CONTINUI SOLUTIO. See SOLUTIO.

CONTINUITY is usually defined among *Schoolmen*, the immediate cohesion of parts in the same *quantum*. Others define it, a mode of body, whereby its extremes become one; and others, a state of body resulting from the mutual implication of its parts.

Continuation relates to *duration*, and continuity to *extension*. We say, the *continuation* of a work, or an action; and the *continuity* of space or size; *continuation* of the same conduct; and *continuity* of the same building.

There are two kinds of continuity, *mathematical* and *physical*. The first is merely imaginary and fictitious; since it supposes real or physical parts where there are none. *Physical* continuity is, strictly, that state of two or more parts, or particles, wherein they appear to adhere, or constitute one uninterrupted quantity, or *continuum*; or between which we perceive no intermediate space.

The schoolmen distinguish two other sorts of continuity; viz. *homogeneous*, and *heterogeneous*. The first, where our senses do not perceive the bounds, or extremes, of the parts; and this agrees even to air, water, &c. The second, where our senses indeed perceive the extremes of certain parts, yet at the same time observe the same parts closely linked to each other; either in virtue of their situation or figure, &c. and

and this is chiefly attributed to the bodies of animals and plants.

The continuity of bodies is a state merely relative to our sight and touch: *e. gr.* if the distance of two separate objects be such, as that the visual angle they subtend is insensible to the eye, which it will be if less than sixteen seconds, the two separate bodies will then appear *contiguous*. Now, the result of several *contiguous* objects, is a *continuity*: so that any number of visible objects, being placed so as that the distances subtend angles of less than sixteen seconds, they will appear to form one *continuum*.

And hence, as we can determine the distance at which any given magnitude becomes invisible; it is easy to find at what distance any two bodies, however remote from each other, will appear as contiguous; and several, as forming one *continuum*. For the physical cause of continuity, see COHESION.

Leibnitz, an eminent mathematician, has supposed what he calls a law of continuity to obtain in the universe, by which law every thing that is executed or done in nature, is done by infinitely small degrees. He urges, that good sense dictates this truth, *natura non operatur per saltum*, or that nothing can pass from one extreme to another, without passing through all the intermediate degrees. Bernoulli Opera, tom. iii. p. 9. *sq.*

This law seems subject to difficulties: rigorously taken, it supposes actual, and yet infinitely small changes, which some philosophers cannot resist; and if we suppose changes only imperceptible to our senses, but finite, the law of continuity is no less violated, than if the universe were to be suddenly destroyed, as M. Maupertuis justly observes. Mem. de l'Acad. de Berlin. tom. ii. p. 284.

This law of continuity led Mr. Bernoulli to reject all hard bodies as chimeras, and naturally impossible.

CONTINUO, in the *Italian Music*, is sometimes applied to *basso*, to signify the thorough-bass. That *l'asso continuo*, is the continual, or thorough-bass. It is sometimes marked in music books by the letters B, C.

CONTINUO is also used for a species of harmony mentioned by Julius Pollux, and which, says Zarlino, answers to the perpetual burden of our bag-pipes, which now and then must be harmonious.

CONTINUOUS FEVERS. See CONTINUED fever.

CONTINUUM, or CONTINUED quantity, in *Physics*, denotes a quantity, or co-extension, whose parts are not divided, but joined and connected together, so as to leave no room to determine where one begins, and another ends.

It is controverted, among philosophers, whether a *continuum* be infinitely divisible, *i. e.* divisible into infinite proportionable parts?

The ancients attributed the rise of water, in pumps, to the love of continuity, and the abhorrence of a vacuum; because the weight and pressure of the air were not then known.

Mathematicians divide quantity into *continued* and *discrete*. The former being that which is expressed by lines, and makes the subject of geometry; and the latter comprehending those that are expressed by numbers, which make the subject of arithmetic.

In medicine and chirurgery, wounds, ulcers, fractures, &c. are expressed by the phrase *solutio continui*, or *solution of continuity*.

In a critical sense, we say, there ought to be a continuity, *i. e.* a connexion between the parts of a discourse.

In the epic poem, particularly, the action should have a continuity in the narration, though the events, or inci-

dents. be not continued. As soon as ever the poet has opened his subject, and brought his persons on the stage, the action is to be continued to the end; every character must be at work, and no such thing as an idle person to be seen.

F. Bossu observes, that, by retrenching dull languishing incidents, and intervals void of action, which break the continuity, the poem acquires a continued force, which makes it run equally throughout.

CONTOBADDITES, a sect in the sixth century. Their first leader was Severus of Antioch, who was succeeded by John the grammarian, surnamed Philoponus, and one Theodosius; whose followers were also called Theodofians.

Some of them who were willing to receive a book composed by Theodosius on the Trinity, made a separate body, and were called *Contobaddites*, from a place not known, which Nicephorus does not mention, but which must apparently have been the place where they held their assemblies.

The Contobaddites allowed of no bishops; which is the only circumstance transmitted to us concerning them.

CONTOCOOK, in *Geography*, a river of the United States of America, in New Hampshire, which runs into the Merrimack, four miles N. of Concord.

CONTOPECTÆ, of *κοντος, pole*, and *πηκτος, compati*, in *Antiquity*, a sort of artists who supported a pole on their foreheads so firmly, that boys could play, dance, and wrestle together on it.

CONTOR, or CUNTORE, in *Ornithology*. See CONDOR.

CONTORSION, in *Surgery*, a twisting or deformity of some part of the body; arising generally from a diseased structure of the bones, or an irregular action of the muscles. Thus a contorsion of the back may be occasioned by a caries, or a rickety disposition in the vertebrae; and a contorsion, or twisting of the head, so that the chin shall be turned towards one shoulder, may arise from a paralysis, or a spasmodic state of the sterno-mastoid muscle. But the nature of this disease is more particularly described under the article DISTORTION, to which the reader is referred.

CONTORTÆ, or CONTORTI, in *Botany*, the twentieth natural order in the *Philosophia Botanica* of Linnæus, and the thirtieth of the *Prælections*. In the *Philosophia Botanica*, it consists of the following genera: *rauwolfia*, *tevetia*, *cerbera*, *plumiera*, *tabernamontana*, *cameraria*, *periploca*, *nerium*, *vinca*, *apocynum*, *cynanchum*, *ceropogia*, *asclepias*, *stapelia*. In the *synoptic table*, annexed to the *Prælections*, they stand thus: I. Pericarp a follicle; *tabernamontana*; *cameraria*; *plumiera*; *echites*; *nerium*; *ceropogia*; *vinca*; *apocynum*; *asclepias*; *cynanchum*; *periploca*; *argularia*; *stapelia*; **umbotrium*, *Forst.* **rhopala*, *Aubl.*; *plecronia*? *allamanda*. II. Pericarp a capsule; *macrocnemum*; *manettia*; *cinchona*, removed from *cymolfa*; *portlandia*; *rondeletia*; *hillsia*; *genipa*. III. Pericarp a berry; *gardenia*; *musfenda*; *randia*; **lagraea*, *Thunb.*; *carissa*; *pæderia*; *arduaia*; *lycium* and *cestrum*, both removed from *vepoculæ*; **gynopogon*, *Forst.* **willughbeja*. *Schreb.*; *melodinus*, *Linn. jun.* IV. Pericarp a drupe; *rauwolfia*; *cerbera*. Those printed in italics were added by Linnæus himself; those marked with an asterisk, by Giseke from other authors. The order was named by Linnæus, from the form of the corolla, which is twisted in a direction contrary to the sun: its border, when open, resembles a wheel, each segment having generally unequal sides, with the shorter side placed under the longer side of the preceding one. Only three of the genera are natives of Europe, *asclepias*, *vinca*, and *cynanchum*: most of them are lactescent and poisonous;

some highly deleterious. *Root* perennial. *Leaves* undivided, generally opposite, sometimes three or four together, rarely alternate. *In-florescence* of ten singular, the peduncle arising from the side of the stem betwixt the pairs of leaves, not from their axils. *Calyx* one-leaved, five-cleft. *Corolla* regular, monopetalous, five-cleft; structure of the nectaries in most genera very singular. *Stamens* five. *Pistils* two, or one with a double stigma. *Germ* generally superior.

CONTOUR, in *Painting* or *Drawing*, a French word, synonymous with *contours* in the Italian, and outline in the English language. Perfection of outline constitutes, perhaps, the greatest difficulty in painting; although it is, properly speaking, only *one* of the requisites of design; yet the knowledge of it seems necessary to pre-suppose a thorough acquaintance with all the remainder; and hence the adage of Annibale Caracci, not very delicately expressed in the Italian, "Give me but a correct outline, and fill it up as you please!" See **DESIGN**.

CONTOUR, also denotes the compass, limits, or enceinte of a country, place, camp, plan, design, &c. It is the ground work of each of these things.

CONTOURNE', a French term applied to any animal that is standing or passing with its face towards the sinister side of the escutcheon. In English heraldry it is termed *counter passant*.

CONTOURNIATED, or **CONTORNIATED**, a term applied among *Antiquaries* to a species of medals, so called from the Italian *contorniate*, encircled, on account of the hollow circle which commonly runs round them. They are distinguished from medallions, as they are sometimes denominated, not by their size, but by their thinness; faint relief; reverses sometimes in *intaglio*, hollowed, not raised; and, in general, by their peculiar and inferior workmanship. Medallist writers have formed various opinions concerning these singular pieces of coinage. Some suppose that they were struck by Gallienus, to the memory of illustrious men, and celebrated athletes, at the time when he caused all the consecration-coins of his predecessors to be reformed. This sentiment seems nearly to have been adopted by M. Mahudel, who says, (Hist. de l'Acad. des Belles Lettres, tom. v. p. 284.) that the contorniate were struck originally at Rome, about the close of the third century. F. Hardouin conjectures, that they were not earlier than the 13th century; other antiquaries refer them to the fifth century; and others find instances of them as ancient as the time of Nero; others again ascribe the invention of them to Greece, in her days of glory, and they suppose that they were appropriated to the purpose of honouring the memories of great men, and principally of those who had borne away the prize at the solemn games; such are those which bear the names or images of Homer, Solon, Euclid, Pythagoras, Socrates, Apollonius Tysæus, and several Athletes, whose victories are expressed upon them by palms, and chariots, either bigæ or quadrigæ. Havercamp, in an express work on these pieces, thinks they were struck from the times of Constantine I. to those of Valentinian III. on account of the public games. Mr. Pinkerton (Ess. on Medals, vol. i. p. 232.) suggests, that they were tickets for different places in the public games. The dye, appearance, device, inscription of the reverse—every thing—confirmed this opinion; which he has found perfectly consonant to that of two or three of the first medallists in this country. This opinion is so far conformable to that of Havercamp, and others, as it supposes that these pieces were struck upon occasion of the games. But it differs in representing these medals, as mere tickets for places at the games; and still more in supposing them struck in all ages of the empire, from Augustus, downwards. Those who suppose them struck

in the lower empire, are reduced to the deplorable dilemma of imagining, that Christian princes thought Nero's head an honour to their games; and that they preserved the portrait of Apollonius Tyanæus, the enemy of their faith, and those of other Pagan philosophers. Joubert indeed ascribes them to the upper empire, without determining whether they were struck under one prince, or all who gave games. Mr. Pinkerton is convinced, that they were struck under the various emperors whose names they bear; and that when Constantine I. introduced Christianity, they would almost vanish, instead of beginning, according to the opinion of Havercamp. The difference of workmanship, in these pieces, if accurately inspected, may shew this of itself, independently of other reasons. Although these pieces are of different kinds, they are mostly of a size between two and three inches in diameter. Some have, upon the obverse part, the head of the emperor or empress, who gave the games; and almost a series of them might be formed from Augustus down to Gallienus. In confirmation of this opinion, it is further alleged, that those emperors, who were remarkably distinguished by their attachment to public diversions, occur very frequently on these pieces, which Mr. Pinkerton calls "ticket-medals," whereas others appear more seldom, and those who never performed any games, not at all. Those with Nero on their obverse are so common as to be of very little value. Other obverses preserve the portraits of illustrious authors of antiquity, that are no where else to be found. Sallust, Horace, and other Roman writers, were delineated on these tickets, when the memory of their persons was yet fresh to the inhabitants of Rome, and we may therefore depend upon their portraits. This cannot be said of the Greek portraits of Homer, Solon, Pythagoras, Socrates, and others, all which our author supposes to have been struck at Rome, when Grecian actors were to perform, or in the Grecian cities, during the Roman empire. A few obverses present athletes, or actors in the games, and such are commonly represented holding a horse by the rein, or in some other attitude peculiar to their profession. On the reverses there is almost always a charioteer driving a chariot, or some similar device, peculiar to public games. Those struck for the theatre are the most scarce, and have sometimes on the reverse an actor at full length, with "PLACEAS;" *mayest thou please*, or some such legend. One, in particular, has a bust of Sallust on the obverse; and on the other side three persons, one of whom bears an instrument, resembling the common flute; another an instrument like the fœnic flute seen in the hands of Pan; while the third is declaiming. The legend is "PETRONI PLACEAS," *mayest thou please, Petronius*. The person declaiming is Petronius, who was, perhaps, that day, to make his first appearance upon the Roman stage; and the whole design, in this last instance, is so clear, that Mr. Pinkerton cannot forbear being surprised, that the intention of these tickets should so long have escaped the medallist authors. The supposition that they were tickets for different seats, or places, at the games, is further confirmed by the variety of marks to be found on the obverses of them. Some have a sprig of laurel; others a P, with an E below it implying, perhaps, "podium equestræ," or the box of the equestrian order, which last is very common; others bear a particular animal, or some such badge. All these marks, in tickets perfectly preserved, are cut in the brass, and then filed up with silver. The pieces of this class, with imperial portraits, are of little value; those bearing the images of illustrious men, are estimable, though not of great price. Apollonius Tyanæus, who flourished in the reign of Domitian, and Apuleius, who lived in that of Antoninus the philosopher, are, it is believed, the

latest of that description who appear upon these ticket-medals.

CONTRA, or **COUNTER**, in *Composition*. See **COUNTER**.

CONTRA, *Lat.* a preposition frequently used by the Italians in their *Musick*: *contrappunto*, counterpoint; *contra basso*, double base; *contralto*, counter tenor; *contrappunto doppio*, double counterpoint; *contrappunto semplice*, simple counterpoint; *contrappunto fiorito*, florid counterpoint, &c. This Latin word, which the Italians have adopted, was originally applied to all the several parts destined to make harmony to a plain song or melody, as counterpoints or counterparts to the canto fermo. Thus, harmony in four and more parts was formed: as *basso*, base; *medius*, mean or middle part; *alto tenore*, high tenor, from the situation of the clef on the staff; the *discantus*, *soprano*, *triplum*, or treble. When the alto tenore sung the part opposite or against the treble, it was called *contralto* or *counter tenor*; and when a lower part was employed than the base, it was called *contra basso*: the title now given to a double base.

CONTRA, in *Surgery*. See **COUNTER-sUTURE**, **COUNTER-extension**, **COUNTER-opening**, **COUNTER-stroke**, &c.

CONTRA battuta, in *Musick*, against, or out of time.

CONTRA formam collationis, in *Law*, a writ that lay where a man had given lands, in perpetual alms, to a religious house, hospital, school, or the like, and the governor, or managers, had alienated the lands, contrary to the intention of the donor, for the recovery of them. Reg. Orig. 258.

This was founded on the statute of Westm. 2. cap. 1.

CONTRA formam feoffamenti, a writ that lay for the heir of a tenant, in fee of lands or tenements by the lord's charter, to make certain suit and service to his court; who was afterwards distrained for more services than were contained in the charter. Reg. Orig. 176. Old Nat. B. ii. 162.

CONTRA formam statuti, is the usual conclusion of every indictment, &c. laid on an offence created by statute.

If one statute be relative to another, as where the former makes the offence, and the latter adds a penalty, the indictment ought to conclude *contra formam statutorum*. 2 Hale's Pl. C. 173. c. 24. Where there are several statutes, and it does not appear on which the information is founded, the conclusion, "contra formam statuti" is ill. Cro. Jac. 142. Pl. 19. Broughton v. Moor, &c.

CONTRABAND, in *Commerce*, a prohibited commodity; or a merchandize bought or sold, imported or exported, in prejudice, and contrary to the laws and ordinances of a state, or the public prohibitions of the sovereign.

The word comes from the Italian *contrabando*, of *contra* and *bando*, q. d. contrary to edict, or publication of prohibition.

Contraband goods are not only liable to confiscation themselves, but do also subject all other allowed merchandizes found with them in the same box, parcel, or bale, together with the horses, waggons, &c. which conduct them to the same.

In England there are two principal contrabands for exportation, wools and live sheep, which all strangers are prohibited from carrying out, on pain of having the right hand cut off; the other, that of sheep-skins and calf-skins, which all foreigners are in like manner prohibited from exporting, on pain also of having the right hand cut off; yet the subjects of England are allowed to transport the same from France to England. See **WOOL** and **SHEEP**.

Since the year 1662, when bills were formed of contraband goods, as to the import, and which included more

than fifty different sorts, many regulations and statutes have been enacted; and these are so numerous and various, and so liable to change in the fluctuating state of commerce, that in a work of this kind it would be of little permanent utility to recite them.

In 1719 and 1720, an attempt was made in parliament to pass a bill for putting gold and silver, whether in coined species, or otherwise, among the number of contraband goods for exportation; but in vain, by reason of the strong opposition made by those who enrich themselves by the export of these metals; which, by the laws of the kingdom, are allowed to be sent away, upon entering them, paying the duty of the export, and making oath of their being foreign, i. e. of their not being the coin or plate of the kingdom, melted down. See **CUSTOMS**.

CONTRACT, a mutual consent of two or more parties, who promise and oblige themselves voluntarily, to do something, pay a certain sum, or the like.

As a contract is a mutual promise, the obligation of contracts, the sense in which they are to be interpreted, and the cases where they are not binding, will be the same as of promises. See **PROMISE**. From the principle on which the obligation of promises is founded, viz. "that this obligation is to be measured by the expectation which the promiser any how voluntarily and knowingly excites," results a rule, which governs the construction of all contracts; and is capable, from its simplicity, of being applied with great ease and certainty: the rule is, that "whatever is expected by one side, and known to be so expected by the other, is to be deemed a part or condition of the contract." The several kinds of contracts may be comprehended under those of sale, hazard, loan of inconsumable property and of money, and labour, including service, commissions, partnership, and offices. With regard to contracts of sale, the rule of justice, which ought principally to be inculcated in the making of bargains, is, that the seller is bound in conscience to disclose the faults of what he offers to sale. If it be deemed dishonest to magnify beyond the truth the good qualities of the commodity which we have to sell, is it less unjust to conceal its faults? The buyer in many cases has no security from imposition, but in the ingenuousness and integrity of the seller. This rule, however, admits of one exception, namely, where the silence of the seller implies some fault in the thing to be sold, and where the buyer has a compensation in the price for the risk which he runs: as where a horse, in a London repository, is sold by public auction, without warranty; the want of warranty is notice of some unfitness, and produces a proportionable abatement in the price. (See **WARRANTY**.) To this head of concealing the faults of the article which we want to dispose of may be referred the practice of passing bad money. This practice has been sometimes defended by a vulgar excuse, that we have taken the money for good, and must therefore get rid of it: that is, in other words, we have been deceived or imposed upon, and therefore we may deceive or impose upon others. This excuse is much the same, as if one, who had been robbed upon the highway, should allege that he had a right to reimburse himself out of the pocket of the first traveller he met; the justice of which reasoning the traveller possibly may not comprehend. (See **UTTERING of false money**.) Where no monopoly or combination exists, the market price is always a fair price; because it will always be proportionable to the use and scarcity of the article. Innumerable questions relating to this kind of contract are determined solely by *custom*; not, indeed, that custom possesses any proper authority to alter or ascertain the nature of right and wrong; but because the contracting parties are presumed

presumed to include, in their stipulation, all the conditions which custom has annexed to contracts of the same sort; and when the usage is notorious, and no exception made to it, this presumption is generally agreeable to the fact. Thus, in justice as well as in law, what is called "the custom of merchants" regulates the construction of mercantile concerns.

By contracts of hazard are meant *gaming* and *insurance*. See these articles.

Contracts of loan comprehend those pertaining to inconvertible property, and to money. When the identical loan is to be returned, as a book, a horse, &c. it is called "inconvertible," in opposition to corn, wine, money, and those things which perish, or are parted with in the use, and can therefore only be restored in kind. The questions pertaining to this class of contracts are few and simple, and admit of an easy and obvious solution. If the thing lent be lost, or damaged by the use, or by accident in the use for which it was lent, the lender ought to bear the loss or damage. With regard to the loan of money, there exists no reason in the law of nature, why a man should not be paid for the use of his money lent, as well as of any other property into which the money might be converted. (See INTEREST and USURY.) For contracts of labour, see SERVANT, COMMISSION, AGENT, FACTOR, STEWARD, ATTORNEY, and ADVOCATE. See also PARTNERSHIP. Under this head it may be observed, that in many offices, as schools, fellowships of colleges, professorships of the universities, and the like, there is a two-fold contract; one with the founder, and the other with the electors. The contract with the founder obliges the incumbent of the office to discharge every duty appointed by the charter, statutes, deed of gift, or will of the founder; because the endowment was given, and consequently accepted, for that purpose, and upon those conditions. The contract with the electors extends this obligation to all duties that have been customarily connected with, and reckoned a part of, the office, though not prescribed by the founder; for the electors expect from the person they chuse all the duties which his predecessors have discharged; and as the person elected cannot be ignorant of their expectation, if he mean to refuse this condition, he ought to apprise them of his objection. Here it should be observed, that the electors can excuse the conscience of the person elected from this class of duties only; because this class results from a contract, to which the electors and the person elected are the only parties. The other class of duties results from a different contract; and with respect to these a question arises of delicate investigation, and of difficult solution, *viz.* how far the incumbent of an office may be allowed to deviate from the will of the founder, and to suppose him placed in circumstances similar to his own, and, in this new state of things, capable of forming a different judgment, and equally disposed to adapt his regulations and injunctions to the change of circumstances, which, in the course of ages, has occurred?—The best mode of easing the consciences of incumbents, in cases of this kind, is to introduce a reformation in many antiquated establishments, and in the laws, already obsolete, and, as it were, quiescent, by which they were designed by their unenlightened, but liberally disposed, founders to be regulated. Few of these contracts, to which we now refer, have, we conceive, been liberally and punctually fulfilled in modern times; and it would be unquestionably more conducive to the honour and usefulness of ancient institutions, and of official incumbents, to abolish regulations, which it is not thought proper to observe. It has been a question of some magnitude and difficulty, what offices may be conscientiously supplied by a

deputy. A deputy, according to archdeacon Paley, may be allowed in all cases, to which the following objections do not apply: 1. Where a particular confidence is reposed in the judgment and contract of the person appointed to it; as the office of a steward, guardian, judge, commander in chief by land or sea. 2. Where the custom hinders; as in the case of schoolmasters, tutors, and of commissioners in the army or navy. 3. Where the duty cannot, from its nature, be so well performed by a deputy; as the deputy-governor of a province may not possess the legal authority, or the actual influence of his principal. 4. When some inconvenience would result to the service in general from the permission of deputies in such cases; *e. g.* it is probable that military merit would be much discouraged, if the duties belonging to commissions in the army were generally allowed to be executed by substitutes. In this connection, the non-residence of the parochial clergy, who supply the duty of their benefices by curates, presents itself to consideration; but as it will require a more distinct discussion, we refer to the article NON-RESIDENCE. On the subject of this article, see Paley's Principles of Moral and Political Philosophy, vol. i. p. 142—163.

CONTRACT is particularly used in *Common Law*, for an agreement or covenant between two or more persons, with a lawful consideration or cause. As, if I sell my horse for money; or covenant in consideration of 20*l.* to make you a lease of a farm; these are good contracts, because there is *quid pro quo*, or one thing for another. Or, a contract, which usually conveys an interest merely in action, may be thus defined: "An agreement upon sufficient consideration, to do or not to do a particular thing." In all contracts, therefore, our attention is directed to three points, *viz.* the agreement, the consideration, and the thing to be done or omitted, or the different species of contracts. In a contract, considered as an agreement, a mutual bargain, or convention, there must be at least two contracting parties, of sufficient abilities to make a contract, as where A. contracts with B. to pay him 10*l.*, and thereby transfers a property in such sum to B. This property, however, is not in possession, but in action merely, and recoverable by suit at law; so that it could not be transferred to another person by the strict rules of the ancient common law, for no chose in action could be assigned or granted over. See CHOSE *in action*.

This contract or agreement may be either *express* or *implied*. *Express* contracts are where the terms of the agreement are openly uttered and avowed at the time of the making, as to deliver an ox, or ten load of timber, or to pay a stated price for certain goods. *Implied* are such as reason and justice dictate, and which, therefore, the law presumes that every man undertakes to perform. There is one species of implied contract, which runs through and is annexed to all other contracts, conditions, and covenants, *viz.* that if I fail in my part of the agreement, I shall pay the other party such damages as he has sustained by such my neglect or refusal. In short, almost all the rights of personal property (when not in actual possession), do in great measure depend upon contracts of one kind or other, or at least might be reduced under some of them; and this is the method taken by the civil law, which has referred the greatest part of the duties and rights, of which it treats, to the head of obligations *ex contractu*, and *quasi ex contractu*. (Inst. 3. 14. 2.) See ASSUMPSIT.

A contract may also be either *executed*, as if A. agree to change horses with B., and they do it immediately; in which case the possession and the right are transferred together:—or it may be *executory*, as if they agree to change

next week; in which case the right only vests, and their reciprocal property in each other's horse is not in possession but in action:—for a contract executed (which differs nothing from a grant) conveys a *chose in possession*; a contract executory conveys only a *chose in action*. For an account of the consideration, upon which a contract is founded, see CONSIDERATION.

A consideration of some sort or other is so absolutely necessary to the forming of a contract, that a *nudum pactum*, or agreement to do or pay any thing on one side, without any compensation on the other, is totally void in law, and a man cannot be compelled to perform it. However a man may or may not be bound to perform such a contract, in honour or conscience, which the municipal laws do not decide, it is certain that these laws will not compel the execution of what he has no visible inducement to engage for:—and, therefore, our law has adopted the maxim of the civil law, that *ex nudo pacto non oritur actio*. (Cod. 2. 3. 10. & 5. 14. t. Ur. & St. d. 2. c. 24. Bro. Abr. tit. de te, 79. Salk. 129.) But any degree of reciprocity will prevent the pact from being nude; nay, even if the thing be founded in a prior moral obligation, (as a promise to pay a just debt, though barred by the statute of limitations,) it is no longer *nudum pactum*. And as this rule was principally established to avoid the inconvenience that would arise from setting up mere verbal promises, for which no good reason could be assigned (Plowd. 308, 309,) it therefore does not hold in some cases, where such promise is authentically proved by written documents. For if a man enters into a voluntary bond, or gives a promissory note, he shall not be allowed to aver the want of a consideration in order to evade the payment; for every bond, from the solemnity of the instrument (Hardr. 200. 1. Ch. Rep. 157,) and every note from the subscription of the drawer (Lord Raym. 760,) carries with it an internal evidence of a good consideration. Courts of justice will, therefore, support them both, as against the contractor himself; but not to the prejudice of creditors, or strangers to the contract.

The most usual contracts, by which the rights of chattels personal may be acquired by the laws of England, are those of *sale or exchange, of bailment, of hiring and borrowing, and of debt*. See these articles respectively. See also INTEREST and USURY, BOTTOMRY and RESPONDENTIA, INSURANCE, and ANNUITY.

Every contract, whatever be its nature, implies in itself an *assumpsit* in law, for the performance of it; for a contract would be to no purpose, if there were no means to enforce its performance. See ASSUMPSIT.

A *diversity* occurs where a day of payment is limited in a contract, and where it is not so limited. In the former case, the contract is good presently, and an action lies upon it, without payment; but in the latter, it is otherwise. Thus, if a man buy any commodity, the contract is void, if he do not pay the money presently; but if a day of payment be stipulated, there the one may have an action for the money, and the other trover for the commodity. (Dyer, 30. 293.) Where a seller says to a buyer, he will sell his horse for a specified sum, and the buyer says he will give it; if he presently tell out the money, it is a contract; but if he do not, it is no contract. (Noy's Max. 87. Hob. 41.) The property of any thing sold is immediately in the buyer by the contract; though regularly it must be delivered to the buyer, before the seller can bring his action for the money. (Noy, 88.) If a person contract to buy a horse, or any thing else, of another, and no money is paid, or earnest given, nor day set for payment, nor the thing delivered; in these cases, no action will lie for the money, or the thing sold, but it may

be sold to another. (Plowd. 128. 309.) All contracts are to be certain and complete. For an agreement to give so much for a thing as it should be reasonably worth, is void on account of its uncertainty: so is also a promise to pay money in a short time, &c. or to give so much, if a person likes the thing when he sees it. (Dyer, 91. 1 Bull. 92.) But if I contract to give another 10*l.* for such a thing, if I like it on seeing the same; this bargain is said to be perfect at my pleasure, though I may not take the thing before I have paid the money:—if I do, the seller may have trespass against me: and if he sell it to another, I may bring an action on the case against him. (Noy, 104.) If a contract be to have for cattle sold 10*l.*, if the buyer do a certain thing, or else to have 20*l.* it is a good, and sufficiently certain contract. Also, if I agree with a person to give him so much for his horse, as A. B. shall judge him to be worth, when he hath judged it, the contract is complete, and an action will lie on it: and the buyer shall have a reasonable time to demand the judgment of A. B. But if he die before the judgment is given, the contract is determined. (Perk. sect. 112, 114. Shep. Abr. 294.) In contracts, the time is to be regarded, in and from which the contract is made; the words shall be taken in the common and usual sense; and the law doth not so much regard the form of words, as the substance, and the mind of the contracting parties. (5 Rep. 83. 1 Bull. 175.) A contract for goods may as well be made by word of mouth, as by deed in writing; and where it is merely written, but not sealed and delivered, it is the same as if it were verbal. But if the contract be by writing sealed and delivered, and so converted into a deed, it is of another nature; and in this case generally the action on the verbal contract is gone, and some other action lies for the breach of it. (Plowd. 130, 309. Dyer, 90.) Contracts, not to be performed in a year, are to be in writing, signed by the party, &c., or no action may be brought on them; but if no day is set, or the time is uncertain, they may be good without it. (Stat. 29 Car. II. c. 3.) And by the same statute, no contract for the sale of goods for 10*l.* or upwards, shall be good, unless the buyer receive part of the goods sold, or give something in earnest to bind the contract; or some note thereof be made in writing, signed by the person charged with the contract. See SALE.

CONTRACT, *nude* and *quasi*. See the adjectives, and

CONTRACT *supra*.

CONTRACT, *Simple*. See SIMPLE and DEBT.

CONTRACT, *Special*. See SPECIALTY and DEBT.

CONTRACT, *usurious*, is a contract to pay more interest for money than the laws allow.

It is a disadvantage in executors to pay a debt upon an usurious contract. See USURY.

CONTRACT of *Marriage*. The Romanists distinguish the civil contract, which is the consent of the parties, from the *sacrament*, which is the benediction of the priest.

These contracts are said to be *null*, which the law prohibits: such are all contracts between persons incapable of contracting, as minors, religious, lunatics, wives without consent of their husbands, &c.

In order to a good civil marriage, the parties must not only be willing and able to contract, but actually must contract themselves in due form of law. Any contract made, *per verba de presenti*, or in words of the present tense, and in case of cohabitation *per verba de futuro* also, between persons able to contract, was before the act (26 Geo. II. c. 33.) deemed a valid marriage to many purposes; and the parties might be compelled in the spiritual courts to celebrate it in *facie ecclesie*. But these verbal contracts are now of no force, to compel a future marriage. See MARRIAGE.

CONTRACT,

CONTRACT, *Originalis*, in *English History*, denotes that reciprocity of protection and subjection, which subsists between the king of Great Britain and his subjects. The duties resulting from hence are what, according to judge Blackstone, (Comm. vol. i.) were meant by the convention in 1688, when they declared that king James had broken the "original contract" between king and people. But however, as the terms of that original contract were in some measure disputed, being alleged to exist principally in theory, and to be only deducible by reason and the rules of natural law; in which deduction different understandings might very considerably differ; it was, after the revolution, judged proper to declare these duties expressly, and to reduce that contract to a plain certainty. So that, whatever doubts might be formerly raised by weak and scrupulous minds about the existence of such an original contract, they must now entirely cease, especially with regard to every prince, who hath reigned since the year 1688. As to the terms of the original contract between king and people, these the learned judge apprehends to be now couched in the *coronation oath*; which see. See also **CONSTITUTION** and **KING**.

CONTRACT is also used for the instrument in writing, which serves as a proof of the consent granted, and the obligation passed between the parties.

Among the ancient Romans, contracts, and all voluntary acts, were written, either by the parties themselves, or by one of the witnesses, or by a domestic secretary of one of the parties, whom they call a *notary*; but who was no public person, as among us.

The contract, when finished, was carried to a magistrate, who gave it a public authority by receiving it *inter acta*, into the number of the acts under his jurisdiction; giving each of the parties a copy thereof, and sealed with his seal. Which practice passed into France, where it obtained a long time. The conscientious performance of private contracts between man and man is frequently recommended in the Koran. For the prevention of disputes, all contracts are directed to be made before witnesses, and in case such contracts are not immediately executed, the same ought to be reduced into writing in the presence of at least two witnesses, (which seems to have been also required by the Jewish law, even in cases where life was not concerned,) who ought to be Moselems and of the male sex; but if two men cannot be conveniently had, then one man and two women may suffice. The same method is also directed to be taken for the security of debts to be paid at a future day; and where a writer is not to be found, pledges are to be taken. Hence, if people trust one another without writing, witnesses, or pledge, the party on whom the demand is made is always acquitted if he denies the charge on oath, and swears that he owes the plaintiff nothing, unless the contrary be proved by very convincing circumstances. Sale's Koran, Introd. p. 139.

CONTRACTS, in *Rhetoric*, furnish one head or class of external arguments. (See **ARGUMENT** and **TOPICS**.) In this view of them, they are either public or private. Public contracts denote transactions between different states, as leagues, alliances, and the like; which depend on the laws of nations. Those are called private, which relate to lesser bodies, or societies of men, and single persons, and they may be either written or verbal. With respect to the force and obligation of contracts, the Roman law declares, that "nothing can be more agreeable to human faith, than that persons should stand to their agreements." Therefore in controversies relating to this kind of human testimony, the party, whose interest it is, that the contract should be maintained, will plead, that such covenants have the force of private laws, and ought religiously to be observed, since the common affairs of mankind

are transacted in that manner; and therefore to violate them is to destroy all commerce and society among men. On the other side it may be said, that justice and equity are chiefly to be regarded, which are immutable; and besides, that the public laws are the common rule to determine such differences, which are designed to redress those, who are aggrieved. Indeed, where a compact has been obtained by force or fraud, it is in itself void, and has no effect either in law or reason. But on the other hand, the Roman lawyers seem to have very rightly determined, that all such obligations, as are founded in natural equity, though not binding by national laws, and are therefore called "*nuda pacta*," ought however in conscience and honour to be performed.

CONTRACTED VEIN, in *Hydraulics*, (*Vena contracta* of Newton,) is a name given to the contraction which has been observed in a stream of fluid issuing out of an aperture. When water, or other fluid analogous to water, issues out of an aperture in the thin side or bottom of a vessel containing that fluid, as at A, fig. 1 and 2; *Plate I. Hydraulics*, the size of the aperture being very small in proportion to the side or bottom of the vessel, the stream AB is not of the same shape throughout its whole length, nor is it of an uniform size. When the aperture is circular, the distance of the narrowest part of the stream, from the inside surface of the vessel, is about equal to the radius of the aperture. This narrowest part of the stream has been called the *contracted vein*; the whole stream itself having been usually denominated the *vein of fluid*, by writers on the subject. From the place of the contracted vein forwards, the stream enlarges its dimensions, and sometimes divides itself into different smaller streams. The diameter of the contracted vein, or narrowest part of the stream, is subject to a little variation, arising from the size of the vessel in proportion to the aperture, and partly from the charge of the vessel, (*viz.* from the height of fluid in the vessel above the level of the aperture); hence the diameter of the contracted vein, as measured by different authors, has not turned out exactly of one invariable dimension; the difference, however, is not very material; as appears from the following table, which contains the different measurements of the contracted vein; calling the diameter of the circular aperture *one*.

<i>Authors of the experiments.</i>	<i>Diameter of the contracted vein.</i>
Poleni (de Castellis, § 35.)	0.790
Micheletti; Sperin. Idraul. tom. II. Exp. 4.	0.800
Boffut (Hydrodyn. art. 437. Exp. 5.)	0.818
Venturi, with 35 inches charge, and a horizontal circular orifice of 18 lines in diameter	0.798

From a mean of the above measurements, it may be concluded, that the diameter of the contracted vein is little more than eight-tenths of the diameter of the aperture. That short part of the stream which stands between the aperture and the greatest contraction, is not uniformly conical, but it approaches to the figure of an hyperbolic conoid.

This contraction of the stream is undoubtedly owing to the different directions, and different velocities, with which the various parts (or, as they are called, *filaments*) of the fluid run towards the aperture, as is indicated by the *figs.* 1 and 2. Hence it has been observed, that when the aperture is very large in proportion to the size of the vessel, the contraction of the stream is less evident. And such, also, is in great measure the case, when the side of the vessel in which the aperture is made, is not very thin.

The various filaments of the fluid, which run from every part of the vessel in oblique directions towards the aperture, partly cross each other at the contracted vein; and this crossing, or tendency to cross, is one of the causes which enlarge the stream beyond that place. It is evident, that with apertures of different shapes, the form of the contracted vein, that is of the stream of that place, must vary considerably. But professor Venturi, desirous of determining the effects of some of those variations from the circular shape, made the following experiments with orifices of peculiar shapes.

"In the orifice A B C D, (*fig. 3.*) the two sides A, B, are parallel to the horizon; the extremities are rounded; the width of this aperture is less than two lines, its length 18 lines, and the charge 32.5 inches. The section of the stream which issues from this orifice, first assumes the form E F, after which, the two extremities E, F, approaching nearer and nearer to enlarge the middle part of the section of the stream, at 4.5 inches distance from the orifice, acquire the quadrangular form G H. The stream afterwards extends itself in the perpendicular direction, in the form of a large fan K L. I have repeated the experiment, by placing the longitudinal axis of the orifice C D vertically. In this case the same phenomena were produced, E F becoming vertical, and K L horizontal, both preserving their form."

"The fluid filaments, which, issuing out of the orifice, pass near the two opposite borders A, B, are very near each other, and becoming convergent, they tend to unite at a very short distance from the orifice itself. The filaments C, D, are more remote, and, perhaps, less convergent; they cannot unite but at a greater distance than the two former. In this case, therefore, there are movements which tend to form two contractions, the one nearer, and the other more remote from the orifice; these two contractions counter balance each other in part. Their mutual opposition carries the effect, G H, to a distance five times greater than that of the contracted vein of a circular orifice, having a diameter of the same breadth as that of this orifice."

"In this experiment we see the cause of a phenomenon, which has been observed in some particular cases by Poleni and others, without giving the explanation. In every orifice of a right-lined figure through a thin plate, the angles of the contracted vein answer to the sides of the orifice and the contrary. When the quadrangular orifice has the situation M N O P, the greatest contraction of the stream is made at a greater distance than in a circular aperture; it assumes the form and situation Q R S T. The reason is, that the opposite angles M, P, are more remote from each other, than the sides I, V, whence the same thing happens as in the long orifice A C B D. In the same manner, the triangular orifice in the situation X, produces a contraction of the form, and in the situation Z, &c."

When the horizontal oblong aperture, C D, (*fig. 3.*) was used, the distance of the contracted vein from that orifice, was found to vary with the height of the fluid; as shewn in the following table; from which it appears, that the contraction of the stream takes place at a greater distance, under strong charges, than in those which have but little elevation.

Height of the charge above the orifice C D.	Distance of the greatest contraction G H.
<i>Inches.</i>	<i>Lines.</i>

18.	48.
10.	40.
6.	36.

If a cylindrical tube be fitted to a circular aperture in the

side of the reservoir, or vessel containing the fluid, and part of it be pushed into the interior part of that vessel, the contraction of the vein will be greater, and the quantity of fluid that runs out in a given time, will be less, than without such tube. If to the external part of the circular orifice, a short tube be adapted exactly of the shape of the contracted vein, or very nearly so, as in *fig. 4.* (it being a tube nearly conical, but with its sides a little convex inwardly,) the quantity of fluid that runs out in a given time, will be the same, or very nearly the same, as when the simple aperture is used, without such tube.

The velocity of the fluid is far from being the same in every part of the stream; for since the same quantity of fluid must pass through every transverse section of the stream in a given time, it follows, that the velocity must be inversely as the area of each transverse section. Therefore the velocity at the contracted vein is greater than at the circular aperture; and since the areas of the sections at those two places, are as the squares of their diameters, and the diameter of the contracted vein is to that of the circular aperture nearly as eight to ten, or as four to five; hence we say, as 16 is to 25, so is the velocity at the aperture, which we shall call *one*, to the velocity at the *vena contracta*; that is, as one to 1.56.

CONTRACTILE FORCE, that property, or power, inherent in certain bodies, whereby, when extended, they are enabled to draw themselves up again to their former dimensions. For the cause of this property, which is of the utmost consequence to a right understanding of the animal economy, see **FIBRE**.

CONTRACTION, in *Surgery*, from *contraho*, to draw together; a rigid or stiffened state of any part in the body, but especially of the joints. This rigidity may arise from a morbid condition, either of the bones, ligaments, or muscles; and may proceed from a great variety of causes. Cullen has given four species of contractions; but Sauvages has multiplied them to the number of eleven! The surgeon who knows the cause and seat of this complaint, will not, however, pay much regard to those nosological distinctions, in his method of cure. If the morbid change arises from inflammation and thickening of the parts affected, he will use discutient remedies, fomentations, and emollient poultices; or, after the inflammatory stage has subsided, he will employ electricity, friction, stimulant embrocations, and moderate extension of the affected muscles, &c. If the rigidity be very obstinate, and the ligaments yield with great difficulty, the surgeon will use mechanical force more freely, and perhaps will enjoin the exercise of alternate bending and straightening the limb, by means of pulleys or steel springs, besides the occasional administration of the vapour-bath, or hot ablutions. The principles of the art being understood, and the nature of the case which comes before us, it will not be difficult, by steady perseverance, to overcome a great number of obstacles which present themselves, in the treatment of contractions.

When the disease is occasioned by an union of the bones which form a joint, the mobility of the limb is not to be expected. This species of contraction is named *anchylosis*, and is explained at large in a separate article of this work. (See **ANCHYLOSIS**.) When one muscle is found in a state of permanent contraction, e.g. the sterno-mastoid of the neck, it is sometimes requisite to divide the muscle in order to effect the cure. (See **DISTORTION of the neck**.) We understand that Mr. Carpus, surgeon of his majesty's forces, has invented many ingenious mechanical instruments, which will soon be made public, for the relief of this class of diseases.

CONTRACTION, in *Grammar*, the reduction of two vowels, or syllables, into one; as, *may'nt*, for *may not*; *shouldest*, for *shouldest*, &c.

The Greeks abound with contractions, both in their verbs and their nouns.

In this language, two simple vowels concurring in the same word are generally combined into a diphthong; and in this case the concurrent vowels are said to be contracted. Contraction is either *simple* or *compounded*; *simple*, when constituent vowels are retained unchanged; and *compounded*, when a new sound results. *E. G.* The contraction of *ευχῆ* into *ευχῆ* is simple; that of *ευχῆ* into *ευχῆ* is compounded. The first sort of contractions is called *synaresis*, the second *crasis*. When two succeeding vowels have dots above them, they are separately founded; but when contracted, they have over them the circumflex accent; hence *ευχῆ* has three syllables, but *ευχῆ* only two. Every contraction, whether simple or compounded, is the coalition of two short vowels; and it takes place in nouns of every declension, in adjectives, in verbs, and in the combination of the article and prepositions with the succeeding words. Simple contractions are all reducible to the following rule.—Let the concurring vowels, instead of being founded separately, be expressed by a single impulse of the voice; as *αι*, *αι*, *ου*, *αι*, *υ*, *υ*, &c. The difficulty lies in the compounded contractions; but all the varieties of these may be comprehended under the four succeeding cases. 1. If the two short vowels to be contracted be the same, they are already represented by one of them lengthened. Thus *αι*, *υ*, *υ*, are contracted into *αι*, *υ*, *υ*, respectively. Note, however, that, in the common tongue, the contraction of *ει* is not into *η*, but into its equivalent *η*; and the contraction of *οι* is not into *ω*, but into *ου*. 2. If the concurrent vowels be not the same, that which is predominant in sound prevails over that which is subordinate to it. The predominant vowel must in most instances be the prepositive; since this pre-occupies the organs, and thus demands a fuller enunciation. The subjunctive, therefore, is lost in the contraction; and its only effect is to lengthen the prepositive, when a *doubtful vowel*, but to convert it, if *short* by nature, into its correspondent long one. Hence *αι*, *ει*, *ου*, and *οι* are contracted into *αι*, *η*, *ω*, and *ω* respectively. The exceptions to the above principle are the following: verbs in *μι* of the first class, in order to be distinguished from the third person plural, have in the three singular, *αι* contracted into *η*. The diphthongs *αι*, *οι*, when succeeded by *ς* are contracted, the former into *αι*, and the latter into *ου*. If a vowel, or *ς*, precede *ει*, they are contracted into *αι*. By attention to the pronunciation of *οι*, *οι*, it will be perceived that the first, having a fuller sound, predominates over the second and third; and, therefore, *οι* are contracted, not into *αι*, but into *η*. In the concurrent vowels *ου*, the latter prevails in sound over the former, and consequently, the contraction is into *ου*, not into *ω*. Conformably to the second case *οι* would be contracted into *ω*; but its contraction, in the common tongue, like that of *ου*, is generally into *ου*. 3. The vowels *υ*, being predominant in sound, and from their nature incapable of coalescing with those subjoined to them, cause the subjunctive to be expelled: as *ιγαυ*, *ιγαυ*, a hawk, *οιδαι*, *οιδαι*, a serpent, *ιχθυαι*, *ιχθυαι*, fishes, &c. 4. As the contraction is the union of two short vowels into one compound sound, it follows, that a short vowel preceding a long one, as having no effect in lengthening a sound which does not admit of different degrees of length, is dropped in the contracted form; as *Απαιλις*, *Απαιλις*, *Apelles*, *Εσσιλιαι*, *Βασιλιαι*, kings, *τιμααι*,

τιμααι, I honour, &c. When a vowel precedes a diphthong, it is either itself rejected, or it causes to be rejected one of the constituents of that diphthong; thus, *αι* preceding *αι*, *αι*, expels the subjunctives *ι*, *υ*; but preceding *οι*, *αι* is itself rejected. In like manner, *ει* is rejected, when preceding *αι*, *οι*, or *ου*. When *ο* precedes *αι*, it requires in nouns and adjectives the rejection of the subjunctive: also in the infinitive mood of verbs in *ου*, *ο* preceding *αι* requires *ι* to be rejected; but in the second and third persons singular indicative, the prepositive is dropped. Before *οι* and *ου*, *ο* is itself rejected. In the adjectives *διπλο* simple, *διπλο* double, *ο* is expelled;—thus, *οπλο*, *διπλο*. See Jones's *Grammar of the Greek Tongue*, on a new and improved Plan, part ii. chap. 1.

CONTRACTION, in *Logic*, or *Composition*, a species of reduction, wherein the thing that reduces does also abridge, or bring the thing reduced into a lesser compass.

The design of contraction is to bring things, which before were too lax and diffusive, nearer together; that so their mutual relation may appear the more clearly, and they may better strengthen and support each other.

To this head are referred the arguments, as they are called, of poems and orations; the titles and summaries of chapters, &c. See ABRIDGMENT.

CONTRACTION, in a general sense, means diminution of the bulk, or extent, of any thing; the nearer approach of its parts to one another. This word is generally used in philosophy, in surgery, in grammar, in the arts, &c. In philosophy the contractions mostly noticed, are those which arise from a diminution of temperature. The shortening of the dimensions of a body is the general effect; but at certain periods of their contraction, bodies change their apparent state of existence; thus the vapour of water is contracted by a diminution of temperature from a higher degree, down to about 212° of Fahrenheit's scale; but below that degree, its contraction is very great, and it is thereby converted into fluid water, in which state it occupies not more than about the 1800th part of the space it took up a little before its conversion into water. Similar phenomena are to be observed with most other bodies, and the particulars which need be remarked concerning them, are the rate, the quantity, and the limits of contraction in different bodies. But those particulars being the reverse of the phenomena which are described under the denomination of *expansion* or *dilatation*, are with more perspicuity stated under those articles, to which the reader is referred. It is, however, necessary in this place briefly to state a few particulars which seem less regular, and some which arise, not from a simple cause, but from the compound effect of pressure, and of diminution of temperature.

“When an elastic fluid is contracted by cold within certain limits, determined by a degree of pressure to which it is exposed, as well as by the nature of the fluid, its particles become subjected to the force of cohesion; they rush still nearer together, and form a liquid. Thus, when steam under the common atmospheric pressure, is cooled below the heat of boiling water, it is instantly condensed, and becomes water; but with a pressure of two atmospheres, it would be condensed at a temperature 36° higher, and with the pressure of half our atmosphere only, it might be cooled without condensation 33° lower than the common temperature of boiling water. And similar effects take place in vapours of other kinds at higher or lower temperatures, a double pressure producing, in all cases, an equal disposition to condensation, with a depression of temperature of between 20 and 40 degrees, and most commonly

of about 35° of Fahrenheit. Thus the vapour of spirit of wine is usually condensed at 175° of Fahrenheit; but with a double pressure it is condensed at a temperature 39° higher; and with the pressure of half an atmosphere, at a temperature 35° lower; and the vapour of ether, which is commonly condensed at 102°; requires a temperature 38° higher, with a double pressure, or as much lower with half the usual pressure. If the temperature be below the freezing point of the liquid, the pressure being sufficiently lessened the vapour may still retain its elasticity, but a further reduction of temperature or increase of pressure will convert it immediately into a solid."

Water, and all aqueous fluids, are gradually contracted by a diminution of temperature, until they arrive at a certain point which is about eight degrees above the freezing point; but below that point they begin to expand and continue to do so according as their temperature is lowered. Effects nearly similar have been observed with a few metallic substances.

Speaking of contraction, a remarkable phenomenon, of considerable importance in manufactures, obtrudes itself on our notice. It is the hardness which certain bodies acquire in consequence of a sudden contraction, and this is particularly the case with glass and some of the metals. Thus glass vessels suddenly cooled after having been formed are so very brittle, that they hardly bear to be touched with any hard body. The cause of this effect is thus properly explained by Dr. Young, "When glass in fusion is very suddenly cooled, its external parts become solid first, and determine the magnitude of the whole piece; while it still remains fluid within. The internal part, as it cools, is disposed to contract still further, but its contraction is prevented by the resistance of the external parts, which form an arch or vault round it, so that the whole is left in a state of constraint; and as soon as the equilibrium is disturbed in any one part, the whole aggregate is destroyed. Hence it becomes necessary to anneal all glass, by placing it in an oven, where it is left to cool slowly; for, without this precaution, a very slight cause would destroy it. The Bologna jars, sometimes called proofs, are small thick vessels, made for the purpose of exhibiting this effect; they are usually destroyed by the impulse of a small and sharp body, for instance, a single grain of sand, dropped into them, and a small body appears to be often more effectual than a larger one; perhaps because the larger one is more liable to strike the glass with an obtuse part of its surface." See *Prince Rupert's Drops*.

The hardening of steel is an effect of the same sort. The piece of steel is made red-hot, and, in that state, is suddenly cooled and contracted by immersion in water; in consequence of which it remains so brittle and hard, as not to suffer its being filed or hammered. If, instead of water, the piece of red-hot steel be plunged in oil, its contraction is not so sudden, and of course its hardness will not be so great. If it be plunged in quicksilver, which cools it much quicker than water, its hardness becomes so great as to render it capable of cutting or scratching glass like a silicious body. But, on the other hand, if the piece of steel, after its having been rendered red-hot, be suffered to contract gradually in the air; then its texture will easily yield to the hammer or to the file.

The necessity and importance of attending to the minute variations in the bulk of bodies by heat and cold, was never before, perhaps, so strikingly exemplified, as in the government Trigonometrical Survey, begun under general Roy,

in the year 1784, by the measurement of a base of 27424.3 feet in length on Hounslow Heath, near London. This was first measured by long deal rods, which were soon laid aside, on account of their great and variable contraction and expansion, and long glass rods or tubes were next tried wherein the sum of the expansions of the rods, during the operation, reduced to 6.2° of Fahrenheit's thermometer, amounted to 6 inches very nearly, and of the contractions to 1.8 inch nearly, making an addition of 4.2 inches to the length of the base, as measured by the glass rods, on account of their expansion and contraction during the operation; see *Phil. Transf.* 1785, p. 477. In 1791, this base was remeasured with a steel chain made for the purpose by Ramsden, with all imaginable attention to accuracy, and the correction necessary to be applied to the length of the base, on account of the excess of the expansions over the contractions of the chain during the operation, was found to be 34.2 inches, but from which 27.11 inches was afterwards deducted, for reducing the base to the length which would have resulted, from a measurement in the temperature of 62°, to which point of the thermometer's scale all lengths in this survey are supposed to be reduced. See *Phil. Transf.* 1795, p. 433.

CONTRACTION of Strata, in Natural History. That clay and argillites have contracted during their hardening in the strata of the earth, Mr. Bergman infers from having observed, that the petrified shells found in these are commonly compressed and flattened, and that argill hardens by contraction, but those found in lime-stone retain their primitive shape, because these harden chiefly by infiltration.

CONTRACTION is frequently used, by anatomical writers, to express the shrinking up of a fibre, or an assemblage of fibres when extended.

Convulsions and spasms proceed from a preternatural contraction of the fibres of the muscles of the part contracted.

On the contrary, paralytic disorders generally proceed from a too great laxness of the fibres of the parts affected; or from the want of that degree of contraction necessary to perform the natural motion or action of the part.

In the first, therefore, the animal spirits are supposed to flow either in too great a quantity, or irregularly; and, in the last, the animal spirits are either denied a free passage into the part affected, or the tension of the fibrillæ is supposed insufficient to promote the circulation.

Contraction evidently appears to be the true natural state of all muscles; for, if a muscle be at any time freed from the power of its antagonist, it is immediately found to contract; and is not, by any action of the will, or the spirits, to be reduced to a state of dilatation.

CONTRACTION of the heart, arteries, lungs, &c. See *SYSTOLE, HEART, ARTERY, PULSE, &c.*

CONTRADICENTE. See *NEMINE contradicente.*

CONTRADICTION, a species of direct opposition, wherein one thing is found diametrically opposite to another.

The schoolmen usually define it, *oppositio inter ens & non-ens metho carens*: where, by *ens*, and *non-ens*, are understood any two extremes, whereof one affirms, and the other denies; and it is said to be *metho carens* to distinguish it from the other species of composition; the extremes, here, neither agreeing in subject, as in the case in privation; nor in essence and kind, as in contrariety.

CONTRADICTION, *freedom of*. See FREEDOM.

CONTRADICTION, *imply a*. See IMPLY.

CONTRADICTOR, in a legal sense, a person who has a right or title to contradict or gainsay.

An inventory of the effects of a minor ought to be made in presence of his guardian, or trustee, who is the legal *contradictor*: a decree against a farmer has no effect on the landlord, the first not being the legitimate *contradictor*.

CONTRADICTORY PROPOSITIONS, are opposites, one of which imports a mere, and naked, denial of the other.

Of these, therefore, one must be positive, and the other negative; as *sitting*, and *not sitting*: *white*, and *not white*. Contradictory propositions mutually destroy each other.

To have two propositions truly contradictory, they must be opposite, both in quantity and quality, *i. e.* one must be universal, and the other particular, which make the opposition of quantity; and the one affirmative, and the other negative, which make the opposition in quality. Thus, *v. gr.* "All use of wine and silver is evil;" false:—"Some use of wine and silver is not evil;" true. To this it is necessary, that the one deny and the other affirm, the same thing, of the same subject, considered in the same circumstances: unless the question be about an essential attribute, in which case, no regard is had to circumstances; every thing having always its own essence. Thus the logicians express by *affirmare* & *negare idem, de eodem, secundum idem*.

There may likewise be contradictory propositions on a particular subject; *e. gr.* an individual. These are called *single* contradictory propositions; as "Peter is innocent. Peter is not innocent, or is a criminal." Now to have these propositions contradictory, Peter must be considered at the same time, without which they may be both true; since there may be a time wherein Peter was innocent, and another wherein he was a criminal.

CONTRA-FISSURE. See COUNTER-FISSURE.

CONTRA-HARMONICAL PROPORTION, that relation of three terms, wherein the difference of the first and second is to the difference of the second and third, as the third is to the first.

Thus, *e. gr.* 3, 5, and 6, are numbers contra-harmonically proportional; for $2 : 1 :: 6 : 3$.

To find a mean contra-harmonically proportional to two given quantities: the rule is, divide the sum of the two squared numbers by the sum of the roots; the quotient is a contra-harmonically mean proportional between the roots.

CONTRA-INDICATION, in *Medicine*, denotes such a symptom, or set of symptoms, as indicate the necessity of remedies, which other symptoms, or the disease in general, forbid us to employ.

Thus, when inflammation of the lungs supervenes to a low or typhous fever, or *vice versa*, the nature of the fever requires cordials and strengtheners for its cure, whilst the inflammation indicates, on the contrary, the use of blood-letting, and other debilitating expedients. Contra-indications are always perplexing occurrences.

CONTRAIT, Fr. restrained. This word is synonymous with *stretto*, in Ital. (which see.) It is an adj. which, in *Musick*, implies, whether in melody or harmony, the *constraint* of a theme or ground.

CONTRALTO, Ital. the Counter-tenor. The compass of this kind of voice is usually very limited; it seldom goes lower than G, in the 4th space of the bass, or higher than C, in the 3d space of the treble. Senefino had no more than

six or seven good notes in his voice; nor had Guadagni, in his younger days, when he was content with the force of his natural compass, which, like Senefino's, were full, rich, and flexible. This species of voice is an octave above the bass; and its clef, that of C on the 3d line, the same as the *alto viola*, or *tenor*, among instruments.

CONTRAMANDATIO PLACITI, in *Law-Books*, signifies a respiting, or giving the defendant further time to answer; or, an imparlance, or countermaning of what was formerly ordered. Leg. H. I. c. 59. See COUNTERMAND.

CONTRAMANDATUM, a lawful excuse, which the defendant, by his attorney, allegeth for himself, to shew that the plaintiff has no cause to complain, *si dies placiti sit contramandatus*. II Hen. I. See COUNTERMAND.

CONTRAMURE, in *Civil Architecture*. See COUNTERMURE.

CONTRAMURE, in *Fortification*, is a wall built before another to strengthen it, and to prevent its receiving any damage from the adjoining buildings. See RAMPART.

CONTRA-POINTS, in *Musick*. See COUNTER-POINT.

CONTRA-POSITIO, in *Law*, a plea or answer. Leg. H. I. c. 34.

CONTRA-POSITION, in *Logic*. See VERSION.

CONTRAPPUNTO. See COUNTER-POINT.

CONTRARIENTUM ROTULUS. See ROTULUS.

CONTRARIETY, that which denominates two things contrary to each other.

Contrariety consists in this, that one of the terms imports a negation of the other, either mediately or immediately; so that contrariety may be said to be the contrast, or opposition of two things, one of which implies the absence of the other.

CONTRARIETY, *freedom of*. See FREEDOM.

CONTRARIES, are positive opposites; which being of the same kind, or same common nature, and subsisting by turns in the same subject, are as remote from each other as possible, and mutually expel each other. Such are whiteness and blackness, cold and heat, &c.

Hence, properly speaking, only qualities can be contraries: *contrariety*, in effect, only agrees to qualities *per se*; to other things it agrees *per accidens*, or *in ordine ad qualitatem*.

CONTRARY, however, is often used in a more extensive signification, *viz.* for any inconsistency or difference between the nature and qualities of things. It is a popular maxim in philosophy, that *contraria juxta se posita magis elucescent*; contraries set off one another. In this sense is the word *contrario* used in the schools; and hence an argument *à contrario*.

This method of improving things, *à contrario*, is much used, and with good success, by F. Bourdaloue, in his Sermons.

CONTRARY, in *Rhetoric*. Contraries are things which, under the same genus, are at the utmost distance from each other: so that what we grant to the one, we utterly deny the other; *e. g.* "Virtue ought to be embraced, therefore vice should be avoided." F. de Colonia lays down three kinds of contraries in rhetoric; *viz. adverbatives, privatives, and contradictories*.

Adverbatives are those that differ much in the same thing, as virtue and vice, war and peace: thus Tully, "Si stultitiam fugimus, sapientiam sequamur; & bonitatem, & mansuetudinem."

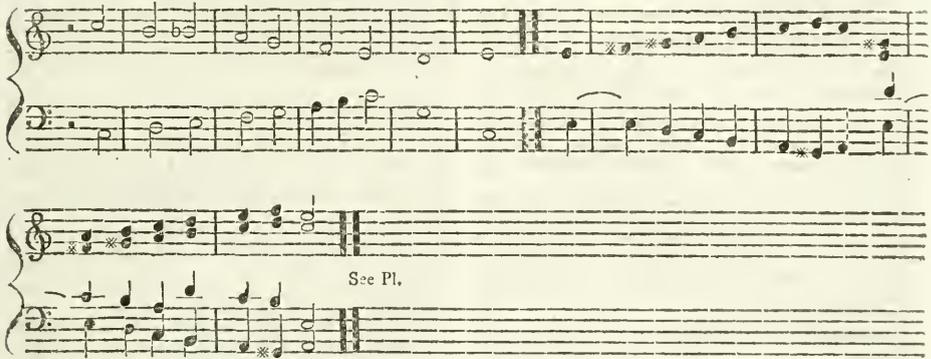

tiam." And Quintilian, "Malorum causa bellum est, eum emendatio pax." Drances argues thus in Virgil:

"Nulla salus bello: pacem te poscimus omnes."

Privatives are habits, and their privations. *Contradictio-*

nes are those, one of which affirms, and the other denies, the same thing of the same subject.

CONTRARY motion, in *Music*, is when one part ascends while another descends, and *vice versa*, opposed to *moto recto*, and *moto obliquo*, which see.

Contrary motion of the parts, in composition, and of the hands in thorough-bass, has a pleasing effect, and precludes the succession of 5ths and 8ths.

CONTRARY propositions, in *Logic*, universal propositions, one of which affirms, and the other denies, the same predicate of the same subject; as "every square is a parallelogram," and "no square is a parallelogram." These propositions differ in quality, but not in quantity, and therefore are distinguished from contradictory propositions, which differ in quantity and quality.

Contrary propositions cannot be both true, but may both be false: whereas, in contradictory propositions, one is necessarily true, and the other false.

CONTRARY point of flexure. See *POINT*.

CONTRA-SOGGETTO, in *Music*, a 2d subject in a fugue or canon, or a new subject, in contrary motion to the first.

CONTRA-TONES, in the *German Musical Writings*, are such as lie below the great octave of their tablature or literal notation, for the notes of the gamut. All notes on an organ, or other instrument which lie, more than two octaves below the tenor cliff note, or

are said to be

contra-tones. See *TABLATURE*.

CONTRAST, in *Music*, is often productive of agreeable effects, when, in the same movement, we pass from loud to soft, and soft to loud; from quick to slow, and slow to quick; from a simple to an elaborate accompaniment, and *e contra*; from low to high, and high to low; and when the harmony is full and thin alternately.

CONTRAST, in *Painting or Drawing*. The proper introduction and management of contrasts of lines, forms, colours, lights, and shadows, form a very principal, and indeed indispensable, branch of the study of a painter; and there is perhaps nothing in the art which so necessarily requires a more than ordinary share of judgment and discretion. If contrasts are only sparingly used, they seldom fail to produce a striking and happy result; if they are too frequent, confusion in the composition, and a spotty disagreeable effect is the consequence; when they are entirely omitted,

insipidity ensues. Contrasts in painting may, therefore, be compared to discords in music, which, when skillfully introduced, give double relish to the harmony, by preventing that nausea naturally attendant on an uninterrupted succession of sweets of any kind soever. The subject of contrasts is necessarily connected with our inquiries respecting the great component parts of painting. We therefore beg to refer the reader to those articles. See *INVENTION*, *COMPOSITION*, *DESIGN*, *EXPRESSION*, *CLAIR-OBSCURE*, and *COLOURING*.

CONTRAST, *to*, in *Architecture*, is to avoid the repetition of the same thing, in order to please by variety; as is done in the great gallery of the Louvre, where the pediments are, alternately, arched and angular.

CONTRAST, or *CONTRATE wheel*, in *Horology*, denotes that wheel in watches which is next to the crown, whose teeth and hoop lie contrary to those of the other wheels; whence its name. See *WATCH-work* and *WHEEL*.

CONTRAVALLATION, or *COUNTERVALLATION*, in *Fortification*. See *CIRCUMVALLATION*.

CONTRAVENTION, a man's failure of performing or discharging his word, obligation, or duty, or the laws and customs of the place. The penalties imposed in cases of contravention, only pass for comminatory.

In a more limited sense, contravention implies the non-execution of an ordinance, or edict.

Contravention is supposed to be a degree below prevarication; and to be only the effect of negligence or ignorance.

In the French and other services, every commanding officer, of whatever rank, was responsible for the wrongs and trespasses committed by the troops under his command. He was obliged to pay the damages; and if himself set an example of such things, he was considered as doubly culpable, and was not only bound to pay the damages, but was otherwise punished.

CONTRAYERVA, in *Botany*. See *DORSTENIA*.

CONTRAYERVA, in the *Materia Medica*, *Dorstenia Contrayerva*, Linn. This is a perennial plant of South America, the root of which has long been used in medicine, and is still retained, though its medicinal powers are but moderate. It is said to have been first brought into Europe by Sir Francis Drake, about the year 1581, and from him called *Draken*.

It was then esteemed a very great alexiterial, and a foreign antidote against poison.

Its juice is a violent poison, said to be used by the Peruvians to poison their arrows. *Contrayerva* signifies *counter-poison*, because the root of it is said to be an antidote against the poison of its juice.

The root is knotty, reddish brown externally, and pale within: its taste is sub-astringent, warm, and somewhat bitter; but its acrimony is much flattered by the very large quantity of mucilage which it contains. *Contrayerva* is a gentle stimulant. Its use is almost entirely confined to the pulvis *contrayervæ* compoſitus, in which it is mixed with crab's claws and chalk. The London Pharmacopœia directs the preparation of it, by mixing 5 ounces, by weight, of powdered *contrayerva* with 1½ pound of compound powder of crab's claws.

There is another kind of *contrayerva* brought from Virginia, more ordinarily called *serpentaria*: this is very aromatic; it is but seldom preferred singly, though said to have the same success against poisons and venoms with the *contrayerva* of Peru. This is an excellent substitute for the *contrayerva*. See Lewis's *Mat. Med.* and Newman's *Chem. Works*.

CONTRE, Fr. in combination with words. See COUNTER.

CONTRE-dance, Fr. *Country-dance*, taken from the lively and familiar dance of our peasants and villagers in England. Some, however, imagine that, during the Norman line, we had this rural dance from the French *contre-dance*, in which the partners are placed opposite or against each other. Of this opinion was the late Mr. Donoyer, dancing-master to the royal family.

CONTRE-sens. The French make use of this expression, in *Musick*, for an absurdity in composition or performance.

CONTRE-temps, Fr. is a breach of time, or false accentuation. Rousseau. But M. Framery (*Encycl. Meth.*) is not satisfied with this definition. According to him, an air is *à contre-temps*, or out of measure, when the cloſes are prepared on the accented part of a bar, and made on the unaccented part. The ear expects that the cloſe or final part of an air or movement should be on an accented part of a bar; in common time of four crotchets, on the first and third; and in triple time, on the first note of a bar. To this we accede, except in Polish airs, called *Polonesi*, or *alla Polacca*, where the cloſe is made on the second note of a bar. See POLONESE.

CONTREBIA, in *Ancient Geography*, *Santavert*, a town of Spain, in the country of the Carpetani, east of Complutum. This town, in 571 or 572, was besieged by the Romans, under the conduct of Q. Flavius Flaccus; and, in consequence of the delay of succour, solicited from the Celtiberians, was obliged to surrender. When the Celtiberians afterwards arrived, they were surpris'd by the Romans, and totally defeated.

CONTREKI, in *Geography*, a town of Arabia, 180 miles S. of Moscat.

CONTRES, a small town of France, in the department of Loir and Cher, and chief place of a canton in the district of Blois. Its population amounts to 1401, and that of the canton to 10,105 persons, divided among 16 communes, upon a territory of 265 kilometres in extent. It is situated 10 miles S. of Blois.

CONTRI, ANTONIO, in *Biography*, was the son of a lawyer at Ferrara. In his youth he spent some time in the study of design, which he practis'd many years in the two capitals of Rome and Paris. Upon his return to Italy, he settled at Cremona, where he studied the painting of land-

scape, under Francesco Bassi. His pictures were frequently embellished with flowers: a species of painting in which he most excelled. But his claim to a place in this work rests principally on a very extraordinary discovery which he made, of the method of transferring pictures, painted in fresco on the wall, to canvas, without in the smallest degree impairing the original beauty of the painting. This he effected by means of a strong cement, or rosin, which he spread over a cloth, the same size as the picture he was desirous of removing. This was then firmly applied to the face of the fresco. A panel of the same size was then fastened to the back of the cloth, when the plaster or fresco was cut round to the size of the cloth. After some days, the board with the cloth was removed from the wall, drawing with it the painting. Another cloth, prepared with a cement still stronger than the first, was then applied to the back of the picture; after which the former cloth was removed, leaving the picture in its original state of perfection. He succeeded in many experiments of this kind in Cremona, Ferrara, and Mantua. This secret, however, has been seldom divulged; and the late pope, Pius VI., for many years, gave a considerable pension to the only person who was acquainted with it at Rome, upon the condition of his removing no fresco paintings from the Ecclesiastical State without his permission: wisely judging, that though the temples and palaces of Italy might be despoiled of oil pictures, the frescos of the great masters would at all times furnish sufficient example for students, and amply gratification to the curious traveller. Antonio Contri died in 1732, leaving a son named Francesco, who followed the footsteps of his father. Lauzi, Storia Pittorica.

CONTRIBUTA, in *Ancient Geography*, *Medina de los Torres*, a town of Spain, in the eastern part of Bética; called also "Julia Contributa."

CONTRIBUTION, the payment of each person's quota, or the part he is to bear in some imposition, or common expence.

Contributions are either *involuntary*, as those of taxes and imposts; or *voluntary*, as those of expences for carrying on some undertaking for the interest of the community.

When goods are cast into the sea, for the safe guard of a ship, or other goods, &c. aboard, in a tempest, there is a contribution among merchants, towards the loss of the owners. (See INSURANCE.) And where a robbery is committed on the highway, and damages are recovered against one or a few persons, in an action against the hundred, the rest of the inhabitants shall make contribution to the same. 27 Eliz. c. 13. See ROBBERY.

CONTRIBUTIONS, *Military*, denote impositions, duties, or taxes, which places and sometimes frontier countries pay to redeem themselves or purchase exemption from being pillaged, plundered, and insulted by the enemy.

It would cost a prince often too much to make war entirely at his own expence. If he adopt just measures according to his finances not to run short of money, he takes them also with his general for finding the means of augmenting or at least sparing his funds. These means are contributions, which are of two kinds, *viz.* those which are exacted in subsistence and commodities, and those which are received in money.

Those that are paid in commodities, or subsistence, are different sorts of grain, forage and provisions, carriage for things wanted as well by water as by land, word of every species, pioneers, and a particular treatment or entertainment of troops in their winter-quarters and lodgings.

No levy ought to be made or taxes raised till a just statement is procured of the situation of the country intended

to be laid under contribution, that the imposition may be rendered as equitable and little burthenfome as possible. No demand, for example, is made of wood on those places that have only grain or meadows, or of land-carriages on those who make use of water-carriage.

The levy of different sorts of grain is made on those tracts or districts of country, that have quietly and peaceably reaped their harvest, and as it were by way of gratitude or acknowledgment for the tranquillity they have enjoyed, through the good behaviour and discipline of the army.

That of oats and other grain for horses should be made under the colour or pretext of regularity or good order, by which means a country is infinitely less burthened than it would be, were it abandoned to the avidity of horsemen, who would carry off the grain, wherefoever they might find it, either in a regular or irregular manner, or with orders or without orders.

That of forage should be made in the same manner, and a convenient time should be fixed on for the carriages that are to carry it to the places, where it is resolved it shall be consumed and made use of.

That of provisions is usually made, if it be possible, in those districts of country, where the troops cannot winter, to prevent the occasioning of a scarcity in that where they are to take up their winter-quarters.

Carriage, whether by land or by water, is necessary for filling the magazines made in the rear of the armies with ammunition and provisions; or for the taking of heavy artillery and ammunition to a place besieged; or for the removing of sick and wounded; or for the transport of materials destined for works.

Impositions of wood are made for palisades, for the construction of caernes and stables, &c. and for fuel to the troops in winter.

Pioneers are assembled or collected together to fortify posts destined for wintering the troops in; for throwing up with promptitude and expedition lines of circumvallation round a place besieged; for repairing roads and opening defiles; for the construction of lines made with a design to cover a country and thereby exempt it from contributions; and for levelling and filling the works made before a place after it is taken.

Utensils and necessaries for the troops taken in an enemy's country are raised or obtained in two ways. The places, where they winter, should not furnish more of them than the conveniencies which the foldier finds in the house of his landlord, supposing there are no barracks in these places. But if there are barracks, the contribution in money is compensated by these commodities, and ought to be less than that which is raised on a level country or in towns, where there are no troops lodged.

The contribution in money is extended as far as possible. It is established in two ways; voluntarily over tracts of country within reach of posts and places destined for winter-quarters; or by force, whether by the army itself whilst it is advancing, or by large parties that are detached for penetrating into these parts which you wish to lay under contribution.

It is made also behind the places belonging to the enemy and rivers by means of terror, whether by incendiaries disguised, who spread and disseminate billets, or by different ways, in which small parties are made to pass the rivers, who endeavour to carry off some persons of consideration in the country, or to burn some large habitation, or dwelling place, or building.

A prince in such ought to have an exact account kept

of all contributions, and have those particularly looked after, who are employed in raising and collecting them, since it is but too common for them to make an improper use of what they raise or collect for their own personal advantage. And when the contributions are not judiciously assessed and demanded, the particular interest of those who impose them, or receive them, always prevails over the interest of the prince or sovereign.

It is a great relief and easement in contributions, when they are imposed with justice, equality, and in an exact proportion to the abilities of those on whom they are raised; and when they are collected without insolence, without feverity or oppression, and without being converted to the profit or benefit of individuals; and when, in default of money, other goods and commodities are taken, as cloths, provisions, &c. but most of all when an army quits its own country to make war in that of the enemy or any other, whatever it may be.

Frederic II, or the Great, in speaking of the conduct of an officer sent out to levy contributions, expresses his sentiments in the following words: "Contributions are generally levied under one of the following circumstances; either being superior to the enemy you cover the whole country; or you possess a part of it till the arrival of the enemy; or you are interrupted by their light troops.

"In the first case it is common for the commander in chief to fix the sum to be raised by the inhabitants, under pain of military execution. Upon this duty the officer must vigorously exert his utmost authority to make his soldiers observe the strictest discipline and decorum, lest the inhabitants should be ruined beyond recovery.

"The second case requires great circumspection in the officer, and a perfect knowledge of the country, that he may not be surpris'd by the unexpected arrival of the enemy; he must pre-determine his plan of retreat, and fix the place of general defence; and for his farther security he must advance small detachments towards the enemy, that he may have early notice of their approach, and so interrupt all communication with the inhabitants.

"On his first arrival in the country, he will dispatch circulating billets of delivery, the duplicates of which are to be carried by the parties which are sent to levy the contributions. These parties are to have orders to return at a certain time, besides which they are to have sealed instructions indicating the places of second and third rendezvous, but these orders are not to be opened unless in cases of necessity.

"When contributions are to be raised in this manner, with the enemy at your heels, all lenity is out of the question. Where there is no coin to be had you must take any thing, that may be easily transported, or cattle, or hostages; but these only as your last resource. If you are close pressed by the enemy, it is best to divide your booty and send it different roads, that you may save at least some part of it.

"In the third case, namely, when the enemy hinders the inhabitants from delivering their quota, the peasants are in great danger of total ruin. Nevertheless, as the exigencies of the army require it, you are to proceed with all possible rigour, and even to punish those who neglect to deliver their proportion at the time required, that the rest through fear may be more punctual in obeying the orders they have received."

CONTRIBUTIOE FACIENDA, in *Laws*, a writ which lies where several persons are jointly bound to the same thing, and one or more of them refuse to contribute their share.

If tenants in common, or joint, hold a mill *pro indiviso*, and equally share the profits of the same; the mill falling to decay,

decay, and one or more of them refusing to contribute to its reparation, the rest shall have the writ of *contributions siccinda* to compel them. And if there be three coparceners of land that owe suit to the lord's court, and the eldest performs the whole; then may he have this writ to compel the refusers to a contribution. So when one suit is required for land, and that land being sold to divers persons, suit is demanded of them all, or some of them by distress, as entirely as if all the land were still in one. Reg. Orig. 175. F. N. B. 162.

CONTRITION, in *Theology*, expresses a real sorrow, resulting from the thought of having offended God; from the sole consideration of his goodness; without any regard, or, at least, independently of any respect, to the punishment annexed to the sin; accompanied with a detestation of sin, and of ourselves on account of it. With this act of the mind, it is said, that repentance, properly speaking, begins.

Some of the Romish doctors avow, notwithstanding the practice of their church, that contrition is valid, and carries with it every thing necessary to obtain pardon, without the ceremony, or as they call it, the *sacrament* of confession and absolution.

And in this they make the difference between contrition and **ATTRITION** (which see) to consist. This doctrine was maintained by F. Seguenot upon St. Anguline; but it was censured by the faculty of Paris.

CONTROL. See **COMPTROL**.

CONTROLLER. See **COMPTROLLER**.

CONTROLES, Fr. the same as **MUSTER-ROLLS**, or **REGISTRY-BOOKS**; which see.

CONTROLEUR General d'Artillerie, controller general of artillery. This appointment was of an old standing in France, and was next to that of grand master or master general of artillery, except that of *garde general d'artillerie*. It was however suppressed, and in 1703 Louis XIV. created two offices in lieu of it, *viz.* that of directors general of artillery, and that of commissary general of powder and salt-petre. But by his declaration of the 21st July 1716, he suppressed these offices, and several others, and attached to that of controller general all the ancient functions, which that officer afterwards exercised in their full extent, and which had been established by the edicts and declarations of Francis I. and his successors.

It is an office of great military importance, and much responsibility. He has a number of commissaries paid by the state to act and manage under him, by his orders, and in his name. They assist at the various proofs of powder and pieces of ordnance, and can take and demand an account of the purchases made in their absence by the principal officer of artillery.

CONTROLEURS Provinciaux d'Artillerie, provincial controllers of artillery. These officers in France used to control all the expences and purchases in general, of whatever kind they might be, that concerned the artillery, and could refuse or reject the arms, ammunition, and in short every thing that proved defective, on the deliveries of articles purchased or contracted for. They have each of them a key of the magazines where they reside. And upon entering on the exercise of their office, they caused inventories to be given to them by the *gardes-magazins* of every article in them, of which they made a register, and on it added the receipts, returns, and expences of stores, that they might be always able to render an account to the controller general, and the commandants of artillery. They often made their visits, and chiefly at the same time that the commandants of artillery made theirs. They gave certificates of the dead

and wounded, and made an inventory and sale of the effects of the dead, with the concurrence of the commissaries, or the *major des equipages*.

CONTROLEUR General de depenses de l'Artillerie, controller general of the expences of the artillery. These officers kept registers or accounts of the receipt and expenditure in money which was made by the treasurer general of artillery, as well as of the receipt and expenditure of pieces of ordnance, ammunition, and of purchases.

CONTROLEURS des Guerres, war controllers. The functions of a *controleur des guerres* are to keep a register and control of the musters and reviews of troops. See the article **MUSTER-MASTERS**.

CONTROLEURS d'Artillerie, controllers of artillery. See the article **CONTROLEURS Provinciaux d'Artillerie**.

CONTROLEUR General des Vivres, controller general of provisions. The undertakers used to choose for this employment an old commissary who was perfectly acquainted with the business, and was a person deserving of confidence. He had a very extensive commission for inspecting and taking cognizance of every thing that concerned provisions; and the exercise of his duty was considered as consisting of two parts; namely, that he should in the first place make himself properly acquainted with the state of the magazines that were to supply the army, and in the second place accompany the director general of provisions, to whom he was subordinate when he should take the field.

The first thing which the controller-general of provisions used to do, was to make a list or statement of all the places that depended on him, and of the commissaries who did duty there. He inquired what were their functions, into their character for zeal and spirit, the extent of their genius, their capacity, what offices they had been employed in, what families they were of, or had, the places of their birth, their age, and their manners.

He examined if the registers of the magazines were in proper form, both as to receipts and expences, and expences; as to the receipts, if the quantity in them is well specified, the quality, the different names of the measures, the weights of the country reduced to avoidupoise weight, in case it should be different; if the name of the seller, the place of his abode, and the date of the purchase, are set forth in the article.

As to the expence, he examined what supplies the commissary had sent to the magazines, or procured, the nature of the grain and flour, the quantities, and the copies of letters of carriage of the articles sent. After taking an extract of the receipts and expences, he saw what remained in the magazine, he himself counted the sacks, and made a certified state of the whole to be given to him.

The duties of this office, in short, were so many and troublesome, that if this officer, who, we have already observed, was subordinate to the director general of provisions, literally fulfilled them, he could not have had so much as one day of rest or repose during the whole continuance of a campaign. See **COMMISSARY-GENERAL of Stores**.

CONTROLEUR des Hopitaux Militaires, controller of military hospitals. Whenever a sick or wounded person enters an hospital, this officer writes upon a register endorsed and marked by a commissary of war, the military appellation or designation of the person sick or wounded, the name of his family, the place of his nativity, and the city nearest to that place. He makes also two statements of his money and his effects, one of which serves as an *etiquette au paquet*, or ticket to the parcel or packet, and the other is returned to the sick or wounded man, in case of whole death an account is rendered to the major of the regiment to which he belonged.

For

For the most part, however, the undertakers are the heirs or inheritors, for after a year and a day no part of either can be demanded from them.

This officer signed the billets of soldiers when they entered an hospital, and made them report themselves to him when they went out. He obliged the overseers of infirmaries to render him an account of the dead immediately after their decease, that he might take them off from his register. In hospitals where there was no controller, every thing now mentioned was executed by the director.

CONTROVER, in *Law*, a person who of his own head devises or invents false or feigned news. 2 Infl. 227.

CONTROVERSIAL DIVINITY. See POLEMICAL DIVINITY.

CONTROVERSY, or CAUSE, *State of a*, among *Ancient Rhetoricians*, denotes the principal point in dispute between contending parties, upon the proof of which the whole cause or controversy depends. Ancient writers have expressed it by several other names, as "the constitution of the cause," "the general head," and "the chief question." (Quint. Infl. Orat. l. iii. c. 6.) As this is the principal thing to every controversial discourse, it also requires the primary consideration of the speaker, and should be well fixed and digested in his mind, before he proceeds to investigate arguments for its support. See Antony's account of his own method of pleading, in Cic. de Orat. l. ii. c. 27. Quintilian (Infl. Orat. l. iii. c. 6.) describes the subject of this article to be "that kind of question which arises from the first conflict of causes." In judicial cases, it immediately succeeds the charge of the plaintiff, and plea of the defendant. Our common law expresses it by one word, *viz.* the ISSUE: which fee. This interpreters explain by describing it to be "that point of matter depending in suit, upon which the parties join, and put their cause to the trial." Thus, in the cause of Milo, the charge of the Clodian party is, "Milo killed Clodius." Milo's plea or defence is, "I killed him, but justly." Hence arises the grand question, or "state of the cause," "whether it was lawful for Milo to kill Clodius?" That Clodius was lawfully killed by Milo is what Cicero, in his admirable oration, in defence of Milo, principally endeavours to prove. The whole of his discourse is to be considered as centering at last in this point. Again, in the case of Roscius, the charge made against him is "that he killed his father." But he denies the fact. The grand question therefore to be argued is, "whether or not he killed his father?" Cicero's design in his defence of him is to shew, that his accusers had not made good their charge.

Besides the principal question, there are subordinate questions that occur in the course of a dispute, which should be carefully distinguished from it: and more particularly that, which arises from the reason or argument alleged in proof of the principal question. Thus, in the cause of Milo, his argument is, "I killed Clodius justly, because he assassinated me." Unless the Clodian party be supposed to deny this, they give up their cause. Hence therefore a subordinate question arises; "whether Clodius assassinated Milo?" Cicero spends much time in the proof of this, as the hinge, on which the rest of the question, and consequently the whole cause depended. But whatever may be the number of subordinate questions, they are all dependent upon the first; and though each of them has its particular state, yet neither of these is what the rhetoricians call "the State of the Cause," which is to be understood only of the principal question. Besides these subordinate questions, incidental ones are often introduced, having some reference to the principal question and contributing towards the proof of it, though they are not necessarily connected with it, or dependent upon it. Each

of these has its "state," though different from that of the "cause." Many questions of this sort occur in Cicero's defence of Milo, occasioned by aspersions that had been thrown out by the Clodian party to the prejudice of Milo. To each of these Cicero replies, before he proceeds to the principal question. And therefore, though the question, in which the "state of a Controversy" consists, is said by Quintilian to arise from the "first conflict of causes," yet we find from the instance of Cicero, now adduced, that it is not always the first question in order, upon which the orator treats. It sometimes happens, that the same cause or controversy comprehends more than one state. Thus in judicial causes, every distinct charge occasions a new state. All Cicero's orations against Verres relate to one cause, founded upon a law of the Romans against unjust exactions, made by the governors of provinces upon the inhabitants; but as that prosecution is made up of as many charges, as there are orations, every charge, or indictment, has its different state. It may be observed, that discourses of a deliberative and demonstrative kind, as well as judicial, are managed in a controversial way; and all controversies have their "state." And therefore Quintilian very justly observes (Infl. Orat. l. iii. c. 6.) that "states belong both to general and particular questions; and to all sorts of causes demonstrative, deliberative, and judicial." As to the number of these "states," Cicero and Quintilian reduce them to three. "Three things," says the latter (Infl. Orat. l. iii. c. 6.) "may be inquired into in all disputes; whether a thing is, what it is, and how it is. And this is the method which nature prescribes. For, in the first place, it is necessary the thing should exist, about which the dispute is; because no judgment can be made either of its nature or quality, till its existence be manifest; which is therefore the first question. But though it be manifest, that a thing is, it does not frequently appear what it is; and when this is known the quality yet remains; and after these three are settled, no further inquiry is necessary." The first of these three states is called the *conjunctural* state; the second is called the *definitive* state; and the third is called the state of *quality*. The first occurs when it is inquired, "whether one person killed another?" The second appears in an example of Cicero; "whether to take a sacred thing out of a private house be theft, or sacrilege?" The third is manifest, when the contending parties are agreed both as to the fact, and the nature of it; but the dispute is, "whether it be just or unjust, profitable or unprofitable, and the like?" as in the cause of Milo. Aristotle (De Rhet. l. iii. c. 26.) and from him Vossius (Infl. Orat. l. i. c. 6. § 7.) add a fourth state, namely that of *quantity*; e.g. "Whether an injury be so great as it is said to be?" Quintilian, however, thinks (ubi supra) that this may be referred to one or other of the preceding states; since it depends upon the circumstances of the fact, as the intention, time, place, or the like. The importance and use of the preceding observations require little illustration. Whenever a person engages in a controversy, he ought in the first place to consider the main question in dispute, to fix it well in his mind, and to keep it constantly in his view: and it is equally necessary for his hearers duly to regard this point, as they will thus be enabled to distinguish and separate from the principal question what is only incidental, and to observe how far the principal question is affected by it; to perceive what is offered by way of proof, and of illustration; and not to be misled by digressions, but to discern when the speaker deviates from his subject, and when he resumes it; and so to accompany him through the whole discourse and through his whole chain of reasoning, as to be able to judge, upon the whole, how far his conclusion is fairly

fairly drawn from his assumed premises. A constant regard to the state of the cause, and principal point in dispute, is very necessary for this purpose. Although rhetoricians treat of these facts only as they relate to epitrochies, and become the subject-matter of dispute between differing parties; yet every discourse has one or more principal heads which the speaker chiefly proposes to prove or illustrate. Ward's Orat. vol. i. lect. vi.

CONTUBERNALES MAGISTRATUM, companions of the magistrates. These were young men destined for civil and military employments, whom the magistrates, in the time of ancient Rome, took into their department to be formed under their eyes and in their houses.

The same appellation of *contubernales* was also given to tent-diers, who lived in one and the same room or under one and the same tent.

CONTUBERNIUM, in *Antiquity*, denotes a sort of connection or cohabitation that took place between male and female slaves in the middle ages. Although their masters or proprietors did not permit them to marry, they were allowed to form this kind of union. This practice so much prevailed, that during several centuries after the barbarous nations embraced Christianity, slaves, who lived as husband and wife, were not joined together by any religious ceremony, and did not receive the nuptial benediction from a priest; when this conjunction between slaves came to be considered as a lawful marriage, they were not permitted to marry without the consent of their master, and such as ventured to do it without obtaining that, were punished with great severity, and sometimes were put to death.

CONTUCCI, ANDREA, in *Biography*, likewise called Andrea Sanfovino, from a town in the Tuscan dominions, which gave him birth in the year 1460. Like Giotto he was the son of a simple shepherd, and, like him, his genius for design discovered itself in childhood, by the drawings which he made in the sand, and the models which he amused himself with forming out of clay. These youthful productions were seen and admired by Simone Vespucci, then chief magistrate of the town of Sanfovino: he perceived in them the prognostics of the future fame of our young artist, and obtained the permission of his father to carry him to Florence, where, under the tuition of Antonio Pollajuolo, he made a rapid progress, and ultimately became one of the most celebrated architects and sculptors of his age. The chapel of the sacrament, in the church of Santo Spirito at Florence, although small, is a beautiful specimen of the perfection which he attained in the former art, and is so finely put together that it appears as if chiselled out of one stone. By this, and other works, he soon acquired an extended reputation; inasmuch, that he was invited into Portugal, where he erected many edifices, and amongst others a palace with four towers for the king. After nine years residence in that country, he returned, loaded with presents, to Italy, and was employed by Leo X. in many considerable works; especially in the statues and basso-relievs which ornament the Santa Casa of Loretto. Several of his other productions in sculpture are at Rome, particularly two sepulchres within the choir of the Madonna del Popolo, and a fine group representing St. Anne, Christ, and the Madonna, in the church of St. Agostino. He died much regretted in the year 1529, at the place of his nativity. Milizia, Mem. degli Architetti.

CONTUMACY, in *Law*, a refusal to appear in court when legally summoned; a disobedience to the rules and orders of a court having power to punish such offence.

The word is used in civil as well as in criminal matters; but more rarely in the first, wherein the words *default*, and

contempt, ordinarily supply its place: the refusing of the charges of contempt, judged at the hearing, is also the penalty of contumacy. In a criminal sense, the contumacious is condemned, not because the crime is proved on him, but because he is absent.

By the Roman laws, there was no process in case of contumacy, during the first year of absence: they only took an inventory of the goods of the fugitive, and if he died in the year, he died *integro flatus*; but, after the year was expired, he was deemed culpable.

In England, contumacy is to be prosecuted to outlawry. In France, all contumacies are annulled, if the accused make his appearance in five years: if he die in that time, his relations are allowed to purge his memory.

CONTUS, *contus*, in *Antiquity*, a long spear, chiefly used by the horse.

CONTUSION, in *Surgery*, a bruise, from the Latin *contusio*. This term is applied to that kind of lesion which is occasioned by the application of a blunt substance to the surface of the body, with more or less violence, but without dividing the skin: it is also used, when any part has been pinched, compressed, or stretched. The first effects of a contusion are a laceration of fibres, or an entire loss of tone in the bruised part; and its common symptoms are swelling and inflammation. A violent contusion occasions considerable lacerations; amongst the many symptoms of which, effusion of fluids into the neighbouring cellular texture, and even fractures of the bones, are the most frequent. (See *Echyrosis* and *Contused Wounds*.) A violent contusion operates not only upon the part at which it immediately takes place, but also upon remote parts of the body; and the lesions thus produced are termed counter-injuries. See **COUNTER FISSURE**.

The degree of the contusion does not always depend upon the force which has occasioned it, but also often upon the nature of the parts that have been bruised. The contusion is always violent, when there is a bone in the injured part, which is little covered with fleshy substance. In every such case of contusion, inflammation, with all its bad consequences, is to be apprehended. In healthy persons, violent contusions often produce as serious consequences; but in persons whose solids are previously debilitated, slight contusions frequently produce gangrene and ulceration. Extravasated fluids, even though in large quantity, are dissolved and reabsorbed, especially when they are situated in parts of a loose spongy texture, or where there are many absorbent vessels. In the more solid parts, for example, in tendinous and aponeurotic parts, small effusions cannot be dissolved, and when situated near to bones, they easily give rise to caries by their pressure.

With regard to the cure, contusions frequently occasion more trouble to the surgeon than fractures; according as the operation and counter-operation of the force applied has been more or less violent, and also according as the patient does or does not give the injured part the requisite repose, which is equally necessary in cases of contusion as it is in fractures. The slighter degrees of contusion require nothing more than the use of external discutient and astringent remedies; the best of which are cold water, wine, brandy, vinegar, and solutions of sal ammoniac, or of alum, or decoction of Peruvian bark, &c. The weakened and stretched parts (if there be not much pain or inflammation) may also be supported by the pressure of a tight bandage; and when the contusion is of considerable extent, by bandaging the whole limb. When the patient is plethoric, and the bruised part is of importance, a vein must be opened, or leeches applied to it.

In the more violent degrees of contusion, the patients require evacuations, especially cooling purgatives frequently repeated. External pressure and friction, when the extravasation is considerable, will greatly aid its absorption, and is therefore beneficial. The more important is the bruised part, and the more copious the extravasation, the more assiduously must all these remedies be employed; but in less extensive contusions, the external applications may be sufficient.

However, the cold fomentations and spirituous affrings must not be applied without proper selection. A decoction of discutient herbs in wine, or in a mixture of equal parts of wine and water, especially when aponeurotic and tendinous parts have been much injured, produces often the greatest benefit; and to this may be added also sal ammoniac, when the pain and tension have abated. But if the skin be abraded, these saline applications cannot well be employed.

Sometimes the pain increases, in spite of these applications, to such a degree, that emollient cataplasms and oleaginous frictions become necessary: the following method is particularly recommended in such cases. Rub well the whole bruised part, above and below the contusion, especially below it, with good oil, and then cover the whole with a mixture of olive oil and strong wine-vinegar, formed into a kind of liniment by agitation. This mixture may best be applied upon thick lint, wrapped round the whole part; thus, when the ankle has suffered the contusion, a part of the leg and foot must be covered with it. These dressings are to be renewed twice or thrice a day, till the swelling and pain disappear. The whole part must then be frequently rubbed with camphorated spirit of wine. When this has been done for about three or four days, a cloth may be applied, spread with a thick ointment composed of white of egg mixed with crude alum. This may be repeated about three times, with intervals of 12 hours.

The yellow or blue spots that remain after the cure of contusions, may easily be made to disappear, by applying to them a mixture of bran, salt, and vinegar, boiled together till the bran has imbibed the fluids.

When the quantity of extravasated blood is very large, or when it is situated in a part where it cannot easily be absorbed, or when it gives rise to symptoms which demand speedy relief, it must be immediately evacuated by an incision, and the sore treated like a wound combined with contusion. The same practice must also be observed, when the internal hæmorrhage by which the extravasation is produced, proceeds from a large vessel, continues, and requires to be stopped by some particular applications; or when, besides the extravasation, other lesions of the parts are also present, as, for example, when the bone has been shattered. Should there still remain lumps of coagulated blood behind, after the use of the discutient remedies, these must also be removed by incisions, if they threaten to produce further mischief by their pressure.

Blows and contusions of the *joints* deserve particular attention: for in these situations, especially in the knee joint, they are always dangerous. The consequences are violent pain and impeded motion; the pain is generally severe at first, but sometimes not. In the first case the ligaments, and in the second the glands, or interior parts, of the joint have been principally affected. In the latter case the consequences are dropsy, or even suppuration of the joint, which frequently proves fatal. When the ligaments or other external parts of the joint have been injured, the part must be kept quiet, and treated, according to the peculiar circumstances of the case, with the remedies formerly mentioned, but especially we should have recourse to leeches: it may

Vol. IX.

afterwards be washed with spirituous and saline applications. When the pain has ceased, and there remains behind, as often happens, a stiffness in the part, the soap, liniment, and vapour bath may be employed with advantage. Should arthritic affections be superadded, speedy relief must be procured, and the dangerous consequences obviated by cupping, blisters, friction with flannel, and the internal use of camphorated remedies. When the ligaments have been stretched and relaxed by a fall, the German surgeons apply, with good effect, small bags filled with the warm powder of plaster of Paris, mixed with a fourth part of sal ammoniac and common salt.

When the glands, or internal parts of the joint, have been injured, the surgeon ought not to intermit the application of appropriate remedies, till the pain has entirely ceased, especially repose, blood-letting, and cold fomentations. The lesion of a joint, particularly of the knee, by a fall, blow, &c. easily gives rise to a white swelling of the part. In such cases the surgeon cannot employ too great care and attention, as the symptoms are so numerous and diversified, that it is in vain to expect a fortunate result from a careless and hurt practice.

Internal contusions are attended, more or less, with distressing and serious symptoms. If the head be violently contused, there is danger lest the brain should have suffered at the same time; or lest the effused blood, lying long upon the cranium, should injure the bone by its pressure, if it be not speedily absorbed.

When the thorax has been violently contused, the heart, lungs, and large blood-vessels within the chest, are liable to partake of the injury; or a rib may be fractured, and may pierce the lungs, so as to occasion alarming consequences, if not death itself.

A general contusion of the abdomen, or a blow received upon it, may perhaps hurt the liver, stomach, uterus, bowels, &c. or may rupture an important blood-vessel, and thus cause the death of the patient by the internal bleeding, inflammation, or suppuration.

The judicious surgeon will therefore, in such cases, consider what internal parts are likely to have sustained an injury, and will adapt his means to the peculiar circumstances which arise. See CONCUSSION, FRACTURE, and HÆMORRHAGE.

CONTWIG, in *Geography*, a small town of France, in the department of Mont Tournon, and chief place of a canton in the district of Deux Ponts, with 780 inhabitants. The canton itself is composed of 16 communes, and reckons 4114 inhabitants.

CONTY, a small town of France, on the river Seille, in the department of Somme, 12 miles S.E. of Amiens, which formerly gave the title of prince to the second line of the house of Bourbon Condé. It has only 759 inhabitants, but is the chief place of a canton, which, in 27 communes, and upon a territorial extent of 220 kilometres, reckons 6675 persons, and forms part of the district of Amiens; $3\frac{1}{2}$ leagues N.N.E. of it.

CONTZ, a small town of France, in the department of Sarre, and chief place of a canton in the district of Treves. The number of its inhabitants does not exceed 351, and the whole canton has 31 communes, and a population of 4972 individuals.

CONTZEN, ADAM, in *Biography*, a Jesuit, and native of the duchy of St. Juliers, has been celebrated for his deep knowledge in the learned languages which he taught in the college of Munich, where he died in the year 1635, after having published "Commentarii in Evangelia in Epit. Pauli ad Rom. et ad Corinth." 2 tom. folio. He wrote

likewise some able pieces in defence of the Catholic religion as opposed to the Protestants. Moreri. Nouv. Hist. Dict.

CONVALESCENCE, in *Medicine*, the insensible recovery of health; or that state in which, after the cure of a disorder, the body which has been reduced, has not yet regained its vigour, but begins to resume its powers. Proper aliments conduce to the re-establishment of the languid faculties; but as the tone of the bowels is weakened, the digestive faculty is not equal to its office, which is shewn by light sweats over the whole body; and the smallest excess in this respect is oftentimes the occasion of dangerous relapses. A person in this state is like a taper relumed, which the least degree of wind is sufficient to extinguish. *Encycl.*

CONVALESCENT, recovering or returning to a state of health. In this country hospitals are established in different districts, for the preservation and recovery of our troops when ill or indisposed. Among others, there is in each district a convalescent hospital.

List of convalescents, is the return made out by the surgeon belonging to a battalion, hospital, &c. in order to ascertain the specific number that may soon be expected to be able to do duty.

CONVALLARIA, in *Botany*. Linn. Gen. 425. Schreb. 575. Willd. 649. Gart. 67. Juss. 42. Vent. 2. 145. Muegt. *Encyc.* Class and order. *hexandria monogynia*. Nat. Ord. *Sarmentacea*, Linn. *Aparagi*, Juss. *Asparagoides*, Vent.

Gen. Ch. *Cal.* none. *Cor.* monopetalous, bell, funnel, or wheel-shaped, smooth, more or less deeply six-cleft; segments open or reflexed. *Stam.* Filaments six, awl-shaped, inserted into the corolla or the receptacle; anthers oblong, erect. *Pist.* Germ superior, globular; style filiform; stigma obtuse, trigonous. *Peric.* Berry globular, spotted before it ripens, three-celled. *Seeds* one, two, or more in each cell, one or two of the cells frequently abortive.

Eff. Ch. *Cor.* six-cleft. Berry superior, when unripe, spotted; three-celled.

* *Corollas bell shaped*. *Lilium convallium*, Tourn.

Sp. 1. *C. majalis*, sweet-scented lily of the valley. Linn. Sp. Pl. 1. Mart. 1. Poir. 1. Willd. 1. Flor. Dan. tab. 854. Lam. Ill. tab. 248. Eng. Bot. 1035. Gart. tab. 16. fig. 6. (*Lilium convallium alpinum & latifolium*; Bauh. Pin. 304. Polygonatum; Hall. n. 1241.) "Scapus semi-cylindrical; flowers in racemes, somewhat unilateral, nodding." *Root* perennial, matted, creeping. *Leaves* radical, two, on long petioles, elliptical, ribbed, entire, acute; petioles equitant, invell'd with scales. *Scapus* extra-foliceous, solitary, erect, simple. *Flowers* white, pedicelled, alternate, bracteate, sweet-scented; segments recurved; pedicels recurved; stamens short; style club-shaped, triangular upwards. *Berry* leaflet when ripe. It varies in having broader or narrower leaves. A native of woods, particularly in hilly countries. 2. *C. japonica*, grass-leaved lily of the valley. Linn. Jun. Supp. 204. Mart. 2. Poir. 2. Willd. 2. Thunb. Flor. Jap. 139. (Monds. Kamp. Amcen. with a figure.) "Scapus two-edged; flowers in racemes, unilateral; leaves linear, three times longer than the scapus." *Root* perennial, tuberous. *Root-leaves* about ten, two feet long, drawn to a point at the bottom, triangular, striated, bent back. *Scapus* finely striated, seven inches long, quadrangular. *Flowers* white; peduncles aggregate, from two to six together, from one to four flowered; bracts lanceolate, white, shorter than the peduncle; divisions of the corolla lanceolate, spreading. *Berry* blue, about the size of a pea, egg-shaped. *Seed* solitary, filling the berry. There is a variety with leaves about seven inches

long, twice the length of the scapus. A native of Japan, introduced into England in 1784. 3. *C. japonica*. Mart. 3. Poir. 3. Willd. 3. Thunb. Jap. 141. "Scapus striated; raceme spiked; flowers aggregate." *Root* perennial, fibrous. *Leaves* linear, narrowed towards the base, somewhat obtuse, much striated, longer than the scapus. *Scapus* from four inches to a foot high, upright, simple, angular, striated, smooth. *Flowers* violet, clustered without order in a spike-like raceme; peduncles very short, cylindrical, spreading, smooth, one-flowered; corolla almost globular, so deeply divided as to appear six-petaled; divisions egg-shaped, obtuse, concave; filaments inserted into the germ. Thunb. (receptacle, Poir.); anthers egg-shaped, erect, two-celled; germ six-striated, smooth; style erect, white, shorter than the filaments; stigma simple. *Fruit* not sufficiently known. A native of Japan, flowering in September.

* * *Corollas funnel-shaped*. Polygonatum, Tourn.

4. *C. verticillata*, narrow-leaved Solomon's seal. Linn. Sp. Pl. 2. Mart. 4. Poir. 4. Willd. 4. Eng. Bot. 128. (Polygonatum; Hall. n. 1244. P. angustifolium non ramosum; Bauh. Pin. 303. Tourn. Inst. 78. β . ramosum; Bauh. Pin. 304.) "Leaves in whorls." *Root* perennial, fleshy, creeping. *Stems* two feet high, erect, commonly simple, angular, smooth, naked near the bottom. *Leaves* three or four in a whorl, five or seven at the top of the stem, lanceolate, acute, sessile, glaucous underneath; stipules none. *Flowers* white, green at the tip; peduncles axillary, solitary, slender, branched, drooping, two or three-flowered; corolla a little narrowed at the mouth of the tube; divisions bearded within under the tip, rather obtuse; stamens short, inserted into the mouth of the tube; style short. *Berry* globular, blue. There is a branched variety, described by Clusius and others as a distinct species. A native of many parts of Europe, of Scotland, but not of England. 5. *C. polygonatum*, angular Solomon's seal. Linn. Sp. Pl. 3. Mart. 5. Poir. 5. Willd. 5. Flor. Dan. tab. 377. Eng. Bot. 280. Woodv. Med. Bot. tab. 44. (Polygonatum latifolium vulgare; Tourn. Inst. 78. Hail. Helv. n. 1242. P. latifolium flore majore odoro; Bauh. Pin. 303. Barrel. Ic. 711.) "Leaves alternate, half-embracing the stem; stem angular; peduncles axillary, generally one-flowered." *Root* perennial, creeping, fleshy, full of knots, which, when cut obliquely, are figured with veins, with somewhat of the appearance of a seal, whence it is said to have obtained the name of Solomon's seal. *Stems* several, a foot and half high, erect, nodding at the top, simple, leafy half way down, angular, somewhat two-edged, zig-zag, smooth. *Leaves* nerve'd, smooth, unilateral. *Flowers* white, with a green line down the segments, nodding, sweet-scented; * unilateral on the side opposite the flowers; peduncles axillary, solitary or in pairs, almost always one-flowered; corolla oblong, a little narrowed in the middle; divisions spreading, bearded; stamens inserted into the middle of the tube; anthers projecting beyond the base of the divisions; style half an inch long. *Berry* blue, with three seeds. A native of England and other parts of Europe. The root is mucilaginous, and in times of scarcity has been made into bread. It has long been employed as a discutient poultice to various kinds of tumours, but more particularly to bruises, accompanied with extravasation of blood in the cellular membrane. It is also recommended as a cosmetic; and in the time of Galen was used by women to remove pimples and freckles of the skin. The berries, flowers, and leaves are extremely acrid, and said to be poisonous; but Poirct has often eaten the young shoots in spring and found them as tender and wholesome as those of asparagus. 6. *C. multi-*
flora.

flora. Many-flowered or common Solomon's seal. Linn. Sp. Pl. 4. Mart. 7. Poir. 6. Willd. 6. Flor. Dan. tab. 152. Eng. Bot. tab. 279. (Polygonatum latifolium maximum; Bauh. pin. 303. Tourn. Inst. 78. Hall. helv. n. 1242.) "Leaves alternate, embracing the stem, stem cylindrical; peduncles axillary, many-flowered." Root perennial, creeping, fleshy, knotted. Stems two feet high or more, simple, leafy, nodding. Leaves elliptical, nerved, a little paler than those of *C. polygonatum*. Flowers white, green at the base and tip; peduncles solitary, about five-flowered; tips of the divisions of the corolla scarcely bearded; stamens inserted into the top of the tube; style half an inch long. Berry bluish black. A native of England and other parts of Europe, chiefly in mountainous parts of the country. The root has similar properties to those of the preceding species; the young shoots are likewise esculent. 7. *C. birta*. Poir. 7. Bosc. act. soc. h. nat. Paris. "Leaves alternate, a little embracing the stem; stem hispid; peduncles with about three flowers." Root spreading. Stem about a foot high, crooked, angular, sprinkled with white stiff hairs. Leaves egg-shaped, broad, ending in a long obtuse point; nerves of the inferior surface hairy. Flowers nodding, unilateral; peduncles axillary, about an inch long, villous. A native of North America, introduced into the Paris garden in 1789. 8. *C. latifolia*. Mur. syst. veg. 334. Mart. 6. Poir. 8. Willd. 7. Jacq. Aust. 2. tab. 222. "Leaves alternate, embracing the stem, acuminate; stem angular; peduncles axillary, many-flowered." This species has the habit of *C. multiflora*, the flowers of *C. polygonatum*, and the leaves of *C. majalis*. Root small, spreading, fleshy, very mucilaginous. Stem a foot and a half or two feet high, cylindrical at the base, then angular to the summit. Leaves egg-shaped, much nerved, quite entire; nerves of the under surface slightly villous when viewed through a lens. Flowers three times larger than those of *C. multiflora*, white, green at the top, and marked lengthwise with greenish lines, nodding; peduncles slightly villous; stamens attached to the middle of the tube. Berry globular, bluish black. Seeds three or four, sometimes five, in each cell. A native of Austria, on woody mountains.

*** Corollas wheel-shaped. Smilacæ, Tourn.

9. *C. racemosa*. Linn. Sp. Pl. 5. Mart. 8. Poir. 9. Willd. 8. Bot. Mag. tab. 899. (Polygonatum racemosum; Corn. Canad. 36. tab. 37. Pluk. Alm. 301. tab. 311. fig. 2.) "Leaves sessile; raceme terminal, compound." Linn. "Leaves alternate, sessile, egg-shaped, acuminate; panicle terminal, naked." Willd. Stem two or three feet high, stiff, angular, flattened, zig-zag. Leaves nerved, thin, flexible, green on both sides, slightly ciliated at the edges. Flowers white, very small, on small alternate branches, with short peduncles; corolla open, divided almost to the base; divisions egg-shaped, a little shorter than the stamens; anthers large, yellowish. Berries small, red. A native of North America, called *Oiole Nowote*, child's physic, by the Cherokee Indians. It is a hardy perennial, easily propagated by parting the roots, but thrives most in a light soil and shady situation. 10. *C. stellata*. Linn. Sp. Pl. 6. Mart. 9. Poir. 10. Willd. 9. (Polygonatum virginianum. Moris. hist. 3. tab. 4. fig. 7. P. canadense; Corn. Canad. tab. 33.) "Leaves embracing the stem, numerous." Linn. "Leaves alternate, embracing the stem, elliptical, somewhat acute; raceme terminal, simple." Willd. Root white, spreading horizontally. Stem about two feet high, thick, not angular, weak, almost hollow within. Leaves growing very near together, large, even surfaced, smooth, slightly ciliated, green on both sides. Flowers white, in a close spike;

corolla large, open, stellate, divided almost to the bottom; segments linear, obtuse, stamens half the length of the corolla; filaments capillary; anthers yellow, small, roundish; style the length of the stamens; stigma obtuse. Berries red. A native of North America. 11. *C. trifoliata*. Linn. Sp. Pl. 7. Mart. 10. Poir. 11. Willd. 10. (*C. floribus racemosis, foliis ovatis oblongis*; Cmel. Sib. 1. tab. 6.) "Leaves embracing the stem, in threes; raceme terminal, simple." Root perennial, long, jointed, knotty, with short slender filaments at each joint. Stem about three or four inches high, slender, crooked. Leaves generally three together, oblong, rarely lanceolate, rather acute, even-surfaced, smooth, nerved, green on both sides. Flowers small, on long simple peduncles; corolla open, deeply divided; divisions ovate-acute; stamens very short, inserted into the receptacle; germ roundish. Berries red, round. Seeds two or three, yellowish, compressed, pointed. A native of the forests in Siberia. 12. *C. bifolia*. Linn. Sp. Pl. 8. Mart. 11. Poir. 12. Willd. 11. Flor. Dan. tab. 291. Bot. Mag. Pl. 510. (Lilium convallium minus; Bauh. pin. 304. Barrel. Icon. 1212. Unifolium; Hall. helv. n. 1240.) "Leaves heart-shaped; flowers tetrandrous." Root perennial, small, fibrous, creeping. Root-leaves solitary, on long petioles, springing from distant parts of the root. Stem from a different part of the root, two or three inches high, slender, slightly angular. Stem leaves generally two, petioled, a little nerved, heart-shaped, acute, with two rounded lobes and some stiff hairs at the base. Flowers white, small, shorter than the peduncles; peduncles very slender, quite simple, sometimes two together, from the axil of a small scale at their base; corolla deeply four-cleft; divisions oval, open; stamens four; filaments long; anthers small, shorter than the corolla; style short, thick; stigma slightly bifid or trifid. Berries red, small, two or three-celled. A native of the mountainous parts of Europe, abundant in Sweden. Poiret observes that the petioled leaves are a rare singularity in the family of the Liliacæ.

Propagation and Culture.—The lily of the valley requires a loose sandy soil and a shady situation. It is propagated by parting the roots in autumn, placing the sets a foot asunder. This should be done every third or fourth year; their flowers will else be small and few. All the sorts of Solomon's seal are hardy. They prefer a light soil and shady situation, and are proper to ornament plantations which are not crowded with shrubs. They are propagated in the same manner and require the same treatment as the lily of the valley. Miller.

CONVENÆ, in *Ancient Geography*, a people of Gaul, who derived their name from the Latin *convivere*. They were established by Pompey, after his return from the Spanish war, against Sertorius, at the foot of the Pyrenees. Their country is Cominges.

CONVENT, from the Latin *conventus, meeting*, of *convivere, to come together*; a monastery of religious, of either sex. See MONASTERY.

Convents are very numerous in Greece, as well as in many Popish countries; and they are generally, though not universally, sanctuaries consecrated to ignorance, superstition, and most frequently to sloth. In the Grecian islands, the monks are denominated *caloyers*, from *καλος, kalos*, good, and *γειος, geios*, old man, *q. d.* good old man. However, the Grecian convents are the habitations, not merely of old men, but of young boys, from 10 to 12 years of age, clothed in the habit, which consists of a plain long black gown, confined by a girdle.

CONVENTA PACTA. See PACTA.

CONVENTI, GIULIO CESARE, in *Biography*, a Bolognese

nese sculptor, who is spoken of in high terms by Malvasia, in his description of the magnificent funeral of Agostino Caracci, upon which occasion Conventi modelled a beautiful figure of virtue, which, with another, personifying honour, was represented, crowning with laurel, the bust of the deceased artist. The celebrated sculptor, Algardi, received his first instruction in modelling from this master. Malvasia.

CONVENTICLE, a diminutive of *convent*, denoting, properly, a cabal, or secret assembly, of a part of the monks of a convent, to make a bribe or party in the election of an abbot.

From the ill use of these assemblies, the word is come into disrepute; and now stands for any mischievous, seditious, or irregular assembly. F. Doucine observes, the occidentals always esteemed the fifth general council an unlawful conventicle. The term conventicle is said, by some, to have been first applied in England to the schools of Wickliff, and has been since used to signify the religious assemblies of all in this country, who do not conform to the established doctrines and worship of the church of England.

Conventicle, however, in strict propriety, denotes an unlawful assembly; and cannot, therefore, be justly applied to the legal assemblies of protestant dissenters, in places of worship certified, or licensed, according to the requisitions of law. See TOLERATION.

This term occurs in the statutes 2 Hen. IV. c. 15, and 1 Hen. VI. c. 3; and 16 Car. II. c. 4. (A. D. 1664), which statute was made to prevent and suppress conventicles. This statute, which was enacted for three years, having expired, was revived A. D. 1670, by 22 Car. II. c. 1. which enacted, that if any persons of the age of sixteen years, subjects of this kingdom, shall be present at any conventicle, where there are five or more assembled, they shall be fined 5s. for the first offence, and 10s. for the second; and persons preaching incur a penalty of 20l. for the first, and 40l. for the second offence. Also, suffering a meeting to be held in a house, &c. is liable to 20l. penalty. Justices of peace, on the oath of two witnesses, or any other sufficient proof, may record the offence under their hands and seals, and this record shall be taken in law for a full and perfect conviction, and shall be certified at the next quarter-sessions. They, and also constables, head boroughs, &c. have power to enter such houses, and seize persons assembled, &c. And if they neglect their duty, they shall forfeit 100l. And if any constable, &c. know of such meetings, and do not inform a justice of peace, or chief magistrate, &c. he shall forfeit 5 l.

“One clause in this act,” says Mr. Hume (Hist. vol. vii. p. 457), “is remarkable; that if any dispute should arise with regard to the interpretation of any part of the act, the judges should always explain the doubt in the sense least favourable to conventicles; it being the intention of parliament entirely to suppress them. Such was the zeal of the commons, that they violated the plainest and most established maxims of civil policy, which require, that in all criminal prosecutions, favour should always be given to the prisoner.” The persecution under this act continued to be very severe, till the operation of the act was suspended by the exercise of a dispensing power, and the king’s declaration of indulgence, A. D. 1671–2. However, alderman Love, member for the city of London, in the name of the dissenters, disavowed the dispensing power, though it had been exercised in their favour, because, as he declared in his speech, “he had rather go without his own desired liberty, than have it in a way so destructive of the liberties of his

country, and the protestant interest; and this (he said) was the sense of the main body of dissenters.” At length it was ordained, by the stat. 1 W. & M. II. c. 18. that protestant dissenters shall be exempted from penalties; though if they meet in a house with the doors locked, barred, or bolted, such dissenters shall have no benefit from that statute. By stat. 10 Anne, c. 2. officers of the government, &c. present at any conventicle, at which there shall be ten persons, if the royal family be not prayed for in express words, shall forfeit 40l. and be disabled. See NONCONFORMISTS and TOLERATION.

CONVENTION, in our *Law-Books*, is used when a parliament is called, which sits and is dissolved without any act passed, or judgment given. It is then said not to be a *session* of parliament, but a *convention*. See CONVENTION *infra*.

CONVENTION of Rouen, the same with burse of Rouen.

CONVENTION, a treaty, contract, or agreement between two or more parties. See CONTRACT.

Every convention between men, provided it be not contrary to honesty, and good manners, produces a natural obligation, and makes the performance a point of conscience.

Every convention has either a name, and a cause or consideration, or it has none: in the first case, it obliges civilly and naturally; in the latter only naturally.

CONVENTIONS *entre souverains pour restitution des deserteurs*, conventions among sovereigns for restitution of deserters. By these sorts of *conventions*, the deserters from all armies are taken up or arrested, if they get into the territories of a power, that is in agreement with that whose colours they have deserted. Notice is given to the nearest commandant, who should send people to find the deserters at the expence of the corps, and should pay those who took them up, for their sustenance or support during the time of their detention.

CONVENTION *secrètes entre les officers d'un corps*, secret conventions among the officers of a corps. See CONCORDAT.

Secret conventions are also made in a treaty of peace, reciprocally agreed on, and concluded between the parties, who have received powers to treat. Then these conventions remain secret and concealed, till what was agreed on between the treating and contracting parties is put in execution.

CONVENTION is much used both in ancient and modern pleadings, for an agreement or covenant,

In the book of rolls of the manor of Hatfield in Yorkshire, we have a record of a pleasant convention, anno 11 Edw. III. between Robert de Roderham, and John de Ithen; the latter of whom sold the devil in a siring for three-pence halfpenny to the former, to be delivered on the fourth day after the convention; when, the purchaser making his demand, the seller refused to give him livery, to the great loss (as the record represents it), of forty shillings to the purchaser, &c. But it appearing to the court, that such a plea does not lie among Christians, the parties were adjourned to hell for judgment.

CONVENTION is also the name given to an extraordinary assembly of parliament, or of the states of the realm, held without the king’s writ. Of this kind was the parliament which restored Charles II. This parliament met above a month before his return, the lords by their own authority, and the commons, in pursuance of writs issued in the name of the keepers of the liberty of England, by authority of parliament; and sat full seven months after his restoration, and enacted several laws still in force.

The necessity of the case, in this instance, superseded all law; for if they had not so met, it was morally impossible that the kingdom should have been settled in peace. After the king's return, the first thing that was done, was to pass an act, declaring this to be a good parliament, notwithstanding the defect of the king's writs. (Stat. 12 Car. II. c. 1.) Nevertheless, though the king himself, who alone had a right to object, consented to waive the objection, it was at that time a great doubt among the lawyers (1 Sid. 1.) whether even this healing act made it a good parliament, and held by very many, says judge Blackstone, in the negative: though, as he adds, it seems to have been too nice a scruple. And yet, out of abundant caution, it was thought necessary to confirm its acts in the next parliament, by statute 13 Car. II. c. 7. & c. 14.

The convention of estates, in 1688, after the retreat of king James II. upon mature deliberation, came to a conclusion, that king James, by his practices here, and his flight hence, had abdicated the kingdom; and that the throne was vacant; and therefore devolved to king William and queen Mary. Upon this their assembly expired as a convention, and was converted into a parliament.

In this case, the lords and commons, by their own authority, and upon the summons of the prince of Orange (afterwards king William) met in a convention, and therein disposed of the king and the kingdom. On this occasion, the peers and bishops, to the number of near 90, addressed the prince, desiring him to summon a convention by circular letters. In order to satisfy his mind by a more general and express declaration of the public consent, the following judicious expedient was adopted. All the members who had sitted in the House of Commons during any parliament of Charles II., were invited to meet; and to them were added the mayor, aldermen, and fifty of the common council of London. This was regarded as the most proper representative of the people that could be summoned during the present emergency. They unanimously voted the same address with the lords. The prince, being thus supported by all the legal authority which could possibly be obtained in this critical conjuncture, wrote circular letters to the counties and corporations of England, and his orders were universally complied with. Accordingly, the English convention was assembled, June 22, 1689, and a vote was passed in a few days by a great majority of the commons, and sent up to the peers for their concurrence. The words which expressed it were these, "that king James II. having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between king and people; and having, by the advice of Jesuits, and other wicked persons, violated the fundamental laws, and withdrawn himself out of the kingdom, has abdicated the government, and that the throne is thereby vacant." (See ABDICATION.) The vote was carried to the upper house, and there met with great opposition. After long debate, and free conference between the houses, and after having obtained the sentiments of the prince, with regard to the settlement of the government, the chief parties agreed, and the convention passed a bill; in which they settled the crown on the prince and princess of Orange; the sole administration to remain in the prince; the prince of Denmark to succeed after the death of the prince and princess of Orange; her posterity after those of the prince's, but before those of the prince by any other wife. The convention annexed to this settlement of the crown, a declaration of rights, where all the points which had of late years been disputed between the king and people, were finally determined; and the powers of royal pro-

rogative were more narrowly circumscribed, and more exactly defined, than in any former period of the English government. See CONSTITUTION.

This convention was assembled upon a similar principle of necessity with that of the restoration; that is, upon a full conviction, that king James had abdicated the government, and that the throne was thereby vacant; which supposition of the individual members was confirmed by their concurrent resolution, when they actually assembled. In such a case as the palpable vacancy of the throne, it follows "*ex necessitate rei*," that the form of the royal writs must be laid aside, otherwise no parliament can ever meet again. Let us suppose, for the sake of argument, that the whole royal line should at any time fail, and become extinct, which would indisputably vacate the throne; in this situation, it seems reasonable to presume, that the body of the nation, consisting of lords and commons, would have a right to meet and settle the government, otherwise there must be no government at all. Upon this, and no other principle, says judge Blackstone, did the convention in 1689 assemble. The vacancy of the throne was precedent to their meeting, without any royal summons, not in consequence of it. They did not assemble without writ, and then make the throne vacant; but, the throne being previously vacant by the king's abdication, they assembled without writ, as they must do if they assembled at all. Had the throne been full, their meeting would not have been regular; but, as it was really empty, such meeting became absolutely necessary. Accordingly, it is declared by statute 1 W. & M. II. c. 1. that this convention was really the two houses of parliament, notwithstanding the want of writs, or other defects of form.

A similar convention, by circular letters from the prince, was summoned at Edinburgh, on the 22d of March 1689. As soon as the purpose of this convention was discovered, the earl of Balcarras, and viscount Dundee, leaders of the tories, withdrew from the city; and the convention having passed a bold and decisive vote, that king James, by his mal-administration and abuse of power, had forfeited all title to the crown, they made a tender of the royal dignity to the prince and princess of Orange.

The constitution of Great Britain having placed the representation of the nation, and the expression of the national will in the parliament, no other meeting or convention, even of every individual in the kingdom, would be a competent organ, to express that will; and meetings of such a nature tending merely to sedition, and to delude the people into an imaginary assertion of rights, which they had before delegated to their representatives in parliament, could only tend to anarchy and confusion; and to overturn every settled principle of government.

Accordingly, an act of parliament was passed in Ireland, in the year 1793, to prevent any such meetings or conventions; and a few ignorant individuals, who in the same year had dared to assemble under that title in Scotland, were quickly dispersed, and their leaders convicted of seditious practices; for which they were sentenced to transportation.

CONVENTIONAL ESTATES *for Life*, are those that are expressly created by the acts of the parties, in contradistinction to such as are merely *legal*, or enacted by constraint and operation of law. See ESTATE.

CONVENTIONAL Subrogation. See SUBROGATION.

CONVENTIONARY RENTS, in *Rural Economy*, is a term which is sometimes applied to the reserved rents of life leases. See LEASE.

CONVENTIONE FACIENDA, in *Law*, is a writ which lies for the breach of any covenant in writing. Fitzherbert calls it a writ of *covenant*.

CONVENTUAL, something belonging to a convent. See **COENOBITE**.

CONVENTUAL is particularly used, since the year 1250, for a religious who actually resides in a convent; in contradistinction to those who are only guests, or are entertained there, or are in possession of benefices depending on the house.

CONVENTUAL likewise denotes a class of the order of Franciscans, who adopted the relaxation introduced into that order by pope Innocent IV. which allowed of property and possessions in their community. They were so called in opposition to the "Brethren of the Observance." This division took place in the year 1368.

CONVENTUAL Church, denotes a church that consists of regular clerks, professing some order of religion; or of dean and chapter, or other societies of spiritual men.

CONVENTUAL Prior, differs from a *claustral prior*, in that the former has the full right and authority of an abbot; the only difference between them being in the name: whereas the claustral prior is a dependent of the abbot, and derives all his authority from him.

The conventual prior is obliged to take priest's orders in a year, or at most in two years, from the day of his admission: in default whereof, the benefice becomes vacant. Some priories are actually conventual, *i. e.* they are stocked with religious: others are only conventual in *habitu*, *v. gr.* where there have been no religious during the space of forty years: the continuance of one single religious, keeps the priory *conventual actu*; for, in default of one, the priory becomes simple. See **PRIOR**.

By a declaration of the king of France, in 1680, it was decided, that a conventuality never degenerates, or ceases, while there are regular places subsisting in it for twelve religious, with revenues for their support.

CONVENTUAL Auditors. See **AUDITOR**.

CONVERGENCY of Meridians, in *Geographical Surveying*, is the angle formed between the meridian of any other place, drawn through the first mentioned place. Thus, if P (*Plate II. Surveying, fig. 10.*) be the pole of the earth, EQ a portion of the equator, PE a meridian drawn through a place or station G, and PQ a meridian drawn through another place R: then, if GR be a portion of a great circle passing through the places G and R, and *ab* be a portion of a small circle passing through G, parallel to the meridian of R (PQ), or perpendicular to the great circle *GR*, which is itself a perpendicular to the meridian PQ, in the point R, then is the angle *aGP* the angle of convergency of the two meridians PG and PR, at the place G. It is to be observed, that at the equator any two meridians, as EP and QP, are parallel to each other; but on their departure from thence, they converge more and more as they approach towards the pole, where the angle of convergency (*aGP*) becomes equal to the angle of longitude EPQ. It may also be remarked, that the angle of convergency, augmented by the excess of the three angles of a spherical triangle above 180°, is equal to the angle of longitude at the pole, on a sphere. Phil. Transf. 1787, p. 218. The principles for applying this to an ellipsoid figure of the earth, or to any other given spheroid, may be found in Mudge and Dalby's Trig. Survey. vol. i. art. 60, &c.

The late general Roy (Phil. Transf. 1787, p. 216.) has explained the mode of applying the convergency of two me-

ridians, obtained by reciprocally observing the azimuth of a station on each, from the other, compared with the meridian there (determined by observations of the pole-star), to the finding of the difference of longitude, or angle at the pole between the meridians of those two stations, by a method somewhat different from that recommended by the Rev. Mr. Mitchell. Phil. Transf. lvi. In the progress of the Government Trigonometrical Survey, this method was first applied in the finding of the difference of longitude between Botley Hill station in Surrey (lat. $51^{\circ} 16' 41\frac{1}{2}''$ N. and long. $0^{\circ} 0' 3''$ E.) of Greenwich Royal Observatory) and Goudhurst people in Kent, about 23 miles distant; as also for settling the latitude of the latter place. Phil. Transf. 1790, p. 206. It was afterwards applied, in a most complete manner, to the determination of the difference of longitude between Beachy Head station in Suffex (lat. $50^{\circ} 44' 23.7''$, long. $0^{\circ} 15' 11.9''$ E.), and Dunnofe station in the Isle of Wight, wherein the bearing of each of these places, with the meridian of the other, was accurately settled by observation, although the places are more than 64 miles apart; and whence, the length of a degree of a great circle of the earth, perpendicular to the meridian in latitude $50^{\circ} 41'$, was calculated to be 61182.3 English fathoms. The latitude of Dunnofe station, as determined by this operation, has since been verified by a series of accurate observations, made with a capital zenith sector, the last work of the celebrated Ramsden, and has been found to err only $\frac{1}{2}$ of a second in defect. See **DUNNOSE**. This method of determining longitudes of stations, by the convergency of meridians, has since been applied to finding the longitudes and latitudes of Black-Down station in Dorsetshire, long. $2^{\circ} 32' 22.4''$ W. lat. $51^{\circ} 41' 14.7''$ N. of Butterton station in Devonshire, long. $3^{\circ} 52' 47.5''$, lat. $50^{\circ} 24' 47.2''$, and of St. Agnes Beacon in Cornwall, long. $5^{\circ} 11' 55.7''$, and lat. $50^{\circ} 18' 27.9''$. Phil. Transf. 1800. But these deductions seem not to have all the pretensions to accuracy, of which the method is susceptible, for want of reciprocal observations; the three last stations being so chosen as to be all invisible from each other: and although the first of them is visible from Dunnofe, that station was not visited again, for the purpose of completing the observations; but one of the angles of this, and both the angles of the other two polar triangles, were made to depend on those of the intermediate chains of triangles. It is with the utmost regret that we observe any opportunities omitted of submitting this grand trigonometrical survey to all the possible tests of its accuracy, or of collecting and recording observations, likely to be of future use in drawing conclusions relative to the anomalies in the figure of the earth. The writer of this, from having assisted in the making of some hundreds of observations with the admirable theodolites, which are in the hands of major William Mudge, and his able assistants employed on the trigonometrical survey, and from having been a witness to the great skill and pains with which they are always used by these gentlemen, and from having since applied his multiplied observations in accurately calculating the situation of many different objects, by series of 4 or 5, and in some cases 10 or 12, independent triangles, is enabled to assert, that an extreme degree of accuracy in the distances and horizontal angles may be obtained in this survey, perhaps unparallelled in any similar undertaking. He laments, therefore, that Ramsden's fine zenith sector (described Phil. Transf. 1804) should, during any favourable season of the year, lie idle in the Tower, instead of being employed in determining the actual latitudes, and, with a theodolite, making pole-star observations, for obtaining the correct azimuths of all the many principal

principal stations, whose horizontal bearings and distances have been so very accurately settled in this survey; which does equal honour to the government that patronizes it, and to the gentlemen by whom it is conducted.

CONVERGING CURVES. See CURVE.

CONVERGING, or CONVERGENT *Lines*, in *Geometry*, are those which continually approximate, or whose distance becomes continually less and less: in opposition to *divergent lines*, whose distance becomes continually greater. Lines that converge one way, diverge the other.

CONVERGING *Rays*, in *Dioptrics*, are those rays which in their passage out of one medium into another, of a different density, are refracted towards one another; so that, if far enough continued, they will meet in a point, or focus.

All convex lenses make the rays converge, and concave ones diverge, *i. e.* the one inflects them towards a centre, and the other deflects them from it; and the more, as such lenses are portions of smaller spheres. On which properties, all the effects of lenses, microscopes, telescopes, &c. depend.

Rays coming converging out of a denser medium into a rarer, become more convergent, and concur sooner than if they were to continue their motion through the first. Rays coming converging out of a rarer into a denser medium, converge less, and concur later, than if they had continued their motion through the first medium.

Parallel rays, passing from a denser into a rarer medium, *v. gr.* from glass into air, the surface of the glass being towards the air, will become convergent, and concur in a focus.

Diverging rays, or rays coming from a point, under the same circumstances, become converging, and meet in a focus; and as the radiant point comes nearer, the focus recedes farther off: if the radiant be near, the focus will be infinitely distant; *i. e.* the rays will be parallel: and if the point be brought nearer still, the rays will diverge.

CONVERGING SERIES, in *Mathematics*. See SERIES.

CONVERSANO, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Bari; the see of a bishop, suffragan of Bari; 15 miles E.S.E. of it.

CONVERSATION, DISCOURSE; these two words denote an interlocution between two, or among more persons: with this distinction, that the conversation is used for any general intercourse of sentiments whatever; whereas a discourse means a conversation limited to some particular subject. Thus we say, a conversable man; meaning a man able to converse on a variety of subjects, or a man of general knowledge; but we do not say a discursible man. The word discourse is generally used when we mention a superior talking to an inferior.

CONVERSATION *Point*, in *Geography*, a head-land on the south side of a bay on the coast of California. N. lat. $32^{\circ} 30'$. W. long. 119° .

CONVERSAZIONI, denote evening assemblies held at Rome, where persons of both sexes met, not for instructive or even amusing conversation, but in order to see and pay transient compliments to one another; and where a person may enjoy the happiness of being squeezed and pressed among the best company in the city. Several of these take place in the same evening, and they are formed by the passing visits of the same persons, who thus seek amusement by a mere change of place and company. These assemblies generally break up about 9 o'clock; a small party excepted, who are invited to supper. They resemble our modern routs. Moore's View of Society, &c. in Italy, vol. i. p. 337. &c.

CONVERSE, in *Geometry*, &c. A proposition is said

to be the converse of another, when, after drawing a conclusion from something first supposed, we proceed to suppose what had been before concluded, and to draw from it what had been supposed. Thus, it is demonstrated in geometry, that if the two sides of a triangle be equal, the two angles opposite to those sides are equal also: the converse of the proposition is, that if the two angles of a triangle be equal, the two sides opposite to those angles are equal also.

CONVERSE *Direction*, in *Astrology*, is used in opposition to *direct* direction, *i. e.* by the latter, the promoter is carried to the significator, according to the order of the signs: but by the former it is carried from east to west, contrary to the order of the signs.

CONVERSERA, in *Geography*, an island of the Adriatic, near the coast of Iliria. N. lat. $45^{\circ} 20'$. E. long. $18^{\circ} 44'$.

CONVERSION, in a *Moral Sense*, a return from evil to good; resulting from a sense, either of the natural deformity of the one, and amiableness of the other: or of the advantages and disadvantages that spring from the one and the other, respectively.

Or, it is the change of the heart, with regard to the morals, passions, desires, and pursuits; and of the mind, with regard to the sentiments, &c. See REGENERATION. For an account of the conversion of St. Paul, considered as an argument for the truth of Christianity, see PAUL.

CONVERSION, in *Law*, is where a person having the goods of another in his possession, converts them to his own use, without consent of the owner; for which the proprietor may maintain an action of trover and conversion against him.

This action of trover and conversion was, in its original, an action of trespass upon the case, and a recovery of damages against the offender, from which it derived its name. Refusal to restore goods is, *prima facie*, sufficient evidence of a conversion, though it does not amount to a conversion. 10 Rep. 56. See TROVER.

CONVERSION, *Contrivisio*, in *Logic*, a circumstance or affection of propositions, wherein the order of the terms, or extremes, is changed; so that the subject comes into the place of the predicate, and the predicate into that of the subject; without any alteration in the quality of either.

As, "No virtuous vice; No vice is virtue." in which we see the subject of the former, made the predicate of the latter, and the predicate the subject; yet both true.

Conversion is usually defined a due change of the order of the extremes, *i. e.* under such a habitude and coherence with respect to each other, that the one is rightly inferred from the other.

Hence, in every legitimate conversion, two things are required: 1. A communication, or reciprocation of terms; not in respect of words, but of order. 2. The inference of one proposition to the other.

Aristotle makes two kinds of conversion; the one *simple*, by others called *universal*; wherein nothing is changed beside the order of extremes, *i. e.* the terms are transposed, without altering either the quality or quantity thereof: as, "No mind is body; No body is mind."

The second, *per accidens*, called also *particular*; wherein, beside changing the places of the terms, there is a change of an universal sign into a particular one; as, "Every good man studies the welfare of his country; some man that studies the welfare of his country is good."

To these, some of Aristotle's followers add a third kind of conversion, called by *contraposition*: as, "Every man is an animal; every non-animal is non-man."

CONVERSION,

CONVERSION, in *Rhetoric*, &c. is understood of arguments which are retained, retorted, and shewn on opposite sides, by changing the subject into the attribute, and the attribute into the subject.

There are conversions of arguments, from one figure to another, and also from general propositions to particular ones. Thus Cicero against Antony: "Doletis tres exercitus P. R. interfectos? Interfecit Antonius. Desideratis clarissimos cives? Eoque vobis eripuit Antonius. Auctoritas hujus ordinis afflicta est? Afflicti Antonius."

CONVERSION, in *War*, denotes a military movement or manoeuvre, which turns the front of a battalion, where the right or left flank was, when either flank is attacked.

CONVERSION of *Diseases*. A disease is said to be converted, when new symptoms arise in its progress, which require a different designation, and which either put a period to the original disorder, or combining with it, alter the physician's views respecting the prognostics, or the method of cure. Many instances of this kind are familiar; as the conversion of intermittents into continued fevers, or obstructions of the viscera; of hæmoptoe into phthisis; of jaundice into dropsy, and the like. Others are more unusual, and unexpected, and deserve to be noticed, because they occasion much perplexity in practice, when they occur, and especially as this subject has been much overlooked by medical writers.

We owe the first observation on the subject of conversion, to Hippocrates, and his annotators. Hoffman has curiously touched on it, in his short dissertation *de morborum transmutationibus*. Baglivi, though very desirous that it should be treated at length, and though liberal in promises of assistance, confines his recital of facts in a great measure to those of Hippocrates. An express treatise was written on the subject by Rodericus à Castro, under the quaint title of *Quæ ex Quibus*, a work better conceived than executed. And an excellent essay was more recently published by Dr. Ferriar, of Manchester, in the 2d vol. of his "Medical Histories and Reflections," in which the substance of this article will be found.

This subject was formerly arranged under two divisions: when the original disease subsisted after the accession of the second, it was termed a case of *epigenesis*, or *propagation*; when the second disease put a period to the first, it was called an instance of *metapostis*, *metastasis*, or *translocation*. But this is a loose distinction, which excludes many cases of conversion. The chief difference between the *metapostis* and *epigenesis* is, that the relation of the successive morbid appearances, and their dependence upon each other, cannot be so clearly perceived in one case as in the other. It would have been more useful, to have distinguished conversions by their influence on the event of the disease; as some are dangerous, and generally fatal; others, while they terminate the original disorder, conduce to a more speedy restoration of health. Thus, when a continued fever supervenes to pneumonic inflammation, the patient is in great danger, it is *gravi malo grave malum accedere*; when a diarrhoea supervenes to continued fever, in certain stages, it terminates the fever earlier than the regular course of the disease could have done.

All cases of conversion may perhaps be conveniently referred to the following heads. 1. The supervening disease may be produced by the remote causes of the original disorder: in this case, the action of those causes, after producing its first effect, is prolonged so as to excite a new train of symptoms. 2. The supervening disease may arise from the excess or combination of the symptoms of the original complaint. 3. The state of the habit, produced by the first disease, may give rise to a new disorder. 4. Conversion

may happen, from the imprudent suppression of habitual diseases.

I. The application of certain remote causes, may be sufficiently powerful to produce a fresh disease, after the first has been brought on by their action. It is common to find pneumonic inflammation supervene to typhus, by a continuance of the application of cold or dampness, which operates as a remote cause of the fever. On the contrary, from the tendency of the system to inflammation, or from the manner in which cold has been applied, the pneumonic symptoms precede the fever in some cases, and even run their course, before the fever assumes a regular form. In a fatal case of the conversion of pleurisy into typhus, the left lobe of the lung was destroyed by suppuration. (Lieutaud. Hist. Anat. Med. tom. i. Obs. 378.) I have seen, says, Dr. Ferriar, a case of peripneumonia notha end in typhus, and the typhus in mania. He also relates, chiefly from his own observation, the conversion of acute rheumatism into typhus in the first week, a circumstance which we have also witnessed;—the conversion of the mild synochus, or typhus, into inflammation of the peritoneum, or villous coat of the intestines;—of cholera into typhus;—of dysentery and diarrhoea into continued fever;—of hysteria into epilepsy and insanity, &c.; changes which are not very infrequent.

Cases of hysterical conversions, which belong to the head, are very common sources of error to young practitioners, and sometimes deceive even the most experienced. Sydenham long ago enumerated an ample catalogue of the diseases, the symptoms of which the mania, hysteria, frequently assumes. This matterly essay, with which Dr. Ferriar appears to have been unacquainted, contains a full disclosure of the conversions of this disorder. The symptoms of apoplexy, paralysis, epilepsy, cough, the iliac passion, jaundice, stone in the kidneys, and in the bladder, vomiting, diarrhoea, rheumatism, lumbago, &c. have been terminated by the accession of a complete hysterical paroxysm. (See Hysteria.) "We are ignorant," says Dr. Ferriar, who has described a similar variety of hysterical conversions, "by what laws the body possesses a power of representing the most hazardous disorders, without incurring danger; of counterfeiting the greatest derangement in the system, without materially altering its movements; of producing madness, conscious of its extravagancies, and of increasing the acuteness of sensation, oppressing the common sensorium. In hysterical affections, all these appearances are excited, which are incompatible with the reasonings of every system-maker, who has yet endeavoured to explain the inexplicable. Nature, as if in ridicule of the attempts to unmask her, has, in this class of diseases, reconciled contradictions, and realized improbabilities, with a mysterious versatility, which inspires the true philosopher with diffidence, and reduces the systematic to despair."

II. The symptoms of an idiopathic disease may, by their violence, assume the appearance, and require the attention due to a new complaint; or affections of particular viscera, which, in their incipient state, are only regarded as symptoms of general indispotion, may, as they gain ground, extinguish the original disease, or be protracted beyond it. This head comprehends such a variety of cases, that to treat it fully, would be to give the history of all symptomatic diseases. A few illustrations will suffice.

Dr. Percival mentions, that he had seen an effusion into the cavities of the brain, produced by the succussions of coughing, in a confirmed pulmonary consumption, which effusion terminated fatally, with a previous suppression, more than a week before death, of all the pulmonic symptoms.

It is one of the most perplexing occurrences in medicine, when the supervening disease is produced by a symptom of some latent complaint : when, for example, phthisical symptoms arise in a scrofulous or gouty patient, who exhibits, at first, no other appearance of those two diseases. Dr. Ferriar saw an instance, in which all the characters of confirmed phthisis pulmonalis were present, that terminated in recovery, upon the patient's coughing up some solid particles, which, upon examination, proved to be chalk-stones. Dr. Percival relates, that a gentleman of rank was supposed to be in an advanced state, of what is called a galloping consumption, having an incessant cough, an expectoration apparently purulent, continued heats, and night sweats: yet his cure was accomplished by giving wine- whey copiously, and by administering doses of hartshorn and spermaceti. A gentle fit of the gout was produced by this cordial regimen. The fever, cough, and spitting, were progressively diminished, and the health of the patient was soon perfectly re-established.

There is, indeed, a strong resemblance between hysteria and gout, in the power of counterfeiting different diseases, but with this material distinction; that the hysterical representations are commonly void of danger, while those produced by gout are often more dangerous than the simple disorder which they imitate. The hysterical hæmoptœe, for example, is seldom productive of bad consequences, but the arthritic apoplexy, pneumonia, and cardialgia, are much more alarming, and run their course quicker than similar complaints originating from other causes. But these diseases agree in this respect, that the accession of the regular paroxysm puts a favourable period to the irregular symptoms.

The prognosies, in conversions of this second class, must evidently vary according to the seat and degree of the supervening disease, and its favourable action upon the original disorder.

III. The original disease, if acute, when it has run its usual course, may leave the habit in a state favourable to the production of another disease: or if the original be a chronic disorder, such a state of the habit may take place during its continuance, and the accessory disease may be simply superadded, or it may vary the form, or affect the duration of the former.

Continued fevers are converted into different diseases, the production of which admits one general explanation. During the increased action of the circulating system, if any part of the body be originally weak, or have been rendered infirm and irritable by preceding disease, congestion, and its consequences, may be expected there. It is therefore easy to conceive, why one patient should suffer a paralytic affection, another phthisis, or a third nephritis, in consequence of tedious cases of typhus. The glandular suppurations, consequent on fevers, seem to depend on the same principle; for although they are represented as critical, by the older medical writers, we sometimes see striking proofs of the contrary. The exanthemata are frequently converted into diseases, which become both chronic and dangerous. The small-pox often produces severe coughs, diarrhœa, and ophthalmia. In some rare instances, tumours of the joints supervene, which suppurate and destroy the patient. The pneumonic inflammation attending the measles, is too often converted into phthisis pulmonalis. Glandular swellings, and general dropsy, frequently succeed the scarlatina anginosa.

There is a curious case in Dr. Percival's Essays, Medical and Experimental, (vol. i. p. 148.) of a woman, in whom a conversion of fever took place, first into palsy, afterwards into epilepsy, and then into amaurosis. Fevers often terminate in hysteri-

cal disorders, especially in women. Nephritis also is a common conversion of fever: it seldom supervenes with considerable violence, excepting in persons who have formerly undergone it; but when it has been familiar to the patient, a very large quantity of gravel is commonly passed, with extraordinary pain in the state of conversion. The accession of nephritis always extinguishes the fever. Other conversions of fever have been noticed, some of them peculiar to certain epidemics.

Various instances of conversion of diseases, under this head, may be found in the writings of physicians. Jaundice is said, by Baglivi, to be converted to tympantites; tympantites, by Dr. Ferriar, to diarrhœa and ichuria; dyspeptic complaints of long standing, to general dropsy; ascites to chronic inflammation of the bowels, and diarrhœa, which generally prove fatal; mania, as observed by Dr. Mead, to fatal epilepsy; and also to a cutaneous eruption, with recovery; &c. &c.

IV. Conversions may arise, when a disease, regular in its usual course, or long familiar to the habit, is violently terminated by improper methods, or suddenly extinguished by accidental circumstances.

Thus epileptic fits have been produced by the retrocession of the itch, in consequence of some external application; the epilepsy having resisted all the usual methods of treatment, was only cured by producing the itch. Instances of the production of melancholy and madness, by the suppression of eruptions, or the healing of old ulcers, and habitual drains, are common in practical writers.

The diseases originating from the suppression of the menstrual and hæmorrhoidal discharges are also well explained in different books. Dr. Hoffman's treatise, *De Morborum transmutatione*, relates almost entirely to this class of disorders. Tedious dyspeptic cases are often converted to cutaneous eruptions, in distinct pimples, of a fiery red colour; such eruptions extinguish the complaint in the stomach. Examples of conversions might be multiplied infinitely: but we must here content ourselves with adverting to the important conclusions, respecting the prognosies and cure of diseases, which may be drawn from an observation of those phenomena. The following most obvious deductions have been pointed out and illustrated by Dr. Ferriar.

1. Whenever local inflammation supervenes to an acute disease, it shortens or extinguishes the original disorder. The danger, or salubrity of this conversion, appears to depend greatly on the nature of the part attacked by its inflammation. In fever, for instance, if it be a conglomerate, or conglomerate gland, the prognosis will be favourable, but if the brain, the pleura, or the peritonæum, be inflamed, the danger is increased. In the former case, the cure of the fever may be in a great measure trusted to the supervening disease; in the latter, the progress of the inflammation will demand our chief attention. Thus, however, contra-indications will be avoided, and the safety of the patient will be better consulted, than by the temporizing practice usually adopted on such occasions.

This deduction serves also to explain the action of blisters, which, by producing local inflammation, imitate the process, and, in proportion to their action, exhibit the effect of this kind of conversion. It explains also the salubrity of the gouty inflammation, when it seizes a part not necessary to life.

2. It is so far certain, that medicines operate by producing conversions, that we perceive very considerable diseases resulting from the use of certain remedies, such as mercury; and we judge of the extinction of the original complaint, in some measure, by the increase and permanency of the

remedial disease. Thus when we give diuretics, or cathartics, we endeavour to excite a disease in the intestines, or kidneys; for an extreme increase of natural action, in any part, is certainly morbid. In like manner, Dr. Darwin has observed, that some derangements of mind cannot be removed, without exciting an artificial delirium.

3. The convulsion denominated hysterical, when it seizes the muscular fibre, in cases of conversion, is always salutary, and may be regarded, in many instances, as the crisis of chronic disorders.

4. Internal inflammation, supervening to chronic diseases, has a less tendency to extinguish the original complaint, than a similar conversion of acute disorders, and is equally dangerous.

5. Cutaneous eruptions often extinguish dangerous diseases. Excepting the regular exanthemata, such conversions seldom happen in acute disorders. But madness and melancholy, epilepsy, delirium, protracted after fever, dyspepsia, various pulmonary affections, are all observed to be mitigated, or removed, on the appearance of cutaneous disorders; especially on the return of those, which, after becoming familiar, had been suddenly suppressed.

6. As it appears that many conversions are processive, constituted by nature for the cure of diseases, and that some of the most active remedies operate in a similar manner, we may not only improve the history of diseases, but the practice of medicine, by paying closer attention to the connection and operation of disorders upon each other. With this view of the subject, the most complicated cases will admit an instructive development, and every additional fact may find an useful place. See METASTASIS.

CONVERSION of equations, in Algebra, is when the quantity sought, or any part thereof, being in fractions, the whole is reduced to one common denomination; and then, omitting the denominators, the equation is continued in the numerators only.

Thus, suppose $a-b = \frac{aa+cc}{d} + b+b$; multiply all by d , and it will stand thus, $da-db=aa+cc+db+db$.

In arithmetic, we use the term *proportion by conversion of ratio*, for a comparison of the antecedent, and consequent, in two equal ratios.

Thus, as there is the same ratio between two and three, as between eight and twelve; it is concluded there is the same ratio between two and one, as between eight and four.

Or, according to Euclid (lib. v. Def. 17.), it is the inference, in the case of four proportionals, that the first is to its excess above the second, as the third is to its excess above the fourth.

E.G. If we have - - - - - 8 : 6 :: 4 : 3.
Then convertendo, or by conversion, 8 : 2 :: 4 : 1.
Or, if we have - - - - - a : b :: c : d.
Then convertendo - - - - - a : a-b :: c : c-d.
CONVERSION, Centre of. See CENTER.
CONVERSOS. See CONVERT.

CONVERT, a person who has undergone CONVERSION.

CONVERT is chiefly used in respect of changes from one religion, or religious sect, to another.

Converts with relation to the religion turned to, are denominated *apostates* with regard to that they have relinquished.

The Jews formerly converted to Christianity in England, were called *convertus*. Henry III. built them a house in London, and allowed them a competent subsistence for their lives; which house was called *domus converforum*. But the

number afterwards increasing, they became a burthen to the crown; upon which they were distributed among the monasteries; and after the expulsion of the Jews under Edward III. the *domus converforum* was given for keeping of the rolls.

CONVERTS, in a *Monastic Sense*, are lay-friars, or brothers, admitted for the service of the house; without orders, and not allowed to sing in the choir.

Till the eleventh century, the word was used for persons who embraced the monkish life at the age of discretion; by which they were distinguished from those devoted to their childhood by their parents, called *oblati*.

But in the eleventh century, when they began to receive into monasteries illiterate persons, incapable of being clerks, and only destined for bodily labour; the signification of the word was necessarily changed. F. Mabillon observes, that it was John, first abbot of Vallombrosa, who first introduced these *brother-converts*, distinguished by their state from the monks of the choir, who were then either clerks, or capable of becoming so.

CONVERTIBILITY of elements into one another. See ELEMENTS.

CONVERTIBILITY of spirits into one another. See SPIRITS.

CONVERTIBLE HUSBANDRY, in Agriculture, is that sort of farm-management in which the land is cultivated, under the alternate systems of tillage and grass.

The lands which are the most proper for this kind of husbandry are those in which the soil is of the more dry and friable description, and in which there is a disposition to take on or produce grass. Wet clayey soils are considered by Mr. Davis as wholly unfit for this sort of management. All the loamy sorts of land which are capable of producing good turnips, and the rich sandy soils, are particularly suited to this method of husbandry. And on many other varieties of land it may be had recourse to with considerable benefit and advantage, where proper care is taken in the cultivation; but it is unquestionably a mode of culture which stands in need of great attention, in order to conduct it in the most proper and beneficial manner, both for the land and the farmer.

It has however been observed by Mr. Nairnith, in his "Elements of Agriculture," that "though it were possible to make drill culture universal, and cultivate the whole country like a garden, it is doubtful if it would be provident. It is to be feared that it would be something like the conduct of a person who consumes part of his capital yearly, along with his annual revenue. Whatever may be said to the contrary, all soils certainly suffer some degree of deterioration by long, unremitted tillage. When divested of that clothing with which nature always defends it if undisturbed, and when turned up naked to abide the force of the blast, the happy medium of confidence is deranged, its best particles carried away in torrents; and it is left a feeble skeleton, possessing only the faint semblance of departed fertility. This is strongly exemplified, he says, in the once fertile island of Barbadoes, in the West Indies. It has been said that this island, no doubt somewhat hyperbolically, since it began to be cultivated by the Europeans, has loaded more vessels with produce than would have been sufficient to have carried away the whole island; and now, it is reported, that the soil is so exhausted, that no kind of culture or manure can restore its fertility. We have correspondent accounts from the county of Norfolk, and other districts, where unceasing tillage has been practised: the species of crop which has been most run upon is now less productive than formerly. In short, there are numerous instances within the personal knowledge

of many, that wherever the ground has been long dunged and laboured for cropping, without rest, though the crops may be as bulky, they are generally less productive than they were at an earlier period.

“Convertible husbandry, or regular alternations of tillage crops and pastures, seem therefore, he says, to be the only system by which the fertility of the country can be preserved and improved. The provisions of a country are not derived from tillage crops alone. A considerable proportion is obtained from the dairy and the fables. Contrasts have been made to shew the vast disproportion between the quantity of food obtained from any given extent of land in a cultivated crop, and what the same extent of pasture yields. But it should be remembered, that the fertility of a cultivated field is often acquired by its having lain in pasture. The quantity of food from cultivated crops is not always in proportion to the extent of the land cultivated. The county of Ayr, in the west of Scotland, contains, he says, a great deal of good soil. It is not much more than forty years since he remembers the inhabitants of that county passing in crowds with horses, pack-saddles, and empty bags, to the East, to bring pease and barley, of which they made a kind of bread to serve them in summer. At that time the farmers were under no restraint as to the proportion of their farms, which they might have in tillage. Soon after, a gentleman who had the management of a great estate in that county, made a regulation in the leases, by which the farmers were bound to have never more than a third of their farms in tillage. Other proprietors adopting the same regulations, it became general: and the farmers were afterwards restricted to plough no more than one fourth. Of late, this county, though not less populous than formerly, sends always a great deal of grain to the neighbouring districts; and instead of empty bags and pack-saddles, sends carriages loaded with cheese to Leith, to be shipped for London. Thus by laying land which has been in tillage, frequently in pasture, the future fertility of the country is enhanced, and its present produce is not diminished.

“But it has been stated, he remarks, from high authority, that there is nothing more difficult than to bring old tillage lands to produce good pasture. A person who has been in the habit of attending to the culture of the fields, will have some difficulty in comprehending this position. He will have observed, that when the seeds of any of the grasses are permitted to vegetate on land which has been long under tillage culture, they grow with remarkable luxuriance, if they be not overwhelmed by the growth of weeds in their infancy. If his experience has been of a long standing, he will remember the introduction of clover and rye-grass into this country, and will recollect that the first time these seeds were sown on old tillage lands, the crops of grass were generally more weighty than any that have succeeded on the same ground. Having found such grounds so much disposed to produce grass, he will be at a loss to conceive why they should not produce good pasture. As grass seeds vegetate best on ground which is of a pretty solid consistence, they will sometimes fail, when the texture is too loose, unless that fault has been remedied by early ploughing, or by sufficient rolling, or both. But the best native *gramina* (grasses), having numerous fibrous roots, extending horizontally, are not easily ejected, after they have gained strength, and become unshaking. In the instances which have given rise to the above position, the ground must not, he thinks, have been stocked with those perennial plants proper to compose a good pasture. In a long course of tillage, the seeds and roots of the native grasses are worn out and banished: the plants introduced from artificial hay frequently fail in a few years;

and the ground is left naked, or stocked only with such coarse weeds as have kept footing in the ground, or had their seeds carried there by winds and birds. But to make tillage grounds bear standing pasture, they should be stocked with the seeds of such indigenous perennial plants as are known to be adapted to that purpose.

“The chief of which are, he says, *antioxanthum odoratum*, *lolum perenne*, and *alopurus pratensis*, for spring pasture, to be followed by *cymsurus cristatus*, *poa trivialis*, &c. The leguminous plants for pasturage, he adds, are of the genus *trifolium*, the *pratense*, the *repens*, the *lupulinum*, and the *procumbens*; of the genus *vicia*, the *cracca* and *sepium*, the *lathyrus pratensis*, &c. If lands which have been long in tillage are stocked with the seeds of these, and care taken not to suffer the young plants to be overwhelmed by rank weeds before they get themselves established in the ground, all difficulties will be overcome, and such grounds will be found to yield the most substantial and unshaking pasture.

“As all vegetables are composed of the same elements, and nourished by the same kind of juices, it may appear somewhat unphilosophical, in a speculative view, to maintain that the fertility of the soil is preserved by cultivating one species of plants upon it one year, or series of years, and plants of a different species and quality the following.

“But it is a generally received aphorism, he observes, that nature delights in variety, and this aphorism is supported by experience in this as well as in other respects. Some kinds of vegetables extend their roots near the surface, others penetrate deeper into the soil, some by overhanging the earth with their broad leaves render it soft and mellow; others, whose naked stalks admit the free circulation of the air, consolidate the soil; some derive the greatest part of their nourishment from the juices lodged in the earth; others draw a considerable proportion from the atmosphere; some, having a longer period of existence, continue long to demand nourishment; others arrive more quickly at maturity, and must be easier supported. Besides, among the various tribes of insects so feeble in themselves, but so formidable and destructive by their numbers, each has some vegetables which it prefers to others for its food, and resorts to the places where such food is produced; and as they propagate their kind where their food is found, they must become more numerous, and consequently more destructive, where the cultivation of the same plant is often repeated. There are weeds too, he says, which bear in this respect some analogy to those insects, and as they cannot be at all times fully eradicated, propagate the more, the oftener they meet with the crop most agreeable to them. By the effects which the growth of different vegetables produce on the soil, the proper medium of consistence is in some measure preserved, the vegetable food better husbanded, and the injuries from noxious insects and weeds somewhat eluded. On all these accounts, the maxim of modern agriculturists, that crops of a different nature and quality should succeed one another, is just tied.

“But the arguments in favour of alternations of tillage and pasture, are, he remarks, still more urgent. The derangement of that happy medium between extremes of too great friability and compactness, which he has endeavoured to shew is essential to the general purposes of vegetation, is the unavoidable consequence of long repeated tillage.

“This is always, he contends, in some degree restored, when land is left to rest. If it has been properly treated when in tillage, and well stocked with perennial herbage, when left to rest, it will quickly assume a close cover over its surface, which, from whatever principle it proceeds, experience has always shewn, has a powerful influence in disposing the soil to fertility. In this state, the washing to which til-

lage lands are exposed in times of rain, is, he supposes, completely suspended, and the water flows away limpid. While the ground continues covered with a close turf, the root-leaves of the herbage spreading over the surface, absorb and digest the carbonic acid of the atmosphere, and perhaps, also, earthy particles which probably float continually in the air, as before stated. As those leaves are smothered and decay, they are perpetually increasing the stock of carbon and vegetable mould. The celebrated Mr. Kirwan, indeed, is, he says, of a different opinion. He supposes, that ground lying in pasture is annually diminishing in fertility, though in a less degree than that from which a vegetable crop is carried off, because a part is restored in the excrements of pasturing animals. But though poor soils which are incapable of producing a close turf over their surface, gain little by lying at rest, it is evident, that every soil, which either from its natural conformation, or from the improvements made on it by proper culture, has attained a close cover of sweet herbage, is perpetually gaining. Whenever the temperature is mild, a continual reproduction is taking place; and all the horizontal foliage, which escapes the mouths of pasturing animals, falls into decay and accumulates on the surface. On breaking up such old pastures a surfaced stratum may be observed, differing in colour and conformation from that which lies under it, the thickness of which is in proportion to the time the ground has lain at rest. What is here stated, is, he thinks, corroborated by the following experiment. Having sometimes observed a kind of turf formed over the hardest stones in certain situations, he collected some of it which had grown to more than an inch thick on some flat stones, lying in a damp place, at the foot of a northerly declivity under some trees. It seemed to have commenced with the growth of some of the smaller *musci* and *algæ*. On this ground the *fesluca ovina* and *poa glauca* had taken root, and formed a strong turf. After it was dried, he subjected a pound of it to combustion on an iron shovel over a fire till it was reduced to black dust. The residue weighed half an ounce, whereas the greatest residue he ever obtained from a pound of dried peat burnt, was not more than five drams. If such a quantity of mould could thus be accumulated by the grasses growing on a naked rock, may it not accumulate at least in as great a proportion on the soil where the succession of growth is incomparably greater?

"It is true, he observes, that some soils by long lying at rest, condense so much as to incommode the roots of the grasses, and on others the mosses prevail so much as to overcome the esculent herbage, but the fertility of the soil is not thereby diminished. Its present energy is only suspended, while it is acquiring additional vigour for future exertion. When such land is again employed in tillage, the spoils of the turf, together with a great part of what has been consumed by pasturing animals restored in excrements, are turned down and mixed with the soil, by which its conformation is improved, and its thickness and principle of fertility augmented. Hence the tillage crops are plentiful—the ears large and plump—and the produce of one year equal to two or more on land wearied out by perpetual turing.

"It must not be understood, by what is here or formerly said, that he means to undervalue the operation of the plough. But, as we are studying in what manner the fertility of the country may be preserved and improved, and the greatest quantity of disposable produce obtained at the least possible expence, it is necessary to examine how all those aids which nature offers may be made to co-operate with the artificial means of agricultural improvement, and not blindly expect from mechanical labour, more than it can possibly produce. When barren soils are to be brought from a wild state, it

is by mechanical labours only that their obstinacy can be subdued, and the different ingredients properly blended. The turf of old grass ground will frequently require a good deal of mechanical operation to mix it with the earths, and facilitate its putrefaction. But when these, and such other aids as mechanical labour is adapted to accomplish, are obtained, that medium of confidence on which fertility depends will be best preserved by alternate successions of labour and rest. The proportion and order of those successions must no doubt vary greatly according to circumstances. While those where the soil is deep and of the most favourable construction, and where adventitious manure is attainable, may be much occupied in tillage crops, without suffering great deterioration; in the more elevated grounds, where the soil is generally less happily constructed, exposed to severer washings and manure less abundant, a greater proportion of the farm ought always to be in pasture. But in all situations and circumstances, the soil will be benefited by being occasionally at rest, provided care has been taken to lay it down unexhausted, free of weeds, and well stocked with proper grasses. By this system of alternations of tillage and grass crops, the attention of the husbandman is less dissipated, and his labours more regularly distributed. The live stock fed on his pasture, furnish him with manure to enrich his tillage fields, and the more they are enriched, they are the better fitted to yield an abundant return of grass, when they come in course to be laid to rest. When ground is brought to yield abundance of sweet grass it is profitable in pasture, and while it continues so is still improving in fertility, and becomes more and more adapted to yield plentiful tillage crops. Thus under good management, the fertility of the country may progressively advance, and the disposable quantity of provisions for the use of the consumer, and the net return to the husbandman, perhaps, exceed what the operose and expensive system of perpetual fallowing, and crops without rest, could produce.

"Convertible husbandry is not less superior to perpetual grass. Land which lies perpetually in grass, is deprived of the advantage of having the vegetable substance accumulating on the surface from time to time mixed into the soil. By the working of moles, ants, and other vermin, by the condensation of the soil, by the prevalence of mosses and useless weeds, the turf is deformed and the reproduction of sweet pasture diminished. Water is frequently detained on the surface, and chills the growth of esculent herbage, and thus the growth becomes more feeble and slow. In proportion to the decay of esculent herbage, plants which are noxious or unprofitable prevail; the pasture becomes gradually less, and the fertility of the soil is almost useless to the owner and to society, while it remains in that state."

The practice of this husbandry must of course in many instances be highly profitable to the cultivator. See TILLAGE and GRASS.

CONVEX, bending down on every side, as the outside of a globular body.

CONVEX freeze, leaf, lens, mirror, superficies. See the several substantives.

CONVEXITY, the exterior surface of a convex, i. e. gibbous and globular thing; in opposition to concavity, or the inner surface, when hollow or depressed.

The word is of particular import in catoptrics, and dioptrics; where it is applied to mirrors and lenses; which see. See also REFRACTION.

CONVEYANCE, in Law, a deed, or instrument, by which lands, &c. are conveyed, or transferred, by the proprietor, to some other person. In the discussion of this subject, it is proper to inquire *quo* may thus aliene and *quomodo*; and then *how* a man may aliene, or the several modes of

of conveyance. With regard to the first inquiry, who is capable of conveying and who of purchasing, the subject of consideration is rather the incapacity, than the capacity, of the several parties: for all persons in possession are *prima facie* capable both of conveying and purchasing, unless the law hath laid them under any particular disabilities. But if a man has only in him the right of either possession or property, he cannot convey it to any other, lest pretended titles might be granted to great men, by which justice might be trodden down, and the weak oppressed. (Co. Litt. 214.) Yet reversions and vested remainders may be granted, because the possession of the particular tenant is the possession of him in reversion or remainder; but contingencies, and mere possibilities, though they may be released, or devised by will, or may pass to the heir or executor, cannot be assigned to a stranger, unless coupled with some present interest. (Sheppard's Touchstone, 238, 239, 322. 11 Mod. 152. 1 P. Wms. 574. Stra. 132.)

