrived a method of evading this duty, by converting, or pretending to convert, to the treasury of the temple, so much of their property, as their distressed parent might be entitled by their law to demand.

Obedience to parents is enjoined by St. Paul to the Ephesians (ch. vi. 1.) and also to the Colossians (ch. iii. 20) upon two principles, the distinct statement of which shews that moral rectitude and conformity to the divine will were, in his apprehension, the same. By the Jewish law, disobedience to parents was, in some extreme cases, capital. Deut. xxi. 18. Paley's Principles of Moral, &c. Philosophy, vol. i. ch. 11. Blackst. Comm. vol. i. p. 453, &c. See PARENT. See also EDUCATION.

CHILD, DR. WILLIAM, in *Biography*, according to Ant. Wood, was a native of Brillot, and disciple of Elway Bevin. In 1631, being then of Christ-church College, Oxford, he took his degree of bachelor in music; and, in 1636, was appointed one of the organists of St. George's Chapel at Windsor, in the room of Dr. John Munday, and soon after one of the organists of the Royal Chapel at Whitehall. After the restoration he was appointed chanter of the King's Chapel, and one of the chamber musicians to Charles II. In 1663, the university of Oxford conferred on him the degree of doctor in music, at an act celebrated in St. Mary's church. Dr. Child, after having been organist of Windsor chapel 65 years, died in that town, 1697, at 90 years of age. In the inscription on his grave-stone, in the same chapel, it is recorded that he paved the body of that choir at his own expence; he likewise gave 20*l.* towards building the town-hall at Windsor, and 50*l.* to the corporation to be disposed of in charitable uses, at their discretion.

The following epitaph is also on his grave-stone in St. George's chapel:

Go happy soul, and in thy seat above
Sing endless hymns of thy great Maker's love.
How fit in heavenly songs to bear a part!
Before well practis'd in the sacred art;
Whilest hearing us, sometimes the choir divine,
Will fure descend, and in our consort join;
So much the musick thou to us hast given,
Has made our earth to represent their heaven.

His works are "Psalms for Three Voices," &c. with a continued base either for the organ or theorbo; composed after the Italian way, London, 1639. "Catches, Rounds, and Canons," published in Hilton's "Catch that Catch can," 1652. "Divine Anthems and Compositions to several Pieces of Poetry," some of which were written by Dr. Thomas Pierce of Oxford. Some of his secular compositions likewise appeared in a book entitled "Court Ayres," printed 1655, which will be mentioned hereafter. But his principal productions are his services and full anthems, printed in Dr. Boyce's collection. His service in E minor has something more varied and interesting, in the modulation, than there is in most of his other works; and in his celebrated service in D major, there is a glow of rich harmony, which, without any great compass of genius or science, is extremely pleasing, the more so, perhaps, from being composed in a key which is more perfectly in tune than most others on the organ. His full anthems are not without imagination and fire, p. 97, (Boyce, vol. ii.) "and upon our solemn festivity, &c." the modulation and contrivance are admirable to the end of the anthem. His style was so remarkably easy and natural, compared with that to which choirmen had been accustomed, that it was frequently treated by them with de-
rision.

rison. Indeed, his modulation, at present, is so nearly modern, as not to produce that solemn, and, seemingly, new effect on our ears, which we now experience from the productions of the sixteenth century.

There are several incedited and valuable compositions by Dr. Child preserved in Dr. Tudway's manuscript "Collection of English Church Music," Brit. Museum.

CHILD-BIRTH, the act of bearing a child. See BIRTH and LABOUR.

CHILD-WIT, a power to take a fine of a bond-woman unlawfully gotten with child; that is, without consent of her lord. Every reputed father of a base child, got within the manor of Writtle in Essex, pays to the lord, for a fine, 7s. 4d. where it seems, *child-wit* extends to free, as well as bond-women.—*Quicumque fecerit child-wit, archiepiscopus aut totam, aut dimidiam emendationis partem habebit, quietum esse de child-wit.* Du-Cange.

CHIDERMASS Day, called also *Innocent's Day*, an anniversary feast of the church, held on the 28th of December, in memory of the children of Bethlehem, massacred by the order of Herod.

CHILDREN, Charity. See CHARITY school and HOSPITAL.

CHILDREN, exposing of. See EXPOSING.

CHILDREN, naming of. See NAME.

CHILDREN, overlaying of. This is a misfortune which frequently happens; to prevent which, the Florentines have contrived an instrument called *arcutio*.

CHILHOWEE, in *Geography*, a town of America, in the Tennessee government; 25 miles S of Knoxville.

CHILI, an extensive, rich, and fertile country of South America, reaching from the frontiers of Peru to the straits of Magellan, terminating towards the east partly on the frontiers of Paraguay, from which it is separated by uninhabited deserts, and partly on the government of Buenos Ayres with the intervening pampas, or extensive and level plains, and bounded on the west by the Pacific ocean. On the north its boundary is the desert of Atacama, or Attacama (which see), extending 80 leagues between the province of the same name, being the last of Peru, and the valley of Copoyapo, or Copiapo, the first in Chili: on the east it is separated by the eastern branch of the Andes from Cuyo, in the vice-royalty of La Plata, and the savage tribes; on the south, by barren mountains and regions covered with sand and snow; and on the west, as we have already said, by the South Sea, extending from 27° nearly, the latitude of Copiapo, to 53° 30'. Its length is computed at 1260 geographical miles, and its breadth, which depends on the distance of the Andes from the ocean, is from 24° to 32° about 210 miles, from 32° to 37° 120 miles, and thence to the island or islands of Chiloe, about 300 miles. If we comprehend within its extent the Andes, Chili may be supposed to contain about 378,000 square miles. Of this extensive and interesting country little or nothing was known till about the middle of the 15th century. At that period the native Chilese were divided into 15 tribes, each of which was governed by its own chief. About the year 1450, the Inca Yupanqui, the 10th emperor, allured by the enchanting account given of this country, undertook the conquest of it, and professed the enterprize with such success, that he subdued the several nations inhabiting the vallies of Copiapo, Coquimbo, and Chili; but having established his dominion in some of the northern districts, his progress farther southward was vigorously opposed by a confederacy on the part of the gallant and high-spirited inhabitants, who were determined to maintain their independence; and the Peruvian army was defeated. The Chilese, however, who were subdued, and those who remained free and independent,

performed the same mode of life. They cultivated their lands with maize, potatoes, yucas, and other native plants; they encouraged the breed of the camel and sheep, which supplied them with flesh for food, and with wool for clothing; and they are said to have had at this time hogs and hens, besides other beasts and birds, which belonged to their country. But though they seemed to have advanced from a pastoral to an agricultural state, their instruments of husbandry were mean and unwieldy. Their villages consisted of scattered huts; and their chiefs, who were probably raised to this dignity on account of their wealth, possessed merely a power of direction, and not of coercion. The right of property was acknowledged; the field that was cultivated belonged to him who bestowed labour on it, and descended to his children. Their looms resembled those of the Europeans, though of ruder fabric, and they were acquainted with the process of manufacturing earthen ware. From their mountains they extracted gold, silver, copper, tin, and lead; and of a mixture, like bell-metal, they formed axes and other instruments; although those in more general use were made of basalt. It has been suggested that they were acquainted with the use of iron; but this fact seems to be doubtful. They were not strangers to salt, both fossil and that produced from water by evaporation: they fixed their dyes by means of an aluminous stone, called "polauva;" they prepared thread for cords and nets from one of their plants; and they possessed canoes of different sorts. In numbers, it is said, they could express one thousand, and they had *prans* or the Peruvian *quipos*, a bundle of threads of various colours, with different knots to express contracts or events. The native Chilese, being generally of a mild character, as Molina cited by Mr. Pinkerton suggests, may probably have proceeded from the isles of Polynesia; though their colour is brown, tinged with red or copper, whereas that of the Polynesiens is generally olive. The language of the Chilese, which is said radically to differ from the *Quechua*, or Peruvian, is remarkably rich and harmonious, and from the vocabulary, formed by Molina, it is capable of expressing most natural objects, and even abstract terms. It essentially differs, however, from the other American languages, not less in its words than in its structure. The Araucans, the present possessors of nearly one half of Chili, and celebrated for their valour in resisting the progress of the Spaniards, may be considered as the genuine representatives of the ancient Chilese. The beautiful tract of country which they inhabit extends from the river Biobio north to that of Valdivia south, and is bounded on the east by the Andes, and on the west by the ocean. These people derive their name from the province Arauca, which is the smallest of their state; and they are also distinguished by the appellation of "Aucas," or freemen. Without surpassing the usual size, they are generally robust, well-formed, and of a warlike aspect. The face is nearly round; the eyes small, but lively and expressive; the nose somewhat flat; the mouth well made, with white and uniform teeth; the legs muscular and elegant, and the feet small and flat. They have naturally little beard, and take pains to extract it; and they also eradicate the hair from other parts of the body. The hair of the head, which they preserve, is black and abundant, and they bind it up in a knot. Many of their women are handsome; particularly those of Boroa. They live to the advanced age of 70, 80, and even 100 years, without any perceptible decay of mind or body. Their mental qualities correspond to their bodily vigour; and they are characterized as intrepid, patient of the fatigues of war, prodigal of their lives in defence of their country, ardent lovers of liberty, in defence of which they are ready to make any sacrifice, jealous of honour,

courtous,

courteous, hospitable, faithful to their engagements, grateful for benefits, generous, and humane towards the vanquished. These excellent qualities, however, are tarnished with the vices incident to savage life; such as drunkenness, sloth, self-confidence, and a pride which leads them to treat other nations with contempt. The dress of the Araucans, who are a military people, is short, wholly made of wool, and generally of a blue colour. The cloathing of the women is modest and simple; though sometimes set off with artificial ornaments. Their hair is parted into flowing tresses, and the head adorned with false emeralds, or with the green stone called "glauca," which they highly value. They also use necklaces and bracelets of glass beads, earrings of silver in a square form, and numerous silver rings on the fingers. Polygamy is almost universal; and their houses are constructed so as to admit the number of wives which the owner can entertain; but their furniture is plain, and such as is merely adapted for use. Their habitations are generally dispersed over the country, and situated near the rivers; but cities are regarded by them as prisons.

Their political arrangements are suited to their discriminating character. The whole territory of Araucana, from north to south, is divided into four parallel tetrarchies; almost equal in size, and denominated the maritime, the plain, the upland, and the mountainous. Each of these is subdivided into five provinces, and each province contains nine districts. The mountainous tetrarchy is possessed by the Puelches, formerly allies to the Araucans, but now united with them. The government is aristocratical; and they have three orders of chiefs, viz. "Toquis," from *toqui*, a judge, who presides over each tetrarchy, and are independent of each other, except that they confederate for the general good; "Apo-ulmens," or grand chiefs, who govern the provinces; and "Ulmens," who preside over the districts, and acknowledge no superior, except on occasions of war. The distinction of a toqui is an axe of porphyry or basalt. Those of the other two orders have staves headed with silver; the apo-ulmens being distinguished by a ring of the same metal round the middle of the staff. All these dignities are hereditary, in the male line, and sole order of primogeniture. The absolute power is vested with the barons, who decide important business in a general diet, called the "Aucacoyag," or assembly of freemen. This congress is commonly held in a spacious meadow. Their laws, descending to them by tradition, are called "Admapu," or customs of the country. No two dignities are allowed to concentrate in the same head; and if a family fail, the vassals exercise the right of electing another: nor are they attached to the glebe, as in the feudal system, or constrained to any personal service, except in time of war. Tributes and taxes are unknown, as each chief lives on his own estate; nor are they respected as superiors, but merely as the first among equals. Although many crimes are punished with death, yet a composition may be entered into with the relations. The ulmens are the legitimate judges of their vassals. Whenever war is resolved on by the great council, the commander in chief is selected from the toquis; who instantly assumes the axe of stone, as the symbol of his authority: all the other chiefs take oaths of obedience; and the people, though at other times unruly, become submissive to their military sovereign. Heralds are sent to the confederate tribes, and to the Indians in the adjacent districts of the Spaniards; and the badges of these heralds are bundles of small arrows bound with a red thread, and their secrecy is equal to their dispatch. The general signifies to the tetrarchs the number of troops that are requisite, and it is divided among the apo-ulmens, who demand the contin-

gent from each ulmen. As every Araucan is a soldier, the levy is easily raised: and the army generally amounts to 5 or 6000, exclusive of a body of reserve. It consists both of cavalry and infantry: the former are armed with lances and sabres, the latter with pikes, or clubs having iron spikes. Each regiment of infantry is composed of 1000, and each company consists of 100: and they have all their particular banners, besides the common badge of the nation, which is a star. Under their usual dress they wear a cuirass of leather; and of this leather, which they have a peculiar mode of hardening, they make helmets and shields. They have not discovered the art of making gun-powder. On the march the infantry is mounted, but they dismount before a battle. Each soldier carries his provision of parched maize, which is steeped in water. Their camp is well formed and guarded. In battle, the cavalry forms two wings, and the infantry occupy the centre, in distinct battalions or divisions; a clubman and a pikeman placed alternately composing the files. The toqui addresses a pathetic discourse to the army, exhorting them not to permit the sacred flame of freedom, bequeathed by their ancestors, to expire. They then advance with loud shouts, generally attacking the Spaniards centre, and, with their clubs, notwithstanding the enemy's artillery, they often make terrible havoc. The booty is equally divided among the captors, without any preference of the officers, or even of the general. The prisoners remain slaves, till exchanged or ransomed; and sometimes, though very seldom, one is sacrificed, to pacify the manes of the slain. Treaties are formed in a kind of council, held in a meadow near the river Biobio. The symbol of peace is a branch of the cinnamon tree; and an Araucan orator discusses, in the Chilese language, the motives of the war, and the means of future harmony. As soon as this speech is interpreted, the Spanish governor or president replies; and the articles being revised, are ratified with a sacrifice of Chilese camels. The president then dines in company with the toqui and chief ulmens, to whom he makes the usual presents, in the name of his sovereign; and these are repeated on the arrival of every new president.

The Araucans acknowledge a supreme being, the author of all things, who is called "Pillan," or the Spirit; and they express, by various epithets, his residence in heaven; his being the soul of all creation; dreadful from his thunder: the architect of the universe; omnipotent, eternal, and infinite. They also held, that the affairs of worlds are administered by inferior spirits, of various rank and power. The Mars of the Araucans is Epunameu; and Meulen is a beneficent god, and lover of the human race. They admit an evil principle, Gucucu, the author of calamity and death; and subordinate to Meulen are many geni, who attempt to counteract the machinations of Gucucu. These geni are male and female; and the latter are supposed to serve the men. Conceiving that the spiritual lords resemble the ulmens, and would despise any attempts of mortals to praise and honour them, they have neither temples, idols, nor priests; and they offer no sacrifices, except during endemic maladies, or on a treaty of peace. However, they often address prayers to Pillan and Meulen. Christianity is tolerated in the country of the Araucans, and the missionaries are well received; but the number of proselytes is small. These people are very attentive to omens and dreams; and the bravest Araucan warrior will tremble at the sight of an owl. They consult their magicians in all affairs of moment; and are firm believers in apparitions. They admit the immortality of the soul, and suppose that, after death, the soul passes to the west, to a place or country called "Galceman," where, according to some, delights abound

for the good, and the bad are punished by privation: but, according to others, all souls will enjoy pleasure; punishments, like crimes, being short and transitory. They watch the dead all night, and, on the third day, carry the body to the cemetery of the family, which is commonly situated in a wood or upon a hill. The bier is surrounded by women, who affect to weep; and another spreads ashes behind, in order to prevent the return of the soul to the house. When the body is set down, wlike weapons are placed round it; and if it be that of a female, her ornaments; together with plenty of food, and vases of liquor, often cyder or wine, that there may be no want on the journey into the other world. After taking leave of the dead, with many lamentations, and wishing a happy journey, the body is covered with earth, or with stones, in the form of a pyramid, over which they pour copious streams of cyder. They farther believe, that an old woman soon arrives, in the form of a whale, to carry the soul across the ocean, where another old woman guards the Elysian fields, and sometimes exacts an eye, when the passenger cannot satisfy her demands. The occupation and pleasures of the future life remain the same; and the husband, if he chooses, may have his wife again; but there are no children, because it is the abode of the dead. There are also wars and battles; and armies, meeting in the air, cause thunder and lightning. The Araucans have an idea of a great deluge; during which many were saved on the mountain "Thegthy," which can float in water. This idea, Molina suggests, has arisen from the earthquakes and volcanos, so common in their country; for, during the terrors excited by a severe earthquake, they'll run to the mountains, with provisions, in hope of escaping, if the sea should overwhelm their country.

The year of the Araucans is solar, and commences on the 22d of December, immediately after their summer solstice; and it is divided by the solstice in June into two parts. They have 12 months of 30 days, and 5 intercalary days. They have 4 seasons, each of 3 months; and they divide the day into 12 parts, 6 of light and 6 of darkness. The hours of the day are distinguished by the height of the sun; and those of the night by the position of the stars. Constellations are also marked; the Pleiades being styled that of *six* from the small apparent stars, and the Antarctic that of *four*. The milky way is called the street of the fable, because the astronomers of the country reject certain popular tales concerning it. They distinguish the planets, and believe them to be inhabited. The Araucans, though they have little or no idea of the speculative sciences, cultivate rhetoric, poetry, and medicine; to the purity of their language and to the eloquence of their public speakers they pay great attention. They accustom themselves much to a figurative and allegorical style, and their discourses abound with apologues and parables. Strong and lively images, bold figures, frequent allusions and similes, novelty and force of expression, and pathetic sentiments concur to form their poetry, which is chiefly employed in celebrating the actions of their heroes. Their lines consist of 8 or 11 syllables; and their poems are all in blank verse, with an occasional, though very rare, admission of rhyme. Of physicians there are 3 classes; the empirical, who are best, have some knowledge of the pulse, and use of herbs; those who believe that all diseases proceed from insects; and others who ascribe them to witchcraft, and thus occasion the death of innocent persons; they have also persons who can set broken bones and cure wounds. With regard to their mode of carrying on trade, we shall observe, that as the use of money is not known, exchange is the only mode of commerce. Their foreign

trade consists chiefly in cloaks and cattle, which are exchanged with the Spaniards for wine and European articles. In their intercourse with Europeans they are proud and self-sufficing; and they themselves expect to be treated with great ceremony and respect; whilst they are duly sensible of benefits, they are eager for vengeance on their enemies. In their discrimination of different families, they use names and surnames. Polygamy, as we have already said, is universal, and a man may buy as many wives as he can maintain; but an old bachelor is regarded with contempt as an enemy of the state. Marriage is a very simple rite; being a kind of amicable rape, as the husband seizes the bride unexpectedly, while she attempts to cry out for assistance. Her friends then pass to his house, and after a festival, receive the nuptial present; to the first wife, however, particular honour is rendered, while the rest are regarded as mere concubines. The husband indicates his preference by ordering one, during supper, to prepare the bed; the others sleep in the same chamber, which no stranger is permitted to enter; strangers being lodged in tents at a distance. All the wives pay great respect to their husbands. The Araucan women are distinguished by neatness and cleanliness in their houses and in their own persons. The bath is universally used both by men and women; but the latter resort to separate places protected by shade and solitude. On the day of parturition, they take the new born infant to the river, wash both it and themselves, and return to their business without inconvenience; no bandages are used for their infants; they are placed in hanging cradles upon thin skins, and covered with a cloth, and they are rocked by means of a cord which hangs from the cradle, so that the mothers are not interrupted in their business; the infant is soon able to take care of itself. The education of children is restricted to horsemanship, the use of arms, and the practice of speaking their language with elegance. Faults are seldom noticed; nor do the Araucans ever chastise, because, in their opinion, punishments can only produce falsehood or cowardice. The food of the Araucans consists mostly of grain or pot-herbs variously dressed; but maize and potatoes are the most esteemed; they use little meat or fish, and instead of bread they have a kind of light cake or potatoes. Their drink consists of various kinds of beer and cyder; and they are fond of wine, which they procure from the Spaniards. The matter and his family eat at the same table, which is covered with earthen-ware and goblets of horn or wood. They light their fire by turning one stick rapidly on another. Although in private they are frugal, yet on solemn occasions they spare no expence in their repasts; and then fermented liquors are freely taken. Music, dancing, and gaming, constitute their principal amusements. Their music is bad, and their songs harsh and hideous; but their dances are more cheerful and harmonious. The women, however, dance apart from the men. Their games are both sedentary and gymnastic. From time immemorial, it is said, they have known the game of chess, which they call "comcan;" the young are fond of wrestling, the race, and a kind of tennis. But their favourite games of the gymnastic kind are the "peuco," and the "palecan;" the first representing the siege of a fortress, when 12 or more persons form a circle and place a boy in the middle of it whom the assailants endeavour to seize, but seldom succeed, the latter resembles a battle, 30 or more players attempting to drive the ball within their bounds, and this game will sometimes last half a day.

Having enlarged on the disposition and manners of the Araucans, because they are a people hitherto so little known, although Dr. Robertson in his "America," and Perouse in his voyages, and some others have very transiently mentioned

mentioned them, we shall close this part of the article Chili with observing, that the Puelches of the mountains, now united with the state of Araucana, are more rude and savage than the other inhabitants. Their name signifies eastern men: their stature is tall, and they are fond of the chase, so that they often change their habitations, and detach colonies to the eastern sides of the Andes, as far as the lake Naguelgrapi, and the shores of the Atlantic, in the plains of Patagonia. By the Araucans the mountaineers are highly esteemed on account of their bold services in war, and their inviolable fidelity in adhering to the confederacy.

The valour of the Araucans, and their love of liberty and independence, have been signally manifested on a variety of occasions; not only in their early contests with the Peruvian Incas, but in their resistance to the hostile attacks of the Spanish invaders of their territory. Soon after their subjugation of Peru, the Spaniards, allured by the fame of the opulence of Chili, commissioned Diego de Almagro to attempt the conquest of it. Accordingly, in 1735, he marched from Cuzco, and, after losing many Indians and a considerable number of Spaniards, who perished with cold in passing over the Cordillera Nevada, as well as with fatigue and famine, he arrived at Copiapo, where the Indians immediately submitted. Thus encouraged, he proceeded to the conquest of other nations, which had never acknowledged the Peruvian Incas. In his progress he met with a vigorous opposition; as the Chilese soon recovered from their first surprize, and not only defended themselves with obliquity, but attacked their new enemies with more determined valour and fierceness than any American nation had hitherto discovered. The Spaniards however continued, amidst increasing difficulties and conflicts, to penetrate into the country, and collected considerable quantities of gold; but they were so far from thinking to make any settlement amidst such formidable neighbours, that, in spite of all the experience and valour of their leader, the final issue of the expedition still remained extremely dubious, when they were recalled from it by an unexpected revolution in Peru. (See the biographical article ALMAGRO.) In the year 1541 the scheme of invading Chili was again resumed, and the command of the expedition for this purpose was conferred by Pizarro on Pedro de Valdivia; and, notwithstanding the fortune of the natives in defending their possessions, he made such progress in the conquest of the country, that he founded the city of St. Jago or Santiago, which still remains the capital of the country, and thus commenced the establishment of the Spanish dominion in that province. In 1548 he was promoted to the government of it by the president of Peru. Valdivia, after having exhibited many displays both of courage and military skill, was cut off in 1553, together with a considerable body of troops under his command. Francisco de Villagra, Valdivia's lieutenant, by his spirited conduct, checked the natives in their career, and saved the remainder of the Spaniards from destruction. By degrees, all the champaign country along the coast was subjected to the Spanish dominion. Several colonial towns were established by the Spaniards, which the Araucans have repeatedly taken and destroyed. The frontier banks of the river Biobio are lined with fortresses. At the peace of 1773, after a war which had cost the Spanish treasury 1,700,000 dollars, the Toqui of the Araucans insisted on having a resident minister at the city of Santiago, and the Spaniards reluctantly complied. The mountainous country, however, is still possessed by the Puelches, Araucans, and other tribes of its original inhabitants, who are formidable neighbours to the Spaniards, and with whom, during the course of about three

centuries, they have been obliged to maintain almost perpetual hostility, suspended only by a few intervals of insecure peace.

That part of Chili, to which the Spaniards are restricted, and which may properly be deemed a Spanish province, is a narrow district, extending along the coast from the desert of Atacama and the river Biobio, and divided into 13 provinces, viz. Copiapo, Coquimbo, Quillota, Aconcagua, Melipilla, Santiago, Rancagua, Colchagua, Mañi, Itata, Chillan, Pucacavi, and Huilquilema. The Spaniards also possess the port Valdivia, in the country of the Cunchi; the archipelago of Chiloe; and the island of Juan Fernandez. Don George Juan and don Antonio de Ulloa, in their voyage to South America, inform us, that the captain-generalship of Chili comprehends four particular governments, viz. the major-generalship of the kingdom of Chili, to which belongs the military government of the frontier towns and fortresses, along the banks of Biobio, which are Aranco, the stated residence of the general, Santajana, Puren, Los Angeles, Tucapel, and Yumbel; Valparaiso; Valdivia; and Chiloe, which see respectively; and the following 11 jurisdictions, viz. Santiago, Rancagua, Colchagua, Chillan, Aconcagua, Melipilla, Quillota, Coquimbo, Copiapo and Guafico, Mendoza, and La Concepcion; which see. The president, governor, or captain-general of Chili, to whose government Spanish Chili is subject, resides in the city of Santiago, exercising, except in time of war, independent authority, and directing all military affairs; the three great officers of the kingdom, viz. the camp-marshal, serjeant-major, and commiffary, and also the four governors of Chiloe, Valdivia, Valparaiso, and Juan Fernandez, being subject to his orders; as president and governor-general, he administers justice, or presides in the court of audience in Santiago, which is divided into two halls, the civil and the criminal, with a regent, judges, fiscal or royal procurator, and a protector of the Indians. In cases where the property exceeds 10,000 dollars, an appeal lies to the supreme council of the Indies. There are also tribunals of finances, of the papal bull, and of vacant lands; and the consulate, or tribunal of commerce, which is a new institution in the Spanish colonies, is independent of all others. The provinces are governed by prefects or corregidores, commonly named by the captain general. The inhabitants are formed into regiments of militia; besides which there is also a body of regular troops. In the town of Concepcion, there is a regiment of cavalry, and another of infantry, to watch the Araucans; and the city of Santiago maintains some troops of dragoons for its police and defence.

Spanish Chili is divided into two extensive archbishoprics, those of Santiago and Concepcion, both suffragans of the archbishop of Lima. The cathedrals are served by canons; and at Santiago the holy, or rather infamous, office of the inquisition, has a commissary and various subalterns. There are no convents, except at Santiago and Concepcion.

This province has derived considerable advantage from the liberty of commerce obtained in 1778; and its population has since that event been augmented. Before that period, the cultivation of the country, though singularly fertile and productive, had been shamefully neglected by the Spaniards. A great part of it remained unoccupied; and in its whole extent, there were not above 80,000 white inhabitants, and about three times that number of negroes and people of a mixed race. The Spanish inhabitants have, for the most part, migrated from the northern provinces; and they are intermixed with a few English, French, and Italians. They are described by Molina, cited by Pinkerton, as "well made, intrepid, incapable of treason or meanness, vain, libe-

val, ardent, fond of pleasure, sagacious, observant, ingenious, docile," and only wanting instructive books and scientific instruments. The noble arts, however, are neglected by them, and mechanics are imperfectly understood. The dress of the men is generally French, and that of the ladies after the fashion of Peru; but the Chilese ladies wear longer gowns, and have a more modish air. The common people have adopted the Araucan dress as being most convenient. Dispersed through a wide country, and unobscured by village magistracies, they enjoy their liberty, and lead a happy and tranquil life, amidst the pleasures of the delicious climate. They are fond of gaiety, music, and poetry. The language generally spoken in Chili is Spanish; but the country people, who reside near the Araucan frontier, use the Araucan or Chilese language. As they are almost always on horse-back, and enjoy the benefit of a sublimous air, they are healthy and robust.

The midland country is plain, but the maritime part of Chili presents three chains of hills parallel to the Andes, which is here about 120 miles in breadth, abounding with stupendous breaks and precipices, but interspersed with vales and excellent pastures that are watered by streams and cascades descending from the rocks. The highest mountains of the Chilese Andes are Manña, at $28^{\circ} 45'$; Tupungato, at $33^{\circ} 24'$; Descabefado, at 35° ; Bianquillo, at $35^{\circ} 4'$; Longavi, at $35^{\circ} 30'$; Chillan, at 36° ; and Corcobido, at 43° . Molina did not measure their height; but the Spaniards and Chilese suppose them to be more than 20,000 feet above the sea. The four seasons are as regular in this country as they are in Europe; but as it lies in the southern hemisphere, their order is inverted. Spring begins on the 21st of September, summer in December, autumn in March, and winter in June. From the beginning of spring to the middle of autumn, the sky is always serene, chiefly between 24° and 35° lat.; showers seldom falling during that period. The rains begin in the middle of April, and last till the end of August; varying in quantity and continuance in the northern and southern districts. Thunder is scarcely known, except on the Andes; snow does not fall in the maritime provinces; but on the mountains from April to November it is perpetual, and prevents the passage over them, except at Midsummer. In Chili, in general, no river is frozen, and the cold seldom exceeds the freezing mark of Reaumur's thermometer. Through the whole kingdom the dews are copious in spring, summer, and autumn. On the other side the Andes, the N.W. wind, called "Sonda," is more suffocating than the Sirocco of Italy; but in the countries of Peru and Chili no such effect is perceived.

About the middle of the day a breeze often rises from the sea, and lasts two hours, so that it is called the clock of the peasants. Fiery meteors are frequent; but the aurora borealis seldom appears. In Chili volcanoes abound. One that was terrible by the convulsions and devastation it occasioned, occurred at Petorca on December 3d, 1762. There are only two other volcanoes in this province, which do not belong to the chain of the Andes; a small one near the river Rapel, which ejects only smoke, and the great volcano of Villarica, near a lake of that name in Araucana. This flaming mountain is seen at the distance of more than 150 miles, and appears isolated; but it is thought to be joined with the Andes, which is at a small distance. The summit, burning day and night, is covered with snow; but the sides, to the extent of 14 miles, are shaded with enchanting forests, watered by innumerable crystalline streams. Earthquakes are little known even in Copiapo and Coquimbo, where subterranean noises are often heard, as in Tucuman. Slight earthquakes are felt three or four times in the year; but

only five of any consequence have occurred since the entrance of the Spaniards: of which the most remarkable were that of 1750, which in July buried the city of Concepcion, and that of 1751, which utterly destroyed the same city, and was accompanied with a globe of fire, which darted from the Andes to the ocean; however, on this occasion, only seven persons perished; there being in Chili always a warring noise, or vibration of the air, and the flocks are horizontal, not explosive.

The rivers of this country, though sometimes considerable, have but a short course from the Andes to the ocean. There are several lakes, both fresh and salt; the two largest being in Araucana, viz. the Lauquen or Villarica, about 72 miles in circuit, with a beautiful conic hill in the centre; and the Nahuelgapi, about 80 miles in circumference, having an island in the centre, crowned with beautiful trees, and giving rise to a river of the same name, which runs towards the Atlantic, while from the first springs the river Tolten, which joins the Pacific. The country abounds with mineral waters and salt rivers, ascribed by the Araucans to the beneficence of their god Meulen.

The climate of Chili is the most delicious in the New World, and is hardly equalled by that of any region on the face of the earth. Though bordering on the torrid zone, it never feels extreme heat, being screened on the east by the Andes, and refreshed on the west by cooling sea-breezes. The temperature of the air is so mild and equable, that the Spaniards give it the preference to that of the southern provinces in their native country. Influences occur in this country of surprising longevity. A Spanish knight attained the age of 126 years, without knowing sickness; and he had by two wives 28 sons. Some of the croles have arrived at the age of 104, 107, and 115. It is also said that the women are fruitful in an extraordinary degree, and that twins are common. A Frenchman who died in 1764, left by one wife 163 descendants. The fertility of the soil corresponds with the benignity of the climate, and is wondrously accommodated to European productions. The most valuable of these, corn, wine, and oil, abound in Chili, as if they had been native to the country. The soil, even that part of it which has been long in tillage, is so little degenerated by producing successive crops, that no manure is necessary. The grain, as some say, yields from 100 to 150; but by a more moderate and just estimate, as it is stated both by Molina and in Perouse's voyage, from 60 to 70 in the midland country, and in the maritime 40 or 50. Many of the plants of Chili are the same with those of Europe, and almost all the pot-herbs and fruits of that continent flourish there. The northern provinces produce the sugar-cane, the sweet-potato, and other tropical plants. Maize is common and abundant; the *magu* is a kind of rice, and the *uca* a species of barley, both of which were cultivated before the arrival of the Spaniards. Peas and potatoes were also well known to the Chilese. Of the latter they have 30 different kinds; and it is even conjectured that this valuable root was first brought into Europe from this country. The large white strawberry of Chili is now known in English garden. Many of its plants are valuable as dyes, and others as medicinal. The gentian is peculiar to Chili. The *vina-vina* expels the ague; the *payco* is excellent for indigestion. Wild tobacco abounds in Chili. The beautiful flowers and shrubs are infinite. Incense, not inferior to that of Arabia, is produced by a shrub, distilling tears of a whitish yellow, and of a bitter aromatic taste. The trunk of the *paqi* supplies excellent cork; the *saifola kali* is plentiful on the shores; and Chili produces seven kinds of beautiful myrtles, one of which yields an excellent stomachic wine preferred by strangers

strangers to any muscatel. The *cañon* furnishes a tea, which is known as a vermifuge. An acacia of the province of Quillota yields a balsam, that is used in the cure of wounds; and the *palqui* is esteemed, as a febrifuge, superior to the Peruvian bark. The *cañon* grows on the banks of the rivers Maypo and Salvia. Of 67 kinds of trees, that diversify the beautiful forests of Chili, only 13 lose their leaves in winter. Cypress, pines, and red and white cedars grow in the valleys of the Andes; the red cedars, particularly in the illc of Chiloé, are of an enormous size, so that from 700 to 800 planks, 20 feet long, may be cut from one tree. The cinnamon tree, that yields what is called winter's bark, is regarded as sacred by the Araucans, who present it as a token of peace. Beautiful woods of various colours are supplied by the Chilse forests. Vines, though none appear to be native, flourish admirably well; they are found in the forests, arising from seeds deposited by the birds: on the confines of the river Mauli, they are three or four feet high, and supported by stakes; but further to the south they are left loose on the sides of the hills. The best wine is that which is obtained from the banks of the river Itata, and is commonly called wine of Conception; it is red, generous, of an excellent flavour, and equal to the best in Europe. Muscatel wines are also excellent. The vintage is April and May. All the other European fruits attain the greatest perfection.

Of the zoology of Chili, Molina has given an ample account. Oysters of an excellent kind are found near Coquimbo; and the rocks of Chiloé furnish the pholas. There are also many kinds of lobsters and crabs. Among the insects is the locust of Africa. Bees abound in the northern provinces. Reptiles are rare; but the sea supplies 76 kinds of fish, all excellent and salutory. The seals, called sea-cows, appear on the shores of Araucana. Of land and aquatic birds the different species amount to 137; and the sea-fowl are innumerable. Of these several retire in spring to the forests of the Andes for propagation, and on return of winter they re-visit the plains. The American ostriches appear in great numbers in the valleys of the Andes, and especially near the grand lake Nahuelgapi. The eggs, of which the female lays from 40 to 60 in the sand, yield, each of them, about two pounds of good food; and the feathers are used for plumes, parasols, fans, &c. The condor is also found in this country. Molina reckons 36 species of quadrupeds in Chili; and it is observed, that most of the European animals have improved in this delicious climate and fertile country. The celebrated Spanish sheep have not lost any of their distinguishing qualities: the horned cattle are larger than those of Spain; and the breed of horses surpasses both in beauty and spirit the famous Andalusian race, from which they sprung.

Nor has nature exhausted her bounty on the surface of the earth: she has stored its bowels with riches. All the argillaceous earths mentioned by Wallerius are found here, exclusive of the bole of Lemnos; and Molina adds five sorts to those already described. Of metallic earths, according to his arrangement, there are mountain-blue and green, native cerule, ore of zinc, with brown, yellow, and red ochres. Among the rocks are slate, bone, green talc, steatite, asbestos, amianthus, gold and silver mica; and the talc called Muscovy glass is found in large plates, and used for windows. Limestone, marble, and gypsum, are plentiful. Besides statuary marble, Chili affords the black, greenish, and yellow; and two mountains of Copiapo and Mauli are altogether composed of marble of different colours, and disposed in regular strata from the bottom to the top. Molina also mentions a great variety of slurs, yellow,

green, and blue, called false topazes, emeralds, and sapphires. The Andes also afford fine alabaster, and large plates of selenite, used by the inhabitants of San Juan in the windows of their churches. Of siliceous stones, there are quartz, flint, and rock crystal. Here are also free-stone and grind-stone, some common agates, and Jasper red, green, grey, white, and variegated. Rock crystal occurs of different colours, called false ruby, topaz, jacinth, emerald, &c. One real emerald, says this author, was found in Coquimbo, and a topaz in the province of Santiago. A little hill, N. E. of Talca, is almost wholly composed of beautiful amethysts, in a kind of grey quartz. Turquoises are found in Copiapo; and beautiful breccias, porphyries, and granites occur in the Andes. Rock-salt is abundant; and is often crystallized in cubes of various colours. Sal ammoniac is common near the volcanoes; and nitre abounds in Coquimbo. The country is supplied with different kinds of alum or bitumen, and all the vitriols. Araucana furnishes jet; and coal is supplied by various parts of the kingdom. The province of Copiapo comprehends two mountains of crystallized sulphur; and the same substance abounds in all the Andes. Pyrites of several kinds and under various forms are found in several places. Of the semi-metals, this country yields arsenic, cobalt, bismuth, zinc, antimony, and mercury, both virgin and cinnabar. Chili contains mines, many of them very rich and productive, of lead, tin, iron, silver, and gold. The chief silver-mines are those of the provinces of Santiago, Aconcagua, Coquimbo, and Copiapo; but the most celebrated is that of Uspallata, situated on the eastern mountains of the Andes, in the province of Aconcagua; supposed to extend to Potosi, through a space of 840 geographical miles; discovered in 1638, neglected till 1762, but since wrought to great advantage. However, of all the metals, gold is the most abundant in Chili; so that there is not a mountain or a hill, which does not more or less produce it, and accordingly, it is found in the soil of the plains and the sand of the rivers. The gold is reckoned the purest in the world, being generally found of 22 carats, and often of 23½ carats. The most considerable mines of gold now wrought in Spanish Chili are those of Copiapo, Guafco, Coquimbo, Petorca, Ligua, Tilti, Putendo, Caren, Alhue, Chibato, and Huillipatagua; all which, except the three last, which have been recently discovered, have, ever since the conquest of the country, yielded a constant and considerable produce. The gold of the mines of Chili, paying the royal fifth, amounts to about four millions of dollars annually; of which a million and a half are coined at the mint of Santiago.

The commerce of Chili employs 23 or 24 ships from 5 to 600 tons each, and in return for the grain, wine, fruits, provisions, tallow, leather, wood, copper, &c. sent to Peru, it receives iron, cloth, and linen made at Quito, hats, bays, of which there are manufacturers in Chili, sugar, cacao, sweetmeats, tobacco, oil, earthen ware, and all kinds of European goods. A small commerce is also carried on between Chili, Paraguay, and Buenos Ayres, of which the latter is the staple. The products of Paraguay, which consist only in its herb and wax, are carried thither, then forwarded to Chili, whence the herb is exported to Peru. Large quantities of tallow are also sent to Mendoza for the manufacture of soap. In exchange for these commodities Chili sends to Buenos Ayres linen and woollen stuffs, some of which are imported from Peru, and others manufactured in the country; also sugar, snuff, wine, and brandy, which two last the traders chiefly buy at San Juan, as most convenient for transportation. Ships from Spain, in return for European goods, receive gold, silver, copper, Vicuña wool.

and dressed leather. The domestic commerce of Chili chiefly consists in the provisions sent to Valdivia, which supplies other places with cedar. Chibó purchases from the other parts brandy, wine, honey, figs, the Paraguay herb, salt, and Guinea pepper; and returns to Valparaiso and Concepcion several kinds of fine wood, with which the island abounds; also woollen stuffs of the country, made into cloaks, quilts, &c.; together with hams and dried pilehards. Coquimbo sends copper to Valparaiso, which in exchange returns Cordovan leather, and soap, made at Mendoza, from whence it is carried to Santiago, and thence sold to different parts of the country. The trade with the wild Indians carried on by barter, consists in hardware, as bits, spurs, and edge tools; also toys, and some wine. They return horned cattle, horses of their own breeding, &c.

Before we close this article, we shall mention as a matter of annual observation, that the sea gradually retreats from the coast of Chili; and therefore, the shore consists mostly of a plain, 5 or 6 miles broad, between the sea and the maritime mountains; their sides bearing evident marks of the sinking of the ocean, which has sometimes formed curious grottos, with different chambers, hung with shells or stalactites, where beasts take refuge in the winter. Voyage to South America, by Juan and de Ulloa, vol. ii. Robertson's America, vol. iii. Pinkerton's Geography, Ed. 2.

CHILIAD, formed of *χίλια*, *mille*, a thousand, an assemblage of several things ranged by thousands. The term was particularly applied to tables of logarithms, which were at first divided into thousands. Thus it was used by Mr. Briggs. See the article BRIGGS.

CHILIAGON, in *Geometry*, a regular plane figure of 1000 sides and angles. We can easily demonstrate, that the sum of all its angles is equal to 1998 right ones; for the internal angles of every plane figure are equal to twice as many right angles as the figure hath sides, except those four which are about the centre of the figure, from whence it may be resolved into as many triangles as it has sides. The author of *L'Art de Penfer*, p. 44, 45, brings this instance to shew the distinction between imagining and conceiving. See NOTION.

CHILIARCHA, or CHILIARCHUS, from *χίλια*, a thousand, and *αρχη*, command, an officer in the armies of the ancients, who had the command of a thousand men.

CHILIARTÆ, in *Church-History*, the same with MILLENARIÏ.

CHILIASTS. See MILLENARIÏ.

CHILIOCOMUS, in *Ancient Geography*, a canton of Asia, in Media; placed by Ammianus Marcellinus in the vicinity of Corduene.

CHILISQUAQUE, in *Geography*, a township of Susquehanna river in Pennsylvania.

CHILKA, a lake of Hindoostan, on the sea-coast of the province of Cattaek on the N.W. side of the bay of Bengal. This lake bounds the Northern Circars on the north. It seems to be produced by a breach of the sea over a flat, sandy shore, whose elevation was somewhat above the interior country. Both this, and the Pulicet lake of similar origin, communicate with the sea by a very narrow, but deep, opening; and are shallow within. The Chilka lake is about 42 miles in length from N.E. to S.W.; and in most places 12 or 15 wide; with a narrow slip of sandy ground between it and the sea. On this lake are many inhabited islands. On the N.W. it is bounded by a ridge of mountains; being a continuation of that which extends from the Mahanuddy to the Godavery river; and shuts up the Circars towards the continent. It forms a pass on each side of it towards the Cattaek province, and affords an

agreeable diversity of objects; mountains, islands, and forests; and an extended surface of water, with boats and small vessels, sailing on it. To those who navigate at some distance from the coast, it has the appearance of a deep bay; the slip of land not being visible.

CHILLAKOTHE, an Indian town of America, seated on the Great Miami, which was destroyed in 1782, by a body of militia from Kentucky. This name is applied to many different places in honour of an eminent chief who formerly headed the Shawanoes. See TAWIATA.

CHILLAKOTHE, *old*, an Indian town, lying about three miles S. of Little Miami river, but destroyed by the forces of the United States in 1780. The part of the adjacent country, which is beautifully chequered with meadows, is rich. See MIAMI.

CHILLAN, or CHILAN, a town of South America and capital of a district of the same name, being one of the jurisdictions of the kingdom of Chili. The place is small, but has the title of city; the number of families not exceeding 2 or 300, and having among them but few Spaniards. It is 75 miles N.E. of Concepcion.

CHILLEIRONS, a town of Portugal, in the province of Estramadura; $\frac{1}{2}$ leagues N.W. of Lisbon.

CHILLEURS, a town of France, in the department of the Loiret and district of Orleans; 14 miles N.E. from it.

CHILLIKOTHE, a town of America, in the state of Ohio and county of Ross; situated on the Scioto river, about 60 miles from the Ohio. Such has been the increase of this settlement, that though it began in 1766, and became an incorporate town in 1782, it is now the seat of government and capital of the state. The adjacent country is fertile, and the town is rapidly increasing. At present it is said to contain 150 houses. Its public buildings are a gaol, built with wood, and a court or state-house of hewn stone.

CHILLINGWORTH, WILLIAM, in *Biography*, distinguished as a theologian, was born at Oxford in October 1602. He was admitted a scholar of Trinity college in the year 1618, and after taking the usual degrees, was elected fellow of his college in 1628. He was, in very early life, characterized by a fondness for disputation; to this temper Lord Clarendon refers in his own life. "He was," says the Noble Lord, "a man of so great a subtlety of understanding, and so rare a temper in debate, that as it was impossible to provoke him into any passion, so it was very difficult to keep a man's self from being a little discomposed by his sharpness and quickness of argument; and instances in which he had a rare felicity, and a great advantage over all the men I ever knew." This turn of mind was attended with its disadvantages, for we are told he had contracted such an irrecollection and habit of doubting, that by degrees he felt confident of nothing. It was probably the cause also of his conversion to popery, through the subtilty of John Fether, a jesuit, at whose instance he went to the college of Douay. Here he made but a short stay, having, by means of a correspondence with his god-father, Laud, bishop of London, afterwards archbishop of Canterbury, seen reason to change his sentiments again. Upon his return to England he retired to Oxford, where he pursued his studies with great care and diligence. In 1634 he wrote a paper in confutation of the arguments by which he had been seduced; such, however, was the ingenuousness of his mind, and his regard for truth, that after his return to Protestantism, he made no scruple to re-examine the grounds of it, which occasioned a report that he had gone back again to the church of Rome, and he continued through life to be reviled by one party and suspected by the other; yet he felt no

flame on account of the candour and impartial inquiry which caused these fluctuations in his creed. Speaking of himself he says, "I know a man, that of a moderate Protestant turned a Papist, and the day he did so, was convicted in conscience, that his yesterday's opinion was an error. The same man afterwards, upon better consideration, became a doubting Papist and of a doubting Papist a confirmed Protestant. And yet this man thinks himself no more to blame for all these changes, than a traveller, who using all diligence to find the right way to some remote city, did yet mistake it, and afterwards find his error and amend it." Few persons, it is presumed, will, upon reading this, dispute Chillingworth's title to self-approbation. In the year 1637, he published a work entitled, "The Religion of Protestants a safe way to Salvation," which is one of the ablest defences of the Protestant cause. Its fundamental principle is, that the scripture is the only rule by which we can judge of controversies, and that no church of any one denomination, is, or ought to be, accounted infallible. "It is sufficient," says he, "for any man's salvation, to believe that the scripture is true, and contains all things necessary to salvation, and to do his best endeavours to find and believe the true sense of it."

Chillingworth's orthodoxy was now suspected, and he was immediately branded with the epithets of Arian and Socinian; he had previously to the publication of this work refused preferment, which was offered him by Sir Thomas Coventry, keeper of the great seal, because he could not, at that time, subscribe to the thirty-nine articles: he declares that he is ready to endure any extremity of indignance and the displeasure of his friends, rather than to make a declaration which his conscience could not thoroughly approve. These scruples were not of long continuance, for in 1638 he complied with the usual forms of subscription, on being promoted to the chancellorship of Salisbury, with the prebend of Brixworth in Northamptonshire, annexed to it. From a passage in the preface to his Religion of Protestants, it appears, that he now considered subscription as an offering to peace and union, not a declaration of faith, to which opinion he was probably led, by the arguments of his friend, Dr. Sheldon, afterwards archbishop of Canterbury. In addition to his other preferments he obtained the mastership of Wigllan's hospital in Leicester, and in 1640, he was deputed as proctor by the chapter of Salisbury to the convocation. At the breaking out of the civil war he adopted instantly the royal cause, and was present in the king's army at the siege of Gloucester, where he even acted as engineer, and contrived some machines for assaulting the city. Very soon after this, on account of ill health, he retired to Arundel castle in Sussex, where he was taken prisoner by Sir William Waller. His illness increasing, and not being able to go to London, he obtained leave to be conveyed to Chichester, where he was lodged in the bishop's palace, and after a short illness died in the month of January 1643-4, and was buried, according to his own desire, in the cathedral church of Chichester. Chillingworth was the author of several works besides his "Religion of Protestants a safe way to Salvation." He wrote nine sermons on special occasions, and a defence of episcopacy. His writings have always been highly esteemed by some of the most eminent persons of the nation, among whom were the great Locke, and archbishop Tillotson. His private character was marked by sincerity, candour, and benevolence: and according to Lord Clarendon "he was a man of excellent parts and of a cheerful disposition, void of all kind of vice, and endued with many notable virtues; of a public heart, and an insatiable desire to do good; his only unhappiness proceeded from his sleeping too

little, and thinking too much, which sometimes threw him into violent fevers." "This last circumstance," says Dr. Aikin, "denotes that warmth of brain which may account for the mutability and the disputatious turn that seem to have superabounded in his nature." Biog. Brit. Gen. Biog. Blackburne's Works.

CHILLOAS, or CHILOAS, a jurisdiction of South America in the diocese of Truxillo, belonging to the viceroyalty of Peru, and the audience of Lima. See LLALLA.

CHILLON, a castle or castellated house, in the canton of Bern, 5 miles E.S.E. of Vevey. This is a large pile with round and square towers, standing on a rock in the lake of Geneva, and connected with the land by a draw-bridge. The vaults are very fine; the arched roofs, and the supporting pillars, are in a neat Gothic style. This castle in 1536 was wrested from Charles III. of Savoy by the canton of Bern assisted by the Genevans, who furnished a frigate to besiege it by water. In a deep dungeon, below the level of the lake, the conqueror found Bonivard, prior of St. Victor, the intrepid antagonist of the dukes of Savoy, and the great assertor of Genevan independence. He had been imprisoned by the Savoyards for 6 years, and by constant walking within his short limits, had worn a hollow in the rock. This castle was for a short time the residence of a bailli from Bern, until a more convenient house was purchased in Vevey. It was seized by the insurgents in January 1798; and this act of rebellion, not being punished, was followed by the separation of the Pays de Vaud from the canton of Bern.

CHILLY, a town of France, in the department of the Jura, and district of Lons-le-Saulnier; one league S.W. of it.

CHILMA, or CHILMANENSE *oppidum*, now called *Gilma*, an ancient town in the interior of Africa. Ptolemy and Pliny place it under the dominion of Carthage, and say that it was situated between the rivers Bagradas and Tiron. It is now in ruins, with scarcely any remaining vestige.

CHILMARK, a township of America on Martha's Vineyard island, in Duke's county and state of Massachusetts, containing 771 inhabitants. It lies 99 miles S.E. of Boston.

CHILMARRY, a town of Hindoostan, in the country of Bengal; 110 miles N.E. of Moorshabad.

CHILMINAR, CHELMINAR, or TCHELMINAR, the noblest and most beautiful piece of architecture remaining of all antiquity; being the ruins of the famous palace of Persepolis, to which Alexander the Great, being drunk, set fire, at the persuasion of the courtisan Thais.

Authors and travellers are exceedingly minute in their descriptions of the Chilmimar; particularly Gracias de Silva Figueroa, Pietro de la Valle, Chardin, and Le Brun. A general idea thereof may be conceived as follows:

There appear the remains of near fourscore columns; the fragments whereof are at least six feet high: but there are only nineteen that can be called entire; with a twentieth all alone, 153 paces from the rest.

A rock of black hard marble serves for the foundation of the edifice. The ascent to the first plan of the building is by fourscore and fifteen steps, cut in the rock. The gate of the palace is twenty feet wide; on one side is the figure of an elephant, and on the other of a rhinoceros, each thirty feet high, and of a shining marble; near these animals are two columns; and not far off the figure of a Pegasus.

After this gate is passed, there are found a great number of columns of white marble; the remains whereof shew the magnificence of the work: the smallest of these columns is fifteen cubits high, the largest eighteen; each has forty flutings,

fluting, three inches broad; whence the height of the whole may be guessed at, with the other proportions. Near the gate is an inscription on a square piece of marble, smooth as glass, containing about twelve lines: the characters are of a very extraordinary figure, resembling triangles and pyramids.

These noble ruins are now the shelter of beasts, and birds of prey. Besides the inscription above mentioned, there are others in Arabic, Persian, and Greek. Dr. Hyde observes, that the inscriptions are very rude and unartful: and that some, if not all of them, are in praise of Alexander the Great; and therefore are later than that conqueror.

M. Le Brun took his voyage to the East Indies, merely for the sake of viewing the Chilminar. See PERSIOLIS.

CHILOE, in *Biography*, one of the wife men of Greece, who flourished about the first year of the 56th olympiad or 556 B. C. But Diogenes Laertius says, that he was an old man in the 52d Olympiad. He was one of the Lacedæmonian Ephori, and celebrated for both his sagacity and probity. In the exercise of his office as a magistrate he acted with so much integrity that in his old age, he said, that he recollected nothing in his public conduct which gave him regret, except that, in one instance, he had endeavoured to screen a friend from punishment. The highest attainment of wisdom, in his opinion, was, that sagacity which enables a person from the view of present circumstances and events to predict future occurrences. Æsop is said to have once asked him, how Jupiter employed himself? He replied, "in humbling those that exalt themselves, and exalting those that abate themselves."

He is said to have lived to a very advanced age, and to have expired through excess of joy, in the arms of his son, when he returned victorious from the Olympic games. Some of his maxims of the greatest value are the following:—Three things are difficult: to keep a secret, to bear an injury patiently, and to spend leisure well.—Visit your friend in misfortune rather than in prosperity.—Never ridicule the unfortunate.—Think before you speak.—Do not desire impossibilities.—Gold is tried by the touchstone, and men are tried by gold.—Honest loss is preferable to shameful gain; for by the one, a man is a sufferer but once; by the other, always.—In conversation use no violent motion of the hands; in walking, do not appear to be always upon business of life or death; for rapid movements indicate a kind of phrenzy.—If you are great, be condescending; for it is better to be loved than feared.—Speak no evil of the dead.—Reverence the aged.—Know thyself. Diogenes Laertius, T. i. l. 1. § 68-74. Plin. H. N. T. i. l. vi. § 32. Brucker's Hist. of Philos. by Enfield. vol. i. p. 133. Rollin's Ancient Hist. vol. ii. p. 354.

CHILOE, in *Geography*, a considerable island, or rather group of islands, being one of the governments of Chili, seated on its coast in the southern Pacific ocean, in the gulf of Chonos, or the archipelago of Guaytecas, and separated in its southern part from the continent by a narrow sea, which forms a bay. It is about 140 miles in length by 30 in breadth; but almost divided, in the middle, by bays or creeks. It lies between 41° 40' and 43° 50' S. lat. The principal harbour of the island on the north coast is Chacao, which is said to be well fortified and capable of a good defence, and at Culbuco, which is larger, reside a corregidor, nominated by the president of Chili, and also regidores and alcaldes chosen annually. Besides the parish church, this place has two convents, and a college of J. suits. The island is well peopled with Spaniards, Mulattoes, and Indian profelytes. We learn from Liguanda, cited by Pinkerton, that from the middle of the 18th century many

ships from Peru have visited the isle of Chiloe. The port of St. Carlos, (S. lat. 41° 50', and long. 503° 57' from the meridian of Tenerife.) is capable of receiving considerable vessels, and the articles of commerce supplied by the island have given rise to a trade somewhat beneficial. The natives are robust and well disposed; but are deficient in industry. Chiloe has forests of excellent timber, particularly cedar: it abounds in wine, and its pigs, feeding on shell-fish, supply excellent hams. It has an ample fishery; its wheat is scanty, though the soil is good; but the deficiency is supplied with a kind of potatoes, called papas, and with barley and bear, of which they make flour. Cattle and sheep, introduced from Spain, are abundant, and afford good meat: the tame and wild birds are numerous; and the kind of seal, called sea-wolf, is plentiful. The flesh of the seal is salted by the Indians of the small adjacent islands called Chonos, and used as common food. The sea-otter, which is common from Chiloe to Valdivia, furnishes fur not inferior to that of the Canadian beaver, which might become a lucrative article of commerce; and the skin of a bird, called the American swan, is covered with an exquisite snowy down, and used as a delicate fur. The females of the island manufacture ponchos or Indian mantles, and other coarse woollen articles. Some few linen articles are also woven: but both these manufactures are insufficient for cloathing the inhabitants, who are estimated at 25,000, exclusively of the Chonos. They begin to import woollens and cottons from Peru; but the consumption is small. During five years, it is said, the imports from Chiloe at Lima in boards, ponchos, hams, and salt-fish, amounted to more than 280,000 dollars. The exports from Lima to Chiloe exceeded 334,000.

CHILOK, a river of Siberia, which runs into the Selenga near Selenginsk.

CHILON, among the *Greek Physicologers*, one who has great lips, called by the Latins *labco*. Thus also among the species of fishes, under the class of *capitones*, some are called *chiloncs*, that is, *labconcs*.

CHILONGO, CHYLONGO, or CYLONGO, in *Geography*, a maritime province of Africa, and the largest in the kingdom of Loango. It is situated between the rivers of Quila on the S. and Combi on the N. which last separates it from Majumba, about a small kingdom of itself, but now a province of this. Its plains are spacious and fertile, and sheltered at a distance by ridges of high mountains. Its inhabitants carry on a very considerable commerce, especially of elephants' teeth, though in other respects they are extremely rude and unpolished. On the coast stands the "Cabo Negro," or black cape, so called by the Portuguese on account of its dark appearance; the whole promontory being covered with trees.

CHILOU, a village of Ceylon, S. of Putallom, where the Dutch have erected houses for the entertainment of strangers. It is situated on the banks of a broad river: and the adjacent country is wild, and dangerous for passengers, on account of the multitude of wild beasts with which it is infested. To the southward of Chilou elephants are numerous, and are hunted with considerable success.

CHILQUES, a jurisdiction of South America, in the kingdom of Peru and diocese of Cuzco; commencing at the distance of about 7 or 8 leagues S. E. of Cuzco, and extending above 30 leagues in length. The temperature of the air corresponds to the situation of its several parts; some of which are very fertile in producing grain, and others feed a great number of cows and sheep. Besides these, its commerce is much augmented by the woollen manufactures of the Indians.

CHILTERN, a ridge of hills, traversing the county of Bucks

Bucks a little to the south of its centre, and reaching from Tring in Hertfordshire, to Henly, in the county of Oxford. To these hills, called the Chiltern Hundreds, is annexed the nominal office of steward under the crown, the acceptance of which enables a member of the British parliament to vacate his seat.

CHILTOTOTL of Hernandez and Ray, in *Ornithology*, the *caulinaria* of Brisson, the *Brazilian tanager* of Latham, and the *tanager Brasilia* of Linnaeus; which see.

CHIMÆRA, in *Ichthyology*, a genus of fishes in the *chondropterigian* order, the head of which is pointed on the upper part; spiracle single, quadripartite, and under the neck; mouth placed beneath; upper lip five-cleft; cutting teeth two in front both above and below; body elongated; dorsal spine single. Gm-lin adds, the tail ending in a slender thread, and longer than the body; but we rather agree with Bloch, who considers the filiform tail of the chimæra monstrofa as a specific than a generical distinction.

Two species only of this singular tribe of fishes have been hitherto discovered; the first, *monstrofa*, or sea monster, was sufficiently well known to the older writers as an inhabitant of the European seas, under the names of *centrina prima*, *finia marina*, *galeas acanthias*, &c.; the other *calorhynchus*, the elephant fish of Cook's voyages, is a native of the southern hemisphere, and ranks among the more recent discoveries in Ichthyology.

CHIMÆRA *monstrofa* has the lower part of the snout porous and plaited, and the tail terminating in a long and slender filament. *Chimæra monstrofa vestro subtus plicis perforata*, Linn. Fn. Succ. *Chimæra caudali filiformi*, Bloch.

A fish of more remarkable appearance can scarcely be conceived. The body is of a lengthened form, compressed, and gradually tapering towards the tail, which terminates in a long and slender filament; the head is large, thick, and ascending in front into a conic or pyramidal form; the mouth is placed beneath, and is of moderate size; each jaw is furnished with a pair of broad bony laminae, which are crenulated at the tip; the upper lip is divided into five parts, and the front, from the mouth to the eyes, is marked by transverse undulations and pores; a line of this kind runs across the forehead beneath the point or tip, and is continued in a serpentine course into the lateral line, and another line passes from this beyond the eyes, which returns again towards the nostrils. The whole body is of a dark brown above, varied with yellowish brown, and silvery, and the lower parts of a bright silver colour. The eyes are large, of a greenish colour with silvery irides, and very brilliant, or shining with phosphoric splendour. The pectoral fins are of considerable magnitude. The male is distinguished by having a small fringed crest on the top of the head, and by the rough lengthened processes at the anal fin, which correspond with those observed in the males of the ray and shark tribe. This fish inhabits the northern seas of Europe, and is very rarely seen so far southward as the British isles. (Vide Donov. Brit. Fishes). It grows to the length of three or four feet, and subsists on marine worms and fish of the smaller kinds. The Norwegian fishermen call it the king of herrings, from the circumstance of its being often lurking among the shoals of that fish, the flesh of which appears to be its principal food. The flesh of the Chimæra is hard, coarse, and uneatable; the inhabitants of Norway employ however the roes of this fish in their pastry, and in making cakes, and extract an oil from the liver, which they consider of singular efficacy in disorders of the eyes, and as an embrocation for wounds and bruises.

Some call it the sea ape, and others the sea-lion; it is the *Chimæra arctica* of modern French writers.

CHIMÆRA *calorhynchus*. Snout produced beneath into an inflected lip. *Calorhynchus*, Gronov. Mus.—*Elephant Fish*, Ellis, It. Cook, It. *Pujegallo*, Frézier. *Chimæra australis*, Southern Chimæra. Shaw.

This nearly corresponds in size with *Chimæra monstrofa*, but has the front rather sloping downwards, and the upper lip extending into a lengthened cartilaginous flap, or appendage, bending down in a reversed direction beneath, from which peculiarity it has acquired the name of the elephant fish. The mouth resembles that of the former fish. The eyes are large; the front marked by undulated lines, and pores, the last of which are less numerous than in *C. monstrofa*. The first dorsal fin, as in that fish, large, somewhat triangular, and armed anteriorly with a strong spine; second dorsal fin resembling the first, but without a spine; the third very shallow, and continued into a thread at the termination of the tail, but which is very short. The pectoral fins are large; ventral moderate; anal small; lateral line commencing from the upper sides of the head, and thence continued in a straight direction, to the beginning of the caudal fin, at which place it terminates. General colour of the whole fish silvery, with a yellowish brown cast on the upper parts; fins pale brown. Inhabits the South Seas.

CHIMÆRA, in *Fabianus History*. See CHIMERA.

CHIMARRHUS, in *Botany*, (so named by Jacquin, *απο του χημάρρως*, because it usually grows by torrents), Schreb. 309. Willd. 350. Jacq. Amer. 61. Class and order, *pentandria monogynia*.

Gen. Ch. Cal perianth entire, crowning the germ, permanent. Cor. one-petalled, funnel-shaped; tube very short; border five-cleft; segments lanceolate, concave, blunt, hairy below, with a longitudinal line running along the middle, spreading. Stam. filaments five, awl-shaped, the length of the corolla. hairy at the base, below the divisions of the border; anthers oval, erect. Pist. germ roundish, inferior; style filiform, the length of the stamens; stigma bifid, obtuse. Peric. capsule somewhat egg-shaped, obtuse, crowned, two-celled, two-valved; valves bifid at the tip. Seeds solitary.

Eff. Ch. Corolla funnel-shaped, with a very short tube. Capsule inferior, obtuse, two-celled, two-valved; valves bifid at the tip. Seeds one in each cell.

Sp. *C. slymsa*. A lofty tree, with branches spreading out horizontally, wood white, used for beams, rafters, &c. Leaves egg-shaped, acuminate at both ends, quite entire, shining, petiole, opposite; a foot long, commonly eight or ten at the end of each twig. Flowers white, numerous, small, scentless, in cyme-like racemes half a foot in diameter; those in the axis opposite and solitary, those at the end usually four together. Capsules small. A native of Martinico, where it is called *Bois de Riviere*.

CHIMARRUS, in *Ancient Geography*, a river of Peloponnesus; placed by Pausanias between the Erasinus and the maritime burgh of Lerna.

CHIMAY, in *Geography*, a town of France, in the department of Jemmappe, and chief place of a canton, in the district of Charleroy. The place contains 1892, and the canton 8935 inhabitants; the territory includes 300 kilometres and 17 communes. In the vicinity of Chimay, are mines, with founderies and forges, of iron. It is 10½ posts E.N.E. of Cambray, and 15½ S.E. of Lillo.

CHIMBADORES. See SANTA.

CHIMBO, a jurisdiction of South America, in the province of Quito, situate on the west side of the jurisdiction of

of Ribamba, and consisting of an assiento and seven villages: the former, being the capital, is called Chimbo, and was the residence of the corregidor; till it was thought proper, for the convenience of commerce, to remove it to Guaranda, the principal of the above villages. Guaranda is inhabited generally by Mestizos, with some Indians, and very few Spaniards. The jurisdiction of Chimbo being the first of the Serrania, or ridge of mountains bordering on that of Guayaquil, carries on, by means of innumerable droves of mules, the whole trade of Quito and the other provinces, by the way of Guayaquil, carrying the bales of cloth and stuffs, together with the wool, cotton, and other products of the country, from the former to the latter; and returning with wine, brandy, salt, cotton, fish, oil, and other goods, for the supply of the provinces of the mountains. This traffic is very advantageous to the inhabitants; but, as the roads, in winter, are impassable to beasts of any kind, it can only be carried on during the summer. This intermission of trade they call "carrife la montana," i. e. the shutting up of the mountains. The temperature of the air at Guaranda, and of the greatest part of the jurisdiction of Chimbo, from the proximity of Chimborazo, is very cold. The country is extensive and fertile; but the haciendas, or farms, are generally appropriated to the breeding of mules; a few only being cultivated for different species of grain.

CHIMBORAZO, a mountain of South America, situate in the province of Quito, about 100 miles to the south of the city of that name, and about 10 miles to the north of Ribamba, and reckoned the highest point of the Andes. The French mathematicians, who were employed from 1735 to 1743 in measuring a degree of the meridian, computed the height of this mountain to be 3217 French toises above the level of the sea, or 16,302 French feet, which, reduced to English feet, are 205,571. Others state the height of this mountain above the ocean to be 19,595 feet. Consequently, if we admit the height of Mont Blanc to be 15,662 feet, Chimborazo, according to the French measure, is nearly 5000 feet, or a quarter higher. That part of Chimborazo which is covered with perpetual snow, is about 2400 feet from the summit. It should be recollected, however, that this mountain is elevated above the high plain of Quito, which constitutes nearly one-half of the computed height, allowing it to be 9377 feet above the ocean; and, therefore, considered as mere excrescences from the land, they still yield to Mont Blanc. This mountain, though it lies in S. lat. $1^{\circ} 41' 40''$, and consequently near the equator in the middle of the torrid zone, is covered on its sides with ice and snow; and the country adjacent to it is often pierced with intolerable cold, on account of the winds which blow from the mountain. See **MOUNTAIN**.

CHIMEPANPESTICK, a river of Canada, which runs into the river St. Lawrence. N. lat. $50^{\circ} 5'$. W. long. $61^{\circ} 25'$.

CHIMER, in *Ornithology*, the Chiming-Thrush and *Turdus Campanella* of Latham, *La Carillonner* of Buffon, and *Turdus tintinnabullatus* of Gmelin; which see.

CHIMERA, or **HIMERA**, in *Ancient Geography*, a town of Sicily. Steph. Byz.

CHIMERA, a mountain of Asia Minor, in a district of Lycia, according to Pliny, who says that it had many volcanoes, and resembled *Ætna*. The Lycians built near this mountain the town of Hephæstia, which they consecrated to Vulcan. Virgil mentions this mountain in his *Æneid*. See **CHIMERA** *infra*.

CHIMERA, in *Geography*, a town and fortrefs of European Turkey, capital of a district in the province of Albania,

situated on a rock near the sea-coast, opposite to the island of Corfu. N. lat. 40° . E. long. $19^{\circ} 2'$.

CHIMERA, or **CHIMÆRA**, in *Fabulous History*, a monster, the daughter of Typhon and Echidna, that breathed a fierce and inextinguishable fire, and which the poets feign to have the head and breast of a lion, the belly of a goat, and the tail of a dragon; and to have been killed by Bellerophon, mounted on the horse Pegasus. This female monster was born in Lycia, and Bellerophon received his orders from Jobates, king of Lycia, to destroy her, and to extirpate a people called the Solymi. Minerva, as a reward, or, according to others, Neptune, commiserating his situation, exposed to such dangers, sent him the flying horse Pegasus, by whose assistance he overcame the Solymi and slew the Chimæra.

The foundation of the fable is this: that anciently, in Lycia, there was a volcano, or burning mountain, of this name; the top whereof, which was desert, only inhabited by lions; the middle, having good pastures, was frequented by goats; and the foot, being marshy, by serpents: Thus Ovid:

" ——— medius in partibus Ircum,
Pectus et ora levi, caudam serpentes habebit."

Bellerophon being the first who caused this mountain to be inhabited, it was hence feigned that he slew Chimæra. Piny says the fire thereof would burn in water, and could be extinguished with nothing but earth or dung. Among other explanations that have been given of this fable, some have supposed that the Chimæra was a pirate ship, whose prow bore the figure of a lion, her middle that of a goat, and her stern a serpent. Among the Bronzes in the collection of the Grand Duke at Florence, is a curious representation of the Chimæra, composed of a lion and goat, in their respective proportions, with an inscription in Etruscan characters. Among philosophers, and in common language, Chimera denotes a mere creature of the imagination.

CHIMERA is used, in *Writers of the Middle Age*, for a kind of vessel or ship. It seems to have been less than the chædonium.

CHIMERIUM *promontorium*, in *Ancient Geography*, a promontory of Asia Minor, on the coast of Lycia, according to Strabo. It was formed by the mountain called Chimera or Chimæra.

CHIMES, in *Horology*, is a species of music mechanically produced by the strokes of hammers against a series of bells, tuned agreeably to a given scale in music; the hammers are lifted by levers acted upon by metallic pins or wooden pegs stuck into a large barrel which is made to revolve by clock-work, and is so connected with the striking part of the clock mechanism, that it is set in motion by it at certain intervals of time, most usually either at every hour, or at every quarter of an hour. The music thus produced may consist of a direct succession of the notes constituting an octave frequently repeated, or otherwise may be a psalm tune, or short popular air in the key to which the bells are tuned. This species of mechanical music is by no means calculated to improve the taste, and had its origin most probably, like clockwork itself, in some of the monastic institutions of Germany, where, according to Dr. Burney, it prevails greatly, and where the ringing of changes on bells, as in England, is but little, if at all practised. The chime mechanism may be adapted either to act with the large bells of a church steeple, by means of wheel-work proportionably strong to raise heavy hammers, or a set of bells of different diameters may be arranged concentrically, within one another

other on one common axis, sufficiently small to be introduced into the frame of a clock, or even of a watch, which we have seen performed by Margetts, who lately died in a state of infirmity. The manner in which the hammers are moved by the pins of the chime-barrel must necessarily vary according to circumstances, as the wires of different rooms are differently placed to produce the sound of a house bell, but an ingenious workman will vary the length and shape of his levers of communication agreeably to the situation and distance of his bells from the clockwork, so that if we give a description of the chime mechanism of a church clock, and also of a portable piece, he will not be at a loss to know how to devise and adapt the necessary parts for any other construction.—But before we proceed to our descriptions, it will be proper to give an account of the chime-barrel, and the method of inserting the lifting pegs, or of what is called pricking it.

CHIME-Barrel is that cylinder of brass in small clocks, or of wood in church-clocks, which gives motion to the hammers, that strike on the bells, and produce a change or tune thereon, by means of pegs inserted into certain points of its circumference at measured intervals, the pegs serving to lift the hammers in regulated succession both of order and time.

In making a chime barrel for any given tune there are certain necessary conditions to be attended to: First, the barrel must be well turned in a lathe upon its own arbor, so as to have the whole surface of its circumference concentric, when revolving on its pivots. Secondly, the train of wheel-work, belonging to the chime-work, must make the barrel revolve in a space of time exactly equal to what is required for playing the requisite tune on any other instrument, which time may be exactly limited by proportioning the fly on the last wheel to the power of the weight or spring that urges the first wheel of the train. Thirdly, there must be as many bells as the compass of the proposed tune contains musical notes, and also as many rows of pegs inserted into parallel circular lines on the circumference of the barrel as there are hammers to be lifted by them; and, lastly, the whole circumference of the barrel must be divided into as many longitudinal parallelograms of equal breadth, as there are musical bars in the proposed tune, each of which must be again subdivided into as many parts as there are notes of the lowest denomination, whether crotchets, quavers, or semi-quavers, in each bar; then the parallel dividing lines will correspond to the bars, and the subdivisions within will be the guides for placing the pegs in those bars respectively: for instance, suppose that Pleyel's German hymn be required to be played by a chime clock of any description, and that the points on the barrel where the pegs or pins are to be inserted be required to be ascertained?

In *fig. 1. of Plate VII. (Horology)*, it will be seen that this popular hymn is marked $\frac{3}{4}$, which implies, that the bar is measured by four, or crotchets, of which there are two in each bar; it is also observable that the quickest note in the tune is a semi-quaver, of which denomination eight constitute two crotchets, or one bar; consequently the bar must be sub-divided into eight. Now suppose the length of the barrel to be represented by the line, DD, or *dd*, because the compass of the hymn is just one octave beginning and ending with D inclusively, the line, DD, or *dd*, must be divided into seven equal parts, which will require eight points in each to include them, viz. D, E, F, G, A, B, C, D, and *d, e, f, g, a, b, c, d*; then, because the whole hymn contains 16 bars, the whole line, DD, which we assume as equal to the circumference of the barrel, must be divided into 16 equal parts, which we have made to fall opposite their re-

spective bars, the better to elucidate our example; then each of these parts may easily be conceived to be sub-divided into eight smaller divisions, as from 1 to 2 in the lower line, D*d*. From the dividing points let straight lines be drawn to complete the square, or parallelogram as the case may be, and there will be a figure, DD*dd*, with $8 \times 16 = 128$ small squares or parallelograms, which we will suppose to be on paper that will exactly cover the barrel when patted round it, in order to convey a more distinct idea of the method of ascertaining the true places of the pins on the barrel, which may be thus done:

The first note, B, is a crotchet, and therefore the pin, represented by a dot, that moves its hammer must be in the beginning of the line B*b*, and the next following pin must be at the space of half a bar forwards to limit its continuance; accordingly the next note, D, is placed on the line, D*d*, at half a bar forwards; again this second note, D, being also a crotchet, requires the next succeeding note of A to be removed another half bar, namely to the intersection of the lines, A*a*, with 2 2; but the third note, A, which we have just mentioned, is equal in length to three quavers, or six semi-quavers; the succeeding pin to represent B must consequently be removed $\frac{2}{3}$ or $\frac{2}{3}$ of the bar, leaving $\frac{1}{3}$ or $\frac{1}{3}$ for the remaining quaver from B to C, the latter of which, being the first note of the third bar, falls on the intersection of the bar line, 3 3, with the hammer-tail line, C*c*; by the same rule the crotchet, C, once struck continues half of a bar, and requires the following A to be half of a bar advanced, but A is here $\frac{3}{4}$ of a crotchet, and the following B only $\frac{1}{4}$ of the same or $\frac{1}{4}$ of the bar; the pin of B must therefore be at $\frac{3}{4}$ of the bar, and the succeeding one on the bar line to limit its duration to $\frac{1}{4}$. In the fourth bar there is a crotchet rest, which is the reason why there is no dot or pin between its bar lines, as though the B of this bar had been a minim.—We might thus have analysed the whole surface of the barrel, so far as relates to this hymn, but it is presumed the preceding detail, clearly understood, will render the rest perfectly intelligible without further explication.

When the hammers are very heavy, as in church clocks, those bells which have quavers or semi-quavers to be struck immediately in succession require to have each two hammers and each a pair of parallel circles pricked to perform within the limit of time; and when either the barrel is made adjustable, or the pins moveable, a number of tunes may be put on the same barrel, and where the bells are sufficiently numerous, the tune may be played in two or even three parts.

This method of pricking a chime barrel for playing on bells differs from that of an organ-barrel in this respect, that in the former the length of the note is measured by the space between the contiguous pins, whereas in the latter the limit of the note is produced by crank pieces, instead of pins, which pieces keep the pipes open, and therefore must cover the very spaces which lie between the pins of the other, the projecting parts of one barrel mutually corresponding to the vacant parts of the other.

CHIMES of a church clock. *Plates V. and VI. of Horology* explain the chime mechanism in the clock-room of St. Margaret's church, Westminster: A (*figs. 1 and 3*) is a barrel on which the rope B is wound; this rope, after passing over a fixed friction roller, has a heavy leaden weight fastened to it, by the descent of which the mechanism is actuated: D is a large wheel at the end, and on the arbor of this barrel, which is worked by a pinion E, not seen, the arbor of which is square at the projecting end for the key of the

the handle by which the weight is wound up; the barrel A is so contrived, by means of the click *b* and ratchet wheel *d*, (*figs. 1*) that, when the rope is in the act of being wound, the barrel slips round its stationary arbor, but when the weight is going down, it turns the large cylinder or chime barrel C attached to the arbor along with it; this chime barrel is made of wood, and has a number of pegs screwed into it, which, as it turns round, at proper intervals take hold of the inner ends *d* of the horizontal and parallel levers F, raise them to a certain height, and then let them go suddenly; this motion at the same time depresses the outer ends *e* of the said levers, and by means of the upright rod G, and other intermediate rods, raises the hammers which strike upon the large bells in the belfry or lobby above. On the end of the chime barrel next to barrel A, is a large wheel H (*figs. 1* and 3) which takes into a small pinion on the arbor of the wheel I; this wheel works a pinion on one end of the long arbor K, (*fig. 1*) on the other end of which arbor is a pair of fans, or a fly-L, the vanes of which catch the air, as they turn, and regulate the velocity of the machine. This fly is shewn separate in *fig. 2*. A is a portion of the arbor, on which is loosely fitted an iron bar B, having a vane D at each end to prevent the bar from slipping round the arbor in a retrograde direction; a ratchet wheel *h* is attached to the outer end of the arbor, and a click *c* is fastened on the fly, which is kept to the teeth of the wheel by a spring, so that when the arbor turns the click stops against the teeth of the wheel, and turns the fly with it, but when the arbor is suddenly stopped (as hereafter described), the fly continues its forward motion for some time by means of its momentum, the click *c* in the mean time slipping round the ratchet *h*; by this contrivance all strain upon the mechanism, by a sudden check of the momentum of the fly, is avoided. On one of the diagonal or cross bars of the wheel I (*figs. 1* and 3), is a projecting piece of metal *f*, which piece, when the machine is to be stayed, is caught by a detent *g*, which detent may be moved towards the centre of the wheel (so as to clear the piece *f*) when the machine is to be put in motion; the upper end of the detent *g* is fastened to an arbor M, so as to have a circular motion with it; to which arbor is also fixed another detent *b* (*fig. 3*) bent to avoid the bar of the frame. On the middle of this detent *h*, a piece of upright iron *i* is riveted, on the end of which a hammer N (*figs. 1* and 3) strikes; this hammer is raised at the proper hour by the church clock, and by its fall strikes the piece *i*, (*fig. 3*) depresses the bent detent *h*, and consequently moves the detent *g* from the stop of the piece *f*. O is a circular plate, having a notch in one part of its circumference; at the back of it are fastened four arms *k, l, m*, (*figs. 3*) and another not seen. On the face of the wheel H there is a projecting tooth *n* (*fig. 1*) which takes hold of one of the arms on O, and at every turn of the wheel H, moves the wheel O round the space of one quarter. Behind the arms *k, l, m*, are four knobs *p, q, r, s*, in a detached plate (shewn in *fig. 4*) against which a lever R (*figs. 3* and 4) is pressed, by a spring S; the use of this additional mechanism is to make the wheel O always describe a complete quarter of a revolution whenever it moves at all, for suppose the arms *m, l, k*, (*fig. 4*) to have the position of the dotted lines *m', l', k'*, the pin *n* on the wheel H (*figs. 1* and 3) takes the arm *m* and pushes it downwards, during which course the knob *p* (*fig. 4*) raises the lever R into the position of the figure; the spring and lever then act upon the knob *p*, and quickly bring the arms to the dotted position, in which situation the letters of reference are advanced each to the next aim. This clock has more-over the striking work, in which there is, as usual, a wheel

called the count wheel, which turns round once in 12 hours; in this wheel there are three pins, that, at the hours 4, 8, and 12, move the end of a lever that communicates, by means of an intermediate rod Q, (*figs. 1* and 3) with the tail P of the hammer N, so as to elevate it; as the count wheel turns round, one of its pins lets go the lever, and the hammer N falls upon the bent *b*. (the end of which is supposed to be in the notch of the plate O) pushes it down, and at the same time moves the detent *g* on the same arbor M inward; as soon as the hammer has made a stroke, it is partly lifted up again by the tail spring *t* (*fig. 3*) acting against the bar of the frame; but the end of the bent detent *b* is prevented from again entering the notch in the plate O, when the hammer rises, by the lever R, which at the instant the lever *b* (*fig. 4*) is pushed down, moves the wheel O a little round, by means of the spring S, into the position of the figure. When the hammer has thus struck and removed the detent *g*, (*fig. 3*) the leaden weight pulls the barrel A, and sets the machine in motion, during which motion the pegs in the chime barrel E strike the lever, F, and move the bell hammers in the due succession of time, the fly (*fig. 2*) in the mean time regulating the velocity of the barrel. At each revolution of the chime barrel E, the peg *n* in wheel H turns the wheel O round one quarter of a revolution, and by the time the barrel has turned four times, the notch in the plate O is brought again opposite to the end of the bent detent *b*, which therefore falls in by the weight of the detent *g*, the latter of which also falls at the same time, so as to catch the stop *f* which stays the machine. The said notch in the plate O is so placed, that when the bent detent *b* is locked into it, the knobs *p, q, r, s*, on the back of this plate, are in the position shewn in *fig. 4*, so that this plate O moves, the instant it is permitted to do so, by the detent *b* being removed by means of the spring S, independently of the great wheel H. This machinery plays four different tunes, which are changed by turning the index W (*fig. 1*) by the handle to the corresponding tune marked on the dial plate T; this handle has a pinion on its arbor, behind the dial plate, which works in a rack upon the crooked iron bar *v, y*, so as to move it up or down when the handle is turned; the bar *v, y* is made to move steadily, by having a crook *x* with parallel sides at each end, sliding against both sides of corresponding steady pins screwed into the frame; and the friction of a spring, *z*, pressing against it, prevents its being moved by accident; in the middle of the bar *v, y* is a bend *y*, which acts like an inclined plane between the rollers 3, 4, fixed in a small frame at the end of the bar W, so as to move that bar horizontally, while the crooked bar *v, y* is moved vertically; to the horizontal bar W are fixed the centres of the keys, or short levers, F, and a long iron plate, 5, with 16 notches to confine each lever to its own plane of action. The sliding pins *g, g*, moving in a cock with two perforations attached to the frame, confine the bar W to a horizontal motion. In setting out the pegs on the barrel, 64 parallel circles, four to each lever, are drawn round it, at equal distances; every four of these coincide successively, by the rack-work adjustment, with one of the levers, so that the respective pegs upon the barrel in the first of each four circles may work its own lever, and play one tune; then by moving the levers, along with the bar W, the distance that two contiguous circles are apart, a second set of pegs is presented to the said levers, which now play a second tune; and in the same manner a third and fourth, successively. The 16 rods C have each a screw adjustment at their lower ends, and their upper ends are connected with revolving rods fixed to the ceiling, by which the motion is conveyed, under each bell, to the

the hammers, which are placed each in a line perpendicularly under the axis of its bell, so as to strike near its lower extremity; (*Plate vii. fig. 4.*) the weight of each hammer H is supported by a spring S, in such a manner that it rises from the bell the instant it has struck. There is moreover a long horizontal iron bar that goes across the levers F (*Plate V. fig. 1*) not seen, the ends of which are connected with another lever also not seen, which, when it is pulled down, takes up all the hammers at once, so as to clear the bells in the act of ringing. There are ten bells in this fleeple, six of which have each two hammers, and the other four but one 2-piece; the double hammers are used where the same bell is require to be struck twice in succession so quickly, that the same hammer could not be lifted up and be made to return twice in the requisite time.

In the mechanism we have here described, the chime barrel is so constructed as to be capable of playing only four tunes; but in some fleeples which we have visited, the barrels have parallel longitudinal apertures, which admit the lifting pegs to slide into any situation, and which consequently render them disposable for any tune within the compass of the two extreme notes, the sliding pieces being fixed by thumb screws within the barrel.

CHIMES of a common clock. After the ample account which we have just given of the chime mechanism of a large church clock, we will satisfy ourselves with giving so much only of the chime work of a common clock, as may suffice to give the reader an idea how a communication is made from the barrel to the bells, which portion could not easily be represented where the bells are at a distance from the barrel, as is the case in a church fleeple. We beg leave, however, to refer our readers to our article *CLOCK with chimies*, for a more particular description of the mechanism which connects the chime part with the going part of the clock, and which alternately locks and unlocks the train of wheel-work that regulates the chime-barrel, it being impossible to describe in a complete manner the contrivance for making the chimies go, and repeat at every quarter of an hour, without describing at the same time the striking mechanism, which does not properly belong to this article. (*Figures 2 and 3 of Plate VII. (Horology)*) represent as much of the chime mechanism of an ordinary clock as will serve our present purpose: A B C D constitute a portion of the clock frame, of which one connecting pillar only is shown; E is the chime barrel of brass, nearly equal in length to the pillar, and of a diameter sufficient to admit of diagonal rows of brass or steel pins to lift the hammer tails F, in the successive order of a descending octave, while the barrel is revolving, there being eight hammers G usually striking successively against as many bells H, which are mounted, concentrically within one another, on a common axis held fast by the bearing piece of steel, I, screwed to the face of one of the plates at its lower extremity. The mechanism connected with the striking part of the clock is so ingeniously contrived and arranged, as may be seen under the article to which we have already referred, that at and after the first quarter from any hour, it will repeat the octave once; at and after the second quarter, it will repeat the same twice; at and after the third, three times; and at and after the hour itself, four times; also whenever the octave is repeated four times, the chime part unlocks the striking part, and allows the clock to strike the last hour as soon as the chimies have ceased, but not before. K is a brass frame screwed at the lower end across the side of the superior part of the clock frame, which holds the works, and has a brass plate N, of hammered metal attached to it by screws: this plate N, is divided nearly to the top by eight parallel vertical slits, made by a saw, which form so many springs; the hammers

all turn upon a common fixed arbor P (*figs. 2 and 3*) by means of a perforation made in each solid part P above the tails, which solid part has a straight edge in each, against the central point of which the respective spring bears a little above its inferior extremity (*fig. 2*); this mode of applying a spring gives the advantage of performing two offices, for it will not only keep the hammer tail in its proper situation, to be taken by a pin of the barrel, but will give a sinarctus to its blow, and then restore it to its original position, by acting alternately, partly above and partly below the central hole; which kind of action will readily be understood, by examining the opening joint of a pen-knife, and attending to the manner in which its spring is applied. L is a cock screwed to the face of one of the plates of the frame, and holds the projecting pivot of the fly wheel, to which the fly M is attached with a spring O pressing against it, in such a manner as to hold it to the arbor of the wheel when the latter revolves, and yet to allow it to turn in a detached state, when the motion of the wheel is suddenly arrested at the conclusion of the chiming, which is a necessary precaution for preventing the destructive effect which might be produced by an instantaneous check of the momentum of the fly, and answers the same purpose as the ratchet wheel and click, together with a spring, on the large fly of the church chime work before described.

The chime barrel which we have here described, is pricked for the performance of a repetition of the eight notes of the octave by a descending gradation, but it might as easily have been made to chime the same scale by an ascending gradation, or to play any hymn or other tune within the compass of the eight notes, or even with more notes, by the addition of a few more bells; and that without more than one hammer to each bell; for when the mechanism is light, the hammers may be made to act with as much rapidity, as the hammers of a grand piano forte.

CHIMIN, or CHEMIN, in Law, a road, or way. See *HIGHWAY and ROAD.*

CHIMINAGE, a toll for wayfarage or passage through a forest. The feudists call it *pedagium.*

CHIMITAS, the name of a tribe of American Indians, in the province of New Granada, who are seated on one side of the river Matadabeca, whilst the Guagiros occupy the other; and both concur in intercepting the trade of Carthagena and the coast.

CHIMNEY, in Architecture, a part of a house or chamber, in which the fire is made.

The word chimney comes from the French *cheminée*, which is derived from the Latin *caminus*, and that from the Greek *καμινος*, a chimney, of *καμινος*, *Thurn*. The parts of a chimney are, the hearth or fire-place, the jams or sides, the back, the mantle resting on the jams, and the tube or flue which conveys away the smoke.

It has been frequently made a question whether or not the ancients were acquainted with the use of chimnies in the common acceptation of the word. On this subject we shall proceed to state those circumstances and arguments that occur.

In favour of the antiquity of chimnies it has been alleged, that Homer (*Odyss. l. i. v. 53.*) represents Ulysses, in the grotto of Calypso, as wishing that he might see the smoke ascending from Ithaca: whence Montfaucon (*L'Antiquité expliquée*) infers, that the homes of Ithaca had chimnies, without which the wish is unintelligible. But in reply, it may be said, that smoke might have been seen in its ascent, though it proceeded from doors or windows. Herodotus also relates (*l. viii. c. 37.*) that a king of Libya, when one of his servants asked for his wages, offered him in jest the fun,

which at that time shone into the house, through the chimney as some have translated the original; but what is here called chimney was merely an opening in the roof, under which, probably, the fire was made in the middle of the edifice. Aristophanes, in his comedy of the *Vespas* (v. 139.), introduces old Philocleon shut up in a chamber whence he endeavours to make his escape by the chimney; which, however, was a mere hole in the roof, as Reiske has determined; and this appears probable, because mention is made of a top or covering, with which the hole was closed. Several passages have been cited from Athenæus (Deipnos.), which seem to refer to chimnies; but these are evidently inconclusive; and some of them intimate that there was no such passage for the smoke as a chimney.

Such are the testimonies of Greek authors, respecting the antiquity of chimnies; but they are rather evidences to the contrary, or that the houses of the ancients were constructed without chimnies; more especially when we consider, that there were no chimnies at Rome at the time when these authors wrote, which would not have been the case if the Romans had ever seen them among the Greeks. Vitruvius makes no mention of them, and it is well known that the Romans were accustomed to use other means for warming their houses, such as stoves and brasiers.

The two words *caminus* and *focus* employed by the Latin authors to denote the fire-place are used indiscriminately, so that it is not possible to observe any difference in their signification. Thus, *focus*, which might be taken for a brasier in which charcoal was burnt, is also used to denote a place proper for the consumption of wood, as the words of Horace prove,

“ Dissolve frigus, ligna super foco
Large reponens.” Lib. 1. Od. 9, 5.

And when Vitruvius directs in what manner the stables of farm-houses should be placed with respect to the kitchen fire, (Lib. vi. cap. 9) he also uses the word *focus*, which certainly cannot be supposed in this place to mean a portable brasier.

Cicero, in writing to Atticus, says in the same sense as Horace: “Camino luculento utendum censo.” When Vitellius was chosen emperor, the eating-room or *triclinium* was set on fire by the *caminus*. Sueton. cap. 8. This passage, however, seems to allude to a chaffing-dish filled with coal.

Thus these two words are used in a manner which gives completely (say the advocates for the antiquity of chimnies) the idea of a common chimney, for it cannot be supposed that in any dwelling where the conveniences of life were tolerably understood, a fire of wood should be made without a passage for the smoke. The line of Virgil,

“ Et jam summa procul villarum culmina fumant,”

in some measure supports this opinion, which is further confirmed by Appian, who says “that of those persons prohibited by the triumvirate some hid themselves in wells and cloaces, some in the tops of houses and chimnies;” for so those who maintain this opinion understand *κεκρυμμένοι ἐν τειχεσιν, σπηλαισιν, σπηλαισιν, σπηλαισιν, σπηλαισιν*. It is alleged, however, that the true translation is *fumosa cœnacula*: and it is further said that the principal persons of Rome endeavoured to conceal themselves in the smoky apartments of the upper story under the roof, which, in general, were inhabited only by poor people; and this seems to be confirmed by what Juvenal expressly says (Sat. x. v. 17) “Rarus venit in cœnacula miles.”

The use of chimnies, it is allowed, if it ever obtained

among the Romans, was superseded by that of stoves and flues; this practice was probably introduced about the reign of Nero. Seneca relates that in his time there were invented certain tubes which were placed in the walls, by which the heat of the fire was made to circulate and warm equally the upper and lower apartments.

Against the antiquity of chimnies it has been urged, that if there had been any in the Roman houses, Vitruvius could not have failed to describe the construction of them. But he does not say a word on this subject; neither does Julius Pollux, who has collected with great care the Greek names of every part of a dwelling-house; and Grapaldus (De partibus ædium libri), who in latter times made a like collection of the Latin terms, has not given a Latin word expressive of a modern chimney. It has been said, indeed, that the word *caminus* means a chimney; but this term, though it was used for a chemical or metallurgic furnace, for a smith's forge, and for a hearth, does not seem, among the Romans, to have denoted a chimney.

In the houses discovered at Herculæanum and Pompeii, there are no chimnies, but they appear all to have been warmed by the means of flues and a subterranean furnace or *hypocaustum*. See that article, and also STOVES.

The complaints often made by the ancients respecting smoke, serve also to confirm the opinion that they had no chimnies. Upon the whole it may be observed, that, though one or more expressions of ancient authors may appear to allude to a chimney, and though we should infer from such expressions, as Montfaucon has done, that the ancients were acquainted with the art of constructing in mason-work elevated funnels for conveying away the smoke, it must be allowed, when we consider the many proofs that occur to the contrary, that they were, at any rate, extremely rare. As they are so convenient and useful, and can be easily constructed upon most occasions, it is impossible, if they had been well known, that they should ever have been forgotten.

It is not easy to determine the period when chimnies first came into use. If it be true, as Du-Cange, Vossius, and others affirm, that apartments called “*caminate*” were apartments with chimnies, they must have been introduced at an early period; for that word occurs in the year 1069, or before that time; but it is always found connected in such a manner as entirely to contradict the above signification. The writers of the 14th century seem either to have been unacquainted with chimnies, or to have considered them as the newest invention of luxury. That there were no chimnies in the 10th, 12th, and 13th centuries has been presumed from the terms “*ignitegium*,” or “*pyritegium*,” the curfew-bell of the English, and *couvre-feu* of the French, which seem to intimate, that the people made fires in their houses in a hole or pit in the centre of the floor, under an opening formed in the roof; and when the fire was burnt out, or the family went to bed at night, the hole was shut by a cover of wood. See CURFEU. The oldest certain account of chimnies that has occurred to Beckmann in his researches (see Hist. of Inventions, vol. ii. p. 103.), is in the year 1347; for an inscription at Venice records that at the above period a great many chimnies (*molti camini*) were thrown down by an earthquake. He adds, that the first chimney-sweepers in Germany came from Savoy, Piedmont, and the neighbouring territories, and these for a long time were the only countries where the cleaning of chimnies was followed as a trade. Hence, he conjectures, that chimnies were invented in Italy.

In considering the countries of modern Europe we may observe the use of stoves prevalent throughout the North, while in France and Great-Britain open chimnies are general. On the other hand, in the warm countries of Italy and Spain there are very few chimnies, and the only method usually

usually practised of tempering the cold, which is sometimes severely felt, is to burn charcoal in portable braziers.

A chimney, as it has been before observed, consists of a fire-place in which the fuel is consumed, and a flue to carry off the smoke and vapour arising from the combustion; thus affording the benefit of the heat of a fire without the inconvenience of its smoke. But these objects were, and still are very imperfectly attained, a very large portion of the fuel being wastefully consumed without increasing the warmth of the apartment, and, in fact, causing those blasts of cold air so commonly complained of by the siders of large open chimnies, while the smoke is frequently driven out to the intolerable inconvenience of the inhabitants. The plague of a smoking chimney is proverbial, and has engaged considerable attention from observers of various descriptions.

Dr. Franklin is the first who has treated this subject in a philosophical manner, and in his "Observation on the Causes and Cure of Smoky Chimnies," published in 1783; he has very satisfactorily explained all the usual causes of this defect, and shewn their remedies. To this pamphlet, succeeded the Essay of Count Rumford, in 1796, whose improvements have been very generally followed in the construction of fire-places. From these two works, which together form a very valuable body of information, we shall draw the materials for the following treatise on the cause and cure of smoky chimnies, together with the methods of increasing the heat and diminishing the quantity of fuel consumed.

The mode and cause of the ascent of smoke in a chimney may be thus explained; the air contained in the flue being heated by the fire immediately below it, becomes rarefied, and therefore lighter than the external air through which it accordingly rises, and as the heated air escapes from the top of the chimney, its place is supplied by the influx of fresh quantities of air, which, passing over the fire, becomes likewise heated, and thus a constant current is formed in the flue which directs and carries off with it the smoke and vapour from the burning materials. It may be observed here that smoke is not, as some are apt to imagine, in its own nature specifically lighter than air, but the contrary, as may be shewn by a simple experiment. Having lit a pipe of tobacco, plunge the stem to the bottom of a decanter half filled with cold water, then putting a cloth over the bowl blown through it, and make the smoke descend in the stem of the pipe, from the end of which it will rise in bubbles through the water, and being thus cooled, will not afterwards rise to go out through the neck of the decanter, but remain spreading itself and resting on the surface of the water. In this case, therefore, smoke is heavier than air, and it is only when rarefied by heat that it becomes lighter. As, however, the vapour rising from a fire must always be highly rarefied, it is easy to perceive that it would be as much a miracle if smoke should not rise in a chimney, (all hindrances to its ascent being removed,) as that water should refuse to run in a syphon, or to descend in a river. What is it then which creates a smoky chimney, that is, a chimney, which, instead of conveying off all the smoke, discharges a part of it into the room? The causes of this effect may be reduced to the following general cases.

Smoky chimnies in a new house, are such, frequently, for want of air. The workmanship of the rooms being all good and just out of the workman's hands, the joints of the flooring and of the panels of the wainscoting are all true and tight; the more so as the walls, perhaps not yet thoroughly dry, preserve a dampness in the air of the room which keeps the wood-work swelled and close: the doors and

the sashes too being worked with truth, shut with exactness, so that the room is perfectly tight, no passage being left open for the air to enter except the key-hole, and even that is frequently closed by a little dropping shutter. In this case it is evident that there can be no regular current through the flue of the chimney, as any air escaping from its aperture would cause an exhaustion in the air of the room similar to that in the receiver of an air-pump, and, therefore an equal quantity of air would rush down the flue to restore the equilibrium; accordingly the smoke, if it ever ascended to the top, would be beat down again into the room. Those, therefore, who stop every crevice in a room to prevent the admission of fresh air, and yet would have their chimney carry up the smoke, require inconsistencies and expect impossibilities. The obvious remedy in this case is, to admit more air, and the question will be how and where this necessary quantity of air from without is to be admitted, so as to produce the least inconvenience; for if the door or window be left so much open, it causes a cold draft of air to the fire-place, to the great discomfort of those who sit there. Various have been the contrivances to avoid this, such as bringing in fresh air through pipes in the jambs of the chimney, which, pointing upwards, should blow the smoke up the funnel; opening passages in the funnel above to let in air for the same purpose; but these produce an effect contrary to that intended, for as it is the constant current of air passing from the room through the opening of the chimney into the flue, which prevents the smoke coming out into the room, if the funnel is supplied by other means with the air it wants, and especially if that air be cold, the force of that current is diminished, and the smoke in its efforts to enter the room finds less resistance.

The wanted air must then indispensably be admitted into the room to supply what goes off through the opening of the chimney, and it is advisable to make the aperture for this purpose as near the ceiling as possible, because the heated air will naturally ascend and occupy the highest part of the room, thus causing a great difference of climate at different heights, a defect which will be in some measure obviated by the admission of cold air near the ceiling, which descending, will beat down and mingle the air more effectually.

Another cause of smoky chimnies is too short a funnel, as, in this case, the ascending current will not always have sufficient power to direct the smoke up the flue. This defect is frequently found in low buildings, or the upper stories of high ones, and is unavoidable, for if the flue be raised high above the roof to strengthen its draft, it is then in danger of being blown down and crushing the roof in its fall. The remedy in this case is to contract the opening of the chimney so as to oblige all the entering air to pass through or very near the fire, by which means it will be considerably heated, and by its great rarefaction, cause a powerful draft, and compensate for the shortness of its column. The case of too short a funnel is more general than would be imagined, and often found where one would not expect it; for it is not uncommon in ill-contrived buildings instead of having a separate funnel for each fire-place to bend and turn the funnel of an upper room so as to make it enter the side of another flue that comes from below. By this means the funnel of the upper room is made short, of course, since its length can only be reckoned from the place where it enters the lower funnel, and that flue is also shortened by all the distance between the entrance of the second funnel and the top of the stack; for all that part being readily supplied with air through the second flue, adds no strength to the draft, especially as that air is cold when there is no fire in the second chimney. The only easy reme-

dy here, is to keep the opening shut of that flue in which there is no fire.

Another very common cause of the smoking of chimnies is, their overpowering one another. For instance, if there be two chimnies in one large room, and you make fires in both of them, you will find that the greater and stronger fire shall overpower the weaker, and draw air down its funnel to supply its own demand, which air descending in the weaker funnel will drive down its smoke, and force it into the room. If, instead of being in one room, the two chimnies are in two different rooms communicating by a door, the case is the same whenever that door is open. The remedy is, to take care that every room have the means of supplying itself from without, with the air its chimney may require, so that no one of them may be obliged to borrow from another, nor under the necessity of lending.

Another cause of smoking is, when the tops of chimnies are commanded by higher buildings, or by a hill, so that the wind blowing over such eminences falls like water over a dam, sometimes almost perpendicularly on the tops of the chimnies that lie in its way, and beats down the smoke contained in them. The remedy commonly applied in this case is, a turn-cap, made of tin or plate-iron, covering the chimney above, and on three sides open on one side, turning on a spindle, and which being guided or governed by a vane, always presents its back to the wind. This method will generally be found effectual, but if not, raising the flues, where practicable, so as their tops may be on a level with or higher than the commanding eminence, is more to be depended on.

There is another case of command, the reverse of that last mentioned; it is where the commanding eminence is farther from the wind than the chimney commanded. For instance, suppose the chimney of a building to be so situated as that its top is below the level of the ridge of the roof, which, when the wind blows against it, forms a kind of dam against its progress. In this case, the wind being obstructed by this dam, will, like water, press and search for passages through it, and finding the top of the chimney below the top of the dam, it will force itself down that funnel in order to get through by some door or window open on the other side of the building, and if there be a fire in such chimney, its smoke is of course beat down and fills the room. The only remedy for this inconvenience is, to raise the funnel higher than the roof, supporting it, if necessary, by iron bars; for a turn-cap in this case has no effect, the dammed up air pressing down through it in whatever position the wind may have placed its opening.

Chimnies otherwise drawing well are sometimes made to smoke by the improper and inconvenient situation of a door. When the door and chimney are placed on the same side of a room, if the door is made to open from the chimney, it follows, that when only partly opened a current of air is admitted and directed across the opening of the chimney, which is apt to draw out some of the smoke.

A room that has no fire in its chimney may sometimes be filled with smoke, which is received at the top of its funnel and descends into the room. To understand this effect, it will be necessary to observe, that currents of air are frequently produced in flues, though not exposed to the influence of fire. The air contained in a funnel, being confined on every side by brick-work, which is a bad conductor of heat, will not be immediately affected by any sudden variation in the temperature of the atmosphere; and thus, while it differs in weight from the external air, an ascending or descending current will be formed in the flue. If, after a warm season, the outward air suddenly grows cold, the empty warm funnels begin to draw strongly upwards, that is, the rarefied air

contained in them begins to rise, cooler air enters to supply its place, is rarefied in its turn, and rises; and this operation continues till the funnel grows cooler, or the outer air warmer, or both, when the motion ceases. On the other hand, if, after a cold season, the outward air suddenly becomes warm, this operation is reversed. When the temperature of the atmosphere and of the flues is nearly equal, the difference of warmth in the air between day and night is sufficient to produce these currents; the air will begin to ascend the funnels as the cool of the evening comes on, and this current will continue till, perhaps, nine or ten o'clock the next morning, when it begins to hesitate, and as the heat of the day approaches, it lets downwards, and continues so till towards evening, when it again hesitates for some time, and then goes upwards constantly during the night, as before mentioned. Now, when smoke, issuing from the tops of the neighbouring chimnies, passes over the tops of funnels which are at the time drawing downwards, as they often are in the middle part of the day, such smoke is of necessity drawn into those funnels, and descends with the air into the chamber.

Chimnies which generally draw well do, nevertheless, sometimes give smoke into the room, it being driven down by strong winds passing over the tops of their flues, though not descending from any commanding eminence. To understand this, it may be considered that the rising light air, to obtain a free issue from the funnel, must push out of its way, or oblige the air that is over it to rise. In a time of calm, or of little wind, this is done visibly; for we see the smoke that is brought up by that air rise in a column above the chimney. But when a violent current of wind passes over the top of a chimney, its particles have received so much force, which keeps them in a horizontal direction, and follow each other so rapidly, that the rising light air has not strength sufficient to oblige them to quit that direction, and move upwards to permit its issue. Add to this, that some of the air may impinge on that part of the inside of the funnel which is oppos'd to its progress, and be thence reflected downwards from side to side, driving the smoke before it into the room. The simplest and best remedy in this case is the application of a chimney-pot, which is a hollow truncated cone of earthenware placed upon the top of the flue. The intention of this contrivance is, that the wind and eddies which strike against the oblique surface of these covers may be reflected upwards instead of blowing down the chimney. The remarkable chimnies observed at Venice, in which the top of the flue is enlarged and rounded in the shape of a funnel, seem also intended as a remedy to this inconvenience, that the wind blowing over one of the edges into the funnel may be flanted out again on the other side by its form.

The bad construction of fire-places is another cause of smoking chimnies; and this case will lead us to the consideration of the second part of our subject, namely, the method of increasing the heat and diminishing the consumption of fuel; for it will be found that the improvements necessary to produce the last-mentioned end will also have a general tendency to cure smoky chimnies. On this subject the meritorious labours of Count Rumford are conspicuous, and we shall proceed to give an abridged account of his method.

In investigating the best form of a fire-place, it will be necessary to consider, first, what are the objects which ought principally to be had in view in the construction of a fire-place; and, secondly, to consider how these objects can best be attained. Now the design of a chimney-fire being simply to warm a room, it is essential to contrive for that end that

shall be actually attained, and with the least possible expence of fuel, and that the air of the room be preserved perfectly pure and fit for respiration, and free from smoke and all disagreeable smells.

In order to take measures with certainty for warming a room by means of an open chimney fire, it will be necessary to consider how and in what manner such a fire communicates heat to a room. This question may, perhaps, at the first view of it, appear to be superfluous and trifling; but a more careful examination of the matter will shew it to be highly deserving of the most attentive examination.

To determine in what manner a room is heated by an open chimney-fire, it will be necessary, first of all, to find out under what form the heat generated in the combustion of the fuel exists, and then to see how it is communicated to those bodies which are heated by it.

In regard to the first of these subjects of inquiry, it is certain that the heat which is generated in the combustion of the fuel exists under two perfectly distinct and different forms. One part of it is combined with the smoke, vapour, and heated air which rise from the burning fuel, and goes off with them into the upper regions of the atmosphere, while the other part, which appears to be uncombined, or combined only with light, is sent off from the fire in rays in all directions. With respect to the second subject of inquiry, it is highly probable that the combined heat can only be communicated to other bodies by actual contact with the body with which it is combined; and with regard to the rays which are sent off by the burning fuel, it is certain that they communicate or generate heat only when and where they are stopped or absorbed. In passing through air which is transparent they certainly do not communicate any heat to it; and it seems highly probable that they do not communicate heat to solid bodies by which they are reflected.

A question which naturally presents itself here is, what proportion does the radiant heat bear to the combined heat? Though that point has not been determined, with any considerable precision, it is, however, certain, that the quantity of heat which goes off combined with the smoke, vapour, and heated air is much more considerable, perhaps three or four times greater, than that which is sent off from the fire in rays; and yet small as the quantity is of this radiant heat, it is the only part of the heat generated by the combustion of fuel in an open fire-place which ever is, or indeed ever can be employed in heating a room. The whole of the combined heat escapes by the chimney, and is totally lost; and no part of it could ever be brought into a room from an open fire-place, without bringing along with it the smoke with which it is combined.

It is, therefore, of the highest importance to determine how the greatest quantity of radiant heat may be generated in the combustion of the fuel, and how the largest proportion of that quantity may be brought into the room. Now the quantity of radiant heat depends very much upon the management of the fire, or upon the manner in which the fuel is consumed. When the fire burns bright much radiant heat will be sent off from it; but when it is smothered up very little will be generated, and, indeed, very little combined heat that can be employed to any useful purpose; most of the heat produced being immediately expended in giving elasticity to a thick dense vapour or smoke, which will be seen rising from the fire; and the combustion being very incomplete, a great part of the inflammable matter of the fuel being merely rarified and driven up the chimney, without being inflamed, the fuel will be wasted to little purpose. During this time no heat is communicated to the room; and what is still worse, the throat of the chimney

being occupied merely by a dense vapour, not possessed of any considerable degree of heat, and consequently, not having much elasticity, the warm air of the room finds less difficulty in forcing its way up the chimney and escaping, than when the fire burns bright: and it happens not unfrequently, especially in fire-places ill constructed, that this current of warm air from the room which presses into the chimney, crossing upon the current of heavy smoke which rises slowly from the fire, obstructs it in its ascent, and beats it back into the room: hence it is, that chimnies so often smoke when too large a quantity of fresh coals is put upon the fire.

To cause as many as possible of the rays, as they are sent off from the fire in straight lines, to come directly into the room, it will be necessary, in the first place, to bring the fire as far forward, and to leave the opening of the fire-place as wide and high as can be done without inconvenience; and secondly, to make the sides and back of the fire-place of such form, and of such materials, as to cause the direct rays from the fire which strike against them, to be sent into the room by reflection in the greatest abundance.

Now, it will be found, upon examination, that the best form for the vertical sides of a fire-place, or the *coivings*, as they are called, is that of an upright plane, making an angle with the plane of the back of the fire-place of about 135 degrees. According to the old construction of chimnies, this angle is 90 degrees, or forms a right angle; but, as in this case the two *coivings* are parallel to each other, it is evident that they are very ill contrived for throwing into the room, by reflection, the rays from the fire which fall on them. The next improvement will be to reduce the throat of the chimney, the immoderate size of which is a most essential fault in their construction; for, however good the formation of a fire-place may be in other respects, if the opening left for the passage of the smoke is larger than is necessary for that purpose, nothing can prevent the warm air of the room from escaping through it; and whenever this happens, there is not only an unnecessary loss of heat, but the warm air, which leaves the room to go up the chimney, being replaced by cold air from without, produces those drafts of air so often complained of. But though these evils may be remedied, by reducing the throat of the chimney to a proper size, yet, in doing this, several considerations will be necessary to determine its proper situation. As the smoke and hot vapour which rise from a fire naturally tend upwards, it is evident that it will be proper to place the throat of the chimney perpendicularly over the fire; but to ascertain its most advantageous distance, or how far above the burning fuel it ought to be placed, is not so easy, and requires several advantages and disadvantages to be balanced. As the smoke and vapour rise in consequence of their being rarified by heat, and made lighter than the air of the surrounding atmosphere, and as the degree of their rarefaction is in proportion to the intensity of their heat, and as this heat is greater near the fire than at a distance from it, it is clear, that the nearer the throat of a chimney is to the fire, the stronger will be what is commonly called its draught, and the less danger there will be of its smoking, or of dust coming into the room when the fire is stirred. But, on the other hand, when a very strong draught is occasioned by the throat of the chimney being very near the fire, it may happen that the influx of air into the fire may become so strong as to cause the fuel to be consumed too rapidly. This however will very seldom be found to be the case, for the throats of chimnies are in general too high.

In regard to the materials which it will be most advantageous to employ in the construction of fire-places, little difficulty

difficulty will attend the determination of that point. As the object in view is to bring radiant heat into the room, it is clear that that material is best for the construction of a fire-place which reflects the most, or which absorbs the least of it, for that heat which is absorbed cannot be reflected. Now, as bodies which absorb radiant heat are necessarily heated in consequence of that absorption; to discover which of the various materials that can be employed for constructing fire-places are best adapted for that purpose, we have only to find, by an experiment very easy to be made, what bodies acquire least heat, when exposed to the direct rays of a clear fire; for those which are least heated evidently absorb the least, and consequently reflect the most radiant heat. And hence it appears that iron, and in general metals of all kinds, which are well known to grow very hot when exposed to the rays projected by burning fuel, are to be reckoned among the very worst materials that it is possible to employ in the construction of fire-places. Perhaps the best materials are fire-stone and common bricks and mortar. These substances are fortunately very cheap, and it is not easy to say to which of the two the preference ought to be given. When bricks are used, they should be covered with a thin coating of plaster, which, when perfectly dry, should be white-washed. The fire-stone should likewise be white-washed, when that is used; and every part of the fire-place which does not come into actual contact with the burning fuel should be kept as white and clean as possible.

We shall now proceed to describe particularly, with the assistance of figures, the improvements of Count Rumford. *Fig. 1, Plate XLI. of Architecture*, is a plan of a fire-place on the old construction; *fig. 2*, an elevation, and *fig. 3*, a section of the same. *Fig. 4*, a plan; *fig. 5*, an elevation, and *fig. 6*, a section of an improved fire-place.

The bringing forward of the fire into the room, or rather bringing it nearer to the front of the opening of the fire-place, and the diminishing of the throat of the chimney, being two objects principally had in view in the alterations of fire-places recommended, it is evident that both these may be attained merely by bringing forward the back of the chimney. It will then remain to be determined how far the back should be brought forward. This point will be limited by the necessity of leaving a proper passage for the smoke. Now, as this passage, which in its narrowest part is called the throat of the chimney, ought, for reasons before stated, to be immediately or perpendicularly over the fire, it is evident that the back of the chimney should be built perfectly upright. To determine therefore the place of the new back, nothing more is necessary than to ascertain how wide the throat of the chimney ought to be left. This width is determined by Count Rumford from numerous experiments, and comparing all circumstances, to be four inches. Therefore, supposing the breast of the chimney, or the wall above the mantle, to be 9 inches thick, allowing 4 inches for the width of the throat, this will give 13 inches for the depth of the fire-place. The next consideration will be the width which it will be proper to give to the back. This, in fire-places of the old construction, is the same with the width of the opening in front; but this construction is faulty, on two accounts; first, because the coverings being parallel to each other, are ill contrived to throw out into the room the heat they receive from the fire in the form of rays; and, secondly, the large open corners occasion eddies of wind which frequently disturb the fire and embarrass the smoke in its ascent, in such a manner as to bring it into the room. Both these defects may be entirely remedied, by diminishing the width of the back of the fire-place. The

width which in most cases it will be best to give it, is one-third of the width of the opening of the fire-place in front. But it is not absolutely necessary to conform rigorously to this decision, nor will it always be possible. Where a chimney is designed for warming a room of moderate size, the depth of the fire-place being determined by the thickness of the breast to 13 inches, the same dimensions would be a good size for the width of the back, and three times 13 inches, or 3 feet 3 inches, for the width of the opening in front, and the angles made by the back of the fire-place, and the sides of it, or coverings, would be just 135 degrees, which is the best position they can have for throwing heat into the room. In determining the width of this opening in front, the chimney is supposed to be perfectly good, and well situated. If there is any reason to apprehend its ever smoking, it will be necessary to reduce the opening in front, placing the coverings at a less angle than 135 degrees, and especially to diminish the height of the opening by lowering the mantle.

If from any consideration, such as the wish to accommodate the fire-place to a grate or stove already on hand, it should be wished to make the back wider than the dimension recommended, as for instance, 16 inches; it will be advisable not to exceed the width of 3 feet 3 inches for the opening in front, as in a very wide and shallow fire-place, any sudden motion of the air in front would be apt to bring out puffs of smoke into the room.

The throat of the chimney being reduced to four inches, it will be necessary to make a provision for the passage of a chimney sweeper. This is to be done in the following manner. In building up the new back of the fire-place, when this wall is brought up so high that there remains no more than about 10 or 11 inches between what is then the top of it and the underside of the mantle, an opening or door-way, 11 or 12 inches wide, must be begun in the middle of the back, and continued quite to the top of it, which according to the height that it will commonly be necessary to carry up the back, will make the opening 12 or 14 inches high, which will be quite sufficient for the purpose. When the fire-place is finished, this door-way is to be closed by a few bricks laid without mortar, or a tile or piece of stone confined in its place by means of a rebate made for that purpose in the brickwork. As often as the chimney is swept, the chimney sweeper removes this temporary wall or stone, which is very easily done, and when he has finished his work, he again puts it in its place.

The new back and coverings may be built either of brickwork or of stone, and the space between them and the old back and coverings, ought to be filled up to give greater solidity to the structure. This may be done with loose rubbish or pieces of broken bricks or stones, provided the work be strengthened by a few layers or courses of bricks laid in mortar; but it will be indispensably necessary to finish the work where these new walls end, that is to say, at the top of the throat of the chimney, where it ends abruptly in the open canal or flue, by a horizontal course of bricks well secured with mortar. It is of much importance that they should terminate in this manner; for were they to be sloped outward and railed in such a manner as to swell out the upper extremity of the throat of the chimney in the form of a trumpet, and increase it by degrees to the size of the flue of the chimney, this construction would tend to assist the winds which may attempt to blow down the chimney, in forcing their way through the throat, and throwing the smoke backward into the room.

The internal form of the breast of the chimney is also a matter of great importance, and which ought to be particularly

larly attended to. The worst form it can have is that of a vertical plane or upright flat, and next to this the worst form is an inclined plane. Both these forms cause the current of warm air from the room which will, in spite of every precaution, sometimes find its way into the chimney, to cross upon the current of smoke which rises from the fire in a manner most likely to embarrass it in its ascent and drive it back. The current of air which, passing under the mantle, gets into the chimney, should be made gradually to bend its course upwards, by which means it will unite quietly with the ascending current of smoke, and will be less likely to check and impede its progress. This is to be effected by rounding off the inside of the breast of the chimney, which may be done by a thick coating of plaster.

Plate XXI. of *Architecture*, fig. 1. The plan of a fire-place on the old construction; A B, the opening of the fire-place in front; C D, the back of the fire-place; A C and B D, the coverings.

Fig. 2, shews the elevation or front view of the same fire-place.

Fig. 3. This figure shews how the fire-place, represented in fig. 1, is to be altered, in order to its being improved. A B is the opening in front, C D the back, and A C and B D the coverings of the fire-place in its original state. *a b* its opening in front, *ik* its back, and *ai* and *bk* its coverings after it has been altered; *e* is a point upon the hearth upon which a plumb suspended from the middle of the upper part of the breast of the chimney falls. The situation for the new back is ascertained by taking the line *ef* equal to 4 inches. The new back and coverings are represented as being built of bricks, and the space between these and the old back and coverings as being filled up with rubbish.

Fig. 4. This figure represents the elevation or front view of the fire-place, fig. 3, after it has been altered. The lower part of the doorway left for the chimney sweeper, is shown in this figure by dotted lines.

Fig. 5. This figure shews the section of a chimney fire-place and of a part of the flue of the chimney on the old construction. *a b* is the opening in front, *b c* the depth of the fire-place at the hearth, *d* the breast of the chimney, *d e* the throat of the chimney, and *d f g e* a part of the flue.

Fig. 6, shews a section of the same chimney after it has been altered: *kl* is the new back of the fire-place, *li* the tile or stone which closes the doorway for the chimney sweeper, *d i* the throat of the chimney narrowed to 4 inches, *a* the old mantle, and *b* the new mantle formed under it to diminish the height of the opening of the fire-place in front, the new mantle being backed with plaster to make the inside of a proper form.

When the breast or wall of the chimney in front is very thin, it may happen, that the depth of the fire-place determined according to the preceding rules may be too small. Thus supposing the breast to be only 4 inches thick, which is sometimes the case, particularly in rooms situated near the top of a house, taking 4 inches for the width of the throat, will give only 8 inches for the depth of the fire-place. In this case, it would be proper to increase the depth of the fire-place at the hearth to 12 or 13 inches, and to build up the back perpendicularly to the height of the top of the grate, and then sloping the back by a gentle inclination forward, bring it to its proper place directly under the back part of the throat of the chimney. This slope, though it ought not to be too abrupt, yet should be quite finished at the height of 8 or 10 inches above the fire, otherwise it may perhaps cause the chimney to smoke; but when it is very near the fire, its heat will enable the current of rising smoke to overcome the obstacle which this slope will oppose to its

ascent, which it could not so easily do, were the slope situated at a greater distance from the burning fuel.

There is one important circumstance respecting chimney fire-places designed for burning coals which remains to be examined, and that is the grate. Although there are few grates that may not be used in chimnies, altered or constructed on the principles recommended by Count Rumford, yet they are not by any means all equally well adapted for that purpose. Those whose construction is most simple, and which of course are the cheapest, are beyond comparison the best on all accounts. Nothing being wanted but merely a grate to contain the coals, and all additional apparatus being not only useless but pernicious; all complicated and expensive grates should be laid aside, and such as are more simple substituted in their room. The proper width for grates in rooms of a middling size, will be from 6 to 8 inches, and their length may be diminished more or less according to the difficulty of heating the room, or the severity of the weather. But where the width of a grate is not more than 5 inches, it will be very difficult to prevent the fire from going out. It has been before observed that the use of metals is as much as possible to be avoided in the construction of fire-places, it will therefore be proper always to line the back and sides of a grate with fire stone, which will cause the fire to burn better and give more heat into the room.

Smoke in its passage through a chimney deposits a great part of the soot, with which it is loaded, upon the sides of the flue, which causes danger from fire, and is besides apt to fall back into the room. It is therefore frequently necessary to have the flues cleaned. To effect this, various expedients have been resorted to, but the most commonly adopted is the use of climbing boys, who ascend within the chimney and sweep down the soot. The evils of this disagreeable and unwholesome occupation to those engaged in it, are generally acknowledged, and of late years the public attention has been directed to this subject, and premiums offered for the discovery of methods which might be substituted to a practice so offensive to humanity.

In the year 1802 a number of public-spirited and wealthy persons associated for this purpose, and offered considerable premiums to those who might invent and bring into practice, a method of cleansing chimnies by mechanical means that should supersede the necessity of climbing boys. Some of themselves, perhaps, inadvicely to the talk of carrying the laudable intentions into full execution, they applied to the "Society for the encouragement of Arts, Manufactures, &c." in the Adelphi, requesting them to engage in it, and to offer premiums on the subject. In consequence of this application the society offered 1000*l*. in gold medal to the person who should invent the most effectual mechanical or other means for cleansing chimnies from soot, and obviating the necessity of children being employed within the flues. In a few months there were five candidates for this premium, whose several inventions were put to the test of experiment upon chimnies not less than 70 feet high. One of the inventions consisted of a set of brushes with pulleys and weights, which were to be let down from the top of the chimney; but as the object was to find an apparatus to effect the purpose from the inside of the house, this was deemed unfit to accomplish the views of the society. Another gentleman proposed the plan of throwing gravel up the chimney by means of condensed air; the machine was tried, and deemed wholly inadequate to the purpose. A third apparatus consisted of elastic rods of whalebone and cane, with a brush at the end of the upper one, which was found to answer only in short and straight chimnies. The next consisted of laths several feet long, which locked into one another,

other, and on the upper one was fixed an elastic expanding brush, which, in its ascending and contracted state, occupied a space of only six or eight inches, but which was to be opened, when forced to the top of the chimney, by means of a spring attached to it the whole length of the rods. After many experiments before divers persons appointed to examine its merits, this was given up as in-effective: the purpose required. The only remaining apparatus was invented by Mr. George Smart, the patentee of a method of making hollow nails for ships: to him, after a long series of practice, in which he has been almost uniformly successful, the gold medal was adjudged; he has received all, we believe, fore other premiums for his invention. As his method is now practised by several persons in and near the metropolis, we shall give a particular account of it, with references to an engraved plate. The principal parts of the machine are a brush, some rods or hollow tubes, that fit into each other, by means of brass sockets, and a cord for connecting the whole together.

The brush consists of four fan-shaped portions (see *Plate Chimney Sweeping*, *figs.* 1 and 2) which are to swing upon hinges, that in ascending the chimney, the brush may take up a small space as possible, and in descending, it may spread out and sweep the sides of the flue; by a contrivance exactly like that which is adopted in the common umbrella, the brush is prevented from falling down into its contracted form: *fig.* 1 represents it expanded, and in *fig.* 2 it is shown in its contracted state. The substance made use of in general for the brush is what is called whilk. The rods represented by *a, b, c, d, e, f, &c.* *figs.* 1, 2, and 5, are hollow tubes with a metal socket, at the lower end; some of the sockets have a screw in them for the purpose of confining the cord after it has been duly stretched, and preventing the rods from separating (see *fig.* 2). The upper end of the rods are either with or without ferrules, and taper to admit of a small motion within the sockets. The rods are about thirty inches long, and the cord runs from the top of the brush through all the rods, and when drawn tight keeps the whole machine together. *Fig.* 3, represents the cloth to be placed before the chimney opening, and a bar of deal or other wood, with a slide on it, fixing it to different sized openings. *Fig.* 4, is a bar or bars made to slide out, like a telescope slide, with a screw to fix it at different lengths, for closing the sides of the cloth to the jumbs of the chimney piece. *Fig.* 5, exhibits the machine raised up the chimney with the man working, he being on the outside of the cloth, through which there is a small slit or opening to admit the tubes passing. *Fig.* 6, a part of the apparatus, consisting of a small post and pulley, fixed on a board for the purpose of more easily drawing the cord tight before it is made fast with the screw. The method of using the machine is this: Having ascertained, by looking up the chimney, what is the direction of the flue, the cloth is then to be fixed before the fire-place, with the horizontal bar, *fig.* 3, and the sides to be closed with two upright bars like *fig.* 4. The brush is introduced through the opening of the cloth, which opening is then to be battomed, and one of the rods is to be passed up the cord into the socket on the lower end of the rod which supports the brush; the other rods are in like manner to be brought up one by one in succession, till the brush is raised somewhat above the top of the chimney, observing to keep the cord constantly tight, and when those rods which have a screw in the socket are brought up, they are to be placed on the purchase; the cord is to be put round the pulley and drawn very tight, and screwed down, by which all the rods above will be firmly connected together, and the whole may be regarded as one long flexible rod. In pulling the machine down, the edges

of the brush striking against the top of the chimney, will cause it to expand, and there being a spring to prevent its contracting again, it will bring down the foot with it. In drawing down the machine, the person should grasp with his left hand, the rod immediately above that which he is separating with his right hand, to prevent the upper ones from sliding down too soon. The rods as they are brought down, are to be laid carefully one by one in a small compass as possible, and arranged like a bundle of sticks.

This machine has been found useful in extinguishing fires in chimnies: for that purpose a coarse cloth is to be tied over the brush, dipped in water, and then passed up in the manner directed. After three years experience, Mr. Smart's machine has been found in a great measure, to answer the purposes for which it was intended; in the course of several thousand trials it is ascertained that not more than one or two chimnies, at most, in a hundred, has resisted the passage of the brush. It is, however, of importance to observe that the invention cannot be deemed in a state of perfection; for from some coals adheres so strongly to the sides of the chimney and chimney pot, that no brush will of itself bring it down, so that after a considerable time it may be expected, that means must be found to scrape off the foot as the climbing boys now generally do. We wish therefore that such an addition to the apparatus could be devised, as should remedy this defect: it is well known that one cause of the smoking of chimnies is from the circumstance of the top of the chimney pot being clogged with foot that adheres to the upper edge, which it is certain Mr. Smart's brush has in many instances failed to remove. He has done much to obviate an evil long complained of; an evil that has deprived of health, and eventually of life, a multitude of persons in their youth, that might for a long course of years have been useful to the community, and we wish to see in his hands, the invention, so honourable to his talents, rendered still more useful by being more perfect. He has attained, with regard to making his brush ascend the chimney, all that can be expected, and instead of bringing up infants to climb the fiftieth or hundredth chimney which on account of the direction of the flue no apparatus can be made to ascend, other means may be adopted, such as, 1st. By having a fixed apparatus at the top, with a chain descending down the flue, and a brush annexed to it; for which purpose two patents were taken out in the year 1757, one by Mrs. Bill of Hamstead, and one by Mr. Davis, of Dooonbury. Or 2^{dly}. By the method practised at Edinburgh, and other places in the northern parts of the united kingdom, of letting down a weight attached to one end of a cord, with a bush of holly tied at the other end, which by means of a person at the top and another at the bottom of the chimney is worked up and down till the foot is thoroughly cleaned away.

CHIMNEY-SWEEPERS, regulations concerning. By stat. 28 Geo. III. c. 48. the church-wardens and overseers of the poor of any parish, with the consent of two justices, may bind any boy of the age of 8 years and upwards, who is chargeable to the parish, to any person following the trade of a chimney sweeper, till he shall attain the age of sixteen years. No master shall have more than six apprentices at one time; nor let out his apprentices to hire to any other person for the purpose of sweeping chimnies; nor cause them to call the streets before seven in the morning, nor after twelve at noon, between Michaelmas day and Lady day; nor before five in the morning, nor after twelve at noon the rest of the year. Every master shall cause his name and place of abode to be engraved on a brass plate, to be fixed upon the front of a leathern cap, which he shall provide for each apprentice.

prentice, who shall wear the same when he is out upon his duty. These regulations are enforced by penalties of not more than 10*l.* and not less than 5*l.* The law is so tender with regard to these generally frigid children, that it has appointed a particular form of indenture, by which the master covenants to find his apprentices cloaths for his daily occupation, and other cloaths for his life when he is not employed in his work and for Sandays; he covenants also to see that he is properly cleansed from all foot and filth once a week, and be required to attend public worship in the dress adapted for the purpose.

CHIMNEY, in *Geography*, a town of the island of Ceylon, 54 miles S.E. of Candy.

CHIMNEY-joints, are the sides of a chimney, usually standing out perpendicularly, sometimes circularly from the back; on the extremities whereof the mantle-tree rests.

CHIMNEY-money, or *hearth-money*, a tax imposed by statute 13 and 14 Car. II. c. 10. expiring, that every fire-hearth, and stove of every dwelling, or other house, within England and Wales, except such as pay it to church and poor, shall be chargeable with two shillings *per ann.* payable at Michaelmas and Lady-day, to the king and his heirs. But this tax was declared to be an oppression and badge of slavery, and accordingly abolished by stat. 1 W. and M. c. 10. and the window-tax established in its room. See *PEACE* and *WINDOW-TAX*.

CHIMNEY-piece, in *Building*, a composition of certain mouldings, of wood or stone, standing on the fore-side of the jambs, and coming over the mantle-piece.

CHIMOS, in *Ancient Geography*, a maritime village of Egypt, on the borders of the Marotide nome. Ptolemy.

CHIMPANZEE, in *Zoology*, the Angola ape, *Simia troglodytes* of Blumenbach, *fatyrus indiens* of Tulpius, &c. This animal very nearly approaches the orang-outang, but in the opinion of most zoologists is specifically distinct. It is, according to Blumenbach and Gmelin, distinguished among other particulars by having the body smooth, except the back and shoulders, which are hairy; the head is also of a somewhat conic form, and the body brawny, or remarkably muscular. The true orang-outang has the body entirely covered with hair, the haunches especially, and the hair on the fore arms is placed in a reversed direction. In the year 1738, one of these chimpanzees was brought over into England by the captain of a ship in the Guinea trade; it was of the female sex, and was two feet four inches high; it naturally walked erect. It would eat very coarse food, and was fond of tea, which it drank out of a cup with milk and sugar, as we do; it slept in the manner of the human species, and in its voice made some imitation of the human speech, when people speak very hastily, but without any articulate sound. The males of this species are represented as very bold; they will fight a man though they see him armed. Their dispositions are extremely lascivious, inasmuch as to render it unsafe for women to venture into the woods alone; it is affirmed that the female negroes are often surprised and overpowered by these disgusting animals. The chimpanzee shewn in London in 1738 was only about twenty months old, and was of a docile disposition: the parent had it in her arms when she was attacked by the Moors in Angola, and would not part with it till she was killed by one of their spears. This full-grown female was five feet high.

CHINA, in *Botany*, *Amboinensis*, Rumph. See *SMILAX* *ceylonica*.

CHINA *radix*, Bauh. Pin. See *SMILAX* *China*.

CHINA *spuria nodosa*, Bauh. Pin. See *SMILAX* *pseudo-China*.

CHINA, in *History and Geography*. The word China is

well known to the people whom we call Chinese; but the most learn'd among them never apply it to themselves or their country. They wish to be described by the people of Han, or of some other illustrious family, by the memory of whose actions they flatter their rational pride; and their country they call *Chum-ear*, or the central kingdom, representing it in their symbolical characters by a parallelogram exactly bisected; at other times they distinguish it by words that mean all that is valuable upon earth. It is difficult to give any account that shall be satisfactory as to the origin of the Chinese. Four opinions have been advanced, all of which have been preceptorily asserted rather than supported by argument and evidence. By a few writers it has been urged that they are an original race who have dwelt for ages, if not from the first creation of things, in the land which they now possess; by others, chiefly the missionaries, it is alleged that they sprang from the same stock with the Hebrews and Arabs; a third assertion is that of the Arabs themselves, and of M. Pauw, who contend that they were originally Tartars, descending in wild clans from the steppes of Inanus; and a fourth is that of the Brahmins, that the Chinas, so they call them in Sanscrit, were Hindus of the military class, who, abandoning the privileges of their tribe, rambled in different bodies to the north-east of Bengal; and forgetting, by degrees, the rites and religion of their ancestors, established separate principalities, which were afterwards united in the plains and valleys which are now possessed by them. Sir William Jones has examined each of these claims with great care and attention, and he observes, that, "in support of an opinion, (viz. that the Chinese and Hindus were the same people), which I offer as the result of long and anxious inquiries, I should regularly proceed to examine the language and letters, religion and philosophy of the present Chinese, and subjoin some remarks on their ancient monuments, on their sciences and their arts, both liberal and mechanical; but their spoken language not having been preserved in the usual symbols of articulate sounds, must have been for many ages in a continual flux; their letters are merely the symbols of ideas; their popular religion was imported from India in an age comparatively modern; and their philosophy seems yet in so rude a state as hardly to deserve the appellation; they have no ancient monuments from which their origin can be traced; their sciences are wholly exotic; and their mechanical arts have nothing in them characteristic of a particular family; nothing which any set of men in a country so highly favoured by nature might not have discovered and improved. They have, indeed, both national music and national poetry, and both of them beautifully pathetic; but of painting, sculpture, or architecture, as arts of imagination, they seem to have no idea. Instead, therefore, of enlarging separately on each of those heads, I shall briefly inquire how far the literature and religious practices of China confirm or oppose the proposition which I have advanced."

In the course of this inquiry, he finds that the Buddha of the Hindus is unquestionably the Fo of China; but the great progenitor of the Chinese is also named Fo-hi, where the second syllable signifies a victim. Now the ancestor of that military tribe whom the Hindus call the Chandravansa, or "children of the moon," was, according to their legends, Buddha, or the genius of the planet Mercury, from whom, in the fifth degree, descended a prince, named Druhya; whom his father, Yayati, sent in exile to the east of Hindostan, with this imprecation, "may thy progeny be ignorant of the Veda." The name of the banished prince cannot be pronounced by the modern Chinese; and though Sir William Jones does not assert that the last syllable of it has been

changed into Yao, he observes, that Yao was the fifth in descent from Fo-hi, or at least the fifth mortal in the first imperial dynasty; that all Chinese history before him is considered by the Chinese themselves as fabulous; that his father, Ti-co, like the Indian king, Yayati, was the first prince who married several women; and that Fo-hi, the head of their race, appeared, say the Chinese, in a province of the west, and held his court in the territory of Chin, where the rovers mentioned by the Indian legislators are supposed to have settled. Another circumstance in defence of this opinion is, that the mother of Fo-hi was the "daughter of heaven," surnamed "a Flower-loving;" and, according to the Chinese mythology, as the nymph was walking alone on the bank of a river, with a similar name, she found herself suddenly encircled by a rainbow; soon became pregnant, and was delivered of a son, called "Sui," or the "Star of the Year." According to the system of the Hindus, the nymph Rohini, who presides over the fourth lunar mansion, was the favourite mistress of Soma, or the Moon, among whose numerous epithets we find one answering to "Delighting in a species of water-flower that blossoms at night;" and their offspring was Buddha, regent of a planet, and called also from his parent *Raahineya*, or *Saumya*. Sir William Jones shews also, that the opinions of the Chinese and Hindus are in many respects similar: they both believe this earth to have been wholly covered with water, which they describe as "flowing abundantly, then subsiding, and separating the higher from the lower age of mankind;" and that the division of time, from which their poetical or fabulous history begins, just preceded the appearance of Fo-hi on the mountains of Chint. Though the religion of Confucius was pure, and worthy of a great mind, contending for the excellence of a Supreme God, and giving a demonstration of his being and providence from the exquisite beauty and perfection of the celestial bodies, and the wonderful order of nature, in the whole fabric of the world; yet the people of China, in general, had an ancient system of ceremonies and superstitions, which the government and philosophers appear to have encouraged, and which has an apparent affinity with many parts of the oldest Indian worship. They believed in the agency of genii, presiding over all things, of which, like the Hindus, they reckoned five. To these they offered victims on high places with ceremonies, and in a language very like those used by the Brahmins. M. Le Gentil observed, he says, a strong resemblance between the funeral rites of the Chinese, and the fradha of the Hindus: and M. Bailly, the celebrated French astronomer, after a very learned investigation, concludes, that, "even the puerile and absurd stories of the Chinese fabulists contain a remnant of ancient Indian history, with a faint sketch of the first Hindu ages." After a very elaborate discussion, in all the particulars of which we cannot follow him, sir William Jones says, that the several circumstances of literature and religion seem collectively to prove, as far as the question admits of proof, that the Chinese and Hindus were originally the same people, but having been separated nearly four thousand years, have retained few strong features of their ancient consanguinity, especially as the Hindus have preferred their old language and ritual, while the Chinese very soon lost both; and the Hindus have constantly intermarried among themselves, while the Chinese, by a mixture of Tartarian blood from the time of their first establishment, have at length formed a race distinct in appearance from Indians and Tartars.

Mr. Barrow, who has visited China, and seen much of the inhabitants, and to whose excellent account of his travels in this country we shall have occasion frequently to refer,

does not agree with Sir William Jones with regard to the origin of the Chinese. He admits several of the facts adduced by M. Bailly and others: he allows that the Hindus, like the Chinese, have always shewn a remarkable predilection for the number nine; that the two nations resemble one another in the observance of the solstitial and equinoctial sacrifices; in making offerings to the manes of their ancestors; in the dread of leaving no offspring behind them, to pay the accustomed obloquies to their memory; in observing eight cardinal or principal points of the world; in the division of the zodiac, and in a variety of other coincidences; which the late Mr. Bryant accounts for, by supposing the Egyptians, Greeks, Romans, and Indians, to be derived from one stock, and that some of these people carried their religion, and their learning into China; but he says their physical character is a sufficient proof that the Chinese do not owe their origin to the same stock as the Hindus. The small eye, rounded at the extremity next the nose, instead of being angular, as is the case in that of Europeans, its oblique instead of horizontal position, and the flat and broad root of the nose, are features or characters entirely distinct from the Hindu, the Greek, or the Roman; and belong more properly to the natives of Tartary. There are scarcely in nature two of the human species that differ more widely than a Chinese and a Hindu, being alike the difference of colour; but the Manchoo, and indeed all the other Tartar tribes bordering upon China, are hardly to be distinguished from the Chinese. The large blue, or the fine eyes, and general turn of countenance peculiar, on the continent of Asia, from the tropic of Cancer to the Frozen Ocean. The peninsula of Malacca, and the vast multitude of islands spread over the eastern seas, and inhabited by Malays, as well as those of Japan and Loo-choo, have clearly been peopled from the same common stock. Having given this account of the different conjectures respecting the origin of the Chinese, we proceed to consider the

Situation and extent of China. In the last century, the Chinese emperors extended this wide empire over many western countries, so that it may be now considered as reaching from those parts of the Pacific Ocean called the Chinese and Japanese seas, to the rivers Satefou and Sihan in the west, a space of 81°, which, taking the medial latitude of 30°, will amount to nearly 4200 geographical, or 4600 British miles. From N. to S. this vast empire may be computed from the Uralian mountains, lat. 50°, to the southern part of China, about lat. 21°, being 29° of latitude, that is, 1740 geographical, or nearly 2030 British miles. This empire consists of three principal divisions; that of Chi a proper; the territory of the Mandchues and Morguts on the north and west; and lastly, the singular and interesting region of Tibet; with the first of these we are at present concerned, reserving the others to their proper places in the alphabet.

China proper extends from the great wall in the north to the Chinese sea in the south, about 1140 geographical, or 1300 British miles. The breadth from the shores of the Pacific ocean to the frontiers of Tibet may be computed at 1330 British miles. In square miles the contents have been estimated at 1,297,369, and in acres at 830,716,360. On the east and south the boundaries are maritime, and to the north they are marked by the great wall and the desert of Shamo, the confines with Tibet on the west seem to be chiefly indicated by an ideal line, though occasionally more strongly marked by mountains and rivers; particularly according to M. D'Anville by the river Yaton, which falls into the Kiau-ku, the country of Sifan lying between Tibet and China, on the south of the Eluths of Kokenor.

As China extends from the second to the fifth climate,

its temperature must vary accordingly. The difference of the length of its days is little more than four hours; the longest in the most northern parts, being about fourteen hours and three quarters; and the shortest, in the most southern, about ten hours and three quarters; and the night proportionable. It is, however, generally reckoned very moderate, except only towards the north, where the cold is extremely piercing, not so much from its northern situation, as from ridges of mountains that intersect those parts, and are vastly high, and mostly covered with deep snows. Even in those parts which lie under the tropics, the winds that blow thither from the large and mountainous parts of Tartary render the weather exceedingly cold and piercing, during the three, and sometimes four, winter months. The southern parts, on the other hand, must be supposed to be very hot and dry; but these heats are the more easily borne, by the help of their grottos, groves, and cooling shades; to these they retire during the heat of the day; at which time there is the same universal silence, and cessation from business, as if it were midnight. In these southern parts there is neither frost nor snow; but they are much troubled with storms, and violent rains, about the time of the equinoxes; all the rest of the year is crowned with a serene sky, and a most delightful verdure. Upon the whole it must be admitted, that where nature has been most unequal in the distribution of her gifts, Chinese industry has supplied the defects. It has in some instances levelled whole ridges of mountains in particular provinces, and raised the land in others. By providing proper fences against excessive colds in some, and heats and droughts in others, and by varying their agriculture, according to the different soils and climates, every spot almost of that vast territory produces enough to maintain its inhabitants, rendering the whole country delightful, populous, healthy, and opulent.

Progressive Geography. The progressive geography of China, as known to the western nations, is not of ancient date, whether with M. D'Anville we suppose the Sinoë to have been in Cochinchina, or with Gosselin place them in the western part of Siam. The most ancient external relation which we possess, is that of the two Mahometan travellers in the ninth century, who surprize us with accounts of barbarism and cannibalism little to be expected; but the Arabs are so fond of fables, that implicit credit may be safely withheld from several passages. Yet these travellers impart high ideas concerning the Chinese empire, and mention Canfu, supposed to be Canton, as a city of great trade, while the emperors resided at Camdan, which seems to be the city also called Nanking, or the southern court, in contradistinction from Peking, or the northern court. This wide empire, continued, however, obscure to the inhabitants of Europe, till the travels of Marco Polo appeared, in the end of the thirteenth century. Yet the work of this traveller remained so unknown, that pope Pius II. in his description of Asia, is contented with the more imperfect account by Nicola Conti, a Venetian traveller of his own time, who visited Cathay. Haitho the Armenian, who wrote his book on the Tartars about the year 1306, begins with an account of Cathay; and Oederic of Portenau described his voyage to China in 1318. Sir John Mandeville visited China about 1346; and Pegoletti gave directions for the route in 1385. But in the following century there seems to have been a strange and unaccountable intermission of intercourse and research, if we except the travels of Nicola Conti above mentioned; and so perishable was the knowledge acquired, as to have escaped even a learned pontiff. After this relapse of darkness, the rays of more genuine and authentic knowledge

gradually emerged by the discovery of the Cape of Good Hope, and the subsequent enterprises of the Portuguese.

History. The Chinese as a nation pretend to an antiquity beyond all credibility; they carry their history back many millions of years before the period assigned by the Scriptures to the creation of the world. According to the Chinese histories, the first monarch of the whole universe, that is, of China, was called Poon-ku, which is a word denoting the highest antiquity. Poon-ku was succeeded by Tienchoang, which signifies the emperor of heaven; to this monarch they ascribe the invention of letters. He was succeeded by Ti-hoang, the emperor of the earth, who is said to have been skilled in astronomy; to have divided the day and night; appointing thirty days to make the period of one moon; and he fixed the winter solstice to the eleventh moon. Ti-hoang was succeeded by Cine-hoang, sovereign of men, who shared the government with nine brothers. These are said to have taught their subjects to build houses, cities, &c. The reigns of these four emperors make up but one of what the Chinese called *li*, "ages" or "periods," of which there were nine before Fo-hi, who is acknowledged, by the most sensible writers, to be the founder of their empire, but the regular history begins with Yau.

The Chinese historians of this country have reckoned twenty three dynalies, of which the first included Fo-hi and his eight successors down to Sheen. The others, together with the number of emperors belonging to each family, and the years they reigned, are as follow:

Dynalies.	Emperors.	Years.
1. Hya	- 17	458
2. Shang	- 28	644
3. Chew	- 35	873
4. Tsin-al-Chin	- 4	43
5. Han	- 25	429
6. Hew-han	- 2	44
7. Tzin, or Chin 2d	15	155
8. Song, or Soum	8	59
9. Tzi, or Chi	5	23
10. Lyang	- 4	55
11. Chin-al-Kin	- 5	32
12. Swi, Soui	- 3	29
13. Tang Tam	- 20	89
14. Hew-lyang	- 2	10
15. Hew-tang	- 4	13
16. Hew-tzin	- 2	11
17. Hew-han	- 2	4
18. Hew-chew	- 3	9
19. Song, or Soum	- 18	379
20. Ywen	- 9	89
21. Ming, or Mim	- 17	279
22. Tzin, Chim	- 2	53

The most interesting particulars of the Chinese history relate to the incursions of the Tartars, who at last conquered the whole empire, and who still continue to hold the sovereignty; though by transferring the seat of empire to Peking, and by adopting the Chinese language, manners, and customs, Tartary seems rather to be incorporated with China, than the conqueror of it. These incursions began very early, even in the time of Shun, the immediate successor of Yau above mentioned, when the Tartars were repulsed and driven back into their own territories. From time to time, however, they continued their invasions, and the northern provinces of China were often ravaged by the Tartars in their neighbourhood. About the year before Christ 213, Chi hoang-ti having subdued all the princes of

the different provinces, became the emperor of China, with the possession of unlimited powers. He divided the whole empire into thirty six provinces; and finding the northern parts of his dominions greatly harassed by the invasions of the neighbouring barbarians, he sent a formidable army against them, which drove them far beyond the boundaries of China: and to prevent their return he built the famous stone-wall which separates China from Tartary. After this, being elated with his own exploits, he formed a design of making posterity believe that he himself had been the first Chinese emperor that ever sat on the throne: for this purpose, he ordered all the historical books and records, which contained the fundamental laws and principles of the ancient government, to be burned, that they might not be employed by the learned to repel his authority, and the changes which he proposed to introduce into the monarchy. He is even said, on this occasion, to have caused four hundred of the literati to be burnt, together with their books. In the tenth century of the Christian era, the Kitan, a people of Eastern Tartary, made incursions into the country, subdued a part of the empire, and established a government of their own in 916. Thirty years after this, Ming-tsong, the emperor of China, was attacked by his brother-in-law She-king tang, and was by him deprived of his crown and life. She-king-tang assumed the title of emperor under the name of Kait-fu. But the Kitan general refused to acknowledge him, except on the condition of his yielding up to the Tartars sixteen cities in the province of Pe-cheli, which is the most northern province of China. This submission served only to inflame the avarice of the Kitan, and in the year 959 they invaded the empire afresh. The emperor, opposed them with a formidable army; but through treachery he was taken prisoner, and was obliged to resign his empire to one of his own generals, who assumed the name of Kait-fu. The successors of this man opposed the barbarians ineffectually till the year 978, when they became so strong as to lay siege to a considerable city. The emperor sent against them in the night 300 soldiers, each carrying a light in his hand, with orders to approach the camp as near as possible. The enemy imagining by the number of lights that the whole Chinese army was at hand, immediately fled, and, falling into the ambuscade laid for them, were almost all cut to pieces. In the year 993, and again in 1035, the Kitan attacked the empire, and laid it under heavy contributions; after which we hear little more of them till the year 1117, when their ravages became so intolerable, that Whey-tsong, the emperor, in order to put a stop to them, called in the assistance of the Eastern Tartars to destroy the kingdom of Kitan, which they effectually accomplished. This, however, proved of no advantage to the Chinese; for the Tartar general, elated with his conquest, gave the name of Kin to his new dominion, assumed the imperial title, and began to think of aggrandizing his empire. For this purpose he invaded and made himself master of the greater part of the provinces of Pe-cheli and Shan-li, when, after several conferences between the Tartar general and Whey-tsong, the latter was thrown into prison, where he ended his days in 1126, having nominated his eldest son, Kin-tsong, to succeed him. Kin-tsong began his reign with putting to death six ministers of state, who had betrayed his father into the hands of the Kin-Tartars. The Barbarians in the mean time pursued their conquests, and, marching directly towards the imperial city, took and plundered it, at the same time seizing the Emperor and his consort, they carried them away captives. The crown devolved on Kaa-tsong, the ninth son of Whey-tsong, who

fixed his court at Nanking. He made several fruitless efforts to recover some of his provinces from the Kin. Kutong, the Kin monarch, in the mean time, endeavoured to gain the esteem of his Chinese subjects, by paying a great regard to their learning and learned men. He advanced to Nanking, from whence Kaa-tsong had retired, and took it: but receiving advice that Yo-fi, general of the Song, or Southern Chinese, was approaching to the relief of the city, he set fire to the palace, and retired northward. However, Yo-fi arrived time enough to fall upon their rear-guard, which suffered so much, that, from this time, the Kin never dared to cross the river Kyang. But in 1163, the king approached the mouth of that river, and commanded his troops, on the pain of death, to cross it, which they refused, rebelled against their sovereign, and killed him in the beginning of the tumult, and then retired.

After this, nothing remarkable occurs in the Chinese history till the year 1210, when the chief of the Western Tartars, Moguis, or Mungis, quarrelled with Yong-tsi, emperor of the Kin. In 1212, the Mogul generals forced the great wall to the north of Shan-li, made incursions as far as Peking, the capital of the Kin empire, and defeated an army of 3,000 Kin. The war was continued, and several battles fought in the next year; in one of which, the ground was strewn with dead bodies for upwards of four leagues. In 1226, Oktay marched into Honan, besieged the capital of the Kin empire, took several cities, cut to pieces an army of 30,000 men, but was, notwithstanding, obliged to retire into Shan-fi. The war was carried on with various success by Oktay and his brother Toley, who took more than sixty important posts in the province of Shan-fi. Toley demanded of the Song a passage for his army through the country of Han-chong-fu, which being refused, he forced the passage, and put to the sword the inhabitants of two cities. Having cut down rocks to fill up deep abysses, and made roads through places almost inaccessible, he besieged the city itself, the miserable inhabitants of which fled to the mountains on his approach, where more than a hundred thousand of them perished. In January 1232, Oktay, passing the Whang-ho, encamped in the district of Kay-fong-fu, the capital of the Kin empire, and sent his general, Suputay, to besiege the city. At that time the place was 50 miles in circumference; but having only 40,000 soldiers to defend it, as many more, besides 20,000 peasants, were ordered into the city, while the emperor published an affecting declaration, animating the people to defend it to the last extremity. Although the Moguls took some considerable spoils, yet, in other instances, they were opposed with such intrepidity and valour, that they were obliged to retire. Oktay resolved to return to Tartary, but Suputay, his general, pushed on the siege of the capital with renewed vigour. For sixteen days and nights he continued his attacks without intermission, which seemed only to inspire the besieged with fresh courage: an incredible number of men perished on both sides; at length Suputay, finding that he could not take the city, withdrew his army. Soon after, the plague broke out in Kay-fong-fu, and raged with such violence, that, in fifty days, more than a million of persons perished by it.

In a short time the war was again renewed. The capital of the Kin empire was delivered up by treachery to Suputay, who put all the males of the imperial race to the sword, while he spared, by command of Oktay, the inhabitants, who are said to have amounted to near a million and a half of families. The monarch, after this disaster, retired to Juning-fu, a city in the southern part of Honan, attended

only by four hundred persons. Here they were again besieged by the Moguls, and reduced to the extremity of living three months on human flesh, killing the old and feeble, as well as many prisoners, for food. This being known to the Moguls, they attacked them, but were repulsed, though at the expense of all the best Kin officers: upon which the emperor resigned his crown to Cheng-hin, a prince of the blood. While the ceremony of investing the new emperor was performing, the Moguls broke into the city, slew the late emperor and his successor; and thus, in the year 1234, an end was put to the dominion of the Kin Tartars in China.

The empire of China was now to be shared between the Song, or Southern Chinese, and the Moguls. It had been agreed upon, that the province of Honan should be delivered up to the Song as soon as the war was finished. But they, without waiting for the expiration of the term, or giving Okтай notice of their proceedings, introduced their troops into some of the considerable Mogul cities. On this the Mogul general resolved to attack them, and repassing the Whang-ho, cut to pieces part of the garrison of Lo-yaug, while they were out in search of provisions. The Song emperor now desired a continuance of peace, which, however, did not accord with the views of Okтай, who, at the head of the Moguls, made great progress in the province of Ho-nang, where he took several cities, and put vast numbers to the sword. From 1239 to 1246, the Moguls were unable to make any progress; but upon the death of the Chinese general, Mong-kong, they renewed the war with more vigour and success than ever, for several years. In 1259 they laid siege to Ho-chew, a strong city, to the west of Peking, defended by a numerous garrison. The siege continued from February till August, when the Moguls made a general assault in the night. They mounted the walls before the governor had intelligence of it, but were soon attacked with the utmost fury; a terrible slaughter ensued, and among the rest fell the emperor himself, upon which they raised the siege, and retired to Shen-hi. Hupday succeeded to Mong-ko, and laid siege to Yu-chang-to, a city near the capital of the Song empire. The relief of this city was committed to a man destitute of courage and talents, and who, to obtain a peace, entered into a treaty, by which he engaged the Song empire to pay an annual tribute of 100,000*taels*, and likewise to acknowledge the sovereignty of the Moguls. This treaty proved the ruin of the empire; for when the Mogul emperor found the terms not fulfilled, he determined to revenge himself on the Song for their treachery, published a manifesto against them, and, in 1268, the war was renewed. They made many conquests, took Nanking, and marched towards Han-chew-fu, the capital of the Song empire. Notwithstanding, however, the progress made by the Moguls, vast territories still remained to be subdued, before they could be considered as masters of the Chinese empire. On the death of Iwon-tsong, therefore, the mandarins raised his brother, Te-ping, to the throne. His army, consisting of nearly 200,000 men, ignorant of the art of war, was defeated by 20,000 Mogul troops. Nor was the fleet more successful; for being thrown into confusion by that of the Moguls, and the emperor in danger of falling into their hands, one of the officers, taking him upon his shoulders, jumped with him into the sea, where they were both drowned. Most of the mandarins followed this example, as did also the empress and minister, all the ladies and maids of honour, and multitudes of others, inasmuch that 100,000 people are supposed to have perished on that day. Thus ended the Chinese race of emperors; and the Mogul dynasty, known by the name of Ywen, commenced.

Though no race of men ever existed more remarkable for cruelty than the Moguls, yet the emperors of the Ywen dynasty were not, in any respect, worse than their predecessors. On the contrary, Hupday, called by the Chinese Shi-tu, who was the first emperor of that race, entered himself so much to the people, that the reign of his family is styled by the Chinese, the wise government. This he accomplished by paying strict regard to their ancient laws and customs, by the mildness of his government, and by his attention and encouragement to learned men. In 1280 he employed some mathematicians to search for the source of the river Whang-ho, which, at that time, was unknown to the Chinese themselves. In four months they made the discovery, and drew a map of it, which they presented to his majesty. A treatise on astronomy was, by his order, published in the same year. And, in 1282, he brought together all the learned men of the empire, to examine into the state of literature, and to take measures for its advancement. Soon after his accession he fixed his residence at Peking, where being informed that the barks, which brought to court the tribute of the fourteen provinces, were obliged to come by sea, and often suffered shipwreck, he caused that celebrated canal to be cut, which is at present one of the wonders of the Chinese empire. It reaches from Canton to Peking, and thus forms a communication between the southern and northern provinces. During the reign of Shi-tu he formed the design of reducing the islands of Japan, and the kingdoms of Tonquin and Cochin-China; but these enterprises failed, with the loss of 100,000 men. The throne continued in this family till the year 1307, when Shun-ti, the last of that dynasty, was driven out by a Chinese, named Chu, who assumed the imperial title under the name of Hong-wu, and thus put an end to the Ywen government. Hong-wu and his successor drove the Moguls beyond the great desert, which separates China from Tartary. They continued, notwithstanding, to make incursions upon the empire till 1583, when vast numbers of them were cut to pieces by the Chinese troops. The twenty-first dynasty of Chinese emperors, founded in the year 1368, continued till 1644, when they were again expelled by the Tartars. The last Chinese emperor was Whey-tong, who ascended the throne in 1628. He found himself at once engaged in a war with the Tartars, and attacked by a number of rebels in the different provinces of his empire. The former were soon vanquished; but the emperor finding himself overpowered by the rebels, deserted by his subjects, betrayed by those in whom he placed the greatest confidence, and preferring death to the disgrace of falling into the hands of his enemies, retired with his empress, whom he tenderly loved, and the princess, their daughter, into the garden. His grief was so great that he was unable to utter a single word. After a few silent embraces the empress hanged herself on a tree. Her husband flaid only to write these words on the border of his veil; "I have been basely deserted by my subjects; do what you will with me, but spare my people." He then cut off the young princess's head with one stroke of his scimitar, and hanged himself on another tree, in the seventeenth year of his reign. His prime minister, queens, and eunuchs followed his example. And thus ended the Chinese monarchy, to give place to that of the Tartars, which has continued ever since. The whole empire submitted to the usurper Li, except prince U-fan-ghy, who commanded the imperial forces in the province of Lyau-tong. This brave prince, finding himself unable to cope with the usurper, invited the Tartars to his assistance; and Ifong-te, their king, immediately joined him with an army of 80,000 men. Upon this Li marched directly to Peking, plundered

and burnt the palace, and then fled with immense treasures. The young Tartar monarch was immediately declared emperor of China, his father, Tfonte, having died almost as soon as he set foot in that empire. The new emperor, Shun chi, conferred upon U-fan-ghey the title of king, and assigned to him the capital of Shen-si for his residence. In 1652 the whole empire was to effectually subdued, that the emperor, Kang-hi, successor to Shun-chi, determined to visit Tartary, his native dominions, in order to take the diversion of hunting. This practice he continued for several years. He was a great encourager of learning and the Christian religion, in favour of which he published a decree in 1692. In 1716, however, he revived some obsolete laws against the Christians; and in the next reign Christians of all denominations, not excepting even those of the imperial race, were persecuted; the J suits were banished into Kankin, a little island inhabited by the Portuguese, but subject to China.

In the year 1720, the emperor received the congratulations of the whole empire, on the signal victory which his forces had gained over the Lamas, who possessed the country of the Lamas, and had committed dreadful ravages for four years successively; which victory gave him now the sole command of the kingdom of Tibet. In the month of June an earthquake was felt at Peking, which lasted about two minutes, and killed above 2000 persons by the fall of houses. In November, the czar of Muscovy made his public entry into Peking, with a numerous and splendid retinue, dressed after the European manner. He met with a gracious reception at the court, though the emperor would not accede to the object of this visit, which was to take measures for establishing a free commerce between the dominions of the two sovereigns.

The emperor, while taking the diversion of hunting in one of his parks, was suddenly seized with a shivering fit, which obliged him to return to his palace immediately. His illness increased, and medical assistance was applied to, but was found to be in vain. Being conscious of his approaching end, he assembled all his grandees, and having in their presence declared his wish for his successor, he expired on the 20th of December, 1722, in the 60th year of his age. Yong-chung was 45 years old when he ascended the throne. He had several brothers, but placed his confidence only in one; the rest he dispersed or banished. He imprisoned many of the princes and grandees for protecting the missionaries, to whose design he had himself formerly been very favourable; and discarded all these fathers from his service except one, who was an excellent painter. In other respects he shewed himself a wise prince, assiduous and indefatigable in the discharge of the duties of government, steady and resolute in his disposition, and endowed with a degree of eloquence and address, and attentive in answering the memorials which were presented to him. He governed wholly by himself; and no monarch was ever more absolute, or more dreaded by his subjects. This unlimited authority enabled him to enforce a great many wholesome laws and regulations, in framing which he spent whole days and nights with the most persevering industry. The surest way of gaining his favour, was by presenting him with some scheme tending to the public good, or to the relief of his subjects in times of calamities, in the execution of which, if it appeared practicable, he spared no pains. On the 17th of November, 1731, the city of Peking was nearly overturned by a dreadful earthquake, such as had never before been felt in China. The first shocks, which happened about eleven in the forenoon, were so sudden and violent, that in less than a minute above 100,000 inhabitants were buried in the

ruins of houses, and a still greater number in the surrounding country, where whole villages and towns were destroyed. The emperor was then at his pleasure-house about two leagues from the capital. While taking an airing in his barge, seeing the edifice instantaneously converted into ruins, he fell prostrate on his knees, with his hands and eyes lifted up to heaven. He published an edict, ascribing himself as the chief cause of the calamity, and attributing the judgment to the wrath of God for his offences and want of care in governing the people. He then ordered an account to be taken of the families that had suffered by it, and an estimate of the damage it had occasioned, advancing considerable sums for their relief; part of which was presented to the missionaries, towards repairing their churches. But in the following year he renewed his persecution against the Christians, and caused the missionaries, and all that belonged to them, to be loaded with irons, and thrown into prison; and many he even condemned to the punishment of carrying the wooden collar. This prince was succeeded by Kien-Lung, who, after a happy, peaceful, and long reign of 63 years, died on the 11th of February, 1796; and was succeeded by Ka-Hing, the present emperor, and the fifth of the Tartar dynasty. These emperors have wisely prevented the European nations, who have overthrown the other eastern governments, from obtaining a footing in China. They permit them, the English in particular, to carry on a restricted intercourse at the single port of Canton; but they treat with coolness every attempt to obtain exclusive privileges, to build forts, or to establish permanent factories.

Topographical Description, Population, &c.—After the above historical sketch, we proceed to the topography of China. It is divided into fifteen provinces, six of which are styled northern and nine southern. The names of these will be given below, when we come to speak of the population; and the description of each province will be found in the alphabetical order of the dictionary. Sensible as the Chinese seem to be of the advantages derived from an easy communication between the different parts of the empire, by means of canals, it is the more surprising what the motives could have been, that, till this moment, have restrained them from facilitating an intercourse by means of good roads, in such parts of the country as have no inland navigation. In this respect they fall short of most civilized nations. Except near the capital, and in some few places where the junction of the grand canal with navigable rivers is interrupted by mountainous ground, there is scarcely a road in the whole country that can be ranked beyond a foot path. Hence it happens that in the northern provinces, during winter, it is impossible to travel with any degree of ease, convenience, or safety; all the canals to the northward of the Yellow river, which runs from 34° to 35° latitude, being frozen up. It is equally surprising that their ingenuity has not extended itself to the invention of sledges, or some sort of carriages, suitable for traveling on ice, which other nations have converted into the best of roads. The cities and large towns are for the most part built in a regular form; their walls are high and strong, the gates are spacious, the main streets are broad and straight, intersected with others, which cross them at right angles. The squares are adorned with noble structures, such as triumphal arches and stately towers several stories high, embellished with galleries, carving, gilding, and a variety of other ornaments. Their public buildings are more remarkable for their extent than for their magnificence; their private houses are large but low, seldom exceeding one story in height, without any windows towards the street; these are often painted, varnished, and gilt, in a most splendid manner. The shops are set out with all their rich mer-

chandize, some of which is brought out and displayed in front of the houses. Before these are erected large wooden pillars, the tops of which are higher than the eaves of the houses, bearing inscriptions in gilt characters, setting forth the nature of the wares to be sold, and the honest reputation of the seller, and, to attract the more notice, they are generally hung with various coloured flags and streamers from top to bottom, exhibiting the appearance of a line of shipping dressed, as may be sometimes seen, on the river Thames, in the colours of all the different nations of Europe. The streets, being generally unpaved and covered with sand, prove so dully in dry weather, as to be not only offensive to the great crowds that continually throng them, but very injurious likewise to the fine merchandize that is exposed. These clouds are still increased by multitudes of horses and carriages of all descriptions that are in continual motion. In rainy weather they are still more inconvenient from the mud and dirt, so that in winter and summer they are very troublesome and even unhealthy to walk in. The towns, villages, and military posts, are regularly placed at intervals of about three miles. No just idea can be formed of the population and magnitude of a Chinese city by the extent of its enclosing walls. Few are without large patches of unoccupied grounds within them, which, in many instances, far exceed the quantity of land that is built upon. Even in that part of the capital called the Chinese city, several hundred acres are under cultivation. The imperial city, containing the palace and buildings for the officers of state, the eunuchs, and artificers, occupies very nearly a square mile, more than two-thirds of which is a kind of park and pleasure grounds; and under the north wall of the Tartar city there is a pond or swamp, which appears to be fully twice the dimensions of Lincoln's-Inn-Fields. Such spaces of unoccupied ground might perhaps have been reserved for the use of the inhabitants in case of siege, as the means of supplying a few vegetables of the pungent kind, as onions and garlic, for the besieged, which are the more necessary for a people who use so small a portion of animal food, and little or no milk. Thus the cities of Babylon and Nineveh, which were so frequently exposed to the calamities of war and siege, had gardens and corn-lands within their walls. Independently of towns and villages, the houses of the peasants are, in many parts, scattered about. The face of the country is often level and entirely open; not a hedge-row, and very few trees to be seen through an extensive district. The cottages appear clean and comfortable; they are without fences, gates, or other apparent precaution, against the intrusion of wild beasts or thieves. Robbery is said to happen seldom, though not punished by death, unless aggravated by the commission of violence. The wives of the peasantry are of material assistance to their families, in addition to the rearing of their children, and the care of domestic concerns; for they carry on most of the trades which can be exercised within doors. Not only do they rear silk-worms and spin the cotton, but the women are almost the sole weavers throughout the empire.

Many parts of the country are so covered with swamps and morasses, as not to admit of the usual cultivation. In such situations the Chinese exhibit new instances of industry and ingenuity. They form rafts or hurdles of bamboo which they float upon the water, or rest upon morasses; on these rafts they spread a layer of soil, from whence they raise various kinds of vegetables; in like manner successful attempts are also made, in miniature, to produce smaller vegetables on ship-board, by laying seeds on moist and soil, or even on pieces of flannel placed in frames and wetted. By these means the radical leaves of mustard, for example,

sprout up quickly and are patiently grateful to persons long absent from land. Besides this method of raising a crop upon the water, the lakes, rivers, and canals of China are converted assiduously to such other useful purposes, either in cultivating vegetables growing from their bottom, or in catching the birds that swim upon its surface, or the fish that exult under it, or the other animals which creep upon the bottom, or by fertilizing the lands, by irrigation from them, and by the cheap and easy communication which they afford between the different districts of the empire; thus saving so much land, otherwise necessary for roads, and so much labour to make and keep them in repair, which is now employed in agriculture. In a country so populous as China every precaution is necessary to prevent the smallest spot of ground from being unoccupied that can be applied to any use; hence grape-vines, vast quantities of which are produced in this country for food, are generally planted on the sides of the canals; and, as they spread, small upright posts are driven in the water five or six feet from the bank, by which means that space is converted into a perfect harbour, without any expense of earth but what is immediately about the roots. Ample provision is likewise made for the constant cultivation of the land, by the forfeiture of such as are neglected, to the sovereign, who immediately grants them to other farmers willing to undertake their culture.

We must next proceed to the rivers of China, of which the Hoan-ho and the Kian-ku, deserve particular attention. The sources of the first, which is also denominated the Yellow river, from the quantity of mud which it devolves, are two lakes, situated among the mountains of that part of Tartary known by the name of Kokonor. These lakes lie about 35° N. lat. and 10° of longitude, to the westward of Peking, or about 97° E. of Greenwich. This prodigious river is extremely winding and devious in its course, pursuing a N. E. direction to about 42° of N. latitude, and after running due east it suddenly bends south to a latitude nearly parallel to its source, and pursues an easterly direction till it is lost in the Yellow sea. Its comparative course may be estimated at about 1800 British miles; or according to the late embassy 2150. At about 70 miles from the sea, where it is crossed by the imperial canal, the breadth is little more than a mile, and the depth only about nine or ten feet, but the velocity equals about seven or eight miles an hour. The Kian-ku rises in the vicinity of the sources of the Hoan-ho; but, according to the received accounts and maps about 200 miles further to the west, and winds nearly as far to the south as the Hoan-ho does to the north. After washing the walls of Nanking, it enters the sea about 100 miles to the south of the Hoan-ho. The Kian-ku is known by various names during its long progress; and near its source is called by the Eluths, Portcho or Petchou; its course is about equal to that of the former; these two rivers being considered as the longest on the face of the earth, for they are supposed to exceed the famous river of the Amazons in South America, and the majestic course of the Ganges does not extend half the length. In the late embassy the length of the Kian-ku is estimated at 2270 miles; and it is observed that these two great Chinese rivers, taking their source from the same mountain, and passing almost close to each other, in a particular spot, afterwards separate from each other, to the distance of 15° of latitude, or about 1050 British miles; and finally discharge themselves into the same sea, comprehending a tract of land of about 1000 miles in length, which they greatly contribute to fertilize. To these grand rivers many important streams are tributary; but it would not be consistent with our plan to enter into details here respecting them, the principal of those meriting

notice, will be found in the alphabetical order of the dictionary.

In China there are many noble and extensive lakes. According to Du Halde, there is one in the province of Hou-quang, that is at least 80 leagues in circumference. In the province of Kiang-li there is another about thirty leagues in circumference, formed by the confluence of four large rivers, and is itself very dangerous to navigators. There is a considerable lake, not far to the south of Nanking, besides a number of smaller ones chiefly in the eastern and central parts of China. Sir George Staunton mentions, that upon a lake near the imperial canal, were observed thousands of small boats and rafts, constructed for a singular species of fishery. On each boat, or raft, are ten or twelve birds, which, at a signal from the owner, plunge into the water; and it is astonishing to see the enormous size of fish with which they return grasped within their bills. They are so well trained, that it does not require either ring or cord about their throats, to prevent them from swallowing any portion of their prey, except what the master is pleased to return them, for encouragement and food. The boat made use of by these fishermen is of a remarkably light make, and is often carried, together with the fishing birds, by the men who are there to be supported by the employment.

Du Halde describes some of the Chinese mountains as abounding with silver; others produce marble and crystal. In the province of Kiang-nan there is a district wholly mountainous. Two grand ranges, running E. and W. intersect the centre of the empire, apparently continuations of the enormous chains of Tibet. In the southern part of China the principal ridges run from N. to S.

The population of China has been a topic of considerable debate. Pauw observes from Du Halde, that when the missionaries proceeded through the empire, to prepare their maps, they found in the greater part of its large governments, countries of more than twenty leagues, little peopled, almost uncultivated, and often so wild as to be quite uninhab-

able, and he infers that the population is even exaggerated when it is computed at 82,000,000. "In so wide an empire," says Mr. Pinkerton, "most of the features are on a large scale, nor can human industry totally overcome, though as we have seen, it diminishes certain impediments of nature, as ridges of rocks, and extensive swamps, in certain positions; and in the north of China large forests are indispensably preferred for the sake of fuel. On a smaller scale, such obstacles to universal population are found even in the most fertile countries; they occur, as we all know, near the capital of our town." Civil wars, which, as we have seen in the foregoing history, have repeatedly raged in China, have laid desolate immense districts of the country for a long period of time. As it would be absurd to suppose that all China consists of land fit for cultivation, so it would be equally absurd to deny that the population has impressed every traveller with astonishment, and with ideas totally different from those of Pauw, who seems to have forgotten that the want of cultivation in some districts is balanced by that residing on the waters, millions of families passing their whole existence in boats, on the numerous rivers, lakes, and canals. The recent English embassy, prepared as they were for something very extraordinary on the subject of population, were nevertheless greatly astonished when the following statement was delivered at the request of Lord Macartney by a mandarin of high rank, as the abstract of a census that had been taken the preceding year: "The amount," says Mr. Barrow in his Travels in China, "appeared so enormous as to surpass credibility. But as we had always found this officer a plain, unaffected, and honest man, who on no occasion had attempted to deceive or impose on us, we could not consistently consider it in any other light than a document drawn up from authentic materials. To the table containing the account of the population are added the number of people on a square mile, and the value of the surplus taxes remitted to Peking in the year 1790:

Provinces.	Population.	Square miles.	No. on each square mile.	Surplus taxes remitted to Peking.
Pe-tche-lee	38,000,000	58,949	644	oz. silver. 3,036,000
Kiang-nan	32,000,000	92,561	344	8,210,000
Kiang-fee	19,000,000	72,176	263	2,120,000
Tche-kiang	21,000,000	39,150	536	3,810,000
Fo-kien	15,000,000	53,480	280	1,277,000
Houquang { Hou-pee { Hou-nan	14,000,000 } 13,000,000 }	144,770	187	1,310,000 } 1,345,000 }
Honan	25,000,000	65,104	384	3,212,000
Shan-tung	24,000,000	65,104	368	3,600,000
Shan-fee	27,000,000	55,268	488	3,722,000
Shen fee { one { province	18,000,000 } 12,000,000 }	154,008	195	1,700,000 } 340,000 }
Se-tchuen	27,000,000	166,800	162	670,000
Quang-tung	21,000,000	79,456	264	1,340,000
Quang-fee	10,000,000	78,250	128	500,000
Yu-nan	8,000,000	107,569	74	210,000
Koei-tchoo	9,000,000	64,554	140	145,000
Totals	333,000,000	1,297,999		36,548,000

The measurement annexed to each of the fifteen ancient provinces was taken from the maps constructed by a laborious, and, as is generally believed in China, very accurate survey, which employed the Jesuits ten years. Whether this great empire, the first in rank both in extent and population, does or does not actually contain three hundred and thirty-three millions, is a point that Europeans are not likely to ascertain. That it is capable of subsisting this and a much greater population, Mr. Barrow, in his work already referred to, has taken considerable pains to prove. He mentions several causes that have contributed to the populousness of this country: since the Tartar conquest China has enjoyed a profound peace, and its army being parcelled out as guards for the towns, cities, and villages, and stationed at the numberless posts on the roads and canals, all marry, have families, and a certain portion of land, which they have time to cultivate, is allotted for their use. As the nation has little foreign commerce, there are but few seamen: such as belong to inland navigation are mostly married: public opinion indeed considers celibacy as disgraceful, and a sort of infamy is attached to a man who continues unmarried beyond a certain time of life. As an encouragement to the nuptial state, every male child may be provided for, and receive a stipend from the moment of his birth by having his name enrolled on the militia list. By the equal division of the country into small farms, every peasant has the means of bringing up his family, if drought or inundations do not frustrate his labour; and the pursuits of agriculture, it is well known, are very favourable to health, and consequently to population. From the general poverty that prevails among the lower classes, drunkenness is little known, and temperance, from necessity, very much practised. The climate in general is moderate and uniform, and, excepting the small pox, the Chinese are liable to few epidemical disorders; the women are very prolific, and from the inanimate kind of life which they lead, are subject to few accidents, and they all suckle and nurse their own children. From these and other favourable circumstances, Mr. Barrow supposes that the population of China may not have been exaggerated even by those who have given the highest calculations.

Canals and Chinese Navigation. In China there is scarcely a town or even a village which has not the advantage either of an arm of the sea or a canal; by which means navigation is rendered so common, that almost as many people live on the water as on land. The great canal is one of the wonders of art; it runs from north to south, extending from the city of Canton to the extremity of the empire; and by it all kinds of foreign merchandise entered at that city are conveyed directly to Peking, a distance of 825 miles. This canal is about 50 feet wide; it passes through, or near 41 large cities; it has 75 large sluices to keep up the water, besides several thousand bridges. China owes the greatest part of her riches to these numerous canals, which are cut through any kind of private property, not even excepting the gardens of the emperor, who, when the water arrives at his ground, digs the first spadeful of earth, and pronounces with an audible voice, "This is to let all know that private pleasure should never obstruct the public good." The canals are bordered or faced with quays of free-stone, and, in low places, long causeways are raised for the convenience of travellers. There are bridges over the canals of three, five, or more arches, of which the middle one is high enough for vessels to pass under with their masts standing. When the water is liable to overflow the neighbouring meadows, they open the sluices to convey it away, and there are inspectors appointed to keep the canals in proper repair. One large canal generally runs through every province, and a

vast number of smaller ones are cut from the large one; which again are divided into some still smaller, that end at a village or great town; sometimes they discharge themselves into a lake, or large pond, from which all the adjacent country is watered. Among all the canals in the southern provinces, one is called the great canal, which is the grandest inland navigation in the known world, being, according to Mr. Barrow, nearly 1000 feet in width, of which the sides are built with massive blocks of grey marble mixed with others of granite; and this immense aqueduct, although forced several feet above the surface of the country, by embankments thrown up by the labour of man, flows with a current of about three miles an hour towards the Yellow river. The bulle and activity both on shore and on the numberless canals that branch out in every direction from the main trunk, exhibit, for several miles, on either side, one continued town, extended to the point of junction with this large river, celebrated in every period of Chinese history. That which most charms the eye is the immense number of large boats with imperial colours, and beautifully painted, that sail in fleets, and commanded by a single mandarin of the province, and loaded with its best productions, and chiefly on the emperor's account. There are several classes or rates of these boats, very neat and commodious; a middle sized one has a hull and four very convenient rooms, besides a good kitchen, and place for the attendants; the rooms are generally carved, painted, and gilt; even the ceiling is painted, and the whole varnished; some of these boats are of 200 tons burthen, and from 300 to 400 of them on the same canal at the same time, and sometimes in one fleet; and by the clearness and good management of the canals, it is rendered the most pleasant and fertile country in the world. The Chinese junks are strong roomy vessels, from 100 to 200, and some 300 tons burthen; the hold below deck is divided into several distinct apartments, partitioned off with two-inch plank, grooved or rabbeted as close as possible, and the joints or seams are caulked with a cement of lime, pitch, &c. prepared in such a manner as to render it perfectly water-tight. A junk may strike against a rock and not sink; a leak may be sprung, but will damage no further than the goods in that apartment. Before the barges are launched from the canal into the stream of the Yellow river, certain ceremonies are conceived to be indispensably necessary: an oblation is made in every vessel to the genius of the river: the animals sacrificed on such occasions consist of fowls or pigs. The blood, with the feathers and the hair, are daubed upon the principal parts of the vessel, and on the fore-castle are placed cups of wine, oil, and salt, the last article being thought by the Chinese as necessary to every sacrifice. The cups, the slaughtered animals, and several made dishes remain on the fore-castle, while the captain stands over them on one side, and a man with his *gong* on the other. On approaching to the rapid part of the stream, at a signal given by the *gong*, the captain takes the cups one by one, the contents of which he throws over the bow of the vessel, into the river. The libation being performed, a quantity of crackers, squibs, and gilt tin foil are burnt with up-lifted hands, while the deep-sounding *gong* is incessantly struck with increasing violence as the vessel sweeps along with the current. The victim and the other dishes are then removed for the use of the captain and the crew, and the ceremony ends by three genuflexions, and as many prostrations. The Chinese are unskilled in the art of navigation. They keep no reckoning at sea, nor possess the least idea of drawing imaginary lines upon the surface of the globe, by the help of which the position of any particular place may be ascertained; in other words, they have no means of ascertaining the latitude or longitude of any

place either by the distance failed, or by observation of the heavenly bodies. Yet they pretend that many of their early navigators made long voyages in which they were guided by charts of the route, sometimes drawn on paper, and sometimes on the convex surface of large gourds. The present system of Chinese navigation is to keep as near the shore as possible, and never to lose sight of land, unless in voyages that absolutely require it, such as to Japan, Batavia, and Cochin-China. Knowing the bearing or direction of the port intended to be made, they endeavour to keep the head of the ship always pointing to it by means of the compass. Yet even with the assistance of the compass it is surprising how their ill-constructed vessels can perform so long and dangerous a voyage as that of Batavia, and, indeed, vast numbers of Chinese vessels are annually lost by shipwreck in attempting it. When a ship leaves Canton on a foreign voyage, it is considered as an equal chance that she will never return; and when the event proves favourable, a general rejoicing takes place among the friends of those who had embarked in the hazardous undertaking. Some of these ships are not less than 1000 tons burthen, and contain half that number of souls, besides passengers, who hope to make their fortunes at Batavia or Menila. A ship belongs to several merchants, and is divided into as many compartments as there are partners, and each sits up his own as he pleases. He ships his goods and accompanies them in person, or sends his son, or a near relation, for it rarely happens that they will trust each other with property where no family connection exists. Each sleeping-place is just the length and breadth of a man, and contains only a small mat spread on the floor, and a pillow. Behind the compass is generally placed a small temple, with an altar, on which is continually kept burning a spiral taper composed of wax, tallow, and sandal-wood. This holy flame answers a double purpose: for while the burning of it fulfils an act of piety, its twelve equal divisions serve to measure the portions of time which make a complete day. It should seem that the superstitious notions inculcated on the people, have led them to believe that some particular influence resides in the compass; for on every appearance of a change in the weather, they burn incense before the magnetic needle.

Government and political Relations. The government of China is patriarchal. The emperor is absolute, but the examples of tyranny are rare, as he is taught to regard the people as his children, and not as his slaves. Being considered as the common father of his subjects, he is accordingly invested with the exercise of the same authority over them, as the father of a family exerts on those of his particular household. In this sense he takes the title of the Great Father; and by his being thus placed out of the reach of any earthly controul, he is supposed to be also above earthly descent, and therefore, as a natural consequence, he sometimes styles himself the sole ruler of the world and the son of heaven. Conformably to this system, founded entirely on parental authority, the governor of a province is considered as the father of that province; of a city, the father of that city; and the head of any office or department is supposed to preside over it with the same authority, interest, and affection, as a father of a family superintends and manages the concerns of domestic life. The stability of the government, in all its sensible and essential forms and customs, justly astonishes those who are most conversant in history. It arises from a circumstance unknown in any other government, the admission and practice of the principle, that "knowledge is power." For all the officers of government pass through a regular education, and a progress of rank, which are held indispensable. Of the officers called manda-

rins, there are nine classes, from the judge of the village to the prime minister. The profession requiring a long and severe course of study, the practice of government remains, like that of medicine, unshaken by exterior events; and while the imperial throne is subject to accident and force, the remainder of the machine goes on without interruption. The governors of the provinces have great and absolute power, yet rebellions are not infrequent. Bribery is also an universal vice, and the Chinese government, like many others, is less beautiful in practice than in theory. The Chinese laws are ancient, but numerous; and edicts of the reigning dynasty have restrained the mandarins within stricter limits of duty.

Though unbounded authority is given to the emperor by the laws, yet the same laws lay upon him a necessity to use his power with moderation and discretion, which are the two props that have so long supported the great fabric of the Chinese monarchy. The first principle inculcated into the people at large, is to respect their prince with so high a veneration as almost to adore him. His commands are indisputable, and his words sacred. He seldom shews himself to the people, and is never spoken to but on the knees. When he is ill, the palace is full of mandarins, who spend their whole time in a large court, offering petitions to heaven in behalf of their prince's cure. No weather, no inconvenience, can excuse them from this duty: so long as the emperor is in pain or in danger, the people seem to fear nothing but the loss of him. Self-interest is no small occasion of the great respect which is shewn him by his subjects; for as soon as he is proclaimed emperor, the whole authority of the empire is in his hands, and the fortunes of his subjects are entirely at his disposal. 1st. All places of honour and profit are in his gift. Honesty, learning, experience, and gravity of behaviour, are said to be the only qualifications to insure success to the candidate for any post of trust or dignity. As the emperor has the sole choice of all officers of state, so he dismisses, without ceremony, those who are deficient in their duty. 2^d. He has absolute power over the lives and properties of all his subjects. Offenders are arraigned and tried in the different provinces, but the sentence is always presented to the emperor, who either confirms or rejects it, as he pleases. He can lay what taxes he thinks fit upon his subjects to supply the pressing wants, and relieve the necessities of the state. 3^d. The right of making peace and war belongs to the emperor; he may make what treaties, and upon what terms, he pleases, provided they are not dishonourable to the kingdom. The judgments passed by him are irrevocable, and his sovereign courts and viceroys dare not use the least delay in registering them. 4th. Another singular circumstance belonging to the Chinese government, is the right that the emperor has of choosing his successor, whom he may select not only from the royal family but from among his other subjects; and there have been emperors, who, finding none of their own family able to support the dignity of a crown, have chosen for their successors persons of mean birth and fortune, but eminent for virtue and understanding. Examples of this nature are not, however, very common, but it frequently happens that the choice does not fall according to seniority, which, in China, never occasions any civil commotions or rebellions. 5th. The grave itself does not put an end to his power over his subjects, which is exercised even upon the dead, whom he disgraces or honours, when he has a mind either to reward or punish them or their families. He confers upon them, after their decease, titles of honour; canonizes them as saints, or, according to their language, "makes them naked spirits." Sometimes he builds for them temples; and, if their administration of public

affairs has been very beneficial, or their virtues remarkably eminent, he commands the people to honour them as gods. The emperor has ever been looked upon as the chief priest and principal servant of religion; and there are ceremonies and public sacrifices which he alone is thought worthy to offer up to the great Creator of heaven. 6th. The emperor may change the figure and character of the letters, abolish characters already received, or form new ones. He may likewise change the names of provinces, of cities, and of families. He may forbid the use of any commonly received expressions or modes of phrase, and introduce others which have hitherto been esteemed obsolete and uncouth.

To assist the emperor in the weighty affairs of the state, and in the arduous task of governing an empire of so great an extent, and such an immense population, the constitution has assigned him two councils; the one, called the ordinary council, is composed of his principal ministers, of which there are six. The other, or extraordinary council, consists entirely of the princes of the blood. For the administration of the affairs of government, there are six boards or departments, consisting of, 1. The court of appointments to vacancies in the offices of government, being composed of the ministers and learned men, qualified to judge of the merits of candidates. 2. The court of finance. 3. The court of ceremonies, presiding over the direction of ancient customs, and treating with foreign ambassadors. 4. The court for regulating military affairs. 5. The tribunal of justice. 6. The board of works.—These public functionaries resolve upon, recommend, and report to the emperor, all matters belonging to their separate jurisdictions, who, with the advice of his ordinary, and, if necessary, of his extraordinary council, confirms, amends, or rejects their decrees. Subordinate to these supreme courts held in the capital, are others of a similar constitution, established in different provinces, and great cities of the empire, each of which corresponds with its principal in Peking.

The political importance and relations of China may be said to be concentrated within itself, as no example is known of alliance with any other state. It has been supposed, that one European ship would destroy the Chinese navy, and that 10,000 European troops might over-run the empire. Yet its very extent is an obstacle to foreign conquest, and, perhaps, not less than 100,000 soldiers would be necessary to maintain the quiet subjugation of it; so that any foreign yoke must prove of very short continuance. The recent conquest by the Mandarins happened in consequence of the general detestation excited against a sanguinary usurper; and the invaders were in the immediate proximity, while even a Russian army would find almost insurmountable difficulties on the route, and the conquest, like that by the descendants of Zingis, would infallibly prove of short duration. The Chinese have taken almost all their civil laws from their canonical books of morality. Filial piety is their basis, as well as that of their government. Some decrees of the emperors, and especially those respecting the observance of certain ceremonies, which custom has established, form the rest of the code. In a word, the Chinese jurisprudence contains every thing that is to be found in the best moral writers. Every mandarin who is a governor, either of a province or city, is obliged, twice a month, to instruct the people around him, and to recommend the observance of certain salutary rules, such as filial piety, a certain deference to elders, frugality, temperance, and the other personal virtues. An express law points out those parts of morality which ought to be the subjects of these discourses. Jurisprudence is taught in China in the same manner as the principles of religion are taught in other countries.

The laws of China which concern marriage are very extensive. A man can have only one lawful wife, and her rank and age must be nearly equal to his own; but he may receive into his house, on certain conditions, several concubines or wives of the second rank, who are wholly subject to the lawful spouse. Their children are considered as hers, they address her as mother, and can give this title to her only. Divorces are granted in China as they were among all ancient nations, but with less facility and only in certain cases, such as adultery, incompatibility of tempers, sterility, hereditary and infectious diseases. The law protects every wife who is abandoned by her husband, and can, if she abstains himself for three years, take another husband, provided she first get the consent of the mandarins. The law forbids marriage in certain circumstances: and marriage is also suspended when a family experiences any severe misfortunes. Every father of a family is responsible for the conduct of his children; he is even accountable for that of his domestics. Every fault is imputed to him, whose duty it is to prevent it. The old persons of a family live generally with the young; the former serve to moderate the passions of the latter, and the influence of age over youth is supported by the sentiments of nature, by habits of obedience, by the precepts of morality ingrafted in the law of the land, and by the unremitting policy and honest endeavours of parents to that effect. They who are paid labour dispense the rules and the wisdom which experience taught them, to those who are advancing in life. Plain moral sentences are written up in the common hall where the male branches of the family assemble. In almost every house is hung up a tablet of the ancestors of the persons then residing in it, to which references are perpetually made, and their example serves as an incitement to travel in the same path. The descendants from a common stock visit the tombs of their forefathers together, at stated times, which practice collects and unites the most remote relations. They can't lose sight of each other, and seldom become indifferent to their respective concerns. The child is bound to labour and to provide for his parents' maintenance and comfort, and the brother for the brother and the sister, who are in extreme want; the failure of which duty would be followed by such detestation that it is not necessary to enforce it by positive law. Even the most distant kinsman, reduced to misery by accident or ill-health, has a claim on his kindred for relief. Manners, stronger than laws, produced and nurtured by intercourse and intimacy, secure effectual assistance for him. These habits and manners fully explain a fact that appears extraordinary to Europeans, that no spectacles of distress are seen to excite the compassion, and explore the casual charity of individuals.

Civil and Military Establishments. From the produce of the taxes, the civil and military establishments, and all the incidental and extraordinary expences, are first paid on the spot where they are incurred, out of the provincial magazines, and the remainder is remitted to the treasury in Peking to meet the expences of the court, the establishment of the emperor, his palaces, temples, gardens, women, and princes of the blood. The confiscations, presents, tributes, and other articles, may be reckoned as attaching to his privy purse. The surplus revenue remitted to Peking in the year 1792 was stated to be about twelve millions sterling. It is a general opinion among the Chinese part of his subjects that vast sums of the surplus revenue, and such as arise from confiscations, are annually sent to the capital of Tartary; this, however, is an erroneous opinion. Notwithstanding the great wealth of the imperial treasury, the present emperor found it necessary, in a single year, to accept of what

C H I N A.

is called an offering, of five hundred ounces of silver, from the salt merchants of Canton, and fums of money, and articles of merchandize from other quarters, to enable him to quell a rebellion that was raging in one of the western provinces. He even sent down to Canton a quantity of pearls, agates, serpentine, and other stones of little value, in the hope of raising a temporary supply from the sale of them to foreign merchants. The emperor of China, therefore, has not so much wealth at his disposal as has usually been

imagined. He even accepts of patriotic gifts from individuals, consisting of pieces of porcelain, silks, fans, tea, and such like trifling articles, which afterwards serve as presents to foreign ambassadors; and each gift is pompously proclaimed in the Peking gazette. The chief officers in the civil departments of government, independent of the ministers and the different boards in Peking, according to the statement of *Tchou-ta-gin*, with their salaries and allowances, reduced into silver, will be seen from the following table:

Quality.	Number.	Salaries in Ounces of Silver.	Total.
Viceroy, over one or more provinces	11	20,000	220,000
Governors of provinces	15	16,000	240,000
Collectors of revenue	19	9,000	171,000
Presidents of criminal tribunals	18	6,000	108,000
Governors of more than one city of the first order	86	3,000	258,000
Governors only of one city of the first order	184	2,000	368,000
Governors of a city of the second order	149	1,000	149,000
Governors of a city of the third order	1,305	800	1,044,000
Presidents of literature and examinations	17		
Inspectors General	117	3,000	402,000
Total ozs.			2,960,000

The inferior officers acting immediately under the orders of these, and amounting to many thousands, together with the salary and expences of the different boards, all of which are paid out of the public treasury, must require a sum, at least equal to the above; so that, on a moderate calculation, the ordinary expences of the civil government will amount to the sum of 5,920,000 ounces of silver, or 1,973,333 pounds sterling. Some idea may be formed of the numerous appointments and the frequent changes in administration, from the Chinese court calendar, which is published every three months, making four large volumes. The attention, precaution, and extreme jealousy of the government, have not been considered as sufficient for the protection of the empire, without the assistance of an immense standing army, which, in the midst of a profound peace, was stated by *Yan-ta-sin*, to consist of one million of infantry and eight hundred thousand of cavalry. The expence of this military establishment, together with artillery, tents, war-quipage, vessels of force on the different rivers and canals, the building and keeping in repair the military posts, &c. &c. has been estimated at 49,982,931 sterling. The revenue is estimated at sixty-six millions sterling, so that the whole will stand as follows:

Total amount of the revenue	£66,000,000
Civil establishment	1,973,333
Military ditto	49,982,933
	51,956,266
Surplus, being for the emperor's establishment	£14,043,734

which accords pretty nearly with the sum said to have been remitted to Peking in the year 1792. It may perhaps be asked, in what manner this large body of men is employed, since the nation is so little engaged in foreign war. To which it may be replied, that the employments of the military differ materially from those among European nations. Except a great part of the Tartar cavalry, who are stationed on the northern frontier, and in the conquered provinces of Tartary, and the Tartar infantry, who are distributed as guards for the different cities of the empire, the rest of the army is parcelled out in the smaller towns, villages, and hamlets, where they act as constables, chief-takers, assistants to magistrates, subordinate collectors of the taxes, guards to

the granaries, and are employed in a variety of different ways under the civil magistracy and police. Besides these, an immense multitude are stationed as guards of the military posts, along the public roads, canals, and rivers. These posts are small square buildings, like so many little castles, each having on its summit a watch-tower and a flag, placed at the distance of three or four miles asunder. At one of these posts there are never fewer than six men, who not only prevent robberies and disputes on the roads, but convey the public dispatches to and from the capital. An express sent from post to post travels in this way at the rate of a hundred miles per day, and there is no other post nor mode of conveying letters for the convenience of the public.

A great part then of the Chinese army may be considered as a kind of militia, which never has been, and probably never will be, embodied; as a part of the community not living entirely on the labour of the soil, but contributing something to the common stock. Every soldier stationed on the different guards has his portion of land assigned to him, which he cultivates for his family, and pays his quota of the produce to the state. The different kinds of troops that compose the Chinese army consist of, 1. Tartar cavalry, whose only weapon is a sabre; and a few who carry bows. 2. Tartar infantry, bowmen having also large sabres. 3. Chinese infantry, carrying the same weapons. 4. Chinese matchlocks. 5. Chinese tigers of war, bearing large round shields of basket-work and long swords. On the shields are painted monstrous faces of some imaginary animal, intending to frighten the enemy, or to petrify their beholders. The military dress varies in almost every province; sometimes they wear blue jackets edged with red, or brown with yellow; some have long pantaloons, some breeches, and others petticoats and boots; the bowmen have long loose gowns of blue cotton, stuffed with wadding, studded with brass knobs, and bound round the middle with a girdle, from which the sabre is appended behind. On the head they wear a helmet, with flaps on each side, that cover the cheeks and fall on the shoulders. The upper part is like an inverted funnel, with a long pipe terminating in a kind of spear, on which is bound a tuft of hair dyed black. "The greatest number of soldiers," says Mr. Barrow, "that we saw at any one place might be from 2 to 3000, which were drawn up in a single line along the bank of a river, and, as they stood

with an interval between each other, equal to the width of a man, they formed a very considerable line in length. Every fifth man had a small triangular flag, and every tenth a large one; the flags that supported them were of different colours, and fixed to the jacket behind the shoulders." The Tartar cavalry appear to be remarkably swift, and to charge with great impetuosity; but the horses are so small, and broken into so quick and short a stroke, that the eye is deceived, and their real speed is but moderate. Their saddles are soft, raised before and behind, so that the rider cannot be easily thrown out of his seat; and the stirrups are so short that the knee is nearly level with the chin. They have little artillery, and that is very bad. They give a decided preference to clumsy match-locks, over the fire-locks now in use among European troops, pretending that the former, by being fixed with iron forks into the ground are capable of doing more execution than the latter; but the true reasons are probably their want of good metal to manufacture locks, or the bad quality of their gun-powder, or, above all, their deficiency in courage to make use of them with that steadiness which is required to produce their full effect. Their favourite weapon is the bow, which, like all other missile weapons, requires less courage to manage than those which bring a man to oppose himself in close contest with man. Although the Tartars have continued the Chinese army on the old footing, they have used every exertion to recruit it with their own countrymen in preference to the Chinese. Every male Tartar child is accordingly enrolled, a precaution highly necessary, as their whole army at the time of the conquest is said not to have exceeded 80,000 men. It is, however, certain, that the Chinese government was at this time under a very weak administration, and every department both civil and military under the controul of eunuchs, 6000 of whom are said to have been turned adrift by the Tartars, on the taking possession of the palace at Peking.

The conduct of the Manchoo Tartars, whose race is now on the throne, was a master-piece of policy not to have been expected in a half-civilized race of people. They entered the Chinese dominions as auxiliaries against rebel chiefs, and in a short time placed their own leader on the throne; but instead of setting up for conquerors they melted into the mass of the conquered. They adopted the dress, the manners, the opinions of the people, and in all the civil departments of the state, they appointed the ablest Chinese, and all vacancies were filled with Chinese in preference to Tartars. They learned the Chinese language, married into Chinese families, encouraged Chinese superstition, and, in short, omitted no step that could tend to incorporate them as one nation; their great object was to strengthen their army with their own countrymen; while the Chinese were so satisfied with the change, that they almost doubted whether a change had really taken place. In proportion as the Tartar power increased, they have become less solicitous to conciliate the Chinese; all the heads of departments are Tartars; the ministers are Tartars; and most of the offices of high trust and power are filled by Tartars. The best soldiers of this empire are collected from the three northern provinces; those supplied by the rest are seldom called forth; but remain with their families, enjoy their pay, and have seldom any occasion to remember that they are soldiers, except when ordered to appear at a review.

State of Society; Manners and Customs. It may be laid down as an invariable maxim that the condition of the female part of society in any nation will furnish a tolerably just criterion of the degree of civilization to which that

nation has arrived. The manners, habits, and prevailing sentiments of women have great influence on those of the society to which they belong, and generally give a tincture to its character. Thus, those nations where the moral and intellectual powers of the mind in the female sex are held in most estimation, will be governed by such laws as are best calculated to promote the general happiness of the people; and, on the contrary, where the personal qualifications of the sex are the only objects of consideration, as is the case in all the despotic governments of Asiatic nations, tyranny, oppression, and slavery are sure to prevail; and these personal accomplishments, so far from being of use to the owner, serve only to deprive her of liberty and the society of her friends, to render her a degraded victim subservient to the sensual gratifications, the caprice, and the jealousy of man. Among savage tribes the labour and grudgery fall heaviest on the weaker sex. The Chinese have imposed on their women a greater degree of humility and restraint than the Greeks of old, or the Europeans in the dark ages. Not satisfied with the physical deprivation of the use of their limbs, they have contrived, in order to keep them the more confined, to make it a moral crime for a woman to be seen abroad. If they should have occasion to visit a friend or relation, they must be carried in a close sedan-chair: to walk would be the height of vulgarity. Even the country ladies, who may not possess the luxury of a chair, rather than walk, suffer themselves to be rolled about in a sort of covered wheel-barrow. The wives and daughters, however, of the lower class are neither confined to the house, nor exempt from hard and slavish labour, many being obliged to work with an infant upon the back, while the husband, in all probability, is gaming, or otherwise idling away his time. In the province of Kiang-see nothing is more common than to see a woman drawing a kind of light plough, with a single handle, through ground that has previously been prepared; the easier task of directing the machine is left to the husband, who, holding the plough with one hand, casts, at the same time, with the other, the seed into the drills. The advantages which these women possess in a higher sphere of life, if any, are not much to be envied. Even at home, in their own family, a woman must neither eat at the same table, nor sit in the same room with her husband. And the male children, at the age of nine or ten years, are entirely separated from their sisters. Thus the feelings of affection, not the instinctive products of nature, but the offspring of frequent intercourse, and of a mutual communication of their little wants and pleasures, are nipped in the very bud. A cold and ceremonious conduct must be observed on all occasions between the members of the same family. There is no common focus to attract and concentrate the love and respect of children for their parents. Each lives retired and apart from the other. The incidents and adventures of the day, which furnish the conversation among children of many a long winter's evening, by a comfortable fire-side, in our own country, are in China buried in silence. Boys, it is true, sometimes mix together in schools, but the stiff and ceremonious behaviour, which constitutes no inconsiderable part of their education, throws a restraint on the little playful actions incident to their time of life, and completely subdues all spirit of activity and enterprise. A Chinese youth of the higher class is inanimate, formal, and inactive, constantly endeavouring to assume the gravity of years. To beguile the many tedious and heavy hours that must unavoidably recur to the secluded females, totally unqualified for mental pursuits, the tobacco-pipe is the usual expedient. Every female from the age of eight or nine years wears, as an appendage to her dress, a small silken purse or pocket,

to hold tobacco and a pipe, with the use of which many of them are not unacquainted at this tender age. Some, indeed, are constantly employed in working embroidery on silk, or in painting birds, insects, and flowers on their gauze. But the women who employ their time in this manner are generally the wives and daughters of tradesmen and artificers; a lady of rank would not be supposed to condescend to use her needle. Daughters may be said to be invariably sold. The bridegroom must always make his bargain with the parents of his intended bride. She has no choice, but is disposed of to the highest bidder. The man, indeed, in this respect, has no great advantage on his side, as he is not allowed to see his intended wife until she arrives in formal procession at his gate. If, however, on opening the door of the chair in which the lady is shut up, and of which the key has been sent before, he should dislike his bargain, he can return her to her parents; in this case the articles are forfeited that constituted her price; and a sum of money in addition may be demanded, not exceeding the value of these articles. "To what a degraded condition," says Mr. Barrow, "is a female reduced by this absurd custom, and how little inducement can she have to render herself amiable or elegant, knowing that she will be consigned into the hands of the first man who will give the price that her parents have fixed up on her charms." The man takes a wife because the laws of the country direct him to do so, and custom has made it indispensable; and a woman after marriage continues to be the same piece of inanimate furniture she always was in her father's house. She suffers no indignity, nor does she feel any jealousy or disturbance when her husband brings into the same house a second or a third woman. Although polygamy be allowed by the government, yet few take the advantage of it. Nine-tenths of the community find it difficult to rear the offspring of one woman by the labour of their hands; such, therefore, are neither in circumstances, nor probably feel much inclination to purchase a second. The unfociable distance which the law prescribes to be observed between the sexes, and the cool and indifferent manner of bargaining for a wife, are not calculated to produce numerous instances of criminal intercourse. These, however, sometimes happen, and the weight of punishment always lies heaviest on the woman. The husband finds no difficulty in obtaining a sentence of divorce, after which he may sell her for a slave, and thus redeem a part at least of his purchase-money. The same thing happens in case a wife should elope; but if a young girl should chance to lose what is justly held to be the most valuable part of female reputation, she is sent to market by her parents, and publicly sold for a slave. In cases of mutual dislike, or incompatibility of temper, the woman is generally sent back to her parents. The prohibition against the frequent intercourse with modest females, for there are public women in every great city, is not attended here with the effect of rendering the pursuit more eager; it seems even to have the contrary effect, of promoting that sort of connection, which, being one of the greatest violations of the law of nature, will ever be considered by an enlightened people as the first of moral crimes, a connexion that ranks the man infinitely below the brute. The commission of this detestable and unnatural act is attended with so little sense of shame, that many of the first officers of state seem to make no hesitation in publicly avowing it. Each of these officers is constantly attended by his pipe-bearer, who is generally a handsome boy, from 14 to 18 years of age, and is always well dressed, the reason of which is too obvious, to bye-standers, to be misinterpreted.

The state of domestic society in China is ill calculated

to promote the affection and kindness which children feel for their parents in many countries. A tyrant to command, and a slave to obey, are found in every family; and if the acts of kindness and attention that create mutual endearments be wanting among the members of the same family living under the same roof, it will be in vain to expect to find them in the large sphere of public life; and in fact there are no friendly societies, nor meetings, to talk over the transactions and the news of the day. These can only take place in a free government. A Chinese, having finished his daily employment, retires to his solitary apartment. There is, it is true, a sort of public houses where the lower orders of people resort for their cup of tea; but such places are not frequented for the sake of company. Whenever a few Chinese meet together, it is generally for the purpose of gaming, or to eat a kettle of boiled rice, or drink a pot of tea, or smoke a pipe of tobacco. The upper ranks indulge at home in the use of opium, of which they are very fond, though it is strictly prohibited by law. It is, however, too expensive to be used by the common people. The young have occasional assemblies for the purpose of dancing, and of exercising themselves in feats of activity, which in Europe are attended with the happiest effects. The first day of the new year, and a few succeeding days, are the only holidays that are observed by the working part of the community. On these the poorest peasant makes a point of procuring new cloaths for himself and his family; they pay visits to their friends and relations, interchange civilities and compliments, make and receive presents; and the officers of government, and the higher ranks, give feasts and entertainments; but even in these there is nothing that bears the resemblance of conviviality. The guests never partake together of the same service of dishes, but each has frequently a separate table; the eyes of all must constantly be kept on the master of the feast, to watch his motions, and to observe every morsel he puts into his mouth, and every time he lifts the cup to his lips (for a Chinese of good breeding can neither eat nor drink without a particular ceremony), to which the guests must pay attention. If a person invited should be prevented from attending, the portion of dinner that was intended for him is sent in procession to his own house; it is even customary to send after the guest the remains of his dinner. Whatever may be the occasion of bringing together a few idlers, they seldom part without trying their luck at some game of chance, for which a Chinese is never unprepared. He rarely goes abroad without a pack of cards in his pocket, or a pair of dice; both of these are different from similar articles elsewhere; their cards are much more numerous than ours, and their games much more complicated. They sometimes play at chess, which appears to be essentially different from that game as played in other Oriental nations. The spirit of gaming is so universal, in most of the towns and cities, that, in almost every bye corner, groups are to be found playing at cards or throwing dice. They are accused of even taking their wives and children on the hazard of a die. One of their most favourite sports is cock-fighting, which is as eagerly pursued by the upper classes in China, as it continues to be by those in a similar situation in some parts of Europe. The training of quails for the same cruel purpose of butchering each other, furnishes abundance of employment for the idle and dissipated. They have even extended their inquiries after fighting animals into the insect tribe, in which they have discovered a species of *gryllus*, or locust, that will attack each other with fuch ferocity, as seldom to quit their hold without bringing away, at the same time, a limb of their antagonist. These little creatures are kept apart in bamboo cages; and the custom of making them

devour

devour each other is so common, that during the summer months scarcely a boy is seen without his cage and grass-hoppers.

Another trait in the Chinese character, which must not be passed over, is the horrid practice of infanticide, tolerated by custom, and allowed by government; because where the legislature does not interfere to prevent crimes, it may be said to lend them countenance. The laws of China do not indeed suppose such an unnatural crime to exist, and have therefore provided no punishment for it. They have left the child entirely to the disposal of the father, concluding, that if his feelings will not prevent him from doing it an injury, no other consideration will. Thus, though the commission of infanticide be frequent in China, it is considered as more prudent to wink at it, as an inevitable evil, which natural affection will better correct than penal statutes. It is, however, tacitly considered as a part of the duty of the police of Peking, to employ certain persons to go their rounds at an early hour in the morning with carts, in order to pick up such bodies of infants as may have been thrown into the streets in the course of the night. No inquiries are made, but the bodies are carried to a common pit without the city walls, into which all those that may be living, as well as those that are dead, are said to be thrown promiscuously. The number of children thus inhumanly slaughtered, in the course of a year, is differently stated by different authors, some making it about 10 and others 30,000 in the whole empire. Mr. Barrow thinks the truth may probably lie in the mean of these extremes. He concludes that about 24 infants are on an average daily destroyed in Peking, where it is supposed about an equal number are exposed, to that of all the other parts of the empire. How very weak then, says he, must be the boasted filial affection of the Chinese for their parents, when they scruple not to become the murderers of their own children, towards whom, according to the immutable laws of nature, the force of affection will ever be stronger, than for those, whom the laws of China, in preference, have commanded to be protected and supported when rendered incapable of assisting themselves. Hence, and from other facts, the result of his own observations, he infers that filial piety, among the Chinese, may rather be considered in the light of an ancient precept, carrying with it the weight of a positive law than the effect of sentiment. These unfavourable features, in the character of a people whose natural disposition is neither ferocious nor morose, but on the contrary mild, obliging, and cheerful, can be attributed only to the habits in which they have been trained, and to the heavy hand of power, perpetually hanging over them. That this is the case may be inferred from the general conduct and character of those who have from time to time emigrated into other countries, where they are not less remarkable for their honesty than for their peaceable and industrious habits. In these places it appears also that their quickness at invention is not surpassed by accuracy of imitation. The exterior deportment of every class in China is uncommonly decent, and all their manners mild and engaging; but even these, among persons of any rank, are considered as objects worthy of the interference of the legislature; hence it follows that they are ceremonious without sincerity, studious of the forms only of politeness, without either the ease or elegance of good-breeding. An inferior makes a sham attempt to fall on his knees before his superior, and the latter affects a slight motion to raise him. A common salutation has its mode prescribed by the court of ceremonies; and any neglect or default in a plebeian towards his superior is punishable by corporal chastisement, and in men in office by degradation or suspension. In a govern-

ment where every man is liable to be made a slave, where every man is subject to be flogged with the bamboo, where he is compelled to thank the tyrant on his knees for the trouble he has taken to correct his morals, high notions of honour, or even of common honesty, cannot be expected. Such a system is well calculated to exclude and obliterate every notion of the dignity of human nature. A slave in fact cannot be dishonoured, the vices of such a condition are innumerable, and they appear on all occasions: a Chinese merchant will cheat, whenever an opportunity offers him the means, because he is considered incapable of acting honestly; a Chinese peasant will steal whenever he can do it without danger of being detected; because the punishment is only the bamboo, to which he is daily liable; and a Chinese prince, or a prime minister, will extort the property of the subject, and apply it to his private use whenever he thinks he can do it with impunity. The only check upon the rapacity of men in power, is the influence of fear, arising from the possibility of detection. The love of honour, the dread of shame, and a sense of justice seem to be equally unfelt by the majority of men in office. Mr. Barrow produces a variety of instances to prove that the character of the Chinese is generally defective in these respects; and he says that the refined knavery displayed by Chinese merchants in their dealings with Europeans, and the tricks that they play off in their transactions with one another, are well known to most nations, and proverbial in their own. A merchant, with them, is considered as the lowest character in the country, as a man that will cheat if he can, and whose trade it is to create, and then supply artificial wants. To this general character, an exception is due to those merchants, who, acting under the immediate sanction of government, have always been remarked for their liberality and accuracy in their dealings with Europeans trading to Canton. The want of principle in the Chinese character seems to be more in the system of government, than in the nature and disposition of the people.

The Tartars, by assuming the dress, the manners, and the habits of the Chinese, are scarcely distinguishable from them in their external appearance; and if any physical difference exists it seems to be in stature only. The Chinese are rather taller and of a more slender and delicate form than the Tartars, who are in general short, thick, and robust. The small eye, elliptical at the end next to the nose, is a predominating feature both in the Tartar and Chinese countenance; they have both the same high cheek-bones and pointed chins, which with the custom of shaving off the hair gives to the head the shape of an inverted cone. The natural colour both of the Chinese and Tartars seems to be that tint between a fair and a dark complexion, and the shades of this complexion are deeper, or lighter, according as they have been more or less exposed to the influence of the climate. The women of the lower class, who labour in the fields or who dwell in vessels, are almost invariably coarse, ill featured, and of a deep complexion, very like that of a Hottentot. Among the men, those who are best dressed wear a sort of velvet cap on their heads; a short jacket close buttoned round the neck and folded across the breast, the sleeves remarkably wide; the materials, cotton cloth; black, blue, or brown silk; or European camblet; they wear quilted petticoats and black satin boots. The common people are dressed in large straw hats, blue or black cotton frocks, wide cotton trowsers, and shoes made of straw; some have coarse stockings of cotton cloth; the legs of others are naked, and a single pair of drawers constitutes the whole cloathing of a great portion of the crowd. On the banks of the Pei-ho, and indeed in most parts of the country, bunches of large artificial flowers,

of different colours, are stuck in the jet black hair of the women, which is screwed up close behind, and folded into a knot across the crown of the head. Two bodkins of silver, brass, or iron, are conspicuously placed behind the head in the form of an oblique cross. Their faces and necks are daubed with white paint, the eye-brows are blackened, and on the centre of the lower lip, and at the point of the chin, are two spots about the size of a small wafer, of a deep vermilion colour. A blue frock like that of the men, reaching in some to the middle of the thigh, in others to the knee, is almost universal. A pair of wide trowsers of different colours are extended a little below the calf of the leg, where they are drawn close, the better to display an ankle and a foot which, for singularity at least, may challenge the whole world. This distorted member consists of a foot that has been cramped in its growth to the length of four or five inches, and an ankle that is generally swollen in the same proportion that the foot is diminished. The little shoe is as fine as tinsel and tawdry can make it, and the ankle is bandaged round with party-coloured cloths ornamented with fringe and tassels: with such a leg and foot thus dressed out they are considered in China superlatively beautiful. This monstrous fashion of cramping the growth of the feet has been attributed to the jealousy of the men. The fashion is, however, at present so universal, that any deviation from it is considered as disgraceful. Upon the principle of being thought superior to others, the men of learning, as they call themselves, suffer the nails of their little fingers to grow, sometimes to the length of three inches, for the sole purpose of demonstrating the impossibility of their being employed in any sort of manual labour; and upon the same principle, perhaps, the ladies of China may be induced to continue the custom of maiming their female infants in order that they may be distinguished from those of the peasantry, who in most of the provinces are condemned to submit to the drudgery of the field. The interior wrappers of the ladies' feet are said to be seldom changed, a custom that conveys no favourable idea of Chinese cleanliness; this, indeed, forms no part of their character; the comfort of clean linen, or frequent change of under garments, is equally unknown to the sovereign and the peasant. A sort of thin coarse silks supplies the place of cotton or linen, next the skin, among the upper ranks; but the common people wear a coarse kind of cotton cloth. These velvets are rarely removed for the purpose of washing; the consequence is an abundant increase of those vermin, to the production of which filthiness is found to be favourable. The highest officers of state make no hesitation of calling their attendants in public to seek in their necks for those troublesome animals, which when caught they put between their teeth. They carry no pocket handkerchiefs, but make use of small square pieces of paper, which their attendants have ready prepared for the purpose. They sleep at night in the same cloaths they wear by day; their bodies are as seldom washed as their articles of dress. At their meals they make no use of table linen, and eat without knife, fork, or spoon; a pair of small sticks, or the quills of a porcupine, are the only substitutes or these convenient articles; and a Chinese, if his rank enables him, lies down to sleep as soon as he has finished his lonely meal. There are no inns in any part of this vast empire, that is, no inhabited and furnished houses where a traveller may purchase those refreshments of which he stands in need. What they call inns are mean hovels, consisting of bare walls, where, perhaps, a passenger may procure a cup of tea for a piece of copper money, and permission to pass the night, but this is the extent of the comfort which such places afford. The practice indeed of journeying by land

is so rare, that no house of decent accommodation could be supported by the occasional visits of travellers. The officers of state invariably make use of the conveniences which the temples afford, as being the best that can be obtained.

Buildings and Furniture of the Chinese. The Chinese buildings, even public monuments, and the emperor's palaces, strike more by their extent than their magnificence. The imperial palace at Peking may be compared to a large city: those of the princes, principal mandarins, and people of great fortune, contain four or five outer courts, in each of which is a separate building with three gates; that in the middle is larger than the other two, and is decorated with two marble lions, which are placed on either side of it. The halls set apart for receiving visits are neat, and provided with seats, and other plain furniture, but nothing can be perceived in them which marks either magnificence or grandeur. The apartment in which they entertain their friends is equally plain and simple. Those set apart for their women and children are inaccessible to every stranger, even the most intimate friend of the master of the house. The Chinese gardens are laid out in a peculiar style. In these are groves, ponds, artificial mountains and rocks, and winding alleys, which conduct to different points of view, each of which presents a new object. The Chinese are fond of every thing that is gigantic: with them the beauty of a column consists in its size and height; and that of a hall in its extent. Two provinces, viz. Chan-tong and Kiang-nan, abound with excellent marble, and in quantities sufficient to supply the rest of the empire; but the Chinese are neither acquainted with the art of cutting it properly, nor of applying it to the purposes of building. They generally employ it in constructing bridges, for thresholds to the doors, and to pave their streets, where any of them are paved. Some triumphal arches, temples, and pagodas, are, however, built of it, but without art or taste. The Chinese exhibit but little attention in ornamenting and embellishing the interior part of their houses: they have neither mirrors, tapestry, nor gilding. They, besides, receive no visits but in a particular hall, which is situated in the front part of the house, and before every other apartment, for the purpose of preventing those who are admitted into it from having any communication with the inner apartment. Its ornaments consist of large lanterns made of painted silk, which are suspended from the ceiling, tables and other furniture, which are generally covered with a most beautiful varnish so transparent, that the veins of the wood may be seen through it, and so bright and shining, that it reflects different objects, like silvered glass. The sort of tapestry manufactured in China is of white satin, on which are wrought birds, flowers, landscapes, &c. Sometimes they contain, in large characters, a few moral sentences, which generally compose a kind of enigma. Poor people are contented with whitening the walls of their apartments; others cover them with that sort of paper which is brought from China, and which people of fortune, in Europe, used formerly to employ in ornamenting some part of their's. The beds of the rich are furnished in winter with curtains of double satin, and in summer of plain white taffety, interspersed with flowers, birds, and trees: sometimes they are composed only of very fine gauze, which keeps out gnats and mosquitoes, and leaves a free passage for the air. The pillows of these beds are gilt, painted and ornamented with what they denominate sculpture. The common people use curtains only of linen, and plain mattresses, stuffed with cotton; in the northern provinces they sleep upon beds constructed of brick. These singular beds are larger or smaller in proportion to the number of the family.

mily. They are kept warm by means of a small stove. Those who are able place on the bricks a kind of mattress. In the morning this is removed, and its place is supplied by a carpet, or mat; the bed then becomes a sort of couch, upon which the whole family sit and work. At the stoves the poor people dress their meat and warm their tea and other liquors, for, notwithstanding the heat of the climate, they never drink any thing cold. In the houses of the great the stoves are built in the wall, and the fire is lighted from the outside.