Persons attainted of treason, felony, and præmunire, are incapable of conveying, from the time of the offence committed, provided attainder follows, for such conveyance by them may tend to defeat the king of his forfeiture, or the lord of his escheat. But they may purchase for the benefit of the crown, or the lord of the fee, though they are disabled to hold the lands so purchased, if after attainder, being subject to immediate forfeiture; if before, to escheat as well as forfeiture, according to the nature of the crime. (Co. Litt. 42. 2.) Thus also corporations, religious or others, may purchase lands; yet, unless they have a licence to hold in mortmain, they cannot retain such purchase; but it shall be forfeited to the lord of the fee. Idiots and persons of non-sane memory, infants, and persons under duress, are not totally disabled either to convey or purchase, but *sub modo* only. For their conveyances and purchases are voidable, but not actually void. The king indeed, on behalf of an idiot, may avoid his grants or other acts. (Co. Litt. 247.) See IDIOT. A feme-covert may purchase an estate without the consent of her husband, and the conveyance is good during the coverture, till he avoids it by some act declaring his dissent. And though he does nothing to avoid it, or even if he actually consents, the feme-covert herself may, after the death of her husband, waive or disagree to the same; nay, even her heirs may waive it after her, if she dies before her husband, or if in her widowhood she does nothing to express her consent or agreement. (Co. Litt. 3.) But the conveyance or other contract of a feme-covert (except by some matter of record) is absolutely void, and not merely voidable (Perkins, § 154. 1 Sid. 120.) and therefore cannot be affirmed or made good by any subsequent agreement. The case of an alien born is also peculiar.—For he may purchase any thing; but after purchase he can hold nothing, except a lease for years of a house for convenience of merchandize, if he be an alien-friend: all other purchases (when found by an inquest of office) being immediately forfeited to the king (Co. Litt. 2.) Papists, and persons professing the popish religion, and neglecting to take the oath prescribed by statute 18 Geo. III. c. 60. within the time limited for that purpose, are by stat. 11 and 12 W. III. c. 4. disabled from purchasing any lands, rents, or hereditaments; and all estates made to their use, or in trust for them, are void. (1 P. Wms. 354.)

In answer to the second inquiry, or how a man may alien or convey, we are led to state the several modes of conveyance. A translation, or transfer, of property being admitted by law, it became necessary that this transfer should be properly evidenced, in order to prevent disputes as to the

fact, or in relation to the persons concerned, or with regard to the subject-matter, or with respect to the mode and quality of the transfer. The legal evidences of this translation of property are called the common assurances of the kingdom. See COMMON ASSURANCES.

Deeds (see DEED) which serve to convey the property of lands and tenements from man to man, are commonly denominated conveyances; and these are either conveyances at common law, or such as receive their force and efficacy by virtue of the statute of uses. Of conveyances by the common law, some may be called original or primary conveyances; which are those by means of which the benefit or estate is created or first arises; and others are derivative or secondary, by which the benefit or estate, originally created, is enlarged, restrained, transferred, or extinguished. Original conveyances are the following, viz. Feoffment, Gift, Grant, Lease, Exchange, and Partition; which see respectively. Derivative conveyances are Release, Confirmation, Surrender, Assignment, and Disseizance; which see under their proper titles. For other conveyances, which have their force and operation by virtue of the statute of uses, which have been derived from it or introduced in consequence of it; see USES. See also COVENANT TO STAND SEISED TO USES, BARGAIN AND SALE, LEASE AND RELEASE, and REVOCATION OF USES.

A conveyance cannot be fraudulent in part, and good as to the rest: for if it be fraudulent and void in part, it is void in all; and it cannot be divided. 1 Lill. Abr. 311. Fraudulent conveyances to deceive creditors, defraud purchasers, &c. are void, by statutes 13 Eliz. c. 5. 27 Eliz. c. 4. See FRAUD.

CONVICT, in Common Law, one who is found guilty of an offence, by the verdict of a jury. This conviction may accrue two ways; either by his confessing the offence and pleading guilty; or by his being found so by the verdict of his country. Judge Blackstone says, that in the Roman republic, when the prisoner was convicted of any capital offence by his judges, the form of pronouncing that conviction was peculiarly delicate, not that he was guilty, but that he had not been sufficiently on his guard, "parum cavisse videtur."

According to Crompton, a person is also a convict, or said to be convicted, when, after having been outlawed, he appears and confesses, or is found guilty by the inquest; and he says, moreover, that when a statute excludes from clergy persons found guilty of felony, &c. it extends to those who are convicted by confession. (Crompt. Init. 9.)

The law implies that there must be a conviction before punishment, though it is not so mentioned in a statute; and where any statute makes a second offence felony, or subject to a heavier punishment than the first, it is always implied that such second offence ought to be committed after a conviction for the first. (1 Hawk. P. C. c. 10. § 9. c. 41. § 3.) Judgment amounts to conviction; though it doth not follow that every one who is convicted is adjudged. A conviction at the king's suit may be pleaded to a suit by an informer, on a penal statute; because while in force it makes the party liable to the forfeiture, and no one ought to be punished twice for the same offence; but conviction may be pleaded to a new suit by the king. (1 Hawk. P. C. c. 10.) A person convicted or attainted of one felony may be prosecuted for another, to bring accessories to punishment, &c. (Fitz. Coron. 379.)

Persons convicted of felony by verdict, &c. are not to be admitted to bail, unless there be some special motive for granting it; as where a man is not the same person, &c. for bail ought to be before trial, when it stands indifferent

whether

whether the party be guilty or not. (2 Hawk. P. C. c. 15. § 45, 80.) See BAIL. Conviction of felony, and other crimes, disables a man to be a juror, witness, &c. Conviction and attainder, &c. are, in our law-books, frequently confounded. On conviction, (or even upon an acquittal upon some reasonable ground to prosecute, and, in fact, a *bona fide* prosecution,) for any grand or petit larceny, or other felony, the reasonable expences of prosecution, and also, if the prosecutor be poor, a compensation for his trouble and loss of time, are by statutes 25 Geo. II. c. 36., and 18 Geo. III. c. 19. to be allowed him out of the county stock, if he petitions the judge for that purpose; and by statutes 27 Geo. II. c. 3. explained by the same statute 18 Geo. III. c. 19; all persons, appearing upon recognizance or *subpoena* to give evidence, whether any indictment be preferred or not, and as well without conviction as with it, are entitled to be paid their charges, with a farther allowance (if poor) for their trouble and loss of time. Moreover, on a conviction of larceny in particular, the prosecutor shall have restitution of his goods, by virtue of the statute 21 Hen. VIII. c. 11. And the construction of this act having been in great measure conformable to the law of appeals, it has therefore in practice superseded the use of appeals of larceny. It is now usual for the court, upon the conviction of a felon, to order (without any writ of restitution) immediate restitution of such goods as are brought into court to be made to the several prosecutors, or else, without such writ, the party may peaceably retake his goods, wherever he happens to find them, unless a new property be fairly acquired in them. Or, if the felon be convicted and pardoned, or be allowed his clergy, the party robbed may bring his action of trover against him for his goods, and recover a satisfaction in damages. But such action does not lie before prosecution; for then felonies would be made up and healed (1 Hal. P. C. § 46.) and also recaption is unlawful, if it be done with intention to smother or compound the larceny; it then becoming the heinous offence of *theft-bote*; which see.

When a person is convicted of a misdemeanor which principally and more immediately affects some individual, as a battery, imprisonment, or the like, it is not uncommon for the court to permit the defendant to *speak with the prosecutor*, before any judgment is pronounced; and if the prosecutor declares himself satisfied, to inflict but a trivial punishment. This is done, to reimburse the prosecutor his expences, and make him some private amends, without the trouble and circuity of a civil action. This, says judge Blackstone, is a dangerous practice, which, though intrusted to the discretion of the judges in the superior courts of record, ought never to be allowed in local or inferior jurisdictions, such as the quarter-sessions; where prosecutions for assaults are by such means too frequently commenced, rather for private lucre than for the great ends of public justice. Above all, he says, it should never be suffered, where the testimony of the prosecutor himself is necessary to convict the defendant; for there the rules of evidence are entirely subverted; the prosecutor becomes in effect a plaintiff, and yet is suffered to bear witness for himself. Nay, even a voluntary forgiveness, by the party injured, ought not, in true policy, to intercept the stroke of justice. "This," says an elegant writer (Beccaria, ch. 46.) who pleads with equal strength for the certainty as for the lenity of punishment, "may be an act of good nature and humanity, but it is contrary to the good of the public. For, although a private citizen may dispense with satisfaction for his private injury, he cannot remove the necessity of public example. The right of punishing belongs not to any

one individual in particular, but to the society in general, or the sovereign who represents that society; and a man may renounce his own portion of this right, but he cannot give up that of others." Blackst. Comm. Book iv.

CONVIC^T *recusant*, he who has been legally presented, indicted, and convicted, for refusing to come to church to hear the common prayer, according to the statutes 35 Eliz. and 3 Jac. I.

This is commonly understood to be a popish recusant; though any others who refuse coming to church on the same account are as properly denominated recusants.

CONVICTION, in *Law*. See CONVIC^T.

CONVICTION, in *Theology*, expresses the first degree of repentance; wherein the sinner becomes sensible of his guilt, of the evil nature of sin, and of the danger of his own ways.

CONVICTION, *summary*, in *Law*, is such as is directed by several acts of parliament, for inflicting certain penalties created by those acts, without the intervention of a jury: the party accused being acquitted or condemned by the suffrage of such person only, as the statute has appointed to be his judge. Of this kind are all trials of offences contrary to the laws of EXCISE, and other branches of the REVENUE, proceedings before JUSTICES of the peace, and the method used by superior courts of justice for punishing contempt by attachment. See CONTEMPT.

CONVIVIVM, *banquet*, in our *Ancient Customs*, and *Law-Books*, signifies the same thing among the laity as prosecution among the clergy; *viz.* when the tenant was obliged, in virtue of his tenure, to provide meat and drink for his lord once, or oftener, in the year.

CONVIVIVM *militare*, a military banquet or repast. The repast of Roman soldiers was a particular object of military discipline, which the commanders themselves paid attention to. The soldiers were not suffered to eat alone but by troops, in order to preserve union and good fellowship amongst them.

CONULI, in *Natural History*, *Conuli Kleinii*, a class of the *Echinus*, in the Mollusca order of Vermes. See ECHINUS.

CONULUS, a genus of the *Trochus*, in the Testacea order of Vermes. See TROCHUS.

CONVOCA^TION, a general assembly of the representatives of the clergy of a province, summoned by the king's writ to consult of the more weighty affairs of the church, as oft as a parliament is convoked to consult of those of the state.

The king's writ is directed to the archbishop of each province, requiring him to summon all bishops, deans, archdeacons, cathedral and collegiate churches, &c.

Upon which, the archbishop directs his mandate to his dean provincial, first citing him preceptorily; then willing him, in like manner, to cite all the bishops, deans, &c. and all the clergy of his province: but directing, withal, that one prætor sent for each cathedral and collegiate church, and two for the body of the inferior clergy of each diocese, may suffice: which the dean accordingly does.

The place where the convocation of the province of Canterbury has been usually held, is St. Paul's church; whence they have been prorogued to St. Peter's in Westminster, in the chapel of Henry VII. or the Jerusalem Chamber, where there is an upper and lower house.

The upper house, in the province of Canterbury, consists of twenty-two bishops, whereof the archbishop is always president, who prorogues and dissolves the convocation by mandate from the king: and before the reformation abbots, priors, and other mitred prelates sat with the bishops. All

at the opening of a convocation, are in their scarlet robes and hoods.

The lower house consists of twenty-two deans, fifty-four archdeacons, twenty-four proctors for the chapters, and forty-four proctors, representing the parochial clergy; in all 144.

Each house hath a prolocutor chosen from among themselves; and that of the lower house is presented to the bishops. Things are first usually proposed in the upper house; then communicated to the lower. All the members of both houses have the same privilege in freedom from arrest, as the members of parliament have, stat 8 Hen. VI. c. 1. and the proctors of the clergy received wages from their constituents.

The convocation exercises jurisdiction in making canons with the king's assent, (stat. 25 Hen. VIII. c. 19.) This statute which restrains the convocation from making or executing any canons repugnant to the king's prerogative, or the laws, customs, and statutes of the realm, was merely declaratory of the old common law (12 Rep. 72.); that part of it only being new, which makes the king's royal assent actually necessary to the validity of every canon. To the convocation also belong the examination and censure of heretical and schismatical books and persons. But appeal lies from their proceedings to the king in chancery, or to his delegates. In case the king himself be a party, the appeal lies by stat. 24 Hen. VIII. c. 12. to all the bishops assembled in the upper house of convocation. See *COURT of delegates*.

The archbishop of York, at the same time, holds a convocation of the clergy of his province, after the like manner at York; and, by constant correspondence, debates and concludes of the same matters as are debated by that of Canterbury; but they are distinct and independent of each other; and when they used to tax the clergy, they granted different subsidies. In the province of York, the convocation consists only of one house; and on account of the small number of dioceses in this province, each archdeacon elects two proctors. It has been customary with the convocation, for many years back, regularly to assemble, and to adjourn without proceeding to any business; so that the convocation now exists more in form than for any effective purpose. See *CHURCH of England*.

In the year 1711, the convocation was assembled with the new parliament; the lower house chose Aterbury for its prolocutor; and both houses concurred in censuring some tenets that favoured Arianism, broached and supported by Mr. Whilston, mathematical professor in Cambridge. The archbishop doubted whether this assembly could proceed against a man for heresy; the judges were consulted, and the majority gave their opinion that the convocation had a jurisdiction. Five of them professed the contrary sentiment, which they maintained from the statutes made at the reformation; the queen, not doubting their jurisdiction, expected them to proceed, but fresh scruples arising, they determined to examine the book, without proceeding against the author, and this was censured accordingly. An extract of the sentence was sent to the queen, but she did not signify her pleasure on this subject, and the affair remained in suspense. Before the queen's death, in 1714, the lower house of convocation had declared, that a book published by Dr. Samuel Clarke, under the title of "The Scripture Doctrine of the Trinity," contained assertions contrary to the Catholic faith. They sent up extracts from this performance to the bishops; and the doctor wrote an answer to their objections. He was prevailed upon to write an apology, which he presented to the upper house; but apprehending that it might be published separately, and misunderstood, he afterwards delivered an explanation to the bishop of London. This was satisfactory to the bishops;

but the lower house resolved, that it was no recantation of his heretical assertions. (See the article *CLARKE*.) In the year 1717, the proceedings in the convocation turned chiefly upon two performances of Dr. Hoadly, bishop of Bangor. One was entitled "A Preservative against the principles and practices of the Non-jurors;" the other was a sermon preached before the king, under the title of "The nature of the kingdom of Christ;" the convocation appointed a committee to examine the bishop's two performances; and thus commenced the famous controversy, called "Bangorian;" in consequence of a letter written on the subject of the bishop's discourse by Dr. Snape, master of Eton college. The convocation drew up a representation, in which the preservative and the sermon were censured, as tending to subvert all government and discipline in the church of Christ; to reduce his kingdom to a state of anarchy and confusion; to impugn and impeach the royal supremacy in causes ecclesiastical, and the authority of the legislature to enforce obedience in matters of religion by civil sanctions. Before this representation could be brought into the upper house, that whole assembly was prorogued by a special order from the king. This measure, however, inflamed the controversy. A great number of pens were drawn against the bishop; but his chief antagonists were Dr. Snape, and Dr. Sherlock, whom the king removed from the office of his chaplains. The convocation has not been permitted by government to do any business of consequence since this time, but merely to confine itself to matters of form. See *CHURCH of England*.

The English clergy, anciently, had their representatives in the lower house of parliament; as appears by the record, much prized by lord Coke. Among the freeholders who were present in parliamentary meetings, we find many of the inferior, secular, clergy; an order of men who were, certainly, of too great estimation and account in the state not to have had a share in the legislature, either personally or by representatives. There are not, indeed, any writs of summons now remaining, which require proctors to be sent for them to the parliaments of this kingdom, before the 23d year of Edward I.; but from the annals of Burton (p. 355, sub anno 1255.) it appears, that the whole body of the clergy were so represented in the 29th of Henry III. Nor is this remarked as a novelty by any of the historians who wrote in that age; though, being all ecclesiastics, they would probably have thought it more worthy of observation than any event in which the laity alone were concerned. It may be therefore presumed, that, not only the attendance of the inferior clergy in parliament, which is evidently proved by many passages in more ancient historians, but this kind of representation of them had been customary long before. (See *BOROUGH*.) In later times, from a desire of independence on the state, to which they were incited more and more by the pope, they gradually withdrew themselves from any attendance in parliament, either personally, or by representatives; so that, after the reign of Henry VI., they are hardly ever mentioned as present there; although in the 21st year of Richard II. the commons had shewn in a petition to the king, "how that before those times many judgments and ordinances, made in the times of the progenitors of our lord the king in parliament, had been repealed and disannulled, because the state of the clergy were not present in parliament at the making of the said judgments and ordinances." After the reformation of religion, in the reign of Edward VI., an attempt was made in convocation to have the lower house united to the house of commons, "according to ancient custom, *sicut ab antiqua fieri consuevit*." It was also proposed to queen Elizabeth, but rejected. The clergy continued to tax themselves in a separate body, till the restoration of Charles II.; soon after which

which they were taxed in the same manner and conjointly with the rest of the commons; and have ever since been represented in parliament by the same persons, which has more embodied them with the laity, and prevents the setting up of a church interest distinct from that of the people. It is remarkable, that this very important alteration in the state of the kingdom was made *without any law*, by agreement with the clergy. (Littleton's Hist. Hen. II. vol. iii.)

In the parliament of Ireland, originally formed on the model of that of England, the clergy continued to be members of the house of commons, till they were excluded by an act of parliament, 28 Hen. VIII. A. D. 1536, because they supported the authority of the pope, and obstructed the reformation of the church. Whilst the clergy continued to grant their own money in their convocations, their grants were not effectual till they were confirmed in parliament. In the 15th century the clergy of England had great influence in all the public councils of the kingdom, and particularly in parliament: they constantly resided in the kingdom, and were present in these councils; while the nobles and great men were engaged in warlike expeditions into France or Scotland. Besides all the archbishops and bishops, twenty-five abbots and two priors were summoned to every parliament, and sometimes many more; so that the spiritual lords were generally double the number of the temporal lords in the house of peers (Prynne's register of writs, vol. i. & iv.). This enabled the prelates to procure sanguinary laws against heretics, and to secure the immense possessions of the church, together with all her absurd errors and wretched superstitions, from all attacks. 1 Hen. IV. c. 15. 2 Hen. V. c. 7.

CONVOLVULI, in *Botany*, the tenth natural order of dicotyledonous hypogynous plants, in the system of Jussieu, with the following character. *Calyx* five-cleft, most frequently permanent. *Corolla* regular, commonly with a five-cleft border. *Stamens* generally five, inserted at the base of the corolla, and alternating with its segments. *Style* one, or definitely divided; when one, with a stigma either simple or divided; when more than one, with as many simple stigmas as there are divisions. *Fruit* capsular, often three-celled, more rarely two or four-celled; cells with one or more seeds. *Seeds* marked with an umbilical eye at the base, somewhat obscure, and affixed below to the central partition; valves free, with their edges adjoining to the angles of the partition; radicle of the arched coraculum inferior. (Coraculum shut up by the perisperm?) *Stems* shrubby, or more frequently herbaceous; many twining; many lactescent. *Leaves* alternate, very rarely almost opposite, (always simple, Vent.). This order is nearly allied to the Borraginæ and Polemoniæ, in its regular five-cleft pentandrous corolla, and alternate leaves; but differs from the latter, in having the partition adjoining to the edges, not to the middle of the valves; and from the former, in the fruit not being gymnospermous. Jussieu assigns to it the following genera: 1. With a single style. *Maripa*, Aubl.; *monoucoa*, Aubl.; *retzia*, Thunb.; *endrachium*, (humbertia, Commers.); *convolvulus*, Linn.; *ipomea*, Linn. 2. With several styles. *Evolvulus*, Linn.; *nama*, Brown and Linn.; *hydrolea*, Linn.; *fagonca*, Aubl.; *creffa*, Linn. 3. Allied to the convolvuli. *Cuscuta*, Linn.; *diapensia*, Linn.; *loefelia*, Linn.

Ventenat has changed the name of the order to convolvulacæ, and has included in it only convolvulus, ipomea, evolvulus, and creffa; entirely omitting maripa, monoucoa, retzia, endrachium, nama, hydrolea, and fagonca; and removing cuscuta to his undetermined plants, and diapensia and loefelia to the polemonia, his polemonacæ. La

Marc's natural family of liferons corresponds exactly with the first two sections of Jussieu.

CONVOLVULUS, (so called, *a convolvendo*, because many of the species are twining). Linn. Gen. 215. Schreb. 287. Willd. 323. Lam. Illust. 296. Gært. 780. Juss. 133. Vent. ii. 396. Class and order, *pentandria monogynia*. Nat. Ord. *Campanaceæ*, Linn. *Convolvuli*, Juss. *Convolvulacæ*, Vent.

Gen. Ch. *Cal.* perianth five-cleft. *Cor.* monopetalous, bell-shaped or funnel-shaped, plaited; border generally spreading, more or less five-lobed. *Stam.* filaments five, awl-shaped, shorter than the corolla, approximating at the base. *Pist.* germ superior, roundish; style filiform; stigma simple or biind. *Peric.* capsule surrounded by the calyx, roundish; one, two, three, or four-celled; one, two, three, four, or many-valved. *Seeds* one or two in each cell.

Eff. Ch. Five-cleft. Corolla bell or funnel-shaped. Stigmas one or two. Pericarp a capsule, or dry berry. Seeds one or two in each cell.

Obf. Authors often call the calyx five-leaved, when it is very deeply five-cleft.

* *Stems twining.*

Sp. 1. *C. arvensis*. Linn. 1. Mart. 1. Desfrouseaux, Encyc. 2. Lam. Ill. 2001. Willd. 1. Bauh. Pin. 294. Flor. Dan. tab. 459. Curt. Flor. Lond. 2. 13. Eng. Bot. 312. (*C.* minor; Bauh. Hist. 2. 157. *C.* purpureus; Lob. Obs. 340. fig. 2. *C.* minor arvensis, flore roseo; Tourn. Inf. 83. *Smilax levis* minor; Ger. Emen. 861. *Helxine foliis sagittatis*, cissampelis; Mat. 1011. Camer. Epit. 753.) "Leaves arrow-shaped; lobes acute; flowers generally solitary; bractes minute, awl-shaped, remote from the flower." *Root* perennial, creeping, striking deeply into the ground, not easily extirpated. *Stems* numerous, angular. *Leaves* alternate, petioled, smoothish. *Flowers* flesh-coloured, sometimes white, sweet-scented, opening only in clear weather; peduncles axillary, generally one-flowered, thickened above. A troublesome weed in cultivated ground, twining closely about the culms of wheat, and other kinds of corn, and thence in many parts of England called bind-weed. Its juice is slightly purgative. The blossoms give a deep yellow or orange tincture to water, which is heightened by alum and alkalis. A native of Great Britain, and most parts of Europe. 2. *C. auriculatus*. Desf. 3. Lam. 2002. (*C. arvensis* β ; Linn. *C. minimus*, angusto auriculato folio; Bocc. Mus. tab. 33. Pluk. Alm. 116. tab. 24. fig. 3. *C. arvensis minimus*; Rai. Syn. 276.) "Leaves linear, hastate-acuminate; lobes entire." Distinguished from the preceding by its narrow elongated leaves, longer petals, and bractes placed nearer the flower. A native of Great Britain, and other parts of Europe: found by Commerfon in the Isle of France, where it is supposed to have been brought with wheat from Persia. 3. *C. sepium*. Linn. 2. Mart. 2. Desf. 1. Lam. 1. Willd. 2. Flor. Dan. tab. 458. Curt. Flor. Lond. 1. tab. 13. Eng. Bot. 313. (*C.* major, albus; Bauh. Pin. 294. Tourn. Inf. 82. *Smilax levis* major; Ger. Emen. 861.) "Leaves arrow-shaped; lobes truncate; peduncles square, one-flowered; bractes larger than the calyx, and close to it." β americanus; with a flesh-coloured flower. Bot. Mag. 732. *Root* perennial, about the thickness of a goose-quill, white, creeping, not easily eradicated. *Stems* numerous, from six to ten inches high, or more, angular, smooth, not much branched. *Leaves* alternate, petioled, dependent. *Flowers* large, generally white, sometimes flesh-coloured; nectary a yellow gland, surrounding the base of the germ. A native of Great Britain,

Britain, and most parts of Europe, climbing up hedges in moist ground. Its inspissated juice, taken in doses of twenty or thirty grains, is a powerful purgative. 4. *C. Wheeleri*. Mart. 84. Willd. 3. Vahl. Symb. 2. 366. (C. fasciataria foliis, Wheeleri; Pluk. Phyt. tab. 85. fig. 3. Ipomea sagittata; Poir. It. 2. 160. tab. 3.) "Leaves arrow-shaped, roundish behind, entire; peduncles cylindrical, one-flowered." Wholly smooth. Leaves acute; petiole the length of the leaf. Peduncles shorter than the petiole, thicker, bractate towards the middle, thicker under the flower. Allied to *C. sepium*. A native of Spain and Barbary. 5. *C. scammonia*. Linn. 3. Mart. 3. Defr. 81. Lam. 2079. Woodv. Med. Bot. 13. tab. 5. (*C. fyiaca*, fusc scammonia; Morif. Hist. 2. 12. tab. 3. fig. 5. Bauh. Pin. 294.) "Leaves triangular-arrow-shaped; peduncles cylindrical, nearly double the length of the leaves, about three-flowered." Root perennial, long, thick, fleshy, full of a milky juice. Stems cylindrical, slender, somewhat villous. Leaves alternate smooth, acute; posterior lobes diverging, with a tooth on the inner side of each. Flowers large, purplish white or pale yellow; peduncles solitary; segments of the calyx emarginate; bractes small, awl-shaped, spreading, remote from the flower. Capsule three or four-celled. A native of Syria and Asia Minor. For its medical uses, see SCAMMONY. 6. *C. involuacratu*. Willd. 5. "Leaves cordate-hastate, pubescent; peduncles about three-flowered; calyxes bracteatate." Stem cylindrical, pubescent-villous. Leaves oblong, obtuse, mucronate, quite entire, pubescent on both sides; truncate at the base, undivided, rather obtuse; petioles villous. Peduncles about the length of the leaves, pubescent. Bractes two at the division of the peduncle, pubescent, oblong, acute; two others at the base of each flower, villous-pubescent, elliptical, rather acute, longer than the calyx, and involving it. A native of Guinea. 7. *C. sagittifolius*. Smith Prod. Fl. Gr. p. 133. Flor. Græc. tab. 103. "Leaves cordate-hastate, covered with long distinct hairs, angular at the base; peduncles generally one-flowered; capsules hirsute." A native of the islands in the Archipelago, in vineyards and cultivated ground. 8. *C. fibrivus*. Linn. Mantis. 203. Mart. 4. Defr. 80. Lam. 2078. Willd. 6. (*C. rufestris*; Pallas It. 3. n. 80. tab. R.) "Leaves cordate-acuminate, even-surfaced; peduncles two-flowered; stipules retuse, decurrent." Root annual. Stems from four to six feet long, slender, slightly winged from the decurrence of the stipules, but not two-edged. Leaves ending in a point, which extends to half their whole length, soft, thin, smooth, veined, entire, paler underneath; stipules vertical, small, obtuse. Flowers small, scarcely twice the length of the calyx, whitish or flesh-coloured, fugacious; bractes often wanting; when present, brittle-shaped, sometimes at the division of the peduncle, sometimes on the pedicels; calyx smooth, deeply divided; stigma capitate, two-lobed. A native of Siberia, flowering in July and Aug. Introduced into England in 1779. 9. *C. rufestris*. Willd. 7. "Leaves obtusely heart-shaped, oblong, lanceolate, acute; peduncles one-flowered." Stem smooth, but little twining, somewhat shrubby. Leaves two inches long, smooth, slightly hairy underneath, and at the edges, when viewed through a lens. Flowers violet; peduncles almost the length of the leaves; bractes two, awl-shaped, about the middle of the peduncle; calyx-leaflets, egg-shaped, acute, a little hairy, corolla flat, five-plaited; plaits a little hairy on the outside. Supposed to be a native of Siberia. 10. *C. farinosus*. Linn. Mant. 203. Mart. 5. Defr. 79. Lam. 2077. Wild. 8. Jacq. Hort. Vind. 1. 13. tab. 35. Salisb. Par. Lond. 45. "Leaves heart-shaped, acuminate, repand; peduncles three-flowered; stem mea-

ly." Linn. "Stem with a silky pubescence, which appears at a little distance like dust; leaves cordate, arrow-shaped, with the base of the sinus prominent, repand-toothed, smooth above; panicles from three to five-flowered; border of the corolla sharply five-cleft; stigmas smooth." Salisb. Root annual. Stem six feet high, about the thickness of a goose-quill. Leaves remote, but from the number of branches appearing crowded. Flowers pale rose-coloured; peduncles longer than the leaves, slender, cylindrical; pedicels turned upward after flowering; bractes small, tinged with dull purple towards the top; segments of the calyx purplish, mucronate; tube of the corolla pale green, funnel-shaped, pentangular, shining; filaments whitish, attached to the tube nearly its whole length, slightly pubescent; anthers pale blue. Nectary deep yellow. Capsule two-celled, two seeds in each cell. Salisb. Four-celled, one seed in each cell. Jaq. A native of fields and hedges in Mytha, Livadia, and Peloponnesus; Sibth. Madeira; Masson. 11. *C. lanuginosus*. Mart. 85. Willd. 9. Vahl. Symb. 3. 23. "Leaves heart-shaped, oblong, somewhat hastate, tomentous-silky, auricled, toothed; peduncles three-flowered; stem hairy." Stem herbaceous, beset with numerous ferruginous hairs. Leaves on short peduncles, acute; auricles with two teeth. Flowers resembling those of scammony, yellowish, having a purplish lanceolate line, with a pile of yellow hairs on each segment of the border; bractes two at the division of the peduncle, lanceolate; two others on each lateral pedicel near the flower; middle pedicel shorter, without bractes; peduncles axillary, solitary, hairy; three outer leaflets of the calyx egg-shaped, acuminate, rough with hairs; style bifid. Supposed to be a native of the Levant. 12. *C. incanus*. Mart. 86. Willd. 10. Vahl. Symb. 3. 23. "Tomentous-silky; leaves lanceolate-arrow-shaped, obtuse, often with two teeth at the base; peduncles two-flowered." Stem herbaceous, cylindrical. Leaves an inch and half long, rounded at the end, mucronate, gradually wider towards the base; auricles rounded behind; petioles one fourth of the length of the leaf. Peduncles the length of the leaves; pedicels one shorter and thicker, with two bractes at the base; one longer, with two brittle-shaped bractes in the middle; segments of the calyx egg-shaped, acute; outer ones more villous; corolla villous on the outside; style bifid. Capsule smooth, globular. A native of America. 13. *C. salicifolius*. Defr. 17. Lam. 2016. "Leaves lanceolate, serrated, on short petioles; calyx angular." Stems cylindrical, slender. Leaves three or four inches long, narrowed to a point at both extremities. Peduncles shorter than the leaves, axillary, solitary, one-flowered; bractes two, very small, awl-shaped, at a distance from the flower; calyxes five-leaved. A native of St. Domingo; specimen in the herbarium of La Marck. 14. *C. emarginatus*. Mart. 87. Willd. 11. Vahl. Symb. 3. 23. (*C. uniflorus*; Defr. 18. Lam. 2017. Burm. Ind. 47. tab. 21. fig. 2.) "Leaves lanceolate; lower ones emarginate, mucronate; peduncles one-flowered; outer calyx-leaves femioveate, large." Stem rooting at the bottom, mucronate upwards, with small spines, and having minute hairs scattered over it at the top. Leaves thickish, veiculis, smooth; lower ones acute at the base; upper ones rounded at the base, mucronate. Peduncles solitary, with two minute bractes above the middle; calyx-leaves smooth, the length of the corolla; three outer ones acute, mucronate; two inner ones linear-lanceolate, attenuated; corolla with five lines on the outside, which are closely beset with fulvous shining hairs; stigma capitate. Capsule smooth, shorter than the calyx. A native of the East Indies. 15. *C. nitidus*. Defr. 19. Lam. 2018. "Leaves oval, shining, silky-white underneath; peduncles one-flow-

ered, shorter than the petiole." *Root* perennial. The young branches, petioles, leaves, peduncles, and calyxes, clothed with a silky shining down. *Stem* cylindrical, woody, almost smooth. *Leaves* broad-oval, alternate, acute, entire, nerved, about twice the length of the petioles. *Peduncles* axillary, solitary, with two awl-shaped bractes about the middle; calyxes short; two inner leaves smaller; corollas at least two inches long, funnel-shaped. A native of the Philippine islands. Specimen in the herbarium of Jussieu. 16. *C. che-nopodioides*. Defr. 21. Lam. 2020. "Villous; leaves egg-shaped, ferrate-venated; flowers solitary, nearly sessile." *Stems* slender, weak, cylindrical. *Leaves* an inch long; petioles about half their length, channelled. *Peduncles* axillary, solitary; bractes two, small, filiform, rather long; leaves of the calyx egg-shaped, acute, corollas narrow, tubular. In the herbarium of La Marek. 17. *C. medium*. Linn. Sp. Pl. 4. Mart. 6. Defr. 10. Lam. 2009. Willd. 12. "Leaves linear, hastate-acuminate; auricles toothed; peduncles one-flowered; calyxes arrow-shaped." Plant smooth in all its parts. *Root* annual. *Stems* very slender. *Peduncles* axillary, solitary, often bent in the middle at the origin of the two bractes; upper half angular, thicker; three outer leaves of the calyx large, nearly as long as the peduncles, acute, arrow-shaped at the base, like those of campanula medium; auricles terminated by two or three small teeth; two inner ones entire, acute, a little shorter; corolla not longer than the calyx. A native of Madagascar and the East Indies. 18. *C. filicaulis*. Mart. 88. Willd. 13. Vahl. Sym. 3. 24. "Leaves linear-lanceolate, obtuse, mucronate, dilated and toothed at the base; calyx leaves oblong." *Root* annual. *Stem* herbaceous, filiform, branched. *Leaves* on very short petioles, distant, two inches long or more, tender, veined, quite smooth. *Peduncles* axillary, filiform, thicker at the top; bractes two, opposite, awl-shaped, above the middle of the peduncle; calyx-leaves mucronate, smooth; stigma simple, bluntish. A native of Guinea. 19. *C. tridentatus*. Linn. Sp. Pl. Ed. 1. Mart. 76. Defr. 12. Lam. 2011. Willd. 14. Pluk. Alm. 117. tab. 276. fig. 6. & Mart. 117. tab. 167. fig. 5. (Evolvulus tridentatus; Linn. Sp. Pl. Ed. 2. Fendera-claudi; Rheed. Mal. 11. 133. tab. 65.) "Leaves spatulate-linear, three-toothed at the tip, dilated and toothed at the base; calyx leaves elliptical, cuspidate." *Root* annual. *Stems* filiform, smooth, slightly striated, almost simple. *Leaves* alternate, about half an inch long, smooth; petioles about a line long. *Flowers* purplish at the base, with a yellowish white border; peduncles axillary, solitary, one-flowered, longer than the leaves, with two small bractes near their summit. A native of the East Indies. Introduced into England in 1778, by Sir Joseph Banks. 20. *C. angustifolius*. Mart. 89. Defr. 32. Lam. 2030. Willd. 15. (Ipomœa angustifolius; Jacq. ic. 2. tab. 37.) "Leaves linear, hastate, obtuse, mucronate, smooth; auricles generally entire; peduncle one-flowered." *Root* spindle-shaped, rising about an inch above the surface of the ground, with the appearance of a slender, simple, erect, leafless stem. *Stems* several, scarcely a foot high, a little twining, almost simple, filiform, weak. *Leaves* an inch long, about a line broad, numerous, on very short petioles. *Flowers* yellow, longer than the calyx; peduncles axillary, solitary, shorter than the leaves, with two awl-shaped bractes, about the middle, upper half thicker; calyx-leaves connivent, lanceolate, mucronate; corolla funnel-shaped; border very open; divisions egg-shaped, obtuse; stigma globular, didymous. *Capsule* two-celled. A native of Guinea and the East Indies. 21. *C. aristolochifolius*. Mill. Houlton MSS. "Leaves hastate-lanceolate; auricles rounded; peduncles many-flowered." *Root* annual.

Stem ten feet high, slender. *Flowers* yellow, in small clusters, on long peduncles. *Capsules* trizonous, three-celled. *Seeds* two in each cell. *Seeds* sent to Mr. Miller from Carthage in New Spain. 22. *C. Adansoni*. Defr. 82. Lam. 2080. "Leaves hastate, linear; stipules in pairs, somewhat filiform; calyx mucronate." *Stems* herbaceous, weak, a little villous. *Leaves* alternate, dilated, petioled, entire, smooth, from three to four inches long; stipules about an inch long. *Flowers* near two inches long, axillary; peduncles nearly the length of the petioles, smooth, with two small bractes about the middle; calyx-leaves egg-shaped, rough, with sharp tubercles. A native of Senegal. 23. *C. japonicus*. Mart. 7. Defr. 6. Lam. 2005. Willd. 16. Thunb. jap. 85. (Kos and Kudr vulgo Firaga wo; Kempf. Amœn. 5. 856.) "Leaves hastate, lanceolate, acute; lateral lobes one-toothed; peduncles one-flowered; stem simple." *Stems* filiform, smooth. *Leaves* alternate, almost unilateral, petioled, smooth; middle lobe an inch long, lanceolate, entire, acute; side ones a little reflexed, shorter. *Flowers* axillary, solitary; peduncles as long as the leaves, filiform, smooth; calyx-leaves egg-shaped, acute, entire, smooth. A native of Japan. 24. *C. ebraheutus*. Defr. 7. Lam. 2006. "Leaves cordate-arrow-shaped, obtuse behind; peduncles shorter than the petiole, without bractes." Whole plant, except the corolla, clothed with short white hairs. *Stems* scarcely a foot and a half long, slender. *Leaves* alternate, acute. *Flowers* white, small; peduncles one or two-flowered; segments of the calyx five; two outer ones broader; stigmas two, globular, purplish. Native country unknown. Cultivated in the botanic garden at Paris. 25. *C. leucanthus*. Defr. 8. Lam. 2007. (Ipomœa leucantha; Jacq. Coll. 2. 280. ic. 2.) "Leaves heart-shaped, acuminate; peduncles shorter than the petiole." *Root* annual. *Stems* about four feet high, slender, cylindrical, branched, reddish, and somewhat rough towards the bottom. *Leaves* alternate, entire, or slightly felloped, smooth. *Flowers* white; peduncles axillary, solitary, an inch long, erect, cylindrical, smooth, one-flowered; calyx leaves mucronate, a little open at the summit, ciliated at the base; corolla funnel-shaped; anthers purplish; stigma two-lobed. A native of America in the torrid zone. 26. *C. fruticosus*. Defr. 9. Lam. 2008. "Shrubby; leaves somewhat heart-shaped at the base, linear, lanceolate, petioles short; flowering branches, thick set with leaves." *Root* perennial. *Stems* three or four feet high, cylindrical, slender. *Leaves* not more than two lines broad, sloped at the base, on very short petioles. *Flowers* with five purple rays; peduncles larger than the petioles, scarcely the length of the flowers; bractes two, small, awl-shaped, unequal, situated nearer to the stem than to the calyx; calyx smooth; corolla shallowly five-lobed. A native of the Canary islands, flowering in April and May. 27. *C. dentatus*. Mart. 90. Willd. 17. Vahl. Symb. 3. 25. "Leaves hastate, smooth; auricles toothed; peduncles many-flowered, mucronate." *Stem* cylindrical, smooth. *Leaves* scarcely an inch long, somewhat heart-shaped at the base; middle lobe lanceolate, quite entire; side ones roundish, unequally four or five-toothed; petioles filiform, often somewhat mucronate towards the base. *General peduncles* spreading, thicker, and a little longer than the petioles; partial peduncles in threes; that in the middle one-flowered; side ones with two or three pedicelled flowers; both mucronate; rigid; calyx-leaves oblong, obtuse, mucronate, equal. A native of the East Indies, found by Schumacher. 28. *C. hastatus*. Mart. 79. Willd. 18. Vahl. Symb. 1. 15. Forst. defr. 203. "Leaves lanceolate, hastate; peduncles axillary, in pairs, two-flowered." *Stem* hairy. *Leaves* remote, quite entire, smooth on the upper surface, villous on the lower; au-

ricles rounded, sometimes with one tooth behind; petiole half the length of the leaf. *Peduncles* shorter than the petiole, villous; calyx-leaves hairy, acuminate, patulous at the tip. A native of Egypt and Arabia. 29. *C. Souneratii*. (C. haitatus; Desf. 11. Lam. 2010. Tala-neli; Rheed. Mal. 11. 113. tab. 55.) "Leaves linear, hastate-acuminate; auricles toothed; calyx-leaves simple." Whole plant smooth. *Stems* very slender, slightly angular. *Leaves* about two lines broad, alternate, nearly sessile. *Peduncles* longer than the flower, slender, one or two-flowered, often bent at the insertion of the bractes, thicker upwards; bractes two, small, awl-shaped, situated a little above the middle of the peduncle. *Flowers* yellowish-white, twice the length of the calyx; calyx leaves egg-shaped, acute. A native of the East Indies, communicated to La Marck by Sounerat. 30. *C. asarifolius*. Desf. 89. Lam. 2087. "Leaves kidney-shaped, broad, veined; peduncles one or two-flowered." *Stems* cylindrical, smooth, not much branched. *Leaves* alternate, large, entire, smooth, firm; petioles about two inches long, channelled. *Peduncles* longer than the petioles; bractes from two to four, small, awl-shaped, situated almost close to the flowers; calyx-leaves short, egg-shaped, obtuse, two outer ones smaller; corollas at least two inches long, tubular; tube about half an inch diameter; border but little open, with five pointed divisions; stigma capitate, didymous. A native of Senegal. 31. *C. tiliaefolius*. "Shrubby; leaves heart-shaped, rounded; younger ones somewhat tomentous; flower and fruit very large." *Stems* cylindrical, almost smooth. *Leaves* alternate, a little orbicular, entire; petioles about half the length of the leaves, channelled. *Flowers* large; peduncles not more than eight or ten lines long, axillary, solitary, one-flowered; calyx-leaves short, obtuse, almost round; corolla at least three inches long, almost cylindrical; tube narrow as far as the length of the calyx, afterwards eight or ten lines in diameter; stigma capitate, two lobed. *Capsule* about the size of a walnut, apparently two-celled. A native of the Isle of France, and the Cape of Good Hope. Found by Commerlon. 32. *C. panduratus*. Linn. Sp. Pl. 5. Mart. 8. Desf. 91. Lam. 2089. Willd. 19. (C. megalorrhizos; Dill. Elth. 101. tab. 85. fig. 99.) "Leaves, some heart-shaped, entire, others panduriform or three-lobed; peduncles longer than the petiole, about two-flowered." *Root* perennial, thick, spindle-shaped. *Stems* long, slender. *Leaves* distant, petioled. *Flowers* large, white, with the bottom of fine purple; peduncles axillary, solitary, from one to three-flowered; calyx-leaves short, two outer ones shorter and narrower. *Capsule* two-celled. *Seeds* hirsute, one in each cell. A native of Carolina and Virginia, flowering from June to September. 33. *C. betoniifolius*. Mart. 72. "Leaves cordate-arrow-shaped, acute; peduncles one-flowered." *Stem* five or six feet high, slender. *Flowers* white, with purple bottoms; peduncles long, slender. A native of Africa, cultivated by Miller in 1730. 34. *C. bracteatus*. Mart. 91. Vahl. Sym. 3. 25. "Leaves heart-shaped, almost entire, and three-lobed, hastate, attenuated; peduncles one-flowered; outer calyx-leaves bractee-shaped." *Stem* thinly beset with short hairs. *Leaves* two inches long; petioles shorter than the leaf, pubescent. *Peduncles* the length of the leaf, solitary; bractes two, lanceolate, acute, situated a little below the calyx; calyx pubescent; inner calyx-leaves oblong, bluntish, nerved; outer ones much broader, enclosing the others as between two bractes; corolla villous on the outside, tender, silky; border five-cleft; stigma capitate, two lobed, found in the East Indies by Koenig. 35. *C. bicolor*. Mart. 92. Willd. 21. Vahl. Symb. 3. 25. "Leaves heart-shaped, villous, somewhat angular-lobed at the base; peduncles one-flowered; outer leaves of the calyx resembling

bractes." *Stem* villous. *Leaves* acute, mucronate, not attenuated, nearly equal in length and breadth, one, two, or three-lobed at the bottom, villous on both sides; very softly villous, hoary, and obscurely veined underneath; the younger ones silky. *Flowers* white, with a violet purple base; bractes, calyx, and corolla, as in the preceding species. Found in the East Indies by Schumacher. 36. *C. Giffroyensis*. (C. bicolor; Desf. 96. Lam. 2094.) Hairy; leaves somewhat heart-shaped, three-lobed, hoary underneath; peduncles many-flowered." On a superficial view having the appearance of a bramble. *Stems* slender, cylindrical; beset, as well as the petioles, peduncles, and calyxes, with blackish points, and hispid with rather long stiffish hairs. *Leaves* alternate, longer than their petioles, clothed with fine recumbent hairs, green on the upper surface, hoary underneath; lobes oval, acute, entire. *Flowers* small; peduncles axillary, solitary, thicker and longer than the petioles, dichotomous; bractes two, linear, awl-shaped, situated at each division of the peduncles; calyx-leaves narrow, acute, rather long. Brought from Senegal by M. Geoffroy. 37. *C. trilobus*. Willd. 22. Thunb. prod. 35. "Leaves heart-shaped, villous, three-lobed; lobes egg-shaped, acute; peduncles one-flowered." A native of the Cape of Good Hope. 38. *C. subquinquelobus*. (C. trilobus; Desf. 94. Lam. 2093. *Ipomoea triloba*; Linn.) "Lower leaves heart-shaped, three-lobed; upper ones somewhat five-lobed; peduncles three-flowered." *Root* annual. *Stems* two or three feet long, slender, slightly angular, smooth. *Leaves* alternate, generally shorter than their petioles; middle lobes of the lower leaves egg-shaped, obtuse, mucronate, smooth; lateral lobes of the upper leaves with a deep sinus, which makes them appear five-lobed. *Flowers* purple or violet; peduncles angular, nearly the length of the petioles; pedicels very short, bractes small, egg-shaped; calyx-leaves half the length of the corolla, smooth, egg-shaped, acute, connivent; corolla small, cylindrical; border with five sharp teeth. A native of South America, cultivated in the botanic garden at Paris. 39. *C. platanifolius*. Mart. 93. Willd. 23. Vahl. Symb. 3. 26. Pluk. phyt. tab. 167. fig. 3. Feuill. peruv. 3. 16. tab. 11. "Leaves heart-shaped, three-lobed; lateral lobes toothed-angular; peduncles, somewhat three-flowered; calyxes almost as long as the peduncles, smooth." Whole plant quite smooth, except the petioles. *Stem* cylindrical. *Leaves* two inches long or more, glaucous, green underneath, with purplish veins; lobes lanceolate; middle one longer, broader, quite entire, acuminate; lateral ones narrower, attenuated, with a smaller broader lobe at the bottom on each side, rounded behind, and furnished with an angular tooth; petioles shorter than the leaf, beset with a few scattered hairs. *Peduncles* solitary, shorter than the leaf, thickened at the top; lower ones three-flowered; middle ones two-flowered, uppermost one-flowered; calyx-leaves oblong, somewhat membranous, ending in a bristle; stigma capitate. It differs altogether from *C. batatas* in the smoothness of the stem, and the form of the leaves. A native of America. 40. *C. acuminatus*. Mart. 94. Willd. 24. Vahl. Symb. 3. 26. "Leaves heart-shaped and three-lobed, attenuated; peduncles elongated, many-flowered; calyxes smooth." *Stem* with a few minute scattered hairs, pressed close, and visible only with a magnifier. *Leaves* four inches long, three or more broad at the base, three-lobed or entire, quite smooth, nerved, acute; lateral lobes lanceolate; middle one egg-shaped, attenuated; petioles longer than the leaf. *Flower* large, bell-shaped, purple with a pale base and five paler rays running to the margin; peduncles axillary, the length of the petioles alternate; pedicels about five, an inch and half long; bractes at the base of each pedicel two, lanceolate, attenuated, finely

nerved, smooth; calyx-leaves lanceolate, attenuated, tender, finely nerved, quite smooth; two inner ones a little shorter, stigma capitate. A native of the island of Santa Cruz in the West Indies. 41. *C. carolinus*. Linn. Sp. Pl. 6. Mart. 9. Defr. 90. Lam. 2088. Willd. 25. Dill. elth. 100. tab. 84. fig. 98. "Leaves heart-shaped, entire, and three-lobed, villous; calyxes even-surfaced; capsules hirsute; peduncles one or two-flowered." *Root* perennial. *Stems* slender, reddish towards the root, hairy at the joints. *Leaves* alternate, scarcely two inches long, some entire, others like those of ivy; petioles about the length of the leaves, slender, channelled. *Flowers* pale purple, resembling those of *C. arvensis*; peduncles the length of the petioles, thicker, axillary, solitary, angular, with a few narrow bractes; calyx-leaves egg-shaped, acute, scarcely half the length of the corolla, a little ciliated at the edges with whitish hairs. *Capsules* round, hairy towards the summit, two-celled, four-valved. *Seeds* two in each cell. A native of Carolina. 42. *C. hederaceus*. Linn. Sp. Pl. 7. Mart. 10. Defr. 92. Lam. 2090. Dill. elth. 99. tab. 83. fig. 96. Gart. tab. 134. fig. 2. "Leaves heart-shaped, entire and three-lobed; corollas undivided; fruit erect." Linn. "Peduncles about three-flowered; calyxes tubercled." Lam. *Root* annual. *Stems* farmentous, cylindrical, dull red, two or three feet high. *Leaves* alternate, petioled, clothed with fine short hairs. *Flowers* fine blue, with a pale base; peduncles nearly the length of the petioles, axillary, solitary, hairy; bractes small; pedicels very short; calyx-leaves rough with numerous long hairs, and small black tubercles; two of them narrower. *Capsules* spherical, smooth, thin, three-celled, three-valved. *Seeds* two in each cell, black, smooth. A native of Asia, Africa, and America. 43. *C. Dillenii*. Defr. 22. Lam. 2021. Dill. elth. 97. tab. 81. fig. 93. "Leaves heart-shaped, entire, and three-lobed; flowers solitary, almost sessile." Distinct from the preceding, with which it has been confounded. *Root* annual. *Stems* long, slender, hairy. *Leaves* alternate, slightly villous, paler underneath; lobes angular; petioles shorter than the leaves, hairy. *Flowers* fine blue, with a whitish base; peduncles axillary, solitary; calyxes oblong, five-cleft, hairy; corollas large, very open, almost entire, supposed to be a native of Africa. 44. *C. nil*. Linn. Sp. Pl. 8. Mart. 11. Willd. 27. Bot. Mag. 188. *C. cœruleus*; Ger. em. 864, fig. 1. *C. hederaceo anguloso folio*; Bauh. p. 295; Dill. elth. 96. tab. 8. fig. 91, 92. *Ipomœa hederacea*; Lam. ? *J. trilobata*; Thunb. Flor. jap. 86. Linn. Transf. 2. 330. "Leaves heart-shaped, three-lobed; corollas femiquinquefid; peduncles shorter than the petiole." *Root* annual. *Stem* eight or ten feet high. *Leaves* woolly, acuminate, on long petioles. *Flowers* deep blue, with purple rays; peduncles two-flowered. *Fruit* erect. Nil is an abbreviation of Anil, one of the names of indigo. A native of America. 45. *C. purpureus*. Linn. Sp. Pl. 9. Mart. 12. Willd. 28. Bot. Mag. 113. (*C. purpureus folio subrotundo*; Bauh. p. 295. *Ipomœa purpurea*; Lam.) "Leaves heart-shaped, undivided; fruit nodding; pedicels thickened." *β. cœruleus minor, folio subrotundo*. Dill. elth. 98. tab. 83. fig. 95. smaller, blue-flowered, with a roundish leaf. *γ. C. folio cordato glabro*. Dill. elth. 98. tab. 84. fig. 97. with a heart-shaped smooth leaf. *δ. elatior*; Bot. Mag. 1005. *Stems* very high; leaves orbicular-heart-shaped; flowers white, with five spots, elegantly shaded with blue and carmine. All the varieties are natives of America. The first is a hardy annual, common in the English gardens, under the name of *Convolvulus major*. 46. *C. obfcurus*. Linn. Sp. Pl. 10. Mart. 14. Defr. 15. Lam. 2014. Willd. 29. Dill. elth. 98. tab. 83. fig. 95.

"Leaves heart-shaped, undivided; stem somewhat pubescent; peduncles thickened, one-flowered; calyxes smooth." *Root* annual. *Stems* cylindrical, villous towards the top, three or four feet high. *Leaves* alternate, acute, green, and smooth above, paler and a little villous underneath; petioles one or two inches long. *Flowers* white, with a purple base and yellowish rays; peduncles longer than the petioles, slender, slightly pubescent towards the bottom, with two small bractes. A native of Java, and other parts of the East Indies. 47. *C. flavus*. Willd. 30. (*Evolvulus hederaceus*; Burm. Ind. 77. tab. 30. fig. 2.) "Leaves heart-shaped, repand, somewhat lobed, with small mucronate teeth; peduncles bifid, many-flowered." *Stem* rather smooth. *Leaves* acuminate, somewhat scabrous. *Peduncles* much longer than the leaves; upper ones three-flowered; lower ones bifid; branches three-flowered, with a single flower at the division. A native of the East Indies. 48. *C. angularis*. Linn. Mant. 203. Mart. 13. Defr. 98. Lam. 2098. Willd. 31. Burm. Ind. 46. tab. 19. fig. 2. "Leaves heart-shaped, pentangular, quite entire, villous; peduncles many-flowered." *Stems* pubescent. *Leaves* on short petioles, quite entire, rough with reddish shining hairs. *Flowers* orange; peduncles the length of the leaves, axillary, solitary, most commonly three-flowered; calyx hairy; segments acute; corollas bell-shaped, three times longer than the calyx. A native of the East Indies. 49. *C. Batatas*. Linn. Sp. Pl. 11. Mart. 15. Willd. 32. (*Batatas*; Bauh. Pin. 91. Rumph. Amb. 5. 367. tab. 130. *C. radice tuberosa esculenta*; Catseb. Car. tab. 60. *Ipomœa Batatas*; Lam.) Spanish or sweet potatoe. "Leaves heart-shaped, hastate, five-nerved; stem hispid, creeping, bearing tubers." *Root* perennial. *Stem* cylindrical, perennial, hispid, prostrate, creeping; sending out scattered, oblong, acuminate tubers, purple or pale on the outside. *Leaves* angular, on long petioles. *Flowers* purple, large, about three together, on upright peduncles. A native of the West Indies, whence it is said to have been introduced by the Spaniards into the Philippine islands. It is now extensively cultivated in the tropical climates of both hemispheres, for the sake of its tubers. They are sweet, sapid, and esteemed nourishing, and are the common potatoe of our old English botanists. There are several varieties, and probably more than one distinct species. 50. *C. mexicanus*. Linn. jun. Sup. 137. Mart. 25. Willd. 33. Vahl. Symb. 3. 268. (*C. marginatus*; Defr. 72. Lam. 2071. Tiru-tali; Rheed. Mal. 11. 109. tab. 53.) "Leaves heart-shaped, acute, smooth; peduncles many-flowered, smooth; stem somewhat hairy." *Root* perennial, fibrous. *Stems* cylindrical, slender, reddish. *Leaves* alternate, thin, soft, even-surfaced, bordered with red; petioles rather long, thick, channelled, reddish. *Flowers* pale red, with a purple base, funnel-shaped; peduncles axillary, solitary, thicker than the branches from which they spring, seven or eight-flowered; calyx-leaves short, somewhat acute; stigma capitate, two-lobed. A native of the East Indies. 51. *C. biflorus*. Linn. Sp. Pl. Append. p. 1668. Mart. 16. Willd. 34. "Leaves heart-shaped, pubescent; peduncles in pairs; corollas with trifid lobes. *Root* annual. *Stem* cylindrical, hairy, branched at the base, about the size of *C. arvensis*. *Leaves* oblong; petioles cylindrical, hairy, shorter than the leaf. *Flowers* white; peduncles hairy, approximating at the base, shorter than the petioles; calyx five-leaved; two outer leaves cordate-oblong; two inner ones linear-lanceolate; the fifth semi-heart-shaped; corolla small, campanulate, quinquefid, plaited; lobes trifid at the tip; middle lobe smaller; tube shorter than the calyx; stigmas two, capitate, purple. A native of China. 52. *C. gemellus*. Mart.

CONVOLVULUS.

Mart. 95. Defr. 71. Lam. 2070. Vahl. Symb. 3. 27. Burm. ind. 46. tab. 41. fig. 1. "Leaves heart-shaped, somewhat villous underneath, peduncles two-flowered." *Stem* tender, pubescent at the top. *Leaves* an inch long, obscurely seven-nerved, a little acuminate; petioles the length of the leaves. *Flowers* white; peduncles the length of the petioles; pedicels almost as long as the peduncles; one shorter, without bractes; the other with two bractes in the middle; both turned back when the fruit ripens; calyx-leaves oblong, obtuse: corolla campanulate, six times as large as the calyx, smooth; stigma capitate. A native of Java and Tranquebar. 53. *C. triflorus*. Mart. 102. Willd. 42. Vahl. Symb. 5. 30. "Leaves cordate-lanceolate, attenuated, obtuse, smooth; peduncles three-flowered." *Stem* herbaceous, smooth. *Leaves* two inches long, quite entire, simply veined, rounded at the end and mucronate; lobes rounded at the end, sometimes but rarely obscurely angular; petiole short. *Peduncles* shorter than the leaf; pedicels angular, without bractes, equal, almost the length of the peduncle. *Calyx-leaves* obtuse. *Corolla* three times the length of the calyx; lobes hairy at the tip. *Stigma* capitate. A native of the East Indies, observed by Koenig. 54. *C. latifolius*. Defr. 58. Lam. 2033. Plum. Cat. 1. and MSS. "Leaves heart-shaped, smooth; peduncles about three-flowered; corolla valver-shaped, very large." *Stems* very long. *Leaves* alternate, large, thin, acuminate, bright green; petioles channelled. *Flowers* white; peduncles axillary, solitary, thicker than the petioles, a little angular under the pedicels: calyx-leaves small; three outer ones long, acute; two inner ones egg-shaped, obtuse; tube of the corolla long, narrow, greenish; border near five inches in diameter, expanded, almost flat, slightly sinuated at the edges, marked with a greenish-white star. *Fruit* membranous, top-shaped, about the size of a walnut. *Seeds* three or four. A native of St. Domingo and Martinico. 55. *C. hypocrateriformis*. Defr. 81. Lam. 2082. "Leaves heart-shaped; corolla valver-shaped; border five-cleft; segments emarginate." *Branches* woody, cylindrical. *Leaves* alternate, near together, about an inch long, coriaceous, smooth, scarcely pointed; petioles rather shorter than the leaves, angular. *Peduncles* axillary, solitary, or in pairs, one-flowered, nearly as long as the petioles, thickened upwards; bractes situated above the middle of the peduncle, linear-lanceolate, reaching almost to the top of the calyx; calyx-leaves short, egg-shaped, obtuse; tube of the corolla near two inches long; border at least an inch and half in diameter, very flat. A native of the East Indies; described from an imperfect specimen gathered by Sonnerat. 56. *C. striatus*. Mart. 96. Willd. 36. Vah. Symb. 3. 28. "Leaves heart-shaped, attenuated, smooth; peduncles longer than the leaf, about four-flowered; corollas smooth, striated on the outside." *Stem* herbaceous, cylindrical, slender, pubescent. *Leaves* two inches long, remote, quite entire, with a rounded mucronate point, smooth on both sides except the rib, simply veined; petioles the length of the leaves, pubescent. *Peduncles* longer than the leaves, solitary, pubescent; pedicels in threes; lateral ones jointed, one of them often two-flowered; intermediate one shorter, thicker, without bractes. *Bractes* two, situated at the joints about the middle of the lateral pedicels, oblong, concave, small, villous, deciduous. *Calyx-leaves* oblong, obtuse, concave, equal; two outer ones villous, somewhat hoary. *Corolla* campanulate, twice the length of the calyx, white, with a purplish base and five paler lanceolate-striated rays extending to the margin; stigma capitate, two-lobed. 57. *C. dominicensis*. Defr. 59. Lam. 2058. "Leaves heart-shaped; racemes numerous, unilateral; calyx acute, smooth." *Stems*

slender, cylindrical, smooth, frutescent. *Leaves* alternate, acute, smooth, except the middle nerve underneath; petioles of a moderate length, channelled. *Flowers* in small peduncled racemes, numerous, situated near the extremities of the branches, often pendant; bractes very small, awl-shaped, at the foot of the pedicels; calyx-leaves smooth, egg-shaped, elongated, unequal in size; corollas bell-shaped, expanding; stigmas capitate, two-lobed. A native of St. Domingo. 58. *C. finensis*. Defr. 69. Lam. 2068. "Hairy; leaves heart-shaped, acute; peduncles two or three flowered; calyx-leaves heart-shaped." Whole plant, especially near the summit, clothed with separate, fine, whitish hairs. *Stems* slender, cylindrical. *Leaves* alternate, entire, on length somewhat villous petioles. *Peduncles* shorter than the petioles, axillary, solitary; bractes small, awl-shaped; three exterior calyx-leaves broader than the others, heart-shaped at the base, very rough with hairs; corollas campanulate, a little longer than the calyx. Supposed to be a native of China. 59. *C. pentanctus*. Willd. 37. Jacq. ic. rar. 2. 316. Collect. 42. 210. "Leaves heart-shaped, acuminate, smooth, somewhat repand; umbels peduncled, capitate, five-flowered; calyxes ciliated." *Root* perennial. *Stem* shrubby. *Flowers* nearly sessile. Native country unknown. 60. *C. guianensis*. Mart. 97. Defr. 58. Lam. 2057. Aubl. guian. 1. 136. tab. 52. "Leaves somewhat heart shaped, mucronate, tomentous; flowers collected into a kind of corymbose head, on very long peduncles." *Root* perennial. *Stems* a little woody at the base, cylindrical, villous. *Leaves* alternate, two inches long, quite entire, veined, nerveless; petiole only half the length of the leaf, a little channelled, tomentous. *Flowers* pale blue, or whitish; peduncles seven inches long, axillary, villous; pedicels very short, intermingled with filiform bractes; calyxes villous, deeply divided into five lanceolate segments; corollas small; lobes of the border acuminate; stigmas two, reflexed. A native of Guiana. 61. *C. capitatus*. Mart. 98. Defr. 57. Lam. 2056. Willd. 39. Vahl. Symb. 3. 28. "Hispid; leaves heart-shaped; flowers capitate, involucred; peduncles scarcely longer than the petiole." Whole plant hispid, with long distinct hairs of a dirty white colour, placed on minute tubercles. *Stem* slender, cylindrical. *Leaves* from two to three inches long, alternate, acute, entire; petioles nearly the length of the leaf. *Peduncles* axillary, solitary, with about five sessile flowers collected into a close head. *Involucre* consisting of six or seven egg-shaped acute bractes, of unequal size, generally as long as the calyx; calyx-leaves one third of the length of the corolla, ovate-lanceolate, acuminate, smooth within; corolla hispid on the outside with long hairs arranged in five lines. *Capitate* globular, shorter than the calyx, even-surfaced, smooth. Found in the East Indies by Koenig and in Senegal by Geoffroy. 62. *C. crinitus*. Defr. 112. Lam. 2114. "Leaves heart-shaped, almost smooth; heads of flowers very hispid, on long peduncles, involucred; capsule even-surfaced." *Stem* herbaceous. Specimen in the herbarium of Justieu. 63. *C. hispidus*. Mart. 99. Willd. 40. Vahl. Symb. 3. 29. "Extremely hispid; leaves cordate-egg-shaped; flowers unbelled; peduncles very short." *Leaves* from two to three inches long, attenuated, quite entire; petiole half the length of the leaf. *Pedicels* the length of the peduncle. *Calyx-leaves* lanceolate, attenuated, smooth within, lax. *Corolla* smooth. *Stigma* capitate. A native of the East Indies. 64. *C. parviflorus*. Mart. 100. Willd. 42. Vahl. Symb. 3. 29. (*Ipomæa paniculata*; Burm. Ind. 50. tab. 21. fig. 3.) "Leaves heart-shaped, acuminate, smooth; peduncles many-flowered; calyxes acuminate, villous." *Stem* weak, slightly villous at the top.

Leaves

CONVOLVULUS.

Leaves an inch long; petiole the length of the leaf, filiform, villous. *Flowers* blue; peduncles the length of the petioles; pedicels umbelled; lateral ones sometimes branched; calyx-leaves egg-shaped, acuminate, small; corolla smooth, twice the length of the calyx, five-cleft; stigma bifid; segments revolute. A native of Java. 65. *C. verticillatus*. Linn. 12. Mart. 17. Willd. 43. Brown. Jam. 153. (*C. nodiflorus*, Lam?) "Leaves oblong, heart-shaped, oblong, naked; peduncles umbelled, bifid, many-flowered." *Leaves* roughish, somewhat repand. *Flowers* bluish, small, campanulate, not cut; peduncles shorter than the leaf; pedicels often somewhat divided. A native of North America. 66. *C. solanifolius*. (*C. parviflorus*; Deffr. 66. Lam. 2065. Quamoclit purpurea solanifolia minor; Plum. MSS. 2. tab. 62. Burm. Amer. 83. tab. 94. fig. 2.) "Leaves cordate-oblong, mucronate; peduncles branched, many-flowered, short, appearing verticillate." Distinct from the preceding. *Roots* the thickness of the human little finger, much branched. *Stems* very slender, long, branched. *Leaves* sinuate, slightly tomentous; petioles rather short. *Flowers* purplish, small, campanulate, deeply five-cleft, as represented in Plumier's figure; peduncles axillary, shorter than the leaves; pedicels forming a corymb. *Capsules* four-celled. *Seeds* yellow, angular. A native of St. Domingo, on stony hills, communicated to La Marck by Joseph Martyn. 67. *C. violaceus*. Mart. 101. Willd. 44. Vahl. Symb. 3. 29. "Leaves cordate-egg-shaped, acute; peduncles elongated, bifid, many-flowered; two outer calyx-leaves cordate-egg-shaped, acute." *Stem*, *petioles*, *peduncles*, and *calyxes* villous. *Leaves* an inch long. *Flowers* violet, with five lanceolate paler rays; peduncles four or five times longer than the leaf; pedicels three or five-flowered, with a pair of linear-lanceolate bractes at the base; calyx-leaves tender; two innermost ones only half the size of the others, somewhat membranous, smooth, mucronate; corolla campanulate; stigmas two, reflexed. It varies with respect to the hairiness of the leaves. A native of the island of Santa Cruz. 68. *C. azureus*. Deffr. 56. Lam. 2055. "Leaves somewhat heart-shaped, acute, naked; flowers collected into a head on a very long petiole." *Stem* woody, finely striated, firm and greyish near the bottom, twining and somewhat villous towards the top. *Leaves* near an inch and half long, a little longer than the petioles, repand, smooth, rather glaucous underneath. *Flowers* fine azure blue, small; peduncles axillary, solitary, divided at the summit into short ramifications intermingled with small bractes; calyxes deeply divided; segments acute. A native of South America. 69. *C. cymosus*. Deffr. 64. Lam. 2063. (*C. laevis* minor; Rumph. Amb. 5. 451. tab. 158.) "Leaves heart-shaped, oblong, acuminate; peduncles cymous; fruit nodding." *Stems* long, slender, cylindrical, almost smooth. *Leaves* four or five inches long, alternate, petioled, nerved, even-surfaced, slightly sinuate. *Peduncles* axillary, about the length of the petioles, branched about the middle into a cyme. *Calyx-leaves* egg-shaped, obtuse. *Corollas* long, not very open. *Stigma* capitate, two lobed. A native of the East Indies. 70. *C. umbellatus*. Linn. Sp. Pl. 13. Mart. 18. Deffr. 63. Lam. 2062. Willd. 45. (*C. luteus* polyanthus; Plum. Am. 88. tab. 103. Sloan. Jam. 53.) "Leaves heart-shaped; petioles stipuleous at the base; peduncles umbelled." *Root* perennial. *Stem* herbaceous, cylindrical, filiform, stiff, subdivided, pubescent. *Leaves* above two inches long, and as broad at the base, deeply heart-shaped, lanceolate, somewhat sinuate, entire, dark green, hoary underneath; petioles three inches long, with two stipules at the base a little decurrent on the stem. *Flowers* yellow; peduncles three

inches long or more; partial peduncles three quarters of an inch long, three-flowered; each flower on a pedicel longer than the partial peduncles; two of the calyx-leaves a little shorter than the rest; stigma bifid, globular. *Capsule* two-celled. *Seeds* one or two in each cell, covered with a velvety down. A native of the West Indies. 71. *C. multiflorus*. Mart. 69. "Leaves heart-shaped, smooth; peduncles many-flowered. *Seeds* villous, ferruginous. *Root* annual. *Stems* eight or ten feet high, slender. *Leaves* shaped like those of *C. sepium*. *Flowers* purple, on rather long peduncles, growing in bunches. *Capsules* trigonous, three-celled, with one seed in each cell. A native of Jamaica. Linnæus quotes Plukenet's Alm. tab. 167. 1. for the preceding species; Miller for the present. 72. *C. tuguriorum*. Mart. 73. Willd. 46. Forst. Prod. 35. "Leaves cordate-arrow-shaped, acute; stem angular; peduncles tetragonal, one-flowered." A native of New-Zealand. 73. *C. bufalinus*. Mart. 77. Lour. Coch. 109. "Stem shrubby; leaves cordate-arrow-shaped, smooth; peduncles many-flowered; anthers spiral." *Stem* large, shrubby, branched, smooth. *Leaves* alternate, petioled. *Flowers* yellow, large, campanulate; anthers filiform. *Capsule* two-celled, with one seed in each cell. A native of the woods of Cochinchina. 74. *C. cordifolius*. Willd. 47. Thunb. Prod. 35. "Leaves heart-shaped, hastate, toothed; peduncles bifid-umbelled." A native of the Cape of Good Hope. 75. *C. roscus*. Mart. 71. Houff. MSS. "Leaves heart-shaped, acuminate; peduncles two-flowered." *Root* annual. *Stem* seven or eight feet high. *Leaves* on very long petioles. *Flowers* large, of a fine rose colour, on long peduncles. *Seeds* large, covered with a fine down. A native of Jamaica, cultivated by Miller. 76. *C. bifidus*. Mart. 103. Willd. 48. Vahl. Symb. 3. 30. (*C. laevis* mas; Rumph. Amb. 5. 431.) "Leaves heart shaped, oblong, acuminate, very soft underneath; peduncles bifid, many-flowered." β *laevis* minor; Rumph. 5. 431. tab. 158. "Leaves heart-shaped, lanceolate-oblong, smooth." *Stem* villous. *Leaves* from two to three inches long, an inch wide at the base, mucronate; petiole one-third of the length of the leaf, hoary. *Peduncles* axillary, solitary; pedicels numerous, somewhat umbelled, oblong, ferruginous, deciduous, with minute scales at the base instead of bractes. *Calyx-leaves* pubescent at the base, rounded at the tip, equal. *Corolla* almost funnel-shaped, three times the length of the calyx, with five slender villous lines on the outside; lobes acute, bearded at the tip. *Stigma* capitate, two lobed. *Capsule* egg-shaped, striated, smooth. It has the habit of *C. umbellatus*, but has smaller narrower leaves. The variety differs only in the fineness, and its narrow leaves. 77. *C. malabaricus*. Linn. Sp. Pl. 14. Mart. 19. Deffr. 68. Lam. 2067. Willd. 49. (Katta-kelngu; Rheed. Mal. 11. 105. tab. 51.) "Leaves heart shaped, smooth; stem perennial, villous." *Root* perennial. *Stem* somewhat woody, cylindrical, weak, villous. *Leaves* alternate, acute, quite entire; petioles reddish, thicker than the stem. *Flowers* yellowish white, with a deep purple base; peduncles axillary, solitary, cylindrical; bractes narrow, situated near the calyx; calyx five-leaved; leaves acute, three outer ones larger; corolla campanulate, open, villous on the outside; stigma capitate; two-lobed. A native of the coast of Malabar. 78. *C. caelestis*. Mart. 74. Lam. 2112. Willd. 50. Forst. Flor. Aust. 77. "Leaves heart-shaped, very acuminate, pubescent; peduncles elongated, umbellate-trifid." A native of the island of Tanna in the South Seas. 79. *C. canariensis*. Linn. Sp. Pl. 15. Mart. 20. Deffr. 65. Lam. 2064. Willd. 51. Comm. Hort. 2. 101. tab. 51. Pluk. Alm. 114. tab. 325. fig. 1. "Leaves heart-shaped, acute, somewhat tomentous;

soft;

CONVOLVULUS.

foft; peduncles axillary, about three-flowered, rather long."

Root perennial. *Stems* woody, twenty feet high or more, cylindrical, a little branched, woolly. *Leaves* alternate, not deciduous, whitish underneath, on short tomentous petioles. *Flowers* purple-violet or pale blue, sometimes white; peduncles axillary, longer than the petioles, tomentous; pedicels three, rarely five or six, short, intermingled with filiform bractes; calyxes very villous, with five deep acute segments; corollas a little villous on the outside; border almost flat; stigmas bihd, filiform. A native of the Canary Islands. 80. *C. pannifolius*. Salisb. Par. Lond. tab. 20. "Stem angular; leaves hastate-wedge-shaped, flaggy, with hairs on both sides; peduncles two or three-flowered; tube of the corolla a line and half long; segments somewhat mucronate; pericarp tender, hairy." *Leaves* pale green, halberd-shaped, very hairy on both sides, like a piece of woollen cloth. *Flowers* pale purple, with a darker base; bractes narrow, attenuated; calyx hairy; margin of the corolla and the wedge-shaped folds of its border pubescent; filaments white, covered with a glandular pubescence towards the bottom; anthers blue; nectary yellow, with a whitish margin; style white, about three lines long; stigmas white, longer than the style, spreading out wide, quite linear, obtuse. *Capsule* two-celled. *Seeds* two in each cell. Raised from seeds received from Lisbon by Messrs. Lee and Kennedy. 81. *C. ferrugineus*. Willd. 52. Vahl. *Ecol.* 1. 17. "Ferruginous-downy; leaves heart-shaped, acute; peduncles axillary, four-flowered." *Root* perennial. A native of South America. 82. *C. muricatus*. Linn. Mant. 44. Mart. 21. Defr. 73. Lam. 2072. Willd. 53. "Leaves heart-shaped; peduncles thickened, and, as well as the calyxes, even-surfaced; stem muricated." Resembling *C. purpureus*, but the stem has a very even surface, with harmle's prickles scattered over it. *Root* annual. *Flowers* purple; peduncles often two-flowered; corolla more funnel-shaped than that of *C. purpureus*. Distinct from *ipomoea bona nox*, a native of Surat; introduced into England by Dr. Solander; flowering in July and August. 83. *C. anceps*. Linn. Mant. 43. Mart. 22. Willd. 54. "Leaves heart-shaped; stem keeled on both sides." *Stem* smooth, winged from leaf to leaf with two decurrent membranes. *Leaves* three inches long, smooth, veined, obtuse, quite entire; petioles nearly the length of the leaf; peduncles axillary, the length of the petioles, thicker, four or five-flowered, villous; pedicels thickened, somewhat umbelled, villous; bractes two, at the base of the calyx, broad, egg-shaped, membranous, mucronate, villous, deciduous; two outer calyx-leaves egg-shaped, villous on the outside, smooth within, mucronate; inner ones only half the size, oblong; corolla twice as long as the calyx, bell-shaped; stigma capitate. A native of Ceylon and Java. 84. *C. triquetra*. Mart. 104. Willd. 54. Vahl. Symb. 3. 30. "Leaves heart-shaped, acute, somewhat villous; peduncles many-flowered; stem three-keeled." *Stem* pubescent. *Leaves* two inches long and more; petiole villous, shorter than the leaf. *Peduncle* the length of the leaves, three or five-flowered; lateral pedicels often two-flowered; middle one one-flowered, shorter, gradually thickened; bractes at the base of the pedicels, egg-shaped, concave, tender, acute, mucronate, coloured, pubescent, deciduous; two outer calycine leaves resembling bractes, egg-shaped, acute, mucronate, silky; inner ones shorter, smooth, rounded at the tip; stigma capitate. Nearly allied to the preceding, but the leaves are not obtuse, and the rings on the stem much narrower. A native of the island of Santa Cruz. 85. *C. Turpethum*. Linn. Sp. Pl. 17. Mart. 23. Defr. 86. Lam. 2084. Willd. 56. (*Turpethum*; Bauh. Pin. 149. *C. zeylanicus alatus*; Herm. Lugdb. 177.

tab. 178, 179.) "Leaves heart-shaped, angular; stem membranous, quadrangular; peduncles many-flowered."

Root perennial, about an inch thick, little branched, striking deep into the ground, throwing out thick fleshy tubers, abounding in a milky juice, which soon hardens into a resinous substance when exposed to the air. *Stems* woody and reddish near the bottom, slender, with four decurrent wings, branched. *Leaves* alternate, crenulate, soft, clothed with a thin whitish down, slightly mucronate; petioles shorter than the leaves, winged, channelled. *Flowers* white, resembling those of *C. sepium*; peduncles longer than the petioles, axillary, solitary, triid; pedicels one or two-flowered; bractes two, egg-shaped, at the base of the calyx; two outer calyx-leaves egg-shaped, villous; three inner ones smooth; anthers spiral; stigma capitate, two-lobed. *Capsule* membranous, globular-depressed, two-celled. *Seeds* one or two in each cell, black, angular on one side. A native of Malabar, Ceylon, the Society and Friendly Isles, and the new Hebrides. For an account of the medicinal qualities of the root, see TURBITH. 86. *C. grandiflorus*. Linn. jun. Sup. 136. Mart. 24. Defr. 14. Lam. 2013. Jacq. Hort. 3. tab. 69. (Munda-valli; Rheed. Mal. 11. 103. tab. 50.) "Leaves cordate-egg-shaped, rather obtuse, quite entire; peduncles generally two-flowered; calyxes coriaceous; stem and petioles pubescent." Linn. jun. "Leaves heart-shaped, acute, on long petioles; peduncles short, one-flowered; corollas very large, funnel-shaped." Lam. *Root* perennial. *Stem* woody at the base, cylindrical, branched, smooth, about twelve feet high. *Leaves* large, with rounded lobes, smooth. *Flowers* very white, sweet-scented. A native of the East and West Indies. 87. *C. speciosus*. Linn. Sup. 137. Mart. 26. Willd. 58. (*C. nervosus*; Defr. 87. Lam. 2085. Burm. Ind. tab. 20. Samudra-ffogam; Rheed. Mal. 11. 125. tab. 61.) "Leaves heart-shaped, tomentous-silky underneath; peduncles longer than the petioles, umbelliferous; calyxes acute." Hort. Kew. *Root* perennial. *Stem* woody at the bottom, pubescent, branched; branches clothed with a thick white cottony down. *Leaves* alternate, large, acute, quite entire, nerved underneath; petioles and peduncles tomentous. *Flowers* purplish, more than two inches long; pedicels five or six, very short; bractes elliptical, longer than the calyx; calyxes small, deeply divided into five egg-shaped segments. A native of the East Indies. 88. *C. trinervius*. Mart. 27. Defr. 16. Lam. 2015. Willd. 59. Thunb. Flor. Jav. 85. "Leaves heart-shaped, oblong, smooth, three nerved; stem cylindrical; peduncles one-flowered." *Stem* filiform, simple, smooth. *Leaves* about an inch long, opposite, acuminate, quite entire, paler underneath; petioles linear, smooth, half an inch long. *Flowers* purplish; peduncles axillary, solitary, or in pairs, very short; segments of the calyx almost bristle-shaped, smooth, half the length of the corolla; stigmas capitate, two-lobed. A native of Japan. Desfontaines observes, that the singularity of the opposite leaves renders the genus dubious. 89. *C. pellatus*. Linn. Sp. Pl. 16. Mart. 28. Defr. 88. Lam. 2086. Willd. 60. Rumph. Am. 5. tab. 157. "Leaves target-shaped; peduncles many-flowered." *Stem*, according to Rumphius, sometimes as thick as the human thigh, and climbing to the top of the highest trees. *Leaves* alternate, large, somewhat acute, smooth; petioles rather long, zig-zag. *Flowers* white or faint purple, bell-shaped, twice the length of the calyx; peduncles axillary, solitary; calyx-leaves egg-shaped, smooth. A native of Amboina. 90. *C. Julapa*. Linn. Mant. 43. Mart. 29. Defr. 13. Lam. 2112. Willd. 61. Woodv. Med. Bot. tab. 21. Lam. III. tab. 104. fig. 2. (*Bryonia mechoacanana nigricans*; Bauh. Pin. 298.) "Leaves

egg-shaped, somewhat heart-shaped, obtuse, obsoletely repand, villos underneath; peduncles one-flowered." Hort. Kew. *Root* perennial, thick, blackish on the outside, whitish within, abounding in a milky juice. *Stems* numerous, herbaceous, ten or twelve feet high. *Leaves* smooth, different in shape, lower ones triangular, almost heart-shaped; upper ones more oblong and acute; petioles long. *Flowers* reddish on the outside, dark purple within (yellow in the Kew Garden); peduncles axillary, solitary. *Seeds* covered with a very white cottony down. A native of South America, about Xalapala, between La Vera Cruz and Mexico. For its medicinal qualities, see JALAP. 91. *C. macropermus*. Willd. 62. (Mouroucoa violacea; Aubl. guian. 1. 142. tab. 54. Juff. 133.) "Leaves elliptical, acute, smooth; corollas flat; capsules two or three-celled, with one seed in each cell." *Root* perennial. *Flowers* silver-shaped. *Seeds* almost an inch and half thick. A native of Guiana. 92. *C. tenellus*. Willd. 63. Defr. 78. Lam. 2076. Pluk. Almag. 114. Phyt. tab. 166. fig. 4. "Leaves oblong-elliptical, obtuse, mucronate, nearly sessile; peduncles longer than the leaf, generally two-flowered." One of the least species of the genus. *Stem* filiform, a little villos. *Leaves* alternate, scarcely an inch long, and about three lines broad, entire. *Peduncles* axillary, solitary; bractes two, awl-shaped, at the base of the pedicels; corollas small, bell-shaped. A native of Carolina and Virginia. 93. *C. Barbudensis*. (C. glaber Mill. Mart. 68.) "Leaves ovate-oblong, smooth; peduncles one-flowered; calyx ten-cleft." *Root* annual. *Stems* eight or ten feet high. *Flowers* purple, large, on long slender peduncles. Sent to Miller from the island of Barbuda. 94. *C. frivexus*. Linn. Mant. 43. Defr. 77. Lam. 2075. (C. mollis; Burm. Ind. 44. tab. 7.) "Leaves lanceolate-elliptical, tomentous-filky underneath; peduncles about three-flowered; calyx short, hairy." *Stems* shrubby, smooth. *Leaves* alternate, petioled. *Peduncles* axillary, solitary, about the length of the petioles. *Calyx*-leaves egg-shaped, whitish, silky. *Tube* of the corolla narrow to the top of the calyx, afterwards widened and terminating in a purple border, covered on the outside with white hairs. *Capsules* downy. A native of the island of Java. 95. *C. tomentosus*. Linn. Sp. Pl. 18. Mart. 31. Defr. 93. Lam. 2091. Willd. 65. Sloan. Jam. 55. hilt. 1. 134. tab. 98. fig. 2. Pluk. alm. 115. tab. 167. fig. 4. "Leaves three-lobed, tomentous; stem lanuginous." *Stem* twenty feet high, cylindrical, whitish. *Leaves* alternate, resembling the older leaves of ivy; petioles three quarters of an inch long. *Flowers* purple; peduncles axillary, solitary, many-flowered, a quarter of an inch long; corollas bell-shaped. *Capsule* spheroidal, acuminate, two-celled. *Seeds* one in each cell, black. A native of Jamaica. 96. *C. quinquelobus*. Mart. 105. Willd. 66. Vahl. Symb. 3. 31. "Leaves sagittate-egg-shaped, attenuated, smooth, crenate, somewhat repand; peduncles about five-flowered." *Stem* slightly pubescent, cylindrical, branched. *Leaves* tender, hoary; petiole shorter than the leaf. *Peduncles* the length of the leaves, pubescent. *Pedicels* in threes, umbelled, lateral ones in the greater number bifid, but on the peduncles near the top all simple, bractes two, linear, at the base of the lateral pedicels; calyx-leaves oblong, obtuse, mucronate, somewhat villos; corolla twice as long as the calyx; lobes bearded at the tip; stigma bifid. Supposed to be a native of the isle of Bourbon. 97. *C. crenatus*. Defr. 74. Lam. 2073. Jacq. ic. rar. 2. tab. 315. (C. Hermannii; Willd. 67. L'Hérit. Rarp. 1. 67. tab. 33.) "Tomentous; leaves cordate oblong obtuse, somewhat repand; peduncles longer than the petiole; border of the corolla acute." β . *erofus*. "Leaves less elongated, appearing bitten here and there at the edge, clothed with a reddish down; flowers larger."

Whole plant whitish, soft to the touch. *Root* perennial, spindle-shaped. *Stems* about three feet long, not much branched. *Leaves* alternate, on short petioles. *Flower* white, small; peduncles long, zig-zag, with two small awl-shaped bractes near the top, often two-flowered; border of the corolla slightly crenulate, with five acute divisions. Found in Peru by Dombey. The variety β found at Monte Video by Commerfon. 98. *C. althæoides*. Linn. Sp. Pl. 19. Mart. 32. Defr. 97. Lam. 2095. Willd. 69. Flor. Gr. tab. 194. Bauh. Pin. 295. Moris. hilt. 2. 13. tab. 3. fig. 10. (C. peregrinus, folio betonica; Tourn. 85.) "Lower leaves heart-shaped, sinuated; upper ones pinnatifid, somewhat palmate; peduncles generally two-flowered." Lam. β . *C. Bryoniaefolius*; Bot. Mag. 943. *Root* perennial. *Stems* a foot and half or two feet high, farinaceous, weak, cylindrical. *Leaves* alternate. *Flowers* reddish, large, very open, almost entire; peduncles longer than the leaves, with two filiform bractes above the middle. The whole plant clothed with numerous hairs, so as to give it a silky aspect. A native of the Levant, Africa, and the South of Europe. The variety β is a much more robust plant; its leaves have no silkiness or silvery whiteness; its flowers are larger and deeper coloured. Raised from seeds procured from China, by Isaac Swainton, eq. in 1802. 99. *C. tenuissimus*. Smith Prod. Flor. Græc. p. 134. Pl. Græc. tab. 195. (C. althæoides β . Linn. γ . Defr. C. althæoides; Bot. Mag. 359? *C. argenteus* elegantissimus foliis tenuiter incisis; Tourn. Iult. 85.) "Leaves pedate, silky, remarkably shining; linear lobes obtuse; root-leaves cordate-ferrated; peduncles one-flowered." Found by Dr. Sibthorp in Candia, about Athens and in the island of Zante. 100. *C. alceifolius*. Lam. 2096. "Hirsute; all the leaves deeply divided, somewhat palmate; peduncles few-flowered, longer than the leaves." A native of the Cape of Good Hope. 101. *C. cairicus*. Linn. Sp. Pl. 21? Mart. 53. Willd. 70. Bot. Mag. 699. (C. foliis lanceolatis vel quinquefoliis; Bauh. Pin. 295. Barrel. icon. 319 and 320. *C. ægyptius*; Velling Ægypt. 73. tab. 74. Ipomæa palmata; Forst. Desc. 43.) "Stem shrubby; leaves palmate-cleft, mucronate, smooth, quite entire, but often minutely crenate; hinder leaflets two-lobed: stipules palmate; calyxes even surfaced; corollas ribbed underneath; divisions acute." *Root* perennial. *Stem* with many slender branches. *Leaves* alternate; segments lanceolate; petioles the length of the leaves, with two leaf-like stipules at the base. *Flowers* violet-purple, large; peduncles the length of the petioles, axillary, from one to three-flowered; pedicels bracteated about the middle, with two small, egg-shaped, acute scales; calyx five-leaved; leaves short, egg-shaped, acute, concave, smooth, very shining either side; tube of the corolla nearly cylindrical, contracted as far as the calyx; border spreading; filaments unequal; anthers somewhat arrow-shaped; stigma divided into furrowed lobes. A common ornamental plant in the gardens of Egypt. 102. *C. quinquelobus*. Mart. 107. Willd. 71. Vahl. Symb. 3. 32. "Leaves palmate-quinquelobed, finely ferrulated, obtuse, smooth; axils tomentous; peduncles one-flowered; stem smooth." *Stem* cylindrical. *Leaves* nerved, finely veined, mucronate; middle lobe scarcely an inch long, lateral ones smaller, and narrower; petioles an inch long, filiform; stipules two, axillary, petioled, similar in structure to the leaves. *Flowers* purple; peduncles the length of the petioles, filiform, without bractes; calyx-leaves oblong, obtuse, smooth; stigma capitate, two lobed. A native of the island of Santa Cruz. 103. *C. egypticus*. Linn. Mant. 559. Mart. 34. Willd. 72. (C. stipulatus; Defr. 26. Lam. 2025. *C. foliis laciniatis*, vel quinquefoliis; Bauh. Pin. 295. Barrel. icon. 319.) "Leaves pedate, ferrated; peduncles eniform,

one or two-flowered; calyxes mucronated." *Root* annual. *Stem* angular, smooth, and even-furfaced. *Leaves* smooth, deeply divided almost to the base; segments five, lanceolate, serrated or unequally toothed, mucronate by the middle nerve; lateral ones feebly shorter; two external ones often bifid. Petioles long, channelled, scabrous underneath; stipules similar to the leaves, but smaller. *Flowers* small, white; peduncles axillary, compressed, longer than the petioles, thickened upwards, with two bractes above the middle. A native of the Levant. 104. *C. laciniatus*. Deffr. 27. Lam. 2026. "Leaves finely laciniated, somewhat bipinnated; peduncles one or two-flowered; calyx of the fruit nearly naked." About a foot and half high, sometimes perfectly smooth, sometimes clothed with fine silky hairs. *Stems* slender, cylindrical. *Leaves* alternate, petioled. *Flowers* white; peduncles slender, longer than the petioles, axillary, solitary, thickened upwards; bractes two, about a line and half long, linear, acute, situated near the top of the peduncles; calyx-leaves egg-shaped, obtuse, mucronate, a little scarious, sometimes rather villous, especially at the time of flowering; corollas campanulate, twice the length of the calyxes. *Seeds* black, naked. A native of South America, about Monte Video. Specimen in the herbarium of Commerfon. There is a variety in the herbarium of Thouin very villous in all its parts, especially the calyxes, with the lower leaves less deeply divided, than the upper. 105. *C. vitifolius*. Linn. Mant. 203. Mart. 35. Deffr. 99. Lam. 2099. Willd. 73. Burm. Ind. 45. tab. 18. fig. 1. Pluk. alm. 135. tab. 25. fig. 3. "Leaves palmate-five-lobed, smooth, toothed; stem hairy; peduncles many-flowered." *Stems* villous. *Leaves* alternate, petioled, divided almost to the middle, hoary underneath. *Peduncles* axillary, solitary, hairy, separating into two principal branches; calyxes villous; corollas campanulate, orange; stigmas two, globular. A native of the East Indies. 106. *C. diffectus*. Linn. Mant. 204. Mart. 36. Deffr. 23. Lam. 2022. Willd. 74. Jacq. ob. 2. 4. tab. 28. Hort. 2. tab. 159. "Leaves palmate, seven-cleft, dentate-sinuated, smooth; stem hairy; peduncles one-flowered." *Root* annual. *Stem* much branched, cylindrical. *Leaves* deeply palmate, almost digitate, segments acute; petioles from one to two inches long, hairy. *Flowers* white, open; peduncles shorter than the leaves, axillary, solitary, hairy at the base; calyx oblong, smooth and even-furfaced; stigma capitate, two-lobed. A native of America. 107. *C. mucronatus*. Mart. 75. Willd. 75. Forst. prod. 79. "Leaves palmate-pedate; lobes ciliate, mucronate; peduncles one-flowered." A native of the Isle of Tanna in the south seas. 108. *C. macrocarpus*. Linn. Sp. 20. Mart. 57. Deffr. 24. Lam. 2023. Willd. 76. (*C. polyphyllus*, flore & fructu purpureis maximis; Plum. Cat. 1. MSS. 2. tab. 56. Burm. Amer. 8. 50. tab. 91. fig. 1.) "Leaves palmate, pedate, five-cleft; peduncles one-flowered." *Root* annual, thick, fleshy, milky. *Stems* long, about the thickness of a goose-quill. *Leaves* deeply palmate, almost digitate, two outer segments less deeply divided, thin, smooth, on rather long petioles. *Flowers* purple; peduncles a little longer than the petioles, axillary, thickened upwards, jointed and bent above the middle, longitudinally winged and curled; calyx-leaves concave, roundish; corollas campanulate, large, slightly sinuated. *Capfule* membranous, orbicular, angular, about the size of a walnut. *Seeds* round, black, villous, about the size of a hazel-nut. A native of Martinico, where its root is esteemed purgative. 109. *C. paniculatus*. Linn. Sp. Pl. 23. Mart. 58. Deffr. 100. Lam. 2100. Willd. 77. (*Pal modeca*; Rheed. mal. 11. 101. tab. 49.) "Leaves palmate; lobes seven, egg-shaped, acute, quite entire; peduncles panicled." *Root* perennial, about a foot and half long,

thick, tuberous. *Stems* slender, even-furfaced. *Leaves* alternate, petioled, rarely three or five-lobed. *Flowers* very open, pale red on the outside, purple within, deeper coloured at the bottom; peduncles axillary, solitary, reddish, a little curved; calyx-leaves rounded, appearing blistered, dull-red, coinivent after the fall of the flower. A native of the coast of Malabar. 110. *C. palmatus*. Mart. 66. (*C. pentaphyllos*, folio glabro dentato, viticulis hirsutis, Plum. Cat. *C. pentaphyllus* *β*. Serpens. Linn. "Leaves palmate; lobes seven, sinuate-pointed; peduncles one-flowered; calyxes very large, spreading." Stem twenty feet high, dividing into several smaller ones. *Flowers* large, purple, on long peduncles. *Capfules* large, roundish, three-celled. *Seeds* one in each cell. A native of La Vera Cruz in New Spain, whence feeds were sent to Miller by Dr. Houffon. 111. *C. aggregatus*. Mart. 78. Lour. Cochinch. 109. "Leaves palmate, seven-lobed, hairy; flowers aggregate." *Stem* perennial, cylindrical, extremely hairy, branched. Lobes of the leaves egg-shaped, rather acute, quite entire. *Flowers* white, large, on a long, solitary, axillary peduncle; common calyx (involucre?) twelve-leaved, bell-shaped; leaves ovate-oblong, unequal, hairy, containing about ten feffile florets; proper calyx-leaves lanceolate, hairy, upright; corolla tubular, five-cleft; segments acute, hairy, closed; anthers bifid at the base; style longer than the corolla; stigma capitate. *Capfule* two-celled, two-seeded. *Seeds* round on one side, angular on the other. A native of Cochinchina. 112. *C. tuberculatus*. Deffr. 25. Lam. 2024. "Leaves digitate, somewhat pedate, seven-cleft, smooth; petioles rough with tubercles; peduncles one-flowered." *Stems* several, two or three feet high, slender, cylindrical, fomentous. *Leaves* alternate; segments egg-shaped, entire, lanceolate, slightly obtuse, mucronate; petioles about two inches long, channelled, tubercled on their convex side, stipules digitate. *Flowers* large, purple; peduncles axillary, thickened upwards; furnished near the bottom with two small glandular points, which rise from a kind of knot; calyxes deeply divided; segments egg-shaped, obtuse, somewhat scarious at the edges; corollas funnel-shaped, almost campanulate, very open; stigma two-lobed. Found in South America, about Monte Video, by Commerfon. Cultivated in the Botanic garden at Paris. 113. *C. macrorhizos*. Linn. Sp. Pl. 22. Mart. 39. Deffr. 106. Lam. 2107. Willd. 78. (*C. coccineus* heptaphyllus, radice crassissima; Plum. Cat. 1. MSS. 2. tab. 58. Burm. Amer. 79. tab. 90. fig. 1.) "Leaves digitate in fevens, quite entire; stem smooth; peduncles many-flowered." *Root* very thick, tuberous, sweet-tafted, abounding in a milky juice, esteemed purgative. *Stems* fermentous, deep green, about the size of a finger, branched, climbing to the top of the highest trees. *Leaves* on long purplish petioles, bright green; segments about three inches long, oval-lanceolate, acute, slightly sinuated, smooth; mid-rib purple underneath. *Flowers* large, scarlet; peduncles axillary, solitary, short, slender; corollas bell-shaped, tubular at the base; border open, slightly crenate; stigma capitate. A native of St. Domingo. 114. *C. pentaphyllus*. Linn. 24. Mart. 41. Deffr. 101. Lam. 2101. Willd. 82. (*C. pentaphyllos* hirsutus; Plum. Cat. 1. MSS. 2. tab. 54. *C. americanus* pent. & heptaphyllus major; Herm. lugbd. 183. tab. 185. Tourm. 84. *Ipomæa* pentaphylla; Jacq. Col. 2. 297. ic. rar. 2. tab. 319.) "Very hairy; leaves digitate, in fives; leaflets egg-shaped, acuminate; peduncles many-flowered." *Stems*, petioles, peduncles, and calyxes rough with numerous long, stiff, reddish hairs. *Root* annual, long, slender, fibrous. *Stem* generally fingle, sometimes thirty-eight feet high, cylindrical, branched, about the size of the human little finger, cinereous brown, woody and smooth at the base,

CONVOLVULUS.

reddish above, green near the top. *Leaves* alternate, petioled; segments quite entire, clothed on both sides with fine decumbent hairs. *Flowers* yellowish white; peduncles about four inches long, axillary, solitary, cylindrical, dichotomous, often furnished with small bracts under the divisions; pedicels very short; calyx-leaves acute, two outward ones longer, more hirute, and of a purplish colour; corolla campanulate, twice the length of the calyx, slightly five-lobed; stigma capitate, two-lobed. *Capsule* two-celled. *Seeds* two in each cell. A native of South America, cultivated in the botanic garden at Paris. Miller received seeds from Cartagena in New Spain, which he cultivated under the name of *C. pentaphyllus*, and which differs from the above in being perennial, and having only two purple flowers on each peduncle. 113. *C. quinquefolius*. Linn. 25? Mart. 40. Dfr. 102. Lam. 2102. Willd. 79. Swartz. 63. Pluk. Alm. 116. tab. 167. fig. 6. "Leaves digitate, smooth, toothed; peduncles even-furcated." Linn. "Leaves digitate, smooth, toothed; stem hispid; peduncles many-flowered." Lam. *Stems* very long, slender, cylindrical, hispid, branched. *Leaves* alternate, petioled, smooth, bright green; segments lanceolate; middle one largest, near two inches long, about half an inch broad. *Flowers* white; peduncles longer than the leaves, slender, axillary, solitary, somewhat villous, dichotomous, from three to six-flowered, with small awl-shaped bracts at the divisions; calyx smooth, segments oblong, the three inner ones larger; corollas campanulate, five-toothed. *Capsule* four-celled. Dfr. Two celled, two-seeded. Swartz. A native of the West Indies. The *C. quinquefolius* of Miller seems a different plant. It was raised by him from seeds sent from New Spain, and is thus described. *Stems* thirty feet high or more, woody, with a purple bark. *Leaves* deeply dividid into five sharp-pointed lobes. *Flowers* large, purple; peduncles long, thick, with a bent joint in the middle. *Capsules* round, as large as a middling apple, three-celled. *Seeds* two in each cell. 116. *C. ciffoides*. Lam. Ill. 2103. "Hirute; leaves digitate, in fives, toothed; peduncles about three-flowered, shorter than the leaf; calyx hispid. A native of Cayenne. 117. *C. venosus*. Mart. 108. Dfr. 104. Lam. 2105. Willd. 80. Vahl. 3. 32. "Smooth; leaves digitate, in fives; leaflets petioled, ovate acuminate; common petioles with tendrils at the base." Lam. "Quite smooth; leaves digitate, in fives, quite entire; peduncles many-flowered." Vahl. *Stems* slender, cylindrical. *Leaves* petioled; leaflets acute at the base (rather than petioled), veined; middle one larger than the others, about two inches long; (common petioles with a shorter tendril at the base. Dfr. Peduncles with an ovate-heart-shaped, acuminate, solitary leaf at the base. Vahl. Is it not properly a stipula, which, as the peduncles are axillary, may be thought by one observer to accompany the petiole (by another, the peduncle?) *Flowers* in a corymb; peduncles solitary, dichotomous near the top, with small awl shaped bracts; calyxes short; segments egg-shaped, two larger; corollas funnel-shaped, tube nearly of the same diameter throughout, not gradually enlarged to the top; border but little widened; stigmas capitate, slightly two-lobed. Sent by Commerçon from the Isles of France and Bourbon. On a strict comparison it appears certain, that Desfontaineux and Vahl have described the same plant, and have given it the same name, without any knowledge of each others specimens. 118. *C. glaber*. Dfr. 103. Lam. 2104. Willd. 81. Aul. guan. 138. tab. 53. "Leaves digitate, in fives; leaflets ovate-lanceolate, quite entire, smooth; peduncles many-flowered." *Stems* numerous, long, cylindrical, flexible. *Leaves* alternate. *Flowers* white; peduncles axillary, solitary; pedicels long; calyx deeply divided;

segments long, firm, smooth, acute; tube of the corolla rather long; border open, with five rounded lobes; stigmas two, long, acute. A native of Cayenne. The whole plant is milky. 119. *C. eriopermus*. Dfr. 105. Lam. 2106. "Shrubby; leaves digitate; leaflets about eight, linear, very narrow; seeds very hirute." Whole plant, except the seeds, smooth. *Stems* barmentous, woody, cylindrical. *Leaves* about an inch long, including the petioles. *Flowers* purple, axillary, in small dichotomous racemes, shorter than the leaves; calyx-leaves obtuse, not a quarter of the length of the flowers; corollas cylindrical. *Capsules* egg-shaped, even-furcated, twice the length of the calyx, four-valved, two-celled. *Seeds* two in each cell; covered on their convex side with numerous, long, decumbent, whitish, silky hairs, directed towards the base. A native of St. Domingo. 120. *C. tenuifolius*. Willd. 109. Vahl. Symb. 3. 33. "Leaves digitate, in fives; leaflets linear; peduncles four or five-flowered." Whole plant smooth. *Stem* angular. *Leaves* petioled; leaflets very narrow, entire. *Peduncles* axillary, short; upper ones sometimes one-flowered. *Calyx* smooth, with oblong leaflets; stigma acute.

** *Stems* not twining.

121. *C. ficulus*. Linn. Sp. Pl. 26. Mart. 44. Dfr. 4. Lam. 2003. Willd. 84. Flor. Græc. tab. 194. (*C. ficinus* minor. flore parvo auriculato; Boec. Sic. 89. tab. 48. Tourn. Init. 83.) "Leaves cordate-egg-shaped; bracts lanceolate; peduncles longer than the petiole." Root annual. *Stems* one or two feet high, cylindrical, nearly simple, sometimes a little twining, but generally not at all. *Leaves* entire, acute. *Flowers* small, bluish; peduncles axillary, curved downwards near the top. A native of Sicily. 122. *C. poters*. Dfr. 33. Lam. 2031. "Filiform, somewhat erect; leaves linear, mucronate; peduncles spreading horizontally, longer than the leaf." Whole plant slightly villous. *Stems* about a foot and half high, very slender, little or not at all twining, cylindrical, somewhat branched. *Leaves* about an inch long, scarcely two lines broad, alternate, almost sessile, sometimes one or two-toothed. *Flowers* on long, axillary, simple peduncles, with two egg-shaped lanceolate bracts a little below the calyx; calyx-leaves egg-shaped, acute, half the length of the corolla. A native of Carolina. 123. *C. pentapetaloides*. Mart. 45. Willd. 85. Vahl. 2. 36. "Leaves lanceolate, obtuse, naked, linear; branches declining; flowers solitary, five-cleft half way down." Resembling *C. tricolor*, but smaller. *Leaves* somewhat petioled. Root annual. *Flowers* axillary, on short peduncles; bracts generally two obscure scales. *Flowers* bluish, with a yellow bottom; segments acute. A native of Majorca, and the islands of the Archipelago. 124. *C. ciliatus*. Roth. Catal. Bot. 2. 22. Ann. Bot. 2. 12. "Leaves oblong, wedge-shaped, emarginate, ciliated; stem prostrate; capsules very hairy." 125. *C. evolutooides*. Smith Prod. Flor. Græc. 134. Desfont. Atlant. 1. 176. tab. 49. Flor. Græc. tab. 198. "Leaves spatule-shaped, obtuse, hairy; upper ones embracing the stem; stem declining; flowers solitary, sessile." Root annual. A native of Cyprus. 126. *C. lineatus*. Linn. Sp. Pl. 29. Mart. 46. Dfr. 53. Lam. 2052. Willd. 86. Flor. Græc. tab. 199. (*C. argenteus* angustifolius, umbellatus, partim erectus partim supinus; Tourn. Cor. 1. *C. octafolius* β; Dfr. *C. marina* repens; Bar. Rar. 3. tab. 1132.) "Leaves lanceolate, silky, linear, petioled; peduncles two-flowered; calyxes silky, somewhat foliaceous." Linn. "Tomentous-silky; leaves oblong, obtuse, attenuated at the base, linear; peduncles two-flowered, shorter than the leaf." Lam. Root perennial, creeping,

ing.

CONVOLVULUS.

ing. *Stems* several, rising among a considerable number of root-leaves, from three to six inches high, weak, zig-zag, slightly angular, villous, a little branched. *Leaves* alternate, sessile, but so much narrowed at their lower extremity as to appear petioled, a little channelled at the base to embrace the stem, nerved; lower ones longer than the others, nearer together, reaching almost to the top of the stem. *Flowers* reddish; peduncles axillary, on the upper part of the stem, solitary, dichotomous near the top, and furnished at the division with two bractes, resembling the leaves in shape and silkiness, and extending a little beyond the calyx; besides these there are sometimes two other small linear bractes, shorter than the calyx; calyxes small; leaflets egg-shaped, acute, silky; corollas middle-sized, half open, villous on the outside. A native of the south of France, and the Levant. 127. *C. spicifolius*. D. fr. 41. Lam. 2039. Barr. Ic. 311. (*C. non convolvulus*; Mant. 29. tab. 140.) "Leaves linear-lanceolate, narrowed at the base, nearly simple; peduncles one-flowered, shorter than the leaf." *Stems* decumbent at the base, then ascending, a little zig-zag. *Leaves* alternate, about three lines long, resembling those of lavender; lower ones the same length as the others. *Flower* rather large; peduncles axillary, scarcely half the length of the leaves; bractes two, linear-lanceolate, situated near the calyx, and a little surpassing it; calyx about one-third of the length of the corolla, with five acute segments; ligmas long, filiform. A native of mountains in Spain. Willdenow thinks this and the preceding the same plant; and they are perhaps nothing more than varieties; but as La Marek and Desfontaux profess to have seen both of them growing in the botanic garden at Paris, in difference to their authority we have kept them distinct. 128. *C. faxatilis*. Mart. 110. Willd. 87. Vahl. Symb. 3. 33. Bar. Ic. 470. Boec. Musf. 2. 79. tab. 70. (*C. lauginifolius*; D. fr. 47. Lam. 2046. *C. argenteus* umbellatus lupinus; Tourn. Infl. 84. Lychnis sylvestris campanulata flore; Bauh. Pin. 206.) "Very hirsute; leaves linear; flowers in terminal heads; calyxes acuminate." *Root* perennial. *Stems* scarcely a foot long, cylindrical, a little branched. *Leaves* about an inch long, thinly set, alternate, sessile, hairy on the young shoots. *Flowers* white, with a slight tint of purple, sessile, eight or ten collected into a head at the extremity of the branches, which are commonly without leaves below to the extent of two inches, surrounded with a sort of involucre consisting of five or six rather broad leaves; each flower surrounded with some small linear bractes; calyxes divided to the base into minute segments, half the length of the corolla. 129. *C. Cneorum* Linn. Sp. Pl. 30. Mart. 47. Willd. 3. Flor. Græc. tab. 200. Bot. Mag. 459. (*C. argenteus*; D. fr. 48. Lam. 2047. *C. argenteus* umbellatus cretus; Tourn. Infl. 84. Morif. Hill. 2. 11. tab. 3. fig. 1. *Cneorum album*, folio argenteo molli; Bauh. Pin. 403. *Dorycnium*; Cluf. Hb. 2. 254.) "Leaves lanceolate, tomentous; flowers umbellic; calyxes hirsute; stem somewhat erect." Linn. "Shrubby, silky; leaves oblong, obtuse; flowers in terminal, capitate umbels; calyx short, somewhat reflex." Lam. *Root* perennial. *Stems* about three feet high, cylindrical, firm, upright. *Leaves* numerous, scattered, about an inch and half long, four or five lines broad, sessile, narrowed at the base, soft, clothed with a fine decumbent, silky, brilliant down. *Flowers* white, tinged with a pale red, on short peduncles; bractes resembling the leaves, but smaller; calyxes about a third of the length of the corolla, short, obtuse, deeply divided, villous; corolla silky on the outside; border rather open. A native of Candia and the islands of the Levant. 130. *C. oleifolius*. D. fr. 49. Lam. 2048. "Shrubby, silky; leaves linear-lanceolate; flowers in terminal capitate un-

bel; calyxes lanceolate." A native of the Levant; nearly allied to the preceding, and scarcely more than a variety 131. *C. linearis*. Willd. 89. Bot. Mag. 289. "Stems erect, shrubby; leaves linear, acute, clothed with silky hairs; flowers terminal, umbellate-panicled; calyxes hairy." Confounded by the English nurserymen with the next species. Most allied to *C. encephali* in having leaves much narrower, more pointed, and less silky. 132. *C. cantabrigiæ*. Linn. Sp. Pl. 31. Mart. 48. D. fr. 46. Lam. 2045. Willd. 90. Jacq. Flor. Ault. 3. tab. 296. (*C. linearis* folio; Bauh. Pin. 295. *C. linearis* folio asurgens; Tourn. Infl. 57. & humilior, 54.) "Leaves linear, acute; stem branched, somewhat dichotomous; calyxes hairy." Linn. "Hairy; leaves linear-lanceolate, acute; stem branched, rather erect; flowers clustered." Lam. *β. C. terrestris*; Linn. Sp. 27. Whole plant clothed with fine whitish hairs, soft to the touch. *Root* perennial. *Stems* about a foot high, cylindrical. *Leaves* two or three lines broad, alternate, sessile. *Flowers* rose-coloured or white, almost sessile, growing two or three together at the end of the stem and branches; bractes linear, acute, resembling the leaves but smaller; calyxes with five acute segments; corollas middle-sized, open, almost flat; ligmas two, filiform. A native of the south of Europe. 133. *C. suffruticosus*. Smith Prod. Flor. Græc. p. 135. Desfont. At, tab. 48. "Leaves linear-lanceolate; stem ascending, villous; peduncles axilary, one-flowered, three times the length of the leaf." *Root* perennial. A native of Barbary and Greece. 134. *C. Amanianus*. D. fr. 40. Lam. 2038. (*C. ramifolius*, cretus, argenteus miuimus; Amm. Ruth. 5. n. 6.) "Silky; leaves linear; peduncles one flowered; bractes long; calyx acute." Whole plant armed with a short silky silvery down. *Root* perennial. *Stems* from four to six inches high, slender, cylindrical, branched, rather erect. *Leaves* alternate, sessile; root-ones not less than half an inch long, narrowed at the base, obtuse; those on the stem and branches longer, acute. *Flowers* campanulate, pale white, starred with purple lines; peduncles filiform, axillary, solitary, nearly the length of the leaves, furnished a little above the middle with two bractes seven or eight lines long, dilating with the leaves only by being opposite; calyx short, with egg-shaped acute segments. A native of Siberia. 135. *C. pilosellofolius*. D. fr. 45. Lam. 2044. Willd. 92. (*C. orientalis*, humifolus, pilosella foliis; Tourn. Cor. 1.) "Leaves lanceolate, sessile, entire; peduncles elongated, many-flowered, loosely branched." *Root* perennial. *Stems* cylindrical, slender, slightly hairy, decumbent. *Leaves* alternate, three or four lines broad; base, especially at the edges, with long separate hairs. *Flowers* small, campanulate; peduncles from four to six-flowered; bractes opposite, small, lanceolate like the leaves, situated at the base of the pedicels; calyx-leaves egg-shaped, acute, villous, half the length of the corolla. A native of the Levant. 136. *C. dorycnium*. Linn. Sp. Pl. 28. Mart. 49. D. fr. 38. Lam. 2039. Willd. 93. Flor. Græc. tab. 201. (*C. ramifolius* incanus, foliis pilosellæ; Tourn. Infl. 84.) "Leaves almost linear, silky; stem shrubby, panicled; calyxes almost naked, obtuse." *Root* perennial. *Stems* a foot and half high, cylindrical, almost smooth, a little zig-zag, much branched, with few leaves, especially towards the top. *Leaves* alternate, sessile, narrow. *Flowers* generally solitary, sessile in the forks of the branches or at their summit, commonly accompanied with one or two small leaves; calyxes very small; corollas campanulate, open, villous on the outside, three or four times the length of the calyxes. A native of the Levant. 137. *C. proflerens*. Willd. 34. Vahl. Ecolg. 1. 18. "Leaves linear, silky underneath; heads of

CONVOLVULUS.

flowers terminal, and in the divisions of the branches; bracts egg-shaped, very hirsute on the outside. A native of South America. 138. *C. lanatur.* Mart. 80. Willd. 95. Vahl. Symb. 1. 16. Flor. Græc. tab. 202. (*C. orientalis humilis argenteus latifolius erectus & villosus*; Tournef. Cor. 1. *C. cneorum*; Forsk. *Ægypt.* 63. n. 124. *C. sericeus*; Burm. Ind. 49. tab. 19. fig. 3?) "Leaves lanceolate-linear, tomentous; old branches spinous; flowers capitate, involucred." *Stems* shrubby, erect, branched at the bottom; old branches leafless, barren; flowering branches from the base of the old ones, quite simple, seven inches long or more, erect, cylindrical, pineleaves, rigid, zig-zag towards the end, and covered with a soft shagreen. *Leaves* alternate; lower ones lanceolate, attenuated at the base, sometimes several from the same point at the foot of the branches, unequal; upper ones lanceolate-linear, sessile, acute; floral ones a little broader than the rest; all thickish, veinless, tomentous, but not silky. *Flowers* campanulate, hairy on the outside, the colour of *C. cneorum*; peduncles from almost all the axils, solitary, half the length of the leaf, from six to eight-flowered; pedicels none; involucre six-leaved, the length of the calyx; three outer leaflets egg-shaped, acute; three inner ones lanceolate; all of them, as well as the peduncles and calyxes, extremely hirsute, with long, very soft, shining hairs on the outside, only somewhat hairy within. *Bracts* two beneath each flower; calyx-segments linear; style bifid; stigmas acute. A native of the Lower Egypt and of Mount Sinai. 139. *C. Hystrix.* Mart. 81. Willd. 96. Vahl. Symb. 1. 16. (*C. spinosus*; Forsk. Arab. 106. n. 121.) "Shrubby; leaves oblong; flowers sessile, almost always solitary; branches spinefret." *Stem* rigid, much branched, diffuse; a foot high; branchlets somewhat silky. *Leaves* sessile, feathered, silky, entire, small. *Flowers* small, axillary, hirsute; bracts two, at the base of the calyx, oblong, rather acute, a little broader at the end and relaxed; two outer calyx-leaves oblong, rigid, larger than the others; stigmas two, capillary. A native of Arabia. 140. *C. spinosus.* Linn. jun. Supp. 137. Desf. 36. Lam. 2035. Willd. 97. (*C. fruticosus*; Pall. It. 2. 734. tab. m.) "Shrubby, erect; leaves lanceolate, silky; flowering branchlets spinous." *Root* perennial. *Stem* short, much branched. *Leaves* alternate, sessile. *Flowers* vertical, sessile; calyx-leaves egg-shaped, acuminate, concave, tomentous; three outer ones larger; corollas plaited, five-toothed, tomentous on the outside of the tube, with a reddish border. A native of Russia. 141. *C. Scoparius.* Linn. jun. Sup. 135. Mart. 50. Desf. 51. Lam. 2050. Willd. 98. "Leaves linear, somewhat hairy; peduncles about three-flowered; calyxes silky, egg-shaped, acute; stem shrubby; branches rod-like." The habit of a broom. *Root* perennial. *Stems* cylindrical, quite smooth; branches erect, simple. *Leaves* alternate, distant, short, thin, upright. *Flowers* white, villous on the outside; peduncles alternate, solitary, bracteate. A native of Africa and the Canary Islands. This species and *C. floridus* produce the true rose-wood of the shops. Ventenat suspects that these two may form a separate genus, having a one-celled capsule, which opens at the base and contains a single seed. 142. *C. secundus.* Desf. 41. Lam. 2051. "Tomentous-ferruginous; leaves sessile, lanceolate; heads of flowers thick-set, unilateral, nearly sessile." *Stems* the size of a goose-quill, cylindrical, somewhat zig-zag, but little branched. *Leaves* about an inch long, alternate, cottony on both sides, unilateral on the branches. *Flowers* five or six in a dense head, on very short peduncles, without pedicels, intermingled with bracts which resemble the young leaves, corollas a little villous on the outside. A native of Syria, observed by La Billardiere. 143. *C. Oenotheroides.* Linn. jun. Supp. 137. Mart. 51. Desf. 34. Lam. 2032. Willd. 99. "Shrubby, erect; leaves linear, somewhat hoary; peduncles axillary, solitary, erect, one-flowered, bracteate; calyxes lanceolate, smooth." *Stems* erect, cylindrical, reddish, and somewhat glaucous. *Leaves* about three inches long, narrow, lax. flat. *Flowers* twinned; peduncles short, angular; bracts two, recurved, awl-shaped; calyx-leaves quite smooth, rather spreading, hoary, membranous at the edges; corolla large, funnel-shaped. A native of the Cape of Good Hope, observed by Sparrman. 144. *C. floridus.* Linn. jun. Sup. 136. Mart. 52. Desf. 50. Lam. 2049. Willd. 100. Jacq. ic. 1. tab. 34. "Leaves oblong lanceolate, attenuated at the base, somewhat hairy; flowering branches and peduncles panicle." *Root* perennial. *Stems* about four feet high, woody, procumbent, smooth; branches slender, erect, stiff, hoary. *Leaves* three or four inches long, scattered, entire, on short petioles. *Flowers* pale red or white, numerous, rather small; peduncles axillary from the upper leaves, repeatedly branched, so as to form a large thyrsoid panicle; calyx-leaves egg-shaped, concave, acute. *Capsules* one-celled, one-seeded, opening from the bottom in ten valves. A native of the Canary Islands. 145. *C. cuneatus.* Willd. 101. "Stem shrubby, erect; leaves wedge-shaped, obtuse, mucronate, smooth; corymbs axillary, shorter than the leaves." *Root* perennial. *Stem* cylindrical, smooth. *Leaves* two inches long, quite entire, beset underneath with a few close-pressed hairs; petioles short, villous on the inside. *Flowers* purple; calyx-leaves obtuse, hairy; corolla an inch long, tube swelling. A native of the East Indies. 146. *C. corymbosus.* Linn. Sp. Pl. 33. Mart. 53. Desf. 62. Lam. 2051. Willd. 102. (*C. niveus, polyanthus*; Plum. Cat. 1. MSS. 2. tab. 50. Burm. Amer. tab. 89. fig. 2.) "Leaves heart-shaped; peduncles umbellated; stem creeping." *Stems* numerous, woody, the thickness of a goose-quill, with long branches. *Leaves* two or three inches long, alternate, petioled, fine green. *Flowers* a beautiful white, with still whiter rays; peduncles slender, nearly the length of the leaves, with one or two bracts, forming a corymb. *Capsules* membranous, top-shaped, one-celled. *Seeds* two or three. DeRouffaux describes the stems as twining, on the authority, as we suppose, of Plumier's MSS. A native of the West Indies. 147. *C. spithameus.* Linn. Sp. 32. Mart. 54. Willd. 103. Gron. Virg. 141. (*C. foliis cordatis pubescentibus incanis*; Walt. Car. 93.) "Leaves heart-shaped, pubescent; stem erect; peduncles one-flowered." *Flowers* large, white. A native of Virginia. 148. *C. perfolius.* Linn. Sp. Pl. 34. Mart. 55. Desf. 39. Lam. 2037. Willd. 104. Gmel. It. 3. 36. tab. 97. "Leaves egg-shaped, tomentous; peduncles one-flowered." Whole plant tomentous like the common mullein. *Root* perennial. *Stems* the size of a goose-quill, cylindrical. *Leaves* quite entire, obtuse, on very short petioles. *Flowers* white; peduncles axillary, solitary, the length of the leaves, with two egg-shaped bracts near the top; calyx-leaves egg-shaped; the three inner ones smaller; corolla campanulate, four times the length of the calyx; germ woolly; stigmas two, linear, thickish. A native of Persia on the shores of the Caspian Sea. 149. *C. tricolor.* Linn. Sp. Pl. 35. Mart. 56. Desf. 35. Lam. 2033. Willd. 105. Bot. Mag. 27. (*C. peregrinus cæruleus, folio oblongo*; Bauh. Pin. 295. *C. lustranicus, flore cæruleo*; Tournef. 83.) "Leaves lanceolate, egg-shaped, sessile; lower ones somewhat spatulate; peduncles one-flowered; stem declining." *Root* annual. *Stems* about a foot long, cylindrical, weak. *Leaves* sometimes smooth, often hairy, especially when young. *Flowers* yellowish at the bottom, white in the middle and fine sky-blue

blue on the upper part of the border; peduncles just above the leaves on the same side about two inches long. A native of Spain, Portugal, Sicily, and the coast of Barbary. It is generally called *C. minus* by the English gardeners. 150. *C. acetosellefolius*. Willd. 106. Vahl *elcog.* 1. 18. Plum. Amer. 9. tab. 105. "Leaves oblong-lanceolate, somewhat hastate; peduncles elongated, one-flowered; stem creeping." *Root* perennial. A native of South America. 151. *C. repens*. Linn. Sp. Pl. 36. Mart. 57. Desf. 30. Lam. 2029. Willd. 107. (*Ipomœa aquatica*; Forsk. Arab. 44. Ballei; Rheed. Mal. 11. 107. tab. 52.) "Leaves arrow-shaped, obtuse behind; peduncles one or two-flowered." *Root* perennial. *Stem* creeping, jointed, rooting, angular, compressed, subdivided. *Leaves* crowded, terminal, emarginate, smooth, somewhat succulent, on longish petioles. *Flowers* whitish, rather large; peduncles from the axis of the terminal petioles, erect. A native of the East and West Indies. 152. *C. reptans*. Linn. Sp. Pl. 37. Mart. 58. Desf. 31. Willd. 108. (*Olivis vagum*; Rumph. amb. 5. 419. tab. 155. fig. 1.) "Leaves hastate-lanceolate; auricles rounded; stem creeping; peduncles one or two-flowered." *Root* perennial. *Stem* filiform, smooth and even. *Leaves* smooth, acuminate. *Flowers* pale purple; peduncles shorter than the petioles; calyx rounded. *Capsule* smooth, two-celled, with two seeds in each cell. A native of the East Indies, China, and Cochinchina, where it is used as a potherb. 153. *C. edulis*. Mart. 59. Desf. 54. Lam. 2053. Willd. 109. Thunb. jap. 84. "Leaves heart-shaped, entire and three-lobed, smooth; stem creeping, angular." *Root* perennial, often as big as the human fist, tubercled, fleshy like *C. batatas*, esculent, soft, and sapid. Said to be brought to Japan by the Portuguese. 154. *C. birtus*. Linn. Sp. Pl. 38. Mart. 60. Desf. 83. Lam. 2081. "Leaves heart-shaped, somewhat hastate, villous; stem and petioles hairy; peduncles many-flowered." *Root* annual; *Stem* a little twining. *Leaves* but little hairy. *Flowers* alternate, pedicelled, smooth, on peduncles longer than the leaves; involucre to each pedicel, very small, lanceolate. A native of the East Indies. 155. *C. Soldanella*. Linn. Sp. Pl. 39. Mart. 61. Eng. Bot. 314. (*C. maritimus nostras rotundifolius*; Tournef. 83. *Soldanella maritima minor*; Bauh. Pin. 295.) "Leaves kidney-shaped; peduncles one-flowered, with winged angles." Dr. Smith. *Root* perennial, long, creeping. *Stems* five or six inches long, procumbent, few-flowered. *Leaves* alternate, petioled, entire or a little angular, smooth and even, somewhat fleshy. *Flowers* flesh-coloured, yellowish at the plaits; peduncles axillary, solitary, rather erect, thickened near the top, quadrangular; bractes large, egg-shaped, close to the flower; calyx-leaves large, egg-shaped. *Capsule* three-celled. *Seeds* black, one in each cell. A native of the sea coasts of Great Britain, and other parts of Europe. It abounds in a milky juice, which has a bitter, acrid, saline taste, and is esteemed a good purgative. 156. *C. Imperati*. Mart. 83. Willd. 112. Vahl *Symb.* 1. 17. (*C. Stoloniferus*; Desf. 43. Lam. 2041. Cyril. Pl. rar. fasc. 1. 14. tab. 5. *Soldanella vel brassica maritima major*; Bauh. Pin. 295. *C. maritimus major italicus*; Tournef. Inst. 83.) "Leaves panduriform, or entire, emarginate, heart-shaped; peduncles one-flowered; corolla bell-shaped; stem creeping." Vahl. "Procumbent; leaves egg-shaped, retuse, emarginate; lower ones undivided; upper ones sinuate-lobed at the side." Lam. Nearly allied to the preceding. *Root* perennial. *Stem* cylindrical, quite smooth, a little branched, extending far on the sand, rooting at the knots. *Leaves* alternate, smooth, shining, on long petioles. *Flowers* yellowish white; peduncles axillary, solitary, or in pairs, nearly the length of the petioles, with two small bractes;

calyx-leaves egg-shaped, obtuse; stigma capitate. A native of the sea-flore in Italy. 157. *C. arenarius*. Mart. 83. Lam. 2042. Willd. 63. Vahl. *Symb.* 1. 18. "Leaves oblong, emarginate, lobed at the base, or entire; peduncles one-flowered; corollas tubular." Whole plant smooth. *Stems* decumbent, filiform, zig-zag, purplish. *Leaves* clustered, veinless; petiole longer than the leaf. *Peduncles* in pairs or solitary, axillary, the length of the petioles; calyx-leaves equal, oblong, somewhat membranous; tube of the corolla enlarged gradually towards the top. A native of the Azores. 158. *C. maritimus*. Desf. 44. Lam. 2043. Pluk. phyt. tab. 24. fig. 5. "Leaves emarginate, two-lobed, wedge-shaped at the base; peduncles many-flowered; stem decumbent, throwing out roots." Whole plant smooth. *Stems* cylindrical. *Leaves* alternate, mucronate by the elongation of the principal nerve, entire, thick, fleshy; petioles channelled. *Flowers* purple, large, bell-shaped; peduncles from three to six-flowered, generally longer than the petioles, cylindrical, divided above the middle, and furnished at the divisions with small awl-shaped bractes; calyx-leaves egg-shaped, slightly mucronate. *Capsules* roundish. *Seeds* four. A native of the Isle of France, and of the East Indies. 159. *C. Pes caprae*. Linn. Sp. Pl. 40. Mart. 63. Willd. 113. (*C. maritimus* β .; Desf. Lam. *Ipomœa biloba*; Forsk. *C. maritimus zeylanicus*; Herm. lugdb. 174. tab. 175. *C. marinus*; Rumph. Amb. 5. 433. tab. 159. *C. maritimus* five *Soldanella* è Maderafrauta; Pluk. phyt. tab. 24. fig. 4. *Schovanna-adambe*; Rheed. Mal. 11. 17. tab. 57.) "Leaves deeply emarginate, crescent-shaped, truncate at the base; peduncles often one-flowered." *Root* annual. *Stem* somewhat shrubby, procumbent, creeping, a little villous, red. *Leaves* thick, tomentous. *Flowers* purplish. A native of the East Indies, China, Cochinchina, and the eastern coast of Africa. 160. *C. brasiliensis*. Linn. Sp. Pl. 41. Mart. 63. Willd. 114. (*C. maritimus* γ .; Desf. Lam. *C. maritimus*; Brown. Jam. C. marinus; Plum. Amer. Sp. tab. 104. Marcgr. bras. 51. Pif. bras. 258.) "Leaves slightly emarginate, roundish, egg-shaped, often three-flowered." *Stems* perennial, and trailing to a great distance. *Leaves* larger than those of the last two species; petioles marked near the leaf with two red spots. *Flowers* large, purple; peduncles long. *Capsules* large, three-celled. *Seeds* one in each cell. Whole plant milky and a strong purgative. A native of the coast of Brazil, and of the Straits of Magellan. 161. *C. multifidus*. Willd. 115. Thunb. prod. 35. "Leaves palmate; lobes seven, linear, entire; peduncles one-flowered; stem decumbent." A native of the Cape of Good Hope. 162. *C. sublobatus*. Linn. jun. Sup. 135. Desf. 55. Lam. 2054. Willd. 116. "Stem procumbent; upper leaves repand-toothed at the tip; flowers capitate." *Root* annual. *Leaves* a little villous; lower ones heart-shaped; upper ones repand and almost lobed. *Flowers* aggregate, three together, sessile, parallel, with a six-leaved involucre. *Flowers* large. A native of the East Indies. 163. *C. capensis*. Willd. 117. Thunb. prod. 35. "Leaves hastate; lobes semibifid; peduncles about two-flowered; stem decumbent, villous." A native of the Cape of Good Hope. 164. *C. sagittatus*. Willd. 118. Thunb. prod. 35. "Leaves hastate and arrow-shaped; peduncles one-flowered; stems prostrate." A native of the Cape of Good Hope. 165. *C. littoralis*. Linn. Sp. Pl. 42. Mart. 65. Desf. 28. Lam. 2027. Willd. 119. (*C. albus, folio laciniato, maritimus*, Plum. Cat. 1. Burm. Amer. 79. tab. 90. fig. 2. Tournef. 84.) "Leaves oblong, lobate-palmate; peduncles one-flowered; stem creeping." *Stems* very long, much branched, nearly the thickness of a goose-quill, white, tender, creeping and taking root. *Leaves* a little larger than the palm of the hand,

palmate in the likeness of a duck's foot, fleshy, tender, bright green, nerved, on longish petioles. *Flowers* large, white; peduncles axillary, solitary, rarely two flowered, shorter than the leaves; corolla campanulate; border spreading, slightly cut. *Capsule* vilious, silky wire. A native of the West Indies, 1766 *C. martinicensis*. Mart 42. Desf. 29. Lam. 2228 Jacq. Amer. 26. tab. 17. pi. 19. tab. 24. "Leaves elliptical, smooth; peduncles one-flowered, longer than the leaf; stem creeping." *Stems* cylindrical, smooth *Leaves* alternate, obtuse, mucronate by the projection of the middle nerve, entire, petioled. *Flowers* white; peduncles axillary, solitary, with two small bracts near the top; three outer calyx leaves large, egg-shaped, acute, lax; two inner ones smaller, lance-ovate, acuminate. A native of Martinico.

Ob! It is not easy, perhaps not possible, to draw a decisive line of separation between convolvulus and ipomæa. Tournefort attributed a bell shaped corolla to the former; and a funnel-shaped one to the latter, under the name of Quamoclit taken up from Clusius, and of which he knew only one species; but these characters were soon abandoned. Linnæus, Schreber, Willdenow, and La Marck, have assigned a two-celled capsule and a bifid stigma to convolvulus, and a three-celled capsule to ipomæa, but this distinction has also been found inconvenient in practice. Gærtner places under convolvulus all the species which have a proper capsule, whatever be the number of its cells; and confines the genus ipomæa to such as have a valvels berry, with four, or by abortion, two single-seeded cells; a distinction which excludes all the species of the latter, except bona nox and zeylanica. Unable to come to a satisfactory determination amidst this discordance of opinion, and unwilling to

increase a genus already embarrassingly large, we have made no alteration in the general distribution adopted by Linnæus and his followers: and have attempted to conduct the genuine and essential characters of convolvulus so as to include all the present received species.

CONVOLVULUS, in Rural Economy. See BIND-WEED and WEED.

CONVOLUTION, a winding or turning motion, proper to the trunks of some plants; as the *convolvulus*, or bind-weeds, and the claspers of vines, and briony.

Dr. Grew thinks, that all those plants whose roots are twisted, have such a *convolution*: and he assigns two great efficient causes of this winding motion, the sun and the moon. It is very easy to try whether there be any such convolution or not in the trunks of plants; which may be done, as he hints, by tying a little bit of paper to any of the branches which are exactly north, south, &c. and then seeing whether it will change its position or not, in respect of the point of the compass.

CONVOY, from the French *convoyer*, to conduct, escort; in Maritime Language, signifies one or more vessels of war, entrusted with the conduct of a fleet of merchants; serving as a watch, and a shelter from the insults of the enemies of the state to which they belong, or of pirates.

CONVOY, in Mechanics, denotes a brake, gripe, or regulator for moderating the velocity of tram or rail-way waggons on steep parts of their descents: in some instances waggons heavily laden with coals, lime-stone, &c. descend for considerable distances on steep rail ways, without horses, and regulated only by a man who rides behind them astride upon the convoy; as from Whibsey-flack to the Bradford-canal in the West-riding of Yorkshire, and other places. Horses are used to drag the empty waggons up the hill again. See our articles CANAL and RAIL-WAY.

On some rail-ways, where the trade is a descending one, and the declivity in some places 12 to 16 inches in a chain, the horses, in holding back to moderate the velocity of the trams, are very liable to be thrown down and much injured, and even killed by the momentum of the trams; for obviating this evil, Mr. Charles Le Caan contrived a convoy, check, or stop, a model and description of which he presented to the Society of Arts in 1805, (see Transactions, Soc. Arts, xxiii. 316.) in which the convoy, in form of circular wedges, to act before the front wheels of the trams, is suspended by chains from the shafts by which the horse draws the tram, so as to cause no impediment to the motion of the wheels, as long as the horse is on his legs, and the shafts nearly in an horizontal position; but in case of the horse falling, and the shafts by that means declining downwards, the convoy instantly drops and stops the further progress of the wheels on the tram-plates; other kinds of convoys and stoppers are described in our article CANAL.

In 1805, Mr. F. D. Walker applied a similar principle to that of Mr. Le Caan's convoy, to the shafts of a four-wheeled carriage called a scotch; which convoy, on being let down by means of a pedal acted on by the coachman's foot, checked the motion of the four wheels in descending steep hills, and greatly secured the carriage and passengers from injury by runaway horses: for two years this contrivance has been used with perfect success by Mr. Walker, in frequently descending very steep hills, without locking the wheels.

CONVOY, in Military Language, denotes some succour or supply of men, money, ammunition, provisions, stores, &c. conveyed in time of war by land or water, to a town or an army. A body of men, that marches to protect any thing, and prevent it from falling into the hands of an enemy,

enemy, is also called a *convoy*. An officer, who has the command of a convoy, should take all possible precautions for its security, and should endeavour, before it marches, or sets out, to procure good intelligence concerning the enemy's out-parties. And as the commanding officer of the place, from which the convoy is to fit out, and those of such other places, by which it is to pass, are the most proper persons for him to apply to for assistance, he should take such measures as will enable him to keep up a constant intercourse with them. The conducting of a convoy is one of the most important and most difficult of all military operations. The strength of the detachment employed to escort a convoy should have a reference to the importance of the convoy itself. For there are cases when the escort should be commanded by an able and experienced general.

When it may be necessary to pass the night in the open fields, the custom is to encamp, that is, to form a close with the waggons, for the troops to sleep in, and this is a good precaution against any unexpected attempt of the enemy to surprise them. But if they should find themselves on the point of being attacked during the march, urgent necessity alone should constrain them to adopt this method; and especially the consideration of their being very inferior to the enemy, since they would thus tie up their own hands and render it impossible for themselves not to surrender, in case it should happen that they were not seasonably relieved. When the convoy is considerable; when it is to pass between places in the hands of the enemy; and when it runs any risk of being attacked; it ought to have a large escort, which is to be disposed in such a manner as to cover the convoy, instead of being covered by it. And as soon as the commanding officer hears of the enemy's being at hand, he is to leave a few detachments to accompany the waggons, and save them from such of the enemy's parties as might attempt to turn them into a wrong road, or break their chain; and assembling the rest of his troops, infantry as well as cavalry, seize the most favourable post within his power, to stop the enemy, or fight him, if he cannot avoid it. In the mean time, the convoy is to make the best of its way, and to get as far from the danger as possible. Should the troops, at any time, think it proper to cover themselves with the waggons of a convoy, they should be made to march in two columns, at a small distance asunder; and if the files should prove too long in two columns, they must be formed into three or four. In this disposition, which, however, the ground will not always allow of, as soon as the enemy is observed to be preparing for a serious attack, the horses are to be immediately unharnessed, and removed, not only that the waggons may be brought more closely together, so as to form a rampart, but to save the horses, of which, otherwise, so many might be lost, as to render it necessary, even after repulsing the enemy, to abandon part of the convoy. This must also be the case, if the troops should be stopped, and obliged to fight in their march, as it would be impossible that several horses should not be maimed or killed. It appears, therefore, that, in order to save a convoy, the troops should not think of covering themselves with it. If at any time a retreat should be necessary with a great number of baggage waggons, the retreating troops should not think so much of the protection they might afford, as the embarrassments they must create. The 10,000 Greeks hid themselves of theirs; and, confining themselves to some beasts of burden, took the resolution of fighting, uncovered. Moreover, regard should be had to the country which the troops are to traverse, and the kind of enemy with which they have to contend. If the country is an extensive plain, and the enemy very strong in ca-

valry, like the Turks, the waggons may prove of great service; besides those for the baggage, which in cases of necessity may be used for that purpose, the army should provide itself with some of these belonging to the inhabitants, to carry the chevaux-de-frise, and the sick and wounded.

Convoy, Order of, in Naval Tactics, denotes that which a fleet holds in making a straight course; the ships being all in the wake of one another, steering on the same point of the compass, and forming a right line. This order, according to M. Bourdieu de Villehuet, is the most simple, and the only one a fleet ought to be in at all times, for the following reasons—it is easily preserved; it cannot be discom-p sed in 20 out of the 32 shifts of wind, and is easily reformed in the 12 other changes; and it is easy to pass from that order to those that are proper for the security of a fleet, in all possible cases, either to preserve one's self, to attack, or to defend. If the fleet be numerous, the ships are to be arranged parallel to one another, that of the admiral occupying the middle, and steering all three the same course.

To form the order of convoy in one line. When the fleet is in no particular order of sailing, the leading ship is to veer sufficiently for the others to get in her wake, and steer the same course she holds. The commanding officer generally takes this post, when the Squadron is not numerous. That the order may be the sooner formed, every ship of the fleet or Squadron should chase at the same time that which is to be a-head of her in the line, taking care to manœuvre in such a manner as to avoid running foul of those which cross her fore-foot in endeavouring to join their leaders in the line. Therefore, such ships as are to leeward of others should take care not to permit obliquately in weathering them; but they must back, or go a-tern if necessary, by keeping away a little more. Such as should already be in the column, and are to be more a-tern, must bring to till they are in their posts, or stand on under a very easy fail, that each ship may contribute to the celerity of forming the order.

To form the order of convoy in three columns. The leaders of each of the three divisions are to place themselves in a line right a-breast of one another; and at a proper distance between themselves, according to the length of the columns, which will accelerate the disposition. Then every ship of each particular Squadron, chasing that which is to be next a-head of her, will come and take their station a-tern of one another at the rear of the leading ship of the division, and steer directly after her. This order, which in practice is easily maintained, has the advantage of keeping the fleet close and connected, without causing any delay in its progress. The best sailors can regulate their velocity by that of those which are inferior to them in sailing; and these, on the other hand, may, with a little attention, carry as much sail as the weather will admit, by which means all imaginable courses may, without breaking, be steered.

To change from the order of convoy, in one line, to the order of battle, continuing on the same tack. The headmost ship is to haul close by the wind on the same tack, and the rest of the fleet are to make the same movement in succession, steering the proper distances from each other.

To change from the order of convoy, in one line, to that of battle on the other tack. The headmost ship is to veer and to come to the wind on the other tack; then all the vessels of the fleet are to perform the same manœuvre in succession. Otherwise, after having formed the order of battle on the same tack, as before, the van-ship is to tack; and all the ships of the fleet are to follow in succession, to form the order of battle on the other tack. Or, if you are steering a

course in the order of convoy, 4 points large, the order of battle on the other tack may be formed at once, by all the ships veering or flaying together.

To change from the order of convoy, in three columns, to the order of battle on the same tack. If the fleet has the wind on the beam, or between close-hauled and eight points large, (See Plate I. *Naval Tactics*, fig. 1) the ships of the lee-column are all to bring to at the same time. The other two columns stand on. When the leader of the weather-column brings the lee leader to bear on the close-hauled line, he tacks, and is followed in succession. The centre-column does the same. But as the weather-column has a greater distance to run, it must make all possible sail, while the centre-column need not make so much; because the centre-column is not to begin to haul its wind till the centre-ship of the weather-column has got on the close-hauled line. The lee-column is to follow in the same manner, when the centre-ship of the centre-column is close by the wind.

If the wind be more than eight points, or right aft, (fig. 2.) ; the column which is to form the van-guard in the order of battle is instantly to haul its wind in succession, with all fails set; while the two others, continuing their course, will put themselves successively by the wind, on the close-hauled line upon which the order of battle is to be formed, and consequently in the wake of the weather-column.

If the columns be close on a wind, it then becomes a case within the usual fifth order of sailing. See *Order of SAILING*.

To change from the order of convoy, in three columns, to the order of battle on the other tack. The fleet may be put first in order of battle, on the same tack; then, making the ships tack in succession, they will be in order of battle on the other tack. But the time of evolution may be diminished, (fig. 3.) by making the two weather-columns bring to, when sailing between close-hauled and eight points large, while the ships of the lee-column veer in succession, and keep their wind on the other tack. The centre-ship of the lee-column having veered, the centre-column is to fill, the leader of which bears away, running exactly with the wind right-aft, and is followed in succession by the ships of his division, till they are in the wake of the lee-column, then on the other tack; when the leader of the centre-column hauls by the wind, the ships of his division haul in succession. When the centre-ship of the centre-column has bore away, the weather squadron manœuvres in the same manner, and thereby completes the order of battle.

To change from the order of convoy to that of retreat. Whether the fleet be the order of convoy in one line or in three columns, they are first to form in the order of battle on the same tack; and thence they are to pass to the order of retreat. See *Order of SAILING*.

To change from the order of battle to the order of convoy, in one line, on the same tack. The van-ship is to bear away as far as the intended course, and the rest are to execute the same manœuvre in succession; so that when the rear-ship shall have made the same movement, the evolution will be completed, and the order of convoy formed on the same tack.

To change from the order of battle to the order of convoy, in one line, on the other tack. The van-ship is to tack and run one point large, till she can bear away, under the stern of the rear-ship, as far as the course which the fleet is to hold. All the ships are to perform the same manœuvre at the same points, to change the order and get upon the other tack. The van-ship, instead of tacking, may veer and run a little time before the wind, before getting on the other tack; then she will heave to the wind on the fleet's course, without

fear of breaking through the rear. This movement is shorter and preferable, since the order of convoy is never held to keep by the wind.

To change from the order of battle to the order of convoy, in three columns, on the same tack. The three leaders of the columns are to bear away together, and steer on the intended course; then the ships of each squadron are to execute the same manœuvre in succession, following the same direction; so that the three rear-ships, veering at the same time in the wake of their respective columns, will complete the evolution. The columns will find themselves too distant from each other; but, as there is nothing which disturbs them, and they have the wind right-aft or very large, it will be easy for them to close as much as may be necessary.

To change from the line of battle to the order of convoy, in three columns, on the other tack. The three leading ships of the columns are to heave in stays at the same time, and bear away on the perpendicular of the wind on the other tack; then the ships of each squadron are to perform the same manœuvre in succession; and when the rear-ships shall have turned about and be in a line with their respective columns, and the leaders of the weather-divisions shall, by crowding all the fails, have come a-bread of the van-ship of the lee squadron, the evolution will be completed. If the fleet is to steer more large than the perpendicular to the wind, it will be easily formed, by making the leaders and their columns bear away in succession, then putting afterwards the columns at the necessary distance from each other.

To change from the order of retreat to the order of convoy, in one line. One of the wings is to haul together close by the wind, on the same tack as the line of bearing on which they are formed, in order to bear away in succession at the point of the angle, in the wake of the other wing; the ships of which are to run with the wind four points large, on their line of bearing; and, when the last ship of the weather-wing is in the wake of her line, the order of convoy is formed. If it be necessary to sail more large, or if you would not keep away so much, the same ships may keep their wind more, and follow the van-ship in succession.

To change from the order of retreat to the order of convoy, in three columns. First form the order of battle, and pass from that to the order of convoy, in three columns.

To restore the order of convoy in one line, when the wind comes a-head more than close-hauled. The order of convoy, it is plain, cannot be disturbed by all the shifts of wind as long as it is more abast than the starboard and larboard lines of bearing; because the ships, steering large in the wake of each other, can easily maintain their poils, having only their fails to trim, whether the fleet be in one line or in several columns. But if the wind draws more a-head than one of the lines above mentioned, it is evident that the ships being obliged to veer, or pay off, all at the same time, on the same tack, the order will be disturbed. In order to restore it on the same tack, when the fleet is in one line in the order of convoy; if we suppose the fleet steering large on the starboard tack, and the wind comes suddenly right a-head, which would throw all the fails flat a-back on their masts, the van-ship is to cast instantly to port, and bring to on the starboard tack, while all the other ships of the fleet are to box off, together and at the same time, to starboard, and make all fail, in order to come with celerity close by the wind on the larboard tack, and get into the wake of the van-ship, then to tack and take their stations successively, under an easy fall, and bringing to likewise till the rear-ship, which has a good way to run, be in her poil. If you should wish to get on the other tack, then the van-ship is to cast to starboard,

larboard, to bring to on the larboard tack by the wind; then the rest of the fleet would cast the other way, to tack afterwards successively in the wake of the ship which lies to, and take their station there, as has been said before, with this difference, that, after the restoring of the order, you would find yourself on the larboard tack. If the sudden shift of wind be not quite a-head, or if it be six points, or between six and twelve, the van-ship is, nevertheless, to bring to on one tack, while the rest of the fleet, casting on the starboard, make all sail to gain her wake, to tack there, and thus regain their stations. The order of convoy may be restored by a shorter and more simple method, which, however, will cause the fleet to drop to leeward more than the former does. In the same case as the last, when the wind comes right a-head, the whole fleet is to pay off on the same tack, if the ships are all on one line, and the rear-ship must bring to, while the rest of the ships running five points large (if the wind has shifted six points beyond the direction of close-hauled), will come and bring to successively a-head of the van-ship, on that line of bearing which they are to hold, observing that such ships are to carry a greater and proportionable press of sail, as, being nearer the van-ship, they have consequently more way to run before they can regain their posts. To know how many points or degrees the weather-ships have to run large to get into their stations, add eight points or 90 degrees to the half of the points or degrees the wind has shifted beyond one of the two lines of bearing; and, in regaining your posts, you will have the number of points by which you differ from the first course you steered.

To restore the order of convoy, in three columns, when disturbed by a sudden shift of wind right a-head. In this case, the whole fleet must cast the same way all together, leaving the three van-ships of the columns lying to, close to the wind on the tack on which you purpose to continue close-hauled, while the ships of the three columns running large all together on a course (to leeward of the first), which must always be determined by half the number of points or degrees the wind has shifted beyond the direction of close-hauled, added to eight points or 90 degrees, will bear away with care for their stations in the close-hauled line of bearing, which they are to hold to the windward side of their rear-ship, where they will arrive successively, by carrying more sail according as they may be nearer to the van, because in that case they have a greater distance to run.

We shall close this article with some remarks on the conveyance of merchant ships, under the protection of men of war. For the due care of a large fleet, the convoy should have a number of frigates, distributed a-head, a-stern, and on the wings of the fleet, which is always to be kept in the order of convoy, on three, four, five, or six columns, according to the number of which it is composed; some other frigates are also to be sent on the look-out, to desery what passes at a distance, and to give timely warning of the approach of the enemy. If these should discover an enemy of superior force, they should make it answer by signal; and it may be advisable that they should steer a different course from that of the fleet, in order to deceive the hostile ships in sight. The men of war are to hold themselves in the order of convoy a little a-head, and to windward of the weather-column of the fleet; because they will then be able readily to attend wherever their presence may be necessary; the frigates will, with alacrity and exactness, repeat their signals from one to another, that their purport may be expeditiously known to the commanding officer, who must not neglect to have all suspected and neutral ships chased, and even stopped by the frigates, which are always to be supported by one or two

line-of-battle ships, according to the exigency of circumstances. The progress of the whole fleet will be regulated by that of the worst going ships; which, however, are to be abandoned, when found to cause too great a loss of time; for to risk a small and partial loss, is better than to expose the whole fleet by delay. Between the columns, there should be floops of war and other swift sailing light vessels, to maintain order, and keep the ships in their stations. Their particular business will be to make the tardy ships to sail with greater expedition, to oblige those ships that are out of their post to return it, and in the evening to give an account to the frigates, having charge of going the round, of those which have not manœuvred well; and these will make their report to the commodore.

During the night, the same order will be observed, except with respect to the look-out frigates, which are to be called in within a certain distance of the fleet, and which are to be allowed lights as well as the rest of the men of war. They are to take special care to oblige all straggling ships to return to the convoy, and to fire, without hesitation, on all strange vessels coming from the main sea, in order to give the alarm. Every night they are to be supported on the wings by some line-of-battle ships. Elements and Practice of Rigging and Seamanship, vol. ii. pt. 2.

CONUS, in *Carchology*, a genus in the Linnæan system, distinguished by that writer as having the shell univalve, convoluted, and turbinate; aperture effuse, longitudinal, linear, without teeth, and entire at the base; pillar smooth. Animal a limax.

Species.

* Section *truncati*, spire nearly truncated.

MARMOREUS. Shell conic, brown with ovate white spots; whorls of the spire canalliculated. Linn.

Inhabits the Asiatic and American seas, and comprehends several distinct varieties. The shell is finely striated, and varies from fulvous to blackish; the spots are often of triangular shape, and running into bands; whorls emarginate, and armed with spinous tubercles.

IMPERIALIS. Shell whitish with longitudinal livid bands, and narrow belts composed of brown and white. Linn. *Kraenboorn*, Rumpf. *Corona imperialis*, Argenv.

A scarce species. The shell is generally marked with two yellowish bands. Supposed to be from the East Indies.

LITTÉRATUS. Shell conic, white with brown dots. Linn. *Volva muscalis*, Rumpf.

Inhabits the Asiatic ocean, and varies from white to reddish, or yellowish; the spots or dots are usually of a somewhat quadrangular form disposed in rows, between which are a few pale yellow bands or chestnut coloured lines; the spire is striped with brown.

GENERALIS. Shell conic, polished, spire flat and muricated; whorls canalliculated. Gmel.

A native of India. The colour of this shell varies from brown to yellow or orange, and is encircled with two, three, or four bands, marked with elongated spots; spire whitish, varied with undulated stripes, and pointed in the middle.

VIROGO. Shell conic, with the base bluish. Linn.

Several varieties of this African species are described by Knorr, Lister, and Chemnitz, from which it appears this shell varies from white to yellow, or yellowish, and is sometimes tessellated with white and red, or white with a straw-coloured band; spire blue, or white marked with an ochraceous band.

CARPANEUS. Shell conic, glabrous, with the base brown; spire a little convex. Linn.

Few distinct varieties of this species are described by Gualtieri, Bonanni, Favanne, and other writers. It is a native of Africa, and is commonly either of an olive, brown, or chestnut, or varied with those colours, and marked with one or two white bands, undulated spots, and numerous rows of dots; spine in general striped. This is an Asiatic shell.

TRIBUNUS. Shell white, with three yellowish bands, spotted with chestnut; spine a little convex; and the base transversely striated. Gmel.

Described on the authority of Martini, who has given a figure of it in his work on Conchology; its native country is unknown. The shell is marked with a few wavy chestnut lines.

MILES. Shell conic, rough, with the base brown; spine convex. Gmel. *Pseudo-archibalthasias*, Argenv.

This shell is a native of India, and is of a white or yellowish colour, with longitudinal undulated lines, the base transversely striated, near the spine a brown band, the spine itself spotted with brown.

CINGULUM. Shell conic, yellowish, with a single elevated belt in the middle; spine acute. Gmel.

Inhabits the Friendly Isles.

* * Section *Pyriiformes*, &c. Pyriiform with a rounded base, the cylinder half as long again as the spine.

PRINCEPS. Shell yellow, with purplish-brown longitudinal ramose lines. Linn.

Length of this shell about two inches and a half; the spine is obtuse and finely striated transversely; the body marked with two white bands which have a few brown spots, the rest of the shell spotted with chestnut. Inhabits the Indies.

AMMIRALIS. Shell with rough punctures at the base. Linn.

The varieties of this species, according to the character assigned it by Linnæus, are numerous beyond example in any other shell, amounting to nearly forty distinct kinds, independently of a much greater number not hitherto well defined. Among the principal varieties the following are most interesting.

Larvatus, *fasciis nullis*, &c. Without bands, figured by Martini.

Americanus, with irregular bands, and admitting of several varieties, as those having the shell brown, and clouded or spotted with white. Shell reticulated and clouded with chestnut; white, spotted, dotted, and clouded with brown; white, having the bands marked with orange lines. Another strong variety *anglicus*, figured in the work of Gualtieri, is of a red colour marked with numerous punctured white belts, and has the spine spotted with brown. The variety *coronatus*, described by Argenville, is distinguished by a belt of reddish dots, and transverse elevated lines, and is sometimes marked with a yellow band in the middle, and numerous punctured belts; or sometimes brown with a white band, and an oblique row of whitish spots. *Regius* has two bands, which are generally of an orange colour with darker lines, the interstices white; shell with orange dots and undulated spots. Martini figures a variety of this kind, the shell of which is white with wavy brown spots, and the bands varied white and brown; another has the bands yellowish with trifarious brown lines, and the shell white striated with brown; and a third variety has the shell clouded white and brown, and the bands of a brown colour. In *ordinarius* the shell is testaceous spotted with white, the bands white,

and somewhat reticulated with an articulated belt in the middle. *Guineensis* has the shell of a straw colour, the middle band marked with angulated lines in a very beautiful manner. The shell of the variety *surinamensis* is of a bay colour with numerous dotted belts, the bands spotted and the lower one dotted with brown and white. This kind includes several inferior varieties. The variety *summus* has the shell of a ferruginous colour with feathered white spots, and is marked with yellow bands, very finely reticulated; it varies in the number of the regular bands. *Occidentalis* is another strong variety; the shell testaceous spotted with white, and an articulated belt; bands yellow and reticulated. The last and principal variety of the genus princeps is the *cedo nulli*, a shell found in the South Seas in amazing variety, some kinds of which are however extremely beautiful and rare, and in high esteem with amateurs. The *geographicæ* *cedo nulli* is a fine and valuable kind, the prevailing colour of which is white, marbled with orange in a map-like manner. Another kind, called the "king of the fouth," (*Roi du Sud*, Argenv.) is of a fine deep golden orange with a white belt, and several distinct circles composed of clear white spots, three of which circles are disposed between the belt and the spine. Before the revolution in France there were three specimens of this kind known in the cabinets of Paris; one in that of Madame la Princesse de Banderle, another in that of the king, and the third, superior in perfection to either, in the possession of M. le Comte de la Tour d'Auvergne, which last was obtained from the Isle of France, and was known by the title of *Le Cedo nulli aux îles*. But the *banded cedo nulli* bears the highest value. This shell, called by the French *cedo nulli a bandes*, or by some more emphatically *la reine du midi*, is better known in England by the name of Lyonet's *cedo nulli*; it was formerly treasured in the cabinet of that distinguished amateur, and estimated at a considerable price, the sum of one hundred pounds sterling being actually refused by its possessor, who was nevertheless disposed to part with it at a fair valuation. Lyonet was an ingenious naturalist resident at the Hague, and, according to popular report, obtained this shell from the cabinet of M. de la Faille, auditor of finances to the states general of Holland, at the death of that eminent collector.

A particular account of this curious shell is given by Argenville, who pronounces it unique; this author describes it from a drawing made under the immediate inspection of Lyonet, the original of which we have seen, and are satisfied in the accuracy of his description. The shell from this drawing appears to be very elegant; its size is about that of the other varieties of the *cedo nulli*, which vary from an inch and an half to an inch and three quarters in length, and measure rather more than three quarters of an inch in the widest part. The colour is yellow, divided by four distinct bands of marbled white, the one of which across the middle of the shell, and another next the base of the spine, are the broadest and most beautifully variegated: the spine itself is fasciated longitudinally. At the first glance the yellow appears two principal bands of pretty considerable breadth, one above and the other below the band of marbled white which encircles the middle of the shell. The two last-mentioned yellow bands are beset with four equidistant transverse striae of little prominent dots, which give the shell in this part a slightly scabrous appearance.

It is only in conformity with popular report, that the shell of Lyonet; as before intimated, is presumed to be the celebrated *cedo nulli* of La Faille's cabinet, the truth of which has been contested by respectable authority. Favanne
thinks

thinks it is not the same, and Gerfaint positively declares it is not. The individual shell of so much repute in the collection of La Faille, according to the latter writers, was sold at the same time, with the other articles, at the Hague, about the year 1728, and was bought by a dealer for the king of Portugal's cabinet, at a price exceeding a thousand French livres. Hence it is imagined that Lyonet procured his famous shell from some other source. If we are not mistaken in our information, there were originally two shells of this same kind in the cabinet of La Faille, who presented Lyonet with one of them, and which, if true, at once resolves the mystery. The fate of Lyonet's shell is not exactly known; it is believed, at present, to enrich one of the Parisian museums.

We shall lastly mention a variety of the *cedo-nulli*, formerly in the rich cabinet of Madame de Bandeville, called *le cedo-nulli marbré*, from the beautiful variegated or marble-like appearance of its colours, which were blueish and violet on a ground of white. The shell was also embellished with three yellowish zones, and beset with a number of little roundish granulations of a white colour encircled with red.

VICARIUS. Shell testaceous, spotted with white, with four yellow immaculate bands, the second divided angularly. Gmel. *Archibalafus secundus*, Argenv.

Said to inhabit the southern ocean.

SENIATOR. Shell conic, smooth, glabrous with obtuse sculptured whorls. Martini.

Native place unknown; the shell is yellow spotted with white, and marked with very numerous transverse striae, composed of white and brown dots.

NOBILIS. Shell sub-cylindrical, smooth and glabrous. Linn. *Tigris lutea*, Argenv.

This species is finely polished, of a yellow or brown colour, occasionally shaded with olivaceous, spotted with white, and marked with very minutely punctured transverse striae.

GENUANUS. Shell with linear belts articulated with white and brown. Linn. *Gensefche toot*, Rumpf. *Jamar*, Adanf.

Found on the shores of Guinea. The shell is red, with bands alternately testated with brown and red. The "*A la papilionis*" of Argenville, called also by English collectors the butterfly cone, is considered as a variety of this species.

GLAUCUS. Shell emarginate at the base, and striated; spire unarmed, with the whorls contiguous. Linn. *Boter-vegie van Boer*. Rumpf.

A native of India and Africa. The shell is varied with brown, chestnut, and red spots, sometimes placed in rows, and the spire, which is transversely striated, varies in being more or less convex, and marked with spots, which are sometimes square.

MONACHUS. Shell gibbous, clouded with blueish brown, acute, and striated at the base. Linn. *Capucinus f. anticula*, Rumpf.

Supposed to be a native of India. Shell sometimes marked with dots disposed in rows.

MINIMUS. Shell greyish, surrounded with oblong dots. Linn.

Delineated in the works of Martini and Knorr; the native country unknown.

RUSTICUS. Shell ovate, rugged, and muricated at the base; the spire conico-convex. Linn.

There are two varieties of this species, one of which, *voluta cinerea* of Rumphius, is without any band, the other has a band, clouded with whitish, and is varied with blackish lines and dots. This shell inhabits Africa.

MERCATOR. Shell ovate and white, with reticulate yellow bands. Linn. *Tilin*, Adans.

Inhabits the shores of Africa. Shell of moderate size, sometimes yellowish, with brown or tawny bands.

BETULINUS. Shell slightly emarginate at the base, and wrinkled; the spire flattish and mucronated. Linn.

This is a native of India; the shell is rather large, and admits of several varieties, being either yellow or ochraceous, with testated spotted bands, and intermediate lines of yellow or brown; white, with three rows of violet characters; or white fasciated, spotted and dotted with brown. The *Conus Methusa* of Martini is esteemed a variety of this species.

FIGULINUS. Shell slightly emarginate at the base, and wrinkled; spire acumined, with flattish whorls. Linn. *Voluta figula*, Rumpf.

Length about three inches; brown, ferruginous, or yellow, and rarely olive, with darker lines; within generally whitish. A variety described by Knorr is of a more elongated form, the colour orange, with darker lines, and two yellowish bands; the spire reddish, spotted with black. Inhabits India.

EBREUS. Shell ovate and white, with black bands, composed of transverse spots. Linn. *Musica rusticorum*, Rumpf. *Hebraica*, Argenv. *Coupet*, Adans.

Native of the same country as the last. Shell rather small, and sometimes reddish, with parallelogramatic spots, which are often chestnut. There are several varieties of this species. It is known by the name of the Hebrew character cone, among English collectors.

STERCUS MUSCARUM. Shell emarginate at the base, and striated; whorls of the spire canaliculated. Linn. *Voluta arcuata*, Rumpf.

Inhabits Asia. This shell is of a long and narrow form, and white colour, with scattered black or red spots, which are sometimes united into bands; whorls of the spire obtuse, and in some of its varieties tuberculated.

VARIUS. Shell elongated and muricated, with the spire coronated and acute. Linn.

A native of the Indian ocean. The shell is white, clouded with brown or yellow, and granulated striae disposed over the whole surface.

ACHATINUS. Shell elongated, very finely striated transversely, and variously clouded and spotted with white; spire short, spotted with brown, and red at the tip. Gmel.

Several varieties of this shell are described by Seba and Chemnitz; the species is a native of the American ocean.

RADIATUS. Shell radiated and fasciated with white. Gmel.

Native country unknown; the shell is brown, pale yellow, or cinereous, and is figured by Martini.

LEONINUS. Shell with pale yellow or chestnut spots; commonly marked transversely with white or yellow bands, composed of grains or spots. Linn.

Found in the Indian ocean; and is a species comprehending an amazing number of varieties, as may be seen by the works of Knorr, Martini, Seba, Chemnitz, and others; about fourteen distinct varieties are ascertained.

JASPEIDUS. Shell light olive, with multifarious white dots, and an oblique band. Martini.

This is a shell of an oblong form, and small size. The native place is uncertain.

NEBULOSUS. Shell brown clouded with blue, and white spots. Gmel. Bonanni, &c. A doubtful species; the country unknown.

COFFEE. Shell short, brown, with two white bands; that nearest the spire spotted with brown. Martini.

Shell of moderate size; country undetermined.

AMADIS. Shell pale brown, with a broad band, and articulated belts above and beneath; spire acute, crowned with tubercles, and very finely striated transversely. Argenv. Zoonorph. Country unknown; shell varies in being more or less ventricose.

VULMINIFUS. Spire acute, and with the pillar-lip spotted with chefnut; shell fluted longitudinally with chefnut; base acute, and striated obliquely. Martini.

ARACHINOIDEUS. Shell reticulated with chefnut, with two or three darker bands; spire coronated and acute. Argenv. Zoonorph.

Defered as an extremely rare shell, and probably not of this tube. Its native place is unknown.

COSTATUS. Shell brown, with a white band, undulated with reddish, with thick and broad striae; spire nodulous, with a granulated band. Gualt. Country unknown.

LEUCOSTICTUS. Shell white, clouded, striped, and spotted with brown, and marked with numerous rows of white and brown dots; spire crowned with tubercles. Gmel.

Inhabits the Indian ocean; and has the spire of the shell sometimes acute.

CITRINUS. Shell citron colour, with black lines interrupted beneath; spire crowned with tubercles, and with the base white. Gmel. Inhabits the Caraccas.

INSULARIS. Shell white, with chefnut clouds, spots, and dots; and spire acute. Gmel. Country unknown.

CORONATUS. Shell with alternate articulate belts, and tessellated spots; spire crowned with tubercles. Gmel.

A small and extremely variable species, and which is oftentimes marked with a white band. Its country is unknown.

PUNCTATUS. Shell with two yellowish-brown bands, and numerous lines of dots; spire varied with yellow dots and lines. Knorr.

ZEYLANICUS. Shell snowy, with rosy and brown clouds, and numerous articulated belts, varied with white and chefnut; spire pointed. Martini. The base of this species is grooved obliquely.

SOLIDUS. Shell conic, thick, transversely striated, clouded with white and brown, with a broad white band, and pyramidal spire; the whorls canalculated. Chemn.

*** Section *elongati*, &c. Elongated and rounded at the base; the cylinder twice the length of the spire.

CRAVUS. Shell with convex smooth striae; the base bluish. Gmel.

An extremely rare species, found in the Indian Ocean. The shell is long, yellow, with white spots, and two deeper bands spotted with white; the spire spotted, and gradually tapering to an obtuse point.

NUSSATELLA. Shell somewhat cylindrical, red, not crowned with tubercles, rough, with tuberculated striae. Gmel. *Terebellum granulosum*, Rumpf.

This is a scarce species, and inhabits the island Nussatello in Asia. The shell is pale, clouded, and spotted with red, or rarely entirely white; with yellowish-brown, granulated, transverse striae; and the spire ending in an obtuse point.

TERESELLUM. Shell white, shaded with blue, subcylindrical, with annulated striae, and yellow bands. Gmel. Inhabits the Indian seas.

FUSUS. Shell fusiform, white transversely striated. Gmel. Martini, &c.

COCCINEUS. Shell red, with transverse lines dotted with

black, with a white band and spire, spotted with red. Gmel., Knorr, &c.

CAEUS. Shell somewhat cylindrical, with annulated ribs, red, with darker clouds, and bars of white; spire spotted. Gmel.

Figured by Liller and Knorr, and is supposed to be a variety only of *C. granulosus*. Its country is unknown.

GRANULATUS. Shell rough, unarmed; spire smooth and grooved. Linn. *Voluta granulata*, Rumpf.

Inhabits the African ocean. Shell red, with large fulcations, fasciated with white and purple linear dots.

OCHROLEUCUS. Shell sub-cylindrical, yellow; the base obliquely striated with a contiguous white band; spire pointed, and marked with striped spots. Gmel.

The native country is unknown. A variety of it is found of a chefnut colour, varied with decussating striae, dotted with red.

LAEVIS. Shell rufous, with fulvous spots, and transverse striae; spire spotted with yellow; base obliquely striated. Gmel., Valent. &c.

AFFINIS. Shell bluish-white, with four fulvous linear bands, and intermediate dull purple dots or marks. Martini.

VIOLACEUS. Shell white, clouded and banded with violet; rays pale brown. Martini.

POLYZONIAS. Shell white within; externally yellowish-brown, and rough, with very fine granulated lines; white band at the spire, denticulated beneath; another at the base paler, and numerous blisiform bands. Born.

BIFASCIATUS. Shell white, with angular chefnut lines, and two orange bands; spire prominent; base surrounded with orange lines, and intermediate tessellated spots. Born.

NIVEUS. Shell conic and snowy; spire prominent and coronated; aperture large. Born.

ARAUZIACUS. Shell not crowned, smooth, with whitish bands; whorls grooved at the tips. Gmel. *Oranjen admiraal*, Rumpf.

A beautiful and rare species found in India. The colour is in general whitish, with two or three orange bands, and white lines, tessellated with brown spots; spire with oblong spots of red, white, and brown.

MAGUS. Shell sub-cylindrical, with longitudinal bands dotted with white. Linn. *Voluta maculosa*, Rumpf.

A native of India. Shell white, with dotted lines, and oblong, chefnut, yellow, and brown spots; spire acute and spotted.

STRIATUS. Shell ovate-oblong, gibbous, clouded, with very fine parallel brown striae. Linn. *Voluta tigrina*, Rumpf. *Melar*, Adans.

Common upon the coast of Africa. Shell four inches long, snowy, with sometimes reddish or yellowish striae; the base emarginate and transversely striated.

TEXTILE. Shell reticulated, with yellow veins, and spotted with yellow and brown. Linn. *Pannus aureus*, Argenv. *Loman*, Adans.

A native of Asia. Chemnitz describes a variety of this species, of a white colour, with three orange bands; and another of a bloom colour, with two darker bands.

AULICUS. Shell white, with brown reticular veins, and interrupted longitudinal bands. Linn. *Nigella*, Argenv.

Nearly allied to the former, and supposed by some to be a variety: it likewise inhabits Asia, and admits of many varieties, several of which are figured by Martini.

THOMÆ. Shell smooth, white, with bay characters, and

and rows of dots, and three white belts and spots; tip reddish; spire conic, with grooved whorls. Gmel.

A native of the Indian seas.

**** Section. Shell ventricose in the middle, and narrow at each end.

SINENSIS. Yellow, ocellated with white, and transversely striated at the base. Gmel., Regenf., &c.

**** Section. Shell ventricose, and tinkling when thrown down on its back.

SPECTRUM. Shell blueish, with yellow clouds, and yellowish white dots and striae. Linn. *Voluta spectrorum*, Rumpf.

Inhabits the Asiatic seas. Four distinct varieties are figured by Chemnitz.

CULLATUS. Shell yellow, clouded with white. Linn. *Potan*, Adans.

Native country unknown. Shell thin, often spotted, clouded, or barred, and more or less ventricose; aperture large and blueish; spire sometimes flat, sometimes acute.

TULIPA. Shell oblong, gibbous, smooth; aperture gaping. Gmel. *Tulipa*, Argenv.

Inhabits India, Africa, and South America. Shell not coronated with tubercles; white, with a few clouds of blueish, brown, yellow, or red, and interrupted lines; aperture blueish; base obsoletely striated obliquely; spire acute, smooth, spotted, and finely striated transversely.

GEOGRAPHICUS. Shell oblong, gibbous, and coronated; aperture gaping. Gmel. *Nubecula*. Rumpf. *Textile sericum*, Argenv. *Nubecula*, *tulipa gallorum*, Klein. *Salar*, Adans.

A rare species found in the Indian and African seas. The shell is of a somewhat cylindrical form, wrinkled at the base, and rather narrower, pellucid, white; spotted and clouded with brown; aperture white; spire sometimes rosy.

NUBECULA. Shell white, clouded and spotted with orange, and scattered white dots; spire prominent and acute. Linn.

SPURIUS. Shell white, with alternate rows of irregular chequid or blackish spots, and interrupted punctured bands. Gmel., Gualt.

VEXILLUM. Shell brown, shaded with white, and marked with an interrupted white band. Rumpf., &c.

VENTRICOSUS. Shell brown, bared with white, beneath narrower, shaded with blueish, and smooth; spire conic and exerted. Kaemm. Country unknown.

CONUSANCE, in *Linn.* See COGNIZANCE.

CONUSOR. See COGNISOR.

CONVULSIONS, in *Pathology*, from *convellere*, *I rent* or *tear*, consist in violent, involuntary, and preternatural contraction and motion of the muscular fibres, in any part of the body.

By modern physicians, convulsions have been divided into two classes, under the terms of tonic and clonic, or *spasmodici* and *agilatorii*, according as the contractions are rigid, not alternating with relaxation, or throw the muscles into a state of constant motion, being immediately succeeded by relaxation, and again returning, alternately. These two species of morbid contraction of the muscles are generally distinguished at present by the terms, *spasm*, which denotes the fixed contraction, and *convulsion*, which implies the preternatural motion. The term *σπασμὸς*, *spasm*, was applied, however, by the Greek physicians, to the convulsive motions; and the rigid contraction was denominated *τῆσις*, *tetanus*. "Frigus modo nervorum distentionem, modo rigorem infert; illud *σπασμὸς*; hoc *τῆσις*; Græcè nominatur." Celsus

de Med. lib. ii. cap. 3. The word *nervus* signified a tendon, as well as an elongation of the brain and spinal marrow, which is now exclusively called a nerve; hence the Roman name for convulsions, which signifies distention of the tendons. And accordingly, those slighter convulsive motions of the muscles of the arms, which occur in fever, and occasion a playing of the tendons under the finger of a person, feeling the pulse, are now called a starting of the tendons, *subsaltus tendinum*. But these different forms of spasm and convulsion are frequently mixed, or pass into each other; and similar causes, affecting the brain and nervous system, produce both the one and the other.

It were vain to attempt to give an explanation of the nature or proximate cause of convulsive motions; since we are ignorant of the nature of the nervous power, or of that medium by which the muscles are connected with the common sensorium, and the volition of the mind is communicated to the muscles. We must be content with the observation of facts: the minute operations of nature are inferrible. The mechanical physicians had, indeed, no difficulty in accounting for the morbid, as well as the healthy operations of the nervous system: their imagination furnished them with a cause for every effect. Thus they supposed, like the natural philosophers, the existence of a subtle, æthereal fluid, the motions and vibrations of which produced all the effects which they observed. By farther supposition, different physiologists explained the mode in which this gratuitous fluid operated. Borelli fancied that there might be oblong vesicles in the fibres of the nerves and muscles, which were rendered spherical by the force of the nervous fluid, and therefore shorter. Others imagined that the influx of the nervous fluid separated the parallel fibres of the muscles from each other, and thus shortened the length of the whole. But it were useless to enumerate the various futile hypotheses, which originated in an erroneous philosophy. All that we know on this subject is, that force of the muscles of the body contract, in a state of health, by the will of the mind, as those of the trunk and extremities:—others, apparently without the intervention of an act of volition, although subject in a great measure to the will, in consequence of a local sensation; as the diaphragm, and the other muscles of respiration; the eyelids, in nictitation, &c.:—and others, again, are excited to contraction, altogether independently of the will, by an irritation so obscure, as to excite no perception in the mind; as the heart, which continues its unperceived motions, in consequence of the irritation or stimulus of the discharging blood, which is returned into its cavities by the veins. The contractions, produced by one or other of these causes, are regular in force and velocity, according to the degree of excitement; are always soon succeeded by a state of relaxation; and are not repeated, except when the will or the irritations again operate. In the morbid or convulsive state, the contractions of the muscles, ordinarily depending on the will, are excited without the concurrence of the will, or in a way contrary to what the will intends; and in the other instances, they are excited disproportionately to the action of the usual and natural irritations. Hence it may be concluded, without any gratuitous hypothesis, that when these convulsive motions are excited, independent of, or in opposition to, the will, some change in the condition of the seat of volition, the brain, and its elongations, the nerves, has occurred; and, if the convulsions are partial, that some great local irritation has been applied.

Now, although it be confessed that the actual condition of the brain, which occasions convulsions of the moving fibres, be unknown, as well as its condition and mode of operation

operation in health; yet certain conditions of the body, in general, have been observed to be connected with the occurrence of convulsions, which lead to a knowledge of the state of the brain in the gross, and serve as valuable guides in our practice in these diseases.

Convulsions have been chiefly observed to occur, when the body was in a state of repletion, inanition, or great irritation. It may seem inexplicable, that the two opposite conditions of repletion and inanition should give rise to similar morbid appearances; but the knowledge of the fact, which is established beyond a doubt, is sufficient for our practical purposes. We shall illustrate the operation of each of these states in producing convulsive diseases.

1. *Repletion of the system at large, or of the brain in particular, is a state in which convulsions frequently occur.* Numerous instances are on record, in which epilepsy has occurred, where a general plethoric state of the constitution was present. Epileptic convulsions have sometimes succeeded apoplexy, which is known to originate in over-turgescence of the brain. Every occasional fulness, or unusual impulse of the blood into the vessels of the brain, such as from a fit of anger, the heat of the sun, or of a warm chamber, violent exercise, a surfeit, or a fit of drunkenness, are frequently the immediate exciting causes of convulsions. (Cullen, *First Lines*, § 1296.) Hence also, in inflammatory fevers, as in the eruptive fever of the small-pox, where the blood is carried to the brain more abundantly, and with greater impetus than in health, convulsions are frequently produced; especially where the circulation is hurried by a hot regimen. The suppression of accustomed discharges, or the omission of habitual evacuations, have also been the occasion of convulsive affections, in consequence of the general plethora which ensues. But the most marked and striking instance of convulsions, induced by repletion, occurs in the puerperal state. They generally come on in the early stage of labour, and are attended with fulness and distention of the features, and other obvious marks of determination of blood to the head; they speedily cease when the delivery is accomplished, if they do not prove fatal before that takes place; and copious blood-letting is the only effectual remedy. In all these instances, indeed, which have just been mentioned, the good effects of evacuating medicines, of a spare diet, and cool regimen, in removing the diseases; and the bad consequences which have ensued, under the employment of an opposite treatment, point out repletion as the cause of the mischief. This is, also, still more clearly ascertained from the dissection of those, who have died in consequence of convulsions, occurring under such circumstances; marks of a congestion in the brain having been generally observed. See EPILEPSY.

2. *Inanition is a frequent cause of convulsions.* It has been observed from the earliest ages, that convulsions invariably precede death, when it is occasioned by loss of blood; and the fact is daily exemplified in slaughter-houses, when animals are killed by opening the large blood vessels. Hippocrates states, in his Aphorisms, Sect. v. Aph. 3, that convulsions, or hicough (which is, in fact, a convulsion of the diaphragm), succeeding a great hæmorrhage, are dangerous, and he repeats the observation in Sect. vii. Aph. 9. From this cause convulsions sometimes occur in the puerperal state, where great hæmorrhage from the uterus has occurred. But in such instances, the countenance, so far from being flushed, with a fulness of the features, is pallid, and the features are sharp and sunk; there are cold sweats, and other symptoms of exhaustion, which mark the distinction between this sort of convulsive disorder, and the proper puerperal convulsions, mentioned under the former

head. In these convulsions from inanition, the contrary remedies, cordials, and powerful stimulants, largely and frequently administered, afford the only means of saving life. "Si fluxus mellebrii," says Hippocrates, "animi deliquium et convulsio supervenit, malum." Sect. v. Aph. 65. Other great evacuations also excite convulsions; such as great discharges from the bowels by purging. In the early periods of the history of medicine, when the limited catalogue of the materia medica debarred the physician from the choice of expedients, according to the circumstances of the case, it would appear that this unfortunate consequence of a violent purgative was by no means uncommon, since we find it often alluded to by Hippocrates. "Convulsion from Hel-lebore is fatal." Sect. v. Aph. 1, and again, he observes, in Sect. vii. Aph. 25; "Convulsions from a purge are fatal." Happily the numerous articles of mild operation, which we now possess, render such an occurrence unknown to the physicians of modern times. Convulsions have been, likewise, observed to occur, in consequence of exhaustion of the animal powers, by other means; such as by excessive fatigue; by want of food; by long continued and severe mental exertion; &c.

The cure of convulsions, occasioned by inanition, from any of the causes just stated, will obviously consist, in the use of such remedies as will put a stop to the evacuations; in the administration of cordials and stimulants, to counteract the present failure of the vital powers; and in the frequent supply of moderate quantities of a cordial and nutritious aliment, to restore the mass of circulating fluids, and the strength of the body. Rest, food, and relaxation, will be the remedies required in the last-mentioned instances.

But 3, *Irritation, corporeal and mental, is the most fruitful source of convulsions.* The degree of corporeal irritation, which is sufficient to occasion convulsions, varies greatly; not only according to the peculiarities of age, and constitution, but according to the part to which it is applied, and sometimes according to circumstances, which are not obvious. Sometimes the irritation amounts to severe agonizing pain; more commonly to a moderate degree of uneasiness; and frequently it is such as to excite no perception: sometimes it is a titillation, or attended with sensations on the whole pleasurable. It may excite convulsions of the muscles in general, when applied to the brain itself; or to other parts of the body, as to the bowels, stomach, kidneys, and other viscera; to the gums, the skin, and the organs of sense.

Convulsions are among the most common symptoms of irritation of the brain itself, either from external or internal causes. Thus they are frequently excited by blows, or wounds, on the head; by fractures of the cranium when a portion of the bone is depressed, or fragments of it are driven in upon the membranes of the brain; by effusions of blood, lymph, serum, or pus, in the ventricles or on the surface; by bony excrescences from the internal surfaces of the skull; or by tumours, thickening, or abscesses, in the membranes or substance of the brain. Mechanical injuries of the nerves, which are elongations of the brain, have also given rise to general convulsions.

Irritations of parts distant from the seat of sensation and voluntary motion, produce the same effects. Thus wounds of the skin, and of the muscles and tendons in the extremities, occasion the most painful and fatal of all convulsive affections, the *tetanus*; and it is remarkable, that it is not a large discharging wound, which in general excites this disease; but a superficial injury, or a wound just healing, when the irritation would seem to be less powerful. In this disease, all the antagonist muscles of the body are seized

seized at once with a convulsive action, so that the trunk and limbs become perfectly rigid, and the jaw is locked. Sometimes the muscles of the back overpower their antagonists, the body is then bent backwards like a bow, and the patient rests on the head and the heels; this state is termed *opisthotonos*. Sometimes, on the contrary, the action of the abdominal muscles is most powerful, and the body is then bent forwards in a similar manner; this condition is called *emprostotonos*. (See these articles.)

Several instances of convulsions are related by authors, in which stones, of sharp and irregular figures, were found after death in the urinary bladder, or lying in the pelvis of the kidney, or in the course of the ureters. In others, convulsions, which had occurred in consequence of such irritations, ceased upon the discharge of calculi with the urine.

Irritations in the alimentary canal are very frequently the cause of general convulsions, more especially in young children. In children, indeed, it has been said that convulsions are not to be considered so much a disease themselves, as the indication of disease in the bowels, or other parts. (Med. Obs. and Inq. vol. iii. p. 202.) The presence of worms, of undigested aliment, of morbid secretions, or even a retention of the natural fæces, by constipation, are common causes of convulsions at an early age. The retention of the meconium is said to occasion the locked jaw of new-born infants, in warm climates, the *trismus nascentium* of authors. Some children, in fact, are so irritable during the few first years of their life, as to be thrown into convulsions by very slight causes of irritation; a disposition which is only removed, as the constitution becomes strengthened by age. The irritation of the rising teeth, when the gums do not readily yield to their pressure, has been frequently observed to excite convulsions in children, which were removed on the appearance of the teeth above the gum, or by the division of the gum by means of a lancet. For it is remarkable, that the greater temporary irritation of a cutting instrument is borne, without any convulsion being excited, while the constant uneasiness of the irritating tooth had frequently been productive of the convulsions. In the same way, when convulsions are occasioned by the irritation of worms, or of undigested food, in the intestines, the additional irritation of a cathartic medicine shall not increase the convulsive affection, which ceases, when its operation is completed. In the treatment of the convulsions of children, where the irritating cause is obvious, but cannot be instantly removed, the convulsive motions may be frequently suspended in the mean time, by immersion in the warm bath, by warm fomentations, or by the use of a small dose of an opiate, proportioned to the age and strength of the child, and the violence of the disease. But such measures are only palliative; the radical cure will depend upon the removal of the cause of irritation.

In constitutions of peculiar irritability, certain irritations of the organs of sense have given rise to convulsions. Thus in regard to the sense of touch, a case is related by Van Swieten in which titillation of the soles of the feet of a young girl, excited convulsions: he also mentions instances of the same effects being produced by a sudden exposure to great light, or great noise; a boy was thrown into convulsions by the unexpected sound of trumpets. Certain powerful odours have occasioned convulsive motions when applied to the organ of smelling. It seems to have been a custom formerly, says the author just mentioned, for those who purchased slaves, to try them with the smell of the jet-stone, in order to discover whether they were subject to the epilepsy. Arctæus has remark-

ed that by this odour the epileptic paroxysm was excited; and Apulius, who was accused of magic, in pleading his own cause, made the following observation. "But if I wanted to throw down an epileptic person in a fit, what need could there be for a charm to do it? seeing the jet-stone, when it is burnt, as I read in physical authors, discovers this disease effectually; and by the smell of it they commonly try the health of the slaves in the markets." Van Swieten. Com. § 1075.

Many poisons, especially the vegetable poisons, by their action on the nervous system, when taken into the stomach, produce the most terrible convulsions. The cicuta aquatica, or water-hemlock, is said by Wepfer to have been eaten by several children, who mistook the roots for parsnips; they were all seized with severe convulsions, which proved fatal to two of them; the rest having been made to vomit, and ejected the poison from the stomach, speedily recovered. Thus vegetable narcotics, even opium itself in an over-dose, have produced similar effects.

Mental irritations, or violent emotions of the mind, frequently give rise to general convulsions, especially in females, and those of hysterical habits. The influence of the mind on the body is too obvious to require much illustration. The actions of the heart, the circulation of the blood, and the functions of the viscera, are variously modified by emotions of the mind, and no organ is more fully affected by them in its functions than the brain itself. Different emotions seem to affect the system in different and even opposite ways; some rousing it to actions of unusual vigour, quickening the circulation, and strengthening the powers of volition; others, again, paralyzing its strength, and giving languor to all its motions. Hence the passions have been divided into two classes, exciting, and depressing passions. Now these opposite passions, which seem to produce the same effects as *repletion* on the one hand, and *inanition* on the other, alike excite convulsions of the body. This may be exemplified in the leading passions, anger, and fear, both of which are occasionally the causes of convulsions. In a man under the influence of the *excitement* of anger, the heart beats with greater force and celerity; the pulse is fuller, stronger, and swifter; every part swells and grows broader; a greater heat overpreads the whole body; almost every muscle is extended; the eyes are prominent from their sockets, and look fierce and sparkling, being charged with blood. These symptoms imply a corresponding fulness and force in the vessels of the brain, which, when carried to a certain extent, induce convulsions. On the contrary, a man under the *depression* of fear, grows pale and cold, and shrinks in every part of the body; his pulse is quick, but small and unequal; the heart palpitates; the lungs are oppressed, and sobs and sighings follow; his strength fails him; his whole body trembles, and he is scarcely able to articulate. These phenomena shew a depression, a collapse of the powers of life, resembling that which occurs from inanition, and, like that, producing sometimes a general convulsion. See Swieten Com. in § 204. Many examples might be quoted of the convulsive attacks occasioned by these passions, and especially by fear. We shall mention one instance from the latter cause, for the sake of illustrating the effects of another principle, the association of ideas, in re-exciting convulsions, thus originally produced. A boy was so much frightened by a large dog jumping upon him, that he presently fell down attacked with epileptic convulsions; afterwards, the paroxysm was brought on by the sight of any large dog, or even by hearing him bark. This effect of association is frequently observed in a minor degree; thus, any substance used as a vehicle for an emetic medicine, will, in some persons,

ions, when taken alone, excite sickness for some time afterwards. Van Swieten affirms that he has seen a person, who, after having frequently taken a nauseous purging draught, upon seeing the cup out of which he took it, not only shuddered, and became squeamish, but likewise had several stools; thus the sole idea of a nauseous remedy being renewed, supplied the place of a purge, and disturbed the whole body. Comment. in § 1075.

There is another prolific source of convulsive affections, which must not be overlooked in describing the mental causes of these formidable disorders; namely, the principle of *imitation*. This principle sometimes operates alone; sometimes its operation is combined with an impression of fear; and sometimes with various other strong impressions made on the imagination. This involuntary imitation is the source of almost all that is learnt in infancy; and its importance in the formation of character, has been well illustrated by Dr. Aikin. See *Athenæum*, No. xiii. Jan. 1808. In after-life we all experience its operation, in the irresistible propensities to yawn, to laugh, to weep, with others. Hence much of the effect of theatrical representations, especially crowded audiences: hence also the facility with which a *panic* spreads among an army of soldiers; and hence the power, on the one hand, and the cowardice, on the other, of a *mob*. This tendency to receive impressions and emotions involuntarily from others, and more especially, when they are accompanied with corporeal motions, and the tendency to repeat those motions involuntarily ourselves, are principles rooted in the human constitution; and upon them much of the history of insurrections, and also of the propagation of religious enthusiasm, depends, as well as the minor circumstances of convulsive diseases.

Every physician has witnessed the effect of the sight of an hysterical convulsion, on other women predisposed to that disease. It is not uncommon to find several women thus convulsed, one after the other, from this cause. We have even known the scream of one woman, seized with an hysterical paroxysm, excite convulsions in another, who heard it in a different room. The well-known cases which occurred in the orphan-hospital at Haerlem, under the care of Dr. Boerhaave, show the extensive operation of this principle, and also that these imitative attacks may be effectually prevented, by exciting a strong counter-impression in the mind. That celebrated physician, finding that epileptic convulsions, which had occurred in one boy, attacked, one after another, all the boys who witnessed the paroxysms, by threats of inflicting severe bodily pain on the first who should be attacked with these fits, succeeded in preventing the recurrence of the epilepsy.

This principle is still farther exemplified in the epidemical convulsions which have occurred at different times in different countries. In several districts of Scotland such epidemics have frequently appeared. The Rev. W. Archibald, parochial clergyman of Unit, the most northerly of the Shetlands, gives the following account of epidemic convulsions which occurred in his parish, "There is a shocking distemper, which has of late years prevailed pretty much, especially among young women, and was hardly known thirty or forty years ago. About that period only one person was subject to it. The inhabitants give it the name of convulsion fits; and indeed, in appearance, it something resembles an epilepsy. In its first rise, it began with a palpitation of the heart, of which they complained for a considerable time; it at length produced swooning fits, in which people seized with it would lie motionless upwards of an hour. At length, as the distemper gathered strength, when any violent passion seized, or on a

fulden surprise, they would all at once fall down, toss their arms about, writhe their bodies into many odd shapes, crying out all the while most dismal y, throwing their heads about from side to side, with their eyes fixed and glaring. At first this distemper obtained in a private way with one female, but being seized in a public way at church, the disease was communicated to others, but whether by the influence of fear or sympathy is not easy to determine. However this was, our public assemblies, especially at church, became greatly disturbed with their outcries. This distemper always prevails most violently during the summer-time, in which season, for many years, we are hardly one sabbath free." The Rev. Mr. Morrison, giving an account of a similar epidemic in his parish of Delling, says, "It most commonly attacks them when the church is crowded, and often interrupts the service in this and many other churches in the country. On a sacramental occasion, fifty or sixty are sometimes carried out of the church, and laid in the church yard, where they struggle and roar with all their strength for five or ten minutes, and then rise up without recollecting a single circumstance that happened to them." *Statistical Acc. of Scotland*, vol. i. p. 385. See *Edin. Med. and Surg. Journ.* N^o xii. In another parish, Northmaven, a cure is said to have been effected, as in the hospital at Haerlem, by a strong counter-impression upon the mind. "The cure is attributed to a rough fellow of a kirks-ficer, who tossed a woman in that state, with whom he had been frequently troubled, into a ditch of water. She was never known to have the disease afterwards, and others dreaded the like treatment." *Stat. Acc.* vol. xii. p. 363.

A similar prevalence of convulsive affections, which occurred on the estates of the earl of Uxbridge and Holland Giffith, esq. in the isle of Anglesea, was checked by the judicious precautions recommended by Dr. Haygarth, from a knowledge of the principle which we are illustrating. He advised that all girls and young women should be prevented from any communication with persons affected with those convulsions, and that those who were ill should be kept separated as much as possible. See *Treat. on the Imagination as a Cause and as a Cure of the Disorders of the Body*. Bath, 1800.

This principle of imitation, especially when the imagination is strongly excited by images of terror or superstition, has been resorted to by designing men for the purposes of imposing on the public credulity, with a view to their own profit. Upon this was founded the success of Mesmer, De Manauduc, and other empirics, in the disgraceful practices of animal magnetism, as it was called; the nature and imposition of which were fully detected and exposed by the commissions appointed by the French king for the purpose of the investigation. The celebrated Dr. Franklin was one of these commissioners, and his report has fully developed the mystery of the magnetizers. By the aid of circumstances, of situation, geom., &c. and by their own enthusiasm, they gradually worked on the minds of their company, who were already pre-disposed to receive any impression, for they did not operate on single individuals, until they brought them, mind and body, to a state of extreme irritability; then, assuming extravagant gestures and violent motions, the spectators were led to an involuntary imitation, and as soon as one of the party shewed any symptoms of violent or convulsive exertion, the rest were speedily affected in the same way. This was called the crisis, and the operation was considered as complete. Dr. Franklin shewed, that, without the aid of local circumstances, of numbers, &c. the powers of the magnetizer amounted to nothing.

It were unnecessary to pursue this illustration farther, or it

might be shewn that the propagation of religious enthusiasm and fanaticism is effected by the same means; is frequently connected with convulsive motions, or frantic gestures, amounting nearly to convulsions; whence we find jumpers, whirlers, and originally quakers, as the distinguishing appellations of sects; and that it depends much upon the contagion of the principle of imitation among crowded assemblies, for its success.

But to return to the subject of convulsions, more strictly within the sphere of pathology. We have mentioned the indications and means of cure, in most cases, as they occurred. In convulsions, which come under the two first heads, as arising from repletion and inanition, it must be obvious, that an evacuating system must be adopted in the first, and the contrary, or a system of support and nutrition, in the second. The individual expedients to be adopted, on either of these occasions, will readily suggest themselves, according to the peculiar circumstances of the case. In convulsions, which arise from irritation, the discovery and removal of the irritating cause, where it is of a nature to be removed, is not less obviously requisite for the cure. But in the mean time, before any of these intentions can be fulfilled, the violence of the convulsive motions may continue, so as to injure the body, or destroy life. It is desirable, therefore, that some palliative measures should be adopted; and these are chiefly the use of medicines of the antispasmodic class, such as opium, musk, æther, and other powerful stimulants; the use of the warm bath; or of the opposite expedient, the cold bath. Of these remedies, with the exception of the last, little is required to be said; the efficacy of the former being well understood. But as the cold bath is a powerful expedient, and can be often resorted to more speedily than the others, it may be necessary to mention the nature of its powers. Dr. Currie, from an experience of eight years, asserts that the cold bath is very efficacious in removing the convulsions of children, whether the disorder originates in worms or other causes; that it seldom fails in stopping the paroxysms, at least for some time, thereby giving an opportunity of employing the means fitted to remove the particular irritation. Several cases of tetanus have also been cured by the cold bath of late years. In the convulsions of hysteria, the cold bath, or indeed a plentiful affusion of cold water, is an almost infallible remedy. Dr. Currie observes, that the efficacy of the cold bath in convulsive disorders is the greatest, when it is employed during the presence of the convulsion; and also that it is of greater efficacy in general convulsive affections, than in those which are only partial. In chorea sancti Viti, for instance, it has been frequently tried without any success. See Currie, Reports on Water, &c. Append. p. 13. et seq.

Where the source of irritation is not discoverable, besides these palliative means, other medicines are commonly employed to give strength and vigour, and to lessen the irritability of the moving fibre, so as to render it less susceptible of being excited to extraordinary action. The various articles of tonic and corroborant medicine have been administered with this view, but most frequently, the metallic salts and oxides; as the sulphates of zinc, and iron, and copper; the oxide of zinc; and even the caustic nitrate of silver has been employed in small doses.

CONVULSIVE DISEASES, those diseases in which convulsions are the leading symptoms. See CONVULSIONS. These diseases have received different appellations, and also require different methods of treatment, according to the varieties of their form. Some consist of general convulsions of the whole muscular system, as tetanus, epilepsy, some forms of hysteria, &c.; others are distinguished by the con-

vulsions being confined to particular parts; as trismus, when the muscles of the jaw are affected with spasm; chorea, or St. Vitus' dance. Hiccough, and even cough, may be considered as partial convulsions. See these articles respectively.

CONVULSIVE Asthma. See ASTHMA.

CONWAY, in Geography, a river in North Wales, called by Ptolemy and Antoninus *Conovius*. *Kynwy*, in the ancient British language, signifies the great river, from which are derived the words *Conwy* and *Convery*. This stream, considered one of the finest in Europe, rises in the mountains of Penmachno, out of Llyn Conwy, and is navigable for small vessels to Llanrwst bridge; erected by Ieigo Jones with a centre arch 60 feet wide (see CANAL); but receiving many tributary streams in the course of 12 miles, it becomes sufficiently deep to bear ships of considerable bulk, and is nearly a mile in breadth at high water, but not more than 150 feet at low water, and eight feet deep, at the ferry opposite the town of Conway, beyond which it flows into the Irish Sea. The spring-tides vary from 14 to 15 feet; consequently vessels of 400 tons burthen may approach close to the town; nevertheless the shifting sand-banks make the entrance of the port dangerous. The *mya margaritifera* of Linnæus, or pearl muscle, made the river of importance previous to the Roman invasion. Such was its celebrity, that Suetonius acknowledged the pearl-fishery of the Conway to have been one of his inducements for undertaking the subjugation of Wales. According to Pliny, the muscles, called by the natives *gregindilæ*, were sought for with avidity by the Romans, and the pearls found within them highly valued; and in proof of which it is asserted, that Julius Cæsar dedicated a breast-plate, set with British pearls, to Venus Genetrix, and placed it in her temple at Rome. A fine specimen from the Conway is said to have been presented to Catharine, consort of Charles II., by sir Richard Wynne of Guedri; and it is further said, that it has since contributed to adorn the regal crown of England. Lady Newborough possesses a good collection of the Conway pearls, which she purchased of those who were fortunate enough to find them, as there is no regular fishery at present. The late sir Robert Vaughan had obtained a sufficient number to appear at court, with a button and loop to his hat, formed of these beautiful productions, about 28 years past.

CONWAY, or ABERCONWAY, an ancient town of Carnarvonshire, North Wales, is seated on the river Conway, near its confluence with the Irish Sea. This place does not appear to have acquired any consequence till the time of Hugh Lupus, earl of Chester, who fortified the mouth of the river about the year 1068; and it obtained more distinguished importance during the reign of Edward I., who enlarged the fortifications, and erected a very strong castle in 1284. The outline of this venerable and romantic place is triangular, and is still surrounded with embattled walls. These are erected in many places upon solid rocks, and are one mile and an half in circumference; they had four gates, and were defended by 24 ballions; in addition to which, two curtains projected into the river, where they terminated with watch-towers; but these and one of the former have fallen. Edward I. evinced great skill in constructing the defensive works of Conway, and particularly by erecting his superb castle on the base of the triangle next the river, where nature had placed a vast perpendicular rock of slate. He thus protected England from the incursions of the Welsh, who were commanded by Llewellyn; and afforded himself and successors an impregnable post for collecting the means of invasion, when an opportunity offered for entering Wales with any prospect of success. By this castle he had it in his power

to occupy the neighbouring passes of Penmaen-Mawr at pleasure, and by that means to cut off all communication with the interior of the principality; and yet this fortress had once nearly cost him his crown, in proceeding to it at the head of his army. On this occasion, Edward incautiously crossed the river Conway with a few attendants, and was separated from the town by the flowing of the tide. At this critical moment the Welsh attacked the castle; but although the monarch and his little band of soldiers were deluged with every refreshment, except honey and water, they had the bravery and address to resist their opponents, till the ebbing of the tide. Richard II. took refuge in this castle, on his return from Ireland in 1399, and was delivered into the power of his enemies from it, through the treachery of the duke of Northumberland. During the civil war, Charles I. particularly requested Williams, archbishop of York, to put the castle in a complete state of defence, for his use; and pledged his honour that the custody of it should remain with the prelate, or any person he thought proper to appoint, till the sum expended was repaid. When the repairs were accomplished, Williams placed the castle under the government of his nephew, William Hooker. The neighbouring gentry, conceiving it a secure depository, sent their most valuable writings and plate to the keeping of the archbishop and Hooker; the former giving his receipts, and making himself responsible in case of loss. About a year afterwards, colonel Sir John Owen obtained the appointment of governor of Conway castle from prince Rupert, and, proceeding suddenly to the place, ejected the prelate and his adherents, who were positively denied permission to remove the articles, for which receipts had been given. Greatly irritated at this unworthy conduct, Williams vainly applied to the court for redress. Yielding at length to the representations of general Mytton, who commanded the parliament's army, he adopted their cause, and fortified his own house, which was garrisoned by Mytton's troops. A conflict soon afterwards occurred, in which the prelate was wounded in the neck. After the rage of the civil wars, a grant was made of it to Edward, earl of Conway, who, in 1665, dilapidated the buildings. At present it is held by a private proprietor under the crown. A little hill is planted and laid out towards the mouth of the river, commanding a fine view of the town and castle on one side, and the sea on the other, to which is given the classical name of Arcadia. The ruins are still uncommonly magnificent, and bounded by the river, a creek, and the town. The walls are not greatly injured; and eight vast towers, furnished by turrets, are yet standing. In one of these is an oriel window, richly ornamented, where the toilet of queen Eleanor is said to have stood, at the period when her lord made the castle the scene of his hospitality: another of the towers, undermined by the inhabitants of Conway, split asunder, and a vast fragment fell upon the beach, where it lies, a wonderful specimen of ancient masonry. The hall, erected over extensive vaults, is lighted by six windows towards the country, and three on the opposite side. Six of the eight pointed arches of the roof are yet entire. The length of the hall is 139 feet, and the breadth 32. The castle is now held from the crown by O. Holland, esq., who pays a rent of 6*s.* 8*d.*, and is bound to furnish lord Hertford with a dish of fish, whenever he passes through Conway. However commanding and beautiful the town appears without the walls, the contrast within is melancholy in the extreme, where ruins and desolation prevail in every direction. Edward I., when he passed a Christmas here with his queen Eleanor and the whole court, erected the place into a free borough, and the mayor was constituted constable of the castle. The present government is composed of an alderman,

recorder, coroner, water bailiff, &c. Mr. Evans mentions, in his "Tour through North Wales," an old house situated in Cattle-freet, called the college, with a curious window, and several coats of arms of the Stanleys; and another of large dimensions, named *Plas Mawr*, built in 1585, by Robert Wynne, esq. of Guedir, which he supposes, from the inscriptions on the front, to have been erected for charitable purposes, particularly as there are many rude badges within, (probably of contributors); and the supporters of the arms of Dudley, earl of Leicester, decorate the walls and ceiling. The only religious structure in Conway was an abbey of Cistercian monks, founded by prince Llewelyn ap Iorwerth, in 1185, who was buried in the abbey church, where his body remained till the dissolution of the monastery, when it was carried to Llanrwst. Edward I., conceiving the monks improper inmates of his fortress, removed them to a new abbey, which he erected near Llanrwst, but did not deprive them of their privileges and endowments. Their old church was then made parochial, and the presentation granted to the abbot and convent, on condition they provided three chaplains, two of whom were to be Englishmen, and the third a Welshman; one of the former received the title and office of vicar, and, after having been named by the convent, was to be presented by the diocesan. The church of the original foundation is situated in the centre of the town; but it is more remarkable for its remote antiquity, than any beauty in the form or decorations. Cynan ap Owen Gwynedd was buried in this church, 1223; and there are at present several modern monuments of the Wynne family: one of the inscriptions within it records the interment of Nicholas Hooker of Conway, gentleman, in 1637, who is said to have been the 41st child of his father, by his wife Alice, and the father himself of 27 children. The tithes of the church are vested in three trustees, for the benefit of the poor of the town, and three villages in the neighbourhood: indeed the want of trade and manufactories renders the lower classes truly wretched, many of whom obtain a miserable subsistence by collecting and burning into *tarilla*, on the beach, different species of *judi* or sea-wreck, which is sold for trifling sums to the purchasers, who make a great profit on their labour. The inconsiderable trade now carried on consists of copper, lead, calamine, and potatoes for exportation; but little or nothing is imported. As Conway has hitherto been the great thoroughfare to Ireland, the inhabitants derived much advantage from the passengers; but the new road through the Orwyn mountains will soon rob them even of this support. Hills of lime-stone abound near this town, and some lead and copper mines, having chert, or a species of black hornstone for a matrix. In a black silicious mountain here masses of porous chert are found, which, on trial, are found as fit for making our mill-stones as those imported from France. Mr. Richard Doves, who made this discovery, and sent specimens of the stones to the Society of Arts, was rewarded by that patriotic body. See their Transactions, vol. xviii. p. 197. Situated 240 miles N.W. of London. Population in 1801 was 880; the number of houses 182. Bingley's and Evans's Tour in North Wales.

CONWAY, a township of America, in the province of New Brunswick, Sudbury county, on the western bank of St. John's river. It has the bay of Fundy on the south; and at the westernmost point of the township there is a tolerably good harbour, called Musquah Cove.—Also, a township in the N.E. corner of Strafford county, New Hampshire, on a bend in Saco river, incorporated in 1765, and containing 574 inhabitants. It was called "Pig-wacket," by the Indians.—Also, a thriving township in Hampshire county, Massachusetts, incorporated in 1767, and contain-

ing 2092 inhabitants. It lies 13 miles N.W. of Northampton, and 115 N.W. by W. of Boston.

CONWAY, *Cape*, a point of land on the east coast of New Holland, so called by captain Cook in 1770, and lying in S. lat. $26^{\circ} 36'$. W. long. $211^{\circ} 28'$; between which and cape Hillsborough is a bay, which the same navigator called *R. Puffin bay*. Within this cape there lie two or three small islands, which would serve to shelter that side of the bay from the southerly and south-easterly winds, that seem to prevail here as trade-winds. Among the many islands that lie upon this coast, called by Cook *Cumberland islands*, one is more remarkable than the rest: it is of small circuit, very high, and peaked, and lies E. by S., 10 miles from cape Conway, at the south end of the passage. This passage is from three to seven miles wide, and eight or nine leagues in length, N. by W. $\frac{1}{2}$ W., S. by E. $\frac{1}{2}$ E. It is formed by the main on the west, and by the islands on the east, one of which is at least five leagues in length. The depth of water, in running through it, was from 20 to 25 fathoms, with good anchorage every where; and the whole passage may be considered as one safe harbour, exclusive of the small bays and coves which abound on each side, where ships might lie as in a basin. The land both upon the main and islands is high, and diversified by hill and valley, wood and lawn, with a green and pleasant appearance. This passage, being discovered on Whitunday, was called *Whitunday passage*.

CONYA, a river of South America, in Surinam, or Dutch Guiana.

CONYBEARE, JOHN, in *Biography*, a celebrated English prelate, born in the neighbourhood of Exeter, and educated at the free-school in that city, from whence he was admitted at Exeter college, Oxford, where he applied himself so diligently to his studies, that, in 1710, when he was but 19 years of age, he was chosen probationary-fellow upon Sir William Petre's foundation. He obtained the several degrees with reputation, and was ordained priest in 1716. During the next year he officiated as curate at Fetcham in Surrey. Upon his return to Oxford, he became tutor to his own college, and gained much celebrity as a preacher. He was afterwards appointed by Dr. Gibson, bishop of London, to the situation of one of his majesty's preachers at Whitehall. In the year 1724, lord chancellor Macclesfield presented him with the rectory of St. Clements, Oxford; and in 1728, he took the degree of bachelor, and in the following year, that of doctor in divinity. In 1730, he was elected to the high and arduous office of master of Exeter college; and in a short time he undertook, at the desire of the bishop of London, and published a very excellent answer to Tindal's "Christianity as old as the Creation," under the title of "A Defence of revealed Religion against the Exceptions of a late Writer, &c." This was published in 1732; and before the end of that year he was raised to the office of dean of Christ-church. He now resigned the headship of his college, and speedily the rectory of St. Clements; and in 1734, he had the honour of entertaining, at his own apartments, the prince and princess of Orange, and of receiving the thanks of queen Caroline for his conduct on that occasion. From this period, to the year 1750, Dr. Conybeare received no additional preferment: he was then appointed to the bishopric of Bristol, which, though it increased his dignity in church preferment, was no addition to his fortune. This high honour was followed by a long train of illness, which terminated his valuable life in the year 1755. The good prelate left behind him a truly estimable character: he fulfilled all the duties of life with honour to himself, and for the advantage of those connected

with or dependent upon him. Zealously attached to the church, of which he was a distinguished member, he was, at the same time, candid and liberal towards protestant dissenters, with some of whom he had been educated, and with others he maintained an occasional but friendly correspondence through life. Two years after his decease, were published, for the benefit of his surviving relations, sermons in two volumes, 8vo. The very numerous list of subscribers who patronized this undertaking, shew in what high public estimation Dr. Conybeare was held by his contemporaries. Biog. Brit.

CONYZA, in *Botany*, (derivation uncertain.) Linn. Gen. 950. Schreb. 1286. Willd. 1480. Gært. 971. Juss. 180. Vert. 2. 511. Conle; and Encyc.

Gen. Ch. *Common calyx* either imbricated, or in several nearly equal ranks. *Cor.* Florets of the disk hermaphrodite, numerous, tubular, funnel-shaped; border five-cleft, patulous; florets of the circumference female, either apetalous or funnel-shaped, not composing a ray; border generally three-cleft. *Stam.* Filaments five, very short, capillary; anthers united into a hollow cylinder. *Pist.* In the disk. Germ oblong; style filiform, length of the stamens; stigma two-cleft: is the circumference styles and stigma more slender. *Seeds* oblong; down simple. *Recept.* naked, flat.

Ess. Ch. *Seeds* of the calyx imbricated, or in several nearly equal ranks. Florets of the circumference female, apetalous, or funnel-shaped, with a three-cleft border, not composing a ray. Down simple. Receptacle naked.

* *Leaves* not decurrent.

* *Herbaceous.*

1. *C. squarrosa*. Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. Lam. Ill. Pl. 697. fig. 1. Gært. tab. 166. Eng. Bot. 1195. Flor. Dan. tab. 622. (*C. major vulgaris*; Bauh. Pin. 265. Tourn. 454. *C. Matthioli*, baccaris Monspeliensium; Clus. Hist. 2. 21. Lob. ic. 574. Blackw. tab. 102.) Great sea-bear, or Plowman's spikenard. "Leaves ovate-lanceolate, downy; stem corymbose; calyx-scalcs foliaceous, recurved, and prominent." *Root* biennial, branched, and fleshy. Whole herb soft and downy, in flavour bitter, and somewhat aromatic. *Stem* two or three feet high, erect, angular, leafy, but little branched, many-flowered. *Leaves* alternate, somewhat crenate, upper ones often entire. *Flowers* yellowish; calyx egg-shaped; outer scales green, recurved; inner ones reddish, erect, ciliated. *Seeds* angular; down scabrous. *Receptacle* tubercled. A native of England, and other parts of Europe, on a dry calcareous soil. 2. *C. linifolia*. Linn. Sp. Pl. 2. Mart. 2. (After dracunculoides; Lam. After solidaginoides; Willd. After americanus aibus, mez. raribus exalparatis foliis; Pluk. alm. 56. tab. 79. fig. 2.) "Leaves linear-lanceolate, quite entire; corollas rayed." *Stems* a foot or a foot and half high, erect, hardish, green. *Leaves* resembling those of mezerion or hyssop, only more obtuse, smooth, and stiff. *Flowers* on short terminal peduncles; florets white, slender, reflexed. Its radiate flower certainly excludes it from this genus; but as it is not inserted in our work under Aster, we have retained it here. A native of North America. 3. *C. scabra*. Linn. Mart. 113. Mart. 7. Willd. 2. "Leaves oblong; somewhat toothed, fissile, scabrous; peduncles one-flowered, elongated." *Leaves* rugged on both surfaces, four or five teeth on each side. *Peduncles* axillary, at the top of the branches, becoming finally six times the length of the leaves. A native of the East Indies. 4. *C. lymphitifolia*. Mart. 35. Houston MSS. "Leaves oblong-egg-shaped, scabrous; flowers in terminal racemes." *Root* perennial. *Stem* three feet high. *Leaves* four or five inches long, one inch and a half broad in the middle, rough,

like those of comfrey. *Flowers* yellow; on branched peduncles. Sent by Dr. Houtton to Miller from La Vera Cruz. 5. *C. foliolosa*. Willd. 3. "Leaves oblong, nearly entire, half embracing the stem, downy; peduncles one-flowered, finally much elongated." *Stem* much branched, diffuse, downy; branches thick set with leaves. *Leaves* alternate, downy on both surfaces. A native of the East Indies. 6. *C. patula*. Mart. 30. Willd. 4. Hort. Kew. 3. 184. "Leaves elliptical, serrated, villous underneath; calyxes somewhat globular; scales lanceolate, awl-shaped; bran being spreading." *Root* annual. *Stem* a foot and half high, taper, slightly covered with a mealy down. *Leaves* about four inches long, and two broad in the middle, diminishing gradually in size on the upper part of the stem and branches. *Flowers* purple; peduncles at the end of the branches generally three-flowered; calyxes soft and swollen in the middle; scales small and acute. A native of the northern parts of China, producing a succession of flowers from July to the end of autumn. 7. *C. paniculata*. Willd. 5. "Leaves oblong, sessile, downy on both surfaces; lower ones petioled; toothed; teeth reflexed; stem paniced; corymbs peduncled, axillary." *Stem* four feet high, about the thickness of a swan's quill, erect, cylindrical, hollow, striated; branches alternate, erect, simple. *Leaves* on the stem petioled, on the branches sessile. *Calyx*-scales linear-awl-shaped, spreading, reflexed. A native of the East Indies. 8. *C. bifrons*. Linn. Sp. Pl. 7. Mart. 9. Willd. 6. (*Eupatorium conyzoides maxima canadensis*; Pluk. alm. 141. tab. 87. fig. 4.) "Leaves ovate-oblong, embracing the stem, serrated, wrinkled." *Root* thick, fibrous. *Stems* several, erect. *Leaves* rough. *Flowers* yellow, in round terminal bunches. A native of Canada, flowering in July. Disting. from *Inula bifrons*. 9. *C. bifoliata*. Linn. Sp. Pl. 9. Mart. 10. Willd. 7. (*Eupatorium conyzoides integro jacobææ folio*; Pluk. alm. 140. tab. 177. fig. 1. *C. axillaris*; Lam. 2.) "Leaves oval, toothed; peduncles two-leaved; bractes opposite;" Linn. "Leaves cuspidate-toothed; lower ones petioled, roundish egg-shaped; upper ones sessile, oblong, wedge-shaped at the base; racemes axillary, leafy at the base, peduncled;" Willd. "Leaves inversely egg-shaped, unequally and finely toothed, petioled; racemes axillary, leafy at the base, forming a terminal panicle;" Lam. *Stem* a foot and half or two feet high, simple, slightly striated, downy. *Leaves* alternate, soft, green, and almost smooth above, cinereous and downy underneath. *Flowers* small; bractes truly alternate, though some seem opposite; calyxes villous, reddish; Lam. Described from a dried specimen in the Herbarium of Commerçon. In smaller specimens, probably the growth of a poor soil, the peduncles are one-flowered, with opposite bractes. In larger specimens the racemes are from three to six-flowered; peduncled, furnished with two, either opposite or alternate bractes, and sometimes with four alternate ones; bractes oblong, sessile, generally entire; Willd. A native of the East Indies and the Isle of France. 12. *C. pubigera*. Linn. Mant. 113. Mart. 11. Lam. 9. Willd. 8. Lour. Cochinchin. 495. (*Sonchus volubilis*; Rumph. Amb. 5. 299. tab. 103. fig. 2.) "Leaves oblong, somewhat toothed, nearly sessile; peduncles woolly, about two-flowered." *Branches* with a few scattered hairs. *Leaves* alternate, wedge-shaped at the base, green on both surfaces, with a few scattered hairs, not scabrous; Linn. *Stem* somewhat shrubby, eight feet high, cylindrical, climbing, branched. *Leaves* broad-lanceolate, somewhat pubescent, scattered, petioled. All the florets intermixed in a simple down; Lour. A native of the East Indies and China. 11. *C. striata*. Willd. 13. "Leaves linear-lanceolate, attenuated at the base, quite entire, hairy; flowers in corymbs; stem paniced, stiff." *Root* annual. *Stem* a foot

and half high, erect; branches short, erect, close to the stem. *Leaves* alternate, numerous, an inch long, obtuse, with a point, narrowed at the base. *Corymbs* small, fatigiate at the tops of the branches. *Flowers* small; down reddish. A native of the East Indies. 14. *C. canescens*. Linn. jun. Sup. 367. Mart. 5. Willd. 18. Thunb. prod. 153. (*C. pinnifolia*; Lam. 18. *Elechyrium peregrinum angustifolium* flocculis spadiceis in apices crispatis delinquentibus; Seb. Mif. 1. 38.) "Leaves linear, stiff, folded back at the edges; downy underneath; panicle fatigiate." Whole plant hoary. *Stem* from twelve to fifteen inches high, nearly simple, cylindrical, stiff, lateral branches short. *Leaves* three inches long, a line broad. *Flowers* purple; calyx short; scales imbricated, lanceolate, villous, only half the length of the flowers; down intermixed with the florets; giving the flowers a feathered appearance. 15. *C. oleifolia*. Lam. 22. Willd. 15. (*C. orientalis pumila incana oleæfolio*; Tourn. cor. 33.) "Leaves lanceolate, attenuated at the base, obtuse, downy; corymb terminal; stem simple." *Root* perennial. *Stem* seven or eight inches high, erect. *Leaves* not an inch long, three or four lines broad, scattered. *Flowers* in a close fatigiate corymb; peduncles scaly; calyx oblong; scales closely imbricated, egg-shaped, obtuse; down reddish, longer than the calyx. A native of America. 16. *C. viscosa*. Mart. 34. Hoffb. MSS. "Leaves egg-shaped, serrated, villous; flowers axillary and terminal." *Root* annual. Whole herb viscid. *Stem* a foot high, branched. *Leaves* one at each joint, sessile. *Flowers* white; peduncles slender; generally three-flowered. *Seeds* chaffy. A native of La Vera Cruz. 17. *C. mollis*. Willd. 19. "Leaves rhomboid-egg-shaped, nearly sessile, toothed, pubescent, tomentous underneath; stem naked upwards; flowers in a corymb." *Branches* cylindrical, striated. *Leaves* an inch long, very white underneath. *Corymb* terminal; branches alternate, few-flowered, divaricated; peduncles one-flowered; calyx-scales linear-lanceolate; down long, snow-white. 18. *C. chenopodiifolia*. Lam. 12. Willd. 20. "Leaves ovate-deltoid, unequally serrated, soft; racemes short, terminating the stem and branches." *Stem* tomentous upwards. *Leaves* alternate, petioled, tomentous when young, afterwards nearly smooth. *Flowers* whitish, sessile, four or five together at the top of the stem and branches; calyx-leaves linear, very narrow, tomentous, almost equal; bractes clothed with fine silky decumbent hairs. A native of the Isle of Bourbon. There is a variety with broader, roundish-egg-shaped leaves, a little cut at the base. 19. *C. cinerea*. Linn. Sp. Pl. 14. Mart. 16. Lam. 3. Willd. 21. (*Senecio india foliis ternis crenatis*; Burm. Zeyl. 211. tab. 96. fig. 1. *S. indicus atriplicis folio*; Mor. Hist. 106. tab. 17. fig. 7. *Olus serophinum*; Rumph. 6. tab. 14. fig. 1.) "Leaves egg-shaped, slightly crenate; lower ones obtuse, upper ones acute; panicles naked, terminal." *Root* annual. *Stem* about a foot high, slender, pubescent. *Leaves* small, rather distant, narrowed into a petiole, cinereous-green, whitish underneath. *Flowers* purple, small; peduncles branched, almost capillary; calyx-scales acute; down white, longer than the calyx. A native of the East Indies. 20. *C. prolifera*. Lam. 7. Willd. 22. (*Sonchus volubilis Javanus*; Rumph. 5. 299. tab. 104. 1?) "Branches proliforous at the top; leaves egg-shaped, toothed-angular, narrowed into a petiole; corymbs close, terminal." *Branches* finely striated, full of pith, scabrous, producing near the top some smaller villous branches, and giving the plant a proliforous appearance. *Leaves* small, acute, green, and almost smooth above, hoary, and clothed with short hairs underneath. *Corymb* almost sessile; calyx-scales awl-shaped, down white, the length of the calyx. A native of the island of Java. 21. *C. heterophylla*. Lam. 8. "Some of the leaves a little heart-shaped; others

others rounder; flowers panicled." *Stem* about a foot and half high, branched, finely striated, clothed with very short hairs. *Leaves* rather small, petioled, cinereous underneath. *Flowers* small; calyx-scales acute, purplish at the tip; down white, a little longer than the calyx. A native of the East Indies. 22. *C. lacera*. Lam. 5. Burm. Ind. 180. tab. 59. fig. 1. "Leaves somewhat lyrate, appearing torn, downy; flowers nodding." *Stem* about a foot and half high, simple, cylindrical, cottony. *Leaves* alternate, obtuse; lower ones petioled. *Flowers* in a small terminal panicle or raceme; peduncles axillary, very short, often in pairs; calyxes villous; scales imbricated, very narrow, awl-shaped; down whitish, not longer than the calyx. A native of Java. 23. *C. hirsuta*. Linn. Sp. Pl. 19. Mart. 19. Willd. 24. Burm. Ind. 180. Lour. Cochinchin. 495. "Leaves oval, quite entire, scabrous, hirsute underneath." *Stem* a foot high, upright, simple, cylindrical, hairy. *Leaves* scattered, somewhat acute, sometimes edged with very minute teeth. *Flowers* yellow, crowded, terminal; calyx short, hairy. A native of Java, China, and Cochinchina. 24. *C. pauciflora*. Willd. 25. "Leaves lanceolate-obovate, attenuated above and below, smooth, scabrous underneath, ferrated; branches one-flowered." *Root* annual. *Stem* from half a foot to a foot and half high, erect, striated, a little branched towards the top. *Leaves* an inch and half long, green. *Flowers* large, solitary, terminating the branches; calyx-scales awl-shaped; down scabrous. A native of Africa, about the river Senegal. 25. *C. aegyptiaca*. Mart. 27. Willd. 26. Hort. Kew. 3. 183. (*Erigeron aegyptiacum*; Linn. Mant. 112. E. ferratum. Forfk. aegypt. 148. C. capitata five globosa; Bocce. Sic. 13. tab. 7. fig. B. Morif. hist. 3. 114. tab. 20. fig. 14.) *Jacobaea aegypt. fol. glauco coronopi*; Boerh. lugdb. 99.) "Leaves oblong-spatulate, toothed, hairy; flowers in somewhat globular panicles; calyx-scales awl-shaped, soft." *Root* annual. *Stem* a foot and half high, erect, somewhat striated, green, pubescent, a little viscid. *Leaves* alternate, sessile, scarcely half embracing the stem, rather obtuse. *Flowers* yellow, terminal, four or five together, on purplish peduncles; calyx roundish; scales awl-shaped; florets minute; those of the circumference numerous; piths yellow, quickly vanishing, surrounding the disk with a broad downy ring. A native of Sicily and Egypt. 26. *C. Gouani*. Linn. Mant. 469. Willd. 27. (*Erigeron Gouani*; Jacq. Hort. 3. 43. tab. 79.) "Leaves lanceolate, serrated near the top, scabrous at the edges; lower ones inversely egg-shaped; flowers clustered; calyx-scales lanceolate, membranous at the margin." *Stem* a foot high, simple, with a few erect hairs. *Leaves* alternate, half embracing the stem, even-surfaced. *Flowers* panicled; calyx roundish, imbricated; scales smooth, convex, close; florets of the circumference apetalous, more numerous than those of the disk; stigma bifid, oblong. A native of the Canary Islands. 27. *C. fengalenfis*. Willd. 28. "Leaves oblong, inversely egg-shaped, toothed; teeth near the base; deeper flowers in somewhat of a clove corymb." *Stem* striated, hairy, hispid. *Leaves* sessile, scabrous on both surfaces with callous points; lower ones an inch long. *Flowers* at the top of the stem; calyx-scales linear-lanceolate, scabrous. A native of Africa, about the river Senegal. 28. *C. dentata*. Willd. 29. "Leaves lanceolate, embracing the stem, dilated at the base, pubescent, toothed; branchlets one-flowered; peduncles elongated; stem hairy." *Stem* cylindrical, branched. *Leaves* an inch long. *Flowers* on long peduncles; calyx-scales linear-awl-shaped, scabrous; lower ones ciliated. A native of Africa about the river Senegal. 29. *C. villosa*. Willd. 30. "Leaves lanceolate, embracing the stem, dilated at the base, villous, ferrated; branchlets one-flowered;

stem villous." But little different from the preceding. 30. *C. aurita*. Linn. jun. Sup. 367. Mart 24. Lam. 17. Willd. 31. "Leaves toothed; root-ones smoothish, inversely egg-shaped; stem ones oblong, pubescent, somewhat pinnatifid at the base; stem panicled; calyx-scales awl-shaped; outer ones hairy." *Root* annual. *Stem* a foot high, erect, red, hairy; branches erect, simple. *Root-leaves* marked with red veins, widely ferrated, and crenated between the ferratures; stem-leaves somewhat lanceolate, soft; ferrated near the top; sinuated in the middle; somewhat pinnated at the bottom; ferrate-toothed along the whole margin; pinnae two or three on each side, spreading. *Flowers* white, small; those of the circumference linear; piths longer, erect. A native of the East Indies. 31. *C. guineensis*. Willd. 32. "Leaves toothed; root-ones scabrous, inversely egg-shaped; those of the stem lanceolate, villous, somewhat pinnatifid at the base; flowers in corymbs; calyx-scales lanceolate; outer ones villous." *Root* annual. *Stem* a foot and half or two feet high, erect, villous. *Root-leaves* an inch and half or two inches long, obtuse, remotely ferrated; lower stem-leaves inversely egg-shaped, an inch long, widely-toothed, deeply auriculate-toothed at the base; those of the branches half an inch long, lanceolate, villous, toothed, somewhat pinnatifid at the base; teeth profound; teeth of the base quite entire, not ferrated as in the preceding. *Flowers* in a terminal corymb; calyx-scales lanceolate, acute; outer ones shorter, villous. Nearly allied to the preceding, but differs in the form of the calyx, and the teeth of the lower leaves. A native of Guinea. 32. *C. amplexicaulis*. Lam. 10. Willd. 35. "Leaves lanceolate, nearly embracing the stem, somewhat toothed, hairy; stem branched, divaricated; peduncles one-flowered." *Root* annual. *Stem* from half a foot to a foot high. *Root-leaves* inversely egg-shaped, toothed; those of the stem oblong or lanceolate, remotely toothed, almost entire towards the top of the branches. *Flowers* resembling those of *C. aurita*; peduncles axillary, solitary, an inch or an inch and half long. A native of the East Indies. 33. *C. obliqua*. Willd. 34. (*Erigeron obliquum*; Linn. Mant. 572.) "Leaves egg-shaped, nearly embracing the stem, finely toothed, oblique; stem much branched; peduncles one-flowered." *Root* annual. *Stem* three inches long, erect, cylindrical, hairy. *Leaves* alternate, veined, not wrinkled, fragil, beset with a few scattered hairs. *Flowers* yellow, solitary, numerous; calyx cylindrical, pubescent; scales numerous, equal, awl-shaped, approximate; florets of the circumference scarcely conspicuous, numerous; ligmas of the disk erect, of the circumference spreading. A native of the East Indies. 34. *C. orientalis*. Willd. 35. (*C. orientalis Asteris attici folio*; Tourn. Cor. 35.) "Leaves scabrous, ferrated; lower ones inversely egg-shaped, petioled; upper ones lanceolate, sessile; flowers terminal, clustered." *Root* perennial. *Stem* cylindrical, striated, hispid-scabrous, branched at the upper part; branches short, simple. *Flowers* yellow, crowded, in a sort of corymb at the top of the stem and branches; calyx-scales awl-shaped. A native of Armenia. 35. *C. ficula*. Willd. 36. (*Erigeron ficulum*; Linn. C. ficula annua, foliis atro-virentibus; Boc. Sic. 62. tab. 31. fig. 4. Morif. hist. 3. 115. tab. 20. fig. 28. Pluk. phyt. 168. fig. 2.) "Leaves linear-lanceolate, scabrous, nearly entire, revolute at the edges; stem panicled; peduncles one-flowered, leafy; lower calyx-scales lax." *Root* annual. *Stems* red. *Flowers* small; peduncles covered with minute linear, recurved leaves. In other respects resembling *erigeron graveolens*, but without a ray. Allied also to *inula pulicaris*. A native of Sicily and the south of France. 36. *C. fatida*. Willd. 37. (*Erigeron fetidum*. Linn. Seneceio africanus.

afficans peregrinis; Pluk. alm. 343. tab. 223. fig. 3.) "Leaves linear, attenuated at the base, mucronate; corymbs peduncled, close, terminal." *Root* perennial, too nearly allied to *inula foetida*, but has no ray. A native of Africa. 37. *C. pungens*. Lam. 21. Willd. 38. (*C. membranacea*; Vahl. act. 1719. p. 501.) "Leaves tri- or quadrifidate, awl-shaped, pungent; stem panicled, angular, smooth." *Stem* a foot high, branched. *Leaves* alternate, distant; two lateral segments very short. *Flowers* yellow, large, solitary; terminal; calyx top shaped or oblong, imbricated; scales egg-shaped, smooth; inner ones mucronate; down reddish, the length of the calyx. A native of Egypt, about Grand Cairo.

** *Stems shrubby.*

38. *C. fasciata*. Linn. Sp. Pl. 3. Mart. 4. Lam. 23. Willd. 45. (*Helichrysum folveltrii* Smilax; Bauh. Prod. 123. *Helichrysum folveltre latifolium*; Tournef. 452. *Helichrysum capitulis singularibus brevibus*; Mor. hist. 3. 87. H. taxatæ; Boec. Meth. 111. tab. 104. *Chrysothamnus latifolia major*; Barcl. Ic. 425.) "Leaves linear, somewhat toothed; peduncles very long, one-flowered." *Root* perennial. *Stems* about a foot high, slender, branched, cottony, a little procumbent when young. *Leaves* an inch and half long, two lines broad, green above, whitish underneath. *Flowers* yellow, solitary, on long peduncles; calyx-scales oblong, somewhat scariosus at the tip, lax. A native of Spain, Italy, the South of France, Palestine, &c. 39. *C. rubra*. Linn. Mant. 113. Mart. 6. Willd. 41. (*C. faxatilis* β. Lam. C. tomentosa; Forsk. Ægypt. 75.) "Leaves spatulate, somewhat toothed, downy; peduncles elongated, one-flowered." Very like the preceding, but the flowering stems have axillary branches of smaller leaves. *Leaves* broader, shorter, more obtuse, all except the lowermost white on both sides. *Flowers* yellow; peduncles shorter and thicker, with one or two lanceolate, not brittle-shaped, bractes; calyx-scales not acute and patulous, but rather obtuse and closely imbricated; outer ones egg-shaped, brown at the tip; middle ones linear, obtuse, with a brown line on the back. A native of Arabia. 40. *C. jordanii*. Linn. Mant. 466. Mart. 3. Lam. 22. Willd. 39. (*Gnaphalium fordii*; Linn. Sp. Pl. *Elichrysum sylvestre angustifolium*, capitulis conglobatis; Bauh. Pin. 264. *Stachæus citrina spuria*, longioribus foliis; Bar. Ic. 368. & 277.) "Leaves linear, quite entire; peduncles long, three-flowered." Nearly allied to *C. faxatilis*. *Stem* resembling that of lavender, about a foot high, slender, cottony. *Leaves* very narrow, soft, cottony, whitish. *Flowers* small; peduncles long, slender, cottony; calyxes conic; scales imbricated, a little scariosus at the tip. A native of the South of France and Italy. 41. *C. ericoides*. Lam. 51. Willd. 43. "Leaves linear, revolute, downy underneath; flowers globular, solitary, terminating the branches." *Stem* much branched; branches downy near the top. *Leaves* resembling those of *physica ericoides*, small, numerous, approximate, scattered, spreading. *Flowers* at the top of the lateral branches, which are so disposed as to give the stems the appearance of being covered with flowers; calyx-scales linear, scarcely imbricated; outer ones downy on the back; down reddish. A native of Peru. 42. *C. thymoides*. Lam. 42. Illus. Pl. 697. fig. 5. Willd. 44. "Leaves embracing the stem, egg-shaped, acute, keeled, compressed, imbricated in two rows; flowers solitary, sessile, lateral." A very singular plant in the form and disposition of its leaves, with somewhat of the habit of a *Thunia*. *Stem* a foot and half high, cylindrical, cottony towards the summit; branches in two rows, gradually diminishing in length from the bottom of the stem to the top. *Leaves* small, nu-

merous, concave, villous on the inside. *Flowers* axillary; calyx-scales few, oblong, smooth and even; down reddish. A native of Peru, found by Joseph Justif. 43. *C. cupressiformis*. Lam. 43. Ill. Pl. 697. fig. 3. Willd. 45. "Whole plant smooth; leaves minute, inversely egg-shaped, keeled, imbricated in four rows; flowers 4 leaved, terminal." A plant as singular as the preceding, with the habit and foliage of a cypress, and the flowers of an *Athanasia*. *Stem* rather thick, stiff, slender branched. *Leaves* thickly covering the branches. *Flowers* yellow, solitary, sessile; calyx cylindrical, scales imbricated, obtuse, inner ones the largest. Found by Commerçon in the Straits of Magellan. 44. *C. hypoides*. Lam. 44. Ill. Pl. 697. fig. 2. Willd. 46. "Leaves awl-shaped, imbricated, pressed close to the branches; flowers solitary, terminal." A shrub six or seven inches high. *Stem* stiff; branches erect, generally fasciculated so as to resemble *lycopodium selago*. *Leaves* three lines long, smooth, convex at the back, with two lateral furrows. *Flowers* white or lemon-coloured, sessile; calyx-scales imbricated, similar to the leaves but smaller; down white, twisted and appearing curled. Found by Commerçon in the Isle of Bourbon. 45. *C. hypoides*. Lam. 45. Willd. 47. "Prostrate; leaves linear, crowded, hoary underneath; branchlets terminated with a sessile flower." A small shrub. *Stem* divided into numerous, short, procumbent branches, throwing out fibrous roots; branches erect, in close tufts somewhat in the manner of a *Bryum*. *Leaves* small, numerous, placed very near each other, green above, whitish and cottony underneath. *Flowers* yellow, solitary; calyx almost cylindrical, containing from six to eight florets; scales imbricated, oblong; down the length of the calyx. Found by Commerçon in the Straits of Magellan. 46. *C. linearifolia*. Lam. 49. Willd. 48. "Smooth; leaves linear, neatly entire, narrowed towards the base; racemes short, leafy, terminal." A small much-branched shrub; branches slender, leafy towards the top, slightly striated. *Leaves* an inch long, two lines broad. *Flowers* sessile or nearly so; calyx oblong, imbricated; inner scales linear-lanceolate, white and scariosus at the edges; down reddish, the length of the calyx. A native of the Isle of Bourbon. 47. *C. punctata*. Willd. 49. "Leaves linear, acuminate, attenuated at the base, slightly marked with concave dots; peduncles very long, one-flowered." *Branches* cylindrical, striated, smooth. *Leaves* an inch and half long, alternate, crowded, somewhat fleshy, rather scabrous, quite entire and scabrous at the edges. *Peduncles* at least half a foot long, solitary or in pairs, bect with awl-shaped distant scales; calyx-scales lanceolate, acute; down reddish. A native of Chili. 48. *C. canariensis*. Willd. 50. "Leaves linear, attenuated at the base, rather obtuse, ferrated; corymbs terminal." *Branches* cylindrical; younger ones pubescent. *Leaves* alternate, crowded, spreading, green on both surfaces, somewhat scabrous. *Flowers* yellow; peduncles fealy; calyx-scales oblong, closely imbricated. A native of the Canaries. 49. *C. incana*. Willd. 51. (*Erigeron incanum*; Vahl. Symb. 1. 72.) "Leaves linear, attenuated at the base, somewhat toothed, downy; corymbs terminal." *Branches* downy. *Leaves* sessile, approximate, rather acute, a little revolute at the margin. *Corymbs* many-flowered; calyx-scales linear, somewhat villous; down ferruginous, longer than the calyx. A native of Arabia Felix. 50. *C. inuloides*. Mart. 25. Willd. 52. Hort. Kew. 3. 182. (*Chrysothamnus dichotoma*; Linn. jun. Supp. 359. Jacq. Ic. Rar. 1. tab. 171.) "Leaves wedge-shaped-linear, obtuse, crenate-toothed, smooth; anthers two bristled." *Stem* smooth, profliferous, dichotomously branched. *Leaves* rather short, a little obtuse, somewhat scabrous, with minute points.

Flowers

Flowers yellow, in terminal simple corymbs; peduncles hirsute; bracts awl-shaped; calyx purplish. A native of rocky ground in the island of Teneriffe. 51. *C. tomentosa*. Mart. 31. Mill. Dict. Houst. MSS. "Leaves oblong-egg-shaped, downy, cinereous underneath, flowers terminal, on branching peduncles." *Stem* ten or twelve feet high, much branched. *Leaves* alternate, on short petioles. *Flowers* white, in loose unilateral spikes. A native of La Vera Cruz in New Spain. 52. *C. cerylocomoides*. Willd. 53. Desfont. Atl. 2. 269. tab. 232. "Leaves linear, quite entire, villous; hairs pressed close; peduncles leafy, one-flowered." Whole plant cinereous green, clothed with short soft hairs pressed close to the surface. *Stems* a foot and half high, slender, branched. *Leaves* spreading. *Flowers* in loose panicles, on filiform peduncles; calyx ovate-cylindrical, scales linear, awl-shaped, imbricated, pubescent, membranous at the edges; florets of the circumference very small, scarcely conspicuous, without teeth. A native of Barbary. 53. *C. coronopus*. Lam. 35. Willd. 54. "Viloid leaves linear-lanceolate, ferrated serratures oblong, turned upwards; flowers globular in terminal corymbs." 54. *C. glutinosa*. Lam. 32. "Leaves lanceolate, serrated, green on both surfaces; viloid when young." A shrub four or five feet high, smooth. *Branches* lax, cylindrical, slightly striated, leafy towards the summit. *Leaves* ever-green, petioled, acute, shining. *Flowers* yellow, numerous, small, in a compound terminal corymb; calyx roundish, imbricated with egg-shaped scales; florets of the circumference very small; down white, short. A native of the Isle of France. 55. *C. appendiculata*. Lam. 31. Willd. 66. "Leaves lanceolate, ferrated, downy underneath, appendiced at the base." *Branches* tubercled, cottony towards the summit. *Leaves* near four inches long, about an inch broad, green above, cottony and whitish underneath, furnished at the base with some narrow appendages which are decurrent along the petiole. *Flowers* yellow, numerous, in a compound terminal corymb; peduncles and calyx cottony; bracts at the divisions of the peduncles linear. Found by Commerçon in the Isle of Bourbon. 56. *C. falsifolia*. Mart. 32. Lam. 33. Willd. 55. "Leaves linear-lanceolate, quite entire, revolute at the edges, attenuated upwards and downwards, downy underneath, corymb terminal, compound." *Branches* cylindrical, tubercled; younger ones downy. *Leaves* resembling those of *Salix viminalis*, two inches long, alternate, petioled. *Corymb* divaricated; peduncles downy; calyxes cylindrical, imbricated; outer scales egg-shaped, pubescent; inner ones longer, linear, smooth. There is a variety with very narrow, almost filiform leaves. 57. *C. laurifolia*. Lam. 34. Willd. 56. "Leaves oblong-lanceolate, narrowed at the base into a petiole, nearly entire; corymb terminal, compound, spreading." A very large shrub. *Branches* cylindrical, almost smooth, leafy on their upper part. *Leaves* about six inches long, rather more than an inch broad, feathered, slightly pubescent, sometimes slightly crenulate. *Flowers* numerous, globular; peduncles clothed with short, woolly hairs; calyx-scales ovate lanceolate, almost smooth; down reddish. Found by Commerçon in the Isle of Bourbon. It seems to have some affinity with *Baccharis arborca* of Linnæus. There is a variety with smooth leaves broader at the top, smaller flowers and longer down, which perhaps may prove a distinct species. 58. *C. uniflora*. Mart. 38. Mill. Houst. MSS. "Leaves lanceolate, acute, sessile; flowers solitary, lateral, calyxes coloured." *Stem* eight or ten feet high, with numerous, long, slender branches. *Leaves* three inches long, three quarters of an inch broad in the middle. *Leaves* growing close to the stems of the smaller branches. *Flowers* white, with a purple calyx,

sitting close to the base of the leaves, one at each joint of the branch. A native of Carthage in New Spain. 59. *C. purpurascens*. Mart. 42. Willd. 9. Swartz. prod. 112. (*C. odorata* minor; Brown. Jam. 318. *C. major* odorata; Sloan. Hist. 1. 258. tab. 158. fig. 1.) "Leaves ovate-lanceolate, ferrated, somewhat downy; stem somewhat herbaceous, simple below, corymbous above; flowers egg-shaped." *Stem* four or five feet high (sixteen or twenty inches; Brown.) *Leaves* on the stem and lower branches four inches long, one inch broad in the middle, on short petioles; on the upper branches much narrower, acute. *Flowers* purple, in round terminal bunches. A native of Jamaica. 60. *C. trinervis*. Mart. 37. Lam. 13. Willd. 10. "Leaves egg-shaped, smooth, three-nerved, quite entire, sessile; flowers in terminal spikes; stem shrubby." Mill. "Leaves ovate-lanceolate, quite entire, smooth, three-nerved; stem-leaves alternate, those of the branches nearly opposite." Lam. *Stem* six or seven feet high, dividing into several woody branches. *Flowers* white. Sent by Robert Millar from Carthage in New Spain. Miller. *Stem* smooth, leafy, full of pith, with numerous lateral and axillary branches. *Leaves* acute, on very short petioles. *Flowers* in a naked, moderate sized, panicle at the summit of the stem and branches; calyx smooth, imbricated with egg-shaped scales; down reddish, longer than the calyx. Found by Commerçon in Brazil. It perhaps may be doubted whether Millar's be the same plant. 61. *C. ferrulata*. Lam. 14. Willd. 11. "Leaves ovate-lanceolate, broader at the base, acutely ferrated, petioled, nearly smooth; corymbs branched, terminal." *Stem* two or three feet high, hard, full of pith, cylindrical, almost smooth, branched. *Leaves* alternate, acute, three-nerved. *Calyx* smooth, imbricated; down reddish. A native of Brazil. 62. *C. madagascariensis*. Lam. 15. Willd. 12. "Leaves lanceolate-linear, dilutely ferrated, smooth; panicle cymous, lax, terminal." *Leaves* three or four inches long, four or five lines broad, erect, quite smooth, on short petioles. *Flowers* small; calyx short, smooth, imbricated; down reddish. A native of Madagascar. 63. *C. candida*. Linn. [Sp. Pl. 12. Mart. 13. Lam. 19. Willd. 16. (*C. cretica* fruticosa, folio molli candidissimo; Tourn. Cor. 33. *C. saxatilis* folio flaginis; Buxb. Cent. 2. 23. tab. 17. *Jacobæa cretica* lucana; Barr. Ic. 217.) "Leaves egg-shaped, downy; flowers crowded; peduncles lateral and terminal." Whole plant white and cottony. *Stem* somewhat shrubby, six inches high or more, rather slender, erect, cylindrical. *Leaves* on long petioles, entire, soft. *Flowers* purple; peduncles one, two, or three-flowered; bracts oblong, sessile, situated just below the calyx; calyx short, imbricated; scales oblong, lanceolate, lax. A native of the island of Candia. Linnæus mentions a rayed variety. 64. *C. verbascifolia*. Willd. 17. (*C. verbasci* foliis ferratis; Tourn. It. 455. Alter tomentosus luteus verbasci folio; Bocc. Sic. 60. tab. 31. fig. 2. After ragufinus; Zann. Hill. 33.) "Leaves egg-shaped, petioled, crenate, obtuse, downy, wrinkled with veins; peduncles one-flowered, solitary, terminal and axillary, thickened upwards." *Stems* like those of *C. candida*. *Leaves* an inch, or an inch and half long, on long petioles. *Flowers* yellow. In other respects similar to the preceding. A native of Sicily, Greece, and Armenia. 65. *C. balsamifera*. Linn. Sp. Pl. 13. Mart. 15. Lam. 11. Willd. 18. (*C. odorata*; Rumph. Amb. 6. tab. 24. fig. 1.) "Leaves oblong-lanceolate, doubly toothed, acute, downy underneath, wrinkled with veins; petioles toothed; corymb terminal, divaricated." *Stem* from four to six feet high, branched. *Leaves* large, profoundly toothed at the base, where they appear pinnatifid,

tifid, very soft; upper ones entire. *Flowers* in terminal panicled racemes; peduncles and calyx clothed with a fine, whitish cottony down; calyx-lobes narrow, awl-shaped; down reddish, longer than the calyx. A native of the East Indies. It has an aromatic smell, resembling that of sage. 66. *C. cinerifolia*. Linn Sp. Pl. 16. Mart. 18. Lam. 4. Willd. 73. Lour. Coch. 496. Burm. Ind. 179. (Senecio amboniensis; Rumph. Amb. 6. 36. tab. 14. fig. 2.) "Leaves lanceolate-egg-shaped, reflex-ferrated, downy underneath; flowers terminal, clustered." *Stem* somewhat shrubby, four feet high, erect, cylindrical, smooth, branched at the top. *Leaves* harshish, petioled, alternate. *Involucres* yellow, peduncled, terminal. *Receptacles* somewhat villous. *Lour.* *Flowers* seldom more than three together. Linn. "The plant described by La Marek, which is cultivated in the Paris garden, has a stem only a foot high, and bluish purple flowers. In other respects it corresponds with the above description." 67. *C. corymbosa*. Mart. 35. Mill. Houft. MSS. "Arborescent; leaves lanceolate; flowers in terminal corymbs, on branching peduncles." *Stem* fourteen or sixteen feet high, divided at the top into many woody branches. *Leaves* alternate, on short petioles. *Flowers* white. Sent by Dr. Houlston from La Vera Cruz in New Spain. 68. *C. laevis*. Mart. 41. "Leaves ovate-oblong, obtuse, ferrated, half embracing the stem; flowers in terminal corymbs." *Stem* ten or twelve feet high, sending out many strong woody branches. *Flowers* purple. A native of Campeachy. 69. *C. tortuosa*. Linn. Hort. Clif. 465. Mart. 12. Willd. 57. "Stem crooked; leaves ovate-oblong, quite entire; racemes reflexed." *Branches* somewhat hirsute, striated, simple. *Leaves* veined, scabrous on both surfaces, on very short petioles. *Flowers* in simple, short, terminal, and axillary racemes, alternate, sessile, turned upwards; calyx roundish, imbricated; scales egg-shaped, inner ones lanceolate; down fetaceous, fastigiata. A native of La Vera Cruz. 70. *C. scandens*. Mart. 36. Mill. Houft. MSS. "Leaves lanceolate, scabrous, nerved, sessile; racemes recurved; flowers ascending; peduncles lateral; stem climbing." *Stem* fourteen or sixteen feet high, much-branched. *Leaves* the size of those of the bay tree, and full as thick in their texture. *Flowers* white, in long unilateral racemes. A native of La Vera Cruz. 71. *C. rigida*. Mart. 43. Willd. 58. Swartz. Prod. 113. "Leaves petioled, inversely egg-shaped, entire, scabrous, veined underneath; spikes zig-zag; flowers unilateral, in pairs." A native of Jamaica. 72. *C. amygdalina*. Lam. 38. "Leaves petioled, ovate-lanceolate, ferrated, somewhat downy; flowers in a terminal corymb." *Leaves* resembling those of the almond-tree, much veined underneath. *Calyx* almost smooth, short, imbricated; scales lanceolate, a little scarious at the edges; down reddish. Found by Commerçon in the Isle of Bourbon. There is a variety with nearly sessile leaves, clothed on both surfaces with a whitish almost silky down. 73. *C. pedunculata*. Mart. 40. "Leaves ovate-lanceolate, three-nerved; peduncles very long, terminal; flowers in a corymb." *Stem* six or seven feet high, branched. *Leaves* smooth, alternate, on short petioles. *Flowers* purple; calyx-scales short, chaffy. A native of Campeachy. 74. *C. melastemoides*. Lam. 40. "Leaves egg-shaped, sessile, toothed, three-nerved, naked and wrinkled above, clothed with a silky down underneath." *Leaves* alternate, sometimes five-nerved, an inch and half long. *Flowers* collected into a dense terminal corymb; calyx-scales linear-acute, almost equal, a little scarious at the edges; down reddish, a little longer than the calyx. Found by Commerçon in the Isle of Bourbon. 75. *C. lobospermifolia*. Lam. 41. Willd. 62. "Leaves lanceo-

late, toothed at the tip, hairy on both surfaces, crowded; inner calyx-scales div." A humble shrub, not more than four or five inches high. *Stem* branched; branches leafy at the summit. *Leaves* narrowed towards the base, almost three-nerved, near an inch and half long. *Flowers* in a terminal corymb; peduncles villous, with narrow bractes; calyx-scales linear-acute; outer ones villous. Found by Commerçon in the Isle of France. 76. *C. lobotryfolia*. Lam. 37. Willd. 67. "Leaves sessile, oblong, quite entire, somewhat downy; corymb terminal, villous; flowers clustered." *Leaves* four or five inches long, one inch broad, growing near each other at the top of the branches, clothed on both surfaces with a cottony reddish down. *Flowers* from four to six in a corymb; peduncles villous; calyx-scales linear, villous; down reddish, longer than the calyx. Found by Commerçon in the Isle of Bourbon. 77. *C. panamerisii*. Willd. 64. "Leaves sessile, ovate-lanceolate, leabrous, quite entire, triply-nerved; panicle terminal." *Stem* cylindrical, striated, smooth. *Leaves* an inch and half long, regularly veined. *Peduncles* long, one or two-flowered; calyx-scales oblong, adpressed; down reddish. 78. *C. pyriformis*. Lam. 36. Willd. 65. "Leaves egg-shaped, acuminate, somewhat toothed, smooth; corymb panicled, lax." *Branches* smooth. *Leaves* alternate, petioled. *Flowers* whitish; calyx short, smooth, imbricated; down reddish, longer than the calyx. Found by Commerçon in the island of Java. 79. *C. argentea*. Lam. 24. Willd. 67. "Leaves egg-shaped, tomentous-silky, half embracing the stem; flowers fissile, terminal, clustered." Abundantly clothed, like a graphalium, with a silvery silky down. *Stem* cylindrical, simple. *Leaves* scattered, numerous. *Flowers* yellow, two or three together; flowers shorter than the calyx; calyx-scales narrow, erect, bearded." Found by Commerçon in the Isle of Bourbon. 80. *C. populosifolia*. Lam. 25. Willd. 68. "Leaves heart-shaped, petioled, downy, quite entire; calyxes hemispherical." *Branches* short, thick, stiff, knotty, cottony, striated, leafy towards the summit. *Leaves* acute. *Flowers* large, from five to seven in a terminal corymb; peduncles an inch long, simple, thickened under the calyx, angular; calyx cottony, imbricated; flowers numerous; down reddish, longer than the calyx, stiffish. Found by Commerçon in the Isle of France. 81. *C. carolinensis*. Willd. 69. Jacq. Ic. rar. 3. tab. 585. "Leaves ovate-lanceolate, quite entire, hoary, downy underneath; corymb terminal, compound." *Stem* five feet high. *Branches* cylindrical, downy. *Leaves* at least two inches long, petioled. *Flowers* violet, small; calyx-scales oblong, downy. A native of Carolina, Florida, and the Bahama Islands. 82. *C. odorata*. Linn. 15. Mart. 17. Lam. 26. Willd. 70. (*C. verbasci* folio undulato; Plum. Sp. 9. Burm. Amer. tab. 97. Tourn. Inst. 455. *C. major* odorata, five barbaensis; Sloan. Jam. Hist. 1. 258. tab. 152. fig. 1. β C. folio verbasci dentato; Plum. Sp. 9. Burm. Amer. tab. 97. Tourn. 455.) "Leaves egg-shaped, petioled, somewhat toothed, downy; flowers aggregate, in a corymb; calyxes hemispherical." An odoriferous shrub, from four to six feet high. *Stem* erect, branched. *Leaves* four or five inches long, more than two inches broad, some entire, others slightly toothed. *Flowers* purple; peduncles short, cottony; calyx imbricated, cottony; scales short, rather obtuse. A native of South America. 83. *C. arborescens*. Linn. Sp. Pl. 18. Mart. 20. Lam. 27. Willd. 71. Plum. Sp. 10. Burm. Amer. tab. 132. fig. 2. (*C. fruticosa* flore pallido purpureo; Sloan. Jam. 124. Hist. 1. 257. *Eupatorium erectum* hirsutum, foliis oblongis rugosis Brown. Jam. 313.) "Leaves egg-shaped, quite entire, acute, downy underneath; spikes recurved, unilateral, bractea

bracts reflexed." Four or five feet high. *Stem* erect, branched towards the top; branches divaricated, sub-divided, bending down, diverging, villous, with a blackish shagreen. *Leaves* two inches long, alternate, on short petioles, wrinkled, green above; pale, pubescent, and nerved underneath. *Flowers* pale purple, in a unilateral spike, or rather raceme. A native of South America. 84. *C. scorpioides*. Lam. 28. "Leaves ovate-lanceolate, petioled, entire, even-furcated; spikis unilateral, revolute, naked." Nearly allied to the preceding, and perhaps only a variety, but its leaves are even-furcated above, and almost smooth underneath. *Flowers* in linear racemes, recurved like the tail of a scorpion; calyx-scales lanceolate; inner ones a little villous at the tip; down white. Found by Commerçon in Brazil. 85. *C. frutescens*. Linn. Sp. Pl. 17. Mart. 1. Lam. 29. Willd. 72. (*C. frutescens*, cydoniaefolio; Plum. Sp. 9. Burm. Amer. tab. 95. fig. 1. Tourn. 455.) "Leaves egg-shaped, quite entire, obtuse; flowers sessile, alternate; branchlets zig zag." A petty shrub, resembling rosemary, but with longer and more slender branches. *Leaves* numerous, alternate, petioled, white with down. *Flowers* purple, axillary, solitary. A native of South America. 86. *C. incisa*. Mart. 29. Willd. 43. Hort. Kew. 3. 184. "Leaves egg-shaped, somewhat heart-shaped, hairy-viscid, toothed, auricled at the base; receptacle honey-combed." Whole plant clothed with viscid hairs. *Stem* three feet high. *Leaves* an inch long, petioled, deeply cut. *Corymbs* terminal, few-flowered, on long peduncles. A native of the Cape of Good Hope, found by Francis Masson. 87. *C. arbutifolia*. Lam. 52. Willd. 74. "Leaves egg shaped, veined, sharply toothed, crowded; flowers sessile, terminal, globular." A smooth shrub, a foot and half high, or more. *Branches* erect, generally fasciculated, leafy on their upper part, naked towards the base, and marked with the scars of fallen leaves, with a decurrent line on each side. *Leaves* scattered, sessile, approximate, narrowed at the base. *Flowers* rather large, clustered; calyx imbricated; scales ovate-lanceolate; down reddish. Found by Joseph Jussieu in Peru. 88. *C. myrsinites*. Lam. 48. Willd. 75. "Leaves lanceolate, two-toothed; flowers globular, somewhat clustered, terminal." *Branches* slender, leafy on the upper part, somewhat angular. *Leaves* small. *Flowers* very small, almost sessile; calyx imbricated; scales egg-shaped, acute, slightly ciliated on the upper edge. A native of St. Domingo. 89. *C. magellanica*. Lam. 47. Willd. 76. "Smooth; leaves very small, ovate-wedge-shaped, obsoletely three-toothed; flowers lateral, solitary, terminating the branchlets." A low, much-branched, spreading shrub. *Leaves* numerous, approximate, obtuse. *Flowers* oval, sessile; calyx-scales egg-shaped. Found by Commerçon in the Straits of Magellan. 90. *C. cuneifolia*. Lam. 46. Willd. 77. (*Erigeron triennetatum*; Linn. jun. Supp.?) "Smooth; leaves wedge-shaped, toothed towards the tip; flowers axillary and terminal, somewhat clustered." Much-branched, viscid. *Leaves* sessile. *Flowers* nearly sessile; calyx egg-shaped, imbricated; scales ovate-acute, a little scarious, fringed towards the tip; down reddish, longer than the calyx. Found by Commerçon near Monte Video, and at the Straits of Magellan. The younger Linnæus's plant was found by Mutis in New Mexico. 91. *C. retusa*. Lam. 39. Willd. 78. "Leaves ovate-wedge-shaped, retuse, crenated near the tip, pubescent; flowers globular, terminal, and axillary, forming a corymb." *Stem* a foot and half or two feet high; branches numerous, cylindrical, naked, and knotty below, leafy near the summit. *Leaves* scattered, thickish, succulent, with three or five longitudinal nerves. *Flowers* whitish; peduncles branched, pubescent; calyx hemispherical, imbricated; scales egg-shaped, inner ones

somewhat scarious and lacerated at the edges; hermaphrodite florets of the disk numerous; female ones of the circumference in two or three ranks. Found by Commerçon in the Isle of Bourbon. 92. *C. buxifolia*. Lam. 50. Willd. 79. "Smooth; branches stiff; leaves oblong-egg-shaped, quite entire; flowers lateral, sessile." About four or five feet high. *Branches* erect, close, somewhat filiform, angular, tubercled, leafy towards the summit. *Leaves* six or seven lines long, scattered, approximate, almost sessile, narrowed towards the base. *Flowers* axillary, solitary; calyx imbricated; scales ovate-oblong, slightly ciliated near the tip; down whitish. Found in Peru by Joseph Jussieu. 93. *C. cartagenensis*. (*C. spicata*; Mart. 39.) "Leaves egg-shaped, three-nerved; flowers in axillary spikes." *Stem* ten or twelve feet high, dividing at the top into many woody branches. *Leaves* an inch long, alternate, sitting close to the branches, acuminate. *Flowers* white. A native of Carthage in New Spain.

** *Leaves decurrent.*

Herbaceous or Shrubby.

94. *C. genifelloides*. Lam. 56. Willd. 80. (Canambaya; Marg. Bras. 78.) "Stems somewhat shrubby, without leaves, nearly smooth; rings interrupted by joints, terminated by a short scale; flowers sessile, lateral, alternate." *Stems* from a foot to three feet long. *Wings* between each joint, broader on one side than on the other, decussated, green. *Flowers* yellow, situated at the joints in the upper part of the plant, solitary in the axil of the scale; calyx round, almost smooth, imbricated; scales ovate-acute; down reddish. A native of Peru. 95. *C. articulata*. Lam. 57. Ill. Pl. 697. fig. 4. Willd. 81. "Stem much branched, interruptedly winged; leaves oblong-elliptical, shorter than the joints; flowers panicled." *Stem* a foot and half high; branches compound, smooth, viscid towards the summit. *Flowers* pale yellow, sessile, almost globular, often clustered together in a kind of terminal spike or panicle; calyx imbricated, scales obtuse. Found by Commerçon at Monte Video. 96. *C. fagittalis*. Lam. 58. Willd. 82. "Leaves decurrent, lanceolate, finely toothed, a little scabrous, green on both surfaces; flowers clustered together at the top of the branches." *Stem* winged as in the two preceding. *Leaves* alternate, two or three inches long. *Flowers* from three to five in a cluster; calyx short; scales egg-shaped, somewhat pubescent; florets numerous; down longer than the calyx. Found by Commerçon at Monte Video. 97. *C. crispata*. Willd. 83. Vahl. 1. 71. Forsk. Arab. 119. n. 495. "Leaves lanceolate, ferrate-toothed, naked; peduncles one-flowered; stem shrubby." Whole plant smooth. *Stem* erect, striated; branches and peduncles with curled tooth-finnated wings. *Leaves* an inch and half long, remote. *Flowers* two or three at the top of the branches; peduncles half an inch long; calyx-scales linear-lanceolate, the length of the florets in the circumference. A native of Arabia Felix. 98. *C. arabica*. Willd. 84. (*Erigeron decurrens*; Vahl. Synb. 1. 72.) "Leaves linear, quite entire, downy; flowers panicled." *Stem* erect, striated, pubescent, downy near the top; branches woody. *Leaves* an inch and half long. *Pedicles* capillary, with two minute bracts near the top; calyxes villous; scales brilliant-shaped, shorter than the down. A native of Arabia Felix. 99. *C. thapsoides*. Willd. 85. Marsch. de Biberst. Fl. Caucas. "Leaves egg-shaped, mucronate, downy; lower ones ferrated; flowers in corymbs." *Root* perennial. A native of Mount Caucasus, near the shores of the Caspian sea. 100. *C. virgata*. Linn. Sp. Pl. 5. Mart. 22. Lam. 53. Willd. 86. (*C. helvii folio*; Pl. Sp. 9. Burm.

Burm. Amer. tab. 98. fig. 2. *C. angulatifolia* subincana; Brown. Jam. 318. *Helichrysum caule alato*; Sloan. Jam. 125. Hill t. 206. tab. 152. fig. 5.) "Leaves linear-lanceolate, finely serrated, downy underneath; spikes terminal, elongated, interrupted." *Root* perennial, woody. *Stem* about two feet high, erect. *Leaves* five or six inches long, alternate, green and smooth above, whitish and downy underneath. *Flowers* pale purple, sessile, lower ones three together, upper ones solitary; calyx oblong, imbricated; scales acute, rather hairy. A native of St. Domingo, Jamaica, and Carolina. 101. *C. rugosa*. Willd. 87. Vahl. Symb. 1. 71. "Leaves elliptical, crenated, downy underneath; flowers in a head." *Branches* woody; wings quite entire, smooth on one side, very downy on the other. *Leaves* an inch and half long, wrinkled, smooth above, downy underneath. *Peduncles* the length of the leaves, from the axils of the upper leaves. A native of Brazil. 102. *C. alopecuroides*. Lam. 54. Willd. 83. Plam. Sp. 9. Burm. Amer. tab. 98. fig. 1. "Leaves egg-shaped, finely serrated, downy underneath; spike terminal, dense, interrupted at the base." *Root* perennial, spindle-shaped, woody. *Stems* about two feet high; wings green on one side, white and downy on the other. *Leaves* alternate; green, smooth, somewhat wrinkled above, whitish and downy underneath. *Flowers* sessile; calyx imbricated, downy at the base; inner scales longer and smooth towards the tip; down rather long. A native of Martinica and Brazil. 103. *C. spicata*. Lam. 55. Willd. 809. Cav. Ic. t. 8. tab. 12. "Stem somewhat shrubby, simple; leaves ovate-lanceolate, finely serrated, downy underneath; spike terminal, dense, entire." *Stem* a foot and half high, erect, striated with green and white. *Leaves* from three to four inches long, six or eight lines broad, alternate, green and smooth above, white and downy underneath. *Flowers* sessile; calyx clothed with a thick down, imbricated; scales narrow-lanceolate, inner ones longer. Female florets intermingled with the hermaphrodites. A native of South America. Obf. As the genera *Baccharis* and *Conyza* now stand, this species belongs to the former. 104. *C. redolens*. Willd. 90. (*Gnaphalium redolens*; Forst. Prod. n. 535.) "Leaves lanceolate, quite entire, downy underneath; spikes terminal, glomerated." *Stem* woody, branched. *Leaves* half an inch long, obtuse. *Spikes* half an inch long; calyxes villous. A native of New Caledonia. 105. *C. decurrens*. Linn. Sp. Pl. 6. Mart. 23. Willd. 91. (*C. alopecuroides*, β . Lam.?) "Leaves lanceolate, finely serrated; stem somewhat dichotomous; flowers axillary, sessile, glomerated." *Root* annual. Whole plant downy. *Stem* about three inches long, erect. A native of the East Indies.

Obf. The only essential distinction between *Baccharis* and *Conyza* consists in the former having the hermaphrodite and female florets intermingled with each other; whereas, in the latter, the female florets are all collected in the circumference, but without rendering the compound flower properly radiate. In dried specimens, it is not always possible to determine these characters with certainty; so that, as La Marek observes, some of the foregoing species may belong to *Baccharis*. Jusseu, Gærtner, and La Marek, are of opinion, that the two genera are scarcely distinct. The latter, however, suggests that two genera might be formed out of them, distinguished by the form of the calyx: one of them with the calyx of *Erigeron*, *i. e.* not properly imbricated, having linear, nearly equal scales in several ranks; the other with the calyx of *Eupatorium*, *i. e.* strictly imbricated. If any of the species should be found to have all the florets hermaphrodite, they must be referred to *Eupatorium*. *Erigeron* differs in having a radiate flower.

Willdenow, in the third part of his third volume, published since our article *Baccharis* went to the press, has added the following species to that genus. 1. *B. viscosa*, 4. Linn. "Leaves elliptical, rather acute, three-nerved, quite entire, petioled; younger ones viscid." *Flowers* in terminal, compound, peduncled corymbs. A native of the Isles Mauritius and Bourbon. 2. *B. arbutifolia*, 6. Vahl. Symb. 3. 97. "Leaves oblong, sessile, rigid, acutely serrated, reticularly veined; corymb terminal; flowers clustered." A smooth shrub. A native of Peru. 3. *B. sessiliflora*, 7. Vahl. 3. 97. "Leaves oblong, sessile, toothed, and entire; flowers terminal, sessile." *Flowers* twice as large as those of *B. halimifolia*. A native of Brazil. 4. *C. villosa*, 9. Vahl. 3. 98. "Leaves lanceolate, petioled, serrated on the upper part, villous-downy underneath." *Branches*, *peduncles*, and *pedicels*, villous-downy. *Corymbs* long, peduncled, fastigiate; calyx-leaves brittle-shaped. A native of Arabia Felix. 5. *C. tridentata*, 12. Vahl. 3. 98. "Leaves sessile, wedge-shaped, even surfaced, three toothed at the tip." *Flowers* in terminal and axillary corymbs. A native of Brazil. 6. *B. dioica*, 13. Vahl. 3. 98. tab. 74. "Leaves wedge-shaped, somewhat retuse, quite entire, even-surfaced, three-nerved; flowers dioicous." *Flowers* from four to seven, sessile, clustered. A native of Montserrat and Dominica.

Conyza asteroides of Linnæus and Martyn is after *Conyzoides* of Willdenow. It is excluded from the present genus by its radiate flower.

CONYZA aegyptiaca juniperifolia; Vaill. See STAEHELINA *Spinosa*.

CONYZOIDES; Dill. See *ERIGERON acre*.

CONZ. See *CONSARBRUCK*.

CONZA, in *Geography*, a town of Naples, in the province of Principato Ultra, considered as the capital of the province; situated at the foot of the Apennines, near the head of the Ofauto; the see of an archbishop. The chief article of its commerce is marble. Distant 48 miles E. of Naples. N. lat. 40° 50'. E. long. 15° 10'.

COOCH BAHAR, or *COOS-BAYHAR*, a district of Balar, in the province of Bengal, separated from that of Rungpore, by the river Durlah. In this district, an usage of a very singular kind has prevailed from remote antiquity, and actually exists at this day. If a reit, or peasant, owes a sum of money, and cannot satisfy his creditor, he is compelled to give up his wife as a pledge, and possession of her is kept till the debt is discharged. It sometimes happens, according to report, that the wife of a debtor is not re-

deemed for the space of one, two, or three years; and then, if during her residence and connection with the creditor, a family shall have been the consequence, half of it is considered as the property of the person with whom she lived, and half that of her real husband. This country has a most wretched appearance, and its inhabitants are a miserable and puny race. Those of the lower ranks, without scruple, dispose of their children for slaves, to any purchaser, and for a very trifling consideration. Nothing is more common, in this unnatural traffic, than to see a mother drags up her child, and bring it to market, with no other view or hope, than to enhance the price she may procure for it. Indeed the extreme poverty and wretchedness of these people will sufficiently appear, when we reflect that the value of the peasant's subsistence amounts to no more than one penny a day, even allowing him to make his meal of two pounds of boiled rice, with a due proportion of salt, oil, vegetable, fish, and chili, the latter of which is a kind of red pepper, in universal use, made from the "capsicum annuum" of Linnæus. The situation of the district exhibits an union of facts, not unfrequently observed, viz. the great facility of obtaining food, and at the same time the wretched indolence of the lower order of inhabitants. Turner's Thibet, p. 11, &c.

COOGHEN, *LEONARD VAN*, in *Biography*, a painter, born at Haarlem in 1610, and scholar of Jac. Jordans. He also amused himself with etching, and published two or three sets of prints, in which the style of Salvator Rosa was imitated with the most happy success. These etchings, several of which represent groups of military figures, are dated from 1664 to 1666. He died in 1681. Heinecken.

COOK, *JAMES*, one of the most eminent navigators and discoverers of unknown territories and seas, recorded either in ancient or modern history, was descended from an obscure family in Northumberland: his father, James Cook, having occupied the humble station of a servant in husbandry, and his mother, whose Christian name was Grace, being a person of the same rank and condition. The subject of this article claims a more distinguished notice, and a more extended detail of particulars, than we have been accustomed to introduce in those biographical sketches that occur in this work. Independently of the singular merit of captain Cook himself, to which a peculiar tribute is due, his voyages and discoveries are so immediately connected with science, both geographical and nautical, as to entitle them to a conspicuous place in a general Dictionary of the Arts and Sciences. The parents of captain Cook, who were noted in their lowly station for honesty, sobriety, and diligence, were settled for some time before his birth at Marton, a village in the North Riding of Yorkshire; and in this place their son James, destined to give celebrity to their name and family, was born on the 27th of October, in the year 1728. Having received the first rudiments of education at his native place, he was further instructed in writing, and the first five rules of arithmetic at Aytton, near which place his father was settled in the service of Thomas Skotow, esq.; and, at the age of 13 years, he was apprenticed to a shop keeper, at Staiths, a fishing town about 10 miles from Whitby. The sea, however, was the object towards which he manifested an early inclination; and, in consequence of some disagreement with his master, he obtained his discharge, and determining to indulge his natural propensity, he bound himself for seven years to Messrs. Walkers of Whitby, quakers by religious profession, who employed two ships in the coal trade. At the expiration of his apprenticeship, he continued in vessels of this description, as a common sailor, till at length he was appointed mate in one of Mr. John Walker's ships. At this time, he was not distinguished by

any peculiar traits of character, though without doubt he must have acquired a considerable degree of knowledge in practical navigation. In the Spring of the year 1755, when hostilities commenced between England and France, Mr. Cook, and the ship to which he belonged, happened to be in the river Thames; and after concealing himself for some time, to avoid being impressed, he determined to enter voluntarily into the British navy. His first situation in his majesty's service, was on board the *Eagle* man of war, to the command of which, captain (afterwards sir Hugh) Palliser was appointed in October 1755. As an active diligent seaman, he recommended himself to the captain's notice; and in consequence of his own acknowledged merit, as well as some private interference, he obtained on the 16th of May, 1759, a master's warrant for the *Grampus* sloop; but this appointment not taking effect, he was made master of the *Garland*, a ship which had failed before he could join her; and therefore, on the 16th of May, he was appointed to the *Mercury*. This ship was destined to North America, where he joined the fleet under the command of sir Charles Saunders, which, in conjunction with the land forces under general Wolfe, was engaged in the famous siege of Quebec. As it was necessary to take the soundings in the river St. Lawrence, between the island of Orleans and the north shore, directly in the front of the French fortified camp at Montmorency and Beauport, Mr. Cook was recommended by captain Palliser, who well knew his sagacity and resolution, to this difficult and hazardous service. He performed it, with great personal risk, to the satisfaction of his employers; and furnished the admiral with a complete and correct draught of the channel and soundings. Before this time, it is thought that he had scarcely ever used a pencil, and that he had no knowledge of drawing. He afterwards surveyed those parts of the river, below Quebec, which navigators had found to be attended with difficulty and danger; this business was executed with his customary diligence and skill; and when his undertaking was finished, his chart of the river St. Lawrence was published, with the necessary soundings and directions for navigating that river. This chart has superseded the necessity of any other. After the expedition to Quebec, Mr. Cook was appointed, by warrant from lord Colville, master of the Northumberland man of war; and in this station, his conduct was such, as to gain him the esteem and friendship of his commander. During the station of his ship at Halifax, he read Euclid, and devoted his leisure hours to the study of astronomy, and other branches of science. In September 1762, the Northumberland came to Newfoundland, to assist in the recapture of the island from the French; and after this service was accomplished, Mr. Cook surveyed the harbour of Placentia, and the heights of the place, with a diligence which engaged the notice of captain (afterwards admiral) Greaves, the governor of Newfoundland. The governor formed a very high opinion of his abilities and character; and this opinion was amply confirmed by the concurring testimony of all the officers under whom he had served. Upon Mr. Cook's return to England, towards the close of the year 1762, he married an amiable woman, who deserved and enjoyed his tenderest affection and regard. Early in the year 1763, he accompanied captain Greaves to Newfoundland, as surveyor of its coasts; and having executed the business that had been assigned him, he returned to England. In April 1764, he was appointed, under the orders of commodore Palliser, marine surveyor of Newfoundland and Labrador; and of the satisfactory manner in which he executed this office, the charts which he afterwards published, afford sufficient evidence. These services were continued till the

year 1767; and whilst he was employed in them, he transmitted to the Royal Society an observation of the eclipse of the sun at Newfoundland, with the longitude deduced from it, (see Phil. Transf. vol. 57.) from which our navigator appears to have already acquired the character of an able mathematician. But a new and more interesting scene opens upon us in the prosecution of these memoirs. A spirit of discovery had been excited towards the latter end of the 15th century, and in the following century it was very vigorous and active; but soon after the commencement of the 17th century, it began to decline: at a subsequent period, during the reign of king George II., it again began to revive; and two voyages were performed for the purpose of discovering a north-west passage through Hudson's Bay. But the noblest displays of this spirit were exhibited during the present reign; and it was reserved for Mr. Cook to furnish the most illustrious example of its influence. Soon after the peace of 1763, two voyages round the world were undertaken by captains Byron, Wallis, and Carteret, to whom we are indebted for several discoveries, which served to extend the knowledge of geography and navigation; but before the return of the two last of these commanders, another voyage was projected, on a more extensive scale than either of the former. The transit of Venus in 1769, which was likely to be observed with the greatest advantage in some of the islands of the South Sea, afforded a peculiar inducement to this expedition; and after a variety of preliminary consultations and debates, Mr. Cook, who was strongly recommended by Mr. Stephens, secretary to the admiralty, and by sir Hugh Palliser, who had long known his abilities and character, was appointed to the command of it, with the rank of a lieutenant in the royal navy, to which he was promoted on the 25th of May 1768. A vessel of 370 tons, called the *Endeavour*, was prepared for this purpose; but before the necessary arrangements were completed captain Wallis returned, and upon being consulted he recommended Port Royal Harbour in George's island, now known by the name of Otaheite, as the most proper place for the proposed observation of the transit. Lieutenant Cook was accompanied by Mr. Charles Green, who had been assistant to Dr. Bradley at the Royal Observatory at Greenwich, and also by Joseph Banks, Esq. now sir Joseph Banks, bart. and president of the Royal Society, and Dr. Solander, gentlemen whose zeal for the promotion of science have been uniform and ardent. Lieutenant Cook had further views in this voyage than the mere observation of the transit, and accordingly, when that business was accomplished, he was directed to pursue further discoveries in the great Southern Ocean. The complement of Cook's ship consisted of 84 persons, besides the commander; she was victualled for 18 months; and furnished with 10 carriage and 12 swivel guns, together with an ample store of ammunition and other necessaries. On the 26th of August our navigators set sail from Plymouth Sound; and on the 1st of September anchored in Tunchiale road, in the island of Madeira. Here they were hospitably entertained; and having laid in a fresh stock of beef, water, and wine, they left the island in the night of the 18th of September. In their way to Rio de Janeiro, they had an opportunity of accounting for that luminous appearance of the sea, which had been often noticed by navigators, and ascribed to various causes. They determined by experiment, fully to their satisfaction, that the flashes which they had observed proceeded from some luminous animal. Their reception at Rio de Janeiro was very different from that which they had met with at Madeira; and it was through mere necessity that they were detained there from the 13th of November to the 7th of the following

following month, when they proceeded on their voyage. On the 14th of January 1799, lieutenant Cook entered the strait of Le Maire, and having contended for some time with a violent tide, he anchored on the next day, first before a small cove, which was understood to be Port Maurice, and afterwards in the bay of Good Success. During the course of the Endeavour in this station, Mr. Banks, Dr. Sclander, Mr. Monkhouse the surgeon, and Mr. Green the astronomer, with their attendants and servants, and two seamen, ascended the mountains in search of plants. This excursion has been often related, and the effect of the cold of the climate is well known. (See COOK. For an account of the inhabitants of the desolate regions adjacent to this strait; see LE MAIRÉ.) It has been a question among former navigators which is the best passage from the Atlantic to the Pacific ocean; and the doubling of Cape Horn has been so much dreaded, that it has been thought more eligible to pass through the strait of Magalhaens or Magellan. Lieutenant Cook has settled this point; for he was no more than 37 days in coming round the land of Terra del Fuego, from the E. entrance of the strait of Le Maire till he had advanced about 12 degrees to the westward and $7\frac{1}{2}$ to the northward of the straits of Magalhaens, and during this time the ship received scarcely any damage; whereas it would have required three months to reach the Pacific ocean through this strait, and in passing it his people would have been much fatigued, and the anchors, cables, sails, and rigging of the vessel would have been much injured. In short, lieutenant Cook, by setting the example of doubling Cape Horn, and by accurately ascertaining the latitude and longitude of different places, as well as by his instructions to future voyagers, has performed the most essential service to this part of navigation. In the prosecution of the voyage from Cape Horn to Otaheite, several islands were discovered, to which were given the names of Lagoon island, S. lat. $18^{\circ} 47'$. W. long. $129^{\circ} 28'$, Thrumb-cap, S. lat. $18^{\circ} 35'$. W. long. $139^{\circ} 48'$, Bow island, S. lat. $18^{\circ} 23'$. W. long. $141^{\circ} 12'$, the Groups, the easternmost in S. lat. $18^{\circ} 12'$. W. long. $142^{\circ} 42'$, Bird island, S. lat. $17^{\circ} 48'$. W. long. $143^{\circ} 35'$, and Chain island, S. lat. $17^{\circ} 25'$. W. long. $145^{\circ} 54'$. Most of these islands were inhabited; and the verdure, or groves of palm-trees, which were visible in some of them, gave them the appearance of a terrestrial paradise to persons who had so lately witnessed the dreary coasts of Terra del Fuego.

On the 13th of April the Endeavour anchored in Port Royal bay, called by the natives "Matavai," in the island of Otaheite. Having fixed upon a place proper for accomplishing the grand object of their commission, they erected an observatory, S. lat. $17^{\circ} 29' 15''$. W. long. $149^{\circ} 32' 30''$, and carried their astronomical quadrant, and some other instruments, on shore. On the following day, very much to their surprize and grief, the quadrant was not to be found. By the judicious and spirited exertions of Mr. Banks, the instrument was restored. The transit was observed with great advantage. A particular account of the observation may be seen in the Phil. Trans. vol. lxi. p. 397. See VENUS. As we shall have occasion to mention some of the leading circumstances that occurred on this and other visits to Otaheite, under that article, we shall attend lieutenant Cook in his departure from the island. Previously to their setting sail, Tupia, one of the natives, the prime minister of Oherea, when he was in the height of her power, and chief priest of the country, who had been a constant companion of the English during their abode on the island, came on board the ship, with a boy thirteen years of age, and intreated that they might be permitted to proceed with them on their

voyage. Lieutenant Cook gladly accepted the proposal. On the 15th of July the English weighed anchor, and whilst they were proceeding on their voyage, Tupia informed lieutenant Cook that at four of the neighbouring islands, which he distinguished by the names of *Huabeine*, *Uiutea*, *Otaha*, and *Bolabola*, they might procure hogs, fowls, and other refreshments, in great abundance. Accordingly, having passed *Telurua*, they approached the N.W. part of Hnaheine on the 16th of July, and in the afternoon anchored in a small but excellent harbour on the W. side of the island, called *Owharee*; and having procured a variety of necessary articles of refreshment, they sailed on the 19th for *Uiutea*, in a good harbour of which the ship anchored on the next day.

The lieutenant hoisted an English jack on this island, and, in the name of his Britannic majesty, took possession of this, and the three neighbouring islands, *Huabeine*, *Otaha*, and *Bolabola*, all of which were in sight. The harbour or bay in which the Endeavour had anchored was called by the native *Oopoo*, and extends almost the whole length of the east side of the island. In its greatest extent it is capable of accommodating any number of ships. After having surveyed the northern and southern parts of this island, they set sail on the 24th; but after encountering considerable danger and discovering several small islands, they returned to *Uiutea*, and cast anchor on the 1st of August in a harbour on the west side of the island. *Tupia* had previously apprized them of the formidable character of the inhabitants of *Bolabola*, but on intercourse with them, and particularly with *Oopoo*, they found there was no foundation for the terrors which *Tupia* had endeavoured to excite. Having finished their necessary repairs, and obtained a fresh stock of provisions, they prepared for leaving the island. The principal islands, about which the English had now spent somewhat more than three weeks, were six in number; viz. *Uiutea*, *Otaha*, *Bolabola*, *Huabeine*, *Tubai*, and *Maurua*; which see respectively. Our voyagers pursued their course till the 13th, when land was discovered bearing S. E., and which *Tupia* informed them was an island called *Oheteroa*. As the inhabitants manifested a hostile disposition, lieutenant Cook, with equal wisdom and humanity, made no attempt for landing. By *Tupia* our navigators were informed, that various islands lay at different distances, and in different directions from *Oheteroa*, between the south and the north-west; and that to the north-east there was an island called *Manua*, or *Bird island*. He also described several islands towards the west; probably *Bolcawen* and *Keppel's islands*, which had been discovered by Captain Wallis. The farthest island towards the south, of which *Tupia* had any knowledge, was called *Moutou*, about three days sail from *Oheteroa*. But his father, he said, had informed him, that there were other islands farther to the south. Lieutenant Cook determined, all circumstances duly considered, to stand southward in search of a continent. On the 15th of August, our voyagers sailed from *Oheteroa*, and on the 30th, in lat. $38^{\circ} 20'$. W. long. $147^{\circ} 6'$, they observed a comet, the tail of which subtended an angle of 42 degrees. On the 6th of October they discovered an extensive tract of land, which they at first conceived to be the "Terra Australis incognita," but which proved, in the event, to be a part of New Zealand. Lieutenant Cook, having anchored, on the 8th, in a bay, at the entrance of a small river, went on shore, accompanied by Mr. Banks and Dr. Sclander, and attended with a party of men, in order to have some intercourse with the natives. They assumed a very hostile appearance; and made attempts for running away with the pinnace, which had been left at the entrance of the river. On the next day they exhibited the same formidable aspect, brandishing their

pikes and lances. Tupia addressed them in a language, which was a dialect of our own and which they understood; informing them that our voyagers only wanted provisions and water, in exchange for iron, the properties of which he explained as far as he was able. Their intentions, however, appeared to be unfriendly; and on the iron and beads, which were presented to them, they seemed to set little value. Tupia told them at length, that if they proceeded to any farther violence, some of them must fall victims to the just retaliation of the English. This salutary counsel, however, produced no effect; and some were killed, and several wounded in the conflict that ensued. The severity exercised on this occasion, was very different from the conduct which Mr. Cook's prudence and humanity suggested in other cases; and, on a calm review, it was not approved by himself; but he pleaded the nature of the service in which he was employed and the necessity of obtaining a knowledge of the country, which he had previously attempted to acquire by kind treatment, and with a view to which he was at length obliged to recur to hostile and fatal measures. The lieutenant finding all his efforts to establish an intercourse with the natives unavailing, determined to re-embark, and on the 11th of the month he left this inhospitable place, which, as it had supplied him with no article except wood, he denominated *Poverty-bay*, called by the natives *Tuomerōa*, or Long Sand, and situated in S. lat. $38^{\circ} 43'$, and W. long. $181^{\circ} 36'$. In this course he spent nearly six months, and made large additions to the knowledge of geography and navigation. By making the whole circuit of New Zealand, he ascertained it to consist of two islands. While the ship was hauling to the south end of a small island, called *Zeabewary* by the natives, and by the lieutenant "Portland island," it suddenly fell into shoal water and broken ground. The inhabitants, perceiving its distress, put off in five canoes, and assumed a very formidable and menacing aspect, and seemed to be prepared for action; and it was its little purpose that guns were fired in order to intimidate them. Whilst some kind of traffic was carrying on with one of the canoes, Tupia's boy, who was standing on the side of the ship, was seized by one of the New Zealanders, and carried off. Upon this atrocious act the marines were ordered to fire; and during the confusion that ensued, the boy made his escape and swam to the ship, though he was pursued by the largest of the canoes. To the cape where this unhappy transaction occurred, Mr. Cook gave the name of "Cape Kidnappers;" it lies in S. lat. $39^{\circ} 43'$, W. long. $182^{\circ} 24'$. Between this cape and the island Portland is a bay, which, in honour of sir Edward Hawke, the lieutenant called "Hawke's bay." While, on the 18th, the Endeavour lay a-breadth of a peninsula within Portland island, called *Terakako*, two of the natives, supposed to be their chiefs, confided so far in Mr. Cook, as to venture on board the ship, and remained there all night, their canoe being hoisted into the ship. On the 23d, while the ship was in *Tegadob* bay, lieutenant Cook went on shore to examine the watering places, and found the water excellent and conveniently situated, and the disposition of the people much more favourable than he expected. This bay is in S. lat. $39^{\circ} 22' 24''$, and W. long. $180^{\circ} 47'$. Here they supplied themselves with as much wood and water as they wanted. On the 28th, some gentlemen of the Endeavour went on shore on an island which lies to the left hand of the entrance of Tolaga bay; and there saw the largest canoe which they had yet observed, her length being $68\frac{1}{2}$ feet, her breadth 5 feet, and her height 3 feet 6 inches. While the ship was in Hicks's bay, the inhabitants of the adjoining coast were found to be very hostile. Early on the 1st of November, they counted 45 canoes coming from the shore towards the Endeavour, and several others

following them from another place. Some of the Indians traded freely; others added derision and insolence to fraud; and though several small shot were fired at them, the canoes merely dropped a-sterm, and set up their song of defiance as they departed from the ship. In standing westward from a small island called *Mawtobera*, the Endeavour encountered some danger amidst the adjacent rocks, but at length it escaped without injury near an island called by the lieutenant the *Mayor*; the inhabitants of the neighbouring coast displayed in many instances their hostility, and, in their traffic with our navigators, committed various acts of fraud and robbery. Here, viz. in S. lat. $36^{\circ} 48' 52''$, lieutenant Cook and Mr. Green made an observation of the transit of Mercury. In the mean while the ship was visited by two large canoes, one of which indicated hostile intentions on the part of its crew. In the course of their traffic, they were guilty of an act of fraud, accompanied with menaces and defiance, which induced Mr. Gore to fire at the offender and to kill him. At length, however, in consequence of small shot fired over their heads, they all fled with the utmost precipitation. On the 10th, our commander, accompanied by Mr. Banks, and the other gentlemen, examined a large river that empties itself into the head of Mercury bay, and found the situation abounding with conveniences, capable of an easy defence, and furnishing beds of excellent oysters; this river Mr. Cook called *Oyster river*. On the 15th he sailed out of "Mercury bay," so called in consequence of the observed transit of Mercury over the sun, and lying in S. lat. $36^{\circ} 47'$, W. long. $184^{\circ} 4'$. Another river lies at the head of the bay, which is the best or safest place for a ship that wants to stay for any length of time. This the lieutenant, observing a number of Mangroves about it, called "Mangrove river." Before the Endeavour left the bay, Mr. Cook, having displayed the English colours, took formal possession of the place in the name of his Britannic majesty, king George III. In the range from Mercury bay several canoes appeared apparently for hostile purposes; but their occupiers were instantly dispersed by a musket ball, fired through one of their boats; although Tupia's oratory had proved ineffectual. While Mr. Cook remained in the "Bay of islands," he took occasion to examine the interior part of the country and its produce. Some circumstances occurred which produced disagreement between the navigators and the inhabitants, and it required singular exertions of prudence, as well as of humanity on the part of Mr. Cook, to bring them to a termination. The number of inhabitants in the Bay of islands was found to be much greater than in any other part of New Zealand which the commander had hitherto visited; and though they did not appear to be united under one head, and though their towns were fortified, they seemed to live together in perfect amity. The Endeavour on the 6th of December, lying becalmed in "Doublets bay," an opportunity offered for making inquiries among the natives concerning their country; and Tupia enabled the lieutenant to learn, that at some distance, at a place called "Moore-whenua," the land would take a short turn to the southward, and thence extend no more to the well. This place the English gentlemen concluded to be the land discovered by Tasman, and which he had named "Cape Maria Van Diemen." The inhabitants, who seemed to be intelligent, farther informed them, that there was a country of great extent, to the N.W. by N. or N.N.W., called *Ulinarua*, where it was understood that the people eat hogs. Our navigators, on the 30th of December, saw the land, which they judged to be "Cape Maria Van Diemen," and which corresponded with the account given of it by the Indians. The next day, they had demonstrative evidence, from the appearance

ance of mount Carmel, that, where they now were, the breadth of New Zealand could not be more than two or three miles from sea to sea. During this part of the navigation, they encountered, in S. lat. 35°, and in the midst of summer, a long-continued and violent gale of wind; but as they were at a considerable distance from the land, they escaped the danger that alarmed them. The shore at "Queen Charlotte's Sound," where the English had arrived on the 14th of January, 1770, seemed to form several bays, into one of which lieutenant Cook proposed to take the ship for necessary repairs, and for obtaining a recruit of wood and water, of which they were supplied with great plenty. On landing they found an Indian family, in which they found horrid and indisputable proofs of the custom of eating human flesh. Evidences of the same custom appeared likewise on several other occasions. Whilst they were near this part of the country, they were entertained with the most enchanting melody of birds, who began their song about two hours after midnight and continued it till sun-rise; thus resembling the nightingales of our own country. Lieutenant Cook, upon ascending one of the hills of the country, had a view of the sea on the eastern side of it, and of a passage leading from it to that of the west, a little east of the inlet where the ship lay. The main land, S. E. of this inlet, appeared to be a narrow ridge of very high hills, forming part of the S. W. side of the strait. On the opposite side, the land trended away E. as far as the eye could reach; and to the S. E. was discovered an opening to the sea, which washed the eastern coast. The lieutenant saw, also, on the E. side of the inlet, some islands which he had before taken to be part of the main land. In returning to the ship, he examined the harbour and coves that lie behind the islands which he had seen from the hills; and he employed the next day in farther surveys and discoveries:—the gentlemen of the ship also accompanied him in visiting a town, which was built upon a small island or rock, very difficult of access, and which consisted of between 80 and 100 houses; the inhabitants of which were very friendly and attentive, and furnished them with a large quantity of dried fish. From a hill of considerable height, which afforded a view of the coast to the N. W., the farthest land that appeared was an island at the distance of about 10 leagues, lying not far from the main; between this island and the place where the commander stood, he discovered, close under the shore, several other islands, forming many bays, in which there appeared to be good anchorage for shipping. On the 30th of January the inlet where our voyagers now lay was named "Queen Charlotte's Sound," and a memorial was erected of their visit to this place. At the same time Mr. Cook took formal possession of this and the adjacent country in the name of king George III.; thus precluding the claims of future navigators, but reserving to the original inhabitants their natural rights. On Monday, the 5th of February, the Endeavour, after encountering a violent storm, got under sail; but was soon obliged to come to an anchor a little above Motuara. Upon inquiring he learnt that there was a distant country, towards the north, called *Ulmaroa*; but he could obtain no farther particulars. Lieutenant Cook, on the 6th of February, got out of the Sound, and in the evening saw two small islands, lying off "Cape Koamaroo," at the S. E. head of Queen Charlotte's Sound, and bearing E. at the distance of about four miles. The rapidity of the stream, occasioned by the tide of ebb, endangered the ship, and it was rescued by some favourable incidents; the narrowest part of the strait through which it was rapidly driven, lies between "Cape Tier-

avite," on the coast of the island of *Eakeinomauro*, and "Cape Koamaroo;" the distance between them being estimated at four or five leagues. During Mr. Cook's long and minute examination of the coast of New Zealand, he gave names to the bays, capes, promontories, islands, and rivers, and other places which he saw or visited; excepting in instances where their original appellations were learned from the natives. After having ascertained New Zealand to be an island, Mr. Cook wished to extend his acquaintance with the country. He completed his circumnavigation, by ranging from "Cape Turnagain," southward along the eastern coast of *Poenamoo*, round "Cape South," and back to the western entrance of the strait which he had passed, and which has been very properly called Cook's *Straits*; which see. In this range an island, lying about five leagues from the coast of *Touy-Poenamoo*, was discovered, and it was named "Banks's island." Lieutenant Cook, pursuing his course to the southward, wished to ascertain, whether *Poenamoo* was an island or a continent. In the prosecution of this object he passed some dangerous rocks on the 9th of March, and on the same day reached a point of land called "South Cape," in S. lat. 47° 19'. W. long. 192° 12', which proved to be the southern extremity of the country. On the 14th the Endeavour passed a small narrow opening in the land, where was a safe and convenient harbour, formed by an island, which lay eastward in the middle of the opening. On the land behind this opening are mountains, the summits of which were covered with snow, that had recently fallen. The land on each side of the entrance of the opening, rises almost perpendicularly from the sea to a stupendous height: and, on this account lieutenant Cook did not chuse to take the ship into the harbour. Before the 27th of March, the commander had circumnavigated the whole country of *Touy-Poenamoo*, and arrived within sight of the island before mentioned, lying nine leagues from the entrance into Queen Charlotte's Sound. With a view of obtaining a supply of water, he hauled round the island, and entered a bay, situated between that and Queen Charlotte's Sound, to which was given the name of *Admiralty-bay*; which see. Lieutenant Cook now directed his views towards Europe; and it was determined to return by the East Indies. In pursuance of this resolution, it was proposed that they should steer eastward till they should fall in with the east coast of New Holland, and then follow the direction of that coast towards the north, till they should arrive at its northern extremity. If that should be found impracticable, it was farther resolved that they should endeavour to fall in with the land, or islands, said to have been discovered by Quiros. For a farther account of *NEW ZEALAND*; see that article.

On the 31st of March our commander sailed from "Cape Farewell" in New Zealand, S. lat. 40° 53'. W. long. 18°, and pursued his voyage towards the west. On the 10th of April "New Holland," or as it is now called, "New South Wales," came in sight; and on the 28th, the ship anchored in *Batany-bay*; which see. During Mr. Cook's stay at this place, he caused the English colours to be displayed every day on shore, and took care that the ship's name, and the date of the year, should be inscribed on one of the trees near the watering-place. On the 6th of May our navigators sailed from this bay; and in their farther progress lieutenant Cook gave the names marked upon the map to the bays, capes, points, and remarkable hills that appeared successively in sight. On the 14th, as the Endeavour advanced to the northward, being then in S. lat. 30° 22'. W. long. 206° 35', the land gradually rose in height, so

that it may be called a hilly country. Between this latitude and Botany-bay, it exhibits a pleasing variety of ridges, hills, valleys, and plains, clothed with wood. On the 17th our navigators were in a bay called "Morston's bay," S. lat. $26^{\circ} 56'$. W. long. $206^{\circ} 28'$; and from appearances they concluded that this bay opened into a river; but they had not then leisure to ascertain the fact. On the 22d, as they were pursuing their voyage from "Harvey's bay," they discovered that the land was covered with olem nut-trees, which they had not seen from the time of their leaving the islands within the tropic. Early in the next day they went on shore, in order to examine the country, and found a channel leading into a large lagoon. Here they discovered a small river of fresh water, and room for a few ships to lie in great security. Near the lagoon grows the true Mangrove, such as exists in the West India islands, and the first of the kind that had been met with by our navigators. Among the islands and shoals they saw many large birds, which they judged to be pelicans, and on the shore a species of bustard of a considerable size and excellent food; so that in honour of it they called the inlet *England-bay*. S. lat. $24^{\circ} 4'$. W. long. $208^{\circ} 18'$. Here they found a number of small pearl-oysters, among others of various kinds; so that Mr. Cook was of opinion, that an advantageous pearl-fishery might be established in this place. On the 25th our voyagers, at the distance of one mile from the land, were abreast of the point which Mr. Cook found to lie directly under the tropic of Capricorn, in W. long. $208^{\circ} 58'$, and he therefore called it "Cape Capricorn." On the 26th the ship, being under sail, was surrounded with islands, which lay at different distances from the main land; and here Mr. Banks, in fishing, took two sorts of crabs, such as had not been seen before; one of them was adorned with a most beautiful blue, equal to the ultramarine, which tinged all his claws and joints, while the under part was white and highly polished; the other was marked with ultramarine, more sparingly, on his joints and toes, and on his back were three brown spots of a singular appearance. Lieutenant Cook finding a passage between the islands, sailed to the northward, and anchored at about two miles distance from the main. A great number of islands were within sight. Here Mr. Cook observing that the tide ebbed and flowed considerably, when the ship had anchored within the inlet, concluded that it was a river that might run pretty far up into the land. Our voyagers having gratified their curiosity with a variety of objects, but being disappointed in their wishes of obtaining fresh water, determined to make a short stay in this place. Before they left it, however, they were desirous of more particularly examining the inlet, in which the ship lay; its breadth was found to be from two to five miles, upon a direction S. W. by S.; but here it opened every way, and formed a large lake, which to the N.W. communicated with the sea. On the south side of the lake was a ridge of hills; and various appearances indicated that the country was inhabited. The country, in general, in this part of New South Wales, appeared sandy and barren, and destitute of the accommodations which would fit it for being possessed by settled inhabitants. This inlet, from its want of fresh water, was called by Mr. Cook "Thirly Sound." S. lat. $22^{\circ} 20'$. W. long. $210^{\circ} 18'$. On the 31st our voyagers left the place and proceeded, till on the 7th of June they perceived on one of the islands, which they were passing, the appearance of cocoa-nut trees; but upon examination, these were mistaken for a small kind of cabbage-palm. On the 8th, when the Endeavour was in the middle of a cluster of small islands, our navigators discerned, with their glasses, upon one of the nearest of them, about 30 of the natives, men, women, and

children, standing together and attentively looking at the ship. This was the first instance of curiosity that had been observed among the people of the country. They were wholly naked; their hair was short, and their complexion resembled that of the other inhabitants that had been before observed. In navigating the coast of New South Wales, for an extent of 22 degrees of latitude, or more than 1000 miles, lieutenant Cook had conducted his vessel in safety; but on the 10th of June, as he was pursuing his course from a bay, which he had called "Trinity bay," the Endeavour fell into a situation peculiarly critical and dangerous; having been lifted over a ledge of rock, and lying in a hollow within it. Her sheathing boards were observed by the light of the moon to be floating away from her, and at last her false keel, so that every moment it was expected the whole company would be swallowed up by the rushing in of the sea. The ship was expeditiously lightened as much as possible, and every exertion was made without murmur and with the greatest alacrity to escape the imminent peril to which their lives were exposed. So sensible were the sailors of the awfulness of their situation, that not an oath was heard among them. When morning dawned upon them they had a clearer view of their danger. Providentially, however, it became a dead calm, and high water came on at eleven in the morning; but it was necessary still further to lighten the ship, and two pumps were instantly worked to discharge the water that rushed in. For the tide at midnight they waited with anxious and awful expectation: in the mean while the leak increased to a very alarming degree; and though the ship righted, it was expected that she must go to the bottom as soon as she ceased to be supported by the rock. The floating of the ship, which in other circumstances, would have been the means of their salvation, was in their situation, a ground of serious alarm; because it might precipitate their destruction. Their possibility of escape was precarious, if the ship sunk; and the coast on which they were to be thrown, if any of them escaped, was inhabited by naked savages, from whose compassion they might derive no relief. The decisive moment at length arrived; and the ship was heaved into deep water, without admitting more water than when she lay upon the rock. The men had experienced long anxiety and were sinking with fatigue, and in an exhausted state they threw themselves upon the deck, and after short intervals and pauses of rest, renewed their laborious and almost fruitless exertion; for the leak gained upon the pumps. In this state of anxiety and labour, an accident occurred, which had almost terminated, at once, all their efforts. The planking which lines the ship's bottom is called the ceiling; between which and the outside planking there is a space of about eighteen inches. From this ceiling only, the man who had attended the well had taken the depth of the water, and had given the measure accordingly. But the person, who relieved him, measured the depth to the outside planking, which had the appearance of the leak's having gained upon the pumps eighteen inches in a few minutes. The mistake, however, was soon detected; and this accident, at first so alarming, became, in the event, highly advantageous. New hopes, from a discovery that their situation was not so dangerous as they apprehended, inspired new vigour; and before eight in the morning the pumps gained considerably on the leak. At eleven o'clock the Endeavour was once more under sail, and stood for the land. They wished, however, to stop the leak; and Mr. Monkhouse, one of the midshipmen, proposed to the commander an expedient which had preserved a merchant ship, which had sprung a leak that admitted more than four feet water

in an hour. This was called *fulbering* the ship. (See FOTHERING.)

The expedient succeeded; and it was owing partly to a fragment of rock, which had filled up one of the holes of the ship, that she did not sink and involve her whole company in inevitable destruction. In consequence of the distress experienced by the whole crew on this occasion, lieutenant Cook called a point in sight, which lay to the northward, in S. lat. $16^{\circ} 6'$. W. long. $214^{\circ} 39'$, "Cape Tribulation." On the 14th a small harbour was discovered, excellently adapted for repairing the damage which the ship had sustained. Another alarming circumstance, which occurred at this time, was the access of the scurvy, that began to make its appearance among the ship's company, and that rendered it still more necessary to get on shore. On the 17th the ship put in for the harbour, the entrance of which was a narrow channel. Tents were erected for the accommodation of the sick; and all of them, except Mr. Green, manifested symptoms of recovery. On the 29th of June an emission of Jupiter's first satellite was observed, from which they obtained the longitude of the place $214^{\circ} 42' 30''$ W., its latitude being $15^{\circ} 26'$ S. A plan of the harbour was taken; and Mr. Cook ascended a hill, from which he observed, to his great concern, innumerable sandbanks and shoals, lying in every direction of the coast. To the northward there was the appearance of a passage, by which lieutenant Cook had the only chance of getting clear, in the prosecution of his voyage. By a large supply of fish, he was able to distribute 2½ pounds to each man; a quantity of greens, being procured, were boiled with the peas: and by these means the ship's company obtained a very considerable refreshment. On the 2d of July our lieutenant sent the master out of the harbour, to sound about the shores, and to search for a passage to the northward. In a subsequent investigation, a passage to the sea was discovered between the shoals, which consisted of coral rocks, and which had furnished cockles of an enormous size, inasmuch that one of them was more than sufficient for two men. Other shell-fish were also found in great abundance. At high water the ship floated; but a leak having been discovered, it was necessary to lay her ashore a second time. The several damages being repaired, the ship was again floated at high water, and preparations were made for proceeding on the voyage. To this harbour Mr. Cook gave the name of "Endeavour river." The master, having been dispatched to re-examine the passage, which he had before discovered, reported that he had been mistaken. In the mean while, the inhabitants of the country, who had been very reserved in holding any intercourse with the navigators, became more familiar, in consequence of the commander's prudent management. Here they discovered an animal, called by the natives *kangaroo*, which, being dressed, proved to be excellent meat; and they were also furnished with great plenty of turtle, superior to any which the gentlemen ever tasted in England. The turtle was of the species called green turtle, and they weighed from two to three hundred pounds. The inland country was agreeably diversified by hills, valleys, and large plains, which in many places were richly covered with wood. The longitude of their station, determined by an observation of the emission of Jupiter's first satellite, July the 16th, was $214^{\circ} 53' 45''$; that on the 29th of June had given $214^{\circ} 48' 30''$, the mean of which was $214^{\circ} 48' 7\frac{1}{2}''$ W. The Indians were very hostile and fraudulent; and so daring and insolent, that nothing would disperse them but small shot repeatedly fired from the muskets. In order to incommode our navigators, they set fire to the grass, which blazed in various directions. On the

4th of August, after frequent unsuccessful attempts to disengage the ship from the harbour, she got under sail; but many difficulties occurred; and on the 5th, the lieutenant had not kept his course long before shoals were discovered in every quarter, which obliged him, at the approach of night, to come to an anchor. On the morning of the 10th, the weather, which had been boisterous, became more moderate, and the commander weighed anchor, and stood in for the land; determining to seek a passage along the shore to the northward. In pursuance of this resolution, the Endeavour proceeded in her course, and at noon came between the farthestmost head-land that lay in sight, and three islands which were four or five leagues to the north of it, out at sea. Here they thought there was a clear opening before them, and began to hope that they were once more out of danger. In this hope, however, they were soon disappointed, and therefore the lieutenant gave to the head-land, in S. lat. $14^{\circ} 56'$. W. long. $214^{\circ} 43'$, the name of "Cape Flattery." After steering for some time along the shore, for what was believed to be the open channel, an officer at the mast-head cried aloud that he saw land ahead, which extended quite round to the three islands; and that between the ship and them there was a large reef. Mr. Cook himself discerned the reef, but was of opinion that the supposed land was a cluster of small islands. In this state of uncertainty, however, he thought it most prudent to come to anchor, under a high point, from which he could have an extensive view of the sea and country. This eminence he called "Point Look-out." In the process of investigating the shoals and channel between them, the lieutenant, accompanied by Mr. Banks, discovered an island on which were no animals except lizards; and he therefore called it "Lizard island." In their return to the ship, they landed on a low sandy island, abounding with an incredible number of birds; and as they here found the nest of an eagle, they called it "Eagle island." At length, after much deliberation, it was resolved to quit the coast entirely, till they could approach it with less danger; and in pursuance of this resolution, the Endeavour, on the 13th, got under sail, and successfully passed through one of the channels or openings in the outer reef, which Mr. Cook had previously observed. The situation of our navigators was now happily changed; and after three months' anxiety and suspense, they found themselves in an open sea, with deep water. The passage or channel, through which the Endeavour passed into the open sea beyond the reef, lies in S. lat. $14^{\circ} 32'$. It is distinguished by the three high islands within it, to which, on account of the use they may be of in guiding the way of future voyagers, our commander gave the appellation of "Islands of Direction." New dangers, which created alarm and required fresh exertions, occurred; but every man did his duty with as much calmness and regularity as if no danger had been near. It was indeed the high and magnanimous spirit of the commander, which inspired his people with such resolution and vigour. On the coast of a new and unknown country he braved all perils, and determined to ascertain whether this country did, or did not, join to New Guinea: a question which he had fixed upon resolving, from the first moment that he had come within sight of land. To the opening, through which he had passed with so much hazard, the commander, under a proper sense of gratitude to the Supreme Being, gave the name of "Providential channel." In the prosecution of the voyage, the navigators, on the 19th, were encompassed on every side with rocks and shoals; but they were little moved, as perils had been familiar to them. On the 21st, as no land could be seen, they conceived hopes of having at last found a passage into the Indian sea: but to

determine this matter with greater certainty, lieutenant Cook resolved to land upon an island, which lies in the S.E. point of the passage. Accordingly he, accompanied by Mr. Banks and Dr. Solander, ascended a high hill, from which no land could be seen between the S.W. and W.S.W.; so that Mr. Cook had not the least doubt of finding a channel, through which he might pass to New Guinea. As he was now about to quit the coast of New Holland, which he had traced from lat. 38° to this place, and where he was certain no European had ever been before, he once more hoisted English colours, taking possession of the whole eastern coast, with all the bays, harbours, rivers, and islands situated upon it, from lat. 58° to lat. $10\frac{1}{2}^{\circ}$ S. in right of his majesty king George III., and by the name of *New South Wales*. Having performed this ceremony upon the island, hence called "Possession island," they re embarked in their boat; and on the 23d Mr. Cook was confirmed by several circumstances in his opinion, that he had arrived to the northern extremity of New Holland, and that to the westward he had an open sea. These circumstances afforded him peculiar satisfaction, not only because the dangers and fatigues of the voyage were drawing to a conclusion, but because it could no longer be doubted whether New Holland or New Guinea were two separate islands. The N.E. entrance of the third lies in S. lat. $10^{\circ} 39'$. W. long. $218^{\circ} 36'$; and the passage is formed by the main land, and by a congeries of islands to the N.W., called by Mr. Cook the "Prince of Wales's islands," and which may probably extend as far as to New Guinea. To the channel through which he passed, he gave the name of "Endeavour straits."

From the coast of New South Wales, the lieutenant steered, on the 23d of August, for the coast of New Guinea; but in the prosecution of his voyage he fell upon a dangerous shoal, which exposed him to great danger; but he fortunately escaped; and on the 3d of September arrived within sight of New Guinea, and brought to within three or four miles of land. Some of the ship's company went on shore, but they were suddenly attacked by the natives, who had for some time concealed themselves in the woods. See NEW GUINEA. Our voyagers leaving this coast, hastened to the westward; and pursuing their course, they discovered on the 6th of September a small island N.N.W.; and another low island, extending from that quarter to N.N.E. Unless these two islands belong to the "Arrou islands," they have no place in the charts; and if they do belong to these, they are laid down at too great a distance from New Guinea. Mr. Cook found the E. part of them in S. lat. $7^{\circ} 6'$. W. long. 225° . On the 7th, when the ship was in S. lat. $9^{\circ} 30'$, and W. long. $229^{\circ} 34'$, our navigators ought to have been in the sight of the Weasel isles, which are laid down in the charts at the distance of 20 or 25 leagues from the coast of New Holland; but Mr. Cook, as he did not see them, concluded that they must have been laid down erroneously. In pursuing their course, our navigators passed the islands of Timor, Timor-lavet, Rotle, and Seman. When they were near these two latter islands they observed a phenomenon in the heavens, in some respects resembling, but in others differing from, the Aurora Borealis. Having passed all the islands between Timor and Java, lieutenant Cook did not expect to meet with any other in that quarter; but on the 17th he observed an island bearing W.S.W., which he thought to be a new discovery. When they came to the N. side of it, they saw houses and cocoa-nut trees, and numerous flocks of sheep. Here they landed; the commander thinking he might thus supply the necessities of the ship's company, and remove both the sickness and the discontent which had spread among them. This proved to be

the island of SAVU; which see. On the 21st of September our navigators left Savu, and on the 11th of October came within sight of the island of Java; and on the 9th they stood in for Batavia road, where the Endeavour was secured from a stroke of lightning by the chain that was attached to it. The injurious effects of this climate were felt by our voyagers within nine days after their arrival; and Mr. Monkhouse, the surgeon of the ship, fell, on the 5th of November, the first sacrifice to this fatal country. Tayeto, Tupia's boy, died the 9th, and Tupia survived him only a few days. The repair of the Endeavour, which had been very much damaged, and which appeared to be in a very alarming state, was an object to which Mr. Cook, though himself affected by the climate, directed his particular attention, and it was performed much to his satisfaction. When this business was accomplished, on the 27th of December, the ship stood out to sea; and on the 5th of January 1771, came to an anchor under the S.E. side of "Prince's island," where the gentlemen of the ship, after having paid their respects to the king, commenced a traffic with the natives for turtles, fowls, fish, monkeys, small deer, and vegetables. On the 15th the commander weighed, and stood out for sea. In the prosecution of the voyage to the Cape of Good Hope, the seeds of disease, which had been received at Batavia, appeared with very threatening symptoms, and reduced the navigators to a very melancholy situation. The ship was a mere hospital; the water taken in at Prince's island was purified with lime; and in order farther to guard against infection, the commander ordered all the parts of the vessel between the decks to be washed with vinegar. So fatal, notwithstanding every precaution, was the disease, that almost every night a dead body was committed to the sea. The loss amounted in all to 23 persons, besides the seven who died at Batavia. Among these were Mr. Green the astronomer, Mr. Parkinson, natural history painter, Mr. Monkhouse the midshipman, another midshipman, &c. &c. These calamitous events contributed most probably to turn the attention of Mr. Cook to those methods of preserving the health of seamen, which he afterwards pursued with such remarkable success. On the 15th of March the Endeavour arrived off the Cape of Good Hope; and a proper place was provided on shore for the accommodation and recovery of the sick. Lieutenant Cook having laid here while the sick of his crew were recovered, necessary stores were procured, and the vessel refitted, till the 14th of April, stood out of the bay, and proceeded on his voyage homeward. In the morning of the 29th, he crossed his first meridian, having circumnavigated the globe in the direction from east to west; the consequence of which was that he had lost a day, an allowance for which had been made at Batavia. On the 11th of May he arrived at St. Helena, and on the 5th he departed from this island, and pursued his course in safety. On the 10th of June, land, which proved to be the Lizard, was discovered; and on the 11th the ship ran up the channel; next morning he passed Beachy head; and in the afternoon of the same day anchored in the Downs, and went on shore at Deal. Thus ended Mr. Cook's first voyage round the world, in which he had gone through so many dangers, explored so many countries, and exhibited the strongest proofs of his possessing an eminently sagacious and active mind; a mind that was equal to every perilous enterprise, and to the boldest and most successful efforts of navigation and discovery.

Mr. Cook having thus recommended himself to the protection of government, and the favour of his sovereign, was promoted in the progressive order of the naval service, to be a commander in his majesty's navy, Aug. 29,

1771; an officer inferior in rank only, but equal in advantage to that of post-captain. On the 21st of May 1772, captain Cook communicated to the Royal Society by a letter to Dr. Maskeyne, "An Account of the flowing of the Tides in the South Sea, &c." (see Phil. Transf. vol. lxii. p. 357-8.) The curiosity of the public was much excited by the reports of lieutenant Cook's voyage; and it was amply gratified by Dr. Hawkefworth's Account, in 3 vols. 4to. Extensive and interesting was the knowledge obtained in consequence of this voyage; but the question concerning a southern continent remained still undecided. The reign of our present sovereign George III. has been favourable to every kind of scientific and literary inquiry; and the earl of Sandwich, who, at the period to which we now refer, was at the head of the admiralty, was eminently capable of comprehending and disposed also to encourage the most enlarged views and schemes with regard to navigation and discovery. By his particular recommendation, it was resolved to appoint a commission for determining the long disputed question relating to the existence of a southern continent. Quiros seems to have been the first person who suggested the idea of such a continent; but though he was sent out to ascertain it, he failed in the attempt. Mr. Dalrymple had now excited the public attention to this object, by his Historical Collection, in 2 vols. 4to. of the several voyages and discoveries in the south Pacific Ocean, 1770, 1771. When the Board of Admiralty determined to take up the business, captain Cook was immediately fixed upon as the person best qualified for conducting an enterprise which was to give the utmost possible extent to the geography of the globe, and the knowledge of navigation. Two ships, similar in construction to the Endeavour, were provided for this purpose; the largest of the two, which consisted of 462 tons burthen, was named the Resolution; and to the other, consisting of 336 tons burthen, was given the name of the Adventure. On the 28th of November 1771, captain Cook was appointed to the command of the former; and, about the same time, Mr. Tobias Furneaux was promoted to the command of the latter. The complement of the Resolution, in officers and men, was fixed at 112 persons, and that of the Adventure at 81. In the equipment of these ships, attention was directed to every circumstance that could contribute to the comfort and success of the voyage. Lord Sandwich was singularly attentive on the occasion; and both the navy and victualling boards took care to procure for the ships the best stores and provisions, together with an ample supply of antiscorbatic articles, such as malt, four krout, salted cabbage, portable broth, soup, mustard, marmalade of carrots, and inspissated juice of wort and beer. Scientific objects were also duly regarded. Mr. William Hodges, an excellent landscape painter, Mr. Reinhold Forster, and his son, well informed in natural history, and Mr. William Wales, and Mr. William Bayley, skilful astronomers, were appointed to accompany the expedition; they were furnished with the best instruments for observation, and particularly with four time-pieces, three of Mr. Arnold's construction, and one of Mr. Kendall's, upon the principles of Mr. Harrison. Captain Cook, on board the Resolution, joined the Adventure in Plymouth Sound, on the 3d of July 1772, and there received his instructions, which comprehended, without entering into a minute detail, the most enlarged plan of discovery that is known in the history of navigation. He was instructed not only to circumnavigate the whole globe, but to circumnavigate it in high southern latitudes, making such traverses, from time to time, into every corner of the Pacific ocean not before examined, as might finally and effectually resolve the much agitated ques-

tion about the existence of a southern continent, in any part of the southern hemisphere, to which access could be had, by the efforts of the boldest and most skilful navigators.

On the 17th of July, captain Cook sailed from Plymouth, and on the 26th anchored in Funchiale road, in the island of Madeira. Having supplied himself with water, wine, and other necessaries, he left the island Aug. 1st, and sailed to the southward. As he proceeded, he made three punchions of beer of the inspissated juice of malt, and the liquor was brisk and drinkable; though on account of the heat of the weather, and the agitation of the ship, the juice was in a high state of fermentation. If it could be kept from fermenting, this would be a most valuable article at sea. At St. Jago, one of the Cape de Verd islands, he stopped to procure a fresh supply of water. On the 20th of the month, they were delayed with rain; but to guard against the pernicious effects of rain on any future occasion, captain Cook took care to well air and dry the ship with fires between the decks, and to smook its damp places; besides, the people were ordered to air their bedding, and to wash and dry their cloaths, whenever they had an opportunity; such was the result of these precautions, that there was not one sick person on board the Resolution. On the 8th of September, the ship crossed the line in W. long. 8°, and proceeded on its voyage. On the 29th, being near the Cape of Good Hope, the whole sea, as far as our voyagers could see, became at once, as it were, illuminated. In order to ascertain the true cause of this phenomenon, which had in the former voyage been attributed to luminous insects, captain Cook examined some buckets of water, and found in them a number of globular insects, about the size of a common pin's head, and quite transparent. Mr. R. Forster was satisfied that these were the cause of the sea's illumination. On the 30th, the Resolution and Adventure anchored in Table bay; and the captains on going a-shore, were received by the governor with great politeness. On the 22d of November, our commander sailed from the Cape, and prosecuted his voyage in search of a southern continent. He directed his course for Cape Circumcision; but, by tempestuous weather, our voyagers were driven far to the eastward of their intended course, being in S. lat. 48° 41'. E. long. 18° 24', so that they had no hopes of reaching this Cape. In this gale, they had the misfortune to lose the principal part of the live stock on board, consisting of sheep, hogs, and geese.

On the 10th of December, in S. lat. 50° 40', and long. 2° E. of the Cape of Good Hope, they began to meet with islands of ice, one of which was judged by captain Cook to be about 50 feet high, and half a mile in circuit. The weather was hazy, and danger was imminent. On the 18th they happily got clear of the field of ice. They were now in S. lat. 55° 8', and long. 24° 3'. An opinion had been entertained, that such ice was formed in bays and rivers; and hence our voyagers were led to conclude, that land was not far distant. But they proceeded without finding it. The whole crew began to complain much of cold, and therefore the captain directed the sleeves of their jackets to be lengthened with baize, and ordered a cap to be made for each, strengthened with canvas. This season, it should be recollected, was with them the middle of summer. As some of the crew appeared to have symptoms of the scurvy, fresh wort was given them every day. By the 29th, the commander was satisfied that the field of ice, along which the ships had sailed, did not join to any land. Determining to run as far W. as the meridian of Cape Circumcision, a gale sprung up on the 31st, which brought with it such a swell

of sea, as rendered a continuance among the ice perilous; our navigators, therefore, hauled to the south. On the 1st of January 1773, the gale abated, and the people had a sight of the moon, which they had observed but once, such was the state of the weather since they had left the Cape of Good Hope. They were now in S. lat. $58^{\circ} 53' 30''$, and E. long. $9^{\circ} 34' 30''$. In this situation, land, if it had existed, might have been at the distance of 14 or 15 leagues; but as it was not visible, captain Cook concluded it to be very probable, that Bouvet had mistaken mountains of ice for land. Upon the whole, there was reason to believe that no land was to be met with under this meridian, between the latitude of 55 and 59 degrees, as some had supposed. From the ice, however, captain Cook derived the advantage of procuring a supply of fresh water, which was sweet, and well tasted. On the fields of ice, they observed penguins, albatrosses, and other birds; but the prevalent opinion, that such birds never go far from land, was now found to be erroneous. On the 17th of January captain Cook, having reached the latitude of $67^{\circ} 15' S.$, could advance no farther; and as the ice towards the south exhibited no appearance of any opening, he thought it prudent not to persevere in sailing farther southward, more especially as the summer was already half spent, and there was no prospect of being able to get round the ice. He, therefore, determined to search for the land which had lately been discovered by the French, and separated the ships at an interval of four miles, the weather being occasionally clear, as the best method of investigation. On the 1st of February our voyagers were in S. lat. $48^{\circ} 30'$, and E. long. $58^{\circ} 7'$, nearly in the meridian of the island of St. Mauritius. From the perpetual high sea which had been lately met with, captain Cook inferred that there could be no great extent of land to the west. But whilst he was steering eastward, in S. lat. $40^{\circ} 13'$, captain Furneaux suggested that the land was to the N.W. of them, as he had observed the sea to be smooth when the wind blew in that direction. Captain Cook, in deference to this opinion, pursued the search; and the result was a conviction, that, if any land was near, it could be only an island of inconsiderable extent. In this part of the southern ocean the mean variation of the compass was $29^{\circ} 4' W.$ When the sun was on the starboard of the ship, the variation was the least; and when on the larboard side, the greatest. A separation now took place between the two ships, and the Resolution was under a necessity of pursuing its voyage alone. As they proceeded they were satisfied that the sight of oceanic birds, which frequent high latitudes, are no sure signs of the vicinity of land. In the morning of the 17th, lights were seen in the heavens, similar to those which are known in the northern hemisphere under the appellation of Aurora Borealis. On the 20th our navigators thought they saw land to the south-west; but they found, on endeavouring to approach it, that they had been deceived by clouds, and nothing could be discerned but ice islands. At night the Aurora Australis was again seen, assuming a very brilliant and luminous appearance, discovering itself first in the east, and soon spreading over the whole heavens. On the 23d, in S. lat. $61^{\circ} 52'$, E. long. $95^{\circ} 2'$, our navigators, in the midst of mountains of ice, were on every side surrounded with danger; and hence captain Cook was led to alter his purpose of once more crossing the Antarctic circle; and on the 24th he stood to the north, exposed to the hazard of injury from large pieces of broken ice, in very thick and hazy weather. In sailing from the 25th to the 28th captain Cook was convinced to a certainty, that no land, of any considerable extent, could lie within 100 or 150

leagues from east to south-west. As he proceeded on his voyage from the 28th of February to the 11th of March, he had ample reason for concluding, from the swell of the sea and other circumstances, that there could be no land to the south, that did not lie at a great distance. By observation of the sun and moon on the 13th and 14th they were in S. lat. $58^{\circ} 22'$, E. long. $136^{\circ} 22'$. Mr. Kendall's and Mr. Arnold's watches gave each of them $134^{\circ} 42'$; and this was the first and only time, in which they had pointed out the same longitude since the ships had left England: the greatest difference, however, between them, since our navigators had left the Cape, had not much exceeded two degrees. Farther evidence occurred to our commander, as he advanced in his course, that he had left no land behind him, in the direction of W. S. W., and that no land lay to the S. on this side of 60 degrees of latitude. On the 17th he therefore determined to quit the high northern latitudes, being now in S. lat. $59^{\circ} 7'$, and E. long. $146^{\circ} 53'$, and to proceed to New Zealand, in search of the Adventure, and for the refreshment of his people. He had also a desire of visiting the east coast of Van Diemen's land, in order to gain satisfaction whether it joined the coast of New South Wales. But the wind preventing his accomplishing this object; he shaped his course for New Zealand, and came to anchor on the 26th in "Dusky bay." He had now been 117 days at sea, in which time he had sailed 3660 leagues, without once coming within sight of land. So salutary had been the effects of sweet wort and several articles of provision, and especially of the frequent airing and sweetening of the ship, that there was only one man on board who could be said to be afflicted with the scurvy; and his disorder was occasioned by a bad habit of body and a complication of other diseases. On the 27th the ship entered "Peckerfkill Harbour," so called from the name of the gentleman by whom it had been first discovered, and situated in S. lat. $45^{\circ} 47' 26'' S.$ and E. long. $166^{\circ} 18'$. Here wood for fuel and other purposes was immediately at hand: and a fine stream of fresh water was not above 100 yards from the stern of the vessel. Having selected a suitable place on the shore for future operations, captain Cook employed some of the crew in the brewing of beer from the branches or leaves of a tree resembling the American black spruce, which, with the addition of the inspissated juice of wort and melasses, would make, as he knew, a very wholesome liquor, and supply the want of vegetables of which the country was destitute. While captain Cook continued in this situation, he took every opportunity of examining the bay. See *Dusky Bay*.

On the 11th of May, captain Cook left Dusky bay, and directed his course for Queen Charlotte's Sound, where he expected to find the Adventure; but on the 17th, the wind flattened to a calm, the sky became suddenly obscured by dark dense clouds, and there was every prognostication of a tempest. Soon after six water spouts were seen, four of which rose and spent themselves between the ship and the land; but they all spent themselves without doing any injury. On the next day the Resolution came within sight of Queen Charlotte's Sound, and there capt. Cook had the satisfaction of finding the Adventure; after a separation of fourteen weeks, captain Furneaux had an opportunity of examining Van Diemen's land; and it was his opinion that there are no straits between this land and New Holland, but a very deep bay. He met likewise, with farther proofs, that the New Zealanders are eaters of human flesh. On the morning after captain Cook's arrival in Queen Charlotte's Sound, he went on shore and returned with a boat-load of scurvy-grass, celery, and other vegetables; and he

gave orders that they should be boiled, with wheat and portable broth, every day for breakfast, and with pease and broth for dinner. Experience had taught him that these vegetables, thus dressed, are very beneficial to seamen, in removing various scorbutic complaints. The intercourse with the natives of the country was of a friendly nature; and proved advantageous in a variety of respects, particularly in supplying a quantity of fish. On the 2d of June, when the ships were almost ready to put to sea, captain Cook sent on shore a male and female goat; and captain Furneaux left at Cannibal cove, two breeding fows, and a boar. It is a remarkable circumstance, that during captain Cook's second visit to Charlotte Sound, he could not recollect the face of any one person he had seen three years before, nor did it appear that a single Indian had any knowledge of him. Hence he infers, that in the interval the natives had either been driven away, or had removed, of their own accord, to some other situation. Not one-third of the inhabitants, formerly observed, seemed to be now there; their strong hold on the point of Motuara was deserted, and in every part of the Sound many forsaken habitations were discovered.

In the captain's opinion, the place had never been very populous. From comparing the two voyages, it appears that the Indians of Eabei-nomaue are in somewhat of a more improved state of society than those of Tavai-poanamo. During captain Cook's stay in the Sound, he had observed that the second visit to this country had not mended the morals of the natives of either sex. He had always looked upon the females of New Zealand as more chaste than the generality of Indian women. But he was now told, that the male Indians were the chief promoters of a shameful traffic, and that, for a spike-nail, or any other thing they valued, they would oblige the women to prostitute themselves, whether it was agreeable or contrary to their inclinations. At the same time, no regard was paid to the privacy which decency required. The account of this fact must be read with concern by every well-wisher to the good order and happiness of society, even without adverting to considerations of a higher nature. On the 7th of June captain Cook put to sea from Queen Charlotte's Sound together with the Adventure; and on the 11th of August, when they were in S. lat. $25^{\circ} 1'$, and W. long. $134^{\circ} 6'$, they were nearly in the situation assigned by captain Carteret for "Pitcairn's island," discovered by him in 1767; but they did not observe it. As our commander advanced in his course, every circumstance concurred to convince him that between the meridian of America and New Zealand there is no southern continent; and that there is no continent farther to the south unless in a very high latitude. But the investigation and decision of the fact were reserved for the employment of the ensuing summer. It was the 6th of August before the ships had the advantage of the trade wind; which they got at S.E. in S. lat. $19^{\circ} 36'$, W. long. $131^{\circ} 32'$. Having obtained this wind, captain Cook directed his course to the W.N.W. and proceeded in the track pursued by M. de Bougainville. To four of the islands which he passed, he gave the names of "Resolution island," "Doubtful island," "Furneaux island," and "Adventure island," which see respectively. These are supposed to be the same that were seen by M. de Bougainville; and they, with several others, constitute a cluster of low and half-drowned isles, which that gentleman distinguished by the name of the Dangerous Archipelago. On the 15th of August the ships came within sight of "Ofnaburg island," or Maitea, which had been discovered by captain Wallis. Having escaped being

wrecked on the coast of Otahite, they anchored, on the 17th, in Oaitipha bay, near the S.E. end of the island; and they were immediately crowded with the inhabitants of the country, who brought with them cocoa-nuts, plaitains, bananas, apples, yams, and other roots, which were exchanged for nails and beads. On the 24th the ships put to sea, and arrived the next evening in Matavai-bay; but before they could come to anchor, the decks were crowded by the natives, many of whom were known to captain Cook or by most of whom he was well remembered. At Oparree the tents and astronomer's observatories remained, on the same spot from which the transit of Venus had been observed in 1769. As soon as the sick were recovered, the water completed, and the necessary repairs of the ships finished, captain Cook determined to put to sea, and on the 1st of September he ordered the vessels to be unmoored. In the mean while lieutenant Pickersgill returned from Attahourou, where he had been to procure hogs; and in this expedition he had seen Oherea, in a very humble situation, compared with that which she had formerly occupied. In the evening of this day a favourable wind having sprung up, the commander put to sea; on which occasion he dismissed his Otahite friends sooner than they wished to depart; but well satisfied with his kind and liberal treatment. From Matavai captain Cook directed his course for the island Huahine; this he reached the next day, and on the 3d of September anchored in the harbour of Owharre. Both the captains landed upon the island, and being cordially received by the natives, commenced a trade with them. Every thing was conducted with mutual confidence and harmony till the 6th, when several circumstances occurred on the part of the natives, which interrupted the friendly intercourse. Captain Cook at length complained to Orco, the king, of their insolence and frauds, who was much concerned on the occasion; and exerted himself to obtain redress and to punish the delinquents. It was from the island Huahine that captain Furneaux received into his ship a young man named Omai, a native of Uliteta, of whom so much hath since been known and written. This choice was at first disapproved by captain Cook, who thought that this youth was not a proper sample of the inhabitants of the Society islands; being inferior to many of them in birth and acquired rank, and not having any peculiar advantage with respect to shape, figure, or complexion. The captain afterwards found reason to be better satisfied with Omai's having accompanied our navigators to England. At Huahine the vessels, though their stay was short, obtained very plentiful supplies of provisions. Not less than 300 hogs, besides fowls and fruit, were procured. From Huahine our navigators sailed for Uliteta, where trade was carried on in the usual manner, and a most friendly intercourse renewed between captain Cook and Orco, the chief of the island. An interruption took place in the intercourse between the ships and the natives, which was occasioned by a misapprehension on the part of the latter, and which upon proper explanation, was soon rectified. So that provisions were furnished at Uliteta no less plentifully than at Huahine. Captain Cook estimated that the number of hogs, which had been obtained, amounted to 400 or upwards. Our commander, by his second visit to the Society islands, gained a farther knowledge of their general state and of the custom of the inhabitants. With regard to a certain disorder, captain Cook was not able to determine whether it was known to the islanders before they were visited by the Europeans; but he found upon inquiry that the introduction of it, if of recent origin, was unanimously ascribed to the voyage of M. de Bougainville.

ville. Captain Cook wished to satisfy himself, whether human sacrifices constituted a part of the religious customs of these people. From Omai he afterwards learned that the inhabitants of the Society islands offer human sacrifices to the Supreme Being. The knowledge he was able to obtain concerning their religion was very defective. With regard to the character of their women, he was enabled to rectify a prevailing error; and he does them justice by informing us, that the favours both of the married women and of the unmarried, of the better sort, were as difficult to be obtained in the Society islands as in any other country. And as to the unmarried females of the lower class, there were many who would not admit of any indecent familiarities. This voyage enabled our commander to gain some further knowledge concerning the geography of the Society isles; and he found it highly probable, that Otaheite is of greater extent than he had computed it in his former estimation. On the 17th of September captain Cook sailed from Ulieeta, directing his course to the west, with an inclination to the south. Land was discovered on the 23d, to which he gave the name of "Harvey's island." S. lat. $19^{\circ} 18'$. W. long. $158^{\circ} 54'$. On the 1st of October he reached the "island of Middleburg." From Middleburg the ship sailed to "Amsterdam," the natives of which island were no less disposed than those of the former to maintain a friendly intercourse with the English. A few old rags at this island were sufficient for the purchase of a pig or a fowl.

Although the natives of Amsterdam were of a friendly disposition, they were not entirely free from the thievish propensity which pertained to the islanders of the Southern Ocean. The two islands of Middleburg and Amsterdam are guarded from the sea by a reef of coral rocks, extending from the shore about 100 fathoms. Similar to this, in a great measure, is the situation of all the tropical isles which our commander had seen in that part of the globe; and hence arises an evidence of the wisdom and goodness of Providence; as by such a provision nature has effectually secured them from the encroachments of the sea, though many of them are mere points, when compared with the vast ocean by which they are surrounded. The two islands above-mentioned are situated between the lat. of $21^{\circ} 29'$ and $21^{\circ} 3'$ S., and between the long. of $174^{\circ} 40'$ and $175^{\circ} 15'$ W. See AMSTERDAM and MIDDLEBURG.