Language and Literature. The Chinese language is not only one of the most ancient in the universe, but is, perhaps, the only language of the early ages, which is still spoken and living: it is indeed as extraordinary, as the people who speak it, and has no relation whatever to any known language. Its genius is such that no laws of analogy can comprehend it. It has no alphabet, and the words which compose it consist of one syllable only, and are very few in number. These words always remain the same; that is to say, monosyllables, even when two are united to signify one single thing: whether they are written or pronounced, they remain always separate and distinct, and are never blended into one. These monosyllables never produce but one sound. When they are written by the European alphabet, they begin by the letters *ch, tch, f, g, j, i, h, l, m, n, ng, p, s, ts, v, ou*; the final letters are *a, e, i, o, oi, ou, u, l, n, gu*. The middle of Chinese words consists of vowels and consonants, which produce only one sound, and are always pronounced as monosyllables. The Chinese language contains only about three hundred and thirty primary and radical words; though some dictionaries make them amount to four hundred and eighty-four. The sense of these primitive words may be multiplied almost without end, by the abundance and variety of accents, inflections, and aspirations used, and by other changes of the voice which pronounces them.

The nice distinctions between the tones and accents of words, nearly resembling each other in sound, but varying much in sense, require a great nicety of ear to distinguish, and of vocal powers to render them exact. To succeed in making those distinctions perfectly, a stranger should begin to learn them at an early age, while his organs are flexible and acute. Synonymous words are frequently introduced into Chinese dialogues to prevent any doubt about the sense. If, however, in an intricate discussion any uncertainty should still remain as to the meaning of a particular expression, recourse is had to the criterion of tracing, with the finger in the air, the form of the character, and thus completely ascertaining at once what was meant to be expressed. In the Chinese language there are not many minute rules of grammar, conjugation or declension. There is no necessity of distinguishing substantives, adjectives, or verbs; nor any accordance of gender, number, and case, in a Chinese sentence. The beginning or end of words is not altered as it is in the Greek verb, by the times of performing the action meant to be expressed, or the cases in which the things mentioned are intended to be placed. A very few particles denote the past, the present, and the future; nor are those auxiliaries employed, when the intended time may be otherwise inferred with certainty. The plural number is marked by the addition of a word, without which the singular is always implied. Neither the memory, nor the organs of speech, are burdened with the pronunciation of more sounds to express ideas, than are absolutely necessary to mark their difference. A single syllable always expresses a complete idea, and may be sounded by an European consonant preceding a vowel, sometimes followed by a liquid. Such an order of words renders the language soft and harmonious as the Italian, from the rarity of consonants, and the frequency of its vowel

terminations. There is in the Chinese a certain order or settled syntax in the succession of words in the same sentence: a succession fixed by custom differently in different languages. The formation of Chinese sentences is often the simplest and most artless possible, and such as may naturally have occurred at the origin of society. A simple character repeated, stands sometimes for more than one of the objects which singly it denotes; and sometimes for a collective quantity of the same thing. The character of *mo*, singly, is a tree; repeated, is a thicket; and tripled, is a forest. In Chinese there are scarcely fifteen hundred distinct sounds. In the written language there are, at least, eighty thousand characters, or different forms of letters.

The Chinese characters are divided into six sorts; the first exhibiting the shape or image of sensible things; the second indicating the object by some visible addition to the shape or symbol; the third associating two characters to express an object, which neither will denote separately; the fourth expressing a sound, in order to supply the defect of the figure, as *ya* adjoined to the figure of a bird, to represent a duck, &c.; the fifth being a metaphorical application of their characters, by which their language acquires a force and vivacity of colouring peculiar to itself, but at the same time rendering it extremely obscure; the sixth extending the primitive sense of a character, so that the same character may denote a verb or adverb, an adjective or substantiv. These characters have been represented by some learned writers for sensible things, and symbols for mental objects, which are tied to no sound, and may be read in every tongue; and this seems to have been the case in the most remote antiquity, when their characters, which are now abbreviated and disguised, might have been more simple and natural. See Phil. Trans. vol. lix. p. 489.

The characters of the Chinese language were originally traced, in most instances, with a view to express either real images, or the allegorical signs of ideas: a circle, for example, for the sun, and a crescent for the moon. A man was represented by an erect figure, with lines to mark the extremities. The difficulty and tediousness of imitation, soon occasioned a change to traits more simple, and more quickly traced. A faint resemblance, however, still remains, in a few instances, of the original forms in the present hieroglyphic characters; and a gradation of their changes is traced in several Chinese books. Not above half a dozen of the present characters consist each of a single line; but most of them consist of many, and a few even of seventy different strokes. A certain connexion is to be perceived in the arrangement of the written characters of the Chinese; as if it had been originally formed upon a system to take place at once, and not to grow up, as other languages, by slow and distant intervals. Upwards of two hundred characters, each consisting of a few lines, are made to mark the principal objects of nature. These may be considered as the genera or roots of language, in which every other word or species, in a systematic sense, is referred to its proper genus. The heart is a genus, of which the representation of a curve line approaches somewhat to the form of the object, and the species referable to it, include all the sentiments, passions, and affections, that agitate the human breast. Each species is accompanied by some mark denoting the genus, or "heart." Under the genus "hand" are arranged most trades and manual exercises. Under the genus "word," every sort of speech, study, writing, understanding, and debate. A horizontal line marks a unit; crossed by another line it stands for ten. The five elements, of which the Chinese suppose all bodies in nature to be compounded, form so many genera, each of which comprehends under it a great number

number of species. As in every compound character or species, the abridged mark of the genus is discernible, a person is soon enabled to consult the Chinese dictionary, in which these characters are arranged under their proper genera. The characters of the genera are placed at the beginning of the dictionary, in an order, which, like that of the alphabet, is invariable, and soon becomes familiar to the learner. The species under each genus follow each other, according to the number of strokes of which each consists, independently of the one or few which serve to point out the genus. The species wanted is thus soon found out, and its meaning and pronunciation are given through other words in common use, the first of which denotes its signification, and the other its sound. When no one word is found to render exactly the same found, it is communicated by two words, with marks to inform the inquirer, that the consonant of the first word, and the vowel of the second, joined together, form the precise sound wanting. The composition of many of the Chinese characters often displays considerable ingenuity, and serves to give an insight into the opinion and manners of the people. The character expressive of happiness, includes abridged marks of land, the source of their physical, and of children, that of their moral enjoyments. This character, embellished in a variety of ways, is hung up in almost every house.

Upon the formation, changes, and allusions of compound characters, the Chinese have published many thousand volumes of philological learning. No where does criticism more abound, or is more strict. The introduction or alteration of a character is a serious undertaking, and seldom fails to meet with opposition. The most ancient writings of the Chinese are still classical among them. The language seems in no instance to have been derived from or mixed with any other. The written seems to have followed the oral language, soon after the men who spoke it were formed into a regular society. The Chinese printed character is the same as is used in most manuscripts, and is chiefly formed of straight lines in angular positions, as most letters are in eastern tongues. A running hand is used by the Chinese only on trivial occasions, or for private notes, for the ease and expedition of the writer; and differs from the other as much as an European manuscript does from print. The principal difficulty in the study of Chinese writings, arises from the general exclusion of the auxiliary particles of colloquial language, that fix a relation between indeclinable words, such as are all those of the Chinese language. The judgment must be constantly exercised by the student, to supply the absence of such assistance. That judgment must be guided by attention to the manners, customs, laws, and opinions of the Chinese, and to the events and local circumstances of the country, to which the allusions of language perpetually refer. The Chinese characters are sketches, or abridged figures; and a sentence is often a string of metaphors. The different relations of life are not marked by arbitrary sounds, simply conveying the idea of such a connection, but the qualities naturally expected to arise out of such relation become frequently the name by which they are respectively known. Kindred, for example, of every degree is thus distinguished, with a minuteness unknown in other languages. That of China has distinct characters for every modification known by them of objects in the physical and intellectual world. Abstract terms are no otherwise expressed by the Chinese than by giving to each the name of the most prominent objects to which it might be applied, which is likewise indeed generally the case of other languages. Among the Latins the abstract idea of virtue was expressed under the name of *virtus*, being the quality most esteemed among them, as filial

piety is considered to be in China. The words of an alphabetical language being formed of different combinations of letters, each with a different sound and name, whoever knows and combines these together, may read the word without the least knowledge of their meaning; this, however, is not the case with hieroglyphic language, in which each character has a sound annexed to it, but which bears no certain relation to the unnamed lines or strokes, of which it is composed. Such character is studied and best learned by becoming acquainted with the idea attached to it; and a dictionary of hieroglyphics is less a vocabulary of the terms of one language with the correspondent terms in another, than a Cyclopaedia containing explanations of the ideas themselves, represented by such hieroglyphics. In such sense, only, can the acquisition of Chinese words be justly said to engross most of the time of men of learning among them. Enough, however, of the language is imperceptibly acquired by every native, and may, with diligence, be attained by foreigners, as far as concerns the ordinary concerns of life.

We now proceed to the literature of the Chinese. In their language are a multitude of books, abounding in useful knowledge; but the highest class consists of *five* works: one of which, at least, every Chinese who aspires to literary fame must diligently peruse. The *first* is purely historical, containing annals of the empire from 2337 years before Christ; it is entitled *Shuking*, and a version of it has been published in France. The *second* classical work of the Chinese contains three hundred odes, or short poems, in praise of ancient sovereigns and legislators, or descriptive of ancient manners, and recommending an imitation of them in the discharge of all public and domestic duties. They abound in wise maxims, and excellent precepts, their whole doctrine being reducible to this grand rule, "that we should not even entertain a thought of any thing base or culpable." So high an opinion do the Chinese entertain for this work, that one of their writers asks, "Why, my sons, do you not study the book of Odes? If we creep on the ground, if we lie useless and inglorious, those poems will raise us to true glory: in them we see, as in a mirror, what may best become us, and what will be unbecoming; by their influence we shall be made social, affable, benevolent: for, as music combines sounds in just melody, so the ancient poetry tempers and composes our passions. The Odes teach us our duty to our parents at home, and abroad to our prince; they instruct us also delightfully in the various productions of nature." "Halt, thou student," said the philosopher to his son, "the first of the three hundred odes? He who studies them not, resembles a man with his face against a wall, unable to advance a step in virtue and wisdom." Most of these odes are three thousand years old. The work is printed in four volumes. The *third* book is entitled *Teking*, or the book of changes, believed to have been written by Fo, the Hermes of the East, and consisting of right lines variously disposed; it is, however, scarcely intelligible to the most learned mandarins. Confucius, himself, being dissatisfied with the commentators upon it, intended to have elucidated it, but was prevented by death. The *fifth*, or *Liki*, is compiled from old monuments, and consists chiefly of the Chinese ritual, and of tracts on moral duties; but the *fourth*, entitled *Chung-Cieus*, or *Spring and Autumn*, by which the writer meant the flourishing state of an empire under a virtuous monarch, and the fall of kingdoms under bad governors, is an interesting work to every nation. The Chinese have their stanzas, odes, elegies, eclogues, epigrams, and satires. The common people also have ballads and songs peculiar to themselves. Some of the most distinguished of the literati have even thought it of importance to turn into verse the celebrated maxims of morality,

rality, the duties of the different conditions, and the rules of civility for their use. Seldom is the Chinese poetry disseminated by obscenity, and if it ever happens, the author must pay dear for it if his works fall into the hands of government. It is in consequence of that rigid and severe attention which watches over every thing in the least tending to corrupt public manners, that all romances, without exception, are expressly prohibited by the laws. The police, however, lets severe than the law, permits such novels and romances as have an useful tendency, and in which nothing is found prejudicial to morality. Every author who writes against government is punished with death, as well as all those who have had any hand in the printing or circulation of his works. The rules of dramatic composition established in Europe are not known to the Chinese. They neither observe our unities, nor any thing that can give regularity and probability to the plot. Their dramas do not represent a single action; they exhibit the whole life of a hero, and this representation may be supposed to continue forty or fifty years. The representation of these is thus described by sir George Staunton. "The company of actors successively exhibited, during a whole day, several different pantomimes and historical dramas. The performers were habited in the ancient dresses of the Chinese, at the period when the personages represented were supposed to have lived. The dialogue was spoken in a kind of recitative, accompanied by a variety of musical instruments; and each pause was filled up by a loud crash, in which the *loo* bore no inconsiderable part. The band of music was placed in full view, immediately behind the stage, which was broad, but by no means deep. Each character announced, on his first entrance, what part he was about to perform, and where the scene of action lay. Unity of place was apparently preserved, for there was no change of scene during the representation of one piece. Female characters were performed by boys or eunuchs."

Chinese Education. According to the book of ceremonies, the education of a child should commence at the moment of its birth: it allows nurses, but enjoins mothers to use the greatest precaution in choosing them. As soon as a child can put its hand to its mouth, it is weaned, and taught to use its right hand. At the age of six, he is made acquainted with the numbers, and with the first principles of geography. At seven he is separated from his sisters; after which he is no longer suffered to eat with them, nor to sit down in their presence. At eight he is instructed in the rules of good-breeding and politeness. The calendar becomes his study at the age of nine. At ten he is sent to school, where he learns to read, write, and cast accounts. From thirteen to fifteen he is taught music; after which he is instructed in the use of the bow and arrow, and how to mount a horse. When the Chinese youth have attained to the age of twenty, they receive the first cap, if they are judged to deserve it: they are then permitted to wear silk dresses, ornamented with furs; but before that period they have no right to wear any thing but cotton. In their mode of instruction, the Chinese select some hundreds of characters that express the commonest objects, or those at least which fall most frequently under the perception of the senses, such as a man, some domestic animals, ordinary plants, the most useful furniture of a house, the sun, the moon, and even the heavens. These objects are engraved or painted separately on certain substances, and under each is put the name of the thing represented, which points out to the children the meaning of the word. The first book put into the hands of a child is a collection of short sentences, consisting of three or four verses each. They are

obliged to give an account in the evening of what they have learned in the day. Youth in China have no relaxation from the severity of their studies, but at the commencement of the new year, and a few days at Midsummer. After this elementary treatise, they have to learn the books that contain the doctrines of Confucius and Mencius; and while they are learning by heart all the characters, they are taught to form them with a pencil: for this purpose they have leaves of paper given them, on which are written or imprinted with red ink very large characters; these they are required to cover with black ink, and to follow exactly their shape and figure, which infensibly accustoms them to form the different strokes. After this they are made to trace other characters, placed under the paper on which they write; these are black and smaller than the former. It is of great advantage to the Chinese literati to be able to paint characters well, because a deficiency in this respect will frequently occasion a student to be rejected at his examinations when he is candidate for his degrees. When a pupil has made himself master of a sufficient number of characters, he is put upon composition. To incite the youth to improvement in this part of their education, there is a sort of competition established in China. Twenty or thirty families, who are all of the same name, and who consequently have only one hall for the names of their ancestors, agree among themselves to send their children to this hall at stated times in order to compose. Each head of a family in turn gives a subject for literary contest, and adjudges the prize; but the exercise of this privilege lays him under the necessity of being at the expense of a dinner, which by his orders is carried to the hall of competition. These contests are private, and have no concern with the rules laid down for public education; but every student is obliged to undergo an examination, at least twice a year, under the inspection of an inferior mandarin of letters. This practice is general throughout all the provinces in China. It happens frequently, that the mandarins of letters order these students to be brought before them, to examine into the progress they have made in their studies, and to excite a spirit of emulation among them. Even the governors of cities do not think it below their dignity to take this care upon themselves. They order all the students, who are not far distant from their residence, to appear at their tribunal once a month. The author of the best composition is honoured with a prize, and the governor treats the candidates on the day of competition at his own expense. To encourage learning, there are in every city, town, and almost in every village, masters who keep schools, for the purpose of teaching what they call the sciences. Besides this, parents, possessed of the means, provide preceptors for their children, to attend and instruct them, to form their minds to the principles of virtue, and to initiate them in the rules of good breeding and the accustomed ceremonies, and, if their age will admit of it, to make them acquainted with the laws, and with the knowledge of history. To give dignity to the examinations, the building in which they are held has always something to distinguish it, even in the smallest cities; but in those denominated capitals of provinces, it is a real palace. When the competition begins, the students are all shut up, each in a small chamber, care being first taken that no one conceals any thing that might afford him assistance in his composition. They are forbidden, under the severest possible penalties, to carry any thing with them into their closet but pencils and ink; and from that moment they are allowed to have no communication with any one.

In connection with this part of our subject we may notice, that

who speak to his father does it with the greatest reverence and modesty; he does not even call himself the son, but the grandson, though he may be the eldest of the family, and perhaps the father of many children himself. He will also often make use of his own name, that is, the name that he possesses at that period, for the Chinese have different names in succession, agreeably to their age and rank.

The family name is that which is given them at their birth; a month after, the parents give a diminutive name to their son, which is generally that of a flower, animal, &c. This name is changed when the youth begins to make progress in his education at a public school, and the master bestows upon him some flattering appellation, which the pupil adds to his name. When he has attained to manhood, he requests a new name from his friends, and this he retains during life, unless he has the good fortune to rise to some dignity in the state, when he is honoured with one that corresponds with his talents and office. No other must be afterwards given him, not even that of his family.

Religion of the Chinese. The primitive religion of China, or at least those opinions, rites, and ceremonies, that prevailed in the time of Confucius, and before that period all seems to be fable and uncertainty, may be pretty nearly ascertained from the writings ascribed to that philosopher. He maintains that out of nothing there cannot possibly be produced any thing; that material bodies must have existed from all eternity; that the cause or principle of things must have had a co-existence with the things themselves; that therefore this cause is also eternal, infinite, indestructible, without limits, omnipotent, and omnipresent; that the central point of influence from which this cause acts, is the blue firmament, from whence its emanations spread over the whole universe; that it is, therefore, the supreme duty of the prince, in the name of his subjects, to present offerings to *Tien*, and particularly at the equinoxes, the one for obtaining a propitious seed-time, and the other a plentiful harvest. These offerings to the deity were always placed on a large stone, or heap of stones, erected on the summit of a high mountain, on the supposition that their influence would be so much the greater, in proportion as they should approach the seat and fountain of creating power, like the ancient Persians, who considered the circle of the heavens to be the ruling power of the universe, to which they also sacrificed on high mountains. To the same principle Tacitus refers, observing that the nearer mortals can approach the heavens the more distinctly will their prayers be heard. Noah also, after quitting the ark, built an altar on the mountain where it rested, and made a burnt offering, the smoke of which ascending unto heaven, was pleasing to the Lord. Abraham was commanded to offer his only son Isaac on a mountain, and Balaam ascended to the top of Mount Pisgah, to offer a sacrifice and to curse Israel. Thus all nations in their infancy seem to have adopted the natural idea of paying adoration to heaven from high places. The large stones or heaps of stones, that have been appropriated to religious uses in almost every part of the world, may have been introduced from the custom among savage nations, to mark with a great stone the place where their worthies were interred; such being at length desired in the opinions of their votaries, the stones that were dedicated to their memory were used in their religious worship. The peculiar homage, that, from time immemorial, has been paid to the memory of the dead by the Chinese, renders probable this explanation of the origin of their altars, or four stones, which are called *Tan*, and which in former times were erected on most of their high mountains. At the present day the *Tan* is re-

presented, upon many of the altars erected in their temples, by four loose stones placed in the corners of the altar, as the horns were in the corners of the Jewish altars. As the people increased and spread over the empire, the inconvenience of ascending any particular mountain was felt, and the *Tan* was then transferred to places better adapted to general accommodation. In the city of Peking, which stands on a sandy plain, the *Ten-tan*, or altar of heaven; the *tee-tan*, or altar of earth; and the *shen-nong-tan*, or altar of ancient agriculturists, are erected on artificial mounts, within the walls of the palace; and here the emperor continues, to this day, to sacrifice at appointed times, exclusively, as the son of heaven, and the only being on earth worthy to intercede for his people. The same doctrine prevailed in the time of Confucius, who observes that the distance between the all creative power and the people is so immeasurably great, that the king, as high priest, can alone offer such a sacrifice; and that this power is best satisfied when man performs the moral duties of life, which consist chiefly in filial piety, and unlimited obedience to the will of the prince. In the writings of Confucius appears a strong predilection for predicting events by the mystical lines of Fo-shee. By the help of these lines, he pretended to foretell the events that would take place for a considerable length of time. This manner of expounding the lines of Fo-shee by Confucius, the supposed system of binary arithmetic by Leibnitz, laid the foundation of consulting future destiny, at this day universally sought after by the Chinese. Government even grants licences to certain persons, who pretend to predict events and cast out evil spirits by a charm, consisting of some character written by them, according to the supposed prevailing planet. Predestination in all ages has formed one of the leading features of popular religion, but the Chinese confine the influence of lots to the events of this life. Other parts of the doctrine of Confucius were well calculated to keep alive the superstitious notions that still prevail among the Chinese multitude. He taught them to believe that the human body was composed of two principles, the one light, invisible, and ascending; the other gross, palpable, and descending; that the separation of these principles causes the death of man, when the light part ascends into the air, and the gross sinks to the earth. The word death never enters into the philosophy of Confucius, nor is it even now employed by the Chinese. When a person departs this life, the common expression is, he is returned to his family, and it was on this ground, that it became the indispensable duty of every good man to observe a strict obedience in the performance of the sacred rites in the temple consecrated to the memory of ancestors. He maintained that all who neglected this duty, would, after death, be deprived of the privilege of visiting the hall of ancestors, and of the pleasure arising from the homage bestowed by their descendants. Such a system could not fail to establish a belief in good and evil spirits presiding over families, towns, cities, houses, mountains, and other particular places.

Neither Confucius nor any of his disciples attached the idea of a personal being to the deity; nor does it seem ever to have entered into their minds to represent their first cause under any image or personification. They considered the sun, moon, stars, and the elements, with the azure firmament, as the creative and productive powers, the immediate agents of the deity, and inseparably connected with him, and they offered adoration to these agents, united in one word, *Tien* (Heaven). The disciples of Confucius, like the Stoics, consider the whole universe as one animated system made up of one material substance and one spirit, of which every

every living thing was an emanation, and to which, when separated by death, from the material part it had animated, every living thing again returned. But what has been esteemed surprising is, that the followers of Confucius have never erected any statue to his memory, nor paid him divine honours, as has been erroneously supposed. In every city is a public building, in which examinations for public offices are held, and this building is called the house of Confucius. Here on certain days the men of letters assemble to pay respect to the memory of their philosopher. In the great hall, appropriated for this ceremony, a plain tablet is erected with an inscription to this effect: "O Cong-foo-tse, our revered master, let thy spiritual part descend, and be thou pleased with this token of respect which we now offer unto thee." Fruit and wine, flowers and perfumes, and other articles are then placed before the tablet and scented gums, frankincense, and tapers of sandal wood are at the same time burnt. This ceremony is in every respect the same as that which Confucius taught to be observed towards the manes of departed relations, who are thought to delight in hovering over the grateful odour of fruits, flowers, and the smoke of incense.

Another religion sprung up shortly after the death of Confucius. A man of the name of *Lao-kung*, having travelled into Tibet, became acquainted with the worship of the priests of Lama, which he thought would suit his countrymen, and he accordingly established a sect under the name of *Tao-tze*, or *Sons of immortals*. He maintained, like Epicurus, that to live at ease and make himself happy were the chief concerns of man. The doctrine of immortality, a branch of the *Metempsychosis*, was converted by *Lao-Kung*, into the art of producing a renovation of the faculties in the same body, by the means of certain preparations taken from the three kingdoms of nature. The infatuated people flew with avidity to the fountain of life. Princes sought after the draughts that should render them immortal, but which, in fact, in numerous instances, brought on premature death. Consistent with the principle of "taking no thought for the morrow," the priests of *Lao-kung* devoted themselves to a state of celibacy, as being more free from cares and the incumbrances which necessarily attend a family connexion; and, the better to accomplish this end, they associated in convents. Here they practised all manner of incantations, and their successors perform their magic tricks as they march in procession round the altar, on which the sacred flame is supposed to be kept continually burning. They chaunt in unison a kind of recitative, and they bow their heads obsequiously every time they pass before the front of the altar. The great *Gong* is struck at intervals, accompanied by tinkling sounds, emitted by gently striking small metal plates, suspended in a frame. Their temples are crowded with large and monstrous figures, some made of wood, some of stone, and others of baked clay, daubed over with paint and varnish, and sometimes gilt. To these figures, however, they do not seem to pay any homage, but they are intended to represent good and evil genii under the various passions to which human nature is liable.

About the year 65 of the Christian era, the sect of Fo was introduced into China from Hindostan. The name was derived from the idol Fo, supposed to be the Booth of Hindostan, and the chief tenets are those of the Hindoos, among which is the metempsychosis, or transition of souls from one animal to another. The priests are denominated bonzes, and Fo is supposed to be gratified by the favour shewn to his servants. Since the sixteenth century, many of the Chinese literati have embraced a new system, which acknowledges an universal principle, under the name of *Tai-ki*,

seeming to correspond with the soul of the world of some ancient philosophers. This opinion may indeed deserve the name of atheism, but it is confined to very few; and the Chinese are so far from being atheists, that they go into the opposite extreme of polytheism, believing even in petty demons, who delight in displaying minute acts of evil or good. There is in China no state religion, none is preferred or encouraged by it; the emperor is of one faith, many of the mandarins of another; and the majority of the common people of a third, which is that of Fo. This last class, the least capable, from ignorance, of explaining the phenomena of nature, and the most exposed to wants which it cannot supply by ordinary means, is willing to recur to the supposition of extraordinary powers, which may operate the effects that it cannot explain, and grant the requests which it could not otherwise obtain. The Chinese have no Sunday, nor even such a division of time as that of a week. The temples are open every day for the visits of devotees, and persons of that description have, from time to time, made grants, though to no great amount, for the maintenance of their clergy; but no lands are subject to ecclesiastical tithes. The common Chinese are remarkably superstitious: besides the habitual offices of devotion, the temples are particularly frequented by the disciples of Fo, previously to any undertaking of importance; whether to marry or to go a journey, or conclude a bargain or change situation, or for any other material event of life, it is necessary first to consult the superintendent deity. This is performed by various methods. Some place a parcel of consecrated sticks differently marked and numbered, which the consultant, kneeling before the altar, shakes in a hollow bamboo till one of them falls on the ground; its mark is examined, and referred to a correspondent mark in a book which the priest holds open, and sometimes even it is written upon a sheet of paper pasted upon the inside of the temple. Polygonal pieces of wood are by others thrown into the air, each side of which has its particular mark; the side that is uppermost when fallen on the floor, is referred to its correspondent mark in the book of fate. If the first throw be favourable, the person who made it, prostrates himself in gratitude, and undertakes, in confidence, the business in agitation. But if the throw be adverse, he tries a second time, and the third throw determines, at any rate, the question. In other respects, the people of the present day seem to pay little attention to their priests. The temples are, as we have observed, always open to such as choose to consult the decrees of heaven. They return thanks when the oracle proves propitious to their wishes. Yet they more frequently call lots to know the issue of a projected enterprise, than to supplicate for its being favourable; and their worship consists more in thanksgiving than in prayer. Although the religion of Fo teaches the doctrine of the transmigration of souls, and promises future happiness to the people, on certain conditions, yet the Chinese seldom carry the objects, to be obtained by their devotion, beyond the benefits of the present life.

The temples of Fo abound with more images than are found in most Christian churches, and some that bear a greater analogy to the ancient than to the present worship of the Romans. One figure, representing a female, was thought to be something similar to Lucia, and is particularly addressed by unmarried women wanting husbands, and married women wanting children. The doctrine of Fo, admitting of a subordinate deity particularly propitious to every wish which can be formed in the human mind, would scarcely fail to spread among those classes of the people, who are not satisfied with their prospects, as resulting from the natural causes of events. Its progress is not obstructed by the

government of the country, which never interferes with mere opinions. It prohibits no creed which is not supposed to affect the tranquillity of society.

Funeral rites may be reckoned among the Chinese religious customs. Formerly it was usual to bury slaves alive with their dead emperors, but this cruel practice has given way to that of burning representations of their domestics in tin-foil, cut into the shape of human beings, and of placing their statues, in wood or stone, upon their graves. The Chinese burying-places, planted with cypress trees, are at a distance from any church or temple, and are no otherwise consecrated than by the veneration of the people, the remains of whose ancestors are deposited in them. The people preserve those sacred repositories with all the care they can afford to bestow upon them. They visit them annually, repair any breaches that accidents may have made, and remove any weeds that may have grown. No person is allowed to be buried within a city, and where there is ground that cannot be cultivated, it is always preferred for places of interment, as less liable to be disturbed; yet the meanest peasant will respect the spot over which a heap of earth denotes a repository of the dead beneath. The last remains of a relation are interred with all the honours which the family can afford. The loss of a parent in China is esteemed the greatest that can happen to any one, and the sentiment of affection and respect towards such, while living, is not suddenly extinguished in the breath of the survivors. The heart is indulged and consoled by paying superfluous duties to the manes of the deceased. The dictates of nature in this instance are enforced by the moral laws which govern the empire. Every institution tending to maintain the habits of affectionate regard of offspring towards their progenitors, is sanctified into a precept, not to be neglected but at the peril of being accounted infamous. The funeral processions of the great officers of state, sometimes extend for nearly half a mile in length. In the front marches a priest uncovered, next a group of musicians with flutes, trumpets, and symbols; after these the male relations of the deceased, in long white frocks, and behind them the chief mourner, supported by two friends, whose exertions to prevent him from tearing his cheeks and hair appear ridiculous; next follows the coffin, covered by a magnificent canopy, and borne generally on the shoulders of men; after the canopy, the female relations proceed in chairs, or in little covered carts, wearing white frocks like the men, their hair dishevelled, and broad white fillets bound across their foreheads. Over the mourners are carried umbrellas, with deep curtains hanging from the edges. Several persons are employed to burn circular pieces of paper, covered chiefly with tin-foil, as they pass by burying-places and temples. These pieces, in the popular opinion, like the coin to Charon for being conveyed to the Elysian fields, are understood to be convertible, in the next stage of existence, into the means of providing the necessaries of that new life. Notwithstanding the philosophical doctrines of the learned Chinese, which exclude all notions not consonant with reason, as well as the reality of all beings not referable to the senses, they often yield, in practice, to the notions of the vulgar. The people, among other superstitious, are particularly scrupulous about the time and place of burying their dead. The delay occasioned before those difficult points are ascertained, has often detained the coffins of the rich on their last repository; many are seen in houses and gardens under temporary roofs to preserve them, in the mean time, from the weather; but necessity obliges the poor to overcome many of their scruples in this respect, and to deposit at once, and with very little ceremony, the remains of their relations in their last abode.

The cemeteries of the dead exhibit a much greater variety of monumental architecture than the dwellings of the living can boast. Some, indeed, deposit the remains of their ancestors in houses, that differ in nothing from those they inhabited while living, except in their diminutive size; others prefer a square vault, ornamented in such a manner as fancy may suggest; some make choice of a hexagon to cover the deceased, and others of an octagon. The round, the triangular, the square, and multangular column, is indifferently raised over the grave of a Chinese; but the most common form of a monument to the remains of persons of rank, consists in three terraces one above another, enclosed by circular walls. The door of the vault is in the centre of the uppermost terrace, covered with an appropriate inscription; and figures of slaves and horses, and cattle, which, when living, were subservient to them, and added to their pleasures, are employed after their death to decorate the terraces of their toms.

The celebration of marriage, ostentatious, and, indeed, expensive as it is, is yet inferior to that of funerals in the same rank of life. Its pomp, was probably, in the origin, suggested by the parents of the parties. They naturally wished to give dignity to an union of their choice, and to mark it with a solemnity tending to render the tie more sacred and more durable. But the impulse which unites the sexes did not require the aid of public festivals. Sir George Staunton describes both a funeral and marriage procession, which he witnessed at the same time. Speaking of the former, he says, "it was moving towards the gate in which the white or bridal colour, according to European ideas, of the persons who formed it, seemed at first to announce a marriage ceremony; but the appearance of young men overwhelmed with grief shewed it to be a funeral, much more, indeed, than the corpse itself, which was contained in a handsome square case, shaded with a canopy, painted with gay and lively colours, and preceded by standards of variegated silks. Behind were sedan chairs covered with white cloth, containing the female relations of the deceased; the white colour, denoting, in China, the affliction of those who wear it, is studiously avoided by such as wish to manifest sentiments of a contrary kind; it is, therefore, never seen in the ceremony of nuptials, (met soon afterwards), where the lady, as yet unseen by the bridegroom, is carried in a gilt and gaudy chair, hung round with festoons of artificial flowers, and followed by relations, attendants, and servants, bearing the paraphernalia, being the only portion given with a daughter in marriage by her parents.

Among the religious ceremonies of the Chinese must be noted their festivals, the first of which is kept on the emperor's anniversary. This festival may be considered as lasting several days. The first is consecrated to the purpose of rendering a sacred and devout homage to the supreme majesty of the emperor. The prince's embassadors, and great officers of state, are assembled in a large hall; and, upon particular notice, they are introduced into an inner building, like a temple, which is chiefly furnished with instruments of music; among these are sets of cylindrical bells, suspended in a line from ornamented frames of wood, and gradually diminishing in size from one extremity to the other, and also triangular pieces of metal arranged in the same order as the bells. To the sound of these instruments a slow solemn hymn is sung by the eunuchs, who have such a command over their voices as to produce the effect of musical glasses at a distance; the performers are directed in gliding from one tone to another by the striking of a shrill and sonorous cymbal. During the performance, and at particular signals, nine times repeated, all the persons present prostrate themselves, nine times, except the em-

peror, who continues, as if it were an imitation of the deity, invisible the whole time.

The celebrated feast of lanterns, when the whole country is lighted up, from one extremity of the empire to the other, in every possible way that fancy can suggest, is an ancient religious usage, of which, at the present day, they can give no plausible account. It has been supposed that it may be derived from a common origin, with an annual illumination of the same kind mentioned by Herodotus; which was generally observed, from the cataracts of the Nile to the borders of the Mediterranean, by hanging lamps of different kinds to the sides of the houses. On this day the Chinese not only illuminate their houses, but they also exercise their ingenuity in making transparencies in the shape of different animals, in which they run through the different streets by night. The effect, when perfectly dark, is whimsical enough. Birds, beasts, fishes, and other animals are seen darting through the air, and contending with each other; some with squibs in their mouths breathing fire, some sending out sky-rockets, others rising into pyramids of party-coloured fire, and others bursting like a mine with violent explosions.

Throughout the whole empire of China a grand festival is celebrated on the same day, called the vernal festival. In the morning the governor of every city comes forth from his palace crowned with flowers, and enters a chair, in which he is carried amidst the noise of different instruments which precede. The chair is surrounded by several litters covered with silk carpets, upon which are represented persons illustrious for the support they have given to agriculture, or some historical painting on the subject. The streets are hung with carpets; triumphal arches are erected at certain distances; and the houses are every where illuminated. A large figure made of baked earth representing a cow comes next. A child with one foot naked and the other shod, which represents "the spirit of labour and diligence," follows, beating the image to make it advance. Labourers furnished with implements of husbandry march behind, and a number of comedians and people in masks close the rear, whose appearance and attitudes afford entertainment to the populace. The governor advances to the eastern gate as if he intended to meet the spring, and then the procession returns to the palace in the same order. After this the cow is stripped of its ornaments, and a number of earthen calves are taken out of its belly, which are distributed, as well as the figure itself, when broken to pieces, among the crowd. The governor then puts an end to the ceremony, by making a short oration in praise of agriculture, in which he endeavours to excite his hearers to promote to usef ul an art by all the means in their power. Another Chinese festival is that on the commencement of the new year, during which all affairs, whether private or public, are suspended; the tribunals are shut; the posts stopped; presents are given and received; the inferior mandarins go and pay their respects to their superiors: children to their parents; and servants to their masters. This is called taking leave of the old year. In the evening all the family assemble to take a grand repast, when no stranger is admitted; but on the following day they become more sociable, the whole of which is employed in diversions and feasting, and the evening concluded with illuminations. It may be worth observing in this place, that almost every intercourse in China between superiors and inferiors, is accompanied or followed by reciprocal presents, but those made by the former are granted as donations, while those on the part of the latter are accepted as offerings. Chinese terms correspondent to these are still applied to the presents passing between the emperor and foreign princes, according to the official style of the arrogated

superiority affected by the Chinese court. But when the emperor of China has occasion to make mention of himself, he uses the most modest and, indeed, humble expressions in every thing that relates to his own person, according to the system of Chinese manners; which require, in the mention of one's self, that the most abject terms should be employed, and the most exalted towards those who are addressed.

State of Knowledge in China. It is a matter of doubt whether natural philosophy or chemistry can be said to be known as sciences in this country. There are several treatises indeed on particular subjects in each, and the Chinese possess a very voluminous Cyclopædia containing facts and observations relating to them; but no traces are to be perceived of any general system or doctrine by which separate facts or observations are connected and compared, or the common properties of bodies ascertained by experiment; or where kindred arts are conducted on similar views; or rules framed, or deductions drawn from analogy, or principles laid down to constitute a science; for some there is not even a name. Of pneumatics, hydraulics, electricity, and magnetism, they may be said to have little or no knowledge; and their optics extend not beyond the making of convex and concave lenses of rock crystal, to assist the sight in magnifying, or for the purpose of burning glasses. The single microscope is in common use, but the Chinese have never hit upon the effect of approximating objects by combining two or more lenses. Their books are full of particular processes and methods, by which a variety of effects may be produced in chemical and mechanic arts, and much might probably be gained by the perusal of them, by persons versed in the language of the describers, and acquainted with the subject of the description. As soon as the product of any art or manufacture has appeared to answer the purpose for which it was intended, it seldom happens that the discoverer is either impelled by curiosity, or enabled by his opulence, to endeavour to make any further progress towards its increased utility. The use of metals for the common purposes of life has made them search for them in the bowels of the earth, where they have found all those that are deemed perfect except platinum. If they have not discovered the best methods of separating the precious metals from the substances among which they are found, nor of reducing the ores of others into their respective metals, they have at least succeeded in obtaining them without alloy, whenever they wish so to do. The gold is chiefly collected in small grains among the sand in the beds of rivers and torrents, which carry it down with them as they descend from the mountains. It is pale, soft, and ductile, and is often formed into bracelets, which some mandarins and many women of rank wear round the wrist, not more for ornament, than from a notion that they preserve the wearer from a variety of diseases. The Chinese beat it into leaf used for gilding, and the weavers employ it in their tilles and embroideries. Trinkets are also made of it at Canton, which are sent to Europe as eastern ornaments. Besides the use of silver as a medium of payment for other goods when it passes according to its weight, it is likewise drawn into threads used in the silk and cotton manufactures. Bell metal and white copper are made in great perfection in China; the latter is found to consist of copper, zinc, and a little silver. The iron ore of the Chinese is not well managed, and the metal is not so soft, malleable, or ductile, as the iron of this country; and their smiths work it exceedingly brittle, clumsy, and without polish. They excel in the art of casting iron, and form plates of it much thinner than is generally known to be done in Europe. Much of the tin imported by the Chinese is formed into a thin foil as possible, to paste it

upon square pieces of paper, which are burnt before the images of their idols. With the amalgam of tin and quicksilver, they make mirrors; and their spectacles, which are much used in China, are formed of crystal, which the Canton artists cut into laminae with a kind of steel saw. The powder of the crystal, like that of the diamond, helps to cut and polish itself. In almost every thing the Canton artists are uncommonly expert in imitating European works: they mend and even make watches, copy paintings, and colour drawings with very great success. They supply strangers with coarse silk stockings, manufactured at Canton, though none of the natives wear such, unless it be some young Chinese, who are fond of following the fashions of Europeans. The toys made at Canton, known under the name of balancers or tumblers, are partly filled with quicksilver. That metal is sometimes used in the same complaints as those to which it is applied in Europe as a specific; but a prejudice prevails among the common people, that it is apt to destroy the powers of one sex, and to occasion barrenness in the other.

The state of physic is extremely low in China: there are no public schools or teachers of it; and a young man who wishes to become a physician has no other way of acquiring medical knowledge than by engaging himself as an apprentice to some practitioner. He has thus the opportunity of seeing his master's practice, of visiting his patients with him, and of learning such parts of his knowledge and secrets as the other chuses to communicate. The emoluments of the profession rarely exceed the skill of the practitioner. As many copper coins as are equal to about sixpence are said to be the usual fee among the people, and perhaps quadruple among the mandarins. The latter of high rank have physicians in their household; and the emperor's physicians, as well as most of the domestics, are chiefly eunuchs. Medicine is not divided in China into distinct branches; the same person acts as physician, surgeon, and apothecary. The surgical part of the profession is still more backward than the other. Amputation in cases of compound fracture is utterly unknown, and death is the speedy consequence of such accidents. The mortality of the small-pox, joined to the observation that it attacked the same person but once, induced the Chinese, at an early period, to expose young persons to its infection when it happened to be mild. This led to the practice of inoculation, which is first mentioned in the annals of China at a time answering to the beginning of the tenth century of the Christian era. The general method of Chinese inoculation is, when the disease breaks out in any district, the physician carefully collects a quantity of proper matter, which is dried, pulverized, and closely shut up in a porcelain jar, so as to exclude it from the air; and in this manner it will retain its property for many years. When the patient has been duly prepared by medicine, and strictly dieted for some time, a lucky day is chosen for the sprinkling a little of the powder upon a piece of fine cotton, which they insert up the nostrils of the patient. No male physician is allowed to attend a pregnant woman, and still less to practise midwifery; in the indecency of which, both sexes seem to agree in China. There are books written on that art for the use of female practitioners, with drawings of the state and position of the infant at different periods of gestation, together with a variety of directions and prescriptions for every supposed case that may occur: the whole is mixed with a number of superstitious observations. In China, as in this country, there are quacks, who gain large sums of money by the sale of nostrums, the efficacy of which is set forth in hand-bills distributed among the people. There are in China no professors of the sciences connected

with medicine. The human body is never, unless privately, dissected there. Books indeed, with drawings of the external structure, are sometimes published; but these are extremely imperfect, and consulted perhaps oftener to find out the name of the spirit under whose protection each particular part is placed, than for observing its form and situation. The physiology of the human body, or the doctrine which explains the constitution of man, is neither understood, nor considered as necessary to be known; and their skill in pathology, or in the causes and effects of diseases, is extremely limited and often absurd. The feat of most diseases is supposed to be discoverable by means of the pulse; yet they have no knowledge whatever of the circulation of the blood. They imagine that every particular part of the human body has a particular pulse assigned to it, and that these have all a corresponding and sympathetic pulse in the arm: thus they suppose one pulse to be situated in the heart, another in the lungs, a third in the kidneys, and so forth; and the skill of the doctor consists in discovering the prevailing pulse in the body, and the mummy made use of on such occasions is highly ludicrous. The best of their medical books are little better than mere herbals, specifying the names, and enumerating the qualities of certain plants. The knowledge of these plants, and of their supposed virtues, goes a great way towards constituting a physician. Those which are most commonly employed are gin-seng, rhubarb, and China-root. A few preparations are also found in their pharmacopoeia from the animal and mineral kingdoms. In the former they employ snakes, beetles, centipedes, and the aureliae of silk-worms and other insects; the meloe and the bee are used for blisters. In the latter, saltpetre, sulphur, native cinabar, and a few other articles, are occasionally preferred. Opium is taken as a medicine, but more generally as a cordial to exhilarate the spirits.

There is no branch of science which the Chinese affect to value so much as astronomy. Nothing indeed can be so well calculated to excite curiosity, and occasion admiration, as the sight which the clear atmosphere of China almost always allows to its inhabitants, of an azure firmament fringed with stars. The vicissitudes of day and night, of summer and winter, and the different phases of the moon, exhibit appearances too striking not to claim attention in the rude as well as the cultivated stages of society. The necessity indeed of being able to mark with some degree of precision the returns of the seasons, in so large a community, must have directed an early attention of the government to this subject: and accordingly we find, that an astronomical board has formed one of the late establishments in China from the earliest periods of their history. Yet so little progress have they made in that science, that the only part of its functions which can be called astronomical has long been committed to the care of foreigners, whom they affect to hold in contempt, and to consider as barbarians. The principal object of this board is to frame and to publish a national calendar, and to point out to the governor the suitable times and seasons for its important undertakings. Even when the marriage of a prince is about to take place, the commissioners of astronomy must appoint a fortunate day for the celebration of the nuptials, which is announced, in form, in the Peking Gazette. In this almanack are inserted all the supposed lucky and unlucky days in the year, predictions of the weather, days proper for taking medicines, commencing journeys, taking home a wife, laying the foundation of a house, and other matters of moment, for entering upon which particular times are assigned. To the superintendance of the Chinese members of this tribunal is committed the astrological part, a committee of whom is selected annually

for the execution of this important task. The phenomena of the heavenly bodies, to an enlightened and intelligent mind, furnish the most grand and sublime spectacle in nature; to the ignorant and superstitious the most awful. The common people in all countries and of all ages have considered the occasional privation of the light of the two great luminaries of heaven as the forerunners of some extraordinary event. The people of China have, from the earliest ages, considered a solar eclipse as ominous of some great calamity; and as great pains are taken to inspire them with a belief that their prosperity is owing to the wisdom and virtues of their sovereign, so they are tempted to attribute whatever they think portents to some deficiency on his part. To this convenient prejudice the emperor finds it prudent to accommodate his conduct. He never ventures upon any undertaking of importance at the approach of such an eclipse, but affects to withdraw himself from the presence of his courtiers, to examine strictly into his late administration of the empire, in order to correct any error, for the commission of which the eclipse may have been an admonition, and invites his subjects to offer him freely their advice. The Chinese government observes on the event of an eclipse ceremonies similar to those that were in use two thousand years ago among the Egyptians, Greeks, and Romans. When the moon is eclipsed, their musical instruments are struck up, under the notion that by their shrill noise they may assist in relieving the labouring goddess. The brazen gong is violently beat by the Chinese on the occasion; and that such an event may not pass unobserved, and the luminary may thereby be deprived of the usual assistance of music to frighten away the dragon, which they suppose to have seized upon it, the great officers of state in every city and town are instructed to give public notice of the time when it will happen according to the calculations of the national almanack. "A rude projection of a lunar eclipse," says Mr. Barrow, "that happened while we were at Tong-choo, was struck up in the corner of the streets; all the officers were in mourning, and all business was suspended for that day." When the Dutch ambassadors were at Peking, the sun was eclipsed on the 21st January 1795, which happened to be the first day of their new year; a day observed through the whole empire with the greatest festivity and rejoicings; and almost the only day on which the bulk of the people refrain from their respective occupations. The ambassador and his suite were summoned to court at the usual hour of three in the morning, and on arriving at the palace, they were told that in consequence of an eclipse of the sun, about to happen on that day, which was a most unfortunate event, portending an unhappy year to the country, the emperor would not be visible for three days, during which time the whole court would go into mourning, and that the amusements usual on that particular day would be suspended from one end of the empire to the other. Just before the eclipse happened, the members of the mathematical board and other learned men assembled near the palace, each having in his hand a stick of the obscurator in order to witness the truth of the astronomer's calculation. The moment the eclipse begins, they fall down on their knees and bow their heads nine times to the ground, during which is struck up the horrible crash of gongs, kettle drums, trumpets, and other noisy instruments, intending to scare away the devouring dragon.

Astronomy, as connected with the first principles of chronology, has however been in high estimation from a very early period of Chinese history. The first mention of it that has come down to us, is, where the emperor Yao instructed his Astronomers *Hi* and *Ho*, how to distinguish and determine the four seasons of the year. "First," says

the mighty prince, "Yao desires that *Hi* and *Ho* will calculate and observe the places and motion of the sun, moon, and stars; and that they will afterwards teach the people whatever relates to the seasons. Secondly, according to Yao the equality of day and night, and the star *Niao*, serve to determine the vernal equinox. The equality of day and night and the star *Hui* point out the autumnal equinox. The longest day, and the star *Ho*, are the signs of the summer solstice. The shortest day, and the star *Mao*, shew the winter. Thirdly, Yao informs his two astronomers, that the *Ki* consists of 366 days, and that to determine the year and its four seasons, an intercalary moon must be employed. Hence it appears that the Chinese astronomers, even at this early period, were required to mark in the calendar the times when the sun and moon entered the different signs, together with the places of the planets, and the times of the eclipses. We know also from other works of authority, that those who neglected to announce these phenomena, were punished with death. It appears likewise, that even at that time, they knew how to determine the equinoxes and solstices by the length of the days and nights, and that they availed themselves of the motion of the planets, in order to compare their places with that of the sun in each of the four seasons. It is also evident, though certainly very extraordinary, that the Chinese were then acquainted with the length of a year of 365 days and six hours. The Chinese have always fixed the beginning of the astronomical year at the winter solstice; but the beginning of the civil year has varied according to the will of the emperors. The Chinese year has at all times consisted of a certain number of lunations, twelve of which form a common year, and thirteen the embolismic year. They reckon their lunations by the number of days which happen to fall between the moment in which the sun is in conjunction with the moon, and the moment of the conjunction following.

The Chinese divide their days into a greater or smaller number of equal parts, but besides these they generally divide them into 12 hours, which are, of course, double the length of those adopted by us. Their day begins and ends at midnight. The path described by the sun has been known in China from the remotest antiquity, and the Chinese have always distinguished the ecliptic from the equator. The former they call *hoang-tao*, the yellow way; the other is named *te-tao*, or the equinoctial line. The year is also, with the Chinese, divided into four equal parts or seasons, each of which has three smaller divisions, its beginning, its middle, and its end, that is, a lunation for each of the three parts: it is likewise subdivided into 24 equal parts, each of which contains 15 degrees, so that the whole together makes the 360 degrees. The Chinese make use of a cycle of sixty years called "kiatse," from the denomination given to the first year of it, which serves as the basis of their whole chronology. Every year of this cycle is marked with two letters, which distinguish it from the others; and all the names of the emperors, for two thousand years and upwards, have names in history common to them with the corresponding cycle. The intricate and irregular motion of the moon has been long known by the Chinese. In the reign of Yao the astronomers were able to calculate, with sufficient precision, the times of new and full moon. The first day of the new moon, they named *cho*, commencement or beginning, and the day of full moon, *ouang*, which signifies to expect, or hope: because the people expected the kindness and protection of certain spirits, which they invoked only at that epocha. To express the age of the moon, besides the numbers, they use the words *superior* and *inferior string*: they say *chang-bien*, a bow having the string uppermost, and *hia-bien*, a bow

a bow having the string undermost. It is thus they distinguish what are denominated the quarters of the moon. Their method of intercalation has varied, but it has generally admitted twenty-nine or thirty days for one lunation; the former is called a small lunation, and the latter a greater lunation. They divide the stars according to the following order: the *po-teou*, or celestial basket of the north, is what we call the *arctus major*: the *nan-teou*, or celestial basket of the south, which comprehends the principal stars opposite to the great bear; and which, together, form a figure, almost like that of the great bear in the north. The five planets called "ou-hing" are next enumerated; these are Saturn, Jupiter, Mars, Venus, and Mercury: and lastly are mentioned 28 constellations, in which are comprehended all the stars of the zodiac, and some of those which lie nearest to it. M. Gaubil, one of the learned Jesuits who resided long in China, and who paid great attention to the astronomy of the Chinese, says they have been long acquainted with the motion of the sun, moon, and planets, and even of the fixed stars from west to east; though they did not determine the motion of the latter till about 400 years after the Christian era. To the five planets just enumerated they have assigned revolutions which approach very near to ours. They have no notion of their different situations, when stationary and retrograde: and as in Europe, some of the Chinese imagine that the heavens and planets revolve round the earth, and others round the sun. By reading their books we may perceive, that the Chinese have had a perfect knowledge of the quantity of the solar year; that they have also known how to estimate the diurnal motions of the sun and moon; that they have been able to take the meridian altitude of the sun, by the shadow of a gnomon; and that they have thence made pretty exact calculations to determine the elevation of the pole, and the sun's declination: it appears that they have had a tolerable knowledge of the right ascension of the stars, and of the time when they pass the meridian; of the reason why the same stars, in the same year, rise and set with the sun; and why they pass the meridian, sometimes when the sun rises, and sometimes when he sets.

In China the first operations of arithmetic are very generally unknown; in the shops regular entries are made of the articles to be disposed of, and the several prices are affixed in the common Chinese characters equivalent to the words which express numbers in other languages; but not by a distinct set of figures upon a similar system to that of those called Arabic by the Europeans. Their arithmetic is mechanical, and to find the aggregate of numbers, a machine called the "swan-pan" is in universal use, from the man of letters to the meanest shopman. See *ABACUS* and *SHWAN-PAN*.

The knowledge of the Chinese in geography is as limited as that in astronomy. Their own empire was considered by them as occupying the middle space of the square surface of the earth, the rest of which was made up of islands. When the Jesuits went first to China, they found the charts, even of their own country, rude and incorrect, sketched without any scale or proportion, in which a ridge of mountains covered a whole province, and a river swept away half of another. At present they have neat and accurate maps of the country, copied after the original survey of the whole empire, undertaken by the Jesuits, and completed after several years labour.

State of the Arts. Little can be said of the state of the fine arts in this country. Of their poetry we have already spoken. Music does not seem to be cultivated as a science, nor learnt as an elegant accomplishment, nor practised as an amusement of genteel life, except by females who are edu-

cated for sale, or by such as hire themselves out for the entertainment of those who may be inclined to purchase their favours. These women play generally upon wind-instruments, such as pipes and flutes, while the favourite instrument of the men is something like a guitar. Eunuchs and the lowest class of persons are hired to play, and the merit of their performance appears to consist in the intenceness of the noise they are able to make. The gong is admirably adapted for this purpose. See *GONG*, and *CHINESE Music*. Kettle drums and different sized bells constitute part of their sacred music. They have also an instrument which consists of stones cut into the shape of a carpenter's square, each stone suspended by the corner in a wooden frame. It is the boast of the Chinese historians, that the whole empire of nature has been laid under contribution in order to complete their system of music: that the skins of animals, fibres of plants, metals, stones, and baked earth, have all been employed in the production of sounds. A Chinese band plays, or endeavours to play, in unison, but they never attempt to play in separate parts. They have not the least notion of counterpoint, an invention to which even the Greeks had not arrived, and which was unknown in Europe, as well as Asia, till the monkish ages. See *CHINESE Music*. With regard to painting, they can be considered in no other light than as miserable daubers, being unable to pencil out a correct outline of many objects, to give body to the same, by the application of proper lights and shadows, and to lay on the nice shades of colour, so as to resemble the tints of nature. But the gaudy colouring of certain flowers, birds, and insects, they imitate with a degree of exactness and brilliancy to which Europeans have not yet arrived; to give distance to objects on canvas, by diminishing them, by faint colouring, and by perspective, they have no sort of conception. At Yuen-min-yuen Mr. Barrow found two very large paintings of landscapes, which, as to the pencilling, were done with tolerable execution, but they were finished with a minuteness of detail, and without any of those strong lights and masses which give force and effect to a picture; none of the rules of perspective were observed, nor any attempt to throw the objects to their proper distances. In a country where painting is at so low an ebb, it would be in vain to expect much execution in sculpture. Grotesque images of ideal beings, and monstrous distortions of nature are sometimes seen upon their bridges, and in their temples, where the niches are filled with gigantic gods of baked clay, sometimes painted with gaudy colours, plastered with gold leaf, or covered with varnish. Near the gates of cities four-sided blocks of stone or wood are frequently erected, with inscriptions upon them, to perpetuate the memory of certain distinguished characters, but they are neither objects of grandeur nor ornament. The whole of their architecture is indeed unsightly and unsoft, without elegance or convenience of design, and without any settled proportions. Their pagodas are the most striking objects. See *PAGODA*. Their temples are mostly constructed upon the same plan. See *TEMPLE*. Next to these the most conspicuous objects are gates of cities, which are generally square buildings carried several stories above the arched gate-way, and, like the temples, are covered with one or more large projecting roofs. But the most stupendous work of this country is the great wall that divides it from northern Tartary, which is built upon the same plan as the wall of Peking, being a mound of earth cased on each side with bricks or stones. The astonishing magnitude of the fabric consists not so much in the plan of the work, as in the immenseness of distance of fifteen hundred miles, through which it is extended, over mountains of two and three miles in height, and across deep vallies and rivers. See *WALL*.

Chinese Trade, Manufactures, Agriculture, &c. The trade of China is now encouraged by the government. Even the foreign commerce, which was formerly shut up by their jealous monarchs, has been laid open by the Tartars since the conquest, so that they now trade with Japan, Manila, Siam, Batavia, and other parts of the East Indies. They likewise derive considerable advantage from their traffic with the Europeans. There have indeed scarce any port open to them, except that of Quang-tong, and that only at certain times of the year; neither are they suffered to sail up quite to that city, but are forced to call anchor at Whang-pu, a place about four leagues short of it, where the river is so crowded with trading vessels, that it looks like a large city on the water. This trade was once very advantageous to the Europeans, who brought thither cloths, swords, clocks, watches, looking-glasses, diamonds, crystals, telescopes, and other mathematical instruments, and sold them at a high rate; but the market is now over-flocked with those commodities, and the trade hardly worth carrying on in any thing but silver exchanged for gold, which is sold higher or lower according to the time of the year; it being cheapest in March, April, and May, when there is the greatest number of vessels in the port returned from Quang-tong. But what the Chinese chiefly depend upon is their home traffic. We ought to consider every province as a separate state or kingdom; some of these abound with certain commodities, or provisions, which others want, and, to communicate which to all the rest, the best methods have been invented, both by land and water-carriage. Thus the provinces of Hu-quang and Kyang-fi, which abound with rice, supply those that want it; Che-kyang furnishes the finest silks; Kyang-nan the finest ink, varnish, and all sorts of curious works; Yunnan, Shen-fi, and Shan-fi, yield plenty of iron, copper, and other metals, horses, mules, and furs; Fo-kyen, the best sugar and tea; and Sechen the greatest variety of medicinal and other plants; all these are conveyed from one province to another, either by their rivers and canals, or by land-carriage; and when brought to the place of sale, are commonly vended in a few days. The next branch of their wealth arises from their manufactures, of which they have great variety. We shall only speak of some of the most considerable, such as their silk and cotton, their porcelain and Japan ware, or varnish. We begin with the silk, the invention of which the Chinese records attribute to one of the wives of the emperor Wang-ti; since which period many other empresses have been recorded for the singular care they took to encourage it, by breeding the silk-worms, spinning the silk, and delivering it to the proper workmen and women to be woven. Their example could not fail of exciting the rest of their sex to put their hands to such a profitable, as well as delightful, work, by which they were enabled to exchange their old garb of skins, for the more easy and elegant drefs made of this new and valuable commodity. Upon the whole, that manufacture hath been so well cultivated among them from time immemorial, that not only the princes, grandees, literati, and other persons of distinction, but their domestics, the merchants, tradesmen, and mechanics, can afford to clothe themselves with it; none, except those of the meanest sort, and the peasants, appearing in cotton. The quantity they send abroad of it is prodigious, and plainly proves that it employs an infinite number of hands; so that it is not without reason that China is styled the silk country. Neither are the Chinese to be less admired for their surprising ingenuity, diligence, and skill, in the management of every branch of it, the contrivance of their looms, and other instruments for spinning and weaving it in a beautiful variety of colours and patterns; their great

care and skill in breeding, hatching, and propagating their worms; and their excellent way of cultivating mulberry-trees to the best advantage for their nourishment.

The Chinese appear to have strong claims to the credit of having been indebted to themselves only, for the invention of the tools required in the primary and necessary arts of life. The traveller will observe, in relation to common tools; such as the plane and awil, that whether in India or in Europe, in ancient or in modern times, they are found fabricated in the same form, denoting one common origin. In China alone, these tools have something peculiar in their construction, clearly indicating that they are of an original invention. Thus, the upper surface of the awil, elsewhere flat and somewhat inclined, is among the Chinese swelled into a convex form. The common plane, too, is distinguished by some minute particulars, which characterize it to be original. There is reason to believe, that not only inventions of the first necessity, but those of decoration and refinement, were known among the Chinese in remote antiquity. The annals of the empire bear testimony to the fact, and it is confirmed by a consideration of the natural progress of those inventions, and of the state of the Chinese arts at this time. In the first establishment of an art, it is practised awkwardly, and this state is supposed to continue stationary, until at length it advances to its second period, when it becomes improved, and the art is enabled to avail himself to the utmost of every tool and machine that can assist him. The last period of perfection is that in which the art is become so dextrous, as to complete his work with few, or awkward tools, and with little or no assistance. And such is the character of the Chinese potter, weaver, worker in precious metals, and in ivory, and of most others in the several trades commonly practised in the country. The process of smelting iron from the ore is well known to them, and their cast ware of this metal is, as we have already observed, remarkably thin and light. Or all the mechanical arts, that in which they seem to have attained the highest degree of perfection, is the cutting of ivory. Nothing can be more exquisitely beautiful than the fine open work displayed in a Chinese fan, the flicks of which would seem to be singly cut by the hand; for, whatever pattern may be required, as a shield with a coat of arms, or a cypher, the article will be finished according to the drawing, at the shortest notice. Out of a solid ball of ivory, with a hole in it not larger than half an inch in diameter, they will cut from nine to fifteen distinct hollow globes, one within another, all loose, and capable of being turned round in every direction, and each of them carved full of the same kind of open work that appears on the fans. A very small sum of money is the price of one of these difficult trifles. Models of temples, pagodas, and other pieces of architecture, are beautifully worked in ivory, and from the shavings, interwoven with pieces of quills, they make baskets and hats, which are as light and pliant as those of straw. In short, all kinds of toys and trinkets are executed in a neater manner, and for less money, in China, than in any other part of the world.

The various uses to which that elegant species of reed called the bamboo, is applied, would require a volume to enumerate. Their chairs, their tables, their screens, their bedsheads and bedding, and many other household moveables, are entirely constructed of this hollow reed. It is used on board ship for poles, for sails, for cables, for rigging, and for caulking. In husbandry, for carts, for wheel-barrows, for wheels to raise water, for fences, for sacks to hold grain, and a variety of other utensils. The young shoots furnish an article of food, and the wicks of their candles are made of its fibres. It serves to embellish the garden of the prince,

and

and to cover the cottage of the peasant. It is the instrument in the hand of power that keeps the whole empire in awe. Indeed there are few uses to which a Chinese cannot apply the bamboo, either entire, or split into thin laths, or divided into fibres, to be twisted into cordage, or macerated into a pulp, to be manufactured into paper. The discovery of making paper from straw is of very ancient date in China. The straw of rice and other grain, the bark of some trees, and various plants, are employed in the paper manufactures of China, where sheets are prepared so large, that a single one will cover the side of a room. The finest sort of paper for writing upon, has a surface as smooth as vellum, and is washed with a solution of alum to prevent it from sinking. Many old persons and children obtain a livelihood by washing the ink from written paper, which is afterwards re-manufactured into new sheets; the ink is also separated from the water, and preserved for future use. See PAPER.

There is no doubt that the art of printing is of great antiquity in China, yet they never proceeded beyond a wooden block. With the Chinese the art consists in nothing more than in cutting in relief the forms of written characters on wood, daubing afterwards those characters with a black glutinous substance, and pressing upon them different sheets of paper. It has not yet occurred to them to form moveable and separate types; they are satisfied, whenever the same characters very frequently occur, as in the public calendars and gazettes, to use types for such cut apart and occasionally inserted. See PRINTING.

In China, the chain-pump, nearly in its primitive state, constitutes an essential part in their ships of war, and other large vessels; the principal improvements since its first invention, consist in the substitution of boards, or basket-work for wips of straw. Its power with them has never been extended beyond that of raising a small stream of water upon an inclined plane from one reservoir to another, to serve the purposes of irrigation. They are of different sizes, and worked in different ways—some by oxen, some by treading in a wheel, and others by the hand. The power of the pulley is understood by the Chinese, and is applied on board all their large vessels, but always in a single state. The lever is also well known among them, and is applied to weighing all their valuable wares; and the tooth and pinion wheels are used in the construction of their rice-mills, that are put in motion by a water-wheel. But none of the mechanical powers are applied on the great scale to facilitate and to expedite labour. Simplicity is the leading feature of all their contrivances, that relate to the arts and manufactures. The tools of every artificer are of a simple construction, and yet each tool is contrived to answer several purposes; thus the bellows of the blacksmith, which is nothing more than a hollow cylinder of wood with a valvular piston, besides blowing the fire, serves for his fan when set on end, and as a box to contain the rest of his tools. The joiner makes use of his rule as a walking stick, and the chisel that holds his tools serves him as a bench to work on. The pedlar's box and a large umbrella are sufficient for him to exhibit all his wares, and to form his little shop. Besides the variety of trades which are stationary in China, there are many thousands of the people, in every large city, who cry their goods about, as is done in our metropolis. Barbers also are seen running about the streets with instruments for shaving the heads and cleansing the ears. They carry with them, for this purpose, a portable chair, a portable stove, and a small vessel of water; and, whoever wishes to undergo either of these operations, sits down in the street, while the operator performs his office. To ditzengzith their profession, they carry a large pair of steel tweezers, with

which they make a great noise, in order to obtain employment. There are persons also engaged in the open streets selling off their goods by auction, and the butchers of Peking not only sell, but dress the meat for their customers, who eat in the shops what is necessary, and having paid the price, go about their business.

The Chinese government has, in all ages, bestowed the first honours on every improvement in agriculture. The husbandman is considered an honourable as well as a useful member of society; he ranks next to men of letters or officers of state, of whom he is frequently the progenitor. The soldier, in China, cultivates the ground. The priests also are agriculturists whenever their events are endowed with land. The emperor is considered as the sole proprietor of the soil, but the tenant is never turned out of possession as long as he continues to pay about the tenth part of what his farm is supposed capable of yielding. And, though the holder of lands is only considered as a tenant at will, it is his own fault if he is dispossessed. If any one happens to hold more than his family can conveniently cultivate, he lets it to another, on condition of receiving half the produce, out of which he pays the whole of the emperor's taxes. A greater part of the poor peasantry cultivate land on these terms. In China there are no immense estates, no monopolizing farmers, nor dealers in grain. Every one can bring his produce to a free and open market; no fisheries are here let out to farm. Every subject is equally intitled to the free and uninterrupted enjoyment of the sea, of the coasts, of the estuaries, of the lakes, and rivers. There are no manor lords with exclusive privileges, nor any game laws.

The Chinese never divide their fields into ridges and furrows, but plant their grain in drills on an even surface. They are not inattentive to the direction of their rows, or dibbling their grain, as may be inferred from the solemn regulations, made concerning the annual ceremony of the emperor's act of husbandry in ploughing the ground. It is fetted that he shall stand with his face turned towards the south, and taking hold of the plough with his right hand, he shall turn up a furrow in that direction. The collection of manure is an object of so much attention with the Chinese, that a prodigious number of old men, women, and children, incapable of much other labour, are constantly employed about the streets, public roads, banks of canals and rivers, with baskets tied before them, and holding in their hands small wooden rakes to pick up the dung of animals, and offals of any kind, that may answer the purpose of manure; this is mixed sparingly with a portion of stiff loamy earth, and formed into cakes, dried afterwards in the sun. It sometimes becomes an object of commerce, and is sold to farmers, who never employ it in a compact state. Their first care is to construct very large cisterns for containing, besides those cakes, and dung of every kind, all sorts of vegetable matter, as leaves, or roots, or stems of plants; mud from the canals, and offals of animals, even to the shavings collected by the barbers. With all these, they mix as much animal water as can be collected, or of common water, as can dilute the whole; and, in this state, generally in the act of putrid fermentation, they apply it to the ploughed earth. In various parts of a farm, and near the paths and roads, large earthen vessels are buried to the edge in the ground for the accommodation of the labourer or passenger who may have occasion to use them. In small retiring houses, built also upon the brink of roads and in the neighbourhood of villages, reservoirs are constructed of compact materials, to prevent the absorption of whatever they receive, and straw is carefully thrown over the surface,

from

from time to time, to prevent evaporation. Such a value is set upon the principal ingredient for manure, that the oldest and most helpless persons are not deemed wholly useless to the family by which they are supported. The quantity of manure collected by all these means is still inadequate to the demand. It is reserved, therefore, for the purpose of procuring a quick succession of culinary vegetables, and for forcing the production of flowers and fruit. Among the vegetables raised in the greatest quantities, is a species of brassica, called by the Chinese Pe-t'ai, which resembles coss lettuce, and is much relished both by foreigners and natives. Whole acres of it are planted in the neighbourhood of populous cities, and it is difficult on a morning to pass through the crowds of wheel barrows and hand-carts loaded with this plant, going into the gates of Peking. It is sown for winter consumption, and, in that state, exchanged, in some of the provinces, for rice. That grain and that herb, together with onions, serve as a meal for the Chinese peasants and mechanics. The husbandman always keeps the grain he intends to sow in liquid manure until it germinates, which has the effect of hastening the growth of plants, as well as defending them from insects. The great object of Chinese agriculture, the production of grain, is generally obtained with little manure, and without letting the land lie fallow. A mixture of earth, in due proportion, is sometimes substituted with success in the deficiency of manure; and a surface of strong loamy clay may, with the addition of sand and water, be rendered an advantageous medium of support of vegetable life. Sea-sand is likewise used for this purpose, and, if laid on in proper proportions, it tends to promote fermentation, which is favourable to the growth of vegetables. By practices similar to these, the Chinese supply the deficiency of manure. They are constantly changing earth from one piece of ground to another; mixing sand with that which they find to be too adhesive, and clay or loam where the soil appears too loose; and having thus given their land the consistency that it requires, their next care is to prevent it from becoming dry.

Besides the great plenty of corn, grain, and pulse of all sorts, which almost every part of this country produces, it hath likewise a sufficient quantity of pasture-ground, which feeds a vast quantity of cattle of all sorts; whilst their spacious woods and forests supply them with as great plenty and variety of wild beasts; such as buffaloes, wild boars, deer of several kinds, elephants, leopards, tigers, bears, wolves, foxes, and a variety of others, not known to us, which afford the Chinese the diversion of hunting, as well as the commerce and profit of their furs, which are commonly very fine and valuable. This country also produces the musk-cat, a profitable creature. They have, likewise, a sort of roebuck which they call hyang-chang-tse, the male of which has a bag of a very odorous substance. This creature, which breeds mostly on the northern ridge of mountains beyond Peking, is first hunted, then killed; the bag above-mentioned is immediately cut off and tied very hard, that it may lose none of its effluvia. The flesh is also good to eat; but the bag is esteemed of more value than the rest of the carcase. The most delightful, however, of the whole quadruped kind, is a small stag bred in the province of Yunnan, and no where else; bought at a high rate by the princes and nobles, merely to be kept for show in their gardens. These are exactly shaped like the common sort, but their size scarcely exceeds that of our ordinary dogs, on which account they are esteemed as curiosities: but they have a great variety of stags of different kinds in the other provinces, some of which are reckoned as extraordinary for their large size. Birds and fowl, both of the wild and tame

kind, are here in great plenty and variety; such as eagles, cranes, storks, hawks, falcons, pelicans, birds of Paradise, peacocks, pheasants, partridges, turkeys, geese, ducks, swans, cocks, and hens, and a vast variety of water-fowl on their lakes, rivers, and canals. Among the tame and curious sort, they have a variety of beautiful parrots, not inferior, either in plumage, colours, or facility of talking, to any that are brought from America: but the most surprising and delightful of all the flying kind, is the little bird called kin-ki, or golden-hen, which is commonly found in the provinces of Yun-nan, Shen-si, and Se-chwen. This admirable creature derived its name from the exquisite symmetry of its shape, the beauty, lustre, and variety of its plumage, the complete mixture and arrangement of light and shade, both in its wings and tail, and the fine plume that crowns its head: but what renders it still more valuable among the epicures is the delicate taste of its flesh, which, we are told, greatly exceeds that of pheasants. China seems to be designed by nature to produce not only all the fruits which grow in other parts of the world, but likewise many others peculiar to its soil and climate; so that, if they have not so great a plenty and variety of the former, it is owing to their neglect of cultivating them; for, in general, they grow naturally almost in every province, and many of the more delicate kind in the southern parts to greater perfection than any in Europe. Apples, pears, plums, quinces, apricots, peaches, figs, pomegranates, mulberries, nectarines, grapes, oranges, lemons, citrons, melons, walnuts, chestnuts, pine-apples, and other fruits, grow almost every where in great plenty. Yet they are not so curious as the Europeans in cultivating and improving them, but content themselves with having three or four different sorts of apples, seven or eight sorts of pears and peaches; and as for their cherries, they are hardly worth eating. The only fruits that exceed ours are their pomegranates, a fine sort of muscadine grapes of exquisite taste and flavour, and their fig-tree, called by the Portuguese macau, which is a kind of fig. Olives are here in great plenty and variety, and, though different from ours, have a very fine taste; but whether out of dislike, or that they do not think it worth their while, they extract no oil from them. Among those fruits which grow in the southern provinces, the li-hi is most esteemed. It is shaped like a date, and hath an oblong stone. The fruit is full of moisture, of an excellent taste and flavour when full ripe; but shrivels, and grows blackish, like our prunes, by keeping. Next to that is the long-yen, or dragon's-eye, which is round, and yellowish, the pulp white, and a little acid. Both these are esteemed very wholesome, especially the latter, which is taken to create an appetite. They have likewise some singular as well as useful trees, particularly that which they style the pepper-tree, which bears a sort of grain like a pea, but of too hot a nature to be eaten; but the hulk, which is less pungent, is used by the common people. The pea-tree produces a sort of pulse, like our common pea, only a little more rank. Their wax-tree is so called from the wax that is produced on it by a kind of little worm which runs up and fastens to its leaves, and quite covers them with combs. This wax is hard, shining, and considerably dearer than that of common bees: though this last they likewise have in much greater quantities. When these worms are once used to the trees of any district, they never leave them, unless something extraordinary drives them away. The nan-mu is a tall straight tree, the wood of which is incorruptible like the cedar: it is commonly used to make pillars, doors, windows, or ornaments for palaces, temples, and large buildings; but it is in other respects much inferior to the tze-tau, or rose-wood, which is of a reddish black, streaked,

and full of fine veins, which appears to be painted by some artill. The furniture and ornaments made of this wood are much esteemed all over the empire, and sell at a greater price than those which are varnished or japanned. We omit a great variety of other valuable and curious trees, such as the cedar, ebony, sanders, pines, oaks, &c. which we have not room to describe. But that which is justly esteemed the most profitable among the Chinese, and hath most excited the envy of the Europeans, is their ti-shu, or varnish-tree, that yields the gum with which they make their fine giran-varnish or japan, which keeps such an infinite number of hands employed in most provinces of the empire, and furnishes it with such a prodigious variety of chests, cabinets, boxes, and other household ornaments, so beautifully painted and varnished, and sent abroad into most parts of the world. The next to that in usefulness is the tong-shu, or oil tree, from which a liquor or oil is drawn, not much differing from the varnish above-mentioned, and used almost to the same end, but chiefly in larger work, such as pillars, cornices, galleries, triumphal arches, and fine floors. This oil, when boiled into a consistency, not only preserves the wood over which it is laid, but gives it a fine lustre, and, like the varnish, may be mixed with any colour to great advantage. China is likewise famous for producing the camphor-tree, which grows to a prodigious size, and rises often to the height of 300 feet; its wood is of a firm texture, of great use in ship-building, as well as in joiners' work, from the beautiful gloss it acquires in polishing; but the most valuable part is the gum, which the Chinese are extremely expert at extracting, percolating, purifying, and subliming. The bark of the tree kind, worth our particular notice, is what they call tie-li-mu, or iron-wood, from its extreme hardness. It is, indeed, very remarkable for its strength and durability, beyond any other wood; the tree is as tall and spreading as our large oaks, and the wood is of a much deeper brown, as well as more weighty and tough.

Almost every part of the country being intersected by rivers and canals, abundance of water is always near at hand; and it remains only for them to contrive the means to convey as much of it as is necessary to the planted grounds. Thus they reap full and constant crops without fallowing, and sometimes without manure. The draught cattle most generally in use are oxen, mules, and asses; horses are scarce, of a miserable breed, and incapable of much work. No pains, however, are bestowed to improve the breed, for the Chinese imagine that this animal requires no other attention than that of giving him food.

The taxes raised for the support of government are neither exorbitant nor burdensome: they consist in the tenth of the produce of the land, in a duty on salt, on foreign imports, and a few smaller taxes that do not affect the bulk of the people. The total amount of taxes and assessments, which each individual pays to the state, does not exceed four shillings a year. With such advantages and such encouragements given to agriculture, one would imagine that the condition of the poor must be better than elsewhere. Yet, in years of scarcity, either from unfavourable seasons of drought or inundations, which are perpetually occurring, in one province or other, thousands perish from an absolute want of food. There are few public charities; no poor laws; and it is not a common custom to ask alms: Mr. Barrow says he did not see a single beggar from one end of China to the other, except in the streets of Canton. The children, or next of kin, must take care of their aged relations; and the parents dispose of their children in what manner they may think best for their family interest. As several generations live together, they are subsisted at a cheaper rate than if they had separate house-

holds; and in cases of real distress, the government is supposed to act the parent; and whenever any of its officers, through neglect or malice, withhold grain from the poor, they are punished with singular severity, and sometimes even with death. Another great advantage enjoyed by the Chinese subject is, that the amount of his taxes is ascertained. He is never required to contribute, by any new assessment, to make up a given sum for the extraordinary expenses of the state: except in cases of rebellion, when an additional tax is sometimes imposed on the neighbouring provinces.

We shall conclude this article with a short account of their coin. Silver and copper are the two current metals in China; gold being on the same footing as precious stones, purchased, like other valuable merchandizes, according to its weight and fineness. Silver, though used in payment, is not coined, but cut into pieces, smaller or larger, as occasion requires; so that its value is rated according to its weight and goodness. The scales, or rather itelyards, with which they weigh the silver or gold, and which they commonly carry about them in a neat japan case, consist of a little round plate, an ebony or ivory beam, and a weight. The beam, which is divided into minute parts on three sides, is suspended by fine silken strings at one of the ends, in three different points, that they may more easily weigh their pieces. These kinds of itelyards are so exceedingly exact for weighing any money, or small pieces of silver, that from fifteen or even twenty crowns, down to the twelfth part of a penny, and less, may be weighed in them with so great a nicety, that the one thousandth part of a crown will turn the scale. The Chinese chule to have it in that manner rather than coined. If, like the Europeans, they had stamped pieces of determinate value, they say their country would swarm with clippers and coiners, and the dealers be forced to have still recourse to their scales and touchstone. The only expeditious way they have to pay any sum in silver, is to keep by them a variety of plates of that metal, beaten, either thinner or thicker, besides the ingots, which are reserved for larger sums; and these, by long use, they can cut to a very great nicety. The only coin, properly so called, in use among them, is of copper, and of a very inconsiderable value, scarcely amounting to the third part of one of our farthings. It is of a round figure, with some Chinese characters on each side, and a square hole in the middle, through which they may be strung in any number. They, however, had, in ancient time, a great variety of coins of gold and silver, which are now only to be seen in the cabinets of the curious, and more particularly in that of the late emperor Kang-li, who caused a noble collection to be made of all that could be found of that kind in the empire, and to be deposited there as curiosities. The Chinese pound, or lyang, weighs sixteen ounces, but is divided into only ten parts, called tshen, this into ten fwen, which are equivalent to about seven pence English; the fwen into ten li of silver. The beam of the Chinese scale carries these divisions no farther; and yet, with respect to gold or silver of a considerable weight, the division is more minute, and almost extremely imperceptible parts, for which reason it is scarce possible to convey a just idea of them in our language. They divide the li into ten wa, the wa into ten fe, the fe into ten fu, the fu into ten chin, which last signifies a grain of dust; this again into ten yay, the yay into ten myau, the myau into ten mo, the mo into ten tshun, and the tshun into ten fun. There were periods at which the scarcity of specie obliged their monarchs to raise the value of the small copper pieces so excessively high, that one of them was worth ten of the same sort current in former times. This scarcity of copper coin, occasioned either by some violent

lent irruption of foreigners, who came and carried it away, or through the cautiousness of the people, who buried it in time of war, and died, without discovering where it lay hid, hath been so terribly felt, that at one time an emperor caused near fourteen hundred temples of Fo to be demolished, and all the images and copper work to be cast into coin; and at other times the people have been expressly forbid the use of any vessels, or other utensils of copper, and obliged to deliver up those they had to the mint.

Penal Laws and Punishments. The laws of China define, in the most periphrastic manner, almost every shade of criminal offences, and the punishment awarded to each crime, and the greatest care has been taken in constructing the scale of crimes and punishments, which are very far from being sanguinary. Of all the despotic governments existing, there is certainly none where the life of man is held so sacred as in the laws of China. A murder is never overlooked, except in the horrid practice of expunging infants; nor dares the emperor himself take away the life of the meanest subject without the formality of a regular process. So tenaciously, however, do they adhere to the principle, "At the hand of every man's brother will I require the life of man; whose sheddeth man's blood, by man shall his blood be shed," that the good intention is oftentimes defeated by requiring of the person last seen in company with one who may have received a mortal wound, or who may have died suddenly, a circumstantial account, supported by evidence, in what manner his death was occasioned. In attempting to proportion punishments to the degrees of crimes, the Chinese seem to have made too little distinction between accidental manslaughter and premeditated murder. To constitute the crime it is not necessary to prove intention or malice; if a man should kill another by accident, his life is forfeited by the law. And however favourable the circumstances may be, the emperor alone has the power of remitting the sentence; a power which he rarely, if ever, exercises, to the extent of a full pardon. The process of every trial for criminal offences, of which the punishment is capital, must be transmitted to Peking, and submitted to the supreme tribunal of justice, which affirms or alters according to the nature of the case. The execution of all capital crimes takes effect once a year, at the same time; and the number, seldom above two hundred, is very small for so populous an empire. In most cases, indeed, fine and imprisonment, flagellation and exile, are the usual inflictions, except in cases of murder, and in crimes against the state or emperor. The punishment of treason extends even to the ninth generation. A traitor's blood is supposed to be tainted, though they usually satisfy the law by including only the nearest male relations, then living, in the guilt of the culprit, and by mitigating their punishment to that of exile. Theft is never punished with death; nor is robbery, unless it be accompanied with personal injury. The moderation of those punishments seems to imply the infrequency of the offence. In a variety of capital punishments, strangulation is deemed less infamous than decapitation: the separation of any part of the body from the remainder being considered as particularly disgraceful. The punishment of the *Cangue*, which consists of an enormous block of wood, with a hole in the middle, to receive the neck, and two smaller ones for the hands of the offender, is generally inflicted for petty crimes. This ambulatory pillory the culprit is sentenced to wear for weeks or months together, provided he is able to walk about, but he is generally glad, for the support of his degrading burthen, to lean against a wall or a tree. If a servant of a civil magistrate takes it into his head that the culprit has reined too long, he beats him with a leathern whip till he rises. The punishment of the bamboo, however degrading it must appear to

an European, is ordered upon a very summary hearing upon any individual not in the rank of mandarins; and a viceroy has not only the power of degrading lower officers, but directing, without the form of a trial, any punishment, not capital, on them. Every mandarin may make use of the *baton*, or *pan-tzee*, which is a flat piece of bamboo, broad at the bottom, either when any one forgets to salute him, or when he administers public justice. On such occasions, he sits at a table, upon which is placed a bag filled with small sticks, while a number of petty officers stand around him, each furnished with some pan-tzees, and waiting only for a signal to make use of them. The mandarin takes one of these little sticks and throws it into the hall of audience, upon which the culprit is seized, and receives five smart blows from the pan-tzee; if the mandarin draws another stick from the bag, a second officer bestows five more blows, and the punishment is thus continued till the judge is pleased to make no more signals; when the criminal is expected to prostrate himself in gratitude for the paternal discipline. Some crimes are punished either with banishment, or by being condemned to drag the royal barks for a term of years, or to have their cheeks branded with a hot iron. Children who are deficient in duty, are condemned to receive a hundred blows; and if they lift up their hands against their parent, or use abusive language, they are punished with death. The slightest punishment in China is the *bastinado*, which is only used for chastising those who are guilty of very trivial faults, and the number of blows is estimated according to the nature of the offence. The lowest number is twenty, when the punishment is considered as paternal correction. The emperor even orders it to be inflicted upon some of his courtiers, which, however, does not prevent them from being afterwards received into favour.

The order and administration of the jails are said to be remarkably good. The debtor and felon are confined in separate places, it being thought impolitic and immoral to associate guilt with imprudence or misfortune. The two sexes are likewise kept carefully apart. Confinement for debt is only temporary; but if after the delivery of all, the debtor's property be insufficient to satisfy the demands against him, he is liable to wear a neck-yoke in public, for a certain period, to induce his family, if able, to discharge the debt. If his insolvency has been incurred by gaming or other improper conduct, he is subject to corporal punishment and exile. A man may sell himself in China in certain cases, such as discharging a debt to the crown, or to assist a father in distress, or to bury him in due form. If his conduct is unimpeachable, he is entitled to his liberty at the end of twenty years; but if otherwise, he continues a slave for life, as do his children also, if he had included them in the original agreement. The emperor's debtors, if fraudulently so, are strangled; if through misfortunes, their wives and children, and property of every kind, are sold, and they themselves are sent to the new settlements in Tartary. In China, the interests of the emperor are always made the first object; no property can be secure against his claims. Disputes among individuals concerning property, do not fill up a large space in the transaction of Chinese affairs. Property, whether real or personal, is held by tenures too simple to occasion much difference of opinion as to the right to it. There are no entails nor settlements, and the little commerce they maintain with foreigners, together with the uniformity of their own principles, customs, and opinions; but above all, the union which exists in families, among whom, elsewhere, the exclusive rights of individuals occasion the greatest feuds; and the sort of community in which most of them continue in China, cut off the principal sources of dissension.

The halls of audience are, in fact, more engaged in solicitations than in contests, and men of talents are employed, sometimes, to support the cause of others, who are young, ignorant, or incapable; but there is no particular order of men, who submit in audience, as lawyers and attorneys; or who arrive at dignities like the former. The impartiality of the judge is endeavoured to be secured by appointing no man to that office in the province of which he is a native. He is, however, liable to be swayed by the weight of presents. Such offerings are universal from an inferior to a superior, and from a pleader to his judge. They are paid by both parties, and the value of the presents is not ascertained; it is even expected, that the offerings should be in proportion to the opulence of the donor. By the laws relating to property, women in China are excluded from inheriting, where there are children, and from disposing of property; but where there are no male children, a man may leave by will the whole of his property to the widow. The reason assigned for women not inheriting is, that a woman can make no offering to deceased relations, in the hall of ancestors. And it is deemed one of the first blessings of life, for a man to have some one to look up to, who will transmit his name to future ages, by performing, at certain periods, the duties of this important ceremony.

Natural Productions and artificial Curiosities of China. Among the natural productions of China must be mentioned the tallow-tree, called by Linnaeus *craton jelsiferum*, from which the Chinese obtain a vegetable fat for their candles. This fruit, in its external appearance, bears some resemblance to the berries of the ivy. As soon as it is ripe, the capsule opens and divides into two or three divisions containing kernels, each attached by a separate foot-stalk, and covered with a white fleshy fat substance. The fat is separated from the kernels by crushing and boiling them in water, and the candles made of it are firmer than those made of tallow, and free from all offensive smell; the wicks are generally made of a light inflammable wood, in the lower extremity of which is pierced a small tube, to receive an iron pin, which is fixed on the flat top of a candlestick, and thus supports the candle without the necessity of a socket. The tallow-tree is said to have been transplanted to Carolina, where it flourishes as well as it does in China. Sugar canes are very much cultivated in China; the plantations of which, belonging to individuals, and being but of little extent, the expense of erecting sugar-mills is too heavy to have one upon each plantation. The business of extracting the juice of the cane, and of boiling it into sugar, is there a separate undertaking from that of him who cultivates the plant. The boilers of sugar travel about the country, with a small apparatus sufficient for their purpose, but which a West India planter would consider as inefficient and contemptible. It is not a matter of great difficulty to travel with this apparatus, as there are few plantations of which some part is not accessible by water-carriage. A few bamboo poles and mats are deemed sufficient for a temporary building; within which, at one end, is fixed a large iron cauldron, with a fire-place and flue, and about the middle, a pair of cylinders or rollers, fixed vertically in a frame. Upon the top of the axis of one of the cylinders, prolonged above the frame, are fixed two shafts or levers, curved in such a manner as to clear the frame in turning round the rollers, and to the end of these shafts are yoked two buffaloes, who, moving round as in a common cattle mill, press the canes between the cylinders, and express their juice, which is conveyed through a tube into the cauldron. The canes, deprived of their juices, become fit fuel, by means of which those juices are boiled into a proper consistence for

granulation. The boiler of sugar endeavours to enter into an agreement with several planters at a time, so that his works, erected near the centre of their several plantations, may serve them all, without changing his establishment. During the time he is employed, the servants and children of the planter are busily engaged in carrying canes to the mill. The canes are planted very regularly in rows, and the earth carefully heaped up about the roots; and under the roots of the canes is found a large white grub, which, freed in oil, is eaten as a dainty by the Chinese. In the neighbourhood of the canes are likewise several groves of orange trees, the fruit of which there is a great variety in size and colour. The pines, which bear large cones, have kernels much relished by the Chinese; and every mountain, either too steep, or too rocky, to be applied to any other use, is planted to the top with various kinds of pines, but most generally with the larch, as preferred for the purposes of building.

On the sides and tops of earthen embankments, dividing the garden grounds and groves of oranges, the tea-plant is seen growing like a common shrub scattered carelessly about. Wherever it is regularly cultivated, it rises from the seed sown in rows, at the distance of about four feet from each other, and is kept very free from weeds. Vast tracks of hilly land are planted with it, particularly in the province of Fo-chien; its perpendicular growth is impeded for the convenience of collecting its leaves, which is done first in spring, and twice afterwards in the course of the summer. The largest and oldest leaves, which are the least esteemed, and destined for the uses of the lowest classes of the people, are often exposed to sale with scarcely any previous preparation, but the young leaves require much trouble before they are fit to be delivered to the purchaser. Every leaf passes through the fingers of a female, who rolls it up almost to the form it had assumed before it became expanded in the progress of its growth. It is afterwards placed upon thin plates of earthen ware or iron, made much thinner than can be executed by artists out of China: these plates are placed over a charcoal fire, which draws all the remaining moisture from the leaves, and renders them dry and crisp. The colour and stringency of green tea is derived from the early period at which the leaves are plucked. The tea is packed in large chests, into which it is pressed down by the naked feet of the Chinese labourers. It is sometimes made up into balls, and sometimes a black extract is drawn from it, to which many virtues are attributed. This plant is cultivated in several of the provinces of China, seldom more northerly than about thirty degrees beyond the equator. It thrives best between that parallel and the line: at separates the temperate from the torrid zone. Such immense quantities of tea are raised in China, that a sudden failure of a demand from Europe would not be likely to occasion any material diminution of its price at the Chinese markets, though it might be attended with inconvenience to particular cultivators. See THEA.

Another natural production of China is the pe-tun-tse, used in the manufactory of porcelain, which is a species of fine granite, or a compound perhaps of quartz, felspar, and mica, in which the quartz seems to bear the largest proportion. It appears from experiment that it is the same as the *grovan stone* of the Cornish miners. The micaceous part, in some of this granite, often contains particles of iron; in which case it will not answer the potters' purpose. This material can be calcined and ground much finer by the mills of England than by the imperfect machinery of the Chinese, and at a cheaper rate than the prepared pe-tun-tse of their country, notwithstanding the cheapness of labour there. See PORCELAIN.

The bamboo is a curious and beautiful, as well as a valuable plant. It is properly a reed, hollow, and generally jointed; it is supposed to flourish most on dry ground in the neighbourhood of running water. Its growth is quick, attaining its height, about twenty feet, in a year and a half. It has the properties of being equally light and solid, and it rises out of the ground with a trunk of which the diameter contracts as its length increases; the branches of the bamboo are few, and of a light shining green; the leaves are long and delicate. Within the hollow of its joints is frequently found a singular substance of a sticeous nature, which has been used in some countries as a medicine. The Chinese reckon above sixty varieties of the bamboo, and apply it perhaps to as many uses. See ARUNDO.

Of all the artificial curiosities in China, their stately towers are the most striking to strangers, though built in a style peculiar to this country. There are two of these without the walls of Nanking, the most beautiful of which, styled the Porcelain Tower, because it is lined all over the inside with China tiles, beautifully painted, is the most admired by all travellers, for its height, symmetry, and variety of carving, gilding, and other ornaments. It is of an octagonal form, nine stories, or two hundred feet high, and forty feet in diameter; so that every side is fifteen feet in length. The whole is built on a large basis of brick, strongly cemented, which forms a stately perron, or flight of nine or ten steps, likewise of an octagonal figure, by which you ascend to the first story; and this perron is surrounded with a balustrade of unpolished marble on the outside. The first story, or, as it is called, the hall, is the highest of all, but has no windows, nor any light but what comes in at three spacious gates, which open into it. The wall is said to be about twelve feet thick, and eight and a half high, cased with porcelain, but of the coarser sort, and not a little damaged by age. From this you ascend to the second, and thence to all the other stories, which are of equal height, by a very inconvenient stair-case, the steps of which are ten inches high, and very narrow. Every story has eight large windows, one at every front. They all lessen, as they mount one over the other, so as to form, in the whole, a kind of cone, or sugar-loaf; and between each of them is a penthouse or shed, which projects some yards from the wall all around, and lessens in the same proportion the higher they rise. Each room is adorned with paintings and other ornaments, after the Chinese style, both on the sides and on the ceiling, whilst the outside is embellished with variety of work in basso-relievo, niches, and imagery. But the most beautiful part of the whole fabric is a kind of cupola, which arises thirty feet higher than the uppermost story, and is supported by a thick wall, fixed at the bottom of the floor of the eighth story. This piece seems to be inclosed in a large iron hoop, all the way, which winds round it like a spiral line or screw, at the distance of several feet, so that the whole looks like a hollow cone rising in the air, and supporting on the top a golden ball of an extraordinary size. Such is the structure of that famed tower, which, whether of brick, marble, or whatever other material, is looked upon by Le Compte, and other authors, as the best contrived, most solid and magnificent work in all the East. Nieuhoff adds two circumstances concerning it, viz. that the ball, or pine-apple on the top, is reported by the Chinese to be of massy gold; and the other, that the tower hath stood seven hundred years, and was erected by the Tartars, as a monument of their having made themselves masters of the Chinese empire; whereas Le Compte asserts it to have been, in his time, of no more than three hundred years standing, and to have been built, together

with the Temple of Gratitude, by the emperor Yong-lo; to which opinion Du Halde seems to subscribe. Most of these towers have in the uppermost gallery, and at every angle, small bells hanging at some distance, by chains or wires, which are easily moved by every blast of wind, and make an agreeable tinkling. But the greatest delight which these kinds of structures afford, is the charming prospect of all the country, exhibiting an incredible number of villas, orchards, gardens, meadows, towns, and monuments. They have a prodigious number of temples, both in town and country. The most celebrated of them are built in barren mountains; to which, however, the industry of the natives hath given beauties which were denied to them by nature; such as canals, cut at a great expence, to convey the water from the adjacent heights into proper reservoirs, for the use of the bonzes and their votaries; gardens, groves, and deep grottoes, cut into the rock, to shelter them from the excessive heat; circumstances which render these solitudes delightfully romantic. These structures consist partly of fine porticos, paved with large square polished stones, and partly of halls and pavilions, seated in the corners of the courts, having a communication with each other by galleries, adorned with statues either of stone or brass. The roofs of these buildings shine with beautiful japanned tiles, of green or yellow, and are embellished at the corners with dragons of the same colour. The rest of those buildings are built of timber, and most of them have high towers. Most of the cities have large bells set up in their high towers, by which they give notice of the different watches of the night; and those which have no bells make use of large drums. Some of their bells are of a monstrous bigness and weight; but the largest of all are those of Nanking and Peking. Le Compte mentions seven they have in the latter of these cities, that weigh one hundred and twenty thousand pounds. This is nearly five times the weight of that at Erfurth in Saxony, which Kircher supposed to be the largest in Europe. But the Chinese bells are very much inferior to those of Europe in sound; their clappers are of a hard wood. Their metal is very coarse, and full of knots, and their shape ill-contrived, for they are almost as wide at top as at bottom, their thickness gradually lessening from the bottom upwards; so that, upon the whole, they are mere unwieldy masses of metal, without musical tone, or any thing worth notice, but their huge, dull, heavy sound, and prodigious weight. The last artificial curiosity we shall mention, is their surprising fire-works, in which they may be justly said to excel all other nations. This was the chief use they made of gun-powder, which it is said they had among them many centuries before it was known in Europe; they used to exhibit these fire-works at their solemn festivals and other grand occasions, and in a great variety of figures and representations. They have carried this art to such perfection, that they can give to every object its true form and natural colour. Magalian relates, that he saw one of them which represented a vine-arbour, that burned without consuming, the root, branches, leaves, and grapes of which appeared all in their true shape and colour; the grapes were red, the leaves green, and the stem and branches exactly imitated nature.—Asiatic Researches. CHINA, *party*. See PARTY.

CHINA, *broken, a cuncta for.* See CEMENT.

CHINA *pink*, in Botany. See DIANTHUS *Chinensis*.

CHINA *rose*. See HIBISCUS; ROSA *Chinensis*.

CHINALAPH, in *Ancient Geography*, a river of Africa, the most considerable in the Numidia Maflaylorum, or present state of the Algerines, who call it *Shellif*. It takes its rise in the Sahara, or Desert, at the distance of about 80 miles to the S.E. in N. lat. 35° 2'. The fountains which form its source, from their number and contiguity, are known amongst the Arabs by the name Sebbiene Aine, or Sebaoun Aioun, the fountains. In its course it receives the Midroe, the Harbecne at the town of Medea, the Tod-dah, or Silver river, the Archew, the Mina, Wooriffa, and Fagia. See SHELLIF.

CHINCHA, in *Geography*, a fertile valley of South America, in the province of Peru, where the ancient Incas had a temple dedicated to the Sun. It was formerly very populous, but now contains about 500 families. The town, whence the valley derives its name, is situated about 16 miles N. of Pisco.

CHINCHE, in *Zoology*: Buffon calls the *Viverra Mephitic* by this name. *Skunk* *useful* of Pennant.

CHINCHILLA, in *Geography*, a town of Spain, in the province of Murcia; 25 leagues S.W. of Valencia.

CHINCHIMEN, in *Zoology*, a name given by Molina and Pennant to the *Lutra felina*, or otter, with the shape and appearance of a cat; its length from nose to tail is 20 inches. Molina (*Chili*, 265) says, that it inhabits the sea of Chili. It swims about in fairs, and loves to bask in the sun, on the tops of rocks; and, when taken, has all the fierceness of a wild cat.

CHINCHINA, in Botany. See CICHONA.

CHINCHIO, in *Geography*, a town of European Turkey, in the province of Dalmatia; 6 miles E. of Spalatro.

CHINCON, a town of Spain, in New Castile; 18 miles E.S.E. of Madrid.

CHIN COUGH, also called *Kink-cough*, and *Hooping-cough*. See PERTUSSIS.

CHINCULAGUA, in *Geography*, a snowy mountain of South America, in the Cordilleras of the Andes, in the province of Quito, N. of Cotopaxi, and of a somewhat less size.

CHINE, in the *Manege*, is used for the back-bone, or the ridge of the back of a horse. The French call it *echine*; and the ancient Italian masters *spina*.

CHINE, *La*, in *Geography*, a village of Canada, seated on the island of Montreal, about 9 miles higher up, whither goods are sent from Montreal in carts, on account of the rapids in the river St. Lawrence just above the town. This village is built on a fine gravelly beach, at the head of a little bay near the lower end of lake St. Louis, which is a broad part of the river St. Lawrence. Its situation is very agreeable; and from some of the storehouses belonging to the king and to the merchants of Montreal, are charming views of the lake and of the country on its opposite side. In the king's storehouse, the presents for the Indians are deposited as soon as they arrive from England. In sight of La Chine, on the opposite side of St. Lawrence, stands the village of the Cachenonaga Indians, containing about 50 wigwags and a Roman Catholic church, built in the Canadian style, and ornamented within with pictures, lamps, &c. The number of the Cachenonagas in this village is estimated at about 150; the other Indian villages in the civilized parts of Lower Canada are, one of the Canadodogs, situated near the mouth of the Utawas river; one of the little Algonquins, near Trois Rivières; one of the Aberathes, near the same place on the opposite side of the river;

and one of the Hurons, near Quebec; but none of these villages are as large as that of the Cachenonagas. The bateaux that navigate the river St. Lawrence ascend from this place by means of poles, oars, and sails.

CHINESE *Music*. This subject, of which we knew so little, except from Pere du Halde, whose information did not much enlighten us, has been so amply treated of late years, by Pere Amiot, the Abbé Ronfleur, M. La Borde, and the authors of the Encyclopédie Méthodique, that little would remain to be said, if we had not other resources from which to draw that which may, perhaps, vary our narrative, if not instruct the reader. The author of the present article, when collecting materials for his "General History of Music in every civilized part of the Globe," did not forget China, the most ancient, extensive, and polished empire that exists. He first queries to an English gentleman, a good judge of music, who had resided many years at Canton, and who transmitted them to different distant provinces, whence he obtained answers in French and Italian, from missionaries long resident there; and our correspondent at Canton not only transmitted to us their answers, but sent with them a complete set of Chinese instruments; among which there was every species of flutes, several stringed instruments of the lute and guitar kind, the *puo*, formerly called *yu*, *telan*, *he*, and *ching*, the appellation to which we shall adhere in the course of this article. The *ching* is a beautiful instrument, which has a gourd, or bamboo, for its basis, and represents in the arrangement of its reeds or bamboo pipes, the column of an organ; with these we received the largest gong which had ever been brought to England. These instruments were accompanied by Chinese airs in Chinese characters of notation, and in those of Europe, with a treatise on music translated into French from the Chinese, and a poem by the late emperor, Kien-Long, on the suppression of a rebellion in a distant province from the capital. These are dated Canton, 1775 and 1777. Further information from books and various other inquiring friends, was accumulated before lord Macartney's embassy took place; when, by his lordship's friendship and liberal spirit of research, not only for the satisfaction of his own mind, but the service of others, he extended his patronage so far as to desire the musical historian to write down a series of questions, not only concerning music, but any thing else that was wished to be investigated; and satisfactory answers were received to most of the queries delivered, at his lordship's return; drawn up by the learned and ingenious Mr. Hüttner, travelling tutor to the son of the late sir George Staunton, a gentleman, who, previous to the Chinese voyage, had resided a considerable time at Naples, and is a well-informed musician. Another chest of instruments, and a gong were added to the collection by the kindness and liberality of lord Macartney, and from all these materials, we shall endeavour to furnish curious inquirers after Chinese music, with as much information as can be compressed into the space usually allowed to articles of a similar kind.

Music has powers so opposite over human affections, that wherever it is cultivated it is sure of at least two sets of friends of very different dispositions, the *grave* and the *gay*. It can equally soothe and exhilarate. The Chinese, the most grave, formal, and frigid people on the globe, boast the having framed the proportions of musical tones into a regular system 4000 years ago, not only long before the time of Pythagoras, but that of the Egyptian "Hermes Trismegistus,"

megistus," or the establishment of their mystagogues or priests. But music, like other ancient arts, has so much depended on the tranquil and prosperous state of the nations by which it has been patronized, that, after being invented, cultivated, and brought to a certain degree of perfection, it has partaken of all the vicissitudes and calamities of states, and has been so totally lost during the horrors of invasion, revolution, and ruin, that if, in a long series of years, prosperity should return, neither its music nor its system is to be found, unless such fragments as, according to M. Baillet's assertion, we now possess of the theory and practice of the ancient Greek music. The Chinese in their old books have the numbers of their ancient scales as we have at present the ratios of Euclid and Ptolemy, which give us (according to the abbé Rouffier) the "true dimensions of each tone, and their reciprocal generation," which are insupportable on our keyed-instruments. So that music being lost after the crash of kingdoms, is again to be found by long labour, study, and experience; again to be lost, and again to be found! *per omnia secula seculorum.*

It is well known in Europe (says and believes Pere Amiot) that Egypt had its Mercury Trismegistus, (thrice great,) who, by the sweetness of his lyre, civilized mankind. It is likewise as well known that Greece had its Orpheus and Amphion, who by their strains stopt the course of rivers, made rocks dance, and even in the infernal regions silenced Cerberus himself; but Europe has still to learn that China has had its philosophical musician, its Lyng-tun, its Kouci, and its Pin-mou-kia; whose strains have been equally marvellous in taming the most furious wild beasts, and in civilizing mankind, often more ferocious than beasts themselves. Pere Amiot de la Musique Chinoise.

The first chapter in the history of every great nation is mythological, and never to be literally understood. And to say the truth, there seems at present in the music of China less enchantment than in our own. Yet the vulgar of all nations prefer their old traditional tunes to the finest compositions, and most exquisite performances that have ever been heard in an opera-house.

"During the first years of my residence at Peking," says the reverend missionary, "I lost no opportunity of trying to convince the Chinese, that our music was superior to theirs. I was pretty well versed in the art; I performed on the German flute and harpsichord, and those I wished to please were not of an ignorant or mean order, but persons well educated and qualified to compare and judge; in short, persons of the first rank, who, honouring the French missionaries with their benevolence, frequently came to their house to converse with them on objects of science, and such arts as were cultivated in China.

"Les Sauvages, and Les Cyclopes, the most admired harpsichord lessons of Blavet for the German flute, made no impression on the Chinese. I saw in their countenances only a cold and absent air, which convinced me that nothing I played was at all felt. I asked them one day what they thought of our music, and begged them to speak sincerely. They answered with the utmost politeness possible, that, "our music not being made for their ears, nor their ears for our music, it was not surprising that they did not feel its beauties, as they did those of their own country." "The airs of our music (adds a doctor among them, called Hiao-lin, and then in the service of the emperor) pass from the ear to the heart, and from the heart to the soul." We feel, we understand it: what you have been playing has no effect on us: the airs of our ancient music were still of a higher order. They were not to be heard without rapture. All

our books abound with the most pompous encomiums of its charms; but at the same time they inform us how much the excellent methods employed by the ancients in producing such marvellous effects were lost, &c."

If Pere Amiot had tried to convert the Chinese to a love for European music by French singing, we should not have wondered at his failure; but the instrumental pieces of Rameau and Blavet were justly admired in their day; and there have been long a neatness and precision in the execution of instrumental music in France, which has not been exceeded in any other country; so that if Pere Amiot did justice to the touch-stones with which he tried the feelings of the Chinese, it was natural to expect a different result.

But a similar disappointment happened to the English musicians during lord Macartney's embassy. His lordship took with him a complete military band of wind instruments, several of whom were able occasionally, to perform well on the violin and the violoncello. But the Chinese seemed wholly unmoved by the perfect execution of the best pieces, of the best composers, in Europe. Among the presents which his excellency took to the court of China, was a good barrel organ, made by Gray, as a curious specimen of our mechanism, upon which, besides our best popular tunes, were set several favourite airs of their own country; to some of which a base was added, and others were set on the barrel in their native state, without any accompaniment whatever. The first they did not feel, and the others, perhaps, from not being played in the time and with the expression to which they were accustomed, they would hardly acknowledge. As it was well known that, with all their long cultivation of music, the Chinese had not arrived at counterpoint, or music in parts, the author of this article tried to betray them into a love of harmony, and "the concord of sweet sounds."

Being in possession of the melody to the hymn that is annually sung by the Chinese with the utmost pomp, reverence, and solemnity, in honour of their ancestors, in the presence of the emperor, entitled, "The Son of Heaven," attended on this occasion by his sons, all the princes of the blood, the great officers of state, the Mandarins, the lettrés, men of science, &c. and whose arrival is the signal for the commencement of the hymn; and the melody to this hymn being, like our psalmody, entirely composed of slow notes of equal length, it was thought a good foundation on which to build harmony in plain counterpoint; and as there are many stanzas to this hymn, a fundamental base only was added to the melody at first; then a second treble; and, afterwards, a tenor; after which a little motion was given to the base, followed by other additional notes to the tenor and base, but always taking care to enforce the principal melody by one of the other parts, either in unison, or in the octave. But this had no other effect than to try the patience and politeness of the Chinese, who heard it without emotion of any kind. And when it was over, one of the Mandarins, an accomplished man of good sense and good breeding, who attached himself to our ambassador, and seemed impressed with a sincere friendship for him, said, but with the utmost politeness, that "he doubted not but that our music was very fine to ears accustomed to it; but that they were not able to understand it. The additional part confused and bewildered them; they disliked the air, and rendered it doubtful which was the principal sound, adding that such music was too complicated for them, and required more attention than they were accustomed to give to their own airs."

Such are the effects which our harmony has on the ears of the most enlightened Chinese, and indeed on those of all nations out of Europe. So that the opinion of Rousseau, that

that "our harmony is only a Gothic and barbarous invention, which we should never have thought of, if we had been more sensible to the true beauties of the art, and to music truly natural," almost ceases to be a paradox.

We shall now endeavour to give a synopsis of the ancient musical system of the Chinese, which, if its chronology is just, must have preceded every other regular system upon earth.

The system of Chinese music bears date from the beginning of the monarchy, at least 2637 years before the Christian era; a proof, according to Pere Amiot, that the Chinese are the original authors of the system of music, which has been to long known in their country; and if it has been altered and abridged in later ages, it must have been from the corruption and decay of the first principles upon which it was founded; and from its being mixed and united with vain and absurd sciences, such as divination by numbers, and judicial astrology, that men of true science have abandoned.