On the 7th of October captain Cook proceeded on his voyage: next day he passed the "island of Pillstait," discovered by Tanorani, and situated in S. lat. $22^{\circ} 26'$. W. long. $175^{\circ} 59'$. On the 21st he made the land of New Zealand, at the distance of 8 or 10 leagues from Table cape. To a chief, who came off in a canoe, he gave two boars, two fows, four hens, and two cocks, and a quantity of seeds, of wheat, French and kidney beans, pease, cabbage, turnips, onions, carrots, parsnips, and yams. On the 3d of November the Resolution was brought into Ship Cove, in Queen Charlotte's Sound. After his arrival, the first object of the captain was to provide for the repair of his ship, and the next to examine into the state of his bread, much of which had become unfit for use. To the inhabitants, who resided at the Cove, he gave a boar, a young fow, two cocks, and two hens, which he had brought from the Society Islands; and at the bottom of the west bay he ordered to be landed three fows and a boar, together with two cocks and two hens; together with as much food as would last them 10 or 12 days. In the second visit of our navigators to New Zealand, they met with indubitable evidence that the inhabitants were eaters of human flesh; but it was captain Cook's firm opinion, that the only flesh that was eaten by these people

was that of their enemies who had been slain in battle. Our commander did not leave New Zealand without making such remarks on the coast between Cape Teera-white and Cape Palliser, as may be of use to future navigators. As the Adventure had been separated from the Resolution, and was thought to be no where upon the island, captain Cook gave up all hopes of seeing her any more during the voyage. On the 26th of November the captain sailed from New Zealand, in search of a continent, and steered to the south, inclining to the east. Some days afterwards, our navigators reckoned themselves to be antipodes to their friends in London, and consequently at as great a distance from them as possible. The first ice island which they saw, was on the 12th of December, in S. lat. $6^{\circ} 10'$. W. long. 172° . In the progress of the voyage such islands continually occurred, and the navigation became daily more difficult and dangerous. In S. lat. $67^{\circ} 5'$, our voyagers all at once got within such a cluster of these islands, and of loose pieces, that they found it almost impossible to escape. However, being relieved, the Resolution, on the 22d of the month, was in the highest latitude she had yet reached, viz. $67^{\circ} 31'$. W. long. $142^{\circ} 54'$; and circumstances became so unfavourable, that captain Cook determined to return towards the north. Here was no probability of finding land, or a possibility of getting farther south. As our navigators advanced to the N. E., on the 24th, the ice-islands increased very much upon them; and in the middle of about 100, they spent Christmas day. As captain Cook, agreeably to his late resolution, had traversed a large extent of ocean, without seeing land, he again directed his course towards the south; and by the 30th of January, 1774, after encountering innumerable obstructions, he reached to S. lat. $71^{\circ} 10'$. W. long. $106^{\circ} 54'$. Farther it would have been extreme folly to have proceeded. The captain was of opinion, in which most of the gentlemen on board concurred, that the ice now in sight extended quite to the pole, or might join to some land, to which it might have been fixed from the earliest time. Compelled at last by inevitable necessity to tack, and to stand towards the north, captain Cook formed a resolution of spending the ensuing winter within the tropic. He was well satisfied, that no continent was to be found in this ocean, but that which must lie so far south as to be wholly inaccessible, on account of ice. If a continent existed in the Southern Atlantic Ocean, he was sensible that he must have the whole summer before him, in order to explore it. Upon the supposition, that no land could be found, he might reach the Cape of Good Hope by April: in that case he would have finished the business of finding a continent, which was indeed the first object of the voyage. But this could not satisfy the comprehensive and magnanimous mind of our commander. He had a good ship, expressly sent out on discoveries, a healthy crew, and wanted neither stores nor provisions. In such circumstances, to have quitted this Southern Pacific Ocean would have been betraying, as he thought, not only a want of perseverance, but of judgment, in supposing it to have been so well explored, that nothing farther could be done. Although he had proved that, if there were a continent, it must lie far to the south, there remained room for very large islands, in places as yet unexamined. He was also persuaded, that his continuing for some time longer in this sea would be serviceable to geography and navigation, and other sciences. Thus he reasoned; and accordingly it was his intention first to go in search of the land, said to have been discovered by Juan Fernandez, in the last century, in about the lat. of 38° ; and if he failed in finding this land, he proposed to direct his course in quest of "Easter Island," or "Davis's land." He next intended to go within the tropic, and

and so proceed westward till he arrived at Otaheite, where it was necessary for him to explore the Adventure. It was also in his contemplation to run as far west as the "Terra Australis del Espíritu Santo," discovered by Quiros, and called by M. de Bougainville the "Great Cyclades." Hence he proposed to steer to the south, and to back to the east, between the latitudes of 50° and 60° . In the execution of this plan, it was his purpose to attain the length of Cape Horn, in the ensuing November, when he should have the best part of the summer before him, to explore the southern part of the Atlantic ocean. When he communicated this extensive plan, comprehending hazards and difficulties without number, to his officers, they unanimously and cheerfully concurred. In pursuing his course to the north, captain Cook became well assured that the discovery of Juan Fernandez, if any such was ever made, could be nothing more than a small island. Our captain was at this time confined to his bed by a bilious colic: by the attention of Mr. Patten, the surgeon, he was relieved, and at length the disorder subsided; but his stomach was so weak, that he could taste nothing but the broth and flesh of a favourite dog, belonging to Mr. Forster. On the 11th of March our navigators came within sight of "Earler island," or "Davis's land," in S. lat. $27^{\circ} 5' 30''$, W. long. $169^{\circ} 46' 20''$. On the 6th and 7th of April they came within sight of four islands, which they knew to be the "Marquisas." To one of them captain Cook gave the name of "Hood's island;" and as soon as the ship was brought to an anchor in Madre de Dios, or Resolusion bay, in the island of "Christina," a traffic commenced, in the course of which the natives would frequently keep the goods, without making any return. Theft was so common, that it was impossible to guard against it; and one of the thieves was accidentally killed by a shot, in the act of stealing. After some time the trade was carried on in a better manner; and the ship was supplied with yams, plantains, bread-fruit, a few coco-nuts, fowls, and small pigs. From the Marquesas captain Cook steered for Otaheite, with a view of falling in with some of the islands discovered by former navigators, and especially by the Dutch, the situation of which had not been accurately determined. In the course of the voyage he passed a number of low islets, connected together by reefs of coral rocks. One of these islands was "Tioukea," discovered and visited by Byron. Besides passing by "St. George's islands," so named by captain Byron, captain Cook discovered four others, which he called "Palliser's isles." On the 22d he anchored in Matavai bay, at Otaheite, where he took measures for the repairs of the ship. During his stay at Otaheite, he maintained a most friendly connection with the inhabitants; and a continual interchange of visits took place between him and Otoo, Towka, and other chiefs of the country. On the 15th of May, our captain anchored in O'wharre harbour, in the island of Huahine, where he procured bread-fruit, coco-nuts, and other vegetables in abundance; but there was a scarcity of hogs. When they were leaving the island, the good old chief, Oroo, was the last man that left the vessel. At parting, captain Cook told him that they should meet each other no more: Oroo wept, and said, "let your fous come, we will treat them well." At Uieeta nothing particular occurred. It was the last request of Oroo, the chief, to captain Cook, that he would return; and when he could not obtain a promise to that effect, he asked the name of his burying place. Oroo's anguish at parting was very great: "he looked up at the ship, burst into tears, and then sunk down into the canoe." On the 6th of June, the day after our voyagers left Uieeta, they saw land, which they found to be a low reef island, about four leagues in compass, and

of a circular form, called "Howe island," discovered by captain Wallis, and situated in S. lat. $16^{\circ} 46'$, W. long. $154^{\circ} 8'$. Another reef island was seen on the 16th, to which captain Cook gave the name of "Palmerston island," in S. lat. $18^{\circ} 4'$, W. long. $163^{\circ} 10'$. On the 20th land was again seen, called by captain Cook "Savage island," S. lat. $19^{\circ} 1'$, W. long. $169^{\circ} 37'$. Pursuing his course to the W.S.W., captain Cook sailed by a number of small islands, and on the 26th anchored on the north side of "Anamooka," or "Rotterdam," S. lat. $20^{\circ} 15'$, W. long. $174^{\circ} 31'$. While the captain was on shore at this island, he got the names of 20 islands which lie between the N.W. and N.E.; but two of them are most remarkable on account of their great height, viz. "Amatatafa," and "Oghao." From the N.W. to the S. of Rotterdam, round by the E. and N., it is encompassed by many small isles, sand-banks, and breakers: no termination of them could be seen to the N., and they may possibly reach as far S. as Amsterdam, or Tongataboo. Together with Middleburg or Eaoowe and Piliart, these form a group, containing about three degrees of latitude and two of longitude; and captain Cook called them the "Friendly isles, or Archipelago." Pursuing their course to the west, our navigators discovered land on the 1st of July, which they found to be a small island, to which captain Cook gave the name of "Turtle isle," on account of the number of turtle which were seen on the coast. On the 16th high land was seen to the S.W., which was the Australis del Espíritu Santo of Quiros, or the Great Cyclades of M. de Bougainville. After exploring the coast for some days, the captain anchored in a harbour of the island of "Mallicollo," which he called "Port Sandwich," situated on the N.E. side of the island, not far from the S.E. end, in S. lat. $16^{\circ} 25' 20''$, E. long. $167^{\circ} 57' 23''$. On the 23d of July our navigators, having gotten to sea, discovered three or four small islands; and at this time the Resolusion was not far from the "isle of Ambryu," "the isle of Paoom," and "the isle of Apee;" S.E. of which latter island was discovered a group, which captain Cook called "Shepherd's isles." Amidst the number of islands now observed, one only appeared to be uninhabited: it consisted of a remarkable peaked rock, accessible only to birds, and obtained the name of the "Monument." In the farther course of the ship to the southward, our navigators approached other islands, which they found to consist of one large island, and three or four smaller ones. The two principal of the latter were called "Montagu" and "Hinchinbrook;" and the large island captain Cook named "Sandwich," in honour of his patron, the earl of Sandwich. Pursuing his discoveries, he came to an island, called by the natives "Erromangu," in a bay of which he anchored. As the inhabitants behaved treacherously, captain Cook called a promontory, or peninsula, near which a skirmish happened, "Traitor's Head," in S. lat. $18^{\circ} 43'$, E. long. $169^{\circ} 28'$. From this place the captain sailed for an island, before discovered, on which he proposed to make some stay, for the purpose of obtaining a supply of wood and water. This island was called "Tanna;" and three others near it were distinguished by the names of "Immer," "Errona," or "Footoona," and "Annatou." The harbour in which he anchored was called by him "Port Resolusion," after the name of the ship; it was situated in S. lat. $19^{\circ} 3' 25\frac{1}{2}''$, and E. long. $169^{\circ} 44' 55''$. To this Archipelago, or group of islands, which captain Cook particularly examined, he gave the name of "New Hebrides." The season of the year came on when captain Cook proposed to return towards the south; but he improved the intervening time in exploring any land which he might yet meet with between the New Hebrides

Hebrides and New Zealand, at which place it was his intention to refresh his people, and to renew his stock of wood and water for another southern course. Sailing with this view, September the 1st, he discovered land on the 4th; and the Resolution anchored next day in a harbour belonging to it. The inhabitants behaved to him in a very civil and friendly manner; and he returned their kindness with presents to their chief. Captain Cook gave this island the name of "New Caledonia." On one of the small adjoining islands the captain found a species of spruce pine, of which spars and very good mats might be made, and called it the "isle of Pines." To another, which afforded ample employment to the botanists, he gave the name of "Botany isle." The captain, before he left this island, was enabled so far to survey it as to ascertain, that, excepting New Zealand, it is probably the largest island in the South Pacific ocean. Another island was observed of good height, and five leagues in circuit, to which was given the name of "Norfolk isle," in S. lat. $29^{\circ} 2' 30''$. E. long. $168^{\circ} 16'$. On the 18th of October our captain anchored in Ship Cove, in Queen Charlotte's Sound, on the coast of New Zealand; and his intercourse with the inhabitants was altogether peaceable and friendly. Mr. Wales, on this occasion, accurately ascertained the latitude and longitude of this sound, and found the bottom of Ship Cove to be in S. lat. $41^{\circ} 5' 56\frac{1}{2}''$, and E. long. $174^{\circ} 25' 7\frac{1}{2}''$. The 10th of November captain Cook left New Zealand, in the prosecution of his great object, or the determination of the question concerning the existence of a southern continent. Having sailed in different latitudes, extending from 43° to $55^{\circ} 48'$ S., till the 27th, the ship being in W. long. $138^{\circ} 56'$, he gave up all hopes of finding any more land in this ocean. He therefore resolved to steer directly for the west entrance of the straits of Magalhaens, with a view of coasting the S. side of Terra del Fuego, round Cape Horn, to the strait Le Maire. In the prosecution of this voyage, on the 17th of December, he reached the W. coast of Terra del Fuego, and on the 20th anchored in a place to which he gave the name of "Christmas Sound." The whole coast and country were desolate and uninteresting. Near every harbour, however, fresh water and wood for fuel were obtained. The country also abounds with wild fowl, and particularly geese. See CHRISTMAS SOUND, and Terra del FUEGO. On the 28th, captain Cook left Christmas Sound, and proceeded round Cape Horn, through strait Le Maire, to Staten land. Having passed this famous Cape on the next day, he entered the southern Atlantic ocean. On Staten island he found a port, on the 1st of January, which, from this circumstance, was denominated "New Year's Harbour." In the small islands adjacent to Staten land, and called "New Year's Isles," captain Cook perceived a harmony between the different animals of the place, which he thought deserving of being recorded. It seemed, he says, as if they had entered into a league not to disturb each other's tranquillity. The greater part of the sea coast is occupied by the sea-lions; the sea-bears take up their abode in the isle; the shags are posted on the highest cliffs; the penguins fix their quarter where they have the most ready communication with the sea; and the rest of the birds chuse the most retired places. All these animals were occasionally seen to mix together like domestic cattle and poultry in a farm yard, without any attempt on the part of one to molest the other. Nay, the captain had often observed the eagles and vultures sitting on the hills among the shags, while none of the latter, whether old or young, appeared to be in the least disturbed at their presence. Should it be asked, how do these birds of prey live? The captain answers the question, by supposing, that they

feed on the carcases of seals and birds, which perish by various causes. It is probable, from the immense quantity of animals with which the isle abounds, that such carcases exist in great numbers. On the 4th of January, captain Cook sailed from Staten island, in order to reconnoitre that extensive coast laid down by Mr. Dalrymple in his chart, in which is the gulf of St. Sebastian. As he had some doubt of the existence of such a coast, he determined to make the western point of the gulf; but when he came to the different points of it, he could discover neither land nor any unequivocal signs of it. Proceeding in his voyage, land was seen on the 14th, but being almost wholly covered with snow, it was at first mistaken for an island of ice. This was named from its first observer, "Willis's island," S. lat. 54° . W. long. $38^{\circ} 23'$. Another larger island, on which was a very considerable number of birds, was called "Bird island." On the 17th captain Cook landed in a bay of an extensive tract of country, very desolate in its appearance, which he took possession of in his majesty's name. The bay, situated in S. lat. $54^{\circ} 5'$. W. long. $37^{\circ} 18'$, he called "Possession bay," and the country, which proved to be an island 70 leagues in circuit, was called the "isle of Georgia," situated between $53^{\circ} 57'$, and $54^{\circ} 57'$ S. lat., and $38^{\circ} 13'$, and $35^{\circ} 34'$ W. long. On the 27th captain Cook, having left Georgia the 25th, computed that he was in S. lat. 65° . Here he was satisfied there could be no land in the direction towards the W., from which there was a long hollow swell; and hence he inferred, that the extensive coast laid down in Mr. Dalrymple's chart of the ocean between Africa and America, and the gulf of St. Sebastian, doth not exist. An elevated coast, observed on the 31st, was called the "Southern Thule," S. lat. $59^{\circ} 13' 30''$. W. long. $27^{\circ} 45'$. To the more distinguished tracts of country, discovered from Jan. 31st to Feb. 6th, captain Cook gave the names of "Cape Britol," "Cape Montagu," "Saunders's isle," "Candlemas isles," and "Sandwich's land." The last is either a group of islands, or else a point of the continent; for the captain was firmly of opinion, that a considerable tract of land existed near the pole, which was the source of most of the ice that is spread over this vast southern ocean. He thought it probable that this land must extend farthest to the N., where it is opposite to the southern Atlantic and Indian oceans. Ice had always been found by him farther to the north in these oceans than any where else, and this he judged could not be the case if there were not land of considerable extent to the south. See SOUTHERN CONTINENT.

Captain Cook having accomplished the great object of his navigation round the globe, began to direct his views towards England. Many circumstances relating to the state of his provisions, and the health of his crew, contributed to hasten his return. In his course to the Cape of Good Hope, he searched for the isles of "Denia" and "Mariveen," laid down in Halley's variation chart, in S. lat. $41^{\circ} 30'$, and about 4° of longitude E. of the meridian of the Cape of Good Hope; but after sailing from February 25th to March 13th, no such islands could be discovered. On the 22d of March he anchored in Table bay; having sailed from the time of leaving the Cape of Good Hope, to his return thither, no less than 20,000 leagues, which was an extent of voyage nearly equal to three times the equatorial circumference of the earth. It could not therefore be surprising, that the rigging and sails of the Resolution should be essentially damaged, and even worn out; and yet in the whole of this run, made in every latitude between 9° and 71° , she did not spring either low-mast, top-mast, lower or top-sail yard; nor did she so much as break a lower or top-mast shroud;

shroud; these happy circumstances were owing to the good properties of the vessel, and the singular care and abilities of her officers. Captain Cook having completed the necessary repairs, and supplied himself with requisite stores and provisions, left the Cape on the 27th of April, and reached the island of St. Helena on the 15th of May; on the 28th he anchored on the island of Ascension, and arrived at the island of Fernando de Noronha, on the 9th of June. In the progress of the voyage, he made an experiment upon the skill for procuring fresh water; the result of which was, that the invention is useful upon the whole, but that it would by no means be advisable to trust to it entirely; more especially as captain Cook was convinced, that nothing contributes more to the health of seamen, than a plentiful supply of water. On the 16th of July, the captain anchored in the bay of Fayal, one of the Azores islands; and on the 19th, proceeded with all expedition for England. On the 30th, he anchored at Spithead, and landed at Portsmouth; having been absent from Great Britain three years and 18 days, during which time, and all changes of climate, he had lost but four men, and only one of them by sickness. The able manner in which captain Cook had conducted this voyage, and the discoveries he had made, could not fail to recommend him to the protection and encouragement of those who had patronized the undertaking. The noble lord who had taken a lead in the plans of navigation and discovery, was still at the head of the admiralty-board; and recommended by him to his majesty, our navigator was raised, on the 9th of August, to the rank of a post-captain, and three days after, appointed a captain in Greenwich hospital; a situation which was intended to afford him a pleasing and honourable reward for his illustrious labours and services. Moreover, so important were his discoveries to science in general, that on the 29th of February 1776, he was unanimously chosen a member of the Royal Society; and on the evening of the 7th of March, when he was admitted, a paper was read containing an account of the method he had taken to preserve the health of the seamen. (See *Philos. Transf.* vol. lxxvi. p. 402—406.) Another paper was communicated, at the request of the president, sir John Pringle, on the 18th of April, relative to the tides in the South Sea, *viz.* those in the Endeavour river, on the east coast of New Holland. (See *Phil. Transf. ibid.* p. 447, &c.) It was also resolved by the president and council to bestow on captain Cook sir Godfrey Copley's gold medal. The president, according to his custom, delivered an elaborate discourse on the subject of the paper, which was thus distinguished.

The particulars of this voyage were related by captain Cook himself, in a manner that redounds to his reputation as a writer. His style is natural, clear, and manly; being well adapted to the subject and to his own character. The superintendance of the publication was undertaken by his learned and valuable friend, Dr. Douglas, who lately died in the see of Salisbury, and whose promotion afforded pleasure to persons of literature of every denomination. The history of the voyage was recommended to the public by the accuracy and excellence of his charts, and by a great variety of engravings from the curious and beautiful drawings of Mr. Hodges. It was followed by the publication of the original astronomical observations, which had been made by Mr. Wales in the Revolution, and Mr. Bayley in the Adventure.

The illusion of a "Terra Australis incognita," to any purposes of commerce, colonization, and utility, having been dispelled; another geographical question of very general interest remained to be determined; and that was the

practicability of a northern passage to the Pacific ocean. Many persons had conceived that there was a shorter, a more commodious, and a more profitable course of sailing to Japan and China, and, indeed, to the East Indies in general, than by the tedious circuit of the Cape of Good Hope. To find a western passage round North America had been attempted by several bold adventurers from Frobisher's first voyage, in 1576, to those of James and of Fox, in 1631. By these expeditions a considerable accession was made to the knowledge of the northern extent of America, and Hudson's and Baffin's bays were discovered. But the wished-for passage, on that side, into the Pacific ocean, was still unattained. Nor were the various attempts of our countrymen, and of the Dutch, to find such a passage, by sailing round the north of Asia, in an eastern direction, attended with better success. Wood's failure in 1676, seems to have terminated the long list of unfortunate expeditions in that century. The discovery had ceased for many years to be an object of pursuit. However, the question was revived in the last century. Accordingly captain Middleton was sent out by government in 1741, and captains Smith and Moore in 1749. But, though an act of parliament had been passed, enacting a reward of 20,000*l.* to the discovery of a passage, the accomplishment of their favourite object still remained to be effected. Previously to the full execution of this design, lord Mulgrave failed with two ships, in order to determine how far navigation was practicable towards the north-pole. In this expedition his lordship encountered many difficulties. Nevertheless, the expectation of opening a communication between the Pacific and Atlantic ocean, by a northerly course, was not abandoned; and it was resolved that a voyage should be undertaken for that purpose. Captain Cook was instantly, and unanimously, thought to be in every respect the most proper person to accomplish this difficult and hazardous, but very important and interesting object. He had, however, done so much, and undergone so many trials, that his most zealous friends, and those who were most ardently devoted to the object, could not think of asking him to engage in fresh perils; the undertaking, however, became a subject of conversation at the table of lord Sandwich, when captain Cook was present. The object, with all the interests connected with it, excited the ardour of the captain's mind, and he offered to undertake the direction of the enterprise. The earl of Sandwich lost no time; the matter was laid before the king; and captain Cook was appointed to the command of the expedition, Feb. 10, 1776. At the same time, it was agreed, that, on his return to England, he should be restored to his situation at Greenwich; and, if no vacancy occurred during the interval, the officer who succeeded him was to resign in his favour. All former navigators round the globe had returned to Europe by the Cape of Good Hope; but captain Cook undertook to accomplish the arduous task by reaching the high northern latitudes between Asia and America; and it is thought that the captain's own reflections on the subject suggested this plan. Instead, therefore, of a passage from the Atlantic to the Pacific, one from the latter into the former was to be tried. Accordingly captain Cook was ordered to proceed into the Pacific ocean, through the chain of new islands, which had been visited by him in the southern tropic. After having crossed the equator into the northern parts of that ocean, he was to hold such a course as might probably fix many interesting points in geography, and produce intermediate discoveries, in his progress northward to the principal scene of his discoveries. With regard to his grand object, it was determined, after the most mature deliberation and inquiry, that,

that, upon his arrival on the coast of New Albion, he should proceed northward as far as the latitude of 65° , and not lose any time in exploring rivers or inlets, or upon any other account, till he had gotten into that latitude. In the prosecution of this great design, motives of interest were annexed to obligations of duty. By a new law, passed in 1776, supplying the deficiencies of the act of 1745, it was enacted, "that if any ship belonging to any of his majesty's subjects, or to his majesty, shall find out, and sail through, any passage, by sea, between the Atlantic and Pacific oceans, in any direction, or parallel of the northern hemisphere, to the northward of the fifty-second degree of latitude; the owners of such ships, if belonging to any of his majesty's subjects, or the commander, officers, and seamen of such ship belonging to his majesty, shall receive, as a reward for such discovery, the sum of 20,000*l*." Two vessels were fixed upon by government for the intended service; the *Resolution* and the *Discovery*; the former commanded by captain Cook, and the latter by captain Clerke. To the *Resolution* was assigned the same number of officers and men, which she had during her former voyage; and the only difference in the establishment of the *Discovery* from that of the *Adventure*, was that she had no marine officer on board. Both ships were equipped in the most complete manner, and furnished with such an establishment and apparatus, &c. as might most effectually conduce to the improvement of astronomy and navigation. As the ships were to touch at Otaheite and the Society islands, it was determined to carry Omai back to his native country, who returned with deep impressions of gratitude and respect for the liberal treatment which he had received during his absence, and whilst he continued in England. Captain Cook sailed from the *Nore* to the Downs on the 25th of June, and on the 30th anchored in Plymouth Sound, where the *Discovery* was already arrived. On the 8th of July he received his instructions, with orders to proceed to the Cape of Good Hope. On the 12th he stood off Plymouth Sound, and proceeding in his course, touched at Teneriffe; anchoring on the 1st of August in the road of Santa Cruz. Having procured the necessary articles of refreshment, he sailed from Teneriffe on the 4th; and on the 13th arrived before Port Praya in the island of St. Jago, and then, not finding the *Discovery* there, stood out to the southward. On the 1st of September, our navigator crossed the equator in W. long. $27^{\circ} 38'$; and on the 8th, being near the eastern coast of Brazil, he took pains to settle its longitude, which he concluded to be $35\frac{1}{2}^{\circ}$ or 36° W. On the 18th of October, the *Resolution* came to an anchor in Table bay, at the Cape of Good Hope. On the 10th of November captain Cook had the satisfaction of seeing the *Discovery* arrive in the bay. Besides the attention which our captain manifested to the state of his ship, and the accommodation of his seamen in the further prosecution of his voyage, scientific objects engaged his particular notice. On the 30th of November he weighed from Table bay, and on the 3d of December got clear of the land. On the 12th land was seen, which was found, upon a nearer approach, to consist of two islands. That which lies most to the south, and is the largest, was estimated to be about 15 leagues in circuit; the northerly one was about nine leagues; and the two islands are about the distance of five leagues from each other. The largest lies in S. lat. $46^{\circ} 53'$, and E. long. $37^{\circ} 46'$; and the smaller one in S. lat. $46^{\circ} 4'$, and E. long. $35^{\circ} 8'$. They seemed to have a rocky and bold shore, and their surface is for the most part composed of barren mountains, the summits and sides of which were covered with snow. There were two islands, with four others, which lie from nine to twelve

degrees of longitude more to the east, and nearly in the same latitude, had been discovered by captain Marion du Fresne, and Crozet, French navigators, in January 1774. As no names had been assigned to them in a chart of the Southern ocean, communicated by Crozet to captain Cook in 1773, our commander distinguished the two larger ones by calling them "Prince Edward's islands." To the other four he gave the name of "Marion's" and "Crozet's" islands. Passing southward of these islands, he shaped his course so as to get into the latitude of the land which had been discovered by M. de Kerguelen, a French navigator. On the 24th he observed land, which proved to be an island of considerable height, and about three leagues in circuit. He soon after discovered another island about the same size, and also a third, besides some smaller ones. Another island was seen in S. lat. $48^{\circ} 29'$, E. long. $68^{\circ} 40'$, which was a high round rock, and which was called "Bligh's Cap." This he perceived to be the same with Kerguelen's "isle of Rendezvous." As soon as the weather began to clear up, captain Cook steered in for the land, called "Kerguelen's land." At length a good harbour was discovered, in which the ships anchored on Christmas day. Here the captain displayed the British flag, and named the place "Christmas Harbour." On the 29th he left this harbour, and ranged along the coast, in order to discover its position and extent. In pursuing his course he met with several promontories and bays, together with a peninsula, all of which he has described and named. Another harbour, in which the ships anchored for one night, is situated in S. lat. $49^{\circ} 3'$, and E. long. $69^{\circ} 37'$, and was called "Port Palliser." On the 30th, when this harbour was discovered, he came to a point, which proved to be the very eastern extremity of Kerguelen's land. This point was called "Cape Digby," and is situated in S. lat. $49^{\circ} 23'$, and E. long. $70^{\circ} 34'$. The result of captain Cook's examination of Kerguelen's land was, that it did not occupy an interval much exceeding $1\frac{1}{2}$ degree. From this desolate coast our captain took his departure on the 31st, intending to touch at New Zealand; but on the 3d of January 1777, the wind veered to the north, and on the 12th the northerly winds ended in a calm; the ship being then in S. lat. $45^{\circ} 40'$, E. long. $110^{\circ} 26'$. On the 24th our voyagers discovered the coast of "Van Diemen's" land, and on the 26th came to an anchor in "Adventure bay." While captain Cook was at this country, he neglected no inquiry which could promote the knowledge of navigation, and other branches of science. He settled the latitude and longitude of places, marked the variations of the compass, and recorded the nature of the tides. Adventure bay he found to be situated in S. lat. $43^{\circ} 21' 20''$, and E. long. $147^{\circ} 26'$. On the 30th of January he sailed from this bay, and on the 12th of February came to his old station in Queen Charlotte's Sound, in New Zealand. Here he found that ten men, who had separated from captain Furneaux's crew in the former voyage, had been murdered by the natives, and that their flesh had been consumed as food. The fear of revenge rendered them very averse from approaching the English vessels. On the 27th captain Cook got clear of New Zealand; and having met with unfavourable winds, it was not till the 29th of March that he discovered land, which was found to be an inhabited island, called "Mangee," in S. lat. $21^{\circ} 57'$, E. long. $201^{\circ} 53'$. Pursuing his voyage, on the 30th he again found land, which was an island, called by the natives "Wateoo," in S. lat. $20^{\circ} 1'$, E. long. $201^{\circ} 45'$. The next place which he visited was a small island called "Wennooa-ete," or "Otakootaia," in S. lat. $19^{\circ} 15'$, E. long. $201^{\circ} 37'$. On the 5th he directed his course to "Harvey's island," which

he had discovered in 1773, and which he now found to be well peopled. Having by various adverse circumstances been so much retarded in his progress, that nothing could be done this year in the high latitudes of the northern hemisphere, he determined to bear away for the Friendly islands, where he was sure of being abundantly provided. Accordingly he reached Palmerston island in his course, where he obtained some refreshment; and after leaving this island, he steered to the west, with a view of making the head of his way to "Annamooka." On the 28th of April, he touched at the island of "Komango," and on the 11th of May arrived at Annamooka. The only interruption of the harmony that subsisted between our voyagers and the natives of this island arose from the thievish disposition of many of them. In order to correct and counteract this propensity, captain Clerke invented a mode of treatment which produced some effect, the putting of the thieves into the hands of the barber, who completely shaved their heads. They thus became objects of ridicule to their countrymen, and their rogueries were restrained. Captain Cook having exhausted Annamooka of its articles of food, proposed, on the 11th, to proceed directly for "Tongataboo." But it was recommended to him to touch at another island, or rather a group of islands, called "Hapae," lying to the N.E., where he might be plentifully supplied with every refreshment in the easiest manner. Hapae was therefore chosen for the next station, where our commander arrived on the 17th, and met with a most friendly reception. Here the captain took an opportunity of examining not only Hapae, but "Lefooga," and other neighbouring islands. On the 10th of June he arrived at "Tongataboo;" where he was kindly received, but somewhat molested by the thievish propensity of the inhabitants. On the 10th he left Tongataboo, and two days after came to an anchor in the island of "Middleburg," or "Eooa," as it is called by the inhabitants. Captain Cook remained at the Friendly islands between two and three months; and his intercourse with the natives was little interrupted. This intercourse was productive of many advantages. See FRIENDLY ISLANDS. On the 17th of July, captain Cook resumed his voyage; and on the 8th of August, an island was discovered, called by the natives "Toobouai," and situated in S. lat. 23° 25'. E. long. 210° 37'. Pursuing his course he reached Otaheite on the 12th, and steered for Oheitepcha bay, desirous to anchor there before he went down to Matavai. Omai's reception among his countrymen was not entirely of a flattering nature. Nothing that was peculiarly striking occurred at their first meeting; his interview with his sister, however, was agreeable to the feelings of nature; and his aunt threw herself at his feet, and bedewed them with tears of joy. On the 24th, the captain resumed his old station in Matavai bay. On this visit he was fully satisfied that human sacrifices formed a part of the religious institutions of Otaheite; for he was witness to a solemnity of this kind, which he has particularly described with the just sentiments of indignation and abhorrence. Here the captain was cured of a rheumatic complaint, extending from the hip to the foot in an extraordinary manner. The mother of Otoo, a chief of the island, his three sisters, and eight other women, undertook the cure. Being desired to lay himself down amongst them, as many as could get round him began to squeeze him with both hands, from head to foot, but more particularly in the part where the pain was lodged, till they made his bones crack, and his flesh became a perfect mummy. After undergoing this discipline about a quarter of an hour, he was glad to be received from his female friends. The operation, however, gave him immediate

relief, so that he was encouraged to submit to another rubbing down before he went to bed; the consequence of which was, that he was tolerably easy the whole succeeding night. His female physicians repeated their prescription the next morning, and again in the evening; after which his pains were entirely removed, and the cure was perfected. This operation, which is called "Romee," is universally practised among these islanders: being sometimes performed by the men, but generally by the women. During this visit of our voyagers to Otaheite, such a cordial friendship and confidence subsisted between them and the natives, as never once to be interrupted by any untoward accident. From Otaheite our voyagers sailed on the 30th to Emoo, where they anchored. The transactions on this island were, upon the whole, unpleasent. On the 11th of October, the ship left it, and next day arrived at Owharre harbour, on the west side of Huahine. Here they settled Omai to mutual satisfaction; having procured for him a portion of land and built a house, on the outside of which was this inscription:

Georgius Tertius, Rex. 2 Novembris, 1777.

*Naves, { Resolutio, Jac. Cook, Pr.
 { Discovery, Car. Clerke, Pr.*

After parting with Omai in an affectionate manner, and leaving him comfortably settled among several of his relatives, captain Cook arrived at Bolabola, the last of the Society islands, which he visited on the 8th of December. Upon the whole, it has been observed, that the future felicity of the inhabitants of Otaheite, and the Society islands, will not a little depend on occasional visits from Europe, for it would have been better for these poor people, as captain Cook says, never to have known our superiority in the accommodations and arts which render life comfortable, than, after once knowing it, to be again abandoned to their original incapacity of improvement. On the 8th of December our commander sailed from Bolabola, and in the night between the 22d and 23d, crossed the line in E. long. 203° 15', and on the 24th discovered land, which was called "Christmas island," the west side of it, on which was observed an eclipse of the sun, being in N. lat. 1° 59'. E. long. 202° 30'. On the 2d of January 1778, the ships resumed their course towards the north, and in their progress discovered three islands. On the 22d they touched at one of these islands, called by the natives "Atooi," and where captain Cook found the horrid practice of eating human flesh, which the inhabitants denominated "favoury eating." But it was ascertained that enemies slain in battle, are the sole objects of this abominable custom. Near this was another island, called "Onecheow," where our commander anchored on the 29th. It is observed, that the islands in the Pacific ocean, which European voyagers have discovered, have generally been found to lie in groups, or clusters. This was the case with those that were now visited; and to which captain Cook gave the name of "Sandwich islands," which see. On the 2d of February, our navigators pursued their course to the northward; and on the 7th of March they discovered the coast of "New Albion," the ships being then in N. lat. 44° 33'. E. long. 235° 20'. In ranging on the west side of America, captain Cook gave names to several capes and head lands, which appeared in sight. At length, on the 29th he anchored in a inlet, where the country appeared full of mountains, with snow covering their summits, interspersed with valleys which produced high straight trees, exhibiting a beautiful prospect, as of one vast forest. The ships were now in N. lat. 49° 29'. E. long. 232° 29'. The inhabitants on the coast appeared to be disposed to maintain a friendly intercourse with stran-

ers; and a trade immediately commenced, the articles of which were the skins of various animals, such as bears, wolves, foxes, deer, raccoons, polecats, and martins; and, particularly, sea-otters. Garments made of these were also offered for sale; the most extraordinary articles, however, were human skulls, and hands not quite stripped of their flesh, some of which exhibited marks of having been upon the fire. In exchange the natives took knives, chisels, pieces of iron and tin, nails, looking-glasses, buttons, or any kind of metal. Although commerce was, in general, carried on with mutual honesty, some of these people were no less inclined to theft than the Indians in the Southern ocean. Of all the uncivilized tribes, which our commander met with in his various navigations, he never found any who had such strict notions of their right to the exclusive property of every thing which their country produced, as the inhabitants of the Sound where he was now stationed. With captain Cook, very much to the honour of his character and of his country, it was a sacred rule never to take any part of the property of the people whom he visited, without an ample compensation. Whilst the ships were under repair for the prosecution of the expedition, our captain improved every opportunity that occurred for extending his knowledge of the manners and customs of the inhabitants, who, in general, treated him with great civility. The natives were much addicted to singing; and in some instances, the whole body joined, some in a slow, and others in a quicker time; accompanying their notes with the most regular motions of their hands, or with beating in concert with their paddles, on the sides of the canoes, to which were added other very expressive gestures. At the end of each song, they continued silent for a few moments, and then began again, sometimes pronouncing the word *Hoee!* forcibly as a chorus. At our captain's first arrival in this inlet, he denominated it "King George's Sound;" but he afterwards was informed that the natives called it "Nootka." The entrance of the Sound is situated in the east corner of Hope bay, in N. lat. $49^{\circ} 53'$. E. long. $233^{\circ} 12'$. On the 26th the repairs of the ships being completed, every thing was ready for the captain's departure. In the prosecution of the voyage to the north, and back again to the Sandwich islands, the incidents that occurred were chiefly of a nautical kind. The first place at which captain Cook landed, after his departure from Nootka Sound, was an island which he called "Kaye's island," situated at its S.W. point in N. lat. $59^{\circ} 49'$. E. long. $216^{\circ} 58'$. To an inlet in which the ships anchored on the 12th, he gave the appellation of "Prince William's Sound." Some days after leaving this Sound, our navigators came to an inlet, which they hoped would be found to communicate with the sea to the north, or with Baffin's or Hudson's bay to the east; and therefore they determined particularly to examine it. In consequence of a complete investigation of this inlet, it was discovered to be a river, which was afterwards called "Cook's river." On the 6th of June they got clear of this river, and pursuing their voyage, they failed on the 15th, amidst the group of islands, which had been called by Bering "Schumagin's islands." On the 21st, among some hills, on the main land, that towered above the clouds to a most amazing height, one was discovered to have a volcano, which continually threw up vast columns of smoke. It does not stand far from the coast, and is situated in N. lat. $54^{\circ} 48'$, and long. $195^{\circ} 45'$. The mountain is of a completely conical figure, and the volcano is at its very summit. A canoe, from an island in the neighbourhood, approached the ship, and the single person on board bowed as he came near. From such tokens of politeness, our captain reasonably inferred, that the Ruf-

fians must have some communication and traffic with these people. On the 27th our voyagers reached an island, known by the name of "Oonalafka," the inhabitants of which behaved with a degree of politeness uncommon to savage tribes. The harbour of "Samgamooda," on the north side of the island, in which captain Cook came to an anchor, is situated in N. lat. $53^{\circ} 55'$. E. long. $193^{\circ} 36'$. On the 2d of July our voyagers left Oonalafka, and on the 16th were within sight of a promontory, on which lieutenant Williamson landed; but he found that the land, as far as his view extended, produces neither tree nor shrub, though the lower grounds were not destitute of grass, and of some other plants. To this promontory, in N. lat. $56^{\circ} 42'$. E. long. $197^{\circ} 36'$, was given the name of "Cape Newenham." When our navigators, on the 3d of August, had advanced to the latitude of $62^{\circ} 34'$, they had the misfortune to lose Mr. Anderfon, the surgeon of the Resolution, who had for more than twelve months been lingering under a consumption. Mr. Anderfon, who was a person of a cultivated understanding and agreeable manners; to distinguished skill in his own profession, added a very considerable knowledge in other branches of science. An island, discovered soon after his death, was honoured with the appellation of "Anderfon's island." On the 9th captain Cook anchored under a point of land, to which he gave the name of "Cape Prince of Wales," situated in N. lat. $65^{\circ} 46'$. E. long. $191^{\circ} 45'$, and remarkable for being the most western extremity of America hitherto explored. This extremity is distant from the eastern cape of Siberia only 17 leagues; and there our commander had the glory of ascertaining the vicinity of the two continents, which had only been conjectured from the reports of the neighbouring Asiatic inhabitants, and the imperfect observations of the Russian navigators. Returning his course on the 10th, captain Cook anchored in a bay, the land of which was at first supposed to be a part of the island "Alafchka;" but from the figure of the coast, from the situation of the opposite shore of America, and from the longitude, the captain thought to be more probably the country of the "Tschutski," on the eastern extremity of Asia, which had been explored by Bering in 1728; and this was found to be the fact. From the bay of St. Lawrence, belonging to the country of the Tschutski, our navigators steered, on the 11th, to the east, in order to get nearer to the coast of America. Afterwards, proceeding to the north, they reached, on the 17th, the latitude of $70^{\circ} 33'$, in longitude $197^{\circ} 41'$. On this day a brightness was perceived in the northern horizon, resembling that which is reflected from ice, and which is commonly called the *blink*. In about an hour's time, the sight of a large field of ice removed all doubt in captain Cook's mind with respect to the cause of the brightness of the horizon. The ships were soon close to the edge of the ice, in lat. $70^{\circ} 41'$, and unable to proceed any farther. On the 18th, in lat. $70^{\circ} 44'$, the ice near them was so compact as a wall, and judged to be at least ten or twelve feet high. Farther to the north, it appeared much higher. A prodigious number of sea-horses lay upon the ice; and some of them were procured for food, in order to supply the want of fresh provisions. Our voyagers lived on the sea-horses as long as they lasted; and they were generally preferred to salt provisions. Captain Cook continued, until the 29th, to traverse the icy sea beyond Bering's strait, in various directions, and through numberless obstructions and difficulties. The season, indeed, was now so far advanced, that it would have been highly imprudent to have made any farther attempts, till the next summer, at finding a passage into the Atlantic. Our commander's attention was now directed to the discovery of a proper

proper place for obtaining a supply of wood and water; and to the manner in which he should spend the winter, with some improvements in geography and navigation, and so as to be in a condition to return to the north, for a farther search of a passage, in the ensuing summer. Before he proceeded to the south, he employed a considerable time in examining the fide and coasts in the vicinity of Beering's strait, on the sea both of Asia and America. In this examination, he ascertained the accuracy of Beering, so far as he went; demonstrated the errors with which Stæhlin's map of the new northern Archipelago abounds; and made large additions to the geographical knowledge of this part of the world. "It reflects," as Mr. Coxe justly observes, "the highest honour even on the British name, that our great navigator extended his discoveries much farther in one expedition, and at so great a distance from the point of his departure, than the Russians accomplished in a long series of years, and in parts belonging or contiguous to their own empire."

On the 2d of October, our voyagers came within sight of the island of Ononashka, and anchored again in Samganoodah harbour. Here, whilst the ships were repairing, the seamen collected berries, with which the island abounds, and which, in conjunction with the spruce-beer, contributed effectually to eradicate every seed of the scurvy that might exist in either of the vessels. They also procured an ample supply of fish. Captain Cook, on the 8th, received a very singular present, which was a rye-loaf, or rather a pye in the form of a loaf, for it inclosed some salmon, highly seasoned with pepper. Captain Cerke received also the same kind of present. These presents, it was reasonably supposed, came, by the hands of an Ononashkan, from some Russians in the neighbourhood. On the 10th corporal Lediard of the marines returned from his researches with three Russian seamen, or furriers, who, with several others, resided at "Engoochhar," where they had a dwelling-house, some store-houses, and a floop of about 30 tons burthen. From these persons captain Cook derived every possible degree of information. Afterwards, another Russian was introduced to our captain, whose name was Erasmus Gregoroff Sin Imyloff, and who was the principal person among his countrymen in this and the neighbouring islands. From him he obtained two charts, which he was permitted to copy. The first included the "Penshinkian" sea; the coast of Tartary, down to the latitude of 41°; the Kuril islands; and the peninsula of Kamtschatka. The second chart, which was the most interesting, comprehended all the discoveries made by the Russians to the eastward of Kamtschatka, towards America; which, however, exclusively of the voyages of Beering and Tichirikoff, amounted to little or nothing. Indeed captain Cook was assured, that no Russians had even seen any part of the continent of America to the northward, excepting that which lies opposite to the country of the Tschuktsis. On the 26th, all things being ready for captain Cook's departure, he put to sea, and sailed for the Sandwich islands; it being his intention to spend a few months there, and then to direct his course to Kamtschatka, so as to endeavour to reach that country by the middle of May, in the ensuing summer. On the 26th of November, when the ships had proceeded southward to the latitude of 20° 55', land was discovered, which proved to be the island of "Mowee," one of the group of the Sandwich islands, with the inhabitants of which a friendly intercourse was maintained. Another island was discovered on the 30th, called by the natives "Owhyhee." Among the articles procured from the natives, was a quantity of sugar-cane, a strong decoction of which was found, upon trial, to be a very palatable

beer; more especially when improved with a few hops. On the 16th of January 1779, canoes in great numbers came out from all parts of the island, so that the two ships were surrounded with no fewer than a thousand, crowded with people and laden with hogs, and other productions of the island. Some of them, however, manifested a thievish disposition, and captain Cook, in order to check it, ordered two or three muskets, and as many four pounders, to be fired over one of the canoes, which had carried away a rudder. Into a bay, affording good anchorage and fresh water, captain Cook resolved to take the ships in order to refit, and to obtain every refreshment which the place could afford. The bay in which the ships anchored on the 17th was called by the inhabitants "Karakakooa." The vessels were soon surrounded with a multitude of canoes; and the whole shore of the bay was covered with spectators, whilst many hundreds were swimming round the ships like shoals of fish. Our navigators were much impressed by the singularity of the scene; and few of them lamented their unsuccessful endeavours of getting homeward, the last summer, by a northern passage. "To this disappointment," says the captain, "we owed our having it in our power to revise the Sandwich islands, and to enrich our voyage with a discovery, which, though the last, seemed, in many respects, to be the most important that had hitherto been made by Europeans, throughout the extent of the Pacific ocean." Such, alas! is the concluding sentence of our illustrious commander's journal. Little did he then imagine, that a discovery which promised to annex no small honour to his name, and to be productive of very agreeable consequences, would be so fatal in the result. Little did he think, that the island of Owhyhee was destined to be the last scene of his exploits and the cause of his destruction.

The reception which the captain met with from the natives, on his proceeding to anchor in Karakakooa bay, was in a very high degree encouraging. The natives expressed their joy by singing and shouting, and by exhibiting a variety of wild and extravagant gestures. During the long cruise of our navigators off the island of Owhyhee, the inhabitants had conducted themselves in their dealings, almost universally, with fairness and honesty; but after the arrival of the ships in the bay, they altered their conduct. The immense crowds of islanders that encompassed the ships afforded frequent opportunities of pilfering without the risk of detection, and held out, especially as their number was much superior to that of the English, the prospect of escaping with impunity. Another circumstance to which the alteration in the conduct of the natives may be ascribed, arose from the presence and encouragement of their chiefs, into whose possession the booty might be traced, and who were probably the instigators of the depredations that were committed. Soon after the Resolution had gotten into her station, three chiefs, one of whom named Koah, who was a priest, and in his youth had been a distinguished warrior, visited the ship; and in the evening, captain Cook, accompanied by Mr. Bayley and Mr. King, attended him on shore. The captain was received with great civility and a respect, on the part of the natives, approaching to adoration. The captain was particularly desirous of procuring from the island some salted hogs for sea-store; and, with this view, of renewing former attempts in the operation for this purpose. The event answered his most sanguine expectations. On the 26th captain Cook had his first interview with Terreeboe, the king of the island; which was conducted with a variety of ceremonies, among which, the custom of exchanging names,

which

which among the islands of the Pacific ocean is the strongest pledge of friendship, was observed. The king, attended by several chiefs, was conducted in a pinnace on board the *Resolution*; where they were received, apparently much to their satisfaction, with peculiar attention and respect. In the progress of the intercourse which was carried on between our voyagers and the natives, the quiet and inoffensive behaviour of the latter took away every apprehension of danger and inspired an unsuspecting confidence in the English. A society of priests, in particular, displayed a generosity and munificence, of which there are few examples; for they furnished a constant supply of hogs and vegetables to our navigators, without ever demanding, or even suggesting, a return. Indeed, the conduct of the warrior chiefs, or *Earees*, was always less satisfactory than that of the priests. Although the kind and liberal behaviour of the natives continued without remission, *Terreeboob*, and his chiefs, began at length to be very inquisitive about the time of the departure of the English; but this is not surprising, when we consider the enormous consumption of hogs and vegetables, which had taken place during their abode of 16 days in the bay. When the king was informed that they were to leave the island in a day or two, a proclamation was made through the island, requiring the people to bring their hogs and vegetables, that they might be presented by the king to the *Orono*, the title of respect given to captain Cook, on his quitting the country. Accordingly, on the 3d of February, being the day preceding that which was fixed for leaving the island, *Terreeboob* invited captain Cook and Mr. King to attend him to the place where *Kaoo* resided. On their arrival, they found the adjoining ground covered with parcels of cloth, and at a little distance an immense quantity of vegetables; and near them was a large herd of hogs. At the close of the visit a great part of the cloth, and all the vegetables and hogs were given by *Terreeboob* to captain Cook and Mr. King, who were astonished at the value of the present. Such was the attachment of the inhabitants of *Owhyhee* to Mr. King, that *Terreeboob* and *Kaoo* waited upon captain Cook, whose son they supposed him to be, to solicit his residence in their country. Early on the 4th the ships sailed out of *Karakakooa* bay, being followed by a large number of canoes. It was the captain's design, before he visited the other islands to make a complete survey of *Owhyhee*, in hopes of finding a better sheltered bay than that which he had left; and upon failure of success to take a view of the south-east part of *Mowee*, where, as he was informed, he might find an excellent harbour. After sailing about the island of *Owhyhee* for several days, the weather being stormy, and the foremast of the *Resolution* being damaged, our navigators returned on the 11th to *Karakakooa* bay; but in coming to an anchor, they found their reception to be very different from what it had been on their first arrival. Their anxiety, however, was in some measure relieved, by the return of a boat which had been sent on shore, and which brought information, that *Terreeboob* was absent, and had left the bay under the *Taloo*. The behaviour of the natives, however, appeared mysterious and excited suspicion; the interdiction of intercourse, on pretence of the king's absence, afforded reason for apprehending that he only wished to gain time for consulting with his chiefs. On the next morning *Terreeboob* arrived and immediately visited captain Cook; this circumstance, and the return of the natives to their usual friendly intercourse, were considered as strong proofs, that they neither meant, nor apprehended, any change of conduct. Some other incidents confirmed this opinion. Towards the evening of the 13th

information was received, that several chiefs assembled at the well near the beach and drove away the natives who had been hired to assist the sailors in rolling down the casks to the shore. It was afterwards found, that the islanders had armed themselves with stones and were very tumultuous. Not to mention some instances of theft and subsequent dissensions which occurred, one of a very serious and unpleasant nature happened, which it may not be improper to specify on account of the consequences that ensued. A canoe, belonging to *Pareea*, was seized; and he, protesting his innocence with regard to the theft that had been committed, claimed his property. A scuffle took place between him and the English officer with some of his companions, in which *Pareea* was knocked down by a violent blow on the head, with an oar. The natives, who had been peaceable spectators, immediately attacked the English seamen with a shower of stones, which obliged them precipitately to retreat and to swim off to a rock at some distance from the shore. The pinnace, which was waiting for captain Cook's return, was immediately ransacked by the islanders; and if it had not been for the reasonable interposition of *Pareea*, would have been entirely demolished, *Pareea* interfered further in restoring the pinnace; and being assured that he would be kindly received by the *Orono*, joined noses (according to their custom) with the officers, in token of friendship, and paddled over to the village of *Kowrowa*. Captain Cook, on being informed of this occurrence, expressed much uneasiness: "I am afraid," says he, "that these people will oblige me to use some violent measures; for," he added, "they must not be left to imagine, that they have gained an advantage over us." The confidence of our navigators in the natives gradually abated; and they thought it necessary to be very much upon their guard. At this time the cutter belonging to the *Discovery* was stolen, and captain Cook made the necessary preparations for the recovery of it. On occasions of a similar kind, it had been his practice to get the king, or some of the principal *Earees*, on board, and to detain them as hostages till the article, that had been lost, was restored. This method he meant now to pursue; and he also gave orders to stop all the canoes that should attempt to leave the bay, with an intention of seizing and destroying them, if by peaceable means he could not recover the cutter. Captain Cook and Mr. King, together with Mr. Phillips, and nine marines, left the ship; and when they landed, the captain instructed Mr. King to quiet the minds of the natives, by assuring them they should not be hurt, to keep his people together, and to be on his guard. Whilst Mr. King was employed in executing his commission, captain Cook proceeded to *Kowrowa*, where the king resided, and landed with the lieutenant and nine marines. The people received him with the usual tokens of respect; prostrating themselves before him, and bringing their customary offerings of small hogs. Having gained an interview with *Terreeboob*, he invited him to return in the boat, and spend the day on board the *Resolution*. To this proposal the old king assented, and immediately accompanied him. One of the king's favourite wives, however, besought him, with many tears and intreaties, not to go on board; and two chiefs, who accompanied her, forced him to sit down. The natives, who were collecting in great numbers on the shore, and who had been alarmed by the hostilities that had previously occurred in the bay, thronged round captain Cook and their king. The lieutenant and marines, perceiving that they were much pressed, and thus rendered incapable of using their arms, if occasion should require it, proposed to the captain to draw them up along the rocks, close to the water's edge; and accordingly

they formed a line, at the distance of about 30 yards from the place where the king was sitting. The old king appeared to be much alarmed; and when captain King urged him to proceed, the chiefs interposed, and at first by prayers and intreaties, and afterwards by force and violence, insisted on his slaying where he was. The captain at length desisted; observing to Mr. Philips, that it would be impossible to compel him to go on board, without the risk of killing a great number of the inhabitants. Captain Cook's person had hitherto appeared to be in no danger; but a circumstance accidentally occurred, which gave a fatal turn to his situation. The boats, which had been stationed across the bay to prevent the escape of the canoes, fired at some of them that were endeavouring to go off, and unfortunately killed a chief of the first rank. The news of his death arrived at the village, where captain Cook was, just as he had left the king, and was walking slowly toward the shore. Upon this, the women and children were immediately sent off; and the men put on their war-mats, and armed themselves with spears and stones. One of the natives, having in his hands a stone, and a long iron spike (called a *pabooa*), advanced to the captain, flourishing his weapon in defiance, and threatening to throw the stone. The captain, after having ineffectually desired him to desist, fired a load of small shot, which, as the man had on his war-mat, served only to irritate and encourage the enraged people. Several stones were thrown at the marines; and one of the *Erees* attempted to stab Mr. Philips with his *pabooa*, but failed in the attempt. Captain Cook now fired his second barrel, loaded with ball, and killed one of the foremost of the natives. A general attack with stones immediately followed, which was returned by a discharge of musquetry from the marines, and the people in the boats. The islanders, contrary to expectation, stood the fire with great firmness; and before the marines had time to reload, broke in upon them with dreadful shouts and yells. Four marines were cut off among the rocks, in their retreat; three more were dangerously wounded; and the lieutenant, who had received a stab between the shoulders with a *pabooa*, having fortunately reserved his fire, shot the man who had wounded him, just as he was going to repeat his blow. The unfortunate commander, the last time in which he was distinctly seen, was standing at the water's edge, and calling out to the boats to cease firing, and to pull in. If it be true, as some of those who were present imagined, that the mariners and boatmen had fired without his orders, and that he was desirous of preventing any further bloodshed, it is not improbable that his humanity, on this occasion, proved fatal to him. For it was remarked, that whilst he faced the natives, none of them had offered him any violence; but that having turned about, to give his orders to the boats, he was stabbed in the back, and fell with his face into the water. On seeing him fall, the islanders set up a great shout, and his body was immediately dragged on shore, and surrounded by the enemy, who, snatching the dagger out of each other's hands, shewed a savage eagerness to have a share in his destruction. "Thus fell," says captain King, "our great and excellent commander!" For other particulars, we refer to "Samwell's Narrative of the Death of Captain Cook."

In consequence of the savage disposition of the natives, the whole remains of captain Cook could not be recovered. Although various means, soothing and menacing, were employed for this purpose, little more than the principal part of the bones could be procured. By the possession of these, our navigators were enabled to perform the last offices to their eminent and unfortunate commander. The bones, having been put into a coffin, and the service being read

over them, were committed to the deep, on the 21st, with the usual military honours. What were the feelings of the companies of both the ships, on this occasion, the world must be left to conjecture; for those who were present know, that it is not in the power of any pen to describe them.

Such was the high estimation in which the character and enterprises of captain Cook were held by neighbouring nations, that, when war was declared between France and England, a letter was issued, on the 15th of March, 1779, by Mons. Sartine, secretary of the marine department at Paris, and sent to all the commanders of the French ships, which, after doing honour to the importance and utility of his discoveries, ordered, that the ship of captain Cook should be treated with respect at sea. The adoption of this measure was suggested by Mons. Turgot, who also composed a memorial, in which he proved that honour, reason, and even interest, dictated this act of respect for humanity; and it was in consequence of this memorial, as we learn from M. Condorcet (in his *Life of M. Turgot*), that an order was given not to treat as an enemy the common benefactor of every European nation. The first thought of such a plan of conduct was very probably suggested by Dr. Benjamin Franklin, who, when he was ambassador at Paris from the United States of America, preceded the court of France in issuing a similar requisition.

We shall close this article, as far as it respects the discoveries of captain Cook, with merely mentioning, that the Sandwich islands were further explored; that Kamtschatka was visited, and a very friendly intercourse maintained with the Russian officers of that country; that our navigators experienced the most generous and hospitable treatment from major Behm, in particular, the commander of the garrison at Bolcharetsk; that they proceeded to the north, in pursuit of the grand object of the expedition; that, having passed through Beering's strait, and attained to somewhat more than 69 $\frac{1}{2}$ degrees of northern latitude, they found it absolutely impossible to penetrate through the ice, either on the side of America or on the side of Asia; that every hope being precluded of accomplishing, in this way, a passage into the Atlantic ocean, captain Clerke was obliged to come to the determination of sailing back to the southward; that on the 22d of April (1779) the captain died of a consumption (see his article); that captain Gore succeeded to the command of the *Resolution*, and lieutenant King to that of the *Discovery*; that a second visit was paid to Kamtschatka, which extended our acquaintance with that part of the world; that no small accession of information was acquired, with respect to geographical science in general; that our voyagers pursued their course by the coasts of Japan and China; that they made some stay at Canton; that thence they proceeded to the Cape of Good Hope; that they came to an anchor at Stromness, on the 22d of May, 1780; that both ships arrived at the Nore, on the 4th of October, after an absence of 4 years, 2 months, and 22 days; that, during the whole of the expedition, the *Resolution* lost only five men by sickness, three of whom were in a precarious state of health at their departure from England, while the *Discovery* did not lose a single man; and that the history of the voyage, from the time in which captain Cook's journal ends, was written with great ability by Mr. King. By the decease of captain King, who died at Nice in Italy, in 1784, this country sustained another loss of an able and scientific commander and navigator, who hath left a memorial of his talents and services, which has honourably united his name with that of the immortal Cook.

In sketching the talents and character of captain Cook, strikingly illustrated in the actions and enterprises of his life,

we shall avail ourselves of the assistance that is afforded us by his professed or incidental biographers. Captain Cook possessed, in an eminent degree, an inventive mind, which, by its native vigour, suggested noble objects of pursuit, and the most effectual methods of prosecuting and attaining them. This faculty he exemplified in a great variety of critical and difficult situations. To this kind of genius he added unwearied application. By his genius and unremitting assiduity he acquired an extensive acquaintance, not only with navigation, but with many other sciences. He was so well informed with regard to different branches of the mathematics, and particularly in astronomy, that he was able to take the lead in various observations of an astronomical kind, in the course of his voyages. In general literature, and even the art of composition, he was so great a proficient, that he acquired reputation, not merely as the performer, but as the narrator, of his various interesting enterprises. Perseverance and steadiness in the prosecution of the objects to which his life was devoted, were distinguishing features of his character; and such was the invincible fortitude of his spirit, that no difficulties or dangers intimidated him, or deterred him from accomplishing any purpose which he formed, or which the hazardous services assigned him required. His fortitude was of course accompanied with complete self-possession. This latter quality was eminently useful to him in many critical and trying circumstances. Accordingly it is observed, that the calmness and composure of his mind were such, that, after having given necessary directions, he could take his rest, and sleep during the hours which he allotted to himself with perfect soundness. To the great qualities possessed by captain Cook, he added the most amiable and conciliatory virtues. His humanity is illustrated in the whole course of his conduct, during his successive voyages; with regard to the inhabitants of the countries which he visited, and with respect to the accommodation, health, and comfort of his own seamen. In the private relations of life, he maintained an excellent and exemplary character, as a husband and father, and as a sincere and steady friend; and his sobriety and virtue gave stability and security to every other moral qualification. He was also distinguished by the simplicity of his manners. In conversation he was unaffected and unassuming; and yet, on necessary occasions, obliging and communicative. To this general account of his talents and virtues, we shall subjoin some delineations of his character by those who were in habits of intimate acquaintance with him, and who had an opportunity of marking his temper and conduct in the various trying circumstances that occurred in the course of his life. Captain King, the continuator of the journal of his last voyage, has given us the following sketch of his character: "The constitution of his body was robust, inured to labour, and capable of undergoing the severest hardships. His stomach bore, without difficulty, the coarsest and most ungrateful food. Indeed temperance in him was scarcely a virtue; so great was the indifference with which he submitted to every kind of self-denial. The qualities of his mind were of the same hardy, vigorous kind with those of his body. His understanding was strong and perspicacious; his judgment, in whatever related to the services he was engaged in, quick and sure. His designs were bold and manly; and both in the conception, and in the mode of execution, bore evident marks of a great original genius. His courage was cool and determined, and accompanied with an admirable presence of mind in the moment of danger. His manners were plain and unaffected. His temper might perhaps have been justly blamed, as subject to bitterness and passion, had not these been disarmed by a disposition the most benevolent and hu-

mane. Such were the outlines of captain Cook's character; but its most distinguished feature was that unremitting perseverance in the pursuit of his object, which was not only superior to the opposition of dangers, and the pressure of hardships, but even exempt from the want of ordinary relaxation. During the long and tedious voyages in which he was engaged, his eagerness and activity were never in the least abated. No incidental temptation could detain him for a moment; even those intervals of recreation, which sometimes unavoidably occurred, and were looked for by us with a longing, that persons, who have experienced the fatigues of service, will readily excuse, were submitted to by him with a certain impatience, whenever they could not be employed in making further provision for the more effectual prosecution of his designs." (See King's Voyage, vol. iii. p. 48, 49.) Mr. Samwell has also annexed some particulars, relative to the life and character of captain Cook, to the "Narrative of his Death." Dr. Reinhold Forster has also, with some abatement, passed an eulogium on his character, in his "History of the Voyages and Discoveries made in the North." The following tribute to his memory, — the memory of "the ablest and most renowned navigator this or any country hath produced," is drawn up by one of his own profession, of whom it is said, that he is not more distinguished by the elevation of rank, than by the dignity of private virtues. (See Introduction to Cook's third Voyage, vol. i. p. 85—87, &c.) Captain James Cook, says this writer, "possessed, in an eminent degree, all the qualifications requisite for his profession and great undertakings; together with the amiable and worthy qualities of the best men. Cool and deliberate in judging; sagacious in determining; active in executing; steady and persevering in enterprising from vigilance and unremitting caution; unflinched by labours, difficulties, and disappointments; fertile in expedients; never wanting presence of mind; always possessing himself, and the full use of a sound understanding. Mild, just, but exact in discipline; he was a father to his people, who were attached to him from affection, and obedient from confidence. His knowledge, his experience, his sagacity, rendered him so entirely master of his subject, that the greatest obstacles were surmounted, and the most dangerous navigations became easy, and almost safe, under his direction. He explored the southern hemisphere to a much higher latitude than had been ever reached, and with fewer accidents than frequently befall those who navigate the coasts of this island. By his benevolent and unabating attention to the welfare of his ship's company, he discovered and introduced a system for the preservation of the health of seamen in long voyages, which has proved wonderfully efficacious; for in his second voyage round the world, which continued upwards of three years, he lost only one man by distemper, of 118, of which his company consisted. The death of this eminent and valuable man was a loss to mankind in general; and particularly to be deplored by every nation that respects useful accomplishments, that honours science, and loves the benevolent and amiable affections of the heart. It is still more to be deplored by this country, which may justly boast of having produced a man hitherto unequalled for nautical talents; and that sorrow is farther aggravated by the reflection, that his country was deprived of this ornament by the enmity of a people, from whom, indeed, it might have been dreaded, but, from whom it was not deserved. For, actuated always by the most attentive care and tender compassion for the savages in general, this excellent man was ever assiduously endeavouring, by kind treatment, to dissipate their fears and court their friendship; overlooking their thefts and treacheries, and frequently

frequently interposing, at the hazard of his life, to protect them from the sudden repentment of his own injured people. The object of his last mission was to discover and ascertain the boundaries of Asia and America, and to penetrate into the northern ocean by the N. E. Cape of Asia.

Traveller! contemplate, admire, revere, and emulate this great master in his profession; whose skill and labours have enlarged natural philosophy; have extended nautical science; and have disclosed the long unsealed and admirable arrangement of the Almighty, in the formation of this globe, and, at the same time, the arrogance of mortals, in presuming to account, by their speculations, for the laws by which he was pleased to create it. It is now discovered, beyond all doubt, that the same great being who created the universe by his fiat, by the same great being who created the earth to keep a just poise, without a corresponding southern continent—and it was so! “*He stretches out the north over the empty place, and hangs the earth upon nothing.* Job. xxxvi. 7. If the arduous but exact researches of this extraordinary man have not discovered a new world, they have discovered seas un navigated and unknown before. They have made us acquainted with islands, people, and productions, of which we had no conception. And if he has not been so fortunate as Americus to give his name to a continent, his pretensions to such a distinction remain unrivalled; and he will be revered, while there remains a page of his own modest account of his voyage, and as long as mariners and geographers shall be instructed, by his new map of the southern hemisphere, to trace the various courses and discoveries he has made. If public services merit public acknowledgments; if the man who adorned and raised the fame of his country, is deserving of honour, then captain Cook deserves to have a monument raised to his memory, by a generous and grateful nation.

Virtutis uberimum alimentum est honos.

Val. Max. l. ii. c. 6.

From the numerous poetical tributes, paid to the memory of captain Cook, by our elegant female writers, we must confine ourselves to a single extract from Miss Hannah More's poem on “Slavery.”

“Had those advent'rous spirits who explore
Thro' ocean's trackless wastes, the far-fought shore,
Whether of wealth insatiate, or of power,
Conquerors who waste, or russians who devour:
Had these posses'd, O Cook! thy gentle mind,
Thy love of arts, thy love of human-kind;
Had these pursu'd thy mild and liberal plan,
DISCOVERERS had not been a curse to man!
Then, blest'd Philanthropy! thy social hands
Had link'd dissolv'd worlds in brother's bands;
Careless, if colour, or if clime divide;
Then lov'd, and loving, man had liv'd, and died.”

Miss Seward's admirable poem in celebration of captain Cook's memory would have furnished many pleasing extracts, if our limits allowed our farther enlarging on this interesting article; but we must refer the reader to this lady's elegy on the occasion.

The Royal Society testified their respect for the memory of their illustrious member by medals, struck on this occasion, some of gold, others of silver, and others of bronze; the expense of which was defrayed by subscription. On one side is the head of captain Cook in profile, and round it, JAC. COOK OCCANI INVESTIGATOR ACERRIMUS; and on the other, the exergue, REG. SOC. LOND. SOCIO SUO. On the reverse, VOL. IX.

verse is a representation of Britannia, holding a globe; round her is inscribed, NIL INTENTATUM NOSTRI LIQUERE; and on the exergue, AUSPICIIIS GEORGH III.

Among the numerous testimonies of regard that have been rendered to the merits and memory of captain Cook, the important object of providing for his family hath not been forgotten. Soon after his death was known, the lords of the admiralty presented a memorial to his majesty; and he was pleased, by the advice of his privy council, to order a pension of 200*l.* a year to be settled on the widow, and 25*l.* a year to each of the three sons of the captain. A considerable benefit also redounded to his family from the sale of the charts and plans, belonging to the voyage to the Pacific ocean, which were provided at the expense of government. On September the 3d, 1785, a coat of arms was granted to the family, with an appropriate device. Our navigator had six children. On the subject of this article see the first, second, and third voyages of Cook; the first included in Hawkesworth's Voyages, published in 3 vols. 4to, 1773. The second, written by captain Cook himself, and published in 2 vols. 4to. in 1777; and the third published in 3 vols. 4to. in 1784; the two first being written by captain Cook, and the third by captain King. To the first of these volumes is prefixed an introduction by Dr. Douglas, the late bishop of Salisbury, containing a brief historical account of voyages that had been previously performed with a view to the objects comprehended by those of captain Cook, a concise statement of his discoveries, and a detail of the advantages resulting from them. See also Kippis's Life of Captain Cook, and Biog. Brit. vol. iv.

COOK, Captain HENRY, a choir-man, brought up in the chapel-royal during the reign of Charles I., which he quitted at the commencement of the grand rebellion, and went into the king's army, where he considerably distinguished himself; and in 1642, obtained a captain's commission. At the restoration, he was appointed master of the children of the chapel-royal. He composed the coronation anthem, according to Ant. Wood, for Charles II., and a hymn in four parts, composed by him, is likewise said to have been performed instead of the litaney, in the chapel of St. George at Windsor, by order of the sovereign and knights of the garter, on the 17th of April 1661. None of his church music, however, was printed, nor has Dr. Tudway inserted any of his compositions in the voluminous MS. Harleian collection of English services and anthems. And, indeed, if we may judge of them by the few secular compositions which appear in the collections of the times, he was little fitted for the high office to which he was appointed at the restoration. In the second part of Playford's “Musical Companion,” 1667, there are two or three of his songs which are dry, ill accented, and equally destitute of melody and masterly harmony. However, he had the merit, or at least the good fortune, to be the master of three boys among the children of the chapel, who gave very early testimony of their genius and progress in composition. These were Pelham Humphrey, John Blow, and Michael Wise, who, even while they were choristers in the chapel, produced verse anthems, far superior in melody and design to any that our church could boast, anterior to Purcell. Cook died in 1672, according to Ant. Wood, of grief, at being so far surpassed in composition by his young pupil, Pelham Humphrey.

COOK, Dr. BENJAMIN, an eminent organist and contrapuntist, in the style of our best ecclesiastical composers, whom he had studied from Tallis, to Crofts, Weldon, and Green; a very correct harmonist and good organ player, but with

limited powers of invention. He was organist of Westminster Abbey, and on the death of Kelway elected organist of St. Martin's in the Fields. He long presided at the Crown and Anchor concert, which was originally established for the preservation of the best works of the most eminent masters of old times. It is a curious circumstance, that at this concert of ancient music, Handel was regarded as an innovator, and Geminiani thought it an honour to be allowed to dedicate his last concertos to this society. Dr. Pepusch, who established and directed this concert, to the time of his death, never allowed Handel any other merit than that of a good practical musician. The irreconcilable enmity between the lovers of old and new music, became from the time of this institution, as violent as the rage between the champions of ancient and modern learning. Dr. Cook, a steady votary of the old masters, died September 1797. He was the son of Benjamin Cook, who kept a music shop in New-Street, Covent Garden, and who published by patent, among other things, six concertos for violins, tenor and bass, by Alexander Scarlatti; the chamber symphonies of Porpora, for three instruments; and the two books of lessons by Domenico Scarlatti, in long 4to., of which Rossini gave was the editor. After the decease of Cook, Johnson reprinted Scarlatti's lessons, with the same title page, and the same errors, as had escaped correction in the former edition.

COOK, HENRY, a native of this country, born in 1642. Having a taste for historical painting, he travelled to Italy for the purpose of improving himself in this branch of the art, and studied under Salvator Rosa; but, on his return to England, met with so little encouragement, that for many years he remained in want and obscurity. At length, however, his talents gained him notice, and he was employed by king William to repair his cartoons; he likewise finished the equestrian portrait of Charles II. at Chelsea-college, painted the choir of New-college chapel Oxford, and the staircase at Ranelagh house, besides many other works mentioned by Mr. Walpole. He is also said to have tried portrait painting, but to have given it up, disgusted with the caprices of those who sat to him. He died 18th Nov. 1700. Walpole's Anecdotes.

COOK, in *Icthyology*, a species of fish, which is sometimes taken in great plenty on the coast of Cornwall. It is a scaly fish, and does not grow to any great size: the back is purple, the belly yellow, and the tail rounded.

COOK'S RIVER, in *Geography*, a river of North America, which runs into the northern Pacific ocean, between Cape Elizabeth and Point Banks, *i. e.* between E. long. 207° 5', and 207° 45'; N. lat. 58° 42', and 59° 10'; and which, by its various branches, opens a very considerable inland navigation. This name was given to the river by lord Sandwich, in honour of captain Cook, who, in the year 1778, traced it as high as the latitude of 61° 30', and the longitude of 210°, or about 70 leagues from its entrance, without perceiving the least appearance of its source. "It was a satisfaction to me," says this persevering navigator, (*Third Voyage*, vol. ii. p. 397.) "to reflect, that, if I had not examined this very considerable inlet, it would have been assumed, by speculative fabricators of geography, as a fact, that it communicated with the sea to the north, or with Baffin's or Hudson's bay to the east; and been marked, perhaps, on future maps of the world, with greater precision, and more certain signs of reality than the invisible, because imaginary, Straits of de Fuca, and de Fonte." Mr. King was ordered to land on the northern point of the low land, on the S.E. side of the river, there to display the flag, to take possession of the country and river in the name

of his British majesty, and to bury in the ground a bottle, containing some pieces of English coin, of the year 1772, and a paper, on which were inscribed the names of the ships and the date of the discovery. Near the shore Mr. King observed about twenty of the natives, who appeared with their arms extended, probably to express their peaceable disposition, and to shew that they were without weapons. When their alarm, occasioned by the sight of mulquets, had subsided, they allowed their new visitors to approach them, and appeared to be cheerful and sociable. Their spears and their other hostile weapons, as it was afterwards discovered, were hid in the bushes close behind them. The ground was swampy, and the soil poor, light, and black. It produced a few trees and shrubs, such as pines, alders, birch, and willows; rose and currant bushes, and a little grass, but not so much as a single plant or flower was discovered. On a future day, several large and some small canoes, with natives, came off to the British ships, and bartered their wine; after which, they sold their garments, till many of them were quite naked. Among others, they brought a number of white hare or rabbit skins, and very beautiful reddish ones of foxes; but there were only two or three skins of otters. They also sold pieces of salmon and halibut. They preferred iron to every thing else offered to them in exchange. The lip-ornaments did not seem so frequent among them as at Prince William's Sound; but they had more of those which pass through the nose, and, in general, these were also much larger. They had, however, a greater quantity of a kind of white and red embroidered work on some parts of their garments, and on other things, such as their quivers and knife-cases. On the west side, a volcano was discovered, in lat 60° 23'; and this is the first high mountain N. of mount St. Augustine. The volcano is on that side of it next the river, and not far from the summit. It only emitted a white smoke without fire. Captain Cook observes, that all the people met with near this river, seemed, by every striking token of resemblance, to be of the same nation with those who inhabit Prince William's Sound, but essentially differing from those of Nootka, or King George's Sound, both in their persons and language. The language of these is rather more guttural; but, like the others, they speak strongly and distinctly in words which seem to be sentences. These people are in possession of iron; that is, the points of their spears and their knives are of this metal, and some of the former are also made of copper. Their spears are like our spontoons; and their knives, which they keep in sheaths, are of a considerable length. These, with a few glass beads, were the only things seen among them that were not of their own manufacture.

Their beads and iron they must have received from some civilized nation; and it seems most probable, that they procured them through the intervention of the more inland tribes from Hudson's Bay, or the settlements on the Canadian lakes; unless it can be supposed (which, however, is less likely) that the Russian traders from Kamtschatka, have already extended their traffic so far; or at least that the natives of their most easterly Fox islands, communicate along the coast, with those of *Prince William's Sound*; which see. The Russians themselves, says captain Cook, have never been among them; for if that had been the case, we should hardly have found them clothed in such valuable skins as those of the sea-otter. There is not the least doubt, continues captain Cook, that a very beneficial fur trade might be carried on with the inhabitants of this vast coast. But unless a northern passage should be found practicable, it seems rather too remote for Great Britain to receive any emolument from it. It must, however, be observed, that

the most valuable, or the only valuable, skins which Cook saw on the west side of America, were those of the sea-otter. All their other skins seemed to be of an inferior quality, particularly those of their foxes and martins. Most of the skins that are fit for sale, are those which are made up for outer garments, and this is the chief use for which they kill the animals. By increasing intercourse with purchasers, they would be more assiduous in procuring skins, and thus a plentiful supply might be obtained in this country.

In Cook's river, the tide is very considerable, and much contributes to facilitate the navigation of it. It is high water in the stream, on the days of the new and full moon, between two and three o'clock; and the tide rises perpendicularly, between three and four fathoms. The reason of the tides being greater here than at other parts of this coast, is, that, the mouth of the river being situated in a corner of the coast, the flood from the ocean is forced into it by both shores, and thus swells the tide to a great height. The variation of the compass was $25^{\circ} 45'$ E.

Cook-room, in a *Ship*, is where the cook and his mates dress and deliver out the meat, &c.

Cook's Strait, in *Geography*, so called from its discoverer captain Cook, a strait which separates the two islands that form New Zealand. This strait is about four or five leagues broad; and the islands, thus divided, are situated between the latitudes of 34° and 45° S.; and between the longitudes of 181° and 194° W. See **NEW ZEALAND**.

COOKE, **Sir ANTHONY**, in *Biography*, governor, preceptor, or schoolmaster, to king Edward VI., and great grandson to sir Thomas Cooke, lord-mayor of London in 1462, was born at Giddy-hall in Essex about the year 1506, and educated, probably, at Cambridge. He became eminent in literature and the arts, being a thorough master of the Latin and Greek languages, an excellent critic and philologist, and equally skilled in poetry, history, and the mathematics. He was no less distinguished for his piety and goodness. These qualities recommended him to the office of instructor to king Edward VI., and the royal pupil is well known to have done honour to the talents and character of his preceptor. During queen Mary's reign he was an exile for religion; but upon the accession of queen Elizabeth he returned to his native country, fixing his residence at Giddy-hall, the building of which he completed. He died June 11, 1576, having attained the age of 70 years, and was buried in the chapel of Rumford in Essex, where a monument was erected to his memory. He left four daughters, eminently learned in the Greek and Latin languages; *viz.* Mildred, married to sir William Cecil, baron Burleigh, lord-treasurer of England; Anne, wife of sir Nicholas Bacon, lord keeper of the great seal; Elizabeth, married to John, lord Russell, son and heir of Francis earl of Bedford; and Catherine, wife of Henry Killigrew, esq. He had also two sons.

COOKERY of Meats, in *Domestic Economy*, denotes the application of heat to the several aliments taken both from vegetables and animals. The advantages attending the application of heat to vegetable aliments are such as follow: 1. That the greatest part of vegetable substances are thus rendered more soluble in the human stomach. The only doubt, says Dr. Cullen, that can arise with regard to this, respects vegetables to which in their crude state a boiling heat is immediately applied, so that in many of them a coagulation is produced; in consequence of which they seem to be rendered less soluble in water than they were before:—

but this, he says, does not seem to have any effect on their solution in the stomach. Whether the difficult solution be obtained by some degree of fermentation that necessarily takes place in the stomach, or by the powers of the gastric fluid, it is not necessary to determine, as it is certain that the action of heat separates in some measure the small particles of bodies, and thereby renders them more readily separable by the solvent powers of the stomach. 2. The application of heat separates and dissipates the volatile parts of vegetable substances, which are seldom of a nutritious nature, and, in many cases, have a tendency to prove noxious. 3. The application of heat to a certain degree extricates and dissipates a considerable quantity of air, which, in the natural state of vegetables, is always fixed in their substance; and it is probably, in this way especially, that heat best contributes to the dividing and loosening of the cohesion of the small parts of vegetable substances. It is certainly in this way, by dissipating a large portion of their air, that vegetables are rendered less liable to fermentation, and less liable to produce that flatulence, which is occasionally so troublesome in the stomach and intestines. Dr. Cullen observes further, that, as the heat may be employed in two ways, either in a humid or a dry form; the former is always better suited than the latter to all the purposes above-mentioned. The cookery of animal substances also consists chiefly in the application of heat. Other practices, however, previous to cookery, may be considered as parts of it; particularly salting, drying, and pickling. These practices, however, are merely useful for the purposes of domestic economy, as preserving meat from putrefaction, before it be subjected to heat, for a longer time than it could be preserved without such means. These practices, Dr. Cullen thinks, can never increase the nutritious quality of meat, or render it even of more easy digestion. Drying certainly brings the solid parts of meat more closely together, which must render it of more difficult solution. The addition of salt, which stimulates the stomach, may seem in some cases to promote digestion; but this must be when the salt is added in small quantity, and when the meats preserved by it are taken in moderate quantity only. For when meats have been long salted they are hardened, and rendered in proportion less soluble in the stomach; and a large quantity of salt accompanying them is certainly hurtful to the system. There is one preparation of animal food, which is made without any addition; and that is by its being kept for some time before it is subjected to cookery, for a longer or shorter interval, according to the seasons, and the nature of the meat; but always till it has made some advance towards putrefaction. The tendency to this seems to take place from the moment that life is extinguished in the animal; and the allowing of it to take place to a certain degree renders the meat more easy of solution in the stomach; and if the putrescency be only in a moderate degree, it does not seem to injure the nutritious quality of the meat. The proper degree of putrescency is not easily ascertained; and it is certainly different according to the constitution of the person. Some can use meats tainted in a considerable degree without inconvenience: whilst the digestion of others is much disturbed by the small quantity of putrescent meat. Every advance in meats towards putrescency, renders them, as Dr. Cullen says, more ready to increase the tendency of the animal fluids to that state which we take to be always hurtful to the human constitution, as it both favours the access of diseases, and aggravates their symptoms and danger when they occur.

The cookery of animal substances by the application of heat is of two kinds, as it is applied in a humid form by

boiling and stewing, or in a dry form, by *roasting, broiling, and baking*. For the processes and effects of boiling and stewing; see **BOILING**. The application of heat in a dry form is of two kinds, as it is in close vessels, or as it is exposed to the free air. The first is *baking*; and though commonly in this practice the cover of the meat is merely paité, any considerable exhalation is prevented, and the retention of the juices under the application of heat renders the meat more tender; and in all cases when the heat applied loosens, and, in some measure, extricates the air, without exhaling it, the substance is rendered more tender than when with any other application an exhalation is allowed. In *broiling* an exhalation takes place; but as the heat of a naked fire is more nearly applied, the outer surface is in a degree hardened before the heat penetrates the whole, and thus a great exhalation is prevented, while the whole is rendered sufficiently tender; but this kind of cookery is especially suited to meats that are chosen to be eaten a little raw. *Frying* is a kin to this; but as in this case the meat is cut into thin slices, and laid in a vessel which is interposed between the meat and the naked fire, the heat is more equally applied to the whole substance. But as the part of the meat lying next to the bottom of the vessel would be suddenly hardened by the heat, it is always necessary to interpose some fluid matter. When this, as is most commonly the case, is of an oily matter, a strong heat is apt to render it empyreumatic, or at least less miscible with the fluids of the stomach; and, therefore, all fried meats are less easily digested than those of any other preparation, except that sometimes the same may happen to baked meats, to which an oily matter, and that only, is added to avoid the too drying heat. By *roasting* the heat may be so managed as to be equally applied, and therefore its effect in rendering the meat more tender is certainly obtained; and though a considerable exhalation is made, it is almost only of a watery humidity. This, indeed, would take place to a very great degree, and render the meat again more insoluble, were it not that large masses only are subjected to this operation, and that thereby the outer surface is first condensed, and prevents the exhalation from the interior parts. At the same time, an oily matter is commonly and repeatedly applied to the outer surface, which prevents both much exhalation, and any great hardening of the outer surface, till the heat has penetrated the whole, and rendered it sufficiently tender. Cullen's Mat. Med. vol. i. pt. i. c. 2.

COOK-HOUSE, in *Geography*, a town of America, situated on the Coquoago branch of Delaware river, in the township of Colchester, New-York, 18 miles S. of the mouth of Unadilla river.

COOKIA, in *Botany*, (named by Sonnerat, in honour of our illustrious circumnavigator, captain Cook.) Willd. 844. Juss. 261. Vent. 3. 155. Sonnerat It. 2. 181. tab. 80. Reiz. Obs. 62. Jacq. Hort. Schoenb. 1. 53. tab. 101. (Quinaria Lanflum; Lour. — Wampi of the Chinese.)

Gen. Ch. Cal. very small, five-celled. Cor. Petals five, spreading. Stam. Filaments ten, distinct; anthers roundish. Pist. Germ somewhat pedicelled, hirsute; style one; stigma capitate. Peric. Berry; Juss. (Pome; Willd.) five-celled; three frequently abortive. Seeds one in each cell.

Eff. Ch. Calyx five-celled, inferior. Petals five, equal, inferior. Berry or pome, five-celled. Seeds one in each cell.

Sp. *Cookia punctata*. A tree. Trunk brownish, striated, rugged. Branches, petioles and common peduncles rough, with prominent points. Leaves alternate, petioled, unequally pinnated; leaflets petioled, alternate, egg-shaped, acuminate,

quite entire, smooth, sprinkled with pellucid dots, inner side narrower. Flowers white, in a large divaricated terminal panicle. A native of China and of the South Sea islands.

COOLER, among *Brewers, Distillers, &c.* a large vessel, usually of small depth and large surface, in which liquors are cooled, after having been boiled.

COOLIES, in the East Indies, are those natives who are employed in carrying of burthens, digging of trenches, and such laborious occupations; and who, supplying the place of pioneers, cannot be dispensed with in the operations of military tactics in Hindoostan.

COOLING is the progressive decrease of temperature from a higher to a lower degree. From the highest degree of heat, which human industry has been able to obtain by means of combustion, or by concentrating the solar rays, to the lowest degree of it, which both natural and artificial methods have produced, the scale is very considerable; and different parts of it have obtained diverse denominations, which are derived from the most striking phenomena that take place at particular points of the scale; thus we hear of porcelain heat, white heat, red heat, boiling heat, temperate, freezing, &c. and all these transitions from the first to the last, fall under the denomination of *cooling*; whereas the contrary transition from the lowest to the highest, is called *heating*. In order to preserve perspicuity, and to assign to each of the received denominations, the particulars which belong more immediately to it, we have divided the subject into three articles, under the words *congelation, cooling, and freezing*. Under the first we have stated the phenomena of natural congelation; the last contains whatever relates to artificial freezing, viz. to the production of cold below 32° of Fahrenheit's scale; and under the present, we shall principally state all the methods and the effects of cooling from the actual temperature of the atmosphere to a lower degree; but not below that of melting ice, viz. 32°, which is commonly called the freezing point.

The temperature of the atmosphere in the hottest climates, has hardly ever been known to exceed 130°, and it is but seldom that it reaches that most oppressive degree of heat. In the human species, nature has made ample provision, and has furnished them with industry sufficient for counteracting the effects of a very high or a very low temperature; but without any artificial assistance, few are the degrees of heat in which human beings can live with perfect comfort. Making some allowance for the natives of different climates, the whole range temperature may be said to reach from the 60th to the 70th degree of Fahrenheit's scale. Below 60° most persons have no objection to a gentle fire in their apartments; and above 70° they generally complain of heat. Yet when the natural temperature of the atmosphere is above 50°, cooled liquors are generally preferred for drink; but when the temperature is above 70°; then not only cooled liquors, but cool apartments also, are articles of great luxury; and (it may in great measure be said) of necessity. The languor which is commonly induced by heat, is in great measure relieved by artificial cooling. Patients affected with fevers of the intermittent and putrid kinds, which are so very common and destructive in hot climates, receive great benefit from the use of cooled liquors, and such are plentifully administered to them, whenever they can be obtained. The preservation likewise, of meats, fruit, butter, &c. in warm climates, or in the hot season, is considerably assisted by cooling; and it may be extended to a very remarkable long period by actual freezing.

In order to answer all these purposes, mankind has, from time immemorial, endeavoured to discover and to apply methods

thods of cooling, or of refrigeration. These methods, as far as they are at present known, may be comprised under the following heads; *viz.* 1st, the application of something naturally colder than the actual temperature of the atmosphere; 2^{dly}, ventilation; 3^{dly}, evaporation; and 4^{thly}, the solution of certain saline substances. Sometimes two or three of these means are applied at the same time, to the article which is required to be cooled. In every country of Europe, and especially in the southern part of it, ice is collected during the winter, in proper places, and is used for cooling liquors, &c. in the summer season, or throughout the whole year. And this undoubtedly is the most easy, the most extensive, and the most effectual method of cooling. A little ice taken out of the ice-house, and placed round a bottle of water or wine, in any convenient vessel, soon cools it to the desired degree; and if the effect is to be increased, so as to freeze creams, fruit, &c. by breaking the ice into small pieces, and mixing common salt with it, the desired end will be obtained. The ice-house itself is of very essential use for preserving meat, fish, butter, fruit, &c. which things need only be laid in it, until they are wanted.

When ice cannot be easily procured, well water forms a useful substitute to a certain degree. When the depth of the well is 40 or 50 feet, or upwards, the constant temperature of its water is very nearly equal to the mean temperature of the country, which, of course, is lower than the usual temperature of the summer season in that country; hence, if a pail of water be drawn, and a bottle of wine, or other liquor, be immediately placed in it; a considerable refrigeration may be obtained, and it may be maintained by drawing fresh water at intervals from the well, &c. Thus in London the mean temperature is about 50°, and so is the temperature of pretty deep wells throughout the year. Now in the summer season, the temperature frequently rises above 65°, or 70°; therefore, at those times, by applying fresh-drawn well-water, the liquors we drink may be cooled about 15 or 20 degrees, which will render them incomparably more pleasant. When articles of food are required to be kept some time longer than the heat of the weather would allow, they may be placed in a basket at the end of a rope, and may be let down into the well, until they come within a foot or two of the water. For the like purposes, pretty deep pits, caves, or grottos may be used; since their temperature is nearly equal to the mean temperature of the country, and suffers little or no variation between winter and summer.

Ventilation is nothing more than a constant change of air; but if the air which has just passed by a body, and that which succeeds it are all of the same temperature, no cooling will be produced by the ventilation; but the refrigeration will take place, when the body is hotter than the air which passes by it, or when an increase of evaporation ensues. Expose a thermometer to the open air, but shelter it from the wind, and when the thermometer is become stationary, let the wind fall upon it; and it will be found that the quicksilver is not lowered in it. But when a human being, or other animal is exposed to ventilation, the quick transition of air cools it; first, because it continually removes the air which has been heated by the contact of the animal body, the breath, &c.; and secondly, because the evaporation from the body is increased by the ventilation. So that, upon the whole, the use of ventilation, such as is effected by means of fans, bellows, a particular disposition of apartments, and other machines, is to remove heated or vitiated air from the vicinity of human beings, from close habitations, prisons, ships, &c. The ingenious Dr. Hales fixed a machine of this sort in the old Newgate prison, which, being put in action by means of

sails, like a wind-mill, constantly ventilated the inside of that prison; and this machine remained in use until the rebuilding of that prison upon a better plan rendered it superfluous. See VENTILATOR.

Hitherto we have supposed, that the air is colder than the human beings who are exposed to it; but should the contrary be the case, then ventilation will produce a different effect; *viz.* it will heat, instead of cooling, as may be easily conceived by considering what has been said above. And such is the case with the hot winds, which sometimes blow in Arabia, Africa, India, and other places.

One of the most useful and efficacious modes of cooling, especially in those countries where it may be most wanted, is performed by means of evaporation. The principle upon which the cooling power of evaporation depends, is, that whenever a body is expanded, *viz.* its volume is increased, its capacity for containing heat is increased at the same time; hence the expanding body absorbs the heat of the surrounding bodies, which, of course, are cooled by it.—A short experimental illustration of this theory will easily explain the effect we are treating of. Take three common mercurial thermometers; keep one in its natural state; place the second in a bottle of water, and close its aperture; wrap some cotton moistened with water round the bulb of the third; then expose all the three thermometers thus prepared to the ambient air, especially when the wind blows in the summer season; and after a few minutes observe their progress. It will be found that the naked thermometer, and that which stands in the bottle, indicate the same degree of temperature; but the third thermometer, which is wrapped in moistened cotton, will be found to indicate a temperature lower by a few degrees, than the former. The effect in this experiment is produced by the evaporation of the water from the cotton, and not from the water as water; for if that were the case, the thermometer in the bottle of water would likewise be cooled like the one involved in moistened cotton. Evaporation is the conversion of water into steam, or vapour; and the bulk of steam has been found to be many hundred times larger than the bulk of the water from which it originated. Now in that expanded state, steam is capable of holding a vast deal more of the element of heat, than in its form of water, and that without manifesting any higher degree of temperature. Or, in other words, if a thermometer be placed in a bottle full of vapour of water, and another thermometer be placed in the water from which that vapour was just produced, their temperatures will be found to be nearly the same; yet the vapour contains a vast deal more of the element of heat than an equal weight of water, which quantity of heat is essentially necessary for maintaining its elastic or vapourous existence; and this is proved by observing, that vapour cannot be converted into water without depositing its heat upon (and of course elevating the temperature of) the surrounding bodies; and on the other hand, that water cannot be converted into vapour, without absorbing heat from (and consequently cooling) the surrounding bodies. Mr. Watt of Birmingham says, that he has observed as exact a coincidence between the heat rendered latent in the vapour, and that which emerges from it, as can be desired; and that the heat obtainable from steam, capable of sustaining the ordinary pressure of the atmosphere, is not less than 900°; and that it does not exceed 950° of Fahrenheit's scale.

The cooling action of evaporation is counteracted by the influx of heat from the surrounding bodies, since heat always tends to equalize the temperature of contiguous bodies. Thus in the above described experiment, the heat of the surrounding air tends to elevate the temperature of the thermometer,

thermometer, at the same time that the evaporation from the cotton tends to lower it. And according as the one or the other of these opposite actions predominates, so the cooling effect is more or less conspicuous. From these observations it naturally follows, that the cooling, occasioned by evaporation, is greater when the evaporation is quicker, and contrarywise; also, that when different fluids are used for the evaporation, in similar circumstances, that fluid which evaporates quickest, produces the greatest refrigeration. Mr. Cavallo says, "in order to try the degree of refrigeration produced by the evaporation of different fluids, I held up a naked thermometer, (*viz.* a thermometer, the bulb of which was not in contact with the metal of the scale) and poured upon its bulb a stream of some particular fluid, which issued out of the capillary aperture of a tube; taking care to throw just fluid enough to supply the waste by evaporation. By this means, when the temperature of the air was 64°, I found that the evaporation of water cooled the thermometer 8°; *viz.* brought it down to 56°; the evaporation of spirit of wine cooled it 16°; *viz.* brought it down to 48°; and the evaporation of ether cooled it 54°; *viz.* brought it down to 10°. But, by the use of the best purified sulphuric ether, when the temperature of the air was about 56°, I brought the thermometer down to 3°. The cooling produced by the evaporation of other fluids needs not be mentioned; their effect being generally intermediate between the effect of water, and that of spirit of wine." (Phil. Trans. vol. lxxi.) Whatever promotes the evaporation, such as a dry air, and especially a dry wind, tends to increase the refrigeration; and when all the favourable circumstances concur, the effect is prodigious; so that in a dry, warm, and brisk wind, by means of the evaporation of the best sulphuric ether, the temperature of any kind of bodies may be lowered many degrees below the freezing point; and animals might be easily frozen to death.

Though several of the above-mentioned particulars, and especially the causes upon which they depend, have been but lately investigated and ascertained; yet the cooling effect of evaporation has been known and used by mankind from time immemorial. Athenæus says, as being related by Protagoras of Cyzicum, that in the time of king Anticleus, it was usual to cool water by evaporation, and to drink it as a luxury. A very easy and familiar experiment to shew the effect of evaporation, may be performed in the following manner. Moisten a small space on the upper part of each hand; cover one of those places with an inverted wine glass, and let a person blow with a pair of bellows upon the other hand. The latter will be sensibly cooled, but not the former. Change the glass and the blowing, from one hand to the other, and the effects will be reversed. Seamen, especially in the night time, frequently employ this natural effect for discovering which way the wind blows. They moisten a finger of their hands by putting it in their mouth; then expose it to the ambient air by elevating it above their head; and justly conclude that the wind blows from that quarter which is opposed to the most cooled side of the finger.

In warm climates, where the dryness of the air generally is very great, the refrigeration arising from evaporation is very considerable, and is of course frequently employed for counteracting the natural heat. The caravans which traverse the parched deserts of Arabia, are obliged to carry their supply of water in earthen jars upon camels; but in order to keep it pleasantly cool, the jars are involved in cloths, which they take care to keep continually moistened with water. It is a pretty common practice in the

southern parts of Europe, as well as in the East and West Indies, in America, &c. to wrap up a bottle of wine, or water, or other liquor, in a wet cloth, and thus to suspend it in a shady place, either under a tree or in a passage, so as to expose it to the briskest current of air that can be obtained; for by this means the liquor will be cooled several degrees; care, however, must be had to sprinkle more water upon the cloth, which surrounds the bottle, in proportion as the former evaporates. Mr. Walker, of Oxford, describes a peculiar method of producing a very considerable degree of cold by means of evaporation. "Having," he says, "in the course of the preceding winter, frequently succeeded in producing ice, by the cold produced from evaporation with water, when the temperature of the air was 38°; it occurred to me, that it might be possible to freeze water in the middle of summer, by a process which depended on this principle, by the use of water only. Accordingly, I procured a tall cylindrical vessel, holding about two gallons, in which is fixed a small spiral tube, as in the worm-tub of a common still; the lower end of this tube comes out through the vessel near the bottom, sufficient to connect the nose of a pair of bellows to it, by the intervention of a bladder, secured air-tight; this spiral tube ends at the top of the cylindrical vessel, where it is somewhat enlarged, like the mouth of a funnel. This vessel, being covered with flannel, was filled with water and hung out in a brisk dry wind, the temperature of the air being 50°; after some time, by repeatedly wetting the flannel on the outside of the vessel, I found the water within was cooled to 40°; air being then forced through the tube (by means of the bellows), surrounded by the cooled water, came out at the upper extremity of the tube at nearly the same temperature.

"A thermometer having its bulb covered with lint, and wetted repeatedly with the cold water in the vessel, placed so as to receive the draught of cold air from the tube, soon sunk to 34°; hence by a series of two or three of these vessels, water might, upon this principle, be frozen at midsummer, recollecting that this experiment may always commence at 50°, the usual temperature of springs; and hence it might be possible upon the same principle, to cause nature upon a small scale, even without the immediate interposition of art, to depart from her usual course, and to assume the hoary garb of winter at midsummer.

"For this purpose a current from the external air might be admitted into the tube, by means of a funnel, communicating with, and receiving, a constant draught of air.

"In an attempt of this kind, it would be necessary (besides some other variation in the vessels, which circumstances might point out.) that the cylindrical vessels be porous, or pierced with small holes; so that the water may be constantly and gently oozing out."

In Spain, in Italy, in Egypt, and probably in other places, certain vessels are made of a porous earth, which, when full of water, will just permit some of that fluid to ooze out on their external surface, whence it evaporates, and thus cools the remainder of the liquor within the vessel. The Spanish vessels for this purpose consist of a reddish brown earth. They are pretty broad, but not very capacious. In Italy they have been made of a pale yellowish material, but much larger. In Egypt they are made somewhat in the shape of a Florence flask, and not much bigger; but their aperture spreads out in the form of a cone, or rather of an ale glass, which is done for the convenience of drinking out of it. Their substance is of the colour of ashes, and it is said to be a scum left on the banks of rivers. But vessels of any degree of porosity may be made by mixing sand and clay in various proportions.

The use of these vessels in Spain, in Italy, and especially in Egypt, is attended with a notable degree of refrigeration, on account of the great dryness of the air in those climates, which enables it to absorb a great deal of moisture in a short time; but the same vessels having been brought over, and having been tried, in this country, have been found to cool the contained liquor in a very trifling degree; evidently owing to the state of the air in this country, which is much less hot, and much less dry than in the above-mentioned places; therefore much less apt to promote evaporation. One of the Egyptian vessels was tried in London at a time when the temperature of the atmosphere was at a mean, and after about half an hour, when almost three quarters of the water had passed through it, and had dropped down, the remaining quantity of water was found barely 3° colder than the surrounding air.

It is but lately that liquor coolers have been manufactured in this country, and they are at present to be found in most of the earthenware shops in and about London. These are cylindrical vessels, about six inches in diameter, and about a foot high. It is directed to keep one of these vessels entirely immersed in water during one hour. The vessel, being then removed, in that moist state, without putting any water in it, a bottle of wine, &c. must be placed in it, and this is said to be cooled by the evaporation of that quantity of water, which the substance of the vessel had imbibed whilst it remained under water. Upon trial, however, it appears that the actual refrigeration which is obtained by means of one of these vessels, seldom amounts to two or three degrees; and that, of course, a bottle of wine may be cooled much more effectually by placing it into a pail of water fresh drawn from a pretty deep well or pump; which may be renewed at intervals. Indeed, considering the form of these coolers, also that the sides of it are at a considerable distance from the surface of the bottle, and the ambient air has a free access to both, it is hardly to be expected that any sensible advantage should be obtained from them.

In India the action of evaporation is used not only for cooling liquors, but likewise for cooling apartments, and the effect, by the testimony of those persons who have experienced it, is said to be very remarkable. The method, (which, however, is practicable only when a dry wind blows,) is as follows. That door of the apartment which is opposed to the wind, and through which the wind enters, is stopped up with a peculiar sort of screen or curtain, which fits it exactly. This screen consists of two surfaces or gratings of bamboo, situated parallel to each other, and about three or four inches apart; then the space between these external surfaces is filled up in a loose manner with the roots of a sweet-scented grass. In short the construction of this screen is calculated to admit the air not in a body, but divided through a vast number of passages. Two men are placed on the outside, each having a goat's skin filled with water, which they keep continually sprinkling upon the screen. A constant and copious evaporation is of course kept up, which presently cools the adjoining room to a very remarkable degree. By this means the temperature of the room has sometimes been lowered upwards of 15°.

Amongst those cooling processes which depend upon the expansion of bodies, that which arises from the expansion of air must not be forgotten; but as this is by no means very practicable, we shall barely mention it in this place. The condensation and expansion of air produce the effects which have been mentioned above; *viz.* the former is attended with an extrication of heat, and the latter with an absorp-

tion of it; hence the contiguous bodies are heated by the former, and are cooled by the latter. When air is suddenly condensed, (see CONDENSER, and CONDENSATION,) the heat which is extricated from it, has been found capable of setting fire to light combustible bodies; and when the air is rarefied either by means of an air-pump, or by liberating it from a vessel, in which it has been condensed; the cold it produces has sometimes been found to lower the thermometer several degrees below the freezing point.

The last method of cooling which remains to be described, is obtained by the solution of salts. That certain saline substances, whilst dissolving in water, or in acids, would generate a considerable degree of refrigeration, and especially that the solution of fat ammoniac would lower the thermometer down to the freezing point, has been long known; but, within these 15 or 20 years, the subject has received wonderful improvements, in consequence of the experiments instituted by various ingenious persons; and especially from the assiduous investigations, and successful experiments of Mr. Walker of Oxford, who has examined the cooling powers of a vast number of saline substances both single and mixed; and has been able to freeze quicksilver at Oxford in the middle of summer, merely by the solution of salts. His interesting experiments, and his various freezing mixtures, will be found described under the article FREEZING.

A vast number of salts and saline mixtures may be used for cooling liquors; but the most advantageous are those which, after solution, may be recovered by means of evaporation, so as to render them useful for a second refrigeration, a third, and so forth. Yet the price of most of those salts in Europe, the trouble of recovering them from the solution, and pounding them in order to render them fit for another cooling operation, have not rendered this method common in this part of the world; especially where other easier methods are practicable. So that in fact the cooling power of saline solutions is mostly used for particular experiments by the European philosophers, especially when a very powerful freezing mixture is required. In India, where nitre is very cheap, and the heat of the climate prompts the inhabitants eagerly to adopt every possible method of cooling, the practice of cooling liquors, by means of the solution of nitre in water, is very common. For this purpose, the wine, the water, or any other liquor, is put into a metallic bottle, generally a pewter one, having a pretty long neck. A tub is partly filled with water, and a quantity of nitre is thrown in it; then the operator holds the bottle by the upper end of its long neck, and gently moves it about the saline solution, and thus cools the liquor in it to a very considerable degree. As salts will produce cold only during their solution, therefore when the first quantity of nitre has been thoroughly dissolved in the above process, more nitre must be added; and when the water is completely saturated, so as not to be capable of dissolving more salt, then the bottle must be removed to another tub with a fresh saline mixture. The nitre might afterwards be easily recovered merely by exposing the solution, in shallow pans, to the hot rays of the sun in that country; this economical plan, however, does not as yet seem to have been adapted.

The salts which might be used for the purpose of cooling liquors in this country, or in long voyages, are nitre and fat ammoniac; the other saline substances being either more expensive or not easily recoverable after solution. Of the effects of nitre alone in water enough may be derived from the above described process. Salt ammoniac by itself gradually

gradually added to a quantity of water, will occasion a considerable refrigeration, so that a bottle of wine, &c. placed in the solution may be cooled even to 32° of Fahrenheit's scale. But a mixture of both salts is much more efficacious, and the best proportion is five parts of nitre, five of salt ammoniac, and 16 of water. During the solution, which will continue a considerable time, this mixture will cool the thermometer several degrees below the freezing point; but it must not be imagined that a small quantity of the same will cool a bottle of wine to an equal degree. The solution of a given quantity of the mixture absorbs a certain quantity of heat, and this quantity abstracted from the small body of the thermometer, will lower its temperature considerably; but the same quantity of heat abstracted from a bottle of wine, will cool it proportionably less than the thermometer. In order to cool a bottle of wine from the usual temperature of spring waters (which in London is about 50° or 51°) down to about 32° ; a pound of nitre with a pound of salt ammoniac, and a proportionate quantity of water, will generally suffice. The salts for this purpose must be finely powdered and as dry as possible. But when a moderate refrigeration is required; half a pound of each salt and about three pints of water will be sufficient.

Glauber salt, (*viz.* sulphate of soda) dissolved in water, likewise produces a very considerable refrigeration; but this salt will not produce that effect unless it be in its crystallized state. In that state, however, it is not easily preserved, since the mere contact of air will render it powdery and opaque, in which case its solution will generate heat rather than cold. On this account, therefore, this salt is not so much to be recommended, as those which have been already mentioned. Nearly the same observations are applicable to the muriate of lime, the solution of which falls subsidence, when properly conducted, has a very powerful cooling property.

Thus we have described all the practicable processes of cooling, which, if not in this country, are undoubtedly of great consequence amongst the inhabitants of warmer climates. We have, likewise, stated the most necessary particulars respecting the quantity of materials proportionate to the effect, whence the intelligent reader may be enabled to make proper choice of a process fit for his purpose, agreeably to the circumstances which the nature of the place, the actual temperature of the atmosphere, and other particulars, may offer.

There are now two other particulars belonging to the present article which deserve to be briefly mentioned. The first is that by cooling, certain bodies acquire electrical properties; and the second is that the law of cooling, or progress of refrigeration, furnishes a method of measuring such high degrees of heat, as exceed the scale of ordinary thermometers.

With respect to the first, it has been observed that sulphur, in cooling after having been melted, becomes electrified, so as to attract and repel small light bodies like any other excited electric. The same thing also takes place with wax, chocolate, and a few other substances. Besides this effect of cooling after fusion, there are certain solids, like the tourmalin, the Brazilian emerald, &c. which are rendered electrical by any alteration of their temperature, be it from cold to heat, or from heat to cold; but for a full and particular account of those facts, which properly belong to the science of electricity, see the articles ELECTRICITY, ELECTRICS, and EXCITATION.

The method of determining high degrees of heat, from the progress of cooling, depends upon the following observation. Sir Isaac Newton, considering the progress of cooling, was led to suppose, that the heat lost by any body originally at a high temperature, in equal small portions of time, is as the heat existing in it; (reckoning the heat in the body, equal to its excess above that of the surrounding atmosphere,) that is, taking the times in arithmetical progression. The portions of heat lost in those times would be in a geometrical one. The truth of this supposition has been sufficiently shown by subsequent experiments, the result of which has not differed much from the theoretical determinations. Hence we have the following practical rule for determining the high temperature to which a body has been exposed, from its subsequent progress of cooling.

Measure the time in minutes that elapses from the hottest state of the body (which is the degree sought,) to such a state of lower temperature as will allow the application of a common thermometer to the body in question, and call this number of degrees A ; then having applied the thermometer, set down the temperature, which is indicated by the same, at the expiration of each successive minute, until you have obtained three or four terms of the series, which, as has been said above, will be found to be a geometrical one (omitting, however, trifling differences.) Now, since from those few terms it is easy to determine any other terms of the same series, by the well known arithmetical rules; find so many terms of the series ascending, as are equal to the number of units in A ; and the last term of the series, thus found, will be the degree of temperature of the body in its hottest state. An example will easily illustrate the application of this rule. Suppose it be required to determine the temperature of a piece of red-hot iron at the time that it came out of the forge. Look at the watch the moment the iron is taken out of the fire, and note the minute. Find by trials when the thermometer may be safely applied to the iron, *viz.* when the heat is not sufficient to rarefy the mercury of the thermometer beyond the limit of its scale, and when this is practicable, observe the temperature of the iron, and the corresponding time as indicated by the watch. Suppose, for instance, that when the temperature of the iron was 250° , four minutes had elapsed since the commencement of the observation; therefore in this experiment A is equal to 4. Let the thermometer continue in contact with the iron, and when one minute more has elapsed, let the temperature be 125° . When another minute has elapsed, let the temperature be $62\frac{1}{2}$ degrees; and after this, the observation needs not be continued. Now we have three successive terms of a geometrical series; *viz.* $62\frac{1}{2}$, 125, and 250; from which four more terms of the series are to be found, (since A was found equal to 4.) and the last of those terms is the number of degrees indicating the temperature sought. By dividing 250 by 125, or the latter by $62\frac{1}{2}$, we have the quotient 2, (or nearly 2) which is the multiplier of the series, and therefore multiplying 250 by 2, we have the term 500, which multiplied by 2, gives the next term 1000, which multiplied by 2, gives 2000; and lastly this term multiplied by 2, gives the fourth term 4000; hence we conclude, that when the iron was taken out of the furnace, its temperature was 4000 degrees. The last term of the series may be found out by other means, but we have chosen the easiest, for the convenience of all readers. The two series are annexed.

Time elapsed in minutes.	Corresponding heat.
0.	4000°.
1.	2000.
2.	1000.
3.	500.
4.	250.
5.	125.
6.	62½.

Instead of minutes, the intervals of time may be half minutes, or hours, or, in short, of any other denomination; provided they be aequal.

COOLING OF LIQUORS in *Domestic Economy*, is a practice of ancient origin, and of general prevalence in warm countries, and, during the heat of summer, even in colder climates. This practice, as some have thought, is referred to by Solomon, in the book of Proverbs (ch. xxv. 13.); but however this be, evidences of it are very numerous in the works of the Greeks and Romans. Ice and snow were generally used for this purpose, and repositories were constructed for keeping these cooling materials. That the snow was preserved in pits or trenches is asserted by many; particularly by Seneca (*Quæst. Natur. iv. 13*.) and Pliny (*H. N. l. xix. 4*.) When Alexander the Great besieged the city of Petra, he caused thirty trenches to be dug, and filled with snow, which was covered with oak-branches, and which was kept in that manner for a long time (*Athenæi Deipnos. iii. p. 124*.) Plutarch says (*Sympos. vi. Quæst. 6*.), that a covering of chaff and coarse cloth is sufficient; and a like method is now practised in Portugal. Where the snow has been collected in a deep gulph, some grass or green fods, covered with dung from the sheep-pens, are thrown over it; and under these it is so well preserved, that it is sent through the whole summer for the distance of 60 Spanish miles to Lisbon. When the ancients wished to have cooling liquors, they either drank the melted snow, or put some of it in their wine, or they placed jars filled with wine in the snow, and suffered it to cool there as long as they thought proper. The dissipated and luxurious Heliogabalus caused whole mounts of snow to be heaped up in summer to cool the air (*Lamprid. Vit. Heliogab. c. 23*.) That ice was also preserved for the like purpose is probable from the testimony of various authors, Pliny, Seneca, &c.; but it appears not to have been used so much in warm countries as in the northern. At present snow is employed in Italy, Spain, Portugal; but in Persia, ice. The art of cooling water without snow or ice was soon suggested to mankind, by observing, that it became cold more speedily when it had been previously boiled, or at least warmed, and then put in a vessel among snow, or in a place much exposed to the air. Pliny (*H. N. l. xxxi. 3. 23*.) seems to ascribe this to the invention of Nero; and aocular expression of Suetonius (*Vit. Ner. e. 4S*.) renders it probable, that he was fond of water thus cooled. But this method was much more ancient than Nero; for it seems to have been known to Hippocrates (*De Morb. Vulgar. lib. vi. 4*.); and Aristotle was acquainted with it; for he says (*Meteorol. l. cap. 12*.) that some were accustomed, when they wished water to become soon cold, to place it first in the sun and suffer it to become warm. He relates also, that the fishermen near the Black Sea poured boiling water over the reeds, which they used in fishing on the ice, to cause them to freeze sooner. See also Galen, in *lib. vi. Hippocrat. de Morb. Vulg. Comment. 4. 10*. Athenæus remarks (*Deipnos. iii.*) that the pitchers filled with water, which had become warm by standing through the whole day in the sun,

were kept continually wet during the night, by servants destined to that office, and in the morning they were bound round with straw. In the island Ciræus, water which had become warm in the day-time was put into earthen jars, and deposited in a cool cellar, where it became as cold as snow. From these facts it appears to have been a general opinion, that water which had been warmed or boiled, was soon it cooled, and acquired a greater degree of refrigeration. The same opinion prevails at present in the southern countries of Asia, and persons there let their water boil before they expose it to the air to cool. The experiments, however, that have been made on this subject, have given different results. Beckmann (*ubi supra*) inclines to the opinion, that the cooling of water in ancient times is not to be ascribed so much to the boiling as to the keeping of the jars continually wet, and to the air to which they were exposed. See CONGELATION and FREEZING, and also the preceding article.

Another method of cooling water seems to have been known to Plutarch. It consisted in throwing into it small pebbles or plates of lead (*Sympos. vi. 5*.)

The practice of cooling liquors, at the tables of the great, was not usual in any country besides Italy and the neighbouring states, before the end of the 16th century. In the middle of that century, there were no ice-cellars in France. Towards the end of this century, under the reign of Henry III., the use of snow must have been well known at the French court, though it appears that it was considered by the people as a mark of excessive and effeminate luxury. Towards the end of the 17th century, this luxury must have been very common in France. At that period there were many who dealt in snow and ice; and that was a free trade which every one might carry on: but soon after government formed out a monopoly of cooling waters.

The method of cooling liquors by placing them in water, in which salt-petre has been dissolved, could not be known to the ancients, because they were unacquainted with that salt. This property of salt-petre was first discovered in the first half of the 16th century; and it was not remarked till a long period afterwards that it belongs also to other salts. The Italians were the first persons by whom it was employed; and about the year 1550, all the water, as well as the wine, drunk at the tables of the great and opulent families at Rome, was cooled in this manner. Towards the end of the 16th century this method of cooling liquors was well known. Mr. Beckmann says, that he cannot determine who first conceived the idea of mixing snow or ice with salt-petre, and other salts, which increase the cold so much, that a vessel filled with water, placed in that mixture, is congealed into a solid mass of ice, that may be used on the table, but the earliest account of it he has been able to find is in a work of Latinus Tancredus, a physician and professor at Naples, who, in his book, "*De Fame et Siti*," published in 1607, speaks of this experiment. In 1626 Sanct. Sanctorius, in his Commentary on the Works of Avicenna, relates, that, in the presence of many spectators, he had converted wine into ice, not by a mixture of snow and salt-petre, but of snow and common salt. When the salt, he says, was equal to a third part of the snow, the cold was three times as strong as when snow was used alone. Lord Bacon, who died in 1626, says, that a new method had been found out of bringing snow and ice to such a degree of cold, by means of salt-petre, as to make water freeze. This, he tells us, can be done also with common salt; and he adds, that in warm countries, where snow was not to be found, people made ice with salt-petre alone; but that he had never tried the experiment. Mr. Boyle, who died in 1691, made experiments with various

kinds of salt; and he describes, how, by means of salt, a piece of ice may be frozen to another solid body. Des Cartes says, that, in his time, this was a well-known phenomenon, but highly worthy of attention. Since that period, the art of making ice has been mentioned in the writings of all philosophers, where they treated on heat and cold. Towards the end of the 17th century, the French began to congeal all kinds of well-tasted juices, which were served up as refreshments at the tables of the great and wealthy. This was a grand invention for the art of cookery, and afterwards it became common, especially in the last century, and since that time the confectioners have universally practised it. Beckmann's Hist. of Inventions, vol. ii. See FREEZING and ICE.

COOLING medicines, those which have a tendency to diminish febrile heat, to allay thirst, and to lessen the activity of the circulation. They consist chiefly of diluents, acids, and neutral salts. With the use of these a cooling regimen is commonly combined, which consists in a free employment of thin watery drinks, and a forbearance from every thing stimulating; such as animal food and fermented or spirituous liquors. Occasional laxatives and gentle diaphoretics contribute to the same purpose. See REFRIGERANTS.

COOLI-POU, in *Geography*, a port of Chinese Tartary; 5 miles N. of Tie-ling-Hotun.

COOLLO, a town of Hindooostan, in the country of Orissa; 39 miles S.W. of Cattaek.

COOLOOME, an Indian town, situated on the W. side of Talapooe river. See TALAPOOSE.

COOM, a term for foot that gathers over an oven's mouth: also for that black greasy substance which works out of the wheels of carriages, and with which the axle-trees and boxes have been daubed or smeared over, in order to lessen friction, and make them run easy.

Coom, or foot, is sometimes used in medicine, infused in wine with other ingredients, as an anti-hysteric, and against palpitations of the heart, &c. The spirit of foot is also used for the same intentions, and in cephalic cases.

COOMB, or *Carnock of wheat*, according to the 9th and 51st Henry III., 12th Henry VII., &c. was, 256 lb troy = 210.6614 lb avoirdupoise = 2 strikes = 16 pecks = 32 gallons = 256 pints or pounds.

COOMB, *Coom*, or *sack of corn*, is = 2 long strikes = 4 Winchester bushels = 16 pecks = 32 dry gallons = 128 dry quarts = 256 dry pints = 8601.6 cubic inches = 4.97 cubic feet = 1.843621 cubic yards = 17.32142 cubic links. In some of the ten districts it consists of 4 bushels, and each bushel of 8 gallons and a quart.

COOMBE HILL Canal, in *Geography*, is a short canal, in Gloucestershire, whose principal trade consists in carrying coals from the pits to the Severn river. See CANAL.

COOMINGS, in *Naval Architecture*. See COAMINGS.

COOMTAH, in *Geography*, a town of Hindooostan, in the country of Berar; 45 miles N.E. of Nagpore.

COOP, in *Rural Economy*, a provincial term, sometimes applied to a tumbrel or cart enclosed with boards, to carry dung, sand, grains, &c. See CART.

COOP, also signifies a pen, or enclosed place, where lambs, poultry, &c. are shut up, to be fed or fattened.

COOP'S Town, in *Geography*, a town of America, in the state of Maryland, and county of Harford; 12 miles N.W. of Harford, and 22 north-easterly of Baltimore.

COOPA, a town of Persia, in the province of Irak; 30 miles E.N.E. of Ispahan.

COOPER, SAMUEL, in *Biography*, a miniature painter, whose works are deservedly held in the highest estimation.

He was born in London in 1699, and was instructed by his uncle, Hoskins, who was himself a limner of considerable merit. The scholar, however, soon surpassed his master in the variety of his tints, the clearness of his carnations, and the beautiful management of his hair. The works of Vandyke were the models upon which he formed his style; and so perfect, yet so bold, is the imitation, that were some of Cooper's pictures magnified to the size of life, they would scarcely lose by their comparison with the finest heads of the great Flemish master. He was the first who gave to his miniatures the freedom and strength of oil painting; and had his skill in drawing the other parts of the body been equal to that which he evinced in the face, his works might have challenged the most scrutinizing eye of criticism. He seems, however, to have been conscious of his defects, and, probably on that account, left many of his finest pictures with the neck and arms unfinished. It would far exceed our present limits to enumerate even the best of Cooper's works. His portrait of Oliver Cromwell, which was lately in the possession of sir Thomas Frankland, a descendant of Oliver, is described as a master-piece of character, and was engraved by Vertue. Mr. Walpole mentions some of his other productions in the closet of queen Caroline, at Kensington; particularly a fine portrait of general Monk, of which the head only is finished. He was employed some time by the court of France, and lived several years in Holland. He died in London, May 5th, 1672, and was buried in Pancras church, where a monument is erected to his memory. Walpole's Anecdotes.

COOPER, ALEXANDER, was the brother of the preceding artist, and, with him, received instruction in miniature painting from their uncle, Hoskins. We learn from Walpole, that Alexander painted landscapes and figures in water colours, as well as portraits. The same author mentions the story of Diana and Actæon by this master, at Burlington. He resided some time at Amsterdam, and ultimately entered into the service of queen Christina. Walpole's Anecdotes.

COOPER, RICHARD, a painter and engraver, a resident of Edinburgh, who flourished in 1730. Amongst other works, he engraved the portrait of William Caritures, and that of Andrea Allen, the painter, after William Robinson.—Mr. Strutt mentions another *Richard Cooper*, who resided at London, and flourished in 1762. Like the former artist, he engraved portraits. One of his best prints represents the five children of Charles I., accompanied by a great dog, from a picture of Vandyke. Other artists of the name of Cooper are mentioned by Heineken. Strutt.

COOPER, or COUPER, THOMAS, a learned prelate of the sixteenth century, was born at Oxford about the year 1517, and educated in grammar learning in the school joining to St. Mary Magdalen College; and afterwards studied in that college, where he took the several degrees, and succeeded to a fellowship. When queen Mary came to the throne, he declined the pursuits of divinity for the study of physic, being a sound protestant in principle. Upon the death of that sovereign, he resumed his former studies, and became a frequent and celebrated preacher. He was made dean of Christ-Church in Oxford, and was for several years vice-chancellor of the university. In 1569, he was inducted to the deanery of Gloucester; and, in the following February, was consecrated bishop of Lincoln. His distinguished merit and great zeal, in the performance of the duties of his high office, recommended him to his sovereign's favour, who caused him to be translated, in 1584, to the rich bishopric of Winchester, where he became celebrated for his learning, and for the exemplariness of his conduct. Soon after his consecration,

consecration, he went and resided in his new diocese; but being apprehensive of danger from the papists, he petitioned the privy council to suppress their boldness. Among other methods proposed by the bishop, were the following, which exhibit the true spirit of the times: "That an hundred or two of obstinate recusants, lusty men, well able to labour, might, by some convenient commission, be taken up, and sent into Flanders, as pioneers and labourers; whereby the country would be disburthened of a company of dangerous people: and the rest that remained be put in some fear." In 1588 he preached at St. Paul's Cross, November 17th, being the day of public thanksgiving, as well for the queen's accession to the throne, as for the signal victory obtained over the Spanish Armada. He died at Winchester, April 29th, 1594, and was buried in the cathedral there, on the fourth side of the choir, a little above the bishop's seat. His publications were numerous, among which are, 1. "The Epitome of Chronicles, from the 17th year after Christ to 1540, and thence afterwards to the year 1560." A part of this work was composed by Thomas Lanquet, a young man of 24 years of age, who died before he could complete what he had taken in hand. 2. "Theaurus Lingue Romanæ et Britannicæ, et Dictionarium Historicum et Poeticum, Lond. 1565." This work was so much esteemed by queen Elizabeth, that she endeavoured to promote the author as high as possible in the church. To these may be added, "An Exposition of certain Parts of the Old Testament;" and "Sermons on various Subjects." Bishop Cooper's character is represented by writers in a very advantageous light. "He was," according to A. Wood, "furnished with all kinds of learning, almost beyond all his contemporaries; and not only adorned the pulpit with his sermons, but also the commonwealth of learning with his writings." Many other testimonies might be adduced, in favour of the high reputation to which he attained with his contemporaries, among these is that of the celebrated sir John Harrington. *Biog. Brit.*

COOPER, ANTHONY ASHLEY, first earl of Shaftesbury, one of the ablest persons, and most distinguished ministers of the 17th century, was son of sir John Cooper of Rockborn, in the county of Southampton, bart., by Anne, daughter and sole heiress of sir Anthony Ashley of Winborne St. Giles, in the county of Dorset, from whom he inherited an estate of 8000*l.* per annum. He was born at Winborne, July 22, 1621, and educated with the greatest care under the eye of his parents, during his infancy, in which he discovered such talents, that extraordinary things were predicted of him, while he was yet a boy. Before he was ten years of age, he had the misfortune to lose his father; at fifteen he became a fellow-commoner of Exeter college Oxford, under the tuition of the celebrated Dr. Prideaux, who was then rector of it. At the university, where he remained but two years, he obtained a character for great assiduity, and extraordinary genius. From Oxford he removed to Lincoln's Inn for the study of the law, and before he had completed his nineteenth year, he was chosen member of parliament for Tewkesbury. This was in the year 1640; and, at the commencement of the civil war, he adhered to the king's side, though he was always a friend to peace, and thought concessions should be made by both parties to attain it. To accomplish this great object, it is said by the great Mr. Locke, that he repaired to the king at Oxford, and proposed a method of putting an end to the war, by treating with the parliamentary garrisons, and promising them amnesty for the past, and full security for liberty in the future. The plan did not succeed; and when sir Ashley found himself suspected by the court, and

that his person was in considerable danger, he went over to the parliament party, by whom he was kindly received, as well on account of his great talents, as for the influence which his property must create. He raised forces in Dorsetshire, and in 1644 he rendered the cause in which he acted some very signal services. He seems even at this period to have been looked up to by the royal party, since he was trusted with private negotiations between the king and Denzil lord Hollis, at the treaty of Uxbridge, for which he was afterwards questioned, and severely threatened, in parliament. After the battle of Naseby, he attempted to check the overgrown power of parliament, by exciting the "Club men," a body of people in several counties, encouraged to take up arms, to declare themselves as a middle party, and to insist upon a sort of treaty by which they might be restored to the benefits of the law, and the protection of the constitution. The plan was in some measure executed; Fairfax received their proposals, and promised to communicate them to parliament, but Cromwell, and other leaders of that party, perceiving that no time was to be lost, attacked the club-men without mercy, killed great numbers of them, and dispersed the rest. The scheme was abandoned, but the author of it contrived so as not only not to involve himself in their fate, but to obtain shortly after the office of high sheriff of the county of Wiltshire. Owing either to his great influence in the country, or to the wariness of his own well-planned schemes, he was elected a member of the convention, which succeeded to the long parliament dissolved by Cromwell; and, in 1754, we find him a member of parliament, and one of those who protested against the tyrannical government of Cromwell. He was on other occasions a strong, though perhaps neither a steady nor uniform, opposer of the protector, as he caused himself to be styled. See CROMWELL. Sir Anthony was nevertheless chosen by the protector to be one of his privy council; and it has been asserted, that he even sought an alliance by marriage with the baronet's daughter. Dr. Kippis, however, who investigated the matter, gives no credit to this part of the charge. When Richard Cromwell was deposed, sir Anthony was appointed by the rump parliament one of the council of state, and a commissioner for the managing army, although, it is now well known, that he was, at the same time, engaged in a plan to restore Charles II. to the throne, notwithstanding the strong protestations which he made of his innocence when questioned on the business, by which he obtained an acquittal. Like other discerning men, he foresaw, from existing circumstances, that a change in favour of monarchy must eventually take place, and therefore he took care to secure a claim of merit in the restoration, which he promoted with great zeal and assiduity, when he perceived an evident tendency to that event. In 1656, he was a member of the healing parliament, and one of twelve who were deputed to invite the return of the king; who, in grateful remembrance of his services, made him a privy counsellor; gave him a commission for the trial of the regicides; and, in the course of a year, raised him to the rank of peer of the realm, by the title of baron Ashley of Winborne St. Giles. He was soon after appointed chancellor and under-treasurer of the exchequer, and, upon the death of lord Southampton, one of the lords commissioners of the treasury. He was a member of the celebrated cabal ministry, in which, from his superior talents and forcible eloquence, he took a decisive lead. He continued in the councils and confidence of the king his master, during the happiest part of his reign, and stood as high in his favour as any of his ministers. He was afterwards appointed to the lord lieutenancy of the county of Dorset, and on the

twenty-third of April 1672, was created baron Cooper of Pawlet, and earl of Shaftesbury. In the following November, he was raised to the highest office of state, viz. that of lord chancellor of England, the duties of which station he executed with equal ability and integrity. In his other capacities, of a minister and privy counsellor, he has been variously described; but he is allowed, on all hands, to have been one of the ablest men, and one of the most accomplished orators that have adorned this country. "The short time," says one of his biographers, "that he was at the helm, was a season of firmness and tempests, and it is but doing him strict justice to say, that they could neither fright nor distract him. Whatever he did, he did with his might, and there was a spirit and dignity in his administration, which that government could never recover after he left it. He was the soul and genius of the ministry while he made a part of it; but whether he did not carry things too high, and out of the reach of all other capacities but his own, it would favour of rashness to determine." Some historians attribute to him the arbitrary counsel of shutting up the exchequer, while others assert that he opposed it with all his power, and drew up a paper of reasons against it. It is certain that he was an earnest promoter of the declaration for liberty of conscience, which, though intended principally to favour the Papists, probably agreed with his own real judgment, as a decided friend to religious toleration. It is generally admitted that he had no concern in the disgraceful treaty with Lewis XIV., of which the main object was to render Charles a pensioner on the French monarch; but he was a strenuous supporter of the Dutch war, and was guilty of advising the illegal measure of issuing writs for the election of members of parliament, during a recess, and abusing the influence of the crown to procure returns in favour of the court. He had not been more than a year in possession of the seals, when he manifested hostility to the principles which governed the Stuart family; so that the duke of York became his enemy, and at length in Nov. 1673 got him removed from his office. After he had quitted the court, he continued to make a great figure in parliament, and for his warmth in maintaining that a prerogation for fifteen months was equal to a dissolution, he was committed to the tower, where he remained a prisoner full thirteen months, when he submitted and was released, and the precedent made in his case was afterwards reversed. Previously to this, he had shewn himself a friend to civil and religious liberty, by opposing the test-bill introduced into the house of peers by lord Danby, and on this business, he is said to have distinguished himself more than he had ever done. He managed the opposition to lord Danby's administration with so much dexterity and vigour, that it was found absolutely impossible to do any thing effectually in parliament, without changing the system which then prevailed. The king accordingly dismissed all the privy council at once, and formed a new one, making lord Shaftesbury the lord president. He had, however, already drawn upon himself the implacable hatred of the duke of York, by readily promoting, if not originally inventing, the project of an "exclusion bill." To him also is imputed the contrivance of the Popish plot in 1678; which, if it were not a fiction of his own, was urged by him with the greatest violence against the court party, so as to be the means of throwing out lord Danby's administration; and there is no doubt that he was the author and promoter of all the persecutions which followed on this business, as well in the inferior courts as in parliament, with a view of quashing the popish party entirely, and of excluding the duke from the succession, which were points he had most at heart, and which he pursued with

an indefensible severity. Amidst many violent and very unjust proceedings, he was the author of a measure of signal national benefit, the passing of the "Habeas Corpus act;" to the protection of which he had occasion to appeal shortly after, for his own personal security. His new employment was short-lived, as he was dismissed after holding it little more than five months; and some of the practices to which he had recourse against the papists, were turned against himself. He was applied to by a man pretending to make discoveries relating to the popish plot, and the murder of sir Edmundbury Godfrey, provided that for this service he might obtain a pardon. The man was conducted to the privy council; but instead of giving the information expected, he charged the noble earl with endeavouring to suborn him. Upon this information his lordship was apprehended on the 2d of July 1681, and after an examination by his majesty in council, he was committed to the tower, where he remained four months, notwithstanding he took every legal method to obtain a trial, or to be admitted to bail, according to the principles of the habeas corpus act. At length, on the 24th of October, a bill was presented to the grand jury at the sessions house in the Old Bailey, against his lordship, for high treason. Witnesses were brought against him, but their characters were too infamous to permit their evidence to have the smallest degree of weight. Considerable sums were laid upon the draught of an association found in his study, which, however, was neither written nor signed by the noble earl; and the jury, after some consideration, threw out the bill, and he was acquitted, amidst the acclamations of the people. A medal was struck on the occasion, which was the cause of a very bitter satirical poem, from the pen of Dryden, who had before persecuted Shaftesbury, as the great counsellor of rebellion, in his "Abalom and Achitophel."

As soon as he was at liberty, lord Shaftesbury endeavoured to vindicate himself by law, and brought an action against a person for speaking of him as a traitor: this he thought proper to discontinue before it came to trial. For many years he had resided at Thanet-house in Aldersgate-street; but finding his health decay, his spirits declining, and the times becoming more serious, he withdrew into Holland, where he arrived in November 1682, and in the following January he died at Amsterdam in the sixty-second year of his age. His body being embalmed was transported to England, and buried with his ancestors, at Winborne St. Giles. Much has been written concerning the character of this nobleman. As a public man, he was, says Dr. Kippis, guilty of manifold inconsistencies, and submitted to shameful compliances. "There were, however," adds the same candid and excellent biographer, "three points in which, through the usual tenor of his life, the earl of Shaftesbury was entitled to applause. These were, his attention to the protection and advancement of trade and commerce; his endeavours to counteract the growing power of France; and his attachment to the cause of religious liberty. He wrote an essay on toleration, still preserved in the family, which was evidently the ground work of Mr. Locke's admirable letters on that subject. Several of the measures, proposed and supported by him, were preparatory to those that were adopted at the Revolution, and he contributed, by his ardour, to raise and animate the spirit, which, in the end, produced the event, so that amidst all his obliquities and faults, he deserves to be celebrated, as having been no small benefactor to the free constitution of England." He left in MS. a history of his own times; and some of his speeches have been published. He was thrice married, but left only one son, who succeeded him

in his estates and titles, and who died in November 1699, and was succeeded by Anthony his son and heir, of whom we are now to give an account.

COOPER, ANTHONY ASHLEY, third earl of Shaftesbury, was born Feb. 26, 1670-71, at Exeter-house, London, which was at that time the town-residence of his grandfather, who undertook the superintendance of his education. He first entrusted him to the care of a learned lady of the name of Birch, under whom he made such rapid advances in the Greek and Latin languages, as to be able to read the common authors in each before he was eleven years old. He was then placed in a private school, where he continued till the death of his grandfather, when he was sent to Winchester; where, on account of the insults which he suffered, through the hatred borne to his grandfather's memory by the friends to arbitrary power, he remained but a short time, and, in 1686, he commenced his travels under the care of a well qualified tutor. With him he spent much time in France and Italy, improving himself in the languages and accomplishments of those countries, and laying the foundation of the knowledge and taste for which his own subsequent writings were justly celebrated. He returned to England in 1689, and was offered a seat in parliament, which for the present he declined, wishing rather to employ all his leisure in the improvement of his mind, and in extending his knowledge on subjects of the greatest importance. In these views he succeeded, and laid a foundation in learning which was accurate, extensive, and truly liberal. After pursuing the studies congenial to his temper, with much ardour and almost unabating diligence, for nearly five years, he was elected member of parliament for Poole. In this high station he shortly had an opportunity of expressing that attachment to liberty, by which he was distinguished through the whole of his life, and of conciliating the house to the object which he had in view. The occasion was the introduction of a bill for granting, among other things, the aid of counsel to persons indicted for high-treason. Lord Ashley had prepared a speech for the purpose, but when the moment came, in which he was to deliver it, he was utterly unable to proceed. After a short pause, he addressed the speaker. "If I, sir, who only rise to give an opinion on the bill now depending, am so confounded, that I am unable to express the least of what I proposed to say, what must be the condition of that man, who, without any assistance, is pleading for his life, and under the apprehension of being deprived of it?" This happy turn of thought, so appropriate to the occasion, is supposed to have contributed more than any of the arguments which were urged in obtaining the justice for which he pleaded. The necessity of this wife and humane law has been of late years amply manifested by the conduct of certain great law officers, who took the very moderate space of seven, nine, and eleven hours in opening cases of *supposed* high-treason. During the remainder of that parliament, lord Ashley was indefatigable in the promotion and support of every measure in favour of liberty, without regard to the person by whom it was introduced, influenced unquestionably by an attention to the public good, without feeling the paltry motives which too frequently actuate political men. At the dissolution in 1698, he resigned his pretensions to a seat in the house, on account of ill health, and with a view also of securing more time for literary pursuits. He went to Holland under the assumed character of a student in physic: here he cultivated an acquaintance with Bayle, Le Clerc, and other men of celebrity, and it was not till a short time before he left the country that he made his name known. Before his lordship's return an imperfect and surreptitious

edition of his "Enquiry concerning Virtue," was published in a most unhandsome manner by Mr. John Toland, who, says Dr. Kippis, in this transaction, repaid with ingratitude a very generous benefactor. His lordship bought up the edition, and set about completing the treatise, which afterwards appeared as the second volume of the "Characteristics." Soon after lord Ashley's return to England, he became, by the decease of his father, the earl of Shaftesbury, but he did not take his seat in the house of peers till the beginning of the year 1700-1, when his friend, lord Somers, sent a messenger to acquaint him that his presence was necessary, on account of the Partition-treaty, which, at that time, was under the consideration of parliament. During the remainder of the session he attended his duty as frequently as the state of his health permitted, zealously supporting the measures of king William, who was, at that period, negotiating the grand alliance. That sovereign regarded the support of lord Shaftesbury so highly, that he wished to appoint him secretary of state. This honour his health did not allow him to accept; but he was nevertheless assiduous in rendering to his majesty advice on every important occasion. Soon after the accession of queen Anne, lord Shaftesbury retired from public life, being no longer a friend to the measures of the court. Ministers now took from him the vice-admiralty of the county of Dorset, which had been held by his family for three successive generations. He went to Holland a second time, where he spent two years among the learned connections, which he had already formed in that country. About this period the French prophets having excited a considerable disturbance, in the nation, by their enthusiastic extravagances; some great men recommended prosecutions and punishments as the only methods of suppressing them; to these lord Shaftesbury was decidedly inimical, thinking that such measures would increase rather than cure the malady. This was the origin of his "Letter on Enthusiasm," which he sent to lord Somers, then president of the council, which, being approved by that nobleman and others, was published in 1703, though without the name of the author, or that of the person to whom it was addressed. In the following year he published his "Moralists," a philosophical rhapsody, being a recital of certain conversations on natural and moral subjects; and in a few months afterwards his "Sensus Communis; an Essay upon the Freedom of Wit and Humour, in a Letter to a Friend." In the same year he married Miss Jane Ewer, the youngest daughter of Thomas Ewer, esq. of Lee, in Hertfordshire. In forming this connection, it should seem that his lordship was principally influenced by the solicitations of his friends, rather than from any inclination of his own, or high expectations of the happiness of that state. Letters to this effect are preserved in the Biographia Britannica. By his lady, to whom he was previously related, he had an only son Anthony, afterwards earl of Shaftesbury. In 1710 the noble lord published his "Sollicitus, or Advice to an Author;" after which his health obliged him to try the effects of a warmer climate. He accordingly, in 1711, passed through France and Piedmont, and fixed his residence at Naples, where he died on the 4th of February, 1712-13, at the early age of forty-two. During his abode at Naples, he finished his "Judgment of Hercules," and the "Letter concerning Design," which have since been added to the "Characteristics." It was in 1711 that the first edition was published of all the Characteristics, in the same order in which they now stand: but this publication not being entirely to his lordship's satisfaction, he chiefly employed his time abroad in preparing his writings for a more elegant edition, which was given to the world soon after

after his decease, in the year 1713. The several engravings, that were then first interposed through the volumes, were all invented by himself, and designed under his immediate inspection. The impression of the "Characteristics of Men, Manners, Opinions, and Times," in 3 vols. 8vo., contains the whole of his works which he intended to submit to the judgment of the public. In the year 1716, some of his private letters upon philosophical and theological subjects were published, under the title of "Several Letters written by a noble Lord to a young Man at the University;" and in 1721, another collection of the same kind appeared, entitled, "Letters from the Right Honourable the late Earl of Shaftesbury to Robert Moleworth, esq. now Lord Viscount of that Name; with two Letters written by the late Sir John Cropley: to which is prefixed, a large Introduction by the Editor." That editor, says the candid biographer already referred to, was Mr. Toland, who, in the present, as well as in the former case, assumed a liberty not very agreeable to the family. In their opinion, as the correspondence was almost entirely of a private nature, it was on that account unfit for public view. It nevertheless set his lordship's integrity in the most amiable point of light. Lord Shaftesbury also wrote a preface to a volume of Dr. Whichcote's sermons, published in 1698; and in his Letters to a young Man at the University, expatiates on the merits of Burnet, Hoadly, Tillotson, Barrow, Chillingworth, and Hammond, as the great pillars of the church against fanaticism. But however highly he might esteem the labours of modern divines, his principal admiration was directed to the writings of antiquity. These were the constant subjects of his study, and on these his philosophy was built. His favourite books were the moral works of Xenophon, Horace, the Commentaries and Enchiridion of Epictetus, as published by Arrian, and Marcus Antoninus. These authors he always carried with him, in his various excursions; and they are still extant, filled with marginal notes, written in his own hand. It remains now to notice more particularly the writings of lord Shaftesbury, which, by one class of critics, have received the most extravagant applause, and, by another, have been the subjects of indiscriminate condemnation. They have been examined with a critical eye, and in rather an elaborate manner, by Dr. Kippis, to whose article, in the Biographia Britannica, we refer the reader, contenting ourselves with a brief outline. Lord Shaftesbury's Letter on Enthusiasm was written from excellent motives: it contains many admirable remarks, delivered in a neat and lively strain; but it wants precision; conveys but little information; and contains some exceptionable passages. The same character may be given, with truth and justice, of "The Essay on the Freedom of Wit and Humour," designed to defend the application of ridicule to subjects of speculative inquiry, and among others to religious opinions. His "Scolloquy, or Advice to an Author," met with more general approbation. It contains a variety of excellent matter; and what the noble lord has advanced in recommendation of self-examination, and in defence of critics and criticism, is particularly valuable: it is evidently the result of the author's knowledge and refined taste in books, in life, and manners. Lord Shaftesbury's "Enquiry concerning Virtue" obtained more general applause. It is ably and finely written, and maintains with great force the important truth, that virtue is the greatest happiness, and vice the greatest misery of men. This work has met with much opposition from those who deduce the principles of virtue from self-love only, and refer the obligation of it solely to the will of God. In this "Enquiry," the noble author appeared in the close, analytical, and the didactic form. But in the "Moralists,"

he assumes a higher tone, and figures in a new character. Here he presents himself in the mode of dialogue, and is the emulator of Plato, in the boldest poetic manner of that eminent philosopher. Bishop Hurd ranks it among the best compositions of the kind in our language. Its matter is highly valuable and important, and presents us with a truly argumentative and eloquent defence of the doctrines of a Deity and a Providence. The "Miscellaneous Reflections on the preceding Treatises, and other critical Subjects," are intended as a sort of defence and explanation of his former works: they contain a variety of just and ingenious remarks, and much fine writing; but they are written in a desultory manner, abounding with many exceptionable passages concerning revelation. With respect to the style of lord Shaftesbury, we may quote the opinion of Dr. Blair, which is at once accurate and judicious. "His language has many beauties; it is firm and supported in an uncommon degree; it is rich and musical. No English author has attended so much to the regular construction of his sentences, both with respect to propriety, and with respect to cadence. All this gives so much elegance and pomp to his language, that there is no wonder it should sometimes be highly admired. It is greatly hurt, however, by perpetual stiffness and affectation. This is its capital fault. His lordship can express nothing with simplicity. He seems to have considered it as vulgar, and beneath the dignity of a man of quality, to speak like other men. Hence he is ever in buskins, full of circumlocutions and artificial elegance. In every sentence we see the marks of labour and art; nothing of that ease which expresses a sentiment coming natural and warm from the heart. Of figures and ornaments of every kind he is exceedingly fond; sometimes happy in them; but his fondness for them is too visible, and having once laid hold of some metaphor or allusion that pleased, he knows not how to part with it. What is most wonderful, he was a professed admirer of simplicity; is always extolling it in the ancients, and censuring the moderns for want of it, though he departs from it himself as far as any one modern whatever. Lord Shaftesbury possessed delicacy and refinement of taste to a degree that we may call excessive and sickly; but he had little warmth of passion; few strong or vigorous feelings; and the coldness of his character led him to that artificial and stately manner which appears in his writings. He is fonder of nothing than of wit and gallery; but he is far from being happy in it. He attempts it often, but always awkwardly: he is stiff even in his pleasantry, and laughs in form like an author, and not like a man." To this Dr. Kippis adds: "On the perusal of the Characteristics, we have been clearly convinced, that the noble author was always excellent in the disposition of his words, but that in the choice of them he is frequently liable to censure." Lord Shaftesbury, in all his works, shews himself a zealous advocate for liberty, the steady friend of virtue, and a true believer in natural religion. He sometimes professed himself a Christian; but his writings, in many parts, render his faith in the divine mission of Christ very questionable. The noble lord left one son, Anthony Ashley Cooper, the fourth earl, of whom the learned Mr. Huntingford says, "there never existed a man of more benevolence, moral worth, and true piety." To this high character Dr. Kippis gives his own testimony, having had the honour of enjoying his acquaintance and correspondence. He was the author of the life of his father, in the great General Dictionary. It may not be improper to add in this place, that the translator of Xenophon's Cyropedia was the honourable Maurice Ashley Cooper, brother to the third earl.

COOPER, JOHN GILBERT, born in 1723, was of an ancient

cient family in Nottinghamshire. He received the early part of his education at Wellminter school, and finished his studies in Trinity College, Cambridge. As an author, his first work was on the "Power of Harmony," formed on the model of the "Pleasures of the Imagination." In 1749 he published "The Life of Socrates, collected from the Memorabilia of Xenophon, and the Dialogues of Plato," &c. Learned notes were added by the Rev. J. Jackson of Leicester. This work was well received, though at present it is in no great estimation. In 1754 he gave to the world "Letters on Taste," which were written in an elegant style, for which, and for the vivacity in the description, they were more admired than for accuracy and depth of thought. Cooper wrote some papers in "The World;" his other works are all poetical, of which the principal are, "The Tomb of Shakspeare, a Vision;" "Epistles to the Great, from Aristippus in Retirement;" "The Call of Aristippus, an Epistle to Dr. Akenfide;" and "A Tranlation of Gresset's Ver Vert." Mr. Cooper was not destitute of fancy, but his fancy was not always under proper regulation, and he sometimes failed in the precision of his ideas. He excelled in the light, easy, and epistolary strain. His sentiments have considerable fameness, being derived from the Shaftesburian school of philosophy, of which he was a disciple. He was an active member of the Society for the Encouragement of Arts, Manufactures, &c.; a diligent and useful magistrate. He died in 1769, of a fit of the stone.

COOPER, on board a *Ship*, the person that looks to the casks and all other vessels, for beer, water, or any other liquors. He has a mate under him.

COOPER, in *Geography*, one of the Bermudas islands. COOPER, a large and navigable river of America, which mingles its waters with Ashley river, below Charleston city, in South Carolina. These form a spacious and convenient harbour, which communicates with the ocean, just below Sullivan's island, leaving it on the N. 7 miles S.E. of the city. Cooper river is a mile wide at the ferry, 9 miles above Charleston.

COOPER'S-BRIDGE, over the Calder river, on the road between Huddersfield and Leeds in Yorkshire, is the place at which sir John Ramsden's canal connects with the Calder and Hibble navigation, which now has become a place of considerable traffic, in consequence of the junction of the Huddersfield canal with the other end of sir John Ramsden's canal. See CANAL.

COOPER'S ISLAND, one of the Virgin islands in the West Indies, S. W. of Ginger island, uninhabited; about five miles long, and from one to two broad. N. lat. 18° 7'. W. long. 63° 5'.

COOPER'S, or DE KUIPER ISLAND, lies on the north coast of the island of Java, near Batavia; about 1620 feet from the island of Onrust, and about one-third less in size. The Dutch company have several warehouses in this island, in which they chiefly lay up coffee. At its south side there are two pier-heads, where vessels may load and discharge. Over the island are interpersed several large tamarind trees, which afford an agreeable shade. The workmen that are employed here in the day-time, are fetched over at night to Onrust, and two are left, as a watch, together with a number of dogs, so remarkably fierce, that no one dares to set his foot on the island at night.

COOPER'S ISLAND, an island in the Southern Pacific ocean, near the E. coast of the ile of Georgia. It is a rock of considerable height, about five miles in circuit, and one mile from the main. At this isle the main coast takes a S.W. direction for the space of four or five leagues to a

point, called by Cook "Cape Disappointment." Off that are three small isles, the southernmost of which is green, low, and flat, and lies one league from the cape. S. lat. 54° 57'. W. long. 36° 4'.

COOPER'S TOWN, a post town, and township of America, in the state of New York and county of Otsego. It is the compact part of the township of Otsego, and the chief town of the country round lake Otsego. It is pleasantly situated at the S.W. end of the lake, on its banks, and those of its outlet; 12 miles N.W. of Cherry valley, and 73 W. of Albany. It has a court-house, gaol, and academy. In 1789 it had only three houses; in 1791 it contained 292 inhabitants; and in 1795, 50 houses had been erected on an improved plan, regularly laid out in squares. N. lat. 42° 44'. W. long. 74° 48'.

COOPER'S TOWN, a town of Pennsylvania, situated on the Susquehanna river. In 1785 this was a wilderness; but in nine years after, it contained 1800 inhabitants, a large and handsome church, a market-house, a library of 1200 volumes, and an academy of 64 scholars. Four hundred and seventy pipes were laid under ground for the purpose of bringing water from West mountain, and conducting it to every house in the town.

CO-OPERATE, TO, in a *Military Sense*, is to carry a well-directed plan into execution in such a manner, that the troops or forces, how much soever divided, may act at one time, on one principle, and towards one end.

CO-OPERATOR, derived from *con*, and *opera*, labour, denotes any cause, natural or supernatural, which concurs with another to the production of an effect. Thus, nature and medicine co-operate in the cure of disorders; and the will of man concurs with the grace of God in the performance of good works.

CO-OPERIE PALLIO. See PALLIO.

COOPERS, *Company of*. See COMPANY. Coopers are enjoined to make their vessels of seasonable wood, and to mark them with their own marks, on pain of forfeiting 3s. 4d.; and the contents of vessels are to be observed under a like penalty, so that the beer barrel shall contain 36 gallons, a kilderkin 18, a firkin 9, &c. The wardens of the Coopers' company in London, with an officer of the mayor, are to search all vessels for ale, beer, and soap to be sold there, and to mark those that are right; and they may burn the others: and if any cooper diminish a vessel by taking out the head, or any one of its staves, it shall be burnt, and the offender forfeit 3s. 4d. Stat. 23 Hen. VIII. c. 4.

CO-OPERATURA, in *Antiquity*, a thicket or covert of wood. Chart. de Forest. cap. 12.

CO-OPERATION, derived from *co-opro*, I choose, signifies the admission of members into any college or society. Thus it was anciently applied to the choice of the augurs and pontiffs; and in modern times, to an extraordinary nomination and election of persons of distinguished merit into a learned society.

CO-ORDINATE, something of equal order, rank, or degree, with another.

CO-ORDINATION, in respect of causes, denotes an order of causes, wherein several of the same kind, order, and tendency, concur to the production of the same effect.

COORNHAERT, or CUERNHERT, in *Biography*. See THEODORE DIRK.

COOROORA, in *Geography*, one of the Pelew isles, the capital of which is called PELEW; which see.

COOS, in *Ancient Geography*, an island of the *Ægean* or *Icarian* sea, near Cnidus (now called *Zia*); in which was a city of the same name, from which Hippocrates, the cele-

brated physician, and Apelles, the famous painter, were called *Cœi*. Here was a large temple of Æsculapius, and another of Juno. It abounded in rich wines, and here were made those "*Cœo vestes*," which were transparent, and are so often mentioned by the ancient poets.

COOS, or COHOS, in *Geography*, a country of America, called *Upper* and *Lower Coos*, which lies on the Connecticut river, between 20 and 40 miles above Dartmouth college. Upper Coos is the country S. of Upper Ammonoosuck river on John and Israel rivers. Lower Coos lies below the town of Haverhill, S. of the lower Ammonoosuck. The distance from Upper Coos to the tide in Kenn-beck river was measured in 1793, and found to be but 90 miles.

COOS-BAYBAR. See COOCH-BABAR.

COOSA, or COOSA-HATCHA, a river which rises in the high lands of the Cherokees' country, and joining Tallapoosie, forms Alabama river. Its course is generally S. through the country of the Natchez, and other tribes of the Upper Creeks. It is rapid, and full of rocks and shoals, so that it is hardly navigable by canoes.

COOSADES, an Indian town on Alabama river, in America, about 60 miles above its mouth, on Mobile river; below McGillivray's town, and opposite the mouth of the Oakesfukee.

COOSA-HATCHEE, or COOSAW, a river of America, in S. Carolina, which rises in Orangeburg district, and after running in a S.S.W. course, discharges itself into Broad river and Whale branch, which separate Beaufort island from the main land.

COOSAWATCHEE, or COOSAHATCHIE, a post town of America, in the state of S. Carolina, and district of Beaufort, situated on the S.W. side of Coosa river, over which a bridge has been erected. The place is flourishing, having about 40 houses, a court-house, and a gaol. The courts formerly held at Beaufort are held here. It is 33 miles distant from Beaufort, and 77 W.S.W. from Charleston.

COOSCOOSOO, a common food among the Moors of Africa, consisting of a paste made of flour in the form of small grains in the manner of Italian pastes. This is dressed by the vapour of broth in a round dish, with holes like a cullender, and that is fixed in the kettle in which they boil their meat. The cooscoosoo, contained in the deep plate or cullender, is slowly softened, and prepared by the vapour of the broth, with which they take care to moisten it occasionally. This is a nourishing and agreeable food, and eaten by the common people either with milk or with butter, but superior persons have it dressed by a rich broth made with mutton, poultry, and pigeons or hedge-hogs, and mix it afterwards with fresh butter.

COOSY, Cosa, or Koss, a river of Asia, which rises in the mountains of Thiber, takes its course through Purneah, and runs into the Ganges, 20 miles E. of Boglipour in the country of Bahar.

COOT, in *Ornithology*. See FULICA atra.

COOTE, Sir CHARLES, in *Biography*, a distinguished military officer in the 17th century, was the eldest son of Sir Charles Coote, who was created baronet in April 1621. He was a gentleman of great consideration in Ireland. Upon the breaking out of the rebellion, in 1641, he had a commission for a regiment of foot, and was made governor of Dublin. From this period, to the year 1652, he was engaged in a great number of important services for his country. In almost all the contests of which he took a part he was successful. After Ireland was reduced to the obedience of the parliament, Sir Charles was one of the court of justice in the province of Connaught, of which he was made president by

act of parliament. Being in England at the time of the deposition of Richard Cromwell, he went post to Ireland, to carry the news to his brother Henry Cromwell, and to concert with him what to do in order to maintain themselves in their posts. When, however, he perceived that King Charles the Second's interest was likely to prevail, he endeavoured to insinuate himself into his favour. For this purpose he sent to the King Sir Arthur Forbes, "to assure his majesty of Sir Charles's affection and duty, and that if his majesty would vouchsafe to come to Ireland, he was confident the whole kingdom would declare for him; that though the present power in England had removed all the able men from the government of the state in Ireland, under the character of presbyterians; and had put Ludlow, Corbet, and others of the King's judges in their places, yet they were generally so odious to the army as well as to the people, that they could seize on their persons, and the castle of Dublin when they should judge it convenient." The King did not think it prudent to accept the invitation. In a short time after Sir Charles Coote, and some others, influenced the whole council of officers, that they prevailed upon them to vote not to receive Colonel Ludlow as commander in chief; they, moreover, made themselves masters of Athlone, Drogheda, Limerick, Dublin, and other important places for the service of the King. He immediately caused Colonel Monk to be made acquainted with the progress of the King's interest in Ireland, who urged them by every means not to restore the suspended commissioners to the exercise of their authority. Soon after, Sir Charles Coote and others sent to the parliament a charge of high treason, against Colonel Ludlow, Corbet, Jones, and Thomlinson. He likewise made himself master of Dublin-castle; and apprehended John Coke, chief justice of Ireland, who had been solicitor-general at the trial of King Charles I. Notwithstanding this, parliament thought themselves so sure of him in their interest, that he received their vote of thanks on the 5th of Jan. 1655—60. On the 16th of the same month he was appointed one of the commissioners for the management of the affairs of Ireland. Before those commissioners declared for King Charles, they insisted upon certain things relating to their interest as members of that nation. On the 6th of September 1660, Sir Charles Coote, on account of his many and very valuable services for the royal cause, was created baron and Viscount Coote, and Earl of Montrath in the Queen's county. He was also appointed one of the lords justices of Ireland, but he did not long enjoy these marks of his sovereign's favour, for he died in December 1661, and was succeeded in his estate and titles by his son Charles, the second earl. Dr. Leland asserts that Coote and his father had engaged in the parliamentary service not from principle, but interest. Dr. Kippis, however, doubts the assertion upon the ground that the Cootes were zealous presbyterians, and therefore he thinks it highly probable that they were influenced, at least in part, by their real sentiments, civil and religious, and especially by their aversion from popery.—*Biog. Britan.*

COOTE-HILL, in *Geography*, a market and post town of the county of Cavan, Ireland, near the borders of Monaghan. It was much neglected by the late proprietor, but the present one is improving its appearance by public buildings, such as a market-house and shambles; and by obliging tenants to build on a plan adopted by him. It contains six houses of worship, besides the parish church. In the sale of its markets it is the most considerable town in the county. The sale of linen alone averages 4000*l.* weekly, principally of sheetings, in which branch no market in Ireland

land can vie with it. It is fifty-three Irish miles N.W. from Dublin, and ten miles N.E. from Cavan. Coote'survey of Cavan, &c.

COOTS-TOWN, a town of America, in the state of Pennsylvania and county of Berks, is situated on a branch of Sauhoeca creek, which is itself a branch of the Schuylkill river. It contains forty houses, and a German Lutheran and Calvinist church. It is distant seventeen miles N.E. from Reading, and seventy-three N.W. by N. from Philadelphia.

COOTWYCK, or **KOOTWYCK**, **JURIAN**, in *Biography*, a goldsmith, born at Amsterdam in 1714, who applied himself after the example of his countryman Ploos Van Amstel, to the imitation of drawings by means of etching and aquatinta. Amongst his works, are several prints from the designs of Backluyfen, Berghem, and other Dutch and Flemish masters; and likewise some, which it is supposed he executed from sketches of his own. One of his prints in imitation of black and white chalk, representing an old woman sitting in a chair, with a paper in her hand, is dated 1748. Heineken.

COP, **WILLIAM**, born at Bale in Switzerland, took his degree of doctor in medicine at Paris, in the year 1495, and soon became so distinguished by his superior knowledge and abilities, that Ramus, no incompetent judge, called him, "*Unica nobilium medicorum gloria.*" He was physician to Lewis the twelfth, and to Francis the first, and ancient to the Faculty of Medicine at Paris. He translated the work of Paulus of Ægina, de Ratione Viæus, which was published at Paris in the year 1510, in 4to.; and the following year at Strasburg; also, Galen's six books, de Locis Affectis, et de Morborum Causis et Differentiis, and the Prognostics of Hippocrates. He died in 1531. His son Nicholas succeeded him as regent of the University of Paris, but giving into the errors, his biographer says, of Calvinism, he was obliged to leave Paris, and to pass the latter part of his life at Bale. Haller Bib. Med. Eloy. Dist. Hist.

COPÆ, in *Ancient Geography*, a town of Greece, in Bœotia, situated on the north banks of the lake Copais, to which it gave name. It is mentioned by Strabo, Ptolemy, and Pliny; the latter of whom says, that cars were invented in this place. It had temples of Ceres, Bacchus, and Serapis.

COPAIBA BALSAM, in the *Materia Medica*. See BALSAM.

COPAIFERA, in *Botany*, (from Copaiwa, the Indian name, and *fero*, to bear.) Linn. Gen. 542. Schreb. 757. Willd. 880. Juss. 355. Vent. 3. 430. Copaiiba; Marg. Pf. Ray. Copaiwa; Jacq. Copaiier; Encyc. Clafs and order, *decandria monogynia*. Nat. Ord. Undetermined by Linnaeus. *Leguminosæ*; Jusseu, with a doubt whether it be not more nearly allied to his next order, *Terebinthaceæ*.

Gen. Ch. Cal. none. Cor. Petals four, oblong, acute, concave, widely spreading. (Calyx with four divisions. Corolla none; or petals numerous, caducous? J. S.) Stam. Filaments ten, filiform, incurved, a little longer than the corolla; anthers oblong, incumbent. *Pist.* Germ. superior, rounded, compressed-flattish, pedicelled; style filiform, curved, the length of the filaments; stigma obtuse. *Peris.* Legume egg-shaped, pointed with part of the style, two-valved. *Seed* single, egg-shaped, involved in a berried aril; (Inclosed in a pulpy envelope; Lam.)

Ess. Ch. Calyx none. Petals four. Legume egg-shaped. Seed single, in a berried aril.

Sp. C. *officinalis*. Balsam of capeivi tree. Linn. Sp. Pl. Jacq. Amer. 133. tab. 86. Picq. 67. 123. Lam. Ill. 342. Woodv. Med. Bot. tab. 137. A lofty tree with a hand-

some head; the smaller branches zig zag, with a nearly smooth, brownish ash-coloured bark. *Leaves* alternate, winged, about four inches long; leaflets six or eight, petioled, lanceolate-egg-shaped, quite entire, ending in a blunt point narrower on one side than on the other, shining, somewhat coriaceous, not exactly opposite, one of the uppermost frequently wanting. *Flowers* white, on short peduncles; in solitary axillary panicles at the summit of the branches, which consist of about eight alternate, spreading racemes. A native of Brazil, Guinea, and New Spain, frequent about Tolu, sixty leagues from Cartagena, growing profusively among the trees which yield balsam of Tolu, Peru, &c. By a deep incision through the bark into the wood of the tree, a fluid balsam or resin is obtained, which gradually thickens when exposed to the air. For its chemical and medical properties, see the article *Copaiba BALSAM*.

COPAIS, in *Ancient Geography*, a lake of Bœotia; Strabo says that it had different names from the towns that were situated near it; thus it was called Copais, from Copæ; Haliartos, from Haliarte. It is also called Leaconis by Steph. Byz., and Cephalis by Pausanias. Its present name is "*Lagordi Topoglia.*" This lake was 380 stadia, or 14½ leagues in circumference, and served as a common receptacle for the rivers which issued from the mountains by which Bœotia was surrounded. As this lake had no apparent outlet, it must have overflowed the country, if nature, or rather the industry of man, had not contrived secret passages for draining off the water. In the part adjoining to the sea, the lake terminates in three bays, which advance to the foot of mount Ptois, situated between the sea and the lake. From the bottom of each of these bays, diverge a number of canals, that traverse the mountain through its whole breadth, some of which are thirty stadia, or more than a league in length, and others of a much greater extent. To excavate or cleanse them, wells had been sunk at stated distances on the mountain, which are of a very great depth. The formation of these wells must be traced to the most remote antiquity, as no traditional or historical account of their origin exists. It requires great labour and expence to maintain them; and as most of them have been choaked up, the lake has proportionally gained on the plain.

It is not improbable that the deluge, or rather the inundation which happened in Bœotia, in the time of Ogyges, was caused merely by the obstruction of the water in these subterraneous conduits.

COPAL. This valuable and singular kind of resin is imported partly from South America, and partly from the East Indies, and like most of the other resins, is a natural exudation from a large tree, which hardens in the air.

The best copal is a hard brittle resin, in rounded lumps of moderate size, easily reducible to fine powder, beautifully transparent, but often, like amber, containing parts of insects and other small extraneous bodies impacted in its substance.

The colour of copal is a light lemon yellow, varying to orange; but when dissolved and thinly spread over any surface, the colour is scarcely perceptible, and it only gives a fine hard, smooth, transparent glazing. It is this union of hardness and transparency, with want of colour, that renders copal so valuable as a varnish.

Copal unquestionably belongs to the class of resins, but it differs from most of these substances in the great difficulty with which it dissolves in alcohol and essential oils, so as to require great purity of these menstrua and particular management.

The three menstrua usually employed in varnishing, are alcohol, oil of turpentine, or any other essential oil, and

drying linseed, or other fixed oil. These are used sometimes separately with the varnish resins, but generally mixed.

We shall give some of the processes by which copal may be dissolved in each of these substances.

Alcohol singly, which so readily dissolves the other resins, has but little action on copal; for if this resin in fine powder be digested with the very purest alcohol, with or without heat, scarcely any of it is dissolved, and the copal coalesces at the bottom of the vessel into a tough cohesive mass. But a solution may be effected by the addition of *camphor*, the action of which, upon the resins, has been partly described under that article. With none is it more striking than with copal. When the two are separately powdered and mixed, the copal absorbs the camphor, swells and softens into a pasty mass, which will remain for months of the same consistence, without hardening. To make an alcoholic solution of copal, dissolve half an ounce of camphor in a pint of highly rectified alcohol; put it in a glass vessel over a lamp, and add four ounces of copal in small pieces, and continue the heat just to that degree at which the bubbles may be counted, till the solution is complete. Part of the copal separates when cold, but most of it remains in permanent solution.

It is necessary first to dissolve the camphor in the alcohol; for, if the pasty mass arising from the mixture of copal and camphor be added to alcohol, the solution will not go on.

A mixture of mastich, elemi, and other resins, will bear a moderate quantity of copal, without being rendered insoluble in alcohol, even without the assistance of camphor.

To dissolve copal in the essential oils, Mr. Sheldrake has given the following process in the Transactions of the Society of Arts.

Reduce two ounces of copal to *coarse* powder; put it into a glass vessel, and pour thereon a pint of the *very best* oil of turpentine, with one eighth of spirit of sal ammoniac, previously well shaken. Cork the glass, leaving a pin-hole through the cork to allow of the escape of vapour, and speedily heat it to that point at which the bubbles may be counted. Continue this till the solution is complete, taking care not to increase the heat, otherwise the copal will coalesce at the bottom of the glass, and the solution will not go on. The vessel should not be opened till quite cold. This liquor is of a rich deep yellow when in quantity, but when applied as a varnish, it is nearly colourless. The spirit of sal ammoniac is not a necessary ingredient.

Mr. Tingry of Geneva (Painter's and Varnisher's Guide, 1804.) finds that copal may be united to oil of turpentine by the intermede of some other of the essential oils, particularly oil of spike and lavender. He gives the following process: Take two ounces of oil of lavender, heat it in a glass matrass, add thereto an ounce of copal grossly powdered, and, at different times, stirring the mixture with a stick of white wood. When the copal is dissolved, add six ounces of oil of turpentine, nearly boiling, and stir the whole thoroughly. This gives a fine gold-coloured liquid, very fit for varnishing.

Camphor also highly assists the solution of copal, in oil of turpentine, as it does in alcohol, and the same precaution is necessary, of dissolving the camphor completely in the oil, before the copal is added. Half an ounce of camphor is sufficient to a quart of the oil, to enable it to take up as much copal as will make a good varnish.

To unite any of the resins with drying linseed oil in the composition of the oil varnishes, it is necessary to expose them to a much greater heat than in the former instances, that is, not less than is sufficient to liquify the resins. This, however, always gives the resin a certain degree of brown colour, which is often injurious to it when used as a varnish. Copal when melted with as little heat as possible, and then dropped into drying linseed oil, dissolves therein with ease, and this solution mixed with clear turpentine, forms a very fine hard varnish. To avoid as much as possible the discolouration of the copal, Mr. Tingry incloses it in a kind of wire-cage suspended in a very slow well-regulated furnace; and, as soon as any portion melts, it falls in drops into the drying oil heated and set beneath it.

When melted copal is dropped into water, a small quantity of oil is separated, and floats at top, and the resin at the bottom is thereby rendered somewhat more soluble in the different menstrua.

Copal is liable to be confounded with gum anime, when the latter is very clear and good. The distinction is of some consequence, as the anime, though valuable in varnishing, is much less so than the finest copal, the varnish with the former being darker coloured, and not so hard. Besides the external appearance of each, which is pretty distinct to a practised eye, the solubility in alcohol furnishes an useful test, the anime being readily soluble in this fluid, but the copal scarcely so.

COPALLI, in *Botany*, Hernand. See RHUS *copallinum*.

COPAR, in *Ancient Geography*, a village of Arabia Felix, according to Ptolemy.—Also, a place of Palestine, in the vicinity of Cæsarea Philippi.

COPARCENARY, the share, or quota, of a coparcener.

COPARCENERS, from *con*, and *particens*, *partner*; or *parceners*; such as have equal portions in the inheritance of their ancestor.

Coparceners are so either by *law*, or *custom*. Coparceners by *common law*, are the issue female; which, in default of a male heir, come equally to the lands of their ancestor: thus, when a person seized in fee-simple or in fee-tail dies, and his next heirs are two or more females, his daughters, sisters, aunts, cousins, or their representatives; in this case they shall all inherit, and these co-heirs are then called coparceners or parceners.

Coparceners by *custom*, are those who, by some peculiar custom of the county, challenge equal parts in such lands; as in Kent, by the custom of gavelkind, according to which lands descend to all the males in equal degree, as sons, brothers, uncles, &c. In either of these cases, all the parceners put together make but one heir, and have but one estate among them. Co. Litt. § 241, 242, 265; and 163. The crown of England is not subject to coparcenary.

COPARTNERSHIP. See PARTNERSHIP.

COPAS, in *Ancient Geography*, a river of Asia Minor, in Caria.

COPATZ, in *Geography*, a town in the island of Cherso; 8 miles N. of Cherso.

COPE, an ecclesiastical ornament, usually worn by chantors and sub-chantors, when they officiate in the church-sollemnity. It is also worn by the Romish bishops, and other ordinaries: it reaches from the shoulders to the feet. The ancients called it *pluviale*.