The Chinese have had, at every period of their history, an universal system, united in all its points, to which every thing was connected and referred, as well in politics, as physics and morality. To this system they have withheld, in some way or other, to make the rules of music accord as well as those of other sciences, connected with their religious and civil establishments. And Pere Amiot, being pressed to declare what were the peculiar excellencies of the primitive music of the Chinese, from which it derived its miraculous powers, and whether he thought they had ever known harmony or music in parts, similar to that of modern times? he answered in the affirmative; and added, that he thought the Chinese were probably the nation in the world that has best known harmony, and most universally observed its laws. But what is this harmony? It is that which consists in the general accord of all things natural, moral, and political, including whatever constitutes religion and government; an accord of which the science of sound is only the representation and the image." So that the expressions concerning this divine music, of which the learned missionary and the Abbé Roussier have laboured so much to explain the laws, are only allegorical and figurative! even the form of their musical instruments was metaphorical.

Their historians tell us that Fohi, the founder of the Chinese empire, 2952 B. C., was likewise the inventor of music; that in framing the instrument called *kin*, a long instrument strung with silk strings; the belly of which was curved to represent the heavens; the back was level to represent the earth; he placed the dragon (the symbol of China) eight inches from the bridge to represent the eight points of the winds, and gave four inches to the neck of the *Foung-Hoang* to represent the four seasons of the year. This instrument was furnished with five strings to represent the five planets and the five elements, and its total length is fixed at seven feet two inches to represent the universality of things. By means of this instrument he began by regulating his own breath, and containing his passions within just bounds; he afterwards laboured at the civilization of mankind; he rendered them capable of obeying laws, performing actions worthy of recompense, and of peaceably cultivating the earth, which gave birth to the arts. Fohi had patriarchal longevity, having reigned 115 years.

This is all symbolical and imaginary music; all that concerns real music that is intelligible is, that (according to Pere Amiot) long before Pythagoras, or any of the ancient sages of Greece, had travelled into Egypt, before the establishment of Hierophants, and even before the time of Mercury himself, the Chinese knew the division of the octave into twelve semitones produced by a gamut or series of fourths

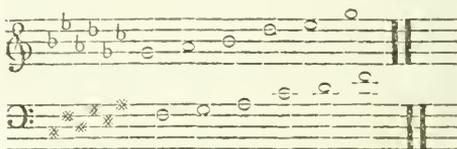

and fifths by the Abbé Roussier's favourite triple progression. Of this series of perfect fifths, however, the ancient Chinese used only five, beginning at F, the fundamental of their system, which produced the following treble scales either way, by beginning at the top or bottom of their great *Lu*, as each distinct arrangement of sounds is called.

And by giving to these sounds a regular diatonic progression, they furnish the following scale without semitones:

and which is, in fact, the precise Scots scale, that may be played on the short keys of a harpichord, or piano forte, in G b or F ♯, for example:

Beginning in C, the scale would be equally deficient.

Had they pursued the series of 5ths two degrees further, they would have had E and B; which would have furnished the two semitones necessary to complete the scale in C natural.

The *kin* (which may be called the lyre of Fo-hi), all agree, had at first but five strings, which were afterwards increased to seven. But in process of time, they were again reduced to five, on which the tunes in present use seem chiefly to be formed, as those that are genuine, and not adulterated by Europeans, who write them down by memory, have no semitones.

Pere Amiot's book is crowded with scales, systems, calculations, and diagrams, which leave us as much in the dark as ever; as to what this learned music was, which ancient sages regarded as the universal science, the science of sciences, whence all other sciences flowed.

Father Amiot did not well know what to do with his Chinese musical discoveries, till he saw the Abbé Roussier's Treatise on the music of the ancients; nor the Abbé how to illustrate his Pythagorean ideas, till he saw the papers of Pere Amiot, of which papers he afterwards became the editor, and published them in the sixth vol. *des Mémoires concernant l'Histoire, les Sciences, les Arts, &c. des Chinois*. In explaining and commenting the work of Pere Amiot, the Abbé had a good opportunity, which he did not neglect, of harmonizing the Chinese system with his own.

Not a passage of the ancient music is preserved, or the least

least idea suggested of what kind it literally could be; but after all these scales and calculations which seem to imply that real practical music, "which at once delighted the sense and gratified the mind, by the evidence of demonstration;" we find that it was an allegorical music, as inaudible as that of the spheres.

Father Amiot observing that the Abbé Rouffier spoke favourably of the Chinese, in his *Memoire sur la Musique des Anciens*, says, the Abbé Rouffier might, with the assistance of the Chinese, have become the flambeau; at once to enlighten men of letters and harmonists; the first by a research into ancient usages, and the last in recovering to China that kind of musical omnipotence which it formerly enjoyed, and which it has unhappily since lost.

This is another specimen of the wide extent of father Amiot's musical creed.

But one of his countrymen, a gentleman to whom queries concerning Chinese music had been sent, who had resided many years at Peking, and who seems to have understood the subject better than Pere Amiot, says, "To hear the Chinese talk of their music in ancient times, we should suppose it to be something marvellous; they confess, themselves, that not a vestige of it remains, and never cease deploring its loss: but for my part, I can hardly believe that their ancestors had carried the art of music to such a high degree of perfection; if they had, the present Chinese could not fail to have a kind of music at least tolerable, and I am inclined to be of the same opinion as one of their lettered, who told me, that what we read in their books concerning the excellence of their ancient music, should not be understood literally, but figuratively, of the good harmony between the prince and people, and the different orders of the state."

The emperor Kan-hi, the grand-father of the late emperor Kien-long, who began his reign in 1662, and reigned 61 years (Eloge de la Ville de Moukden, Poeme par l'Empereur Kien-long, 1770, 8vo.), was a true lover of arts and sciences, who tried to procure from the Europeans residing at Peking all the knowledge possible on every sort of subject. With their assistance he had new books written in the Chinese language upon astronomy, mathematics, geography, medicine, &c. which ought to be recorded in our histories, that if in future times it is said that excellent books on these subjects had been written in China, it might be known to whom the debt are due.

The ancient Chinese had no notation; but at present they express sounds by the characters of their language, in imitation of the Europeans. But they have no modulation, and consequently know not what is meant by a \flat , \sharp , or half note.

In the southern part of China they have only five notes or tones in the octave; but in the north, bordering on Tartary, seven can be distinguished. The generation of the 12 *lu*, or scales, in this MS. tract, differ considerably from those of Pere Amiot. But these scales, in Chinese characters, for which we have no types, though they might gratify curiosity, could convey no more intelligence to the reader concerning the practical music of the Chinese, than those in the treatise of Alypius, in Meibomius, of the practical music of the Greeks, concerning which we know little more than the alphabet.

After the scales and table of the twelve *lu*, or orders of sounds, combined with the five tones, or rather table of the variations of different *lus*, the very intelligent correspondent of our zealous friend (Mr. R.) concludes thus: "This, sir, is all that I can at present communicate concerning the music of the Chinese, of which Kan-hi said with great truth, the more pains were taken to understand it, the more obscure

and perplexing it became, for want of being able to trace it up to its true principles.

"It was asked, whether eunuchs were employed as singers on the stage, or in the palace; and the answer was, that some from Europe had been introduced in the palace early in the reign of the late emperor, as musicians, to sing, play on instruments, and teach others; but that was not of long continuance; and now, as formerly, no other use is made of them than as guardians of the wives and concubines of the emperor and of great personages." This communication bears date, Peking, 1780.

We have a letter, likewise procured by Mr. R. from an Italian missionary, on the same subject, who had been near thirty years in China, and had been admitted into the imperial palace to perform to the emperor, among European musicians, who had been sent for, expressly, for that purpose.

Of the ancient music of the Chinese we can have no account but from books, equally fabulous with Egyptian mythology and the Grecian pantheon. But of the modern, we can form an idea, not very wide of the truth, by correspondence and conversation with intelligent persons, judges of European music, who have long resided in China, as well as by drawings of their instruments, and by the instruments themselves in our possession, and by specimens of Chinese melodies (they have had nothing else) current from time immemorial, and they are still current throughout the empire.

But the national airs of China being appropriated to particular times and occasions, are constantly recognized, felt, and understood; so that no Chinese Fontenelle need ask, "Sonate que vent-tu?" the times and the seasons would save him that trouble. Some of these airs are only publicly performed once a year, others twice, and the rest are usually confined to one particular occasion. In high antiquity the *nomoi* of the Greeks had all appropriate names and applications; and their ancient modes the same, which must greatly brighten their popular effects. "God save great George our King," in turbulent times, and "Rule Britannia" (which has supplanted "Britons strike home") in time of war, are proofs of the effects of appropriate tunes.

But the variety after which musicians and dilettanti are ever craving in Europe, prevents all popular effects from new music, however good the composition and performance. Fine music can never have the general effect of familiar and simple airs, which require no science to comprehend. Mr. R.'s friend says, that Pere Amiot has written a treatise of great length on the music of the Chinese, chiefly the ancient, which has certainly suffered many changes from time, and which is now very difficult to verify. It is by the Europeans that the notation which the Chinese now have has been furnished, from their own alphabetic characters. That given for the instruments does not correspond with the same European notes as the vocal.

The Chinese, formal and symmetric in every thing, have a specific number of airs for great occasions, which are never changed or varied.

1. *The court airs*, performed on the emperor's birth-day, and on days of ceremonial, but always when his imperial majesty is present.

2. *Airs to inspire true concord and national felicity*, performed at the beginning and end of each year, when the emperor ascends his throne.

3. *Airs of incitement to virtue*, when an eloge on the emperor is read, and his imperial majesty officiates in sacrifice in a temple to the souls of his ancestors.

4. Ditto, on another day of sacrifice.

5. When his imperial majesty dines in public.

CHINESE MUSIC.

6. Also performed after a grand council has been held, and the emperor returns to his apartments.

7. Ditto to the fusticial ceremonies, when the emperor shows fertility on a round altar.

There is a certain number of mandarins to superintend the performing on all these occasions: the musicians, too, are limited to a certain number, and to instruments of different kinds, on different occasions.

This will account for the torpid state of the art, and the insensibility of the ingenious inhabitants of China to European music. People must learn to hear music, as well as to perform it. There is no forcing pleasure on any animal, and every man will be pleased his own way—"Not by compulsion, Hal!"

The Chinese began with simplicity, and habit has fixed that simplicity into an immutable law. The Europeans began their present polyphonic music with complication and eternal change of style; and effusions of unbounded imagination will preclude simplicity, and prevent any music from living to be superannuated, or becoming venerable for its antiquity.

On the grand annual feast given by the emperor when he receives the homage of governors of provinces, chiefs of tribes, tributary princes, &c. the grand music begins. It has nine strains, or movements, performed between the several courses, which are eight in number. The first music precedes the first course, the other seven are severally performed between and after the eight courses. Pere Amiot.

Of all the Chinese instruments which we have seen, or which have been described in books, there is no one which seems likely to please Europeans, except one instrument made of a sonorous stone, and another of small reeds of the bamboo. The instrument formed of the *pierre sonore* is of the highest antiquity, and mentioned with great encomiums in their most ancient books.

It is hard to say whether it was an invention of the original inhabitants, or brought thither by colonial invaders. The instrument is called the *king*, is made of all shapes and sizes, hanging like a bell, and beat with a covered mallet, like a *gong*. Its tone is as clear as if of glass or metal. This sonorous stone Pere Amiot believes to be metalline crystallized, of five different properties; hardness, weight, colour, grain, and tone. It is as hard as agate and precious stones; so that it retails the best tempered steel. The harder it is, the higher it can be polished, and the clearer its sound. It is so heavy, that a rude piece of it, such as one man might be thought able to carry, requires four to move it. As to colour, it partakes of yellow, carnation, white, red, cinnamon, and deep brown. It oft resembles marble of five colours.

The principal use made of these pierres sonores, is giving signals for a concert to begin or end: the entrance or exit of the emperor, or other great personage, as in Europe by a great bell or cannon.

As to the pitch and tuning of these lapidary instruments, the Abbe Roussier tries hard to prove it to be from the datum F, in the triple progression.

These instruments are suspended by a ring, or rings, to a frame, and the largest give the national pitch, F, to which the rest are proportioned. (See *Plates, Music*.)

One of the most useful qualities of the *King*, is, that its pitch is never subject to variation, by heat or cold, like instruments of wood or metal.

The Chinese have such a reverence for this instrument, that they hold it in profanation to use it on common occasions, as the Germans do an organ; and think the English very profligate in using it any where but in a church.

Pany l. 3. c. 10. mentions a sonorous stone, under the

title *Kao no Jangos*. "Calcophonos nigra est; sed illius, æris virtutum redditus."

But the *Ching* is the only instrument that we have received from China which would please European ears. It is composed of reeds of different lengths, arranged into columns of organ pipes. See *Plate, Music*. Its tone is more sweet and delicate than that of any of our wind instruments. It is not so loud enough for a theatre or concert room; but in a small apartment of a mansion, if cultivated by a musician of taste and talents, it might be made the most exquisite and captivating of instruments. It has from 13 to 19 pipes, which speak either by blowing or inhaling, so that a tone may be continued to any length. It never speaks till a hole is stopp'd, and as many ventages as are covered by the fingers, so many sounds will be produced; so that duets may be played on a single individual instrument, or even chords, which, if harmonically proportioned, like the tones of our instruments, would greatly delight ears well organized. But no scale has ever been sent to Europe which has come to our knowledge. Pere Amiot evades giving one. The master of the *Ching* is equivalent to organist or maestro di capella. These regals, as we may call them, are of different size and compass, and composed of a different number of reeds. The small *Ching*, of which we have three in our own possession, has 13 pipes or reeds, which, says the Abbé Roussier, give the 12 semitones of the octave above the generator, or principal. But query, how can we reconcile this to there being no semitones in Chinese melodies?

The belly of several stringed instruments in China is a section of the gourd or pumpkin.

Such is that of the Yee-Yen, which is played with a bow, and has two strings which are tuned fifths.

But the *Ching* has sometimes a section of the cocoa-nut for its basis. This instrument is composed of many pipes; each of its reeds has a different tone, produced by a very narrow, thin, brazen or copper plate, such as is used in the reed-work of an European organ.

The scale to this sweet little instrument, remains the grand desideratum in Chinese music.

The Chinese vocal music is not likely to please any other ears than their own. Most of them, even boys not excepted, sing in falsetto, and it seems as if a natural voice was as much disliked by them, as the original shape of a woman's foot. Nor did the officers or attendants in lord Macartney's embassy ever hear in China a base or tenor voice. This unnatural method of singing is not improved by the perpetual tumultuous motion of the voice.

The found of a double base they detest; yet, notwithstanding their dislike of low tones, on their seeming to like the bassoon better than any other of our wind instruments, lord Macartney offered to give it them; but they declined the acceptance, and immediately set a joiner to work, who placing it on the ground, took the exact dimension of its several joints, keys, &c. and made one for themselves.

The Chinese have theatrical dramas, with and without music. Of the latter kind are their comedies and farces. But their tragic scenes are generally accompanied with all the noise of drums, gongs, &c. and the screaming and bawling of mandarins, after which they commonly introduce love scenes and pastoral entertainments.

All the Chinese airs which we have seen or heard, are in common time. "At Canton (says Mr. Hüttner) we were surpris'd by an opera consisting of recitatives and airs that did not want expression. At least I observ'd that most of our party seem'd to be highly pleas'd with them, and though ignorant of the Chinese language, to understand in some measure the meaning of the words, which, if I am not mistaken, was entirely

entirely owing to the excellent imitation of the different accents of the passions, and to their adequate movements and gestures. These players, natives of Nanking, reminded me of the famous music of ancient Rome. The instrumental music which constantly accompanied both recitatives and airs, was very pleasing and in excellent time.

"The military music of the Chinese is indeed miserable, and certainly not at all calculated to inspire courage. It has neither melody, expression, nor time. Hautbois and horns together make such a continued and jarring noise, as if they vied with each other to imitate the wawling of cats. Their horns, however, have a very good tone, and resemble our serpents.

"The best music we heard, was at the presentation of the ambassador at Gelo. After the emperor had ascended the throne and a religious silence prevailed through the numerous assembly, we were struck with a delightful music from the great tent. The soft sound, the simple melody, the solemn progress of a slow hymn, gave at least to my mind that elevation to which only Handel's music can raise it. For a long time I remained doubtful whether I heard human voices or instruments, till the latter were seen by some that stood nearer; they were stringed instruments, and a sort of hauboo-lyrx. The hymn resembled those sung in protestant churches, but had no parts. Between each bar a seemingly metal cymbal sounded the tone of the following bar, which had a very good effect; but this was probably a large pierre sonore, and the bamboo lyrix was doubtless a ching.

"What the Chinese judged of the ambassador's band, I am not able to determine, but our interpreter told me, they liked their own music much better. They took great notice of the construction, neatness, and management of our musical instruments, as well as of our musical notation.

"For though the missionaries have introduced musical instruments in China, they seem to be known only by a few individuals, more as a curiosity, than as the easiest and most accurate method of communicating musical ideas. All the music we heard was played by rote, yet I have seen several printed Chinese books of music or musical notes.

"The gentlemen in the ambassador's suite, who are fond of music, sometimes used to take a part in the concerts performed by the band. At this some of the mandarins were surpris'd: upon my inquiring the reason, I learnt that they, like the Romans, thought music no proper amusement for a gentleman."

That the exquisite harmony with which Mr. Hüttner was so surpris'd and pleas'd on the day of presentation in the great imperial tent, was produced by the Ching, we have no doubt. That instrument, of which the tones are so extremely sweet, has harmony in itself, as every ventage in the swazads, or pipes of which it is formed, when stopp'd by a finger of the player, produce a different tone; and as many holes as are stopp'd produce an equal number of sounds; and though we know not the scale, nor how to find the several notes, so as to form melody or harmony, yet by chance at different trials, we have found 3ds, 5ths, 8ths, and every interval consonant and dissonant in the diatonic scale.

Mr. Barrow's account of the music that was prepared for the ambassador and his suite at Canton, is the following:

On the arrival of lord Macartney and his officers at the factory, they found in the midst of a garden prepared for them on the opposite side of the river, "a company of comedians hard at work in the middle of a piece, which it seem'd had begun at sun-rise; but the squalling, and their shrill and harsh music, were so dreadful, that they were prevail'd upon, with difficulty, to break off during dinner,

which was serv'd up in a viranda directly opposite the theatre.

"Next morning, however, at sun-rise, they set to work a-fresh, but at the particular request of the ambassador, in which he was join'd by the whole suite, they were discharged, to the no small astonishment of our Chinese conductors, who concluded, from this circumstance, that the English had very little taste for elegant amusements. Players, it seems, are here hired by the day, and the more incessantly they labour, the more they are applauded. They are always ready to begin any one piece out of a list of 20 or 30 that is presented for the principal to make his choice." Travels through China.

But though the music of the Chinese is severely censur'd by the gentlemen of the embassy, they all agree that they are excellent actors. The best of those that perform at Canton generally come from Nanking.

CHINESE Philosophy, Poetry, &c. See CHINA.

CHINESE Stoves. See KANG.

CHINESE Wall. See CHINA and WALL.

CHINESE Weights. See CHINA and WEIGHT.

CHINESE Wheel. See WHEEL.

CHINEY, or CIN Y, in Geography. See CHINY.

CHING, a town of China, of the third rank, in the province of Tehe-kiang; 10 leagues S. of Chao-hing, &c.

CHING, or CHING-TING-FU, a town of China of the first rank, in the province of Pe-tche-li, seated near a fine river, of an oblong figure, and walled, and near 4 miles in circuit. Under this are 32 cities, 5 of the second, and 27 of the third rank. Upon the adjacent mountains N. of it, which produce a great variety of medicinal herbs, are several superb monuments erected to the heroes of the Chinese, and one in particular, consecrated to the memory of the first emperor of the dynasty of Han.

CHING-CHEW, a city of China of the first rank, in the southern district of the province of Hou-quang.

CHINGE, in Zoology, the name given by Molina, who has first described it, (Cull. 269.) to the *Troera Chinge*, or black weazle, with changeable calls of blue, with a row of white spots from head to tail. In shape and general form, it resembles the *Climba*, which see. It is a native of Chili; and Molina says, that the smell issuing from it is owing to a certain greenish oil, ejected from a follicle or receptacle near the tail. The Indians are said to value the skin of this species on account of its beauty, and to use it for various purposes, quilts, &c. &c. Shaw.

CHING-HAI, in Geography, a town of Asia, in the kingdom of Corea; 60 miles E.S.E. of Kang-tcheu.

CHING-HO-ANG, a mountain of China, in the province of Tehe-kiang, near its capital, Hang-chou, or Hang-tcheou-fou; in which stands a high tower, which, by the help of a large water glass that is made to turn the hand of a dial, shews the hour of the day at a considerable distance: the figures of the hours being gilt, and about 18 inches long.

CHING-KYANG, or TCHING-IANG-FOU, a city of China, of the first rank, in the province of Yun-nan.

CHINGOLEAGUL, a small American island, near the coast of Virginia. N. lat. 37° 50'. E. long. 75° 26'.

CHING-GONGO, a river of Hindoostan, which rises in the Elliehpour country, and runs into the Godavery, 16 miles S.W. of Nœrcmul.

CHING-NGHAN, or TCHIN-NGAN-FOU, a city of China, of the first rank, in the province of Quang-si.

CHING-TU, or TCHING-TOU-FOU, a city of China, the capital of the province of Se-chwen, or Se-tchuen, formerly the residence of the emperors, and one of the largest

and most beautiful cities of China; but in 1646, it was almost entirely destroyed during the civil wars which preceded the last invasion by the Tartars; its temples, bridges, and the ruins of its ancient palaces, are still objects of admiration to strangers. Father Martini, in his *Chinese Atlas*, mentions a singular bird that is seen in the neighbourhood of this place, called "tong-hoa-fang," or the bird of the flower; "tong-hoa," from which the vulgar pretend that it is produced, on account of the resemblance of its plumage to the colours of this flower; so that it is called the "living flower." This city has under its jurisdiction 6 cities of the second, and 25 of the third rank.

CHINIAN, Sr., a town of France, in the department of Hérault, and chief place of a canton, in the district of St. Pons. The place contains 2838, and the canton 7105, inhabitants; the territory includes 230 kilometres, and 10 communes.

CHINIZ, a town of Persia, in the province of Farfistan, situated on the Persian gulf; 140 miles W. of Shiraz.

CHIN KIEOU, a town of China, of the third rank, in the province of Ho-nan; 15 leagues N.E. of Yun-hing.

CHIN-LI, a town on the N.W. coast of the island of Hainan, of the third rank; 12 miles W. of King-tcheou.

CHIN-MOU, a town of China, of the third rank, in the province of Chen-fi, on the river Kin; 50 miles N.N.W. of Kia.

CHINNA, in *Ancient Geography*, a town of Europe, in Dalmatia. Ptolemy. This is named Cinna in Antonine's Itinerary.

CHINNABALABARAM, in *Geography*, a town of Hindoostan, in the Mysore country; 85 miles N.E. of Seringapatam. N. lat. 13° 25'. E. long. 77° 55'.

CHINNAPUTTUN, a city of Hindoostan, with a fort of Rome, in the Nizam's territories, 37 colles, or about 56½ geographical miles W.N.W. from Satore-Banacpour.

CHINNOR, an instrument of music among the Hebrews, consisting of thirty-two chords. Kircher has given a figure of it.

CHINON, in *Geography*, a town of France, and principal place of a district, in the department of the Indre and Loire; situated on the Vienne, and defended by a strong castle. The place contains 6106, and the canton 15,040 inhabitants; the territory includes 247½ kilometres, and 13 communes. It is distant 8 leagues W. S.W. from Tours, and 4½ S.E. from Saumur.

CHINQUIS, in *Ornithology*, the name given by some writers to the Tibet peacock, *Pavo Tibetanus*, which see.

CHINSE, in *Sua Language*, is used for thrusting oskum into a seam or chink, with the point of a knife or chisel.

CHIN-SHAN, or the *Golden Mountain*, in *Geography*, an island of China, situated in the middle of the river Yang-tse-kiang, which rises almost perpendicularly out of the river, and is interspersed with gardens and pleasure-houses. Art and nature seem to have combined in giving to this spot the appearance of enchantment. It belongs to the emperor, who has built upon it a large and handsome palace, and on the highest eminence several temples and pagodas. The island also contains a large monastery of priests, by whom it is chiefly inhabited. In one of the plates annexed to the "Embassy to China," we have a view of this island.

CHINSURAH, called also *Hoagly*, a town of Hindoostan, in the province of Bengal, situated on the western bank of the Ganges, 40 leagues from its mouth at Ingallee, about 19 from Patna, and 17 miles N. from Calcutta. The Dutch, who established a settlement in this place obtained it by gift, or rather by purchase, from the Moorish government. It is partly built along the river, and requires three-

quarters of an hour to walk round it. On the land side it is closed by barrier gates; within, it is very irregularly built; it has many markets or bazars, which are plentifully supplied with all kinds of goods and provisions: that of the money-changers, which is a long and broad street, is the handsomest. The principal houses are built of brick, with terrace-roofs, in the Moorish style; they consist only of one story, and are whitened on the outside with lime, which gives them an elegant appearance. Little wood is used in the buildings, because it is liable to be destroyed by the white ants. Instead of glass windows, frames of twisted cane are used. The apartments, thus guarded from the extreme heat which prevails for 8 or 9 months in the year, are spacious and airy, and provided on the fourth side with galleries or porticos, resting upon pillars. On the terrace-roofs the inhabitants take the evening air, and sometimes pass a part of the night with their friends. The houses, or rather the huts, of the poor Bengalees are mostly made of mud and straw, and receive their light through the entrance. The town has a handsome little church with a steeple. The lodge, formerly belonging to the Dutch East-India company, is an oblong square with stone walls, and called Gullens fort. A battery of 21 pieces of cannon is thrown up, by the river side, for the purpose of firing salutes. Hoagly is a Moorish fort, about half an hour's walk from Chinfurah; but it is not in a very defensible state. The English are now in possession of Chinfurah.

CHIN-TCHEN, a town of China, of the third rank, in the province of Chen fi; 20 miles N. of To. g.

CHINY, or CREVEY, a town of France, in the department of the Sambre and Meuse; and chief place of a canton, in the district of Dinant, seated on the Semois, 9 leagues W. of Luxembourg. The place contains 1055, and the canton 5978 inhabitants; the territory includes 275 kilometres and 18 communes. Before the revolution, this town was the capital of a comté in the duchy of Luxembourg, which was of great extent, and included 13 cities or capital towns, and it was sometimes called imperial. After passing through the possession of several proprietors, since Bruno, the 25th archbishop of Cologne, and chancellor of the empire, erected it into a comté, about which time it was surrounded with walls; it was adjudged to the house of Austria, by the treaty of Ryswick.

CHIN-YANG. See CHEN-YANG.

CHIO pear, a name given to a small species of pear, called also by some the ballard musk pear, from its resembling the little musk pear in its sweet flavour. Its skin is yellow streaked with red; it is of a roundish shape, and does not hang in clusters, but singly on the tree.

CHIOCCO, ANDREW, in *Biography*. Of the life of this ingenious and learned physician, we have few memorials. We only know he was a native of Verona, where he appears to have practised medicine, towards the end of the 16th and the beginning of the 17th centuries, and that he died there on the 3d of April, 1624. From his works it is that we obtain the information that he was well versed in the learning of the schools; that is, that he was minutely acquainted with the writings of Aristotle, and of Galen, whose dogmas he every where defends; and that he was more than moderately imbued with classical and polite literature. The following are among the most esteemed of his productions. "Quæstionum Philosophicarum et Medicarum Libri tres," 4to. 154. He defends the practice of giving antimonial vomits, and insists that the source of many calamities is more frequently in the bladder, than in the kidneys. "Piscium, seu de Scabiæ Libri duo, de contagii natura, &c. Carmina descripta," 4to. 1577. Haller gives a good character

character of this poem, which we have not seen, as also of his defence of the Signilis of Fracastorius, against the strictures of Scaliger. "De Aeris Veronensis clementia," 1597, 4to.; from the general longevity of the inhabitants, many of them having attained a great age, he argues for the salubrity of the soil and atmosphere of that city. He also wrote a treatise on contagious fevers, and of the utility of bleeding, with the view of removing obstructions: Also "De Collegii Veronensis illustribus Medicis at Philoſophis, &c." 1623, 4to. The account of the writings of the persons commemorated, which should have formed a principal feature in the work, is very imperfectly performed. Haller Bib. Med.

CHIOCOCCA, in *Botany*. (from *χαιρα*, *suave*, and *κοκκος*, a berry.) Linn. Gen. 331. Schreb. 325. Gart. 150. Juffl. 204. Vent. 2. 551. Ciocoque; Lam. Encyc. Clafs and ord. *Pentandria monogynia*. Nat. ord. *Aggregate*, Linn. *Rubiaceae*, Juffl.

Gen. Ch. *Cal.* Perianth small, superior, five-toothed. *Cov.* monopetalous, funnel shaped; tube long, spreading; border five-cleft; segments equal, acute, reflected. *Stam.* Filaments five, filiform, the length of the corolla; anthers oblong, erect. *Pist.* Germ inferior, roundish, compressed; style filiform, the length of the stamens; stigma simple, obtuse. *Peric.* Berry roundish, compressed, crowned with the calyx, one-celled. (two-celled, Gart. and Brown.) *Seeds* two, roundish, compressed, dullant, (one in each cell, pedunculous, Gart.)

Effl. Ch. Corolla funnel-shaped, equal; berry two-fetted, inferior.

Sp. 1. *C. racemosa*; climbing Snowberry-tree, or David's-root, Linn. Spec. Mart. 2. Lam. 1. Willd. Jacq. Amer. 65. Picq. tab. 69. Brown, Jam. 164. No. 1. 2. Linn. Illust. Pl. 160. (Lonicera, Linn. Spec. Edit. 1. Periclymenum; Plum. tab. 217. fig. 2. Dill. Elth. tab. 228. fig. 205. Jussimum; Sloan. Jam. tab. 188. fig. 3. (The Pandacqui of Sonnerat Nouv. Guin. tab. 19. quoted by the younger Linnæus as a synonym of this species, does not belong to the genus, nor even to the natural order of Rubaceæ, but is a species of Tabernamontana.) "Some- what climbing; leaves broad-lanceolate; flowers in loose, lateral racemes: with one stipular tooth." Linn. jun. *Stem* six feet high or more. *Branches* smooth, loose, spreading out horizontally. *Leaves* petioled, opposite, acuminate, nerved, smooth, shining on the upper surface. *Stipules* minute, acuminate, within the petioles. *Racemes* axillary, opposite to the branches, simple, or subdivided, scarcely longer than the leaves, many-flowered. *Flowers* pale yellow, peduncled, usually in pairs, directed one way. *Berry* snow-white. There is a variety found in woods (No. 2. Brown) which grows to a much more considerable height, with long, cylindrical, weak branches, which cannot support themselves without the aid of the neighbouring trees or shrubs. Its leaves are said to be smaller, somewhat convex, a little rigid; the racemes short and simple; the corollas a little larger, pale coloured, but purple at the corners. Jussieu seems inclined to regard it as a distinct species, but La Marek attributes the difference solely to the plant's being drawn up to a greater height in woods. The root has much the same bitter acrid taste with the feneka fake root, and is a strong resolutive and attenuant; a decoction of it is administered with success in obstinate rheumatisms and venereal complaints. A native of Jamaica, St. Domingo, and the neighbourhood of Carthagenæ. 2. *C. Esbatæ*, Mart. Willd. Forst. Flor. Austral. No. 96. "Erect leaves egg-shaped; peduncles axillary, one-flowered; corollas bearded in the throat." A

native of the Marquêsas, Society and Friendly islands in the South Seas.

CHIOCOCCA nocturna, Jacq. See *Cestrum nocturnum*.
CHIOCOCCA paniculata, Linn. jun. Lam. See *Psychotria paniculata*.

CHIONANTHUS, (from *χαιρα*, *suave*, and *ανθος*, a flower.) Linn. Gen. 21. Schreb. 26. Willd. 37. Juffl. 105. Vent. 2. 502. Gart. 2. 9. Lam. Ill. 27. Clafs and ord. *Diandria monogynia*. Nat. ord. *Separiæ*, Linn. *Juf- minceæ*, Juffl.

Gen. Ch. *Cal.* Perianth one-leaved, four-cleft, erect, acute, permanent. *Cov.* one-petalled; tube very short, the length of the calyx, spreading; segments of the border four, linear, erect, acute, oblique, very long. *Stam.* Filaments two, three, or four, very short, awl-shaped, inserted into the tube; anthers heart shaped, erect. *Pist.* Germ egg-shaped; styles simple, the length of the calyx. *Peric.* Drupe round, one-celled. *Seeds*, nut striated.

Effl. Ch. Corolla quadrifid; divisions extremely long; drupes with a striated nut.

Sp. 1. *C. virginica*. Virginian snow tree or fringe tree, Linn. Sp. Pl. 1. Mart. 1. Lam. Encyc. 1. Illust. 1. tab. 9. fig. 1. Willd. 1. (*C. larifolia* and *angustifolia*; Hort. Kew. 1. 14. Anclanchier, Catf. Car. 1. tab. 68. "Peduncles three-cleft, three flowered." Linn. "Leaves ovate-lanceolate, somewhat pubescent underneath; drupes globular." Lam. A shrub from six to ten feet high. *Leaves* opposite, petioled, entire, from five to seven inches long, and about three broad. *Flowers* white, in pendulous paniced racemes; segments of the corolla eight or nine lines long, whence it has been called fringe-tree. Lam. A native of South Carolina and Virginia, in moist places on the banks of rivers; flowering in June. 2. *C. zeylanica*, Linn. Sp. Pl. 2. Mart. 2. Lam. Encyc. 2. Illust. 2. tab. 9. fig. 2. (*C. cotinifolia*, Willd. *Arbofcula zeylanica cotini foliis*, Pink. Alm. 241. fig. 4.) "Peduncles paniced, many-flowered." Linn. "Leaves egg-shaped, villous underneath; drupes inversely egg-shaped." Lam. Nearly allied to the preceding, but differs in the shape of the leaves; the segments of the corolla also, as figured by Plukenet, are five in number, and shorter in proportion than those of *C. virginica*. A native of the isle of Ceylon. 3. *C. purpurea*, Lam. Ill. 3. (*C. zeylanica*, Willd.? *Thouinia nutans*, Linn. jun. Sup. 89.) "Leaves elliptical, quite smooth, veined; flowers purple, nodding." Lam. A native of Ceylon. 4. *C. domingensis*, Lam. 4. "Leaves egg shaped, smooth on both sides; panicle terminal, somewhat cymose, calyxes with an even surface." A native of St. Domingo. Jof. Martin. 5. *C. compacta*, Swartz Prod. Vahl. Symb. Mart. 3. Willd. 3. (*C. caribæa*, Jacq. Collect. tab. 6. fig. 1. Lam. Illust. 5.) "Panicles trichotomous; the last flowers somewhat capitate; calyxes villous; leaves lanceolate-oblong; anthers acuminate." Swartz. "Leaves smooth on both sides, very acuminate; calyxes ciliated." Jacq. A tree fifteen feet high, with a dully ash-coloured bark. *Leaves* about half a foot long, an inch and a half broad, opposite, on short petioles, quite entire, thickish, firm, shining. *Flowers* snow-white, with long linear segments; bracts at the divisions of the peduncles, opposite, small, narrow, concave, sharp, somewhat villous; calyx deeply cleft; segments egg-shaped, acute, somewhat villous, ciliated at the edge; styles twice as long as the calyx. Jacq. A native of the Caribee islands. 6. *C. gbari*, Lam. Illust. 6. Gart. Fruet. tab. 39. fig. 6. "Drupe egg-shaped, attenuated at both ends, angularly furrowed." Fruit described and figured by Gærtner from a specimen belonging to the botanic gar-

den at Leyden. Plant unknown. 7. *C. incrassata*, Swartz. Prod. 13. Willd. 5. (*C. mayeeca*, Vahl. Symb. 2. 1. Mart. 4. *Ceratanthus Schrebrii*, Gmel. Syst. Veg. 1. 256. *Mayeoea guianensis*, Aub. Guin. tab. 31. Lam. Encyc. Illust. tab. 72. Juss. 319. Vent. 2. 312.) "Panicles axillary, trichotomous; flowers all distinct; anthers obtuse." A shrub five or six feet high, covered with a whitish bitter bark. *Leaves* seven inches long and two broad, oval-oblong, entire, thin, firm, ending in a point; petioles short, swollen and hard at the base. *Flowers* bracteate, small, white, of an agreeable smell. *Fruit* oblong, about the size of an olive; the fleshy part two lines thick, violet, faculent, bitter. In deference to the high authority of Swartz and Vahl, we have placed this plant under the present genus; although we are sensible that, if we can rely on the accuracy of Aublet's description, which appears to be the only original one in existence, a very considerable alteration must be made in the genuine character, before it can be fairly admitted. This alteration, however, we have not ventured to make, much doubting whether it would not be better to follow the French botanists in keeping it distinct. See MAYECCA. A native of the forests of Guiana.

CHIONIS, in *Ornithology*, one of the synonymous names of the Shearwater, VAGINALIS ALBA. *Fowler, Lath. &c.*

CHIONITÆ, in *Ancient Geography*, a people of Asia, neighbours and allies of the Persians, according to Ammianus Marcellinus, who inhabited the vicinity of the Caspian sea, near the Coloni and Albani.

CHIORME, a band or crew of galley-slaves, and of *Bonaventurers*, or volunteers, who pull the oars in a galley.

CHIOS, now Scio, in *Ancient Geography*, an island of the Ægean sea, about 900 leagues in circuit, lying between Lesbos and Samos, and opposite to the peninsula of Ionia, from which it was probably detached, as it is now separated from the continent only by a canal or strait three leagues wide. To the ancients this island was known by the names of Æchalia, Mæris, and Pithuysa; but the most prevalent name was Chios, which some have derived from the Greek word χιον, *chion*, signifying snow; the mountains of the island being often covered with snow; but others, as Isidorus, are of opinion, that the name of Chios was borrowed from the Syriac, in which language it signifies maltich, with which this island abounds. Athenæus calls it a rugged and mountainous country; however, it produced excellent wine, and, on that account, it is highly commended by the ancients. Athenæus suggests, on an ancient authority, that the Chians were taught the manner of cultivating the vine by Oenopion, the son of Bacchus, and that they communicated this art to the rest of mankind. He adds, that the first red wine was made in this island. Strabo mentions the quarries of this island; and Pliny says that here was discovered the first jasper; but its chief produce is maltich. Vitruvius mentions a spring in Chios, the water of which deprived those of their senses who tasted of it, and therefore passers by were warned of the danger by an epigram inscribed over it.

Chios was also the name of the chief town of the island, which was seated on the eastern coast, in the most pleasant and fruitful part, and, according to Strabo, was 40 stadia in circumference. This city pretended to be the birth-place of Homer; however this be, it had the honour of producing several extraordinary persons: such were Ion, who flourished in the eighty-second olympiad, and is celebrated as an elegant writer of tragedies:—Theopompus, the disciple of Iocrates, who, as some have thought, excelled his master, and wrote several books, and who flourished in the reigns of Artaxerxes Ochus in Persia, and Philip

the father of Alexander the Great, in Macedon:—Theocritus, the contemporary of Theopompus, who wrote some learned epistles, and the history of Libya:—and Metrodorus, a philosopher and physician, and the author of several books relating to physic, who flourished in the reign of Artaxerxes Mucron, king of Persia, and, according to Suidas, was preceptor to Hippocrates and Anaxarchus. This city had a spacious harbour, capable of containing 80 vessels. Strabo says that this island was first peopled by the Pelasgians: Diodorus maintains that Macaræus and his followers settled here, after they had made themselves masters of Lesbos; but Herodotus's opinion, that the Chians were Ionians, has been more generally received. Their first government was monarchical; but Hippocles, one of their kings, being murdered by his subjects, for a pretended affront offered to the bride of one of the chief men of the island, the Chians formed themselves into a republic. In process of time, by the assistance of Iocrates, they formed their republic on the plan of that of Athens; but they did not long enjoy the blessings of liberty, being, like the other small states of Greece, brought under subjection by their domestic tyrants. In ancient times, the Chians seem to have been a numerous and powerful people. They assisted the Milesians against the kings of Lydia; but after the defeat of Cræsus by Cyrus, they submitted, with the other islanders, to the conqueror; and in recompence for having delivered up Pacyas the Lydian who had excited his countrymen to revolt against the Persians, Mazares, the Persian general, conferred upon them the city of Atarneus in Mysia, reduced by the Persians; they were employed in all their naval expeditions, and they served Darius against the Scythians. However, in the Ionian revolt, the Chians readily joined Aristagoras, shook off the Persian yoke, and equipped 100 ships, each of which had 40 chosen citizens on board. In the sea-fight at Lade they distinguished themselves by their persevering valour; but at length, abandoned by their allies, they were overpowered, and obliged to run their ships aground at Mycale; whence they marched into the territory of Ephesus. Arriving thither in the night, while the women were celebrating the rites of Ceres, the Ephesians supposed them to be robbers, who were come to strip the women, sacked out of the city with their whole force, and killed them on the spot. After the defeat of the Ionians, Histæus, who had been the principal cause of their revolt, availing himself of the assistance of the Lesbians, reduced the whole island. But Histæus, unable to maintain possession of it, abandoned it to the Persians, who punished the Chians with the utmost severity. The most handsome of their youths they made eunuchs, and their daughters they sent to the king of Persia, after having destroyed their houses and temples, ravaged their territories, and reduced the few inhabitants that remained to a state of slavery. Having for some time continued subject to the Persians, they recovered their liberty, and flourished, according to Thucydides, above all the states of Greece, Lacedæmon alone excepted. They were favoured by the Athenians, who obtained the supreme command, above all their other allies, being exempted from tribute, and obliged only to furnish a certain number of ships. After some severe conflicts with the Athenians and with the Lacedæmonians, they returned to their ancient confederacy, in which they continued till the social war, when, become weary of their alliance with Athens, they joined the Rhodians and others, with a view of emancipating themselves from the Athenian yoke. After a war which lasted three years, they concluded an advantageous peace. Until the destruction of the Persian empire, they enjoyed uninterrupted tranquility, and then they, together with

the other Greek states in Europe and Asia, became subject to the Macedonian princes. Their city was unsuccessfully besieged by Philip, father of Perſes; and when he had abandoned the ſiege, they joined the Æolians in their war againſt him, and Pruſias, king of Bithynia; and, in conſequence of this impolitic alliance, their territories were laid waſte, and all the open places in the iſland were utterly deſtroyed by the troops of the confederate princes. For the aſſiſtance they aſſorded to the Romans in their wars againſt Philip and his ſon Perſes, and Antiochus the Great, king of Syria, they were not only declared free, but honoured with the appellation of the friends and allies of the people of Rome. Sylla recompenſed their perſevering attachment to Rome, by reſtoring them to the poſſeſſion of all their ancient rights and privileges, which they maintained, without diſturbance, living in eaſe and plenty, till the reign of Veſpaſian, who reduced Chios, with the other iſlands of the Ægean ſea, to the ſtate of a Roman province; but at the ſame time he allowed the Chians to live according to their own laws, under the ſuperintendance of a Roman prætor, whoſe province comprehended all the iſlands in the Ægean ſea, from the mouth of the Hellespont to Rhodes. See *Sio*.

CHIOS, a town of the iſland of Eulœa. *Steph. Byz.*

CHIOURLIC, in *Geography*, a town of European Turkey, in Rumania, the ſee of a Greek biſhop ſituated on a river of the ſame name; 50 miles N.W. of Conſtantinople.

CHIOZ, a town of Poland, in the palatinate of Sando-mir; 35 miles N. of Malogocz.

CHIOZZA, a ſmall iſland of the Adriatic, near the coast of Italy, not far from the mouth of the Brenta, with a town of the ſame name, the ſee of a biſhop, ſuffragan of Venice, containing three churches and eight monaſteries; 31 miles S. of Venice. N. lat. 45° 15'. E. long. 12° 14'.

CHIPAWAS. See *CHEPEWYANS*.

CHIPEAU, (Buffon), in *Ornithology*, the *anas strepera* of Linnæus.

CHIPEOS, in *Geography*. See *PAMPAS del Sacramento*.

CHIPEWYAN. See *CHEPEWYANS*.

CHIPENHAM, a market and borough town of Wiltſhire, in England, is ſituated on the banks of the river Avon, and on the great road leading from London to Bath; at the diſtance of 93 miles weſt of the former, and 13 eaſt from the latter. It is noted in the Anglo-Saxon annals as a principal place of reſidence for the Weſt-Saxon kings, and was bequeathed by the great Alfred to his youngeſt daughter, Ethelſeda. Of the ancient hiſtory of this town we have little on record; the moſt to be depended on is, that when Alfred, with inferior forces, had conquered the Danes, and made them ſign a treaty, by which they engaged to quit the kingdom, they treacherouſly poſſeſſed themſelves of this place, and, being ſtrengthened by numbers of their countrymen, ſoon obliged the Saxons to diſperſe, and their monarch to ſeek ſecurity in diſguiſe, and take refuge in the cottage of a neatherd.

This town, in the time of Richard II, belonged to the Hungerford family, but reverting to the crown by the death of lord Hallings, was given, by Richard III, to John Howard, duke of Norfolk. It was reſtored by Henry VII. to the heirs of its former poſſeſſors.

Chippenham was a borough by preſcription; but queen Mary, by charter, dated the 24 day of May, in the firſt year of her reign, ordained, "that the village, town, and borough of Chippenham, ſhould be a free borough, corporate in deed, fact, and name for ever, of one bailiff and twelve burgeſſes." The charter then ſitates the limits of

the borough, names of burgeſſes, manner of appointing them; and for keeping in repair the bridge and caſtway, gives to the bailiff and burgeſſes ſeveral parcels of grounds, the names and extent of which are ſpecified, and called the "borough lands." This, with many other charters of the kingdom, were ſurrendered into the hands of Charles II. A. D. 1684. Another charter was granted by James II. in the firſt year of his reign, by which the ſame privileges were reſtored, and the revenues of the corporation were valued at 9l. 10s. 8d. The free houſes, at this period, amounted to 129 in number; and the ſpots then occupied are the only parcels of *free-land* where burgage houſes are ſtill kept up, and the inhabitants of which, with the bailiff and burgeſſes, have the excluſive privilege of returning two members to parliament. The town is populous, and of conſiderable extent; the principal ſtreet is about half a mile in length. Chippenham, like many other towns in this part of the country, is celebrated for its cloathing manufactures. The church is a large pile of building, diſplaying ſome curious ſpecimens of ancient architecture; but the greateſt part of it is modern. On the north of the town there is a handſome free-ſtone bridge of twenty-one arches, ornamented with baluſtrades, lamps, &c. and near the middle a road branches off to Bath and Briſtol. Cloſe to this is a large modern factory. On the banks of the river are ſeveral dyeing-houſes, Chippenham has a weekly market on Saturdays, and four annual fairs. By the laſt returns made to parliament of the population, &c. of the county, here were 683 houſes, and 3366 inhabitants, moſt of whom were employed in manufactures. For more copious particulars relating to the borough hiſtory, and manufactures of the town, ſee *Beauties of Wiltſhire*, 2 vols. 1801.

CHIPPEWAY FORT, a ſmall ſtockaded fort of Lower Canada, ſituated on the borders of a creek of the ſame name, about 200 yards diſtant from Niagara river. The fort occupies about one rood of ground, and conſiſts of a ſmall block-houſe, enclosed by a ſtockade of cedar poſts, about 12 feet high, which is merely ſufficient to defend the garriſon againſt muſket ſhot. Adjoining to the fort, there are about ſeven or eight farm houſes, and ſome large ſtore-houſes, where goods are depoſited preparatory to their being conveyed up the river in bateaux, or acroſs the portage in carts, to Queenſtown. A canal from hence to Queenſtown would be extremely convenient. About 15 men, under the command of a lieutenant, are uſually quartered at fort Chippeway, who are moſtly employed in conducting, in bateaux from thence to fort Erie, the ſtores for the troops in the upper country, and the preſents for the Indians.

CHIPPEWAY River, a river of N. America, that runs ſouthweſtward into Miſſiſſippi river, in that part where the conſluent waſe form lake Pepin, in N. lat. 44°, and W. long. 93° 54'.

CHIPPING, in the *Manufactures*, a term uſed by the potters and china-men to expreſs that common accident both of our own ſtone and earthen ware, and the porcelain of China, the flying off of ſmall pieces, or breaking at the edges. Our earthen wares are particularly ſubject to this, and are always ſpoiled by it before any other flaw appears in them. Our ſtone wares eſcape it better than theſe, but leſs than the porcelain of China, which is leſs ſubject to it than any other manufacture in the world. The method by which the Chineſe defend their ware from this accident, is this: they carefully burn ſome ſmall bamboo canes to a fort of charcoal, which is very light, and very black; this they reduce to a fine powder, and then mix into a thin paſte, with ſome

some of the varnish which they use for their ware: they next take the vessels when dried, and not yet baked, to the wheel, and turning them softly round, they, with a pencil dip in this paste, cover the whole circumference with a thin coat of it: after this, the vessel is again dried; and the border made with this paste appears of a pale greyish colour when it is thoroughly dry. They work on it afterwards in the common way, covering both this edge and the rest of the vessel with the common varnish. When the whole is baked on, the colour given by the ashes disappears, and the edges are as white as any other part; only when the baking has not been sufficient, or the edges have not been covered with the second varnishing, we sometimes find a dusky edge, as in some of the ordinary thick tea-cups.

It may be a great advantage to our English manufactures to attempt something of this kind. The willow is known to make a very light and black charcoal: but the elder, though a thing seldom used, greatly exceeds it. The young green shoots of this shrub, which are almost all pith, make the lightest and the blackest of all charcoal; this readily mixes with any liquid, and might be easily used in the same way that the Chinese use the charcoal of the bamboo cane, which is a light hollow vegetable, more resembling the elder shoots than any other English plant. It is no wonder that the fixed salt and oil contained in this charcoal should be able to penetrate the yet raw edges of the ware, and to give them in the subsequent baking a somewhat different degree of vitrification from the other parts of the vessel, which, though if given to the whole, it might take off from the true famitrified state of that ware; yet at the edges is not to be regarded, and only serves to defend them from common accidents, and keep them entire.

The Chinese use two cautions in this application: the first in the preparation; the second in the laying of it on. They prepare the bamboo canes for burning into charcoal, by peeling off the rind. This might easily be done with our elder shoots, which are so succulent, that the bark strips off with a touch. The Chinese say that if this is not done with their bamboo, the edges touched with the paste will burst in the baking: this does not seem indeed very probable; but the charcoal will certainly be lighter made from the peeled sticks, and this is a known advantage. The other caution is, never to touch the vessel with hands that have any greasy or fatty substance about them; for if this is done, they always find the vessel crack in that place. *Obs. sur les Cout. de l'Asie.*

CHIPPINGGAVEL, or **CHEAPINGGAVEL**, in our *Old Writers*, toll paid for buying and selling.

CHIPPING-NORTON, in *Geography*. See **NORTON**.

CHIPPING-ONGAR. See **ONGAR**.

CHIPPING SODBURY. See **SODBURY**.

CHIPIONA, a town of Spain, in the country of Seville, seated on a rock near the coast of the Atlantic; 5 miles S.W. of San Lucar de Barmeda.

CHIQUE, in *Commerce*, a weight in Smyrna, equal to 5 lb. 7 oz. 10 dr. avoirduois.

CHIKUITOS, a chain of mountains in South America, lying between 15° and 23° of S. latitude. This chain of primitive mountains unites the Andes of Peru and Chili with the mountains of Brazil and Paraguay, stretching from La Paz, Potoli, and Tucuman, through the provinces of Moxos, Chiquitos, and Chaco, towards the government of the mines, and of St. Paul in Brazil. The highest fummits appear to be between 15° and 25°: the rivers there passing to that of Arazués, or that of La Plata.

CHIKUITOS, INDIOS, or *Little Indians*, a name given by the Spaniards to Indians of South America, on account of

the extreme smallness of the doors of their houses. The country lies between Santa Cruz de la Sierra, a province of the second bishopric in the audience of Characa, or new vice-royalty of Buenos Ayres, and the lake Xarayes, where the river Paraguay has its rise, and being encreased by the conflux of others, forms the famous river de la Plata. The Jesuit missions are said to have began their preaching to this nation about the close of the 17th century, and their success is reported to have been so great that, in 1731, they had formed seven towns, each consisting of above 120 families; and the number of their converts has since considerably increased. These Indios Chiquitos are well made and active; and their courage has been often experienced by the Portuguese, who used to make incursions, in order to carry off the inhabitants for slaves; but the valour of these people has taught them to desist from such inhuman attempts, and, for their own safety, to keep within their limits. The arms of these Indians are muskets, sabres, and poisoned arrows. Though their language is different from that of the other nations of Paraguay, the same customs nearly obtain here as among the other Indians. These Chiquitos have no regular form of government, or civil life, but in matters of public concern they listen to the advice of their old men, and usually follow it. The dignity of cacique is not hereditary, but conferred according to merit, as the reward of valour in war. The union among them is imperfect. Their society resembles a republic without any head, in which every man is master of himself, and upon the least disgust, separates from those with whom he seemed to be connected. The tree which bears the quinquina or jesuit's bark, is frequent among the Chiquitos; and vanilla is also found among them, though not equal to that of New Spain.

CHIRA, an island on the N.W. coast of New Mexico, 15 leagues to N.N.W. from Herradura cape; having the town of Landecheo, about midway between them, and the river of Cipaños, two leagues beyond it. Close by Chira is another small island; and both abound with cattle, especially sheep and hogs.

CHIRAC, PETER, in *Biography*, born at Couques, a small town in Languedoc, in the year 1650, was at first intended for the church. In 1678 he was sent by his father to Montpellier, to complete his education. As the allowance made for his provision was scanty, he undertook to instruct the son of an eminent apothecary at Montpellier in classical literature, and by conversing with that family was induced to turn his mind to the study of medicine. In this he made such progress, that Michael Chiconneau, chancellor of the university, placed two of his sons under his tuition. As he had paid particular attention to the study of anatomy, he was soon enabled to give lectures in that branch of science. In 1688 he was admitted doctor in medicine, and under the patronage of Barbeyrac, the first physician at Montpellier, obtained a considerable share of practice. In 1692 he was appointed by the duke de Noailles, physician to the army of Rouffillon, and at the siege of Roses, in which the army was engaged, was singularly successful in stopping the ravages of the dysentery, with which the men were severely afflicted. He was next appointed physician to the port at Rochford, and obtained similar credit for his success in treating the disease called "Le Mal de Siam," then epidemic there, and for his management of persons affected with the small pox, whom he frequently directed to be bled, contrary to the generally received opinion, and practice in that complaint. After residing two years at Rochford, he returned to Montpellier, much elated with the success, and consequent reputation he had acquired. At Montpellier he continued until the year 1706. In this interval

val he published his hypotheses on the structure of the hairs. He supposes them to be derived from the tendons of the ribs, and to contain in their bulbs, and to the extent of about two inches, a medulla: Also "De Motu Cordis," which, he contends, depends upon an innate power in its muscular fibres. These opinions engaged him in controversies with Senac, Vieussens, and other anatomists, which were on his part conducted with great acrimony. In 1706 he accompanied the duke of Orleans, who went with the army, first to Italy, then to Spain. On his return he went to Paris, where he passed the remainder of his life. In 1715, Homberg, the duke's physician, being dead, he was advanced to that honour. He was soon after made honorary member of the Academy of Sciences, and in 1718, on the death of M. Fagan, he was appointed superintendent of the royal garden. Some time after he projected a plan for the improvement of medicine. A society was proposed to be formed of thirty or forty physicians, who were to hold their meetings at Paris. They were to solicit the correspondence, and observations on the methods found most successful in curing diseases, of physicians and surgeons to public institutions, in all parts of Europe. From these he hoped a code of practical maxims might be drawn, that would have been generally beneficial. A more useful project, or one promising more advantage to the public, could not well have been conceived, and it would have succeeded, had it been proposed by a character less haughty and ostentatious. It failed through the want of the concurrence of his brethren, who wished to humble, rather than increase, his importance. His reputation, however, was not diminished by their jealousy and opposition. In 1728 letters of nobility were accorded to him, and in 1730 he was made first physician to the king, though, as he was then 80 years of age, it could scarcely be with the view of using his assistance. Two years after he died. By his will he left a considerable legacy to the university of Montpellier, for the foundation of two lectureships, one on comparative anatomy, the other for the explanation of Boerhaave's doctrine on animal motion. For an account of the remainder of his works, see Haller Bib. Eloy. Diét. Hist. Gen. Biography.

CHIRAC, in *Geography*, a town of France, in the department of the Lozere, and chief place of a canton in the district of Marvejols: one league S.W. of it. The place contains 2032 and the canton 7987 inhabitants: the territory comprehends 222½ kilometres and 8 communes.

CHIRAGRA, in *Medicine*, from *χίρῆς*, the hand, and *αἰσῆσις*, I seize, the gout in the hand. The gout attacks the agnomena about the hand and wrist occasionally, as well as those of the feet. The local and general symptoms which accompany it, are the same in both instances, and require similar treatment. See PODAGRA.

CHIRAMAXIUM, in *Antiquity*, a kind of chariot, or conveyance, which was drawn by men instead of horses. This word is derived from *χίρῆς*, the hand, and *αμαξία*, a chariot.

CHIRCEES, or CHIRCHEES, a small town of Hindoostan, about 1½ league from Amedabad. It has a great number of the tombs of the kings and princes of Guzerat, which have led the Indians to believe, that it was, in ancient times, the capital of that kingdom; but it is more probable that it was only the burial-place of their kings, and that Amedabad was the capital. The Dutch, in 1620, established a factory in this place for the purchase of indigo; but it was abandoned before the year 1670.

CHIRCHSED. See CHURCH SCOT.

CHIRENS, in *Geography*, a town of France, in the de-

partment of the Here, and district of La Tour-du-pin; 5 leagues N.N.W. of Grenoble.

CHIREZOUR, a town of Asiatic Turkey, in the province of Kirsehir; 60 miles S. of Moful.

CHIRIGUANOS, or CHIRIGUANACS, a tribe of Pagau Indians in South America, bordering on the Chiquitos, who have always refused to listen to the missionaries; though the fathers who visit them, when accompanied with some Chiquitos for their security, occasionally succeed in making a few converts, who are sent to their towns, and there lead a social life. This commonly occurs after some misfortune that happens in the wars continually carried on between them and the Chiquitos; when in order the more easily to obtain a peace, and to prevent being exterminated by the Chiquitos, they send for missionaries; but soon dismiss them again, pretending that they cannot bear to see punishments inflicted on persons merely for deviating from the rules of reason. This, it is alleged, is a proof that the object of their wish and aim is an unbounded licentiousness of manners.

CHIRIPHEE, in *Ancient Geography*, a town of Asia, in Babylonia, according to Ptolemy; situate near the marshes of Arabia Del rta.

CHIRIQUI, or CHIRICUITA, in *Geography*, a town of New Mexico, in the province of Veragua, on the coast of the Pacific ocean, with a harbour about a league from the sea, and 8 miles from the town: 30 leagues west of St. Jago. N. lat. 11° 20'. W. long. 83° 36'.

CHIRITES, in *Natural History*, a name given by authors to a stone resembling the human hand. The accounts we have of it say, that it is of a white colour, and of the nature of gypsum or plaster stone; and that it represents the palm of the hand with the fingers, and their nails on the other side. This seems to have been a name given to some single specimen in a cabinet of some collector; for it is certainly no distinct species of fossil, but a mere *lusus naturæ*, in the configuration of some accidental piece of gypsum.

CHIRIVICOLA, in *Geography*, a town of Naples, in the province of Capitanata; nine miles S.W. of Viesta.

CHIROGRAPH, *Chirographum*, compounded of *χίρῆς*, hand, and *γράφω*, scribo. I write, q. d. hand-writing, every public instrument or gift of conveyance, attested by the subscription and crosses of witnesses, so called in the time of the Saxons, which being somewhat changed in form and manner by the Normans, was by them styled "charta." In succeeding times, for the prevention of frauds and concealments, they made their deeds of mutual covenant in a "script" and "re-script," or in a part and counterpart; and in the middle, between the two copies, they drew the capital letters of the alphabet, and then talked or cut asunder, in an indent d manner, the sheet or skin of parchment; which being delivered to the two parties concerned, were proved authentic, by matching with and corresponding to one another; and when this prudential custom had for some time prevailed, then the word "chirographum" was appropriated to such writings. When they amicably made a chirograph or deed, which required a counterpart, they engrossed it twice on the same piece of parchment, counterwise; leaving a space between, wherein was wrote chirograph; through the middle whereof the parchment was cut, sometimes straight, sometimes indentedly; and a moiety went to each of the parties. This was afterwards called *divicenda* and *charta divise*; and was the same with what we now call charter-party.

The first use of these chirographs with us, is said to have occurred in the time of King Henry III.

According

According to some, a deed was properly a chirograph, when it was subscribed by the hand writing of the vendor, or debtor, and delivered to the vendor, buyer, or creditor. These authors make the chirograph differ from a "syngraph," in this; that in the latter, the word syngraph was wrote in the middle, and cut through, in the manner just observed of chirograph. Those authors therefore make the syngraph and the chirograph a different thing.

Chirograph was also anciently used for a fine: the manner of ingrossing the fines, and cutting the parchment in two pieces, is still retained in the office called the chirographer's office.

CHIROGRAPHER *of fines*, an officer in the common pleas, who ingrosses fines, acknowledged in that court, into a perpetual record (after they have been examined and passed by other officers); and writes and delivers the indentures of them to the party. He makes two indentures; one for the buyer, the other for the seller: and a third indented piece, containing the effect of the fine, and called the *foot of the fine*; and delivers it to the *custos brevium*.

The same officer also, or his deputy, proclaims all fines in court every term, and indorses the proclamations on the back-side of the foot; keeping always the writ of covenant and the note of the fine. The chirographer shall take but 4s. for a fine, on pain of forfeiting his office, &c. Stats. 2 Hen. IV. c. 8. 23 Eliz. c. 3. 2 Inst. 468.

CHIROGYLIUM, in *Ancient Geography*, an island of the Mediterranean, placed by Piny on the coast of Lycia.

CHIROMANCY, from *χρῆ*, hand, and *μαντις*, divination, the art of divining the fate, temperament, and disposition, of a person, by the lines and lineaments of the hand: this is otherwise called *palmistry*.

We have a great number of authors on this vain and trifling art; as Artemidorus, Fludd, and Johannes de Indagine, Tausnerus, and M. de le Chan bre, are esteemed the best.

CHIRON, in *Biography*, denominated by Plutarch, the "wise centaur," was born in the first age after Deucalion's deluge, commonly called the golden age, according to Sir Isaac Newton; who adds, that he formed the constellations for the use of the Argonauts, when he was 88 years old; for he, as well as his daughter Hippo, are said to have been practical astronomers. By this account, Chiron must have flourished in the earliest ages of Greece, as he preceded the conquest of the golden fleece and the Trojan war. He is generally called the son of Saturn and Philyra, and is said to have been born in Thessaly, among the centaurs, who were the first Greeks that had acquired the art of breaking and riding horses. See **CENTAURS**.

Chiron was regarded by the ancients, as one of the first inventors of medicine, botany, and surgery, or chirurgery, which some etymologists have derived from his name. He inhabited a grotto, or cave, called "Chironicum Specus," at the foot of Mount Pelion, which, from his wisdom, and universal knowledge, became the most famous and frequented school throughout Greece. Almost all the heroes of his time were ambitious of receiving his instructions; and Xenophon classes in the number of his disciples, several of the most illustrious personages of antiquity; and yet he has omitted, in his enumeration, some of his most celebrated scholars. Among these we may reckon the Grecian Bæceus, who, as it is pretended, was the favourite scholar of the centaur, and learned of this matter, the revels, orgies, Bacchanalia, and other ceremonies of his worship. Plutarch says, that Hercules studied music, medicine, and justice, at the school of Chiron; but among all the heroes who have been disciples of this centaur, no one reflected so much honour upon him

as Achilles, whose renown he in some measure shared, and to whose education he particularly attended, being his grandfather by his mother's side. Apollodorus informs us that the ludy of music employed a considerable part of the time, which he bestowed upon his young pupil, as an incitement to virtuous actions, and a bridle to the impetuosity of his temper. One of the best remains of antique painting now subsisting is a picture upon this subject, dug out of Hercules' lance, in which Chiron is teaching the young Achilles to play upon the lyre. See **ACHILLES**.

The death of this philosophical musician was occasioned, at an extreme old age, by an accidental wound in the knee with a poisoned arrow, shot by his scholar Hercules, at another. After his death he was placed by Muses among the constellations, from respect for his virtues, and gratitude for the great services which he had rendered the people of Greece. Accordingly Sir Isaac Newton alleges, (Chronology, p. 151) as a proof that the constellations were formed by Chiron and Musæus for the use and honour of the Argonauts, that nothing later than that expedition was delineated on the original sphere; and the same author intimates, that Chiron lived till after the Argonautic expedition, in which he had two grandsons. The ancients have attributed to Chiron several writings; among which, according to Suidas, are precepts, *υποθεσις*, in verse, composed for the use of Achilles; and a medicinal treatise on the "Diseases incidental to Horses;" and other quadrupeds, *ἰππιτρικον*; and the lexicographer even pretends, that it is from this work that Chiron derived his name. Fabricius (Bib. Græc. vol. i.) gives a list of the works ascribed to Chiron, and discusses the claims which have been made for others to the same writings; and in vol. xiii. he gives him a distinguished place in his catalogue of ancient physicians. Berycy's Hist. Medic. vol. i.

CHIRONIA, in *Botany*, (so called from Chiron the centaur, physician and tutor to Achilles,) Linn. Gen. 255. Schreb. 349. Willd. 394. Juss. 142. Vent. 2. 416. Gært. 667. Clais and Ord. *Pentandria monogynia*. Nat. Ord. *Rosacea*; Linn. *Gentiana*; Juss.

Gen. Ch. Cal. Perianth one-leafed, five-cleft, erect, permanent; segments oblong, acute. Cor. monopetalous, salver-shaped, or almost wheel-shaped, regular; tube scarcely longer than the calyx; border five-cleft, spreading; segments egg-shaped, open. Stam. Filaments five, short, attached to the tip of the tube; anthers oblong, erect, converging, spirally twisted after shedding the pollen. Pist. Germ superior, egg-shaped; style filiform, a little longer than the filament, declining; stigma capitate, ascending. Pericarp. Capsule or berry egg-shaped, two-celled. Linn. Smith (one-celled; Lam. Gært.) valves inflexed. Smith. Seeds numerous, small, attached to the sides of the receptacle.

Efl. Ch. Corolla salver shaped. Stamens inserted into the tube; anthers finally becoming spiral. Style declining. Pericarp superior, two-celled; valves inflexed. Smith.

Obt. In some of the species the anthers have not been observed to become spiral.

Sp. 1. *C. trinervis*. Linn. Sp. Pl. 1. Mart. 1. Lam. Encyc. 1. Ill. 1. Willd. 1. (Lysimachia; Burm. Zeyl. tab. 67.) "Stem herbaceous; segments of the calyx membranaceous-celled." Root annual. Stem smooth, quadrangular. Leaves opposite, lanceolate, acuminate at each end, quite entire, waved, smooth, three-nerved. Flowers blue, large, from the upper axils, solitary, peduncled. Fruit an oval capsule. A native of Ceylon. 2. *C. jasminoides*. Linn. Sp. Pl. 3. Mart. 2. Lam. Encyc. 2. Ill. 2. Willd. 2. "Stem herbaceous, four-cornered; leaves lanceolate, shorter than

than the internodes." Stem about two feet high, glossy, with few leaves near the top. *Leaves* opposite, sessile, erect, smooth, quite entire. *Panicle* terminal, dichotomous, erect, few-flowered; bracts opposite, awl-shaped; segments of the calyx, narrow, lanceolate, very acute, as long as the tube of the corolla; corolla divided half way down; segments oval-lanceolate, acute, spreading. A native of the Cape of Good Hope. 3. *C. lyboides*, Linn. Mart. 207. Mart. 3. Lam. Encyc. 3. Ill. 3. Willd. 1. "Stem simple; leaves linear-lanceolate, longer than the internodes." Stem a foot high or more, herbaceous, cylindrical, stiff and straight. *Leaves* opposite, sessile, somewhat decurrent, smooth, erect. *Flowers* purple, disposed three or four together in a terminal panicle; peduncles longer than the leaves; lateral ones with a pair of awl-shaped bracts; segments of the calyx lanceolate-awl-shaped, keeled; tube of the corolla the length of the calyx; segments acute, longer than the tube. (Anthers not becoming spiral, Lam.) A native of the Cape of Good Hope, at the foot of mountains. 4. *C. melanogryfolia*, Lam. Illus. 4. "Leaves lanceolate, sessile, decurrent; calyx shorter than the tube." Border of the corolla longer than the tube. A native of the Cape of Good Hope. From a specimen in the herbarium of La Marche. 5. *C. campanulata*, Linn. Sp. Pl. 4. Mart. 4. Lam. Encyc. 4. Illus. 5. Willd. 5. "Stem herbaceous; leaves nearly linear; calyxes the length of the corolla." Stem a foot high, round, with long branches. *Leaves* lanceolate-linear, glossy. *Flowers* purple, terminal, solitary, wheel-shaped, on long peduncles; segments of the calyx awl-shaped, anthers spiral. A native of Canada. Kalm. 6. *C. angularis*, Linn. Sp. Pl. 5. Mart. 5. Lam. Encyc. 5. Illus. 6. Willd. 6. "Stem herbaceous, acutely angular; leaves egg-shaped, embracing the stem." In habit extremely similar to *C. centaurium*, or the lesser centaury. Stem a foot high, four-cornered, with imbricant wings, smooth, branched and panicle near the top. *Leaves* opposite, short, smooth. *Flowers* red, growing from two to five together at the end of the branches; segments of the calyx narrow, acute; of the corolla oblong; anthers spiral. A native of Virginia. Kalm. 7. *C. cynosu*, Lam. Ill. 7. (*C. lanceolata*; Walt. flor. Car.) "Stem herbaceous, four-cornered; leaves lanceolate, sessile; cyme terminal; bracts linear." A native of Carolina. 8. *C. nudicaulis*, Linn. jun. Supp. Mart. 7. Lam. Encyc. 10. Illus. 8. Willd. 4. Thunb. Prod. 35. "Stem herbaceous, quite simple, one-flowered, with one or two pairs of leaves about the middle. *Leaves* oblong, rather obtuse; teeth of the calyx bristle-shaped." Stems several, elongated. *Root-leaves* often forming a turf. A native of the Cape of Good Hope. 9. *C. uniflora*, Lam. Encyc. 10. Ill. 9. Pl. 108. fig. 3. "Stem simple, rod-like, angular; leaves linear-lanceolate, a little shorter than the internodes; flower large, terminal." Stem at least a foot high, very slender. *Leaves* opposite, sessile, acute, smooth, about five lines long. *Flower* seven lines long, erect; segments of the calyx erect, acute, with a prominent membranous angle; tube of the corolla the length of the calyxes; border bell-shaped; segments oblong, obtuse; anthers not spiral. A native of the Cape of Good Hope, communicated by Sonnerat. 10. *C. chilensis*, Willd. 8. (*Gentiana* Cachaianum; Molina Chilen. 170. *Centaurium* vulgo caicho; Feuille Peruv. 2. tab. 35. "Stem herbaceous; leaves lanceolate, veinless; stem dichotomous, corymbic; segments of the calyx close-pressed." In habit much resembling the next species. *Root* annual. *Branches* opposite, spreading. *Flowers* funnel-shaped. A native of Chili. 11. *C. centaurium*, Willd. 9. Curt. flor. Lond. fasc. 4. tab. 22.

Smith Flor. Brit. Eng. Bot. Pl. 417. Woodville Med. Bot. tab. 157. Schmidt bohem. 1. n. 130. (*Gentiana* Centaurium; Linn. Sp. Pl. Mart. Lam.) Common centaury. "Stem herbaceous, dichotomously panicle; leaves ovate-lanceolate, three-nerved; calyx shorter than the tube." *Root* annual, small, branched. *Stem* about a foot high, erect, solitary, with four sharp edges, seldom branched from the bottom. *Leaves* opposite, sessile, quite entire, smooth. *Flowers* pink-coloured, proceeding from the forks of the stem, sessile, erect, expanding only to a bright red; calyx semiquinquefid; segments awl-shaped, erect, adnate to the tube of the corolla, and only half as long; border of the corolla equal, spreading, shining; segments elliptical, somewhat concave; stamens declivity; anthers three spiral; stigma capitate; with a transverse notch. Whole plant smooth, and very bitter. A native of dry gravelly pastures in Great Britain, and other parts of Europe. Obs. Dr. Boelock, and Mr. Shepherd of Liverpool, have observed two remarkable varieties growing intermixed with the common plant on the sandy shores of that neighbourhood. The first resembles the common plant in its size, general appearance, and the form of its flowers; but differs in having narrow, spatulate-linear leaves; the segments of its calyx elongated and narrowed, exceeding the tube of the corolla. The other is a much humbler plant; with broad, almost orbicular leaves; small, clustered flowers; segments of the calyx longer, but not so much narrowed as in the preceding variety. Dr. Smith expresses a doubt whether they may not be distinct species. See Flor. Brit. vol. iii. p. 1092. 12. *C. pulchella*, Willd. 7. Swartz. Act. Holm. 1783, p. 85. tab. 3. fig. 8, 9. Smith Flor. Brit. Eng. Bot. pl. 458. (*Gentiana* Centaurium β ; Linn. Sp. Pl. Centaurium minus palustre; Vaill. Paris. 32. tab. 6. fig. 1.) "Stem herbaceous, sometimes simple, but generally branched, and often much so; leaves egg-shaped; segments of the calyx awl-shaped, a little shorter than the tube." *Root* annual, small, branched. *Stem* scarcely two inches high, dichotomous, with four sharp edges. *Leaves* ovate-elliptical; lower ones very broad; upper ones lanceolate, shining, three or five-nerved. *Flowers* pink-coloured, from the forks of the stem, often pumpled, erect; calyx five-cleft to the base; segments awl-shaped, attenuated, free, about the length of the tube; corolla very slender; segments of the border elliptic-lanceolate; anthers not twisted so much as those of the preceding species, scarcely making one turn. A native of dry places about the sea coast in Great Britain and other parts of Europe, flowering in August and September. 13. *C. inaperta*, Willd. 10. (*C. Vaillantii*; Schmidt bohem. 1. n. 132. *Centaurium* palustre flore inaperto; Vaill. Paris. 32. tab. 6. fig. 2.) "Stem herbaceous; much branched, dichotomous; leaves oblong, three-nerved; segments of the calyx awl-shaped, somewhat spreading; border of the corolla connate." Allied to *C. centaurium*, but not a variety of it. A native of pastures on the continent of Europe. 14. *C. spicata*, Willd. 12. (*Gentiana* spicata; Linn. Mart. Lam. Centaurium minus spicatum; Bauh. pin. 278. Prod. tab. 130.) "Stem herbaceous, bifid; leaves lanceolate, three-nerved; flowers alternate, sessile." Differs from *C. centaurium* chiefly in the disposition of its flowers. *Root* annual. *Stem* from six to ten inches high, erect, branched, angular. *Leaves* opposite, smooth, sessile; lower ones egg-shaped; middle ones lanceolate; upper ones linear-lanceolate, almost awl-shaped. *Flowers* purple, sometimes white, sessile, alternate, forming a loose terminal spike; segments of the corolla very acute. A native of moist places in Italy and the south of France. 15. *C. fimbria*, Linn. Sp. Pl. 2. M. 6. Lam. Encyc. 6. Ill. 10. Bot. Mag. 511. "Stem

somewhat shrubby; leaves linear, glaucous; calyxes cloven half way down; segments rather obtuse." *Stem* a foot high or more, slender, cylindrical, smooth, branched near the top. *Leaves* an inch long, narrow, acute, sessile, smooth, rather erect. *Flowers* pale red, solitary, at the summit of the upper branches; calyx a little bell-shaped, narrowed at the base; tube of the corolla shorter than the calyx; segments of the border oval-oblong, almost erect; anthers not becoming spiral. A native of the Cape of Good Hope. 16. *C. baccifera*, Linn. Sp. Pl. 7. Mart. 9. Lam. Encyc. 7. Ill. 11. Willd. 14. Gært. tab. 114. Bot. Mag. 233. (Centaurium puliferum, Comm. Rar. tab. 9.) "Stem shrubby at the base, much branched, four-cornered; leaves linear, green; pericarp resembling a berry." *Root* perennial. *Stem* two feet high, cylindrical, naked near the bottom, paniced upwards; branches slender, smooth, compound. *Leaves* near an inch long, opposite, narrow, acute, smooth, spreading, decurrent. *Flowers* pale red, small, terminal, on short peduncles; calyx short; segments almost obtuse, keeled; tube of the corolla shorter than the calyx; segments oval-oblong; anthers not becoming spiral. Lam. Pericarp resembling a berry, succulent, somewhat transparent, globular, didymous, red, or saffron-coloured, one-celled; skin very thin; pulp watery; receptacles two, spongy, fixed to the internal side of the berry, corresponding with the external groove; two-lobed within; lobes curved back to the sides. Gært. A native of Africa. Mr. Curtis (Bot. Mag.) observes, that the seed-vessel is by no means a proper berry, for when cut transversely, it is hollow, and divided into two cells, the sides of which are fleshy, and do not appear to split in any regular manner for the discharge of the seeds. 17. *C. frutescens*, Linn. Sp. Pl. 8. Mart. 10. Lam. Encyc. 8. Ill. 12. Bot. Mag. 37. (Centaurium, Comm. Rar. tab. 8. Burm. Afr. tab. 74. fig. 1.) "Stem shrubby; leaves linear-lanceolate, fleshy, somewhat tomentous; calyxes somewhat egg-shaped, inflated, pubescent." *Stem* a foot and half high, woody; branches upright, cylindrical, pubescent. *Leaves* an inch and half long, opposite, obtuse. *Flowers* bright red, at the summits of the branches; anthers spiral. Gærtner observes, that the seed-vessel of this species has somewhat of the appearance of a berry, but less so than the preceding, lying entirely concealed within the calyx. It is egg-shaped, acuminate, red, and finally divides by the future into two valves; so that it is a proper capsule, and forms the connecting link between *C. baccifera* and the other species. We are even inclined to conjecture, that the seed-vessel of *C. baccifera*, if observed in its last stage, may be found to split into regular valves. A native of Africa. 18. *C. decussatis*, Bot. Mag. 707. Ventenat Hort. Cels. 31. "Stem shrubby, somewhat tomentous; leaves crowded, decussated, oblong, obtuse; calyxes globular, five-cleft." According to Ventenat it is distinguished from the preceding by its simpler form, its very short branches, its larger flowers, and more globular calyx, deeply divided into five segments, and its broader leaves growing in two ranks. But Dr. Sims observes (Bot. Mag.), that there are for many intermediate varieties, as to leave it doubtful whether it be a genuine species. It has been long known in the English nurseries by the name of latifolia. 19. *C. angustifolia*, Bot. Mag. 818. "Stem shrubby, smooth; leaves linear, spreading; calyxes egg-shaped; segments connivent; segments of the corolla wedge-shaped, ending abruptly in a remarkable tooth-like point." Whole plant smooth. Tube of the corolla longer than in the preceding, extending considerably beyond the calyx. Raised from Cape seeds by Mr. Whitley of Brompton. 20. *C. tetragona*, Linn. jun. Sup. 151. Mart. 8. Lam. Encyc. 11. Illust. 12. Willd. 16. "Stem shrubby; leaves egg-shaped, three-nerved, rather

obtuse; segments of the calyx rather obtuse, keeled." *Flowers* large, yellow. A native of the Cape of Good Hope.

CHIRONIA maritima. Willd. See *GENTIANA maritima*.
CHIRONIA didcaendria, Linn. Sp. Pl. See *CHLORA didcaendria*.

CHIRONIS, VILLA, in *Ancient Geography*, a town of Greece, in the Peloponnesus, according to Polybius; who places it near the town of Messina, and says that it was destroyed by pirates.

CHIRONIUM, in *Medicine*, is sometimes used to signify a great ulcer, and of difficult cure.

CHIRONOMI, on the *Grecian Stage*, were those actors who performed, without using words, by the motions of the hand.

CHIRONOMIA, in *Antiquity*, the art of representing, by the motions of the hand, and other gestures of the body, any past transactions, whether of true or fabulous history. This made a part of a liberal education among the ancients: it had the approbation of Socrates, and was ranked by Plato among the political virtues.

CHIROPER, in *Geography*, a bay on the W. coast of New Mexico, situated in about N. lat. 7°; into which the river of Piara discharges itself, about 40 miles from Payta. This bay being full of shoals, is seldom frequented.

CHIROTHECA. See *GLOVE*.

CHIROTHECA marina, in *Natural History*, the name under which Rumphius describes *Spongia aculeata*, which see.

CHIROTHESIA, the imposition of hands on conferring any priestly orders. The word comes from $\chi\upsilon\iota\varsigma$, *manus*, and $\pi\acute{o}\nu\eta\varsigma$, *pono*, which signifies the laying hands upon another.

CHIROTONIA, the stretching forth, or holding up of hands, in electing any magistrate, &c.

The word comes from $\chi\upsilon\iota\varsigma$, *manus*, and *tendo*, the action of stretching out the hands; and because the ancients gave their suffrages by stretching out their hands, they gave the name *chirotonia* to the election of magistrates.

This custom was first established in Greece; as appears from an oration of Demosthenes against Neæra, and that of Æschines against Ctesiphon; thence it passed to the Romans. From profane authors it passed to ecclesiastical ones; and was used by them, not only in speaking of elections, but also of ordinations. See *IMPOSITION*, and *ORDINATION*.

For the difference between *chirothesia* and *chirotonia*, see Harrington's *Prer. of Popular Government*.

CHIRP, in *Ornithology*, is the name of the first sound which a young bird utters, as a cry for food, and is different in all nestlings, if attentively regarded; so that the hearer may distinguish the species of the birds, though the nest should hang out of his sight and reach. This cry is weak and querulous; it is dropped entirely as the bird grows stronger, nor is it afterwards intermixed with its song: the chirp of a nightingale (e. g.) being hoarse and disagreeable. The chirp consists of a single sound repeated at very short intervals, and is common to nestlings of both sexes. Phil. Transf. vol. lxxiii.

CHIRURGEON, an obsolete word, from $\chi\upsilon\iota\varsigma$, the *hand*, and $\epsilon\rho\gamma\omicron\varsigma$, *work*; denoting a manual operator, and now always pronounced, as well as written, *surgeon*. The conduct of *surgeons* was formerly so much under the guidance and control of physicians, that Dr. Samuel Johnson defines a *surgeon* to be "one whose duty is to act in external maladies by the direction of the physician." See the article *surgeon*.

CHIRURGERY, belonging to the practice of a surgeon,

geon, and now univerſally written and pronounced *SURGERY*.

CHIRURGICAL, pertaining to ſurgery, or manual operations.

CHIRURGIEN noir, in *Ornithology*, the Black Jacana, *PARRA nigra* of Gmelin, is ſo named by Buffon.

CHIRY, in *Geography*, a town of France, in the department of the Oife and diſtrict of Compiègne, 3 miles S.S.W. of Noyon.

CHISELY land, in *Agriculture, a term appropriated to that fort of land which breaks, when it is turned up by the plough, into pieces like the chips made by the bone-cutter's chifſel in the hewing of ſtones. It is of a middle nature, between the ſandy land that falls off from the plough-ſhare, like bran or ſaw-duſt, and the clayey, that is raiſed in large glebes.*

It is of ſeveral colours, grey, brown, reddiſh, and blackiſh, and uſually contains a large quantity of ſand, and no ſmall number of pebbles.

CHISHULL, EDMUND, in *Biography*, a learned divine and antiquary, was born at Eyworth, in Bedfordſhire, and educated at Corpus Chriſti college, Oxford, where he obtained the degree of maſter of arts in 1693, and was alſo choſen a fellow of his college; previously to this he had publiſhed a Latin poem, on the battle of La Hogue, and in 1694 he publiſhed another ode on the death of the queen, which is preſerved in the third volume of the Muſæ Anglicæ, though it does not diſplay poetical fervour ſo much as a true claſſical taſte. Four years afterwards Mr. Chiffull obtained a traveller's exhibition from his college, and ſailed for Smyrna. Before he left his native country, he preached a ſermon to the Levant company, which was publiſhed, and which obtained for him the chaplainſhip to the Engliſh factory at Smyrna, in which ſtation he continued till the ſpring of 1702. In June 1705 he was admitted to the degree of bachelior of divinity, and ſoon after he engaged in a controverſy with the learned Mr. Dodwell, by publiſhing "A Charge of Hereſy maintained againſt Mr. Dodwell's Diſcourſe concerning the Mortality of the Soul," which is reckoned one of the principal books written in this controverſy. In 1707 Mr. Chiffull preached a ſermon againſt the abſurdities and entuſiaſm of the French prophets, which he publiſhed in the enſuing year, with an hiſtorical appendix, containing collections applicable to all ſuch prophecies as were condemned in the ſermon. Immediately after this, he was preſented with the vicarage of Walthamſlow in Eſſex, and in 1711 he was appointed one of the chaplains in ordinary to queen Anne. Beſides the above, he publiſhed ſeveral other theological diſcourſes; of which one was on dueling, preached before the queen, and publiſhed by her ſpecial command. As an antiquarian, one of his firſt works was entitled "Inſcriptio Sigææ antiquiſſima *Βουσιρεφθίου* exarata," this was illuſtrated with a learned commentary; to which he afterwards added "Notarum ad Inſcriptionem Sigæam appendicula." Theſe pieces were afterwards incorporated in his "Antiquitates Aſiaticæ." When Dr. Mead publiſhed his Harveian oration in 1724, Mr. Chiffull added to it, as an appendix, "Diſſertatio de Nummis quibuſdam a Smyrnezis in Medicorum honorem percuffis." This diſſertation excited a controverſy concerning the condition of phyſicians at ancient Rome. The queſtion was whether they were not uſually vile and deſpicable ſlaves; or, at leaſt, ſome among them, thoſe who enjoyed the privileges of a free condition. The greateſt literary work of Mr. Chiffull was entitled "Antiquitates Aſiaticæ Chriſtianiani æram antecedentes, ex Picturis Monumentis Græcis Deſcriptæ, Latine verſæ, Notis que et Commentariis illuſtratæ. Accedit Monumentum Lati-

num Ancyranum." This work was printed by ſubſcription to which Dr. Mead contributed fifty-one guineas. The iſcriptions contained in it were collected by conſul Sierrard. Dr. Piccini, and Dr. Liſſe, afterwards biſhop of St. Aſaph; they were afterwards depoſited in the Earl of Oxford's library, and are now preſerved in the Britiſh Muſæum. Mr. Chiffull added to his "Antiquitates" two ſmall pieces addreſſed to the Rev. John Horn. He formed a deſign of publiſhing a ſecond volume, the printing of which was actually begun, when death put a ſtop to its progreſs, and it has never been aſcertained in what manner the manuſcripts were diſpoſed of. In 1731 Mr. Chiffull was preſented with the rectory of South-church in Eſſex, which he did not long enjoy. He died at Walthamſlow on the 18th of May 1733, ſincerely regretted by his friends, and by thoſe who were capable of duly appreciating his learning and talents. One of his contemporaries, Dr. Taylor, ſtyles him "Vir celeberrimus ingenii acumiæ et literarum peritiæ, quibus excellēbat maximè;" and Dr. Mead has beſtowed on him a very high encomium in the preface which introduced Mr. Chiffull's diſſertation on the Smyrnezian coins; he likewiſe teſtified a ſincere regard to the memory of his friend, by publiſhing an account of his travels in Turkey. Mr. Chiffull ſuſtained an excellent character as a divine.

CHISOING, or **CISOING**, in *Geography*, a town of Flanders, with an abbey; 2 leagues N.N.W. from Orchies.

CHISME, or **CISME**, a ſea-port town of Aſiatic Turkey, on the weſt coaſt of Natolia, oppoſite the iſland of Scio, between which and the continent is a narrow ſtrait, where the Turkiſh fleet was deſtroyed by the Ruſſians in the year 1770; 40 miles W. of Smyrna. The ancient name of this town was Cyſtus. N. lat. 38° 24'. E. long. 36° 16'.

CHISSAMA, a province of the kingdom of Angola in Africa, ſituated under the 9th degree of S. lat. near the mouth of the river Coanza. It is a Portugueſe ſettlement, conſiſting of three commanderies, whoſe deſpotic governors exerciſe a tyrannic cruelty over the natives. The ſoil abounds with a peculiar ſalt, formed of a briny water, which the inhabitants call into oblong pieces like bricks, about 5 or 6 inches long, and exchange with the Portugueſe for meal, oil, and other commodities. This ſalt is reckoned of ſuch excellent quality, not only for food, but alſo for phyſic, that the merchants convey it through all Ethiopia, and derive from it an extraordinary gain. The province affords likewiſe fine honey and wax; but water is extremely ſcarce, as this province has no rain from May to October, and its mountains are deſtitute of ſprings; ſo that the inhabitants who are near the Coanza ſupply themſelves from that river, at the hazard of being devoured by the wild beaſts, which ſwarm along its banks.

CHISSEL, an instrument much uſed in ſculpture, inlaid, joinery, carpentry, &c.

There are chifſels of different kinds; though their chief difference lies in their different ſize and ſtrength, as being ad made of ſteel well ſharpened and tempered: but they have different names, according to the different uſes to which they are applied.

The chifſels uſed in carpentry and joinery are, 1. The *former*, which is uſed firſt of all before the *paring chifſel*, and juſt after the work is ſcribed. 2. The *paring-chifſel*, which has a fine ſmooth edge, and is uſed to pare off or ſmooth the irregularities which the *former* makes. This is not ſtruck with a mallet, as the *former* is, but is preſſed with the ſhoulder of the workman. 3. *Sheave former*: this is uſed for cleaning acute angles with the point, or corner of its narrow edge. 4. The *mortiſe-chifſel*, which is narrow, but very thick and ſtrong, to encure hard blows; and it is cut to a

very broad bafil: its use is, to cut deep square holes in the wood, for mortises. 5. The *gogge*, which is a chisel with a round edge; one side whereof serves to prepare the way for an auger, and the other to cut such wood as is to be rounded, hollowed, &c. 6. *Sucker chisels*, which are chiefly used by carpenters, &c. to have their shank made with a hollow socket at top, to receive a strong wooden sprig, fitted into it with a shoulder. These chisels are distinguished, according to the breadth of the blade, into half-inch chisels, three quarters of an inch chisels, &c. 7. *Ripping-chisels*, which is a socket chisel of an inch broad; having a blunt edge, with no bafil to it; its use is to rip or tear two pieces of wood asunder, by forcing in the blunt edge between them.

CHISSEL, in *Geography*, a fort in the state of the Tennessee, 2½ miles from the English ferry on New River, 43 from Abingdon, and 107 from Long Island, on Holston.

CHIP, is the name of an instrument used in cleaving Laths.

CHITARRONE. A large Spanish guitar.

CHITARRA, *Ital.* See GUITAR.

CHITH, in *Geography*, a town of the island of Cyprus, near Larnica, much celebrated among the ancients. See CITIUM.

CHITIQUE, Du, lake, called also *Pelican lake*, a lake of North America, separated from lake Milton, in N. lat. 55° 7', by a short, narrow, and small strait. It is not more than 7 miles long, and its course is about N.W. and is succeeded by the lake Des Bois, which runs about 21 miles in a S.S.E. and N.N.W. course, and is full of islands; the passage to it being through an intricate, narrow, winding, and shallow channel for 8 miles.

CHITON, in *Conchology*, a genus of TESTACEA, or shells, the animal inhabitant of which is a doris (see DORIS), and the shell, which is multivalve, consisting of several segments or valves disposed down the back.

Species.

HEXIDUS. Shell of six striated valves. Schroet.

This is of a moderate size; the colour blackish-grey, with white spots and dots, and very finely marked with minute granulated striæ. A native of America.

TUBERCULATUS. Shell of seven valves; body tuberculated. Gmel. *Chiton oscarion*, Linn. Mus. A. J. Fr. *Chiton cylindricus*, Schroet.

Inhabits America. The form is an oblong-oval, narrow, with tubercles above disposed in a quincunx; sides cinereous, mixed with white and marked with brown undulated bands; back greenish, with a broad deep band of black.

ACULEATUS. Shell of eight valves, striated; body somewhat aculeated. Linn. Amoen. Acad. *Linax marina*, Rumpf.

An Asiatic species. The shell is tuberculated, oval, rough on the upper part, with narrow, fimbriate, somewhat curved, unequal red prickles.

FASCICULARIS. Shell of eight valves; body with a tuft of hair on each side of the valves. Schroet.

Described as a native of the coast of Barbary; the valves are cinereous, smooth, and slightly carinated; the lateral tufts of hair whitish.

SCAMOSUS. Shell of eight valves and semi-striated; the margin covered with minute fesses. Linn. &c.

There are many varieties of this species; one (β) is rough and variegated, *Chiton feaber variegatus*, Chemn. And another smooth and variegated (γ) *Chiton leachi variegatus*, Chemn. The *o-scarion* gallicum of Argenville, and *Chiton squamosus*, *neglectus* of Schroeter, are also deemed varieties of this species. The valves are partly granulated, and partly stri-

ated very finely; the extreme valves lunulated. Found chiefly in America.

RUBER. Shell of eight valves; somewhat striated, the striæ curved; body red. Linn. Fn. Suec.

This is of an oval and sub-oblong form, with the back carinated or elevated into a keel. Colour tawny, with a darker streak on the back border red with white; margin of the animal brown or yellow with red spots and dots.

Inhabits the North seas. Chemnitz describes a variety of it in species that is marked with white and red.

PUNCTATUS. Shell of eight valves, and smooth; body with excavated dots. *Chiton corpore punctatus* of its auct. Linn. *Calca forpensis distans*, Linn. nat. cur. A general inhabitant of Europe, Asia, and Africa.

ALBUS. Shell of eight valves, smooth, first emarginate behind; body white.

This is of an oval shape. It inhabits the North Seas. Linn. Fabr. &c.

CINEREUS. Shell of eight valves, smooth, and carinated; body reddish, with a somewhat elevated border. O. Fabr. Found among the rocks of the north in the Norway seas. It is of a small size, measuring only two lines in length; the form is depressed, and narrower before, with two longitudinal grooves down the back, one on each side the middle dorsal ridge. Colour reddish when the animal is alive.

BICOLOR. Shell of eight valves, thick; outside sea green; inside snowy white, edged with black. Gmel. &c. Native country unknown. The size is rather large.

CERASINUS. Shell of eight valves, smooth, and cherry-coloured, with snowy marginal teeth. Chemn. &c. Native place unknown.

MAGELLANICUS. Shell of eight valves, thick. Black-brown; above convex, with a blackish band in the middle of the back, and lateral yellowish striæ. Gmel. Seba. &c.

Inhabits the straits of Magellan. This species is of a large size; shell sea green, bordered with brown, and black within the middle.

FUSCUS. Shell of eight valves. Brown, smooth; inside and teeth of the margin snowy; back with triangular black spots, and obscure yellowish bands on each side. Chemn. &c.

This is found in India. It is of a narrower form than the last; marginal teeth are numerous, and largest on the two extreme valves; and the back is more elevated and carinated.

MACULATUS. Shell of eight valves, smooth; within sea-green; margin covered with greenish white scales; an erior part of the middle valves, and sides of some spotted with brown. Chemn. A rare species. Country unknown.

MARMORATUS. Shell of eight valves, smooth, black and white varied; middle valves greenish within. Gmel. Chemn. &c.

Inhabits the American seas. Size variable; colours black and white, variously disposed in alternate blackish and white bands, streaks, veins, and spots; the fibrous border tumid with alternate whitish, steel blue, and blackish patches. A variety with seven valves is described by Schroeter.

GRANULATUS. Pitehy, above flat, with numerous elevated dots disposed in regular series; border broad, coriaceous, spinous, with alternate black and white patches. Chemn.

A native of the American ocean. Valves usually eight, rarely seven.

PICTUS. Shell eight valved, above smooth, pitehy, black varied with white. Chemn.

Inhabits the American and Red seas. This is allied to the preceding species. The inside of the shell is black in

the middle, at the sides greenish; and the back is marked with alternate black and white spots, bands, and veins. Rarely found with only six or seven valves.

INUS. Shell of eight valves; whitish ash colour, with the border fealy; middle valves very finely punctured. Chemn. A native of the American seas.

MINIUS. Shell of eight valves, smooth black, and sprinkled with laminaeous or powdery patches. Chemn.

Inhabits the Norway seas, near Bergen. Size very small.

CIMEX. Shell of eight valves, carinated, diaphanous, and banded; each of the extreme valves very finely punctured. Chemn.

This species is of a small size, and inhabits the Norway seas. Within the colour is whitish-ash, with alternate blackish and paler bands.

ASELLUS. Shell of eight valves; deep black; above convex, with a yellowish spot on each of the valves. Chemn.

Inhabits the North seas, affixed to the large muscle, *mytilus modiolus*.

GIGAS. Shell of eight valves, thick, convex, and white; first valve crenated, the middle ones emarginated, and the extreme one armed with teeth. Chemn. &c.

Length four inches; border tumid, coriaceous, and black brown. This inhabits the Cape of Good Hope.

THALASSIUS. Shell of six valves, glossy, oval; sea-green, with a pale line above, in the middle; border thin and hyaline. Schroet. Native place unknown.

ISLANDIUS. Shell of eight valves, sub-cylindrical, very finely punctured, black with cinereous border. Schroet. &c. This is of a small size, and narrow at each end.

CRINITUS. Shell of seven valves, and thickly beset with short hairs. Gmel.

This is described by Gmelin, on the authority of Pennant, as a species inhabiting the sea near Aberdeen, Scotland. The species occurs on several other of the British coasts, and has commonly eight valves.

MARGINATUS. Shell of eight valves, smooth, with serrated reflected margin. Gmelin, &c. Found on the sea-coast of Sea-borough, and on the western coasts, and those of Scotland.

LÆVIS. Shell of eight valves, very glossy, with elevated dorsal band. Gmel. Inhabits the Scottish shores.

AMICULATUS. Shell of eight valves, uniform, very fragile, and covered externally with a coriaceous membrane. Pallas.

Length about six inches; the valves are imbricated. This inhabits the coast of the Kurile islands.

CHITORE. See CHEITORE.

CHITPOUR, or CHITTIPUR, probably the ancient *Supara*, in *Geography*, a town of Hindoostan, in the country of Guzerat; celebrated for its manufacture of clinties; 172 miles S.W. of Amedabad. N. lat. 21° 25'. E. long. 75° 3'.

CHITRO, a town of European Turkey, in the province of Macedonia, situated in the bay of Salonichi; 36 miles S.S.E. of Edessa. N. lat. 40° 35'. E. long. 29° 10'.

CHITSEE, in *Botany*, the name of a Chinese tree, called also Setse.

CHITTAGONG, CHITTIGONG, or ISLAMABAD, in *Geography*, the name of a province of the peninsula, which separates the gulf of Bengal from the Chinese sea, between the Burampooter river and the borders of Arracan, and the Birman empire. Its chief town of the same name, situated at a considerable distance from the river Naaf, which bounds the British and Birman territories, is the seat of the pro-

vincial government, and residence of the English magistrate. The banks of the river are covered with deep jungles, interspersed with featy spots of cultivation, and a few wretched villages, inhabited by the poorest class of herdsmen, and the families of roving hunters, whose occupation it is to catch and tame the wild elephants, with which the forests abound. Such infrequented places afforded to pirates, concerned in a lawless traffic, an asylum, where they eluded the cognizance of the English officers of justice, and furnished the emperor of the Birman with occasion for complaint and remonstrance, or rather for aggression on the territories of the English East-India company, which terminated, after a threatened conflict, in compromise and conciliation. The Portuguese made their first settlement in this country. The capital, called also Islamabad, is 4° 55' E. of Balafore, in N. lat. 22° 20', and E. long. 91° 55'. From this town the coasts of Arracan and Pegu take a S.S.E. course to Cape Negrais, the extreme point of Pegu to the S.W. the latitude of which is under 16 degrees, and distance from Islamabad about 40 geographical miles.

CHITTELDRÖOG, a town of Hindoostan, and capital of a province of the same name, in the Mysore country; though which passes the river Hogery. It is distant 85 miles N.W. from Seringapatam, and 95 E. of Bedanore. N. lat. 14° 50'. E. long. 73°.

CHITTENDEN, a county of America, in the state of Vermont, situate on the lake Champlain, between Franklin county on the N. and Addison S.; the Mallett river passes through its N.W. corner, and Otter river divides it nearly in the centre. Its chief town is Burlington. This county contained, by the census of 1791, 44 townships, and 7301 inhabitants. Since that time the northern counties have been taken from it, so that neither its size nor number of inhabitants can now be ascertained.—Also, a township in Rutland county, and state of Vermont, containing 159 inhabitants. The road over the mountain passes through this township. It is distant 7 miles N. from the fort on Otter creek, in Pittsford, and about 60 N. by E. from Bennington.

CHITTENENGO, or CANASERAGE, a considerable stream, which runs northerly into lake Oacida, in the state of New York.

CHITTEPUT, a town of Hindoostan, in the Carnatic; 14 miles N. of Gingee.

CHITTIGONG, or ISLAMABAD. See CHITTAGONG.

CHITTIM, in *Scripture Geography*, denote, according to Bafnage, the Cutibeans, who inhabited Sufiana, near Babylon, and who, marching under Nabuchad 2215, contributed to the siege of Tyre. Bochart supposes the Romans to be meant by Chittim; but as the Cutibeans are never called Chittim in Scripture, and the Romans were not concerned in the siege of Tyre, mentioned by the prophet Isaiah (ch. xxiii. v. 1, &c.), Calmet supposes that the appellation of Chittim is applied to the Macedonians, and that the prophet speaks of the country of Macedonia as an island, (denominating it the hills of Chittim,) after the manner of the Hebrews, who thus call peninsulas and maritime countries. However, there seems to be no sufficient reason for restraining the term Chittim to Macedonia, which was not particularly a maritime country, but it may include all Greece; and more especially the islands of the Archipelago, and perhaps up the Bosphorus, since vessels might navigate from thence to Tyre, as they now do to Egypt, &c. The Greek colonies, dispersed about the Mediterranean, might also be comprehended under the denomination; and consequently, Sicily, Sardinia, and a great part of Italy.

CHITTING, in *Gardening*. A feed is said to *chit*, when it first shoots its small roots into the earth.

CHITTOOR, in *Geography*, a town of Hindoostan, in the Carnatic; 28 miles N.W. of Arcot, and 70 W. of Madras.

CHITTRA, a town of Hindoostan, in the Bahar country; 85 miles S. of Patna, and 72 S.S.W. of Bahar.

CHI-TUAY, in the *Materia Medica*, a name used by some authors for a kind of *Synnum aloes*, which is reddish, and of a very fine scent.

CHITWA, in *Geography*, a town of the peninsula of India, in the province of Cochin, near the coast of Malabar. N. lat. 10° 33' 15". E. long. 76° 5'.

CHIVA, a town of Spain, in the province of Valencia; 15 miles W.N.W. of Valencia.

CHIVALGE. See CHEVAGE.

CHIVALRY, in *Antiquity*, an institution which, according to some writers, took its rise from the *crusades*, but according to others, gave occasion to that enterprise; and which, though founded in caprice, and productive of extravagance, had a very considerable influence in refining the manners of the European nations, during the 12th, 13th, 14th, and 15th centuries. This institution naturally arose, says Dr. Robertson, (ubi infra.) from the state of society at that period. The feudal state was a state of perpetual war, rapine, and anarchy; during which the weak and unarmed were exposed to perpetual insults or injuries. The power of the sovereign was too limited to prevent these wrongs; and the administration of justice too feeble to redress them. Against violence and oppression there was scarcely any protection, besides that which the valour and generosity of private persons afforded. The same spirit of enterprise which had prompted for many gentlemen to take arms in defence of the oppressed pilgrims in Palestine, incited others to declare themselves the patrons and avengers of injured innocence at home. When the final reduction of the Holy Land under the dominion of Infidels, put an end to these foreign expeditions, the latter was the only employment left for the activity and courage of adventurers. The objects of this institution were to check the insolence of overgrown oppressors, to succour the distressed, to rescue the helpless from captivity, to protect or to avenge women, orphans, and ecclesiastics, who could not bear arms in their own defence, to redress wrongs, and to remove grievances. These were considered as acts of the highest prowess and merit. Valour, gallantry, and religion, were blended in this institution, humanity, courtesy, justice, and honour were its characteristic qualities; the enthusiastic zeal produced by religion served to give it singular energy, and to carry it even to a romantic excess: men were trained to knighthood by long previous discipline; they were admitted into the order by solemnities no less devout than pompous; every person of noble birth courted the honour; it was deemed a distinction superior to royalty, and monarchs were found to receive it from the hands of private gentlemen. These various circumstances contributed to render a whimsical institution of substantial benefit to mankind.

Another ingenious writer, who traces the origin of chivalry to the *crusades*, thus represents the occasion and manner of its introduction. On the crumbling of the western empire into small states, with regular subordinations of vassals and their chiefs, who looked up to a common sovereign, it was soon found that these chiefs had it in their power to make themselves very formidable to their masters; and just in that crisis of European manners and empire, the Saracens having expelled Christianity from the East, the western princes seized the opportunity, and with great craft turned the warlike genius of their feudatories, which would

otherwise have preyed upon themselves, into the spirit of crusades against the common enemy. See *CRUSADES*. Put when, afterwards, the ardour of the crusades was somewhat abated, though not extinguished, the Gothic princes and their families had fitted out established monarchies. At this juncture, when the restless spirit of their vassals had little employment abroad, and was restrained, in a considerable degree, from exerting itself with success in domestic quarrels, it broke out in all the extravagance of "knight-errantry." Military fame, acquired in the Holy Land, had entitled the adventurers to the insignia of arms, the force of heraldry; and inspired them with the love of war and the passion of enterprise. Their late expeditions had given them a turn for roving in quest of adventures; and their religious zeal had infused high notions of piety, justice, and equality. The scene of action being now more confined, they turned themselves from "the world's debate," to private and personal animosities. Chivalry was employed in rescuing humble and faithful vassals from the oppression of petty lords; their women from savage lust; and the holy heads of hermits (a species of eastern monks, much revered in the Holy Land) from rapine and outrage. In the mean time the courts of the feudal sovereigns became magnificent and polite; and, as the military constitution still subsisted, military merit was to be upheld; but, destitute of its former objects, it naturally softened into fictitious images and courtly exercises of war, in "Juits" and "Tournaments;" where the honour of the ladies supplied the place of zeal for the holy sepulchre; and thus the courtesy of elegant love, but of a wild and fanatic species, as being engrafted on spiritual enthusiasm, came to mix itself with the other characters of the knights-errant.

Dr. Hurd, in his "Letters on Chivalry and Romance," observes, that *chivalry*, properly so called, and under the idea of "a distinct military order, conferred in the way of investiture, and accompanied with the solemnity of an oath and other ceremonies, as described in the old historians and romances," was of later date than the feats of Charlemagne and our Arthur, and seems to have sprung immediately out of the feudal constitution. This constitution produced a very great change in the politics of Europe; and its first and most sensible effect was the erection of a prodigious number of petty tyrannies, exercised by the great barons over their dependent vassals. These barons, though closely attached to the service of their prince by the conditions of their tenure, became a kind of absolute sovereigns, at least with regard to one another; and as their aims and interests often interfered, the feudal state was, in a great degree, a state of war; the several combinations of feudal tenants were so many separate armies under their head or chief; and their castles were so many fortresses, as well as palaces, of these puny princes. Hence arose the peculiar encouragement which was given to the use of arms, under every different form of attack and defence, as the safety of these different communities, or the ambition of their leaders, might require. This condition of the times is supported by the ingenious prelate to have given rise to that military institution, which we know by the name of "Chivalry." In the intervals of peace, the military discipline of the followers of these independent nobles was not to be relaxed, nor their ardour suffered to cool, by a total disuse of martial exercises. To this circumstance, he conceives, may be traced the proper origin of "Juits" and "Tournaments;" those images of war, which were kept up in the castles of the barons, and, by an useful policy, converted into the amusement of the knights, when their arms were employed on no serious occasion. See *JUST* and *TOURNAMENT*.

From

From the circumstances of the feudal government, which gave rise to chivalry, the author accounts for the various characteristics of this singular profession. Hence were derived the passion for arms, the spirit of enterprise, the rewards of valour, the splendour of equipage, and, in short, every thing that raises our ideas of the prowess, gallantry, and magnificence of these sons of Mars. Hence also proceeded their romantic ideas of justice, their passion for adventures, their eagerness to run to the succour of the distressed, and the pride they took in redressing wrongs and removing grievances, which are distinguishing characteristics of genuine chivalry. Moreover, the courtesy, affability, and gallantry, for which these adventurers were so famous, are but the natural effects and consequences of their situation. The castles of the barons were the courts of those little sovereigns, as well as their fortresses; and the resort of their vassals thither, in honour of their chiefs, and for their own proper security, would render that civility and politeness, which are seen in courts and infensibly prevail there, a predominant part in the character of these assemblies. Besides, the pre-eminence of the ladies, in those courts and circles of the great, would operate so far on the sturdiest knights, as to give birth to the attentions of gallantry: and as violations of chastity were the most atrocious crimes which they had to charge on their enemies, they would pride themselves in the merit of being its protectors; this virtue furnishing the fairest and strongest claim of the sex itself to such protection, it is no wonder that the notions of it were, in time, carried to so Platonic an elevation. To this purpose the great master of chivalry expresses his sentiments on the subject:—

“It hath been thro’ all ages ever seen,
That, with the praise of arms and chivalry,
The prize of beauty still hath joined been;
And that for reason’s special joined vein;
For either doth on other much rely;
For *He* meesseems most fit the fair to serve,
That can her best defend from villany;
And *She* most fit his service doth deserve,
That fairest is, and from her faith will never swerve.”
Spenser, b. iv. c. 5.

As to the character of religion, which was so deeply imprinted on the minds of all knights, and was essential to their institution, inasmuch that, it is said, “the love of God and of the ladies,” went hand in hand in the duties and ritual of chivalry, two reasons may be assigned for this singularity; viz. the superstition of the times in which chivalry arose, which was so great, that no institution of a public nature could have found credit in the world, that was not consecrated by the churchmen, and closely interwoven with religion; and also the condition of the christian states, which had been harassed by long wars, and had but just recovered a breathing time from the brutal ravages of the Saracens. The remembrance of what they had lately suffered from these grand enemies of the faith, made it natural and even necessary to engage a new military order on the side of religion. See *RECREANT*. The preceding characteristics of chivalry, which Dr. Hurd deduces from the essential properties of a feudal government, are made to result from the spirit of crusades, by those who trace their origin to these military enterprises; whereas this author considers the latter as only an accidental effect of the former. He allows, however, what indeed cannot be reasonably contested, that chivalry as it is represented in books of romance, (so much posterior to the date of that military institution) took its colour and character from the impressions

made on the minds of men by the spirit of crusading into the holy land. Accordingly there are, as he apprehends, two distinct periods, which ought to be carefully observed in a deduction of the rise and progress of chivalry. The *first* is that in which the empire was overturned, and the feudal governments were every where introduced on its ruins, by the northern nations. In this era, that new policy settled itself in the west, and operated so powerfully as to lay the first foundations, and to furnish the remote causes of what we know by the name of chivalry. The *other* period is, when these causes had taken a fuller effect, and shewed themselves in that signal enterprise of the crusades; which not only concurred with the spirit of chivalry, already pulsating in the minds of men, but brought a prodigious increase, and gave a singular vigour and force, to all its operations. In this era, chivalry took deep root, and at the same time shot up to its full height and size. From this last period the Romances both in prose and verse, derive all their ideas of chivalry. See *ROMANCE*. But it was, as our learned prelate conceives, the former period that gave birth to this institution; as he infers not only from the reason of the thing, but from the surer information of authentic history. For there are traces of chivalry, in its most peculiar and characteristic forms, to be found in the ages preceding the crusades; and even jousts and tournaments, the image of serious knight-errantry, was certainly of earlier date than that event. Our author, (referring to the “Memoirs of the Academy of Inscriptions and Belles Lettres,” T. xx), proceeds to shew that there is a remarkable correspondence between the manners of the old heroic times, as painted by their great romancer, Homer, and those which are represented to us in books of modern knight-errantry: and this is a fact which is accounted for by the assistance of another, viz. that the political state of Greece, in the earlier periods of its history, was similar in many respects to that of Europe, as broken by the feudal system into an infinite number of petty independent governments.

This similarity is illustrated in the following particulars.

The military enthusiasm of the barons is but of a piece with the fanaticism of the heroes, as they are exhibited by the Gothic romances and by the Greek poet. We also hear much of knights-errant encountering giants and quelling savages, in books of chivalry. These giants were oppressive feudal lords, occupying their strong holds or castles; and their dependents of a lower form, who imitated the violence of their superiors, and though destitute of castles, had their lurking places, were the savages of romance. The greater lord was denominated a giant, for his power; the less, a savage, for his brutality. Another terror of the Gothic ages was monsters, dragons, and serpents. In all these respects, Greek antiquity very much resembles it. For what are Homer’s Lætrigons and Cyclops, but bands of lawless savages, with, each of them, a giant of enormous size at their head? And what are the Grecian Bacchus and Hercules, but knights-errant, the exact counterparts of Sir Launcelot and Amadis de Gaule? Moreover, the oppressions which it was the glory of the knight to avenge, were frequently carried on, as we are told, by the charms and enchantments of women. Similar to stories of this kind are those of Calypso and Circe, the enchantresses of the Greek poet. Besides, robbery and piracy were honourable in both; so far were they from reflecting any discredit on the ancient or modern redressors of wrongs. To account for this odd circumstance, we ought to recollect, that in the feudal times, and in the early days of Greece, when government was weak, and unable to redress the frequent injuries of petty sovereigns, it would be glorious for private adventurers to undertake this work; and if they could

could accomplish it in no other way, to pay them in kind by downright plunder and rapine. Their manners, in another respect, were the same. Ballardy was in credit with both. Whilst they were extremely watchful over the chastity of their own women, those whom they could seize upon in the enemy's quarter, were deemed lawful prize. Or, if at any time they transferred in this way at home, the heroic ages were confidential enough to cover the fact by an ingenious fiction. The offspring was reputed divine. We also find, that together with the great fierceness and savageness of character, the utmost generosity, hospitality, and courtesy were imparted to the heroic ages. Achilles was at once the most relentless, vindictive, implacable, and the friendliest of men. Similar to this is the reputation that occurs in the Gothic romances, where it is almost true what Butler says humorously of these benign heroes, that

"They did in fight but cut work out
To employ their courtesies about."

These contradictions in the characters of ancient and modern men of arms can be reconciled only by observing, that as in these lawless times dangers and distresses of all sorts abounded, there would be the same demand for compassion, gentleness, and generous attachment to the unfortunate, those especially of their own class, as of resentment, rage, and animosity against their enemies. Further, if we advert to the martial games which ancient Greece delighted to celebrate on great and solemn occasions, we shall perceive that they had the same origin, and served the same purpose, as the tournaments of the Gothic warriors. And, lastly, the passion for adventures, so natural in their situation, would be as naturally attended with the love of praise and glory. Hence the same encouragement, in the old Greek and Gothic times, to panegyric and poets: the bards being as welcome to the tables of the feudal lords, as the AOIDOI of old to those of the Grecian heroes.

Bishop Warburton (in a note to Love's Labour lost) and Warton (Diff. 1. prefixed to the History of English Poetry, vol. 1.) incline to the hypothesis which traces the first idea of chivalry and romance to Spain, where it was introduced by the Saracens or Arabians, who having been for some time seated on the northern coasts of Africa, entered Spain about the beginning of the 8th century. Mallet, in his "Introduction to the History of Denmark," followed by Pinkerton (Diff. on the Scythians or Goths) and Percy (in the Ancient Metrical Romances), ascribes to the tales and rites of chivalry a Scandinavian origin. An anonymous writer, however, is of opinion, (Month. Magaz. Feb. 1803) that neither Moorish Spain, nor Gothic Scandinavia gave this very decisive impulse to the character of early modern civilization; but rather Armorica, and the concealed provinces of Britain. In support of this opinion it is argued, that all the European nations take their romances of chivalry from the French; that the French romances celebrate in the north of France; that the older romances of chivalry have especially celebrated the heroes of Greater or Lesser Britany, and are therefore of Armorican origin; that time is derived from the language of Armorica; and that chivalry, though of obscure origin, is also probably Armorican. Accordingly it is also held, that chivalry resembles in the spirit of its operation, a confederacy of country-gentlemen, to ward off from each other the dangers and evils of an enemy. A defensive, not an offensive, spirit characterizes the obligations of a knight; and his oath required him to protect the church against heathens, ladies against ravishers, orphans against encroaching guardians, and the conquered equal against insult. An exclusive care for the interests of

gentlemen distinguishes the practice of the knights; and whilst the personal rights of women of the lower classes were invaded without scruple, those of ladies were respected with superstitious politeness. Such features, it is said, seem to be rather the relics of a receding than the tokens of a growing civilization. The whole ritual of chivalry, the ordinary exercises, the tournaments, the fortified palaces, and its religious character, early an advanced ment of society to which the Scandinavians could not be attained. The feudal reverence for ladies cannot have proceeded from the Mahometan East. Armorica alone, as this anonymous writer maintains, was adapted by its political circumstances, its Cavalry, and its long participation of Roman culture, to become the nurse of such peculiarities. Some ceremonies of knighthood bear a strong resemblance to those barbarous institutions which were common to the Celtic provinces of Gaul and Britain; and which retain, till this time among the Welsh, a great influence. See ROMANCE.

Chivalry, whatever might be the era of its origin, died in England during the reigns of King John and Henry III. but revived under Edward I. This prince was one of the most accomplished knights of the age, in which he flourished, and both delighted and excelled in feats of chivalry. As a proof of this, it will be sufficient to allege, that when he was on his return from the Holy Land after his father's death, and knew that his presence was ardently desired in England, he accepted an invitation to a tournament at Chalons in Burgundy; where he displayed his skill and valour to great advantage, and gained a complete victory. Edward III. was no less fond of chivalry, and encouraged it both by his example and influence. Having formed the design of asserting his claim to the crown of France, he laboured to inspire his own subjects with a bold enterprising spirit, and to excite as many valiant foreigners as possible into his service. With this view, he first offered several companies to knights, to which he invited all persons who delighted in feats of arms, entertained them with great hospitality, and loaded such of them as excelled in martial sports with honours and rewards, in order to attach them to his person and engage them to fight in his cause; with the same view, and at the same time, he founded the most honourable order of the garter, of which his own heroism, the Black Prince, was the first knight; and all the first companions were persons famous for their victories at tournaments, and in real wars. The revival of chivalry in these two reigns of Edw. I. and Edw. III. contributed not a little to promote valour, munificence, and a liberal kind of gallantry among persons of condition, who applied to the honours of knighthood, which were then objects of ambition to the greatest princes. All the heroic virtues, it has been said, which then entered into the several rates of Chivalry, were the fruits of industry. A knight, his may be regarded as an extirpator of idleness; it cannot be denied that the spirit and the laws of chivalry were friendly to the cause of virtue. By these laws a knight pursued of military character could obtain the honours of knighthood, which were conferred with much solemnity, in the most public occasions, and in the presence of the most august assemblies. After the candidate had given sufficient proofs of his prowess, and other virtues, to merit distinction, he had prepared himself for the ensuing day by fasting, confessing, hearing masses, both his, and other several devotions, he took an oath consisting of 23 articles, in which, amongst other things, he swore, that he would be a good, brave, loyal, just, generous, and gentle knight; a champion of the church and clergy, a protector of the ladies, and a redresser of the wrongs of widows and orphans. To this

purple

purpose we may observe, that when Alphonso V. king of Portugal, conferred the honour of knighthood on his son, he commanded him to kneel down by his side, and instructed him in the nature and duties of the order into which he was admitted; and, amongst other things, directed him to consider, that as the priesthood was instituted for divine service, so was chivalry for the maintenance of religion and justice. A knight, he adds, ought to be the husband of widows, the father of orphans, the protector of the poor, and the prop of those who have no support; and they who do not act thus, are unworthy to bear that name. Those who acquitted themselves of these obligations in an honourable manner were favoured by the fair and courted by the great; but those who were guilty of base dishonourable actions, were degraded with every possible mark of infamy. (See KNIGHT.) All this could hardly fail to have some influence on the conduct of those who were invested with that dignity; though, from the rudeness of the times, and the general dissolution of manners which then prevailed, that influence was probably, less than might have been expected. However, the spirit and practice of chivalry did actually produce a very beneficial effect. "I will venture to say," as lord Lyttelton observes (Hist. Hen. II. vol. iii. p. 161, 8vo.) "that from the 9th to the 16th century, the brightest virtues which dignified either the history of this nation or that of any other people in the whole Christian world, were chiefly derived from this source. Had it not been for the spirit of chivalry, the corruption of religion, the want of all good learning, the superstition, the ferocity, the barbarism of the times, would have extinguished all virtue and sense of humanity, as well as all generous sentiments of honour, in the hearts of the nobility and gentry of Europe; nor could they have been able to resist the military enthusiasm of the Saracens and the Turks, without the aid of another kind of fanaticism, which was excited and nourished in them by means of that spirit."

"This singular institution," says Dr. Robertson (ubi infra), "in which valour, gallantry, and religion, were so strangely blended, was wonderfully adapted to the taste and genius of martial nobles; and its effects were soon visible in their manners. War was carried on with less ferocity, when humanity came to be deemed the ornament of knighthood no less than courage. More gentle and polished manners were introduced, when courtesy was recommended as the most amiable of knightly virtues. Violence and oppression decreased, when it was reckoned meritorious to check and to punish them. A scrupulous adherence to truth, with the most religious attention to fulfil every engagement, became the distinguishing characteristic of a gentleman, because chivalry was regarded as the school of honour, and inculcated the most delicate sensibility with respect to that point. The admiration of these qualities, together with the high distinctions and prerogatives conferred on knighthood in every part of Europe, inspired persons of noble birth, on some occasions, with a species of military fanaticism, and led them to extravagant enterprises. But they imprinted deeply on their minds the principles of generosity and honour. They were strengthened by every thing that can affect the senses or touch the heart. The wild exploits of those romantic knights who sallied forth in quest of adventures, are well known, and have been treated with proper ridicule. The political and permanent efforts of the spirit of chivalry have been less observed. Perhaps, the humanity which accompanies all the operations of war, the refinements of gallantry, and the point of honour, the three chief circumstances which distinguish modern from ancient manners, may be ascribed in a great measure to this whimsical institution,

VOL. VII.

seemingly of little benefit to mankind. The sentiments which chivalry inspired had a wonderful influence on manners and conduct during the 12th, 13th, 14th, and 15th centuries. They were so deeply rooted, that they continued to operate after the vigour and reputation of the institution itself began to decline." In a word, chivalry, which is now an object of ridicule, was, at the period to which we have above referred, a matter of the greatest moment, and had no little influence on the manners of mankind and the fate of nations. Robertson's Ch. V. vol. i. Henry's Hist. vol. viii. Lyttelton's Hist. vol. iii. Hurd's Moral and Political Dialogues, vol. iii. Memoirs of Ancient Chivalry, &c. translated from the French of M. de St. Palaye, by the translator of the Life of Peterarch (Mrs. Dobson), 8vo. 1784.

CHIVALRY, or *Chivalry*, in *Law*, a tenure of land by knight-service; whereby the tenant was anciently bound to perform service in war, to the king, or to the noble lord of whom he held by that tenure.

By a statute of 12 Car. II. cap. 24. all tenures by *chivalry*, in *capite*, &c. are abolished. See COURT and GUARDIAN.

CHIVALRY, *Court of*. See COURT.

CHIVAZZO, or CHIVAS, in *Geography*, a town of Piedmont, situated near the union of the river Orco with the Po, on a large plain, part of which is converted to tillage, and produces Turkey corn, but towards Zigliano a barren waste in many places, covered with a kind of reddish heath. It is defended with ancient and new walls, bastions, and large fosses filled with water; and well supplied with artillery and a numerous garrison, especially in time of war. Its situation is so advantageous, that those who are masters of it are said to possess the key of the country of Turin, the Canavois, the country of Verceili, Montferat, and Lombardy, all which they may enter at pleasure. It has several churches and convents; 11 miles N.E. of Turin, and 12 S. of Ivrea. N. lat. 45° 1'. E. long. 7° 43'.

CHIUDENDO, in *Italian Music*, to conclude; as *chiudendo col ritornello*, *col Paria*, signifies to end with a *ritornello*, or some passage which has been before sung in some parts of the piece.

CHIVEN, in *Ornithology*, a name given by some old writers to the fly-catcher, *Muscicapa griseola*.

CHIVERNY, in *Geography*, a town of France, in the department of the Loir and Cher, seated on the south side of the Conon; 3 leagues S.E. of Blois.

CHIVES, or CHIVES, in *Botany*, the small knobs growing on the ends of the fine threads, or stamina of flowers; by Ray, and others, called also *apices*. See AN-THERE.

Dr. Grew calls the stamina, or threads themselves, on which the apices are fixed, the chives.

CHIVES, a very small species of the onion kind, is also called by this name. See ALLIUM.

CHIUM *marmor*. See MARBLE.

CHIUM *vinum*, *Chian wine*, or wine of the growth of the island of Chios, now Scio, is commended by Dioscorides, as affording a good nourishment, fit to drink, less disposed to intoxicate, endued with the virtue of restraining delusions, and a proper ingredient in ophthalmic medicines. Hence Scribonius Largus directs the dry ingredients in *collyria* for the eyes, to be made up with Chian wine.

CHIUN, or CHEVAN, in *Hebrew Antiquity*. We meet with this word in the prophet Amos (ch. v. 26) cited in the Acts of the Apostles, (ch. vii. 43.). St. Luke reads the passage thus: "Ye took up the tabernacle of Moloch, and the star of your god Remphan, figures which ye made to worship them." The import of the Hebrew is as follows:

“Ye have borne the tabernacle of your kings, and the pedestal (the *chinn*) of your images, the star of your gods, which ye made to yourselves.” The Septuagint in all probability read *repham* or *revan*, instead of *chinn* or *chevan*, and took the pedestal for a god.

Some say that the Septuagint, who made their translation in Egypt, changed the word *chinn* into that of *repham*, because they had the same signification. M. Bagnage, in his book entitled Jewish Antiquities, after having discoursed a good deal upon *chinn* or *repham*, concludes that Moloch was the sun, *chinn*, *chean*, or *repham*, the moon.

CHIUREA, in *Zoology*, a name given by Cardan, Oviedo, and some others, to the Opossum, *DIDELPHIS opossum*.

CHIUSA, LA, in *Geography*, a town of Italy, in the Veronese, belonging to the state of Venice; 9 miles N.W. of Verona.—ALIO, a town of Italy in the Friuli, seated on a small river, called the “Fella,” which runs into the Tadjamento; taken by the French in 1797; 14 miles N. of Friuli.

CHIUSANO, a town of Naples, in the province of Principato Citra; 13 miles S.S.E. of Benevento.

CHIUSELLE, a river of Piedmont, which runs into the Orco; 1 mile W.S.W. of Fogliasso.

CHIUSI, a town of Italy, in the country of Sienna, containing about 1000 inhabitants, the see of a bishop; 31 miles S.S.E. of Sienna.

CHIUSO, *Ital.* Clove, concealed, locked up: as in *Musica*, *canone chiusos*, is a canon, not in score, but written entirely on one staff, sometimes without any indications of clefs, signals when the several parts come in, or information of any kind to point out the solution. See CANON.

CHIUSTENGI, in *Geography*, a town of European Turkey, in the province of Bulgaria; 70 miles E. of Silbitria. N. lat. 43° 2'. E. long. 27° 30'.

CHIUTAYA, KIUTAJA, or CUTAJA, a town of Asiatic Turkey, and capital of a district in Natolia, situated at the foot of a mountain, in a fertile and healthy country, and defended by a castle on a rock. It contains several mosques, and three Armenian churches; 136 miles S.S.E. from Constantinople. N. lat. 39° 14'. E. long. 30° 44'.

CHIZE', a town of France, in the department of the Two Sevrés, and district of Niort, situated near the Bou-tonne; 3½ leagues S. of Niort.

CHIZILARABAD, a town of Asia, in the kingdom of Kurdistan; 70 miles S.S.E. of Kerkuk.

CHLÆNA, in *Antiquity*, a kind of thick, shaggy, upper garment; its use was very ancient; for we find Homer makes his heroes first put off their *chlæna*, and afterwards their tunics or coats.

CHLAMYDIA, in *Botany*, Gært. See PHORMIUM.

CHLAMYDULA, in *Antiquity*, a small upper garment worn by children. See CHLAMYS.

CHLAMYS, among the Romans called *paludamentum*, in *Antiquity*, a military habit, worn by the ancients over the tunica. Chlamys was the same, in time of war, that the toga was in time of peace; each belonged to the patricians. It did not cover the whole body, but chiefly the hind-part; though it also came over the shoulders, usually the left shoulder, so as to leave the right arm at liberty, and was fastened with a buckle on the breast. There were four or five kinds of chlamys; that of children, that of women, and that of men, which last was divided into that of the people, and that of the emperor. The consuls and generals, before they set out for the field, went to the capitol dressed in this robe, in order to pray and make

vows to the gods, and threw it aside on their return, entering the city in the toga.

CHLËNN, in *Geography*, a town of Bohemia, in the circle of Koniggratz; 18 miles S.E. of it.

CHLJASMA, in *Medicine*, a warm fomentation of the moist kind: as pyria is of the dry kind.

CHLOEIA, in *Antiquity*, a festival celebrated at Athens, in honour of Ceres, to whom, under the name *χλωος*, i. e. *grofs*, they sacrificed a ram.

CHLOPAN, in *Geography*, a town of Poland, in the palatinate of Volhynia; 72 E.N.E. of Luncko.

CHLORA, in *Botany*, (said to be so called from *χλωρος*, pale or greenish yellow, alluding to the colour of the flowers.) Linn. Syst. Nat. 1258. Reich. 519. Schreb. 653. Willd. 752. Juss. 142. Vent. 2. 425. (Blacktonia; Hudf. Flor. Ang. ed. 1.)

Class and order, *œlandria monogynia*, Nat. Ord. *Rotaceæ*, Linn. *Gentianeæ*, Juss. Vent.

Gen. Ch. Cal. Perianth eight-leaved; leaves linear, permanent. Cor. monopetalous, salver-shaped; tube shorter than the calyx, coating the germ; border eight-cleft; segments lanceolate, longer than the tube. Stam. Filaments eight, very short, seated in the throat; anthers linear, erect, shorter than the segments of the corolla. Pist. Germ ovate-oblong; style filiform; stigma four-cleft. Peric. capsule ovate-oblong, somewhat compressed, furrowed, one-celled, two-valved; valves incurved on the side. Seeds numerous, minute.

Ess. Ch. Calyx eight-leaved. Corolla monopetalous, eight-cleft. Capsule one-celled, two-valved, many-seeded. Stigma four-cleft.

Sp. 1. *C. perfoliata*. Linn. Syst. Nat. 1. Mart. 1. Lam. Encyc. 1. Willd. 1. (*Gentiana perfoliata*; Linn. Sp. Pl. Centaureum luteum perfoliatum, Bauh. Pin. 278.) Yellow centaury. “Leaves perfoliate.” Root annual, small, twisted. Whole herb glaucous, intensely bitter. Stem from three inches to three feet high, erect, cylindrical, dichotomous near the top. Leaves quite entire, smooth, egg-shaped, acute. Flowers from the forks of the stem, solitary, peduncled, of a golden hue; leaves of the calyx generally eight, border of the calyx generally eight-cleft; filaments generally eight; stigma red, two-cleft; segments bifid. A native of a calcareous soil in England, and the southern part of the continent of Europe. 2. *C. quadrifolia*, Linn. Syst. Nat. 2. (*Gentiana*; Linn. Sp. Plant.) “Leaves growing by fours.” Stem about seven inches high, simple, somewhat quadrangular, jointed. Leaves in whorls, linear, a little broader towards the top, rather obtuse, the length of the internodes. Peduncles five, terminal; the fifth intermediate; each with two opposite bractes about the middle; corolla eight-cleft as in the preceding, but the segments smaller. A native of the south of Europe. Linnaeus supposed it a hybrid plant produced from *Chlora perfoliata*, and *Linum quadrifolium*. 3. *C. dodocandria*, Linn. Syst. Nat. 3. Mart. 4. Lam. Encyc. 3. Willd. 3. (*Chironia*; Linn. Sp. Pl. *Gentiana*; Gron. Virg.) “Leaves opposite; corollas twelve-cleft.” Flowers flesh-coloured; calyx twelve-cleft; segments linear, erect; corolla twelve-cleft, longer than the calyx; segments lanceolate. Stamens twelve; anthers oblong, spiral; germ roundish; style long, twisted; stigma simple. A native of Virginia. 4. *C. imperfoliata*, Linn. Juss. Sup. 218. Mart. 2. Lam. Encyc. 4. Willd. 5. “Corollas six-cleft.” Root annual. Stem about four inches high, herbaceous, quite simple, erect, quadrangular. Leaves opposite, sessile, half-embracing the stem, egg-shaped, smooth, acute, shorter than the internodes. Flower yellow,

low, larger than the leaves, terminal, peduncled; calyx one-lobed, campanulate, the length of the corolla, bifid beyond the middle, spreading, permanent; segments lanceolate; corolla monopetalous, falver-shaped: tube short, spreading; border longer, with six oval segments; filaments six, awl-shaped, a little longer than the tube, and attached to it; anthers roundish; germ oblong; styles two, agglutinated together; stigmas obtuse. A native of Italy. The fruit of this plant is unknown, and nearly all its known parts of fructification are totally at variance with the generic character; it cannot therefore be a chlora, as that genus is at present understood, notwithstanding its agreement in habit with *C. perfoliata*, from which the generic character was originally formed. *C. dodecandra* is in the same predicament; and, on account of its spiral anthers, had perhaps better have been left with *Chironia*, where Linnæus once placed it.

CHLORANTHUS, (from $\chi\lambda\omicron\rho\omicron\varsigma$, pale yellow, and $\alpha\lambda\omicron\upsilon\varsigma$, a flower.) Mart. Wild. L. Herit. Sett. Ang. 35. tab. 2. Swartz. Phil. Transf. Vol. 77. tab. 14. Jul. 423. (*Nigrina*; Schreb. 212. Lam. Ill. 185. tab. 71. Poir. in Encyc.) Class and order, *terrandria monogynia*. Nat. Ord. uncertain; supposed by Jussieu to have some affinity to *Viscum*.

Gen. Ch. Cal. none. Cor. monopetalous, scale-like, three-lobed, concave within, convex outwards, half-superior, attached to the outer side of the germ. Stam. filaments none; anthers four, oval-oblong, sessile, adnate to the petal within towards its edges. Pist. germ half-superior, egg-shaped; style none; stigma capitate, somewhat two-lobed. Peric. Berry oval, somewhat mucronate at the tip, transparent at the base, one-celled. Seed single, roundish.

Eff. Ch. calyx none. Petal scale-like, three-lobed, fixed to the side of the germ. Anthers adnate to the inner side of the petal. Berry one-seeded.

Sp. *C. inconspicuus*. A toisoniferous under shrub. Stems about a foot high, cylindrical, procumbent at the base, throwing out roots from the lower knots. Leaves about two inches long, and opposite, oblong-ovate, revolute, somewhat wrinkled, spreading, flat, permanent; petioles short, opposite, uniting at the base into a kind of ring, which supports two awl-shaped erect stipules. Flowers pale yellow, in a terminal panicle composed of opposite spikes, arranged in pairs on a common receptacle, each accompanied by a small scale-like bractæ. The ripe fruit is marked towards the top with the scars of the corolla, and its bractæ, which, as Jussieu observes, proves it to be truly inferior. A native of China and Japan, and cultivated by the Chinese in their gardens. It was introduced into the royal garden at Kew, in 1781, by Dr. James Lind.

CHLORAS, in *Zoology*, one of the synonyms of *Simia Mermon*. Brevlaufer.

CHLOREUS, in *Ornithology*, a name given by Turner and others to the common yellow-hammer, *Emberiza Citrinella*; which see.

CHLOREUS, is also a name assigned by several of the early writers to the golden oriole, *Oriolus gallula*.

CHLORION, of Gesner, in *Ornithology*, the golden oriole, *Oriolus gallula* of Linnæus.

CHLORIS, *Chloris ludoviciana vulgo Papa dicta*. Briff. See *EMBERIZA ciris*.

CHLORIS indica, Briff. the yellow finch. See *FRINGILLA luteirostris*.

CHLORIS bahamensis. Briff. See *FRINGILLA bicolor*.

CHLORITE, in *Mineralogy*, *Saint Erle*, or *pearls of the Cornish* mines, a species of the muriatic genus in the arrangement of Kirwan, (Vol. I.) which he distributes into

3 families. The first is in a loose form; colour, grass-green, or greenish-brown, or dark-green inclining to black; external lustre o. i; it feels greasy, shews a white streak, and gives an earthy smell when breathed on. It is found in scales either inclosing other stones or heaped together. It melts into a dull black compact slag, and then becomes magnetic. By the analysis of Mr. Hæpner it contains 0.4375 magnesia, 0.375 silica, 0.0417 argill, 0.0166 calx, and 0.1092 iron. 2. Sands. 133. The second family is indurated and crystallized: colour, dark-green, almost black; form oblong, quadrangular, and acuminate. Lustre, 1; transparency, 0. Fracture earthy, but somewhat scaly. Hardness, 6; not remarkably heavy; gives a mountain green streak; feels meagre; does not effervesce with acids. Feib. Briefe. 43. According to Hæpner, it contains 0.415 silica, 0.3047 magnesia, 0.0613 argill, 0.015 calx, 0.1015 iron, 0.015 air and water. 1. Chy. Ann. 1790. 56. The third family is stony. It is said to abound with garnets and magnetic iron stone. According to Baron Bern. (1 Raab. 247.) its colour is greenish grey; according to others, dark-green, inclining to black. Internal lustre, 1.2; transparency, 0; fracture more or less perfectly flaty, sometimes curved flaty, or passing into the scaly foliated; and then accompanied with more lustre and a darker colour. Fragments flattened. Gives a mountain green streak, feels smooth and somewhat greasy. Hardness, 5.4.

CHLOROPUS, in *Ornithology*, the common water-hen or moor-hen of Will. Penn. &c. The common gallinule of Latham Syn. and *fulica-chloropus* of Linnæus and Gmelin, which see.

CHLOROSIS, in *Medicine*, the *green-sickness*, from $\chi\lambda\omicron\rho\omicron\varsigma$, green, or pale, a disease peculiar to young women, about the period of the commencement of menstruation; the most obvious and characteristic symptom of which is an extremely pallid complexion, frequently with a tinge of yellow, sometimes verging towards green. It has hence been also called occasionally, from the days of Hippocrates, *icterus albus*, or *cubite jaundice*.

This disease usually commences with languor, lassitude, and indispotion to motion or exertion; and a failure of animation or depression of spirits. The stomach is deranged in its functions, and various symptoms of dyspepsia, such as heartburn, nausea, acid eructations, &c. appear; the appetite for natural food is diminished, and a depraved appetite for indigestible substances, such as chalk, or earth, ensues. The respiration becomes short and difficult, especially upon every slight exertion, such as ascending the stairs, or any declivity, and on these occasions the heart is frequently seized with palpitation. The patient complains of considerable pain in the loins and head, and frequently in the whole of the muscles of the limbs. The bowels are often irregular in their evacuations, most frequently inclined to constipation. The skin over the whole body becomes extremely pallid, sometimes nearly white, more frequently fallow, and in the advanced stages a slight greenish-tinge is occasionally observed; the lips lose altogether their redness; and the eyes become of an excessive pearly whiteness. As the disease proceeds, the legs and feet become œdematous, especially in the evening, and the serum flows into the cellular membrane of the eyelids, which are swelled and livid in the morning, and at length into that of the whole body, producing a general anasarca. In this condition of the body, some of the viscera, as the stomach, liver or spleen, become occasionally affected with some organic disease, the functions generally fail, and the patient dies, tabid or dropsical. This termination, however, is rare; for the chlorosis, in general, is readily removed by medicine and regimen.

CHLOROSIS.

It is obvious, from this enumeration of the symptoms, that the disease is connected with a great debility or atony of the whole system, and especially of the circulation. Hence the languor and lassitude, and pains in the muscles, especially on being exerted; hence the imperfect secretions of the stomach and liver, and intestines, which give rise to indigestion, flatulence, constipation, &c.; and hence the deficiency of that healthy complexion of the skin, which the free and vigorous circulation of the blood through the cutaneous vessels produces. The pain of the back, which is an almost constant symptom of chlorosis, arises partly from the state of atony in the muscles, as in other diseases where the strength is much impaired, but chiefly perhaps from the disordered state of the uterus.

The chlorotic condition of the body is so commonly connected with a partial or complete retention of the menstrual discharge, or *amenorrhœa*, that the latter is frequently considered as an almost synonymous term, and by the females themselves all the symptoms of chlorosis are attributed solely to the amenorrhœa. This, however, is undoubtedly an erroneous notion. The general debility of the system is the common cause of the non-appearance of the monthly discharges, and of those other symptoms which constitute chlorosis, both the one and the other are symptoms of the general morbid state of the habit. Thus all the symptoms of chlorosis occur occasionally when the menses continue to appear at the regular periods. Many of the symptoms are sometimes observed, in which neither the colour of the skin, which characterizes chlorosis, is present, nor are the catamenia suspended. And a suspension of the catamenia, where the chlorotic condition does not take place, is a very common occurrence. Indeed, whatever occasions a considerable reduction of the strength, at any period of life, generally causes a suppression of the menses; such as a want of nutritive food, watching, chronic diseases, &c. But it is chiefly about the period, when the discharge of the menses first appears, or when it has already appeared partially, but not yet attained its regularity, that this debility, which induces chlorosis, is readily excited. Why the body should at that period be thus easily diseased, it is very difficult to explain satisfactorily.

The causes which induce chlorosis are more easily ascertained. Whatever contributes to reduce the strength of the system, or greatly to disturb the digestive organs, at the period of life just alluded to, tends to produce a chlorotic condition. Hence the occasional causes of chlorosis are as various as the sources of debility. Fatigue, loss of sleep, deficiency of nutritive food, previous diseases, exposure to cold, a sedentary mode of life, grief, and other depressing passions, are frequent causes of this disease. But of all the mental causes, love, which "feeds on the damask cheek," is said to be the most common source of chlorosis. The habits, therefore, of all conditions of society are favourable to the frequent production of the complaint. The crowded and close streets, the small unventilated tenements, in which young females of the poorer class, occupied in sedentary occupations, scarcely ever enjoy the benefit of free air, together with their scanty and poor diet, render this class of girls very obnoxious to the attacks of chlorosis. And, to use the words of an intelligent physician, "we cannot be surprised that young ladies of the highest rank should suffer equally; eight months of the year they sit on thick carpets, in close rooms, heated by register stoves; have large fires kept in their bed rooms, never stir out except in carriages, and are often too much restricted in their diet. The weakness and extreme irritability, induced by this mode of living, not only bring on the chlorotic state, but after the

slightest exposure to damp or cold air, render them also liable to be affected with pains and inflammations of the bowels, rheumatism, head-ach, catarrh, phthisis, &c." See Willan Diss. of London, p. 175.

With respect to the *proximate cause* of chlorosis, perhaps little that is satisfactory can be said. As the disease is most commonly connected with a retention of the catamenia, and occurs solely, or almost solely, at that period of life, when the organs destined for the work of generation are evolved, or attain their mature condition, the general laxity and debility of the system, upon which all the symptoms, even the amenorrhœa, depend, have been attributed to some morbid condition of the *ovaria*. Thus a celebrated professor has remarked, that as a certain state of the ovary in females prepares and disposes them to the exercise of venery, about the very period at which the menses first appear, it is to be presumed that the state of the ovary and that of the uterine vessels are in some measure connected together; and as generally symptoms of a change in the state of the former appear before those of the latter, it may be inferred, that the state of the ovary has a great share in exciting the action of the uterine vessels, and producing the menstrual flux. But analogous to what happens in the male sex it may be presumed, that in females a certain state of the genitals is necessary to give tone and tension to the whole system; and therefore that, if the stimulus arising from the genitals be wanting, the whole system may fall into a torpid and flaccid state, and from thence the chlorosis and retention of the menses may arise. Cullen, first lines, 1521. This hypothesis possesses the recommendation of ingenuity, but it does not remove every difficulty. It is not clear that the morbid condition of the ovary, like that of the uterine vessels, or of the constitution at large, is not rather a consequence of the general debility, than a cause of it.

It is fortunate, that in this, as in many other diseases, concerning the nature of which physicians have differed in sentiment, we have a more solid basis than that of hypothesis, on which the cure is accomplished; namely, experience. In the disease in question, as general debility is the apparent source of all the symptoms; so experience has shewn, that those expedients and medicines which restore the strength of the constitution, remove all the symptoms of the disease. In a state of mere debility of the system, unconnected with any organic disease, although medicine can do much, yet much is also to be done by regimen and the general conduct of the patient. One of the most powerful means of strengthening the frame is regular *exercise* in the open air. This should, therefore, be steadily and daily resorted to, according to the condition of the constitution, increasing the quantity and degree of it in proportion to the increasing powers of the patient. It is most effectual in the pure air of the country, and hence it is advisable to resort to it where it is in the power of the patient; as a regularity of diet and hours will also materially aid the general plan. It is, doubtless, in these circumstances principally, that numbers of chlorotic females speedily recover their strength, complexion, and the healthy functions of the uterus, at the watering-places, where exercise, temperance, regularity, and good air, contribute to the attainment of health. And among those who are unable to obtain that sort of benefit, still the effects of medicines are aided in a most important degree by regular exercise in the open air.

A variety of medicines have been employed by different practitioners for the cure of chlorosis and amenorrhœa; some, with a view of strengthening the flaccid and languid system, and others, with a view of stimulating the uterine vessels in particular. The latter, from their supposed effect

CHLOROSIS.

in exciting the flow of the menses, have been termed *emmenagogues*.

Among the general tonic, or strengthening medicines, iron, or, as it is improperly named, *fleel*, in its different preparations, is the most valuable and effectual remedy. Some physicians have gone so far as to consider it as a specific in chlorosis; a notion which, though in itself absurd, implies the general success with which they have employed this medicine. It has been administered in almost all its preparations with advantage; most frequently in the form of a sulphate, or saline compound with the sulphuric acid, (ferrum vitriolatum of the Pharmacopœias), or of rust (ferri rubigo). A mixture, which was administered with considerable success by Dr. Griffiths, and is now celebrated under his name, has been universally employed; it consists of the ferrum vitriolatum, with the vegetable alkali, and myrrh. It is obvious, however, that the result of this mixture must be a decomposition of the sulphate of iron, a formation of a neutral salt (the sulphate of pot-ash) and a precipitation of the oxyd of iron in an impalpable powder. Instead, therefore, of taking the salt of iron, the patient swallows a nauseous mixture of Glauber's salt, with the oxyd of iron, and myrrh. This precipitate, freed from the Glauber's salt, is a carbonated oxyd of iron, and may be collected and given in a more simple form, or combined with other ingredients; it is, perhaps, the least offensive to the stomach, and one of the most efficacious preparations of iron. Being in a more impalpable powder, it may supersede the rust of iron, which has been long administered with success, as it may be retained on the stomach in a larger dose. In whatever form the iron is given, it contributes greatly, with exercise and good air, to improve the digestive powers, and to promote a more perfect assimilation of the food, and also, by accelerating the circulation, to restore the impeded secretions, and the languid action of the uterine, as well as the other parts of the system. The small quantity of iron contained in the chalybeate waters is very minute, in comparison with the quantity which may be received into the system in the forms of artificial combination; and the advantages of a watering-place are therefore probably not to be imputed to this source, as has been already hinted.

With the same intention of supporting the strength, other tonic medicines may occasionally be employed; such as the various bitters, bark, gentian, &c.; combined with cordials, where the action of the stomach is extremely feeble; or with absorbents, such as magnesia, where there is a preva- lence of acidity in that organ. The aromatic gums, or gum-resins, seem to afford a grateful stimulus to the digestive organs, and are often conjoined with the preparations of iron, especially in the form of pills. The cautious application of cold, where there is still sufficient energy in the constitution, has been attended with great benefit, as in the form of a shower-bath: and a bath of the temperature of about 80°, such as that of Buxton, has proved efficacious. But on the whole, the practice may be considered as unsafe, until the patient is in a state of convalescence, and has regained a considerable portion of her strength.

In the writings of the older physicians many medicines are enumerated under the title of "Emmenagogues," and their specific action on the uterus is contended for; and among the vulgar, at present, several articles are believed to be possessed of that power, which they administer on every occasion of menstrual stoppage. But the evidence in favour of the existence of such powers is so unsatisfactory, that the notion of a specific emmenagogue is now generally discarded. The *melampodium*, or black bell-bore, was recommended in the strongest terms by Dr. Mead; he affirmed that it rarely

failed to produce the menses, and that, when it did, hæmorrhages occurred from some other part. But subsequent experience has not confirmed this extraordinary encoium. The medicine is a strong general stimulant. Savin is another hot and irritating vegetable, which has been said to exert powerful effects on the uterus, which it perhaps may sometimes excite, in common with rest of the body, by its diffusible stimulus. Dr. Home (Clinical Obs. and Exp. p. 385.) considers it as possessed of emmenagogue qualities.

There are two other classes of medicines, which sometimes induce a flow of the menses, by their action upon the parts adjoining the uterus; these are purgatives which stimulate the rectum or lower end of the intestines; and those medicines, which, being carried off in the urine, stimulate the bladder; such as cantharides, the balsams, and other terribinathate substances. The powers of the latter are but slight; but an acrid purgative is perhaps one of the most direct promoters of the catamenia in the catalogue of the *Materia Medica*. The pediluvium is occasionally employed to restore the menstrual discharge, and frequently with the desired effect, if it be resorted to about the regular period at which the discharge is expected, and when the pains of the back, &c. betoken a disposition in the constitution to perform its healthy function. The strong stimulus of the electric fluid has been sometimes directed to the region of the uterus, by passing slight shocks across the pelvis, with the effect of bringing on the catamenia. Like the remedies just mentioned, it is very uncertain in its operation, and may be resorted to with the greatest prospect of success at the approach of the regular period.

We have said nothing of the rubia tinctorum, or madder, and some other substances extolled as emmenagogues; nor of the inspiration of oxygen gas, recommended by Hufeland and Dr. Thornton, because the evidence in favour of these remedies is altogether unsatisfactory.

But after all that is said respecting emmenagogues, it must be remembered, that the amenorrhœa, or retention of the menses, is not the cause, but one of the symptoms of the chlorotic condition; and, therefore, that a partial stimulus to the uterus can but partially remove the disease, which will cease only with the removal of the general debility.

It may be added, that the natural stimulus to the uterus is the exercise of venery, and that where marriage is impending, it may be delicately recommended to be accelerated according to circumstances.

Dr. James Hamilton of Edinburgh, in a valuable treatise on purgative medicines lately published, observes, that chlorosis is often attended with a torpor of the intestines and constipation, and that the daily use of purgatives, in laxative doses, until the black and fetid stools assume a natural appearance, is followed with great success. It will not be denied, that a sluggish action of the bowels frequently accompanies chlorosis, and that the colour of the stools is dark in consequence of the morbid secretions of the intestines and the liver, and also that this state of the canal, though perhaps an effect in the first instance, becomes a cause of aggravation to the disease in general. Hence, there is an obvious necessity of preserving a regularity of the intestinal evacuations in this disease. And hence, perhaps, Dr. Friend found mercury a good emmenagogue, and Dr. Paris in selected the disease to torpor of the liver. Nevertheless, the general languor and debility oppose the idea of active purgation, and suggest the propriety of combining the general tonic plan, with a careful relaxation of the bowels.

CHLOROXYLON, in *Botany*. Brown, Jam. See *LAURUS chloroxylon*.

CHLORUS, in *Ancient Geography*, a river of Asia, placed by Pliny in Cilicia.

CHLUMETZ, in *Geography*, a town of Bohemia, in the circle of Koniggratz; 5 miles S. of it.

CHMICLOWKA, a town of Poland, in the palatinate of Braclau; 46 miles E.N.E. of Braclau.

CHNA, in *Ancient Geography*, a name which, according to Steph. Byz. was formerly given to Phœnicia; but according to Bochart, it is the diminutive of Canaan.

CHNIM, in *Geography*, a strong town of Bosnia, belonging to the Venetians; 15 miles S. of Banjaluka.

CHNUMBMIS, or **CHNUMIS**, in *Ancient Geography*, an ancient town of Egypt, placed by Ptolemy in the nome of Thebes.

CHNUS, in Hippocrates, is a fine soft wool, to which he compares an aqueous spleen, on account of its softness.

CHOAKING the luff, in *Rigging*, denotes placing the bight of the leading part, or fall of a tackle, close up between the nest part and jaw of the block.

CHOAM-YU SO, in *Geography*, a town of China, in the province of Quang-tong; 16 leagues E.S.E. of Kao-tcheon.

CHOAN, in *Grecian Antiquity*, so called from the $\chi\omicron\alpha\eta$, a libation, an epithet applied among the Athenians to sacrifices that were offered for appeasing the manes of the deceased. They consisted of honey, wine, and milk.

CHOANA, in *Ancient Anatomy*, a cavity in the brain like a funnel, called also *pelvis*.

CHOANA, in *Natural History*, one of the synonymous names of *MADREPORA infundibuliferis*. Gualt. (t. 11. 24.) calls it *Choana faxea crispata rugosa, minimis poris*.

CHOANA, or **CHOANA**, called *Choana* by Diodorus Siculus, in *Ancient Geography*, an ancient town of Asia, in Media, according to Ptolemy.—Also, an ancient town of Asia, placed by Ptolemy in Bactriana.—A so, a town placed by the same geographer in Parthia.

CHOANI, the name of an ancient people placed by Pliny in Arabia Felix.—Also, a people placed by Marcian of Heraclea in Europe, near the Borythenes and the Alauni.

CHIOAPA, in *Geography*, a small harbour on the coast of Chili in South America, in about S. lat. $31^{\circ} 42'$.

CHIOARA, in *Ancient Geography*, the name of a country of Asia, placed by Pliny in the western part of Parthia.

CHIOARAXES, a river of Asia, which served as a boundary between the Colchide territory and Armenia, according to Strabo.

CHIOARENA, or **CHIOARINA**, a district of Asia in the country of the Parthians according to Strabo; it was that region of Parthia which was nearest to India.

CHIOASPA, a town of Arachofia, according to Ptolemy.

CHIOASPES, a river of India, according to Strabo. It discharged itself into the Cophes on the confines of Arachofia.

CHIOASPES, or **CHIOASIS**, the modern *Abwas*, a river of Asia, the source of which is placed by Pliny in Media, and he says it ran into the Pasitigris. According to Strabo, this river had its source in the country of the Uxians, traversed Susiana, and discharged itself into a lake which also received the Euleus and the Pasitigris. This river is said to have flowed into the Persian gulf by a separate mouth, though it had a communication with the Tigris. Herodotus says, that the Choaspes washed the walls of Susa, and that the Persian kings drank no other water besides that of this river, which they carried about with them in silver vessels, whithersoever they went. Pliny places the city of Susa on the banks of the Euleus, or the Ulac of the prophet Daniel, and according to this

writer, the Persians drank no other water; whence it is inferred, that the Choaspes and the Euleus were the same river, at least at Susa. From this city they flowed in one stream, and were afterwards distinguished, sometimes by one name, sometimes by the other. Although the ancient Susa decorated the banks of this river, the modern towns of Kiab and Abwas are of small account.

CHIOASPITES, in *Natural History*, a name given by the ancients to a species of the *chrysopterus*, a gem of a colour between yellow and green. It was called *choaspites* from the name of a river in which it was frequently found.

CHIOATRA, in *Ancient Geography*, a mountain of Asia, which branched out from the Gordyean mountains on the confines of Assyria and Armenia, and which separated Media from Assyria.

CHOBAR, a river which discharged itself into the Euphrates. See **CHABORAS**.

CHOBAT, a town of Africa, in Mauritania Cæsariensis, called in the Itinerary of Antonine Caba, represented as a municipium, and placed between Mussubium and Igilzilis.

CHOBATA, a town of Asia in Albania, placed by Ptolemy between the rivers Albanus and Casus.

CHOBOLTIVO, in *Geography*, a town of Poland in the palatinate of Volhynia; 36 miles W. of Lucko.

CHOBUS, **КЕМНАЛ**, in *Ancient Geography*, a river of Asia in the Colchide territory, between the Charius and Singama, according to Arrian. Pliny calls it Cobus, and adds, that it had its source in mount Caucaus, and traversed the country of the Suani. It ran from the north to the south-east, and fell into the Euxine sea to the north of the mouth of the Phasis.

CHOC, **SHOCK**. This word or term is employed, in *Military Language*, to express the act of two corps encountering or engaging each other. In speaking also of two hostile corps, who have only had a brush, or some skirmishing, it is said, that there has been *un choc*, a shock between them.

CHOC Bay, in *Geography*, a bay on the W. coast of the island of St. Lucia, a little to the N. of Carenage bay.

CHOCCHARMO, a town of Asia in Thibet; 27 miles N.E. of Tolon-Hotun.

CHOCCE, in *Ancient Geography*, a town of Arabia Deserta.

CHOCHE, a village of Asia, situated near the Tigris, according to Arrian.

CHOCK, in *Sea Language*, a wedge used to confine a cask, or other heavy body, to prevent it from fetching away when the ship is in motion.

CHOCK is also a triangular piece of wood fastened occasionally in the strap at the arse of the block: on the base of which wedges are driven to force the block into its place.

CHOCK is also a short mallet for boats, by which they are towed along.

CHOCKS, denote, in *Mast-Making*, pieces made to fashion out some part that is wanting, or to place between the head of a lower-mast and heel of a top-mast.

CHOCO, in *Geography*, a province of South America, in the vice-royalty of New Granada, bounded on the N. by the province of Darien and Carthagena, on the E. and S. by Popayan, and on the W. by the Pacific Ocean. The soil, climate, products, &c. are similar to those of Popayan.

CHOCOLATE, a kind of cake or confection, prepared of certain drugs; the basis or principal whereof, is the *cacao-nut*. See **THEOBROMA**.

The trees that produce these nuts grow plentifully on the banks of the river Magdalena in South America, and in other situations where the soil is adapted to them; but the

C H O C O L A T E.

in the jurisdiction of Carthagena are said to excel those of the Caracacs, Maracaybo, Guayaquil, and other parts; both as to the size and goodness of the fruit. The Carthagena cacao or chocolate is little known in Spain, being only sent by way of presents; for, as it is more esteemed than that of other countries, the greater part of it is consumed in this jurisdiction, or sent to other parts of America. It is also imported from the Caracacs, and sent up the country; that of the Magdalena not being sufficient to answer the great demand of these parts. The former is mixed with the latter, as it serves to correct the extreme oiliness of the chocolate when made only with the cacao of the Magdalena. The latter, by way of distinction from the former, is sold at Carthagena by millares, whereas the former is disposed of by the bulliel, each weighing 110 pounds: but that of Maracaybo weighs only 96 pounds. The cacao tree abounds in the district of Guayaquil, and is generally not less than 18 or 20 feet high. It begins from the ground to separate into four or five stems, according to the vigour of the root from whence they all proceed. They are commonly between four and seven inches in diameter; but they first grow in an oblique direction, so that the branches are expanded and separated from one another. The length of the leaf is between four and six inches, and its breadth three or four. It is very smooth, soft, and terminating in a point, like that of the China orange tree, but differing from it in colour: the former being of a dull green, and having no gloss which is observable on the latter; nor is the tree so full of leaves as that of the orange. The pods, that contain the cacao, grow from the stem, as well as from the branches. The first appearance is a white blossom, whose pith contains the embryo of the pod, which grows to the length of six or seven inches, and four or five in breadth, resembling a cucumber in shape; and striated in a longitudinal direction, but deeper than the cucumber. These pods are proportionable in their dimensions to the stem or branch, to which they adhere in the form of excrescences, some smaller and others larger. When two happen to grow in contact, one of them attracts all the nutritive juice, and thrives on the decay of the other. The colour of the pod, while growing, is green, like that of the leaf; but when arrived at its full perfection, it gradually changes to a yellow. The shell that covers it is thin, smooth, and clear. When the fruit is arrived at its full growth, it is gathered; and being cut in slices, its pulp appears white and juicy, with small seeds regularly arranged, and at that time of no greater consistence than the rest of the pulp, but whiter, and enclosed by a very fine delicate membrane, full of liquor, resembling milk, but transparent and somewhat viscid: in this state it may be eaten, like any other fruit; its taste being a sweetish acid, but thought in the country to promote fevers. The yellowness of the pod indicates that the cacao begins to feed on its substance, to acquire a greater consistence, and that the buds begin to fill; the colour gradually fading till they are fully completed, when the dark brown colour of the shell, into which the yellow has deviated, indicates that it is a proper time to gather it. The thickness of the shell is now about two lines, and each seed found enclosed in one of the compartments, formed by the transverse membranes of the pod. After gathering the fruit, it is opened, and the seeds taken out and laid in skins kept for that purpose, or more generally on vijahua leaves, and left in the air to dry. When fully dried, they are put into leather bags, sent to market, and sold by the carga or load, which is equal to 81 pounds; but the price is not fixed, as it is sometimes sold for six or eight rials per carga, though less than the charge of gathering; but the general

price is between three and four dollars, and at the time of the armadas, when the demand has been very large, rises in proportion. This tree produces its fruit twice a-year, and in the same plenty and goodness of quality. The quantity gathered through the whole jurisdiction of Guayaquil amounts at least to 50,000 cargas. The cacao trees so much delight in water, that the ground where they are planted must be reduced to a mire; and if not carefully supplied with water, they die. They must also be planted in the shade, or defended from the perpendicular rays of the sun. Accordingly, they are always placed near other larger trees, under the shelter of which they grow and flourish. No soil can be better adapted to the nature of these trees than that of Guayaquil, as it favours them in both respects; in the former, as consisting wholly of savannahs, or wide plains overflowed in winter, and in summer plentifully watered by canals; and with regard to the latter, it abounds with other trees, which afford them the requisite shelter. The culture of this tree requires no other attention besides that of clearing the ground from the weeds and shrubs that are abundant in so wet a soil. This, indeed, is so necessary, that, if neglected, these vegetables will, in a few years, destroy the cacao plantations, by robbing the soil of all its nourishment. See GUAYAQUIL.

The name *chocolate* is also given to a drink, prepared from the above-mentioned cake, of a dusky colour, soft, and oily; usually drank hot, and esteemed not only an excellent food, as being very nourishing, but also a good medicine; at least a diet, for keeping up the warmth of the stomach, and assisting digestion.

The Spaniards were the first who brought chocolate into use in Europe; and that, perhaps, as much out of interest, to have the better market for their cacao-nuts, vanilla, and other drugs which their West Indies furnish, and which enter the composition of chocolate, as out of regard to those extraordinary virtues which their authors so amply enumerate in it. The qualities above mentioned are all that the generality of physicians, and others, allow it.

CHOCOLATE, original manner of making. The method first used by the Spaniards was very simple, and the same with that in use among the Indians: they only used cacao-nut, maize, and raw sugar, as expressed from the canes, with a little achiotte, or rocan, to give it a colour: of these four drugs, ground between two stones, and mixed together in a certain proportion, they made a kind of bread, which served them equally for solid food, and for drink; eating it dry when hungry, and steeping it in hot water when thirsty. The Indians, to one pound of the roasted nuts, put half a pound of sugar, dissolved in rose-water, and half a pound of flour of maize.

This drink the Mexicans called *chocolate*, from *chacoc*, *found*; and *alte*, or *ate*, *water*; q. d. *water that makes a noise*: from the noise which the instrument, used to mill and prepare the liquor, made in the water.

But the Spaniards, and other nations, afterwards added a great number of other ingredients to the composition of chocolate; all of which, however, vanilla alone excepted, spoil rather than mend it.

CHOCOLATE, method of making, now in use among the Spaniards of Mexico. The fruit, being gathered from the cacao-tree, is dried in the sun, and the kernel taken out, and roasted at the fire, in an iron pan pierced full of holes; then pounded in a mortar; then ground on a marble stone, with a grinder of the same matter, till it be brought into the consistence of a palle: mixing with it more or less sugar, as it is to be more or less sweet. In proportion as the palle ad-

vances,

They all find in pepper, little achiote, and, (1 lb.), vanilla; for 1 lb. of non. cloves, and anice; and those who love perfume, make as 1 lb. of rose. To 6 lbs. of the nut, they add $\frac{1}{2}$ lb. of sugar, 7 pods of vanilla, or the seeds of 4 dozen vanilla, $\frac{1}{2}$ lb. of oil of rose, $\frac{1}{2}$ lb. of cinnamon, 6 cloves, one dram of capsaicum, and as much of the rose-water as is thought necessary to improve the colour, together with ambergris or musk, to impart an agreeable scent. In the more simple and common way, 10 lbs. of nuts are added 10 lbs. of sugar, 28 pods of vanilla, one dram of ambergris, and 6 ounces of cinnamon.

There is also a kind of Mexican chocolate, in the composition whereof there enter almonds and fibres; but it is rather to spare the cacao, than to render the chocolate better; and, according^{ly}, this is looked on as sophisticated chocolate.

Chocolate, *the made in Spain*, differs somewhat from that made in Mexico: for, besides the drugs used in this last, they add two or three kinds of flowers, pods of campeche, and generally almonds and hazel-nuts. The usual proportion, at Madrid is, to an hundred kernels of cacao, to add two grams of *chili*, or Mexican pepper; or, in lieu thereof, Indian pepper; a handful of anise; as many flowers, called by the natives *simvastilla*, or little ears; six white roses in powder; a little machusia; a pod of campeche; two drachms of cinnamon; a dozen almonds, and as many hazel nuts; with achiote enough to give it a reddish tincture; and the sugar and vanilla are mixed at discretion; as also the musk and ambergris. They frequently work their paste with orange-water, which they think gives it a greater consistence and firmness.

The paste is usually made up into cakes, sometimes into long rolls; and sometimes the cakes are made up of pure chocolate, without any admixture; those who use it being to add what quantity they please of sugar, cinnamon, and vanilla, when in the water.

Among us, in England, the chocolate is chiefly made thus simple and unmixed, (though perhaps not undulcerated) of the kernel of the cacao; excepting that sometimes sugar, and sometimes vanilla, is added; any other ingredient being scarcely known among us.

The mode of preparing the mass into a liquor, with the proportions, are various: ordinarily, the chocolate is boiled in water, sometimes in milk; and sometimes, by good economists, in water-gruel: when boiled, it is milled, or agitated with a wooden machine for the purpose, and boiled again, till it be of the proper consistence for drinking; then strained, if the mass were pure; then milled a second time, and poured off.

Note, the best chocolate is, that which dissolves entirely in the water; leaving no grounds or sediment at the bottom of the pot.

The Spaniards esteem it the last misfortune that can befall a man, to be reduced to want chocolate: they are never known to leave it, excepting for some other liquor that will mix with it.

Hoffman, in his "Potus Chocolate," 1765, considers chocolate as an aliment; and, in a medicinal view, he recommends it in evacuating diseases, both as aliment and medicine; and next very freely in hypochondriacal cases; and in confirmation, advises that of cardinal Richelieu, who, he says, was restored to health by living on chocolate. It is not less copious on its good effects against the hæmorrhoids.

The newest chocolate is esteemed the best; the drug never keeping well above two years; but usually degenerating much before that time.

It is to be kept in brown paper, put up in a box; and this in another, in a dry place.

CHOCOLATE, *laws relating to*. By 43 Geo. III. c. 68. all former duties of customs are repealed, and the following new duties imposed; viz. for cocoa-nuts of the produce of any British colony or plantation in America, and of the produce of any other country or place, on importation, 10^s. per cwt. For the conditions, regulations, and restrictions, under which cocoa nuts shall on importation be secured in warehouses, see 10 Geo. c. 10. 6 Geo. III. c. 52. A. 3. 3 Geo. III. c. 118. When taken out of such warehouses for consumption in Great Britain, they are charged with a duty of 20^s. per lb. By 43 Geo. III. c. 69. all former duties of excise are in like manner repealed, and in lieu thereof the following are imposed; viz. for every lb. weight avoirdupois of cocoa-nuts, of the growth or produce of any British colony or plantation in America, imported into Great Britain, 1^s. 10^d.; for ditto, if imported into Great Britain by the East India company, 2^s.; for ditto, of all other cocoa nuts imported into Great Britain, 3^s. No chocolate ready made, or cocoa paste, shall be imported, on pain of forfeiting the same, and double value, and also the bags, casks, and other package. 10 Geo. c. 10. §. 2. Cocoa-nut shells or hulks may be seized, and destroyed; and the officer who seizes them rewarded with any sum not exceeding 20^s. per cwt. 4 Geo. II. c. 14. §. 12. The excise officers may search ships for cocoa-nuts, chocolate, and cocoa-paste, and seize, &c. 11 Geo. c. 30. §. 1. Cocoa-nuts shall not be taken out of the warehouses, either for home consumption or exportation, but upon payment of the inland duties. 21 Geo. III. c. 55. §. 10, 11. Cocoa-nuts for which the duty has been paid, or the chocolate made of such nuts, may be exported, on security given that they shall not be re-landed; and under certain regulations, specified in 27 Geo. III. c. 13. §. 12. Every person, who shall keep a shop, &c. and have in his custody above 6 lbs. of chocolate or cocoa-nuts, shall be deemed a dealer in the said commodity. 11 Geo. c. 30. §. 4. By 20 Geo. III. c. 35. no person shall trade in chocolate without an annual licence, for which he shall pay (by 45 Geo. III. c. 64.) 5^s. 6^d. under penalty of 20^l. Houses of manufacturing or sale are to be entered, on pain of forfeiting 200^l. and goods, &c. 10 Geo. III. c. 10. §. 10. The said houses shall be marked over the doors with the words "dealer in cocoa-nuts, chocolate, &c." on pain of 200^l. 19 Geo. III. c. 64. §. 18. Any dealer buying these commodities of any person, not having his shop, &c. so marked, shall forfeit 100^l. Any person, not having entered his shop, &c. who shall print over his door the aforesaid words, shall forfeit 50^l. besides other penalties. If any person, not being a dealer, shall buy these articles, not having these words over his door, he shall forfeit 100^l. Notice shall be given to the next officer of the district, of bringing in these commodities into any shop, &c. and a certificate duly signed, expressing that the duties have been paid, and that they were condemned and forfeited, and also the quantity and quality, &c. shall be delivered, on pain of forfeiting the same and treble value. And a permit shall be given to the buyer, &c. 10 Geo. c. 10. §. 11, 15. Officers shall enter at all times by day warehouses, shops, &c. and survey, the owner assisting and keeping just weights and scales, on pain of 100^l. and forfeiture of the commodities, which may be seized by the officer. 10 Geo. c. 10. §. 12. 10 Geo. III. c. 44. §. 1. 28 Geo. III. c. 27. §. 15. Deceiving or obstructing the officer incurs a forfeiture of 100^l. 2 Geo. III. c. 77. §. 8. Search shall be made for goods concealed, and if any person obstruct the officer, he shall forfeit 100^l.; and if any seller or dealer shall conceal

any of the said goods, he shall forfeit the same and treble value; and if any person shall obstruct the officer in seizing such goods, or endeavour to rescue the same after seizure, he shall forfeit 50*l.* 10 Geo. c. 10. §. 13. 39, 40. If any article made to resemble cocoa shall be found in the possession of any dealer, under the name of American cocoa, or English or British cocoa, or any other name of cocoa, it shall be forfeited, and the dealer shall forfeit 100*l.* 4*th* Geo. III. c. 129. §. 5. The maker of chocolate, within the bills, shall weekly, and elsewhere every 6 weeks, enter in writing at the next office the weight of chocolate made by him, and clear off the duties, on pain of 50*l.*; nor shall he, after default in payment, sell or deliver any out till the duty is paid, on pain of treble value. 10 Geo. c. 10. §. 17, 18. He shall also produce at the place and time of entry the chocolate made, (on pain of 20*l.* for every pound not produced), which shall be tied up with thread in papers of 1 lb., $\frac{1}{2}$ lb., or $\frac{3}{4}$ lb. each, and neither more or less; which shall be marked or stamped by the officers. 32 Geo. II. c. 10. §. 16. Offences against these regulations incur a forfeiture of 2*l.* The counterfeiting of the stamp, or the knowingly selling of any chocolate, or the fixing of any paper with a stamp on such chocolate, as has not been entered, and on which the duties have not been paid, incurs the penalty of a forfeiture of 50*l.*, and of commitment to the next county gaol for 12 months. 10 Geo. c. 10. §. 22. 11 Geo. c. 30. §. 13. Notice shall be given by those who make chocolate for private families, and not for sale, three days before it is begun to be made, specifying the quantity, &c.; and within three days after it is finished, the person for whom it is made shall enter the whole quantity on oath, and have it duly stamped, and pay the duty, under penalty of forfeiting the same and treble value. Nor shall any person be permitted to make into chocolate for their own private use less than half a hundred weight of cocoa-nuts at a time. 10 Geo. c. 10. §. 23, 24, 25.

Mr. Henly, an ingenious electrician, discovered that chocolate, fresh from the mill, as it cools in the tin pans into which it is received, becomes strongly electrical; and that it retains this property for some time after it has been turned out of the pans, but soon loses it by being ing. The power may be once or twice renewed by making it again in an iron ladle, and pouring it into the tin pans as at first; but when it becomes dry and powdery, the power is not capable of being revived by simple melting: but if a small quantity of olive-oil be added, and well mixed with the chocolate in the ladle, its electricity will be completely restored by cooling it in the tin pan as before. From this experiment he conjectures, that there is a great affinity between phlogiston and the electric fluid, if indeed they be not the same thing. Phil. Trans. vol. lxxvii. part 1. p. 94, &c.

CHOCOLATE Creek, in *Geography*, a head-water of Tioga river in the state of New York, whose mouth lies 10 miles S.W. of the Painted Post.

CHOCOLATE-nut tree, in *Botany*. See THEOBROMA.

CHOCOLOCO-CA, in *Geography*, called by the Spaniards *Castro Virreyra*, a town of Peru, famous for its silver mines, which are at the top of a mountain always covered with snow, and a leagues from the town. Its wine also is plentiful and good. See *CASTRO Virreyra*.

CHOCOPE, a town of South America, in the country of Peru, and jurisdiction of Truxillo, 13 or 14 leagues distant from St. Pedro, and 11 leagues from Truxillo, in S. lat. 7° 45' 40". The town consists of between 80 and 90 houses, covered with earth: occupied by between 60 and 70 families, chiefly Spaniards, with some of the other casta, but not above 20 or 25 Indian families. It has a large and

VOL. VII.

cent church, built of bricks. In 1726 a rain which continued 40 nights, from 4 or 5 in the evening till about the same time in the morning, entirely ruined the houses, and even the brick church, so that only some fragments of its walls remained. Two years afterwards a similar phenomenon occurred, which lasted 11 or 12 days, but much less violent and destructive. For an account of the adjacent country, see CHICAMA.

CHOCORUA, a mountain of America, in Grafton county and state of New Hampshire, on the N. line of Stafford county, N. of Tamworth.

CHOCUITO. See CHUCUITO.

CHOCZIM, or **COKZIM**, a town of European Turkey in Moldavia, situated on the fourth side of the Danister, near the frontiers of Poland, remarkable for two victories gained here by the Poles over the Turks, one in 1621, and the other in 1683. The suburbs were destroyed by fire in 1769; on the 3d of September 1789, the city, after a long siege which reduced it almost to ruins, surrendered to the Russians. Choczim is 12 miles S.S.W. from Kamienieck, and 68 miles W.N.W. from Mogilow. N. lat. 48° 52'. E. long. 26° 59'.

CHODDA, in *Ancient Geography*, a town or village of Asia in Carmania, according to Ptolemy.

CHODIVOJA, in *Geography*, a town of Walachia; 32 miles S.S.W. of Bucharest.

CHODOROSTAU, a town of Poland, in the palatinate of Lemberg; 20 miles S.E. of Lemberg.

CHOENICIS, in *Ancient Surgery*, the trepan, so called by Galen and Ægineta, and mentioned by Celsus, where he calls it *modulus*.

CHOENIX, an Attic dry measure, containing three *cotyle*, or one *sextarius* and a half, which is two pounds and a quarter. Its mark was a χ with a γ over it.

The choenix likewise contained the forty-eighth part of a medimnus, and was otherwise called HEMEROTROPHIS.

Grotius and others have observed, on the authorities of Herodotus (lib. iii. and vii.), Hippocrates, Drogens Lartins, and Athenæus, that a choenix of corn was a man's daily allowance, as a penny (denarius) was his daily wages; and hence we may infer, (in reference to Rev. vi. 5, 6), that if his daily labour could earn no more than his daily bread, without other provision for himself or his family, corn must necessarily bear a very high price. In another mode of computation, if we reckon the choenix to be about a quart English (which is supposed not to be a full pint and a half), and the Roman penny or denarius to be about 8*d*. English, the nearest and common climate of both, without descending to greater exactness, corn at that price will be above 20*s*. per English bushel; which, when the common wages of a man's labour was but 8*d*. a day, shewed a very great scarcity of corn, next to a famine.

But whatever may be the capacity of the choenix, which is difficult to be determined, as it varied in different times and countries, yet such care and such regulations about the necessities of life imply some want and scarcity of them. Scarcity obliges men to be exact in the price and measure of things. In short, the intent of the prophecy, to which we now refer, is, that corn should be provided for the people, but that it should be distributed in exact measure and proportion. Accordingly bishop Newton observes, (Diff. on the Prophecies, vol. iii.—see also Mede on chap. vi. v. 5.) that this third period, to which the cited passage pertains, commenced with Septimius Severus, and continued under Alexander Severus and the Septimian family during 42 years. These two emperors, it is remarked, who enacted just and

4 Y

equal

equal laws, and were very severe and implacable against offences, were no less celebrated for the procuring of corn and oil and other provisions, and for supplying the Romans with them after they had experienced the want of them. The colour of the *black horse*, it is said, befits the severity of their nature and their name; and the *balances* are the well-known emblem of justice, as well as an intimation of scarcity.

Lowman (Paraphrase on the Revelations) refers this period of prophecy to that interval, which succeeded the reigns of Trajan and Hadrian. Antoninus Pius succeeded Hadrian A.D. 138. Antoninus the philosopher, partly with Verus and partly alone, and after them Commodus, governed the Roman empire, till within a few months of the reign of Severus, who began his empire, A.D. 193, a space of about 50 years. The fourth general persecution was within this period, nearly 60 years after the third general persecution by Trajan, A.D. 107. Moreover, it appears from the concurring testimonies of Tertullian (ad Scap. c. 3.), Aurelius Victor, Julius Capitol., Antoninus Pius, and Anton. Philol., and Xiphilin ex Dione, that a scarcity of provisions, approaching to famine, which occurred in every reign of the Antonines, continued to the empire of Severus, who exerted himself in redressing this evil: and thus the reign of Severus appears to be a proper termination to the judgment of this prediction.

CHOERADES, in *Ancient Geography*, an island of the Ionian sea, on the coast of Italy, near the Iapygian promontory, according to Thucydides.—Also, islands of the Euxine sea, near the Hellespont, supposed by Ortelius to have been in the Cyanean isles.—Also, a name given to the Balearic islands.—Also, islands of the Persian gulf.—Also, islands on the coast of Eubœa, near mount Caphareus, where Ajax is said to have suffered shipwreck, after having violated Cassandra.—Also, a town of Asia, in the country of the Molyndi, inhabited by Greeks. Steph. Byz.

CHOERAGIA, a place of Thrace, in the vicinity of Constantinople.

CHOERÆAS, a place of the island Eubœa, according to Herodotus.

CHOERATÆ, a lake of Peloponnesus in Sicily, according to Herodotus.

CHOERINÆ, in *Antiquity*, a kind of sea shells, with which the ancient Greeks used to give their suffrage, or vote.

CHOERIUS SALTUS, in *Ancient Geography*, a forest of Peloponnesus, placed by Pausanias near the town of Gensia, in Messenia.

CHOERORYLLUS. See *Hædæ-Hog*.

CHOES, or the *Lenæans*, in *Antiquity*, an Athenian festival in honour of Bacchus, celebrated on the 12th of the month Anthesterion. It lasted only one day; and as the inhabitants of Attica were only permitted to be present at the celebration of this festival, authors reserved their new pieces for the greater *Dionysia*, which were solemnized a month after, and which attracted from all parts an infinite number of spectators. It was usual at the festivals of Bacchus, to present tragedies and comedies to the public, and the authors thus contended for victory. See *DIONYSIA*.

CHOES, in *Ancient Geography*. See *COPHENES* and *COW river*.

CHŒUR, *French*, a chorus, or a musical composition of never less than three or four vocal parts, in which the harmony is complete, and performed simultaneously by all the voices, enforced by the orchestra. See *Tenor*, and *Base*.

CHOHAN, in *Geography*, a circle of Hindoostan, in the country of Allahabad.

CHOIHREN, or *KOHREN*, a town of Germany, is the circle of Upper Saxony, and territory of Leipzig, 20 miles S.S.E. of Leipzig.

CHOIR, that part of a church, cathedral, &c. where the clergy and choristers, or singers, are placed.

The word, according to Isidore, is derived à *coronis circumfantiam*; because, anciently, the choristers were disposed round the altar to sing; which is still the manner of building altars among the Greeks. Others derive the term choir from *χορος*, a dancer, or a company of dancers, alleging that dancing was one of the religious ceremonies of the church, although numerous anathemas against it occur in the works of the fathers, among the primitive Christians, as well as the Hebrews and Pagans. The following passage from St. Augustine's eighth sermon is cited to prove that the early Christians made dancing a part of their Sunday's amusements, and that they accompanied their sacred songs with instruments. "It is better to dig or to plough on the Lord's day than to dance. Instead of singing psalms to the psalter by lyre, as virgins and matrons were wont to do, they now waste their time in dancing, and even employ mallets in that art." The above derivation is remarkable, and not one of those that can be suspected of proceeding from fancy, and accidental similitude of sound. One of the acceptations of the term *χορος* given by Suidas, is, *το σπασμα των εν ταις εκκλησιαις αδοντων*, a company of singers in a church, that is, a choir. It seems to have been sometimes used, like our word choir, in the local sense: *χορος*, says Suidas, *και ο χορηγισται, και ο χορος*, &c. that is, dancers, and the place in which they danced. It is so used by Homer, (Od. viii. 260.) *Νεμεσος δε χορον*; they made smooth or level the place appointed for dancing. Father Menclerier (Des Ballets, anc. et mod. Paris, 1682), after speaking of the religious dances of the Hebrews and Pagans, observes, that the name of choir is still retained in our churches for that part of a cathedral where the canons and priests sing and perform the ceremonies of religion. The choir was formerly separated from the altar, and elevated in the form of a theatre, inclosed on all sides with a balustrade. It had a pulpit on each side, in which the epistle and gospel were sung, as may be still seen at Rome in the churches of St. Clement and St. Pancratius, the only two that remain in this antique form. Spain, continues this author, has preserved in the church, and in solemn processions, the use of dancing to this day. France seems to have had the same custom till the 12th century, when it was abolished by the synodical constitutions of Odo, bishop of Paris. The same author, however, in his preface, informs us, that he himself had seen, in some churches, the canons, on Easter-sunday, take the choristers by the hand and dance in the choir, while hymns of jubilation were performing. Burney's Hist. Music, Vol. ii. See *DANCING*.

The choir with us is distinguished from the chancel, or sanctuary, where the communion is celebrated: as also from the nave, or body of the church, where the people are placed.

The patron is said to be obliged to repair the choir of a church; and the parishioners the nave.

The choir was not separated from the nave, till the time of Constantine: from that time the choir was raised in with a balustrade, with curtains drawn over, not to be opened till after the consecration. In the twelfth century they began to inclose the choir with walls; but the ancient balustrades have been since restored; out of a view to the beauty of the architecture. The chantor is master of the choir.

In nunneries, the choir is a large hall, adjoining to the body

body of the church, separated by a grate, where the religious sing the office.

CHOIR *music*, music sung in a chorus, as in churches. It is sometimes used for *musica piana*, *canto fermo*, or what we call *plain chant*, or *song*. See CHANT and CHORAL *Service*.

CHOIROUS, in *Ichthyology*, a name given by Aristotle, and others of the old Greek writers to the *Cernua* or *Acerina* of the Latins. This fish has been called by a variety of names, but it is a species of perch, the *Perca cernua* of modern naturalists, and the pope or ruffe, of the English fishermen. It is by no means so abundant as the common perch, neither is it of the same family, for it has only one dorsal fin, while the common perch has two; it is also a smaller fish, seldom exceeding the length of six or seven inches. The body is more elongated, and the back less prominent and arched. The colour is olivaceous green on the back, yellowish on the sides, and spotted with black; belly whitish. Donov. Brit. Fishes. See PERCA *cernua*.

CHOISEUL, in *Geography*, a town of France, is the department of the Upper Marne; 4 leagues N.E. of Langres.

CHOISEUL *Bay*, a bay that lies on the N.W. coast of the islands of the Arcades, W. of Port Praslin. The ancient inhabitants, like those of Port Praslin, powder their hair with lime, which burns it and gives it a red appearance.

CHOISEUL *Bay*, a bay that lies on the S. side of Maghellan Straits, between Swallow Harbour and the channel of St. Barbara.

CHOISY, FRANCIS-TIMOLEON DE, in *Biography*, was born at Paris in the year 1644. He is reckoned among the celebrated writers and extraordinary characters that have flourished in France. In his infancy he was taught to pay the greatest deference to persons of rank, and to endeavour to attach himself to those who might hereafter promote his interests. He was intended for the church, but the habits of his youthful years were irregular, and he afforded opportunity for scandal to the decent part of society, by appearing perpetually in public in female habiliments. He was handsome and delicate, and having been accustomed by his mother, from his childhood, to appear in this disguise, the habit of it had grown into a kind of passion. He passed some years under the name of the countess des Barras, indulging in gallantries which were inspired or facilitated by his assumed character. Such, indeed, were the manners of the higher ranks in France, that he was admitted at court in this masquerade, and few were found in that circle who did not encourage a character which they ought to have frowned at with indignation. Of these few was the duke de Montausier, who rearing him one day in the queen's drawing-room, said in a tone of angry contempt, "Sir, or madam, I know not how to address you, you ought to die of shame for appearing dressed like a woman, when God has done you the favour to make you a man: Go, hide yourself." While he lived in this state he had been inducted to the office of abbé, and it was not till he was thirty years of age, that he thought it expedient to change his course of life, and to obliterate the remembrance of the scenes that he had exhibited, from his own mind, as well as from the minds of others. He went to Italy in 1676, and took an active part in promoting the election of Innocent XI. and was so far beneficial to the interests of the pontiff, that he was employed to draw up a letter from the French cardinals to Louis XIV. for the purpose of engaging him in his favour, who had been devoted to his enemies. De Choisy succeeded, and gained nothing by it but the honour of being the first to kiss the toe of the new pope. On his return to

France he was attacked with a severe illness, which excited in him compunction for the past, and the most terrible apprehensions for the future. He at length recovered, and during his convalescence he held religious conversations with the abbé Dangeau, the result of these were published in four dialogues: On the Immortality of the Soul; On the Existence of God; On Religious Worship; and On Providence.

From this period, 1684, de Choisy engaged in a new career: in the following year he went on an embassy from the sovereign of France to the king of Siam, where the Jesuits had represented as willing to become a convert to Christianity. But on arriving at Siam, he found that the royal conversion was no more than a comedy planned by the Jesuits, in order to procure an embassy that might be serviceable to their commercial plans, and that the ambassador and himself were intended to act parts in their favour. He was resolved that the voyage should not, with regard to himself, be without its uses: he took priest's orders, and he was apparently very much impressed with the sacredness of his new character. He would not venture to say mass till he had been a month on board the ship which brought the mission back to France. He then became a zealous preacher to the crew, who were much edified by his pious exhortations.

He brought home with him a complimentary message from the king of Siam with his patron the cardinal de Bouillon, who unfortunately was not in favour at court. Louis was therefore displeas'd that this mark of distinction should have been obtained for his disgraced minister. Choisy, finding himself slighted, retired to a religious seminary, and employed himself in writing a life of David, and a translation of the Psalms. These he was allowed to present to his sovereign, whose smiles now abundantly repaid him for past neglect. He was immediately elected a member of the French academy; and his eulogy on the death of cardinal de Richelieu in 1687 was greatly admired. He was indeed a very useful member of that society, and drew up a sort of journal of all that passed at its meetings, which on account of the anecdotes that were interwoven with it, was not published by the academy, though it was printed in the *Opuscules* of the abbé d'Olivet in the year 1754. De Choisy was chosen in 1697 dean of the cathedral of Bayeux, which was the highest post he ever obtained in the church. His early adventures, of which himself was ashamed, precluded him from any distinguished ecclesiastical preferment. Besides the life of David, he published lives of Solomon, St. Louis, and of several of the French monarchs; but his most considerable work was an Ecclesiastical History, in eleven volumes, which was undertaken at the desire of Bossuet; and it comprised the most interesting facts of general history, written on a pleasing and popular plan. His last work, which did not appear till after his death, was *Memoirs of Louis XIV.* in 2 vols. 12mo. This has been reckoned the most agreeable of his writings. His style and manner were particularly adapted to the compilation of memoirs; yet in all the biographical pieces which he drew up, he has been charged with having paid too little regard to truth. He published a translation of the celebrated "Imitation of Jesus Christ;" to the first edition of which he prefixed a print of Madame de Maintenon on her knees before a crucifix, with the following inscription: "Hearken, O daughter, and consider and incline thine ear: forget also thine own people, and thy father's house; for shall the king greatly desire thy beauty." The text was in the subsequent editions omitted. To this writer has been ascribed a licentious work, in which his own gallantries are supposed to have been portrayed:

it is entitled *Memoirs of the Countess des Barras*. This was not printed till the year 1736; but the abbé de Choisy died in 1724, after completing his eightieth year. His character could not command the respect of the really wise, nor the estimation of the truly virtuous. After he had reformed the manners of his youth, which cannot be too severely reprobated, he exhibited those symptoms of frivolity which were highly unbecoming his rank and station in life. He was nevertheless beloved, on account of his disposition, which was kind, and of his manners, which were gentle, easy, and very insinuating. Gen. Biog. Du Fresnoy.

CHOISY, in *Geography*, a town of France, in the department of the Seine and Marne; 4 leagues N. of Provins.

CHOISY-Bellegarde, a town of France, in the department of the Loiret; 4 leagues W. of Montargis.

CHOISY le Roy, or CHOISY-sur-Seine, a town of France, in the department of the Seine, and district of Paris; 6 miles S. of Paris.

CHOIX, *Port a*, lies on the N.W. side of Newfoundland, N. by W. from the bay of Highgounachet, and S.E. from point Riche.

CHOIX, *Old Port a*, a semicircular bay on the N.W. side of Newfoundland, round point Riche from the S.ward; the N.W. point of which is called Point Ferrol. Within this point are several islands; but the interior bay is spacious.

CHO-KE', a town of Asia, in Thibet; 145 miles E.S.E. of Lassa.

CHORE-Weed, in *Botany*, See OROBANCHE.

CHOLAGOGUE, in *Medicine*, from $\chi\omicron\lambda\acute{o}\nu$ *Ule*, and $\alpha\gamma\gamma\omega$, *I impel*, a term applied by the older writers to those purgative drugs, which they imagined to possess the property of acting specifically on the liver, and expelling bile. These were aloes, scammony, black hellebore, &c. Any acrid or drastic cathartic will, by its strong stimulus, necessarily excite the biliary ducts, as well as those of the pancreas and the mucous follicles, which line the intestines, to pour out their fluids. See CATHARTIC. If the term be applicable to any medicine, it is to elomel, which appears to have the power of exciting the action of the whole apparatus of the liver, and of increasing its production of bile, as well as of emulging the biliary ducts.

CHOLALLAN, in *Geography*, one of the most considerable states near the mountain of Popocatepec, in Mexico. This, and the state Haexotzincó, having, with the assistance of the Tlascalans, shaken off the Mexican yoke, re-established their former aristocratical government.

CHOLARGUS, or COLARGOS, in *Ancient Geography*, a borough of Greece, in Attica, belonging to the Æcanantide tribe, according to Steph. Byz. and Suidas.

CHOLAWIA, in *Geography*, a town of Lithuania, in the palatinate of Minsk; 42 miles S.E. of Minsk.

CHOLEESINA, in *Ancient Geography*, a town of Asia, in Sogdiana, situated near the Oxus.

CHOLEDOCHUS, in *Anatomy*, a term derived from $\chi\omicron\lambda\acute{o}\nu$, *bile*, and $\delta\omicron\chi\omicron\upsilon\sigma$, *I receive*. The hepatic duct, having been joined by the cystic, takes the name of *ductus communis choledochus*, and proceeds to open into the duodenum. For a further account of this duct, see LIVER.

CHOLELITHUS, in *Medicine*, from $\chi\omicron\lambda\acute{o}\nu$, *bile*, and $\lambda\acute{i}\theta\omicron\varsigma$, *a stone*, a term applied to the concretions, which occur in the gall-bladder and biliary ducts. See GALL-STONE.

CHOLER. See BILE.

CHOLERA, $\chi\omicron\lambda\acute{o}\rho\alpha$, sometimes written with the addition of the word *morbus*, *disease*, is so called from $\chi\omicron\lambda\acute{o}\nu$, *bile*; the leading character of the disease being a copious evacuation of bilious matter both by vomiting and by stool.

The phenomena of cholera, as well as the successful mode of treating it, have been well known, and described, in very similar terms, by physicians from the earliest dawn to the present times. In the writings of Hippocrates, Aræteus, Celsus, Sydenham, and Cullen, we trace the same opinions respecting the disorder, and the same precepts as to its cure. The attack of this complaint is generally sudden. The bowels are seized with griping pains, and the stools, which are at first thick and watery, as in a common diarrhœa, are passed frequently: the stomach is seized with sickness, discharges its contents, and rejects what is swallowed. In the course of a few hours the matter vomited, as well as that which is discharged by stool, appears to be pure bile, and passes off both ways in considerable quantities. The griping pains of the intestines now become more severe, in consequence of the extraordinary irritation of the passing bile, which excites them to partial and irregular spasmodic contractions. These spasms are often communicated to the abdominal muscles, and generally to the muscles of the lower extremities; so that the cramps in the legs become very distressing. The stomach is also affected with considerable pain, and a sense of great heat, in consequence of the same irritation: there is usually great thirst, and sometimes a severe head-ach, from the sympathy of the head with the stomach. The pulse becomes small and frequent, and the heat of the skin is increased. A great degree of debility, languor, and faintness, amounting even to syncope, speedily comes on, in consequence of the sudden and copious evacuation of the fluids; sometimes attended with a colligative sweat, coldness of the extremities, "and such like symptoms," Sydenham says, "as frighten the by-standers, and kill the patient in 24 hours." Syd. sect. iv. chap. 2. In this climate, however, though the powers of life are often so rapidly reduced by an attack of cholera, as to excite considerable alarm for the safety of the patient, yet it seldom terminates fatally. Though both the pulse and respiration are hurried and irregular during the course of the disease, yet, it is remarked by Dr. Cullen, that there is no proper *pyrexia*, but merely a feverishness from irritation, as these symptoms are generally removed entirely by those remedies which quiet the spasmodic affections attendant on the disease.

It is scarcely necessary to point out the diagnosis of cholera, and the diseases which bear some resemblance to it, since the discharge of almost pure bile by vomiting and stool, simultaneously or alternately, is not observed in any other disease. Vomiting and purging do, indeed, frequently occur at the same time, as after a surfeit, or taking a large quantity of indigestible food, or from other causes; but the matter discharged is not bilious. The practice, however, must be similar in both; the object being to get rid of an irritating matter from the intestinal canal in both cases, which, in the true cholera, is bile, in the other instances a mass of undigested aliment.

The true cholera occurs, in temperate climates, only during the hot season. Sydenham remarks, that it appears as certainly in the month of August, as swallows in the early spring, or cuckoos at the approach of summer; and that it very seldom continues longer than the month in which it began. This observation, however, does not accord with the experience of the present times. Cholera is now seen perhaps more frequently in September than in August; and cases occasionally occur, though it be not epidemical, considerably earlier than August; even in June or May. Sydenham seemed to consider the copious use of the summer-fruits as the general cause of cholera; although the observation which he has made upon the subject is inconsistent with that

that notion. "For though the same causes," he remarks, "wholly remain, so that many should be seized with this disease, as well in September as in August, by reason of eating too much fruit, yet we see the same effect does not follow." Probably this notion, which is still adopted by many practitioners, originated merely from the concurrence of the season of the disease, with that of the ripening of fruit. But when it is considered that the hot season is also coincident; that in all hot countries the bilious secretion is usually increased, and thus gives rise to this and similar diseases; that in this climate cholera attacks those who procure much fruit, and those who are unable to procure it, indiscriminately; and that the disorder ceases, even while the fruit remained abundant, according to Sydenham; there can remain little doubt that it is the heat of the atmosphere which produces cholera. Hence it is, that cholera is sometimes most prevalent in August, sometimes in September, according to the earlier or later occurrence of a high temperature; and that after a few hot days, even in May or June, a few cases of the disease are sometimes observed to ensue. It has been remarked, however, that, both in hot climates, and in the hot seasons of mild climates, occasional falls of rain have been particularly followed by an epidemic cholera. In some cases, indeed, it is probable that the heat of the season may give only a predisposition, and that certain ingesta, sudden change of temperature, or other causes in this state, readily excite the disease. Hence various circumstances are enumerated by authors, as having produced cholera; such as cold drink, drastic purgatives, acids, fear, &c. But it is certain that the disease constantly appears during a hot season, of steady temperature, and often without any obvious change or error in the diet or manner of life.

In the cure of cholera, which consists in the production of a large quantity of bile by the liver, and its necessary passage through the alimentary canal, the experience of all ages wholly concurs. A summary of this experience is given by Dr. Cullen in such conspicuous terms, that we shall prefer transcribing it.

"In the beginning of the disease the evacuation of the redundant bile is to be favoured by the plentiful exhibition of mild diluents, both given by the mouth and injected by the anus; and all evacuant medicines, employed in either way, are not only superfluous, but commonly hurtful.

"When the redundant bile appears to be sufficiently wasted out, and even before that, if the spasmodic affections of the alimentary canal become very violent, and are communicated in a considerable degree to other parts of the body, or when a dangerous debility seems to be induced, the irritation is to be immediately obviated by opiates, in sufficiently large doses, but in small bulk, and given either by the mouth or by glyster.

"Though the patient be in this manner relieved, it frequently happens, that when the operation of the opium is over, the disease shews a tendency to return; and, for at least some days after the first attack, the irritability of the intestines, and their disposition to fall into painful spasmodic contractions, seem to continue. In this situation, the repetition of the opiates, for perhaps several days, may come to be necessary; and as the debility commonly induced by the disease favours the disposition to spasmodic affections, it is often useful and necessary, together with the opiates, to employ the tonic powers of the Peruvian bark." First Lines, § 1462.

Thus, by commencing the cure with the free use of diluents, we partly contribute to the expulsion of the bilious matter, and partly correct its acrimony. To employ eva-

cuants, as Sydenham quaintly observes, is to increase the disturbance, and, as it were, to endeavour to quench fire by oil; and, on the other hand, to commence with opiates, is shutting up the enemy in the bowels.

Although this simple and rational practice has stood the test of experience from the earliest date, yet other modes have been occasionally resorted to as auxiliary, or superadding it. The Columbo-root has been employed, it is said, with considerable efficacy in the cure of cholera. Dr. Percival, speaking of this root, says, "in the cholera morbus it alleviates the violent tormina, checks the purging and vomiting, corrects the putrid tendency of the bile, quiets the inordinate motions of the bowels, and speedily recruits the exhausted strength of the patient." In confirmation of this, he adds, that an eminent surgeon, who, in 1756, had the care of an hospital-ship in the East Indies, gave the Columbo-root in that climate (in the dose of half a drachm or more), to a great number of patients, often twenty in a day, attacked with this disease. "He seldom employed any means to promote the discharge of the bile, or to cleanse the stomach and bowels, previous to its exhibition; and he generally found that it soon stopped the vomiting, which was the most fatal symptom, and that the purging and remaining complaints quickly yielded to the same remedy. The mortality on board his ship, after he used this medicine, was remarkably less than in the other ships of the same fleet." Percival's Essays Med. and Exp. vol. ii. p. 7. We have seen the Columbo-root remain on the stomach, when almost every thing else was rejected in this disorder; but we think also that we have observed the mischiefs suspected by Sydenham from stopping the evacuation; the purging has assumed the form of dysentery.

Dr. Douglas (see Edin. Med. Essays, vol. v. part ii. p. 646.) recommends a simple, but, he affirms, an efficacious remedy, after the bile has been considerably thrown off; namely, a decoction of oat-bread, toasted as brown as coffee, but not burnt. A copious draught of this is extremely powerful, he says, in settling the nausea and vomiting. If the patient is greatly exhausted, he renders it more cordial by an admixture of wine. This, Dr. Douglas remarks, is nearly the practice of Celsus, who recommends, first, repeated draughts of warm water to clear the stomach, and a little after that, he advises the patient to take wine and water mixed with polenta. Now this was, according to Piny, barley, fried or toasted brown, and ground to powder; it was an astringent, and good for a diarrhoea. Dr. Douglas supposes that wheaten bread, or meal, treated in the same manner, would answer every purpose.

The warm bath, or warm fomentations, have been used with advantage, when the spasmodic affections of the bowels were severe. And in other instances cold drink has been given with beneficial effects. Dr. Cleghorn observes, (Obs. on Diseases of Minorca, p. 224.) "The Spanish physicians have often assured me, that they found nothing more beneficial in violent deplorable choieras than drinking of cold water: which practice is recommended by many of the ancients." Thus Aretæus remarks, "Sin autem omnia antiqua sterora dejecta fuerint, et biliosi humores tranierint, biliosusque vomitus et diſſentia adſit, salſidium, anxietas, virium labſactio, tunc frigida: aquæ cyathi duo aut tres propinandi ſunt ad ventris aſtriſtionem, ut retrogradus humorum curſus cohibeatur, atque ſtomachus ardens refrigeretur."

CHOIET, in *Geography* a town of France, in the department of the Maine and Loire, and chief place of a canton in the district of Beaupréau, 9 leagues S.S.W. of Angers.

gers. The place contains 4709 and the canton 15,000 inhabitants: the territory includes 347½ kilometres and 12 communes. N. lat. 47° 3'. W. long. 0° 55'.

CHOLIMMA, in *Ancient Geography*, a town of Asia, placed by Ptolemy in Greater Armenia.

CHOLLE, a town of Asia, in the Palmyrene. Ptolemy. — Also, a town of Africa, according to Appian.

CHOLLE, *Cape de la*, in *Geography*, the most prominent part of the coast, on the N.W. part of the island of Corfica, between the gulf of Fiorenzo to the S.E. and the harbour of Calvi to the S.W.

CHOLLIDÆ, in *Ancient Geography*, a people of Greece, in Atricia, belonging to the Leontide tribe. Steph. Byz.

CHOLM, or **KHOLM**, in *Geography*, a town of Russia, in the government of Pskof, seated on the river Lovat, and also one of the 9 districts included in this government; 180 miles S. of Petersburg. N. lat. 57°. E. long. 31° 14'.

CHOLMADARA, in *Ancient Geography*, a town of Asia, in the Comagene, seated on the right bank of the Euphrates, N.E. of Samofata and near it.

CHOLMOGORI, or **KOLMOGORI**, in *Geography*, a town and district of Russia in the government of Archangel, seated on the west side of the Dwina; 28 miles S. of Archangel.

CHOLOBAPHIS, in *Natural History*, a name given by some of the ancient Greeks to a peculiar kind of emerald which was inferior to many others, and was of a colour tending to yellow.

It is plain that the Romans called all the green crystals found in copper-mines by the name of emeralds; for they express in their descriptions all the defects we find in these crystals, such as their having hairs, or substances like hairs, within, as also salts, and the like.

CHOLOBETANA, in *Ancient Geography*, a country of Asia, in Armenia.

CHOLOE, an ancient town of Pontus Galaticus, in Cappadocia.

CHOLOMA, or **CHOLOSIS**, signifies, according to Galen, any distortion of a member or deprivation of it with respect to motion. It is taken also, in a particular sense, for halting or lameness of a leg, arising from luxation.

CHOLONG, in *Geography*, a town of Asia, in Thibet; 57 miles N.N.W. of Chao-mahing-Hotun.

CHOLTITZ, a town of Bohemia, in the circle of Chrudim; 6 miles N. W. of Chrudim.

CHOLUA, in *Ancient Geography*, a town of Asia, in Greater Armenia.

CHOLULA, in *Geography*, a town of Mexico, in the province of Tlascalala, which formerly formed an independent state. It was held by the people of Mexico as a sacred spot, and the sanctuary of the gods, with a temple, in which they offered more victims than in that of Mexico; 5 leagues from Tlascalala. The treachery of the Cholulans was very severely punished by Cortes, when he took possession of this place in 1519. The Spaniards and Tlascalalans, under the direction of their commander, fell upon the multitude, and filled the streets with bloodshed and death. The temples which afforded a retreat to the priests, and some of the leading men, were set on fire, and they perished in the flames. This scene of horror continued two days; during which, the wretched inhabitants suffered all that the destructive rage of the Spaniards, or the implacable revenge of their Indian allies, could inflict. At length the carnage ceased, after the slaughter of 6000 Cholulans, without the loss of

a single Spaniard. Cortes then released the magistrates, whom he had previously seized, and reproaching them bitterly for their intended treachery, declared, that as justice was now appeased, he forgave the offence, but required them to recall the citizens who had fled, and re-establish order in the town. Barthol. de las Casas says, there was no occasion for this massacre, and that it was an act of wanton cruelty, perpetrated merely to strike terror into the people of New Spain. But the zeal of Las Casas often leads him to exaggerate. On the other hand Bern. Diaz asserts that the first missionaries sent into New Spain by the emperor, made a judicial inquiry into this transaction; and having examined the priests and elders of Cholula, found that there was a real conspiracy to cut off the Spaniards, and that the account given by Cortes was exactly true. However this be, the severity of the punishment was certainly excessive and atrocious. Robertson's Amer. vol. ii.

CHOMA, in *Ancient Geography*, a town of Asia Minor in Lycia, according to Ptolemy; which had been episcopal. — Also, the name of a place of Peloponnesus, in Arcadia, according to Pausanias.

CHOMARA, a town of Asia, in Bactriana. Ptol.

CHOMASI, a people of Bactriana, mentioned by Mela and Ptolemy.

CHOMEL, **JAMES FRANCIS**, in *Biography*, born at Paris, towards the end of the 17th century, studied medicine at Montpellier, where he took his degree of doctor, in 1728. Returning to his native city, he soon so far distinguished himself as to be appointed physician and counsellor to the king. The following year he published, "Univerſe Médecine Theorique pars prima, seu Physiologia, ad usum ſcholæ accommodata," 12mo.; and in 1734, "Traite des Eaux Minerales, Bains et Douches de Vichi, 12mo." This work passed through several editions. To that of the year 1738 the author added a preliminary discourse on mineral waters in general, with accounts of the principal of the medicinal waters found in France. His elder brother,

CHOMEL, **PETER**, **JOHN BAPTISTE**, studied medicine at Paris, and was admitted to the degree of doctor there in 1697. Applying himself more particularly to the study of botany, while making his collection, he sent his observations to the Royal Academy of Sciences, who elected him one of their members. He was also chosen, in November 1738, dean of the faculty of medicine, and the following year, was re-elected but died in June 1740. Besides his "Memoirs" sent to the Academy of Sciences and his "Defence of Tournefort," published in the Journal des Savans, he published "Abrégé de l'Histoire des Plantes usuelles," Paris, 1712, 12mo. This was, in the year 1715, increased to two, and in 1730, to three volumes in 12mo., and is esteemed an useful manual.

CHOMEL, **JOHN BAPTISTE**, **LEWIS**, his son, educated also at Paris, took his degree of doctor in Medicine, in 1752. He was several years physician in ordinary to the king, and in November 1734 was chosen dean of the faculty. He died in 1765. He published in 1745, "An Account of the Disease: then epidemic among cattle," and beasts of great success in the cure, which was effected, he says, by using fetons, imbued with white hellebore; "Dissertation historique, sur la Mal de Gorge Gangrène: eaux, qui a regné parme les Entans, en 1748;" the malignant sore throat, first treated of in this country by Dr. Fothergill, about ten years later than this period. Chomel recommends bleeding, vomiting, and blisters, and had then recourse to cordials. "Essai historique sur la Médecine en France," 12mo. 1762. He also wrote, "Vie de M. Morin," and "Eloge historique de M. Louis Duret,"

which

which were published in 1765. Eloy. Dict. Hist. Haller Bib. Bot.

CHOMELIS, in *Geography*, a town of France, in the department of the Upper Loire; 4½ leagues N. of Le Puy.

CHOMER. See *CHORUS*.

CHOMERAC, in *Geography*, a town of France, in the department of the Ardèche, and chief place of a canton, in the district of Privas; 3 miles S.E. of Privas. The place contains 1566 and the canton 6423 inhabitants; the territory includes 110 kilometres and 9 communes.

CHOMONCHOUAN, a lake of Canada; 73 leagues N.W. of Quebec. N. lat. 49° 20'. W. long. 75° 40'.

CHOMSK, a town of Lithuania, in the palatinate of Brzele; 56 miles E. of Brzele.

CHONAD, a town of Hungary, seated on the Marosch, the see of a bishop, suffragan of Colocz; 25 miles N. of Temesvar.

CHONÆ, in *Ancient Geography*, a town of Asia Minor, in Phrygia. It had been episcopal and metropolitan.

CHONAS, in *Geography*, a town of France, in the department of the Iſere, and district of Vienne; 13 miles S. of Vienne.

CHOND, a town of Arabia; 190 miles S.W. of Amenzinlin.

CHONDRILLA, in *Botany*, (*Χονδρίλλα*, Dioscor.) Linn. Gen. 910 Schreb. 1235. Willd. 1405. Juss. 160. Vent. 2. 464. Gært. 913. Condrille; Lam. Encyc. Clafs and order, *ſyngeſia polygamia equalis*. Nat. ord. *Compoſite ſemiſtoſuloſa*, Linn. *Cichoraceæ*, Juss.

Gen. Ch. Calyx common calyced, cylindrical; ſcales of the cylinder numerous, parallel, linear, equal; thoſe of the baſe few, very ſhort. *Corolla* compound uniform; florets all ſtrap-shaped, linear, truncated, four or five-toothed; hermaphrodite ones very numerous, in ſeveral ranks. *Stam.* Filament five, capillary, very ſhort; anthers forming a hollow cylinder. *Piſt.* Germ ſomewhat egg-shaped; ſtyle filiform, the length of the ſtamens; ſtigmas two, reflexed. *Peric.* none, except the permanent common calyx. *Seeds* ovate, compressed, mucicated; down capillary. *Rec.* naked.

Eſſ. Ch. Calyx calyced. Florets in many ranks. Seeds mucicated; down ſimple.

Sp. 1. *C. juncea*, Rulhy gum-fuccory. Linn. Sp. Pl. Gært. tab. 158. fig. 6. Jacq. Auſt. 5. tab. 427. Bauh. pin. 130. (*C. viminea*; Bauh. hilt. 2. 1021. fig. 1. Rai. hilt. 223.) "Root-leaves runcinate; ſtem-leaves linear, entire."

Root perennial. *Stem* two or three feet high, branched, erect, hard, villous near the bottom, ſmooth and ſtriated above. *Flowers* yellow, ſlender, like thoſe of lettuce, ſolitary or in bunches, ſeſſile or on ſhort peduncles; ſlices of the down long, attenuated above. A native of the ſouthern parts of Europe, flowering in July and ripening its ſeeds in September. 2. *C. crepidoides*, Murray Syst. Veg. 713. Mart. Lam. Willd. (*C. juncea*; Linn. Syst. Nat. 52.) "Leaves arrow-shaped, embracing the ſtem; ſtem ſimple; flowers nearly ſeſſile, lateral." *Root* annual. *Stem* a foot and half high, ſtriated, purple at the baſe, beſprinkled with a few white bristles. *Leaves* reſembling thoſe of *turritis*, undivided, oblong, rough about the edge, and eſpecially about the keel, with white hairs, gloſſy on the upper ſurface; lower ones with ſmall teeth. *Flowers* yellow, purpliſh underneath, alternate, on a peduncle ſcarcely longer than the calyx, with one or two bractes; calyx ſtriated, beſet with black tubercles and a white bristle; calyche very ſhort, with awl-shaped permanent leaflets. It may perhaps be associated with the genus *crepis*. Native country unknown. Such is the deſcription of this plant copied verbatim by all recent botanists from the *Systema Naturæ* of Linnæus,

where it unaccountably appears under the name of *juncea* to the total excluſion of the well-known original *juncea* of the Species Plantarum. No one ſince Linnæus appears to have ſeen even a dried ſpecimen; and as it is not known whence it came, or whether it is gone, it muſt ſurely be conſidered as a vagabond of very dubious character. 3. *C. nudicaulis*, Linn. Mant. 2. Mart. Lam. Willd. (*Lactuca nudicaulis*; Murr. in Comment. gott. 1772. tab. 4.) "Stem nearly naked; flowers panicled." *Stems* few, a foot high, panicled, ſtraight, cylindrical, gloſſy, furniſhed with a ſmall leaf or two. *Root* leaves runcinate, obtuſe at the end, ciliated with ſmall teeth. *Flowers* pale yellow; calyx eight-leaved, gloſſy, imbricated below with a few caducous leaflets; ray conſiſting of about twenty-four florets; diſk compoſed of ſtyles reſembling the florets in colour; down ſeſſile. *Seeds* black. A native of the Eaſt Indies, and not of North America or of Egypt, as Linnæus ſuppoſed.

Obſ. La Marck has included in his chondrilla the whole Linnæan genus *prenanthes*, and has divided it into two ſections. 1. With florets in ſeveral ranks, comprehending the three preceding ſpecies with the *crepis pulchra* of Linnæus, which, he ſays, cannot be a *crepis*, as its calyche conſiſts of cloſe ſeales. 2. With florets in a ſingle rank, the *prenanthes* of Linnæus. The only point at iſſue is, therefore, whether a difference in the number of ranks in the florets of the ray be ſufficient to conſtitute a generic character; for it is evidently of no conſequence whether the down be ſtipitated or ſeſſile. We ſhall adhere to the Linnæan diſtribution. See *PRENANTHES*.

CHONDRILLA species tertia; Dod. pomp. See CATANANCHA *carula*.

CHONDROGLOSSUS, in *Anatomy*, a name applied, by Albinus, and some other anatomists, to a number of the hyoglossus muscles which arise from the cornus minus of the os hyoides. See TONGUE.

CHONDROPTERYGII, in *Ichthyology*, the sixth, or last order of fishes, in the Linnæan system. All fishes that have the gills cartilaginous are comprehended under this order; as *acipenser* (sturgeon), *chimera squatin* (shark), *pristis* (saw-fish), *raja* (ray), and *petromyzon* (lamprey). See article **ICHTHYOLOGY**.

The word is derived, by Artedi and others, from *χονδρος*, a cartilage, and *πτερυγιον*, a wing or fin, and may therefore be understood as comprehending all fishes that have a cartilaginous instead of bony skeleton. The French term *chondropterygiens* applies precisely to this description of fishes in the latter sense.

CHONDROS, in *Ancient Medical Writers*, the same as alca. It signifies also some grumous concretion, as of mastic, or frankincense. It is, besides, the Greek word for a cartilage.

CHONDROSYNDESMUS, signifies a cartilaginous ligament. The word is derived from *χονδρος*, a cartilage, and *συνδεσμος*, a ligament.

CHONE, or **CHONIS**, in *Ancient Geography*, a town of the Oenotrians in Italy, the capital of a country of the same name, near the territory of Crotona.

CHONG, the name of a spirituous liquor, similar to whisky, extracted in B'otan from grain. It is slightly acid and spirituous, and extemporaneously prepared by the infusion of a mass of grain in a state of fermentation. Capt. Turner, in his Embassy to Tibet (p. 24, &c.) has detailed the process employed in the preparation of it. Wheat, rice, barley, and other kinds of grain are indiscriminately made use of for this purpose. To a given quantity of grain is added rather more water than will completely cover it, and the mixture is placed over a slow fire till it begins to boil; it is then taken up, and the water drained from the grain, which is spread abroad upon mats, or coarse cloths, to cool. When it is cold, a ball of the composition, here called "Bakka," (which is the blossom of the *Cacalia farencana* Linnæi, collected and rolled together in small balls), is crumbled, and strewn over the grain, and both are well mixed together. The usual proportion is a ball of the size of a nutmeg to two pounds of grain. The grain thus prepared is put into baskets lined with leaves, and pressed down with the hand slightly, to draw off the superfluous moisture. It is then covered with leaves and cloths, to defend it from the external air, and put in a place of moderate warmth, where it is suffered to stand three days. It is afterwards deposited in dry earthen jars; a little cold water is sprinkled upon the top in the proportion of about a tea-cup full to a gallon of grain; the vessel is then covered close, and the cask fortified with some strong compost, or stiff clay. It remains thus at least 10 days, before it is fit for use; and, if it be suffered to continue longer, it always improves by age.

To make the chong, when required, they put a quantity of the fermented mass into some capacious vessel, pouring boiling water upon it, sufficient completely to cover it, and stirring the whole well together. A short time is sufficient

for it to digest; a small wicker basket is then thrust down in the centre, and the infusion, called Chong, immediately drains through, and occupies the vacant space. This liquor is, at entertainments, expeditiously distributed to the guests; the segment of a gourd, fastened upon a staff, serving the purpose of a table. Each person holds a shallow wooden cup upon the points of his fingers, for its receptacle, and is seldom satisfied with one supply. This liquor, which is slightly acid, and without any powerful spirit, furnishes a grateful beverage; and it is usually drank warm. From chong an ardent spirit is obtained by distillation; this spirit is denominated "Arra;" it is fiery, and powerfully incriminating.

CHONG-TCHOU, in *Geography*, a town of Asia, in the kingdom of Corea; 25 miles S.W. of Oou-tcheou.

CHONNAMAGARA, or **CHONNANARARA**, in *Ancient Geography, a town of India, on this side of the Ganges. Ptolemy.*

CHONOS Gulf, in *Geography, or the archipelago of *Guay-tecas*, lies towards the southern extremity of the continent of Chili, in the northern Pacific Ocean. The most remarkable island in it is that of Chiloé, which see. The islands, called Chonos, are inhabited by Indians, who use the salted flesh of the species of seal, called the sea-wolf, as common food. To the south of Chiloé and the archipelago of Chonos is the peninsula of the three mountains, followed by three considerable islands, that of Campana, lat. 48° to 49° 25', explored by Malestria; that of Madre de Dios; and that of St. Francis, by some called Roca Partida. The rigour of the climate renders these islands of little importance.*

CHOOK-TCHOO, in *Geography*, one of the Ladrone islands, under the lee of which the ships of the embassy to China came to anchor, in 12 fathoms water, on a muddy bottom. N. lat. 21° 55'. E. long. 113° 44'. See **LADRONES**.

CHOOZ, a town of France, in the department of the Ardennes, and district of Rocroy.

CHOP-CHURCH, or **CHURCH-CHOPPER**, in *Laws*, a name, or rather nick-name, given to persons, who make a practice of exchanging benefices.