In the trial of archbishop Laud, one of the charges alleged against him was his introducing the use of copes and church music into divine worship. To this charge he replied,

plied, that the use of copes is prescribed by the 24th canon of 1603, which says, "that in all cathedrals and collegiate churches, the communion shall be administered on principal feast-days, sometimes by the bishop, if present, sometimes by the dean, and sometimes by the canon or prebendary, the principal minister using a decent cope;" so that in this respect he had made no innovation.

To this defence it was replied, that neither the common-prayer book, nor book of ordination, nor homilies confirmed by parliament, nor queen Elizabeth's injunctions in her first year, make any mention of copes, though they are evidently derived from the popish wardrobe; and the last common-prayer book of king Edward VI. expressly prohibits them. The 24th canon of 1603 enjoins only the chief minister to wear a cope at the administration of the sacrament, whereas the archbishop prescribed them to be worn by others besides the chief minister, and as well when the sacrament was not administered as when it was. But these canons not being confirmed in parliament, expired with king James, and therefore could be no warrant for their present use.

COPE, in *Biography*, a Flemish sculptor of the 16th century, who resided at Rome, and is celebrated by Baglione for the beautiful basso-relievos which he modelled, in a small size, from the Fables of Ovid; and which were afterwards cast in gold and silver, for the purpose of ornamenting the magnificent furniture of those times. The above-mentioned author informs us, that impressions from these beautiful models were generally dispersed and much admired at Rome. From Baglione's description of these works, we might be led to conjecture, that many of those small basso-relievos in bronze, which are usually attributed to Benvenuto Cellini, are no other than casts from these models of Cope. He is said to have succeeded in some small productions in ivory; and, ultimately, to have attempted a statue of a larger size in marble, which, however, after a long and fruitless labour, he left unfinished. He was not less remarkable for his talents, than for his morose and unfeeling disposition, and he died miserably at about the age of 80, in the pontificate of Paul V. Baglione.

COPE, *St. Martin's*, was a relic formerly in great esteem among the French kings; and was often carried with them to war as their standard.

COPE, among *Miners*, is a custom or tribute due to the king, or lord of the soil, out of the lead mines in some part of Derbyshire. This duty amounted, according to Manlove, to sixpence a load, nine dishes making one load.

COPECE, in *Commerces*, a Muscovite coin, valued at about a half-penny; so that 100 copecs are equal to a ruble, which is valued at an average at 4s.

COPE-STAKE, a German coin, valued at 12d. sterling.

COPENHAGEN (in Latin *Hafnia*, in Danish *Kiøbenhavn*, originally *Kiøbmansbyen*, the *Merchants' harbour*), in *Geography*, is the capital of the kingdom of Denmark, situated on the eastern shore of the island of Zealand, in a bay of the Baltic sea, about 24 English miles from the Sound. E. long. 12° 35' 15". N. lat. 55° 41' 4", 160 miles N. E. of Hamburg, and 240 S.W. of Stockholm. Its circumference is from 4 to 5 English miles.

In the 11th century Copenhagen was only a mean fishing place. It owed its increase to a castle, which protected its inhabitants against the numerous pirates who infested the Baltic sea. Leyre, or Letlra, of which some remains have been found near Roschild, had been the residence of the Danish kings till the year 950, when that distinction was bestowed on Roschild itself, from whence the seat of empire

was transferred to Copenhagen, in 1445, during the reign of Christopher of Bavaria. From that time the kings of Denmark have constantly resided at Copenhagen.

This city was always well fortified by nature and art, but the strong citadel of Fredericksbavn, between the harbour and the east gate, was only erected in 1663, previous to which time Copenhagen had often been attacked. In the year 1523 it was besieged by Frederick, duke of Gutorp, supported by a fleet from Lubeck, consisting of ten ships of war. Pressed by famine, and cut off from all hopes of relief, the citizens surrendered, after a close siege of seven months. Thirteen years after, when, on the death of Frederick, the inhabitants attempted to replace their old and favourite king Christian II. on the throne, Copenhagen underwent the same fate.

In 1658, Charles Gustavus, king of Sweden, having led his army over the ice, overran Denmark, and in the month of August appeared before Copenhagen, whilst his fleet blockaded the harbour. Bombs and red-hot balls were thrown into the city, but the fire was immediately extinguished by the activity of the inhabitants. However, in the month of October of the same year the Dutch fleet, under the command of admiral Opdam, came to the assistance of the besieged, defeated the Swedish fleet, and threw a large supply of provisions into the town. Charles Gustavus at length ventured a general assault in the night between the 11th and 12th of February 1659, when the ditches about the ramparts were thickly frozen. The chief attack was directed against the western rampart which the citizens and students defended with such obstinacy, that the Swedish monarch, giving up all hopes of taking the city, retired, and the year following concluded a peace. As a reward for their bravery, the citizens and students obtained privileges which they enjoy at this day.

During the reign of Frederick IV. in the year 1700, Copenhagen was again besieged on the land side by a Swedish army under the command of the renowned Charles XII. and on the sea side by the combined fleets of Holland, England, and Sweden. The Danish king was in Holsten, but the queen dowager, Charlotte Amalia, having animated the citizens and students to a brave resistance, neither the numerous Swedish army, nor the combined fleets, could make any impression on the town. The peace of Travendahl put an end to the siege, and Copenhagen enjoyed a complete century of uninterrupted peace.

On the 2d of April, 1801, the English vice-admiral, Nelson, with 11 ships of the line, 7 frigates, and 10 small vessels, attacked the line of defence before the port of Copenhagen, and, after a most obstinate engagement of three hours and a half, unfurled the white flag, took possession of 11 Danish ships, and, by an equally well-timed and skilful negotiation, detached Denmark from the maritime league into which she had entered with Russia and Sweden against England. The harmony between the two countries was restored, but continued only until the month of August 1807, when a strong English fleet encircled the island of Zealand, having previously disembarked an army of nearly 20,000 men, under the command of lord Cathcart, which invested Copenhagen by land. After a vigorous bombardment of five days and nights, during which Copenhagen made a defence worthy of the acknowledged bravery of the Danes, and the citizens and students displayed the most undaunted courage, a capitulation was agreed upon on the 7th of September, by which the English troops were allowed to take possession of the citadel for six weeks, and the whole Danish navy, consisting of 18 sail of the line, 15 frigates, 6 sloops,

and 25 gun-boats, together with all the stores of the naval arsenal of Christiansholm, were surrendered to the disposal of the king of Great Britain.

On this occasion Copenhagen suffered severely. In the night of the 4th of September the grand steeple of St. Mary's, or our lady's church, which was 380 feet high, and stood on the highest spot in the city, was set on fire, and after having blazed for four hours, fell with a most tremendous crash. From six to seven hundred buildings, besides those of the university and one hospital, were burnt to the ground; thousands were damaged, and no more than four hundred houses escaped unhurt. Several valuable libraries fell a prey to the flames, and five or six hundred peaceable inhabitants were killed or maimed.

Anciently, Copenhagen had often been visited by the plague. The last which raged, in 1711, swept away great numbers of the inhabitants. In more recent times, Copenhagen has been frequently exposed to terrible conflagrations. On the evening of the 20th of October 1728, a fire broke out in a low house, not far from the west-gate, which spread with such fury, that in eight-and-forty hours the most elegant part of the city was laid in ashes; 1650 dwelling houses, four churches, the university buildings, and several other public edifices were burnt down to the ground. On the 26th of February 1794, the church of St. Nicholas, and the royal palace of Christiansburg, the gorgeous magnificence of which is sufficiently attested by its stupendous remains, were destroyed by fire, and hardly had the private houses, which suffered in this dreadful calamity, been rebuilt, when another considerable part of the city was reduced to ashes in 1795.

These conflagrations contributed, however, to render Copenhagen one of the finest cities in the north. The houses, though mostly of brick, succeed, exhibit a beautiful and uniform appearance, the streets are furnished with lamps; well paved, with a foot way on each side, and running in a straight line; but some of the streets are rather too narrow.

Copenhagen is divided into the Old and New Town and Christianshafen. The *Kongens nye Torge*, or king's New Market, which connects the Old with the New Town, is a spacious, irregular area, embellished with an equestrian statue in bronze of Christian V., and adorned with several handsome buildings, among which are the palace of Charlottenburg, devoted in part to the Royal Academy of painting, architecture, and sculpture; and the theatre, which, though small, is neat and elegantly decorated within. In the New Town is a beautiful octagon, containing four uniform and elegant buildings, in two of which the royal family resided ever since the palace was burnt down. In the middle of the octagon stands an equestrian statue of Frederick V. in bronze.

Christianshafen is built on the island of Amack, and connected with the Old Town by two bridges. Besides the fine dock-yards, where the men of war are refitted, Christianshafen contains the great West India sugar house and the East India house. The island of Amack itself is considered as the kitchen garden of Copenhagen, and furnishes the same with greens, fruit, milk, butter, and cheese in abundance. It is 9 miles long and about $2\frac{1}{2}$ miles in breadth. It contains above 800 families or 4000 souls, and is divided into two parishes, Taarneby which is inhabited by Danes and Dutchmen, and Hollanderby inhabited only by the descendants of a Dutch colony, which king Christian II. transplanted hither from North Holland, in 1516, at the request of his wife Elizabeth, sister to Charles

V. who was a native of the Low Countries. The language of the inhabitants of Amack is still a mixture of Danish and Low Dutch. They have preserved their particular dress, manners, and customs. The men wear broad brimmed hats, black jackets, full glazed black breeches, loose at the knee; the women black jackets, red petticoats, and a piece of blue glazed cloth bound round their heads. There is a particular market place at Copenhagen for the peasants of Amack, called the Amacker market.

The harbour of Copenhagen, formed by the straits of Kellebos, between the islands of Zealand and Amack, is capable of holding 500 ships. It is protected by several batteries, of which that of the three crowns is the most formidable. The naval arsenal, called Christiansholm, is much superior to that of Venice. The forges, workshops, rope-walks, are upon an admirable construction. Each ship has her separate magazine, containing all the materials for her equipment. The seamen are registered and divided into two classes; those who in time of peace are permitted to serve on board the merchants' ships, or to enter into foreign service, subject to be recalled in case of war, and the stationary sailors who are always in the employ of the crown. The latter, 4000 in number, live in barracks at Copenhagen. The academy of marine cadets forms one of the places in the octagon of the New Town. It was founded in 1701, for the education of fifty young gentlemen, who are boarded and instructed gratis; but more are admitted, on paying, to share in their instruction. They have to pass through several severe examinations before they are entered as midshipmen in the king's ships.

Copenhagen is the chief commercial town of all Denmark. Its principal domestic trade is with Norway, Iceland, the Faro islands, and Greenland. Since the year 1754, the trade to the West Indies is free to all the Danish ports; yet Copenhagen receives, almost exclusively, the return cargoes from St. Croix, St. Thomas, and St. John. Copenhagen is also the seat of an East India Company, a Jiro Bank, an Insurance Company; and its extensive foreign trade is chiefly with Germany, the countries round the Baltic, and the Mediterranean seas, France, Portugal, and Spain. In the year 1792, Copenhagen had only 218 ships of about 24,000 tons, but during the long wars between France and England their number has been nearly doubled.

The most important manufactures of Copenhagen are the woollen cloth and stuff, the calico-printing, silk, and China manufacture. The latter, though in its infancy, is thought to rival those of Dresden and Berlin.

Copenhagen is the seat of an university founded in 1475. It is richly endowed, grants a support of 4 marks Danish, or nearly 3 shillings English, a week to 180 poor students, and since the year 1791 distributes eight premiums annually for the best answer to eight prize questions. There are four colleges, in which 168 students are provided with lodging, fire wood, and pecuniary stipends. The number of students is generally between five and six hundred.

Since the year 1742, several learned associations have been formed at Copenhagen, the oldest and most known of which is the Royal Society, whose researches have thrown great light on northern history. This society superintends also the geographical mensuration of the country, and the publication of new special maps. It proposes four questions annually, and the prize for each is a gold medal worth twenty pounds sterling. But besides the Medical Society, founded in 1772, that of Icelandic literature, founded in

1779, and that of natural history, founded in 1789, the most important is the Royal Economical Society, founded in 1768, whose annual income of 6000 dollars, or 1200*l.* sterling, is expended in promoting the fine arts, fisheries, agriculture, and horticulture, and in encouraging every attempt that tends to benefit the country. It is now endeavouring to establish a regular importation of coals from the Faro islands. There is also a board of longitude and a repository for marine charts, founded in 1784, which has published excellent charts of the entrance of the Sound, of the two Belts, the Sound and the Baltic as far as Bornholm, of the Categat, of part of the western coast of Iceland, of part of the eastern coast of Iceland, of the Faro islands, and six charts of the coast of Norway. Copenhagen has likewise acquired some celebrity from its royal museum or cabinet of curiosities remarkable for Laplandish dresses, implements, and arms; from its excellent theatre of anatomy, founded in 1736, and from its public royal library, which, in 1797, was increased with the celebrated Suhm's library of 50,000 volumes, collected by himself, and relating chiefly to the antiquities of northern Europe.

There is only one theatre at Copenhagen, which is partly supported by the court. During the year 1806, it brought out nine translated pieces, and only one original Danish comedy. The performances of the season amounted to 158. There has been no Italian opera of late; only occasionally, and for a short time, German and French plays are performed by itinerant companies.

Copenhagen is the seat of a supreme tribunal, which is the highest court of justice for all the Danish dominions. Its sittings are opened with great solemnity in the beginning of March, on the ancient *Herredag* or *Daneboev* (meeting of parliament) by the king himself. And besides the inferior courts of justice there are *boards of conciliation*, or rather *conciliatory committees*, whose duty it is to accommodate matters between the parties by all possible means of persuasion. If an accommodation takes place, the expenses are very trifling, and the parties are bound to abide by it. From the 13th of August, 1795, when the first conciliatory committee was established at Copenhagen till the 31st of December 1801, 13,223 litigations were prevented at Copenhagen only in the course of six years and a half.

The bishop of Zealand, who is first in rank among the twelve bishops, of whom the Danish hierarchy is composed, resides at Copenhagen, which, besides the cathedral, counts 20 churches, one French protestant church, and several synagogues for the Jews, whose number amounts to 1500. They are most liberally treated at Copenhagen, and there is even a society established by Christians for the purpose of encouraging the instruction of Jews in arts and handicraft-trades.

In 1714, Frederick IV. established at Copenhagen a board of missions or *Collegium de Curfu evangelii promovendo*, which sends missionaries to Greenland, and to the East Indies. The latter are also supported in part by contributions collected at London. In the beginning of 1807, Copenhagen, with its suburbs, counted 3156 houses, and 104,000 inhabitants. The registers for the year 1806, gave 3440 born, 3109 dead, and 930 couples married. In 1799, Copenhagen counted only 82,608 inhabitants, one-sixteenth, or 5163, of whom were paupers. Yet no beggars are seen in the streets. A board of alms watches over the poor, who are provided for by voluntary contributions. Copenhagen has twenty-two hospitals, and thirty poor-houses. In 1802, the principal infirmary admitted 2349 patients, 1813 of whom were cured, 218 died, and 318 remained in the

house. The naval hospital, or *Quaesch-bouise*, contains 302 invalid sailors.

The police at Copenhagen is vigilant and good. A paper published weekly, under the title of the *Friend of the Police*, has particularly contributed to render the police excellent, by pointing out the most minute objects with regard to which it was thought deficient. Since the year 1804, the prisons have been rendered much more comfortable. They are all wainscotted and boarded, provided with bedsteads, blankets, and mattresses; and no person, whatever may be his crime, is ever confined in a dungeon or cellar. In the Rasp-house, where capital offenders are shut up for life, the male convicts rasp and saw Brazil wood, the females spin, and thus they all contribute towards their support by their labour. There is also a board of health, and a committee for promoting vaccination, under whose superintendance 6489 individuals were inoculated for the cow-pox at Copenhagen, in the course of the year 1802.

Copenhagen is surrounded with country seats, which offer the most enchanting sea-views. Its environs are beautiful, the country being finely varied with small forests of beech and oak. Of the former-palaces in its neighbourhood, *Fredericksberg* is the most remarkable for its delightful situation.

Without the western gate, close to Copenhagen on the high road, stands an interesting monument in commemoration of the emancipation of the peasants, which was effected under the present king. Four figures of white marble, representing peace, plenty, content, and industry, occupy the four corners of a pedestal, from the centre of which rises a pyramid. On one side of the base are these words: "For Christian den syvende de Danikes og Norges Konge af eenige og taknemmelige Borgere." To Christian the Seventh king of the Danes and Norwegians from united and grateful citizens; and on the other, "Grund steenen blev lagt af Frederik kongens son, folkets ven 1792." The foundation stone was laid by Frederic the king's son, the friend of the people.

A. Anderson's Tour in Zealand, in the year 1802. Busching, I. 85. Coxe's Travels, fifth edition, vol. v. p. 97. Cateau's Tableau du Danemarck. Sir John Carr's Northern Summer, p. 42. Fr. Thaarup's Statilik der Dänischen Monarchie. 1796.

COPERARIO, GIOVANNI, or JOHN COOPER, in *Biography*, an English musician, who, having resided for some time in Italy, on returning to his native country, Italianized his name, and became a favourite performer on the lute and viol du gambe, and a voluminous composer of *fantasie*, fancies, for viols, in three, four, five, and six parts. He was appointed music-master to the children of James I.; and prince Charles, under his instruction, made a considerable progress on the viol. Some of his vocal compositions were printed in the musical publications of the times. In conjunction with Nicholas Laniere, and others, he composed the songs in a *Malque*, written by Sir Thomas Campion, on the marriage of Carr, earl of Somerset, and lady Frances Howard, the divorced countess of Essex, which was performed in the Banqueting Room at Whitehall, on St. Stephen's night, in the year 1604. Mr. Fenton, in his notes on Waller, says, that Henry Lawes, having been educated under him (Coperario), "introduced a softer mixture of Italian airs than had before been practised in this country;" from which, and from his giving him the title of *Signor*, he seems to intimate, that he regarded him as an Italian. The following are the titles of his printed works, exclusive of the songs which he composed in conjunction
with

with Lanieri: "Funeral Tears for the Death of the Right Hon. the Earl of Devonshire, figured in seven Songs, whereof six are so set forth that the Wordes may be expressed by a treble Voyce alone to the Late, and base Viol, or else that the meane part may be added, if any shall effect more fullnesse of parts." The seventh is made in forme of a Dialogue, and cannot be sung without two Voyces. Invented by John Coperario." Fol. London, 1606. 2. "Songs of Mourning, bewailing the untimely death of Prince Henry, worded by Thomas Campion, and set forth to be sung with one Voyce to the Lute or Violl, by John Coperario." Fol. Lond. 1613.

COPERNICAN SPHERE. See SPHERE.

COPERNICAN System, is that system of the world, wherein the sun is supposed at rest in the centre; and the planets, with the earth, to move in ellipses round him.

The heavens and stars are here supposed at rest; and that diurnal motion which they appear to have from east to west, is imputed to the earth's motion from west to east.

This system was asserted by many of the ancients; and particularly Ephantus, Seleucus, Aristarchus, Philolaus, Cleantes Samius, Nicetas, Heraclides Ponticus, Plato, and Pythagoras; from the last of whom it was anciently denominated the *Pythagoric system*.

It was also held by Archimedes, in his book *De Granorum Arææ Numero*; but after him it became neglected, and even forgotten, for many ages; till above three hundred years ago, when Copernicus revived it; from whom it took the new name of the *Copernican system*. See COPERNICUS.

COPERNICUS, NICHOLAS, or rather COPERNICK, in *Biography*, the celebrated astronomer, was born at Thorn in Prussia, near the Old Gate, on the 19th of February, 1473, in a house which was still extant in 1797, and shewn to strangers as one of the greatest curiosities of that town. His father was a surgeon; his mother's brother, *Lucas Walzelrodt*, or, as he is sometimes called, *Waissbrodt Von Alten*, was, some years after young Copernicus's birth, raised to the dignity of bishop of Ermeland, in Latin, *Episcopus Warmiensis*: which circumstance has betrayed most of the English biographers into a singular mistake. They make Copernicus canon of Worms, in the south of Germany, instead of Frauenburg in Prussia, which is the see of the bishops of Ermeland.

Copernicus received his first instructions in the grammar school of his native city, from whence he was sent to study physic at the university of Cracow, where he gained the academical honour of a doctor's diploma. But he never practised as a physician, though he readily gave his advice, and his medicines, without any fee, to those friends who consulted him. Mathematics were his favourite study; and he took particular delight in the study of perspective; and this induced him to acquire the art of painting, in which he is said to have excelled. From the infant he had heard Albert Brudzewius's mathematical lectures at Cracow, he was fired with the nobleness of emulating the two greatest mathematicians of his time, George Parbach, an Austrian, and John Regiomontanus, a native of Königsberg, in the Newmark of Brandenburg. To accomplish this arduous design, he went to Italy, and was at first the pupil, but soon became the friend and assistant, of Dominicus Maria, of Ferrara, who was then teaching mathematics at Bologna, and whose hypothesis about the variability of the axis of the globe, by exciting universal attention, gave Copernicus the first ideas of the motion of the earth. At Bologna, in the year 1497, Copernicus first observed the occultation of Pallas by the moon.

He left Bologna to teach mathematics at Rome, where he observed an eclipse of the moon in the year 1500; and such was his dawning celebrity, that, even after his return to Prussia, he was consulted by the clergy of Rome, in the year 1515, respecting the improvement of the calendar. In the mean time his uncle, the bishop of Ermeland, had made him a canon of the chapter of Frauenburg; and the town of Thorn had named him to the archdeaconry of the church of St. John: yet he seldom lived in his native city, but made Frauenburg his principal residence. Zealously attached to the tenets of his church, he fulfilled the duties of his clerical offices with punctual care. The glorious Reformation, which he witnessed, had no influence on his religious opinions: his mind pursued a different track. Drawing and painting, the study of perspective, and the making of mathematical instruments, filled his leisure hours; and besides his regular avocations, the construction of some aqueducts absorbed his time. That which feeds the mill of Graudentz with water has been completely preserved; of another, which supplied the mill of Frauenburg, on which the canons reside, nothing remains but the tower on the banks of the Passarge, to the top of which he raised the waters of that river, and which exhibits still the following inscription:

"Hic patiuntur aquæ sursum preparare coactæ,
Ne careat sitiens Incola montis ope,
Quod natura negat tribuit Copernicus arte,
Unum pro cunctis fama loquatur opus."

Whenever the bishop was absent, Copernicus was entrusted with the government of the diocese; and after the death of two prelates, he was appointed general vicar during the vacancy. He was also frequently deputed to the provincial diets. Nothing, however, could divert him from his original purpose. He applied his stores of mathematical knowledge to the improvement of astronomy. The garret of his house at Frauenburg, which is still shewn, and the steeple of the cathedral, were his observatories. The epicycles and eccentrics of Ptolemy embarrassed and perplexed him; but the hypothesis of the earth being the motionless centre of the universe, was generally received: it had been adopted by Plato and Aristotle, whose authority was considered paramount to that of the bible; and Joshua's command to the sun and moon confirmed it. To attack this system was incurring the imputation of heresy; and it required no ordinary courage to advance an opinion, for which Galileo suffered a century after.

In this perplexity, Copernicus assiduously searched the lore of antiquity. He found that the Egyptians taught the revolution of Mercury and Venus about the sun; that Apollonius and Pergæus had assigned the same motion to Mars, Jupiter, and Saturn; that, according to his disciples, Nicetas and Heraclides, Pythagoras, whose learning was derived from the Egyptians, asserted the earth's motion round its own axis; and that Aristarchus and Philolaus went still farther, and maintained that the earth did not only move about its axis, but employed twelve months in revolving round the sun.

On these foundations Copernicus reised a structure, of which his intense and acute study furnished him with the most correct mathematical evidence. According to his system, the sun occupies the centre of the universe; the planets, in their motion round him, describe ellipses proportioned to their size; Mercury moves round the sun within three months, Venus within eight, the earth within twelve, and within four-and-twenty hours it revolves round its own axis; the moon is a satellite of the earth, about which she turns thirteen

thirteen times in a year; Mars takes two, Jupiter almost twelve, and Saturn nearly thirty, years to move about the sun.

It was in the year 1530 that Copernicus laid the last hand to his system, which he had begun to form about the year 1507; but he had not yet ventured to launch it into the learned world, when its fame reached the bishop of Capoua, cardinal Nicholas Schönberg, who, in 1534, by a letter which does honour to his sentiments, invited Copernicus to publish his new system. Other great men, particularly Tindemann Giese, bishop of Culm, assailed him with their in-treaties to the same purpose. But his modesty was still resisting their pressing application, when Rheticus, professor of mathematics at Wittenberg, excited by an ardent thirst of learning, resigned his chair, and visited Copernicus at Frauenburg, in the year 1539. To him Copernicus at last trusted his work, which, in 1543, was printed at Marienburg, at the expense of cardinal Schönberg, under the title of "Nicolai Copernici de Revolutionibus Orbium Cœlestium, Libri vi." But he did not live to read his book in print. A copy of it reached him only a few hours before his death, which happened at Frauenburg, on the 22d of May, 1543, three months and three days after he had entered the seventy-first year of his age. He was probably buried at the foot of the altar before which he used to celebrate mass; for, 38 years after his death, Cromerus, bishop of Ermeland, caused the following inscription to be placed on his tomb-stone, which is now shewn in the chapter's room:

D. O. M.

R. D. Nicolai Copernico Torunenſi,
Artium et Medicinæ Doctõri, Canonico Varmienſi,
Præſtanti Aſtologo et ejus Diſciplinæ inſtauratori,
Martino Cromero Epifcopo Varmienſi,
Honoris et ad Poſteritatem Memoriz Cauſa poſuit,
MDLXXXI.

Others pretend that Copernicus, having requested to be interred near his relations, was buried at Thorn, in the church of St. John, where he is represented in his canonical dress, kneeling before a crucifix, and a globe on his side, with this inscription:

"Non parem Pauli gratiam requiro,
Venian Patri neque poſco, ſed quam
In crucis ligno dederas Latroni, ſedulus oro."

Nicolai Copernico Thorunenſi abſolutæ ſubtilitatis mathematico, ne tanti viri, apud exteros celeberrimus, in ſua patria periret memoria hoc monumentum poſitum. Mort. Varmiz in ſuo Canoniceatu, anno 1543, die 4, ætatis LXXXIII.

This painting was renovated, in the year 1733, by a postmaster of Thorn, named Rubinkowki. A print of it may be ſeen in Hartknock's Ancient and Modern Prussia.

It is ſuppoſed that Copernicus's manuſcripts were depoſited at Braunſberg, in the Jeſuits' library, with the books of which they may have been removed to Sweden by Charles XI. Whether they be ſtill extant in that country is uncertain. Ludwig von Bazcko's Kleine Schriften, 1797, vol. ii. p. 135. Gaſſendi Opera, vol. v. p. 499. Bernoulli's Travels, vol. iii. p. 18.

See the order and diſpoſition of the heavenly bodies, as laid down by him, compared with thoſe in the other ſystems, under the head SYSTEM.

This ſystem has been eſtabliſhed by new arguments advanced by Kepler, Galileo, and Newton, in every ſucceeding age; and notwithstanding the oppoſition it met with, from the prejudices of ſenſe againſt the earth's motion, the au-

thority of Aristotle in the ſchools, the threats of ignorant bigots, and the terror of the inquisition, it has generally prevailed. Galileo, after having demonſtrated the motion of the earth, was obliged, by the rancour of the Jeſuits, to go to Rome, and there ſolemnly renounce it. Beſides which cruel treatment, he was condemned to a year's imprisonment in the inquisition, and the penance of repeating daily ſome penitential plalms. As a ſpecimen of the authority of the Romiſh church in oppoſition to this ſystem, we ſhall only tranſcribe the declaration of the excellent commentators, Le Seur and Jaquier, on the Principia, prefixed to the third volume. "Newtonus in hoc tertio libro telluris motu hypotheſim affumit. Autoris propoſitiones aliter explicari non poterant, niſi eadem quoque facta hypotheſi. Hinc alienam coacti ſunus gerere perſonam. Cæterum lætis a ſummis pontificibus contra telluris motum decretis nos obſequi profitemur."

COPERNICUS is the name of an aſtronomical inſtrument, contrived by Mr. Whiſton, for the calculation and exhibition of eclipses, and of the motions of the planets, both the primary and ſecundary ones, &c.

It was ſo called by the inventor, as being conſtructed on the Copernican ſystem; or as repreſenting the heavenly bodies agreeable to it. It conſiſts of ſeveral concentric circles of wood; upon which are inſcribed numbers, tranſferred hither from the aſtronomical tables: by the various diſpoſitions of theſe circles, which are made fo as to ſlide within each other, queſtions are ſolved; and thus long calculations are ſaved, and the work of many hours brought into a few minutes.

For the exhibition of eclipses there is a peculiar apparatus, conſiſting of a terreſtrial globe, ſo diſpoſed, as that, being turned round its axis, the light of the ſun, or a candle, is projected through a glaſs plane, marked out into concentric circles, expreſſing digits of the eclipse: and thus is the path of the eclipse, with its degree or quantity in any part of its path, agreeably and accurately repreſented.

The inſtrument not being very common, a particular deſcription would be ſuperfluous. The author of it has written a book to explain it.

COPHANTA, in *Ancient Geography*, a port of Carmania.

COPHANTUS, a mountain of Aſia, placed by Pliney in Baſtriana.

COPHENES, a river of India, which ran between Alexandria, and the firſt ſcene of the military operations of Alexander, and which, as major Rennell conjectures, occurred pretty early in his march. In Alexander's arrangement of boundaries, the river Cophenes was the eaſtern limit of the province of Paropamiſus, of which Alexandria was regarded as the capital; and that province, according to the ideas of Ptolemy, lay between thoſe which the moderns name Korafan and Cabul. The major therefore concludes, with ſome degree of confidence, that the river "Cow" of the Turkiſh geography, and the "Cow-mull" of Baber, which paſſes by Nughz, and whole principal branches are the rivers of Ghizni and Gurdaiſ, is the Cophenes; and that we muſt look for Alexandria in the quarter of Bamian, though it is not poſſible to aſſign its particular ſituation. At all events, the proximity of Alexandria to the northern mountains, a fact which Arrian impreſſes very ſtrongly, renders it an impoſſible caſe, that Alexandria and Candahar can be one and the ſame place. Leaving Alexandria, at the foot of Caucasus, Alexander came to the river Cophenes, and paſſed it in the higher part of its courſe. From Cophenes, Hephæſtion and Perdicæus, with a ſtrong

a strong detachment, were sent into the country of Pene-laitis (Arrian) or Pucolaitis (Strabo) near the Indus. Alexander marched from the banks of the Cophenes against the Alpii, Thyraei, and Arafaci, nations, whose situations and modern names are unknown, but supposed by Rennell to be inferior divisions of the modern Cabul, and situated between the rivers of Ghizni and Cabul, at the height of Irjab and Dulkah. In his march to Arigeus, Alexander crossed two rivers, the "Choe" and "Euafla," and defeating the Asprians in a pitched battle, near the latter, passed through the territories of the Gurezi, and crossed the river of the same name (see CUREUS). The Choe and Euafla may be two of the five rivers of the Lumphanat. It is very difficult to determine the length of Alexander's march from the Cophenes to the Gurezi; but it might possibly be 100 road miles. As Alexander had crossed the Indus, probably at Attock, when he came to the bridge (which was completed before his arrival), he made an excursion by land into the country adjacent to the western bank of the Indus, in order to view the city of Nyfa (supposed by M. d'Anville to be Nughz, or Nagaz, the Nagara, or Dionysopolis of Ptolemy); and he is then said to have entered the country, that lay between the two rivers, Cophenes and Indus. Admitting that the Cophenes is the river that runs by Nughz, and falls into the Indus, 30 or 35 miles below the city of Attock, and as the river Cabul joins the Indus in front of the city of Attock, it is clear that, till he came opposite to that city, he could not be between the Cophenes and Indus. And if it be said, that the Cabul river was the Cophenes, he had all along been between the Cophenes and Indus; and Arrian's words could have no meaning. Upon the whole we may conclude that the ancient Cophenes was the same with the modern *Cow*, which see. Rennell's Memoir, p. 170, &c.

COPHOS, a place of Greece, in Attica, situated before Piræa.

COPHOSIS, in *Medical Writers*, is used for deafness, whether beginning, or perfect, or from what cause soever.

The word is derived from κωφω, *I am deaf*.

COPHRANTA, or COPHANTA, an ancient town of Asia, in Carmania. Ptolemy.

COPHSIS, SAMUEL, in *Biography*, a learned Jewish Rabbi of Spain in the eleventh century, was a native of Cordova, and published a commentary on the Pentateuch, the manuscript of which is still extant in the Vatican library. Those who have examined it commend it as an excellent work, except that it too much abounds with allegories. The author died A. D. 1034.

COPHTI, COPTES, or COPTS, a name given to the Christians of Egypt; who are of the sect of Jacobites.

They derive the latter appellation from the learned Jacobus Zanzalus, bishop of Edessa, who, when the Coptic party had sunk in number and credit, appeared in defence of the Monophysite doctrine; and by his writings, as well as indefatigable travels through most parts of the East, succeeded to such a degree in reviving and disseminating it, that he hath been revered and esteemed by the whole sect, which, from respect to him have assumed the name of Jacobites: though the other Christians, as well as the Turks, call them by their old name Copts. By way of contempt some have called them "Kusti" or Girdlers, thus intimating that they are Christians only from the girdle upwards, but bear the fear of Judaism below it.

The critics are extremely divided about the origin and orthography of the word: some write it *Cophiti*, others *Cophitites*, *Cophitite*, *Copti*, &c. Scaliger derives the name

from *Coptos*, an anciently celebrated town of Egypt, the metropolis of the Thebaid, whither they retired from the tyranny of the Greeks. Kircher refutes this opinion, and maintains, that the word originally signifies *cut* and *circum-scribed*; and was given these people by the Mahometans, by way of reproach, because of their practice of circumcising; but P. Sollier, another Jesuit, refutes this opinion. Scaliger afterwards changed his opinion, and derived the word from ΑΙΓΥΠΤΟΣ, the ancient name of Egypt, by retrenching the first syllable; but this opinion, too, P. Sollier disputes. Volney, concurring in opinion with Scaliger, observes, that the Arabic term *Kobti*, a Copt, seems to be an evident abbreviation of the Greek word *Ai-goupti-os*, an Egyptian; for the *y* was pronounced *ou* among the ancient Greeks; and the Arabs, having neither *p* nor *g* before *a*, *o*, *u*, always substitute for those letters *b* and *t*. John de Leo and others say, that the Egyptians anciently called their country *Elebitis*, or *Cibit*, from Cibth their first king, whence *Cophitite*. &c. others say from Cobth second king of Egypt. Vansleb derives the word *Cophi* from Copt, son of Miraim, grandson of Noah. All these etymologies P. Sollier rejects, on this principle, that were they true, the Egyptians ought all equally to be called *Cophiti*; whereas, in effect, none but the Christians, and among those none but the Jacobites, bear the name; the Melchites not being comprehended under it. Hence he chooses to derive the word from the name *Jacobite*, by retrenching the first syllable; whence *Cobite*, *Cobea*, *Copta*, and *Coptita*.

Several families of these Copts are to be found in the Delta; but the greatest number inhabit the Said, where they in some places occupy whole villages. Both history and tradition attest their descent from the people who were conquered by the Arabs, that is, from that mixture of Egyptians, Persians, and, above all, Greeks, who, under the Ptolemies and the Constantines were so long in possession of Egypt. Their name, according to the etymology given of it by Scaliger and by Volney, seems to indicate that they are the remains of the ancient Egyptians; and this is the more probable, since we find them in the Said before the time of Diocletian; and it is certain the Greeks were less numerous in the Said than in the Delta. This opinion of their origin is rendered still more probable, by considering the distinguishing features of this race of people; and they are found to be all characterized by a sort of yellowish dusky complexion, which is neither Grecian nor Arabian; they have all a puffed visage, swollen eyes, flat noses, and thick lips, or, in short, the exact countenance of a Mulatto. Volney, when he saw the figure of the sphinx, and observed its features to be precisely those of a negro, recollected the remarkable passage of Herodotus, in which he says, (lib. ii.) "For my part, I believe the Colchi to be a colony of Egyptians, because, like them, they have black skins and frizzled hair." Hence he concludes, that the ancient Egyptians were real negroes, of the same species with all the natives of Africa; and though, as we might naturally expect, after mixing for so many ages with the Greeks and Romans, they have lost the intensity of their first colour, yet they still retain strong marks of their original conformation. "How are we astonished," says Volney, "when we behold the present barbarism and ignorance of the Copts, descended from the profound genius of the Egyptians, and the brilliant imagination of the Greeks; when we reflect that to the race of negroes, at present our slaves, and the objects of our extreme contempt, we owe our arts, sciences, and even the very use of speech; and when we recollect that, in the midst of those nations who call themselves the friends of liberty and humanity, the most barbarous of slaveries is just-
ned

tified; and that it is even a problem, whether the understanding of negroes be of the same species with that of white men!" The language formerly spoken by the Copts furnishes another argument in favour of the origin above ascribed to them. On the one hand the form of their letters, and the greater part of their words, demonstrate that the Greek nation, during the thousand years it continued in Egypt, has left deep marks of its influence; but, on the other, the Coptic alphabet has five letters, and the language a number of words, which are to be considered as the remains of the ancient Egyptian. These, when critically examined, have a sensible analogy with the dialects of the ancient neighbouring nations, such as the Arabs, Ethiopians, Syrians, and even those who lived on the banks of the Euphrates; nor can it be doubted that all these languages are derived from one common stock. For upwards of three centuries, that of the Copts has fallen into disuse. The Arabs, disdain the language of the nations they subdued, imposed on them, together with their yoke, the necessity of learning that of their conquerors. This obligation became even a law, when, about the end of the first century of the Hegira, the Caliph Waled I. prohibited the Greek tongue throughout his whole empire. From that time the Arabic became universal; and the other languages, confined to books, subsisted only for the learned, who neglected them. Such has been the fate of the Coptic. The priests and monks no longer understand it, in their scriptures and books of devotion in which alone it exists.

Mr. Browne, a late traveller in Africa, (p. 71.) does not admit this hypothesis of Volney; for he observes, that the Copts, or original inhabitants of Egypt, have no resemblance of the negro features or form; though they have some peculiarities of feature common to them all. Their hair and eyes are of a dark hue, and the former is often curled; but not in a greater degree than is occasionally seen among Europeans. The nose is often aquiline; and though the lips be sometimes thick, they are by no means generally so; and on the whole, a strong resemblance may be traced between the form of visage in the modern Copts, and that presented in the ancient monuments, paintings, and statues. Their complexion, like that of the Arabs, is of a dusky brown; it is represented of the same colour in the paintings, seen by Mr. Browne in the tombs of Thebes. The Coptic women have interesting features, large black eyes, and a genteel form.

The Copts differ from the Arabs by their religion, which is Christianity, and which they embraced at an early period; but they are again distinct from other Christians by their opinions, which are those of the Eutychians or Monophysites. Their adherence to these opinions has exposed them to the persecution of the other Greeks, and thus they are rendered irreconcilable enemies. When the Arabs conquered the country, they took advantage of these animosities, to enslave them both. The Copts, however, have at length expelled their rivals; and as they have been always intimately acquainted with the interior of the country, they are become the depositaries of the registers of the lands and tribes. Under the name of "Writers," they are at Cairo the intendants, secretaries, and collectors of government. These writers, despised by the Turks whom they serve, and hated by the peasants whom they oppress, form a kind of separate class, the head of which is the writer to the principal Bey. He disposes of all employments in that department, which, according to the spirit of the Turkish government, he bestows on the best bidder.

The Copts endured many severities, and were reduced

to extreme poverty and distress by the intolerance and persecution of the Greeks; but when Amron invaded Egypt, A. D. 658, the Copts availed themselves of the opportunity which was afforded by their voluntary submission to the conqueror for retaliation on their persecutors. The Saracens were received by them as the deliverers of the Jacobite church; and during the siege of Memphis a secret and effectual treaty was opened between a victorious army and a people reduced to the most abject distress and bondage. "The Greeks," said Mokawkas, a rich and noble Egyptian, connected with the Coptic sect, in his first conference with Amron, "are determined to abide the determination of the sword; but with the Greeks I desire no communion, either in this world or in the next; and I abjure for ever the Byzantine tyrant, his synod of Chalcedon, and his Melchite slaves. For myself and my brethren, we are resolved to live and die in the profession of the gospel and unity of Christians. It is impossible for us to embrace the revelations of your prophet; but we are desirous of peace, and cheerfully submit to pay tribute and obedience to his temporal successors."

The tribute was ascertained at two pieces of gold for the head of every Christian; but old men, monks, women, and children, of both sexes, under 16 years of age, were exempted from this personal assessment; the Copts above and below Memphis swore allegiance to the caliph, and promised an hospitable entertainment of three days to every muselman who should travel through their country. By this charter of security, the Copts obtained a triumph over their enemies, and the sacred edifices, with the patrimony of the church, were restored to the national communion of the Jacobites, who enjoyed without moderation the moment of triumph and revenge. From the superiority thus acquired, and the conduct by which it was obtained, and by which it was succeeded, proceeded that permanent and invincible animosity, which hath subsisted between the Copts and the Greeks ever since their subjection to the Turks; and which the Romish missionaries have endeavoured to terminate, by using every method likely to reconcile both these sects to the church of Rome. In the 17th century attempts were made for uniting the Monophysites of Asia with the Romish church, and they were attended with a partial and temporary success; but the African Monophysites, and more especially the Copts, notwithstanding that poverty and ignorance which exposed them to the seductions of sophistry and gain, maintained their principles with firmness, and made an obstinate resistance to the promises, presents, and attempts, employed by the papal missionaries to bring them under the Roman yoke. The Copts, ever since the Saracenic conquest above-mentioned, have had churches, priests, bishops, and a patriarch, who fixed his seat of residence at Cairo, when that city became the capital. In their worship they blend a number of superstitious customs, which have been transmitted to them from their ancestors and which they obstinately retain. In other respects, says Savary (Letters on Egypt, vol. ii.) the Copts are gentle, humane, and hospitable. Paternal tenderness and filial love constitute the happiness of their families. They honour and cherish all the ties of blood. The internal commerce, the art of hatching chickens, and that of bringing up bees, form almost their only science. They often acquire considerable wealth in the management of the affairs with which they are entrusted, but they are never allowed to enjoy the fruit of their labours in tranquility. The Bey, who sees their opulence, strips them without pity;—happy if they can secure their lives by the sacrifice of their fortune. These vexations, however, never excite them to revolt.

Their want of energy keeps them chained down to servitude and misery, which they endure without murmuring. Mr. Browne represents the Copts as an acute and ingenious people, who get money steadily without ostentation, considering, that, under an arbitrary government, obscurity is safety. In their temperament, he says, they are melancholic, but, if called into action, industrious and laborious. However, they are fond of their distilled liquors, and rather licentious in their amours. They are zealous in their faith, this writer adds, and their ecclesiastics are numerous. The populous city of Cairo, as we have said, affords a residence, or rather a shelter, for their indigent patriarch, and a remnant of 10 (some say 12 or 13) bishops; 40 monasteries have survived the depredations of the Arabs; and the progress of servitude and apostacy has reduced the Coptic nation to the despicable number of twenty-five or thirty thousand families; a race of illiterate beggars, whose only consolation is derived from the superior wretchedness of the Greek patriarch and his diminutive congregation.

The Coptic patriarch, though he resides at Cairo, takes his title from Alexandria; and the body of the inferior clergy, whether secular or regular, is composed of the orders of St. Antony, St. Paul, and St. Macarius, who have each their monasteries.

Besides the orders of priests, deacons, and subdeacons, the Copts have likewise archimandrites, the dignity whereof they confer with all the prayers and ceremonies of a strict ordination. This makes a considerable difference among the priests; and besides the rank and authority it gives them with regard to the religious, it comprehends the degree and functions of archpriests. By a custom of about seven hundred years, if a priest elected bishop be not already archimandrite, that dignity must be conferred on him before episcopal ordination.

The second person among the clergy, after the patriarch, is the titular-patriarch of Jerusalem, who also resides at Cairo, because of the few Copts at Jerusalem; he is, in effect, little more than the bishop of Cairo: only he goes to Jerusalem every Easter, and visits some other places in Palestine near Egypt, which own his jurisdiction.

To him belongs the government of the Coptic church, during the vacancy of the patriarchal see.

To be elected patriarch, it is necessary the person have lived all his life in continence: it is he confers the bishoprics. To be elected bishop, the person must be in the celibate; or, if he have been married, it must not be above once.

The priests and inferior ministers are allowed to be married before ordination; but are not obliged to it, as Ludolphus erroneously observes. They have a great number of deacons, and even confer the dignity frequently on children. None but the lowest rank among the people commence ecclesiastics; whence arises that excessive ignorance found among them: yet the respect of the laity towards the clergy is very extraordinary. Their office is longer than the Roman office, and never changes in any thing: they have three liturgies, which they vary occasionally.

The monastic life is in great esteem among the Copts; to be admitted into it, there is always required the consent of the bishop. The religious Copts make a vow of perpetual chastity; renounce the world, and live with great austerities in deserts: they are obliged to sleep in their cloaths and their girdle, on a mat stretched on the ground; and to prostrate themselves every evening a hundred and fifty times, with their face and breast on the ground.

They are all, both men and women, of the lowest class of the people; and live on alms. The nunneries are properly hospitals; and few enter but widows reduced to beggary.

The present habitation of the Coptic cenobites is situated in the desert of Nitria, called also after the name of a famous saint denominated Macarius, and is distinguished by the appellation of "Zaidi el Baramous," and called by the Arabs, "Kastr Zaidi." It is an enclosure of high walls without any gate, unless that name should be given to a small wicket, which is opened only twice or thrice in the course of a year. Persons entering or leaving it are hoisted up and lowered down by means of a strong rope and a pulley. The building is entirely constructed of soft calcareous stones, several of which contain fossil shells. Within the walls there is a kind of small fort, surrounded by ditches, over which is built a drawbridge. Here the monks retire, when the Arabs succeed in forcing the outer walls. In this little fort are a church, a cistern, and provisions; in short, every thing for enabling the monks to sustain a long siege. Here they also keep their books, written in the Coptic language; which they cannot on any consideration be prevailed on to part with, although they never read them, and suffer them to lie on the ground, eaten by vermin and covered with dust. The cells of the monks are vaulted and very low, and are indeed no better than a sort of dens, not unsuitable to the ignorant and slothful wretches who inhabit them. The church is simple in its construction, and has no other ornament besides a few ostrich's eggs, and bad pictures of saints. It is impossible, says Sonmini, (Travels in Upper and Lower Egypt, p. 354.) to give an idea of the confusion that sometimes prevails in their church: they often know not what they are to sing; one will have a particular anthem or psalm, and another a different one: they then dispute and come to blows; in the mean time a third chants a prayer, which is followed by the choir, and thus the quarrel terminates. Their singing consists of Turkish and Arabic airs, accompanied by cymbals, the noise of which, mixed with their squalling voices, and their discordant music, makes the church re-echo with a medley of jarring sounds. The priest celebrates mass with water. They consecrate common bread; which the priest cuts in pieces and mixes with water, which is likewise consecrated. This makes a kind of soup, of which he eats a few spoonfuls; and afterwards administers the sacrament, also with a spoon, to all that are present. After the communion the priest washes his hands, and standing at the door of the chancel, extends them to stroke the face of every one who passes. During mass, the priest also blesses little loaves which are distributed at the close of the service. The priest who celebrates mass is dressed in a kind of white shirt, made with a cowl, and covered with little crosses. During the other prayers, he only wears a large fillet of white linen, with similar little crosses, half twisted round his head in the form of a turban, with the two ends hanging down before and behind. In this convent there were only three priests and some friars, with a succession of persons who come hither from time to time to do penance, and who bring the monks the means of subsistence. Their fare consists of bread, or rather biscuit, made of flour of lentils, and rice boiled in salt and water, bad cheese, and a little honey; and their only beverage is a brackish and ill-tasted water. Their supplies are conveyed to them from the alms of the rich Copts at Cairo. In these monasteries, several of which are found in this desolate country, the Coptic travellers through the desert are sure of finding necessaries for themselves and their horses; which they obtain by ringing a small

small bell, the cord of which hangs down on the outside.

F. Roderic reduces the errors and opinions of the Copts to the following heads: 1. That they put away their wives, and espouse others while the first are living. 2. That they have seven sacraments; viz. baptism, the eucharist, confirmation, ordination, faith, fasting, and prayer. 3. That they deny the Holy Spirit to proceed from the Son. 4. That they only allow of three œumenical councils; that of Nice, Constantinople, and Ephesus. 5. That they only allow of one nature, will, and operation, in Jesus Christ, after the union of the humanity with the divinity: in other words, they are Monophysites, Monothelites, or Eutychians. Mr. Browne (*ubi supra*) says, that they embrace transubstantiation; in which, and other points, the Catholics of Cairo think they approach their faith nearer than the Greeks. As to their errors in discipline, they may be reduced, 1. To the practice of circumcising their children of both sexes before baptism, which has obtained among them from the twelfth century. 2. To their ordaining deacons at five years of age. 3. To their allowing of marriage in the second degree. 4. To their forbearing to eat blood: to which some add their belief of a baptism by fire, which they confer by applying a hot iron to their forehead or cheeks.

Others palliate these errors, and shew that many of them are rather abuses of particular persons, than doctrines of the sect. This seems to be the case with regard to their polygamy, eating of blood, marrying in the second degree, and the baptism by fire: as for circumcision, it is said not to be practised as a ceremony of religion, nor as of any divine appointment, but merely as a custom which they derive from the Ishmaelites; and which, perhaps, may have had its origin from a view to health and decency in those hot countries.

The Copts have adopted, from the Mahometans, the custom of frequent prostrations during divine service; of ablation after the conjugal rites, &c. In many respects their faith, discipline, and worship, resemble those of the Abyssinians; see that article.

The Copts, at different times, have made several reunions with the Latins; but always in appearance only, and under some necessity of their affairs. In the time of pope Paul IV., a Syrian was dispatched to Rome from the patriarch of Alexandria, with letters to that pope; wherein he acknowledged his authority, and promised obedience; desiring a person to be dispatched to Alexandria, to treat about a re-union of his church to that of Rome: pursuant to which, Pius IV., successor to Paul, chose F. Roderic, a Jesuit, whom he dispatched in 1561, in quality of apostolical nuntio.

But the Jesuit, upon a conference with two Copts deputed for that purpose by the patriarch, was made to know, that the titles of *father of fathers, pastor of pastors, and master of all churches*, which the patriarch had bestowed on the pope in his letters, were no more than mere matters of civility and compliment; and that it was in this manner the patriarch used to write to his friends: they added, that since the council of Chalcedon, and the establishment of several patriarchs independent of one another, each was chief and master of his own church. This was the answer the patriarch gave the pope, after he had received a sum of money remitted to him from Rome, by the hands of the Venetian consul.

COPHTIC, or COPTIC, the language of the Copts, the ancient language of the Egyptians, mixed with a great deal of Greek; its alphabet being manifestly nothing else but Greek, with the addition of some few letters, to express

sounds, which the Grecians had not, and which probably came to be used in Egypt after the time of Alexander; though we know that the Greek language, and perhaps also the Greek letters, were taught there long before, in the reign of Psammetichus. Of this affinity the reader may judge, by the following table of the Coptic alphabet:

Figure.	Name.	Power.	Figure.	Name.	Power.
Αα	Alpha	A.	Ππ	Pi	P.
Ββ	Beta	B. V.	Ρρ	Ro	R.
Γγ	Gamma	G.	Σσ	Simā	S.
Δδ	Dalda	D.	Ττ	Tau	T.
Εε	Ei	E.	Υυ	Ypsilon	Y. U.
Ϛϛ	So	S.	Φφ	Phi	Ph.
Ζζ	Zita	Z.	Χχ	Chi	Ch. Græc.
Ηη	Hita	I. Æ.	Ο	O	O long.
Θθ	Thita	Th.	Ψψ	Shai	Sh.
Ιι	Iauda	I.	Ϝϝ	Fei	F.
Κκ	Kappa	K.	Ϟϟ	Khei	Kh.
Λλ	Lauda	L.	Ϡϡ	Hori	H.
Μμ	Mi	M.	Ϣϣ	Janja	J.
Νν	Ni	N.	Ϥϥ	Shima	Sh.
Ξξ	Xi	X.	Ϧϧ	Dhei	Dh.
Οο	O	O short.	Ϩϩ	Ephi	Pf.

The old Coptic, which Kircher maintains to be a mother-tongue, and independent of all others, had been much altered by the Greek; for besides that it has borrowed all its characters from the Greek, with a very little variation, a great number of the words are pure Greek.

Vossius, indeed, asserts, that there was no Coptic language till after Egypt became subject to the Arabs. The language, according to him, is a mixture of Greek and Arabic: the very name thereof not being in the world till after the Arabs were masters of the country. But this, M. Simon observes, proves nothing; except that what was anciently called Egyptian, has since by the Arabs been called Coptic, by a corruption of speech. There are, it is true, Arabic words in the Coptic; yet this by no means proves but that there was a language before that time, either Coptic or Egyptian. Pietro de la Valle observes, that the Copts have entirely lost their ancient tongue; that it is now no longer understood among them; and that they have nothing extant therein but some sacred books; and that they still say mass in it.

All their other books have been translated into Arabic, which is their vulgar tongue; and this has occasioned the originals to be lost: it is added, that they rehearse the Epistles and Gospels in the mass, twice; once in Arabic, and once in Coptic.

Indeed, if we believe F. Vanl. b, the Copts say the mass in Arabic, all but the Epistles and Gospels, which they rehearse both in that and Coptic.

It sufficiently appears, that, after the conquest by the Saracens, the ancient language so far continued to be that of religion, that it was used in the divine service; and in the country of the Copts, the gospel, according to Niebuhr, is even now read in Coptic: but he observes, that this tongue is not understood even by the priests, and that the service is afterwards read in the Arabic, which is the present language of Egypt. Mr. Browne says, that in the Coptic monasteries, the prayers are read in Arabic, and the epistle

and gospel in Coptic; but the priest is a mere parrot, repeating a dead letter.

The Coptic tongue, at present, consists chiefly of the old Egyptian and Greek, still bearing evident marks of primitive antiquity in its structure and constitution, with regard to which it differs so much from all the Oriental and European languages, that it is impossible to conceive it derived from any of them. For the Copts neither decline their nouns, nor conjugate their verbs, (not even those of foreign extract,) otherwise than by prefixing particles sometimes of one or more syllables, and sometimes of a single letter, which denote the case, gender, number, and person; several of them being often joined together in one word, and the primitive word usually placed last. Hence the difficulty of this tongue consists in the incredible combination of the words and particles, in the change of the vowels, and in transposing the middle part of the word, and in adding superfluous letters: so that it requires great labour and skill to distinguish them.

From numerous and minute researches, Mr. Browne is led to affirm, that the Coptic language may be considered as extinct: although in Upper Egypt, they unknowingly retain some Coptic words.

F. Kircher is the first who published a grammar and vocabulary of the Coptic. There is not known any book extant in the Coptic, except translations of the Holy Scriptures or of ecclesiastical offices; or others that have relation to these, as dictionaries, &c.

Dr. Woide, who began his Coptic studies at Leyden, and was assisted in them by Saholtz, the editor of La Croze's Coptic lexicon, returned his obligations by the services which he rendered to him in that publication. He superintended the impression of the abridgement of it, which was published at Oxford, and there applied himself to the study of the Sahidic dialect, or that of the Upper Egypt. In 1778, he published the celebrated Coptic and Sahidic grammar of Saholtz, under the following title: "CHRIS. SAHOLTZ Grammatica Egypti utriusque Dialecti, quam breviorit, illustravit, edidit C. G. WOIDE." An excellent Coptic grammar was also published at Parma, in 1783, under the title, "*Didymi Taurinensis Liturae Coptica Rudimentum.*"

COPTIC, or COPTIC Bible. See **COPTIC BIBLES.**

COPTIC Liturgies are three; one attributed to Basil; another to St. Gregory, and the third to Cyril: they are translated into Arabic for the use of the priests and people.

COPTOS, in Geography. See **COPTOS.**

COPIA CLAUDIA AUGUSTA COLONIA, a name given to the modern Lyons.

COPIA Cornu. See **CORNUCOPIA.**

COPIA libelli deliberanda, in Law, a writ that lay where a man could not get the copy of a libel at the hand of a judge ecclesiastical, to have the same delivered to him. Reg. Orig. 51.

COPIÆ, in Ancient Geography, a town of Italy, in the gulf of Tarentum; called also *Sylaris*.

COPIÆ Militares, military forces, a military body instituted particularly by Augustus, for the defence of the Roman empire. It was divided into three classes or descriptions. The first, called *copiæ classicae*, was destined to defend the seas and rivers against the incursions of pirates, and to protect navigation; the second, called *copiæ provinciales*, defended the frontiers, and encamped or sojourned in the frontier towns, as necessity or occasion required; and the third, called *copiæ urbanae*, remained at Rome, as a guard for the capital, and also for the emperor, in case of need.

COPIÆ Provinciales. See **COPIÆ Militares.**

COPIÆ Urbanae. See **COPIÆ Militares.**

COPIAPO, in Geography, one of the thirteen provinces into which the kingdom of Chili in South America is divided. It is situated in the most northern part of the kingdom, and is one of the richest metallic countries in the world. In this province are two mountains entirely composed of crystallized sulphur, so pure that there is no occasion for refining it. It has also mines of gold, silver, iron, copper, and lead. The whole soil is impregnated with sal-gem; and salt-petre is common. It furnishes also turquoises, that is, teeth or bone coloured green by metallic vapours. In this province and that of Coquimbo little rain falls; and earthquakes are seldom known in either of them. It has two ports; one of the same name, and another which lies 30 leagues further to the south, and consists only of a few huts.

COPIAPO, a town of Chili, in the fore-mentioned province, to which it gives name; situated about 12 leagues from the sea-coast, very irregularly built, but containing between three and four hundred families. S. lat. 26° 50'. W. long. 70° 18'.

COPIAPO, a river of S. America, in Chili, which runs into the Pacific Ocean, a little to the north of the town of Copiapo.

COPIATA, under the Western Empire, a grave-digger. In the first ages of the church, there were clerks destined for this employment. In the year 357, Constantine made a law in favour of the priests *copiatae*, i. e. of those who had the care of interments; whereby he exempts them from the lustral contribution which all other traders paid.

It was under him also that they first began to be called *copiatae*, q. d. clerks destined for bodily labour, from *κοπος*, of *κοπος*, *scindo, cado, serio, I cut, beat,* &c. Before that time they were called *decani* and *lecticarii*; perhaps, because they were divided by decads or tens, each whereof had a bier or litter for the carriage of the dead bodies. Their place among the clerks was the next in order before the chantors.

COPING OVER, in Carpentry, a sort of hanging over, not square to its upright, but bevelling on its under side till it end in an edge.

COPING, among Builders, signifies the top or covering of a wall. The best copings are of hewn stone, where it can readily be procured; in other situations, where large paving-bricks are made of a good and durable quality, these may with propriety be used flat for coping. Bricks of particular shapes are often made for coping, either to be used singly, or first a course of two bricks in width, to form a projection for shooting the wet off the faces of the wall, and then a half cylindrical brick for completing the coping. Several years ago, Mr. Peter Wych communicated to the Society of Arts in London (Doffie's Memoirs, vol. ii. p. 16.) a method of making a durable coping for garden walls, of a mixture of baked gypsum and coal-ashes. We lately observed on the Grand Junction Canal, that several of their bridges have been repaired, where the coping stones were broken by accidents, with Parker's Roman cement; and that others of their bridges and walls were wholly coped with this composition, which appeared little inferior to stone in hardness, and less brittle than most kinds of coping-stones are. See **CANAL.** In stony districts, where the fields are separated by rough and dry stone walls, the same are usually coped by a row of rough and triangular stones, set edgewise on the top of the wall. The cementing of these together with a little good mortar is a good practice. Where the stone is less hard or durable, these kinds of dry walls are sometimes coped with a circular ridge of good but very coarse mortar, prepared for the purpose. The practice of properly securing and

and attending to the coping of dry-built walls cannot be too much enforced, for want of which the rubbing of cattle and other accidents soon make breaches in such walls, that are very expensive to repair. In some counties, where stone is very scarce, and fuel for burning bricks very dear, garden and other walls are made of mud or tempered clay, with a mixture of chopped straw or flubble to hold them together; and such are sometimes thatched with straw, by way of coping; for both these, and the *pisé* walls, composed of dry earth rammed together in a mould, which have lately been introduced in England, must be carefully preserved from the wet by a secure coping, or they soon moulder into their original dirt.

COPLAND, in *Geography*, the name of a cluster of small islands in the north Channel, nearly opposite to Donaghadee, in the county of Down, Ireland. One of them has a few cabins upon it; and another has a light-house, which is very useful to those going to Belfast, or crossing the Channel between Donaghadee and Portpatrick. That which has the light-house on it is in W. long. $5^{\circ} 24'$. N. lat. $54^{\circ} 39'$.

COPLE, a vicarage in Bedfordshire, in Wixamtree hundred, is remarkable for being formerly the residence of sir Samuel Luke, and of Butler, the author of Hudibras, which celebrated poem is supposed to have been written at Wood-End house, in this parish. The Ouse navigation passes the northern extremity of this parish; and some years ago, a cut was made, a mile or more in length, for conveying barges up to a new house and premises, intended as a wharf, (now the Dog-ale-house;) but for want of previous consent on the part of the owner of this part of the Ouse navigation, it was not permitted to be used. See **CANAL**. The subsoil or strata in this parish is clay throughout, with lime-stone at a considerable depth beneath the surface: for a considerable width next the Ouse the clay is covered with gravel, and produces good turnip land.

COPOS, from *ωπος*, labour, in *Medical Writers*, is used for a weariness of the body, when the muscles, or their fibres rather, are loaded and obstructed with viscous humours, so as to render them unfit for motion.

COPPA, IL CAVALIER, called *Ant. Girola*, in *Biography*, an historical painter, who was born at Verona about the year 1595, and became successively the scholar of the celebrated Bolognese masters; Guido and Albano. He is considered one of the best imitators of the graceful and delicate manner of the former, although in his compositions he is sometimes too crowded; and he was ranked by his second master, Albano, amongst his most favoured disciples. He was some time painter to the court of Mantua, the churches of which city are enriched by many of his principal works. He died in the year 1665. Lanzi. Storia Pitt.

COPPA, in *Law*, a cop or cock of grass, hay, or corn, divided into titheable portions; as the tenth cock, &c. This word in strictness denotes the gathering or laying up the corn in copes or heaps, as the method is for barley or oats, &c. not bound up, that it may be the more fairly and justly tithed: and in Kent they still retain the word, a *cop* or *cop* of hay, straw, &c.

COPPARBERG, in *Geography*, one of the twenty-eight governments into which the kingdom of Sweden is divided, comprizing the province of Dalecarlia, is also called *Fahlun*, and *Gamla Copparberger*, old copper mines. It is a large, populous mine town, situated between two lakes and two mountains; 36 miles W. of Geste, 24 N.E. of Hedemora, in N. lat. $60^{\circ} 36'$. The streets are regular, but the houses are all of wood, except the town's hall and two churches, the roofs of which are covered with copper. It is the six-

teenth among the towns that vote in the Swedish diet. The governor resides at *Noor*, a royal manor near the town. The famous copper mine, which Gultavus Adolphus used to call the Swedish exchequer, lies a little to the west. It has been worked one thousand years, and its copper is still reckoned the best in Europe. From 1633 to 1761 it yielded 1,180,724 Swedish shippounds. Its greatest produce was in the year 1650, when it gave 20,321 shippounds. Since the year 1780, it yields nearly 6000 shippounds annually; but the expences increase in proportion, as the miners must go to a greater depth. In 1801, the mine was said to be 1080 feet deep, and to give employment to 1200 workmen. The copper is found in large masses. *Catteau Tableau de la Suede*. Schlözer's Briefwechsel.

COPPAY, one of the small western islands of Scotland; 2 miles W. from the S.W. extremity of the island of Lewis.

COPEL, **COPEL**, or **CUPPEL**, in *Chemistry*. See **CUPPELL**.

COPELLING. See **CUPPELLATION**.

COPPENBRUGGE, in *Geography*, a town of Germany, in the circle of Westphalia, and county of Spiegelberg; 19 miles S.W. of Hanover.

COPPER, *Kupper*, Germ. *Cuivre*, Fr. *Cuprum*, *Act.* Lat. *Venus*, *Aelchem*.

Copper is a ductile and malleable metal, of a pale yellowish red colour. It is soluble in most acids, and is precipitable from them in the metallic state, by iron or zinc: its oxyd is soluble in ammonia, to which it communicates a bright blue purple colour.

§ 1. Ores of Copper.

Sp. 1. Native copper. *Gedigen Kupper*. *Cuivre natif*. Its colour is a clear copper-red, often tarnished, externally yellowish, blackish, or whitish.

It occurs in mass, disseminated, in leaves and grains, also capillary, moss-like, dendritical and crystallized. The regular forms that it presents, are the cube, the octohedron, and the pyramidal dodecahedron often with a short six-sided prism interposed.

The crystals are small, and generally implanted in each other, forming clustered masses. Its lustre internally is glistening and metallic; its fracture is hacky: when cut or rubbed, it acquires a high metallic lustre. It is not very hard, is malleable and flexible, but not elastic, is tough and difficultly frangible. Sp. gr. 7.72.—8.58.

It is fusible before the blow-pipe, and appears to be pure copper.

It occurs in veins and beds in various primitive and secondary mountains, accompanied by many of the other ores of copper, also by galena, horn silver, native silver, calcareous, heavy, and fluor spars.

It is very extensively, but not very abundantly, diffused; the largest masses appear to be procured from the copper mine river, within the arctic circle in North America; it is also of frequent occurrence in Japan and Brazil, in Siberia, Hungary, Norway, Sweden, Saxony, and Cornwall.

Sp. 2. Vitreous copper. *Kupperglas*. *Cuivre vitreux*.

Its colour is dark lead-grey, passing into blackish-grey; it is often covered superficially by a steel-coloured tawny. It occurs in mass, disseminated or crystallized. The forms of its crystals are the cube, the octohedron, and a hexahedral prism, sometimes terminated by trilateral summits. The crystals are small; externally they are shining, internally they exhibit a glistening metallic lustre. The fracture is fine-grained, uneven, passing into conchoidal. It gives a thin

C O P P E R.

shining streak, is blackish when pulverized; is somewhat brittle, and easily frangible. Sp. gr. 4.1.—5.4.

It effervesces with nitrous acid, and when exposed to the blow-pipe, gives a metallic button of a steel-grey colour, and generally attractible by the magnet.

When pure, it appears to be a simple sulphuret of copper, consisting, according to Chenevix, of

81	Copper
19	Sulphur
<hr/>	
100	

It is generally however mixed with iron in the proportion of iron 3 to 6 per cent. A specimen from Siberia was analyzed by Klaproth, and afforded

78.5	Copper
18.5	Sulphur
2.25	Iron
0.75	Silex
<hr/>	
100.	

It occurs in veins and beds in primitive and secondary mountains, accompanied by copper pyrites, and other ores of this metal. It is not very abundant, but is found in various places, especially Cornwall, Hungary, Saxony, Norway, and Siberia.

Sp. 3. Variegated copper. *Buntkuppererz.*

Its colour is intermediate between copper-red, and Tombac brown; by exposure to the air it acquires a superficial tarnish, which is first reddish, then violet, afterwards blue, and lastly green. It occurs in masses, disseminated, superficial, or crystallized in octohedrons. Internally it is shining, with a metallic lustre. Its fracture is small, and imperfectly conchoidal, passing into fine-grained, uneven. It takes a polish by friction, and gives a reddish coloured streak. It is soft, somewhat brittle, and easily frangible. Sp. gr. 4.9-5.4.

It effervesces with nitrous acid, and melts readily before the blow-pipe, without vapour or odour. Two specimens, the one from Hitterdahl in Norway, and the other from Rudelitadt in Siberia, have been analyzed by Klaproth, with the following results.

Hitt.	Rud.
69.5	58. Copper
19.	19. Sulphur
7.5	18. Iron
4.	5. Oxygen
<hr/>	
100.	100.

This ore occurs in beds, veins, and disseminated through rocks, for the most part belonging to the class of primitive. It is usually accompanied by vitreous copper, and copper pyrites. It is found in Cornwall, in Hungary, Saxony, Norway, and Sweden.

Sp. 4. Copper pyrites. *Kupperkies. Pyrite cuivreuse.*

Its colour is deep brass-yellow, passing into gold-yellow. Its surface is often iridescently tarnished. It occurs in masses, disseminated, superficial, stalactical, clustered, reniform and crystallized in tetrahedrons, and the derivative octohedron, and dodecahedron. The crystals are usually very small and imperfect. The surface of the crystals is smooth and shining; that of the other varieties is rough and glimmering. The fracture is coarse or fine-grained, uneven, passing into conchoidal, and imperfectly foliated. It is

brittle, and with difficulty gives a few feeble sparks with the steel; it may be readily cut by a knife. Sp. gr. 4.—4.1.

When exposed to the blow-pipe on charcoal, it decrepitates, emits a sulphureous vapour, and melts into a black globule, which, by further application of the heat, acquires the colour and lustre of copper. It does not appear that the crystallized varieties of this ore have been regularly analyzed, and the proportion of its constituent parts cannot be estimated from the other varieties, on account of the iron pyrites, with which they are always more or less mixed. A specimen analyzed by Lampadius afforded

41.	Copper
17.1	Iron
45.1	Sulphur
<hr/>	
103.2	

The richer this ore is in copper, the softer it is, and its colour approaches the more to that of gold. It seldom, however, in the large way, affords more than 20 per cent. of copper. It may readily be distinguished from iron pyrites (the only substance with which it is likely to be confounded) by the pale brass yellow colour, and superior hardness of the latter.

Copper pyrites is the most abundant, and most generally diffused of any of the ores of this metal. It occurs in veins and beds in primitive, transition, and secondary rocks, in most countries of the world.

Sp. 5. White copper. *Weiss Kuppererz. Mine de cuivre blanche.*

Its colour is intermediate between silver-white and brass-yellow. It occurs in masses or disseminated. Internally it has a slight metallic lustre. Its fracture is small, and fine-grained uneven. It yields readily to the knife, is brittle, and easily frangible. Sp. gr. 4.5.

Before the blow-pipe it yields a white smoky, and an arsenical odour, and melts into a blackish slag. According to Henckel it yields about 40 per cent. of copper, the rest being iron, arsenic, and sulphur.

It occurs in veins and beds, in primitive mountains, and is generally accompanied by copper pyrites and vitreous copper.

It is found in Cornwall, Saxony, Silesia, Hungary, Siberia, and Chili in South America.

Sp. 6. Grey copper. *Fahlerz. Cuivre gris.*

Its usual colour is steel-grey, which passes into iron-black and lead-grey; some varieties incline towards yellow and others again present superficial iridescent colours. It occurs in masses, disseminated or investing, or crystallized in regular tetrahedrons and their modifications. The crystals are small, with shining surfaces. Internally it is glitening, or shining with a metallic lustre. The fracture is coarse, and small-grained, uneven, inclining to imperfectly conchoidal. It gives a black or reddish-brown powder. It is moderately hard, brittle, and easily frangible. Sp. gr. 4.46.—4.36.

The only necessary ingredients of this species (as appears from an analysis by Chenevix; of the crystallized variety) appear to be copper, iron, and sulphur in the following proportions, viz.

52	Copper
33	Iron
14	Sulphur
<hr/>	
99.	

The uncrystallized varieties, however, generally contain also antimony, silver, and lead, but in very variable proportions.

tions. In several varieties from Germany, Mr. Chenevix found antimony varying in proportion from 5 to 38 per cent. but neither lead nor silver. Two specimens, the one from Andreasberg, and the other from Crannitz, have been analyzed by Klaproth with the following results.

Copper	31.36	16
Iron	3.3	17
Sulphur	11.5	10
Antimony	34.09	16
Silver	14.77	2.25
Lead	0.	34.
Silex	0.	2.5
<hr/>		<hr/>
	95.02	93.75

Finally, a specimen from Piedmont has been examined by Napione, and found to consist of

Copper	29.3
Iron	12.1
Sulphur	12.7
Antimony	36.9
Silver	0.7
Arsenic	4.
Alumina	1.1
<hr/>	
	96.8

Those specimens that give a reddish-brown streak, are generally the most abundant in silver.

It occurs in veins in slate, and some other of the newest primitive rocks, and in beds in the transition and floetz rocks. It is accompanied by copper pyrites, galena, manganese, spathose iron, and rarely by malachite. When it contains a notable proportion of silver, it is considered and worked as an ore of this metal.

It is found in Cornwall, and in the county of Ayr in Scotland; also in Bohemia, Hungary, Transylvania, Saxony, Hesse, the Hartz, France, Spain, Piedmont, Sweden, Norway, Siberia, and Chili.

Sp. 7. Black copper. *Kupferblauwartz. Cuivre noir.*

Its colour is intermediate, between bluish and brownish black. It occurs in masses, disseminated or inveiling. It is composed of dull moderately cohering particles. It is friable, slightly soils the fingers, is meagre to the feel, and heavy.

Before the blow-pipe it emits a sulphureous odour, and melts into a slag that colours borax green. It has not been regularly analyzed, but is said to contain from 40 to 50 per cent. of copper.

It occurs with other ores of copper, particularly copper pyrites, malachite, mountain green, and vitreous copper.

It is found of remarkable beauty, at Kupperberg, in Sillesia, also in Saxony, Hungary, Norway, and Siberia.

Sp. 8. Ruby copper. *Roth. Kuppererz. Cuivre oxyde rouge.*

Of this species, there are the three following varieties.

Var. 1. Lamellar.

Its colour is dark cochineal red, inclining sometimes to lead grey; when crystallized it is often of a full carmine red. It occurs in masses, disseminated and crystallized in cubes, and aluminiform octohedrons. The crystals are small, and for the most part laterally aggregated: their surfaces are smooth and shining. Its internal lustre is more or less shining, and is intermediate between metallic and adamantine. Its fracture is imperfectly foliated, passing into granular uneven. When in masses it is usually opaque, or at most translucent on the edges; the

crystals are transparent, verging into translucent. It gives a brownish brick-red streak, is moderately hard, brittle, and easily frangible. Sp. gr. 3.95.

By exposure to the blow-pipe on charcoal, it is easily reducible to a metallic bead, without emitting either odour, or smoke. It dissolves in the nitrous and muriatic acids, in the former with, and in the latter without, effervescence. According to Mr. Chenevix, it consists of

88.5	Copper
11.5	Oxygen
<hr/>	
100.	

It is met with chiefly in veins, and appears to be peculiar to primitive mountains. It is accompanied by native copper and other ores of this metal. It is found in Cornwall, in Hungary, Saxony, the Hartz, Siberia, Peru, and Chili.

Var. 2. Capillary.

This variety differs from the preceding in being of a somewhat lighter colour, superior lustre, and being composed of small capillary crystals and thin flakes.

Var. 3. Compact.

It occurs in masses and disseminated, but never crystallized. Its internal lustre is glimmering, semi-metallic: its fracture is even; and it is opaque. In other respects it agrees with var. 1.

Sp. 9. Tile-red copper. *Ziegelerz.*

This species presents two varieties, indurated and earthy.

Var. 1. Indurated.

Its colour is intermediate between hyacinth and brownish-red, passing on the one hand into lead-grey, and on the other into reddish-brown. It occurs massive and disseminated. The reddish kind has a glimmering lustre and flat conchoidal fracture; the browner kind has a somewhat resinous lustre and a small conchoidal fracture. It acquires a lustre by friction, is moderately hard and brittle.

When exposed to the blow-pipe it becomes black, and is infusible without addition. Borax is tinged by it of a dirty green. It appears to be an intimate mixture of compact ruby copper with brown iron ochre, and its produce of copper varies from 10 to 50 per cent.

It occurs in veins with ruby copper, malachite, copper pyrites, and iron ochre.

Var. 2. Earthy.

Its colour is hyacinth-red, passing into reddish or yellowish brown. Its texture is between friable and solid. It occurs in masses, disseminated, and inveiling copper pyrites. It is without lustre, has an earthy fracture, and slightly soils the fingers. In its other characters it agrees with the preceding variety.

Sp. 10. Mountain blue. *Kupperlazar. Cuivre carbonate bleu.*

Of this there are the two following varieties.

Var. 1. Radiated.

Its principal colour is sky-blue, which passes into Prussian and indigo-blue. It occurs in masses, disseminated or inveiling, more frequently botryoidal, stalactitic, and cellular, but most frequently crystallized in oblique rhomboidal prisms or octohedral prisms with dihedral summits. The crystals are generally very small and aggregated into globular masses or bundles. The crystallized varieties are externally shining, but the rest are dull. Internally it is shining or glittering, with a lustre between vitreous and resinous. Its fracture is straight or divergingly radiated, rarely lamellar. The crystals are translucent and semi-transparent; the other varieties are

are opaque, or at most translucent on the edges. When pulverized it is of a sky-blue colour. It is soft, brittle, and easily frangible. Sp. g. 3.2.—3.4.

It is very difficult of fusion before the blow-pipe, *per se*; but with borax it gives a bright green glass, and a metallic globule.

According to Pelletier it consists of

66	to	70	Copper
18	—	20	Carbonic acid
8	—	10	Oxygen
2	—	—	Water

Var. 2. Earthy.

Its colour is small-blue: it occurs rarely in mass, generally disseminated or superficial: it is composed of fine pulverulent cohering dull particles. Its fracture is fine-grained earthy, passing into even and imperfectly conchoidal. It is opaque, slightly stains the fingers, and is easily frangible.

Before the blow-pipe it becomes black, but does not melt. In borax it dissolves with great ebullition, and forms a green glass.

Mountain-green occurs in the newer primitive rocks, but more commonly in floetz mountains. It accompanies other ores of copper, especially malachite, grey copper, and copper pyrites. The most beautiful specimens come from the Bannat in Hungary, and from Siberia. In the Tyrol it is found in sufficient plenty to be manufactured into the pigment called mountain-blue.

Sp. 11. Malachite.

Of this there are the two following varieties.

Var. 1. Fibrous.

Its common colour is grass-green passing into emerald-green, and sometimes into dark leek-green. It seldom occurs massive or disseminated, but generally investing, and often crystallized in short capillary needles, disposed in divergent bundles, or fans. Externally they are shining, but internally only glistening with a silky lustre. Its fracture is delicate, diverging fibrous, passing into coarse fibrous. It is opaque or translucent on the edges; the crystals are for the most part translucent. When pulverized it retains its colour, only the tint is somewhat lighter. It is very soft, brittle, and easily frangible. Sp. gr. 3.5.

It effervesces with acids, and forms a blue solution with ammonia. Before the blow-pipe it blackens and decrepitates, but is infusible, *per se*. With borax it melts into a green glass. Its constituent parts, according to Klaproth, are

58	Copper
18	Oxygen
12.5	Carbonic acid
11.5	Water

100

It occurs usually in the newer primitive and floetz mountains, accompanied by other ores of copper, also by carbonate of lead, calcareous spar, brown spar, and quartz. The finest specimens of this variety of malachite are found in the Siberian and Hungarian mines; it occurs also in Saxony and other mining districts in Germany, in Norway, and in Shetland, and the counties of Cornwall and Derby in Britain.

Var. 2. Compact.

Its colour is emerald-green passing into grass and verdegris-green, the same specimen exhibiting different shades of colour: its external surface is commonly overpread with a greenish-white crust. It occurs massive and disseminated, but most frequently reniform, botryoidal, mammillated, stalactitic, or globular. Externally it is rough and dull; inter-

nally it is, according to the fracture, either dull, glistening, or shining. Its fracture is conchoidal, or fine-granular uneven, or minutely fibrous. It generally occurs in thin lamellar concentric distinct concretions, each of which has usually a different shade of colour. It is opaque, soft, brittle, and easily frangible. Sp. gr. 3.5.—3.6.

Its chemical characters and component parts are nearly the same as those of the preceding variety, with which it also agrees in its geognostic and geographical situation.

Its beautiful colour, lustre, and the high polish that it is capable of receiving, render it much sought after for various ornamental purposes: it would however be much more esteemed if it was harder.

Sp. 12. Mountain-green. *Kuppergrün. Vert de cuivre.*

Its colour is verdegris-green, passing occasionally into emerald-green and sky-blue. It occurs in mass, disseminated or investing. Internally it is shining passing into glittering, with a resinous lustre. Its fracture is small conchoidal. It is translucent and semi-transparent; is soft and easily frangible.

Its chief chemical character is that of giving little or no effervescence, while dissolving in acids. It has not been analyzed. It is found in similar situations with malachite, but is of much rarer occurrence.

Sp. 13. Emerald copper. *Kupperfermaragd. Diopstafel Haüy.*

Its colour is emerald-green. It occurs crystallized in lengthened dodecahedrons. It is shining both externally and internally, and has a vitreous lustre. It is translucent, passing to semi-transparent; scratches glass feebly, and with difficulty; is brittle. Sp. gr. 3.3.

Before the blow-pipe it becomes of a chestnut-brown colour, and is infusible, *per se*. With borax it gives a bead of copper. According to an analysis by Vauquelin it consists of

25.57	Oxyd of copper
42.85	Carbonat of lime
28.57	Silex

96.99

It has hitherto been found only in Daouria on the Russian and Chinese frontiers in a vein accompanied by malachite.

Sp. 14. Micaceous copper. *Kupperglimmer.*

Its colour is deep emerald-green passing to verdegris-green. It occurs massive, disseminated, and crystallized in hexahedral tables. Externally it is smooth and shining with a pearly lustre. Its fracture is foliated. It is translucent passing into semi-transparent. It is softer than calcareous spar. Sp. gr. 2.54.

It decrepitates strongly when suddenly heated, and is composed, according to Chenevix, of

58	Oxyd of copper
21	Arsenic acid
21	Water

100

It is found in Huel Gorland mine in Cornwall, in veins accompanied by vitreous copper, copper pyrites, arsenical pyrites, and iron ochre.

Sp. 15. Octohedral arseniat of copper. *Linsenerz* of Werner.

Its colour is deep sky-blue, passing into Prussian-blue, bluish-white, apple-green, and grass-green. It occurs in obtuse pyramidal octohedrons. The crystals are small and aggregated into clusters; they have a shining vitreous lustre, and

and a lamellar fracture, are semi-transparent passing into transparent. In hardness they are inferior to fluor spar. Sp. gr. 2.88.

It is composed, according to Chenevix, of

49	Oxyd of copper
14	Arsenic acid
35	Water
<hr/>	
98	

It is found in the same mine as the preceding species.

Sp. 16. Foliated arseniat of copper. *Blatriges olivenerz* of Werner.

Its colour is olive-green, passing to oil and leek-green. It occurs rarely massive, and generally crystallized in acute rhomboids and oblique quadrilateral prisms. The surfaces of the crystals are smooth and shining. Internally it is glistening and shining, with a diamond lustre. Its fracture is imperfectly foliated. It is translucent passing into transparent. It is somewhat harder than calcareous spar. Its component parts, according to Chenevix, are,

54	Oxyd of copper
30	Arsenic acid
16	Water

100

It is found in the same mine with Sp. 14.

Sp. 17. Fibrous arseniat of copper. *Fafriges olivenerz*. Werner.

Its colour is brownish, or dark bottle-green, passing into yellowish; when capillary it is of a lighter and brighter colour. It occurs crystallized in an irregular acute octohedron, or a long compressed hexahedral prism, or capillary. Sometimes the crystals are regular at one extremity, and terminate in capillary brushes at the other. The crystals are small and laterally aggregated. It has a considerable lustre between vitreous and resinous, is translucent passing to transparent; is harder than fluor spar, but will not scratch glass. Sp. gr. 4.28. It passes into the two following varieties.

1. Amianthiform.

Its colour varies from blueish-green to grass-green, brown-green, straw-yellow, and white. It occurs in extremely minute parallel, or diverging flexible fibres, or thin dusky flexible laminae, with more or less of a fatty lustre.

2. Hematitiform.

Its colour is brownish or whitish-yellow. It occurs in flat or lamellated layers, either smooth or varied with small rough crystalline points.

Its texture is fibrous but very compact, resembling wood-tin.

The above species, with its varieties, has been analyzed by Mr. Chenevix, with the following result:

Prismatic.	Capillary.	Hematif.	
60.	54.	50.	Oxyd of copper
39.7	29.	29.	Arsenic acid
0.	18.	27.	Water
<hr/>			
99.7	98.	100.	

It is found in Huel Gorland mine, in Cornwall.

Sp. 18. Phosphat of copper.

Its colour is, externally, greyish-black; internally, between emerald and verdegis-green. It occurs in mass, disseminated and crystallized in rhomboids. The crystals are small and very small; their lustre is externally vitreous

and shining. Internally, it is glistening with a silky lustre. Its fracture is fine and diverging fibrous. It is opaque, and moderately hard. It conffils, according to Klaproth, of

68.13	Oxyd of copper
30.95	Phosphoric acid
<hr/>	
99.08	

It has hitherto been found only at Firneberg in Cologne, in white drusy quartz.

Sp. 19. Sandy copper. *Saltzkypererz*. Werner.

Its colour is emerald-green, passing into leek and olive-green. It occurs massive, disseminated, and crystallized in extremely minute six or four-sided prisms. The surface of the crystals is smooth and brilliant, and their fracture lamellar. The massive variety is opaque; the crystals are transparent. It is soft and easily frangible. Sp. gr. 4.43.

Before the blow-pipe on charcoal, it tinges the flame of a bright green and blue colour, and a metallic globule remains behind. It is soluble in nitrous acid, without effervescence. The following are its constituent parts, according to Prout and Klaproth.

Prout.		Klaproth.
From Peru.	Chili.	Chili.
76.595	70.482	73.
10.038	11.416	10.1
12.797	18.072	16.9
<hr/>		
100.	100.	100.

It is found loose in the bed of a river at Kernolinos, in Chili, and elsewhere, though rarely in Spanish South America.

§ 2. Assay and Analysis.

The assay of copper ores, (though by no means so accurate a method of ascertaining their metallic contents as a regular analysis) being the method by which the market price of the ore is always determined, requires the first notice. The best method, upon the whole, of conducting it, is as follows.

First, expose a small piece of the ore, under examination, to the action of the blow-pipe, and by the appearance and odour of the vapour given out, it is easy to discover whether it contains any arsenic or sulphur. It may very probably contain both, in which case, take 300 grains of the ore coarsely pulverized, mix it with half its weight of saw-dust, and keep it at a moderate red heat in an earthen crucible, till the disengagement of arsenical vapour entirely ceases. Then pour the contents of the crucible into an iron mortar, and reduce them carefully to a fine powder. Transfer this powder to a teli, and expose it to a good red heat, with occasional stirring, till both the charcoal and sulphur are burnt off. The residue is then to be accurately mixed with $\frac{1}{2}$ of its weight of lamp-black, half its weight of pulverized glass of borax, and a drop or two of oil; the mass thus formed, is to be put into a found earthen crucible, a cover is to be luted on, and the whole is to be placed in a good wind furnace. The heat should be moderate for the first quarter of an hour, to allow the borax time to combine with the earthy impurities of the ore; then a moderate white heat is to be applied for about twenty minutes. After this, the crucible being withdrawn and cooled, is to be carefully

fully broken, and will be found to contain a button of copper, covered by vitreous scum. The purity of the copper thus procured, is to be estimated from its colour, softness, malleability, and tenacity; after which, a part of it may be cupelled with pure lead, in order to ascertain whether it holds any silver or gold. If the ore contains sulphur, but no arsenic, it may be mixed with half its weight of charcoal, and roasted on a test, without being previously heated in the crucible. If the ore contains neither sulphur nor arsenic, it should be first moderately ignited in a covered crucible, to drive off any moisture, and may then be treated with borax and lamp black, as already described.

The proper analysis, by means of liquid menstrua, is however much more accurate than even the most carefully conducted assay, and the general mode of proceeding with the ores of copper is, upon the whole, very simple. The copper, together with the other metals with which it may happen to be mixed, is to be separated from the flux and sulphur, by means of an acid, the other metals are then to be got rid of by their appropriate reagents, and the copper is then to be procured either in the state of green carbonate, of black oxyd, or of pure metal: of the first, 180 parts are equivalent to 100 of metallic copper; and of the second, 100 parts contain 80 of metal.

Previously to undertaking an analysis, a part of the specimen, under examination, should be subjected to the usual reagents, in order to ascertain not indeed the proportion, but the nature of the ingredients of which it consists; and, in few cases is this more necessary than in the analysis of the ores of copper, both as they are so numerous and so various in their composition. This previous examination being duly performed, the analysis may be conducted in the following manner:

For the analysis of the *pyritical*, and other *sulphurized* ores of copper, provided they contain neither silver nor lead, take 200 grains of the pulverized ore, and digest it at a boiling heat with muriatic acid, (adding occasionally a few drops of nitric acid) till every thing soluble in this menstruum is taken up. Of the insoluble portion, a part, consisting chiefly of sulphur, will be found floating on the liquor; and this being washed, dried, and weighed, is to be ignited on a test, by which the sulphur will be burnt off, and its amount may be estimated from the loss of weight sustained by the process. The incombustible residue is to be digested in a little warm muriatic acid, and what remains insoluble, is to be added to the other insoluble residue. The muriatic solutions being mixed together, the whole is to be decomposed by carbonated potash, and the precipitate, hence resulting, is to be digested in repeated portions of caustic ammonia, as long as this latter acquires any blue tinge. The whole of the copper, and nothing else, will thus be taken up by the ammonia, from which it may be obtained in the state of black oxyd, by the addition of a little caustic potash, and a boiling heat. The residue, insoluble in ammonia, consists of oxyd of iron, with perhaps a little alumine, which may be separated by caustic potash, the alumine alone being soluble in this fluid. Finally, the portion insoluble in muriatic acid, may be considered as little else than flux.

The ores which, besides copper, sulphur, and iron, contain silver, lead, and antimony, may be thus analyzed. The ore, reduced to fine powder, is to be repeatedly digested with moderately diluted nitric acid, as long as any thing continues to be taken up by this menstruum. To the nitric solution as then to be added muriat of soda, which will throw down

the silver in the state of luna cornea; this being separated, the lead is to be precipitated in the form of sulphat, by sulphat of soda; the solution is now to be supersaturated with ammonia, which will dissolve the copper, and save behind the oxyd of iron, with probably a little alumine and flux. The copper is to be procured from the ammoniacal solution, in the manner directed in the preceding paragraph; and the oxyd of iron may be separated from the admixed earths, by caustic potash. That portion of ore, insoluble in nitric acid, is to be digested in muriatic acid, which will take up every thing except the sulphur, flux, and probably a little luna cornea. Of this insoluble residue, the sulphur is to be burnt off by gentle ignition, and the remainder is to be fused with twice its weight of pearl ash, by which the silver in the luna cornea will be reduced to the metallic state. The muriatic solution being concentrated by evaporation, and then poured into a considerable quantity of water, will deposit the antimony in the form of a white oxyd.

The simple oxyds of copper, are best analyzed by digestion in nitric acid, and then supersaturating the solution with ammonia, by which any casual admixture of iron will be separated.

The carbonats of copper are to be thus treated. One portion is to be gently calcined in a covered crucible, and the loss of weight sustained, indicates the united amount of the water and carbonic acid. A second portion is to be thrown into a known quantity of dilute sulphuric acid, and the loss of weight, by the effervescence which ensues, shows the amount of carbonic acid. The sulphat of copper thus obtained, may be subsequently decomposed, either by a stick of zinc, or by liquid ammonia.

The arseniats of copper are most conveniently analyzed by first moderately heating them, in order to drive off and thus estimate the water, and then digesting the residue in dilute nitric acid, by which it will be entirely dissolved; nitrat of lead is then to be dropped in as long as it occasions any precipitate, and this latter being removed, the fluid is to be evaporated nearly to dryness, after which, warm alcohol is to be added, which will take up the whole, except a white powder; this powder, and the precipitate on the addition of nitrated lead, are arseniat of lead. 33.66 per cent. of which is arsenic acid. The alcoholic solution is then to be evaporated nearly to dryness, and then to be digested with ammonia, which will take up the copper, leaving behind any oxyd of iron that may have happened to be contained in the ore. The ammoniuret of copper, being decomposed by caustic potash, gives the copper in the state of black oxyd, which is that in which it exists in the ore.

The analysis of *muriat of copper* is very simple. It was thus effected by Klaproth. The ore, being pulverized, was dissolved in cold nitric acid, with the exception of 1.5 per cent. of oxyd of iron; the solution being then diluted, nitrat of silver was added, till it occasioned no further precipitate; the luna cornea thus obtained, indicated, according to the known proportions of this salt, the amount of muriatic acid in the ore. The nitrous solution was then decomposed, and the copper obtained in the metallic form, by means of a bar of iron.

Phosphat of copper was thus analyzed by Klaproth. On digestion in nitric acid, the whole was taken up except a few grains of quartz; the excess of acid in the solution was then saturated by potash, and acetite of lead was poured in till it had quite ceased to occasion any precipitate; the phosphat of lead, thus obtained, was separated from the solution, and sulphat of soda was added to decompose and precipitate

precipitate the small excess of acetite of lead which had been made use of. A little sulphuric acid was then added to the solution, and the copper was precipitated in the usual way, by means of a bar of iron.

§ 3. Reduction of Ores.

The only ores of copper that are in fact wrought in the large way, and from which the copper of commerce is for the most part supplied, are the sulphureous and arsenical or s of this metal. The method of reducing them, though consisting of a great number of processes, on account of the powerful affinity, both of the arsenic and sulphur, is yet upon the whole very simple, being little more than repeated roastings and fusions, till the metal has acquired the necessary ductility, for it is never brought to a state of absolute purity, and the common sorts contain both arsenic and antimony, in such proportions, as to be wholly unfit for alloying with either gold or silver.

The rough ore, if simply sulphureous, is broken into pieces not larger than an egg, and separated as much as possible from the adhering earthy impurities; after which, it is piled in large kilns, and heat being applied at the bottom, the whole mass becomes gradually heated, and a large portion of the sulphur sublimes out, and may be either collected by proper flues, or allowed to escape; this first process occupies about six months, at the expiration of which time, the evaporation of the sulphur ceases, and when the ore has cooled sufficiently, it is in a fit state to be smelted.

If, however, the ore is largely combined with arsenic, it is not capable of keeping up a long combustion of itself, nor is the heat thus generated adequate to the expulsion of the arsenic; a somewhat different method, therefore, of roasting must be had recourse to. For this purpose the ore is still more carefully dressed than in the former case, and is reduced to pieces not larger than a hazel-nut. It is then spread on the floor of a large reverberatory furnace, and exposed to a dull red heat, with frequent stirring, in order to offer fresh surfaces to the action of the flame. The arsenic and sulphur by this treatment are rapidly driven off, and in about twelve hours the roasting is completed.

The ore is now transferred into the fusing furnace, which is a reverberatory of the common construction; a little bruised lime-stone is generally added by way of flux, and in the course of four or five hours the fusion is usually complete; the slag, now of the consistence of soft dough, is raked off, and the copper is discharged through a plug-hole into water, by which it is reduced into small drops or grains.

The copper, however, though in the metallic state, is still very impure, being largely mixed with sulphur and arsenic, which give it a grey colour, and render it perfectly brittle. In order to separate these impurities, it is re-melted and granulated twice more or oftener, a considerable quantity of slag being separated at each fusion; but as this slag contains some copper it is not thrown away, but worked over again with the next charge of calcined ore. The number of fusions and granulations entirely depend on the quantity of impurities, and the obstinacy with which they combine with the copper; but when these processes have been repeated the requisite number of times, the granulated mass is melted and cast into pigs. These again are broken to pieces, and roasted for one or two days in a low red heat, and again melted and roasted several times, till the metal approaches to the state of malleable copper. It is now cast into oblong masses, about 14 inches in length, and is fit for the refining furnace. In this it is again melted, with the addition of a

little charcoal, till it acquires the necessary degree of malleability, and thus becomes saleable copper.

Sometimes lead is employed with good effect in the refining of copper, as it combines with, and scorifies iron, and the other easily oxydable metals in preference to copper. For this purpose the rough copper is spread on the floor of a furnace, and when it is in complete fusion, about 6 or 8 per cent. of lead is thrown in, and well mixed with the rest. In a short time the surface of the melted metal becomes covered with a semi-viscous blackish brown scoria, consisting of the mixed oxyds of lead, iron, and other impurities, together with a little copper. The first scoria being removed, a second is formed, which is in like manner summed off, and so on successively, till, after ten or twelve hours, the copper is sufficiently purified: this is ascertained by the thinness of the film with which the melted copper is covered, and by its being of a brick-red colour, also by the circumstance that if a rod of polished iron is dipped into the fused mass the portion of copper that adheres to it immediately falls off when the rod is dipped in cold water.

§ 4. Chemical and Physical Properties.

The colour of copper is yel ovi red red; its hardness is superior to that of silver, but somewhat inferior to that of platinum; it is very tough, ductile, and malleable; hence it may be beaten into plates or drawn into wire of great strength and compactness. It breaks with a hackly fracture. When rubbed, it emits a disagreeable odour; to the taste it is nauseous and styptic. The specific gravity of Swedish copper, which is the purest that is met with in commerce, amounts to about 8.89: that of the common sorts does not exceed 8.6; while that of the Japanese copper, on the other hand, amounts, according to Bergmann, to 9.0.

The fusing point of copper is nearly the same as that of gold, namely, a low white heat; before it melts, changeable prismatic colours appear on its surface. When in fusion, or even at a full red heat, if exposed to the air, it is soon covered with a thin brittle plate of brownish oxyd, that readily separates from the metal when cold.

This substance is an imperfect oxyd, and was formerly called *copper ashes*, as *ullum*, or *cinis aris*, and by repeatedly heating and cooling a bar of this metal, the whole may be thus changed. These scales, according to Proust, are composed of about 62 per cent. of perfect or black oxyd, and 38 of copper nearly in the metallic state; hence, when they are digested in cold dilute sulphuric acid, only the former portion is taken up. By subsequent calcination, the scales are wholly converted into black oxyd, the weight of which is one-fourth more than that of the original copper. At a very high heat, this oxyd runs into a bright reddish-brown opaque glass.

Copper, when in high fusion, and in contact with the air, like all the other easily oxydable metals, is actually combustible; it burns with a beautiful light green flame; the same delicate tinge is visible when a little of the oxyd, or of any of the salts of this metal, is strewn on burning coals. The green flame thus produced deposits a small portion of greenish-grey pulverulent oxyd, and hence it gradually collects as a kind of soot in the chimnies of furnaces employed in smelting this metal.

Copper soon rusts in a damp air, and becomes covered with a green crust of carbonated oxyd, but this coating, by its strong adhesion to the metal beneath, long preserves it from further alteration; hence it requires a length of time, and the concurrence of circumstances peculiarly unfavourable to preservation, in order to corrode entirely a thick plate of

this metal. Water is not decomposed by copper even at a white heat.

With the exception of a few cases, that will be mentioned presently, copper appears to unite very uniformly with the same proportion of oxygen, forming (when uncombined with water and every other substance) a brownish-black oxyd, of which one-fifth, or 20 per cent., is oxygen, and the remainder copper. This oxyd is produced, as has been already mentioned, by boiling the precipitate from any of the cupreous salts by an alkali, or the ammoniuret of copper, with caustic potash or soda.

Copper, or rather its oxyd, combines with every acid, forming salts, many of which are both curious and important.

Sulphuric acid acts upon metallic copper only when concentrated and boiling hot. For this purpose take copper filings, or thin sheet copper, put it into a glass vessel with twice its weight of strong sulphuric acid, and heat the mixture. As soon as it begins to boil, much sulphureous acid gas is given out, and at length the whole dissolves into a dark-coloured liquor, which, by dilution with water, becomes of a fine blue. If common copper is used for this purpose, there always remains a black sediment, which consists for the most part of sulphuret of copper. If the pure carbonated oxyds are employed, instead of the metal, they will be found to be soluble even in cold and diluted sulphuric acid. The solution, in whichever way it is formed, deposits, by evaporation and gradual cooling, rhomboidal crystals of a deep sky-blue colour, which are sulphat of copper, the *blue* or *Roman vitriol* of the shops.

The same salt is also met with native in copper mines, partly crystallized, but more generally dissolved in the water which drains more or less into all mines. When native, it appears to be formed in consequence of the iron pyrites being first vitriolized, and the resulting sulphat of iron re-acting on the copper.

Sulphat of copper has a very strong, styptic, somewhat acidulous, and excessively nauseous taste. It is soluble in about four times its weight of water. When dried at a heat not exceeding that of boiling water, it loses, according to Proust, about 36 per cent., which is mere water, after which the residue, which is a white pulverulent mass, is again soluble and crystallizable, as at first. But if it is calcined with a strong white heat, the acid itself is expelled without undergoing decomposition, and at length there only remains black oxyd of copper, in the proportion of 32 per cent. of the original crystallized salt. Hence 100 parts of sulphat of copper consist, according to Proust, of

Copper 25.6	}	forming	}	33
Oxygen 6.4				
		Sulphuric acid	32	
		Water	36	

		100		

Bergmann's analysis of this salt nearly agrees with that of Proust in the proportion of copper (26 per cent.); but of the other ingredients he reckons 28 of water, and 46 of acid.

Besides the common sulphat, Proust describes a *sub-sulphat* of copper. This is prepared by adding to the common sulphat some caustic potash, but not sufficient entirely to decompose it. A green precipitate is in consequence deposited, which is the sub-sulphat in question. This salt loses by distillation only 14 per cent. of water. The residue, boiled

with caustic potash, gives 68 per cent. of black oxyd; hence its component parts are

Copper 54.4	}	68
Oxygen 13.6		
		Sulphuric acid 18
		Water - 14

		100

Sulphat of copper is decomposed by the alkalis, whether pure or carbonated. If either of the fixed alkalis in their caustic state is made use of, the precipitate is not, as might be supposed, a simple oxyd of copper, but that peculiar combination first discovered by Proust, and named by him *hydrat of copper*. It is thus prepared: to a cold solution of sulphat of copper add liquid potash, also cold, to complete saturation; a blue precipitate falls down, which, when thoroughly washed with boiling water, is the pure hydrat. Its consistence, when dried at a heat not exceeding 212° Fahr., is nearly that of Prussian-blue; at a somewhat higher temperature it shrinks, and is gradually converted into black oxyd, by the evaporation of its water. By dry distillation it is found to give out about 24 per cent. of water, and 1 of carbonic acid, which it probably has absorbed from the air while drying: there remain behind 75 parts of black oxyd. If this latter is again moistened with water, it does not return to the state of hydrat. Hence it appears that the hydrat is a true chemical combination of water and oxyd of copper, in the proportion of about one part of the former to three of the latter, and as such enters into the composition of the cupreous salts. The hydrat is decomposable not merely by heat, but also by boiling with either of the fixed alkalis.

Carbonic acid and oxyd of copper unite together without difficulty. This combination is found native, forming the mountain-blue, the malachite, and some of the other ores of copper. It may be prepared artificially by exposing the metal to a damp confined air, in which case it constitutes rust of copper; or more expeditiously by decomposing any of the acid salts of copper by a carbonated alkali. A copious bulky precipitate falls down, which, when well washed and gently dried, is a fine powder, of a beautiful pale apple-green colour. One hundred parts of copper dissolved in any acid, and precipitated by carbonated potash or soda, produce invariably 180 of the green carbonat, dried at a boiling-water heat. This carbonat, when distilled by itself, with a heat gradually increased to redness, gives out 10 parts of water, and 46 of carbonic acid; the black oxyd, remaining behind in the retort, amounts to 125 parts, of which 100 are copper, and 25 oxygen.

When hydrat of copper is gently heated with a solution of super-carbonated potash, a portion is dissolved, forming a greenish-blue liquor, whilst the undissolved residue becomes almost as dark in colour as the black oxyd. The solution, if slowly evaporated, yields a singular salt, consisting of 52 per cent. potash, 43 carbonic acid, and 5 oxyd of copper. It is crystallizable and slightly deliquescent. A similar salt, with a base of soda, is produced, when this latter alkali is employed instead of potash.

Copper is very readily soluble in nitric acid, even when cold and considerably diluted. Much heat is excited, and a torrent of nitrous gas given out, the liquor becoming of a bright blue colour in proportion as the copper is dissolved. The oxyds of copper are equally soluble in this acid as the metal is, but without the evolution of nitrous gas. When this solution is hastily evaporated to a certain point,

C O P P E R.

and then suffered to cool, it congeals into a deep blue saline mass, which deliquesces rapidly when exposed to the air. By a slow and careful evaporation this salt may be obtained in the form of hexahedral prisms, but equally deliquescent as the former amorphous variety. If this blue nitrat be evaporated beyond the point at which it would crystallize when cold, nitrous gas begins to be produced, and a green scaly concretion separates from the thick blue liquor. If the evaporation is here stopped, this green matter may be separated by water, either hot or cold, which dissolves only the undecomposed blue nitrat. This green substance is considered by Proust as a subnitrat of copper; that it still contains nitric acid is proved by its still giving out this acid when mixed with sulphuric acid and heated. By thorough calcination all the acid and water are expelled, and the black oxyd of copper only remains. The proportions of the subnitrat, according to the above-mentioned chemist, are

Black oxyd of copper	67
Nitric acid - -	16
Water - - -	17
	100

The blue or perfect nitrat, on the other hand, contains only 27 per cent. of black oxyd.

Nitrat of copper is very soluble in alcohol, to the flame of which it communicates a very delicate green colour.

The decomposition of this nitrat by tin is so violent as in certain cases to produce actual combustion. This forms an amusing experiment, and was, we believe, first discovered by Dr. Higgins. It is thus performed; spread out a piece of tin-foil four or five inches square, lay in the middle a small heap of the solid blue nitrat, sprinkle the salt with a few drops of water, spread over it a little tow, then double up the tin-foil round it on all sides, twisting it as tight as may be without breaking. In a short time the mass will feel burning hot, small bubbles of blue liquor will be seen oozing through, and will presently be succeeded by a copious eruption of nitrous gas, attended by minute sparks of fire and deflagration.

A fine blue pigment is prepared from nitrated copper, called *verditer* (*cesdres blues, Fr.*) It is made in quantity by the refiners, who, after the process of separating silver from gold by aquafortis, recover the silver from its solution by means of copper, and thus obtain a residue of nitrat of copper. This solution is decomposed by lime (the precise method of doing which is kept secret), and the produce being made into cakes and dried slowly constitutes the best kind of verditer.

This pigment has been analyzed by Pelletier with the following results. It was totally soluble in nitric and muriatic acids, with a copious effervescence of carbonic acid: when distilled by itself 600 hundred grains lost 200, and afforded 2 French pints of carbonic acid together with some water. The calcined residue was a black powder, which, being fused with a reducing flux, yielded a button of pure copper, amounting to about half the weight of the original verditer. A fresh parcel was then treated with sulphuric acid, which afforded sulphat of lime, the earth of which formed about 7 per cent. of the original verditer. Of the 200 grains lost by distillation, Pelletier considers 180 as carbonic acid. Hence 100 parts of verditer contain

Copper	50
Carbonic acid	30
Water -	3½
Lime -	7
	90½
Remains for oxygen	9¾
	100

But in this estimate the amount of carbonic acid is by some oversight greatly overrated. The quantity obtained from 600 grains was about 2 French pints, the weight of which, according to Lavoisier, would be only 66 grains; consequently 100 grains would yield only 11 grains of this acid. The water was obviously only estimated at random, and as the copper was in the state of hydrat, certainly amounted to much more than Pelletier has allowed for it. The corrected results of the above analysis therefore would be

Copper	50	} 83.3 Hydrat of copper
Oxygen	12.5	
Water	20.8	
Lime	7.	
Carbonic acid	11.	
	101.3	

which corresponds very closely with the quantity analyzed.

The muriatic acid dissolves copper with difficulty except when concentrated and boiling, and then hydrogen gas is given out. The oxyds, however, of this metal, and especially the green carbonat, are very readily soluble in this acid. The colour of muriat of copper when hot or highly concentrated is brown, but by dilution becomes of a grass-green. By careful evaporation and cooling it crystallizes in lengthened rhomboids, and when hastily evaporated in feathery crystals. This salt is commonly deliquescent, but when both the copper and acid are quite free from iron is permanent in the air. It is readily soluble both in water and alcohol; the latter takes up its own weight when boiling, a part of which afterwards separates in a crystalline state as the liquor cools. The composition of the crystallized salt is, according to Proust,

Black oxyd of copper	40
Muriatic acid -	24
Water - - -	36
	100

A dilute solution of muriated copper in water makes a kind of sympathetic ink, which is colourless in the cold, becomes yellow by warming, and again loses its colour on cooling. Besides the common muriat, the ingenious researches of Proust have discovered a second muriat, in which the copper appears to be at a lower state of oxydation than in the former salt. It affords a nearly colourless solution, and when solid is of a greyish white; it may therefore without impropriety be called the white muriat of copper. It is prepared from the common muriat by means of muriat of tin, a salt remarkable for the eagerness with which it absorbs oxygen from almost all the other metallic salts. If therefore some of this latter is poured into common muriat of copper, a precipitate falls down which is at first white, but by subsequent exposure to air passes through

through different shades of violet and blue to black. This precipitate is for the most part a muriated sub-oxid of copper. On exposure to a moderate heat it melts like luna cornea. If directed in warm muriatic acid it readily dissolves, and is deposited, on cooling, in the form of tetrahedral crystals. With nitrous acid some nitrous gas is given out, which shews that the metal was not previously saturated with oxygen. Another remarkable character of this white muriat is, that when dissolved in ammonia the solution is colourless, though, on exposure to the air, it gradually acquires the sky-blue colour of common ammoniac of copper. Its composition, according to Proust, is

Muriatic acid	24.75
Oxyd of tin	1.
Copper	63.
Oxygen	11.25
	—
	100.
	—

Assuming this analysis as correct, it is obvious that the copper exists in a much lower state of oxygenation in this salt than in any hitherto mentioned, for in this the oxyd of copper is composed of 63 of metal and 11.25 of oxygen, or (reduced to the hundred) of 84.84 copper, and 15.16 oxygen, whereas the black copper, to which all the common cupreous salts are reducible by loss of their acid and water, consists of 80 per cent. copper, and 20 oxygen.

There appears to be yet another state of combination of muriatic acid and oxyd of copper, also first noticed by Proust. It is the *submuriat of copper*, differing from the common muriat not by a lower degree of oxygenation in the metal, but in a smaller proportion of acid. It is produced by adding a little potash (less than required for saturation) to the green muriat. A green powder falls down, which is the submuriat in question. This salt when boiled with potash loses about 28 per cent. of its weight, and is reduced to the black oxyd. A similar submuriat is said by the same chemist to be spontaneously deposited when copper is dissolved in nitro-muriatic acid. The composition of this last is as follows:

Black oxyd of copper	79.
Muriatic acid	12.5
Water	8.5
	—
	100.
	—

The native green muriat of copper from Peru appears to be nearly in this state.

Copper seems to have a stronger affinity for muriatic acid than even for the nitric or sulphuric. Thus, if either the solid nitrat or sulphat of copper be digested in muriatic acid a solution takes place, and then, on the application of heat, the liquor immediately loses the blue colour, characteristic of these two salts, and acquires the green of the muriat: also by slow evaporation muriat of copper is obtained in crystals.

Acetous acid has no action on reguline copper, but its oxyd is easily soluble in this fluid, to which it communicates a beautiful grass-green colour. There are two species of acetited copper, the one with an excess of base, the common verdeggris of the shops, and the other in which the acid and oxyd are in a state of mutual saturation, forming the crystallized or distilled verdeggris.

The manufacture of verdeggris is carried on to a considerable extent in most of the southern provinces of France,

and a very exact account, apparently, of the process has been published by Chaptal, from which the following particulars are extracted.

The materials for this manufacture are the *marc* or cake that remains in the wine-press, after the greater part of the juice has been liqezed out: and plates of copper of convenient size and hammered well, in order to smoothe the surface, that the corroded portion may be readily detached from the rest.

The marc of the grape is first fermented by being laid as lightly as possible in a large barrel and moistened with common wine, and then set in a warm airy place. In a few days, varying according to the heat of the weather, it begins to swell, grows hot and exhales a strong odour of vinegar; the fermentation then declines and the marc is fit for use. A layer of this is then put into an earthen pot and a plate of copper, previously made scorching hot, is laid upon it; to this succeeds another layer of marc, and then a plate of copper, in regular alternation till the pot is filled, observing that both the top and bottom layers are of marc. The mouth of the pot is then loosely flopped with straw, and the whole is left at rest from ten to twenty days.

When the marc begins to whiten the pots are unpacked, and, if the process has gone on well, the copper-plates are found covered with a green crust, interspersed with silky green crystals. The marc is thrown away; the plates are set on end on wooden racks in a cellar, and when dry are dipped in water and again set to dry; this is repeated once a week for six or eight times, which makes the crust of oxyd swell and increase both in quantity and quality: after which it is scraped off by a knife without difficulty. Each pot yields about 5 or 6 lbs. of rough verdeggris, and the plates will serve again repeatedly till they are corroded quite through.

This rough verdeggris is further prepared for market by being ground in wooden mortars, and exposed to the air till it is sufficiently dry; and in so doing it loses about half its weight.

Verdeggris thus prepared, may be considered as copper oxydated by the action of the acetous acid, and combined with water, with carbonic acid, and with part of the extractive or mucilaginous part of the marc. It is nearly insoluble in water and its colour is bluish green. If this verdeggris is digested in distilled vinegar it dissolves readily in this fluid, and by evaporation and cooling a crystallized salt of a deep green colour may be obtained, which is known in the shops by the name of *distilled verdeggris*. The method in which this valuable salt is prepared at Montpellier is as follows. Common vinegar is first distilled in a copper alembic, and the acid thus produced is put with common verdeggris into a copper boiler; when a hot saturated solution is thus made, it is strained and transferred to another copper evaporating vessel, where it is boiled down till a saline crust begins to collect on its surface; a light frame of cross sticks is now sunk into the liquor and the fire is put out. On cooling, the acetite of copper crists round the sticks in clusters of rhomboidal crystals of a deep bluish-green colour. It requires about 5 lbs. of verdeggris to make 1 lb. of the crystallized acetite.

The composition of common verdeggris is subject (as might be expected from the method in which it is prepared) to a considerable variation, and this difference is still further increased by variations in the way of manufacturing this salt. Thus, at Grenoble, verdeggris is made merely by disposing plates of copper in a proper room, and moistening their surfaces

surfaces repeatedly with distilled vinegar, till the incrustation of oxyd acquires a proper thickness. Hence this latter is purer, and approaches nearer to the state of crystallized acetite, than that of Montpellier.

A hundred parts of the verdegriis of Grenoble yield, according to Chaptal, by dry distillation,

Carbonic acid	-	-	9.1
Water weakly acidulous	-	-	13.05
Strong, and coloured acetous acid	-	-	53.95
Left in the retort	} Copper	-	20.9
Charcoal		-	3.
			100.

A like quantity of the Montpellier verdegriis afforded

Carbonic acid	-	-	8.
Acetous acid, weak and empyreumatic,	65	15	
Copper	-	-	22.5
Charcoal	-	-	4.35
			100.

To the above particulars may be added some observations, by Proust, on the properties and composition of this salt.

When common verdegriis is put into cold water, it gradually falls to pieces and nearly half of it is dissolved, the remainder is a fine green powder which diffuses itself through the liquor and subsides very slowly. This green powder appears to be pure subacetite of copper, and when washed and dried weighs about 42 per cent. of the original verdegriis. When sulphuric acid is poured on it, pungent vapours of vinegar are given out. Boiled with potash it affords 63 per cent. of black oxyd; and when distilled, after all the volatile products have passed over, there remains about 52 per cent. of copper, principally in the metallic state. From these data therefore the subacetite appears to consist of

Copper	50.4	} forming black oxyd	63
Oxygen	12.0		
Remains for acid and water			37
			100

With regard to the crystallized acetite, Proust found that 39 parts of black oxyd produce, with distilled vinegar, 100 parts of acetite; and on the other hand, that 100 parts of this salt, when decomposed by boiling with potash, yield 39 or 40 parts of black oxyd. Hence it is composed of

Copper	31.2	} forming black oxyd	39
Oxygen	7.8		
Acetous acid	-	-	61
			100

The distillation of the crystallized acetite furnishes the most pungent acetic acid, or radical vinegar, as has been already described under ACETOUS ACID. Acetite of copper, beside being made by direct combination of its ingredients, may be prepared in various ways by double affinity; of these the best upon the whole is the following: Make a cold solution of sugar of lead (*acetite of lead*) in distilled water, to which add, by degrees, a cold solution of blue vitriol (*sulphat of copper*), as long as any precipitation takes place; then pour the whole on a filter, and a green liquor passes through, the sulphat of lead remaining on the filter, in the form of a white powder. The green liquor, being concen-

trated by evaporation, deposits, by cooling, very pure and beautiful crystals of acetite of copper.

The natural combinations of copper with arsenic and arsenic acid have already been noticed. With regard to the artificial arseniats, Scheele discovered that when arsenic acid is digested with copper filings, a green solution is formed, and a blue powder, which is also an arseniat, is precipitated. The sulphat, nitrat, and muriat of copper undergo no apparent change, when added to arsenic acid; but the acetite is decomposed, and arseniat of copper is precipitated. All the cupreous salts, however, are decomposed by arseniated alkali, and a blue arseniat falls down. To these facts Mr. Chenevix has added the following: If arseniat of ammonia and nitrat of copper are added, there falls down a blue crystalline arseniat of copper. On evaporating the supernatant liquor, and adding alcohol, another copious deposition of crystals took place, of a deeper colour than the former, and of a rhomboidal shape. Each of these arseniats was examined separately, first by calcination at a low red heat to expel the water, then by potash for the black oxyd of copper, and lastly by nitrat of lead for the arsenic acid. By this method, the first arseniat was found to consist of

Oxyd of copper	-	50
Arsenic acid	-	27
Water	-	23
		99

The second arseniat afforded

Oxyd of copper	-	35.
Arsenic acid	-	39.5
Water	-	24.
		98.5

Arsenic, in the state of white oxyd, combines with oxyd of copper into a pale green powder, called, from its discoverer, *Scheele's green*. It is prepared in the following manner: Dissolve 24 ounces of sulphat of copper in water, and heat the solution in a copper vessel; also boil in another vessel 24 ounces of pearlsh, 11 ounces of white arsenic, and about 3 pints of water: when the whole is dissolved, strain each solution separately through lincn, and then add the arsenicated potash, little by little, to the sulphat of copper, with constant stirring: an effervescence will take place, and then a green powder will be deposited. When the whole is mixed, let it stand some hours, then separate the precipitate by the filter, edulcorate it well with clear hot water, and dry it very gently in a warm room. The above quantity of ingredients will afford about 184 ounces of the powder, which may be used as a pigment.

Phosphat of copper may be prepared by adding phosphat of soda to the nitrat, or any other readily soluble salt of copper, a bluish-green sediment falls to the bottom, which dries to a powdery semi-crystalline mass. A low red heat turns it brown, and drives off about 15.5 per cent. of water; there remains a phosphat of copper, composed of 35 parts of phosphoric acid, and 49.5 of oxyd of copper.

A striking decomposition of nitrat of copper also takes place, when a tick of fresh melted phosphorus is immersed in a solution of this salt, and exposed to the light. By degrees the copper is precipitated on the surface of the phosphorus, in the metallic salt, and in the form of crystalline grains.

All the salts of copper are decomposed by the alkaline prussiates, and the residu is a sediment of a reddish-brown colour, which, by drying and exposure to the air, acquires a dark

dark chocolate hue. This prussiat of copper mixed well with oil, and has been employed with some success as a pigment.

Tincture or infusion of galls throws down from all cupreous solutions a precipitate of a dirty yellow colour.

Oxyd of copper is soluble in all the other acids, forming with them, however, salts little known, and of little importance: the predominating colour in all of them is green.

Of the alkalies, neither potash nor soda have any action on copper or its oxyds, except that already mentioned, of taking away from the hydrat its water of combination, and reducing it to black oxyd.

Ammonia has no action on metallic copper, but dissolves its oxyds without difficulty. The usual colour of this solution is a deep blue-purple. The most direct method of preparing it is by digesting together liquid ammonia and any oxyd, or carbonated oxyd of copper: the liquor becomes blue almost immediately, and its colour deepens till saturation takes place. By slow and careful evaporation, blue silky crystals of ammoniuret of copper may be procured. This salt, by exposure to the air, gradually loses its alkali, and absorbs carbonic acid, so that at length it is wholly converted into green carbonate. The *acqua saphyrima* of pharmacy and surgery consists, for the most part, of ammoniated copper, to which its colour is owing: it is made chiefly in two ways. The first is to digest in a glass vessel quick-lime, muriat of ammonia, verdegris, and water; the lime decomposes the muriat of ammonia, disengaging the alkali, which, in its turn, decomposes the verdegris, and dissolves the oxyd of copper: hence the clear liquor consists of ammoniated copper and muriat of lime. The second method, where a weaker solution is wanted, is to employ lime-water instead of lime. Another way of producing ammoniated copper immediately is to supersaturate with this acid any of the salts of copper, in consequence of which the first portions of alkali decompose the cupreous salt, throwing down an oxyd, and the succeeding portions redissolve the oxyd, forming a dark-blue solution. As there is no other metal besides copper and nickel which produces this particular colour, and as the latter of these metals is not common, the production of this beautiful tinge, by the addition of ammonia, may be considered as a very probable indication of the presence of copper.

A singular circumstance takes place with regard to ammoniated copper. If a bottle be filled with liquid ammonia, and a few clean copper filings be added, no solution ensues, as long as the bottle is kept close corked. But if the bottle be opened for a while, and then shut again, a solution indeed of part of the copper takes place, but without any change of colour in the liquor: but when the bottle is again opened, the characteristic blue tinge appears first at the surface of the solution, and gradually spreads down to the bottom. If now a few more copper filings be added, and the bottle again corked, the solution will in a short time again become colourless, and continue so till it is again exposed to the air. The reason of these changes appears to be the following: copper requires some, but only a very small quantity, of oxygen to be soluble in ammonia; and when in this lowest state of oxydation, it forms with ammonia a colourless solution, as it forms with muriatic acid a white sub-muriat: but if this solution is exposed to the air, the metal absorbs oxygen, and is thus brought to that state in which it tinges ammonia blue; being again shut up with a few copper filings, the oxygen is partly absorbed by the recently added metal, and reduces the whole to the state of white oxyd.

Many of the neutral salts, especially the muriats, are capable of oxydizing, and, in part, of dissolving copper: this

is especially the case with muriat of ammonia, which, when made into a mass with copper filings and a little water, and kept warm, precisely converts the copper into a green muriated oxyd.

Copper and sulphur readily unite. If equal parts of copper filings and flowers of sulphur are mixed and heated in a crucible, much of the sulphur burns off; but the remainder melts into a blueish-black mass, which is sulphuret of copper. According to Prout, 100 parts of copper take up in this way 28 of sulphur; so that the sulphuret is composed of about 79 of metallic copper, and 21 of sulphur. No oxygen appears to be present. This substance is more fusible than copper, melting readily at a red heat. By roasting in the open air, the sulphur is expelled: the last portions, however, adhere with great obstinacy. According to Dr. Thomson, sulphur and copper filings unite together, by being merely mixed together with or without water, and exposed for a long time to the air.

Hydrofulphureted water, or any of the liquid hydrofulphurets, when added to the solutions of copper, produce a deep blueish-black precipitate, which is a hydrofulphuret of copper.

Phosphorus is capable of intimate combination with copper. If 8 parts of this metal in filings, 8 of vitreous phosphoric acid, and 1 of charcoal powder, are intimately mixed together, and then put into a crucible, and exposed to an intense heat, the phosphoric acid is decomposed by the action of the charcoal, and the phosphorus in part burns off, and in part unites with the copper, forming a hard, steel-grey, brittle alloy, capable of a high polish. A simpler way of preparing the same is to make copper filings red hot in a crucible, and project upon them small pieces of phosphorus, which combines with the metal, and melts down into a grey mass, similar to the former. One hundred parts of copper may thus be increased to about 120; but if this phosphuret is kept for some time melted under charcoal powder, or melted glass, part of the phosphorus burns off. When this excess is thus got rid of, the ingredients of the remaining phosphuret appear to be in a state of mutual saturation, no more phosphorus being dissipated by a continuation of the fusion. In this state the mass appears to consist of 92.3 of copper, and 7.7 of phosphorus: it retains the grain and colour of steel, is susceptible of a high polish, and does not readily tarnish in the air, but is brittle. With a still less proportion of phosphorus, it becomes malleable, and of a yellowish-white colour. Phosphuret of copper, if kept in fusion, with free exposure to the air, loses gradually most of its phosphorus, which burns away with the bright flame and odour peculiar to this substance.

The fixed oils, when kept long in contact with copper, oxydate it, and dissolve a portion, by which they acquire a green colour.

The uses of copper, in its various states, are so numerous and important, as to be scarcely inferior to those of iron. All the salts of copper are more or less poisonous, producing violent nausea, with severe pain and inflammation of the intestinal canal. Yet from the sudden vomiting that they excite, a large dose may be given with safety; and this is sometimes done, when there is an immediate necessity of emptying the stomach. Copper, however, is very little used medicinally in any form.

§ 5. Alloys of Copper.

The alloys of copper are, upon the whole, of more importance than those of any other metal: we shall, therefore, treat of them with some minuteness.

Copper with gold and silver.

Copper,

Copper, when added in small quantity to either of these metals, greatly increases their hardness, without materially debasing their colour or malleability: hence it has been generally adopted as the alloy for that portion of the precious metals which is employed with current coin, and for plate.

Copper with arsenic.

On account of the volatility of arsenic some precautions are required in the preparation of this alloy. The best way, upon the whole, is to melt some copper in rather a large crucible, and then to wrap up in paper some reguline arsenic, or white arsenic, either with or without a mixture of charcoal powder, and to immerse the paper, with its contents, in the melted copper, either by means of a pair of long tongs, or by ramming the paper into a small crucible, and then inverting the crucible in the fluid metal. The arsenic presently rises through the copper in dense white fumes, and is in a great part dissipated; a portion however is retained by the copper, and by repeating the process once or twice more, the alloy will be fully saturated with arsenic.

This alloy is of a silvery white colour and a close texture; it is however very brittle, and, in proportion to the perfect whiteness of its colour, liable to tarnish in the air. As soon as it is brought to fusion the arsenic begins to escape, and the copper regains its malleability: the last portions however of arsenic are not driven off even by long continued heat, and although the copper regains its malleability, its colour remains of a dingy yellow.

Vauquelin has discovered that if to an alloy of copper and silver, in equal proportions (the colour of which is a pale yellow), there be added 2 per cent. of arsenic, the result is a perfectly white ductile and malleable alloy. If this latter ingredient exceeds 5 per cent. the alloy begins to be brittle.

Copper with iron.

These two metals only unite when the former of them is greatly in excess. The result is a hard, grey, and somewhat brittle alloy. According to Mr. Keir, the *tutenag* of the Chinese is a white alloy of copper, zinc, and iron: it is hard, tough, and sufficiently malleable to be wrought into candlesticks and various other articles of domestic furniture, which take a high polish, and are scarcely to be distinguished from silver. The inferior sort of *tutenag* has, however, a very perceptible brassy tinge.

According to D'Azé, the alloy of iron and copper only ceases to be acted on by the magnet, when the proportion of the former is less than $\frac{7}{10}$ of the whole mass. Iron is much inferior in its power of whitening copper to tin or even to arsenic.

Copper with lead.

These metals unite, to appearance, very intimately by fusion; but when a mass of this alloy is exposed to a very low red heat, the greater part of the lead, with a small portion of copper, sweats out, leaving the rest in a porous honey-combed state. When the copper holds a little silver, the lead carries the latter out with it: this process is called *eliquation*, and will be treated of more at large in the article SILVER. Copper, with about a fourth of its weight of lead, forms *pot-metal*. The Roman pot metal was composed, according to Pliny, of 100 parts copper, 2 lead, and 2 tin. The same ingredients, but with larger proportions of the two latter, were the materials of many of the ancient Greek and Sicilian coins, as appears from analyses of them by Klaproth.

Copper with zinc.

Copper, when nearly saturated with zinc, that is, when

the latter amounts to about one-fourth of the alloy, forms *brass*, of which an account has been already given. With a smaller proportion of zinc, the colour of the alloy approaches more nearly to that of gold, and its malleability increases. Mixtures, chiefly of these two metals, are employed to form a variety of gold coloured alloys, known by the names of *tombac*, *Mansheim* or *Dutch gold*, *tinzel*, *similar*, *prince Rupert's metal*, *pinchbeck*, &c. the precise composition of which varies according to the fancy or experience of different artists. The Dutch gold may be beaten into extremely fine leaves, which when fresh are a cheap and good imitation of gold leaf; but they tarnish very soon. The mixture may be made either by melting together copper and zinc, or copper and brass. In either case the copper should be melted first, and the other ingredient added afterwards: being then carefully stirred together with a stick, the alloy is to be poured out into proper moulds without loss of time, lest the zinc should burn off.

A fine malleable *tombac* may be made with 16 parts of copper, one of zinc, and one of tin; if a larger proportion of this latter is added, the alloy becomes harder and brittle. Several Roman coins struck, during the first century of the emperors, have been analyzed by Klaproth, and appear to consist, some of nearly pure copper, others of copper, with from a fifth to a sixth of zinc. A little tin and lead were found in some, but in such small proportions as to appear only an accidental impurity.

Copper with tin.

The alloy of copper and tin are extremely important in the arts, and curious as chemical mixtures. Tin added to copper makes it more fusible, less liable to rust or be corroded by the air and other common substances, harder, denser, and more sonorous. In these respects the alloy has a real advantage over unmixed copper; but this is in many cases more than counterbalanced by the great brittleness which even a moderate portion of tin imparts, and which is a singular circumstance, considering how very malleable both metals are before mixture.

The sensible qualities of the different mixtures of these two metals are the following: Copper, alloyed with from one to five per cent. of tin, is much harder than before; its colour is yellow, with a cast of red, and its fracture is granular: it is still considerably malleable. This appears to be the usual composition of many of the ancient edged tools and weapons before the use of iron; when it appears that the ancients did not possess (as has often been supposed) any peculiar art of hardening pure copper, otherwise than by mixture. An alloy in which the tin is from $\frac{1}{15}$ to $\frac{1}{4}$ of the whole is hard, brittle; but still a little malleable, close-grained, and yellowish white. When the tin is as much as $\frac{2}{3}$ of the mass, it is entirely brittle, and continues so in every higher proportion. The yellowness of the alloy is not entirely lost till the tin amounts to $\frac{2}{3}$ of the whole.

Copper (or sometimes copper with a little zinc) alloyed with as much tin as will make from about $\frac{1}{15}$ to $\frac{1}{4}$ of the whole, forms an alloy which is principally employed for bells, brass cannon (so called), bronze statues, and various other purposes. Hence it is called *bronze* or *bell-metal*, and is excellently fitted for the uses to which it is applied by its hardness, density, sonorousness, and fusibility. For cannon a lower proportion of tin is commonly used. According to Dr. Watson, the metal employed at Woolwich consists of 100 parts of copper, and from 8 to 12 of tin; hence it retains some little malleability, and therefore is tougher than it would be with a larger portion of tin. A common alloy for bell-metal is 80 of copper and 20 of tin; some artists add to these ingredients, zinc, antimony, and silver, in

small proportions, all of which certainly improve the sonorousness of the compound.

When in an alloy of copper and tin, the latter metal amounts to about $\frac{1}{3}$ of the mass, the result is a beautifully white alloy, with a lustre almost equal to that of mercury; extremely hard, very close-grained, and perfectly brittle. It takes an exquisite polish, which well adapts it for the reflection of light for all optical purposes. It is called *speculum metal*, and, besides the above ingredients, generally contains a little arsenic, zinc, or silver. The application of an alloy, similar to the above, to the construction of mirrors, is of great antiquity, being mentioned by Pliny. From the actual analysis, by Klaproth, of a portion of an ancient speculum, it appeared to consist of

Copper	62
Tin	32
Lead	8
<hr/>	
	102
<hr/>	

Of these ingredients the last is considered by Klaproth, with high probability, as only a casual adulteration of the tin.

When the amount of the tin exceeds that of the copper, the alloy begins to lose its splendid whiteness, and acquires a bluish-grey hue; its texture likewise becomes rough-grained, and, as it were, rotten and incapable of receiving a polish.

A perfect speculum metal should be quite white, without showing any cast of yellow when polished, not very liable to tarnish, quite free from pores, even when examined by a lens, of a certain coherence or toughness to bear the grinder, and, for the convenience of working, as soft as may be consistent with the other requisites.

Mr. Mudge, whose specula were celebrated for their goodness, observes, that the extreme of whiteness is given by 32 parts of copper and 16 of tin, but this compound is too hard and brittle; 32 parts of copper with $14\frac{1}{2}$ of tin form an alloy quite white, and as hard as can be wrought. In order that the metal should turn out free from pores, it ought to be twice fused, once for mixture of the ingredients, and afterwards, with as little heat as possible, for casting.

The following observations on the same subject are extracted from an elaborate paper by Mr. Edwards, published in the *Nautical Almanack* for 1787.

The quality of the copper should first be tried by adding successively from so much short of half of its weight of tin, that the mixture proves a little yellow, to the full half of tin, and by comparison of the various samples ascertaining the *maximum* of whiteness. When this is found, take 32 parts of copper, melt it, then add one part of brass and the same of silver, with a little black flux to cover the surface; when these are melted stir them together with a wooden rod, and pour in from 15 to 16 parts of tin (as ascertained by previous experiment) fused in a separate crucible, at a low heat; then stir the mixture again, and immediately pour it into cold water. Re-melt, with as little heat as possible, the alloy thus formed, and for every 16 parts take one of white arsenic, wrap it in paper, thrust the packet to the bottom of the fluid metal with a wooden rod, and stir it well as long as any arsenical vapours arise; when these cease pour the metal into a mould of sand, and as soon as it has solidified lay it in a pot full of very hot embers, and cool it very slowly: unless this precaution is particularly observed, the metal will fly in pieces when cold, or will split in the polishing.

The brass, the silver, and the arsenic in this composition appear to have their distinct use; the brass makes the mixture tougher, and somewhat brittle, the silver improves its colour, and the arsenic renders the texture remarkably finer, closer, and less porous; a larger proportion of this however would make the metal liable to tarnish.

Sir J. Newton's specula were composed of 6 parts of copper, 2 tin, and 1 arsenic; they are upon the whole very good; but after being polished exhibit a rather yellow cast.

The other alloys of copper are not of much importance, and will be found under the respective metals to which they belong.

COPPER, in *Military Affairs*, a kind of metal white as silver, frequently brought from China, and supposed by many to be natural. But it is only an alloy of copper, zinc, and arsenic, in certain proportions. It is made with difficulty, because of the volatility of the two semi-metals; and, as its quality is noxious, it is not much used.

COPPER, in *Military Affairs*. No other metal is allowed in magazines, or for barrels of gun-powder.

COPPER, in *Calico-Printing*, a vessel in which the operations of dyeing, dunging, rinsing, &c. are performed, and which derives its name from the material it is generally constructed of. As these vessels are used indifferently for any of the above purposes, their size, form, and arrangement, are generally the same, and vary little throughout the whole kingdom. They are always circular, from $4\frac{1}{2}$ to 5 feet diameter at the top; $3\frac{1}{2}$ to four feet deep, and about the same in width, across the bottom, which is the thickest and stoutest part of the vessel. This circular form, though in general use, is perhaps the worst that could have been devised for the purpose of calico-printing. It is no doubt the first that was employed, and has advantages in point of solidity of form, and ease of transportation from one place to another, over any other. For the purpose of dyeing, however, or any operations where goods are kept for a long time at a boiling heat, and turned over the winch, it is the most inconvenient that could have been adopted.

In a vessel of this size and form, it is customary to dye from six to twelve pieces of twenty-eight yards each, at one operation. The goods are disposed either in two lengths of four or six over the winch; or, when quick turning is necessary, in one length only, in which case, six pieces, or at most eight, are disposed equally over the whole surface of the winch. In this latter case, the inconvenience of the circular form is particularly felt. It is evident that when six or more pieces are crowded upon a winch, those which are at the extremities will have little or no space in which to float, without disturbing those which are nearer the centre; whilst, on the other hand, those which are in the middle will have more than sufficient, and will float in the copper, scarcely ever touching its sides. In consequence of this, the pieces at the extremities of the winch, being crowded, will press along the sides of the copper, and thus be exposed to greater heat and hazard of copper-marking, than those which are in the middle. Their disposition on the winch will also be deranged, and the copper-man, with all his care and attention, will be unable to preserve that order and regularity in the distribution of their folds, so essentially requisite in good dyeing. When the copper is in a state of ebullition, these evils increase, and it rarely happens that the most experienced dyer can keep his goods disengaged, or prevent their getting completely fastened, when he has two lengths of six over the winch, and keeps them twenty or thirty minutes at an actual boil.

By adopting a square, or, what is still better, an oblong vessel of the same capacity as the former, these inconveniences are in a great measure done away; the goods have all equal space to float in, are equally removed from the centre and sides of the vessel, and preserve their order and disposition on the winch, even in a state of ebullition, with ease, certainty, and comparatively trifling attention.

Dye-coppers are generally set up in brick work, with each their separate and distinct fire-place, chimney, &c.

The same principles apply to the heating of these vessels as to all other boilers, but we need not enter here upon a subject which will be more fully treated of in another part of this work. The recent improvements in the application of steam, as a vehicle of heat, are however of such importance, and have at this moment excited such general interest amongst dyers, and calico-printers, as to claim a short notice in this place.

Mr Gott, of Leeds, was the first who applied steam in the large way, to the heating of dye-coppers, and the success of his experiment was so complete, as to induce many others to follow his example. This mode, which is the simplest and most economical that can be employed, consists in throwing the steam directly into the dyeing vessel. One steam boiler, situated at the extremity of the building, supplies his numerous coppers which are disposed promiscuously about the dye-house, unincumbered with fire-places, ash-pits, chimneys, &c. and simply surrounded with a casing of brick, to support the copper, and confine the heat.

The steam is conveyed in horizontal pipes, carried along the ceiling of the dye-house, from which descend vertical tubes of from $\frac{3}{4}$ of an inch to $2\frac{1}{2}$ inches diameter, according to the size of the copper they belong to. These steam tubes all pass down on the outside of their coppers, and enter them horizontally at the level of their bottoms; and are furnished with brass cocks for regulating the admission of the steam, or entirely interrupting it when the copper is not wanted.

The rapidity with which these coppers are heated, is truly astonishing. One of the largest in Mr. Gott's dye-house of 1800 gallons capacity, according to count Rumford, was brought to the boiling point in half an hour. The saving of fuel, though in general over-rated, is another advantage gained by this mode of applying heat. Mr. Gott states this at two-thirds of the quantity consumed when the coppers are heated by separate fire-places; but this is evidently too much. The saving consists in the application of fire to one vessel only of large dimensions, instead of to a number of small ones; and though this is certainly accomplished with less expence of fuel, yet, if the fire has been well and properly applied in the latter case, the saving will amount nearer to one-third than to two.

The burning of the copper sides and bottoms, when heated by a naked fire, is a heavy expence in a large establishment, and often a source of serious inconvenience. By the application of steam, this is entirely done away, and even copper vessels themselves, for many operations, rendered wholly unnecessary. Wooden vessels have been substituted, with great advantage, in their stead, and when the use of copper cannot be dispensed with, it may be employed in thin sheets, supported by a frame work of brick or wood. Important as these advantages are in an economical point of view, the system of steam-heating has, if possible, still more powerful recommendations. The ease, elegance, and regularity, with which the heat can be transmitted by a steam tube, are of themselves sufficient to entitle it to decided preference.

By the adjustment of the steam-cock, the rate of heating is so regulated, that the copper may be brought to the boiling point in any given time, with an exactness as well as celerity, unattainable by the other mode. The heat may in an instant be withdrawn, or rendered stationary at any fixed point, by a single turn of the cock, the first of which is impracticable, and the latter extremely difficult, when the coppers are heated by separate fire-places. The sides and bottom of a dyeing copper, exposed to a strong and naked fire, are always much hotter than the dye-liquor, and occasion copper-marks and unevenness in the goods, in some cases difficult to avoid. This inconvenience is entirely removed by the use of steam, since the dyeing-vessel deriving all its heat from the heated liquor within it, can never, it is evident, acquire a higher temperature.

The success of Mr. Gott's experiments was such, that many of his neighbours, at first much prejudiced against it, immediately adopted the plan. With a liberality worthy of imitation, his dye-house was open to all inquirers; and such was the interest excited by this new and extraordinary mode of applying heat, that experiments were immediately instituted in different parts of the country, with a view of extending this improvement to other branches of the art of dyeing. Mr. Gott had proved and established the practice as far as the dyeing of woollen goods was concerned, and little more remained to be done; in its application to calico-printing and the dyeing of lighter goods, however, difficulties occurred, of such a nature, as wholly to discourage many whose trials were made in a hasty ill-considered manner, and considerably to embarrass those whose experiments were conducted with greater skill and patience.

The great, and only well-founded, objection arose from the agitation into which the water was thrown when it approached the boiling point, by which the goods were entangled and fastened, much more than in the ordinary mode. This inconvenience was not felt in Mr. Gott's dye-house, where the goods being woollen, and of much greater weight and substance, were less liable to be tossed about by the ascending currents from the steam-tubes than the thin and lighter goods manufactured from cotton. The evil was often increased by want of sufficient attention to the regulation of the steam-cock; thrice the quantity of steam necessary to maintain the copper at the boiling point being admitted, which, retaining its elastic form at that temperature, passed through the copper uncondensed, and threw the goods into the greatest confusion.

To diminish the agitation, it has been found necessary to break the force of the current, by introducing the steam in small quantities, through two or three different openings, or in some cases by introducing a false bottom, pierced full of holes, between the goods and the end of the steam-tube; by this means, and still more by carefully admitting only the necessary quantity of steam, the agitation may be so far reduced, as to be no longer troublesome.

The accumulation of condensed water in the dye-copper, is a necessary consequence of this mode of applying steam, and cannot be avoided. Where it is an object to diminish this as much as possible, it may be accomplished by using strong, or which is the same thing, very hot steam; but it does not appear that any great inconvenience results from this trifling increase, which ceases when the copper has attained the boiling point, due allowance being made for it in the first instance, when the vessel is filled with cold water.

When strong steam is rapidly thrown into a vessel filled with

with cold water, the condensation is instantaneous, and attended with a loud noise, and violent shock.

We have seen a stone cistern of large dimensions, and firm joinings, nearly shaken to pieces by the incautious admission of steam, and many of the early experimenters complained that their coppers were nearly knocked to pieces, and that few would hold water after being heated once or twice.

This inconvenience may be corrected by stopping the end of the steam tube, and piercing the sides full of small holes, or, which is still better, by turning up the end of the pipe, and fixing a valve in it. In either case the steam is emitted through the openings in steamjets, or sheets of small volume, whose condensation is attended with trifling noise, and little agitation of the vessel. Several dye-houses in Lancashire and Cheshire have been fitted up on these principles, and the coppers, thus heated, are used, with few exceptions, for every purpose of calico-printing.

Mr. Gott, as we have before stated, was the first who introduced this improvement on a large scale, the idea of which, count Rumford informs us, was derived from the perusal of his seventh Essay. We know not what share the count's publication might have in deciding the trial, but the idea of heating water by steam had occurred long before that time to Mr. Watt; and, if we mistake not, a warm bath at Soho had been heated in this way, and seen by Mr. Gott, and many others, to whom the idea of its application to more useful purposes had naturally occurred.

For some few purposes we believe this mode of applying heat, by throwing steam directly into the dye-copper, is less advantageous. When goods, for example, are kept a long time at a low heat and never boiled, the accumulation of condensed water, in this case, continues to the end of the operation, and weakens considerably the effect of the dye. All the advantages of this mode may, however, be obtained without any of the inconveniences we have before alluded to, by surrounding the dyeing-vessel with a casing of cast iron, and throwing the steam in between this and the copper. The heat in this case is transmitted through the sides of the copper, as in the ordinary mode of heating by a naked fire, and the condensed water is carried off from the casing either by a reversed syphon, eight or nine feet long, or, when the situation will not admit of this, by a floating valve. In this way the noise and shock, from the rapid condensation of steam in cold water, the agitation in the dye-copper, and the condensed water, are all completely got rid of. The apparatus is, however, less simple and much more expensive than the former.

A strong steam is necessary to produce the boiling heat in a dye copper cooled by the continued exposure of the goods on the winch, and the vessel and joints must be found strong to support this pressure. Both modes have their advantages, and will, we have little doubt, in a few years entirely supersede the ordinary mode of heating by separate fire places.

Copper mark, is a stain, discolouration, and unevenness in dyed goods, caused by contact with the sides of a hot or dirty copper, during the operation of dyeing. In the ordinary mode of heating, as has been observed in the foregoing article, the bottom and sides of a dyeing-vessel, when exposed to a strong and naked fire, are much hotter than the dye-liquor. When this is the case, and the colours pale and delicate, simple contact with the hot copper is sufficient to cause unevenness, either by affecting the hue by the excess of heat, or enabling the mordant to combine with an extra portion of colouring matter. This inconvenience is in general remedied by placing a basket of wicker work within the

copper, which prevents the goods from touching the sides of the vessel; it is still more completely guarded against by heating the copper with steam, in the manner already described.

The sides of a copper will often occasion marks or stains when the vessel has been negligently washed out, and especially when it has not been used for some time. A dye-copper not in use should always remain filled with clean water. It prevents the formation of a rust on its surface, which simple washing will not remove, and which acts as a mordant, and fixes the dye whenever it touches the cloth.

Copper Island, in Geography, otherwise called *Меднои Остров*, i. e. Mednoi island, lies in the sea of Kamtschatka, which separates the two continents of Asia and America. It takes its name from large masses of native copper found upon the beach; and as it lies full in sight of Beering's isle, it was easily and speedily discovered by those who succeeded Beering. These two uninhabited spots, to which the sea-otters and other marine animals were accustomed to resort in great numbers, and which were first visited in 1741, were for some time the only islands that were known, until a scarcity of land and sea-animals, whose numbers were greatly diminished by the Russian hunters, occasioned other expeditions. Besides the native copper which is found on the coast of this island, the true right camphor-wood, and another sort of wood, very white, soft, and sweet-scented, are found among the floating bodies which the sea casts upon the shore. The copper lies on the shore in such abundance, that many ships might be laden with it; and an Indian trader might make a profitable voyage from thence to China, where this metal is in high demand. This copper is mostly in a metallic or malleable state, and many pieces of it seem as if they had been formerly in fusion. The island is not high, but has many hillocks, each of which has the appearance of having formerly been the funnel of a volcano. This island, as well as the others in its vicinity, are subject to frequent and violent earthquakes, and abound in sulphur. (Cox's Russian Discoveries.) From the account in captain Cook's Third Voyage (vol. iii. p. 247.) we learn, that, on Mednoi and Beering's island, scarcely a sea-otter is now to be found; though it appears from Muller, that in his time they were exceedingly plentiful.

Copper-Plates for Engraving. We are favoured with the following account of the method of preparing copper-plates, as practised at present in London, by Mr. Harris, son-in-law and successor to Mr. Whitton of Shoe-lane.

A sheet of copper must be chosen as free as possible from flaws, and of a somewhat greater thickness than the finished plate is intended to be: it is then to be scraped all over with a *scraper*, in shape something like the head of a spear, and fixed in a handle long enough to go under the arm, the other hand holding the tool near the cutting part. When it has been perfectly freed from the outward crust, scales, or rust, it must be carefully examined to see if there are any holes or flaws in it; if there are (which is almost always the case), they must be scooped out by a tool called a *scoper*. This being done, it is next to be well and regularly hammered all over on an anvil, of a considerable degree of convexity, in order to harden it; and afterwards on a broad and nearly flat anvil, to flatten and planish it. After this has been performed, it is to be cut to the size wanted, and the edges a little chamfered or bevilled, and is now to be stoned, that is, rubbed all over with a salt cutting, but not very coarse, grit stone, care being taken to use a great quantity of water, to float off the particles mutually abraded from the copper and stone. When it is judged that all the marks of the scoper

and

nad hammer are rubbed out, a stone of a fine grit is to be used in the same manner, and after this a third.

The two first-mentioned stones are sold at the ironmongers in London, under the name of "Carpenters' stone;" the best kind are brought principally from the coal fields in the neighbourhood of Bilton in Staffordshire. The stone last used is called "Water of Aye stone," and brought from Dumfriesshire. All the three kinds contain a considerable quantity of argil in their composition. Lately, a very fine grained argillaceous grit, brought from the neighbourhood of Sheffield, has been used instead of the Bilton stone.

After the operation of floning has been performed, the plate is to be "enald." This is done by rubbing it first with charcoal of birch-wood, or alder, and water, and then with charcoal of willow: the latter gives the finer polish, particularly if oil instead of water be used. Sometimes the plates are finished by burnishing, but this is not now often done.

The charcoal is not prepared by the copper-plate makers, but is procured from the dealers in that article by the workmen, who take a plate of copper, and by trial discover which pieces are fit for their purpose.

COPPER-Plate Printing. See *Rolling-press* PRINTING.

COPPER-Plate Work, in Calico-Printing. The application of engraving has given birth to a new and important branch of calico-printing. It first introduced those machines whose subsequent improvement has so much contributed to the perfection of the art, and which surpass the ordinary mode of block-printing, not only in neatness, accuracy, and precision, but still more in the economy and activity with which the labour is performed.

These machines are of two kinds, the flat press, and the rolling or cylinder press.

The flat press, in its original form, was merely a modification, considerably enlarged, of the press for ornamental prints or engravings; to which was added a contrivance for joining, with accuracy, the numerous and successive impressions necessary to cover a piece of cloth. It was confined at first to one colour, but later improvements have extended it to two and even three. The single colour presses are, however, principally in use.

The cylinder, or rolling-press, is of later invention, and differs from the former chiefly in the substitution of an engraved cylinder for a flat plate. With the latter the cloth is printed by successive impressions, in which the accuracy of the joining is of great importance: in the rolling-press, the revolution of the engraved cylinder forms one continued impression, from one end of the piece to the other, in which there are consequently no joinings. This is a great advantage, especially in small and delicate patterns, where a variation of a hair's breadth in the joint is readily perceived; but its great superiority over the flat press consists in the economy of time and labour. With a well-constructed cylinder-press, and proper arrangements for accelerating the work, one man and a boy will print 200 pieces, of 28 yards each, in the same time that a flat press man will print 12 pieces, or a block printer 8; that is, in one day. They are constructed to work one, two, and even three colours, but are generally confined to one; the difficulty and delay in adjusting the several cylinders to each other, when more than one colour is worked, counteracting, in great measure, the chief advantage of the machine. For a description of these presses, and the mode of working them, see *Press*. See also the article *ENGRAVING*.

COPPERAS, a term employed popularly and by the old chemists as synonymous with vitriol. Of Copperas there are three kinds, the *Green* or Sulphat of IRON, the *Blue* or Sul-

phat of COPPER, and the *White* or Sulphat of ZINC, which see.

The former is distinguished in common by a variety of names, as Martial vitriol and Roman vitriol, but most commonly by the names of green copperas or green vitriol. It is seldom made by the direct combination of sulphuric acid with the oxyd of iron, which constitutes this substance, except for the purposes of experiment in the laboratory of the chemist. The common, as well as the refined, is manufactured on the large scale, as an article of commerce, in the neighbourhood of collieries, and is in some instances found native. It was known to the ancients, as Pliny informs us, (N. H. l. xxiv. c. 12.) and denominated by them Misy, Sory, or Calcanthum. Concentrated sulphuric acid has scarcely any action on iron; when it is heated the acid is decomposed, part of its oxygen combines with the iron and sulphurous acid gas is evolved, but when diluted sulphuric acid is added to iron filings, a violent effervescence takes place, and hydrogen gas is disengaged; in this process the water, with which the acid is diluted, is decomposed, the oxygen of which combines with the iron; and converts it into an oxyde; whilst the hydrogen escapes in the form of gas, the solution is of a green colour, and by evaporation affords crystals of sulphat of iron which are transparent, of a fine green colour, in the form of rhomboidal prisms, having an acid astringent taste; this salt almost always reddens vegetable blues, is very soluble; two parts of cold water, or less than its weight of boiling water, being sufficient for its solution.

The mode of preparing it, as an article of commerce, is pursued principally, as before observed, in the neighbourhood of coal pits, in many of which a substance is found in great abundance, which, though injurious to the coal, forms nevertheless a valuable material as being the basis of copperas, known by the name of pyrites or brasses; these are carefully separated from the coal, and the expence which this labour occasions, is amply repaid by the produce of the manufacture; the process is at once simple and economical, and does honour to the intelligence of those who first suggested it. A large area of ground is inclosed, to which a gentle but sensible declivity is given; the surface is made quite equal, and covered with an unctuous clay, which is every year extended and smoothed, as if plastered, in order to prevent the water from filtrating into the earth; at the same time a furrow is formed in the middle of the area, for collecting all the water in one point, and conveying it to a reservoir; the area being thus prepared, the pyrites are spread all over its surface, in layers one above another to the height of several feet; care is taken in placing the different pieces to leave intervals for the admission of the air: now as these pyrites contain iron in combination with sulphur, when they are exposed to the alternate action of water and the atmosphere, they undergo a material change, the water is decomposed, one of its constituent parts, namely, the oxygen, combines with the sulphur, and forms sulphuric acid, or oil of vitriol; the hydrogen escapes into the atmosphere, by this means a saline powdery mass is formed, the taste of which is aultere and styptic; the decomposition is materially assisted by occasionally turning the pyrites with rakes having long iron teeth, like those used in Glasgow and neighbouring places, for stirring the boiling ingredients of the glue maker, by which means new surfaces are presented to the action of the atmosphere. In summer, when it is long dry weather, it is necessary to sprinkle the brasses frequently with water, to wash away the salt which is already formed, and also to produce that humid warmth which accelerates still further the decomposition; gentle showers are therefore excellent for bringing forward this part of the operation. The water loaded with vitriol,

finding

finding a clay bottom, which prevents its losing itself in the earth, flows down the inclined plane, and falls into the reservoir, in which a quantity of old iron is placed, purchased principally from the smiths and the coopers, as their refuse. It is well known that, during the decomposition of the pyrites, more sulphuric acid is produced, than the iron contained in them will neutralize; the refuse iron is therefore placed in the reservoir and the liquor run upon it, in order to combine with the superabundant acid. The natural evaporation which takes place here adds to its strength, and, when it is conceived to be properly prepared, it is drawn off into a second reservoir, attached to the workhouses of the manufactory; from thence it passes into leaden boilers, where it is made to boil and evaporate by a large fire, formed of the most inferior kind of coal; when the liquor is brought to a proper state, it is run out by syphons, or drawn out by pumps, into long wooden troughs, where it is crystallized by the operation of cold, the crystals attaching themselves to twigs and branches of trees, which are suspended in the troughs for the purpose by being hung over pieces of wood, several of which are laid across the top of each trough; from these branches they are taken and dried, and are then ready for the market.

Refined Copper is an improvement in the mode of preparing coppers, and was discovered by the late Mr. Thomas Barnes, of Walker, near Newcastle-upon-Tyne, a coal viewer of the first eminence in that neighbourhood; this is effected by merely evaporating still further than in the common mode the water of crystallization, and attending throughout the whole process to a little more cleanliness and exactness in the manipulations.

Two or three men are sufficient to manage a manufactory of either kind, and to produce a great quantity of the articles; considering which, and the rate it sells at, at present (1806) from 10 to 14*l.* per ton, it ranks with the most beneficial manufactories.

Amongst the few places in which this salt is found native, we shall only notice that at Hurlet near Paisley, in a stratum of schistus, sunk through in 1789 to a seam of coal, pyrites abound so much, that native coppers is sometimes found; it does not in this instance lie in any regular bed, but is interperched through the stratum, and separated from the coal by the workmen. These works were established in 1753 by a company of gentlemen from Liverpool, for the sole purpose of making alum, but finding both pyrites and native coppers, they added the manufacture of that article also.

COPPERAS stone. See PYRITES.

COPPER Mine, in Geography, a large river in the central parts of N. America, reckoned to be the most northern in the American continent. Pursuing a northern course, it falls into the sea in N. lat. 72°, and W. long. 120°, according to Mr. Hearne, and 113° according to the position assigned it by Mr. Arrowsmith. In 1771 Mr. Hearne arrived at this river, who found that it flows into the Arctic ocean, or rather, as he intimates in the preface to his book, published in 1795, into an inland sea like that of Hudson. From his journeys, performed in 1769—1772, we may infer, with a great degree of confidence, that the search after a N. W. passage is not likely to succeed. Upon his arrival at the copper river, on the 14th of July 1771, the savages who attended him murdered, in a shocking manner, some of his families. On the 17th he was within sight of the sea; and commencing his survey, pursued it to the mouth of the river, which he found so full of shoals and falls, that it was not navigable even for a boat, and that it emptied itself into the sea over a ridge or bar. As the tide was out, he perceived

by marks on the edge of the ice, that it flowed about 12 or 14 feet, and of course could reach but a little way within the river's mouth, and he found the water perfectly fresh. He concluded that this river ran into the sea, or some branch of it, by the quantity of whalebone and seal-skins which the Eskimos, (or Etiquimaux) had at their huts, and also by the number of seals which he saw on the ice. It has been suggested that, as he did not taste the water, which seems somewhat surprising, this sea, or branch of it, as he conceived it to be, might have been a fresh water lake. Seals, it is observed, are not uncommon in the sea of Daikal; and the whalebone might have been procured in barter. The supposed tide is not unknown on occasion of high winds in the southern lakes. However this be, Mr. Hearne says, that he had an extensive view of the sea, and that, from the mouth of the river, it was full of islands and shoals, as far as he could see with the assistance of a good pocket telescope. The ice was not then broken up, but was thawed for about $\frac{1}{2}$ of a mile from the main shore, and to a little distance round the islands and shoals. The Eskimos here were of a dirty copper colour, and rather shorter in stature than those to the south. Their kettles were made of lapis ollaris, of a mixed brown and white; and their bat-lets and knives were of copper. The dogs have sharp erect ears, sharp noses, and bushy tails, being a fine breed of that sort. Many kinds of sea fowl were observed: and in the ponds and marshes swans, geese, curlews, and plovers. The quadrupeds are mink, cattle, rein-deer, bears, wolves, wolverenes, foxes, Alpine hares, squirrels, ermins, mice. Mr. Hearne, in the prosecution of his survey, visited one of the copper mines, about 30 miles S.E. from the mouth of the river, which was merely a hill that seemed to have been rent by an earthquake, or perhaps by subterraneous water. The copper is found in lumps, and is beaten out by the help of fire and two stones.

COPPER-Mine hills, hills of N. America, in N. lat. 68° 30'. W. long. 112°.

COPPET, a small town of the Pays de Vaud, in Switzerland, delightfully situated on the banks of the lake of Geneva, 12 miles N. of Geneva. It is an ancient Swiss barony, comprising eight villages besides the town; its territory produces excellent red wine. The castle which commands the lake sustained an obstinate siege in 1536 against the troops of Berne, who at last reduced it to ashes. In the year 1657, the barony of Coppet was bought by Frederick, count of Donau. He rebuilt the castle in a modern style, but his son sold the estate to an inhabitant of St. Gall, from whose descendants it was purchased some time before the French revolution by the celebrated Necker, who expended large sums in embellishing a seat, the situation of which is truly enchanting, and where he closed his chequered career. He left it to his daughter, the baroness of Stahl Hollein, whose name is dear to French literature, and who was banished to this estate in 1807, for having produced the interesting novel of Corinna. *Durand.* Statistique Elémentaire de la Suisse 1795.

COPPI, JACOPO, in Biography, considered by Lanzi the same person with *Jacopo del Migliò*, was born in the Florentine state in 1523, and was employed, in concurrence with the other expert mannerists of his school, in the large altar pictures of the church of Santa Croce at Florence. If, however, we may judge from the critiques of Borghini and other writers, his merit upon this occasion appeared less conspicuous than in some small pictures of fabulous subjects, which formed part of the ornament of a chœur executed, under the inspection of Vasari, the chief of the Florentine school of that period, for the prince Francesco de Medici: but his masterpiece is a picture representing the crucifixion

in the church of St. Salvatore at Bologna, which, according to Lanzi, is nowise inferior to the finest works of Vasari himself, and may indeed rank with the best productions of the Bolognese artists prior to the Caracci. It is dated 1579. The artist died in 1591. Lanzi. Storia Pittorica.

COPPICIE, in *Rural Economy*, a low sort of inclosed wood, which is cut over at stated periods, for different purposes.

These sorts of woods, wherever there is much demand for the various small stuff which they are capable of affording, yield considerable returns to their owners; particularly where proper care is taken in fencing and preserving them against live stock.

In cases where new coppices are to be raised, it is necessary to bestow great attention on the nature of the soil, and the exposure of the land; adapting the trees and plants to the nature of these, as much as possible; and at the same time, taking into consideration the sorts that are the most useful, and most in request in the particular district or vicinity: as this sort of wood is in general disposed of to the greatest profit and advantage, where there is little trouble of carriage. The ground should be well drained, where it is inclined to be wet, and also well inclosed from the cropping of cattle. Some likewise advise, that where it is covered with bushes or briars, that they should remain to shelter the young growth of wood; and that if there happen to be a moderate quantity of young oak and ash-trees on the spot, to let them stand by all means: always keeping in mind how necessary shelter is for the growth of wood of all kinds and sorts. But that as newly planted coppice-woods, where all the plants are of the same age, there is not the same reason for letting them stand before they are stocked off for underwood, as for young trees planted to fill up old woods. Those which are intended for underwood may, in such newly planted woods, be cut off when planted, or at any age from eight to fourteen years, without injury. Indeed, young woods should not stand too long previous to the first cutting. It is observed in the seventh volume of the Letters and Papers of the Bath Society, that the kinds of wood to be planted in coppices, either in making new ones, or filling up old ones, should be regulated partly by the demands of the country, but chiefly by the peculiar aptitude of the soil and situation to produce particular sorts. Let nature be the guide, says the writer, in planting, and you will seldom do wrong. Particular soils and particular situations will always favour particular kinds of trees: we need not look for the reason, but only for the fact.

The chalk hills of Hampshire are peculiarly proper for beech; the stony loams and clays of the same county, for oak and ash; the mossy steep sides of the Wiltshire downs, for hazel; and the sands of the same district, for ash; the rugged and smooth naked rocks of Mendip, in Somersetshire, produce the lime tree and the walnut in the greatest luxuriance; and on the highest parts of the same Mendip hills, where no other tree can stand the sea-breeze, fycamore flourisheth as well as in the most fertile valley. Taking the general demand of counties, and the peculiarities of different soils, into consideration, it is asserted that there is no kind of wood so generally proper for planting in coppices as ash: the value of ash-poles being at least one-third more, and frequently as much again, *per hundred*, as that of other poles, as being applicable in all ways to some useful purpose or other; the timber being always in request, and saleable at any age or size, at almost the price of oak; and the wood itself being as quick a grower as any, and quicker than most; and, above all, there being but few soils, from the blackest and wettest bogs to the highest and most exposed mountains,

where it will not grow, are reasons why ash is one of the most profitable woods to plant in such coppices as are favourable to its growth. In soils and situations where ash does not grow kindly, let such other sorts of wood be planted as appear to thrive best in similar soils and situations in the same county. Spanish chestnut, though not so general a grower as ash, is a most excellent wood, either for timber or underwood, and wants only to be more known to be higher in estimation. It partakes much of the properties of oak, but excels it in two points, namely, that it grows faster, and that the sap part of the timber is firmer and less corruptible. To fill up woods that are become thin by age or neglect, the proper time is one year, or at the utmost two years, after the underwood is cut. The young plants should be eight or ten feet high, and an inch and an half diameter at the ground, and should be planted without cutting off. If the soil be dry, no other preparation is necessary than barely digging the holes for the plants; if wet, deep drains should be made, to take off the superabundant water. The earth dug from these drains should be thrown out on the lower side of them, and upon this new earth the plants should be planted. If land of this latter description be black and peaty, ash is peculiarly proper for it; and will, if planted on the earth thrown from the drains, make a most surprising progress. If it be a stiff yellow clay, it is generally more favourable to the growth of oak than of ash. In such soils, oak for timber, with a mixture of willow, birch, alder, and Spanish chestnut, for underwood, will perhaps be the most proper. All these kinds should stand one round of the underwood; and if still weak, should stand two, before those are cut off which are intended for underwood. Birch plants are indeed an exception to this rule: they should always be cut off the first round of the underwood; for, if they are large when cut off, the stocks frequently decay and die. In all mixtures of kinds of wood for coppices, those sorts should be used which are not unfriendly to each other, and which will come round fit to be cut together at the same periods; and such kinds should be allowed to stand for timber, and that at such distances as to injure the underwood as little as possible. The plants for filling up old decayed woods of the coppice kind, should be the strongest and best of their kinds. Those which are weak at first will be drawn up by the surrounding underwood, and become, from their increased height, still weaker. At the next cutting of the underwood, they will be blown down; or, if cut off, the shoots will be too weak to grow up with the other underwood. Oak, ash, and Spanish chestnut, should be kept in a nursery for this purpose. Alder and birch plants grow plentifully spontaneously in some countries, and may be taken up for use; if none such are to be obtained, they may be raised from seed sown on a moderate hot-bed, in the open air. Alder is sometimes propagated by taking up old roots, and dividing them into several parts; and hazel may be propagated the same way. Willow is generally planted in cuttings; but a much better way, where there are any old willow stocks, is to slash down the shoots, and fill up the vacant places round such old stocks. The wild cherry, which will grow on almost any soil, and is easily propagated, makes an exceedingly good underwood, though as yet it is but seldom used for that purpose.

It is remarked by the author of *Modern Agriculture*, that the coppice-woods, when the shoots are young, whether of oak, ash, elm, or birch, or a mixture of these with other sorts, are very little attended to in any part of the island, fencing being the only particular which marks the difference between a good and a bad manager. But, he says, when the wood can be sold for different useful purposes, at various

stages of its growth, as is the case in many parts, an essential improvement in the management of coppices might be introduced with great propriety. In all such situations, it would be profitable to the owners, were the stools thinned two or three times between each general cutting. The weedings or thinnings would do much more than defray the expence, while, by admitting a more free circulation of air, and by cutting off the supernumeraries, the principal stools would advance more rapidly, and become by that means fit for sale, perhaps, two or three years sooner than they do by being allowed to remain in a neglected state. This is a circumstance that particularly merits the attention of those who are favourably situated, in regard to market, for the various productions of coppices; as saving two or three years in the regular cuttings would materially enhance the value of the land so occupied.

He further states, that several other improvements in the management of coppices might certainly be effected, were the owners to bestow due attention. It frequently happens, that, from mismanagement in cutting, many of the stools become useless, while scraggy thorns, brambles, &c. are allowed to spring up, and occupy the place of more valuable plants. Were the owners of coppices in general to permit their labourers, or other industrious poor people in the neighbourhood, to dig up the decayed stools and useless brushwood for fuel, under condition that they plant healthy vigorous stools in their places, the coppices by this management would necessarily become more valuable. Much damage also frequently happens from allowing the underwood to remain scattered over the surface of the wood, for a considerable time after it is cut. Every person must be sensible, that if the cuttings are allowed to remain in this situation till after the young stools begin to spring, it is scarcely possible to remove them without breaking or otherwise injuring these tender sprigs. In all auctions of coppices, it ought, therefore, to be an article of sale, that the whole should be carried off the premises in a limited time; and the forester, or wood-officer, should receive injunctions to see this condition of the sale strictly fulfilled.