Chop-church occurs in an ancient statute of King Henry VI. as a lawful trade, or occupation; and some of the judges say, it was a good addition. Brook holds, that it was no occupation, but only a thing permissible by law.

CHOPER, or **KHOPER**, in *Geography*, a river of Asiatic Russia, which runs into the Don, near Choperkaia.

CHOPERSK, or **KHOPERSK**, formerly *Narokh perz*, a town of Asiatic Russia, in the government of Saratoff, seated on the Choper; and one of the 11 districts of the government: 140 miles W. of Saratoff, and 64 S S.E. of Peterburg.

CHOPERSKAIA, a town of Russian Tartary, in the country of the Cossacs, on the Don: 191 miles N.E. of Asoph, and 60 south west of Archadinkaia.

CHOPIN, RENÉ, in *Biography*, an eminent French lawyer, born in Ajou, in 1537. He was for a considerable time a pleader before the parliament of Paris, and at length retired, when he was consulted in every difficult case in the law. He published many works, which have been collected in six volumes folio. His Latin style is concise, but often obscure. The best of his productions was on the "Custom of Ajou," on account of which the city of Angers granted him the honors and title of sheriff of their city. In the year 1594 he was sentenced to banishment for his adherence to the league, but the sentence was not executed on him. The day on which Henry IV. entered Paris, Chopin's wife went mad through party rage. He commonly studied lying

on the ground with his books about him. He was afflicted with the stone, and died under an operation in 1656.

CHOPIN, or CHOPINE, a French and Scotch liquid measure, containing half pint.

CHOPS, *The*, in *Geography*. See *SWAN ISLAND*.

CHOPTANK, a large navigable river of America, on the eastern shore of Maryland, which discharges itself into Chesapeake bay.

CHOCQUE-BAY, lies on the W. side of the island of St. Lucia, between Gros Islet bay on the N. and Carenage bay to the S.

CHORA, in *Ancient Geography*, a place of Thrace on the Euxine sea, at a small distance N.E. of Mauron-Tichos and near Gmos.—Also, a place of Gaul, on a river of the same name, (la Cure) between Avalon and Auxerre. The abbé le Beuf supposed it to be *Caveant*: but M. d'Anville places it on the confines of the diocese of Auxerre, on the side of Autun, in the situation of a farm which now bears this name. Sanfon has confounded it with Corbeil. It is mentioned in the *Notitia Imperii* in the following terms: "præfectus Sarmatorum gentium a Chorâ Parisios usque."

CHORAGIUM, in *Antiquity*, was used to denote the funeral of a young unmarried woman.

Some think it should be written *coragium*, from *χορηγία*, *fuella*, and *αγο*, *duco*. But Pufcens chooses rather to derive it from *chorus*; because a chorus or company of virgins always attended such funerals.

CHORAGIUM signified also the tiring or dressing-room belonging to the stage; and sometimes was taken for the dress itself.

CHORAGUS, in *Antiquity*, he who had the superintendance of the chorus, whose business it was to take care they observed the rules of the music, and performed their parts with decorum.

It was the province of the master of the chorus, in the absence of the poet, to exercise the actors for a long time before the representation of the piece. He beat the measure with his feet, his hands, or by other means which might give the movement to the performers in the chorus, who were attentive to his gestures. It was also his duty, not only to guide the voices of those who were under his direction; but he gave them lessons in the two kinds of dances which were adapted to the theatre. See *DANCE*.

Choragi were likewise certain Athenian citizens chosen annually, who were obliged to be at the expence of players, singers, dancers, and musicians, as often as there was occasion, at the celebration of their public festivals on occasion of the greater Dionysia, or festivals of Bacchus, which were celebrated with extraordinary magnificence, when tragedies and comedies were exhibited in the theatre; and hymns in honour of Bacchus, accompanied with flutes, were chanted by the chorus in the Odeum. Each of the ten Athenian tribes appointed a choragus to lead his chorus, who was to be at least 40 years of age, and whose province it was to choose the performance and to prepare them for the exhibition by previous instruction. With this view the choragus for some months previous to the festivals took the performers, that they might be duly instructed, into his house, and provided for their support; so that it was an office of great expence. At the festival he appeared, as well as his followers, with a gilt crown, and a magnificent robe. These functions, consecrated by religion, were still farther ennobled by the example of Aristides, Epaminondas, and the greatest men, who deemed it an honour to discharge them; but they were so expensive, that many citizens declined the dangerous honour of sacrificing part of their fortunes to the precarious hope of rising by this means, to the first offi-

ces of magistracy. Sometimes a tribe was unable to find a choragus; and in this case the state took upon itself the expence, ordered two citizens conjointly to support the burthen, or permitted the choragus of one tribe to conduct the chorus of another. When the festival drew near, an emulous contention arose among the choragi, which sometimes proceeded to great violence, each striving to excel his competitors; and even intrigues and corruption were sometimes employed in order to obtain the victory. Judges were appointed to decree the prize, which sometimes was a tripod carefully consecrated by the victorious tribe, either in a temple, or in an edifice erected on the occasion. The people waited the decision of the contest with the same anxiety, and the same tumult, as if their most important interests were the objects of discussion. The glory resulting from the victory was shared between the triumphant chorus, the tribe to which it belonged, the choragus who was at its head, and the masters who, under his direction, had given the preparatory lessons. During the festivals the laws declared the persons of the choragi and the actors inviolable. To the expence that preceded the contest, were added the disbursements that followed the victory; there still remained for the choragus the charge of dedicating the tripod he had won, and probably of erecting a little edifice, or temple, in which it was to be placed. The tripod, thus won and preserved, and dedicated, became a family honour, and was appealed to as an authentic testimony of the merit and virtue of the person who obtained it. The choragic temples and tripods were numerous at Athens.

CHORALIC music, a sort of music proper for dancing, by the variety of its different motions.

CHORAL, signifies any person that, by virtue of any of the orders of the clergy, was in ancient times admitted to sit and serve God in the choir.

Dugdale in his History of St. Paul's Church, says, that there were with the chorus formerly six vicars choral belonging to that church.

CHORAL service. The difference between *cathedral* or *choral service* and *parochial*, consists in the choir of cathedrals chanting the psalms, accompanied by the organ, in 4 parts, antiphonally, instead of the minister and the clerk and congregation, as in parish churches, reading them verse for verse without music. The responses are chanted in cathedrals, and the *Te Deum*, *Jubilate*, *Magnificat*, and *Nunc dimittis*, are either chanted like the psalms, or sung to measure and elaborate music, under the title of *Choral Service*. See *CATHEDRAL SERVICE*, *CHORAL SERVICE* and *CHAPEL ESTABLISHMENT*.

CHORAMNEI, in *Ancient Geography*, a savage people of Asia, in Persia, who, according to a passage of Ctesias, cited by Steph. Byz., ran so swiftly that they were able to overtake a flag.

CHORAN-KIAMEN, in *Geography*, a port of Chinese Tartary; 20 miles W. S.W. of Ningouta.

CHORASAN. See *KORASAN*.

CHORASMEI, in *Ancient Geography*, a people mentioned by Athenæus and placed in Asia. They occupied the territory to the north and east of Parthia, and extended themselves, according to Ptolemy, to Sogdiana. Accordingly they were found in the vicinity of the river Aces, and of the plain through which this river flowed. They chiefly inhabited the mountains, and, according to Strabo, they were not very remote from the Bactrians and Sogdians.

CHORASMENI, a people of Asia, mentioned by Arrian, who places them in the neighbourhood of the country of the Amazons and of the Colchide territory.

CHORASMIA, a country of Asia, in Sogdiana, according

cording to Ptolemy, whose situation he assigns near to that of the Mallageæ—Also, a town of Asia, E. of the Parthians. Steph. Byz.

CHORAULES, *Lat.* A minstrel.

CHORAULISTRIA, *Lat.* A female minstrel.

CHORAZIN, in *Ancient Geography*, a town of Palestine, in Galilee, which our blessed Lord deploras for incredulity, (Matth. xii. 22.) Dr. Lightfoot expresses his surprize how such a woe should be denounced against it, when we do not read, in the whole New Testament, that our Lord had ever been there; however we read that he had frequently been at Bethsaida and Capernaum. Now, Chorazin being placed by Dr. Lightfoot between these two towns, and being, according to St. Jerome, but two miles distant from Capernaum, and in many maps at a small distance from Bethsaida, and it being expressly said "that mighty works were done in her," Christ must, without doubt, have been often there.

CHORD, or CORN, primarily denotes a slender rope or cordage. The word is formed of *chorda*, and that from $\chi\omicron\rho\delta\omicron\nu$, a gut; whereof strings may be made.

CHORD, CHORDA, in *Anatomy*. See CHORDA.

CHORD, CHORDA, in *Geometry*, a right line connecting the two extremes of an arc. Or, it is a right line, terminated at each extreme in the circumference of a circle, without passing through the centre; and dividing the circle into two unequal parts, called *segments*. Such is the line AB, Plate III. *Geometry*, fig. 43.

CHORD of the complement of an arc is the chord that subtends the rest of the arc; or so much as makes up the arc a femicircle.

The chord is perpendicular to a line drawn from the centre of the circle to the middle of the arc, as CE; and has the same disposition to it, as the *chord*, or *string* of a bow, has to the arrow: which occasioned the ancient geometers to call this line the chord of the arc, and the other the *sagitta*, or *arrow*, the former of which names is still continued, though the latter is disused. What the ancients called *sagitta*, is now termed the *versed sine*.

Half the chord of the double arc BD, is what we now call the *right sine*; and the excess of the radius beyond the chord DE, the *versed sine*.

The chord of an angle, and the chord of its complement to a whole circle, are the same thing; the chord of fifty degrees is also the chord of 310.

It is demonstrated, in geometry, that the radius CE, bisecting the chord BA in D, does also bisect the arc in E, and is perpendicular to the chord AB and *vice versa*; and again, if the right line NE bisect the chord AB, and be perpendicular to it; that it passes through the centre, and does bisect both the arch AEB, and the circle ANB.

Hence we derive several useful corollaries: as, 1. To divide a given arc AB into two equal parts; draw a perpendicular to the middle point D of the chord AB; this bisects the given arc AB.

2. To describe a circle, that shall pass through any three points, A, B, C, fig. 44. From A and C describe arcs intersecting in D and E; and also others, G and H, from C and B; draw the right lines DE and GH; the point of intersection I, is the centre of the circle to be described through A, B, and C.

Demonstration. For the points A, B, and C, are in the periphery of some circle; and therefore the lines AC and CB are chords, but ED is perpendicular to AC, and GH to BC; ED bisects AC, and GH bisects BC; whereof each passes through the centre. Now as DE and GH only intersect in I; I will be the centre of a circle, passing through the given points, A, C, and B. Hence,

assuming three points in the periphery, or arc, of any circle, the centre may be found, and the given arc completed; hence, also, if three points of one periphery do agree or coincide with three points of another; the whole peripheries agree, and therefore the circles are equal.

And hence, lastly, every triangle may be inscribed in a circle. The chord of an arc AB (fig. 43.) and the radius CE, being given; to find the chord of the half-arc AE. From the square of the radius CE, subtract the square of half the given chord AD, the remainder is the square of DC; from which, extract the square root; and then DC subtracted from the radius EC, leaves DE. Add the squares of AD, and EO; the sum is the square of AE; whence, the root being extracted, we have the chord of the half-arc AE.

CHORDS, *line of*, is one of the lines of the sector and plain scale. See its description and use under SECTOR and PLAIN SCALE. See also SINE.

CHORDS, or CORDS, in *Music*, denote the strings, or lines, by whose vibrations the tension of sound is excited; and by whose divisions the several degrees of tune are determined. They are called *chords*, or *choris*, from the Greek $\chi\omicron\rho\delta\omicron\nu$, a name which the physicians give to the intestines; in regard the strings of musical instruments are ordinarily made of guts; though others are made of brass or iron wire; as those of spinets, harpichords, &c. See STRING.

Chords of gold wire in harpichords, yield a sound almost twice as strong as those of brass; chords, or strings, of steel, yield a feebler sound than those of brass; as being both less heavy, and less ductile.

Mr. Periaud observes, that of late they have invented a way of changing the chords, to render the sound stronger, without altering the tone.

The sixth chord of bass viols, and the tenth of large theorbos, consist of fifty threads, or guts; there are some of them a hundred feet long twisted and polished with equitum, or horse-tail.

CHORDS for the division of, so as to constitute any given interval, the rules are as follow: 1. To assign such part of a chord A B, as shall constitute any concord, v. g. a fifth, or any other interval, with the whole.

Divide AB into as many parts, as the greatest number of the interval has mits; v. g. the fifth being 2 : 3, the line is divided into 3. Of these take as $A \text{---} | \text{---} | \text{---} B$ many of the lesser number, v. g. $\frac{C}{1} \text{---} | \text{---} \frac{2}{2} \text{---} | \text{---} \frac{3}{3}$ 2 = AC; then is AC the part sought; that is, two lines, whose lengths are to each other as AB to AC, make a fifth.

Hence, if it be required to find several different sections of the line AB, v. g. such as shall be 8ve, fifth, and 3d g; reduce the given ratios 1 : 2, 2 : 3, and 4 : 5, to one fundamental; the series becomes 30, 24, 20 : 15. The fundamental is 30, and the sections sought are 24, the third g; 20, the fifth; and 15, the octave.

2. To find several sections of a line AB, that from the least, gradually to the whole, shall contain a given series of intervals in any given order; viz. so that the least to the next greater contains a third g; that to the next greater, a fifth; and that to the whole, an octave.

Reduce the three ratios 4 : 5, 2 : 3, 1 : 2, to one series; hence we have 8 : 10 : 15 : 30; divide the line into the number of parts $A \text{---} | \text{---} | \text{---} | \text{---} | \text{---} B$ of the greatest extreme $\frac{8}{C} \text{---} | \text{---} | \text{---} \frac{10}{D} \text{---} | \text{---} | \text{---} \frac{15}{E} \text{---} | \text{---} | \text{---} \frac{30}{B}$ of the series; viz. 30,

we have the sections sought at the points of division, answering

fwering to the several numbers of the series, viz. at the points C, D, and E; so that AC to AD is a third, AD to AE a fifth, and AE to AB octave.

3. To divide a line AB into two parts, to contain betwixt them any interval, v. g. a fourth.

Add together the numbers containing the ratio of the interval, v. g. 3 : 4; and the line divided into as many parts as the sum contains, v. g. 7; taken to any of the given numbers, v. g. 4, or C, gives the thing sought.

4. For the harmonical division of Chords. To find two sections of a line, which with the whole shall be in harmonical proportion, with regard to their quantity.

Take any three numbers in harmonical proportion, as 3, 4, 6; and divide the whole line into as many parts as the greatest of these three numbers, v. g. 6; and at the points of division answering to the other two numbers, v. g. 3 and 4, you have the sections sought.

5. To find two sections of a line, which together with the whole shall be harmonical, with respect to quality or tune.

Take any three numbers, concords with each other, v. g. 2, 3, and 8, and divide the line by the greatest; the points of division answering to the other two, give the sections sought.

6. To divide a CHORD, A B, in the most simple manner, so as to exhibit all the original concords.

Divide the line into two equal parts at C, and subdivide the part C B into two equal parts at D; and again, the part C D into two equal parts at E.

Here AC to A B is an octave; AC to AD a fifth; AD to A B a fourth; AC to A E a third; A E to A D a third; A E to E B a sixth; and A E to A B a sixth *l*. Malcolm's Treat. of Music, ch. 6. sect. 1, 2, 3.

To find the number of vibrations made by a musical chord or string, in a given time, its weight, length, and tension being given.

Before we proceed to the solution of this problem, we shall premise and demonstrate the principle on which it is founded; and with this view, we shall adopt the method of demonstration presented to the Royal Society by Dr. B. Taylor, and published in the Philosophical Transactions, N^o 337; or Jones's Abr. vol. iv. p. 391.

Lemma 1. Let A D F B, A Δ Φ B, (Plate III. Geometry, fig. 45.) be two curves, the relation of which is such, that the ordinates C Δ D, E Φ F, being drawn, it may be C Δ : C D :: E Φ : E F. Then the ordinates being diminished *ad infinitum*, so that the curves may coincide with the axis A B; the ultimate ratio of the curvature in Δ will be to the curvature in D, as C Δ to C D.

Demonstr. Draw the ordinate e d d very near to C D, and at D and Δ draw the tangents D t and Δ θ, meeting the ordinate e d in t and θ. Then because of e d : e d :: C Δ : C D (by hypothesis), the tangents being produced will meet one another, and the axis, in the same point P. Whence, because of similar triangles C D P and e t P, C Δ P and e θ P, it will be e θ : e t :: C Δ : C D :: e d : e d (by hypoth.). ∴ δ θ : (e θ - e d) : d t (e t - e d). But the curvatures in Δ and D are as the angles of contact θ Δ θ and t D d; and because δ Δ and d D coinciding with e C, those angles are as their sines δ θ, d t; that is, by the proportion above, as C Δ, C D. Therefore, &c. Q. E. D.

Lemma 2. In some instant of its vibration, let a string, stretched between the points A and B, fig. 46. put on the

form of any curve A ρ π B; then the increment of the velocity of any point o, or the acceleration arising from the force of the tension of the string, is as the curvature of the string in the same point.

Demonstr. Conceive the string to consist of equal rigid particles, which are infinitely little, as ρ o, o π, &c. and at the point o erect a perpendicular o R, equal to the radius of the curvature at o, which let the tangents ρ t, π t, meet in t, the parallels to them π s, ρ s, in s, the chord ρ π in c. Then by the principles of mechanics, the absolute force by which the two particles ρ o and o π are urged towards R, will be to the force of tension of the string, as s t to t ρ; and half this force by which one particle ρ o is urged, will be to the tension of the string, as c t to t ρ; that is (because of similar triangles e t ρ, t ρ R) as t ρ or o p t to R t, or o R. Wherefore, because of the force of tension being given, the absolute accelerating force will be as $\frac{o p}{o R}$. But the acceleration generated is in a

compound ratio of the ratios of the absolute force directly, and of the matter to be moved inversely; and the matter to be moved is the particle itself o p. Wherefore the acceleration is as $\frac{1}{o R}$; that is, as the curvature in o. For the curvature is reciprocally as the radius of curvature in that point. Q. E. D.

Prob. 1. To determine the motion of a stretched string. In this and the following problem, we suppose the string to move from the axis of motion through an indefinitely little space; that the increment of tension from the increase of the length, also the obliquity of the radii of curvature, may safely be neglected.

Therefore let the string be stretched between the points A and B, fig. 47. and with a bow let the point z be drawn to the distance C z, from the axis A B. Then taking away the bow, because of the flexure in the point C alone, that will first begin to move (by Lem. 2.). But no sooner will the string be bent in the nearest points δ and d, but these points also will begin to move; and then E and e; and so on. Also because of the great flexure in C, that point will first move very swiftly; and hence the curvature being increased in the next points D, E, &c. they will immediately be accelerated more swiftly; and at the same time the curvature in C being diminished, that point in its turn will be accelerated more slowly. And, in general, those points which are slower than they should be, being accelerated more, and the quicker less, it will be brought about at last, that the forces being duly tempered one with another, all the motions will conspire together, and all the points will at the same time approach to the axis, going and returning alternately, *ad infinitum*.

Now, that this may be done, the string must always put on the form of the curve A C D E B, the curvature of which, in any point E, is as the distance of the same E n from the axis; the velocities of the points C, D, E, &c. being also in the ratio of the distances from the axis C z, D δ, E n, &c. For in this case the spaces C z, D δ, E n, &c. described in the same infinitely little time, will be as the velocities; that is, as the spaces described C z, D δ, &c.

Wherefore the remaining spaces x z, δ θ, e n, &c. will be to each other in the same ratio. Also (by Lem. 2.) the accelerations will be to one another in the same ratio. By which means the ratio of the velocities always continuing the same with the ratio of the spaces to be described, all the points will arrive at the axis at the same time, and always depart from it at the same time. And therefore the curve A C D E B will be rightly determined. Q. E. D.

Moreover the two curves ACDEB and $Ax\delta t B$, being compared together, by *Lemma 1.* the curvatures in D and δ will be as the distances from the axis D δ and $\delta\delta$; and therefore, by *Lemma 2.* the acceleration of any given point in the string will be as its distance from the axis. Whence (by Sect. 10. Prop. 51. of Newton's Principia), all the vibrations, both great and small, will be performed in the same periodical time, and the motion of any point will be similar to the oscillation of a body vibrating in a cycloid. Q E I.

Cor. Curvatures are reciprocally as the radii of circles of the same degree of curvature. Therefore let a be a given line, and the radius of curvature in E will be equal to $\frac{aa}{E\eta}$.

Prob. 2. The length and weight of a string being given, together with the weight that stretches the string, to find the time of a single vibration.

Let the string be stretched between the points A and B, fig. 48. by the force of the weight P, and let the weight of the string itself be N, and its length L. Also let the string be put in the position AF ρ C B, and at the middle point C, let CS, a perpendicular, be raised, equal to the radius of the curvature in C, and meeting the axis AB in D; and taking a point ρ near to C, draw the perpendicular ρc and the tangent ρt .

Therefore it appears, as in *Lemma 2.* that the absolute force by which the particle ρC is accelerated, is to the force of the weight P, as $c t$ to ρt ; that is, as ρC to CS. But the weight P is to the weight of the particle ρC , in a ratio compounded of the ratios of P to N, and of N to the weight of the particle ρC , or of L to ρC ; that is, as $P \times L$ to $N \times \rho C$. Therefore, compounding these ratios, the accelerating force is to the force of gravity, as $P \times L$ to $N \times CS$. Let therefore a pendulum be constructed, whose length is CD; then (by sect. x. prop. 52. of Newton's Principia) the periodical time of the string will be to the periodical time of that pendulum as $\sqrt{N \times CS}$ to $\sqrt{P \times L}$. But by the same proposition, the force of gravity being given, the longitudes of the pendula are in a duplicate ratio of the periodical times. Whence $\frac{N \times CS \times CD}{P \times L}$, or writing $\frac{aa}{CD}$ for

CS (by *Cor. Prob. 1.*) $\frac{N \times aa}{P \times L}$ will be the length of a pendulum, the vibrations of which are isochronous to the vibrations of the string.

To find the line a , let the absciss of the curve be AE = x , and the ordinate EF = z , and the curve itself AF = v , and CD = b . Then (by *Cor. Prob. 1.*) the radius of curvature is F will be $\frac{aa}{x}$. But v being given,

the radius of curvature is $\frac{v \dot{x}}{\dot{z}}$. Whence $\frac{aa}{x} = \frac{v \dot{x}}{\dot{z}}$, and therefore $aa \dot{z} = v \dot{x} x$; and taking the fluents $aa \dot{z} = \frac{v \dot{x}^2}{2} - \frac{v \dot{b}^2}{2} + v a^2$. Here the given quantity $-\frac{v \dot{b}^2}{2} + v a^2$ is added, that it may be $\dot{z} = v$ in the middle point C. And hence the calculus being completed, it will be $\dot{z} = \frac{a^2 \dot{x} - \frac{1}{2} b^2 \dot{x} + \frac{1}{2} x^2 \dot{x}}{\sqrt{a^2 b^2 - a^2 x^2 - \frac{1}{4} b^4 - \frac{1}{4} b^2 x^2 + \frac{1}{4} b^2 x^4}}$. Now let b and

x vanish in respect to a , that the curve may coincide with the axis, and it will be $\dot{z} = \frac{a \dot{x}}{\sqrt{b b - x x}}$. Now, with the centre C, and radius DC = b , fig. 49, a quadrant of a

circle DPE being described, and making CQ = x , and erecting the perpendicular QP; then the arc DP being = y , it will be $y = \frac{b \dot{x}}{\sqrt{b b - x x}} = \frac{b}{a} \dot{z}$.

Whence $y = \frac{b}{a} z$, and $z = \frac{a}{b} y$. And making $x = b =$ CD, in which case it is also $y =$ quadrantal arc DPE, and $z = AD = \frac{1}{2} L$; it will be $\frac{1}{2} L = a \times \frac{DE}{CD}$, and a

= $L \times \frac{CD}{2 DE}$. Let it be therefore CD : 2 DE :: diameter of a circle : circumference :: $d : c$; and it will be $aa = L \times \frac{d d}{c c}$. Therefore this value being substituted for

$aa \frac{N}{P} \times L \times \frac{d d}{c c}$ will be the length of a pendulum, which will be isochronous to the string. Therefore let D be the length, whose periodical time is t , and $\frac{d}{c} \sqrt{\frac{N \times L}{P \times L}}$ will be the periodical time of the string. Q E I.

For the periodical times of pendulums are as the square roots of their lengths.

Cor. 1. The number of vibrations of the string in the time of one vibration of the pendulum D, is $\frac{c}{d}$

$$\sqrt{\frac{P}{N} \times \frac{D}{L}}$$

Cor. 2. Because $\frac{d}{c} \times \sqrt{\frac{1}{D}}$ is given, the periodical time of the string is as $\sqrt{\frac{N}{P} \times L}$. And the weight P

being given, the time is as $\sqrt{N \times L}$. And the strings being made of the same thread, in which case it is N as L, the time will be as L.

If we take L for the number of inches and decimals contained in the length of the chord, and the proportion of the tension to the weight of the chord as n to 1, then will the number of vibrations of the chord in one second be (by *Cor. 1.*) $\frac{355}{113} \sqrt{\frac{39.12 n}{L}}$. Where $\frac{355}{113}$ denotes the proportion of the circumference to the diameter of the circle; and 39.12 the length of a pendulum vibrating seconds, in inches and decimals of an inch, English measure. This last expression coincides with Mr. Euler's rule (Tentam. Nov. Theor. Mus. p. 6, 7.), only we here express in English what he gives in Rhinland length. To illustrate this rule by an example: suppose the length of the chord to be 18.7 inches, its weight 65 grains, and the tension or weight extending this chord to be 8lb. troy, or 46080 grains. Then $L = 18.7$, and $n = \frac{46080}{6.2} = 7432$. The number of vibrations

therefore by the rule will be $\frac{355}{113} \sqrt{\frac{39.12 \times 7432}{18.7}} =$

391.4. See Taylor's Method. Increm. Prop. 29. MacLaurin's Fluxions, § 929. Smith's Harmonics, Prop. 23 and 24. Malcolm's Music, ch. ii. § 2.

By logarithms the rule may be thus expressed $L \frac{1}{2} + \frac{W}{2} +$

C = V. Where L is the logarithm of the ratio of a pendulum, vibrating seconds, to the length of the given string; W the logarithm of the ratio of the tension to the weight of the string; C the logarithm of the ratio of the circum-

ference of a circle to its diameter, or 0.4971500; and lastly, $V =$ logarithm of the required number of vibrations in one second.

From what has been above laid down, we may easily deduce the following particulars relative to stretched chords or strings. (See Cavallo's Philosophy, vol. ii.)

1. If a stretched cylindrical chord be struck, and then be left to vibrate by itself, it will perform its vibrations, whether large or narrow, in equal times, and, of course, the sound, though decaying gradually, yet continues in the same pitch; excepting, however, when the string is struck violently; for in that case its sound is a little higher at first, viz. its vibrations are a little more frequent at first.

2. If various strings be equally stretched, and be of the same substance; or, in short, if they be equal in every respect, excepting in their lengths; then the duration of a single vibration of each string will be as the length of the string; or (which is the same thing) the number of vibrations performed by each string in a given time will be inversely as the length; for instance, if a string be four feet long, and another string, *ceteris paribus*, be one foot long; then the latter will vibrate four times whilst the former vibrates once. Or if the length of the former be to that of the latter as 10 to 3; then the vibrations performed by the latter will be to those that are performed by the former, as 3 to 10; and so on. Also, the same thing must be understood of the parts of the same string; for instance, if a certain string perform 8 vibrations in a second; then, if that string be stopped in the middle, and one half of it only be caused to sound, then that half will perform 16 vibrations in a second.—One-third part of the same string will perform 24 vibrations in a second; and so on.

The length of the string is reckoned from one bridge to the other, or from one resting place to the other. The tension of the string is measured by the weight which is suspended to one end of it. If instead of stretching a string by suspending a weight to it, the string be twisted round a peg, after the manner commonly used in musical instruments, then the tension still must be expressed by a weight; meaning a weight which may be capable of stretching the string as much as it is stretched by turning the peg.

3. If various chords differ in tension only; then the number of vibrations which each of them performs in a given time, is as the square root of the stretching weight. Thus, if a chord be stretched by a weight of 16 pounds, and another chord be stretched by a weight of 9 pounds; then the former will perform 4 vibrations in the same time that the latter performs 3 vibrations.

4. If cylindrical chords differ in thickness only; then the number of vibrations which they perform will be inversely as the diameters, viz. if the diameter of a chord be equal to twice the diameter of another chord; then the former will perform one vibration in the same time that the latter performs two vibrations.

5. By a proper adjustment of the lengths, thicknesses, and stretching weights, dissimilar chords may be caused to perform any required number of vibrations; which is evidently derived from the preceding paragraphs.

6. The actual number of vibrations, which are performed by a given stretched cord, may be determined, without any great error, by using the following rule; provided the length and weight of the vibrating part of the chord, and likewise the stretching weight be known.—*Rule.* Multiply the stretching weight by 39.12 inches (which is nearly the length of the pendulum that vibrates seconds). Also multiply the weight of the chord by its length in inches; divide the first

product by the second; extract the square root of the quotient; multiply this square root by 3.1416, and this last product is the number of vibrations that are performed in one second of time by the given chord.—The resistance of the air, as also some other fluctuating causes of obstruction, not being noticed in this rule; it is most probable that the real vibrations are not quite so numerous as they are given by the rule.

The pitch in music is denoted by the number of vibrations that are performed in a given time, or by the length of the string which emits each of those sounds; for it has been already shewn that, when stretched strings are alike in all other respects, excepting in their lengths, then the duration of a single vibration of each string is proportionate to the length of the string; or (which amounts to the same thing) that the number of vibrations performed by each string in a given time, is inversely as the length of the string.

If you take several strings, or chords, precisely of the same substance, the same form, and the same thickness, and stretch them equally by suspending equal weights at their extremities or otherwise; and their respective lengths be made of the due proportions; then these strings, when struck, will express the proper musical sounds or tones, and the whole set is called "the Scale of Music." See SCALE, STRING, and VIBRATION.

Mr. Euler informs us, that he found the chord, making 392 vibrations in a second, to be at unison with the key called *a* in instruments, that is, an octave and sixth major above the lowest *C* in our harpichords or violoncellos. Consequently the note *C*, being to *a* as 3 to 10, will make 118 vibrations in one second. And the highest *C*, or *c''*, as Mr. Euler calls it, being four octaves above the lowest *c*, will vibrate 1888 times in one second of time. Mr. Euler supposes the limits of the human ear to be, with respect to gravity, two octaves lower than *C*; and with respect to acuteness, two octaves higher than *c''*. See INTERVAL and VIBRATION.

CHORD, is sometimes also used for accord. Thus we say, the common chords to such a bass note, meaning its third, fifth, and octave. See ACCORD.

CHORD is also used, in Music, for the note or string to be touched or sounded, in which sense it is applicable to all the intervals of music.

CHORD is also a technical term in music, implying a combination of not less than three sounds, as the third and fifth to any base, or the

8
5
3
which compose what, in practice, is called a common chord;

which may be written and played three several ways, as

8 3 5
5 8 3
3 5 8
C C C
The first of these is called the common chord; the second, the chord of the 6th; the third, the chord of the 4th; yet still each of these is but the common chord to C, the fundamental or principal base, reversed. See COMMON CHORD, FUNDAMENTAL BASE, ACCOMPANIMENT, and THOROUGH-BASE.

CHORDA TYMPANI, in Anatomy, a very slender nervous twig, forming a communication between the facial nerve, (portio dura of the 7th pair) and the lingual branch of the inferior maxillary. In its course it crosses the cavity of the tympanum. See NERVES and EAR.

CHORDA, Lat. the string of a lute, harp, violini, &c.

CHORDÆ MOBILES, Lat. in Ancient Music, strings in the tetrachords which were changeable in the chromatic and enharmonic genera.

Chordæ stabiles, strings at the top and bottom of tetrachords of the ancient lyre, of which the tuning was never altered by change of genus.

CHORDAPSUS, in *Medicine*, a term used by some of the ancient physicians, to denote a violent pain in the abdomen. There is a difference among them as to the precise signification of the term; some applying it only to spasmodic affections of the bowels, and others to inflammatory pains, or to both. Celsus (lib. iv. cap. 13.) observes, that Diocles Carytus denominated the acute disease of the small intestines *chordapsus*; and that of the large intestines, which is sometimes chronic, *ileus*; but he adds, that by most physicians the former is called *ileus*, and the latter *colicæ*. Cælius Aurelianus remarks, that some physicians denominate the acute disease (or ileus) chordapsus, because the intestines are stretched, as it were, like cords. But he adds, that others apply the term to pains of the bowels in general, among whom are Hippocrates, Pexagoras, and Euriphon the Galidian. De Acut. Morb. m. 17.

By some the word is derived from $\chi\omicron\rho\acute{\alpha}\nu$ and $\acute{\alpha}\rho\tau\omicron\rho\epsilon\iota$, *tango*, because the bowels feel hard and stretched like a cord to the hand, applied to the abdomen; by others, probably with more correctness, from $\chi\omicron\rho\acute{\alpha}\nu$ and $\acute{\alpha}\rho\tau\omicron$, *necto*, *I bind*, from the tension and contraction of the bowels during these pains. For Cælius Aurelianus observes, the ancient Greeks used the term $\chi\omicron\rho\acute{\alpha}\nu$ for *intestine*. See *COLICæ* and *ENTERITIS*.

CHORDEE, in *Surgery*, (from $\chi\omicron\rho\acute{\alpha}\nu$, the string of a musical instrument,) denotes a painful, involuntary, and sometimes dilated, erection of the penis, happening at all times, but more commonly when the patient is warm in bed; under which circumstance the penis becomes hard and painful to the touch, and is most frequently curved downwards in a considerable degree. It sometimes remains, after the heat of urine, and other symptoms of gonorrhœa, are gone off; but is usually more severe during the continuance of the inflammation, and becomes more or less violent, according to the greater or less urgency of that symptom.

Mr. Benjamin Bell states, that chordee is the effect of inflammation, arising from irritation, communicated from the nerves of the urethra to those of the contiguous muscles, whereby those unequal degrees of contraction are produced over the whole substance of the penis, which universally take place in this disease.

Mr. Hunter says, the chordee appears to be inflammatory in some cases, and spasmodic in others. Speaking of the inflammatory, he says, "When the inflammation is not confined merely to the surface of the urethra and its glands, but goes deeper and affects the reticular membrane; it produces an extravasation of coagulable lymph, as in the adhesive inflammation, which, uniting the cells together, destroys the power of dilatation of the corpus spongiosum urethrae, and makes it unequal in this respect to the corpora cavernosa penis, and therefore a curvature on that side takes place in the time of erection, which is called a chordee. The curvature is generally in the lower part of the penis, arising from the cells of the corpus cavernosum penis of that side, having their sides united by adhesions, sometimes, as it were spontaneously, at other times, in consequence of the inflammation attending bad chancres. Besides this effect of inflammation, when the chordee is violent the inner membrane is probably so much upon the stretch, as to be in some degree torn, which frequently causes a profuse bleeding from the urethra, that often relieves, and even sometimes cures. As chordee arises from a greater degree of inflammation than common, it is an effect which may, and often does, remain after all infection is gone, being merely a consequence of the adhesive inflammation."

The spasmodic chordee, Mr. Hunter says, arises from spasm; at least it cannot proceed from the same cause as the other, if his idea of that complaint be well founded. The spasmodic comes and goes, but at no flatted times; at one time there will be an erection entirely free from it, at another it will be severely felt, and this will often happen at short intervals.

In the beginning of this complaint, Mr. Hunter sometimes advised bleeding from the arm, but, he says, it is of more immediate service to take away blood from the part itself by leeches; for we often find, by a vessel accidentally giving way in the urethra, and a considerable hæmorrhage ensuing, that the patient is greatly relieved.—"To menten't the penis by holding it over the steam of warm water, will give ease, as will also poultices; and if camphor be added to the fomentation and poultice, it will, in many cases, assist in taking off the inflammation.

"Opium given internally is of singular service, and if joined with camphor, the effect will be still greater; but opium, in such cases, acts rather by lessening the pain than by removing the inflammation, though by preventing erections, it may be said to obviate the immediate cause of the complaint."

For a chordee, continuing after all other symptoms are gone, Mr. Hunter thinks evacuation seldom necessary, the inflammation being gone, and a consequence of it only remaining, which, he says, will go off gradually by the absorption of the extravasated coagulable lymph. Rubbing the parts, however, with mercurial ointments will promote the absorption of the extravasated coagulable lymph, for we find that mercury has considerable powers in exciting absorption; and the friction will also be of use. In one case Mr. Hunter thought he saw considerable benefit from giving cicuta, after he had tried the common methods of cure to no purpose. Bark and electricity may also be of use in such cases; but evacuations, whether from the part, or from the conglutination, generally do harm rather than good.

A chordee is often longer in going off than either the discharge or the pain; but its declension is generally gradual and uniform, as is the case with most of the consequences of inflammation.

CHORDIRAZA, in *Ancient Geography*, a town of Asia in Mesopotamia, situated in the environs of Carrhæ, according to Strabo.

CHORDYLA, or **CORDULA**, a town of Asia in the Colchide, in the country of the Lazæ, on the left bank and near the mouth of the Acinasis. According to Ptolemy it was situated about 6 or 7 leagues to the south of Gygaenum.

CHOREA, Gr. $\chi\omicron\rho\acute{\alpha}\nu$, a dance, *saltare cum cantu*. See **BALLAD**, **BALLATA**.

CHOREA, in *Medicine, more commonly written *Chorea Sancti Viti*, or *Saint Vitus's Dance*, from $\chi\omicron\rho\acute{\alpha}\nu$, a dance, is a spasmodic or convulsive disease, in which the muscles of the extremities and other parts are thrown into various involuntary motions, and perform in an irregular manner those motions which are dictated by the will.*

It is remarkable, that of a disease so singular and formidable in its appearance, so obstinate in its continuance, and which reduces the patient to such a distressful state, no satisfactory history is to be collected from the writings of physicians, except of those of our own country, and those of the later continental writers, who appeal to Sydenham as their authority. From the nature of its symptoms it would seem probable that the disease is not of modern origin, but must have been occasionally observed from the earliest times. The ancients, however, have either not described it, or described it indistinctly, and confounded it with some other

nervous

nervous disorders, with which it exhibits only a few symptoms in common.

The disease, anciently denominated *αχσενν;σν, scelotyrbē*, (*quasi cruris perturbatio*;) appears to resemble chorea in several circumstances, inasmuch that some modern authors have considered the terms as synonymous. Sauvages treats of chorea under the appellation of *scelotyrbē chorea viti*. Nofol. Method. Class IV. See Langius, Epit. Med.—But the definitions of scelotyrbē, left us by the ancients, scarcely apply to chorea, as it has been understood since the time of Sydenham. Galen describes it as a sort of paralysis of the legs, which renders the patient unable to walk in a straight direction; he turns from one side to the other, crossing the left foot over the right, or the right foot over the left, or both alternately; and sometimes elevates the feet as if ascending a great acclivity. This deordination will also apply to a partial or incipient palsy of the lower extremities: and indeed the term itself excludes the notion of any affection of the muscles of the arm, or superior parts of the body. Piny mentions the scelotyrbē, as a disease which occurred together with the fevry (*Bomacee*) among the Roman soldiers encamped near the Rhine, in consequence of drinking for a considerable time the waters of a certain spring. He designates it in a few words; “compages in genibus solverentur;” which seem to imply a simple paralysis of the legs. Nat. Hist. lib. xxv. cap. 3.

The disease, of which we now treat, is widely different in its nature: and the appellations of *Chorea Sancti Viti, Saltus Viti*, &c. imply that it has been first distinguished from other affections in modern times. The writers, however, who have adopted these appellations, have by no means agreed in the congeries of symptoms to which they apply them. The connection of the name of this faint (*Vitus*) with a convulsive disease seems to have originated among the continental writers, during the days of fanaticism and superstition in the seventeenth century. Gregorius Horstius and Juncker relate, that a superstitious belief prevailed in Germany, among the people addicted to worship the images of the faints, that by presenting gifts, and dancing before the image of St. Vitus, on his festival in the month of May, they should live in health and safety during the ensuing year; and that for this purpose they repaired to a chapel dedicated to this faint, where they danced night and day, until they were seized with a delirium, and fell down in a sort of trance. They then returned home, having undergone a supposed renovation. But on the return of May, in the following year, they began to perceive a restlessness and agitation of their limbs, as if a fresh regeneration were become necessary, and were compelled to assemble again in the chapel, on the festival of the faint. This Juncker attributes to the force of imagination and habit! There were two chapels sacred to St. Vitus, the one near Ulm, the other near Ravensberg; both famous for the annual assemblies of dancing fanatics. Gregorius Horstius affirms that he had conversed with several persons, who resorted to this superstitious dance, as a preservative from disease, and who were strenuous advocates of its efficacy; one of them had paid the annual visit for the space of 24, and another for 30 years. Greg. Horl. Opera Med. tom. ii. lib. ii. obs. 45. Juncker Conspect. Patholog.

Such is the origin of the appellation given to this disease. It was applied, it would seem, in the first instance, chiefly to cases of insanity, in which there was an extraordinary disposition to violent exercise, whether of running, dancing, or otherwise; and as well to the temporary delirium of the fanatic, as to the more permanent derangement of the maniac. Such were two cases related by Platerus, if they are not alto-

gether fabulous; in one of which, a woman danced vehemently, night and day, until the skin was worn off her feet. Observ. Med. lib. i. p. 58. Tulpius records the history of a man seized with a similar insanity, who ran about night and day, until he suffered the most profuse perspirations, and was unable to cease from his exertions, except when overpowered by sleep. Obs. Phys. lib. i. obs. 16. See also Jo. Rud. Camerar. Sylloge Mem. cent. xi. obs. 84—88.

Our countryman, Sydenham, was the first writer, we believe, who described the series of symptoms, which is now comprehended under the term, *chorea*, or *Saint Vitis's Dance*; and he has been copied or followed, in this description, by most of the subsequent writers on the subject. Sydenham, however, speaks of it as a disease, which was vulgarly called *chorea sancti Viti* in his time. Dr. James Hamilton, in a late excellent treatise, on the utility of purgative medicines, has, from a more extensive experience in the disorder, given a more correct and ample view of chorea. It is characterized by the following symptoms.

The approach of the disease is commonly slow, and is indicated by a loss of the usual vivacity and playfulness, by a variable and often ravenous appetite, a swelling and hardness in the lower belly in most cases, in some a lank and soft belly, and, in general, a contipated state of the bowels, which is aggravated as the disease advances. Slight irregular involuntary motions are soon observed, especially on the muscles of the face, which are thought to be the effect of irritation, and are the harbingers of the more violent convulsive motions, which now attract the attention of the friends of the patient.

These convulsive motions vary considerably. The muscles of the extremities, and of the face, those moving the lower jaw, the head and the trunk of the body, are, at different times, and in different instances, affected by it. In this state the patient does not walk steadily; his gait resembles a jumping or starting; he sometimes cannot walk, and seems palled, nor can he perform the common and necessary motions with the affected arms. In a word, when the patient wishes to be at rest, the muscles are perpetually moving, and distorting the limbs, face, and trunk; and when any motion is attempted by the will, it is performed irregularly, and with difficulty, after several useless efforts. “Thus if the patient take a cup of drink in his hand, he performs,” as Sydenham has remarked, “a thousand ludicrous gesticulations, before he is able to bring it to his mouth; for he cannot direct it in a straight line, his hand being drawn hither and thither by the convulsions, but is compelled to move it about for some time, till at length, reaching his lips, he flings the liquor suddenly into his mouth, and drinks it greedily, as if the poor creature designed only to excite the laughter of the spectators.”

These convulsive motions are more or less violent, and are constant, except during sleep, when, in most instances, they cease altogether: but sometimes they continue, and when the disease is greatly aggravated, even severe, inasmuch that the sleep becomes unfound and disturbed by the incessant motions. Although different muscles are sometimes successively convulsed, yet, in general, the muscles affected in the early part of the disease, remain so during the course of it. The disease advancing, articulation becomes impeded, and is frequently completely suspended. Deglutition is also occasionally performed with difficulty. The eye loses its lustre and intelligence; the countenance is pale and expressive of vacuity and languor. These circumstances give the patient an appearance of fatuity; and indeed there is little doubt, that, when the disease has subsisted for some time, fatuity, to a certain extent,

interrupts the exercise of the mental faculties. Fever, such as arises in marasmus, is not a necessary attendant on chorea; nevertheless, in the advanced periods of the disease, slackness and wasting of the muscular flesh take place, the consequence of constant irritation, of abating appetite, and impaired digestion, the common attendants of protracted chorea; and which, doubtless, may, in some instances, have been the forerunners of death; although no fatal instances of chorea have been recorded.

Chorea attacks the male and female sex indifferently; and those chiefly who are of a weak constitution, or whose natural good health and vigour have been impaired by confinement, or by the use of feanty or improper nourishment. It appears most commonly from the eighth to the fourteenth year of age; but sometimes, especially in females, it has been observed at the age of sixteen or eighteen years. Sydenham Schedul. Monitor. de nov. febris ingressu.—Hamilton Obs. on Purgative Med.—Bisset Med. Essays and Obs.

Although chorea, in the precise form above described, seldom, if ever, attacks adults, yet a series of irregular, distressing, and unquiet motions in the muscles of the extremities, abdomen, neck, and face, occasionally occur in adults, which bear a great resemblance to the motions of the chorea of children. This disorder is sometimes connected with a derangement of the biliary system and the organs of digestion; sometimes with anxiety or distress of mind; sometimes it is combined with symptoms of hysteria; and we have seen it succeed to a state of mental irregularity and depression, bordering on melancholy. Dr. Darwin has attempted to distinguish these motions from those of chorea; but he has obviously mistaken the nature of the latter. He has termed the disease of adults, *convulsio dolorifica*, (painful convulsion,) because the exertion of the muscles, he affirms, is made to relieve some uneasy sensation, especially the pains left after rheumatism in young and delicate people: but in chorea, "the undue motions only occur when the patient endeavours to exert the natural ones; are not attended with pain; and cease when he lies down without trying to move." See Zoonomia. Class IV. 2. 3. and Class III. 1. 1. This statement, however, is incorrect; since, as we have before mentioned, the motions of chorea are almost incessant, and that even during sleep, in inveterate cases. An intelligent young man, who now labours under this convulsion, expressed his conviction, that Dr. Darwin's conjecture is correct, and affirmed, that he could, by a strong exertion of the will, prevent the motions from taking place at any time, but that that exertion was extremely painful, and was followed by languor and distressful sensations. Whether this be also the case in the chorea of children, we know not, since their immature understanding precludes the possibility of making the experiment.

Many causes have been assigned to chorea. It is often attributed to the presence of worms in the alimentary canal, and to the repulsion, or drying up of cutaneous eruptions: Dr. Darwin seems to have conceived that its most common cause was the repulsion of the itch. Rheumatism, acute fevers, diseases of the stomach, the use of mercury, terror, and other strong mental impressions, are also enumerated among the occasional causes of chorea; but these relate chiefly to those convulsive affections which occur in adults. Dr. Monro, the son, used to affirm, in his lectures, that he had several times observed the disease to occur in children about the period of the second dentition, when the former set of teeth remained, or when the new set were shining through the gums; and that he had speedily cured the disease, by drawing the first teeth, or lancing the gums. Dr. Ha-

milton believes that chorea is connected with a sluggish action and constipation of the bowels, and the consequent large accumulation of feces in the canal. He observes, with regard to one of his patients; "This boy was emaciated and exceedingly puny, and his abdomen was lank; yet, from the 15th day of December, when the commencement of his recovery was observable, to the 25th day of the same month, the quantity of feces discharged was most wonderful, such as I had never seen before. It appeared to me, during the above period, to have nearly equalled in weight, that of the whole body of the extenuated patient." Page 68.

The cure of chorea has been variously attempted, according to the particular notion entertained by the practitioner, of the nature and cause of the disease. All the remedies, however, which have been adopted, may be considered as belonging to two classes, tonics and evacuations; such as terra, on the one hand, to support the strength of the constitution, and to diminish the susceptibility of irritation; or such, on the other, as evacuate the bowels, or lessen the quantity of the circulating fluids. The two plans of cure have been combined with success.

The systems of modern medicine, and more particularly the dogmatic doctrines of Brown, have led their followers to consider every spasmodic disease as a disease of debility, to the cure of which tonics and stimulant medicines are alone adequate, and to which the slightest evacuation is greatly detrimental. Numerous examples of chorea, among the rest, are recited in the periodical journals, in which a cure was obtained under the employment of medicines of this nature. Thus we find cures attributed to the use of asaëtida, valerian, mullk, camphor, the flowers of cardamine, and belladonna; to electricity and the cold bath; to Peruvian bark and other vegetable bitters; and, of late years, more particularly to the virtues of the metallic tonics, especially the oxyd of lime, and sulphate of zinc, the ammoniated copper, and nitrate of silver. See Bisset loc. cit. Edinburgh Med. Com. vol. x. and xii. Memoirs of the Lond. Med. Soc. vol. iii. Fothergill, Phil. Trans. 1779, &c. Under the administration of remedies of this class, the disease unquestionably occasionally disappears; sometimes in consequence of the casual cessation or removal of the irritation which excited it; and sometimes, no doubt, from the direct effects of the medicines, in rendering the body less susceptible of the ill effects of the exciting irritation, in slight cases. It is certain, however, that the symptoms of chorea have often continued with unremitting severity, under the employment of the most powerful of these tonic and anti-spasmodic medicines, during many months, nay even for years; terminating only, on some occasions, about the age of puberty, and even leaving the unconquerable remains of its grotesque and irregular motions imposed on the young sufferer for life.

To the opposite mode of employing evacuations, especially purgatives, different physicians have been led by some peculiar notion of the disease which they entertained; which, however different, conducted them to the same conclusion. Sydenham ascribed the convulsions of chorea to a humour falling upon the nerves, (*humor aliquis in nervos irruens*), and stimulating them to extraordinary action; hence he inferred, that the indications of cure were to diminish or remove this supposed humour by blood-letting and purging; and to strengthen the nerves, by administering tonics and anti-spasmodics in the intervening days. He cured five cases, the only ones that he had seen, by this method. It is probable, however, that the purgatives were the only useful evacuants that Sydenham employed, and the protracted cures may be attributed partly to the interruption of the use of them,

them, and partly to the debilitating effects of blood letting, which appears to be decidedly prejudicial, and is no longer recommended. But the general disuse of purgatives is chiefly to be attributed to the theories of modern systematics, especially to the opinion of Dr. Cullen, and the more dogmatic doctrines of Dr. John Brown, which inculcate, that all spasmodic diseases are diseases of debility; and, consequently, that all evacuations are hurtful, and strengthening or stimulating medicines are required.

But Dr. Hamilton, in a late excellent treatise "On the Utility of Purgative Medicines," has brought forward the result of a long experience in the infirmary at Edinburgh, which establishes the propriety of the purgative plan in the cure of chorea. He has seen twenty cases of the disease, and has generally found it connected with a state of irregularity in the action of the bowels, frequently with a tumid abdomen, and has effected many and comparatively speedy cures by the regular administration of purgative medicines. It appears that, so far from increasing the state of debility, the evacuation of the intestines contributes to restore the strength, by re-estab- lishing the functions of the viscera. He particularly recommends the inspection of the feces of the patient, as a guide to the practitioner in the administration of his medicines, and in forming a prognosis of the disease.

The usual practice of Dr. Hamilton is, to administer three grains of calomel, with six or eight of jalap daily, till the feces begin to assume a natural appearance, and the spasmodic symptoms to abate, which are generally observed at the same time. By this plan, he affirms, that "chorea is speedily cured, generally in ten days or a fortnight, from the commencement of the course of purgative medicines." The torpor of the intestines in this disease is, however, sometimes extremely great, and, in such instances, more active purgatives must be resorted to, and repeated until the end is accomplished. In the early stage of the disease, while the intestines yet retain their sensibility, and before the accumulation of feces is great, gentle purgatives, repeated as occasion may require, will readily effect a cure, or rather prevent the full formation of the disease. But "in the confirmed stage more sedulous attention is necessary. Powerful purgatives must be given in successive doses, in such a manner that the latter doses may support the effect of the former, till the movement and expulsion of the accumulated matter are effected, when symptoms of returning health appear. Whoever undertakes the cure of chorea by purgatives must be decided, and firm to his purpose. The confidence which he assumes is necessary to carry home, to the friends of the patient, conviction of ultimate success. Their prejudices will otherwise throw insurmountable obstacles in the way. Half measures, in instances of this kind, will prove unsuccessful; and were it not for perseverance in unloading the alimentary canal the disease would be prolonged, and, recurring, would place the patient in danger, and thus bring into discredit a practice which promises certain safety.

"Here, as in all other cases of extreme debility induced by disease, the recovery is at first slow and gradual. A regular appetite for food, a more intelligent eye, and lightened countenance, cheerfulness, and pliancy of temper, increasing aptitude for firmer motions, the restoration of articulation, and of the power of deglutition, a renovation of flesh and strength succeed each other, and being more and confirmed, are, ere long, followed by complete recovery.

"For some time after these salutary changes take place, the state of the bowels must continue an object of attention. An occasional stimulus from purgatives will be requisite to support their regular action, and to restore their healthy

tone, the only security against the recurring accumulation of feces, and of a consequent relapse. About this time also, remedies, possessed of tonic and stimulant powers, may be used with propriety and effect; they restore energy to the torpid bowels, aid the purgative medicines in obviating colicness, and thus confirm a recovery already advanced. Vegetable bitters, or the preparations of steel, may perhaps be most useful for accomplishing these ends. I have not felt the necessity of having recourse to medicines of this kind: under a proper regimen of light and nourishing food, and of exercise in the open air, my patients, in general, quickly recover their strength. But many practitioners set a value upon tonic medicines; and the usual routine of practice demands them." Page 99, et seq.

This tone of confident expression from a cautious and sagacious practitioner, supported by the successful practice of Sydenham, De Haen, Stoll, &c. will, doubtless, have its due influence on the general practice. For a detail of cases treated in this way, the reader may consult the appendix to Dr. Hamilton's treatise, the Edinburgh Medical and Surgical Journal, N^o 1. vol. i. 1805, and Maximilian Stoll. Ratio. Medendi, pars 3^{ma}.

From five cases described in the Edin. Journal, the writer observes that the following facts appear to be established:

1st. From the exhibition of even two or three cathartics, the involuntary motions and other symptoms were much abated.

2d. Although the cathartics were continued daily for a considerable length of time, the patient, instead of becoming more debilitated, became stronger, and walked with a firmer pace.

3d. During the progress of the cure, if at any time the cathartics did not produce an evacuation, the involuntary motions recurred, and all the symptoms were aggravated.

4th. The æces, before the exhibition of the cathartics, were small in quantity, and, in every instance, black and fetid.

And, lastly, when the disease was cured, the appearance of the feces became natural.

Thus the connection of the disease with the state of the alimentary canal and its contents appears very conspicuously, and the disappearance of the symptoms was proportionate to the obvious effects of the remedies; affording a degree of evidence in favour of the practice, such as is seldom obtained in medicine.

CHOREGRAPHY, as defined by Noverre, is the art of expressing a dance in writing, by means of different characters or notes in a similar manner to music; with this difference, that a good musician will read 200 bars in an instant, and an excellent choregraphist will not be able to decipher 200 bars of a dance in two hours.

Thoinet Arbeau, canon of Langres, was the first who acquired reputation by a treatise in 1588, which he entitled "Orchecographie." He wrote below the notes of the air such movements and steps of the dance as he thought suitable. Beauchamps afterwards gave a new form to choregraphy, and perfected the sketch of the ingenious Thoinet Arbeau: he found the means of writing the steps by signs to which he assigned a different signification and value; so that he was declared the inventor of this art by a decree of the French parliament. Feuillet applied himself entirely to this art, and has left several works on the subject.

It was much used in France by the ballet-masters till about the year 1754, when it was censured by Cahusac "Traité Hist. de la Dance anc. et mod." and by the admirable Noverre in his "Lettres sur la Dance, 1760," who regarded it as too mechanical, and incapable of expressing the grace of

the countenance of the performers. "I learned choregraphy, (says Noverre,) and have forgotten it; if I thought it useful to my plans, I would learn it again. The best dancers and most renowned ballet-masters disdain it, because it seems to be of no real use. If all the figures and steps of the great dancers were to be recorded, it would reduce the art to servile imitation; like modern Latin, where no expression or word must be used for which classical authority during the Augustan age cannot be produced." Mr. Steel published an essay in 1775, towards establishing the melody and measure of speech to be expressed and perpetuated by peculiar symbols.

By means of a great number of new characters, the author undertook to record in his notation not only how Garrick played his principal parts in general, but any particular night, how, from different degrees of animation and feeling, he varied from himself. But we believe this ingenious book was not only never well understood by the public, but never entirely read by any individual purchaser.

The choregraphic art, we believe, is now wholly laid aside in France, and we have heard nothing of it in England for a long time. In 1710, however, Mr. Effex, a celebrated English dancing-master in London, applied the choregraphic art to country dances, and published a little book engraved on copper, in which beneath a line of music he delineates, on the same page, the steps and movements in characters. Mr. Weaver, a ballet-master, also wrote at Sir Richard Steele's request, the three spectators on dancing, Nos. 67, 334, and 370, translated, at the request of Mr. Isaac, another eminent dancing-master, from the original of M. Feuillet, this then new art of dancing by notation, to which all the dancing-masters of eminence subscribed; and we remember it in general use even in the country, among the professors of the Art. Mr. Weaver, besides his professional knowledge, was a man of infinite wit and considerable learning, who, after retiring from the capital, ended his days at Shrewsbury, where he had established a boarding-school of great reputation, and continued teaching to dance till he was 90 years of age. At his balls the children, besides the minuet, rigadon, and loupé, performed figure dances, such as the wooden-shoe dance, Mars and Venus, with Vulcan's discovery and imprisonment of the lovers in a cage, in Pantomimes &c. in which our own juvenile vanity was highly exalted by being honoured with a part. See DANCE.

CHOREPISCOPUS, in *Ecclesiastical History*, rural or country bishop, an officer in the ancient church, about whose function the learned are extremely divided. The word comes from *χορηγος*, a region or little country, and *επισκοπος*, a bishop, or overseer.

The chorepiscopi were suffragan or local bishops, holding a middle rank between bishops and presbyters, and delegated to exercise episcopal jurisdiction within certain districts, when the boundaries of particular churches, over which separate bishops presided, were considerably enlarged.

It is not certain when this office was first introduced: some trace it to the close of the first century; others tell us, that chorepiscopi were not known in the East till the beginning of the fourth century; and in the West, about the year 459. In a council held at Antioch, in 341, they were forbidden to ordain priests or deacons, and had only the power of appointing persons to inferior offices in the church. They ceased, both in the East and West, in the tenth century; when rural deans and arch-priests were instituted in their places. After this the system of diocesan episcopacy was fully established.

CHOREPISCOPUS is also the name of a dignity still subsist-

ing in some cathedrals, particularly in Germany; signifying the same with chori episcopus, or bishop of the choir. The word, in this sense, does not come from *χορηγος*, place, but *χορος*, choir, &c. In the church of Cologne, &c. the first chanor is called *chorepiscopus*.

CHOREUS, a foot in the ancient poetry, more commonly called *trocheus*, or *truchee*.

CHORFAKAN, or CERFUCAN, in *Geography*, a town of Arabia, in the country of Oman, pillaged by the Portuguese in 1508; 64 miles S.E. of Julfar.

CHORGES, a town of France, in the department of the Higher Alps, and chief place of a canton in the district of Embrun; 10 miles W. of it. The place, which was burnt by the duke of Savoy in 1692, contains 1477 and the canton 4249 inhabitants; the territory includes 147½ kilometres and 8 communes.

CHORIAMBUS, in the *Latin Poetry*, a foot compounded of a *choreus*, or *trucheeus*, and an *iambus*.

It consists of four syllables; of which the first and last are long, and the two middle ones short: as *sfivāūm*.

CHORIER, NICHOLAS, in *Biography*, a lawyer and man of letters, was born at Vienne in Dauphine in 1609. He spent the greater part of his life in the profession of an advocate at the parliament of Grenoble, employing his leisure in the composition of historical and literary works. He died at Grenoble in 1692. The principal of his writings are "La Philosophie de Phionnette Homme," 4to. "Histoire general de Dauphine," 2 vol. fol. of which the abbé Lenglet says "that Chorier is an author of little accuracy, and that the knowledge of a fact sufficed him to build a history upon it. In these and many other volumes Chorier appears in the character of a grave scholar and industrious inquirer: but his name must descend with infamy on account of a licentious work, entitled "Aloisire Toletan Satyrz Sodadica de Arcanis Amoris & Veneris," which he published under the name of a lady celebrated for her learning.

CHORIN, in *Geography*, a town of Germany, in the circle of Upper Saxony, Uecker mark of Brandenburg; 6 miles S. of Neu Angermunde.

CHORINEUS, in *Entomology*: the *Papilio* or butterfly of this name in Cramer's exotic insects is the *Papilio Faunus* of Fabricius. Spec. Inf. and *Pap. Obavivus* of that author's *Mantissa*, and *Entomologia Systemat. &c.* See PAPILO *Obavivus*.

CHORION, in *Anatomy*, one of the membranes of the human ovum. It surrounds the amnios, and contains therefore that membrane, with its fluid. (the liquor amni), the fetus, and the navel string. See GENERATION, *female organs* of.

CHORIST, or CHORISTER, a chanor or singer in the choir.

CHORIZANTES, in *Ecclesiastical History*, the name of a sect in Germany, ann. 1774, said to be demoniacs that assembled in streets and churches.

We may suppose their enemies called them demoniacs. Du Cange does not mention any of their tenets.

CHORLEY, in *Geography*, a market and manufacturing town of Lancashire, England, is situated near the spring-head of a rivulet called Chor, which issues from several springs on the east side of the town, and flowing through one part thereof along the picturesque and pleasant valley beneath, after giving motion to several mills, engines, and cotton machines, communicates with the river Yarrow; on whose banks, and for many miles round, are great numbers of bleaching grounds and printing works, with some cotton factories intermixed. Chorley has an ancient chapel, lately

made parochial, supposed to be of Saxon structure, dedicated to St. Lawrence, the walls of which are ornamented with coats of arms and Saxon characters: the windows with hieroglyphic paintings. Here are other places of worship, a grammar-school, a poor-house, six alms-houses, and Sunday-schools. At the fourth end of the town is a dungeon or prison for the confinement of malefactors or disorderly persons. The bishop of Chester holds his court here twice a-year by proxy. The cotton manufactory, in all its branches, is carried on with great success, as also the trade of bleaching and printing cottons, fullians, calicoes, and muslins. The town and its vicinity abound in mines of coal, lead, and alum; in beds of gravel, sand, and marl; in rocks of stone, and quarries of flag and slate, asflar and mill-stone. Chorley is N.W. of London 208 miles, and contains, according to the late return, 865 houses, and 4516 inhabitants; the population as well as the trade having greatly increased for several years past. Here are two weekly markets, one on Tuesday, plentifully supplied with every necessary article of life, the other on Saturday, for meat and vegetables only. Another market for fish continues for two or three days in the week, when all sorts in season, fresh and salt, are brought from Lancaster and Preston. Four fairs are annually held here, three for horned cattle, and one for toys, small wares, and Yorkshire cloth. Aikin's Manchester, 4to.

CHORNOY *Kuban river*, a branch of the Kuban, falling northward into the sea of Azoph to the E. of Caffa or Caffa-fruits; probably the same with Aganly, at the mouth of which, on the W. side of the river, stands the town of Ahuyef.

CHORO *favorites*, in the *Italian Music*, a chorus, in which are employed the best voices and instruments to sing the recitatives, play the ritornellos, &c. It is otherwise called the little chorus, or *choro cantante*.

CHORO *spezato*, a composition of two, three, or more chorusses. It is often met with instead of *tutti* or *da capella*, which mean the grand chorus. *A doi, a tre, a quatro chori*, is for two, three, or four chorusses. When after the name of a part we find *primo, I^o choro*, we must understand that it is to be played in the first chorus; if *2. II^o*, or *secondo choro*, the part must be sung or played in the second chorus. And consequently it shews, that the composition is for eight voices or different parts.

CHOROANA, in *Ancient Geography*, a small country of Asia, which Ptolemy places in Parthia. Strabo calls it Choroana.

CHOROBATES, from *χωροβάτης*, to overrun a country, a kind of water-level, used among the ancients; composed of a double square, in form of a T, described by Vitruvius.

CHOROCHOAD, in *Ancient Geography*, a town of Asia, in Arachosia.

CHOROCITHARISTRIA, in *Music*, he who accompanies dances on the cithara or harp.

CHORODNA, or *CHORODRA*, a town of Asia in Persia Propria.

CHOROGRAPHY, the art of making a MAP, or description of some country, province, or district.

The word comes from *χωρος*, region, and *γραφω*, I describe. *Chorography* is distinguished from *GEOGRAPHY*, as the description of a particular country is from that of the whole earth. And from *TOPOGRAPHY*, as the description of the same country is from that of a single place, town, or district in it.

CHOROIDEA TUNICA, in *Anatomy*, or choroid coat of the eye, is the vascular and delicate membrane, which invests the globe of the eye within the sclerotica. See *EYE*.

CHOROIDES PLEXUS, a vascular production of the pia mater, contained in the lateral ventricles of the brain. See *BRAIN*.

CHOROIDES, in *Optics*, is applied to the inner and posterior tunic of the eye, immediately under the sclerotica.

It is soft, thin, and black; and its inner, or concave surface, is very smooth and polished. It has its name from its being interperfed with vessels. Its anterior part is called the *uvea*; or rather the *iris*, as the internal surface is called the *Ruyfchian coat*.

Next under the choroides is the *retina*. Ruyfch, indeed, says, he has found another tunic between the choroides and retina; and denominates it from himself, *tunica Ruyfchiana*. He adds, that it grows so firmly to the choroides, that it is over-looked in the common distinctions.

But Verheyen, though he found the choroides of a bird divisible into two membranes, could never separate those of the human eyes; and therefore he thinks there needed not any new name. The choroides is, for the most part, black in men; though it appears often, as M. Pecquet has observed, in very different shades: in lions, camels, bears, sheep, cattle, dogs, cats, and most fishes, it is of a shining colour, like the brilliancy of silver, or the lustre of oriental pearl; and makes what naturalists call the *tapis*, or colour of the eye.

Mufchenbroeck also says (Intro. vol. ii. p. 748.) that in many animals, as the lion, camel, bear, ox, stag, sheep, dog, cat, and many birds, the choroides is not black, but blue, green, yellow, or some other colour.

M. Marriotte maintains, that vision is performed rather in the choroides than in the retina; in which he agrees with Bar. Torinus, and is seconded by M. Mery; but most other authors are of a different sentiment.

He was led to this hypothesis by observing that part of the retina, at the insertion of the optic nerve, is insensible to the impression of light, and that in this part the choroides is wanting.

He was confirmed in opinion, that the retina could not be the seat of vision, because of its transparency; though M. Pecquet observes in reply, that it is very imperfeclly transparent, only resembling oiled paper. He urges likewise the greater sensibility of the choroides than that of the retina, as is evident by the alternate contraction and dilatation of the iris, which is a continuation of the choroides, in light and shade.

It has been replied, that some creatures, such as the porcupine and sea-calf, have the optic nerves inserted into the axes of their eyes, exactly opposite to the pupil; and hence it has been inferred, that, in these animals, the retina is perfectly sensible to the impression of light, at the insertion of the nerve. This fact, according to Dr. Porterfield, overturns Marriotte's hypothesis of the choroides being the principal and immediate organ of sight.

Mr. Le Cat strenuously defends Marriotte's opinion, that the choroid coat, which is the production of the pia mater, and not the retina, is the immediate organ of vision. The retina, according to him, is to the choroid what the epidermis is to the skin; receiving the impression of light, and preparing it for its proper organ. Mr. Michell has likewise urged some farther considerations in favour of the choroides as the proper seat of vision, deduced from its greater sensibility, and from the variety of its colours in different animals, according to their situation and necessity. He adds that the choroides is in no case transparent, and has no reflecting surface beyond it, and that it is better formed as an organ of distinct vision than the retina.

To the hypothesis of the seat of vision being in the choroides,

rocles, it is peculiarly favourable, says Dr. Pricstley, that it affords a sufficient reason for the diversity of its colour in different animals, according as they are circumstanced with respect to vision. In all terrestrial animals, which have occasion to make use of their eyes by night, the choroides is either of a light white, or of some very vivid colour, which reflects the light very strongly. On this account, vision may be performed with less light, but it cannot be with great distinctness; the reflection of the rays doubling their effect; since it must extend over some space; all reflection being made at a distance from the reflecting body. Besides, the choroides in brutes is not in general perfectly white, but a little inclined to blue, and is therefore, probably, better adapted to see by the fainter coloured light, which chiefly prevails in the night; and on the same account, says this author, is more liable to be strongly impressed by the colours to which they are chiefly exposed. On the other hand, the choroides of birds in general, especially eagles, hawks, and other birds of prey, is black; by which means they are able to see with the greatest distinctness, but only in bright day-light. The owl, however, seeking her food by night, has, as he suggests, the choroides white, like that of a cat. In the eyes of man, which are adapted to various uses, the choroides is neither so black as that of birds, nor so white as that of those animals who make the greatest use of their eyes in the night.

M. de la Hire has advanced another hypothesis; alleging, that the choroides receives the impressions of images in order to transmit them to the retina. Against which hypothesis, Mr. Michell objects, that the impulsions which are thus secondarily communicated to the nerves must be fainter, and that it is more natural to suppose, that the impression first made upon the choroides should be conveyed to the brain by its own proper nerves. Pricstley's History of Vision, chap. ii. p. 189, &c. See *RETINA* and *VISION*.

It had been long observed that the choroides in men is black; but no observation had been made on the change in suffers by age, before Mr. Petit, who perceived that it appears quite brown under the retina in children, and grows considerably brighter as they advance in age.

CHOROK, in *Zoology*: Buffon calls the Linnæan *Muscula Sibirica* by this name.

CHOROL, in *Geography*, a river of Russia, which runs into the Pisol, near Goltva, in the government of Kiow.

CHOROMITHRENA, in *Ancient Geography*, a country of Asia, placed by Ptolemy in Media.

CHOROPATA, in *Geography*, a river on the coast of Peru, which falls into the bay of Caracac.

CHOROS, an island 4 leagues W. from the Pajaros or Birds islands, or between these islands and port *Gusfo*, which see.

CHOROSCIESSOW, a town of Poland, in the palatinate of Kiow; 64 miles W.N.W. of Kiow.

CHOROSKI, a town of Poland, in the palatinate of Volhynia, 15 miles N.W. of Zytomiers.

CHOROSSOZA, a town of Poland, in the palatinate of Biellk; 28 miles N. of Biellk.

CHOROR MANCAN, a town of Chinese Tartary, N. lat. 43° 18'. E. long. 120° 50'.

CHORREI, or **HORREI**, **HORITES**, in *Ancient Geography, a people of Asia who occupied the country of Seir before the Idumæans. They dwelt in Arabia Petrea and Deferta, to the S. and to the E. of the land of Canaan. They are mentioned in Scripture, in the book of Kings, in that of Judges, &c.*

CHORSA, a town of Asia in Greater Armenia, accord-

ing to Ptolemy. It seems to have been situated above the Euphrates.

CHORSALIA, a place in the interior of Lesser Armenia.

CHORSEUS, or **CHEREUS**, a river of Phœnicia, in the vicinity of the town of Dora, according to Ptolemy. Ortelius places it in Palestine; and it is marked in the map of Palestine by M. D'Anville.

CHORSIA, or **CORSIA**, a small town of Greece, in Æolia.

CHORSUS, a river of the Colchide, according to the peripus of Scylax.

CHORTACANA, an ancient town of Asia, situated in the northern part of Aria, on the confines of Parthia, according to Diodorus Siculus. Strabo and Quintus Curtius call it *Artacana*.

CHORUM, an ancient place of Thrace.

CHORUS, in *Dramatic Poetry*, one or more persons, present on the stage during the representation, and supposed to be by standers without any particular share or intrest in the action.

Tragedy, in its origin, M. Dacier observes, was no more than a single chorus, who trod the stage alone, and without any other actors; singing dithyrambics, or hymns, in honour of Bacchus, so that the chorus was the basis or foundation of the ancient tragedy. Thespis, who lived about 576 years before the Christian era, to relieve the chorus, added an actor, who rehearsed the adventures of some of their heroes. Æschylus, about 50 years afterwards, finding a single person too dry an entertainment, added a second, who, during a dialogue between these two persons or actors, in which he contrived to interweave some interesting story, brought his actors on a stage, adorned with proper scenery and decorations; and at the same time greatly reduced the singing of the chorus, to make more room for the recitation.

Every thing introduced between the four songs of the chorus, they called by the term *episode*; and those four songs made the four intervals, or acts of the piece.

But when once tragedy began to be formed, those recitatives, or episodes, which at first were only intended as accessory parts, to give the chorus a breathing time, became now the principal parts of the performance; and whereas, before, they were taken from various subjects, they were now all drawn from one and the same, or the subject of the story in which the actors were principally concerned.

The chorus, as the subject demanded, was composed of men and women, old men or youths, citizens or slaves, priests, soldiers, &c. to the number of 15 in tragedy, and 24 in comedy; and the persons of it were always supposed to be of inferior condition to the principal characters of the piece. As it usually represented the people, or at least a part of them, foreigners, even though settled at Athens, were forbidden to act in the choruses, for the same reason as they were prohibited from being present in the general assembly of the people. The actors, who composed the chorus, came on the stage preceded by a flute-player, who regulated their steps, sometimes one after the other, but more frequently, in tragedy, 3 in front and 5 in depth, or 5 in front and 3 in depth. In comedy, they were usually arranged 4 in front and 6 deep, or 6 in front and 4 deep.

The chorus, by degrees, became inserted and incorporated into the action, to which it served as an addition or ornament. Sometimes the chorus was to speak, and then their chief, whom they called *Corypheus*, spoke in behalf of all the rest: the singing was performed by the whole company; so that when the Corypheus struck into a song, the chorus immediately joined him.

Beſides

Besides the four songs, which made the division of the piece, and which were managed by the chorus, the chorus sometimes also joined the actors in the course of the representation, with their plaints and lamentations; on occasion of any unhappy accidents that befel them.

Thus, in the course of the piece, the chorus sometimes performed the part of an actor, and sometimes it formed the interlude. In the first case it took a part in the action, and sung or declaimed with the persons of the drama, the coryphæus speaking for it. On certain occasions it was divided into two parts, headed by two leaders, who related certain circumstances of the action, or mutually communicated their hopes and fears. Scenes of this kind, which were almost always sung, were sometimes concluded by the reunion of the two parts of the chorus. In the second case the chorus confined itself to lamenting the calamities incident to humanity, or imploring the assistance of the gods for the dramatic personage whose cause it espoused. In the interludes the chorus sung; and the actors declaimed when the chorus was silent; but when it entered into dialogue with the actors, its coryphæus recited with them, or they sang alternately with the chorus. During these scenes the chorus rarely quitted its place. In the interludes, and especially in the first, it executed different evolutions to the sound of the flute. The verses which it sung were like those of the ode, disposed in strophes, antistrophes, epodes, &c. At the first strophe, the choral performers passed from right to left; at the first antistrophe, from left to right, in an equal time, and repeating the same air to other words. They afterwards stopped, and turning towards the spectators, sung a new melody. Frequently they repeated the same evolutions with sensible differences in the words and music, but always with the same correspondence between the march and the countermarches.

The proper function of the chorus, when tragedy was formed, and that for which it seemed chiefly retained, was to shew the intervals of the acts: while the actors were behind the scenes, the chorus engaged the spectators; their songs chiefly turned on what was just exhibited; and were not to contain any thing but what was suited to the subject, and had a natural connection with it: so that the chorus concurred with the actors for advancing the action.

It is a fault observed in Euripides's tragedies, that his choruses are detached from the action, and not taken from the same subject. There were some other poets, who, to save the pains of composing choruses, and adapting them to the piece, contented themselves with inventing songs, which had no relation at all to the action. These foreign choruses were the less pardonable, as the chorus was esteemed to act a part in the piece: and to represent the spectators, who were looked on as interested therein; inasmuch that the chorus was not always to be mute, even in the course of the acts. In the modern tragedies the chorus is laid aside, and the music supplies its place. At first the chorus was not a mere ornament added to the drama, or a contrivance designed to render it more perfect: but, in reality, the dramatic dialogue was an addition to the chorus, which was the original entertainment. In process of time, the chorus, from being the principal, became only the accessory in tragedy; till at last, in modern tragedy, it has altogether disappeared; which forms the chief distinction between the ancient and the modern stage.

That which occasioned the suppression of the chorus was its being incompatible with certain plots, and secret deliberations of the actors. For it is in no-wise probable, that such machinations should be carried on in the eyes of persons interested in the action. As the chorus, therefore,

never went off the stage, there seemed a necessity for laying it aside, to give the greater probability to those kinds of intrigues which require secrecy.

M. Dacier observes, there was a chorus, or grex, also in the ancient comedy; but this too is suppressed in the new: chiefly because it was made use of to reprove vices, by attacking particular persons.

The chorus in comedy was at first no more than a single person, who spoke in the ancient compositions for the stage; the poets, by degrees, added to him another; then two, afterwards three, and at last more: so that the most ancient comedies had nothing but the chorus, and were only so many lectures of virtue.

The suppression of the chorus has given rise to a question, much agitated between the partizans of the ancients and the moderns, whether the drama has gained or suffered by the abolition of the chorus. It must be admitted, that the chorus tended to render tragedy both more magnificent and more instructive and moral. It was always the most sublime and poetical part of the work; and being carried on by singing, and accompanied with music, it must, without doubt, have diversified the entertainment, and added to its splendour. The chorus, at the same time, uniformly conveyed lessons of virtue. It was composed of such persons as might most naturally be supposed present on the occasion; inhabitants of the place where the scene was laid, often the companions of some of the principal actors, and therefore, in some degree, interested in the issue of the action. This company, which, in the days of Sophocles, was restricted to the number of 15 persons, was constantly on the stage, during the whole performance, mingled in discourse with the actors, entered into their concerns, suggested counsel and advice to them, moralised on all the incidents that were going on, and during the intervals of the action, sung their odes, or songs, in which they addressed the gods, prayed for success to the virtuous, lamented their misfortunes, and delivered many moral and religious sentiments.

The office of the chorus is thus described by Horace (De Art. Poet.):

“ Actoris partes chorus, officiumque virile
Defendat: neu quid medius intercinat actus,
Quod non proposito conducat, et hæreat apta.
Ille bonis favcatque, et conciliatur amicis,
Et regat iratos, et amet peccare timentes;
Ille daples laudet mensæ brevis; ille salubrem
Justitiam, lequesque, et apertis otia portis.
Ille tergat commissâ; deoque precectur, et orat
Ut redeat miseris, abeat fortuna superba.”

“ The chorus must support an actor's part,
Defend the virtuous, and advise with art;
Govern the choleric, and the proud appease,
And the short feasts of frugal tables praise;
Applaud the justice of well-govern'd states,
And peace triumphant with her open gates.
Intruded secrets let them never betray,
But to the righteous Gods with ardour pray,
That fortune, with returning smiles, may bless
A sinned worth, and impious pride depress;
Yet let their songs with apt coherence join,
Promote the plot, and aid the critic design.”

FRANCIS.

The judgment of two such critics, as Horace in the passage above cited (l. i.), and also Aristotle (*πρὸς ποιητ. κ. v.*), and the practice of wise antiquity, concurring to establish this precept concerning the chorus, it should therefore, one would think (says Dr. Hurd, Notes on the Art of Poetry),

Poetry), have become a fundamental rule and maxim of the stage. And so indeed it appeared to some few writers. The most admired of the French tragic poets ventured to introduce it into two of his latter plays, and with such success, that, as one observes, "it should, in all reason, have disabused his countrymen on this head." *Pensai heureux de M. Racine, que les (chœurs) a fait revivre dans *Albion* et dans *Esther*, devroit, ce semble, nous avoir detrompez sur cet article.* (P. Brumoi, vol. i. p. 107.) And before him, our Milton, who, with his other great talents, possessed a supreme knowledge of antiquity, was so struck with its use and beauty, as to attempt to bring it into our language. His "Samson Agonistes" was, as might be expected, a master piece. But even his credit hath not been sufficient to restore the chorus. Hear a late professor of the art declaring, "De choro nihil differi, quia non est essentialis dramati, atque a neotericis penitus, *atque ne judice, merito, reprobatur.* (Pœl. Poet. vol. ii. p. 185.) Whence it hath come to pass, says Dr. Hurd, that the chorus hath been thus neglected is not now the enquiry. But that this critic, and all such, are greatly out in their judgments, when they presume to censure it in the ancients, must appear (if we look no farther) from the double use, insisted on by the poet. For, 1st, A chorus interposing, and bearing a part in the progress of the action, gives the representation that *probability* (Le Théâtre des Grecs, vol. i. p. 105,) and striking resemblance of real life, which every man of sense perceives, and feels the want of upon our stage; a want, which nothing but such an expedient as the chorus can possibly relieve. And, 2^d, The importance of its other office (Ille bonis favetque, &c.) to the utility of the representation, is so great, that, in a moral view, nothing can compensate for this deficiency. For it is necessary to the truth and decorum of characters, that the *manners*, bad as well as good, be drawn in strong vivid colours; and to that end, that immoral sentiments, forcibly expressed, and speciously maintained, be sometimes *imputed* to the speakers. Hence the sound philosophy of the chorus will be constantly wanting, to rectify the wrong conclusions of the audience, and prevent the ill impressions that might otherwise be made upon it. Nor let any one say, that the audience is able to do this for itself: Euripides did not find even an Athenian theatre so quick-sighted. The story is well known (Sen. Ep. 115,) that when this painter of the *manners* was obliged, by the rules of his art, and the character to be sustained, to put a run of bold sentiments in the mouth of one of his persons, the people instantly took fire, charging the poet with the *imputed* villany, as though it had been his own. Now if such an audience could so easily misinterpret an attention to the truth of character into the real doctrine of the poet, and this too, when a chorus was at hand to correct, and disabuse their judgments, what must be the case, when the whole is left to the sagacity and penetration of the people? The wiser sort, it is true, have little need of this information. Yet the reflexions of sober sense on the course and occurrences of the representation, clothed in the noblest dress of poetry, and enforced by the joint powers of *harmony* and *action* (which is the true character of the chorus) might make it, even to such, a no unpleasant or unprofitable entertainment. But these two are a small part of the uses of the chorus; which in every light is seen so important to the truth, decorum, and dignity of the tragic scene, that the *modern* stage, which hath not thought proper to adopt it, is even, with the advantage of, sometimes, the justest moral painting and sublimest imagery, but a very faint shadow of the *old*; as must needs appear to those who have looked into the ancient models, or, dwelling themselves of modern prejudices, are

disposed to consult the dictates of plain sense. Dr. Hurd, for a fuller view of the important benefits arising to the drama from the observance of Horace's rule, refers to "the 8th tome of the History of the Academy of Inscriptions and Belles Lettres;" or, he says, it may be sufficient to refer the English reader to the tragedies of "Elfrida" and "Caractacus," which furnish a better apology than he could make for the ancient chorus.

To the above reasoning it has been replied by Mr. Colman, in the *note* to his "Translation of Horace's Art of Poetry," 4to. 1783, that the judgment of two such critics as Aristotle and Horace, cannot be decisively quoted as concurring with the practice of wise antiquity, to establish the chorus. Neither of these two critics, it is said, have taken up the question; each of them giving directions for the proper conduct of the chorus, considered as an established and received part of tragedy, and indeed originally, as they both tell us, the whole of it. Aristotle, in his "Poetics," has not said much on the subject; and from the little he has said, more arguments might perhaps be drawn in favour of the omission, than for the introduction of the chorus. It is true that he says, in his 4th chapter, that "tragedy, after many changes, paused, having gained its natural form." This might, at first sight, seem to include his approbation of the chorus, as well as of all the other parts of tragedy then in use; but he himself expressly tells us in the same chapter, that he had no such meaning; saying, that "to enquire whether tragedy be perfect in its parts, either considered in itself, or with relation to the theatre, was foreign to his present purpose." In the passage from which Horace has, in the verses above cited, described the office, and laid down the duties of the chorus, the passage referred to by Dr. Hurd, the words of Aristotle are not particularly favourable to the institution, or much calculated to recommend the use of it. For Aristotle there informs us, "that Sophocles alone, of all the Grecian writers, made the chorus conducive to the progress of the fable; not only even Euripides being culpable in this instance; but other writers, after the example of Agathon, introducing odes as little to the purpose, as if they had borrowed whole scenes from another play."

Mr. Colman concludes upon the whole, that, whatever may be the merits, or advantages of the chorus, the judgment neither of Aristotle nor of Horace can be adduced in recommendation of it. As to "the probability given to the representation, by the chorus interposing and bearing a part in the action," the public, he adds, who have lately seen a troop of singers assembled on the stage, as a chorus, during the whole representations of "Elfrida" and "Caractacus," are competent to decide for themselves how far such an expedient gives a more "striking resemblance of human life," than the common usage of our drama. As to its importance in a moral view, to correct the evil impression of vicious sentiments, imputed to the speakers; the story told, to enforce its use for this purpose, conveys a proof of its inefficacy. To give due force to sentiments as well as to direct their proper tendency, depends on the skill and address of the poet, independent of the chorus. M. Dacier, as well as Dr. Hurd, censures the modern stage for having rejected the chorus, and having lost thereby "at least half its probability and its greatest ornament;" so that our tragedy is "but a very faint shadow of the old." Learned critics, however, ought to consider, that if it be expedient to revive the chorus, all the other parts of the ancient tragedy must be revived along with it. Aristotle mentions music as one of the six parts of tragedy, and Horace no sooner introduces the chorus, but he proceeds to the pipe and lyre. If a chorus be really necessary, our dramas, like those of the ancients,

ents, should be rendered wholly musical; the dancers also will then claim their place, and the pretensions of *Vestris* and *Noverre* must be admitted as classical. Such a spectacle, if not more natural than the modern, would at least be consistent; but to introduce a group of spectacular actors, speaking in one part of the drama, and singing in another, is as strange and incoherent a medley, and full as unclassical, as the dialogue and airs of the "Beggar's Opera." Admitting the full force of Mr. Colman's arguments, nothing, it may be said, though somewhat harshly, but the most invincible pedantry can wish for the revival of the ancient chorus on the modern stage.

Notwithstanding the advantages, which were obtained by means of the chorus, it is alleged, (see *Blair's Lectures*, vol. iii. lect. 45.) that the inconveniences on the other side are so great, as to render the modern practice of excluding the chorus far more eligible upon the whole. For if a natural and probable imitation of human actions be the chief end of the drama, no other persons ought to be brought on the stage, than those who are necessary to the dramatic action.

The introduction of an adventitious company of persons, who have but a slight concern in the business of the play, is unnatural in itself, embarrassing to the poet, and though it may render the spectacle splendid, tends, without doubt, to render it more cold and uninteresting, because it becomes more unlike a real transaction. The mixture of music, or song, on the part of the chorus, with the dialogue carried on by the actors, is another unnatural circumstance, removing the representation still farther from the resemblance of life. Besides, the poet is subjected to innumerable difficulties in so contriving his plan, that the presence of the chorus, during all the incidents of the play, shall consist with any probability. The scene must be constantly, and often absurdly, laid in some public place, that the chorus may be supposed to have free access to it. To many things that ought to be transacted in private, the chorus must ever be witness; they must be the confederates of both parties who come successively upon the stage, and who are, perhaps, conspiring against each other. In short, says Dr. Blair, the management of a chorus is an unnatural confinement to a poet; it requires too great a sacrifice of probability in the conduct of the action; it has too much the air of a theatrical decoration, to be consistent with that appearance of reality, which a poet must ever preserve in order to move our passions. The origin of tragedy among the Greeks, as we have above observed, was a choral song, or hymn, to the gods. There is, therefore, no wonder, that on the Greek stage it so long maintained possession. But it may confidently, as Dr. Blair thinks, be asserted, that if, instead of the dramatic dialogue having been superadded to the chorus, the dialogue itself had been the first invention, the chorus would, in that case, never have been thought of. One eye, however, might still be made of the ancient chorus, which would be a considerable improvement of the modern theatre; if, instead of that unmeaning, and often improperly chosen music, with which the audience is entertained in the intervals between the acts, a chorus were then to be introduced, whose music and songs, though forming no part of the play, should have a relation to the incidents of the preceding act, and to the dispositions which these incidents are presumed to have awakened in the spectators. By these means, the tone of passion would be kept up without interruption; and all the good effects of the ancient chorus might be preserved, for inspiring proper sentiments, and for increasing the morality of the performance, without those inconveniences which arose from the chorus forming a constituent part of the play, and

mingling unseasonably, and unnaturally, with the personages of the drama. See *DRAMA*, and *CHORUS infra*.

CHORUS, to give the, among the Greeks, was to purchase a dramatic piece of the poet, and defray the expences of its representation.

The person who did this was called *choragus*. At Athens the office of *choragus* was imposed on the *archons*; and at Rome on the *ædiles*.

CHORUS, in *Musick*. It has already been said, (see *CHOEUR*) that there are choruses of various kinds: ecclesiastical choruses, such as those in the mass of Roman Catholics, in the service of the Lutheran church, in the psalmody and hymnology of the Calvinists, and in the cathedral service of the church of England. In this last, a species of music has been retained to English words, such as had been cultivated in all Christian churches before the reformation, to Latin words. In our choral music, fugues, canon learning and complication, with what was called by the Puritans *curious singing*, have been allowed to have place with propriety in our services and anthems on Sundays and festivals, regarding them as the voice of prayer, supplication, or jubilation, by voices of different pitch, harmonized; but always with one mind, addressing the Supreme Being, sometimes together, and sometimes after each other, as the psalms and responses are uttered in a parish-church, but with less regularity and reverence.

To dramatic choruses there are many objections, on the side of probability, to elaborate counterpoint, when different personages are uttering different words at the same time, all talking together, without listening to each other. This is unnatural, and as difficult to perform without book, as if it were extempore.

There are few dramatic situations where a chorus, even in plain counter-point, can have place with propriety. It may happen, indeed, that the representatives of a whole people at once shall cry out with joy, sorrow, or even demand concessions with united clamour; as the citizens in *Metastasio's* oratorio of *Betulia liberata* did, to surrender the town, uttering the same words in the language of the piece, be it sung or declaimed. This may, for a short space, be reconciled to probability; but for a whole nation to continue a long discourse in the same words, is improbable, unless they were supposed to be formed into an harangue, and gotten by heart, as a *bymn* to some divinity, or on a solemn celebration of rites.

A distinction should therefore be made between an extemporaneous chorus, and a chorus repeated by memory, as well as between an oratorio chorus performed by book, and an opera chorus sung in action by heart. Handel, whose sublime choral genius enabled him with facility to produce choruses of all kinds, never exercised that genius in composing elaborate choruses for his operas, all which were as short and simple as those of the Italians in present use; all built on a short air easily retained in memory. But Sacchini, and other Italian masters, finding how much Handel was admired and revered for his oratorio choruses, composed some to be performed in action on the stage; but though many of these, particularly Sacchini's, were admirable productions, full of grace, pathos, and dramatic effects; yet, being performed by occasional singers, unacquainted with the Italian language and vocal expression, they produced no other effect than that of exciting as much laughter as our early operas did, when sung half in Italian and half in English. See *SPECTATOR*, No. 18.

An ecclesiastical chorus may be extended to what length the composer pleases; but a dramatic chorus, analogous to the fable, and situation of the interlocutors, must be of a

length and character suitable to the drama, and the scene in which it is introduced. See **GENERA**, and *Ancient Greek Music*.

CHORZENA, in *Ancient Geography*, a country of Asia, in Greater Armenia, situated, according to Strabo, towards the north, in the mountains of Caucasus, and belonging to Iberia and the Colchide.

CHORZIANI, a people of Asia, in the Asiatic territory, a country of Armenia; placed by Ptolemy in the environs of fort Citharifa. 4 journeys from Theodosiopolis.

CHOSCIABAD, in *Geography*, a town of Persia in the province of Kerman; 57 miles S.W. of Sirjan.

CHOSE, *thing*. This word, in *Lazæ*, is used in various circumstances, and with various epithets: as,

CHOSE in action, which is not any thing corporeal, but only a right, v. g. an annuity, obligation, covenant. See the perfection of which may, however, be recovered by a suit or action at law; from whence the thing so recoverable is called a thing, or *chose*, in action. Thus money due on a bond is a chose in action; for a property in the debt vests at the time of forfeiture mentioned in the obligation, but there is no possession till recovered by course of law. If a man covenants with me, or promises, to do any act, and fails in it, by which I suffer damage, the recompence for this damage is a chose in action, for though a right to have recompence vests in me, at the time of the damage done, yet what and how large such recompence shall be, can only be ascertained by verdict; and the possession can only be given me by legal judgment and execution. If a person disseises me of land, or takes away my goods, my right or title of entry into the lands, or action and suit for it, and so for the goods, is a chose in action; a condition and power of re-entry into land upon a feoffment, gift, or grant, before the performance of the condition, is of the nature of a chose in action. Co. Lit. 214. 6 Rep. 50. Dyer, 244. If one have an advowson, when the church becomes void, the presentation is but as a chose in action, and not grantable, but it is otherwise before the church is void. Dyer, 296. Where a man hath a judgment against another for money, or estate, these are choses in action. An annuity in fee to a man and his heirs is grantable for ever; but it has been held, that an annuity is a chose in action, and not grantable. 5 Rep. 89. Fitz. Grant. 45.

Chose in action may also be called *chose in suspense*, as having no real existence, and not being properly in possession: being a thing, as it is expressed, rather in *potentia* than in *esse*.

No *chose in action* could, by the ancient common law, be transferred or assigned; but this is now allowed; and the form of doing it is in the nature of a declaration of trust, and an agreement to permit the assignee to make use of the name of the assignor, in order to recover the possession: and when a debt or bond is assigned over, it must still be sued in the original creditor's name: the person to whom it is transferred being rather an attorney than an assignee. The king, however, is an exception to this general rule; for he might always either grant or receive a chose in action by assignment; and our courts of equity, considering that in a commercial country almost all personal property must necessarily lie in contract, will protect the assignment of a chose in action, as much as the law will that of a chose in possession. The legal possibility and convenience of assigning a chose in action, which our ancestors so long doubted, have been sufficiently evinced since the introduction and establishment of paper credit by indorsements upon bills and notes.

CHOSE local, is something annexed to a place, v. g. a mill.

CHOSE in story, something moveable, and which may be transported from place to place.

CHOSE in possession. See **POSSESSION**, and **PROPERTY**.

CHOSISTAN, in *Geography*. See **CHUSISTAN**.

CHOSROES I. or **KHOSROU**, in *Biography*, king of Persia, celebrated as the *Magnanimous*, was the third son of Cabades or Cobad, by whose appointment he succeeded to the throne in 531, to the prejudice of his elder brothers. The example of his father, a prince of a proud and imperious disposition, and who was a bitter persecutor of those who did not embrace the Persian religion, had, in some measure, blunted the moral feelings of the son, who commenced his reign with acts of great severity. A conspiracy was indeed formed in behalf of his brother, which having discovered, he put to death all who were in any respect engaged in it. He then executed Mazdak, the head and leader of a new sect, who preached a community of all things, even of property and women; and he treated the Jews with still greater rigour than they had experienced from his father. He next removed such governors of provinces as, during his father's reign, had rendered themselves obnoxious to the people, and for the better administration of justice, he divided his dominions into four vicarships, viz. those of Assyria, Media, Persia, and Bactriana. At his accession to the crown, Persia was involved in a war with the Roman empire under Justinian, to whom he granted a peace, having accepted a large sum of money as its price. This peace, which was denominated perpetual, was soon broken, and in 549, Chosroes invaded Syria, and marched to Antioch, which he soon reduced to ashes. After an unsuccessful attempt upon Dara, he returned across the Euphrates laden with spoil, leaving his generals to contend with Belarius, who had come to the defence of the Roman empire. Chosroes then made an expedition into Colchis, at the extremity of the Euxine sea, whither he had been invited by the inhabitants as their protector from the oppression of Justinian. It would not comport with our limits to follow this prince in all his expeditions: he went on conquering, and received as tokens of homage, ambassadors from the greatest potentates of the East, at his splendid palace at Ctesiphon, one of the wonders of that part of the world. In the midst of his prosperity one of his sons, whom he had by a Christian slave, raised the standard of rebellion; but in an engagement with the general sent against him by his father, he lost his life. Chosroes having invaded India, marched to the opposite quarter of his vast dominions, and entered Arabia Felix, where he dispossessed many usurpers of their power, restored the ancient lords, and used the people with so much kindness that he obtained the title of *Jyfi*. Towards the conclusion of Justinian's reign, Chosroes was attacked with a dangerous disease, from which he sought relief from the physicians of Constantinople, whose aid he borrowed of the emperor. This interchange of kindness did not prevent a renewal of hostilities between the two empires after the accession of Justin. Chosroes took the field, and reduced and sacked the principal cities of Mesopotamia and Syria. These and other serious losses obliged the imperial court to solicit a truce, which Chosroes granted for three years. In the mean time Tiberius succeeded to the imperial throne, who improved the discipline and strength of his army so as to be able to contend with and finally overcome the Persian monarch. Chosroes, in his retreat, was so closely pursued, that he was forced to pass the river Euphrates on an elephant, while several of his lords and great men were drowned in attempting to follow him. The Roman general took up his winter quarters in the Persian provinces, an indignity which Chosroes severely felt, and which, joined to the mis-

firmities

firmities of old age, put an end to his life, in the year 579, having reigned forty-eight years, and lived eighty. Chosroes possessed many qualities that confer splendour on a despotic monarch, and his memory is still venerated in the East. He was famed for his love of justice, which, as we have seen, was sometimes accompanied with cruelty. He was an encourager of the arts, and paid considerable attention to the improvement of his subjects. He, in imitation of the ancients, founded academies for literature and the sciences, and obtained himself a proficiency in moral and philosophical studies, a report of which having reached Greece, he received a visit from seven sages who adhered to the religion and philosophy of antiquity. They expected to see the republic of Plato realized in Persia, but returned to their own country greatly disappointed. Chosroes, however, so far merited their gratitude, that in a treaty with the emperor Justinian, he insisted that they should be exempt from the penal laws enacted against the remaining advocates for paganism. To Chosroes has been ascribed, by the Persian historians, the completion of the great wall of Jabouge and Magouge, commencing at D-i-bent, and running from mountain to mountain, so as to secure the Persian territories from invasion. His son Hormidas succeeded him, who, in 590, was deposed by

CHOSROES II., grandson to Chosroes the Great. The Persian nobility conspired against this prince, and obliged him to seek the assistance of the Romans, who placed him again on the throne. He afterwards carried his arms into Judea, Libya, and Egypt, and made himself master of Carthage. In 617 he pressed the Constantinopolitan empire still closer; in vain did Heraclius use every effort to avert his enmity and obtain a peace for his almost ruined empire. To an embassy of this kind, brought by officers of the highest distinction, and conducted by Sain, the Persian general, Chosroes replied, "I will listen to no terms from the Roman emperor till he and all his subjects have renounced their crucified God, and embraced the worship of the sun, the great deity of the Persians;" he cruelly caused Sain to be flayed alive for his presumption, and imprisoned the ambassadors. Distress, however, roused the dormant courage and talents of the Roman emperor, who, in his turn, penetrated into the centre of the Persian dominions, and put Chosroes first upon his defence, and afterwards drove him a fugitive from his palace, which was pillaged and burnt by the Roman soldiers. Still he declined to ask for peace, but being taken suddenly ill, was desirous of resigning his crown to his favourite son Merdaza; his eldest son, however, seized the sovereignty, and stopped Chosroes in his flight; eighteen of his sons were massacred before his face, himself was loaded with chains, and thrown into the dungeon in which he had been accustomed to conceal his treasure. Here every indignity was inflicted upon him that malice could devise, and to which his own cruelty fairly entitled him, had the punishment of his crimes been exacted by any other hands, than by those of his own son. In five days death put an end to his sufferings, which happened in 628, and at no great distance of time the Persian empire was subjugated to the power of the Arabian caliphs. See PERSIA. Univers. Hist.—Gibbon.

CHOSSESO, in *Geography*, a town of Poland, in the palatinate of Volhynia; 64 miles E. of Lucko.

CHOSTLARN, a town of Germany, in the circle of Bavaria; 22 miles W.S.W. of Passau.

CHOTA, a town of America, in the state of Georgia; 55 miles W. of Tugaloo.—Also a town of South America, in the country of Peru, and jurisdiction of Caxamarca; 60 miles N.W. of Caxamarca.

CHOTASTITE, a town of Bohemia, in the circle of Czaflau; 2 miles N. of Czaflau.

CHOTIEBOR, a town of Bohemia, in the circle of Czaflau; 8 miles N.N.E. of Teutsch-Brod.

CHOTIN, in *Conchology*, a name given by Adanson to a shell of the cone kind, found in the West Indies, *Conus jamaicensis* of Gmelin, which see.

CHOTMIZSK, or КНОТМЫСК, in *Geography*, a town of Russia, in the government of Charkov, or Чарков; seated on the Voriska; 52 miles N.N.W. of Charkov, and 588 S.S.E. of Petersburg.

CHOTOW, a town of Lithuania, in the palatinate of Minsk; 2 miles S.W. of Minsk.

CHOTUSITZ, a town of Bohemia, in the circle of Czaflau.

CHOTZEMITS, a town of Bohemia, in the circle of Cauzim, near the Elbe.

CHOTZEN, a town of Bohemia, in the circle of Chrudim; 3 miles N.N.E. of Hohenmaut.

CHOVACOURT, a river of North America, in Canada.

CHOUAN, in *Ichthyology*, synonymous with Chevanne, names by which the Linnaean *Cyprinus cephalotes* is known in some parts of France.

CHOUAN, in the *Materia Medica*, the name of a small seed, called by some also carmine feed. It is a very light and chaffy seed, in a great measure resembling worm-feed, of an acid taste, and a yellowish-green colour, but is larger than worm-feed. It is brought into Europe from Turkey, and many parts of the East, and the choice should be made of such as is largest, clearest, of the greenest colour, and least marked with specks or holes. It is not used in medicine, but is of some value among the people who make carmine for the painters. It is called *santonium viride*, or the green worm-feed, in our catalogues of the *Materia Medica*, but is unknown in the shops. Lemery.

CHOUANS, in *Modern History*, the denomination of a powerful body which sprung up in France, during the late revolution, derived from three sons of a blacksmith of the name of *Chouan*, near Fougères. They were at first no better than highway-robbers; but their number was increased by the system of terror, which induced all persons, declared to be suspected by Robespierre's government, to fly for safety to the woods, and join the Chouans. They were at last said to amount to nearly 30,000 men, dispersed in different bodies through the woods of Brittany, from the north to the south, from Fougères to Vannes; and they gave occupation to upwards of 80,000 republicans, who were endeavouring to enclose them in that great extent, and starve them into a surrender. They submitted to organization and discipline, and dropping the trade of robbers, declared for the king, and put themselves under the command of officers of reputation.

CHOUANG-LEOU, in *Geography*, a town of China, of the third rank, in the province of Se-tchuen; 10 miles S.W. of Tching-tong.

CHOUANG-TAL, a town of Tartary, in the country of Hami; 9 miles N.N.W. of Tchontori.

CHOVANNA-MANDARU, in *Botany*, Rheed. Mal. Burm. Ind. See *BAUHINIA variegata* & *purpurea*.

CHOUCARI de la nouvelle Guinée, in *Ornithology*. The *Corvus papuensis* of Latham is described under this name by Buffon.

CHOUCAS, the generic name under which several species of the *CORVUS* genus are described by Buffon, and later French writers; as *choucas*, the jackdaw, *Corvus monedula*, Linn.—*Choucas moufliche*, & *Choucas du Cap de Bonne Espérance*,

rance, the *Corvus boitenotus*.—*Choucas des Philippines*, the *Corvus balfassus*, &c. See *CORVUS*. *Chocotte* is the most common French name of the choucas.

CHOUCHA, in *Geography*, a town of Africa, in Upper Guinea, on the river Maguiba, surrounded with rocks.

CHOUQUEN, a town of Canada, on the lake Ontario, where the English carry on their commerce of furs with the savages.

CHOUET, JOHN-ROBERT, in *Biography*, an eminent philosopher and magistrate of Geneva, was born in 1642. He studied philosophy and dialectics with great ardour and success under professor Wifs of Geneva; and when he was only 22 years of age, obtained the professorship at Saumur, against the interest of his rivals. He succeeded Wifs at Geneva, in 1669, when his lectures were uncommonly crowded. Among the more celebrated of his pupils was Bayle, who speaks of him with great applause. In 1672 he went to Paris, where his society was much courted: upon his return to Geneva, he became rector of the academy; and, in 1686, he was admitted into the council of twenty-five. From this period he devoted himself to public employments, for which he was admirably qualified. He was well versed in the history of the state which gave him birth, and introduced into its archives a method of order and clearness never known before. He was several times syndic, and distinguished himself as a negotiator with the French and Sardinian ministers. Notwithstanding these employments, his attachment to literature was unabated, and he greatly promoted the progress of science by augmenting, at his own expence, the public library. This amiable man died in 1731, regretted by all his fellow-citizens. His publications are, "An Introduction to Logic," in Latin, 8vo. 1672; "Theses Physicæ de varia Altrorum luce," 4to. 1674; "Memoire succinct sur la Reformation," 1694; "Reponses à des Questions de Milord Townsend sur Geneve ancienne, faites, en 1696, et publies en 1774. Besides these, he left in MS. in 3 vols. folio, a work entitled, "Diverses Recherches sur l'Hist. de Geneve, sur son Gouvernement et sa Constitution." Hist. de Geneve.

CHOUETTE, in *Ornithology*: the French call the owls in general by this name. *La chouette* of Buffon is our brown owl, *Strix ulula*; *La chouette blanche* is the *Strix neoca* of Latham; *La chouette blanche tachetée*, *Strix alba*, &c. See OWL and STRIX.

CHOUG, or SHOGLA, in *Geography*, a town of Asia, in Syria, on the Orontes, in the route from Sayd to Aleppo; where all travellers are entertained gratis in an excellent caravan-sera for three days, without any distinction of country or religion.

CHOUGH, in *Ornithology*, the name by which the common jackdaw is sometimes called in England. See *CORVUS monedula*.

CHOUGH, *Cornish*, of Albin and Borlase, is the *Red legged crow* of later English authors. See *CORVUS graculus*.

CHOU-CHAN, in *Geography*, a town of Asia, in the kingdom of Corea; 12 miles N.W. of Haimen.

CHOU-SONG, a town of China, of the third rank, in the province of Kiang-fi; 25 miles N.E. of Ki-ngan.

CHOU-YUNG, a town of Asia, in the kingdom of Corea; 20 miles S.S.W. of Haimen.

CHOU-KING, a town of China, of the third rank, in the province of Kiang-fi; 65 miles E. of Kan-cheou.

CHOU-NGAN, a town of China, of the third rank, in the province of Tche-kiang; 4 leagues S. of Ouen-tcheou.

CHOU-TCHANG, a town of China, of the third rank, in the province of Tche-kiang; 12 leagues W.N.W.

of Tchu-tcheo.—Aïso, a town of the third rank, in the province of Kiang-fi; 6 leagues W. of Kiou-kiang.

CHOU-TCHEOU, a city of China, of the first rank, in the province of Kiang-fi; 712 miles S. of Peking. This town is situated on the bank of a river, in a fertile country; and the adjacent mountains contain mines of lapis lazuli. N. lat. 38° 27'. E. long. 114° 53'.

CHOU-YUEN, a town of Asia, in the kingdom of Corea; 37 miles N.E. of Haimen.

CHOU, WILLIAM DU, in *Biography*, a Lyonsese gentleman, and one of the earliest Frenchmen who applied to antiquarian pursuits. He lived at the summit of the mountain Gourgillon, where the ground could scarcely be dug without discovering Roman inscriptions, medals, urns, lamps, &c. Du Choul made a collection of these remains, with a view of decyphering them; the fruit of his labours he published in a "Discourse on the Religion of the ancient Romans, illustrated by a great number of Medals and Figures." This work was printed in folio at Lyons, in 1556. It was afterwards reprinted in 1580, in 4to. with the addition of a "Discourse on the Caltramentation and Military Discipline of the Romans, their Baths and Antiques, and Greek and Roman Exercises." The work in this form has been highly celebrated, and translated into the Latin, Italian, and Spanish languages. The Latin edition was printed at Amsterdam in 1684, 4to.

CHOU, in *Geography*, a river of the duchy of Luxembourg, or the department of the Forêts, in the Ardennes, which discharges itself into the Meuse.

CHOLE, a town of India, on the coast of Concan, with a fortified harbour for small vessels, belonging to the Portuguese; 25 miles S. of Bombay. N. lat. 18° 37'. E. long. 72° 40'.

CHOU-LOU, a town of China, of the third rank, in the province of Pe-tche-li; 12 miles S.W. of Ching.

CHOU-TRIES, a name given in India to houses built for the accommodation of travellers, which are frequent in every part of the country, and are useful, whilst they are noble monuments of Indian munificence and humanity. The structure of these choultries is alleged by Dr. Robertson (Hist. Disq. concerning India), as one evidence of the high state of civilization to which the Indians had attained. On the ceilings of these buildings, as well as other ancient edifices, the twelve signs of the zodiac are frequently delineated; and from their resemblance to those which are now universally used, it is highly probable, says this judicious historian, that the knowledge of these arbitrary symbols was derived from the East. Col. Call has published a drawing of the signs of the zodiac, which he found on the ceiling of a choultry at Verdapettah, in the Madura country. (Phil. Trans. vol. lxii. p. 353.)

CHOU-PAOTOU, in *Geography*, a town of Asia, in the country of Tibet; 265 miles E. of Lassa.

CHOURAGUR, a town of Hindostan, in the country of Gurry Mundelia; 57 miles S.W. of Gorrul.

CHOURTONG, a town of Asia, in the country of Tibet; 255 miles E.S.E. of Lassa.

CHOUS, in the *Eastern Military Orders*, the title of the messengers of the divan of janizaries. There are several degrees of honour in this post. When a person is first advanced to it, he is called *cubuck*, or little *chous*; after this he is advanced to be the *alloy chous*, that is, the messenger of the ceremonies; and from this, having passed through the office of *petelma*, or procurator of the effects of the body, he is advanced to be the *bas chous*.

CHOUSGMAYAN, in *Geography*, a town of Persia, in the province of Chorasan; 220 miles N.N.E. of Herat. CHOU.

CHOU-TCHUEN, a town of Asia, in Corea; 30 miles S. of Haimen.

CHOUX, in *Natural History*, a name given by the French to a species of shell-fish of the *cardiform* or *bucardium* kind. Fabius Columna has elegantly described it, and Lister has given a figure of it twice over, in two different parts of his book. There is another species less elegant, and wanting the hollow ribs. See *CORDIFORMIS*.

CHOUYANG, in *Geography*, a town of Asia, in Corea; 40 miles N.E. of King-ki-tao.

CHOUZE', a town of France, in the department of the Indre and Loire; seated on the Loire; 4 leagues E. of Saumur, and 6 leagues N.W. of Tours.

CHOWAN, a county of North America, in Edenton district, North Carolina, on the N. side of Albemarle found; containing 5011 inhabitants, of whom 2588 are slaves. The chief town is Edenton.—Also, a river of North Carolina, which falls into the N.W. corner of Albemarle Sound. At its mouth it is 3 miles wide, but quickly becomes narrower, as you ascend it. It is formed 5 miles from the Virginia line, by the confluence of Meherrin, Nottaway, and Black rivers, all which rise in Virginia.

CHOWDER-BEER, a provincial phrase of Devonshire, denoting a cheap and easily prepared drink, highly commended for preventing the scurvy in long voyages, or for the cure of it where it may have been contracted. It is prepared in the following manner: take twelve gallons of water, in which put three pounds and a half of black spruce; boil it for three hours, and having taken out the fir or spruce, mix with the liquor seven pounds of melasses, and just boil it up; strain it through a sieve, and, when milk warm, put to it about four spoonfuls of yeast to work it. In two or three days stop the bung of the cask, and in five or six days, when fine, bottle it for drinking. Two gallons of melasses are sufficient for an hoghead of liquor; but if melasses cannot be procured, treacle or coarse sugar will answer the purpose.

CHOWRY, in *Geography*, one of the Nicobar islands, in the Indian Sea. N. lat. 8° 27'. E. long. 93° 32'.

CHO-YANG, a town of China, of the third rank, in the province of Hou-quang; 10 leagues E.N.E. of Siang-yang.

CHOZALA, or CHOIZALA, in *Ancient Geography*, a town of Africa, in Mauritania Cæsariensis; situated at the foot of a craggy rock, about 4 miles S.E. of Julia Cæsarea.

CHOZEVKA, in *Geography*, a town of Siberia, on the river Tchiuna; 180 miles E.S.E. of Enisek.

CHRABAZA, in *Ancient Geography*, a town of Africa Propria. Ptolemy.

CHRABRATE, in *Natural History*, a name given by the writers of the middle ages to a pellucid stone, said to have great virtues against disorders of the liver and spleen, and many other imaginary qualities. It appears by their descriptions to have been no other than the common pebble crystal.

CHRAST, in *Geography*, a town of Bohemia, in the circle of Boleflau; 6 miles S.E. of Melnik.—Also, a town of Bohemia, in the circle of Clurdim; 5 miles S.E. of Clurdim.

CHREBET *Chandabga*, a range of mountains, between Russian Tartary and Chinese Tartary. N. lat. 52°. E. long. from 96° 14' to 101° 14'.

CHREBET *Dzrak*, a range of mountains similarly situated with the preceding. N. lat. 52° to 53°. E. long. 96° 14'.

CHREMETES, in *Ancient Geography*, a river of Africa, the mouth of which is placed in the Atlantic Ocean by Aristotle and Hefychius; supposed to be the Zaire.

CHREMPIS, in *Ichthyology*, a name given by the eldest Greek writers to the fish since called *chromis*.

CHRENDI, in *Ancient Geography*, a people of Asia, in Hircania. Ptolemy.

CHRENECRUDA, a term occurring in *Writers of the Middle Age*, and expressing a custom of those times, but its signification is doubtful. It is mentioned in *Leges Sælicæ*, Tit. 61, which says, he who kills a man, and hath not wherewithal to satisfy the law, or pay the fine, makes oath that he has delivered up every thing he was possessed of; the truth of which must be confirmed by the oaths of twelve other persons. Then he invites his next relations by the father's side to pay off the remainder of the fine, having first made over to them all his effects by the following ceremony. He goes into his house, and, taking in his hand a small quantity of dust from each of the four corners, he returns to the door, and, with his face inwards, throws the dust with his left hand over his shoulders upon his nearest of kin. Which done, he strips to his shirt; and, coming out with a pole in his hand, jumps over the hedge. His relations, whether one or several, are upon this obliged to pay off the composition for the murder. And if these (or any one of them) are not able to pay, *iterum super illum chreneruda qui pauperior est, jactat, & ille totam legem componat*. Whence it appears, that *chreneruda jactare*, is the same with throwing the dust, gathered from the four corners of the house. Goldastus and Spelman translate it *viridem herbam, green grass*, from the German, *gruen krant*, or from the Dutch, *grass, green, and gruid, grass*. Wendelinus is of a contrary opinion, who thinks that by this word *denotari purificationis approbationem*, from *chrein, pure, chaffe, clean; and keuren, to prove*; so that it must refer to the oaths of the twelve jurors. Be this as it will, king Childbert reformed this law by a decree, chap. 15, both because it favoured of pagan ceremonies, and because several persons were thereby obliged to make over all their effects: *De chreneruda lex quam paganorum tempore observabant, deinceps nunquam valeat, quia per ipsam cecidit multorum potestas*.

CHRES, in *Ancient Geography*, a large river of Libya, on the western coast of Africa, and near the island of Cerne, according to the Periplus of Hannon.

CHRESTOIA, in *Geography*, a town of Ithria; 9 miles E.S.E. of Capo d'Ithria.

CHRETES, in *Ancient Geography*, a lake of Libya, containing, according to the Periplus of Hannon, three islands.

CHRETIEN, FLORENT, in *Biography*, a French poet and man of letters, was born at Orleans in 1541. He was educated in the Protestant religion, and having made considerable progress in literature, was appointed preceptor to Henry IV. of France. He wrote poems in the learned and dead languages, as well as in his own. In the French he composed a severe satire against Rosnard, with whom he had a quarrel. He translated Oppian, some plays of Aristophanes, and other Greek works into the French. He composed tragedies and Greek epigrams, and also learned and considerable annotations on various classical authors. He died at the age of 55, having first been reconciled to the Catholic church. Though he wrote satires, his temper was mild and friendly, and his mind was elevated above mean and servile complaisance, and he was incapable of uttering a sentiment that he did not believe.

CHRETINA, in *Geography*, a town of Spain, placed by Ptolemy in Lusitania Propria.

CHREWITZ. See GREITZ.

CHRISM, from *χρῆμα, I anoint*, oil consecrated by the bishop, and used in the Romish and Greek churches, in the

administration of baptism, confirmation, ordination, and extreme unction, which is prepared on Holy Thursday with much ceremony. In Spain it was anciently the custom for the bishop to take one third of a sol for the chrism distributed to each church, on account of the balsam that entered its composition.

Du Cange observes, that there are two kinds of chrism; the one prepared of oil and balsam, used in baptism, confirmation, and ordination; the other of oil alone, consecrated by the bishop, used anciently for the catechumens, and still in extreme unction.

The Maronites, before their reconciliation with Rome, besides oil and balsam, used musk, saffron, cinnamon, roses, white frankincense, and several other drugs mentioned by Rynaldus, in 1541, with the doses of each. The jesuit Dandini, who went to mount Libanus in quality of the pope's nuncio, ordained, in a synod held there in 1596, that chrism, for the future, should be made only of two ingredients, oil and balsam; the one representing the human nature of Jesus Christ, the other his divine nature.

The action of imposing the chrism, is called *chrismation*; this the generality of the Romish divines hold to be the next matter of the sacrament of confirmation.

The chrismation in baptism is performed by the priest; that in confirmation by the bishop; that in ordination, &c. is more usually styled *unction*, which see.

CHRISM PENCE, *CHRISMATIS DENARIUS*, or *CHRISMALES DENARIUS*, a tribute anciently paid to the bishop by the parish-clergy, for their chrism, consecrated at Easter for the ensuing year: this was afterwards condemned as simoniacal.

CHRISOM, *CHRISMALE*, has been said to have denoted anciently the face-cloth, or piece of linen laid over the child's head when it was baptized. Whence, in our bills of mortality, children who die in the month, or such as have never been baptized, are usually called *chrifoms*. The time between the child's birth and baptism was also called *chrifomus*.

But the chrifom was, in reality, a white vesture or garment, which, immediately after the child was baptized, was put upon it by the priest, who with the act pronounced these words: "Take this white vesture as a token of the innocency, which, by God's grace in this holy sacrament of baptism, is given to thee, and for a sign whereby thou art admonished so long as thou livest, to give thyself to innocency of living, that, after this transitory life, thou mayest be partaker of life everlasting. Amen." As soon as the priest had pronounced these words, he anointed the infant upon the head, saying, "Almighty God, the father of our Lord Jesus Christ, who hath regenerated thee by water and the Holy Ghost, and hath given unto thee the remission of all thy sins; may he vouchsafe to anoint thee with the unction of his Holy Spirit, and to bring thee to the inheritance of everlasting life. Amen." From this anointing, or chrifom, the white garment obtained the name of "Chrifom," which, after being worn a few days, was presented to the priest to be kept in the church, or vestry, in order to be produced as evidence against the person whose chrifom it was, if he afterwards denied the faith in which he was baptized. These ceremonies were retained, for some time after the reformation, in the church of England, which ordered the mother of the child, if the child was then alive, to offer, when she was churched, the chrifom, and other accustomed offerings. If the child died before its mother was churched, the chrifom was not given to the priest, but employed as a shroud, in which the body was buried; and hence it is that chrifoms are now enumerated in the weekly bills of mortality, very absurdly; because, children who die unbaptized

are called chrifoms, though the chrifom, when it was used, was never put on till baptism was administered. Whutby on the Book of Common Prayer, &c.

CHRIST, an appellation synonymous with *MESSIAH*, usually added to Jesus: and, together therewith, denominated the Saviour of the world. The word $\chi\rho\iota\sigma\tau\acute{o}\varsigma$ signifies *anointed*, from $\chi\rho\iota\sigma\mu$, *untoing*, *I anoint*. Sometimes the word *Christ* is used singly, by way of *antonomasis*, to denote a person sent from God, as an anointed prophet, king, or priest.

Christ, says Laſtantius (de Vera Sapientia, l. iv. c. 6.) is no proper name, but only denoting power; for the Jews used to give this appellation to their kings, calling them *Chrill*, or anointed, by reason of their sacred unction. But he adds, "the Heathens, by mistake, call Jesus *Christ*, *Chreflus*." Accordingly, Suetonius, speaking of Claudius, and of his expelling the Jews from Rome, says, that he banished them because they were continually promoting tumults, under the influence of one "Chreflus." "Judæos, impulſore *Chreflo*, affidue tumultuantes, Româ expulit."

The names of *Messiah* and *Chrill*, which, as we have already observed, are synonymous, were originally derived from the ceremony of anointing, by which the kings and the high-priests of God's people, and sometimes the prophets (1 Kings, xix. 16.) were consecrated and admitted to the exercise of their holy functions; for all these functions were accounted holy among the Israelites. As this consecration was considered as adding a sacredness to their persons, it served as a guard against violence, from the respect that was paid to religion. The term "anointed," in Hebrew "Messiah," and in the Greek of the lxx, "Christ," was, in its original use, applicable to the whole succession of kings and priests, both good and bad, of the people of Israel. But, as the king and the high-priest were the heads of the whole nation, the one in civil, the other in religious matters, the term "anointed," that is "Messiah" or "Christ," might not improbably serve, by a figure, to denote the chief, head, or principal of any class or people. This, however, is the opinion of the learned Grotius. Accordingly the high-priest is sometimes distinguished from ordinary priests by the title of "the anointed priest," in the lxx " $\delta \epsilon\iota\gamma\mu\acute{o}\varsigma \delta \chi\rho\iota\sigma\tau\acute{o}\varsigma$;" but the word is sometimes applied, when, in the literal sense, no anointing had been used. Thus it is applied to Cyrus, the Persian monarch, by the prophet Isaiah: (Isai. xlv. 1.) The word was also employed to denote those especially favoured of God, as were the patriarchs Abraham, Isaac, and Jacob; concerning whom he is represented by the psalmist (Ps. cv. 15.) as having said; "touch not mine anointed." From scripture there is no ground for concluding that any one of them was in the literal sense anointed. But the most eminent use and application of the word concern the title of that illustrious personage, typified and predicted from the beginning; who is described by the prophets, David (Ps. ii. 2.) Isaiah (ch. xli. 1.) and Daniel (ch. ix. 25, 26.) under the character of "God's anointed," the "Messiah," or the "Christ." As to the use of the term in the New Testament, if we were to judge by the common version, or even by most versions into modern tongues, we should consider it rather as a proper name, than an appellative, or name of office, and should think of it only as a surname given to our Lord. To this mistake our translators have greatly contributed, by seldom prefixing the article before "Christ," though it is rarely wanting in the original. The word "Christ" was at first as much an appellative as the word "baptist" was, and the one was as regularly accompanied with the article as the other. Yet our translators who would always say "the baptist,"

baptist," have, it should seem, studiously avoided saying "the Christ." Such is the importance of the article, that the common application of the words "Jesus" and "Christ" would lead an unlearned reader uniformly to consider them as no other than the name and surname of the same person. The article in such expressions as occur in Acts, xvii. 3. xviii. 5, 28 ad's considerable light to them, and yet no more than what the words of the historian manifestly convey to every reader who understands his language. It should therefore be, "Paul testified to the Jews that Jesus was the Christ" or the Messiah, &c. Many other similar instances occur. Should it be asked, is the word "Christ" never to be understood in the New Testament as a proper name, but always as having a direct reference to the office or dignity? It may be replied, that this word, though originally an appellation, came at length, from the frequency of application to some individual, and only to one, to supply the place of a proper name. It would also very much accelerate this effect that the name "Jesus" was common among the Jews at that time, and this rendered an addition necessary for distinguishing the person. To this purpose Grotius remarks, that in process of time the name "Jesus" was very much dropped, and "Christ," which had never been used before as the proper name of any person, and was, for that reason, a better distinction, was substituted for it; inasmuch that, among the Heathens, our Lord came to be more known by the latter than by the former. This use seems to have begun soon after his ascension. During his life, it does not appear that the word was ever used in this manner; nay, the contrary is evident from several passages of the gospels. The Evangelists wrote some years after the period above mentioned; and, therefore, they adopted the practice common among Christians at that time, which was to employ the word as a surname for the sake of distinction. See Matt. i. 1, 18. Mark. i. 1. In all the three places it is *Ιησους Χριστος*, Jesus Christ, not *Ιησους* *την* *Χριστος*, Jesus the Christ, or the Messiah. Afterwards, in their history, Matthew and Mark neither name him so themselves, nor mention this name as given him by any of his contemporaries. The word was never applied to him as a proper name, whilst he remained on this earth. It was at that time always understood as the denomination of the dignity or office to which some believed him entitled, others disbelieved, and many doubted. The same reason which induced our translators to have rendered *ὁ βαπτιστης* uniformly "the baptist" with the article, should have led them to render *ὁ χριστος*, "the Christ," or the Messiah, with the article. By not doing this, they have thrown much obscurity on some passages, and weakened others. Upon the whole we may observe, that one mark of distinction, by which the title *χριστος* may be discriminated from the name, is its being attached with the article. When the article is inserted between the words *Ιησους* and *Χριστος* we have reason to consider the latter as used emphatically, and pointing directly to his office.

As a conclusion of this subject it may be added, that the word *χριστος* is frequently used by St. Paul as a trope, denoting sometimes the christian spirit and temper, as in Gal. iv. 19. Eph. iv. 20. Campbell's Prelim. Disc. to the four Gospels, vol. i. p. 165, &c.

CHRIST, *Order of*, a military order, founded in 1317, by Dionysius I. king of Portugal, to animate his nobles against the Moors.

Pope John XXII. confirmed it in 1319, and appointed for the knights the rule of St. Bennet. Alexander VI. permitted them to marry.

This order had been under the controul of 12 grand masters, when Pope Adrian VI. in 1522, conferred the

administration of it on John III. In 1551, pope Julius III. velted in the crown a perpetual right to the grand mastership: from which time the kings of Portugal have taken the title of perpetual administrators of the order, which consisted of 417 commanderies. Before the grand mastership was united to the crown, it was by election of the knights, who are now under the same regulations, and enjoy the same privileges, as those of the order of Calatrava in Spain.

According to the statutes, the candidate should prove his nobleness of blood for four generations; but this is usually dispensed with by the sovereign. The badge of the order is "a cross pattée gules, charged with a cross argent," pendant to "a collar of gold, composed of three rows of chains;" on common days the knights also wear round their necks a scarlet ribbon with the badge of the order pendant to it. They had their residence, at first, at Callromarin: afterwards they removed to the city of Thomar, as being nearer to the Moors of Andalusia and Eltramadura.

CHRIST is also the name of a military order in Livonia, instituted in 1205, by Albert bishop of Riga. The principal end of their institution was to defend the new Christians who were successively converted in Livonia, but were persecuted by the heathens.

The first occasion of their institution is said to have been as follows: In 1158 some merchants of Bremen, bound to Wisby, in the isle of Gothland, driven by stress of weather, landed at the mouth of the Dunna, trafficked with the natives, and gradually established a settlement. A German monk of the Augustine order, who accompanied the new colonists, acquired the language of the country, converted several of the natives to christianity, and persuaded them to be baptized. According to the custom of that barbarous era, an order of knighthood, first called "the knights of Christ," and afterwards with greater propriety "the knights of the sword," was instituted for the propagation of christianity by force of arms. These military missionaries, equally fanatic and languinary, gradually overran the country, and reducing the ancient inhabitants, rendered them at the same time Christians and slaves. In 1231, these knights, being incorporated in the Teutonic order, styled themselves "knights and lords of the cross," and purchased Esthonia, in 1321, from the king of Denmark. Walter Plettenburgh, chief or general, having obtained from the grand master of the Teutonic order the jurisdiction of Livonia, was considered as independent, and admitted by Charles V. among the princes of the empire. The knights continued in possession of Esthonia and Livonia, until the impolitic conduct of their masters, and civil dissensions, incited the ambition of the neighbouring powers, and involved the country in a series of bloody wars. See LIVONIA. These knights wore on their cloaks a sword with a cross over it; whence they were also denominated "brothers of the sword."

CHRISTBURG, in Geography, a town of Prussia, in the territory of Culm; 12 miles S.E. of Marienburg.

CHRISTBURG, or ALT-CHRISTBURG, a town of Prussia, in the territory of Oberland; 4 miles S.W. of Preusschmark.

CHRIST-CHURCH or CHRIST-CHURCH-TWYNEHAM, but more correctly *Taynam-bourne* or *Tawcon-ca*, as it was called in the Saxon Chronicle, is situated near the sea-coast on the S.W. verge of Hampshire, England, between the rivers Avon and Stour, which unite their streams at a short distance below the town, and soon afterwards join with the waters of the ocean at Christ-Church Bay. It is a market and borough town; and though it presents no claim to a British or Roman origin, it certainly has been a place of note in the Anglo-Saxon dynasties. From their Chronicle it appears that Ethelwold, cousin-german to Edward the Elder,

took possession of it during his short-lived revolt. Christ-Church is mentioned in Domesday as a Royal Manor; and continued to be a part of the crown demesne till it was given, with other possessions of immense value, by Henry I. to Richard de Repariis, or Redvers; who is supposed to have strengthened the town by walls, and to have erected a castle here, though Norden attributes its erection to Edward the Elder: that it must have been built previously to the twelfth century is evident from the *fastium castelli* being expressly mentioned in a charter granted to the priory by Baldwin, son of the above Richard de Redvers. This family retained possession of the town, except a short alienation by the marriage of an heiress, till Isabella de Fontibus released it to Edward II. The borough, manor, and hundred of Christ-church, after passing through the families of sir William de Montacute, Richard Neville Earl of Salisbury, and several others, were purchased by the right honourable George Rose in 1790. Parts of the castle, by which the town was formerly defended, are now standing; the principal appear to be portions of the keep, and of the flat apartment or governor's residence. The latter is upwards of seventy feet long, and nearly thirty broad; its walls, like those of the keep, being of immense thickness. On the ground floor are a number of loop holes, formed by a large semicircular arch within, lessening by degrees, and terminating in a chink. The access to the upper apartments was by a stone stair-case, part of it is yet remaining. "The place for receiving the floor of the first story is very visible; it seems to have had one room only, lighted by three large windows on the east, and as many on the west side: they were all included in semicircular arches, formed of stones very neatly cut, and divided by a small pillar in the centre. In the east side, and somewhat north of the centre, was a very large fireplace, worked circularly into the main wall, having also a high cylindrical stone chimney, seemingly the only (original) one in the building. At the north end there appears to have been a large arched window; the columns and part of the internal arch are still remaining and answer to a handsome semicircular arch on the outside, decorated with zig-zag ornaments. From what remains of the ornamental parts of this building, it appears to have been elegantly finished, and cased with squared stones; most of which, however, have been taken away: by the ruins of several walls, there were some ancient buildings at right angles to this hall, stretching away towards the keep." (Grose's Antiquities, vol. ii.) The priory of Christ-church was, according to Camden, founded early in the Saxon times: its inmates were secular canons of the order St. of Augustine, and the establishment, as early as Edward the Confessor's reign, consisted of a dean and twenty-four canons. The church and convent were given by William Rufus to the minion of his tyranny, Ralph Flambard, bishop of Durham, who in his early days held this deanery. This prelate determined to rebuild the church, and the other conventual edifices, which he found extremely out of repair, on a scale more extensive and superb than their original construction; and for this purpose seized the revenues of the canons, merely allowing to each a bare subsistence. Codric, then dean, strenuously opposing this arbitrary measure, was deprived of his dignity, and forced to seek an asylum on the continent; but had afterwards permission to return and re-assume his office. The bishop having thus subdued all opposition to his designs, levelled the ancient building with the ground; and, having completed his undertaking, solemnly dedicated the church to Christ. At the dissolution, its revenues were valued, according to Speed, at 541. 6s. od.: the site was given by Henry VIII. to Stephen Kirton, and Margaret his wife.

In the following year, the church, with the church-yard, and all appurtenances, were granted to the churchwardens and inhabitants of the town for ever. This grant was confirmed by James I., and has undoubtedly operated to the preservation of the church from the destruction in which the other buildings situated to the south were involved. The church is a very large and interesting building; and though great alterations have taken place in it since the time of Flambard, yet the nave, the south-western aisle, and the northern transept still display considerable portions of his work. The nave is formed by a double row of massive square pillars, ornamented with demi-columns: between these pillars are semicircular arches springing from grouped pilasters, which are lateral projections from the main pillars. The south-western aisle, called also the Lower Walk, exhibits some semicircular arches, with zig-zag moulding, and other ornaments. At the end of this aisle is a neat chapel, which is said to have been erected by John Draper, the first prior of that name, who was installed in 1477. The north transept, though greatly altered, still displays evident marks of the Norman style: especially on the outside in the scallop and net-work ornaments. Here are two small chantries or oratories, adjoining each other, supposed to have been built by some earl and countess of Salisbury, as the pavement within and contiguous has been composed of square tiles ornamented with the family arms. The chancel, and all that part which is east of the transept, is of more modern date. Most of the windows are large, and decorated with mullions and tracery: from the low aisles at the sides the upper part is strengthened by flying buttresses. The altar-piece is a very curious specimen of ancient carving in wood, which Mr. Warner considers as coeval with bishop Flambard. It represents the genealogy of Christ by a tree springing from the loins of Jesse, who is represented in a recumbent position, supporting his head with his left hand: in niches, on each side of Jesse, are David playing on his harp, and S-lomon in a musing posture. Above these are the Virgin, infant Jesus, and Joseph, with several other figures illustrative of the circumstances of our Saviour's birth. North of the altar is a beautiful, but now mutilated, chapel, erected in the reign of Henry VII. by the venerable Margaret, countess of Salisbury, for her burial-place: the sculpture of the ornaments is excellent, and the most florid style of that age pervades the whole interior. At the eastern extremity of the church is a spacious chapel, dedicated to the Virgin Mary, and supposed to have been built by the West family, ancestors of the lords Delaware, about the close of the 14th century: as sir Thomas West, by will dated April 1495, ordered his body to be interred in the new chapel, and bequeathed 100l. towards the completion of the works of the church. Immediately over this chapel is a large room, called St. Michael's Loft, which is recorded, in the old register of this parish, to have been set apart and used as a free grammar school-room ever since the year 1662. A school is known to have existed in this town so early as the time of the first Baldwin de Redvers, as appears from his confirmation of his father's grant to the priory. The dimensions of the church, and its principal parts, are as follow; whole length, including St. Mary's chapel and the tower, 311 feet; extreme breadth at the western extremity 60 feet; extent of the transept 104 feet, breadth 24; chancel in length 70 feet, in breadth 20; breadth of the nave 27 feet; the great pillars in circumference 36 feet 6 inches, in height 76 feet; height of the tower 120 feet. In the reign of Edward I. Christ-church received a precept, ordering the return of two members to the national council. This was repeated in the first and

second years of Edward II., but no returns were made, through the "poverty of the burghesses." It was again summoned 13 Eliz. as a prescriptive borough; and the circumstances of the times inducing compliance, it has ever since been represented by two members. The right of election is exercised by the corporation, which consists of the mayor, recorder, aldermen, bailiffs, and common council; in all 24: but Browne Willis and others have flated the real right to be in the inhabitant householders paying foot and lot. Christ-church is 105 miles S.W. of London; has a market on Mondays, and two annual fairs. The inhabitants, according to the return to parliament in 1801, were 1410; the number of houses 295. Many of the former find employment in two large breweries that have been established here; others in the salmon fishery on the rivers Avon and Stour, or in fishing round the neighbouring shores, where various kinds of fine fish abound. The lower order of females, both in the town and its vicinity, are mostly engaged in knitting stockings; and children derive employment from a manufactory of watch-spring chains lately established here. The poor-house is conducted on a very excellent plan, by which considerable sums are saved to the parish. The former expenditure has also been greatly reduced by the establishment of several friendly societies; the advantages arising from which have been considerably increased under the influence of Mr. Rose.

The Bay or Harbour of Christ Church is spacious; but, from various local causes, it is too shallow and dangerous to be frequented by vessels that draw more than five feet and a half of water. This imperfection is chiefly owing to a bar or ledge of sand, that extends from the point called Hengilbury-head, on the Hampshire side, to St. Christopher's Calf, in the Isle of Wight. The situation of this bar is occasionally shifted, either by a succession of heavy rains, which increase the force of the waters discharged into the bay by the rivers Avon and Stour, or by sea storms attended by southerly winds. Another circumstance peculiar to this harbour, and the neighbouring port of Poole in Dorsetshire, is that of every tide producing two high waters. This phenomenon, so inexplicable from the general laws of tides, is occasioned by the situation of this coast with respect to the Isle of Wight, and from the contraction of the channel by the jutting out of the point of land on which Hurst Castle stands. The tide flows into this channel from the west; and though it sets in with uncommon violence at Hurst Castle, it does not meet the tide that passes round the island, till it has reached Spithead: the passage being too narrow for all the water to pass through, the time of high water at Hengilbury-head is of course much earlier than either at Portsmouth or Chichester; at the full and change of the moon the difference is three hours and a half. When the water begins to ebb, by flowing off from the west, the contraction in the channel at Hurst castle operates in a contrary direction; and, by confining the water that has spread itself over the whole surface of the Southampton water, and of the channel within the island, gives the water in Christ-church bay an opportunity of flowing off much quicker, by which means it becomes so low, that the water that now pours through with great velocity at Hurst castle is sufficient to produce a second rise in Christ-church and Poole harbours of nearly three feet.

CHRISTENING. See BAPTISM.

CHRISTIAN, in a general sense, something that relates to CHRIST.

The king of France bore the title or surname of the *most Christian king*. The French antiquaries trace the origin of the appellation up to Gregory the Great; who, writing a letter to Charles Martel, occasionally gave him

that title, which his successors during the existence of the French monarchy retained.

Lambecius in the third tome of his Catalogue of the emperor's library, holds, that the quality of *most Christian* was not ascribed to the ancient French kings, Louis le Debonair, &c. as kings of France, but as emperors of Germany: but the French historians endeavour to refute this plea.

CHRISTIAN, in a more restricted and peculiar sense, denotes a disciple of Christ. The followers of Christ, or the profelytes to his religion, from among both the Jews and Gentiles, were distinguished by various appellations. Those which they generally appropriated to one another were believers, brethren, faithful, saints, holy, and disciples. By the Gentiles and their adversaries, they were called Nazarenes and Galileans. They were first called Christians at Antioch; about A.D. 43 or 44, according to the vulgar computation, (Acts xi. 26.) "The name of Christian," says Tertullian, (Apol.) "comes from the unctio received by Jesus Christ; and that of 'Christians,' which you sometimes through mistake give us (for you are not particularly acquainted with our name) signifies that gentleness and benignity of which we make profession;" thus deriving the name of Christian from the Greek *χριστος*, good or useful. It was in consequence of the conversion of Cornelius and his family, that the believing Jews and Gentiles were formed into one church; and, therefore, in order to prevent the continuance of that separation and distance which subsisted between them, under the former appellations of Jews and Heathens, this new name of Christians was given them; as some conceive according to the prophecy mentioned (Is. lxx. 15). It has been maintained by learned commentators, (in loc.) among whom we may reckon Benson and Doddridge, that this name was given them by divine direction or appointment; accordingly, they allege that the word *χριστιανισμῶν*, implies as much, and Dr. Doddridge has translated the passage: "and the disciples were by divine appointment first named Christians at Antioch." (Compare Matt. ii. 12. 22. Luke, ii. 26. Acts, x. 22. Heb. viii. 5. xi. 7. xii. 25.) Some have said, that Euodius was then bishop of Antioch, and gave the disciples this name; but the silence of St. Luke with regard to this circumstance renders it improbable; nor is there any sufficient evidence that it was given by Barnabas or Saul, as bishop Pearson (on the Creed, p. 103.) seems to think. There is, however, a manifest propriety in the name, as it expresses their relation to Christ; and reminds them of their obligation to adhere to his doctrine; and it is certain that they gloried in it, and avowed it before the face of their enemies. (Tertull. Apolog. c. 3. 5. Euseb. Hist. Eccles. l. v. c. 1.) Witius (de Vit. Paul. cap. iii. § 5), thinks it a circumstance of remarkable wisdom, that this celebrated name should arise from Antioch, a church consisting of a mixture of Jews and Gentiles, rather than from Jerusalem, dignified in so many other respects; and that it was a kind of victory, gained over Satan, who from Antioch had, some ages before, raised so many cruel persecutors of the church of God. Witius, however, does not discern any particular emphasis in the word *χριστιανισμῶν*, and readily admits the interpretation of Grotius, that the Greek word, according to its usual meaning in the best Greek writers, and in the New Testament itself, signifies named, or called. And he inclines to the conjecture of archbishop Usher, that this appellation was given to the believers by the Romans then at Antioch. Suicer, in his "Thesaurus," explains the original word, and understands this text exactly as Grotius did. Dr. Heumann has a dissertation concerning the origin of the name of Christians, in which he shews it to be very probable, that this name had not

its rise from the Jews. Nor did the disciples of Jesus take it to themselves. But, probably, they were first so called by Heathens, particularly the Romans, as archbishop Usher had argued; the name not having a Greek but a Latin termination. St. Paul, therefore, did not give the name, as bishop Pearson, after Chrysolom, conjectured; and indeed Dr. Heumann shews, that both St. Luke and St. Paul seem to have declined the use of it; possibly left our Saviour should have been esteemed an ordinary leader of a sect, like the philosophers at that time much celebrated among the Greeks and Romans. However, it was not long before it obtained, and was very acceptable to the followers of Jesus. It is used by St. Peter i. iv. 16. And some have thought it to be the "worthy name," intended by St. James, ch. ii. 7. And it is certain, that afterwards it was much, and justly valued by those who bore it. In the epistle of the churches of Vienna and Lyons, giving an account of their late sufferings, it is styled an honourable, and glorious, and reviving appellation. Benson's Hist. Plant. Christi. Rel. vol. i. ch. i. § 6. Doddr. in loc. Lardner's Works, vol. vi. p. 265.

The conduct of the first Christians corresponded to the name by which they were distinguished. They were humble, upright, and diligent in availing themselves of the instructions of the apostles; they were resolute and persevering in maintaining their profession of Christianity amidst various reproaches and sufferings, and they testified their sincerity by numerous exercises of self-denial, fortitude and patience, and by submitting even to death, in its most awful forms, rather than incur the guilt of renouncing their faith in the gospel and its divine author. Their general character was not only irreproachable, but exemplary; and they recommended their religion by their uniform temper and practice, as well as by verbal declarations of its excellence and invincible adherence to their profession. We have many early testimonies to this purpose, delivered not only by persons of unquestionable integrity among themselves, but also by their adversaries and persecutors. To their lives they were able to appeal, and did frequently appeal, in vindication of their character against the accusations of their enemies; and they thus evinced the falsehood and inveterate malice from which such accusations originated. We shall here select, out of a variety of ancient documents to the same purpose, the letter of Pliny the younger; who was proconsul of Bithynia, in the third year of the reign of Trajan, about the 65th year after our Lord's ascension, A. D. 100. In this letter Pliny, who was a person of good sense and moderation explained to Trajan the difficulties which occurred to him in the execution of the severe laws that were enacted against the Christians. He informs him concerning the method which he had observed in punishing the Christians, gives him an account of their faith, worship, and manners, according to the account which he had received from those who had apostatized to avoid persecution, and requests the emperor's advice how he should act towards them for the future. This letter is cited by Tertullian and Eusebius; and being still extant, does great honour to the Christian religion and its votaries. In the process of his examination of those who were brought before him under the charge of being Christians, he says, that some of them denied that they were Christians, or even had been of this number; and to other evidence of their not being justly subject to this charge, they added, as he informs the emperor, that of reviling Christ; which none of those, as they themselves acknowledged, who were really Christians, could be compelled to do. Others of them affirmed, that the whole of their fault or error was, "that they were wont on an appointed day to meet before it was light, and to sing

with one another a hymn to Christ as a God, and to bind themselves with an oath, not to do any wicked thing, but to commit no thefts, no robberies, no adulteries, to break on promise, and to refuse giving back no pledge when asked. These things finished, it was their custom to depart, then to meet again in order to take food, which, however, was innocent and eaten in common." He adds, as a reason for not proceeding against them with rigour and severity, that this was a matter worthy of deliberation, "chiefly because of the number of those who are in danger. For many of all ages, of every rank, and of both sexes also, are called to account, and will be called. Neither through the cities only, but the villages also, and the country, is the contagion of that superstition spread, which, it appears, may yet be stopped and corrected: at least it is very certain, that the almost idolatrous temples are begun to be frequented, and the sacred rites long neglected to be renewed. Moreover the victims every where are sold, of which hitherto scarcely any buyer was found. Hence it is easy to collect, what a multitude of men may be reclaimed, if there be allowed place for repentance." A rescript of Antoninus Pius (see his article) also bears honourable testimony to the character of the Christians. In this rescript Antoninus intimates that the Christians gained advantage over their opposers, and manifested their superiority by their readiness to lay down their lives in support of their cause; and that they incurred enmity and persecution on account of their greater regard to religion; and he issued an edict, ordering among other things, that "if any shall still proceed to create trouble to one that is a Christian, or to accuse him of crimes merely because he is a Christian, let him who is indicted be discharged though he is found to be a Christian, and let the informer himself undergo the punishment." But it is needless to multiply instances of this kind.

CHRISTIANS, persecution of. See PERSECUTION.

CHRISTIAN Religion, or CHRISTIANITY, that instituted by Jesus Christ, comprehending doctrines of faith and rules of practice, all of which are contained in the New Testament, and are designed to recover mankind from ignorance and vice, from guilt and death, to true knowledge and virtue, to the divine favour, and everlasting life. Its aptitude to this end, its conformity to reason, and to the state of man, the sublimity and excellence of its doctrines, the equally venerable and lovely character of its author, the purity of its precepts, its benign tendency and salutary effects, concur, with the external evidence of PROPHECY and MIRACLES, to establish its divine origin and truth.

Dr. Gerard, in the introduction to his "Dissertations on Subjects relating to the Genius and Evidences of Christianity," observes, that the evidences of the Christian religion may very properly be distinguished into two kinds; the *direct* and the *collateral*. The direct evidences are *internal* and *external*. The external evidences of Christianity are miracles and prophecy; these are the most direct proofs of its divinity. The internal evidence, arising from its excellence, has also great force. But when its excellence is urged as a *direct* proof of its truth and divinity, it should be considered in reference to the principal end of Christianity. The end which Christianity professedly aims at is the spiritual improvement of mankind, the present virtue and comfort, and the future perfection and happiness of all who yield themselves up to its power. This end it keeps continually in view; it represents all its doctrines and precepts as means of promoting this end; and it is careful to set them in that attitude in which they may most directly and powerfully contribute

to it. If it contains powerful means of virtue: if it affords solid grounds of joy, suited to the condition of human creatures, it is excellent.

It not only is such a religion as may have been revealed by God, and ought to be received as a positive proof that it was revealed by him; but its very structure indicates that it is actually divine, in a manner similar to that in which the wise and benign contrivance of the world proves it to be the work of God. It is sufficient, that Christianity is exactly adapted to its own end. It is from the importance of this and from its fitness for promoting it, that the proper excellence of Christianity arises. Whatever does not either belong to its excellence considered in this light, or falls under the head of miracles wrought on purpose to attest it, or of prophecies fulfilled; and yet affords a proof of any real presumption of its truth and divinity, is a *collateral* evidence of it. The use of such arguments is either to rouse the inattentive and the prejudiced to a careful and impartial examination of the more direct evidences of the Gospel, or to strengthen the conviction which these evidences have already produced. To keep it steadily in view, that this is their proper use, is necessary for prosecuting arguments of this kind to the greatest advantage. All the *collateral* evidences of Christianity are in one sense *internal* evidences; they all arise from some particulars in the nature of this religion; from some circumstances which have attended its reception or springing from it, or from some remarkable facts connected with it, and related in the Gospel-history. Some of them are in the strictest sense *internal*. That excellence of Christianity, which constitutes its internal evidence, may be sufficiently ascertained by an examination of the doctrines and precepts of this religion: an examination of its nature is indeed the direct and proper method of bringing its excellence to the trial; and if, on this trial, it be approved, the direct argument there resulting for its divinity is completed. If there be any topic from which a proof of its excellence can be deduced, additionally to, and dependent on, what arises from the examination of its nature, that topic may really be considered as affording a separate and collateral proof of its truth. Such is the argument deduced from its great efficacy at its first appearance, in banishing polytheism, idolatry and superstition, and the arts of magic, and in reforming the temper and manners of those who embraced it. This efficacy gives us new assurance of the excellence of Christianity, by shewing us corresponding effects, actually resulting from it. By this it strengthens our belief of its divine original; it likewise begets a general presumption, that there must have been very satisfying evidence of its truth, or else men would never have made so great sacrifices to it. Again, though the virtue and spiritual good of man be the only main and ultimate end of Christianity, yet it may at the same time be fit for promoting many other good ends subordinate to this or consistent with it. A fitness for promoting such an end is a new instance of the excellence of Christianity, distinct, indeed, from its proper and essential excellence, but strengthening the argument for its divinity arising from this, and strengthening it by a similar operation on the mind. It begets an additional degree of conviction, by giving an additional perception of excellence. Thus, the spirit of Christianity naturally softens the rigour of despotism, introduces moderation into government, banishes many inconvenient civil laws once generally prevalent, gives rise to others of a very happy tendency, refines the laws of war, humanizes the manners and improves the customs of nations. See "Montesquieu's Spirit of Laws," b. iv. ch. 33, 4. 6. 19.

Another class of *collateral* arguments for the truth of the

Christian religion arises from particulars in its nature, or from effects produced by it, or from facts in the Gospel-history which cannot be at all accounted for but on the supposition of a divine original, or which are, at least, most naturally explicable on that supposition. Such arguments produce conviction, not by simply exciting a perception of excellence, but by making us feel, that we must offer violence to the natural principles of our understanding, and be involved in absurdities, if we deny the divinity of Christianity. Whatever circumstance is unaccountable, without supposing the truth of Christianity, affords a real presumption for it. See "Duchal's presumptive Arguments, &c. in 10 Sermons, 1753."

Some of these presumptive arguments, with respect to the circumstances from which they arise, and the manner in which they affect the understanding, are allied chiefly to the internal evidences of Christianity; others to the external. The circumstances from which some presumptive arguments for our religion arise, are such in their nature as, while they are inexplicable without supposing its divinity, excite at the same time a perception of excellence. Thus, the character of Jesus is such, and so uniformly supported, that, if it had not been real, the evangelists cannot be supposed capable of delineating it. There are several circumstances in our Saviour's last discourses with his disciples which prove that, if he had not really spoken them, the evangelists could never have feigned or ascribed them to him. The characters of some of the apostles of Christ; the controversies among Christians, in the apostolic age; the practice of Christ and his apostles in uniformly referring their claim to the impartial inquiries of men, and renouncing every other method of recommending it, have been shewn by Dr. Duchal to contain strong presumptions of the truth of Christianity. All these arguments have an affinity to the internal evidence of Christianity. There are others which bear affinity to its external evidences. They add credibility to them; they predispose the mind to admit them; or heighten its acquiescence in their sufficiency. They contain a mixture of something miraculous, which, by being such, implies the divinity of this religion, and which carries along with it satisfying evidence of its own reality. Thus, Bell, in his "Inquiry into the divine Mission of John the Baptist and Jesus Christ," has shewn, that the claims of both mutually support each other; and that the circumstances attending their births, many of which were miraculous, and their whole conduct towards one another in their public life, afford a full proof that Jesus was the Messiah, and John his forerunner. The case is the same with regard to the miraculous conversion and subsequent conduct of the apostle Paul, forbidding us to ascribe the origin and prevalence of Christianity either to enthusiasm or imposture; as has been displayed with great length of reason by Lord Lyttelton and by Dr. Duchal. See PAUL.

There are other arguments, which corroborate the truth of Christianity, by adding weight to its external evidence in a manner still more direct. They arise from circumstances not absolutely necessary for rendering these evidences complete; and therefore they may be considered as separate and independent evidences of the collateral kind. Thus, when we consider that many of the particulars predicted concerning the Messiah and accomplished in Jesus are perfectly extraordinary in their own nature, and seemingly incompatible with one another, this affords evidence of the truth of our religion, additional to what arises merely from the accomplishment of any prophecy. A similar confirmation of Christianity has been deduced by Dr. Duchal, from some circumstances in the character of the Man of Sin, foretold by Paul, so singular, that mere imagination could scarcely have suggested them; and if it had, they never could

have taken place. These instances have an immediate relation to the proof of Christianity from *prophecy*, which see. Others are related to the proof from *miracles*, which see; such is the argument from the quick and extensive propagation of the Gospel, illustrating the evidence from miracles in the same way as the efficacy of the Gospel corroborates its internal evidence; and the argument from the concessions of ancient infidels, stated by Gerard, in one of his dissertations. The argument for Christianity from the continuance and present state of the Jewish nation, is almost equally related to the proof from miracles and to that from prophecy. See "Lardner's Discourses on the Circumstances of the Jewish People, an Argument for the Truth of Christianity." There are other arguments, which have an equal relation to the internal and external evidences for Christianity, and which add weight equally to both. Such are the two arguments illustrated by Dr. Gerard; the one deduced from the manner in which Christ and his apostles proposed the evidence of their mission, which was the most proper; and the other, from the result of the scrutiny and examination of infidels. There are other arguments, deducible from the permanence of the positive institutions of Christianity, which are a kind of monuments of its truth and divine original; and others again, of the presumptive kind, furnished by the history of the *Acts of the Apostles*; which see. Dr. Leland has given an excellent summary of the evidences of Christianity, in his "View of the Deistical Writers, vol. i. p. 417, &c." See also Beattie's "Evidences, &c." and Paley's "View of the Evidences of Christianity, vol. i." Macknight's "Truth of the Gospel History," "An Answer to the Question, Why are you a Christian?" by John Clarke, minister of a church in Boston, 6th ed. Lond. 1803. See APOSTLES, BIBLE, CANON, GOSPEL, RELIGION, REVELATION, TESTAMENT, &c."

The argument in proof of the truth of Christianity, to which we have above referred, deduced from its sudden and extensive propagation, and permanent duration, deserves, on various accounts, to be more amply stated, and to be vindicated from the objections that have been alleged against it. No just and satisfactory reason can be given for its speedy diffusion, general prevalence, and continued subsistence in the world; without admitting its divine original, and the supernatural efficacy that contributed to its reception and propagation. In its own nature and avowed design, it had to encounter with a host of enemies both among Jews and Heathens; whose passions and prejudices, secular interest and honour, and established habits and usages, would combine in discouraging its advocates and raising obstacles, which it would be difficult to surmount. More especially when we consider that independently of its claims to a divine origin, and of the supernatural power which accompanied it, the missionaries in the Christian cause laboured under a variety of personal and local disadvantages. They were destitute of those natural talents and acquired accomplishments, and of that authority and influence usually resulting from rank and opulence, which would of themselves have contributed to their favourable reception with the multitude. Nevertheless, Christianity "grew mightily and prevailed;" of the weapons that were wielded against it by prejudice and error, talents and learning, wealth and worldly power, none eventually prevailed. Many circumstances concurred, indeed, to favour its reception and spread soon after the time, when it was introduced. This was the precise period, which had been predicted many ages before it occurred. This was the time in which a general expectation of the Messiah or Saviour prevailed. At this time the Jewish system both of doctrine and practice was become ex-

tremely corrupt, and the inquiries of the sordid heathens had been found insufficient to satisfy them on the most important and interesting subjects. There are also several other collateral circumstances, which mark the period in which our Saviour appeared as the most proper for the introduction, establishment, and propagation of the religion which he communicated to mankind. This was an age of general knowledge and inquiry, when genius and science were cultivated and promoted, both in Greece and Rome, and when the human mind was beginning to emancipate itself from that blind and obdurate attachment to old opinions and systems, venerable merely on account of their antiquity, which is inseparable from ignorance and barbarity. This was an age in which men began to discover a very general disposition for moral inquiries; and in which some of the most distinguished sages and philosophers flourished. The Augustan age is proverbially celebrated for its refinement and culture; for the knowledge and investigation by which it was distinguished. This was a period of general peace through the whole Roman empire. It was likewise a period of general toleration and liberty; it was also a time, in which by the wide extent of the Roman empire, an intercourse was opened and maintained between the inhabitants of very distant nations; and this intercourse was further promoted by the dispersion of Jews and Christians in consequence of the destruction of Jerusalem and the dissolution of the Jewish state. The Greek language at this time was almost universal; and, therefore, the inspired writers, whose gospels and epistles were published in this language, enjoyed peculiar advantage for extending the knowledge of the sacred doctrines, precepts, and institutions of Christianity. Our limits will not allow our enlarging on these particulars; and we must, therefore, content ourselves with merely suggesting them.

Of the success and prevalence of Christianity, during the apostolic age, we have already given a brief account under the article APOSTLES. In process of time, it made a wonderful progress through Europe, Asia, and Africa; and its progress was much accelerated by means of the wide extent of the Roman empire, and by a variety of circumstances which took place, at and soon after the period of its first introduction. In the third century there were Christians in the camp, in the senate, and in the palace; in short, every where, as we are informed, except in the temples and the theatres; they filled the towns, the country, and the islands. Men and women of all ages and ranks, and even those of the first dignity, embraced the Christian faith; inasmuch that the Pagans complained that the revenues of their temples were ruined. They were in such great numbers in the empire, that, as Tertullian expresses it, if they had retired into another country, they would have left the Romans only a frightful solitude. For the further illustration of this argument, we may observe that the Christian religion was introduced everywhere in opposition to the sword of the magistrate, the craft and interest of the priests, the pride of the philosophers, the passions and prejudices of the people, all closely combined in support of the national worship, and to crush the Christian faith, which aimed at the subversion of heathenism and idolatry, and the abrogation of the Jewish law. Moreover, this religion was not propagated in the dark, by persons who tacitly endeavoured to deceive the credulous; nor delivered out by little and little, so that one doctrine might prepare the way for the reception of another; but it was fully and without disguise laid before men all at once, that they might judge of the whole under one view of it. Consequently mankind were not deluded into the belief of it, but received it upon proper examination and conviction.

tion. Besides, the gospel was first preached and first believed by multitudes in Judæa, where Jesus exercised his ministry, and where every individual had access to know whether the things that were told him were matters of fact; and in this country, the scene of the principal transactions on which its credibility depended, the history of Christ would never have been received, unless it had been true, and known to all as truth; again, the doctrine and history of Jesus were preached and believed in the most noted countries and cities of the world, in the very age when he is said to have lived. On the 50th day after our Lord's crucifixion, 3000 persons were converted in Jerusalem, by a single sermon of the apostles; and a few weeks after this, 5000 who believed were present at another sermon preached also in Jerusalem. (Acts ii. 41. iv. 4. vi. 7. viii. 1. ix. 1. 20.) About 8 or 10 years after our Lord's death, the disciples were become so numerous at Jerusalem and in the adjacent country, that they were objects of jealousy and alarm to Herod himself. (Acts, xii. 1.) In the 22d year after the crucifixion, the disciples in Judæa are said to have been many *myriads*. (Acts, xxi. 20.) See APOSTLES. The age, in which Christianity was introduced and received, was famous for men, whose faculties were improved by the most perfect state of social life, but who were good judges of the evidence offered in support of the facts recorded in the gospel-history. For it should be recollected, that the fucets of the gospel was not restricted to Judæa; but it was preached in all the different provinces of the Roman empire. The first triumphs of Christianity were in the heart of Greece itself, the nursery of learning and the polite arts; for churches were planted at a very early period at Corinth, Ephesus, Berea, Thessalonica, and Philippi. Even Rome herself, the seat of wealth and empire, was not able to resist the force of truth, at a time when the facts related were recent, and when they might, if they had been false, have easily been disproved. From Greece and Rome, at a period of cultivation and refinement, of general peace, and extensive intercourse, when one great empire united different nations and distant people, the confutation of these facts would very soon have passed from one country to another, to the utter confusion of the persons who endeavoured to propagate the belief of them. Earlier, although most of the early converts were persons in the middle and lower classes of life, yet even these, in an age of such general knowledge and intercourse, were sufficiently secured against every kind of false pretensions; and as for the more ignorant, their attachment to their first religious notions would be strong; and consequently, miracles, or unquestionable operations of divine power, would be necessary to convince persons of this rank and character, and to induce them to change their principles. Their conversion, therefore, affords an incontestible argument in proof of the facts by which it was accomplished. It should here be considered that the religion to which they were profelyted was *exclusive*. It denied, without reserve, the truth of every article of heathen mythology, the existence of every object of their worship. It accepted no compromise; it admitted no comprehension. If it prevailed at all, it must prevail by the overthrow of every statue, altar, and temple in the world. It pronounced all other gods to be false, and all other worship vain. These are considerations which must have strengthened the opposition to it, augmented the hostility which it must encounter, and enhanced the difficulty of gaining profelytes. More especially when we recollect, that among the first converts to Christianity in the earliest age, a number of persons remarkable for their station, office, genius, education, and fortune, and who were personally interested by their emolu-

ments and honours in the continued subsistence either of Judaism or heathenism, appeared among the Christian profelytes. Its evidences approved themselves, not only to the multitude, but to men of the most refined sense and most distinguished abilities; and it dissolved the attachments which all-powerful interest and authority created and upheld. Among the profelytes to Christianity we find Nicodemus, and Joseph of Arimathea, members of the senate of Israel; Jairus, a ruler of the synagogue; Zacheus, the chief of the publicans at Jericho; Anollos, distinguished for eloquence; Paul, learned in the Jewish law; Sergius Paulus, governor of the island of Cyprus; Cornelius, a Roman captain; Dionysius, a judge and senator of the Athenian Areopagus; Erastus, treasurer of Corinth; Tyrannus, a teacher of grammar and rhetoric at Corinth; Publius, governor of Malta; Philemon, a person of considerable rank at Colosse; Simon, a magician in Samaria; Zenas, a lawyer; and even the domestics of the emperor himself. These are noticed in the sacred writings; and the heathen historians also mention some persons of great note who were converted at an early period. To all the preceding circumstances we may add a consideration of peculiar moment, which is, that the profession of Christianity led all, without exception, to renounce the world, and to expose themselves to the most ignominious and excruciating sufferings. On the other hand, we should reflect on the character and condition of the persons, who persuaded mankind to change their belief, and to abandon all their former connections and habits. They were a few, selected from the meanest of the people, and they belonged to a nation that was despised on account of the ill-will which they bore to the rest of mankind. By such persons were thousands prevailed upon in a very short time to change their belief and to reform their lives. And, without adding any more in this way, the Christian religion, thus introduced by the power of God and of truth, has been supported in the world by the same powers through a course of many ages, amidst the corruptions of its friends, the opposition of its enemies, the dangers of prosperous periods, and the persecutions and violence of adverse circumstances: all which must have destroyed it, if it had not been founded in truth, and guarded by the protection of an Almighty providence.

Mr. Gibbon, the elegant and instructive historian, has endeavoured to account for the wonderful propagation of Christianity, independently of its truth and divine original, in a manner which tends, in our opinion, to make an impression on the mind of his reader not at all advantageous to our holy religion. To the inquiry by what means the Christian faith obtained so remarkable a victory over the established religions of the earth, he says, an obvious but satisfactory answer may be returned; that it was owing to the convincing evidence of the doctrine itself, and to the ruling providence of its great author. But afterwards, in assigning for this astonishing event, *five* secondary causes, derived from the passions of the human heart and the general circumstances of mankind, he seems to have insinuated, that Christianity, like other impostures, might have made its way in the world, though its origin had been as human as the means by which he supposes it was rapidly spread. Whether it was his intention to depreciate the primary means by which Christianity prevailed, and to intimate his dissatisfaction with the obvious answer which others have returned to the inquiry concerning its reception and spread, we shall not presume to determine; but we may be allowed to say, without incurring the charge of want of candour, that his reasoning on this subject has a tendency to divert the attention of his readers from the principal cause of the triumph of Christianity to other causes less favourable to its truth

and divine original, and altogether inadequate to this great event. As the subject is in a high degree important and interesting, we shall here avail ourselves of the replies that have been made by the advocates of Christianity, and particularly by the learned and ingenious Dr. Watson, bishop of Landaff, to the reasoning of the acute historian.

The *first* cause, which he alleges, is, "the inflexible, and, if we may use the expression (he says), the intolerant zeal of the Christians, derived, it is true, from the Jewish religion, but purified from the narrow and unfocial spirit, which, instead of inviting, had detoured the Gentiles from embracing the law of Moses." The zeal of the Christians is allowed to have been inflexible, as far as it concerned a steady adherence to their religious principles and profession, and intolerant, in not admitting to Christian worship those who supplicated the image of Cæsar, who bowed down at the altars of Paganism, who mixed with the votaries of Venus, or wallowed in the filth of Bacchanalian festivals; but, instead of deducting it, as Mr. Gibbon does, from the Jewish religion, it ought to be ascribed to a full persuasion of the truth of Christianity. The zeal of the apostles or primitive Christians did not bear the slightest similitude to the fierceness and bigotry of the Jews; it was derived from very different causes, and aimed at far nobler ends. It is not conceivable, that a zeal resulting from the Jewish religion should urge the Christians to propagate the gospel amongst Jews as well as Gentiles; and that such a zeal as Mr. Gibbon has described, whatever might be its principle, should ever have been devised by any human understanding as a probable mean of promoting the progress of a reformation in religion; much less that it should have been thought of or adopted by a few ignorant and unconnected men.

The *second* cause to which Mr. Gibbon has attributed the rapid growth of Christianity is, "the doctrine of a future life, improved by every additional circumstance which could give weight and efficacy to that important truth." Such a doctrine is unquestionably congenial to the nature of man as a moral and accountable agent; it is repeatedly inculcated in the gospel, and most ultimately, and in a favourable state of things, have increased its efficacy; but, considering the circumstances of the persons to whom this doctrine, in its whole extent, as comprehending punishments and rewards, and the immortality of the soul, in connection with the resurrection, was delivered, it is not likely that, abstracted from the supernatural testimony by which it was enforced, it could have met with any very extensive reception among them. It was not the kind of future life, which they expected. Future punishments, which constituted a prominent part of this doctrine, were reckoned by the philosophers among the *anties fabulas*; nor was the absurdity of this part of the Christian doctrine confined to the writings of the philosophers, and to the circles of the learned and polite; but Cicero makes no secret of it in his public pleadings before the people at large. Besides, its rewards were not attractive, nor were they such as the multitude wished. The pride of the philosopher was shocked by the doctrine of a resurrection, the mode of which he was unable to comprehend; and the imaginations of other men were feebly impressed by the representation of a future life, which did not portray the serene sky, the verdant garden, and the luxurious enjoyments of an Elysium. Upon the whole, the Christian doctrine of a future life was neither agreeable to the expectations, nor corresponding with the wishes, nor conformable to the reason of the Gentiles: and it, therefore, afforded no inducements for their receiving it, and, in consequence of their belief, regulating their loose morals according to the rigid standard of gospel purity, upon the mere authority of

a few contemptible fishermen of Judæa. Mr. Gibbon himself observes in another place, that the "Pagan multitude, reserving their gratitude for temporal benefits alone, rejected the incalculable present of life and immortality, which was offered to mankind by Jesus of Nazareth." When this writer ascribes the conversion of the Gentiles to the influence of their fears, excited, as he pretends, but without sufficient reason, by the expectation of Christ's speedy appearance, of the millennium (which see,) and of the general conflagration; it is natural to ask from what source they derived those fears which converted them? not, we may say, from the labours of such men, as the apostles and first preachers of Christianity, who from their mean condition and rude speech were very ill adapted to inspire the haughty and the learned Romans with any other passions than those of pity or contempt.

"The miraculous powers ascribed to the primitive church," are the *third* of the secondary causes to which Mr. G. ascribes the rapid propagation of Christianity. It must be allowed that the miracles, not merely ascribed to the primitive church, but really performed by the apostles, ought to be considered not only as a secondary, but as one great primary cause of the conversion of the Gentiles. But the miraculous powers attributed by Mr. Gibbon to the primitive church, and which he describes with a degree of derision, implying his scepticism or incredulity concerning them, were by no means calculated, at least in any eminent degree, to spread the belief of Christianity amongst a great and an enlightened people. When we consider that the pretended miracles of the heathens were so numerous as to have insensibly lost their force, and sunk in their esteem, those that were ascribed to the first propagators of Christianity must have created an immediate and stubborn prejudice against their cause; and nothing could have subdued that prejudice, but miracles, really and visibly performed. See *MIRACLES*.

The utility of Mr. Gibbon's *fourth* cause, viz. "the virtues of the first Christians," cannot be disputed; as they very much conduced to the spread of their religion: but these virtues are depreciated by his representation of them, as proceeding from their mean and timid repentance for having been the most abandoned sinners, or from an impetuous zeal in supporting the reputation of the sect or society to which they belonged. "After the example of their divine master," says Mr. G. in language that more than insinuates unmerited reproach, "the missionaries of the gospel disdained not the society of men, and especially of women, oppressed by the consciousness, and very often by the effects of their vices." The pernicious tendency of such a declaration, connected with the gross misrepresentation implied in it, reflects reproach on the character of the historian, and seems to indicate a design to degrade the importance of Christianity and to expose it to contempt. But whatever may be its effect on the heedless and dissipated, it supplies its own antidote in the estimation of the impartial, thoughtful, and judicious, who will not fail to distinguish between assertion and fact. Very contrary to the declaration of Mr. G. was the conduct enjoined on the first teachers of Christianity; for they were ordered to turn away from, to have no fellowship or intercourse with, such as were wont "to creep into houses, and lead captive silly women laden with sins, led away with divers lusts." And if a few women, who had either been seduced by their passions, or had fallen victims to the licentious manners of their age, should be found amongst those who were most ready to receive a religion that forbade all impurity; this circumstance cannot warrant an insinuation of discredit, either upon the sex, or upon those

those who wrought their reformation. The attention manifested by the primitive Christians with regard to their conduct is invidiously ascribed to improper motives; whereas their solicitude to avoid reproach in this respect might as candidly, perhaps, and as reasonably, be derived from a sense of their duty, and an honest endeavour to discharge it, as from the mere desire of increasing the honour of their confraternity by the illustrious integrity of its members. After all, the austere morality of the primitive Christians, which Mr. G. describes as adverse to the propensities of sense, and abhorrent from all the innocent pleasures, and amusements of life, is exhibited under such dismal colouring, that instead of alluring persons to a closer inspection of it, it must have made every man of pleasure or of sense to turn away from it with horror or disgust; and so far from contributing to the rapid growth of Christianity, it must excite wonder, how the first Christians ever made a single convert. The aversion of Christians from the business of war and government is charged upon them by Mr. G. as a criminal disregard to the public welfare. By way of general reply it may be observed, that Christianity does not concern itself with ordering the constitutions of civil societies, but levels its whole influence at the hearts of individuals who compose them; and, as Origen said to Celsus, if every individual in every nation was a good Christian, there would be neither internal injustice, nor external war; there would be none of those passions which embitter the intercourse of civil life, and desolate the globe. It can therefore be no reproach to the Christian religion, that it should inculcate doctrines, which, if universally practised, would introduce universal tranquillity, and the most exalted happiness amongst mankind. Nothing but a total misapprehension of the design of the Christian dispensation, or a misinterpretation of particular injunctions, forbidding its votaries to make riches or honours a primary pursuit, or the prompt gratification of revenge a first principle of action, can lead any one to infer, that a Christian is obliged to offer his throat to an assassin, and his property to the first plunderer; or that a society of Christians may not repel, in the best manner they are able, the unjust assaults of hostile invasion. No precepts of the gospel, whatever may be asserted or insinuated to the contrary, debar a man from the possession of domestic comforts, or deaden the activity of his private friendships, or prohibit the exertion of his utmost ability in the service of the public.

The fifth and last secondary cause of the rapid and extensive spread of Christianity, mentioned by Mr. G. is "the union and the discipline of the Christian church." Union, it must be allowed, is strength to every association; and it is much to be wished, that it could be found even in the early period of the Christian dispensation, and much to be lamented that the too general defect of it has been the reproach of Christians from the apostolic age to our own. There was, indeed, a certain community of doctrine, an intercourse of hospitality, and a confederacy of discipline established among the individuals of every church; so that none could be admitted into any assembly of Christians without undergoing a previous examination into his manner of life, and without professing in the most solemn manner that they would not be guilty of murder, adultery, theft, or perjury. It may be also granted, that those who broke this compact were rejected by common consent from the confraternity into which they had been admitted; and this confederacy extended itself to independent churches; so that those who had, for their immoralities, been excluded from Christian community in any one church, were rarely, if ever, admitted to this privilege by another:—but it is not

admitted, that this severity and this union of discipline could ever have induced the Pagans to forsake the gods of their country, and to expose themselves to the contemptuous hatred of their neighbours, and to all the severities of persecution, exercised with unrelenting barbarity, against the Christians. After this brief abstract of the reasoning of Mr. Gibbon, and the replies of the advocates of Christianity on the subject of its propagation, we must refer to Gibbon's History of the Decline and Fall of the Roman Empire, vol. ii. chap. 15. Bp. Watson's Apology for Christianity, passing; White's Sermons, Sermon III. and other writers who have either directly or indirectly written on the same subject. See COMMUNITY OF GOODS, EXCOMMUNICATION, PENANCE, PERSECUTION, &c.

CHRISTIAN I, in *Biography*, king of Denmark, son of Theodorice Count of Odenburg, was elected to the throne in the year 1448, and in him we behold the founder of the royal house of Odenburg, which still possesses the throne of Denmark. He owed his elevation as well to his lineal descent from Eric VII. as to the moderation of his uncle Adolphus, duke of Sleswick, to whom the crown was offered upon the death of Christopher of Bavaria without success. Adolphus declined the honour on account of his advanced age, and recommended, in his stead, Christian, then twenty-two years of age. In the same year that he ascended the throne of Denmark, he was crowned king of Norway, in right of his descent from one of their ancient kings. After some struggles he obtained also the crown of Sweden in 1558, upon the deposition of Charles Canutus. About the same time the duchy of Sleswick reverted to the crown of Denmark, and Christian obtained possession of the counties of Holstein and Stormar. The Swedes, in a short time, grew discontented with the government of Christian, who neglected to visit them, and had applied the public money in the purchase of Holstein and Stormar. To put an end to their machinations, Christian seized the archbishop of Upsal, whom he suspected, and sent him prisoner to Denmark. This action caused an open revolt, and led to the deposition of the king. From this period Christian abandoned all projects of ambition, and attended to the concerns of his own kingdom. He was distinguished for his liberality to the clergy, and in 1473 made a pilgrimage to Rome, where he was received with extraordinary honours. On his return he founded the university of Copenhagen, and died in 1481, after a reign of thirty-three years. He was a sovereign of great moderation and humanity, whose qualities, being less shining than solid, were more adapted to the administration of his own government, than to the exploits of war. By Mallet, the most celebrated of Danish historians, Christian I. is characterized as one of those princes who do not attract the admiration of mankind, yet whom Providence never bestows upon a nation but as a signal mark of favour. Christian was succeeded by his son John, whom he had already associated with himself in this throne.

CHRISTIAN II. king of Denmark, was born in 1481, the same year in which his grand-father died. In his youth he discovered a lively genius and a good understanding, which, if they had been properly cultivated, might have rendered him the ornament, instead of becoming, as he proved, the disgrace of his country. The young prince was first entrusted to the care of a common burgher of Copenhagen, and was afterwards removed to the house of a school-master, who was canon of the cathedral. In this situation his chief employment consisted in regularly accompanying his master to church, where he distinguished himself beyond the other scholars and choristers in chanting and singing psalms. He was afterwards placed under the tuition of a German preceptor,

ceptor, under whom he made a considerable proficiency in the Latin tongue. From this humble education, or from other circumstances not known to the world, Christian imbibed a taste for bad company; was accustomed to haunt common taverns, to mix with the lowest of the populace, and was, in short, guilty of almost every excess. The king, his father, who had, unintentionally, been the cause of his son's misconduct, was now indignant at the irregularities which were become notorious to the whole country, but the bad habits which the prince had contracted were too strongly rooted to yield to any effort. He nevertheless feigned contrition for his past behaviour, and recalled his father's affections by his military prowess and successes in Norway, and by an unwearied application to the affairs of government. He succeeded his father in 1513, and during the first years of his reign, his administration was in many respects worthy of praise, and the excellence of his laws induced Holberg to affirm, that if the character of Christian II. were to be determined by his laws, and not by his actions, he would merit the appellation of Good, rather than of Tyrant. Foreseeing the difficulties he should meet with in obtaining the crown of Sweden, he resolved to strengthen himself by an alliance with the house of Austria, and accordingly married Isabella, sister to the emperor Charles V. Notwithstanding this marriage, which was merely political, he kept a mistress named Columbula, in whose favours he suspected that Torbern Oxy, a young nobleman, had participated. The monarch, amidst the festivity of banquet, urged him to avow the fact. The young man possessed a mind incapable of falsehood; he acknowledged, that he had loved Columbula, and had solicited, but never obtained her favours. He was instantly arrested, imprisoned, and arraigned; but by the senate Torbern was acquitted, because the law had assigned no punishment for simple concupiscence. Dissatisfied with this decision, Christian assembled another tribunal, where he had him convicted and immediately executed. In 1517 Lutheranism began to excite attention; and in Denmark it was favoured by the king, who hoped it might lead to the confiscation of the church lands. He was, however, obliged to submit to the pope, and to sue, through the house of Austria, for a reconciliation with the holy see. The domestic government of Christian became more oppressive, chiefly through the extortions contrived by Sigebrette, the mother of Columbula, who had the complete confidence of the king. This base woman, who felt no compassion for the poor, nor regard for the rich: who paid no respect to the laws, and who acknowledged no other rule than the passions of the monarch, commanded with despotic authority, disposed of all places and preferments, imposed taxes at pleasure, and exacted them with such rigour, that the household furniture and cloathing of those who did not pay them were seized and publicly sold. In 1519 Christian renewed the war against Sweden, defeated and killed the administrator of that country, and through the treachery of the archbishop of Upsal, he was in the succeeding year recognized king of Sweden. He fixed upon the following November for his coronation, and then returned to Denmark, where, with two of his prelates, he concerted one of the most atrocious and sanguinary projects that stands recorded in history. Returning to Sweden, he convoked the assembly of the states, and was publicly crowned at Stockholm. After the ceremonial, the Swedish nobility were invited to a splendid entertainment, and received with the utmost affability. In the midst of the festivity, he caused the soldiers to arrest the administrator's widow, the senate, and the principal nobility; and after accusing them of various crimes for which there was no pretence, he instituted a mock

prosecution by Danish commissioners. The process was, however, too slow for his blood-thirsty disposition; he caused a summary condemnation to be pronounced, and they were led to instant execution. Fourscore or ninety noblemen and senators of the first rank, both of the laity and clergy, were in one day hanged on gibbets, as felons or traitors. Not contented with this exhibition of his savage cruelty, to conclude the scene, the soldiers were ordered to butcher the surrounding spectators, and the burghers of the city. He even caused the administrator's body to be dug from its grave, which, in its putrid state, he tore to pieces with his teeth and nails like a wild beast. His progress on his return to Denmark was marked with blood, and he left no memorials behind him but those of cruelty.

The massacre of Stockholm, in which six hundred persons were murdered in cold blood, and amidst the rejoicings of a coronation, exhibited such a striking instance of the malignant and implacable character of the king, that upon the revolt of Gustavus Vasa, the spirit of resistance diffused itself rapidly from Sweden to Denmark, where he had exasperated his subjects by repeated cruelties and oppressions. In 1523 he was publicly deposed by the states of Denmark, and the crown transferred to his uncle Frederic, duke of Holstein. The deposition of this infamous tyrant was in consequence only of the just abhorrence in which he was held by all ranks of people. For several years he submitted without a struggle to the ignominy of banishment, but in 1532 he invaded the Danish dominions, and was taken prisoner. The place of his confinement was a dungeon in the castle of Sunderburg, in the isle of Alsen. Having entered the gloomy cell, with a favourite dwarf, the sole companion of his misery, the door was instantly blocked up. In this state he remained till the year 1546, when he made a solemn renunciation for himself and heirs of all claims to the crowns of Denmark and Norway, and promised never to go out of the fortrefs of Callemburg without the king's consent, and never to speak to a stranger but in the governor's presence. On these conditions he was allowed the privilege of hunting and fishing, within certain limits, and received a handsome appointment, and other advantages were stipulated for him in a treaty concluded between the king of Denmark and the emperor at Spire. In this retreat did Christian reach his seventy-eighth year, enjoying a degree of comfort to which his many crimes gave no title whatever. He died in 1559, leaving two daughters, one electress Palatine, the other, duchess first of Milan, then of Lorraine. Of himself is left the character of the Nero of the North. It is said, that during his imprisonment, he was occasionally so much affected with reflections on his past conduct, that he would burst into tears, throw himself upon the ground, utter the most bitter lamentations, and continue for some time in a state approaching to insanity.

There were several other monarchs of Sweden of the name of Christian, concerning whom little need be said.

CHRISTIAN III. succeeded Frederic in 1534; he embraced the Lutheran religion, introduced it among his subjects, and at length established it as the religion of the state. This prince united in his character firmness and moderation: he was a lover of letters and learned men, and founded a valuable library at Copenhagen. He died in 1558, and was succeeded by Frederic II., who was followed in 1588 by

CHRISTIAN IV. This prince ascended the throne before he was twelve years of age. The regency paid every attention to his education, and masters were procured in all the various accomplishments of mind and body from different parts of Europe, to whose exertions the prince did the greatest credit. He was able to converse with all the amba-

fadors from foreign courts, and, at an early period, to dictate to his own ministers who were abroad. In 1611 he made war against Sweden, and was elected chief of the Protestant league against the emperor for the re-establishment of the prince palatine in 1625. The several wars in which he was engaged were detrimental to the finances of his country. He died in 1643, leaving a high character for vigour of mind and body. He was a slave to violent passions, which gained strength with increasing years. He was addicted to women, a circumstance that injured his reputation. It must, however, be admitted in his praise, that he was a firm and intrepid warrior, a prince of extensive genius, and possessing great generosity and magnanimity.

CHRISTIAN V. ascended the throne of Denmark in 1670. He found his kingdom involved in various foreign and domestic disputes, which led him to employ the first years of his reign in putting the revenue into a state of order, restoring discipline among his troops, and strengthening his fortifications. In 1675 he joined the league against Sweden, and in the war between the Danes and their allies with the Swedes, Christian displayed great activity and enterprise. His fleet, in conjunction with that of the Dutch under Van Tromp, completely defeated that of the Swedes. For two years the king was generally successful in all his undertakings, but in 1677 the tide of victory seemed to turn against him, and in 1679 he was glad to conclude a peace. From this period he aimed to settle all disputes with foreign powers by means of negotiation. He attempted to gain possession of Hamburg, and obtained at first a considerable tribute from that city, but his conduct there led the neighbouring princes to guarantee its protection. Christian died in 1699, at the age of fifty-four, when his subjects were enjoying the fruits of his mature wisdom and reputation. As a prince he had established a high character, and claimed respect throughout Europe. As a man, he spoke with fluency most foreign languages, was a promoter of the sciences, and had made great progress in those branches of the mathematics which relate to the military art. See DENMARK. Mod. Univers. Hist. Coxe's Travels. Du Fresnoy.

CHRISTIAN, ANDREW, born at Rippen, a small town in Denmark, in 1551. He received the rudiments of his education at Wittenburg, which he perfected at Balle, where he took his degree of doctor in medicine. Being called to Copenhagen, he taught medicine there for fifteen years, at the end of which time he was sent by his sovereign, Christian IV. to preside in the college of nobles lately established at Sorø. In this situation he died in 1606. The work by which he is known, is entitled "Enchiridion Medicum, de cognoscendis, curandisque externis et internis Humani Corporis Morbis." Balthæ, 1583, 8vo. It contains, in epitome, the method, then most approved, of treating diseases; as such it was several times re-printed. Haller. Bib. Eloy. Dict. Hist.

CHRISTIANA, in *Geography*, a post-town of America, in the state of Delaware and county of Newcastle, seated on a navigable creek of the same name, which falls into Delaware river from the south-west, a little below Wilmington. The town, consisting of about 50 houses and a Presbyterian church, stands on a declivity, commanding a pleasant prospect of the country towards the Delaware, and carries on a considerable trade with Philadelphia in flour. This is the greatest carrying-place between the navigable waters of the Delaware and Chesapeake, which are here 13 miles apart. It was built by the Swedes in 1640, and derived its name from that of their queen. It is 9 miles S.W. of Wilmington, and 37 S.W. of Philadelphia.

CHRISTIANA, *Great and Little*, two islets in the Grecian Archipelago, situated 2 leagues S.W. of Santorin.

CHRISTIANA, or CHRISTINA, *Santa*, one of the Marquesas islands, called by the natives *Olituboo*, or *Waiitabá*, lying under the same parallel with St. Pedro, or Onateaya, 3 or 4 leagues more to the west. Resolution bay, near the middle of the west coast of the island, lies in S. lat. $9^{\circ} 55' 30''$, and W. long. $139^{\circ} 8' 40''$; and the west end of Dommonia, or Olchewhoo, lies N. 15° W. Capt Cook gave this bay the name of his ship. By the Spaniards it was called Port Madre de Dios. It is not more than 2 miles across at its mouth by $\frac{2}{3}$ of a mile in depth; and the two points which form it lie, with respect to each other, in a north by east and south by west direction. The south point is terminated by a steep rock, and a hill of gentle declivity terminates the north point, which is formed by bold and excavated rocks, and is covered with "casuarinas," the large trees, whose hard and heavy wood is used for making clubs and other weapons. The lands at the bottom of the bay present a chain of high hills, slightly broken at their summits, and steep in several places. Mr. G. Forster says, that the bottom of the harbour is filled up with a very high ridge, level at top, and resembling the Table-mountain at the Cape of Good Hope. With the exception of two small coves, which both receive a rivulet, and where an accessible beach occurs, the remainder of the circumference of the bay exhibits, throughout, nothing but bold rocks, close to which the lead indicates a coral bottom, with a depth of water of 20 fathoms and upwards. One of these coves is called the "North Cove," the other the "South Cove." Two valleys, well covered with trees, terminate at the north cove, and a pretty rivulet, after having fertilised the lands, affords, at its mouth, a good watering-place for ships. The bottom of the bay is sandy, excellent for holding, over a depth of water, which shoals, towards the shore, from 36 to 13 or 14 fathoms. Fresh water of the best quality is procured in the North Cove, and wood is also easily obtained. It appears from different accounts, that the springs and rivers of the island are subject to considerable augmentations and diminutions; and alternate inundations or drought oblige the natives to remove their dwellings from one part of the island to another. The huts or cabins occupied by the inhabitants are built on a little platform of stones, raised somewhat above the level of the ground. The walls are formed with bamboo-canes, 7 or 8 feet high, placed close together; and the roof, the middle of which rises 9 or 10 feet above the foundation, is formed by other bamboos laid in a parallel direction, one above the other, and covered with leaves of a species of the fan-palm, or of the bread-fruit tree. The roofs are ridged, so as to carry off the water by a double slope; and in one of the fronts are a door and window. These cabins are, in general, 9 or 10 feet long, by 5 or 6 broad, and some are square. The floor is paved with large stones, joined together very neatly, and covered with mats. On the outside of these habitations are platforms, on which the natives sit down and amuse themselves; and these are paved, in order to guard against damp in the rainy season. The religious ceremonies of the inhabitants resemble those of the Society Islands. The French, during their stay here, discovered nothing that had the appearance of worship to a Supreme Being. Pleasure is the divinity of the country; they have no superstition, no ceremony, no priests or jugglers, says Marchand. In each district they have a morai, where the dead are buried beneath a pavement of large stones. They have a multitude of deities; and they only offer hogs in their sacrifices, but never men. They have no regular govern-

ment, established law, or punishments; but custom is the general rule. Their chief food is the hog, which they eat five or six times a day, without having any regular meals. Their pork, and also their fowls, they dress in ovens dug in the ground, and heated with stones: sometimes in wooden vessels, where the water is made to boil by means of hot stones, which they throw into it repeatedly. Not unfrequently they eat fish raw, and even pork. They know how to extract from the cocoa-nut an oil, which is probably employed in the dressing of their dishes; but which is principally used for anointing the whole body: the women consume great quantities of it in maintaining the gloss and beauty of their hair. When they are destitute of animal food, they use the roasted bread-fruit, fish, mahie, pudding made of it and other vegetables, a kind of walnuts, and a paste made of a root resembling the yam. Their common drink is pure water, and also cocoa-nut milk. They also prepare a strong liquor, either of pepper-root, which they use as a token of peace, or of the root of ginger; but they are temperate in the use of it, and no instance of intoxication occurs amongst them. To their friends they manifest their civility in a singular manner, by offering to them bits which they have previously chewed, in order to put them to no other trouble than that of swallowing what is thus prepared. The women are not allowed to eat hog, and are probably under other prohibitions, as at Otahete, and seem much more servile to the men, and more harshly treated. It has been said that the women are not allowed to mels with the men, as is the case in other islands; but Capt. Chanal says that he was several times at their meals, and that he saw the men, women, and children eat in common, and feed on the same dishes. They are employed in making cloth and matting, but not in cookery, except for themselves. The men seldom work, some old persons excepted, who make cords and nets. The rest bask indolently in the sun, telling their stories, and thus beguiling their time. The chief is said to have three wives, and has several children; but polygamy seems to be a privilege restricted to the chief. From what is known, however, of the disposition and manners of the natives of St. Christiana, we may hesitate in admitting that they are at all acquainted with conjugal union; at least it is certain, that the men know no more of jealousy than the women do of fidelity. Every woman seems to be the wife of all the men; and every man the husband of all the women. Every man makes to strangers the offer of every woman without any distinction. The Spaniards lead us to believe that the women are common without any distinction of age or kindred; but surgeon Roblet assures us, that the intimate union of the sexes between relations is rigorously prohibited; but he cannot assign the degree of relationship to which the prohibition extends. These people appear to be very fond of their children. Before the age of puberty, the operation of flitting the prepuce, is performed; and all the men are tattooed (see TATTOOING), even to the lips and eye-lids. They have few diseases, and, as the missionaries say, are yet happily free from the fatal malady which has made such ravages in the Society Islands. Capt. Cook, in his Second Voyage, describes them as surpassing all other nations in symmetry of shape and regular features. His observations have been confirmed by those of Capt. Chanal and surgeon Roblet, recorded by Marchand. Not a single deformed or ill-proportioned person was seen on the island; all were strong, tall, well-limbed, and remarkably active. The men are from 5 feet 10 inches high to 6 feet. Their eyes are not so full, nor their teeth so good as those of many other nations; but Capt. Chanal says, that they have fine large black eyes and handsome teeth; their hair is of various col-

ours, but none red; some have it long, but the general custom was to wear it short, except a bunch on each side of the crown, which is tied in a knot. In these respects there is a great variety; and also in their treatment of the beard. Those who preserve it at full length, which is commonly the case, arrange it in different ways; generally parting it into two tufts, and either shaving or plucking out the portion which belongs to the chin. When it is suffered to grow to its full length, it is parted into locks, of which they form braids, or to which they fasten the teeth of fishes, or of men, or small pieces of bone, shells, and beads of coloured glass, which they receive from the Europeans. Some eradicate the whole of the beard. On their heads they place various ornaments, framed of feathers, cloth, or cocoa-nut leaves, to which they suspend pearl oyster-shells, tortoise-shell, and pieces of mother of pearl, or various sizes and differently arranged; all which pieces being concentric, and of unequal diameter, form together a large cockade, striped circularly. This kind of diadem is sometimes surmounted by a plume. They also use various kinds of ornaments for the neck, which are composed of small pieces of light wood, with small red seeds attached to them with gum or size, or of red husks, or of polished bone, shells, white coral, or stone. Men and women have, in general, their ears pierced; but none habitually wear pendants. In the number of their most curious ornaments, they reckon all that they receive from strangers, and even all that they can steal from them; and every thing is hung to the neck, the ears, and the waist. They also adorn their heads, arms, waist, knees, and even insteps, as well as clubs and other weapons, with tresses or locks of hair, which may be that of the enemies whom they have slain in battle, or rather, when we consider their mild and pleasurable disposition, that of their friends or domestic relatives. To their waist, and on their shoulders, they suspend two, and sometimes three sculls; but they are not so highly appreciated as the hair. They have, among their ornaments, large fans formed of the fibres of grass and whitened with lime, which they use for cooling themselves, and parasols made of large palm-leaves adorned with a variety of feathers. Their countenances are pleasing and open, and display much vivacity. Their complexion is tawny, and rendered almost black by the punctures of the whole body. Capt. Chanal thinks there are no such differences among individuals as warrant an inference, that there exist among them species essentially different. But the physical differences in individuals, noticed by surgeon Roblet, seemed to him to indicate a difference in the species. It is also known, that in order to designate the same object, they have several names which seem not to belong to the same language. Possibly the Mendocans, from their mild and hospitable disposition, have been induced to receive strangers among them, thrown by storms or the chances of war on their coasts, and to incorporate them in the primitive nation, with which they are at this day confounded. They were entirely naked, except a small piece of cloth round their waist and loins. Their punctures were disposed with the utmost regularity, so that the marks on each leg, arm, and cheek, were in general similar. The women, who are extolled for their beauty, are rather of tall stature, though well-proportioned, and their general colour inclining to brown. Some few are punctured or tattooed. They wear a long narrow piece of cloth wrapped two or three times round their waist, and having the ends tucked up between their thighs; above this is a broad piece of cloth, nearly as large as a sheet, tied at the upper corners; they lay the knot over one shoulder, and the garment, hanging loose, reaches half way down the leg. Their garments, however, are of little use to the females;

females; as they are a sort of amphibious animals, who spend a great part of the day in water; and appear there as much at their ease as if they were reclined on a mossy carpet, or sporting on a feather-bed. Among these females a very great degree of libertinism prevails; and they either sell or gratuitously give their favours to any indiscriminately who seek them. Surgeon Roblet describes the licentiousness of their amours, though in guard-language, in a manner that must disgust every chaste reader, and that shews their extreme degeneracy and indecorum. Their canoes are made of wood, and the bark of a soft tree, which grows near the sea; they are from 16 to 20 feet long, and about 16 inches broad. The head and stern are formed out of two solid pieces of wood; the former is curved, and the latter ends in a point, which projects horizontally, and is decorated with a rude carved figure, having a faint resemblance to a human face. Some of the canoes have a latten sail, but they are generally rowed with paddles.

Their naval architecture, however, is still in its infancy, if we compare it with that of the Otaheites. Sometimes two of their ill-constructed and leaking canoes are joined together, but they most commonly content themselves with adapting to them an outrigger, composed of two bamboos projecting laterally, and fastened at their outer extremities by a branch of a light wood, which forms the gunwale of the frame. These canoes carry from three to seven men, and from ten to fifteen when two are lashed together. If a canoe oversets, an accident not uncommon, the men jump overboard, right her, bale her out, and get into her again very quietly. Capt. Cusnel says, that the construction of their houses and canoes evinces no inconsiderable share of industry and patience. In the fabrication of their weapons, they display great care and ingenuity. These consist of lances from nine to eleven feet long, a sort of sabre, pikes or javelins, and clubs, having at one extremity a large knob, and made of casuarina wood, ornamented with carving. In the rainy season they maintain intercourse with one another by means of flits, composed of two pieces, so adapted to each other, as to admit of being accommodated to shallow or deep water.

Their tools, rude as they are, their fishing implements, differing very little from ours, and the various utensils, articles of furniture, garments and dresses, all announce intelligence and industry in the persons by whom they were invented, and also in those by whom they are fabricated. Their hatchet, which is a black and sharp stone, shaped like an elongated wedge, or a mortise chisel, and fastened to a piece of crooked wood by small fennit made of cocoa-nut bafs; their pieces of shell, formed in sharp-edged instruments and saws, and their rough skin of some fish, serve to fashion and polish their different works of carpentry and of sculpture. Their fishing implements, consisting of the scoop-net and the sweep-net, are made, some of them with cocoa-nut bafs, others with the cortical fibres of a species of nettle. The same materials are employed for making ropes, fennit, and mats. Their household utensils consist of calabashes of different capacities, which they contrive to stop so hermetically, that they may be employed for the conveyance of liquids, and of various wooden vessels used for their food; and on these they amuse themselves in carving and engraving figures of men, fishes, and birds. The substance of their cloths is the bark of the paper mulberry tree; and some are also made of the cortical fibres of the bread-fruit tree; and these not only wear tolerably well, but are sometimes dyed yellow. After all, the principal occupation of the natives of St. Christiana is to sing, dance, and amuse themselves. The music of Otaheite and of this island are much the same, and the inhabitants of both

make use of the same kind of drums. They amuse themselves in running on their flits, and also in swimming, to which exercise they devote whole days, without any other nourishment besides the flesh and the milk of cocoa-nuts. Thus devoted to amusement and pleasure, the Mendocans are an amiable, hospitable, and generous people. Although, from the levity and indolence that are natural to them, they are addicted to theft, yet they revere on the first demand, and even with laughter, the articles which they have purloined. Nevertheless robbery is not authorized, nor even tolerated at Santa Christiana: and whilst they steal from strangers, they observe the most scrupulous fidelity among one another. It is not easy to estimate the population of this island; but Marchand, allowing 1000 inhabitants for every league of coast, estimates the whole number at 7000.

On making a general comparison between the island of St. Christiana and that of Otaheite, it is evident that the former does not exhibit the opulence, the luxury, the profusion of food, the studied variety and vast quantity of cloth, which are remarked in the principal island of the great equinoxial ocean. The Tahiteians have many superfluities; they have made great advances towards civilization, and great progress, not only in the useful, but even in the agreeable arts. The Mendocans possess a respectable competence, and in every respect a desirable degree of comfort, and their disposition inclines them not to wish for more than they enjoy; divided between pleasure and idleness, they appear sheltered from the political storms which must frequently disturb the government, partly monarchical, partly feudal, which is established among the Tahiteians. The latter have lost in liberty what they have acquired in civilization; one part lives by the labours of the other, and this is the natural and ordinary routine of great societies; they lead a sensual life; and hereditary diseases already begin to punish them for their excesses. The Mendocans have preserved their primitive liberty in its full perfection; and every one lives through himself and for himself: the robust health which they enjoy is, without doubt, far preferable to that voluptuousness to which they are yet strangers. An European, I conceive, (says Marchand) would for himself prefer Tahiteite to Wahihetö; but a Mendocan would be much to blame, if he envied the lot of a Tahiteian: by deviating more from nature, he could have little to gain, and, perhaps, much to lose.

The only tame fowls are cocks and hens, and their quadrupeds only hogs; but the woods are inhabited by small birds, whose plumage is exceedingly beautiful, and their notes sweetly varied.

The Oceanic birds, which frequent the bay, are man-of-war birds, tropic birds, boobies, and different species of terns and swallows.

Captain Cook, Mr. Reinhold Forster, and Messrs. Chanal and Roblet, have given a vocabulary of the words commonly used in this island; from which it appears, that the Mendocans employ no difficult articulation, and that their language, notwithstanding the frequent aspirations, and the vehemence with which they are accustomed to express themselves, possesses sweetness and a sort of harmony.

The language of this island has a great affinity to that of the Society islands, or it is rather, as Marchand suggests, the same tongue; and if this be true, it proves, that, although the two archipelagos are separated by an interval of sea of 200 leagues, and although it may be presumed, that their canoes do not maintain between them an habitual communication, the people who inhabit them must have had a common origin. A native of the Society islands, who was embarked in the Resolution, conversed fluently with the natives

tives of La Made de Dios; but captain Cook says, that the English, who must in their visits to Otahete have acquired a knowledge of most of the words spoken there, could never succeed in making themselves understood at Santa Christiana. As far as it has been examined, the language of this island employs 5 vowels, *a, e, i, o, u*, but the consonants, in 95 words that have been collected by captain Chanal, are only 8 in number, and perform the office of 12 of ours; viz. *b* or *p*, *d*, *c* hard, *g* hard, *k* and *q*, *f*, *m*, *n*, *t*, *v*. The natives of Santa Christiana cannot articulate our *r*, and they supply the defect by a sort of aspiration. Our consonants *e*, *f*, *x*, make no part of the articulations of the language of this island. Missionary Voyage, 1797, p. 144, &c. Marchand's Voyage, vol. i. and ii.

In Marchand's Voyage, (vol. i.) we have an account very much in detail of this island; together with a statement of the circumstances in which the Spaniards, English, and French, differ from one another. This island, it is said, presents itself under an agreeable aspect; being very lofty, as well as the other islands of the group. A narrow chain of high hills extends through its whole length, and from the shore run other chains of equal elevation, which branch out and join the principal chain; these hills are separated by confined and deep vallies, into which run some rivulets or cascades, that water every part of the island; fruit trees of various species here occasion coolness, and yield abundance to its inhabitants. According to the statement of captain Cook, the island is in length, from N. to S. 3 leagues, of 20 to a degree, and in circuit 7 leagues, whereas Quiros extends it to 9 Spanish leagues of $17\frac{1}{2}$ to a degree; but as neither of them examined more than a portion of the west coast of the island, its absolute extent and circumference remain still undetermined. The shores of this island present hollow rocks, the black, spongy, hard, and brittle stone of which indicates the effect and the produce of a great volcanic eruption; so that in regard to its origin and the nature of its minerals it is similar to the higher of the Society islands, which appear to have been the seat of ancient volcanoes. The soil of the vallies is a very strong mould, sometimes black, sometimes red, and very fit for vegetation, and it produces various species of lichens, grasses, purslains, and shrubs. These vallies are covered with trees; such as the cocoa-palm, the bread-fruit tree, the plantain tree, the casuarina, the paper-mulberry tree, (*morus papyrifera*,) the fibres of the bark of which are employed by the natives in the fabrication of their cloths, &c. &c. Besides the fruits of the cocoa-nut, plantain, and bread-fruit tree, the island furnishes a sort of sweet potatoe, a species of apple, ginger, cucumbers like those of the West-India islands, water-cress, and purslain, the yam, the chestnut, the walnut, &c. Santa Christiana possesses the sugar-cane; but the inhabitants are ignorant of its value. European animals, though left there by captain Cook, either could not accommodate themselves to this climate, or were neglected, and perhaps exterminated, by the inhabitants, so that later voyagers could not discover any of them; neither could they find any of the European utensils or commodities, such as looking-glasses, knives, hatchets, nails, glass-beads, &c. left there by captain Cook, in 1774. The only quadruped found in Santa Christiana was the hog, small in size, but of delicate and well-tasted flesh; if we except the rat, which, to the great detriment of the inhabitants, has exceedingly multiplied in the island. Poultry are scarce; and apparently reared merely for the sake of plucking the cocks, whose large tail feathers, affixed for forming plumes, are employed in shading their head-dresses. The sea furnishes excellent rock-fish;

the bonito is very common. The bay is often frequented by porpoises and shark. The climate is salubrious, and the natives appear healthy and robust; but the temperature is subject to great variations from one season to the other. In 1774 the variation observed by Mr. Wales was $4^{\circ} 22' 15''$ E. and in 1791, it was observed by captain Marchand to be $5^{\circ} 14' 18''$. From comparing the observations of Mr. Wales and captain Marchand, it may be concluded, that in the space of 17 years, the variation of the compass has not undergone any material change in this latitude.

CHRISTIANIA, a city and sea-port of Norway, in the government of Aggerhuus; situated at the extremity of an extensive and fertile valley, forming a semicircular bend along the shore of a beautiful bay, which, being enclosed by hills, uplands, and forests, has the appearance of a large lake; and about 30 English miles from the open sea. The navigation of the bay is somewhat difficult, but it is sufficiently deep for the largest vessels, having six or seven fathoms of water close to the quay. It is esteemed the capital of the kingdom; because it contains the supreme court of justice. It lies in N. lat. $59^{\circ} 56' 37''$, and E. long. $10^{\circ} 56'$, on the northern extremity of the bay of Biorning, an inlet of the sea, forming the northern extremity of the gulf of Christiania, whose rocky shores are overpread with thick forests. The town is divided into three parts, viz. the city and the three suburbs of Waterlandt, Peterwigen, and Fierdingen, the fortrefs of Aggerhuus, and the old town of Opsloe, or Apsloe. The city contains 413 houses, the suburbs 682, Opsloe 400, including the episcopal palace, (the bishop of Christiania being metropolitan of Norway, and the fee yielding an annual revenue of 400l.); and the number of inhabitants amounts to about 6000. The city formerly occupied the site of Opsloe, and was rebuilt in its present situation by Christian IV. in 1624, after a plan designed by himself: the streets are carried in straight lines, and at right angles to each other, and are uniformly 40 feet broad, and very neat and clean. It has a Latin school, founded by Christian IV. in 1625, and a public library. The castle of Aggerhuus is built on the west side of the bay, at a small distance from the city; and was erected in 1310 by the Swedes, and strengthened in 1633 by Christian IV. and by succeeding kings of Denmark at subsequent periods. See AGGERHUUS.

Christiania has an excellent harbour, and carries on a considerable trade. The principal exports are tar, soap, iron, copper, planks, and deals; allum manufactured at Mr. Cooper's works for about 3000l.; iron from the four works of Borum, Edswold, Narkedahl, and Ondahlen, 14,000l.; copper from Fildahl, 10,000l.; planks and deals, 90,000l., principally to England. The planks and deals are said to be of superior climatioa to those sent from America, Russia, and the different parts of the Baltic; because the trees grow on the rocks, and are therefore firmer, more compact, and less liable to rot than the others, which chiefly shoot from a sandy or loamy soil. The planks are either red or white fir or pine. The red wood is produced from the Scotch fir, and the white wood, which is in such high estimation, from the spruce fir. Each tree yields three pieces of timber, eleven or twelve feet in length, and is usually sawed into three planks; a tree generally requires 70 or 80 years' growth before it arrives at the greatest perfection. The greatest part of the timber is hewn in the inland country, and floated down the rivers and cataracts. Saw-mills are used for cutting the planks; but they must be privileged, and they are restricted to cut only a certain quantity. The proprietors are bound to declare on oath, that they have not exceeded

exceed that quantity: and if they do, the privilege is taken away, and the saw-mill destroyed. At Chiriliana there are 136 privileged saw-mills, of which 100 belong to the family of Anker. The quantity of planks permitted to be cut amounts to 20,000,000 standard deals, 12 feet long, and $1\frac{1}{4}$ inches thick.

CHRISTIANIA, a government of Norway, otherwise called **AGGERHUUS**; which see.

CHRISTIANOAO, Str. a Portuguese town on the coast of Brazil; off which is a small bay without the northernmost reef of the river Serugippa, which is six leagues from the river Francisco, where is good anchorage.

CHRISTIANOPLE, a fortified sea-port town of South Gotland in Sweden. N. lat. about $56^{\circ} 26'$. E. long. $15^{\circ} 41'$. It is four leagues from the S. end of the island of Oeland to the point of Chritianople, which is the breadth of the S. entrance of Calmar sound.

CHRISTIANOPOLIS, in *Ancient Geography*, an episcopal town of the Peloponnesus, in Arcadia.

CHRISTIANS of *St. John*, in *Ecclesiastical History*, a corrupt sect of Christians, very numerous in Baffora, and the neighbouring towns.

They formerly inhabited along the river Jordan, where St. John baptized: and it was thence they had their name. But after the Mahometans became masters of Palestine, they retired into Mesopotomia and Chaldea.

They hold an anniversary feast of five days; during which, they all go to their bishops, who baptize them with the baptism of St. John; but their baptism is always performed in rivers, and that only on Sundays.

They have no notion of the third person of the Trinity; nor have they any canonical books, but several which are full of charms, &c. Their bishoprics descend by inheritance, as our estates do; though they have the ceremony of an election. There is no satisfactory account of the origin or principles of this sect. See **SABÆANS**.

CHRISTIANS of *St. Thomas*, or *San Thomé*, a sect of ancient Christians found in the East Indies, when the Europeans touched at the port of Calicut; who pretend to be descended from those of St. Thomas converted in the East Indies; whence the name.

The natives call them, by way of contempt, *Nazarenes*; their more honourable appellation is *Mappuleymar*. See **THOMÆANS**.

Some learned men in Europe say, it was not St. Thomas the apostle that converted that country, but another St. Thomas; others say, it was a Nestorian merchant, called 'Thomas. It is certain they are Nestorians, and have been so a long time; in so much that *Christians* of *St. Thomas* now passes for the name of a sect. They have a patriarch, who resides at Mosul. The pope has made several attempts to reduce them under his obedience, but to no purpose. The number of these Christians must have been very considerable in the beginning of the 16th century, when the Portuguese became first acquainted with them, since they possessed about 110 churches, in the countries now subject to the Travancore and Cochin rajahs; and, at the present time, after the manifold persecutions, oppressions, and successive revolutions, that have almost depopulated the whole coast, they are computed to amount to no less than 150,000 persons. They are indiscriminately called St. Thomé Christians, Nestorians, Syrians, and sometimes the Malabar Christians of the mountains, by the Portuguese writers of that time, and by the subsequent missionaries from Rome. The most common name given to them by the Hindoos of the country is that of "Nazaranee Mapila," and more frequently "Suriens," or "Suriæne Mapila." The appellation of "St. Thomé

Christians," which the Portuguese were fond of bestowing upon them, probably originated from the chief who settled the first colony of Syrians on the coast, and who, according to their tradition, was their first bishop and founder of their religion in these countries, whose name was "Mar Thomé." His arrival may, perhaps, be ascertained to have occurred during the violent persecution of the sect of Nestorius, under Theodosius II., or some time after. The Portuguese, however, pretend that St. Thomas the apostle arrived in India, and, having converted a great number of idolaters on the coast of Malabar, and afterwards on the other side of India, as far as Mallapoor, now St. Thomé, suffered martyrdom there. The Malabar Christians, as they say, remained a long time without ecclesiastical chiefs, and without intercourse with the rest of the Christian world, till they procured bishops from Mosul in Syria, who introduced into this country the heresy of Nestorius. This story, though very improbable, and unsupported by any historical proof, has been repeatedly asserted, even by Protestant writers. Common tradition, which has been admitted by the Portuguese writers of the 16th century, probably on the foundation of written records in the Syriac language, which then excited, and were afterwards all destroyed by the famous archbishop De Menezes at the synod of Odiampar, mentions Mar Thomé as the first who introduced the Christian religion into Malabar. The Nestorians consider him as their first bishop and founder, from whom they derive their name of St. Thomé Christians. His arrival may be placed towards the middle of the 5th century; as notice is taken by Cosmas Indicopleustes of Christians in the pepper country or Malé, who received their bishops from Persia, where the Nestorian patriarch of that period resided, whose first seat was at Seleucia in Persia, afterwards removed to Babylon, and at last to Mosul.

In the Malabar histories the first mention of a Syrian colony of Christians is made in the reign of Coccoorangoon Perumal, who probably lived in the 6th century; and again we have an account of two Syrian or Chaldean bishops, named Mar Sapor and Mar Peroses, who arrived at Coilan, about 100 years after its foundation, where they were extremely well received by the raja, and permitted to build a church, which subsisted when Cabral first visited Coilan. The grants and privileges, which they received from the raja, were engraved upon copper-plates, which many centuries after were shewn to archbishop de Menezes, probably the same that are now in possession of the Jews at Cochin. Other circumstances, such as the name of Syrians retained by the St. Thomé Christians, their peculiar features and complexion, the style of their buildings, especially of their churches, and above all, the general use of the Syrian or rather Chaldean language preserved in all their religious functions, concur in confirming the opinion, that the St. Thomé Christians were originally a colony of Nestorians. They formerly possessed, according to the Portuguese account, upwards of 100 villages, situated mostly in the mountainous part of the southern division of Malabar. They were distinguished from the other inhabitants in a variety of respects; and as to their religious tenets, they generally followed the doctrine of Nestorius. Upon the arrival of the Portuguese, attempts were made to proselyte them to the church of Rome; and, when persuasion failed, recourse was had to open force. At length Menezes, archbishop of Goa, made a personal visit to the Malabar Christians, and having appointed a synod at Odiampar, in the vicinity of Cochin, in 1599, he assembled the Syrian priests of "Cassanas" and 4 elders from each village, and after some show of disputation and explanation of the controverted tenets of the church of Rome, he dic-

tated the law to them; and overpowering them by his authority, effected in appearance an union of the Nestorians of Malabar with the Romish church; and they were for some time governed by Roz and his successors, under the title of archbishop of Cranganore. But this union was neither general, sincere, nor permanent; for soon after some Maronites, or Nestorian priests, found their way to the mountains of Travancore, where they revived the old doctrines and rites, and ever since kept up their communication with the Jacobites, Maronites, and Nestorians of Syria. At present there are 32 churches of this description remaining, which are called Schismatic Chriilians by the Portuguese and Roman clergy. They have a bishop or "Mar Thomé," who resides at Narnate, about 10 miles inland from Porca, and was consecrated by some Jacobite bishops sent from Antiochia, for that purpose, in 1752. He adheres more to the doctrine of Eutyches than of Nestorius. About 84 of the old St. Thomé churches remain united to the Roman catholic religion, and are governed by the archbishop of Cranganore, or, as he styles himself, the archbishop of the Malabar Christians of the mountains. Since the death of the last archbishop, the government of Goa, which had formerly the nomination, has thought proper to appoint only a vicar-general, who resides at present at Packepallipote. The Chaldean language is still used in their churches, and they are furnished with the necessary books by the "Congregatio de propaganda fide."

The St. Thomé or Syrian Christians, of both descriptions, never claimed the particular protection of either the Portuguese or Dutch, as the new Christians do, but considered themselves as subjects of the different rajahs in whose districts they lived, and for a considerable time remained unmolested. But when the rajahs of Travancore and Cochin had succeeded in subjecting the petty rajahs and chiefs, that were situated within the lines of Travancore, they established an oppressive despotism. The new or Portuguese Christians consist of that race of new converts, gained by the Portuguese mostly from the lowest castes along the sea-shore, where they built many churches; which, by way of distinction from the Syrian churches, are generally called the Latin churches. They formerly enjoyed the protection of the Portuguese and Dutch governments, without considering themselves as subjects of the rajahs in whose territories they reside; and acknowledged only their jurisdiction in civil and criminal matters, and paid no taxes to their native princes. This exemption they maintained till the year 1785, when the governor of Cochin entered, for the preservation of their privileges, into a written agreement with the rajah of Cochin, which stipulated that they should pay a yearly sum to the rajah, and in delay or failure of payment, the Dutch, and the rajah, were to enforce it; the rajah, however, did not adhere to his stipulations; but compelled, by oppressive treatment, a great part of them to abandon his dominions. The number of these Christians who consider themselves as under the protection of the fort of Cochin, is estimated at about 36,000. In ecclesiastical matters they were formerly subject to the Portuguese bishop of Cochin; but being expelled by the Dutch, when they got possession of the fort, he fixed his residence at Coilan, retaining his former appellation of bishop of Cochin, and also his ecclesiastical jurisdiction over such churches as were not under the immediate controul of the Dutch. His successors continue to preside over the same diocese, which extends as far as the Cavery river, on the other coast, including the isle of Ceylon; comprehending more than 100 churches of the new or Latin Christians. When the Dutch had expelled the Portuguese bishops from Cochin, they applied to the

see of Rome for a new bishop subject to their controul; and the pope sent out a Carmelite prior, with episcopal powers, under the name of vicar-general, to whom the Seces-General granted a diploma to that purpose in 1693. This ecclesiastical dignitary has an annual stipend of about 400 rupees, paid him by the "Congregatio de propaganda fide;" and he resides at Varapoly, in a convent of his own order, supported by the "Propaganda." His diocese and power gradually declined; and at present only 14 churches are subject to his episcopal jurisdiction. The St. Thomé Christians formerly possessed a great number of churches or temples, sumptuously built, in the inland parts of the Travancore and Cochin dominions; some of these have cost upwards of a lack of rupees, and few less than half that sum. Now they are reduced to a wretched condition, being scarcely able to erect a shed for their religious meetings over the splendid ruins of their famous churches. As their opulence has decreased, their population has also diminished. Formerly the converts to Christianity were allowed to retain their patrimonial estates; and under the ancient mild Hindoo government, and even in modern times, till Hyder Ally made his first irruption, imposed on landed property were unknown in Malabar. Another source of the opulence of the St. Thomé Christians was trade; for they were, in fact, the only, or at least the principal merchants in the country, till the Arabs settled on the coast. See Asiatic Researches, vol. vii.

CHRISTIANSAND, in *Geography*, one of the governments into which Southern Norway, or Norway Proper, is divided. It occupies the south western part of the kingdom; and contains 113,024 inhabitants. It is a bishopric yielding an annual revenue of 600*l*.

CHRISTIANSAND, a sea-port town of Norway in the government or diocese of Christiansand, opposite to the island of Flekker or Fleckeren. N. lat. 58° 10'. E. long. 8° 14'.

CHRISTIANSBURG, a fortress of Africa on the gold coast, belonging to Denmark. It was taken by the negroes in 1693, who pillaged it, and kept it for some time.

CHRISTIANSBURG, the chief town of Montgomery county, in the state of Virginia, North America. It contains few houses; has a court-house and gaol, situated near a branch of Little river, a water of the Kenhaway. N. lat. 37° 5'.

CHRISTIANSHAFEN, a part of the city of Copenhagen, built on the isle of Amak. See AMACK.

CHRISTIANSOE, a fortress of Denmark, built on a rock, on the east coast of the island of Bornholm.

CHRISTIANSTADT, a strong fortified town of Sweden, in the province of Skone, or Scania, built in 1614, by Christian IV. king of Denmark, when this province belonged to the Danes, and finally ceded to the Swedes by the peace of Roschild in 1658. The town is small, but neatly built, and is esteemed the strongest fortress in Sweden. The houses are all of brick, and mostly flucco-d white. It stands on a marshy plain close to the river Helge-a, which flows into the Baltic at Alus, at the distance of 20 miles, and is navigable only for small craft of 7 tons burden. English vessels annually resort to this port for alum, pitch and tar. The inhabitants have manufactories of silken cloth and fluffs, and carry on a small degree of commerce: 57 miles W. of Carlserona. N. lat. 55° 58'. E. long. 14° 6'.

CHRISTIANSTADT, a town of Silesia, on the west side of the Bober, 32 miles W. of Glogau, and 54 N.E. of Dresden.

CHRISTIANSTED, the principal town in the island of Santa Cruz, seated on the north side of the island, with a fine

fine harbour. It is the residence of the Danish governor, and is defended by a *lobe fortres*.

CHRISTIANSUND, a small island of the Northern Ocean on the Western coast of the province of Drontheim in Norway. N. lat. $63^{\circ} 10'$. E. long. $7^{\circ} 58'$.

CHRISTIGNETH, a river of North Wales, which runs into the Dee, in the county of Denbigh.