Much greater care is requisite, the same writer says, in cutting coppices properly than the owners, in many cases, are disposed to bestow. It cannot be supposed, when fifty or a hundred purchasers, with their assistants, are allowed to use their axes with no other view than to cut the wood which they have purchased, without regard to the success of what may be called the next or following crops, that any regard will be bestowed as to the proper manner of cutting. It is certainly of much importance, not only for the future vigour, but also for the durability of the stools, that the stems or stools should be cut in that manner which experience has proved most effectual for answering both purposes. The stools ought to be cut as low as possible, without injuring the stools. When that practice is adopted, the stools remain nearly even with the ground, and consequently in a much better state of preservation than by cutting the stems at the height of six, eight, or ten inches; as, by this method of cutting being frequently repeated, the stools get in process of time, as he has frequently seen, to the height of several feet above the surface soil. Another common error, and which wood-cutters of the above description may be supposed very guilty of, is to leave the butt ends of the stems jagged and uneven, and part of the bark torn off, or loosened all the way down to the stool, than which nothing can be more injurious. The butt-ends of the stems ought rather to be brought to a point in the middle, and the bark remain quite close and firm, otherwise dews and rain drop into the hollows, and either rot or otherwise prove ruinous

to the future health and vigour of the stools. In short, to render a coppice both valuable and lasting, a larger system of management ought to be adopted. For the reasons mentioned above, they ought to be thinned two or three times between every general cutting. The useless brushwood ought to be rooted out, and other more useful plants substituted. Where too much water abounds, drains ought to be opened; the fences at all times kept in a substantial state of repair; and on no consideration whatever should the purchasers of coppices be allowed to cut down the woods. Men employed by the owners, and who are properly bred to the business, ought only to be employed; who, by bestowing proper pains in dressing and pruning the butts and stools as they go along, would thereby ensure the springing of numerous and vigorous stools the following season.

The periods of cutting coppice underwood must be regulated, it is observed in the work first mentioned, by the luxuriance of its growth, and by the demand of the country, and the uses to which the wood is to be applied when cut: but, in general, the common rule of trade will hold good here, *viz.* "that small gains and quick returns make the dealer rich, but long credit ruins." In the article of underwood, not only the interest of money, but the loss of the succeeding growth, tells against the value of standing wood after it is fit to cut, and makes it doubly the advantage of the owner to cut his underwood as early as it is saleable. As soon, therefore, as any kind of wood is fit for the uses of the country, it should then be cut; unless it can be made appear, that it will pay compound interest for standing longer, or, in other words, will pay not only the simple interest of the first value, but also the loss of so many years growth of the wood, as so far advanced towards another crop. Wood merely for fuel can scarcely be cut too young. Hazel is usually fit for hurdles and dead hedges, from nine to twelve years old; ash for sheep-crisbs, at the same age; and ash and other woods for hop-poles, from eleven to fourteen years old: while ash for carpenters, and other large uses; alder, birch, and willow, for rafters, turner's uses, patters, clogs, coal-pit uses, &c. must stand from sixteen to twenty years, before the poles are large enough for their respective purposes. It therefore behoves every owner of woods of the latter description, unless he is public-spirited enough to give up his own profit to the good of the public, to consider well before he suffers his wood to stand to the age of sixteen, eighteen, or twenty years, whether the value of such wood, when cut younger, and sold for other purposes, added to the interest thereof up to the usual period of cutting, and the gain by the growth between these two periods, will not more than equal the value the wood will be of, if suffered to stand so long; and if so, whether he ought not to cut his wood at shorter periods. He will have this additional satisfaction, that, by more frequent cuttings, his wood will be the less liable to decay, by the strong stools smothering the weak ones, as is before explained: and will have an opportunity of letting up more saplings for timber than he could otherwise do. There are many opinions respecting the most proper time of the year for cutting underwood; but there is one rule which, on the seller's part, is without exception, *viz.* that the older the wood is, the later in the spring it should be cut. When old wood is cut early in the winter, and a hard winter follows, the damage done to the stools is very great: young flourishing wood will bear cutting at any time. But on the part of the buyer, it is allowed that all woods are more durable, when cut in the most stagnant state of the sap; and in all cases where bending is required, such as hurdles, hoops, and even dead hedges, the wood cannot be cut too early in the winter, being,

ing, if cut when the sap is rising, brittle, and unfit for those purposes. Oak underwood will, at the present price of bark, pay well for standing till the sap is up for barking it; and it seldom happens that the stocks are injured by cutting it so late in the year.

The best way of disposing of coppice-underwood, to answer the purpose of the seller, is, in the opinion of this writer, to cut it at the seller's expence, before it is sold; to lay it out in ranges or drifts, according to the custom of the country; to value it in that state, and sell it in such sized lots as the number of buyers may warrant: always keeping up a sufficient number to make a competition, and particularly to oblige the buyers to clear the whole out of the wood by the 24th day of June; and never to suffer them to bring their horses into the woods, after any new shoots are shot out, without muzzling them, or at least tying up their heads.

But in the View of Modern Husbandry, Mr. Donaldson thinks, that the more approved method of disposing of coppice, or other under-sized wood, is that which is practised in Northamptonshire. When the season for cutting arrives, which is during the winter months, or before the sap begins to ascend, that operation is performed by people employed by, and who work under the direction of, the owner of the woods or his agent. The part of the wood intended to be sold, is parcelled out into regular sized lots, to suit the convenience of the intended purchasers. The whole of the underwood, growing upon each lot, is indiscriminately cut, and laid in one direction. As soon as the operation of cutting is completed, and the wood parcelled out in a proper manner, a valuation is put on each lot or parcel according to its quality, and the whole is then sold by public auction to such persons as incline to become purchasers, who, over and above the price of the underwood, repay the expence of cutting. This is, however, by no means the general mode in which woods of this description are cut. It is a very common, but a very bad, practice, to sell the coppice under the condition that the purchasers are to be at the expence of cutting it down. This is often performed in such a careless manner, that the stools are so greatly injured, that they either rot or die, or a few weak stunted shoots only spring up.

The price of coppice or underwood varies so exceedingly, that it is almost impossible to form any idea of the value of the acre. Perhaps 8 or 9*l.* may not be far from the average price of coppices, not remarkably situated in regard to market, and when they are cut every twelve or fourteen years. But the value of coppices depends on many circumstances; as the roots of wood, the uses to which they are applied; the price of bark, &c. In some parts of Kent, where hop-poles are in great request, an acre of coppice will yield sometimes 30 or 40*l.* at a cutting. Whereas in Scotland, where the coppices are for the most part oak, and where the wood is chiefly used for fuel, or converted into charcoal, the value of the coppices consists almost entirely in the quantity and quality of the bark, the wood being little more than sufficient to defray the expence of cutting and peeling.

Mr. Mustall, in his "Management of Landed Estates," has remarked, in respect to stub or coppice wood, that "the proper harvesting it as of timber, depends on situation and other circumstances. And that the age or size of cutting must ever be guided by the demand in a given district; whether it be for the use of coal-mines, or for cord-wood, hop-poles, hoops, sticks, faggot-wood, or other ware.

"The mode of disposal is," says he, "to be determined

upon by the succeeding crop. If the land be intended to be appropriated wholly to coppice wood, it is generally the most eligible to dispose of the crop, as it stands, by auction or proposal. But if seedling plants are to be set out for timber stands, or the young shoots from the stubs to be trained up, in the grove manner, it is requisite that a proprietor should employ his own people in reaping the crop, and making it up into such wares as are the most saleable and profitable.

"In cutting down coppice-woods, the main observances are," he thinks, "to cut them in season, to take off the stems, clean and smooth, with upward strokes of the axe, and that the stubs may shoot with the greater certainty; and to cut them off as low as conveniency will allow, in order that the shoots may be few and vigorous."

COPPICE-WOOD, is that sort of small woody growth, which is raised in inclosed woods of the coppice kind, and which is converted to various purposes of the farmer and manufacturer, such as cord-wood, hop-poles, hoop-stuff, hedge-stuff, faggot-wood, and various other ware.

COPPLE-STONES, in *Natural History*, globuli lapidei, rotule lapideæ, boulder-stones, rolled-stones, or pebbles, as some call them, are rounded and worn fragments of stones and rocks, that are not invested with an exterior stony crust or skin, occasioned by concentric laminæ of the stone, but shew the internal plane laminæ broken off and rounded at their edges by attrition. It is of the utmost consequence, in all researches relating to the strata of the earth, to distinguish carefully between copple or boulder-stones, and original nodules of the strata.

COPPY, in *Rural Economy*, is a term sometimes provincially applied to signify a wood of the coppice kind. Thus to coppy, in some districts, signifies to cut over for underwood.

COPRATAS, in *Ancient Geography*, a river of Asia, in the Persian territory, mentioned by Strabo and Diodorus Siculus; the latter of whom says, that it discharged itself into the Tigris.

COPRIA, a name given by Strabo to a shore of Sicily before Tauromenium, because the wrecks of vessels that were lost in the gulf of Charybdis were collected in this place.

COPROCRITICA, from κοπρος, excrement, and κριτα, separate; medicines which purge away the excrements in the guts.

COPROPHAGOS, from κοπρος, and φάγω, I eat; the dung-fly, in *Natural History*, the name given by many authors to the common yellowish fly found on human excrements. There are several other species found on the excrements of various animals, and thence called *meridivora*.

COPROSMA, in *Botany*, (from κοπρος, dung, and σμα, smell, alluding to the offensive smell of the first species.) Forst. Gen. 69. Linn. jun. Supp. 24. Schreb. 1503. Juss. 205. Lam. Ill. pl. 854. Class and order, *polygamia monœcia (pentandria digynia)*; Linn. jun.) Nat. Ord. Rubiaceæ, Juss.

Gen. Ch. *Hermaphrodite flowers*. Cal. Perianth inferior, one-leaved, short, five-toothed, permanent. Cor. monopetalous, bell-shaped, much larger than the calyx, five, six, or seven-lobed; segments acute, erect. Stam. Filaments five, six, or seven, capillary; anthers oblong, bifid at the base, erect, a little incurved, acuminate. Pist. Germ superior, oblong; styles two, filiform, slightly cohering at the base, longer than the corolla, divaricated; stigma simple. Peric. Berry ovate-globular. Seeds two, flat on the inner,

ner, and convex on the outer side, separated from each other by the pulp of the berry. *Male flowers, Cal., Cor., and Stam.,* as in the hermaphrodite. *Pist.* abortive.

Ess. Ch. Calyx one-leaved, five-toothed. Corolla five, six, or seven-cleft. Stamens five, six, or seven. Styles two, long. Berry with two seeds.

Sp. 1. *C. fetidissima*. Forst. Fl. Aust. 138. Linn. jun. Supp. 178. Mart. 1. Lam. 2. "Flowers solitary." A very fetid shrub. 2. *C. lucida*. Forst. Fl. Aust. 137. Linn. jun. Supp. 178. Mart. 2. Lam. 1. "Peduncles compound." A perfectly smooth shrub, resembling phyllis in its habit. Leaves opposite, petioled, egg-shaped, acuminate upwards and downwards, quite entire. *Stipule* interfoliaceous, solitary, combining the leaves, acute. *Peduncles* axillary, solitary, opposite, two-leaved, terminated by heads of pedicelled flowers. Calyx and corolla greenish. Both the species are natives of New Zealand.

COPSE, in *Agriculture*, a term applied to the regulating iron apparatus, which is fixed to the end of the beam of a plough, and to which the team is attached. These irons are of very different forms and constructions according to circumstances.

COPTIS, in *Botany*, (from *κοπτος, scindo*; a name taken from the cut leaves of the plant.) Linn. Transf. vol. viii. p. 305. A genus formed by Mr. Salisbury for *Helleborus trifolius* of Linnæus, which differs from the other hellebores, in having a caducous corolla. See *HELLEBORUS trifolius*.

COPTIS, in *Ancient Geography*. See **COPTOS**.

COPTITES Nomos, a nome of Egypt, extending along the bank of the Nile, which derived its name from *Coptos* or *Ceptis*, its capital.

COPTOSKILL, in *Geography*, a town of America, in the state of New York; 42 miles N. of New York.

COPTOS, Coptus, or Coptis, in *Ancient Geography*, now *Kepht*, a city of Upper Egypt, three miles distant from the Nile, and connected with it by a navigable canal. It was the centre of communication between Egypt and the Red Sea, by a N.E. route to Myos Hormus, situated on the western coast of the Red Sea, and by a S.E. course to Berenice, which was the staple of the trade with India. If Plutarch is to be credited, Isis, upon receiving the news of the death of Osiris, cut off one of her locks in token of grief; and hence the place was named Coptos, which, in the Egyptian language, is said to denote want or privation. This city was inhabited both by the Egyptians and Arabians, and Piny calls it the emporium of commodities brought from India and Arabia, which were conveyed by the Nile to Alexandria. Piny mentions Juliopolis, as being two miles distant from Alexandria, and says that from Juliopolis to Coptos, the voyage of 303 miles was performed in 12 days, when the northerly winds blew; the distance between Berenice and Coptos was, according to the same author, 258 Roman miles, and the journey was performed in 12 days. The road, however, lay through the desert of Thebais, almost entirely destitute of water; but Ptolemy Philadelphus not only repaired the road, but made provision for supplying the want of water by searching for springs; and wherever these were found he built inns, or more probably in the eastern style caravanseras, for the accommodation of merchants. (Strabo, lib. xvii. p. 1157.) In this channel the intercourse between the east and west continued to be carried on during 250 years, as long as Egypt remained an independent kingdom. The Christians were formerly very numerous in the city of Coptos. The rubbish of this ancient city may fill a circumference of two

miles, and sufficiently evinces its former extent. Amidst the ruins are seen several small columns of grey granite lying on the ground, and some large stones, engraved with hieroglyphics. Near it is also a small part of a bridge over the canal by which water was conveyed from the river into a large basin. This place has occasionally afforded medals, small statues of earthen-ware, pieces of rock crystal, and precious stones.

COPULA, in *Logic*, a verb that connects any two terms in a proposition, either negative or affirmative: as, *A rose is sweet*; where *is* is the copula.

COPULATION. See **COITION**, **CONGRESS**, and **CONSUMMATION**.

COPULATIVE Propositions, are those which include several subjects, or several attributes joined together by an affirmative or negative conjunction.

Thus, v. gr. *Poverty and riches do not make a man happy*. Where *and* is the conjunction that couples *poverty* and *riches*.

COPULATIVE Conjunction. See **CONJUNCTION**.

COPY, in *Law*, a transcript of a writing or instrument, made for the use and satisfaction of some of the parties concerned; or in order to preserve the memory thereof. See **COPIA**.

The copy of an inrolled deed is admitted in evidence; but not the copy of a will of lands nor the probates, nor of a common deed where the original may be procured. Few ancient documents do now subsist otherwise than in copies.

COPY is also used for an imitation of any original work; particularly a painting, draught, figure, &c.

The following process for taking a copy of a recent MS., was communicated to the Philomatic Society at Paris, by M. Charles Coquebert. It consists in putting a little sugar in common writing ink, and with this the writing is made on common paper, sized as usual, when a copy is required; this unsized paper is taken and lightly moistened with a sponge. The wet paper is then applied to the writing, and a flat iron, such as is used by laundresses, of a moderate heat, being lightly passed over the unsized paper, the counter-proof or copy is immediately produced. This process is the more interesting, as it requires neither machine nor preparation, and may be used in any situation. That sugar prevents ink from speedily drying, has been long known (see **INK**); and this method of impression has been used in some of our public offices, and elsewhere in England, for some years.

COPY, among *Printers*, denotes the manuscript or original of a book given to print from.

To cast off a copy, is to make a computation of the number of sheets a manuscript will make in print.

In the bookellers' style, a *good copy* is that which produces a saleable book.

Tenant by COPY of court roll. See **TENANT**.

COPY-HOLD, is a tenure for which the tenant has nothing to shew but the *copy* of the roll made by the steward of the lord's court.

The steward of the court is, among other things, to inroll and keep a register of all such tenants as are admitted to any parcel of land, or teneement, belonging to the manor; and the transcript is called the *copy of the court-roll*, which the tenant keeps as his own evidence.

This tenure is called a *base tenure*, because the tenant holds, in some sort, at the will of the lord. Fitzherbert says, it was formerly called *tenure in villenage*; and that *copy hold* is but a modern name.

This is the land which the Saxons called *folk-land*, as being held *sine scripto*, in contradistinction to *bock-land*, or *charter-land*, *terra ex scripto*, and now *free land*, or *free hold*.

However, it is not simply at the lord's will, but according to the custom of the manor; so that if the copy-holder doth not break that custom, and forfeit his tenure, he seems not to stand at the lord's courtesy. These customs are infinite; varying in one point or other, almost in every manor.

Copy-holders are, in reality, no other but villeins (see *VILLEIN*), who, by a long series of immemorial encroachments on the lords, have at last established a customary right to those estates, which before were held absolutely at the lord's will.

This affords a very substantial reason for the great variety of customs that prevail in different manors, with regard both to the descent of the estates, and the privileges belonging to the tenants. By various means the generality of villeins in the kingdom have long sprouted up into copy-holders; their persons being enfranchised by manumission, or long acquiescence; and their estates, in strictness, remaining subject to the same servile conditions and forfeitures as before; though, in general, the villein-services are usually commuted for a small pecuniary quit-rent. In some manors the copy-holders were bound to perform the most servile offices; as to hedge and ditch the lord's grounds, to lop his trees, and reap his corn, and the like; the lord usually finding them meat and drink, and sometimes, (as is still the case in the highlands of Scotland) a minarel or pipe for their diversion. Thus also, in the kingdom of Whidah, on the coast of Africa, the people are bound to cut and carry in the king's corn from off his demesne lands, and are attended by music during the whole time of their labour. See *WHIDAH*.

The custom of the manor is the life of copy-hold estates; for, without a custom, or if copy-holders break their custom, they are subject to the will of the lord; and as a copy-hold is created by custom, it is also guided by custom. (4 Rep. 21.) A copy-holder, whilst he performs his services, and doth not break the custom of the manor, cannot be ejected by the lord; if he be, he shall have trespass against him:—but if a copy-holder refuse to perform his services, it is a breach of the custom, and forfeiture of his estate. Some copyholders hold by the *verge* in *ancient demesne*; so that though they hold by copy, they are a kind of free-holders; some others hold by common tenure, called “mere copy-hold,” whose land, upon the commission of felony, escheats to the lord of the manor.

It should be recollected, however, that copy-hold land cannot be made at this day; for the foundation of a copy-hold is, that it hath been demised time out of mind, by copy of court-roll; and that the tenements are parcel of, or within the manor. 1 Inst. 58. 4 Rep. 24.

Estates held by copy of court-roll, and not at the will of the lord, have been deemed free-hold by lord Coke (1 Inst. 59 b.) and also by others; and by way of distinction from the ordinary kind, they have been denominated “customary free-holds.” Tenants of this description have claimed the right of voting at the election of the knights of the shire. But the stat. 31 Geo. II. c. 14, enacts, that no person holding by copy of court-roll, should have this privilege.

In some manors, where it has been the custom to permit the heir to succeed the ancestor in his tenure, the estates are styled “copy-holds of inheritance;” in others, where the lords have been more vigilant to maintain their rights,

they remain “copy-holds for life,” only; for the custom of the manor has, in both cases, so far superseeded the will of the lord, that provided the services be performed or stipulated for by fealty, he cannot, in the first instance, refuse to admit the heir of his tenant upon his death; nor, in the second, can he remove his present tenant, so long as he lives, though he holds nominally by the precarious tenure of his lord's will. If the lord refuses to admit, he shall be compelled in chancery. (2 Cro. 368.) And if the lord refuse to admit a surrenderee, on account of a disagreement about the fine to be paid, the court of B. R. will grant a mandamus to compel the lord to admit without examining the right to the fine. (2 Term Rep. 484.) But that court will not grant a mandamus to admit a copy-holder by descent; because, without admittance, he has a complete title against all but the lord. (2 Term Rep. 198.) Copy-holds descend, according to the rules and maxims of the common law (unless in particular manors there are contrary customs of great antiquity); but such customary inheritances shall not be assets, to charge the heir in action of debt, &c. (4 Rep. 22.) though a lease for one year, of copy-hold lands, which is warranted by the common law, shall be assets in the hands of an executor. (1 Vent. 163.) Copy-holders hold their estates free of dower, being created by custom, which is paramount to title of dower. (4 Rep. 24.) By particular custom, there may be dower and tenancy by the curtesy. (Cro. Eliz. 361.) There may be an estate-tail in copy-hold lands by custom, with the co-operation of the stat. W. II. And as a copy-hold may be entailed by custom, so by custom the tail may be cut off by surrender. (1 Inst. 61.) A copy-hold may be barred by a recovery, by special custom; and a surrender may bar the issue by custom. A fine and recovery at common law will not destroy a copy-hold estate; because common law assurances do not work upon the assurance of the copy-hold; though copy-hold lands are within the stat. 4 Hen. VII. c. 24, of fines and proclamations, and five years non-claim, and shall be barred. (1 Rol. Abr. 506.) Copy-holds are not within the statute 27 Hen. VIII. c. 10, of jointures; nor stat. 32 Hen. VIII. c. 28, of leases; copy-holds being in their nature devisable only by copy; they are not within the statute of uses; nor are copy-holds extendible in execution; but they are within the statute of limitation of actions, and the statutes against bankrupts. The lord shall have the custody of lands of idiots, &c. And a copy-holder is not within the act 12 Car. II. c. 24, to dispose of the custody and guardianship of the heir; for, if there be a custom for it, it belongs to the lord of the manor. (3 Lev. 395. 1 Nelf. Abr. 492, 522.) A copy-holder cannot convey or transfer his copy-hold to another, otherwise than by *surrender*; which see.

A manor may be held by copy of court-roll, and the lord of such manor may grant copies; and such customary manor may pass by surrender and admittance, &c.

The fruits and appendages of a copy-hold tenure, which it hath in common with free tenures, are fealty, services, (as well in rents as otherwise,) reliefs, and escheats. The two latter belong only to copy-holds of inheritance, the former to those for life only. Besides these, copyholds have also heriots, wardships, and fine. See each of these articles. See also *FORFEITURE*, *FREENHOLD*, *SURRENDER*, and *TENURE*.

COPY-HOLDER, is defined by West, a person admitted tenant of any lands, or tenements, within a manor, which, time out of mind, by the use and custom thereof, have been devisable to such as will take the same by copy of court-roll, according to the custom of the said manor.

COPYING of LETTERS, and other writings. The celebrated Dr. Franklin made several essays, many years ago, for speedily multiplying the copies of his own hand-writing, which he exhibited to M. Alexis Rochon, of the French National Institute, and director of the Marine Observatory at the port of Brest: an account of which he has given in his memoir on the Typographic Art. This method consisted in writing upon smooth paper, with ink containing much gum, which was afterwards lanced with emery, or powder of cast-iron, and by means of a rolling-press, such as is used by the copper-plate printers, the strokes of the writing were transferred to a plate of rose copper or pewter. This plate supplies as many copies as the depth of the engraving can allow; but the copies are far from being beautiful, and the ground is spotted and spoiled. Before Dr. Franklin's process was communicated to M. Rochon, he showed him that by writing with a steel point on a copper-plate previously varnished, a more satisfactory result might be obtained, by etching the strokes with nitric acid to a sufficient depth, for the subsequent use of a liquid ink similar to that of the printers. In this case, the plate may be wiped without precaution, and twelve or more copies may be pulled off upon coarse paper. These proofs are foul and reversed; and, therefore, in order to have them neat and in the proper direction of the writing, it becomes necessary to place the same number of leaves of white paper, wetted and prepared, upon the twelve proofs; and while the ink is still fresh, the whole being passed together through the rolling-press, the same number of leaves of counter-proofs are obtained as there were proofs; so that instead of twelve turns of the press, thirteen will be required to supply twelve counter-proofs, very black, neat, and legible, even when the plate has not been perfectly wiped. This method is certainly not to be compared with fine engraving; but it may be useful in military operations, and all other cases in which a speedy multiplication of copies is required. No precaution is here necessary; whether the nitrous acid be more or less strong, or remain a longer or shorter time upon the plate, or whether the plate be somewhat heated to increase the strength of the solvent, the process of the operation will never fail; provided the steel point made use of to trace the characters through the varnish, shall lay the copper perfectly bare. It is of advantage that the nitric acid should bite deep, because the counter-proofs are, by these means, much darker. The plate need not be well wiped, because it is of no consequence whether the proof which is used to afford a counter-proof should be very clean, provided that it does not spot the copy intended to be procured. The most liquid kind of printers ink may be used. See ENGRAVING and STEREOTYPE.

In 1780, Mr. James Watt, of Birmingham, obtained a patent for a new method which he had invented to this purpose; of which the following description is given in his specification: Let the letter or other writing, that is intended to be copied, be written with the ink hereinafter described, or with any other writing-ink fit for the purpose. Take a piece, or pieces, of thin paper which contains no size, or glue, or gummy or mucilaginous matter, or which at least does not contain so much size, or other matter, as would make it fit for being written upon. Cut this paper, or papers, to the size and shape of the writing of which a copy is wanted; moisten or wet the same thin paper with water, or other liquid, by means of a sponge or brush, or by dipping, or otherwise. Having moistened or wet the thin paper, lay it between two thick unglazed spongy papers, or between two cloths, or other substances capable of absorbing the superfluous moisture from the thin paper; when it

has been slightly pressed between such thick spongy papers, or other substances, by the hand or otherwise, lay the said thin paper, so moistened and pressed, upon or under the side of the writing which is to be copied, and in such manner that the one side of the said moistened paper shall be in contact all over the side of the said writing, so intended to be copied; and that to the other side of the said moistened thin paper, there shall be applied a piece of clean writing-paper, or cloth, or other smooth uniform substance. Lay the said writing intended to be copied, with the thin moistened paper intended to receive the copy, (placed respectively as above directed,) upon the board of a common rolling-press, or of that of which a description and drawing are hereunder written and drawn, and press them once, or oftener, through the rolls of the said press, in the same manner as is used in printing by copper-plates; or, instead of using the said or any rolling-press, squeeze the said papers, placed respectively in the manner above described, in a screw-press; or subject them to any other pressure sufficient for the purpose; by means of which pressure, in whatever manner applied, part of the ink of the writing intended to be copied shall press from the said writing into, upon, and through, the said thin moistened paper, so that a copy of the writing, more or less faint, according to the quality of the ink and paper employed, shall appear impressed on both sides of the said moistened paper, *viz.* upon one of the sides in the natural or proper order and direction of the lines, as they are in the original writing, and on the other side in the reverse order and direction. But, in order to make the impression or copy of the writing more strong, legible, and durable, it is proper and useful to moisten the said thin paper, which is to receive the copy or impression, with the following liquor, instead of water or other liquid, and to proceed in all other respects as is above directed; or to moisten the said thin paper with the following liquor, and to dry the said paper, and, when a copy of a writing is required to be taken, the said paper, thus previously prepared and dried, ought to be moistened with water or other liquid, and to be proceeded with in all other respects as has been directed. The said liquor to be used for moistening the said thin paper, or for preparing the said paper previously to its being used, is made in the following manner: Take of distilled vinegar two pounds weight, dissolve in it one ounce of the sedative salt of borax; then take four ounces of oyster-shells, calcined to whiteness and carefully freed from their brown crust, put them into the vinegar, shake the mixture frequently for four-and-twenty hours, then let it stand until it deposits its sediment; filter the clear part through unglazed paper into a glass vessel, then add to the said mixture or solution two ounces of the best blue Aleppo galls bruised, and place the liquor in a warm place, shaking it frequently for twenty-four hours: then filter the liquor again through unglazed paper, and add to it, after filtration, one quart, *ae* measure, of distilled or other pure water. It must then stand twenty-four hours, and be filtered again if it shews a disposition to deposit any sediment, which it generally does. The liquor, thus compounded and prepared, is to be used as hath been directed.

N. B. In place of the vinegar, any other liquor impregnated with a vegetable acid may be used; and, in place of the galls, oak bark, or any other vegetable astringent, or substance which is capable of becoming black, or deep coloured, with solutions of iron; and, in place of the oyster-shells, any other pure calcareous earth may be used. But if the impressions are not wanted to be very black, and the writing ink is good, water itself may be used to moisten the thin paper, as herein first directed. It may be found necessary

fary to add more or less water, in the preparation of the above liquor to be used for moistening the thin paper, or to vary the proportions of the other ingredients, according as they are more or less perfect strong, or as the impression is required to be more or less deep coloured. The writing-ink, which the patentee uses for letters or writings intended to be copied, is prepared as follows: Take four quarts, ale measure, of spring water; one pound and a half, avoidupoise weight, of Aleppo galls; half a pound of green copperas or green vitriol; half a pound of gum-arabic; four ounces of macealun; pound the solid ingredients, and infuse them in the water six weeks or two months, during which time the liquor should be frequently shaken; strain the liquor through a linen cloth, and keep it in bottles, closely corked, for use.

Plate III. *Miscellany*, *fig. 1.* represents a front or end view of the rolling-press invented by Mr. Watt, and referred to in the above specification. A B C is one of the ends of an iron or wooden frame, which serves to connect the two rollers. D, D, are two wooden or metalline rollers, turned extremely exact, or truly cylindrical, and which are mounted on iron axles, firmly fixed in them. E E is a double-ended lever, by means of which the roller, on whose axle it is applied, may be forcibly turned round. F F represents the board of the rolling-press, on which the writings to be copied are to be laid. N N is a piece of cloth, or other elastic pliable substance, placed next the roller, and above the writings to be copied; and the board, G, is a strong plank of wood, or plate of metal, serving to connect the two end-pieces of the frame at bottom. H H represents the edge of a common table, to which the press may be fastened by the iron screw-cramps I, I. K is a slit, of which there is one in each end-piece of the frame; these slits are filled with elastic steel, or other metalline springs, or with some other elastic substances which serve to press the two rollers forcibly together. L is a brass bolster, supported upon the springs, and serving to support the end of the axis of the under roller.

Fig. 2. represents a side view of the rolling-press, in which A B, A B, are the two end-pieces of the frame. D, D, are the two rollers. E is the double-ended lever. G is a strong plank, or plate of metal, which forms the bottom of the frame. H H is the table on which the press stands. I is one of the iron cramps which fasten the press to the table; and M is a bar of iron which connects the upper part of the frame.

Fig. 3. represents a screw-press, which may be used, instead of the rolling-press, in taking off impressions from writings. A A is a double-ended lever. B B the screw. C a block of wood, or metal, which the screw acts upon, and which is attached to it. D D the frame of the press, made of iron or wood. E E is a moveable board, on which the writing to be copied is to be laid, with a cloth over it. F F the bottom or sole of the press, made of wood or metal. Be it remembered, that these presses are made of different sizes, according to the sizes or largeness of the writings intended to be copied. Those now referred to are drawn from one sufficiently large to take an impression from a folio page of writing or post paper, and are drawn to a scale of one inch and a half for each foot, or one-eighth of their natural size.

Fig. 4. represents one of Hawkins's patent polygraphs, for making two or more copies of any writing at once. A A B, is an upright frame, from the upper piece of which is suspended a double parallel ruler, D D, E E; *dd, ee,* is another similar parallel ruler, of which *fig. 5.* is a plan, fastened to the board, F F, of the instrument. These two rulers are connected to a stout bar, G; the vertical one, D D E E, by pivots at the end of the bar, H,

fig. 4. going into holes in the projecting part of two pieces of brass, *gg,* at each end of G; and the horizontal one, *dd ee,* by pivots at the ends of its corresponding bar, *b,* working in holes in another arm of the same brasses. The pens are connected with the bar, G, by a curved brass limb, *a,* turning on a screw put through the bar, G, as a centre. On the other side of the bar is a short arm, *b,* in the same piece with the limb: this is jointed at its upper end to the end of a small rod, *i,* the other end of which is jointed to another exactly similar limb, carrying the other pen. The pens are fitted into a small tube, called the pen-tube, having a shoulder at its upper end. This fits tight into another tube, in the same piece with the curved limb, and is pushed in as far as the shoulder of the pen-tube will allow.

The weight of the machinery is suspended by eight small spiral springs, I, fastened to a ring fixed to the bar, G; their upper ends are connected with the end of a double jointed lever, K, which can follow the motion of the bar, G, without stretching the springs too much. The rod, L, by which the perpendicular motion is suspended, turns upon pivots working in pieces of brass beneath the piece, B: the right-hand one is called a regulator, and has two screws, one moving the pivot vertically, and the other horizontally, for adjusting the instrument. The two bars, *ee,* of the horizontal motion are connected with *dd* by pivots at the end of *b,* so that *dd* can be lifted up without moving the other, whose weight is supported upon two small brass wheels *ii.* The frame, A A B, when the instrument is not in use, turns down on the board, F F, and is kept fast by a spring lock, which is opened by pushing in a round button, *k.* The frame now forms the sides, and the front board becomes the lid, and, when shut down, is locked by a lock, M. In explaining the use of the instrument, we cannot do better than copy the printed directions fold with the instrument. Choose two goose quills, taking care they are of the size wanted; make them into pens, and put them into the pen-tubes. Having introduced them with the nibs first, apply the shoulder end of the pen-tube against the semi-circular hollow, in the upright part of the gauge, Q, *fig. 4.* and push the pen through the tube, till the nib reaches a line drawn across the end of the gauge; slide the pen-tube into the fixed socket, until the shoulder of the pen-tube stop it, holding by the fixed socket, and not by the work, so as not to strain the machinery. If the polygraph is in order, the pens will now write, draw, or copy whatever may be required, with the greatest exactness. To prove the machine's being in order, bring the pens to the upper part of the paper, and try if they both touch; if not, with a small screw-driver turn the perpendicular screw of the regulator, till they touch equally. Bring the pens to the bottom of the paper, and move the horizontal screw till they both touch. When a pen wants mending, nothing more is necessary than to take the pen-tube out of the socket, and mend the pen, gauge it, and return it into the socket again. When the machine is out of use, wipe the pens clean, and place the left one, with the curved limb, on the hook beneath the horizontal rulers. Let down the frame, A A B, which falls up by a spring-lock, and at the same time raises the writing-board, which then becomes the lid of the portable case for the polygraph.

The patent now belongs to Mr. Farthing, Cornhill, who manufactures the instruments.

These instruments are made with three, four, and five pens, and answer the purpose very well.

COPYIST, in *DIPLOMATIC SCIENCE*, signifies a transcriber or copier of deeds, books, &c.

COMPOSIT, a transcriber of *Musick*. Whatever improvements have been made in literary typography, no music printed

Printed with types has equalled that of writing, engraving, or stamping. Rousseau has extended this article to a greater length than seems necessary. It is indeed necessary for a *copyist* to know practical music well, and to be sufficiently acquainted with composition to avoid gross mistakes himself and detect them in others; to write a neat and legible hand; to know the Italian and French technic, to form all the characters in a bold and clean manner; and, by understanding the language of music, leaving no bar incomplete, by omission or redundancy. These seem to be all the necessary requisites of a good *copyist*, if to them be added care and accuracy, particularly in forming a score, where quantity must be attended to in the exact arrangement of the notes over each other. Music has long been very neatly engraved in France, on copper; and in Holland, though less neat, with more force and distinctness: 60 or 70 years ago, the Dutch editions of the works of Corelli were much sought all over Europe; and 30 or 40 years ago, there was no music printed in Italy or Germany; all was MS. By which employment so many *copyists* obtained a livelihood, that it was thought a cruelty to shorten labour by the press; as in the first attempts at erecting silk and cotton-mills. Works in literature, till the invention of the press, must have been disseminated very slowly by transcription; perhaps by the medium of the press works of little merit, and of corrupt and noxious principles, have been too easily multiplied, and put in circulation. And indeed cheapness has not been eventually the consequence of musical typography, stamping, or engraving; as printed music is now dearer than written was, early in the last century.

COPY-RIGHT. See *Literary Property*.

COQ. *ad med. consumpt.* an abbreviation among Physicians, signifying that the thing is to be boiled till half of it be consumed.—*Cog.* in *S. Q. Ag.* implies it to be boiled in a sufficient quantity of common water.

COQUALLIN, in *Zoology*, the *SCIURUS variegatus* of Gmelin, and *varied squirrel* of Pennant.

COQUANTOTOTL, in *Ornithology*, a bird of the warmer climates of America, described by Seba under this name: it is a small crested-bird, shaped like a sparrow; the *PIPPA Grisea* of Gmelin, the *manacus cristatus griseus* of Brisson, and the *gray manakin* of Latham.

COQUAR, the variety *hybrida*, ϵ . of Gmelin's *PHASIANUS Colechicus* and the pied-pheasant of Hayes's British birds.

COQUATOTOTL of Hernandez and Ray, the variety ϵ . of Gmelin's *AMPELIS garrulus*, the *chatterer* of Carolina of Edwards and Catfishy.

COQUES, GONZALO, in *Biography*, a painter who was born at Antwerp in 1618, and became the disciple of David Ryckaert the elder. He soon gave proofs of extraordinary talents in small pictures; and the early friendship which he formed with the son of Ryckaert, whose name was likewise David, did not a little contribute to rouse his emulation, and quicken his diligence. His first essays, after the example of his master, were domestic subjects and conversations, in the manner of Teniers and Ostade; but his admiration of the works of Vandyke, soon caused him to adopt a style, in which the beautiful and picturesque grouping of his former models acquired additional interest, by being united to greater elegance and dignity of character. In this manner he painted a picture for Jacques Le Mercier, a rich merchant of Antwerp, which gained him great applause. It represented his employer with his wife and children at table: the painter himself was introduced in profile. From this period he devoted himself princi-

pally to the painting of small portraits, which he executed with such delicacy and happy effect, that excepting Vandyke, no artist of his time enjoyed a greater reputation. He was employed by the court of Brussels, Charles I. king of England, and several other potentates. He died in 1684, leaving considerable riches to his family. Descamps.

COQUET, in *Geography*, a river of England, in Northumberland, which runs into the sea seven miles S. E. of Alnwick, at Hawkfley, and is navigable for about 12 miles up to Warkworth bridge.—Alto, a small island of England, in the German ocean, about a mile in circumference, near the coast of Northumberland. It was taken by the Scots in the reign of Charles I. N. lat. 55° 13'. W. long. 1° 36'.

COQUETTE, a female character, no less contemptible than odious; against the iniquity of which Mr. Osborne, in his excellent treatise, "On the Duties of the Female Sex," cautions his readers in the following descriptive and unpressive terms. "To delude a young man by encouraging his attentions for the pleasure of exhibiting him as a conquest, for the purpose of exciting the assiduities of another person, or from any motive except the impulse of mutual regard, is a proceeding too plainly repugnant to justice, and to delicacy of sentiment, to require much observation. On such subjects, even inadvertence is highly culpable, what then is the guilt of her, who deliberately raises hopes which she is resolved not to fulfil!"

COQUILLADE, in *Ornithology*, the *ALAUDA undata* of Gmelin and *undated lark* of Latham.

COQUILLES A BOULETS, shells or moulds for bullets. They are made either of brass or iron. Two of them are required for the casting of a cannon-ball. And they never join or close so effectually, as to prevent the liquid metal when poured in from running somewhat out at the seam, where they join. This small part of the metal, or excess of the bullet, is called the beard, which is broken or knocked off to make the ball perfectly round.

COQUIMBO, or *LA SERENA,* in *Geography*, one of the 13 provinces of Chili in South America. This is a rich, verdant fruitful valley, not far from the coast of the South Sea, producing corn sufficient for considerable exportation to Lima, and abounding with various mines. One mine of copper, situated about 5 leagues N. from the town of Coquimbo on mount Carro Verde, or Green Hill, rises to a considerable elevation in form of a sugar-loaf, and serves as a land-mark to the port. The climate is singularly agreeable, being almost uniformly mild and serene.

COQUIMBO, or *La Serena*, the capital of the fore-mentioned province, was the second town built by Valdivia, in the kingdom of Chili, in 1544, for the purpose of maintaining an intercourse between Peru and Chili, in order to procure a regular supply, and to secure the fidelity of the Indians who lived in that valley. The town stands about $\frac{1}{2}$ of a league from the sea in a most delightful situation, commanding an extensive prospect of the sea, a river of the same name, and the country, and presenting to view a charming variety of fields, with different kinds of grain and woods of a lively verdure. The town is large but not proportionably populous; the number of families not amounting to above four or five hundred, consisting of Spaniards, Mestizos, and a few Indians. The streets are conveniently wide, intersecting one another from north to east, and from east to west, so as to form squares of buildings, with intervals for gardens. The houses are constructed with mud walls and covered with leaves, and each of them is provided with a large garden, planted with fruit trees and excellent vegetables.

vegetables. It has several parish churches, and three convents, and also a town-house, where the Alcaldes and Regidores meet, who, with the corregidor, form the corporation. On the north side of the town runs the river; after flowing in various meanders through the whole valley of the same name; and, by canals cut from it, furnishes the town with water, which is principally applied to preferve the fertility and beauty of their gardens. The river at its mouth forms a very fine bay, where ships lie safely and commodiously, though the coast is rocky; some islands lying fo as to keep off the winds. S. lat. 29° 52'. W. long. 71° 59'.

COR, in *Geography*, a town of Chinese Tartary, in the desert of Cobi. N. lat. 44° 16'. E. long. 93° 29'.

COR, in *Anatomy*. See HEART.

COR, Fr. CORNO, Ital. in *Misic*. A HORN.

COR de *Chasse* is a very long and instructive article in the *Encycl. Meth.*; but the plates, to which the reader is frequently referred, not being yet published, the precepts for performing on the instrument, if translated, would not be intelligible.

COR, in *Natural History*. See CHAMA.

COR Caroli, in *Astronomy*, an extra-constellated star of the second magnitude in the northern hemisphere, situated between the Coma Berenices and Ursa Major; so called by sir Charles Scarborough, in honour of king Charles I.

COR Hydrae, a star of the second magnitude, in the heart of the constellation HYDRA.

COR Leonis, or *Regulus*, a fixed star of the first magnitude, in the constellation LEO.

COR Scorpii. See ANTARES.

COR Anguinum, in *Natural History*, a species of ECHINUS found only in a fossil state.

COR Bovis. See CARDIUM ACULEATUM.

COR Marinum, the name of one of the classes of the *echini marini*, the characters of which are, that the anus is placed in the side of that point of the shell which appears as if cut off; and the mouth has two lips, and is placed in the third region of the axis of the base. Klein's *Echin.* p. 34.

COR Venaris, *Venus's heart*. See CARDIUM CARDISSA.

CORA, in *Ancient Geography*, a town and Latin colony of Italy, in the country of the Volsci, according to Virgil, Silius Italicus, and Livy; now *Cori*. This is a town of Latium on the left of the Appian way. S. E. of Velitæ. By its ruins we may conclude, that it was a place of importance: among these we discover a temple of Castor and Pollux, and an aqueduct for conducting water, &c. The ancient walls are still remaining.—Also, a town of Italy, situated in a promontory of Etruria. Justus Lipsius says, that in the passage of Tacitus which mentions it, we ought to read *Cosa*, which is not improbable.

CORAAE, CORAAGIUM, in our *Old Customs*, a kind of imposition extraordinary, growing upon some unusual occasion; and it seems to be of certain measures of corn; for *corus tritici* is a measure of wheat. *Bracton*, lib. ii. cap. 116. num. 6. who, in the same chapter, num. 8. has these words: "Sunt etiam quædam communes præstationes, quæ servitia non dicuntur, nec de consuetudine veniunt, nisi cum necessitas intervenerit, vel cum rex venerit; sicut sunt hidagia, coraagia, & carvagia, et alia plura de necessitate et ex consensu communi totius regni introducta, &c."

CORACA, or CORACE, in *Ancient Geography*, a town of Arabia Petraea. Ptolemy.

CORACE, in *Geography*, a river of Naples, which runs into the gulf of Squillace; four miles south of Balicastro.

CORACESIUM, a fortified place of Asia in Cilicia, according to Piny and Strabo; the latter of whom says, that it was situated on a rugged rock at the extremity of Cilicia.

CORACIAS, in *Ornithology*, a genus of the order, *Pica*, or Pies. The birds of this genus have the bill sharp at the edges, the tip incurvated, and the base bare of feathers; tongue cartilaginous and bifid; feet formed for walking.

The coracias genus comprehends only those birds which are known by English writers under the title of *Roller*, amounting altogether to between twenty and thirty species. In Dr. Latham's synopsis it is observed, that the bill of the roller is straight, bending towards the tip, with the edges cultrated; the nostrils narrow and naked; and the legs for the most part short, with the toes placed three before and one behind, the whole of which are divided to their origin. It differs from the corvus, or crow tribe, chiefly in the nostrils being destitute of reflected bristles, and having the legs shorter. Brisson makes a particular genus of pies under the name of coracias, including those birds of the Linnæan genus corvus which have the beak a little bent or arched. The coracias of the late French writers, it may be likewise remarked, belongs to the corvus genus both of Gmelin and Latham, as for example, the corvus graculus (*Cornish chough*) and corvus eremita (*Hermit crow*), &c. of the two last mentioned writers are referred to the coracias genus by the French.

The roller tribe is not confined to any particular part of the world like some other genera of birds, but the far greater number of its species are found in warm climates.

Only one species of the roller has been yet discovered in England, the *garrulous roller*, *coracias garrula*.

GARRULA. Blue, back red; quill-feathers black. Linn. Fn. Sv. Common roller. Penn.—Donov. Brit. birds. *Pica marina* et *garrulus argenteatensis*, Ray. *Galgulus*, Brisson. *Rollier*, Buffon. *Gazza marina*, Zinn.

A beautiful bird, in size somewhat inferior to the common jay; the head, neck, breast, and belly are of a fine blueish-green, the back and scapulars reddish-brown; coverts on the edge of the wing rich blue; the tips of the quill feathers dusky above, beneath blue; the tail forked with the two middle feathers obscure green, the rest blue with the tip on the outer edge black; legs short and dirty yellow.

This species inhabits various parts of Africa, and Europe, but in greatest numbers in the warmer regions; in the north of Europe they are uncommon, in England very rare. It has obtained the name of garrulous roller in allusion to its chattering noise. The species is of the migratory kind, gregarious and timid, and builds in trees, particularly the beech. In the south of Germany it is seen in flocks in autumn, in company with the rooks and other birds searching for worms, small seeds and roots, in tilled, or cultivated grounds.

BENGALENSIS. Somewhat fulvous, beneath blueish; neck beneath violet with paler streaks; tail entire. Lath. *Coracias bengalensis*, Linn. *Galgulus mindanensis*, Briff. *Rollier de Mindanao*, Buff. *Le cui*, ibid. Jay from Bengal, or Bengal Pyc, Albin. *Bengal roller*, Lath.

Inhabits Bengal and the ile of Mindanao. Dr. Latham observes that it does not essentially differ from the following species, the chief difference being the rufous violet colour on the breast, and the want of the long outer tail-feathers. The bengalensis, he thinks, may be perhaps the female or a young bird, as the long tail-feathers of coracias caudata do not appear till the second year. Lath. Gen. Syn.

530. In Ind. Orn. of the same writer, since published, these two birds are considered as distinct species.

CAUDATA. Somewhat fulvous, beneath bluish; neck beneath violet, streaked with paler; the outer tail-feathers very long. Linn. *Galgulus angolensis*, Buff. *Rollier d'Angola*, Buff. *Long-tailed roller*, Lath.

A native of Angola, and measures fifteen inches and a half in length.

SENEGALA. Reddish fuscous; beneath, head, tail, and upper part of the wings bluish sea-green; face white, shoulders and quill-feathers blue; exterior tail-feathers very long. Lath. *Coracias senegalensis*, Gmel. *Rollier de Senegal*, Buff. *Swallow-tailed Indian roller*, Edwards. *Senegal roller*, Lath.

This is rather less than the common jay. The bill black; the whole space round the base of the bill white; head and under parts of the body, the upper parts of the wings, and tail, bluish-sea-green; shoulders and quills deep blue; the outer tail-feathers of great length as in the last species; hind part of the neck, and the back of a reddish-brown; the legs of a reddish-flesh-colour. It inhabits Ceylon and Senegal.

ABYSSINICA. Rufous-brown; head, neck, body beneath, and wing-coverts green; shoulders, greater quill-feathers, and rump blue; outer tail-feathers very long. Lath. *Coracias Abyssinica*, Gmel. *Rollier d'Abyssinie*, Buff. *Abyssinian roller*, Lath.

The bill of this bird is black; tip of the upper mandible much bent; sides of the head from the nostrils to a little beyond the eyes are white; the rest of the head, neck, and under parts of the body fine green; the two middle feathers of the tail are dusky, with a gloss of blue especially down the middle, the outer ones blue-green: the two exterior tail-feathers are five inches longer than the rest, and the end, beyond the extremity of the others, of a fine deep blue; the legs are red-brown. A native of Abyssinia.

ORIENTALIS. Green; throat striated with bluish; tail-feathers black at the tip. Lath. Linn. *Galgulus indicus*, Buff. *Rollier des Indes*, Buff. *Oriental roller*, Lath.

A native of the East Indies. Its size is that of a jay, the length ten inches and a half; the bill yellowish, broader at the base, and more hooked than in any of the genus; the head and hind part of the neck brown; back, rump, and scapulars, with the wing and tail-coverts, green-brown; throat fine blue; down the shaft of each feather a pale line, the other parts beneath blue-green; quills blue and black, with a large pale blue spot. The wings are longer than in the other species of roller; the tail even at the end, the two middle feathers green at the base, with the other part black; legs yellowish with black claws.

INDICA. Blue, fore-part tawaceous; cap green. Linn. *Blue jay* from the East Indies. Edwards. *Indian roller*, Lath.

The length of this bird is eleven inches. The bill is dusky, an inch and a half in length; the crown of the head blue-green; throat, breast, neck, and back, reddish-brown, with the sides of the head and throat darkest, streaked with white; rump and tail, with the under parts from the breast, fine cyanous blue; the middle feathers of the tail green, the outer ones blue at the bottoms and tips, in the middle sea-green; the wings green and blue. A native of Ceylon.

CAFFRA. Blue, exterior edge of the quill-feathers pale yellow. Linn. *Cape roller*, Lath. Inhabits Ethiopia; an obscure species described on the authority of Linnæus.

VIVIDA. Entirely of a molt vivid blue. Lath. *Coracias cyanea*, Gmel. *Ultramarine roller*, Lath.

Length of this species eight inches; the bill dusky. Native place unknown.

MADAGASCARIENSIS. Purp'e-brown; rump, vent, and tail bluish-green; tail towards the tip marked with a purplish band, tip and quill-feathers dark blue. Gmel. *Rollier de Madagascar*, Buff. *Madagascar roller*, Lath.

A beautiful species found in Madagascar. The length of this bird is ten inches; the bill is very stout at the base, rather short and of a yellow colour; the legs reddish-brown.

MEXICANA. Reddish-grey; beneath and on the wings pale grey mixed with flame colour. Gmel. *Galgulus mexicanus*, Buff. *Merula mexicana*, Seba. *Rollier de Mexique*, Buff. *Mexican roller*, Lath.

Larger than a thrush, and inhabits Mexico.

PUELLA. Blue, collar in front, and at the side, with the breast, belly, quill-feathers, and greater wing-coverts black. *Fairy roller*, Lath.

Size of a blackbird, and inhabits India.

STRATA. Blue-black, streaked with greenish-blue; bill, tail, and legs, black. Lath. *Coracias striata*, Gmel. *Blue-striped roller*, Lath.

The length of this bird is eight inches. The female cinereous-grey and not streaked like the male; quill-feathers black, edged with cinereous; irids pale red. A native of New Caledonia.

SINENSIS. Green, beneath yellowish-green, tail cuneated, and white at the tip. Gmel. *Galgulus sinensis*, Buff. *Rollier de la Chine*, Buff. *Chinese roller*, Lath.

Inhabits China, and is called at Canton Sau-ta-hoang. The size is that of a jay, the length eleven inches and a half; the bill and irids are red; head, and hind part of the neck, back, rump, and upper tail-coverts green; through the eyes on each side is a black stripe; the underparts from the chin to the vent yellowish-white tinged with green; wing-coverts olive-brown; quills the same with a mixture of chestnut in some, and others tipped with white; the tail resembles that of a magpie in form, and is marked at the tip of every feather with a white spot; the legs and claws are pale red, and longer than in other rollers.

VAGABUNDA. Head and neck black; body above ferruginous-brown, beneath cinereous; middle of the wing white; tail very long, wedge-formed, greyish with the tip black. Lath. *Grey-tailed roller*, Lath.

This is a native of India; the length is seventeen inches; its bill black; legs cinereous; lesser wing-coverts rusty brown; greater and secondary quill-feathers white, the primary ones black.

CAYANA. Tawny-green; beneath dirty white; eyelids white; chin with a black streak each side; tail cuneated. Gmel. *Grievet, ou rolle de Cayenne*, Buff. *Cayenne roller*, Lath.

Inhabits Cayenne, and measures about nine inches in length, the bill is reddish; legs long and grey.

DOCILIS. White interspersed with reddish; beneath chestnut; legs pale yellow; tail-feathers black with the tips white. Gmel. *Docile roller*.

Size of a blackbird, and inhabits the southern parts of Asia. The bill is yellow; the nine first quill-feathers white as far as the middle and from thence black, the rest entirely black; claws flesh colour.

NIGRA. Body and limbs entirely black; tail long. Gmel. *Black roller*, Lath.

Length sixteen inches; bill thick, and with the legs black; tail seven inches. Native country unknown.

AFRA. Tawaceous red; beneath reddish-purple; vent blue-green; wing and tail-feathers blue, with the tips blackish. Gmel. *African roller*, Lath.

Length

Length eight inches and a half; the body stout, bill yellow; legs brown. A native of Africa.

MELANOCOPHALA. Blue-purple; head and neck black; body beneath white; quill-feathers fuscous; tail emarginated and white at the tip. Gmel. *Black-headed roller*, Lath.

Size of a crow, bill and legs red; nape pale grey; two middle tail-feathers blue, the rest purplish, and the whole white at the tip. Inhabits China.

STRERPERA. Black; spot on the wings, vent, base, and tip of the tail black. Lath. *Noisy roller*.

This is an inhabitant of Norfolk island in the Pacific ocean, where it occurs in vast numbers; it has the reputation of being a silly bird, and is very noisy in the night. The length is nineteen inches, of which the bill is two inches and a half long, somewhat straight, black, denticulate, and horn-coloured near the tip; nostrils naked, long, and placed near the base of the bill. The first six quill-feathers are white at the base; the tail long and rounded, the larger feathers white at the base, the lateral ones white at the tips within. When the wings are folded they reach as far as the middle of the tail. The legs are black, the outer toe connected at the base to the middle one.

VARIA. Black; beneath, lower part of the back, rump, and upper tail coverts white; tail black, equal, with the tips of the feathers white. Gmel. *Cassican de la Nouvelle Guinée*, Buff. *Pied roller*, Lath.

Length about thirteen inches; the bill two inches and a half long, and of a bluish colour with the tip dark; legs lead colour. A native of New Guinea. This bird partakes of characters common to the oriolus, coracias, and ramphastus genera, and might with some propriety be referred to either. In the index ornithologicus it is placed with the coracias tribe.

CORACINSII, in *Ancient Geography*, a people who inhabited the northern part of the isle of Sardinia.

CORACINUS, in *Ichthyology*, the name of a ten-fish caught in the Mediterranean, and called by some authors *skiena*, and by Aldrovand and Salvian *umbra*. It is of the colour of the common tench, but in figure more approaches to the perch: its scales are small; its mouth not very large, but well furnished with teeth; and its tail is not forked, but when extended, seems of a roundish figure; the ends of the rays or nerves of the tail-fin are black, and the other fins are all black, and seem as if dyed with ink.

CORACINUS Brasiliensis, the *LABRUS Cromis* of Gmelin, and *Guatucupa* of Maregrave. Found in Carolina.

CORACIUS Mons, in *Ancient Geography*, a mountain of Asia Minor in Jonia, situated near the town of Colophon. Strabo.

CORACLE, a fishing boat of curious construction used in Wales for time almost immemorial. These boats afford a specimen of the earliest British navigation, and they are used at this time on many of the rivers in Wales, probably without any deviation from their original form. They are made with very strong basket-work, and covered with hides, or coarse canvas, with a thick coating of pitch. Their shape is oval and resembles the section of a walnut-shell, their length is generally five feet, and their breadth seldom less than four. They contain only one person, who sits precisely in the middle, and by dextrous management maintains his just balance. The instrument with which he moves his boat is a paddle; one end of which rests upon his shoulder, and the other is employed by his right hand, in making a stroke alternately on each side. The left hand is, in the mean while, employed in conducting the net, and he holds the line between his teeth. These vessels were anciently used, as the means of intercourse between the inhabitants on the opposite banks of

the rivers. They are now applied only to the purpose of fishing. So frail an invention would probably have been succeeded by something of greater strength and capacity, had not there been found a remarkable convenience in their lightness. The fisherman, when his labour is finished, slings his boat across his back, and marches homewards under the burden of his machine and booty. There is scarcely a cottage in the neighbourhood of the Tivy in South Wales, or several other rivers in those parts, abounding with fish, that has not its coracle hanging by the door. Such is the adroitness of those who use them, that they are very rarely overturned on lakes or rivers; and they sometimes even venture a little way out to sea, when the weather is perfectly calm. Similar to these in their nature are the Indian canoes; though they are constructed of different materials and forms, and applied to different purposes.

CORACOBRACHIALIS, in *Myology*, a muscle of the shoulder-joint, arising by a tendinous and fleshy origin from the apex of the coracoid process of the scapula, and connected for some extent with the short head of the biceps. It passes downwards and backwards, to be inserted into the inner side of the os humeri about the middle of the bone. The musculo-cutaneous nerve generally penetrates the fibres of the muscle; whence it has been called the *miculus perforatus* Cassirii. It will move the os humeri towards the side; it will elevate the bone, and carry it obliquely forwards across the front of the chest. It may rotate the os humeri outwards, particularly if that bone has been previously turned inwards.

CORACODES, in *Ancient Geography*, a port of the W. coast of the island of Sardinia. Ptolemy.

CORACHOYHOIDEUS, in *Myology*, a term applied to the omohyoides muscle, for which see **LARYNX**.

CORACOIDES, in *Anatomy*, a small sharp process of the scapula; so called from its resembling a crow's bill.

The word comes from *κοραξ*, *corvus*, and *ειδος*, *imago*. The coracoides is placed in the upper part of the neck, and projects over the head of the bone of the arm. It serves to strengthen the articulation of the shoulder; and gives origin to one of the muscles of the arm.

CORACOMANTES, from *κοραξ*, *crow*, and *μαντις*, *divination*, in *Antiquity*, a kind of diviners, who made their predictions by observing the crows.

CORACONESUS, in *Ancient Geography*, an island of the Mediterranean sea, towards the coasts of Libya. Steph. Byz.—Also, a place of Peloponnesus, in Arcadia; situated, according to Pausanias, where the river Ladon discharged itself into the Alpheus.

CORACORADIALIS, a name given by Winslow to the biceps flexor cubiti. See **BICEPS**.

CORADI, or **CURADI**, **OTTAVIO**, in *Biography*, a Bolognese painter, the scholar of Giacomo Cavedone. His principal excellence consisted in the boldness and truth with which he copied the works of his master. He flourished in 1630, and is said by Pilkington to have died in 1643. Malvasia, Orlandi.

CORAH, or **CORAH-JENEHABAD**, in *Geography*, a small city of Hindoostan, or capital of a province in the Doob, or country between the rivers Ganges and Jumnah; subject to the nabob of Oude; 184 miles S.E. of Agra, and 67 S.S.W. of Lucknow. N. lat. 26° 10'. W. long. 80° 50'. When lord Clive assumed the government of Bengal, in 1755, he restored to Sujah Dowlah all the conquests that had been gained from him, except the provinces of Corah and Allahabad, which were reserved as part of an establishment for the emperor, or great Mogul. The Corah provinces were valued at 30 lacs. The emperor was to reside at Allahabad, under the protection of the English, to whom,

in reality, be owed all that he possessed; and a treaty offensive and defensive was entered into with Sujah Dowlah, nabob of Oude. The ambition of the emperor was not satisfied; but after about six years quiet residence at A lahabad, he put himself into the hands of the Mahrattas, who promised to feat him on the throne of Delhi. The immediate consequence of this connexion was a cession of the Corah provinces to the Mahrattas, who, unless the English had interposed, would have established themselves in that important angle of the Doab, which commands the navigation of the upper part of the river Ganges, and the whole course of the Jumnah. On this occasion, the British government considered the Corah, &c. p. ovinces, which, by right of conquest, were originally theirs, as having reverted to them again, when they were alienated from the purposes for which they had been originally granted to the emperor; and applied to the aggrandisement of a power inimical to them and their allies. They, therefore, resumed the possession of these provinces, and immediately ceded them to the nabob of Oude, for a valuable consideration. See OUDE.

CORAL, in *Botany*, *arbor non spinosa*; Pct. Rai. See *ERYTHRINA cristata gali*.

CORAL *arbori affinis*; Sloan. See *SOPHORA occidentalis*.

CORAL *arbor americana*; Com. See *ERYTHRINA corallo-dendrum*.

CORAL *carolinensis*; Dill. See *ERYTHRINA herbacea*.

CORAL *arbor polyphylla*; Sloan. See *PISCIDIA erythrina*.

CORAL, in *Zoology*, a general English name for zoophytes of the Isis tribe, or those whose animal resembles a plant, and have the stem stony and articulated; with the joints longitudinally striated, united by spongy or corneous junctures, and covered by soft porous cellular flesh. About six species of this curious genus are at present known. See ISIS.

CORAL, *red*, or true red coral, was considered by Linnæus as an Isis, and arranged as such in the Systema; though Linnæus himself acknowledged to Mr. Ellis, the author of the Natural History of Zoophytes, that the latter had more properly classed it with the gorgonia, or sea-fan, the genus Isis being sufficiently distinguished by its jointed stem. In the last edition of the Systema, the coral is placed with the sea-fans, or gorgonia.

The red coral grows in an expanded and somewhat flattened form, with dichotomous branches, that lessen towards their extremities. The flesh is of the colour of red lead, or inclining to vermilion, soft, slippery, and full of minute vessels. The mouths are placed on the surface, and rise up in a conical form, consisting of eight valves, just opening, from whence proceed polypes of a white colour, with eight claws, each of which has a double fibre at both edges. The bone itself, disenclosed of the flesh, is the true coral of the shops, and which, in its natural state, is of a stony texture, and of a bright red colour, with the outside marked with minute furrows, or irregular striations, interspersed with a few slight depressions, corresponding with the situation of the shells, before the flesh be removed. For a further account of this curious article, see *GORGONIA nobilis*.

CORAL, *black*. In the Linnæan system, the true black coral is described as appertaining to the same genus of zoophytes as the red kind, under the specific name of antipathes. This sort is found on the shores of the Indian and Mediterranean seas, and grows in a shrubby form to the height of about two feet, with the branches erect, and alternately pinnated. The bone is of a black colour, marked on the outside with flexuous striae, and in its native state is covered with flesh of a grey colour. See *GORGONIA antipathes*.

The gorgonia antipathes, or true black coral, must not be confounded, from the similarity of names, with the antipathes genus, the latter being very distinct, although its species are not unfrequently denominated black corals, as well as the gorgonia before-mentioned. There is a great affinity between the antipathes and gorgonia genera; notwithstanding which they may be readily distinguished, the bony part of the antipathes being beset with small spines, and covered with gelatinous flesh, and numerous polype-bearing tubercles, while the bone of the gorgonia is smooth, or destitute of spines, and the flesh cellular.

From the old botanical writers it appears, that many of the zoophytes were considered as genuine plants; and that in particular several sorts of black corals were formerly called antipathes. But as the characters of these marine bodies are better understood in the present age, only part of these have been retained in the genus antipathes, and some of the kind referred to the gorgonia. The antipathes of certain reefs were formerly used as sceptres for princes, and likewise for diving rods, and other similar purposes, as is evident from the remarks of Salmalius, addressed to Solinus, wherein he says, that antipathes denotes something proper to resist incantations, and that they were in use for that purpose by several Indian nations.

There are a number of different species of this kind of black coral, which, not being sufficiently noticed under the article antipathes, it may be proper to describe in this place.

SPIRALIS. With a very simple, spiral, rough stem. *Antipathes simplicissima attenuata flexuoso-spiralis spinulis seriatis scabra* of Pallas. *Gorgonia spiralis*, Linn. *Palinjuncus anguinus*, Rumpf.

This kind inhabits the Indian, Mediterranean, and North seas. It is of a hard and horny black substance, extremely brittle, and varying in length and thickness; one described by Mr. Ellis measured two feet long, and was about the thickness of a writing-pen; another, not thicker at the base than the quill of a hen's feather, was seven feet in length. In its natural state this kind is variously twisted, or generally in a spiral manner, and the flesh which covers the spiny surface of the bone is full of little gelatinous warts.

ULEX. Very much branched, with scattered spreading rough and pointed branches. *Furze-like antipathes*, Soland. and Ellis.

A native of the Indian ocean. This kind is full of small short spines, the branches are loose and irregular, and the whole remarkably black. The specimen brought from Batavia, and described by Mr. Ellis, had the surface marked with ovate cavities, dispersed about the branches, which were of a brownish-yellow colour, and supposed to be the ovaries.

SUBPINNATA. Branched and pinnated, rough with fetaceous alternate sub-divisions, and a few others proceeding transversely from them. Soland. and Ellis.

Described by Gmelin as a native of the Mediterranean sea on the authority of Ellis, who, however, merely informs us his specimen was brought from Gibraltar, and is supposed to be taken in the sea thereabouts. The spines of this kind are long and small, and of an amber colour when magnified. The surface of the antipathes appears to be cinereous.

MYRIOPHYLLA. With numerous, incurved, pinnate branches, the subdivisions with lesser spinous pinnules on the upper side. Soland. and Ellis. *Myriophyllum indicum ramosissimum*, Petiv. *Erica marina tenuis*, Rumpf.

This is called by Ellis the yarrow-leaved antipathes; it is of a beautiful shrub-like appearance, with many pinnated branches, bending downwards all round; the colour yellowish-

lowish-brown, and the surface rough, but considerably less so than the species subspinata. Found near the Spice islands.

ALOPECUROIDES. With spinous, setaceous, closely panicled branches. Soland. and Ellis. *Fox-tail antipathes*.

The trunk of this species rises from a broad spreading base, and divides immediately into several large branches, of about one-third of an inch in diameter. As they rise up, one side of them appears flat, with a groove or channel along the middle of it, where there are the remains of many little branches that have grown in rows on each side. It then divides into branches, and often into other branches, all which are in form of close panicles, not unlike the fox-tail grass. These panicles are composed of very rough thorny minute branches, which are twice as long on one side of the stem as the other. This rises to the height of two feet, and is of a greyish colour on the outside, the inside black and very brittle. A rare species, discovered on the coast of South Carolina.

CUPRESSUS. Growing in the form of a simple rough panicle, with recurved branches. Soland. and Ellis. *Antipathes cupressina*, Pallas. *Gorgia abies*, Linn. *Cupressus marina*, Rumpf.

The cupress antipathes was erroneously classed by Linnæus with the gorgia; Gmelin places it with the antipathes. The species inhabits the Indian ocean; it is about two feet in length, and is covered with a brownish-down, beneath which the colour is deep black.

DICHOTOMA. Very long, dichotomous, and upright. Pallas.

Inhabits the Mediterranean, is about two feet in height, round, and dusky.

ORICHALCEA. Brassy, smooth, with a simple, rigid, flexuous stem, and alternate, scattered, dichotomous branches. Pallas. *Gorgia enea*, Linn.

Twelve inches in length, and very rigid. A native of the Indian ocean.

CLATHRATA. Very much branched, intricate, with confused sub-divisions in every part coalescing, the younger ones setaceous. Pallas.

Size of the last, and of a black colour within: this inhabits the Indian ocean.

FLABELLUM. Dilated, very ramose, and sub-divided, the sub-divisions branching both ways, and cohering together in a reticulated manner. Pallas. *Erica marina affinis*, Rumpf. This kind inhabits the Indian sea, and is about six inches wide, black, rough, and undulately curved.

PENNACEA. Branched, somewhat incavated, the branches with setaceous and very crowded rough sub-divisions. Pallas. *Acabarr rutturuttu*, or *Erica marina crassa*, Rumpf. *Peucites prifina*, Aïd.

Inhabits the Indian ocean, the outside grey and rough, within black.

ERICOIDES. Very much branched, rough and black, with scattered branches, covered throughout with subulate sub-divisions. Pallas. *Cupressus marina prior*, Rumpf.

A species about a foot high, and of a deep black colour; an inhabitant of the Indian ocean.

POENICULACEA. Very much branched, with setaceous decomposite sub-divisions. Pallas. *Fenum marinum*, Rumpf. Twelve inches high, the colour black. A native of the Mediterranean.

CORAL, white. See MADREPORA, MILLEPORA, and CELLEPORA.

CORAL gives title to an official composition, called *Jyrup of coral*, sometimes prescribed by physicians; as is likewise the powder of coral finely ground, and afterwards levigated

on a marble, and made up into a proper form. But there are few, except those who are fond of medicines with gems in them, that make use of it. By means of its exceeding hardness, it is suspected to take away with it a great deal of the levigating stone.

Dispensary writers have given us receipts for a great many preparations of coral, as magilleries, tinctures, salts, &c. none of which enter the present practice.

Coral and coralline being the shells of marine animals of the polype kind, possess the same chemical properties as the fresh shells of oysters and other shell fish, i. e. they are calcareous earths impregnated with some animal principles.

CORAL, artificial, is made of cinnamon well beaten; a layer whereof is applied on a piece of wood well dried, and polished, first moistened with fixæ: the whole is then again polished; and for varnish, rubbed over with the white of an egg. See GROTTO.

CORAL-fishery. The time for fishing coral is from April to July; the places are the Persian gulf, the Red sea, coasts of Africa towards the bastion of France, the isles of Majorca and Corsica, and the coasts of Provence and Catalonia.

The method of fishing is nearly the same in all places: that used at the bastion of France, where there is an established fishery, under the direction of a company at Marseilles, is as follows.

Seven or eight men go in a boat, commanded by the patron or proprietor; the cafter throws his net, if we may so call the machine wherewith he uses to tear up the coral from the bottom of the sea; and the other six manage the boat. The net is composed of two beams tied across, with a leaden weight to press them down; to the beams is fastened a great quantity of hemp loosely twisted round, among which they mix some iron nets. In this condition the machine is let down into the sea; and when the coral is pretty strongly embarrassed in the hemp and the nets, they draw it out by a rope, which they unwind according to the depth, and which sometimes requires half a dozen boats to draw. If the rope happen to break, the fishermen are in great danger of drowning. They have two machines, one for fishing up the coral where the bottom is smooth; and the other, called in the Provençal language the *salabre*, so constructed as to be employed where the bottom of the sea is rocky and unequal.

Before the fishermen go out, they agree on the price of the coral, which is ordinarily at the rate of 4 s. 6 d. per pound.

When the fishery is over, which in a season usually amounts to twenty-five quintals of coral each boat, it is divided into thirteen parts: the patron whereof, or master coraller, has four, the cafter two, and each of the six companions one: the thirteenth being reserved for the company, &c.

Spallanzani has particularly described the coral-fishery in the Strait of Messina. (Travels in the two Sicilies, &c. vol. iv. p. 305.) This, he says, is both a laborious and dangerous occupation. The instrument, with which they force the branches of coral from the rocks, is formed with two poles of wood, crossing each other at right angles, and having a piece of a net fastened on the under side to their extremities. A large stone is fixed where the poles cross each other, that the instrument may more readily sink to the bottom. A cord is strongly tied round the middle of it, one end of which the fisherman holds in his hand, guiding by it the net to those places where the coral is supposed to grow; and which is inclosed, in the pieces of the net, broken off, and drawn up. This fishery

is carried on from the entrance of the Faro to the part of the strait opposite to the church of the grotto, or through a tract six miles in length, and to the distance of three miles from Messina. The rocks which produce the coral are situated almost in the middle of the strait, at different depths, from 350 to 650 feet. The bottom and caverns of the rocks are the places from which they endeavour to bring up the coral with their nets; and it is a constant observation, that every branch is perpendicular to the plain on which it grows, without ever turning on one side. Coral, it is said, grows more plentifully in places situated to the east than in those to the south; it is rarely found to the west, and never to the north. In the first situation it is larger, and of a finer colour, than in the second and third; which two valuable qualities are likewise found in that which is brought from a less depth, compared with that which is grown at a greater. The greatest height to which it grows is never a foot, and its usual thickness is that of the little finger, and somewhat less than that of the coats of Trapani and Barbary; but the latter are exceeded by the Messinae in vividness of colour. These differences, according to the account of the fishermen, arise from their coral being produced in a sea which is kept in continual agitation, from the surface to the bottom, by the current and the winds. With respect to colour, there are three kinds; the red, the vermilion, and the white coral. The first is subdivided into the deep crimson-red, and the lighter red. The vermilion is extremely rare, but the white common. In the white they include the clear white and the dull white.

The coral fishermen have divided the whole tract in which they fish into ten parts. Every year they fish only in one of these parts, and do not fish in it again till ten years are elapsed. This interval of ten years they think necessary for the coral to acquire its full growth in height and consistence. When they transgress this law, they find, in fact, the coral smaller, and of less consistence, and the intensity of the colour is always in proportion to the number of years they have desisted from fishing. When the ten years have elapsed, they believe that the coral no more increases in height, but only in thickness, which, however, has its limits. In fact, they have observed that the coral fished up near San Stefano, a place where none had been sought for in the memory of man, though it was of a very bright colour, was not higher than the ordinary coral, though it exceeded it by one-third in thickness.

The number of ships which usually go together in this fishery is eighteen or twenty, each of which is usually managed by eight men. The quantity of coral procured may amount every year to twelve Sicilian quintals. The quintal, as is well known, contains two hundred and fifty pounds, and the pound twelve ounces. The gain acquired is therefore adequate to the labour; yet may the fishery be considered as a secondary occupation, since the fishermen only follow it when they have no other employment by which they can make a greater profit. Spallanzani examined the branches of coral, as they were taken out of the nets, by putting them into glass vessels filled with sea-water. It is well known that, in this case, the white polypi will come out of their cells in the coral as soon as the water is perfectly at rest. He examined and re-examined these polypi, as it was the first time he had seen them; but he discovered nothing which can make any addition to the accurate observations of Peyssonel, Jusseau, Guettard, Donati, and the very recent remarks of the celebrated Cavolini, which seem to leave nothing to be desired to complete our knowledge of these animalcula, and their na-

tural habitudes. Having made some additions and corrections to the observations of count Marfigli, relative to this subject, he proceeds to describe the principal of those branches, which now make a valuable addition to the class of Zoophyta in the imperial museum at Paris. He observes, 1. That the bark of this branch has the colour of sealing wax; but the solid coral is purple, with some transparency at the extremity of the branches.

2. The bark in colour resembles that of the foregoing; but the included solid coral is of a less vivid red.

3. The bark is of a blueish grey; the solid coral grey, with a slightly reddish tinge.

4. In this specimen four branches shoot from the same stem; two of a pale red in the bark, and a whitish red in the solid coral. In the fourth the bark is of a whitish colour, and the solid coral still whiter.

5. Three branches joining in one, the colour of which, both in the bark and the solid coral, is a milky white.

With respect to the structure of the cortical and solid parts of the white corals, he observes that they are the orifices of the cells in the bark of the white coral, which being orificed like those in the red, appears to be a proof that the polypi in both are of the same structure, and consequently of the same species; the polypi inhabiting the red coral having likewise eight tentacula. That coral is soft in the sea, but hardens when it comes in contact with the air, was the opinion of the ancients; but has been proved false by the observations of the moderns. The coral-fishermen of Messina, who derive all their knowledge from experience only, are convinced this opinion is erroneous; but they assert that coral which has not attained maturity has not that degree of consistence it acquires when it has arrived at its full growth. The truth of this position Spallanzani was not able to ascertain, as, for that purpose, it would have been necessary to call the net in one of those ten parts of the strait in which it is prohibited by the law to fish till the expiration of the ten years prescribed. Yet the rules of analogy derived from what is observed in all animals and vegetables, incline him to favour this opinion. It is agreed however by the fishermen on the coasts of Barbary, and also by those of Messina, Sardinia, and Corsica, that the deeper they descend into the sea, the smaller is the coral. Donati observes, that the broken and detached branches of coral will continue to live and multiply in the sea; and this Spallanzani allows to be the case, provided they meet with a firm point of support to which they can attach themselves with their viscous humour. Otherwise, if they fall on the moveable sand, they become the sport of the waves, and he has no doubt that they must perish. The fishermen, with whom Spallanzani conversed, appeared to be well acquainted with the true generation of coral; as they told him that they had frequently observed, on hard matters drawn from the bottom of the sea, the first principles of coral beginning to germinate; which they describe as having the appearance of a red spot, with a button or bud implanted in those matters, sometimes tender and fragile, and sometimes hardened, and of the colour and nature of ordinary coral.

They were likewise acquainted with those branches of coral which, when fished up, are sometimes found perforated by lithophagous worms, and which are mentioned by Vitaliani and Marfigli. Their nets had frequently brought them up, either from the bottom of the sea, from caverns, or the sides of rocks; and these perforated corals were found sometimes broken in the trunk, where the per-

forations

forations are most frequent; and at other times attached to some body which served them as a base. They were of opinion that these corals were thus perforated, because they were dry; and this dryness, they imagine, proceeds either from age, or their having been broken from their root by some fish, or by a part of a rock falling on them; or possibly by the coral nets, which do not always bring up all the branches of coral they tear away from their roots.

CORAL ISLANDS, in *Geography*, called by the Spaniards in their old charts *los corales*, or *isles del coral*, three islands lying in the form of a triangle and situated S.W. of the Ladrões, in the East Indian ocean.

CORAL RIVER, a river of New Mexico which runs a W. by S. course and discharges itself into the head of the gulf of California, near the mouth of the Colerado river.

CORAL-TREE, in *Botany*. See *ERYTHRINA CORALLOBENDRUM*.

CORAL-WOOL. See *DENTARIA BULBIFERA*.

CORALARIA, *parvifolia*; Rumph. See *ADENANTHERA PAVONINA*.

CORALIS, in *Ancient Geography*, a marsh of Asia, in Lycæonia, placed by Strabo in the vicinity of Galatia.

CORALIUS, a river of Greece, in Bœotia.

CORALLA, a place of Asia, in Cappadocia, on the Euxine sea, according to Arrian's Periplus.

CORALLI, a people of European Sarmatia, who inhabited the banks of the Euxine sea, towards the Danube.

CORALLINA, in *Zoology*, a genus of zoophytes, the animal of which is of a plant-like form, with the stem fixed, and the branches subdivided, calcareous, and mostly jointed.

The ancient naturalists mistook corallines for a particular tribe of plants, and accordingly introduced them into their works under the title of marine mosses. Tournefort enumerates thirty-six species among his plants; and indeed certain kinds appear to be so nearly allied to the lichen family, that some continental botanists, even in the present day, are in doubt where to draw the exact limit between the cryptogamia and the corallina.

All the corallines adhere to rocks or other solid bodies, and are concretions formed by the polype animals which inhabit them, the coralline itself being only the habitation of these creatures. The branches are commonly elevated, of a shrub-like form, and exhibit an elegant appearance from the symmetry and general proportions of their respective articulations; the branches being composed of little joints, like beads strung in a necklace. The joints consist of a calcareous and gelatinous matter, and have the surface perforated, or full of minute pores, which in many species are so very small as to be visible only with the aid of glasses. It is in these minute cells that the polypes reside, and through which they either protrude their limbs when they lie in wait for food; or draw their nourishment through the aperture. When a branch of coralline is immersed in vinegar the calcareous crust dissolves, and leaves the cartilaginous parts uninjured, and by that means enables us to examine its internal tubular structure. In point of colour the corallines differ very considerably, not only in different, but also in the same species, and without exception the whole become white on exposure to air.

The coralline tribe, possessing much elegance and beauty, are highly ornamental in a collection of natural history; one species only appears to be appropriated to an useful purpose, which is the *corallina officinalis*, vast quantities of

which are gathered and employed in medicine as an abortif.

Among the older writers the word coralline had a very general acceptation, and seems to have comprehended every description of polype-bearing substances, in addition to the coralline genus of modern naturalists, such as the *subipora*, *fertularia*, *cellepora*, *flustra*, *alcyonium*, *spongia*, &c. Mr. Ellis, in his publications on corallines, adheres rather too closely to this idea, and still defines the several genera with so much accuracy as to render his works of the greatest value to future naturalists. His vesiculated, tubular, ciliated, and articulated corallines are referable to the different genera above-mentioned (which see respectively). He includes also among his corallines the *iris*, *gorgonia*, *antipathes*, &c. in which he is certainly wrong. The species of the true corallina at present known are as follow.

Species.

TRIDENS. Trichotomous, with compressed three-lobed flat joints. Ellis.

Found on the coast of the North American islands, where it was first discovered by Mr. John Greg.

OPUNTIA. Trichotomous, with kidney-shaped joints waved at the edges. Gmel. Indian fig coralline, Ellis. *Corallina latifolia*, Plunk. *Muscus*, &c. *Bocc. Fucus*, &c. C. Bauh. *Scutellaria*, *opuntia marina*, J. Bauh. *Sertolaria*, Imper.

This kind grows on the coast of Jamaica, and other West India islands, and is found also in the Mediterranean sea. The colour is white, and the joints somewhat kidney-shaped.

MONILE. Trichotomous, with the lower joints compressed, convex, cuneated, oblong, and with the upper ones sub-cylindrical. Soland. and Ellis. Necklace coralline.

Inhabits the shores of Jamaica.

INCRASSATA. Trichotomous, with compressed plano-convex wedge-shaped joints. Soland. and Ellis. Flethy coralline.

This kind is very frequently cast up on the shores of the American islands, particularly Jamaica.

TUNA. Trichotomous, with compressed flat roundish joints. Soland. and Ellis. *Tuna coralline*. *Opuntia marina*. Park. Theat.

Found in the Mediterranean sea.

NOBULARIA. Trichotomous, and very much branched, with thick wedge-shaped joints, those at the divisions broadest, the terminal ones tricuspidate or ovate. Pallas. *Nodularia alba*, Imp. *Muscus coralloides*, C. Bauh.

Inhabits the same sea as the preceding. Grows to the height of eighteen inches, and is very thick, strong and white.

SQUAMATA. Trichotomous, the joints of the stem roundly compressed and wedge-shaped, those of the branches flatly compressed; terminal ones flatish and sharply two-edged. Ellis.

Inhabits European coasts, and is of a sea-green colour.

LORICATA. Trichotomous, with compressed, sub-convex, wedge-shaped joints, angulated at the sides; the terminal ones with small obtuse lobes. Ellis.

A native of the Mediterranean sea.

PALMATA. Trichotomous, with compressed, sub-convex, wedge-shaped joints, slightly denticulated at the tip; the extreme joints broad, and often furnished with short finger-like lobes. Ellis.

This was found in the American seas, and is of a glossy white colour.

ELONGATA. Trichotomous, with the joints of the stem roundish and cuneated; those of the branches cylindrical; the extreme joints a little obtuse, and some of them capitated. Ellis.

Varies in colour from red to purple. It inhabits the European coasts.

SUBULATA. Trichotomous, with the joints of the stem cuneated and two-edged, and projecting small pointed branches from the top of each of their sides, with round joints. Ellis.

The appearance of this coralline is very flat, white, slender, and small, and seems as if it were very closely pennated or beset with fine white fibres, projecting out on each side like the plume of a feather. This is the most delicate of the coralline tribe. Found in the West Indies.

GRANIFERA. Trichotomous, with the joints of the stem compressed and wedge-shaped; those of the branches roundish, and furnished with opposite ovate ovaries, seated on small pedicles. Ellis.

This differs from all the other kinds of trichotomous corallines, in having proliferous ovaries, or branches growing out of them, being other ovaries. It is of a fine slender texture, and of a sea-green colour. It was found on the coast of Africa, in the Mediterranean sea.

OFFICINALIS. Sub-bipinnate, and usually trichotomous, with the joints of the stem somewhat cuneated or turbinated; those of the branches round, and some of the terminal ones capitated. Ellis. *Corallina officinalis, sub-bipinnata, articularis fulturbinatis*, Linn. Fn. Suec. *Corallina altera*, Tobernacm herb. *Muscus corallinus flicinus*, Barrel.

Common on almost every shore, where it grows on the rocks in tufts of two, three, or four inches in length, and varying considerably in colour, being red, yellow, green, and white. This is the coralline of the shops, and is the kind used in powder as an astringent.

PINNATA. With pinnated branches without joints, and covered with a mealy substance. Ellis.

Found on the coast of the Bahama islands.

RUBENS. Dichotomous, filiform, with the joints of the stem round; those supporting the divisions clavated, and some of the lower ones bicornuted. Ellis. *Corallina rubens*, Linn. *Corallina filiformis dichotoma fastigiata, articularis omnibus cylindricis*, Pallas.

Inhabits European seas; length two inches; colour red.

CRISTATA. Dichotomous, filiform, in crested clusters, with roundish joints; those supporting the last sub-divisions clavated. Pallas.

This kind inhabits the European and American seas. The colour, as in officinalis, varies from red to purple, green, yellow, and white.

FRAGILISSIMA. Dichotomous, with smooth, even, cylindrical joints; those at the extremity broadest at the tip. Linn. *Corallina minimum capillaceum*, Sloane.

This is found in the West Indian and Mediterranean seas, and is so extremely fragile, that perfect specimens are very rarely obtained; the colour is milk-white; length about two inches.

SPERMOPHOROS. Dichotomous, filiform, with roundish branches; those supporting the two last sub-divisions clavate. Linn., &c.

Inhabits European seas, is of a milk-white colour, and about an inch in length.

CORNICULATA. Dichotomous, with the joints of the stem and branches bicornuted; those of the subdivisions roundish. Linn.

Inhabits the same seas as the preceding.

FRUTICULOSA. Dichotomous, with round branches tapering towards the extremities, without joints, and mealy. Ellis and Soland.

There are many varieties of this shrub-like coralline; the species occurs on the coast of the Bahama isles.

INDURATA. Dichotomous, with smooth round spreading branches, scarcely jointed. Ellis and Soland.

Found on the same shores as the preceding species.

LICHENOIDES. Dichotomous, with the branches a little rugged and not jointed, the tips dilated and flattened. Ellis. Liver-wort coralline.

This coralline is of a sea-green colour; it inhabits the Bahama islands.

RUGOSA. Dichotomous, with cylindrical branches, hardly jointed, rough, with transverse wrinkles, and compressed at the tips. Ellis and Soland. *Fucus Marinus*, &c. Sloane.

Found on the coast of Jamaica.

MARGINATA. Dichotomous, with scarcely jointed smooth flat branches, and raised margin. Ellis.

This kind occurred on the shore of one of the Bahama islands. Mr. Ellis observes, that though this coralline is found, when dry, on the shore, more flat than the rest of this kind, it is very probable, when it is fresh taken out of the sea, it is much rounder, the fibres in the inside being extremely delicate, which occasions its shrinking very much, when the gelatinous fluid is evaporated.

CYLINDRICA. Dichotomous, with cylindrical and nearly equal smooth joints. Ellis.

Mr. Ellis received this species of coralline preferred in spirits, from the West Indies, and observed by that means the internal parts appeared full of a clear gelatinous substance. Upon opening some of the joints, a number of minutely branched tubes were also disclosed, and hence this writer concludes, that the tubular-hollow appearance described by authors, proceeds from their having dissected only dried specimens.

OBTUSATA. Dichotomous, with oval-oblong joints, a little compressed and rounded at the ends. Ellis.

Inhabits the shores of the Bahama islands.

OBELONGATA. Dichotomous, with oblong cylindrical joints, a little compressed. Ellis.

A species allied to the two foregoing corallines, and found on the shores of the same islands.

LAPIDESCENS. Dichotomous, with cylindrical downy branches. Ellis.

This kind is sometimes found trichotomous, or three-branched, instead of two. In specimens just received from the sea, the surface appears covered with short hair-like verticillate down, of a reddish colour, disposed in regular circles, one above another.

BARBATA. Dichotomous, with short cylindrical joints; those at the extremity bearded at the tips. Linn.

Inhabits the shores of Jamaica, and measures about three inches in length. This is the bearded, or bead-coraline, of Ellis.

ROSARIUM. Dichotomous, with round bead-like joints, those of the stem longest and cylindrical. Ellis. Kofary coralline.

Nearly allied to the last, but specifically different. A native of the West Indies.

CUSPIDATA. Branches often dividing into four parts, and ending in sharp points; joints cylindrical, and united by a glutinous tendinous substance. Ellis.

Found in the West Indies; it is very brittle, white, and grows in tufts about three inches high.

* TRIBULUS.

TRIBULUS. Branches often dividing into five; joints two-edged, and united by a glutinous tendinous substance. Ellis.

A West Indian species, of a whitish colour, and rather larger than the last.

FLABELLUM. Stem single, incrustated, with the branches flicking together, in a foliaceous fan-shaped manner, and somewhat waved. Ellis.

This coralline is also found in the West Indies, and varies much in figure, being sometimes of a flat kidney-shaped form, of about an inch in height, and sometimes expanding to a large subdivided, lobed, and undulated mass, from one to five inches broad, and as many in height. At the bottom of the stalk is a tuft of fine hair-like tubes. There are many kinds of this curious coralline found in the West Indies, which vary in colour from a greenish-brown to a milk white.

CONGLUTINATA. Stem single, slightly incrustated, with the branches dichotomous, and agglutinated together, and forming a naked fan-shaped leaf. Ellis.

Found on the coast of the Bahama islands; the colour sea-green, and the height an inch and a half.

PHOENIX. Stem single, incrustated, terminating in an oblong frond, composed of distinct fasciculated branches, produced on all sides, the sub-divisions of which are united together, and appear quite flat. Ellis.

This is the palm coralline of Ellis, a singular species found on the coast of the Bahama islands; it is of a milk white colour, and about three inches and a half high.

PENCILLUS. Stem single, incrustated, terminated by an orbicular tuft of dichotomous, filiform, jointed ramifications. Linn. Pencill coralline. Ellis.

This coralline varies in the thickness of its branches, as well as in size, being found from one to four inches long. In some the stem is very short, in others four times the length of the head. The joints are easily distinguished where the branches divide; the stem is composed of tubular filaments covered with calcareous crust; its general colour is white. This sort of coralline adheres to shells by the base of its filaments, and is often found attached to such bodies, in large clusters, in the West Indian ocean.

PENICULUM. Stem single, incrustated, and terminated by an orbicular tuft of dichotomous, filiform, jointed ramifications. Ellis, &c. Mop coralline.

This is one of the most singular of the coralline genus, and differs from the rest, among other particulars, in having the stem regularly wrinkled. The stem is small at the base, and grows wider as it rises, till it sends forth its branches at the top; it adheres at the base like the fertilizing, by means of ramose tubes, which tubes do not lessen as they extend or branch out, but have an equal diameter throughout their whole length. The species is found in clusters in the American seas, particularly near the Bahama islands.

We must lastly mention the coralline terrestris of Linnæus, a species, according to that writer, distinguished by having the branches placed opposite, and the joints cylindrical, with lateral peduncled, and transversely wrinkled fructifications; it is further added, that the species is a few lines high, and inhabits heaths in Friesland. Gmelin admits it as a species of coralline, with some doubt, and seems uncertain whether to consider it of the animal or vegetable kingdom, and undoubtedly not without reason, for it has been described by different writers, both as a plant and a coralline. Meese defines it to be a vegetable of the cryp-

togamia class "Lichen fruticulosus ramifolus articulatus, articulis longis cylindricis peltis pedunculatus." But Pallas, on the contrary, inserts it in his work on Zoophytes, as a genuine coralline. "Corallina opposita ramifolia articulis cylindricis, fructificationibus lateribus pedunculatis transversim oblongis." Between two such opposite authorities, it must be acknowledged it might be improper to form any very conclusive opinion as to the real nature of the article in question. Considering the situation in which it was said to be discovered, we should scarcely hesitate for a moment in concluding that it must belong to the vegetable kingdom, but then again the decided assertion of Pallas would militate against such an opinion, and the testimony of such an intelligent naturalist is not unworthy of regard. It is fortunate, however, that the accurate Ellis has afforded us much satisfactory information on this very subject: the matter is not so completely elucidated, perhaps, as we might wish; but his observations on the article are remarkable, and deserve to be transcribed. "I should have taken notice, (says this writer) of the corallina terrestris mentioned by Linnæus, Syst. Nat. 1306, from other authors; but as I found it a defective specimen, of some one of the trichotomous corallines already described, I must refer the reader to a full account which I have given of it, in the Philosophical Transactions, vol. lvii. p. 415, wherein the absurdity of a marine animal substance, growing on a heath many miles from the sea, is, I hope, fully demonstrated." We are hence inclined to suppose, that in the course of correspondence between Mr Ellis and Linnæus, the former had obtained an opportunity of examining some specimen of the article in question, or at least of ascertaining from Linnæus himself, what was really meant by his corallina terrestris, and we shall therefore conclude, that it could not be of the shrubby lichen kind, as some imagine, but as Mr. Ellis states it, a defective or mutilated specimen of the coralline tribe, and in which case Linnæus and others must have been greatly deceived as to its habit; the specimen might, indeed, be found on a heath at any distance from the sea; but, if truly a marine production, no one can be ridiculous enough to conceive it could grow there.

The ancients have said great things of the virtues of the common coralline. Dioscorides prescribes it for mitigating the pain of the gout, and for preventing stagnations of the humours in any part; he says nothing of its virtues against worms, which are what we alone esteem it for. They have been given in powder from ten grains to a scruple or half a dram twice a day in these cases, and it has been said with considerable good effect. Geoffroy, Mat. Med. vol. ii. p. 238.

Although the corallum and coralline are reckoned alkaline and absorbent, they are neglected in the present practice as unnecessary.

CORALLINUM ARCANUM. See ARCANUM.

CORALLO ACHATES, in the *Natural History of the Ancients*, the name of a very beautiful species of agate, found at this time in the East Indies, but not in any plenty. It is very hard, and capable of a fine polish; and, when wrought, is an extremely elegant stone.

CORALLO-DENDRON, in *Botany*. See *CORAL-tree*.

CORALLO-FUNGUS, Vail. See *CLAVARIA*.

CORALLOIDE MARBLE See *MARBLE*.

CORALLOIDES, in *Botany*, Tournef. See *CLAVARIA*.

CORALLOIDES, Cord. See *DENTARIA enncaphylla* and *vulgifera*.

COPALLOIDES, Dill. See LICHENES *Scyphiferi* and *Fruiculosi*.

CORALLORHIZA, Gmel. Hall. Scop. See OPHREYS *corallorhiza*.

CORALLUM, in *Mineralogy*, a name given by some of the writers on these subjects to the common PYRITES.

CORAM, THOMAS, in *Biography*, a name worthy of some memorial, as the founder of a new species of charity, was born about the year 1688, and introduced at an early period to the business of the seas. Having spent some years in the service, he settled in the eastern part of the metropolis, and was frequently witness to distressing scenes of children exposed, through the indigence or cruelty of their parents, which excited him to project the founding hospital; for which he obtained a charter in 1730. This charity has been of much real benefit to society; but its regulations respecting the children seem to require revision, as it should seem, by some late publications on the subject, that for a child to become an inmate there, the parent must be prevented for a long term of years from having the smallest intercourse with her infant, for which she must be supposed to have a tender affection, although unable to support it. Mr. Coram was highly instrumental in procuring a bounty upon naval stores imported from the colonies, and in establishing the colonies of Georgia and Nova Scotia. He died March 29, 1751, in his 84th year, and was buried in a vault under the chapel of the Foundling Hospital, where an inscription perpetuates his memory; but his good deeds will live longer than inscriptions on brass or marble. *Biog. Brit.*

CORAM, in *Geography*, a post-town of America, in Suffolk county, Long island, New York. It has about 60 houses, and lies 62 miles eastward of New York city, and 10 from Smithtown.

CORAM *non Judice*, in *Law*, is when a cause is brought into a court whereof the judges have no jurisdiction.

CORAMBIS, in *Ancient Geography*, a town of Ethiopia, near Egypt.

CORANCALI, a people of India, on this side of the Ganges. *Ptolemy*.

CORANI, a people of Italy, in the country of the Volsci. *Pliny* gave this name to the inhabitants of Cora; and says, that they derived their origin from Dardanus the Trojan.

CORANITÆ, a people of Arabia Felix. *Pliny*.

CORANTO, a *Dance*, *Courante*, *Fr. Corrente*, *Ital.* &c. It is strange that the *courant* is said by some writers to be the *most solemn* of all dance-tunes; forgetting the *saraband*, and that the word is derived from *currere*, to run. See *COURANT*.

CORAS, JOHN DE, in *Biography*, a learned French lawyer, born at Realmont in 1513. He studied law at Toulouse with so much success, that he gave public lectures upon it before he attained to manhood. He was afterwards elected professor of the university of Toulouse, where he taught with so much celebrity that he is said to have had 4000 auditors at one and the same time. He was appointed to the chancellorship under the queen of Navarre; and counsellor in parliament in the reign of Hen. II. He embraced the reformed religion, and lay under the suspicion of being one of the authors of the conspiracy in 1562, to deliver Toulouse into the power of the Calvinists. On this account it was with difficulty that his life was spared. For taking part with the prince of Conde, and other alleged offenders, he was apprehended in 1572, imprisoned, and at length assassinated. The works of Coras, consisting of interpretations of the civil law, were printed at Lyons in 1556 and 1558, in two folio volumes, *Moreri*.

CORASAN, in *Geography*. See KORASAN.

CORASIE INSULÆ, in *Ancient Geography*, a name given by *Pliny* to islands of the Ægean sea.

CORASIUS MONS, a mountain of Asia in Syria, near Antioch.

CORASPHI, or CORAXI, a people of Scythia, on this side of Imaus. *Ptolemy*.

CORAX, a mountain of Greece, in Etolia, between Naupacte and Callipolis, according to *Livy*, *Ptolemy*, and *Strabo*. It is now a mountain near Lepanto.—Also, a river of Asiatic Sarmatia.—Also, mountains of Asia, between Sarmatia and the Colchide territory, forming the boundary between the countries.—Also, a promontory of Tauric Cherfonefus; E. N. E. of Cricu-Metopon.—Also, a river of Asia (*Carvasday*) which took its rise in the mountains, ran from N. to S., traversed the country of the Abari, and discharged itself into the Euxine sea, E. of Pytium.

CORAX, in *Ichthyology*, the TRIGLA *hirundo* of Gmelin.

CORAX, in *Ornithology*, the raven, a species of CORVUS.

CORAYA, the name given by *Buffon* to the TURDUS *Coraya* of Gmelin, or barred tail thrush of *Latham*.

CORBACH, in Latin *Corbacum*, in *Geography*, a small town of Germany, in the circle of the Upper Rhine, capital of the principality of Waldeck, which is now enclosed on all sides by the kingdom of Westphalia, and likely to be considered only as a fief of the same.

The town is divided into the Old and New, each of which has its church. There is an excellent gymnasium or grammar school. One of the churches is adorned with a fine marble monument, erected by the republic of Holland to the memory of prince George Frederic of Waldeck, who was a field marshal in the Dutch service. Corbach is situated in N. lat. 51° 17', forty miles south of Paderborn.

CORBAN, a Scripture term, signifying an oblation, or offering, to God on the altar.

CORBAN also denotes a ceremony in use among the Mahometans, yearly performed at the foot of mount Ararat in Arabia, near Mecca. It consists in slaying a great number of sheep, and distributing them among the poor.

This festival occurs seventy days after that of Beiram, and like the latter, continues three days; and these two are the only festivals which the Mahometans of the East observe with great ceremony; so that the people do not labour during these three days. The Moors keep each of these festivals eight days; and the emperor of Morocco holds this festival out of the city, that more people may assemble, and he thus preserves the custom which subsists among the Moors, of praying in the open fields, before they were converted to Mahometanism. He leads a slain sheep to his palace by a horseman, and, if the heart palpitates when it arrives there, this is interpreted to be a good omen.

CORBASA, in *Ancient Geography*, a town of Asia, in Carbalia, a country of Pamphylia.

CORBEIAN MS. in *Biblical History*, *Codex Corbientis*, a MS. of the New Testament; of which there are two; one published by Bianchini, and the other by Sabatier. These two MSS. were noted 1. 2. by Griesbach, in his preface, p. 23, 24.

CORBEAU, *Raven* or *crow*, a moveable bridge, that received at the distance of six feet, from one end of it, a round pillar of wood about 12 feet high, and three palms in diameter, fixed or erected on the prow of a vessel with a pulley at the top of it. This moveable bridge or stage was about 18 feet long, and 4 feet broad, and was made somewhat in the form of a ladder of strong timbers, laid close

close across, and cramped together with iron. On each side lengthways of this bridge or stage, there was a parapet, which reached just above a soldier's knee. At the farthest end of this stage or ladder, there was a bar of iron in shape somewhat like a pebble, but sharpened at the bottom, or brought to a point at the lower end. And connected with the top or upper end of it, there was a ring. To the ring there was fixed a rope, by means of which, with the help of the pulley at the top of the pillar, the machine was hoisted up, and as an enemy's vessel approached let fall on it, sometimes on the prow, and sometimes on either side, as an opportunity presented itself. The farthest end of the machine falling with great force, struck into the deck of the enemy's vessel, and held it fast. In this situation, if the two vessels happened to be side by side, the Romans, who first made use of such means in the sea-fight between them, commanded by Duilius, and the Carthaginians, leaped on board the enemy's vessel from every part of the side of their own at once. But if the vessels were joined only by the prows, they then went two and two abreast along the machine, the two foremost extending their shields or bucklers right before them to ward off the strokes or blows that were aimed at them in front, whilst those that followed, rested each of them, the boss of his buckler upon the top of the parapet on either side, and thus covered both their flanks. Such were the machines employed on that occasion by the Romans, to which they gave the name of *Corvi*, or *Corbeaux*.

Some French writers give the name of *Corbeaux* to the machines with long beaks extending beyond the battlements and iron-hands suspended to them by chains, with which Archimedes, at the siege of Syracuse, under Marcellus, raised the Roman vessels erect out of the water, and then, by loosening the chains from the beaks, let them fall into the water sometimes on one side, and sometimes bottom uppermost. But it is evident from Polybius's account of those machines, that they were quite different from the *corvi* of the Romans, which we have just given a description of. The *corvus* was also very different from what these writers call the *corbeau à laes-courans*, the *corbeau à griffes*, the *corbeau demolisseur*, the *corbeau à tenailles*, and the *corbeau à faux*.

CORBELL, in *Natural History*, the name of a curious species of *Chama*. It is of the larger kind, and is deeply striated, both longitudinally and transversely; so that it has a sort of reticulated surface, like basket-work.

CORBELL, in Latin *Corbellium*, in *Geography*, a town of France, in the department of Seine and Oise, situated at the confluence of the rivers Seine and Juine or Elonne, which divides it into the Old and New Town, in N. lat. 48° 38', twenty-four miles south of Paris. It is the chief place of a district, and has a sub-precinct and a court of justice. The inhabitants excel in calico-printing and the manufacturing of glue; they have also very good tan-yards. Between Elonne and Corbell is a larger powder-mill. The district has besides several manufactures of cotton and linen, a sugar-house, a paper-mill; and in the village of Moulin Galons there is a considerable manufactory of large copper coppers, kettles, and all sorts of tinned copper kitchen utensils. The population of Corbell itself is 3200; that of the canton, which contains 26 communes upon a territorial extent of 225 kilometres, is 14,807. The district comprises four cantons, containing together 56,567 inhabitants upon 697 kilometres and a half. Corbell was formerly a county.

CORBEILLES, *Fr.* Baskets about eighteen inches high, eighteen inches wide at top, and only about nine or ten inches wide at bottom, in order to furnish loop-holes or

openings for men standing behind the parapet or work, they are placed on, to fire through without being seen by the enemy. They may be used either by the besieged, or the besiegers, on the parapet of the body of a place, or of any of its out-works, and on all kinds of retrenchments, whether they be lines of circumvallation or countervallation, of approach or counter-approach, &c.

CORBEILLES, in *Geography*, a town of France, in the department of the Loiret, and district of Montargis; eight miles N. W. of Montargis.

CORBEL, in *Architecture*, the representation of a basket, sometimes seen on the heads of carvatures.

The word is also used for the vase, or tambour, of the Corinthian column; so called from its resemblance to a basket, or because it was first formed on the model of a basket.

CORBEL, or *Corbil*, is also used, in *Building*, for a short piece of timber placed in a wall, with its end sticking out six or eight inches, as occasion serves, in manner of a shouldering-piece. The under-part of the end, thus sticking out, is sometimes cut into the form of a baulkin; sometimes of an ogee, and sometimes of a face, &c. according to the workman's fancy; the upper-side being plain and flat.

These corbels are usually placed for strength immediately under the semi-girders of a platform, and sometimes under the ends of chamber-beams: in which latter case they are commonly placed a foot or two below the beam, and have a piece of timber standing upright close to the wall from the corbel to the beam.

CORBEL is also used by some architects for a niche, or hollow, left in walls for images, figures, or statues to stand in.

CORBELIN, in *Geography*, a town of France, in the department of the Isere, and district of La Tour-du-Pin; 30 miles E. S. E. of Lyons.

CORBENY, or *St. MARCOUL*, a small town of France, in the department of the Aisne, with a priory of Benedictines, where the kings of France used to pray for nine days, after having been anointed at Rheims.

CORBERA, a town of Spain, in the province of Valencia; 20 miles S. of Valencia.

CORBETT, in *Architecture*, is used by some, as Harris, in his *Lexicon*, for corbel.

CORBEUNTOS, in *Ancient Geography*, a town of Asia, in Galatia, assigned by Ptolemy to the Tectosages.

CORBIA, a town of the island of Sardinia, situated 25 miles from Bos, according to the Itinerary of Antonine.

CORBIANA, or *CORBIENA*, a province of Asia, between Hyrcania and Bactriana, according to Strabo, who says that it was in the country of the Elymaeani.

CORBIE, in Latin *Corbeia*, a small town of France, in the department of the Somme, on the Somme, in N. lat. 49° 54' 32", one hundred miles north of Paris; it is the chief place and canton in the district of Amiens, and has 1913 inhabitants. The whole canton contains 14,626 inhabitants dispersed in 24 communes upon an extent of 173 kilometres and a half.

CORBIENA, in *Ancient Geography*, (*Khorren abad*) a place of Asia, on the banks of the Gyndes, S. S. W. of Ecbatana and N. N. W. of Susa.

CORBIERES, in *Geography*, a town of Switzerland, and chief place of a bailwick, in the canton of Friburg; 10 miles south of Friburg.

CORBIERES, a valley of France near the Pyrenées, celebrated on account of a victory which Charles Martel obtained over the Saracens.

CORBIGNY, or **ST. LEONARD**, in Latin *Corbinacum*, a small town of France, in the department of the Nièvre, chief place of a canton in the district of Clamecy, has 2315, and the whole canton 11,221 inhabitants. The territorial extent of the latter is 307 kilometres and a half. It is composed of 15 communes.

CORBILO, in *Ancient Geography*, (*Coctton*) a port of Gaul, upon the Loire. M. D'Aville places it at a little distance from Condivicnum or Nantes to the west.

CORBIO, a town of Spain belonging to the Suesitanii. —Also, a town of Latium, whose situation is unknown.

CORBIVEAU, from *Corbeau*, a raven, in *Ornithology*, an African bird, described by M. F. le Vaillant, in his "Histoire Naturelle des Oiseaux d'Afrique, &c." This bird is similar to the raven in the shape of his body, his feet, and his claws; his middle claw is united as far as the first articulation, by a membrane, to the inner one; and the feathers on the lower part of his beak are turned upwards, and cover his nostrils; but he is unlike the raven in his back, in the length of his wings, and in his graduated (*stagé*) tail. He appears, says the writer, to occupy in part the interval between the genus of the ravens and that of the vultures; though he resembles the former in a greater degree than the latter. He is similar to the African vulture in the size of his wings, which when spread are three inches longer than his tail; in his *graduated* tail, in the form of his beak, which is compressed side-ways, convex above, crooked and rounded. These particulars distinguish the corbiveau from all the species of ravens hitherto described; and this bird may be always ascertained by the white patch on the nape of his neck, which strongly contrasts with the glossy black that constitutes the rest of his plumage; except a white mark which separates the sides of this white patch on the back of his neck, and encircles the neck. This bird has some resemblance, in point of form, to birds of prey; and his manners and mode of life confirm the resemblance. Carnion constitutes the chief part of his food; and these birds frequently assemble in large and noisy crowds. The appetite for flesh and blood leads him to kill lambs and young antelopes, and to pursue even the largest quadrupeds. He flies with great strength, and raises himself to a great height by his long wings. He constructs his nest, in October, amidst the trees; and lays four eggs greenish, spotted with brown. The corbiveau is not a bird of passage, but continues the whole year in the country where he was born. The female is less than the male, and the black less glossy.

CORBRENÉ, in *Ancient Geography*, a people of Asia, placed by Polybius in the valleys of Media, with the Cossians and other barbarous nations.

CORBRIDGE, in *Geography*, a place of England in Northumberland formerly a borough, which sent members to parliament. In 1295 it was burned by the Scots, and in 1311 suffered severely from the same invaders; 4 miles east of Hexham.

CORBULO, **CN. DOMITIUS**, in *Biography*, a distinguished commander under some of the Roman emperors. By Tiberius he was made superintendent of the highways in Italy. His conduct in this situation was questioned by succeeding sovereigns. In the year 57, he engaged in military service, and had the command of an army in Lower Germany, among whom he maintained, though at the expense of his humanity, the most exact discipline. In this commission he was eminently successful over the enemies of the empire. By Nero, in 54, he was sent into Armenia, which was invaded by the Parthians. He employed all his efforts in restoring the discipline of the legions which had been enervated by the luxury of Syria. A maxim by which

his conduct was governed, was, "that an enemy might be conquered with a pick-axe," referring to the labours of entrenchment and fortification, for which the Roman armies were so much distinguished. No severity, either of season or climate, prevented him from keeping his troops in the field; and in suffering, as well as in exertion, he was an example to his men, going constantly in their clothing, and with his head bare. He never pardoned a deserter who was apprehended. His various successes were important to the government under which he was employed, and will be related under the article **ROME**. After he had forced the Parthians to an accommodation, he became, on account of the glory attached to his military reputation, an object of suspicion and jealousy with Nero, who resolved upon his death. He accordingly summoned him to his presence by a letter filled with the most flattering expressions of regard. The brave soldier scorned to suspect the integrity and honour of his infamous sovereign. He prepared to attend the court, but no sooner had he reached the port of Corinth, than he met an order to die. Reflecting for a moment upon his own want of prudence and foresight, he exclaimed, "I have merited my fate by trusting to the professions of the monster," and instantly plunged his sword through his body. This was in the year 67. He left behind him memoirs of the several wars in which he had been engaged.

CORBUT, **CHARLES** and **PHILIP**, two draftsmen and mezzotinto scrapers of London, by whom we have several portraits from different masters, as well as other prints from Vandyke, Ramsley, Titian, Oildate, Reynolds, Wilson, &c. Charles Corbut, who was the elder, flourished about the year 1760. Heinecken. Strutt.

CORCANG, or **ALJORJANIYAH**, in *Geography*, a town of Asia, on the river Gihon.

CORCAS, or **GRAND CORCAS**, an island almost in the form of a crescent, N. of St. Domingo, in the windward passage, about seven leagues W. of Turk's island, and about twenty E. of Little Inagua, or Henecagua. N. lat. 21° 55'. W. long. 70° 55'.

CORCELET, in *Natural History*, that part of the fly class which is analogous in its situation to the breast in other animals. Many have called it the breast in these also, but improperly; because the breast of other animals is the place of the lungs and trachea; but these organs are in the fly class distributed through the whole body. The wings are affixed to this part of the fly class; and there are some distinctions of great consequence, in regard to the arrangement and distribution of those animals into genera. Reaumur's Hist. Insect. tom. iv. p. 126.

CORCELE, in *Geography*, a river of France, which runs into the Aroux near Autun.

CORCHORUS, in *Botany*, a name given by the ancients to one or more of their most common pot-herbs. Linn. gen. 675. Schreb. 917. Willd. 1052. Tourn. Cl. 6. gen. 9. Gært. 391. Jusq. 290. Vent. 3. 207. (Corete. Encyc.) Class and order, *polyandria monogynia*. Nat. Ord. *Colummifera*, Linn. *Tiliaceae*, Jusq.

Gen. Ch. *Cal.* Perianth five-leaved; leaves linear-lanceolate, acute, erect, deciduous. *Cor.* Petals five, oblong, obtuse, narrowed towards the base, erect, the length of the calyx. *Stam.* Filaments numerous, capillary, shorter than the corolla; anthers small. *Pist.* Germ superior, furrowed; style thick, very short; styles simple or bifid. *Peric.* Capsule from two to six-celled, from two to six-valved. *Seeds* numerous, angular.

Ess. Ch. Corolla five-petalled. Calyx five-leaved, deciduous. Capsule from two to six-celled, from two to six-valved.

Sp. 1. *C. vilitarius*. Britly-leaved corchorus, or common

moon Jews' mallow. Linn. Sp. Pl. 2. Mart. 1. Lam. 1. Willd. 1. Comm. Hort. tab. 12. Lam. Ill. Pl. 478. fig. 1. Gært. tab. 64. fig. 2. (C. Plinii; Bauh. Pin. 317. Lob. ic. 505. Melochia; Alp. Egypt. 45. tab. 30.) "Capsules oblong, ventricose; lowest ferratures of the leaves bristle-shaped." *Root* annual. *Stem* about two feet high, cylindrical, smooth, even-surfaced, a little branched. *Leaves* alternate, some spear-shaped, some oval, some almost heart-shaped, serrated, with a bristle-shaped reflexed appendage on each side at the base, on long slender petioles; stipules simple, red at the base. *Flowers* small, reddish-yellow; peduncles a line and half long; bracts three, awl-shaped. *Capsules* oblong, somewhat cylindrical or spindle-shaped, two inches long, obsoletely pentagonal, attenuated into a beak at the tip, five-celled, five-valved; cells divided by incomplete transverse partitions. *Seeds* numerous, nearly pyramidal, dark brown, fixed in a double longitudinal row to the central margin of the partitions. A native of Asia, Africa, and America; cultivated as a pot-herb in Egypt, Syria, and other parts of the East, particularly by the Jews. It is said to possess some medicinal qualities, and to be useful as an emollient, a sweetener, and a pectoral. 2. *C. trilocularis*. Linn. Mant. 177. Mart. 2. Lam. 2. Willd. 2. Jacq. Hort. 173. (C. fluans; Forsk. Desc. 101.) "Capsules triquetrous, three-celled, three-valved; angles bifid, scabrous; leaves oblong; lowest ferratures bristle-shaped." *Root* annual. *Stems* a foot high, erect, cylindrical, even-surfaced, green. *Leaves* alternate, petioled, undulate-ferrated; stipules bristle-shaped, small. *Flowers* yellow; peduncles nearly opposite to the leaves, short, two-flowered; calyxes angular; petals narrow. *Capsules* linear, triangularly prism-shaped, channelled at each angle, scabrous, obtuse and simple at the tip. A native of Arabia. 3. *C. tridentis*. Linn. Mant. 565. Mart. 3. Lam. 3. (C. Americanus angulato barbato folio; Pluk. Phyt. tab. 127. fig. 4.) "C. trilocularis; Burm. ind. 123. tab. 37. fig. 2." "Capsules linear, nearly cylindrical, scabrous; lowest ferratures of the leaves bristle-shaped." *Stem* even-surfaced, green. *Leaves* lanceolate, marked with lines, undulate-ferrated. *Capsules* terminated by the three, much diverging, bifid styles. La Marck received from Sonnerat an East Indian specimen, which seems to be *C. trilocularis* of Burman, and to be somewhat different from Plukenet's plant. Its leaves are linear-lanceolate, toothed, on short petioles; its capsules grow two or three together, on very short peduncles, and are terminated by three diverging points, which do not appear bifid. 4. *C. fluans*. Linn. Sp. Pl. 3. Mart. 4. Lam. 4. Willd. 4. Gært. tab. 64. Lam. Ill. Pl. 478. fig. 2. Jacq. Hort. 1. tab. 85. (C. americana carpinifolia, fructu longiore; Tourn. 250. Triumfetta subvillosa; Brown, Jam. 232. tab. 25. fig. 1.) "Capsules oblong, three-celled, three-valved, six-furrowed, six-cuspidate; leaves heart-shaped; lowest ferratures bristle-shaped." *Root* perennial. *Stem* about a foot high, cylindrical, purplish, with divaricating branches. *Leaves* petioled, oval-heart-shaped or oblong, edged with sharp teeth, the two lowest sometimes, but not always, extended into a long awl-shaped appendage. *Flowers* yellow, small, lateral, two together, on short petioles. *Capsules* terminated by three widely divaricated bifid beaks; valves marked on the inside with obsolete transverse wrinkles, instead of partitions; furnished with a double, crenulate, and somewhat undulated dorsal wing. A native of the West Indies. 5. *C. acutangulus*. Lam. 5. Willd. 5. (Lyfimachia; Pluk. Phyt. tab. 44. fig. 1) "Capsules prismatic-wedge-shaped, acutely angular, three-toothed; leaves egg-shaped, sometimes with a single bristle at the base; petioles hispid." *Root* perennial. *Stem* about a foot high, cylindrical, rather slender, hispid,

branched. *Leaves* alternate, on long petioles; stipules five or six lines long, narrow, bristle-shaped. *Flowers* yellow, small, lateral, in pairs, on short peduncles; petals oblong, rather narrow; bracts three, bristle-shaped, often longer than the flower. *Capsules* scarcely an inch long, narrowed towards the base, pentangular, two of the angles more acute and more prominent than the others, terminated by three bifid beaks. A native of the East Indies. 6. *C. capsularis*. Linn. Sp. Pl. 4. Mart. 5. Lam. 6. Willd. 7. Gært. tab. 179. fig. 6. Lam. Ill. Pl. 478. fig. 3. (Alcea sine corchorus; Pluk. am. 18. tab. 255. fig. 4. Genia fativa; Rumph. amb. 5. 212. tab. 78. fig. 1.) "Capsules roundish, depressed, wrinkled; lowest ferratures of the leaves bristle-shaped." *Root* annual. *Stem* five or six feet high, erect, cylindrical, smooth, branched. *Leaves* five or six inches long, petioled, oval-lanceolate, toothed, thin, pale green above, glaucous underneath. *Flowers* small, lateral, single; calyx-leaves concave, incurved, shorter than the corolla; petals emarginate. *Capsules* short, striated, wrinkled, five-celled, five-valved, (imperfectly ten-celled, ten-valved; five larger cells fertile; five smaller barren, placed between the others near the circumference of the capsule; Gært.) A native of China and the East Indies. A kind of hemp is obtained from the macerated stems, which is much used in China. 7. *C. fascicularis*. Mart. 13. Lam. 7. Willd. 6. Vahl. symb. 3. p. 69. (Euphrasia affinis; Pluk. amath. 85. tab. 439. fig. 6.) "Capsules conoid, woolly, facieled, nearly sessile; leaves oblong-elliptical, petioled, without bristle-shaped appendages at the base." *Root* perennial. *Stem* one or two feet high, slender, cylindrical, almost entirely smooth, a little branched. *Leaves* less than an inch long, alternate, toothed; petioles somewhat villous; stipules simple, narrow-lanceolate. *Flowers* yellowish, small, almost sessile, lateral, in fascicles opposite to the leaves. *Capsules* five or six lines long, erect, three-valved, six-celled, furrowed. A native of the East Indies. 8. *C. hirsutus*. Linn. Sp. Pl. 6. Mart. 6. Lam. 8. Willd. 10. Jacq. Amer. 165. Hort. 3. 57. Pfl. 81. tab. 157. (Guazuma; Plum. gen. 36. Burm. amer. tab. 104.) "Capsules roundish, woolly; leaves egg-shaped, obtuse, tomentous, equally ferrated." Linn. "Leaves elliptical, tomentous, crenate; capsules ovate-oblong, downy, unbelled." Lam. A shrub three feet high, or more; branches alternate, cylindrical, clothed with a whitish cottony down. *Leaves* alternate, petioled, near two inches long, and one broad. *Flowers* yellow; common peduncles opposite to the leaves, the length of the petioles, solitary, cottony, supporting five or six pedicelled flowers; calyx cottony on the outside; petals scarcely the length of the calyx. *Capsules* a little incurved, very woolly, obtuse, two-celled. A native of South America. 9. *C. tomentosus*. Thunb. Fl. Jap. 223. "Capsules oblong, woolly; leaves tomentous." Thunb. *Stem* shrubby, cylindrical, erect, two feet high, and more; smooth, purple, branched; branches alternate; at the bottom purple and smooth; at the top tomentous, erect, wand-like; branchlets filiform, spreading, tomentous. *Leaves* alternate, petioled, nerved, spreading; petiole very short, tomentous. *Flowers* orange-coloured, axillary and terminal, generally solitary. *Capsules* cylindrical, woolly. A native of Japan. La Marck asserts that it is distinct from the preceding. 10. *C. hirtus*. Linn. Sp. Pl. 5. Mart. 8. Lam. 9. Willd. 13. Jacq. Hort. 3. tab. 58. (C. folio ulmi major; Plum. Sp. 7. Burm. Amer. tab. 103. fig. 2) "Capsules oblong, hairy; stem hairy; leaves oblong, equally ferrated." *Root* annual. *Stem* about two feet high, cylindrical, rather slender, branched. *Leaves* alternate, unequal at the base, on short hispid petioles; stipules narrow,

very hispid. *Flowers* yellow; peduncles and calyxes hispid; petals oblong, shorter than the calyx, obtuse, narrowed a little towards the base; filaments yellow, the length of the petals; germ oblong, columnar, hispid, with whitish hairs directed upwards; style filiform, the length of the filaments; stigmas two, not spreading. *Capsule* near an inch long, two-furrowed, two-valved. *Seeds* small, black. A native of the West Indies, and South America. 11. *C. hirsutus*. Linn. Sp. Pl. 1. Mart. 9. Lam. 10. Willd. 14. Jacq. Hort. 3. tab. 59. (C. folio ulmi minor; Plum. Sp. 7. Burm. Amer. tab. 103. fig. 1. Corchoro affinis; Sloan. Jam. 50. hilt. 1. 145. tab. 94. fig. 1. Coreta foliis minoribus; Brown. Jams. 147.) "Capsules linear, compressed, two-valved; leaves lanceolate, equally serrated." *Root* perennial. *Stem* about two feet high, almost woody, erect, slender, cylindrical, panicle, somewhat pubescent. *Leaves* smaller than those of the preceding species, without awl-shaped appendages at the base, on rather long petioles, which are pubescent on one side. *Flowers* yellow; lateral, peduncled, solitary or in pairs; germs clothed with short hairs. *Capsules* nearly smooth, two-valved. According to Linnaeus, the spring flowers are without petals, tetrandrous, with a four-leaved calyx; but those produced in autumn, correspond with the generic character. A native of the West Indies. 12. *C. japonicus*. Mart. 7. Lam. 11. Willd. 11. Thunb. Fl. Jap. 227. (Teito, vulgo jamma buki; Kämpf. aman. 844.) "Capsules round, smooth; leaves doubly serrated." *Stem* shrubby, two feet high or more, smooth; branches alternate, filiform, angular. *Leaves* several together from alternate buds, petioled, almost heart-shaped, ovate-acuminate; serratures acute, almost bristle-shaped, nerved, villous, and particularly so on the nerves underneath. *Flowers* yellow or orange-coloured, terminal, solitary, on short peduncles. A native of Japan, where it is cultivated on account of its beauty. There is a variety with double flowers. 13. *C. tetragonus*. Mil. Mart. 10. (C. flor. flavo fructu ceryophylloide; Pluk.) "Capsules quadrangular, reflexed at the points; leaves ovate-heart-shaped, crenate." *Stem* about two feet high, with small branches. *Flowers* pale yellow, very small. *Capsules* swelling, rough, about an inch long, flattened at the top. A native of both Indies. 14. *C. linearis*. Mil. Mart. 11. "Capsules linear, compressed, two-valved; leaves lanceolate, serrate toothed." *Stem* three feet high, with weak branches. *Leaves* about three inches long, and one broad, sitting close to the branches. *Flowers* pale yellow, very small, opposite to the leaves, solitary. *Capsules* two inches long, flat, two-celled. A native of New Spain, about Carthage. 15. *C. bifurcatus*. Mil. Mart. 12. "Capsules linear, compressed, with two horns at the points; leaves heart-shaped, serrated." *Stem* between three and four feet high, herbaceous, strong, with upright branches. *Leaves* on long slender petioles, and between them many smaller leaves, nearly of the same form, sitting close to the branches. *Flowers* pale yellow, very small, lateral, on short peduncles. *Capsules* near three inches long, flat, ending in two horns, two-celled. A native of Jamaica; raised from seeds sent to Miller by Dr. Houlton. 16. *C. flexuosus*. Mart. 14. Willd. 12. Thunb. in Linn. Transf. 2. 335. "Leaves doubly serrated, cuspidate; stem zig-zag." *Stem* cylindrical, rendered somewhat angular by the decurrent leaves, two feet high, erect, smooth. *Leaves* two inches long, alternate, petioled, obliquely heart-shaped, villous, spreading. *Flowers* yellow, terminal. 17. *C. ferratus*. Mart. 15. Willd. 9. Thunb. ibid. "Leaves oblong, serrated, cuspidate; branches smooth." *Stem* erect, smooth, branched; branches cylindrical, purple, erect. *Leaves* two inches long, alternate, petioled, spread-

ing; serratures large, bristle-shaped at the tip, slightly rough with hairs above, smooth underneath. 18. *C. scandens*. Mart. 16. Willd. 8. Thunb. ibid. "Leaves egg-shaped, bristly-serrated, opposite; stem and branches zig-zag, climbing." *Stem* cylindrical, branched; branches opposite, divaricated. *Leaves* opposite, on short petioles, rounded at the base, acuminate, an inch long. *Flowers* yellow, terminal, solitary. The last three species are natives of Japan.

Propagation and Culture.—All the species may be raised from seeds sown in the spring in a hot-bed, protected by a glass frame. Soon after they come up, they should be transplanted into a fresh hot-bed; when they are grown strong, they should be removed into separate pots; and if gradually enured to the open air, they may be shaken out of the pots in June, and let in an open border, where they will generally flower and ripen their seeds. *C. hirsutus* must be kept in a bark-bed in the stove during winter. Miller.

CORCIA, in *Geography*, a town of the island of Corsica; 14 miles N.N.W. of Corte.

CORCIEUX, a small town of France, in the department of the Vosges, chief place of a canton, in the district of Saint Dié, with a population of 1143 individuals; that of the canton amounts to 8351, upon 177½ kilometers; and the number of its communes is 13.

CORCOBA, in *Ancient Geography*, a town situated on the south coast of the island of Taprobana, according to Ptolemy.

CORCOMA, a town of Africa, in Mauritania Cæsariensis, between Carepula and Lagrutum. Ptolemy.

CORCONIANA MANSIE, a place of Sicily, on the route from Catania to Agrigentum, according to the Itinerary of Antonin e.

CORCORAS, a river of Pannonia, which, according to Strabo, passed before Naupontus, and discharged itself into the Savaus.

CORCULUM, in *Vegetable Physiology, is a term used by Linnaeus, after Cæsalpinus, for the heart, or more properly embryo, of a seed; alluding to its shape, which, in the walnut, and many other seeds, resembles the animal heart in miniature. It is the most important and even essential part of a perfect seed, to which all the rest are subservient, being the point whence the future plant originates. In unimpregnated seeds it is deficient, or rather abortive; in fertile ones it is closely connected with the cotyledons, on which it depends for the first supplies of nutriment, and other exciting causes of its evolution. The corculum consists of two parts: the *rostellum*, or radicle, which, by an unerring law of nature, descends in order to become the root; and the *plumula*, or feather, which as regularly ascends, and becomes the stem and leaves. Dr. Darwin ingeniously accounts for this diversity of direction in these two parts, from the former being stimulated by moisture, the latter by air; and presumes that each extends itself accordingly where its vitality is most excited. Other philosophers have explained the same phenomenon, far less happily, on mechanical principles. See **COTYLEDON** and **EMBRYO**. S.*

CORCULUS, the *little heart*, in *Natural History*, a name given by authors to a small species of *cordiformis*, or *heart-shell*, of a rose colour.

CORCURA, in *Ancient Geography*, a town of Asia, in Assyria. Ptolemy.

CORCYRA, (*Corfu*) one of the Greek islands, situated in the Ionian sea, and called, in more ancient times, Drepane, Scheria, and Phæacia. It is said to have taken its name from that of a nymph, whom Neptune ravished in this

this island. It is about 45 miles in length, 23 in breadth, and 210 in compass. It was famous for the delightful gardens of king Alcinous, who courteously entertained Ulysses after his shipwreck. The southern parts of the island are barren, mountainous, and ill provided with water; but the northern coast is very fertile in all kinds of delicious fruit, excellent wines, olives, grain, &c.; whence Homer has denominated it the fruitful Scheria. It had anciently two cities of no small note, *viz.* Corcyra and Cassiope: the former was the metropolis of the island, and once very powerful, as appears from Thucydides, and others; the latter is commended by Pliny and Ptolemy as a wealthy and well-built city, but Cicero calls it only a haven.

This island is said to have been first inhabited by the Phæaciæ, whence it was called Phæaciæ; but afterwards the Corinthians sent hither a numerous colony, B.C. 756. The Corcyrians were, for some time, masters of the sea. Their government was first monarchical; but afterwards they formed themselves into a republic, and made a very considerable figure in the flourishing times of Greece. Herodotus informs us (lib. vii. cap. 168.) that they were very powerful by land; but he much blames them for their deceitful conduct, with respect to the assistance they promised the Greeks against Xerxes: for, being invited by the Athenian and Lacedæmonian ambassadors to join them in the common cause, they readily engaged to send powerful succours, assuring them that they would not neglect the safety of Greece in so imminent a danger; being well apprized, that if the enemy prevailed, they would soon be reduced to the condition of slaves. The ambassadors departed; and the Corcyrians, fitting out a squadron of 60 ships, sailed to the coast of Peloponnesus, and having anchored about Pylos and Tenarus, waited in that station to see the event of the war, being resolved to join the victorious party. When they heard that the Persians were defeated at Salamis, they left their station, and joined the rest of the Greeks, pretending that they had been prevented by the Etesian winds from doubling the cape of Maleæ, and being present at the battle. The Corcyrians submitted to Alexander, and remained subject to the kings of Macedon, till they were delivered by the Romans, in the reign of Perseus, from which time they enjoyed their liberty, till the reign of Vespasian, when they underwent the common fate of the other Greek islands and states both in Europe and Asia. The Corcyrian seditions were proverbial even among the Greeks. See CORFU.

CORCYRA *Melana*, or *Nigra*, so called to distinguish it from the former, an island in the Adriatic sea, on the coast of Illyricum. The Cnidians built a town on this island. In the war of Illyricum, B. C. 229, the Romans, under the consulship of L. Postumius Albinus II. and Cn. Fulvius Centimalus, landed in the island, and the Corcyrians delivered up the garrison of the Illyrians, who had taken possession of it under the command of Demetrius of Pharos; and the whole island submitted, conceiving that this was the only method of securing themselves for ever from the insults of the Illyrians. Upon the conclusion of peace, it was agreed, that Corcyra, as well as some other places, should continue in the possession of the Romans. This island is now called *Curfola*.

CORCYRIS, a town of Egypt. Steph. Byz.

CORCZYCZ, in *Geography*, a town of Poland, in the palatinate of Volhynia; 46 miles N. of Constantinow.

CORCZYN, or KORTSCHIN, a town of Poland, in the palatinate of Sandomirz, on the Vistula; 48 miles W.S.W. of Sandomirz.

CORD, or CHORD, an assemblage of several threads of hemp, cabled or twisted together by means of a wheel.

The word comes from *χορδή*, which properly signifies an intestine, or gut, whereof cords may be made.

CORD of *St. Francis*, a kind of rope adorned with knots, worn by the brothers of the fraternity instituted in honour of that saint.

Some, as the Cordeliers, Capuchins, Minorites, and Recolets, wear it white; others, as the Pique-puces, black. Its design is to commemorate the bonds wherewith Jesus Christ was bound.

CORD, the *scitry of the*, includes a great number of people besides religious. To obtain indulgences, they are only obliged to say five Paters, five Ave Mariæ and Gloria Patris, and to wear this rope, which must have been first blessed by the superiors of the order.

CORD of wood, a certain quantity of wood for burning; so called, because formerly measured with a cord.

It is now measured, particularly in Worestershire, where the fane has been regulated by statute, between two stakes of wood, four feet high, and eight feet apart; and is to be four feet broad and high, and eight feet long = 128 cubic feet = 4 7/4 cubic yards = 3,622 steres or cubic inches of France = 445.223 cubic links.

CORD wood is properly new wood; and such as, when brought by water, comes aboard a vessel; in opposition to that which is floated. All burning wood, not exceeding eighteen inches circumference, is deemed cord-wood.

CORD, in *Geometry*, *Music*, &c. See CHORD, and STRING.

CORD, *Magical*, an instrument in great use among the Laplanders, and supposed to be of great virtues among them. It is a cord or rope, with three knots tied in it. They use many magical rites and ceremonies in the preparing and tying of this cord; and when thus prepared, it is supposed to have power over the winds; and they will sell, by means of it, a good wind, or at least a promise of one, to a ship. If they untie only one of these knots, a moderate gale is to succeed; if two, it is to be much stronger; and if three, there is to be a storm.

CORD, *Umbilical*. See UMBILICALIS funiculus.

CORD-Wood, in *Rural Economy*, a term applied to the small sorts of broken-up or other wood, which was formerly sold by the cord.

CORDA, in *Ancient Geography*, a town of Albion, in the country of the Sclavovæ. As this place was situated farther to the N.W. than the other towns of the Sclavovæ, it is thought to have stood on the banks of Loch-Cure, out of which the river Neith springs.

CORDAGE, is used, in *general*, for all sorts of ropes and cords, great and small; and more particularly for those that are used in the rigging and fitting out of small vessels. The word is also used for the art of preparing and manufacturing the ropes, &c. See CABLE. See also ROPE, and RIGGING.

The naval cordage of different ages and nations has been formed of very different materials. Those of the earlier ages were probably thongs of hide or leather; the use of which was retained by the Caledonians in the third century, and by the nations north of the Baltic in the ninth and tenth centuries. They are even now used as ropes in the western isles of Scotland. These were superseded in the southern parts of Britain, and on the continent, at an early period, by iron chains. Accordingly we find, that in the maritime and commercial

commercial country of the Veneti, who were intimately connected with the Belgæ of Britain. Iron chains were used for cables in the days of Cæsar. However, in the more improved countries of the south, thongs of leather and chains of iron had long given place to the use of vegetable threads; and the art of combining them into strong cords was understood and practised. In this manner the Greeks used the common rushes of their country, and the Carthaginians applied to the same purpose the Spartium or bloom of Spain. And as all the cordage of the Romans was formed of these materials, at their late descent on our island, the art of manufacturing them would necessarily be introduced with the Roman settlements among the Britons. Under the direction of the Roman artists, their *junci*, or rushes, would be wrought into cordage. Accordingly the remains of old cables and ropes are still distinguished among the British sailors, by the name of "old junk." Moreover, the Roman sails, which, in the days of Agricola, were composed of flax, were afterwards made of hemp; and our own are therefore denominated *cannabis*, or "canvas," by our present mariners. About the same period, the same materials were substituted for the junk of the British cordage; for the use of hempen ropes upon land, and of hempen nets for hunting, was very common among the Romans in the first century. The Indians still make their cordage of the bark of coccos, and other trees, and of shreds of plants. The cordage of the British navy is made of the Riga or best Russian break hemp, and tarred with good Stockholm or Ruffia tar.

The cordage is said to be *baked*, when, having passed a stove, or other hot place, it is drained of all its moisture. *White cordage* is that not yet pitched. *Cordage pitched in the stove*, is that which is passed through hot pitch as it comes out of the stove. Each quintal of cordage may take up about twenty pounds of pitch. The cordage is sometimes pitched in the thread. For the method of making ropes and different sorts of cordage, see *ROPE-making*.

By 25 Geo. III. c. 56. no person shall use, in the manufacture of any ropes for shipping, (or sell the same,) hemp called *street chucking*, half clean, whale line, or other topping, cordilla, damaged hemp, or any hemp from which the staple part thereof shall have been taken away by the manufacturer, on pain of forfeiting, for the manufacturer, such rope, and treble the value of it; and for the vender, not being the manufacturer, a sum equal to treble its value. For the better distinguishing the quality of such ropes, that which is inferior to clean Petersburg hemp shall be deemed *inferior cordage*, and marked accordingly, by running from one end of it to the other three-tarred mark yarns, spun with turn contrary to that of rope yarn, and also one like tarred yarn in every other rope for the use of shipping; and the maker shall mark or write, on a tally to be affixed on it, the word "staple," or "inferior," (as the case shall be,) and also his name, signed by himself or his attorney, together with the name of the place where manufactured; and in default thereof, shall forfeit 10*l.* for every hundred-weight. And if any such rope-maker shall wilfully or knowingly permit his name to be put to any such ropes, not being of his own manufacture; or if the vender or proprietor, or any other person, mark upon the tally the name of any person, not being the manufacturer, he shall forfeit 20*l.* And if any person shall make any cables of any old or worn stuff, which shall contain above 7 inches in compass, he shall forfeit four times its value. Foreign-made cordage, for which no duties have been paid, belonging to a ship owned by any of his majesty's subjects, resident in Great Britain, or the British

colonies, and entering any port in this kingdom, shall be duly entered on oath at the custom-house (standing and running rigging excepted); and before the ship be cleared inwards, the master shall pay the duties, on pain of forfeiting the cordage, and 2*s.* for every *cut*. of it. Upon the importation of cordage, tarred or untarred, there is a duty payable of 8*s.* *od.* per *cut*., and no drawback allowed upon exportation; and in the port of London there is a further seavage-rate of 1*d.* per *cut.* of 112 *lbs.* upon the importation of cable-ropes for cordage.

As to the strength of ropes, or cordage, M. Reaumur takes occasion, in the Memoirs of the Royal Academy, to consider the question, whether a rope composed of several twills, or strands, interwoven, *v. gr.* ten, have more strength to sustain a weight, than the ten twills would have separately, placed parallel over one another; or, which is the same thing, whether, if each twill be capable of sustaining the weight of a pound, the whole cord be able to sustain more than ten?

On the one hand, 1. By virtue of the twisting, the diameter of the rope is made larger than are those of the ten twills together; but it is apparently by its thickness that a rope sustains a weight, or resists a fracture. 2. Twisted strands have not all, as when parallel; a vertical direction with regard to the weight: several of them, and even the greatest part, have oblique directions, and of consequence do not bear all the share of the burden they would otherwise bear. In effect, they are inclined planes that are only pressed with a part of the load.

Hence it would follow, that the surplus of the strength of the twills might be employed in raising a larger weight.

On the other hand, it is true, that, in twisting the strands, some are stretched, and others left more loose; and the new tension given the former, serves to weaken them, and has of itself the effect of a weight: thus they become less able to sustain one so large. Those more lax, on the contrary, evade, in some measure, the action of weight: for the action is distributed equally on the ten supposed equal twills; and if some, by reason of their particular disposition, receive less than their quota, the weight will act more forcibly on the rest, and will break them first, as being more tense; after which, it will easily dispatch the rest, as not being in sufficient number to oppose it.

This is the sum of what can be urged for and against the twisting: to decide between them, M. Reaumur had recourse to experiment. The result was, that, contrary to all expectation, he still found the twisting diminished the strength of the rope: whence it is easily inferred, that it diminishes it the more, as the rope is the thicker. For inasmuch as the twisting diminishes; the more twisting, the more diminution.

The resistance or friction of cordage is very considerable; and by all means to be considered in calculating the power of machines. M. Amontons observes, in the Memoirs of the Royal Academy, that a rope is so much the more difficult to bend, 1. As it is stiffer, and more stretched by the weight it draws. 2. As it is thicker; and, 3. As it is to be more bent; *i. e.* as it is to be coiled, for instance, into a smaller ring.

The same author has thought of ways to prove, in what proportion these different resistances increase: that arising from the stiffness or rigidity occasioned by the weight which draws the rope, increases in proportion to the weight; and that arising from its thickness, in proportion to the diameter. Lastly, That arising from the smallness of the gyres, or pulleys,

pulleys, about which it is to be wound, is indeed greater for smaller circumferences than large ones, but does not increase so much as in the proportion of those circumferences.

On this footing, the loss a machine sustains by the cordage, being estimated in pounds, becomes, as it were, a new weight, to be added to that which the machine is to raise. This augmentation of weight will render the cords still the more flaccid; which excess is to be computed as before.

Thus we shall have several sums still decreasing; which are to be added together, as in the article of friction; and it will be surprising to see what a sum they will amount to. See FRICTION.

Where ropes are used in a machine, all the resistance resulting from their stiffness is to be put together; and all that occasioned by the friction; which will make so considerable an augmentation to the difficulty of the motion, that a power which to raise a weight of 3000 pounds, by means of a fixed and moveable pulley, needed only 1500 pounds, must, according to M. Amontons, have 3942 pounds, on account of the frictions, and the resistance of the cordage.

CORDAGE, *twice-laid*, is that which is made of cast rigging, as shrouds, stays, mooring and other cables, which, if not much worn, will make good ropes for wetting the sides of ships, worming and wood'ing for cables, spun-yarn for seizing, worming for large stays, seizing for stays of blocks, small cable-laid ropes for warping ships, rat-lines, scaffolding-ropes for dock-yards, &c. When the yarn of this old stuff is overhauled, a little thin tar should be poured on it, which will make it pliable and lie better. The yarn unfit for knotting will pick into oakum for caulking.

CORDATED LEAF, in *Botany*. See **LEAF**.

CORDAX, in *Antiquity*, a gay sort of dance.

CORDE, MAURICE DE LA, in *Biography*, born at Rheims, where he attained considerable eminence for his classical and critical learning, was made doctor of the faculty of medicine, at Paris, in the year 1559. In the course of an harangue, before his brethren of the faculty, having censured with asperity the manners of the Romish clergy, and some of their ceremonies, and spoken too favourably of the reformed religion, he was seized and thrown into prison. This happened in the year 1569. An edict of pacification being obtained the following year, he was released, and, with the rest of the Huguenots, allowed openly to profess his religion. He was also permitted to practise medicine; but the College, who were firm in the Catholic religion, took from him the place of reader or lecturer. De la Corde was one of the few Huguenots who escaped the massacre, which took place on the eve of St. Bartholomew, in the year 1572; and in 1574, he obtained an order from parliament, reinstating him in his rights in the faculty of medicine. He published, in 1574, "Hippocratis Libellus de iis quæ Virginibus accidunt," with Commentaries, 8vo. Paris; and in 1584, "Hippocratis de morbis Mulierum, Interpretatio," folio. Haller Bib. Med. Eloy Diët. Hist.

CORDE A feu, *Fr.* cord-match, or match of cord, fit for retaining a small quantity of fire for a long time, and of furnishing it, or being lighted up, when wanted.

CORDEAU, *Fr.* a cord made use of for measuring ground. That which engineers commonly made use of was divided into toises, feet, and inches, in order to have the exact openings or magnitudes of angles, and the lengths of lines, which they wished to trace or measure. But as cords shrink in moist or wet weather, and lengthen in dry, this in-

equality of extension rendered the measures of the divisions untrue, and not to be depended on. To guard against such errors or mistakes, a chain of iron-wire, not so liable to undergo alterations with those of the weather, was introduced and made use of. The French say, *manier le cordeau, prendre le cordeau, travailler au cordeau*.

CORDEAU de campement, or *cordeau d'alignement pour le campement*, cord of the encampment, or cord of alignment for the encampment; a long line or cord, divided equally from distance to distance, and marked at the points of equal divisions by pieces of cloth of a scarlet or other vivid colour, in order to be the better seen and perceived. It serves, in the first place, to mark and aligne, from the left wing to the right wing, the extent on the front line of the camp for each battalion, company by company; and on which line are the colours and standards of the troops that occupy the camp. It then serves for laying or marking off, on one and the same right line, the bundles or bells of arms advanced in front of the aforesaid line, about ten paces, or five toises, or thirty feet, and parallel thereto. The same operation is performed for the alignment or the tracing out of the rear of the camp. Then the tents are placed, which occupy each about three paces or nine feet, with an interval of three paces between every two of them. About ten paces, or 30 feet, from the rear of the camp is the line for the kitchens or cooking-places for the companies; and about ten paces behind them is the ground for the drums and fiddlers. At about 20 paces from this ground are the tents of the subaltern officers; and from 10 paces to 20 paces behind them are those of the majors and captains, and those of the colonels and lieutenant-colonels.

CORDED CROSS, in *Heraldry*. See **CROSS-CORDED**. This is a term used to express the cordage of a bale; as for example, a bale argent, corded gules.

CORDELIER, a Franciscan, or religious of the order of St. Francis.

The Cordeliers are clothed in thick grey cloth, with a little cowl, a chaperon, and cloak, of the same; having a girdle of rope, or cords tied with three knots: whence the name.

The Cordeliers are otherwise called *Minor Friars*, their original name. The denomination Cordelier is said to have been first given them in the war of St. Louis against the Infidels; wherein the *Friars Minor* having repulsed the Barabians, and that king having inquired their name, it was answered, they were people *cordeliez*, tied with ropes. The Cordeliers are, to a man, professed Scotists.

CORDELIER, *Order of*, in *Heraldry*. Anne de Bretagne, after the death of her first husband, Charles VIII., instituted this order in 1498, for widow ladies of noble families.

The badge was a Cordelier's girdle argent, and was placed round the escutcheon of their arms. It was also worn round the waist, with the ends hanging down. This order, however, soon after the decease of the founder, fell into disuse.

CORDEMOI, GERARD DE, in *Biography*, a native of Paris, destined by his friends for the bar; the studies preparatory to which he neglected for the more alluring pursuits of philosophy. On this subject he wrote some treatises, that recommended him to Bossuet, by whose influence he was appointed reader to the dauphin. For the instruction of that prince, he studied with much assiduity the history of France, and the result of his labours were published in two volumes, folio, soon after his death, which happened in 1684. This work did not obtain from the French that praise which it justly merited. By some English historians

toian: it has been more worthily appreciated; as well on account of the purity of its style, as from the depth of its researches. M. Coudemou was elected a member of the French academy in 1775. Besides his History of France, we have a 4to. volume of his works, published in 1702. In the latter part of his life, he was assisted in his literary labours by his son Lewis, who was born in 1651, and who became successively a licentiate of Sorbonne, and an abbot in the diocese of Clermont. He was a voluminous writer, chiefly on theological subjects; and was considered among the Catholics as an able advocate of their cause, against the attacks of the defenders of Protestantism. He was, however, of considerable service to his father, in the latter part of his General History of France; and, it is believed, wrote the whole of that part which extends from about the conclusion of the reign of Lewis V. to the end of the work. By order of Lewis XIV. he continued that history from the time of Hugh Capet until the year 1660, which he did not live to finish. He died at the age of 71, in the year 1722. Moreti.

CORDERIE, *Fr.* a rope-yard. A sort of work-house or place convenient for making, both for the artillery and vessels, cords, cables, hawsers, &c. In inland towns, the corderies are open and uncovered, and commonly on the rampart, along by the walls; and in maritime towns, or sea-ports, where considerable armaments are made, they are usually low buildings, covered, long, and narrow, constructed near the arsenals and magazines. These last mentioned corderies have generally, in France, been called *Corderies Royales*, because the most of them were built and kept up at the expence of the king.

CORDES, in *Ancient Geography*, a river of Asia, in Mesopotamia, which, rising in the mountains, pursued its course to the south, and encompassing the town of Dara, was lost in a gulf near it.

CORDES, BALTHASAR, in *Biography*, born at Antwerp, in the year 1592, belonged to the society of Jesuits in the Low Countries, and was doctor of theology at Vienna, where he attained a considerable share of celebrity, as professor of that faculty. He was a man of great learning, particularly in Greek literature. His principal works, as editor and author, were, "S. Dionysii Areopagitæ Opera omnia, Gr. et Lat., cum Scholiis, &c." in 2 tom. fol.; "Expositiones Patrum Græcorum in Pfalmos," in 3 tom. fol. He died at Rome, in the year 1650.

CORDES, JOHN DE, was born at Limoges, in the year 1570, and at an early age discovered a considerable turn for literary pursuits, in which he would probably have been encouraged, but the death of his father obliged him to apply to trade. When he was about 30 years of age, a change of circumstances enabled him to relinquish business, and to indulge his original propensity. He entered himself with the society of Jesuits at Avignon; but a series of ill health obliged him to quit their seminary, and to pursue his studies privately. He afterwards became a canon of his native place, and a collector of rare and valuable books. He was himself an author and editor of considerable reputation; and after his death, which happened in 1642, his library was purchased by cardinal Mazarine. He was editor of the works of Hincmar, archbishop of Rheims; and of the works of George Cassander. He translated father Paul's "History of the Differences between Pope Paul V. and the Republic of Venice;" and likewise Camillo Portio's "History of the Troubles in the Kingdom of Naples, under Ferdinand I." Moreti.

CORDES, in *Geography*, a small town of France, in the department of the Tarn, on the river Ceron; 12 miles N.W.

of Alby. It is the chief place of a canton, in the district of Gaillac, and counts 2303 inhabitants. The canton contains 24 communes, upon 185 kilometres, with 8019 inhabitants.

CORDES Toulouse, a town of France, in the department of the Upper Garonne; 20 miles N.W. of Toulouse.

CORDESHAGEN, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania; 10 miles W. of Collin.

CORDESSE, a town of France, in the department of the Saone and Loire, and district of Autun; 2 leagues N. of Autun.

CORDEVATO, a town of Italy, belonging to the state of Venice, in the country of Friuli; 5 miles N. of Coucordia.

CORDEVOL, a river of Italy, which runs into the Piavo, between Belluno and Feltri.

CORDIA, in *Botany*, (named by Plumier in honour of Emericus Cordus and his son Valerius, two German botanists of the sixteenth century, the former author of *Botanologia, seu Colloquium de varis Herbis*; the latter of *Annotations on Dioscorides*, and of a *History of Plants in four books with figures*.) Linn. Gen. 256. Schreb. 350. Willd. 396. Lam. Ill. 270. Juss. 128. Vent. 2. 382. (Sebestena; Gært. 474.) Clats and order, *Pentandria monogynia*. Nat. Ord. *Asterifolia*, Linn. *Borraginea*, Juss. *Fragaria*, Vent.

Gen. Ch. Cal. Perianth one-leaved, tubular, or bell-shaped, toothed or deeply divided. *Cor.* monopetalous, generally funnel-shaped, sometimes campanulate or wheel-shaped; tube about the length of the calyx, often enlarging upwards; border erect-spreading; generally cut into five, sometimes four, six, seven, or eight obtuse divisions. *Stam.* generally five, sometimes four, six, seven, or eight, awl-shaped, inserted into the tube; anthers oblong. *Pist.* Germ. superior, roundish, acuminate; style twice bifid; stigmas obtuse. *Peric.* Drupe globular or egg-shaped, growing to the calyx; nut furrowed or pitted, two or four-celled; some of the cells frequently abortive. *Seeds* solitary, egg-shaped, acuminate at the summit.

Ess. Ch. Style twice bifid. Drupe with two or four-celled nuts.

Sp. 1. C. *Myxa*. Assyrian plum. Linn. Sp. Pl. 1. Mart. 1. Poir. in Encyc. 1. Mart. 1. *Myxa* seu sebestena, J. Bauh. Hist. 1. 197. Rai. Hist. 1555. *Sebestena niveitris* et *domestica*. C. Bauh. Pin. 446. Prosp. Alp. Egypt. 30? *Cornus sanguinea*; Forsk. Egypt. arab. 33. "Leaves egg-shaped, smooth above; corymbs lateral; calyxes ten-lobed." *B. officinalis*; Lam. Ill. 1895. tab. 96. fig. 3. *Sebestena officinalis*; Gært. tab. 76. fig. 1. *Sebestena domestica*. seu *Myxa*; Comm. Hort. 1. 139. tab. 72. Blackw. tab. 398. *Prunus sebestena*, longiore folio; Pluk. Almag. 306. tab. 217. fig. 3. *Vidi-maram*; Rheed. Mal. 4. 97. tab. 37. Rai. Hist. 1563. Burm. Flor. ind. 58. "Leaves egg-shaped, rather acute, unequally serrated above; calyx somewhat cylindrical, even-surfaced." *Leaves* like those of alder, serrate-angular, scabrous underneath. Linn. A middle-sized tree. *Trunk* thick; wood whitish; bark scaly, marked with purple lines; branches and branchlets very smooth and even surfaced, cinereous, dotted. *Leaves* alternate, petioled, large, narrowed at the base, enlarged, rounded, and a little acute at the summit, entire towards the base, toothed or almost slightly sinuated on the upper part; teeth unequal, distant, acute or obtuse; nerves lateral, oblique, projecting; veins reticulated; petioles smooth, cylindrical, little more than one-third of the length of the leaves. *Flowers* white, sweet-scented, in a large, close, terminal panicle,

consisting of lateral branches with a few short ramifications; calyx green, cylindrical, five-cleft; divisions of the corolla five or six, open, a little reflexed. *Drupe* black, oval, acuminate, smooth, pulpy; not deeply furrowed, perforated; naturally four-celled, but two of the cells generally abortive or quite obliterated. α . a native of Egypt; β . of the East Indies. Poir. asserts that it is not easy to determine what was the myxa of Linnæus, and thinks it probable that two species have been confounded, but though the African and the East Indian plants differ a little in habit, and in the form of their leaves, he has, for the present, considered them only as varieties. A more accurate knowledge of their flowers and fruit will be necessary before they can be pronounced to be absolutely distinct. The fruit has been esteemed a valuable medicine in disorders of the chest and urinary passages, but is now entirely out of use in England. The East Indians eat it macerated in salted vinegar, and reckon it serviceable in diarrhœas. An excellent glue is made of the pulp, which is more viscid than that of the Jujube. 2. *C. lutea*. Lam. Ill. 187. Poir. 15. "Leaves egg-shaped, obtuse, crenate near the summit, corymbs lateral and terminal; calyxes ten-friated." A shrub twelve or fifteen feet high; branches zig-zag, smooth, cinereous, pubescent on their upper part. *Leaves* alternate, petioled, scabrous on both sides, marked on the upper surface with small whitish joints, a little pubescent underneath when young; petioles pubescent, half the length of the leaves. *Flowers* yellowish; peduncles very short; calyxes whitish, strongly striated, four-toothed, a little scabrous at the edges; tube of the corolla the length of the calyx; border open, with six, seven, or eight divisions; filaments eight; filaments erect, filiform, villous at the base; anthers oval, compressed; style the length of the filaments. *Drupe* whitish, egg-shaped; not terminated by a recurved point, four-celled, two of the cells frequently abortive. Found by Dombey at Huanca and in the neighbourhood of Lima, where it is very common. La Marck enquires whether it may not be the myxa of Linnæus, excluding all the synonyms; but there can be no ground for the conjecture, as Linnæus certainly referred to a plant of the old continent. 3. *C. obliqua*. Willd. 2. Phyt. 1. 4. tab. 4. fig. 1. (*C. myxa* γ . Poir.) "Leaves roundish, heart-shaped, nerved, veined, oblique. Nearly allied to *C. myxa*, but the leaves are quite entire and the calyxes not striated. A native of the East Indies. 4. *C. monoica*. Willd. 3. Roxb. Coromand. 1. 43. tab. 58. "Leaves roundish, egg-shaped, toothed, veined, scabrous; corymbs axillary, monœcious." *Leaves* three inches long or more, two inches broad, alternate, very scabrous, acute; petioles about one-third of the length of the leaves. *Flowers* white, small, in axillary or terminal corymbs, which are shorter than the leaves; corolla funnel-shaped, with five egg-shaped obtuse divisions; filaments within the tube of the corolla; filaments awl-shaped, enlarged at the base, anthers lanceolate. *Drupe* yellowish, globular, point-d, filled with a glutinous pulp. A native of forests on the coast of Coromandel. 5. *C. ferrata*. Juss. Poir. 3. "Leaves heart-shaped, acutely serrated; panicle terminal." *Branches* erect, cylindrical, smooth and even. *Leaves* about three inches long and two broad, alternate, petioled, egg-shaped, acute or somewhat acuminate, irregularly serrated, membranous, dark green above, yellowish-green underneath; nerves simple, alternate. *Flowers* in a cyme, somewhat conical, panicle, a little leafy at the base of its first branches, small, white; calyx and border of the corolla five-lobed; filaments five. A native of the East Indies; described from a dried specimen without fruit in the herbarium of Jussieu. 6. *C. subcordata*. Lam. Ill. (189). Poir. 4. (*Novella nigra*, seu *taamari*; Rumph. Amb. 2. 226. tab.

77?) "Leaves somewhat heart-shaped, entire, even on the upper surface; calyx cylindrical." A tree. *Branches* spreading, tufted, smooth. *Leaves* from four to six inches long or more, and nearly as many broad, alternate, slightly pubescent underneath along the principal nerves. *Flowers* in short, loose, terminal racemes, large, white with a reddish tinge; calyx tubular, smooth, three-toothed; corolla funnel-shaped, wrinkled or plaited; tube at least twice the length of the calyx, much enlarged near the top; border with six or seven roundish lobes; filaments six or seven; anthers versatile; style shorter than the filaments. *Drupe* the size of a hazel-nut, four-celled; some of them abortive. Discovered by Commerçon in the Praslin Islands in the East Indies. 7. *C. collococca*. Linn. Sp. Pl. 5. Mart. 6. Poir. 5. Willd. 14. (*C. chretoides*; Lam. Ill. 1902? *C. foliis rugosis*; Brown Jam. 167. *Cerafa* affinis; Sloan. Jam. 169. hist. 2. 95. tab. 203. fig. 2. *Cerafa americana*; Pluk. Phyt. tab. 158. fig. 1.) "Leaves oblong-ovate (cordate-ovate; fylt. nat.) quite entire; flowers in corymbs; calyxes tomentous on the inner side." A middle-sized tree. *Trunk* divided near the top into spreading branches. *Leaves* alternate, petioled, acute, wrinkled. *Flowers* yellowish-green, in loose somewhat-paniced terminal corymbs; peduncles branched, very unequal; corolla funnel shaped, with five deep divisions. *Drupe* bright red, the size of a small cherry, with a sweetish clammy pulp. A native of the West Indies, where the fruit is a favourite food of turkies and other poultry. In Jamaica it is called clammy cherry, or turkey-berry tree. 8. *C. biflora*. Willd. 15. (*C. collococca*; Aub. Guian. 1. 219. tab. 86. *C. nodosa*; Lam. 1905. Poir. 8.) "Leaves oblong, attenuated both ways, pubescent; flowers in terminal and axillary corymbs; peduncles hirsute." *Leaves* narrower than those of the preceding species. *Stem* and *peduncles* hirsute. *Corymbs* dense, somewhat umbel-
 not dichotomous-divaricate. *Fruit* white, oblique, acuminate. A native of Cayenne and Guiana. 9. *C. tetrandra*. Lam. Ill. 1909. Poir. 11. Willd. 16. Aubl. Guian. 1. 222. tab. 87. "Leaves egg-shaped, somewhat heart-shaped, acute, scabrous underneath; corymb or cyme terminal; flowers tetrandrous." A tree forty or fifty feet high, with spreading branches. *Leaves* eight or ten inches long, three or four broad, alternate, entire or slightly undulated, nerved; petioles an inch long. *Flowers* greenish; common peduncle forked, dichotomous at the summit, and branched; calyx top-shaped, with four roundish acute lobes; corolla funnel-shaped; tube short, border expanding; four-lobed; filaments four. *Drupe* whitish, round; nuts three or four-celled; somewhat oval, wrinkled, enveloped in a white gelatinous substance. A native of Cayenne and Guiana. 10. *C. tetraphylla*. Lam. Ill. 1908. Poir. 6. Willd. 18. Aubl. 1. 422. tab. 85. "Leaves four in a whorl, inversely egg-shaped, quite entire; peduncles lateral, many-flowered." A shrub six or seven feet high, with knotty branches. *Leaves* nearly sessile, firm, nerved, a little reticulated, smooth on both sides. *Flowers* white, sessile, on long common peduncles; calyx with five acute teeth; corolla funnel-shaped; tube narrowed at the base; border five-lobed; filaments longer than the corolla. *Drupe* yellowish, the form and size of an olive; not very hard, generally one-celled. A native of Guiana, on sandy soil near the sea. 11. *C. gerajantbur*. Linn. Sp. Pl. 2. Mart. 4. Lam. 1903. tab. 96. fig. 2. Poir. 7. Jacq. Stimp. Amer. 43. tab. 175. fig. 16. Brown Jam. 170. tab. 29. fig. 3. "Leaves lanceolate-egg-shaped, quite entire; panicle terminal; calyxes tomentous, ten-friated." A considerable tree. *Branches* spreading, cylindrical, clothed on the upper part with a thickish cinereous down. *Leaves* alternate, smooth, coriaceous, on short petioles. *Flowers* rather large, white,

white, permanent, shrivelling; principal branches of the panicle furnished at the base with narrow sessile bractes; pedicels short, unequal, three-flowered; calyx oblong, funnel-shaped, slightly toothed; corolla twice the size of the calyx, with four, five, or six almost oval obtuse divisions; filaments fastened to the tube of the corolla, from the base to the middle; anthers incumbent, yellow; germ oblong, striated; style shorter than the stamens; stigmas thick, obtuse, yellow. A native of Jamaica, where it is esteemed one of the best timber-trees. 12. *C. flavescens*. Poir. 9. Aubl. 1. 226. tab. 89. (C. fermentosa; Lam. Ill. 1097.) "Leaves ovate-oblong, acuminate, smooth, quite entire; racemes lateral; drupes obtuse." A shrub, producing from the roots several woody, farmentous stems, eight or nine feet long, spreading upon the neighbouring plants and trees. *Leaves* alternate, petioled, nerved, reticularly veined, six or seven inches long, and three broad. *Flowers* yellowish, in lateral racemes, on a rather long common peduncle; calyx with five or six deep, roundish, acute divisions; corolla funnel-shaped; tube enlarged above the calyx; border with four or six round, spreading lobes; stamens five or six; anthers arrow-shaped; germ greenish. *Drupe* purplish; nut enveloped with a dry and firm membrane. *Seeds* affording a glutinous matter. A native of Cayenne and Guiana. 13. *C. spinescens*. Linn. Mant. 206. Mart. 2. Lam. 1004. Poir. 10. Willd. 4. "Leaves egg-shaped, acute, serrated, scabrous; petioles becoming thorns." *Branches* stiff, erect, tomentous, ferruginous. *Leaves* alternate, tomentous underneath; petioles very short, jointed, breaking off at the joint when the leaves fall, the part that remains sharpening into a thorn, as in volkammeria. *Flowers* in axillary, simple, or biid racemes, equal in length to the leaf; calyx campanulate, with five obscure teeth; corolla campanulate, five-toothed, twice the length of the calyx; stigmas acute. *Drupe* black, sessile, about the size of gooseberries. 14. *C. toqueve*. Lam. 1911. Poir. 12. Willd. 10. Aubl. Guian. 1. 228. tab. 90. "Leaves cordate-ovate, acuminate, quite entire, villous; racemes compound." A much-branched, spreading shrub, five or six feet high; branchlets brittle, villous, rusted. *Leaves* from four to six inches long, three or four broad, alternate, nearly sessile, rough and villous above, tomentous and pale green underneath. *Flowers* white, in axillary and terminal racemes; common peduncle long, villous, leafless; calyx almost tubular, five-toothed; tube of the corolla short; border spreading, with five roundish lobes; stamens five; filaments the length of the corolla; germ a little villous at the summit. *Drupe* yellowish, fleshy, one-celled. A native of Guiana. 15. *C. macrophylla*. Linn. Sp. Pl. 4. Mart. 5. Lam. 1001. Poir. 13. Redouté Pl. Muf. Par. Annals of Museum of Nat. Hist. vol. i. Annals of Botany, 1. 127. (Colococcus platyphyllus; Brown Jam. 168. Prunus racemosa foliis maximis; Sloan. Jam. 184. Hist. 2. 130. tab. 221. fig. 1.) "Leaves ovate-oblong, villous, veined, very large; racemes forming a corymb; calyx cup-shaped." A tree from forty-five to sixty feet high. *Trunk* never more than sixteen inches thick; branches cylindrical, villous while young, several times two or three-forked, diverging, and declined towards the earth. *Leaves* from six to thirteen inches long, from three to seven broad, alternate, deflexed, clothed with short rough scattered hairs, entire, or edged with small sharp teeth; nerves obliquely transverse, prominent underneath; petiole short, cylindrical, channelled. *Flowers* white; calyx oval, villous, with five upright, straight, obtuse teeth; tube of the corolla cylindrical, entirely villous; segments of the border elliptical, deflexed, a little curled, rounded at the tip; stamens five, longer than the corolla; anthers versatile, with two cells separated at the base, and attached to the fila-

ments by their backs; gem oval, acute. *Drupe* red, spherical, about the size of a pea, two-celled. A native of Jamaica. 16. *C. sebifera*. Linn. Sp. Pl. 3. Mart. 3. Lam. 1898. tab. 96. fig. 1. Poir. 14. Willd. 5. Bot. Mag. 794. Bot. Rep. tab. 157. (C. foliis tuberculatis; Jacq. Amer. 42. C. nucis juglandis folio; Plum. Gen. Amer. 105. C. foliis amplioribus; Brown Jam. 202. Sebifera feabra; Dill. Elth. 341. tab. 255. fig. 331. Caryophyllus spurius; Sloan. Jam. 136. Hist. 2. 20. tab. 64. Catal. Car. 2. 91. tab. 91. Novella nigra; Rumph. Amb. 2. 226. tab. 75. Brown Fl. Ind. 59.) "Leaves egg-shaped, somewhat repand, scabrous; calyx cylindrical." A shrub seven or eight feet high. *Stems* several, erect, smooth, cylindrical, branched. *Leaves* alternate, on short petioles, slightly serrated when young, the older ones more or less repand, the upper ones entire. *Flowers* deep yellow or scarlet, in large terminal racemes; pedicels one, two, or three-flowered; calyx with three divisions near the top; corolla funnel-shaped; border with five oval, obtuse, crenulate divisions; stamens five; stigmas recurved. *Drupe* inversely pear-shaped; nut deeply furrowed. A native of the East and West Indies. It is not improbable that the above quoted synonyms refer to more than one species; but no botanist has hitherto found sufficiently discriminating specific characters. The East Indian plants have yellow, the West Indian scarlet flowers. 17. *C. africana*. Lam. 1806. (C. sebifera β ; Poir. Willd. Sebifera alpini; Lam. Wanzey; Bruce's Travels, 5. 57, with a figure.) "Leaves roundish-oval, entire; panicle terminal; calyxes top-shaped; nut of the drupe triquetrous." A tree. *Trunk* dividing into four or five thick branches, about three feet and a half from the ground. *Flowers* snow-white, funnel-shaped, entire, and folded back at the margin. A native of Abyssinia. 18. *C. aspera*. Willd. 6. Forst. Prod. 109. "Leaves egg-shaped, acuminate, rough; flowers in cymes, wrinkled." A native of the island of Tongatabu. 19. *C. dichotoma*. Willd. 7. Forst. 110. "Leaves oblong-egg-shaped, scarcely crenate; corymbs dichotomous." A native of New Caledonia. 20. *C. subvisifolia*. Poir. 16. "Leaves ovate-lanceolate, obtuse, wrinkled, very rough, reticularly veined underneath; racemes lateral." *Branches* smooth, striated, cinereous, or yellowish, somewhat pubescent when young. *Leaves* two inches long, one inch broad, alternate, very firm, coriaceous; petioles two or three lines long, short, firm, rough. *Racemes* stiff, villous, beset with whitish hairs. Native country unknown, communicated by Dupuis to Jussieu, and preserved in his Herbarium. 21. *C. domingensis*. Lam. 1900. "Leaves egg-shaped, entire, rough, whitish underneath; panicle terminal; calyxes cylindrical." *Branches* dark brown, thick, angular, very rough. *Leaves* from six to eight inches long, four or five broad, alternate, thick, coriaceous, nerved, reticularly veined; petioles almost cylindrical, short, thick, very rough. *Flowers* in panicle racemes, shorter than the leaves; racemes unequal, erect, cylindrical, stiff, scabrous, a little pubescent; pedicels one-flowered. A native of St. Domingo. 22. *C. levigata*. Lam. Ill. 1912. Poir. 18. "Leaves egg-shaped, veined, shining; panicles lateral; stamens villous near the base." *Branches* slender, filiform, cinereous, cylindrical, knotty. *Leaves* alternate, petioled, rather small, quite entire, obtuse, or a little acute, narrowed at the base, coriaceous, smooth on both sides, reticularly veined. *Panicles* short, but longer than the leaves, smooth, branched; calyxes smooth, short, striated; corolla open, somewhat campanulate; border five-lobed. A native of the West Indies. 23. *C. senegalensis*. Juss. MSS. Poir. 19. "Flowers tetrandrous; leaves membranous, egg-shaped, acute, smooth; racemes short." A tree about twenty feet high. *Branches* dark brown, slender, cylindrical, quite smooth.

smooth. *Leaves* alternate, four or five inches long, about three inches broad, thin, nerved, and reticularly veined; petioles two inches long and more, smooth, compressed. *Flowers* in panicle racemes, scarcely longer than the petioles; pedicels very short, one-flowered; calyx with three divisions; corolla with four divisions half way down. Brought from Senegal by Adanson. 24. *C. exaltata*. Lam. II. 1910. Poir. 21. "Leaves egg-shaped, acute at the base, rough; corymb terminal; flowers quinquefid." A large tree. *Branches* smooth, striated. *Leaves* about four inches long and two broad, alternate, quite entire, obtuse, somewhat acuminate, c-riaceous, almost shining; petioles very short, striated, slightly compressed. *Corymb* a little longer than the leaves; pedicels very short, thick, one-flowered, calyx short, smooth, campanulate, with five small acute teeth. *Drupe* globular, the size of a pea, two-celled. A native of Guiana. 25. *C. nervosa*. Lam. III. 1906. Poir. 22. "Leaves alternate and opposite, ovate-oblong, acuminate, nerved; panicle short; bractes avale-flaped." A tree. *Branches* cinereous, thick, angular, rough. *Leaves* from eight to ten inches long, four or more broad, alternate, entire, smooth, deep green and shining above, pale yellow underneath; nerves strong, oblique, parallel, a little branched or confluent towards the edges of the leaf; petioles very short, thick, knotty at the base. First divisions of the panicle almost dichotomous; branches short, thick, almost woody, smooth; calyxes smooth, with five short oval divisions. A native of Guiana. 26. *C. rotundifolia*. Poir. 23. Ruiz and Pav. Flor. Peruv. 2. 24. tab. 148. Prunus Sebestena; Pluk. Almag. 306. Phytog. tab. 217. fig. 2. "Leaves roundish and oval, crenate, scabrous; peduncles corymbodichotomous." A shrub about twelve feet high. *Stems* straight, often almost procumbent, cylindrical; branches numerous, very long, supple, zig-zag, villous when young. *Leaves* from two to three inches long, and two broad, alternate, petioled, wrinkled, veined, rough, rather hispid. *Flowers* yellow, large; calyx tubular, striated, with five short acute teeth; corolla funnel-shaped; tube the length of the calyx, dilated at the orifice; border with five plaited, oval, acute divisions; filaments awl-shaped, villous at the base; anthers oval-oblong, concave; germ oval, acuminate; style the length of the filaments. *Drupe* whitish, half enveloped by the calyx and a viscid pulp; nut oval, acuminate, five-furrowed, two-celled. The fructification often varies from six to eight in the number of its parts. A native of Peru, in dry sandy ground, and by the sides of the roads. 27. *C. dentata*. Poir. 24. "Leaves egg-shaped, angularly-cut, toothed; panicle dichotomous, large, divaricate, branches petioled, hirsute." *Branches* a little zig-zag, brown or cinereous, cylindrical, rough, clothed with short stiff whitish hairs. *Leaves* from three to five inches long, from two to four broad, alternate, rough with small whitish points and deep green above, paler and yellowish underneath; some scarcely toothed, others moderately cut, a little angular, with short acute teeth; nerved and reticularly veined; petioles about an inch long, slender, cylindrical, villous. *Flowers* white, almost campanulate; panicle terminal; ramifications numerous, growing gradually shorter, stiff, pubescent; pedicels very short, one-flowered; calyx short, almost campanulate; tube of the corolla short, dilated at the orifice; border large, very open, with five or six very short lobes. A native of Curaçao. 28. *C. micrantha*. Mart. 11. Poir. 25. Willd. 12. Swartz. Prod. 47. Flor. Ind. Occid. 1. 460. "Leaves elliptical, acute, entire, membranous, veined; racemes compound, loose." *Branches* cinereous, a little twisted, wrinkled, smooth. *Leaves* alternate, coria-

ceous, quite entire, deep green and almost shining above, paler underneath, obtuse or somewhat acuminate; petioles short, striated. *Flowers* very small; calyx very short, smooth, striated. A native of Jamaica on woody mountains. 29. *C. sinensis*. Lam. 1914. Poir. 26. "Leaves oblong, obtuse, villous at the axils of the nerves; panicles shorter than the leaves." *Branches* slender, filiform, smooth, somewhat striated, cylindrical, slightly compressed near the summit. *Leaves* two or three inches long, half an inch broad, alternate, quite entire, a little narrowed at the base; petioles filiform, less than an inch long, smooth. *Flowers* whitish, in lateral and terminal panicles; calyx whitish green, short, open, campanulate after the time of flowering, smooth, four or five-lobed, obtuse at its orifice; corolla funnel-shaped, lobed, about twice the length of the calyx. *Drupe* small, oval, nut two-celled. A native of China. 30. *C. indica*. Lam. II. 1913. Poir. 27. "Leaves egg-shaped, petioled, naked; flowers panicle; tube of the corolla entirely concealed in the calyx." *Branches* smooth, cylindrical, long. *Leaves* from one to four inches long, from one to two broad, alternate, quite entire, obtuse or somewhat obtuse, membranous, smooth, nerved and reticularly veined; petioles an inch and half long, slender, supple. *Flowers* in long lateral and terminal branched panicles; branches alternate, terminated by small pendulous racemes; pedicels short, unequal; calyx whitish, campanulate, smooth, lobed and appearing gnawed at the edge, very open after the time of flowering; corolla small; border short, open. *Drupe*s small, oval, two-celled. A native of the East Indies; discovered by Sonnerat. 31. *C. elliptica*. Mart. 12. Poir. 28. Willd. 12. Swartz. Prod. 47. Flor. Ind. Occid. 1. 461. "Leaves oblong, attenuated at the tip, entire, somewhat coriaceous; racemes compound, diffuse; drupes acuminate." A large tree with spreading branches. *Leaves* alternate, smooth on both sides, shining, nerved and veined; petioles semi-cylindrical, channelled underneath, smooth. *Flowers* white, in terminal racemes, almost sessile, unilateral; calyx coriaceous, elliptical, tubular, smooth, from two to five-cleft; tube of the corolla enlarged at its base, scarcely longer than the calyx; border with five linear, lanceolate, reflexed divisions; filaments bearded; anthers oblong, inclining, glandular at the summit; germ oblong; style cylindrical. *Drupe* about six lines long, supported by the enlarged very open calyx; nut wrinkled. A native of Jamaica and St. Domingo. 32. *C. patagonula*. Mart. 7. Willd. 17. Hort. Kew. 1. 259. (Patagonula americana; Linn. Sp. Pl. Lam. III. 271. Pl. 66. Poir. Dill. Elth. 306. tab. 226. fig. 293.) "Leaves oblong-lanceolate, smooth on both surfaces; upper part ferrated; branchlets hairy." A shrub, with the habit partly of privet and partly of alaternus. *Stem* straight, cinereous, spotted with white; ends of the branches covered with long hairs. *Leaves* alternate, obtuse or acute, entire and narrowed into a petiole at the base. *Flowers* in a kind of terminal corymb; calyx very small, but much enlarged after the time of flowering, with five deep divisions; corolla wheel-shaped; tube very short; border flat, with five oval acute divisions; filaments five, as long as the corolla; anthers simple; germ oval, acute; style permanent, the length of the filaments. *Fruit* an oval, acuminate capsule? A native of Patagonia.

This species, we believe, was first referred to cordia by Mr. Dryander in Hortus Kewensis. Linnæus made it a separate genus, partly on account of the enlargement of the calyx during the ripening of the fruit; but this is a circumstance common to other species of cordia; and partly

on account of the fruit which appears to be a capsule; it is, however, not sufficiently known, and Juskie doubts whether it be really a capsule.

CORDIA retusa; Vahl. Mart. See *EHRETIA lutea*.

CORDIA, in *Gardening*, comprises plants of the flowering shrubby exotic kind: of which the species most cultivated is the fleshy or rough leaved cordia. (*C. alliodora*.) See the preceding article. It is of a beautiful scarlet colour, making a fine appearance. A small piece of the wood thrown on a pan of lighted coals perfumes the whole house with a most agreeable smell. It is said to be from the juice of the leaves combined with that of the fruit of a species of fig, that the fine red colour with which they dye their cloths in Otalcaite is manufactured.

Method of Culture. This is a plant which is raised by sowing seeds obtained from the West Indies as soon as possible after they arrive, in pots of light earth, plunging them in a common hot bed or bark bed, and when the plants have two or three months' growth pricking them out singly in small pots, replunging them in the hot bed, to forward their rooting afresh; being afterwards constantly continued in the stove or hot house. They require frequent watering in the summer season.

These are plants which are very ornamental in stove collections, where they can only be kept.

CORDIAL. See *CARDIAC*.

CORDIAL waters. See *Compound WATERS*.

CORDERI, NICCOLO, in *Biography*, called likewise by the Italians Il Franciofino, because a native of France, was born in Loraine in the year 1567. He came to Rome in his childhood, and applied himself with unremitting assiduity to the study of design and modelling, as well from the finest remains of ancient art, as from the life. He soon became a sculptor of considerable ability and eminence, inasmuch that he was more than once honoured by the visits of the pontiffs Clement VIII. and Paul V. while at work. Amongst his principal performances, which are enumerated by Baghione, are four large statues in a chapel at Santa Maria Maggiore, representing David, Aaron, St. Bernardo, and St. Athanasius. This artist died at Rome in the year 1612, and was buried at the church of the Trinita del Monte. Baghione.

CORDERIERS, Fr. rope-makers. There is an immense number of them employed in France for the use of the artillery. But there was a certain class of them who enjoyed barracks under part of the fortification of the arsenal on the river Seine and had the privilege of working there, under the walls of the arsenal, on condition of being always in readiness to furnish cordage for the artillery.

CORDILLERAS, in *Geography*. See *ANDES*.

CORDON, in *Fortification*, is a row or layer of stones, rounded on the outside towards the ditch, and placed between the termination or upper part of the slope of the wall or revetement, and that part of it, which is on the outside of the parapet and stands perpendicularly. The cordon serves to prevent this difference between the lower and upper part of the revetement, from being offensive to the eye, and is at the same time ornamental.

The cordon of the revetement of the rampart is often on a level with the terre-plain of the rampart. Certain writers are of opinion, that it might be placed to more advantage some feet lower, particularly when there is a wall in front of the parapet, and a space between them for going the rounds and titling them from the enemy's side.

CORDON, in *Military Operations and History*, is a chain

of posts, or an imaginary line of separation, between two armies either in the field or in winter-quarters, or for covering a particular frontier or tract of country.

CORDON, in *Geography*, a small island in the Pacific ocean, near the west coast of Nicaragua, at the entrance of the bay of Realejo.

CORDON-JAUNE, the order of, or of the yellow sring, in France, was instituted by the Duke de Nevers in 1606, and abolished the same year by Henry IV. of France.

CORDON, in *Ornithology*, a name given by Buffon to the *AMPELIS cotinga* of Gmelin, and the purple-breasted chat-tier of Pennant and Latham.

CORDONA, or *CARDONA*, in *Geography*, a mountain of Valencia in Spain, is composed entirely of rock salt, 4 or 500 feet high and about 3 miles in circumference: Mr. Bowles informs us, that there are no traces of gypsum near this mountain, as in most similar instances is the case. In the climate of Spain, this mass of salt remains undissolved by the rains, or the waters of a river which washes it. Mr. Townsend carried a fragment of this salt with him through Spain, without the least sign of deliquescence, but on his return to England he soon found it surrounded by a pool of water, owing to the coldness and humidity of our atmosphere. In Spain this rock-salt, like the fluor-spars of Derbyshire, is employed to make snuff-boxes, vases, and other ornaments and trinkets.

CORDOVA, ADRIANO of, in *Biography*, so called from the place of his nativity, a considerable town in Spain, was a barefooted Carmelite who applied himself to historical painting with success. It is regretted, however, that from a too great modesty or diffidence of his own powers, he was induced to deface so many of his pictures as soon as he had finished them. The few that remain are at Cordova, the most remarkable of which is a Crucifixion with St. John, Mary Magdalene, and other figures of half length, in the manner of Rafael Sadelen, in the convent of the Carmelites. This artist died at Cordova in the year 1630. Cumberland.

CORDOVA, or *Cordona*, in *Geography*, a city of Andalusia in Spain, forming a kind of semi-circular amphitheatre on the right bank of the Guadalquivir, in an extensive and fertile plain at the foot of that ridge of mountains, named the Sierra Morena, 84 miles N.E. of Seville; 112 N. of Malaga; 210 S.W. of Madrid, in N. lat. 37° 40'. It is the ancient *Corduba*, the first Roman colony in Spain, and probably on that account called *Colonia Patricia*, or simply *Patricia*, as appears from an inscription on an antique marble in the church of St. Marina:

D. M. S.

M. Lucretius. Verna Patriciensis. Ann. LV.

Pius in Suos. H. E. S.

Sit T. T. Levis.

Cordova has been styled the mother of men of genius. From the very foundation of this city it was the seat of learning and sciences. Strabo says, that the ancient books of the Turdetani, their poetry, and their laws written in verse, were preserved at Cordova. Its academy was celebrated for rhetoric and philology; it had also a Greek professorship. The elder Seneca, and Lucius Annaeus Seneca, preceptor to Nero, were born at Cordova, as well as Lucan the poet, whose grandfather Aicius Lucanus, celebrated for his eloquence, studied here. So did Gallo, another famous orator; Portius Lado, of whose works there remains one harangue; and Manlius, master of the elder Seneca. Tully, in his oration for the poet Archias, men-

tions several poets of Cordova who were established at Rome among others, Sextilius Henna, of whose writings there is only one elegy extant, in which he laments the death of the Roman orator.

After the fall of the Roman empire, Cordova was subject to the dominion of the Goths, until the Gothic monarchy of Spain was overthrown by the Saracens, under the command of Tarik. A Roman captive and proselyte who had been enfranchised by the caliph of Damascus, assaulted Cordova with seven hundred horse. He surprised the town, and drove the Christians into the great church, where they defended themselves above three months; and of all the Spanish military chiefs the governor of Cordova is recorded as the only one, who fell, without conditions, a prisoner into the hands of the Saracens.

Abdelaziz, the son of Musa, to whom the administration of Spain, under the caliph of Damascus, was confided, conceived the design of erecting an independent throne at Cordova; but no sooner was a suspicion of his intentions diffused than a powerful conspiracy was formed against him. As he was repairing alone to the mosque of Cordova, he was attacked and murdered by the conspirators.

On the assassination of Abdelaziz, Ayub assumed the administration of Spain. He was soon removed by the superior favour or merit of Alahor, who, like Abdrame one of his successors, vainly attempted the conquest of the west.

Under twenty successive lieutenants of the caliphs, Spain imbibed, in a few generations, the manners of the Arabs; and by assuming the name of Spaniards, the Arabs asserted their original claim of conquest.

In the mean time the rival houses of Ommijah and of Abbas, the uncle of Mahomet, convulsed the east by their pretensions, from the Indus to the Euphrates. Their contest was decided on the banks of the Zeb. Mervan XIV., and last caliph of the house of Ommijah, was forced to yield to the enthusiasm of the Abbassides, conducted by Abdallah the uncle of his competitor. The vanquished caliph crossed the Euphrates, and without halting in Palestine, pitched his last camp on the banks of the Nile, where he was attacked by Abdallah, and the lance of an Abbasside terminated the reign and life of Mervan.

In the proscription of the Omniades, a royal youth of the name of Abdalrahman above escaped from the rage of his enemies, and was received on the coast of Andalusia with open arms. The Arabian chiefs, who revered the memory of the immediate successors of Mahomet, drew their sabres in his support. The defeat of the Zeb was avenged on the banks of the Guadalquivir; that river was swelled with the bodies of the slaughtered Abbassides; and the throne of the victorious Abdalrahman was established at Cordova in the year 755 of our era.

During a prosperous reign of thirty years, Abdalrahman I. encouraged agriculture, commerce, and the arts. Cordova became the centre of industry, of politeness, and of genius. His son Hassam, who succeeded him, not only patronized, but was even a proficient in the arts. He finished the famous mosque, which had been begun by his father, and threw over the Guadalquivir a bridge which remains a lasting monument of his skill.

Under the second Abdalrahman a perpetual supply of pure water was conducted through pipes and aqueducts into the heart of Cordova, and numerous mosques augmented its magnificence.

Learning flourished under Alkaham the second. He founded the university of Cordova, and the birth-place of

the Senecas, and the Lucans, asserted again its pretensions to literary fame. He collected to immense a quantity of manuscripts, that before the end of his reign the royal library is reported to have contained the almost incredible number of six hundred thousand volumes, of which the catalogue alone filled forty-four.

But the pomp of the third Abdalrahman, who reigned from the year 912 til 961, appears still more incredible. His wives, concubines, and black eunuchs, amounted to six thousand three hundred persons. He was attended to the field by a guard of twelve thousand horse, whose belts and scimitars were studded with gold. To perpetuate the name of his favourite Sultana, he constructed, three miles from Cordova, the palace and gardens of Zehra or Arizapha. The edifice was supported by above a thousand columns of the finest marble; the walls of the hall of audience were incruited with gold and pearls. A formidable army secured the prosperity which his dominions derived from his wife administration. The royal city of Cordova contained six hundred mosques, nine hundred baths, and two hundred thousand houses. Eighty large cities, three hundred towns, and twelve thousand villages obeyed his sway, and yet, in less than fifty years after his decease, the kingdom of Cordova was dissolved, and the house of Ommijah overwhelmed.

His son, Alkaham the second, whom we have already mentioned as the founder of the university of Cordova, died in 976, and left the throne to Hassam his son, a feeble infant, and the reins of administration to the celebrated vizir Mahomet Abenamiir, who from his valour acquired the surname of Almanzor or the Defender. He successfully struggled against civil and foreign commotion, and at his death, his renown was respected in his descendants. The office of vizir became hereditary in his family. His son ruled with a power as absolute as that of the caliphs; their insolence provoked the ambition of other chiefs; the exclusive pretensions of the house of Ommijah were disregarded, the grandson of the great Abdalrahman was plunged into a dungeon, and the glory of the throne of Cordova, which under the Omniades had shone with such a lustre, during a little more than two centuries, was overshadowed by a long night. The limits of the Saracen dominions gradually receded. Several petty principalities were formed on the ruins of their empire, which was at length confined within the boundaries of Grenada.

In the mean time the university of Cordova preserved for a long period of years the reputation which it had acquired under Alkaham II. It was at Cordova that Avenpace and Algazel, two sages mentioned by St. Thomas, taught moral philosophy; that Aliai Cobacena and Aliaben Rezel acquired their profound erudition; and that Abenzuel, the great astrologer and physician, firmamed the Wife, received his education. Within its walls were formed those thirty philosophers and physicians, who arranged the works which, under the name of Avicenna, were dedicated to prince Galatalai, to whom they have been falsely attributed.

Among the learned Moors, to whom Cordova gave birth, are Albeimarcar, Abramo, Meluco, Rachez Almanzor, known by a number of curious works, and a history of the conquest of Spain, Aben Regid who likewise wrote on the division and conquest of Spain, and Averiges, called, by way of eminence, the commentator.

Cordova has preserved nothing of its ancient grandeur, except a vast enclosure filled with houses half in ruins. Its population, from 300,000, which it was in the time of the Moors, is reduced to 15,000. Its long, narrow, and ill-

paved streets are almost deserted: most of the houses are uninhabited; and the multitude of churches and convents which it contains, are besieged by a crowd of vagabonds covered with rags. Although the art of softening leather and giving a brilliant polish to its surface was invented here, Cordova has but a few tan-yards. Its industry is confined to some manufactures of woollen cloth, ribbands, laces, and hats. Rents and provisions are low; and the value of estates has fallen one half in the course of the century.

The bishop of Cordova is suffragan of the archbishop of Seville. His annual income exceeds 3000*l.* sterling. St. Raphael, the patron of Cordova, has a magnificent gilt statue at one of the gates, which forms a singular contrast with the wretchedness that reigns within the town.

The only remarkable edifice of Cordova is its famous cathedral, which formerly served as a mosque to the Moors, and still retains the name of Mezquita. It forms a long square of one hundred and fifty-eight paces by one hundred and thirty-eight, and is well lighted, but too low. About six hundred columns of blackish marble placed in Quincunx are well preserved; but they do not reach the ceiling; they are scarcely more than ten or twelve feet high, and have neither base nor capital; they are joined to each other by two arches placed one above the other, covered with plaster, and supported with stone work whitened over. The result of the whole is not altogether agreeable to the eye, and the cathedral is more remarkable for its oddity than for any very striking beauties, though nothing would equal its magnificence were the height proportioned to the extent. Its exterior presents only a massy and irregular edifice with enormous square pillars.

By the side of the cathedral is a small grove, the fascinating remains of the tasteless luxury of the Moors. It is planted with orange-trees, the tufted foliage of which serves as an asylum to great numbers of birds, and hangs over several fountains which constantly cool the air.

The ancient palace of the Moors has been converted into stables, in which one hundred stallions are usually kept. Their genealogy is carefully preserved; the name and age of each are written over the stall in which he stands. The beautiful horse of Cordova is reckoned the most perfect. There is a curious manuscript in the Escorial marked D.CCC.XCVII on horfes and horfemanship, written by a Moorish general, and dedicated to the third king of the race of Bennefaret, who reigned in the year 1301.

The country round Cordova abounds in oranges and lemons, and produces excellent wine. Gibbon's Rome. J. Talbot Dillon's Travels through Spain, second edit. 4to. London, 1782. Bourgoing's Tableau de l'Espagne. Peyron's Essays on Spain. F. A. Fischer's Travels in Spain, in 1797 and 1798.

Archbishop Roderic Ximenes, in his "Historia Arabum," informs us, that Cordova was paved so early as the middle of the ninth century, or about the year 850, by Abdalrahman II. the 4th Spanish caliph. This prince, who knew the value of the arts and sciences, and who favoured trade so much, that in his reign abundance prevailed throughout the whole land, caused water to be conveyed into this city, which was then his capital, by leaden pipes, and ornamented it with a mosque, and other elegant buildings.

Cordova, a province of South America, being, by the new division of 1782, an intendancy of the viceroyalty of Buenos Ayres, about 100 leagues in length, and 70 in breadth, intersected by several chains of mountains, and watered by several rivers. This district is chiefly celebrated

for woollen manufactures, being seated on the eastern side of a grand and high branch of the Andes.

Cordova, a neat clean town, in the above-mentioned district, distant 156 miles from Buenos Ayres, and pleasantly situated near a wood, at the foot of a branch of the Andes. This town was founded about the year 1530, by Juan Nuñez de Prado; and in 1570 erected into an episcopal see. Its chapter consists of the bishop, dean, archdeacon, chanter, rector, and treasurer; but it has neither canons nor prebendaries. Cordova is situated between the river Primero, so called because it is the first of five in the neighbourhood, which flow in the same direction, and a hill, on a level but sandy soil, so that the rains speedily pass, though the vapours be unwholesome. The city approaches a square form; but the cathedral is irregular, from the want of symmetry in the towers. There are many good and strong houses in the city, but seldom high, though the roofs be elevated; and there are three convents, and two colleges, one of which the Franciscans have absurdly styled the university. Few places of equal extent can display equal wealth; all the inhabitants, Spaniards as well as Creoles, being noted for activity and industry. The chief trade is in mules, which are brought from the southern provinces; and having fed them in the fields, they conduct them to the fair of Saïta, where they are sold to merchants from Peru, at 8 or 10 dollars each; but some send them, on their own account, to be sold in the Peruvian markets, the value being proportioned to the distance. The inhabitants may be 600; and the slaves, mostly of different mixtures, do not procure their freedom so easily as in other parts of America. As meat is very cheap, and the slaves weave and make their own clothes, they are at once easily maintained, and very useful; nor do they wish for freedom, being neither fatigued nor oppressed. The female slaves are excellent washer-women, and go into the river with the water above their middle; nor are they deficient in other kinds of industry. The ladies of Cordova are meanly clothed, and careful observers of the customs of their ancestors; whence the slaves are not permitted to wear any cloth but that manufactured in the country. The wine, and a considerable part of the grain, are procured from Mendoza; while brandy is brought, in leathern bags or bottles, from S. Juan de la Frontera, 30 leagues to the N.W. of Mendoza, on the northern extremity of the province of Cuyo. N. lat. 31° 30'. W. long. 63° 15'.

Cordova, *Mountains of*, are a chain passing N. and S. on the W. of that province, regarded by some as a branch of the Andes, and said to be covered with perpetual snow. These mountains, according to Helms, sometimes present red and green granite, and gneiss, while the grand chain of the Andes consists of argillaceous schistus. As the ridge of mountains becomes gradually higher, the population increases; but at Ramanso, 60 miles from Cordova, they again branch, and so far from one another, that from that place to Tucuman the traveller passes through a saline plain, 70 Spanish miles in length, and for the most part barren and desert, from which the mountains are seen at a distance. The whole ground is covered with a white incrustation of salt; and bears no plants except the "salsola kali," which grows here to the height of four Parisian yards. The decayed town of "St. Jago de Estero" is situated in this plain.

Cordova, a considerable town of North America, in Mexico, the chief article of its trade being sugar, for which it has 33 mills. Eitalla says, there are 260 families of Spaniards, 126 of Meltizos, and 273 of Mexican Indians. Thierry describes Cordova as a large town, with numerous domes, towers, and steeples, and a large square in the centre,

with Gothic arcades on three sides, the cathedral filling the fourth, and a fountain of delicious water in the middle. The streets are wide, straight, and paved, and the houses mostly of stone; but the inhabitants are indolent. The situation is in a kind of natural passage towards the province of Mexico; the vegetation being rich and beautiful, on a soil of red clay, from 10 to 15 feet in depth, producing all the fruits of the two hemispheres. N. lat. $19^{\circ} 15'$. W. long. $97^{\circ} 40'$.

CORDOVA, *New*. See CUMANÁ.

CORDOUAN, *the Tower of*, an extremely well-constructed pharos or light-house, at the mouth of the river Gironde, in France; 66 miles N.W. of Bourdeaux, and 15 miles S.W. of La Rochette; in N. lat. $45^{\circ} 35' 15''$. It was rebuilt by Louis XIV. in the year 1665. The formidable mass of rocks on which it stands is formed by the reefs that skirt the shore. The tower itself is 160 feet high, the great lantern 15; and from 200 to 350 pounds of pit-coal are consumed in it every night. The watchmen are generally relieved every fortnight; they take care, however, to provide themselves with at least one month's provisions, because the boats cannot approach the rocks but when the sea is perfectly calm. F. A. Fischer's Travels in Spain, Letter vi.

CORDUBA, CAVR. FRANCESCO, in *Biography*, a painter and engraver of Italy, by whom we have a set of 44 etchings, middling sized upright plates, from the fountains in the gardens about Rome, embellished by figures much in the style of Callot. He marks his plates thus: "Eques Franc. Corduba del et Sculp." Strutt. Heinecken.

CORDUBA, in *Botany*, Clus. See ASPARAGUS *albus* and *Aphyllus*.

CORDUBA, now Cordova, in *Ancient Geography*, a town of Spain, S.E. of Mellaria, upon the river Batis. It was in this town, as Strabo informs us, that the Romans fixed their habitation, when they first entered Spain. But if it be true that it was founded by Marcellus, as Strabo himself says, we are led to imagine, that from the time when the Romans first inhabited it to the period when Macellus conducted a colony hither, it could not have been very considerable. However, Silius Italicus says, that it subsisted from the time of the second Punic war. However this be, it was from the epoch of Marcellus that it bore the title of a patrician colony, from his having established in it families of this order. Corduba was the first place which the Romans had in Spain, distinguished by the appellation of *Conventus*, and with the privilege of coining money. It afterwards became so considerable, that Strabo compares it, with regard to its commerce, with Gades; and he also extols the extent and fertility of the adjacent country. It was no less celebrated for its literary reputation, as it was the residence of the two Senecas, and of the poet Lucan. On some medals, bearing the name of Corduba, we see on one side a well-dressed female head, and on the other a winged figure, holding a cornucopia; but the greatest number of medals belonging to this city are inscribed with "Colonia Patricia." It is probable that it was called by the first name before the establishment of the colony, and afterwards by the other. See CORDOVA.

CORDUENA, a town of Armenia. See GORDUENA.

CORDULA, or CORDYLA, *Portus*, a port of Asia in Pontus, upon the Euxine sea, according to Arrian, who places it between mount *Sacer* and *Hermonassa*, S.E. of *Trapezus*.

CORDUS, or SORDUS, the name given to an ancient people of Gallia Tarragonense, who dwelt in the vicinity

of the Pyrenées, upon the coast of the Mediterranean sea.

CORDUS, AULUS CREMUTIUS, in *Biography*, a senator and historian of Rome, during the reigns of its first two emperors. In his history of the civil wars, and of the reign of Augustus, he refers to C. Cassius, and denominates him "the last of the Romans." For this offence he was impeached, and put on his trial; during which he manfully vindicated his cause, and in his defence exclaimed, "Posterity will pay to every man his due honour, nor, if I am condemned, will there be wanting those who will cherish the memory, not only of Brutus and Cassius, but of me also." This was not the effusion of an enthusiast, but the confidence to which his virtue and talents gave him a just claim. His prediction has been abundantly fulfilled; and it affords us pleasure, at the distance of nearly two thousand years, to record the heroism of a man who did not disdain to fear the arm of power, and who held in contempt the tyrant Sejanus, whose name has descended with as much infamy attached to it, as that of Cordus has with unsullied honour. Foreseeing that he should be condemned by the tribunal appointed to hear his cause, he resolved to put an end to his life, by abstaining from his daily food. On the fourth day, finding himself well nigh exhausted by hunger and debility, he sent for his beloved daughter, Marcia, from whom he had concealed his intention, and embracing her with tender affection, apologized for keeping this only secret from her, adding, "I am now half-way on the road, and you neither ought to call me back, nor can do it." She departed; and while his accusers and judges were debating what course to pursue, he breathed his last in peace. The senate ordered his books to be burnt; and though some copies were spared, which his daughter caused to be made as public as possible, yet nothing now remains except an eulogy of Cicero, preserved in the *Suafioria* of M. Seneca. Of their value an estimate may be formed by the character given of them by Seneca. Speaking to Marcia, he says, "You have well deserved of Roman literature, and of posterity, to whom will descend a faithful record of events, which cost the author so dear: you have well deserved of himself, whose memory will live and flourish, as long as it is thought worth while to know the history of Rome; as long as there shall remain any one, who shall wish to recur to the acts of his ancestors, any one who shall be desirous of knowing what a Roman once was; what, when all necks were bowed beneath the Sejanian yoke, was the character of an unconquerable spirit, free in his head, his heart, his hands." Rom. Hist.

CORDUS, EBRICIUS, by Melchior Adam called *Henry Urban*, celebrated for his skill in medicine and in poetry, was a native of Simmerhays in Hesse. To assist himself in the prosecution of his studies, he employed some of his early years in instructing the sons of some of the neighbouring gentry. In performing this office, he had the good fortune to attract the notice of Erasmus. In 1521 he went to Italy, where he attached himself in a particular manner to the study of botany; collecting and examining a number of rare plants, and diligently comparing them with the descriptions of them left by Dioscorides. At Ferrara he took the degree of doctor in medicine, which he afterwards taught at Erfurt and Maipurg. In 1535 he went to Bremen, where he spent the small remainder of his life, which terminated, when he was only of a middling age, in the year 1538. He was author of several, and some very valuable, works. His "Treatise on the English Sweating Sickness" was published at Fribourg, in 1529, 4to.; and in 1532, he gave a Latin version

version of the Theriaca, and Alexipharmica of Nicander. His "Botanologicon, five Collogium de Herbis," was printed at Colonia, in 1534, which is commended by Haller, and was several times reprinted; and his "De Abusu Uroscopie," in 1546, at Frankfort. His Latin poems were published in the *Deliciae Poet. Germ.* His son,

CORDUS, VALERIUS, who followed in the steps of his father, and who acquired a still greater portion of fame for his botanical researches, was born February 18th, 1515. The early part of his education he received under his father, who sent him for further improvement to Wittenberg, and other German universities. Applying almost exclusively to the study of botany, he ranged over the neighbouring countries, in search of plants, of which he made a considerable collection, many of them not before known or noticed. In 1542 he went to Italy, and visited the universities of Padua, Pisa, Lucca, and Florence; every where conversing with the most eminent of the professors. In his way to Rome, he had the misfortune to be wounded in his leg, by the kick of a horse; but not thinking it dangerous, and continuing his excursions, in search of plants, the wound, by the time he arrived at Rome, was so much inflamed as to occasion a fever, which put an end to his life in September, 1544, when he was only 29 years of age. He left several works, among them a "History of Plants," many of them never before described. It was published by Conrad Gesner. Also, "Annotations on Dioscorides;" "Dispensatorium Pharm. omnium quæ in usu sunt Noriberge;" "De Spermate Cati, vulgi dict." &c. Haller Bib. Botan. Eloy Dict. Hist. Gen. Bing.

CORDWAINERS, or CORDINERS, the term whereby the statutes denominated *shoe-makers*.

The word is formed from the French *cordonnier*, which Menage derives from *cordonan*, a kind of leather brought from *Cordoua*, whereof they formerly made the upper-leathers of their shoes. Others derive it from *corde, rope*, because anciently shoes were made of cords; as they still are in some parts of Spain, under the name of *alparagates*. But the former etymology is better warranted: for, in effect, the French workmen, who prepared the *cordouas*, are still called *cordouanniers*.

In Paris they have two pious societies, under the titles of *Freres Cordonniers, Brothers Shoemakers*, established by authority towards the middle of the seventeenth century; the one under the protection of St. Crispin, the other of St. Crispianus, two saints who had formerly honoured the profession. They live in community, and under fixed statutes and officers; by which they are directed both in their spiritual and secular concerns. The produce of their shoes goes into a common stock, to furnish necessaries for their support; the rest to be distributed among the poor.

By stat. 1. Jac. I. c. 22. the masters and wardens of the cordwainers company in London are to appoint searchers and triers of leather; and leather is not to be sold before it is searched and sealed. See COMPANY.

CORDYLA, in Botany, Lour. Cochinch. Bosc. Dict. Hist. Nat. class and order, *monadelphia decandria*.

Gen. Ch. *Cal.* campanulate, with four acute divisions. *Cor.* none. *Stam.* Filaments twenty four, united at the base. *Pist.* Germ superior; style one; stigmas simple. *Peric.* Berry pedicelled, oval, acute, one-celled. *Seeds* six, oval.

Sp. C. *parvifolia*. A large tree. *Leaves* small, oblong, emarginate, smooth. *Flowers* in small, lateral, solitary tufts. A native of the eastern coasts of Africa.

CORDYLA, in Ichthyology, an American fish, the *Scomber cordylus* of Gmelin, the *Guara tereba* of Margraave, and the *Trachurus brasiliensis* of Ray.

CORDYLINA, in Botany, Roy. See *DRACENA draco*, and *YUCCA gloriosa et draconis*.

CORDYLOCARPUS, (from *κορύνω*, a club, and *καρπος*; fruit, alluding to the form of the siliqua,) Willd. 1248. Desfont. (Sinapi; Encyc.) Class and order, *tetralinamia siliquosa*. Nat. Ord. *Sinapisifera*, Linn. *Crucifera*, Jussl.

Gen. Ch. *Cal.* four-leaved, caducous; leaves linear, nearly clove. *Cor.* four-petalled, cruciform, open; claws the length of the calyx; border oval, quite entire. *Stam.* Filaments six, erect, filiform; two lateral ones shorter; anthers almost erect, small, oval. *Pist.* Germ superior, cylindrical, swollen at the upper end; style very short; stigma obtuse. *Peric.* Siliqua jointed; the last joint dilated, globular, swollen, terminated by the permanent style. *Seeds* several, convex, somewhat compressed, oblong.

Eff. Ch. Calyx nearly close. Siliqua cylindrical, jointed; the last joint more distinctly separated.

Sp. 1. *C. muricatus*. Poiret in Encyc. 1. Willd. 1. Desf. Atl. 2. 72. tab. 152. "Siliques one-celled, spreading; last joint mucrate; leaves partly lyrate." *Root* annual. *Stems* about two feet high, erect, scabrous, hispid, especially on the lower part, slightly striated, branched; branches alternate, axillary. *Leaves* smooth, or clothed with a few distant hairs; lower ones oblong, or elliptical, decurrent; some quite entire, others lyrate; upper ones lanceolate, alternate, slightly sinuated, or a little toothed. *Flowers* alternate, almost sessile, in a terminal raceme; calyx smooth, or somewhat villous, coloured; corolla pale yellow. *Siliques* smooth, or a little villous. *Seeds* four or five. Discovered by Desfontaines about Mayane, in the kingdom of Algiers. 2. *C. levigatus*. Willd. 2. Poir. 2. (Sinapi græcum; Tournef. Cor. 17. It. 1. 398. tab. 35. *Erucaia alexpeica*; Gært. 298. tab. 143. fig. 9. Vent. Jard. de Cels. tab. 64.) "Siliques two-celled, pressed; terminal joint smooth; leaves pinnatifid." *Stem* a foot high, erect, quite smooth; branches alternate, widely spreading. *Leaves* somewhat fleshy, alternate, smooth, petioled; segments linear, entire, channelled. *Flowers* in terminal upright racemes; corolla purple, or pale red. A native of the islands of the Archipelago.

CORDYLUS, in Ancient Geography, a town of Asia, placed by Steph. Byz. in Pamphylia.

CORDYLUS, in Zoology, a species of lizard, the *LACERTA cordylus* of Gmelin and Linnæus, with a short verticillated tail, denticulated scales, and a smooth body. It is found in Asia and Africa. Its body is livid or blackish.

CORE, in Rural Economy, a name applied to a disorder incident to sheep, occasioned by the presence of small flat worms situated in the liver. The greatest chance of removing this complaint is by changing the sheep into a more airy and dry pasture.—It also signifies the heart of the wood of trees, and likewise of some sorts of fruit, as the apple, pear, &c.

CORE Bank, in Geography, a narrow island of America, on the coast of N. Carolina, about 40 miles long, and scarcely 2 broad. N. lat. 34° 22' to 34° 55'. W. long. 76° 26' to 76° 50'.

CORE Sound lies on the coast of N. Carolina, south of, and communicating with, Pamlico.

COREA, or COREE, in Ancient Geography, a place at which Palestine commenced on the northern side, according to

to Josephus; who says it was near Scythiopolis and a fortress named Alexandrium.

COREA, in *Geography*, called by the Chinese *Kao-li*, and by the Manchew Tartars *Sol-bo*, a kingdom of Asia, in the form of a peninsula, extended between China and Japan, and every where surrounded by the sea, except towards the north, where it is connected with Chinese Tartary, which bounds it on the north; it is bounded on the east by the sea and isles of Japan; on the south by the straits of Corea, separating it from Japan, and by the ocean; and on the west by the Yellow sea, which parts it from China. This kingdom is commonly reckoned to be 200 leagues in length from N. to S. and 100 in breadth from E. to W. The great number of shoals and sand-banks which surround the coasts of this peninsula, render access to it by sea equally dangerous and difficult. Its least distance from Japan is only 25 leagues. The origin of the Coreans is very obscure. It appears, however, that this peninsula was at first inhabited by different tribes, which composed several states; and that, in process of time, they united under the same government, and formed one kingdom, which was called *Kao-li*. The Coreans were most probably of Tartarian extraction. This kingdom is governed by a sovereign, who exercises absolute authority over his subjects, although he himself is a vassal and tributary of the emperor of China. On every succession to the crown, the prince receives on his knees the investiture of his states, granted, or at least, confirmed by the emperor, and distributes among the emperor's envoys the sum of 800 taels, and several other customary presents. The minister of Corea afterwards repairs to Pe-king, to prostrate himself before the emperor, and present him the tribute. The princes, who have espoused the king, cannot assume the title of queen, until she has received it from the court of Pe-king.

The Japanese conquered this kingdom about the end of the 16th century; but the Coreans, assisted by the Tartars, who had subdued China, drove them from their country. The Manchewes, thus masters of Corea, endeavoured to compel their new subjects to shave their heads, alter their manner, and to adopt the Tartar dress. This innovation irritated their minds, and occasioned a general revolt throughout the kingdom of Corea, which was at length appeased by the prudent attention of the reigning family. The interior geography of this kingdom is little known: we are informed, however, that it is divided into eight provinces, containing 40 districts, 33 cities of the first class, 58 of the second, and 70 of the third. King-kitan, or Kinka-tao, situated in the province of King-hi, is the capital of the whole kingdom, and the ordinary residence of the sovereign. This prince is absolute master of all the wealth of his subjects, which he inherits after their death. He is very rigid in the administration of justice; and particular punishments are appointed for murder, robbery, and adultery. Every seventh year all the freemen of the different provinces are obliged to go to court in rotation, and to keep guard round his person for two months; so that, during this year, the whole country is in motion and under arms.

The Coreans are well-formed, ingenious, brave, and tractable. They are fond of dancing and music, and peculiarly docile in acquiring the sciences, which they are said to study with ardour. Men of learning are distinguished from other classes of people by two plumes of feathers, which they wear in their caps. When merchants prefer any books for sale to the Coreans, they shew their respect by dressing in the richest attire, and burn perfumes before they treat concerning the price. The northern Coreans are of a larger size, and more robust than those of the south; they are addicted to arms and become excellent soldiers; using, in combat, cross-

bows and very long fabres. The Coreans do not inter their dead till three years after their decease; they wear mourning for a father or mother three years, and for a brother three months. When they perform the ceremony of interment, they place around the tomb the clothes, chariot, and horses of the deceased, and any thing else of which he was fond when alive; all which they leave to be carried away by those who assisted at the funeral. Their houses consist only of one story, and are very ill built; in the country, they are of earth, in cities, generally of brick; but they are all thatched with straw. The walls of their cities are constructed after the Chinese manner, with square turrets, battlements, and arched gates. These people have borrowed their writing, dress, religious worship, ceremonies, belief of the transmigration of souls, and the greater part of their customs, from the Chinese. Their language, however, is different. (See CHINA.) Their women are subject to less restrictions than those of China; and they also differ from the Chinese with regard to their marriage ceremonies. In China, fathers and mothers often marry their children without their consent and even without their knowledge; but in Corea, the contracting parties choose for themselves, nor do they consult the inclinations of their parents, or allow them to interpose any obstacles in the way of their union. The principal productions of Corea are wheat, rice, and ginseng. This country also produces gold, silver, iron, fossil salt, castor and fable's skins, a beautiful yellow varnish, the splendour of which is almost equal to gilding, and which distils from a tree resembling the palm tree, small horses about three feet high, and white paper. Small brushes for painting are made here of the hair of a wolf's tail, which are much esteemed in China. The paper of Corea, of which a considerable quantity is annually imported into China, is made of cotton; it is as strong as cloth, and those who write upon it make use of a small hair brush or pencil: without the precaution of rubbing it over gently with a little alum-water, it would not bear the ink of European pens. With this paper the Coreans partly pay the tribute due to the emperor, supplying the palace with it every year. The Chinese purchase it, not for the purpose of writing, but for filling up the squares of their shew-windows, because, when oiled, it resists the wind and rain much better than theirs; they also use it as wrapping-paper; and it is likewise serviceable to their tailors, who rub it between their hands till it becomes as soft and flexible as the finest cotton cloth, instead of which they often employ it in lining clothes. If it be too thick for the purpose intended, it may be easily split into two or three leaves; and these leaves are even stronger, and less liable to be broken, than the best paper of China.

The sea-coasts of Corea abound with fish; many whales are found there every year towards the north-east, several of which, it is said, bear in their bodies the darts and harpoons of the French and Dutch, from whom they have escaped in the northern extremities of Europe. If this be true, it seems to indicate the existence of a passage from thence into the seas that lead to the north of America. We refer the reader for farther information with regard to this country to Du Halde and Grofier.

COREA, *Strait of*, that part of the sea which separates the southern part of the continent of Corea from the Japan islands, between N. lat. 24° and 36°, and E. long. 130° and 132° 30'. The channel, *Sy's Prouse* (*Voyage*, vol. ii. p. 17, Eng. ed.), that separates the coast of Japan from the continent may be 15 leagues wide, but it is reduced to 10 leagues by rocks which uninterruptedly border the southern coasts of Corea, from Quelpaert, and which continued, till we had doubled the S. E. point of that peninsula, so that we

were able to keep very close to the continent, distinguish the houses and towns on the coast, and reconnoitre the bays. We saw, says Peroué, on the summits of the mountains some fortifications exactly similar to European forts. It is highly probable the principal means of defence, employed by the Coreans, are directed against the Japanese. This part of the coast is very favourable to navigation, for there appears no cause of danger; and at 3 leagues in the offing the depth of water is 60 fathoms over a muddy bottom; but the country is mountainous, and appears very arid. The snow was not entirely melted in some hollows (May, 1787); and the soil seemed but little susceptible of cultivation. The habitations, however, are very numerous. We counted a dozen sampans, or junks, sailing along the coast, and seeming in no respect to differ from those in China, their sails being also made of matting. See DAGELET, *Island of*.

COREATIS, in *Ancient Geography*, a place of India, near the mouths of the Indus, according to Arrian.

CORED, in *Geography*, a town of Egypt; 16 miles N.E. of Belbeis.

CORED *Herrings*. See HERRINGS.

COREGGIO, in *Biography*. See CORREGGIO.

COREGLIO, in *Geography*, a town of Italy, in the state of Lucca; 15 miles N. of Lucca.

COREGONI, in *Ichthyology*, a division of the SALMO, including those with scarcely conspicuous teeth.

COREIA, in *Antiquity*, a festival in honour of Proserpine, named *Corce*, *Korn*, which, in the Molossian dialect, signifies a beautiful woman.

CORELLA, in *Geography*, a town of Spain, in Navarre, on the Alhama; 6 leagues from Tudela.

CORELLI, ARCANGELO, in *Biography*. The performance and compositions of this admirable musician, form an æra in instrumental music, particularly for the VIOLIN, and its kindred instruments, the *tenor* and *violoncello*, which he made respectable, and fixed their use and reputation, in all probability, as long as the present system of music shall continue to delight the ears of mankind. Indeed, this most excellent master had the happiness of enjoying part of his fame during mortality; for scarce a contemporary musical writer, historian, or poet, neglected to celebrate his genius and talents; and his productions have contributed longer to charm the lovers of music by the mere powers of the bow, without the assistance of the human voice, than those of any composer that has yet existed. Haydn, indeed, with more varied abilities, and a much more creative genius, when instruments of all kinds are better understood, has captivated the musical world in, perhaps, a still higher degree; but whether the duration of his favour will be equal to that of Corelli, who reigned supreme in all concerts, and excited undiminished rapture full half a century, must be left to the determination of time, and the increased rage of depraved appetites for novelty.

Corelli was born at Fusignano, near Imola, in the territory of Bologna, in February 1653. He is said by Adami to have received his first instructions in counterpoint from Matteo Simonelli of the Papal chapel; but the general opinion is, that his master on the violin was Giambatista Bassani, of Bologna. It has been said (Life of Handel, 1760, p. 46.) without authority, that Corelli went to Paris in the year 1672, but was soon driven thence by the jealousy and violence of Lulli. That he visited Germany after he had finished his studies, we are assured by Gaspar Printz (Satyr. Tomponill, 3ten. Theil. p. 227.) who informs us, that he was in the service of the duke of Bavaria, in 1680. Soon after this period, he seems to have returned to Italy, and

settled at Rome, where, about 1683, he published his first "Twelve Sonatas." In 1685, the second set appeared, under the title of "Balletti da Camera," which, the same year, gave rise to a controversy between the author and Paolo Colonna, concerning the diatonic succession of fifths, between the first treble and the base of the allemand in the second sonata. In 1690, Corelli published the third opera of his sonatas; and in 1694, the fourth, which, consisting of movements fit for dancing, like the second, he called "Balletti da Camera."

In the works of the poet Guidi, published at Verona, 1726, it is recorded that, in 1686, when our king James II. piously sent an ambassador to pope Innocent XI. to make a tender of his duty as a faithful son of the Romish church, at a grand academia which Christina queen of Sweden, then a proselyte, and resident in the Alma Città di Roma, gave on the occasion, the music was composed by Bernardo Pasquini, and the band, amounting to one hundred and fifty performers on bowed-instruments, *instrumenti d' arco*, led by Arcangelo Corelli.

About this time, when the opera was in a very flourishing state at Rome, Corelli led the band as principal violin.

But his solos, the work by which he acquired the greatest reputation during his life time, did not appear till the year 1700, when they were published at Rome, under the following title: "Sonate à Violino, e Violone, ò Cembalo, Opera quinta, Parte prima, Parte seconda, Preludii, Allemande, Corrente, Gighe; Sarabande, Gavotte e Follia." This work was dedicated to Sophia Charlotta, electress of Brandenburg. His great patron at Rome was cardinal Ottoboni, the general encourager of polite arts and learning, to whom, in 1694, he dedicates his "Opera Quinta," and in whose palace he constantly resided, *col spetioso carattere d' attuale servitore* of his eminence, as he expresses himself in the dedication.

Crescimbeni (Comment. della Volg. Poesia, vol. i. chap. xi. Roma 1702.) speaking of the splendid and majestic academia, or concert, held at cardinal Ottoboni's every Monday evening, says, that this performance was regulated by Arcangelo Corelli, that most eminent professor of the violin: *famosissimo professore di violino*.

In 1708, we have an honourable testimony of his high rank in the profession, given at Venice in the first edition of the "Armonico pratico al Cembalo," by Francesco Gasparini, who calls him, "virtuosissimo di violino, e vero Orfeo di nostro tempo," (cap. vii.) And Adami, in speaking of Simonelli, Corelli's first master in counterpoint, says, that he made many scholars, "among whom, the most celebrated was the famous Corelli, the chief glory of the age, with the fame of whose five works, already published, the world is filled; and the sixth, consisting of concertos, which he is now (1711) polishing for the press, will complete his immortality."

A very particular and intelligent friend, upon whose judgment and probity we have a most perfect reliance, having had a conversation with Geminiani about five or six years before his death, and a friend of his at that time having had in meditation the writing a history of music, he committed to paper, when he got home, the chief particulars of his conversation, supposing they might be of some use to his friend; but as the plan he had in view has been long laid aside, we have been favoured with the anecdotes and particulars that were obtained from Geminiani, which, as they chiefly concern Corelli, and were communicated by one of his most illustrious scholars, who heard and saw what he relates; we shall insert them here.

"At the time that Corelli enjoyed the highest reputation,

his fame having reached the court of Naples, and excited a desire in the king to hear him perform; he was invited, by order of his majesty, to that capital. Corelli, with some reluctance, was at length prevailed on to accept the invitation; but, lest he should not be well accompanied, he took with him his own second violin and violoncello. At Naples he found Alessandro Scarlatti, and several other masters, who entreated him to play some of his concertos before the king; this he for some time declined, on account of his whole band not being with him, and there was no time, he said, for a rehearsal. At length, however, he consented; and in great fear performed the first of his concertos. His astonishment was very great to find that the Neapolitan band executed his concertos almost as accurately at sight, as his own band, after repeated rehearsals, when they had almost got them by heart. *Si suona*, (says he to Matteo, his second violin) *à Napoli!*

“After this, being again admitted into his majesty’s presence, and desired to perform one of his sonatas, the king found one of the adagios so long and dry, that being tired, he quitted the room, to the great mortification of Corelli. Afterwards, he was desired to lead in the performance of a masque composed by Scarlatti, which was to be executed before the king; this he undertook, but from Scarlatti’s little knowledge of the violin, the part was somewhat awkward and difficult: in one place it went up to F; and when they came to that passage, Corelli failed, and was unable to execute it; but he was assisted beyond measure to hear Petrillo, the Neapolitan leader, and the other violins, perform that which had baffled his skill. A song succeeded this in C minor, which Corelli led off in C major; *ricominciamo*, said Scarlatti, good-naturedly. Still Corelli persisted in the major key, till Scarlatti was obliged to call out to him, and set him right. So mortified was poor Corelli with this disgrace, and the general had figure he imagined he had made at Naples, that he stole back to Rome in silence.

“It was soon after this, that a hautbois player, whose name Geminiani could not recollect, acquired such applause at Rome, that Corelli, disgusted, would never play again in public. All these mortifications, joined to the success of Valentini, whose concertos and performance, though infinitely inferior to those of Corelli, were become fashionable, threw him into such a state of melancholy and chagrin, as was thought, said Geminiani, to have hastened his death.”

This account of Corelli’s journey to Naples is not a mere personal anecdote, as it throws a light upon the comparative state of music at Naples and at Rome, in Corelli’s time, and exhibits a curious contrast between the fiery genius of the Neapolitans, and the meek, timid, and gentle character of Corelli, so analogous to the style of his music.

In 1712, his concertos were published in a beautiful edition, engraved at Amsterdam, by Estienne Roger and Michael Charles le Cene, and dedicated to John William, prince palatine of the Rhine; but, alas! the author survived the publication of this admirable work but six weeks; the dedication bearing date at Rome, the 3d day of December 1712, and he died on the 18th of January 1713!

He was buried in the church of the Rotunda or Pantheon, in the first chapel on the left hand of the entrance of that beautiful temple, where a monument, with a marble bust on it, was erected to his memory, near that of the great painter Raphael, by Philip William, count palatine of the Rhine,

under the care of Cardinal Ottoboni; on which is the following inscription:

D. O. M.
 Archangelio Corellio a Fusignano
 Philippi Willelmi Comitiss Palatini Rheni
 S. R. I. Principis ac Electoris
 Beneficentia
 Marchioni de Laderburg
 quod eximius Animi Doctus
 et Incomparabili in Muncis modulis peritia
 fummis Pontificibus apprime curas
 Italice atque externis Nationibus Admirationi fuerit
 indulgente Clemente XI P. O. M.
 Petrus Cardinalis Ottobonus S. R. E. Vic. Cam.
 et Calliarum Protector
 Lyrici Celeberrimo
 inter Familiars suos jam diu adscito
 ejus Nomen Immortalitari commendaturus
 M. P. C.
 Vixit Annos LIX. Mens X. Dies XX.
 Obiit. IV. Id. Januarii Anno Sal. MDCCXIII.

During many years after his decease, there was a kind of commemoration of this admirable musician in the Pantheon, by a solemn service, consisting of pieces selected from his own works, and performed by a numerous band, on the anniversary of his funeral. A solemnity which continued as long as his immediate scholars survived, to conduct and perform in it. The late Mr. Wiseman, who arrived at Rome before the discontinuance of this laudable custom, assured us that his works used to be performed, on this occasion, in a slow, firm, and distinct manner, just as they were written, without changing the passages in the way of embellishment. And this, it is probable, was the way in which Corelli himself used to play them.

Of the private life and moral character of this composer, little new information can now be acquired or expected; but if we may judge of his equanimity and natural disposition by the mildness, sweetness, and even tenor of his musical ideas, his temper must have endeared him to all his acquaintance, as much as his talents.

Indeed, the account that is given of his dying worth 6000*l.* besides a valuable collection of pictures, and bequeathing them all to his patron Cardinal Ottoboni, does more honour to his parsimony and gratitude, than judgment; a musician leaving money to a cardinal, while he had a relation or necessitous friend in the world, seems to favour more of vanity, than true generosity. And the cardinal, himself, manifested his opinion of this bequest, by keeping only the pictures, and distributing the rest of Corelli’s effects among his poor relations, to whom they naturally appertained.

To attempt to give a character here of Corelli’s compositions, which have been so long heard and universally admired, may to many of our readers appear wholly useless; yet as they are thrown aside as antiquated lumber by some, and regarded as models of perfection by others, our wish to rank each musician in his true place, with equity and fairness, inclines us to make a few reflexions on the genius and works of this master, before we quit the subject.

As Corelli originally titled the second and fourth opera of his sonatas, “*Balletti da Camera*,” from the dancing and familiar movements contained in them; the first and third set, from their gravity of style and movement, may be called “*Sonate da Chiesa*.” The same distinction may be made with propriety in his concertos, and even solos; the first

eight of the former, and six of the latter, being much more solemn and ecclesiastical than the rest.

With regard to the intrinsic worth of his four books of sonatas at present, notwithstanding the exquisite pleasure they may have afforded ourselves and others, during youth, it is very much diminished by the general improvement of melody, knowledge of the bow, and boldness of modulation, which have freed invention from former shackles, and generated new ideas and effects. Indeed, during the time of Corelli, and long after, every one who knew the mechanical laws of harmony, however ignorant of the violin, set about composing sonatas, solos, and concertos, for it; but the great masters of that instrument, whose genius and invention have kept pace with their hands, have now nearly crushed all such infipid and impotent attempts.

Corelli's solos, as a classical book for forming the hand of a young practitioner on the violin, has ever been regarded as a most useful and valuable work, by the greatest masters of that instrument. We were told by Mr Wiseman at Rome, that when he first arrived in that city, about twenty years after Corelli's decease, he was informed by several persons who had been acquainted with him, that his "Opera Quinta," on which all good schools for the violin have been since founded, cost him three years to revise and correct. Tartini formed all his scholars on these solos; and Signor Gardini has told us, that of any two pupils of equal age and disposition,

if the one was to begin his studies by Corelli, and the other by Geminiani, or any other eminent master whatever, he is sure that the first would become the best performer.

The concertos of Corelli seem to have withstood all the attacks of time and fashion with more firmness than any of his other works. The harmony is so pure, so rich, and so grateful; the parts are so clearly, judiciously, and ingeniously disposed; and the effect of the whole, from a large band, so majestic, solemn, and sublime, that they preclude all criticism, and make us forget that there is any other music of the same kind existing.

Geminiani, according to our friend's memorandums, whence an extract has already been given, asserted that "Corelli availed himself much of the compositions of other masters, particularly of the masses in which he played at Rome; that he acquired much from Lulli, particularly the method of modulating in the *legatura*, and from Bononcini's famous *Camilla*." This was not very intelligible; nor does the charge appear well founded; as Lulli has made but little use of the *legatura*. With these masses we are unacquainted; but we find frequent imitations of the more natural passages of Scarlatti, particularly in the beautiful adagio of his eighth concerto, in which there is a great resemblance to a movement in a cantata which was set by Scarlatti in 1704, eight years prior to the publication of Corelli's concertos.

Geminiani's character of Corelli, upon the whole, however, seems very just; he said, that "his merit was not depth of learning, like that of Alessandro Scarlatti; nor great fancy, or rich invention in melody or harmony; but a nice ear and most delicate taste, which led him to select the most pleasing harmonies and melodies, and to contract the parts so as to produce the most delightful effect upon the ear." At the time of Corelli's greatest reputation, Geminiani asked Scarlatti what he thought of him, who answered, that "he found nothing greatly to admire in his composition, but was extremely struck with the manner in which he played his concertos, and his nice management of his band, the uncommon accuracy of whose performance gave the concertos an amazing effect even to the eye as well as the ear;" for, continued Geminiani, "Corelli regarded it as essential to the *ensemble* of a band, that their bows should all move exactly together, all up, or all down; so that at his rehearsals, which constantly preceded every public performance of his concertos, he would immediately stop the band if he discovered one irregular bow."

There seems some justice in Geminiani's opinion, that Corelli's continual recourse to certain favourite passages betrays a want of *resource*. They were so many *bar rests* for his invention. All the varieties of Corelli's harmony, modulation, and melody, might perhaps be comprised in a narrow compass. The musical index to his works would not be long.

Indeed Corelli was not the inventor of his own favourite style, though it was greatly polished and perfected by him. Corelli's concertos, though posthumous, were published

three years before those of Corelli; and we know not how long they had been composed, or how often performed, previous to publication.

For a model of his graver sonatas in the first and third set, he certainly had those of Bassani in his mind; and for the lighter sort, he had many models. His solos seem drawn from his own source more entirely than any of his other productions.

There was little or no melody in instrumental music before Corelli's time. And though he has much more grace and elegance in his *cantilena* than his predecessors, and slow and solemn movements abound in his works; yet true pathetic and impassioned melody and modulation seem wanting in them all. He appears to have been gifted with no uncommon powers of execution; yet, with all his purity and simplicity, he condescended to aim at difficulty, and manifestly did all he could in rapidity of finger and bow, in the long unmeaning allegros of his first, third, and sixth solos; where, for two whole pages together, common chords are broken into common divisions, all of one kind and colour, which nothing but the playing with great velocity and neatness could ever render tolerable. But like some characters and indecorous scenes in our best old plays, these have been long omitted in performance.

Indeed his knowledge of the power of the bow, in varying the expression of the same notes, was very much limited. Veracini and Tartini greatly extended these powers; and we well remember our pleasure and astonishment in hearing Gardini, in a solo that he performed at the oratorio, 1769,

play an air at the end of it with variations, in which, by repeating each strain with different bowing, without changing a single note in the melody, he gave it all the effect and novelty of a new variation of the passages.

However, if we recollect that some of Corelli's works are now more than a hundred years old, we shall wonder at their grace and elegance; which can only be accounted for on the principle of ease and simplicity. Purcell, who composed for ignorant and clumsy performers, was obliged to write down all the fashionable graces and embellishments of the times, on which account his music soon became obsolete and old-fashioned; whereas the plainness and simplicity of Corelli have given longevity to his works, which can always be modernized by a judicious performer, with very few changes or embellishments. And, indeed, Corelli's productions continued longer in un fading favour in England than in his own country, or in any other part of Europe; and have since only given way to the more fanciful compositions of the two Martinis, Zaneffi, Campioni, Giardini, Bach, Abel, Schwindl, Boccherini, Stamitz, Haydn, Mozart, and Pleyel.

After the publication of Corelli's works, the violin seems to have increased in favour all over Europe.

CORENDELIN, in *Geography*, a town of Switzerland, in the canton of Soleure; 10 mile. N. of Soleure.

CORENTIN, a considerable river of South America, in Dutch Guiana.

COREOPSIS, in *Botany*, (from *κορη*, a bug, and *opsis*, appearance, alluding to a fancied resemblance between the seed and the insect.) Linn. gen. 981. Schreb. 1325. Willd. 1538. Gert. 1037. Juss. 188. Vent. 2. 528. (Cariope; Enc.) Class and order, *syngenesia polygama frutricina*. Nat. Ord. *Compositæ oppositifoliae*. Linn. *Corymbiferae*, Juss.

Gen. Ch. *Cal.* many-leaved, generally double, sometimes simple, and somewhat imbricated. *Cor.* compound; florets of the disk numerous, hermaphrodite, fertile, tubular, five-toothed; florets of the ray female, abortive, ligulate, spreading, large. *Stam.* Filaments five, capillary, very short. *Pist.* Germ compressed; style filiform; stigma bifid. *Recep.* generally chaffy. *Seeds* solitary, compressed, crowned with a two or three-horned border.

This genus differs from *bidens* in having a ray, and from *verbena* in having the florets of the ray barren.

Sp. 1. *C. ferulifolia*. Willd. 1. Jacq. Hort. Schœn. 3. 65. tab. 373. "Leaves bipinnate; pinnule linear-lanceolate, with ribs half their breadth." *Root* perennial; outer-leaves of the *calyx* numerous, reflexed. A native of Mexico. 2. *C. verticillata*. Linn. Sp. Pl. 1. Mart. 1. Willd. 2. Bot. Mag. 156. (*C. foliis verticillatis*; Gron. Virg. 131. *Chrysanthemum*; Pluk. Mant. 48. tab. 344. fig. 4.) "Leaves decomposed-pinnate; segments filiform." *Root* biennial. *Stem* from a foot and half to three feet high, erect, striated. *Leaves* sessile, opposite, but often appearing to grow in whorls in consequence of being cut to the base into linear segments, which are curved in various directions. *Flowers* terminal; florets of the disk brown; of the ray yellow; calyx short; outer leaves narrow, loose, shorter than the others. A native of Virginia and Louisiana. 5. *C. delphinifolia*. Lam. 2. (*Ceratophyllum Delphinii foliis*; Vaill. act. 1720. Ehret. pict. tab. 9. fig. 1.) "Leaves tripartite-pinnate; segments linear, channelled on the upper surface." Nearly allied to the preceding, but constantly distinguished from it by its foliage and habit. *Root* perennial. *Stem* a foot and half high, erect, smooth, striated. *Leaves* opposite, connate, sessile, divided at the base into three pinnate segments. *Flowers* terminal; florets of the disk brown, on a somewhat prominent receptacle; of the ray yellow, acute, entire, or bifid;

outer scales of the calyx narrow, loose, obtuse. A native of Virginia. It may perhaps be doubted which of the last two is the *verticillata* of Linnæus. 4. *C. tenuifolia*. Willd. 3. Ehret. Beitr. 7. 168. "Leaves three or five in a whorl, pinnate; pinnæ linear, three-parted or undivided; disk the same colour with the ray." *Root* perennial. A native of Carolina. Willdenow supposes this species to be the *verticillata* of La Marek; but he cannot be right, if it have the disk and ray of the same colour; for La Marek, who described from a living plant, expressly says, that the disk of his *verticillata* is brown, and its ray yellow. It is on this circumstance alone, that the separate existence of *tenuifolia* seems to depend. 5. *C. coronata*. Linn. Sp. Pl. 2. Mart. 2. Willd. 4. (*Ceratophyllum foliis pentapteris*; Vaill. act. 1720. 328. *Bidens pentaphylla*; Plum. Sp. 10. ic. 53. fig. 2.) "Leaves pinnate, serrated, marked with lines, smooth." *Root* annual. The plant is altogether that of *Bidens frondosa*; but it has the flowers of *C. verticillata*, with a large ray of eight striated, oval florets. A native of Virginia. 6. *C. trichosperma*. Willd. 5. Mich. am. 2. 139. "Leaves pinnate, lanceolate; serrated, smooth; scales of the outer calyx ciliate-serrated." A native of Upper Carolina, in moist ground. 7. *C. aristata*. Willd. 5. (*C. aristata*; Mich. am. 2. 1. 140.) "Leaves pinnate, serrated, pubescent; horns of the seed very long, divaricated." A native of North America in the country of the Illinois. 8. *C. leucorhiza*. Mart. 18. Lour. Coch. 508. "Leaves pinnate; pinnæ five, serrate-gashed; ray six-flowered; seed three-horned." *Root* spindle-shaped, fleshy, white. *Stem* a foot and half high, herbaceous, erect, quadrangular, grooved. *Leaves* quinate, lanceolate. *Flowers* entirely saffron-coloured, few together, on terminal peduncles; florets of the ray six; egg-shaped, quite entire; horns of the seed beset with inverted bristles; calyx erect, many-leaved. A native of China. 9. *C. mitis*. Willd. 7. Mich. amer. 2. 140. "Lower leaves bipinnatifid; upper ones linear, three-parted; seeds naked." *Calyx*s generally simple, sometimes somewhat calycel. A native of marshes in Carolina. 10. *C. leucantha*. Linn. Sp. Pl. 6. Mart. 3. Lam. 6. (*Bidens leucantha*; Willd.) "Leaves pinnate, serrated; florets of the ray of a different colour from those of the disk." *Root* annual. *Stem* three or four feet high, quadrangular, smoothish; the opposite sides channelled; branches opposite. *Pinnæ* five, seldom three, egg-shaped, undivided, smooth, equal, even; the three outer often confluent, almost decurrent by the outer side, quite entire at the tip; petioles channelled, connected on both sides by villous hairs. *Flowers* terminal, alternate, two or three, on length peduncles; inner scales of the calyx five; outer five, smaller, more distinctly separated; florets of the ray five, egg-shaped, three-toothed, three-nerved underneath; disk small, convex, yellow. *Seeds* three-horned, hispid backwards. Linn. A native of Virginia. La Marek thinks it not distinct from *C. coronata*. 11. *C. odorata*. Lam. 7. (*C. chrysantha*; Linn. Sp. Pl. 5. Mart. 4. Willd. 7. *Bidens americana triphylla*; Plum. Sp. 10. ic. 53. fig. 1.) "Leaves ternate, serrated, smooth; floret of the ray of a different colour." *Root* sweet-scented, whitish, fibrous. *Stem* about three feet high, quadrangular, smooth, sweet-scented. *Leaves* opposite; generally composed of three egg-shaped, acute, smooth, toothed-loblets. *Flowers* terminal, solitary; florets of the ray white; of the disk yellow, resembling the common camomile. *Seeds* two-lobed; receptacle almost hemispherical. Plum. MSS. A native of the West Indies, and South America. Linnæus, in his specific character, describes the ray as similar in colour to the disk, and if he had not quoted Plumier as his

only synonym, we should have thought La Mèrc referred to a different plant. 12. *C. biternata*. Willd. 19. Lour. Coch. 508. "Leaves twice ternate, ovate-lanceolate, serrated; panicle diffuse; ray six-flowered." *Stem* two feet high, herbaceous, quadrangular, four-grooved. *Flowers* entirely yellow. *Seeds* with two branched horns. *Receptacle* flatfish, naked. A native of China about Canton. The naked receptacle is inconsistent with the generic character. 13. *C. aurea*. Mart. 13. Willd. 9. Hort. Kew. 3. 252. "Leaves ferrated; root ones three-parted; stem ones triid or entire, lanceolate-linear." *Root* perennial. A native of North America. 14. *C. tripteris*. Linn. Sp. Pl. 9. Mart. 5. Lam. 3. Willd. 10. (C. virginianum, folio anagradis; Moris. Hist. 3. 21. tab. 3. fig. 44.) "Lower stem leaves pinnated, upper ones ternate, uppermost simple, petioled; leaflets lanceolate-linear." *Root* perennial. *Stems* three or four feet high (six or seven; Mill.) erect, cylindrical, smooth, branched near the summit. *Flowers* solitary, in a loose corymbus, with a yellow ray and brown disk; florets of the ray pointed, entire or with two teeth. A native of Virginia. 15. *C. fenifolia*. Willd. 11. Mich. am. 2. 138. "Leaves quite entire, ternate, sessile." A native of sandy hills in Carolina. 16. *C. alba*. Linn. Sp. Pl. 8. Mart. 6. Lam. 8. Willd. 12. (C. scandens; Brown. Jam. 321. *Chrysanthemum americanum*, cicris folio glabro; Herm. par. tab. 124. Pluk. alm. 101. tab. 160. fig. 3.) "Leaves generally ternate, wedge-shaped, ferrated." *Root* perennial. *Stems* a foot and half long, slender, incapable of supporting themselves, branched. *Leaves* often quinate, smooth. *Flowers* terminal, peduncled; florets of the ray about eight, white; sometimes with a tinge of purple, rather large; those of the disk orange-yellow. *Seeds* two-horned. A native of St. Cruz, one of the Antilles. 17. *C. foetida*. Mart. 20. Willd. 13. Cav. ic. 1. 55. tab. 77. "Leaves heart-shaped, three-lobed, acuminate, ferrated; middle lobe longer." *Root* annual. *Stem* six feet high, erect, cylindrical, branched, clothed with a short glutinous nap. *Leaves* glutinous, fetid, opposite; petioles long, connate at the base. *Flowers* in a corymb, entirely yellow; calyx-leaves sixteen, ovate-acute, keeled; eight outer ones blackish-green, hirsute, glutinous; florets of the ray eight, three-nerved, somewhat emarginate. *Seeds* inversely egg-shaped, obscurely three-sided, compressed, with two white capillary horns. A native of Mexico. 18. *C. reptans*. Linn. Sp. Pl. 3. Mart. 7. Lam. 9. Willd. 14. Smith spicil. 20. tab. 22. (*Chrysanthemum trifoliatum* scandens; Sloan. Jam. 125. Hist. 1. 261. tab. 154. fig. 2, 3.) "Leaves ferrated, egg-shaped; upper ones ternate; stem creeping." *Root* annual, small, fibrous. *Stem* five feet high, weak, climbing, square at the base, somewhat cylindrical above, striated, branched. *Leaves* opposite, acute, veined, soft, slightly downy, bright green, paler underneath; petioles channelled, hairy. *Flowers* entirely gold-coloured; peduncles from three to five, from the axils of the top leaves, erect, cylindrical, striated, hairy, single-flowered; sometimes with two or three lanceolate bractes at the base; calyx nearly cylindrical; a few of the outer leaves spreading; florets of the ray four-toothed, veined; anthers half excluded, brown; germ linear, ciliate at the edges, stigmas downy above, obtuse. Smith. A native of Antigua. 19. *C. heterophylla*. Willd. 15. Cav. ic. 3. 34. tab. 268. "Leaves scabrous; those from the root, panduriform, repand; on the stem, lanceolate, ferrated, attenuated at the base, nearly sessile." A native of Mexico. 20. *C. baccata*. Linn. jun. Supp. 380. Mart. 8. Lam. 11. Willd. 16. "Leaves egg-shaped, ferrated; seeds resembling a berry." *Stem* eight

feet high, herbaceous, erect. *Leaves* opposite, petioled, three-nerved. *Flowers* yellow, peduncled, often three together, terminal; calyx-leaves sixteen, lanceolate, recurved, the length of the disk; florets of the ray three-toothed. *Seeds* naked, nearly globular, black, somewhat tetragonous, fitting on a convex receptacle and forming an aggregate not unlike the compound berry of rubus; down none. A native of Surinam. The naked seeds exclude it from this genus, independent of the peculiar structure of the fruit. 21. *C. auriculata*. J. Inn. Sp. Pl. 7. Mart. 9. Lam. 4. Willd. 17. Mich. Amer. 2. 138. (*Chrysanthemum hirsutum virginianum*; Pluk. Alm. 101. tab. 83. fig. 5. and tab. 242. fig. 4.) *C. virg. trifoliatum*; Moris. Hist. 3. 20. tab. 3. fig. 45.) "Leaves quite entire, egg-shaped; lower ones ternate." *Root* perennial. *Stem* a foot and half or two feet high, filiform, cylindrical, slightly villous, a little branched towards the top. *Leaves* opposite, connate; lower ones with two small leaves at the base which make them appear auricled, smooth above, slightly villous underneath; petioles channelled. *Flowers* entirely yellow, terminal; florets of the ray eight, large, five-toothed. A native of Virginia. 22. *C. lanceolata*. Linn. Sp. Pl. 10. Mart. 10. Lam. 5. Willd. 18. Mich. Am. 2. 137. (*Bidens succisa* folio; Dill. Eth. 55. tab. 48. fig. 56. B. caroliniana; Mart. Cent. tab. 26.) "Leaves lanceolate, quite entire, ciliated." *Root* biennial. *Stems* several, a foot and half high, decumbent at the bottom, thence rising obliquely. *Root-leaves* long, spread on the ground, thickish, narrowed towards the base, resembling those of scabiosa succisa. *Flowers* large, yellow; peduncles long, smooth; florets of the ray eight or nine, deeply four-toothed. *Seeds* with three horns. A native of Carolina. 23. *C. crassifolia*. Mart. 14. Willd. 19. Hort. Kew. 3. 253. "Leaves inversely egg-shaped, oblong, obtuse, quite entire, pubescent." *Root* perennial. A native of Carolina, flowering from August to September. 24. *C. latifolia*. Willd. 20. Mich. Amer. 2. 137. Lam. Illust. tab. 794. fig. 2? "Leaves egg-shaped, acuminate, crenate-toothed; seeds naked." A native of Carolina, on high mountains. 25. *C. angustifolia*. Mart. 15. Willd. 21. Hort. Kew. 3. 253. "Leaves a ternate, linear-lanceolate, quite entire, even surfaced; florets of the ray oblong, triid; middle segment larger." A native of Carolina and Florida. 26. *C. alata*. Willd. 22. Cav. ic. 3. 30. tab. 260. "Stem winged; leaves a ternate, scabrous, roundish egg-shaped, wedge-shaped at the base, triplinerved." *Root* perennial. A native of Mexico. 27. *C. alternifolia*. Linn. Sp. Pl. 11. Mart. 12. Lam. 10. Willd. 24. Jacq. Hort. 2. tab. 110. Gart. tab. 171. fig. 9. (*Chrysanthemum virginianum*, alato caule. Moris. Hist. 3. 25. tab. 7. fig. 75, 76. Pluk. Alm. 100. tab. 159. fig. 3.) "Leaves lanceolate, ferrated, alternate, petioled, decurrent." Linn. "Stem winged; leaves lanceolate, on short petioles, ferrated; flowers in corymbs; florets of the ray lanceolate." Willd. *Root* perennial. *Stems* several, from five to seven feet high or more, erect, firm, simple. *Leaves* about five inches long, rugged on both sides, of a dirty green colour, narrowed at the base; the lower ones three or four together or two opposite; the rest alternate. *Flowers* yellow, in a terminal corymb; calyx many-leaved, spreading very much; florets of the ray distant, two-horned. A native of North America, from Canada to Virginia, flowering in October and November. 28. *C. ovata*. Willd. 23. Cav. ic. 3. 41. tab. 280. "Stem winged; leaves alternate, oblong, nearly sessile, ferrated; flowers in corymbs; florets of the ray elliptical." *Root* perennial. Very similar to the preceding, perhaps only a variety. A native of Mexico. 29. *C. proserna*. Willd. 25. Hort. Kew. 3. 253. "Leaves elliptical, acuminate, ferrated, petioled,

toiled, veined, decurrent; lower ones whorled; upper ones alternate." *Root* perennial. A native of North America, flowering in September and October. Professor Martyn conjectures that this is the *alternifolia* of Linnæus, and that the *alternifolia* of Hærtus Kewensis is a different plant. 30. *C. radiata*. Mill. Mart. 17. "Leaves linear-lanceolate, sharply serrated, opposite; ray of the flower large, entire." *Root* annual. Stems four feet high, erect. Leaves from three to four inches long, three quarters of an inch broad, acuminate, on short petioles. Flowers two from each of the upper joints of the stem, opposite; peduncles, long, slender, bearing two or three pairs of small leaves or bractes, one-flowered; florets of the ray seven, oval, entire; of the disk numerous, dark-coloured. A native of South Carolina, flowering in August; raised by Miller from seeds sent by Dr. Dale.

COREOPSIS *Bidens*; Linn. See *BIDENS cernua*.

COREOPSIS *foliis linearibus integerrimis*; Gron. See *RUBRICA angustifolia*.

Propagation and Culture. Most of the perennial species are hardy and may be readily increased by parting the roots. The second and fourteenth require a light loamy earth and sunny exposure. The annuals should be sown in a hot-bed and afterwards transplanted into a warm border.

COREOPSIS, in *Gardening*, contains plants of the flowering herbaceous perennial kind; of which the species cultivated are the whole leaved *coreopsis*, or tick seed sun-flower. (*C. verticillata*.) The three leaved *coreopsis*. (*C. tripteris*.) The alternate leaved *coreopsis*. (*C. alternifolia*.) The span leaved *coreopsis*. (*C. lanceolata*.)

Method of Culture. The mode of propagation in these plants is easily effected, either by slipping or dividing the roots in autumn when the stalks decay, planting them out where they are to remain, keeping them clear from weeds, and cutting down the stalks annually in autumn when they begin to decay. The third and fourth sorts may be rendered more forward by the use of a hot-bed. All these plants are well calculated for the more large borders and clumps, introducing them in the vacant spaces between shrubs, as they exhibit a plentiful bloom till late in the autumnal months.

CORESIUM, in *Ancient Geography*, a lake or marsh in the island of Crete. Steph. Byz.

CORESSUS, one of the four towns of the island of Cos, according to Suidas. Ptolemy calls it *Cereffus*; Strabo, and also Steph. Byz. denominate it *Coriffa*.

CORESSUS, or *Corefus*, a name given by Xenophon, Diodorus Siculus, &c. to a high mountain of Asia Minor in Ionia, about 40 stadia from the city of Ephesus. At the foot of this mountain was a town of the same name, called by Steph. Byz. *Coriffos*, which he represents as a town of Ephesus, because of its dependence upon it. He says that it derived its name from the following circumstance. Diana, having been delivered of Latona, and having brought her hither asked of the people of the country to whom this place belonged? they replied "Κορη, κορ;" Virgin, it is yours. In this fable is traced the etymology of the name.

CORETA, in *Betany*, Brown. See *CORCHORUS siliquosus*.

CORETT, in *Ichthyology*, the name of a large East Indian fish of the tunny kind, and suspected to be no other than the common tunny, or *SCOMBER Thynnus*. It grows to six or seven feet long. Its eyes are large, and their irises yellow; its tail is broad and forked, and in colour of a yellowish green; its belly-fins are yellowish, and its belly of a fine bright glossy blue, with a silvery cast. It is generally caught with hooks, and is a very fine tasted fish. Ray.

CORETUM, in *Ancient Geography*, a gulf of Palus-Mæotis, according to Pliny; who says that a mountain of

rocks separated this gulf from the lake of Boges, into which the river Hypanis discharged itself.

COREVA, or *COREBA*, a place of Africa propria, on the route from Turburba to Tacape, between Valli and Musti, according to Antonine.

COREUR, a town of India on this side of the Ganges, according to Ptolemy. It is thought to be the same with *Cereura*.

CORFE CASTLE, in *Geography*, is an ancient market-town, situated near the centre of the Isle of Purbeck in Dorsetshire, England; at the foot of a range of hills, on a rising ground, declining to the east. Its origin must undoubtedly be attributed to the castle, which existed previous to the year 980: though the town itself does not appear to have been of any importance till after the conquest, it being wholly unnoticed in Domesday book. The manor and castle seem always to have defended together. Though this is an ancient borough by prescription, it was not incorporated till 15th Eliz., when Sir Christopher Hatton obtained a charter, investing the inhabitants with liberties similar to those of the Cinque-ports, with various other privileges: these were confirmed by James I. and Charles II. The government of the town is vested in a mayor, and eight barons who have served the office of mayor. The earliest return to parliament was in 14 Eliz.; the right of election is possessed by all persons within the borough who are seized in fee, in possession, or reversion, of any messuage, or tenement, or corporal hereditament, and in such as are tenants for life or lives, and in want of such freehold, in tenants for years, determinable on any life or lives, paying rent and lot. The town consists chiefly of two streets of stone buildings. The church, a large ancient fabric, comprises a nave, chancel, two aisles, and a large embattled tower: twelve irregular arches support the roof, and four pillars, in the Saxon style, but all different, are connected with the porch. The number of houses in the late return was 152; and of inhabitants 741; many of whom find employment in the neighbouring clay-works and stone quarries; and a few in knitting stockings. A weekly market is held on Thursdays. This town is 116 miles S.W. from London. The district which includes Corfe castle, and is about ten miles in length and eight in breadth, contains twelve or thirteen Sunday schools, distributed through the different parishes; each being governed by a committee of the principal inhabitants, subject to the superintendance of a general committee who meet at Corfe castle as occasion may require. The average number of children who attend these schools is about 400. Dorsetshire was one of the first counties in which Sunday schools were established. Some excellent regulations, relative to the general management of these institutions, may be seen in Hutchins's Dorset, vol. i. p. 308, 2d edit.

The castle at Corfe "stands a little north of the town, opposite to the church, on a very steep rocky hill, mingled with hard, rubbly chalk-stone, in the opening of those ranges of hills that inclose the east part of the isle. Its situation between the ends of these hills deprives it of much of its natural and artificial strength, being so much commanded by them, that they overlook the tops of the highest towers; yet its structure is so strong, the ascent of the hill on all sides but the south is steep, and the walls so massy and thick, that it must have been one of the most impregnable fortresses in the kingdom before the invention of artillery. It was of great importance in respect to its command over the whole isle; whence our Saxon ancestors justly styled it Corfe gate, as being the pass and avenue into the best part of the isle." (Hutchins's Dorset, i. 280.) The castle is separated from

the town by a strong bridge, of four very high, narrow, semi-circular arches, crossing a deep moat, now dry. The bridge leads to the gate of the first ward, which remains nearly entire, probably from the thickness of the walls, which, from the outward to the inner facing, is in some parts full nine yards. On the higher part of the hill, at some distance from the centre of the fortress, stands the keep or citadel, which still retains nearly its original height, and commands a very extensive prospect to the north and west.

The precise period when the castle was built is uncertain; but from concurrent circumstances its erection is ascribed to King Edgar. That it did not exist previously to the year 887, when the nunnery at Shaftesbury was established, is certain, from an inquisition taken 54 Hen. III.; wherein the jurors returned, "that the abbess and nuns at Shalton (Shaftesbury) had, without molestation, before the foundation of the castle at Corfe, all wrecks within their manor of Kingston, in the isle of Purbeck."

Between two and three miles eastward of Corfe, is *Nine Barrow Down*, an eminence so named from nine large barrows situated on it in a line, supposed to be of British construction. The whole number of barrows on this down are sixteen of various dimensions; most of them circular, and very regularly shaped. A shallow trench surrounds eight or ten; and near them is a hollow or cavity. The highest part of the down rises 642 feet above low water mark.

At a small distance, north west of Corfe, is *Grange or Creech Grange*, the seat of John Bond, Esq.; it anciently was part of the possessions of the abbeys of Bindon, and the occasional residence of the Abbot. Hutchins's History of Dorsetshire.

CORFINIUM (*S. Pelino*), in *Ancient Geography*, a town of Italy, the capital of the Peligni, situated at a small distance from the Aterisus, on a delightful plain surrounded by mountains. In the time of the Social war, A. U. C. 662, the allies fortified it, and made it a place of arms. During the civil wars, Cæsar obliged Domitian to retire hither, besieged him there, and took the place.

CORFU, in *Geography*, the ancient CORCYRA (which see), an island of the Mediterranean, at the mouth of the Adriatic, near the coast of Albania, about 15 leagues long and 8 wide. In ancient times the inhabitants of this island formed a powerful republic; in succeeding times it belonged to the king of Naples; and it was afterwards sold for 30,000 ducats to the Venetians, who maintained a fleet of galleys in the port, and a strong garrison to defend this and the neighbouring islands. It was seized by the French in 1797; and by an article in the treaty of Campo Formio, in 1797, the French republic was allowed by his majesty, the emperor, king of Hungary and Bohemia, to possess, in full sovereignty, the six adjacent Venetian islands of the Levant, viz. Corfu, Zante, Cephalonia, St. Maurice, Cerigo, and other islands dependent on them, together with all the six adjacent establishments in Albania, which are situate lower down than the gulf of Ladrino. In 1799 this island was taken by the Russians, and, together with Cephalonia and Zante, &c. constitute an independent republic under the protection of Russia.

This island is said to contain about 50,000 persons, and is divided into four bailiwicks or governments. The religion of Corfu is partly that of the Latin and partly that of the Greek church. The latter has for its chief a proto-papa, or head-priest, elected in an assembly of the clergy and nobility; he is immediately dependent on the patriarch of Constantinople, and possesses all the episcopal powers. His office lasts five years, and he then returns to the class of ordinary

papas, with the privilege of wearing a crimson girdle. His revenue is confined to the perquisites of his office, the amount of which he continues to increase, as an indemnity for the expence he incurred in procuring his nomination. To the cathedral there are canons attached, as to that of the Latin church; but they have no fixed prebend. The only advantage accruing from their canonicate is that of being at the head of the clergy, together with the honour of wearing a violet girdle, and a small tassel of the same colour to their hats. The number of churches in Corfu is very considerable. Each officiating priest is annually elected by the assembled parishioners; but he has no fixed salary. Most of the churches, especially those in the country, have been built by private persons, who, as proprietors, nominate the papa. The richest of these churches is that in which are deposited the relics of St. Spiridon, to whom the Greeks pay a peculiar devotion; and the festival of this saint is celebrated with the greatest pomp. The night between Holy Thursday and Good Friday is remarkable for the number of processions which perambulate the city.

In the isle of Corfu are several convents of men and women, which tend very much to oppress the inhabitants. The ignorance of the Greek clergy, especially in the rural parts, is so great as to be proverbial; the most learned among them being hardly capable of writing and reading their own language.

The air of this island is healthy, the land fertile, and the fruit excellent. Oranges, citrons, the most delicious grapes, honey, wax, and oil are very abundant. Some places are mountainous and barren, and good water is scarce. Salt forms a great part of its riches.

CORFE, the capital of the fore-mentioned island, the seat of a bailiff, a provost, a captain, &c. and the see of an archbishop. It is fortified, and defended by two fortresses; the town has a good harbour and a considerable trade. N. lat. 39° 42'. E. long. 20° 2'.

CORGA, a country of India, near the coast of Malabar, bounded on the N. and E. by the Mysore country, on the S. by the country of the Nayrs, and on the W. by the sea.

CORGATHEA, in *Ancient Geography*, a town of India, according to Ptolemy.

CORGOLOIN, in *Geography*, a town of France, in the department of the Côte d'Or, and district of Beaune; 5 miles N. of Beaune.

CORI, anciently *Coria*, a town of Italy, in the Campagna di Roma; 10 miles S. of Palefrino.

CORIA, or CURIA, in *Ancient Geography*, a town of the isle of Albion, in the country of the Damii, according to Ptolemy. The conjectures about the situation of this place are various and doubtful; but, upon the whole, that of Mr. Baxter seems to be the most probable, who places it at Kirkintilloch, a place of great antiquity, upon the wall, about 6 miles from Glasgow.—Also, a town of Albion, belonging to the Otadeni, and supposed to be Corbridge in Northumberland by Camden and Baxter; but Horsley imagines it to have been situated much farther north, probably at Jedburgh, and suspects it to have belonged to the Gadeni.—Also, a place of Greece, in the Peloponnesus; near the town of Helice, according to Ælian.—Also, a town of Italy, near Rome. See CORI.

CORIA, in *Geography*, a town of Spain, in the province of Estremadura, the see of a bishop. It contains two churches, two convents, and two hospitals; near it are medicinal springs; 90 miles E. of Toledo, and 110 E. S. E. of Madrid. N. lat. 39° 36'. Long. 10° 28' E. of Peak of Teneriffe.—
Also,

—Alfo, a town of Spain, in the country of Seville, on the Guadalquivir; 7 miles from Seville.

CORIACO, a town of S. America, in the province of Cumana, on a gulf to which it gives name; 40 miles E. of New Cordova. It contains about 6500 perfons.

CORIALLUM, in *Ancient Geography*, a place of Gaul, in the *Lyonnensis fecunda*; near the cape de la Hogue, according to d'Anville.

CORIANDEK, in *Agriculture*, the name of a plant which is cultivated in the field by the farmer in some diftricts, though not to any very great extent. In both Effex and Kent it is, however, occasionally met with as a field crop.

In its culture it is advised, that the feed fhould be fown in the autumnal feafon, on rich, friable land, which has been well prepared by tillage; and that when the plants have rifen above the furface of the ground, they fhould be hoed out to the diftance of about four inches every way, clearing them well from all forts of weeds. It is fuppofed that by this management they will become ftrong, and produce a greater quantity of good feed.

The advantages of cultivating this fort of crop are thus fitted in the fourth volume of the Letters and Papers of the Bath Society.

Sowed ten perches of land with coriander feed, the foil a good fandy loam.

or 15 l. 18 s. 4 d. per acre.

The author of the paper obferves, that he has fince made feveral larger experiments in this article, but that none has proved fo good a crop as the preceding, yet all of them fuch as to afford a good profit. There is a ready fale for the feed with the diftillers, druggifts, and confectiioners. The former purchafe very large quantities: the price varies from 16s. to 42s.

According to Mr. Vancouver, in his Account of Effex Husbandry, the mode of cultivation is thus performed. "The culture of coriander, which has been much attended to in the neighbourhood of Tolthunt Darcy, is, he fays, thus managed: old lay-ground is ploughed in the beginning of March, and after the furface is completely pulverized, the feed is fown fourteen pounds to the acre; three hoeings and fetting out the plants four inches fquare will coft one guinea per acre. Average produce, 10 *cwt.* per acre, 12s. per *cwt.* This is confidered to be a very good preparation, after once ploughing, for wheat; and as the land is generally ploughed in two yard ridges, or fitches of eight furrows wide, a row of beans is generally planted with the coriander, on each fide

VOL. IX.

of the open furrows between the fitches, and are ufually harvefted at the fame time.

"It is frequently the cafe in this diftrict to cultivate a triple fort of crop, confifting of coriander, carraway, and tealf.

"When (fays the above writer) carraway is fown with the coriander, from the care and attention neceffarily beftowed on diftinguifhing the plants, the hoeing feldom cofts lefs than one guinea and a half per acre; but the carraway is not regularly fet out for a crop till after the coriander is harvefted, at which time a very expenfive hoeing becomes indifpenfably neceffary.

"Tealfe is fometimes cultivated in the fame field, the feed being fown with the coriander and carraway; but as neither the carraway nor tealfe come completely and regularly the fecond year, both crops are ufually allowed to ftand for the third fummer. This is eftemed good management for old coarfe pature grounds, which, after three ploughings, are commonly fown with wheat, and then clean chalked."

The following directions are given for this culture, by Mr. Sewell of Maplehead: "about the beginning of March, plough fome old pature land; if it has been pature for a century, the better; and the foil fhould be a very ftrong clayey loam. Mix 12 *lbs.* of carraway, 10 *lbs.* of coriander, and 12 *lbs.* of tealfe feeds together, which is fufficient for one acre; fow direftly after the plough and drefs (he fuppofes harrow) the land well. When the plants appear of fufficient ftrength to bear the hoe (which will not be until about ten weeks after fowing), it muft not be omitted, and in the courfe of the fummer it will require three hoeings, and one at Michaelmas; each will be about 8s. per acre. The coriander is annual, and is fit to cut about the beginning of July: it fhould be left in the field after cutting, and thrufhed on a cloth, in the fame manner as rape feed.

"About April following, your tealfe and carraway will want a good hoeing, done deep and well, and another hoeing about the beginning of June; thefe two hoeings are to be done at 7s. per acre each. The carraway will be fit to cut the beginning of July, and muft be thrufhed in the fame manner as coriander. The tealfe will not be ready till the middle of September, when thofe heads which are beginning to turn brown are cut off the ftem, with a ftalk a foot long, and 25 of them are tied in a bunch, 24 of the bunches are fixed on a fmall ftick, and called a row, 240 of which make a load in bulk, equal to a ton of hay from the meadow. The work of cutting and bunching the tealfe can only be done by thofe who have been well acquainted with and learned the mode; it muft be looked over, and the heads cut at feveral times, as they ripen. The tealfe and carraway are perennial, and fome of the plants do not perfect their feeds till the third or fourth year, though in general you have a crop the fecond year, and the feeds that are fcattered from the crop the fecond year often come to perfection the fourth year; he has known inftances of this being continued for feven years. The ufual way is to plough direftly after the crop is gathered the third year, and fow wheat, of which commonly a good crop is obtained, the land being in fine order, from the turf being rotted, and the repeated hoeings. See TEASEL.

"The firft appearance of tealfe, after it is fown, is much like a lettuce, coriander like a parifup, and carraway like carrots. The produce of carraway has often been, on the very rich old lays in the hundreds or low lands of the county, 20 *cwt.* per acre. There is always a demand for it in the London market, fometimes fo low as 12s. per *cwt.* and it has been up to 50s. per *cwt.*; moftly on an average at 21s.

5 B

Cori-

Coriander is also very productive on good land, often producing 24 *cwt.* per acre, sometimes not more than 6 or 7 *cwt.*, the price being sometimes 30s. per *Cwt.*, often 10s. as 10s., average in general about 16s., London market. Teasel is used only amongst the manufacturers of ordinary cloth and baizes, to raise the wool on them that covers the thread. As we have a large business of that kind carried on in this part of the country, we have a regular demand for teasel; the average price 12l. per load, the produce sometimes a load per acre, often not more than one-fourth of a load. The land can only be filled with plants, and the more one kind predominates, the less must reasonably be expected of the crop that succeeds. It is mostly sown on land so strong, as to require being a little exhausted to bring it fit for bearing corn. In most of the land sown with carraway and coriander the teasel is omitted, as being a more troublesome and uncertain crop, and generally the product of carraway is much greater without than with teasel.

"In many parts of this district there are gardening-farmers who travel about and contract for breaking up old grass-land, in order to grow carraway. The farmer ploughs to a great depth, and does whatever horse-work is wanted, finding the land also at a rent of 15s. per acre on some farms, and the produce is divided. It is reckoned a more profitable way of breaking up grass than for common crops; but, much depending on a variable price, is reckoned hazardous; though the carraway men have intelligence enough among themselves to aim at not overstocking the market.

"It is observed, that the coriander is always the first crop, the carraway being sown with it as clover is with barley to succeed it; and it is left from three to six years, according to the success; great hoeing is bestowed on it to keep the land clean: when it returns to the farmer, if there be twine he follows, if not, he sows wheat. With some farmers their half receipt from 30 acres has varied from 180l. to 300l. a year."

CORIANDER, in Botany. See CORIANDRUM.

CORIANDRUM, (κοριανδρον, or κοριαννον; Theophras. Dioscor. Coriandrum; Plin. Supposed to be so called from κορις, a bug; the bruised leaves smelling like that offensive insect.) TOURN. Cl. 7. § 3. gen. 2. Linn. gen. 356. Schreb. 488. Willd. 552. Gært. 109. Juss. 220. Vent. 3. 16. Class and order, *pentandria monogynia*. Nat. Ord. *Umbellate*, Linn. *Umbelliferae*, Juss.

Gen. Ch. *General umbel* flat. *Partial umbel* generally with abortive flowers in the centre. *General involucre* one-leaved, or none. *Partial involucre* going half way round; or none. *Calyx* proper five-toothed, standing out. *Cor.* Petals five, equal or unequal, emarginate, inflexed. *Stam.* Filaments five; anthers roundish. *Pist.* Germ inferior; styles two, distant; stigmas capitate. *Peric.* none. Fruit spherical, dividing into two. *Seeds* two, concave.

Eff. Ch. Petals inflexed, emarginate. *General involucre* one-leaved or none; partial, going half way round, or none. Fruit spherical, or scrotiform.

Sp. 1. *C. sativum*. Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. Gært. tab. 22. fig. 2. Lam. Illust. Pl. 196. fig. 1. Woodv. Med. Bot. tab. 181. Eng. Bot. Pl. 67. Bauh. Pin. "Fruit globalar." *Root* annual, strong-scented. *Stem* about a foot and half high, erect, smooth, slightly striated, cylindrical, generally branched and divaricated. *Leaves* compound; lower ones pinnated; leaflets roundish-wedge-shaped, lobed and toothed; upper ones twice-ternate; segments linear. *General and partial umbels* many-rayed. *General involucre* of one linear leaf; *partial involucre* from three to five-leaved, going half way

round; leaves lanceolate. *Flowers* white, tinged with red; proper calyx very conspicuous; outer petals of the outer flowers large, forming a kind of ray round the umbel. *Fruit* obsoletely ribbed, aromatic. A native of the southern parts of Europe and of China; naturalized in Suffolk about Ipswich, and in some parts of Essex. Every part of the plant, when fresh, has a very offensive smell; but the dried seeds have a tolerably grateful smell, with a moderately warm and slightly pungent taste. They are stomachic and carminative, and are commonly sold by the confectioners enrobed with sugar. When taken in large quantities they are said to be deleterious, but Dr. Withering asserts that he has known six drams of them taken at once, without any remarkable effect. They give out their virtue totally to rectified spirit, but only partially to water. The Edinburgh college use them in the bitter infusion and the preparations of sena, to cover the disagreeable taste, and prevent the gripping tendency of those medicines. 2. *C. testiculatum*. Linn. Sp. Pl. 2. Mart. 2. Lam. 2. Ill. Pl. 196. fig. 2. Willd. 2. (*C. minus testiculatum*; Bauh. Pin. 158. Pluk. alm. 120. tab. 169. fig. 2.) β. *C. sylvestre foetidissimum*; Bauh. Pin. 158. "Fruit didymous." *Root* annual. *Stem* scarcely a foot and half high, angular, branched. *Leaves* once or twice pinnated; leaflets deeply cut into narrow acute segments. *Umbels* small, often simple. *Partial involucre* none, outer petals not forming a ray. *Seeds* separating below, almost cohering above, a little wrinkled, but not striated. A native of the south of Europe.

Propagation and Culture.—Both species are raised from seeds sown in the autumn, in an open situation, on a bed of good fresh earth. When the plants are come up, nothing farther is necessary but to hoe them to about four inches distance every way, and to keep them clear from weeds. The first species is cultivated in Essex, mingled with carum carui, or caraway; both solely for the sake of the seeds. See CARUM CARUI. To prevent the largest and best part of the seed being lost, women and children are employed to cut every plant separately, and to put it immediately into a cloth, in which it is carried to some convenient part of the field, and there threshed upon a sail-cloth. The produce of an acre is from ten to fourteen hundred weight. See CORIANDER, in *Agriculture*.

CORIARIA, (so called from its use in tanning hides.) Lin. Gen. 1129. Schreb. 1540. Juss. 441. Vent. 43. Redoul; Enc. Class and order, *diacis decandria* (Polygamia; Gowan.) Nat. Ord. undetermined.

Gen. Ch. *Flowers* dioicous, sometimes monoicous or polygamous. *Male*. Cal. Perianth very short, five-leaved; leaves somewhat egg-shaped, concave. *Cor.* Petals (Gland. Juss.) five, very small, placed on a disk on the outside of the filaments. *Stam.* Filaments ten, very short; anthers erect, oblong, with two cells separate at the base. *Female* Cal. like the male. *Cor.* Petals, as in the males, converging. *Stam.* as in the males, but abortive. *Pist.* Germs five, compressed, united; styles long, bristle-shaped; stigmas simple. *Peric.* none. *Seeds* five, kidney-shaped, covered by the succulent petals which take the appearance of a berry; Linn. (*Peric.* Capsules five, connivent, small, one-seeded, not delincent, covered on the side by the enlarged and thickened glands, making the fruit look like half a berry; Juss.)

Eff. Ch. Calyx five-leaved; corolla five-petalled; anthers ten, almost sessile. Styles five. Seeds five, covered by the succulent petals.

Sp. 1. *C. myrsifolia*. Linn. Sp. Pl. 1. Mart. 1. Poir. 1.

Lam. Ill. Pl. 822. (*Rhus myrtifolia monspeliaca*; Bauh. Pin. p. 414.) "Leaves almost sessile, ovate-oblong, flowers in racemes." A shrub four or five feet high. *Stems* smooth, cinereous; branches opposite, loose, flexible; young ones quadrangular. *Leaves* opposite, entire, smooth, acute, green on both sides, nerved, smaller on the flowering branches. *Racemes* simple, terminating the young lateral branches; bractes foliary, small, awl-shaped; peduncles twice the length of the bractes; calyx and corolla pale green; flowers sometimes monoicous, and sometimes hermaphrodite. A native of the south of France, and of Africa about mount Atlas. 2. *C. ruscifolia*. Linn. Sp. Pl. 2. Mart. 2. Poir. 2. Feuill. Peruv. 3. 17. tab. 12. "Leaves cordate egg-shaped, sessile." A tree from twenty to twenty-five feet high. *Trunk* the thickness of a man, branched from the bottom. *Leaves* an inch and half long, an inch broad. *Leaves* opposite, ternate on the young branches, almost embracing the stem. *Flowers* as in the preceding species. A native of Chili. 3. *C. microphylla*. Poir. 3. "Leaves very small, egg-shaped, obtuse, nearly sessile; flowers spiked, lateral." A shrub. *Stems* quadrangular; branches numerous, crowded, filiform, flexible, short. *Leaves* four or five lines long, three broad, opposite, firm, entire, slightly heart-shaped, green above, paler underneath, nerved. *Flowers* on small filiform peduncles, with solitary acute bractes. A native of Peru. 4. *C. sarmatosa*. Mart. 3. Poir. 4. Forst. Flor. Aust. 7. "Leaves cordate egg-shaped, on short petioles; stem procumbent, diffuse. A native of New Zealand.

CORIARIO. See ARTO LEONE.

CORIBRASSUS, in *Ancient Geography*, an episcopal town of Asia, in Pamphylia.

CORICANI. See CORIANTI.

CORICÆ *insule*, small islands between the island of Crete and the Peloponnesus. Pliny.

CORICEON *promontorium*, a promontory S. of the peninsula of Ionia, which advances towards the isle of Chios, in which is found Erythræ.

CORICEUM, in *Antiquity*, the undressing-room belonging to the GYMNASIUM.

CORIDERVA, in *Geography*, a rock situated about 2½ miles S.W. from Ila, one of the western islands of Scotland.

CORIDIS FOLIO, in *Botany*; Herm. See LINEARIA.

CORIDOR, is used, in *Architecture*, for a gallery, or long aisle, around a building leading to several chambers at a distance from each other, sometimes wholly inclosed, and sometimes open on one side.

CORIDOR, or *Corridor*, in *Fortification*, the same as the *covert-way*, which see.

CORIDORGIS, in *Ancient Geography*, a town of Germany, situated on the Danube, between Medoitanium and Phurgifates. Ptolemy.

N. lat. 4° 50'.—Also, a cape of Africa, on the eastern coast in the Indian sea. S. lat. 24° 15'. E. long. 33° 31'.—Also, the name of the south-westernmost point of the island of Cuba. N. lat. 21° 38'. W. long. 84° 30'.

CORIENTES, *Los*. See CORRIENTES.

CORILLA, in *Biography*, the Arcadian name given to the celebrated *Improvvisatrice*, Maria Maddalena Morelli

Fernandez, of Pistoia; honoured at Rome with the laurel crown, 16 Feb. 1776, in the same manner as Petrarca, Tasso, and Peretto, had been before. An account of this transaction, beautifully printed at Parma, by Budoni, in 1779, contains her diploma and all the discourses, poems, sonnets, &c. written on the occasion, with the examination which she underwent, concerning her knowledge of the most important subjects upon which she was required to *Improvvisare*, or treat extemporaneously, in verse publicly at the Campidoglio in Rome. The Italian title of this narrative is, "Atti della solenne coronazione fatta in Campidoglio della insigne poetessa D-na. Maria Maddalena Morelli Fernandez Pistoiese, Tragli Arcadi Corilla Olimpica." Twelve members of the Arcadian academy were selected out of 30, publicly to examine this new edition of a *Tenth Muse*, which has been so often dedicated to ladies of poetical and literary talents. Three several days were allotted for this public exhibition of poetical powers on the following subjects: sacred history, revealed religion, moral philosophy, natural history, metaphysics, epic poetry, legislation, eloquence, mythology, fine arts, and pastoral poetry.

In the list of examiners there appear a prince, an archbishop, three monsignors, the pope's physician, abati, avvocati, all of high rank in literature and criticism. These, severally, gave her subjects, which, besides a readiness at versification in all the measures of Italian poetry, required science, reading, and knowledge of every kind. In all these severe trials, she acquitted herself to the satisfaction and astonishment of all the principal personages, clergy, literati, and foreigners then resident at Rome; among the latter was our sovereign's brother, the duke of Gloucester.

Near 50 sonnets by different poets, with odes, canzoni, terze rime, ottave, canzonette, &c. produced on the subject of this event, are inserted at the end of this narrative and description of the order and ceremonials of this splendid, honourable, and enthusiastic homage, paid to poetry, classical taste, talents, literature, and the fine arts.

This renowned lady merits some notice as a musician, as well as poetess; as she sung her own verses to simple tunes with a sweet voice, and in good taste. She likewise played on the violin; but at Florence, where we saw and heard her, in 1770, she was accompanied on the violin by the celebrated and worthy pupil of Tartini, Nardini. At this time she was not more than 30; and had a pleasing, dignified, and intelligent countenance. See in the music pl. No. the two airs to which she sung at Florence, extempore verses on subjects given.

CORIM. See HASTA *militaris*.

CORINÆUM, in *Ancient Geography*, a promontory of Asia Minor in Ionia; part of mount Mimas.

CORINDIUR, a town of India, on this side of the Ganges. Ptolemy.

CORINDUM, in *Botany*. TOURN. See CARDIOSPERMUM.

CORINE, in *Zoology*, the ANTILOPE *Corinna* of Gmelin, has very slender, short, smooth, straightish horns, bent slightly into the form of a lyre; the upper parts of the body are yellowish-tawny, the under parts white, with a dusky stripe along the sides, and two lines on each side of the face, the upper one white and the other black. This animal, which inhabits Senegal, is less than a roe; the neck, body, and flanks are of a tawny-yellow colour, the insides of the thighs and belly are white, and a dark line, along the sides, divides the two colours; the knees are tufted with hair;

the ears are large; the horns are about six inches long, almost upright, bending a little outwards in the middle, and somewhat approaching at the tips, the lower parts being furrowed with circular wrinkles. This species resembles the kevel in colour, size, swiftness, and mulky odour; but differs very much from it in the figure of the horns; though Gmelin, after Pallas, suspects that it is the female of that species.

CORINEA, in *Ancient Geography*, a country of Asia, in Armenia Major. Ptolemy places it between the sources of the Tigris and Euphrates, and to the south of Thospitide.

CORINEUM, a town situated on the southern coast of the isle of Cyprus, between Citium and Salamis. It was episcopal, and called by Hierocles, in his *Notitia*, Coren.

CORINIUM, a town of Albion, belonging to the Dobuni, and allowed to be Cirencester in Gloucestershire.—Also, an ancient town of Illyria on the Adriatic gulf; supposed to be the present *Cori*.

CORINTH, CORINTHUS, a city of Greece in the Peloponnesus, upon a gulf of the same name. This city was the capital of a small state, situate on the isthmus of Corinth, having the bay of that name, now called "Golfo di Lepanto," and the isthmus or neck of land, which joins Peloponnesus to the continent, on the north; Sicyon, on the west; the gulf of Saron, on the east; and the kingdom of Argos, on the south. Its utmost extent from east to west was about half a degree, and from north to south, about half that space. It had no rivers of any note; but abounded with mountains, the chief of which was called "Acrocorinthum," at the foot of which the city of Corinth was built, and on the top stood the citadel. It was also famed for the fountain Pyrene, sacred to the muses; though others place this fountain on the hill Helicon, and most others again, on that of Paranaüs.

Corinth is said to have been founded by Sisyphus, the son of Æolus, and grandfather of Ulysses, about the year of the world 2490, as some say, or according to others 2500; B. C. 1507, and about six years before Deucalion's flood, B. C. 1503. The ancient name of this city is said to have been Ephyra, which it took from a nymph of that name, reported to have been the daughter of Oceanus and Tethys, or, according to others, of Myrmex, the wife of Epimetheus, the son of Japetus, and brother of Prometheus. At this time it was but an inconsiderable town, though it rose afterwards to be the metropolis of the kingdom, and one of the noblest and most opulent cities in Greece.

Corinth, the new name of this city, has been variously derived; some have deduced it from the Greek *κορῖνος*, *fecundity* or *abundance*, implying the opulence of the place; but the ancient inhabitants trace the origin of the appellation to Corinthus, the son, as some have said, of Jupiter, or, according to others, of Marathon, and brother of Sicyon. However, most authors ascribe the name, as well as the building, or rebuilding of it, to Corinthus, the son of Pelops. Corinth was also called "Heliopolis," or the city of the Sun, probably, as Gronovius conjectures, from the ruggedness and barrenness of its situation and territory, for such, as Strabo tells us, it really was.

Corinth, besides the citadel already mentioned, had two port-towns, *viz.* Lecheum situate on the bay of Corinth, and Cenchrea on that of Samos, and connected with the city by a double wall of about 12 stadia or half a league in length; distant from the city 70 stadia or about 3 leagues. These were the only two havens; and, indeed, the only two cities of any note, next to Corinth, that belonged to this territory. These were so well situated for naval commerce,

and so near the metropolis, that they made ample compensation for the barrenness of the soil. These two naval roads which opened a way into the Ionian and Ægean seas, might easily have gained for them a superiority, if not a command, over all Greece, if this advantageous situation had not inclined them more to commerce than war. For their citadel being almost impregnable by nature, and commanding both seas, they could easily cut off all communication betwixt one half of Greece and the other; so that it was not without reason called one of the fetters of Greece. But being led by their genius and disposition to improve their advantages more for navigation and commerce than for martial exploits, they became in process of time so exceedingly opulent, that the little influence they had over the other states was owing rather to their wealth than their valour. By the gradual increase of their opulence, partly from commerce, and partly from the influx of strangers that flocked hither from Europe and Asia, their city became at length one of the most considerable and splendid in Greece; being adorned with a great variety of sumptuous buildings, such as temples, palaces, theatres, porticos, cenotaphs, baths, and other edifices; all enriched with a beautiful kind of columns, capitals, and bases, from which the CORINTHIAN order took its name, together with numberless statues executed by the most famous artists. Such indeed were its wealth, magnificence, and excellent situation, that it was thought by the Romans equally worthy of empire with Carthage and Capua. It would carry us far beyond our limits minutely to describe even the principal edifices that adorned this famous city; but in order to enable the reader to form some judgment of its extent and magnificence, we shall recite some few particulars, referring to Pausanias "in Cor." for a more ample account. We have already observed that this city was seated at the foot of a high hill, on which stood the citadel. To the south it was defended by the hill itself, which is there extremely steep. Very strong and lofty ramparts protected it on the other sides. Its circumference was 40 stadia, or about 1½ league; but as the walls extended along the sides of the hill, and surrounded the citadel, it might be reckoned upon the whole at 85 stadia or near 3½ leagues. The road to the citadel had so many windings, that the summit could not be attained, without passing through an interval of 30 stadia. The situation of the citadel and its ramparts rendered it so strong, that it could only be taken by treachery or famine. At the entrance was the temple of Venus, with the statue of the goddess clad in brilliant armour, and accompanied by another of the god of love, and a third of the sun, who was adored in this place before the worship of Venus was introduced. In the way to the citadel was a chapel dedicated to the Egyptian Isis, and another to the Pelagian Isis. Two others were dedicated, one to Serapis of Canopus, and the other to another Serapis. The spring Pyrene, where Bellerophon is said to have found the horse Pegasus, was ornamented with sumptuous embellishments, consisting of several caves in form of grottoes, all covered with white marble, from which the cold and limpid water of that fountain fell into a large basin. The forum was decorated with temples and statues; the theatre was a grand and beautiful edifice of white marble, in which the assembly of the people deliberated on affairs of state, and the musical contests and other entertainments were exhibited at the festivals. The stadium, or course, was also constructed of white marble. The temple of Neptune was a grand building; its avenue was lined on one side with the statues of all those athletes who had won the prize at the ISTHMIAN games (which see), and on the

the other with stately pines planted in regular rows. The temple itself, though not very spacious, was adorned with a multitude of brazen Tritons, or sea-gods. Here were also the chariots of Neptune and of his wife Amphitrite, drawn by horses covered all over with gold, except their hoofs, which were of ivory. The two deities were carved in a standing posture, and Neptune had young Palemon riding on a dolphin by his side. The bases of the chariots were likewise adorned with curious basso-relievos, and the temple itself with a multitude of other embellishments. Diana of Ephesus was also exhibited in a public place together with two gilt wooden statues of Bacchus. Fortune also had a temple, and her statue was made of Persian marble; and near this temple was that which was dedicated to the mother of all the gods. There were several other statues; among which we may select an Apollo, surnamed Clarus, in bronze; a Venus by Hermogenes of Cythera, two Mercuries, three statues of Jupiter, a Minerva in bronze, mounted on a pedestal, the basso-relievos of which represented the Muses. The city of Corinth abounded with public baths, the number of which was augmented by the emperor Adrian; but those of Neptune, constructed by Eurycles of Sparta, were the most famous. The temple of Venus at Corinth is said by Strabo to have been so rich, that it maintained more than 1000 courtezans, who were devoted to her service, and which drew hither a multitude of strangers. The festivals of the Aphrodisia were celebrated in this city by harlots, as we learn from Athenæus (Deipnos. l. xiii. c. 6.); who also informs us, that they who supplicated the goddess Venus, promised to dedicate some females to her rites, and they obtained what they requested.

At first the commerce of Greece was carried on by land, and entered or left the Peloponnesus by the road of the isthmus. The Corinthians took occasion to impose a duty on the transit of all commodities, and derived from this duty a certain degree of opulence. In order to avoid the dangers of the sea, proverbially stormy, between the isle of Crete and Cape Malea in Laconia, merchants chose to transport their goods to the seas terminating at the isthmus. Thus, the merchandize of Italy, Sicily, and the western nations, was landed at the harbour of Lecheum; and that from the islands of the Ægean sea, the coasts of Asia Minor, and of the Phœnicians, at the port of Cenchrea. In process of time, commodities were conveyed by land from one harbour to the other, and means contrived for transporting even the vessels. Corinth, having thus become the mart of Asia and Europe, continued to collect duties on foreign merchandize, covered the sea with ships, and formed a navy to protect her commerce. Her industry was excited and encouraged by success; she built ships of a new form, and first produced (triremes) galleys, with three branches of oars. Her naval force procured her respect; all nations poured their productions into her emporium. The sea was covered with reams of paper, and sailcloth, brought from Egypt, ivory from Libya, the leather of Cyrene, incense from Syria, Phœnician dates, Carthaginian carpets, corn and cheese from Syracuse, pears and apples from Eubœa, Phrygian and Thessalian slaves, together with a multitude of other articles which were continually brought into the ports of Greece, and particularly into those of Corinth. The games of the isthmus also drew together to this city a prodigious number of spectators. These resources increasing the wealth of the state, workmen of every kind were protected, and exerted themselves with new emulation.

Corinth abounded not only with warehouses, but with

manufactures of her own. Among other articles, the inhabitants made coverlets for beds, which were much sought after by foreign countries; she also collected a great number of the pictures and statues of the best masters. Her manufactures of brass and earthen ware were held in great estimation. Although Corinth possessed no copper-mines, her workmen contrived, by mixing that which she received from foreign countries, with a small quantity of gold and silver, to compose a metal extremely brilliant, and almost proof against rust. (See *Æs.*) Of this they made cuirasses, helmets, small figures, cups, and vessels; no less esteemed for the workmanship than for the material, which were enriched with foliage and other chased ornaments. Those on their pottery were equally beautiful.

The women of Corinth were admired for their beauty, and the men were distinguished by their love of gain, and of licentious pleasure. Venus was their principal deity; and the courtezans consecrated to her service, attended, in the time of public calamities and imminent danger, at the sacrifices, and walked in procession with the other citizens, singing sacred hymns. The Corinthians, indeed, were so much devoted to traffic and luxury, that they very much neglected the encouragement of the liberal arts and sciences, and also of that thirst for glory and conquest, so much valued by their neighbours. Nevertheless, they cultivated a good discipline, both in peace and in war; and this their opulence, with its effects on their disposition and conduct, rendered absolutely necessary. Though they seldom, if ever, engaged in war, with a view of enlarging, but chiefly for the purpose of defending their territories, protecting some neighbouring state, or maintaining the liberty of Greece; yet this small kingdom furnished many brave and experienced officers to the other Grecian cities, who were frequently preferred to their own generals. The Corinthians were, in reality, the greatest assertors of liberty; and though they remained for some centuries under a monarchical government, yet they always manifested an aversion from tyranny, and an inclination to assist those who were oppressed.

We have already observed, that Sisyphus was supposed to be the founder of the Corinthian monarchy; which is said to have continued in the lineal succession of his family, for seven or eight generations; till it became extinct, or till it was expelled the kingdom by Alæthes, one of the Heraclidæ, about thirty years subsequent to their return, about B. C. 1074, in whose family the kingdom of Corinth remained for a long interval, between three and four hundred years. Royalty was at length abolished, and the sovereign power was intrusted to 200 citizens, one of whom presided over the rest under the appellation of "Prytanis," about the year B. C. 779. About the year 659 B. C., Cyprius terminated this aristocracy, by usurping the sole government, and restored the monarchy, which he retained for about thirty years. He was succeeded by his son Periander, who held the government for 44 years. Having banished his son Lycophron to the island of Corcyra, the capital of which had been built by the Corinthians, in the year B. C. 703, Periander was reduced to the necessity of recalling him, but his proposals were received by the exiled son with indignation. He finally, however, resolved to abdicate the crown, and confine himself to Corcyra, whilst his son, quitting that island, assumed the reins of government at Corinth. But the Corcyreans, dreading the arrival of Periander, defeated this project by putting Lycophron to death. Tormented by impotent rage, Periander died at 80 years of age, after a reign of 44 years. As soon as he had closed his eyes, the Corinthians destroyed every monument, and even the flight-

est traces of tyranny. His successor reigned only three years; and after this short interval, the Corinthians, joining their troops to those of Sparta, established a government which subsisted for a long period, and which approached nearer to an oligarchy than a democracy, as no affairs of importance were submitted to the arbitrary decision of the multitude. In the year 439 B. C. a war commenced between Corinth and Corcyra; and in the year 435 B. C. the Corinthians were defeated at sea by the Corcyreans, aided by the Athenians. And this contest between Corinth and Corcyra, brought on the Peloponnesian war. In the year 395 B. C. the Athenians, Thebans, Argives, and Corinthians, formed an alliance against the Lacedæmonians, and this gave occasion to the Corinthian war. For an account of the assistance which Corinth afforded to the Syracusans, see the article TIMOLEON. By the peace of Antalcidas B. C. 387, the Corinthians were obliged to withdraw their garrison from Argos, which then became free and independent. When Alexander entered Babylon, the Corinthians sent ambassadors to offer him the freedom of their city; and after first treating the offer with contempt, he was afterwards induced to accept it with joy, when he was told, that this honour had been conferred only on Hercules. When Aratus of Sicyon, prætor of the Achæans, had taken possession of the citadel of Corinth, B. C. 243, the Corinthians were prevailed upon to enter into the Achæan league; and about the same time they issued a decree, that the Romans should be admitted to celebrate the Isthmian games, with the same privileges as the Greeks. At a subsequent period, B. C. 146, they insulted the Roman deputies, commissioned by Metellus to appease the troubles occasioned in Peloponnesus by the Achæan league; but upon the arrival of the consul Mummius, Corinth was besieged; and after the defeat at the battle of Leucopetra, the consul entered the city, and abandoned it to be plundered by the soldiers. All the men who were left in it were put to the sword, and the women and slaves sold; and after the statues, paintings, and richest moveables, were removed, in order to their being carried to Rome, the houses were set on fire, and the whole city was consumed. From that time the Corinthian brass, which was in reputation long before, became yet more famous; for it is pretended, that the gold, silver, and brass, which were melted, and which ran together in this conflagration, formed a new and precious metal. The walls were afterwards demolished, and raised to their former foundations. This dreadful calamity was inflicted by order of the senate, for punishing the insolence of the Corinthians, who had violated the law of nations, in their treatment of the ambassadors sent to them by Rome. The booty taken at Corinth was sold, and it produced a considerable sum; no part of which Mummius reserved for himself, but consigned the whole to Rome, for the purpose of being laid out in adorning the city. Amongst the paintings, it is said there was a piece drawn by Apollides, the most celebrated painter in Greece, which represented Bacchus; the beauty of which was not known to the Romans, for Polybius had the mortification to see it used by the soldiers as a table, upon which they played at dice. In the sale of the booty, it was adjudged to Attalus for 600,000 sesterces, or about 3625*l.* sterling. Many other statues and paintings of the most excellent masters, preserved in the wreck of Corinth, were transported to Rome. Upon Polybius's return into Peloponnesus, he had the painful and mortifying sight of the destruction and burning of Corinth, and the affliction of finding his country reduced into a province of the Roman empire. Corinth remained in a ruined and desolate state for

many years. At length Cæsar, after he had subdued Africa, and whilst his fleet lay at anchor at Utica, gave orders for rebuilding Carthage; and soon after his return to Italy, he likewise caused Corinth to be rebuilt. Strabo and Plutarch agree in ascribing the rebuilding of Carthage and Corinth to Julius Cæsar; and Plutarch remarks this singular circumstance with regard to these two cities, that as they were taken and destroyed in the same year, they were rebuilt and reoccupied at the same time. Under the eastern emperors, Corinth was the see of an archbishop, subject to the patriarch of Constantinople. Roger, king of Naples, obtained possession of it under the empire of Emanuel. It had afterwards its own sovereigns, who ceded it to the Venetians, from whom it was taken by Mahomet II., in the year 1458. The Venetians retook it in 1687, and held it till the year 1715, when they lost it to the Turks, in whose possession it has remained ever since.

CORINTH, in *Modern Geography*, *Corinto*, or *Coranto*, a town of Greece, in the Morea, situated near a narrow isthmus of the same name, which joins the Morea to the rest of Greece, between the gulf of Lepanto and that of Engia. It was formerly, as we have shewn in the preceding article, a very rich and powerful city. At present it contains about 13 or 14 hundred inhabitants; each house has a garden, planted with orange and other fruit trees. It is 46 miles E. of Athens or Atini, and 342 S.W. of Constantinople. N. lat. 38°. E. long. 22° 50'.

CORINTH, a township of America, in Orange county, in Vermont, W. of Bradford, containing 578 inhabitants.

CORINTH, *Isthmus of*, in *Ancient Geography*, the neck of land which joins Peloponnesus (the present Morea) to the upper part of Greece, and which is computed to be about six miles wide. As this forms an obstacle to the passage from the Ionian to the Ægean sea, it has been frequently proposed to dig a canal through it, forming a junction between these seas, and thus preventing the circumnavigation of the Peloponnesus. Pliny, who mentions this project, and who, without being superstitious, represents it as a rash attempt, alleges the unhappy end of four princes who set about it, *viz.* Demetrius of Phalera, Julius Cæsar, Caligula, and Nero. When Nero undertook this business, superstition discouraged the attempt; and it was said, that, at the first stroke into the earth, blood gushed out, that groans issued from the subterranean caverns, and that phantoms had appeared to the inhabitants of those parts. Nero, however, despised these idle tales, and determined to proceed. He encouraged the Pretorian soldiers in their work by personal assistance, and flattering hopes of success. The number of workmen whom he collected from all parts, and from all the gaols in the empire, was immense; and Vespasian, as Josephus informs us, furnished him with 6000 Jews, selected from a much greater number whom he had imprisoned. The work was begun on the side next the Ionian sea, at the port called Lecheum, and in 75 days an interval of four stadia was dug; and this was about the tenth part of the breadth of the isthmus. On the last of these days, Nero sent an order to discontinue the work. Two reasons were alleged for this change of opinion and purpose. By some it was said, that certain Egyptian mathematicians, whom the emperor had consulted, having taken the level of the two seas, east and west of Peloponnesus, found the waters of the Ionian higher than those of the Ægean sea; so that there was ground for apprehending that, if a communication were opened by a canal across the isthmus, the island of Ægina, and the low lands on the side of the Ægean sea, would be overflowed and destroyed. But this allegation is a mere pretence;

pretence; because these two seas do actually communicate fourth of Peloponnesus, and therefore their waters must be on a level. Considering the pertinacious temper and extreme vanity of Nero, it is very probable that he would have persecuted, notwithstanding every objection of mathematicians, if he had not been alarmed by reports from Italy, where disturbances arose in consequence of his absence, and which made it necessary for him to return, so that he abandoned his enterprise. The news of a conspiracy at Rome terrified him exceedingly, and hastened his return. For an account of the games celebrated on this illustrious, see *ISTHMIAN Games*.

CORINTH, Gulf of, now the gulf of Lepanto, commencing, as some of the ancients have said, at the isles called *Oxie*, having to the N. the mouth of the river *Achelous* and the *Echinades*, and to the S. the promontory called "*Araxum Promontorium*;" but, according to others, the gulf of Corinth denotes that portion of water forming a strait to the S. by the point called "*Rhium*," and to the N. by that called "*Anti-Rhium*." This gulf extends eastward as far as *Bœotia*. In the interior part, it forms two small gulfs; the one, advancing to the N., between parts of the *Loeride* and *Phocide* territories, called, after the town of *Croica* to the N.E., "*Criffæus Sinus*;" the other was formed by the most eastern part of the gulf, and was called "*Alcyonium Mare*."

CORINTHIAN BRASS. See *Æs Corinthium*.

CORINTHIAN Order, in *Architecture*. This is generally enumerated as the third of the Grecian orders, and forms the ultimate term of richness and elegance proper to that style of architecture.

The Corinthian order is principally distinguished by its capital, which may be described as consisting of a bell-shaped body, covered with an abacus of a quadrilateral plan, with convex sides; two tiers of leaves surround the lower part of the capital, between which little stalks or cauliculi rise up to the corners of the abacus, and those bending over form four volutes, and other volutes or ornaments occupy the centre of each side. Considerable varieties occur in ancient buildings; but this may be taken as a general analysis, which will include all Corinthian capitals.

The account, given by Vitruvius, of the origin of this order, has been already detailed in the article *GROÏL ARCHITECTURE*. It must, however, be observed, that the Egyptian buildings present many capitals of a bell-form, decorated with leaves, which bear a sufficient resemblance to the Corinthian capital, to justify a suspicion that this composition may have been derived from the imitation of an Egyptian model.

Callimachus, to whom the invention of the Corinthian capital is attributed, is supposed to have lived about the 6th Olympiad, or 540 years before the Christian æra, which would give a very high antiquity to this order; but the first distinct account we have been able to find of its introduction in any building, is the following from *Pausanias*, l. viii. The ancient temple of *Minerva* at *Tegea*, in *Arcadia*, having been destroyed, a second edifice was erected, under the direction of *Scopas*, far exceeding in splendour and magnificence every building of the kind in the *Peloponnesus*. In this structure the three orders of architecture were employed. Within the enclosure were galleries supported by Doric and Corinthian columns, surrounding the hypæthæos or open area of the cella; and on the outside of the temple were porticoes of the Ionic order. This building may be dated in the fourth century B. C. To judge from the extant remains of this order in Greece, which are comparatively neither numerous nor important, we should

say, that it had never obtained a degree of favour equal to the other two orders; but in the buildings of Rome, and in works in other countries under Roman influence and direction, quite the contrary is the case; and it is to these sources that we are to look for the best examples of the Corinthian order.

Vitruvius, l. 3. c. 1. in treating of this order, observes that Corinthian columns, excepting in their capitals, have their symmetry the same as the Ionic; but the height of the capital renders them proportionally taller, and more graceful: for the height of the Ionic capital is only a third part of the thickness of the column, whereas that of the Corinthian is the whole diameter of the shaft. The other members, which are placed above the column, are taken from the Doric or Ionic orders; for the Corinthian has no entablature peculiar to itself, but has either triglyphs, mutules in the cornice, and guttae in the cymatium, as in the Doric manner; or else, according to the Ionic disposition, the frieze is ornamented, and dentils are placed in the cornice: so that by these two orders, joined with a different capital, a third order is produced.

The preceding observation of Vitruvius, that the Doric entablature was sometimes applied to Corinthian columns, is in itself very extraordinary, and is not supported by any antique examples; but the remark respecting the Ionic entablature is found to be strictly true in a number of instances, as we shall proceed to shew by the description of the following examples:

A temple at *Jackly*, near *Mylasa*. In this building there is a cornice, with dentils, a swelled frieze, an architrave, with three plain facias, and an Attic base.

The arch of *Adrian* at *Athens*. A cornice, with dentils, a plain frieze, an architrave, with two plain facias, and an Attic base.

A building called the *Incantada* at *Salonica*, the ancient *Thessalonica*. A cornice, with dentils, a swelled frieze, ornamented with flutings, an architrave, with three plain facias, an Attic base.

The temple of *Vesta* at *Tivoli*. A plain cornice, with uncut dentil-band, an ornamented frieze, an architrave, with two plain facias, and an Attic base.

The temple of *Antoninus* and *Faustina* at *Rome*. A plain cornice, with uncut dentil-band, ornamented frieze, an architrave of two facias, divided by an *Aitragal*, and an Attic base.

The portico of *Septimius Severus* at *Rome*. A plain cornice, with a small uncut dentil-band, a plain frieze, an architrave of three facias, divided by mouldings.

In all these instances, the entablature and base are entirely similar to those commonly observed in the Ionic order, from which those Corinthian examples only differ in the form of the capital; but in the examples which remain to be cited, it will appear that the Romans attempted to give the Corinthian order a more distinct character, by appropriating to it a peculiar entablature and base, and thus made a complete order of what might be previously regarded, as Vitruvius appears to consider it, in the light of a composite invention.

The Portico of the *Pantheon*. A cornice, with mouldings, and an uncut dentil-band, a plain frieze, an architrave of two facias, divided by mouldings, and a Corinthian base.

The temple of *Peace* at *Rome*. A cornice, with mouldings and dentils, a plain frieze, and an architrave of three facias, divided by mouldings.

The three columns of the *Campo Vaccino*, supposed to belong

belong to a temple of Jupiter Stator. A cornice, with modillions and dentils, a straight frieze, an architrave of three facias, divided by mouldings, and a Corinthian base.

The temple of Jupiter Tonans at Rome. A cornice, with modillions and dentils, a straight frieze, and an architrave of three facias, divided by mouldings.

The arch of Constantine. A cornice, with modillions and dentils, a plain frieze, an architrave of three plain facias, and an Attic base.

A temple at Ephesus, supposed by Chandler to be the temple erected, by permission of Augustus, to the god Julius. A cornice, with modillions and dentils, a swelled and ornamented frieze, an architrave of three facias, divided by mouldings, and an Attic base.

The temple at Nîmes called the *Maïson Quarré*. A cornice, with modillions and dentils, a straight frieze, an architrave of three facias, divided by mouldings, and an Attic base.

To render this account of the progressive improvement in the Corinthian order more complete and satisfactory, some instances may be given, in which the alteration remains imperfect, having only taken place partially, with a great resemblance to Ionic forms.

A portico at Athens, supposed by Stuart to be the ancient Poikile. This building presents a cornice, with mutules of two square faces, an architrave, with two plain facias, and an Attic base.

The frontispiece of Nero at Rome. A cornice, with mutules of the same form as the last mentioned, an ornamented frieze, and an architrave of two facias, divided by an ogee.

In these two instances, there are no dentils or dentil-bands in the cornices; and the mutules, by their situation and shape, appear rather to be a variation from the proper Ionic dentil than a new member.

Considering the Corinthian order in its most complete state, we find it possessed of a peculiar entablature distinguished from that of the other orders by a cornice with modillions and dentils, a straight frieze, and an architrave of three facias divided by mouldings. The column is marked by its capital, and also by a peculiar base called the Corinthian base. This description is wholly applicable to the three columns of the campo Vaccino, which are probably the most complete and beautiful examples of the order extant. See *Plate 29*.

Of the modern architects, who have treated of this order, Palladio makes the column $9\frac{1}{2}$ diameters high, and gives only one-fifth part of this altitude to the entablature, which consists of a cornice with modillion and dentils, a straight frieze, and an architrave of three facias divided by Astragals. The base is Attic. Scamozzi's design bears a great general resemblance to Palladio's, but he gives ten diameters to the column. The entablature is one-fifth of this height, the cornice has modillions, only the architrave consists of three facias divided by Astragals, and the base is Attic. Serlio, in his Corinthian order, has followed Vitruvius in giving it an Ionic entablature with dentils, and in the proportion of the capital. The column is nine diameters high, and has a Corinthian base. Vignola's is a grand and beautiful composition in which he has chiefly imitated the three columns. He gives the column ten diameters in height with a Corinthian base. The entablature is one-fourth of the height of the column, the cornice has modillions and dentils; a plain frieze, and an architrave of three facias divided by mouldings.

The following Table will exhibit the proportions of some of the principal examples of the Corinthian order, premising that the different members are measured by the diameter at the bottom of the shaft, which is divided into sixty minutes.

	Height of Column.	Height of Capital.	Architrave.	Frieze.	Cornice.

"The Corinthian order," says Sir William Chambers "is proper for all buildings where elegance, gaiety, and magnificence are required. The ancients employed it in temples, dedicated to Venus, to Flora, Proserpine, and the nymphs of fountains; because the flowers, foliage, and volutes with which it is adorned, seemed well adapted to the delicacy and elegance of such deities." This account, though plausible in theory, is wholly unfounded, and is, in fact, a mere modern refinement. The Romans, in borrowing their architecture from Greece, appear to have particularly appropriated the Corinthian order, they found it possessed of an ornamental character adapted to the splendour and magnificence of their taste, and used it indiscriminately on all occasions, and in the temple of any deity in the same manner that the early Greeks used the Doric, and the Ionians the Ionic order. Thus the Romans erected Corinthian temples to Jupiter, Neptune, and Mars; and the Greeks built the temples of the same deities of the Doric order. The temples of Minerva at Athens and at Sunium are Doric; the temple of Minerva at Priene is Ionic. The temple of Jupiter Olympius at Elis, was of the Doric order; the temple of the same god, erected by Adrian at Athens, is Corinthian. The orders of architecture are national. Thus the numerous temples of the Grecian colonies in Sicily and Italy are uniformly Doric, marked by the most severe and massy simplicity. The cities of Ionia present the best examples of a chaste and elegant Ionic; while the magnificent structures of Balbec and Palmyra, are wholly of the Corinthian order, and in the most florid style of ornament.

CORINTHIANS, *Epistles to the*, in *Biblical History*, are two letters, addressed by the apostle Paul to the inhabitants of Corinth,

Corinth, including both Gentile and Jewish converts, and comprehended in the sacred canon of the New Testament. Some have inferred from 1 Cor. v. 9, that the apostle had written another epistle to the church at Corinth; but Dr. Whitby (*in loc.*) observes, that no fathers ever ascribed to St. Paul more than 14 epistles, including that to the *Hebrews*; nor does Eusebius mention any third epistle to the Corinthians, amongst the true, controverted, or spurious writings which pass under his name. Moreover, no Christian writer ever cited any thing from this supposed epistle; and all the Greek scholiasts declare, that the apostle speaks in these words, "not of another, but of this very epistle," which, says Dr. Whitby, "is sufficient to justify the version I have given of these words, I had written, or was writing, in this epistle." Besides, his supposed epistle to Laodicea is cited as a book expanded by St. Jerom; his epistles to Seneca are in like manner cited by St. Jerom and St. Austin; the acts of Paul are cited, and rejected by Origen and Eusebius; but none of them make any mention of more than two epistles to the church of Corinth.

The *first epistle* was written about three years after the apostle had left Corinth, to preach the gospel in other parts of Greece; and it was written at Ephesus, as appears from ch. xvi. 8, 9, 19, and Acts, xviii. 18, 19, according to Pearson and Mill in the year 57, the third of the emperor Nero; but, according to Lardner's computation of St. Paul's times and travels, in the spring of the year 56, and this was also the opinion of Lefant and Beaufobre. This epistle was written in answer to some important inquiries proposed by the Corinthians, and for the purpose of correcting the various irregularities and disorders, of which they were guilty. The first article under the head of abuses, with which they were chargeable, related to the parties and factions into which they had fallen, and the opposition which was made by some of them to St. Paul's apostolical mission. The first four chapters comprehend this first head. The second topic which the apostle considers was the case of a notorious offender in the Corinthian church, who had been guilty of most scandalous incest with his father's wife. (See chap. v.) The third article which the apostle exhibits against the Corinthians is, that by a covetous and litigious temper they were led, in violation of the rules of Christian prudence and charity, and sometimes in opposition to the principles of justice, to prosecute their brethren in the heathen courts. (Chap. vi. 1—11.) In the fourth place, the apostle cautions them against the sin of fornication, to which, in their Gentile state, they had been much addicted, and which some seem to have reckoned among things that were indifferent, or to consider as of inferior enormity; introducing useful reflections on matters of indifference, and illustrating the heinous evil of fornication from views peculiar to the Christian religion. (Chap. vi. 12. to the end.) As Corinth was conveniently situated for commerce, it abounded in riches, and was furnished with all the accommodations, elegancies, and superfluities of life. Hence, by too natural a consequence, the inhabitants were led into luxury, lewdness, and all manner of vice; so that they became infamous even to a proverb. Thus, Κορινθία γυνί, a Corinthian woman, is, in the language of the ancients, a lewd prostitute, according to the proverb (cited in Erasmus, *Adag. Cent. 7. p. 633. 720.*) ἡ κορινθία ἑκαστα χροστειλασται, *at Corinthia videris corpore questum salutura.* And Κορινθιαζου, Κορινθιαζουσαι, is *luxurians, fornicationibus indulgere.* (Hesych. *Plavor.*) We have already observed (from Strabo) that there was in it a temple dedicated to Venus, which *πλειονς ἢ χιλιας ἱεροδοτους ἐκκλησιο ἱσταισας.* See CORINTH.

Having thus largely, and with great fidelity and plain-

ness, corrected some lamentable disorders which prevailed among the Co-inthians; the apostle proceeds to the other principal object of his epistle, which was to answer certain questions which they had proposed to him. Here he determines, *first*, those which related to the marriage-state; stating that in some circumstances this state should be entered into, and continued in; but in others, foreborne, particularly at that time; and enjoining wives not to depart from their husbands, and husbands not to dismiss their wives. (Ch. vii. 1—11.) He then shews, that marriages were not to be dissolved, as some thought they might, on account of a difference in religion; and he urges contentment with the stations, in which they were called, whether they were married or single, bond or free. (v. 12—14.) And with regard to single persons, he asserts the inexpediency of their marrying in the peculiar circumstances of the church at that juncture. (v. 25, to the end.) To the *second* query proposed, *viz.* how far they might comply with their heathen neighbours in "eating things sacrificed to idols," he replies, by reminding them that though all Christians might well be supposed to know the vanity of those imaginary deities, to which the sacrifices were offered, yet it might prove an occasion of grief and scandal to some, if the professors of Christianity should partake of those sacrifices in their temples; which, therefore, Charity would require them by all means to avoid. (Ch. xii.) He then, after waving, for his own part, the expectation of a maintenance from the Corinthians, states the right, which, as a minister of the gospel, he really had to be supported by those among whom he laboured; and this he argues both from natural equity, and scripture-principles. (Ch. ix. 1, to the end.) He next resumes the argument against partaking of entertainments upon "things offered to idols" in the heathen temples. (Ch. x. 1—13.) He proceeds to caution them against all approaches to idolatry. (v. 14, to the end, ch. xi. 1.) In reply to a *third* query, concerning the manner in which women should deliver any thing in public, when urged to it by a divine impulse, he first settles this point; he then considers various circumstances relating to public worship and guards against abuses in the celebration of the Lord's supper, and also in the exercise of spiritual gifts; concluding with a recommendation and description of mutual charity. (Ch. xi. 2, to the end, ch. xii. ch. xiii. Ch. xiv.) As some of the Corinthians doubted, and others denied, the resurrection of the dead, the apostle establishes this great and peculiar article of the Christian faith. (Ch. xv.) He then closes the whole with some necessary counsels to the Corinthian churches and exhortations to fortitude and charity. (Ch. xvi.)

The *second epistle* of St. Paul to the Corinthians was written during his stay in Macedonia, whither he had gone from Ephesus, somewhat more than a year after his former epistle; according to Pearson in the year 57, and as Mill supposes near the end of that year; or, as Dr. Lardner suggests, in September or October. (Ch. ix. 1—5. ch. xiii. 1.) It was conveyed by Titus, who was returning to Corinth in order to forward the collection intended for the poor Christians in Judea. Its evident design is, in general, to illustrate some of the same points upon which he had discoursed in the former, according to the information which the apostle had received from Titus concerning the circumstances and temper of the Corinthian church; and the writer intersperses and enforces some occasional reflections and advices upon various subjects, which he thought most conducive to their instruction and edification. From a view of the epistle it is evident, that a great part of it is employed in reclaiming the Corinthian church from their undue at-

tachment to Judaizing teachers, and from that party-spirit, which they had indulged, and in rekindling proper regards to the unadulterated doctrine of the gospel, and to his own apostolical counsels. This leading design of the epistle is interrupted by the occasional introduction of other matters, which can form no reasonable objection to the accuracy and beauty of this excellent composition; for the transitions arise from some obvious and important sentiments, which render them natural and just. In these digressions there is an admirable wisdom; because they relieve the minds of the Corinthians from that uneasiness, which they must have felt from a constant attention to so disagreeable a subject as their unsuitable conduct towards the apostle himself. It is with the same kind of propriety and sagacity, that the severe intimations, which the dignity of the apostolical character obliged St. Paul to drop against those, who might persevere in their opposition, are reserved to the close of the epistle; as they would feel with additional weight, in all probability, after their minds had been softened with the reiterated expressions of his tender affection to the Corinthians in general, and the innocence and amiableness of his character had been represented in such a variety of views. See Doddridge's Exposition, vol. iv. Whitby's Comment. vol. ii.

We cannot close this article, without referring to some pertinent and judicious remarks, made by archdeacon Paley, in his "Horæ Paulinæ," (an excellent work of original criticism and reasoning,) on the undesigned agreement or conformity that is manifest between these letters of St. Paul to the Corinthians, and the history of his life and travels in the book of Acts.

As it appears, from chap. vii. v. 1. that the first epistle was written to the Corinthians, in answer to one which he had received from them, this alone is a circumstance that favours the authenticity of the epistle:—for it must have been a far-fetched contrivance in a forger, first to have feigned the receipt of a letter from the church of Corinth, which letter does not appear; and then to have drawn up a fictitious answer to it, relative to a great variety of doubts and inquiries, purely economical and domestic; and which, though likely enough to have occurred in an infant society, in a situation and under an institution so novel as that of a Christian church then was, it must have very much exercised the author's invention, and could have answered no imaginable purpose of forgery, to introduce the mention of it all. Particulars of this kind are such as follow:—the rule of duty and prudence relative to entering into marriage, as applicable to virgins, to widows—the care of husbands married to unconverted wives, of wives having unconverted husbands—the care where the unconverted party chuses to separate, when he chuses to continue the union—the effect which their conversion produced upon their prior state, of circumcision, of slavery—the eating of things offered to idols, as it was in itself, as others were affected by it—the joining in idolatrous sacrifices—the decorum to be observed in their religious assemblies, the order of speaking, the silence of women, the covering or uncovering of the head, as it became men, as it became women. These subjects, with their several subdivisions, are so particular, minute, and numerous, that though they be exactly agreeable to the circumstances of the persons to whom the letter was written, nothing but the existence and reality of these circumstances could have suggested to the writer's thoughts. Another particular deserving of notice is, that in this correspondence the Corinthians did not say one syllable about the enormities and disorders which had crept in among them, and in the blame of which they all shared; but that the apostle's information,

concerning the irregularities then prevailing at Corinth, had come round to him from other quarters. (Ch. i. 11, 12. v. 1, 2.) That the Corinthians should, in their own letter, exhibit the fair side of their conduct to the apostle, and conceal from him the faults of their behaviour, was extremely natural, and extremely probable; but it was a distinction which would not have easily occurred to the author of a forgery; and much less likely is it, that it should have entered into his thoughts to make the distinction appear in the way in which it does appear, viz. not by the original letter, not by any express observation upon it in the answer, but distantly by marks perceivable in the manner, or in the order, in which St. Paul takes notice of their faults. For the particular traces of unintended and seemingly accidental coincidence between the facts that are recited in the two epistles, and those that may be collected from the history, and which is altogether irreconcilable with a premeditated impolture or forgery, we must refer the reader, conversant with subjects of this kind, and desirous of farther information, to the work already cited, p. 72—151.

We may here observe, that there is another epistle of St. Paul to the Corinthians, besides the two above mentioned, purporting to be an answer to an epistle from the Corinthians to him. This was translated by Scroderus, from a copy in the Armenian language, which had been lent to Mr. Whitton, and was afterwards, from a more perfect copy procured at Aleppo, published by his sons, as an appendix to their edition of Moses Chorenensis. No Greek copy exists of this epistle: it is not only unsupported by ancient testimony, but negatived and excluded; as it has never found admission into any catalogue of apostolical writings, acknowledged by, or known to, the early ages of Christianity. This epistle is an artful and specious forgery, introduced with a list of names of persons who wrote to St. Paul from Corinth, and preceded by an account, sufficiently particular, of the manner in which the epistle was sent from Corinth to St. Paul, and the answer returned. But they are names which no one ever heard of, and the account it is impossible to combine with any thing found in the Acts, or in the other epistles.

CORINTHUS, in *Ancient Geography*, a town of Greece, in Thessaly.—Also, a town of Greece, in Epirus.

CORIO, in *Geography*, formerly a town of Piedmont, in Italy, belonging to the king of Sardinia, is now a town of France, in the department of the Po, chief place of a canton, in the district of Turin, containing 5132 inhabitants. The canton is composed of 5 communes, and reckons in all 6764 inhabitants.

CORIOLOGO, CHRISTOFANO, in *Biography*, a designer and engraver in wood, who is said to have been a native of Nuremberg, but who afterwards established himself at Venice. Heineken conjectures that his real name was that of *Lederer*, a family still existing in Saxony, and which Christofano might translate into Coriolano, according to the custom of those times.

Vafari informs us, in his *Life of Marc Antonio*, that Christofano engraved, from the designs of himself and his scholars, all the portraits prefixed to the lives of the different painters, sculptors, and architects in his extensive work; and that he continued to enjoy the reputation of an excellent artist at Venice, where he was established. If so, Christofano Coriolano cannot have been born so late as 1566, which M. Huber supposes. Besides the prints for Vafari, many of those in the *Arts Gynnaſiæ Hieronymi Mercatoris*, the work of Ulyſſes Aldrovandini, are attributed to this master. But it is probable there were two artists of the same name. Huber.

CORIOLOGO, CAV. BARTOLOMEO, supposed the son of the

the preceding artist, was born at Bologna, about 1550, and is said to have perfected himself in design by studying in the academy of Caracci. Guido, however, seems to have been the painter he most admired; and we are indebted to Bartolommeo for several excellent engravings in chiaro-scuro, from the drawings of that graceful painter. These prints were produced, like those of Ugo de' Carpi and Andrea Andreani, by means of three blocks of wood; one of which gave the outlines and the greatest depths of shadow, as if hatched with a pen; the second, the middle tints; and the third, the darker masses. He flourished from 1620 to 1650. His prints are generally signed with his name, or with his initials, thus, B. C. Eques.

Amongst his best prints are the following: "St. Jerome before a Crucifix," a half-length figure, dated 1636, after Guido; "the Daughter of Herodias, with the Head of John the Baptist," from the same; "the Fall of the Giants," a large upright print on four sheets, from the same painter, dated 1647, and considered the chef d'œuvre of Coriolano Heineken. Huber.

CORIOLOANO, GIO. BATISTA, the younger brother of Bartolommeo, was born at Bologna, about 1596, and studied painting and design under Gio. Luigi. Valesio. Some of the pictures of Gio. Batista exist in the churches of St. Anna and the Annunziata, at Bologna. He is better known by his numerous engravings in wood and copper, the former of which are preferred by the connoisseurs.

We shall only notice the following prints by this artist, who is said to have died in 1649: "the Portrait of Fortunatus Licetus," 1639, in 4to.; "Christ crowned with Thorns," a middling-sized upright plate, boldly etched from Lod. Caracci. Huber.

CORIOLOANO, TERESA MARIA, sister to the two preceding artists, after having acquired sufficient knowledge of design from the instructions of her father, studied painting under Elisabetta Sirani. She also amused herself with etching, as appears by a small print representing the Virgin and Child. Huber.

CORIOLOANUS, CAIUS MARCUS, celebrated in Roman history, was descended from the family of the Marcii, and in his early years he displayed uncommon courage and nobleness of mind, united with strong passion and the pride of high birth. He first distinguished himself in the war against Tarquin, who was expelled; and obtained a civic crown, for having preserved the life of a fellow-citizen. For his success over the Volscians, he was presented with a fine horse richly caparisoned, and a tenth part of the spoil. The former he accepted, but disdained a greater share of the booty than fell to his lot in common with others of the same rank. As a further favour, he demanded the release of a Volscian prisoner, who had been connected with him by the tie of friendship, which was immediately granted; and the surname of Coriolanus was unanimously conferred upon him, on account of his great services in the capture of Corioli, the capital of the Volscians, which happened in the year 493 B. C. About this time dissensions prevailed between the patricians and plebeians; Coriolanus sided with the former, and was exceedingly severe against the plebeians. For some of his measures he was flogged before the tribunes, to which he paid no attention, till he conceived the safety of the state required him to come forward in his own justification. Instead, however, of softening the resentment of the people by submission, he aggravated their displeasure by the haughtiness of his behaviour. He was now condemned to be thrown from the Tarpian rock; but from this severe punishment he was saved by the courage of the patricians, in

whose cause he had embarked. He was at length tried by the people, to whom he appealed by the fears he had received in fighting for his country, and by the lives he had saved in battle; but the tribunes succeeded in obtaining against him a sentence of perpetual banishment. He heard the decree without emotion, and with a manly composure took leave of his mother, his wife, and children; but the ingratitude of his country made an indelible impression on his mind. He was bent on revenge: he joined with the enemies of Rome, took many of the towns, and encamped within five miles of the city itself. The people now law their error, and a deputation was sent out to treat with him: he received them with haughtiness, but would give them no hopes of a reconciliation. To a second and third message of the same kind he shewed himself inexorable. At length, his mother, wife, and children, came out to plead their country's cause. To their intreaties he could no longer refuse his ear. Raising his venerable parent from the ground, on which she had prostrated herself, he exclaimed, "You have saved Rome, my mother, but you have destroyed your son." He retired to his tent, and soon after took measures for a retreat. When he had brought back the troops to the Volscian country, he divided all the booty among the soldiers; on which account he so ingratiated himself with the men, that his own want of resolution was forgotten. By some of the historians we are told he lived to a great age; though others maintain that he was slain in a tumult, excited against him for yielding to the prayers of his country. Plutarch.

CORIOLEA, CORIOLI, in *Ancient Geography*, a town of Italy, situated in the country of the Volsci, of which it was the metropolis. From this town, which no longer subsisted in the time of Pliny, Marcius took the name of *Cerriolanus*.

CORIOS, a river of Asia, towards Carmania.

CORIORAGEMATODENDRON, in *Botany*, Pluk. See *MYRICA quercifolia*.

CORIOVALLUM, in *Ancient Geography*, a town of Belgic Gaul, on the route from Colonia Trajana, between Tunderum and Juliacum. Anton. Itin.

CORIS, in *Botany*, (*coris*; Dief.) Tournef. 652. Appendix. Linn. gen. 243. Schreb. 329. Willd. 374. Lam. Ill. 292. Juss. 96. Vent. 2. 288. Class and order, *pentandria monogynia*. Nat. Ord. *Lythnaceae*, Juss. *Primulaceae*, Vent.

Gen. Ch. Cal. one-leaved, ventricose, five-toothed, crowned externally with strong sharp bristles. Cor. monopetalous, irregular; tube the length of the calyx, cylindrical; border flat, five-parted; segments oblong, obtuse, emarginate, unequal. Stam. five, bristle-shaped, shorter than the corolla, declining; anthers roundish. Pist. Germ. superior, roundish; style filiform, the length of the stamens; stigma simple. Peric. Capsule globular, placed at the bottom of the calyx, one-celled, five-valved. Seeds numerous, somewhat egg-shaped, small.

Ess. Ch. Calyx ventricose, with thorn-like teeth. Corolla monopetalous, irregular. Capsule five-valved, included in the calyx.

Sp. C. *monspeliensis*. Linn. Sp. Mart. Lam. Ill. Pl. 102. Willd. (C. *carulea maritima*; Benth. Pin. 280. *Symphlytum petrum*; Camb. Epit. 699.) Root perennial. Stems several, about six inches high, more or less erect, cylindrical, branched, cinereous, or reddish. Leaves scattered, numerous, small, linear; the upper ones in the wild plant edged with sharp prickly teeth. Flowers red or

white, in dense, egg-shaped, terminal spikes. A native of sandy shores in the south of Europe.

CORIS lutea; C. Bauh. See *HYPERICUM coris*.

CORIS is also used in the East Indies for a kind of shells which pass for money. See *BIA* and *COWRY*.

CORISCO, in *Geography*, two islands of that name on the coast of Guinea, belonging to Benin.

CORISPERMUM, in *Botany*, (from *coris*; a bug, and *perma*, feed.) Linn. Gen. 12. Schreb. Willd. 26. Gært. 469. Lam. Illus. 12. Juss. 86. Vent. 2. 261. Class and order, *monandria digynia*. Nat. Ord. *Oleraceae*, Linn. *Atriplicae*, Juss. *Cheopodiceae*, Vent.

Gen. Ch. *Cal.* none; Linn. Schreb. Willd. (two-leaved; leaves opposite, compressed, acuminate, incurved; Lam. Juss. Vent. Gært.) *Cor.* dipetalous; Linn. (none, Lam.) *Stam.* Filament one, but in the lower flowers often from two to five, filiform; anther roundish. *Pist.* Germ superior, egg-shaped, compressed; styles two, capillary (one; Gært.) stigmas acute. *Peric.* none. *Seed* single, oval, compressed, flat or a little concave on one side, convex on the other, with an acute margin.

Eff. Ch. Calyx or corolla two-leaved, or two-petalled, one of them wanting. Seed single, elliptical, plano-convex, with an acute margin.

Sp. 1. *C. hyssopifolium*. Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. Lam. Illus. Pl. 5. "Flowers lateral; bracts like the leaves, linear, smooth underneath." *Root* annual. *Stem* scarcely a foot high, pubescent towards the top, reddish beneath, striated, branched. *Leaves* alternate, entire, with a white longitudinal nerve, and somewhat membranous edges; lower ones two inches long, about a line broad, ending in a long point, diminishing gradually towards the top of the stem, without assuming the form of bracts. *Flowers* axillary within the upper leaves, sessile. *Seeds* emarginate. A native of Russia and the south of France.

2. *C. squarrosifolium*. Linn. Sp. 2. Mart. 2. Lam. 2. Willd. 2. "Spices lateral and terminal, squarrous; bracts egg-shaped, short, mucronate, somewhat villous." *Root* annual. *Stem* a foot high or more, much branched, panicled, zig-zag, cylindrical, almost smooth, greenish, with purple striæ; lower branches almost decumbent. *Leaves* about two inches long, alternate, linear, smooth, rather equally distant from each other. *Spikes* an inch long or more; bracts very different from the leaves, with white membranous edges; flowers sessile. *Seeds* not emarginate. A native of Tartary and Siberia. There is a variety, perhaps a distinct species, found in the south of France, with weaker stems and more slender generally terminal spikes. 3. *C. orientale*. Lam. 3. "Leaves long, narrow, linear; flowers somewhat panicled, growing only at the ends of the branches." *Root* annual. *Stems* about a foot high, slender, reddish at the base, branched. *Leaves* narrowing towards the base. *Bracts* small, oblong, villous. A native of the Levant.

CORISPERNUM foliis oppositis; Fl. lap. Gron. See *CALLITRICHÆ*.

CORITA, in *Geography*, a town of Spain, in the province of Leon; 17 miles S.S.W. of Leon.

CORITANI, or *CORICENI*, inhabitants of ancient Albion, were situated to the W. and N. of the Iceni, and, according to Camden, were the ancient inhabitants of the country, which is now divided into Northamptonshire, Leicestershire, Rutlandshire, Lincolnshire, Nottinghamshire, and Derbyshire. Other antiquaries, however, are of opinion that their territory was not so extensive. The name of the Cor-Iceni plainly indicates that there was some kind of affinity or connection between them and their neighbours, the Iceni. Some think they were two tribes of the

fame nation, and that Cor-Iceni denotes the lesser Iceni, from *Carr*, a dwarf, and Iceni. Others imagine that both these British tribes derived their name from the different kinds of animals which constituted their chief riches, and the tending of which was their chief employment; the Iceni from *Uchen*, oxen; and the *Cor-Iceni*, from *Cor*, a sheep. However this be, if the two tribes did not form one nation, they were in very strict alliance, and shared the same fate; having been both reduced to some degree of subjection to the Romans by Ostorius Scapula, and totally subdued by Suetonius Paulinus. The Romans made great changes in the country of the Cor-Iceni, by introducing agriculture, and by building many forts and stations in it to keep them in subjection. Lindum, now Lincoln, the ancient capital of the Cor-Iceni, became the seat of a Roman colony, and one of the most considerable cities which these people had in Britain; and it is mentioned both by Ptolemy and by Antoninus in both his journeys. By following the course of the 6th journey of Antoninus, from London to Lincoln, we meet with a considerable number of Roman towns and stations within the territories of the Cor-Iceni; as Venone, now Claycester; Ratae, now Leicester; Virometum, now Willoughby; Margidunum, now East-Bridgeford; Ad-Pontem, now Southwell; and Crocolana, now Brugh, near Cottingham. The extensive country of the Cor-Iceni was included in the Roman province called Britannia Prima.

CORITHUS, or *CORYTHUS*, a town and mountain of Italy, in Etruria, according to Servius on Virgil; but Cluvier thinks that Servius is mistaken; and that if such a place existed, it must have been in the country since called Cortona.

CORTIUM, a town of Asia, towards Syria; placed near the Euphrates by William of Tyre.

CORITUS, a mountain of Italy in Umbria; now Monte Corvo.

CORIUM, a place in the isle of Crete, near the lake or marsh called Corefium.

CORIUNDI, a people of Hibernia, according to Ptolemy.

CORIUS, a river of Carmania.

CORIZENSIS, an episcopal see of Asia, in the patriarchate of Antioch.

CORIZIOLA, in the *Materia Medica*, is a name given by some authors, particularly by Rhasis, to the scammony.

CORK, the exterior bark of a tree belonging to the genus of oak (*QUERCUS Suber*), which grows wild in the southern parts of Europe, particularly France, Spain, Portugal, and Tuscany. When the tree is about 15 years old, it is fit to be barked, and this can be done successively for eight years. The bark always grows up again; and its quality improves as the age of the tree increases. If care is not taken to strip the bark, it splits and peels off by itself, being pushed up by a second growth forming under that of the preceding year.

Stripping and preparing the Bark.—The bark is taken off by the Portuguese in sheets or tables, by cutting it with knives having two handles, similar to those which the tanners or skinners use at their beam, or horse, sitting it down after the circular incision is made, from top to bottom; to effect this incision they ascend the tree by a ladder to the part where the branches spring from the top; they then make a slice or slip: the filaments connecting the bark with the trunk are next cut down, or through, by a knife formed like our hay-spade, and which they use in nearly the same manner: the bark is frequently, through haste, broken off

at the root, in which case the two ends are distinguished by the appellations of "cut end" and "falt end;" the first is that which had been at the top of the tree, where the circular cut was first made, and the second is that which had been next the ground.

Another mode of accomplishing the artificial stripping of the tree, is thus performed: several incisions are made from the top of the trunk to the bottom, and at each extremity of these incisions a circular cut is effected; by this operation the bark is cut off from communication with either the lower or higher parts of the tree; consequently it is entirely deprived of support; in a little time it loosens, and its separation is completely accomplished by the hand; thus the progress of nature is expedited by very simple means. Before the operation of barking is again performed upon the same tree, should it be a young one, it ought to stand three years; it is not however unfrequently cut within the period; when it is cut too young, it is generally preferred by the English cork-cutter in his cellar till it alters from green to the colour proper for his purpose, which is effected merely from the time he keeps it in that state, though after all, it is still much inferior to that taken when the tree has arrived at maturity.

After being detached from the tree, the Portuguese "burn it," laying the convex side of the bark to the fire; in this operation they are careful to cover all the blemishes they possibly can, holes are filled up in an insufficient manner either by the swelling and straightening of the wood upon the fire, or by the artful introduction of foot and dirt. When the judgment of the burner is sufficiently exercised in flattening the bark, and artificially repairing its defects, it is laid into the farm yard for sale, in stacks, and bought by the merchants from thence for exportation.

Another method used in straightening the bark, is to pile it up in pits, loaded with heavy stones, by which method it becomes flat, this is afterwards more completely effected in a damp cellar, and is called "laying the corks;" when this operation is finished it is dried over a strong fire in what is called "a burning yard;" from negligence in this process it receives too much of that black colour which is so frequently discovered in articles made of cork: when sufficiently dried it is ready for stacking.

The cork is not burnt, but only charred on each surface; previous to this operation the pores of the bark are open, and its consequent sponginess of texture would make it not only give too much way to the knife; but particularly in the case of "taps" and "bungs" would render it a filter, rather than a preserver, of liquids. It shrinks with the application of moderate heat, and thereby closes the pores, by which any filtration might be effected. If "burning" ever be used as a cover for defects, it is not an original design but an accidental advantage, which is taken of a necessary process; "bungs" and "taps" are always charred on both surfaces; good bottle corks, though the bark of which they are made is likewise subjected to the operation of fire, do not after they are cut exhibit any marks of that element, being cut in the length way of the wood, the pores lie in a contrary direction, and the charring consequently is taken off by the process of rounding them.

The cork tree as well as the uses to which the bark is applied, &c.—This tree, as well as its use, was known to both the Greeks and Romans. By the former it was called *phellus*. Theophrastus reckons it among the oaks, and says, that it has a thick fleshy bark, which must be stripped off every three years to prevent it from perishing. He adds, that it was so light as never to sink in water, and on that

account might be used with great advantage for a variety of purposes. That the *faber* of the Romans was our cork-tree is generally and justly admitted. Pliny relates of it every thing said by Theophrastus of the *phellus*; and from his account we learn, that at the period when he wrote, cork was applied to as many purposes as at present. At that time fishermen made floats to their nets of cork; that is, they affixed pieces of cork to the rope which formed the upper edge of the net, in order to keep it at the surface of the water. Another use to which cork was applied, according to Pliny, was for anchor-buoys. "Ulus ejus ancoralibus maxime navium;" that is, as this passage may be interpreted, it was used for making buoys, called "Ancoralis," which were fixed to the cable, and by floating on the surface of the water, over the anchor, pointed out the place where it lay. Our navigators use for that purpose a large but light block of wood, which, in order that it may float better, is often made hollow. See BUOY.

Another use of cork among the Romans was for being made into soles, which were put into their shoes, in order to secure their feet from water, especially in winter; and, as high heels were not then introduced, they served the purpose of elevating ladies and making them appear taller than they naturally seemed. The practice of employing cork for jackets to assist in swimming is also very ancient; for we are informed, that the Roman whom Camillus sent to the capitol when besieged by the Gauls, put on a light dress, and took cork with him under it, because, to avoid being taken by the enemy, it was necessary that he should swim through the Tiber. When he arrived at the river, he bound his clothes upon his head, and placing the cork under him, was so fortunate as to succeed in his attempt. The most extensive and principal use of cork at present is for stoppers to bottles. To this purpose it is excellently adapted; because it is very light, may be easily compressed, and expands again by its elasticity as soon as the pressure upon it is removed, and, therefore, it fills and stops up very closely the space into which it has been driven by force. Besides, it may be easily cut into all forms; and though it abounds with pores, which are the cause of its lightness, it suffers neither water, beer, nor any common liquid to escape through it, and it is but slowly and after a considerable interval that it can be penetrated even by spirits; its numerous pores seem to be too small to afford a passage to the finest particles of water and wine, which can with greater facility ooze through more compact wood that has larger or wider pores. This use of corks was not altogether unknown to the Romans; for Pliny expressly says, that it served to stop vessels of every kind, and instances of its being employed for that purpose may be seen in Cato (*De Re rustica*, cap. 120.) and Horace (*lib. iii. od. 8. 10.*); its application to this use does not seem, however, to have been very common as other substances have been generally employed for this purpose. Stoppers of cork seem to have been first introduced after the invention of glass bottles, of which no mention occurs before the 15th century. See BOTTLES.

This wood is still formed into soles for shoes, into corks and bungs for stopping bottles, &c. into a floatage for the nets of fishermen; it is employed generally, though perhaps with a considerable degree of error in teaching the art of swimming; it is also ingeniously used on account of its lightness, when an amputation of the human leg has been necessary, to supply the deficiency; the Spaniards line stone walls with it, which not only renders their houses very warm but corrects the moisture of the air; the Egyptians made coffins of it, which being covered in the inside with a resinous composition

position preserved their dead bodies. It is hard to make that light black substance, called Spanish black, from its having been first made in Spain.