CHRISTINA, in *Biography*, queen of Sweden, the only child of the great Gustavus Adolphus, who succeeded to the throne of her father in 1632, when she was only five years of age. During her minority Sweden enjoyed internal repose, but involved in a long state of warfare with the German empire, in consequence of the invasion of Gustavus, as supporter of the protestant league. The war was conducted by able men whom the king left behind him. The abilities of Oxenstierna, who pursued the plans laid down by Gustavus, preferred for Christina that preponderance which the cabinet of Sweden possessed in the affairs of Germany. The young queen, at an early age, discovered but little taste for the society and occupations of her sex. Her education was conducted upon a very liberal plan. She possessed a strong understanding, and a great turn for abstract studies. At an early age she was capable of reading the Greek historians. Thucydides, Polybius and Tacitus were her favourite authors, and as she advanced in life, the love of letters became her ruling passion, which influenced the fortune and conduct of her whole life. At the age of eighteen she assumed the reins of government, and proved herself fully able to conduct the affairs of a powerful kingdom. The general peace of Westphalia had in 1648 restored tranquillity to Sweden on terms sufficiently honourable and advantageous to a nation which had attained to a military reputation in no wise inferior to that of any European state. Several princes of Europe aspired to the hand of Christina, but she rejected their proposals, pleading as the motives of her conduct, political interests, contrariety of religion, and diversity of manners. Her people, anxious for her marriage, recommended to her Charles Gustavus, count palatine, her cousin; she rejected their solicitations, having an insuperable aversion to the marriage state, of which she made no secret, declaring, in reply to one of the remonstrances made to her on the occasion, "that there were certain duties required in the nuptial ceremony with which she could not persuade herself to comply." These words were variously interpreted, but the probably regarded the conjugal connection, as a complete humiliation, as it regards the female sex. To prevent a renewal of applications on this subject, she solemnly appointed Gustavus her successor, but without the smallest participation in the rights of the crown during her own life. In the year 1650 she was crowned with great splendour. From this time she entertained a philosophical contempt for pomp and parade, and a kind of disgust for the affairs of state. She seemed to be only interested in that part of the sovereign power which gave her the opportunity of acting as the patron of the learned throughout Europe, and the encourger of the fine arts. She invited to her court men of the first reputation in various studies; among these were Grotius, Descartes, Bochart, Hoet, Vossius, and others who were highly celebrated. Her choice with regard to these seems to have been directed more by general fame, than by her own judgment, or taste for their several excellencies, and in general estimation she has derived no great credit either as a learned lady, or as a discriminating patroness of literature. She was much under the influence of a Bourdelot, a physician who gained his ascendancy by outrageous flattery: and her inattention to the high duties of her station disgusted her subjects. She was a collector of books, manu-

scripts, medals, paintings, antiques and other curiosities, and by her profusion, and indifferer grants, she soon brought the finances of her country into a state of disorder.

In 1652 she resolved to resign the reins of government to her successor, and communicated her intentions to the states, who dissuaded her from the purpose; Charles Gustavus, who had manifested no desire to reign in her stead, and who since the settlement of the crown had avoided meddling with state affairs, joined the states in their remonstrances. For a time she renounced the project, but in 1654, when she was only in the twenty-eighth year, Christina abdicated the crown, in order that she might live a life of freedom, and indulge unrestrained in the pursuits to which she was irrevocably addicted. With her crown, she renounced the Lutheran, and embraced the Roman catholic religion: she had however exhibited too great an indifference to the duties and modes of any religion to be suspected of having taken this step through conscientious motives. It was probably preparatory only to her residence in those countries of Europe which for other reasons were most agreeable to her. In quitting the scene of her regal power, she appeared, or affected to appear, as one who had escaped imprisonment; at Inspruck she made her abjuration, and proceeded from thence to Rome, where she intended to fix her abode. Some disgust which she received at Rome, induced her in the space of two years to determine to visit France. Here she was treated with respect by Louis XIV. but the ladies were shocked with her masculine appearance and demeanor, and the unguarded freedom of her conversation. The learned of Paris paid her every attention, but the person whom she most distinguished was Menage, whom she appointed master of the ceremonies, an office rarely conferred upon a man of letters. Apartments were assigned to her at Fontainebleau, where she committed an action which has indelibly stained her memory, and for which in other countries she would have paid the forfeit of her own life. This was the murder of an Italian, Monaldeschi, her master of the horse, who had betrayed some secret entrusted to him. He was summoned into a gallery in the palace, letters were then shewn to him, at the sight of which he turned pale, and intreated for mercy, but he was instantly slashed by two of her own domestics in an apartment adjoining that in which she herself was. The French court was justly offended at this atrocious deed, yet it met with vindicators, among whom was Leibnitz, whose name was disgraced by the cause which he attempted to justify. Christina was sensible that she was now regarded with horror in France, and would gladly have visited England, but she received no encouragement for that purpose from Cromwell; she therefore, in 1658, returned to Rome, and resumed her amusements in the arts and sciences. Her deranged finances were put in order by cardinal Azzolini, but she still manifested much levity and inconstancy in her pass and character. In 1660, on the death of Charles Gustavus she took a journey to Sweden for the purpose of recovering her crown and dignity. She found, however, her ancient subjects much indisposed against her and her new religion. They refused to contribute her revenues, caused her chapel to be pulled down, banished all her Italian chaplains, and, in short, rejected her claims. She submitted to a second renunciation of the throne, after which she returned to Rome, and pretended to interest herself warmly, first in behalf of the island of Candia, then besieged by the Turks, and afterwards to procure supplies of men and money for the Venetians. Some differences with the pope, made her resolve, in 1662, once more to return to Sweden; but the conditions annexed by the senate to her residence there, were now so mortifying, that she proceeded no farther than Ham-

ough. She returned to Rome, and cultivated a correspondence with the learned men there and in other parts of Europe, which was her chief solace under the neglect of persons in power. At the peace of Nimègue, she sent a plenipotentiary to take care of her interests, who with difficulty procured remittances of her arrears. In 1679 she took a decided interest in the doctrines of Molinos, the founder of the sect of Quietists, who was persecuted by the French government: and on the revocation of the edict of Nantz, in 1685, she wrote to the French ambassador in Sweden, animadverting with much freedom and good sense on the project of making converts by persecution, and the want of real policy in banishing useful artisans on account of differences in religion. Bayle published this letter, with his own remarks, which offended Christina, but the dispute was amicably settled. In a letter written in 1687 to mademoiselle Scudery, she expresses herself with great tranquillity on the prospect of approaching death, an event, however, which did not take place till 1689. The last scene she passed with philosophical composure; she died at the age of sixty-three, leaving behind her many letters; a "Collection of Miscellaneous Thoughts or Maxims;" and "Reflections on the Life and Actions of Alexander the Great." In Christina we behold qualities worthy of commendation and even high applause; but it cannot be concealed that she possessed faults meriting a strong and decided reprobation. In her we see a princess discrediting her great endowments by a vain parade and affectation of singularity, and apostatizing to a religion which she sometimes affected to ridicule and despise. While upon the throne, she was desirous of a private station, and after she had attained her wishes by the voluntary sacrifice of her authority, incessantly repining, and anxious to recover, upon the most humiliating conditions, that crown which she had so capriciously resigned. Coxe's Travels. Universal History.

CHRISTINA, *Santa*. See CHRISTIANIA, *St*.

CHRISTINESTADT, in *Geography*, a sea-port town of Sweden, in the province of East Bothnia, built in 1649.

CHRISTIPOLIS, in *Ancient Geography*, an episcopal town of Cappadocia.

CHRISTISEE, in *Geography*, a town of Poland, in the palatinate of Braclaw; 44 miles S.S.W. of Braclaw.

CHRISTMAS, the feast of the nativity of Jesus Christ.

It appears from St. Chrysostom, that in the primitive times, Christmas and Epiphany were celebrated at one and the same feast; that father observes, that it was but of a little while that Christmas had been celebrated at Antioch on the 25th of December, as a distinct feast; and that the use thereof came from the West. The Armenians made but one feast of them, as low as the 12th century.

It is commonly maintained, that pope Telephorus was the first who ordered the feast of the Nativity to be held on the 25th of December. John, archbishop of Nice, in an epistle upon this subject, relates that at the instance of St. Cyril of Jerusalem, pope Julius procured a strict inquiry to be made into the day of our Saviour's nativity, which being found to be on the 25th of December, they began thenceforth to celebrate the feast on that day. However, the precise day, or even the month, in which our Saviour was born, is extremely uncertain. Some, as Clemens Alexandrinus informs us, affixed it to the 25th of the month Pachon, corresponding to the 10th of May. But there are some circumstances which should rather lead us to conclude, that he was born in autumn; as this was, in every respect, the most proper season of the year for a general assentment, which took place at the birth of Christ, and which required personal at-

tendance; and as there were shepherds watching their flocks by night at the time when Christ was born; and therefore it is probable, that the era of the Nativity was either in September or October, A. U. 748 or 749. See EPOCHA.

CHRISTMAS HARBOUR, in *Geography*, a safe and commodious harbour, with good anchorage and plenty of fresh water, situated on the N.E. coast of Kerguelen's land, otherwise called Desolation island. S. lat. 48° 41'. E. long. 69° 4'. Variation, in 1777, 27° 45' W.

CHRISTMAS ISLAND, an island of the Pacific ocean, so called by capt. Cook, on account of his first landing there on Christmas day. It is situated between the Sandwich islands on the N., and the Marquesas on the S., at about an equal distance from the one and the other. It is about 15 or 20 leagues in circumference, covered with wood, and bounded by a reef of coral rocks; having on the W. side a bank of fine sand, which extends a mile into the sea, and affords good anchorage. In digging no fresh water could be found; and this almost desolate and uninhabited island furnishes nothing but turtle, fish, and a few birds. Capt. Cook caused the seeds of the cocoa-nuts, yams, and melons to be planted in this island. N. lat. 1° 59'. E. long. 202° 30'.

CHRISTMAS ROSE, in *Botany*. See HELEBORUS *niger*.

CHRISTMAS SOUND, a bay on the S. coast of Terra del Fuego, at the extremity of S. America, in S. lat. 55° 22'. W. long. 70° 3'. The entrance into this bay is 3 leagues wide, and bears from St. Ildesfonso's islands, at the distance of 10 leagues, N. 37° W. The shore is generally a rocky bottom, so that ships should not anchor very near it. The E. point of this sound is named Point Nativity; and the E. side of York Minster forms the W. point of this sound; the variation here is 23° 30' E., and it has high water on full and change days at half past two o'clock. The adjacent land appeared to capt. Cook, when he visited this coast, desolate beyond any thing which he had yet experienced. It seemed to be entirely composed of rocky mountains, without the least appearance of vegetation. These mountains terminate in pointed precipices, the craggy summits of which rise to a vast height, so that scarcely any thing in nature can present a more barren and savage aspect than the whole country. Barren and dreary, however, as the coast was, it was not totally destitute of accommodations about Christmas sound. Fresh water and wood for fuel were found about every harbour; and the country every where abounds with fowl, particularly geese. A considerable number of plants was also found upon it, almost every species of which was new to the botanists.

CHRISTO, MONTE, an island in the Mediterranean, S.E. from Corfica, in N. lat. 42° 17'. E. long. 10° 55'.—Also, an island, due W. from Port Plata, on the N. side of the island of Hispaniola.—Also, a remarkable mountain on the coast of Peru in S. America, a little to the southward of Point de Cames.

CHRISTO, PONTA, a point of land on the Asiatic shore, forming the S. limit of the gulf of Nicomedia; nearly S. from Scutari, and almost due E. across the Hellespont, from Constantinople.

CHRISTOFHER, in *Geography*, a town of Poland; in the palatinate of Sandomirz; 16 miles S.S.W. of Sandomirz.

CHRISTOGENON, from $\chi\rho\iota\sigma\tau\omicron\varsigma$, *Christ*, and $\gamma\epsilon\gamma\omicron\gamma\epsilon\kappa\alpha\iota$, *I am born*; in the *Greek Church*, a fast of 40 days, immediately preceding the supposed time of Christ's nativity.

CHRISTOLYTI, from $\chi\rho\iota\sigma\tau\omicron\varsigma$, *Christ*, and $\lambda\upsilon\tau\epsilon\iota\varsigma$, *I dissolve*, a sect mentioned by Damascenus; so called, because they maintained that Christ descended into hell, body and soul;

foul; and that he left both there; ascending to heaven with his divinity alone.

CHRISTOMACHI, *Χριστομαχι*, from the Greek *Χριστος*, *Christi*, and *μαχημας*, *I fight or oppose*, a designation given to all sorts of heretics who deny the divinity of our Saviour, or hold heterodox opinions concerning his incarnation.

CHRISTOPHER, HERB, in *Botany*. See *ACTÆA spicata*.

CHRISTOPHER'S, *St.* commonly called *St. Kitt's*, in *Geography*, is one of the leeward Caribbee or Charaiban Islands in the West Indies, which was called by its ancient possessors, the Charaibes, *Lienuiga*, or the fertile island. It was discovered, in November 1493, by Columbus, who, pleased with its appearance, gave it his own Christian name. It was never planted nor possessed by the Spaniards; nevertheless it is said to have been the most early British territory in the West Indies, and the common parent both of the English and French settlements in the Charaiban islands. It was suggested by an experienced friend to Mr. Thomas Warner, that St. Christopher, though despised and deserted by the Spaniards, afforded the prospect of a favourable settlement for a colony; and in 1620 he formed the resolution of executing the project of his friend. Accordingly, he and 14 other companions took their passage in a ship bound for Virginia, and from thence they sailed to this island in January 1623, and by the following September they had raised a good crop of tobacco, which they proposed to make the staple commodity. Thus it appears, that the first actual establishment in this island was prior to that in Barbadoes, which did not take place before the latter end of 1624. The plantations of the English settlers were destroyed by a hurricane before the close of the year 1623; and Mr. Warner was obliged to return to England, where he sought and obtained the powerful patronage and support of James Hay, earl of Carlisle, and thus by a seasonable supply in 1624, he preserved the existence of the settlement. In the following year Mr. Warner returned to the island, accompanied by a large body of recruits, and at the same time arrived M. d'Efianbuc, captain of a French privateer, who, after a severe engagement with a Spanish galleon, sought refuge in these islands. Having brought with him to St. Christopher's about 30 hardy veterans, they were hospitably received by the English, who thought themselves thus secured against an apprehended attack on the part of the Charaibes. The fact seems to have been, that Warner's first colony lived on friendly terms with these savages, who liberally supplied it with provisions; but when their lands were seized by the planters, the latter, conscious of meriting retaliation, apprehended an attack, though none was really intended. The French and English feeling, or perhaps feigning, the alarm of a projected revolt, determined to seize the conspirators. With this view they fell on the Charaibes by night, and having in cold blood murdered from 100 to 120 of the stoutest, drove all the rest from the island, except such of the women who were young and handsome, of whom, says Pere Du Tertre, they made concubines and slaves. The Charaibes who had escaped the massacre, united with their countrymen in the neighbouring islands, made a vigorous attack in order to revenge themselves; and, after a severe conflict, the Europeans, indebted to the superiority of their weapons more than to that of their valour, obtained a complete conquest, purchasing their triumph with the loss of 100 men, who were left dead on the field of battle.

After this exploit the Charaibes quitted this and some of the small islands in the neighbourhood, and retired towards the south. Warner and d'Efianbuc returned to Europe in order to solicit farther success. The former was

knighted, and was sent back as governor in 1626, with 400 new recruits, amply supplied with necessaries; and D'Efianbuc, patronized by Richelieu, then minister of France, projected the establishment of an exclusive company for trading to this and some of the neighbouring islands. The French, however, in general, either misunderstood or disapproved the project; and though D'Efianbuc sailed from France in 1627 with 532 recruits, they were so scantily supplied with provisions and necessaries, that the greater part perished miserably at sea for want of food. The survivors were kindly received by the English; and for preventing future contentions, the commanders of each nation agreed to divide the whole island pretty equally between their respective followers. In May 1627 they signed a treaty of partition, which comprehended a league defensive and offensive; but this was of little avail against the Spanish invasion in 1629. For some time the French and English lived amicably; but at length national rivalry and hereditary animosity rendered the island a scene of internal contention and bloodshed. Who were the first aggressors it is not now easy to ascertain; it is probable, however, that each nation would lay the blame on the other. In the reign of Charles II., during the first Dutch war, the French king declared for the United States, and his subjects in St. Christopher's, disdainful an inglorious neutrality, attacked the English planters, and drove them out of their possessions; which were afterwards restored to them by the treaty of Breda. In 1689 the French planters, taking part with the interest of the abdicated monarch, again attacked and expelled their English neighbours; and laying waste their plantations, committed outrages that are unjustifiable among civilized nations, even in a time of open and avowed hostility. So cruel and treacherous was their conduct, that it was assigned by William and Mary as one of the causes which induced them to declare war against the French nation. The French, after having continued about eight months sole masters of the island, were compelled by the English, under the command of general Codrington, to surrender, and 1800 of them were transported to Martinico and Hispaniola. In 1705 many of the English possessions were again laid waste by a French armament, which committed such ravages that the British parliament found it necessary to distribute the sum of 103,000*l.* among the sufferers, in order to enable them to re-settle their plantations. At the peace of Utrecht, this island was ceded wholly to the English, and the French possessions were publicly sold for the benefit of the English government; part of this sum, viz. 80,000*l.* was appropriated in 1733, as a marriage portion to the princess Anne, who was betrothed to the prince of Orange. Some few of the French planters, who consented to take the oaths, were naturalized, and permitted to retain their estates. In 1782 it was compelled by a superior force to surrender to the French, after a very vigorous and noble defence; but by the general peace of 1783 it was restored to Great Britain.

St. Christopher lies in N. lat. 17° 15', and W. long. 63° 17'. It is about 14 leagues in circuit, and contains 43,726 acres of land, of which about 17,000 acres are appropriated to the growth of sugar, and 4000 to pasture. Sugar is the only commodity of any account that is raised, except provisions and a little cotton, and consequently it is probable, that nearly one-half of the island is unfit for cultivation. The interior part consists of many rugged precipices and barren mountains. Of these the highest is Mount-Misery, (evidently a decayed volcano), which rises 3,711 feet in perpendicular height from the sea. The sterility of the mountains is, however, amply compensated by the fertility of the plains. The soil, which is peculiar to this island, is in general

ral a dark grey loam, very light and porous; and conceived to be the production of subterraneous fires, the black ferruginous pumice of naturalists finely incorporated with a pure loam, or virgin mould. The under stratum is gravel, from 8 to 12 inches deep. Clay is only found at a considerable height in the mountains. Sugar-canes planted in particular spots of this island yield 8000 lbs of Mulcovado sugar from a single acre. The general average produce for a series of years is 16,000 hogheads of 16 cwt., which, as one-half only of the whole cane-land, or 8,500 acres, is annually cut, (the remainder being in young canes) gives nearly 2 hogheads of 16 cwt. per acre for the whole of the land in ripe canes; and even this is a return such, it is conceived, as is not equalled by any other sugar country in any part of the globe. The planters of St. Christopher's, it is said, are at a great expence for manure; they never cut ratoon-canes, i. e. those from old roots; and although springs and rivulets are sufficiently plentiful in the country for the subsistence of the inhabitants, their plantations fuller much in dry weather, as the sub-stratum does not long retain moisture.

This island is divided into 9 parishes, and contains 4 towns and hamlets; viz. Basse-terre, the port at capital, containing about 800 houses, Sandy-Point, Old Road, and Deep Bay. Of these, the two first are ports of entry established by law. The fortifications consist of Charles-fort and Brimstone-hill, both near Sandy-Point; three batteries at Basse-terre, one at Figtree bay, another at Palmeto point, and some smaller ones of inferior importance.

The proportion which St. Christopher's contributes, with the other islands, towards an honourable provision for the governor-general, is 1000*l.* currency per annum; which is settled on him by the assembly immediately on his arrival. He has also some perquisites, which, in time of war, are considerable. Each island within this government has a separate council, and each of them an assembly, or house of representatives. In St. Christopher's the council should consist of 10 members, but more than 7 are seldom present. The house of assembly is composed of 24 representatives, of whom 15 make a quorum. The requisite qualification is a freehold of 40 acres of land, or a house worth 40*l.* a year. Of the electors, the qualification is a freehold of 10*l.* per annum. The governor of this, and the other islands in the same government, is chancellor by his office, and in St. Christopher's sits alone. In this island the jurisdiction of both the King's Bench and Common Pleas centres in one superior court, in which justice is administered by a chief justice and 4 puisne judges. The chief is appointed by the crown, the other by the governor in the king's name; and they hold their commissions during pleasure. The office of chief judge is worth about 600*l.* The emoluments of the assistant judges are trifling. The present number of white inhabitants is computed at 4000, and taxes are levied on 26,000 negroes; and there are about 300 blacks and mulattoes of free condition. All the white men from the age of 16 to 60 are obliged to enlist in the militia, and they serve without pay. They form two regiments of foot, although the whole number of effective men in each regiment seldom exceeds 300. There is also a company of free blacks. The natural strength of this island is such, that a garrison of 2000 effective troops, properly supplied with ammunition and provisions, would, in all human probability, have rendered it impregnable to the formidable invasion of 1782. St. Christopher's is separated from the island of Nevis by a narrow strait about $\frac{2}{3}$ of a league broad; W. from Antigua, as some say, 15 leagues, and according to others 21; and St. Eustatia is about 3 leagues W. by N. from the W. point of this island. Edwards's Hist. of the West Indies, vol. i.

CHRISTOPHER'S, *St.* an island in the channel between the island of Madagascar and the coast of Africa. S. lat. 17° 20'. E. long. 42° 13'.

CHRISTOPHER'S, *St. River*, lies on the S.E. coast of Africa. S. lat. 22° 47'. E. long. 27° 33'.

CHRISTOPHORIANA *canadensis*, Morif. Hist. See *ARALIA racemosa*.

CHRISTOPHORSON, JOHN, in *Biography*, a learned divine, a native of Lancashire, who studied at Cambridge, and afterwards was master of Trinity college. He was promoted to the deanery of Norwich, but his attachment to papacy obliged him to retire from the kingdom during the reigns of Henry VIII. and his son Edward VI. He returned to England in the reign of Mary, and was by her made bishop of Chichester in 1557, an office which he enjoyed only a few years, when he paid the debt of nature. He was a man of great industry, and translated from the Greek the works of Philo. Eusebius, Socrates, Sozomen, and Eusebius. His style is obscure, and from an almost total ignorance of the Roman antiquities, he has made a multitude of errors in the names and dates of civil and military employments.

CHRISTOPOLIS, in *Ancient Geography*, an ancient episcopal town of Asia, under the metropolis of Bithynia.

CHRISTOPHORUS *sigis*, a name by which some have called the *fenice*, or as we call it the *doree*, or *jaune doree*, the golden ash.

CHRISTORF, in *Geography*, a town of Bohemia, in the archdiocese of Bredlau; 6 miles S.S.E. of Krottau.

CHRISTOVAL, *St. Bay*, a bay on the W. coast of California, in N. lat. about 26° 44'.

CHRIST'S THORN, in *Botany*. See *RUAMNUS palustris*.

CHROË, in the *Musie of the Ancients*. See *COLOURS, GENRES, and SPECIES*.

CHROAS PACES, in *Natural History*, a genus of pellucid gems, comprehending all those of variable colours as viewed in different lights, of which kind are the opal and the ASTERIA, or the *cat's oculis*.

CHROBATI, in *Ancient Geography*, the denomination of a people who formed a part of the Slavi, as well as the Avari. They were armed by Heraclius, the successor of Phocas, against the Avari. They were under the direction of a prince called "Porga," who with several persons of the same tribe, left their habitations, advanced along the maritime coasts of Dalmatia, put the Avari to flight, and took possession of their provinces. Heraclius sent them priests and bishops, from whom they received baptism. These Chrobati migrated from the north of Bohemia and of Poland, where the Selavonian language prevailed, and they continued to speak it when they arrived on this side of the Danube. Some authors, according to M. de Peyssonel, pretend that the word Chrobati signifies possessors of large territories. Mr. Dodwell says this name was derived from that of their prince, Chrowatus; and Constantine Porphyrogenitus says they were the same people with the Bulgarians; but this opinion has been controverted by Theophylact and others, who allege that the Bulgarians did not commence their incursions to the other side of the Danube till a later period. Besides,

the

the Chrobati submitted to the emperors of Constantinople; whereas the Bulgarians remained independent.

CHROBERG, in *Geography*, a town of Poland, in the palatinate of Sandomirz; 52 miles W. of Sandomirz.

CHROKIEL, in *Ornithology*, the common quail, *Tetrao coturnix*, called Chrokiel, or Grande Caille de Pologne, by Buffon.

CHROMA, in the *Botanical Writings of the Ancients*, a word used to express a famous root brought from Syria into Greece, and used by the women of that country to paint their cheeks red. It was also called *rhizium* and *facus*, and by the Latins *valicula*.

CHROMA, in *Geography*, a river of Siberia, which runs into the Frozen sea. N. lat. 73°. E. long. 139° 14'.

CHROMA, in the *Italian Music*. The Italians take this term from the Greeks, but use it to signify a note or character of time, by us called a quaver, and when the word *femi* is added thereto, it means our semiquaver. Eight of the former are contained in a bar, and sixteen of the latter in common time.

CHROMA, in *Rhetoric*, a colour or fair pretence.

The word is Greek, and literally denotes colour.

CHROMA is also a graceful way of singing, or playing with quavers and trill-oes.

CHROMA also sometimes signifies the same as the chromatic DIESIS or semitone minor.

CHROMA is also used to signify the genus chromaticum. In this sense we find it used by Aristoxenus, and in Ptolemy's Harmonics.

CHROMATIC, in the *Ancient Music*, the second of the three genera, or kinds, in which the consonant intervals were subdivided into their concinnous parts.

The other two kinds were, the *enharmonic* and the *diatonic*. The chromatic consisted of semitones, and minor thirds: it had its name, either because the Greeks marked it with the character of colour, which they call *χρῶμα*; or as P. Parran suggests, because the chromatic kind is a medium between the other two, as colour is between black and white; or else because the chromatic kind varies and embellishes the diatonic kind, by its semitones; which have the same effect in music, with variety of colours in painting. M. Rousseau says, that this species of music was written in coloured notes. Aristoxenus divides the chromatic genus into three species; the *molle*, *hemilolon*, and *tonicum*: Ptolemy, into *molle* or *antiquum*, and *intensum*.

These species were also called *chroai*, or colours of the genera; the *molle* expresses a progression by small intervals, the *intensum* by greater.

The chromatic and enharmonic kinds only contain the smallest of the diatonic degrees; so that they have the same proportion to the diatonic, as fractions have to integers.

Boethius, and after him Zarlino, attribute the invention

of the chromatic genus to Timotheus, a Milesian, in the time of Alexander the Great. The Spartans banished it their city, on account of its softness. The characters of this genus, according to Aristides Quintilianus, were sweetness and pathos.

Mr. Malcolm observes, that we are at a loss what use the ancients could make of these divisions and subdivisions, into genera and species. All acknowledge the diatonic to be the true melody; the others seem only humorous irregularities, calculated to please the fancy by their novelty and oddness; and were besides so very difficult, that few, if any, are said to have ever practised them accurately.

The moderns have been much perplexed to understand the different species of the chromatic music in use among the ancient Greeks. Most of our musicians have no other notion of the chromatic than of a melody proceeding by semitones, major and minor. This is what Broussin says of it. But this is not sufficient to convey a true notion of the chromatic. Dr. Pepusch has given us a clearer light in this affair: his doctrine is as follows.

The ancients distinguished three sorts of chromatic, which were denoted by the names, *molle*, *sesquialterum*, and *tonicum*.

The *chromaticum molle*, was a division of the diatessaron, or fourth, into three intervals, which were two subsequent semitones minor, and the interval, which is the complement of these two to the fourth; and this interval will be found equal to a third minor added to an enharmonic diesis. This species is not to be met with among the moderns.

The *chromaticum sesquialterum*, or *hemilolon*, was a division of the fourth into a semitone major, a semitone minor, and a third minor. This is mentioned by Ptolemy as the *chromatic* of Didymus. It occurs in modern compositions.

The *chromaticum tonicum*, or *tonicum*, was a division of the fourth into a semitone major succeeded by another semitone major, and the complement of these two to the fourth, which is the interval, commonly called a superfluous tone. This often occurs in modern music. Dict. de Musique, p. 19. Phil. Trans. No. 481. p. 272. Wallis, Append. Ptolem. Harm. p. 164.

Of the modern chromatic, the scale of which is so different from the ancient, we can easily explain the principles upon which it is built, by giving it a fundamental base. The regular chromatic scale in modern music, consisting entirely of a series of major and minor semi-tones, such as the temperament of our keyed and wind instruments allows, ascending and descending, may receive the following fundamental bases. As it can very seldom happen that a complete octave of half notes can be wanted with a base to them, in order to avoid double sharps and flats, we have divided the chromatic octave into two tetrachords.

These are the general ideas throughout Europe of the ancient and modern chromatic. But the abbé Feytaud, who has meditated on these matters more perhaps than any other modern theorist, has furnished an article to the musical Encyclopedists, which, though very ingenious, will, we fear, VOL. VII.

puzzle the cause, and destroy the few ideas concerning this genus, which had been formed from the perusal of ancient and modern authors on the subject. The first period of this article is, however, clear and indisputable.

“CHROMATIC. The *semitone* is the element, the precise interval

interval which constitutes the *chromatic* genus: as the *tone* is that of the *diatonic*; and the *quarter-tone* that of the *enharmonic*: the *half-quarter tone* that of the *diacrommatic*. This is evident, but it remains to be discovered, what ancient Greek, and modern authors, understand by a *semi-tone*.

“1st. It is more than probable that Aristoxenus did not understand himself, in speaking of half tones, or a third or fourth part of a tone; it is in vain for him to say that he was accused wrongfully of dividing a tone rigorously into halves, (Meibonius, p. 46. Aristox.,) of consulting in his division of tones, only the judgment of the ear, (ib. pp. 14 and 33) rejecting musical ratios of intervals (ib. p. 32) which are their natural signs, and the proof of their degree of consonance and dissonance, i. e. of their harmonic or enharmonic character, it is wholly impossible for him to prove that a nominal semi-tone is, or is not, the precise half of a tone given.

2dly. The Pythagoreans of the last ages of Greece, those who dared to assume that title, after the total extinction of the Italic sect, were not much more reasonable than the Aristoxinians, their opponents. Neglecting to consult the founts themselves in their theory, they were carried away by certain metaphysical prejudices, to calculations too complicated to lead to the simplicity of the ratio of sounds. Did they think that the ratio of the interval from the 7th to the 8th of a key (as in C, BC) which is 15 to 16, was with them 243 to 56: that of the major 3d (which is 4 to 5) to be 64 to 81? which rendered it so dissonant, that they agreed with the Aristoxinians, that it ought not to be ranked among concords. Aristoxenus pp. 20 and 45; Nichomachus, p. 20 and 21; Bacchius, pp. 3; Arist. Quint. p. 16. N. B. These three last were Pythagoreans, that is to say, pretended to possess the numerical theory of Pythagoras. Aristotle's Quint., indeed, (p. 114.) tells us, that the ancients, meaning the Pythagoreans, had determined the ratio of the semi-tones to be 16 to 17, and 17 to 18; but we do not find that this division had been adopted in the *chromatic* genus, when the semi-tones were from 243 to 256.

“3dly. The moderns make the *chromatic* scale proceed by semi-tones, major and minor, alternately: the first in the ratio of 15 to 16, the other of 24 to 25. Now an interval from 15 to 16, is not a semi-tone, but a true diatonic interval, a real tone and a half of the natural scale. Modern *chromatic*, therefore, admit but a single *chromatic* interval, which therefore cannot constitute a genus; for the *chromatic* genus ought to proceed by semi-tones. Now it is impossible in practice, to use two equal intervals without changing the key. *Chromatic* melody therefore would not have place in any of our keys. We must then either suppose that the moderns use no *chromatic* genus, or that they use many kinds of semi-tones, which are only equalized by temperament.”

It has long been said by writers on the subject, that modern *chromatic* is totally differ'd from the ancient; but the above observations tend to afford a reason for the difference, which is not to be met, not with a very lively hope that we shall be able to do so.

“4thly. The ancients in *Greek Music*. It would be of little use to enquire on the ratio of the *chromatic* intervals of the Italic or Syllabic system. What seems necessary to observe is, that in all the branches of the three genera have the same fundamental, the lowest and the highest. Thus the *chromatic* in us, in modern notes, being BCDE; B and C being the notes common to the three genera: the *chromatic* in us is called *Chordæ Syllabæ*. Whence I conclude that the Greeks never executed their different formulae of keys, but in reality; where we may infer, that they were not the inventors of their formulae.

“2dly. That in each formula of the *chromatic* genus, the first semi-tone is always equal to the second; (see the table of Aristoxenus's system at the head of his treatise.) Hence I conclude, that the Greeks had not the least notion of what we call a key; because they had not the curiosity, I durst not say the science, to use every tetrachord in one sole key. Now it is impossible to produce two consecutive similar intervals in one single key. But Ptolemy, in re-establishing the ratios of the Greek system in their ancient simplicity, demonstrated that these semi-tones were rendered equal only by temperament. (What says the abbé Rouffier to this?) What ought to confirm us more and more in this idea, that the Greeks were not the inventors of their system, is their ignorance of its harmonic character, its modulation, and its relations. Though the tetrachord was the most ancient system of the Greeks, we must not conclude that it was the only one in each genus; they had likewise pentachords and diatonic, of which the intrinsic form has not been always the same: (could the diapason or octave have a latitude?) But in the last analysis, each of these systems is resolved, ultimately, in the tetrachord, which is, properly speaking, the gamut of the Greeks.

“CHROMATIC, in *Modern Music*. The chromatic may be practised in modern music by using at pleasure different gamuts, passages, transitions, and chromatic graces or embellishments.

“1st. *Of Gamuts*. The natural, physical, and primitive form of a gamut is progressive, since every scale is included in a progression of the harmonics of a generator, that is, of a key note. Thus the diatonic gamut is the result of the regular production of sounds, comprehended between the extremes of the 4th octave from C the generator. The chromatic gamut immediately follows the diatonic in the acute, and is comprised between the 15th and 32d harmonic of C. Thus this gamut forms the 5th octave of the key note C, $\overset{16}{C}, \overset{17}{D}, \overset{18}{D\sharp}, \overset{19}{E}, \overset{20}{E\sharp}, \overset{21}{F}$. But much is wanting to render our *chromatic* gamut progressive, in which the semi-tones decrease uniformly from grave to acute. For including only semi-tones major and minor, its melody is less natural than a melody formed of progressive sounds; and the accompaniment is forced, being reduced to three or four chords at most. For, when the *chromatic* melody proceeds by semi-tones major, in ascending each note is successively 7th and 8th of a key, or 3d and 4th, and reciprocally in descending. When the melody proceeds by semi-tones minor, we are driven to different combinations of the chord of the extreme flat 7th. When a succession of sounds alternately major and minor is used, we have a series of minor tones. But it is easy to procure a *chromatic* accompaniment superior to all these which have been in use hitherto, in supposing our gamut really progressive and altered only by temperament. Now temperament ought not to change the harmony. Upon this supposition, when we sing C, $\overset{16}{C}, \overset{17}{D}, \overset{18}{D\sharp}, \overset{19}{E}$, we are supposed to sound the natural gamut. $\overset{16}{C}, \overset{17}{C}, \overset{18}{D}, \overset{19}{D\sharp}, \overset{20}{E}$, and we accompany it with this fundamental note only $\overset{2}{C}, \overset{3}{C}, \overset{4}{C}, \overset{5}{C}$, (which is making the intermediate half notes between C and E passing notes; and in a rapid succession of half notes rising or falling, allowing a half to the first and last note is sufficient. And this is the best apparatus that can be made for rapid semi-tonic successions.)

“CHROMATIC *Pedestals*, which we have hitherto accompanied by the several resolutions of the extreme flat 7th, and extreme sharp 6th, may be regarded as parts of the natural gamut. With a little use we may refer them to the true chord to which they appertain; in remembering that the major

major semi-tone has no place in the chromatic scale, and that its true and only place, even in the modern gamut, is between the sharp 7th and 8th of the key note; and, consequently, in ascending, it may be accompanied by all the chords which include the sharp 7th; as in the key of C: G B D F, C E G B, D F A B, D F G \times B, F A B D \times , &c. and by the chords upon which they ought to be resolved; and in descending, by a contrary motion; i. e. in making the resolved chord precede and follow the discord.

"But a general rule is, that every time the semi-tones succeed each other chromatically, that is, without being separated by wider intervals, we ought never to suppose them equal; but always gradually, and progressively unequal. If this rule is violated, you will have passages, but never chromatic melody, and a harmony which, far from determining the key of the treble, will have no other effect, than to puzzle and mislead the hearer.

"Chromatic transitions consist in changing the key at each note of the melody; which is supposing all the half notes equal. But this supposition is more favourable to the ignorance of the composer than to the effect of the harmony and melody. The composer regards each found as 7th and 8th of a key successively, as superfluous 5th and 6th, or indeed as 3d and 5th below the key note, so that one form only of resolution serves him for the most considerable traits in harmony; an harmonic mechanism more likely to degrade the melody than to enforce the effect. In general, it is the ignorance of the key of a chromatic melody, and of its true harmony, which drives composers to transitions (modulations). To this there are some exceptions, but they are rare.

"Chromatic graces, or embellishments, are passages not allowed for in the time, by which piano-forte players, when the right hand is low on the keys, mount up to the point where the melody re-commences. It is, however, a feat which destroys all idea of the key of the piece, if such runs are not very short and rapid, and the performer has not the taste and address to make the principal chords of the key heard; which would require a profound knowledge of harmony, and a very active finger. But good harpmonists leave to mediocrity these childish ornaments, which are truly offensive to delicate ears."

For our own parts, the running up and down the keys in semi-tones is now become so common, affected, mechanical, and unpleasant a trick, that we never wish to hear it performed more frequently than once a year.

The nice discriminations of major and minor semi-tones in the abbé Feyton's ingenious article *Chromatic*, whence we have made such long extracts, are speculations for discussion, and materials for disputation, rather than practice. In composing for our keyed instruments, and in playing on them, both the composer and performer are at the mercy of the tuner, and of his habitual temperament. The composer writes, and the performer plays, as if the instrument were perfect. Our forefathers, knowing where the *wolf* lay in the organ and harpsichord, touched that key and its relatives as seldom as possible. A composition in E \flat or E \natural , with a sharp 3d, is hardly to be found in music of 200 years old; and we have old organs where E \flat and A \flat seem, by the dust with which they are covered, as if they had never felt the finger since the instrument was erected. But now the bold modulations of Emanuel Bach, Haydn, and Mozart, have provoked another temperament; the tuners have, by degrees, been obliged, much against their will, to try at equal harmony; and composers and performers may now ramble about, without the fear of offending nice ears by one key more than another. There is not time for calculation during the performance of a written piece, much less of a voluntary. If a keyed-instrument is out of tune, the

auditor knows that it is the fault neither of the composer nor player, and accommodates his auricular organ to the evil; but if a vocal performer sings out of tune, or the intonations of a violin player are false, it is never forgotten or forgiven. Imperfection of intervals in singing, however, depends on the chest of the singer, and on the strength of hand in the violin player, more than on the ear of either; the mischief being done before the ear of either is offended. The abbé Feyton justly calls chromatic passages in which the key is so disguised as not to be known, *chromatic graces*; very different things from chromatic modulations. See in *Plato's Music* examples of modern chromatic to a fundamental base; of *contrappunto d'oppio in genuro chromatico*; and of Rousseau's *chromatic successions*.

CHROMATIC, in *Painting*, is sometimes used to signify the colouring. See COLOUR.

CHROMATICS, in *Philosophy*, denote that branch of the science of optics, which treats and explains the properties of the colours of light and of natural bodies. See the detail under COLOUR and REFRACTION.

CHROME. Chrome is a metallic substance of a greyish-white colour, extremely brittle, acidifiable with great difficulty by nitric acid, and then capable of combining with caustic potash into a lemon yellow salt. This salt being added to a solution of nitrat of lead occasions a deep orange-red precipitate of chromated lead.

Chrome has hitherto been found only in the acid state combined with lead and with iron.

Sp. 1. Chromat of Lead. Red Lead Spar, of Kirwan. The colour of this mineral is auro-red, passing into hyacinth red. It occurs sometimes disseminated, but most commonly crystallized, either in rectangular prisms, or in six or eight sided prisms. The crystals are of moderate size, adhering laterally to each other, and generally very imperfect and ill defined; they have a brilliant external lustre. The fracture is fine-grained uneven, passing into conchoidal and irregularly lamellar. It breaks into blunt edged indeterminate fragments. It is translucent, passing into semi-transparent, is brittle, easily frangible, and, when scraped, gives a yellowish orange-coloured powder. Sp. gr. 6.02.

Chromat of lead, when exposed to the blow pipe, crackles a little, and melts into a blackish slag. With borax it is, in part, reduced to the metallic state, and communicates a green colour to the flux. It has been analysed by Vauquelin with the following result:

69.96	Oxyd of lead
36.40	Chronic acid

100.36

This mineral has hitherto been found only in the gold mine of Berezoſ, to the north of Ekaterinenburg, on the eastern side of the Uralian mountains: it is thinly dispersed in a vein passing through gneiss and micaceous schistus, accompanied by quartz, galena, and numerous pyrites: none of the crystallized varieties have been found for some years.

Sp. 2. Chromat of iron. The colour of this mineral is greyish, or blackish brown; it occurs in mass; it possesses a slight degree of metallic lustre; its fracture is compact uneven, sometimes imperfectly lamellar; when pulverized, it is of an ash-coloured grey. It is hard enough to scratch glass, is difficultly frangible, opaque, and gives an argillaceous odour when breathed upon. Sp. gr. 4.03.

It is infusible before the blow-pipe without addition, but, with borax, melts into a beautiful green-coloured glass. It contains, according to an analysis by Vauquelin,

43	Chromic acid
35	Oxyd of iron
20	Aluminae
2	Silex

100

Chromat of iron is said to have been found in Siberia; it has also been discovered in France near Goffin, in the department of Var, forming nodules and veins in serpentine.

The method of analysing the chromat of lead is very simple: Vauquelin has pointed out two ways, both of which we shall mention.

Take one part of finely pulverized chromat of lead, three parts of perfectly saturated carbonat of potash, and forty parts of water, and boil the mixture for the space of an hour. As soon as the substances begin to act on each other a brisk effervescence will take place, the orange-colour of the lead will change to brick red, and finally, when the effervescence has ceased, there will remain at the bottom of the vessel a powder of a dirty yellow colour, consisting of carbonat and chromat of lead, covered by a liquor of a bright golden yellow, which is chromat of potash. The liquor being poured off, and the powder well washed, some very dilute nitric acid is to be poured on the powder till it ceases to effervesce; the colourless solution, thus obtained, is nitrat of lead, while the undecomposed residue of chromated lead will remain unaltered, and is afterwards to be decomposed by a second digestion with thrice its weight of carbonated potash. The nitric solutions of lead being mixed together are to be decomposed by sulphat of soda, and the lead contained in the ore is to be eliminated from the sulphat of lead thus procured. The alkaline solutions of chromated potash are to be mixed with weak nitric acid, as long as any carbonic acid from the undecomposed carbonat of potash is given out, and the liquor, by subsequent evaporation and cooling, deposits crystals of chromat of potash mixed with nitre.

The other method of decomposing this substance is, to digest together, at a moderate temperature, equal parts of chromat of lead very finely pulverized, strong and pure muriatic acid, and water; taking care to stir the mixture from time to time. The chromat of lead will change to a white colour, and will be decomposed, being converted for the most part to muriat of lead. When the acid has ceased to act, the liquor must be poured off, and fresh muriatic acid, (diluted as before with water,) to the amount of about one-fourth of the former quantity, is to be digested with the residue, till no more orange-coloured grains appear among the white muriat. This liquor being added to the former, together with the washings, the whole, after being heated, is to be placed for a few days in a cool place, that the small quantity of muriated lead that it holds may be deposited; when this is removed, some oxyd of silver (precipitated from its solution in nitric acid by pure potash), is to be added very gradually till the last portions acquire a red purple colour; thus the whole of the muriatic acid will be got rid of, and the liquor will contain only chromic acid, which, by slow evaporation, is deposited in small prismatic ruby-red crystals.

The decomposition of chromat of iron is not effected by any means so easily as that of chromated lead. The action of either muriatic or oxy muriatic acids upon it is very slow and imperfect; nor is a boiling solution of either pure or carbonated potash attended with better success. The most effectual way of proceeding is, to fuse in a platina crucible the finely powdered ore, with an equal weight of caustic potash; then to separate by water all that is soluble in this

fluid, and treat the residue with hot muriatic acid. By the alternate use of these menstrua six or seven times each, the whole of the ore will be taken up and dissolved. The muriatic solution being evaporated to dryness, and then left to cool, will become gelatinous, thus announcing the presence of silex, which may be separated by drying the jelly, and then digesting the residue in boiling water, in consequence of which the silex will remain undissolved: the clear liquor being then treated with ammonia, the iron will be obtained in the state of oxyd. The muriatic solution being thus exhausted, the alkaline solution is to be carefully neutralized by nitric acid, by which means the alumine will be precipitated, and nothing will remain in the liquor but chromat of potash and nitre, from which the chromic acid may be obtained pure; by adding nitrat of lead till no further precipitate takes place, and then treating the chromat of lead thus formed with muriatic acid, as mentioned above.

Chromic acid is of an orange-red colour, and a pungent metallic taste; it is very soluble in water, and by gentle evaporation crystallizes in lengthened prisms. Like other acids it combines with the salifiable bases, whence results a genus of compound salts called *chromats*, the chief of which we shall proceed to describe.

Chromat of barytes is formed by mixing together the aqueous solutions of barytes and chromic acid: it appears as a pale lemon-yellow precipitate, is sparingly soluble in water, and has no perceptible taste. When heated, it gives out oxygen gas, and assumes a green colour.

Chromat of lime is prepared, like the preceding, by adding the liquid acid to lime water; an orange yellow precipitate falls down; differing from the chromat of barytes only in being less soluble, and in a somewhat different order of affinities.

The carbonated alkalies are decomposed with effervescence by chromic acid, forming very soluble and crystallizable salts of a lemon yellow colour. Chromat of ammonia is destroyed by a red heat, the alkaline base being decomposed, and deoxygenating the acid, so that only a green oxyd of chrome remains behind. The alkaline chromats are decomposable with abstraction of their acid by barytes, lime, and strontian, and with abstraction of their base by the mineral acids; when added to any of the soluble metallic salts a double decomposition takes place, and the chromated metal is precipitated in the form of a coloured powder; mercury gives a vermilion red precipitate, silver a carmine red, lead an orange yellow, tin a green, &c.

Chromic acid appears to be very easily reducible to the state of oxyd, in which state it is generally of a green colour. Thus, when heated on charcoal before the blowpipe, it first boils, and when the moisture is evaporated, a green pulverulent infusible oxyd remains. By fusion with borax and glass of phosphorus, it affords vitreous globules of a bright emerald green. With tan it forms an insoluble yellowish brown flocculent sediment; and with hydrofulphuret of potash a brownish green one.

Muriatic and chromic acids, when beaten together in a retort, occasion a considerable effervescence; part of the muriatic acid is converted into oxy muriatic, which flies off, and the chromic acid is changed into the green oxyd. Ether or alcohol, when heated for a few minutes with this acid, produce on it a similar effect; as does also muriat of tin, and the same metal in the reguline state, also iron, zinc, and most other metallic substances. Even light will decompose chromic acid, for a paper wetted with it, and exposed for a few days to the sun, assumes a permanent green colour.

In order to reduce chromic acid to a regulus, it is sufficient to heat it strongly in a crucible lined with charcoal; the re-

felt will be a brittle, brilliant, greyish white, metallic button, amounting to about 67 per cent. of the acid employed. At a high temperature it assumes the form of feathery crystals. A fragment of this metal, when exposed to the blowpipe, first tarnishes, and then acquires a thin coating of greenish oxyd. When finely pulverized, and treated with boiling concentrated nitric acid, it is oxydated, though with extreme difficulty, and gives the acid a light bluish green colour; by repeated abstractions it is at length completely acidified, and then exhibits exactly the same characters as the native acid.

Chrome, on account of its scarcity, and the short time that it has been known, has not yet been applied to any use; it is probably, however, capable of furnishing some fine pigments to the painter and enameller; in particular it will tinge glass with a true emerald green; the colouring matter of this beautiful gem having been recently proved to be this very metallic oxyd.

CHROMIS, in *Ichthyology*, the name of a little fish caught frequently in the Mediterranean, the chief colour of which is dusky brown. Linnæus describes it after Artedi as a *sparus*, with the second ray of the ventral fins fetaceous. See SPARUS *chromis*.

CHRONIC *disease*, in *Medicine*, from χρόνος, *time*, is a disease which, from its nature, may be of long duration. The term *chronic* is used in contradistinction to *acute*, which implies a state of violent and febrile action in the constitution, which must necessarily soon terminate, either in recovery or death. See DISEASE.

CHRONIC *weakness*, a term employed by some physicians in a vague and somewhat general sense, to denote a variety of modifications of disease, which have often been called *nervous*, and which are accompanied with a general debility of the constitution, and a failure in the performance of certain functions, especially that of digestion. It includes those varieties which Dr. Cullen included in his genus of *dyspepsia*, and Sauvages in that of *asthenia*, as well as *hypochondriasis*, *chlorosis*, and other diseases, where the dysility is symptomatic of some derangement of the stomach and bowels, or of the other viscera. The causes and the means of cure are such as belong to the varieties of *dyspepsia* and *asthenia*. This term is rejected from the more correct medical vocabulary of the present day. With other Chronic Weakness. See DYSPEPSIA and ASTHENIA.

CHRONICLE, CHRONICON, denotes a history digested in order of time; though the term is seldom used but in speaking of our old English histories, as Holinshed's *Chronicle*, Stow's *Chronicle*, &c. See ANNALS.

CHRONICLE, *Parian*. See ARUNDELIAN *Marbles*, and *PARIAN Chronicle*.

CHRONICLES, in the *Canon of Scripture*, are two sacred books called by the Greeks *Paralipomena*, Παρολιπομένα, because they contain many supplemental relations omitted in the other historical books. The Hebrews, says Dupin, (*Complete Hill. of the Canon*, &c. p. 86.), make but one book of them, under the title of "Dibre-Haanam," the sayings or actions of days or years, i. e. journals or annals; either because the order of time is more exactly observed in them, or else because they were taken out of the records, journals, or annals of history. They are an abridgment of sacred history from its beginning, to the return of the Jews from the Babylonish captivity, taken out of the books which we have, and out of other annals which the author had by him in his time. The design of the author was to represent to the Jews the series of their history, which might have been obliterated from their memory during the captivity, and thus to put them in mind of their original. Accordingly, the

first book traces the genealogies of the Israelites from Adam, relates the death of Saul, and gives a brief account of David's reign. The second traces the progress of the kingdom of Judah, its various revolutions, its period under Zedekiah, and the restoration of the Jews by Cyrus.

It has been generally supposed, that these books were compiled by Ezra; and that they were written after the termination of the Babylonish captivity, and the first year of the reign of Cyrus, who is mentioned in the last chapter of the second book. Some passages seem to have been transcribed *verbatim* from the histories and records that were made at the time when the temple stood, and when the Jews were in possession of Judæa; and others were probably interpolated or added after the time of Ezra. Dr. Kennicott has satisfactorily shewn (*Dissertations*, vol. i. and ii.) that several apparent contradictions between the accounts in Chronicles and in the books of Kings, with regard to numbers, have arisen from the corruption of the Hebrew text; which may be easily accounted for when we consider that numeral letters, used to express numbers, might easily be changed into one another by transcribers. See CHARACTERS, *Hebrew*. Several words are also omitted, e. g. 34 in 1 Chron. xi. 13, preserved in the parallel place in 2 Sam. xxiii.; and others are interpolated, e. g. two verses at the end of Chronicles; which interpolation is discovered by means of the beginning of the book of Ezra, which has the same words, fully proving that part, and a very abrupt part, of the decree of Cyrus had been subjoined to Chronicles, through the inadvertence of some transcriber. Thus, the two verses at the end of the book, which are far from being chronologically connected with the preceding mention, and merely mention, the decree of Cyrus. They begin that memorable decree, but leave it unfinished; breaking off in the very midst of a sentence, in a manner perhaps unparalleled. Those two last verses have, probably, been added improperly. Some transcriber, having finished the book of Chronicles at verse 21, proceeded, without leaving the usual distance between different books, to write the book of Ezra, but, finding his mistake, he broke off abruptly; and so began Ezra at the customary distance, without publishing his error, by erasing or blotting out those lines, which he had carelessly subjoined to Chronicles. Hence we may perceive, that the book of Ezra once followed that of Chronicles.

CHRONOGRAM, a kind of composition, whose numeral letters, joined together, make up some date, or epocha. See ANAGRAM.

The word is compounded of χρόνος, *time*, and γράμμα, *letter*. CHRONOLOGICAL, belonging to CHRONOLOGY.

Chronological characters, are characters by which times are distinguished. See CHARACTERS. Of these some are *natural*, or *astronomical*; others are *artificial*, or *historical*. *Natural chronological characters* are such as depend on the motions of the stars, as eclipses, solstices, equinoxes, the different aspects of planets, &c. *Artificial chronological characters* are those which men have established, as the solar cycle, the lunar cycle, &c. *Historical chronological characters* are those which are supported by the testimonies of historians, when they fix the dates of certain events to certain periods. We say also chronological tables, abridgments, machines, &c. See CHRONOMETER, and CHRONOLOGICAL *Table* at the close of the next article.

CHRONOLOGY, compounded of χρόνος, *time*, and λογία, *discourse*, is the art or measuring time (See TIME), distinguishing its several constituent parts, such as centuries or ages, years, months, weeks, days, hours, &c. (which see respectively,) by appropriate marks and characters, and of adjusting

adjoining these parts, in an orderly manner, to past transactions, by means of eras, epochs, cycles, &c. (which see respectively) to the illustration of history. See HISTORY.

Strabon divides chronology into five distinct branches; viz. *metaphysical, physical, political, historical, and ecclesiastical*; according to the various relations, or habitudes, in which time is considered; viz. as it is in itself; as connected and subjected to the affections, states, and alterations of natural things; as accommodated to civil use; as matched with events that pass in the world; and particularly as it relates to the celebration of Easter, which see. The importance and utility of chronology, as it comprehends the distribution of time into its subordinate parts, and the arrangement of historical events by means of these several divisions in the order according to which they occurred, so that their respective dates may be accurately fixed, must be universally acknowledged. Chronology has been, therefore, not unaptly denominated "one of the eyes of history;" and it also serves many interrelated purposes in theology, and in various other departments of literature and science. As its use is extensive, the difficulty of acquiring it is not inconsiderable. It derives necessary assistance from astronomy and geography, and also from arithmetic, geometry, and trigonometry, both plain and spherical; and likewise from a studious and laborious application to various sources of information, supplied by the observation of eclipses, by the testimonies of credible authors, and by ancient medals, coins, monuments, and inscriptions. Its history, however, is comparatively of modern date, as we shall shew in the sequel of this article.

CHRONOLOGY, CHINESE. No nation has boasted more of its antiquity than the Chinese; but though we allow them to trace their origin as far back as the deluge, they have few, if any, authentic records of their history for so long a period as five hundred years before the Christian era. This, however, may probably be owing to the general destruction of a nation remains by the tyrant Tin-chi-hoang, in the year 213, or, as some say, 246, before the Christian era. We learn from a chronological table of the Chinese history, for which we are obliged to an illustrious Tartar, who was viceroy of Canton in the year 1724, and a Latin translation of which was published at Rome in 1730, that the most remote epocha of the Chinese chronology does not surpass the first year of a prince called Guai-lie wang, who began his reign four hundred and twenty-four years before the vulgar era. This opinion is confirmed by the testimony of two of the most approved historians of China, who admit nothing into their histories previous to this period. The Chinese in their computation make use of a cycle of sixty years, called *kiang*. From the denomination given to the first year of it, which serves as the basis of their whole chronology. Every year of this cycle is marked with two letters, which distinguish it from the others; and all the years of the emperors, for above two thousand years, have names in history common to them with the corresponding years of the cycle. Phil. Trans. abr. vol. viii. part iv. p. 13. &c. According to M. Perret, in his Essays, the Chinese date the epocha of Yao, one of their first emperors, about the year 245, or as others date it, 2057; or according to Du Halde 2357 years before Christ; and reckon their first astronomical observations, and the composition of their famous calendar, to have preceded Yao a hundred and fifty years; and thence it is inferred, that the astronomical observations of the Chinese and Chaldeans coincide. Accordingly Mr. Whiston (Short View of the Chronology of the Old Testament) maintains that the Chinese chronology, when rightly understood, is exactly agreeable to that which he has deduced from the Hebrew text of the Old Testament. Later authors date the rise and

progress of the sciences in China from the grand dynasty of Theou, about twelve hundred years before the Christian era, and shew, that all historical relations of events prior to the reign of Yao are fabulous. Mem. de l'Histoire des Sciences, &c. Chinois; a work compiled by the missionaries of Pekin, vol. i. Paris, 1776. See CHINA.

CHRONOLOGY, HEBREW, and Neoterican principles of. Many ages in it have elapsed before the mode of computing time, or of dating events, was brought into established use. The most ancient philosophers and historians write in verse, and were unacquainted with chronology. In the age of Homer, a formal calendar seems to have been unknown; and at that early period time was measured by the seasons, the revolutions of the sun and moon, and the five five returns of labour and rest; but we read of no public estimation of time, at least in part, as months, weeks, or hours, being the purpose of guides to labour or as registers of events; nor do we discover any allusions to clocks, dials, or cyclical astronomical centuries intervening between the Olympic era, and the first historians; and a few more elapsed before the period in which the first chronologies appeared. We find that even after the computation of time commenced, its particulars were very indeterminate. See the sequel of this article.

Sir Isaac Newton has shewn that all a time, before they began to keep exact accounts of time, have been prone to mistake their antiquity. Thus Herodotus informs us (lib. ii. c. 43.) that the priests of Egypt reckoned from the reign of Memnon to that of Sethon, who put Sennacherib to flight, 231 generations of men, as many priests of Vulcan, and as many kings of Egypt; and as 3 generations were computed to amount to 100 years; the whole interval from Memnon to Sethon was estimated at 11340 years. The Chaldeans also boasted of their antiquity; for Callisthenes, the disciple of Aristotle, sent astronomical observations from Babylon to Greece, which were said to have comprehended an interval of 1903 years before the time of Alexander the Great; and they farther boasted, that they had observed the stars 47000 years. There were also others, who made the kingdoms of Assyria, Media, and Damascus, much older than the truth. Some of the Greeks, says Sir Isaac, called the times before the reign of Ogyges unknown, because they had no history of them; those between his flood and the beginning of the Olympiads, fabulous, because their history was very much blended with poetical fables; and those after the beginning of the olympiads, historical, because their history was free from such fables. The fabulous ages, however, wanted a good chronology; and so also did the historical, for the first 60 or 70 olympiads. Hence it appears, that the chronology of ancient kingdoms was involved in the greatest uncertainty; and this illustrious philosopher has shewn, that the Europeans in particular had no chronology before the Persian empire, which began 538 years before Christ, when Cyrus conquered Darius the Mede, and that the chronology which they now have of more ancient times has been since framed by reasoning and conjecture. In the beginning of that monarchy, Acuilias made Phoroneus as old as Ozyges and his flood; and that flood 1000 years older than the first olympiad, or 680 years more ancient than the truth; and in order to warrant this computation, his followers have increased the reigns of kings both in number and duration. The antiquities of the Greeks are full of fables, because their writings were composed only in verse. The ancient philosophers, as Orphus, Hesiodus, Parmenides, Xenophanes, Empedocles, and Thales, anciently delivered their opinions in verse, but this mode was afterwards discontinued. Plutarch farther informs us, (Oper. tom. ii. p. 462.)

CHRONOLOGY.

that Aristarchus, Timocharis, Aristillus, and Hipparchus, described astronomy in prose, without rendering it the more contemptible, after Eudoxus, Hesiod, and Thales had written concerning it in verse. We learn from Pliny (Nat. Hist. l. vii. c. 56.) that Pherecydes Syrius taught to compose discourses in prose in the 59th olympiad, or the reign of Cyrus; and Cadmus Milefus to write history. In another place (l. v. c. 29.) he says, that Cadmus Milefus, who flourished at a period somewhat earlier than the Persian monarchy, was the first who wrote in prose. Josephus (Cont. Apion.) informs us, that Cadmus Milefus and Acutillus, the oldest historians among the Greeks, flourished a little before the expedition of the Persians against the Greeks; and Suidas says of Acutillus, not only that he was a most ancient historian, but that he wrote genealogies out of tables of brass, found in a corner of his father's house. Pherecydes, already mentioned, wrote of the antiquities and ancient genealogies of the Athenians, in ten books, and was one of the first and best of the European writers of this kind, whence he obtained the name of "Genealogus;" and Dionysius Halicarnassensis (l. i. c. 13.) esteems him to be second to none of the genealogers. Epimenides, the historian or genealoger, who was a different person from the Cretan philosopher of the same name, wrote of the ancient genealogies; and Hellanicus, who was 12 years older than Herodotus, digested his history by the ages, or successions of the priestesses of Juno Argiva. Others digested theirs by the archons of Athens, or kings of the Lacedæmonians.

Ephorus, the disciple of Isocrates, digested his records by generations. Accordingly Polybius is of opinion, (lib. v. §. 33.) that this historian of Cumæ was the first who attempted to reduce chronology into a regular science, under the form of an universal history; and we know that he flourished in the time of Philip of Macedon, about 350 years before Christ. He began with the return of the Heraclidæ into Peloponnesus, and ended his chronological history with the siege of Perinthus, in the 20th year of Philip, the father of Alexander the Great, that is, eleven years before the fall of the Persian empire. We may observe, however, that the Arundelian marbles (which see), composed 60 years after the death of Alexander the Great, take no notice of olympiads, and reckon backwards from the then present time by years; and that in the histories of Herodotus and Thucydides, the dates of events are not ascertained by any fixed epochs; nor were the olympiads applied to this purpose at so early a period. Timæus of Sicily, who flourished in the reign of Ptolemy Philadelphus, about the middle of the third century before Christ, or in the 129th olympiad, was the first who attempted to establish an æra, by comparing the dates of the olympiads, the Spartan kings, the archons of Athens, and the priestesses of Juno, and adapting them to one another, according to the best of his judgment. Where he left off Polybius began, and continued the history. Before this time nothing satisfactory on the subject of chronology seems to have appeared; and the true reason is obvious, because before the conquests of Alexander, the Greeks had very scanty materials for such a work, as their knowledge was confined to a very narrow tract of country, and to the annals of a very short period of time. Their travellers could not easily impart the historical memoirs of the countries through which they passed, as they wanted the necessary advantages for this purpose; such were a thorough knowledge of the language of the country, a free access to all their principal records, and a perseverance in such laborious researches for several years. But general wars, notwithstanding the numberless disastrous calamities

that attended them, afforded opportunities for observing the situation, nature, and improvements, of other countries; and thus the progress and circulation both of learning and of other useful arts were the more easily propagated into different countries. Strabo informs us (Geog. lib. 1.) that the Greeks derived great advantages, even in their knowledge of geography, from the conquests of Alexander; for by his means they became more perfectly acquainted with the larger tracts of Asia, and all the northern parts of Europe to the river Ilter; and he might have added the whole extent of Egypt; so that, at the same time, they obtained the full possession of Babylon and Egypt, the two great fountains of ancient learning. The Romans, says Strabo, in like manner diffused the same light over the western parts of Europe, up to the river Elbe, which divided Germany into two parts; and they went beyond the Ilter even to the Tyra; and as for the countries round the lake Mæotis, and the sea coast to Colchis, they were undiscovered till the days of Mithridates surnamed Eupator, king of Pontus; and the Parthian empire made Hyrcania, Bactria, and the Scythians that lived beyond them, to be better known. We may therefore take it for granted that no general history could be properly composed, till the geography of these countries was sufficiently known, in order to describe the length of each particular kingdom, the number of its inhabitants, the progress of its armies, or the provinces that might be lost or acquired in its quarrels with other kingdoms. But whenever the access to all these countries was laid open by the conquests of Alexander; when so many new kingdoms were established under the Macedonian government, into which the citizens of all the Greek states were freely admitted; when it extended the Greek tongue, as an universal language, over Asia and Egypt; it gave the most favourable opportunity to several eminent men to write the histories of different nations. Berossus compiled the history of Chaldæa, from the records of Babylon; and Manetho that of Egypt, from the records of Memphis and of Thebes; and the Arundelian marbles gave a complete series of the annals of Greece from their earliest times; all of which were composed in that age, by contemporary writers. And when we add to this, that the great library of Alexandria was first formed under Ptolemy Philadelphus, into which the writings of all nations were collected; we may well conclude from this induction of particulars, that it was at this period, and not before, that chronology became a science. Moreover, if we consider the situation of the world at this time, we shall be confirmed in the same opinion. For, as there was a collection of proper materials brought together, such as the manuscripts of all nations must contain, it was impossible to separate the truth of history from the rubbish of fable; because facts are only to be canvassed from a multitude of circumstances, which combine together to give light to each other, while the cotemporary history of one country corresponds to the cotemporary state of another. As a library was necessary to furnish the materials for this purpose, we accordingly find that the first "great father of chronology" was Eratosthenes, appointed by Ptolemy Euergetes, the librarian of Alexandria, who flourished about 100 years after the death of Alexander the Great, who had access to that invaluable treasure of learning. The possession of such a multitude of historical memoirs both prompted and enabled him to determine the dates of many remote facts. And we are informed by Dionysius of Halicarnassus (lib. i. §. 46.) that in the execution of this work, he had laid down to himself certain "chronological canons," which that great writer declares he found to be accurate and uncorrupted; having examined them, in a traffic

CHRONOLOGY.

written upon that subject, which, to the regret of the learned world, has been irrecoverably lost. The chronographic canons, or general principles of the chronology of Eratosthenes, are found in the *Stromata* of Clemens Alexandrinus (p. 145); and they are as follow :

	Years.
From the taking of Troy to the return of the Heraclidae	80
From the return of the Heraclidae to the settlement of Ionia	60
From the settlement of Ionia to the guardianship of Lycurgus	159
From the guardianship of Lycurgus to the year next preceding the 11th olympiad	108
From that year to the invasion of Xerxes	297
From the invasion of Xerxes to the beginning of the Peloponnesian war	48
From the beginning to the end of that war	27
From the end of the Peloponnesian war to the battle of Leuctra	34
From the battle of Leuctra to the death of Philip	35
From the death of Philip to the death of Alexander	12

These numbers are fortunately confirmed by a passage of Dionysius Halicarnassensis (p. 60); from which we learn, that the 432d year from the taking of Troy was, according to the canons of Eratosthenes, the 11th of the 7th olympiad; which agrees with the Clementine numbers. Eratosthenes was succeeded by Apollodorus, the disciple of Panetius, the stoic philosopher, who flourished in the time of Ptolemy Physcon. The following circumstances may lead us to presume, that in his system of chronology, he followed Eratosthenes. They both agreed concerning the interval, that elapsed between the taking of Troy and the return of the Heraclidae, both making it 80 years. They also agreed concerning the age of Homer, and likewise concerning the age of Lycurgus; and they pursued the same method in determining it. Apollodorus adopted Eratosthenes's list of the kings of Thebais. Eratosthenes and Apollodorus have been followed by all succeeding chronologers. Nevertheless, after all the improvements made in chronological computation by the writers above-mentioned, chronology was still, in a very considerable degree, uncertain; and that it was reputed doubtful by the Greeks of those times is evident from several passages in the beginning of Plutarch's life of Lycurgus, and also in his life of Solon, to which we refer the reader.

As Cambyfes destroyed all the records of Egypt, imperfect and dubious as they were, we have no account of its inhabitants, which can be depended upon before their intercourse with the Greeks, from whom we derive all that is known of them, and that was not before the time of Pfammetichus, whose reign began in the year 600 B. C. Of this we are informed by Herodotus, who, speaking of those Grecians who had aided in setting Pfammetichus on the throne of Egypt, says, that the Ionians and Carians continued for a long time to inhabit those parts which lay near the sea, below the city of Bubastis, on the Pelusiac branch of the Nile, till in succeeding times Amasis, king of Egypt, caused them to abandon their habitations, and settle at Memphis, to defend him against the Egyptians. But from the time of their establishment, he says, they had no constant communication with the Greeks, that one may justly say we know all things that passed in Egypt from the reign of Pfammetichus to our age.

The chronology of the Latins was still more uncertain than that of the Greeks, &c. Plutarch (in *Romulo et Numa*), and Servius (in *Æneid. vii. v. 678.*) represent the

originals of Rome as attended with great uncertainties; nor can we wonder at this, when we consider that the old records of the Latins, or at least a considerable part of them, were burned by the Gauls in the year 390 B. C., or 120 years after the refuge, in 509 B. C., and 64 years before the death of Alexander the Great, in 454 B. C. Quintus Fabius Pictor, the oldest historian of the Latins, lived 100 years later than Alexander, and took almost every thing from Diocles Preperethius, a Greek. At the time when the Greeks and Latins were forming their technical chronology, there were among them great disputes about the antiquity of Rome. (See *EPOCHÆ* and *ROME*.)

The chronologers of Gallia, Spain, Germany, Scythia, Sweden, Britain, and Ireland, are of a still later date; for Scythia beyond the Danube, had no letters, till Ulphilas, its bishop, introduced them, about 600 years after the death of Alexander the Great; and Germany had none till it received them from the western empire of the Latins, above 700 years after the death of that king. The Huns had none in the days of Procopius, who flourished 850 years after the death of that king; and Sweden and Norway received them at a still later period. And it must be allowed, that things, said to be done above one or two hundred years before the use of letters, are of little credit.

After a general account of the defects and obscurity of the ancient chronology, sir Isaac observes, that, though many of the ancients computed by generations and successions, yet the Egyptians, Greeks, and Latins, reckoned the reigns of kings equal to generations of men, and three of them to a hundred, and sometimes to a hundred and twenty years; and this was the foundation of their technical chronology. He then proceeds to evince, from the ordinary course of nature, and a detail of historical facts, the difference between *reigns* and *generations*; and that, though the latter, from father to son, may at an average be reckoned about thirty-three years, or three of them equal to a hundred years, yet when they are taken by the eldest sons, three of them cannot be computed at more than about seventy-five or eighty years; and the reigns of kings are still shorter, so that eighteen or twenty years may be allowed a just medium. He then fixes on four remarkable periods, viz. the return of the Heraclidae into Peloponnesus, the taking of Troy, the Argonaucic expedition, and the return of Sesostris into Egypt, after his wars in Thracia; and settles the epocha of each by the true value of a generation. We shall confine ourselves at present to his estimate of that of the Argonaucic expedition. Having fixed the return of the Heraclidae to about the hundred and fifty-ninth year after the death of Solomon, and the destruction of Troy, to about the seventy-sixth year after the same period (see *HERACLIDÆ* and *TROY*), he observes, that Hercules the Argonauc was the father of Hyllus, the father of Cleodorus, the father of Arilomachus, the father of Arilodemus, who conducted the Heraclidae into Peloponnesus; so that their return was four generations, reckoning by the chief of the family, later than the Argonaucic expedition, which therefore happened about forty-three years after the death of Solomon. This is further confirmed by another argument. Esculapius and Hercules were Argonaucians. Hippocrates was the eighteenth inclusively from the former by the father's side, and the nineteenth from the latter by the mother's side; allowing twenty-eight or thirty years to a generation, the seventeen intervals by the father, and the eighteen intervals by the mother, will, at a medium, give five hundred and seven years; and these, reckoning back from the commencement of the Peloponnesian war, or four hundred and thirty-first year before Christ, when Hippocrates began to flourish, will place the Argonaucic expedition

tion in the forty-third year after Solomon's death, or nine hundred and thirty seven years before Christ.

If we date the commencement of the Peloponnesian war in the 2d year of the 87th olympiad, and count back 507 years, we shall come to the 162d before the olympiads, which is about the 37th year after the death of Solomon.

Sir Isaac Newton ascertains the Argonaute expedition, and several other principal events in the Grecian history, by such a variety of independent arguments, drawn from the fame and different mediums, all so agreeable to the present course of nature, that it seems impossible for a person who pays a sufficient regard to it not to be determined by them. It is surprising, indeed, that the manifest inconsistencies of the commonly received chronology with the course of nature, should not have prevented the establishment of it; and it is absolutely unaccountable, but upon the disposition which all men have discovered, to admit any hypothesis which tends to give dignity to their nations and families, by adding to the antiquity of them. But must it not be a more unaccountable attachment to established hypotheses, which can induce any person of the present age, after these inconsistencies have been so clearly pointed out, still to adhere to a chronology, which, in those turbulent unsettled times, supposes kings to have reigned one with another in some successions 35, in some 38, in some 40, in some 42, in some 44, and in some 46 years a-piece; and which generally allows about 60 years to a generation, and in one instance 85?

With respect to the chronology of the kings of Rome, Mr. Hooke has shewn, by several independent arguments, deduced from the connexion of events in the history of their reigns, that to suppose them to have reigned one with another 19 or 20 years, makes a more consistent series of facts, than to imagine them to have reigned 35 years a-piece, which is the common hypothesis.

The chief inconveniences attending the old chronology in the Roman history are, that it supposes an interval of 63 years of peace in that restless nation before the accession of Tullus Hostilius. It makes the reign of Servius Tullius so long in proportion to the few censuses, which (according to the most authentic records) were taken in his reign, as would argue a most unaccountable neglect of his own favourite institution. It obliges us to suppose Tarquinius Superbus not to have been the son of Tarquinius Priscus, Dido not to have been contemporary with Æneas, or Numa with Pythagoras, as well as Solon with Cræsus in the Grecian history; all which have the unanimous voice of all tradition in their favour, and what Dionysius Halicarnassensis, Livy, and Plutarch, express their extreme unwillingness to give up, but that they were compelled to it by a regard to a chronology which in their times was unquestioned. Indeed, the congress of Solon and Cræsus Plutarch expresses his determination not to give up, notwithstanding his general attachment to a theory which would not admit of it, and the fallacy of which he did not expect. To this purpose he says, 'The congress of Solon with Cræsus some think they can confute by chronology. But a history so illustrious, verified by so many witnesses, and, which is more, so agreeable to the manners of Solon, and worthy of the greatness of his mind and of his wisdom, I cannot persuade myself to reject because of some chronological canons, as they call them; which 100 authors correcting have not been able to constitute any thing certain, and have not been able to agree among themselves about repugnances.'

If the number of kings that reigned at Alba be joined to those who reigned at Rome, and they be allowed to have reigned 19 or 20 years a-piece, they will place the coming of Æneas into Italy, and the siege of Troy, exactly at the

time in which arguments drawn from generations and successions in Greece, as well as astronomical calculations (as we shall shew in the sequel), place that event, which is a reciprocal confirmation of the just correction both of the Greek and Latin chronology. For from Latinus to Numitor are 16 kings, who reigned at Alba; Romulus was contemporary with Numitor, and after him Dionysius and other historians reckon 6 kings more at Rome to the beginning of the consuls. Now these 22 reigns, at about 18 years to a reign one with another (for many of these kings were slain), took up 396 years, which, counted back from the consulship of J. Brutus and Valerius Poplicola, the two first consuls, place the Trojan war 78 years after the death of Solomon. See *Troy*.

This computation likewise agrees, as Sir Isaac has shewn, with what Apian, in his History of the Punic Wars, relates, out of the archives of Carthage, which came into the hands of the Romans, viz. that Carthage stood 760 years. This is a round number, but Solinus adds the odd years when he says, "Carthago post annos 737 quam fuerat extirpata excidit," which places Dido, the founder of Carthage, about 76 years after the death of Solomon. See *CARTHAGE*. It likewise agrees with the Arundelian marbles, which say that Teucer came to Cyprus 7 years after the destruction of Troy, and built Salamis, in the days of Dido. It is indeed an argument very much in favour of Newton's computations, that they agree very nearly with all the most ancient monuments, the most correct traditions of antiquity, and the oldest historians; particularly Herodotus and Thucydides, who wrote before chronology was corrupted by the vanity of their nation, or the absurd systems of later historians. Moreover, it conduces very much to the credibility of the Old Testament history, that the courses of generations and descents which are mentioned in it, parallel to those in the fabulous period of the Grecian history, fall within the same intervals of time with those which have been measured since history has been authentic. Consequently, it is another argument in favour of Newton's correction of the ancient Greek chronology, that it brings the courses of generations and successions in the one to correspond to those in the other. Besides, in several other respects it brings them to a greater harmony than can be attained on any other principles; and, in particular, it places the expedition of Sesostris (probably the same person with Sésac) at the precise time in which it is spoken of in the Scriptures. See *SESOSTRIS*.

The other kind of reasoning, by which Sir Isaac endeavours to establish the epocha of the Argonaute expedition, is purely astronomical. The sphere was formed by Chiron and Mæzus at the time, and for the use of the Argonaute expedition, as several of the asterisms, mentioned by Aratus, and referring to this event, plainly shew; and at this time (as several ancient writers testify) the cardinal points of the equinoxes and solstices were placed in the middle of the constellations of Aries, Cancer, Chelæ, and Capricorn. Our author establishes this point by a consideration of the ancient Greek calendar, which consisted of 12 lunar months, and each month of 30 days, and which required an intercalary month. Of course this lunifolar year, with the intercalary month, began sometimes a week or a fortnight before or after the equinox or solstice; and hence the first astronomers were led to the above-mentioned disposition of the equinoxes and solstices; and that this was really the case, is confirmed by the testimonies of Eudoxus, Aratus, and Hipparchus. On these principles, Sir Isaac proceeds to argue in this manner. In the end of the year 1689, the star called the *Prima Arictis* was in $9^{\circ} 28' 51''$ with north latitude $7^{\circ} 8' 58''$; and the star called the *Ultima cruce Arictis* was in $8^{\circ} 19' 3''$

CHRONOLOGY.

42" with north latitude $2^{\circ} 34' 5''$; consequently the equinoctial colure at this time cut the ecliptic in $8^{\circ} 6' 44''$, or by the calculations of bishop Horfley in $8^{\circ} 6' 50' 20''$, and by this reckoning the equinox was then gone back (according to Newton) $3^{\circ} 5' 44''$, and according to his editor Horfley $3^{\circ} 5' 20''$, since the Argonautic expedition. But it recedes $50''$ in a year, or 1° in seventy-two years, and consequently $36^{\circ} 44'$ in 2645 years; which counted backward from the beginning of 1693, will place this expedition about twenty-five years after the death of Solomon. According to Horfley's calculations the equinoctial points recede $36^{\circ} 50'$ in 2642 years. From the end of the year 1689, i. e. of the Julian period 6402, count back 2642, and you come to the year of the Julian period 3760, the 22d from Solomon's death, according to Petavius. But, as there is no necessity for allowing that the *middle* of the constellations, according to the general account of the ancients, should be precisely the middle between the *prima Arietis*, and *ultima Capre*, Sir Isaac Newton proceeds to examine what were those stars, through which Eudoxus made the colures to pass in the primitive sphere, and in this way to fix the position of the cardinal points. From the mean of five places he finds, that the great circle, which in the primitive sphere, described by Eudoxus, or at the time of the Argonautic expedition, was the equinoctial colure, did, in the end of 1689, cut the ecliptic in $8^{\circ} 6' 29' 15''$; or according to the calculations of bishop Horfley, in $8^{\circ} 6' 30' 05''$, and according to Raper's copy of Newton's chronology, $8^{\circ} 6' 30' 17''$, written by his own hand in the margin. He likewise, in the same manner, determines the mean place of the solstitial colure to be $82^{\circ} 28' 46''$, or, as Horfley states it, $82^{\circ} 28' 48''$; and as it is at right angles with the other, concludes that it is rightly drawn. Hence he infers, that the cardinal points, in the interval between that expedition, and the year 1689, have receded from these colures 1 sign 6° and $29'$; which, allowing seventy-two years to a degree, amounts to 2627 years; and these counted backwards, as above, will place the Argonautic expedition forty-three years after the death of Solomon, or about 37 years after this event; as placed by Petavius.

The principles on which the preceding calculation is founded are these: Let $\varphi p c$ (*Plate III Astronomy, fig. 22.*) be an arc of the ecliptic, φ being the equinoctial point at the end of the year 1689. Let the point P be the place of the first star in Aries (γ of Bayer) and C the place of the

last in the tail (τ of Bayer). Imagine a great circle of the sphere drawn through P and O; and bisect the arc PC in H. Then is H the middle point between P and C, through which the equinoctial colure of the primitive sphere passed. Therefore through H draw a great circle H A, which may make an angle of $66^{\circ} 30'$ with the ecliptic, the acute angle looking eastward. Then H A will be the equinoctial colure of the primitive sphere, and A the equinoctial point of that sphere.

To find the distance of A from φ , the equinoctial point of the sphere of 1690; find H the pole of the ecliptic; and through P, C, and H, draw circles of latitude, ΠP , ΠC , ΠH , meeting the ecliptic in the points p , c , and h : and from P and H draw arcs of great circles, P B and H D, perpendicular to ΠC . Now the arcs φp , φc , are given; being the given longitudes of the stars P and C at the end of the year 1689. Therefore $p c$, the difference of these arcs, is given, and the angle $p \Pi c$, which is measured by that given arc $p c$. But the arc ΠP is given, being the complement of the given latitude P p . Consequently in the right-angled spherical triangle, P B Π , the hypotenuse P Π is given, and the angle P ΠB . Therefore both the legs, P B, ΠB , will be given by trigonometry. But ΠB being given; since ΠC is also given, being the complement of the given latitude C c ; their difference, B C, is given. Therefore in the right-angled spherical triangle, P B C, the two legs, P B and B C, are given. Consequently the hypotenuse P C, and the angle P C B will be given by trigonometry. But P C being given, its half, H C, will be given. Therefore, in the right-angled spherical triangle, H D C, the hypotenuse C H being given with the angle H C D; the legs H D, D C, will be given by trigonometry. But D C being given, since ΠC is also given, their difference, ΠD , is given. And in the right-angled spherical triangle, $\Pi D H$, the two sides ΠD , D H, being given, the angle D ΠH and the hypotenuse ΠH will be given by trigonometry. But ΠH being given, its complement, H h , which is the latitude of the point, H, is given. And in the right-angled spherical triangle H h A, the side H h being given with the angle H A h ; the side h A, will be given by trigonometry. But the arc $h c$ is given, being the measure of the given angle D ΠH . Therefore the arc c A, the sum of $c h$ and h A, is given. But φc is given; consequently φA is given. Q. E. I.

Computation.

Given	$\varphi p = 28^{\circ} 51' 00''$	}	consequently	$p c = 20^{\circ} 12' 42''$
	$\varphi c = 49^{\circ} 03' 42''$		consequently	$\Pi p = 82^{\circ} 51' 02''$
	$P p = 7^{\circ} 8' 58''$		consequently	$\Pi c = 87^{\circ} 25' 58''$
	$C c = 2^{\circ} 34' 5''$			

Hence, in the right-angled triangle $\Pi B P$,	$\Pi p = 82^{\circ} 51' 02''$
	$P \Pi B = 20^{\circ} 12' 42''$
Therefore the legs	$P B = 20^{\circ} 2' 52''$
	$\Pi B = 82^{\circ} 23' 12''$
But	$\Pi C = 87^{\circ} 25' 55''$
Therefore	$B C = 5^{\circ} 02' 43''$

Hence, in the right-angled triangle P B C,	$P B = 20^{\circ} 2' 52''$
	$B C = 5^{\circ} 2' 43''$
Therefore	$P C B = 76^{\circ} 27' 00''$
And	$P C = 20^{\circ} 38' 51''$
Therefore	$H C = \frac{1}{2} P C = 10^{\circ} 19' 25.5''$

Hence,

CHRONOLOGY.

Hence, in the right-angled triangle HDC,	HC = 10° 19' 25"
And	HCD = 76 27 00
Therefore	HD = 10 1 59
And	CD = 2 26 57
But	πC = 87 25 55
Therefore	πD = 84 59 18

Hence, in the right-angled triangle πDH,	πD = 84 59 18
And	HD = 10 1 59
Therefore	DπH = 10 4 15 = <i>h</i>
And	πH = 85 3 55
Therefore	H <i>h</i> = 4 56 5

Hence, in the right-angled triangle H <i>h</i> A,	H <i>h</i> = 4 56 5
And	H <i>h</i> A = 66 30 00
Therefore	<i>h</i> A = 2 9 7
But	<i>cb</i> = 10 4 15
Therefore	<i>c</i> A = 12 13 22
But	π <i>c</i> = 49 3 42
Therefore	πA = 36 50 20

It should be observed, says bishop Horsley, that in finding the place of the equinoctial colure of the primitive sphere on the sphere of 1690; the obliquity of the ecliptic, on the primitive sphere, has been supposed to be just 23° 30', and the complement of the obliquity 66° 30'; and computing from these elements, we have found reason to conclude, that the primitive sphere of the Greeks was 2627 years older than the sphere of 1690. But at that distance of time, before the commencement of the year 1690, Dr. Horsley finds, by Mayer's tables, that the obliquity of the ecliptic was 23° 48' 54". He therefore assumes 23° 48' 30" for the obliquity on the primitive sphere, and repeating his calculations, he found the following five places of the primitive equinox on the sphere of 1690:

The primitive equinoctial colure being drawn	
Through γ of Aries - - -	87° 05' 34"
Through the middle point between γ and ζ Ceti 6	56 25
Through ε of Cetus - - -	7 23 16
Through τ of Perseus - - -	6 03 00
Through η of Perseus - - -	4 39 39

The mean place of these five is $8^{\circ} 25' 23''$: and if this be the place of the primitive equinoctial point on the sphere of 1690, the place of the summer solstice should be $\Omega 6^{\circ} 25' 23''$. But by the description of the solstitial colure it should be $\Omega 6^{\circ} 28' 46''$. It may be reasonable, therefore, to take $8^{\circ} 6' 27''$ and $\Omega 6^{\circ} 27''$ for the places of the primitive equinox and solstice on the sphere of 1690; by which reckoning these points will be less advanced by 2' than sir Isaac Newton has supposed. But these two minutes will not make a difference of 3 years in the age of the primitive sphere.

Our illustrious author hath, by other methods of a similar nature, established the epocha of the Argonautic expedition, as well as others, and reduced the age of the world about 500 years. What gives great weight to this argument, from the precision of the equinoxes is, that if we reckon from whatever time the position of the equinoctial points hath been mentioned by astronomers whose age is known, this motion, counted backwards, fixes that great event in the same year. It likewise demonstrates, that the observations of the ancients, though coarse enough, as sir Isaac Newton acknowledges, are sufficiently exact for the purpose. This being a remarkable circumstance, the particulars of it are as follow. According to Pliny, and the calculations of Petavius, Thales, who wrote a book of the tropics and equinoxes, fixed the

equinoxes and solstices in the 11th degree of their respective signs; so that they had receded $4^{\circ} 26' 52''$ from their original place at the time of the Argonautic expedition. This answers to 320 years, and calculated backwards from the 41st olympiad, when Thales was a young man, fit to apply to astronomical studies, will place that event 44 years after the death of Solomon.

Petavius, in the calculation above referred to, deriving information from Pliny (l. xviii. c. 25.), who says, that Thales determined the "occulus matutinus" of the Pleiades to be upon the 25th day after the autumnal equinox, thence computes the longitude of the Pleiades in $\gamma 23^{\circ} 53'$, and consequently that the *Lucida Pleiadum* had, since the Argonautic expedition, moved from the equinox $4^{\circ} 26' 52''$, as above stated. From the passage of Pliny, to which we have now referred, an objection has been deduced against the chronological computation of Newton. Pliny's authority, it is said, avails as much to prove, that Hesiod places the morning-setting of the Pleiades on the very day of the equinox, as that Thales placed it 25 days later. And if it be true, that *Lucida Pleiadum* did really set at sun-rise on the day of the autumnal equinox, in the age of Hesiod; this will much more refute sir Isaac's date of the Argonautic expedition than the assumption, that the morning-setting of the same star was 25 days later in the age of Thales, confirms it. For it is agreed, that Hesiod was some time later than the Argonautic expedition; for we have his own testimony, that he lived after the war of Troy. The Argonautic expedition happened, according to sir Isaac Newton, in that age when the longitude of *Lucida Pleiadum* was in the 20th degree of the sign of Aries. But when this star set at sun-rise, on the day of the autumnal equinox, its longitude must have been rather behind the vernal equinox; as any astronomer, who will take the trouble to make the necessary calculations, may easily perceive. So that between the age of Hesiod, as thus defined by the morning setting of the *Lucida Pleiadum*, and that time which sir Isaac Newton assigns to the Argonautic expedition, the stars must have advanced more than 20 degrees in longitude; and a change of 20 degrees, at the rate of 1" in 72 years, requires 1440 years. Consequently, it may be said, his date of the Argonautic expedition cannot be less than 1700 years too late.

To this specious objection Newton might have replied, that Pliny reports the season of the morning-setting of this star, in the age of Hesiod, from a book of astronomy, which

CHRONOLOGY.

which he says only, that it was extant *under the name of Hefiod*: and that this book could not be Hefiod's. For Hefiod speaks of Arcturus as rising at sun-set 60 days after the winter solstice. And it is impossible that any star of the Pleiades could set at sun-rise, on the day of the autumnal equinox, in the same age when Arcturus rose at sun-rise 60 days after the winter solstice; or that these two circumstances of the sphere should be removed from each other by a less interval of time than the space of 1440 years. This book of astronomy, extant in Pliny's time, under the name of Hefiod, must have been a supposititious work, and probably the imposition of some petty retailers of science in the decline of the Grecian learning. The extravagant antiquity, which it gives to the Greek astronomy, entirely destroys its credit.

According to Columella, Meton, and Eusebion, who published the lunar cycle of 19 years (see CYCLES), and for this purpose observed the summer solstice in the 316th year of Nabonassar, the year before the Peloponnesian war began, placed the summer solstice in the eighth degree of Cancer, which is at least 7° more backwards than at first. This interval answers to 504 years, which counted backwards from the year of observation, makes the Argonautic expedition fall upon the 44th year after the death of Solomon. Lastly, Hipparchus, who first discovered that the equinoxes had a regular motion backwards, made his observations about the 602d year of Nabonassar, and fixed the vernal equinox in the fourth degree of Aries. Consequently, the equinoctial points had receded eleven degrees since the Argonautic expedition, which is equivalent to 792 years, and which counted backwards, places the expedition in the 43d year after the death of Solomon. These coincidences are remarkable, and could not have placed the same event so near the same year, unless all the observations had been sufficiently exact. And when we consider the coincidences of a great many more independent evidences, derived from the course of generation, and the order of succession, with those which are deduced from astronomical principles, nothing seems to be better established than that the Argonautic expedition, an event on which the whole Greek chronology depends, really happened about 43 years after the death of Solomon, and not in the days of Gideon, above 300 years before, as the common opinion has flated it.

The rising and setting of the sun depend also upon the precession of the equinoxes. Any writer, therefore, who mentions the rising or setting of any star, at any particular time of the year, with respect to the sun, furnishes us with data sufficient to determine the time in which he wrote. Thus Hefiod tells us, that 60 days after the winter solstice the star Arcturus rose just at sun-set; from which circumstance it is easily calculated that Hefiod flourished about 100 years after the death of Solomon, or in the generation, or age, next after the Trojan war, as Hefiod himself declares; and this affords another independent argument for the date assigned by Newton to that war, and the whole Greek chronology connected with it. Bishop Horfley, in his edition of Newton's works, observes that he cannot deduce Sir Isaac Newton's conclusion from his premises. When Arcturus rose at sun-set 60 days after the winter solstice, he finds the longitude of that star to have been $13^{\circ} 28' 38''$, which exceeds its longitude on the primitive sphere by no more than $1^{\circ} 46''$. Taking the longitude and latitude of Arcturus, each such as it was in the primitive sphere, viz. the longitude $19^{\circ} 13' 26'' 5''$, the latitude $30^{\circ} 32' 18''$, he finds, that when the star rose at sun-set, the sun's true place must have been $26^{\circ} 56'$; and according to the situation of the aphelion

of the earth's orbit, which obtained in that age of the world, when the equinoxes were in $8^{\circ} 6' 27''$, and $11^{\circ} 6' 27''$ of the sphere of 1690, the sun was in this place 60 days after the winter solstice. So that the conclusion from this passage of Hefiod should rather be that he flourished in that very age when the Greeks first formed their sphere; that is, according to Newton's system, in the age of the Argonautic expedition. The bishop supposes the truth to be, that before the retrograde motion of the equinoctial points was discovered, all writers speak of the risings and settings of the stars, as they were flated by the astronomers who first formed the sphere. This was probably the case with regard to Hefiod in particular, if he lived so near the age of the Argonautic expedition, and the beginning of the Greek sphere, as Sir Isaac supposes. No conclusion is therefore to be drawn, concerning the particular age of any writer, much older than Hipparchus, from what he may say of the phenomena of the sphere; unless it be certain, that he was a practical astronomer, and lived at such a distance of time from the commencement of the Greek astronomy, as might produce sensible changes in the seasons of the risings and settings of the stars. Such writers might, indeed, without any knowledge of the motion of the equinoxes, describe the phenomena according to their own observations, and impute the difference, between what they saw and what their masters had delivered, to the coarseness of the first observations. Bishop Horfley, when he speaks of the appearances of the primitive sphere, means the appearances in the latitude of 40° N., at that time when the vernal equinox was in $8^{\circ} 6' 27''$ on the sphere of 1690.

Sir Isaac Newton having, by the concurring aids of Scripture and reason, refused the chronology of the Greeks, made use of this rectified chronology to adjust the contemporary affairs of the Egyptians, Assyrians, Babylonians, Medes, and Persians. His elaborate system, however, has not escaped censure. M. Freret and M. Soucier have attacked it on much the same ground: the former hath confounded *reigns* and *generations*, which are carefully distinguished in this system. The astronomical objections of both have been answered by Sir Isaac Newton himself, and by Dr. Halley. Phil. Trans. Abr. vol. viii. part iv. p. 43 &c. Newton's Chronology, ch. 1.

Mr. Gibert, in a letter published at Amsterdam in 1743, has attempted to reduce the Babylonian, Egyptian, and Chaldean annals to our chronology. He begins with shewing, by the authorities of Macrobius, Eudoxus, Varro, Diodorus Siculus, Pliny, Plutarch, St. Augustin, &c. that by a year the ancients meant the revolution of any planet in the heavens; so that it consisted sometimes only of one day. Thus, according to him, the solar day was the astronomical year of the Chaldeans; and the boaled period of 473,000 years assigned to their observations is reduced to 1297 years, 9 months; the number of years which elapsed, according to Eusebius, from the first discoveries of Atlas in astronomy, in the 384th year of Abraham, to the march of Alexander into Asia in the year 1682 of the same era; and the seventeen thousand years added by Berofus, to the observations of the Chaldeans, reduced in the same manner, will give forty-six years, and six or seven months, being the exact interval between Alexander's march, and the first year of the 123d olympiad, or the time to which Berofus carried his history. Epigenius attributes 720,000 years to the observations preserved at Babylon; but these, according to M. Gibert's system, amount only to 1671 years, three months, which differ from Callisthenes's period of 1903 years allotted to the same observations, only by 68 years, the period elapsed from the taking of Babylon by Alexander, which terminated the latter

CHRONOLOGY.

latter account, and to the time of Ptolemy Philadelphus, to which Epigenius extended his account.

CHRONOLOGY sacred. The systems of sacred chronology have been very various. Nor is this to be wondered at, since our three biblical copies of principal note give a very different account of the first ages of the world. The Hebrew text reckons about 4000 years from Adam to Christ, and to the flood 1656 years; the Samaritan makes this interval longer, and reckons from Adam to the flood only 1307 years; and the version of the Septuagint removes the creation of the world to 6000 years before Christ. The interval between the creation and flood, according to Eusebius and the Septuagint, is 2242 years; according to Josephus and the Septuagint, 2256 years; and according to Julius Africanus, Epiphanius, Petavius, and the Septuagint, it is reckoned at 2262 years. Many attempts have been made to reconcile these differences; but none are quite satisfactory. See **EPOCHS, SAMARITAN, &c.**

Walton, and I. Vossius, give the preference to the account of the Septuagint. Walton's Prolegomena. Vossii Chronologia Sacra. Others have defended the Hebrew text. The reader may find an abstract of the different opinions of learned men on this subject, in Strauchius's *Brev. Chron.* translated by Sault, p. 166, &c. and p. 176.

The more eminent writers on chronology, among the ancients are, Julius Africanus, in the third century; Dionysius Exiguus, Eusebius, and Cyril.

Among the moderns, Bede, Fuceius, Mercator, Lilius, Clavius, Scaliger, Vietta, Petavius, Cassini, Munter, Calvisius, Hardouin, Capellus, Uther, Newton, Marham, Helvicus, I. Vossius, Pagi, Strauchius, Perron, Blair, Playfair, &c.

It will be proper to add to the above account of the history and principles of chronology a few words on the construction and utility of *Chronological Tables*. By means of such tables history is reduced into a short compass, and the reader is aided in the study of it. Thus an entire course of history is easily comprehended, and at the same time a proper distinction may be observed between its several parts. If such tables consist of nothing more than an enumeration of the capital events in history, thrown together promiscuously, without any distinction of kingdoms, regard being only had to the order of time in which the events happened, they have their use. We thus see, at almost one view, the principal things which history records, and from the dates annexed to each article, we form an idea of the interval of time between one and another of them; such tables are often compiled for single histories; of this kind is the "short Chronicle" prefixed to "Newton's Chronology." But in a more complex and extended history, it will be useful to keep

the separate parts distinct, and, for this purpose, to arrange them in different columns. By such means we obtain a distinct idea of the course of any single history; and at the same time a clear comparative view of the cotemporary state of any other history which was parallel with it. The neglect of this method has introduced confusion into the chronological tables published with the "Universal History," and the advantage resulting from it may be perceived in those of Marshall, Talents, &c. Besides a distinct view of the succession of events in different histories, it is an advantage to have, in separate columns, an account of the "great men," in arts or in arms, which each age has produced. This has been exhibited by the last-mentioned authors and others. For this purpose two columns are quite sufficient; one for statesmen and warriors, and the other for men of learning and science. Another improvement in chronological tables has been to annex a variety of dates, in distinct columns, to every event, to save the reader the trouble of reducing the different methods of computation to one another. But many chronologers have multiplied these different epochs far beyond any real use, so as greatly to encumber their page, and leave little room for more valuable matter. Helvicus furnishes an example of this kind. Four æras are abundantly sufficient, viz. the year before and after Christ, and the Julian period to run through the whole extent of the work; the olympiads for the course of the Grecian history; and the year of the city for the Roman. These are used by Blair. The last, and capital improvement in chronological tables, which has been effected in some measure by Talents and Marshall, more perfectly in Helvicus, but most completely by Blair, is to dispose the events in such a manner, as that the distance at which they are placed, without attending to the date in the margin, shall give a just idea of the real interval of time between them. This is done by having a single line, or any fit interval appropriated to any certain period of time, or number of years. In the chronological tables engraved by Sturt, we see a great deal of matter, by a singular method, and the help of arbitrary and symbolical characters, crowded into a short compass; so that we see the state of the several kingdoms of Europe for any century since the Christian æra in a single page. This author has also annexed an alphabetical index to his work, in which, by the help of symbols, he has expressed the character of every prince mentioned in his tables, and the principal events of his life. This small work is valuable for its conciseness, but is not so much recommended by its distinctness. Genealogical tables are of very considerable use in subordination to those of a chronological kind; for an account of which, see **GENEALOGY**. Priestley's *Lectures on History*, &c. 1788.

A

CHRONOLOGICAL TABLE

OF

Remarkable Events, Discoveries, and Inventions, from the Creation to the Year 1807.

B. C.
4004.—Creation of the world, at the autumnal equinox, on Sunday, October 23, according to archbishop Uther and the Hebrew text.
Julian 5872, according to the LXX.
period. 4700, according to the Samaritan.
Creation of Adam and Eve, on Friday, Oct. 28.

B. C.
4003.—The Birth of Cain, the first who was born of a woman.
3875.—Abel murdered by Cain.
3874.—The birth of Seth.
3017.—Enoch translated to heaven for his piety, at the age of 365.
3317.—Birth of Methusalem, who died at the age of 960.

B. C.

- 2948.—Birth of Noah, who died at the age of 950.
 2446.—Birth of Shem, who died at the age of 600.
 2349.—Noah entered the ark on Sunday, Nov. 30th, and on Sunday, Dec. 7, it began to rain.
 2348.—The deluge.—On Wednesday, May 6, the ark rested on mount Ararat.—On Friday, Dec. 18, Noah left the ark, built an altar, and offered sacrifice to God for his deliverance.
 2247.—The tower of Babel is built about this time by Noah's posterity in the valley of Shinar, upon which God miraculously confounded their language, and thus dispersed them into different nations.
 2234.—Celestial observations begun at Babylon, a register of which was sent by Callisthenes to Aristotle for 1903 years to the capture of that city by Alexander in the year 331 B. C.
 2221.—The Chaldean monarchy founded by Nimrod.
 2207.—The Chinese monarchy founded, according to some historians.
 2188.—The kingdom of Egypt commences under Misraim, the son of Ham, which lasted for 1663 years, to the conquest of Canbyces, in the year 525 B. C.
 2089.—The kingdom of Sicily established.
 2059.—The kingdom of Assyria begins.
 1996.—Abram born, who died 1821, at. 175.
 1921.—The covenant made by God with Abram, when the 430 years of sojourning commenced.
 1897.—The covenant renewed with Abram, his name changed to Abraham.—Circumcision instituted.—The cities of Sodom, &c. destroyed.
 1806.—The birth of Isaac.
 1871.—Trial of Abraham's faith by the command to offer his son Isaac.
 1856.—The kingdom of Argos begins.—Isaac marries Rebekah.
 1827.—The 17th dynasty of the six shepherd kings in Egypt begins, and continues 103 years.
 1822.—Memnon, the Egyptian, invents the letters.
 1796.—The reign of Ogyges begins 1020 years before the first olympiad.
 1764.—The deluge of Ogyges, which laid waste Attica for more than 200 years, till the coming of Cecrops.
 1759.—Jacob, blessed by his father, goes to Haran, and marries the two daughters of his uncle Laban.
 1728.—Joseph sold into Egypt.
 1715.—Joseph interprets Pharaoh's dreams, and is promoted.—The 7 years of plenty begin.
 1708.—The 7 years of famine begin.
 1706.—Joseph discovers himself to his brethren.
 1702.—All the lands in Egypt, sold to Joseph, who let them out with a perpetual tax of a fifth part of their produce.
 1689.—Jacob predicts the advent of the Messiah, and dies at. 147.
 1635.—Joseph foretels the egress of the Israelites from Egypt, and dies at. 110, having been pæfect of Egypt for 80 years. His death terminates the book of Genesis, containing a period of 2399 years.
 1615.—The Ethiopians, coming from the Indus, settle in the neighbourhood of Egypt.
 1582.—The chronology of the Arundelian marbles begins, at which time Cecrops is supposed to have come into Attica.
 1574.—Aaron born, and in the following year Pharaoh pub-

B. C.

- lishes an edict for drowning all the children of the Israelites.
 1571.—Moses born.
 1556.—Cecrops brings a colony of Saïtes from Egypt into Attica, and founds the kingdom of Athens, 780 years before the 1st olympiad.
 1546.—About this period Scamander comes from Crete into Phrygia, and begins the kingdom of Troy.
 1531.—Moses visits the Israelites; flies into Midian, and continues there 40 years.
 1503.—The deluge of Deucalion in Thessaly.
 1497.—The council of Amphictyons established.
 1493.—Cadmus carried the Phœnician letters into Greece and built the citadel of Thebes.
 1491.—God appears to Moses in a burning bush, and sends him into Egypt, where he performed many miracles, and insisted on Pharaoh to successeive plagues, till he allowed the Israelites to depart, in number amounting to 600,000 besides children, on Tuesday the 5th of May, which completed the 430 years of sojourning. On Monday, May the 11th, Moses opened a passage for the Israelites through the Red Sea into the desert of Etlam, when Pharaoh's host attempting to follow them, were drowned; about the 22d of June they arrive in the desert of Simai, near mount Horeb, where they remain near a year, during which Moses receives from God and delivers to the people the 10 commandments, with other laws, and sets up the tabernacle, containing the ark of the covenant.
 1490.—Sparta built by Lacedæmon.
 1485.—The first ship that appeared in Greece, brought from Egypt by Danaus firmamed Armais.
 1480.—Troy supposed to have been built by Dardanus.
 1453.—The first Olympic games celebrated at Elis by the Idæi Daëtyli.
 1452.—The 5 books of Moses written in the land of Moab, where Moses died in the following year, at. 110.
 1451.—The Israelites, under Joshua, pass Jordan and enter Canaan, on Friday, April 30.
 1445.—Joshua divides the land of Canaan, and rests from his conquest upon the sabbatical year, which begins from the autumnal equinox.
 1426.—Joshua dies at Timnath-Serah, at. 110.
 1415.—The Israelites, sunk into idolatry, continued in slavery under Cushan, king of Mesopotamia, for 8 years.
 1406.—Minos gives laws to the Cretans, and acquires a great maritime power.—Iron is found by the Idæi Daëtyli from the accidental burning of the woods of mount Ida in Crete.
 1405.—Othniel, the first judge of Israel, defeats Cushan, and gives rest to Israel, in the 40th year after that given them by Joshua.
 1390.—Benjamin almost totally destroyed by the other 11 tribes, Phineas being high-priest.
 1383.—Ceres came to Athens, and taught them to sow corn.
 1356.—The Eleusinian mysteries first introduced at Athens.
 1344.—The kingdom of Mycene begins about this time, when the kingdom of Argos was divided; Mycene forming the most considerable part.
 1343.—The Israelites, relapsing into idolatry, enslaved by Eglon, king of Moab, for 18 years.
 1336.—The Ithmian games first instituted.

- B. C.
 1325.—Ehud, the 2d judge of the Israelites, kills Eglon, and relieves them from their 2d bondage; the great Egyptian canicuar year began on Saturday, July 26, and consisted of 1460 years.
 1307.—The Olympic games instituted by Pelops.
 1305.—The 3d servitude of the Israelites under Jabin, king of Canaan, which continued 40 years.
 1300.—The Lupercalia instituted.
 1285.—Deborah the prophetess defeats the Canaanites under Siera, and Israel had rest in the 40th year after that given by Ehud.
 1284.—The Siculi pass out of Italy into Sicily, about 3 generations before the Trojan war. Others say the first colony arrived in 1294, and a second in 1264.
 1263.—The Argonautic expedition, 79 years before the taking of Troy. According to others, in 1225. About this time the first Pythian games were celebrated by Adraftus.
 1252.—The 4th servitude of the Israelites under the Midianites, which continued for 7 years.—The city of Tyre was built.
 1245.—Gideon routs the Midianites, and Israel had rest in the 40th year after that given by Deborah.
 1243.—A colony of Arcadians, conducted by Evander into Italy.
 1234.—Theseus settles a democracy in Attica, and renews the Isthmian games; others say in 1231.
 1233.—Carthage founded by the Tyrians.
 1225.—The Theban war of the 7 heroes.
 1222.—The celebration of the Olympic games by Hercules.
 1213.—The rape of Helen by Theseus.
 1206.—The 5th servitude of the Israelites under the Philistines and Ammonites, which continued 18 years.
 1198.—The rape of Helen by Paris; others say in 1204.
 1194.—The Trojan war begins, and continues 10 years.
 1188.—Jephtha, the 7th judge of Israel for 6 years, his rash vow with respect to his daughter.
 1184.—Troy is taken and burned by the Greeks, in the night, between the 11th and 12th of June, 408 years before the 1st olympiad.—Æneas set sail in the beginning of autumn for Thrace.
 1182.—The kingdom of the Latins begins under Æneas, who builds Lavinium.
 1179.—The maritime power of the Mediterranean acquired by the Lydians.
 1176.—Salamis in Cyprus built by Teucer.
 1157.—Eli the high priest, 11th judge of Israel for 40 years.
 1156.—The 6th servitude of the Israelites under the Philistines, which continued 40 years.
 1152.—The city of Alba-Longa built by Ascanius, 2d king of the Latins.
 1141.—The Amazons burned the temple of Ephesus.
 1136.—Sampson kills 3000 Philistines.
 1134.—The migration of the Æolian colonies 80 years before that of the Ionians.—Thebes built by the Bœotians.
 1122.—The 3d dynasty of China, called Tchou, begins.
 1117.—Sampson betrayed to the Philistines.—Eli dies.
 1116.—Samuel the 12th and last judge of Israel for 21 years.
 1115.—The mariner's compass said to be known in China.
 1104.—The return of the Heraclidæ into Peloponnesus; they divide it.—The kingdom of Lacedæmon begins.—That of Mycænæ ends.—Others say that the kingdom of Lacedæmon, or Sparta, commenced in 1102.
- B. C.
 1095.—The Israelites obtain a king, and Saul anointed by Samuel.
 1073.—Saul rejected, and David anointed king.
 1088.—The kingdom of Sicyon ends; others say in 1130.
 1070.—The kingdom of Athens ends in Codrus, and governed by archons.
 1058.—The Pelagians, the 2d people who acquire the maritime power of the Mediterranean.
 1055.—Saul consults the witch of Endor, and kills himself on mount Gilboa.
 1048.—Jerusalem taken by David from the Jebusites, and made the seat of his kingdom.
 1044.—The migration of the Ionian colonies from Greece, 60 years after the return of the Heraclidæ, and their settlement.
 1034.—David reproved by Nathan, and repents.
 1023.—Absalom rebels, and is killed by Joab.
 1012.—Solomon begins to build the temple, 480 years after the exodus from Egypt; others say in 1016.
 1004.—The temple dedicated on Friday, October 30th, 1000 years before Christ; others say in 1008.
 1000.—The Thracians acquire the maritime power of the Mediterranean, about this time, and hold it for 19 years.
 996.—Solomon's fleet prepared in the Red Sea, and sent to Ophir.
 992.—Solomon's palace finished, which with the temple employed him 20 years.
 986.—Samos, in the island of the same name, and Utica, built about this time.