Cork bark has not only been applied as above, but also in the preservation of life, when endangered by shipwreck; the most conspicuous exhibition of its advantages is in the application of it in the construction of the "life boat" or "cork boat," as it was originally called. We have under the article *Boat*, "*life boat*," given our readers a short account of that inestimable invention; since which we have procured a very valuable account by the principal secretary of the meeting who first advertised the reward; we have also obtained from the liberality of Mr. Greathead, and the interest of the gentleman alluded to, a plan or section of the boat, drawn by the original inventor, which will be given under the article *LIFE BOAT*.

A cork jacket too has been revived from an old German discovery, by Mr. Dubourg, to preserve the lives of persons in danger of drowning, which is constructed as follows. Pieces of cork about three inches long, by two wide, and the usual thickness of the bark, are incised between two pieces of strong cloth or canvas and formed like a jacket without sleeves; the pieces of cloth are sewed together round each piece of cork, to keep them in their proper situations; the lower part of the jacket about the hips is made like the same part of women's stays, to give freedom to the thighs in swimming; it is made sufficiently large to fit a robust man, and is secured to the body by two or three strong tapes sewed far back on each side, and tied before; the strings are thus placed to enable any wearer to tighten it to his own convenience.

Cork in its action has the elasticity of a spring, and when pressed into any aperture, it exerts a force acting outwardly on all sides from the centre. It is this quality that makes it valuable in shutting out the external air from liquors, and elastic fluids; and it is fitted for this purpose in a degree proportioned to the impermeability of its pores. The elasticity of cork has also been employed for many other purposes in the arts; it forms the spring of the lifter in ordinary candlesticks, and where the frame is not heavy, it can be made into a good substitute for the pulleys and weights of the sashes of windows. See *CANDLESTICK* and *WINDOW-SASH*.

Other vegetable productions have likewise been occasionally employed possessing qualities similar to cork. The spondias lutea, a native of South America, which flourishes in moist situations, and which is there called monbin or monban, is sometimes brought to England, as a substitute for cork. The roots of liquorice are applied to the same use, and on this account, as well as its medicinal properties, is much cultivated in Sclavonia, and exported to different countries. The tree called myria, which is found in North America, has also been applied to similar purposes.

Cork-cutting, or the *Manufacturing of Corks*. This business, though it is thought one of the most dirty, is not one of the least profitable: it is likewise easy in the acquirement. The cork, after being pressed into square pieces, as above noted in the treatment of the bark, is received by the cork-cutters, and if not sufficiently flat for their purpose, they "lay" it again over a fire in their "burning yard," turning the convex part to the flame; the heat by twisting the edges of the bark, counteracts the natural bend, and compels it to receive a flat form. During this operation, a considerable degree of attention is paid to smoothing it, and particularly again to cover its defects. It is next cut into slips, narrow or wide, according to the intended cork, bung, or tap, for such are the names of the general divisions

in this business. The use of the two former is well known, the latter is used for stopping the tap-holes of barrels, as the name implies. These slips are again cut into squares, of a length proportioned to the use they are intended for. This operation is performed by one man, from whom they are handed forward to several others. A further division of corks takes place, of these different sorts according to their lengths, and are denominated "short," "short long," and "full long."

The cork maker places himself before the table or plank, on which is fastened a board about three inches thick, four broad, and twelve long; immediately on a line with his left hand is a piece of wood, rising about four inches from the board, and fixed about the middle of it, on which the cork is laid, after being cut as above. This wood not only supports the cork, and is as a guide to the workman, but by its elevation above the board, gives room for the knife to cut a part of the cork in a smooth and circular manner, without striking on the table below. The piece is then turned to where the last cut ceased, and this is continued until the knife has gone completely round: the top and bottom are then pared level, and the cork thrown into a box or basket, with the rest of the same length. As the bark is not of the same quality throughout each piece, the corks are sorted by a boy into four kinds, "superfine," "fine," "common," and "coarse," and are sold accordingly.

The only tool employed by the cork-cutter is a knife about three inches broad in the blade, and about six inches long, very thin and sharp, and equal in breadth from the handle nearly to the end, which is finished by a gentle curve. This knife he sharpens upon the board where the guard is placed, by one whet or stroke on each side, after every cut, and now and then upon a common whet-stone.

From the foregoing review it is evident, that the art of a cork cutter is principally to obtain a regular, round, and quick turn of the whist, in guiding the knife so as to complete a pretty correct circle, and to make a smooth surface; it is on this account that the knife must be particularly sharp, to enable the workman to turn it with ease.

The parings of the cork are carefully kept, and sold to the dry colour makers, to be burnt into Spanish black.

It may be supposed that those who give the detail of any manufacture would be the best able to point out improvements in it, though this is not always the case; yet one improvement in the "laying" of the cork wood, appears of great importance to the writer of this. In the present mode, a great deal of time is lost in placing and removing the stones used to flatten the bark; and though the weight may be moderated or introduced by degrees, yet it cannot be done in that regular manner which appears the most likely to effect the purpose. In addition to which it may be observed, that in proportion as the weight is carefully applied, will be the risk of breaking those pieces which most partake of the circular bend of the tree. To remedy this inconvenience, and to do away the old, gross, and cumbersome method, a screw might be used, such as that employed by the printers in pressing their work; by its operation a gradual pressure would be given, the former objections done away, and a much neater and workman-like method adopted.

Cutting the cork into stripes might also be accomplished with much greater facility; the whole breadth of the cork might be cut by one stroke, by means of semi-circular knives, like small cheese knives, set at certain distances, in a frame, which, by being affixed to a pole, with a cross bar as a handle, might be driven through the whole breadth, in the

the same time that a single slip is cut by the present method.

CORK, Acid of, in Chemistry, a yellowish thick acid matter obtained by distilling four times its weight of nitrous acid from cork. This is soluble in water and has an aultere bitterish taste. It does not crystallize, but becomes consistent like wax by evaporation; is soluble in ardent spirit; forms deliquescent salts with the earths and alkalis; and has as strong an attraction for lime as the acid of sugar.

CORK, Mountain, *Suber montanum*, or *Corium montanum*, in Mineralogy, a species of the micritic genus of earths and stones, according to the arrangement of Kirwan (Mineral. vol. i.) Its colour is white, or reddish-white, or yellowish-grey, or isabella, or ochre-yellow, or yellowish-brown. It is found either in thick compact pieces, and then called "mountain cork;" or in thin flat pieces, then called "mountain leather or paper;" or cellular, and then called "Caro montana, &c." The lustre is σ , rarely γ , and transparency δ . Its fracture presents fibres confusedly interwoven with each other, sometimes too subtle as to be distinguished with difficulty, and thus they give the fracture a compact earthy appearance. Hardness 4; it takes an impression, or yields like cork to the finger, and is somewhat elastic. Sp. gr. before it is penetrated by water, from 0.6806 to 0.9933; and after admission of water, from 1.2492 to 1.3492. (Briffon.) If perfectly dry, and sufficiently thick, it gives a found when struck. It feels meagre. Bergmann and Saussure found it fusible, though with difficulty, by the blow-pipe. By Mr. Bergmann's analysis it contains from 56 to 62 per cent. of silica, 22 to 26 of aerated magnesia, from 2.8 to 12.7 of argill, about 3 of calx of iron, and from 10 to 12.7 of aerated calx.

CORK-SCREW, in Mechanics. *Fig. 1. Plate XVII. Mechanics,* is a simple cork-screw, consisting of a screw, A, turning in a female screw attached by two small rods to the collar B, which receives the neck of the bottle from which the cork is to be extracted; the two rods have a groove in them to receive the ends of a cross piece, connected with the cork-screw, and prevent its turning round with the screw A. *Fig. 2.* is nearly the same, except that the nut, B, is turned instead of the screw.

Fig. 3. is called the *ae-plus-ultra* cork-screw; it consists of two cork-screws A, B, one within the other; the screw which enters the cork is fixed to the internal one. In using this instrument both screws are screwed up to their shoulders, and the whole is turned round together till the cork-screw has penetrated the cork. The handle and the two screws are then turned in the same direction, without permitting the frame to turn, till the cork is drawn. The handle is then turned the contrary way, and the screw drawn out of the cork by means of the small screw B.

Fig. 4. is a screw of nearly the same kind, a rack and pinion being substituted for the screw B.

A corking-machine is represented in *fig. 5*; in which A is a treadle to be worked by the foot; it is connected by a rod *b*, with an iron-lever D; the bottle to be corked is placed in a leathern case E, fastened to a board sliding in a groove; the cork is inserted, and the bottle slid under the lever D, the foot is then placed on the treadle, and the cork forced in; the corks are first pinched by placing them under the lever at *d*, to make them enter easily.

CORK-TREE, in Botany. See *QUERCUS SUBER*.

CORK, in Geography, a county of Ireland, in the province of Munster, lying in the south-western extremity of the island, and by far the greatest in extent and population. It has the Atlantic ocean on the south and south-west: the county of Kerry on the west; those of Limerick and Tip-

perary on the north, and that of Waterford on the east. Its greatest length extending eastward from Kerry is 78 miles (99 English); and its greatest breadth 56 miles (71½ English) containing 1,048,800 plantation acres (1,685,920 Eng.) and being about 1638 (or 2,65; English) square miles. The number of houses, according to an official return made to parliament in 1791, was 56,739, and they must have since considerably increased. From this the population has been estimated at 416,000, which is allowing 9.06 to a house in the city of Cork, and 5.6 to a house in other parts of the county, which those who are acquainted with the many populous towns in this county, and with the manner in which the cottages are crowded, must admit to be a very moderate computation. According to this statement, which is taken from Dr. Beaufort, the county of C rk contains very nearly a tenth-part of the number of acres in all Ireland, and above a tenth-part of the whole population. For not only its absolute population is the greatest, but its relative population is amongst the most considerable, being nearly the same as that of Antrim and Londonderry, and exceeded only by the very populous districts of Armagh, Monaghan, Down, Louth, and Dublin. It cannot therefore be wondered at, that it has three militia regiments to keep up. The number of parishes is 269, in which there are 105 churches. The bishoprics of Cork, Ross, and Cloyne lie entirely within the county, and all the above parishes belong to them except five. Cork returns eight members to the imperial parliament, *viz.* two knights of the shire, two for the city of Cork, and one each for the boroughs of Kinsale, Youghel, Bandon, and Mallow. In so large a district there must be a great variety of soil. It contains more good land than bad, and some parts of the county are highly cultivated, especially the neighbourhood of the Blackwater, and the barony of Muskilly in the eastern part. The barony of Ban and Bantry, which is covered with mountains, and the western parts of Carbery and Muskerry, in which are the Sheehy mountains, are the poorest and the least improved. The whole county is hilly, and, a few places excepted, very destitute of trees, which is the consequence of the vast number consumed in the iron-works in the 17th century, without new ones being planted. There are however some spots which are richly wooded. The Gaitees and the Waterford mountains bound it on the north-east. The Nagle mountains and the Boge which run westward through the heart of the county, though separated from each other by a long valley, may be considered as part of a range, that is continued with few interruptions from Helwick Leed in Waterford, across the counties of Cork and Kerry to the ocean. On the north of this range lies a narrow plain, which extends from the bounds of Tipperary to Dingle-bay. The rocks most common in this county are argillaceous. A coarse red or grey sandstone, often varying to a coarser and more slaty fracture, forms the greater part of the coast and the hills near it. There are in this many strata of slate, some of good quality for roofing houses. A large vein of limestone intersects the red argillite, commencing in the peninsula of Corshbeg and the islands in Cork harbour, and extending on the south side of the river Lee to its junction with the Bride, and thence through a valley adjoining this latter river to the distance of about 12 miles from the city of Cork. This limestone is evidently secondary as it contains a variety of petrified shells; and much of it on scaping has that disagreeable smell which characterises *Stinkstone*. This district contains some marbles which admit a good polish. In some of the limestone quarries near the city of Cork, there are not only very transparent quartz crystals, but also large amethysts which are

are much esteemed by the jewellers. The bottom of Bantry bay is entirely composed of broken pieces of coral, called coral sand, which is found to be an excellent manure. In Carbery there is a magnesian limestone. On the Cork side of the Galtees there is abundance of fine limestone, and this useful article may be procured on moderate terms in every part of the county. The Galtee mountains themselves consist of a very coarse pudding stone, in which is much iron shot quartz. Near Galtymore, on the estate of the countess of Kingston, is the remarkable cave of Skeheenrinky, which is deemed by Mr. A. Young superior to the peak. (See MITCHELSTOWN.) The county of Cork abounds in fine rivers, and good harbours. The Blackwater rises in the mountains between Limerick and Kerry, and flows eastward through this county, receiving the Awbeg, the Funchem, the Bride, and many smaller streams in a course of 80 miles. The Awbeg is the *Mulla* of Spenser, who resided at Kileolemen-castle, not far from its banks, and the Blackwater is the *Awinduff* of the same poet. On the banks of the Blackwater are many fine orchards remarkable for the cyder procured from them; and several handsome seats. It is navigable from Cappoquin in the county of Waterford, where it turns to the southward, and disembogues itself in the harbour of Youghel. The Lee issues from a lake called Gougane-Barra; which is, according to Smith, a most elegant and romantic spot, and has by some been preferred even to the lake of Killarney. This lake is west of Inchigeelch, by which town the river passes, and thence to the city of Cork, above which it divides into two branches which unite below the city; and it contributes much to the wealth and prosperity of that great commercial town. The passage down the river from Cork to the outer harbour consists of a succession of varied and beautiful scenery, which can scarcely be surpassed. The Bandon is another fine river, which, after watering the large and thriving town of Bandon-bridge, and the village of Inishonan falls into the harbour of Kinsale: it is navigable for large sloops as far as Inishonan, between winding banks which still deserve the character given them by Spenser; "the pleasant Bandon crowned with many-a wood." The whole coast of Cork is broken into creeks and bays. The harbour of Crookhaven, near Mizen-head, the south-west point of Ireland, is often resorted to, when the easterly winds prevent vessels from gaining the harbour of Cork. Bantry-bay, a little to the north of this cape, is, at least, 20 miles long, and from three to five broad, every where deep, sheltered, and free from rocks. For particulars of these harbours, and of the many towns which this county contains, the reader must be referred to their respective articles. At Dromagh and Dromana, in the barony of Duhallow are coal-pits, which are worked, but not in a judicious manner, or to much advantage. There is much ironstone, and there were many furnaces; but the dearth of fuel is a great check. Much linen is woven about Dunmanway, which is purchased by merchants in Bandon, and shipped from Cork. Near Bandon is a very extensive cotton mill, which gives employment to great numbers. There are some other manufactures, but none of much consequence, except those which belong more properly to the account of the city of Cork. The peasants in the county are very thickly disseminated. In many parts they are very dependent on their landlords, working for them at a low price in payment of the rent of their cottages, and the small lot of ground adjoining them. This has been called the *Cottar* system. The cottages in general, though bad, are not so wretched in appearance as in some other counties, and with scarcely a single exception have a small garden for cabbages,

as well as a field for potatoes, attached to them. The last supplies them with the principal article of their food. They all have a pig, and some of them several, in which last case they generally kill one for themselves at Christmas. This animal, as well as some poultry, often inhabits the same dwelling with its owner, though, of late, pig-flyes are becoming more common. There is a dunghill formed before the door of every cottage, which has a disagreeable appearance; but it is often the only place the owners have for laying up manure for their potatoe gardens. Spinning is the general business of the women, and notwithstanding the severe remarks that have been made on the laziness of the lower Irish, they are seldom seen idle. They spin more wool than flax. The middling and lower farmers have, of late years, improved much, both in their wealth and manner of living, and there is reason to expect further improvement, if the encouragement to agriculture continues, and the peace of the country be undisturbed. The system of agriculture, however, in use, is very bad, and much praise cannot be bestowed on the great landholders for their exertions to improve it. Cork partakes, with other counties of Ireland, the evils arising from absentees, some of the greatest proprietors being of this class; yet few counties have so great a proportion of respectable residents. With respect to the history of this county, we may observe that it was a kingdom of itself before the arrival of the English, and was governed by the M-Cartys. A descendant of that family, on resigning his Irish title of *M'Cartymore*, was made by queen Elizabeth, earl of Clancarty, a title which was attained soon after the revolution, in consequence of the attachment of the earl to the deposed monarch. Henry II. granted the whole kingdom of Cork by charter to Robert Fitz Stephen and Milo de Cogan, about the year 1177; but they were able to get possession only of a small part of it. It is unnecessary to trace the various changes of property which took place from forfeitures and intermarriages. It may be right however to mention that queen Elizabeth divided a great number of acres, which had been forfeited, amongst various undertakers, who agreed to introduce English tenants. Sir Walter Raleigh had three feignories and a half given to him on this occasion, which he sold, in 1602, to sir R. Boyle, afterwards the first earl of Cork, who was a great improver, and founded several towns. This property now chiefly belongs to the duke of Devonshire, who is the representative of the elder branch of the Boyle family. Many of Cromwell's officers afterwards obtained settlements in this county. Beaufort's Memoir. Young, &c. &c.

CORK, the second city of Ireland, and capital of the county of the same name, was originally built on a low marshy island, formed by the branches of the river Lee, from which circumstance its name is said to be derived, *cor-cach*, in Irish, signifying a moor or marsh. It appears, from the imperfect account we have of the early periods of Irish history, that in the 5th, or, as Ware says, in the 7th century, there lived a pious hermit called Barroc, or Fin Barroc, and in after ages, St. Fin Barry, who founded a monastery for regular canons of St. Augustine, and a school on the south side of the river Lee, near the place where the present cathedral stands; and that his fame drew such numbers to it, that to use the words of Colgan, "it changed a desert into a city." In the 9th and 10th centuries, this monastery and town were often plundered by the Danes, who then infested Ireland; but, at the beginning of the 11th century, they founded the present town in an island of the river, of an oval shape; and called it either from the name of the town they had burned, or the marshy situation, *Cor-ran*.

It was, however, very small, and probably did not contain above 1000 inhabitants; but the creeks which intersected it, were convenient for mooring the Danish vessels, and thus their merchandize and plunder were secured. On the arrival of the English in 1172, Cork became an English colony, and a royal garrison. King John ordered the fortifications to be repaired; a stone wall was built; caides were erected at the north and south gates; and bridges were made with portcullises for maintaining communication with the little towns adjoining the abbeys that had been founded on the north, as well as on the south side of the river, and which are now the north and south suburbs. Cork, however, was not so early a place of the first importance in the island. Stanishurt speaks of it as inferior to Limerick and Waterford; and Boate, who wrote near a century later, in the time of Cromwell, as inferior to the same towns, and Galway. Camden, who wrote in the time of Queen Elizabeth, thus describes it: "It is of an oval form, inclosed with walls, and encompassed with the channel of the river, which also crosses it, and is not accessible but by bridges lying along, as it were, in one direct street, with a bridge over it. It is a populous little trading town, and much resorted to; but so beset with rebel enemies on all sides, that they are obliged to keep constant watch, as if the town was continually besieged, and dare not marry out their daughters into the country, but contract one with another among themselves, whereby all the citizens are related in some degree or other." But though the town of Cork was confined to the small island now occupied by the main street and the numerous lanes which intersect it; yet the suburbs were considerable, and were protected by several castles.

The trade of Cork, in these periods, was not extensive, and the principal support of the inhabitants was the consumption of the monasteries, of which there were several. As a haven, Kinsale was in greater estimation. Since the commencement of the 18th century, the town has been gradually enlarged, by taking in and building upon the several marshy islands which lay near the principal one. The channels which were between these, served the purpose of canals, and were convenient in some respects, by enabling the merchants to load and unload their vessels at their respective warehouses, which often joined their dwelling-houses. In this, it resembled a Dutch town, and such is the description given of it in "the Traveller's Guide through Ireland," published in 1806. It is now, however, more than twenty years since the plan was adopted, of filling up these canals; and there is at present (1807) not a single one in the city, which appears as one island, lying between the north and south branches of the river. By this means, there are several wide pleasant streets, which want only regularity in the buildings, to enable them to vie with those even of the capital. The health of the city has also been promoted, for putrid exhalations arose from these canals, which were a receptacle for filth of all kinds; and, when the tide was out, had both a disagreeable smell and appearance. Many houses have been rebuilt, and in consequence of a new bridge thrown over the north channel, the city is increasing rapidly on the northern bank of the river. So long ago as 1788, the houses were 8093 in number; since which time, there has been a considerable increase. The number of inhabitants in several of the old houses is very great, in some cases above 50; and from the account Dr. Whitclaw has given of the population of Dublin, we may safely reckon ten to a house. We shall then be within bounds in stating the population of Cork at 80,000. It may serve to strengthen this opinion, that in the year 1801, when, in consequence

of the scarcity, committees were appointed to make returns of the persons needing charitable aid in each parish, the number was very nearly 30,000. The appearance of the city has nothing striking to recommend it in the structure of the houses. There are many comfortable, and even elegant mansions, but the want of uniformity, from their being built at different periods, and from the caprice or different views of the builders, prevents their appearing to as much advantage as they would otherwise. Cork has no public buildings of much consequence. The cathedral is a modern church, which is neat and convenient, but is surpassed by many country parish churches in England. The church of the Holy Trinity, or Christ-church, is larger, but is only remarkable for an awkward leaning, in consequence of a settlement at the time of building, which strikes every stranger, and made it necessary to take down the steeple. There are five other parish churches, and a French church. The Roman Catholic parish chapels are three in number, which accommodate immense crowds of people. One of these has been lately rebuilt at a great expence. There are, besides, four chapels belonging to friaries and the chapel of the nunnery. There are six meeting-houses for Protestant dissenters, viz. one for Presbyterians, one for Baptists, one for Quakers, one for Calvinists, and two for Methodists. The bishop's palace, which is near the cathedral, is an elegant and convenient modern structure, containing some spacious apartments. The exchange is a light and elegant building, in the Italian style, ornamented by columns of the Doric and Ionic orders. It was built by an Italian architect; as was also the corn-market house, of the Tuscan order, which has great merit as a building for that purpose. Adjoining to the exchange is the city court-house, and a very extensive coffee-house. The mansion-house, where the mayor resides, during his year of office, is a plain building, but contains two very spacious rooms for public entertainments. In one of them is a statue of William III., of plaster, which is painted, and which Mr. Twiss having confounded with a statue of the earl of Chatham, of white marble, has made the subject of ridiculing the corporation. The old custom-house is a large brick building, which having been deemed ineligible for business, has been promised by government to the *INSTITUTION for applying Science to the common purposes of Life*; and a new custom-house is to be erected in a better situation. There are two theatres; the Theatre Royal is tolerably large, but stands in great need of extensive repairs and embellishments; the other, which was built by Mr. Astley, is much smaller. The assembly room is very large, and the profits derived from it increase the funds of the North Infirmary, to the corporation of which it belongs. There are several bridges. St. Patrick's bridge over the north channel is one of the most elegant structures in Europe. It is built, in some respects, on the plan of the beautiful bridge at Neuilly, near Paris, and consists of a centre arch of 60 feet, and two of 50 feet; which arches are exact semi-ellipses. Mr. Shanelau was the architect. Parliament bridge, over the fourth channel, has been lately rebuilt, with a single arch, and makes a handsome appearance. The new barrack, at a short distance from the city, on the north, is on a commanding eminence, so as to be seen at a great distance from the city, in various directions. It is very extensive, containing accommodation for four regiments of foot, and 1000 horse, with an hospital and suitable apartments for officers. The old barrack on the south-side is still retained, and there is a convenient general hospital near it. The artillery have also a barrack and store; and there is a magazine about half a mile from the city. About three miles up the river are very extensive powder-

mills, with large floors, at a place called Ballincollig, belonging to government. The public-market, nearly in the centre of the town, is very neat and convenient. The meat-market consists of three rows, on each side of which the butchers have stalls. The whole is well flagged, covered in, and lighted from above. Adjoining, are the fish, poultry, and root markets. These markets are open, and supplied on every day, except Sunday; but on Wednesdays and Saturdays, which are reckoned market days, the supply is abundant, and of the best quality. There are some inferior markets, but they do not deserve notice. The county jail is a handsome new structure, built at a short distance from the city, which will enable the grand jury to take down the fourth gate at one end of the main street; and, adjoining which, was the old county jail. As a new city jail is shortly to be erected, the north gate may also be taken down, which will be a material improvement to that part of the city. The bridewell is a plain building, suitable to its purpose. The county court-house has been lately new-modelled, and an elegant entrance to it built, so as to be more worthy of the extensive and opulent county, the business of which is transacted there.

There are a great number of charitable institutions, but the buildings are not remarkable. Where the funds, indeed, depend on voluntary contributions, it cannot be expected that there should be money to expend on ornaments. If, however, they cannot be spoken of as contributing to the beauty of the city, they undoubtedly do honour to the feelings of the inhabitants. There are two infirmaries, containing upwards of 50 beds; a house of industry, with commodious cells for lunatics adjoining it; a house of recovery, for the reception of fever patients; a lying-in hospital; a foundling hospital, which receives about 200 children, besides those at nurse; a blue-coat hospital for 24 boys; a school of industry for 100 children of both sexes, with several alms-houses and parish school-houses. There are, besides, a general dispensary, which is provided with every thing necessary for restoring suspended animation; a society for relieving persons confined for small debts, and for lending small sums of money to poor tradesmen; a society for relieving the labouring poor, in time of sickness; and a society for assisting strangers, and enabling them to return to their respective homes. Except the foundling hospital, which is supported by a tax on coal; and the house of industry, which receives grants from the county and city grand juries; all of them chiefly depend on voluntary contributions, or on public amusements, which are made in a great degree conducive to charitable purposes. The consequent difficulty of procuring funds for their support, obliges the conductors of these institutions to use rigid economy: yet it may be questioned, whether the time now spent in providing necessaries might not be better employed in inspecting the internal regulations; and whether a permanent support for every useful institution would not, on that account, be desirable. Cork has also a society for *bettering the condition and increasing the comforts of the poor*, which maintains a correspondence with the similar societies in London and Dublin, and has suggested many useful plans, some of which are persevered in with success. Though the citizens of Cork have been stigmatised, by some illiberal travellers, as neglectful of the sciences and fine arts; yet there seems to be no just ground for this censure. The public library, supported by annual subscriptions, contains a large and well chosen collection of books, which is rapidly increasing. The institution already referred to, which also originated in private subscriptions, has a scientific library, a large collection of minerals, and the necessary apparatus for giving lectures in natural philosophy

and chemistry. The managers of it, having received the countenance and support of government, are now adding a botanical garden, and extending their plan in many respects. The proprietors of the institution, with some other gentlemen, form a literary and philosophical society, which meets on two evenings in every month. With respect to the fine arts, music is a favourite amusement; and there are many excellent performers, both professors and amateurs. The jolly celebrated Barry, who was a native of Cork, was first brought into notice by an ingenious townfman, Dr. Keigh; and there are not wanting, at the present time, men who have taste to discern, and liberality to encourage, rising merit: though a place so remote from the capital cannot be expected to afford scope for eminent talents. The environs of Cork, towards Passage and Glanmire, are extremely beautiful: the lands rise in gentle hills, ornamented with many country houses, gardens, and plantations, and with woods and fields of variegated verdure. On an island between the two branches of the Lee, above the city, is a walk of an English mile in length, planted with trees; from which there is a pleasant view of part of the city, and of the suburb of Sunday's Well. It is called the Mardyke, and is a fashionable walk. But whatever advantages its environs may possess, or whatever improvements may take place in this city, the source of all must be sought in its safe and capacious harbour, which has now become a regular station for an admiral, and which is the place of rendezvous for fleets sailing to the West Indies. The principal export from Cork has long been provisions, including beef, pork, and butter, made up either for the West Indies, or for the supply of the British fleet. The average exportation of beef, in the years 1743-4-5, was 92,950 barrels; the average of butter, in the same years, was 84,105 *cwt.*; and Smith says, it was ascertained that the average number of bullocks and cows slaughtered in Cork, from August to Christmas in each year, was near 100,000. The export of butter began about the year 1633; and about the same time the merchants began to barrel up their beef and butter with hoops bound about with twigs, after the English manner; and at present they are also iron-hooped. The average of beef for 19 years, ending in 1773, had increased to 291,970 barrels; and that of butter to 120,000 *cwt.* The export of pork was at that time inconsiderable. The average value of the whole exports was 1,100,190*l.* sterling. The other articles of export were hides, bay and woollen yarn, camblets, ferges, candles, soap, tallow, herrings, glue, wool, and some small articles. Of late years, the export of beef, and of all the articles connected with it, has decreased; and that of yarn, camblets, and ferges, has almost entirely ceased: but the export of pickled pork and bacon, of corn, of porter, spirits, &c. has become considerable. The quantity of butter exported in 1806 was 160,000 *cwt.*; the number of black cattle, on the average of the three last years, was only 18,000; the number of calf-skins, on an average of the same years, about 50,000. The imports are chiefly for the supply of the city, and the adjoining district. The breweries and distilleries of Cork are a great source of wealth. There are five porter breweries, besides many of ale and small beer. That distinguished by the name of the Cork porter brewery is the most extensive, not only in Cork, but in Ireland, and is probably surpassed only in London. There are four large distilleries, each of which pays 2100*l.* duty *per week.* At one of these is a steam-engine, of Boulton and Watt's latest construction: it is of 40 horse power, and no expence has been spared in the erection of it. The manufacture of clothing for the army is also very extensively carried on; and there are many lesser factories for coarse cloth, serge, &c.

The manufactories of sail-cloth, sheeting, paper, leather, glue, glass, &c. are also considerable. The corporation consists of a mayor, two sheriffs, a recorder, and several aldermen. The charter was given by Charles I. The sheriffs are chosen by the freemen at large; and, after having served the office, are called burgesses. On the day of election, the names of all these burgesses are put into a box or hat, and five names are drawn out: of these five the freemen are to chuse one to be mayor for the ensuing year. By an agreement, however, which has been entered into by a great number of freemen, who form a club, the senior burgess, if willing to serve, is always elected. The same club has also assumed to itself the choice of sheriffs, so as to render the public election a mere farce, or rather a ratification, according to form, of what has been previously determined at a meeting of the club. Cork, as well as Dublin, retains the privilege of sending two members to the imperial parliament. The electors consist of about 1500 freemen, and a number of freeholders in the county of the city, which is very extensive. The eldest sons of freemen are entitled to their freedom, as well as those who serve a regular apprenticeship to freemen. Many also obtain this privilege by favour every year; for as the number of voters is too great to admit of any attempt to dictate to them at elections, so there is little inducement to throw difficulties in the way of obtaining freedom. The income of the corporation, which arises chiefly from duties paid by those not free on articles of trade brought into the city, is so small as to be scarcely sufficient for the current expences. In history Cork has not been remarkable. Like most other parts of Ireland, it engaged in the interest of the impostor, Perkins Warbeck, which brought the citizens into some difficulty. In 1690 it was besieged by king William's forces, under the earl (afterwards duke) of Marlborough, and taken after a short resistance. The duke of Grafton, a natural son of Charles II., was killed at this siege.

Cork is 126 Irish miles S.W. from Dublin. The latitude of the observatory of the Cork Institution is $51^{\circ} 53' 54''$ N. Longitude W. from Greenwich, in time, $33^{\circ} 56''$; in degrees, $8^{\circ} 20'$. Smith, Young, &c. &c.

CORK, *Bisboprick of*, is supposed to have been founded in the seventh century. It was united with Ross by queen Elizabeth, in 1586; and they are both contained in the county of Cork, as is also the adjoining one of Cloyne. The Union is, in Irish miles, about 65 by 17; and in English, 83 by 23. The number of acres is 480,300, which are divided into 127 parishes, of which only 54 have churches. Beaufort.

CORK-BAY, a bay on the east side of Newfoundland island.

CORK, or CORKING of a saddle, are pieces of wood upon which the bolsters are made fast.

This part of the saddle was formerly made of cork, whence it still retains the name.

CORLAY, in *Geography*, a small town of France, in the department of the Côtes du Nord; is the chief place of a canton, in the district of Loudéac. The town contains 1483, and the canton 6481, inhabitants, dispersed in five communes, upon a territorial extent of $117\frac{1}{2}$ kilometers.

CORLIEU, in *Ornithology*, the name given by Albinus to the SCOLOPAX *totanus*, the spotted red-shank of Pennant, and spotted snipe of Latham.

CORLIN, in *Geography*, a small town of Prussian Pomerania, on the river Persante; 12 miles S.E. of Colberg. It has a few woollen manufactures.

CORLIS, in *Ornithology*, the common curlew, or SCOLOPAX *arquata*.

CORMA, in *Ancient Geography*, a river of Asia, in the territory of Chalontis, which discharged itself into the river Delos or Silla.

CORMALOS, a river of Asia Minor, in the Troad.

CORMANTIN, LITTLE, in *Geography*, a village of Africa, situated on the Gold Coast, three miles from Mawri, and a little below Aga; so called in contradistinction to Great Cormantin, from which it is distant $\frac{1}{2}$ miles W.S.W. The French and Portuguese formerly carried on a great trade with this place, in which the Dutch also shared, till it was discovered that the negroes adulterated the gold. About the year 1682, the Dutch resumed the trade, when they enlarged and strengthened Fort Amsterdams, the chief residence of the English, till they were forced to abandon it by De Ruyter, in 1665. The fort is a square stone building, fortified with four bastions, mounting 20 pieces of cannon; having convenient apartments for the officers and soldiers, and commanding fine views of the country and sea. Large cisterns, receiving the rain-water, supply the fort with water.

CORMANTIN, Great, a large and populous town, on the Gold Coast, in the territory of Fantin, standing about cannon-shot from the fort of Little Cormantin, on a high hill behind, and under the cannon of the fort. The town is occupied by a considerable number of merchants and fishermen, together with other inhabitants of different employments. Cormantin and Anamaboa were formerly the great marts of the English and Dutch commerce, as they were much frequented by the Akhaufce, who came hither with their goods in large caravans. N. lat. $5^{\circ} 5'$. E. long. $0^{\circ} 8'$.

CORMASA, or, as Polybius calls it, CURMASA, in *Ancient Geography*, a town of Asia, in Pamphylia.

COR-MASS, the name of a grand procession, said to have been established at Dunkirk during the dominion of Charles V., and renewed on St. John's day, the 24th of June. After the celebration of high mass, the procession, consisting of the several tradesmen of the town, begins. Each person has a burning taper of wax in his hand; and after each company comes a pageant, followed by the patron-saint, usually of solid silver, richly wrought and adorned. The companies are followed by music; and after the musicians, the friars, in the habits of their order, the secular priests, and then the abbot magnificently adorned, and preceded by the host. Machines likewise of various fantastical forms and devices, and as variously accounted, form a part of the shew on this occasion; which is described as one of the most superb and magnificent in the world, by an eye-witness, in 1755. Gent. Mag. vol. xxix. p. 263.

CORMELLES, in *Geography*, a small town of France, in the department of Eure, and district of Pontaudemer, with 1230 inhabitants. It is the chief place of a canton, which has 15 communes, and 10,063 inhabitants, on a territorial extent of 127 kilometers.—Also, a town of France, in the department of the Oise, and district of Clermont; 4 miles W.N.W. of Breteil.

CORMERY, a town of France, in the department of the Indre and Loire, and district of Tours; 7 miles S.E. of Tours.

CORMICY, a town of France, in the department of the Marne, and district of Reims; 10 miles N.W. of Reims.

CORMION, or LICONIUM, in *Ancient Geography*, a town of Asia Minor, situated on the Bosphorus of Thrace, and near the western bank of the river Aneretus. This small town lay to the east of the Hermezan promontory.

CORNIOX Sinus, a gulf of Asia Minor, in the Bosphorus of Thrace, over against the Hermezan promontory.

CORMOLAIN, in *Geography*, a town of France, in the department of the Calvados; 10 miles S.S.W. of Baveux.

CORMONS, a town of Germany, in the county of Goritz; 7 miles S.W. of Goritz.

CORMORANT, in *Ornithology*. See PELECANUS *carbo*, and *CORVUS aquaticus*.

CORMOS, or CORMON, in *Ancient Geography*, a town of Arcadia, on the frontiers of Laconia, near the source of the river Carrion, S.E. of Megalopolis. In the time of Pausanias, its ruins only were to be seen.

CORN, in *Agriculture*, a term applied to all sorts of grain fit for food; particularly wheat, rye, &c.

The farmers, indeed, rank under the denomination of corn several other grains; as barley, oats, and even pulse; as peas, vetches, &c. which, however, they sometimes distinguish by the denomination, *smaller corn*.

Europe, in every part of it; Egypt, and some other cantons of Africa, particularly the coasts of Barbary; and some parts of America, cultivated by the Europeans; and the Armenians themselves, produce corn. Other countries have maize and rice, in lieu of it; and some parts of America, both in the islands and continents, simple roots, such as potatoes, and manioc.

Egypt was anciently the most fertile of all countries in corn; as appears both from sacred and profane history. It furnished a good part of the people subject to the Roman empire, and was called the dry nurse of Rome and Italy. England, France, and Poland, seem now to have supplied the place of Egypt, and with their superfluities support a good part of Europe.

For the first discovery and culture of corn, authors are much divided: the common opinion is, that in the first ages man lived on the spontaneous fruits of the earth; as acorns, and the nut, or malt, produced by the beech; which, they say, took its name, *fagus*, from the Greek *φαγος*, *I eat*. It is added, that they had not either the use of corn, nor the art of preparing, or making it eatable. See *BAKING*.

Ceres has the credit of being the first that sowed the seed of corn, on which account she was placed among the gods; others give the honour to Triptolemus; others share it between the two, making Ceres the first discoverer, and Triptolemus the first planter and cultivator of corn.

Diodorus Siculus ascribes the whole to Isis; in which Polydore Virgil observes, he does not differ from the rest; Isis and Ceres being, in reality, the same. The Athenians pretend, it was among them the art began; and the Cretans, or Candiots, Sicilians, and Egyptians, lay claim to the same. Some think the title of the Sicilians best supported, that being the country of Ceres; and authors add, she did not teach the secret to the Athenians, till she had first instructed her own countrymen. Others say, Ceres passed first into Attica, thence into Crete, and, last of all, into Sicily; many of the learned, however, maintain, it was in Egypt the art of cultivating corn first began; and it is certain, there was corn in Egypt and the East, long before the time of Ceres. For the various modes of producing corn, and preparing it for use; see *HUSBANDRY*, and other articles appropriate to each kind of grain in this dictionary. For the best method of preserving corn, see *GRANARY*.

CORN *Laws*, in *Rural and Commercial Economy*, are those laws and regulations which relate to the importation and exportation, as well as general trade in grain. They are a set of rules and regulations which have undergone much change and alteration at different periods, but which still seem far from having attained that degree of perfection which is essential in so important an article of commerce. It has

been remarked by an able writer, that "almost every other manufacture may be admitted to a free trade; but as the trade of corn must at all times be limited by, and subservient to, the necessities of the state, it requires the attention of a careful and fostering parent." It is therefore contended, that the agriculture of the nation "ought to be guarded by the wisest laws and the strictest execution of them, as the only certain means of employing the greatest number of people, and consequently of increasing the population; and that it is the better entitled to this attention, that the farmer and the landholder pay a full proportion of all taxes imposed for promoting and protecting the sale of our other manufactures, both at home and abroad, as well as for the growth of corn at home."

Though very different principles have been laid down as the basis of these laws at different times, it seems evident that, as the strength and power of a nation must be proportioned to the extent and industry of its population, the chief attention of the framers of them should be directed to such measures as have an immediate tendency to encourage and promote the improvement of agriculture. It has indeed been contended; on the ground of long experience, that the foundation of such regulations should always be such as is calculated to induce the inhabitants to improve their grounds in such a manner as to raise the largest proportion of grain, the particular soil and climate is capable of permitting. And that this is "an object which can only be attained by securing a certain and steady market to the farmer for his produce; not only by preventing importation, but also, whenever it shall appear, from the moderate price of grain at home, that a greater quantity has been raised than is required for the annual supply of the inhabitants, by giving such a bounty on exportation, as shall ensure a ready vent for the excrement stock in foreign countries. It is not enough, says the able writer, that a nation raises, in general, a sufficiency of corn for the consumption of its inhabitants: it must be accustomed to raise considerably more, in order to afford plenty in bad seasons; and its annals ought to be distinguished by a greater or lesser exportation; but on no occasion ought it to be reduced to the necessity of importation, and having recourse to foreign countries for an expensive and precarious relief."

Mr. Young in his "Political Arithmetic" likewise remarks, in speaking of the obstacles which bad corn laws throw in the way of good husbandry, and of the want of permission to export grain in Spain, Portugal, and some parts of Italy, that he does not conceive it possible, "under such a system, to have a flourishing corn husbandry—prices will be too fluctuating—some years will be so cheap that the farmers will be ruined, and others so dear that the people will be starved. Long experience must convince us, continues he, that this is not only reasoning but fact. Famines never appear in countries that admit a free exportation; but in all above named, where a contrary policy has been pursued, they have appeared frequently and severely." And he farther observes that "the variations in the earth's products, owing to seasons, though not so great as some have imagined, whereby the husbandry is good, yet where it is indifferent, must necessarily be considerable." He thinks that one maxim may be laid down on this subject which can hardly be contradicted, which is, that "the good of husbandry requires that the price of corn should be proportioned to the product. Let us then, adds he, suppose the common consumption of a nation to be 5,000,000 of quarters of bread corn: the proportion between the common product and the common consumption must vibrate according to various circumstances.—Suppose a crop of 6,000,000 of quarters, and no exportation,

what

what, he asks, must be the consequence? There is the surplus of a sixth in the markets, consequently the price is brought down much lower than that proportion. Here, says he, lies the misfortune. If corn in such a year yielded a price proportioned only to the plenty, the misfortune would not be great; but the addition in the markets of a sixth links the price probably a third, and perhaps more." And further, supposing "another good crop, with a new surplus of a sixth or seventh; this coming upon granaries full of a part of the former surplus, links the price yet lower; and then the farmers are not only discouraged, as, he says, several writers have observed, from sowing another crop, but what is as bad, they are impoverished so much that they cannot plough, harrow, dung, drain, ditch, fence, or do any thing with proper spirit. These two circumstances, inability in future to act well, and discouragement from sowing again, can hardly fail, he thinks, of occasioning in future years a scarcity, or probably a famine. Then the farmers reap of course a thin crop, from their former inability, and that too over only part of the land usually sown; in such a case, corn, he contends, must be very high to recompense the farmer; probably so high, that the government of the country is alarmed, and imports corn from wherever they can get it; then the price falls, when he again suffers. Thus a great crop or a bad one operates equally against him, and nothing can support him at all but such a product as pretty exactly answers the annual consumption. There is no balance preserved in the measures, exportation is prohibited, yet importation is allowed; so that it is impossible the price should with any regularity be such as can encourage good husbandry."

"On the contrary, if the policy of the state admits exportation, the surplus of a large crop being sent away, keeps the price at home, he maintains, from falling too low: this is an encouragement to the farmer acting two ways; first, by enriching him, he is able the better to improve all his culture; secondly, he is induced to sow as much corn as possible, for every man, whatever be his trade, is desirous of increasing that commodity which sells best at market."

The bounty on exportation, which was formerly given in this country, is considered as a refinement on this policy, and which, though given originally with the view of raising the price of grain, as an encouragement to the country gentlemen, yet it had the contrary effect, having rendered corn much more cheap, by becoming so great an inducement to the cultivation of it.

It is, in short, strongly contended, that "in such countries as will adhere to so destructive a system as that of restraining the export of corn, it is not of much consequence whatever advantages are given to husbandry, since all others united, that can be named, or thought of, will not make amends to the farmer for the want of a market: it is of no consequence to enable him to raise noble crops, if when he has got them, he cannot sell at a proper price; his plentiful harvests tend only to his ruin."

From the fullest consideration of the subject in various points of view, an able writer conceives it obvious, "that agriculture and manufactures are established on very different principles, and that whilst wealth and population raise considerably the money price of corn, and other rude produce of the soil, they have not an equal effect in advancing the price of manufactures." Hence, contrary to the opinion of the celebrated author of the *Wealth of Nations*, it is supposed the following political maxim may be fairly deduced: "that agriculture in rich and populous countries, stands more in need of a monopoly for its support than manufactures; and that the farther a nation advances in prosperity, it becomes the more necessary to secure its agriculture, not only by

restraining the importation of foreign corn, but also by removing every impediment which may prevent, and by giving every encouragement which may promote, the extension of cultivation and improvement over the whole face of the country."

Consequently, that, if this country wish "to preserve her present superiority in wealth and resources over the surrounding nations, agriculture must be protected by allowing to the husbandmen prices for their produce proportioned to the internal wealth and prosperity of the country; and that, if at any time, the bringing in of foreign corn tends to sink the money price of British grain below the corresponding value of labour and other commodities, the importation must be checked by judicious laws, altered from time to time, at different periods, to correspond with the prosperous or declining state of the country."

The principles on which the corn laws have been constructed at different times, so far as they can be traced and recognized, appear to have been these.

1st. That of cutting off the importation of corn from foreign countries, except when the price at home was very high.

2d. That of granting a bounty on the exportation of it, when it does not exceed certain prices.

3d. That of having recourse to both these measures according to circumstances; or what may be termed a sort of mixed or shifting policy, without any thing being permanent, without any regular law, or due arrangements of prices at which export should be allowed, or import be prohibited.

4th. That of lowering the import rates and duties, as well as that of the bounty, on exportation in a considerable degree, in order to reduce the prices of corn in the home market, to the state of former periods, and thus to introduce a permanent law in respect to corn by which the inconveniences of a varying policy may be remedied. And,

Lastly, That of regulating the import and export of corn, and the bounties and duties upon them, by the particular circumstances of the period, so that the farmer may obtain a fair and reasonable profit in the home market.

Having now considered the different objects which should be particularly attended to in constructing laws for the regulation of the commerce in grain, and shewn the principles on which they seem to have been in general founded, it may not be improper to trace the causes from which they proceeded, and the effects which they have produced at different times.

In regard to the corn laws of this country, as they existed previous to the revolution in 1688, it may be observed, that in order to preserve the laws of the kingdom in force, it was considered necessary, for several centuries after the conquest, to renew or confirm them upon the accessions of new sovereigns, a practice which explains the reason of the various confirmations of the great charter, and the frequent re-enactions of the same laws, on this subject, as well as others, without any new meaning appearing on the statute-book.

At this period, the rents of lands, held by farmers or tenants, were for the most part payable in produce, as in corn, cattle, or some other product afforded by the soil. And the rules by which the rents were received were extremely indefinite and irregular; the measures of grain being various, and taken heaped, nine bushels generally constituting the quarter. For though by the great charters of king John and Henry III., which had been often confirmed by succeeding kings and their parliaments, one weight

and measure had been directed to be made use of over all England, yet it was far from being the case, as is shewn by an act of 1360, the 25th of Edward III., in which the weights and measures are again attempted to be regulated; and in which it is directed, that eight bushels stricken and no more, shall be received as the quarter of grain, "but saving the rents and farms, and all manner of franchises of the lords." On which Mr. Dirom remarks, that, "with such reservations, it is not to be expected that the law could have any effect." And he adds, that, "under such impositions with the oppression of purveyance, and the depressed situation in life wherein the farmers were placed, it is not to be wondered that agriculture languished, and that a numerous community depended upon foreign provisions for their subsistence."

In tracing the progressive advances of agriculture from this depressed situation, it may be necessary to observe, that, at these periods, most of the business of the dealer or trader was carried on in the different markets and fairs of the kingdom, and that a large proportion of the revenue of the crown was drawn from the duties payable to the king, on the goods brought to them in order to be sold. And the barons had likewise, within their respective jurisdictions, tolls at the fairs. Hence it not unfrequently happened, that as the farmers and other dealers were conveying their corn and other necessaries to the markets and fairs to be disposed of, they were met by persons on the road, in order to purchase them for the purpose of retailing them at a higher price, in consequence of which, the king and the lords of the manors were deprived of the different duties payable upon them, and at the same time the price was enhanced on the people, in consequence of the diminished quantity brought to market. It of course became necessary, both on the score of public and private interest, to prevent the practice as much as possible, by the infliction of severe penalties; and various laws were enacted for the purpose at different times, the offenders being termed forestallers, regrators, and ingrossers.

Hitherto, as various laws had been formed with the view of inviting the importation of foreign articles of necessity, while the exportation of the superabundant stock of British grain had been prohibited, it cannot be supposed that agriculture had been encouraged as an object of national importance. About this period, 1393, however, a law was made, the 17th Richard II. c. 7, which authorized all the king's subjects to carry corn out of the kingdom, upon the payment of the customs and subsidies. And which was confirmed in 1425, referring to the king and council, power to restrain the exportation when they should judge it necessary.

However, from this reservation being construed into a prohibition to export grain without a licence, or from the difficulty of procuring the licence, the beneficial consequences to be derived from it were prevented; and from the check which was thus given to the art of cultivation, much inconvenience and distress experienced in the country, as is fully shewn by the preamble to the law of 1436, the 15th Henry VI. c. 2, by which it was followed, and in which liberty was given to persons to transport grain, without a licence to wherever they chose, except to the enemies of the king, when wheat was at 6s. and 8d. and barley at 3s. the quarter; which were sums rather above the medium prices, being in the proportion of the present money of 2l. 4s. for the quarter of the former, and 19s. 10d. for that of the latter.

The advantage of this law had been found so beneficial to the country in restoring abundance of grain, that it was in

1442 and 1444, confirmed and continued for ten years as well as soon afterwards made perpetual, by the acts of 20 Henry VI. c. 6. and 23 Henry VI. c. 5: and the effects of which, so far as they can now be discerned, were those of a very moderate and more steady, or less fluctuating, price of corn for forty years.

However, notwithstanding this, the laws favouring the importation of foreign grain still continued in force; and the trade was in the hands of foreign merchants or dealers, who conveyed their corn or other articles from one port to another, so as to anticipate the English farmers in the sale and disposal of their grain or other produce. And it is suggested by Mr. Dirom in his "Inquiry into the Corn Laws and Corn Trade," that, "although those merchants may have lost upon the grain which they imported into England at this time, they gained upon the general course of the trade; because they received in return, wool, unfinished woollen cloth, and ready money, upon which they made great profit in their own countries, and thus were enabled to undersell the produce of our fields at home."

Further, "this appears to have been the case, even after this period, from two restrictive and regulating laws of Richard III. 1. c. 8, 13, by the last of which it appears, that the foreign merchants who imported wines into England, had not only taken their payment two-thirds in woollen cloth, and one-third in ready money, but had considerably lessened the contents of their wine casks, although sold under the former titles and contents."

The inconvenience and consequent distress to which the business of cultivation was exposed, by the constant importation of foreign grain, at length awakened the attention of the legislature, and in 1463, a preventive law was made, 3 Edward IV. c. 2; some of the causes of which seem to have been, that the labourers or cultivators and occupiers of land, had been grievously injured by the importation of foreign grain, when corn at home was at a low price; by which the importation of foreign grain was prohibited, until the prices at home should exceed 6s. 8d. the quarter for wheat, 4s. for rye, and 3s. for barley; which is in the proportion of 1l. 15s. 2d. 1l. 1s. and 15s. 10d. of the present money.

The able author quoted above, considers these as the laws to which the agriculture of this country owes its origin; and that notwithstanding their objects have frequently been defeated by others, they are the basis or foundation which still remains; and on which a great fabric, now out of repair, has been erected; but which, by "moderate attention, may long continue to be the chief ornament and support" of the kingdom. It was on these laws, he adds, that the agriculture of the country rested for nearly a century; though the want of their being duly executed, rendered them in a considerable degree nugatory. For as the prohibition of the importation of foreign grain, was never sufficiently regarded; the occupiers of land had still to contend with the competition of grain from abroad as well as other oppressions and grievances at home; as is fully shewn by an act made in the year 1552 against regrators, forestallers, and ingrossers, the 5 and 6 of Edw. VI. c. 14; "by which the crime of forestalling is extended to persons buying victuals coming in ships from beyond the seas, to be sold in any market or fair, city, port, haven, creek, or road, as if no laws had subsisted by which such importation had been prohibited." And after observing that although the "repression of the practices of forestalling and regrating might have been necessary," it is not easy to discover any cause "for the enactment of ingrossing;" at a period so late as this when commerce had made such considerable advances: and further that, "by the same law, no person

perform at home could transport corn from one port to another without a licence; neither could they purchase corn to be laid up in their granaries for home sale, until the quarter of wheat was at, or under, *6s. 8d.* (equal to *16s. 6d.* of present money): malt and barley at *3s. 4d.* (*8s. 3d.*); oats at *2s.* (*4s. 11½d.*); pease and beans at *4s.* (*9s. 11d.*): and rye at *5s.* (*12s. 5d.*) per quarter."

By these means it is contended that the former system of corn laws was wholly subverted, for that, "although these were the prices to which exportation was limited by the act of Edward IV. in 1463, the value of money was materially changed; for, at the former period, there were only *37s. 6d.* in the pound of silver, and now there were *60s.* and at the former period, money bore a very high and unlimited interest, and now, it yielded only about *12 per cent. per annum*; so that *6s. 8d.* for a quarter of wheat, in 1463, was equal to *11. 15s. 2d.* and in the year 1552, it was only equal to *16s. 6d.*" as has been noticed above. And further that the prohibition to the purchasing of grain for storing up or conveying coast-ways, till the price should sink beneath the expense of raising it, must have necessarily put a total stop to all dealings in grain and of course ruin the farmers; all of which was done at a period when the price of corn had been invariably at a low state. It is supposed not to have occurred to the legislature at this period, that by keeping the grain at home in seasons of great plenty the price must be enhanced, as the farmers would not be capable of continuing their trade of raising grain under such disadvantageous circumstances; of course, that as soon as the stock on hand was consumed, scarcity if not famine must be the consequence; nor that by permitting an exportation of the excess of stock, plenty would be ensured, by preserving an open market to the farmers, and in that way enabling them to carry on their business, and raise more grain than was in general necessary for the home consumption: nor was the benefit that would arise to the nation, from the increased number of persons who might be engaged in raising and exporting the quantity of corn that could be spared, or the sums of money which would be brought into the country as the price of it, in the least attended to.

It seemed to have proceeded on the idea that the only mode of preserving plenty, was that of keeping the whole of the corn and other provisions at home, and importing as much as possible from abroad, which appears from experience to be far from having any foundation in truth.

However, the same system was farther enforced and followed out by the enacting of another law this year 1554, 1 & 2 Phil. & Mary, c. 5. under the supposition of injury from the exportation of corn and other victuals; by which it was provided that "no manner of person or persons should export any wheat, rye, barley, or other sort of grain, growing within England; or any malt made within the same; or any butter, cheese, herring, or wood, without having licence for to do, under severe penalties; except when the common price of corn, within England, should not exceed for wheat *6s. 8d.* (equal to *16s. 6d.* of present money): rye *4s.* (*9s. 11d.*) and barley *3s.* (*7s. 5d.*) per quarter.

Such was the policy of Edward IV. as well as of Philip and Mary, notwithstanding the price of wheat this and several years before, had been only *8s.* the quarter (equal to *19s. 10d.* of present money); and the export prices below the medium ones in times of ordinary plenty; and in Scotland it was soon afterwards followed by laws expressly prohibitory under very severe penalties of the exportation of all sorts of victuals, tallow, and flesh. Mary par. 6. c. 40. Jas. par. 11. c. 55.

After the enacting of this law, from the seasons being

favourable and the importation of foreign grain being continued, though the price of wheat remained about *8s.* the quarter; the farmers became ruined, and the business of cultivation much relinquished; which strongly marks the absurdity of directing persons to labour in occupations in which they cannot procure a reasonable subsistence. The excellent laws of Henry VI. and Edw. IV. had continued without repeal throughout the reigns of Henry VII. and VIII. without, however, being countenanced or having any execution, yet these sovereigns, as well as Edw. VI. and Philip and Mary, made repeated laws to enforce the people to cultivate and sow their grounds, 4 Hen. VII. c. 10. 7 Hen. VIII. c. 1. 27 Hen. VIII. c. 22; 5 and 6 Edw. VI. c. 15. 2 and 3 Phil. and Mary c. 2. those of the latter being particularly prejudicial in repressing the spirit of husbandry.

These inconsistencies did not however escape the attention of Elizabeth, as almost immediately upon her accession she not only renewed the laws which formerly existed for rebuilding farm houses, and tilling the land formerly in cultivation with greater vigour, 5 Eliz. c. 2. but by another law 5 Eliz. c. 5. § 26. permitted farmers to export their corn as merchandise, when the price was not high at home, as when wheat did not exceed *10s.* the quarter, equal to *11. 8s.* of present money, rye, peas or beans, *8s.* (*16s. 7d.*) barley and malt *6s. 8d.* (*13s. 10d.*) And as in the former of these laws, the penalties had been given to the king, they were now given to the next heir, &c. of the person offending. By this means a considerable extension of the exportation prices took place, which is remarked by the best writers of that period to have had a direct and immediate effect in the increase of tillage and the reduction of importation, though it had been observed by one of them that for several years preceding that time, "the importation of grain had exceeded forty-five millions of livres." These are probably the first traces of the navigation laws.

Not long after this, in 1570, a still more vigorous effort was made to restore the agriculture of the country, in a law enacted for the better increase of tillage, &c. 13 Eliz. c. 13. by which exportation was permitted, without limitation of prices, from such ports and creeks, in which a customer or collector of the subsidy of tonnage and poundage, had been placed, to any part beyond the seas in amity with England, when not restrained by proclamation, provided such exportations were made in ships belonging to English born subjects residing within the dominions; at such times as the several prices of grain should be so reasonable and moderate, when such exportations were intended, as that no prohibition should be made by the queen's proclamation, or by the presidents of the North, or of Wales, within their several jurisdictions; or of the justices of assize at their sessions, in other shires out of the jurisdiction of the said two presidents and councils; or by the major part of the justices of peace of the county at their quarter sessions. Thus, these different magistrates were to annually confer and deliberate with the inhabitants of the county concerning the prices of the different sorts of corn within their jurisdictions, in regard to its cheapness or dearness, and by their discretion decide whether it would be meet, at any time, to prevent any grain from being carried out of the realm, by any port within their jurisdictions or limits, and by a writing under their hands and seals, make a determination, either for permission or prohibition, and cause the same to be published by the sheriffs of the several counties; which was to continue in force until the same should be altered, by the said presidents and councils, or other powers respectively, except the same should, in the mean time, be countermanded by the queen, her heirs or successors; or by some order of the justices

judges of peace, in the counties situated out of the jurisdiction of the said two councils, in their quarter sessions to be holden in the mean time, or the greater part of them, should find the determination of the judges of assize to be hurtful to the country, in consequence of the dearth, or a great hindrance to tillage, in consequence of the great cheapness; which determination was in like manner to be published, and continue in force until a new regulation should be made; except the same should in the mean time be altered by the queen, her heirs or successors: provided always, that these preachers &c. should not publish their determinations, until the same was first notified to, and approved by, the queen, or her privy council: and that the custom or poundage be paid upon exportation: provided likewise, that the queen, her heirs and successors, might at all times by proclamation, prohibit exportation, either generally from all the ports of the realm, or particular ports only.

Mr. Dirom supposes the corn trade, in this case, to have been considered in a scientific manner: and that if the plan marked out had been properly digested and modified, as well as the duties upon exportation removed, there could have been no doubt of the act producing the most beneficial consequences to the kingdom; but the judges, to whom this important business was intrusted, had no certain rule by which to direct their proceedings, not being permitted to determine, by the price of grain at the time of their annual inquiry, the only certain index of plenty or deficiency, but simply upon a conference with the people of the country, to decide whether it would be hurtful to the kingdom, from the dearth, or a great hindrance to tillage, from the too great cheapness, to admit the exportation of corn, than which, he thinks, nothing could be more vague and uncertain. But further that, "whatever consideration might have been given to the framing of this act, the laying a duty of twenty *per cent. ad valorem* upon grain to be exported by licence, and ten *per cent.* upon grain to be exported by the statute, was equal to prohibition, and gave full scope to the importation of foreign grain, which was still (he says) received without the payment of any duty."

However, "in Scotland, the prohibition to export grain to foreign parts was continued under severe penalties;" as by Jas. 6. par. 11. c. 55.

Judging concerning the effects of the preceding law of England, from the prices of grain immediately subsequent to it; they do not seem to have been favourable, as the price of the quarter of wheat in 1574 was 2*l.* 16*s.* equal to 5*l.* 15*s.* 8*d.* of present money; and in 1587 not lower than 3*l.* 4*s.* equal to 6*l.* 12*s.* 8*d.*

In 1593, the corn laws seem to have again undergone a sort of revision, though the reason is not by any means explained; but they are taken notice of in an act, the 35 Eliz. c. 7. made for the adjusting of other acts, and which is entitled, "An Act for revising, continuance, explanation, and perfecting of divers Statutes:" by which it would seem, that the absurd and impracticable scheme of forcing the people to labour or cultivate their land, whether they could live by such means or not, had been given up; as the act passed in the 5th of the present reign was now repealed, and the plan laid down by that of the 13th appears likewise, from other circumstances, to have been relinquished, though the act itself is neither mentioned nor repealed, as the resolutions of the legislature are found to be changed by the 23d section of the present act: by which exportation was permitted, when wheat was at 20*s.* the quarter (equal to 2*l.* 1*s.* 4*d.* of present money); rye, pease, and beans, at 13*s.* 4*d.* (1*l.* 7*s.* 8*d.*); and barley and malt at 12*s.* (1*l.* 4*s.* 10*d.*); which are exactly double the prices at which exportation was per-

mitted by the former law of the 5th. However, at the same time, the duties payable upon corn, exported by force of the statute, were doubled; which, together with an unlimited importation, without the payment of any duty whatever, amounted to a prohibition, and consequently rendered the act nugatory, keeping the price of grain at an extravagant height; as, in 1594, the quarter of wheat sold at 2*l.* 16*s.*, equal to 5*l.* 15*s.* 8*d.*; in 1595, at 2*l.* 13*s.* 4*d.*, equal to 5*l.* 10*s.* 2*d.*; in 1596, at 4*l.*, equal to 8*l.* 5*s.* 4*d.*; and in 1597, at 4*l.* 12*s.*, equal to 9*l.* 10*s.* of present money.

The laws concerning grain continued, however, in this situation till 1604, when, on the accession of James I. to the crown, various statutes were revised; some continued, and others repealed, without any specific reason being given; and one was enacted in respect to grain, the 2 Ja. I. c. 25. § 26, 27. by which the exportation prices were considerably increased; namely, when the quarter of wheat was at 26*s.* 8*d.* (equal to 2*l.* 13*s.* 4*d.* of present money); the quarter of rye, pease, and beans, 15*s.* (1*l.* 10*s.*); the quarter of barley and malt, 14*s.* (1*l.* 8*s.*); provided the grain was carried abroad in ships belonging to English born subjects; reserving to the king, his heirs, and successors, the power to restrain, by proclamation, the exportation from the realm in general, or from particular places. But from exportation being still, under this act, encumbered with duties, it is obvious that the complete operation of it must have been greatly retarded or prevented.

And in another revising act of the same reign, 21 Ja. I. c. 28. § 3, 4. in the sections relating to grain, the exportation prices were still farther extended, under similar terms with the former act; namely, the quarter of wheat at 32*s.*, the quarter of rye at 20*s.*, the quarter of pease and beans at 16*s.*, and the quarter of barley and malt at 16*s.*, of current English money. This extent of 32*s.* for wheat was equal to 3*l.* 4*s.* of present money; 20*s.* for rye, to 2*l.*; and 16*s.* for barley and malt, pease and beans, to 1*l.* 12*s.*: which different sums are nearly double the medium prices of the present time, consequently very great, having obviously the extension of revenue in view. Besides this, the penalties for ingrossing were obviated by this act, while the prices of grain did not exceed those stated in it, which was become essentially necessary, in order to restore the internal as well as external trade in corn, which they had nearly put a stop to.

But the duties upon exportation having still been kept up, the proper effects of the law could not be produced.

In 1627, not long after the accession of Charles I., it was again renewed in exactly the same terms. 3 Cha. I. c. 5. § 24, 25. It is, however, remarked by Mr. Dirom, that "although the export prices were literally the same, they were very different in fact; for, in the year 1624, the yearly interest of money having been reduced from 10 to 8 *per cent.*, 32*s.* for a quarter of wheat, which, in 1623, was equal to 3*l.* 4*s.*, was, in 1627, equal to only 2*l.* 11*s.* 2*d.* of present money;" and so in proportion, in respect to the prices of other grain. It is conceived that the long interval of parliament, after the session in which this act passed, and the confusion which quickly succeeded the meeting of the following parliament, in 1640, were probably the causes of no farther attention having been had to the business during the remainder of the reign.

Though, from the unfortunate circumstance of connecting the corn laws with the revenue, the excellent institutions of the reign of Elizabeth, and those of her two immediate successors, had in a great degree been frustrated, agriculture had, in other respects, been treated by the laws as an object of much importance; not merely in the view of the numbers employed

employed in it, or the intrinsic value of the produce which it afforded, but likewise in consequence of the support which would be given to the navy, from the export trade, arising from it. On the restoration of Charles II. however, it was inconsiderately abandoned, being treated merely as an object of revenue.

In the year 1660, without the least reason being stated for any alteration in the corn laws, in a section of the act of tonnage and poundage, 12 Cha. II. c. 4. § 11. corn is considered in the same list or roll with other articles, on which duties are made payable. The exportation prices of grain were still more extended; but the duties were raised so high, as to be equal to a prohibition. Importation was also permitted; but the duties here likewise operated as a prohibition. The prices let for the exportation of wheat being 40s., equal to 2l. 8s. of present money; 2l. 8s. for the quarter of rye, pease, and beans, equal to 1l. 8s. 10d.; 20s. for the quarter of barley and malt, equal to 1l. 4s.; and 16s. for the quarter of oats, equal to 19s. 2d. And further by this act, the duties payable on exportation were 20s. for the quarter of wheat, equal to 1l. 4s.; 10s. for the quarter of rye, pease, beans, barley, malt, and buck wheat, equal to 12s.; and 6s. 8d. for the quarter of oats, equal to 8s. And by the same act, the rates inward, or duties on importation, were thus regulated: for the quarter of wheat, when the price, at the place of importation, did not exceed 44s., equal to 2l. 12s. 10d. the sum of 2l., equal to 2l. 8s.; and when it exceeded that price, 6s. 8d., equal to 8s. of present money. For the quarter of rye, when not exceeding in price as above, 36s., equal to 2l. 3s. 2d., the sum of 1l. 6s. 8d., equal to 1l. 12s.; and when it exceeded that price, 5s., equal to 6s. of present money. For the quarter of pease, beans, barley, and malt, not exceeding in price as above, 1l. 6s. 8d., equal to 1l. 12s., the sum of 1l. 6s. 8d., equal to 1l. 12s.; and when it exceeded that price, 5s., equal to 6s. of present money. Consequently, Mr. Dirom observes, that until the price of wheat per quarter was higher than 2l. 12s. 10d. of present money, and that of other grain in proportion, from the importation high duties acting as a prohibition, and exportation being in fact prohibited, prices would quickly rise, and bring the country to import at the low duties; a circumstance which, he says, accordingly happened: "for, in 1660, the quarter of wheat sold at 2l. 16s. 6d., equal to 3l. 7s. 9d. of present money;" "in 1661, it rose to 3l. 10s., equal to 4l. 4s.; and in 1662, to 3l. 14s., equal to 4l. 8s. 10d. of present money." He adds, that these laws, in addition to their having raised the price of grain to an "extravaгант height, had ruined many of the farmers;" and that agriculture declined, a great part of the lands lying without tillage or cultivation.

In consequence of this, the corn laws were again taken into consideration in 1663, the preamble to the act concerning which, 15 Cha. II. c. 7. § 1, 2, 3, 4, sufficiently shews the deplorable state into which husbandry had fallen; and it would seem that the legislature was now seriously anxious to afford it encouragement. By this law, the exportation prices were extended beyond their former limits: that of the quarter of wheat being fixed at 48s., equal to 2l. 17s. 7d. of present money; the quarter of buck wheat, barley, or malt, 28s., equal to 1l. 13s. 7d.; the quarter of oats, 13s. 4d., equal to 16s.; the quarter of rye, pease, and beans, 32s., equal to 1l. 18s. 5d. current English money: but the exported grain being still suffered to continue loaded with nearly 50 per cent. of duties, it operated as a prohibi-

tion. While, on the contrary, the high duties on importation were removed, and when the prices of grain did not exceed the same rates limited for exportation, or when grain was at the lowest price, importation was allowed, on the payment of about 9 per cent. of duties *ad valorem*, which were much lower than the low duties fixed by the act of tonnage and poundage. These duties were, for every quarter of wheat, 5s. 4d., equal to 6s. 5d. of present money; for every quarter of rye, 4s., equal to 4s. 10d.; for every quarter of barley or malt, 2s. 8d., equal to 3s. 2d.; for every quarter of buck wheat, 2s., equal to 2s. 5d.; for every quarter of oats, 1s. 4d., equal to 1s. 6d.; and for every quarter of pease and beans, 4s., equal to 4s. 10d.

By the introduction of the monosyllable *not*, in the clause of the act which relates to importation, it is observed, the meaning of the whole was perverted; as it never could have been the design of the framers of the act to a low importation at low duties, till grain had risen above the prices fixed for exportation; as, until that rise, the prohibition to *ingross* was taken off, and similar reasons influenced both cases.

This is rendered still more probable by a law of Scotland, Cha. II. par. 1. *sess.* 3. c. 12. 14. of the same year; in which the powers of exportation were extended, referring to the king and privy council to restrain or prohibit it as they should judge necessary; while a duty of about 40 per cent. *ad valorem* was laid upon grain imported, when the prices did not exceed those of exportation, namely, for ilk boll of wheat, under 12l., equal to 1l. 4s. of present money; bear and barley, under 8l., equal to 16s. the boll; and oats and pease, under 8 *merks*, equal to 10s. 8d. the boll; with power to the king and council to remit the duties, if the prices should rise.

In this case Mr. Dirom contends, that "the Scotch parliament clearly took the lead in the liberal and wise exercise of their powers, for the encouraging of agriculture, and thereby procuring plenty and cheapness of provisions." He adds, that "they permitted the exportation of all sorts of grain, when the prices at home were moderate, upon payment of a small duty; and as long as the prices remained in that situation, the duties payable upon importation were equal to a prohibition: and they gave unlimited powers to export cattle, and barrelled stiches of all kinds, without the payment of any duties: while, in England, importation was permitted, when the price of corn at home was at the cheapest rate, upon payment of a low duty; and the duties upon exportation, when the price of corn was in the same situation, amounted to a prohibition."

And in 1669, the parliament of Scotland, from reconsidering the subject, and finding that the exportation of corn had been impeded by the duty payable upon the same, now removed all duties, except a merk the chaldre, equal to 1s. 4d. of present money, payable upon corn exported, when the prices at home did not exceed those stated in the act of 1663. Cha. II. par. 2. *sess.* 1. c. 14. And in order to prevent any debates that might arise concerning the respective prices of victual, when the same were under or above the rates expressed in the said act, they recommended to, and authorized, the lords of the privy council to determine the same; declaring that it should be lawful for his majesty's subjects to export corns of all sorts, unless prohibited and discharged from doing the same, by a proclamation or public intimation from the said lords of council.

In 1670, a revision of the corn laws again took place, probably in consequence, as Mr. Dirom suggests, of the continual drain upon England for the payment of the price of the large quantities of grain imported; and by a law now

passed, entitled, "An Act for Improvement of Tillage, and the Breed of Cattle, for the common Good and Welfare of the Kingdom," it was enacted as lawful for every person, native or foreigner, to transport, at any time, as merchandise, all sorts of corn, although the prices exceeded the rates in the act of the 15th of the present reign; paying for the same the rates expressed in the act of tonnage and poundage. And that in cases where the prices of grain, at the places of importation, should not exceed the rates, as follows; there should be paid for custom these rates, namely, for every quarter of wheat, when the same should not exceed 53*s.* 4*d.*, equal to 3*l.* 4*s.* of present money, the sum of 16*s.*, equal to 19*s.* 2*d.*; when the same should exceed 53*s.* 4*d.*, and not exceed 4*l.*, equal to 4*l.* 16*s.*, there should be paid 8*s.*, equal to 9*s.* 7*d.*; for every quarter of rye, when the same did not exceed 40*s.*, equal to 2*l.* 8*s.*, the sum of 16*s.*, equal to 19*s.* 2*d.*; for every quarter of barley, malt, or buck wheat, when the same did not exceed 32*s.*, equal to 1*l.* 8*s.* 5*d.*, the sum of 16*s.*, equal to 19*s.* 2*d.*; for every quarter of oats, when the same did not exceed 16*s.*, equal to 19*s.* 2*d.*, the sum of 5*s.* 4*d.*, equal to 6*s.* 5*d.*; and for every quarter of pease and beans, when the same did not exceed 40*s.*, equal to 2*l.* 8*s.*, the sum of 16*s.*, equal to 19*s.* 2*d.* And that when the prices of corn should exceed the aforesaid rates, there should be paid the former custom and poundage: imagined to have been intended to be, by the act of 1663, 5*s.* 4*d.*, equal to 6*s.* 5*d.*, for wheat; 4*s.*, equal to 4*s.* 10*d.*, for rye, pease, and beans; 2*s.* 8*d.*, equal to 3*s.* 2*d.*, for barley and malt; and 1*s.* 4*d.*, equal to 1*s.* 6*d.*, for oats. 22 Charles II. c. 13. § 1, 2.

The above mentioned writer supposes that this law was without doubt designed to promote the exportation of English corn, and to restrain, if not prohibit, the importation of grain from abroad; but that the former was completely prevented, from the high duties continued upon it; and that the latter was rendered nugatory, in consequence of no rule being laid down for ascertaining the price of grain, at the time or place of importation: of course the trade continued to be carried on, on the payment of the low duties; agriculture languished; the dealers finding their account in feeding the populace with foreign grain, the prices of course keeping high: the average price of the quarter of wheat, for the ten years preceding this period, having been 2*l.* 8*s.* 10*d.*, equal to 2*l.* 18*s.* 8*d.* of present money. It is suggested, that by these laws the poorer sort of farmers became ruined, and the richer were weakened, being necessitated to turn their attention from corn to live stock, or any other objects by which they could support their families: the price of corn consequently rose on the manufacturer and labourer; and the importer of foreign grain became an important

man, upon the ruins of the landholders, farmers, and others.

Notwithstanding this, the rest of this thoughtless and inattentive reign passed away without any alteration being made, though it continued for a period of fifteen years afterwards. Grain, of course, kept high in price: the average of the quarter of wheat, for the twenty years, from 1660 to 1680, having been 2*l.* 9*s.* 9*d.*, equal to 2*l.* 19*s.* 9*d.* of the present money.

In 1685, on the accession of James II., the evasion of the duties payable on imported corn, and the distress caused by the vast importation of grain from abroad, were brought under the consideration of the legislature; and another act for the improvement of tillage passed, 1 Ja. II. c. 19, by which the defect of the above law was endeavoured to be obviated; it being there referred to the justices of the peace, in the several counties of England, where foreign grain might be imported, at their quarter sessions, after Michaelmas and Easter, on the oaths of two or more substantial persons, neither being merchants nor factors for the importation of corn, nor anywise concerned or interested in the corn to be imported, and each having a free estate of 20*l.* per annum, or a leasehold of 50*l.* per annum, to determine the prices of the several kinds of grain, which they were to certify to the principal officer of the customs in the several counties, for his rule and regulation.

The importation of victual from Ireland had been prohibited in Scotland, under very severe penalties, Char. II. par. 2. seff. 3. c. 3, only referring to the lords of the privy council power to admit of it, for such times as they should think proper, when the price within the kingdom should be at or above 8*l.* Scots, equal to 16*s.* of present money, for bear and meal; and 10*l.*, equal to 20*s.*, for wheat per boll. But in this year, 1686, by the act of Ja. VII. par. 1. seff. 3. c. 14, a total prohibition was enforced; all victual which should then be imported, being directed to be sunk or destroyed.

It is remarked by the writer we have quoted above, that for the ten years from 1650 to 1660, the average price of the quarter of wheat in this country had been 2*l.* 9*s.* 6*d.*, equal to 2*l.* 19*s.* 5*d.* of present money; that from the latter period to 1670, it had been 2*l.* 8*s.* 10*d.*, equal to 2*l.* 18*s.* 8*d.*; from this last period to 1680, it had been 2*l.* 10*s.* 8*d.*, equal to 3*l.* 0*s.* 10*d.*; and that from 1681 to 1685 inclusive, it had been 2*l.* 4*s.* 3*d.*, equal to 2*l.* 13*s.* 1*d.*

But the unfavourable tendency of the above system of corn laws is more fully shewn by the scale of prices, fixed by them for the exportation and importation of wheat, in the following tables, from 1360 to 1688, as taken from the above excellent work.

C O R N.

TABLE of Exportation Prices and Duties for Wheat.

It is considered by Mr. Dirom as extraordinary, that the advantage which must necessarily accrue to a nation from raising the utmost possible quantity of corn, and exporting such portions of it as the consumption at home does not demand, should, for such a great length of time, have been misunderstood in this country; especially since the example of the neighbouring states, constantly bartering their excrecent stock of this article for the raw materials and money of the kingdom, could scarcely have escaped notice for such a number of centuries. The importation trade is considered as operating, in various ways, in direct opposition to the benefit of the country: in consequence of which, agriculture became in a declining state; much of the ground was without cultivation; there was a decrease in the population, a proportionate reduction in the public revenue necessarily took place; and the number of remaining manufacturers were of course fed at an exorbitant price, by the products of

foreign lands, the inhabitants of which were not unfrequently at enmity with us, but who drew vast sums from the country, and thus robbed it of its riches.

But we now approach a period in which a different system was acted upon, and in which a very material change took place in the laws respecting corn; but which was not accomplished by simply reviving or amending the old acts, or by merely reducing the duties upon exported grain, but by at once giving up every idea of revenue from grain raised at home; and thus holding out a new system which should invigorate and encourage the cultivation of the soil, while it afforded a new stimulus to the trade and navigation of the country.

In 1688, not long after the accession of William and Mary to the crown, the subsequent important act for encouraging the exportation of corn was passed, 1 Will. & Mary, c. 12. and *ibid.* c. 24. § 18, by which exportation was permitted from

from England, when the prices at home did not exceed the following rates: malt or barley, 2*s.* the quarter, Winchester measure, equal to 28*s.* 10*d.* of present money; rye, 32*s.*, equal to 38*s.* 5*d.* per quarter; and wheat, 48*s.*, equal to 2*l.* 17*s.* 7*d.* the quarter; provided it was made in English shipping, the maller and two-thirds of the mariners, at least, being subjects of that state, and the exporter producing a certificate under his hand, of the quantity of grain shipped, to the collector of the customs at the port where the grain had been shipped, and proving the said certificate by the oaths of one or more credible persons; and upon bond, of at least 200*l.* for every 100 tons of corn, that the said grain should be exported to parts beyond the seas, and not again re-landed, the exporter should receive the following bounties: for every quarter of barley or malt, ground or unground, 2*s.* 6*d.*, equal to 3*s.* of present money; for every quarter of rye, ground or unground, 3*s.* 6*d.*; equal to 4*s.* 2*d.*; for every quarter of wheat, ground or unground, 5*s.*, equal to 6*s.*; and on producing a certificate, under the common seal of the chief magistrate in any places beyond the seas, or under the hands and seals of two known English merchants, that such corn had been actually landed; or upon proof, by credible persons, that such corn had been taken by enemies, or perished on the seas, the exporter's bond was to be given up; and the money, paid by the collector or commissioner of the customs, to pass in his account.

And the same system of policy was adopted soon afterwards in Scotland in 1695, by an act Will. par. 1. c. 32, in which all export duties were taken off, and a bounty of eight merks granted upon ilk chaldor of corn exported, when the prices did not exceed the following: wheat twelve pounds the boll equal to 1*l.* 4*s.*; bear, barley, or malt, eight pounds, equal to 16*s.* the boll; pease, oats, and meal, six pounds, equal to 12*s.* the boll; the whole being of Linnlithgow measure, provided that the exportation was made in Scotch ships and by Scotsmen, the maller and three-fourths of the seamen being Scotsmen, power however being reserved to the lords of the secret council, when the prices exceeded the fixed rates, to discharge and discontinue exportation.

The duties and subsidies payable upon exported corn from England, not having been given up by the former act, they were now, 1700, finally removed and taken away by another act, 11 and 12 Will. III. c. 20. § 4, whether upon ground or unground grain.

By this means what has been termed a new system of corn laws, was finally established in both this country and Scotland, and the act of Union taking place soon afterwards, 1706, their laws concerning grain were made alike. That when oats shall be sold at 1*s.* sterling, shall be paid 18*s.* of present money, the quarter or under, there shall be paid 2*s.* 6*d.* sterling, equal to 3*s.* bounty, for every quarter of the oatmeal, so long as rewards are granted for exportation of other grains; and that the bear of Scotland have the same reward as barley.

It has been already seen that the prices and duties of corn imported, had been determined by the act of 1670, but that for want of a rule for ascertaining the prices at the times and places of importation, the duties were evaded. The act of 1685 was to supply this defect; it enjoined and required the justices of peace of the several counties, at their respective quarter sessions, to inquire into and determine the prices of grain at fixed periods, and to send certificates thereof to the several custom houses within their jurisdiction, to be there hung up in a public place for the rule and direction of the parties concerned. But in consequence of neither the trouble of its execution being compensated, nor the neglect of it

permitted, it was in many places unattended to; and from no mode or rule having been substituted, in such an event, the defect was laid hold of by the importer, and much foreign grain was imported without payment of the duties during 1728 and 1729. And difficulties had likewise been met with from the modes employed in ascertaining the prices and quantities of grain exported.

There being, therefore, in different places a great neglect in the justices of peace, to determine the prices of grain, by which the duties on imported corn were to be regulated, the matter was now, 1729, taken up, and they were directed to do it in future, in their respective counties, at their next quarter sessions, or any adjournment, according to the act of 1670, and that on their omitting or neglecting to do it, and to certify the same, the collectors of the customs at the respective places of importation, were empowered to demand and receive the duties according to the lowest price of the several sorts of corn mentioned in the last named act.

And to ascertain the quantity of grain shipped, for which a bounty was to be paid, in a better manner, the proper officers of the customs were directed to admeasure the same, by a tub, or measure, containing four Winchester bushels; and when such corn to be exported was brought to be shipped off in sacks, they were empowered to make choice of any two of them out of twenty, and in that way compute the quantity to be shipped, on which the bounty was to be paid. And that the same powers should be employed in ascertaining the prices and quantity of bear, bigg, oatmeal, and malt, made from wheat or wheat malt, for being exported, 2 Geo. II. c. 18. § 1, 2, 3, 4, 5. That in all such cases, as where any corn or grain had been imported since the first day of the Michaelmas quarter session, then last past, where the importers or proprietors had omitted to pay the respective duties on the same on demand, they should forfeit and lose all such grain, or the value of it.

Notwithstanding this, neglects still frequently occurred in determining the prices of grain, according to which the duties payable on importation were to be levied, and of course the means were afforded of much foreign grain being brought in, though the prices at home were very low; consequently another act was now, 1732, passed, for the better ascertaining the same, and preventing fraudulent importation, in which it was again recommended to the justices of peace, at their quarter sessions, in the several counties where foreign grain should or might be imported, to give in charge, to the grand jury, in the open court, to make inquiry and presentment, upon their oaths, of the common corn market prices, of middling English corn and grain, of the respective sorts and quantities mentioned in the act, made in the 2*d.* year of the reign of king Charles II. as the same should be commonly bought and sold, in every such county, which presentment should be certified by the said parties, in writing, to his majesty's chief officer and collector of the customs for the time being, at every such port, place, or haven, where importation should be made, and which should be hung up in some public place in the custom house, for general information and instruction: and that the custom duty upon foreign grain imported, as directed by the above act of Charles II., should be collected and paid, according to the prices contained in such certificate. But that after importation, no foreign corn or grain was to be exported, or in any manner or shape laden on ship board, or put to sea, for carrying, conveying, or transporting it from one part or port of the kingdom to another, either by itself or in mixture with English corn, under the very severe penalties and forfeitures therein mentioned. 5 Geo. II. c. 12.

It is stated by Mr. Dirom, in his very able "Inquiry into the Corn Laws and Corn Trade," that at this period agriculture had considerably recovered its strength, and that the exertions of the farmers had become vigorous and constant. That the prices of corn for several years preceding it had been very reasonable, and that a great export trade in corn had been carried on from this country; proper attention having been paid to the execution of those laws which were made to guard against fraudulent importations: the average price of the quarter of wheat, for the five years from 1731 to 1735 inclusive, being only 34*s.*; in 1736, 40*s.*; in 1737, 38*s.*; and in this year 1738, only 35*s.* 6*d.* yet under these plentiful circumstances, the lower orders of the populace were excited to commit various outrages, by which the corn was destroyed. Therefore, in order to repress such disorders, an act was passed, 11 Geo. c. 22, by which such offenders were severely punished, and the inhabitants of the hundreds, in which such outrages should be committed, subjected to the payment of the damages.

The power of suspending the laws, in Scotland, which were made to prohibit the importation of foreign grain, or to buy, sell, or retail the same, which had rested on the act of 1703, and the two preceding ones therein referred to, having been formerly vested in the privy council of that kingdom; in consequence of the prices of grain having risen in 1740, from the severity of the winter, and some importation of foreign grain made contrary to law, from there existing no power of suspending the prohibitory acts there, on account of the act of the sixth Anne, c. 6. having done away the privy council, a temporary expedient without any new plan was now, 1741, had recourse to, and a law made, which transferred such power to the courts of session, judiciary, and exchequer; the judges in these courts being required to determine on the necessity of exportation or importation, from the prices of grain in the county of Edinburgh. The duties payable in England by the act of the 22 Charles II. being required by the same law to be paid on the importation of grain into Scotland; the whole of the clauses and provisions of that act, as well as of that of the 2 George II., termed "An act to ascertain the custom payable on Corn imported, being extended to Scotland."

Difficulties having arisen concerning the computation and measurement of wheat, meal, and other ground corn, on which a bounty was payable upon exportation, in order to adjust all differences arising thereon, by a law now (1751) made, the officers of the customs were empowered to allow the same bounty on the exportation of 224 pounds weight of wheat meal, or other ground corn or grain, as was allowed upon the exportation of four bushels of wheat, or other corn or grain, unground; and for the more effectually expediting the business, they were permitted to make choice of any two sacks out of twenty, from which to compute the weight. 24 Geo. II. c. 56. § 1.

These laws had greatly contributed to the extension of the export trade in grain, while plenty continued at home, with moderate prices. It is stated, that the average exportation of four years, from 1748 to 1751 inclusive, was 1,212,686 quarters annually; and that the average price of wheat, for the same four years, was 36*s.* 3*d.* the quarter.

From the money, applicable to the payment of the bounty, becoming inadequate to the discharge of the sums due on such extensive exportations, an act was now (1753) passed, 26 Geo. II. c. 15, by which the debentures, for the bounties on exported corn, were to carry an interest, when not paid within six months, at the rate of 3 per cent. per annum, according to the regulations of the act of the 12 and 13 of King William.

The crop of 1756 being defective and the prices of course rising, the populace from being long in the habits of plenty, mistaking the cause, committed various outrages in different places. And a law was brought forward in 1757 30 Geo. II. c. 1, by which all sorts of corn, meal, malt, flour, bread, biscuit, or starch, were prohibited exportation, before the 25th December 1757, except malt made to be exported, and declared to be so before the 4th December 1756, ships cleared out with it before the 25th being suffered to proceed on their voyages: power was however reserved to the king to remove the prohibition by proclamation, and to admit all persons, natives as well as foreigners, but no particular person or persons, to export grain. All duties, customs, rates, and impositions of every kind, on corn or flour, imported, or taken from the enemy and brought into the kingdom, were discontinued until the 24th of August 1757; and the same might be carried coastways free of duty, 30 Geo. II. c. 7, and importation without duty was permitted also in ships of other friendly nations from any port or place whatever, 30 Geo. II. c. 9. § 14. After 11th March 1757, the distillation of low wines and spirits from any wheat, barley, malt, or any other sort of grain, or from any meal or flour, was prohibited during the space of two months, 30 Geo. II. c. 10. and it was afterwards continued to the 11th December in the same year; but with power to his majesty to suspend the act and permit it, by proclamation or an order of council. 30 Geo. II. c. 15.

By these laws and regulations, the exportation of corn is stated to have been completely checked, the quantity of about 80,000 quarters having been exported, previously to the prohibition, and about 150,000 quarters of foreign grain brought in.

There was however a restoration of the exportation trade in 1759 it proceeding as usual, with but little importation of foreign corn, but in consequence of the crop of 1762, being a little deficient, importation took place from the rise of prices, which at the low duties was capable of being done, and of course was considerable, during that and the three years which followed it. During the last, from some cause of fear, an embargo was laid upon all ships laden with corn for exportation, the 26th of September, but which having been done contrary to law, it was necessary to pass an act of indemnity for it in the following year 1766, the 7 Geo. III. c. 7. On this it is remarked by the writer quoted above that there does not now seem to have been any sufficient ground for those measures; as in the year stated there were more than 300,000 quarters of grain exported, and under 250,000 imported.

In 1767, prohibitory laws were passed for a limited period, for the prevention of the exportation of corn, grain, meal, flour, bread, biscuit, and starch, as well as the extraction of low wines, and spirits from wheat and wheat flour. Also a law for permitting, for a limited time, the importation of wheat and wheat flour, oats, and oatmeal, rye, and rye-mal without duty. 7 Geo. III. c. 3, 4, 5, 8. And in 1768 the same laws were renewed, having some additions made to them; it being now enacted that they should continue in force until twenty days after the beginning of the next sessions of parliament, or the exportation of the above different articles, as well as their distillation and preparation from wheat or wheat flour, was prohibited, except to particular British dependencies. And the importation both of wheat, wheat flour, barley, barley-mal, pulse, oats, oatmeal, rye, rye-mal, from any part of Europe, and maize or Indian corn and rice from North America, as well as wheat and wheat flour from Africa, were allowed without any duty. 8 Geo. III. c. 1, 2, 3. And in 1769, the prohibition

was continued until twenty days after the meeting of the next sessions of parliament, but the importation of rice from North America permitted duty free.

But in 1770 the former law of the preceding year, prohibiting the exportation of corn, grain, meal, malt, flour, bread, biscuit, and starch, and also the extraction of low wines and spirits from wheat or wheat flour, was continued in force until twenty days after the commencement of the ensuing session of parliament, provided that the said continuation might be abridged, and this act, or any part of it, altered and varied by any other act or acts to be enacted in the present session. 10 Geo. III. c. 1. Consequently by another law of this session, those parts of the former acts, which prohibited the exportation of malt, were repealed. 10 Geo. III. c. 10. And an act was likewise passed for registering the prices at which corn was sold in the several counties of Great Britain, as well as the quantity exported and imported. 10 Geo. III. c. 39. And in 1771 prohibitory laws against the exportation and extraction of the above different articles were again passed, 11 Geo. III. c. 1. (with the exception of victualling ships, on their being sent to British dependencies) to be in force till the twentieth day after the meeting of the next session of parliament. On the meeting of the session of parliament in the following year (1772), a prohibitory law was again passed, against the exportation and extraction of the same articles, to be in force till the twentieth day after the meeting of the next session of parliament. Afterwards an act was likewise passed, permitting the importation of wheat, wheat flour, rye, ryemeal, and Indian corn, without duty, until the first day of December in the same year.

It is considered by the able inquirer into the corn laws and corn trade mentioned above, that all this would seem to have been had recourse to without any sufficient grounds, as the price of grain was not by any means very high, and the quantity exported from the year 1760 to 1770 greatly exceeded that which was imported.

On the meeting of parliament in 1773, an act was, however, passed, by which a free importation was permitted before the first day of January in the following year, for any

wheat, wheat flour, rye, ryemeal, barley, barleymeal, oats, oatmeal, pease, beans, tares, calivancies, and all other sorts of pulse, from any part of Europe or Africa; and permission to carry the same coastwards, under similar regulations to those of wheat or wheat flour the growth of this country, provided due entries were made according to the previous practice of the kingdom; and likewise for the free importation of wheat, wheat flour, Indian corn and meal, biscuit, pease, beans, tares, calivancies and all other sorts of pulse, from North America, under the same regulations. And another prohibitory law was enacted, 13 Geo. III. c. 1, 2, 3, preventing the exportation and extraction of all the above named articles, wines and spirits, except for victualling ships, or to British dependencies, until the first day of January 1774.

These laws, though radically injurious to the agriculture of the country, are conceived by Mr. Diron, from their not trenching on the general system, as only productive of a temporary effect which might have been overcome.

By another law of the same year 1773, the 13 Geo. III. c. 40. such alterations and changes were however made, by the reduction of the export and import prices, and the rendering the duties on importation a mere trifling, that a new system seems to have been introduced and established in the corn laws, destructive of the old code by which such benefits had accrued to the agriculture and commercial industry of the country; and by which, besides producing plenty and reasonable prices at home, by the disposal of the excremental flock in foreign markets, vast sums of money had been brought into the kingdom. The manner in which that useful code had been gradually raised, formed, and matured by experience, through a vast length of time, and finally established by the laws of 1670, 1688, and 1706, has been amply shewn in the preceding part. But in order to place the different systems in a better point of contrast, and thereby afford a more distinct notion of their nature and principles, the excellent comparative tables introduced below, have been drawn from Mr. Diron's "Inquiry into the Corn Laws, &c."

TABLE.—Old System of Laws for Importation of Grain.

Importation Prices and Duties.		Money of the Time.				Present Money.							
		Prices.		Duties.		Prices.		Duties.					
		£.	s.	d.	£.	s.	d.	£.	s.	d.			
1670	For every quarter of wheat, when the prices did not exceed	2	13	4	0	16	0	3	4	0	0	19	2
	when above that price, and not exceeding	4	0	0	0	8	0	4	16	0	0	0	7
	when above that price	0	0	0	0	5	4	0	0	0	0	6	5
1670	For every quarter of rye, peas, and beans, when the price did not exceed	2	0	0	0	16	0	2	8	0	0	19	2

	For every quarter of barley, when the price did not exceed	1	12	0	0	16	0	1	18	5	0	19	2
1670	when above that price	0	0	0	0	2	0	0	0	0	0	3	2
	For every quarter of oats, when the price did not exceed	0	16	0	0	5	4	0	19	2	0	6	5
	when above that price	0	0	0	0	1	4	0	0	0	0	1	6

TABLE

TABLE.—New System of Laws for Importation of Grain.

Importation Prices and Duties.		Prices.				Duties.				
		£.	s.	d.	£.	s.	d.	£.	s.	d.
1773	For every quarter of wheat, when the price was at or above	-	-	-	2	8	0	0	0	0
	100 weight of wheat flour	-	-	-	0	0	0	0	0	2
	quarter of rye, peas, or beans, when the price was at or above	-	-	-	1	12	0	0	0	3
	barley, bear, or bigg, when the price was at or above	-	-	-	1	4	0	0	0	2
	oats, when the price was at or above	-	-	-	1	6	0	0	0	5

It is remarked by the able writer, in respect to these tables, that, according to the *old laws*, but especially that of 1670, importation was not allowed till the prices at home were very high, and then even the duties were great, in consequence of which, foreign corn could be only introduced for the supply of times of scarcity, never being able to come in competition with the home produce. That, the law of 1688 did not even notice importation; it being solely enacted for the purpose of promoting and encouraging the agriculture of the country, by affording a new market for the superabundant grain, and in that way giving a new stimulus to the exertion of the people, to bring the waste and barren lands into a state of profitable cultivation: The business of importation being left to the laws which previously existed, by which it was supposed to be sufficiently restricted, if not wholly prohibited.

It is observed further, that at the time these laws were passed, and till 1714, the interest, borne by money, was *6 per centum per annum*, being of course proportionally of greater value than at present, when the interest is only *5 per cent per annum*. Besides, the old acts did not, in fact, admit the importation of flour or ground corn at any period; only the grain at certain places, where the prices should happen to be very high. Neither did they allow the carrying of imported grain by sea, coastways, nor the transporting of it to any other place, except that to which necessity had brought it; restrictions which seemed so essential as to require being enforced, under very severe penalties, by the act of the 5th of George II.

But that the *new law*, or that of 1773, commences with

importation, and directs that, at any time when the price of the middling sort of British grain shall be at the prices stated in the above tables, at the several ports and places where the same should be imported; then all customs and duties, formerly payable on wheat, wheat flour, rye, peas, beans, barley, bear, bigg, and oats, imported into the kingdom, should cease and be no longer payable, while these prices continued. That, instead of the former duties, those stated in the above table, should only be paid. It was likewise enacted, that the importation of oatmeal from Ireland, or any other part beyond the seas, into any port or place in Scotland, should be lawful, where the price of oatmeal exceeds *16s.* the boll of 8 stone, troy weight.

Further, that by the new law importation is admitted, when the prices of grain at home are at such a reduced rate, as that foreign corn may always come in competition with the home produce in the markets, an evil that has constantly existed since the passing of the act; besides, by this law, wheat and other grain imported, may be conveyed coastways, and entered and landed in any other parts of the kingdom, at which the prices of middling British corn, grain, or flour, are at or above the respective rates stated in the table given above, under such regulations as wheat, wheat flour, rye, peas, beans, barley, bear, bigg, or oats, the growth of this kingdom, are permitted to be conveyed coastwise. Also, that on importing corn, grain, or flour, and paying the duties, where the same shall be again exported within six months, the duties were to be drawn back and repaid.

TABLE.—New Laws for the Exportation of Grain.

Exportation Prices and Bounties.		Prices.	Bounties.
		£. s. d.	£. s. d.
1773	Upon every quarter of wheat, or malt of wheat, when the price is under	2 4 0	0 5 0
	of rye, when the price is under	1 8 0	0 3 0
	of barley, bigg, or malt made thereof, when the price is under	2 0 0	0 2 6
	of oats, when the price is under	10 14 0	0 2 0
	And for every quarter of oatmeal, consisting of 276 lbs. avoirdupois	0 0 0	0 2 6

The provisions of the *old laws* of 1688 and 1706, have been already so fully stated and considered, that nothing further than what is contained in the above table seems requisite here.

Under the *new law* it was enacted, that, when the price of the quarter of wheat was at, or above, 44s.; rye, pease, and beans, 28s.; barley, bear, and bigg, 22s.; and oats, 14s. no such corn or grain should be transported or conveyed out of the kingdom, under severe penalties. That after the 1st day of January 1774, the bounties formerly allowed by law upon grain exported, should cease and determine; and that, in the place thereof, when the prices of it should be under the rates stated below, at the ports and places, whence the same should be shipped, there should be allowed, on the exportation of such grain, either ground or unground, being the growth of this kingdom, and shipped in British ships, the master, and at least two-thirds of the mariners of such ships being subjects of his majesty, these bounties; that is to say, when the price of middling British wheat is *per* quarter under 44s. a bounty for every quarter of wheat, or malt made from it, 5s.; when the quarter of rye was under 28s. a bounty of 3s.; when the quarter of barley, bear, or bigg, was under 22s. a bounty of 2s. 6d. for every quarter of them, or of malt made from them, and when the quarter of oats was under 14s. a bounty of 2s. on every quarter, and 2s. 6d. upon every quarter of oatmeal, consisting of 276 pounds avoirdupois weight.

Further, that, by the old laws, the justices of peace were to ascertain the prices at their quarter sessions, which, by the new law, was continued the same for England; but for Scotland it was transferred to the sheriffs of the different counties to be ascertained four times in every year, certificates of which were to be sent to the custom-houses within their jurisdiction respectively, so as to regulate the payment of the export and import bounties and duties.

However, so far as exportation was concerned, those rules were, in 1774, wholly altered, it being enacted, that the prices of exported corn, grain, and oatmeal should be regulated and directed according to the average prices, at which they should be respectively sold in the public market at or nearest to the port or place whence they should be intended to be exported, on the market day preceding that of their being shipped, and the bounties to be payable accordingly.

From the comparative statements given in the above tables, the difference in the principles and operations of these different systems of laws, will be easily understood, the former being calculated for the promotion of cultivation at home, and preventing the importation of foreign corn, unless called for by necessity; while the latter is formed for the purpose of promoting the importation of grain from abroad, whether there may be any necessity for it or not. Thus the foreign cultivator is allowed the liberty of importing his

flour into the country almost free from duty, while the bounty upon flour or meal produced from wheat is taken off.

But in order to expedite and render the conception of the various laws, which have been detailed above, more easy and familiar, we shall here introduce the tabular view of them given by the author of the "Inquiry into the Corn Laws and Corn Trade," as brought down to the year 1773.

T A B L E.

Anno Dom.	Anno Regis	Abbreviation of English Exportation Laws.
1300	34 Ewd. III.	Exportation prohibited.
1393	17 Rich. II.	Allowed, upon payment of the ordinary subsidies and duties.
1425	4 Hen. VI.	The last law confirmed, but reserving power to the king and council to refrain it.
1436	15 Hen. VI.	Allowed, when wheat did not exceed 6s. 8d. and barley 3s. <i>per</i> quarter.
1442	20 Hen. VI.	The last act confirmed for 10 years.
1444	23 Hen. VI.	And that act now made perpetual.
1552	5 & 6 Ed. VI.	Prohibited, until the prices were at or under 6s. 8d. for wheat, 3s. 4d. for barley and malt, 2s. for oats, 4s. for pease and beans, and 5s. for rye <i>per</i> quarter.
1554	1 & 2 P. & M.	Prohibited, when the prices did not exceed 6s. 8d. for wheat, 4s. for rye, and 3s. for barley <i>per</i> qr.
1562	5 Eliz.	Allowed, when the prices did not exceed 10s. for wheat; 8s. for rye, pease, and beans; 6s. 8d. for barley and malt, <i>per</i> quarter.
1570	13 Eliz.	Allowed, under the direction of prebendaries, &c. upon payment of duties.
1593	35 Eliz.	Allowed, when the prices did not exceed 20s. for wheat, 13s. 4d. for rye, pease, and beans, 12s. for barley and malt, upon payment of a duty of 2s. for every quarter of wheat, and 16d. for every quarter of other grain.
1604	2 James I.	Allowed, when the prices did not exceed 27s. 8d. for wheat, 15s. for rye, pease, and beans, and 14s. for barley and malt <i>per</i> quarter, and upon payment of the same duties

5 F Allowed.

C O R N.

Anno Dom.	Anno Regis.	Abbreviation of English Exportation Laws.	Anno Dom.	Anno Regis.	Abbreviation of British Exportation Laws.
1623	21 James I.	Allowed, when the prices did not exceed 32s. for wheat; 20s. for rye, pease, and beans, barley and malt <i>per</i> quarter, and upon payment of the same duties.	1757	10 Geo. II.	Prohibited until the 25th Dec. 1757. but with power to the king and council to take off the prohibition.
1627	3 Charles I.	Allowed upon the same terms with the last act.	1757	11 Geo. II.	Corn-market established at Westminster; and, the same year, an assize made for bread.
1655	12 Charles II.	Allowed, when the prices did not exceed 40s. for wheat; 24s. for rye, pease, and beans; 20s. for barley and malt, and 16s. for oats, upon payment of the same high duties.	1766	6 Geo. III.	Exportation prohibited for a limited time; and, same year, an embargo laid upon ships loaded with corn for exportation; and same year, the mayor and aldermen of London empowered to determine the prices of corn in January and July, as well as in April and October.
1663	15 Charles II.	Allowed, when the prices did not exceed 48s. for wheat, 32s. for rye, pease, and beans, 28s. for barley and malt, and 13s. 4d. for oats <i>per</i> quarter, upon payment of the same high duties.	1767	7 Geo. III.	Exportation of grain, and distilling from wheat or wheat-flour, prohibited from the 26th Sept. to the 14th Nov. 1767.
1670	22 Charles II.	Allowed, without limitation of prices, upon payment of the same high duties.	1768	8 Geo. III.	Exportation of corn, and distilling from wheat or wheat-flour, prohibited until 20 days after the commencement of the next sessions of parliament.
1688	1 W. & M.	Not only allowed, when wheat was not above 48s. rye 32s. and barley and malt 24s. <i>per</i> quarter; but bounties granted.	1769	9 Geo. III.	Five thousand quarters of bigg allowed to be exported from the islands of Orkney, yearly; and, same year, exportation of grain and distilling from wheat or wheat-flour prohibited for a limited time.
1699	10 Will. III.	Prohibited for one year, from the 10th February 1699.	1770	10 Geo. III.	Corn regiter established; and weekly returns, from market-towns in the several countries, to be made of the prices of wheat, rye, barley, oats, and beans, in England; and of bear or bigg in Scotland. Same year the exportation of corn, and the distilling from wheat or wheat-flour, prohibited till 20 days after the commencement of the next session of parliament.
1700	11 & 12 W. III.	Bounty suspended from 9th Feb. 1699, to 29th September 1700. The subsidy and all the duties payable upon corn and grain, ground and unground, bread, biscuit, and meal given up and totally removed.	1771	11 Geo. III.	Exportation of corn prohibited, and also the distilling from wheat or wheat-flour, until 20 days after the commencement of the next session of parliament.

T A B L E.

Anno Dom.	Anno Regis.	Abbreviation of British Exportation Laws.	Anno Dom.	Anno Regis.	Abbreviation of British Exportation Laws.
1706	5 Anne.	Union settled-English bounties adopted over all the kingdom, and extended to oatmeal, bigg, and malt of wheat.	1772	12 Geo. III.	Exportation of corn, and distilling from wheat and wheat-flour, prohibited until 20 days after the commencement of next session of parliament.
1709	8 Anne.	Exportation prohibited, until the 29th Sept. 1710.	1773	13 Geo. III.	Exportation of grain, and distilling from wheat and wheat-flour, prohibited until the 1st day of Jan. 1774. Same year, the former bounties and duties repealed, and a total alteration made in the corn laws.
1729	2 Geo. II.	Rules laid down for measuring corn to be exported, and for ascertaining the prices, &c.	1774	14 Geo. III.	Alteration of the method of ascertaining the prices of corn to be shipped for exportation.
1732	5 Geo. II.	Grand juries at sessions, to prevent the price of corn, and corn imported, not to be again exported, nor carried coastways.			
1741	14 Geo. II.	Prohibited until the 25th Dec. 1741.			
1751	24 Geo. II.	Bounties upon corn exported in meal, to be paid according to the weight, at the rate of 448 pounds for the quarter			
1753	26 Geo. II.	Money due upon debentures for corn exported, to bear interest at 3 <i>per cent per annum</i> , if not paid in six months after presenting the certificate.

T A B L E.

Anno Domini.	Anno Regis.	Abbreviation of Scotch Importation Laws.
1454	17 James II.	Importation of foreign grain invited to be made, either by foreigners or denizens.
1493	5 James IV.	Invited.
1663	15 Charles II.	Allowed from Ireland upon payment of a duty of 3 <i>l.</i> per boll, when meal and barley did not exceed the price of 5 <i>l.</i> per boll at home.
1672	24 Charles II.	Importation of victual from Ireland prohibited under severe penalties.
1687	3 James VII.	Prohibition to import victual from Ireland renewed, and victual so imported ordered to be destroyed.
1703	2 Anne.	Importation of victual prohibited from foreign parts, until the price of the boll of grain exceeds 12 <i>l.</i> for wheat, 8 <i>l.</i> for bear, meal, and malt, and 6 <i>l.</i> for oats and pease; but with power to the lords of the privy council to suspend this prohibition when necessary.
1741	14 Geo. II.	Importation permitted, when the prices of grain, in the county of Edinburgh, exceeded 40 <i>s.</i> for wheat; 20 <i>s.</i> for pease and beans; 18 <i>s.</i> for bear and barley; and 13 <i>s.</i> 4 <i>d.</i> for oats, per quarter, and 8 <i>l.</i> Scots, per boll, for oatmeal, upon payment of the duties fixed by the English acts of the 22d Charles II.

1706	5 Anne.	The same bounties with England.											

As it would appear from what has been advanced in the preceding pages, that on the experience of a great length of time, it would seem that the laws and regulations in respect to grain, which were brought forward under the acts of 1670, 1688, 1706, and 1732, had considerable influence and effect in promoting the improvement of agriculture, increasing the quantity of corn, and thereby preventing the necessity of having

recourse to *importation* for a precarious and uncertain supply; it may not only be proper to afford the following tabular view from the valuable work quoted above, of the prices, bounties, and duties, as laid down by them, by which their principles and objects may be more clearly comprehended, but also to contrast them with the regulations concerning those which have been enacted by the law of 1791.

C O R N.

TABLE.—Prices, Bounties, and Duties, on Exportation and Importation of Grain by the former Acts.

N. B.—Flour, meal, and malt, are regulated in proportion to the several sorts of grain. The importation of malt is at all times prohibited.

* The bounty, by the tables in the act of parliament, appears to be given only upon rye, and not also upon the exportation of peas and beans.

It has been observed on these tables, by Mr. Mackie, that though the import prices and duties are higher in a small degree in the latter, than was the case in the act of 1773, which is so far returning to the old system, yet that the encouragement held out to the husbandman is considerably less, than was the case under the ancient regulations. Without considering the difference in the value of money between the periods, it may be noticed, he says, that the bounty of 5s. on wheat, is now withdrawn when it reaches 44s., and exportation flopped when it advances to 46s. the quarter; while, by the old laws, exportation, with the bounty, was continued till the price reached 48s.

And importation, by this act, is permitted on low duties, when the price of wheat advances to 2l. 10s.; while, by the old acts, the duties were equal to a prohibition, until the price reached 4l. and even then, the duty was high, instead of being reduced to almost nothing, as is now the case, before wheat reaches a price capable of repaying the farmer in an unfavourable season. In fact, it is contended, that agriculture has derived little protection or support from the late laws, its continued prosperity depending rather on the impossibility of procuring adequate supplies of grain from abroad, by which the farmers in this country have, in a great degree, retained the monopoly of the markets, than the countenance it has received from the legislature.

Since the period already noticed, however, the above plan has been relinquished, and different changes and alterations have been made in the corn laws, by which it would seem that some parts of the old system have been again in some measure reverted to.

The act of 1773, by so greatly lowering the rates and duties on the importation of foreign grain, had contributed to fix and establish the import system, and speculation in corn, under the direction of the merchants, by which, from the prices of grain in the markets abroad, being commonly so much below those of this country, they were constantly ready, by some contrivance or other, to open the ports, before the price of the home grain in the markets, came to the rate at which foreign grain was permitted to be imported. It consequently became necessary, from time to time, to pass acts, in order to counteract such designs, and render the general law more efficient.

Accordingly, in 1781, an act was made, 21 Geo. III. c. 50, by which so much of the acts of the 1 Ja. II.; 5 Geo. II.; 6 Geo. III.; and 14 Geo. III., as related to the ascertaining of the prices of medium English wheat, and other grain, in the port of London, and counties of Kent and Essex, was repealed; and, in the place of which, an inspector was appointed, to fix the weekly average prices, from the actual sales in the said port; by which exportation, and the bounties paid thereon, were to be regulated. But besides this, an average price is directed to be made up from the weekly returns of each three months, on the first day of the sessions held in London, in January, April, July, and September, for the purpose of regulating importation for three months, and the duty payable thereon, in the port of London, and the above-mentioned counties. And, in 1783, the law respecting corn was suspended, importation being permitted at low duties, and exportation prohibited, till the 25th August of the same year, in England, and the 25th of September in Scotland. 23 Geo. III. c. 1, 53, 81.

In 1789, an act was passed, 29 Geo. III. c. 38., for improving and extending the act of the 21 Geo. III. c. 50, by which every corn-factor in London, and the suburbs,

was necessitated to give in weekly returns of his sales to the inspectors; and importation was permitted into London, Kent, and Essex, when the prices of middling British grain reached the rates fixed in the act of 1773, as formed from the six last weekly returns in the port of London, immediately preceding the quarterly sessions, with the exception of oats, which was formerly was directed to be regulated by twelve weekly returns: the act being extended to the maritime counties of England, which were divided into eleven districts. The inspectors of corn returns, were to be appointed by the justices of peace in each county, and directed to make weekly returns of the prices of grain, from not more than twelve, or less than eight market towns in each county, the average prices, made from the weekly returns, being directed to be sent to the collectors of the ports in the district, for regulating exportation; and the average prices for the whole district, formed from the six weekly returns, immediately preceding the first day of February, of May, of August, and of November, were to regulate the importation of foreign grain and the duties paid thereon.

In 1790, an act of indemnity, 30 Geo. III. c. 1, was passed, for abrogating the corn laws, in pursuance of orders from the privy council of the 11th and 18th of November, 23d of December 1786, 2d and 8th of January 1790, by which the above orders are confirmed, and the laws respecting corn suspended; no sort of British grain being permitted to be exported, except the particular specified quantities for the use of the sugar colonies; but all kinds of foreign grain permitted to be brought freely into every port in the kingdom at the low duties; the act being to continue in full force, until the 29th of September in this year.

And, by the 30 Geo. III. c. 43, the execution of these laws was further suspended, until the 28th February 1791, full powers however being given to the privy council, to admit the exportation of all kinds of British grain, whenever it judged it necessary. Further, by the 31 Geo. III. c. 4, the two preceding acts were amended; and, by the introduction of a clause in the general corn law, passed this session, they were continued in full force until its commencement on the 15th of November 1791.

It is remarked by Mr. Mackie, in his "Letters on the Corn Laws," that none of these acts for rendering the law of 1773 more efficient, were extended to Scotland, the consequence of which was, that from the average prices not being fixed and determined by the actual sales, whenever the ports were opened for the importation of grain from abroad into it, it constantly took place, when the current price of produce there was greatly under the reduced rates at which that act even admitted the importation of foreign corn; namely, wheat at 48s. the quarter, Winchester measure, &c. And that, on the contrary, when the overplus quantity of corn was in such abundance, as to permit exportation, the ports there were constantly shut, before the price of the home produce reached the limit at which exportation ceases; both of which cases operate unfavourably for the agriculture of the country.

In 1791, an act for a new general corn law was passed, 31 Geo. III. c. 30., commencing on the 15th of November of the same year, by which the 1 Ja. II. c. 19.; 1 Gul. & M. c. 12.; 5 Geo. II. c. 2.; 10 Geo. III. c. 39.; 13 Geo. III. c. 43.; 21 Geo. III. c. 50.; 29 Geo. III. c. 58.; and so much of the 15 Cha. II. c. 7., as prohibits the buying of corn to sell again, and laying it up in granaries, when above certain prices, were repealed.

By this act, the maritime counties of England are divided into twelve districts, and Scotland into four districts, making sixteen in the whole. The prices of grain at the corn exchange in London, being made to regulate the exports and imports of the first district, which comprehends the ports of that city, together with the counties of Kent, Essex, and Suffolk. And, in the other districts, the particular market towns, at which the prices and quantities of grain actually sold are collected, are listed in the act. The dealers in grain are directed to give in, on oath, weekly accounts of their actual sales for that time, to the officer termed the inspector of returns, who, from such returns, is to make out an account of the general weekly average price of the whole district, which is to be transmitted to the collectors of the customs at the different ports within the said district, by which the bounties payable on exportation are to be regulated.

And, at four different times in the year, as within the space of seven days after the 15th of February, 15th of May, 15th of August, and the 15th of November, the receivers of corn returns, in each district, are to make up the average prices of corn within the same, from the last six weekly returns thereof, with the exception of oats, which is to be made up from twelve weekly returns, this quarterly average being sent to the collectors of the customs at the different ports within the said district, at such periods as mentioned above, by which importation, and the duties payable thereon, are to be regulated for the following quarter.

But, in Scotland, the average prices of grain are not ascertained from the actual sales. The sheriffs of the different counties, once in the month, convene juries for fixing the average price at which it is usually selling, but the witnesses brought forward produce no account of their actual purchases or sales, only deposing to what they believe from their own experience, and the opinion of others, to be the current prices. Monthly accounts of the average prices of grain within each county, are made from these, by the sheriffs of the different counties, which are sent up to the receiver of corn returns in the port of London, from which the receiver is to make up an average account for each district, and transmit it to the collectors of the ports within the same, which is to regulate the bounties upon exportation; and, at the above-named quarterly periods, he is to make up the average prices from the two last monthly returns, which are to regulate the duties payable upon importation for the following quarter.

But corn from abroad may be imported and landed at any time without payment of duties, provided it be warehoused under certain regulations, but cannot be taken out of the warehouse for home consumption, until the low duties are paid, and such other duties as are payable at the time, in the district where intended to be used; nor can corn of either foreign or home produce be conveyed coastways from the port of any district, where exportation is not permitted, at the time of shipping, to the ports of any district in which exportation is permitted.

And when the general average of the whole country exceeds the rates of import at the low duties, his majesty, in such case, the parliament not being sitting, can, with the consent of the privy council, suspend the execution of the act so far as to prohibit exportation wholly, and permit importation at the low duties, such permission continuing in force three months; but this power does not extend to prohibiting the exportation of foreign grain warehoused before.

Since the above act, other laws have been made for the further regulation of the trade in grain. In 1793, an act

of indemnity was passed, the 39 Geo. III. c. 3, for putting a stop to the execution of the general corn law, by an order of council of the 9th of November 1792, prohibiting the exportation of home produce, and granting liberty to import corn from abroad, until the 1st of March 1793; and for further suspending the said law, by granting power to his majesty and council at any time during the sitting of the parliament, to permit importation and prohibit exportation.

And by the 33 Geo. III. c. 63., the general corn law of 1791 was altered, by the repeal of the clauses for ascertaining the average prices of corn in England, and substituting others of a similar tendency in their stead. And further, by granting liberty to his majesty and council, when parliament is not sitting, to permit the importation of grain, and prohibit the exportation of home produce, when the general average of the whole kingdom exceeds the prices at which grain can be imported at the low duties from Ireland and the colonies of North America; namely, wheat, 48s. 6d., 32s. barley, 24s. oats, 16s. Likewise, by allowing exportation with a bounty of 1s. 6d. when oatmeal is under 14s. per boll; prohibiting exportation to foreign countries, when above 14s. the boll.

The law of 1795, the 35 Geo. III. c. 4, passed the 13th February, suspends the general corn law of 1791, by giving power to his majesty, with the consent of the privy council, to prohibit the exportation and permit the importation of all sorts of grain from abroad, without the payment of any duties whatsoever. The act to be in force until six weeks after the next parliament has met.

In consequence of a report of a committee of the house of commons, made in 1804, on which it appeared, that the price of corn from 1791 to the harvest of 1803, though very irregular, and increased on the average greatly by the years of scarcity, has in common afforded a fair profit to the grower; but that, from the stimulus of the usual high prices having increased industry, by which large tracts of waste land have been brought into cultivation, which, joined to the two last productive seasons, and other causes, have occasioned such a depression in the value of corn, as may tend to the discouragement of agriculture, unless supported by the aid of the legislature. Accordingly an act was this year passed the 44th Geo. III. c. 109, for the purpose of regulating the importation and exportation of corn, and the bounties and duties payable on the same; and by which it was enacted, that from and after the 15th of November, 1804, so much of the act of the 31 Geo. III. c. 30. as regulates the prices at which British corn, grain, malt, meal, flour, and biscuit, may be exported, except to Ireland, and at which corn from abroad, grain, meal, and flour may be imported, except from Ireland, and as fixes the duties and bounties payable thereon, be repealed. Further, that, by this act, the importation and exportation of grain, into and from England and Wales, be regulated by the average price of the twelve maritime districts, and into or from Scotland, by the average price of the four districts of it; and that the bounties and duties be regulated by schedules annexed to the act; that whenever the average shall be under the prices, at which corn may be importable into Great Britain and Ireland, from abroad, on the low duties, exportation shall be permitted from Great Britain to Ireland, &c.; and that the importation and exportation of corn into and from Ireland shall be regulated by schedules annexed to the act. The first schedule shews the prices, to which the scale of bounty is to attach on the export of corn, &c. and the prices at which the exportation is prohibited. According to which wheat may be exported

when at or under 48*s.* the quarter, with a bounty of 5*s.*; rye at or under 32*s.* with a bounty of 3*s.*; peafe and beans are exportable withut a bounty, until at or under 35*s.*; barley, bear, or bigg, or malt made of barley, bear, or bigg, may be exported at or under 28*s.* with a bounty of 2*s.* 6*d.*; oats at or under 16*s.* with a bounty of 2*s.*; wheat, flour, bifcuit, &c. with a bounty of 1*s.* 6*d.* per cwt.; wheat meal, with a bounty of 1*s.* 3*d.* per cwt.; barley, bear, or biggmeal, with a bounty of 10*d.* per cwt.; and oatmeal, with a bounty of 1*s.* per cwt. But that when the price of wheat exceeds 54*s.* that of rye 35*s.* that of peafe and beans 35*s.* that of barley, bear, or bigg, or malt made of them, 31*s.* and that of oats 19*s.* no export is to be allowed.

The fecond fchedule fhews the prices, according to which high or low duties are to take place on importation. When imported from the province of Quebec, or the other colonies or plantations in North America, wheat under 53*s.* the quarter, is fubject to the high duty of 24*s.* 3*d.* the quarter; at or above 53*s.* but under 56*s.* to the firft low duty of 2*s.* 6*d.*; and at or above 56*s.* to the fecond low duty of 6*d.*; rye, peafe, and beans, under 35*s.* the quarter are fubject to the high duty of 22*s.*; at or above 35*s.* but under 37*s.* to the firft low duty of 1*s.* 6*d.*; and at or above 37*s.* to the fecond low duty of 3*d.*; barley, bear, or bigg, under 26*s.* are fubject to the high duty of 22*s.*; at or above 26*s.* but under 28*s.* to the firft low duty of 1*s.* 3*d.*; and at or above 28*s.* to the fecond low duty of 3*d.*; oats under 17*s.* are fubject to pay the duty of 6*s.* 7*d.*; and at or above 17*s.* but under 18*s.* the firft low duty of 1*s.*; and at or above 18*s.* the fecond low duty of 2*d.*; oatmeal, if under 16*s.* 6*d.* the boll of 140 lbs. avoirdupois, or 128 lbs. Scotch troy, is fubject for every boll to the high duty of 8*s.*; at or above 16*s.* 6*d.* the boll, but under 17*s.* 4*d.* to the firft low duty of 1*s.*; and at or above 17*s.* 4*d.* the boll, to the fecond low duty of 2*d.* When imported from any other country abroad, wheat under 63*s.* the quarter is fubject to pay the high duty of 24*s.* 3*d.*; at or above 63*s.* but under 66*s.* the firft low duty of 2*s.* 6*d.*; and at or above 66*s.* the fecond low duty of 6*d.*; rye, peafe, and beans, under 42*s.* pay the high duty of 22*s.*; at or above 42*s.* but under 44*s.* the firft low duty of 1*s.* 6*d.*; and at or above 44*s.* the fecond low duty of 3*d.*; barley, bear, or bigg, under 31*s.* 6*d.* pays the high duty of 22*s.*; at or above 31*s.* 6*d.* but under 33*s.* the firft low duty of 1*s.* 3*d.*; and at or above 33*s.* the fecond low duty of 3*d.*; oats, under 21*s.* pay the high duty of 6*s.* 7*d.*; at or above 21*s.* but under 22*s.* the firft low duty of 1*s.*; and at or above 22*s.* the fecond low duty of 2*d.*; oatmeal under 20*s.* the boll, pays the high duty of 8*s.*; at or above 20*s.* but under 21*s.* the firft low duty of 1*s.*; and at or above 21*s.* the fecond low duty of 6*d.*

The third fchedule fhews the prices to which the feale of bounty attaches on the export of corn, ground corn, flour, or meal, malt, &c. from Ireland, and the prices at which the exportation is prohibited. When exported to any country abroad, wheat at or under 29*s.* 5*d.* the barrel Britifh, is allowed a bounty of 3*s.*; rye, and likewise peas and beans, at or under 29*s.* 4*d.*, a bounty of 1*s.* 10*d.*; barley, bear, or bigg, or malt made from them, at or under 16*s.*, a bounty of 1*s.* 5*d.*; oats, at or under 10*s.* 2*d.*, a bounty of 1*s.* 3*d.*; wheat flour, bifcuit, &c. a bounty of 1*s.* 6*d.* the cwt.; wheat, meal, 1*s.* 3*d.* the cwt.; rye meal, or flour, 9*d.* the cwt.; barley, bear, or bigg flour, 10*d.* the cwt.; and oatmeal 1*s.* the cwt. When the price of wheat exceeds 33*s.* 1*d.* the barrel Britifh; of rye, peas, and beans, 22*s.* 3*d.*; of barley, bear, or bigg, or malt made

from them, 17*s.* 8*d.*; and of oats 12*s.* 3*d.*, no exportation is permitted.

The fourth fchedule fhews the prices according to which the high or low duties are to take place on importation into Ireland.

By the aft of the 45 Geo. III. c. 26. fec. 3, paffed in 1805, fo much of the aft of the 41 Geo. III. c. 36, as may enable the lord lieutenant of Ireland to prohibit the exportation from it for a limited time, fo as not to endure longer than the expiration of fix weeks, after the commencement of the next feffion of parliament, corn, potatoes, and all other provisions whatever, and to permit the importation of corn, &c. for fuch limited time, without the payment of duty, and the faid aft to be further continued in force until the 25th day of March 1806.

The aft of the 16th July 1806, 46 Geo. III. c. 97, which is intitled, "An Aft to permit the free Interchange of every fpecies of Corn between Great Britain and Ireland," enacts that the bounty and duties payable on exportation and importation of all corn and grain, meal, flour, bread, or bifcuit, from Great Britain into any port or place of Ireland, or from Ireland, into any port or place of Great Britain, fhall ceafe and determine. Provided always that the perfon exporting fuch articles declare before the chief officer of the customs that the corn, &c. is really intended to be exported to Great Britain or Ireland, as the cafe may be, on which certificates, &c. are to be given to the exporter as in other cafes of tranfmitting goods coastways, without any fee or perquifite.

And by an aft of the 19th February, 1807, the 47 Geo. III. c. 7, the above recited aft is amended, it being enacted that the faid aft, and the feveral claufes and provisions therein mentioned, concerning the exportation and importation of any fort of grain or corn, meal, flour, bread, or bifcuit, from Great Britain to Ireland, or from Ireland to Great Britain was intended to extend, and is hereby declared to extend only to fuch corn or grain, meal, flour, bread, or bifcuit, as is the growth, produce, or manufacture of Great Britain or Ireland refpectively, and not to fuch being the growth, produce, or manufacture of any other country or place.

It is obferved by Mr. Mackie, in his excellent "Letters on the Corn Laws," after fuggellng many judicious amendments in the aft of 1791, that the power of the crown in fufpending thefe laws without the confent of parliament is a highly dangerous power, which renders them in fome meafure of no effect. He conceives that in all free countries agriculture, which is an objeet of the greateft national importance, fhould conflantly be under the facred proteetion of ftanding laws, left the cultivators of the foil fhould not have their induftry fufficiently encouraged. And that at prefent, however deficient the cafe might formerly have been, when capitalifts are always ready and on the watch to open the ports, and fpeculate in the introduction of grain from abroad, importation fhould never be permitted but with the greateft precaution, nor exportation put a flop to contrary to the eftablifhed laws, except in cafes of abfolute neceffity, when indemnity would be readily granted. Some method of counteraeting this and other inconveniencies of a fimilar kind he conceives to be effential. From the barriers which had been formerly fet up, as a preventative of the importation of corn from abroad, being deltroyed, by the repeal of the old laws and reducing the import duties, a change made by the law of the year 1773, has arifen, he conceives, the inability of Great Britain to fupply herfelf with corn the produce of her own foil.

"In proportion," fays he, "as the country advanced in
prosperity,

prosperity, the surplus quantity, after supplying the inhabitants, which used formerly to be exported, was gradually absorbed by the increasing population and luxury of the nation; and the law in question, among other causes, giving a check to the further extension of agriculture, necessary to counterbalance the additional consumption, the tide at last turned against the country, and a regular influx of foreign grain became expedient to supply the growing wants of the inhabitants."

The differences which took place in this way, are strikingly shewn in the statement given below from Mr. Dirom, who remarks that no accounts have been preserved concerning the exports and imports of corn, previously to 1697, or that, from the high duties, little trade of this nature was carried on; but that in the years from that period to 1700 inclusive, the amount of the exportation of the different sorts of grain was 331,223 quarters; while the importation was only 8,948 quarters: that, in the course of the ten years from the last of the above periods to 1710, the amount of the annual exportation was 248,945 quarters; while the average of the importation only came to 442 quarters. That in one of these years (1709) more than half a million of quarters, and in the course of the whole, not less than 2,849,446 quarters were exported, while only 4,442 quarters were imported.

In the next ten years, from 1711 to 1720 inclusive, the average yearly exportation increased to 449,193 quarters; the average annual importation being only 71 quarters. The amount of the exportation of these ten years being nearly in a double proportion to that of the preceding ten, amounting to 4,491,933 quarters; while the import was only 714 quarters.

In the subsequent ten years, from 1721 to 1730 inclusive, though from different circumstances, much foreign grain was introduced in some of the years, the exports kept nearly up to the preceding equal period; the amount of the whole of them for these ten years being 4,479,683 quarters; the imports of the different kinds of grain being 732,692 quarters.

For the ten years, from 1731 to 1740 inclusive, the act of 1729 having given a check to foreign importation and promoted cultivation, the average annual exportation was 549,447 quarters; while the amount of the average importation was only 4,690: the whole export of the ten years being 5,494,471 quarters; and the whole import only 46,909 quarters.

For the ten years from 1741 to 1750 inclusive, on

account of the great industry and exertion of the farmers, in consequence of being released from prohibitory and injudicious laws, the annual average amount of exportation rose to the extraordinary height of 848,660 quarters; while the imports amounted only to 15,193 quarters. The exports in 1748 were 1,123,953 quarters, in 1749, 1,250,306 quarters, and in the following year the amazing amount of 1,667,778 quarters; the whole for the ten years being 8,486,602 quarters; while the imports of the several sorts of grain were only 159,437 quarters.

But for the ten years from 1751 to 1760 inclusive, the exports declined, on the average, to 582,837 quarters; the imports, on the average, being 37,397 quarters. This reduction in the exports is supposed to have depended on the deficient crops of 1756 and that of the following year.

From about this period the commencement of the import system seems to have taken its rise, which has since been carried to such an amazing extent.

The imports of the years 1763 and 1764 chiefly consisted of oats; but in 1765 they were different sorts of foreign grain, chiefly wheat, amounting to 218,031 quarters; while the exports of the several sorts of corn amounted to the extent of 457,730 quarters. In 1767 the vast amount of 907,420 quarters was imported, 500,000 of which were wheat; and on the average of the twelve years, from 1761 to 1772 inclusive, the annual exportation had sunk to 370,703, the yearly importation having increased to 251,279 quarters.

Under the sanction of the act of 1773, in 1774 the large amount of 926,174 quarters of grain were imported from abroad, one third being wheat or wheat flour; while the quantity exported was not more than 51,099. In 1775 the immense quantity of 1,163,407 quarters of foreign corn was imported, half of which being wheat and wheat flour, while the exportation only rose to 191,007 quarters. On the whole, for the twelve years from 1773 to 1784 inclusive, the annual average importation came up to 578,358 quarters; while the exportation decreased to 267,182 quarters. The whole importation of this period being not less than 6,940,293 quarters of foreign grain; while only 3,206,184 quarters of grain of home growth were exported.

This reverse in our corn trade, with the vast disadvantages which are sustained by it to the nation, are still further shown by Mr. Mackie in the table of the exports and imports of all sorts of grain, sent from or brought into Great Britain, from the conclusion of the above period to the year 1793.

					By surplus quantity of grain imported by Great Britain, in the 9 years above-mentioned, after deducting the quantity exported, being at the rate of 564,185 qrs. $\frac{3}{4}$ value 550,756 $\frac{3}{4}$ l. per ann.]	5,077,668	4,956,804	13	8
	7,958,418	9,921,190	6	5		7,958,418	9,921,190	6	5

The same writer, after observing that the act of 1791 in some degree discouraged the importation of corn from abroad, by increasing the rates or duties on it, which was a defect in the old laws, yet still that statute is far from a state of perfection. A radical error had, he conceives, been committed in the outset of the corn laws, which has never been removed, which is that of the relative regulating rates of exportation and importation for the different kinds of grain, not having been fixed for such, proportionably to their real values, the labour and expence they stand the farmer in raising and bringing to market, as in such instances he would be under the necessity of relinquishing the cultivation of any particular sort of grain, so rated from the corn dealer, in consequence being able to have almost a complete command of the home market, from his being capable of supplying it from abroad. This he contends is the case at present in regard to oats, as from various statements he shews, that if the rate of importation for that sort of grain had been regulated originally, "in proportion to the current values in 1670 and 1688, when the present system of corn laws was first enacted," it should have been in the following proportion. "As 28*s.*, the average price of wheat is to 85*s.* 4*d.*, the import rate of wheat including the duty, so is 12*s.*, the average price of oats, to 36*s.* 6*d.*, being the relative import rate at which oats ought to have been imported, including the duty; whereas the law allowed foreign oats to be imported at 17*s.* 4*d.* including the duty. This he shews to have continued still the case with this sort of grain, from which the culture has been greatly abandoned by our farmers; and a large importation of that sort of corn, though much inferior to our own, rendered necessary, 5,362,921 quarters having been imported from 1785 to 1793 at the value of 4,863,599*l.* 6*s.* 4*d.*

It is concluded on the whole, that as the "wealth of nations varies considerably at different times, so ought the rates which regulate the export and import of foreign corn; if these affect the money price of our own produce in the home market, and tend to sink its relative value below the current price of labour, with which it must always bear a just and necessary proportion, the rates must consequently be raised in order to preserve agriculture, the only solid basis on which the real wealth and lasting prosperity of a state can be founded." Should our industry and capital continue to increase for thirty years, in the same ratio it has done since the peace of 1783, the money in circulation, the price of labour, and the expence of cultivation may be double what it now is; and the price of corn will naturally increase in the same degree: should the rates, at which corn from abroad is then permitted to be imported, have a tendency to obstruct such a rise, he contends, that they must either be heightened or this country will lose its agriculture, as has already happened in the case of oats; but that, on the other hand, should the prosperity of the country decline, so as to lessen the demand for labour, or the floating capital to one-half, the price of corn should sink in the same proportion, to the diminished price of labour, and the import rates be lowered, if the means of preventing such a necessary diminution. Consequently, that, if these principles be well founded, a permanent law for the regulation of the export and import of grain, is inconsistent with sound policy; it should be such as to expire regularly at fixed periods, according to the wisdom of the legislature, on taking the situation of the country into full consideration, so as to regulate it in conformity to the price of labour, which is "the most certain index of the growing prosperity, stationary situation, or declining state of the nation."

In support of which Mr. Malpas, in his late work

on the "Principle of Population," observes, that in order "to restore our independence, and build our national greatness and commercial prosperity on the sure foundation of agriculture, it is evidently not sufficient to propose premiums for tillage, to cultivate this or that waste, or even to pass a general inclosure bill, though these are all excellent as far as they go. If the increase of the commercial population keep pace with these efforts, we shall only be where we were before, with regard to the necessity of importation. The object required is, to alter the relative proportion between the commercial and the agricultural population of the country, which, he thinks, can only be done by some system, that will determine a greater proportion of the national capital to the national land." And he "sees no other way at present of effecting this object, but by corn laws adapted to the peculiar circumstances of the country, and the state of foreign markets." These are stated as the leading principles and circumstances which are necessary to be particularly had in view in the framing of laws for the regulation of the trade in corn.

CORN, in *Surgery*, is a hard, dry, cuticular, warty, or horny induration in the skin, and sometimes also in the subjacent cellular membrane. In the former case, the induration may be moved backwards and forwards; but in the latter, it is immovable. Corns are in general not larger than about the size of a small pea, and are produced in consequence of external pressure, especially in such parts as are exposed to much friction, and where the skin is very near to the bone. They are, therefore, most generally found in the toes, or the soles of the feet; but sometimes also in other parts, as on the upper ridge of the hip bone, where they are produced by the pressure of women's stays. Sometimes also similar indurations are formed in the ears of women, who wear heavy ear-rings. When they are formed in the feet, they generally arise from the use of too narrow or high-heeled shoes, and sometimes merely by wearing the stockings too tight. Frequently they produce no inconvenience; but sometimes they become so painful as to render the patient entirely lame. The pain is increased by wearing warm stockings, tight shoes, violent motion of the body, standing or walking too long, drinking spirituous liquors, and during variable weather. They are generally painful in hot weather, but rarely so in cold.

With respect to the cure, the surgeon may either endeavour to remove the pain for a time, or radically to free the patient from the disease. The violence of the pain may be immediately relieved, by the patient's sitting down, taking off his narrow shoes, placing his foot in a horizontal position, and cooling it a little. A more permanent relief may be obtained, by shaving off the prominent part of the corn with a knife, as far as it can conveniently be got at, without, however, exciting any hæmorrhage, and by the use of emollient warm fomentations. The patient cannot be radically freed from his corns, unless he resolves, during the progress of the cure, to wear no other than wide, soft, and low-heeled shoes, and to walk and stand as little as possible. If this is out of his power, and he is under the necessity of frequently walking or standing for a considerable time, the pressure may be prevented in the following manner: Take a piece of linen spread with some emollient plaster; lay one piece over another, from eight to twelve times together, and cut a hole in the middle of them, exactly the same size and circumference as the corn; then apply it in such a manner that the corn enters the hole in the plaster, and is thus defended against the contact of the stockings and shoes. When such a plaster has been worn for the space of some weeks, the corn, if recent, generally disappears without requiring any

other remedy. When the corn is situated in the sole of the foot, we need only cut a hole into a felt-sole, so as to fit the corn, and introduce it into the shoe.

By the following treatment, corns may be removed with certainty, radically, and speedily, especially if we employ at the same time the perforated sole or plaster: Rub two or three times a day an emollient liniment, such as the ointment of althea, or, which is still better, the volatile liniment, upon the corn, and keep it covered during the intervals with an emollient plaster. Every morning and evening let the foot be kept for half an hour in warm water, and the corn well rubbed with soap. Let the external part of the corn, which will have become perfectly white, soft, and pulpy, be then scraped with a blunt knife, till all the soft part is removed, and till the operation begins to give pain to the patient; upon which, we must immediately desist. This treatment is to be continued till the corn is entirely extirpated; for if we desist from it earlier, the corn will grow again. However, we must take care not to cut the part with the knife, so as to make it give pain or bleed.

Amongst a variety of remedies that have been recommended for corns, the following are the principal: green wax, soap plaster, diachylon, mercurial or henlock plaster, a piece of bacon, the juicy pulp of a fresh lemon, and even a piece of green oil-cloth, &c. which are to be changed as often as may be necessary. The following remedies have also been recommended as infallible: R Gum. ammoniac. Cer. citrin. aa ʒij Aerng. æris ʒvj. M. F. Emplastr. S. To be spread upon linen and applied to the corn. Or, R Enpl. de gabano, de ammoniac. diachyl. comp. aa ʒiij. Camph. ʒij. M. F. Empl. D. S. To be spread pretty thick upon linen, and applied to the corn, in pieces just sufficiently large to cover it. In order to aid the operation of the remedy, we may previously soften the corn in warm water, and scrape off as much of it as we are able. The following plaster has been said to produce the separation of the corn within three or four days: R Gum. galban. ʒij. in acet. dissolut. & ad spiritumdinem evaporat. Add. Picis naval ʒfs. Empl. diach. simpl. ʒij. In fine, Sal. ammon. virid. Aeris pulverif. aa ʒj. M. F. Empl. The excision of the corn is not to be recommended as a radical method of cure, both on account of the difficulty and danger with which it is attended, and because it sometimes proves unsuccessful. When the patient has got rid of his corns, he must avoid all the above-mentioned causes which tend to produce them, or they will again return.

CORNS, in *Veterinary Science*, a troublesome disease in the feet of horses, most generally occurring in the fore feet, and in the inside heel, within the angle or union of the quarter with the bar; though these bruises are sometimes found in both quarters or sides of the foot.

Terms improperly used in any art or science render its accents more difficult, obscure our views of it, and retard its advancement: so the term *corns* is, in this case, a gross misapplication of words, creating perplexity and misconception, and which actual experience even in the disease is hardly sufficient to do away.

When the skin of the human foot is gradually compressed or rubbed, without any sudden and violent irritation that shall raise the cuticle or create a sore, it thickens first, then becomes horny, and is rightly enough termed a corn, from *cornu*, Lat. or *corne*, Fr. *horn*.

In the horse, on the contrary, whose foot is every where thickly clothed with natural horn, such an occurrence, if it were possible, could not be a disease; but if a bruise takes place in the foot, at the point above described, it is also called a *corn*, though agreeing in nothing with the former

disease, but in the common circumstance of its affecting the foot with pain and lameness.

Where a corn, as it is called, exists in the foot, it is known by a redness, more or less intense, in the angle formed by the union of the bar with the sides of the foot, and is most generally observed, as we have already stated, in the inner quarter: it is tender, if pressed upon, producing lameness; and if the irritation is carried far enough, it fester, and the pus, being prevented escaping below by the sole, forms a passage inside the hoof upwards, through the foliated substance or clavic processes, to the coronet; and if a shoe, pressing too hard upon the part, continues to be used, the irritation being kept up for a long time, the part becomes weakened in its function, not forming good sound horn, and a painful disease is created, which is eradicated with difficulty, and is liable to return, after relief has been obtained, by the slightest renewal of this permanent pressure, or of irritation of any kind.

Having briefly described the disease, as it commonly appears, we proceed to consider its cause, and the cure.

As it is unequal pressure that produces corns, even in strong feet, from the shoe bearing too hard upon the point of the foot above indicated; so, in feet naturally weak, a slighter degree of pressure, if the pressure be permanent, shall be sufficient to induce it: so that the disease may be observed in all sorts of feet, but far more frequently in weak ones, as in low heeled feet, or where the heels project very much, and the horn turns under, and is thin.

The horse's foot, we may remark, by being continually bound by the nails which attach the shoe to the foot, is ever hardening and diminishing in its volume, under their influence and pressure, and especially all the elastic parts of the foot, which, not being then called into much action, become inert and rigid, or are absorbed; the posterior parts of the foot, in particular, are deranged by it, and in its contracting the foot, often forms waving lines of horn, which turn under at the heels, so that the shoe will take its bearing on the parts so disposed, in a direction tending inwards, and bring on bruises and weaknesses, or *corns*, as the smiths have been pleased to call them.

The inflammation induced by the bruise or pressure occasions an increase, or sometimes rupture, of the blood-vessels of the part pressed on; so that instead of lymph, the red parts of the blood flow into them: and hence that redness in the horn of the bruised part, the external indication of this disease.

If the pressure be speedily and effectually removed, and all external irritation be kept away, healthy horn forms again, and the disease disappears; but if the irritation be kept up for any length of time, or has been attended with much violence, the vascular parts go on to suppurate; and the pus, as we have observed, forces its way with great pain to the coronet. Its frequent recurrence leaves the parts very weak, and the smiths are then apt to imagine it is natural to them, and convey this idea to others, and seldom admit the real cause of the disease.

One circumstance, we believe not much understood, it is of importance to disclose here, respecting the production of this disorder, and which cannot be too generally known and considered, as it may be the means of warning those whose experience has not yet informed them of the danger: it is this, that if we make a perpendicular section of the horse's foot, across the two points of the heel, where the corns usually are found, it will be observed that the outside and inside heels exhibit different appearances: the vascular parts lying much lower on the inside than on the outside quarter; so much so, that any one holding the foot from the ground, and

and levelling the sole to his eye with his drawing-knife or butrets, he would meet with the blood of the inside quarter before he had brought it to what he would conceive the proper level of the outer, and before he at all suspects it; for the horse's foot, no doubt for the wisest purposes, is not made a regular cone, as on a careless inspection we should apprehend it to be, but is placed inclining on the ground, with the inside the highest, forming a species of rhomb or lozenge; the inner parts being thinner in horn, more elastic, and flatter; while the outer are flatter in horn, and with less vascular matter, and more adapted for receiving the wear, which, we may observe, takes place primarily on the outer side of the toe or pincer, as may be seen by looking at the shoes when taken off, or observing the wear of the natural foot unshod; and thus compression and uneasiness are prevented by the greater yielding and elasticity of the inner quarter and the heels: for had the foot been on every side equally unyielding, resistance, compression, and pain, under heavy burdens, or great or long continued exertions of the animal, would have been produced.

It is this difference which may deceive the smith, and make him bring the shoe nearer the quick on this quarter than he intends; and it is the superior elasticity and vascularity of his fore feet that occasions them to be more the subjects of this disease than the hind, where corns rarely occur, and which we have heard the smiths attribute to the cause of their standing with their hind feet in the dung of the stable.

The position, also, in which the smith is obliged to hold the foot between his thighs, turned upwards, and drawn away from the horse outwards, will tend to increase his deception, in regard to these circumstances of the apparent levelling of the hoof; and where there is a weak, low, fleshy heel, as it is termed, a slight mistake is sufficient to produce a bruised heel, or corn, which in flatter feet it would be more difficult to do; though in these we sometimes find it has been done.

A shoe too narrow for the foot, or with the heel made very sloping inwards, would also induce a bruise of these parts; for we see, by the brightness of the shoe at this part, after it has been on some time and removed, that the nails do not entirely prevent the motion of the heels on this surface.

Finally, a shoe not equally fitted to bear alike on all the parts of the foot, but bearing on the toe and heels only, especially the inner heel, and not taking sufficient pressure at the quarters, would, by this partiality of pressure, induce inflammation and pain. Clenching the nails too forcibly near the heel, so as to induce more pressure there than at the toe, would also do the same thing. Under the article FARRIERY, we propose considering some other parts of this subject, having barely inserted enough of that branch of the business here as may be said particularly to belong to this subject.

If this reasoning, therefore, be true, the corn arises from the weakness and insufficiency of the foot to bear the pressure of a nailed shoe, or from partial and ill disposed pressure in the strong feet, or improper paring: therefore the ancients, who, we believe, knew nothing of this nail shoeing, had not their horses subject to this disease; and such, on examining their writings, turns out to be the fact: for though they have described, and often most truly, the distiches of the horse, they have not described this disease, so as for us to conclude on its identity. The "Pulmonum ad aperturam" of Vegetius, lib. ii. cap. 56. has some of the characters of the corn; but it is not clear whether oxen or horses were the objects of it, and he recommends unsole-

ing for it: whatever it is, it was probably a disease arising from a weak heel, which, by long journeys or rough roads, might be so bruised as to bring on similar consequences.

Having treated of the appearance of the corn and its causes, we have now to consider the remedy, first observing that prevention from it is ever the wisest line of conduct, especially in a disease where the mechanical causes of it are obvious, and can be prevented. Where the corn or bruised heel has taken place, the first and most natural suggestion is to remove the shoe, and take away all the red diseased horn with the drawing knife, so as, on the re-application of the shoe, to remove all pressure from the part, and thus admit a new growth of horn not subject to external pressure. For this purpose, the horse may be turned to graze during its growth, when in general it will grow down apparently perfect: it is, however, if the disease has been of any duration, too apt to return, if the smith brings only the ordinary pressure of a shoe upon it; though this takes place by degrees, and not at the first shoeing: the parts weakened by the disease become unable to sustain even this pressure, and first become tender, and afterwards lame; or the parts fester, according to the degree of it. The barred shoe, on this account, is often had recourse to by the smiths with good success; the pressure to the corn being done away by the parts of the shoe opposite it being bent out of the line or plane of the shoe, and then to the foot a light stopping of turpentine dressings on tow is applied, and bound in with tar cord. The continuance of this, which is seldom persisted in long enough, restores the horn to soundness; which being then left off, and the ordinary shoe applied, induces again the consequences, sooner or later, that we have described. A shoe may be beat or filed out with a space opposite the corn; but we have found it more easy and certain, when the parts are arrived at this state, to make a shoe rather thicker than the ordinary shoe, and to cut off entirely that extremity of it that comes opposite the corn, to a short distance from it, so as to be assured no pressure can arise from the shoe itself; for if the shoe be left long, however managed, by long wear it is apt to play and become relaxed, from the parts both of the hoof and shoe giving way to each other, and thus creating a degree of looseness, when the heel of the shoe, coming upon the part, reproduces the disease. It will be objected to this proposal, that the corn is left unprotected, and at first it will be a little tender, but this will speedily go off, and at each shaving will become of less consequence; and it is better of the two evils to contend with the occurrence of accidental pressure from irregularities in the road, than the perpetual pressure of the shoe. In slight cases, after the shoe has been nailed on pretty firmly, we have taken a small saw, and sawed away the horn resting on the shoe at this part, so as to make it press less there than on any other part of the foot; but if the shoe be allowed to stay on too long, the nails, as we before stated, become relaxed, by the horn giving way, and pressure will occasionally take place on the corn.

Of late we have had several opportunities of using the shoe above described, and have found it in practice beyond our expectation; nor have we found it, though avowedly imperfect, produce any of the evils we had apprehended it would be subject to. There are other methods than those we have described, but we do not mention them, from finding them insufficient. Where pus has formed, the horn covering it being effectually removed, digestives of turpentine are used, as in any other wound, till the horning of the sore takes place, when the cause that originally produced it must be carefully avoided.

Corn-Buttle, in *Agriculture*. See CENTAURY and WEED.

Corn-Butterfly, in *Entomology*. See PAPHIO.

Corn-Creeperfoot, in *Agriculture*, is the common name of a plant of the weed kind, often found among corn crops, and which is very troublesome to the farmer. It has an upright stem, with pale green leaves, cut into long narrow acute segments, the flowers are of a pale colour. It is extremely difficult to be eradicated from places where it is established. See WEED.

Corn, Ears of, in *Natural History*. Under this name different authors have described a variety of organic remains found in the strata of the earth. M. Schuechzer, in particular, gives the figure of a fossil, which he describes as an ear of corn, and from its figure, and supposed fulness, he argues, that the Mosatic deluge took place in the month of May! but Mr Walsh considers this body rather as a zoophyte, the rays of which are divided by transverse lines, marking their separation into distinct vertebrae.

The spica fecalina, and graminis panicis of Dr Richardson, and the ear of barley which Mylius has figured, are of like doubtful origin; the latter, in particular, does not bear the proportions of an ear of barley.

The flangengraupen of the German mineralogists more nearly resemble ears of corn, than the above. These are flat, oblong, blackish, and sometimes greenish bodies; but, becoming white, and acquiring a metallic lustre on their prominent parts by friction. Many have supposed these to be mineral substances, to which mere accident has given their present form; but they seem to be real vegetable substances, impregnated with metallic particles. They vary considerably in form, but are in general flattened, and are fluted with little round prominences, bearing very much the appearance of corn. They are found but very rarely, and perhaps only in the copper mines of Frankenburg in Hesse. M. Lihman, who has written expressly on these substances, does not consider them as changed vegetable substances, but as being of mineral origin; he found them to consist of copper, arsenic, sulphur, and iron, with a small quantity of silver in their composition. Wolfart, who has delineated and described these substances, calls them *frumenti metallares*, acknowledging that he cannot refer them to any particular species of grain. Mr. Parkinson gives two figures of these substances, but concludes his description thus: "I am therefore of opinion, that we must be satisfied with considering them as fossils, whose origin must be referred to some hitherto unknown subject of the vegetable kingdom." Mr. Whitehurst, "Theory of the Earth," p. 169, mentions corn among the vegetable impressions found in the coal measures of Derbyshire; but this is doubtless as ill-founded as any of the foregoing; and we have the best reason to suppose, that minute and scientific examinations will place all these among the incognita of a former state of aquatic existence.

Corn-Farm, in *Agriculture*, is that sort of farm which is principally cultivated and conducted under the system of corn, or the chief produce of which is grain. All the more dry sorts of land are adapted to this purpose. See CORN and FARM.

Corn-Flag, in *Botany*. See GLADIOLUS.

Corn-Flags, in *Agriculture*, is the name of a troublesome plant of the weed kind, which increases greatly by the root; when established in the field, it is with difficulty extirpated, as it is capable of sending up new plants from every part of its roots. See WEED.

Corn, Indian. See INDIAN CORN and MAIZE.

Corn Land, that kind of land which is adapted to the growth of grain. See FARM.

Corn, Lent, is a term applied to that sort of grain which is usually sown, or put into the soil about that season.

Corn Marygold, is the name of a plant of the weed kind, of which there are two species, one found commonly in arable land, and the other in pastures of the more moist kind. It is a great enemy to all sorts of corn crops. It is extirpated with much difficulty, as it multiplies both by its roots and seeds. Deep and effectual hoeings, frequently repeated, are of course requisite, before it runs up to seed. See WEED.

Corn Measure, in *Rural Economy*, that sort of measure which is used for grain. See MEASURE, and WEIGHTS and MEASURES.

Corn Mill, that sort of mill which is employed in the grinding of corn. See MILL.

Corn Parsley, in *Agriculture*, is the name of a low branching plant of the weed kind, often met with among corn crops. See WEED.

Corn Rent, that sort of rent which is regulated by the price of grain. See RENT.

Corn-Rents, in *Law*, denote those third parts of the old rents on college leases, which were to be reserved by the lesses. Stat. 18 Eliz. cap. 6. These were the invention of lord-treasurer Burleigh, and sir Thomas Smith, then principal secretary of state, for upholding the revenues of colleges.

These great statesmen, observing how much the value of money had sunk, and the price of all provisions risen, by the quantity of bullion imported from the new-found Indies, which effects were likely further to increase, devised this method. Their foresight and penetration have in this respect been very apparent; for though the rent so reserved in corn was at first but one-third of the old rent, or half of what was still reserved in money, yet now the proportion is nearly inverted; and the money arising from corn rents is, *communibus annis*, almost double to the rents reserved in money.

Corn-Rocket, in *Botany*. See BUNIAS.

Corn-Sallad, in *Agriculture*, a species of the Valerian. See VALERIAN.

Corn-Sharping. See SHARPING.

Corn, Spring, a term signifying such sorts of grain as are put into the earth in the spring season.

Corn-Stand. See STAND.

Corn-Stubble, that sort of stubble which remains after reaping or cutting any sort of grain crop. It should constantly be collected for the purpose of litter. See STUBBLE.

Corn-Stubble Rake, is a large kind of horse-rake, employed in some counties with much benefit. See RAKE.

Corn-trug. See TRUE-corn.

Corn-violet. See WEED.

Corn, white, a general term used to signify all sorts of grain.

Corn-Worm, a sort of insect of the caterpillar kind, which is said to be very detrimental to corn.

CORNA, in *Ancient Geography*, an episcopal town of Asia, in Lycania, mentioned in the acts of the council of Chalcedon, held in 451.

CORNA, in *Geography*, a town of Asiatic Turkey, in the Arabian Irak, on the Euphrates; 6 miles N. W. of Basora.

CORNACHINE POWDER, in *Pharmacy*, a purgative powder,

der, called also 'eal of Warwicks' powder, and pulvis diatribus. It is composed of equal parts of antimonium diareticum, diagrydium, and cream of tartar.

CORNACHINI, THOMAS, in *Biography*, born at Arezzo, in Tuscany, about the middle of the 16th century, obtained considerable celebrity, as professor of medicine at Pisa, where he lectured to large audiences several years. He died in 1555, and was succeeded in the professorship by his son Mark, who published at Venice, in 1607, in fol. "Tabule Medicæ," the only work left by his father, in which he has collected the descriptions and accounts of diseases left by the Greek and Arabian physicians, with commentaries upon them. His son had the credit of giving his name to a purging powder, Pulvis Cornachini, consisting of calomel, scammony, and burnt hartshorn, which still retains its credit, for its efficacy in destroying the ascarides, a small worm, infecting the bowels of children. Mark also published, "De Hominis Generatione, de vino, et aqua, balneisque Pisanis," Frankfurt, 1607. fol. and a "Discovery on the Method of Curing, tuto, cito, et jucundè," he says, all those diseases, which are said to be derived from peccant humours. Haller Bib. Med. Eloy Dist. Hist.

CORNACUM, in *Ancient Geography*, a town of Lower Pannonia, according to Ptolemy and Antonine's Itinerary.

CORNAGE, an ancient tenure, the service whereof was to blow a horn, when any invasion of the Scots was perceived.

This tenure, which was a species of grand serjeanty, was very frequent in the northern counties, near the Picts and the Roman walls; but by stat. 12 Car. II. all tenures are converted into free, and common socage.

An old rental calls *cornage*, *newgeld*, q. d. *neat geld*. Lord Coke says, in old books, it is called HORNGELD.

CORNARISTS, in *Ecclesiastical History*, the disciples of Theodore Cornbert, an enthusiastic secretary of the states of Holland. He writ at the same time against the Catholics, Lutherans, and Calvinists. He maintained that every religious communion needed reformation; but he added, that no person had a right to engage in accomplishing it, without a mission supported by miracles. He was also of opinion, that a person might be a good Christian, without being a member of any visible church.

CORNARIUS, JOHN, in *Biography*, a physician of great eminence, and author of numerous treatises on the theory and practice of medicine, was born at Zwickaw, in Upper Saxony, in the year 1500. Haller says, his proper name was Hagenbot or Hanbut, but that following the custom of the time, he took the name of Cornarius, which he affixed to all his publications. He is said to have attached himself to the study of medicine, in the hope of discovering some method, or medicine, capable of restoring, or invigorating his constitution, naturally feeble and delicate. With this view, he resided in succession, at several German universities, and at length at Basle, in Switzerland, where he met with copies of Hippocrates, Ætius, and other of the Greek fathers, in their own language, which he had not before been able to procure. Returning with this treasure to his own country, having previously taken the degree of doctor in medicine at Padua, he set himself down to translate first the works of Hippocrates into Latin, which he completed in five years, and published at Basle, in folio, in 1543; then Ætius, and Paul of Ægina. He had before published, viz. in 1529. "Universæ rei medicæ, epigraphæ, seu enumeratio," which has been several times reprinted. "De rebus medicæ studiiis amplexendis" "De conviviis veterum Græcorum" "De peste libri duo; de Podagræ laudibus," in 1553, with various other

dissertations. While thus employed, he did not neglect the practice of medicine, of which he is said to have had a considerable portion. His translations of Hippocrates, having been rudely attacked by Fuchsius, he answered it by a satirical effusion, which he called, *Vulpecula excorata*. This was printed at Franckfort, in 1543, in 4to. Fuchsius answered this by a similar piece of satire, *Cornarius furens*. The translation of Hippocrates has long since been superseded by those of Vander Linden, and Fucsius, and those of Ætius, and Paulus Ægineta, were not much longer lived. They were however works of great labour, and contributed to lessen the difficulties of the task to those that followed. Cornarius died at Jena, March the 16th, 1558. His son, Diomedes, succeeded to his practice. He was appointed professor of medicine, in the university of Vienna, and physician to the emperor Maximilian II. He published at Leipzig, in 1595, in 4to. "Consiliorum medicinalium tractatus;" also "Historiæ admirandæ, rare, et orationis medicinales." Haller Bib. Eloy. Dist. Hist.

CORNARO, FRANCIS, cardinal and bishop of Brescia in the sixteenth century, began his career as a military man, during the contests in Italy excited by the rival interests of Charles V. and Francis I. in which the Venetian republic was involved. Upon a general pacification, he quitted the army and devoted himself to the pursuits of literature and the study of politics. He was afterwards fixed upon as ambassador from the republic to the emperor Charles V. In 1527 he was raised to the dignity of cardinal by pope Clement VII. and after his admission into the college, he confined his labours to the deliberations of that body, where his learning and experience were highly appreciated. He died in his sixty-fifth year, A. D. 1543, of the gout, with which he had been long afflicted. Moreri.

CORNARO, GEORGE BASIL, cardinal and bishop of Padua, was born in 1658. He also began life in the army, which he left for the church. He was member of the order of Malta, and grand prior of Cyprus, an office which was hereditary in his family. His application to literature, and his acquirements by foreign travel, pointed him out as a person well and highly qualified to fill offices of great responsibility in the republic. He was first appointed to the superintendency of the marine, and would have been sent as ambassador to France, had not his preference led him to embrace an ecclesiastical life. He accordingly went to Rome, where he was entrusted with certain commissions which led him to high preferment and great dignities in the church.

In 1692 he was appointed ambassador to the court of Portugal, and was made titular archbishop of Rhodes. On his return, he was created cardinal by Innocent XII. and nominated to the bishopric of Padua. He died in the year 1722. Moreri.

CORNARO, LEWIS, of a noble Venetian family, though from his not enjoying the honours attached to it, supposed not to have been legitimate, was born in 1467. He lived to a great age, which he attributed, and probably with justice, to a strict, abstemious regimen, adopted by him, on his recovering from a severe illness, when he was more than forty years of age. His health had been declining several years, prior to this attack, owing as he acknowledges to his living a debauched and voluptuous life. In entering on his new regimen, he took care to avoid, he says, the extremes of heat, or cold, together with all violent exercise, and to live in a pure dry air; all which, he contended, were equally important in attaining the end proposed, the restoration of a decayed constitution, as temperance and diet. During the remainder of his life, he only took twelve ounces of solid food,

fool, viz. bread, soups, yolks of eggs, and meat, and fourteen ounces of wine in the day. This portion, as he grew old, he rather diminished than increased, observing that the power of concoction is then less vigorous, and as that weakens, the ingesta should be lessened. He married a lady of the house of Spil-berg, at Udina, by whom he had an only child, a daughter, when they were both advanced in years. At the age of 83 he wrote his "Discorsi della vita sobria;" a short treatise on the advantages of temperance, from which this account is principally taken. The work has been repeatedly translated, and printed in every country in Europe. He was then, he says, so brisk, lively, and active, that he could mount his horse, without assistance from any rising ground. Sometimes he retired to his villa, seated in a valley, watered by the Brenta, encircled with large, well cultivated fields, and a considerable number of buildings, made habitable by his own industry. "It had been full of fens and bogs, he says, a habitation, more fit for snakes, toads, and serpents, than for man." He had the pleasure of enjoying the society of his daughter and eleven grandchildren he had produced; who amused him with their musical exhibitions, in which science as well as in that of architecture, he had no inconsiderable skill. He died at Padua, April 26th, 1566, at the age of 68. His wife, who survived him, lived also to nearly the same age. Sir John Sinclair, in his "Code of health and longevity," mentions the edition of 1779 as the best English translation of Cornaro's works. There are four discourses on one subject, penned at different times; the first, which he wrote at the age of 83, is intitled "A treatise on a sober life," in which he declares war against every kind of intemperance. The second was composed three years after, and contains directions for repairing a bad constitution. The third he wrote when he was 91, entitled "An earnest exhortation to a sober life;" and the last is a letter to Barbaro, patriarch of Aquileia, written when he was 95, which contains a lively description of the health, vigour, and perfect use of all his faculties, which he had the happiness of enjoying at that advanced period of life. Eloy. D.ct. Hill. Gen. Biog.

CORNARO-PISCOPIA, LUCRETIA HELENA, an illustrious Venetian lady, was born at Venice in 1646. At the age of eleven having imbibed a devotional temper, and an ardent love of literature, she took a vow of chastity, which she maintained through life, though a dispensation was obtained from it, without her knowledge. She was an excellent linguist, being thoroughly conversant with several of the modern languages and with the Latin, the Greek, Hebrew, and Arabic. She had a taste for poetry and music, and composed verses which she sung to her instrument. In many of the abstruse sciences she was deeply read, and acquired so much reputation, that it was proposed to give her a seat among the doctors of theology at Padua; this was opposed by the bishop; she was however honoured with a cap of doctor in philosophy. The ceremony used on the occasion was performed in 1678 in the cathedral of Padua, at which an immense concourse of people was assembled as witnesses of so extraordinary a sight. She was elected a member of all the principal literary societies in Italy, and no person of distinction visited the country without paying his respects to this excellent lady. She had a great desire to enter into some religious society; but by the entreaties of her father she remained under his roof, contenting herself with wearing the habit of the Benedictine nuns, and observing the rules of the order. She died in the year 1684, and her works were collected and published in 8vo. at Parma, 1688, but their merit is not equal to the

high reputation which the author sustained during life. Monren.

CORNAU, in *Geography*, a town of Germany, in the circle of Westphalia, and county of Diepholz; 6 miles N. of Diepholz.

CORNAVII, in *Ancient Geography*, a people of the isle of Albion, who were situated to the west of the Coritani or Cor-Iceni, in that country, according to Camden, which is now divided into Warwickshire, Worcester-shire, Shropshire, and Cheshire. There were several British tribes of this name, in other parts of this island; and particularly in the most northerly part of Britain, called Strathavern, which seems to retain some vestige of the name of its first possessors; and they all seem to have been called Cornavi, from the two British words *Corn*, a horn, and *Av*, a river, descriptive of the form and situation of their respective countries. Besides the Cornavii, there was another British tribe or nation, seated in the countries above mentioned; and seeming to have possessed the best part of the two counties of Warwick and Worcester. This nation is called by Tacitus (*Annal.* l. xii. c. 38.) the Jugantes, by a mistake as it is thought of his transcribers, for Wigantes, or Huicri, their real name.

The Wigantes, signifying in the ancient language of Britain, brave men, seem to have been an independent nation under their own prince Venutius, who married the famous Cartesmandua, queen of the Brigantes. But both the Wigantes and Cornavii, were in such strict alliance with the Iceni and Cor-Iceni, that they were reduced at the same time, and by the same generals, under the dominion of the Romans. (*Tacit. Annal.* l. xii. c. 29, 30.) That brave and industrious people built many forts, stations, and towers in the country of the Cornavii and Wigantes, to keep the inhabitants in subjection.

As the second journey of Antonius from beyond the wall of Severus to Richborough in Kent, passes through this country from north to south, it will conduct us to several of these Roman towns and stations. The most northerly of these towns was Condate, supposed to be Northwich in Cheshire. We come next to Diva or Deva, now Chester, which was a city of great consideration in the time of the Romans, a colony, and the station of the 20th legion. Pursuing the same route southward, we meet with the following towns in their order; Bovium, near Stretton; Mediolanum near Drayton; Rutonium, near Wem; Uriconium, near Wroxeter, the ancient capital of the Cornavii; Uxacona, near Sheriff-Hales; Pennoerucium, near the river Penk; Erocetum, Wall near Litchfield; and Manduessum, near Manchester, in Warwickshire. The precise boundaries of the several Roman provinces in Britain are so little known, that we cannot be certain whether the whole country of the Cornavii and Wigantes was within the limits of that which was called Britannia Prima, or some part of it belonged to Britannia Secunda.

CORNAX, MATTHIAS, in *Biography*, a native of Meldola, a small town in Italy, studied medicine at Venice, where he afterwards continued to practise, and was appointed one of the teachers in the art. He is here noticed, on account of his having published a case of a woman who had carried an extra fetus in the abdomen, for the space of five years. An abscess at length forming, near the navel, and bursting, our practitioner enlarged the aperture, and extracted through the wound, a half putrid fetus. The woman recovered, but becoming again pregnant, and it not being practicable to deliver her by the natural passage, she died.

It does not appear that the body was opened. The case was originally published at Venice in 1550, in 4to, "Historia quinquennis fere gestationis," &c. It was republished in 1564, with other similar cases, in the author's "Enchiridion Medicæ consultationis apud Ægrotos, &c; Basilee," 8vo. Haller Bib. Ch.

CORNAZZANI, ΑΝΘΩΝΥ, an eminent Italian poet, who flourished in the sixteenth century. He was born at Placentia, but resided chiefly in the early part of life at Milan, but after the death of Sforza he was obliged to take refuge at Venice, where he was hospitably received by Bartholomew Colleone, whose life he afterwards wrote. From Venice he went to France, and from thence to Ferrara, where he finally settled under the patronage of Duke Hercules the first, and his duchess Lucretia Borgia. He is chiefly known by his sonnets and lyric poems, some of which are

reckoned the most perfect of their kind in the language. He wrote the lives of the Virgin Mary and of Christ in verse; and among his prose works, we have, besides the life of Colleone, a treatise "De Mulieribus admirandis;" and another entitled "De excellentum Virorum principibus."

CORNE, or CORNA, in *Ancient Geography*, a town of Cappadocia, towards the Euphrates, to the south of Melitene.

CORNE, in *Geography*, an island, ten miles long and one wide, in the gulf of Mexico, near the coast of West Florida. N. lat. 30° 11'. W. long. 83° 32'.

CORNE, a town of France, in the department of the Mayne and Loire; 7 miles E. of Angers.

CORNE. See HORN-work.

CORNE a amorcer, priming-horn. An ox-horn filled with fine powder for priming cannon.
